While it may appear presumptuous for a mere layman to offer an opinion on the organization of a great army department, nevertheless I am of opinion that the maximum of medical work is not at present produced by the medical service of the army. The allocation of medical officers is on too generous a scale. Under the present system, as is well known, each unit (battalion or battery) has its own medical officer, and this system obtains throughout the army wherever possible. After six months' experience as civil medical officer to three battalions at different times, I am of opinion that the medical work of each of these units could easily be done in three or four hours. It is no uncommon experience amongst home battalions to find that the medical officers have finished all the necessary work by mid-day. After that they have nothing to do. This is not the fault of the doctors. They have not joined the army to enjoy a well-paid holiday; they want work, but it is not there to be done. The system is altogether too extravagant in allocating one medical officer to each unit, and more men than are absolutely necessary are taken up by it. There is certainly room here for a thorough remodelling of the medical organization. Where there are large numbers of troops congregated together in training centres and behind the actual fighting lines it is difficult to believe that each separate unit must have a separate medical man. A medical station or dépôt with an adequate staff of medical men could be established in these centres, a part of which would be always available at call; thus the requirements of the troops could be met in a very satisfactory manner.

The advantages of such a centralization are obvious:

1. The medical service in these dépôts would be mobile yet unified under medical supervision (as distinct from purely military).
2. A great economy of medical men would be effected. Twenty-five doctors could do the work of forty without hardship.
3. Incidentally medical men attached to those centres would be members of an army medical corps in reality as well as in name. At present medical officers belong to a corps distinct from that to which they are attached. They are not of the mess.

Such a grouping is applicable only to troops not engaged in the actual firing line. The first line must of necessity be well supplied with medical men, but the extravagant allocation of men does not take place in this direction. It undoubtedly is to be found in the training centres. The system of individual attachment is cast-iron and antiquated in its application, but such an arrangement as suggested, assisted by telephone and automobile, could be rendered elastic, effective, and economical. This is but a general illustration of the kind of readjustment that suggests itself, and no attempt is made to cover the whole ground. The point, however, that I desire to emphasize is that when mention is seriously made of calling upon one-half the medical men in the country for army service it is time to make vigorous investigation as to whether the best and most economical use is being now made of the material available. Every eligible medical man will gladly offer his services, but he will do so all the more readily if he can be assured that such services will be put to the best possible use.—I am, etc.,

December 16th.

Late M.O. 30th Divisional (C.P.), R.F., etc.

THE PROPHYLAXIS OF TRINITROTOLUENE POISONING.

Sir,—Replying to a question as to the prevalence of trinitrotoluene poisoning at Woolwich Arsenal, Mr. Lloyd George stated in Parliament that some workmen are injuriously affected, but that the degree of susceptibility varies greatly, many workers being immune.

Experiments carried out under the direction of the American Board of Health some time ago seem to show that susceptibility to the action of such nitro compounds depends on the activity of the thyroid gland. When this gland secreted freely the animal became comparatively immune. It was also found possible, by feeding the animal on oatmeal, to increase the activity of the gland very many times.

It would therefore appear worth while to insist that workers with trinitrotoluene who experience ill effects should feed largely on oatmeal porridge.—I am, etc.,

J. C. McWALTER, M.D., LL.D., D.P.H.,

Dublin, Dec. 15th.

Lieutenant, R.A.M.C.(T.).

The Services.

WAR PENSIONS AND GRATUITIES.

RETIRED PAY, WOUNDS PENSIONS AND GRATUITIES, WIDOWS' PENSIONS, ETC., DURING THE PRESENT WAR.

A Royal Warrant dated November 26th, 1915, was published in Army Orders of December 6th, 1915, amending the regulations for officers' retired pay, wounds pensions and gratuities, widows' pensions, etc., for casualties during the present war.

Its provisions apply only to combatant officers; and it is stated that regulations as to retired pay, etc., for disabled medical, veterinary and other officers, whether regular permanent officers or officers of the Special Reserve or Territorial Force, and non-combatant officers holding temporary commissions, will be made known at a later date.

Officers' Wounds Pensions and Gratuities.

Lieutenants and second lieutenants may be granted wounds pensions and gratuities at the rate laid down for captains in the Royal Warrant for December 6th, 1914. Total loss of vision occurring within five years after the wound, and solely attributable to it, will entitle the officer to not less than £300 a year in wounds pensions and retired pay taken altogether.

Pensions to Widows and Children.

The highest rate of pensions and the accompanying gratuities may be granted if the deceased officer was killed in action, or suffered violent death due directly and wholly to war services, or died within seven years from wounds or injuries so received. A pension at the intermediate rate may be granted if the officer died from disease due to active operations in the field or otherwise directly attributable to military services within seven years, provided the illness is certified to have commenced during the war, or if he died within seven years in consequence of wounds or injuries received through the performance of military duty, but not in action, or wholly or directly due to war services. In the case of a permanent regular officer who married after he received the wound or contracted the illness, the widow and children will not be eligible unless he survived his marriage by at least a year; and in the special case of officers of the Special Reserve or Territorial Forces, or holding temporary commissions, the widow and children will not be eligible for the highest or intermediate rates unless the marriage took place before he received the wound or contracted the illness. If an officer dies from other causes while on full pay and his widow is disqualified only through the insufficiency of the officer's services for an ordinary pension, she may be granted a gratuity of not less than one and not more than three years' pay. In cases of peculiar need the Army Council may grant an education allowance not exceeding £5 a year for a boy and £25 for a girl, commencing at the age of 15 and ceasing at the age of 18, with power to extend until the age of 21 in the recommendation of a competent educational authority. The grant of double pensions for motherless children will be discontinued.

The provisions of the Warrant are applicable to all cases arising out of the present war, even though the casualty occurred before the date of the Warrant, but the increased rates will not be payable for any period before March 1st, 1915, except in the case of wounds gratuities for lieutenants and second lieutenants.

PARENTS AND SISTERS.

A Royal Warrant, dated December 10th, 1915, was published in Army Orders of December 15th, 1915, amending the conditions under which allowances may be granted to the relatives of a deceased officer. It is in substitution for articles 675 and 676 of the Royal Warrant of December 1st, 1914.

On the death of an officer who leaves no widow or legitimate child under conditions such as entitle an officer's widow to pension at the highest or the intermediate rate, allowances may be granted as under:

THE MOTHER.

The mother may be granted an annual allowance, provided that:

(a) The mother is a widow, or her husband is totally incapacitated by age or infirmity, or he had permanently deserted her and ceased to support her; or

(b) She was largely dependent for support upon the deceased officer; and

(c) She is in distressed circumstances, and is not in receipt of pension as an officer's widow or of any other charitable provision of any kind from the public.

The amount of the allowance shall be determined in each case by the Army Council with regard to the mother's pecuniary circumstances. It shall not in any case exceed the pension which would have been awarded to the officer's widow had he left one, or the annual value of the support afforded by the officer. It shall cease in the event of the recipient remarrying or attaining to pecuniary circumstances which in the opinion of the Army Council disqualify her, and shall not in any case be transferrable.

FATHER.

The father may, subject to the same conditions so far as they are applicable, receive an allowance similar to that granted to a mother, provided he is a widower and totally incapacitated by age or infirmity.

SISTERS.

The sister or sisters jointly may be granted an allowance, provided that—

- The officer did not leave a mother;
- The sister or sisters are incapable or deceased unmarried;
- They were largely dependent on the deceased officer;
- The surviving brothers, if any, are unable through youth or bodily or mental infirmity to give them support;
- They are in distressed circumstances, and are not in receipt of any other charitable provision of any kind from the public.

The amount of the allowance shall be determined in each case by the Army Council, with regard to the pecuniary circumstances of the sister or sisters.

Not more than £50 a year shall be granted to any one sister, and the total shall not in any case exceed the pension which would have been awarded to the officer's widow had he left one, or the annual value of the support afforded by the officer.

Except in special cases where the officer's sister is shown to be unable by age or infirmity to earn her living, an allowance will not be granted if she is over 21 years of age, nor be continued beyond that age, or shall also cease in the event of the recipient marrying or attaining to pecuniary circumstances which in the opinion of the Army Council disqualify her.

Further, the mother or sisters of a deceased officer shall be entitled to have granted to them, in lieu of the allowances granted by this Warrant, the benefits of the Warrant of December 1st, 1914, in respect of the rank held by the deceased officer before the date of this Warrant.

APPLICATIONS FOR WAR PENSIONS.

In the official report of the House of Commons for December 16th the following written answer (to a question by Mr. Hogge) appears under the name of the Financial Secretary to the War Office (Mr. Forster):

APPLICATIONS FOR NAVAL WAR PENSIONS.

Officers.

Disability and service pensions are awarded in the ordinary course of routine without special application.

A claim for wounds or injury gratuity or pension must be made within five years after the officer was wounded, and should be addressed to the Secretary of the Admiralty.

Applications for pensions to widows, compassionate allowances to children, or allowances to other dependants should also be addressed to the Secretary of the Admiralty.

Such pensions and allowances commence from the day following the date of death of the officer—except in the case of warrant applications in which the pension or gratuity commences from the date of cessation of the period of compulsory separation allowance or allotment—provided application be made within twelve months. Otherwise they take effect from the date of application.

Men.

Pensions to men are awarded in the ordinary course of routine, without special application. Payment begins normally immediately after the man's discharge from the Navy or Marine (or discharge from hospital, if later).

When there is reason to suppose that a case has been overlooked, or that the award is not in accord with regulation, application should be made in writing to the Accountant-General of the Navy, Admiralty, S.W.

There is no limit of time within an application for an award must be made.

Pensions to the widows and children of seamen and marines are awarded in the ordinary course of routine, without special application. Payment begins normally immediately after the cessation of separation allowance, or when there is no separation allowance, from date of death.

Where there is reason to suppose that a case has been overlooked, or that the award made is not in accordance with regulation, application should be made in writing to the Director of Greenwich Hospital, Admiralty, Whitehall, S.W.

Applications for allowances to other dependants of seamen and marines should be addressed to the Accountant-General of the Navy.

APPLICATIONS FOR MILITARY WAR PENSIONS.

Officers.

Disability and service pensions to officers are awarded in the ordinary course of routine, without special application. Claims for wounds pensions and gratuities, and pensions for widows and other dependants, should be made in writing to the Secretary, War Office.

Other Ranks.

Pensions of all kinds are awarded in the ordinary course of routine, without special application. Payment begins normally immediately after the man's discharge from the army (not from hospital), or in the case of widows and other dependants immediately after the cessation of separation allowance.

When there is reason to suppose that a case has been overlooked, or that the award made is not in accordance with regulation, application should be made in writing, in the case of officers, to the Secretary, Royal Hospital, Chelsea, and in case of widows or dependants to the Secretary, War Office.

Time Limits.

Under the preamble of the Royal Warrant for Pay, payments not claimed within a period of twelve months are forfeited, unless exceptional circumstances are shown, satisfactorily explaining the delay. A delay in claiming pension for more than one year thus invalidates the right to receive more than one year's arrears of the pension, but does not affect the claim to have the pension granted.

An officer's claim for a wound or injury gratuity or pension must be made within five years after he was wounded.

EXCHANGE DESIRED.

CAPTAIN, Field Ambulance, desires exchange with another officer at Casualty Clearing Station, General or Stationary Hospital, B.E.F. Address No. 6565, BRITISH MEDICAL JOURNAL Office, 423, Strand, W.C.

Public Health

AND

POOR LAW MEDICAL SERVICES.

POOR LAW ADMINISTRATION.

REDUCTION OF WORK.

THE President of the Local Government Board has notified in a circular dated December 17th, to boards of guardians, that in view of the depletion of the staffs both of the boards of guardians themselves and of the central authority, owing to the large number of men who have joined or will shortly join His Majesty's forces, it is recognized that some reduction of the work which normally falls upon Poor Law authorities and the department is necessary. Mr. Long considers that the ordinary methods of administration should, so far as practicable, be modified and adapted to the present exceptional circumstances. A list is given of the matters in which for the present applications for sanction or reports may be dispensed with. They include:

The reappointments of district medical officers who are not resident in their district and who require to be reappointed periodically. (For a further period similar to the last and upon the same terms.)

Appointment of temporary substitutes for officers absent on naval or military service, or prevented by sickness or accident from the performance of their duties. (It will, however, be convenient that arrangements relating to the office of clerk to the guardians, or to principal officers of institutions, should be notified to this department. Men eligible for military service should not be appointed unless already attested under the recent recruiting arrangements.)

Medical and general relief arrangements approved for a temporary period. (For a further year.)

Payment of reasonable fees to medical officers for minor operations and assistance of anaesthetists.

Alterations of the dietary tables made in conformity with the regulations in the Poor Law Institutions Order, 1913.

In all or any of these cases, if the guardians so desire, sanction may be understood to be given without any reference to the department.

After January 1st, 1916, monthly instead of weekly reports on pauperism will be required, and certain other minor reductions in time and material can be made. The circular concludes as follows:

Each board of guardians will no doubt find other means of diminishing the work of their staff, and in particular Mr. Long would ask them carefully to consider to what extent it would be practicable, without detriment to the efficiency of their control, to reduce the number of meetings both of the board of guardians and of the various committees. The substitution of monthly for fortnightly meetings would, in Mr. Long's opinion, be quite justifiable during the period of the war.

Medico-Legal.

PASSPORT APPLICATIONS: A WARNING.

A CHANGE has been heard at Bow Street police court against Dr. A. H. Vassie, a well-known practitioner in Hampstead, in respect of a declaration signed by him on the strength of which a passport to travel in Europe was issued on August 3rd, 1914, to a woman who was convicted in September for an offence under the Defence of the Realm Act and sentenced to ten years' penal servitude. The defendant in his evidence said, according to the report in the *Times*, that Mr. Hildesheimer, formerly head of a large publishing business, with whom and several members of his family he had had an intimate professional acquaintance for thirteen years, had introduced his niece to him, saying that she wished to go to Germany to nurse her mother. He put a number of questions to her as to her mother's illness, and after being assured by Mr. Hildesheimer as to her position, he had felt justified in recommending her for a passport. The evidence was corroborated by Mr. Hildesheimer but the magistrate committed the defendant for trial, allowing bail in his own recognizances of £50.

DR. R. MURRAY LESLIE v. DR. CASSELL'S MEDICINE COMPANY, LIMITED.

IN THE Chancery Division, on December 21st, Mr. Justice Sargant had before him a motion at the instance of Dr. R. Murray Leslie for an injunction restraining the Dr. Cassell's Medicine Company, Limited, from publishing or making any advertisements representing or calculated to induce the belief that Dr. Leslie recommended or approved of or had any connexion with any medicines or remedies sold by the company or associated with the name of "Dr. Cassell." The circumstances under which the injunction was sought were these: On October 20th last Dr. Leslie delivered a public lecture at the Institute of Hygiene in London on the subject of war strain and its prevention, and a summarized report appeared in the public press. The Dr. Cassell's Medicine Company, Limited, who were the vendors of "Dr. Cassell's tablets," thereupon inserted in the advertisements which they published in the press a reference to Dr. Leslie and to the lecture he had given in terms which gave the impression that Dr. Leslie recommended or approved of the "tablets" which the company purveyed. The company did not resist the proceedings, and Mr. Justice Sargant granted Dr. Leslie an injunction in the terms asked for.

Universities and Colleges.

UNIVERSITY OF CAMBRIDGE.

AT the next examination for entrance scholarships and exhibitions at Downing College, Cambridge, commencing on February 29th, 1916, preference will be given to prospective students of law or medicine. This preference is in accordance with the terms of the original charter of the college. Further information can be obtained from Mr. J. H. Widdicombe, tutor of the College.

UNIVERSITY OF LIVERPOOL.

THE following candidates have been approved at the examinations indicated:

SECOND M.B., CH.B.—Part A: R. A. Cooke, S. G. Evans, S. D. S. Greval, Phoebe A. Ince, W. A. Jackson, V. E. Jones, G. A. Mitchell, S. G. Mohamed, W. L. de Silva, G. S. Swan, H. G. Young. Part B: A. L. Davies, W. H. Evans, S. M. A. Faruqi, H. P. Williams.

FINAL M.B., CH.B.—Part I: E. H. T. Cummings, R. I. Dugale, G. Eastwood, Constant E. Edwards, R. B. Evans, A. J. P. Griffin, W. Griffiths, J. J. Griffiths, W. Griffiths, J. J. Griffiths, C. V. Pearson, B. P. Pinkerton, E. S. Stubbs, R. C. Watt. Part II: M. Azer, H. H. Eastwood, W. Griffiths.

Diploma in Tropical Medicine.—G. H. Pearson, J. Wood.

Diploma in Operative Surgery.—B. P. Ramskar.

† Distinction in pathology.

† Distinction in therapeutics, forensic medicine, and toxicology.

VICTORIA UNIVERSITY OF MANCHESTER.

THE following candidates have been approved at the examinations indicated:

FIRST M.B., Part III, Organic Chemistry and Bio-Chemistry.—H. P. Fay, F. L. Pickett.

SECOND M.B.—Abdoh Noeman, T. H. Almond, Sybil Bailey, Mary G. Campbell, P. Colley, A. M. Cotes, S. E. Cuthley, F. E. Healy, P. S. Horrocks, A. W. Kirkham, J. Mills, Kathleen O'Donnell, L. J. Schwartz, V. T. Smith, G. E. Wadsworth (Anatomy). F. L. Whincup. † Distinction in physiology.

THIRD M.B., CH.B.—(General Pathology and Morbid Anatomy) G. E. Archer, Mercy D. Barber, W. F. G. Boul, Hilda E. Brade, Frances G. Bullock, C. P. J. Carruthers, Kathleen L. Cass, Ruth E. Conway, W. C. C. Easton, J. Holley, N. Klete, E. N. P. Martland, J. A. S. Panton, B. S. Paterson, Elizabeth C. Powell, J. Schlosberg, D. M. Sutherland H. Taylor. (Pharmacology and Therapeutics) Mercy D. Barber, J. Charnley, J. C. T. F. R. Edrington, Mercy D. Barber, J. Charnley. (Anatomy) FINAL M.B., CH.B.—H. W. Bennett, W. Halliwell, J. D. Kenyon, J. F. C. O'Mera, C. G. Todd, L. Walton. (Obstetrics and Surgery) R. Chevasant, (Obstetrics and Medicine) G. Labrecq, (Forensic Medicine and Toxicology) H. Chadwick, J. B. Leigh.

UNIVERSITY OF EDINBURGH.
Graduation Ceremonial.

THE number of degrees conferred at the graduation ceremonial of December 17th was smaller than usual, owing to the fact that a special graduation ceremony was held last October. There were eight graduates for the M.D., and nineteen for the M.B., Ch.B.

The Vice-Chancellor, Sir William Turner, K.C.B., who conferred the degrees, said in his address that the past year had been one of anxiety, and had witnessed a great fall in the number of students. The university had sought to show to the country and to the whole world that it was alive to its responsibilities. It had furnished a great accession to the army and to the navy, not only in connection with its great specialty—education in medicine—but also in the other faculties, more especially in those of law, science, and arts. The degrees granted that day were mainly in medicine, and between December, 1914, and December, 1915, the university had conferred degrees of M.B., B.Ch. on 194 candidates; had promoted 24 graduates of previous years to the M.D.; and two medical graduates to the degree of B.Sc. in public health. The number of medical students in the present winter was 676, as compared with 1,111 at the corresponding period in 1913. The diminution in the number of students of medicine in the first year, 147 as compared with 188 in 1913, was not so great as might have been anticipated, but it must be remembered that the students in medicine, and, indeed, in the other faculties, entering for their first year, were becoming students under conditions much more serious than any students in the past had experienced, because the needs of the nation would undoubtedly call on some of them to do their duty as young men competent to share in the responsibilities of the nation, and to help to fight for the country through this formidable and long-enduring war.

The following is a list of those who have degrees were conferred:

M.D.—E. C. Girdling, G. D. Logan, S. S. MacNaughtan, Adelaide A. Renshaw, W. Russell, C. P. Stewart, Vatsirampalli Sankara Vallathan, G. J. Williams.

M.B., Ch.B.—J. W. Brownie, T. F. Corhill, H. F. Ferguson, G. W. M. Findlay, Padal Kumar Ghosh, E. L. Innes, H. W. Kirk, A. J. M'Ilroy, Fremral Frambrakrai Majumdar, Kunand Sankar Ray, A. D. Rowan, C. I. Stockley, G. M. Torrance, B. A. Warters, J. A. C. Williams, W. Williams, Tin Po Woo, Margaret Kirk Jolly Wright, P. H. Young.

B.Sc. (Public Health)—J. A. Henderson.

* Highly commended for thesis. † Commended for thesis.
‡ Passed with first-class honours.

ROYAL COLLEGE OF SURGEONS OF EDINBURGH.

At a meeting of the College on December 15th the following gentlemen, having passed the requisite examinations between October 4th and 6th, were admitted Fellows:

James Buchanan, M.B., Ch.B. Univ. Glasg., Shettleston, Glasgow; Shyama Pado Chattopadhyay, L.R.C.S.E., etc., Halliabar, Bengal; Jacobus Stephanus du Toit, M.D. Univ. Edin., Royal Westminster Ophthalmic Hospital, London, W.C.; Arthur Owen Evans, M.B., Ch.B. Univ. New Zeal., Belmont, Surrey, England; James Norman Jackson Hartley, M.B., Ch.B. Univ. Edin., Edinburgh; Alfred William Macbeth, M.D., C.M. Queen's Univ., Kingston, Ontario, Canada, L.C.P. and S. Saskatchewan, Edinburgh.

Obituary.

GEORGE ALLAN HERON, M.D., F.R.C.P.,

CONSULTING PHYSICIAN, CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST.

DR. GEORGE ALLAN HERON, whose death in London on December 10th was briefly announced in our last issue, was born in Glasgow in 1845. He received his early education in Ottawa and in Glasgow. He studied medicine in the University of Glasgow and at University College, London, and graduated M.B. and C.M. Glasg. in 1867 and M.D. in 1869. He took the diploma of D.P.H. in 1877 and that of M.R.C.P. Lond. in 1880. He was elected F.R.C.P. in 1887. As a young man he studied also in Berlin and Paris, but he always insisted that though he learnt much in foreign schools his real teacher in the true principles of the science and art of medicine was Sir William Gairdner of Glasgow, where, at the Royal Infirmary, Heron held resident appointments. After holding the appointment of assistant medical officer to the Glamorgan County Asylum, Dr. Heron practised in the south of England for a few years, but ultimately settled as a consulting physician in London. He became a member of the staff of the City of London Hospital for Diseases of the Chest, Victoria Park, and henceforth took a great interest in pulmonary phthisis and other forms of tuberculosis. He worked with Professor Koch before the researches of that pathologist became public property, and received Koch as his guest when he visited England.

Heron was one of the first physicians in this country to whom Koch communicated the result of his researches as to cholera and the hopes he entertained as to the first tuberculin treatment. He submitted the treatment to a prolonged and careful test in the Victoria Park Hospital, and in this work, as Dr. Vincent Harris informs us, he was intimately associated with his colleagues, of whom Dr. Harris was one. Notwithstanding many failures some striking results were occasionally observed, and Heron to the last appeared to believe in its efficacy. He was a shrewd and trained observer, but his opinions in this matter may have been biased by his friendship for Koch and admiration for his powers as a leader in experimental medicine. Dr. Heron published a book on the *Evidences of the Communicability of Consumption* in 1890, and contributed much to the dissemination of Koch's views as to tuberculosis both by papers contributed to the transactions of societies and by the speeches with which he frequently intervened in debates. He was a member and for some time president of the Assurance Medical Society, and in 1899 contributed to its *Proceedings* a paper on the extra ratings of healthy lives.

Dr. Heron was for many years a member of the British Medical Association. He served on the council of the Metropolitan Counties Branch for four or five years, and was chairman of its Finance Committee. He became a member of the Central Council in 1903, and took an active part in drafting a scheme of individual medical defence for members of the British Medical Association. This was a subject to which he had long given attention. He was one of the chief founders of the London and Counties Medical Protection Society in 1892 and its treasurer from that time until he was elected president in 1913 on the death of Sir Jonathan Hutchinson. During practically the whole period Dr. Heron acted as chairman of the council of the society, which at its meeting on December 16th adopted a resolution putting on record its deep sense of the great loss sustained by the society by the death of one who devoted so much valuable time and energy during twenty three years to its interests.

Dr. Heron was a man of striking presence, and in his day a good cricketer. He was a Liberal in politics and a member of the Reform Club. He was a widower, but leaves three sons who survive him, one now serving in the army.

THE death is announced of Dr. THOMAS RICE, of Burgh by Sands, Cumberland, aged 73 years. He was a native of Cumberland, graduated M.D. Edin. in 1864, and in the same year took the diploma of M.R.C.S. Eng. After two years spent as a ship surgeon, during which he made several voyages to Australia and China, he settled in 1866 at Burgh and remained in practice for 45 years, when failing health compelled him to retire from active work. He had a large country practice, and was held in high esteem by the community in which he worked for so long. He died on December 2nd, and was interred on December 6th in the village churchyard in the presence of a large number of friends from over a wide area.

WE regret to announce the death of Dr. JOHN ALEXANDER RAYNER, which occurred at his residence, Stamford Hill, N. on December 7th. He had been in failing health for several months past, and the end was not unexpected. Dr. Rayner was born on August 9th, 1845, at Queen's Road Dalston, and was the only son of the late Dr. John Rayner one of the most successful of local family practitioners. He was educated at Homer House, Dalston, and King's College. He graduated B.A. Lond. in 1871 and received the diploma of M.R.C.S. in 1868. After several years experience in the Midlands he returned to London and took over the practice of his father, and soon endeared himself to a large circle of patients. In 1898 he was joined in practice by Dr. David Ross and retired in 1908 on account of failing eyesight. Dr. Rayner's whole interest was centred in his work, and by his sterling honesty and integrity he won the confidence and esteem of his patients. In private life he was genial, cultured, and most hospitable and had a wide circle of friends. Dr. Rayner was an unmarried, but had the lifelong devoted companionship of his eldest sister, for whom much sympathy is felt. He was a member of the City Division of the British Medical Association and of the Aesculapian Society.

DR. MARCEL OUI, whose death was recently announced in the *BRITISH MEDICAL JOURNAL*, was born at Saumur in 1868. He studied first at the Medical School of Rochefort, afterwards at Bordeaux. In 1895 he became *agrégé* in obstetrics at Lille. At the end of his term of office he was appointed assistant professor. In 1907 a chair of obstetrics and infantile hygiene was created for him; in 1910 this was transformed into a chair of clinical midwifery. In 1911 OUI was elected a corresponding member of the *Académie de Médecine*, and in 1912 he received the distinction of Chevalier of the Legion of Honour. On the outbreak of the war he offered himself for service with the army. Forced to leave Lille when it was occupied by the Germans, he worked successively as surgeon in several military hospitals; finally he was appointed inspector of the first sector of the eighteenth region. The arduous work of that post, which involved constant travelling, undermined his health, and his life of usefulness was brought to a premature end after an urgency operation. The University of Bordeaux was officially represented at the funeral, and the dean, Professor Sigalas, delivered an appreciative address at the graveside.

DR. JOHN ALLAN died on December 4th at Ardrossan in his 57th year. He studied medicine in the University of Glasgow, and graduated as M.B. and C.M. in 1885, and M.D. in 1891. He practised in Ardrossan with one of his five brothers, all of whom entered the medical profession. He spent a good many years in South Africa, and held a commission during the Boer war as major in a battalion raised for the protection of the mines in the Johannesburg district. On the outbreak of the European war he organized the Ardrossan Red Cross Hospital, of which he was honorary commandant to the time of his death. He leaves a widow and three children, the elder son being at present in France with the Commercial Battalion, I.L.L.

DR. EDWARD LIVINGSTON TRUDEAU, the well-known pioneer of the open-air treatment of tuberculosis in America, died at Saranac Lake, the name of which he had made famous, on November 15th. He was born at New York in 1848, and took his degree at the College of Physicians and Surgeons of that city in 1871. In 1872 he began to practise in New York, but two years later he was pronounced to be dying of consumption, and retired to Saranac to spend what remained to him of life in the pure air of the Adirondack Mountains. His health was so much benefited, however, that he was able to strike out a new path of work in the treatment of tuberculosis. In 1885 he founded the Adirondack Cottage Sanatorium for the treatment of incipient tuberculosis in working men and women. From small beginnings it has grown into an institution with accommodation for more than a hundred patients. It is conducted on a semi-charitable basis, and was managed by Trudeau without salary. Among many distinguished persons who sought health at Saranac was Robert Louis Stevenson, who, always fond of doctors, became a fast friend of Trudeau. In 1894 Trudeau built the Saranac Lake Laboratory for the Study of Tuberculosis; it was the first institution of the kind established in the United States. Much valuable work, largely dealing with the question of immunity, has come from this scientific workshop. Trudeau contributed largely to medical literature on subjects relating to tuberculosis. The honorary degree of M.Sc. was conferred upon him by Columbia University in 1899, that of LL.D. by McGill University, Montreal, in 1904, and the University of Pennsylvania in 1913. He was president of the Eighth Congress of American Physicians and Surgeons held at Washington in 1910. He was a man of great intellectual gifts and of fine character. So fruitful has been Trudeau's work that in the thirty-one years that have elapsed since the Cottage Sanatorium at Saranac Lake was opened, the number of similar institutions has increased till now there are in the United States (according to the *Journal of the American Medical Association*) 575 sanatoriums and dispensaries, and more than 1,000 doctors and over 4,000 nurses who give themselves wholly to the study and treatment of the disease.

DR. ABRAHAM CROSS GODFREY died very suddenly on October 21st at his residence, Broom Hill, Dripsey, co. Cork. He received his professional education at McGill College, Montreal, qualifying as M.D. and C.M. in 1865. In the same year he took the diplomas of L.R.C.P., L.R.C.S. Edin., and wrote an essay on diphtheria. He was for some time physician to the Southampton Dispensary.

DR. WILLIAM OMAND SCLATER, whose death was announced in the *JOURNAL* of November 27th, p. 797, was born in Orkney thirty-one years ago. He commenced practice at Ipoh, Perak, with his friend and contemporary, Dr. W. P. Chrystall, four years ago. After the death of Dr. Chrystall in February Dr. Sclater was continuously overworked, but once a week he never failed to be on parade with the Malay States Volunteers.

FLEET SURGEON JOHN FREDERICK MITCHELL, R.N. (retired), died recently in London, aged 84. He took the diploma of M.R.C.S. in 1856, joined the navy in the same year, became staff surgeon in 1875, and fleet surgeon in 1876.

A RELATIVE of the late Deputy Surgeon-General WILLIAM FARQUHAR, Madras Medical Service (retired), who died in London on October 15th, and an obituary notice of whom was published in the *BRITISH MEDICAL JOURNAL* of November 15th, has sent us some further interesting particulars of his early life before he entered the Indian Medical Service. While a medical student, in 1852, he made a voyage to the Arctic regions in medical charge of the whaler *Spitbergen*, of Peterhead, on her maiden voyage. After a very successful season the ship was caught in the ice, and by a fortnight's alternate crushing and release became a total loss. The crew were fortunately saved by another ship. After qualifying, in 1853, he sailed from London to New Zealand as medical officer of the *Northfleet*, a passenger ship, which after landing her passengers at Auckland went on to Hong Kong. There he joined the P. and O. service, in which he served in eight different vessels between Suez and Shanghai, incidentally seeing a good deal of the Taiping rebellion while serving on the China coast. He returned home in 1856, and entered the Indian Medical Service on May 28th, 1858, passing third on the list. While in the service, in addition to the posts previously mentioned, he held the Sanitary Commissionership of Madras for some time in 1886, and in 1890, before his retirement, acted for a brief period as surgeon-general with the Government of Madras.

THE HON. JAMES EDWIN ROBERTSON, M.D., died at Montague, Prince Edward Island, on October 19th, aged 76. He was born at Peith, P.E.I., in 1840, was educated at the Charlottetown Academy, and took the degree of M.D. from McGill University in 1865. He was a member of the provincial parliament from 1870 to 1882, when he became a member of the Canadian House of Commons. In 1902 he was made Liberal Senator.

Medical News.

CORNELL UNIVERSITY has received a bequest of £10,000 from Mrs. Sarah Manning Sage to be applied to the promotion of medical science by research.

THE Government of Saskatchewan will in future pay 25 dollars to a mother on the birth of a child, and 15 dollars to the doctor who attends her.

ON December 20th the Queen visited Upper Lodge, Bushey Park, which has been lent by the King to the Canadian Red Cross Society for a convalescent hospital for the Canadian contingents. Her Majesty was received by Surgeon-General G. Carlton Jones, Director of Canadian Medical Services, and Colonel C. A. Hodgetts, Canadian Red Cross Society.

UNDER the auspices of the American Red Cross, an organization has been formed to raise funds for the establishment of a hospital in Paris for the treatment of wounds of the face. The new hospital will be devoted to skin grafting and plastic surgery for the treatment of disfigurements.

THE first number of a new medical periodical, entitled, *The Journal of Laboratory and Clinical Medicine*, appeared at St. Louis in October. The editor is Professor Victor G. Vaughan. It is intended "to bring discovery and its application closer together, to supply the research man with

a strictly scientific organ through which he can report the results of his labours, and to suggest to the practitioner how he may use the latest discoveries." The publishers are the C. V. Mosby Company, St. Louis.

The Ligue Française de l'Enseignement has presented its large medal of honour to Dr. Langlet, the Mayor of Rheims. M. Poincaré, President of the Republic, M. Painlevé, Minister of Public Instruction, and M. Léon Bourgeois, Minister of State, who were present at the ceremony, each delivered a short speech expressing their warm appreciation of the services rendered by Dr. Langlet to Rheims and to the cause of education.

The proposal for the creation of a new cabinet office in the United States Government to be known as the Department of Health is to be revived in the next Congress. It has the support of medical societies and of the political parties which recognize the movement a step towards the better safeguarding of the public health. The only opposition, it is said, comes from Christian Scientists and osteopaths, who declare that the proposal is made in the interests of the "medical trust."

Asclepius is the title of a new monthly medical review published at Havana under the direction of Drs. Otto Bluhme and Solano Ramos. The October number contains a very interesting account, with an excellent portrait, of the late Dr. Carlos Finlay. Our new contemporary makes a feature of illustrations, most of which are well produced. Among these are portraits of leading Cuban doctors whose professional achievements and personal characteristics are displayed with a touch of not unkindly caricature. The scientific contents are of the usual kind. *Asclepius* is a "live" journal, and we wish it success.

We have received a packet of booklets from that energetic body, the Women's Co-operative Guild, which did so much to help on the passing of the Notification of Births (Extension) Act. The booklets deal with: (1) *The Work of Maternity Committees of Public Health Authorities*, the work being the securing of a full service of health visitors, the setting up of maternity centres, the arrangement for the confinement of necessitous women, and hospital treatment for abnormal cases; (2) *Home Helps* (during the lying-in time); (3) *A Municipal Maternity Centre* (its establishment, cost, etc.), and (4) *What Health Authorities Can Do, and What We Can Do*.

MEETINGS of the Central Midwives Board were held on December 16th and 17th for hearing penal charges; Sir Francis Champneys presided. The reports on three adjourned cases were all satisfactory. Fifteen fresh cases were heard, and in eight instances the women were struck off. Judgement was postponed in six others, and in one no action was taken. In addition to the usual faults of want of cleanliness and ignorance as to the taking of pulse and temperature, there were several cases in which either puerperal fever had occurred, or ophthalmia a comoritant had been neglected. At the monthly meeting on December 16th the Standing Committee reported letters from two districts asking the opinion of the Board on the signing of maternity benefit forms by registered medical practitioners where the patient has been delivered by an uncertified woman. The Board's reply was to the effect that the matter should be brought to the notice of the General Medical Council. In reply to another letter, a resolution was passed asking the London County Council not to delegate its powers and duties to various borough councils under the Registration of Lying-in Homes Act, 1915.

AMONG the cards of a desk calendar issued by the company is one giving a very modest account of the fifty years' doings of the Booth Line. The various types of boats are shown in coloured sketches; the earliest boat was "a kind of a glidy hand-kroite"—steamer and sailer too. The owners of a boat of that day would announce that she "carried a surgeon and a cow;" the advertisement, though it gave offence to some, was really an appeal to the anxious mother. To-day the last new boat of the Booth Line "carries (normally) doctor, doctor's orderly (ex-R.A.M.C.), nurse," and so on. We are glad to note this utilization of a very deserving class of men who often have rather a poor time after leaving the corps where they learn, or can learn, a great deal about handling and carrying a hurt man, and tending the sick, and may become very useful surgery attendants. The Booth Line is best known to the medical profession for its cruises to Portugal and Madeira, very beneficial to overworked or convalescent patients, but its chief trade is to South America, and it can boast that a mosquito-proof ship belonging to it made voyages up the Madeira river, a tributary of the Amazon, without sickness of any kind, whereas unprotected steamers only made the voyage with a terrible total of death and sickness amongst the crew.

Letters, Notes, and Answers.

ACTIONS desiring reprints of their articles published in the BRITISH MEDICAL JOURNAL are requested to communicate with the Office, 429, Strand, W.C., on receipt of proof.

THE telegraphic addresses of the BRITISH MEDICAL ASSOCIATION and JOURNAL, are: (1) EDITOR of the BRITISH MEDICAL JOURNAL, *Strand, W.C.* (Telephone, 2541, Gerrard). (2) FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements, etc.), *Articulate, Westrand, London*; telephone, 7659, Gerrard. (3) MEDICAL SECRETARY, *Meiseers, Westrand, London*; telephone, 463, Gerrard. The address of the Irish office of the British Medical Association is 16, South Frederick Street, Dublin.

LETTERS, answers, and communications relating to subjects to which special departments of the BRITISH MEDICAL JOURNAL are devoted will be found under their respective headings.

QUERIES.

S. would be glad to hear of a remedy to prevent loud snoring in the case of a fat man aged 45. Uvula and soft palate normal; no organic disease apparent anywhere.

N. S. C. asks for particulars of experience of the use of subcutaneous injections of adrenalin in asthma. He is treating a woman, aged 46, who has had asthma ever since her first child was born, eleven years ago. She has tried most of the usual drugs given for this complaint, but the attacks get more numerous and severe.

DR. DE REZENDE (Guaratingeta, S. Paulo, Brazil) asks for advice in the treatment of an obstinate case of aphthous stomatitis in a woman aged 26. He has painted the ulcerated surfaces with 5 per cent. solution of silver nitrate and with tincture of iodine. Arsenic and iron have been given internally, and mouth-washes of camphor, carbolic acid, and salicylic acid in glycerine and hydrogen peroxide have been prescribed. The patient also suffers from anaemia and hypertrophy of the tonsils with hyperplastic rhinitis. The teeth are in good condition.

A CORRESPONDENT asks advice about an infant 18 months old. Three days after birth, right flat-foot was detected, and was cured by massage, etc. The child now throws its whole weight on the right foot and brings down the heel only of the left foot when walking. The left tibia is slightly bowed forwards. Our correspondent asks if a piece of steel, vertical to the leg, with a horizontal heel piece so as to keep the heel high, would be productive of good.

LETTERS, NOTES, ETC.

"GERMAN MEASLES."

DR. CLEMENT DICKS (Consulting Physician to Rugby School) writes: For more than ten years I care to think I have not got rid of the above obnoxious name for a very common disease. Has not the time now arrived to bury this name in oblivion, and substitute the more suitable title of epidemic roseola or rose-rash?

THE TONSILS.

DR. ARTHUR MECHAN (Downhull, Glasgow) writes: I have not yet read Dr. Henry A. Barnes's monograph on the tonsils, but judging from a recent review of it in the BRITISH MEDICAL JOURNAL of October 16th (p. 569) it should be worthy of perusal and study. I quite agree with Dr. Barnes regarding his views of tonsillectomy and tonsillotomy. I would even go further, and eliminate the so-called operation of tonsillotomy altogether. In my opinion it is never a radical operation, and does not fulfil the object for which the removal of tonsils is carried out. The late Professor George Buchanan of Glasgow strongly advocated and practised tonsillectomy over thirty years ago, and I frequently assisted him at the operation. He would have none of Morell Mackenzie's guillotine, and expressed his opinion of it and other instruments in his usual characteristic brusque and pithy manner. A pair of dressing forceps, a Syme's or a right forefinger nail were his armaments. Later, at the old Golden Square Throat Hospital, where Morell Mackenzie's instrument was daily manipulated (he being one of the surgeons at the time), I was conversant with its alleged utility. I still adhere to the teaching of my old chief, and a quarter of a century's experience only strengthens my belief in it.

SCALE OF CHARGES FOR ADVERTISEMENTS IN THE BRITISH MEDICAL JOURNAL.

	£	s.	d.
Seven lines and under	0 5 0
Each additional line	0 0 5
A whole column	3 10 0
A page	10 0 0

An average line contains six words.

All remittances by Post Office Orders must be made payable to the British Medical Association at the General Post Office, London. No responsibility will be accepted for any such remittance not so forwarded.

Advertisements should be delivered, addressed to the Manager, 429, Strand, London, not later than the first post on Wednesday morning preceding publication, and, if not paid for at the time, should be accompanied by a reference.

NOTE.—It is against the rules of the Post Office to receive *post restante* letters addressed either in initials or numbers.

SUPPLEMENT

TO THE

BRITISH MEDICAL JOURNAL.

LONDON: SATURDAY, JULY 3RD, 1915.

MATTERS REFERRED TO DIVISIONS.

SUPPLEMENTARY REPORT OF COUNCIL, 1914-15.

The Sections numbered (A), (B), etc., of the Supplementary Report of Council are the continuations, respectively, of the similarly lettered sections of the Annual Report, published in the Supplement of May 8th, 1915. The paragraphs of the Supplementary Report are numbered consecutively to those of the Annual Report.

CONTENTS.

NOTE.—This is not a complete Index, but an indication of some of the more important paragraphs in the respective sections.

	PAGE		PAGE
(A) PRELIMINARY.		(I) NATIONAL INSURANCE.	
Presentation of Gold Medal of Association to Captain Arthur Martin-Leake, V.C., R.A.M.C.	2	Medical Referees under the Insurance Acts ...	5
(B) FINANCE.		Conference of Representatives of Local Medical and Panel Committees ...	5
Salaries of Clerical Staff ...	2	Standing Insurance Acts Committee ...	6
(C) THE ASSOCIATION AND THE WAR.		Non-Panel Doctors and New Certification Forms. Effects of the War on the Medical Side of the Insurance Acts ...	6

(A) Preliminary.

187. The Council appends (*see* Appendix XVIII. p. 7) a list of the matters referred to the Council by the A.R.M., 1914.

**PRESENTATION OF GOLD MEDAL OF ASSOCIATION TO CAPT.
ARTHUR MARTIN-LEAKE, V.C., R.A.M.C.**

188. The Council has resolved to present the Gold Medal of the Association to Captain Arthur Martin-Leake, V.C., F.R.C.S., R.A.M.C., for his most conspicuous bravery and devotion to duty throughout the war, especially during the period October 29th to November 8th, 1914, near Zonnebeke, in re-seeing, whilst exposed to constant fire, a large number of wounded who were lying close to the enemy's trenches. For this gallant conduct Captain Martin-Leake was given the distinction, unique so far as the medical profession is concerned, of a bar added to the Victoria Cross which he had already won in South Africa. The Council has informed Captain Martin-Leake of its intention to offer him the highest honour at its disposal and will await a suitable opportunity for presenting the medal publicly.

(B) Finance.**SALARIES OF CLERICAL STAFF.**

189. At Aberdeen the Representative Body passed the following Resolution:—

Minute 40.—That the question of the Salaries of the Clerical Staff be referred to the Council for favourable consideration.

In accordance with the foregoing instruction the Council has carefully considered the whole question of the salaries of the Clerical Staff, and has put into operation a scheme of classification with definite prospects of advancement. It is hoped that this will make for better conditions of service and thus secure for the Association greater efficiency.

(C) The Association and the War.

190. Through the Special Committee consisting of the Chairmen of the Standing Committees of the Association, referred to in para. 29 of its Annual Report, the Council has continued to assist the Military Authorities in every way within its power to make adequate provision for the medical care of the Forces, while at the same time safeguarding the efficiency of the medical service of the civil population. In this important work, the Council is glad to report, it has had the cordial help of the profession generally, and the Council has specially to acknowledge the assistance rendered by the Honorary Secretaries of Branches and Divisions, the Scottish Medical Service Emergency Committee and the War Emergency Committee of the Metropolitan Counties Branch.

THE MEDICAL CARE OF THE FORCES.**(a) Question of Whole-time Military Service.**

191. In connection with the question of securing adequate provision for the medical requirements of the Forces, the Council has had to consider, as vitally affecting the recruiting of medical men for work with the Army, certain grievances of medical practitioners already serving with the Army, and certain other difficulties which have to a greater or less extent operated to prevent medical practitioners from accepting commissions. These matters were summarised in a letter which the Special Committee addressed on May 26th, 1915, to the Government through the Director-General of the Army Medical Service (*see* Appendix XIX, page 7). No detailed reply to that letter has yet been received, delay having occurred owing to the changes in the Government, but the Association has been informed that the subject has been under the consideration of the Army Council and that an early decision may be expected.

(b) Question of Recognition of Practitioners performing Part-time Military Service.

192. The Council has had many representations in favour of some visible form of recognition being given to those practitioners who are engaged in part-time military work, and has informed the Director-General of the Army Medical Service that in its opinion some such recognition should be given.

(c) Analysis of Medical Profession as regards War Work.

193. Having been applied to by the War Emergency Committee of the Metropolitan Counties Branch, which is engaged in the work of classifying the practitioners in its area to show

the War work which they are doing or are prepared to undertake, the Council placed at the disposal of that Committee information as to the names and addresses of practitioners whose addresses are in the Metropolitan area and who have qualified during the last five years, obtained through the Card Register of the Association.

Subsequently the Council was informed on behalf of the Metropolitan Counties Branch Committee that both the Director-General and the Assistant Director-General of the Army Medical Service had shown great interest in the interim report on the information collected by the Committee, had stated that such information was not available from any other source, and had enquired whether a similar analysis could not be made as regards the whole of Great Britain and Ireland. The Council has therefore decided itself to tabulate, as regards the practitioners in each Division area, information as to the War Service they are doing or are prepared to undertake, and to this end has addressed a communication to the Honorary Secretaries of Divisions in England (except the Metropolitan Counties Branch), Scotland, Ireland and Wales, asking them to supply as regards each practitioner in their area information already in their hands, under the desired heads. After eliminating those areas as to which complete information can be furnished by the Secretaries, a direct application will be addressed by the Council to the practitioners in all remaining areas.

It is hoped that within a few weeks the Association will thus have in its possession a complete War register of the medical profession, showing (a) those who are in whole-time naval or military service, (b) those who are doing part-time service, (c) those who are prepared to offer themselves if necessary for (i.) whole-time, (ii.) part-time service, and what kind of part-time service, (d) the ages of all medical men not in whole-time military service, and whether they are married or unmarried, and (e) what kind of practice every member of the profession was engaged in at the time War broke out. The Council confidently appeals to the Honorary local Officers of the Association and to members generally to help it in making this register as complete and as correct as possible, as it is anticipated that it will prove to be of great service in organising the medical profession of the country to meet any calls the nation may have to make on it.

(D) Organisation.**REPRESENTATION OF HOME DIVISIONS IN REPRESENTATIVE BODY, 1915-16.**

(Continuation of para. 40 of Annual Report, p. 180).

194. Pursuant to the instruction of the Representative Body the Council has settled and submits (*see* Appendix XX., p. 9) the list of Constituencies in the United Kingdom for representation in the Representative Body, 1915-16. The only case in which the Council has deviated from the provisional list has been that of the North Carnarvon and Anglesea and South Carnarvon and Merioneth Divisions, each of which has been made independent for 1915-16, as for 1914-15.

GROUPING OF HOME CONSTITUENCIES FOR ELECTION OF 12 MEMBERS OF COUNCIL, 1915-16.

195. The A.R.M., 1914, left it to the Council to settle the grouping of the Constituencies in the United Kingdom for election of 12 members of Council, 1915-16, the 1914-15 scheme of grouping to be adhered to in the absence of any changes of Divisions or Constituencies such as would make modification necessary or desirable. The Council accordingly considered the matter in the light of the 1915 Annual List figures, and has continued the grouping of last year, with the exception that the Constituency formed by the Divisions of the new Wiltshire Branch has been placed in the South-Western group of Branches (Supplement, May 8th, 1915, p. 201).

GROUPING OF HOME CONSTITUENCIES FOR ELECTION OF 12 MEMBERS OF COUNCIL, 1916-17: GENERAL QUESTION OF GROUPING OF HOME CONSTITUENCIES AND BRANCHES FOR ELECTION OF COUNCIL.

196. In connection with the question of the grouping of Home Constituencies for election of 12 members of Council, 1916-17, the Council considers it to be its duty to draw attention to the great disparity that exists in the number of members of the Association that different members of Council represent.

In the case of the 12-grouping (By-law 46 (c)) the average number of members per member of Council is on present figures:—

England and Wales	1,540
Scotland	895
Ireland	310,

while in the 24-grouping (By-law 46 (a)) the groups of voters in these respective areas returning a member of Council average as follows:—

England and Wales	770
Scotland	447
Ireland	155

The 230 Irish members are represented on the Council by 6 members.

The Council is aware that it was deliberately decided by the Representative Body, at the time when the present system of election of members of Council was adopted, to give over-representation to Scotland, and more especially to Ireland, as compared with England and Wales, because of the difficulty which members of Council from Scotland and Ireland experience in attending meetings, owing to the great distance from London. It appears to the Council however, in the light of the above figures, that the time has come for re-consideration of the whole question of the grouping of the Home members for representation on the Council. The Council has accordingly instructed the Organisation Committee to report to the Council early next session on the question, with a view to a report of the Council on the subject to the Divisions and Representative Body.

The Council recommends:

Recommendation I.—That the grouping of Constituencies for election of 12 members of Council, 1916-17, be left to the Council.

REPORTS OF DIVISIONS AND BRANCHES FOR 1914.

(Continuation of paras. 43-6 of Annual Report, p. 181.)

197. The reports of Divisions were due in January, and of Branches by at latest March 15th. The Council is glad to report that, notwithstanding the unfavourable conditions due to the war the large majority of these bodies have now reported.

(a) *Reports of Home Divisions.*

(Continuation of para. 44 of Annual Report, p. 181.)

198. In addition to 21 unorganised Divisions, which are being otherwise dealt with by the Council, the following 39 Divisions have still failed to report:—

Argyllshire, Ballymoney, Banff, Elgin and Nairn, Barnsley, Birkenhead, Elyth, Bradford, Crewe, Croxden, Dartford, Denbigh and Flint, Derry, Dover, Dublin, Dudley, Durham, East Herts, Fimbley and Hendon, Folkestone, Hampstead, Hastings, Hexham, Kilkenny, Luton, Maidstone, Monaghan and Cavan, North Northumberland, North-West Essex, Orkney, Rotherham, South Connaught, South Shields, South-West Essex, Torquay, Tower Hamlets, Waterford, Westminster, Wigan, York.

(b) *Reports of Home Branches.*

(Continuation of para. 45 of Annual Report, p. 181.)

199. Reports for 1914 have been received from all of these, except Connaught and Leitner.

(c) *Reports of Oversea Divisions and Branches.*

(Continuation of para. 46 of Annual Report, p. 181.)

200. Reports for 1914 have been received from 6 of the 16 Oversea Divisions—not themselves Branches, and from 17 of the 42 Oversea Branches.

QUESTION OF SAVING OF CENTRAL FUNDS EFFECTED BY PRESENT SYSTEM OF VARIABLE GRANTS TO BRANCHES AS COMPARED WITH THAT OF A FIXED GRANT OF 4s. PER HEAD.

201. The question having at various times been raised as to whether any material saving of the central funds of the Association is effected by employing a system of variable grants to Branches, as compared with the method of giving a fixed grant of 4s. per member, the Council has had prepared a statement of the sums actually paid or awarded by way of variable grants to the Home Branches since the year 1912 inclusive, and of the amounts which would have been paid by the Association to these Branches under a system of fixed 4s. grant per head. The Council finds that the saving to the central funds effected for these years by the present system has been as follows:—

1912	£924 10 0
1913	359 9 0
1914	355 1 0
1915 (Jan. to June)	1,428 7 0

Total saving, 1912-15 **£3,067 7 0**

The Council, however, does not consider that the chief gain has been in mere financial saving. The prevention of the accumulation of reserve funds in the hands of Divisions and Branches has given rise to much better financial control, and, through that, to great improvements in Division and Branch organization.

For practical purposes the question of the Oversea Branches does not arise, as it has been the invariable practice to make grants to these Branches at the rate of 4s. for each member's subscription paid.

It must be remembered that this saving to the central funds of the Association has been effected without any disadvantages to the Branches receiving the grants, as grants within the limit of 4s. per member per annum are always made on receipt of a satisfactory report showing the amount which is necessary for the work the Branch is doing.

QUESTION RAISED BY THE NEW ZEALAND BRANCH, OF AMENDMENT OF BY-LAW 11, AS TO AMOUNT OF SUBSCRIPTIONS.

202. The Council has considered a motion placed by the New Zealand Branch on the Agenda of the A.R.M., 1915, proposing that steps be taken for amendment of By-law 11, so as to make it more clear that members of the Association resident outside the United Kingdom may be called upon to pay, in addition to the 25s. subscription payable by them to the Association under that By-law, a special subscription to their Branch under By-law 15. While of opinion that the present By-laws as to subscriptions are quite correct, the Council is of opinion that By-law 11 might perhaps be rendered clearer if for the words "except as hereinafter provided," in the second line, there were substituted the words "except as otherwise provided in these By-laws," and has asked the Branch if such an amendment would meet its views.

DIVISION AND BRANCH AREAS.

(Continuation of para. 51 of Annual Report, p. 181.)

203. Essex, Norfolk and Suffolk Branches were formed by the Council in December, 1914, to take the place of the East Anglian Branch, but it having been found that owing to various circumstances in connection with the War the organisation of the area would be best provided for meantime by the continuance of the East Anglian Branch, the latter has been temporarily re-established. Other less important changes have also been effected, in response to local wishes.

MEMBERSHIP.

204. The Council has received a report as to the membership of the Association in the period March to May, 1915. During that period 139 new members joined, and the Association lost by death, resignation and expulsion, 92, a net increase of 47 members, as compared with a net increase of 11 members in the same period in 1914. On May 31st, 1915, the total membership of the Association was 21,654, as compared with 23,049 on the same date last year.

ABANDONMENT OF CONFERENCE OF SECRETARIES, 1915.

(Continuation of para. 53 of Annual Report, p. 181.)

205. In view of the exceptional circumstances resulting from the War, referred to in paragraph 53 of the Annual Report, the Council has decided not to hold a Conference of Secretaries this year.

(F) Science.

MIDDLEMORE PRIZE.

(Continuation of para. 70 of Annual Report, p. 183.)

206. The Middlemore Prize for 1915 has been awarded to R. Foster Moore, M.A., B.C., F.R.C.S., for his essay on "The Pathology of the Affections of the Retina met with in connection with Diseases of the Kidneys."

The adjudicators in their report on the essay make the following statement:—

It is of the greatest help in elucidating many obscure points in connection with affections of the retina depending on kidney disease. It is particularly valuable, in that its author has been able to determine by the test of pathological examination the interpretation of ophthalmoscopic appearances observed by himself during life.

The ophthalmoscopic changes associated with kidney disease have been long known; the present essay is a distinct advance in more clearly establishing the histological basis on which they depend.

To reach the object in view not only has the author conducted a large amount of very careful research of a pathological nature, but the prolonged and careful pathological observations which were also made have thrown much light on the development and progress of the retinal appearances as they present themselves to the clinician.

(G) Medical Ethics.

PROFESSIONAL SECRECY.

(Continuation of para. 80 of Annual Report, p. 184).

207. Pursuant to paragraph 80 of its Annual Report the Council appointed the Chairman of Representative Meetings, the Chairman of Council, the Treasurer, and the Chairman and Deputy-Chairman of the Central Ethical Committee as a Deputation to confer with the Lord Chief Justice on the subject of Professional Secrecy.

The Council reports that the Lord Chief Justice together with the Attorney-General, the Public Prosecutor, and other legal authorities received the deputation on May 3rd, 1915. The Lord Chief Justice stated at the outset of the Conference that no observation made by him during the discussion should be treated as a judicial pronouncement of the law. As a result of this Conference the Council has ascertained:—

(a) That it is desired by the Authorities that information should be given to them by medical men in attendance upon a woman suffering from the effects of abortion brought about by artificial intervention.

(b) That the circumstances under which it was desired that this communication should be made were the subject of the following three limitations:—

(1) That the medical man was of opinion either from his examination of the patient and/or from some communication that she may have made to him that abortion had been attempted or had been procured by artificial intervention.

(2) That he was of opinion either from his observations of and/or from a communication made to him by his patient that such artificial intervention had been attempted by some third party other than the patient herself, and

(3) That the medical man was of opinion that his patient, due to such artificial intervention, was likely to die and that there was no hope of her ultimate recovery.

(These limitations are stated in the records approved by the Lord Chief Justice.)

The Council understands that whereas Solicitors and Barristers have an absolute privilege of protection in regard to statements made to them in their professional capacity involving matters of criminal import or otherwise, no other class of persons is accorded such legal protection by State authority or Act of Parliament, although in the case of ministers of religion such protection is universally observed and recognised by custom in the Courts.

There is, however, no such universally recognised protection attaching to medical men in respect of statements made to them by a patient; in fact there is a considerable conflict of authority upon the subject.

The Council is advised that no obligation rests upon a medical practitioner to disclose the confidences of his patient without the patient's consent, and suggests that if the State desires to set up such an obligation it should at the very least preface such an endeavour by affording to the practitioner protection from any legal consequences that may result from his action. Without any desire to claim the right to refuse to make such disclosures in obedience to the order of a Court of Justice, the Council, after hearing the report of the Deputation received by the Lord Chief Justice on May 3rd, 1915, has decided to adhere to the following Resolutions which it passed on January 27th, 1915:—

Motion 542.—Resolved: That the Council is of opinion that a medical practitioner should not under any circumstances disclose voluntarily, without the patient's consent, information which he has obtained from that patient in the exercise of his professional duties.

Motion 550.—Resolved: That the Council is advised that the State has no right to claim that an obligation rests upon a medical practitioner to disclose voluntarily information which he has obtained in the exercise of his professional duties.

A communication has been received from the Registrar of the General Medical Council which shows that the subject is under the consideration of that body and the Council has for-

warded to the Royal College of Physicians, London, and the Royal College of Surgeons, England, a statement of what has transpired in this matter and has invited the Colleges to appoint representatives to meet representatives of the Association in conference on the subject.

EXPULSIONS.

208. The Council regrets to report that since the issue of the Annual Report for 1914-15, it has been necessary to remove from membership of the Association two members who continued to hold appointments as Medical Certifiers under the National Insurance Act, in Ireland, contrary to the expressed wish of the Branch to which they belonged.

(H) Medico-Political.

ALLOCATION OF VARIOUS DUTIES BETWEEN SCHOOL MEDICAL STAFF, TEACHERS, AND NURSES.

(Continuation of para. 107 of Annual Report, p. 187).

209. The Council submits a Memorandum (see Appendix XXI, p. 11), on the allocation of various duties in connection with the medical inspection and treatment of school children between School Medical Officers, Teachers and Nurses. It is the outcome of conferences between representatives of the Association and of the National Union of Teachers, held at the instance of the latter body, and it is the opinion of all those concerned in the preparation of the Memorandum that it will prove to be useful as a pronouncement jointly made by bodies representing teachers and the medical profession on a subject which is capable of giving rise to differences of opinion on the part of the officers referred to. It is intended to circulate copies of the Memorandum to School Medical Officers, and to any member of the Association making application for advice on any of the points mentioned, with an intimation that the Memorandum is the considered opinion of the Association and the National Union of Teachers.

The Council recommends:

Recommendation P.—That the Representative Body approve the Memorandum (see Appendix XXI, p. 11) on the allocation of various duties between the School Medical Staff, Teachers and Nurses respectively, in connection with medical inspection and treatment of school children.

PUBLICATION OF NOTICES IN LOCAL PRESS AS REGARDS APPOINTMENTS.

210. The Council has had its attention called by the South Wales and Monmouthshire Branch to the question of the publication in the local press of notices asking practitioners before applying for certain appointments to make enquiries from the Association. The cost of such notices has in the past been defrayed partly out of Division or Branch funds, and partly out of special funds raised locally, and a considerable sum of money has been so spent in South Wales. The practice has proved of considerable value and the Council is of opinion that it should be continued and financed, partly at any rate, from central funds, subject to the provision of some central control. The Council has therefore decided that on the application of a Branch or Division in suitable cases, where Notices of a similar kind are appearing in the JOURNAL, part of the cost of local Notices may be defrayed from central funds. The publication will be subject to the control of the Central Ethical Committee and the proportion of the cost to be defrayed centrally will be determined by the Medico-Political Committee subject to the approval of the Finance Committee.

FEES FOR MEDICAL EXAMINATIONS FOR LIFE INSURANCE.

(Continuation of para. 99 of Annual Report, p. 185.)

211. Only 18 Divisions have up to the present forwarded to the Council their opinions on the proposals contained in the special report on this subject issued by the Council to the Divisions in the Supplement of March 20th, 1915 (see Appendix XXII, page 12). Of the 15 Divisions, 10 approve, and 7 disapprove, the fees suggested by the Council, while the remaining Division professes to keep an open mind on the subject. Of the 7 Divisions disapproving, 3 are of opinion that there should be no lower fee than 10s. 6d.

Notwithstanding this unsatisfactory response of the Divisions to the Council's request for their opinions on this subject, due obviously to circumstances in connection with the War, the Council recognises that in all probability many more Divisions will have considered the matter and instructed their Representatives thereon between now and the A.R.M., especially as a reminder on the subject has been sent to every Division Secretary. In these circumstances, and as the

question of the fees for medical examinations for life insurance examinations has been under the consideration of the Association more or less continuously since 1904, the Council is of opinion that the A.R.M. should come to a decision on the subject.

The Council recommends:—

Recommendation Q.—That the Representative Body adopt the following fees for medical examinations for life assurance:—

1. 1s. for a formal full report, such as that contained in Sub-Appendix A to the Special Report of Council (p. 13).*
- 10s. 6d. for a formal short report, such as that contained in Sub-Appendix B to the Special Report of Council (p. 14).*
- 5s. for a simple form of certificate, such as that contained in Sub-Appendix C to the Special Report of Council (p. 14).*

ELECTION OF DIRECT REPRESENTATIVES ON GENERAL MEDICAL COUNCIL.

212. There will be in 1916 two elections of direct representatives of the medical profession on the General Medical Council, viz., a by-election in May, 1916, to fill the vacancy consequent upon the termination of the period of office of Dr. J. A. Macdonald, and a general election in November of that year to fill the vacancies created by the termination of the period of office of Drs. Langley Brown, H. A. Lintner, and T. Jenner Vennell. These four representatives were, it will be remembered, nominated by the Association, and they have all intimated their willingness, if invited, to stand again as the candidates of the Association.

In accordance with precedent the Council is consulting the Divisions in order that they may make nominations from which the Representative Meeting will select the candidates to be supported by the Association.

IMMATURE SPIRITS BILL (NOW ACT) OF THE GOVERNMENT.

213. It having been found by the Pharmaceutical Society of Great Britain and the Association, which had jointly under observation the proposals of the Government regarding the sale and taxation of spirits, that the Immature Spirits Bill of the Government, as amended in Committee of the House of Commons in May, would prevent any practising pharmacist or doctor from obtaining rectified spirits for shop or surgery use, while the Bill proposed to give an undue preference to manufacturing pharmacists, remonstrances were, on May 18th, addressed by both bodies to the Chancellor of the Exchequer, it being pointed out that an impossible situation would be created if doctors and chemists requiring rectified spirits for use in connection with prescriptions had to send an order to a manufacturing chemist. As a result, the Council is glad to report, the Chancellor of the Exchequer accepted the following amendment, moved by the Parliamentary Agent of the Pharmaceutical Society, Mr. Glyn Jones, M.P.:—

"(2) Nothing contained in this section shall interfere with the supply of rectified spirits of wine for the purpose of making medicines to registered medical practitioners, to hospitals, and to persons, firms and bodies corporate entitled to carry on the business of a chemist and druggist."

and the new Clause was duly included in the Bill. The Pharmaceutical Society has expressed its appreciation of the help of the Association, in that it enabled Mr. Glyn Jones, to make special mention in Parliament of the fact that the representative organisation of the doctors was in favour of the amendment, and that doctors, at any rate, had no financial interest in the matter. The Council is pleased to report this incident, as, apart from the advantage gained by members of the profession, it is an instructive example of what can be done by two organisations acting in co-operation in matters in which both are interested.

(I) National Insurance

MEDICAL REFEREES UNDER THE INSURANCE ACTS.

214. The Council has had under consideration the following Minute of the A.R.M., 1914:—

Minute 250.—Resolved: That half-a-guinea be the minimum fee for examination and report as referee under

* The Council takes no responsibility for the details of the sample forms submitted, which were taken from the reports of certain Life Insurance Companies for purposes of illustration.

the National Insurance Act, and that mileage be charged extra at the rate of not less than one shilling a mile or part of a mile beyond one mile.

During the year there has been a great deal of correspondence received in connection with this subject from Divisions and from individual members of the Association and it is evident that very considerable difficulty has been experienced in many areas in enforcing the above decision of the Representative Body, while many Divisions have apparently not attempted to enforce it. On the important general question thus raised the Council would refer Divisions and the Representative Body to paragraph 54 of the Annual Report of Council and the Special Report of Council on the question (Appendix VII. to the Annual Report, Supplement of May 8th, 1915, page 207).

The Council is of opinion that the only effective remedy for the present very unsatisfactory state of things is that the Commissioners should proceed with the appointment of official referees. The Council has reason to know that if it had not been for the War these appointments would already have been made, and that the Commissioners are anxious to proceed with them at the earliest possible opportunity; but in view of the present claims by the nation on the services of the profession the Council felt bound to inform the Commissioners of its opinion that at the present time it would be inadvisable to proceed with the appointments.

Opportunities have been taken to interview representatives of the Prudential Approved Societies and certain proposals have been made by them for modification of the present policy of the Association as regards the fees to be paid to part-time referees. Information as to these proposals will be laid before the Representative Body.

The Council recommends:

Recommendation B.—That the Representative Body reconsider the whole subject of fees for examination and report on cases submitted to part-time referees under the National Insurance Act.

CONFERENCE OF REPRESENTATIVES OF LOCAL MEDICAL AND PANEL COMMITTEES.

(Continuation of paragraph 121 of Annual Report, p. 189.)

215. The Council is pleased to report that a very successful Conference of representatives of Local Medical and Panel Committees was held in London on June 16th. The Local Medical and Panel Committees of each Insurance area were asked jointly to appoint one representative, but in those areas in which the *personnel* of the two Committees differs materially each Committee was allowed to appoint a representative. The members of the Insurance Act Committee, and of its Local Medical and Panel Sub-Committee who are not members of the full Committee, were present for the purpose of joining in the discussion, but with no power to vote except in the case of those who were also appointed representatives. At the invitation of the Insurance Act Committee the Chairman of Council accepted the Chairmanship of the Conference.

There were 119 practitioners present from England, Scotland and Wales (in addition to 15 members of the Committee and its Local Medical and Panel Sub-Committee), representing 122 out of the 199 Insurance areas of Great Britain. In addition a large number of Committees expressed their regret that they could not be represented owing to the difficulty at the present time of securing a representative. Only one representative from Ireland was appointed to attend, and he at the last moment found himself unable to be present owing to military duties.

The Council has not yet had an opportunity of considering in detail the resolutions passed by the Conference, but a full report of the Conference appeared in the Supplement of June 26th, from which it will be seen that the resolutions were referred to the Insurance Act Committee, with a request that it should take suitable action in reference to them, approaching the Commissioners by deputation on such of them as require to be dealt with in that way. The Chairman of the Joint Committee, National Health Insurance Commission, Mr. C. H. Roberts, M.P., has consented to receive a deputation from the Association on July 9th. The Insurance Act Committee will report the result of that deputation and generally on the resolutions of the Conference direct to the Representative Body.

The Council is pleased to report that the efforts of the Association to promote the best interests of Insurance practi-

tioners were appreciated by the Conference, as shown by the passing of the following resolution:—

Minute 79.—Resolved: That this Conference of representatives of Local Medical and Panel Committees cordially welcomes the assistance given to these Committees in their work by the British Medical Association, and urges all Committees to make use of such assistance and to look to the Association to voice the opinion of Local Medical and Panel Committees as a whole in central negotiations.

The Council thus has good reason for believing that the Conference will have served the very useful purpose of convincing Local Medical and Panel Committees and Insurance practitioners generally of the desire and of the ability of the Association to help them in their work, and also of eliciting in a very direct manner the opinions of the Local Medical and Panel Committees on the main subjects of controversy in connection with the working of the National Insurance Acts.

PROPOSED STANDING INSURANCE ACTS COMMITTEE.

(Continuation of paragraph 117 of Annual Report, p. 188.)

216. Opportunity was taken at the Conference of representatives of Local Medical and Panel Committees to secure nomination of the six members to be nominated by these Committees and selected on a territorial basis who are to be appointed on the proposed Standing Insurance Acts Committee of the Association if the constitution of that body is approved by the Representative Meeting.

The representatives present grouped themselves into six areas, and selected Dr. H. B. Brackenbury (Middlesex), Dr. T. Ridley Bailey (Staffordshire), Dr. T. Campbell (Lancashire), Dr. J. R. Drever (Glasgow), Dr. F. V. Fry (West Riding, Yorkshire), and Mr. P. Napier Jones (Berkshire).

NON-PANEL DOCTORS AND NEW CERTIFICATION FORMS.

(Continuation of paragraph 131 of Annual Report, p. 190.)

217. In accordance with the announcement made in paragraph 131 of the Annual Report, the Council after consulting the English Insurance Commission has put on sale, at cost price, a form of certificate for use by non-panel doctors, and by panel doctors who are attending insured persons in a private capacity. The Council believes that these forms will be of great use to the classes of practitioners specified, as they should reduce very materially the difficulties raised by some Approved Societies with those of their members who are not able to produce the official form of certificate in support of their claims for sickness benefit.

EFFECTS OF THE WAR ON THE MEDICAL SIDE OF THE INSURANCE ACTS.

218. The Council has drawn the attention of the Chairman of the Joint Committee, National Health Insurance Commission, to the question of the large reductions recently made in the amounts of the periodical advances made to doctors under agreement with Insurance Committees, and has informed him that while it is realised that the lists, and therefore the remuneration, of panel doctors must be diminished by reason of the removal of the large number of insured persons now serving with the Colours, the Association has reason to believe that the reduction in the work expected from panel doctors is by no means commensurate with the reduction in their incomes.

The Chairman of the Joint Committee was asked if he could see his way to receive a deputation, after the Conference of representatives of Local Medical and Panel Committees, and after the Association had collected some more definite information on the subject. In reply Mr. Montague agreed to receive a deputation and left the suggestion of a suitable time to the Association. The matter is now under consideration and in view of the concessions which have been made to the Approved Societies in respect of the upsetting of their calculations by the large reduction in the number of contributors to their funds, the Council is of opinion that the profession has a strong case for consideration. The fact that large numbers of insured persons, most of them the best lives from a sickness insurance point of view, have been removed from insurance, and that those who return will, many of them, do so in a disabled condition or greatly deteriorated in health, seems to the Council to have entirely upset the actuarial calculations on which the medical benefit of the Insurance Act was based.

DOMICILIARY TREATMENT OF TUBERCULOSIS.

219. The Council submits a Memorandum on this question which it hopes will receive the most careful consideration of the Divisions and Representative Body (see Appendix XXIII., p. 14). There is evidently being prepared a strong campaign in favour of taking the treatment of tuberculosis as much as possible out of the hands of insurance and general practitioners and placing it more and more under the control of specialists, with the corollary that the sixpence per annum at present paid to insurance practitioners for each insured person in respect of domiciliary attendance will be taken no method of dealing with the treatment of tuberculosis can possibly be successful which does not enlist the active co-operation of the general practitioner, and these views were stated in a memorandum presented to the Astor Committee which laid down the lines on which sanatorium benefit was to be administered. The Astor Committee very largely endorsed these views, but it seems clear that there are many members of Public Health Authorities and Insurance Committees who fail to grasp the fact that if the early cases of tuberculosis are to be detected at a stage where further treatment is likely to be effective, they must, in the large majority of cases, be detected by the general practitioner or go undetected.

The Council believes that this movement in favour of aggrandising the position of the specialist to the virtual exclusion of the general practitioner is, from a public point of view, a grave error, as the services of both are essential to any effective scheme of treatment.

The Council draws the special attention of the Divisions and Representative Body to the Memorandum mentioned above, and urges that the matter should receive serious consideration at the forthcoming Representative Meeting.

EMPLOYMENT OF NURSES AS SICK VISITORS.

220. The Council has had brought to its attention the tendency on the part of some Approved Societies to employ trained nurses in uniform as sick visitors, and has made representations to the Queen Victoria Jubilee Nursing Association to the effect that in the opinion of the Association such employment of nurses in uniform is detrimental to the best interests of the public and the nursing profession for the following reasons:—

(a) because the system of employing nurses in uniform for such a purpose will tend to cause confusion in the minds of the public; and

(b) because the functions of a nurse and sick visitor are essentially different, the former being actuated only by a desire for the welfare of the patient, while the latter is employed primarily in the interests of the Approved Society.

REDUCTION IN THE AMOUNTS OF QUARTERLY ADVANCES TO PANEL PRACTITIONERS.

221. A great deal of attention has been given to this subject, as owing to the intricacies of the Insurance Act system of accountancy and the inefficient methods of keeping the lists of insured persons, there have been continual complaints that insurance practitioners had no means of ascertaining whether they were or were not obtaining the payments due to them. The opinion of the Solicitor was obtained on the question, was published in the Supplement of May 15th, 1915, and is appended (see Appendix XXIV., p. 15), and the matter was placed before the Conference of representatives of Local Medical and Panel Committees for discussion.

(L) Naval and Military.

REPRESENTATIVE ON COUNCIL OF ROYAL NAVY MEDICAL SERVICE.

222. Sir James Porter, K.C.B., R.N., who was appointed at the last Representative Meeting a member of the Council to represent the Royal Navy Medical Service for the ensuing 3 years, has found it necessary owing to Service duties to resign his appointment. Under By-law 55 (Casual Vacancies) the vacancy so created must be filled by the Representative Body, and the person elected thereto retains office on the Council for

the unexpired portion of his predecessor's term of office, in this case to the end of the A.R.M., 1917.

The Council recommends:

Recommendation.—That Fleet Surgeon Frederick Davidson Lunley, R.N. (ret'd.), be appointed Representative of the Royal Navy Medical Service on the Council in place of Sir James Porter, K.C.B., R.N., retired, to hold office until the termination of the A.R.M., 1917.

(M) Scotland.

THE WAR.

Military Medical Needs of the Nation.

(Continuation of paras. 165-7 of Annual Report, p. 194.)

223. The Scottish Committee conferred on May 15th with the Deputy Director of Medical Services for Scotland, the Presidents of the Edinburgh Colleges of Physicians and Surgeons, and of the Glasgow Faculty of Physicians and Surgeons, the Dean of the Faculty of Medicine, Edinburgh, Dr. Leslie McKenzie of the Local Government Board, Dr. McVail of the Scottish Insurance Commission, and Dr. Norman Walker, Convener of the Scottish Medical Service Emergency Committee, as to the question of the immediate need of the Royal Army Medical Corps for additional medical men. It was decided to endeavour to provide from Scotland, by July 7th, at least 400 additional medical men for the Army, and each Branch and Division Secretary has been informed of the proportion which the Branch and Division is expected to contribute, on the basis of the local medical population. The Branches and Divisions have been urged to look upon the work of providing the additional men required as a national duty of the most important kind.

Position of Government Medical Officers in Relation to the War.

224. The Scottish Committee has expressed the opinion that Tuberculosis Officers, School Medical Officers, Medical Officers of Health, Poor Law Medical Officers, Prison Medical Officers, and all other Government Medical Officers willing to offer their services for the War, should be released during the War from the duties of their appointments, and that their interests in respect of these appointments should be safeguarded.

NATIONAL INSURANCE ACT.

(Continuation of paras. 169-74 of Annual Report, pp. 194-5).

Keeping of Records of Practitioners on Active Service.

225. The Scottish Committee has provisionally decided to urge upon the Treasury the necessity of abandoning the keeping of records of those doctors who have offered their services with the Forces, and whose work is being carried on by neighbouring practitioners.

Certificates in Chronic Cases.

226. The Scottish Committee has represented to the Scottish Commissioners that in the present crisis, in order to enable practitioners to give adequate attention to the medical needs of the army and the public, it is of great importance that they should be relieved from much of the clerical work required under the National Insurance Act, including in particular the writing of weekly sickness certificates in chronic and long-continued cases.

J. A. MACDONALD,

Chairman of Council.

APPENDIX XVIII.

LIST OF MATTERS REFERRED TO THE COUNCIL BY THE ANNUAL REPRESENTATIVE MEETING, ABERDEEN, 1914.

(See para. 187 of Supplementary Report.)

Min. of A.R.M., 1914.	Subject.	Para. of Ann. or Supp. Report.*

APPENDIX XIX.

LETTER ADDRESSED BY THE ASSOCIATION ON MAY 20TH, 1915, TO THE DIRECTOR-GENERAL OF THE ARMY MEDICAL SERVICE IN CONNECTION WITH THE RECRUITING OF MEDICAL OFFICERS FOR THE ARMY.

(See para. 191 of Supplementary Report of Council.)

Offices of the British Medical Association,
Medical Department,
429, Strand, London, W.C.
May 20th, 1915.

Sir,

1. The Association has felt it to be of great pleasure as well as a privilege to be allowed to place its organisation at your disposal for the purpose of recruiting medical officers for the Army, and for helping to provide locally for medical attendance required or likely to be required by the Army, when the commissioned officers have been removed in accordance with the requirements of the Service. During the course of the Association's recruiting campaign certain points have been brought to

* Paragraphs up to 197, inclusive, are in Annual Report of Council, and the others in the Supplementary.

the attention of the Special Committee which has been dealing with the subject, and as these are said to be having a detrimental effect upon the recruiting of medical men, I am instructed to bring some of them to your notice in the hope that something may be done to remove the difficulties indicated.

2. For the sake of convenience the points are divided into (a) grievances of medical men already serving in the Army, and (b) difficulties which are preventing medical practitioners from applying for commissions, but the division is an artificial one, because any grievances which come under the former head are not only felt by the men who are actually serving, but they have a deterrent effect upon men who might otherwise be expected to offer themselves for service.

(a) GRIEVANCES OF MEDICAL MEN ALREADY SERVING IN THE ARMY.

(1) Junior Officers R.A.M.C. (T.F.)

3. There is an undoubted feeling of soreness amongst junior officers in the R.A.M.C. (T.F.) as to the inferiority of their pay as compared with that of Temporary Lieutenants in the R.A.M.C. The former point out that they were patriotic enough to take the trouble to make themselves efficient in times of peace, and that it seems invidious that men who did not join until after the war broke out, most of whom had no military training whatever, should be paid at a much higher rate than they. The reply that is generally given is that Territorial Officers are being paid according to their contract and therefore cannot complain. In the opinion of the Association this is not a correct representation of the position. The contract of the Territorial Medical Officers is to serve at home, but large numbers of them have expressed their willingness to serve abroad, and many of them are already doing so. The dissatisfaction of the R.A.M.C. (T.F.) Officers has been caused by the action of the Government in offering temporary commissions in the Regular R.A.M.C. at superior rates of pay, and the Association would press upon your attention and through you on the Government that in some way the pecuniary position of the junior Officers in the R.A.M.C. (T.F.), at any rate those who have volunteered for service abroad, should be made as good as that of Temporary Lieutenants.

4. The dissatisfaction of the junior R.A.M.C. (T.F.) Officers has been increased by the fact that all Regular R.A.M.C. Lieutenants, whatever their length of service, have been promoted to Captains. The Committee quite understands the military reasons for this, but would submit that this general promotion affords another reason for sympathetic consideration of the position of the junior Medical Officers in the Territorial Force, who are doing much the same work as the regular R.A.M.C. Officers of the same rank, or will shortly be doing it, and who in addition have in many cases the advantage of longer service.

(2) Lieutenants Special Reserve R.A.M.C.

5. The Association would particularly press upon your attention the position of Lieutenants in the Special Reserve R.A.M.C. According to the information at the disposal of the Association the claim of these gentlemen to be dealt with on the same lines as the Lieutenants in the R.A.M.C., namely, to be promoted to Captains, would seem to be a very strong one.

(3) Pay of Majors in the R.A.M.C. (T.F.)

6. The Association has already asked that Majors in the R.A.M.C. (T.F.) should be relieved from the grievance which they feel in regard to the interpretation which is being put upon the term "after three years service as such" appearing in Article 358 of the Royal Warrant for Pay 1914. It may have been due to a misreading of the regulations but it is undoubtedly the case that many Majors were under the impression that "three years service as such" meant three years service as a Major, and the Association would respectfully submit that this is the natural interpretation of Article 358 as it stands. The official interpretation of this phrase namely that it means three years of mobilised service has come as a great disappointment to many officers, and in view of the favourable nature of your reply of February 20th, 1915, in which you intimated that it was hoped to have the present interpretation amended the Association trusts that such action will soon be taken.

(4) Pensions and Compensation.

7. There has apparently been some misunderstanding on this question, on the part of many Medical Officers who have

recently joined the Army, but the letter of Colonel Blenkinsop of May 16th, 1915, makes the exact position quite plain, namely, that Territorial and Temporary Medical Officers are in this respect on exactly the same footing as permanent officers in the R.A.M.C. With regard to the late Major Burnett's case the Committee regrets to find that the War Office has already come to a decision unfavourable to the claims of the widow of the late officer.

(b) DIFFICULTIES WHICH ARE PREVENTING MEDICAL PRACTITIONERS ACCEPTING COMMISSIONS.

(1) Young Practitioners holding Public Appointments.

8. The Association has evidence which leads it to believe that some local authorities are not as willing as they should be to set free young medical men in their employ. The Government Departments concerned, namely the Local Government Board and the Board of Education, have signified to the local authorities their desire that no undue difficulties should be placed in the way of doctors who are willing to apply for commissions, but these Departments have no power of compulsion. The Association would suggest that power should be taken by the Government to compel local authorities which are proved to be unnecessarily retaining young practitioners in their employment to let them go, and to protect their interests during their absence.

(2) Financial Considerations.

9. Very many representations have been made to the Committee to the effect that practitioners who would have been glad to offer themselves for commissions are unable to do so on account of their financial commitments as regards their practices or their families. In the case of the younger practitioners who are not established in practice the remuneration offered by the War Office is probably sufficient to protect them from any financial loss, but the case is quite otherwise as regards the men who have been for some years established in practice. Many suggestions have been made to the Committee on this point which have resolved themselves into proposals either to raise the remuneration or to increase the gratuity at the end of service. On this subject Colonel Blenkinsop placed before the Committee certain considerations which have led it to the conclusion that it cannot at the present moment press either of the above mentioned suggestions. But the Committee feels that it must place on record its conviction that financial considerations of very varied kinds are preventing many experienced practitioners from offering their services to the War Office, and that an increase in the remuneration offered to such practitioners would be justifiable and will be necessary if it is really desired to secure their services. The Committee believes that if the Government could see its way to grant extra pay or gratuity to cover what to many practitioners would be a considerable loss of income or capital, such action would to a considerable extent solve the present difficulty of securing medical officers.

(3) Question of Compulsion.

10. Suggestions have been received by the Committee from various quarters that the difficulties of obtaining Medical Officers can only be overcome by some system of compulsion, but the Committee is of opinion that it would be impracticable to apply compulsion to members of the medical profession alone, and that compulsory medical service for the Army could only be considered as part of a National compulsory service system.

11. In placing these considerations before you the Committee desires to state that as a result of its recent experience it is convinced that a very large section of the Medical profession is extremely anxious to place its services at the disposal of the War Office and is only restrained from so doing by the above mentioned difficulties coupled with the natural desire not to leave the civilian population without medical attendance. The Committee would very respectfully urge on the Government, through you, its opinion that if prompt and sympathetic consideration were given to the points mentioned in this letter, the effects on the recruiting of medical officers would be immediate and satisfactory.

I am,

Yours faithfully,

ALFRED COX,

Medical Secretary.

The Director-General,

Army Medical Service,

War Office,

Whitehall, S.W.

APPENDIX XXI.

MEMORANDUM APPROVED BY THE BRITISH MEDICAL ASSOCIATION AND THE NATIONAL UNION OF TEACHERS CONCERNING THE ALLOCATION, TO SCHOOL MEDICAL OFFICERS, TEACHERS AND SCHOOL NURSES, OF VARIOUS DUTIES IN CONNECTION WITH THE MEDICAL INSPECTION AND TREATMENT OF SCHOOL CHILDREN.

(See para. 2.2 of Supplementary Report of Council.)

Section 13 (1) (b) of the Education (Administrative Provisions) Act, 1907, provides that the powers and duties of a Local Education Authority under Part III. of the Education Act, 1902, shall include:—

“The duty to provide for the medical inspection of children immediately before, or at the time of, or as soon as possible after, their admission to a public elementary school, and on such other occasions as the Board of Education direct, and the power to make such arrangements as may be sanctioned by the Board of Education for attending to the health and physical condition of the children educated in public elementary schools.”

In the discharge of the duties connected with medical inspection regard should be had to the qualifications and special training of the various persons concerned, to the desirability of securing the co-operation and of avoiding the opposition of the parents. It is also necessary to avoid as far as possible any interference with the ordinary educational work of the school.

In the allocation of various duties between medical practitioners, teachers and nurses, considerable diversity of practice exists, and in a few cases friction has arisen. To secure the willing co-operation of all concerned, the subject has been considered by representatives of the medical and teaching professions, who have agreed as follows:—

(I.) DUTIES WHICH SHOULD BE UNDERTAKEN BY THE SCHOOL MEDICAL STAFF.

(a) *Notices to Parents.*—Undertake the duty of preparing and of arranging for the distribution by means of the school children of any notices to parents which they may desire to issue as the outcome of inspection.

(Such notices should be headed with the name of the Education Authority and the name of the Director of Education and be signed at the foot by the doctor.)

(b) *Health Records.*—Obtain information as to the child's previous illnesses and family medical history, any information in the possession of the head teacher or Education Authority to be placed at the disposal of the School Medical Officer.

(Usually it would be impossible in a large school at the commencement of the school year, with perhaps 100 children waiting to be admitted, for head teachers to ascertain from the parents (when present) the detailed information required under these headings. Further the character of some of the queries, e.g., insanity in the family, is of such a nature as to make it desirable that they should be addressed by the Medical Officer to the parents.)

(c) *Measure and Weigh.*—Accept responsibility for measuring and weighing children.

(These duties usually involve the removal of some of the children's clothing, a task which should be undertaken by the school nurses under the direction of the Medical Officer.)

(d) *Eyesight, Teeth, &c.*—Test children's eyesight, examine their teeth, examine them for vaccination marks, and also examine their heads.

(Though the above duties should be discharged by the school doctor, with the assistance of nurses, it is desirable that the teacher should be present as children are sometimes nervous with the Medical Officer, and in connection with the examination of eyesight this nervousness on their part might lead the doctor to think that they are suffering from defective eyesight and the presence of the teacher might avoid any such erroneous conclusion.)

(e) *Record of Inspection.*—Accept responsibility for entering on the school cards details respecting state of clothing, footwear, cleanliness, nutrition, speech, mental condition, and such other information as shall be obtained, e.g., other classes or work outside school hours, parents occupation, number of rooms and of persons in house occupied by child.

(Some of these entries are of a character calculated to cause friction between parents and teachers, should it transpire, on action being taken, that entries have been made by the teacher. Many of the questions cannot be satisfactorily answered without the skilled assistance of a Medical Officer, though nurses might with advantage make use of the teacher's knowledge of each child by securing information before the doctor begins the work of inspection.)

(f) *Details of Inspection.*—The nurse should dress and undress the children whenever necessary as the inspection proceeds. Wherever the School Medical Officer requires assistance in the discharge of his duties such assistance should be rendered by school nurses who might visit the children's homes to assist in giving effect to the doctor's recommendations.

(II.) DUTIES WHICH SHOULD BE UNDERTAKEN BY THE TEACHING STAFF.

(a) *Date and Hour of Inspection.*—Confer with the School Medical Officer as to the date on which school medical inspection should take place, and as to the number to be inspected.

(It is unreasonable that this date should be fixed by the Medical Officer without first ascertaining the probable school conditions on the date required.)

(b) *Selection of Children.*—Select the children for the doctor to examine.

(c) *Particulars respecting children to be examined.*—Supply such particulars respecting each child to be examined as are contained in the ordinary school records, that is, name, address, age, standard and regularity of attendance.

(d) *Attend Inspection.*—It is very desirable that the head teacher or a deputy should attend the inspection for the purpose of assisting the doctor with their special knowledge of the children examined, and in order to be made acquainted with any special facts disclosed by the Medical Inspection. In Mixed Schools under a Head Master a

qualified assistant mistress would replace the Head Master during the inspection of girls, but where there is no adequately qualified assistant mistress, the Medical Officer should consult with the Head Master on any special points which may arise.

(c) *School Time-table.*—The Head Teacher must remain responsible for such alterations (if any) in the time-table as may be necessary to facilitate the work of Medical inspection.

(III.) JOINT DUTIES.

A Medical Officer is justified in considering the whole work and conditions of the school in their medical aspect and in recommending alterations. There are subjects on which his advice is useful, as for example, in determining the size and character of the type to be employed in printing books and papers for the use of school children. His advice should be sought on certain forms of needle-work from the point of view of its effect on eyesight. Where, however, the Medical Officer is of opinion that in the interests of the children alterations should be made, he should confer with the Head Teacher before making any representations to the Education Authority, and should inform the Head Teacher of the exact nature of the report which he proposes to make.

(IV.) DUTIES WHICH SHOULD NOT BE UNDERTAKEN.

(a) *Collection of Fees for Medical Treatment.*—It is not part of the duty of either teacher or doctor to collect fees for medical treatment.

GENERAL NOTE.

It is possible that in connection with the medical inspection and treatment of school children circumstances may arise to which no specific reference is made in this memorandum. In determining whether the responsibility should rest with the Medical Officer or with the teachers, it should be noted that the duties which require for their satisfactory discharge medical knowledge and skill, should in no case be imposed upon the teachers but should be undertaken by the medical staff. Without careful observance of this general rule serious injury may be inflicted upon the children. On the other hand teachers who have been trained for their special work must be prepared to accept full responsibility for the manner in which their duties may be discharged, taking constant care to avoid in the methods and practice of education anything which would be prejudicial to the physical well-being of their scholars.

APPENDIX XXII

SPECIAL REPORT TO DIVISIONS AND REPRESENTATIVE BODY ON QUESTION OF FEES FOR MEDICAL EXAMINATIONS FOR LIFE INSURANCE.

(See para. 211 of *Supplementary Report of Council.*)

(i.) HISTORY OF PREVIOUS ACTION BY ASSOCIATION.

1. The following is a brief report of the action which has been taken in the matter since it first received consideration by the Representative Body.

2. In 1904, the Norwich Division made a preliminary inquiry, locally and generally, the results of which were communicated to the Representative Body that year. At the Annual Representative Meeting, 1905, the Medico-Political Committee submitted a further report from the Norwich Division upon the matter and recommended that the whole matter be remitted to the Divisions for consideration. The Representative Body accordingly passed the following Minutes 115 and 116:—

A.R.M., 1905: *Minute 115.*—Resolved: That, with a view to giving effect to the principles adopted in the report of the Norwich Division, it is desirable that the Association, through the Medico-Political Committee, should ascertain from the Life and Sickness Insurance Societies throughout the country the proportion between the amount of work expected from the Medical Referee and the fee offered to him by the Insurance Company.

Minute 116.—Resolved: That the report on Insurance Fees be approved, and that it be suggested to the Divisions that each Division should take the question into consideration.

These instructions were renewed by the Annual Representative Meeting, 1906, consequent upon no action being taken during the Session 1905-6.

3. Early in 1907 the Medico-Political Committee communicated with the various Insurance Companies in the Kingdom

and the information thus collected was forwarded in February, 1908, to the Divisions for their information, certain questions of fact and opinion being put to the Divisions by the Committee. (See Report to Divisions, Supplement to JOURNAL, February 22nd, 1908.)

4. After consideration of the replies of the Divisions the Committee, through one of its members, interviewed the General Managers, or their representatives, of eight of the leading Life Insurance Companies representing different types of Insurance work, when the proposition was put to them that in the opinion of the Association the time had arrived when the application of the principle that the fees paid to each medical examiner should bear a proportionate relationship to the sum assured (which principle was even then carried out to a certain extent), should be extended, in contradistinction to the present general practice of paying fees varying from 2s. 6d. up to £2. 2s. and not beyond.

5. The gist of such interviews may be summed up as follows:—

(i.) that the majority of the companies were apparently sympathetic to the views put forward, agreeing that in many instances the fees paid for medical examinations were totally inadequate, and appeared disposed to admit that there was much to be said for the adoption of a scale of fees to medical men for life insurance examinations bearing a direct relationship to the degree of responsibility measured in terms of the sum assured;

(ii.) that one company had dispensed altogether with medical examinations, the results of which practice, however, were considered as unsatisfactory by other companies;

(iii.) that two of the largest and most important industrial companies were entirely unsympathetic to the proposition put before them, and one went so far as to state that for some time they had been preparing in anticipation of such a demand by the medical examiners and would if pressed in the matter either (a) adopt a system of whole-time medical officers, or (b) dispense with medical examination altogether.

6. The Council in considering the question in 1914 found that difficulties arose owing to the lapse of time since the approval by the Representative Body of the principle that the amount of payment of practitioners for this class of examination should be based on the amount of evidence required by the insurance company, which principle it first approved in 1905. The Annual Representative Meeting, 1914, decided that fees for life insurance examinations should be based upon the amount of evidence required in confirmation of the examiner's professional opinion of the life.

(ii.) RECOMMENDATIONS.

7. To give effect to this principle, it is necessary that some indication of the kind of report or opinion which could fairly be given for a stated fee should be given, and the Council therefore submits a recommendation hereon with specimen forms of Report. The Council does not wish it to be understood that it considers that the fee of £1 1s. will be adequate remuneration for each and every case upon which a practitioner may be called upon to give a full report. But, taking an average of such cases, and especially having regard to the facts quoted above as to the views of the leading insurance companies, the Council is of opinion that the time has come when the profession should state definitely for what fee it is prepared to give a certain kind of report. In view of what has happened in connection with the fixing of minimum fees for similar work, e.g., examinations by referees under the Insurance Acts, the Council trusts that every effort will be made to impress on the Divisions the necessity for placing this matter fully before their members and securing a discussion on it so that Representatives may be fully informed as to the opinion of their constituents on the proposed fees and the practicability of their being obtained from the Insurance Companies.

Recommendation.

The Council submits the following recommendation to the Divisions and Representative Body:—

That the following fees for medical examinations for life assurance be adopted:

£1 1s. for a formal full report, such as that contained in Sub-Appendix A.*

10s. 6d. for a formal short report, such as that contained in Sub-Appendix B.

5s. for a simple form of certificate, such as that contained in Sub-Appendix C.*

* The Council takes no responsibility for the details of the sample forms submitted, which were taken from the reports of certain Life Insurance Companies for purposes of illustration.

SUB-APPENDIX A.
FORM OF "FULL" REPORT.

Confidential Medical Report to the Directors of the.....
.....Life Insurance Company.

I.—CONFORMATION AND APPEARANCE.

1. (a) Is the Proposer well formed? (b) Does he appear to be healthy?	(a) (b)
2. (a) Is there anything injurious to health in the Proposer's occupation, or ordinary manner of life? (b) Or any reason to suspect past or present intemperance?	(a) (b)
3. What is the height and weight?	Height..... Weight.....

II.—RESPIRATION.

1. Is the chest well developed?	
2. After examination of the chest by percussion and auscultation, (a) state if the resonance on percussion and the movements of the walls of the chest are normal (b) Are the breath sounds healthy, particularly in the subclavian region? and (c) state if there are any, and, if so, what abnormal pulmonary sounds?	(a) (b) (c)
3. What is the actual number of respirations per minute?	
4. Is there a tendency to cough, spitting of blood, or bronchitis?	
5. Does anything lead you to suspect any disposition to disease in the lungs? (NOTE.—As phthisis is the chief cause of loss in Life Assurance, this is important.)	

III.—CIRCULATION.

1. (a) What is the number of beats of the pulse per minute? and (b) what is its character?	(a) (b)
2. Are the impulse and sounds of the heart distinct and normal? If not, describe the abnormal signs	
3. Is there, or has there been, palpitation or syncope?	
4. Are the large blood vessels in a healthy condition?	
5. Do you suspect any disposition to cardiac disease?	

IV.—DIGESTIVE SYSTEM.

1. Are the stomach, liver and bowels sound, and their functions normally performed?	
2. Is there, or has there been, tumour or swelling of any kind? If hernia (a) of what kind? and (b) is a truss worn?	(a) (b)

V.—URINO-GENITAL SYSTEM.

1. (a) What is the specific gravity of the urine? (b) Is it healthy in quantity and quality?	(a) (b)
2. Does it contain albumen or sugar?	
3. Is there any difficulty or pain in passing it?	

VI.—NERVOUS SYSTEM.

1. Are the brain, spinal cord, and organs of sense normal?	
2. Is there any tendency to apoplexy, paralysis, insanity, or other nervous disease?	

VII.—APPLICABLE TO FEMALES.

1. Whether married?	
2. (a) Whether had any children or miscarriages? (b) If now pregnant?	(a) (b)
3. Is there any indication of uterine or ovarian disease, and if so, what?	

GENERAL SUMMARY.

1. As the result of your personal examination, do you consider the Proposer eligible as a first-class life?	
2. Do any of the facts connected with the Proposer's habits of life, occupation, or family history mentioned in the "Personal Statement" or otherwise known to you, render any, and what increased assessment advisable?	

Signature of Medical Examiner
Address.....
QualificationsDate.....

SUB-APPENDIX B.

FORM OF "SHORT" REPORT.

Medical Examiner's Certificate.

Questions to be answered by the Medical Examiner.

1. Have you personally made a medical examination of the Proposer?	
2. What is the height and weight?	Height..... Weight.....
3. Is there hernia, and if so, of what kind, and is a truss worn?	
4. Is there any disposition to phthisis?	
5. As the result of your personal examination, and taking into consideration the general state of health, the condition of the several organs, the constitution and habits, do you consider the Proposer eligible as a first-class life? (If a female, state whether married or single, and any circumstances as to pregnancy, or otherwise, which you consider the officers of the Company ought to know.)	
6. Are there any facts connected with Proposer's habits of life, occupation, antecedents, or family history, on account of which you consider any extra premium should be charged?	

Signature of Medical Examiner.....

Address..... Qualifications.....

SUB-APPENDIX C.

FORM OF CERTIFICATE.

I,..... hereby certify that I have this day examined A.B., and believe him to be in good health and fit to be accepted for life assurance upon ordinary terms.

APPENDIX XXIII.

MEMORANDUM ON METHOD OF PAYMENT FOR DOMICILIARY TREATMENT OF TUBERCULOUS INSURED PERSONS.

(See *para. 219 of Supplementary Report of Council.*)

1. The Association notes that attacks are being made in various insurance areas on the present method of payment for attendance on tuberculous insured persons, and is of opinion that it may be useful to Panel Committees and insurance practitioners generally to have a general review of the situation.

2. It will be remembered that Sanatorium Benefit came into operation before Medical Benefit, and at first payment was made on a scale of fees to medical practitioners for domiciliary attendance on persons certified to be suffering from tuberculosis. When the Chancellor of the Exchequer on October 23rd, 1912, explained the proposals of the Government to a Medical Benefit, he stated that the Government thought it would be much better that there should be an inclusive fee for all the work which the general practitioner

does for tuberculous persons, and that it was proposed that 6d. should be set aside from the 1s. 3d. payable for Sanatorium Benefit in respect of each insured person for the remuneration of the general practitioner for all such work. The Chancellor went on to say "It is true that at first this figure may be very much too high, because after all the Act only applies to employed persons, of whom the numbers suffering from tuberculosis will at first be small. I am sorry to say that gradually these numbers will increase, but for the first few years I have no doubt that 6d. is more than adequate. At the same time I hope that this is an arrangement that will last at any rate some time."

3. In reply to a request for further details as to the proposed grant and especially as to the amount and kind of work which would be expected in return for it, the Chancellor of the Exchequer stated in a letter to the Association dated November 6th, 1912: "The amount and kind of attendance will be such as, in the best interests of the patient, can be given by the practitioner himself. The 6d. from the Sanatorium Fund will be added to the fund available for the provision of medical attendance and treatment by practitioners on the panel. The 6d. is solely for the remuneration of the doctor and no deduction will be made from it for the provision of drugs or any other purpose."

4. The deduction of the 6d. from the Sanatorium Benefit Fund was strongly resented by Insurance Committees who foresaw that with the 9d. remaining they would not be able to carry out the amount of institutional treatment which the public had been led to expect, and from the very inception of the Insurance Committees there has been a steady stream of complaints on this ground. Recently, however, the complaints have taken a more definite form, and at a meeting of the Executive of the National Association of Insurance Committees the following motion was carried on the initiative of the Bristol Committee:

"That strong representations be made to the Commissioners that Committees should control the whole of the money provided for Sanatorium Benefit under Section 16 (2) (a) of the Act of 1911, and that the arrangement whereby medical practitioners are credited with 6d. per insured person on their lists for defraying the costs of domiciliary treatment be discontinued."

5. In the Bristol Insurance Committee on March 1st, 1915, as reported in the *National Insurance Gazette* of March 27th, 1915, a member said that doctors for their 6d. per head of insured persons had treated 183 tuberculous patients while the Sanatorium Benefit Sub-Committee for their 9d. per head had treated 349 patients, which latter treatment included institutional treatment of various kinds. He said that the Committee were giving a great deal for their 9d. and doctors were getting far too much for the little they did. Out of 130 doctors it was reported that only 69 had administered domiciliary treatment and 53 doctors had not a case between them. At a meeting of the Lancashire Insurance Committee on February 28th, 1915, a member stated that he doubted very much whether they were getting anything like a proportionate return for the large sum of money per head for all persons suffering from tuberculosis which the Committee was paying to medical men under their agreement. He went on to say "A doctor who had to attend to 30 or 40 patients in a single evening was not in a position to give the care and attention which cases of tuberculosis required."

They would find that for each person suffering from tuberculosis the Committee were paying something like £10 per head per annum to the doctors." This latter statement is ambiguous. If it means that, including the salaries of Tuberculosis Officers and doctors at Sanatoriums, £10 per head was being spent on medical attendance for tuberculous persons, that may well be so, but it is to be noted that in a report published on March 5th, 1913, by the Tuberculosis Officer of Lancashire, it is shown that the amount per head received by the doctors for domiciliary treatment would average between £3 and £4. This calculation is based on his statement that there are "about 6,000 cases of all forms of tuberculosis in the County. Of these it is estimated that 3,500 to 4,000 insured persons will annually come under treatment by the medical practitioner." The report states that of 1,159 persons reported upon by the Tuberculosis Officers as suffering from phthisis and recommended for treatment, 25.7 per cent. were in the early stages of the disease, 27 per cent. in the intermediate, and 47.1 in the advanced stage.

6. It appears therefore that the attack on the present method of payment of panel doctors for domiciliary treatment of tuberculosis is being made on three lines. First on the ground that the deduction of the doctor's sixpence from the 1s. 3d. definitely set aside for Sanatorium Benefit is crippling the work which the Insurance Committees might do in

the way of institutional treatment. Secondly, that the cases reported by doctors are so few that the aggregate of the sixpences received by many individual doctors proves that the fee per case treated is extravagant—ranging as high as £20 to £30 it is alleged in some areas. Thirdly, that the capitation system has been a failure because the proportion of late cases to early ones reported shows that the doctor is not sufficiently interested in the matter to examine his cases carefully. This is to say, he gets his money whether he examines them or not and consequently all but the very conscientious practitioners do their work in a slovenly fashion.

7. As regards the first objection it need only be said that if the funds of Insurance Committees are proved to be insufficient they ought to be increased either from central funds or from the rates.

8. The second objection is based on a too limited interpretation of what domiciliary attendance is. According to the Chancellor of the Exchequer, it is "all the work which the general practitioner does for tuberculosis persons." Apparently many members of Insurance Committees believe that it is possible to have accurate particulars of every person who has received domiciliary attendance, but every practitioner will at once see that this is impossible. What the Insurance Committees get, or ought to get, is the number of persons who are definitely notified as suffering from tuberculosis. But a great deal of the panel doctor's work in the way of domiciliary treatment of tuberculosis is, and must be, unrecorded so far as the Insurance Committee is concerned. There is for example a large number of young persons who are taken to the doctor because they are "run down," or suffering from anaemia, or indigestion, or a slight cough and receive domiciliary treatment. Most of these persons will not afford evidence of the presence of the bacillus, but to the experienced eye of the doctor the possibility of what is known as the "pre-tubercular" stage is always present. By judicious treatment many cases of this kind are restored to health and never come under the notice of the Medical Officer of Health or the Tuberculosis Officer. Moreover many of those who are definitely tuberculous decline to apply for Sanatorium Benefit or to see the Tuberculosis Officer. They are afraid of imperilling their work and they continue to be treated by the panel doctor until they recover or, more often, until they get so much worse that they no longer care about their work and are now eager for institutional treatment which may however then be too late. No doubt doctors in these cases should consider the desirability of the Tuberculosis Officer being called into consultation but the difficulty of securing the patient's consent should not be underestimated. An Insurance Committee which bases the statement that the panel doctor is being over-paid for domiciliary attendance on the number of cases which are reported to the Medical Officer or the Tuberculosis Officer, is labouring under the same fallacy as the old Friendly Societies were when they contended that the doctors were well paid on the rates formerly given for club work because only a small proportion of their members applied for sickness benefit, entirely overlooking the much larger number of persons who consulted the doctor but did not claim sickness benefit.

9. The third objection, namely, that payment by capitation leads to carelessness may have more substance in it. But the payment per fee was tried and abandoned, first because it was more expensive than the capitation fee, and secondly because it necessitated more administrative and clerical work. As a matter of fact enlightened self-interest should lead every doctor to keep his eyes very wide open for the earliest stages of tuberculosis, for a little work then may obviate much trouble to himself later, besides saving the patient from almost inevitable death. There may be no logical case for giving the panel doctor a separate payment for tuberculosis work, for as has been shown the line of partition between this disease and others is at times very thin. But there is every reason for keeping up the total remuneration to the panel doctor, for if the total remuneration is lowered, the temptation to the doctor to take more patients than he can properly attend to would be greater, and his capacity for giving careful attention to his early tuberculosis cases would be lowered.

10. The answer to the profession to the attempt to take away from it the Sanatorium 6d. should, therefore, be on three lines, first, that the 6d. was definitely promised by the responsible authorities of the Government; secondly, that a great deal of work is being done for the money which is and must be incapable of being shown by figures; thirdly, that the Insurance Committees are best secure that they and the insured persons will get the best return for their money by furthering the co-operation between the panel doctor, the tuberculosis officer, the tuberculosis dispensary and the Sanatorium. The

co-operation of these various agencies is by no means as close as it ought to be, and every effort should be made to improve it, in which steps Insurance Committees could count on the support of the Association. It should be suggested that not only should the panel practitioner make full use of the services of the Tuberculosis Officer, but the latter should make reports on the cases dealt with by him to the panel doctor. The form of reports as drafted by the Local Government Board should be simplified and every effort should be made to make the panel doctor, the Tuberculosis Officer and the Sanatorium Medical Officer realise that they are parts of a co-operative scheme working for the benefit of the tuberculous patient.

11. But it cannot be too forcibly pointed out that even if the Insurance Committees had the whole 1s. 3d. per head, or double that amount, and spent it all on sanatorium and other institutional treatment it would still be necessary to provide somehow for domiciliary treatment. The Tuberculosis Officer could not give it because he has not that free access to the homes of insured persons which the family doctor has. The family doctor is the only one who can give it, and unless he is enlisted in the campaign against tuberculosis, the most promising cases—the earliest ones—will never be discovered, and the Insurance Committee, instead of getting only 74 per cent. of cases in the intermediate and advanced stages, will get all its cases in those stages. It would be worth the while of the Insurance Committee to pay the Sanatorium 6d. for discovering even 25 per cent. of the cases, but it is certain that with more co-operation between the various agencies at work this percentage should rapidly increase.

APPENDIX XXIV.

REDUCTIONS IN ADVANCES TO INSURANCE PRACTITIONERS.

(See para. 221 of Supplementary Report of Council.)

SOLICITOR'S OPINION.

The steps recently taken by Insurance Committees, acting on the advice of the Commissioners, to reduce the monthly or quarterly advances made to insurance practitioners have naturally caused great concern on the part of these practitioners and of the Panel Committees, the result being that the Insurance Act Committee has had many applications for advice as to the legality and necessity of such a step. That Committee instructed its Local Medical and Panel Sub-Committee to take legal advice, and this was done by conference between Mr. Hempsen and several members of the Sub-Committee.

Mr. Hempsen's opinion is set out below and should be read very carefully, in conjunction with the report of the interview between representatives of the Sub-Committee and the Commissioners on December 22nd, 1914, which is reprinted on page 234 et seq. of the Supplement to the BRITISH MEDICAL JOURNAL of May 8th, 1915. Mr. Hempsen's opinion as to the legality and justifiability of reasonable reductions is clear and definite. In consideration of this matter, however, many important points emerged, such as whether the reductions made were not in some cases more than are warranted by the circumstances; whether the reduction in the amount of work demanded from the doctors on the panel is proportionate to the reduction in the remuneration; and as to what will be the position when many of the insured persons now on military service return to the panel lists in a deteriorated state of health. These points were felt to be of such importance that the Sub-Committee decided to collect what information it could from the Panel Committees of the country, and to put the matter down for discussion at the Conference of Representatives of Local Medical and Panel Committees which is to be held in London on June 16th and possibly 17th.

Opinion.

1. As requested, I have carefully perused the printed correspondence between the Commissioners, the Bristol Insurance Committee, and the Chairman of the Bristol Panel Committee (printed in the Supplement to the BRITISH MEDICAL JOURNAL of April 3rd, 1915), and also the report in the Supplement to the BRITISH MEDICAL JOURNAL of January 13th, 1915, of an interview between a deputation from a Sub-Committee of the Insurance Act Committee and the Insurance Commissioners on December 22nd, 1914, and at the same time I have had before

me the Regulations and the Form of Agreement usually entered into between an Insurance Committee and a panel practitioner.

2. In the above mentioned report there is set out (more or less fully) a speech made by Sir Robert Morant at this interview. The first clause of such speech, headed "The total debt to Societies," refers to the administration of the Insurance Fund as between Insurance Committees and approved societies, and therefore presumably I am not called upon to deal with this aspect.

3. The next clause, "The distribution of the pool among Insurance Committees," deals with the ordinary procedure in the distribution of the pool (that is the entire Insurance fund) among the several Insurance Committees. This has to do with the administration of the Insurance Fund as between the Insurance Commissioners and Insurance Committees. Various statements are made in this, as well as in the earlier clause, with the object of showing why the particular procedure is followed by the Insurance Commissioners. Of course I cannot verify such statements, as I have no knowledge of these facts, though the procedure adopted in the distribution, as detailed by Sir Robert Morant, seems to be in accordance with the Regulations.

4. With respect to the third head, namely, "Distribution of the Committee's fund among individual doctors on their panel," I think it best, in expressing my opinion, to follow the language of the Regulations rather than to sum it up in the terse way in which Sir Robert Morant is reported to have done in his speech, which may be liable to misconstruction.

5. By Regulation 35 the Insurance Committees have to credit to each practitioner in respect of each of the persons on his list at the commencement of each quarter an amount calculated in accordance with the rate contained in his agreement with the Committee; that is to say, if the practitioner has 500 persons on his panel and the rate contained in his agreement is 1s. 7½d., he would be entitled to be credited with 1s. 7½d. × 500 = say £40. 12s. 6d. In addition, he is also to be credited with further capitation fees in respect of insured persons which have not been accepted by or assigned to any doctor. It will be recognised that the doctor is to be credited with this £40. 12s. 6d., which means that the whole of such sum is not necessarily to be paid to him at that time, or, in fact, at any later time. In fact, Regulation 37 provides that, "as soon as may be" (whatever that expression may mean) after the expiration of each quarter, the Committee shall pay to each practitioner in advance of the amount due to him such sum as may be agreed between the Insurance Committee and the Panel Committee, and gives power to the Insurance Committee to pay to a practitioner, if they think fit, additional sums "on account."

6. These payments are to be "in advance of the amount due to him." The clause therefore appears to contemplate that the amount does not become payable to him until some later period, which is not definitely stated, but the Regulation in question says that the balance due to the practitioner is to be paid to him "as soon as may be" after the expiration of the year.

7. The deduction from this seems to be that it is only after the expiration of the year and when the final account has been taken that the money is actually due and payable to the practitioner, but that power is given to make payments on account in advance.

8. It must be understood that while a practitioner may be credited with a certain amount he is not necessarily entitled to be paid that sum in full, but only his proportionate share (based upon the number of persons upon his list) of the whole Practitioners' Fund. For instance, for the sake of argument, if there are five practitioners on the panel of a certain Committee — A having 1,000 patients on his list, B having 900, C having 800, D having 700, and E 600—there would therefore be on these five lists 4,000 persons in all. A would accordingly receive 25% of the total Practitioners' Fund X, B 18%, C 16%, D 14%, and so on. If the fund eventually worked out so as to permit of payment in full to each practitioner upon the panel in respect of each person for whom he was wholly responsible, there would, of course, be no need to trouble with this proportionate method of division, but there are bound to be more names on the total of the lists of practitioners than have been allowed for in the Practitioners' Fund due to duplication, failure to notify change of address or death, travellers and the like, so this method was provided for by Regulation 35 (3).

9. With regard to the questions raised by the Chairman of the Bristol Panel Committee to the Insurance Commissioners, dated March 1st, 1915, and set out in the printed correspondence before referred to.

10. There seems to me to be a certain misconception underlying these questions, and on which they all depend, and which I should wish to deal with before answering these questions *seriatim*.

11. The Chairman of the Panel Committee, as voicing the opinion of his Committee, seems to be under the impression that there is due to each medical man upon the panel a fixed sum quarterly for each of the insured persons named on his list, and that he is entitled to receive this intact. Such, however, is not the case, as it is only at the end of the year, or rather "as soon as may be after the expiration of the year" when the Committee have declared a final account, that there is any opportunity for estimating the probable number of insured persons entitled to be considered as being on his list, and for deciding the sum actually due to him; as these quarterly payments are merely "payments on account" regulated by what the Committees deem expedient (see Regulation 37).

12. I now deal with the questions *seriatim* :

(a) "Was the Insurance Committee justified in making a deduction of 6d. per insured person for the third quarter followed by one of 8d. for the last quarter?"

The word "deduction" is, in my opinion, incorrectly used. I have stated above, under paragraph 8, the principles upon which a practitioner upon the panel is entitled to be paid, and that, practically, he cannot claim that any definite sum is due to him until after the end of the year. The Committee, however, credit him with a certain sum every quarter, of which sum they are at liberty by Regulation 37 to pay him the whole or such portion of the whole as they may deem expedient having regard to the condition of the fund and the contingencies that may arise.

13. It must, of course, always be borne in mind that the Commissioners, and under them the various Committees, are dealing with public funds, and are accordingly accountable for every penny they expend, and it is incumbent upon them to keep in hand a certain sum to meet eventualities, and to guard against paying more to one source than a total final account will permit of.

14. If, for instance, every practitioner on the panel were to receive the full amount mentioned in the agreement each quarter for every name upon his list, it might be found when the final annual account came to be taken that a considerably greater sum had been expended in this way, due to duplication, travellers (temporary residents), or other causes, such as insured persons having died, changed their address, or joined the forces, and their names being allowed inadvertently to remain on the doctor's list, than should properly have been allotted to the Practitioners' Fund, and consequently it would be necessary for the Committee to obtain back from each practitioner such sums as have been paid to him in excess of his true share. The objections to this course are, I think, so obvious that it is unnecessary for me to enlarge upon them.

(b) "Was the Insurance Committee justified in making deductions pro rata to the panel lists on account of persons serving with His Majesty's forces?"

Under Section 46 of the Insurance Act, 1911, a soldier is not entitled to medical benefit, and provision therefore has to be made in respect of those insured persons who have joined the forces. As I have said before, the Committee has a discretion as to these quarterly payments on account, and this discretion cannot in my opinion be disputed. I consider, however, that if a doctor can prove that on his list there is no person who has joined the Army or Navy or likely to do so, he would be entitled to protest formally against any temporary withholding on this account from payment, made in advance. But as the question of "deduction" for insured persons who have joined the forces cannot finally be adjusted until the final account has been taken after the end of the year, only then could a legal claim be made based on evidence that a deduction made was not justified.

(c) "Has the Insurance Committee the power of making any deductions from the quarterly cheques that may seem advisable? and, if the answer to this question be in the negative,"

(d) "In what way can the Insurance Committee be restrained from following this procedure?"

The foregoing questions have already been answered by me earlier in this opinion, so there is no need for me to deal with them specifically.

(Signed) W. E. HEMFSON.

Annual Representative Meeting, London, 1915.

NOTICES OF MOTION FORWARDED BY DIVISIONS

SINCE PUBLICATION OF NOTICES OF MOTION IN SUPPLEMENT OF MAY 22ND, 1915 (P. 265).*

(C) The Association and the War.

Question of Medical Attendance upon Dependants of Men Serving with the Colours.

1. **Amendment**, by WAKEFIELD, PONTEFRAC, and CASTLEFORD, to Item 9 of Provisional Agenda, as to approval of Annual Report of Council under heading "(C) The Association and the War":

That the free medical attendance upon the dependants of men serving with His Majesty's Forces should be discontinued after July 31st next; and that such action be taken as may be necessary to secure this step being taken generally throughout the country, and to find out whether the War Office is prepared to provide medical attendance for such dependants or not.

(D) Organization.

Expenses of Representatives.

2. **Rider**, by SALFORD, to Item 24 of Provisional Agenda, as to approval of remainder of Annual Report of Council under heading "(D) Organization":

That the expenses of Representatives of Divisions at Representative Meetings should be paid out of the funds of the Association, and that 2 guineas per diem be allowed towards such expenses.

(H) Medico-Political.

Contract Fees for Medical Attendance and Treatment of Juvenile Members of Friendly Societies.

3. **Amendment**, by WORCESTER, to Motion contained in Item 34 of Provisional Agenda, as to choice of doctor:

That there be inserted in Recommendation C of Council after the word "patient" the words "or representative."

Fees for Medical Examinations for Life Insurance.

4. **Amendment**, by CAMBERWELL, to Recommendation Q of Council (Paragraph 211 of Supplementary Report, p. 5 of this SUPPLEMENT):

That Recommendation Q be referred back to the Council on the ground that the proposed terms are not satisfactory.

5. **Rider**, by WORCESTER, to Recommendation Q of Council (Paragraph 211 of Supplementary Report, p. 5 of this SUPPLEMENT):

That a medical report is solely for the Insurance Company on whose behalf the medical examination is made, and must not be communicated to any other office.

Duties of School Medical Officers.

6. **Amendment**, by CENTRAL BIRMINGHAM, to Motion by North-East Essex (SUPPLEMENT, May 22nd, p. 265):

That the words "without special payment" in the Motion by North-East Essex be omitted.

(I) National Insurance.

Effects of the War on the Medical Side of the Insurance Acts.

7. **Amendment**, by SALFORD, to Motion for approval of paragraph 218 of Supplementary Report of Council (p. 6 of this SUPPLEMENT):

That the profession notes with alarm the disturbance of the probable sickness incidence of insured persons owing to the withdrawal of healthy lives by enlistment in the Army, with the probable return of many unhealthy lives into the insured classes at a later day; and also the reduction of advances of grants by the Insurance Commissioners to the different Insurance Committees.

* The Provisional Agenda of the A.R.M., 1915, and Annual Report of Council, 1914-15, were published in the SUPPLEMENT of May 8th. For Supplementary Reports of Council see page 1 of this SUPPLEMENT. The items contained in Sections (C), (D), etc., above are in connexion with the similarly lettered sections of the Reports of Council.

Importance of Membership of Association.

8. **Rider**, by WAKEFIELD, PONTEFRAC, and CASTLEFORD, in connexion with the same paragraph.

That the members of the profession be circularized as to the importance of joining or remaining members of the Association, in view of the time of severe stress which is undoubtedly coming in the near future in connexion with the Insurance Act.

June 30th, 1915.

ALFRED COX,
Medical Secretary.

Meetings of Branches and Divisions.

EDINBURGH BRANCH:

SOUTH-EASTERN COUNTIES DIVISION.

The annual meeting of the Division was held at Newtown St. Boswells on June 22nd, when Dr. P. C. MACROBERT presided, owing to the absence of Dr. J. Young, chairman-elect, who succeeded to the office of chairman.

Election of Officers.—The following were elected:

Chairman-elect: Dr. W. T. Barrie (Hawick).
Representative on Branch Council: Dr. J. Carlyle Johnston (Melrose).

Representative at Representative Meetings: Dr. W. Blair (Jedburgh).

Honorary Secretary and Treasurer: Dr. M. J. Oliver, re-elected.

Deputy Representative at Representative Meetings: The chairman and secretary were empowered to select a deputy in the event of the Representative being unable or unwilling to attend.

Executive Committee: Drs. McMillan, P. Henderson, Bannerman, Fairfax, S. Davidson and Muir.

Annual Report.—The annual report of the Executive Committee, which was approved, stated that three meetings of the Division and one of the Executive Committee had been held, when among the subjects considered were the administrative work of the Association, medico-political matters, the war emergency, and subjects connected with national insurance. No scientific meetings or annual dinner had been held.

Direct Representatives on the General Medical Council.—It was decided to recommend members to support Dr. J. A. Macdonald, LL.D. (Chairman of Council) as one of the direct representatives on the General Medical Council.

FIFE BRANCH.

The thirteenth annual meeting of the Branch was held in the Station Hotel, Kirkcaldy, on June 4th, when Dr. R. BALFOUR GRAHAM, President, was in the chair.

Election of Officers.—It was unanimously agreed to adopt a recommendation of the Branch Council that, in view of so many members being absent on service and otherwise at this time, and that, as other Medical Committees were being re-elected, the office-bearers and members of Branch Council be re-elected for the current year. The President agreed to act as interim Secretary in room of Dr. Anderson, who expects to be called up shortly as a medical officer to the Forces. The CHAIRMAN, in the name of the meeting, congratulated Dr. Anderson, and trusted that his special knowledge and experience would be utilized.

Annual Representative Meeting.—Dr. Sneddon was re-elected the Representative of the Branch at Representative Meetings, and Dr. Macdonald (Cupar), Deputy Representative, falling whom Dr. Dow (Dunfermline). With regard to the business of the Annual Representative Meeting, it was agreed that the Representative should use his discretion thereon.

KENT BRANCH:

BROMLEY DIVISION.

The annual meeting of the Bromley Division was held on June 29th, when Dr. UMSEY took the chair, and was followed by the new chairman, Dr. BAILEY.

Election of Officers.—The following were elected:

Chairman: Dr. Bailey.
Vice Chairman: Dr. Crombie.
Joint Honorary Secretaries: Dr. A. Tennyson Smith and Dr. W. H. Chesters.

Representative for Representative Meetings: Dr. A. Tennyson Smith.

Deputy Representative: Dr. G. R. Stilwell.
Representative on Branch Council: Dr. Lewis.

Executive Committee: Drs. A. F. G. Codd, J. F. Douse, C. E. M. Lewis, E. C. Michael, T. D. Miller, E. G. Pringle, G. R. Stillwell, W. F. Umney, J. H. Yolland.
The Executive Committee to be also the Ethical Committee.

Annual Representative Meeting.—The Representative was instructed to support the Council's recommendations on (1) assistant asylum medical officers; (2) fees for life insurance examination; (3) to oppose contract fees for juveniles and the maternity and child welfare report, on the ground that the time was inopportune for questions of such magnitude. A levy of 2s. 6d. towards the expenses of the Representative for the Annual Representative Meeting was passed, and was paid by those present.

Direct Representatives on the General Medical Council.—Dr. Macdonald was recommended a Direct Representative on the General Medical Council.

Vote of Sympathy.—A cordial vote of sympathy was passed to the Branch Secretary, Dr. Starling, on his illness.

METROPOLITAN COUNTIES BRANCH:

HAMPESTEAD DIVISION.

A MEETING of the Hampstead Division was held on May 23rd, when Dr. COODE ADAMS was in the chair.

Election of Officers.—The following officers were elected to fill vacancies caused by enlistment:

Honorary Treasurer and Honorary Secretary: L. Barnett, M.D.
Members of Executive Committee: Dr. E. Barker, Dr. Delia Macdonald.

Representative at Representative Meeting: Dr. Cunningham.
Representatives at Branch Council: Drs. Tidcock and Shettleworth.

Belgian Relief Fund.—It was resolved to contribute £5 5s. out of the funds of the Division towards the Belgian Relief Fund for Medical Men and Pharmacists.

Matters Referred to Divisions.—With reference to the question of the medical attendance upon juvenile members of friendly societies, the Representative was instructed to move that if the fee be fixed at 4s. 4d. per member per annum, including drugs, it must be distinctly stated that for this sum no records are to be kept.

Vote of Thanks.—It was resolved to send a letter of thanks to Mr. Sidney Boyd for his past services.

Vote of Condolence.—A vote of condolence was directed to be sent to Dr. Collingwood Andrews.

KENSINGTON DIVISION.

The annual meeting of the Division was held at Kensington Town Hall on June 11th, when Dr. S. D. CLIPPINGDALE was in the chair.

Election of Officers.—The following officers were elected for 1915-16:

Chairman: Dr. Herbert Chambers.
Honorary Secretary and Treasurer: Dr. Walter E. Fry.
Representatives at Branch Council: Drs. Christine Murrell, Wilfred Kingdon, and W. H. Burnhill.
Executive Committee: Drs. Gunton Alderton, G. A. H. Barton, Benjamin Jones, H. T. N. Merrick, Vernon Sinclair, Thoresby Jones.

Representatives at Representative Meetings: Mr. E. B. Turner, Dr. Charles Buttar, and Dr. S. D. Clippingdale.

Vote of Thanks.—On the motion of Mr. TURNER, seconded by Dr. RICE-OLKLEY, a hearty vote of thanks was accorded to the retiring Chairman, Dr. S. D. Clippingdale, who returned thanks.

Annual Report.—The annual report for 1914-15, showing a membership of over 200, and the annual financial statement, showing a balance in hand, was accepted.

Medical Attendance on Dependents.—The Executive Committee reported that a new arrangement had been made with the various Committees of the Soldiers' and Sailors' Families Association, and that in future no free medical attendance books would be issued except on the written request of the doctor in attendance.

Annual Representatives Meeting.—The Representatives were duly instructed for the forthcoming Representative Meeting.

ST. PANCRAS AND ISLINGTON DIVISION.

At the annual meeting of the Division held on June 10th there were elected, in addition to the officers named in the Supplement of June 19th, the following:

Representative, 1915-16: Dr. R. M. Beaton.
Deputy: Dr. Alexander Town.

STRATFORD DIVISION.

The annual meeting of the Division was held at the West Ham Hospital on June 15th. Dr. BEADLES was in the chair.

Election of Officers.—The following officers were elected for the ensuing year:

Chairman: Dr. J. Ross Steen.
Treasurer: Dr. P. J. Nicoll.
Representative: Dr. H. S. Beadles.
Honorary Secretary: Dr. Percy Rose.
Executive Committee: Drs. Couzens, Dayus, Fraser, Frederic, Grigono, Hay, Kennedy, McDonald, McMurtry, Nelson, Randal, and Taylor, together with the above *ex officio* members.

Association Notices.

ANNUAL REPRESENTATIVE MEETING, 1915.

DATE OF MEETING.

The Annual Representative Meeting of the Association, 1915, will be held at the Connaught Rooms, Great Queen Street, London, W.C., on Friday, July 23rd, 1915, and following days as may be required.

By order,
ALFRED COX, *Medical Secretary.*

May 19th, 1915.

ANNUAL GENERAL MEETING.

NOTICE is hereby given by the Council that the Annual General Meeting of the British Medical Association will be held at the Connaught Rooms, Great Queen Street, London, W.C., on Saturday, the 24th day of July, 1915, at 2 o'clock in the afternoon.

Dated this 22nd day of June, 1915.

By order,
GUY ELLISTON,
Financial Secretary and Business Manager.
429, Strand, London, W.C.

ALTERATION OF ARTICLES OF ASSOCIATION: EXTRAORDINARY GENERAL MEETING.

NOTICE is hereby given by the Council that an Extraordinary General Meeting of the British Medical Association will be held at the Connaught Rooms, Great Queen Street, London, W.C., on Saturday, the 24th day of July, 1915, immediately after the conclusion of the Annual General Meeting of the same Association, called for 2 o'clock in the afternoon of that day, when the subjoined Resolutions will be proposed as Extraordinary Resolutions:

1. That Articles 3, 43 and 44, and the words "whether an existing Member or a future Member" in Article 9, be cancelled.
2. That in Article 4 there be inserted immediately after the word "Acts" the words following—"and any Medical Practitioner who does not reside within the area of any Branch of the Association and who though not so registered is possessed of any of the qualifications described in Schedule (A) of the Medical Act, 1858."
3. That in Heading III immediately after Article II the word "and" be substituted for the word "or."
4. That in Article 28 the last six words be altered so as to read "provisions as to Referendum herein-after contained."

Should the above Resolutions or any of them be passed by the requisite majority the same will be submitted for confirmation as Special Resolutions or a Special Resolution to a further Extraordinary General Meeting, and such Meeting will be held at the Head Office of the Association, No. 429, Strand, London, W.C., on Wednesday, the 11th day of August, 1915, at 2 o'clock in the afternoon, for the purpose of considering and, if thought fit, confirming as Special Resolutions or a Special Resolution any of the above Resolutions set forth which shall have been so passed.

Dated this 22nd day of June, 1915.

By order,
GUY ELLISTON,
Financial Secretary and Business Manager.
429, Strand, London, W.C.

ELECTION OF MEMBERS OF COUNCIL BY GROUPED REPRESENTATIVES.

NOTICE is hereby given that Nominations for Candidates for election of Members of Council by grouped Representatives for the year 1915-16 will be received by the Medical Secretary up to the end of the first hour of the proceedings of the Annual Representative Meeting on Friday, July 23rd, 1915. Each Nomination must be on the prescribed form, copies of which will be forwarded by the Medical Secretary on application.

Separate forms have been prepared: (1) For Nomination by a Division (through its Representative), and (11) for Nomination by a Representative of a Constituency included in the Group, and those applying are requested to state for which purpose the form is desired.

The voting papers will be issued at the Representative Meeting to each Representative or Deputy Representative of a Constituency in the United Kingdom in attendance at the Meeting.

By order of the Council,

ALFRED COX,
Medical Secretary.

June 30th, 1915.

BRANCH AND DIVISION MEETINGS TO BE HELD.

DORSET AND WEST HANTS BRANCH.—Dr. F. Fowler and Mr. P. A. Ross, Honorary Secretaries, give notice that the summer meeting of the Branch will be held on Wednesday, July 7th, at Church Hall, Sherborne, at 3 p.m. The meeting of the Branch Council will take place at 2.30 p.m. The Sherborne practitioners kindly invite members to luncheon at the Digby Hotel at 1.30 to 2.30 p.m.

CAMBRIDGE AND HUNTINGDON BRANCH.—Dr. G. S. Haynes, Honorary Secretary 63, Trumpington Street, Cambridge, gives notice that the annual general meeting will be held on Friday, July 9th, at 3 o'clock, at the 1st Eastern General Hospital, Cambridge, by kind permission of the Officer Commanding, Colonel J. Griffiths. After the meeting Colonel Griffiths will be pleased to show members and their wives over the hospital and to give them tea. Will those members who intend to be present kindly notify the Secretary?

EAST YORKSHIRE AND NORTH LINCOLNSHIRE BRANCH.—Dr. H. L. Evans, Honorary Secretary, 101, Princes Avenue, Hull, gives notice that the annual meeting will be held in the Grimsby and District Hospital on Friday, July 9th, at 4.15 p.m. Business: To elect members and their wives over the hospital and to give them tea. Will those members who intend to be present kindly notify the Secretary?

SOUTHERN BRANCH.—Mr. James Green, Honorary Secretary (Brandon House, Mile End, Portsmouth), gives notice that the forty-second annual meeting of the Branch will be held at the Speedwell Hotel (opposite to the Portsmouth Town Station) on Thursday, July 8th, at 3.30 p.m., when Mr. George H. Cowen, F.R.C.S., will take the chair. Agenda: Correspondence. Return of election of officers of Branch for 1915-16. Annual report of Council. Balance sheet. Election of associate members. General business. At the conclusion of the business Mr. Cowen will vacate the chair in favour of Dr. C. F. South, the President for the ensuing year, who will deliver a presidential address. Dr. South kindly invites the members to tea, which will be served during or after the proceedings. On account of the war there will be no luncheon, golf competition, or other social function, except the above. Gentlemen who intend to attend the meeting will oblige by sending word to that effect to the Honorary Secretary.

IRISH COMMITTEE.

The quarterly meeting of the Irish Committee of the British Medical Association was held on June 15th, at the Irish Offices, 16, South Frederick Street, Dublin, when Mr. R. J. JOHNSTONE, F.R.C.S., was in the chair.

Medical Assessorship under the Employers' Liability Act.—Dr. THOMPSON (Omagh) wrote stating that he had been removed from the position of medical assessor, under the Employers' Liability Act, for the co. Tyrone without notice to him or cause shown. It was resolved unanimously:

That this Committee has heard with great regret of the removal of Dr. Thompson from the position of medical assessor, under the Employers' Liability Act, for the co. Tyrone, and protest very strongly against the arbitrary removal, without any cause stated, of a most respected member of the profession.

Illegal Conditions of Appointment of Dispensary Medical Officer.—A letter was received from the Local Government Board (Ireland) stating that at the request of the Irish

Committee of the British Medical Association it had forwarded a letter to the Clerk of the Castlebar Board of Guardians, calling attention to the terms of the advertisement issued by the guardians inviting applications for appointment to the office of medical officer of the Balla dispensary district, and stating that the proposed condition of appointment—that the medical officer should attend private patients at fees prescribed by the guardians—would not be binding on the gentleman appointed medical officer.

Medical Secretary for the Irish Medical Committee.—The meeting thanked Dr. HENNESSY, Irish Medical Secretary, for his offer to act again for the ensuing year as Medical Secretary to the Irish Medical Committee, and decided to place his services at the disposal of that body.

IRISH MEDICAL COMMITTEE.

The annual meeting of delegates, representing Borough and Local Medical Committees and the other professional bodies in Ireland, was held on June 15th at the Royal College of Surgeons, Dublin, when Mr. R. J. JOHNSTONE, F.R.C.S. Eng., was in the chair.

Irish Medical Committee.—It was resolved that a committee be formed possessing the same constitution, duties, and power as the Irish Medical Committee elected on July 17th, 1913.

Medical Certificates for Sickness and Sanatorium Benefits.—It was resolved:

- That this meeting reiterates the opinion expressed by three previous annual meetings of delegates that all medical certificates be issued by the medical attendant.
- That any system whereby the primary certification of patients for sanatorium benefit is relegated to medical officials, to the exclusion of the medical attendant, would prevent the discovery of early cases and their efficient treatment.

Circulation of Matter by the Irish Insurance Commissioners Detrimental to the Honour of the Profession.—It was resolved to appoint a small committee to confer with the governing bodies of the Irish and other licensing bodies relative to the action of the Irish Insurance Commissioners circulating privately matter detrimental to the honour and interests of the Irish medical profession without giving the representatives of that body an opportunity of investigating openly the charges made against its members.

Relations of the Profession with Medical Certifiers.—The meeting decided that the Secretaries should communicate with each Borough and Local Medical Committee requesting that a document should be drawn up and signed by each medical practitioner and consultant similar to that in force in Cork regulating professional relations with medical certifiers under the Insurance Act.

Dispensary Doctors as Medical Certifiers for their own Districts.—For the purpose of obtaining the views of the delegates a motion was formally proposed that in the case of a small number of dispensary doctors who were appointed by the Commissioners as medical certifiers for their dispensary districts, professional relations be continued as heretofore. It was pointed out that these doctors certified for insured patients attended by other doctors, and after some further discussion the proposal was unanimously rejected.

Medical Referees under the Insurance Act in Ireland.—It was resolved:

That this delegates' meeting is of opinion that medical referees under the Insurance Act in Ireland and appointed on terms approved by the Irish Medical Committee, should in all cases notify the medical attendant the day and hour of the proposed visit, and in the event of their not doing so we consider their conduct unprofessional.

Medical Deputations to Parish Committees.—It was decided to instruct Borough and Local Medical Committees to send deputations to Parish Committees to endeavour to enlist their active support on behalf of the profession in their efforts to have the present system of certification for sickness benefits altered.

THE WAR EMERGENCY.

CORNWALL.

The first meeting of the War Emergencies Medical Committee for Cornwall was held at St. Austell on June 8th, when Dr. R. B. ANDERSON was elected Chairman and

Dr. Houghton Honorary Secretary. Drs. A. E. Shaw and Trinder were co-opted. Acting on the instructions of the committee the Honorary Secretary has issued the following circular letter to all medical men practising in Cornwall. If, owing to change of address or other reasons, any practitioner does not receive a copy, it is hoped he will avail himself of this publication:

Tannachie, Falmouth.

War Emergencies Medical Committee.

Dear Sir,—At a meeting held at St. Austell on June 8th it was decided to form a committee to safeguard the interests of those practitioners who volunteer for the army.

In many cases, no doubt, men have been able to make the necessary arrangements with their neighbours to have their patients efficiently looked after during their absence. But it was felt that there might be cases where a man might be diffident about approaching his neighbours on such a matter. Therefore the services of a committee would be welcome as intermediaries to arrange the terms under which such services could be rendered.

In this time of serious national danger all must make some sacrifices for the common good. Those who do take commissions in the R.A.M.C. will undoubtedly suffer serious financial loss, so it is not asking too much of those who cannot get away to help loyally to safeguard the interest of the colleagues of theirs who have gone away to serve their country in her time of need.

It was felt by the meeting, when this committee was elected, that no one scheme would suit all cases, and therefore each case would have to be arranged for on its own merits. For instance, a scattered country district would probably involve more labour than would be the case in a town practice.

If you have already joined or intend joining the R.A.M.C., and have not been able to make the necessary arrangements, the services of the committee are at your disposal. When writing, please give the names of those who live nearest to you, or who you think could most easily do your work.

If, on the other hand, you cannot get away, will you be willing to take some of the burden on your shoulders, and loyally help those who are making the sacrifice of leaving their practices to help to relieve some of the awful horrors of this war?

Kindly let me have an answer, and let me know if you are in any way serving at present?—Yours truly,

J. W. HAUGHTON,
Honorary Secretary.

EDINBURGH.

At the annual meeting of the Edinburgh and Leith Division of the Edinburgh Branch, on June 22nd, the Chairman, Dr. R. A. Lundie, stated that 800 clinicians had been sent out by the Division, and the secretaries had prepared lists of all medical men engaged in service under the colours. At the present time, out of 123 engaged in war work, 112 were in the army or naval service, 7 were doing Red Cross work, 7 female practitioners had gone to women's hospitals in France and Serbia, and 2 doctors were called up as combatants, while 85 medical men in the area had offered themselves for part-time service.

At the annual meeting of the South-Eastern Counties Division of the Edinburgh Branch, on June 22nd, the Secretary stated that out of 64 circulars sent to practitioners, he had received replies from 26 giving the desired information, 4 had written giving partial information, 11 were absent on service, while 23 had not replied. The Secretary was directed to send another communication to those who had not replied, asking for the information sought. In accordance with the request of the Scottish Medical Emergency Committee, Dr. J. Young (chairman of the Division) and the Drs. W. Blair and J. S. Muir (ex-chairman) were appointed a War Committee, and to it was remitted the duty of (1) suggesting schemes and proposals by which medical men could be freed for service; (2) approaching individual practitioners with suggestions for that object; (3) advising practitioners as to the terms and conditions under which the practices of absentees might be carried on; and (4) advising and directing the secretary in the work of organization.

The Secretary was instructed to call the attention of the Medical Emergency Committee to the fact that fifth-year medical students were acting as combatants and were not allowed to transfer to medical work, and to the fact that the Government, through the National Insurance Commissioners, had not as yet taken steps to relieve practitioners of the duty of signing weekly medical certificates required by approved societies or in any other way to diminish their clerical work.

With reference to the advertisement by relief committees of free medical attendance on the dependants of those serving with the military and naval forces, the Secretary

was instructed to write to the relief committees pointing out that such attendance was in the nature of a charity and not a right, and should only be given in necessitous cases.

PROPOSED DUTY-FREE ALCOHOL IN PUBLIC HOSPITALS.

THE following letter has been addressed to the Chancellor of the Exchequer on behalf of the British Medical Association:

June 24th, 1915.

Sir,—A Committee of the Association has had under consideration the new clause proposed to be inserted by the Government in the Finance (No. 2) Bill headed "Power to authorize use of duty-free spirits in hospitals in preparation of tinctures," etc., and I am instructed to bring to your notice the following considerations in reference to it.

The Association naturally welcomes any proposition which has for its object the assistance of the hospitals which deal with the sick poor, but my Committee, after careful consideration of the proposed clause, has come to the conclusion that in its present form it is dangerous and likely to do more harm than good, and my Committee would respectfully urge that the proposal should not be persisted in at the present time.

In the first place, the new Finance Act does not in any way worsen the position of the hospitals in regard to their use of alcohol as compared with former years, and there is no evidence that the present tax limits the use of alcohol to the detriment of medical treatment.

There are many disadvantages to the practice of medicine in general which might follow if alcohol were permitted to be used in hospitals under conditions which differed from those obtaining outside. There is no doubt that if alcohol in hospitals were duty-free the present economic restrictions on its use would entirely disappear, and preparations largely consisting of alcohol would be used much more frequently than they are now. This would be unfortunate, because the tendency of recent years has been to limit the use of alcohol in medical preparations as far as is consistent with efficiency, and many new forms of drugs have been brought into general use because they have been found to be quite efficient although they contain little or no alcohol, and are therefore cheaper than the older preparations. It would be unfortunate, too, if students who, after they had qualified, would have to prescribe or use preparations containing duty-paid alcohol were trained under conditions in which the cost of alcohol need not be considered. This would lead either to an extravagant use of alcohol in their prescriptions, for which the public would have to pay, or to their having largely to unlearn the habits of prescribing they have been taught in the hospitals; and in particular the possible effect of such free prescribing of preparations containing alcohol on the Drug Fund of the National Health Insurance Acts should not be overlooked.

My Committee would point to the difficulty, of which you are no doubt already aware, of controlling the use of alcohol in a large institution. It is difficult even now when the cost of alcohol makes its economical use a matter of great care, but it would be a much more difficult problem to safeguard it if the cost of alcohol were negligible. There is also the possibility of abuse in connexion with the out-patient departments of hospitals, inasmuch as out-patients are sometimes given comparatively large quantities of liniments which consist largely of alcohol. There would be a distinct incentive to unscrupulous persons to buy these alcoholic preparations for which they could afford to give a price, which though small in comparison with the duty-paid alcohol, would be quite sufficient to tempt the class of persons which frequents the out-patient departments of hospitals.

My Committee anticipates great difficulty in connexion with the definition of the institutions which can be authorized to use duty-free spirits. For purposes of its own this Association at various times has spent a considerable amount of time in trying to define a hospital, but has never succeeded, and my Committee does not think the definition in the clause will be able to prevent abuse. There are many pseudo-hospitals, some of which are really commercial ventures.

My Committee suggests that these would come within the definition in the clause. It is to be feared that the possibility of securing a supply of cheap medicines may lead to the multiplication of institutions which are only "hospitals" in name, but which could easily prove that they were, at any rate partly, supported by voluntary subscriptions. My Committee could say much on this

question and would be prepared if necessary to send a deputation to discuss the question, but his opinion is that at the present time it is not possible to define adequately a "public hospital." It would submit that if the clause cannot be withdrawn it should at any rate be modified so that instead of trying to define a "public hospital" the privilege of duty-free spirit should be given only to institutions which can satisfy some Standing Committee appointed to consider the claims sent in.

My Committee is very sorry to take up a position which superficially may appear like cavilling at a generous offer on the part of the Government, but it feels that the matter is too important and too serious to be allowed to go through in its present form without at any rate strong representations being made on behalf of the medical profession in favour of a postponement of the whole matter and full consideration before the next Finance Bill.

In view of the fact that the Finance proposals of the Government do not in any way prejudice the position of hospitals, and that the concession now offered to them would in the opinion of my Committee be dearly bought if it led to the abuses outlined in this letter, I am instructed to express the hope that the clause may be dropped and the whole question of the use of duty-free alcohol in medicine be referred to a Special Committee for consideration and report.—I am, Sir, your obedient servant,

(Signed) ALFRED COX,
Medical Secretary.

The Right Hon. Reginald McKenna,
Chancellor of the Exchequer,
Treasury, S.W.

LOCAL MEDICAL AND PANEL COMMITTEES.

CROYDON. PANEL COMMITTEE.

A MEETING of the Croydon panel practitioners was held at the Croydon General Hospital on June 17th.

Election of Committee.—The following were elected to form the Panel Committee holding office after July 15th next: T. A. Dulkes, G. G. Genge, G. B. Jameson, W. A. Montgomery, F. Nicholls, G. Wale, J. B. Ridley, C. H. Phillips, A. P. Allan, P. Beard, S. D. Turner, S. H. C. Air, F. J. Davids, N. A. Rose, S. S. Simmons, C. O. Fowler, F. G. Grapel, J. A. Howard, C. G. C. Scudamore, E. H. Willock.

Doctors' Lists.—It was decided to read the following resolution to the Insurance Committee:

That no person be removed from a doctor's list (except in the event of such person being dead or having ceased to be an insured person) until a new doctor has been chosen by him.

Supply of Drugs and Appliances.—It was resolved: That where an insured person visits a consultant, who prescribes proprietary or extraordinary treatment, the panel practitioner of such patient is not bound to, and as a general rule should not, order such treatment at the expense of the drug fund.

LOCAL MEDICAL COMMITTEE.

At a meeting of resident practitioners held at the Croydon General Hospital on June 17th last the following ten practitioners were duly elected to constitute, together with the elected members of the Panel Committee, the Local Medical Committee, to hold office after July 15th next: G. Lewin, R. L. Pinkerton, J. Wraye, C. Wray, P. T. O'Hagan, W. Ledlie, H. A. Easton, H. C. Male, F. W. Davidson, and J. J. Foran.

BERKSHIRE.

LOCAL MEDICAL AND PANEL COMMITTEE.

The thirtieth meeting of the Berkshire Local Medical and Panel Committee was held in the Library, Royal Berks Hospital, on June 3rd, when Dr. NAPIER JONES was in the chair.

Election of Committee.—The SECRETARY reported that he had informed the British Medical Association that the Committee would wish the Association to approach the Commissioners with regard to the abolition of election of Panel Committees during the war, and his action was approved.

Application for Money due from 1913.—The SECRETARY reported that £468 Os. 6d. had been paid by the Commissioners to the Insurance Committee for 1913, and he was instructed to inform the Insurance Committee that this sum should be paid to the doctor as soon as possible. He was also instructed to call the attention of the

Insurance Committee to Article 37 of the Statutory Rules and Order, 1914, and to suggest that the Insurance Committee should agree to the payment of Is. 9d. per insured person per quarter for the first three quarters.

SOUTHAMPTON.

PANEL COMMITTEE.

A MEETING of the Southampton Panel Committee was held on June 3rd at the Insurance Committee's new offices, 17, Hanover Buildings, when Dr. MAY was in the chair.

Persons Suspended from Medical Benefit.—The Committee expressed the opinion that it is desirable that when an insured person is suspended from medical benefit, the medical ticket should be immediately recalled by the society to which he belonged, to prevent him from obtaining medical attendance to which he was not entitled.

Stock Mixtures.—Letters from the Pharmaceutical Committee were read objecting to the list of stock mixtures submitted on the ground that they did not possess the necessary keeping qualities. The Committee resolved to inform the Insurance Commissioners that it adhered to its desire that they be incorporated in the contract.

Dressings.—It was agreed to recommend the Insurance Committee that in order to obviate waste, dressings should be put up in penny packets. It was also decided to ask doctors to satisfy themselves that the quantities of surgical dressings and drugs ordered were supplied, and to report any specific instance of wrong quantities having been supplied by the chemists.

Payments to Doctors.—It was decided to recommend acceptance on account of 75 per cent. of the accounts, the reduced amount being due to insured persons having enlisted.

Agua Destillata.—It was reported that the recommendation of the Joint Checking Committee to allow the charge made for distilled water by the chemists when ordinary water had been ordered had been withdrawn by the Southampton Insurance Committee, but it was still necessary to write "Aq. font." when distilled water was not required.

COUNTY OF SOMERSET.

LOCAL MEDICAL AND PANEL COMMITTEE.

A MEETING of the County of Somerset Local Medical and Panel Committee was held at Taunton on June 10th, when Dr. WALLACE was in the chair.

Payments for 1914.—The CHAIRMAN presented a statement from the Commissioners showing the final financial settlement in respect of the year ending January 11th, 1914. The number of insured persons on the doctors' lists was 95,667, while the amount available for treatment in respect of the same was £39,209 3s. 1d. This worked out at 8s. 2,364d. a head, including the unallocated. The amount available from Drug and Drug Suspense Fund worked out at 1s. 7d. a head for insured persons.

Payments for 1915.—The CHAIRMAN explained that with the Commissioners' approval, only £72 per quarter for a thousand insured persons on the register should be paid. This was really equivalent to a deduction of 36 per cent. The Chairman of the Insurance Committee had decided that this deduction was too large, and that 20 per cent. only should be deducted, but it was anticipated that the proportion of deduction would have to be increased.

Increased Cost of Drugs.—Inasmuch as chemists were to have special allowances in respect of the increased price of certain drugs, the Honorary Secretary was instructed to communicate with the Commissioners and ask that a special allowance should also be made to dispensing doctors.

Expenses of Pharmaceutical Committee.—The Pharmaceutical Committee's estimate for expenses for the ensuing year was approved.

Election of Panel Committee.—It was proposed that the Honorary Secretary should inform the Commissioners that the Committee approved of the suggestion that the present Committee should stay in office for the coming year, and it was decided to approve the suggestion of the Local Medical and Panel Committee of Gloucestershire that this election of committees be triennial instead of annual.

RENFREW COUNTY.

PANEL COMMITTEE.

A MEETING of the Renfrew County Panel Committee was held in the Y.M.C.A. Rooms, High Street, Paisley, on May 26th, when Dr. CORBETT presided.

Complaint against a Practitioner.—A letter was read from the Pharmaceutical Committee, complaining that a practitioner had been consistently committing a breach of his agreement with the Insurance Committee in that, instead of furnishing prescription forms to certain of his insured patients, he had been supplying them gratuitously with whatever drugs and appliances they required. This complaint had been reported to the practitioner concerned, whose reply indicated that he intended to continue the practice complained of. The Panel Committee decided to inform the Pharmaceutical Committee that in its view, on the facts as stated, a breach of the practitioner's agreement had been committed, and that the Pharmaceutical Committee would now be justified in putting the matter before the Insurance Committee.

Conference of Local Medical and Panel Committees.—With reference to the Conference of Local Medical and Panel Committees arranged by the British Medical Association, it was observed from the agenda that the British Medical Association had decided to recommend for general adoption the scheme devised by this Committee for the automatic restoration of discharged soldiers to the lists of their former panel practitioners.

Continuance of Present Panel Committees during War.—It was decided to inform the British Medical Association that as Panel Committees in Scotland hold office until March 31st, 1916, this Committee did not meantime favour suspension of elections during the war.

INSURANCE COMMITTEES.

LONDON.

Reorganization of the Office Staff.

The London Insurance Committee on June 24th received a report from the subcommittee which has been considering the reorganization of the office staff. The report indicated that in the registers department the plan of having a staff mainly temporary in character had proved unsatisfactory, and the number—150—wholly inadequate. The Committee decided to increase the permanent established staff from 84 to 169.

Alleged Undue Economy after Surcharge.

Amongst a number of cases in which complaints had been made against practitioners was one in which an insured person stated that the practitioner informed her that he was only able to order a limited supply of bandages. The practitioner's explanation to the Medical Services Subcommittee was that until recently he supplied the number of bandages he considered adequate for the treatment of an ulcerated leg, but as he had been somewhat heavily surcharged for alleged excessive prescribing, he had felt bound to curtail the supply, this being one of the cases in which he was alleged to have been extravagant. Unless the bandages could be washed and used again as he had instructed, he agreed that the number ordered was insufficient. The Subcommittee expressed the opinion that the surcharge was unjustified, and that in the practitioner's efforts not to prescribe extravagantly the interests of the insured person suffered.

CORRESPONDENCE.

METHOD OF PAYMENT FOR DOMICILIARY TREATMENT OF TUBERCULOUS INSURED PERSONS.

DR. A. CHRISTIE REID (Nottingham) writes: On reading through Appendix D in the SUPPLEMENT of June 26th, and the short note on the resolution re domiciliary treatment of tuberculosis, I was struck with the absence of any recognition of the fact that the 6d. taken out of the sanatorium fund, for our benefit, was really of the nature of a raid on that fund in order to make up our capitation fee to what was considered to be the irreducible minimum of 6s. 6d. (though this was less than our demand). To cast it up against us as a payment for the domiciliary treatment of tuberculosis, and nothing more, as was done by the Bristol Insurance Committee, and then to calculate the rate at £10 for each case so attended is so grossly unfair that I find it difficult to believe that the point was not noticed at the conference, though no record of it was made.

A similar suggestion was sent round to us in Nottingham some months ago, in which it was calculated that we got

£5 for each case of tuberculosis attended at home. We did not take the calculation seriously, as it was so obviously based on a complete misunderstanding of the compromise, or adjustment of the capitation fee as a whole. But as the same ingenious fallacy seems to have occurred to other Insurance Committees it must be at once dispensed whenever it shows itself.

INSURANCE ACT IN PARLIAMENT.

DRUG SUPPLIES.

MR. WATT asked the Secretary to the Treasury, on June 24th, whether medical Insurance Committees would be sued for supplies of drugs which they had purchased, received, and passed, or whether these Committees had the privilege of Government Departments of not being amenable to the courts of the land; and, if the latter, would he introduce legislation altering the principle of a purchasing body being able to pay or not pay, as seemed to them convenient, for goods purchased. Mr. Charles Roberts (Chairman of the Joint Committee of Insurance Commissioners) said that the circumstances under which Insurance Committees contracted for the supply of drugs were not as stated in the question. Section 30 of the National Insurance Act, 1911, provided that every Insurance Committee should be a body corporate and might sue and be sued. Mr. O'Grady asked how many cases of inaccurate dispensing of prescriptions had occurred within the last six months; whether the Commissioners were satisfied that any inaccuracies which had occurred arose from the fact that dispensing had been carried on by unqualified men and boys who had not been apprenticed to a registered chemist and druggist; whether in all such cases of inaccurate dispensing the registered chemist who was responsible in law would be struck off the panel of insurance dispensers; and whether, in view of the danger arising from the fact of inaccurate dispensing, a Committee of Inquiry would be set up to go into the whole matter and report with recommendations to remove the danger. Mr. C. Roberts said that the particulars asked for in the first part of the question were not available, but he had no reason to suspect the existence of any circumstances which called for such an inquiry as was suggested. He would, however, be happy to make inquiries in any specific case brought to his notice.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following notifications are announced by the Admiralty: Fleet Surgeons P. L. Williams, G. Ley to the *Victoria*, additional; J. F. Hall, M.B., to R.M. Division, Portsmouth, vice Strickland; P. G. Williams to the *Field*, additional. Surgeons W. F. Beattie, M.B., and R. F. Quinlan, to the *Victoria*, additional; G. W. Foot to the *President*, additional; D. G. Arthur to the *Field*, additional. Temporary Surgeons R. St. L. Brockman, W. Lowell, to the *Victoria*, additional; A. Viney to the *Field*, additional, for Plymouth Temporary Hospital; T. Wyndham to the *Field*, additional; R. B. Smith, M.B., F.R.C.S.F., to the Hospital Ship *Reva*; B. Lewitt to the *Ganges*, additional, for Shotley sick Quarters, vice Walker.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeons W. J. Gettard, M.B., to the *Impervise*, vice Carr; A. G. V. Elder to the Hospital Yacht *Liberty*. To be Surgeon Probationers for temporary service: B. S. Collins, F. Hessey-Anderson, W. H. Jones, N. Braithwaite, G. E. Bickett.

ARMY MEDICAL SERVICE.

Temporary Colonel Charles J. Synnott, M.D., F.R.C.S., from R.A.M.C. to be temporary Colonel.

The following officers of the Royal Army Medical Corps (T.F.) to be temporary Colonels: Major A. H. Tabbly, M.B., F.R.C.S., Captain V. W. Low, M.D., F.R.C.S., Captain J. P. Stewart, M.D., F.R.C.P., Lieutenant-Colonel (local Colonel) R. B. Sleeman, M.D., R.A.M.C. (T.F.) to be temporary Colonel whilst employed as Deputy Director of Medical Services at Malta.

ROYAL ARMY MEDICAL CORPS.

Captain Sir Victor A. H. Hornley, R.A.M.C. (T.F.), to be Major. Captain T. C. English, M.B., F.R.C.S., R.A.M.C. (T.F.), to be temporary Lieutenant-Colonel. E. F. Elliot, F.R.C.S.E., is granted temporarily the honorary rank of Major. Captain C. S. Myers, M.D., to be temporary Major. B. T. Edye, M.B., to be temporary Captain whilst serving with the Australian Hospital. B. Z. Myers, M.B., to be temporary Major whilst serving with the New Zealand Auxiliary Hospital. To be temporary Captains: J. W. Beattie, M.D., temporary Lieutenant Harold Wilton, M.D., temporary Lieutenant T. Kay, M.B., Major, R.A.M.C. (T.F.), to be temporary Major. Temporary Lieutenant V. P. Foote relinquishes his commission on account of ill health. Lieutenant R. R. Scott, M.B., Canadian A.M.C., to be temporary Lieutenant.

Non-commissioned officers and men of the Canadian Army Medical Corps to be temporary Lieutenants: Corporal E. LaSopola, M.B.; Staff Sergeant O. P. Laing, M.B.; Sergeants R. S. Armour, M.B., P. B. ...

To be temporary Lieutenants: J. R. White, M.B., J. J. Brown, M.B., F. R. ... To be temporary Lieutenants: J. R. White, M.B., J. J. Brown, M.B., F. R. ...

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS. Lieutenants on probation confirmed in their rank: J. H. Bayley, A. E. Richmond, R. R. Thompson, D. W. J. Andrews, I. C. Mackay. ...

INDIAN MEDICAL SERVICE.

The services of Captain W. C. Gray, M.B., I.M.S., are placed permanently at the disposal of the Government of Madras, with effect from April 1915. ...

TERRITORIAL FORCE.

ARMY MEDICAL SERVICE. Lieutenant-Colonel D. L. Hamilton, F.R.C.S., from 2nd Home Counties Field Ambulance. ...

ROYAL ARMY MEDICAL CORPS.

1st Southern General Hospital.—A. Radford, M.B., to be Lieutenant. 2nd Southern General Hospital.—Captain E. W. S. Rowland is exempted for duty at Reading War Hospital. ...

1st West Riding Field Ambulance.—T. J. Mills to be Lieut. capt. 2nd West Riding Field Ambulance.—A. G. Hieblichwaite to be Lieutenant. 1st Northern General Hospital.—T. S. P. Finkelson, M.B., to be Lieutenant. ...

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

IN ninety-six of the largest English towns, 3,623 births and 4,297 deaths were registered during the week ended Saturday, June 19th. The annual rate of mortality in these towns, which had been 13.7, 13.9, and 14.0 in the three preceding weeks, further fell to 12.4 per 1,000 in the week under notice. ...

HEALTH OF SCOTTISH TOWNS.

IN the sixteen largest Scottish towns 1,122 births and 707 deaths were registered during the week ended Saturday, June 19th. The annual rate of mortality in these towns, which had been 18.2, 18.9, and 17.9 per 1,000 in the three preceding weeks, further fell to 15.4 per 1,000 in the week under notice. ...

HEALTH OF IRISH TOWNS.

DURING the week ending Saturday, June 12th, 536 births and 357 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 618 births and 396 deaths in the preceding period. These figures represent a mortality of 15.4 per 1,000 of the aggregate population in the districts in question, as against 17.0 per 1,000 in the previous period. ...

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notice re Appointments) appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

ASHTON UNDER-LYNE UNION.—Resident Assistant Medical Officer for the Workhouse. Salary, £150 per annum.

BIRMINGHAM AND MIDLAND EYE HOSPITAL.—Junior House-Surgeon. Salary, £100 per annum, and £5 laundry allowance.

BIRMINGHAM GENERAL DISPENSARY.—Resident Medical Officer. Salary, £250 per annum.

Bristol: COSSHAM HOSPITAL, Kingswood.—Surgeon. Salary, £150 per annum.

Bristol GENERAL HOSPITAL.—House-Physician. Salary, £150 per annum.

Bristol, ROYAL INFIRMARY.—Assistant to the Ear, Throat, and Nose Department.

BURY INFIRMARY.—Senior and Junior House-Surgeons. Salary, £175 and £150 per annum respectively.

CHELTENHAM EDUCATION COMMITTEE.—Assistant Medical Officer of Health and School Medical Officer. Salary, £300 per annum, rising to £350.

CHESTER: COUNTY ASYLUM.—Third Assistant Medical Officer. Salary, £200 per annum.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park.—Tubercle Officer. Salary, £500 per annum.

CRODON MENTAL HOSPITAL, Upper Warrington.—Second Assistant Medical Officer. Salary, £250 per annum, rising to £300.

DUNDEE COMBINATION POORHOUSE AND HOSPITAL.—Resident Medical Officer. Salary, £200 per annum, rising to £300.

DURHAM COUNTY HOSPITAL.—House-Surgeon. Salary, £150 per annum.

FOLKESTONE: ROYAL VICTORIA HOSPITAL.—House-Surgeon.

GUILDFORD: ROYAL SURREY COUNTY HOSPITAL.—House-Surgeon. Salary, £150 per annum.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brighton, S.W.—House-Physician. Honorarium, 30 guineas for six months.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.—(1) House-Surgeon; (2) Assistant Clinical Medical Officer. Salary, £50 for six months and £2 10s. weekly afterwards.

LEAMINGTON SPA: WARNEFORD, LEAMINGTON, AND SOUTH WARWICKSHIRE GENERAL HOSPITAL.—Second Resident Medical Officer. Salary, £250 per annum.

LONDON SCHOOL OF MEDICINE FOR WOMEN, Hunter Street, W.C.—Part-time Demonstrator in Anatomy.

MACEFELD GENERAL INFIRMARY.—House-Surgeon. Salary, £150 per annum.

MANCHESTER: COUNTY ASYLUM, Prestwich.—Assistant Medical Officer. Salary, £250 per annum, rising to £300, and upon promotion to £350.

MANCHESTER HOSPITAL FOR CONSUMPTION AND DISEASES OF THE THROAT AND CHEST.—Resident Medical Officer for In-patient Department, Lowgate. Salary, £250 per annum.

MANCHESTER: NORTH LANCASHIRE HOSPITAL FOR WOMEN AND CHILDREN.—House-Surgeon. Salary, £120 per annum.

MARGATE: ROYAL SEA-BATHING HOSPITAL.—(1) Resident Surgeon; (2) Non-resident Surgeon (female). Salary at the rate of £150 and £250 per annum for first six months, rising to £200 and £300 respectively.

MIDDLESEX HOSPITAL MEDICAL SCHOOL.—(1) Senior Demonstrator of Anatomy. Salary, £103 1s. annum; (2) Additional Demonstrator for the Physiological Department.

NATIONAL HOSPITAL FOR DISEASES OF THE HEART, Westmead Street, W.—(1) Resident Medical Officer; (2) Laboratory Assistant. Salary, £85 and £100 per annum respectively.

NOTTINGHAM GENERAL HOSPITAL.—Senior House-Physician. Salary, £300 per annum.

PLYMOUTH: SOUTH DEVON AND EAST CORNWALL HOSPITAL.—(1) House-Surgeon; (2) House-Physician. Salary, £250 and £240 per annum respectively.

PUTNEY HOSPITAL, Putney Common, S.W.—Resident Medical Officer. Salary, £150 per annum.

QUEEN CHARLOTTE'S LINGEN HOSPITAL, Marylebone Road, N.W.—District Resident Medical Officer. Salary at the rate of £50 p.a. annum.

ROCHESTER: ST. BARTHOLOMEW'S HOSPITAL.—Resident Assistant House-Surgeon. Salary, £140 per annum.

ROTHAMPTON HOSPITAL AND DISPENSARY.—Junior House-Surgeon. Salary, £125 per annum.

ST. PAUL'S HOSPITAL FOR SKIN AND GENITO-URINARY DISEASES, Red Lion Square, W.C.—(1) Honorary Assistant Surgeon; (2) Clinical Assistant.

SALISBURY GENERAL INFIRMARY.—(1) House-Surgeon; (2) Assistant House-Surgeon. Salary, £150 and £100 per annum respectively.

ECARBOROUGH HOSPITAL AND DISPENSARY.—Senior and Junior House-Surgeons. Salary, £100 and £80 per annum respectively.

SHEFFIELD ROYAL INFIRMARY.—(1) House Surgeon; (2) Assistant House-Physician. Salary, £100 per annum.

SHEFFIELD: WHARNCLEIFE WAR HOSPITAL.—Resident Medical Officers.

STAFFORDSHIRE GENERAL INFIRMARY, Stafford.—House-Surgeon. Salary, £250 per annum.

STOKE-ON-TRENT: NORTH STAFFORDSHIRE INFIRMARY, Hartshill.—(1) Two House-Surgeons; (2) House-Physician. Salary, £200 per annum each.

SUNDERLAND ROYAL INFIRMARY.—Resident Medical Officer. Salary, £150 per annum.

SWANSEA GENERAL AND EYE HOSPITAL.—House-Physician. Salary, £200 per annum.

VENTNOR: ROYAL NATIONAL HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST.—Assistant Resident Medical Officer.

WALSALL AND DISTRICT HOSPITAL.—Assistant House-Surgeon and Anaesthetist. Salary, £150 per annum.

WARRINGTON COUNTY BOROUGH.—Assistant Medical Officer of Health (temporary). Salary, £300 per annum.

WARRINGTON INFIRMARY AND DISPENSARY.—Senior House-Surgeon. Salary, £200 per annum.

WEST BROMWICH AND DISTRICT HOSPITAL.—(1) House-Surgeon; (2) Assistant House-Surgeon. Salary, £150 and £120 per annum respectively.

WEST HAM AND EASTERN GENERAL HOSPITAL, Stratford.—(1) Resident Medical Officer; (2) House-Physician and House-Surgeons. Salary for (1) £160 per annum, and for (2) £120 and £100 per annum respectively.

WEST RIDING ASYLUM, Menston.—Temporary Assistant Medical Officer.

WIGAN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Junior House-Surgeon. Salary, £150 per annum.

CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointments: Hanley, Yorkshire (West Riding); Normanston, Yorkshire (West Riding); Rufford, Essex.

To enquire into this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

BALLANTYNE, Arthur J., M.D. Honorary Consulting Ophthalmic Surgeon, Glasgow Royal Maternity and Women's Hospital.

BARRIS, W. M., M.D., Darb. Medical Officer of Health to the Houghton-Spring Urban District Council, vice D. B. Park, F.R.C.S.E., resigned.

BARRY, W. J. M., M.D., Darb. F.R.C.P.E., Consulting Physician to the Royal Hamadryad Seaman's Hospital, Cardiff, vice Dr. W. T. Edwards, deceased.

BOREHAM, H. W., M.B., Ch.B., Edin., School Oculist to the County of Somerset.

CRICHTON, J. S., M.B., Ch.B., Edin., Assistant Medical Officer of the Swansea Union.

DAVISON, Miss G. E., M.B., Ch.B. Non-resident House Surgeon to the City of Edinburgh, Edinburgh Royal Infirmary.

DECKETT, A. H., M.B., Ch.B., Aberd., Medical Officer of the Workhouse and Children's Homes of the Bath Union.

HAYNES, V. F., L.R.C.P. Lond., Medical Officer of the Cottage Homes of the Woburn Stafford Union.

IGOROV, E. C. B., M.D., Lond., Certifying Factory Surgeon for the Corbis District Co. Merioneth.

JONES, W. B., M.D., Medical Officer of Health to the Bulth Wells Urban District Council.

PROCEEDINGS OF COUNCIL.

A MEETING of the Council was held at 429, Strand, W.C., on Wednesday, June 30th, 1915.

Present:

Dr. J. A. MACDONALD, LL.D., Taunton, Chairman of Council, in the Chair.

Dr. W. AINSLIE HOLLIS, Hove, Past President.

Mr. T. JENNER VERRALL, LL.D., Bath, Chairman of Representative Meetings,

Dr. EDWIN RAYNER, Stockport, Treasurer.

Dr. JOHN ADAMS, Glasgow Mr. JAMES GREEN, Portsmouth

Lieutenant-Colonel Sir JAMES Dr. MAJOR GREENWOOD, London

BARR, M.D., LL.D., Liverpool Mr. RICHARD HARDING, New

Surgeon-General P. H. BENSON, Radnor

I.M.S., Walmer, Kent (Indian Captain F. CHARLES LARKIN, Liverpool)

Dr. M. G. BIGGS, London Major ALBERT LUCAS, Birmingham

Dr. H. B. BRACKENBURY, London Dr. H. C. MACTIER, Wolverhampton

Dr. CHARLES BUTTAR, London Colonel C. H. MILBURN, D.L., Lurgan, Hull

Dr. J. SINGLETON DAELING, Lurgan Captain J. E. MOORHOUSE, Stirling

Dr. DAVID EWART, Chichester Major GEORGE PARKER, Bristol

Lieutenant E. ROWLAND Dr. A. TENNYSON SMITH, Orpington

FOTHERGILL, Hove Captain F. J. SMITH, London

Dr. ADAM FULTON, Basford Dr. W. JOHNSON SMYTH, Bournemouth

Major JAMES GALLOWAY, London Mr. E. B. TURNER, London

Mr. T. W. H. GARSTANG, Altrincham Dr. DENIS WALSHÉ, Graigue

Dr. THOMAS A. GOODFELLOW, Manchester Dr. O. R. M. WOOD, Woolpit

Dr. JOHN GORDON, Aberdeen

APOLOGIES.

Letters of apology for non-attendance, owing to military and other duties, were received from Dr. H. J. Campbell, Major T. Duncan Greenlees, Lieutenant-Colonel R. I. D. Hackett, Dr. J. R. Hamilton, Major R. Wallace Henry, Colonel W. T. Johnston, Mr. R. J. Johnstone, Lieutenant-Colonel J. Munro Moir, Dr. H. F. Oldham, and Major David F. Todd.

RESIGNATION.

Sir James Porter, K.C.B., the Representative of the Royal Navy Medical Service on the Council, has been compelled to resign on account of war duties in connexion with the Admiralty. The resignation was accepted with much regret.

ROLL OF HONOUR.

The Council considered and approved a recommendation from the Metropolitan Counties Branch to institute a "Roll of Honour of the British Medical Association" to include the names of those members who have died on active service, the names to be placed in a suitable position set apart in the head quarters of the Association.

FINANCE.

QUARTERLY ACCOUNTS.

The accounts for the period April 1st to June 4th, 1915, amounting to £9,429 7s. 3d., were received and approved.

ORGANIZATION COMMITTEE.

GROUPING OF HOME CONSTITUENCIES FOR ELECTION OF TWELVE MEMBERS OF COUNCIL, 1915-16.

In pursuance of the authority conferred by Minute 91 of the Annual Representative Meeting, 1914, the Council has grouped the Home Constituencies for election of twelve members of Council, 1915-16, in the same manner as for 1914-15, the Constituency formed of the Divisions of the new Wiltshire Branch being included in the group of Constituencies comprised in the South-Western group of Branches (SUPPLEMENT, May 8th, 1915, p. 201).

GRANTS TO BRANCHES FOR 1915.

Grants for 1915 were made as follows, provided that in each case a report for 1914 satisfactory to the Grants Subcommittee had first been received:

	Per Head on Annual List.	Total.
	£ s. d.	£ s. d.
East York and North Lincoln	2s. ...	13 12 0
Midland	1s. ...	29 15 0
Sussex	1s. ...	17 15 0
Stirling	4s. ...	14 3 0
Wiltshire (further grant)...	2s. ...	9 0 0

No grant for 1915 was made to the West Somerset Branch, that Branch having had in its possession, as at December, 31st, 1914, a balance equivalent to nearly 5s. per head of its membership.

JOURNAL COMMITTEE.

ANNUAL MEETING SECTIONAL ARRANGEMENTS.

The Memorandum of Duties of Officers of Sections is to be revised so as to include the following amendments:

1. That in order to secure continuity one of the Secretaries of each Section be continued in office for a second year.
2. That the Programme of the Sections be settled by the officers of the respective Sections at the earliest date convenient and published in the JOURNAL.
3. That the circulars at present issued from this office to Honorary Secretaries, for the purpose of asking individuals to take part in the discussions and to contribute papers to be read in the Sections, be discontinued.
4. That the speech opening the discussion be limited to thirty minutes.
5. That officers of Sections be informed that the regulations must be strictly adhered to.

SCIENCE COMMITTEE.

MIDDLEMORE PRIZE.

The Middlemore Prize, founded by the late Richard Middlemore of Birmingham, was awarded for 1915 to R. Foster Moore, M.A., B.C., F.R.C.S., for his essay on

"The Pathology of the Affections of the Retina met with in connexion with Disease of the Kidneys."

CENTRAL ETHICAL COMMITTEE.

CASES UNDER ARTICLES 10 AND 11.

Having received a special report from the Central Ethical Committee with regard to representations of a Division with reference to two members of the Association, the Council resolved that the two members in question should be expelled from membership of the Association.

MEDICO-POLITICAL COMMITTEE.

ALLOCATION OF VARIOUS DUTIES BETWEEN THE SCHOOL MEDICAL STAFF, TEACHERS, AND NURSES.

The Memorandum (*see* Appendix XXI to Supplementary Report of Council, SUPPLEMENT, July 3rd) on the allocation of various duties of the school medical staff, teachers, and nurses in connexion with medical inspection and treatment of school children respectively was approved for presentation to the Representative Body.

It was decided to circulate copies of the Memorandum to school medical officers, and to any member of the Association making application for advice on any of the points mentioned, with an intimation that the Memorandum is the considered opinion of both bodies, but to defer such circulation until after the Annual Representative Meeting, 1915.

MEDICAL AID INSTITUTES.

The CHAIRMAN of the Committee reported that a conference with representatives of the Friendly Societies' Medical Alliance and the South Wales and Monmouthshire Alliance of Medical Societies had been arranged for Friday, July 9th.

CENTRAL NURSING COUNCIL FOR LONDON.

Mr. E. B. TURNER, representative of the Council on the Central Nursing Council for London, stated that the report of the latter body would shortly be published, when he would bring it before the Council.

CONFERENCE OF REPRESENTATIVES OF LOCAL MEDICAL AND PANEL COMMITTEES.

The Insurance Act Committee was authorized to consider the resolutions of the Conference of Local Medical and Panel Committees, to take what action thereon it considers necessary, and to report, with recommendations, on behalf of the Council to the Representative Body.

AWARD OF GOLD MEDAL FOR DISTINGUISHED MERIT.

The Council by a unanimous vote decided to present the Gold Medal of the Association to Captain Arthur Martin-Leake, V.C., F.R.C.S., R.A.M.C., for his most conspicuous bravery and devotion to duty throughout the war, especially during the period October 29th to November 8th, 1914, near Zonnebeke, in rescuing, whilst exposed to constant fire, a large number of wounded who were lying close to the enemy's trenches.

NEW MEMBERS OF ASSOCIATION.

Four candidates whose names had been circulated on the notice convening the meeting were elected members of the British Medical Association.

ELECTION OF COUNCIL, SESSION 1915-16.

The CHAIRMAN reported the election of the 1915-16 Council as follows:

Professor R. A. BOLAM, M.D., North of England, and North Lancashire and South Westmorland Branches.

Dr. H. J. CAMPBELL, Yorkshire Branch.

Dr. T. A. GODFELLOW, Mr. F. C. LARKIN, Lancashire and Cheshire Branch.

Dr. ADAM FULTON, East York and North Lincoln, and Midland Branches.

Dr. O. R. M. WOOD, Cambridge and Huntingdon, East Anglian, and South Midland Branches.

Mr. ALBERT LUCAS, Birmingham and Staffordshire Branches.

Mr. W. F. BROOK, North Wales, Shropshire and Mid-Wales and South Wales and Monmouthshire Branches.

Dr. F. J. SMITH, Dr. JAMES GALLOWAY, Dr. MAJOR GREENWOOD, Mr. H. B. BRACKENBURY, Metropolitan Counties Branch.

Dr. GEORGE PARKER, Bath and Bristol, Gloucestershire, West Somerset, and Worcestershire and Herefordshire Branches.

Dr. W. JOHNSON SMITH, Dorset and West Hants, and South-Western Branches.

Mr. JAMES GREENE, Oxford and Reading, and Southern Branches.

Dr. A. TENNYSON SMITH, Kent, Surrey, and Sussex Branches.

Scotland.

Dr. JOHN GORDON, Aberdeen, Northern Counties, Dundee, and Perth Branches.

Dr. J. R. HAMILTON, Edinburgh and Fife Branches.

Dr. JOHN ADAMS, Glasgow and West of Scotland Branch (four City Divisions).

Dr. J. LIVINGSTONE LOUDON, Glasgow and West of Scotland, five County Divisions, Border Counties, and Stirling Branches.

Ireland.

Dr. DENIS WALSH, Connaught, and South-Eastern of Ireland Branches.

Professor ARTHUR HAMILTON WHITE, Leinster Branch.

Dr. J. J. GIBSON, Munster Branch.

Mr. R. J. JOHNSTONE, Ulster Branch.

Dominions Returns.

Dr. C. J. MARTIN, F.R.S., New South Wales and Queensland Branches.

Dr. DAVID EWART, New Zealand Branch.

Dr. G. S. SYME, South Australian, Tasmanian, Victorian, and Western Australian Branches.

Dr. T. DUNCAN GREENLEES, South African, etc., Group of Branches.

A considerable part of the business of the Council is embodied in the Supplementary Report of Council to the Representative Body, published in the SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL of July 3rd.

Meetings of Branches and Divisions.

METROPOLITAN COUNTIES BRANCH.

The sixty-third annual meeting of the Branch was held on June 25th at the offices of the Association, 429, Strand, when Dr. F. J. SMITH, President, was in the chair.

Election of Officers.—Dr. PERCIVAL BARNES, the Chairman of the Organization Committee—the Committee which carried out the scrutiny of the vote—reported that a contest had taken place for the election of four vice-presidents and an honorary treasurer. Dr. R. E. CROSSE, Honorary Secretary, reported that there had been no contests for the other offices, and declared the following to be the officers of the Branch for the year 1915-16:

President: Dr. Major Greenwood.

President-elect: Atwood Thorne, Esq.

Past-President: Dr. F. J. Smith.

Vice-Presidents: Dr. Francis John Allan, William McAdam Eccles, Esq., M.S., F.R.C.S., Dr. James Galloway, Dr. Joseph William Hunt.

Honorary Treasurer: H. Betham Robinson, Esq., M.S., F.R.C.S.

Honorary Secretaries: Dr. R. E. Crosse, 68, Nightingale Lane, Wandsworth Common, S.W.; N. Bishop Harman, Esq., F.R.C.S., 108, Harley Street, W.

Representatives on the Central Council: H. B. Brackenbury, Esq., 21, Overmore Road, Strand, Green, N.; Dr. James Galloway, 54, Harley Street, W.; Dr. F. J. Smith, 158, Harley Street, W.

On the motion of Dr. LANGDON-DOWN, seconded by Mr. H. BETHAM ROBINSON, it was resolved:

That it be referred to the Organization Committee to consider the question of the desirability of drafting a rule of the Branch requiring that the candidate's sanction to be nominated be first obtained.

Annual Report.—The annual report for the year 1914-15 and the balance sheet for the year ended December 31st, 1914, were adopted. Dr. BRACKENBURY criticized the report of the representatives on the Central Council, and pointed out certain shortcomings. The PRESIDENT admitted the force of the criticism, and it was agreed that attention should be given to the matter in future reports.

Alteration of Rule.—The following alteration of Rule 196 by the insertion of the words "and adopt (with or without amendment)" after the words "to receive" was agreed to, so that the rule now reads as follows:

19. In addition to the ordinary business of any ordinary general meeting, the business of the annual meeting shall be: (a) to receive the report of the election of new officers; (b) to receive and adopt (with or without amendment) the annual report of the Council on the affairs of the Branch, and the annual financial statement; (c) to receive the annual report of the Representatives of the Branch on the Central Council of the Association; (d) to make new rules or alter or repeal existing rules.

Induction of President.—Dr. F. J. SMITH, in introducing his successor, Dr. Major Greenwood, expressed his thanks for the kindly manner in which they had accepted his somewhat despotic rulings during the past year. He had not had any of them, so far as he knew, seriously disputed, and he was obliged for the forbearance shown him. The war had taken their attention to such an extent that it was impossible to throw the mind as thoroughly into the work of the Branch as was desirable, although he was pleased to say that the routine work had not been neglected, but had been satisfactorily carried out. On account of the events which overshadowed everything else—the war—he had not been able to devote that interest to the work of his office which he otherwise would have done. In conclusion, he trusted that the members would extend the same kindness and generosity to his successor in the chair, Dr. Major Greenwood, as they had shown him. Dr. MAJOR GREENWOOD thereupon took the chair, and, on the motion of Mr. BETHAM ROBINSON, a vote of thanks was accorded to Dr. F. J. Smith for the manner in which he had discharged the duties of his office during the past year. Dr. SMITH briefly returned thanks. Dr. MAJOR GREENWOOD thereupon read his presidential address, entitled "Side Lights on the Practice of Medicine in the Past from Early English Literature." Dr. F. J. SMITH proposed a hearty vote of thanks to the President for his able and interesting address, and Dr. CLIPPINGDALE, in seconding, said that there could be no mystery as to the origin of medicine, as the whole subject was easily divided into two stages—one, the period at which universities were founded and gave medical degrees; the other, the period during which the monks paid special attention to physic. It was well known that William the Conqueror died of dropsy and was attended by two abbots. The physicians who attended our early sovereigns were always rewarded with livings, an instance of which was Linacre, who was presented with seven livings. The PRESIDENT returned thanks.

CITY DIVISION.

A MEETING of the City Division was held on June 28th, when Dr. DUBNO was in the chair.

Fees for Life Insurance.—The Council's report of fees for life insurance was fully discussed and the following resolutions adopted:

That the fee of £1 ls. recommended in Appendix A be accepted, with a rider that when an amount insured exceeded £1,000 fee should be £2 2s.

That the minimum fee for reports in Appendix B should be 10s. 6d.

That in Appendix C the minimum fee should be fixed at 2s. 6d.

Direct Representative on the General Medical Council.—On the motion of Dr. GREENWOOD, seconded by Dr. J. W. HUNT, the Division decided to support Dr. J. A. Macdonald as Direct Representative on the General Medical Council.

Corporation of London Tuberculosis Scheme.—The papers relating to the Corporation of London Tuberculosis Scheme were directed to be forwarded to the Medical Secretary, with the request that the Central Body would take action.

NORTH OF ENGLAND BRANCH:

NEWCASTLE-UPON-TYNE DIVISION.

THE twelfth annual meeting of the Newcastle-upon-Tyne Division was held at the Royal Victoria Infirmary, Newcastle-upon-Tyne, on June 23rd. For the purpose of electing Representatives and Deputy Representatives for the Annual Representative Meeting, this meeting was held in conjunction with the Hexham Division.

Annual Report.—The annual report and balance-sheet for 1914 were read and confirmed. The report stated that no winter scientific meetings, for the organization of which the Division has been largely responsible in the past, had been held during the session 1914-15. Dr. J. L. Wilson had resigned his position as Honorary Secretary in October, 1914, and had been succeeded by Mr. David Ranken. During the year 1914 the Executive Committee of the Division had very largely increased responsibilities owing to the entirely new circumstances brought about by the war. A scheme for the attendance on dependants of soldiers and sailors with the colours was submitted to the Lord Mayor's Relief Fund Committee, and has been in full swing

for many months. At the suggestion of the Executive Committee a scheme for a motor ambulance for military service was promoted among the doctors in the Division. The sum of £500 was raised, and the motor ambulance is being temporarily lent to the 1st Northern General Hospital. A War Emergency Committee has been formed and through its exertions a list has been supplied to the War Office of those willing to do whole-time and part-time service or to carry on the practices of those called to the colours. This list has already been exceedingly useful, as by its means the Northumberland War Hospital has been largely staffed. In July of 1914 the Division, in conjunction with the Panel Committee, agreed to rent and furnish the premises at 25, Ridley Place, at which all meetings were now regularly held and which has been of inestimable service for many and varied purposes from the very beginning.

Election of Officers.—In view of the special circumstances of this year, all officials for last year were re-elected. Dr. Ruddock was appointed to the Executive Committee in place of Dr. Farquharson, deceased.

Annual Representative Meeting.—The Representatives and Deputy Representatives were then instructed as regards the business of the Annual Representative Meeting.

PERTH BRANCH.

THE summer meeting of the Branch was held on June 29th, and the following were the appointments of officers for the ensuing year:

President: John Hume, M.D., D.P.H., Perth.

Vice-President: James Gairdner, M.D., D.P.H., Crieff.

Honorary Secretary: John H. Lyell, M.D., Perth.

Honorary Treasurer: Dr. John Hume, Perth.

Representative to Annual Meeting: Dr. Trotter (Perth).

Deputy Representative: Dr. Lyell.

Branch Council: Drs. Bisset, Menzies, Dods Brown (Perth); Dr. Edwards (Bridge of Earn), Dr. Burgess (Stanley), Dr. Trotter (co-opted as Secretary of Panel Committee).

Annual Representative Meeting.—The matters referred to Divisions were discussed by the members, and the Representative instructed in regard to voting thereon at the Representative Meeting.

SOUTH MIDLAND BRANCH:

BEDFORDSHIRE DIVISION.

THE annual meeting of the Bedfordshire Division was held at Bedford on June 8th, when Dr. KILHAM ROBERTS was in the chair.

Election of Officers.—The following officers were elected for the ensuing year:

Chairman: Dr. G. H. Goldsmith.

Vice-Chairman: Dr. Waugh.

Honorary Secretary and Treasurer: Dr. Birks.

Representative: Dr. J. W. Bone.

Representatives on Branch Council: Drs. Milburn, Dixon, Pollard, and L. G. Nash.

Executive Committee: Drs. Butters, W. A. Sharpin, S. J. Ross, and F. S. Lloyd, and *ex officio* members.

Annual Report.—The annual report was adopted.

Bullet Wounds of Bones.—Sir JOHN BLAND-SUTTON read a paper entitled "Bullet Wounds of Bones."

Annual Representative Meeting.—The Representative was duly instructed for the Representative Meeting.

Insurance Act Resignations.—It was resolved that members who had resigned membership in connexion with the Insurance Act should be invited to rejoin.

Roll of Honour.—It was resolved that the names of the members of the Division who had joined His Majesty's Forces should be inscribed on a roll of honour.

Votes of Thanks.—Votes of thanks were passed to Dr. Kilham Roberts for his services as chairman for the past year and for his entertainment of the Division to luncheon before the meeting, and to Sir John Bland-Sutton for his most interesting paper.

SOUTH WALES AND MONMOUTHSHIRE DIVISION:

SOUTH-WEST WALES DIVISION.

THE annual meeting of the Division was held at Carmarthen on July 1st, when Dr. D. PHILLIPS was in the chair.

Annual Report.—The annual report of the Executive Committee was read and approved.

Election of Officers.—The following were elected:*Chairman:* Dr. Samuel Williams (Llanelli).*Chairman-elect:* Dr. Joshua Powell (Newcastle Emlyn).*Honorary Secretary and Treasurer:* Dr. D. R. Price (Ammanford), re-elected.*Representative:* Dr. Richard Hopkin (Llangadoc).
Executive Committee: Drs. T. Morgan, Owen Williams, Captain C. D. Mathias, R. Hopkin, Colonel Evan Evans (Llanelli), Lieutenant Evan Evans (Lampeter), J. Edgar, P. Davies, E. R. Williams, C. A. Brigstocke, T. J. Jenkins, D. G. Lloyd, D. Lewis Williams, and D. M. Davies.*Members of Branch Council:* Drs. Evan Jones, Y. H. Mills, and H. H. Roberts.*Members of Contract Practice Committee:* Drs. J. E. P. Davies, T. Morgan, and Owen Williams.*Direct Representative on the General Medical Council.*—It was recommended to support Dr. J. A. Macdonald as a Direct Representative on the General Medical Council.*Annual Representative Meeting.*—It was agreed that the Representative should use his discretion with regard to the business of the Annual Representative Meeting.*Conference of Local Medical and Panel Committees.*—Dr. C. A. BRIGSTOCKE gave a report of the Conference of the Local Medical and Panel Committees held in London on June 16th.**SOUTH-WESTERN BRANCH.**

THE seventy-sixth annual meeting of the South-Western Branch was held at the Athenaeum, Plymouth, on June 29th, when Major WOOLCOMBE was in the chair.

Annual Report.—The Acting Secretary, Mr. S. M. ACKLAND, read the report of the Branch Council for 1914-15, which was adopted. It stated that the Council decided to recommend the postponement of the annual meeting at Exeter until 1916, and invited Major Woolcombe to continue to act as President for a second year. The Council also recommended that Mr. Ackland be asked to allow himself to be reappointed as President-elect. The strength of the Branch on April 30th was 419, against 479 in the previous year—a drop of 60; and there was no doubt that quite a large proportion of resignations were from medical men who had gone to serve with the army. The Council had to deplore the death of Mr. E. L. DONBAYAND, Secretary of the Plymouth Division. Renewed efforts had been made to obtain elective medical representation on the Committee of the County Nursing Association. Shortly after the outbreak of the war the Association was asked by the War Office to give its aid in preparing lists of medical men prepared to offer service either at home or abroad; and more recently the Director-General again approached the Association for assistance, and a strong County Committee was appointed, consisting of the Lord Lieutenant and other members of the County Council and the Branch officers of the Devonshire Divisions of the Association, to assist the Branch in carrying out the organization asked for by the Director-General. At the request of the Devon County Director V.A.D. it was decided to request members to forego during the war the ordinary fees for ambulance, Red Cross, and voluntary aid lectures, when the courses were authorized from the office of the County Director. Grants amounted to £95 16s., and expenses to £56 11s. 6d., but there were some sums due to Divisions still to be paid.*Votes of Thanks.*—The President was thanked for his services and for consenting to act for another year. A similar compliment was paid to the President-elect for continuing as such. Major Russell Coombe was re-elected Secretary and Treasurer with the best thanks of the Branch for his past services.*Organization Rules.*—The new organization rules were adopted.*Tea.*—At the conclusion of the meeting the members were entertained to tea by the President at 16, The Crescent.**ULSTER BRANCH:**

PORTADOWN AND WEST DOWN DIVISION.

THE annual meeting of the Portadown and West Down Division was held at Portadown on June 11th, when Dr. DEANE was in the chair.

Election of Officers.—The following office-bearers were elected:*Chairman:* Dr. T. B. Pedlow (Lurgan).*Vice-Chairmen:* Dr. Graves (Cookstown), and Dr. Dawson (Newton Hamilton).*Representatives on Branch Council:* Drs. Agnew, Taylor, and Marshall.*Honorary Secretary:* Dr. J. Singleton Darling.*Representative for Representative Meetings:* Dr. J. Singleton Darling.*Deputy Representative:* Dr. W. J. Dawson.*Executive and Ethical Committee:* The above, and Drs. Deane, Fergus, Flood, Hadden, Johnson, Lavery, Kerr, and Stuart.*The War Emergency.*—A discussion as to the need of medical men in the army elicited the fact that at least twenty-one gentlemen, almost all members or sons of members, from the Division area had joined since the outbreak of war, including the chairman and an ex-chairman.*Pituitary Extract.*—An interesting discussion on the use of pituitary extract was introduced by Drs. JOHNSON and BRISTOW, and taken part in by most of those present.*Specimens.*—Dr. DARLING showed a number of pathological specimens, and gave short notes of some cases.**YORKSHIRE BRANCH:**

WAKEFIELD, PONTEFRAC, AND CASTLEFORD DIVISION.

THE annual meeting of the Division was held at the Clayton Hospital, Wakefield, on June 25th, when Dr. A. THOMSON (Wakefield) presided.

Election of Officers.—A letter was read from the Chairman (Dr. Hillman), who had taken up a temporary commission in the R.A.M.C., resigning his position of chairman, but, in the circumstances, the resignation was not accepted; and, upon the motion of Dr. MAY, seconded by Dr. LISTER, the officers of last year were re-elected in a body for the ensuing year, with Mr. Wm. Stanger, F.R.C.S., as an extra Vice-Chairman.*The War Emergency.*—THE HONORARY SECRETARY presented a report of the meeting of the profession held at the County Hall, Wakefield, on April 23rd, which was addressed by Lieutenant-Colonel J. F. Dobson, F.R.C.S., Administrator of the Second Northern General Hospital, Leeds.*Insurance Act.*—On the motion of Dr. MAY, seconded by Dr. HERMON, it was resolved:

That the Honorary Secretary be directed to request the British Medical Association to secure from the Insurance Commissioners an advance copy of the Draft Regulations and Form of Practitioners' Agreement for next year in sufficient time to allow them to be discussed by the profession.

The following motion, by Dr. TWIST, seconded by Dr. LISTER, was carried:

That the British Medical Association be asked to circularize the profession as to the importance of joining, or remaining members of the Association, in view of the time of severe stress which is undoubtedly coming in the near future in connexion with the Insurance Act.

Free Medical Attendance of Dependents of Soldiers and Sailors.—The opinion was expressed that this privilege was being greatly abused in many cases, and upon the motion of Dr. HERMON, seconded by Dr. THOMSON, it was resolved:

That this Division is of opinion that the free medical attendance upon the dependants of men serving with His Majesty's Forces should be discontinued after July 31st next; and the British Medical Association should be requested to take such action as may be necessary to secure this step being taken generally throughout the country, and to find out whether the War Office is prepared to provide medical attendance for dependants or not.

Association Notices.**ANNUAL REPRESENTATIVE MEETING, 1915.****DATE OF MEETING.**

THE Annual Representative Meeting of the Association, 1915, will be held at the Connaught Rooms, Great Queen Street, London, W.C., on Friday, July 23rd, 1915, and following days as may be required.

By order,
ALFRED COX, Medical Secretary.

May 19th, 1915.

ANNUAL GENERAL MEETING.

NOTICE is hereby given by the Council that the Annual General Meeting of the British Medical Association will be held at the Connaught Rooms, Great Queen Street, London, W.C., on Saturday, the 24th day of July, 1915, at 2 o'clock in the afternoon.

Dated this 22nd day of June, 1915.

By order,

GUY ELLISTON,

Financial Secretary and Business Manager.

429, Strand, London, W.C.

**ALTERATION OF ARTICLES OF ASSOCIATION:
EXTRAORDINARY GENERAL MEETING.**

NOTICE is hereby given by the Council that an Extraordinary General Meeting of the British Medical Association will be held at the Connaught Rooms, Great Queen Street, London, W.C., on Saturday, the 24th day of July, 1915, immediately after the conclusion of the Annual General Meeting of the same Association, called for 2 o'clock in the afternoon of that day, when the subjoined Resolutions will be proposed as Extraordinary Resolutions:

1. That Articles 3, 43 and 44, and the words "whether an existing Member or a future Member" in Article 9, be cancelled.
2. That in Article 4 there be inserted immediately after the word "Acts" the words following—"and any Medical Practitioner who does not reside within the area of any Branch of the Association and who though not so registered is possessed of any of the qualifications described in Schedule (A) of the Medical Act, 1858."
3. That in Heading III immediately after Article 11 the word "and" be substituted for the word "or."
4. That in Article 28 the last six words be altered so as to read "provisions as to Referendum herein-after contained."

Should the above Resolutions or any of them be passed by the requisite majority the same will be submitted for confirmation as Special Resolutions or a Special Resolution to a further Extraordinary General Meeting, and such Meeting will be held at the Head Office of the Association, No. 429, Strand, London, W.C., on Wednesday, the 11th day of August, 1915, at 2 o'clock in the afternoon, for the purpose of considering and, if thought fit, confirming as Special Resolutions or a Special Resolution any of the above Resolutions set forth which shall have been so passed.

Dated this 22nd day of June, 1915.

By order,

GUY ELLISTON,

Financial Secretary and Business Manager.

429, Strand, London, W.C.

**ELECTION OF MEMBERS OF COUNCIL BY
GROUPED REPRESENTATIVES.**

NOTICE is hereby given that Nominations for Candidates for election of Members of Council by grouped Representatives for the year 1915-16 will be received by the Medical Secretary up to the end of the first hour of the proceedings of the Annual Representative Meeting on Friday, July 23rd, 1915. Each Nomination must be on the prescribed form, copies of which will be forwarded by the Medical Secretary on application.

Separate forms have been prepared: (I) For Nomination by a Division (through its Representative), and (II) for Nomination by a Representative of a Constituency included in the Group, and those applying are requested to state by which purpose the form is desired.

The voting papers will be issued at the Representative Meeting to each Representative or Deputy Representative of a Constituency in the United Kingdom in attendance at the Meeting.

By order of the Council,

ALFRED COX,

Medical Secretary.

June 30th, 1915.

**FREE MEDICAL ATTENDANCE FOR THE
DEPENDANTS OF SOLDIERS AND
SAILORS.**

At several recent meetings of Divisions of the Association dissatisfaction has been expressed at the loose way in which some of those to whom recommendations for free medical attendance upon the dependants of soldiers and sailors have been submitted have dealt with the cases. A committee appointed at the recent annual meeting of the Sheffield Division to discuss the matter had a conference with members of the local relief committee who admitted that there had been abuses, and expressed their willingness to assist the profession in remedying them. As the result of the deliberations the following are the terms agreed upon, and books are now issued in conformity with the terms set forth:

The conditions governing the provision of free medical treatment for dependants of soldiers and sailors have been revised, and an applicant must satisfy the Committee that the case comes within the following rules:

1. Wife without children or other dependants, and able to work. Medical book not to be issued.
2. Wife with one or two children. Medical book issued, provided total income from all sources does not exceed 24s. per week.
3. Wife with more than two children. Medical book issued, provided total income from all sources does not exceed 28s. per week.

Any case in which the foregoing rules debar the issue of a medical book but which appears to be of an exceptional nature, will be considered by a Special Committee.

Two doctors elected by the medical profession to be members of the Special Committee.

The Nuneaton branch of the Soldiers' and Sailors' Families Association has agreed to act upon the following rules decided upon by the medical practitioners in the town:

1. That the dependants of soldiers and sailors serving with His Majesty's Forces be divided into two classes—namely:
 - (a) Those unable to pay for medical treatment.
 - (b) Those able to pay.

That those in class (a) be treated under the scheme arranged by the British Medical Association with the Soldiers' and Sailors' Families Association, and that those in class (b) be treated as private patients.

(It was also decided that cards should only be issued on the request of the doctor and old cards renewed if the doctor shows he considers it is a case falling under class (a) by signing the request at the back.)

2. That the dependants of soldiers and sailors killed on active service falling under class (a) be attended until, and only until, the Government arranges the pension; when the dependant is in receipt of the pension all responsibility for gratuitous service ceases.

**LOCAL MEDICAL AND PANEL
COMMITTEES.****WEST RIDING OF YORKSHIRE.****LOCAL MEDICAL AND PANEL COMMITTEE.**

A MEETING of the West Riding Local Medical and Panel Committee was held at the County Hall, Wakefield, on June 11th, when Dr. MAY was in the chair.

Vacancy on Medical Service Subcommittee.—Dr. Steven was appointed on the Medical Service Subcommittee in place of Dr. Russell, resigned owing to military duties.

Conference of Local Medical and Panel Committees.—Dr. Fry was appointed to attend the Conference, to be held under the auspices of the British Medical Association at the Connaught Rooms, Great Queen Street, London, W.C., on Wednesday, June 16th.

New Edition of West Riding Formulary.—A further report of the Pharmacy Subcommittee containing its revised draft of the new edition of the Formulary was approved.

"Extravagant Prescribing."—It was decided to issue a circular letter to panel doctors on the alleged excessive prescribing, and a draft of the proposed circular, submitted by Dr. Fry on behalf of the Pharmacy Subcommittee, was approved.

Election of New Panel Committee.—The Committee was unanimous that the practitioners on the panel desired no election at the present time, but preferred the present Committee to continue in office during the period of the war, and it was decided to request the Commissioners to suspend the election to be held in June.

EAST SUSSEX.

LOCAL MEDICAL AND PANEL COMMITTEES.

A MEETING OF THE EAST SUSSEX LOCAL MEDICAL AND PANEL COMMITTEES WAS HELD ON JUNE 23RD.

Extension of Sanatorium Benefit.—It was reported that the Insurance Committee had adopted a recommendation that, as from July 1st, 1915, in exercise of the power conferred by Section 17 (1) of the National Insurance Act, 1911, tuberculosis (sanatorium) benefit should be extended to the undermentioned class of dependants of insured persons resident in the county, namely:

Such persons as the Insurance Committee shall ascertain to be wholly or in part dependent upon the earnings of any insured person, and as in the opinion of the Committee are at the date of application for benefit either disqualified for entry into insurance because they are under 16, or in a position to prove that since attaining that age they have spent their time in a school or college, in indentured apprenticeship or otherwise under instruction without wages, or otherwise in the completion of their education. And with a view to the provision of domiciliary treatment for dependants the scale of fees suggested by the British Medical Association in their model scheme for the treatment of tuberculosis was considered, and it was decided to submit the following scale to the Medical and Panel Committees for their consideration:

	s.	d.
(a) For full medical report (including consultation at the surgery or visit)	5	0
(b) Extra for first visit with consulting tuberculosis officer	2	6
(c) Continuous record (per quarter)	5	0
(d) Quarterly reports	5	0
(e) Attendance on patient at doctor's residence or surgery	2	0
(f) Visit at patient's home	2	6
(g) Night visit—that is, visit paid between 8 p.m. and 8 a.m. in response to call within these hours	5	0
(h) Special visit—that is, visit paid in response to call sent after 10 a.m. and before 8 p.m.	3	6
(i) Injection of vaccines (vaccines to be provided by Local Authority)	2	6
(j) Mileage—The fees in a, f, g and h to be increased by 20 per cent. for each visit paid to the residence of the patient—		

(1) Situate more than a quarter of a mile from a metalled road or in an exceptionally sparsely populated locality as defined by the Committee's mileage scheme; and

(2) In respect of each complete half-mile of the distance between the residence of insured person and the metalled road the general conditions contained in the Committee's mileage scheme to apply.

The scale of fees was referred to the Executive Committee for consideration.

IRELAND.

MEDICAL CERTIFIERS.

THE LOCAL GOVERNMENT BOARD (IRELAND) HAS REFUSED TO sanction doctors who hold appointments for large areas as medical certifiers under the Insurance Act in Ireland to act either in a temporary or permanent capacity as Poor Law medical officers, stating that they were not satisfied that doctors could discharge efficiently the double duties of medical certifier under the Insurance Act and Poor Law medical officer for a dispensary district—the latter in Ireland having a very extensive area. Considering that the Local Government Board had, both before and since the Insurance Act came into force in Ireland, refused to allow one dispensary doctor to do duty for another in an adjoining district for a few weeks' holiday in the summer, when sickness is at its lowest, much surprise and comment have been caused by the fact that they (the Local Government Board) did not take action in this matter earlier, as they must have recognized, from their experience, the physical impossibility of one doctor discharging at the same time the duties of Poor Law medical officer and medical certifier of a large area under the Insurance Act. It has been discovered that a considerable number of attested cases have been certified without the patients having been seen by the medical certifiers appointed by the Irish Insurance Commissioners, and arrangements are being made to have the medical certifiers who issue such certificates brought before the General Medical Council. The necessity for adopting this course is regrettable, as it is believed that the Insurance Commissioners should not have, by their system of certification, tempted doctors to undertake duties which were physically impossible to discharge.

INSURANCE ACT IN PARLIAMENT.

SUPPLY OF DRUGS.

ON June 30th Mr. Snowden asked whether the Panel Committee at Newcastle-on-Tyne had decided to surcharge those practitioners whose drug cost had exceeded that allocated to them under the Act a portion of the cost, with a view to making them more careful in the future; if this had been done without any consideration as to whether the excess was accounted for by the special character of cases; whether the two women practitioners on the panel had been surcharged, the excess expenditure on drugs in these cases being due to the special character of their panels, and could not be avoided if justice was done to the patients; and whether the Insurance Commissioners would take the steps necessary to stop this practice of surcharging medical practitioners in cases where it had clearly been necessary to exceed the allocated expenditure upon drugs in the interests of the patients. Mr. C. Roberts (Chairman of the Joint Committee of Insurance Commissioners) said he was not in possession of the details of the specific cases referred to, but a practitioner had a right to be heard by the Panel Committee of the area before that body reported to the Insurance Committee; and, further, to appeal to the Insurance Commissioners against any decision of the Insurance Committee to impose a surcharge.

CORRESPONDENCE.

JUVENILE CONTRACT RATES.

DR. T. CUMING ASKIN (Woodbridge, Suffolk) writes: We are now on the eve of another Representative Meeting, at which many matters of great importance are to be discussed. I should like to allude to one—that of contract fees for medical attendance and treatment of juvenile members of friendly societies.

Unless Recommendations B and D of the Council are rejected, my loyalty—and I believe, that of many others—will be strained almost to the breaking point.

A rate of 4s. 4d. per annum ought not to be entertained for a moment except as part of a set of Regulations such as those adopted by the Woodbridge and Felixstowe area of the South Suffolk Division. I enclose a copy of these Regulations as drawn up in 1913 and agreed to by the various friendly societies in the district, and would suggest that they be adopted by the Representative Meeting with a few necessary alterations.

I have carefully read the Special Report of Council (Appendix IX), but can there find no justification whatever for its recommendations.

Well may Dr. Bateaman write in the same SUPPLEMENT, p. 239: "The approved societies are asserting their control, and a condition of *coroë* is rapidly being developed."

It is stated that between the ages of 5 and 16 juveniles require less attention than adults, and certainly less than women. This may be so, though personally I do not admit it. What about epidemics, etc.? The reference to women is out of place, because I think all agree that 9s. is inadequate payment for them. A very important point, however, is that although the experience of "some members of the Council" is said to refer to juveniles between 5 and 16, the recommendations of the Council apply to children from the age of 3 years.

It may be improbable that any Government would think of offering 9s. for each child, but there is a very great difference between 9s. and 4s. 4d. The Government will no doubt offer as little as they possibly can, but are we bound to accept their offer?

Allusion is made to a meeting between the Medico-Political Committee and a deputation from the Manchester Unity of Oddfellows, and a brief report follows. What sad reading! Truly a veritable triumph for the friendly societies. It practically amounts to this: We have received our orders and the Council recommends us to obey them, lest worse things befall us—a very humiliating position for any profession to be placed in. It looks very like our betrayal.

What are these orders?

1. You must ignore the question of income limit.
2. You must help us in our fight for existence with the collecting societies.

3. You must agree to accept children from the age of 3, if not from birth.
4. You must provide drugs for these children.
5. You must accept 4s. 4d. per annum because that is all that can be afforded.

Note it is not suggested that 4s. 4d. is adequate payment for the service rendered; that is immaterial. It is simply a question of what the societies are good enough to say they can afford. I unhesitatingly say that in most cases the parents can easily afford more. Where there is a will there is a way. What about the money spent on amusements, dress, and drink?

I believe great stress is laid upon the fact that 4s. 4d. is a minimum rate, and that some doctors are accepting smaller sums. We all know the minimum is practically bound to become the maximum, and that some doctors will get their own way whatever happens.

I implore the Council to withdraw these recommendations, and give a strong lead in this matter of supreme importance not only to the general practitioner, but to the whole profession.

Regulations for Non-insured Patients of Subarea 9 (South of Suffolk Division of British Medical Association).

1. Free choice of doctor.
2. Income limit: 30s. for country, 40s. for town.
3. State insured between 65 and 70, and who are friendly society members, to be treated at old rates for three months; and strong representations should be made to the Government to pay the doctor at the ordinary rates for insured people.
4. State insured between 65 and 70, and who did not belong to a friendly society, 8s. 6d. per annum.
5. Friendly society members over 70, at the present rates, except where it is evident to the medical man that the patient is able to pay more.
6. Disabled and chronics at the old rates, except where it is evident to the medical man that the patient is able to pay more.
7. Members of friendly societies who are not insured under the State, 8s. 6d. without tuberculosis, 9s. with tuberculosis.
8. Juveniles only, from 4 to 16, at 4s. each (male and female).
9. Women at same rates as men.
10. Charges for examinations, 1s. each (new members). If the Government in the future make any allowance for any of the above-mentioned classes of patients, the above scales to be revised.

These terms are subject to alterations at three months' notice by either side. Mileage over three miles to be charged at the option of the doctor, and paid to him by the patient. Extras for fractures, anaesthetics, consultations, confinements, and miscarriages, etc., as usual.

P. L. GUSEPPI, F.R.C.S., Secretary.

Temporary Lieutenancy of A. Fleming, M.B., F.R.C.S., and J. C. Venicker, M.D., F.R.C.S. E., relinquish their commission. The notification regarding the appointment of D. Boylan, M.B., to a temporary Lieutenancy published in the *Lancet* of November 5th, 1914, is cancelled.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.
Lieutenant R. O. C. THOMSON, M.B., is confirmed in his rank.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.
1st London (City of London) Field Ambulance.—Captain D. G. Rice Oley, from Attached to Units other than Medical Units, to be Captain; W. K. H. Herdy, to be Lieutenant.
1st London (City of London) Sanitary Company.—To be Lieutenants: C. C. Frye, A. Romanes, M.B., H. G. A. Pearson.
2nd London General Hospital.—E. Bingley, late Surgeon Captain Bengal Nagpur Railway Volunteer Rifles, to be Captain, temporary.
3rd London General Hospital.—L. I. Preston to be Lieutenant.
4th London General Hospital.—F. R. Ridge to be Captain, whose services will be available on mobilization.
6th London Field Ambulance.—Captain S. R. Matthews, from Attached to Units other than Medical Units, to be Captain.
7th London General Hospital.—J. B. Marshall to be Captain, to be Lieutenant.
2nd East Anglian Field Ambulance.—Lieutenant J. Arthur, M.D., to be temporary Captain.
2nd London General Hospital.—C. H. Bryant, M.D., F.R.C.S., to be Captain, whose services will be available on mobilization.
1st Southern General Hospital.—J. W. Stretton to be Captain, whose services will be available on mobilization.
3rd Southern General Hospital.—J. B. Marshall to be Captain, whose services will be available on mobilization.
4th Southern General Hospital.—Captain G. C. Sandford, M.D., to be temporary Major.
2nd South Western Mounted Brigade Field Ambulance.—C. D. Reiton, M.B., to be Lieutenant.
North Midland Mounted Brigade Field Ambulance.—Lieutenant L. A. Dyer, M.D., to be temporary Captain.
2nd South Midland Mounted Brigade Field Ambulance.—V. V. Wood to be Lieutenant.
3rd South Midland Field Ambulance.—Captain C. Corfield to be temporary Major.
2nd Western General Hospital.—Major J. J. Cox, M.D., F.R.C.S., is seconded while acting as Chief Recruiting Medical Officer for Manchester.
2nd Northern General Hospital.—W. Longley to be Lieutenant.
4th Northern General Hospital.—Lieutenant-Colonel C. Harrison, M.D., resigns his commission on account of ill health.
Yorkshire Mounted Brigade Field Ambulance.—Surgeon-Captain R. G. Dyer, from East Yorkshire Yeomanry, to be Major, (his substitution of notice published in the *Lancet* of March 17th.)
3rd East Lancashire Field Ambulance.—Lieutenant W. P. Ferguson, M.D., to be temporary Captain.
Scottish Services.—Lieutenant E. Lyster, M.D., to be Captain, whose services will be available on mobilization.
3rd Lovatish Field Ambulance.—Captain A. C. McMaster, M.B., is seconded on his appointment as Resident Surgeon to the Military Hospital at Banquet.
Attached to Units other than Medical Units.—To be Lieutenant: R. V. C. Aab, M.B.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following announcements are notified by the Admiralty: To be temporary Surgeon-Generals: G. L. Chettle, C.B., C.V.O., F.R.C.S.; Sir W. Watson Cheyne, Bt., F.R.C.S., F.R.S.; Raymond Johnson, M.B., F.R.C.S.; Sir William Macnave, M.D.; H. D. Rolleston, M.D., F.R.C.P. Fleet Surgeons: C. B. Bettings, C.B., M.D., to the *Dido*, vice Penfold; T. W. Philip, M.B., to the Hospital Ship *Soudan*; F. F. Lobb to the *Queen Mary*, vice Philip; W. H. Pope to the *Boudicca*, vice Penfold; N. H. Roche to the *Blake*, vice Lyster; W. Hasard, M.D., to the *Cete*, vice Davidson; C. M. Burrell, E. J. Tongue, J. Drummond, M.B., and J. L. Pringle to the *Victory*, additional, for Haslar Hospital; S. Rivers to the *Pembroke*, additional, for disposal; C. H. E. Ayrton to the *Zeus*, additional, to be temporary Surgeon; W. S. O'Loughlin, S. L. Baker, E. D. D. Davies.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon A. G. V. Elder granted acting rank of Staff Surgeon; W. F. R. Castle to the *Leopard*, vice Watson. Surgeon Probationers: P. Barlow to the *Paragon*, vice Evans; J. E. MacIntyre to the *Ardent*, vice Clegg; G. E. Birckett to the *Loyal*, vice Waddington; F. H. Anderson to the *London*; H. Tomlinson to the *Zeus*, vice Castle. To be Surgeon Probationers for temporary service: D. J. Adams-Lewis, E. Hall.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

Granted temporary rank whilst employed with the Wharfedale War Hospital: Lieutenant-Colonel W. J. N. Vincent, M.D., as Majors: D. Gillespie, M.D., J. M. Mathison, M.B., Captain G. S. Simpson, F.R.C.S., 3rd Northern General Hospital, R.A.M.C.(T.F.). To be temporary Majors whilst serving with the Beaufort War Hospital: R. G. Duncanson, M.B., F.R.C.S., R.A.M.C. P. A. Pesh, M.B., to be temporary Major whilst employed with the County of London War Hospital. C. F. McDowell, M.D., is granted temporarily the honorary rank of Captain whilst serving at the Hosiery Military Hospital. Temporary Captain R. A. R. Wallace, having ceased duty with the Australian Hospital, relinquishes his commission. Temporary Lieutenants to be temporary Captains: D. K. McDowell, C.H., J. G. Duncanson, M.B., A. B. Bradford, M.B., H. F. Woolfenden, M.D., F.R.C.S., W. G. Mumford, M.B., F.R.C.S., M. Fitzmaurice-Kelly, M.B., F.R.C.S., M. W. B. Oliver, M.B.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

IN ninety-six of the largest English towns, 7,759 births and 4,295 deaths were registered during the week ended Saturday, June 26th. The annual rate of mortality in these towns, which had been 15.9, 13.5, and 12.4 per 1,000 in the three preceding weeks, further fell to 12.3 per 1,000 in the week under notice. In London the death-rate was equal to 11.8, while among the ninety-five other large towns it ranged from 5.9 in Tottenham, 6.0 in Enfield, 6.1 in Wimbledon and in Lincoln, 6.2 in Newport (Mon.), 7.0 in Lewton, and 8.1 in East Ham and in Southend, to 19.4 in Sunderland, 19.9 in Cambridge, 20.1 in South Shields, 20.3 in Halifax, 22.7 in Middlesbrough, and 23.7 in Carlisle. Measles caused a death-rate of 2.0 in Sheffield and in Aberdare. The principal infectious diseases averaged 3.0 per 1,000, as in Middlesbrough, and whooping-cough of 1.9 in South Shields and 2.1 in St. Helens. The mortality from the remaining infective diseases showed no marked excess in any of the large towns, and each of the principal towns, Birmingham, Sunderland, and Newcastle-on-Tyne, a registered medical practitioner or by a corner; of this number, 6 were recorded in Birmingham, 3 in Liverpool, 3 in Sunderland, and 2 each in Glasgow, Brighton, and Newcastle-on-Tyne. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 2,267, 2,336, and 2,373 at the end of the three preceding weeks, further rose to 2,422 on Saturday, June 26th; 352 new cases were admitted during the week, against 327, 330, and 330 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

IN the sixteen largest Scottish towns 1,116 births and 708 deaths were registered during the week ended Saturday, June 25th. The annual rate of mortality in these towns, which had been 15.9, 17.9, and 15.7 per 1,000 in the three preceding weeks, was again 15.7 in the week under notice. The principal infectious diseases averaged 3.0 per 1,000, as in Glasgow and Aberdeen. The death-rate in the sixteen largest English towns. The death-rate in the sixteen largest Scottish towns ranged from 2.8 in Kilmarnock, 7.6 in Falkirk, and 8.8 in Perth, to 17.9 in Kilmacdo, 19.9 in Aberdeen, and 21.7 in Ayr. The mortality from the principal infectious diseases averaged 3.0 per 1,000, as in Glasgow and Aberdeen. The 361 deaths from all causes in Glasgow included 51 from measles, 15 from whooping-cough, 6 from scarlet fever, 3 from diphtheria, 2 from infantile diarrhoea, and 1 from enteric fever. Eighteen deaths from measles were recorded in Aberdeen, 2 in Edinburgh, and 2 in Kilmacdo; from scarlet fever, 2 deaths in Paisley; from whooping-cough, 5 deaths in Edinburgh and 2 in Ayr; and from infantile diarrhoea, 4 deaths in Dundee.

HEALTH OF IRISH TOWNS.

During the week ending Saturday, June 26th, 579 births and 365 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 571 births and 331 deaths in the preceding period. These deaths represent a mortality of 14.8 per 1,000 of the aggregate population in the districts in question, as against 14.2 per 1,000 in the preceding period. The mortality in these Irish areas was, therefore, 2.5 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate in the other hand, was equal to 24.9 per 1,000 of population. As for mortality of individual localities, that in the Dublin registration area was 15.7 as against an average of 17.3 for the previous four weeks; in Dublin city 15.2 (as against 17.8), in Belfast 12.9 (as against 15.1), in Cork 14.5 (as against 15.1), in Londonderry 11.4 (as against 17.4), in Limerick 10.8 (as against 15.9), and in Waterford 20.9 (as against 11.9). The zymotic death-rate was 1.0, as against 1.1 in the previous period.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notice re Appointments) appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

BIRMINGHAM GENERAL DISPENSARY.—Resident Medical Officer. Salary, £250 per annum.

BIRMINGHAM AND MIDLAND EYE HOSPITAL.—Junior House-Surgeon. Salary, £150 per annum, and 45 laundry allowance.

BIRMINGHAM UNIVERSITY.—Female Demonstrator in Anatomy for Women Students.

BOLTON INFIRMARY AND DISPENSARY.—Second House-Surgeon. Salary, £200 per annum.

BRISTOL: COSHAM HOSPITAL, Kingswood.—Surgeon. Salary, £150 per annum.

BRISTOL GENERAL HOSPITAL.—House-Physician. Salary, £150 per annum.

BURY INFIRMARY.—Senior and Junior House-Surgeons. Salary, £250 and £150 per annum respectively.

CARLISLE: KING EDWARD VII HOSPITAL.—House-Surgeon. Salary, £180 per annum.

CHELTENHAM EDUCATION COMMITTEE.—Assistant Medical Officer of Health and School Medical Officer. Salary, £300 per annum, rising to £350.

CHELTENHAM GENERAL HOSPITAL.—(1) House-Physician. (2) House-Surgeon.

CHESTER: COUNTY ASYLUM.—Third Assistant Medical Officer. Salary, £200 per annum.

CROYDON MENTAL HOSPITAL, Upper Warrington.—Second Assistant Medical Officer. Salary, £250 per annum, rising to £300.

DUNDEE COMBINATION POORHOUSE AND HOSPITAL.—Resident Medical Officer. Salary, £225 per annum, rising to £300.

DURHAM COUNTY HOSPITAL.—House-Surgeon. Salary, £150 per annum.

FOLKESTONE: ROYAL VICTORIA HOSPITAL.—House-Surgeon.

GREAT NORTHERN CENTRAL HOSPITAL, Holloway, N.—House-Surgeon. Salary, £60 per annum.

GUILDFORD: ROYAL SURREY COUNTY HOSPITAL.—House-Surgeon. Salary, £150 per annum.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton, S.W.—House-Physician. Honorarium, 30 guineas for six months.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.—(1) House-Surgeon; (2) Assistant Clinical Medical Officer. Salary, £200 for six months and £2 10s. washing allowance each.

LEEDS PUBLIC DISPENSARY.—Lady Resident Medical Officer. Salary, £130 per annum.

LONDON SCHOOL OF MEDICINE FOR WOMEN, Hunter Street, W.C.—Female Demonstrator in Anatomy.

MACLESFIELD GENERAL INFIRMARY.—House-Surgeon. Salary, £180 per annum.

MANCHESTER CHILDREN'S HOSPITAL.—Resident Medical Officer. Salary, £100 per annum, and 45 monthly bonus during the war.

MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN.—House-Surgeon. Salary, £120 per annum.

Meetings of Branches and Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

EDINBURGH BRANCH.

The summer annual meeting of the Branch was held in the hall of the Royal College of Physicians on June 23rd, when Dr. PLAYFAIR, President, was in the chair.

Annual Report.—The report of the Branch Council and the Treasurer's statement for the year to December 31st, 1914, were read and approved.

Queen Mary Nursing Home.—Mr. W. J. Stuart was elected to fill the vacancy on the board of management of the Queen Mary Nursing Home.

Investments.—The question of investing the money to the credit of the old Branch fund was referred to the Branch Council.

War Emergency.—It was resolved that any further steps to meet the claims of the war emergency on the profession within the Branch area should be left in the hands of the Scottish Medical Service Emergency Committee.

Election of Officers.—The Branch Council for 1915-16 was elected as follows:

President: Professor F. M. Caird, F.R.C.S.E., Edinburgh.
President-elect: James Ritchie, M.D., Edinburgh.
Vice-Presidents: W. Blair, M.D., Jedburgh (also Representative to Representative Meeting); R. McKenzie Johnston, M.D., Edinburgh.

Honorary Secretaries: John Stevens, M.D., Edinburgh (also Representative to Representative Meeting); John Eason, M.D., Edinburgh.

Honorary Treasurer: R. A. Lundie, M.B., F.R.C.S.E., Edinburgh (also Representative to Representative Meeting).
Representatives on Council of Association: J. R. Hamilton, M.D., Hawick; J. Munro Moir, M.D., Inverness.

Honorary Secretaries of Divisions: A. M. Easterbrook, M.B., Gorebridge; M. J. Oliver, M.B., St. Boswells; G. Keppie Paterson, M.B., F.R.C.P.E., Edinburgh.

Representatives of Divisions—Edinburgh and Leith: E. F. Armour, M.B., Edinburgh; J. D. Comrie, M.D., Edinburgh; J. Lamond Lackie, M.D., Edinburgh; John Playfair, M.D., Edinburgh; R. Thin, M.B., F.R.C.P.E., Edinburgh. (Lothians): W. B. Martine, M.B., Weston, Hamilton. (South-Eastern Counties): J. Cardyle Johnstone, M.D., Roxburgh District Asylum, Melrose.

Dr. Munro Moir holds office until the Representative Meeting, when election to his office takes place.

EDINBURGH AND LEITH DIVISION.

The annual meeting of the Division was held on June 22nd, when the Chairman, Dr. R. A. LUNDIE, presided.

Annual Report.—The annual report of the Division, as presented by the SENIOR SECRETARY, stated the action taken with regard to the appointment of an assistant tuberculosis officer to the Corporation of Edinburgh, with the result that the salary offered at first of £250 was

raised to £350, the sum fixed by the Association for this work.

Matters Referred to Divisions.—The Division unanimously decided to oppose contract practice for children under any conditions, and the Division strongly opposed the proposed fees for examination for insurance, and advised the retention of 10s. 6d. for sums under £300. The Division decided to oppose the motions by the Rochdale and Westminster Divisions. The motion by the Plymouth Division was agreed to after deleting the last clause.

Election of Officers.—The following were elected office-bearers and Committee for 1915-16:

Chairman: Dr. W. Stewart.
Vice-Chairman: Drs. R. A. Lundie and R. McKenzie Johnston.
Senior Secretary and Treasurer: Dr. G. Keppie Paterson.
Junior Secretary: Dr. J. D. Comrie.
Representatives to Representative Meeting: Drs. J. Stevens and R. A. Lundie.
Representatives to Branch Council: Drs. E. F. Armour, J. D. Comrie, J. Lamond Lackie, J. Playfair, R. Thin.
Executive Committee: Mr. L. Beesly, Drs. L. F. Bianchi, R. H. Blair, J. M. Bowie, G. S. Carmichael, A. Goodall, A. Morrison McIntosh, J. McLaren, C. M. Pearson, James Ritchie, I. Venters, and A. Murray Wood.

KENT BRANCH:

MAIDSTONE DIVISION.

Election of Officers.—The following officers have been elected for the coming year:

Chairman: Dr. W. Shaw (Maidstone).
Vice-Chairman: Dr. E. J. Wood (Yalding).
Secretary: Dr. G. Southwell-Sander (Wateringbury).
Representative at Representative Meetings: Dr. W. Douglas (Goudhurst).
Representative on Branch Council: Dr. Parr-Dudley (East Malling).
Executive Committee: Dr. Travers, Dr. Harvey, Dr. Grey, Dr. R. Johnson, Dr. Parr-Dudley.

LANCASHIRE AND CHESHIRE BRANCH:

HYDE DIVISION.

The annual meeting of the Division was held at Hyde Town Hall on July 1st, when Dr. J. BENNETT took the chair, and was followed by the new chairman, Dr. F. CANT.

Election of Officers.—The following were elected:

Chairman: Dr. F. Cant.
Vice-Chairman: Dr. G. B. Hows.
Joint Honorary Secretaries: Dr. F. G. Ralphs and Dr. J. Kerr.
Representative on Branch Council: Dr. T. Watts.

Fees for Medical Examination for Life Insurance.—The Division unanimously resolved to support the recommendation of the Council relative to the reports and fees for life insurance.

MUNSTER BRANCH.

The annual general meeting of the Branch was held on June 26th, when Dr. Wm. DONOVAN, Vice-President, was in the chair.

Note of Condolence.—On the motion of Professor CORRY, seconded by Dr. Wm. DONOVAN, a unanimous vote of

condolence was accorded to Mrs. McCall on the death of Dr. McCall, President of the Branch.

Annual Report.—The annual report of the Branch Council was unanimously adopted.

Medical Certifiers.—The resolution passed by the Branch on January 23rd was reaffirmed, namely:

The Munster Branch of the British Medical Association expresses its strongest disapproval of the acceptance by Irish practitioners of the posts of part-time or whole-time certifiers under the Insurance Act, and considers such appointments inconsistent with the honour and interests of the medical profession.

On the recommendation of the Branch Council the following resolution was unanimously adopted:

That this meeting is of opinion that no member of the British Medical Association in Ireland should accept or continue to hold an appointment as medical certifier under the National Insurance Act.

The Honorary Secretary was directed to forward a letter to all the members of the Branch asking any of them who had accepted such posts to take steps immediately to terminate such appointments and to notify him thereto.

Election of Officers.—The following officers and Council for 1915-6 were appointed:

President: Dr. William Donovan, Queenstown.
Vice-President: Dr. D. J. O'Connor, F.R.C.P.I., Cork.
Honorary Secretary: Dr. Philip G. Lee, Cork.
Member of Central Council: Dr. J. Giussani, Cork.
Representative to Representative Meeting: Dr. W. MacFettridge, Cork.
Representative to Irish Committee: Professor H. Corby, Cork.
Council: Drs. H. R. Townsend, Lucy Smith, O. MacCarthy, P. T. O'Sullivan, J. T. O'Connor, E. Murphy, C. Yelverton Pearson, W. Ashley Cummins, A. S. Nance (Bantry), R. Foot (Monkstown), J. Devane (Limerick), Humphrey O'Sullivan (Corkstown).
Ethical Committee: Dr. D. J. O'Connor (Cork), Dr. W. Donovan (Queenstown), Dr. Philip G. Lee (Cork).

NORTH OF ENGLAND BRANCH

STOCKTON DIVISION.

The annual meeting of the Division was held on June 30th.

Election of Officers.—The following officers were elected for the ensuing year:

Chairman: Dr. A. H. Smith.
Vice-Chairman: Dr. G. M. Hogg.
Honorary Secretary: Dr. John Brydon.
Assistant Honorary Secretary: Dr. G. Hall.
Representative for Representative Meetings: Dr. A. N. Ross.
Representatives on Branch Council: Dr. H. B. Densham, and Dr. Ross and Dr. Brydon, *ex officio*.
Executive Committee: The above, together with Drs. S. D. Craig, Henry Fawcett, J. Fleming, T. J. Kirk, F. T. Talbot, T. Watson.

Treatment of Juveniles.—It was decided to adhere to the following resolutions adopted in March, 1913:

1. That a wage limit of £2 a week be fixed.
2. That a fee of 6s. 6d. be charged, to include medicines.
3. To insist upon a full list of names being furnished to medical men quarterly.
4. That the age limit be fixed at from 1 to 16 years.

Life Insurance.—The scale of fees recommended by the Council of the British Medical Association was approved.

OXFORD AND READING BRANCH:

READING DIVISION.

The annual meeting of the Division was held in the Library, Royal Berks Hospital, on July 1st, when Dr. Napier Jones was in the chair.

Election of Officers.—The following were elected officers for the ensuing year:

Chairman: Dr. Guilding.
Vice-Chairman: Dr. McCrae.
Executive Committee: Drs. Napier Jones, Abrams, Clowes, Rowland, Hope, Sidney Gilford, N. H. Joy, A. G. Paterson, T. B. Bokenham, W. J. Sussmann, A. Thompson, in addition to *ex officio* members.
Representative: Dr. G. H. R. Holden.
Deputy Representative: Dr. P. Napier Jones.
Treasurer: Dr. W. T. Freeman.
Honorary Secretary: Dr. G. O. Lambert.

Annual Report.—The Honorary Secretary read the annual report giving a summary of the business transacted at the Division and Executive meetings held during the past year.

Medical Attendance on Dependents of Soldiers and Sailors.—The Executive Committee reported that Dr. Rowland, medical representative on the Reading Committee of the Soldiers' and Sailors' Families Association, had drawn their attention to the fact that medical benefit was being granted to dependants who were not in necessitous circumstances. In some instances the dependants granted free medical attendance were actually in receipt of an income larger than they had enjoyed before the outbreak of the war. Several members took part in the discussion which followed. The opinion of several speakers was that the scheme for medical attendance on dependants of those serving with the colours was unnecessary in Reading; the terms of subscription to the Borough of Reading Medical Society were within the means of nearly all dependants, and Governors' tickets for free medical attendance under that institution were available to the very few who were in genuinely necessitous circumstance. The Executive Committee was empowered to consider the matter, and to alter or withdraw the agreement in force for free attendance on dependants of soldiers and sailors on service.

Fees for Life Insurance Examinations.—Dr. SIDNEY GILFORD opened a discussion regarding the suggested fees for life insurance examinations. He considered that the important point was to insist on a fee of one guinea for an examination which included testing of the urine, while for an examination not including that procedure a fee of half a guinea might be accepted. Many members thought that the form of examination for which a fee of half a guinea was offered should be abolished, on the ground that a medical man could not conscientiously recommend the acceptance of a candidate without careful examination. Dr. COLEMAN considered that it would be a pity to adopt measures opposed to the industrial policies, which tended to encourage thrift among the working classes. It was decided to instruct the Representative to support the following policy:

1. A full and complete examination at a fee of one guinea; a less elaborate examination at a fee of half a guinea.
2. Fees of half a guinea for cursory examinations be not accepted.

Vote of Thanks to Retiring Chairman.—A hearty vote of thanks was accorded to Dr. Napier Jones, the retiring chairman. Dr. NAPIER JONES, in acknowledging the vote, said that he regretted one thing only. He had hoped that the social side of the Division would have been more fully developed during the past year, that members would have met more often for purely social purposes apart from Division meetings. Unfortunately, the outbreak of the war had put an end to all prospects of holding social meetings.

STAFFORDSHIRE BRANCH:

MID STAFFORDSHIRE DIVISION.

The annual meeting of the Division was held at the Trent Valley Hotel, Lichfield, on June 29th, when Dr. F. M. ROWLAND, Chairman, presided.

Report of the Representative.—Dr. CLENDINNEN read his report on the Annual Representative Meeting, 1914, for which he was accorded the thanks of the meeting.

Election of Officers, 1915-16.—The following were elected:

Chairman: Dr. F. M. Rowland.
Vice-Chairman: Dr. A. E. Hodder.
Honorary Secretary: Dr. T. D. Stuart Shaw.
Representative at Representative Meeting: Dr. Wm. Clendinnen.
Representatives on the Branch Council: Drs. W. G. Lowe, G. Reid, E. C. Stack.
Members of the Executive Committee: Drs. C. J. Armson, H. D. Chapman, J. S. Gettings, R. S. Harvey, C. Thompson, and *ex officio* members.

War Emergency.—It was decided to compile a register of members of the Division willing to undertake whole-time or part-time service, with details as to the latter, and to forward the same to the D.D.M.S. at York, but this, in consequence of the action of the British Medical Association, will be suspended. The recruiting officer for Staffordshire (Major Wedgewood) attended the meeting for the purpose of obtaining the assistance of members' influence in recruiting, and the reasons of failure in the matter of recruiting in some areas were discussed.

Matters Referred to Divisions.—The matters referred to Divisions were fully discussed and the Representative instructed.

Association Notices.

ANNUAL REPRESENTATIVE MEETING, 1916.

DATE OF MEETING.

The Annual Representative Meeting of the Association, 1915, will be held at the Connaught Rooms, Great Queen Street, London, W.C., on Friday, July 23rd, 1915, and following days as may be required.

By order,
ALFRED COX, *Medical Secretary.*

May 19th, 1915.

ANNUAL GENERAL MEETING.

NOTICE is hereby given by the Council that the Annual General Meeting of the British Medical Association will be held at the Connaught Rooms, Great Queen Street, London, W.C., on Saturday, the 24th day of July, 1915, at 2 o'clock in the afternoon.

Dated this 22nd day of June, 1915.

By order,
GUY ELLISTON,
Financial Secretary and Business Manager.
429, Strand, London, W.C.

ALTERATION OF ARTICLES OF ASSOCIATION: EXTRAORDINARY GENERAL MEETING.

NOTICE is hereby given by the Council that an Extraordinary General Meeting of the British Medical Association will be held at the Connaught Rooms, Great Queen Street, London, W.C., on Saturday, the 24th day of July, 1915, immediately after the conclusion of the Annual General Meeting of the same Association, called for 2 o'clock in the afternoon of that day, when the subjoined Resolutions will be proposed as Extraordinary Resolutions:

1. That Articles 3, 43 and 44, and the words "whether an existing Member or a future Member" in Article 9, be cancelled.
2. That in Article 4 there be inserted immediately after the word "acts" the words following—"and any Medical Practitioner who does not reside within the area of any Branch of the Association and who though not so registered is possessed of any of the qualifications described in Schedule (A) of the Medical Act, 1858."
3. That in Heading III immediately after Article 11 the word "and" be substituted for the word "or."
4. That in Article 28 the last six words be altered so as to read "provisions as to Referendum herein-after contained."

Should the above Resolutions or any of them be passed by the requisite majority the same will be submitted for confirmation as Special Resolutions or a Special Resolution to a further Extraordinary General Meeting, and such Meeting will be held at the Head Office of the Association, No. 429, Strand, London, W.C., on Wednesday, the 11th day of August, 1915, at 2 o'clock in the afternoon, for the purpose of considering and, if thought fit, confirming as Special Resolutions or a Special Resolution any of the above Resolutions set forth which shall have been so passed.

Dated this 22nd day of June, 1915.

By order,
GUY ELLISTON,
Financial Secretary and Business Manager.
429, Strand, London, W.C.

ELECTION OF MEMBERS OF COUNCIL BY GROUPED REPRESENTATIVES.

NOTICE is hereby given that Nominations for Candidates for election as Members of Council by grouped Representatives for the year 1915-16 will be received by the Medical Secretary up to the end of the first hour of the proceedings of the Annual Representative Meeting on Friday, July 23rd, 1915. Each Nomination must be on the prescribed form, copies of which will be forwarded by the Medical Secretary on application.

Separate forms have been prepared: (I) For Nomination by a Division (through its Representative), and (II) for Nomination by a Representative of a Constituency included in the Group, and those applying are requested to state for which purpose the form is desired.

The voting papers will be issued at the Representative Meeting to each Representative or Deputy Representative of a Constituency in the United Kingdom in attendance at the Meeting.

By order of the Council,

ALFRED COX,
Medical Secretary.

June 30th, 1915.

BRANCH AND DIVISION MEETINGS TO BE HELD*

NORTH OF ENGLAND BRANCH.—Dr. James Don, Honorary Secretary, 1, Grove Street, Newcastle-upon-Tyne, gives notice that the annual meeting of the Branch, which will be purely a business meeting, will be held at the Royal Victoria Infirmary, Newcastle-upon-Tyne, on Tuesday, August 10th, at 3.30 p.m.

THE WAR EMERGENCY.

OLDHAM.

THE scheme adopted in Oldham for the remuneration of practitioners carrying on the work of their colleagues absent on military service differs in some respects from any scheme for the same purpose yet published. The patients of the absent practitioners are seen by any doctor for whom they send. The attending practitioner sends a record of the work done to the representatives of the doctor on service, and in addition sends a quarterly statement of the work done to a small central committee. The collection of the fees from the patients is left to the representatives of the absent doctors, but by means of the quarterly statements the committee is able to ascertain the exact amount of work done for each absentee. Each doctor on his return is furnished by the committee with a statement of the amount of work done for him during his absence, and he is expected to contribute to the committee a certain proportion of the amount earned for the services rendered. This proportion will be fixed by the Committee, and will vary in different cases according to the nature of the practice, the length of time it has been in the owner's hands, and the general position of the holder. The contributions obtained in this way will form a central fund which the committee will proceed to distribute among the practitioners who have done the work, and as far as possible in accordance with the circumstances of the practitioner, and in proportion to the amount of work done. It is claimed that this system has many advantages over the more usual method of a deduction of a fixed proportion of the fees, or any sliding scale for such deductions. It is evident that the members of the committee will find their position no sinecure, and the practitioners in Oldham are to be congratulated on having found practitioners who are sufficiently public spirited to undertake the duties.

LOCAL MEDICAL AND PANEL COMMITTEES.

COUNTY BOROUGH OF BATH.

LOCAL PANEL COMMITTEE.

At a meeting of the Local Panel Committee held at the Royal United Hospital, Bath, Dr. TABOR presiding, the following resolution was proposed from the chair and carried unanimously:

This Committee records its deep sympathy with the acting chairman, Dr. C. J. Whitty, on the loss of his son from wounds received in action.

Prescriptions.—After discussing a letter from the Bath Insurance Committee the following resolution was adopted:

This Committee notes the statement that prescriptions for persons receiving sanatorium benefit are not always marked "Sanatorium," and the request of the clinicians relating thereto. This Committee agrees that occasionally a prescription may not be so marked through inadvertence, and agrees that a transference be made from the sanatorium fund to the drug fund. It is impossible to estimate the exact amount so affected, but this Committee is of opinion that during the first year this mistake may have arisen through lack of knowledge of the rules, but that now it rarely happens.

INSURANCE ACT IN PARLIAMENT.

INSURANCE ESTIMATES.

Statement by Chairman of National Insurance Joint Committee.

On the vote for the National Insurance Joint Committee, Mr. Charles Roberts, Chairman of the Committee, began his statement by saying that at the present time most of the old controversies in connexion with the Insurance Act were in abeyance, and he had no desire to renew them at the present moment. He dealt with two main matters: First, the effect of the war on the department, and secondly, the proposals for economy in administration. Clerks on the staff of military age had been released for military service to the number of 533, and six of them had already fallen. Other members of the staff had been lent to several departments, but as their salaries were being paid from the insurance vote no economy in that vote was effected. The extra burden thrown on the department had been borne with cheerful alacrity by those of the staff who remained. There had inevitably been some scaling down in promptitude, and possibly there had not been the same freedom from mistakes as had been guaranteed before. The war had raised a number of new problems with which the Joint Insurance Committee had had to grapple. Of the three emergency measures passed, perhaps the most important in its effect on the approved societies was the grant of 5s. relief from sickness and disablement benefit to those soldiers who had come back totally disabled, and had secured disablement pensions from the Pensions Fund in accordance with the recommendation of the Select Committee on pensions and grants. Assistance had been given to the approved societies in some other ways, and he believed that the funds of the approved societies had been safeguarded, as far as was possible at present, from the strain which the war was causing upon their resources; its ultimate effect would have to be considered when more information was available. The societies were undergoing a considerable strain owing to the depletion of members and by the additional work the war had thrown upon them. They had to record the number of members who had enlisted, and to pay maternity benefit in proper cases to the families of soldiers who enlisted. To meet this additional expense a grant had been made which would to some extent relieve the societies. In co-operation with the War Office the Insurance Commissioners had secured medical attendance for soldiers on furlough and soldiers living at home or in billets. They had also dealt with the case of workmen engaged in constructing camps. Arrangements had been made to secure medical attendance for those who were not insured, the account afterwards to be settled by the military authorities. He then mentioned the generous offer made by the medical profession and the chemists to treat the dependants of soldiers serving with the forces. The Commissioners had been able to help in the dissemination of the information and in the preparation of the scheme. "It is, I think," he said, "a very generous act on the part of these two professions which deserves all due recognition." It had been arranged with the War Office that soldiers suffering from tuberculosis when they were discharged from the military hospitals should without any interval undergo treatment in residential institutions. The Insurance Committees had helped this scheme with great alacrity, and grants of £10 a head had been made out of the grants sanctioned last year by Parliament; a considerable number of soldiers had already been benefited by these arrangements. Numbers of men engaged in civil employment with the consent of the War Office—such, for instance, as in the dock battalion at Liverpool, and those sent back from the army to assist in munition or engineering work had all been given the advantage of the Insurance Act and provided with medical attendance and treatment. Foreigners did not come within the provision of the Insurance Act, and the Belgian refugees had been allowed to claim exemption; the employer had paid his contribution though the employee had not, and the 5s. weekly which the employer paid went, in the case of the Belgians, to provide medical and sanatorium benefits for them. At one munition works where a large number of Belgians were being employed special arrangements were made that after a month they were to be

entitled to medical treatment, and special cards were being prepared for such cases which could be presented to any doctor on the panel; they would be renewed every three months. One of the first difficulties on the outbreak of the war was the rapid rise in the price of certain drugs; the Treasury had allowed a special grant, and the prices of those drugs were being fixed monthly by agreement between the British Medical Association and the Pharmaceutical Society, with the approval of the Insurance Commissioners. Dealing next with the Medical Research Committee, which received an income of about £56,500 a year out of the penny taken from the insurance fund voted by Parliament, he said that when the war broke out the whole staff was handed over to the War Office, their buildings had been turned into a hospital, and the staff was engaged in the investigation of means to prevent disease and in the preparation of the history of the war. He believed that no single penny had been better spent by any of the 14,000,000 insured persons during the year than this particular penny contributed for the purpose of medical research, for it would result in the prevention of disease. He was, he said, in great sympathy with the critics who desired to see economy practised, and the estimate presented showed some indication of economy. The vote of the Joint Committee was reduced by some £495,000; this involved the postponement of various schemes of development which would have been undertaken but for the war. For instance, the grant for the institution of medical referees and for extra provision for nursing had to be held up pending the return of peace. It had been stated in the press that the actual benefits provided by the Government amounted to only 60 per cent. of the expenditure. That rested upon the statement made by the critics that out of the total expenditure of £25,000,000 under the Insurance Act the benefits accounted for only £15,000,000; as a matter of fact, the value of the benefits—sickness, medical, sanatorium, and maternity, was about £17,000,000 in a normal year. The critics had alleged that about £3 was being spent in the cost of administration for every £5 given in benefits. But the critics made two mistakes: In the first place, they had underrated the value of the benefit; and, in the second, there was put to reserve to accumulate a sum amounting to just under £5,000,000 to meet claims for sickness in the future. That was, of course, an entirely proper action on the part of any insurance fund. The income of £25,000,000 was really accounted for in the following way: To reserve 19 per cent., benefit account 67.3 per cent., working expenses 13.7 per cent. He believed that for a private concern that ratio of expenditure would not be bad. In the figures he had given he included sums taken out for the post-office, stationery, customs and excise and other votes, and for the expenses of Insurance Committees and approved societies. So far as the expenses of approved societies went, any savings they made went to increase the benefits at their disposal. In the calculation the expenses of the societies had been put at their maximum, but if they reduced their working expenses below 13.7 per cent. they could correspondingly increase the percentage of the total which went for benefit; the 13.7 per cent. represented the maximum expenditure, and he was not able to say how many of the societies were making savings or how great those savings were. There was the greatest possible inducement to members of approved societies to save on their working expenses in order to get higher benefit. After discussing some details of expenditure, he said that any idea that the country could save a million and a half by economy in the administration of the Insurance Act was fanciful and would not bear examination; there was room only for minor economies, which he agreed ought to be made. It had been alleged, he said, that in the first three months of the Act the Commissioners ordered 2,800 tons of paper, but he found that this included 120,000,000 insurance books and cards, and by careful attention to the choice of paper the Stationery Office had been able to save £70,000 a year. An economy had been effected by not filling the office of legal adviser to the Joint Committee, with a salary of £1,500 a year, which had recently become vacant. He was satisfied that it was not possible to cut down expenditure to any considerable extent without diminishing efficiency of administration, and any real inefficiency might result in poor persons losing the help and comfort which were their due under the Act at a time of stress and trouble. He believed that the Act was

performing a vast beneficence, and that it would not be less indispensable after the war for the sake of men who came back in bad health. On this and all other grounds the efficiency of the administration must be maintained.

The discussion which followed turned principally upon the manner in which the estimates were presented, the enormous amount of circulars and leaflets issued by the Insurance Commissioners and the frequent changes of regulations. Mr. Booth said that experience was proving the justice of the opinion he expressed when the Act was passed to the effect that the amount then voted would be nothing like sufficient, and would have to be increased. He believed that at this time when those who were working on the committees set up under the Insurance Act had their minds centred upon the war, the Commissioners were contemplating important changes in the administration, but they had not called the Advisory Committee together. There was, he complained, a lack of sympathy on the part of the English Commissioners. It had been intended that the societies which represented the insured persons should have a large influence upon the work of the Commissioners, but the regulations issued by the Commissioners were so puzzling that he did not believe 5 per cent. of the members of the House of Commons were capable of given an intelligible explanation of them. The basis of the Act was that of service through the voluntary societies, and if that principle was lost sight of the Act must crumble; those who were giving voluntary service or service very inadequately paid were entitled to the fullest recognition from the Commissioners at Buckingham Gate. With regard to the actuarial basis of the Act he believed that experience had shown that so far as it concerned men it was sound and that the benefits were in accordance with the contributions, but he hoped that by this time the Commissioners realized that that was not the case with regard to women. Some special societies, such as domestic servants, might produce good results, but others, such as those for landladies, were producing very bad results. The House was entitled to know what were the views of the Commission upon that point. Mr. Booth also criticized the cost of the county committees and of the committees generally. He urged the Commissioners to take steps to simplify the work of the committees. He also drew attention to the case of men returning from the war crippled not by the loss of a limb but by rheumatism or other diseases contracted during the war, who when they attempted to work at their respective trades would soon come on the insurance fund.

Sir J. D. Rees, after referring to the question of out-workers, complained that tons of printed matter was issued perfectly useless for the purpose for which it was intended.

Mr. Tyson Wilson dealt with the same point. He said that he did not believe that 15 per cent. of the secretaries who administered the Act ever looked at the circulars because they felt quite satisfied that in a month or two new leaflets would be issued contradicting those previously issued. When the Act was passed the rules of the societies affected were altered with the object of making them comply with regulations issued by the Commissioners, but afterwards new regulations were issued which made the rules of some of the societies actually null and void. Before the regulations were issued the societies affected ought to be consulted so that sick members should not receive visits from officials who stated that the regulations issued by the Commissioners had been violated.

Mr. Wardle criticized the system of permitting the use of stock mixtures. The stocking of these medicines led, he believed, to deterioration and inclined the doctor to give a stock medicine rather than write out a prescription exactly to fit the case.

Mr. Roberts, in a general reply, said that the regulations were documents which had the force of law, and had to be couched in legal language; and legal language was complicated, and sometimes not easy to follow. Many of the leaflets had been issued in an effort to put into simple and popular language the effect of the regulations, so that there was on the one hand the legal document which had the force of law, and on the other the simple popular explanation. He promised to look into the matter of out-workers and into that of stock medicines, recognizing that the insured person was entitled to thorough efficient treatment. He regarded the approved societies as an

integral part of the scheme devised under the Insurance Act, and regretted that there had been any cause of complaint of want of sympathy on the part of the English Insurance Commissioners. As to the actual effect of the war upon women in approved societies, he did not feel at the present time competent to embark on large speculations. Only on the previous day he had received a deputation from the British Medical Association, which raised some of the points, and the Association had promised that it would place before the Commissioners such evidence as it could collect bearing on these difficult questions.

The English, Welsh, and Scottish Commissions.

The vote for the Joint Committee having been agreed to, that for the English Commission was considered. Sir F. Banbury asked for information as to the increase in the item dealing with sickness, disablement, and maternity benefit (grants in aid), and the decrease in the item dealing with medical benefit (grants in aid). Mr. Roberts said that it was an accounting point which was rather technical. The money for medical benefit was for only one quarter of a year, and as a matter of fact there had been no real increase in sickness, disablement, and maternity benefit, and no real extra charge upon the taxpayer, but the basis of the grants had been altered as compared with last year. After some further speeches, Mr. Tyson Wilson said it was quite clear that nobody in the Committee understood the way in which the accounts were put; they were a bad example of the methods adopted by the Commissioners. The Commissioners themselves might understand their system of accounts, but nobody else seemed to do so, and the same statement applied to many of their regulations; there should be somebody to tell people in simple language what ought to be done. The vote was agreed to, and also those for Wales and Scotland.

The Irish Commission.

On the vote for Ireland, Sir F. Banbury drew attention to the fact that while last year the amount voted for medical certification was £9,700, this year it was £100. Mr. Booth said that this did not mean that the large sum was spent in one year and only £100 in the next. The grants were made and the money had been voted to be available. Mr. Roberts said that the matter was explained in a footnote to the estimate, and protested that these documents did not profess to be a complete record of revenue and expenditure, but only authorized expenditure for the coming year. The vote was agreed to, and was also that for the audit department.

The alteration in the form in the estimates was explained at some length in the BRITISH MEDICAL JOURNAL of April 17th, 1915, p. 680.]

UNALLOCATED FUNDS.

Mr. Charles Roberts, as Chairman of the Joint Committee of Insurance Commissioners, stated, on July 13th, in reply to Sir Philip Magnus, that the final payments were now being made to doctors on the panel in London in respect of the balance, amounting to about £13,000, of the original sum of money representing the premium of those insured who had neglected to choose a doctor.

IRELAND.

MEDICAL CERTIFICATION UNDER THE INSURANCE ACT IN IRELAND.

A LARGE and representative meeting of the Cork medical profession was held on July 3rd, when Dr. J. Cotter was in the chair. The Cork panel doctors decided at their meeting, held in May, to give a month's notice of their intention to the Irish Insurance Commissioners to come off the panel owing to the failure of the Commissioners to distribute the increased grant for medical certification promised by Mr. Lloyd George in the House of Commons on August 14th, 1913. The notice to come off the panel was adopted with only one dissentient. When the month's notice given by the doctors was about to expire, it was found the Commissioners made no attempt to come to terms with the panel doctors, nor had they any alternative scheme for medical certification, with the result that 25,000 insured persons were threatened to be left unprotected with medical certificates for sickness benefits. At

this juncture the Cork Borough Insurance Committee held a meeting, and sharply criticized the Insurance Commissioners for their failure to make any attempt to arrive at a settlement with the panel doctors or to provide some alternative scheme in order that 25,000 insured persons would not be left without medical certificates. The Insurance Committee strongly appealed to the doctors to remain on the panel for another month, so that the insured would not suffer in the case of sickness from want of medical certificates; the Committee also passed a strong resolution, urging that the Insurance Commissioners should come to terms with the panel doctors. As a result of the Insurance Committee's appeal the panel doctors consented to remain on the panel for another month, so that the Insurance Commissioners may have an opportunity of settling the question of certification with the doctors.

The Medical Commissioner sent his proposals for certification to be considered by the Cork medical profession, and the meeting held on July 3rd was specially convened for the purpose. The conditions proposed by the Medical Commissioner, Dr. Maguire, increased the capitation grant from 9d. to 1s.; doctors to attend at special depôts to be used for the purposes of medical certification alone, and doctors were to certify promiscuously for all patients, whether they were their medical attendants or not. The Medical Commissioner's scheme was considered in all respects most unsatisfactory and objectionable, and it was believed that it was not meant as a serious attempt to settle the question. In connexion with the Medical Commissioner's proposals the following resolutions were passed unanimously:

1. That we reject the scheme submitted by Dr. Maguire, Irish Insurance Medical Commissioner, as it does not fulfil in any manner the just demands of the medical profession—that is, the scheme put forward by the Irish Medical Committee for certification; and we again wish to inform the Commissioners that the Irish Medical Committee is the only body to conduct negotiations on behalf of the profession in Ireland.
2. That we, the members of the medical profession of the city of Cork, call upon the Government to have the increased grant, promised by Mr. Lloyd George on August 14th, 1913, for medical certification under the Insurance Act, distributed amongst the medical profession in Ireland. We make this claim with confidence, as the medical profession in Ireland has given its services freely and without reward to the treatment of the wounded soldiers and the dependants of those fighting at the front.

IRISH MEDICAL MEN AND INSURANCE COMMISSIONERS.

At the recent delegates' meeting of the Irish medical profession, held at the Royal College of Surgeons, a small subcommittee of the Irish Medical Committee was appointed to meet and confer with the governing bodies of the Irish Universities, the Royal Colleges of Physicians and Surgeons, the Apothecaries' Hall, and to make representations to other licensing bodies with a view to determining what immediate action should be taken in regard to: (a) The position adopted by the Irish Insurance Commissioners in circulating privately to members of Parliament matter detrimental to the honour and interests of the Irish medical profession without given the representatives of that body an opportunity of investigating openly the charges made against its members. (b) Medical certificates under the Insurance Act.

CORRESPONDENCE.

PROPORTIONAL REPRESENTATION.

DR. GEORGE CRICHTON (London, S.W.) writes: "The only comment to be made on the recent election to the Central Council (SUPPLEMENT, June 19th) is that it further emphasizes the importance of the method of election, as well as its practicability. Four members are elected by the Metropolitan Branch, and every mode of thought or of opinion which has a sufficient amount of support finds representation. Each one elected feels that he stands on his own qualifications, and not as does sometimes happen in other methods of election, just because he subserviently attaches himself to some popular candidate. It is to be hoped that in quieter times the method will be rigidly applied to all the elections to the Central Council and throughout the Association.

An enlargement of the electoral areas and a slight increase in the number of members of Central Council would enable each area to elect two, at least, or three men competent to express varieties of experience and of outlook, and accordingly be more truly representative. I do not advocate this as simply meaning a change in the policy of the Association. Who looks for that will be somewhat disappointed. But I think that there exists some discontent, and our policy may be modified. The resolutions of the Central Council would then, however, have more weight with the profession and with civil bodies, such as the Exchequer and town councils. "You must help us in our fight for existence with the collecting societies" (p. 30).

It is through the voice of genuine controversy and discussion that facts relating to such matters as are dealt with, for instance, under the Insurance Act sink into the ears of the electors and the Government and bear their fruit in due season.

It is a matter of public concern to draw attention to the recent election of the London Panel Committee. Every doctor who treats insured persons was asked to elect in the borough where he resides two members of the committee. Personal attendance is necessary, and the hour fixed was 3 p.m. How many men can find this hour possible? Two members are to be elected—that is, if 25 practitioners out of 100 or 200 attend to vote, 13 may elect them both; the other 12 and their opinions may count for nothing. I have not seen the result of the recent elections, but am told that in several instances no one turned up. I think those elected would be more fully employed in meeting at Woolwich and making ammunition for next year or till the war is over.

THE SURCHARGING OF PANEL PRACTITIONERS.

"STOPPAGE IS NO PAYMENT" writes: "The Medical Defence Union is doing well to defend us from the injustice of surcharging, especially as carried out by the London Panel Committee. In my case the amount is trifling, but note the following points:

1. I am surcharged for ordering 6 oz. of gly. thymol, of which I am told 4 oz. is the normal quantity. On the back of the printed list giving me this information is another doctor's case. He is informed that 6 oz. is the normal quantity, and is only surcharged when he has ordered more. Why this difference between two practitioners under the same committee?

2. A case in which I wanted a further opinion was kindly seen by a physician at Guy's. I merely copied his prescription for my patient, and am now surcharged for it! What would have been given to a patient at the hospital is too good for a panel patient. Are we to receive this treatment when consultants are appointed under the Act?

These two cases practically account for the few shillings that I am now surcharged by the full Panel Committee, and is only about one-third of that originally intended by the Panel Subcommittee, before whom I did not receive the consideration that is shown a criminal in our courts. They seemed to start with the determination to surcharge, and to know what my patients required without seeing or examining them. No wonder the capitation fee is in danger of being reduced from the imaginary seven shillings.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Deputy Surgeon-General C. J. Mansfield, M.V.O., M.D., to the *Victory*, additional for Haslar Hospital, vice Dimsey; Fleet Surgeons A. J. Fickelton (retired) to the *Victory*, additional, for disposal; S. H. Eacey to the *Indomitable*, vice W. P. Diller; S. H. Eacey, additional, vice Thorpe; H. S. Burniston, M.B., to the *Penbrooke*, additional, for R.N. Barracks, vice Mansfield; H. E. Tomlinson to the *Victory*, additional; F. Roister to the *Warrior*, vice Burniston; Staff Surgeon A. C. W. Newport to the *Hullbroke*, vice Hill; Surgeon P. L. Gibson, M.B., to the *Penbrooke*, additional, for disposal. Temporary Surgeons: G. A. Walker, M.B., to the *Victory*, additional; for Royal Naval Division; A. Craig to Stephen Furness for Sick Quarters, at Invergordon, vice Walker; W. H. S. Hodge to the *Penbrooke*, additional; N. C. Arver, M.B., to the *Indomitable*, vice Carter; A. D. E. Bayliss, M.D., to the *Warrior*, J. A. Walker and S. G. Ansell, M.B., to the *President*, additional; Alexander G. Pollock, M.B., to the *Admiral*, vice Sharratt; T. Owen to the *Spenser*, vice Carter; H. B. Padwick to the *Victory*, additional, for R.N. Division; W. Whitson to the *New Zealand*, vice Clark Hall; G. S. Aspinall to the *Diamond*, vice Whitson.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon Promotable B. S. Collins to the *Harby*, vice Corth; H. Gordon to the *Leopold*, vice Corth; J. Brunwell to the *Archer*; N. Braithwaite to the *Ambrose*, vice Brunwell. To be Surgeon

Probationers for temporary service: R. S. Smith, R. H. Woods, J. M. Macpherson, T. Scott, H. Gordon, J. W. Scharrif.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

Lieutenant-Colonel C. Stomham, C.M.G., R.A.M.C.(T.F.), to be temporary Colonel.

Lieutenant-Colonel C. A. Lane, M.B., is retained on the active list and to be supernumerary.

Lieutenant-Colonel G. A. T. Bray, from Deputy Surgeon, to be Physician and Surgeon at the Royal Hospital, Chelsea, vice Colonel O. R. A. Julian, C.M.G.

To be temporary Lieutenant-Colonels: Lieutenant-Colonel Sir Robert Ross, C.M.G., R.A.M.C.(T.F.), A. Balfour, C.M.G., M.D., L. S. Dudgeon, M.R.C.P., H. W. Wilcox, M.D.

Major Sir Allan Perry, M.D., to be temporary Lieutenant-Colonel whilst in command of a general hospital.

The following to be granted temporary rank whilst serving with the Allied Forces Base Hospital:—As Lieutenant-Colonel: Major W. E. Miles, F.R.C.S., R.A.M.C. (T.F. Reserve). As Major: Captain T. J. Borden, M.D., R.A.M.C.(T.F.), H. D. Gillies, F.R.C.S., As Captains: R. G. Jarvis, A. E. Fourster, J. S. Burn, M.D.

To be temporary Majors: Captain Sir Victor Horsley, R.A.M.C. (T.F.), (substituted for notification which appeared in the *London Gazette* of June 25th); H. W. A. Burke, late First Surgeon R.N.; A. L. Perkins, M.B., late Surgeon Captain, 1st Essex and 2nd London (Howland), D. W. Hume, M.B. (whilst employed with the Norfolk War Hospital).

A. Palling, M.B., F.R.C.S. (whilst employed with the County of London War Hospital), W. D. Bunscombe, M.D. (whilst serving with the City of London War Hospital), substituted for notification which appeared in the *London Gazette* of May 15th.

Captain C. M. Drew, M.B., from the seconded list, is restored to the establishment.

To be temporary Captains: A. Burton, M.B., F.R.C.S., temporary Lieutenant H. MacCormac, M.B., A. E. Marsack, late Surgeon Captain, 1st Volunteer Battalion, Queen's (Royal West Kent Regiment), J. S. S. Perkins, M.B., late Surgeon Captain, 1st Essex and 2nd South Devon Rifle Volunteers, temporary Lieutenant S. W. Woollett.

Temporary Lieutenant J. J. Johnson relinquishes his commission on account of ill health.

Second Lieutenant H. J. McCurric, from Reserve of Officers, to be temporary Lieutenant (substituted for notification published in the *London Gazette* of June 25th).

To be temporary Lieutenants: R. E. Welsh, M.B., H. E. Graham, M.B., W. L. Roberts, M.B., A. F. Bell, M.B., G. M. B. Goding, M.B., E. M. Wigley, M.B., J. E. Hodson, L. J. Pellow, M.B., D. Bird, J. R. Davies, Second Lieutenant R. T. Grant (from Reserve of Officers), W. F. Law, M.D., F.R.C.S.L., C. H. Silis, F. G. O'Donoghue, F. J. Allen, G. F. Macdonald, F. Ross, M.B., A. A. O'Connor, P. J. Stewart, M.B., F.R.C.S.E., E. C. Bowden, A. Bryans, E. R. R. Cheesman, T. C. Fiddler, M. B., J. H. Davis, M.B., W. S. Hall, M.B., D. B. T. Hallett, M.D., M. J. Jackets, M.B., D. J. Lewis, G. F. May, M.D., J. R. Hinton, F. A. M. Jones, M.B., B. A. Jones, M.B., J. T. Stewart, M.B., J. R. K. Thomson, W. F. Hare, M.B., E. J. Griffiths, M.B., H. C. Beasley, H. H. Kendrick, D. J. McLeish, A. Hipwell, H. Smithwaite, M.D., W. Watkins, G. Gilmer, M.B., E. S. Glead, H. S. Darlington, F. Nash, F.R.C.S., A. B. J. B. Matthews, E. B. F. Keegan, M.B., F.R.C.S.L., B. W. Walker, M.B., T. E. Cottu, C. H. Corbett, M.D., H. O. Leembrugan, A. J. Turner, M.B., W. J. Harper, S. Hodgson, M.B., J. E. Paterson, M.B., S. S. Thomson, M.B., A. S. J. Batson, J. E. Coleman, M.B., T. Chalmers, H. V. Walsh, M.B., J. W. W. Linington, F.R.C.S., R. V. G. Monckton, M.D., G. V. T. McMichael, M.B., C. Fanks, M.B., J. D. Ryan, A. Q. Christian, M.D., A. O'Flaherty, V. E. Kyle, M.D., A. J. Matthews, E. B. F. McKail, M.B., T. A. O'Brien, M.B., A. W. Petrie, M.D., F.R.C.S.E., R. Ronnie, M.B., E. J. Selby, W. R. Logan, M.D., A. Grant, M.B., T. Chalmers, M.D., G. J. B. Candler-Hope, M.B., J. W. Edington, M.B., A. G. Macdonald, M.D., O. T. Rawlinson, M.B., J. R. H. R. Earle-Davis, M.B., G. E. Delling, M.B., E. A. Wilson, M.D., G. R. Thompson, M.B., C. A. Meaden, A. E. Hutton, J. Appleyard, M.B., J. Lamont, J. N. Donnellan, M.B., C. E. Droop, M.B., R. Nicoll, M.B., W. M. D. Pritchard, M.B., S. W. P. L. H. W. W. Stewart, M.B., J. T. Grant, M.B., C. G. Shields, M.B., F. Grone, M.D., G. H. Roberts, M.B., D. B. Crerar, M.B., G. L. Thornton, G. H. Brown, M.D., W. G. L. Wambuck, J. McC. Lang, M.B., G. S. Coghlan, J. B. Boyd, M.B., F. R. Brown, M.B., J. C. Cotran, J. G. Fitzgerald, F.R.C.S.E., Le B. H. Wilmut, M.D., T. L. Kenyon, W. M. Thunder, M.B., M. J. Gallagher, M.B., A. Halliday, M.B., F.R.C.S., H. M. Rainsford, W. S. O. Warner, M.B., G. L. Kennedy, M.B., H. W. Drew, F.R.C.S., L. S. M. Mackintosh, W. M. Duke, M.B., H. W. Stewart, J. Hunter, M.B., A. Wylie, M.B., L. E. Napier, D. K. Parkes, M.B., J. Pearson, M.B., W. R. Taylor, F. P. Wight, M.B., O. S. Wraith, M.D., F.R.C.S.E., H. H. Moore, M.B., A. Harrison, J. L. B. Dixon, M.B., G. E. Hillhouse, E. L. Jenkin, M.B., D. C. Laird, M.B., T. A. Hiermarsh, M.B., J. W. Darling, M.B., W. Anderson, M.B., C. H. Levers, E. D. Smith, M.B., W. Parker, M.B., J. Mills, M.B., J. E. Long, M.B., G. K. King, W. C. Grant, M.B., M. G. W. Williams, M.D., H. H. Dunmore, J. V. McDonnell, E. F. Clowes, A. C. Greenwood, J. C. Walker, H. R. Ibbotson, W. M. M. Jackson, M.D., T. F. Keenan, M.B., J. Thompson, M.D., J. G. Walpole, M.B., W. J. D. Smyth, H. W. Sutherland, J. D. A. G. Meier, M.D., G. M. G. Williams, M.D., W. Matheson, M.B., H. E. Brown, F.R.C.S., I. F. Bruneau, M.D.

Lieutenants of the Canadian Army Medical Corps to be temporary Lieutenants: A. A. Wilson, M.D., D. B. Maclean, M.B., C. F. Knicht, M.B., D. Zealand, M.D., A. G. Menzies, M.D., G. M. Williams, M.D., W. E. Campbell, M.D., L. De C. MacIntosh, M.D., H. E. Lawson, M.B., E. V. Sullivan, M.D., R. J. Hutton, M.B.

To be temporary Honorary Lieutenants: E. Atkinson, O. A. Beaumont, A. R. Elliott, M.B., L. M. Inglis, J. B. Thackeray, A. G. Winter, J. A. Liley, H. H. Mathias, R. B. John.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Lieutenant J. W. Gray, M.B., to be Captain.

TERRITORIAL FORCE.

ARMY MEDICAL SERVICE.

Major J. Tait from attached Ambulance, to be Deputy Assistant Director of Medical Services, Highland Reserve Division.

Major R. B. Sidebottom, from Attached to Units other than Medical Units, to be Deputy Assistant Director of Medical Services, Welsh (North) Division.

Captain W. H. Rowall, M.D., from the Territorial Force Reserve, to be Deputy Assistant Director of Medical Services, East Lancashire (Reserve) Division.

ROYAL ARMY MEDICAL CORPS.

1st Southern General Hospital.—Captain L. P. Gamgee, F.R.C.S., to be Major.

4th Northern General Hospital.—Major Russell C. Coombe, M.D., F.R.C.S., is seconded for duty at the Royal Victoria Hospital, Netley.

5th Southern General Hospital.—Captain H. Barrows, M.B., F.R.C.S., is seconded for duty with No. 20 General Hospital.

2nd West Lancashire Mounted Brigade Field Ambulance.—To be Lieutenants: H. R. Dive, W. S. Scobie.

2nd Wessex Field Ambulance.—The announcement of the resignation of Lieutenant H. W. Spaight, which appeared in the *London Gazette* of July 1st, is cancelled. Lieutenant H. W. Spaight is placed on temporary half-pay list on account of ill health.

Welsh Border Mounted Brigade Field Ambulance.—Major D. C. L. Orton to be temporary Lieutenant-Colonel.

South Wales Mounted Brigade Field Ambulance.—A. W. W. Hayles to be Lieutenant.

London Mounted Brigade Field Ambulance.—Lieutenant-Colonel C. Stomham, C.M.G., is seconded.

1st London Casualty Clearing Station.—Captain J. W. Kemp to be temporary Major.

2nd London Casualty Clearing Station.—A. C. Pearson, M.B., to be Lieutenant.

2nd London Sanitary Company.—G. S. Hoffman to be Lieutenant.

3rd London (City of London) Field Ambulance.—Captain L. C. V. Hardwicke, M.B., from Attached to Units other than Medical Units, to be Major, temporary.

4th London General Hospital.—H. R. D. Spitta to be Captain, whose services will be available on mobilization.

6th London Field Ambulance.—Lieutenant P. S. Price to be temporary Major.

1st Eastern General Hospital.—R. V. Slattery to be Captain, whose services will be available on mobilization.

1st East Anglian Field Ambulance.—Captain W. D. Watson to be temporary Major.

1st Home Counties Field Ambulance.—G. Hislop, M.B., to be Lieutenant.

2nd Home Counties Field Ambulance.—Major T. H. Chittenden, attached to Units other than Medical Units, to be Major.

1st South Midland Field Ambulance.—Lieutenant F. E. France, M.B., from Attached to Units other than Medical Units, to be Captain, temporary.

2nd South Midland Field Ambulance.—Lieutenant E. J. C. Groves, M.B., is seconded.

North Midland Mounted Brigade Field Ambulance.—W. E. Kingston, M.B., to be Lieutenant.

1st Victoria General Hospital.—Lieutenant N. Hodgson, M.B., to be Captain, whose services will be available on mobilization.

2nd Northern General Hospital.—W. Scatteray, M.D., to be Captain, whose services will be available on mobilization; I. C. Marshall, M.D., to be Lieutenant.

5th Northern General Hospital.—A. M. Crossfield to be Captain, whose services will be available on mobilization.

1st West Lancashire Field Ambulance.—A. B. Thompson, M.B., to be Lieutenant.

West Lancashire Casualty Clearing Station.—Lieutenant W. N. West-Watson, M.D., to be temporary Captain.

1st Scottish General Hospital.—Lieutenant-Colonel A. H. Lister, M.D., is seconded for duty with a general hospital.

Highland Mounted Brigade Field Ambulance.—J. F. Neary, M.B., to be Lieutenant.

Attached to Units other than Medical Units.—Lieutenant H. K. Griffith, M.B., F.R.C.S., to be Captain. To be Lieutenants: R. B. Reid, M.B., C. W. J. Brashear. Lieutenant H. N. Pelly resigns his commission on account of ill health.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

78 ninety-six of the largest English towns 7,779 births and 4,155 deaths registered during the week ended Saturday, July 3rd. The annual rate of mortality in these towns, which had been 15.5, 12.4, and 12.3 per 1,000 in the three preceding weeks, fell to 11.9 per 1,000 in the week under notice. In London the death-rate was equal to 11.7, with among the largest towns some of the largest rates being recorded in Hford and in Reading, 5.6 in Tottenham, 5.7 in Acton, 5.9 in Hounslow, 6.1 in Lincoln, and 6.2 in Southend, to 16.6 in Stoke-on-Trent, 16.9 in Gillingham, 17.3 in South Shields, 17.8 in Carlisle, 19.5 in Gloucester, and 24.8 in Middlesbrough. Measles caused a death rate of 1.1 in West Ham, 1.2 in Manchester, 1.3 in Preston, 1.5 in West Bromwich, 1.7 in Exeter, 2.2 in Walsall, 3.7 in Dorley, and 4.9 in Middlesbrough, and whooping-cough of 1.7 in Wigan and 2.0 in Aberdeen. The mortality from scarlet fever and infectious diseases showed no marked excess in any of the large towns, and no fatal case of small-pox was registered during the week. The causes of 48, or 1.2 per cent., of the total deaths were not certified by a registered medical practitioner or by a coroner; of this number 8 were recorded in Gillingham, 6 in Liverpool, 5 each in Stoke-on-Trent and Birmingham, 4 in St. Helens, and 3 in Bolton. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospital and the London Fever Hospital, which had been 526, 373, and 422 at the end of the preceding weeks, increased further rose to 2,446 on Saturday, July 3rd; 348 new cases were admitted during the week, against 350, 330, and 332 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In the sixteen largest Scottish towns 1,015 births and 477 deaths were registered during the week-ended Saturday, July 3rd. The annual rate of mortality in these towns, which had been 17.9, 15.7, and 15.7 per 1,000 in the three preceding weeks, rose to 16.6 in the week under notice, and was 16.9, 16.9, and 16.9 in the three preceding weeks. The towns with the lowest rates were Glasgow, 9.5, Dundee, and Perth, 9.5, 10.0 in Motherwell, and 10.5 in Clydebank, to 19.0 in Glasgow, 19.4 in Dundee, and 19.6 in Aberdeen. The mortality from the principal infectious diseases averaged 2.7 per 1,000, and was highest in Clydebank and Aberdeen. The 335 deaths from all causes in Glasgow included 53 from measles, 7 from whooping-cough, 6 from infantile diarrhoea, 4 from diphtheria, and 1 from scarlet fever. Ten deaths from measles were recorded in Aberdeen, 3 in Dundee, and 2 in Paisley and in Perth; from scarlet fever, 3 deaths in Aberdeen; from whooping-cough, 5 deaths in Aberdeen and 2 in Edinburgh; and from infantile diarrhoea, 4 deaths in Dundee.

HEALTH OF IRISH TOWNS.

During the week ending Saturday, July 3rd, 636 births and 387 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 579 births and 345 deaths in the preceding period. These deaths represent a mortality of 16.6 per 1,000 of the aggregate population in 19 districts in question, as against 14.8 per 1,000 in the previous period. The mortality in these Irish areas was therefore 4.7 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate on the other hand, was equal to 27.8 per 1,000 of population. As for mortality of individual localities, that in the Dublin registration area was 18.6 (as against an average of 17 for the previous four weeks), in Dublin City 19.5 (as against 17.3), in Belfast 14.1 (as against 14.1), in Cork 19.0 (as against 15.8), in Londonderry 26.6 (as against 16.1), in Limerick 25.7 (as against 15.2), and in Waterford 9.5 (as against 15.2). The zymotic death-rate was 1.0, or the same as in the previous period.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice in the Advertisement Department Notice regarding Appointments appearing in our advertisement columns, giving particulars of vacancies as to which enquiries should be made before application.

VACANCIES.

BIRMINGHAM AND MIDLAND EYE HOSPITAL.—Junior House-Surgeon. Salary, £100 per annum and 45 sanitary allowances.

BIRMINGHAM GENERAL DISPENSARY.—Resident Medical Officer. Salary, £250 per annum.

BIRMINGHAM UNIVERSITY.—Female Demonstrator in Anatomy for Women Student.

BOLTON INFIRMARY AND DISPENSARY. Second House-Surgeon. Salary, £200 per annum.

BRIDGWATER HOSPITAL.—House-Surgeon. Salary, £125 per annum.

BRISTOL GENERAL HOSPITAL.—House-Physician. Salary, £150 per annum.

BROMLEY EDUCATION COMMITTEE. School Dental Surgeon. Salary, £150 per annum.

BURY INFIRMARY.—Senior and Junior House-Surgeons. Salary, £250 and £150 per annum respectively.

CARDIFF: KING EDWARD VII HOSPITAL.—House-Surgeon. Salary, £400 per annum.

CHELtenham GENERAL HOSPITAL.—(1) House-Surgeon; (2) House-Physician. Salary, £125 per annum each.

CITY OF LONDON RED CROSS HOSPITAL.—Resident Medical Officer. Salary, £200.

CROYDON COUNTY BOROUGH.—Assistant Medical Officer of Health and Assistant School Medical Officer. Salary, £350 per annum.

CROYDON MENTAL HOSPITAL. Upper Waringham.—Second Assistant Medical Officer. Salary, £250 per annum, rising to £300.

DERBY COUNTY ASYLUM. Mickleover.—Locum-tenent. Terms, 48s. per week.

EVELINA HOSPITAL FOR SICK CHILDREN. Southwark.—(1) House-Physician; (2) House-Surgeon (males). Salary, £75 per annum.

EXETER: ROYAL DEVON AND EXETER HOSPITAL.—Assistant House-Surgeon. Salary, £150 per annum.

FOLKESTONE: ROYAL VICTORIA HOSPITAL.—House-Surgeon.

GUILDFORD: ROYAL SURREY COUNTY HOSPITAL.—House-Surgeon. Salary, £150 per annum.

HOSPITAL FOR CONSUMPTIONS AND DISEASES OF THE CHEST. Brompton, W.—House-Physician. Honorarium, 30 guineas for six months.

HOSPITAL FOR SICK CHILDREN. Great Ormond Street, W.C.—(1) House-Surgeon; (2) Assistant Casualty Medical Officer. Salary, £30 for six months and £2 10s. washing allowance each.

LEAMINGTON SPA: WARNEFORD, LEAMINGTON, AND SOUTH WARWICKSHIRE GENERAL HOSPITAL.—Second Resident Medical Officer. Salary, £200 per annum.

LEEDS PUBLIC DISPENSARY.—Lady Resident Medical Officer. Salary, £300 per annum.

MANCHESTER CHILDREN'S HOSPITAL. Pendlebury.—Resident Medical Officer. Salary, £100 per annum.

MANCHESTER COUNTY ASYLUM. Prestwich.—Assistant Medical Officer. Salary, £250 per annum, increasing to £300, and, upon promotion, to £350.

MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN.—House-Surgeon. Salary, £120 per annum.

Meetings of Branches and Divisions.

The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.

DORSET AND WEST HANTS BRANCH.

A GENERAL meeting of the Branch was held at Sherborne on July 7th, when the President, Dr. C. D. MUSPRAT, was in the chair.

New Members.—The PRESIDENT, on behalf of the Branch Council, reported the election of Robert Andrew George Elliott and Telford Telfordsmith as members of the Association.

Autumn Meeting.—On the motion of the PRESIDENT, it was unanimously agreed to hold the autumn meeting at Bournemouth in October.

New Hospital at Bridport.—The PRESIDENT, on behalf of Dr. Edwards of Bridport, gave an invitation to the members to visit and inspect the new hospital at Bridport, and a date early in September was suggested.

Vote of Thanks.—The PRESIDENT proposed a hearty vote of thanks to the Sherborne practitioners for their hospitality in entertaining the members to lunch at the Digby Hotel, where, after the meeting, the members were also entertained to tea.

LANCASHIRE AND CHESHIRE BRANCH: BURY DIVISION.

A MEETING of the Bury Division was held on June 30th, when Dr. GROMPTON was in the chair.

New Members.—The following were nominated for election to membership of the Division: Dr. Gladys Ramsden, Dr. Clarence Lees, Dr. James Williamson.

Medical Attendance on Dependants.—A letter was read from Mr. Larkin concerning attendance on necessitous dependants of soldiers, and work done for practitioners absent on war service.

Annual Report.—The Secretary's report and balance-sheet were accepted. The report stated that the Division contained 53 members, a decrease of 2 due to removals, while 3 new members were down for election. One general meeting and one executive meeting had been held during the year with an attendance of 20 and 9 respectively. Much of the medico-political work formerly done by the Division had now devolved on the Local Medical Committee. No social or scientific meetings had been held owing to the abnormal times, but it was hoped to arrange for such meetings to be held during the ensuing year. Out of 69 men in general practice in the area of the Division 54 were taking part in the work of free treatment of necessitous dependants of soldiers, and £16 10s. 6d. had been collected for the Belgian Doctors' and Pharmacists' Relief Fund. In connexion with the subject of earrying on the practices of men who had gone, or were desirous of going, on active service, the report stated that the Bury

Local Medical Committee had made the necessary arrangements for the county borough previous to the receipt of communications on the subject from head quarters. Inquiries had been received from all parts of the country with regard to the Bury holiday scheme (see BRITISH MEDICAL JOURNAL, April 24th, p. 730. June 12th, p. 1011), and full particulars and sample stationery had been supplied.

Election of Officers.—The following officers were elected for the coming year:

President: Dr. F. B. G. Holmes (Bury).
Vice-President: Dr. Young (Whitefield).
Representative to Representative Meetings and Branch Council: Dr. J. W. Johnson.

Deputy Representative: Dr. Smith (Radcliffe).
Honorary Secretary: Dr. P. F. Braidwaite, with permission to arrange for an assistant honorary secretary if required.
Executive: Drs. R. Crompton (Rausbotton), Stewart (Haslingden), Nuttall and Dewar (Bury).

Local Honorary Secretaries: R. Goldfinch, Dr. Smith; Rausbotton, Dr. Lawrie; Haslingden, Dr. J. G. Harrison; Rautenstall, to be arranged by the secretary.

Matters Referred to Divisions.—Regarding the suggestion that the fee of 10s. 6d. for acting as a referee under the Insurance Act was sometimes excessive, the Division agreed to rescind the resolution enforcing this, and to the recognition of a fee of 7s. 6d. The Division expressed its opposition to attending juveniles at contract rates at all, but instructed its representative to support all the other recommendations in the SUPPLEMENT for May 8th, including the suggested scales of fees for examination for life assurance.

Insurance Certificates.—Attention was drawn to the books of certificates issued by the British Medical Association to replace Form Med. 40, with a view to minimizing as much as possible the inconvenience caused to doctors who attend insured persons in their private capacity.

Lery.—All the members present paid the voluntary levy of 5s. for 1914; a number of members who were unable to be present had previously sent their levies on by post.

SOUTHERN BRANCH.

The annual general meeting of the Branch was held on July 8th at the Speedwell Hotel, Portsmouth, when the President, Mr. G. H. COWEN, F.R.C.S., was in the chair. Owing to the inclemency of the weather the attendance was small, only fifteen members being present.

Annual Report.—On the motion of Mr. C. P. CHILDE, seconded by Dr. J. T. LEON, the annual report and statement of accounts were adopted.

Associate Members.—Drs. James Watson of Dormans Park and Mr. W. A. S. Roys of Haslemere, formerly members of the Council, were elected as associate members of the Branch.

Vote of Sympathy.—A resolution of sympathy with the Honorary Secretary on the occasion of his illness was moved by Dr. W. H. HARMAN, seconded by the PRESIDENT, and carried unanimously.

Pay and Allowances of Territorial Medical Officers.—A letter from Captain G. F. Morley, R.A.M.C.(T.), re pay

and allowances, was read and referred to the Acting Secretary to answer.

Induction of Chairman.—Mr. COWEN then vacated the chair in favour of Dr. C. F. ROUTH, who, having expressed his thanks for the honour conferred upon him in electing him as President for the coming year, moved a vote of thanks to Mr. Cowen for his services during the year 1914-15. This was seconded by Dr. SHEAHAN, and Mr. COWEN suitably responded.

Presidential Address.—Dr. ROUTH delivered an address on *Bacillus coli* infection of the urinary tract. At its conclusion a vote of thanks was, on the motion of Dr. HACKMAN, seconded by Dr. LEON, accorded to him.

Tea.—The PRESIDENT invited the members to tea, during which a collection was made on behalf of Epsom College. On account of the war there was no luncheon, golf competition, or other social event.

PORTSMOUTH DIVISION.

The annual general meeting of the Portsmouth Division was held on June 25th, when Dr. COLE-BAKER was in the chair.

Annual Report.—The annual report and statement of accounts were received and adopted, the latter showing a deficit of £4 10s. 10d.

Election of Officers.—The following gentlemen were elected to serve for the ensuing year:

Chairman: Dr. J. T. Leon.
Vice-Chairman: Mr. C. A. Scott Ridout, F.R.C.S.
Secretary and Treasurer: Mr. L. K. H. Hackman.
Representative at Annual Representative Meeting: Dr. D. A. Sheahan.

Representatives on Branch Council: Dr. Cole-Baker, Mr. A. B. Wright, Mr. J. T. Leon.

Executive Committee: Dr. J. G. Blackman, Mr. T. A. Colt, Dr. A. V. Maybury, sen., Dr. W. A. Salmund, Mr. H. S. Thomas, Mr. G. McGregor, Mr. E. B. Bird, Dr. C. Lamplough, Mr. H. E. Crawley, Dr. F. C. H. Magdalen, together with, *ex officio*, Dr. W. Carling (Librarian), Mr. James Green (Central Council), and Mr. J. H. F. Way (Secretary, Local Medical Committee).

Election of Direct Representative.—It was unanimously resolved that the nomination of Dr. J. A. Macdonald as a Direct Representative on the General Medical Council be cordially supported.

Annual Representative Meeting.—The provisional agenda of the Annual Representative Meeting were considered, and the recommendations of the Council were agreed to except on the following points:

1. **Ethical Rules.**—(a) The Ethical Committee of a Division should only investigate facts and report; (b) *in re* Branches, the Secretary should not send the recommendation of the Ethical Committee to each party concerned, but only the resolution adopted by the Council.

2. **Attendance on Juveniles.**—It was resolved that in voting on this question our Representative be given a free hand, as also in the matter of fees for examination in life insurance.

SOUTH WALES AND MONMOUTHSHIRE BRANCH:

CARLIF DIVISION.

The annual meeting of the Carliff Division was held on June 2nd.

Vote of Condolence.—A vote of condolence with the family of the late Dr. W. T. Edwards was proposed from the chair and carried unanimously.

Election of Officers.—The following officers were elected for the ensuing year:

Chairman: Dr. P. J. O'Donnell, Barry.
Vice-Chairman: Dr. Fred. W. S. Davies.
Honorary Secretary: Dr. D. C. Evans.

Assistant Secretary: Dr. H. Walker.
Branch Councillors: Drs. O'Donnell, E. E. Brierley, Fitzgerald, W. B. Crawford Treasure, Fred. W. S. Davies, Leigh (Treharris), Shaw Lyttle, McCrea (Bargoed).

Ordinary Members of Executive: Drs. Herbert Cook, MacKenzie (Caerphilly), Thos. Wallace, and Thornley.

Branch Contract Practice Committee: Drs. John Powell (Barry), Leigh (Treharris), MacKenzie (Caerphilly).

Representatives: Drs. W. B. Crawford Treasure and Fitzgerald.

Annual Representative Meeting.—The Report of Council and Provisional Agenda were considered and the Representatives instructed.

War Emergency.—The question for facilitating the supply of medical men for military service was considered. Dr. E. E. BRIERLEY stated he had twice written to the D.D.M.S. and had received no reply.

Matters referred to Divisions.—It was unanimously resolved to support the recommendations of Council regarding fees for treatment of juvenile members of friendly societies and for medical examination for life insurance.

Vote of Thanks.—A hearty vote of thanks was accorded Dr. Brierley, the retiring chairman, for his past services.

SURREY BRANCH,

CROYDON DIVISION.

The annual meeting of the Division was held at the Croydon General Hospital on July 6th.

Annual Report.—The annual report of the committee was received and adopted.

Election of Officers.—The following officers were appointed:

Chairman: A. C. Z. Cressy.
Vice-Chairman: J. A. Howard, M.D.
Honorary Secretaries: E. H. Willock, J.P., C. G. C. Scudamore.

Representative for Representative Meeting: E. H. Willock, J.P.
Deputy Representatives for Representative Meeting: E. J. C. Daniel, M.B., G. G. George, M.D.

Representatives on Branch Council: C. G. C. Scudamore, J. A. Howard, M.D.

Annual Representative Meeting.—The annual report of the Council (SUPPLEMENT, May 8th), together with the supplementary report (SUPPLEMENT, July 3rd), were considered. The Representative was instructed to support the Council's proposals with the exception of Recommendation II (SUPPLEMENT, May 8th, p. 186), referring to local ambulance services. It was resolved to suggest that the hour of seven should be substituted in each case for eight. With regard to the proposed amendment by the Wakefield, Pontefract, and Castleford Division (SUPPLEMENT, July 3rd, p. 17), it was resolved:

That the Division instruct its Representative not to vote for the withdrawal of medical attendance on dependants of men on service, but to endeavour to obtain an arrangement whereby those attending necessitous cases in larger numbers may be relieved beyond a certain number, and that committees entrusted with the granting of cards have their attention drawn to the fact that it is only intended for necessitous cases.

YORKSHIRE BRANCH:

HARROGATE DIVISION.

A MEETING of the Harrogate Division was held at the Royal Baths on July 9th, when Dr. SHEPHERD BOYD was in the chair.

Members Serving.—On the motion of Dr. BAIN, seconded by Dr. MANTLE, it was resolved that the names of those other members who had since joined the R.A.M.C. be added to the former list—Drs. Bennett, May, Garrad, and Thomas.

Election of Officers.—The following officers were elected for the ensuing year:

Chairman: Dr. Mantle.
Vice-Chairman: Dr. Nimmo Watson.
Honorary Secretary: Dr. Gibson.
Representative for Representative Meetings: Dr. Hinsley Walker.

Representative for Branch Council: Dr. Gibson.
Committee: Drs. Daggett, Dimmock, Lever, Mackay, Solly, Bertram Watson, Crawford Watson, Greenwood, and Colonel Gibbon, P.M.O. (Ripon).

Honorary Members of Division.—It was resolved to elect as honorary members of the Division all medical officers attached in the Division and being members of the British Medical Association.

Votes of Sympathy.—Votes of sympathy were accorded to Mrs. Mouillot on the death of Dr. Mouillot and to the family of Dr. Collier (Ripon) on the double bereavement of both father and son.

BOMBAY BRANCH.

The annual meeting of the Bombay Branch was held in the University Library on April 8th, when Lieutenant-Colonel ASHTON STREET, I.M.S., presided.

Election of Officers.—The following officers were elected:

President: The Hon. Surgeon-General R. W. Lyons, I.M.S.
Vice-Presidents: Lieutenant-Colonel Ashton Street, I.M.S.; Dr. R. Row, D.Sc.

Honorary Secretary and Treasurer: Dr. D. R. Bardi, F.R.C.S.I., I.M.S.

Branch Council: Lieutenant-Colonel L. F. Childe, I.M.S.; Lieutenant-Colonel S. C. Evans, I.M.S.; Dr. Sorab K. Nariman.

Dr. Sarah K. Engineer; Miss A. M. Benson, M.D.; Assistant-Surgeon Erlich S. Bharucha.
Representative in Representative Meeting: Lieutenant-Colonel L. F. Child, I.M.S.

Annual Report.—The report of the Branch Council and the statement of accounts were received. The report gave particulars of the papers read and the cases shown at the clinical meetings, and the Council expressed its indebtedness to those members who had contributed to the success of the meetings.

Cases.—Lieutenant-Colonel ASHTON STREET, I.M.S., showed two cases of elephantiasis scroti; two kidney stones removed by him from a policeman—patient was shown; a peculiar tumour removed from the mesentery—calcified gland. Lieutenant-Colonel L. F. CHILDE, I.M.S., showed a case of primary lateral sclerosis with facial palsy.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

NORTH OF ENGLAND BRANCH.—Dr. James Don, Honorary Secretary, 1, Grove Street, Newcastle-on-Tyne, gives notice that the annual meeting of the Branch, which will be purely a business meeting, will be held at the Royal Victoria Infirmary, Newcastle-upon-Tyne, on Tuesday, August 10th, at 3.30 p.m.

CONDUCT OF PRACTICE OF PRACTITIONERS ON WAR SERVICE.

SUGGESTED RULES.

THE following rules for the conduct of practice as between practitioners at home and practitioners absent on whole or part time war service have been adopted by the Kingston-on-Thames Division of the Surrey Branch of the British Medical Association:

1. That any practitioner called away on duty in connexion with the war be invited in the first instance to make his own arrangements for the carrying on of his practice and to notify the Honorary Secretary of the Division of the same.

2. That if he be unable to make such private arrangements he shall also notify the Honorary Secretary of the Division.

3. That in the latter case the arrangements for carrying on the absent practitioner's practice shall be left in the hands of trustees appointed by practitioners in the district as represented at this meeting, the trustees to be empowered to add to their number and to employ necessary legal and clerical help, all expenses for the same being defrayed by the funds due to the practitioners for whom they are acting or have acted, in proportion to the work done for each, as far as possible.

4. That in any case the medical practitioners in the area covered by the Kingston-on-Thames Division of the British Medical Association will attend, so far as they are able, any patients belonging to the absent practitioner for him in his absence, and will decline to continue to attend them after his return until one year has elapsed, and then only if released by written word from the practitioner, the application for such release not coming from the acting practitioner or his representative.

5. (a) When a practitioner absent on whole or part time service has made private arrangements for the carrying on of his practice and a patient of his is seen by a practitioner outside these arrangements, such acting practitioner shall receive one-half of the fees paid by the patient for such attendance, the accounts being rendered to the accredited representative of the absent practitioner at least quarterly, and the obligation of collecting the same resting with him. As regards the supply of medicine, when the absent practitioner has a dispenser the prescriptions shall be sent to him, but if the acting practitioner supply medicines he shall receive five-eighths of the fees instead of one-half and the entire charges for repeated medicines.

(b) When the practitioner absent on whole or part time service has no representative except the aforesaid trustees, the acting practitioner shall collect the fees and pay three-eighths to the trustees, for them to hold on behalf of the absent practitioner, retaining five-eighths for the work done, as well as the entire charges for repeated medicines.

6. As regards panel patients, when a practitioner absent on service has made private arrangements for the carrying on of his practice, his panel patients shall conform to these arrangements, but if any of them apply to another practitioner outside these arrangements that practitioner may attend such patients on his own terms.

7. Where a practitioner, absent on service, has made no arrangements for attendance on his panel patients, any practitioner who attends such patients shall receive 1s. for such attendance, and shall keep a record card for each patient and make a return quarterly to the representative of the absent practitioner or to the trustees if there be no representative, and such record cards shall be an account of the amount due from the absent practitioner to the acting practitioner.

8. That no transfer of panel patients on the list of a practitioner absent on service shall be accepted by any other practitioner until a year has elapsed after his return.

9. That all questions of doubt or difficulty shall be referred to a committee consisting of the aforesaid trustees and the Executive Committee of the Kingston-on-Thames Division of the British Medical Association.

BOND.

I, the undersigned, having read the above rules, which have been approved by a meeting of the medical practitioners of the area of the Kingston-on-Thames Division of the British Medical Association, and fully understanding the purpose for which they have been drawn up, do hereby consent to them and pledge myself to abide by them faithfully and honourably.

Three trustees under the scheme, Dr. H. Cooper (Surrebiton), Dr. A. E. Evans (Kingston Hill), Dr. R. N. Goodman (Kingston-on-Thames), were elected at a meeting on May 11th. Up to the end of July 13th the bond had been signed by sixty-three practitioners.

LOCAL MEDICAL AND PANEL COMMITTEES.

LONDON.

PANEL COMMITTEE.

The Constitution of the Committee.

At the first meeting of the newly elected Panel Committee for the County of London on July 20th Dr. H. J. CARDALE was reappointed to the chair, Dr. J. A. ANGUS to the vice-chair, and, subject to his being co-opted a member, Dr. Lauriston Shaw to the treasurership. The motion to co-opt members, however, was subsequently referred back, so that the Chairman acts as treasurer for the time being. A motion was before the meeting, in the name of Dr. Cardale, providing that, in addition to the three subcommittees hitherto appointed, there should be a fourth, consisting of the chairmen and vice-chairmen of the Panel Committee and of the other three subcommittees. This new subcommittee would represent the full committee on deputations, and would also have power to act on its behalf in all matters which would not permit of delay. The motion was seconded by Dr. MAJOR GREENWOOD, but Dr. ALFRED SALTER objected that the proposal was a deliberate attempt to introduce a Cabinet system of government. There was no guarantee that the emergency powers would not be used without warrant or authorization. It was the policy of the Insurance bureaucracy to insist that important decisions should be made within a very limited space of time, and such a subcommittee would exactly serve the purpose of that bureaucracy. In any case it would be possible to summon the whole Panel Committee within twenty-four or forty-eight hours. Believing their democratic basis to be in peril, he moved an amendment negating the proposal; this was supported by Dr. C. H. FRING and others, and carried by a large majority.

To the proposal for the co-option of eleven non-panel members, Dr. SALTER also offered opposition. As illustrating one danger of such a procedure, he pointed out that very often the meetings were prolonged until late in the afternoon, and many panel doctors had to leave early, while those co-opted members, being more leisured, would remain, and it was possible, would exercise a controlling influence. Dr. MAJOR GREENWOOD, on the other hand, thought that the Panel Committee should be made as representative as possible, and Dr. ANGUS asked how they could complain of the action of the British Medical Association, or of any other outside body, if they proceeded to boycott other branches of the profession in the way suggested by Dr. Salter. On being put to the vote, however, it was agreed, by 21 to 15, that the question of co-option be referred back to the Finance and General Purposes Subcommittee.

The Remuneration of Practitioners.

A report was presented by the members of the deputation appointed at the last meeting to confer with the London Insurance Committee as to the defects in the registration of insured persons and their effect upon the remuneration of practitioners. A memorandum was also presented which had been placed before the Insurance Committee with regard to the defects in the London register and the means to be adopted by the Panel Committee, the approved societies, and the Insurance Committee respectively to remove the difficulties. Dr. ANCOX moved and Dr. A. REID seconded a motion concurring in the proposal of the Insurance Committee to make to each practitioner on the panel, during the third quarter of 1915, two payments, in advance of the amount due to him, at the rate of 6d. for each capitation fee credited to him in accordance with the Medical Benefit Registers, 1913.

Dr. SALTER moved as an amendment that the Panel Committee decline to agree with the reduction in the rate of payment, and that the matter be referred to the sub-committee for further consideration and report to a special meeting of the whole Panel Committee. No shred of evidence had been put forward that anything like such a proportion as one-third of the insured persons had enlisted. It was preposterous, especially when they remembered how many of the insured were women. Before the practitioners of London were compelled to submit to such a serious reduction in their incomes as this, they should approach the Government.

Several members spoke in support of Dr. Salter's opinion, one of them advocating a strike, but, on being put to the vote, the amendment was negatived by 28 to 10. Dr. SALTER insisted that the names of the members with their votes should be placed on record, and this was done.

Dispensing Fees at Half-Rates.

Dr. R. J. FARMAN moved, and it was agreed:

That, subject to the Pharmaceutical Committee agreeing that the mixtures are capable of being stocked in bulk without deterioration, the Panel Committee do select ten mixtures from the London Insurance Pharmacopoeia, in respect of which dispensing fees at half the rates set forth in the drug tariff shall be allowed; that the Insurance and Pharmaceutical Committees be so informed, and that the Insurance Committee be asked to give the requisite notice to persons supplying drugs and appliances of the intention to apply those rates as from September 1st, 1915.

ESSEX.

LOCAL MEDICAL AND PANEL COMMITTEES.

SINCE the last report (SUPPLEMENT, April 17th, p. 136) three regular meetings and several subcommittee meetings have been held, and the Secretary has, as member of deputations from British Medical Association, interviewed the Commissioners on one or two important matters.

Continuance in Office till 1916.—The same Committees will hold office till July, 1916, having, in consequence of almost insuperable difficulties in the way of holding elections in the twenty-one panel areas, requested the Commissioners to be allowed to remain in office, any vacancies being filled in the way usual to casual vacancies.

The matters dealt with during the three months are briefly:

Referees.—The Commissioners have been again requested to appoint referees.

Prescriptions.—Surcharging has been avoided for 1914, the Pharmaceutical Committee having agreed to all further inquiry being confined to 1915, and for prescriptions to be dealt with fortnightly, they being satisfied that the system of private letters to practitioners by the panel secretary has been satisfactory in the past, and is likely to reduce unnecessary expense in future.

Pharmacopoeia.—The National Health Insurance Pharmacopoeia was issued in June, and has met with much appreciation among practitioners and pharmacists. Suggestions for improvements in next edition will be appreciated by the Secretary.

Certification.—The Commissioners were asked if possible to remove the differences between 211, f.c. and A.S. 156, so as to avoid societies trying to obtain certificates upon certain dates. Any day between fourth and eighth day are available to the practitioner, who cannot be forced to sign the second certificate before the eighth day.

Medical Representatives upon Insurance Committee.—The suggestion that these should be named by the panel

practitioners of the various areas and a list compiled, from which the Panel and Local Medical Committees should nominate representatives to be appointed by Commissioners and county council, was approved. The next election will be in 1916, of which due notice will be given.

"Rep. Mist."—It was decided that "Rep. mist." should only hold good from the first to the last day of any month, after which the original prescription should be re-written. The Pharmacists and Insurance Committee having agreed to group "scripts" under doctors' names as from June 1st, it is hoped the great expense of analysis will be avoided and checking facilitated. The system now runs: (a) Priced prescriptions in Pharmacopoeia save pricing and checking each item; (b) prescriptions grouped under doctors' names facilitate reference and avoid analysis; and (c) enable secretary to trace expensive items fortnightly and write to the practitioner, which it is hoped will avoid, as in 1914, the unpleasant process of surcharging, which has caused considerable disturbance, with appeals (and consequent cost) in other areas.

Payments for 1913.—The absence of details of the payment for 1913 has been pointed out to the Insurance Committee, who has been asked to give the amounts for panel service, unallotted, dispensing, and temporary residents.

WEST HAM.

PANEL PRACTITIONERS' MEETING.

A MEETING of practitioners on the West Ham panel was held at the Stratford Town Hall on June 29th.

Annual Report.—The annual report of the Panel Committee was received and adopted.

Election of Panel Committee.—The new Panel Committee to come into office on July 15th, 1915, was elected as follows: Drs. Beadles, Cannan, Challans, Darlow, Dayus, Duffy, Fairfax, Frederick, Grigono, Hay, Kennedy, McCormack, Nelson, Panting, Reid, Rose, J. Russell, Lillian Simpson, Taylor, Watkin, and Welply.

Appeals against Surcharging.—It was resolved that when a practitioner is surcharged by the West Ham Insurance Committee and appeals to the Insurance Commissioners the Panel Committee should have a representative at that appeal. It was also resolved that the treasurer of the Panel Committee should pay such representative the sum of 3 guineas per day out of the Panel Committee's funds.

COUNTY OF SURREY.

PANEL COMMITTEE.

The monthly meeting of the County of Surrey Panel Committee was held at Surbiton Cottage Hospital on June 18th, when Dr. LANKESTER was in the chair.

Pharmacopoeia.—It was decided to inform the Pharmaceutical Committee that the prices in the Pharmacopoeia are placed there as a guide to practitioners in economical prescribing, and not as a guarantee to the chemist that the prices are correct.

Expenses of Pharmaceutical Committee.—It was decided not to support the application of the Pharmaceutical Committee that the expenses of that committee be paid out of the Drug Fund.

Range of Medical Services.—It was decided to inform the County Committee that the examination of the eyes was work that should be undertaken by a specialist, or one specially trained for such work.

Practitioners' Lists.—The Secretary was instructed to inform both the Insurance Commissioners and the County Committee that as six months had now elapsed since the end of 1914, practitioners' lists should now be corrected up to that period, and the proper credits made to the County Committee.

Prescribing for Insured Persons in Hospitals.—It was decided to ask all hospitals in the county what arrangements were made for prescribing for insured persons in those institutions.

Joint Committee for Checking Prescriptions.—Drs. Morton Mackenzie, Lyndon, and Cran were appointed to serve on the Joint Committee for the checking of prescriptions.

LIVERPOOL.

PANEL COMMITTEE.

A MEETING of the Liverpool Panel Committee was held at the Medical Institution on June 29th, when Mr. F. C. LARSEN was in the chair.

Allocation of Surplus Funds.—A letter was read from the Medical Secretary of the British Medical Association in reference to Clause VI of the agreement as to the allocation of surplus funds. It was resolved that action by the Panel Committee with regard to Clause VI be deferred for the present.

Conference of Local Medical and Panel Committees.—Dr. ALLEN, who had acted as representative at the conference of Local Medical and Panel Committees, gave a report of the proceedings.

Revised Formulary.—A revised formulary, which had been drawn up by the Subcommittee appointed to consider this subject, was considered and amended.

The Committee met again on July 6th, when Mr. F. C. LARKIN was in the chair.

"Rep. Mist."—Dr. PARKINSON reported the result of his appeal to the Commissioners in reference to "Rep. mist.," and it was resolved that no action be taken by the Committee until the conference suggested by the Commissioners between Dr. Parkinson and the administrative officer had taken place.

Election of the Committee.—The nominations for the forthcoming election of the Panel Committee were considered, and it was resolved that the nomination and re-election of the members of the present Committee should, if possible, be effected.

COUNTY OF LANARK.

LOCAL MEDICAL AND PANEL COMMITTEES.

A MEETING of the Local Medical and Panel Committees for the County of Lanark was held on June 30th at Glasgow, when Dr. W. G. MACPHERSON (Bothwell) was in the chair.

Domiciliary Treatment.—A communication was read from the County of Lanark Pharmaceutical Insurance Committee, and it was agreed at the first opportunity to issue a circular to doctors regarding domiciliary treatment.

Doctors' Prescriptions for April.—A communication was submitted from the County of Lanark Pharmaceutical Insurance Committee regarding the various prescriptions issued by doctors in April last. It was agreed to communicate with the doctors concerned.

Conference of Representatives of Local Medical and Panel Committees.—Dr. THOMSON (Uddingston) and Dr. GRANT (Blantyre) reported on the business transacted at the recent Conference, and were thanked for their services.

Secretary.—A vote of appreciation on the gallantry of the Secretary of the Committee, Major McKenzie, 16th Cameronians (Scottish Rifles), who had been wounded while with his battalion charging the German trenches, was unanimously passed, along with the expression of a hope for his speedy and complete recovery.

INSURANCE COMMITTEES.

EDINBURGH.

Administrative Work, 1914-15.

A REPORT on the administrative work of the Edinburgh Insurance Committee from April, 1914, to July, 1915, has been issued. It states that the machinery of medical benefit is working smoothly. In January, 1915, the Committee had on its register 103,634 insured persons; at the date of report the number was 119,767. A scheme was prepared and agreed upon for the assignment of insured persons requiring a doctor. It was rendered necessary by the fact that many insured persons did not take the precaution to select a panel doctor until they found themselves ill and requiring medical benefit. The parliamentary divisions of the city had been taken as a basis for fixing the areas under which the assignment scheme would operate, and doctors on the panel list had each been placed in one of these areas or divisions, having due regard to the place of residence of the doctor and to the need for having a distribution of doctors over the respective areas in proportion to the insured population of each such area. In the East Division there were 30 doctors, in the West Division 24, in the Central Division 29, and in the South Division 31. Since the outbreak of war twenty-one members of the medical panel had gone on army service, one of whom (Dr. J. M. Bowie) was wounded while tending wounded soldiers in a field hospital. He is

now happily recovering. The panel lists of doctors on army service amounted in the aggregate to 16,280 persons.

For the years 1913 and 1914 the "floating sixpence" had been saved for the doctors. The highest number of insured persons on the panel list of any one doctor in Edinburgh in 1913 was 2,989, and in 1914, 3,025, and the lowest number 53. The number of surgery attendances was 193,956 in 1914, against 157,079 in 1913; and the number of visits at patients' own homes was 80,938, as against 78,306. The highest number of attendances and visits made by any one doctor in Edinburgh was 10,999, as compared with 9,181; and the lowest number was 84, as against 74. The highest sum paid to any one doctor in Edinburgh was £1,104 8s. 5d., as against £1,062 14s. 1d.; and the lowest sum was £45 11s. 8d., as against £94 1s. 1d. The highest average paid to any one doctor for each attendance or visit was 5s. 6d. in 1914, and the lowest average was 1s. 8d. The general average paid for each attendance or visit was 2s. 8d., compared with 3s. 4d. in 1913. The payments made to panel practitioners for the year to December 31st, 1914, amounted to £30,802 3s. 2d., while the "floating sixpence," distributed in the ratio of one-fourteenth of each doctor's total remuneration for the year, amounted to £2,200 3s.; and the unallocated money for the half-year to July 12th, 1914, distributed among doctors according to the approved scheme, was £1,421 5s. 3d. In addition to the above payments, there remained to be distributed among the doctors a further sum of £2,046 0s. 7d., being the balance of unallocated money in the panel fund for the year 1914.

The total number of insurance prescriptions dispensed in the Committee's area for the year 1913 was 149,289; for the year 1914, 156,460. The total amounts of accounts paid in respect of these prescriptions were, for 1913, £6,398 13s. 10d., and for 1914, £6,898 2s. 6d. The bonuses paid to chemists and appliance dealers in respect of the year 1913 amounted to £1,278 13s. 6d., being 20 per cent. of the amounts of their accounts. A first bonus, amounting to £320, had been paid for the year 1914, and it was anticipated that a further bonus would be available out of additional credits yet to be advised by the Insurance Commissioners. The average cost per prescription for the year 1913 was 10.28d.; for 1914, 10.58d. The rate of cost per person for 1913, 1s. 4½d.; for 1914, 1s. 5d.

The report goes on to discuss the negotiations between the Town Council and the Insurance Committee in relation to sanatorium benefit to dependants of insured persons. The matter is still pending, but the report states that the work is carried on efficiently in the meantime, and it is expected that an understanding will be reached shortly.

CORRESPONDENCE.

DEDUCTIONS FOR SOLDIERS.

PANEL DOCTOR writes: In reference to the Conference of Representatives of Local Medical and Panel Committees—the discussions at which were detailed in the SUPPLEMENT of June 26th—on pages 330 to 331, under "Termination of Agreements," a statement was made by the representative from Gloucestershire that those serving with the colours had been practically deducted twice over, and the Chairman stated: "It was not certainly the common practice throughout the country to deduct soldiers twice."

I think this point ought to be inquired into and definitely fixed, because in the important county in which I reside and practise, since last autumn I have had 15 per cent. deducted for soldiers who have joined the army, and, taking only this last six months into consideration, I have had removed from this cause more than 50. I should consider that altogether, what between *en bloc* and detailed removals, I have had over 20 per cent. deduction made to me on this account. This is, of course, in addition to the other deductions of 10 per cent., etc.

If the Chairman is right that it is not the common practice, may I ask who is responsible for these most important deductions in the quarterly advances? Is it the clerks and their committees? Or is it the Commissioners?

In view of the delay in the settlement for 1913 and the rumours that there is to be no settlement because there is no money, it is a most important thing that each practitioner obtains payment every quarter on his full value and leaves as "little as possible" to the "as soon as possible,"

DEATHS FROM EPIDEMIC DISEASES IN LONDON DURING THE FIRST QUARTER OF 1915.

NOTE.—The black lines show the recorded number of deaths from each disease during each week of the quarter. The dotted lines show the average number of deaths in the corresponding weeks of the five preceding years, 1910-14. Under the heading "Diarrhoea" are given the deaths from diarrhoea and enteritis among children under 2 years of age; the corrected average number of these deaths is not available.

Scarlet Fever.—The fatal cases of scarlet fever, which had been 69, 75, and 108 in the three preceding quarters, declined again in the quarter under notice to 100, but were 48 above the corrected average number; this disease was proportionally most fatal in Hammersmith, Fulham, Stoke Newington, Bethnal Green, Stepney, and Deptford. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals, which had been 3,095, 4,157, and 4,431 at the end of the three preceding quarters, had declined again to 2,514 at the end of the quarter under notice; 3,958 new cases were admitted during the quarter, against 4,731, 5,283, and 7,540 in the three preceding quarters.

Whooping-Cough.—The deaths from whooping-cough, which had been 510, 206, and 121 in the three preceding quarters, rose again in the quarter under notice to 378, but were slightly below the corrected average number. The greatest proportional mortality from this disease was recorded in Holborn, Finsbury, Bethnal Green, Brompton, Battersea, Deptford, and Greenwich.

Diphtheria.—The fatal cases of diphtheria, which had been 143, 138 and 214 in the three preceding quarters, declined again in the quarter under notice to 193, but were 53 in excess of the corrected average number. The highest death-rates from this disease occurred in St. Pancras, Islington, Holborn, Bethnal Green, Stepney, Battersea, and Woolwich. There were 1,322 diphtheria patients under treatment in the Metropolitan Asylums Hospitals at the end of the quarter, against 1,083, 1,236, and 1,665 at the end of the three preceding quarters; 2,033 new cases were admitted during the quarter, against 1,675, 1,975, and 2,728 in the three preceding quarters.

Diarrhoea.—The deaths under this heading are those attributed to diarrhoea and enteritis among children under 2 years of age; measured in proportion to the births registered during the quarter, the mortality from this cause was greatest in Hammersmith, the City of Westminster, Holborn, Shoreditch, Bethnal Green, Southwark, and Woolwich.

In conclusion, it may be stated that the aggregate mortality in the quarter under notice from these epidemic diseases, excluding diarrhoea, was 51.2 per cent. above the average.

HEALTH OF ENGLISH TOWNS.

In ninety-six of the largest English towns, 7,681 births and 4,072 deaths were registered during the week ended Saturday, July 10th. The annual rate of mortality in these towns, which had been 12.4,

12.3, and 11.9 per 1,000 in the three preceding weeks, further fell to 11.7 per 1,000 in the week under notice. In London the death-rate was equal to 11.5, while among the ninety-five other large towns it ranged from 5.1 in Enfield, 5.6 in Tottenham, 6.3 in Norwich, 6.6 in Ealing, 7.2 in Croydon, and 7.4 in Ilford, to 16.8 in Wakefield, 17.3 in Derby, 17.5 in Gateshead, 17.6 in Stockton-on-Tees, 18.8 in West Bromwich, and 21.4 in Barrow. Measles caused a death-rate of 1.6 in Halifax, 1.7 in Derby, 2.1 in Boodle, 3.0 in West Bromwich, and 3.3 in Middlesbrough, and diphtheria of 1.0 in Oldham and 1.7 in Northampton. The mortality from the remaining infective diseases showed no marked excess in any of the large towns, and no fatal case of smallpox was registered during the week. The causes of 37, or 0.9 per cent. of the total deaths were not certified either by a registered medical practitioner or by a coroner; of this number, 6 were recorded in Gillingham, 6 in Gateshead, 5 in Liverpool, 4 in Birmingham, 3 in Manchester, and 2 in South Shields. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 2,373, 2,422, and 2,446 at the end of the three preceding weeks, further rose to 2,471 on Saturday, July 10th; 322 new cases were admitted during the week, against 330, 332, and 248 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In the sixteen largest Scottish towns 1,022 births and 705 deaths were registered during the week ended Saturday, July 10th. The annual rate of mortality in these towns, which had been 15.7, 15.7, and 16.6 per 1,000 in the three preceding weeks, fell to 15.7 in the week under notice, but was 4.0 per 1,000 above the rate recorded in the ninety-six large English towns. Among the several towns the death-rate ranged from 8.5 in Kilmarnock, 8.8 in Perth, and 8.9 in Kirkcaldy, to 18.7 in Clydebank, 21.3 in Falkirk, and 23.3 in Ayr. The mortality from the principal infective diseases averaged 2.8 per 1,000, and was highest in Aberdeen and Falkirk. The 356 deaths from all causes in Glasgow included 57 from measles, 10 from whooping-cough, 5 from diphtheria, 5 from infantile diarrhoeal diseases, 3 from scarlet fever, and 1 from enteric fever. Six deaths from measles were recorded in Aberdeen and 3 in Clydebank; from scarlet fever, 3 deaths in Edinburgh; from whooping-cough, 6 deaths in Aberdeen; and from diphtheria, 2 deaths in Edinburgh.

HEALTH OF IRISH TOWNS.

During the week ending Saturday, July 10th, 537 births and 309 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 646 births and 387 deaths in the preceding period. These deaths represent a mortality of 1.3 per 1,000 of the aggregate population in the twenty-seven principal urban districts of Ireland, as against 1.6 per 1,000 in the preceding period. The mortality in these Irish areas was, therefore, 1.6 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate, on the other hand, was only 2.1 per 1,000 of population. As regards mortality of individual localities, that in the Dublin registration area was 15.9 as against an average of 16.9 for the previous four weeks. In Dublin city 15.7 as against 17.0, in Belfast 10.0 as against 13.2, in Londonderry 16.5 as against 17.7, in Limerick 21.7 as against 15.9, and in Waterford 19.0 as against 13.8. The zymotic death-rate was 1.2, as against 1.0 in the previous period.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements) *Importance of Notice to Applicants* appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

BETHNAL GREEN INFIRMARY.—Assistant Medical Officer. Salary, £280 per annum.

BIRMINGHAM AND MIDLAND EYE HOSPITAL.—Junior House-Surgeon. Salary, £100 per annum and £5 in laundry allowance.

BIRMINGHAM GENERAL DISPENSARY.—Resident Medical Officer. Salary, £250 per annum.

BOLINGBROKE HOSPITAL, Wandsworth Common, S.W.—House-Surgeon. Salary, £100 per annum.

BOLTON INFIRMARY AND DISPENSARY.—Second House-Surgeon. Salary, £200 per annum.

BOTHWELL KIRKLANDS ASYLUM.—Resident Medical Superintendent. Salary, £400 per annum.

BRISTOL GENERAL HOSPITAL.—House Physician. Salary, £150 per annum.

BRISTOL ROYAL INFIRMARY.—Honorary Surgeon, and, if necessary, an Honorary Assistant Surgeon.

BURY INFIRMARY.—Senior and Junior House-Surgeons. Salary, £250 and £150 per annum respectively.

CARDIFF: KING EDWARD VII HOSPITAL.—House-Surgeon. Salary, £140 per annum.

CARDIFF: WELSH METROPOLITAN WAR HOSPITAL, Whitehall.—(1) Resident Medical Officer. (2) Resident Physician.

CHELTENHAM GENERAL HOSPITAL.—(1) House-Surgeon. (2) House-Physician. Salary, £125 per annum.

CROYDON COUNTY BOROUGH.—Assistant Medical Officer of Health and Assistant School Medical Officer. Salary, £350 per annum.

DEVONPORT: ROYAL ALBERT HOSPITAL.—House-Surgeon. Salary, £150 per annum; 21s. allowed weekly for working single-handed.

EXETER: ROYAL DEVON AND EXETER HOSPITAL.—Assistant House-Surgeon. Salary, £150 per annum.

FOLKSTONE: ROYAL VICTORIA HOSPITAL.—House-Surgeon. Salary, £150 per annum.

GREENOCK: SMITHSON FOURHOUSE AND ASYLUM.—Assistant Medical Officer. Salary, £200 per annum.

GUILDFORD: ROYAL SURREY COUNTY HOSPITAL.—House-Surgeon. Salary, £150 per annum.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST,rompton, S.W.—House-Physician. Honorarium, 50 guineas for six months.

HUNTERSFIELD COUNTY BOROUGH.—Assistant School Medical Officer. Salary, £300 per annum.

KING EDWARD VII'S HOSPITAL FOR OFFICERS, Grosvenor Gardens, S.W.—Resident Medical Officer.

EIGHTY-THIRD ANNUAL MEETING

OF THE

British Medical Association.

LONDON, 1915.

ANNUAL REPRESENTATIVE MEETING.

Mr. T. JENNER FERRELL, LL.D. (Chairman of Representative Meetings), in the Chair.

The proceedings of the Annual Representative Meeting began on Friday, July 23rd, 1915, at the Connaught Rooms, Great Queen Street, London, at 10 a.m.

The return of the election of Representatives of Divisions for the year 1915-16 was received, approved, and entered on the minutes. Notices of appointment of substitutes for Representatives were also received. Intimation was made of numerous letters of apology for absence, and it was stated by the CHAIRMAN that in most cases the absentees were engaged on military duty or on work on behalf of practitioners serving with the forces. There were 141 present.

STANDING ORDERS.

The Standing Orders of the last Representative Meeting were adopted subject to certain formal amendments.

ORDER OF BUSINESS.

The report of the Agenda Committee, dealing with the order of business, was adopted.

ILLNESS OF MR. EDMUND OWEN.

The CHAIRMAN said he was sure those who remembered the progress of affairs in connexion with the establishment of the Representative Meeting would bear with concern that Mr. Edmund Owen, whose name was a household word in the profession, whose eloquence and devotion to duty in Association affairs and elsewhere were known to many, was grievously stricken with illness, to which he might very possibly succumb. His recovery could hardly be complete. Those who remembered how he laboured as Chairman of the Constitution Committee in the preliminary stages which led to the reorganization of the constitution of the Association, and who remembered the genial and tactful words in which Mr. Owen introduced the subject at the Annual Meeting at Cheltenham, thus smoothing away many difficulties—would take this opportunity of offering a word of sympathy to Mr. Owen in his illness. The meeting, he was sure, hoped that Mr. Owen would yet be spared to do useful work.

A resolution of sympathy was ordered to be sent to Mr. Owen. (Before the conclusion of the meeting the news of Mr. Owen's death was communicated by the Chairman to the members and by them received with poignant regret.)

ANNUAL AND SUPPLEMENTARY REPORTS
OF COUNCIL.

The Annual and Supplementary Reports of Council for 1914-15, published in the SUPPLEMENT to the JOURNAL, May 8th and July 3rd respectively, were received.

OFFICERS FOR 1915-16.

Standing Order No. 34 was suspended, so as to take, at an early period in the proceedings, the re-election of the President, together with the other proposals of the Council in connexion with the officers for the year. The CHAIRMAN remarked that it was usual for the President to be elected from the area in which the scientific meeting was held, but as there was to be no scientific meeting this year the position needed adjustment.

The CHAIRMAN of COUNCIL moved:

That Sir Alexander Ogston, K.C.V.O., M.D., be re-elected as President of the Association for 1915-16, Sir Thomas Clifford Albutt, K.C.B., LL.D., as President-elect, and Dr. W. Ainslie Hollis as Past-President.

The motion was carried unanimously.

The point was raised that the Association was bound by its constitution to hold a scientific meeting each year, but the CHAIRMAN of COUNCIL remarked that the situation was so completely altered by the war that he did not think the Representatives would find fault with the Council on account of its action in this matter. (Hear, hear.)

VOTES OF CONDOLENCE.

The "preliminary" paragraphs of the Annual Report of Council (SUPPLEMENT, May 8th, pp. 166-8, paragraphs 1-9), giving a historical account of the events of the year, and mentioning the losses the Association had sustained by death, were approved.

The CHAIRMAN of Council said he was glad to be able to make a correction in the list of members reported as dead. Dr. Dearden, whose name was given, was not dead, and was present at the meeting.

The CHAIRMAN moved that an expression of sympathy and condolence be sent on behalf of the meeting to the relatives of the late Dr. B. G. Morison, the Representative of the St. Pancras and Islington Division, 1913-1914. No more honest, straightforward, or painstaking member had attended the Representative Meeting, and he was sure the Association would desire to express its sympathy with the relatives in their loss. The members signified their approval by rising.

The CHAIRMAN moved that the meeting express its sympathy with the relatives of Dr. Bruce Goff, of Bothwell, a very old member of the Association and a former Representative. A letter of condolence was ordered to be sent to the relatives.

CAPTAIN MARTIN-LEAKE, V.C.

The preliminary paragraphs of the Supplementary Report of Council (SUPPLEMENT, July 3rd, paragraphs 187-8), including the proposal that the Gold Medal of the Association be awarded to Captain Arthur Martin-Leake, V.C., R.A.M.C., were approved.

STANDING INSURANCE ACTS COMMITTEE.

The CHAIRMAN of the Insurance Acts Committee (Dr. J. A. Macdonald) moved, on behalf of the Council, that the Representative Meeting should add to the schedule to the by-laws as to Standing Committees a new paragraph appointing a standing Insurance Acts Committee and setting forth its constitution and duties. The addition to the by-laws was as follows:

Name of Committee.—Insurance Acts.

Members.—Members of the Association appointed as follows: 12 elected by the elected Representatives of the Constituencies comprised in the groups of Branches and Divisions formed for the purpose mentioned in By-law 46 (c), the Representatives of all the Constituencies in each such group being entitled together to elect one member of the Committee in the same manner as they elect one member of the Council in pursuance of that By-law; 12 elected by the four *ex officio* members and the above-mentioned 12 elected members of the Committee acting together, such 12 members to be nominated or qualified as under—namely, 6 selected so far as possible on a territorial basis from among members nominated by the Local Medical Committees and Panel Committees formed in Great Britain under the Insurance Acts; 2 non-panel practitioners; 1 Representative nominated by each of the following bodies—namely: (a) The Association of Registered Medical Women, together with the Northern Association of Registered Medical Women; (b) The Society of Medical Officers of Health; (c) The Poor Law Medical Officers' Association of England and Wales.

Duties.—To deal with all matters arising under the National Insurance Acts, 1911 to 1914, and any Act amending or consolidating the same, and to watch the interests of the profession in relation to those Acts.

Dr. MACKFETH (Southampton) said that in order to avoid criticism of the Committee in the future he would propose that all members, except the two non-panel practitioners and the four *ex officio* members, be panel practitioners. The Committee would deal entirely with panel matters and should be thoroughly representative of the interests of those engaged in insurance practice.

On a point of order raised by Captain F. CHARLES LAERIN (Council and Deputy Representative for Manchester), the CHAIRMAN ruled that the amendment was incompetent, as notice had not been given. The meeting must either accept or reject the motion.

Dr. C. E. ROBERTSON (Glasgow) pointed out that in some instances the Local Medical Committee was not identical with the Panel Committee.

The CHAIRMAN of COUNCIL intimated that the matter was capable of local adjustment.

The motion to adopt the proposed addition to the Schedule was agreed to.

THE FINANCIAL STATEMENT.

The Treasurer (Dr. RAYNER) submitted the financial portion of the Annual Report of Council (SUPPLEMENT, May 8th, paras. 10 to 25). He mentioned that the balance of

income over expenditure for 1914-15 was £15,296—(ap-
plause)—whilst in the previous year there was a deficit of
£4,000, which meant that in the year there had been a
swinging of the pendulum in favour of the Association of
more than £20,000. Nobody rejoiced more than he did,
because it had now been possible to reduce the overdraft
at the bank from £45,000 to £31,000.

The financial statement was approved without discussion.

SALARIES OF CLERICAL STAFF.

Paragraph 189 of the Supplementary Report of Council
(SUPPLEMENT, July 3rd, p. 2), stating that a scheme for the
improvement of the conditions of service of the clerical
staff had been adopted by the Council, was approved.

THE ASSOCIATION AND THE WAR.

Dr. T. JENNER VERRALL being the Chairman of the
Committee of Chairmen of Standing Committees which
had dealt with matters arising out of the war, the Deputy
Chairman (Mr. E. B. TURNER) took the chair at this stage.

Dr. VERRALL, in moving the adoption of the paragraphs
(25-33) of the Annual Report of Council, headed "The
Association and the War" (SUPPLEMENT, May 8th, p. 178),
remarked that he did not suppose that there would be no
criticism in respect of what had been done or of what had
been omitted. The Association had worked in harmony
with the authorities at the War Office, and the officials
there had thoroughly appreciated the efforts of the Associa-
tion to supply the nation with the medical service
which was absolutely necessary for the army.

ATTENDANCE UPON DEPENDANTS.

The paragraphs (26-33) dealt with the subject under
three heads: (i) The organization of medical attend-
ance upon dependants of men serving with the colours;
(ii) the organization of the medical profession to meet
the medical needs of the forces in addition to those of
the civil population, and (iii) the assistance of the
Belgian medical profession.

Dr. WILLIAM EARDLEY (Wakefield, Pontefract, and Castle-
ford) moved the following amendment:

That the free medical attendance upon the dependants of men
serving with His Majesty's Forces be discontinued after
July 31st next; and that such action be taken as may be
necessary to secure this step being taken generally through-
out the country, and to find out whether the War Office is
prepared to provide medical attendance for such dependants
or not.

The motion expressed the opinion prevalent in many parts
of the kingdom that the privilege of free medical attend-
ance, given very gladly by the profession, had been abused.
There could hardly be any doubt that, in the majority of
cases, the dependants of soldiers were better off now than
they were in times of peace. As one who had taken some
part in organizing these services he could testify to the
enthusiasm and willingness displayed by his colleagues in
undertaking this work. But in many cases the doctors
knew that the dependants were able and were probably
willing to pay if they were asked. It had been stated in
Parliament that no less than 25 millions had been paid in
separation allowances, and it was reasonable to suppose
that most of the dependants could afford to pay a reason-
able amount for the necessities of life.

The CHAIRMAN OF COUNCIL reminded the meeting of the
history of the question. The attendance on dependants of
those on active service was given in order that no
dependant of a man fighting for his country should
need to apply to the Poor Law authorities. When the
scheme was started there was no such separation allow-
ance as was given now. There was no doubt the privilege
the profession had granted had been abused in certain
districts, but, to a certain extent, medical practitioners
themselves were to blame. If at the beginning practi-
tioners had explained the medical point of view to the
committees organizing the relief, as they were urged
by the Association to do, there would have been
no abuse. The privilege had sometimes come to be re-
garded as a right, and books had been scattered broadcast
by committees. He told the committee in his locality
that it would destroy the scheme altogether if it continued
such widespread distribution, and pointed out that the free
treatment was a pure act of grace on the part of the
doctors and chemists. The committee realized that it
had taken a wrong view altogether. According to

the most recent figures, the number of books dis-
tributed in England was 150,291; in Scotland, 25,808;
in Ireland, 72; and in Wales, 7,655—a total of 185,826.
It showed how much smaller the scheme had proved than
was anticipated. The Prince of Wales's Fund had under-
taken to provide a grant of £40,000 for drugs for the
working of the scheme during the first six months, but the
amount required for the past seven months had been only
£4,500. If the members of the profession throughout the
country interested themselves in the matter, they would
be able themselves to put anomalies right. He would be
very sorry if the meeting agreed to the motion by Wake-
field; it would be very ungracious if, having undertaken
the work, the profession stopped in the middle, especially
when, to some extent, the difficulties were due to the
sluggishness of some doctors.

Dr. LUNBIE (Edinburgh and Leith) said that in Edinburgh
the profession made arrangements with the local commit-
tees. These had, on the whole, worked well, though, as in
other parts of the country, there were benevolent ladies
who had large ideas. The chief complaint in Edinburgh
had been as to the excessive benevolence of the medical
men, on whose suggestion the lady visitors had issued
books to unsuitable cases, and then the chemists com-
plained. He specially objected to the last clause of the
amendment, which proposed to throw the attendance of
dependants on the Government, as it would be opening
the gates to State Socialism.

Dr. A. DREY (Halifax) said that he had been convinced
by the Chairman of the Council. All that the profession
was asked to do was to provide free attendance for neces-
sitous persons, and there was no member of the profession
who was not prepared to do so. Undoubtedly there had
been abuse; that was no reason for abandonment. The
abuse only should be stopped.

The amendment was lost.

COMMUNICATIONS WITH THE WAR OFFICE.

The paragraphs of the Supplementary Report of Council
dealing with this matter (SUPPLEMENT, July 3rd, p. 2) were
then considered.

With regard to the question of whole time military
medical service, the Council reported that it had to
consider as vitally affecting the recruiting of medical
men for work with the army certain grievances of
medical practitioners already serving, as well as
certain other difficulties which had to a greater or
less extent operated to prevent medical practitioners
from accepting commissions.

The Special Committee of Chairmen of Standing
Committees had addressed a letter to the Government,
through the Director-General of the Army Medical
Service, pointing out the grievances of junior officers
of the R.A.M.C.(T.F.), of lieutenants in the Special
Reserve R.A.M.C., of majors in the R.A.M.C.(T.F.),
and as to pensions and compensation. With regard to
the latter point, it was stated that a communication,
dated May 16th, received from the War Office made it
plain that Territorial and temporary medical officers
were, in respect of pensions and gratuities, on the
same footing as officers in the Regular R.A.M.C.

The difficulties which were found to be preventing
practitioners from accepting commissions were stated
to be:

1. That some local authorities were not as willing
as they should be to set free young medical men in
their employ.

(2) That practitioners who would have been glad to
offer themselves for commissions were unable to do so
on account of their financial commitments as regards
their practices or families. The Committee reported
that though it had been convinced that it could not at
the present moment press proposals either to raise the
remuneration or increase the gratuity at the end of
service, it had placed on record its conviction that if
the Government could see its way to grant extra pay
or gratuity to cover what to many practitioners would
be a considerable loss of income or capital such action
would to a considerable extent solve the present diffi-
culty of securing medical officers.

The Committee went on to express its opinion that
it would be impracticable to apply compulsion to
members of the medical profession alone, and that
compulsory medical service for the army could only
be considered as part of a national compulsory
system.

Dr. VERRALL, in moving the adoption of this part of the Supplementary Report, said that the Special Committee had had many communications and conferences with the War Office. The Committee had recognized that it was the duty of the War Office to get the men wanted for the army, but had pointed out that the Association had also to concern itself with the needs of the civil community. Representations had been made as to the grievances of those serving with the Territorial Force and the Special Reserve. Opinions had been expressed as to the financial considerations which perhaps were holding men back. The report, he said, showed that the Committee had done everything possible to ensure that the Government should know the medical point of view. The Committee, in its representations to the War Office, had laid stress on the fact that in many cases financial considerations prevented men from joining the forces. Practitioners were torn between a loyal desire to serve their country and the financial difficulty. The Committee had asked that some greater consideration should be given to these cases, and a higher gratuity on quitting service, so that practitioners should be enabled to make a fresh start more easily. Alternatively, or in addition, it was suggested that possibly some greater facilities for insurance might be given. At present the Committee had had no favourable answer to these representations. No doubt the Army Medical Department was faced with difficulties in regard to money. That was no excuse, however, for treating doctors unfairly. The nation was now beginning to see that the British purse was not absolutely bottomless, and that being so the profession could hardly blame the Department—when it still received fresh applications in fair numbers for commissions on the present terms—if it was slow to acquiesce in a request for better terms. While admitting that there was something to be said for the Department's side of the question, the Committee was putting it as strongly as it ought in asking that the Department should give better terms, and in saying plainly that financial causes were holding some men back. From statements made in Parliament it appeared that arrangements were being made for promoting lieutenants of the Territorial medical service to the rank of captain after six months' mobilized service. So far as it went, that was clearly a step in the right direction, and there was reason to hope that the position of officers of the Special Reserve (R.A.M.C.) would receive favourable consideration.

The paragraphs of the Supplementary Report of the Council dealing with this subject were then approved.

THE ASSOCIATION'S WAR REGISTER.

Dr. VERRALL, in reply to a request, said that he was now in possession of a somewhat lengthy interim report as to the progress of the Association's war register, but it was hardly necessary to enter into detail at this stage. He must say that the Divisional Secretaries had exhibited no sort of resentment at being asked to do more work, but, on the contrary, had shown their usual zeal and self-sacrifice. The returns from those districts where difficulties were known to exist had been, on the whole, extremely good. In a few weeks the Committee hoped to have a record covering about 75 per cent. of the practitioners, and when it was remembered that there was always a percentage who would never answer inquiries, it must be admitted that the prospect was satisfactory.

Lieutenant FOTHERGILL (Brighton) thought that the Association ought to do everything it could to see that the position of the dependants of any medical man who volunteered for medical service was safeguarded. He moved, as a rider, that the Council should take every possible step to obtain the favourable consideration by the Government of the question raised in the appendix to the supplementary report of the Council (SUPPLEMENT, July 3rd, p. 6), as to the grievances of medical men already serving and the difficulties preventing medical practitioners from accepting commissions.

Dr. TOMKINS seconded, and the motion was approved.

SALARIES OF INSTITUTIONAL MEDICAL OFFICERS.

Dr. MAJOR GREENWOOD moved a further rider:

That in all cases where military duties are discharged by institutional medical officers the salaries paid to full time officers should be on a scale not less than that paid by the

War Office to members of the R.A.M.C.; (2) that where the duties are part time only a condition should be made that the medical officer's salary should be in proportion to the extra labour involved.

As long, he said, as a voluntary system existed the Association should see that members of the profession helping in the war were fairly treated and doctors had reasons for asking that their new remuneration should be on a higher scale than that of the R.A.M.C. There were cases in which institutions were taken over by the army, and the superintendent was given charge simply as a military officer, so that he did not always get proper remuneration.

Dr. DENNING, in seconding the rider, said that the salaries paid to full time officers should be on a scale not less than those paid by the War Office to members of the R.A.M.C. Where the duties were only part time a condition should be made that the medical officers' salary should be in proportion to the extra labour involved.

Major GALLOWAY (Marylebone) said the Metropolitan Counties Branch had pressed this question forward, but it was complicated, and it would be waste of time to discuss it at the present stage. Pay or rank was not given to a medical officer on account of the actual work he had to do; he had to do what he was told. It had been the custom in peace time that the man in charge of a general hospital of 520 beds should be a lieutenant-colonel, but in many cases a major had to take charge. He suggested that the question should be referred to a committee.

With the permission of the meeting the rider was withdrawn, and an undertaking was given that it would be considered by the special committee.

DISTRIBUTION OF MILITARY MEDICAL OFFICERS.

Dr. G. E. HASLIP (Westminster) regretted that the Report of Council made no protest against what he regarded as the wasteful distribution of military medical officers. A flagrant case in London was that of a hospital with twenty-five resident medical officers and seven R.A.M.C. men.

Dr. EWART (Eastbourne) said that at Beachy Head during the last three months there had been from 100 to 250 R.A.M.C. men learning stretcher drill and forming fous. At the same time there was said to be a shortage of workers to attend the wounded at the Dardanelles. In the neighbourhood of a camp accommodating 3,000 convalescent soldiers, the older doctors united in offering to work the camp for the military authorities, but the officer, in charge, while expressing his thanks, said that there was nothing they could do. One medical officer spent his time in arranging sports and concerts and so on for the men. That was an absolute waste of a doctor.

Dr. VERRALL said the Chairman's Committee had been by no means oblivious of the question raised. At its very first interview with Sir Alfred Keogh the point was mentioned, and the answer was that the authorities had to keep medical men in places where they were available at a moment's notice to satisfy demands for fresh men for the front. Only the other day the call came for a large number of medical officers to go to the Dardanelles at very short notice.

Dr. W. JOHNSON SMYTH (Bournemouth) pointed out that doctors engaged in stretcher drill were probably teaching the rank and file of the R.A.M.C. He hoped the meeting would not indulge in unnecessary criticism of the Director-General.

WAR EMERGENCY COMMITTEE.

Dr. VERRALL having resigned the chair, Mr. E. B. TURNER (Kensington) moved:

1. That a war emergency committee be appointed for the session 1915-16.
2. That it consist of the four *ex officio* members, four members appointed by the Council, and four members elected by the Representatives present in the Representative Meeting.
3. That it shall have power to co-opt not more than six other members representative of universities, colleges, and other medical bodies.
4. That the reference to the Committee be: To organize the medical profession in such a way as will enable the Government to use every medical practitioner fit to serve the country in such a manner as to turn his qualifications to the best possible use; to deal with all matters affecting the medical profession arising in connexion with the war; and to report to the Council.

It would, he said, be necessary for the duration of the war and for some time afterwards that there should be a committee to deal with various questions that would arise.

The motion was not brought forward on the ground that the present Committee of Chairmen had not done its work exceedingly well. But the emergency, Mr. Turner said, was national, imperial, even European. The suggestion had been received enthusiastically by the War Office. The Committee should comprise practitioners who would carry weight with the public and the profession, and should work in harmony with the War Office. The four members he proposed to the meeting to elect were Sir Clifford Allbutt, the Regius Professor of Medicine in the University of Cambridge and President-elect of the Association; Sir William Osler, Regius Professor of Physic in the University of Oxford; the Master of Christ's College, Cambridge (Dr. A. E. Shipley), and Dr. Verrall.

Major GALLOWAY seconded.

Dr. C. O. HAWTHORNE (Marylebone) remarked that the difficulty had been, in the Metropolitan Counties Branch, to find anyone who would say to the practitioners eligible for military service that it was their duty to take service. What guarantee was there that the new committee would undertake the responsibility from which the committee in the metropolis had shrunk? He wanted the profession to say that it would see that every man who sacrificed his practice for his country should not suffer.

In reply to Dr. JOHN GORDON (Aberdeen), Mr. TURNER said that it was not proposed to interfere with the existing arrangements in Scotland. It was agreed that the Committee should be empowered to organize the medical profession "in England, Wales, and Ireland."

Discussion also took place regarding the number of members of the Committee who would be members of the Association, and, on the motion of Lieutenant FOTHERGILL, it was agreed that the four members to be elected by the Council should be from their own body; also, that the Committee should contain, in addition to the four members indicated by Mr. Turner, four Representatives elected by and from the Representative Meeting.

The motion as amended was then put to the meeting and carried.

Mr. E. B. TURNER moved that the Representative Meeting elect as members of the Committee Sir William Osler, Sir T. Clifford Allbutt, K.C.B. (President-elect of the Association), Dr. A. E. Shipley (the Master of Christ's College), and Dr. T. Jenner Verrall.

Attention was directed to the fact that Dr. Verrall was already, by virtue of his position as Chairman of the Representative Meeting, a member of the Committee *ex officio*.

The CHAIRMAN said that a question which he had foreseen had now arisen. He regarded the custom—it had not been a rule—whereby the Chairman of Representative Meetings should continue in office for a period of not more than three years as a good one. Personally he had been very proud to serve as Chairman during his three years of office, but he intended to ask the meeting to allow someone else to be nominated for the chairmanship. (Cries of "No.") It was because of his intention to vacate office in favour of a successor that Mr. Turner had included his name in the motion he had made.

The motion was carried unanimously.

PROPOSED SPECIAL FUND.

The CHAIRMAN said that a proposal had been made as to the establishment of a fund for dealing with cases of difficulty which might arise amongst members of the profession as the outcome of the war.

Mr. E. B. TURNER said that the matter had been discussed by the War Emergency Committee of the Metropolitan Branch Council. The gist of the proposal was that the profession should attempt to raise some sort of fund from which those who came back after the war and found their practices deteriorated or dissipated could be helped. There were difficulties no doubt. Some might say: "These men are doing the work of the country, and their profession is so particularly personal that it differs from any other profession. Therefore, if they sacrifice their capital and their means of livelihood to do their duty to the country, the country ought to see that they come back to a position which should be as nearly as possible to that they left." The point to be kept in view, however, was that there was still a very large number of doctors

required in addition to those who were serving. Because of that and the large sum of money which would be involved the Treasury was against a proposal for payment by the State. It came, therefore, to be a matter for the consideration of the Representative Meeting, whether there should not be some attempt made to raise such a fund as he had indicated, and whether there was not now available money which might be used or diverted to such purpose. If it was determined to establish such a fund, there ought to be a reasonable certainty that its amount would be worthy of the object aimed at. The profession had at the moment a sum of £10,000, which was the produce of the special organization and fighting fund raised by the profession during the negotiations connected with the Insurance Act. The question might arise whether it would be possible to divert that sum from its original purpose and use it as the nucleus of a fund for giving grants in aid of dependants of doctors who came back from the war impoverished in any way. Obviously, there were legal difficulties, and it might be necessary to get the assent of every subscriber—or, at any rate, to ensure that there would be no dissent. He was prepared to move that the Representative Meeting should consider the raising of a fund for the purpose of helping those men who had been serving the country as medical officers in the army, both in re-establishing them in practice and in aiding their dependants if necessary.

Dr. C. O. HAWTHORNE (Marylebone), in seconding, expressed the opinion that the profession generally would not stand well with the country in these days if it was not able to show something like equality of sacrifice. Men who gave up their practice in order to go to the army made a serious sacrifice. Any young man lately started in practice who enlisted would be fortunate, on his return, if he found any considerable practice left; indeed, if he might venture upon an apriorism, it would be that the smaller the practice the greater the necessity for the practitioner to remain at home. Mr. Turner had mentioned the Special Fund of £10,000, raised for another purpose, but in this hour of crisis money ought not to be doing nothing.

Dr. I. W. JOHNSON (Bury) said that there had already been so many appeals to the profession that another call might not have the success which was desired. If by any chance the scheme should prove a failure it would reflect badly on the Association.

Dr. LANKESTER (Guildford) believed that unless and until the demand for assistance was very much greater than at present it would be useless to apply to the medical profession throughout the country for money on behalf of objects which at present were somewhat indefinite.

Dr. POCHIN (Oldham) asked if it was proposed to use the fighting fund of £10,000 as part of the scheme? There was no doubt a fight was coming, sooner or later, and if it was proposed to utilize the £10,000 now he would vote against it, but he thought it would be a good thing to raise an entirely new fund.

The CHAIRMAN OF COUNCIL said the meeting might disabuse its mind of the idea that the £10,000 could be made the nucleus of the fund, because he was certain the subscribers of that money would refuse to allow it to be used in that way. It must also disabuse its mind of the idea that they would get help from the Government, because the Government could not distinguish between members of the medical profession and other professions which had been affected by the war.

Dr. H. M. BEAON (St. Pancras and Islington) reminded the meeting that it had not been easy to raise money from medical practitioners. Why was it that the men who went away on war service suffered? It was because some other men took their work. That should not be possible in an honourable profession which should endeavour to see that, when the men who were at the front returned, they received back all their patients. Another point was that a great many men who had gone were really better off for the time being than they were before. His feeling was that the meeting should ask the Council to consider this question.

It was suggested that the Representative Meeting should request the Council to consider the advisability of establishing a medical fund for the purpose of helping those practitioners who had been serving in the army and navy, and this was agreed to.

ORGANIZATION.
ELIGIBILITY FOR MEMBERSHIP,
Overseas Branches.

On the motion of the CHAIRMAN of the Organization Committee (Captain F. Charles Larkin) the following recommendation was adopted:

That on the information in its possession, including the replies on the subject received from the overseas bodies, the Representative Body is of opinion that no change such as was contemplated by the motion of the late Natal Branch contained in Minute 366 of the Annual Representative Meeting, 1915, should be made in the Articles and By-laws of the Association as to the eligibility of membership, other than the alteration of Article 4 already decided upon by Minute 68 of the Annual Representative Meeting, 1914.

It was also agreed:

That the Overseas Branches be grouped for election of seven members of Council for 1916-17, under By-law 46 (b), in the same way as for 1915-16, except that the new Hyderabad and Central Provinces Branch be included in the Indian group of Branches.

In the absence of the New Zealand Representative the following motion by that Branch was formally moved by the CHAIRMAN:

That steps be taken for amendment (by footnote or otherwise) of By-law 11 so as to make it clear that members of the Association resident outside the United Kingdom may be called upon to pay, in addition to the 2s. subscription payable by them to the Association under that By-law, a special subscription to their Branch under By-law 15. (SUPPLEMENT, May 22nd, 1915.)

The CHAIRMAN of the Organization Committee contended that the alteration was unnecessary, and said that the Committee had written to New Zealand asking if it would accept a slight formal alteration in the by-law, if it were necessary to alter it at all.

The SOLICITOR said that to his mind the by-laws were perfectly clear in what they were intended to permit, and it would be redundant to put into them what was suggested by the motion. There had been too much tampering with the regulations in the past, and he trusted there would be less in the future. He did not advise the meeting to accept the resolution.

The motion was lost.

THE ASSOCIATION AS A FEDERATION FOR OTHER
MEDICAL BODIES.

On the Special Report of Council as to the question of the Association becoming also a Federation for other Medical Bodies (Appendix II to Annual Report of Council SUPPLEMENT, May 8th, p. 196), the CHAIRMAN of the Organization Committee moved, and the meeting adopted the following:

That the Representative Body is of opinion, on the legal advice the Association has formally received, that it is impossible for the Association so to extend its objects as to become in any legal manner a federation of medical societies.

That the Representative Body would welcome any constitutional method whereby the Association, without interference with its own self-government, could come into closer relationship with other societies formed to safeguard the interests of any sections of the medical profession.

That the Representative Body approve the principle of the Council adding to any Standing Committee of the Association a member of the Association nominated by any society, formed to safeguard the interests of any section of the profession, which desires to become more closely associated with the Association, and to work in co-operation with it, and instructs the Council to prepare drafts of the necessary alterations in the by-laws to carry this into effect.

Captain LARKIN also moved as follows:

That the Council be instructed to call into conference with itself certain other societies referred to in Recommendation C of Council, with a view to determining how it might be possible to come into closer relationship with such other societies, and to report to the next Annual Representative Meeting, with drafts of the necessary alterations in the Articles and By-laws, if any.

Lieutenant FOTHERGILL moved an amendment that the following words be added to the motion:

and that in the meanwhile further consideration of the Special Report of Council as to the question of the Association becoming also a Federation for other Medical Bodies be adjourned.

The report seemed to slam the door in the face of other persons.

Captain LARKIN having said that the report did not close the door, Lieutenant FOTHERGILL withdrew his amendment.

GROUPING OF HOME BRANCHES.

Captain LARKIN moved the following motion, which was adopted:

That the Home Branches be grouped for election of twenty-four members of Council for 1916-17, under By-law 46 (a), in the same way as for 1915-16, except that the new Wiltshire Branch be grouped with the Dorset and West Hants and South-Western Branches.

BOUND VOLUMES OF SUPPLEMENTS.

The meeting agreed to rescind the resolution passed at the Representative Meeting in 1913, under which the practice of sending bound volumes of the SUPPLEMENT to the JOURNAL to local secretaries was stopped. It was stated that many of the secretaries had asked that the supply of bound volumes might be continued.

"DECISIONS" OF THE ASSOCIATION.

The Special Report of Council on the Status and Authority of Decisions of the Association (Appendix VII to Annual Report of Council, SUPPLEMENT, May 8th, p. 207), was proposed for approval.

Mr. GAESTANG (Mid Cheshire) said that it appeared as if decisions which were come to at the Representative Meeting were not legally binding upon any Branch or Division that was not prepared to carry them out. The Association was a voluntary body, which had no powers of punishing its members for disobedience of its commands, except by expulsion from membership, and that would be impossible to carry out on any large scale. It could only exercise moral influence over its members exactly as all other voluntary associations.

The CHAIRMAN intervened the remark that, although the legal force of statements and resolutions which the Association might promulgate was not so great as might be hoped and wished, still they should not despair on that account. While the weight of the resolution might be largely moral, the aim was to raise the whole profession to such a pitch of *camaraderie* as that the decisions of the Association would become the common practice, and that the profession generally would accept what was the strong opinion of a central body like the British Medical Association, even although the legal weight was a little less or a great deal less than might be desired.

The SOLICITOR explained the penalties which attached to any member who offended against the Association. The maximum punishment which could be meted out for any offence was simply the passing of a resolution by the Association that the offender had no longer a right to remain a member.

The motion was carried unanimously.

The CHAIRMAN ruled that a motion by the Rochdale Division was incompetent in the form in which it appeared on the agenda. He suggested, for the purpose of ensuring a debate which might prove helpful, that the motion should be in the following form:

That the Council be requested to take into its consideration what articles and by-laws would be necessary to give effect to the following resolution, and to report accordingly:

That any resolution of a Division relating to matters of medical politics within the area of that Division shall, subject to veto by the Council of the Association to be exercised only on the advice of the Council of the Branch to which the said Division belongs, be deemed the policy of the Association within the area of such Division.

Dr. S. T. LORD (Rochdale) said his Division felt that there should be more local autonomy. Many resolutions were carried at the Representative Meeting which were often very impracticable. The motion which his Division proposed would not deprive the central authority of any of its present power and prestige. By ensuring that there would be greater local autonomy the influence of the Association, as well as its popularity, would be increased.

The CHAIRMAN of COUNCIL said he disapproved of the proposal. It might easily happen that as a result of the policy suggested the Association might be involved in various difficulties, including libel actions, and it would certainly happen that there would be all kinds of variations of practice, each of them dignified by the name of the "policy of the Association."

Lieutenant FOTHERGILL moved to omit all words after "shall" in line 2, down to and including word "belongs" in line 5, and to insert after the word "shall" in line 2 the words "if approved of by the Branch Council and Representative Meeting."

The SOLICITOR said that as under present circumstances it was within the power of a Division to bring any matter before the Representative Meeting, the words "if approved by the Branch Council" would put a clog on the wheels by making it necessary to obtain such approval before any matter could be brought before the Representative Meeting, and if approved by such meeting it would become the policy of the Association. It was now proposed to introduce a greater difficulty in obtaining approval of policy for a limited area of the Association than obtained at present under their regulations for the policy of the Association to prevail throughout the whole country. The matter seemed to him to be somewhat of an anomaly. Of course, this could be provided for if they adapted their regulations accordingly, but they ought to consider whether they wanted to put greater impediments as to approval being obtained for a limited area than would be necessary for the whole area to which the Association extended.

Mr. GARSTANG contended that the adoption of the resolution would result in different policies being in existence in different areas geographically close to one another.

Dr. POCHIN said he had been informed by Dr. Walker (Rochdale) that the resolution was intended to deal with financial matters only, and contended that it would be valuable, for example, in fixing the local minimum fees for referees, a subject on which the Division would be better informed than the Association generally. The resolution as proposed covered too much ground; it should be confined to financial matters.

The CHAIRMAN warned members that the acceptance or rejection of the proposal involved a somewhat serious decision.

Dr. E. E. BRIERLEY (Cardiff), after amendments had been put and lost, said his Division instructed him strongly to oppose the motion, believing that the present was not the time to tinker with the rules of the Association. Important matters such as that before the meeting ought to come before full meetings of the Divisions which could not be obtained at the present time, in order that they might be settled on a proper basis.

Captain LARKIN asked who it was proposed should formulate the policy of the Association. At the present time it was the Representative Body. The motion, if carried, would bring about a chaotic condition of affairs.

On a division the motion was lost by a large majority.

GROUPING OF CONSTITUENCIES.

On the motion of the CHAIRMAN of the Organization Committee, it was resolved that the grouping of constituencies for election of twelve members of Council, 1916-17, be left to the Council, and the remainder of the Supplementary Report of the Council dealing with organization was approved.

PAYMENT OF REPRESENTATIVES' EXPENSES.

Mr. CANTLEY moved, on behalf of the Salford Division:

That the expenses of Representatives of Divisions at Representative Meetings should be paid out of the funds of the Association, and that two guineas per diem be allowed towards such expenses.

The matter had been raised at the meeting in Aberdeen last year, but was withdrawn for reasons which he did not think were really expressed, but had reference, he thought, to the proposal to increase the subscription to 2 guineas. He would be glad to know how many Divisions had been in the habit of paying their Representatives by means of a voluntary fund. It was rather an invidious task for the secretary or treasurer of the Division to go round and ask a contribution from members for this purpose.

The CHAIRMAN pointed out that the amendment could not be put in its present form because By-law 75 defined the term "expenses." He would ask the Solicitor to say whether there was anything to prevent the meeting altering it.

The SOLICITOR said that if the members turned to paragraph 4 of the Memorandum they would find that such paragraph had a very pertinent bearing on the question

now raised. The Association had gone as far in its regulations as it could. The Association had provided that there should be payment of expenses of attending meetings of Council and meetings of the Representative Body. He did not understand from the terms of the motion whether the 2 guineas was intended to cover the whole of the expenses. It appeared to be intended that the member was to have his 2 guineas per day in addition to his expenses.

Mr. CANTLEY: Two guineas only.

The SOLICITOR said there must be some members who would make a profit out of 2 guineas. Expenses, as defined by By-law 75, were limited to the items that fell within such by-law. It might be possible under the regulations and by-laws to provide for payment of expenses upon some such footing as that contemplated by the amendment, but the present By-law 75 would in such circumstances have to be expanded in order to give effect thereto. The Association, as a company licensed by the Board of Trade, must not run the risk of infringing its licence. It could not give a sum to cover expenses from which an appreciable margin of profit arose.

Mr. CANTLEY pointed out that members coming to the meeting had to leave someone in charge. Therefore they could not possibly make a profit.

The SOLICITOR remarked that the highest legal advice which could be obtained on the subject coincided with his views.

Dr. LAWSON (Aberdeen) asked why hotel expenses should not be allowed. The expenses of a Representative attending the meeting were not confined to his railway fare, and he did not see the reason for discriminating.

The SOLICITOR said that until the Association repealed By-law 75 and made a fresh one, the members could not go outside it. Paragraph 4 of the memorandum would not debar the Association from paying hotel expenses. Expenses were expenses, and could not be anything else. It must be shown how and when they were incurred, and, if properly incurred, they might be refunded.

The CHAIRMAN asked whether, supposing the Association got rid of the by-law and of the definition of what expenses were, it would be possible to pay a man a guinea or two guineas *per diem*, in addition to his first-class fare as compensation for his loss of business while attending to the Association's business.

The SOLICITOR said that the question raised a very debatable point. He did not think the Board of Trade would regard such payment as a contravention of paragraph 4, and even if the Board did so contend, he did not think such contention would succeed.

Captain WALLACE HENRY (Leicester) asked if it was for the good of the Association that those who attended the Representative Meeting should receive remuneration. It had generally been found on public bodies that work done voluntarily and, to some extent, at a sacrifice, was better done than that paid for.

Captain LARKIN appealed to Representatives to remember that the change proposed necessitated an alteration of the by-laws, and therefore could not be finally disposed of at this meeting.

The amendment was lost.

PROPOSED COMMITTEE FOR LONDON.

Dr. G. E. HASLIP (Westminster) moved:

That in view of the large number of members and potential members within the area of the Metropolitan Counties Branch, and in view of the varying local conditions prevailing for the purposes of effectively organizing the Branch the time has arrived for the appointment of a special committee, to be called the "London Committee," on the same lines as the Irish and Scottish Committees.

The Westminster Division felt that there was real justification for the establishment of a London Committee, particularly when the membership in London was compared with that in Ireland or Scotland, where similar committees existed. His own feeling, and that of the Division which he represented, was that the Council of the Metropolitan Counties Branch was far too large, and that a smaller local committee would be able to do better work, and that the Association membership would be increased through its efforts.

Captain LARKIN moved an amendment that the proposal be referred to the Metropolitan Counties Branch in order that it might be able to give its own view and that of its

constituent Divisions on this matter to the Council of the Association.

Mr. BISHOP HARMAN (Marylebone) said that the proposal made by Dr. Haslip was brought forward so late as to preclude the feeling of the various Divisions in London being obtained. The proposal ought to have been brought before the Divisions and the Branch Council first.

Captain LARKIN's amendment was carried and adopted as a substantive proposition.

MEMBERSHIP OF ASSOCIATION.

Mr. S. NOY SCOTT (Plymouth) moved that arrangements should be made for the Medical Secretary, or his deputy, to visit the Divisions with a view to increasing the membership of the Association.

The resolution was suggested by the leakage of members which had been going on. The Association had lost over 2,000 members in 1913-14, and this would be a serious handicap when it was necessary to fight the Insurance Commissioners or any other Government department.

Captain LARKIN pointed out that the Council had made regulations whereby it agreed to send representatives from the central office to every Division at least once in two years. A member of the staff was always sent when such services were specially asked for.

After a short discussion the motion was adopted in the following form:

That the Council be asked to make arrangements whereby the Medical Secretary, or his deputy, shall visit the Divisions, to take such action as may be considered advisable to increase the membership of the Association, and especially by holding meetings or by such other means as may be thought desirable.

THE JOURNAL COMMITTEE.

Mr. LUCAS, Chairman of the Journal Committee, moved the recommendation of Council:

That the existing arrangements concerning the remuneration of the editorial staff be continued for the present.

He said that certain arrangements were in contemplation with reference to the staff, but owing to the war it had been thought desirable to continue the present arrangements. If at any time changes were made in the department they would probably be in the nature of providing for the payment of an inclusive salary.

Dr. MAJOR GREENWOOD stated that he had been instructed to oppose the recommendation, but after the Chairman's explanation he would not proceed further, and the motion was agreed to.

On the motion to approve the remaining portion of this section of the Annual Report of Council, Dr. RATCLIFF-GAYLARD proposed an amendment that the SUPPLEMENT to the JOURNAL be issued loose and declared to be a confidential document. It contained information of extreme use to the profession, but also to its enemies. If the SUPPLEMENT were issued separately and declared to be confidential, it could not then be purchased at any bookstall.

Dr. JOHNSON (Bury) seconded.

THE SOLICITOR, in reply to a question by the CHAIRMAN, said that the JOURNAL being the JOURNAL priced at so much, and the SUPPLEMENT being an addition thereto, it appeared to him there was no impediment to selling the JOURNAL on the bookstalls without the SUPPLEMENT.

THE FINANCIAL SECRETARY, in reply to a question, explained that by stitching in the SUPPLEMENT as at present the Association saved from £300 to £400 a year. The present system had been adopted because of its mechanical advantages.

The amendment was withdrawn, and the remainder of the report on this subject was then adopted.

SCIENCE.

The section of the Report of Council dealing with the work of the Science Committee (SUPPLEMENT, May 8th, p. 183, paras. 69-76) was approved.

MEDICAL ETHICS.

PROCEDURE IN ETHICAL MATTERS.

THE CHAIRMAN of the Central Ethical Committee (Dr. M. G. Biggs) moved the Recommendation of Council dealing with the duties and powers of the Committee (SUPPLEMENT, May 8th, p. 183, para. 77). The Association, he said, had been advised by its Solicitor and also by

counsel that it would be wise to put the reference to the duties of the Central Ethical Committee on a firmer and simpler basis. Last year at the Representative Meeting the Council was empowered to approve Regulations relative to Notices respecting appointments, and the Committee on the present occasion came before the meeting with a new schedule and revised ethical rules. If the meeting decided to pass these, the Association would have what it never had before, namely, machinery for the conduct of ethical business which had been elaborated after consultation with the Solicitor with, where necessary, additional legal assistance. The special schedule in the form in which it came before the meeting was that suggested by Mr. Colquhoun Dill.

The motion was adopted.

Dr. BIGGS also moved:

That the revised rules governing procedure in ethical matters of (1) a Division not itself a Branch, (2) a Branch composed of one Division, and (3) a Branch composed of several Divisions (Appendix VIII to Annual Report of Council, SUPPLEMENT, May 8th, pp. 208-218), be approved.

A revision of the rules had become necessary in order to render them more workable. The Solicitor of the Association had seen and endorsed every amendment. That insured that so far as possible the revised rules carried with them the utmost liberty with the minimum of risk.

Dr. D. A. SHEAHAN (Portsmouth) moved an amendment:

That the revised rules be amended so as to provide that the Ethical Committee of a Division shall only investigate facts, and report.

The adoption of the amendment would diminish the likelihood of friction in the Divisions.

Dr. BIGGS said that the Ethical Committee of a Division first investigated the case and heard witnesses. In that way it was in a far better position to form a clear and fresh inference from the evidence. The Central Ethical Committee came to the conclusion that it was absolutely essential that the matter should be put in the way proposed. The work would be far better done by a small committee than by a large one, whereas Dr. Sheahan's amendment would involve the discussion of facts and findings by a meeting of the whole Division. In the opinion of the Council that was objectionable, and might be dangerous. The Division was not bound to accept the report, but might vary it.

The amendment was ruled out of order.

On No. 18 of the proposed revised rules governing procedure in ethical matters of a Branch composed of several Divisions, namely—

The report and the recommendation of the Ethical Committee of the Branch shall be circulated to all members of the Branch Council, and to each party concerned, not less than seven days before the meeting of the Branch Council at which it is to be considered, and shall be issued in sealed envelopes, marked "Private and confidential."

—Dr. SHEAHAN (Portsmouth) moved to omit the words "and to each party concerned." It was, he said, undesirable to give each of the parties notice of the recommendation of the Ethical Committee before the Branch had given its decision.

Dr. BIGGS suggested that it was a question of fair play. When a practitioner had been charged with a definite offence he could not be refused information as to the nature of the charge until after the decision was reached.

Dr. SHEAHAN said that when the question was brought before the Ethical Committee both parties would be present and would hear the evidence. The recommendation which was then made to the Branch Council should not be made known to those two individuals until the Branch Council, which was the determining body, had given its decision.

Dr. BIGGS said that the amendment would upset the whole of the system and do a serious injustice to the practitioners against whom complaints were made.

The amendment was lost by a large majority, and the revised rules were then approved.

On the motion of Dr. BIGGS, it was agreed:

That all Divisions and Branches in the British Islands be asked to adopt the Revised Rules governing procedure in ethical matters as approved by the Representative Body, 1915, without modification and in substitution for any ethical rules now in use by the Divisions and Branches respectively, which will not be recognized after December 31st, 1915.

PROFESSIONAL SECRECY.

The meeting then passed to the consideration of the paragraphs in the Annual Report and Supplementary Report of the Council dealing with the subject of professional secrecy (SUPPLEMENT, May 8th, p. 183, and July 3rd, p. 4).

In its annual report the Council stated that it had considered the observations made by Mr. Justice Avory at the Birmingham Assizes on December 1st, 1914, concerning the case of a woman who had been committed on the coroner's warrant to stand her trial on a charge of manslaughter in consequence of the death of a woman upon whom she was alleged to have performed an illegal operation. Three medical men at least had attended the deceased, and to one at least she had confided the name of the person who performed the act, but no information was given to the police, and the patient died without any deposition being taken or without any statement being made by her on her deathbed which could be used in a court of law.

The Council forwarded to the Home Secretary and the Lord Chief Justice its opinion as to the position of a medical practitioner respecting information which he has obtained from a patient in the exercise of his professional duties, and as the result the Association was invited to send a deputation to the Lord Chief Justice. Accordingly on May 3rd the Chairman of Representative Meetings, the Chairman of Council, the Treasurer, and the Chairman and Deputy Chairman of the Central Ethical Committee had an interview with the Lord Chief Justice, who was accompanied by the Attorney-General, the Public Prosecutor, and other legal officials. The Lord Chief Justice stated at the outset of the conference that no observation made by him during the discussion should be treated as a judicial pronouncement of the law. As a result of this conference the Council has ascertained:

(a) That it is desired by the authorities that information should be given to them by medical men in attendance upon a woman suffering from the effects of abortion brought about by artificial intervention.

(b) That the circumstances under which it was desired that this communication should be made were the subject of the following three limitations:

(1) That the medical man was of opinion, either from his examination of the patient and/or from some communication that she may have made to him, that abortion had been attempted or had been procured by artificial intervention.

(2) That he was of opinion, either from his observations of and/or from a communication made to him by his patient, that such artificial intervention had been attempted by some third party other than the patient herself; and

(3) That the medical man was of opinion that his patient, due to such artificial intervention, was likely to die, and that there was no hope of her ultimate recovery.

The Council went on to report that it was advised as follows:

(a) That whereas solicitors and barristers have an absolute privilege of protection in regard to statements made to them in their professional capacity involving matters of criminal import or otherwise, no other class of persons is accorded such legal protection by State authority or Act of Parliament, although in the case of ministers of religion such protection is universally observed and recognized by custom in the courts.

(b) There is, however, no such universally recognized protection attaching to medical men in respect of statements made to them by a patient; in fact, there is a considerable conflict of authority upon the subject. The Council, however, reported that it was advised that no obligation rests upon a medical practitioner to disclose the confidences of his patient without the patient's consent, and suggests that if the State desires to set up such an obligation it should at the very least preface such an endeavour by affording to the practitioner protection from any legal consequences that may result from his action. Without any desire to claim the right to refuse to make such disclosures in obedience to the order of a Court of Justice, the Council, after hearing the report of the deputation received by the Lord Chief Justice on May 3rd, 1915, has decided to adhere to the following resolutions which it passed on January 27th, 1915:

Minute 542.—Resolved: That the Council is of opinion that a medical practitioner should not under any circumstances disclose voluntarily, without the patient's

consent, information which he has obtained from that patient in the exercise of his professional duties.

Minute 550.—Resolved: That the Council is advised that the State has no right to claim that an obligation rests upon a medical practitioner to disclose voluntarily information which he has obtained in the exercise of his professional duties.

The Council reported further, first, that it had learnt that the subject was under the consideration of the General Medical Council, and, secondly, that it had forwarded a statement of what had transpired in this matter to the Royal College of Physicians of London and the Royal College of Surgeons of England, and had invited the colleges to appoint representatives to meet representatives of the Association in conference on the subject.

The CHAIRMAN of the Ethical Committee (Dr. Biggs) said that the position as to professional secrecy had been indeterminate, and had given trouble for many years. It had been raised recently in a marked way by Mr. Justice Avory at the Warwick County Assizes at Birmingham in December last. Sir Horace Avory then referred to the opinion given by Sir Edward Clarke and himself as counsel in 1905, in reply to certain questions submitted to them by the Royal College of Physicians. The remarks of Mr. Justice Avory were brought before the Council of the Association, and Mr. Hempson explained the law affecting professional secrecy in regard to barristers and solicitors and ministers of religion. Members of these professions were privileged, but no such privilege existed with regard to the medical profession. The matter was taken up by the Central Ethical Committee, which made certain proposals to the Council, which that body adopted, and these were substantially the same as those now submitted to the meeting for approval. The decisions of the Council were sent to the Lord Chief Justice and to the Home Secretary. As a result there had been an interview between the Lord Chief Justice, the former Attorney-General, the Public Prosecutor, and representatives of the Council. After a statement of the matter and a general discussion, the Lord Chief Justice formulated certain suggestions. The Council felt strongly that the profession should not go into this question without being united, because in the past it had so often been beaten as a result of differences of opinion. Accordingly, the Central Ethical Committee had entered into communication with the Royal College of Physicians and the Royal College of Surgeons. The answer of the Royal College of Surgeons was to the effect that it did not contemplate taking any active steps in the matter. The Royal College of Physicians had forwarded a reply received on July 20th, which, though expressed in somewhat different language, showed that, in effect, it was really of the same mind as the British Medical Association. The Lord Chief Justice was anxious that nothing he had indicated should be taken as a pronouncement of his on the law. In other words, the Lord Chief Justice had expressed his own views as an individual and not by virtue of his office. The suggestion had been made to the Lord Chief Justice that if any fresh rule was contemplated it would be better to have this done by Act of Parliament. His answer, however, had made it quite clear that in anything he had said he was merely suggesting a partial suspension of professional secrecy, and if Parliament dealt with the subject at all it might possibly proceed on much wider lines. The resolutions adopted by the Royal College of Physicians of London were as follows:

1. That a moral obligation rests upon every medical practitioner to respect the confidence of his patient; and that without her consent he is not justified in disclosing information obtained in the course of his professional attendance on her.
2. That every medical practitioner who is convinced that criminal abortion has been practised on his patient, should urge her, especially when she is likely to die, to make a statement which may be taken as evidence against the person who has performed the operation, provided always that her chances of recovery are not thereby prejudiced.
3. That in the event of her refusal to make such a statement, he is under no legal obligation to the Council or his patient, to take further action, but he should continue to attend the patient to the best of his ability.
4. That before taking any action which may lead to legal proceedings, a medical practitioner will be wise to obtain the best medical and legal advice available, both to ensure that the patient's statement may have value as legal evidence, and to safeguard his own interests, since, in the

present state of the law, there is no certainty that he will be protected against subsequent litigation.

5. That if the patient should die, he should refuse to give a certificate of the cause of death, and should communicate with the coroner.

In reply to a question as to the position of the legal profession in regard to professional secrecy, the SOLICITOR said the legal profession had complete protection and privilege in regard to this matter both so far as concerned solicitors and members of the bar. That protection, however, only came to them *quod* the profession they followed. If a man came to him at his offices, and confessed that he had committed a crime, whether or not he as a solicitor undertook to defend him, he was bound to respect entirely as inviolable that which he had been told. In point of fact, no one could make him divulge it. The same applied to counsel at the bar. The same conditions did not apply if the information were given to him as a private citizen and not as a solicitor. If he were given the information as a citizen, then his duty was imperative, and he was bound to convey that which he had been told to the proper quarter. The legal profession had a protection and privilege which was absolute to itself. He had known members of the medical profession who had absolutely refused to divulge statements made to them. Personally he had advised them to refuse to divulge the information, even to the point of being threatened with committal for contempt of court. He had known cases adjourned for the purpose of allowing the medical witness to "come to his senses," as it was termed. In the end the medical witness had not "come to his senses," and no committal had taken place. (Applause.)

Captain WALLACE HENRY asked what the standing of the medical profession was in other countries.

Mr. HEMFORD replied that he was given to understand that in the United States of America the medical profession could plead privilege in regard to the disclosure of these matters. In France it was practically an indictable offence to disclose such matters at all. It seemed to him that the medical profession in this country stood on a quite different footing, although that ought not to be so. Personally he thought the profession was entitled to protection; it was a matter on which he felt very strongly.

Mr. TURNER said that the Association was on the brink of a most momentous time. Those responsible for prosecutions and for obtaining convictions in criminal cases seemed to be making a big attempt to bring in the medical profession as an amateur unpaid branch of the detective service. The Council had asked the other medical bodies to join the Association in presenting a united front to the attack. The position of the College of Physicians was satisfactory, but that of the College of Surgeons was less so. There was no protection for members of the medical profession if they gave away to legal authorities secrets supposed to be inviolate. If doctors allowed themselves to be so used by the legal authorities, women would not go to a doctor, as they would know that he would be in the service of the police. They would rather seek to be treated by the herbalist or the midwife. Doctors were to be called upon to do their duties as citizens, and were to sacrifice that which had been most sacred to them. He was prepared as a citizen to do all he could to get the conviction of any one who was carrying out those practices, but he did not intend to comply, whatever the law might do or say, with any attempt to force or persuade him to betray professional confidences, and felt certain he would have the support of the enormous majority of the public. He hoped the profession would stand solid against that aggression on its rights and privileges, and that the decision of the meeting would be communicated to the proper authorities.

Dr. SHEAHAN (Portsmouth) asked whether medical practitioners should also refuse to give evidence in cases of divorce as well as in cases of abortion.

The CHAIRMAN said that that question was interesting, but the ramifications of the subject were too great to be dealt with. Every one knew that in a court of law a man must answer questions or stand the consequences. The Association said that when a doctor had obtained information through his professional relations with a patient he was not to go to the police authorities and voluntarily offer that information in order that a conviction might be obtained.

Dr. C. E. ROBERTSON (Glasgow Southern) considered that doctors were under the Hippocratic oath, and could not break that oath even under the direction of a judge.

Dr. JOHNSON SMYTH (Bournemouth) said that doctors should claim a protection not less complete than ministers of religion, who were completely protected.

The report was adopted unanimously, and included the approval of the following resolutions adopted by the Council on January 27th, 1915:

That the Council is of opinion that a medical practitioner should not under any circumstances disclose voluntarily, without the patient's consent, information which he has obtained from that patient in the exercise of his professional duties.

The Council is advised that the State has no right to claim that an obligation rests upon a medical practitioner to disclose voluntarily information which he has obtained in the exercise of his professional duties.

MEDICO-POLITICAL.

FEES OF PRACTITIONERS CALLED IN BY MIDWIVES.

The CHAIRMAN of the Medico-Political Committee (Mr. T. W. H. Garstang) moved as follows, in accordance with the recommendations in the Annual Report of the Council (para. 84, SUPPLEMENT, May 8th, p. 184):

- (c) That the following should be the minimum scale of fees for the payment of medical practitioners called in on the advice of midwives, but power should be obtained to pay special fees in special cases:

(i) Attendance at cases requiring or necessitating operative assistance, and subsequent necessary visits during the first ten days ...	2	2	0
(ii) Attendance at cases without operative assistance, and subsequent necessary visits during first ten days ...	1	1	0
(iii) Assistance for administration of an anaesthetic ...	1	1	0
(iv) Any visit not covered by (i), (ii), or (iii), including any necessary prescription—			
Day (8 a.m. to 8 p.m.) ...	0	3	6
Night (8 p.m. to 8 a.m.) ...	0	7	6

The motion was adopted.

FEES FOR ATTENDANCE UPON JUVENILES.

On the Special Report of Council on the question of fees for treatment of juvenile members of friendly societies (Appendix IX to Annual Report of Council, SUPPLEMENT, May 8th, p. 219), the CHAIRMAN of the Medico-Political Committee moved:

That juvenile contract rates apply only to the children of persons eligible for the benefits of the Insurance Acts.

Dr. STEVENS (Edinburgh and Leith) said that the Edinburgh and Leith Division had instructed him to oppose contract practice for children under any conditions. It objected to the imprimatur of the Association being given to contract practice in the case of children or to any extension of contract practice. It specially objected to lower rates for children than for adults.

Dr. GOODFELLOW (Manchester) said that the members of his Division were strongly opposed to any increase in contract practice. Their experience had always been that juveniles needed as much attention as adults, if not more, and the Committee had not produced any evidence to controvert that.

Dr. MAJOR GREENWOOD (City) stated that he, too, had been instructed to oppose the recommendation on the ground that the Division objected to the lower rate being fixed. In addition, it was no business of the Association to take the part of either one party or the other in a difference between the friendly societies and the collecting societies.

Dr. H. J. CAMPBELL (Bradford), who also opposed the extension of contract practice, said that the policy of the Association in the past had been to set its face against such practice, and if the recommendation was approved it would increase difficulties in the future.

Dr. SELLERS (Preston) said it had been claimed that the Insurance Act would give the death-blow to other forms of contract practice, but if the recommendation were adopted juvenile clubs would be encouraged.

Dr. JOHNSON (Bury) also opposed the recommendation.

Mr. WALKER (Liverpool) said his Division also opposed the recommendation; its members were not at all impressed by the arguments brought forward in the Council's report.

Dr. WARD (North and South Suffolk) strongly urged that the whole question of contract practice for children

should be left in abeyance by the Association and dealt with, as far as possible, locally.

Dr. MACKRITH (Southampton) said the Council appeared to think it was not possible to get more than 4s. 4d. for juveniles, but in Southampton there was a society which was paying 6s. 6d. for juveniles. In this society there were 10,000 members altogether; the adults, who constituted one half, paid 8s. 8d. a year, and juveniles paid 6s. 6d. each. It was well to bear in mind also that a society in opposition to their own in Southampton paid 5s. 8d. each for the juveniles. These instances showed that it was possible to get more than the Council indicated in the report.

Mr. GARSTANG desired to point out that the recommendations were not made as the outcome of any inherent wickedness on the part of the Council, or any love on its part for the extension of contract practice. When he mentioned that some districts were getting as little as 2s. 6d. for juveniles it would be understood how it was that the Council came to fix the minimum charge at 4s. 4d.

On a vote the section of the annual report dealing with this subject was rejected by a large majority.

Saturday, July 24th.

The proceedings were resumed on Saturday, July 24th, at 9.30 a.m., with Dr. T. JENNER VERRELL (Chairman of Representative Meetings) in the chair. The minutes of the previous day's proceedings were corrected and confirmed.

REPRESENTATION OF NAVAL MEDICAL SERVICE.

On the motion of the CHAIRMAN, Fleet Surgeon Frederick Davidson Linnley, R.N. (ret.) was appointed Representative of the Royal Navy Medical Service on the Council in place of Sir James Porter, K.C.B., R.N., resigned, to hold office until the termination of the Annual Representative Meeting, 1917.

SELECT COMMITTEE ON PATENT MEDICINES.

The CHAIRMAN of the Medico-Political Committee (Mr. Garstang) moved the following recommendation of Council:

That the Representative Body place on record its satisfaction with the recommendations of the Select Committee on Patent Medicines, and instruct the Council, as soon as it considers the time opportune, to take all necessary steps in pressing for legislation on the lines of the report.

Mr. GARSTANG remarked that the report formed one of the most important endorsements of the views of the Association which had ever emanated from a Select Committee of the House of Commons.

The motion was carried, and it was agreed, on the suggestion of the CHAIRMAN of the Medico-Political Committee, to forward a copy of the resolution to Sir Henry Norman, the chairman of the Select Committee.

UNQUALIFIED PRACTICE OF DENTISTRY.

The CHAIRMAN of the Medico-Political Committee moved that the Representative Body should approve the draft bill of the British Dental Association concerning the practice of dentistry by unqualified persons.

Dr. J. WISLIART KERR (Glasgow Eastern) expressed the hope that the rights of medical practitioners who practise dentistry exclusively would be protected. A dispute had occurred in Glasgow with regard to refusal to accept a certificate by a doctor who practised as a dentist, on the ground that he was not registered as a dentist. The doctor was thereby injured in his practice.

The motion was passed.

FEES FOR MEDICAL ATTENDANCE ON CASES RECEIVING AMBULANCE TREATMENT THROUGH MUNICIPAL SERVICES.

The CHAIRMAN of the Medico-Political Committee moved the following recommendation of Council:

That the Representative Body approve the establishment of local ambulance services for emergency cases of sickness or accident on the following conditions:

- The responsibility to be undertaken by some local authority.
- The cases to be referred to the nearest available practitioner.
- The fees to be paid by the local authority on the following scale:
 - For a day call between 8 a.m. and 8 p.m., 3s. 6d.;
 - for a night call between 8 p.m. and 8 a.m., 7s. 6d.
 - Mileage beyond first mile at the rate of 1s. per mile

Captain LARKIN questioned the practicability of the proposals in the case of a large town.

Mr. GARSTANG said it was not contemplated that the resolutions would apply in the great towns where a municipal ambulance service existed.

Mr. J. H. EWART (Eastbourne) remarked that a doctor was often requested by a policeman to attend in street accident cases, or a private individual was sent by the policeman. It frequently happened that the local authority afterwards disclaimed responsibility and the doctor received no fee.

Mr. GARSTANG said that to meet this it was proposed by the Council that a local authority should undertake the responsibility.

Dr. SHEAHAN (Potsmouth) confirmed Dr. Ewart's statements.

The CHAIRMAN remarked that the vague term, "local authority," was used in the motion because the responsibility for treatment of street casualties would fall upon different bodies in different areas. The responsibility ought to be accepted by the proper local authority.

Dr. JOHN STEVENS (Edinburgh and Leith) asked who would accept responsibility for treatment if a private individual called in a doctor to attend a street accident case.

Mr. GARSTANG said the first condition the Association wished to establish was that some local authority should accept responsibility.

The motion was approved.

CRIME AND PUNISHMENT SUBCOMMITTEE.

The CHAIRMAN of the Medico-Political Committee, in moving that the report on the question of the present state of the law with regard to the legal responsibility for crime (SUPPLEMENT, May 8th, p. 186, para. 9) be approved, said that the report was one of the most important which had ever been laid before the Representative Meeting.

Lieutenant FOTHERGILL (Brighton) referred to the correspondence on the question which had appeared in the JOURNAL, and asked if the Subcommittee was satisfied that the criticisms there had been met.

Mr. E. J. DOMVILLE (Bristol), replying as Chairman of the Subcommittee, said that the comments in the JOURNAL had been almost wholly laudatory. It had been stated that the Subcommittee had not recognized Dr. Mercier's opinion as expressed in his book, but as a matter of fact that book was under consideration when the Committee formulated its conclusions, and had been most useful to it. The work of the Subcommittee marked a further stage in promoting the influence of the British Medical Association with the public and the legal profession. It was very important to seize all opportunities of educating the legal profession with regard to lunacy as understood by medical men. Some judges appeared to think that lay minds were quite capable of deciding the state of mind of a person charged with the commission of a crime.

In reply to a further question, Mr. DOMVILLE said that as soon as the report was approved steps would be taken to have it circulated as widely as possible amongst those who were interested.

The report was approved.

ELECTION OF STANDING COMMITTEES.

The CHAIRMAN mentioned that if it was the intention of the Representatives to complete the business that day it would be necessary to suspend certain Standing Orders with regard to elections to committees and to place in the hands of the Election Returns Committee the duty of electing on behalf of the Representative Meeting, from nominations made by the Representatives, the members of the various standing committees. He moved the suspension of the Standing Orders accordingly.

Mr. E. J. DOMVILLE (Bristol) seconded.

Dr. R. A. LUNDIE (Edinburgh and Leith) proposed an amendment that the election of Representatives to the several standing committees should be carried out by postal vote. The amendment was lost and the necessary Standing Orders were suspended.

ASSISTANT ASYLUM MEDICAL OFFICERS.

On the motion of the CHAIRMAN of the Medico-Political Committee, the Special Report on the Conditions of Employment and Remuneration of Assistant Medical Officers (Appendix XII, Annual Report, 1914) was adopted.

May 8th, p. 226) was received, and he then moved the recommendations attached to the report, as follows:

Salaries and Emoluments.

- (a) That the minimum commencing salary of assistant asylum medical officers be £220, rising after one year of probation to £250, and then by £25 per annum to £350 per annum irrespective of promotion, and that the salaries of officers who are not promoted should then rise automatically by £10 per annum for ten years.
- (b) That in addition to the operation of the above scale, an officer on being promoted to second assistant should receive an additional £50 per annum, and on being promoted to senior assistant an additional £50 per annum.
- (c) That assistant asylum medical officers who have received promotion should also participate in the automatic increase of £10 per annum for ten years, which commences after five years' service.
- (d) That emoluments should be valued at least at £100 per annum, and made commutable for full value at the end of five years.

House Accommodation.

- (e) That every asylum should contain a separate house suitable for a married assistant officer, and that where an asylum contains four or more assistants, two such houses for assistant officers should be provided.

The recommendations were, he said, the result of a conference the Committee had with a deputation of assistant asylum medical officers.

Dr. J. STEVENS (Edinburgh and Leith) moved to refer the report back for reconsideration, on the grounds that much diversity of opinion existed amongst those concerned.

Dr. W. BLAIR (South-Eastern Counties), in seconding this amendment, asked whether the motion, if carried, would be binding on assistant medical officers of asylums.

Mr. GARSTANG said that nothing passed by the meeting would be binding on an individual, but the Association would do its best to get the standard laid down recognized by all concerned.

Dr. A. A. MACKETH (Southampton) asked if the JOURNAL would be prevented from inserting advertisements offering lower salaries than those set forth in the motion. He thought the motion should be binding, at any rate, on the Association.

In reply to Lieutenant FOTHEREILL, Mr. GARSTANG said that the matter was urgent. One great complaint amongst assistant asylum medical officers was that they were in a blind alley occupation, because senior posts were few in proportion to assistant posts. Therefore, the great majority of the assistants spent the best years of their lives in getting to a point at which they were useless for any other form of practice. They asked that the financial conditions of their service should be improved in order that it should be worth while to undertake and remain in such work. If the recommendation were approved the Association would decline to accept advertisements which did not reach the required standard.

The amendment was lost, and the recommendation was approved.

INSPECTION AND TREATMENT OF SCHOOL CHILDREN.

On the motion to approve the Memorandum on Medical Inspection and Treatment of School Children, as a statement of the policy of the Association in regard to these matters (SUPPLEMENT, May 8th, p. 227),

Dr. AGNES ESTCOURT-OSWALD (North-East Essex) moved the following rider:

That, without special payment, treatment should not be included in the duties of the school medical officer.

She said that the treatment of school children was rather a difficult question, and that the ideal method was, undoubtedly, treatment by the children's own doctor. If, however, the private practitioner undertook the treatment of school children, the amount of clerical work involved would be enormous, unless he acted as a part-time school doctor, in which case he would be treating occasionally another doctor's patients. In some cases, when medical treatment was undertaken by a school medical officer, it was not paid for. The number of places in which this occurred was increasing every year, and the plan appeared to have the sanction of the Association—perhaps not the official sanction, but certainly the Association shut its eyes to it.

Mr. GARSTANG asked Dr. Estcourt-Oswald if it was meant that the existing school medical officers should not be re-

quired to undertake treatment without additional payment or that the salary should include payment for inspection and treatment from the beginning. The policy of the Association, as laid down at its meetings up to the present, had always included the defence of the interests of the private practitioner against encroachment by any whole-time State-paid service. A number of State-paid whole-time services were in operation. The Association could not alter that, but there appeared to be a tendency for these services to increase. The recommendation made by the Council attempted to maintain the original position of the Association. It modified the Association's original position to the extent that it said that where the local medical practitioners could not or would not undertake the treatment of school children, the Association would not take exception to treatment being carried out by whole-time officers. Under certain conditions the Association bowed to the inevitable, and recognized the possibility of different arrangements to those which it would itself prefer.

Mr. ALBERT LUCAS (Birmingham Central) moved an amendment to the rider by North-East Essex to omit the words "without special payment," so that the rider would read:

That treatment should not be included in the duties of the school medical officer.

He said that in Birmingham the profession had done its utmost to prevent treatment being carried on by whole-time school medical officers, on the ground that the interests of the general practitioner should be protected. The fear was that if the educational authorities were allowed to use their school medical officers for the purposes of treatment, they would be enabled to undersell the general practitioner.

Dr. W. JOHNSON SMYTH (Bournemouth), in seconding, said that his Division desired to enter a vigorous protest against the whole-time school medical officer taking part in treatment of any kind whatever, even the administration of anaesthetics.

Mr. H. B. BRACKENBURY (Council, Middlesex) said that there was some danger of the Association going too far in this matter. It should maintain the position of the general practitioner as against the whole-time medical officer, but where treatment was done by the whole-time school officer that officer ought to be paid adequately for treatment and medical inspection, and, if possible, for the two separately.

Mr. HARDING H. TOMKINS (South-West Essex) supported the amendment, and said that in the case of new advertisements the Association could prevent treatment being included. In an advertisement applying to his own area, which had originally included "treatment," representations made by the profession led to its alteration before publication.

Captain LARKIN said that the position was not quite clear. The recommendation appeared to provide for two people, one the school medical officer, who had to do with the inspection of children, and the other the persons, unnamed, who might be employed in a whole-time or part-time capacity. The amendment, he thought, did not conflict with the report.

The CHAIRMAN intimated that if the amendment by Central Birmingham was carried, the Chairman of the Committee would prefer to take the whole matter back for reconsideration.

Mr. LUCAS, in reply to Mr. Domville, stated that the term "school medical officer" in the amendment meant school medical officer, inspecting officer, or his assistant.

The CHAIRMAN said that the term "school medical officer" was generally used throughout the kingdom, and was understood to include more than mere inspection.

The amendment by Central Birmingham was carried, whereupon Mr. GARSTANG withdrew the report in order to reconsider the whole question.

TREATMENT OF SCHOOL CHILDREN AT HOSPITALS.

The CHAIRMAN of the Medico-Political Committee moved:

That the Annual Representative Meeting, 1915, approve the Memorandum on the Treatment at Voluntary Hospitals of School Children found Defective on Medical Inspection, as a statement of the policy of the Association in regard to that matter (SUPPLEMENT, May 8th, p. 229).

Dr. WALKER (Liverpool) said that in Liverpool the local authority had approached the hospitals, but was refused permission to obtain treatment for school children at the

hospitals. The matter became acute because the children were not being treated. A special sub-committee had the matter under consideration. The chairman of that sub-committee, who was a medical practitioner, was very anxious that there should be a proper clinic in Liverpool on the lines of that in Birmingham. The committee of the Division had approved generally of this scheme. The Division was desirous that, if general practitioners could do the work they should be allowed to undertake it. It afterwards appeared that the local authority in Liverpool was going behind the back of the committee of the Division, and was approaching hospitals, asking them to undertake treatment. At least three institutions in Liverpool were willing to do the work at a ridiculously small fee. It appeared to the Liverpool Division that the policy of the Association was not sufficiently known throughout the profession. He would like to appeal to the individual doctors and staffs of hospitals not to allow themselves to be used by the hospital committees to deprive their brethren of their legitimate rights.

The motion was approved.

MEDICAL AID INSTITUTIONS.

On the motion of the CHAIRMAN of the Medico-Political Committee, a report of the Medical Secretary on the position of the colliery and works doctors schemes in South Wales and a report of the Medico-Political Committee on a conference between representatives of the Association and of the Friendly Societies Medical Alliance and the South Wales and Monmouthshire Alliance of Medical Societies with reference to proposals of the Council as to medical aid institutions were received.

Mr. GARSTANG said that the report by Dr. Cox was an exceedingly important and valuable document. It contained a history of the South Wales disputes. Very great assistance had been received from Captain Greer, the secretary of the South Wales and Monmouthshire Branch. He moved:

That it is inadvisable to take objection to the acceptance by members of the Association of appointments at those existing institutions recognized under Section 15 (4) of the Insurance Act which will conform to the following conditions:

(a) Salaries or other forms of payment to be satisfactory to the Association.

(b) Free choice of doctor by patient and of patient by doctor to be allowed.

(c) The institution doctor to be placed as nearly as possible in the same conditions as the panel doctor as regards complaints by patients.

(d) The rules of the institution, so far as they affect the doctor, to be approved by the Association before any member is allowed to accept or retain appointment.

(e) Some guarantee to be obtained that the institution is not using the insurance funds to finance the medical attendance on the dependants, thereby lowering the rate which the outside profession would be able to secure for the same work.

The conditions laid down were agreed to at the conference with the representatives of the Medical Alliance. (The minutes of the conference are printed at p. 66.) Mr. Garstang added, in reply to Mr. J. H. EWART (Eastbourne), that Clause (b) was accepted in the sense that every one knew it was one of the fundamental points for which the Association had contended for many years. The Association had not got that point equally and entirely in force, but it was to be carried out as far as was reasonably practicable. In reply to Mr. H. H. TOMKINS, Mr. Garstang explained that it was not always possible to have free choice of doctor, for geographical reasons. The population was scattered over bleak country districts, and it would be quite impossible for the work to be distributed between half a dozen men.

Dr. MACKREITH (Southampton) asked how, in the event of the motion being carried, the members of the British Medical Association and other members of the profession would know which societies met the requirements of the Association.

Mr. GARSTANG said that the report was only preliminary. If it was approved there would be further conferences, and steps would be taken to ensure proper publicity.

Lieutenant FOTHERGILL (Brighton) moved an amendment to refer the matter back, in order that the Divisions might be consulted.

Dr. J. W. BONE (Bedford) said that as he had been instructed by his Division to vote against the recommendation of Council he would second the amendment. Although he had no wish to disturb any arrangement

that might satisfy Wales, his Division was concerned in a conflict with a large medical institute, and had always understood it to be the policy of the Association that no lay committee should intervene between the patient and the doctor. The present recommendation proposed to reverse the policy of the Association by putting the seal of its approval on institutions controlled by lay committees which intervened between the patient and the doctor.

Dr. A. A. MACKREITH (Southampton) thought the Representative Meeting could not carry the present proposals unless previous resolutions were rescinded.

Dr. JOHN STEVENS (Edinburgh and Leith) asked if the position taken up on the subject of free choice in the recommendation of Council was consistent with the latter part of Subsection (4) of Section 15 of the National Insurance Act.

The CHAIRMAN replied that nobody could confidently interpret an Act of Parliament until the courts of law had pronounced on it.

Dr. MAJOR GREENWOOD (City of London) considered that the recommendation safeguarded what the profession had always regarded as first principles. Under the Insurance Act institutions had a definite position, and the Association must have some dealings with them and should seek to make them better.

Captain W. J. GREER (Monmouthshire) admitted that the recommendations before the meeting were in the nature of a compromise. One of the chief difficulties was that in times gone by the Association had allowed its own members to accept positions in connexion with these institutes. When these men were approached and asked to give up the posts they expressed their willingness to do so, but wished to know what the Association would do for them. If the Association bought them out it would be found an expensive matter. None of the members of the Association liked the recommendations, but if there was to be a compromise at all they constituted the only compromise possible.

Mr. GARSTANG said Captain Greer had struck the right note. A conference between bodies which had been engaged in a life and death struggle for years must result in a compromise if it was to do any good. He did not think the Committee could do any more if the matter were to be referred back. In reply to questions, Mr. Garstang added that the Committee had definitely laid it down that it would not approve any additional institutes, and the Welsh representatives definitely undertook on certain conditions to agree to the compromise and to use their influence to see that no further institutes were created. This also included a proviso that no further branches of existing institutes would be formed.

The proposal to refer the matter back was lost.

Dr. J. W. BONE (Bedford) moved an amendment to insert the words "in Wales and Monmouthshire" after the words "existing institutions" in the preamble of the recommendation.

This was seconded by Mr. S. NOY SCOTT (Plymouth). It was accepted by Mr. GARSTANG, and agreed to.

The recommendation as altered was then adopted. Mr. GARSTANG moved the following recommendation of Council:

That the strongest opposition be offered to any extension of similar institutions or schemes, and especially to those schemes formed in South Wales under Section 15 (3) of the Insurance Act.

The whole of the work which led up to this report had been largely in the hands of Dr. Cox, who wished that before this motion was accepted the attention of Representatives should be drawn to the fact that the recommendation involved the strongest opposition to any extension of similar institutions and schemes under Section 15 (3) of the Insurance Act. The representatives who met the Committee put forward the plea that the British Medical Association should agree to some six schemes under 15 (3) being accorded the same status as schemes under Section 15 (4). It was felt that this could not be accepted, and it was accordingly proposed that opposition should still be offered to any further schemes under Section 15 (3).

The motion was ultimately carried in the following amended form:

That the strongest opposition be offered to any extension of similar institutions or schemes under 15 (4), and further

to those schemes which are formed or may be formed in Wales and Northamptonshire under Section 15 (3) of the Insurance Act.

MATERNITY AND CHILD WELFARE.

The CHAIRMAN of the Medico-Political Committee having moved to approve the Special Report submitted by the Council on Maternity and Child Welfare Schemes (SUPPLEMENT, May 8th, p. 230), Dr. AGNES ESTCOURT-OSWALD (North-East Essex) asked if the schemes included any whole-time appointments.

Mr. GARSTANG replied that the intention of the report was to include whole-time appointments under the conditions already discussed, where the private practitioners of a district were not willing or not able to undertake treatment.

Lieutenant FOTHERGILL (Brighton) moved:

That the engagement of a doctor be placed so far as possible on the same terms and conditions as in the case of the treatment of school children scheme.

Mr. H. B. BRACKENBURY (Council) said that the question was of great importance to the profession, and it contained the most serious possibilities of an attack on the position of the general practitioner. Schemes by municipalities or county councils for the treatment of children up to the age of 5 years were being established, and would be established to a greater extent in the future, and it behoved the Association to see that the position of the general practitioner was not undermined. If the general practitioner was deprived of the possibility of treating children up to the age of 5 years—the age at which they were treated by the school medical officer—it required very little foresight to see that the whole-time medical service system was likely to be extended further in the future. The object of the report was to demonstrate to the Local Government Board, to municipalities and to county councils, that the work could be done better by general practitioners than by whole-time officers, and that it was better for the patients themselves that the treatment should be undertaken by the general practitioners in the patients' own homes. The scheme was put forward not as a definite recommendation that the particular payments mentioned should be endorsed by the Representative Meeting, but in response to a request made to the profession by the Local Government Board, and by representatives of municipalities and county councils, that the profession should state its views. The Association had to contemplate the possibility of local bodies creating complete schemes by which the public health authority would undertake complete treatment for all sorts and conditions of children up to 5 years of age. The matter was one for each Division to consider. The scheme was only put forward as an example of what could be done.

The CHAIRMAN of COUNCIL said the report was really more or less a warning of a great danger that lay before the profession—the danger of a whole-time medical service throughout the country. The report had already been submitted to the Divisions for consideration, and the Council had drawn special attention to it.

Dr. CRAWFORD TREASURE (Cardiff) proposed an amendment that the portion of the report referring to remuneration of doctors be referred, together with the motion by Lieutenant Fothergill, to the Council. This was seconded by Dr. STEVENS (Edinburgh and Leith).

Dr. JOHNSON SMYTH (Bournemouth) declared that if any delay occurred it would be found that the local authorities would have entrenched themselves. He hoped the Council would be allowed to proceed as rapidly as possible.

The amendment was carried.

Dr. AGNES ESTCOURT-OSWALD (North-East Essex) asked whether, seeing that no decision had been arrived at as regards remuneration, advertisements for whole-time appointments at £350 per annum would be inserted in the JOURNAL.

The CHAIRMAN said he was informed by the Medical Secretary that in such a case, where no definite salary had been fixed as a general policy and there was any doubt on the matter, the local members of the profession would be communicated with before the advertisement was inserted.

On the suggestion of Captain LARKIN, it was ultimately decided to leave the Council to decide the amount of the remuneration that should be required, and the remainder of the recommendation was adopted.

MENTAL DEFECTIVES: SALARIES OF MEDICAL OFFICERS.
The CHAIRMAN of the Medico-Political Committee moved on behalf of the Council the following recommendation, which was carried:

That the minimum salary of a whole-time medical officer to a committee for the care of the mentally defective, appointed under the Mental Deficiency Act, 1913, should be £500 per annum.

SCHOOL MEDICAL STAFF: ALLOCATION OF DUTIES.

The meeting next proceeded to consider the memorandum (SUPPLEMENT, July 3rd, 1915, p. 11) approved by the British Medical Association and the National Union of Teachers concerning the allocation to school medical officers, teachers, and nurses of various duties in connexion with medical inspection and treatment of school children.

The CHAIRMAN said that a telegram had been received from Dr. ASHKENNY, Secretary of the School Medical Service Group of the Society of Medical Officers of Health, and a member of the subcommittee which met representatives of the National Union of Teachers. The telegram was read to the meeting by the Medical Secretary, and contained the following declaration:

The School Medical Service Group of the Society of Medical Officers of Health have considered the memorandum and unanimously decided that it will not be to their interest, and hopes the meeting will not consider that it represents its considered opinion.

Mr. GARSTANG said that Dr. Ashkeny had attended the meetings of the subcommittee, but from beginning to end had not been in harmony with the views of the majority of the subcommittee. It was quite possible that he might be right and the remainder of the subcommittee wrong, but Mr. Garstang thought the arrangement came to at the conference—he would not use the word compromise because they did not give anything away—was a good one. It was reasonable that the teachers should not be required to do any duty of a medical nature. If the Representative Meeting upset the arrangement the difficulties which had arisen in certain quarters where there had been misunderstandings between the medical officers and the head teachers would be perpetuated.

The memorandum was approved.

MEDICAL FEES FOR LIFE ASSURANCE EXAMINATIONS.

The Special Report of Council on the question of Fees for Medical Examinations for Life Insurance (SUPPLEMENT, July 3rd, p. 12) was received, and the CHAIRMAN of the Medico-Political Committee moved:

That the Representative Body adopt the following fees for medical examinations for life assurance:

£1 1s. for a formal full report, such as that contained in Sub-Appendix A to the Special Report of Council (SUPPLEMENT, July 3rd, p. 15).

10s. 6d. for a formal short report, such as that contained in Sub-Appendix B to the Special Report of Council (SUPPLEMENT, July 3rd, p. 14).

5s. for a simple form of certificate, such as that contained in Sub-Appendix C to the Special Report of Council (SUPPLEMENT, July 3rd, p. 14).

If, he said, there was any strong difference of opinion as to the amounts of the fees it would be better to reject the proposition altogether than to refer them back.

Dr. F. C. LANGFORD (Camberwell) moved an amendment:

That the recommendation be referred back to the Council on the ground that the proposed terms were not satisfactory.

He criticized especially the clause providing for a fee of 5s. for a simple form of certificate.

Dr. D. LAWSON (Aberdeen, Orkney, and Shetland) said it had been the policy of the Association for some years to endeavour to advance the material interests of the profession. The recommendation of Council put back the hands of the clock in this respect. He urged that when a doctor examined a person who was about to be insured he should be paid in some ratio proportionate to the amount of the policy. At present a doctor received the same fee, whether the policy was for £500 or for £5,000. The remuneration to the agent who brought the business was 1 per cent., so that for a £5,000 policy he would receive £50. An architect was paid according to the value of the structure, and there was no reason why a doctor should not receive a fee beyond a guinea when the policy was a large one.

Mr. C. E. S. FLEMING (Salisbury, Swindon, and Trowbridge), in supporting the amendment, asked if the doctors were to accept different remuneration for doing exactly the same work on behalf of insurance companies. The forms could perfectly well be filled up by a clerk; the whole importance of the doctor's report lay in the last clause where he stated whether or not the life was fit for insurance. The insurance companies in the past had a scale proportionate to the premium, and if the profession accepted that principle it should do so on condition that the scale went up as well as down.

Dr. HASLIP (Westminster), after reviewing the history of the question, said that Dr. Lawson had rather exaggerated the value of the opinion that a medical practitioner gave upon a life insurance paper. An agent in a large insurance company had told him that companies could very well do without a medical examination, because, although they would lose something on bad lives accepted, the loss was compensated by the saving of medical fees. In the case of a policy of £10,000 no life office accepted the opinion of one doctor, but obtained the opinions of two or three. The profession would not succeed in obtaining two or three guineas for life insurance examinations.

Dr. R. A. LUNDIE (Edinburgh and Leith) thought that the better class of insurance companies would not think the short formal report and the simple certificate worth the money they were asked to pay for them. There was a tendency at present on the part of insurance companies to accept lives without a medical examination—a course which had been followed systematically in the past by one or two companies. These companies gave the proposer an extremely stringent form of questions to answer. The list of diseases enumerated was very extensive, and if the proposer stated that he had not suffered from any of these the insurance companies could be pretty certain that the proposer's organs were sound. His Division thought the report should be referred back.

On a division the amendment to refer the report back was lost, and an amendment by Dr. C. E. PURSLOW (Birmingham Central), seconded by Dr. H. C. TERRY (Gloucestershire), to insert the word "minimum" before the word "fees" in the Recommendation of Council, was agreed to.

Dr. H. J. MACEVOY (Willesden) moved as an amendment that the fee for a policy of £1,000 or over should be 2 guineas, and this was carried.

Dr. JOHNSON SMYTH (Bournemouth) asked what would be the position of members who received fees of 2s. 6d. from industrial societies in respect of insurance.

The CHAIRMAN replied that he could only repeat an answer he gave to a similar question the previous day. When the Representative Meeting adopted a policy, it was the moral duty of members, so far as they could, to fall in with it, though there were no strong penalties which necessarily followed on their not doing so.

Dr. HASLIP said there was not an insurance company in England, with one or two exceptions, that would give over 1 guinea for a £1,000 insurance. ("No.")

Mr. DOMVILLE proposed an amendment that the phrase "that the Representative Body recommend" should be substituted for the phrase "the Representative Body adopt" in the Recommendation of Council.

The amendment was carried.

Mr. P. NAPIER JONES (Reading) thought it would be wise for the meeting to drop the question of the smaller fee.

The CHAIRMAN OF COUNCIL said that the extraordinary number of different propositions which had been put before the meeting must be proof that it was almost impossible to find a common ground of action in this matter. The question had been discussed at many previous meetings, and he saw no prospect of a unanimous decision being reached.

A resolution that the meeting proceed to the next business was carried by a large majority. The recommendation under discussion accordingly fell to the ground.

NOTIFICATION OF BIRTHS ACT.

Dr. C. O. HAWTHORNE (Marylebone) thought there was a most important omission in the report of the Council on medico-political matters, for it contained no reference to the Notification of Births Act. It had recently been applied to the whole country, and some important obligations were, as a consequence, cast upon the medical pro-

fession in every district. When the original measure was before Parliament, the Association took up a very strong attitude, and it was unfortunate that no reference should now be made to the Act. The public might conclude that the previous attitude of the Association was ill advised.

The motion that the remainder of the Supplementary Report of Council on medico-political matters be approved was then carried.

Major PARKER (Bristol) moved that the meeting enter a protest against the extension of the Notification of Births Act, on the ground that it compelled members of the profession to reveal information which they had received in the course of their professional work.

Dr. HAWTHORNE (Marylebone) seconded.

Mr. W. J. YOUNG (Cambridge, Huntingdon, and Isle of Ely) said he never sent in the cards with reference to notification of births. He left a card with the parent with the instruction that it must be filled in and posted.

The CHAIRMAN of the Medico-Political Committee declared that there was absolutely no compulsion on the doctor to do anything at all under the Act if he would only see that somebody else acted. (Laughter.) It was a distinction with a very great difference. The Act required that there should be notification by the father of the child if he was resident in the house, or by any other person who was in attendance on the patient, within thirty-six hours of the birth, and it was quite easy for the doctor to satisfy himself that one of these persons had carried out the duty.

The motion was carried.

GREAT NORTHERN RAILWAY CONTRACT PRACTICE.

On the motion of Dr. ARTHUR DRURY (Halifax) the following rider was approved:

That it be an instruction of this Representative Meeting to the Council to inquire into the conditions and terms of the Great Northern Railway contract practice, so as to ascertain if they are consistent with the decisions of the Association of contract practice. If found to be inconsistent with those decisions, to take steps to remedy such inconsistency so far as possible where members of the Association have undertaken this contract work.

NATIONAL INSURANCE.

The memorandum of the Council on the legal position of medical aid institutions under the Insurance Acts (SUPPLEMENT, May 8th, p. 233) was approved.

Dr. F. L. POCHIN (Oldham) moved:

That the Council be instructed to approach the Commissioners with a view to inducing them to take such steps as will cause approved societies to see that their agents are fully aware of the effect upon medical benefit generally, and certification in particular, of any regulations which may be issued from time to time by the Commissioners.

The Insurance Commissioners, he said, were constantly sending out new regulations modifying earlier ones. The insured person went to the agent of his approved society, who always tried to make it appear that the doctor was to blame if the patient did not get what he wanted. It was the business of the officers of the approved societies to be thoroughly conversant with the regulations.

Dr. C. E. ROBERTSON (Glasgow Southern) seconded the motion, which was carried.

The remainder of the Report of Council on National Insurance (SUPPLEMENT, May 8th) was then approved.

MEDICAL REFEREES UNDER THE INSURANCE ACTS.

The CHAIRMAN of the Insurance Act Committee then moved the following recommendation of Council (SUPPLEMENT, July 3rd, para. 214):

That the Representative Body reconsider the whole subject of fees for examination and report on cases submitted to part-time referees under the National Insurance Act.

Dr. MACDONALD said that two years ago the Representative Meeting agreed that the fee for reporting on these cases should be 10s. 6d. That decision was reaffirmed at the Representative Meeting in Aberdeen last year. It was then decided that 10s. 6d. was to be regarded as the minimum fee, but the decision had, unfortunately, led to a great deal of trouble throughout the country. As a matter of fact the rule with regard to a fee of 10s. 6d. was carried out in very few districts, scarcely any indeed, and where some of the Divisions had endeavoured to give effect to the decision they had found themselves in a considerable difficulty. Trouble had arisen because some members were not loyal to the recommendation of the Association

and accepted a smaller fee. It had also been found that doctors not members of the Association were prepared to undertake the work at a fee lower than 10s. 6d., and unfortunately some members who had been loyal to the Association had as a result been victimized. From information the Committee had received from various Divisions throughout the country there seemed to be a general feeling that the basis of payment should be reconsidered.

Mr. GARSTANG (Mid-Cheshire) said his Division was responsible for bringing this matter under the notice of the Council. It felt somewhat strongly in regard to it, because loyal members had been adversely affected. In order that the question might come before the Representative Meeting in a concrete form he was prepared to give notice now that at the next annual meeting he would bring forward a motion to rescind the previous resolutions which were now standing in the way. In the twelve months which would intervene the subject could be fully considered by the Divisions and the Council.

The CHAIRMAN thought it would be preferable to refer the whole question back to the Council with a recommendation that, as there was an obvious difference in the character of the cases which arose, some elasticity should be introduced into the rule fixing 10s. 6d. as the fee.

Dr. C. J. PALMER (Nottingham) said his Division was strongly opposed to any alteration in the fee, which was considered a reasonable one. The Division had suffered severely in this matter.

The CHAIRMAN thought the motion might be altered to read, "and that the Council be asked to consider whether there should not be greater elasticity in the matter of fees."

Dr. J. BAIRD (Glasgow N.W.) objected strongly to the matter being hung up for another year, and asked that the meeting should come to a definite decision. Some disloyal members of the Association in his Division had resigned simply because the Division had decided in favour of the 10s. 6d. fee.

The motion was altered as suggested by the Chairman and carried as follows:

That the Representative Body, on reconsidering the whole subject of fees for examination and report on cases submitted to part-time referees under the National Insurance Act, requests the Council to consider and report as to the advisability of greater elasticity as between case and case in the fees demanded for these examinations.

DOMICILIARY TREATMENT OF TUBERCULOSIS.

Dr. MACDONALD, in moving that the Memorandum of the Council on the method of payment for domiciliary treatment of tuberculous insured persons (SUPPLEMENT, July 3rd, p. 14) be approved, drew attention to the very serious questions raised in the Memorandum, and said there were many indications that attempts were about to be made to deprive panel practitioners of some of the money hitherto received in respect of domiciliary treatment. It was suggested that patients were being more cheaply treated by tuberculous officers than by panel doctors.

The memorandum was approved.

CONFERENCE OF LOCAL MEDICAL AND PANEL COMMITTEES.

Dr. MACDONALD moved:

That the special report of the Insurance Act Committee on the resolutions of the Conference of Representatives of Local Medical and Panel Committees held June 16th, 1915, together with the report of the Deputation to the Chairman of the Joint Committee National Health Insurance Commission, July 10th, be received.

The Conference, he said, had been very satisfactory; about 120 representatives were present. There was evidently a great deal of dissatisfaction among panel practitioners throughout the country as to the way in which the medical benefit fund was distributed, but the Conference came to the conclusion that the arrangements provided in the Act were satisfactory as long as they were properly carried out by the administrative bodies concerned. Mr. Charles Roberts, M.P., the Chairman of the Joint Committee of Insurance Committees, when approached by the deputation, led it to believe that a great deal of the disorganization in the payment of doctors was due to the unsatisfactory nature of the arrangements made in the early stages of the administration of the

Act. He hoped, he in very much better working order than in the past. The enlistment of members of clerical staffs of the Commission and Insurance Committees had, however, contributed to the disorganization, so that there might not be much improvement for a time.

The motion was passed.

THE WAR AND SICKNESS INCIDENCE.

On the motion that the remainder of the Supplementary Report on this subject (SUPPLEMENT, July 3rd, pp. 5 and 6) be approved,

Mr. JOSEPH CANTLEY (Salford) moved:

That the profession notes with alarm the disturbance of the probable sickness incidence of insured persons owing to the withdrawal of healthy lives by enlistment in the army, with the probable return of many unhealthy lives into the insured classes at a later date; and also the reduction of advances of grants by the Insurance Commissioners to the different Insurance Committees.

Mr. Cantley said that the motion was intended to focus the attention of the profession upon a really alarming state of matters. His Division had already sent a similar resolution to the local Insurance Committee with excellent results.

It was pointed out by the CHAIRMAN that the motion was not in conflict with the report of the Council, but that it put in stronger form the views expressed there. The motion was carried.

INTEREST ON MONEYS DUE TO INSURANCE PRACTITIONERS.

Dr. SHEAHAN (Portsmouth) moved and Mr. A. P. THUNDER (East Cornwall) seconded a motion expressing the strong opinion that interest accrued on moneys due to practitioners now lying in the Medical Benefit Fund should be paid to them.

The CHAIRMAN of COUNCIL said that the question of payment of interest had only arisen because of the great delays in the payment of moneys due to practitioners. The excuse offered by the Commissioners for these delays was that the method of compiling the panel lists of practitioners had been started on a wrong principle, and that the transfer of patients had been so badly conducted under the original system that matters had not been cleared up yet. The Commissioners believed that under the present system there would be no great delay in paying the money.

Dr. E. E. BRIERLEY (Cardiff) said the point ought to be kept in view that if doctors insisted on the payment of interest on sums not promptly received the Insurance Commissioners might stop advance payments and keep them waiting till the end of each year.

The motion was lost by a small majority.

TENURE OF OFFICE BY MEDICAL OFFICERS OF HEALTH.

In the absence of Mr. James Green, the CHAIRMAN of the Public Health Committee (Mr. E. J. Donville) brought up the passages of the Annual Report of Council under heading "Public Health and Poor Law" (SUPPLEMENT, May 8th, p. 193, paras. 150-6). Referring to the deputation which waited upon the Government with reference to the tenure of office of medical officers of health, he said that it had had a most pleasant reception from Ministers. Unfortunately, as in the case of three previous deputations, the visit was followed shortly afterwards by a change of Government; so that the objects in view had again been impeded.

The report was approved.

HOSPITALS.

MODEL SCHEME FOR TUBERCULOSIS TREATMENT.

Dr. H. J. CAMPBELL, the Chairman of the Hospitals Committee, moved on its behalf:

That the Representative Body express the opinion that it is necessary for the training of medical students in the diagnosis and treatment of tuberculosis that any tuberculosis dispensary situated in the area of a voluntary hospital to which a medical school is attached should, so far as possible, be worked in co-operation with the hospital for teaching purposes.

Owing to the gradual devolution of tuberculosis from general hospitals and teaching schools to special tuberculosis institutions, there was considerable risk that there might be an actual lack of clinical material for teaching in respect of tuberculosis.

The motion was adopted.

VOLUNTARY HOSPITAL STAFFS AND STATE PATIENTS.

Dr. CAMPBELL said that it had been the Association's policy recently to insist that in all cases in which it could be arranged hospital staffs should be adequately paid for services rendered in respect of patients for whose maintenance the State was responsible. On the other hand, the Association had passed a very definite resolution that in all cases efforts should be made to maintain voluntary hospitals upon a voluntary basis. If the Association insisted that hospital staffs should be adequately paid it seemed inevitable that in a large number of cases the voluntary staff would be dispensed with, and whole time medical officers appointed. The reconciliation of this dual policy had been under consideration, but no conclusion was reached by the Committee owing to the delay caused by the war. The Committee proposed to draw up a report dealing with the whole matter, and submit it to the Divisions and to the next Annual Representative Meeting. The motion was approved.

NAVAL AND MILITARY.

The portion of the Report of Council under heading "Naval and Military" (SUPPLEMENT, May 8th, p. 194, and July 3rd, p. 6) was approved without discussion.

SCOTTISH COMMITTEE.

On the motion of Dr. HAMILTON, the Annual and Supplementary Reports of Council relating to Scotland were approved.

Dr. HAMILTON remarked that at the meeting in Aberdeen it was arranged to appoint a medical secretary for Scotland within a certain time, but the matter had been deferred, because the Committee considered that during the war the field of choice was greatly limited, and that after the war eligible men might be available who, though rendered unfit for general practice, were yet quite qualified for the work of secretary.

IRISH COMMITTEE.

Mr. R. J. JOHNSTONE, Chairman of the Irish Committee, moved that the Annual Report of Council under heading "Ireland" (SUPPLEMENT, May 8th, pp. 195-6, paragraphs 176-82) be approved.

In reply to Lieutenant FOTHERGILL (Brighton).

Mr. JOHNSTONE said that a deputation had waited upon Mr. C. H. Roberts, M.P., Chairman of the Insurance Joint Committee, that day, and was given to understand that a scheme was under consideration for dealing with the question of certification in Ireland. It was proposed to place that scheme before the members of the profession in Ireland at an early date.

The motion was carried.

GENERAL APPROVAL OF ANNUAL REPORT OF COUNCIL.

On the motion of the CHAIRMAN of the Council, it was agreed that, subject to amendments and other resolutions adopted by the meeting, the Annual Report of the Council, together with the Supplementary Report, be approved.

VACANCY ON GENERAL MEDICAL COUNCIL.

On the motion by the CHAIRMAN of the Representative Meetings it was resolved:

That the Representatives of Constituencies in England and Wales should consider the nomination of a candidate for election as Direct Representative for England and Wales on the General Medical Council;

And the CHAIRMAN thereupon moved:

That the candidature of Dr. J. A. Macdonald, LL.D., for the seat of Direct Representative for England and Wales on the General Medical Council vacant May, 1916, be supported by the Association.

The CHAIRMAN intimated that the nomination of Dr. Macdonald was the only one which had been received.

The proposal was enthusiastically agreed to.

Dr. MACDONALD said he thanked the meeting very much for selecting him as candidate for the distinguished position of Direct Representative for England and Wales on the General Medical Council. It was a body that required strenuous work and careful attention, and while sometimes the proceedings were a little bit sleepy and not so interesting as those of the Representative Meeting it certainly did an enormous amount of work.

VOTE OF THANKS TO RETIRING CHAIRMAN.

Dr. DOUGLAS (Maidstone) said it seemed hard to believe, with so many familiar faces before him that he had known for many years, that he was the only member who had been continuously a Representative from the first meeting of the Representative Body. Because of that he had been asked to move a resolution, which it was pleasant to know would have the support of every one, namely:

That this meeting of the Representative Body desires to place on record its great appreciation of the services in the chair for the past three years of Mr. T. Jenner Verrall, LL.D., and also its warm feeling of personal regard, and its thanks of the able manner in which he has conducted the business of the Representative Body during a period of exceptional importance to the Association and the medical profession.

The resolution needed no words of his to commend it. They all felt that Dr. Verrall had discharged the duties of Chairman with great ability and great conscientiousness, and they regretted that he had insisted upon vacating the chair at this time. But it was hard work, and the Representatives must feel more than satisfied with the services he had rendered. (Applause.)

Dr. MACDONALD said he regarded it as an honour to second the resolution. He did so from his official position as Chairman of Council, and on another ground—a much stronger one—from his personal regard for Dr. Verrall. The Association could never repay the debt of gratitude it owed to Dr. Verrall for the work he had done in the chair. As the resolution stated, he had occupied the chair during a time of exceptional stress and difficulty for the Association. Dr. Verrall possessed personal qualities which had enabled him to steer the Association successfully through all the difficulties it had encountered. His quick, critical intellect, the rapidity with which he picked up points, the firmness with which he gave his findings when he came to a decision, as well as the rapidity with which he came to a decision—the whole toned with that beautiful suavity characteristic of Dr. Verrall—made him such a chairman that the meeting would find it very difficult to get another to approach him in excellence. He knew no one he felt it a greater honour to be allowed to claim as a friend. For these reasons he had the greatest pleasure in seconding the resolution proposed by Dr. Douglas. (Applause.)

Mr. E. B. TURNER (Chairman-elect) said that as the Elisha on whom the mantle of Elijah was to descend he felt he must support most heartily the vote of thanks to Dr. Verrall. Dr. Verrall must have accomplished what, in the annals of the Association, he believed to be an unparalleled and unsurpassed record, when it was considered that during his term of office he had presided not only at annual but at many Special Representative Meetings, and at the same time he had had a tremendous amount of additional work on Committees. Dr. Verrall had raised the position of chairman to a level even higher than it had been previously maintained. He had the Attic salt of wit and the saving grace of humour; these things were very great factors when a man was managing and controlling a meeting in which feelings, and the expression of feelings, sometimes ran very high. The Association would always owe an enormous debt to Dr. Verrall for his work during these years and would agree that the promise Dr. Verrall gave at the beginning of his term of office had been more than amply fulfilled. Speaking for himself he could only say that when the time came for him to lay down his office he would be satisfied if he had done one-tenth part as well as Dr. Verrall. (Applause.)

The resolution was put and was carried with great enthusiasm and with musical honours.

Dr. VERRALL, in acknowledging the vote of thanks, said he felt the time had come when it was better that a change should be made in the chairmanship of the Representative Body. He did not say that this step did not create in his mind a feeling of regret; it did. On the other hand, he had already said that he did not think it was good for a representative body or an association to continue a man too long in one position. He held that opinion very strongly, and for that reason he had asked that his name should not be submitted as a candidate for the position of Chairman. While he had tried to do his duty, he had at the same time thoroughly enjoyed himself—(laughter)—and that afforded a certain satisfaction to a properly constituted human being. It had given him an opportunity of being occasionally right in his

decisions, and also for being wrong, when he was wrong, with impunity, and this was also attractive. (Laughter.) He thanked the meeting very much for the vote of thanks, and he hoped that in whatever position they might choose to place him in connexion with the Association—if they made him a member of the Council—it would be an honour and pleasure to serve them. (Applause.)

VOTE OF THANKS TO CLERICAL STAFF.

On the motion of Dr. VERRALL, a hearty vote of thanks was accorded the clerical staff for their work in connexion with the meeting.

CHAIRMAN AND DEPUTY CHAIRMAN.

During the meeting a new Chairman and Deputy Chairman were elected. For the first office the only candidate nominated was Mr. E. B. Turner, previously Deputy Chairman, and he was accordingly declared elected. For the office of Deputy Chairman Mr. T. W. H. Garstang, a member of the Council elected by the Lancashire and Cheshire Branch, and the Representative of the Mid-Cheshire Division, was chosen.

CONFIRMATION OF MINUTES.

The minutes of the day's proceedings were thereafter corrected and confirmed.

ELECTION OF MEMBERS OF COUNCIL.

The CHAIRMAN announced the result of the voting for the four members of Council elected by the Representative Meeting as follows: Sir James Barr, Mr. Donville, Dr. Haslip, and Dr. T. Jenner Verrall.

The proceedings then terminated.

MINUTES OF CONFERENCE

BETWEEN THE BRITISH MEDICAL ASSOCIATION AND THE FRIENDLY SOCIETIES MEDICAL ALLIANCE.

A CONFERENCE between representatives of the Medical Political Committee and of the Contract Practice Subcommittee of the British Medical Association, and representatives of the Friendly Societies Medical Alliance and the South Wales and Monmouthshire Alliance of Friendly Societies, was held at the offices of the Association, 423, Strand, London, W.C., on Thursday, July 8th, 1915.

Present: Mr. T. W. H. Garstang (in the Chair); Mr. H. B. Brackenbury, Capt. A. C. Farquharson, Dr. Adam Fulton, Mr. E. J. Donville, Mr. N. Bishop Harman, Dr. R. E. Howell, Lieut. J. T. Macnamara, Dr. H. C. Mactier, Dr. Edwin Rayner, Dr. J. Ratcliff-Gaylard, Dr. W. E. Thomas, Mr. T. Jenner Verrall, H. D., representing the British Medical Association, Mr. E. F. Hind, Mr. Walter R. G. Langford, Mr. Samuel Pride, representing the Friendly Societies Medical Alliance, Mr. Walter Conway, Mr. Sam Filer, Mr. Llewellyn Jones, Mr. Thos. Parfitt, Mr. Evan Pugh, representing South Wales and Monmouth Alliance of Medical Societies.

The CHAIRMAN, in welcoming the representatives of the South Wales and Monmouthshire Alliance of Medical Societies and the Friendly Societies Medical Alliance, expressed the hope that whatever other result the Conference might have, it would be the means of acquainting each side with the other's position. He pointed out that that day's proceedings could not be binding upon either party, as he took it that they were there to hear what each had to say, and report to their respective parent bodies.

Mr. HIND stated that they greatly appreciated the Association's action in meeting them, and said that their desire to confer with the Association was the result of the publication in the SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL of May 8th, 1915, of the Recommendations L and M of the Council of the Association to its Representative Body, which had suggested to them the desirability of a conference prior to the meeting of the Representative Body. Their instructions were to ascertain, if possible, the minimum requirements of the Association as regards institutes, and to find out what were the outstanding differences between the two parties.

Mr. S. FILER, on behalf of the Welsh Alliance representatives, stated that they were quite as anxious as the English Alliance to come to a lasting arrangement with the Association. He stated that there was no intention on the part of any one interested in institutes to make money

out of those undertakings, but there were many reasons for their continuance.

WHOLE TIME SERVICE.

Mr. PRIDE stated that one of the principles of the Alliance was the employment of medical officers as whole time officers, and asked whether the Association had any objection to that principle.

After discussion, the following statement by Dr. VERRALL appeared to meet with the approval of the Conference—namely, that the Association did not object to doctors undertaking whole time service, subject to proper conditions, and that if such an officer signed a bond not to take private work he must stand by such bond.

The Conference then discussed the conditions set forth in the Council's Recommendations.

CONDITIONS OF PAYMENT.

Recommendation L.—That it is inadvisable to take objection to the acceptance by members of the Association of appointments at those existing institutions recognized under Section 15 (4) of the Insurance Act which will conform to the following conditions:

Condition (a): Salaries or other forms of payment to be satisfactory to the Association.

Mr. HIND stated that they felt that a minimum salary of £400, plus house (and sometimes light, rates, and extra fees) would make a good starting-point for discussion, and pointed out that all the agreements of the Chesterfield Institute with its medical officers provided for the latter having the right at the end of the financial year to examine the accounts with the view of sharing in surplus funds, if any.

After discussion the CHAIRMAN stated that he thought they were within a measurable distance of agreement on Condition (a), and that any difference of opinion thereon appeared to be more a matter of detail than of principle, but that it would be appreciated that the Association could not attempt to establish a definite scale of salaries that would apply everywhere, because it felt that each case should be dealt with on its merits—that is, on the amount of work allotted to a medical officer.

The MEDICAL SECRETARY pointed out that the method of carrying out any agreement that might be arrived at as regards Condition (a) would be that those institutes that wished to have as medical officers members of the Association or wished to be regarded as institutions to which the Association would take no objection, would submit to the Association full information as to the salary, fees, amount of work, etc., attaching to the post, and that the Association would indicate whether it was prepared to advise the institute and any intending applicants for the post whether it considered the salary and conditions attached to the post were suitable.

A summing up by Dr. VERRALL appeared to be satisfactory to the Conference—namely, that it is reported to the Representative Body that the Association would recommend practitioners not to enter into an agreement with an institute without knowing whether the salary was approved by the Association. He pointed out that the Representative Body might possibly take one of two steps—namely, either fix a minimum salary below which it would not advise any medical practitioner to accept any appointment, or decide that under no circumstances should a practitioner enter into agreement to give his whole time unless a salary were offered which the Association considered to be a fair one in the circumstances.

Mr. HIND asked whether in any instance where the Association centrally approved the terms of an appointment, there would be any likelihood of the local profession being hostile to the decision, and was informed that the central authorities of the Association would deal with the local profession.

The CHAIRMAN suggested that possibly one method of giving effect to any agreement on the point might be that institutes should submit their advertisements for vacancies, together with the conditions attaching thereto, to the Central Office of the Association; and a Welsh Alliance representative suggested that it might be made a condition of the agreement that all advertisements for medical officers of institutes must be published in the BRITISH MEDICAL JOURNAL.

Mr. HIND stated that he would have liked to have some idea of the minimum salary which the Association thought should attach to such posts, but quite understood that the Conference was dealing only with main principles, and suggested the possibility of some later conference to deal with details.

FREE CHOICE.

Condition (b): Free choice of doctor by patient and of patient by doctor to be allowed.

The CHAIRMAN referred to the fact that Condition (b) had been one of the most strongly held principles of the Association in connexion with the Insurance Act campaign, and was the Association's view of what was the best way of carrying out medical treatment.

Mr. HIND thought they agreed, but pointed out that the Insurance Act allowed persons to choose an institution if they liked, instead of an individual doctor.

The MEDICAL SECRETARY asked if the Alliance representatives meant that when an insured person chose an institution as the means by which he desired to obtain his medical treatment the Association's responsibility ended, as the person has then exercised his free choice; and that the Association should not insist upon any further free choice amongst the medical officers of the institute if there were more than one.

The representatives of the alliances indicated that that was their view of the requirements of the Insurance Act, and agreed that they were entirely with the doctors in objecting to any compulsion or restraint being placed upon an insured person's choice as to joining or remaining outside of an institution, but that when an insured person had chosen an institution they objected to any further requirements on behalf of the profession as to free choice. Mr. HIND stated that they looked upon an insured person who had chosen an institute as having "contracted out" of the medical regulations under the Act. The Welsh Alliance representatives intimated that they were not in agreement with Mr. Hind's interpretation *re* "contracting out," but rather with the Medical Secretary in his interpretation in previous paragraph.

POSITION OF INSTITUTION DOCTOR AS REGARDS COMPLAINTS.

Condition (c): The institution doctor to be placed as nearly as possible in the same conditions as the panel doctor as regards complaints by patients.

Mr. HIND stated that Condition (c) was impossible to carry out in the light of the Regulations of the Insurance Act, and pointed out that recent rules approved by the English Commissioners provided for the setting up of a board of five independent arbitrators, from whom three were selected by the insured person complaining, for the purposes of settling any particular case of complaint, and from whose decision there was a right of appeal to the Commissioners.

The MEDICAL SECRETARY pointed out that the Association's solicitor held that an insured member of an institute who elected to make a complaint against a doctor had a right to ask that his complaint go straight to the Medical Service Subcommittee of the Insurance Committee of the area, as no Regulations could deprive him of his rights, as an insured person, to the protection of the Insurance Committee.

Mr. HIND did not agree.

Mr. HIND, in reply to a question by Dr. THOMAS as to whether they would agree to the Medical Service Subcommittee being the tribunal for such complaints, stated that they contended that insured persons who had chosen an institute had "contracted out," and that institutes were not desirous of allowing any interference in their work by Insurance Committees, but desired to deal direct with the Insurance Commissioners.

Dr. THOMAS stated that the Association desired that if the Medical Service Subcommittee were not utilized there should be a similarly constituted tribunal to deal with complaints by members of institutes against the doctor.

Mr. LAXFORD stated that, while they were bound by the present rules outlined by Mr. Hind, if a general agreement were come to he did not see why in the future they should not include among their present five arbitrators the names of two or even three medical practitioners.

The Welsh Alliance representatives agreed to the suggestion put forward by Dr. Thomas.

The MEDICAL SECRETARY pointed out that the Welsh Commissioners in their model rules for institutions provided that appeals against the decision of the committee of an institution as regards a complaint should go to the Insurance Committee, which should deal with the matter so far as possible in accordance with Part V of the Regulations.

The Welsh Alliance representatives expressed themselves as quite agreeable to Condition (c), but the English Alliance representatives desired it to be left as a debatable point.

Dr. VERRALL suggested that, with regard to uninsured persons, the English Alliance representatives considered that they had set up an entirely fair committee for the hearing of complaints, but asked whether they would not be inclined so to vary their committee that it would have some medical representation on similar lines to the Medical Service Subcommittee.

Mr. HIND stated that at the moment he must admit that he was prejudiced in that the general feeling of the profession in his locality was one of hostility to the institute, and that therefore they might have considerable difficulty in constituting a satisfactory committee. He felt that it was a debatable point, and one that must be discussed at the Alliance meeting. In reply to Captain FARQUHARSON, he did not think there was any objection to a medical assessor sitting with the committee of arbitrators when the medical officer asked for such.

Mr. HIND, in reply to a question by the CHAIRMAN, stated that the experience of the institutes was that there was not a large number of complaints.

Dr. RAYNER, however, stated that in some areas the number was large.

APPROVAL OF RULES OF INSTITUTION BY THE ASSOCIATION, SO FAR AS THEY AFFECT THE MEDICAL OFFICER.

Condition (d): The rules of the institution, so far as they affect the doctor, to be approved by the Association before any member is allowed to accept or retain appointment.

The CHAIRMAN stated that by Condition (d) the Association did not desire to dictate to the institutions as regards their rules, but only wished to see that there was nothing unfair or improper in the rules as affecting the doctor.

The MEDICAL SECRETARY stated that in working practice it would mean that those institutions which desired to work in harmony with the Association would send such of their rules as applied to the employment of medical officers to the Association and ask whether there was anything therein to which the Association objected.

No objection was raised to Condition (d).

SAFEGUARD AGAINST USE OF INSURANCE FUNDS TO FINANCE ATTENDANCE ON DEPENDANTS.

Condition (e): Some guarantee to be obtained that the institution is not using insurance funds to finance the medical attendance on dependants, thereby lowering the rate which the outside profession would be able to secure for the same work.

Mr. HIND suggested that the Committee deal first with the Welsh representatives upon this point.

A Welsh Alliance representative stated they were quite prepared to accept the condition, and that they did not see how they could take any exception to it as it was a point which the Welsh Commissioners already demanded.

The MEDICAL SECRETARY called attention to the fact that in some Welsh colliery areas, prior to the Act, it had been necessary for the provision of medical attendance on workmen and dependants that all workmen, married and single, must pay the same poundage, whereas in some areas now single men were refusing to pay because they were insured persons. It was obvious that in these areas it must be the intention to use insurance money to provide or partly provide for the treatment of dependants.

A discussion followed upon the Aberillery case, and eventually the Welsh Alliance representatives reiterated that they were quite prepared to accept the condition as being a fair one.

Mr. HIND asked if they were to understand that what was required was that the whole of the State money should be kept separate from the voluntary contributions, and that the whole of the State money should be paid, with the exception of a certain percentage, to the

medical officers. If so, what percentage should be paid to the doctors and dispensers, and what amount did the Association think should go for other expenses, as, for example, housing of doctors, locomotion, etc., incurred with the doctor's consent?

The MEDICAL SECRETARY drew attention to the following paragraph of the Welsh Commissioners' rules as to Institutes:

Returns and Accounts.

(5) The administrative expenses shall not exceed a sum which the Commissioners shall, on reference to them, determine to be reasonable. The Board of Management, or any of the medical officers of the institutes, may make such representations to the Commissioners with regard thereto as they may consider necessary, but no deductions shall be made for administrative expenses in excess of the sum so determined from the amount available for cost of medical attendance and treatment.

The Medical Secretary asked, with respect to a suggestion by Mr. Hind that he did not consider Condition (c) necessary in view of what had already been practically agreed upon, if Mr. Hind's point was that if the Association satisfied itself thoroughly under conditions (a) and (d), that is, as to salaries and conditions, there was no need to worry about (c), and Mr. Hind agreed that that was his point.

The discussion on (c) then terminated, the English Alliance representatives reserving themselves on this point until after their Alliance had discussed the subject in the light of the information now obtained.

OPPOSITION TO FUTURE EXTENSIONS.

Recommendation M.—That the strongest opposition be offered to any extension of similar institutions or schemes, and especially to those schemes formed in South Wales under Section 15 (3) of the Insurance Act.

A Welsh Alliance representative, in asking the Association to extend its sympathy to existing 15 (3) Schemes said they felt they were in a difficult position, as they knew there had been considerable contention between the profession and the miners in Wales in regard to 15 (3) Schemes, many of which had gone to considerable expense in their operations. They desired to ask if it would be possible for the Association to agree to accept the existing 15 (3) Schemes as 15 (4) Institutions, and, if it could be so agreed they took it that it would be part of any agreement that they must fall in with any conditions agreed upon as to institutions.

Dr. THOMAS asked if the practitioners who had accepted posts with 15 (3) Schemes against the Association's desire would be dismissed, to which the Welsh Alliance representatives replied that the Alliance would have no power to enforce this. They would, however, if agreement were reached as to recognition of existing 15 (3) Schemes, undertake to prevent, to the best of their ability, any new schemes coming into existence.

The MEDICAL SECRETARY read out from his South Wales report the list of 15 (3) Schemes approved by the Commissioners and asked if that included all for which the Welsh representatives desired recognition. The list was as follows: Blaينا, Risca, Garw Valley, Mountain Ash, Llywynypia, Briton Ferry, and Neath.

The Welsh Alliance representatives agreed, except that the list should include Abertillery, and gave as the reason therefor that that scheme had been in existence since the passing of the Act, but had not been able to apply to the Commissioners for approval owing to trouble with the local profession.

The Welsh Alliance representatives, in reply to Dr. Thomas's query as to what influence they would have in preventing any new scheme being started, stated that they believed that they had been largely instrumental in putting the existing institutions and schemes in South Wales on a sound footing, and that their influence would now be cast against the establishment of any others in the event of agreement.

Dr. VERELL drew attention to the fact that if the Association agreed to the proposal it would be giving up one of its strongly held convictions—namely, that the approval of 15 (3) Schemes, such as obtained in Wales, was absolutely contrary to the Act itself, and that if the Association once gave away the principle it might (even with the help of the Alliance) have other demands for recognition by any other schemes that might be started,

and, as it would have already given away the principle, it would have no logical basis for refusal of such recognition.

A Welsh Alliance representative stated that if the Association agreed to his proposal to recognize existing schemes, they would be quite willing to join in a joint deputation to the Welsh Commissioners to ask that that body approve no further schemes. He firmly believed that they could persuade the Welsh Commissioners to agree. He further pointed out that the Commissioners could not take that line at present because the Alliance had the written undertaking of the Commissioners to accept 15 (3) Schemes. If the Association agreed, the Alliance was quite willing to free the Welsh Commissioners from the undertaking given them on the point.

The CHAIRMAN asked if he could take it that as regards existing schemes the Welsh Alliance, in order to bring about peace, asked that the Association should extend its approval not only to institutions approved under Section 15 (4) of the Act, but also to existing 15 (3) Schemes under exactly the same conditions, and that the Alliance in return would undertake to use all its influence to prevent any extension of such schemes, and was willing to join with the Association to the Welsh Commissioners in asking them not to approve any more schemes. The Welsh Alliance representatives agreed that that was the position.

MINUTES OF CONFERENCE.

The CHAIRMAN stated that the Medical Secretary would submit draft minutes of the Conference to the Secretaries of both Alliances for their approval or suggestions for alteration, with a view to an agreed report of the Conference being submitted to the respective parent bodies.

BRITISH MEDICAL ASSOCIATION.

DEPUTATION TO THE INSURANCE JOINT COMMITTEE.

The following is the agreed report of the deputation from the Insurance Act Committee to the Chairman of the National Health Insurance Joint Committee on July 9th, 1915, with respect to the resolutions passed by the Conference of Representatives of Local Medical and Panel Committees, June 16th, 1915.

Position of B.M.A. in relation to Local Medical and Panel Committees.

In introducing the Deputation charged with the duty of laying before Mr. Roberts the resolutions adopted by the Conference, Dr. Macdonald stated that the Conference was attended by 117 representatives of the Local Medical and Panel Committees in the United Kingdom. Of these 91 were from the English Committees out of a possible 126, 12 from the Welsh Committees out of a possible 17, 14 from the Scottish Committees out of a possible 56. A large number of Committees intimated that they had wished to appoint representatives but had been unable to find a representative in view of the exceptional pressure upon the profession. The terms of the resolution recorded in Minute 86, viz.:—

Minute 86.—“That this Conference of representatives of Local Medical and Panel Committees cordially welcomes the assistance given by the British Medical Association to these Committees in their work, and urges all Committees to make use of such assistance and to look to the Association to voice the opinion of Local Medical and Panel Committees as a whole in central negotiations.”

had been communicated before the date of the Conference to all Panel and Local Medical Committees, none of which had expressed any dissatisfaction with or taken any exception to the policy embodied therein, while the resolution itself was adopted by the Conference unanimously; and, as affording further evidence of the attitude of these Committees towards the B.M.A., Dr. Macdonald drew attention to the resolutions recorded in Minute 84 and 85 (*vide infra*).

Mr. Roberts expressed his pleasure at receiving the members of a deputation which, as Dr. Macdonald's statement indicated, appeared so justly entitled to speak for the general body of medical practitioners undertaking work under the Insurance Act. He noted with interest the circumstances which had led to the present interview, and while he assumed that it was not suggested that the continuance of the direct relations at present existing between the Commissioners or Insurance Committees and the several Panel and Local Medical Committees was in any way in question, it was recognised that the Association was, in view of the above Resolution, in a singularly favourable position to voice the general opinion of those Committees.

The discussion of the particular resolutions was then proceeded with.

System of Payment of Insurance Practitioners.

Minute 8.—That in the opinion of the Conference the present system of payment of Insurance practitioners is equitable if the administrative details are properly carried out by approved societies and Insurance Committees.

Mr. Roberts stated that he appreciated the assurance contained in this resolution. As regards the administrative details alluded to in the provision, these could be discussed upon the specific resolutions relating thereto, viz., those recorded in Minutes 31, 35, 38, 40 and 41.

Procedure as regards Doctors' Lists.

Minute 31.—That Regulations are desirable with respect to removals of insured persons to secure:—

- (a) That no person be removed from a Doctor's list (except in the event of such person being dead or having ceased to be an insured person) until a new doctor has been chosen by him.

With reference to this resolution, it was pointed out on behalf of the Commissioners that ever since the beginning of 1914 a system had been in force (the Medical Card System) the principle and effect of which was precisely what the resolution regarded as desirable. Prior to the beginning of 1914, the correction of the doctors' lists in respect of removals had depended upon the notification by Approved Societies of the changes of addresses of their members. But this system had proved to be a failure, and the Medical Card System which superseded it was entirely based upon the principle that an insured person who changed his address after choosing a doctor should not be removed from that doctor's list until he chose a new doctor in the area of his new address. If, therefore, in adopting this resolution the Conference had in mind any actual cases in which this general procedure was not followed, such cases must be exceptions to the rule now in force; and it could only be conjectured that any such exceptions related to the clearance of the removals which had taken place prior to the introduction of the Medical Card System.

As already stated, the system previously in force had not proved a success. The Medical Card System, though it had incidentally corrected a good deal of the error which had crept in under the previous system, was not intended, and could not be expected, of itself, to clear it up completely. Accordingly, Insurance Committees had spent much trouble and money in the laudable effort (undertaken almost solely in the doctors' interests) of clearing up the pre-medical card error; and in so doing they have necessarily had to follow the principles previously in operation and to utilise any available sources of information.

The current machinery, however, which has been in force since the beginning of 1914 is based on the very principles recommended in the resolution.

Procedure in cases of Suspension from Medical Benefit.

Minute 36.—That this Conference recommends that Approved Societies, and Insurance Committees in the case of Deposit Contributors, should in all cases of suspension from Medical Benefit of an Insured Person, secure the medical card of that individual and that the Approved Societies should forward it with the suspense slip to the Clerk to the Insurance Committee affected.

It was stated on behalf of the Commissioners that Insurance Committees do as a matter of fact make a practice of calling upon insured persons suspended from medical benefit to surrender their medical cards; and that the Commissioners have lately instituted arrangements to facilitate the work of Insurance Committees in the recovery of these cards. Whether Approved Societies were likely to be any more successful in the recovery was open to doubt; but in any case it was put to the Deputation whether they thought it advisable that any duties of administration of medical benefits should be entrusted to any bodies, such as Approved Societies, other than those specifically charged with those duties, viz., Insurance Committees.

Delay in issue of Medical Cards.

Minute 38. That this Conference draws the attention of the Commissioners to the serious delay in the issuing of the medical cards to insured persons, and urges them to take immediate steps to ensure an earlier delivery by Insurance Committees in the future.

With reference to this resolution, the Deputation were asked what cases they had in mind and upon what information the resolution was based.

It was stated in reply that the Deputation were not as yet fully satisfied as to the particulars of the circumstances referred to and that they would request that the resolution might be regarded as withdrawn pending further enquiry.

Correction of Registers of Committees.

Minute 40.—That the Conference urges upon the National Health Insurance Commissioners the advisability of taking immediate steps to revise and correct the registers of Insurance Committees and to adopt such modification of the Regulations as will ensure that in the future such registers will continuously be a correct index of the number of insured persons entitled to Medical Benefit in each Insurance area, and so secure an accurate factor for estimating and obtaining a true and equitable credit for each area from the Central Medical Fund.

In reply, the Commissioners referred to the intention expressed by them on the occasion of a previous conference with representatives of the B.M.A. on the 22nd December last. The Commissioners had not in any respect abandoned the intention announced on that occasion of taking action to secure greater accuracy in the Index Register, but shortage of staff and increased pressure of work due to the exceptional war conditions had led to unavoidable delay in initiating the action contemplated. In response to an inquiry by the Deputation, it was stated that the Medical Card System had amply fulfilled the expectations with which it had been established, and that the Commissioners had reason to believe that it was working successfully.

Onus of tracing Removals.

Minute 41.—That the onus of tracing removals should be placed upon Approved Societies.

It was pointed out on behalf of the Commissioners that, as already explained in the course of the discussion on Minute 31, the system of tracing removals by means of notifications from Approved Societies had proved in practice to be unsuccessful. Approved Societies were not by any means fully informed as to the changes of address of their members, and such changes of address as came to their knowledge and were notified by them to Insurance Committees were received by the latter too late to be of any practical value. Indeed, as regards the instances brought forward by members of the deputation, in which insured persons had been removed from lists of doctors while still resident in the district of the doctor's practice, it was only under the system of notification by societies that the circumstances complained of could arise, since, as already explained, the removal from the doctor's list under the Medical Card System could not take place until the patient had proved his actual removal by choosing a doctor in another area or district. It was pointed out, therefore, that the course recommended in this resolution would be a retrograde step, and would, it was believed, defeat its own ends. Where, however, the name of an insured person had been removed from a doctor's list in error, the proper course for the Insurance Committee was to reinstate the insured person without a break.

Balancing of General Medical Fund.

Minute 15.—That the Commissioners be urged to take prompt steps to ensure that the Central Medical Fund is balanced and final payments made therefrom not later than the 30th April in the following year, penalties being imposed on persons or bodies not making returns which are necessary to enable this to be done.

With regard to this resolution the Commissioners appreciated that the considerable period which had elapsed between the conclusion of the medical year 1913, and the final settlement in respect of that year had naturally given rise to a desire that arrangements should be made which would enable the accounts to be finally closed at an earlier date. It was pointed out however that the delay as regards 1913 arose directly out of the system adopted in that year, the debts to Societies for that year being calculated on a mean of the membership of Societies based upon their actual membership (as represented by contribution cards) at the beginning and end of the year. Consequently, the calculations necessary for the purpose of a settlement could not begin to be made until considerably after the end of the year; and with the object of obviating this delay the Commissioners had instituted the system, embodied in the Payments to Insurance Committees Regulations, of debiting Approved Societies on their mean membership as represented by their membership in the middle of the year of account. This improved system was in force in 1914, and but for the fact that the new and unavoidable difficulties in securing information as to enlistments had proved in themselves a fruitful

source of delay, the settlement would have been effected for 1914 and subsequent years much earlier than was possible in the case of 1913.

The request contained in the resolution would however be favourably considered by the Commissioners and apart from the present exceptional circumstances there appeared to be no insuperable obstacle in the way of meeting the substance of the request. It should be borne in mind however that any proposals as to a fixed date for settlement must involve two necessary consequences—(a) that any sums of money which would otherwise have accrued to the General Medical Benefit Fund subsequently to the fixed date would have to be excluded from the accounts and carried forward and (b) that any accounts from individual doctors, etc., not received by a fixed date anterior to the settlement date would have to be excluded altogether.

Interest accruing on Moneys due to Practitioners.

Minute 24.—That the interest accruing from the moneys due to Panel Practitioners which are held over after the termination of the Insurance year be paid into the Practitioners' Fund.

It was pointed out that in principle, the sums paid to doctors for medical benefit were the subject of bargain between Insurance Committees and Approved Societies, and that being so, it was immaterial whether the bargain was for the payment of a net sum without interest or for a smaller sum with interest. So far as the resolution had a practical bearing upon the actual present position, it was agreed that it was in fact complementary to the resolution recorded in Minute 15, and that if a final settlement could be secured within a reasonable period after the end of the year (on which point the Commissioners hoped to be able to meet the views of the Conference) no question as to interest would arise.

Reductions from Advances owing to War conditions.

Minute 56.—That in the opinion of this Conference the numbers of insured persons, who may be expected to enlist by the end of the year must necessarily be so uncertain that it is impossible at this stage to determine whether the advice of the Insurance Commissioners to Insurance Committees to advance only £72 per 1,000 on behalf of Medical Benefit was justified or not.

Mr. Roberts stated that the conclusions to which the Conference had arrived, as expressed in this resolution, were fully appreciated by the Commissioners, who had, of course, no other object in the advice which they had given to Insurance Committees but the avoidance of inconvenience and friction which, from the point of view of the medical profession, might otherwise have arisen upon a final settlement had a less conservative basis for advances been adopted.

Suspension of right of transfer in certain cases.

Minute 45.—That the Commissioners be invited to withhold the right of an insured person to transfer from the list of any doctor who is absent on naval or military service for the period of the War or until a reasonable time after his return (either during the year under Section 26 (6) of the N.H.I. Regulations, dated January, 1914, or at the end of the year, as laid down in Section 30 (1) of the N.H.I. Regulations, dated January, 1914).

It was stated on behalf of the Commissioners that they were anxious to meet the profession as regards the request contained in this resolution. It must be recognised, however, that exceptional cases might exist in which hardship might result from any universal prohibition which prevented insured persons from changing their doctor at the end of the year in all cases, and the Commissioners felt it necessary to make provision for such exceptional cases. They proposed, therefore, to make a regulation suspending the right of insured persons to change their doctor in the circumstances alluded to in the resolution unless they were able to make a special case for transfer which after investigation by the Medical Service Sub-Committee was regarded by the Insurance Committee as affording sufficient ground for a transfer being allowed. Enquiry was made of the deputation as to what precise period they regarded as "a reasonable time" after the doctor's return; and a discussion ensued on this point. In conclusion it was stated on behalf of the Commissioners that the question of period would receive their careful consideration and that they would meet the views of the profession so far as might be found practicable without hardship to the insured population.

Doctors' Lists and persons discharged from Military Service.

Minute 64.—That the Conference approves (a) the action of the Insurance Act Committee in approving the arrangement arrived at between the Renfrewshire Insurance and

Panel Committees, and also in some other areas, to the effect that insured persons on discharge from the Army shall be reinstated on the list of the doctor previously selected by them without the necessity of their making a formal choice of that doctor by means of a fresh Medical Card, without prejudice to the right of the insured person to change his doctor, and that of the doctor to refuse to re-accept the insured person, and (b) urges the Commissioners to approve and adopt the foregoing arrangement for general use.

It was stated on behalf of the Commissioners that they were sympathetic to the object of this resolution. It was pointed out, however, that the substance of the resolution could be secured administratively by arrangements between Panel Committees and Insurance Committees, as in fact had been done in several areas, and it was stated that any appropriate administrative action to secure this object would have the Commissioners' acquiescence.

Effects of War on Insurance Practice.

Minutes 54 and 60.—That this Conference requests the B.M.A. to convey to the Insurance Commissioners, and to the Chairman of the National Health Insurance Joint Committee the following findings, etc., of the Conference as regards the question of reduction in amount of the moneys paid to Insurance practitioners under present War conditions:—

(a) That the different bases of allocation of the credits available for medical benefit adversely and unfairly affect Insurance practitioners because whereas the amount available for the Drug Fund is, in certain areas, sufficient to discharge the chemists' accounts either in full or with moderate reduction, the amounts available for the Practitioners' Fund is reduced by between 25 and 30 per cent., although the amount of work done is at least equal to that done prior to the War.

(b) Therefore the whole or greater part of the pecuniary loss represented by the withdrawal of insured persons serving in the Navy or Army has to be borne by practitioners alone.

(c) That in the opinion of this Conference the above facts indicate a condition of things the effects of which ought not to be borne by one class alone but by the nation as a whole.

Minute 60.—That inasmuch as the men who are removed from the panel lists are amongst the best lives, and were unlikely to be any serious charge on the medical services for many years, and that many of them are now returning permanently damaged in health, the Conference is of opinion that the actuarial calculations of the Insurance Act so far as medical benefit is concerned have been vitiated and that some provision should be made by Parliament to meet the situation.

Mr. Roberts said that he gathered that the Conference were not now putting forward any financial proposals to meet the present circumstances created by the exceptional war conditions, but that their desire was to put on record the views expressed in the resolution in order that they might be fully considered after the war. He reminded the deputation, however, that as against the return of a portion of the insured population in damaged health, it was not unreasonable to expect that a large proportion of the insured population would have been considerably benefited in health by the physical training undergone during military service, and that the existence of compensating influences of this kind should not be ignored. Further, he reminded the deputation that in any case some definite evidence would be required before any such proposal could be even considered, and that mere theory or conjecture (which is all that is at present possible) could not be sufficient. He also pointed out that in effect the resolutions amounted to a request from a particular profession to be indemnified by the nation as a whole for the immediate consequences of the war; and he reminded the deputation that if the principle were to be admitted that the State should come to the aid of any particular class or profession which had suffered owing to the war, there would be no end to similar claims from every section of the community.

Notification of Return to Civil Life of Insured Persons.

Minute 62.—That the Commissioners be urged to take steps to expedite the notification to Insurance Committees of the return to civil life of insured persons who have been on War Service.

While the Commissioners were sympathetic with the objects of this resolution, it was pointed out that so far as the individual doctor was concerned, the resolution recorded in

Minute 64 substantially met the case. So far as the resolution dealt with the necessity for securing adequate payment by Societies for the insured persons referred to from the date of their discharge, it was pointed out that the method of debiting Approved Societies and crediting Insurance Committees would secure the proper payment to the fund of the area in respect of the whole period during which the doctors of that area were at risk in respect of the treatment of any discharged soldier.

Additional Payment for Treatment of Permanently Incapacitated Insured Persons.

Minute 67.—That in the opinion of this Conference the position of the Medical Benefit Fund as regards insured persons who are permanently incapacitated is unsatisfactory; and that this Conference urges that some Special Fund should be provided to meet these cases.

It was stated on behalf of the deputation that after fuller consideration of the statements made at the previous conference in December last, the Conference was not wholly satisfied as to the explanations which were then given, viz., that the overpayment in respect of persons who surrendered contribution cards at the end of the first half-year, compensated for the absence of any contribution cards in respect of insured persons permanently incapacitated. In reply it was pointed out on behalf of the Commissioners that the assurance given by them at the previous Conference was based on many complicated calculations involving, to a considerable extent, questions of an actuarial nature, with which it was not possible to deal adequately in the course of oral discussion. At the request, however, of Mr. Roberts, Sir Alfred Watson, Chief Actuary to the Joint Committee, made a statement in the course of which he assured the deputation that he was fully satisfied that the calculations upon which the set-off was based resulted in fact in the Insurance Committees, and through them the doctors, receiving to the full the funds to which they were entitled.

Amendment of Act as regards Certification.

Minute 73.—That the Conference is of opinion that the Insurance Acts should be so amended as to allow of practitioners certifying insured persons as being "unfit to follow their usual occupation."

It was pointed out on behalf of the Commissioners that in any event the legislation which would be required to secure any amendment in the terms of the principal Act as regards the conditions of title to sickness or disablement benefit was not at present practicable. In response to an enquiry as to whether by the use of the word "unfit" the Conference intended to imply any different sense from that of the word "incapable," it was stated on behalf of the deputation that they had no special distinction in meaning in their minds. The deputation were further asked whether the proposed amendment was intended to apply to the early stages of sickness or to all possible stages of sickness which might be involved in a claim for sickness or disablement benefit, and they were reminded that circumstances arose in the later stages of sickness which might render the formula recommended in the resolution inapplicable. In response it was stated on behalf of the deputation that they had not addressed themselves especially to this particular aspect of the matter, and that they would re-consider it before putting forward any definite proposals. It was suggested to them that in so doing they might find it helpful to refer to relevant portions of the Report of the Departmental Committee on Excessive Sickness Claims.

Preparation of New Regulations and Agreements.

Minute 81.—That the Commissioners be asked to give Panel Committees and the British Medical Association not later than the 30th June notice of the draft Regulations and Agreement for the ensuing year.

Minute 84.—That the Conference request the British Medical Association to prepare, in collaboration with Local Medical and Panel Committees, Amendments to Regulations, and to submit them to the Commissioners on behalf of those Committees.

Minute 85.—That the Conference requests the British Medical Association in collaboration with Local Medical and Panel Committees, to deal similarly with the model form of agreement issued by the Commissioners; and that Local Medical and Panel Committees desiring to introduce local variations should be urged to submit such at once to the Association in order that legal advice thereon may, if necessary, be obtained for them.

Enquiry was first made of the deputation as to whether the intention of Minute 81 was that notice should be given of the actual text of the Regulations or whether notice was only

desired of the substantial nature of any revision contemplated; and the deputation stated in reply that their intention was the latter. It was then pointed out on behalf of the Commissioners that what the Conference asked for in Minute 81 had in fact taken place in 1914, and that no difficulty was anticipated in meeting the views of the profession in this respect on future occasions. The difficulty was, however, pointed out that the earlier in any year the process of revision was commenced the less experience was available as to the working of the Regulations in operation during that year; consequently, points of reform which might otherwise have been included in the revision would be omitted. The whole question appeared to be one as to the best utilisation of a reasonable period of time reckoning backwards from the dates towards the end of the year by which the final individual notices would require to be given, and in this connection it was suggested that the more time was used in the central discussion the less time would probably be necessary in the subsequent stages.

Suggested Revision of Regulation 40.

At this stage of the discussion reference was made by the Commissioners to a resolution with regard to the machinery of Article 40 of the Medical Benefit Regulations, consideration of which, as the Commissioners gathered from public reports of the proceedings at the Conference, was postponed pending the report of the Departmental Committee on the Drug Tariff. In view, however, of the desire of the Conference as expressed in Minute 81 that any necessary revision of the regulations should not be postponed to an extent which would provide an unduly short time for their consideration, the point was put to the deputation whether such postponement was advisable in view of the fact that it was possible that the Departmental Committee's Report might not be available for some weeks. It was further pointed out on behalf of the Commissioners that some of the consequences of the Departmental Committee's Report might reasonably be inferred from the terms of their reference without awaiting the Report itself, and that if in the opinion of the medical profession the discharge of the functions of the Departmental Committee, as expressed in their terms of reference, was likely to involve any revision of the Medical Benefit Regulations, it would be of assistance to the Commissioners and of convenience to the profession itself, if the matter could be considered with a view to a further Conference between representatives of the Association and the Commissioners. The Deputation assented to these views, and it was agreed that a further small Conference should be arranged to discuss the matters referred to.

Claims on Drug Fund.

Minute 101.—That in the opinion of the Conference where an insured patient visits a consultant who prescribes proprietary or extraordinary treatment, the panel practitioner of such patient is not bound to, and as a general rule should not, order such treatment at the expense of the General Drug Fund.

It was suggested on behalf of the Commissioners that this resolution appeared to be based upon some misunderstanding as to the position of the panel practitioner. It would probably be agreed that the whole question depended upon whether the panel practitioner endorsed the view of the consultant as to the necessity of the medicine prescribed by him or not. In the former case, if in the exercise of his clinical discretion he is of opinion that the medicine is necessary for the adequate treatment of the patient, he is entitled and obliged to prescribe it at the cost of the Drug Fund; if, however, he is not of that opinion, the patient is not entitled to the medicine, and the panel practitioner in these circumstances would not prescribe it.

B.M.A. Representatives on Advisory Committee.

Minute 110.—That the conference is of opinion that the British Medical Association should take steps to ensure that its nominees on the Advisory Committee be appointed triennially, and that they should be selected from nominations by Local Medical and Panel Committees to the Insurance Act Committee of the Association.

It was stated on behalf of the Commissioners that they were unable to take any immediate steps as regards the constitution of the Advisory Committee. The deputation might take it, however, that the British Medical Association would be consulted as to any appointments to fill vacancies created by the resignation of any members appointed to the Committee on the nomination of the Association.

Domiciliary Attendance on Tuberculous Insured Persons.

Minute 116.—That the Conference is of opinion that the payment to Insurance practitioners for domiciliary attend-

insured on tuberculous insured persons of the sixpence per insured person from the Sanatorium Benefit Fund should be continued; and that Insurance practitioners should insist on taking their proper share in the doncliairly treatment of tuberculous insured persons, and on arrangements being made for proper co-operation between Insurance practitioners and Tuberculosis Officers.

The views of the Conference were noted.

Official Medical Referees.

Minute 126. That this Conference of representatives of Local Medical and Panel Committees respectfully urges upon the National Health Insurance Commissioners for England the urgent necessity which exists for the appointment by them of Official Medical Referees, and would urge that such appointments be made as soon as possible after the declaration of peace.

It was enquired of the deputation whether the Commissioners were to understand that it was the considered opinion of the Conference that any appointments of Government Medical Referees should be postponed until the declaration of peace. On receiving a reply in the affirmative it was stated on behalf of the Commissioners that they noted this view and concurred in it.

Insurance Certification in Ireland.

Minute 119.—That this Conference express most emphatically its disapprobation of the employment of part-time Certifiers by the Irish National Health Insurance Commission.

Mr. Roberts stated that the position, especially in the present exceptional circumstances, which precluded several solutions of the problem which would otherwise have been possible, was one of great difficulty. He was, however, not hopeless of a settlement, and he expressed his willingness to receive a deputation from the Irish doctors with the object of effecting such a settlement, but he stated his view that it would materially conduce to the possibility of a settlement if the deputation came possessed of plenipotentiary powers. It was stated in response that the Irish doctors had already appointed a Committee with full powers and that they would willingly accept Mr. Roberts's offer to discuss the matter on those lines.

Various Diseases and Sickness Benefit.

Minute 127.—That this Conference requests the Insurance Committee of the British Medical Association to consider the advisability of taking such action as may be possible to secure that patients incapacitated for work by venereal disease should not for that reason be refused sickness benefit.

In reply to an enquiry by Mr. Roberts it was stated on behalf of the deputation that the Insurance Act Committee had endorsed the resolution. Mr. Roberts stated that the terms of the resolution had been noted.

The Munitions Act and removal of large numbers of Insured Persons.

The deputation then alluded to the possibility of large masses of the insured population being moved from one district to another under the Munitions Act, and enquired what action the Commissioners would take to protect the doctors affected from any hardship which might accrue. In response it was stated on behalf of the Commissioners that the existing machinery had hitherto proved adequate, with any necessary adaptations, to meet emergencies such as had arisen in the case of workmen engaged in camp construction. The Commissioners would, however, continue to watch any action under the Munitions Act which might appear to call for emergency procedure, and they would be prepared, in the case of any such emergency arising, to put into operation any special adaptation of the existing machinery which might appear to be called for.

ANNUAL GENERAL MEETING.

The eighty-third annual general meeting of the British Medical Association was held in the Connaught Rooms, Great Queen Street, London, on Saturday, July 24th, at 2 p.m.

Dr. Macdonald, Chairman of Council, in the absence of the President, occupied the chair.

The Financial Secretary, Mr. Guy Elliston, having read the notice convening the meeting, the minutes of the last general meeting were confirmed.

The Chairman said that, as members were aware, the Association ought to be enjoying the hospitality of

Cambridge, and it was a matter of great regret that it was not doing so. It was doubly a matter of regret on account of the reason. Furthermore, instead of having the President in the chair, Sir Alexander Ogston was in Serbia.

THE MIDDLEMORE PRIZE.

The next business was the presentation of the Middlemore Prize. The winner of the prize was Dr. R. Foster Moore, for an essay on the pathology of the retina of the eye.

The prize was presented by Sir Clifford Allbutt, the President-elect, to Dr. Foster Moore.

THE ANNUAL MEETING, 1916.

Sir Clifford Allbutt, in the course of a brief address, said members of the Association were only too well aware of the difficulties created by the time of trial which, to their honour, had fallen upon all universities, and perhaps with greatest force upon the two great residential universities. That being so, the question was how far it was probable that it might be possible to meet at Cambridge next year. He thought the members would agree that it was impossible to make any forecast as to next year. Let them hope that the favourable issue for which they looked with confidence might be carried through in sufficient time to enable Cambridge University to receive the members of the Association. The meeting in Cambridge might not be a very showy one, but, at any rate, he looked for a good scientific business meeting. (Applause.)

APPOINTMENT OF AUDITORS.

On the motion of Sir Thomas E. FITZROFT (Bolton), seconded by Dr. W. JOHNSON SMYTH (Bournemouth), Messrs. Price, Waterhouse and Co. were appointed auditors of the British Medical Association until the next annual general meeting, at a remuneration of 150 guineas.

This completed the business of the annual general meeting.

EXTRAORDINARY GENERAL MEETING.

An extraordinary general meeting of the British Medical Association was held on July 24th at the Connaught Rooms, London, Dr. Macdonald, Chairman of Council, presiding.

The Financial Secretary, Mr. Guy Elliston, read the notice convening the meeting.

The only business before the meeting was the alteration in certain particulars of the Articles of Association, and especially to amend Article 4 to make it possible to admit to membership of the Association practitioners who do not reside in the area of any Branch of the Association.

The resolutions were adopted, and the meeting agreed that they should be submitted to a further Extraordinary General Meeting, to be held at the Head Office of the Association, No. 429, Strand, London, W.C., on Wednesday, August 11th, 1915, at 2 p.m.

This terminated the business of the Extraordinary General Meeting.

Meetings of Branches and Divisions.

EAST ANGLIAN BRANCH:

SOUTH ESSEX DIVISION.

A MEETING of the Division was held at the Victoria Hospital, Southend, on July 20th, when Dr. V. HODGSON was in the chair.

Annual Representative Meeting.—The Representative was instructed to oppose the Council's resolution dealing with the contract rate of practice for the children of insured people, and also to endeavour to obtain more adequate supervision over the issue of medical cards to the dependants of soldiers and sailors on active service. It was further decided to hold a meeting on July 27th to receive the Representative's report.

Belgian Fund.—The meeting decided to circularize members to support the fund for the relief of Belgian physicians and surgeons.

WEST SUFFOLK DIVISION.

A meeting of the West Suffolk Division was held at Bury St. Edmunds on July 15th, when Dr. METCALFE and subsequently the Vice-Chairman (Dr. Wood) was in the chair.

Annual Representative Meeting.—Dr. Wood consented to act as deputy for Dr. Batt, who was unable to be present at the meeting. The Annual Report of the Council (SUPPLEMENT, May 8th), together with the Supplementary Report (SUPPLEMENT, July 3rd), were considered, and the meeting expressed approval of: (1) The recommendation in regard to the British Medical Association becoming also a federation of other medical bodies; (2) the special report on decisions of the Association; (3) the special report and recommendation in regard to contract fees and treatment of juveniles; (4) the recommendation with reference to a standing Insurance Acts Committee; (5) the Council's decision as to professional secrecy; and (6) the Council's decision with regard to the employment of nurses as sick visitors; the meeting felt very strongly that every effort should be made to stop this practice. In regard to fees for life insurance examinations the Division adhered to its previous resolution, namely, that no fee of less than 10s. 6d. should be accepted. The Representative was requested to vote according to his own judgement bearing in mind the opinion expressed by the meeting.

Medical Treatment of School Children.—The report of the Special Subcommittee on this subject was read, together with a letter from Dr. Cox, stating that the Medico-Political Committee did not approve of the proposed temporary gratuitous scheme of treatment. After some discussion it was decided that the only course open to the Division was to ask the medical staff of the voluntary hospitals in the area to refuse to treat cases of tonsils and adenoids referred to by the school authorities, unless expressly recommended by a medical man, but it was agreed that the Subcommittee should again meet to arrange for the necessary action to be taken.

Insured Persons Receiving Hospital Treatment.—Dr. METCALFE raised the question of hospital patients, and the Secretary was instructed to ask the staff of the Bury Hospital to consider the possibility of refusing to treat, except in cases of emergency, either in-patients or out-patients, unless provided with a doctor's recommendation.

LANCASHIRE AND CHESHIRE BRANCH:

ROCHDALE DIVISION.

A MEETING of the Rochdale Division was held on July 15th, when Dr. GEDDES, the Vice-Chairman, presided.

Vote of Condolence.—A vote of condolence was passed to Mrs. Jefferson and family on the death of Dr. Jefferson, Chairman of the Division.

Annual Representative Meeting.—The Deputy Representative undertook to attend the meeting in place of the Representative, who had been called up on military duty. The Provisional Agenda (SUPPLEMENT, May 8th and July 3rd) were considered. Motion 31, referring to payment to medical practitioners called in by midwives, was carried, as were also Recommendations (F), legislation for patent medicines; (G), practice of dentistry by unqualified persons; (H), local ambulance services, the authority to be the municipal, urban, or rural district authority; (L and M), medical aid institutions; and (O), salaries of medical officers to committees for the care of the mentally defective. It was decided to oppose the amendment of the Salford Division recommending that the expenses of Representatives of Divisions at Representative Meetings should be paid out of the funds of the Association. It was decided to leave the other matters to the discretion of the Deputy Representative.

STIRLING BRANCH.

A SPECIAL meeting of the Branch was held at Stirling on July 15th, when Dr. YOUNG, President, was in the chair.

War Emergency.—The CHAIRMAN reported on the work of the Council in sending to doctors absent on military service documents for signature by the absent doctors or their deputies, to authorize the Council to receive and pay 50 per cent. of income of their practices to those deputizing. The circular of the Scottish Medical Service Emergency Committee was considered, and it was agreed to appoint a central committee and subcommittee for populous areas. The Scottish Emergency Committee considered that four-

teen members from the district should volunteer for whole time service. The meeting was of opinion that the number could be attained provided the commissions dated from May 15th, 1915.

Appointment of Secretary.—Dr. Yellowlees was appointed secretary of the Branch in the place of Dr. D. C. MacLachlan (Denny) who had applied for a commission.

Association Notices.

FURTHER EXTRAORDINARY GENERAL MEETING.

MEMBERS are reminded that a further Extraordinary General Meeting of the British Medical Association will be held at the Head Office of the Association, No. 429, Strand, London, W.C., on Wednesday, the 11th day of August, 1915, at 2 o'clock in the afternoon for the purpose of considering and if thought fit confirming as Special Resolutions the Resolutions which were passed by the requisite majority at the Extraordinary General Meeting of the Association held at the Connaught Rooms, Great Queen Street, London, W.C., on Saturday, the 24th day of July, 1915, Notice of which Meeting was given in the successive SUPPLEMENTS to the BRITISH MEDICAL JOURNAL dated June 26th and July 3rd, 10th, and 17th.

It is necessary that a quorum should be obtained at this Meeting in conformity with By-law 29, otherwise the Meeting will have to be adjourned in pursuance of the provisions of By-laws 29 and 30.

By order,

GUY ELLISTON,
Financial Secretary and Business Manager.

BRANCH AND DIVISION MEETINGS TO BE HELD.

NORTH OF ENGLAND BRANCH.—Dr. James Don, Honorary Secretary, 1, Grove Street, Newcastle-on-Tyne, gives notice that the annual meeting of the Branch, which will be purely a business meeting, will be held at the Royal Victoria Infirmary, Newcastle-upon-Tyne, on Tuesday, August 10th, at 3.30 p.m.

INSURANCE COMMITTEES.

LONDON.

Dispensary Treatment of Tuberculosis.

At the meeting of the Insurance Committee on July 22nd a lengthy discussion took place upon the agreement with the borough councils as to the dispensary treatment of insured persons suffering from tuberculosis. The form of agreement sanctioned at a previous meeting provided that a certain sum should be allocated for two or three years from the sanatorium benefit fund, and applied for dispensary services throughout the county. This sum was to be apportioned by the Local Government Board between the various boroughs. It had been anticipated that the cost of dispensary services for insured persons would not exceed £5,000 a year, but the Sanatorium Benefit Subcommittee now reported that the Commission had been unable to induce the Local Government Board to accept any sum less than £9,300 a year. In view of the fact that the Commissioners had made strong representations as to the necessity for a complete dispensary system being set up without delay, and the apparent impossibility of any other arrangement, the subcommittee agreed to pay the sum suggested, although the increase in cost would almost inevitably necessitate a reduction in the number of beds for institutional treatment. This action did not meet with the full concurrence of the Committee, and ultimately the matter was referred back to the subcommittee for further consideration and report. At the end of June, 526 persons were receiving institutional treatment for tuberculosis, 789 dispensary treatment, and 1,354 domiciliary treatment under practitioners on the panel.

Duties of a Full Time Medical Adviser.

The duties of the full time medical adviser to the Committee (Dr. J. Edward Squire), who was appointed in May last, have been set out in detail. The principal of them is to classify cases to be recommended for sanatorium benefit, and to examine the applicant when necessary. He is also to visit tuberculosis dispensaries to confer with the officers, and to assist in securing co-operation between the dispensary medical officer and the panel practitioner. The

visiting of institutions, the submitting of reports in connexion with the administration of sanatorium benefit and other matters, as well as the responsibility for the preparation of the medical records of the Committee are also among his duties.

Practitioners on War Service.

The Committee concurred in the scheme proposed by the Panel Committee for providing for the treatment of insured persons on the lists of practitioners who accepted commissions in the forces, and decided to support the Panel Committee also in its application to the Insurance Commissioners to suspend during the period of the war the right of an insured person on the list of a practitioner engaged on active service to change his doctor at the end of the year. It is proposed that the right shall be suspended until the end of the year following the conclusion of the war or the practitioner's retirement from military service, whichever should be the earlier.

INSURANCE ACT IN PARLIAMENT.

BELGIAN REFUGEES.

MAJOR-GENERAL SIR IVOR HERBERT asked the Chairman of the Joint Committee of Insurance Commissioners on July 22nd whether he could state the grounds on which claims were made under the National Insurance Act for contributions in respect of health insurance for Belgian refugees temporarily engaged as agricultural labourers and from their employers, seeing that they were not permanently domiciled in this country, that no provision existed for free medical attendance on them in case of illness or accident, and that on return to their own country all possible benefit of such contributions would be lost to them. Mr. C. Roberts, in reply, referred to a statement made on this subject in the House of Commons on July 12th (SUPPLEMENT, July 17th, p. 36). The persons referred to were required to be insured in accordance with the terms of the Statute. Attention had been drawn to the fact that they would in many cases obtain a certificate of exemption, and if they did so were not themselves liable to pay any contributions, though their employers' contributions remained payable. Whether exempt or not, they were entitled to medical and sanatorium benefit under the appropriate conditions. If they were deposit contributors, four-sevenths of the amount standing to their credit might be returned when they permanently ceased to reside in the United Kingdom. It was a statutory obligation upon the employers to pay their contributions.

IDENTIFICATION OF INSURANCE CARDS.

Earl of Ronaldshay asked the Prime Minister, on July 22nd, if the Insurance Commissioners had decided to place an identification mark upon insurance cards; if this decision was a contravention of promises given by ministers during the passing of the Act; and, if so, under whose authority such decision had been taken. Mr. C. Roberts, Chairman of the Joint Committee of Insurance Commissioners, said that the regulation enabling a society, if it thought fit, to inscribe a distinctive mark upon contribution cards, was issued in consequence of strong representations from approved societies of every type; the proposal was endorsed by the Parliamentary Committee of the Trades Union Congress and the General Federation of Trade Unions. It rested entirely with individual societies to decide for themselves whether they would adopt the course provided for in this regulation, and steps had been taken to insure that the marks employed should not convey any suggestion as to the nature of the society.

TUBERCULOSIS DISPENSARY SERVICES.

Mr. Booth, on July 26th, asked the President of the Local Government Board whether the chairman of the Insurance Commission (England) had informed the London Insurance Committee that the Local Government Board stipulated for a sum of £9,500 annually for a scheme of dispensary services to deal with tuberculous patients; and whether he could give the Committee any information to enable it to come to a decision about the proposed expenditure. Mr. Long said that the answer to the first part of the question was in the affirmative. He was informed that the Committee had arrived at a decision as to the amount to be paid, excepting the amount which was esti-

mated by the Local Government Board to be the annual cost of the maintenance of the serics; he had no special knowledge. Mr. Booth asked if Mr. Long was not aware that the London Insurance Committee had refused to endorse the action of the subcommittee, had rejected the paragraph, and asked for further information. Mr. Long said he would be glad to consider anything sent him, but he had no control over the London Insurance Committee, and no right to represent them there. In reply to a question by Mr. Booth on the same day, the Chairman of the Joint Committee of Insurance Commissioners (Mr. C. Roberts) said that the Insurance Commission had merely communicated to the London Insurance Committee, for its consideration, certain proposals resulting from the negotiations undertaken, at the request of the London Insurance Committee, by the Local Government Board with the metropolitan borough councils, together with an explanation of the principles on which those proposals were based.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments were announced by the Admiralty: Fleet Surgeon F. B. C. Gillman to be Acting Interpreter in German; and E. Peilott to the *Frieda*, additional, for disposal; P. V. White, G. G. Skinnard, Cape Hospital Reserve; F. F. German, late Surgeon-Captain R.G.A. (Vois).

G. Dreyer to be temporary honorary Captain. The following are granted temporarily honorary rank as stated when they joined the St. John Ambulance Brigade Hospital:—To be Majors: Lieutenant-Colonel and Honorary Colonel C. J. Trimble, C.M.G., T.F.R., Captain S. M. Smith, M.B., F.R.C.S., R.A.M.C.(E.F.). To be Captains: P. Houston, M.D., J. R. MacLain, M.D., G. W. M. Hope, M.D., F.R.C.S., F. W. Gwyder, M.B., F.R.C.S., R. W. Collum, P. T. Crymble, M.B., F.R.C.S. To be Lieutenants: A. D. Brunwin, M.D., F. Hall, M.B., J. M. McCoy, M.D., C. E. Butterworth, M.B., W. R. Mason, M.D., J. V. S. Taylor, H. de L. Crawford, M.B., F.R.C.S.I., J. Beckett, M.D., A. C. McAllister, W. D. Copstone.

The following Lieutenants of the Canadian Army Medical Corps to be temporary Lieutenants: H. T. Lippatt, M.D., J. S. McClellan, M.D., D. W. Davis, M.D., P. McGibbin, M.B., S. J. Staples, M.D., A. Drouin, M.D.

K. C. Walker, F.R.C.S., M.B., is granted temporarily the honorary rank of Captain whilst serving with No. 1 British Red Cross (Duchess of Westminster's) Hospital.

Captain W. D. Chambers, M.D., from 7th (Service) Battalion, Royal Irish Fusiliers, to be temporary Captain (substituted for notification published in the *London Gazette* of July 17th).

The name of temporary Lieutenant Walter Groomie is as now described, and not as stated in the *London Gazette* of August 25th, 1914.

The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 2,422, 2,246, and 2,747 at the end of the three preceding weeks, had fallen to 2,468 on Saturday, July 17th; 299 new cases were admitted during the week, against 332, 348, and 322 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In the sixteen largest Scottish towns 985 births and 561 deaths were recorded during the week ending Saturday, July 17th. The annual rate of mortality in these towns, which had been 15.7, 16.6, and 15.7 per 1,000 in the three preceding weeks, fell to 12.5 in the week under notice, and was 11.1 per 1,000 above the rate in the ninety-six large English towns. Among the several towns the death-rate ranged from 5.0 in Motherwell, 8.1 in Hamilton, and 9.1 in Falkirk, to 14.1 in Kilmarnock, 14.3 in Paisley, and 15.3 in Dundee. The mortality from the principal epidemic diseases was 2.0 per 1,000, and was highest in Paisley, Leith, and Kirkcaldy. The 272 deaths from all causes in Glasgow included 31 from measles, 8 from infantile diarrhoea, 5 from scarlet fever, 5 from whooping-cough, 2 from diphtheria, and 4 from enteric fever. Three deaths from measles were recorded in Paisley and 3 in Leith; from scarlet fever, 2 deaths in Aberdeen; and from diphtheria, 3 deaths in Paisley.

HEALTH OF IRISH TOWNS.

During the week ending Saturday, July 17th, 548 births and 293 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 537 births and 309 deaths in the preceding period. These deaths represent a mortality of 12.6 per 1,000 of the aggregate population in the districts in question, an against 13.3 per 1,000 in the previous period. The mortality in the principal large English towns was 12 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate, on the other hand, was equal to 23.6 per 1,000 of population. As to the mortality of individual localities, that in the Dublin registration area was 13.96, against an average of 16.6 for the previous four weeks; in Dublin city, 14.2 (as against 16.7); in Belfast, 12.0 (as against 12.3); in Cork, 10.9 (as against 16.1); in Londonderry, 24.0 (as against 15.7); in Limerick, 15.7 (as against 16.6); and in Waterford, 7.6 (as against 15.7). The zymotic death-rate was 1.2, the same as in the previous period.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notice re Appointments) appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

BERMONDSEY MEDICAL MISSION FOR WOMEN AND CHILDREN.—Resident Assistant Medical Officer. Salary, £80 per annum.

PROCEEDINGS OF COUNCIL.

THERE was a meeting of the Council at the Connaught Rooms, London, on the morning of Saturday, July 24th, 1915.

Present:

- Dr. J. A. MACDONALD, LL.D., Taunton, Chairman of Council, in the chair.
- Mr. T. JENNER VEREALL, LL.D., Bath, Chairman of Representative Meetings.
- Dr. EDWIN RAYNER, Stockport, Treasurer.
- Lieutenant-Colonel Sir JAMES BARR, M.D., LL.D., Liverpool
- Dr. M. G. BIGGS, London
- Mr. H. B. BRACKENBURY, London
- Dr. H. J. CAMPBELL, Bradford
- Dr. J. SINGLETON DARLING, Lurgan
- Lieutenant E. ROWLAND FOTHERGILL, Hove
- Major James GALLOWAY, London
- Mr. T. W. H. GARSTANG, Altrincham
- Dr. THOMAS A. GOODFELLOW, Manchester
- Dr. JOHN GORDON, Aberdeen
- Major T. DENCAN GREENLEES, Weymouth
- Dr. MAJOR GREENWOOD, London
- Major W. J. GREER, Newport, Mon.
- Dr. J. R. HAMILTON, Hawick
- Mr. RICHARD HARDING, New Radnor
- Major R. WALLACE HENRY, Leicester
- Mr. R. J. JOHNSTON, Belfast
- Captain F. CHARLES LARKIN, Liverpool
- Major ALBERT LUCAS, Birmingham
- Fleet Surgeon F. D. LUMLEY, R.N., Greenock
- Dr. H. C. MACTIER, Wolverhampton
- Major GEORGE PARKER, Bristol
- Dr. A. TENNYSON SMITH, Orpington
- Dr. W. JOHNSON SMYTH, Bournemouth
- Mr. E. B. TURNER, London
- Dr. O. K. M. WOOD, Woolpit

APOLOGIES.

Letters of apology for non-attendance were read from: The President-elect, Major S. H. Lee Abbott, I.M.S.; Dr. John Adams, Dr. David Ewart, Dr. J. J. Giussani, Mr. James Green, Colonel R. I. D. Hackett, Colonel W. Jolliston, Lieutenant-Colonel J. Munro Moir, Captain J. E. Moorhouse, Major F. J. Smith, and Dr. Denis Walshe.

DEATHS.

The deaths of Mr. Edmund Owen, a former Chairman of Council, and Dr. Bruce Goff, for many years a member of the Council, were reported by the CHAIRMAN, who was requested to convey to the respective families the deep sympathy of the Council in their bereavement, and at the same time to express sincere appreciation of the valuable services they rendered to the Association.

REPRESENTATIVE MEETING.

The minutes of the Representative Meeting of Friday, July 23rd, 1915, were considered and approved.

SCIENCE COMMITTEE.

The CHAIRMAN OF COUNCIL (in the absence of the Chairman of the Science Committee) presented the report of the Science Committee.

RENEWED GRANTS.

Renewed grants were made for 1915-16 for the following work:

- Donald, John, M.D.Glasg., D.P.H.Camb.: The action of hectol on animals, especially on heart and vessels.
- Knowles, Kate, M.B., B.S.Lond.: (1) The causes of osteomalacia. (2) The action of extracts of ductless glands on the disease, including B and P records. (3) Examination of blood, urine, and ovaries of patients suffering from osteomalacia.
- Mutch, Nathan, M.D., B.C.Cantab., M.A.Cantab.: The bacteriological and chemical investigation of chronic intestinal infections.
- Sykes, W. L., M.R.C.S.Eng.: On digitalis: (1) Diuresis. (2) Influence of enzymes on digitalis glycosides. (3) Mutual influence of the several digitalis glycosides.

NEW GRANTS.

New grants were made for 1915-16 for the following work:

- Barber, H. W., M.B., B.C.Cantab., M.A.Cantab.: (1) To complete research begun in Hamburg "On the chemical nature and staining properties of certain undescribed substances in the epidermis"; (2) On the metabolism of psoriasis patients; (3) The bacteriology of the faeces in certain diseases.
- Drinkwater, H., M.D., C.M., F.R.S.Edin.: A second brachydactylous family. (The work is completed.)
- Harvey, W. H., M.D.Tor., M.A.Cantab.: Investigation of the musculature of glands, especially in reference to the kidney.
- Dove, Miss E. L., M.B.Lond.: The simplest and most practicable means in the home of disinfecting floor surfaces, handkerchiefs, books, toys, etc., which have been exposed to infection by the tubercle bacillus.

AWARD OF GOLD MEDAL FOR DISTINGUISHED MERIT.

The following letter was read from Captain Martin-Leake, V.C.:

Marshalls, Ware,
July 16th, 1915.

The Secretary, British Medical Association.

Dear Sir,—I am in receipt of your letter dated July 7th stating that at a meeting of the Council of the British Medical Association it was decided that the Gold Medal for Distinguished Merit should be offered to me. In reply I beg to request that you will convey my deep feelings of appreciation to the members of the Council for their great honour, and inform them that I shall accept the medal with great pride and gratitude. I much regret to say that at present I cannot see my way to have the honour of attending to accept the medal as I have to return to France in a few days.—I am, Sir, your most obedient servant,

A. MARTIN-LEAKE.

CENTRAL NURSING COUNCIL FOR LONDON.

Mr. E. B. TURNER, representative of the Council on the Central Nursing Council for London, reported that owing to new Standing Orders having been agreed upon it would be necessary for the Council to appoint its three representatives. Mr. Turner was thanked for his services, and the consideration of the question was deferred until the October Council.

There was a further meeting of the Council in the evening of July 24th, this being the new Council for 1915-16. Dr. J. A. MACDONALD (Taunton), Chairman of Council, in the chair.

WAR EMERGENCY COMMITTEE.

There were seven nominations for the four members of the Council to the War Emergency Committee, appointed under Minute 37 of the A.R.M., and Lieutenant-Colonel Sir James Barr, Lieutenant-Colonel J. A. Bolam, Major James Galloway, and Mr. Bishop Harman were duly elected.

RETURNS OF THE ELECTION OF MEMBERS OF COUNCIL BY THE REPRESENTATIVE MEETING.

The CHAIRMAN of Representative Meetings reported the returns of the election of members of Council as follows:

(a) Elected by Grouped Representatives.

Dr. M. G. Biggs, Major Russell Coombe, Dr. J. Singleton Darling, Major A. C. Farquharson, Lieutenant E. Rowland Fothergill, Mr. T. W. H. Garstang, Mr. N. Bishop Harman, Dr. H. C. Mactier, Colonel C. H. Milburn, Lieutenant-Colonel J. Munro Moir, and Captain J. E. Moorhouse.

(b) Elected by the Representative Body as a Whole.

Lieutenant-Colonel Sir James Barr, Mr. E. J. Domville, Dr. G. E. Haslip, and Dr. T. Jenner Verrall.

DATES OF MEETINGS.

The following dates were provisionally fixed for the quarterly meetings of Council for the ensuing twelve months: Wednesday, October 27th, 1915; Wednesday, January 26th, 1916; Wednesday, April 26th, 1916; and Wednesday, June 7th, 1916.

MINUTES OF ANNUAL REPRESENTATIVE MEETING.

The CHAIRMAN of Representative Meetings presented the minutes of the Representative Meetings of Saturday, July 24th, which were considered and approved.

It was left to the Chairman of Council, in conference with the Chairman of Representative Meetings, to remit the various resolutions of the Representative Meeting to the appropriate Committees.

[The meeting terminated at 6.25 p.m.]

Association Notices.

FURTHER EXTRAORDINARY GENERAL MEETING.

MEMBERS are reminded that a further Extraordinary General Meeting of the British Medical Association will be held at the Head Office of the Association, No. 429, Strand, London, W.C., on Wednesday, the 11th day of August, 1915, at 2 o'clock in the afternoon for the purpose of considering and if thought fit confirming as Special Resolutions the Resolutions which were passed by the requisite majority at the Extraordinary General Meeting of the Association held at the Connaught Rooms, Great Queen Street, London, W.C., on Saturday, the 24th day of July, 1915, Notice of which Meeting was given in the successive SUPPLEMENTS TO THE BRITISH MEDICAL JOURNAL dated June 26th and July 3rd, 10th, and 17th.

It is necessary that a quorum should be obtained at this Meeting in conformity with By-law 29, otherwise the Meeting will have to be adjourned in pursuance of the provisions of By-laws 29 and 30.

By order,

GUY ELLISTON,
Financial Secretary and Business Manager.

BRANCH AND DIVISION MEETINGS TO BE HELD.

NORTH OF ENGLAND BRANCH.—Dr. James Don, Honorary Secretary, 1, Grove Street, Newcastle-on-Tyne, gives notice that the annual meeting of the Branch, which will be purely a business meeting, will be held at the Royal Victoria Infirmary, Newcastle-upon-Tyne, on Tuesday, August 10th, at 3.30 p.m.

A list of periodical publications, official reports, and Blue Books in the Library of the British Medical Association available for issue to members on loan has been printed, and copies can be obtained free on application to the Librarian, at the house of the Association, 429, Strand, W.C. The regulations governing the loan of these publications are stated in the introduction to the list. The Library is open for consultation from 10 a.m. till 5 p.m. (on Saturdays till 2 p.m.).

LOCAL MEDICAL AND PANEL COMMITTEES.

BERKS COUNTY.
MEDICAL COMMITTEE.

THE thirty-first meeting of the Berks County Medical Committee was held in the Board Room, Royal Berks Hospital, on July 8th, when Mr. NAPIE JONES was in the chair.

Election of Committee.—The HONORARY SECRETARY reported that he had, by permission of the Commissioners, sent notices to all the practitioners on the panel, asking whether they had any objection to the Panel Committee remaining in office for a year. About fifty answers had been received, and no objections had been raised. The Committee approved the Honorary Secretary's action.

Committee.—Dr. Bokenham was elected on the Finance Subcommittee in place of Dr. Sussman, and the members of the Medical Service Subcommittee were re-elected.

BIRMINGHAM.
PANEL COMMITTEE.

THE first meeting of the Birmingham Panel Committee for the year 1915-1916 was held on July 27th, when Mr. PARROTT (the Returning Officer) presided at the outset.

Election of Officers.—The following were elected:

Chairman: Dr. Dain.
Vice-Chairman: Dr. Lydall.
Honorary Secretary: Dr. Garbutt.
Honorary Treasurer: Dr. Dain.

Several members were co-opted and casual vacancies were filled. The various Subcommittees were also elected.

Excessive Prescribing.—A list of those practitioners who had exceeded the capitation fee during 1914 was presented by the Pharmaceutical Committee with a request for investigation of the same. The matter was referred to the Pharmacopoeia Subcommittee.

EAST SUFFOLK.
PANEL COMMITTEE.

A MEETING of the East Suffolk Panel Committee was held at Saxmundham on July 13th, when Dr. HELSHAM was in the chair.

Medical Service Subcommittee.—Drs. Leach, Perry, and Giuseppe were appointed to represent the Committee on the Medical Service Subcommittee.

Final Settlement for 1913.—The CHAIRMAN reported that the subcommittee appointed at the last meeting to deal with the final settlement for 1913 had effected a satisfactory settlement upon the basis shown in the statements, copies of which had been sent to each member of the Committee. The action of the subcommittee was confirmed.

Attendance of Members of Committee.—A letter from the Insurance Commissioners, dated June 9th, 1915, was read with reference to the absence of certain members of the Committee from three consecutive meetings. The question of altering the time and place of the meetings of the Committee was postponed.

Prescriptions.—The CHAIRMAN read the report of the checker with reference to prescriptions for the quarter ending March 31st, 1915, and explained that the Committee might deem it advisable to hold inquiries in certain cases of alleged over-prescribing. The Clerk to the Insurance Committee was requested to furnish a copy of the report and analysis to each member of the Committee, and the matter was adjourned to the next meeting.

Pharmacopoeia.—Drs. Baron, Giuseppe, Havell, Keor, and Ranson were appointed a subcommittee to consider and report on the advisability of adopting a pharmacopoeia.

LOCAL MEDICAL COMMITTEE.

A meeting of the East Suffolk Local Medical Committee was held on the same day and with the same Chairman.

Representative on the Insurance Committee.—It was resolved that Dr. Barraclough be appointed to fill the vacancy upon the Insurance Committee caused by the resignation of Dr. H. Muir Evans.

Medical Service Subcommittee.—It was resolved that Dr. Askin be appointed to represent the Committee upon the Medical Service Subcommittee.

WEST SUFFOLK.

LOCAL MEDICAL AND PANEL COMMITTEE.

A MEETING of the West Suffolk Local Medical and Panel Committee was held at the Angel Hotel, Bury St. Edmunds, on July 13th, when Dr. Wood was in the chair.

Suspense Register.—It was reported that 1,460 slips had been cleared from the suspense register, but as against this 995 slips had been added to it in respect of persons for whom no "slip" had been entered. The result of some six months' work, therefore, was the diminution of the suspense register by 465 slips.

Final Credit for the Year 1913.—A letter was read from the Clerk to the Insurance Committee pointing out that the method of distribution of the final credit for 1913 suggested by the Panel Committee at its last meeting could not be carried out, and that the portion of the credit applicable to the first quarter of the year 1913 must be distributed on the basis previously adopted for the provisional credit in order to ensure a full and legal discharge for the Insurance Committee. It was agreed to request the Insurance Committee that in respect of the portion of the final credit for 1913 applicable to the first quarter of the year, the balance after paying the doctor's accounts for attendance in full should be paid in proportion to the numbers on the doctors' lists at the end of the quarter.

Election of Panel Committee.—The SECRETARY read a letter from the Commissioners stating that practitioners must be given the opportunity of objecting to the postponement of election. A circular on the subject had been issued and no objections had been raised.

GLOUCESTERSHIRE.

LOCAL MEDICAL AND PANEL COMMITTEE.

A MEETING of the newly-elected Panel Committee of Gloucestershire took place at the Royal Infirmary, Gloucester, on July 15th. Dr. CAMPBELL was re-elected Chairman, and will continue to act as Secretary. Dr. Miles having promised to assist him where necessary.

The following were co-opted: Dr. F. Lidderdale, Cheltenham; Dr. A. P. Davies, Stroud; Dr. A. F. Turner, Tewkesbury; Dr. T. G. Miles, E. Dean; Dr. A. H. Grace, Chipping Sodbury; Dr. William Cox, Winchcombe; Dr. E. Denning, Stow-on-the-Wold; Dr. W. I. Awdry, Berkeley; Dr. H. Cairns Terry, Gloucester.

The election expenses were calculated to amount to £20. At this election thirty-three voters attended. Thirteen members were elected and five elections were void through absence of voters or other causes. The absurdity of carrying on elections in this manner was considered to be apparent. A postal vote is contemplated in the future, and the Committee were unanimous in desiring triennial elections.

Conference of Local Medical and Panel Committees.—Dr. H. CAIRNS TERRY gave an account of the proceedings at the conference of representatives of Local Medical and Panel Committees, and its decisions were approved.

Excessive Prescribing.—It was reported that the Pharmaceutical Committee seemed to object to a circular issued by the Panel Committee requesting doctors to abstain from expensive prescribing, but it was felt to be necessary from time to time to draw the attention of panel doctors to the risk of being surcharged in cases where expensive drugs, etc., were used.

Fee for Attendance on a Panel Patient.—It was agreed that a patient temporarily residing six miles from the doctor's house, there being other panel doctors within a mile or two of this patient's temporary abode, should be charged a fee, as not only did the patient not present a medical card or inform the doctor that he was a panel patient, but the distance was over that which the agreement covered (four miles).

Checker's Salary.—The Insurance Committee, having requested the Panel Committee to pay 25 per cent. of the "Checker's" salary for the investigation of prescriptions, the Chairman was directed to inform the Insurance Committee that the Local Medical and Panel Committee would be willing to pay its share if the Pharmaceutical Committee would pay a similar amount out of the voluntary levy made by it.

LANCASHIRE.

PANEL COMMITTEE.

A MEETING of the Lancashire County Panel Committee was held at Preston on June 9th, when Dr. H. F. OLDFHAM was in the chair.

Medical Certification.—Three doctors practising on the Lancashire County panel had been summoned to attend the meeting for the purpose of giving explanations of their conduct in having broken the rules governing the system of medical certification in so far as they had antedated and post-dated certificates. It was found that in each case the rules had not been broken wilfully, but chiefly through ignorance of the correct procedure with regard to the issuing of certificates. The practitioners expressed their regret and stated that it was their intention to adhere more rigidly to the rules in future. It was decided that no action should be taken in these cases, but it was pointed out to each of the three practitioners in question that a very serious breach of the certification rules had been made, and that, should there be a recurrence of such conduct, the Committee would have no alternative but to place the matter in the hands of the General Medical Council, which would deal very firmly with such cases.

Excessive Prescribing.—A number of cases of alleged prescribing were considered. In the majority satisfactory explanations had been given, and it was found that only a comparatively small number of practitioners could be said to have prescribed excessively. It was considered, however, that some were at fault in prescribing in excess of the requirements of the case, and in each of these cases the Committee estimated the amount of such excess. The Secretary was instructed to write to the Lancashire Insurance Committee, informing them of the Committee's finding in the above-mentioned cases.

SOUTHPORT.

LOCAL MEDICAL AND PANEL COMMITTEE.

A MEETING was held on July 30th, when Dr. LIMONT was in the chair.

Election of Officers.—The SECRETARY reported that the Commissioners had dispensed with an election and the present members were to remain in office for another year. The following officers were elected:

Chairman: Dr. Limont.
Vice-Chairman: Dr. Brown.
Secretary and Treasurer: Dr. Penrose.

Annual Report.—The annual report and statement of accounts were approved.

Vote of Thanks.—The Committee accorded a vote of thanks to Dr. Penrose for his work as Secretary during last year.

Recognition of Committee.—The SECRETARY reported that the Commissioners had "recognized" the Committee as the Local Medical Committee for Southport for 1915-1916.

Contract Practice.—It was resolved to request the Assistant Secretary of the local Division of the British Medical Association to write to two doctors, newcomers to the town, with reference to the payments for contract practice which are acceptable to the local profession.

Payments.—It was resolved:

That the Insurance Committee be requested, when making out the statements for payments at the end of each quarter, to adhere to the old system, namely, that the amount indicated is for "so many" insured persons on the list, at "so much" per person. Also that it be made clear in the receipt form that the payment is "on account."

YORK.

LOCAL MEDICAL AND PANEL COMMITTEE.

A MEETING of the York Local Medical and Panel Committee was held on June 30th and an adjourned meeting on July 5th.

Complaint against a Practitioner.—It was reported that the agent of an approved society, who had brought a complaint against a practitioner which was subsequently proved to be groundless, had refused to apologize in any way, and it was decided that the practitioner should forward the correspondence to the Medical Defence Union, of which he was a member, for advice.

Unallocated Insured Persons.—A letter was read from the Clerk to the Insurance Committee, stating that the Commissioners considered the draft scheme dealing with unallocated insured persons should provide for treatment being given forthwith in urgent cases by the practitioner to whom the insured person applied in the first instance, and that the basis of apportionment of capitation fees should be subject to revision in any case in which a

practitioner neglected to carry out any duties devolved upon him. It was agreed to accept the suggestions.

Expenses of Pharmaceutical Committee.—A letter was read from the Clerk to the Insurance Committee, stating that the Pharmaceutical Committee had submitted a claim for £47 in respect of its administration expenses for 1914, and asking whether the Panel Committee would have any objection to that amount being paid out of the moneys available for the provision of medical benefit, provided the Commissioners approved. The Committee strongly disapproved, and instructed the Secretary to suggest that the funds of the Pharmaceutical Committee should be raised by voluntary subscription, as was done in the case of the Panel Committee.

Conference of Local Medical and Panel Committees.—Dr. J. C. LYTH reported the proceedings at the conference on June 16th. Great satisfaction was expressed at the results achieved, and Dr. Lyth was thanked for his services as Representative.

Reinstatement of Insured Persons discharged from the Army.—It was decided to request the Insurance Committee to arrange that insured persons on discharge from the army shall be reinstated on the list of the doctor previously selected by them without the necessity of their making a formal choice of that doctor by means of a fresh medical card, but without prejudice to the right of the insured person to change his doctor, and that of the doctor to refuse to reaccept the insured person.

Change of Address of Insured Persons.—The Secretary was instructed to ascertain from the Clerk to the Insurance Committee whether the new address of an insured person could be stated in the notice of removal from the doctor's list.

NEWCASTLE-UPON-TYNE, PANEL COMMITTEE.

A MEETING of the Newcastle-upon-Tyne Panel Committee was held on July 20th for the purpose of electing officials of the new Panel Committee for the ensuing year.

Dr. Rutter, Dr. Dagger, and Mr. David Ranken were appointed Chairman, Vice-Chairman, and Secretary respectively. It was unanimously agreed that the co-opted members for the past year should be re-elected for the ensuing year. Dr. Mathews was elected to the vacancy for the Central district, caused by the resignation of Dr. A. J. Collis. The Medical Service Subcommittee and the Drug Subcommittee were re-elected. The same Executive Committee was re-elected, with the exception that Dr. Slater was elected instead of Dr. Hawthorn, who, owing to military duties, was unable to attend the Executive Committee meetings.

Surcharging.—The question of the surcharging of certain doctors on the panel was then debated.

COUNTY OF SURREY, PANEL COMMITTEE.

THE monthly meeting of the County of Surrey Panel Committee was held at Surliton Cottage Hospital on July 16th, when Dr. LANKESTER was in the chair.

Election of Officers.—The following officers were elected for the ensuing year:

Chairman: Dr. Lankester.
Vice-Chairman: Dr. Lyden.
Honorary Treasurer: Dr. Walters.
Honorary Secretary: Dr. Cran.

Term of Office of Panel Committee.—It was reported that the Insurance Commissioners had extended the period of recognition of the present Committee to July 15th, 1916.

Temporary Residents.—A letter was read from the British Medical Association, stating that it saw no reason why patients in convalescent homes should not be treated as temporary residents. The Honorary Secretary was instructed to explain that the Panel Committee only took exception to the patients being treated as temporary residents when all they needed was a certificate.

Nurses Acting as Sick Visitors.—A letter was read from the British Association stating that the Queen Victoria Institute of Nurses agreed as to the undesirability of nurses acting as sick visitors. It was resolved to ask the British Medical Association to bring the matter to the notice of other nursing associations, and also if possible get a notice into some of the nursing papers, and distribute through the medium of the panel associations to the provincial nursing associations.

Joint Meetings of Local Medical and Panel Committees.

—It was agreed that in future the Local Medical and Panel Committees should meet jointly each month, and that the minutes be kept separately.

Prescriptions for Insured Persons in Hospitals.—Replies were received from the hospitals in the county on the prescribing for insured persons in those institutions. It was resolved:

That any medical officer of a hospital who is a panel practitioner may only order medicines for insured persons under his care in the hospital, on Insurance Act prescription forms, provided that such patient is on his panel list, and is only receiving such treatment as he or she is entitled to under the Insurance Act.

The Honorary Secretary was instructed to send a copy of this resolution, together with an explanation of what treatment was included, to all hospitals where insured persons receive their medicine from Insurance Act prescription forms.

Expenses of Pharmaceutical Committee.—The question of the expenses of the Pharmaceutical Committee was again considered, and the Honorary Secretary was instructed to write to the Insurance Committee and state the items in the estimate to which the Panel Committee took exception were the rent of office and its furnishing and clerical assistance apart from the Secretary's remuneration, and it was resolved that if the estimate was reduced to £80 per annum the Panel Committee would put no obstacle in the way of the Commissioners granting it.

Special Mileage Grant, 1914.—The Honorary Secretary was instructed to write to the County Committee and ask for an increased grant for 1914, and it was resolved that the method of distribution should be the same as 1914.

COUNTY OF GLAMORGAN, PANEL COMMITTEE.

A MEETING of the County of Glamorgan Panel Committee was held at the Glamorgan Insurance Offices, Cardiff, on July 27th, when Dr. W. E. THOMAS was in the chair.

Deductions from Payments to Doctors.—The Secretary was instructed to send the following resolution to the Insurance Commissioners and Insurance Committee:

That this Panel Committee enters its most emphatic protest against the various excessive deductions made from our payments during the past twelve months, and unless a satisfactory answer is received from the Insurance Commissioners and the Insurance Committee within a reasonable time we shall have to take stronger steps.

Unallotted Persons.—The scheme of the Glamorgan Insurance Committee for the division of the surplus fund and the assigning of insured persons was agreed to.

SWANSEA.

LOCAL MEDICAL AND PANEL COMMITTEES.

Conference of Local Medical and Panel Committees.—Dr. KNIGHT gave an interesting account of the recent conference, and was thanked for his services.

Payments to Doctors.—It was reported that the Finance Subcommittee of the Local Insurance Committee had recommended that 1s. 2d. per patient should be paid; that this was passed by the full Committee, and was sent to the Commissioners, who replied that they would not pay more than 11d. per patient. The meeting passed a resolution strongly protesting against the proposal to pay only 50 per cent. of the moneys now due, and pointing out that the percentage of insured persons enlisted cannot in fact exceed 20 per cent., and that the panel doctors feel they are being unfairly treated. Further, the resolution asked that the Insurance Commissioners state upon what basis they arrive at the 50 per cent. proposed to be deducted, and that unless a satisfactory answer is given the meeting will consider the "advisability of taking further steps."

Removal of Insured Persons.—It was decided that each doctor should help the Clerk to the Local Insurance Committee in tracing people who were in suspense.

Stock Mixtures.—Ten stock mixtures were adopted.

AYRSHIRE.

PANEL COMMITTEE.

A MEETING of the Panel Committee of the County of Ayr was held in the County Hospital, Ayr, on May 27th, when Dr. BEVERIDGE was in the chair.

Payment for Domiciliary Treatment of Dependents.—A letter was read from the Clerk to the Insurance Committee intimating that a communication had been received from the Commissioners approving of the scale of payment laid down for the domiciliary treatment of tuberculosis in connexion with dependants of insured persons, subject to the reservation that mileage should be paid only in cases where the person lives beyond a three-mile radius from the place of residence of the practitioner. The arrangement with the Insurance Committee was that mileage should be paid in cases where the persons resided outside a two-mile radius, and it was decided to adhere to that arrangement. The meeting was resolved into a joint meeting with the Local Medical Committee, the members of the latter Committee present consisting of the members attending the Panel Committee meeting, with the addition of Dr. J. Wilson.

Notification of Tuberculosis.—The CHAIRMAN raised the question of insufficient notification of cases of tuberculosis, and the assistant secretary was instructed to issue a circular to panel practitioners recommending them to notify all cases of tuberculosis of every kind.

A further meeting of the Committee was held at Kilmarnock on June 25th, when Dr. BEVERIDGE presided.

Payments for 1914.—A letter from the Clerk to the Insurance Committee was submitted suggesting that the total Practitioners' Fund credited to the Insurance Committee for 1914, including the "suspense sixpence," and deducting the sum paid to the Panel Committee for administrative expenses, and the P. O. Medical System, in all £112 17s. 7d., should be divided among the doctors under contract with the Committee during that year, according to the number of persons on doctors' lists as at December 31st last, less payments to account made for that year. The number of persons on doctors' lists, as at December 31st last, was stated at 56,842, and the balance of cash available for division £2,718 15s. 5d. This showed a payment of within a fraction of 7s. instead of 7s. 6d. per person, the reason given for the discrepancy being that no deduction in respect of soldiers and sailors was being made from any doctor's list. The letter also proposed that doctors who were dispensing medicines on a capitation basis, and who had been paid at the rate of 1s. per person to account, should be paid the remaining 6d., the sum to be paid being 50 per cent. of the payments to account already made, the amount still to be paid under this head being £456 10s. 6d. The suggestions were approved. The meeting was strongly of opinion that the Commissioners should furnish a statement annually, showing how the sums credited to the Insurance Committee for medical benefit were arrived at, as practitioners, and also the Insurance Committee, were at present furnished with no information of any kind on this most important matter.

Payments for 1915.—A letter was read from the Clerk of the Insurance Committee regarding payments to be made on account to doctors for the quarter ending June 30th, 1915, stating that of the amount credited to the Insurance Committee for that quarter for medical benefit the seven-ninths available for payments to doctors amounted to £3,546 (a decrease compared with last quarter of £483), which would permit of a payment on account of 70 per cent. only of the 9d. per person per quarter due, as against 80 per cent. paid last quarter. The payment of 70 per cent. would absorb £3,496. It was agreed to accept this, coupled with a protest against the reduction in the sum to be paid on account, it being pointed out that the possible number of insured persons who had enlisted was insufficient to justify such a reduction as was being made, and that the fact of this unwarranted deduction emphasized the need of an annual statement from the Commissioners showing how sums credited to each insurance area were arrived at.

Conference of Local Medical and Panel Committees.—Dr. PATERSON gave an interesting report as to the conference held in London on June 16th, which he attended as the delegate of the Local Medical and Panel Committees. A hearty vote of thanks was accorded Dr. Paterson for his services and report.

RENFREW COUNTY.

PANEL COMMITTEE.

A MEETING of the Renfrew County Panel Committee was held in the Y.M.C.A. Rooms, High Street, Paisley, on June 23rd, when Dr. CORRETT presided.

"Rep. Mist."—The Committee expressed the opinion that the arrangement presently in force with the Renfrew Insurance Committee whereby "repeats" are limited to one calendar month should be afforded a reasonable trial. Authority was given to Drs. Hill and Corbett to represent to the Insurance Committee the views of the Panel Committee, and, if possible, to come to some arrangement whereby the limited use of "repeats" might be continued.

Report of Central Checking Bureau.—The points raised in the first monthly report issued from the Central Checking Bureau on Chemists' Accounts were fully discussed, but it was decided to delay any formal expression of opinion until the Insurance Committee had had an opportunity of considering the report, when its views would probably be communicated to the Panel Committee.

WIGTOWNSHIRE.

PANEL COMMITTEE.

A MEETING of the Wigtownshire Panel Committee was held on July 16th.

Reduced Payments.—The reduction of the last quarterly payment to 65 per cent. was considered much more drastic than the needs of the area required, but, in view of the great difference in the percentage of recruits in different areas, it was not considered advisable to make any appeal against the reduction.

Non-payment of Balance for 1914.—It was agreed, in view of the increased cost of drugs, dressings (most of the practitioners in the area dispense), and other working expenses, to call upon the Scottish Commissioners to pay the balances for 1914 within one month, and to inform them that failing payment the panel practitioners would reconsider their position with a view to repudiating their contracts with the Insurance Committee.

Doctors' Lists.—It was decided to request the Clerk to the Insurance Committee to furnish each panel practitioner with a list of insured persons who have been put on each quarter, along with the quarterly list of withdrawals from their panels.

MATERNITY BENEFIT.

MATERNITY BENEFIT AND APPROVED SOCIETIES.

AN important conference was held at Dundee on July 16th between representatives of the approved societies under the Insurance Act and the Maternity Hospital, dealing with the present unsatisfactory regulations as to midwifery in Scotland, and especially the payment that should be made by approved societies for the treatment at confinements of their insured members at hospitals or by the staffs of hospitals. Dr. J. C. McVail, Vice-Chairman of the Scottish Insurance Commissioners, presided, and among many others present were: Miss Paterson, of the Insurance Commission; Professor Knoch, Professor of Obstetrics, University College, Dundee; and Dr. Hugh Fraser, of the Dundee Royal Infirmary.

Dr. McVail said that though the Commissioners were not actually parties to the conference, they had a very distinct interest in its subject. Experience of the operation of the Insurance Act had tended to dissipate many of the fears which the hospitals had at first entertained, but the Commissioners had agreed that it would be useful if the insurance committees and the hospital authorities of the four cities which had maternity hospitals could be brought together to discuss certain questions that had arisen between these hospitals and the approved societies. It was very distinctly to the interest of the approved societies that the maternity hospitals of Scotland should be prosperous and successful. He was not for a moment suggesting on behalf of the Commissioners that any one should go to the hospital for maternity attendance rather than be attended by a skilled doctor or midwife at home, as the Act gave the mother an absolute free choice of doctor or midwife, but the question that had to be considered was simply one of finance between the societies and the hospitals when the mother elected to go to the hospital.

Professor Knoch said that when the Insurance Act came into force the directors and staffs of maternity hospitals had felt some anxiety lest the usefulness of these hospitals should be crippled instead of increased. The chief object of maternity benefit was to obtain the best possible attendance for confinements. The Midwives Act

of 1902 had proved to be a safeguard for the poor women, and it was to be hoped that it would soon be extended to Scotland, so that every woman should be assured of attendance by a fully qualified doctor or midwife. But they could not afford to wait for such legislation, and it was necessary to emphasize the importance at the present moment of doing all in their power to reduce infant mortality. In 1913 there were born in Scotland 121,000 children, and of these 13,163 died within the first year of life—a death-rate of 106.8 per 1,000 births. Moreover, the antenatal mortality was probably quite as large as the death-rate in the first year of life; putting the two figures together, it would appear that quite one-third of the new population that should be the nation of to-morrow did not survive the first year. The future health of the unborn child depended on the health of the expectant mother, and to obtain satisfactory surroundings and efficient nursing it was necessary to remove many of the mothers from their homes. Universal experience showed that manipulative midwifery in the homes of the poorer patients was dangerous, and from his own experience of twenty years he could say that nearly a third of the diseases and derangements requiring gynaecological treatment was due to previous childbed illness. Patients in healthy, clean homes could quite well be treated at home, whereas those living in unhealthy homes were best treated in hospitals, as were also complicated cases. It must be remembered that the hospitals were kept up by voluntary subscriptions, and were training centres for nurses and doctors. For that training it was not sufficient that only serious and complicated cases should be admitted. The future nurses and doctors must be enabled to see normal cases, and for that purpose it was important that the maternity hospitals should be well filled. Last year the Dundee hospital only received £410 from insurance societies, and most of this was given voluntarily by insured persons. It was very difficult to get all insured persons to contribute on a voluntary basis, and it would be better if all societies would enter into an agreement with the maternity hospitals so as to equalize payment. In Australia the infant death-rate, in spite of a £5 bonus paid to the mothers for every child, still continued at 71 per 1,000, while in New Zealand, where the assistance was wholly given in the form of skilled attention and teaching, the infant death-rate had fallen in five years from 80 to 35 per 1,000. It thus appeared that skilled assistance was far better than mere cash, and he thought that such assistance could best be obtained by an agreement between the insurance societies and the hospitals, so that the maternity cases might receive the best attention in the hospitals or in their own homes under the maternity hospital authorities. In that way much of the impaired health, chronic suffering, and disablement which later cost the societies so much would be prevented, so that the societies would be more than compensated in the long run. It had been suggested that patients treated in the hospitals might contribute 10s., and those treated in their homes by the hospital staffs might contribute, say, 7s. 6d., but personally he thought that some fixed sum for both classes would be better.

After some discussion, during which it appeared that several of the approved societies had already some agreement with the hospitals, the following resolution was carried unanimously:

That the various approved societies in Dundee should enter into a uniform agreement with the Dundee Maternity Hospital as to the amount to be paid for indoor and outdoor cases who elect to be treated in the hospital or by the hospital staff.

A further resolution was also carried to the effect that:

This meeting records its opinion that it is most important that the Midwives Bill for Scotland should be passed at the earliest possible date.

MATERNITY HOSPITALS AND MATERNITY BENEFIT.

On the evening of July 23rd a conference was held between the officials of the approved insurance societies of Edinburgh and district and representatives of the Edinburgh Royal Maternity Hospital. Dr. McVail, Vice-Chairman of the Scottish Insurance Commissioners, presided, and Sir Halliday Croom gave the principal address; the hospital was also represented by Mr. Middleton (Chairman), Mr. James Peterson (Secretary), and by Bailie

Buchan. The object of the conference was to correlate more effectively the working of the maternity hospital and the approved societies; and meetings for the same object are being held in the other large towns of Scotland. It was considered by the Insurance Commissioners that a systematic utilization of the services of the competent staff of the maternity hospital would be a considerable step in the right direction.

Dr. McVail said that he was there more in the capacity of an onlooker, but he referred to the many-sided value of an institution like the Royal Maternity Hospital, in which everything was done to prevent not only any immediate evil results, but also any chronic ailment of mothers at childbirth, in which pains were taken to prevent eye disease in the infants such as might, if unchecked, cause blindness, and in which doctors and midwives were trained. In the absence of a Midwives Act for Scotland, it was necessary to limit as far as possible the sphere of activity of ignorant women of the Sairey Gamp type.

Sir Halliday Croom, in his address, spoke of the maternity benefit as one of the most satisfactory features of the Insurance Act, for the proper care and conduct of maternity was one of the most urgent problems of the time. In three ways death might come to a woman during maternity: She might die of some ordinary ailment, such as bronchitis, occurring solely as an accidental complication; she might die through one of the conditions known as the accidents of childbirth, such as eclampsia; or she might perish through puerperal infection. Of the women who died in childbed, one quarter succumbed to the accidents referred to, and the rest died from blood poisoning, which was entirely and absolutely preventable. At one time this puerperal blood poisoning decimated the inmates of maternity hospitals, from 15 to 25 per cent. dying of it, whilst the ordinary death-rate in childbed was only 1 in 120. Maternity hospitals then were dangerous places; now Lister's antiseptic treatment of wounds had altered all that, and blood poisoning in hospitals had been practically stamped out, the cases which still occurred being purely sporadic. Outside the hospitals, however, the disease went on unchecked, and the mortality from blood poisoning in private work remained extraordinarily high; for, whilst at the hospitals the doctors and nurses were under discipline and antiseptic treatment was carried out under pain of dismissal, in private practice nurses and doctors could do what they pleased, and there was a tendency to both laxity and carelessness; and, further, in private practice some of the antiseptic precautions could not be carried out so thoroughly. Sir Halliday proceeded to describe the advantages offered by the hospital, referring to the trained medical staff and nurses and to the consultants attached to the institution. He spoke of the prenaternity home, where girls pregnant for the first time were taken in and supervised medically, of the prenaternity ward for the treatment of the diseases of pregnancy, of the pregnancy and infant clinics for outpatients, and he gave details of the extern department of the hospital, with its nurses, students, and qualified doctors. He claimed he had made out an absolutely incontrovertible case for the maternity hospital, and he touched, in addition, upon the relief of suffering through the administration of chloroform, which was used more freely in Scotland than in any other quarter of the globe. He further showed the importance of all these matters in connexion with infantile mortality, referring to the greater mortality (for mothers and infants) in male births and to the necessity in these days, when men were at a premium, to conserve the sex as far as possible. The prevention of ophthalmia neonatorum meant the saving of many individuals from blindness. The fee to be charged by the hospital for persons under the Insurance Act was 10s. for intern cases and 5s. for those attended at their own homes, and he made a special appeal to the approved societies to support the hospital adequately in order that the teaching of the subject of midwifery might not cease.

A discussion followed, during which a resolution was passed in favour of a Midwives Act for Scotland; a further resolution was carried expressing the earnest hope that the outcome of the conference would be that all the societies in the district would enter into an agreement with the Royal Maternity Hospital, the question of the fee to be paid by each patient being left open.

EXCESSIVE PRESCRIBING.

The Croylon Panel Committee has issued the following circular to the members of the local panel:

Report of Subcommittee on the Checker's Statement for March, and the Prescriptions referred for Examination.

Your Subcommittee beg to report that they have given careful and detailed consideration to the Checker's Statement for March, and to the prescriptions referred for examination, and they are of opinion that it is essential for the Panel Committee to adopt a settled policy and to carry out that policy with determination.

Either they must abandon all care of the Drug Fund or put down excessive prescribing.

That two-thirds of the men on the Panel can give adequate treatment for an average of less than 1s. 6d. a head shows that excessive prescribing is unnecessary and a waste of public money.

We recommend that from time to time warning notices (a suggested form for which is appended) should be sent to those men who appear to be exceeding 2s. a head, and that no surcharges be made until the end of the year.

Then, after full inquiries to any possibly mitigating circumstances, a surcharge should be recommended of those men who continued to prescribe excessively after the warnings.

We make these recommendations for the following reasons: Any surcharges made now would be comparatively trifling in amount, and would by no means compensate for the damage done to the Drug Fund.

Many prescriptions to which exception is taken might be defended if considered alone, but taken in bulk their successful defence is impossible.

Further, it might fairly be argued that a pecuniary bad case may have caused the amount for any particular month to appear excessive, but at the end of the year, if the average rate of prescribing has been anything like reasonable, there should be no excuse for exceeding the 2s.

A study of the prescriptions in general suggests the reflection that some of the excessive prescribing is great symptoms merely, and when at a loss for further treatment give pleasing draughts of well-flavoured mixtures.

Thus, naturally enough, they fail to cure their cases, and patients come again and again for medicine, giving these practitioners a fictitious appearance of high sickness incidence.

The argument that this is to the advantage of insured persons and to the funds of approved societies will not stand examination for a moment.

Such methods of treatment are disadvantageous to both. In prescribing, as in most other things, economy and efficiency walk hand in hand.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Staff Surgeon W. C. B. Smith to the *Comus*, vice Hughes; Surgeon A. M. Danmatt and J. Smith, M.B., to the *Victory*, additional; for Plymouth Hospital: W. S. O'Loughlin, M. B. Macleod, M.B., R. M. Dyott, F. C. Gladstone, M.B., A. L. Blinn, C. S. Ogilvy to the *Victory*, additional; for Haslar Hospital: J. P. Johnson, M.B., A. W. Guan, M.B., and D. A. E. Clarke, M.B., to the *Pembroke*, additional; for Cleithrum Hospital: J. Drummond, M.B., to the *Warrior*; E. J. Tongue to the *Ganges*, additional; for Shotley Sick Quarters. To be temporary Surgeon: P. U. Mawer.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon Probationers: R. McI. Gardner to the *Ouse*, vice Barker; D. MacEachran to the *Lisnet*, vice Storrer; J. B. D. Gallahue to the *Blenheim*, additional. To be Surgeon Probationers: G. Woods, A. B. Byrn, D. Macgregor, A. Macpherson, R. D. Mackenzie, B. Bannerman, A. M. Davidson, J. Johnston.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

H. A. Kidd to be temporary Lieutenant-Colonel whilst employed at the Graylingwell War Hospital (substituted for the notification published in the *London Gazette* of April 16th).

To be temporary Major whilst employed at the Graylingwell War Hospital: W. Pearson, M.D., F.R.C.S.I., J. L. Maxwell, M.D. (substituted for notification published in the *London Gazette* of May 1st).

Major A. E. Smithson, M.B., is retained on the active list and to be supernumerary.

Sir David Hardie, M.D., from temporary Major to be temporary honorary Lieutenant-Colonel whilst serving with the Australian Voluntary Hospital.

G. A. Paul, M.B., is granted the temporary honorary rank of Captain whilst serving with the Australian Voluntary Hospital.

The following having ceased to be employed with the Australian Voluntary Hospital relinquish their temporary honorary commissions:

Lieutenant-Colonel Sir A. MacCormick, M.D., Captain L. L. Harris, Lieutenant-Colonel H. A. MacCormick, M.D., Captain M. D. (substituted for notification published in the *London Gazette* of April 15th).

To be temporary Lieutenants: H. Rogers-Thomson, M. B. Blacklock, M.D., N. McC. Boyce, M.B., J. A. Meccall, J. V. Cope, M.B.,

A. Chalm, M.B., D. Whyte, M.B., F.A.J. R. Brooke, A. McEwan, M.B., M. B. Stuart, M.B., W. M. Thomas, C. J. West, M.D., G. A. Upcott-Gill, F.R.C.S.E., J. F. W. Leech, M.D., F. P. Nicholas, E. D. Wolff, H. W. Dyke, M.B., H. W. Hodgson, W. C. O'Brien, M.B., E. C. Cunningham, H. Hope, M.B., A. G. Glass, M.D., C. D. Pile, M.B., H. Croly, M.D., Temporary Lieutenant J. Smith, M.B., relinquishes his commission.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Lieutenant W. McE. Shodgers, M.B., is confirmed in his rank. Cadet Sergeant T. Y. Barley, M.B., and Cadet J. S. Armstrong, M.B., from the Edinburgh University Contingent, O.T.C., to be Lieutenants on probation.

INDIAN MEDICAL SERVICE.

Lieutenant-Colonel W. B. Scott Moncrieff (ret.), on re-employment, 17th, 1915; and as Residency Surgeon in the Western States of Rajputana, with effect from February 20th, 1915. Lieutenant-Colonel R. Shore (ret.), on re-employment, was posted as Residency Surgeon, Bawar, with effect from March 9th, 1915; and to hold visiting charge of the office of Medical Officer, Mervat, Pbil Corps, in addition to his own duties, with effect from March 15th, 1915.

Major T. S. B. Williams, Agency Surgeon, Eastern Rajputana States, is appointed temporarily to hold visiting charge of the office of Agency Surgeon, Kotah and Jhalawar, in addition to his own duties, with effect from May 1st, 1915.

To be temporary Lieutenants: Shapurji Hormasji Modi, F.R.C.S., Vinayak Halvart Gokhale, Ali Azhar Hasanally Fyzee, Jehangir Eddaji Framji Sarabji Mehta, Sorab Dhanraj Ajiyus, M.B., Upendra Nath Banerjee, Mehta, M.B., J. Nasarajji Hormasji Choksy, M.B., Balley Glenice Valerie Dias, Ramroo Narayan Jijus, M.B., Upendra Nath Banerjee, Alexander Dias, Vinayak Ramrao Chatterjee, Pramadha Nath Ghosh, M.B., C. E. R. Norman, Ganu Chandra Mahabir, M.B., Housi Shalvee Dattar, Rustom Burjorji Spencer, M.B., Devendra Bhadravajra, Dattaji Mitra, M.B., H. Anuj Khin, M.B., Shridhar Chhistanan, Jrs, Pirosha Kerpawia Antia, M.B., Mansejee Mervanjee Cowasjee, Brij Bushan Mitra, M.B.

INDIAN MEDICAL SUBORDINATE DEPARTMENT.

Senior Assistant Surgeons, with the honorary rank of Lieutenant, to be Senior Assistant Surgeons, with the honorary rank of Captain: C. W. E. Carr, C. Fox, W. J. Corridor, E. J. Greenon.

To be Senior Assistant Surgeons, with the honorary rank of Lieutenant: 1st class Assistant Surgeon J. Malir alias W. H. Holmes, W. J. Gillson, F. G. H. Deeks, W. Bamford, and W. G. Marsh.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

1st London (City of London) General Hospital.—Captain T. J. Hodder is seconded; N. S. Fizzi to be Captain, whose services will be available on mobilization.

2nd London (City of London) General Hospital.—Major C. H. Fiske, M.H., F.R.C.S., is seconded while in charge of the Hampstead Military Hospital.

3rd London General Hospital.—Captain V. W. Low, M.D., F.R.C.S., is seconded.

4th London General Hospital.—Major A. H. Tabby, M.B., F.R.C.S., F.R.C.S., are seconded.

3rd Home Counties Field Ambulance.—Lieutenant M. A. Curry relinquishes his commission.

1st Eastern General Hospital.—H. A. Cookson, M.B., F.R.C.S.E., to be Captain, whose services will be available on mobilization.

1st East Anglian Field Ambulance.—Major G. M. Hethington to be temporary Lieutenant-Colonel. To be Lieutenants: J. E. Brooks, S. D. Graham, M.B.

1st South-Western Mounted Brigade Field Ambulance.—Captain C. W. Edwards, F.R.C.S.E., from Attached to Units other than Medical Units, to be Captain.

3rd Western General Hospital.—To be Lieutenants: J. Lloyd, M.D., E. W. Richards, M.B.

Notte and Derby Mounted Brigade Field Ambulance.—Captain F. R. M. Hesse, from F.R.N., to be Captain, temporary (substituted for notice published in the *London Gazette* of April 26th). To be Lieutenants: J. W. Rammell, W. Bailey-Thomson, M.B.

1st East Lancashire Field Ambulance.—Lieutenant R. S. Young, M.B., from F.R.N., to be Lieutenant.

2nd East Lancashire Field Ambulance.—Lieutenant-Colonel W. R. Matthews, M.B., from 3rd East Lancashire Field Ambulance, to be Lieutenant-Colonel, temporary.

West Lancashire Casualty Clearing Station.—R. K. Merson to be Lieutenant.

1st West Lancashire Field Ambulance.—Major W. P. Blackledge, M.B., from 2nd West Lancashire Field Ambulance, to be Lieutenant-Colonel, temporary; Captain H. Hulton, M.D., from Attached to Units other than Medical Units, to be Major; Captain M. J. Dick, from 3rd West Lancashire Field Ambulance, to be Captain.

2nd West Riding Field Ambulance.—Captain F. G. Dobson, M.B., to be temporary Lieutenant-Colonel.

1st Northern General Hospital.—W. Johnston, M.B., to be Lieutenant.

2nd Northern General Hospital.—Majors to be temporary Lieutenant-Colonels: W. H. M. Collins, W. Thompson, F.R.C.S., Major G. W. Watson, M.D., to be transferred to permanent personnel.

Captains to be temporary Majors: A. L. Whitehead, L. R. Braithwaite, M.B., R. A. Little, M.D., C. W. Vinings, M.D., J. B. Hall to be Captains whose services will be available on mobilization.

5th Northern General Hospital.—M. W. Williams and A. Foster, M.B., late Surgeon-Lieutenant 1st Volunteer Battalion East Lancashire Regiment, to be Captains whose services will be available on mobilization.

1st Highland Field Ambulance.—R. R. Macnicoll, M.B., late Captain, Ban Aghlinn Battalion (Princess Louise's) Argyll and Sutherland Highlanders, to be Captain, temporary.

3rd Scottish General Hospital.—J. Patrick, M.B., F.R.C.S.E., to be Captain, whose services will be available on mobilization.

Attached to Units Other than Medical Units.—Lieutenant W. Marley-Cass to be Captain. To be Lieutenant: J. de V. Maher, M.D.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

In ninety-six of the largest English towns, 7,430 births and 3,555 deaths were registered during the week ended Saturday, July 24th. The annual rate of mortality in these towns, which had been 11.9, 11.7, and 11.4 in the three preceding weeks, was again 11.5 per 1,000 in the week under notice. In London the death-rate was equal to 11.2, while among the ninety-five other large towns it ranged from 4.4 in Wimbledon, 5.3 in Hornsey, 5.7 in Acton, 5.8 in Leyton, 6.0 in Enfield, 6.2 in Bury, 10.3 in Gillingham, 10.5 in Warrington, 16.5 in Middlesbrough, 16.6 in Halifax, 18.9 in Birkenhead, 19.5 in Barnsley, and 20.3 in West Bromwich. Measles caused a death-rate of 1.6 in Rotherham and in Rhondda, 2.1 in Halifax, 2.2 in Barnsley and in Middlesbrough, 3.1 in York, and 3.8 in West Bromwich. The mortality from the remaining infective diseases showed no marked excess in any of the large towns, and no fatal case of small-pox was registered during the week. The either by a registered medical practitioner or by a coroner; of this number, 4 were recorded in Gillingham, 3 in Birmingham, 3 in Rhondda, and 2 each in London, Liverpool, Manchester, Newcastle-on-Tyne, and Carlisle. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 2,486, 2,471, and 2,468 at the end of the three preceding weeks, rose to 2,483 on Saturday, July 24th; 342 new cases were admitted during the week, against 348, 322 and 290 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In the sixteen largest Scottish towns, 1,083 births and 942 deaths were registered during the week ended Saturday, July 24th. The annual rate of mortality in these towns, which had been 16.6, 15.7, and 12.5 in the three preceding weeks, rose to 14.7 in the week under notice, and was 2.8 per 1,000 above the rate recorded in the ninety-six large English towns. Among the several towns the death-rate ranged from 5.4 in Hamilton, 6.1 in Falkirk, and 8.2 in Clydebank, to 10.3 in Aberdeen, 13.4 in Leith, and 14.8 in Glasgow. The mortality from the principal infective diseases averaged 2.2 per 1,000, and was highest in Aberdeen, Glasgow, and Hamilton. The 342 deaths from all causes in Glasgow included 29 from measles, 10 from infantile diarrhoeal disease, 9 from whooping-cough, 7 from scarlet fever, and 2 each from enteric fever and from diphtheria. Four deaths from measles were recorded in Aberdeen and 3 in Paisley; 7 from scarlet fever in Aberdeen and 2 in Edinburgh; 2 from whooping-cough in Aberdeen, 5 from diphtheria in Edinburgh; and 4 from infantile diarrhoea in Dundee and 2 in Motherwell.

HEALTH OF IRISH TOWNS.

During the week ending Saturday, July 24th, 550 births and 341 deaths were registered in the twenty-five largest districts of Ireland, against 548 births and 293 deaths in the preceding period. These deaths represent a mortality of 14.7 per 1,000 of the aggregate population in the districts in question, as against 12.6 per 1,000 in the previous period. The mortality in these towns was therefore 3.3 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate, on the other hand, was equal to 23.7 per 1,000 of population. As for mortality in individual localities, that in the Dublin registration area was 14.3 (as against an average of 16.0 for the previous four weeks), in Dublin city 15.2 (as against 16.1), in Belfast 14.4 (as against 12.0), in Cork 15.6 (as against 16.3), in Londonderry 16.3 (as against 19.6), in Limerick 23.0 (as against 18.6), and in Waterford 7.6 (as against 14.3). The zymotic death-rate was 1.1, as against 1.2 in the previous period.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notice re Appointments) appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

- BIRMINGHAM AND MIDLAND EYE HOSPITAL.—Junior House-Surgeon. Salary, £100 per annum and £3 laundry allowance.
- BIRMINGHAM GENERAL DISPENSARY.—Resident Medical Officer. Salary, £200 per annum.
- BRISTOL GENERAL HOSPITAL.—House-Physician. Salary, £150 per annum.
- BURNLEY VICTORIA HOSPITAL.—House-Surgeon. Salary, £135 per annum.
- BURY INFIRMARY.—Senior House-Surgeon. Salary, £250 per annum.
- CHESTERFIELD AND NORTH DERBYSHIRE HOSPITAL.—Second House-Surgeon. Salary, £150 per annum.
- CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park, E. (1) Resident Medical Officer; (2) House-Physician. Salary, £300 and £100 per annum respectively.
- DEVONPORT: ROYAL ALBERT HOSPITAL.—House-Surgeon. Salary, £150 per annum; 2ls. allowed weekly for working single-handed.
- DORSET COUNTY COUNCIL EDUCATION COMMITTEE.—School Dentist. Salary, £260 per annum.
- DUNDEE: SIDLAU SANATORIUM.—Resident Medical Officer.
- ILKESTONE: ROYAL VICTORIA HOSPITAL.—House-Surgeon. Salary, £150 per annum.
- GUILDFORD: ROYAL SURREY COUNTY HOSPITAL.—House-Surgeon. Salary, £150 per annum.
- HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton, S.W.—House-Physician. Honorarium, 30 guineas for six months.
- LEEDS PUBLIC DISPENSARY.—Lady Resident Medical Officer. Salary, £150 per annum.
- MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN.—House-Surgeon. Salary, £120 per annum.

- NATIONAL SANATORIUM, Benenden.—Assistant Medical Officer. Salary, £120 per annum.
- NORTHAMPTON GENERAL HOSPITAL.—House-Surgeon. Salary, £150 per annum.
- OCHIL HILLS SANATORIUM, Milnathort, N.B.—Junior Medical Officer. Salary, £150 per annum, rising to £200.
- OXFORD LYE HOSPITAL.—House-Surgeon. Salary, £100 per annum.
- ROYAL EYE HOSPITAL, Southwark S.E.—House-Surgeon. Salary, £100 per annum.
- ST. MARK'S HOSPITAL FOR CANCER, FISTULA, Etc., City Road, E.C.—House-Surgeon. Salary, £150 per annum.
- SALISBURY GENERAL INFIRMARY.—Assistant House-Surgeon. Salary, £100 per annum.
- SHEFFIELD ROYAL INFIRMARY.—(1) House-Surgeon; (2) Assistant House-Physician. Salary, £100 per annum.
- SHEFFIELD UNIVERSITY.—Demonstrator of Pathology and Bacteriology.
- SHEWENSBURY BOROUGH.—Medical Officer of Health and School Medical Officer. Salary, £500 per annum.
- SOUTHAMPTON: ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL.—Junior House-Surgeon. Salary, £120 per annum.
- STOKE-ON-TRENT INFECTIOUS DISEASES HOSPITAL.—Resident Lady Medical Officer. Salary, £200 per annum.
- WALSALL AND DISTRICT HOSPITAL.—Assistant House-Surgeon and Anaesthetist. Salary, £150 per annum.
- WEST HAM AND EASTERN GENERAL HOSPITAL, Stratford.—(1) Resident Medical Officer; (2) House-Physician and House-Surgeons. Salary for (1) £160 per annum, and for (2) £120 and £100 per annum respectively.
- WIGAN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Junior House-Surgeon. Salary, £150 per annum.
- WINSLEY SANATORIUM, near Bath.—Senior Resident Medical Officer. Salary, £400 per annum.
- CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointment: Knaresborough (Yorkshire, West Riding).
To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—It is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

- BAINBRIDGE, F. A., M.D., F.R.C.P., to the University Chair of Physiology at St. Bartholomew's Hospital.
- BUDGE, E. J. H., L.R.C.P. and S. Edin., L.F.P.S. Glas., District Medical Officer of the Cardiff Union.
- EARLE, H. G., M.B. Camb., Professor of Physiology at the University of Hong Kong.
- JAGO, E. B., M.B., C.M. Glas., Medical Officer of Health to the Greenborough Urban District Council.
- MENZIES, James A., M.D. Edin., Professor of Physiology, University of Durham College of Medicine, Newcastle-upon-Tyne.
- RANSAT, Mabel L., M.D., Ch.B. Edin., D.F.H. Camb., Anaesthetist (during war) to the South Devon and East Cornwall Hospital, Plymouth.
- SMILES, W. H., M.D. Lond., Certifying Factory Surgeon for the Henley District, Warwickshire.
- WRIGHT, S. R., M.R.C.S., L.R.C.P., Certifying Factory Surgeon for the Roumford District, Co. Essex.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages and Deaths is 5s., which sum should be forwarded to Post Office Orders or Stamps with the notice not later than the first post Wednesday morning in order to ensure insertion in the current issue.

BIRTHS.

- COLLINS.—On July 31st, at Woodford Green, Essex, the wife of F. Garland Collins, Lieutenant R.A.M.C., of a son.
- DICKSON.—On July 30th, at Nelson Place, Newcastle, Staffordshire, the wife of Robert H. Dickson, F.R.C.S., of a son.
- STUART.—On July 24th, at Leamore, Walsall, Violet (Mallie), wife of Allen Murray Stuart, M.R.C.S., L.R.C.P., of a son.

MARRIAGE.

- THOMAS—WAGGOTT.—On July 27th, 1913, at the Church of All Saints, St. Pegasus, County Scotland, by the Rev. W. E. Knight-Aldin, E.A., Chaplain Royal Navy, Surgeon E. Fairfield Thomas, M.B., D.P.H., Royal Navy, third son of Mr. and Mrs. Edmund Thomas, Gilwern House, Pontllantrah, Monmouthshire, to Gertrude, second daughter of Mr. and Mrs. J. B. Waggot, of Warden House, Tynemouth.

WAR EMERGENCY COMMITTEE.

It has already been reported that the War Emergency Committee appointed by the Representative Meeting on July 23rd had at its meeting on July 30th elected Dr. T. Jenner Verrall chairman, Dr. A. E. Shipley, Master of Christ's College, Cambridge, and Mr. E. B. Turner, Chairman of Representative Meetings, vice-chairmen, and Mr. Bishop Harman and Dr. Alfred Cox, Medical Secretary of the Association, joint secretaries. The membership of the Committee as at present constituted is shown below.

The Committee met for the second time on Wednesday, August 4th, when Dr. T. JENNER VERRALL was in the chair. The other members present were Sir T. Clifford Allbutt, K.C.B., M.D., F.R.S., Lieutenant-Colonel Sir James Barr, LL.D., Major James Galloway, Major W. J. Greer, Mr. N. Bishop Harman, Dr. J. A. Macdonald, LL.D., Dr. Edwin Rayner, Dr. A. E. Shipley, F.R.S., and Mr. E. B. Turner.

It was announced that Professor Harvey Littlejohn, Dean of the Faculty of Medicine of the University of Edinburgh, had accepted the invitation to become a member of the Committee; he was co-opted accordingly, and was present at the meeting.

A letter was read from Sir Donald MacAlister, President of the General Medical Council, stating that while he was very willing, as in the case of the Scottish Emergency Committee, to co-operate with the Committee to the best of his power, he preferred, having regard to his official position, not to accept the responsibility of membership.

CORRESPONDENCE WITH THE WAR OFFICE.

The following correspondence with the War Office was read:

July 30th, 1915.

Sir,—We are instructed to inform you that at the Annual Representative Meeting of the British Medical Association on Friday, the 23rd inst., it was resolved to appoint a Special War Emergency Committee with the following constitution, reference, and personnel:

1. That a War Emergency Committee be appointed for the Session 1915-16.

2. That it consist of the four *ex officio* members, four members elected by the Council from its own number, four members elected by the Representatives present in the Representative Meeting, and four other members elected in the same way, who shall themselves be Representatives.

3. That it shall have power to co-opt not more than six other members representative of universities, colleges, and other medical bodies.

4. That the reference to the Committee be to organize the medical profession in England, Wales, and Ireland in such a way as will enable the Government to use every medical practitioner fit to serve the country in such a manner as to turn his qualifications

to the best possible use; to deal with all matters affecting the medical profession arising in connexion with the war; and to report to the Council.

Members of Committee.

Sir Thomas Clifford Allbutt, K.C.B., M.D., F.R.S., Cambridge.
 Sir William Osler, Bt., M.D., F.R.S., Oxford.
 Dr. A. E. Shipley, F.R.S., Master of Christ's College, Cambridge.
 Sir Alex. Ogston, K.C.V.O., Aberdeen (*President, British Medical Association*).
 Mr. E. B. Turner, F.R.C.S., London (*Chairman of Representative Meetings, British Medical Association*).
 Dr. J. A. Macdonald, LL.D., Taunton (*Chairman of Council, British Medical Association*).
 Dr. Edwin Rayner, Stockport (*Treasurer, British Medical Association*).
 Lieutenant-Colonel Sir James Barr, M.D., LL.D., Liverpool.
 Lieutenant-Colonel R. A. Bolam, Newcastle-upon-Tyne.
 Dr. C. Buttar, London.
 Major Russell Coombe, Exeter.
 Major J. Galloway, London.
 Major W. J. Greer, Newport, Monmouthshire.
 Mr. N. Bishop Harman, London.
 Major Albert Lucas, Birmingham.
 Dr. T. Jenner Verrall, LL.D., Bath.

[Dr. Frederick Taylor, President of the Royal College of Physicians of London, and Sir Rickman Godlee, Bt., ex-President of the Royal College of Surgeons of England, have since joined the Committee.]

The meeting to-day appointed Dr. Verrall as its Chairman.

We are instructed to say that the Committee desires to place itself freely at the disposal of the War Office for any purposes included in its reference in which you think it could be of service.

As you are already aware, the British Medical Association has for some time been engaged in forming a register of the whole medical profession in England and Wales and Ireland which will show what the members of the profession are doing, or are prepared to do, in connexion with the war, and that register is now sufficiently complete as regards certain areas for the Committee to ask practitioners who have stated their willingness to apply for commissions to do so. The Committee feels, however, very strongly that its position in approaching practitioners for this purpose would be greatly strengthened if the War Office would state, as far as could safely be done, its actual requirements as regards medical officers, and would give its authority to approach practitioners on behalf of, and in the name of, the War Office. Doubtless you will be best able to indicate the way in which this could be done, but the Committee is firmly convinced that without some such authorization its usefulness will be greatly limited. We are authorized to say on behalf of the Chairman that we, together with the Chairman, if thought desirable, would be ready to confer with you on this matter in order to further the objects for which the Committee has been constituted.—We are, Sir, your obedient servants,

(Signed) N. BISHOP HARMAN,
 ALFRED COX,
 Secretaries.

Surg.-Gen. Sir Alfred Keogh, K.C.B.,
 Director-General A.M.S.,
 War Office, S.W.

War Office,
London, S.W.,
31st July, 1915.

Sirs,—I am directed to acknowledge your letter of the 30th July and am to request you to convey to the War Emergency Committee the deep appreciation of the Director-General, Army Medical Service, for the good work they have done and are doing in organizing the medical profession so as to meet the requirements of the war.

I am to say that Sir Alfred Keogh would be glad to meet representatives of the Committee, say six, at 11 a.m., on Wednesday, 4th August, when he would be glad to explain to them the present and the anticipated future needs of the Army Medical Services, and to discuss with them the best means of meeting them.

I am to add that the Director-General suggests that Major Galloway should be appointed to represent the Army Medical Service on the Committee, as this gentleman has been for some years on our Advisory Board and is therefore informed as to our military necessities, and is in close touch with the medical representatives of the War Office Staff.—I am, Sirs, your obedient servant,
(Signed) A. P. BLENKINSOP, Colonel,
for Director-General, Army Medical Service.

The Secretaries,
British Medical Association,
429, Strand, W.C.

The CHAIRMAN reported that, in compliance with the invitation contained in Colonel Blenkinsop's letter, a deputation from the Committee, consisting of himself, the two vice-chairmen of the Committee (Dr. Shipley and Mr. E. B. Turner), Major James Galloway, and the two secretaries, had that day had an interview with Sir Alfred Keogh, who stated that he was very glad that the Association had widened the scope of the Committee by appointing members of bodies outside the Association. The members of the deputation stated that the Committee desired to have the authority of the War Office in calling upon medical practitioners to join the R.A.M.C. Sir Alfred Keogh replied that while he believed the constitution and scope of the Committee to be well known to the profession, he was quite ready to give such authority if it was thought that further recognition would be useful. The following letter has since been received:

War Office,
Whitehall, S.W.,
August 9th, 1915.

Dear Sirs.—As I explained at my interview with members of the War Emergency Committee on the 4th instant, I cordially welcome the establishment of the new Committee on its extended basis, representing as it does all sections of the medical profession, and I hope to receive from it much help in my work of providing officers for the Royal Army Medical Corps.

In order that there may be no doubt as to the close relationship which I hope will exist between your Committee and this department, I have pleasure in stating that I recognize in it an excellent medium for dealing with the great problem which now faces the profession—namely, how to supply medical officers for the forces and at the same time to protect the needs of the civil population as far as possible, and I gladly authorize the Committee to make appeals to the profession with the object of securing these ends.

After my conversation with your deputation, I need only emphasize the importance of prompt and increasing supplies of medical officers by saying that, in my opinion, you cannot put the claims of the Medical Department of the War Office too strongly.—I am, yours faithfully,
(Signed) ALFRED KEOGH, D.G., A.M.S.

The Secretaries,
Officers of the British Medical Association,
429, Strand, W.C.

Sir Alfred Keogh went very thoroughly with the deputation into the question of the number of practitioners who during the next six months would be required by the War Office.

Having heard the correspondence and the statements of the members of the deputation, the Committee resolved that the following letter, based upon that recently issued by the Scottish Emergency Committee, should be sent to every practitioner in England and Wales, except those at present on active service, pointing out the urgent needs of the army for medical practitioners under 40 years of age.

WAR EMERGENCY COMMITTEE.

Offices, 429, Strand,
London, W.C.,
August, 1915.

To Members of the Medical Profession not on Active Service.

Dear Sir,—The War Emergency Committee is anxious to impress on every medical practitioner not on present or whole-time naval or military service its opinion that the immense military effort in which this country is engaged necessitates a further and immediate response from our profession.

A deputation of the Committee met Sir Alfred Keogh, Director-General of the Army Medical Service at the War Office, on August 4th, and received from him such information as left no doubt in its mind as to the vital and immediate necessity for more medical officers of military age—namely, 40 years and under. Sir Alfred Keogh has authorized the Committee to act as his agent in securing this further response from the profession, which, in view of the fine way in which the profession has already risen to the occasion, we have no doubt will be forthcoming.

Without medical officers fighting units cannot be properly constituted. They are necessary to keep the soldier fit, to supervise his physical activities in drill and march, to watch food and water, to secure a sanitary camp, and above all, to act as an educational influence to the men from the physical and sanitary point of view. If a medical man is to carry out such duties successfully he must have some military training. Professional training alone is not sufficient. The officers are therefore required at once so that they may be trained for the calls which will be made upon them in the early future both for the above-mentioned services, and for the treatment of the sick and wounded.

This appeal is addressed to you personally. The Committee knows how difficult it is for most medical men to arrange to leave their work, but the same thing applies to a greater or less extent to nearly every man who is serving his country. If you are of military age, we ask for your personal service as a naval or military medical officer. If you are over age, we ask you to encourage the enlistment of the younger men by co-operating with your neighbours as to set free the men who are willing to go if arrangements can be made. The elder man who helps to release the younger man is doing his part just as much as he who serves abroad.

Already in most areas special Committees have been set up representative of the whole medical profession, in order to make arrangements for setting practitioners free for naval or military service, and this Committee is urging those areas which have not constituted local Committees to do so at once.

You will no doubt be approached shortly by the Secretary of your local Committee, but in the meantime we urge you to act at once, and to communicate with us so that we may help you in making such arrangements as are necessary.

It is realized that the responsibilities for carrying on your work must rest primarily with your neighbours, but we invite you to look to this Committee for any advice or assistance that can be given centrally, and the Committee, acting in co-operation with the local Committee, will by every means in its power try to protect the interests of practitioners who respond to the call of their country.

Finally, we ask you to believe, on the strength of confidential information which has been given to this Committee, that the need for medical officers of military age is extremely urgent, and the Committee has no doubt that it is the duty of every medical man of military age who can by any possibility offer himself for service, to do so.

(Signed) T. JENNER VERRALL, Chairman,
N. BISHOP HARMAN, } Secretaries.
ALFRED COX, }

Conditions of Service.

Offers for whole-time service may be divided into two classes:

1. Men under 40, whose services will be accepted for a period of twelve months, and who will be liable for service at home or abroad.
2. Men over 40, who may offer their services for a period of six or twelve months. These will not in present circumstances be sent to the front, but will be employed in this country (if they have joined for six months only) or at home or in such stations as Egypt, Malta, and Gibraltar (if they have joined for twelve months). If they desire it, and have been found serviceable, they may be re-engaged at the end of six months. Men not much over 40 of good physique should, however, offer for general service, as they may be required to do duty with the Expeditionary Force later on.

Men may enrol their names with the War Emergency Committee, declaring their readiness to join after a certain date on receiving thirty-six hours' notice from the War Office that their services are forthwith required. If they engage on a twelve months' contract they will receive temporary commissions in the R.A.M.C., with an allowance of £30 for outfit, and pay at the rate of 24s. a day, with 1s. 9d. for ration allowance, and a gratuity of £60 at the termination of the engagement, subject to satisfactory service. If the engagement is for six months the terms are the same as for the longer period, but the gratuity would be £15 instead of £60.

It was also resolved to issue a letter to Division secretaries and secretaries of local War Emergency Committees (1) informing them of the issue of the above circular letter to every practitioner, and (2) stating (a) that the Committee now left it to each area to supply its quota of the number of practitioners still required (the actual proportionate number required of each area being given), (b) that in those areas where a War Emergency Committee was already in existence it should deal with the question, and such Committees representative of the whole of the local profession, and not restricted to members of the Association, should be appointed in all other areas for the purpose; (c) that the local War Emergency Committee should proceed to obtain the signatures of the number of men required from its area to the contract form of the War Office, which forms, after being duly noted by the local Committee, should be forwarded to the Central War Emergency Committee, and (d) that the local Committee, when urging practitioners to join the R.A.M.C., should advise them

- (i) To enter into a properly drawn agreement with their local colleagues as to the working of their practices while absent;
- (ii) To appoint a legal representative who could be consulted on their affairs during their absence;
- (iii) To apply to the Central War Emergency Committee for advice in case any difficulty is experienced in making arrangements for the carrying on of their practices during absence; and
- (iv) That the Central Committee was prepared, in co-operation with the local Committee, to safeguard their interests both during their absence and on their return, to the best of its ability.

SUPPLY OF MEDICAL OFFICERS.

It was reported that the following reply had been received from the Director-General to the letter written to him on May 26th on behalf of the Association concerning the grievances of medical men serving in the army, and the difficulties which are preventing medical practitioners from accepting commissions:

War Office,
London, S.W.,
31st July, 1915.

Sir.—With reference to your letter of the 26th instant I am directed to acquaint you that the points mentioned in your letter of 26th May are still under consideration.

Approval has, however, been given to the promotion of Special Reserve and Territorial Force Lieutenants to the rank of Captain after six months' mobilized service, but no promotion to be antedated beyond 1st April inst.—I am, Sir, your obedient servant.

(Signed) A. P. BLENKINSP, Colonel,
for Director-General, Army
Medical Service.

The Medical Secretary,
British Medical Association,
423, Strand, W.C.

EXECUTIVE SUBCOMMITTEE.

It was resolved to appoint an Executive Subcommittee as follows: The Chairman, Dr. T. Jenner Verrall, Major Galloway, Mr. E. B. Turner, Dr. Charles Buttar, and the two Secretaries.

NEXT MEETING.

The next meeting of the Committee will be held on Wednesday, August 25th.

INSURANCE ACTS COMMITTEE.

A MEETING of the Insurance Acts Committee was held at the office of the Association on Thursday, August 5th, when Dr. J. A. MACDONALD, LL.D., was in the chair, and the other members present were:—*England and Wales*: Mr. H. B. Brackenbury (London), Dr. T. Campbell (Wigan), Dr. J. Divine (Hull), Major A. C. Farquharson (Spennymoor), Lieutenant E. R. Fothergill (Hove), Dr. P. V. Fry (Sowerby Bridge), Dr. Major Greenwood (London), Mr. R. Harding (New Radnor), Dr. I. W.

Johnson (Bury), Mr. P. Napier Jones (Reading), Dr. B. A. Richmond (London), Dr. T. Ridley-Bailey (Bilston), Mr. Harding H. Tomkins (Leyton), Dr. W. B. Crawford Treasure (Cardiff), Dr. T. Jenner Verrall, LL.D. (Bath), *Scotland*: Dr. John Adams (Glasgow), Dr. J. R. Dreyer (Glasgow), Lieutenant J. Hunter (Corstorphine), *Es officio*: Mr. E. B. Turner, Chairman of Representative Meetings (London), Dr. E. Rayner, Treasurer (Stockport).

APPOINTMENT OF CHAIRMAN.

Dr. J. A. Macdonald was reappointed Chairman for the ensuing session.

ELECTION OF REPRESENTATIVE MEMBERS.

Dr. Olive Claydon (Oldham), having been nominated by the two Associations of Registered Medical Women, was appointed a member of the Committee.

INSURED TUBERCULOUS PERSONS AND INSTITUTIONAL TREATMENT.

A correspondence with the Joint Committee of Insurance Commissioners regarding the position of insured tuberculous persons suspended from institutional treatment because of refusal to obey orders having been read, it was resolved:

That the Commissioners be informed that the Committee is of opinion that the suspension of such recalcitrant insured persons from sanatorium benefit is not the best method of punishment, and would, in addition, be unfair to the Drug Fund and the insurance practitioner; and be asked whether the model rules for the administration of medical benefit, which confer power on Insurance Committees to inflict fines in similar cases occurring in connexion with medical benefit, apply to sanatorium benefit. That the Commissioners be also informed of the opinion of the Committee that if the rules do not so apply steps should be taken to extend their range to such cases.

NURSES AS SICK VISITORS.

With regard to the question of nurses acting as sick visitors, it was decided to communicate with the Victoria Jubilee Institute for Nurses, as the principal representative body of nurses, to suggest that it should use its influence to persuade other nursing associations to adopt the view already approved by it, namely, that the functions of nurses and sick visitors are essentially different, and could not be properly combined in one individual.

APPROVED SOCIETIES AND SICKNESS BENEFIT CERTIFICATES.

After considering a circular issued by an approved society stating that no payment was to be made for sickness benefit in cases in which the certified cause of illness was included in a list of 141 illnesses named until the case had been visited by the sick visitor from the district office of the society, the Committee expressed the following opinions: (1) That it was inadvisable for the profession to concern itself in matters primarily concerning the insured persons and the approved society; and (2) that in suitable cases aggrieved insured persons should be advised to lay a complaint with the Insurance Committee.

APPOINTMENT OF EXECUTIVE SUBCOMMITTEE.

A Subcommittee was appointed to consider subjects referred to it by the Insurance Acts Committee and to take action when authorized, to keep in close touch with and assist in the co-operation of all Local Medical and Panel Committees, advising them on all circulars, memorandums, and documents issued locally or centrally, having reference to the medical service under the Insurance Acts, and generally to advise the Insurance Acts Committee.

The members of the Subcommittee are the Chairman (Dr. J. A. Macdonald), Mr. John Adams, Mr. H. B. Brackenbury, Dr. Olive Claydon, Dr. John Divine, Lieutenant E. R. Fothergill, Mr. P. Napier Jones, Dr. B. A. Richmond, Dr. W. B. Crawford Treasure, Mr. E. B. Turner.

The following matters were referred to the Subcommittee: (1) The question of the amendment of regulations with power to make representations to the Commissioners. (2) The further consideration of matters arising out of the conference of representatives of Local Medical and Panel Committees and the deputation to the Commissioners thereon. (3) The resolutions adopted by the Annual Representative Meeting concerning the Insurance Acts.

CENTRAL INSURANCE DEFENCE FUND.

Two applications for assistance from the fund were considered. With regard to one it was decided to make a grant of £50. In the other the Committee found it impossible to accede to the request.

CONFERENCE OF REPRESENTATIVES OF LOCAL MEDICAL AND PANEL COMMITTEES.

DEPUTATION TO COMMISSIONERS.

Under date of July 29th the Medical Secretary has addressed a letter to the honorary secretaries of Local Medical and Panel Committees enclosing a copy of the agreed report of the deputation from the Insurance Acts Committee of the Association on July 9th to the Chairman of the National Health Insurance Joint Committee with respect to the resolutions passed by the conference of representatives of Local Medical and Panel Committees held on June 16th. The report was published in the SUPPLEMENT of July 31st, p. 63, et seq. The report was adopted by the Annual Representative Meeting on July 24th (SUPPLEMENT to the JOURNAL of July 31st, p. 64). The Medical Secretary in his letter to the honorary secretaries of Local Medical and Panel Committees called attention to the fact that from the report of the conference it would be seen that the Commissioners were willing to recognize the British Medical Association as the mouthpiece of the Local Medical and Panel Committees of the country knowing that the Association would continue to consult with and support those Committees in their work for the protection of the interests of insurance practitioners. Dr. Cox went on to request the secretaries to keep him acquainted with any matters of interest dealt with by their committees, and to ask for any help the Insurance Acts Committee or the central office could give to those committees.

INSURANCE ACTS COMMITTEE.

The six members of the Insurance Acts Committee selected by the conference on June 16th for appointment upon the new standing Insurance Acts Committee of the British Medical Association were at the meeting of that Committee on Saturday, July 24th, unanimously appointed members of the Committee, which is constituted as follows:

Nominated by the Conference.

Dr. T. Ridley-Bailey, Bilston, Staffs (Chairman, Local Medical Committee and member of Insurance Committee of County of Staffordshire).

Mr. H. B. Brackenbury, London (Chairman of Panel Committee and member of Insurance Committee of County of Middlesex).

Dr. T. Campbell, Wigan (Secretary, Local Medical and Panel Committees and member of Insurance Committee of Lancashire).

Dr. J. R. Drever, Glasgow (Secretary, Local Medical and Panel Committees of Glasgow).

Dr. P. V. Fry, Sowerby Bridge (Treasurer and Assistant Secretary, Local Medical and Panel Committees of West Riding of Yorkshire).

Mr. P. Napier Jones, Crowthorne, Berks (Chairman of Local Medical, and member of Panel and Insurance Committees of Berkshire).

Ex officio.

Sir Alex. Ogston, K.C.V.O., M.D., Aberdeen, President of the Association.

Mr. E. B. Turner, London, Chairman of Representative Meetings (member of Advisory Committee and late member of London Insurance Committee).

Dr. J. A. Macdonald, LL.D., Taunton, Chairman of Council, Direct Representative on General Medical Council (member of Advisory Committee and of Local Medical, Panel, and Insurance Committees of County of Somerset).

Dr. Edwin Rayner, Stockport, Treasurer of the Association.

Two Co-opted Non-panel Practitioners.

Dr. T. Jenner Verrall, LL.D., Bath, late Chairman of Representative Meetings, Direct Representative on General Medical Council (member of Advisory Committee and member of Insurance Act Committee since its inception).
Vacancy.

Elected by the Representative Body.

Dr. J. Adams, Glasgow (member of Advisory Committee; member, late Chairman, of Local Medical Committee, and member, Panel Committee of Glasgow).

Dr. J. S. Daring, Lurgan, co. Armagh (member, Advisory Committee).

Elected by the Representative Body.

Dr. John Divine, Hull (Secretary, Local Medical and Panel Committees, and member of Insurance Committee of Kingston-upon-Hull).

Captain A. C. Farquharson, Spennymoor, Durham (member of County of Durham Local Medical and Panel Committees, and member of Durham County Insurance Committee).

Lieutenant E. R. Pothergill, Hove, Sussex (member of Local Medical and Panel and Insurance Committees of Brighton).

Mr. R. Harding, Radnor (Chairman and Secretary of Local Medical and Panel Committees, and Chairman of Insurance Committee of Radnorshire).

Lieutenant J. Hunter, Corstorphine (Secretary, West Lothian Local Medical and Panel Committees).

Dr. I. W. Johnson, Bury (member of Local Medical and Panel Committees of Bury).

Dr. B. A. Richmond, London (Secretary, Local Medical and Panel Committees for County of London, and member of Insurance Committee).

Mr. Harding H. Tomkins, Leyton (Secretary, Local Medical and Panel Committees of County of Essex).

Dr. W. B. Crawford, Cardiff (Secretary, Local Medical and Panel Committees, and member of Insurance Committee of Cardiff).

Nominee of Poor Law Medical Officers Association.

Dr. Major Greenwood, London (member of Local Medical and Panel Committees of London).

Nominee of Society of Medical Officers Association.

Not yet appointed; the late representative (who may probably be reappointed) was Lt.-Colonel Herbert Jones, M.O.H. Herefordshire Combined Districts, member of Advisory Committee and of the Insurance Act Committee since its inception.

Nominee of Registered Medical Women's Associations.

Dr. Olive Claydon (Secretary, Oldham Panel Committee).

LOCAL MEDICAL AND PANEL COMMITTEES.

MIDDLESEX.

PANEL COMMITTEE.

The Middlesex Panel Committee has issued its report for 1914-15. The first Panel Committee for the County of Middlesex came into office in January, 1914, the second in July, 1914. The Committee consists of 39 members—36 elected and 3 co-opted. Up to the present there have been held 12 meetings of the Committee and 30 of Sub-committees.

Method of Election.—The scheme imposing the method of election issued by the Insurance Commissioners was found to be totally unsuited to the conditions of Middlesex. Serious representations were made to the Commissioners, and certain amendments of the scheme have now been adopted by the Committee, which it is hoped may be accepted and found suitable.

Agreement for 1915.—The agreement which practitioners have signed with the Insurance Committee is not yet exactly in the form in which the Panel Committee would wish to have it, but after conferences with the Insurance Committee and the Commissioners certain modifications were secured which seemed to be an improvement on the original provisions, and the Panel Committee therefore feel justified in recommending practitioners to accept it. The Panel Committee, however, made it a condition of this recommendation that rules for the conduct of insured persons should be made by the Insurance Committee in accordance with a form approved by the Panel Committee, and this was accordingly done.

Drug Tariff.—The drug tariff has never been submitted to the Panel Committee in sufficient time to allow of its proper examination. The Committee has protested against this, as it is convinced that the tariff still contains anomalies which it would be advantageous and economical to correct. The Committee has not been able to recommend the adoption of a special pharmacopoeia for the county, but it has now prepared a list of some twenty simple prescriptions of an economical kind.

Treatment of Unallotted Insured Persons.—The insurance practitioners of Middlesex are collectively responsible for giving to all properly authenticated insured persons in the county who have not been allowed to make other arrangements such treatment as they may require. The assignment of the comparatively few cases in which there is some difficulty in obtaining treatment to practitioners by any lay body seemed to the Panel Committee to be an objectionable course, and it has been avoided by the adoption of a scheme made pursuant to Regulation 21 whereby these cases are to be dealt with by the profession themselves acting through a local representative of the Panel Committee in each insurance area. The number of cases

dealt with under this scheme has so far been very few, but it is essential that in any difficulty the provisions of the scheme should be loyally adhered to by every practitioner, as it is by virtue of these arrangements that practitioners are assured of the distribution amongst them of the whole of the available medical benefit funds.

Doctors' Lists.—At one period so great was the confusion with regard to the issue of medical cards whereby practitioners might accept patients, to the correctness of the lists of persons who had been accepted, and to the correspondence of payments made to practitioners with the numbers on their lists, that the Panel Committee sent a very strongly-worded protest to the Insurance Committee. In consequence of this, steps were immediately taken by the latter Committee to remove such of the causes of the muddle as lay within their control, and a clearer understanding was arrived at as to the correction of practitioners' lists and the calculation of the numbers thereon. Though there has been a considerable improvement, the position is still far from satisfactory, and the Panel Committee are at present in communication with the Insurance Committee and the Commissioners with regard to certain irregularities, and are making inquiries in order to discover whether it would be practicable to advise all practitioners in the county to refuse attendance on any insured person who could not produce a medical card or such a form of application for a medical card as would enable the practitioner to signify his intention to accept the patient.

Checking of Prescriptions.—With a view to preventing any undue demands upon the drug fund and thereby securing at least a full payment of the pharmacists' accounts and possibly some surplus for distribution among practitioners, the Panel Committee have entered into an arrangement jointly with the Pharmaceutical Committee and the Insurance Committee for checking all the prescriptions written and reporting as to any that appear extravagant. The Panel Committee has not initiated any investigation, but it has inquired carefully into a number of cases to which the Pharmaceutical Committee has drawn its attention, and in ten of these cases it has felt compelled to advise the Insurance Committee to make some deduction from the amount payable to the practitioner. The Panel Committee has appointed two members of the Medical Service Subcommittee, and has carefully watched the proceedings of that subcommittee. It is glad to report that in no case has any serious complaint against a practitioner been substantiated.

Expenses of Committee.—The expenditure of the Panel Committee is met by a sum authorized by the Commissioners to be deducted from the medical benefit fund, such sum not to exceed one halfpenny per insured person in the area.

COVENTRY.

PANEL COMMITTEE.

THE annual report of the Panel Committee states that there had only been one complaint by the Insurance Committee against a medical practitioner; it related to his refusal to supply charts and reports in tuberculous cases; the Panel Committee replied that the charts and reports should be kept in accordance with the doctor's agreement.

The local pharmacopoeia had been amended and inserted in the drug tariff, 1915. A memorandum issued by the Commissioners in October, 1914, gave the Panel Committee power to specify a certain number (not exceeding ten) of stock mixtures which should be dispensed at half rates. The Panel Committee, however, did not think this reduction in dispensing fee called for, and gave an undertaking to the Pharmaceutical Committee that they would not in future star any stock mixtures to be dispensed at a reduced rate.

An analysis of prescriptions for one quarter of 1914 had shown that the doctors generally were endeavouring to keep within reasonable limits, and the Secretary had interviewed most of those practitioners whose prescriptions cost above the average, and endeavoured to show how their cost could be reduced without loss of efficiency. In future all prescriptions would be analysed by a special prescription clerk in the offices of the Insurance Committee.

With regard to the fees received in connexion with the practices of those doctors who had gone on active service,

it was agreed that two-thirds should be paid to the absentee doctor, and one third to the locum provided the absent practitioner approved.

Arrangements had been made with Insurance and Pharmaceutical Committees that emergency drugs and dressings should now be paid for at a flat rate of 1s. per annum per 100 insured persons.

The Commissioners having dispensed with an election this year owing to the war the personnel of the Committee remains the same.

LIVERPOOL.

PANEL COMMITTEE.

A MEETING of the members elected by the panel practitioners to form the Panel Committee was held at the Medical Institution on July 23rd, when Dr. BAXTER was in the chair.

Co-optation of Members.—The following were co-opted members of the Committee: Mr. F. Charles Larkin, Dr. F. H. Barendt, Dr. T. R. Bradshaw, Dr. T. Clarke, Dr. Richardson, Dr. J. G. Moyles, Mr. G. P. Newbolt.

A meeting of the Committee was held on July 30th, when Mr. LARKIN was requested to act as Chairman of the meeting.

Election of Officers.—The following officers were elected for 1915-16:

Chairman: Mr. F. Charles Larkin.

Vice-Chairman: Dr. J. C. Baxter.

Honorary Treasurer: Dr. Hamilton Shaw.

Honorary Secretary: Dr. W. T. D. Allen.

Auditors: Drs. Barendt and Baxter.

Representatives on Medical Service Subcommittee: Drs. Richardson, Bennett, and Paterson.

Sanatorium Benefit.—A communication was received from the Insurance Committee suggesting a joint conference to consider the question of sanatorium benefit—domiciliary sickness. The Panel Committee decided that before considering the desirability of a joint conference the Honorary Secretary be directed to write to the Administrative Officer inquiring what were the "several grounds" on which the Insurance Committee considered the present arrangements unsatisfactory.

SHROPSHIRE.

PANEL COMMITTEE.

A MEETING of the Shropshire Panel Committee, convened by the clerk to the Salop Insurance Committee, was held at Shrewsbury on July 30th.

Election of Officers.—The following officers were elected:

Chairman: Dr. Exham, Market Drayton.

Vice-Chairman: Dr. Lytle, Shrewsbury.

Secretary: Dr. Cuthbert, Newport.

Special Mileage Fund.—It was decided to adopt the Derbyshire Insurance Committee's scheme, with an addition that 6d. be paid the doctor for every insured person on his list residing a quarter of a mile off a metalled road.

Medical Service in the Munslow Area.—The area being without a medical man, through death, it was decided that the neighbouring practitioners should endeavour to provide an adequate service in the area.

Scrutiny of Prescriptions.—The Committee decided to pay one-third (about £25) of the salary of the official checker of chemists' prescriptions, and for this and other expenses it was decided to raise a voluntary levy of 1d. per insured person on each doctor's list.

CORRESPONDENCE.

THE GOVERNMENT GRANT OF 2s. 6d. PER INSURED PERSON TO PANEL PRACTITIONERS.

DR. E. ROWLAND FOTHERGILL (HOVE) writes: A copy of what a certain periodical has termed "a stirring appeal" has been received during the past few days by every insurance practitioner who happens not to be a member of that trade union organization called "the Panel Medicopolitical Union."

As similar appeals have been issued by that body in the past it would be well to consider this one carefully before adopting the advice given therein, namely, to put one's trust in it and to join forthwith.

This stirring appeal contains two statements in its argument.

1. That the Commission intend at a few weeks' notice to introduce in the regulations what certain members of that union have termed "revolutionary changes."

2. That the 2s. 6d. per head grant is in jeopardy and probably will not be paid for 1916 as the Government is being urged on all sides to effect all possible economy.

The appeal terms the former "a threatened momentous alteration," whilst it considers the latter a "special sacrifice" of panel practitioners. It urges all to join the union at once and by so doing place it in funds to fight the enemy. What are the true facts on these two points?

A. That the Commission notified last March through the British Medical Association that it had "no changes of any kind under consideration for adoption during the currency of the present year." This was published in the *BRITISH MEDICAL JOURNAL* and the *Panel Medico-Political Union* periodical.

B. That on July 14th last Parliament passed the Estimates for Civil Services, 1915-16, which included the 2s. 6d. grant for 1916 (Class VII, pages 12, 16, and 20).

That being so, this stirring appeal for money has been issued either in total ignorance of these two facts, thus marking the Panel Medico-Political Union as an unreliable body, or with the deliberate intention and hope to trade on the probable ignorance of the average panel practitioner.

This circular goes on to state that the Panel Medico-Political Union obtained recently certain delayed payments. Shortly, probably, we shall hear that it has obtained the payment of this 2s. 6d. per head grant.

At this time, when every medical practitioner, even if he can only crawl into a motor or carriage, is trying to repay in part his debt to his country, this appeal for funds for an aggressive campaign is greatly to be deprecated, especially when it is based on fiction. Panel practitioners will do well to consult some reliable and recognized authority for confirmation of "facts" before they part with their hardy earned guineas in response to any "stirring appeals" that may reach them.

Meetings of Branches and Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

SURREY BRANCH.

The annual meeting of the Branch was held at the house of the Association, 429, Strand, on July 1st, when the President, Dr. A. R. WALTERS, was in the chair.

Election of Officers.—Owing to the war the officers were re-elected as follows:

President: Dr. A. R. Walters (Reigate).

Vice-Presidents: Dr. A. M. Mitchell (Guildford), Dr. J. Hewson (Reigate).

Honorary Secretary and Treasurer: Mr. Cecil P. Lankester (Guildford).

Honorary Auditors: Dr. A. M. Mitchell, Dr. F. K. Weaver.

Annual Report and Financial Statement.—The annual report and financial statement for the year were adopted.

Model Rules.—The meeting adopted, with one or two slight modifications, the new model Branch rules issued by the Association as the rules of the Branch, and also the model ethical rules of the Association.

Motor Ambulance for the War.—THE SECRETARY reported that, in response to the appeal, the £300 required for the purchase of a motor ambulance had been subscribed by Surrey doctors, and an ambulance to form one of a convoy organized by Mr. Arthur du Cros, M.P., had been presented to the War Office for service on the Continent.

A list of periodical publications, official reports, and Blue Books in the Library of the British Medical Association available for issue to members on loan has been printed, and copies can be obtained free on application to the Librarian, at the house of the Association, 429, Strand, W.C. The regulations governing the loan of these publications are stated in the introduction to the list. The Library is open for consultation from 10 a.m. till 5 p.m. (on Saturdays till 2 p.m.).

British Medical Association.

FURTHER EXTRAORDINARY GENERAL MEETING.

MEMBERS are hereby informed that as there was not a quorum present at the Further Extraordinary General Meeting of the British Medical Association called for Wednesday, the 11th day of August, 1915, at 2 o'clock in the afternoon, at the registered offices of the Association, 429, Strand, London, W.C., by notice published in the SUPPLEMENTS of 31st July and 7th August, 1915, such meeting stands adjourned to Wednesday, the 18th day of August, 1915, at 2 o'clock in the afternoon, at the registered offices of the Association, in accordance with the provisions contained in the By-laws of the Association.

By order of the Council,
GUY ELLISTON,
Financial Secretary and Business Manager.

Dated this Eleventh day of August, 1915.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: M.P. To the *Zeacoth*, vice Macleod; C. H. Cook to the *Beccor*, for R.N. College, Osborne, vice Jones; J. A. L. Campbell to the *Victory*, for R.N. Division, Crystal Palace, vice Cook; H. L. Georgetown, M.B., to the *Zeacoth*, vice Parish, Staff Surgeon; G. J. Ashdown, M.B., to the *Victory*, additional, for Haslar Hospital, Surgeon; R. F. Quinton to the *Victory*, additional, for Portland Hospital, Temporary Surgeon; G. L. Ranking to the *Victory*, additional, for disposal; J. C. Williams, M.B., to the *Pembroke*, additional, for disposal; J. L. Pringle, M.B., and R. W. Townley, to the *Hindustan*; J. D. Judson, M.B., to the *Pembroke*, for R.N. Barracks; F. U. Mawer to the *Victory*, additional, for Haslar Hospital.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon W. J. Quine, M.B., to the *President*, additional, Surgeon Physicians; J. H. Hughes to the *RAFORD*, to be transferred to the *Rifles*. To be Surgeon Probationers: L. V. Galt, D. J. Morrison.

ARMY MEDICAL SERVICE.

Colonel R. S. F. Henderson, K.H.P., is seconded for service under the Colonial Office.

To be temporary Colonels: Lieutenant-Colonel C. Stonham, C.M.G., F.R.C.S., R.A.M.C.(T.); Lieutenant-Colonel W. Thorburn, M.D., F.R.C.S., R.A.M.C.(T.); Major G. L. Guiland, M.D., R.A.M.C.(T.); Colonel C. S. Ryan, M.B., Australian A.M.C.; temporary Lieutenant-Colonel F. D. Birch, M.B., F.R.C.S., temporary; Major Sir Victor A. H. Horsley, M.D., F.R.C.S., R.A.M.C.

Lieutenant-Colonel R. J. Blackham, C.I.E., from the seconded list, is reappointed.

Temporary honorary Lieutenant-Colonel G. S. Buchanan, M.D., to be temporary Lieutenant-Colonel.

ROYAL ARMY MEDICAL CORPS.

T. P. Legg, M.B., F.R.C.S., to be temporary Lieutenant-Colonel. H. G. Ashwell to be temporary Lieutenant-Colonel whilst employed at the Bechtelme War Hospital.

J. F. W. Silk, M.D., to be temporary Major.

Sir John Collie, M.D., to be temporary honorary Major.

Temporary honorary Lieutenant T. G. Evans, M.D., to be temporary honorary Captain whilst serving with the Welsh Hospital, Netley.

Captain R. J. B. Buchanan is placed temporarily on the half-pay list on account of ill health.

To be temporary Captains: J. C. Woods, M.D., P. H. Gillies, M.B., late Captain 8th (Army)shire Battalion (Territorial), Princess Louise's (Argyll and Sutherland Highlanders), Captain Norval J. Watt, M.B., South African Medical Corps; R. B. Wallace, M.B., R. H. Makgill, M.D., temporary Lieutenant; P. R. Fisherenden, late Surgeon, M.B., temporary Lieutenant A. Matthey, late Captain British Guiana Militia Force.

Temporary Lieutenant G. W. Maw relinquishes his commission. (Substituted for notification published in the *London Gazette* of July 7th.)

Temporary Lieutenant J. L. Ferris, M.B., relinquishes his commission.

To be temporary Lieutenants: L. J. Legris, M.D., D. T. Skeen, M.B., T. C. Ritchie, M.D., J. E. Power, M.B., A. L. Saunders, Lieutenant A. Peden, M.B., R.F.A. (T.F.A.), F. Flower, K. B. Pinson, M.B., E. D. F. Hayes, M.B., G. R. Alley, M.B., F. Greeno, M.D., S. G. Winter, H. Armstrong, J. C. Fisher, M.B., A. D. Hamilton, M.B., F. G. Ralston, M.B., D. Renton, M.B., L. S. Shoo-smith, E. H. Paddison, M.F., R. Dow, M.B., A. G. Cook, M.B., N. Macleod, M.B., J. M. Swanton, G. De F. P'Amico, M.D., D. Reeves, M.D., T. Morgan, M.B., J. R. McVail, M.B., H. P. Hall, M.B., G. Buchanan, M.B., A. F. Studdert, G. R. Plaister, A. R. Young, C. L. Miller, M.B., E. A. Lindsay, A. Z. Phillips, M.D., H. L. H. Green, M.D., A. J. W. Cunningham, W. B. S. McE. B. Purce, M.B., J. Cook, M.B., A. Patrick, M.D., F. B. Martin, M.B., F.R.C.S., R. N. Geach, F.R.C.S., J. Patrick, M.B., D. Glen, M.B., A. Gibson, M.B., F.R.C.S., C. D. Davies, W. Yorke, M.D., C. Spill, M.B., W. G. C. D. P. M. Russell, M.B., M. D. F. McKenna, M.D., H. S. Smith, M.B., E. Fullerton, M.B., P. A. Sullivan, W. P. Jones, C. Russell, M.B., R. Rimmer, M.B., A. C. Major, F. C. H. Figgott, M.D., G. H. Sheehan, M.B., O. P. Cartwright, W. Williams, G. B. Purce, M.B., A. W. Mitchell, J. K. Small, M.B., J. Hegarty, W. Hutcheson, M.D., W. H. N. Bright, M.B., R. W. Statham, A. F. G. Codd, M.B., F.R.C.S., J. C. Watson, M.B., D. A. Birrell, M. D. Cruickshank, M.B., H. E. R. C. Russell, M.B., W. H. McVie, M.B., H. G. Moffat, M.B., A. M. J. Halligan, J. Brown-Sun, M.B., A. H. Craik, M.B., C. S. Miller, M.B., F. C. Tibbs, W. Wigglesworth, D. Wilson, M.D., C. Wace, F.R.C.S., Lieutenant V. F. Stock, M.B., Canadian A.M.C.

To be temporary honorary Lieutenants: Eric A. Soot, J. R. Tibbles, C. S. Doldon, H. J. Bower.
The appointment to a temporary honorary lieutenantcy of Wm. F. Thompson, published in the *London Gazette* of July 21st, is cancelled.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.
1st Wessex Field Ambulance.—E. Holly to be Lieutenant.
1st Western General Hospital.—Major C. Ruddle, M.D., to be temporary Lieutenant-Colonel.
1st South-Western Mounted Brigade Field Ambulance.—Captain R. Waterhouse, M.D., to be temporary Major.
1st Southern General Hospital.—To be Captains whose services will be available on mobilization: Lieutenant E. C. Bradford; B. S. Jones, F.R.C.S.
1st Eastern General Hospital.—Major H. A. Ballance, M.D., F.R.C.S., to be temporary Lieutenant-Colonel.
1st London General Hospital.—Lieutenant A. W. Stott is seconded for duty with a General Hospital overseas; J. D. L. Currie to be Lieutenant.
5th London Sanitary Company.—C. D. Edwards, M.D., to be Lieutenant.
2nd East Anglian Field Ambulance.—To be Lieutenants: J. Anderson, M.B., N. McG. Smith, M.B., W. J. Wilkinson, J. Humphrey, A. D. Reid, M.B. The surname of Lieutenant Arthur Greene, M.D., F.R.C.S., is as now stated, and not as announced in the *London Gazette* of July 20th.
1st West Riding Field Ambulance.—Lieutenant H. W. Shadwell to be Captain.
1st West Lancashire Field Ambulance.—Major W. T. Blackledge, M.B., to be temporary Lieutenant-Colonel.
1st South Midland Mounted Brigade Field Ambulance.—Major T. H. Forrest, M.B., to be Lieutenant-Colonel.
1st Northern General Hospital.—To be Lieutenants: A. J. W. Stephen, M.B., R. A. Hooper, M.B., late Cadet, University Contingent, Senior Division, O.T.C.
3rd Northern General Hospital.—J. S. C. Douglas to be Captain, whose services will be available on mobilization. To be Lieutenants: J. Pearson, M.B., F. Harvey.
1st Northumbrian Field Ambulance.—To be Lieutenants: F. J. B. Reason, M.B., C. G. Strachan, M.B., Cadet A. G. McFarlane, M.B., from Durham University Contingent, Senior Division, O.T.C.

Martin, M.B., Captain S. W. Plummer, M.D. To be Captain: G. Higginson, late Lieutenant, 1st Shropshire and Staffordshire R.G.A. (Vols.).

TERRITORIAL FORCE RESERVE.

ROYAL ARMY MEDICAL CORPS.
Captain A. C. Bird, from Attached to Units other than Medical Units, to be Captain.

Vital Statistics.

VITAL STATISTICS OF LONDON DURING THE SECOND QUARTER OF 1915.

[SPECIALLY REPORTED FOR THE "BRITISH MEDICAL JOURNAL."]
In the accompanying table will be found summarized the vital statistics of the City of London and of the metropolitan boroughs, for the year. The mortality figures in the table relate to the deaths of persons actually belonging to the several boroughs, and are obtained by distributing the deaths of persons in institutions among the several boroughs in which the deceased persons had previously resided. The annual rate of 24.1 per 1,000 of the population; in the corresponding quarters of the three preceding years the rates were 24.7, 25.2, and 25.2 per 1,000 respectively. The lowest birth-rates last quarter were 11.0 in the City of Westminster, 14.0 in Holborn, 17.2 in Hampstead, 18.2 in Kensington, 18.6 in Paddington, and 18.8 in Chelsea and in Stoke Newington; among the highest rates were 28.5 in Southwark, 29.4 in Poplar, 29.7 in Brompton, 30.0 in Stepney, 30.3 in Shoreditch, and 35.0 in Finsbury.

During the quarter the deaths of 17,120 London residents were registered, equal to an annual rate of 15.2 per 1,000; in the corresponding quarters of the three preceding years the rates were 12.4, 13.3, and 13.1 per 1,000 respectively. The death-rates last quarter ranged from 11.0 in Lewisham, 11.7 in Wandsworth, 12.0 in Hampstead, 13.0 in Woolwich, 13.6 in Hackney, and 13.8 in Stoke Newington, to 17.1 in Poplar, 17.4 in Finsbury, in Southwark, and in Greenwich, 19.2 in the City of London, 19.3 in Brompton, and 19.7 in Shoreditch.

The 17,120 deaths from all causes included 24 from enteric fever, 96 from measles, 90 from scarlet fever, 417 from whooping-cough, 136 from diphtheria, and 201 from diarrhoea and enteritis among children under two years of age. Of the 24 deaths from enteric fever, 4 belonged to Hackney, 3 to Camberwell, and 2 each to Paddington and Southwark. Measles was proportionally most fatal in Fulham, Chelsea, Shoreditch, Poplar, Brompton, and Battersea; scarlet fever whooping-cough in Fulham, Islington, Finsbury, Shoreditch, Brompton, Battersea, Deptford and Greenwich; and diphtheria in Highbury, Bethnal Green, and Poplar.

The deaths from phthisis among London residents last quarter numbered 1,597, and were equal to an annual rate of 1.42 per 1,000, against 1.21, 1.27, and 1.28 in the corresponding quarters of the three preceding years. The death-rates from this disease last quarter ranged from 0.72 in Lewisham to 2.79 in Hampstead, 0.95 in Stoke Newington, 1.11 in Fulham, and 1.12 in Wandsworth, to 1.85 in Finsbury, 1.84 in Greenwich, 1.85 in Stepney, 1.92 in Shoreditch, 1.95 in Southwark, and 2.05 in Brompton.

Infant mortality, measured by the proportion of deaths among children under 1 year of age to registered births, was equal to 93 per 1,000 last quarter, against 82, 81, and 79 in the corresponding quarters of the three preceding years. Among the lowest rates recorded last quarter were 38 in the City of London, 54 in Hampstead, 74 in Lambeth, in Lewisham, and in Woolwich, and 79 in Greenwich; the highest rates were 115 in Deptford, 114 in Battersea, 115 in Southwark, and 121 in the City of Westminster, 126 in Brompton, 127 in Shoreditch, and 131 in Kensington.

Analysis of the Vital Statistics of the Metropolitan Boroughs and of the City of London after Distribution of Deaths occurring in Public Institutions during the Second Quarter of 1915.

* No correction is made for births in lying-in institutions; the boroughs principally affected are marked thus (*).

HEALTH OF ENGLISH TOWNS.

In ninety-six of the largest English towns 7,916 births and 3,554 deaths were registered during the week ended Saturday, July 31st. The annual rate of mortality in these towns was 44.1, which compares with 45.6 in the three preceding weeks, was again 11.4 per 1,000 in the week under notice. In London the death-rate was equal to 10.9, while among the ninety-five other large towns it ranged from 3.5 in Wingham, 5.6 in and 6.6 in Edmonton, to 16.6 in Northampton, 16.7 in Warrington, 17.0 in Acton, 17.6 in Aberdare, 17.8 in Gillingham, and 17.9 in Wallasey. Measles caused the greatest number of deaths, 1,714, and 11.4 in Barnley, and 2.6 in Lincoln; and diphtheria of 1.8 in Bourne-mouth. The mortality from the remaining infective diseases was not marked except in any of the large towns, and no fatal case of small-pox was registered. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 2,471, 2,468, and 2,483 at the end of the three preceding weeks, fell to 2,431 on Saturday, July 31st; 294 new cases were admitted during the week, against 322, 290, and 342 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In the sixteen largest Scottish towns, 1,568 births and 622 deaths were registered during the week ending July 31st. The annual rate of mortality in these towns, which had been 15.7, 12.5, and 14.2 in the three preceding weeks, fell to 13.8 per 1,000 in the week under notice, and was 2.4 per 1,000 above the rate in the ninety-six largest English towns. In the several towns the death-rate ranged from 4.9 in Clydebank, 9 in Falkirk, and 11.3 in Motherwell, to 16.9 in Leith, 17.1 in Aberdeen, and 18.0 in Greenock. The mortality from the principal infective diseases averaged 1.9 per 1,000, and was highest in Paisley and Aberdeen. The 288 deaths from all causes in Glasgow included 32 from measles, 7 from infantile diarrhoeal diseases, 5 from scarlet fever, 2 from diphtheria, and 1 from whooping-cough. Five deaths from influenza were recorded in Aberdeen, 3 in Leith, and 2 in Paisley; from scarlet fever 4 in Aberdeen and 2 in Paisley; from diphtheria 3 in Aberdeen; and from infantile diarrhoea 5 in Dundee.

HEALTH OF IRISH TOWNS.

During the week ending Saturday, July 31st, 560 births and 337 deaths were registered in the twenty-seven principal Irish districts of Ireland, as against 550 births and 314 deaths in the preceding period. These deaths represent a mortality of 14.1 per 1,000 of the aggregate population in the districts in question, as against 14.7 per 1,000 in the previous period. The mortality in these Irish areas was therefore 2.7 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate, on the other hand, was equal to 24.1 per 1,000 of population. As for mortality of infantile diarrhoeal diseases, that in the registration area was 13.6 (as against an average of 15.7 for the previous four weeks), in Dublin city 14.0 (as against 16.1), in Belfast 15.0 (as against 12.4), in Cork 9.5 (as against 11.8), in Londonderry 16.5 (as against 21.1), in Limerick 23.0 (as against 21.6), and in Waterford 11.4 (as against 10.9). The zymotic death-rate was 1.3, as against 1.1 in the previous period.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notices) in the present issue of the JOURNAL, regarding the publication of vacancies as to which inquiries should be made before application.

VACANCIES.

BIRMINGHAM AND MIDLAND EYE HOSPITAL.—Junior House-Surgeon. Salary, £100 per annum and 100 guineas Allowance.
BIRMINGHAM EDUCATION COMMITTEE.—Temporary Assistant School Medical Officer. Salary, £500 per annum.
BRISTOL ROYAL INFIRMARY.—Resident Obstetric and Ophthalmic House-Surgeon. Salary, £120 per annum.
BURLEY VICTORIA HOSPITAL.—House-Surgeon. Salary, £175 per annum.
BURY INFIRMARY.—Senior House-Surgeon. Salary, £250 per annum.
BURY ST. EDMUND'S UNION.—Medical Officer for St. James's District. Salary, £100 per annum.
CROYDON UNION.—Assistant Medical Superintendent of Infirmary and Assistant Medical Officer of Union House and Children's Homes. Salary, £225 per annum, rising to £250.
DEVONPORT ROYAL ALBERT HOSPITAL.—House-Surgeon. Salary, £150 per annum; 21s. allowed weekly for working single-handed.
DONCASTER ROYAL INFIRMARY AND DISPENSARY.—Resident House-Surgeon. Salary, £200 per annum.
DORSET COUNTY COUNCIL EDUCATION COMMITTEE.—School Dentist. Salary, £260 per annum.
FOLKSTONE ROYAL VICTORIA HOSPITAL.—House-Surgeon. Salary, £150 per annum.
GUILDFORD ROYAL SURREY COUNTY HOSPITAL.—House-Surgeon. Salary, £150 per annum.
HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST.—Brompton, S.W.—House-Physician. Honorarium, 30 guineas for six months.

LLEDS PUBLIC DISPENSARY.—Lady Resident Medical Officer. Salary, £130 per annum.
LIVERPOOL EYE AND EAR INFIRMARY.—Honorary Anaesthetist.

MANCHESTER COUNTY ASYLUM.—Preswick.—Assistant Medical Officer. Salary, £250 per annum, increasing to £300, and on promotion to £450.
MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN.—House-Surgeon. Salary, £120 per annum.
NORTHAMPTON COUNTY BOROUGH.—Clinical Tuberculosis Officer. Salary, £400 per annum.
OXFORD EYE HOSPITAL.—House-Surgeon. Salary, £100 per annum.
RHONDDA URBAN DISTRICT COUNCIL.—Temporary Assistant Medical Officer of Health and School Medical Officer. Salary, £350 per annum.
ST. MARK'S HOSPITAL FOR CANCER, FISTULA, Etc.—City Road, E.C.4.—House-Surgeon. Salary, £250 per annum.
ST. PETER'S HOSPITAL FOR STONE.—Henrietta Street, W.C.—Junior House-Surgeon. Salary, £75 per annum.
SALISBURY GENERAL INFIRMARY.—Assistant House-Surgeon. Salary, £100 per annum.
SHEFFIELD ROYAL INFIRMARY.—(1) House-Surgeon; (2) Assistant House-Physician. Salary, £100 per annum.
SHEFFIELD UNIVERSITY.—(1) Demonstrator of Pathology and Bacteriology; (2) Demonstrator of Anatomy.
SOUTHAMPTON ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL.—Junior House-Surgeon. Salary, £120 per annum.
SUNDERLAND ROYAL INFIRMARY.—Junior House-Surgeon (male). Salary, £150 per annum.
SURREY EDUCATION COMMITTEE.—Female Assistant School Medical Officer.
SWANSEA EDUCATION COMMITTEE.—(1) Lady Assistant School Medical Officer; (2) Temporary Assistant School Medical Officer. Salary, £300 per annum each.
WALSAL AND DISTRICT HOSPITAL.—Assistant House-Surgeon and Anaesthetist. Salary, £120 per annum.
WEST HAM AND EASTERN GENERAL HOSPITAL.—Stratford.—(1) Resident Medical Officer; (2) House-Physicians and House-Surgeons. Salary for (1) £160 per annum, and for (2) £120 and £100 per annum respectively.
WEST HAM UNION.—At the Infirmary: (Third Assistant Medical Officer (male); Fourth Assistant (Resident Lady) Medical Officer. Salary, £200 and £180 per annum, rising to £220 and £200 respectively. At the Workhouse: Resident (Lady) Assistant Medical Officer. Salary, £180 per annum.
WEST RIDING COUNTY COUNCIL.—Resident Medical Superintendent at the Middleton-in-Wharfedale Sanatorium. Salary, £400 per annum.
WESTMINSTER GENERAL DISPENSARY.—Gerrard Street, Solo, W.—Resident Medical Officer. Salary, £220 per annum.
WIGAN ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Junior House-Surgeon. Salary, £150 per annum.
CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories and Workshops, in consequence of appointments: Ashton-under-Lyne (Lancashire), Salts (Cornwall).
To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

BIRTHS, MARRIAGES, AND DEATHS.

The charges for inserting announcements of Births, Marriages, and Deaths is 5s., which sum should be forwarded in Post Office Order or Stamps with the notice not later than the first post Wednesday morning in order to ensure insertion in the current issue.

BIRTHS.

BOND.—On the 3rd August, at Warrington Lodge (nursing house), Warrington Crescent, W., the wife of C. Hubert Bond, D.Sc., M.D., Commissioner of the Board of Control—a daughter.
CRICHTON-MILLER.—At Bowden House, Harrow, on 6th inst., the wife of H. Crichton-Miller, M.D., 124A, Harley Street, W., of a son.

MARRIAGE.

GROGONO—STEELE.—On July 29th, at St. Paul's Church, Hammer-smith, Dr. Jonathan Grogono, third son of late Dr. Grogono, of Weymouth, Dorset, and Mrs. Grogono, Herne Bay, to Florence Muriel (Sissie), elder daughter of late Dr. Russell Steele, of Henstead House, Hemel Hempstead, and Mrs. Steele, 32, Arnhem Road, West Kensington.

DIARY OF THE ASSOCIATION.

Date.	Meetings to be Held.

HIGHLANDS AND ISLANDS MEDICAL BOARD.

SCHEMES FOR GRANTS.

SCHEMES framed by the Highlands and Islands (Medical Service) Board providing for (A) grants to medical practitioners, (B) grants to district nursing associations, (C) grants to hospitals and for ambulance services, (D) grants towards the provision or improvement of houses for doctors and nurses, (E) grants towards specialized services, (F) grants towards telegraph and telephone facilities, have been approved by the Secretary for Scotland with the consent of the Treasury, and issued on August 16th.*

A.—GRANTS TO MEDICAL PRACTITIONERS.

General Conditions under which Medical Practitioners will be eligible to participate in Grants from the Highlands and Islands (Medical Service) Fund.

1. The purpose for which the Fund has been created is, as defined in Section 1 (2) of the Highlands and Islands (Medical Service) Grant Act of 1913, for "improving medical service, including nursing, in the Highlands and Islands of Scotland, and otherwise providing and improving means for the prevention, treatment, and alleviation of illness and suffering therein."

2. While the Board have in contemplation various schemes for the prevention, treatment, and alleviation of illness and suffering within their area, the first and most pressing need is, in their opinion, for the adoption of means whereby an efficient medical service can be brought within the reach of persons of the crofter and cottar classes and their families, and others in like circumstances, at fees which they can reasonably be expected to pay, it being understood that the cost of such medical attendance shall not be increased by reason of their distance from the residence of a medical practitioner.

3. The first step, therefore, which the Board propose to take is to endeavour to adjust with the various practitioners the subsidy that may be payable to them in order that they may be in a position to offer an adequate medical service at fixed and reasonable charges to persons of limited means, irrespective of their distance from the doctor. The introduction of low uniform fees, or a system of annual payments within the means of such persons, for medical attention will no doubt result in more work for the doctor, and, in many cases, a considerable addition to his travelling expenses, but it is precisely to meet this that

the Board believe that a considerable part of the funds at their disposal should be applied.

4. It is important that it should be made quite clear at the outset what the funds at the disposal of the Board amount to. The annual grant-in-aid voted by Parliament is £42,000. The grant of £10,000 previously voted in aid of mileage and other special charges connected with attendance on insured persons in the Highlands and Islands is, however, included in the annual grant-in-aid, and the additional grant provided for by the Act of 1913 is therefore £32,000. For the current year no payments will be made by the Insurance Committees in respect of mileage for attendance on insured persons, but the subsidy payable to the doctor will be arranged on a footing that will cover the travelling expenses involved in attendance on insured persons as well as on all others entitled to receive medical attention under any arrangement between the doctor and the Board.

5. With a view to the provision of a more effective general medical service the Board also propose, according to circumstances, to attach certain general conditions to the payment of grants to medical practitioners. Amongst these the following may be enumerated:

(a) That within the area of his ordinary practice the doctor shall visit systematically and when asked to do so all persons in need of medical attention.

(b) That, in single-practice areas, he shall continue to give attendance to Poor Law and insured patients in accordance with his agreements with the parish council and Insurance Committee respectively; and that he shall, when required by the Board, undertake, on terms and conditions to be approved by the Board, such duties as the public health authorities of the district may desire him to perform.

(c) That wherever practicable he shall give, when required, personal attendance in midwifery cases.

(d) That he shall arrange for regular and systematic visits to certain localities on fixed days.

(e) That, in suitable cases, and according to circumstances, he shall provide himself with a motor-car, motorcycle, motor-boats, or other means of conveyance, and use it, so far as practicable, in his practice.

(f) That he shall give such regular attendance at schools, or elsewhere, on such terms as may be agreed upon with the School Board or the Secondary Education Committee, with the approval of the Board, for the treatment of diseases and defects disclosed by the medical inspection of school children.

(g) That he shall keep a classified register, to be supplied by the Board, and to be open to inspection by a duly accredited representative of the Board, of cases attended under arrangements with the Board, showing in each case the number of visits paid, the distance of the patient from his house, and the fees collected.

6. The claims of individual practitioners fall into two main categories. First, there is the case of single-practice areas in insular districts, or in wide and sparsely-populated districts on the mainland, where the service of separate doctors cannot be dispensed with, but where the total professional income is entirely inadequate either as a

* The memorandums can be purchased, 6d. each, either directly or through any bookseller, from H.M. Stationery Office, Scottish Branch, 23, North Street, Edinburgh.

fair recompense for the work involved, or as an inducement to a suitable medical man to settle in the locality. Second, there is the case of multiple-practice areas or districts where there are several doctors whose practices overlap to some extent and who, in most cases, have patients of very limited means or insured persons living at a considerable distance.

In the first case it may be necessary to guarantee such a supplement to the income of the doctor as will bring his total emoluments up to a fixed sum after he has paid all rates and taxes (other than Income Tax) and such approved charges under the heads of travelling expenses and house rent as, in the circumstances, may appear to the Board to be appropriate.

In the second case referred to above, the arrangement with the doctor will take the form of a payment in respect of additional work and any increase in travelling expenses involved in giving medical attention at modified fees to patients living at a distance.

7. While the salaries paid to medical practitioners by parish councils for attendance on the registered poor and on other persons entitled to medical relief might be held to cover the cost of locomotion so far as attendance on such persons is concerned, it would be extremely difficult in practice to apportion the doctor's travelling expenses as between persons entitled to free medical attendance and persons entitled to attendance under arrangements made with the Board. But where the provision of travelling facilities under any public service enables the doctor to overtake these public duties more expeditiously there is obviously a saving of time, which can, to some extent at least, be set against the extra work that may be involved in the fuller medical service which will be available for the community as a whole.

The provision of a reasonably full service of well qualified nurses, and the possibility of it being made a requirement that special calls for the doctor's services from remote localities should be made through the nurse, should help to save the doctor's time and to keep down his travelling expenses.

It is the intention of the Board to assist, where necessary and as far as may be practicable, in the provision and improvement of houses for doctors throughout their area.

From what has already been said, it is clear that the allowances payable to doctors will, in every case, fall to be reconsidered from year to year in the light of the experience of the previous year's working of the scheme, and also in the light of any new factors affecting the medical service in the district, that may arise from time to time.

8. Always provided that the fees to be charged to persons receiving medical attention under arrangements made with the Board are strictly reasonable, and such as, in all the circumstances, the Board can approve, they desire to interfere as little as possible between the doctor and his patient in the matter of payment for services rendered. The question of securing the maximum local contribution to the medical service, in the shape of fees, depends to some extent on the system of payments that has been in use in the district. All medical practitioners making a claim on the Fund will be invited by the Board to frame a tariff of fees suited to local circumstances, whereby persons of limited means may be assured of medical attendance at a low uniform fee per visit, or by a system of annual payments per individual or per family. In other than single-practice areas the Board will endeavour to allow a free choice of doctor to persons coming under any scheme of medical attendance arranged by them so far as this may be found to be practicable, and so long as it does not materially add to the cost of the scheme.

A separate charge should, as a rule, be made for medicines supplied by the doctor to persons receiving medical attention under arrangements with the Board, the cost to the patient being kept as low as possible. But if, in any district, or for any particular class of patients, it has been customary for the doctor to make an inclusive charge for advice and medicines the Board may, if they are satisfied that the charge is reasonable, agree to a continuance of the custom. Arrangements for the supply of expensive drugs or appliances at anything less than cost price may be made only with the special approval of the Board, if any such arrangement would involve a charge on the funds at the disposal of the Board.

Medicines for insured persons will be provided in

accordance with the arrangements made on their behalf by Insurance Committees.

9. From the suggestions which have reached the Board from various local bodies, and persons interested in medical services in the Highlands and Islands, it would appear that, except in a few localities, there is no pressing need for additional medical practitioners, if adequate travelling facilities are provided to enable doctors to overtake their work. The Board recognize, however, that this view may be modified when all that is involved in a full and efficient medical service comes to be realized. In the districts where additional medical assistance is required the Board will endeavour to arrange with the existing practitioners for a fair division of the work as between them and any new medical man who may be appointed. In some cases the difficulty may be met by the appointment of an assistant to the doctor already in practice in the district. But, in view of the present scarcity of doctors,^{*} the Board can hope to overtake this part of their work only by degrees.

10. The Board hope to give assistance towards the provision of certain specialized services such as the examination and treatment of eyes, ears, and teeth, medical consultations, assistance at operations, and other approved forms of special medical service. Arrangements for this branch of the Board's work will be made after consultation with county and district medical officers of health, school medical officers, Secondary Education Committees, Insurance Committees, and representatives of the medical profession in the various districts. In considering the question of assistance towards provision, by school clinics or otherwise, for the medical treatment of school children, the Board will have regard to the imperial funds available to school boards and Secondary Education Committees for this purpose.

11. So far as practicable, arrangements will be made to enable medical practitioners subsidized by the Board to be absent for a fixed period for the purposes of a holiday, or post-graduate study, or during illness, or for other approved reasons. Such assistance will usually take the form of a grant towards the cost of employing a deputy if the services of a doctor in the direct employment of the Board are not available.

12. As a condition of grants to any practitioner the Board must be satisfied as to the efficiency of the service both as regards his fitness for the work he is called upon to do for the Board, and as regards the manner in which he discharges his duties. Where the Board are satisfied that any medical practitioner employed or subsidized by them is not giving efficient service in terms of any scheme under the Highlands and Islands (Medical Service) Grant Act, 1913, no part of the funds at the disposal of the Board shall, after reasonable notice, be applied towards the remuneration of such practitioner.

13. Generally, the Board propose to take all necessary steps to satisfy themselves that the whole local income available for medical services in the various districts in their area is being maintained, and that the general principle which the Lords Commissioners of His Majesty's Treasury have taken occasion to lay down is being observed—namely, "That the grant should be devoted wholly to increasing and improving the medical and kindred services in the Highlands and Islands, and in no degree to relieving those who at present bear the cost of these services, or any part of that cost." Accordingly, the Board propose to make it a condition of grant to, or in respect of, any medical practitioner employed or subsidized by them who may, at the same time, be employed by a parish council in terms of the Poor Law Acts that, except with the special sanction of the Board, a salary calculated on the average salary of the three years ended May 15th, 1914, shall continue to be paid by the parish council to such practitioner in respect of attendance on the registered poor and other persons entitled to medical relief, and that any fees or other remuneration that have hitherto been paid, or that may in future be payable, for certification and visitation of lunatics and defectives and for vaccination, shall be duly paid to the practitioner.

* In the exceptional circumstances of the present time, and so long as the services of suitable doctors are not available, certain districts that may reasonably hope to see a separate doctor established in their midst must, in the meantime, be content with the help that the Board can give in the shape of additional travelling facilities to the existing practitioners.

B.—GRANTS TO DISTRICT NURSING ASSOCIATIONS.

The Memorandum in regard to district nursing associations and as to the general conditions under which such associations will be eligible to participate in grants from the Highlands and Islands (Medical Service) Fund is as follows:

The Board desire to call the attention of district nursing associations, county councils, public health authorities, parish councils, Secondary Education Committees, school boards, and other bodies and persons interested in nursing in the Highlands and Islands to the annexed statement of general conditions under which district nursing associations will be eligible to participate in grants from the Highlands and Islands (Medical Service) Fund.

The Board are of opinion that a well-organized nursing service is the natural corollary of any efficient medical service. They are, accordingly, prepared to treat in a liberal spirit all reasonable proposals for the maintenance or extension of the nursing service wherever anything like adequate local support is forthcoming. But they would view with concern any indication that the local efforts, on which this branch of the service has hitherto had to depend for its existence, were likely to be relaxed in anticipation of grants from the Board. The qualifications of nurses will always require careful scrutiny, having regard to the work which they will be called upon to perform. In most cases, the nurse should have had a training in midwifery sufficient to enable her to act in cases where the services of a doctor may not be available. In addition, an adequate general medical and surgical training will be necessary wherever the nurse is required to assist, in the domiciliary treatment of tuberculosis, in the treatment of diseases and defects of infants and school children, or in promoting among the people a knowledge of personal and household hygiene. The claims of island communities for the services of well-qualified nurses, where the population is not sufficiently large to warrant the appointment of resident medical practitioners, will receive sympathetic consideration. Nurses have already been sent with the help of the Board, and on a temporary footing, to some of the more remote islands, and these provisional arrangements will now fall to be incorporated on a more permanent basis in the general nursing schemes of the Board. The Board will endeavour to utilize to the full the existing nursing organizations, and the services of nurses in the employment of such organizations. There should be in every parish, or group of parishes, a nursing association to act as the managers of the local nursing scheme, to keep alive local interest, and, generally, to see that the nurse duly performs her duties under the direction of the medical practitioner. Larger nursing associations on a county or other basis would serve a most useful purpose in the matter of organization. By helping to form new nursing areas, or to rearrange existing ones where necessary, and by maintaining a sufficient number of relief nurses, or nurses specially qualified for emergency work, such associations would materially assist the Board in the development of an efficient nursing system throughout their area.

With a view to providing for a more effective general nursing service the Board will endeavour to arrange that the services of nurses employed or subsidized by them, whether directly or through nursing associations, or otherwise, shall be made available to county councils, public health authorities, Secondary Education Committees, school boards, and parish councils in respect of cases for which these bodies may desire the services of a nurse or for whose nursing they may be responsible.

Proper housing accommodation for nurses is a matter to which the Board attach much importance, and they will be prepared to consider the question of providing or of giving assistance towards providing houses for nurses in suitable cases. But, in view of the fact that the number of nurses employed in the Highlands and Islands will be considerably increased as the result of the Board's grants, they think that wherever fairly convenient houses can be rented, or suitable lodgings can be procured, the question of the erection of houses should be deferred till any necessary readjustment of districts has been effected, and until experience has shown where the nurse should be stationed for her own convenience and for the convenience of those to whom she will give attendance.

General Conditions under which District Nursing Associations will be Eligible to Participate in Grants from the Highlands and Islands (Medical Service) Fund.

1. The Highlands and Islands Medical Service Board must be satisfied as to:

(a) The constitution, organization, and management of the Association.

(b) The need for assistance from the Fund, regard being had to the circumstances of the district.

(c) The maintenance of a reasonable local contribution towards the expenditure.

(d) The accounts of the Association.

(e) The efficiency of the nursing service, including arrangements for the supervision of the nurse's work by a duly qualified medical practitioner.

(f) The terms on which nurses are made available for nursing services to the various classes of the community.

2. The Association must, within its present area or such other area as may be arranged, undertake responsibility for the employment, housing, payment of salaries and travelling and other expenses of the nurses, and for the provision of substitutes for them during their absence on holiday or on account of illness.

3. The Association must submit for the approval of the Board a statement of the qualifications of all nurses before their appointment, and a copy of the rules under which they work.

4. The nurses must reside at the centres deemed to be most suitable for the work of their respective districts.

5. The Association must arrange that its nurses shall be prepared to act under the direction of the local medical practitioner, and, in so far as they are qualified and if required by the Board to do so, in the treatment of diseases and defects in school children as disclosed by the system of school medical inspection, in the domiciliary treatment of tuberculosis, the domiciliary nursing of infectious diseases, in maternity and general medical and surgical nursing, and in the nursing of the registered sick poor and old age pensioners:

Provided that where a district nurse is employed in nursing a case of infectious disease treated at home, arrangements shall be made for relieving her of her ordinary duties while she is so engaged if, in the opinion of the doctor in attendance, such an arrangement is necessary in the interests of the community.

6. The Association must keep accounts showing particulars of income from all sources and of expenditure, and, at the beginning of each year or on such date as may be arranged, it must submit to the Board a statement of its accounts for the past year and an estimate, on a form to be supplied by the Board, of its income from all sources and of its proposed expenditure, including any necessary expenses of management.

N.B.—The foregoing regulations are intended to apply mainly to existing nursing associations organized on the basis of a parish or group of parishes and employing, as a rule, one or two nurses, and to new associations formed on a similar basis. Schemes proposed by nursing associations on a larger basis, such as that of a county or district of a county, will be considered individually by the Board.

C.—GRANTS TO HOSPITALS AND FOR AMBULANCE SERVICES.

General Conditions under which Grants will be made from the Highlands and Islands (Medical Service) Fund towards Capital Expenditure and Maintenance of Hospitals, and for the Provision of Ambulance Services in Connection therewith.

I. HOSPITALS.

1. In considering applications for grants, the Highlands and Islands Medical Service Board must be satisfied as to—

(a) The constitution, organization, and management of the hospital.

(b) The need for assistance from the Fund, regard being had to the circumstances of the district.

(c) The maintenance of a reasonable local contribution towards the expenditure.

(d) The accounts of the hospital.

(e) The sufficiency of the medical and nursing staff and as to their qualifications.

(f) The terms and conditions on which patients, treated under arrangements with the Board, may be admitted to the hospital.

2. The Board may make it a condition of grant that a representative of the Board is associated with the board of management or trustees.

3. The Board may require, as a condition of the payment of grants to a hospital, that it shall be open for the reception and treatment of patients from such districts as the Board may determine, and the districts from which patients will be received, under arrangements with the Board, must be specified.

4. Where under a Trust Deed or other instrument a hospital is reserved to a particular class of patients or to patients from a specified area, steps must be taken by the trustees or managers to ascertain how far the constitution can be modified so as to permit of the admission of other patients if it is desired to increase the usefulness of the hospital with the help of grants from the Board.

5. No grant will be made towards capital expenditure or maintenance of hospitals or institutions established under the Poor Law Acts or Public Health Acts for the treatment of the registered sick poor or for the treatment of infectious diseases.

II. AMBULANCE.

1. In considering applications for grants from the Fund for the provision of an ambulance service or for assistance towards such provision, and the upkeep thereof, the Board must be satisfied as to—

(a) The need for the provision or improvement of an ambulance service, regard being had to the circumstances of the district.

(b) The area for which such a service will be available.

(c) The conditions under which the service will be at the disposal of the persons for whom it may be needed.

(d) The provision for the proper housing, care, and custody of the ambulance.

2. No grant will be payable to any public health authority in respect of the provision or maintenance of an ambulance used exclusively for infectious diseases. But if in any district separate services for infectious and for general medical and surgical cases are not required, the Board would be prepared to consider any scheme whereby a single service might be available for all cases, provided the construction of the ambulance is such as to lend itself readily to the process of disinfection, and provided due precautions are taken by the public health authorities for its disinfection after its use for infectious cases. As a rule, the scheme for an ambulance service should be arranged by the public health authority, with the approval of the authorities of the general hospital of the district, and must provide for the requirements set forth in Section 1 above.

3. The Board may require, as a condition of the payment of any grant towards the provision of the ambulance, or the upkeep thereof, that it shall be available for use in such districts as the Board may determine, and the districts served by the ambulance must in all cases be specified.

D.—GRANTS TOWARDS THE PROVISION OR IMPROVEMENT OF HOUSES FOR DOCTORS AND NURSES.

Scheme providing for the General Conditions under which Grants will be payable from the Highlands and Islands (Medical Service) Fund towards the Provision or Improvement of Houses for Doctors and Nurses.

1. The Board regard the provision and improvement of houses for doctors and nurses as a matter of much importance, and they are prepared to consider applications for grants from the Fund so far as practicable for this purpose.

2. In Section 3 (3) of the Highlands and Islands (Medical Service) Grant Act, 1913, it is provided that—

Where under any such scheme any money is to be applied by a local authority for any purpose, that authority shall have all such powers for the purpose as the scheme may provide, and, if the scheme so provides, any powers vested in a local authority of acquiring land, or erecting buildings, or borrowing on the security of any rate for any purpose, shall be extended so as to include the purposes of the scheme, and any Act conferring any such power shall be construed accordingly.

3. The Board will, as a rule, proceed in this matter through the agency of the parish council, and where a suitable scheme can be arranged they will be prepared to submit for the approval of the Secretary for Scotland and

the Treasury a special scheme extending the powers of the parish council under Section 3 (3) of the Act.

4. On any application for a grant, the Board must be satisfied that the provision or improvement of a house for a doctor is a necessary part of a scheme for the improvement of the medical service of the district, and that a suitable house in a convenient situation is not available.

5. Before agreeing to a grant towards the purchase of a house the Board will require to be satisfied as to the present value of the property and state of repair, and as to the title and the terms of the conveyance.

6. Where a new house is to be erected with the help of a grant from the Fund the Board must be satisfied as to the site and the title thereto, and as to the plans.* Specifications and estimates must be submitted to and approved by the Board before the work is begun or contracts are made.

7. The title to any property acquired or provided with the Board's assistance will usually be vested in the parish council, but in all cases where a grant is made from the Fund for this purpose provision must be made, to the satisfaction of the Board, for the repayment to the Board of the grant given from the fund in the event of the house being sold or used for any other purpose than as a house for a doctor, unless at any time the Board shall resolve, with the consent of the Treasury, that such repayment or any part thereof shall not be insisted upon.

8. The proportions in which the Board and the parish council may respectively contribute to the initial expenditure and to the upkeep and annual burdens affecting the property shall be matter for arrangement between the Board and the parish council in each individual case, after consultation between the board and the Local Government Board for Scotland.

9. The Board will be ready to deal in like manner with applications from parish councils or other local bodies or persons for assistance towards the provision or improvement of houses for nurses at suitable centres, and, so far as the funds at their disposal will permit, they are prepared to contribute towards suitable proposals. In this connexion reference should be made to the scheme providing for the general conditions under which district nursing associations will be eligible to participate in grants from the Fund.

10. The Board will not be in a position to consider the question of a grant towards improvements in houses for either doctors or nurses which are private property unless suitable conditions as to lease and subsequent upkeep can be arranged.

11. The conditions under which a medical practitioner or nurse is allowed to occupy a house provided or improved with the assistance of grants from the Fund shall be subject to the approval of the Board.

E.—GRANTS TOWARDS SPECIALIZED SERVICES.

The preliminary scheme indicating the general conditions under which grants will be made from the Highlands and Islands (Medical Service) Fund towards specialized services, including medical consultations, assistance at operations, and the provision of surgical appliances, dentistry, school clinics, and other approved forms of special medical service is as follows:

1. The Board recognize that the inadequacy of the medical service in the Highlands and Islands cannot be entirely removed merely by bringing ordinary medical attention within the reach of the various classes of the community at fees which they can reasonably be expected to pay.

2. The Highlands and Islands (Medical Service) Committee has placed it on record "that apart from specialisms like dentistry, or ophthalmology, or pathological bacteriology, there ought to be much more provision for medical and surgical consultations between local doctors." The Committee add that "there should be provision for assistance at operations, or in difficult confinements, or in the administration of anaesthetics, or in the many classes of unforeseen emergency, where professional discussion and assistance are desirable."

* Model plans, approved by the Board, will be available for the guidance of parish councils and other local authorities.

3. It is clear that the organization of assistance of the kind contemplated by the Committee must depend largely on the existing facilities in the various districts of the Highlands and Islands, on the proximity or availability of well-equipped general hospitals, and on various local considerations in regard to which the Board have not at present sufficiently detailed information.

4. In order that a beginning may be made with this important branch of their work the Board propose to ask the county and district medical officers of health, the school medical officers, one or two representatives of the Local Medical Committees or Panel Committees under the National Insurance Act, the principal medical officer and one other representative of each of the various general hospitals, the chairman or some other member of the Insurance Committee and of the Secondary Education Committee and one or more persons nominated by the Board, to meet at an early date, under the chairmanship of the conveners or vice conveners of the various counties, for the purpose of discussing the whole matter and framing suggestions for the guidance of the Board.

5. The Board feel that recommendations framed by persons so intimately acquainted with the difficulties of medical service in its broader aspects as those referred to in the preceding paragraph would carry great weight, and they will be ready to give the most careful consideration to any proposals that may be put forward.

6. The Board do not desire to anticipate any recommendations that may be made to them, but they feel that there are some general considerations affecting specialized services to which reference might suitably be made, and it might be convenient to refer to them under the following main heads:

- (a) Medical consultations, assistance at operations, and the supply of surgical appliances.
- (b) Dentistry, medical treatment of school children, and school clinics.
- (c) Laboratory facilities.

(a) *Medical Consultations, Assistance at Operations, and the Supply of Surgical Appliances.*

7. The Board believe that the provision of an efficient ambulance service and arrangements with central hospitals, to which reference is made in a separate memorandum, should greatly reduce the number of serious cases treated at home. From all points of view it is obviously the best arrangement that patients in need of specially skilled treatment should be removed at the earliest possible moment to some central hospital or institution where such treatment can be obtained. Generally, the Board feel that, wherever practicable, the patient should be brought to the specialist rather than that the specialist should be sent to the patient.

For purely local consultations—that is, consultations between neighbouring practitioners and for assistance at operations such as a general practitioner usually undertakes—no special provision would seem to be required. Medical men have been accustomed to meet each other in this way in the past, and, in view of the grants to be made to them from the Fund, it is expected that they will be better able to do so in future at fees within the reach of the patient.

8. The remuneration of a specialist for services rendered is a matter that will call for very careful consideration. It may be found to be desirable to make arrangements with specialists whereby, in return for a retaining fee from the Board and modified fees from patients who are unable to pay the usual charges, they shall undertake to visit, as required, a certain area and to treat at a convenient centre patients sent to them for the purpose. In the case of patients of very limited means no additional charge should be made in respect of a consultation or operation, it being understood that the fee payable by them for ordinary medical attendance is all that they can reasonably be expected to meet.

It may further be found to be desirable to make arrangements with physicians or surgeons in various centres whereby, in return for a fee from the Board and modified fees from patients, they shall be prepared to place their advice and assistance at the disposal of local practitioners.

9. The provision of assistance towards obtaining surgical appliances for persons who are not in a position to provide themselves with what is required to make the treatment effective, and who are unable to obtain the same from any

other source, would, the Board think be a legitimate charge on their funds. All such cases would, however, need very careful consideration and, as indicated in the scheme in regard to grants to medical practitioners, would require to be specially reported to the Board.

(b) *Dentistry, Medical Treatment of School Children, and School Clinics.*

10. Where under any scheme of medical treatment school boards or Secondary Education Committees propose to employ doctors or dentists for the treatment of diseases of eyes, ears, and teeth of school children, the Board would be prepared to co-operate with the school boards or Secondary Education Committees in obtaining the services of doctors or dentists—either whole-time or part-time—provided it could be arranged that their services would be available, on terms and conditions to be agreed upon, for the pupils who have left school and for the adult population in need of such treatment.

11. School boards are empowered to provide medical (including surgical and dental) treatment for school children either independently or in combination with one or more other school boards or with the Secondary Education Committee for the district. Where such provision is made to the satisfaction of the Scottish Education Department the school boards are entitled to receive a grant-in-aid from public funds not exceeding one-half of the net expenditure, and in these circumstances the Board do not contemplate that, as a rule, any assistance from the Fund will be required by individual school boards. Where, however, it is proposed to provide special central premises for the purpose of medical treatment of school children the Board would be prepared to consider the question of giving assistance, so far as the funds at their disposal will permit, if it can be shown that, in the special circumstances of the district, the grants from other sources are inadequate for this purpose, and that no other premises are available, and provided that any such special premises will be available, as may be arranged for the purpose of any general scheme of the Board.

12. Where treatment is carried out by the local doctors the Board propose to make it a condition of grants to medical practitioners that they shall give such regular attendance at schools or elsewhere on such terms as may be agreed upon with the school board or Secondary Education Committee, with the approval of the Board, for the treatment of diseases and defects disclosed by the medical inspection of school children. Similarly, as a condition of grant, district nursing associations must be prepared to arrange that their nurses shall act under the direction of the local medical practitioner, in so far as they are qualified, and if required by the Board, to do so, in the treatment of school children upon terms and conditions to be agreed upon between the school board and the association with the approval of the Board.

(c) *Laboratory Facilities.*

13. Individual doctors in certain districts maintain small pathological laboratories and provide vaccines of various kinds. But, while independent work of this kind might suitably be encouraged, the pathological service should not be left to the accident of locality or to the intellectual interests of individuals. It will be the endeavour of the Board to place this branch of medical service on an organized footing, and to bring medical men in the Highlands and Islands into closer touch with the laboratories at the great medical schools. Whether this can best be done through the agency of the public health authorities, or directly by the Board, or otherwise, has yet to be determined, but the matter is one which will be specially considered in connexion with the questions already referred to.

F.—GRANTS TOWARDS EXTENSION OF TELEGRAPH AND TELEPHONE FACILITIES.

The general conditions under which grants will be made from the Highlands and Islands (Medical Service) Fund towards the extension of telegraph and telephone services in connexion with the improvement of the medical and nursing service in the Highlands and Islands, are set out as follows:

1. The part of the Fund which can be utilized for the purpose of such extensions is strictly limited, and the Board could

undertake to share only to a very limited extent and in suitable circumstances in any guarantee required by the Post Office in connexion with extensions which are required for general business purposes or for the convenience of the general public, and only in so far as such extensions would serve a distinct purpose for the improvement of the existing medical and kindred services.

2. The main purpose for which payments from the Fund will be made will be the connecting up of doctors' and nurses' houses and hospitals with central call offices or Post Offices where suitable arrangements can be made.

3. Where the telephone is already used at any telegraph office in a country district the Board would be prepared to consider the question of the payment of the rent or a contribution towards the cost of a circuit to the local doctor's or nurse's house on a representation from the parish council or other local body that such an extension would be advantageous to the public from the point of view of the medical and nursing services of the locality. But no representation could be considered unless exact information were placed before the Board as to—

(a) The cost involved.

(b) To what extent the proposed facilities would improve the medical or nursing services, that is, to what extent the public would be placed in closer touch with the doctor or nurse.

4. It is obvious that the question of telegraph and telephone extension could be considered from the point of view of a single parish only in such local extensions as those referred to in the preceding paragraph. Larger schemes would, as a rule, affect several parishes, and must in all cases be considered in connexion with the existing facilities. Where such is the case, the Board would be ready to consider any representation prepared by the district committee or the county council giving the information indicated in the previous paragraph.

Appended to this scheme is a copy of a memorandum supplied to the Board by the Postmaster-General, showing the lines upon which he is in a position to arrange for the extension of telegraph and telephone facilities. As suggested in that memorandum, the local bodies should in the first place communicate with the Secretary, General Post Office, Edinburgh, in regard to any scheme that they think to be necessary in order that inquiry may be made and terms quoted.

WAR EMERGENCY COMMITTEE.

 Alfred Cox, M.B., Medical Secretary, }
 British Medical Association.

It was announced last week that the Chairman and Secretaries of the War Emergency Committee established by the British Medical Association had addressed a letter to every medical practitioner in England and Wales, except those at present on active service, pointing out the urgent need of the army for medical practitioners under 40 years of age. The Committee has since issued the following letter to Honorary Secretaries of Divisions of the British Medical Association, and of local War Emergency Committees, and to the Honorary Secretaries of Branches of the British Medical Association for their information.

War Emergency Committee.

Offices:
 429, Strand, London, W.C.
 August, 1915.

Dear Sir,

We are instructed by the War Emergency Committee to send you a copy of a letter just issued to every practitioner in England and Wales who is not on whole-

time active service.* The issue of this letter is the first step in what it is hoped will be a most active campaign for the enlistment of every medical man of military age who can possibly be spared.

The Committee is well aware of the great sacrifice which the acceptance of a commission entails on many medical men who join the army, but in view of the statements made to it by Sir Alfred Keogh, the Committee feels it to be its duty to press on the profession the absolute necessity of such sacrifices being made, if the medical demands of the army are to be met. The Committee particularly wishes to impress upon you the fact that it has been convinced by irrefutable arguments and figures that the demand is both great and urgent.

As you will see, the Director-General has authorized the War Emergency Committee to act as his agents in securing medical men for commissions, and the Committee has accepted the responsibility, feeling sure of the support of the profession throughout the country. It now asks you as Secretary of a Division of the British Medical Association or of a local War Emergency Committee to organize the profession in your area so that your quota of medical men may be secured.

Acting on the information given to it by the Director-General as to the number of medical officers required, the Committee has decided that your area should be expected to produce . . . whole-time military medical officers. The way in which this number is secured must be left very largely to local initiative. It is essential, however, that the effort should be made and *at once*. If you have a local War Emergency Committee, it should at once set about interviewing the practitioners of military age with a view of making it possible for them to apply for commissions. Practitioners above the military age will be doing their duty if they throw themselves into the task of so arranging their work that they can do the work of those who are willing to take commissions. The Committee is assured that before the war is over the military authorities will need a great deal of the part time service which has been so freely offered by the profession. The need *at present*, however, is for whole-time men of about 40 years and under.

If you have no local War Emergency Committee, the machinery of the Division should be set to work to establish one, and it should be made representative of all practitioners in the area, both members and non-members of the Association.

Enclosed is a list of all the men of 45 and under resident in your area, so far as has been ascertained by the replies to our War Register circular. The following is suggested as an outline of what your local War Emergency Committee should do:

- (1) Interview all the practitioners of military age.
- (2) Get such of them as are prepared to do so to sign a copy of the application to the War Office for a commission, a supply of which is enclosed; more will be sent on application here.
- (3) Ascertain the earliest dates at which such practitioners can be freed to commence service.
- (4) Draw up agreements between the practitioner volunteering for service and his local colleagues as to the working of his practice during his absence. Appended will be found suggestions which will, it is hoped, serve as a basis for a local agreement. The War Emergency Committee will be glad to advise local committees on any difficulties that may arise.
- (5) Get the practitioner to appoint a legal representative who can be consulted on his affairs during his absence.
- (6) Send up the completed forms to us as soon as possible, after noting the names of those offering service on your local list.

This Committee will be glad to advise your local Committee as to any difficulties which arise in making arrangements for the carrying on of practices, or as to any other matter connected with the safeguarding of the interests of men who accept service.

Please advise us as soon as possible either that your Committee has begun work, or that a committee will at once be formed, and keep this Committee in touch with what is going on.

* The text of this letter was published in the SUPPLEMENT to THE BRITISH MEDICAL JOURNAL of August 14th, p. 86.

The War Emergency Committee, in pressing that no time shall be lost in dealing with this matter, trusts you will believe that this urgent appeal for your assistance is based on definite knowledge that the occasion is one which brooks no delay. A great responsibility rests on the profession of any area which fails to rise to the occasion. In the words of the Director-General, the War Emergency Committee feels that "the claims of the Army Medical Service cannot be pressed too strongly."

We are,

Yours faithfully,
T. JENNER VERRALL, *Chairman*.
N. BISHOP HARMAN, } *Secretaries*.
ALFRED COX, }

P.S.—The Editor of the BRITISH MEDICAL JOURNAL is trying to publish lists of the sons of doctors who lose their lives in the war. The idea, unfortunately, did not occur at the beginning, so that there are considerable arrears. As the official lists do not state anything as to the percentage of officers or men killed, the Editor must depend largely upon the assistance of parents, and it is hoped that you will be so good as to take any opportunity you may have, informally, of making the proposal known to members of your Division. The Editor would, of course, be grateful for any assistance you can yourself give.

APPENDIX.

SUGGESTIONS AS TO LOCAL ARRANGEMENTS.

A.—The following suggestions as regards the division of remuneration between the practitioner on service and the practitioner or practitioners doing his work are taken from the circular of the Scottish Medical Service Emergency Committee:

CLASS I.—*Town Practice*.—Large towns where the question of mileage is not a very important consideration. Here it is suggested that an equal division of the remuneration should be agreed upon, this to apply both to private and insurance practice. Where a bureau is in operation the plan should be to deduct the expenses of working from the receipts and divide the balance equally.

CLASS II.—*Town and Country Practice*.—Towns with a considerable population, but with a large amount of country work, necessarily involving the question of travelling expenses. It may be possible to ascertain these with more or less exactness, but as a general rule probably a division of all remuneration on the basis of three-eighths to the absentee and five-eighths to the man who is doing all the work and paying all the expenses is the nearest to equity.

CLASS III.—*Country Practice*.—Smaller centres or single practice areas where the question of travelling expenses and consumption of time becomes still more important. In such, three-fourths at least should be allotted to the man who is doing the work.

B.—The following letter and form of undertaking issued by the Mid-Cheshire Division of the British Medical Association may be found useful and suggestive:

Several medical men in the area of this Division are offering themselves, and have asked the Division to help them in making arrangements as to carrying on their work while they are away, and restoring their practices to them intact on their return.

At the last meeting of the Division a subcommittee was appointed to consider the matter, and this subcommittee has decided to ask every medical man in practice in this area to undertake that he will attend any patients of a man on service for him during his absence, and that he will refuse to attend any patients he thus comes in contact with as his own patients for at least six months after the absentee's return.

[Note (by War Emergency Committee).—*Twelve months is the more usual arrangement.*]

It is arranged that all fees for confinements attended for an absentee shall belong to the medical man who attends the case, and that all other fees paid for work done shall be equally divided between the absentee and the doctor who has acted for him.

The subcommittee realizes that much extra work will be thrown on practitioners, and it is clear that any doctor must have the right to refer such patients of the absentee as he cannot find time to attend to some other doctor.

The subcommittee expects that no medical man will feel disinclined to assist his country and his professional friends who are making such a great sacrifice,

and it therefore instructs me to ask you to sign the enclosed undertaking, and send it to me by return of post.

BRITISH MEDICAL ASSOCIATION.
To the Honorary Secretary of the Mid-Cheshire Division.

Dear Sir,
I hereby promise on my word of honour that if any persons, who are ordinarily patients of any medical man practising in this neighbourhood who is on active service with the Forces, consult me during his absence, I will attend them for him (on the terms arranged by the Division's Subcommittee appointed for the purpose) and will refuse to act as their medical attendant on my own behalf from the date of his return until at least six months have elapsed. Also I will in every way do all in my power to safeguard the absentee's interests with the patients I attend for him, and to induce them to return to him when he resumes practice.

Signed.....
Date.....

Terms arranged are: Equal division of all fees, other than confinements, between the absentee and the doctor who attends the patient; the whole fee in the case of confinements to belong to the doctor who attends the case.

British Medical Association.

EXTRAORDINARY GENERAL MEETING.

ALTERATION OF ARTICLES OF ASSOCIATION.

An Extraordinary General Meeting of the British Medical Association, adjourned from Wednesday, August 11th, 1911, was held at the registered offices of the Association, 429, Strand, London, W.C., on Wednesday, August 18th, 1915.

In the absence of the President (Sir Alexander Ogston), Dr. J. A. MACDONALD, Chairman of Council, took the chair. Mr. GUY ELLISTON, Financial Secretary and Business Manager, read the notice convening the meeting.

The minutes of the Extraordinary General Meeting of July 24th having been signed by the CHAIRMAN, he explained that the meeting was a purely formal one and was called for the purpose of confirming the Resolutions passed unanimously by an Extraordinary General Meeting of the Association held at the Connaught Rooms on July 24th, 1915. He accordingly moved *seriatim* the following resolutions, which were duly confirmed:

1. That Articles 3, 43 and 44, and the words "whether an existing Member or a future Member" in Article 9, be cancelled.
2. That in Article 4 there be inserted immediately after the word "Acts" the words following, "and any Medical Practitioner who does not reside within the area of any Branch of the Association and who though not so registered is possessed of any of the qualifications described in Schedule (A) of the Medical Act, 1857."
3. That in Heading III. immediately after Article 11 the word "and" be substituted for the word "or."
4. That in Article 23 the last six words be altered so as to read "provisions as to Referendum hereinafter contained."

NOTIFICATION OF BIRTHS ACT.

The following is the text of the Notification of Births (Extension) Act, 1915:

CHAPTER 64.

An Act to extend the Notification of Births Act, 1907, to Areas in which it has not been adopted, and to make further provision in connexion therewith for the Care of Mothers and Young Children. (29th July 1915.)

BE it enacted by the King's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:

1. *Extension of Notification of Births Act, 1907* (7 Edw. VII, c. 40).—(1) The Notification of Births Act, 1907 (in this Act referred to as the principal Act), shall, on and after the first day of September, nineteen hundred and fifteen, extend to and take effect in every area in which it is not already in force, and in the case of an area for which it could be adopted either by the council of an urban or

rural district, or by the county council, shall take effect as if it had been adopted by the council of the district.

(2) Where by virtue of this Act the principal Act comes into force in any county district in which it is not already in force, the medical officer of health shall send duplicates of any notices of birth received by him under that Act to the county medical officer of health as soon as may be after they are received.

(3) Where by virtue of this Act the principal Act comes into force in any area in which it is not already in force, it shall be the duty of the local authority to bring the provisions of the principal Act to the attention of all medical practitioners and midwives practising in the area.

2. *Arrangements for Attending to Mothers and Young Children (54 and 55 Vict. c. 76).*—(1) Any local authority within the meaning of the principal Act (whether a sanitary authority or not) may, for the purpose of the care of expectant mothers, nursing mothers, and young children, exercise any powers which a sanitary authority has under the Public Health Acts, 1875 to 1907, or the Public Health (London) Act, 1891, as the case requires.

(2) Any expenses incurred in the exercise of these powers shall be defrayed in the same manner as expenses of the local authority are defrayed under the principal Act.

Any such powers may be exercised in such manner as the authority direct by a committee or committees which shall include women and may comprise, if it is thought fit, persons who are not members of the authority. Any such committee may be empowered by the authority by which it is appointed to incur expenses up to a limit for the time being fixed by the authority, and, if so empowered, shall report any expenditure by them to the authority in such manner and at such times as the authority may direct. A committee appointed for the purposes of this section shall hold office for such period not exceeding three years as the authority by which it is appointed may determine.

3. *Application to Scotland and Ireland.*—(1) In the application of this Act to Scotland—

(a) Subsection (2) of section one shall not apply: Provided that the Local Government Board for Scotland may, if they think fit, by order, authorize any two or more local authorities to act together for the purposes of the principal Act and this Act, and may prescribe the mode of such joint action and of defraying the costs thereof.

(b) The following subsection shall be substituted for subsection (1) of section two:—

(1) Any local authority within the meaning of the principal Act may make such arrangements as they think fit, and as may be sanctioned by the Local Government Board for Scotland, for attending to the health of expectant mothers and nursing mothers, and of children under five years of age within the meaning of section seven of the Education (Scotland) Act, 1908 (8 Edw. VII, c. 63).

(2) In the application of this Act to Ireland—

(a) Subsection (2) of section one shall not apply.

(b) The following subsection shall be substituted for subsection (1) of section two:

(1) Any local authority within the meaning of the principal Act may make such arrangements as they think fit, and as may be sanctioned by the Local Government Board for Ireland, for attending to the health of expectant mothers and nursing mothers, and of children under five years of age.

(c) The provisions for the extension of the principal Act shall not apply as respects any rural district; and

(d) The expression "medical officer of health" means, for the purposes both of this Act and the principal Act, as respects any district for which there is a medical superintendent officer of health that officer, and elsewhere the medical officer of health of the dispensary district.

4. *Short Title and Repeal.*—(1) This Act may be cited as the Notification of Births (Extension) Act, 1915, and the principal Act and this Act may be cited together as the Notification of Births Acts, 1907 and 1915.

(2) The enactments mentioned in the Schedule to this Act are hereby repealed (except as respects rural districts

in Ireland) to the extent specified in the third column of that Schedule.

SCHEDULE.

Session and Chapter.	Title.	Extent of Repeal.
7 Edw. VII. c. 40.	The Notification of Births Act, 1907.	In section one, the words "in which this Act is adopted by that authority in accordance with the provisions of this Act," in subsection (1) the words "in an area in which this Act is adopted," and in subsection (4) the words "whose sub-district or any part thereof is situate within any area in which this Act is adopted." Subsections (1) (2) and (3) of section two, and in subsection (4) the words "who may adopt the Act either for their whole county or for any county district therein." Section three. The Schedule.

GENERAL MEDICAL COUNCIL.

EXECUTIVE COMMITTEE.

A MEETING of the Executive Committee was held on July 26th, when Sir DONALD MACALISTER was in the chair, and Sir Henry Morris, Mr. Tomes, Mr. Hodson, Dr. Norman Walker, Sir John Moore, and Sir Charles Ball were present.

RECIPROCITY WITH CANADA.

Saskatchewan.

A communication dated June 10th was received from the Clerk to the Privy Council stating that an Order in Council had been made recognizing the Province of Saskatchewan in the Dominion of Canada as a separate British possession, applying to it the second part of the Medical Act, 1886. It was reported that application had been made to the Registrar of the Medical Council, Saskatchewan, for further information as to the course of study and examination required. The Executive Committee adopted the following resolution:

That in the event of information being received that the arrangements for reciprocity with the Province of Saskatchewan have been satisfactorily completed, and that a course of professional study extending over five years has been instituted in the province, the President be empowered on behalf of the Executive Committee to direct the Registrar as follows:

That any person who holds the licence of the College of Physicians and Surgeons of Saskatchewan, granted after examination in medicine, surgery, and midwifery, together with the licence to practise in the province, shall be entitled to be registered in the Colonial List of the *Medical Register*, provided he satisfies the Registrar of the General Medical Council regarding the other particulars set forth in Part II of the Medical Act, 1886.

That the attention of the Council of the College of Physicians and Surgeons of Saskatchewan be called to the resolution of the General Medical Council of June 5th, 1890, requiring that the course of professional study should occupy at least five years, and the Council be informed that the foregoing resolution becomes operative only on condition that such a course is instituted in the province.

Ontario.

Correspondence with the Registrar of the College of Physicians and Surgeons, Ontario, was read. It was reported that a telegram had been received, in reply to an inquiry, stating that the College had adopted the reciprocity legislation, and that a copy of the regulations was in the hands of the Ontario Government. The Executive Committee adopted the following resolution:

That in the event of information being received that the arrangements for reciprocity with the Province of Ontario have been satisfactorily completed, the President be empowered on behalf of the Executive Committee to direct the Registrar as follows:

That any person who holds the licence or membership of the College of Physicians and Surgeons of Ontario, granted after examination in medicine, surgery, and midwifery, together with the licence to practise in the province, shall be entitled to be registered in the Colonial List of the *Medical Register*, provided he satisfies the Registrar of the General Medical Council regarding the other particulars set forth in Part II of the Medical Act, 1886; and

That any graduate in medicine, surgery, and midwifery of the province of Ontario, approved by the College of Physicians and Surgeons of the province, whose name is registered in the Colonial List, shall be entitled to register his medical

degree as an additional title in the Colonial List of the *Medical Register*.

The following are the universities at present approved by the College of Physicians and Surgeons of Ontario:
Queen's University, Kingston, Ontario;
The Western University, London, Ontario, and
The University of Toronto.

Manitoba, Alberta, and British Columbia.

The following report by the Acting Registrar was read:

Report.

With regard to the other Provinces of the Dominion of Canada which are taking steps to secure the extension of Part II of the Medical Act to Manitoba, Alberta, and British Columbia respectively, it was reported that nothing further has been heard since the presentation of the report of May 7th, 1915, except in the case of British Columbia.

On May 28th, 1915, the Registrar, by direction of the President, forwarded to the Clerk of the Privy Council a communication from the Colonial Office asking for the application of Part II of the Medical Act, 1886, to that province, together with the correspondence in regard to the matter and copies of the provincial Medical Acts.

L.M.S. UNIVERSITY OF MADRAS.

A communication was read from the Acting Principal of the Medical College, Madras, giving particulars as to the requirements at the examinations. The Executive Committee adopted the following resolution:

That the Principal of the Madras Medical College be informed that the Executive Committee is not prepared to recognize the L.M.S. degree of the University of Madras, if the pass marks are of a lower standard than those required to obtain the corresponding degree of the University of Bombay—namely, 53 per cent. in Anatomy, 33 per cent. in Physiology and Histology, and 45 per cent. on the total—that is, Anatomy and Physiology and Histology taken together; and for the final examinations 50 per cent. in each of the four subjects (1) Medicine and Pathology; (2) Midwifery and Diseases of Women and Children; (3) Surgery; and (4) Medical Jurisprudence and Hygiene.

And further, that the Committee had been informed that it was the intention of the other Indian universities whose L.M.S. degree had been recognized by the General Council to discontinue granting this or any degree of lower standard than the M.B., B.S. degrees.

SOCIETY OF APOTHECARIES OF LONDON.

A letter was read from the Clerk to the Society of Apothecaries of London stating that two of the surgical examiners—Mr. Warren Low and Mr. Philip Turner—were at the present time in France with the British forces, and that they had, with the approval of the Society, requested Mr. Hugh Lett and Mr. H. S. Pendlebury, both of whom were former surgical examiners, to act in their places. The President stated that he had assented to the suggestion, and his action was approved.

APOTHECARIES' HALL, DUBLIN.

Sir CHARLES BALL stated that Mr. Taylor, owing to illness, had been unable to take up his duties in connexion with the professional examinations of the Apothecaries' Hall on June 28th and 29th, and that the Irish Branch Council had asked Dr. Little to attend on behalf of the Branch Council at the final examination of the Apothecaries' Hall on June 28th, and Sir John Moore at that on June 29th, and had requested them to report thereon to the General Medical Council.

FINANCE.

A report was received *in camera* from the Senior Treasurer on the steps taken by the trustees of the English Branch Council and the Dental Fund to convert the 2½ per cent. Consols held into War Loan stock.

The powers of the Office Site Committee were enlarged to include the provision of suitable furniture for the new premises.

SALE OF LAUDANUM.

A letter was received from the Clerk to the Privy Council transmitting a correspondence with the Pharmaceutical Society of Great Britain. The Lord President of the Council desired the opinion of the General Medical Council on the question whether the Pharmaceutical Society was acting properly in assisting the sale of any preparation of opium that does not comply with the requirements of the new edition of the *British Pharmacopoeia*.

The correspondence which was remitted to the Pharmacopoeia Committee for report was as follows:

The Clerk of the Council,
Privy Council Office, London, S.W.,
July 22nd, 1915.

Sir,—I am directed by the Lord President of the Council to transmit to you the accompanying copy of a correspondence, as marked in the margin,* relating to the sale of laudanum, and to state that His Lordship will be glad to be favoured with any observations the General Medical Council may have to offer thereon, with special reference to the Recommendation passed by the Council of the Pharmaceutical Society in January last.

In the Lord President's view, the question to be determined is whether the Society is acting properly in assisting the sale of any preparation of opium that does not comply with the requirements of the new edition of the *British Pharmacopoeia*.—I am, Sir, your obedient servant,

ALMERIC FITZROY.

The Registrar,
General Medical Council.

(Copy.) 115.749.
Privy Council Office, Whitehall, S.W.,
May 8th, 1915.

Sir,—I am directed by the Lord President of the Council to transmit to you the accompanying copy of a letter received from Dr. P. J. Waldo, His Majesty's Coroner for the City of London and Borough of Southwark, together with a copy of the annual return mentioned in that letter, and to ask you to be good enough to move the Council of the Pharmaceutical Society to favour His Lordship with any observations they may have to offer on the point referred to in the first paragraph of Dr. Waldo's letter, and on pages 10-11 of the return.

You will observe that according to Dr. Waldo's statement, laudanum, that is, tincture of opium, is being made up on a formula distinct from that prescribed by the new edition of the *British Pharmacopoeia*.—I am, Sir, your obedient servant,

ALMERIC FITZROY.

The Secretary and Registrar,
Pharmaceutical Society of Great Britain,
17, Bloomsbury Square, W.C.

(Copy.) Coroner's Office,
Golden Lane, City, E.C.,
May 4th, 1915.

My Lord,—I have the honour to enclose a copy of my annual return for 1914, in which I refer to the important subject of the easy purchase of poisonous drugs, such as tincture of opium or laudanum, under which latter name chemists are selling two kinds of different strength.

My return may, possibly, be of service to you and your Council.—I have the honour to be, your obedient servant,

P. J. WALDO, M.D.,

His Majesty's City Coroner.

The Earl Beauchamp,
Lord President of the Privy Council.

(Copy.) Pharmaceutical Society of Great Britain,
17, Bloomsbury Square, London, W.C.,
July 20th, 1915.
No. 115.749.

Sir,—Referring to your letter of May 8th last, enclosing copy of a letter received from Dr. F. J. Waldo, His Majesty's Coroner for the City of London and Borough of Southwark, together with a copy of his annual return, I have to state that these communications have been carefully considered by the Law Committee and the council of this society, and I am instructed to inform you that in January last the council of this society passed and published the following recommendation:

That the policy to be advocated by the council in regard to the sale of laudanum should be that when "laudanum" is asked for the 1914 preparation should be supplied and the poison book signed; but where the 1898 preparation is demanded great care should be taken to label it accordingly, and the attention of the purchaser should be called to the fact that it is the 1898 preparation.

—I am, Sir, your obedient servant,

W. J. UGLOW WOOLCOCK,
Registrar.

The Clerk of the Council,
Privy Council Office, S.W.

ELECTION OF DIRECT REPRESENTATIVES.

It was resolved to address a communication to the Lord President suggesting the expediency in the present emergency of postponing all the separate elections of direct representatives till the end of the year 1916.

DENTAL BUSINESS.

A letter was read, dated June 12th, from the Colonial Office, transmitting a copy of an ordinance to provide for the registration of dentists in Ceylon. The Executive Committee referred the ordinance to the Dental Education and Examination Committee for its information, and adopted the following resolution:

That the Colonial Office be informed that the Executive Committee expresses its warm approval of the provision

* Note by the Acting Registrar.—The correspondence marked in the margin is that which follows the letter of the Clerk of the Council.

of the Ceylon Ordinance No. 3 of 1915, by which it made a punishable offence for an unregistered and unqualified person (other than a Veredala, Government apothecaries, estate dispensers appointed with the approval of the principal civil medical officer, and existing unqualified practitioners) to practise dentistry for gain, or to profess to practise or publish his name as practising dentistry or dental surgery, and trusts that the local exigencies which require the exceptions in favour of the unqualified persons specified may be of a temporary nature, and that Ceylon may soon be in a position to require that all those who undertake to practise dentistry and dental surgery should be fully qualified for that important duty.

LOCAL MEDICAL AND PANEL COMMITTEES.

EAST SUSSEX.

LOCAL MEDICAL AND PANEL COMMITTEES.

A MEETING of the Local Medical and Panel Committees was held at Lewes on July 28th.

Reappointment of Committees.—The Commissioners having reappointed the former members, the meeting re-elected the officers as follows:

Chairman: Dr. Benham (Hove).
Vice-Chairman: Dr. Collins (East Grinstead).
Honorary Secretary and Treasurer: Dr. Vallance (Lewes).
Secretary: Mr. Morgan, solicitor (Hustings).
Executive Committee: Drs. F. Barfield, T. S. Taylor, and E. W. Skinner, together with the Chairman, Vice-Chairman, and Secretary.

Drug Committee: Drs. Mackwood and Simpson.
Representatives on Medical Service Subcommittee of Insurance Committee: Drs. Vallance, Holman, and J. R. Skinner.

Payment of Accounts.—The meeting approved of the arrangements proposed by the Medical Service Subcommittee of the Insurance Committee for the settlement of the accounts for 1913-14. Approval was expressed at the decision of the Insurance Committee that payments on account for 1915 might, in the circumstances of East Sussex, be made on a more liberal footing than that suggested by the Commissioners.

Treatment of Tuberculosis.—The scale suggested by the Insurance Committee for attendance on certain dependants of insured persons in cases of tuberculosis was discussed. As it was not proposed to pay mileage for distances, however long, upon metalled roads, but only for distances off such roads, it was decided to press for the former also.

Checking Chemists' Accounts.—The Committees consented to the payment out of the Medical Benefit Fund of one-third of the cost of checking chemists' accounts for 1914, but objected to such payment in the future. The checking has already been suspended for the current year by the Insurance Committee.

Temporary Residents.—The Committees advised practitioners to continue to treat temporary residents until further notice, and decided that an additional grant ought to be made to meet the additional cost of the drugs supplied to such patients.

Conference.—Dr. BENHAM reported on the proceedings of the recent conference of the Local Medical and Panel Committees, and was accorded a vote of thanks for attending.

CORRESPONDENCE.

NATIONAL INSURANCE AND INCAPACITY FOR WORK.

DR. LACHLAN GRANT (Ballachulish) writes: As a panel doctor who has dealt with a considerable number of cases under the Act, I beg to point out what I consider a minor flaw in regard to certificates for incapacity.

Form Med. 40 requires certification that the patient is "incapable of work" before he or she is entitled to benefit, but it frequently happens this is not strictly according to fact, and applies only to the regular occupation, which may be more or less onerous. The patient might be all the better of some light kind of work, sedentary or otherwise, which he might do with advantage to himself and others. Especially does this apply in the case of female insured persons, and also where a patient is nearing recovery, where some slight activity, such as gardening, messages, or light home work would aid the cure and act as a tonic for mind and body. In cases, for example,

of influenza, nerve strain, debility, or fractured limb, where symptoms of illness or of injury go off slowly this would in some cases be very helpful in hastening the patient's recovery. Sometimes a doctor, using his discretion, may allow a patient to undertake some light duties, but there is no statutory sanction for such procedure, and the patient is compelled to affirm in certificate that he or she has not been at work since the last certificate was forwarded. I therefore submit that a clause should be added to certificates empowering the medical man in charge to permit some modified form of work, if, after due consideration, he deems same beneficial for the patient. This would prevent the depressing *ennui* of long periods of enforced idleness, help on the world's work, tend to lessen dishonest methods in our patients, and, in a certain number of cases, partially relieve the drain on the funds of the approved societies by reducing malingering, and get many off to regular work considerably earlier than under present regulations. It might be arranged that when a patient was permitted to undertake light duties during convalescence that there would be a corresponding reduction of the usual weekly allowance—say, from 10s. to 7s. 6d. or 6s., and the 5s. benefit to 4s. or 3s. 6d. I fully admit that under this arrangement some patients would be inclined to take fullest advantage of the permit, and do as much for themselves as possible while at home; but, as is well known, such work really goes on surreptitiously under the conditions obtaining at present. If it were found that a patient was unduly prolonging his convalescence the permission could be withdrawn.

We know that the appointment of medical referees to decide on doubtful cases would partly meet the difficulty, but even then it would be advisable to leave some discretion in the matter of off-time occupation to them and to the doctor in attendance.

NON-PANEL DOCTORS AND NATIONAL INSURANCE CERTIFICATES.

IN order to minimize as much as possible the inconveniences caused to doctors who attend insured persons in their private capacity, the Association has published books of certificates which, it is believed, will meet the requirements of approved societies, so far as is practicable in the case of certificates not given under the obligations of the official medical certification rules. The form of certificate is sufficiently like the official form to remove many of the difficulties which insured persons who have been attended by private doctors have had in satisfying the requirements of their approved societies, but is sufficiently distinct from the official form to show at once that it is being used by a doctor who is attending the patient in a private capacity—that is to say, either by a doctor who is not on a panel, or by a panel doctor other than the one on whose list the insured person is.

The Association has shown the certificates to the Insurance Commissions for England, Scotland, and Wales, and they raise no objection to the issue of them by the Association to medical practitioners for use when attending insured persons not being their panel patients, and not being persons whom they are attending as medical officers of institutions under Section 15 (4), or in virtue of "own arrangements" under Section 15 (3).

The books are being issued at cost price. They contain 50 certificate forms, and may be obtained from the Financial Secretary and Business Manager, British Medical Association, 429, Strand, W.C., price 6d. each, post free.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Staff Surgeons W. G. Edwards to the *Victoria*, additional; A. B. Marsh to the *Fenwick*, additional; Surgeons E. L. Atkinson to the *Exmouth*, W. F. Beattie, M.B., to the *St. Vincent*, vice Atkinson. Temporary Surgeons: J. A. B. Snell to the *Duke of Edinburgh*, vice Edwards; E. Granger, M.B., to the *Collingwood*, vice Marsh; G. J. C. Smyth to the *Princess*; J. E. C. Martin, M.B., to the *Fife*, vice Granger; J. McFarlane and F. S. Martyn, M.B., to the *Fife*, additional; for Plymouth Hospital; H. O. Martin to the *Colossus*, vice Goble. To be temporary Surgeons: D. W. K. Moody, M.D., C. G. Dyer.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon Probationer R. D. Macdonald to the *Minerva*, vice Kerby; H. L. Moody to the *Lambart*; D. Macgregor to the *Peterhead*; G. C. Lockhart-Cottle to the *Afridi*, vice Macdonald. To be Surgeon Probationer: J. A. Robertson.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

Lieutenant-Colonel H. A. Bray from the seconded list is restored to that establishment.

To be temporary Majors: J. M. Atkinson, M.B., W. McDougall, M.B. The notification of appointment of Major E. T. Hughes, Welsh Divisional Hospital, to a temporary Majorcy, published in the *London Gazette* of June 24th, is cancelled.

To be temporary Captains: Captain R. C. M. Hoare, South African A.M.C., temporary Lieutenant G. S. Sammelson, M.D., Captain Alan Gray, M.B., M.C.

Captain J. W. Nunn relinquishes his temporary commission on ceasing to be employed with the Duchesses of Westminster's Hospital.

The following are granted the temporary rank indicated whilst assisting with the British Expeditionary Forces: As Lieutenant-Colonel: A. C. Sulfern, M.D. As Major: W. J. Orr, M.B., F.R.S.E., and R. W. Housman, F.R.C.S., is granted the temporary rank of Major whilst serving with the 2nd Birmingham War Hospital.

Temporary Captain C. Gouldsbrough, M.B., relinquishes his commission.

The following officers of the Canadian Army Medical Corps to be temporary Lieutenants: Captains F. H. Boven, M.D., R. Millar, M.D., A. E. London, M.D., Lieutenants G. M. D. Lyon, M.D., L. G. Gecume, M.D., C. C. Gibson, I. D. Hayes, M.B., S. L. Alexander, M.B., R. D. Nasmyth, M.D., W. A. Smith, M.D., I. Wilson, M.D., T. Campbell, M.B., F. W. Hark, M.D., W. R. Tait, M.B., F. J. Ellis, M.D., F. S. Pope, M.D., J. G. R. Story, M.B., J. G. A. Donell, M.D., G. B. Kennedy, F. R. Hassard, M.B., G. W. Anderson, M.B., H. S. Tait, M.D., W. B. Honey, M.D., F. A. Keiller, M.D., W. A. Prond, M.B., G. F. Richmond, M.B., D. R. Paul, M.D., W. McArthur, M.D., C. Verge, G. F. Richards, M.B., D. R. Paul, M.D., R. F. McCulloch, M.B., H. E. Sheffield, M.D., W. A. Henderson, M.D., R. Paul, M.B., L. R. J. Keil, M.B., W. C. Swenerson, M.B., W. S. Macdonell, M.D., L. R. Meech, T. H. Lannay, M.B., B. W. Young, M.D., G. Belne, M.B., A. T. Bond, T. W. J. Hicks, M.B., M. D. V. Desrosiers, M.D., W. J. Macdonell, M.D., G. Kalchman, M.D., W. Hall, M.D., C. T. Galbraith, M.B., J. A. Creighton, J. A. Proudfoot, M.D., W. V. Coffey, M.D., G. T. O'Donnell, M.D., D. A. McAulay, M.D., M. V. D. Desrosiers, M.D.

The following temporary Lieutenants relinquish their commissions: J. B. Anderson, M.B., T. E. A. Carr, M.B., J. G. B. Coleman, M.D., E. Ashby, J. F. Gill, M.B., E. T. Evans, J. M. Fry. To be temporary Lieutenants: G. G. Wilmore, H. G. Holson, O. J. F. C. Greenidge, M.B., L. Horsley, C. McK. Craig, M.D., M. C. Gibson, M.D., A. H. Watson, M.B., A. Hegarty, G. O. Jacobson, G. F. Wilson, J. Wallace, M.D., A. Chalmers, M.B., C. Mitchell, M.B., J. Wilson, M.B., M. B. M. J. T. Murray, M.B., E. Underhill, M.B., F. J. P. Daly, S. Forrest, M.D., J. F. Dow, M.D., E. Melcher, P. J. Kelly, M.B., H. F. Hutchinson, M.B., A. C. Keay, M.B., J. White, C. B. Macdonald, M.B.

INDIAN MEDICAL SERVICE.

Colonel H. Hendley, M.D., Deputy Director, Medical Services in India, to be Inspector-General of Civil Hospitals, Punjab, with effect from July 22nd.

Lieutenant-Colonel H. E. Drake-Brockman, Director of His Highness the Nizam's Medical Department, temporarily to hold charge of the current duties of the Office of the Residency Surgeon at Hyderabad, in India, with effect from June 1st.

Surgeon-General T. Grainger, C.B., M.D., an Honorary Surgeon to the King, vice Surgeon-General G. F. A. Harris, C.S.I., M.D. (retired), dated April 1st, 1915.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

2nd Southern General Hospital.—A. G. T. Fisher, M.B., to be Captain on the permanent personnel.

3rd London General Hospital.—To Lieutenants: H. G. Mellam, late Surgeon-Captain Sussex and Kent Rearer Company; Lieutenant G. Finch, from Attached to Units other than Medical Units.

4th Southern General Hospital.—M. G. Williams, M.B., to be Lieutenant.

J. M. McLannahan to the 2nd Southern General Hospital, announced in the *London Gazette* of May 28th, is cancelled.

5th Western General Hospital.—G. M. Benton, M.B., to be Captain, with effect to be available on mobilization; J. G. McKinlay, M.B., to be Lieutenant.

3rd Western General Hospital.—To be Lieutenants: R. T. Jones, C. Boyle, M.B.

2nd Casualty Clearing Station.—R. T. Hughes, late Major Welsh Divisional Train, A.S.C., to be Major, temporary.

2nd Scottish General Hospital.—Cadet J. W. Simpson, M.B., from Edinburgh University Contingent, Senior Division, O.T.C., to be Lieutenant.

2nd London General Hospital.—Order of the name of Parshah, M.B., late Captain 10th Battalion, Manchester Regiment, to be Captain.

The seconding of Captain H. D. Davis, announced in the *London Gazette* of November 13, 1914, is cancelled. Captain A. F. Gladstone and Lieutenant J. B. McKay resign their commissions on account of ill health. Lieutenant G. McL. Leveck, from the 3rd Highland Field Ambulance, to be Lieutenant.

COLONIAL MEDICAL SERVICES.

The following changes are notified by the Colonial Office:

WEST AFRICAN MEDICAL STAFF.

Transfers and Promotions.—Clough, M.B.Lond., Provincial Medical Officer, Gold Coast, transferred on promotion to Nigeria as Deputy Principal Medical Officer; M. E. O'Dea, M.B., Ch.B.Edin., Senior Medical Officer, Nigeria, transferred on promotion to the Gold Coast as Provincial Medical Officer.

Retirements.—C. R. Chichester, M.B.Dub., D.P.H.Irel., Deputy Principal Medical Officer, Nigeria, retires on pension; F. W. McCoy, L.R.C.S., L.R.C.P.Edin., L.F.P.S.Glasg., appointment terminated.

Appointments.—C. N. McHattie, M.B., M.Ch.E., Chief Medical Officer, Bahamas, Medical Officer, Nigeria.

Re-employment.—E. E. Maples, M.D., B.S.Lond., F.R.C.S.Eng., L.R.C.P.Lond., Medical Officer, Nigeria.

Deaths.—F. A. Baldwin, M.B., F.R.C.S.Eng., L.R.C.P.Lond.; A. W. H. Grant, L.M.S.S.A.Lond.; J. A. Beattie, M.D., Ch.B.Aberd.

OTHER COLONIAL MEDICAL APPOINTMENTS.

F. Mahabir, M.R.C.S.Eng., L.R.C.P.Lond., appointed Superintending Medical Officer, Trinidad, and seconded for service as Assistant Medical Superintendent in the same Asylum; J. C. McNaughton, M.D., C.M., M.R.C.P.Edin., Medical Officer, Gilbert and Ellice Islands Protectorate, R. F. Weldon, L.R.C.S., L.R.C.P.Irel., Superintending Medical Officer, Trinidad, H. R. MacIntyre, M.B., Ch.B.Glasg., D.P.H., R.C.P.S.Eng., Medical Officer, Fiji. Brewster, L.R.C.S., L.R.C.P.Edin., L.F.P.S.Glasg., Superintending Medical Officer, Trinidad, H. W. Bell, M.B., Ch.B.Edin., Medical

Officer, Weihaiwei, J. S. O'Sullivan, M.B., B.Ch., B.A.O.N.U.I., Medical Officer, Solomon Islands, H. W. A. B. Welch, M.B., Ch.B., Liverpool, Medical Officer, Zanzibar Protectorate, W. L. Peacock, M.B., Ch.B.Glasg., Temporary Medical Officer, Uganda Protectorate.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

In ninety-six of the largest English towns 6,770 births and 5,914 deaths were registered during the week ended Saturday, August 7th. The annual rate of mortality in these towns, which had been 11.4 per 1,000 in each of the three preceding weeks, fell to 11.3 per 1,000 in the week under notice. In London the death-rate was equal to 10.8, while among the ninety-six towns the rate was equal to 11.6, of which 5.0 in Walthamstow, 5.6 in other large towns it ranged from 4.5 in Bath, 4.8 in Ipswich, to 16.6 in Hastings, 17.0 in West-Hartlepool, 17.1 in Wigan, 17.3 in South Shields, 17.8 in Bootle, and 18.1 in Middlesbrough. Measles caused a death-rate of 1.1 in Bradford and in Lincoln. The deaths of children under 2 years of age from diarrhoea and enteritis, which had been 121, 144, and 171 in the three preceding weeks, further rose to 202, and included 45 in London, 24 in Liverpool, 29 in Leeds, 16 in Manchester, and 9 in Birkenhead. The mortality from the remaining infective diseases showed no marked excess in any of the large towns, and no marked excess in any of the smaller towns. The causes of 38, or 1.0 per cent., of the total deaths were not certified by a registered medical practitioner or by a coroner; of this number 9 were recorded in Birmingham, 5 in Liverpool, 2 in Gateshead, and 2 in Truro.

The number of scarlet fever deaths under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 2,468, 2,483, and 2,431 at the end of the three preceding weeks, rose to 2,536 on Saturday, August 7th; 285 new cases were admitted during the week, against 250, 342, and 291 in the three preceding weeks.

In ninety-six of the largest English towns, 7,983 births and 3,966 deaths were registered during the week ended Saturday, August 14th. The annual rate of mortality in these towns, which had been 11.4, 11.4, and 11.3 per 1,000 in the three preceding weeks, rose to 11.5 per 1,000 in the week under notice. In London the death-rate was equal to 10.8, while among the ninety-five other large towns it ranged from 4.1 in Gloucester, 4.5 in Coventry, 4.5 in Cardiff, 4.5 in Ilford, and 6.8 in Enfield, in Smethwick, and in Aberdare, to 15.6 in Halifax, 16.4 in Hootie, 17.1 in Rochdale, 17.3 in Middlesbrough, 17.5 in Stoke-on-Trent, and 19.3 in Barnsley. Measles caused a death-rate of 1.2 in Derby, 1.3 in Norwich and in Rhondda, 1.3 in Sheffield, 3.0 in West Bromwich, 4.3 in Lincoln, and 4.8 in Barnsley. The deaths of children from diarrhoea and enteritis, which had been 144, 171, and 202 in the three preceding weeks, further rose to 262, and included 59 in London, 29 in Liverpool, 16 in Manchester, and 11 in West Ham. The mortality from the remaining infective diseases showed no marked excess in any of the large towns, and no marked excess in any of the smaller towns. The causes of 44, or 1.1 per cent., of the total deaths were not certified by a registered medical practitioner or by a coroner; of this number 8 were recorded in Liverpool, 6 in Birmingham, 4 in Stoke-on-Trent, and 3 in Gateshead. The number of scarlet fever deaths under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 2,483, 2,431, and 2,436 at the end of the three preceding weeks, fell to 2,415 on Saturday, August 14th; 279 new cases were admitted during the week, against 342, 294, and 285 in the three preceding weeks.

HEALTH OF SCOTCH TOWNS.

In the sixteen largest Scottish towns 1,025 births and 615 deaths were registered during the week ended Saturday, August 7th. The annual rate of mortality in these towns, which had been 12.5, 13.2, and 13.8 per 1,000 in the three preceding weeks, fell to 13.7 in the week under notice, but rose to 14.0 above the rate in the week ending August 14th in large English towns. Among the several towns the death-rate ranged from 5.0 in Motherwell, 5.9 in Coatbridge, and 8.1 in Hamilton, to 17.0 in Perth, 17.1 in Aberdeen, and 19.0 in Paisley. The mortality to be certified by a registered medical practitioner or by a coroner from the principal infective diseases averaged 1.8 per 1,000, and was highest in Paisley and Aberdeen. The 296 deaths from all causes in Glasgow included 19 from measles, 10 from infantile diarrhoeal diseases, 10 from scarlet fever, 10 from whooping-cough, and 1 from diphtheria. Six deaths from smallpox were recorded, and 15 in Paisley, 2 in Leith, and 2 in Kirkcaldy; from scarlet fever 4 deaths in Aberdeen; and from infantile diarrhoea 3 deaths in Dundee and 3 in Glasgow.

In the sixteen largest Scottish towns, 1,002 births and 565 deaths were registered during the week ended Saturday, August 14th. The annual rate of mortality in these towns, which had been 14.2, 13.8, and 13.7 per 1,000 in the three preceding weeks, rose to 12.5 in the week under notice, but was 1.1 per 1,000 above the rate in the week ending August 7th in large English towns. Among the several towns the death-rate ranged from 5.9 in Clydebank, 8.3 in Coatbridge, and 8.9 in Kirkcaldy, to 15.9 in Glasgow, 14.5 in Leith, and 15.5 in Aberdeen. The mortality to be certified by a registered medical practitioner or by a coroner from the principal infective diseases averaged 2.0 per 1,000, and was highest in Ayr and Paisley. The 287 deaths from all causes in Glasgow included 20 from measles, 16 from infantile diarrhoea, 10 from scarlet fever, 1 from diphtheria, 10 from infantile diarrhoea, 10 from whooping-cough, and 1 from diphtheria. Six deaths from smallpox were recorded, and 15 in Paisley, 3 in Edinburgh, and 2 in Aberdeen; from scarlet fever 4 deaths in Aberdeen, and 2 in Edinburgh; from diphtheria, 3 deaths in Edinburgh; and from infantile diarrhoea, 4 deaths in Dundee, 3 in Edinburgh, and 3 in Greenock.

HEALTH OF IRISH TOWNS.

During the week ended Saturday, August 7th, 573 births and 277 deaths were registered in the twenty-seven principal urban districts of the Republic of Ireland, 576 births and 278 deaths in the four period. These deaths represent a mortality of 11.9 per 1,000 of the aggregate population in the districts in question, as against 14.1 per 1,000 in the previous period. The mortality in these Irish areas was therefore 0.4 per 1,000 higher than the highest corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate, on the other hand, was equal to 24.6 per 1,000 of population. As for mortality of individual localities, the rate in the Dublin region was 11.4, as against 11.4 in the previous period. During the four weeks ending August 7th, in Dublin city 12.3 (as against 13.9, in Belfast 11.5 (as against 13.2), in Cork 12.9 (as against 12.2), in Londonderry 11.4 (as against 12.4), in Limerick 11.4 (as against 12.2), and in Waterford 11.4 (as against 9.5). The zymotic death-rate was 1.2, as against 1.3 in the previous period.

PUBLISHERS' ANNOUNCEMENTS.

Messrs. J. and A. Churchill will shortly publish the following new editions: A sixth edition of Professor Cusby's *Text-book of Pharmacology and Therapeutics*; several new chapters have been added upon recently introduced remedies, and the whole text has been revised. A fourth edition of Dr. T. W. Eden's *Manual of Midwifery*; a new feature has been introduced by the insertion of coloured plates. A fourth edition of *Elementary Hygiene and Sanitation*, with special reference to the Tropics, by W. T. Prout, M.B., C.M.G., Medical Adviser to the Colonial Office.

The same firm will publish in September a sixth edition of *The Operations of Surgery*, originally written by W. H. A. Jacobson, now entirely revised by Messrs. R. P. Rowlands and Philip Turner. Of the 800 illustrations 420 have been specially drawn for this edition, and about 40 of the figures appear in colour. The same firm will publish a *Text-book of Surgery*, by Mr. Richard Warren, Assistant Surgeon to the London Hospital, in two volumes, containing over 500 original illustrations.

Mr. John Murray announces that he will publish in the autumn a book by Dr. Thomas Buzzard, entitled *With the Turkish Army in the Crimea War*. It records his experiences of service with the British medical staff in the Turkish army. He was for some time attached to Omar Pasha's staff in the Crimea and Transcaucasia, but the reminiscences chiefly refer to the less known incidents of the war, such as the battle of the Tchernaya and the operations in Asia Minor connected with the siege of Kars.

Mr. Henry Kington announces the following new books: *Surgery of the Blood Vessels*, by Dr. J. Shelton Horsley, surgeon in charge of St. Elizabeth's Hospital, Richmond, Virginia; and *Operative Gynaecology*, by Dr. Henry Sturtevant Crossen, Associate in Gynaecology, Washington University Medical School.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements)—Important Notice re Appointments appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

ANGLO-SERBIAN HOSPITAL, Vrnjatka, Ranja, Serbia.—Surgeon. ASHTON-UNDER-LYNE UNION.—Resident Assistant Medical Officer for the Workhouse. Salary, £250 per annum. BIRMINGHAM AND MIDLAND EAR AND THROAT HOSPITAL.—House-Surgeon. Salary, £100 per annum. BIRMINGHAM AND MIDLAND EYE HOSPITAL.—Junior House-Surgeon. Salary, £100 per annum and 45 laundry allowance. BIRMINGHAM: CITY FEVER HOSPITAL.—Resident Lady Medical Officer. Salary, £550 per annum. BRADFORD ROYAL INFIRMARY.—(1) House-Physician; salary, £150 per annum. (2) Two Honorary Assistant Physicians. BRISTOL ROYAL INFIRMARY.—(1) Resident Obstetric and Ophthalmic House-Surgeon; salary, £120 per annum. (2) Dental House-Surgeon; salary, £120 per annum. BURY INFIRMARY.—Senior House-Surgeon. Salary, £250 per annum. BURY ST. EDMUND'S UNION.—Medical Officer for St. James's District. Salary, £100 per annum. CROOKSLEY SANATORIUM.—Resident Medical Officer (temporary). DEVONPORT: ROYAL ALBERT HOSPITAL.—House-Surgeon. Salary, £150 per annum; 21s. allowed weekly for working single-handed. DOHSEY COUNTY COUNCIL EDUCATION COMMITTEE.—School Dental Officer. Salary, £250 per annum. FOLKESTONE: ROYAL VICTORIA HOSPITAL.—House-Surgeon. Salary, £150 per annum. GLASGOW ROYAL MATERNITY AND WOMEN'S HOSPITAL.—(1) House-Surgeons at the Hospital. (2) House-Surgeon at the West End Branch (female). GUILDFORD: ROYAL SURREY COUNTY HOSPITAL.—House-Surgeon. Salary, £150 per annum. HASTINGS: EAST SUSSEX HOSPITAL.—House-Surgeon. Salary, £100 per annum. LANSHIRE COUNTY COUNCIL.—Medical Superintendent at High Carley Sanatorium. Salary, £450 per annum, rising to £550. LEWIS PUBLIC DISPENSARY.—Lady Resident Medical Officer. Salary, £130 per annum. LIVERPOOL EYE AND EAR INFIRMARY.—Honorary Anatomist. LIVERPOOL INFIRMARY FOR CHILDREN.—(1) Two Resident House-Physicians; (2) Resident House-Surgeon. Salary, £30 each for six months. MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN.—House-Surgeon. Salary, £120 per annum.

MANCHESTER ROYAL INFIRMARY.—Assistant Director in the Clinical Laboratory. Salary, £75 per annum. MIDDLEBROUGH: NORTH ORMESBY HOSPITAL.—House-Surgeon. Salary, £150 per annum. NORTHAMPTON COUNTY BOROUGH.—Clinical Tuberculosis Officer. Salary, £400 per annum. NOTTINGHAM GENERAL HOSPITAL.—Assistant House-Surgeon. Salary, £250 per annum. OLDHAM UNION.—Resident Assistant Medical Officer for the Poor Law Institution. Salary, £350 per annum. PORTSMOUTH COUNTY BOROUGH.—Chief Tuberculosis Officer. Salary, £500 per annum. QUEEN ELIZABETH'S LIVING IN HOSPITAL, Marylebone Road, N.W.—District Resident Medical Officer. Salary, £60 per annum. ROYAL FREE HOSPITAL, Gray's Inn Road, W.C.—Resident Medical Officer (male) to the Military Block. ST. MARY'S HOSPITAL, Paddington, W.—Resident Medical Officer for the Inoculation Ward. Salary, £100 per annum. ST. PETER'S HOSPITAL FOR STONE, Henrietta Street, W.C.—Junior House-Surgeon. Salary, £75 per annum. SALISBURY GENERAL INFIRMARY.—Assistant House-Surgeon. Salary, £100 per annum. SHEFFIELD ROYAL INFIRMARY.—(1) House-Surgeon; (2) Assistant Surgeon and Resident Physician. Salary, £100 per annum. SHEFFIELD UNIVERSITY.—(1) Demonstrator of Pathology and Bacteriology. (2) Demonstrator of Anatomy. SHREWSBURY: ROYAL SALOP INFIRMARY.—House-Physician. Salary, £120 per annum. STORTES HALL ASYLUM, Kirkburton.—Locumtenent. Salary, £5 5s. per week. SURREY EDUCATION COMMITTEE.—Female Assistant School Medical Officers. SWANSEA EDUCATION COMMITTEE.—(1) Lady Assistant School Medical Officer. (2) Temporary Assistant School Medical Officer. Salary, £200 per annum each. WALSALL AND DISTRICT HOSPITAL.—Assistant House-Surgeon and Anaesthetist. Salary, £150 per annum. WELSH METROPOLITAN WAR HOSPITAL, Whitechurch.—Resident Surgeon and Resident Physician. WEST HAM AND EASTERN GENERAL HOSPITAL, Stratford.—(1) Resident Medical Officer; (2) House-Physicians and House-Surgeons. Salary for (1) £160 per annum, and for (2) £120 and £100 per annum respectively. WEST HAM UNION.—At the Infirmary: Third Assistant Medical Officer (male); Fourth Assistant (Resident Lady) Medical Officer. Salary, £200 and £180 per annum, rising to £220 and £200 respectively. At the Workhouse: Resident (Lady) Assistant Medical Officer. Salary, £180, rising to £200. WESTMINSTER GENERAL DISPENSARY, Gerrard Street, Soho, W.—Resident Medical Officer. Salary, £120 per annum. WEST RIDING COUNTY COUNCIL.—Resident Medical Superintendent at the Middleton-in-Wharfedale Sanatorium. Salary, £200 per annum. WHITECHAPEL UNION INFIRMARY.—Second Assistant (female) Resident Medical Officer. Salary, £200 per annum. WIGAN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Junior House-Surgeon. Salary, £150 per annum. CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointment: Gainsborough, Cambridgeshire. To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

ADAIR, E. W. M., L.R.C.P. and S.L. District Medical Officer of the Caistor Union. CHILD, W. N., M.A. Camb., M.R.C.S., L.R.C.P., District Medical Officer of the Cuckfield Union. FLETCHER, A. H. B., M.B., Ch.B. Vict., District Medical Officer of the North Bierly Union. GALBRAITH, S. Nicol, M.B., Ch.B. Glasg., D.P.H. Camb., Medical Officer of Health and School Medical Officer for the Borough of Newark-on-Trent. PARKINSON, H. R., L.R.C.P. and S. Edin., J.F.P.S. Glasg., District Medical Officer and Medical Officer of Cottage Homes of the Fyde Union. PULFORD, J. B., M.B., B.C. Cantab., District Medical Officer of the Faringdon Union. SCOTT, R. A., L.R.C.P. and S. Edin., District Medical Officer of the Pickering Union.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s., which sum should be forwarded in Post Office Orders or Stamps with the notice not later than the first post Wednesday morning in order to ensure insertion in the current issue.

BIRTH.

REY.—On August 15th, at 9, Park Road, Bognor, Sussex, the wife of Jules F. Rey, a son.

MARRIAGE.

BRUNTON—MUIR.—On August 14th, at the Church of St. John, Knotty Ash, by the Vicar, the Rev. F. J. Powell, George L. Brunton, M.D., Lieutenant R.A.M.C., to Lucy Mary Muir, M.B., the daughter of the late Robert Muir, Esq., Upper Scapa, Orkney.

SCIENCE COMMITTEE.

The Science Committee has presented to the Council a report on the work of research scholars and recipients of scientific grants during 1914-15.

(A) SCHOLARS.

The researches of all the scholars are in abeyance owing to the war. The names of these gentlemen and the subjects they had proposed to investigate were as follows:

Ernest Hart Memorial Scholar.

ARMSTRONG, Richard Robins, M.B., B.C.Cantab.
1. The causation, method of infection and spread, and the treatment of all forms of pneumonia.
2. Experimental production of pneumonia in animals.

Research Scholars.

BEDSON, S. Phillips, M.D., B.S.Durh.
A continuation of the investigation on the effect of nuclein and nucleic acid on the normal antibody, and also an experimental inquiry into purpura and allied conditions.

INCHLEY, Orlando, M.D.Cantab.

The influence of the constant current on the absorption of drugs.

SCHLESINGER, Edward G., M.B., B.S.Lond.

1. The regulation of sweating, and its relation to internal and external changes.
2. The influence of the pericardium on the circulation, and the possibilities and effects of its surgery.
3. The surgical applications of variations in blood supply by means of vessel anastomosis.

(B) GRANTEES.

J. O. W. BARRATT, M.D., D.Sc.

STUDY OF NATURE AND MODE OF ACTION OF SUBSTANCES CONTAINED IN OR DERIVED FROM BLOOD PLASMA, AND TAKING PART IN PLASMA OR SERUM REACTIONS; ALSO CYTOLOGICAL STUDIES.

The first portion of this research upon the relation between (1) the time required for coagulation of fibrinogen to occur and (2) the amounts of thrombokinase, thrombin, and calcium chloride present has been completed and will shortly be published in full. An equation, valid for the experiments made within wide limits of concentration, has been obtained, by the aid of which the coagulation periods, corresponding to given amounts of thrombokinase, thrombin, and calcium chloride, can be calculated. In addition, further observations upon the physico-chemical relations of thrombokinase, thrombin, and fibrinogen have been made, but are not yet ready for publication. The work has been carried out at the Lister Institute. The progress of the

research has been greatly aided by the grant, and thanks are due to Dr. C. J. Martin, Director of the Lister Institute, for the valuable assistance received from him.

R. A. CHISOLM, M.D., B.CH.

THE INVESTIGATION OF NEPHRITIS BY EXPERIMENTAL METHODS.

Two researches have been carried out.

1. A further investigation into the regulation of the blood volume in experimental nephritis. The results were published in full in the *Journal of Pathology and Bacteriology*, vol. xix, October, 1914.

2. An investigation, conducted with Dr. G. Marshall, into the amount of active principle present in the pituitary body in various pathological conditions. The results, which are at present incomplete, go to show that in conditions where the blood pressure falls very low before death, such as shock and haemorrhage, all the active principle is washed out of the pituitary into the circulation, and very little remains in the gland. There is some evidence that the amount present in the gland is increased in pregnancy and also in diseases of the other ductless glands, but these points require further investigation.

JOHN DONALD, M.D., C.M.

THE ACTION OF HEDONAL OR OTHER ANAESTHETICS UPON ANIMALS, USED MAINLY AS WOULD BE DONE IN THE HUMAN SUBJECT.

EXPERIMENTS have been made on the action of "hedonal" by intravenous injection in animals:

1. Action on auricle and ventricle.
2. Effect on the vessel walls.
3. Muscle—effect on contractility.
4. Nerves—effect on excitability and conductivity, effect on the vagi.
5. Respiration.
6. Anaesthetic effect.

LEONARD FINDLAY, M.D.

TUBERCULOSIS AND TETANY.

DR. FINDLAY has been engaged on two problems: (1) The effect of light and drying on the bovine and human types of the tubercle bacillus, and (2) on the relationship of infantile tetany to rickets.

The work on the tubercle bacillus is being continued, but as yet there is nothing to report beyond what was published by Dr. Martin and himself in the *BRITISH MEDICAL JOURNAL* for December, 1914.

Most time has been spent on the question of tetany, its cause and relationship to rickets, but as yet the results are not sufficient to warrant the expression of any opinion. This work is also being continued.

IVY MACKENZIE, M.D.

ARTERIO-SCLEROSIS AND ITS RELATION TO
KIDNEY DISEASE.

The report is based on the examination of 14 cases, in 6 of which the disease appeared to be primarily arterial and general, while in 8 it appeared to be renal in origin.

1. In those cases of arterio-sclerosis which came to *post-mortem* examination, the heart varied in weight from 17 to 25 oz., and the kidneys were in each case larger than normal. In 4 of the kidneys, there was a distinctly granular appearance, after stripping the capsule; in one case there was a very slightly granular appearance, and in another case the kidney surface was quite smooth. The sclerotic condition of the arteries was general, and in each case was more marked in the mesenteric arteries than in any others in the body. In some cases the small arterioles protruded from the cut surface of fat in the axilla, groin, and mesentery, just as they did from the cut surface of the kidney. In all these cases the lesions—cardiac, renal, and arterial—are probably secondary to a functional disturbance of the vasomotor mechanism controlling the tonicity of the arterial musculature. The kidney changes are probably the result, in the first instance, of a deficient blood supply resulting from contraction of the small arterioles in an organ where the blood has passed through two systems of capillaries between the arteries and the veins.

2. These cases of arterio-sclerosis are quite distinct from cases of kidney disease of a chronic character, in some of which the heart may be enlarged, and in others of which the heart may not be enlarged. Cardiac enlargement is not an inevitable result of any form of chronic kidney disease, but it is an inevitable result of any such cases of arterio-sclerosis as are referred to in the preceding paragraph. To what extent certain cases of chronic kidney disease predispose to an increase in the general blood pressure through increased vascular tonus is a question for further study.

NATHAN MITCH, M.D., B.C.

INVESTIGATION OF POINTS CONCERNING THE
PATHOLOGY OF CHRONIC INTESTINAL INFEC-
TIONS.

DURING the past year several points concerning the pathology of chronic intestinal infections have been investigated, and the conclusions reached are:

1. Parahydroxyphenylacetic acid is often excreted in the urine by constipated patients.
2. The infection of the ileum with organisms of the *B. coli* group varies in intensity directly as the degree of ileal stasis.
3. In constipation the excretion of indoxyl, indolacetic acid, and parahydroxyphenylacetic acid in the urine varies directly as the degree of infection of the ileum with *B. coli* and its mutants.
4. The duodenum in diabetes mellitus is usually greatly enlarged, and has in two cases been shown to be severely infected with *Streptococcus brevis*. This organism is rarely found in other conditions.
5. Ileal stasis is frequently present in diabetes mellitus, and in proportion to its severity affects the prognosis adversely.
6. Chronic multiple arthritis has been found to be associated with chronic infection of the duodenum, ileum, mesenteric glands, and blood with pyogenic staphylococci. These organisms have not been found in these localities in other diseases.

More detailed accounts of these researches will be found in the following articles published during the last year:

1. The Isolation of Parahydroxyphenylacetic Acid from the Urine in Disease (*Journ. Physiol.*, 1914).
2. Bacterial Activity in the Alimentary Tract (*Brit. Journ. of Surg.*, 1915).
3. Bacterio-chemistry of the Ileum (chapter in Lane's *Operative Treatment of Chronic Intestinal Stasis*, 1915).
4. The Duodenum in Diabetes Mellitus (*Practitioner*, 1915.)
5. Chronic Staphylococcal Infection of the Alimentary Tract as a Cause of Chronic Arthritis. (*American Medicine*, 1915).

List of Grantees whose Researches are not yet Completed and who are Continuing their Work.

GOODBART, Gordon W., M.B., B.C.

Tumour growth in relation to anaplasia.

KENNWAY, E. L., M.D., M.A.

1. Estimations of the amounts of different acetone bodies in the blood in diabetic comas and other conditions in conjunction with investigation by Dr. Foulton of reaction of blood in pathological conditions.
2. Investigation of metabolism of two isomers of β -oxybutyric acid in diabetes and other conditions.
3. Testing of methods for estimation of acetone bodies in blood.

KNOWLES, Kate, M.D., B.S.

1. The causes of osteomalacia.
2. The action of extracts of ductless glands on the disease.
3. Examination of blood, urine, and ovaries of patients suffering from osteomalacia.

PEMBREY, M. S., M.D., B.Ch.

Continuation of observations on secretion of sweat in cases of injury or disease of nerves. Respiratory exchange of infants in health and in disease. Continuation of observations upon influence of anaesthetics and narcotics upon respiratory exchange.

RYFTEL, J. H., B.C., M.A.

1. On acid formation, especially lactic acid formation, in the alimentary canal in infants, with reference to diet and the possible effects on metabolism.
2. The relation between chloride in blood serum and in urine under physiological and pathological conditions (*continued*).

STEWART, M. J., M.B., Ch.B.

The study of the nature and conditions of occurrence of foreign-body giant cells and the investigation of the relation of cholesterol to various lesions both in man, and, under experimental conditions, in animals.

SYMES, W. L., M.R.C.S.

Effect of digestive juices on digitalis glucosides. Mutual influence of digitalis glucosides on the activity of each other.

List of Grantees whose Researches are in Abeyance owing to the War.

BACH, Edward, M.B., B.S.

The relation between the pathogenic and non-pathogenic acid-fast bacilli.

CASSELLS, W. L., M.B., Ch.B., B.Sc.

The action of thyroid on the nervous mechanism of the heart. The interaction of the thyroid and the suprarenals on nerve endings, and on blood pressure.

CLARK, Alfred J., M.D.

To determine the manner in which the electric variations of the mammalian heart are modified when the composition of the circulating fluid is altered.

COPLANS, Myer, M.D.

Action of the silicates upon bacteria, with special reference to immunity.

DEAN, Henry R., M.D., B.Ch.

- (a) The mode of formation and nature of complement.
- (b) The nature of interaction of antigens and antibodies.
- (c) The serum diagnosis of tuberculosis.

DOUGLAS, J. S. C., M.D.

Immunity reactions in animals suffering from experimental renal necrosis.

EMRYS ROBERTS, E. M.D., Ch.B.

The effects upon the respiratory system of particles of coal dust and shale—of varying composition—with special reference to the incidence of pulmonary tuberculosis amongst workers in coal.

GROVES, E. W. Hey, M.D., M.S.

Application of operative treatment of fractures to horses and dogs. Also some investigations on the repair of fractures in cats by bone-grafting.

LAIDLAW, P. P., B.C., M.A.

The electrical response in the heart as a result of a paradoxical action of the vagus nerve.

PEDEX, Andrew, M.B., Ch.B.

The retention of iodine and bromine in the thyroid gland. The output of acetone as influenced by different diets.

POULTON, E. P., M.D., M.R.C.S.

Investigations on the metabolism and reaction of the arterial blood in various pathological conditions by Barcroft's and other methods.

A list of periodical publications, official reports, and Blue Books in the Library of the British Medical Association available for issue to members on loan has been printed, and copies can be obtained free on application to the Librarian, at the house of the Association, 429, Strand, W.C. The regulations governing the loan of these publications are stated in the introduction to the list. The Library is open for consultation from 10 a.m. till 5 p.m. (on Saturdays till 2 p.m.).

Meetings of Branches and Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

NORTH OF ENGLAND BRANCH.

The annual meeting of the North of England Branch was held at the Royal Victoria Infirmary, Newcastle-upon-Tyne, on August 10th. Considering the urgent demands on the services of medical men at the present time, there was a good attendance. In the absence of the retiring president, Dr. A. C. Farquharson, Dr. McDOWALL was in the chair.

Election of Officers.—The following officers were elected:

President: Dr. T. W. McDOWALL (Morpeth).
President-elect: Dr. A. E. MORISON (Sunderland).
Vice-presidents: Dr. C. G. MACLAGAN (Berwick-on-Tweed), Major L. G. DILLON, M.D. (Seaham Harbour).
Secretary: Dr. J. DON (Newcastle).
Scientific Secretary: Staff Surgeon R. J. WILLAN, R.N.V.R., F.R.C.S.

Dr. McDOWALL, in proposing a vote of thanks to the retiring president, said that though Dr. A. C. Farquharson had been mobilized at an early stage of the war he had at first been able to attend the meetings, but not latterly. The Branch, however, was grateful to Dr. Farquharson for the services he had rendered as president, and a vote of thanks was heartily accorded him. A telegram was subsequently received from Dr. Farquharson sending his best wishes, and congratulations to the new president, Dr. McDOWALL.

Annual Report.—The report of the Branch Council showed that the efforts of the Branch on behalf of its members had been both numerous and varied, and, despite the prevailing conditions in the medical world, had been highly successful. It was felt, however, that the unsuccessful efforts which had been made to secure a grant on behalf of the widow of a deceased member who had suffered through his loyalty to the Association should not be allowed to rest, and it was agreed to make a local appeal on her behalf. The financial statement for the year 1914 showed that there was a balance in hand on December 31st, 1914, of £117 6s. 1d., which, however, was more than expended in paying the accounts which became due in January, a deficit being then left of £3 1s. 5d.

Uncertified Midwives.—The HONORARY SECRETARY read a letter from Dr. Hill, M.O.H. of the County of Durham. From this and other sources of information it appeared that practice by uncertified midwives was on the increase in the county, and there was reason to believe that certain medical men encouraged it and even took advantage of the services of these women to attend patients for whom they themselves were responsible. Several speakers strongly deprecated such a relationship between doctors and the uncertified midwives, and the following resolution was unanimously agreed to:

That this annual meeting of the North of England Branch condemns the practice which it is led to believe exists, in that certain medical men have professional relationships with uncertified midwives in the carrying out of their midwifery practices.

Vote of Thanks.—A vote of thanks to the Honorary Secretary for his services during the year concluded a highly successful business meeting.

SOUTH MIDLAND BRANCH:

BUCKINGHAMSHIRE DIVISION.

The annual general meeting of the Buckinghamshire Division took place at Aylesbury on June 8th, Dr. SHAW in the chair.

Election of Officers.—On the motion of Dr. BRADBROOK, seconded by Dr. BENSON, the office-bearers were unanimously re-elected. The committee was empowered to elect substitutes to fill vacancies caused by present holders being on active service.

Annual Report of the Council.—The annual report of the Council was considered and the recommendation regarding juvenile members of friendly societies agreed to. The recommendation with reference to fees for practitioners called in by midwives was also agreed to, and the

following resolution regarding the difficulty of obtaining these fees was adopted after some discussion:

That the Council be urged to take some action to fix the responsibility for fees to practitioners called in by midwives upon the association or society under which the midwife works.

War Emergency.—Colonel MURRAY, Colonel WARD, Colonel ARCHER, and some twenty officers of the R.A.M.C. in the district were invited to the meeting, and Colonel MURRAY said that there was a demand for men under 40 to take up temporary commissions for service anywhere; also for men over 40 for whole-time service at home in certain cases. Part-time service was confined chiefly to the areas in which troops were billeted or in camp, or where there were temporary hospitals. The duties consist of sick parade, the inspection of sanitary surroundings and arrangements of camp and billets, examination of recruits, visiting sick in billets, or attendance at hospital, sitting on medical boards, etc. He impressed the necessity of being careful in the use of the term "maalingering," unless one could swear to it on all points, and advised the use of the phrase, "Going sick without sufficient cause." Dr. SHAW, in proposing a vote of thanks, commented on the disparity between the pay of the temporary lieutenants and of the R.A.M.C. Territorials. Colonel MURRAY explained the difference as to terms of service between the R.A.M.C. and R.A.M.C. Territorial, and stated that temporary commission was for one year, or the duration of the war if that be less than one year. Colonel MURRAY, in reply to a question by Dr. HENDERSON regarding the amount of records to be kept, pointed out the importance of certain documents which had to be filled up, particularly those with reference to invaliding. In reply to Dr. ROSE, he stated that the appointment for part-time services would not carry a commission, and those willing to offer services should write to him (Colonel Murray, 35, Spring Road, Bedford). Colonel Murray made an emphatic request that certificates for extension of furlough on the ground of unfitness should not be granted indiscriminately, and stated that if not confined to bed the man should be sent to join his regiment and report sick on arrival, when the medical officer will decide what to do with him. A hearty vote of thanks was accorded to Colonel Murray.

Trench Foot.—The members present were entertained at tea by the Chairman, and afterwards Lieutenant C. KERNE read a paper on trench foot, showing two cases which were well on the way to recovery. One occurred in December and the other in February. Both presented the same symptoms—intense pain in metatarsophalangeal joints, and early numbness followed by swelling extending to the ankles; the swelling increased, blebs appeared on the dorsum of the foot, and filled with blood-stained serum. As the swelling subsided ulceration appeared on the site of the blebs, and, later, gangrenous sloughs. The affected areas were early anaesthetic, and in cases shown the anaesthesia still persisted in the healed toes. He and Lieutenant KNOCKER, whose cases they were, had found colloidal argentinum valuable in the treatment of the ulcerated surfaces. In the case contracted in February the dorsum of the foot was still purple, puffy, and cold to the touch, and both had intense pain in the metatarsophalangeal joints if they were moved.

Members on Active Service.—On the motion of Dr. BENSON, seconded by Dr. LONG, the meeting passed a hearty vote of good wishes for the members on service.

THE LIBRARY OF THE BRITISH MEDICAL ASSOCIATION.

BOOKS NEEDED TO COMPLETE SERIES.

THE Librarian will be glad to receive any of the following volumes, which are needed to complete series in the Library:

- American Association of Genito-Urinary Surgeons. Transactions. 1906.
- American Climatological Transactions. Vols. 1, 4, 5, 6.
- American Dermatological Association Transactions. Vols. 5, 7, 8, 11, and 29.
- United States Department of Agriculture, Bureau of Animal Industry. Reports 1-7, 10-14.
- United States Hygienic Laboratory Bulletins. Nos. 3, 8, 9, 10, 11, 12, 13, 15, 17, 18, 19, 24, 29, 43.
- Virchow's Archiv. Vols. 1-150.
- Watt. Bibliographia Britannica, 4 vols., 1824.
- Yearbook of Pharmacy. 1912.

British Medical Association.

INSURANCE ACTS COMMITTEE.

A MEETING of the Insurance Acts Committee was held at the office of the British Medical Association on Thursday, August 19th, when Dr. J. A. MACDONALD, LL.D., was in the chair. The other members present were:—England and Wales: Dr. T. Ridley Bailey (Bilston), Mr. H. B. Brackenbury (London), Dr. T. Campbell (Wigan), Dr. Olive Clayton (Oldham), Dr. J. Divine (Hull), Major A. C. Parquharson (Spennymoor), Lieutenant E. R. Fothergill (Here), Dr. P. V. Fry (Sowerby Bridge), Dr. Major Greenwood (London), Mr. R. Harding (New Radnor), Mr. P. Napier Jones (Reading), Dr. B. A. Richmond (London), Mr. Harding H. Tomkins (Leyton), Dr. W. B. Crawford (Treasure (Cardiff)). Scotland: Dr. John Adams (Glasgow), Dr. J. R. Dreyer (Glasgow), Lieutenant J. Hunter (Corstorphine). *Ex officio*: Mr. E. B. Turner, Chairman of Representative Meetings.

The minute of the meeting of August 5th regarding the appointment of the Executive Committee having been rescinded, it was decided to increase the Executive Subcommittee to eleven members, in addition to the Chairman *ex officio*, and to invite Dr. T. Jenner Verrall to accept one of the vacancies. Dr. T. Ridley Bailey, one of the Panel Committees' representatives, was elected to the other vacancy.

Dr. W. Ainslie Hollis (Brighton) was co-opted as a non-panel practitioner to serve on the Insurance Acts Committee.

DRUG TARIFF.

Most of the sitting was taken up by consideration of the question of drug supply finance, in the event of the introduction of a commercial tariff. Further discussion was adjourned to a meeting to be held on August 26th.

CORRESPONDENCE.

THE INSURANCE ACTS COMMITTEE AND ITS WORK.

SIR,—We cannot be mistaken in assuming that your leading article of August 14th last gives authoritative expression to the feeling of the British Medical Association. In this article we find published an emphatic disapproval of a circular recently issued by the Panel Medico-Political Union. The union finds itself charged with ignorance of the present security of the panel profession. If it is to escape from the charge of ignorance it must fall under the imputation of "malice," though towards what body—whether the British Medical Association, the Commissioners, or the panel profession itself—we are not at all informed. In any event the Panel Medico-Political Union has in the mind of our critic "set afoot a false alarm," and "played upon the fears" of the panel practitioner in the hope that a crop of new members may "be frightened into its ranks." That the fear did exist is on all hands admitted—this is allowed us even by our critic. We assert that a grave financial danger continues to await the panel profession, and we contend that the degree of that danger is materially enhanced by the fact that its incidence is no longer furnished with a date.

Our critic is of opinion that a danger under a cloak is a danger diminished. We, on the contrary, believe that it is a danger increased. Nothing short of a Governmental pledge of a three years' grant induced the medical profession to accept service under the Act. Attached to that pledge was a reconsideration and revision which, in the ordinary course, was to take place in July last—six months before the stipulated time. *This period of three years under a Government pledge, with a fixed date for revision, was, in our opinion, a term of three years of guaranteed security.* Much as our critic may dislike the phrase, we assert that the term has well nigh run its appointed course. Indeed, this expression is inadequate by the over-modesty of its statement.

Our critic is entirely reassured by an extension of the grant for three months. "It need only be pointed out," he remarks, "that the 2s. 6d. was voted in the Estimates for 1915-6, and no alteration of the terms of remuneration can take effect before March of next year at the earliest."

Our comment upon this statement is a very material one. *A definite pledge of a number of years, and running between precise dates, is a state of affairs altogether different from a system of dates meted out at intervals to cover a period of indecision in the mind of the Government.* Does any one believe that it was the intention of the Government to renew the grant at the time of the revision? Surely not. The postponement of the whole matter was due to the absence of so many medical men who are giving their services in the field. A reduction of their incomes could not with decency be carried out in their absence. Had the Government intended to renew the grant there had been no occasion for postponement. But why in these circumstances has not the Government renewed its pledge for a full year or for a period covering the duration of the war? And why has it not appended to that pledge a guarantee that no revision of terms shall take place later than six months before the termination of the grant? This would have been straightforward dealing. No! We see here a recognition on the part of the Government of "an unforeseen contingency" in the shape of such a financial embarrassment as may lay them under the necessity of reducing civil expenditure. It is to this unforeseen contingency that Sir Robert Morant, in our opinion, makes allusion—a contingency which is to preserve to the Commissioners the right of taking action at eight weeks' notice. What man of judgement can doubt that such a season of financial crisis lies in the immediate future as has perhaps never in past history fallen upon this country. Into this straitened period the panel profession is advancing, seduced by a system of short periodical extensions of the Treasury grant and comforted by ill defined reassurances from high places. The panel community together with others is prepared to take its share in national sacrifice, but it demands to be treated openly and provided with full opportunity for business discussion.

We have shown that in place of ignorance we are in full possession of the facts, and what is perhaps more important, that our mind has passed through those facts to their proper interpretation. We propose to pause for a moment upon an illuminating statement from the pen of our critic. "No alteration in the terms of remuneration," writes this gentleman, can take effect before March of next year at the earliest! with which statement we find ourselves in complete agreement, but, continues he, "whether or not any attempt will be made at that time to revise the terms, it is quite likely that the medical profession will have ample warning through the British Medical Association" (!) Our critic, if he indeed means what he writes, presents to us the ominous possibility that the termination of the grant may mark the date chosen for revision. This picture of the labourer deprived of his accustomed wage and continuing his task with no fixed scale of payment while he bargains with his employer makes bright comedy! Unfortunately, however, it makes bad business! The smile is seen upon the lips of the employer be it understood—the bad business will be found in the pockets of the labourer! But did our critic mean what he has written, or in the sentences we have quoted did he endeavour to conceal the fact that if the grant is not to be renewed next March it is already high time that we were preparing ourselves to meet the necessary revision? Did our critic guess that herein lay the *raison d'être* of our circular appealing to the panel profession? Remembering who it is who has charged us with stupidity on the one hand or with misrepresentation upon the other, we hold him now upon the horns of this dilemma. Struggle how he may he shall not extricate himself from his difficulty except he leave behind him either his good sense or his honesty. Bereft of one or other of these polemical requisites, he will be hard put to it to explain to the world how an ample warning on the part of the British Medical Association provides the panel profession with a loss of their present remuneration and a bargain for their future emolument, coincidentally, in the month of March, 1916.

If the flattering description which our critic renders of the new standing Insurance Acts Committee is to be taken at its face value, what occasion is there for such a body as the Panel Medico-Political Union!

We must defend, it appears, our very existence. The necessity for such defence has about it a somewhat humorous peculiarity. This is inevitable when we place

upon record our confident belief that the constitution of this new Insurance Acts Committee is the direct outcome of our own example. When the Insurance Act came into operation the British Medical Association was an ancient and revered organization. As month after month passed by it became apparent that the business of the Association was but little concerned with the affairs of the panel profession; that, speaking generally, its members of council were not themselves engaged in panel practice; that, in fact, many of them were antagonistic to the panel system altogether, provided a sufficient explanation. The appreciation of this point led naturally enough to the formation of the Panel Medico-Political Union—a new and independent body with a constitution of panel men only, and devoted to panel interests alone. The steady growth of this new organization has been accompanied by an increasing activity in the British Medical Association. That each new step adventured by the union has provoked an outburst of energy in the same direction in the elder body has given us courage and built up our confidence. Any discouragement arising in the course of our activities has always been countered by the consciousness that at least we existed as an efficient stimulus. Need we remind the profession that it is in the nature of a stimulus to create irritation, and that the relief from irritation in the sting of criticism is after all an appropriate phenomenon.

And to-day we have the new standing Insurance Acts Committee, of whose twenty-five members "seventeen are actually insurance practitioners." We enjoyed "actually." There is a sort of iridescent play and double meaning about the word which touched for a moment our lighter vein of humour. But, seriously, seventeen members out of twenty-five on that Committee are actually Insurance practitioners! Surely we should be satisfied! The figures look well and the words sound finely, but what degree of meaning are we to attach to that word "actually"? To what depth of actuality in panel practice are these gentlemen engaged. We will challenge them to declare that actuality.

For how many panel patients are these seventeen members personally responsible? We venture to think that the publication of these individual and true figures will place the members of the Committee in an invidious position. The council of the Panel Medico-Political Union will stand pledged to do the like. It should prove an interesting comparison! A few panel patients and a handsome private practice; a big panel practice with a few handsome patients—can we not see these two men and the wide world of difference in their respective attitudes? But for us this does not end the matter; when all is said, the decisions of the standing Insurance Acts Committee are at the mercy of the Association. The British Medical Association does not reflect the soul of the panel man nor the heart of the general practitioner. Through the failure to recognize this piece of wisdom the rank and file of our profession are suffering the sad consequence to-day. Upon the ranks of the profession is now weighing the obligation of supplying gratuitous attendance to the dependants of between three and four million persons. That a hasty and inefficient endeavour was made to gauge the feelings of the general medical world we readily admit. But that the idea emanated from and was imposed by the Association is a point which cannot be sufficiently emphasized. That the general practitioner upon whom the whole weight of this philanthropy has fallen is disallowed the dignity of exercising his personal discretion is an index of the attitude held towards him by those who are supposed to represent his interests. The event has proved that the great mass of dependants are to-day in better financial circumstances than in the time of peace. Many a practitioner has found himself in the anomalous position of pocketing a fee tendered with a tact and a delicate insistence which indicates only too clearly that the cloak of philanthropy has been lifted from the shoulders of the physician to be carried with dignity upon the person of his humble client! Such incidents sharply point the panel profession to the need of personal organization. When the continued growth and popularity of the Panel Medico-Political Union shall have made that institution the accredited body of the panel practitioner blunders of the type indicated will find less opportunity for reaching their fruition. Every new advantage is tinged with a regret. Perhaps in times

to come we may lament the impossibility of producing so humorous a spectacle as that we enjoy to-day—we allude to the picture of the British Medical Association enjoying the glorious exercise of a vicarious patriotism.—I am, etc.,

A. WELPLY,

General Secretary.

London, E.C., Aug. 24th.

The letter from the Secretary of the Panel Medico-Political Union seems to be an attempt to beg for a perfectly clear position. If times had been normal, the Government would have been justified in revising the financial bargain at the end of this year; but times are not normal, and the British Medical Association has obtained from the Commissioners an assurance that no attempt will be made to force any revolutionary propositions on panel practitioners during the war. When the war is over the profession must of course be ready to meet the situation. Dr. Welply claims that everything useful that the Insurance Acts Committee has done has been done at the instigation or because of the fear of the Panel Medico-Political Union. This is as true as the repeated assertions of that body that it was owing to its exertions that the unallocated funds in London and Glasgow were distributed to the panel practitioners—assertions which we leave to the Panel Committees of those areas to characterize. May we suggest to Dr. Welply that his concluding paragraph is an aspersion on the practitioner who is willingly giving his services in suitable cases to soldiers' dependants? To suggest that this service is "imposed" on him by the British Medical Association, and that but for its power these practitioners would not be taking part in an effort of which the profession is justly proud, is an insult to the intelligence as well as to the patriotism of the profession.

Lieutenant CHARLES FORBES, R.A.M.C.(T.), writes under date August 18th: The Insurance Acts Committee, as resuscitated by the Representative Body, is, as the article in the JOURNAL of August 14th points out, on its trial. That the Committee, as now constituted, will prove a most admirable clearing house for Panel Committees, and that it will prove itself generally to be indispensable to Panel Committees in the proper discharge of their administration, no one can more sincerely desire than the writer. As one who has had experience of the advantages of a central body in assisting a Panel Committee I would urge all Panel Committees to respond to the appeal made in the leading article referred to and make the Committee their "central agent," and thus "build up a strong central and peripheral organization." If I could I would desire to make a "stirring appeal," for this is surely a question that is vital to the interests of all panel men. The leading article, no doubt voicing the opinions of the majority of the members of this Committee, recognizes that a strong organization has not been made by the reconstitution of the Insurance Acts Committee; nor, indeed, could it, when only 6 out of a Committee of 26 are directly representative of the insurance practitioner. In a former letter I urged panel men to bestir themselves and secure a strong central organization to fight their battles when the next big fight comes along. The Insurance Acts Committee linked up with the Panel Committees, and guided by an annual or more frequent conference between these Committees, and having amongst its members seventeen practitioners with experience of panel work, is an admirable central body for administrative purposes if the Panel Committees care to make it so. It has done good work in the past, and with the hearty co-operation of the local committees it should do even better work in the future in negotiating with or fighting the Commissioners over details of administration, such as the "drug tariff," etc. Like the writer of the leading article and Mr. Fothergill, I have a contempt for "mischievous divisions" or any attempt to break up the profession into groups. The British Medical Association holds the field as the only organization that is likely efficiently to represent panel practitioners, and this for reasons obvious to all who have followed the course of medical politics in recent years.

There is all the more need for wisdom on the part of those who are guiding the policy of the Association in these times of remodelling things medical. The best organization would undoubtedly be one representative of insurance practitioners having the hearty support of the whole profession. I notice that the idea of making the British Medical Association a sort of federation of

Norwich, 16.43 in Darlington, 18.78 in Snettwhick, 22.17 in Barnsley, 23.13 in Middleton, and 29.80 in Burnley.
Infant mortality, measured by the proportion of deaths among children under 1 year of age to registered births, was equal to 99 per 1,000 in London, the proportion being 92 in 1,000 white children in other towns it ranged from 33 in Hastings, 44 in Oxford, 47 in Hornsey, 48 in Wallasey, 51 in Wimbledon, 53 in Lincoln, 57 in Bath, and 58 in Leyton, to 136 in Northampton and in Wolverhampton, 137 in Tyne-mouth, 138 in Sheffield, 147 in Burnley, 152 in Middlebrough, and 175 in Wigan.

The causes of 565, or 0.8 per cent., of the deaths registered in the ninety-six towns last quarter were not certified either by a registered medical practitioner or by a duly qualified medical officer. Among the causes of all the deaths were duly certified; among the other towns the highest proportions per cent. of uncertified deaths recorded were 3.5 in St. Helens, 4.4 in Wigan, 4.5 in Gateshead, 5.3 in Dudley, 5.5 in Beccle, 7.1 in Warrington, and 16.1 in Gillingham.

HEALTH OF ENGLISH TOWNS.

In ninety-six of the largest English towns 7,925 births and 3,979 deaths were registered during the week ended Saturday, August 28. The annual rate of mortality in these towns, which had been 11.4, 11.3, and 11.5 per 1,000 in the three preceding weeks, fell to 11.4 per 1,000 in the week under notice. In London the death-rate was equal to 12.5, while among the ninety-five other large towns it ranged from 4.7 in Hornsey, 5.2 in Hastings, 6.1 in Coventry, 6.4 in East Ham and in Swansea, 6.6 in Gillingham, and 6.7 in Bath, to 16.1 in stockport and in Middlebrough, 17.0 in Liverpool, 19.7 in South Shields, 19.9 in Wigan, 22.5 in Gateshead, and 23.1 in Burnley. Measles caused a death-rate of 1.2 in Middlebrough, 1.3 in Gateshead, 2.0 in Aberlary, 2.9 in Barnsley, and 3.5 in Lincoln. The deaths of children from diphtheria and enteritis, which were 171, 226, and 262 in the three preceding weeks, further rose to 348, and included 85 in London, 39 in Liverpool, 22 in Birmingham, 17 in Manchester, 15 each in Sheffield and Hull, and 13 in Leeds. The mortality from the remaining infectious diseases showed no marked excess in any of the large towns, and no fatal case of small-pox was registered during the week. The causes of 30, or 0.8 per cent., of the total deaths were not certified by a registered medical practitioner or by a coroner; of this number 7 were recorded in Birmingham, 6 in Liverpool, 4 in Sunderland, 3 in Gateshead, and 2 in South Shields. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 2,361, 2,436, and 2,415 at the end of the three preceding weeks, fell to 2,437 on Saturday, August 21st: 225 new cases were admitted during the week, against 294, 285, and 279 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In the sixteen largest Scottish towns 967 births and 552 deaths were registered during the week ended Saturday, August 28. The annual rate of mortality in these towns, which had been 13.8, 13.7, and 12.6 per 1,000 in the three preceding weeks, further fell to 12.3 in the week under notice, but was 0.9 per 1,000 above the rate in the ninety-six large English towns. Among the several towns the death-rate ranged from 4.4 in Perth, 9.3 in Ayr, 10.2 in Glasgow, 10.4 in Aberdeen, 14.7 in Dundee, and 17.2 in Paisley. The mortality from the principal infective diseases averaged 1.6 per 1,000, and was highest in Dundee and Paisley, 2.85 deaths from all causes in Glasgow included 13 from measles, 13 from infantile diarrhoea, 4 from whooping cough, 2 from diphtheria, 1 from enteric fever, and 1 from scarlet fever. Three deaths from measles were recorded in Edinburgh, 2 in Aberdeen, and 1 in Paisley. In Glasgow 4 deaths from diphtheria and 1 from diphtheria 3 deaths in Paisley; and from infantile diarrhoea 8 deaths in Dundee.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index) to Advertisements—Important Notice re Appointments appearing in our advertisement columns, and particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

ASBTON-UNDER-LYNE UNION.—Resident Assistant Medical Officer for the Workhouse. Salary, £250 per annum.
BRIMMINGHAM AND MIDLAND EAR AND THROAT HOSPITAL.—House-Surgeon. Salary, £100 per annum.
BRIMMINGHAM AND MIDLAND EYE HOSPITAL.—Junior House-Surgeon. Salary, £100 per annum and £5 per week.
BRIMMINGHAM.—CITY FEVER HOSPITAL.—Resident Lady Medical Officer. Salary, £250 per annum.
BLACKBURN AND EAST LANCASHIRE ROYAL INFIRMARY.—Senior and Junior House-Surgeons. Salary, £200 and £250 per annum respectively.
BRISTOL ROYAL HOSPITAL FOR SICK CHILDREN AND WOMEN.—Junior Resident Officer. Salary, £100 per annum.
BRISTOL ROYAL INFIRMARY.—(1) Resident Obstetric and Ophthalmic House-Surgeon; salary, £120 per annum. (2) Dental House-Surgeon; salary, £120 per annum.
BUXTON.—DEVONSHIRE HOSPITAL.—Assistant House-Physician. Salary, £100 per annum.
CARDIFF.—KING EDWARD VII HOSPITAL.—House-Surgeon. Salary, £150 per annum; 21s. allowed weekly for working single-handed.
CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park, E.—Assistant Resident Medical Officer. Salary, £150 per annum.
DEVONPORT.—ROYAL ALBERT HOSPITAL.—House-Surgeon. Salary, £150 per annum; 21s. allowed weekly for working single-handed.
EVELINA HOSPITAL FOR SICK CHILDREN, Southwark.—(1) House-Physician; (2) House-Surgeon. Salary, £75 per annum each.
FALKLAND ISLANDS.—Colonial Dental Surgeon. Salary, £300 per annum.
FOLKESTONE.—ROYAL VICTORIA HOSPITAL.—House-Surgeon. Salary, £150 per annum.
GUILDFORD.—ROYAL SURREY COUNTY HOSPITAL.—House-Surgeon. Salary, £135 per annum.

HASTINGS.—EAST SUSSEX HOSPITAL.—House-Surgeon. Salary, £100 per annum.

HOSPITAL (SPECIAL) FOR MENTAL CASES UNDER THE WAR OFFICE.—Resident Medical Officer.

KENSINGTON AND FULHAM GENERAL HOSPITAL, Earl's Court, S.W.—Dental Surgeon.

LANCASHIRE COUNTY COUNCIL.—Medical Superintendent at High Carley Sanatorium. Salary, £450 per annum, rising to £550.

LEEDS PUBLIC DISPENSARY.—Lady Resident Medical Officer. Salary, £130 per annum.

LIVERPOOL INFIRMARY FOR CHILDREN.—(1) Two Resident House-Physicians; (2) Resident House-Surgeon. Salary, £30 each for six months.

MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN.—House-Surgeon. Salary, £120 per annum.

MANCHESTER ROYAL INFIRMARY.—General Superintendent and Secretary. Salary, £70 per annum.

MIDDLEBROUGH.—NORTH ORMESBY HOSPITAL.—House-Surgeon. Salary, £150 per annum.

MIDDLESEX COUNTY ASYLUM, Napsbury.—Temporary Assistant Medical Officer. Salary, 45 fs. per week.

NOTTINGHAM GENERAL HOSPITAL.—Assistant House-Surgeon. Salary, £250 per annum.

QUEEN CHARLOTTE'S LYING-IN HOSPITAL, Marylebone Road, N.W.—District Resident Medical Officer. Salary, 450 per annum.

READING.—ROYAL BERKSHIRE HOSPITAL.—Resident Clinical Assistant. Salary, £150 per annum if qualified, and £75 if unqualified.

ROYAL FREE HOSPITAL, Gray's Inn Road, W.C.—Resident Medical Officer (male) to the Military Block.

ST. MARY'S HOSPITAL, Paddington, W.—Resident Medical Officer for the Isolation Wards. Salary, £100 per annum.

ST. PETER'S HOSPITAL FOR STROKE, Henrietta Street, W.C.—Junior House-Surgeon. Salary, £75 per annum.

SALFORD ROYAL HOSPITAL.—(1) Resident Surgical Officer; (2) House-Physician; (3) House-Surgeon; (6) Junior House-Surgeon; (5) Casualty House-Surgeon. Salary for (1) £120, (2) £110, and (3), (4), and (5) £100 per annum and £5 per month war bonus.

SALISBURY GENERAL INFIRMARY.—Assistant House-Surgeon. Salary, £100 per annum.

SOUTHAMPTON.—ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL.—House-Surgeon. (2) House-Physician. Salary, £200 and £150 per annum respectively.

STORTES HALL ASYLUM, Kirkburton. Locomotives. Salary, £65 per week.

WANDSWORTH UNION INFIRMARY, S.W.—Female Assistant Medical Officer. Salary, £200 per annum.

WELSH METROPOLITAN WAR HOSPITAL, Whitechurch.—Resident Surgeon and Resident Physician.

WEST BROMWICH AND DISTRICT HOSPITAL.—Assistant House-Surgeon. Salary, £120 per annum.

WEST HAM AND EASTERN GENERAL HOSPITAL, Stratford.—(1) Resident Medical Officer; (2) House-Physician and House-Surgeons. Salary for (1) £160 per annum, and for (2) £120 and £100 per annum respectively.

WHITECHAPEL UNION INFIRMARY.—Second Assistant (female) Resident Medical Officer. Salary, £300 per annum.

WIGAN.—ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Junior House-Surgeon. Salary, £150 per annum.

CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointments: Eichenbrough (Kent), Lettermey (co. Donegal), Milford Haven (Pembrok).

To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found, it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

COOMER. A. B., M.R.C.S., L.R.C.P., Temporary Assistant Medical Officer at the Hendon Infirmary of the Westminster Union.

SALISBURY. Henry M. D., R.C.P., etc., Medical Officer and Public Vaccinator, No. 5 District, Leicester Union.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s., which sum should be forwarded in Post Office Orders or Stamps with the notice not later than the first post Wednesday morning in order to ensure insertion in the current issue.

BIRTHS.

SEDWICK.—On the 16th of August, at Baveno, Theybergh, near Rothbarth, to the wife of G. H. Sedwick, M.R.C.S., L.R.C.P., a son.

TAYLOR.—At Kola Bharu, F.M.S., on 12th or 13th August, the wife of L. H. Taylor, M.B., of a son. (By eulic.)

WAIN.—On the 23rd August, at the Clipping, Wotton-under-Edge, Glos., the wife of H. Welshman Ward, F.R.C.S. Edin., of a son.

MARRIAGES.

COLTHER-KING.—On the 19th inst., at Holy Trinity Church, Claxgate, Surrey, by the Rev.—Garrard, Lieutenant Claude H. Colther, R.M., youngest son of M. R.C.S., etc., Medical Officer of The Larches, Horsham, to Gladys May, daughter of the late Robert King, Esq., J.P., of South Africa.

ROWAN-WILKINSON.—On August 2nd, at the Church of St. Andrew, Leamington, by the Rev. F. Wood, M.R.C.S., etc., Medical Officer and Superintendent, Derby County Asylum, to Sara C. Wilkinson.

DEATH.

JOYCE.—On August 17th, at Glyn Rhonda, Cathedral Road, Cardiff, Robert Conwy Joyce, M.B., C.M., aged 53.

THE WAR EMERGENCY.

THE APPEAL TO THE PROFESSION.

We would press upon our readers the importance of making a special effort to ensure the success of the recruiting scheme for whole-time commissioned medical officers. Notes of the proceedings of each of the meetings of the War Emergency Committee have been published, and it will be evident to the readers of these reports that the need for medical men under 40 years of age is urgent.

The figures of the Committee's register show that one man in every three under the age of 40 and now at home must volunteer to meet the present demand.

The Committee asks therefore that:

1. Men who will volunteer for immediate service should send in their names forthwith to the Committee's secretaries at the offices of the British Medical Association, 429, Strand, London, W.C.; or, if resident in Scotland, to the Convener of the Scottish War Emergency Committee at the Royal College of Physicians, Edinburgh.
2. Men who will volunteer for some late and specified date should send in their names with this date clearly marked.
3. Men who are willing to send their names on a special list of those willing to be called upon for service if and when there is a call for more men in special urgency should send in their names with this qualification noted.

The Committee reports that it is most anxious that local War Emergency Committees should be set up in every area representative of the whole profession. These local committees are necessary to the satisfactory working of the scheme. It will be necessary for these local committees to review the work to be done in their districts and the men who possibly could be spared for foreign service. Local committees alone can safeguard the practices of those who have volunteered. Further, the War Office has agreed to accept the nomination of local committees for men applying for commissions.

The Central Committee is preparing a number of leaflets. These have been drawn up so as to meet deficiencies, personal and local, shown in a voluminous correspondence. Local secretaries are invited to apply for advance copies.

At the meeting of the War Emergency Committee on August 25th the following business was transacted, in addition to that recorded in the *JOURNAL* of August 28th,

p. 333: The Committee considered further the terms of its reference from the Representative Body; it was instructed "to organize the medical profession in England, Wales, and Ireland in such a way as will enable the Government to use every medical practitioner fit to serve the country in such a manner as to turn his qualifications to the best possible use; to deal with all matters affecting the medical profession arising in connexion with the war; and to report to the Council." Dr. Buttar, Chairman of the Executive Subcommittee, suggested that the Committee should go rather further than it had hitherto, and bring before the profession the fact that the War Emergency Committee was willing to enrol medical men under 40 years of age for full-time service, and to arrange that after enrolment such men should be called up as required. The proposal was supported by Major Galloway, and the Committee adopted the following resolution:

That the policy of this Committee be to urge all medical practitioners who are under 40 years of age and physically fit to enrol themselves with the War Emergency Committee to come up for whole-time service whenever called upon by the Committee.

The resolution is intended to include, among others, all men under 40 years of age physically fit for military service who are at present at base hospitals in civilian capacities; and, as already reported, it was resolved at a later stage of the meeting, to ask the Director-General to instruct the Deputy Directors of Medical Services and Assistant Directors of Medical Services not to retain or accept for work in military hospitals at home medical practitioners of military age who are physically fit, but to encourage them to accept commissions in the R.A.M.C. It was further resolved that this principle should apply to those practitioners who have signed the Imperial Service declaration and are at present at work in Red Cross and Voluntary Aid Detachment hospitals. In addition, as already stated, the Committee resolved to address a letter to the governing bodies of hospitals, pointing out the urgency of relieving from their hospital duties those junior members of their resident and visiting staffs who are eligible for commissions in the R.A.M.C., and to notify the British Hospitals Association that such a letter was being issued.

The Medical Secretary of the British Medical Association made a report on the Medical War Register and the work hitherto done by the Committee. In preparing the register it had been borne in mind that in many areas the profession had already been canvassed either personally or by circular, and that much organizing work had already been done. A list of all the practitioners believed to be resident

therein was prepared for each Division, and the names of those known to be already serving in the army or navy were indicated. This was done for England, Wales, Scotland, and Ireland, but not for the metropolitan area, where the matter has been dealt with by a special committee. The lists so prepared were sent to the honorary secretaries of the smaller Divisions, in the hope that from their personal knowledge they might be able to supply the information required. In the case of the larger Divisions the honorary secretaries were consulted as to whether it would be better to send the lists to them or to proceed at once to make individual applications through the central office. The response from the honorary secretaries exceeded expectations, and in almost all cases the lists were promptly returned and in a great deal of valuable information provided. Every assistance was rendered also by the Scottish Medical Service Emergency Committee.

After these lists had been checked every individual in England (excluding the metropolitan area), Wales, and Ireland, about whom information was not sufficiently complete, was approached directly by circular. The number of circulars sent out was 13,500; of these 9,600 were returned. The information given was very full, and the request in many cases elicited expressions of approbation. After the examination of the information so obtained a second appeal was issued to about one thousand persons. From the information obtained a list has been prepared, showing for each area:

1. The number of men already on whole-time war service (total, 5,265).
2. The number of men of 50 years of age and over offering whole-time war service (total, 447).
3. The number of men from 40 to 49 offering whole-time war service (total, 436).
4. The number of men of 40 and under offering whole-time war service (total, 633).
5. The number of men of 40 and under not on whole-time war service, nor offering to undertake it (total, 6,555 up to date).

From these figures it will be seen that there are approximately 6,555 men of military age in England and Wales and Ireland not at present engaged in war service; of these the services of about one-third are at present required. Upwards of 900 men over military age are offering whole-time service, and it is felt that if they could be induced to take up work as locum tenents, as they are for the most part not wanted by the military authorities, they would be instrumental in setting free a number of men who are unable to go unless they can obtain substitutes, local help not being available; a beginning has been made in establishing a War Bureau for locum tenents, to furnish the names of those over military age willing to do such work.

By the courtesy of the General Registrar of the General Medical Council the Committee receives the names of all men newly admitted to the *Medical Register*, and a circular had been sent to all those registered in July. Of 71 replies received all but 20 of those eligible for service were serving or about to serve. An approximate list of those medical men of military age in the area has been supplied to honorary secretaries of Divisions and Local Emergency Committees, and the quota of medical officers each area is expected to provide indicated. It has also been asked that local committees should be established at once.

The general conclusion to be drawn at the present time was that the Committee's register showed that previous to the issue of the last circular many members of the profession did not appreciate the urgency of the position. The correspondence received showed also that there was need for widespread and general appeal to the public for their sincere co-operation in order to make it possible for those doctors who remain at home to carry out the work of the absentees.

THE DEMAND FOR A MIDWIVES BILL FOR SCOTLAND.

By a printer's error the name of A. W. Russell, M.A., M.B., Obstetric Physician, Royal Maternity Hospital, Glasgow, was accidentally omitted from the list of signatories to the Memorial to the Secretary for Scotland and the Lord President of the Privy Council published in our last issue.

LOCAL MEDICAL AND PANEL COMMITTEES.

BOLTON.

LOCAL MEDICAL AND PANEL COMMITTEE.

A MEETING of the above Committee was held on August 10th at the Central Hall, when Sir THOMAS FLITROFF was in the chair. The following elections were made:

Representatives on the Medical Service Subcommittee: Sir Thomas Flitroff, Drs. Mallett, Wright, and Jean Marshall.
Representatives on the Joint Service Subcommittee: Drs. O'Neill and Jean Marshall.
Local Medical and Panel Committee: Dr. Wright in place of the late Dr. Macle.

The Local Pharmacopoeia.—Ten stock mixtures were adopted for the use of practitioners in the area after October 1st, 1915.

Excessive Prescribing.—The report of the Subcommittee on the alleged excessive prescribing was read, and it was decided to caution certain doctors to exercise more care in the future in those directions indicated in the report.

NEWCASTLE-UPON-TYNE.

PANEL COMMITTEE.

The following scheme of medical referees adopted by the Newcastle-upon-Tyne Panel Committee will come into force on September 1st:

1. There shall be appointed by medical societies of each of the three districts in the city, or, failing the societies, by the Panel Committee for the time being, three practitioners (hereinafter called the "referees") for the purpose of examining cases referred to them in a manner hereinafter mentioned and making the necessary reports thereon.
2. The Clerk to the Insurance Committee shall act as secretary in connexion with this scheme.
3. The referees shall meet at the office of the Insurance Committee, 26, Ellison Place, Newcastle-upon-Tyne, and patients shall be examined there. Patients living in the area of one district shall be examined by referees practising in another district.
4. If a panel practitioner desires one of his patients to be examined by the referees, he shall fill up the appropriate form (copies of which will be provided), giving the necessary details, and forward same to the secretary. The secretary will thereupon notify the insured person to attend at his office for the purpose of being examined by the referees, and he will also notify the referees.
5. If an approved society desires any of its members to be examined, they should forward particulars of same to the secretary. The secretary shall then communicate with the doctor in charge of the case, and the procedure outlined in the preceding paragraph shall be followed. The approved society shall pay a fee of 10s. 6d. for each person so examined. All fees received shall be placed into a separate account, and distributed at the end of the year among the referees.
6. The secretary shall send a copy of the report of the referees to the panel practitioners and society concerned, if the society initiated the proceedings.
7. Nothing herein contained shall be deemed to take away the duties and obligations of medical practitioners on the panel under the Medical Certification Rules.
8. This scheme shall come into operation on September 1st, 1915, and will remain in force until the national scheme proposed to be set up by the Government, shall come into operation.

STAFFORDSHIRE.

LOCAL MEDICAL AND PANEL COMMITTEE.

A MEETING of the Staffordshire Local Medical and Panel Committee was held at Stafford on August 10th.

Election of Officers.—The following officers were appointed:

Chairman: Dr. T. Ridley Bailey.
Treasurer: Dr. H. A. Bull.
Honorary Secretary: Dr. Lefevre.
Executive Committee: Drs. Mitchell Smith, Daly, Entzer, Shaw, Wolferson, Taylor, and Stockwell, together with the Chairman, Secretary, and Treasurer.
Representatives on Medical Service Subcommittee: Appointed by Panel Committee—Drs. T. Ridley Bailey, Daly, and Lefevre.
Appointed by Local Medical Committee:—Dr. W. Mitchell Smith.

Representatives on Pharmaceutical Joint Subcommittee: Drs. Taylor, Daly, Shaw, and Lefevre, with the Chairman *ex officio*.
Insurance Acts Committee.—The Committee congratulated the Chairman, Dr. T. Ridley Bailey, on his election by the conference of Local Medical and Panel Committees as one of the six representatives for the whole of Great Britain on the Insurance Acts Committee of the British Medical Association.

NON-PANEL DOCTORS AND NATIONAL INSURANCE CERTIFICATES.

In order to minimize as much as possible the inconveniences caused to doctors who attend insured persons in their private capacity, the Association has published books of certificates which, it is believed, will meet the requirements of approved societies, so far as is practicable in the case of certificates not given under the obligations of the official medical certificate forms. The form of certificate is sufficiently like the official form to remove many of the difficulties which insured persons who have been attended by private doctors have had in satisfying the requirements of their approved societies, but is sufficiently distinct from the official form to show at once that it is being used by a doctor who is attending the patient in a private capacity—that is to say, either by a doctor who is not on a panel, or by a panel doctor other than the one on whose list the insured person is.

The Association has shown the certificates to the Insurance Commissions for England, Scotland, and Wales, and they raise no objection to the issue of them by the Association to medical practitioners for use when attending insured persons not being their panel patients, and not being persons whom they are attending as medical officers of institutions under Section 15 (4), or in virtue of "own arrangements" under Section 15 (5).

The books are being issued at cost price. They contain 50 certificate forms, and may be obtained from the Financial Secretary and Business Manager, British Medical Association, 429, Strand, W.C., price 6d. each, post free.

Vital Statistics.

THE REGISTRAR GENERAL'S QUARTERLY RETURN.

SPECIAL REPORT FOR THE "BRITISH MEDICAL JOURNAL."

The Registrar-General has issued his return relating to the births and deaths in the second quarter of the year, and to the marriages in the three months ending May 31, 1914. The population of the United Kingdom in the period was equal to 12.0 per 1,000, which was 0.8 per 1,000 more than the rate in the corresponding periods of the ten preceding years.

The 35,591 births registered in England and Wales last quarter were equal to an annual rate of 32.9 per 1,000 of the population, estimated at 37,02,983 persons. This rate is 3.5 per 1,000 below the mean rate in the ten preceding second quarters, and is the lowest rate recorded in the second quarter of any year since civil registration was established.

The birth-rates in the several counties last quarter ranged from 45.0 in Devon, 37.0 in Somerset, 37.1 in Westmorland, and 17.3 in Cardigan, to 27.3 in Stafford, 27.5 in Cornwall, 27.5 in Northumberland, 28.5 in Devon, 28.5 in Monmouth, and 30.8 in Durham. In ninety-six of the largest towns the birth-rate averaged 24.2 per 1,000, and ranged from 13.8 in Bournemouth, 14.1 in Hastings, 14.8 in Southampton, 15.0 in Bath, 15.3 in Eastbourne, and 15.5 in Ealing, to 32.1 in Rhondda, 32.2 in West Bromwich, 32.8 in Sunderland, 33.0 in South Shields, and 33.1 in Gateshead; in London the birth rate was 24.1 per 1,000.

The excess of births over deaths last quarter was only 74,515, against 102,293, 105,177, and 101,935 in the second quarters of the three preceding years. From a return issued by the Board of Trade it appears that between the United Kingdom and places out of Europe the arrivals of persons stated to be of British nationality exceed the departures by 8,563 persons, while the numbers of aliens leaving exceeded those arriving by 81. The balance of the aggregate passenger movement in the quarter to and from all countries was 6,580 inward.

The 138,579 deaths registered in England and Wales during the quarter under notice were equal to an annual rate of 12.5 per 1,000, and to an average rate of 13.5 per 1,000 in the corresponding periods of the ten preceding years. The death-rates in the several counties last quarter ranged from 11.2 in Middlesex, 12.0 in Essex and in England, 12.4 in Berkshire, and 12.5 in Buckinghamshire and in Dorset, to 17.2 in Cumberland, 17.3 in Monmouth, 17.7 in Durham, 17.8 in Donagh, 18.3 in the North Riding of Yorkshire, and 18.4 in Cardigan. In ninety-six of the largest towns the death-rate averaged 10.5 per 1,000, and ranged from 7.0 in Liverpool, 7.1 in Walthamstow, 7.2 in Leyton and in Ealing, and 10.0 in Oxford and in Lincoln, to 19.0 in Sheffield, 19.1 in Wigam, 19.2 in Walsall, 19.9 in South Shields, 21.2 in Sunderland, and 23.3 in Middlesbrough; in London the death rate was 12.5 per 1,000.

The 138,579 deaths from all causes last quarter included 311 which were attributed to enteric fever, 6 to small-pox, 6,724 to measles, 590 to scarlet fever, 2,585 to whooping-cough, 1,176 to diphtheria, and 126 to diarrhoea and enteric and non-enteric fevers. During the quarter the mortality from measles was nearly double the average, and that from diphtheria was slightly above the average; from scarlet fever and whooping-cough the mortality was slightly below the average, and that from enteric was 40 per cent. below.

The rate of infant mortality, measured by the proportion of deaths among children under 1 year of age to registered births, was equal to 97 per 1,000, which was 2 per 1,000 above the mean rate in the ten preceding second quarters. Among non-severe counties the rates of infant mortality ranged from 5.9 in Westmorland, 5.5 in Huntingdon, 5.6 in Oxford, and 5.7 in Hertford, to 11.7 in Lancashire and in the North Riding of Yorkshire, 13.0 in Lincoln, 13.3 in Durham, and 13.8 in East Lancashire. In the ninety-six largest towns the rate of infant mortality averaged 49 per 1,000, and ranged from 35.5 in Hastings, 44 in Oxford, 47 in Morley, 48 in Walsley, 51 in Wimbeldon, and 53 in Lincoln, to 136 in Southampton, 137 in Warrington, 138 in Wigan, 138 in South Shields, 147 in Burnley, 152 in Middlesbrough, and 175 in Wigam; in London the rate was 93 per 1,000.

The death-rate among persons aged 1 to 65 years of age was equal to 85.1 per 1,000, and estimated population in this period of life averaged 9.4

per 1,000, and ranged from 5.1 in Ealing, 5.5 in Oxford, 5.6 in Wirralbe-don and in Great Yarmouth, and 5.7 in Ilford, to 12.3 in St. Helens and in Wigam, 12.5 in Sheffield, 12.7 in South Shields, 13.5 in Gillingham, 14.1 in Sunderland, and 17.5 in Wigan.

Among persons aged 65 years of age and upwards the death-rate was 85.2 per 1,000, the corresponding rate in the ninety-six largest towns averaged 5.7 per 1,000, and ranged from 46.7 in Edinboro, 60.5 in Reading, 61.9 in Eastbourne, 65.5 in Ealing, and 65.9 in Leyton, to 116.5 in Oltham, 118.6 in Bradford, 121.4 in Huddersfield, 126.3 in Dudley, and 134.5 in Middlesbrough.

The mean temperature of the air last quarter was very near the average, the rainfall was considerably below the average except in the south-eastern districts, and the duration of bright sunshine was above the normal except in the south and south-west.

HEALTH OF IRISH TOWNS.

DURING the week ending Saturday, August 14th, 541 births and 339 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 573 births and 277 deaths in the preceding period. These deaths represent a mortality of 5.6 per 1,000 of the aggregate population in the districts in question, as against 11.5 per 1,000 in the previous period. The mortality in these Irish areas was therefore 3.1 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate, on the other hand, was equal to 25.3 per 1,000 of population. As for mortality of individual localities, that in the Dub in registration area was 16.4 (as against an average of 14.7) for the four weeks ending August 7th, in the South Eastern Hospital area in Belfast 12.7 (as against 13.9), in Cork 17.0 (as against 15.7), in Londonderry 21.5 (as against 19.6), in Limerick 14.9 (as against 18.3), and in Wexford 15.2 (as against 11.3). The zymotic death-rate was 1.8, as against 1.2 in the previous period.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are notified by the Admiralty: *Plat* Surgeons R. H. Hughes to the *Victory*, additional; for disposal: A. J. Field, promoted to the *Empress Castle* on pay for one day with effect from August 1st, 1914; to the *South Eastern Hospital* ship in charge, vice Collingwood; G. T. Collingwood, M.V.O., to the R.M. Division, Portsmouth, vice Hall; E. T. Burton to the *Victory*, for R.N. Division, vice Richardson; H. R. Gardner, M.B., to the *Northampton*, vice Burton; A. S. Machie, M.B., to the *Franklin*, additional, for disposal. Temporary Surgeons A. L. Dykes, M.D., to the *Victory*, additional, for Royal Naval Division; C. H. Gould to the *Field*, additional; A. P. McDonald to the *Victory*, additional, for Haslar Hospital; D. G. Boddie, M.B., W. H. Pickup to the *Empress*, additional, for Plymouth Hospital; H. Williamson to the *Empress*; and F. C. S. Broome to the *Victory*, for R.N. Barracks.

ROYAL NAVAL VOLUNTEER SERVICE.

Surgeon Probationer R. Walker to the *Shark*, vice Wylie.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

E. F. Elliot, F.R.C.S.E., to be temporary Major substituted for the notified promotion published in the *London Gazette* of June 22nd. W. F. Jones to be temporary Major whilst employed with the Brock War Hospital. J. H. Brooks to be temporary Major whilst serving with the Mile End War Hospital.

INDIAN MEDICAL SERVICE.

Colonel H. Hendley, M.D., has relinquished the appointment of Deputy Director of Medical Services, India, and Union Inspector-General, Civil Hospitals, Punjab.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Captain O. Wilson, M.B., resigns his commission. Lieutenant D. M. May, M.B., to be Captain, with seniority next below W. Walker (substituted for notification published in the *London Gazette* of July 26th). Temporary Lieutenant K. A. Maclean, M.B., from R.A.M.C., to be Captain. The following Lieutenants on probation are confirmed in their rank: D. C. Pinn, M.B., N. L. Reiss, M.B., W. J. Dowling, M.B., P. R. S. Shaw, M.B., J. C. Henry, M.B., B. G. Blair, M.B., G. Stanton, M.B., J. D. Frond, M.B., C. E. H. Gater. To be Lieutenants on probation: En-Cadets A. R. Lemrie, M.B., from Edinburgh University Continent, and J. T. Scrogie, M.B., from Aberdeen University Continent, O.T.C.

TERRITORIAL FORCE.

ARMY MEDICAL SERVICE.

Major A. W. Merrick, F.R.C.S., from 3rd West Lancashire Field Ambulance, to be Deputy Assistant Director of Medical Services, 2nd Medical (Reserve) Division.

ROYAL ARMY MEDICAL CORPS.

South Wales Mounted Brigade Field Ambulance.—Lieutenants to be Captains: A. J. Campbell, E. L. Seddall, M.B., M. Scallan. *Weish Field Ambulance*.—Captain H. J. Dunbar, M.B., to be temporary Major. *South-Western Mounted Brigade Field Ambulance*.—Lieutenants to be Captains: P. W. Mason, M.B., H. B. Porteous, M.B., B. M. Young. *Westes Divisional Sanitary Section*.—A. E. Bonham, to be Lieutenant. *Westes Field Ambulance*.—Lieutenant A. Cameron, M.B., from Attached to Units other than Medical Units, to be Lieutenant. *3rd Wessex Field Ambulance*.—Major H. C. Parsons, to be temporary Lieutenant. *London Field Ambulance*.—Lieutenant C. F. Williams from London (City of London) Field Ambulance; W. M. Langdon. *Sanitary Company*.—Lieutenant V. P. Norman to be Captain.

London (City of London) Sanitary Company.—To be Lieutenants: J. O. W. Harratt, M.D., N. Greenwood, Cadet G. L. Matthews from University of London Contingent, Senior Division, O.T.C., E. H. Matthews.

London (City of London) General Hospital.—Lieutenants to be Captains: A. J. P. Smith, L. G. Crossman, M.B., M. W. K. Bird, A. W. Stott, and to remain seconded, Lieutenants to be Captains: C. E. Telfer, L. Milton, H. Sharpe, K. E. Clarke.

London General Hospital.—Major W. A. Turner, M.D., is seconded.

Eastern General Hospital.—Lieutenants to be Captains: J. H. Owens, F. Roberts.

East Anglian Field Ambulance.—Major H. A. Rudyard, from Attached to Units other than Medical Units, to be Lieutenant-Colonel.

South Midland Field Ambulance.—W. G. McKenzie to be Lieutenant.

2nd South Midland Mounted Brigade Field Ambulance.—Lieutenant J. V. S. Dunn to be Captain.

West General Hospital.—E. Moir to be Captain, whose services will be available on mobilization.

1st Western General Hospital.—The seconding of Captain Keith W. Mossarrat, M.B., announced in the *London Gazette* of May 20th, is cancelled.

1st West Lancashire Field Ambulance.—Captain W. H. Broad, M.D., 6th Rifle Battalion, King's Liverpool Regiment, to be Captain, temporarily substituted for notification published in the *London Gazette* of July 19th.

East Lancashire Field Ambulance.—To be Lieutenants: E. I. Forward, A. W. Hayward, M.D.

West Indian Grenade Clearing Station.—Lieutenants to be Captains: R. G. Dixon, M.B., H. W. Symons, M.B., F. P. Gibson, M.B., H. T. Bates, M.B., J. W. Mahin, M.B., D. R. Cramb, M.B., G. P. P. Chapman, A. S. Babbington, M.B., C. M. Cozney, M.B.

3rd West Riding Field Ambulance.—Captain W. J. Gray, from Attached to Units other than Medical Units, to be Captain.

Yorkshire Mounted Brigade Field Ambulance.—Lieutenant W. H. N. White, M.B., to be Captain.

Northern General Hospital.—Lieutenants to be Captains: F. J. Natrass, M.B., S. Thompson, M.B. To be Lieutenant: F. E. Fisher, M.B.

Northernburgh Field Ambulance.—P. J. Sheehan to be Lieutenant.

London Field Ambulance.—Lieutenants to be Captains: R. A. Leonic, M.B., C. C. Phillip, M.B., J. R. Menzies, M.B., W. H. Arundel, M.B.

London Mounted Brigade Field Ambulance.—Lieutenants to be Captains: A. R. Muir, M.B., H. Forrest, M.B., A. M. Young, M.B., E. N. Thomson, M.B.

East Lothian Field Ambulance.—H. T. Findlay, M.B., to be Lieutenant.

Highland Field Ambulance.—Major J. Robertson, M.D., to be temporary Lieutenant-Colonel.

1st Highland Field Ambulance.—Captain A. Kelso to be temporary Major, A. B. Whitton, M.B. (late Lieutenant-Colonel, 6th Battalion, Gordon Highlanders), to be Captain, temporary.

Highland Mounted Brigade Field Ambulance.—Lieutenants to be Captains: G. G. Middleton, M.B., E. A. Mackenzie, T. E. Roberts, M.D., M. Haller, from Edinburgh University Contingent, Senior Division, O.T.C., to be Lieutenant.

Attached to Units other than Medical Units.—Lieutenants to be Captains: Hugh A. McLean, M.B., A. Ambrose, M.B., E. S. Stork, M.B., W. A. Robertson, A. G. Van Someren, M.B., M. C. Anderson, R. D. Gavin, M.B., C. McKenna, M.B., G. H. Donnan, J. A. Thomson, M.B., A. N. S. Carmichael, M.B., E. R. Keen, H. F. L. Hugo, M.B., J. W. M. Jamieson, M.B., T. Ehdin, W. H. Dale, M.D., E. M. Martin, M.D., J. T. Decker, S. Rutherford, M.B., H. G. Bruce, M.B., J. M. Docherty, M.B., Captain T. E. Roberts, M.D., from the Highland Mounted Brigade Field Ambulance, to be Captain.

LEEDS PUBLIC DISPENSARY.—Lady Resident Medical Officer. Salary, £130 per annum.

LIVERPOOL INFIRMARY FOR CHILDREN.—(1) Two Resident House-Physicians; (2) one Resident House-Surgeon. Salary, £30 in each case for six months.

MANCHESTER HOSPITAL FOR CONSUMPTION AND DISEASES OF THE THROAT AND CHEST.—Resident Medical Officer. Salary, £250 per annum.

MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN.—House-Surgeon. Salary, £120 per annum.

MIDDLEBROUGH: NORTH OSMESBY HOSPITAL.—House-Surgeon. Salary, £150 per annum.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Grosvenor Square, W.C.—Resident Medical Officer. Salary, £100 per annum.

NORFOLK WAR HOSPITAL, Thorpe, Norwich.—Vacancies on Resident Medical Staff. Pay, £1 per diem.

QUEEN CHARLOTTE'S LYING-IN HOSPITAL, Marylebone Road, N.W.—District Resident Medical Officer. Salary, £50 per annum.

READING: ROYAL BERKSHIRE HOSPITAL.—Resident Civilian Assistant. Salary, £150 per annum if qualified, and £75 if unqualified.

SALISBURY GENERAL INFIRMARY.—Assistant House-Surgeon. Salary, £100 per annum.

SOUTHAMPTON: ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL.—(1) House-Surgeon; (2) House-Physician. Salary, £200 and £150 per annum respectively.

VICTORIA HOSPITAL FOR CHILDREN, Tite Street, S.W.—(1) House-Physician; (2) Senior Resident Medical Officer. Salary, £200 per annum each.

WEST BROMWICH AND DISTRICT HOSPITAL.—Assistant House-Surgeon. Salary, £120 per annum.

WEST HAM AND EASTERN GENERAL HOSPITAL, Stratford.—(1) Resident Medical Officer; (2) House-Physicians and House-Surgeons. Salary for (1) £160 per annum, and for (2) £120 and £100 per annum respectively.

WIGAN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Junior House-Surgeon. Salary, £150 per annum.

CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointments: Inilly-ford (co. Cork), Banhook (Forthshire), Tring (Hertfordshire).

To ensure notice in this column—which is compiled from our advertisements containing, where full particulars will be found, it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

BALLANTYNE, A. J., M.D., Lecturer on Ophthalmic Medicine and Surgery, Anderson College of Medicine, Glasgow, vice Dr. A. Robertson, deceased.

ENRIGHT, G. H., L.R.C.P. and S.I., Certifying Factory Surgeon for the Sixmilecross, co. Clare.

FABIAN, A. M., D.Glasg., Certifying Factory Surgeon for the Blyth District, co. Northumberland.

GILBERTSON, H. M., M.R.C.S., L.R.C.P., District Medical Officer of the Hildon Union.

JAGO, E. B., M.B., C.M.Glasg., District Medical Officer of the Rotherham Union.

JONES, Wm. H., M.D. Lond., Certifying Factory Surgeon for the Bulth District, co. Brecknock and Radnor.

ROBERTSON, F., M.R.C.S., L.R.C.P., District Medical Officer of the Barton-upon-Irwell Union.

STROVEL, H. W. M., M.B., Ch.B. Aberd., Temporary Medical Referee under the Workmen's Compensation Act for County Court, Circuit No. 2, and to be attached more particularly to the West Harpley County Court.

WALTERS, C. Ferrier, F.R.C.S., Surgeon to the Bristol Royal Infirmary.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s., which sum should be forwarded in Post Office Orders or Stamps with the notice not later than the first post Monday morning in order to ensure insertion in the current issue.

BIRTHS.

GUTHRIE.—On August 22nd, at Greta, Heswall, Cheshire, the wife of Thomas Guthrie, M.A., M.B., B.C. Cantab., F.R.C.S. Eng., of 78, Rodney Street, Liverpool, has a son.

HENRY.—On the 26th August, at Argyle House, Halifax, Yorkshire, the wife of Lieutenant McWilliams Henry, F.R.C.S.E., R.A.M.C., of a son.

McKANE.—On August 27th, to the wife of Dr. Rudolph McKane, Gilpin House, Grimsby, a son.

MARRIAGE.

SHERA-DAYES.—On September 1st, at St. Mark's Church, Sheffield, by the Rev. E. B. Holland of Milnrow, Lancs., Arthur Geoffrey Shera, M.B. Cantab., etc., Lieutenant R.A.M.C., son of the late H. Arthur Shera, M.R.C.S., L.R.C.P., of Sheffield, to Annie L. Davies, adopted daughter of the late Mr. and Mrs. J. Davies, of Homeville, Eastbourne.

DEATHS.

DOUGLAS.—On the 26th August, at the Medical Superintendent's House, the Royal Albert Institution, Lancaster, Archibald Robertson Douglas, L.R.C.P., F.R.C.S., etc., aged 47.

JONES.—On August 30th, at Bryn Tŷrion, Church Walks, Llanidloes, Cardigan, John Matthew Jones, A.M.S., late A.D.M.S. Plymouth District. Invalided whilst on active service.

WELSH.—On the 25th August, suddenly, at Whitworth House, Whitworth, Alexander Welsh, M.D., C.M., aged 72.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice Issued under the heading "Advertisements—Important Notice re Advertisements" appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

ASHTON UNDERLYNE UNION.—Resident Assistant Medical Officer for the Workhouse. Salary, £250 per annum.

BIRMINGHAM AND MIDLANDS EYE HOSPITAL.—Junior House-Surgeon. Salary, £100 per annum and £5 laundry allowance.

BIRMINGHAM GENERAL DISPENSARY.—Resident Medical Officer. Salary, £250 per annum.

BRISTOL GENERAL HOSPITAL.—(1) House-Physician; (2) Casualty House-Surgeon. Salary, £150 per annum each.

BRISTOL ROYAL HOSPITAL FOR SICK CHILDREN AND WOMEN.—Junior Resident Officer. Salary, £100 per annum.

BRISTOL ROYAL INFIRMARY.—(1) Resident Obstetric and Ophthalmic House-Surgeon; salary, £120 per annum. (2) Dental House-Surgeon; salary, £120 per annum.

BUNTON: DEVONSHIRE HOSPITAL.—Assistant House-Physician. Salary, £100 per annum.

CARDIFF: KING EDWARD VII HOSPITAL.—House-Surgeon. Salary, £140 per annum.

EVELINA HOSPITAL FOR SICK CHILDREN, Southwark.—(1) House-Physician; (2) House-Surgeon. Salary, £75 per annum each.

GLOUCESTERSHIRE JOINT COMMITTEE FOR TUBERCULOSIS.—Assistant Tuberculosis Medical Officer. Salary, £50 per annum.

GRIMSBY AND DISTRICT HOSPITAL.—House-Surgeon. Salary, £55 s. a week.

HASTINGS: EAST SUSSEX HOSPITAL.—House-Surgeon. Salary, £100 per annum.

INGHAM INFIRMARY AND SOUTH SHIELDS AND WESTON DISPENSARY.—House-Surgeon. Salary, £150 per annum.

LABYATORIES OF PATHOLOGY AND PUBLIC HEALTH, New Cavendish Street.—Bacteriologist.

British Medical Association.

INSURANCE ACTS COMMITTEE.

THE DRUG TARIFF.

The following Memorandum on possible changes of Medical Benefit Regulations connected with the placing of the Drug Tariff on a commercial basis has been issued to Local Medical and Panel Committees by the Insurance Acts Committee of the British Medical Association:

INTRODUCTORY.

1. When the Deputation from the Insurance Acts Committee was received on July 9th (as reported in the B.M.J., July 31st, 1915, Supplement, pages 68-72) by the National Health Insurance Joint Committee, Mr. Charles Roberts, M.P., being in the Chair, for the purpose of placing before that body the decisions of the Conference of Representatives of Local Medical and Panel Committees, held in London, on June 16th, the Deputation was asked whether the Conference had considered the question of what alterations of the Regulations would be required in order to give effect to the Recommendations of the Departmental Committee on the Drug Tariff. The Deputation replied that a motion on the subject had been before the Conference, but had been postponed until after the Report of the Departmental Committee had been published. It was then pointed out on behalf of the Commissioners that the Report of the Departmental Committee might probably not appear until a date which would make adequate consideration of the necessary changes in Regulations by the Insurance Acts Committee of the Association and the Local Medical and Panel Committees of the country difficult, in view of the fact that any changes in the Drug Tariff would naturally come into operation on January 1st, 1916. The Deputation promised to take the matter into immediate consideration, and since then conferences have taken place between representatives of the Insurance Acts Committee and representatives of the Commissioners.

2. The Insurance Acts Committee is now in a position to place the matter in broad outline before the Local Medical and Panel Committees with a view to eliciting their opinions before the Commissioners commence drafting any new Regulations that may be required, and it is hoped that these Committees will at once take the following memorandum into consideration and favour the Insurance Acts Committee with their opinion on the points raised therein. The Deputation was informed by the Commissioners that the position is that, within wide limits, the way in which the new Regulations dealing with Drug Finance will be drafted is mainly a matter for insurance practitioners themselves to decide.

3. Before discussing the proposed changes it is important that the history of the matter should be clearly understood.

4. Shortly after the National Health Insurance Act came into full operation complaints were raised on behalf of insurance practitioners that the Drug Tariff was unsatisfactory, and these complaints steadily increased in volume and

intensity. The Insurance Acts Committee appointed a Sub-Committee which spent a great deal of time on the subject, and conferred several times with representatives of the Pharmaceutical Society of Great Britain. The complaints from doctors as to the inequity of the Tariff, and from pharmacists who found that their bills were being discounted, compelled the late Chairman of the National Health Insurance Joint Committee to appoint a Departmental Committee, the chief item in whose reference was to "consider what revision, if any, of prices was required to place the Tariff on a commercial basis and to submit a Tariff in accordance with their recommendations," and the British Medical Association was asked to nominate two members of the Departmental Committee. The Insurance Acts Committee presented to the Departmental Committee a Memorandum of Evidence drawing attention to the many anomalies of the present Tariff, and supported it orally by the evidence of three witnesses who had given special attention to the subject. The first three paragraphs of that memorandum were as follows:—

"1. The British Medical Association submits the following Memorandum of Evidence as a result of detailed examination of the present Drug Tariff and consultation with the Panel Committees of the country in regard to the matter. Many of the points dealt with in this Memorandum were suggested by such Committees in reply to a circular letter sent to all Panel Committees in November, 1914, in which they were specially asked for their remarks on the present Tariff and for suggestions for its improvement. This Memorandum has been drafted under the direction of a Sub-Committee consisting largely of representatives of those Panel Committees which have shown a special interest in this question.

2. Early in 1914 the Association came to the conclusion that steps ought to be taken for the radical revision of the present Tariff so that it should not only be put on a commercial basis, but should be governed by easily understood and rigidly applied principles. Action in this direction was, however, suspended, when it was known that the present Departmental Committee had been appointed.

3. For reasons into which it is unnecessary to enter, representatives of the Association were not consulted when the 1913 Tariff was formulated, but it is understood, from the report of the remarks made by Mr. Masterman, when he received a deputation on the subject of the Tariff on July 15th, 1914, that the original Tariff was elaborated by the Pharmaceutical Society on an experimental basis of a Tariff subject to a discount, and that in consequence of the protection afforded to the Drug Fund by the discounting clause the Tariff had not been examined closely either by the Commissioners or by the Insurance Committees. Doubtless it was based on previous pharmaceutical experience, but the Association has been unable to detect any clear guiding principle underlying the Tariff with this exception, namely, that there should be a charge for each ingredient according to its quantity and value, and an additional charge for the time and skill required for dispensing those ingredients on the prescription of the doctor. That is, the pharmacist sets out to obtain a trade profit on each of the articles he handles as a tradesman and additional remuneration for his professional services."

5. It is clear from the above that great dissatisfaction was exhibited by insurance practitioners as regards the present Tariff, and that from no quarter has pressure been more persistent for its revision. It is believed that within a few weeks the Departmental Committee will report, and it may safely be assumed that the chief result of its labours will be the introduction of a Tariff on a commercial basis, that is to say, a Tariff in which the prices laid down are such as to afford the lowest rate of remuneration that pharmacists could reasonably be expected to accept in the course of business. The Insurance Acts Committee is informed that in view of the absence of so many panel practitioners on Military service the Commissioners would be very reluctant to make any fundamental alterations in the Regulations without a general consensus of medical opinion in their favour. (See Appendix.)

EFFECTS OF A COMMERCIAL TARIFF.

6. The present Tariff as framed is subject to a discounting clause; the acceptance of the new Commercial Tariff by pharmacists, the Insurance Commissions, and doctors, is dependent on the proviso that the pharmacists' bills will be paid in full.

7. The total amount available for the purpose of Medical Benefit is 9s. per insured person. Of this amount a fixed minimum sum (at present 1s. 6d.) is set apart for the provision of drugs and appliances and an additional or floating 6d. is also available for the same purpose in case of need. Under these arrangements so long as the total cost of drugs and appliances does not exceed 2s. no difficulty arises, but hitherto when that amount has been exceeded in any area the pharmacists' bills have had to be discounted.

8. The Commissioners have stated definitely that the 9s. available for the purpose of medical benefit cannot be supplemented by any other moneys provided by the Government; consequently if the expenditure on drugs and appliances, taking the country as a whole, exceeds the 2s. and the pharmacists' bills are to be paid in full, an encroachment on the fund at present set apart for the remuneration of medical practitioners (i.e., 6s. 6d. + 6d. for Sanatorium Benefit) would be inevitable.

9. The question for the profession to decide is whether the advantages of the proposed Commercial Tariff outweigh this plain disadvantage.

10. The Insurance Acts Committee of the British Medical Association does not feel itself able to advise the abrogation of the principle that the Drug Fund should never encroach upon the Practitioners' Fund and has passed the following resolution:—

Minute 42 of Insurance Acts Committee of August 19th, 1915.

That while willing to consider the establishment of a commercial tariff and a re-arrangement of credits between insurance areas or of the methods of distribution to practitioners within each area, the Committee is not willing to do this except with a guarantee that any excess of the cost of drugs and appliances (taking the country as a whole) over an average of 2s. per insured person will not be met by any call upon the Practitioners' Fund.

This principle was plainly conceded in 1912 by the then Chancellor of the Exchequer during the negotiations with the Association when the promise was made that 7s. per insured person should be the basis of the doctors' remuneration for a period of three years, and that this sum of 7s. was not to be encroached upon on account of drugs was clearly set forth in his speech to the Nottingham miners on August 10th, 1913, as follows:—

"The doctors have the right to prescribe the drug which they think is best adapted for the patient. When they do so it does not come out of their remuneration, and the result is that the poor man who is insured can have as pure and potent medicine as the richest man in the land."

11. In order that the profession may be able to estimate how far the present Drug Fund is likely to meet the total cost of drugs under a Commercial Tariff, the Insurance Acts Committee submits the following figures which have been obtained from the English Commissioners:—

(i) Total Drug Fund for England in 1913	£920,000
Total payments to chemists	£808,342
Difference	£111,658

*The additional Grant-in-aid of £90,000 set apart as a Special Drug Fund is not available for this purpose, as it can only be applied by way of special grants towards the cost of Drugs where epidemics or other abnormal sickness conditions have caused an excessive demand upon the funds available for this purpose.

It must also be understood that no part of this Special Drug Fund will be available for the increased cost of drugs due to the War.

The difference represents the proportions of the floating 6d. paid to doctors in the areas where the drug bills were lower than 2s. per head and the unexpended balances in those areas where the drug bills were lower than 1s. 6d.

(ii) In England there are 126 areas. In 35 of these areas the chemists' bills were discounted to the amount of £54,663 in 1913.

The figures for 1914 are incomplete, but are probably less favourable; those for 1915 so far indicate a saving as compared with 1914.

(iii) The saving in the cost of drugs by a Commercial Tariff may safely be assumed to be not less than 12-15%. If 15% be the figure, it is estimated to be equivalent to 2½d. per insured person per annum, or a total sum of about £125,000.

12. In the majority of areas the cost of drugs has been between 1s. 6d. and 2s.; in some areas it has been lower, in fact as low as 10½d. per head. If prices are reduced and the demand for drugs is not increased the difference must represent an increase in medical remuneration in all those areas whose costs were between 1s. 6d. and 2s. per head, or only slightly over the latter amount. Any risk due to the abolition of discounting could only affect the areas in which the cost has exceeded 2s., and some at least of these cases must disappear if the tariff prices are reduced.

13. Moreover the present system in that unexpended balances are reserved to meet in the future increased cost of drugs in the areas in which they have accumulated. It is suggested by the Commissioners that, under new regulations introducing the Commercial Tariff, such unexpended balances might be pooled for the benefit of areas in which greater sickness incidence or other unavoidable cause, but not excessive prescribing, has caused a drain upon the Drug Fund. In no case would unexpended balances revert to the Exchequer, or prevent the doctors who are careful in prescribing from saving the floating 6d. for themselves; such balances would arise only from money saved on the minimum sum allocated for Drugs, whether the 1s. 6d. as at present or some other less amount agreed upon.

14. Another advantage of the new system would be the elimination of the Pharmaceutical Committee as complainant in cases of alleged over-prescribing. Panel Committees, particularly those which have had experience of the irksome and unpleasant duty of conducting enquiries under Regulation 40, will attach great weight to this consideration. Apart from the great decrease in such enquiries and the saving of considerable expense thereby which may be expected to occur when insurance practitioners generally have grasped the implications of the new system, Panel Committees would have no responsibility to the Pharmaceutical Committee for any kind of check which they exercise over doctors who have a tendency to extravagance. If the pharmacists are assured of their bills being paid in full they will no longer have any interest or *locus standi* in the question of economy in the use of drugs, and the duty of Panel Committees as regards this question will be simply to their constituents, and as technical advisers to the Insurance Committees.

15. The first question for the Local Medical and Panel Committees is, therefore, what will be their attitude towards the proposition that the cost of drugs and appliances must be entirely met from the total Medical Benefit Fund, whether the amount is greater or less than 2s. per insured person? Is the risk to the profession, involved in the abolition of discounting, balanced or more than balanced by the advantage resulting from the Tariff being fixed on a commercial basis?—that is to say, by a reduction in the drug bills of something like 15 per cent. or approximately £125,000.

16. The next question is whether, even on a reduced Tariff, there are areas in which, with due regard to economy, the cost of drugs cannot be kept lower than 2s. If there are no such areas, then clearly the profession stands to gain everywhere by the change. If there are such areas, the question must be considered whether there should be some adjustment of funds between one insurance area and another in order that the few areas in which on a reduced Tariff and with reasonable economy the cost cannot be kept below 2s. per head, shall not suffer from a cause which it would then be clear was entirely beyond their control, that is to say, from an excessive incidence of sickness, the burden of which on insurance principles should be borne by the country as a whole and not by the particular area.

ARRANGEMENTS FOR DISTRIBUTION AMONG INSURANCE AREAS OF THE AMOUNT AVAILABLE FOR THE COST OF DRUGS.

17. Assuming that with a Commercial Tariff and in normal circumstances (i.e., apart from epidemics and high prices due to the War) the cost of drugs and appliances for the whole country could with reasonable economy be met for the sum of

not more than 2s. per insured person per annum, can it be assumed that the cost of drugs in each separate area can be met without encroachment on the present minimum of medical remuneration? It is clear that if the amount available is adequate for the whole country it must also be adequate for each separate area, unless there are special circumstances in any particular area making the cost of drugs higher there than the average. Such differences could only be due to the varying number of insured persons in different areas, to excessive incidence of sickness, or to differences in the standard of prescribing. Differences of the last kind are within the control of the members of the panel and therefore should be dealt with, and the burden, if any, borne by them. Differences of the first and second kind are not within the control of the doctors and it remains for consideration whether such a burden should not be spread over the country as a whole. If there are in fact districts in which even after practising every reasonable economy the cost of drugs cannot be kept below, say 2s. 3d. per insured person per annum, doctors in those areas would be under a strong temptation to economise more than they ought to do if their area had no more than 2s. per insured person allotted to it for the payment of drugs, in order to prevent the reduction of their remuneration below what they regard as the minimum amount. If there are on the other hand areas in which the necessary demand for drugs is so low that with full regard for the needs of insured persons the cost is not more than, say 1s. or 1s. 3d. per insured person per annum, there would be very little inducement to practise that economy which it must be recognised is desirable for its own sake if such areas were allotted 2s. per head for drugs, and if saving below the minimum (at present 1s. 6d.) remained distributable therein.

18. If, therefore, such differences can be foretold, equity would seem to demand that there should be an increase in the total amount paid to the areas in which drug bills must be expected to be higher than the maximum, and a reduced payment to areas in which there was no reason, apart from extravagance, to expect drug bills to reach the minimum. In neither case would the distribution of the floating 6d. be affected.

19. The theoretically exact method of distributing the total drug fund according to sickness incidence would be to give each area more or less than 2s. per insured person according to the circumstances of the area. The Commissioners have stated that they have statistical data upon which such a differentiation might possibly be based. These data are mortality returns, reports of medical officers of health, etc., but it is not suggested that the distribution should in any way depend on past experience as regards expenditure on drugs.

20. Another method would be that the whole, or, if considered equitable, a part, of the amount which some areas may be able to save below 1s. 6d. should be placed to a central fund which would be available for the relief of areas which with due economy may be unable to work under 2s.

21. A third method would be that a certain sum, say 2d. per insured person, should be deducted from the credit of each area and placed to the credit of a central fund which would be available for grants in aid of areas in which expenses are in excess of 2s.

22. There might also be a possible combination of the second and third methods.

DISTRIBUTION OF DRUG FUND AMONG PRACTITIONERS IN EACH AREA.

23. Let it be assumed that the drug fund of each area is sufficient to meet, without injustice to the doctors of that area taken as a whole, the total drug bills of that area. It remains to consider the different kinds of arrangements, with their respective advantages and disadvantages, that may be made for distributing the fund among the practitioners in the area.

24. Alternative arrangements are:

(a) That each practitioner should be made responsible for the total cost of whose prescriptions above a minimum limit say of 1s. 3d. per insured person with a local indemnity fund of say 3d. per insured person out of which relief might be given to individual practitioners the cost of whose prescriptions is over 2s. per insured person on appeal to and at the discretion of the Panel Committee.

(b) An automatic surcharge of every practitioner, the total cost of whose prescriptions exceeds the maximum of 2s. per insured person, with power to the Panel Committee on appeal to grant a certificate of indemnity which shall entitle such practitioner to relief out of the Drug Fund of the area.

(c) Continuous scrutiny and surcharging on the present plan, except that the Pharmaceutical Committee would not be concerned therein.

It would be possible if thought desirable under (a) or (b) to continue the scrutiny and surcharge.

PROPER SUPPLY OF DRUGS TO INSURED PERSONS.

25. It is specially important that no system should be even suggested by the profession for adoption which could give rise to a suspicion that the rights of the insured persons to a proper supply of drugs were being over-ridden by a desire for gain on the part of the profession. It will therefore be necessary to fix for each area a minimum limit of money, any saving below which should not accrue to the doctors of the area.

REPLIES OF LOCAL MEDICAL AND PANEL COMMITTEES.

26. In order that the opinions of Local Medical and Panel Committees may be collected a list of questions is submitted, to which it is hoped that Local Medical and Panel Committees will return answers as soon as possible. In order that time may be given for consideration of the replies of Committees to this memorandum by the Insurance Acts Committee and their submission to the Commissioners, before the drafting of regulations to meet the introduction of the new tariff, answers must be received here **not later than September 30th**. It is important therefore that your Committee should be called together at an early date, and in order that the members may thoroughly understand the pros and cons of a very difficult question, sufficient copies of this memorandum to go round your Committee will be forwarded to you on request. Please state the number of copies required.

QUESTIONS.

1. Are you prepared to accept a Commercial Tariff on the lines laid down in this Memorandum as from January 1st, 1916?
2. If so, do you approve of the policy laid down in the resolution of the Insurance Acts Committee (see para. 10) and consider that some such guarantee is essential?
3. If you regard some such guarantee as essential are you (a) prepared to accept the facts and considerations set out in paragraphs 11, 12 and 13, as together constituting such guarantee, or
(b) What additional requirement do you regard as essential?
4. Are you in favour of (a) each Insurance area being credited with an amount for drugs and appliances on the same basis (as at present), or
(b) Do you prefer some form of differentiation between the different areas? (see para. 13).
5. If the latter, which method of differentiation do you prefer of those set out in paras. 19, 20 and 21?
6. Which method of those mentioned in paragraph 24 do you prefer for the distribution of the Drug Fund among Practitioners within each area?

..... *Honorary Secretary*.

Local Medical Panel Committee for

Date September , 1915.

APPENDIX.

LETTER FROM SIR ROBERT MORANT DATED 23RD AUGUST, 1915.

I understand that your Committee is to consider, at its meeting on Thursday next, the Memorandum on Drug Finance under the Insurance Act, which was drawn up after consultation with some of the members of the Committee a few weeks ago.* It is important that the purpose of the Memorandum should not be misunderstood and it has occurred to me that it might be desirable, in order to avoid any possibility of misunderstanding, that I should briefly explain the present position.

As was indicated in Memorandum 201 I.C. and in my letter to Dr. Cox of the 17th March, published in the BRITISH MEDICAL JOURNAL of March 20th, the Commissioners would,

* This memorandum was considered by the Insurance Acts Committee and formed the basis of the present document.

in the present exceptional circumstances, with so many members of the profession inaccessible, be most reluctant to make any substantial modifications of the terms of service of medical practitioners under the Insurance Act unless they could be assured that such modifications were "desirable in the view of all concerned." (Paragraph 5, Memorandum 201.) The present Memorandum must not therefore be taken as an exposition of a new scheme which the Commissioners are intending to embody in draft Regulations for the ensuing year; its object was merely to set out certain tentative ideas, arising out of the deliberations of the Tariff Committee and embodying the results of discussions between representatives of the Commissioners and of your Committee, with a view to their being more closely examined by your Committee from the point of view of their effect on the medical profession if carried out.

If your Committee welcome the proposals as being of advantage to the profession, and are prepared to recommend them to the Panel Committees, the Commissioners would be prepared to put them forward, in accordance with the usual procedure, with a view to their incorporation in new Regulations for 1916.

If, on the other hand, your Committee were to come to the conclusion—however mistaken such conclusion might be in the Commissioners' view—that the advantages of the new proposals to panel practitioners are more than outweighed, under present circumstances at any rate, by disadvantages, the Commissioners would have to consider whether the idea of making any change on these lines must not be abandoned, for the time being; and pending such consideration, your Committee would, of course, refrain from circulating any document to Panel Committees as representing the Commissioners' views as to the policy now to be adopted on the drug question.

THE PRESENT ATTITUDE OF THE MEDICAL PROFESSION TOWARDS THE INSURANCE ACT.

BEING THE PRESIDENTIAL ADDRESS DELIVERED AT THE ANNUAL MEETING OF THE BIRMINGHAM BRANCH.

By J. ORTON, M.D., D.P.H., M.R.C.S., L.R.C.P.,
COVENTRY.

I HAVE taken for the subject of this address the present attitude of the profession towards the Insurance Act. It is only fair at the outset to express the great indebtedness of the whole profession to the arduous work done by the head quarters staff of the Association in London in the long struggle which ensued before the Act came into force. No doubt many men may still hold the view that the Association might have taken up a much stronger position and have prosecuted a much sterner campaign on behalf of the profession than was actually carried out. We must remember, however, that the British Medical Association, as a purely democratic body, stands for ourselves, and the interests we severally and individually hold, and personally I maintain that, as far as the Association could voice the opinion of the profession throughout the country, so long as that profession spoke with no uncertain voice, the Association did put up as good a fight as could possibly be expected against one of the strongest Governments of modern times. I would therefore claim that, as a result of the fight, the profession has obtained terms and conditions which were very, very different to those first proposed to it; and, although it has been said in many quarters that the profession ought not to have taken office under the Act, or to have agreed to the conditions of the Act at the eleventh hour as they did, still I consider that as many concessions were obtained as could reasonably be expected, and subsequent events up to the present time have undoubtedly proved that the acceptance of the Act was wise, both financially and ethically.

I have myself, since the passing of the Act, been Chairman of the Local Medical Committees for the County of Warwick and the City of Coventry, Chairman of the two Panel Committees for the same areas, and have been elected a member of both Insurance Committees. At one time I was a member of no less than fifteen or sixteen committees under the Act, so that I think I may claim to have had some little knowledge of its working as it has affected the profession during the last two years.

I should like briefly to consider two aspects of the whole

question: First, that the profession has always been looked upon as the custodian of the public health and well-being; secondly, the effect of the practical working of the Act upon the status and emoluments of the profession as a whole.

With regard to the first point, it cannot be denied that the Insurance Act must be looked upon as the first serious attempt in this country to combat phthisis, and in working the Act we have, therefore, undertaken to do our best in order to remedy an evil that has caused and is causing such ravages amongst the population.

The sanatorium benefit established under the Act, with the aid from the Treasury, both in regard to the erection, equipment, and maintenance of sanatoriums, and the provision and maintenance of tuberculosis dispensaries, cannot fail to give a great stimulus to all attempts to stamp out a disease which is infectious and preventable. It is absurd to suppose that the system adopted under the Act will stamp out the disease in any given term of years, and great modifications to the present administration of the sanatorium benefit will have to come about, unless bankruptcy is to overtake the majority of the authorities; but the measures now in vogue will undoubtedly lead to the detection of early cases and the isolation of chronic ones, and will educate the public opinion. They will teach infected persons how to guard against transmitting the infection to others, and they will thus reduce the numbers of consumptives, but not cure all—that is too much to be hoped for even with sanatorium, diet accessories to treatment, tuberculin, and other modes of treatment.

Again, venereal disease, which as a social evil has been ignored by the State, both in regard to its existence and its cure, is a condition which the Act, through the profession, is rightly attempting to cure. Under the old club system, a man who contracted venereal disease was not recognized as coming within the scope of medical treatment; as a consequence he drifted to quack medicines or treatment by correspondence. This led public opinion gradually to suppose that quack treatment—that is, treatment otherwise than by qualified medical men—was that to be sought for; disastrous consequences both to the sufferer and his offspring ensued.

It is still difficult to decide, taking for granted that each case of syphilitic disease is to be systematically and efficiently treated under the Act, whether the injection of salvarsan should be carried out at the expense of the country practitioner who is paid a 2s. capitation fee for all his drugs and appliances, or whether the patient should himself pay for such treatment; because, although it might be argued that a practitioner within two miles of a chemist should be able to prescribe any drug which he knows will effect a cure, if this be allowed, it follows that a doctor who dispenses for his own patients must also supply this and similar drugs.

To mention one further disease under this heading, I will take anaemia. Formerly, a girl suffering at the age of puberty from a marked anaemic condition was forced by stress of civilization, as a working girl, to pursue her work often for long hours and with insufficient nourishment—conditions which sow the seeds of phthisis and cause a poor state of development. The benefits of the Act allow such cases now to procure medical advice and medicines at an early stage, and, if necessary, rest, with some payment during disablement. Speaking generally in regard to insured persons, the benefits now enjoyed were formerly available only to the more thrifty and provident persons. Those who most needed medical surveillance did not trouble to make any provision for sickness or ill health. Such persons under the Act are now compelled to insure themselves against sickness.

Under the second heading—that of the effect of the practical working of the Act upon the status and emoluments of the profession as a whole—several things may be said. At the outset I would state that it is eminently desirable that every man who is a general practitioner should be upon the panel of his area. Personally, I consider this most important. It would be deplorable to conceive the profession split up into two classes—the so-called superior one of non-panel doctors and an inferior one of panel. Infinitely better would it be for a man to have a limited panel, and thus to be associated with the working of the Act and to have an interest in the personnel of his Panel and Local Medical Committees.

A great deal of work will have to be done by members of the profession on such committees if the profession is to have any voice in the future. Alterations in the regulations of the Act and in control and management are inevitable, and I would strongly urge upon every man not to become apathetic or lukewarm, but take interest in the election of men who will represent him on the various committees. No doubt the work is somewhat thankless, and in a busy practitioner's life to be avoided if possible, but if the profession wishes to be consulted in all matters appertaining to the working of the Act, such an interest is necessary; neglect will in time produce consequences which may prove hard for each individual of the profession.

Perhaps the most important committee which the medical men have to serve upon is what is usually termed the "Complaints Committee," or, to give it its right name, "The Medical Service Subcommittee." The medical men appointed to this committee, who constitute one-half of the whole committee, should be men carefully chosen who will attend conscientiously, and carry out their duties in an impartial and judicial manner. So far as my experience goes, in the two areas of which I have full knowledge, these committees, though much drenched by the profession before the Act came into force, have not proved so formidable either in regard to the number of complaints or the course of proceedings.

The relation of panel doctors to hospitals, which before the Act came into force was a factor viewed with grave concern, has not proved so great a difficulty as was expected. At the same time, panel practitioners should take all responsibility for minor surgery, dressing of wounds, etc., in accordance with their agreements under the Act. Accidents which have been treated at hospital for the first time should certainly be subsequently referred as out-patients to their panel doctors for subsequent dressing, unless there be some exceptional reason to the contrary. It must be remembered that, under a practitioner's agreement, he is bound to afford every treatment which can be undertaken by a practitioner of ordinary competence and skill, and this may entail the administration of an anaesthetic by a colleague for such a case as the reduction of a dislocation—treatment to which a patient has a right under the Act, unless a distinct arrangement be entered into with the patient beforehand for the services of a specialist.

Various other difficulties will, I believe, be cured by experience and the efflux of time, such as the limitation of numbers on a panel list, the matter of certificates, the provision of nurses, the administration of serums and oxygen.

As to the limitation of numbers, we have not, in the Warwickshire area, taken any definite steps in this direction. I am, however, personally of opinion that if a man has any private practice, 2,000 to 2,500 represents about the limit of the number of insured persons he can conscientiously be responsible for.

With regard to the enrolment of the profession, I think it must candidly be admitted that this has been all to the good of the profession under the Act, but, under this heading, I much fear that when the three years' trial is over, the profession will have to put up a strong and determined opposition to demands which will be made for the reduction of the capitation fee. The public as a whole have got the idea that the profession is too well paid for the services it renders. Governments too often but echo the public mind, and we must recollect that our profession is inadequately represented in Parliament. We shall have to resist attempts which will be made to prove that a State medical service will be as efficient and far less costly, and the profession should remember that such an attack can only be met by a strong binding together of all members of our profession, both consultants and general practitioners alike. A State medical service for the practitioner would most assuredly mean a State hospital service for the consultant, and the organization necessary to oppose both can, I feel convinced, only be effected by the Association which has represented us in the past so ably in all its negotiations with the Government.

I feel strongly that we ought to combine as a profession to adopt prospective candidates for election to the House of Commons. During the last fight we had to be content with representation by—I believe I am right in saying—

two members of that House, neither of whom could be said to voice the opinions of the general profession. When we reflect that labour, as well as the educational and legal professions in this country, are well represented, the latter, perhaps, too much so, it seems but another proof of the charge so often levelled against us—that doctors are not business men, and show little forethought in the management of their own interests. Surely it would be well worth our while to subscribe to a central fund to promote the election of medical candidates to Parliament. The question of a State medical service is one which the profession will have to deal with seriously in the future, though I consider that the numerical strength of men upon the register will preclude any great attempt to force this through for the present. Even in the ranks of our own profession men are found who strenuously push a campaign in its favour. Last year, during the Annual Meeting at Aberdeen, a large evening meeting was held to further the object, two medical men making vehement speeches in favour of it, and we may be sure that the policy will not be lost sight of. Arguments can be piled up which are plausible and convincing to many who hold that the medical man should be the servant of the community as much as the policeman or tramway conductor, ignoring the fact that personality is a more determining factor in the success or failure of a medical practitioner than qualifications, degrees, or any other attribute.

Another menace I regard is the opposition on the part of the large collecting insurance societies and companies. I regard as nothing short of a catastrophe the possibility of these obtaining a mastery over the machinery of the Insurance Acts. Such an attempt will most assuredly be made, both in and out of Parliament; and we must recollect that large vested interests are here involved. It is notorious that the calculations for sickness benefit were far too low, and many of the approved societies were hard hit, even to the extent of extinction. The scapegoat for these miscalculations has been the medical profession, and although perhaps little is heard, I fear that much is being prepared for an onslaught upon our emoluments and privileges when the time is deemed ripe. Compared to the alleged control of the club doctor by the old friendly societies, which was brought out so prominently during the Insurance Act fight, a control by the big insurance societies would be to substitute chastisement by scorpions for chastisement by whips.

Meetings of Branches and Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

BIRMINGHAM BRANCH:

NUNESTON AND TARNWORTH DIVISION.

The annual meeting of the above Division was held at Nuneston on June 25th.

Election of Officers and Committees.—The following were elected to serve for the ensuing year:

Chairman: Dr. Smart.

Vice-Chairman: Dr. Shaw.

Honorary Secretary: Dr. Price.

Representative of Division on the Branch Council: Dr. E. Nason.

Ethical Committee: Drs. Smart, Power, E. Nason, Joy, Wood, Richardson, Price.

Executive Committee: Dr. Smart (Chairman of the Division); Dr. Price (Honorary Secretary of the Division); Dr. Lowson (Representative on Panel Committee); Dr. E. Nason (Representative on Warwickshire Insurance Committee); Dr. Wood (Representative on Panel Committee); Drs. Joy, Power, Shaw, and such other members elected by the Division as the Division may determine.

OXFORD AND READING BRANCH:

OXFORD DIVISION.

A SPECIAL general meeting was held at the Radcliffe Infirmary, Oxford, on August 27th, which was very largely attended. Sir WILLIAM OSLER, who was in the chair, called on Major GALLOWAY, R.A.M.C.(T.F.), to explain the urgency of the appeal now being made for additional medical officers. Major GALLOWAY stated that the Army

Medical Department required many more medical men for service with the new armies. It was estimated, he said, that there were in the country 6,555 medical men under 40 who were not serving. If the Oxford district contributed its fair share, 13 more men would be required to join in addition to the 7 who have already joined. He explained the steps that had already been taken in many parts of the country to supply the men, and urged the necessity of at once forming a Local War Emergency Committee. After a short discussion—in which Major COLLIER, Lieutenant-Colonel PARKER, Dr. CARTER, Lieutenant BLOSSOM, and Dr. CADWELL took part—it was decided to ask the Executive Committee to at once form a War Emergency Committee to deal with the whole question.

THE LIBRARY OF THE BRITISH MEDICAL ASSOCIATION.

BOOKS NEEDED TO COMPLETE SERIES.

The Librarian will be glad to receive any of the following volumes, which are needed to complete series in the Library:

- Archiv für Dermatologie und Syphilis. Bd. 24 and 25 (1892 and 1893).
Archives générales de médecine. Third new series 7-8 (1839-40); 4th series, 10-17, 20-25, 1852-55; 1858-64, 1872-1897; 1846-55 inclusive; 1857-64 inclusive; 1871.
Archives of Ophthalmology. Vols. 1-3, 6, 7, 14, 15, 16 and 20.
Archives of Otolaryngology. Vols. 1-7, and 20-22.
Archives de Parasitologie. Vols. 1-3.
Archives de Pédiatrie. Vols. 1-16.
Asylum Journal of Mental Science. Vol. 1, 1854.
Biochemical Journal. Vols. 1-4.
British Dental Journal. Vols. 1-29.
Biometrika. Vols. 2-6.
St. Mary's Hospital Gazette. Vol. 4.
Sanitary Commissioner with the Government of India Reports, 1-24.

LOCAL MEDICAL AND PANEL COMMITTEES.

COUNTY OF FORFAR.

LOCAL MEDICAL COMMITTEE.

A MEETING of the County of Forfar Local Medical Committee was held within the Reference Room, Town Hall, Forfar, on August 4th.

Election of Chairman.—Dr. JOHNSTON (Montrose) was appointed interim Chairman during Dr. Hoile's absence on military service.

Postponement of Elections of Local Medical and Panel Committees.—A circular of date June 8th last from the British Medical Association was read, urging all Committees who desired to suspend elections during the war to make individual application at once to that effect to the Commissioners. It was decided to write to the Commissioners urging the suspension of elections during the period of the war.

PANEL COMMITTEE.

A meeting of the Panel Committee was held on the same day.

Election of Chairman.—Dr. JOHNSTON (Montrose) was appointed interim Chairman during Dr. Hoile's absence on military service.

Rural Areas.—A letter from the Scottish Insurance Commissioners was read, defining the area they have approved as a rural area for the purpose of Rule 8 for the giving of certificates to insured persons by medical practitioners.

Medical Referees.—In view of letters from the British Medical Association intimating that the Local Medical and Panel Subcommittee of the British Medical Association did not favour the part payment of the proposed medical referees out of the funds available under Section 33 (2) of the 1913 Act, and from the Scottish Insurance Commissioners, stating that they were not disposed to sanction the scheme, it was decided to do nothing further in the matter.

Postponement of Elections of Local Medical and Panel Committees.—It was decided to write to the Commissioners urging the suspension of elections during the period of the war.

Allocation.—It was agreed to apportion the balance remaining in the Fund according to the numbers on the doctors' lists, irrespective of whether such persons were represented by index or suspense slips in the Committee's register. The CLERK to the County Insurance Committee, having pointed out that the scheme under Regulation 24 decided upon by the Insurance Committee and approved by the Panel Committee was defective in so far as no arrangement was in operation for the treatment of an insured person until his allocation had been effected, the Clerk to the County Insurance Committee was instructed to notify each practitioner that he would be expected to accept the responsibility for the treatment of a case pending the person's allocation to another doctor on the panel.

EAST SUFFOLK.

PANEL COMMITTEE.

A MEETING of the East Suffolk Panel Committee was held at the White Hart Hotel, Saxmundham, on August 10th, when Dr. HERSHAM was in the chair.

Reinstatement of Insured Persons Discharged from the Army.—The Secretary was instructed to communicate with the Clerk of the Insurance Committee with a view to the adoption of the arrangements for the reinstatement of insured persons discharged from the army set out in the report of the deputation from the British Medical Association to the Insurance Joint Committee published in the SUPPLEMENT of July 31st, p. 70.

Local Pharmacopoeia.—The report of the Subcommittee appointed to consider the advisability of the adoption of a pharmacopoeia was referred back for further consideration.

Analysis of Prescriptions.—The report of the analysis of prescriptions for the first quarter of 1915 was considered, and it was resolved that a letter should be sent to each practitioner who had exceeded the average allowance for the quarter, showing in each case the particulars and cost of the scripts as set out in the analysis of the checker, and pointing out that he was liable to be surcharged the amount overpaid by him at the end of the year.

Practitioners' Lists.—A letter from the Clerk to the Insurance Committee was read with reference to the Panel Committee's request to be furnished with information as to the capitation fees credited to the practitioner on the panel in accordance with Clause 35 (1) of the Statutory Rules and Orders, 1914 (No. 5) for the year 1913, and for each quarter of the year 1914. The letter pointed out that the Statutory Rules and Orders, 1914 (No. 5), did not apply to 1913, and as regards 1914 and 1915 it was not practicable to furnish the information quarterly, owing to the fact that the war had necessitated deductions being made in the index and medical registers for each quarter affected since the date of enlistment. The Clerk, however, undertook to give such information as regards 1914 at the earliest possible date.

Conference of Local Medical and Panel Committees.—It was resolved that a sincere vote of thanks be accorded to Dr. Askin for his services to the Committee in attending the recent Conference of Representatives of Local Medical and Panel Committees. The Committee also expressed their sympathy with Dr. Askin in his recent accident.

INSURANCE NOTES.

SURREY FRIENDLY SOCIETIES COUNCIL.

AT a meeting of the Executive Council of the Surrey United Friendly Societies Council held at Guildford on August 7th, a discussion took place as to the provision made at the various doctors' surgeries throughout the county in respect of waiting and consulting rooms and the times fixed for attendance on insured persons. The secretary reported that in consequence of complaints received he had communicated with 130 branches asking for information on the matter and the returns, which affected nearly 200 doctors, in all parts of Surrey, could be regarded on the whole as satisfactory. During the last few months there had been a marked improvement in the character of the waiting room accommodation though there was still room for a further improvement in some cases. No serious complaints had been made as to the surgery hours of the doctors. In some cases doctors had had their premises enlarged and rebuilt so as to provide the necessary accommodation, and since March, a member stated, no cases had been heard of where persons had been kept waiting in the streets.

The meeting also considered the question of the fees to be paid for the medical attendance on both the old and the juvenile members of societies affiliated to the council. A resolution had been received from the Mitcham district of the Manchester

M.R., Surgeon-Major J. Nightingale, M.D., from West Riding Brigade, R.F.A. Licentiate to be Captain. G. Forgy, J. Jeffrey, M.B., G. Candler, H. F. Everett, J. R. Garrod, M.D., G. B. H. Jones, M.D., W. E. L. Elliott, M.D., C. A. Sampson, R. L. Guthrie, M.D., C. J. Fox, F. Hinton, M.D. To be Lieutenants: H. M. Rodger, from Welsh Field Ambulance, A. B. Winter, M.D., F. Pring, W. P. Atkinson.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

In ninety-six of the largest English towns 7,599 births and 4,274 deaths were registered during the week ended Saturday, August 28th. The annual rate of mortality in these towns, which had been 11.5, 11.5, and 11.4 per 1,000 in the three preceding weeks, rose to 12.3 per 1,000 in the week under notice. In London the death-rate was equal to 12.4, while in 5,6 in Southern, 6.1 in Lincoln, 6.2 in Gloucester, 6.4 in Harnsey and in Reading, and 6.5 in Acton, to 16.7 in Stockton, 17.2 in Great Yarmouth, 17.7 in Middleburgh, 17.8 in Bootle, 18.2 in Barrow, and 18.7 in South Shields. Measles caused a death-rate of 1.3 in Rhodfa, and 1.9 in York. The deaths of children under 2 years of age from diarrhoea and enteritis, which had been 262, 262, and 348 in the three preceding weeks, further rose to 498, and included 120 in London, 40 in Birmingham, 31 in Liverpool, 25 to Manchester, 25 in Hull, and 22 in Sheffield. The mortality from the remaining infective diseases showed no marked excess in any of the large towns, and no fatal case of small-pox was registered. During the week 4,900 cases of 55, or 1.7 per cent. of the total deaths were not certified by a registered medical practitioner or by a coroner; of this number, 4 were recorded in Birmingham, 3 in London, and 2 each in Gillingham, Liverpool, Bolton, Preston, Gateshead, and Tynemouth. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 2,436, 2,415, and 2,367 at the end of the three preceding weeks, further fell to 2,360 on Saturday, August 28th. 315 new cases were admitted during the week, against 285, 279, and 225 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In the sixteen largest Scottish towns 1,024 births and 600 deaths were registered during the week ended Saturday, August 28th. The annual rate of mortality in these towns, which had been 13.7, 12.6, and 12.3 per 1,000 in the three preceding weeks, rose to 15.3 in the week under notice, and was 14.0 per 1,000 above the rate recorded in the ninety-six large English towns. Among the several towns the death-rate ranged from 8.2 in Clydebank, 8.8 in Motherwell, and 10.0 in Dundee, to 15.5 in Aberdeen, and 17.8 in Paisley. The mortality from the principal infective diseases averaged 1.7 per 1,000, and was highest in Aberdeen and Coatbridge. The 267 deaths from all causes in Glasgow included 12 from infantile diarrhoea, 9 from measles, 4 from whooping cough, 3 from scarlet fever, 2 from diphtheria, and 1 from enteric fever. Four deaths from measles were recorded in Edinburgh; from scarlet fever, 3 deaths in Aberdeen and 2 in Paisley; from whooping cough, 3 deaths in Aberdeen; from diphtheria, 3 deaths in Aberdeen and 2 in Edinburgh; and from infantile diarrhoea, 4 deaths in Dundee, 3 in Edinburgh, and 2 in Coatbridge.

HEALTH OF IRISH TOWNS.

During the week ended Saturday, August 21st, 539 births and 317 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 541 births and 339 deaths in the preceding period. These deaths represent a mortality of 13.6 per 1,000 of the aggregate population in the districts in question, as against 14.6 per 1,000 in the previous period. The mortality in Dublin Irish areas was therefore 2.2 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate, on the other hand, was equal to 23.2 per 1,000 of population. As regards mortality in the principal urban districts in the Dublin registration area was 14.7 (as against an average of 14.2 for the previous four weeks), in Dublin city 15.3 (as against 14.7), in Belfast 13.6 (as against 13.4), in Cork 13.0 (as against 13.7), in Londonderry 22.2 (as against 19.5), in Limerick 8.1 (as against 18.3), and in Waterford 22.8 (as against 11.4). The zymotic death-rate was 2.1, as against 1.8 in the previous period.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notice re Appointments) appearing in our advertisement column, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

ALTON, HANTS: LORD MAYOR TRELOR CRIPPLES HOSPITAL.—Assistant Resident Medical Officer.
BIRMINGHAM AND MIDLAND EYE HOSPITAL.—Junior House-Surgeon. Salary, £300 per annum and £5 per annum. A post of **BIRMINGHAM GENERAL DISPENSARY.**—Resident Medical Officer. Salary, £350 per annum.
BRISTOL ROYAL INFIRMARY.—(1) Resident Obstetric and Ophthalmic House-Surgeon; salary, £120 per annum. (2) Dental House-Surgeon; salary, £100 per annum.
BUXFON, DEVONSHIRE HOSPITAL.—Assistant House-Physician. Salary, £100 per annum.
CAMBRIDGESHIRE ASYLUM, Fullourn, near Cambridge.—Junior Assistant Medical Officer. Salary, £200, rising to £250 per annum.
CARDIFF: KING EDWARD VII HOSPITAL.—House-Surgeon. Salary, £140 per annum.
DEWSBURY COUNTY BOROUGH.—Temporary Assistant School Medical Officer. Salary, £300 per annum.

DUMFRIES: CRICHTON ROYAL MENTAL HOSPITAL.—Temporary Assistant Physician during War. Salary, £300 per annum.
DUNDEE COMBINATION POOR-HOUSE AND HOSPITAL.—Resident Medical Officer. Salary, £225, rising to £300 per annum.
GLOUCESTERSHIRE JOINT COMMITTEE FOR TUBERCULOSIS.—Assistant Tuberculosis Medical Officer. Salary, £350 per annum.
GRIMSBY AND DISTRICT HOSPITAL.—House-Surgeon. Salary, £5 5s. a week.
HARROGATE INFIRMARY.—Resident House-Surgeon. Salary, £100.
INGHAM INFIRMARY AND SOUTH SHIELDS AND WESTOE DISPENSARY.—House-Surgeon. Salary, £150 per annum.
LABRATORIES OF PATHOLOGY AND PUBLIC HEALTH, New Cavendish Street.—Bacteriologist.
LANCASTER COUNTY ASYLUM.—Temporary Assistant Medical Officer. Salary, £6 6s. per week.
LEEDS PUBLIC DISPENSARY.—Resident Medical Officer (lady). Salary, £30 per annum.
LIVERPOOL INFIRMARY FOR CHILDREN.—(1) Two Resident House-Physicians; (2) one Resident House-Surgeon. Salary, £30 in each case for six months.
LIVERPOOL STANLEY HOSPITAL.—Resident House-Surgeon.
MANCHESTER: NORTHERN HOSPITAL FOR WOMEN AND CHILDREN.—House-Surgeon. Salary, £120 per annum.
MIDDLEBROUGH: NORTH ORMESBY HOSPITAL.—House-Surgeon. Salary, £150 per annum.
NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.—Resident Medical Officer. Salary, £100 per annum.
PARISH OF INVERAVON, Banffshire.—Medical Officer.
PARISH OF LIVERPOOL.—Head:—1 Assistant Medical Officer. Salary at the rate of £300 per annum.
PARISH OF ST. MARYLEBONE.—Visiting Medical Officer to Work-house. Salary, £25 per annum.
QUEEN CHARLOTTE'S LYING-IN HOSPITAL, Marylebone Road, N.W.—District Resident Medical Officer. Salary, £60 per annum.
ROYAL FREE HOSPITAL, Gray's Inn Road, W.C.—Resident Medical Officer to Military Block.
ROYAL SALOP INFIRMARY.—House-Physician. Salary at the rate of £120 per annum.
ST. ANDREW'S HOSPITAL, Dollis Hill, N.W.—Resident Medical Officer.
SOUTHAMPTON: ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL.—(1) House-Surgeon; (2) House-Physician. Salary, £250 per annum respectively.
SWANSEA EDUCATION COMMITTEE.—Two Temporary Assistant School Medical Officers. Salary, £300 in each case.
TOXTETH PARK TOWNSHIP.—Assistant Resident Medical Officer. Salary, £250 per annum.
WEST BROMWICH AND DISTRICT HOSPITAL.—Assistant House-Surgeon. Salary, £120 per annum.
WEST HAM AND EASTERN GENERAL HOSPITAL, Stratford.—(1) Resident Medical Officer; (2) House-Physicians and House-Surgeons. Salary for (1) £160 per annum, and for (2) £120 and £100 per annum respectively.
WESTMINSTER GENERAL DISPENSARY.—Resident Medical Officer. Salary, £120 per annum.
WESTMORLAND SANATORIUM, Meathop, Grange-over-Sands.—Second Assistant to Medical Superintendent. Salary, £200 per annum.
WIMBORNE ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Junior House-Surgeon. Salary, £150 per annum.
CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointments: Rothes (Edin).

To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—if it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

FORBES, W. J., M.B., Ch.B., Certifying Factory Surgeon for the Knaresborough District, co. Yorks.
GARDNER, A. M.B., C.M., Certifying Factory Surgeon for the Dronfield District, co. Derby.
ROBINSON, H. G., M.B., Ch.B., Certifying Factory Surgeon for the South District, co. Cornwall.
THOMSON, RUBY, M.B., Ch.B., Edin., Chief Tuberculosis Officer for South Staffordshire (during war).
WELCH, R. C., M.B., C.M.Edin., temporary Deputy County Medical Officer of Health to the Bedfordshire County Council.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s., which sum should be forwarded in Post Office Orders or Stamps with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

MARRIAGE.

BRUSHFIELD—NUGENT.—On August 26th, 1915, at St. Peter's Church, Sowerby, Yorks, Dr. Archibald Nugent, second son of the late Dr. T. Nadault Brushfield, of Bulleigh Salterton, to Evelyn Dorothy Noel, fourth daughter of Mr. and Mrs. Nugent, of White-windows, Sowerby, and granddaughter of the late Sir Oliver Nugent, of the Island of Antigua.

British Medical Association.

SCOTTISH COMMITTEE.

A MEETING of the Scottish Committee of the British Medical Association was held in the Station Hotel, Perth, on September 10th. Dr. J. R. HAMILTON, Hawick, presided, and there were also present Dr. Cox, Medical Secretary; Dr. John Adams, Glasgow; Dr. Wishart Kerr, Glasgow; Dr. Lyell, Perth; Dr. Stevens, Edinburgh; Captain C. S. Young, Dundee; Dr. Michael Dewar, Edinburgh; Captain Moorhouse, Stirling; Dr. Grant Macpherson, Bothwell; Dr. Caskie, Glasgow; Dr. R. C. Buist, Dundee; and by invitation Dr. Norman Walker, Edinburgh; Dr. Mackay, Aberfeldy. Apologies were intimated from Dr. Martin Smith, Dundee; Dr. Balfour Graham, Leven; and Dr. Gordon, Aberdeen.

THE WAR EMERGENCY.

Medical Men and the Army.

Dr. NORMAN WALKER said it was exceedingly difficult to give figures, but in general terms, so far as the country districts of Scotland were concerned, the response had been admirable. From the large towns, excepting Dundee and Aberdeen, which had also done admirably, the response had not been so large in proportion. The reason was pretty evident—it was easier to arrange for the conduct of a practice in the country than in the town, and this kept men in the town back. The Emergency Committee at present had to deal with the problem of assuring the town practitioners that their private practice would, to some extent at least, be kept together for them. They had all sorts of suggestions and plans, and the one that commended itself most to the Committee was that every doctor in Scotland should place in his waiting-room a notice requesting patients, when their doctors were away, to mention the fact when they consulted another doctor. When everybody was doing exactly what he ought to do, the doctor would ask a new patient the question. Legislation and regulation did not bear on the people who did right; it had to be devised for those who did not; if this responsibility were put on every doctor in Scotland, whatever class of practice he might have, it would bring it home to the public in a way that nothing else could. Advertisement was considered, and the President of the General Medical Council was of opinion that it would be legitimate to go considerably further than in ordinary times, provided the advertisements were not in the name of any doctor, but in the name of the Emergency Committee. But all people did not read the newspapers, and

especially the advertisement columns, whereas, if the notice was constantly in the waiting-room, everybody's attention would be called to it. Although it was not considered judicious to give figures at present, he might say that the Committee had been encouraged by the response, and wanted as many as could possibly go. The War Office was co-operating in an extremely cordial way, utilizing the Emergency Committee in communicating with the profession in Scotland. The system had the very great advantage that men who had special qualifications were utilized. A man had to take a commission as temporary lieutenant in the first instance, but his qualifications were noted. The Committee was greatly indebted to the War Secretaries and to the Divisions for their invariable care and courtesy.

Dr. ADAMS said that the Committee would be delighted to receive practical suggestions from the point of view of the general practitioner.

Dr. CASKIE suggested that better would be a circular, or a request, or a demand even from the War Office—a personal appeal by the War Office to each member of the profession between 25 and 45.

Dr. COX, in reply to Dr. Moorhouse, said that, according to the most recent returns, 2,500 medical men were wanted before Christmas, and preferably men under 40. Previous to that Scotland had made up its mind to provide 400 as its proportion, but when the numbers were distributed the conclusion was that Scotland should provide 500 as its fair share.

Dr. ADAMS said that men of 45 and under would be engaged, not for six months as hitherto, but for one year, and they were taken on the assumption that they would go abroad if required.

The CHAIRMAN said they were all obliged to Dr. Walker. He hoped all present would take the hints they had got, and bring them up at early meetings.

Records of Practitioners on Active Service.

Dr. COX said that the present position was that the Insurance Acts Committee had resolved not to press this point.

Certificates in Chronic Cases.

In reply to Dr. FINDLAY, Dr. COX said that the decision of the question as to certificates in chronic cases lay with the societies, and not with the Insurance Commissioners. Most of the big societies had shown themselves reasonable in the matter. Friction was often due to some want of tact. When a case went on for weeks or months, a certificate every week was not necessary, and generally after explanation the society would agree to an interval of a fortnight or three weeks.

HIGHLANDS AND ISLANDS MEDICAL SERVICE.

The CHAIRMAN invited the meeting to consider the report of the Highlands and Islands Board, the effect of its conditions upon practitioners in the Highlands, and any other question arising out of the report. The feeling on the subject in the Highlands seemed to be rather acute. The Committee desired to learn the views of the Highland practitioners. The Association would always do its best for the Highlands or any other part professionally.

Dr. MACKAY (Aberfeldy) said that the scheme, framed by the Highlands and Islands Medical Service Board with the consent of the Treasury, providing for the general conditions under which medical practitioners would be eligible to participate in grants from the Highlands and Islands Medical Service Fund, was not suitable for the Highland district of Perthshire, which was quite different from those in the outlying districts, such as the Western Islands and many parts in the West of Scotland. The scheme seemed to imply that the Board wanted practically every medical man in the Highlands to have a minimum income. That was quite right. In the case of remote districts the Board's principle seemed to be that, having ascertained that a man got so much for his parish appointments and so much for insurance work, it would make up his income to at least £300 a year. The medical men in his part of Perthshire were quite differently situated; the incomes of all were over the minimum, and they did not want anything from the Highlands and Islands Board except what they worked for. He saw in paragraph 4 of the scheme that medical men were not to be paid the mileage grant for the current year. He did not see with what right or why the Board should withhold the grant for travelling for this year, any more than the two former years—1913 and 1914. At present the doctors had an agreement with the County Insurance Committee that they would attend the insurance patients at a certain rate, and they received 1s. per mile per annum for every patient outside the three-mile limit. That agreement held good to the end of this year, so he held that the Highlands and Islands Board had no right to tell them now, when three-fourths of the grant was already earned, that they were not to get anything for the current year. The Board ought to pay them as usual up till the end of 1915, and then, if it had any new arrangement to propose, the medical practitioners were at liberty to accept or reject it. Reading between the lines, it seemed that the Board was asking the medical practitioners to fill up a return stating what they received from other sources, such as insurance fees, parochial fees, and any other emoluments. He had pointed out to the secretary that in the parishes in the Highland district of Perthshire the paupers were very few, and that the doctors only got very small sums from the parish councils for attending those paupers. As a rule the paupers were not far distant, and the doctors could not count on anything from that source whereby they might lower the mileage rate. The Board did not tell them what it proposed to give per mile, but on the previous day he had a letter from the Secretary of the Highlands and Islands Medical Service Board, in which he said:

Dear Sir,—I beg to acknowledge the receipt of your letter of the 4th inst., enclosing statement by yourself and your colleagues in the Highland District of the county. I had an opportunity of submitting the statement to the members of the Board yesterday, and I was instructed to say that they find themselves in full agreement with most of the points set out in the statement.

In the case of yourself and your colleagues it is clear that the arrangement with the Board should take the form of a payment in respect of additional work, and any increase in travelling expenses involved in giving medical attention at modified fees to poor patients living at a distance. As regards the mileage grants, the subsidy which will be payable to the doctors in respect of the current year will make provision for the payment of a grant equivalent to the old mileage grant, and for such additional grant as may be arranged between the doctors and the Board in respect of any work undertaken for the Board.

The information asked for in Form 2, and particularly in Sections IV, V, and VI thereof, is required to enable the Board to determine whether, and if so to what extent, there are persons within the area of a particular practice to whom the Board's scheme should apply, and to serve as a basis for discussion of the subsidy payable to the doctor. If your colleagues would kindly fill up the form and return it at their early convenience, a representative of the Board will be ready to visit the district, and to discuss with them the terms of the scheme, and any arrangements that it may be proposed to make with them.

What the doctors wanted, Dr. Mackay said, was that their present agreement should hold good till the end of this year, and that they should get the mileage grant for 1915 as they had for 1914 and 1913. Then if the Highlands and Islands Medical Service Board put a scheme before them and told them what it wanted, they should consider the matter. His proposal was that the best thing to do would be to fix a certain sum per mile to cover the travelling and also the fee. They did not want to have their insurance work mixed up with the Highlands and Islands Board work. In reply to Dr. CASKIE, Dr. MACKAY said the agreement for 1915 with the County Insurance Committee was the same as for 1913 and 1914. The 1914 agreement was accepted for 1915, and stood till the end of December. He did not see why the Board should break up this agreement, or how it could.

Dr. NORMAN WALKER, member of the Board, said the Board felt convinced that this was a pure misunderstanding. He had better say, in reply to one of Dr. Mackay's points, that Perthshire was not always in the Highlands, so far as the Medical Board was concerned. By a very narrow majority in the House of Commons some parts of Perthshire were added. He desired, first of all, to clear up the question of mileage before he referred to any other matter. He was quite certain Dr. Mackay spoke in good faith when he made his statement, but as a matter of fact the mileage was not guaranteed for this year. The agreement with the Insurance Committee was simply carried on. When the Highlands and Islands Act was passed the sum of £10,000, allowed annually, was transferred to the Highlands and Islands Board. During last year (1914), by arrangement, because the scheme was not then sanctioned by the Treasury, the sum of £10,000 was handed over to the Insurance Committees to distribute on the same basis as in the previous year. But speaking as a representative of the Board, he wished to say it was absolutely and quite clearly laid down that this sum of £10,000 should pass to the Board. There was no idea of depriving the practitioners of the mileage for this year. There was no such idea in the mind of the Board. So far from that being the case, the subsidy would be considerably increased. Members of the Acting Business Committee of the Board, of which he was chairman, thought that if he could attend that meeting he might be useful in giving information and clearing up misunderstandings. The Highlands and Islands presented a very peculiar medical problem; the difficulties had been notorious for years. Recently he had unearthed a report on their condition in 1854 by a large committee of which Sir James Simpson was a member. A circular was issued, but nothing was done. There had been constant difficulties, dismissal of medical officers, etc. After the introduction of the Insurance Act it was plain that it would not run in the Highlands of Scotland. Crofters were not insured. They were their own employers. The Dewar Committee was instituted, and took evidence from 80 per cent. of the doctors. The outcome of the report of that committee was the Highlands and Islands Act. Taking the whole circumstances into consideration, the Committee suggested a sum of £32,000 per annum, excluding the £10,000 for mileage, as what was required. The Treasury accepted that amount. The Committee recommended that the Board, which would be concerned with all sorts of medical services—public health, education, and so on—should contain a representative of each of these departments. Accordingly Dr. Leslie Mackenzie represented the Local Government Board, Dr. McVail the Insurance Commissioners, Dr. Macpherson the Board of Control, and Dr. Robertson the Education Committee. Then to represent the medical profession Sir Donald MacAlister's name was added. Sir Donald had a very serious illness, and he (Dr. Norman Walker) was asked by the Secretary for Scotland if he were prepared to do the work of the Board in conjunction with the other members. There were thus five doctors on the Board, most of them at least being pretty experienced. The other members were Sir John Dewar and Lady Susan Gilmore. Five of eight members were medical men, and it might be taken that they were not biased against the members of the profession. The first step was the same as that taken by the committee of 1854, which issued schedules to the various doctors and boards in the Highlands. Most of them were returned and the replies were similar to those received in 1854. They showed that in many

districts of the Highlands the living the doctor made could not be called a living. His whole income was often under £150 a year, and while the expenses were comparatively small, the conditions were such that good medical men were not attracted. It was quite a common thing to find a salary of £100, £120, or more offered for Poor Law administration with only six, eight, or ten pappers in the parish. It was the only way to get a doctor there, but in some districts the doctor near a shooting lodge received a subsidy from the proprietor. In many cases that was quite an honourable thing, and worked perfectly well, though a subsidized doctor was not very desirable from a medical point of view. It was most depressing to see men return in some of the schedules sums like £14 as derived from private practice, and others very small sums indeed. Personally he was one of the first witnesses, and the Committee pressed him very hard as to what would be an adequate salary, but he refused to commit himself, and ultimately the Committee adopted the principle that where it thought a doctor was necessary, and where he did satisfactory work, he should be guaranteed a salary of £300 net after paying his travelling expenses, his drugs, and his house rent. Because of the peculiar condition of the people and the enormous distances the travelling expenses were guaranteed. Suppose a patient was twenty-five miles away from the doctor, what possible fee could the latter charge less than 25s.—a good deal more than his patient's entire weekly wage? The result was that there was extraordinarily little medical attendance in some districts, and a great part of the work was done in charity by the doctors. The object of the Board was that it should, so far as this £42,000 went, place those poor patients in the Highlands as nearly as possible in the condition of people of more settled districts, and they would use that money to bring the doctor to the door. The result of those inquiries went to show that a great deal of hardship existed when the patients were at a great distance. In one or two districts the Committee found a club practice. Speaking generally, the system adopted was that the patient, whether he lived one mile from the doctor or thirty miles, was to pay for a first visit a fee of 5s., and for subsequent visits 2s. 6d.; and the Board was to come in and pay the doctor's expenses of getting there. Nursing was another problem, and schemes were proposed which would have added another "0" to the grant if carried out. One county asked that seventeen hospitals should be built in it. The Board decided to visit those places, and made what had been very erroneously described as pleasure trips. He went with one of them to the Western Isles. Six o'clock was the latest he rose, and he was often up at four hearing the views of the local people and of the members of nursing associations. After obtaining all this information the Committee arrived at a basis for making and distributing grants. The object, he hoped he had made clear, was to abolish distance so far as the patient was concerned. There were two classes of doctor. There was the one in many of the Orkney and Shetland islands and in the north-west part of Scotland who had incomes very much under £300 a year. It was quite obvious, if the Board was to guarantee a sum of £300, they must know what else he was getting. Then came the other class, which he had felt it his business particularly to look after that he should not be hurt—the doctor whose income was sometimes a good deal over £300. So no particulars with regard to his income was asked except for his appointments. He was not asked what he made from private practice. One of the conditions laid down by the Treasury for the grant to be made year by year was that no existing source of income was to be diminished. The Local Government Board was responsible for payment of salaries of £100, £110, and £150 under the Poor Law, and would be very pleased to throw that expense on the Highlands and Islands Board. The Board asked all the doctors to state what income they received from the various sources of a public nature. There were, of course, many other matters. The Board was concerned in hospitals, ambulances, and nurses. The Ross-shire practitioners, after hearing at a meeting held at Dingwall the explanations by the representative of the Board, all agreed to fill up and send in the form. The agreement was not a binding agreement, but a draft for the suggestions of practitioners. When the draft form had been filled up and considered by the Board, special points, if any, would be considered. Then a representative of the Board would visit

each area, and each doctor would discuss with him the form he had drafted, and arrive at a final agreement. He had every confidence in the Board, which was reasonably composed. He would be very much surprised if, instead of the mileage being diminished under the new system, it was not very much increased. It was now mileage for visiting insured persons; in future it would be also mileage for visiting uninsured persons, who were more numerous. He ventured to think that the whole thing had been a misunderstanding, and that the Board's proposals should have the entire sympathy of the profession.

Dr. MACKAY said he thought Dr. Walker had gone a long way to prove what he had said—namely, that a scheme applicable to the West Highlands was not applicable to his district. When the bill was first presented the Highland district of Perthshire was included; then after debate it was excluded, and finally it was included. To show the absurdity of the whole thing, districts round Aberfeldy and Pitlochry were included, while Killin, which was a far more Highland district, Balquhider and round about Callander, were outside. The scheme was unfair. The doctors had been attending their insurance patients all the year according to their agreement with the county. He saw no reason why the mileage grant should not be paid up from the beginning of the year till now as in the past, and when this new scheme brought in by the Highlands and Islands Board came in force, let it be submitted further. But in the meantime the doctors ought to be paid the mileage grant till now or to the end of the year.

Dr. NORMAN WALKER said that instead of the mileage grant being diminished it was increased; but it was not called mileage. Mileage disappeared under that name, and now appeared under the name of subsidy. Dr. Mackay with his district must have a large mileage, therefore a large subsidy. If a man had a practice radius of about three miles he had a small mileage, but he would get his subsidy for attending the people. If this year's grant was confined to £10,000 for mileage, it would mean that a great part of it might have to go back to the Treasury. Last year that £10,000 was handed over to the Insurance Committees to distribute on the same basis as the old mileage grant. The Board was not cheating anybody; it would see that everybody got his fair share. Certain conditions were laid down which might seem hard. These did not refer to Aberfeldy, but there were conditions the Board had to lay down in places where there was no other doctor within twenty miles. It had to make it a condition of those guaranteed sums that a man must be willing to do all the medical work of the district. He would have to be ready to work Poor Law, insurance, appointments, light-houses, and all such things. It would upset the work if a man said, for example, he would not work the lighthouses, and another had to be brought from fifty miles away.

Dr. ADAMS appealed to any one who thought it over that if £10,000 was given before in the name of mileage, it followed logically, if £32,000 was given in addition, the doctors concerned were bound to be much better off. In reply to Dr. STEVENS, who observed that there were six schemes, Dr. ADAMS said that if £10,000 was allowed for mileage in addition to £10,000 already given, it stood to reason that the men must be better off, and the conditions under which a man making over £300 a year worked would be improved. The area over which he agreed to practise would be considered in each case by the Board, and a certain agreed upon subsidy allowed to him applicable to the area he covered; he was bound to be better off.

Dr. MACKAY thought Dr. Adams had not taken into consideration the extra amount of travelling to be done. His own practice extended ten miles on one side and thirty-two miles on the other.

Dr. ADAMS said that the financial conditions of practice were bound to be improved by this additional subsidy. Those of them who knew working people and their incomes could not believe that a doctor visiting such a person twenty miles away three times a week could be paid adequately for the work by a patient making 20s. a week. This subsidy, with the amount that lay between 2s. 6d. or 5s. and 25s. would make up to the doctor for mileage.

Dr. BUIST said that the matter was very clearly expressed in the circular: "The subsidy payable to the doctor will

be arranged on a footing that will cover the travelling expenses involved in attendance on insured persons (present mileage) as well as on all others entitled to receive medical attention under any arrangement between the doctor and the Board."

Dr. GRANT MACPHERSON pointed out that the clerical work would be tremendously increased. A large proportion of the doctors in the Highlands and Islands were at the war, and it would be difficult to arrange for the clerical work in connexion with their practice.

Dr. NORMAN WALKER said that there would be some clerical work, but the Board had to know how the money was being spent. The Treasury required to know, and returns indicating whether a patient was Poor Law, insured, or otherwise under arrangement had to be received. The scheme did not touch the better-to-do people, but it was necessary to know how much of the Board's subsidy was helping the poor. As to doctors who were away, two of the members of the Board were members of the War Emergency Committee, and they were taking care that in the arrangements for the conduct of his practice, when a man came back from the war his position was clear.

The CHAIRMAN: Is there any income limit?

Dr. WALKER: We have the phrase "persons in the crofter and cottar class." It may possibly be a matter of arrangement.

Dr. MACKAY thought that when the arrangements came into force something more definite must be done.

Dr. LYELL said that a great deal of the objection seemed to be in connexion with points in the agreement. First of all, the doctor was to be bound to visit systematically all persons within the area of his practice. He was to make systematic and regular visits to outlying patients. He was personally to attend midwifery cases, provide himself with a motor cycle, and so on. There were a number of points like that which bound a man down, but those whose incomes were over £300 a year naturally objected to fix themselves in that way for a subsidy the amount of which was not named. Was there, he asked, to be some system of inspection? Was the crofter to appeal to any inspector to vent his grievances, or how was this to be carried out in the event of the practitioner not having implemented his part of the agreement? Was there to be an underhand system of inspection in connexion with the work of the doctor, or how was the whole thing to be worked unless there was some such disagreeable and unpleasant form of inspection of a doctor's work?

Dr. NORMAN WALKER said that it was open to the practitioner to criticize when he filled up the draft agreement, "Visit systematically particular places." Men conducted their practices in different ways. Some men visited systematically a certain place on a certain day when it was convenient. If a man said he would visit a place every Wednesday if he got another £10 a year as subsidy, it was a matter of fair arrangement that he should do it if it was in the public interest. The question of discipline was a delicate subject. The Board might be trusted not to abuse its position in that matter.

Dr. LYELL said that two classes of practitioners were distinguished—those guaranteed £300 and those above that. Would those in the latter section be bound down in the same way to these obligations? Would not there be a different way of dealing with the two cases?

Dr. NORMAN WALKER said there was an individual agreement in each case.

Dr. BUIST asked if the difficulty was not the same as that when the Insurance Act was brought in. It seemed to him that it was putting an extreme legal interpretation on phrases intended to be interpreted in the ordinary way.

Dr. LYELL: Then he is to be under obligation to attend and visit all persons in the area of his practice.

Dr. STEVENS said that Clause 14 of the draft agreement seemed to put the doctor practically in the hands of any one member of the Board.

Dr. BUIST: Surely, again that is legal misinterpretation. It is to save the whole Board having to sign every letter as it goes out.

Dr. STEVENS said the scheme was intended to help the practitioners in the Highlands financially, but anything beyond the £10,000 for mileage seemed to be in an entirely nebulous state. The nursing scheme alone might take a large part of it. It seemed rather a pity that all this should be done while a fourth or a third of the men were at the front. They would not have any chance of

criticizing, but would have to go into it whether it was good or bad. He asked Dr. Mackenzie (Tain) two questions. His answer to them was as follows: "(1) The profession, locally or in any other way, has not been consulted as to the scheme as now submitted, nor has such a scheme been foreshadowed in any report issued by the Board. (2) The Board does state that their scheme is largely based upon the reports of local medicals and their own inquiries. This I do not believe, except in a very wide and general way. I do not think their scheme at all consistent with the evidence they obtained, except in a general way and in exceptional cases. If their scheme was consistent with these reports, why the widespread feeling of concern from all parts of the Highlands? Their scheme is wholly a one-sided business."

Dr. MACKAY said that men must have a certain amount of discretion as to visiting certain districts on certain days. He went down to Strathgairn three days a week. Everybody knew it. But he also went as a rule every day. In the other direction he went two days a week. It would be absurd to ask a man to go twelve or fifteen miles to a certain place when there was not a patient to be seen.

Dr. ADAMS said that Dr. Norman Walker had emphasized the fact that of eight members of the Board five were members of the medical profession. With regard to the medical profession, what were the interests of those two members of the Board? Was it not the interest of Sir Donald MacAlister to see the work of the medical profession made as attractive as possible? As he wanted students, recruits, it would be his interest and duty to see that the medical men carrying out this scheme were looked after as well as possible, and Dr. Mackay and his colleagues might have every confidence in the Board looking after this matter, and might feel quite sure nothing would be done in any way likely to hurt or hinder the profession.

Dr. COX said that if the scheme was not put through soon the profession stood a chance of losing this £32,000. He considered the matter had not been rushed, and unless the profession in the Highlands was careful it stood a risk of losing the whole or part of the money.

Dr. NORMAN WALKER said that what would very probably happen would be that if the money was not utilized it would be put to capital for the building of hospitals, nurses' houses, etc., and the profession would stand to lose it. Really the rush had not been so great. The meetings were held in the summer and the early months of last year. It took a long time to get things through the Treasury.

The CHAIRMAN said he had just received a letter from Dr. Moir (Inverness) intimating that at a meeting of the medical practitioners of Ross and Cromarty held on September 8th in the Ross Memorial Hospital, Dingwall, to discuss the scheme of the Board with their representative, Dr. Cruickshank, many of the difficulties and obscurities in comprehending the scheme were removed, and there was a good deal of unanimity as to the benefits to be derived from the scheme as explained by Dr. Cruickshank. Modification of the wording of clauses 1, 12, and 14, felt to be of vital importance to medical men, was suggested to Dr. Cruickshank, who sympathized with the views expressed, and stated that he would draw the attention of the Board to them. The following resolutions were agreed upon unanimously by the meeting, which was representative of all parts of the county:

1. It was agreed to complete Form 2, and to send it as soon as possible to the secretary of the Board.
2. As Dr. Cruickshank pointed out that agreements would have to be made with individual medical men based upon the conditions under which he practised, it was unanimously agreed that it would be to the interests of the profession in the county, as a whole, to have a common consideration of the drafts of individual agreements, and that these be considered at a meeting of the general practitioners of the county to be summoned for that purpose before the agreements are actually signed. It was resolved, however, that at this meeting no statement of financial returns made to the Board by individual practitioners, nor what subsidies the Board had agreed to these individual practitioners, should be submitted.

Dr. WISHART KEER said that after hearing the various speakers it seemed to him that the doctors in the Highlands and Islands of Scotland would be infinitely better off in the future than in the past. If they were to get Government grants they could not remain absolutely free

agents, and the man who did not do his work would be brought to book.

Dr. ADAMS proposed:

The Scottish Committee, having considered the reports of the Board, and heard the statements of Dr. Mackay, Abercrombie, and Dr. Norman Walker, finds that the anxiety which the report has caused in certain districts is due to misapprehension of the import of the terms; that the insurance mileage grant is absorbed and supplemented by the subsidy of the Board, and that the conditions of practice are to be settled by individual agreements at the discretion of each practitioner.

Dr. DEWAR seconded.

Dr. LYELL said it had not been brought out why the Board approached men individually and why the accredited authorities of the profession were not consulted in regard to these agreements. He supposed the same tactics were taken up at this time as were taken in the case of the Insurance Act. Why did they not approach the local secretaries, the Scottish Committee, or the head office of the British Medical Association before sending out this scheme to individual practitioners and leaving them only a fortnight to decide? That point had to be settled, for a very important principle was involved.

Dr. WISHART KERK said that the answer to that could only be in the difficulty of the Highlands and Islands having a corporate meeting of the members, and each one would be approached separately.

Dr. STEVENS moved:

That consideration be continued till a further meeting of the Committee, to enable further inquiry to be made into the conditions affecting service under the scheme.

It was, he said, a very large subject. The Scottish Committee had never had that important subject before it until that day. That was a curious circumstance, but no reflection upon the Committee. The Committee was now asked to give a pretty decisive opinion on this immense scheme, though no papers had been circulated among the members beforehand. In those circumstances he did not think the Committee ought to be expected to commit itself until the men in the Highlands had an opportunity of more thoroughly considering the matter. Although the men in Ross and Cromarty had apparently to some extent compromised matters, he did not think that the Scottish Committee should commit itself to approval or disapproval. No doubt there were valuable points in the whole of the six schemes. Increased money would probably come in some cases, but not in others. The whole matter was in an indefinite position.

Dr. LYELL seconded.

Dr. CASKIE wished to know if the Highland representatives were asking their advice in the matter. So far as the report of the Highlands and Islands Board was concerned, he had never seen it till that day and had not read it. But, as a matter of practical business, the difference between the two schemes was plain. The one involved £10,000, and the other £10,000 plus £32,000. It seemed to him that it became a personal matter altogether, and that it was a subject on which the Committee should come to a decision. It was a matter of money. If it was apparent that £32,000 or £42,000 was to be divided among "practitioners" of the Highlands and Islands of Scotland, it was not the duty of the Committee to recommend practitioners to take or refuse it; it should be left to themselves to say whether it was to their benefit.

Dr. LYELL objected that the whole idea of the Scottish Committee was that local practitioners might approach it with the view of getting some little guidance and advice on schemes which were exceedingly difficult. This was acknowledged by the Board to be an exceedingly difficult scheme, and he sympathized with those Highland practitioners who desired that the Committee should discuss the matter. He hoped they could rely on the Scottish Committee for friendly advice and counsel. He strongly supported the amendment.

Dr. BUIST expressed the hope that the meeting would not delay. The petitioners had represented that there was a certain anxiety that some were to be worse off than they were in the past, and had asked the Committee to consider the matter. It had now been considered, with quite sufficient information at its disposal to decide whether the anxiety was just. The Scottish Committee had taken some share in elaborating and developing the question, and every point had been discussed in the

BRITISH MEDICAL JOURNAL. As to indefiniteness, the first charge on the funds of this scheme was the remuneration of the practitioners and their expenses. One of these expenses was that attending insured persons and also the expenses involved in attending other persons. With a statement like that put down as a first charge on the scheme, there was no ground for entertaining the opinion that men were to be worse off than at present. To delay a decision would imply that the Scottish Committee thought there was ground for the anxiety entertained.

Dr. ADAMS asked what kind of friend would the Scottish Committee of the British Medical Association be considered to the poor practitioner in the Highlands, whose present income was from £180 to £250 a year, and who under this scheme was to be guaranteed by the Board a sum, free to himself after paying all expenses for the carrying on of his practice, of £300, if it delayed coming to a decision. The Act was passed primarily to provide medical attendance to people who at present did not get it. At the same time the encouragement was held out which that definite salary provided, and those whose income was less than £300 would think that the Committee had done them a very bad service if they threw any doubt as to the value of the Act as regarded that. What had the conditions under the Insurance Act proved to be? There was no more restriction practically on those who had worked the Act willingly and without prejudice in carrying on their work, than there was before. If men in the country were to be asked to take payment for a large amount of work they did at present without payment how could they be worse off?

On a division the motion was carried, two members only voting for the amendment.

MIDWIVES BILL FOR SCOTLAND.

The Committee resolved to write to the Secretary for Scotland asking for the support of the Government for the bill.

It was agreed formally to record the thanks of the Committee to Dr. Norman Walker and to Dr. Mackay for attending and assisting the Committee in the discussion of the report by the Highlands and Islands Board.

WAR EMERGENCY COMMITTEE.

A MEETING of the War Emergency Committee was held at the offices of the British Medical Association in London on Wednesday last (September 15th).

ENROLMENT.

The Executive Subcommittee reported that it had considered the resolution adopted by the full Committee on August 25th, setting out that the policy of the Committee should be to urge all medical practitioners who are under 40 years of age and physically fit to enrol themselves with the War Emergency Committee to come up for whole-time service whenever called upon to do so by the Committee. Two circulars were being sent to the secretaries of War Emergency Committees. Such committees, it was reported, had been appointed in 87 districts, covering approximately 83 Divisions of the Association; this left 87 Divisions of the Association which, so far as was known, were not yet covered by any War Emergency Committee.

The first leaflet was intended for circulation by War Emergency Committees to all practitioners in their area under 40 years of age. After setting out the policy quoted above and giving some indication of the numbers required, the leaflet went on to point out that there are two sources of supply of medical officers for the army—(1) the civil practitioners of this country, and (2) those of the colonies; but that the latter source has already been largely tapped. If both these sources failed, the country might be driven to avail itself of help tendered by practitioners from America. The circular continues as follows:

The number of men remaining in England, Wales, and Ireland under 40 from whom commissioned officers can be drawn is limited; out of every three men under 40, fit or unfit, at least one is required to serve in the army as a whole-time commissioned medical officer.

In the opinion of the Committee it is not the business of civilian practitioners to criticize at such a time as this the demand of the war authorities, still less to make such criticism the ground for refusing to volunteer. It is the duty of every

man to place himself at the disposal of those responsible for carrying the war to a successful conclusion.

Enrolment offers the best means for preventing men being called upon for service before the need for their taking on active duties has arisen. Further, with such a roll as is asked for, the Committee will be in the best position to judge when the time has arrived which renders it imperative for men to take service.

The War Emergency Committee went on in this circular to impress upon local committees the need for every medical man in their area, who is under 40 and physically fit, to volunteer at once or to enrol his name as willing to apply for a commission when told that it is his duty to do so. The selection for service amongst the men enrolled may be carried out by the Local Committee or by the Central Committee, as preferred by each medical man.

Attached to the circular is the following form, for use by practitioners of military age who cannot volunteer for immediate service, but who are willing to take a commission when told by the War Emergency Committee that it is their duty to do so:

FORM OF ENROLMENT FOR THOSE WHO CANNOT VOLUNTEER
FOR IMMEDIATE SERVICE.

I am willing to enrol my name with the War Emergency Committee, and to apply after..... for a commission in the R.A.M.C. when told by the Committee that it is my duty to do so.

I prefer that if the need arises for men to be called up for service from this locality, the selection shall be made by the (a) Central War Emergency Committee.

I propose to leave my practice in the hands of:

a. Neighbouring practitioners Drs.....

b. Locum Dr.

c. A Bureau organized by colleagues.....

The difficulties connected with my leaving practice are:

Local conditions:

Personal difficulties:

Signature.....

Address.....

Date.....

This Form when completed should be returned to the Secretaries of the War Emergency Committee, 49, Strand, London, W.C.

* Please fill in the date after which practitioner is willing to accept a commission.

LOCAL ARRANGEMENTS FOR THE CONDUCT OF PRACTICES.

The Committee has also issued to local War Emergency Committees a circular containing suggestions as to arrangements for the carrying on by the local profession of the practices of practitioners who accept commissions. This circular points out that there are three methods by which the practice of a medical man on military service can be carried on—(a) neighbouring practitioners, (b) locumtenents, (c) a bureau organized by colleagues. In practices in which work is taken over by local men the main questions are: Division of fees; restoration of patients to absence on his return.

I. As regards fees the following is considered to be the best plan:

- Town practices, where mileage is not an important question. An equal division of remuneration between the absentee and his representative.
- Combined town and country practices. As a general rule probably a division in the proportion of three-eighths to the absentee and five-eighths to the man who does the work and pays the expenses is best.
- Country practices. Where the question of travelling expenses is important at least three-fourths should be allotted to the man who does the work.

II. As regard restoration of patients, the Committee considers that the following measures should be adopted:

- Draw up agreements between the practitioner going on service and his local colleagues in some such form as that adopted by the Mid-Cheshire Division of the British Medical Association, namely:

"I hereby promise on my word of honour that if any persons who are ordinarily patients of any medical man practising in this neighbourhood who is on active service with the Forces, consult me during his absence, I will attend them for him (on the terms arranged by the Local Committee) and will refuse to act as their medical attendant on my own behalf until at least one year from my colleague's return has elapsed. Also I will do all in my power to safeguard the absentee's interests with his patients, and to induce them to return to him when he resumes practice."

Signed.....

Date.....

- Urge those going on service to appoint a legal representative who may be consulted on their behalf during their absence.
- The Central Committee will be prepared to offer its services in arbitrating on any difficulty or dispute referred to it by the Local Committee.

III.

- Local Committees should impress upon all local public bodies the importance of setting free any medical men of military age in their employ, while keeping their appointments open to them on their return. Arrangements for carrying on public work by means of the older practitioners in the neighbourhood should be made wherever possible.
- Insurance Committees should be approached in every district, in order to discourage as far as possible the transfer of patients from a doctor absent on military duty.
- Panel Committees should be asked to arrange that no practitioner shall take over as a panel patient any insured person on the list of a doctor absent on military service, until twelve months after the latter's return.

HOSPITAL STAFFS.

Civil Hospitals.

The Subcommittee reported that in accordance with the instructions of the Committee it had issued a letter to the governing bodies of the hospitals, pointing out the urgency of relieving from their hospital duties those junior members of their resident and visiting staffs who were eligible for commissions in the R.A.M.C., and that the British Hospitals Association had been informed of the action taken. The letter informed the governing bodies that from particulars supplied by the Director-General of the Army Medical Service it appeared that more than a third of all the medical men of military age in this country were required for service within the next few months.

Military Hospitals.

It was reported, with regard to a letter addressed to the Director-General, requesting him to give instructions to D.D.M.S. and A.D.M.S. not to retain or accept for work in military hospitals at home medical practitioners of military age who were physically fit, but to encourage such practitioners to accept commissions in the R.A.M.C., that a reply had been received from Colonel Blenkinsop, Assistant Director-General, stating that the question of men of military age doing military work at home was under consideration, and that the War Office was discouraging younger men who were physically fit for active service from engaging for home service only.

AGE FOR TEMPORARY COMMISSIONS.

It was reported that a letter had also been received from Colonel Blenkinsop stating that the following policy will be adopted with regard to the engagement of medical men as temporarily commissioned officers in the R.A.M.C.:

- No man under 45 years of age will be employed unless he undertakes general service obligations for a year, and is found to be physically fit for duty at home and abroad.
- No man over 55 years of age will be accepted for home service.
- No man under 45 years of age will be re-engaged after the expiration of his first contract unless he offers for general service.

I am to say that it is hoped that these restrictions will facilitate the work of the War Emergency Committee in setting free men of military age and providing for the older practitioners to look after their interests during their absence.

It will be noticed that the age for the general service has been advanced by five years, and that the age for home service only has been reduced by the same period.

INSURANCE ACT.

Transfer of Insured Patients of Practitioners on
Military Duty.

A statement was submitted, prepared in response to a request for information with regard to the transfer of insured patients of practitioners on military duty. Paragraph 14 of the circular letter issued by the Insurance Acts Committee on February 8th to all Local Medical and Panel Committees (SUPPLEMENT, February 15th, 1915, p. 50) was quoted in full. It was therein suggested that "the most effective way in which insurance practitioners can show their support of their absent colleagues is to decline in any circumstances to accept transfers of patients of doctors on military duty until the expiration of 18CC

year after the absent doctors' return, and to attend their patients during their absence as deputies." The statement also recalled that the question came before the Conference of Representatives of Local Medical and Panel Committees on June 16th, 1915, when a resolution was passed requesting the Commissioners to withhold the right of an insured person to transfer from the list of any doctor who was absent on naval or military service for the period of the war, or until a reasonable time after his return. This was brought to the notice of the Insurance Commissioners on July 9th by a deputation, and the following is a report of the discussion which ensued:

It was stated on behalf of the Commissioners that they were anxious to meet the profession as regards the request contained in this resolution. It must be recognized, however, that exceptional cases might exist in which hardship might result from any universal prohibition which prevented insured persons from changing their doctor at the end of the year in all cases, and the Commissioners felt it necessary to make provision for such exceptional cases. They proposed, therefore, to make a regulation suspending the right of insured persons to change their doctor in the circumstances alluded to in the resolution unless they were able to make a special case for transfer which, after investigation by the Medical Service Subcommittee, was regarded by the Insurance Committee as affording sufficient ground for a transfer being allowed. Inquiry was made of the deputation as to what precise period they regarded as "a reasonable time" after the doctor's return; and a discussion ensued on this point. In conclusion, it was stated on behalf of the Commissioners that the question would receive their careful consideration, and that they would meet the views of the profession so far as might be found practicable without hardship to the insured population.

MEETING OF HAMPSHIRE PRACTITIONERS.

A MEETING of the medical practitioners of Hampshire, called jointly by the Chairman of the Winchester Division of the British Medical Association and the Chairman of the Panel Committee, was held at Winchester on Wednesday, September 8th. The Chairman of the Panel Committee, Dr. WILLIAMS-FREEMAN, presided, and after Major RUSSELL COMBE, representing the Central War Emergency Committee, had addressed the meeting, resolutions pledging those present to further the endeavours of the Central Committee and to safeguard the interests of absentees were passed *unanimously*. A committee representative of the districts of the county was appointed.

In the course of an interesting discussion it was stated that thirty men from the Hampshire panel had already joined the R.A.M.C., and that the difficulty of obtaining locumtenents in arduous and scattered country practices was very great, older men being often unfitted for the work. Many offers of part-time services were received, and the action of the War Office in employing R.A.M.C. officers to attend women and children at Aldershot, Fareham, and other places was severely commented on. Many of the military hospitals in the county could also, it was said, be wholly or largely staffed by civilians. A letter was read from the Chairman of the County Council stating that three of its junior medical officers had been given facilities to join the services, and that he felt confident that any further applications would receive favourable consideration.

Meetings of Branches and Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

BIRMINGHAM BRANCH:

DUDLEY DIVISION.

THE annual meeting of the Division was held at the Town Hall, Stourbridge, on September 2nd. Non-members as well as members had been invited to the meeting, and there were present Drs. W. Kirkpatrick (Chairman), T. E. Mitchell, L. Francis, H. W. Freer, E. T. McDonnell, G. Grindlay, H. W. Plant, G. J. Dudley, and L. A. Taylor (Secretary). The Chairman and Secretary were re-elected, and they were also appointed to be the members of the council of the Birmingham Branch for his Division. Dr. C. L. Hawkins (Bromsgrove) is the representative for the Bromsgrove and Dudley Divisions.

War Emergency.—A further circular letter and a letter from the War Emergency Committee of the Association concerning the supply of whole-time medical officers for military service were read, and it was stated that four more practitioners were needed from this district. One practitioner, a non-member, wrote saying that he intended to apply for military service, but should not be able to leave his present post for two or three months. It was decided to form a war emergency subcommittee of six members, consisting of Drs. J. G. Beasley, T. E. Mitchell, M. A. Messiter, G. J. Dudley, W. Kirkpatrick, and L. A. Taylor, and it was resolved unanimously:

That in the event of any practitioner leaving his practice and going on military service being unable to provide a locumtenent, his work shall be attended to by his neighbouring practitioners, and that the remuneration from his practice for insurance, private, or other work shall be equally divided between the practitioner actually attending the cases and the absent doctor; further, that the patients shall be returned to the doctor on his return, and that any practitioner attending such cases shall not take over any such patients during a period of twelve months after the doctor's return.

THE DRUG TARIFF.

REPORT OF DEPARTMENTAL COMMITTEE.

THE report of the Departmental Committee on the Drug Tariff, appointed by the Chairman of the Insurance Joint Committee last February, was issued on September 16th. The Committee was instructed to consider what margin of profit, apart from discounting, is yielded by the present drug tariff; what revision, if any, of prices is required to place that tariff on a commercial basis, and whether any extension or rearrangement of the list of priced drugs and mixtures is desirable. We intend to give an analysis of the report in an early issue, but meanwhile quote the Committee's summary of its conclusions, which is as follows:

IV. SUMMARY OF CONCLUSIONS.

56. Our conclusions may be summarized as follows:

- I. That the present tariff requires revision to place it on a commercial basis.
- II. That the tariff printed as Appendix V, providing for payment of—
 - (a) the cost price of the drugs, etc., supplied,
 - (b) a flat rate per prescription for establishment expenses, and
 - (c) a fee per prescription for any professional services, graded according to the nature of the prescription,
 should be adopted for the whole of Great Britain.
- III. That the present discounting clause should be abolished.
- IV. (a) That a general revision of the prices in the tariff should be undertaken annually, provision being made whereby prices of individual drugs can be revised during the year in exceptional cases.
 - (b) That during the war the present arrangement should be continued whereby the prices of certain drugs specially liable to war fluctuations are revised at frequent intervals.
 - (c) That any revision, whether of a general nature or otherwise, should be undertaken by the central bodies representative of the various interests involved.
 - (d) That any revision should be made uniformly applicable, so far as possible, to the whole of Great Britain.
- V. That the contracts of the chemists should include an obligation to supply a grade of drug costing them approximately the price allowed in the tariff.
- VI. That the pricing of prescriptions should be undertaken by Insurance Committees.

* National Insurance Acts. Report of the Departmental Committee appointed to consider the Drug Tariff under the National Insurance Acts. Vol. I. Report. (Cd. 802.) 3s. (new and not post free). Conboy, Ltd., 116, Grafton Street, Dublin; or from the agencies in the British Colonies and Dependencies, New United States of America, the Continent of Europe, and abroad, of T. Fisher Uwin, London, W.C.

LOCAL MEDICAL AND PANEL COMMITTEES.

OXFORD.

PANEL COMMITTEE.

The first meeting of the Panel Committee for 1915-16 was held on August 26th.

Election of Officers.—The following officials were elected:

Chairman: Dr. Rivers-Wilson.

Vice-Chairman: Dr. Counsell.

Honorary Secretary: Dr. Higgs.

Definition of "Incapable of Work."—The SECRETARY reported that he had asked the Commissioners for a definition of "incapable of work," and had been informed in reply that it was for the societies to decide when they would pay sick pay, but if the patient was not satisfied he had a right of appeal to the Commissioners, and as they would have to give the final decision they could not pre-empt by giving any definition of the term.

Analysis of Prescriptions.—The analysis of prescriptions for the last year showed that the average cost per capita was 3.77d.

Drug Fund.—The SECRETARY reported that he had had a dispute with the Finance Committee as to their method of dealing with the credit balance in the drug fund at the end of 1913, and as the Finance Committee persisted in their standpoint he had appealed to the Commissioners, who had decided in favour of the Panel Committee on every point, and had ordered the Finance Committee to rescind their resolution and carry out the decision now given. The Secretary also reported that the British Medical Association had supported him in this matter, and had offered to take the matter up, if necessary, with the Commissioners.

Separate Surgery Hours for Tuberculous Patients.—The SECRETARY read a letter from the Insurance Committee suggesting that the panel doctors should arrange separate surgery hours for tuberculous patients, on account of the risk of infection to other patients. The Secretary was instructed to reply that the Committee considered such a plan quite unnecessary, and that the suggestion must have been made in ignorance as to the nature and method of the infection in these cases.

Reinstatement of Insured Persons discharged from the Army.—It was decided to request the Insurance Committee to adopt the same method as adopted in Renfrewshire in dealing with discharged soldiers and sailors—namely, to reinstate them on their doctor's list with the same reservation as to the right of choice, when expressed.

Finance.—The accounts for the past year were passed, and it was decided to grant the Honorary Secretary an honorarium of £20 per annum.

BUCKINGHAMSHIRE.

LOCAL MEDICAL AND PANEL COMMITTEES.

A MEETING of the Local Medical and Panel Committees was held at Aylesbury on August 27th, when Dr. REYNOLDS presided, in the absence of the Chairman and Vice-Chairman.

Term of Office of Committees.—Letters from the Commissioners were read extending the term of office of the Local Medical and Panel Committees for one year. It was decided to take no steps to fill up any vacancies, as the Committee now numbered 21.

Finance.—The Finance Subcommittee reported that there was a balance of £98 in the bank, and recommended that no levy should be made at present. It also recommended that the Secretary be paid annually, in the month of September, the sum of 25 guineas as an honorarium.

Local Formularies.—Correspondence with the Pharmaceutical Committee was read concerning the list of formularies issued, in which the pharmacists expressed a desire to be consulted in the event of any alteration in the list being made.

Cost of Scrutiny.—It was reported that the pharmacists agreed to pay a third part of the cost of the scrutiny of prescriptions if the total cost did not exceed £60 a year.

"Rept. Mist."—The Secretary was instructed to write to all doctors who were still using the term "Rept. mist.," pointing out that it was not allowed, and they would be surcharged the copying fee. The middle copy of the triplicate

prescription could be given to patients to bring with them, when they came again, thus obviating the use of the term "Rept. mist."

Drug Fund.—It was reported that in 1913 the doctors received 4.72d. of the floating sixpence. Owing to the great delay in ascertaining enlistments, etc., it was at present impossible to say how 1914 would come out. The Committee agreed to 80 per cent. being paid in September.

Panel Patients of Doctors on Military Duty.—It was decided that the best plan for a doctor absent on military duty would be for him to make arrangements himself with his panel patients and his medical neighbours as to their treatment during his absence, and they would all remain on his list. The money due would be paid over to him, and on his return he could settle with the doctors who had done his work. Cases having occurred of medical men having new medical cards brought to them by persons on another doctor's list who had been away and been treated as temporary residents, and who thought that they could change their doctor on their return, it was decided to ask the Insurance Committee to exercise great care in granting new medical cards, or a doctor might thus inadvertently accept a patient of a colleague away on military duty. It was decided to take steps to secure an insertion in the local press of a notice asking patients to send for the doctor before 10 a.m.

The War Emergency.

A joint meeting was then held with the Executive Committee of the Buckinghamshire Division of the British Medical Association on the war emergency, when Drs. Kennish and Long attended.

Correspondence from the Central War Emergency Committee was read, showing that more doctors were required at once, and that the proportion expected from the Buckinghamshire Division was nine, although seventeen had already gone. The plan suggested of obtaining a signed promise from every medical man to do his best, accept their terms for at least six months after their engagements was agreed to. It was agreed also that arrangements should be made with neighbouring practitioners, so that they could be called in to do their share of the work. The Committee would appoint three to act as arbitrators.

A list of medical men suitable for war duty was laid through, and it was decided to make a special appeal to eighteen.

LANCASHIRE COUNTY.

PANEL COMMITTEE.

A MEETING of the Lancashire County Panel Committee was held at Preston on July 21st, when Dr. H. F. Oldfield was in the chair.

Term of Office of Panel Committee.—It was reported that the Commissioners had, in accordance with the Committee's requests, dispensed with the necessity of holding an election, and had appointed the persons who were members of the Committee on August 14th, 1913, to be members for a further term of office which would expire on July 15th, 1916.

Payments to Panel Practitioners.—It was decided that the following resolution, passed at the meeting of practitioners held in Wigan on July 8th, be adopted, subject to the addition of the words, "provided that such a reduction, owing to the war conditions, is necessary":

That the Lancashire Insurance Committee, in making their monthly advances on account of medical benefit for the remaining portion of the year 1915, be invited to adhere to the rate of payment as laid down in the explanatory pamphlet accompanying the cheque, June 30th, 1915—namely, that in the future the monthly cheque be at the rate of 50 per cent on the names of the doctor's lists at the commencement of each quarter less voluntary levy where authorized, instead of varying the amount per head per month as heretofore.

Mileage Scheme.—It was resolved that the mileage scheme for 1914 be the same as that for 1913, and that the amended scheme drawn up by this Committee be adopted for 1915.

Excessive Prescribing.—The Committee decided to deal no further with individual prescriptions, but with the doctors who had exceeded the 2s. limit as shown by a scrutiny, which showed that only 120 doctors had failed to prescribe within the 2s. limit, leaving 856 practitioners who had worked within the limit. It was decided, therefore, that the 120 doctors above mentioned should be asked for an explanation.

STOKE-ON-TRENT,
PANEL COMMITTEE.

A MEETING of the newly elected Panel Committee was held on July 15th, when Dr. PHILLIPS was in the chair.

Election of Officers.—The following officers were elected:

Chairman: Dr. Phillips.
Vice-Chairman: Dr. Frendergast.
Secretary: Dr. Anderson.
Treasurer: Dr. Dawes.

Domiciliary Treatment.—A letter was read from the Clerk to the Stoke-on-Trent Insurance Committee complaining of the delay by doctors in sending in reports, etc., of patients under domiciliary treatment. It was felt that this was a matter to which attention should be given.

YORK.

PANEL COMMITTEE.

A MEETING of the York Panel Committee was held on August 6th.

Election of Officers for 1915-16.—The following officers were elected:

Chairman: Dr. W. A. Evelyn.
Honorary Treasurer: Dr. H. Foster.
Honorary Secretary: Dr. J. C. Lyth.

Report of Deputation from Insurance Acts Committee, British Medical Association, to Chairman of National Health Insurance Joint Committee.—In connexion with the Commissioners' comments on Minutes 64 and 62 of the Conference, a letter was read from the Clerk to the York Insurance Committee stating that his Committee was unable to carry out the suggestion of the York Panel Committee for the automatic replacement on doctors' lists of insured persons discharged from the army, because no notification of any description is received by the Insurance Committee of such discharge, unless or until the insured person applies for a fresh card. The HONORARY SECRETARY stated that he had asked the Clerk to inquire from the Renfrewshire Insurance Committee what procedure had been adopted there, and it was decided to await the reply.

Messrs. Rowntree's Cottage Hospital.—It was reported that employees of Messrs. Rowntree are sent by them to their cottage hospital at Scarborough, if considered advisable, without their necessarily being unfit for work, and that these were in the habit of getting their panel doctors to certify them as unfit for work and drawing sick benefit during their absence; also that the employees would go to a panel doctor at Scarborough while there to get further certificates, thereby depleting the Medical Benefit Fund. It was decided to issue a circular to all doctors on the York panel, pointing out that they should not certify any of these cases as unfit without careful consideration.

Pharmaceutical Committee's Expenses.—Letters were read from the Clerk to the York Insurance Committee, from the Secretary to the British Medical Association, and from the Secretary to the Insurance Commission to the Clerk of the Insurance Committee, all urging the inability of the chemists to pay this expense, and from which it was evident that the Panel Committee could not really prevent its being taken from the drug fund. Drs. Macdonald and Lyth were appointed to confer with the Pharmaceutical Committee's representative as to the best method of settlement, with full powers to conclude the matter as appeared best in the interests of the panel doctors.

Weekly Certificates.—It was decided that members should report to the Honorary Secretary the names of those approved societies which were still demanding a weekly certificate in all cases, in order, if possible, to secure that fortnightly certificates should be accepted in suitable cases.

Unallocated Insured Persons.—It was stated that the Insurance Commissioners had finally accepted the proposed arrangements suggested by the Panel Committee.

Addresses of Persons removed from York Area.—It was reported that the Clerk to the York Insurance Committee had agreed that it would be feasible to state the new address of an insured person who had removed into one of the neighboring areas, which he pointed out would serve the purpose of the Committee in enabling a York doctor, who wished, to take steps to secure that such person should be placed on his list in the new area.

WEST RIDING OF YORKSHIRE,
LOCAL MEDICAL AND PANEL COMMITTEE.

THE ninth meeting of the Local Medical and Panel Committee of the West Riding of Yorkshire was held at the County Hall, Wakefield, on July 30th, when Dr. R. MAX (Wakefield) was in the chair.

Suspension of Elections.—It was reported that the Commissioners had dispensed with the necessity of holding an election of the Panel and Local Medical Committees, and had continued the present Committee until July 15th, 1916. The officers of the Committee were reappointed.

Vacancies on the Committee.—Dr. H. J. Campbell, of 36, Manningham Lane, Bradford, was co-opted a member of the Committee in place of Dr. Bronner, resigned. Dr. William H. Smalles of Newtown House, Honley, was elected a member of the Committee to fill the vacancy caused by the death of his father, Dr. Thomas Smalles.

Vacancy on the Insurance Committee.—Dr. William Steven was appointed representative on the Insurance Committee to fill the vacancy created by the recent resignation of Dr. J. Russell (absent on military service).

A Private Formulary.—A letter was read from the Clerk (dated June 24th) enclosing copy correspondence with the Pharmaceutical Committee concerning the use of a private formulary by a panel doctor in prescribing for his patients. It was resolved that the doctor be requested to prescribe from the *British Pharmacopoeia* or the *West Riding Formulary*, or, as an alternative, to write out all his prescriptions in full.

Alleged Transfer of the Patients of Doctors absent on Military Service.—It was reported that over sixty patients of a practitioner absent on military service had been "allowed new choice" of doctor without his consent during his absence. Reference was made to the Clerk's statement (January 29th, 1915) that there had not been any wholesale transfers from the lists of doctors absent on military duty; and the Secretary was directed to investigate the index slips and to communicate with the local colleagues of the absent practitioner with a view to their allowing retransfer of the patients to his list.

CORRESPONDENCE.

PROPOSED COMMERCIAL TARIFF.

DR. MAJOR GREENWOOD (London, N.E.) writes: Now that the Memorandum of the Insurance Acts Committee is in the hands of panel practitioners may I urge upon all interested in panel practice to consider very carefully the proposals put before them?

No doubt a commercial tariff of the kind proposed would be advantageous to us, and if it could be obtained by a reasonable concession should not be refused. But, in my opinion, the price asked is altogether unreasonable. Unless we are willing to permit the practitioners' fund—namely, the 6s. 6d. which we were led to believe would be an irreducible minimum for our services—to be a security for the payment in full of the druggists, the latter refuse to accept that tariff. If this is the last word of the druggists, it only remains for us to "bear the ills we have" rather than take upon ourselves others that might prove overwhelming.

It is roundly stated that there is no risk of the present drug fund proving insufficient under the proposed tariff. If so, the druggist need not fear that his accounts will be discounted. If it is urged that it is necessary for disciplinary reasons to impress on practitioners the need of economy in prescribing, that the practitioners' fund should be exposed to some risk, I much prefer that individual practitioners proved guilty of improper prescribing should pay the penalty rather than that all the panel should be penalized. The various adjustments, whereby under the proposed scheme innocent practitioners might be safeguarded, are, in my opinion, impracticable, however plausible they may seem.

The drug question may not unlikely become very critical in the near future. Nearly all drugs are going up steadily. Even magnesium sulphate has increased in price nearly 300 per cent. It has been authoritatively stated that whatever the war prices of drugs, the cost will have to be defrayed by the drug fund. If, then, the practitioners' fund is to guarantee the drug fund, the liability we take upon ourselves must be obvious. Already

in London we are receiving no more than 1s. a quarter—that is, the old club rate—for our services; for the balance promised at the end of the year had better not be reckoned until it is in our possession.

The legality of the proposed mixing up of the two funds is also questionable without an amending Act. If there was one thing we thought clear when the Insurance Act was passed it was that the practitioner would not be responsible for the cost of drugs conscientiously prescribed. Speaking to the Nottingham miners on August 10th, 1913, two years after the passing of the Act, Mr. Lloyd George said:

The doctors have the right to prescribe the drug which they think best adapted for the patient. When they do so it does not come out of their remuneration, and the result is that the poor man who is insured can have as pure and potent medicine as the richest man in the land.

All the regulations hitherto have been framed on this principle, and if the said principle should be voluntarily surrendered in exchange for this proposed tariff it would be the height of folly.

Dr. J. DALLGESH (Dunfermline) writes: May I be allowed to make a few comments on the memorandum of the Insurance Acts Committee, published in the SUPPLEMENT of the JOURNAL of September 11th?

I have read the memorandum carefully, and, from amidst a somewhat obscuring cloud of words, it appears that the recommendation of the Committee is nothing more nor less than that the drug account should be made a first charge on the Medical Benefit Fund. Why is this not definitely stated in so many words?

The expression "placing the drug tariff on a commercial basis," which appears with suspicious frequency in the memorandum, seems at first sight to be a most laudable object, and one which every one will be anxious to support. Then, as one reads on, it seems that this laudable object is to be attained by yet another sacrifice on the part of the unfortunate medical practitioner. Great pains are taken to show that there may possibly be a saving of as much as 15 per cent., and a good deal is made of the fact that the Pharmaceutical Committee will not be the complainers in cases of over-prescribing if this scheme is adopted. All this may be quite true, but surely that is no reason why we should agree to a scheme which means that we medical men may have to make up the deficits in the drug fund whenever that fund is inadequate.

If this scheme is so much to our interest, as one might be led to suppose from the tone of the memorandum, why is Sir Robert Morant so anxious lest the Commissioners' views on the matter are known by the profession unless those views have the pious sanction of the British Medical Association? Is it that the Commissioners expect us to accept without question every memorandum that the British Medical Association submits?

By all means "place the drug fund on a commercial basis" by pooling the fund, or any other means, provided that no further encroachments are made on the remuneration of the medical practitioner.

Dr. E. ROWLAND FOTHERGILL (Hove) writes: In the SUPPLEMENT for September 11th there appears a most important memorandum, which raises the whole question of the drug tariff. Every insurance practitioner will do well to peruse it carefully, and as soon as possible advise his Panel Committee of his opinion on the various questions therein asked, if he has not been called to a meeting in order to consider them.

It is unfortunate that so many are actually engaged just now with other more important matters; all the more reason, however, for those left comparatively free to be at special pains to consider the proposals.

There will be probably general agreement that the arrangements at present in force with regard to the drug tariff must go, and the sooner the better. They are based on no sound principles, and have proved a source of vexation and friction to all concerned.

But it should not be imagined that the adoption of a commercial tariff, as suggested by the memorandum, will end all the troubles of the insurance practitioner. Even under that arrangement it will be still necessary for each practitioner to keep a very firm hand over his own and his neighbour's prescribing if he wishes to see his own share of the floating sixpence. A closer study of the

figures given in paragraph 11 shows this very clearly. Taking these figures and presuming an allotment of funds to each insurance area has been made as suggested in paragraphs 17-22, the following facts appear for 1913:

(a) That there were 9,200,000 insured persons.

(b) That the 1s. 6d. portion of the drug fund was £690,000; and the floating sixpence portion was £230,000.

(c) That the total of the accounts of the pharmacists came to £865,005, meaning a call on the floating sixpence of £175,005 had these accounts been paid in full.

Had the drug tariff in 1913 been on a commercial basis as now suggested, that—

(d) The total of the accounts of the pharmacists would have been £735,555, with a call on the floating sixpence of £43,555 (rather more than 1d. per insured person) if the accounts had been paid in full as now proposed.

(The memorandum states that the figures for 1914 will prove less favourable to the practitioners' floating sixpence.)

The adoption of a commercial tariff will remove the Pharmaceutical Committee as complainant, but owing to the retention of the floating sixpence scheme the inquisitorial and irritating supervision of one's colleagues (under Regulation 40) must of necessity remain. Is it not derogatory to the profession that this bait be retained; that before we prescribe the drug which we consider best for the patient we have to pause to consider that by so doing we may possibly find ourselves called to account by our colleagues as their remuneration under the Acts may be somewhat reduced? The giving of "pure and potent medicines to the poor man as received by the richest man in the land" becomes impossible. Could not this drawback of the scheme be also eliminated?

One recognizes that in certain areas the sixpence has floated in its entirety into the pockets of the practitioners, although the credit for this need not necessarily be theirs. One also allows that those who can be proved to have prescribed extravagantly should be made to pay for it personally (see paragraph 24b), but not, as at present, the whole panel.

The suggestion, therefore, that I would like the Panel Committees to consider is whether there could be local option, so that either (1) the floating sixpence arrangements continue as at present; or (2) that this sum be divided equally (say) between the local Practitioners' Fund and the local Drug Fund.

This latter arrangement, while making ample allowance for the payment of all the pharmacists' accounts in full if the other proposals of the memorandum are adopted, would sweep away the obnoxious and invidious Regulation 40, the legality of which many question, and so would go far towards equalizing "the potency and purity" of the poor man's drugs to those of the millionaire.

Would Panel Committees consider this proposal, as also whether the British Medical Association should not protest to the Government against the suggestion in paragraph 8 footnote, that the extra cost of drugs consequent on the war is to be paid for by the practitioners and not by a parliamentary grant? The protective policy outlined by the resolution in paragraph 10 seems to be already of paramount necessity.

MILEAGE.

Dr. G. F. SYDENHAM (Dulverton, Somerset) writes: Under the National Insurance Acts a sum was voted for extra mileage for the scattered districts of Scotland, and also for similar districts in England and Wales. Will any of your readers communicate with me, telling me:

1. What sum they get for the insured persons in their district—that is, the extra amount for that district?
2. How the money is divided up among the practitioners concerned?
3. At what dates they have received payments for 1913 and 1914?

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Staff Surgeons: J. H. L. Page to the *Victory*, additional, for disposal; A. R. Schofield, M.B., to the *Pembroke*, additional, for disposal; J. McA. Holmes, M.B., to the *Firth's*, additional, for disposal; Surgeons A. A. Sanders, M.D., and J. G. Baul, M.B., to the *Pembroke*, additional, for disposal; M. M. Melrose and J. S. Ward to the *Victory*, additional, for disposal; F. St. G. S. Goodwin, M.B., to the *Firth's*, additional, for disposal. Temporary Surgeons: E. M. Dannatt to the hospital ship *Agadir*; C. M. Burrell to the *Princess Royal*; A. F. McIntosh, M.B., to the *Temeraire*; R. St. L. Brockman to the *Pomone*, additional, for disposal; J. D. Milligan, M.B., to the *Defence*:

been 2,415, 2,367, and 2,350 at the end of the three preceding weeks, rose to 2,355 on Saturday, September 4th; 465 new cases were admitted during the week, against 279, 225, and 315 in the three preceding weeks.

In the ninety-six largest English towns 7,501 births and 4,865 deaths were registered during the week ended Saturday, September 11th. The annual rate of mortality in these towns, which had been 11.4, 12.3, and 12.1 per 1,000 in the three preceding weeks, rose to 14.0 per 1,000 in the week under notice. In London the death rate was also raised to 14.0, and in Scotland, where fifty-five other large towns it ranged from 5.7 in Eastbourne, 6.2 in Southend, 7.4 in Ilford, 7.5 in Blackpool, 7.7 in Enfield, and 7.8 in Willesden, to 19.7 in Halifax, 20.0 in Rotherham, 20.6 in South Shields, 22.8 in Boodle, 23.3 in Tynemouth, and 23.6 in Gateshead. Measles caused a death-rate of 1.2 in Blackburn, 1.8 in Bury, and 3.9 in Barnsley, and whooping-cough of 1.3 in Southampton and 1.4 in South Shields. The death of children (under 5 years) from diarrhoeal diseases, which had been 336, 494, and 593 in the three preceding weeks, further rose to 661, and included 176 in London, 48 in Birmingham, 42 in Liverpool, 31 in Sheffield, 26 in Manchester, and 25 in Leicester. The mortality from the remaining infective diseases showed no marked excess in any of the large towns, and no fatal case of small-pox was registered during the week. The cases of 30, or 0.6 per cent., of the total deaths were not certified by a registered medical practitioner or by a coroner: of this number, 5 were registered in Liverpool, 4 in Birmingham, and 2 each in London, Stoke-on-Trent, St. Helens, and Sheffield. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 2,367, 2,360, and 2,355 at the end of the three preceding weeks, rose to 2,443 on Saturday, September 11th; 385 new cases were admitted during the week, against 225, 315, and 365 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In the sixteen largest Scottish towns 991 births and 550 deaths were registered during the week ended Saturday, September 4th. The annual rate of mortality in these towns, which had been 12.5, 12.3, and 13.3 per 1,000 in the three preceding weeks, fell to 12.2 in the week under notice, but was 0.1 per 1,000 above the rate in the ninety-six large English towns. Among the several towns the death-rate ranged from 5.1 in Kirkcaldy, 7.1 in Paisley, and 10.9 in Clydebank, to 16.5 in Glasgow. The mortality from the remaining infective diseases averaged 1.6 per 1,000, and was highest in Perth and Hamilton. The 253 deaths from all causes in Glasgow included 16 from infantile diarrhoea, 5 from measles, 4 from scarlet fever, 1 from enteric fever, and 1 from whooping-cough. Six deaths from measles were recorded in Edinburgh, 2 in Paisley, and 2 in Leith; from enteric fever 2 deaths in Dundee; from scarlet fever, 4 deaths in Aberdeen; from diphtheria, 3 deaths in Edinburgh; and from infantile diarrhoea, 7 deaths in Dumfries.

HEALTH OF IRISH TOWNS.

During the week ending Saturday, September 4th, 563 births and 338 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 539 births and 317 deaths in the preceding period. These deaths represent a mortality of 14.5 per 1,000 of the aggregate population in the district in question, as against 13.6 per 1,000 in the previous period. The mortality in these Irish areas was therefore 2.2 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate on the other hand, was equal to 94.2 per 1,000 of population, as against 94.2 for individual localities, that in the Dublin registration area was 16.8 (as against an average of 14.3 for the previous four weeks); in Dublin city, 19.0 (as against 17.7); in Belfast, 14.0 (as against 13.2); in Cork, 11.6 (as against 14.5); in Londonderry, 19.0 (as against 18.3); in Limerick, 19.0 (as against 14.5); and in Waterford, 19.0 (as against 15.2). The zymotic death-rate was 2.2, as against 2.1 in the previous period.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notice re Appointments) appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

ALTON, HANTS: LORD MAYOR TRELLOAR CRIPPLES' HOSPITAL.—Assistant Resident Medical Officer.

BELGRADE HOSPITAL FOR CHILDREN, Clapham Road, S.W.—Resident Medical Officer (male or female). Salary, £100 per annum.

BIRMINGHAM AND MIDLAND EYE HOSPITAL.—Junior House-Surgeon. Salary, £100 per annum, and 45 laundry allowance.

BIRMINGHAM GENERAL DISPENSARY.—Resident Medical Officer. Salary, £50 per annum.

BRISTOL ROYAL INFIRMARY.—(1) House-Physicians; (2) House-Surgeons; (3) Dental House-Surgeon. Salary, £120 per annum in each case.

BXTON: DEVONSHIRE HOSPITAL.—Assistant House-Physician. Salary, £100 per annum.

CAMBRIDGESHIRE ASYLUM, Fulbourn, near Cambridge.—Junior Assistant Medical Officer. Salary, £200, rising to £250 per annum.

CARDIFF: KING EDWARD VII HOSPITAL.—House-Surgeon. Salary, £140 per annum.

CITY OF NORWICH.—Assistant School Medical Officer. Salary, £400 per annum.

CLOCKSURRY SANATORIUM.—Resident Medical Officer.

DUNDEE COMBINATION POOR-HOUSE AND HOSPITAL.—Resident Medical Officer. Salary, £225, rising to £300 per annum.

EVELINA HOSPITAL FOR SICK CHILDREN, Southwark, S.E.—Clinical Assistants in Out-patient Departments.

GREAT NORTHERN CENTRAL HOSPITAL, Holloway, N.—House-Surgeon (male).

GREAT YARMOUTH HOSPITAL.—House-Surgeon (male). Salary, £200 per annum.

HUDDESFIELD ROYAL INFIRMARY.—Assistant House-Surgeon (male or female). Salary, £100 per annum.

INGHAM INFIRMARY AND SOUTH SHIELDS AND WESTOE DISPENSARY.—House-Surgeon. Salary, £150 per annum.

LEEDS PUBLIC DISPENSARY.—Lady Resident Medical Officer. Salary, £130 per annum.

LIVERPOOL: DAVID LEWIS NORTHERN HOSPITAL.—Two Lady Resident Surgeons. Salary, £100 per annum.

LIVERPOOL STANLEY HOSPITAL.—Resident House-Surgeon.

LONDON HOMOEOPATHIC HOSPITAL, Great Ormond Street.—(1) House-Surgeon; (2) Two Resident Medical Officers.

LONDON TEMPERANCE HOSPITAL, Hamstead Road, N.W.—(1) Resident Medical Officer; (2) Assistant Resident Medical Officer. Salary for (1) £200 per annum, and for (2) £120 per annum.

MIDDLEBROUGH: NORTH ORMSBY HOSPITAL.—House-Surgeon. Salary, £120 per annum.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.—Resident Medical Officer. Salary, £100 per annum.

PARISH OF INVERAVON, Banffshire.—Medical Officer.

PARISH OF SOUTHAMPTON.—Resident Assistant Medical Officer (male or female). Salary, £250 per annum.

QUEEN CHARLOTTE'S LYING-IN HOSPITAL, Marylebone Road, N.W.—District Resident Medical Officer. Salary, £60 per annum.

ROCHESTER: ST. BARTHOLOMEW'S HOSPITAL.—Assistant Surgeon to Out-patient.

ROYAL FREE HOSPITAL, Gray's Inn Road, W.C.—Pathologist and Director of Pathological Studies in the London (R.F.H.) School of Medicine for Women. Salary, £400 per annum.

ROYAL LONDON OPHTHALMIC HOSPITAL, City Road, E.C.—Two Refraction Assistants. Salary, £50 per annum.

ROYAL SALOP INFIRMARY.—House-Physician. Salary at the rate of £120 per annum.

ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL.—House-Physician (male or female). Salary, £150 per annum.

ST. ANDREW'S HOSPITAL, Dolis Hill, London, N.W.—Resident Medical Officer.

ST. MARY ISLINGTON INFIRMARY, Highgate Hill, N.—Resident Junior Assistant Medical Officer. Salary, £140 per annum.

SOUTHWARK UNION.—Temporary Assistant Medical Superintendent. Salary, £50 per annum.

SW. 16 PREGNANCY COMMITTEE.—Two Temporary Assistant School Medical Officers. Salary, £300 in each case.

WEST BROMWICH AND DISTRICT HOSPITAL.—Assistant House-Surgeon. Salary, £120 per annum.

WEST HAM AND EASTERN GENERAL HOSPITAL, Stratford.—(1) Resident Medical Officer; (2) House-Physicians and House-Surgeons. Salary for (1) £200 per annum, and for (2) £120 and £100 per annum respectively.

WESTMINSTER GENERAL DISPENSARY.—Resident Medical Officer. Salary, £120 per annum.

WESTMOULAND SANATORIUM.—Methop, Grange-over-Sands.—Second Assistant to Medical Superintendent. Salary, £200 per annum.

WIGAN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Junior House-Surgeon. Salary, £150 per annum.

WORCESTER COUNTY AND CITY ASYLUM, Powick.—Assistant Medical Officer. Salary, £250.

WORCESTER GENERAL INFIRMARY.—Resident Medical Officer (male or female). Salary, £150 per annum.

YORK COUNTY HOSPITAL.—Resident Medical Officer (male or female). Salary, £150 per annum.

CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointments: Dalneington (Ayr), Hereford (Herefordshire).

To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Saturday 13th. Letters, to Jenny Foulkes, persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the Journal.

APPOINTMENTS.

BYRNE, E. C., L.R.C.P. and S.L., L.M., District Medical Officer of the Redcross Union.

EAMES, E. V., L.R.C.P. and S. Edin., L.M., L.R.F.P.S. Glasg., District Medical Officer of the Basford Union.

VERNOB, H. A., L.S.A., District Medical Officer of the Greenwich Union.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s., which sum should be forwarded in Post Office Orders or Stamps with the notice not later than the first post Wednesday morning in order to ensure insertion in the current issue.

BIRTHS.

BENNETT JONES.—On September 3rd, at 80A, Shell Road, Liverpool, the wife of W. J. Bennett Jones, M.D., of a daughter.

SCOTT.—On September 13th, at Lanes, to Jenny Foulkes, persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the Journal.

MARRIAGE.

SHARPLES—HALLACK.—On September 7th, at Hendon, London, Lieutenant Sydney Sharples, R.A.M.C.(F.), son of Dr. and Mrs. Sharples, Linstead, near Lanes, to Jenny Foulkes, daughter of the late J. B. Hallack, J.P., of Preston.

THE WAR EMERGENCY.

ADDRESS BY MR. LITTLEWOOD OF LEEDS.

A STRIKING address was delivered by Lieutenant-Colonel H. Littlewood, R.A.M.C.(T.), consulting surgeon to the Leeds General Infirmary, and now administrator of the 2nd Northern General Hospital (Leeds), at a special meeting of the medical profession in the Wakefield area, to consider the action that should be taken locally to meet the demand for more medical men to serve with the army. The meeting, which was convened by Dr. W. Eardley (Honorary Secretary of the Wakefield, Pentraet, and Castleford Division of the British Medical Association), was held in the County Hall, Wakefield, on September 17th. In the absence of Dr. Hillman, on active service, Dr. E. Selby (Doncaster) took the chair. In opening the proceedings the chairman expressed the hope that the medical profession would be able to meet the requirements of the military authorities without any question or suspicion of compulsion. The present was, he considered, no time for criticism, and though it had happened that the services of some doctors who had left large and lucrative practices to take commissions seemed as yet to have been very little used by the military authorities, it might be assumed that the authorities knew their business, and it was not to be expected that men with no knowledge of military work could be sent to the front without some instruction in military requirements and military surgery.

Colonel Littlewood's Address.

Lieutenant-Colonel Littlewood, after a reference to the illness of Colonel Dobson, his predecessor as administrator of the 2nd Northern General Hospital, who had addressed a meeting of a similar character held in Wakefield last April, and after expressing the pleasure with which all would hear that Colonel Dobson was now making rapid progress towards recovery from the illness with which he was attacked two days after the meeting in April, continued as follows:

When I retired from practice in June, 1913, I resigned, amongst other things, my membership of the British Medical Association. In the past I have not been in sympathy with many things the Association has done. In this movement it has my entire sympathy and I will do all in my power to help.

A year ago many people believed the war would be over in a few months; now many of us will be satisfied if it is successfully over in a few years.

Mr. Asquith said on November 9th, 1914: "We shall never sheathe the sword, which we have not lightly drawn, until Belgium recovers in full measure all and more than all she has sacrificed; until France is adequately secured against the menace of aggression, until the rights of the

smaller nationalities of Europe are placed on an unassailable foundation, and until the military domination of Prussia is wholly and finally destroyed. That is a great task worthy of a great nation." These noble words are the minimum for the Allies, and I am sure every one here realizes the gravity of the position and the stupendous task before them. It can only be accomplished by every man and woman in the British Empire doing their utmost—*Germania delenda est*.

What the Allies—and more particularly the British Empire—have to realize is that, if we are not successful, our fate will be infinitely worse than that of Belgium. They have been scourged with whips; we shall be scourged with scorpions. If the Germans once landed in this country, we should not waste our time discussing compulsory service—we should act, and be thankful if we had any one to lead us to drive them out; but how little chance we should have if we were not prepared!

Since the beginning of the war I have had large numbers of wounded men under my care—all brave and cheerful fellows. I cannot imagine how any one seeing them and hearing their stories could delay one moment in striving to do all in his power to defeat any chances of German domination.

It has been said that any number of cups of hot water cannot make one cup of boiling water. I am afraid a large number of people have not got to boiling point, and success can only be achieved when this has been attained. Whatever our hands find to do we must do it with all our might.

The medical profession has been said to be one of the greatest of trades unions. Up to a certain point this may be true, but fortunately we are bound together by great and noble traditions and high ideals, so there is no suspicion of limiting our output, and when we are called to act there is one dominating motive—to do our best—and more than that no man or woman can do. And this is what is required of the nation. At times our profession has been misled by agitators, but at the present anxious time no voice has been raised except to urge the members of the profession to put themselves unreservedly at the service of the empire. And this is what I am here to urge this afternoon.

The Director-General, Sir Alfred Keogh, says he wants 2,500 more men before Christmas. We are confident he knows what he is talking about, and we can assure him he shall have everything he asks for. How is this to be brought about? I think all men under 40, and all under 45 who are physically fit, should indicate their willingness to accept service wherever they may be sent; and those who are over age or for physical reasons are unable to serve abroad should help to carry on at home. There will be an enormous amount for them to do in looking after the civil population and the wounded soldiers who are sent to this country.

Here will be a great chance for those who stay at home—not only to do the work of those who have gone abroad,

but to safeguard their interests; so that those who are fortunate enough to return, when they do so, will find they have not to begin professional life over again.

A good deal of work has been done, and many valuable suggestions made, by the War Emergency Committee. Their paper, W. 3, contains useful suggestions, and the form adopted by the Mid-Cheshire Division sums up the best and most honourable line for those who stay at home. [The document W. 3, and the form adopted by the Mid-Cheshire Division, will be found in the first column of page 130 of the SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL of last week.]

Many members of the medical profession (and I should like to include the nursing profession) have already gone—both general practitioners and consultants and nurses—making great monetary and other sacrifices; their one thought and pride is to do their best for their country. Any man or woman in the British Empire who does not act in the same way is unworthy to be called a British citizen, and those who invite British subjects not to take this view of their great privilege are traitors, and should, by the common voice of the nation, be treated as such.

This meeting has been called to see how best you can help to supply the men Sir Alfred Keogh has asked for, so we will now proceed to the real business.

In the course of the subsequent discussion the question of the shortage of medical men to meet the needs of the civil population was raised, and, together with certain other matters, referred to the local War Emergency Committee. Colonel Littlewood remarked that the first and pressing need was for medical men for the wounded soldiers, and that for the present the civil population must take second place. The Chairman, in endorsing this view, said that the civil population must realize the true state of affairs, and not needlessly occupy a doctor's time. He considered that of the urgent calls a doctor received, barely 1 per cent. were really urgent.

The meeting concluded with a vote thanks to Lieutenant-Colonel Littlewood for his address.

In the circular convening the meeting it was stated that the number of doctors from the area already on active service was about forty.

RAWTENSTALL.

A MEETING of the medical profession was held at Rawtenstall on September 17th, under the chairmanship of Dr. F. B. Holmes, President of the Bury Division. It was attended by practitioners residing in Rawtenstall, and also by Dr. Johnson (representative of the Bury Division), Dr. Nuttall, Dr. Vine (Honorary Secretary of the Bury local War Emergency Committee), and Dr. Braithwaite (Honorary Secretary of the Division).

Dr. Holmes made a statement explaining the reason for holding the meeting, and the urgent need there was for more medical men for whole-time military service. This was supported and amplified by a short speech from Dr. Johnson. The Secretary read two letters from the Central War Emergency Committee on the matter. After some general discussion it was decided by a unanimous vote to form a local War Emergency Committee for Haslingden and Rawtenstall, to work in conjunction with that for Bury. Drs. J. B. Stewart (Haslingden), Edward (Rawtenstall), and Hindle (Haslingden), not a member of the British Medical Association, were elected to form this committee.

Meetings of Branches and Divisions.

PERTH BRANCH.

A MEETING of the Perth Branch was held at Perth on September 17th, when Dr. J. HUME, President, was in the chair.

Highlands and Islands Schemes.

THE SECRETARY stated that the Highlands and Islands Grant Act was dated August 15th, 1913, and almost exactly two years after, on August 15th of this year, and without any warning, there were issued to the practitioners in the Highland area an elaborate series of documents, consisting of six "schemes," a draft form of agreement, and a schedule, somewhat similar to that issued by the income tax authorities, asking for minute details of professional earnings, a fortnight only being allowed for decision on the whole matter. Naturally, a considerable amount of concern

was aroused in the minds of practitioners, and numerous letters had been written to the newspapers, and meetings held, with the view of clearing up the many difficulties contained in the Board's proposals. Amongst various objections raised were the facts that the acknowledged medical authorities and central bodies had not been consulted; that a most inopportune time had been chosen when so many medical men were absent on military duty; that intolerable conditions were imposed upon doctors in regard to the conduct of their practices; and that the provisions concerning remuneration were vague and confusing, and accompanied by no guarantees. The documents were now before the profession at large in the pages of the BRITISH MEDICAL JOURNAL. While no doubt the schemes in themselves were very laudable, and likely to benefit those concerned if properly administered, the methods adopted in bringing them before the profession, and the extraordinary conditions attached to the draft agreement, were matters of serious import. The subject had been brought up before the Branch owing to the fact that part of Perthshire came under the Board, and several members of the Branch were involved.

Dr. MACKEY stated that in the proposals two classes of practitioners were distinguished—those whose incomes were under £300, and those whose incomes were over £300. While the proposals of the Board might be suitable enough for the former class, they were quite inapplicable, in their present form, to the doctors in the Highland district of Perthshire, who were above the £300 limit, and did not require to have their whole incomes guaranteed by the Board. The most objectionable feature, however, was the proposal to withhold the mileage grant for the present year, which practitioners were entitled to receive under the National Insurance Act. Their agreements were with the Insurance Committees, and the mileage grant ought to be paid to the end of the current year, and if the Board had any new proposals to submit, practitioners would then be free to accept or reject them as they saw fit.

Dr. TROTTER said that from all he could learn the great majority of the Highland practitioners would greatly benefit by the schemes, and that it was as far as possible from the minds of the Board that there should be any deprivation or reduction of the mileage grant, which would probably be doubled under the new arrangements. If too many objections were raised, it might happen that Perthshire would be withdrawn from the schemes altogether. Difficulties connected with special districts or practices could be adjusted in the agreements, which were to be individually arranged with the Board. He therefore moved the following resolution, which was seconded by Dr. BURNER, and passed:

That the meeting generally approves of the Highlands and Islands schemes as such, and that the Branch will support the practitioners in the Highland district of Perthshire in any negotiations with the Board as regards their individual agreements.

After remarks by Drs. ANDERSON and COCHRAN, it was decided to call a special meeting of the Branch, to be held at Logierait Poorhouse on a date to be arranged by a representative of the Board, so that negotiations may be conducted with the knowledge and concurrence of the Branch, and not with individual doctors.

Belgian Refugees.—It was resolved that, while individual doctors would always endeavour that no real case of illness lacked the necessary attention, the profession as a whole could not give any undertaking as to medical attendance on Belgian refugees in the town.

Dependants of Soldiers and Sailors.—It was resolved that, while individual doctors would always be willing to attend free such cases as they found to be necessities, the profession could take no further collective responsibility in the matter.

Ambulance Lectures.—It was decided that practitioners should continue to charge for giving lectures.

A list of periodical publications, official reports, and Blue Books in the Library of the British Medical Association available for issue to members on loan has been printed, and copies can be obtained free on application to the Librarian, at the house of the Association, 429, Strand, W.C. The regulations governing the loan of these publications are stated in the introduction to the list. The Library is open for consultation from 10 a.m. till 5 p.m. (on Saturdays till 2 p.m.).

THE DRUG TARIFF.

REPORT OF THE DEPARTMENTAL
COMMITTEE.

This Committee, as announced shortly in our columns last week, has just issued its report, which shows the result of an enormous amount of detailed investigation into the working of the present drug tariff and presents a carefully prepared scheme for its revision. The main lines of investigation were as follows:

(a) Investigations of prescriptions actually dispensed in 1913 and 1914 under the Insurance Acts in order to obtain the following data:

- (i) Actual cost price to chemists of drugs, etc., supplied.
- (ii) Tariff price.
- (iii) Dispensing fee.
- (iv) Medicament class.
- (v) Frequency with which individual drugs were ordered and frequency with which various quantities of the same drug were ordered.

(b) Investigations by a firm of accountants of chemists' businesses in order to ascertain the profit earned prior to inception of medical benefit under the National Insurance Act, 1911, and subsequently thereto.

(c) A dispensing test with a view to determining the ratios in which the several medicament classes stand to one another, having regard to the relative claims of each class upon the dispenser's skill and time.

The report begins with a description of the present financial and administrative arrangements for the supply of medicines and appliances; these are familiar to our readers. It is pointed out that the tariff prices are subject to the possibility of a discount, and the answer to any question as to the fairness of the present arrangement will depend not only on the degree of the practical risk involved in the liability to discount, but also on the extent, if any, to which the tariff prices may be abated without loss of reasonable profit to the chemists. Also it is clear that the Insurance Committee is not financially concerned to resist any upward tendency of prices, as its liability is strictly limited.

The Committee admits that, owing to the withdrawal of the medical profession from negotiations in the latter part of 1912, "the natural and not unreasonable consequence was that a tariff framed by the Standing Committee on Insurance of the Pharmaceutical Society was propounded by the local bodies of pharmacists and adopted by Insurance Committees in all areas without any real investigation or scrutiny. Modifications in details have been subsequently made, mainly at the instance of local bodies, including those representing practitioners, but any such revision has of necessity left untouched the essential principles and framework of the original tariff."

The ingredient-price fixed by the present tariff comprises an allowance for "trade profit" or establishment charges which is proportionately greater in the case of small quantities than large. Moreover, the minimum price is one halfpenny, and all fractions are adjusted to a level halfpenny (generally upwards). These two adjustments have a material effect, as the value of the quantities ordered is frequently very small, and the Committee makes the following observations:

"On a review of nearly three years' working we are brought to the conclusion that the present tariff has faults of construction which are responsible for serious inequity to individual chemists. The tariff is pervaded by a system of balances and compensations upon which its authors relied to ensure the fairness of its ultimate yield. Thus anomalies in relative over-pricing in the case of par-

ticular drugs are set off against other anomalies of a contrary tendency; anomalies in the dispensing fee scale are balanced against the effects of certain features of the ingredient pricing method. This system of balances and compensations has proved in working to be unsatisfactory."

It is not to be expected that a document which requires for its justification a detailed knowledge of a series of empirical compromises will inspire confidence. The present system yields in practice to different chemists for their establishment charges sums differing very widely in amount, the variations being entirely independent of their actual establishment charges and dependent chiefly on the habits of prescribing of local practitioners. The allowance was found to vary from £5 15s. 1d. to £9 11s. per 1,000 prescriptions. The dispensing fees again vary very greatly according to the varying proportion of the different classes of medicaments, which varies strikingly, for instance, between England and Scotland.

The Committee therefore recommends a drastic revision of the tariff, so that the remuneration of the chemist should be based on simple and self-evident principles, and should consist of:

1. The actual cost of the drugs and appliances supplied. A good medium quality is to be specified in the tariff in regard to certain articles of which several grades are available, all fulfilling the B.P. standard, and the chemist's contract is to include an obligation to supply a grade of quality costing approximately the price allowed for in the tariff. In the specimen tariff appended the price is (with a distinct gain in convenience) calculated on a "tariff pound" of 7,000 grains for solids or 7,000 minims for liquids. By this device the specific gravity will not have to be further taken into account. Flat rates are altogether eliminated. The cost will be calculated to the nearest second decimal point of a penny with a minimum of 0.01d.

2. The dispensing fee has been calculated after careful experiments on the time required for dispensing the different medicament classes. The dispensing fee includes in all cases a fixed allowance of 0.8d. per prescription for establishment charges. A differentiation is made between mixtures, liniments, lotions, etc., which are extemporarily prepared (2.8d.), and those which are prepared or stocked in bulk (2.3d.). All solid or liquid drugs or preparations requiring no compounding or preparation by the chemist carry a fee of 1.8d. Appliances take no dispensing fee beyond the 0.8d. for establishment expenses.

The discounting clause is altogether abolished.

It is contemplated that the prices shall be revised annually, with a provision for more frequent revision in exceptional circumstances—for example, during the war. The revision is to be made by the central representatives of the various interests concerned for the whole of Great Britain. It is recommended that the pricing should be done by, and presumably at the expense of, the Insurance Committee, and not by the chemist.

A series of interesting appendices give the statistical data on which the Committee has formulated its report. One table shows that if the Committee's recommendations had come into force in 1913 the chemists' profits, without allowing for the greatly increased turnover, would have been at a slightly higher rate than they had previously obtained for the same type of work. This implies a reduction in receipts compared with the present scale, but against this has to be offset the abolition of discounting and the transfer of the pricing of prescriptions to the Insurance Committee.

Memoranda of dissent to certain paragraphs are appended. Mr. Woolcock, Secretary and Registrar to the Pharmaceutical Society of Great Britain, indicates his disagreement with the figure fixed for establishment charges. Mr. James P. Gilmore, a member of the Pharmaceutical Society of Great Britain, dissents from the conclusion II (b) and (c) providing for a flat rate per prescription for establishment expenses and a fee per prescription for any professional services graded according to the nature of the prescription, and to the dispensing scale published in the appendix. Dr. Tocher of Aberdeen also objects to fixing the establishment charges at 0.8d. per prescription. He regards it as a doubtful figure, because the data the Committee was able to collect were insufficient with respect to the number of pharmacists from whom particulars were collected.

National Insurance Acts. Report of the Departmental Committee appointed to consider the Drug Tariff under the National Insurance Acts. Vol. I: Report. (Cd. 8,652.) 3d. (net and not post free). To be purchased, either directly or through any bookseller, from Messrs. Eyre and Spottiswoode, East Harding Street, E.C.1; or Messrs. Wynan and Sons, Ltd., 29, Beccan Buildings, Fetter Lane, E.C.4; and 59, St. Mary Street, Cardiff; or H.M. Stationery Office (Scottish Branch), 23, Forth Street, Edinburgh; or E. Ponsonby, Ltd., 116, Grafton Street, Dublin; or from the agencies in the British Colonies and Dependencies, the United States of America, the Continent of Europe, and abroad, of T. Fisher & Co., London, W.C.

INSURANCE ACT.

CERTIFICATION OF SICKNESS BENEFITS IN
IRELAND.

THE COMMISSIONERS' SCHEME ACCEPTED.

A MEETING of the delegates of the Irish medical profession was held on September 17th at the Royal College of Surgeons, Dublin, to consider proposals from the Irish National Insurance Commission for certification of sickness benefits under the Insurance Act as applied to Ireland. Mr. R. J. JOHNSTONE, F.R.C.S. (Belfast), occupied the chair.

The letter received from Sir Joseph Glynn, Chairman of the Irish Insurance Commission, stated that with the approval of the Treasury the Commission was now in a position to offer the following capitation rates as a basis for the remuneration of practitioners for certifying alone:

A. In county boroughs and towns of 10,000 population and upwards one shilling and three pence per insured person.

B. In county areas where the density of the insured population, excluding towns of 10,000 and upwards, equals or exceeds 0.02 per acre, the sum of two shillings per insured person. This group includes the counties of Dublin, Down, Armagh, Antrim, Lond, Kildare, Wexford, Carlow, Londonderry, Wicklow, Tyrone, Meath, Queen's County, Monaghan, Cork, and Westmeath.

C. In county areas where the density of the insured population is less than 0.02 per acre the sum of two shillings and sixpence per insured person. This group includes the counties of Limerick, Tipperary (S.R.), Waterford, Kilkenny, King's County, Cavan, Tipperary (N.R.), Fermanagh, Longford, Clare, Donegal, Kerry, Leitrim, Roscommon, Sligo, Mayo, and Galway.

Sir Joseph Glynn's letter continued as follows:

"As a guide to what practitioners would receive under this scale the following illustrations may be of interest; but I should explain that in preparing them we had to go on the pre-war figures for the insured population, as we have not got any returns of the insured population since war began which would prove in any way reliable. Our insured population must have been somewhat reduced by enlistment, but to what extent we do not know. These changes, however, are only temporary, and after the war we may hope to see an increase in the numbers.

"Taking the figures we have got, the above rates in Dublin city (exclusive of Rathmines, Rathgar, and Pembroke) would mean a sum of £5,830 for the doctors who would join the pool. In Cork the sum would be £1,450, and in Belfast £8,715.

"In Group B, County Dublin (excluding the townships of Rathmines, Rathgar, and Pembroke) would receive £2,030, County Down (excluding Newry) £3,356, County Wexford (excluding Wexford town) £1,508, County Meath £1,216, and County Cork £3,764.

"In Group C, Tipperary (S.R.) (excluding Clonmel) would receive £1,248, Clare £1,318, Galway £1,228 (excluding Galway town).

"I give these figures as typical examples under pre-war conditions and cannot say to what extent they would be altered by enlistments. The reduction in the number of insured persons is, of course, accompanied by a reduction (not necessarily proportionate) in the amount of certification to be done. The figures given do not include exempt persons to whom a lower capitation-rate will be paid. The number is under 2,200 and the amount of certification which will be required will be small, as short illnesses do not count with this class, and the benefits given are strictly limited. The rate for this class will, however, be added to the above rates and to that extent will somewhat increase the figures quoted.

"We hope that the doctors will recognize that this offer is substantial and, when we consider the absolute necessity of economy in every branch of the public service owing to the strain imposed by the war, it is really generous."

The Chairman, Mr. JOHNSTONE, on behalf of the deputation appointed to interview Mr. C. Roberts, M.P., Chairman of the Joint Insurance Committee, which subsequently conferred with the Irish National Insurance Commissioners and representatives of the approved societies, gave an interesting account of the main points of the scheme of medical certification proposed under the Insurance Act in Ireland for acceptance by the profession. Under the new scheme the cardinal principle contended for by the profession, that the medical attendant should, in the first instance, certify for sickness benefit, is conceded—a con-

cession which has given very great satisfaction, as it was always held that the remuneration was quite a secondary consideration to the attainment of this principle. In about half the counties in Ireland, which include the more sparsely populated, practically the full demands of the doctors have been granted; in the remaining counties and county boroughs the remuneration, while a substantial advance on former offers, has fallen somewhat short of the demands of the profession. It was, however, recognized by the delegates that the midst of a great national crisis was not the proper time for the medical profession to continue the struggle, particularly as regards finances, with the Treasury.

In the circumstances the delegates decided to accept the offer made by Sir Joseph Glynn, Chairman of the Irish National Insurance Commission, with instructions to the Irish Medical Committee that the deputation appointed by it to meet the Commissioners was to press (1) for local option on the part of medical committees as regards the unit and method of distribution of the money allotted to each area for certification; and (2) that, considering the large amount contemplated to be deducted from the certification grants, at the expense of the general body of the profession, for the payment of referees, doctors of good professional standing, and who would command the respect and confidence of their colleagues, should be selected for these offices in the best interests of all concerned.

The proceedings of the delegates' meeting were brought to a conclusion by the adoption of a warm vote of thanks to the Chairman and the Irish Medical Committee for the satisfactory manner in which they had conducted the business of the profession for the past two years. The Chairman, Mr. Johnstone, on rising to reply, was most enthusiastically received by the entire meeting.

In the House of Commons, on September 21st, Mr. Charles Roberts, Chairman of the Joint Committee of Insurance Commissioners, said, in reply to Mr. J. P. Farrell (Longford), that the part-time appointments in respect to the scheme for certification of insured persons in Ireland were made on purely a temporary basis pending the settlement of a permanent scheme for certification, and were terminable by one month's notice on either side, and this fact was clearly indicated by the Irish Insurance Commissioners to all candidates for such appointments.

LOCAL MEDICAL AND PANEL
COMMITTEES.

WARWICKSHIRE.

PANEL COMMITTEE.

A MEETING of the Warwickshire Panel Committee was held at Coventry on September 1st. Dr. J. Orton (Coventry) was appointed Chairman; Dr. R. Latimer Greene (Stratford-on-Avon) Vice-Chairman; and Mr. W. P. Whitehead (Leamington) Acting Secretary during the absence of Dr. Arnold Morris on active service.

Voluntary Levy.—It was reported that the amount produced by the voluntary levy of 2d., to which all but fifteen had assented, was £181 16s.

"Covering."—A complaint made against a practitioner for refusing to supply certificates of incapacity to a patient who was being attended by a homoeopath was considered, and a letter from the General Medical Council was read. A resolution was adopted to the effect that the practitioner's action was in accordance with the certification rules, and the Chairman was asked to press this view upon the Medical Service Subcommittee.

Attendance on Discharged Soldiers.—Attention was drawn to cases in which on discharge wounded soldiers came under the care of a general practitioner, and it was reported that in one such case a claim on the War Office had been repudiated. It was resolved to ask the British Medical Association to take action with a view to securing that the provision made by the nation for men discharged when in need of medical and surgical treatment should include such treatment, or be such as to enable the men to obtain it otherwise than through charity.

LOCAL MEDICAL COMMITTEE.

At a meeting of the Warwickshire Local Medical Committee held on the same date, the same officers were

elected as for the Panel Committee, and it was reported that the Committee had been recognized by the Commissioners down to July 15th, 1916.

SHPROSHIRE. PANEL COMMITTEE.

A MEETING of the Shropshire Panel Committee was held at Shrewsbury on August 31st, when Dr. EXHAM was in the chair. Dr. Wedd, of Wellington, was co-opted to act for Dr. Mackie, absent on military service.

Resolutions forwarded to County Committee.—The following resolutions were passed, and the Honorary Secretary instructed to forward them to the County Insurance Committee:

1. That the County Committee be requested to withhold the right of an insured person to transfer from the list of any doctor absent on naval or military service for the period of the war or until a reasonable time after his return.
2. That the County Committee be requested not to remove an insured person from a doctor's list until the insured person has proved his actual removal by choosing another doctor in another area or district by means of the medical card.
3. That emergency dispensing be paid for at a flat rate.

COUNTY TYRONE.

LOCAL MEDICAL COMMITTEE.

A MEETING of the County Tyrone Local Medical Committee was held at the Tyrone County Hospital on September 3rd, when Dr. E. C. THOMPSON was in the chair.

Election of Dispensary Medical Officers in the Clogher Union.—The following resolution was unanimously passed:

That we, the Tyrone Medical Committee, condemn in the strongest possible manner the unpatriotic action of the majority of the Clogher Board of Guardians in appointing to the office of dispensary medical officer a young man qualified to serve his country at the front in the Royal Army Medical Corps, where every self-respecting man should be, and ignoring the long services of the other candidate, Dr. ROSS, who, already for many years permanently settled in the district, had proved his ability to discharge the duties of this office in addition to those of medical officer of the workhouse.

Poor Law Medical Officers' Fees and Holidays.—It was decided that the Secretary should communicate with the different clerks of unions in the county Tyrone, stating that the very moderate scale of fees already in force—namely, £3 5s. a week for district hospitals and £4 4s. a week for dispensary districts—would be rigidly adhered to.

Insurance Act.—The feeling of the meeting was against the proposed pooling system for certification, which meant that the doctor who managed to issue the largest number of certificates received the largest payments. A resolution was unanimously passed:

That the capitation and panel system be adhered to, under a proper scheme and adequate remuneration, and that no whole-time medical referees be appointed, but that the procedure under the Workmen's Compensation Act be adopted.

Amalgamation of the British and Irish Medical Associations.—It was unanimously resolved:

That the British and Irish Medical Associations be combined, and that the co. Tyrone be formed into a branch of the British Medical Association.

Resignation of the Honorary Secretary.—The resignation, through ill health, of Dr. DUNCAN was received with much regret, and the Committee expressed its profound sympathy with him and placed on record its high appreciation of his services to the Tyrone Medical Committee. Dr. TODD, Omagh, was unanimously elected to replace Dr. DUNCAN as Secretary.

CORRESPONDENCE.

THE PROPOSED COMMERCIAL TARIFF.

DR. J. H. TAYLOR (Salford) writes: Of all the documents issued by the Insurance Acts Committee, the memorandum dealing with a commercial tariff is perhaps the most remarkable, and, in many details, the most incomprehensible.

The Committee began by passing, on August 19th, a resolution to the effect that any excess cost for drugs over 2s. should not be a charge on the practitioners' fund, and it professes that it does not feel able to advise the abrogation of this. So far good; if there were one thing more than any other on which both the Government and the profession were agreed when the bill was passing through Parliament, it was the principle that the doctors should not have to suffer for prescribing the best possible medicines. The memorandum quotes one of a dozen similar statements of the then Chancellor, who laid the greatest possible stress on this principle, and yet immediately afterwards the Committee proceeds to furnish up a number of arguments, all depending on chances and guesses, for abandoning this principle. To me this is quite incomprehensible, except on the theory that, at present at any rate, the Committee is ready to swallow even its own words for the sake of peace.

The whole profession must feel sympathy with the chemists who have had to accept a discount on their bills, and I would show no mercy to doctors who may be guilty of wanton and extravagant prescribing. At the same time, practically all who are interested feel that the machinery of Regulation 40 is obnoxious all round, and needs radical alteration. But it appears to be hinted that unless we accept an unlimited liability in order to pay the chemists in full, Regulation 40 must be continued. In other words, we must accept an injustice in order that the chemists may get justice. I protest against being placed in any such dilemma. The chance of being surcharged under this regulation has made a large number of doctors afraid to prescribe as they ought to do and would like to do. This is so well known to the insured themselves that it has damaged the reputation of the medical service under the Act in a most disastrous way. Of course very few formal complaints can be made by the insured, as not one patient in a thousand knows what is in the medicines, but the impression is quite common, perfectly natural, and not altogether without some foundation in some areas, that the prescribing under the Act has to be done in a cheap and nasty way, and it is by no means rare for patients to hint that they would be glad to pay for proper medicines. This disastrous effect was exactly what Mr. Lloyd George and all of us especially wished to avoid, and it has been caused entirely by Regulation 40. As a member of a large Insurance Committee and of the Panel Committee, and as Chairman of the Salford Division of the British Medical Association, I have had abundant opportunity of seeing how Regulation 40 has worked, and have no hesitation in saying that it has done incalculable harm to the interests of the insured. It is badly conceived, cumbersome, very costly, unfair to the doctors, unfair to the chemists, and grossly damaging to the insured, and, with all that, it frequently fails in its object. The proposed scheme of a commercial tariff, which some of the chemists are already calling a "sweating tariff," with unlimited liability of the doctors, even after prescribing with the most conscientious care, so far from lessening, would aggravate the present condition.

We are told that the commercial tariff would reduce the drug bill by about 15 per cent. on the 1913 figures, and as 2s. was then sufficient, taking the country as a whole, we are assured that there would be no danger of encroaching on the practitioners' fund. But I altogether doubt the value of the figure 15 per cent. I am assured by a number of chemists that even when the war is over the high prices of many drugs will still continue indefinitely, and new drugs of the greatest importance, though costly, are constantly being put forward. In spite of any commercial tariff, there is the greatest danger that in the future the 2s. may become insufficient, even taking the country as a whole, and to ask us to take on unlimited liability is to ask us to trust to luck with the chances against us. By all means let the drug fund be centralized in any way so that areas where the fund is insufficient for proper prescribing may be assisted by other areas which have a surplus. Common sense would point to this, and it ought not to depend on, nor to wait for, any commercial tariff nor for any scheme of robbing the doctors to pay the chemists.

In Salford the plan was tried of crediting the practitioners' pool with the whole of the 9s. for medical benefit, and charging each individual practitioner with the cost of

Vital Statistics.

EPIDEMIC MORTALITY IN LONDON DURING THE SECOND QUARTER OF 1915.

[SPECIALLY REPORTED FOR THE "BRITISH MEDICAL JOURNAL."]

The accompanying diagram shows the mortality from each of the principal epidemic diseases during each week of the second quarter of the year, and the average mortality in the corresponding periods of the five preceding years, except in the case of diarrhoea and enteritis among children under 2 years of age, for which the average mortality figures are not available.

Enteric Fever.—The fatal cases of enteric fever, which had been 35, 32, and 37 in the three preceding quarters, declined last quarter to 24, and were slightly below the corrected average number in the corresponding period of the five preceding years. This disease showed the highest proportional mortality last quarter in Paddington, Hackney, Southwark, and Camberwell. The number of enteric fever patients under treatment in the Metropolitan Asylums Hospitals, which had been 57, 63, and 46 at the end of the three preceding quarters, had declined to 23 at the end of last quarter; 124 new cases were admitted during the quarter, against 109, 126, and 113 in the three preceding quarters.

Small-pox.—No death from small-pox was registered last quarter, and no case of this disease was admitted into any of the Metropolitan Asylums Hospitals during the quarter.

Measles.—The deaths from measles, which had been 412, 473, and 1,120 in the three preceding quarters, declined to 945 last quarter, but were 437 above the corrected average number. This disease was proportionally most fatal last quarter in Fulham, Chelsea, Poplar, Hornsey, and Battersea.

Scarlet Fever.—The fatal cases of scarlet fever, which had been 73, 103, and 100 in the three preceding quarters, declined last quarter to 90, but were 42 in excess of the corrected average number. The greatest proportional mortality from this disease last quarter was recorded in Fulham, Islington, Stoke Newington, Finsbury, and Shoreditch. The Metropolitan Asylums Hospitals contained 2,411 scarlet fever patients at the end of last quarter, against 4,157, 4,131, and 2,514 at the end of the three preceding quarters; the number of new cases admitted during the quarter was 3,356, against 6,283, 7,340, and 3,958 in the three preceding quarters.

Whooping-cough.—The deaths from whooping-cough, which had been 226, 121, and 378 in the three preceding quarters, rose again last quarter to 417, and were 81 in excess of the corrected average number in the corresponding periods of the five preceding years. The highest death-rates from this disease last quarter were recorded in Fulham, Islington, Finsbury, Shoreditch, Hornsey, Battersea, and Deptford, and Greenwich.

Diphtheria.—The fatal cases of diphtheria, which had been 133, 214, and 199 in the three preceding quarters, declined last quarter to 136, but were 28 above the corrected average number. The greatest proportional mortality from this disease last quarter occurred in Holborn, Bethnal Green, Stepney, Poplar, and Southwark. The number of diphtheria patients under treatment in the Metropolitan Asylums Hospital at the end of last quarter was 1,043, against 1,236, 1,306, and 1,562 at the end of the three preceding quarters; 1,719 new cases were admitted during the quarter, against 1,975, 2,728, and 2,023 in the three preceding quarters.

Diarrhoea.—The 201 deaths under this heading are those attributed to diarrhoea and enteritis among children under 2 years of age; measured in proportion to the births registered during the quarter, the mortality from this cause was greatest in Paddington, Kensington, the City of Westminster, Stoke Newington, Bethnal Green, and Poplar.

In conclusion, it may be stated that the aggregate mortality last quarter from these epidemic diseases, excluding diarrhoea, was 57.1 per cent. above the average.

HEALTH OF ENGLISH TOWNS.

In the ninety-six largest English towns 7,451 births and 4,785 deaths were registered during the week ended Saturday, September 18th. The annual rate of mortality in these towns, which had been 12.5, 12.1, and 14.0 per 1,000 in the three preceding weeks, fell to 13.8 per 1,000 in the week under notice. In London the death-rate was equal to 14.7, while among the ninety-five other large towns it ranged from 5.8 in Southampton, 5.9 in Tynemouth, 6.7 in Bourne-mouth, 6.8 in Darlington, 8.0 in Tottenham, and 8.5 in Beole, to 17.2 in Great Yarmouth and in Hull, 17.7 in Ipswich, 19.0 in Sheffield, 19.3 in Dewsbury, 20.3 in Bursley, and 23.2 in Gateshead. Measles caused a death-rate of 3.5 in Lincoln, and whooping-cough of 1.1 in Birkenhead and 2.2 in Edmonton. The deaths of children (under 2 years) from diarrhoea and enteritis, which had been 495, 595, and 664 in the three preceding weeks, fell to 638, and included 171 in London, 36 in Birmingham, 36 in Liverpool, 33 in Sheffield, 27 in Manchester, and 22 in Gateshead. The mortality from the remaining infective diseases showed no marked excess in any of the large towns, and no fatal case of small-pox

DEATHS FROM EPIDEMIC DISEASES IN LONDON DURING THE SECOND QUARTER OF 1915.

NOTE.—The black lines show the recorded number of deaths from each disease during each week of the quarter. The dotted lines show the average number of deaths in the corresponding weeks of the five preceding years, 1909-14. Under the heading "Diarrhoea" are given the deaths from diarrhoea and enteritis among children under 2 years of age; the corrected average number of these deaths is not available.

registered during the week. The causes of 36, or 0.8 per cent. of the total deaths were not certified by a registered medical practitioner or by a coroner; of this number, 11 were recorded in Birmingham, 4 in London, and 2 each in Liverpool, St. Helens, and South Shields. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 2,360, 2,365, and 2,443 at the end of the three preceding weeks, further rose to 2,550 on Saturday, September 18th; 429 new cases were admitted during the week, against 315, 365, and 385 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In the sixteen largest Scottish towns 955 births and 629 deaths were registered during the week ended Saturday, September 11th. The annual rate of mortality in these towns, which had been 13.3, 13.5, and 12.2 per 1,000 in the three preceding weeks, rose to 16.0 per 1,000 in the week under notice, and was equal to the death-rate recorded in the ninety-six large English towns. Among the several towns the death-rate ranged from 7.1 in Kilmaronock, 7.4 in Perth, and 8.4 in Leith, to 15.2 in Clydebank, 16.7 in Greenock, and 16.8 in Dundee and in Aberdeen. The mortality from the principal infective diseases averaged 2.0 per 1,000, and was highest in Aberdeen and Dundee. The 229 deaths from all causes in Glasgow included 29 from infantile diarrhoea, 5 from diphtheria, 5 from measles, 3 from scarlet fever, 2 from enteric fever, and 2 from whooping cough. Five deaths from measles were recorded in Edinburgh and 2 in Paisley; from enteric fever, 3 deaths in Dundee; from scarlet fever, 6 deaths in Aberdeen; from diphtheria, 5 deaths in Edinburgh and 2 in Aberdeen; and from infantile diarrhoea, 8 deaths in Dundee.

HEALTH OF IRISH TOWNS.

During the week ending Saturday, September 4th, 586 births and 368 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 563 births and 388 deaths in the preceding period. These deaths represent a mortality of 15.8 per 1,000 of the aggregate population in the districts in question, as against 14.5 per 1,000 in the previous period. The mortality in these Irish areas was therefore 3.7 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate, on the other hand, was equal to 25.2 per 1,000 of population. As for mortality of individual localities, that in the Dublin registration area was 16.5 (as against an average of 15.1 for the previous four weeks), in Dublin city 18.3 (as against 16.0), in Belfast 15.4 (as against 12.9), in Cork 15.6 (as against 15.1), in Londonderry 29.1 (as against 19.0), in Belfast 19.9 (as against 13.6), and in Waterford 18.0 (as against 17.1). The zymotic death-rate was 2.8, as against 2.2 in the previous period.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notices re Appointments) appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

BIRMINGHAM GENERAL DISPENSARY.—Resident Medical Officer. Salary, £350 per annum.

BRIGHTON: ROYAL SUSSEX COUNTY HOSPITAL.—(1) Senior House-Surgeon, (2) Junior House-Surgeon, (3) Assistant House-Surgeon. Salary for (1), £440, and for (2) and (3) £300 per annum, together with war bonus of £50 per annum in each case.

Bristol ROYAL INFIRMARY.—(1) House-Physician, (2) House-Surgeon, (3) Dental House-Surgeon. Salary, £420 per annum in each case.

CANTERBURY MENTAL HOSPITAL.—Licutenant Assistant Medical Officer. Salary, £75, a week.

CARDIFF: KING EDWARD VII HOSPITAL.—House-Surgeon. Salary, £140 per annum.

CITY OF NORWICH.—Assistant School Medical Officer. Salary, £400 per annum.

DARLINGTON HOSPITAL AND DISPENSARY.—House-Surgeon. Salary, £160 per annum.

DUNDEE COMBINATION POOR HOUSE AND HOSPITAL.—Resident Medical Officer. Salary, £225, rising to £300 per annum.

EVELINA HOSPITAL FOR SICK CHILDREN, Southwark, S.E.—Clinical Assistant in Out-patient Department.

GREAT YARMOUTH HOSPITAL.—House-Surgeon (male). Salary, £200 per annum.

HABROGATE INFIRMARY.—Resident House-Surgeon. Salary, £100 per annum.

HUNDESFIELD ROYAL INFIRMARY.—Assistant House-Surgeon (male or female). Salary, £100 per annum.

INGHAM INFIRMARY AND SOUTH SHIELDS AND WESTOE DISPENSARY.—House-Surgeon. Salary, £150 per annum.

LIVERPOOL: DAVID LEWIS NORTHERN HOSPITAL.—Two Lady Resident Surgeons. Salary, £120 per annum.

LONDON TEMPERANCE HOSPITAL, Hampstead Road, N.W.—(1) Resident Medical Officer, (2) Assistant Resident Medical Officer. Salary for (1) £200 per annum, and for (2) £120 per annum.

LONDON THROAT HOSPITAL, Great Portland Street, W.—Honorary Anaesthetist.

LEDS PUBLIC DISPENSARY.—Resident Medical Officer (lady). Salary, £130 per annum.

MANCHESTER ROYAL INFIRMARY.—(1) Honorary Pathologist, (2) Resident Surgical Officer; salary, £150 per annum and £75 per annum war bonus.

MIDDLESEX HOSPITAL MEDICAL SCHOOL.—Lecturer in Anatomy.

NEWCASTLE-UPON-TYNE POOR LAW INFIRMARY.—Assistant Medical Officer. Salary, £200 per annum.

PARISH OF TYNENAVON Infirmary.—Medical Officer.

PORTSMOUTH: ROYAL PORTSMOUTH HOSPITAL.—House-Surgeon. Salary, £150 per annum.

QUEEN CHARLOTTE'S LYING-IN HOSPITAL, Marylebone Road, N.W.—District Resident Medical Officer. Salary, £60 per annum.

RHONDDA URBAN DISTRICT COUNCIL.—Temporary Assistant Medical Officer of Health and School Medical Officer. Salary, £50 per annum.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—Examiner in Dental Surgery.

ROYAL FREE HOSPITAL, Gray's Inn Road, W.C.—(1) Pathologist and Director of Pathological Studies in the London (R.F.H.) School of Medicine for Women; salary, £400 per annum. (2) Resident Medical Officer (male) to the Military Block.

ROYAL LONDON OPHTHALMIC HOSPITAL, City Road, E.C.—Two Refraction Assistants. Salary, £50 per annum.

ST. PAUL'S HOSPITAL FOR SKIN AND URINARY DISEASES, Red Lion Square, W.C.—Casualty Out-patient Surgeon.

SALFORD ROYAL HOSPITAL.—(1) Junior House-Surgeon, (2) Casualty House-Surgeon. Salary, £100 per annum each.

SHEFFIELD ROYAL INFIRMARY.—House-Surgeon. Salary, £100 per annum.

SOUTHWARK UNION.—Temporary Assistant Medical Superintendent. Salary, £300 per annum.

STORTHESE HALL ASYLUM, Kirkburton.—Licutenant. Salary, £65 per annum.

TOXTETH PARK TOWNSHIP.—Assistant Resident Medical Officer of the Poor Law Institution and Infirmary. Salary, £300 per annum.

WEST BROMWICH AND DISTRICT HOSPITAL.—Assistant House-Surgeon. Salary, £120 per annum.

WEST DERBY UNION.—Temporary Assistant Resident Medical Officer at the Mill Road Infirmary, Liverpool. Salary, £300 per annum.

WEST HAM AND EASTERN GENERAL HOSPITAL, Stratford.—(1) Resident Medical Officer, (2) House-Physician and House-Surgeons. Salary for (1) £160 per annum, and for (2) £120 and £100 per annum respectively.

WESTMORLAND SANATORIUM, Meathop.—Second Assistant to the Medical Superintendent. Salary, £200 per annum.

WHITEHAVEN AND WEST CUMBERLAND INFIRMARY.—Resident House-Surgeon. Salary, £150 per annum.

WIGAN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Junior House-Surgeon. Salary, £150 per annum.

WINSLEY SANATORIUM FOR CONSUMPTION, near Bath.—Assistant Resident Medical Officer. Salary, £250 per annum.

WORCESTER GENERAL INFIRMARY.—Resident Medical Officer (male or female). Salary, £150 per annum.

YORK COUNTY HOSPITAL.—Resident Medical Officer (male or female). Salary, £150 per annum.

CERTIFYING FACTORY SURGEON.—The Chief Inspector of Factories announces the following vacant appointment: Abouze (Aberdeenshire).

To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

SOLOMON H. L.R.C.P. and S.Edin., L.F.P.S.Glas. District Medical Officer of the Leicester Parish.

WILLIAMS, H. O. M.B., B.S. Lond., Certifying Factory Surgeon for the Milford Haven District, co. Pembroke.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s., which sum should be forwarded in Post Office Orders or Stamps with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

MARRIAGE.

PORTER—ROBERTSON.—At Beechgrove United Free Church, Aberdeen, on September 16th, by the Very Rev. the Principal and Vice-Chancellor of the University of Aberdeen, Lieutenant R. M. Porter, Indian Medical Service, to Elizabeth Garvie, daughter of A. B. Robertson, Esq., J.P., 6, Moray Place, Aberdeen.

DIARY OF THE ASSOCIATION.

Date. Meetings to be held.

OCTOBER.

6 Wed. London: War Emergency Committee, 2 p.m.

8 Fri. London: Central Ethical Committee, 2 p.m.

13 Wed. London: Medico-Political Committee.

THE RETURN TO MEDICAL BENEFIT OF SOLDIERS AND SAILORS.

THE enlistment of large numbers of insured persons has naturally caused insurance practitioners to feel a good deal of interest in the administrative steps to be taken on the return of these persons to civil life. When they enlist they are removed from the lists of the doctors, and during their period of service in the navy or army medical attendance and maintenance is found for them, and they fall out of all the National Insurance benefits, except maternity benefit. On their return they are entitled to select a doctor just as though they had newly entered into insurance. Now this right of fresh choice, unless guarded in some way, is certain to lead to confusion, judging from the experience every one concerned in the working of the Act has had of the extreme difficulty of getting many insured persons to take the trouble necessary to place their name on a doctor's list. The Insurance Acts Committee of the Association came to the conclusion in March, 1915, that some arrangement ought to be made to allow these returned soldiers and sailors to be replaced immediately on the lists of the doctors formerly selected by them, without prejudice to their right to change their doctors or to the right of the doctors to refuse to accept them again. The Conference of Local Medical and Panel Committees approved this suggestion and endorsed the procedure devised by the Renfrewshire Insurance Committee. Full particulars of this scheme are now available, and it will be seen that the procedure is simple and very convenient.

As the Commissioners informed the deputation from the Insurance Acts Committee that they would acquiesce in any suitable arrangements set up in any area to meet the difficulty, which they fully recognized, there can be no excuse for any Insurance Committee raising difficulties as we are informed some of them are doing.

The scheme, for the details of which we are indebted to Mr. E. D. Anderson, B.L., Deputy Clerk, Renfrewshire Insurance Committee, who was the author of it, is as follows:

John Smith, a member of an approved society, joins the army, and is on the list of Dr. Blank. His society sends an orange slip to the Insurance Committee announcing his enlistment. The ordinary white index slip is thereupon removed from the Committee's Register, and the orange slip substituted. Smith's name is removed from Dr. Blank's list, but Dr. Blank's name is noted on the orange slip. When Smith returns to civil life his society will send to the Committee another white index slip reinstating him in insurance, the orange slip will be destroyed, and the white slip substituted. At the same time a medical

card will be issued to Smith, bearing Dr. Blank's name. Along with the card Letter A will be sent, and to Dr. Blank Letter B will be sent along with a slip bearing Smith's name for insertion on the doctor's list.

RENFREWSHIRE INSURANCE COMMITTEE,
Letter A.

Dear Sir,

I enclose a medical card bearing the name of your former doctor. I have to explain that, although the card is issued for convenience in this form, you may, if you please, make selection of another practitioner than the one named.

If you do not desire to be restored to the list of your former doctor, you should take the medical card along with this letter to the doctor whom you wish to select. If he accepts you, he will sign the card at Part B, and send it to this office.

If you are satisfied to remain upon the list of your former doctor, you will simply retain this card. Nothing further is required.

Yours faithfully,

.....
Clerk.

RENFREWSHIRE INSURANCE COMMITTEE,
Letter B.

Dear Sir,

The enclosed slips represent insured persons now discharged from military service who were formerly upon your list, and are now restored to it automatically by virtue of the arrangement to this effect entered into between the Insurance Committee and the panel practitioners in this area.

The automatic restoration is without prejudice to your right to reject any of the restored persons if you so desire. If you wish to exercise your right of rejection in any case you should return to this office the slip marked "Rejected."

Yours faithfully,

.....
Clerk.

EXCESSIVE COST OF PRESCRIBING.

A CASE was heard recently, by direction of the Insurance Commissioners for England, in which Dr. X. appealed to them against the action of the Insurance Committee, which, exercising powers under Article 40 of the Insurance (Medical Benefit) Regulations (England), 1913, had deducted the sum of £77 6s. 10d. from the amount payable to Dr. X., the Committee being of opinion that an excessive demand upon the Drug Fund had arisen owing to orders given by Dr. X. having been extravagant in character or in quantity during a certain half-year. Dr. X. was represented by counsel, and the Insurance Committee by its clerk. Evidence was given by Dr. X., by the clerk to the Insurance Committee, and by the Honorary Secretary of the Panel Committee, and by the Chairman of the Medical Benefit Subcommittee.

It appeared that the Insurance Committee, the Panel Committee, and the Pharmaceutical Committee had caused the prescriptions given in the area to be checked and had found that the prescriptions of Dr. X. exceeded the average price of all doctors by 22.02d. per insured person for the half-year, showing on the basis of the number of prescriptions issued an excess of 16.14d. per prescription. At the instance of the Pharmaceutical Committee the matter was considered by the Panel Committee, which, after hearing Dr. X., had reported to the Insurance Committee that his prescriptions had been extravagant and unnecessary in frequency. Though no method had been laid down by any authority for estimating such excess, the Panel Committee expressed the opinion that 25 per cent. of the cost of the whole of Dr. X.'s prescriptions (£205 19s. 8d.) for the period named was an arbitrary but fair estimate. The Medical Benefit Subcommittee recommended the Insurance Committee to concur in the Panel Committee's view, and the Committee did so concur.

After the Commissioners had heard and reviewed the evidence, they expressed the opinion that the Insurance Committee was justified in holding that orders for drugs given by Dr. X. had been extravagant in character and in quantity, that an excessive demand on the Drug Fund had consequently arisen, and that the Committee was therefore justified in making a deduction from the amount payable to him. The decision went on to say that had evidence been given to satisfy the Commissioners that the amount of the excessive demand was as estimated, they might not have been disposed to revise the amount, being of opinion that, *ceteris paribus*, the deduction should bear some relation to the extent of the extravagance; but having regard to the fact that Dr. X.'s prescribing had shown a general profuseness very difficult to bring to a precise measurement in money, and to the consideration that the provision for a deduction was largely intended to act as a deterrent, the Commissioners reduced the amount of the deduction to £25.

Counsel for Dr. X. contended that the Insurance Committee had no power to delegate to its Subcommittee, the Medical (Benefit) Subcommittee, the consideration of the report of the Panel Committee, on the ground that the regulations of 1912 empowering it to appoint a subcommittee and to delegate to any subcommittee any of the powers and duties of the Committee could not extend to duties imposed upon an Insurance Committee by regulations subsequently issued. The Commissioners considered that there was no substance in this objection, since by virtue of Section 65 of the Act of 1911 all regulations made under that Act were to have effect as if enacted in that Act. All the regulations, therefore, must be read together, and the power of delegating duties to subcommittees extended to duties imposed on Insurance Committees by any regulations whenever made, unless a contrary intention was clearly expressed in the particular regulations imposing the duty in question.

DEBILITY AS A DIAGNOSIS.

THE OPINIONS OF TWO JUDGES, A FRIENDLY SOCIETY, AND THE COMMISSIONERS.

In commenting on the Memorandum on the new system of medical certification of incapacity of insured persons for work (Memo. 211/L.C.), issued by the Insurance Commissioners on December 11th, 1914, "for the information of medical practitioners and approved societies," it was said that in all probability many points other than those dealt with in our comments then published would present themselves when the system had been in operation for a time. Such a difficulty had in fact already arisen with regard to the use of the word "debility" in medical certificates.

In the memorandum, paragraph 50, the Commissioners express their opinion that "recognition of the fact that diagnosis of a patient's illness in the early stages cannot always be definite will not excuse or justify a doctor in using, then or at any stage, terms less precise than his knowledge of the case enables him to give." This expression of opinion was qualified by the statement that in exceptional cases the full diagnosis need not be given on the face of the certificate, such cases being those in which unjustifiable distress or injury would be caused by giving

the information either to the patient or other parties! Provision was made that in such circumstances the doctor, on the certificate handed to the patient, might describe the disease in less precise terms than his knowledge would enable him to use, but must send to the society notice on a special form that he had given such certificate, and to the Government referee, or, if there were no such person, to the Commissioners, on another form a precise statement of the true nature of the disease and his reasons for not stating it on his certificate.

The difficulty to which attention is now drawn has, however, nothing to do with these exceptional cases. It consists in the desire of some practitioners to use merely the term "debility"; upon this matter the memorandum says

If . . . first certificates only are considered, there can be but few cases in which a doctor is warranted in declaring a patient to be incapable of work, and yet is unable to ascertain some further facts as to the nature of the illness than are conveyed by such a vague term as "debility" standing alone. . . . For instance, a doctor can certainly be expected in such a case to state, where he so finds, "debility with anaemia," or "debility with high temperature," or "debility with dyspepsia," and similarly in other conditions.

A correspondent who recently raised the point with the Commissioners informs us that he has received a letter from them pointing out "that medical certificates are intended to give information to officials of approved societies and other persons who, without technical knowledge, have to decide whether the condition of an insured person is such as to entitle him to benefit, and who are accordingly justified in requiring as much precision as possible in the certificate." The Commissioners go on to decline to discuss questions which may in a particular case come before them in a judicial capacity, but refer the correspondent to Case xxiv in the Report of Decisions of Appeals under Section 67 of the Insurance Act, 1911.

Two parts of these reports have been published.¹ They have been issued, the Commissioners state, because it was thought desirable "that the decisions which have been given in the various cases which have arisen under Section 67 of the Act should be published *in extenso* for the information generally of societies and others interested in the administration of the Act." As the cases are "invariably heard in private and often involve questions of an intimate and delicate nature, the Commissioners were of opinion that the names of the parties and societies concerned, or any information which would enable them to be identified, ought not to be published." The decisions deal with a large number of questions, and come down to July 3rd, 1915.

In Case xxiv, which antedated the Memorandum 211/L.C., the doctor attending an insured woman had declined to respond to the request of the society that he should further define a certificate to the effect that she was incapable of work by reason of "debility." The society refused to pay sickness benefit, and the insured person obtained a judgement in the County Court against the society for 15s. 6d. The society appealed on the ground that the jurisdiction of the county court was ousted by Section 67 (1) of the Act and the society's "Disputes" Rule, and the Divisional Court allowed the appeal. One of the judges of the Divisional Court, in the course of his judgement, said:

If it appeared that the society, under the false guise of a decision that the evidence was insufficient, were really excluding a class of ailment which ought to be included, I think that upon well-known principles their action could be challenged. But have the society in this case done anything of that kind? I think they have not. They are to decide whether a person is suffering from a specific disease or bodily or mental disablement. They are to decide whether such and such information is sufficient to prove a specific disease or bodily or mental disablement. . . . In this case it is perfectly plain that whether they decided rightly or wrongly they decided a matter within their jurisdiction. . . . The question whether a state of ill health, as described, shows sickness coming within the Act and rules is the very thing left for them to decide.

This decided the legal question, but gave no help towards solving what may by courtesy be called "the scientific" question. The insured woman then went to the general delegates' meeting of the society, who dismissed her appeal, and she then appealed to the Commissioners, the case being heard by referees appointed by the Commissioners. The society treated the case as one raising a

¹ Part I. (Cd. 7810), price 4d.; Part II. (Cd. 8040), price 3d. To be obtained through any bookseller.

question of principle and did not suggest that the insured woman had put forward a dishonest claim. The referees found that the society was justified in the action it took and suggested that if the society felt that the principle for which it had contended was established, it might be willing to adopt a generous attitude towards the appellant; this suggestion was adopted. The referees did not make a final award, but gave the following reasons for holding that the society was justified in the course it originally took.

By Section 8 (1) (c) of the Act, an insured person who is rendered incapable of work by some specific disease or by bodily or mental disablement is entitled to sickness benefit. By Section 14 (2) societies may, with the consent of the Commissioners, make rules with regard (*inter alia*) to notices and proof of disease or disablement. Before a member can obtain benefit, therefore, he must give such notice and proof of his disease or disablement as the rules of his society require. In the present case the society's rules provide that a member must send to the local secretary a medical certificate or other sufficient evidence of incapacity and cause thereof. It is for the society to decide, as the judge of the Divisional Court (whose judgment has been referred to) probably be, whether the evidence tendered is in their judgment sufficient to prove a specific disease or bodily or mental disablement. They must, it need hardly be said, apply their minds to a consideration of this question in a reasonable way. If, for example, a medical certificate stated that the member was incapacitated because he was suffering from small-pox or because he had just been operated upon for appendicitis, it would probably be unreasonable to require further evidence. But where the cause of the incapacity is described in terms which, from the layman's point of view, may reasonably be regarded as ambiguous or wanting in precision, a society is in our opinion entitled, if not bound, to seek for further information in order that they may satisfy themselves that the title to benefit is a good one, and that the doctor operating in such circumstances to afford all the help in his power. The committee of a society does not profess to have expert medical knowledge; it must rely upon the assistance of those who have; but it has to make up its own mind and is under no obligation blindly to accept, as conclusive evidence of incapacity, a medical formula which it does not understand.

Here again we have the case decided on the legal point and it was after this that the Commissioners embarked on their attempt to deal with what we have called the scientific aspect of the matter, with the result to be found in Memo. 211/I.C. noted above.

It may be confessed that there seems here a mighty piper about a small matter. One can see the pedantic official making himself officious and a tired doctor irritated by pinpricks. A reasonable amount of tact would have saved the expenditure of the time of the courts and some public money. The Commissioners have not ventured to tell the officials of the friendly societies that they ought to accept the doctor's certificate that the insured person is incapacitated from work; they might have pointed out that, apart from any question of integrity, it is not to the interest of a doctor working under a contract with an Insurance Committee to add to the number of sick among the insured persons on his list. This would be the common-sense view; but at the same time it must be admitted that "debility" is not a satisfactory diagnosis. It is, as practical men know, sometimes the only diagnosis that can honestly be given; but there is, nevertheless, a lack of precision about it which the doctor who has to make it must lament as much as the Commissioners who have to adjudicate on it. A certain amount of sympathy cannot be denied also to the official who thought that debility was an effect and not a cause. He might, however, have reflected that this finding out of causes is a matter which has troubled mankind for a long time, and might have recalled—but perhaps he does not give his leisure to the Georgics—that the difficulty had wrung from Virgil the well-known exclamation:

Felix qui potuit rerum cognoscere causas!

Happy indeed is he who understands the causes of things, but if we set to work to analyse medical terminology in this meticulous fashion we shall only arrive at the foregone conclusion that medicine is not one of the exact sciences. Whether it will really be helped to become more exact by such authorized diagnoses as "debility with anaemia" or "with high temperature" we cannot now stay to consider, but clearly anaemia and high temperature are effects and not causes. So that we are brought back to the position from which we started—namely, that there is no way of going behind the doctor's certificate and preserving our common sense, and that there has been a

great potter about a very little thing. Somebody, however, said that life was made up of little things; this was before the war.

THE WAR EMERGENCY.

AN APPEAL TO THE PUBLIC.

The following letter, signed by the Chairman, by Sir William Osler, Sir Clifford Allbutt, the President of the Royal College of Physicians of London, Sir Rickman Godlee (ex-President of the Royal College of Surgeons of England), Sir Alexander Ogston (President of the British Medical Association), and other members of the War Emergency Committee, has been issued to the daily press and has been inserted in some newspapers:

Sir,

May we be allowed, through the medium of your columns, to call the attention of the public to the need for its sympathy and assistance in setting free medical practitioners for service with the Forces? The shortage of commissioned medical officers is a serious matter for our new armies; and this shortage can only be made good by releasing medical practitioners from civil life. These men are dependent on their practices for their livelihood. At the call of duty they go to assist in saving the lives and relieving the sufferings of their countrymen, and in so doing they risk not only death and injury but also the loss of their means of livelihood on their return.

While recognizing the right of every person to consult any doctor he chooses, we appeal to all British citizens not to give up their usual medical attendant on account of his temporary absence on military duty, and to insured persons we appeal not to apply for transfer. In all cases it should be regarded as an obligation and patriotic duty to safeguard in every possible manner the interest of the doctors who volunteer for active service. Every medical man who leaves his practice has either appointed a locum tenent to carry on his work, or has arranged with neighbouring practitioners to attend his patients while he is away.

We hope that patients will inform the practitioner they may consult that their own doctor is absent on military service, and that they intend to place themselves again under his care whenever the need arises after his return.

The medical men who remain are willingly attending the patients of those on service on the distinct understanding that they shall not be asked to continue to do so after the war. The public will assist these men greatly to fulfil this honourable understanding if it will observe the lines of conduct we have indicated.

The *Leicester Mail*, in commenting upon this letter, has the following observation:

"Every person has a right to consult any doctor he chooses, and I will accept no dictation," may be the hasty retort of some selfish or thoughtless person. The right is not denied, but there are some things which, though lawful, are not expedient. The present conditions are quite abnormal, and they involve moral responsibilities which no one now alive has ever previously been called upon to accept. The medical men who are remaining at home have willingly and notly shouldered the burden of extra work, on the distinct understanding that the arrangement is a temporary one and, as the British Medical Association says, the public will assist these men to fulfil this honourable understanding if they observe the lines of conduct here indicated. It is well to have this frank and full explanation of the situation, and we cannot doubt that the arrangement suggested will prove a workable one.

SALFORD WAR EMERGENCY COMMITTEE.

A meeting of the Executive Committee of the Salford Division of the British Medical Association was held last week, Dr. J. H. Taylor in the chair, to consider the formation of a Local War Emergency Committee. A number of practitioners who are not members of the Association were also invited to be present. It was stated that eight Salford practitioners were already away on active service, and that to fill up the number that Salford ought to supply in order to meet the demands of the war authorities at least eight more ought to enlist. A Local Emergency Committee was at once formed, and as it is already known that at least six practitioners have notified their intention to offer their services, there will be very little delay in

providing Salford's full proportion, and probably even more.

Manchester has already sent a large number of doctors to the war, some of whom have greatly distinguished themselves on the field, but if one out of every three medical men of military age is required, it will be necessary for about forty more to enlist. The difficulty of releasing so large a number from their work in the city will be considerable, but it, it is confidently believed, be surmounted, though it will entail no little sacrifice on both those who go and those who remain at home.

PROPOSED DUTY-FREE ALCOHOL IN HOSPITALS.

On June 24th the Medical Secretary of the British Medical Association addressed a letter to the Chancellor of the Exchequer criticizing the form of the clause proposed to be inserted by the Government in Finance (No. 2) Bill to authorize the use of duty-free spirits in hospitals in the preparation of tinctures, etc., and on June 28th the Association, acting with the Pharmaceutical Society of Great Britain, addressed a communication to certain members of Parliament, asking them to support the proposal that the clause should be dropped, and that the whole question of the use of duty-free alcohol in medicine should be referred to a special committee for consideration and report. The clause was withdrawn, and subsequently Mr. W. C. Bridgeman, M.P., one of the Lords of the Treasury who had introduced the clause, met a deputation from the British Medical Association and the Pharmaceutical Society. As the result of the discussion, Mr. Bridgeman agreed to draft an amended clause so as to give a grant based on the amount of alcohol used in medicine during the past year, and not, as was formerly proposed, on the actual amount consumed in any given year, to such hospitals as complied with certain requirements, and to submit the draft to the two associations for consideration and comment. A new subclause has now been agreed with Mr. Bridgeman, and Dr. Alfred Cox and Mr. W. J. Uglow Woolcock have notified those members of Parliament formerly approached on the subject that the opposition of the two associations they represent has been withdrawn. The draft now subclause is as follows:

(1) If the treasurer or other responsible officer of a public hospital shows to the satisfaction of the Treasury that any tinctures or other articles which contain spirits or in the preparation or manufacture of which spirits are used have within the twelve months preceding the thirty-first day of July nineteen hundred and fifteen been consumed for medical purposes in the hospital, the Treasury may, subject to such conditions and regulations as they may prescribe, pay to the treasurer or officer out of moneys provided by Parliament an allowance equal to the amount which is shown to their satisfaction to have been paid by way of duty in respect of the spirits contained in or used in the preparation or manufacture of those articles.

(2) The Treasury shall constitute an advisory committee for the purposes of this section, and may refer to the committee any application for payment under this section or any question arising as to any such payment.

(3) If any person for the purpose of obtaining any payment under the foregoing provisions knowingly makes any false statement or false representation he shall be liable on summary conviction to imprisonment, with or without hard labour, for a term not exceeding six months.

(4) For the purposes of this section the expression "public hospital" means a hospital supported by any public authority or wholly or partly out of any public or charitable funds or by voluntary contributions, but does not include any institution carried on for the purposes of gain.

INSURANCE COMMITTEES.

COUNTY OF LONDON.

Finance and Sanatorium Benefit.

At the meeting of the London Insurance Committee on September 23rd it was stated that its financial system was in some danger of breaking down, and, after discussion, it was resolved, on the motion of Mr. Handel Booth, that a deputation, headed by the chairman of the Committee, should wait upon the Insurance Commissioners to discuss the subject. An addendum that the same deputation should also seek out the Chancellor of the Exchequer,

whose budget proposals were expected to involve the Committee in an additional expenditure of £3,000 a year, was negative.

The matter which brought the financial question to a head was the deficit likely to arise in the sanatorium benefit fund by the end of the year. The commitments in respect of sanatorium benefit cannot immediately be reduced, but it was promised that the whole question of revising the expenditure would be brought up for consideration. It was agreed to augment the income available for sanatorium benefit on this occasion only by transferring £2,000 from the general purposes fund, thereby, however, seriously depleting the funds available for ordinary administration.

Dispensary Treatment of Tuberculosis.

The question of the arrangements to be made with the borough councils with regard to dispensary treatment of insured persons suffering from tuberculosis was referred back at the previous meeting, owing to the absence of information as to the grounds on which the Local Government Board had arrived at the figure (£9,300) stipulated as the Committee's contribution for this purpose. Mr. R. W. Maffrey, the chairman of the Sanatorium Benefit Subcommittee, now gave full details furnished by the board, and the amount was accepted as reasonable. Wherever possible, the arrangements with the borough councils come into operation on October 1st.

Number of Deposit Contributors.

Mr. James Skinner, chairman of the General Purposes Subcommittee, announced the number of deposit contributors in London in this and preceding years to be as follows:

July, 1915	60,099
July, 1914	64,874
July, 1913	73,744

There has thus been a decrease of 13,445 in two years.

LOCAL MEDICAL AND PANEL COMMITTEES.

LONDON.

PANEL COMMITTEE.

The Proposed Commercial Drug Tariff.

A LONG discussion took place at the meeting of the London Panel Committee on September 28th with regard to the changes in medical benefit regulations which would follow upon the placing of the drug tariff upon a commercial basis. The General Purposes Subcommittee reported that the anomalies of the present drug tariff were so extraordinary and unjust, and that the advantages of a commercial tariff were so great, that the profession should hesitate to take any action which might lead to a continuance of the present tariff. At the same time it would be ill-advised to abrogate the principle that no portion of the drug fund should ever be chargeable to the practitioners' fund. The report crystallized into the following recommendations:

(a) That the medical profession should oppose any proposed alteration in the Medical Benefit Regulations which may provide for the chemists' bills being paid in full, and for the Drug Fund being made a first charge upon the Medical Benefit Fund, without the provision of a special fund to meet any excess in the cost of drugs beyond 2s. per insured person.

(b) That, in view of the differences which exist in the incidence of sickness in various parts of the country, it is inequitable that each local Drug Fund should consist of 2s. per head of the insured population.

(c) That a differentiation in the amount of the Drug Funds of the various areas might well be secured by the award of special grants to necessitous areas from a Central Fund made up of the whole or a portion of the amounts by which the cost of drugs in any area may fall below 1s. 6d. per insured person.

(d) That control over any tendency towards excessive prescribing by practitioners should not be secured by an automatic surcharge of every practitioner, the total cost of whose prescriptions exceeds a fixed amount per insured person, with or without some form of relief in special cases, but by continuous scrutiny by the Panel Committee of the prescriptions issued, and by surcharge on the present basis of practitioners prescribing extravagantly, with the elimination, however, of the interest therein of the Pharmaceutical Committee.

Dr. H. G. Cowie moved an amendment that "practices" be substituted for "areas" in Recommendation (c). For a

practitioner with 1,000 insured persons on his list, the sum of £75 for drugs appeared quite reasonable; if the drug expenditure was in excess of this the practitioner should not necessarily be penalized, and even if it were in excess of £100, which would represent the full 2s. per head, while a case for inquiry as to surcharge might arise, the practitioner on showing that the money had been reasonably spent should be refunded from the central fund for anything above the £75 limit. Dr. Cowie supported the idea of a central fund, which, as it accumulated, he thought, might ultimately be used for extra benefits for the insured person, including perhaps dentistry, surgical appliances, and the advice of consultants. The amendment, after further discussion, was withdrawn by consent, and eventually the original recommendation was adopted by 32 votes to 2.

A report from the Pharmacy Subcommittee asked the Panel Committee to inquire into the charges on this score made against London practitioners, and suggested that periodically, perhaps once a quarter, each practitioner should be informed of the cost of the drugs he had ordered.

The Effect of the War on Insurance Practice.

It was stated that consequent upon the removal from their lists of men serving with His Majesty's Forces practitioners on the panel were only receiving 70 per cent. of the income to which ordinarily they would be entitled, while in many cases their work was equal in amount to that performed before the war. The removals, of course, represented some of the best lives, which were unlikely to have been any serious charge upon the services of practitioners for many years to come. It was agreed that the Chancellor of the Exchequer, the Chairman of the Joint Committee, the Insurance Commissioners, and the Insurance Committee should be made acquainted with the panel practitioners' point of view.

Subsequently the following resolution, moved by Dr. P. T. GOODMAN, was adopted:

That, inasmuch as the incomes of practitioners on the panel have been seriously depleted by the reductions in the amounts paid to them half-quarterly in advance, the Panel Committee regard the long delay in effecting a settlement in connexion with the 1914 accounts as most unsatisfactory and urge the Insurance Commissioners and the London Insurance Committee to expedite the payment of the money so long overdue; and that the Insurance Commissioners and the Insurance Committee be so informed.

COUNTY OF SURREY.

PANEL COMMITTEE.

The monthly meeting of the County of Surrey Panel Committee was held at Surbiton Cottage Hospital on September 17th, when Dr. LANKESTER was in the chair.

Expenses of Pharmaceutical Committee.—It was reported that the Insurance Commissioners had granted up to £80, plus the third share of the cost of checking prescriptions, as the expenses of the Pharmaceutical Committee to be deducted from the Drug Fund.

Nurses acting as Sick Visitors.—A letter was read from the British Medical Association, dated August 7th, stating that it had again drawn the attention of the Queen Victoria Jubilee Institute for Nurses to the undesirability of nurses acting as sick visitors.

"Own Arrangements."—In reply to an inquiry, it was decided that the County Committee was within its rights in not allowing an insured person to "make his own arrangements" with a practitioner on the panel.

Proposed Commercial Drug Tariff.—The memorandum by the Insurance Acts Committee (SUPPLEMENT, September 11th, p. 117) was considered and replies agreed upon.

LOCAL MEDICAL COMMITTEE.

The twenty-fifth meeting of the County of Surrey Local Medical Committee was held on the same day and with the same chairman.

Range of Medical Service.—The CHAIRMAN gave a report of the hearing before referees of a case which raised the question whether a practitioner on the panel was justified in making a charge for the excision of a portion of the lip of an insured person. The Committee, while of opinion that the practitioner should have performed the operation as part of medical benefit, considered that the removal of a malignant growth on the lip was not an operation to be undertaken by a practitioner "of ordinary competence and skill." A second case raised the point whether a practitioner on the panel was entitled to make a charge for the

estimation of refraction. The Committee informed the Insurance Committee that the examination was done, and had to be done, out of ordinary consulting-room hours, owing to the considerable time it took; that the great majority of practitioners were not competent to make such an examination; and that the patient in this case definitely consulted the practitioner with a view to his prescribing spectacles.

OXFORD.

PANEL COMMITTEE.

At a meeting on September 16th, when Dr. COUNSELL was in the chair, the drug tariff was discussed, and the SECRETARY reported the number of removals from each doctor's list due to enlistment. Great dissatisfaction was expressed that none of the money due towards the settlement for 1914 had yet been received, and that no information could be obtained in respect to this.

EAST SUFFOLK.

PANEL COMMITTEE.

Special Mileage Fund.—It was reported to a meeting of the East Suffolk Panel Committee at Saxmundham, on September 14th, when Dr. HELSHAM was in the chair, that the Insurance Joint Committee had increased to £220 the sum allocated to the East Suffolk Committee from the Special Mileage Fund for 1915. The Commissioners suggested that the committee should modify the terms of the mileage scheme in dividing the grant so that the rate of credit under Clause 3 might be increased relatively to that afforded under Clause 2. It was resolved to accept the increased grant, while regretting that the Commissioners had not granted in full the moderate claim that was put forward, and to adhere to the terms of the scheme in dividing the sum allocated.

Reinstatement of Persons discharged from the Army and Navy.—It was reported that the Insurance Committee had agreed to support the resolution of the Panel Committee with reference to the reinstatement of persons discharged from the army or navy on doctors' lists.

Proposed Commercial Drug Tariff.—The memorandum from the British Medical Association (SUPPLEMENT, September 11th, p. 117) with regard to the possible changes of Medical Benefit Regulations connected with the placing of the drug tariff on a commercial basis was considered and replies to the several questions prepared.

BIRMINGHAM.

PANEL COMMITTEE.

Excessive Prescribing.—At a meeting of the Committee on September 14th Dr. LYDALL presented the report of the Pharmacopoeia Subcommittee on the question of excessive prescribing during the year 1914. The report, among other things, drew special attention to the marked improvement noticeable in the figures for the first quarter of 1915, which gave promise of good results for this year.

Proposed Commercial Drug Tariff.—The Memorandum issued by the British Medical Association (SUPPLEMENT, September 11th, p. 117) was considered, and it was decided to advocate some revision of the drug tariff with automatic surcharging of those whose expenses exceeded 2s. per insured person, with continuous scrutiny of prescriptions.

WOLVERHAMPTON.

PANEL COMMITTEE.

A MEETING of the Wolverhampton Panel Committee was held on September 16th, when Dr. JOEBENS was in the chair.

Election of Officers.—The following officers for 1915-16 were unanimously elected:

Dr. T. C. CRAIG (Chairman), Dr. H. C. MAETLER (Honorary Secretary), Dr. J. A. WOLVERSON (Honorary Treasurer).

Finance.—The accounts, showing receipts of £60 16s. 8d., expenditure £23 6s. 6d., leaving a balance of £37 10s. 2d., were approved.

Proposed Commercial Drug Tariff.—The Memorandum of the British Medical Association on the possible changes in the Medical Benefit Regulations connected with the placing of the drug tariff on a commercial basis was discussed and the questions answered.

Checking of Prescriptions.—The report of the Wolverhampton Subcommittee of the Joint Checking Committee for the quarter ending March, 1915, was presented, showing

the average cost per script to be 7.72d. The individual averages ranged from 5.14d. to 13.7d. per script. The report was received, but since it had not been before the Joint Committee for its approval, it was not discussed.

DERBYSHIRE.

LOCAL MEDICAL AND PANEL COMMITTEES.

War Emergency.—At a meeting on September 2nd, when Dr. TOBIN was in the chair, the War Emergency arrangements were explained, and the Committee asked to help in obtaining signatures to the circulars which were being issued.

Payments to Panel Practitioners.—It was decided to send the following resolution to the Insurance Committee:

That this Committee is dissatisfied that the accounts for last year have not yet been settled, and protest against any further deductions being made from the money due, after taking the enlisted men from the panel lists.

At a meeting of the Derbyshire Panel Committee, held on September 23rd, when Dr. TOBIN was in the chair, it was decided to send the following resolution to the British Medical Association, the Insurance Committee, and the Commissioners:

That the Panel Committee strongly objects to the excessive deductions from the quarterly cheques, and, seeing that the payments for 1914 are still unpaid, therefore gives warning of the danger of a combined refusal of the doctors in the county of Derby to continue to work the Act.

NORTHAMPTONSHIRE.

PANEL COMMITTEE.

At a meeting held at Northampton on September 21st, when Dr. BAXTER was in the chair, it was reported that the Commissioners had continued the present membership of the Committee until July 15th, 1916, and had recognized the personnel of the Panel Committee as the Local Medical Committee for Northamptonshire until the same date.

Proposed Commercial Drug Tariff.—The Memorandum on the "Drug Tariff" issued to Local Medical and Panel Committees of the Insurance Acts Committee of the British Medical Association was considered, and it was decided to answer the first two questions in the affirmative, to dissent strongly from paragraph 13, and to agree to each insurance area being credited with an amount for drugs and appliances on the same basis, with continuous scrutiny and surcharging as at present.

SHROPSHIRE.

PANEL COMMITTEE.

A MEETING of the Shropshire Panel Committee was held at the Infirmary, Shrewsbury, on September 21st, when Dr. EXHAM was in the chair. The Memorandum of the Insurance Acts Committee (SUPPLEMENT, September 11th, p. 117), as to placing the drug tariff on a commercial basis, was considered and the questions answered.

BOLTON.

LOCAL MEDICAL AND PANEL COMMITTEE.

At a meeting held at the Bolton Infirmary on September 17th, when Sir THOMAS FLITCROFT was in the chair, it was decided not to accept the commercial tariff on the lines laid down in a memorandum from the Insurance Acts Committee on the possible changes of Medical Benefit Regulations connected with the placing of the drug tariff on a commercial basis, and the following resolutions were adopted:

That the Drug Fund be centralized, and that the areas where the fund is insufficient be assisted by those areas which have a surplus.

That the scrutiny of prescriptions be continued; and that the arrangement as in the Memorandum, par. 24 (b), be adopted.

WIGAN AND DISTRICT.

Proposed Commercial Drug Tariff.—A meeting of the panel practitioners of Wigan and Area 14 was held on September 14th to consider the proposed adoption of a commercial tariff for 1916. Dr. T. CAMPBELL (a member of the Insurance Acts Committee of the British Medical Association) gave a summary of the Association's memorandum on the question. The general opinion expressed during the ensuing discussion was that a revision of the present drug tariff was necessary on account of the high prices contained therein, but those present were not prepared to acquiesce in any arrangement whereby the fee due to practitioners for the attendance and treatment

of insured persons could be drawn upon to meet any excess in the cost of prescriptions, but considered that cases of extravagant prescribing should be dealt with under Section 40 of the Insurance Regulations, which empowered the Insurance Committee, on the recommendation of the Panel Committee, to surcharge any practitioner who prescribes excessively. It was ultimately resolved to agree to the adoption of a commercial tariff under the conditions that any excess of the cost of drugs and appliances over an average of 2s. per insured person would not be met by any call upon the Practitioners' Fund, and that that fund and the Drug Fund remained separate.

FIFESHIRE.

A COMBINED meeting of the Local Medical and Panel Committees was held at Kirkcaldy on September 16th, when there were present representative members from the Kirkcaldy and Dunfermline Panel Committees.

Drug Tariff.—The memorandum by the Insurance Acts Committee (SUPPLEMENT, September 11th, p. 117) on the drug tariff was carefully considered, and the unanimous feeling was that the commercial tariff described in this memorandum meant nothing else than making the Drug Fund a first charge on the Medical Benefit Fund, and so the unanimous answer to question 1 (M5) was in the negative. The following resolution was unanimously adopted:

That if any attempt is made in the Medical Benefit Regulations on the lines of M4 for 1916, or in any other way to make the Drug Fund a first charge on the Medical Benefit Fund, then the Panel Committees of the county of Fife will recommend practitioners to refuse to sign agreements and, if necessary, to leave the panel.

Cost of Checking Prescriptions.—It was agreed that panel practitioners bear a third share in the expenses of the checking bureau.

CORRESPONDENCE.

THE PROPOSED COMMERCIAL TARIFF.

DR. H. FALCONER OLDHAM (Moucecambe) writes: The replies of the Panel Committees to the memorandum of the Insurance Acts Committee will most probably have been returned by this. The final decision, however, will be made by that Committee.

To the Insurance Acts Committee I would appeal, and would, as a loyal supporter of the British Medical Association and as one who till quite recently has been able to take an active part in the direction of its policy, urge the Committee not to entertain any such disastrous step as that discussed in the memorandum in question.

The proposition that the Medical Benefit Fund is primarily chargeable with the provision of drugs and appliances, and that the medical practitioners can receive no remuneration for professional services until the chemists have been paid—the plain meaning of a "commercial tariff" on the lines of the memorandum—is in view of the Insurance Acts 1911-1913 questionably legal.

The suggestion that we might safely accept such a proposition and make money by allowing the consideration of the cost of treatment to influence our conduct rather than the consideration what that treatment should be is distinctly immoral.

Surely the wisest course would be to be content at present with a revision of the tariff prices so as to bring these more nearly into commercial relationship with the prices chemists pay for the drugs and appliances they provide. Wait till the Departmental Committee publishes its report on the drug tariff, and until we have the results of 1914 and 1915, as well as those of 1913, for comparison. Meantime the whole question of the drug tariff and its relation to the medical practitioner can be discussed in committee and in the JOURNAL and a considered opinion arrived at deliberately, and not rushed as is now suggested.

There is no immediate necessity for a final decision. Sir R. Morant's clear statement in his letter of August 23rd—

The Commissioners would in the present exceptional circumstances, with so many members of the profession inaccessible, be most reluctant to make any substantial modifications of the terms of medical practitioners under the Insurance Act unless they could feel assured that such modifications were "desirable in the view of all concerned"—

Highland Field Ambulance.—Captains to be temporary Majors: J. D. Fiddes, M.B., F.R.C.S.E. and J. H. Stapham, M.B., Licentiate in F. D. Chandler, M.B., to be Major (substituted for notice published in the *London Gazette* of August 4th).

Sanitary Service.—Major C. E. Humphreys to be Lieutenant-Colonel.

Attached to Units other than Medical Units.—Temporary Major A. A. Martin, M.D., from Home Counties Field Ambulance, to be Major, temporary. Lieutenants to be Captains: G. H. H. Mansfield, F. D. Lane, J. L. Green, M. H. Barton, G. A. Broaden, M.D., W. Dale, J. W. Scott, F. R. Arnitage, M.B., R. E. T. Talbot, M.D., J. G. Cooke, M.B., W. E. Falconar, M.B., J. P. N. Casey, E. Copland, H. C. C. Hackney, N. C. Chavasse, M.B., J. H. Wood, G. S. Hall, M.B., F. H. C. Watson, M.B., S. Southall, J. H. Crane, M.D., J. S. Clarke, M.B., J. J. Porter, H. M. Soden, S. Scott, M.B., J. A. Stenhouse, M.B., J. A. J. Scott, M.B., J. A. Green, M.B., J. E. Carr, J. S. Hill, M.B., J. A. Aldin, H. Cunningham, M.B., J. Walker, M.B., A. E. Delgado, M.B., J. O. Marklove, D. A. R. Haddon, M.B., Lieutenant W. M. Cox, from South Midland Casualty Clearing Station, to be Lieutenant.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

In the ninety-six largest English towns 7,482 births and 4,700 deaths were registered during the week ended Saturday, September 25th. The annual rate of mortality in these towns, which had been 12.1, 14.0, and 13.8 per 1,000 in the three preceding weeks, fell to 13.5 per 1,000 in the week under notice. In London the death rate was equal to 14.0, while among the ninety-five other large towns it ranged from 5.2 in Lincoln, 5.8 in Ipswich, 5.9 in Swindon, 6.5 in Milton, 7.0 in Leyton, and 7.4 in Ilford, to 21.5 in Aberdeen, 21.8 in Gateshead, 23.5 in Sunderland, 24.7 in Rotherham, 25.7 in Carlisle, and 36.1 in Barrowley. Enteric fever caused a death-rate of 1.7 in Fyfe, 1.7 in Thornhill, scarlet fever of 1.1 in Darlington, 1.1 in West Hartlepool, and diphtheria of 1.5 in Southampton. The deaths of children (under 2 years) from diarrhoeal disease, which had been 293, 664, and 638 in the three preceding weeks, and included 183 in London, 58 in Liverpool, 47 in Birmingham, 35 in Sheffield, 29 in Manchester, and 20 in Leeds. The causes of 33, or 0.7 per cent, of the total deaths were not certified by a registered medical practitioner or by a coroner; of this number, 8 were recorded in Birmingham, 6 in South Shields, 4 in Liverpool, 3 in Gateshead, and 2 in Bole. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 2,365, 2,445, and 2,550 at the end of the three preceding weeks, further rose to 2,656 on Saturday, September 25th; 372 new cases were admitted during the week, against 365, 385, and 429 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In the sixteen largest Scottish towns 956 births and 615 deaths were registered during the week ended Saturday, September 18th. The annual rate of mortality in these towns, which had been 13.3, 12.2, and 14.0 per 1,000 in the three preceding weeks, fell to 13.7 in the week under notice, and was 0.1 per 1,000 below the rate in the ninety-six large English towns. Among the sixteen towns the death-rate ranged from 6.3 in Motherwell, 8.1 in Hamilton, and 8.2 in Clydebank, to 15.8 in Aberdeen, 17.1 in Ayr, and 17.7 in Greenock. The mortality from the principal infective diseases averaged 1.8 per 1,000, and was highest in Ayr and Paisley. The 229 deaths from all causes in Glasgow included 25 from infantile diarrhoea, 5 from scarlet fever, 4 from measles, 1 from whooping-cough, and 1 from diphtheria. Six deaths from measles were recorded in Edinburgh; 4 deaths from scarlet fever in Aberdeen and 2 in Paisley; from diphtheria, 4 deaths in Edinburgh and 2 in Paisley; from infantile diarrhoea, 6 deaths in Edinburgh and 3 in Aberdeen; and from typhus, 1 death in Paisley.

HEALTH OF IRISH TOWNS.

DURING the week ending Saturday, September 11th, 513 births and 389 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 586 births and 368 deaths in the preceding period. These deaths represent a mortality of 16.7 per 1,000 of the aggregate population in the districts in question, as against 15.8 per 1,000 in the previous period. The mortality in these Irish areas was therefore 2.7 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate in the other 15 towns was equal to 22.1 per 1,000 of population. As for mortality of individual localities, that in the Dublin registration area was 18.4 (as against an average of 16.0 for the previous four weeks); in Dublin City, 18.2 (as against 17.5); in Belfast, 16.5 (as against 15.9); in Cork, 22.4 (as against 15.8); in Londonderry, 15.2 (as against 22.4); in Limerick, 13.5 (as against 14.2); and in Waterford, 13.5 (as against 19.0). The zymotic death-rate was 1.8, as against 2.8 in the previous period.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notice re Appointments) appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

BETHNAL GREEN INFIRMARY.—Assistant Medical Officer. Salary, £280 per annum.
BIRMINGHAM GENERAL DISPENSARY.—Resident Medical Officer. Salary, £350 per annum.
BRIGHTON ROYAL INFIRMARY.—(1) House-Physicians. (2) House-Surgeons. (3) Dental House-Surgeon. Salary, £120 per annum in each case.
CANTERBURY MENTAL HOSPITAL.—Locumtenent Assistant Medical Officer. Salary, 277s. 6d. per week.
CARDIFF: KING EDWARD VII HOSPITAL.—House-Surgeon. Salary, £140 per annum.

DARLINGTON HOSPITAL AND DISPENSARY.—House-Surgeon. Salary, £120 per annum.
GREAT YARMOUTH HOSPITAL.—House-Surgeon. Salary, £200 per annum.
INVERNESS: NORTHERN INFIRMARY.—House-Surgeon. Salary, £150 per annum.
LABORATORIES OF PATHOLOGY AND PUBLIC HEALTH, 38 New-evesditch Street, W.—Bacteriologist.
LEEDS PUBLIC DISPENSARY.—Lady Resident Medical Officer. Salary, £130 per annum.
LIVERPOOL: DAVID LEWIS NORTHERN HOSPITAL.—Two Lady Resident Surgeons. Salary, £120 per annum.
LONDON TEMPERANCE HOSPITAL, Hampstead Road, N.W.—(1) Assistant Resident Medical Officer; salary, £120 per annum. (2) Medical Registrar; honorarium, 40 guineas per annum.
PORTSMOUTH: ROYAL PORTSMOUTH HOSPITAL.—House-Surgeon. Salary, £150 per annum.
PURVEY HOSPITAL, S.W.—Resident Medical Officer. Salary, £150 per annum.
QUEEN'S HOSPITAL FOR CHILDREN, Hackney Road, N.E.—House-Surgeon. Salary, £100 per annum.
ST. MARY, ISLINGTON, INFIRMARY.—Junior Assistant Medical Officer. Salary, £180 per annum.
SALFORD ROYAL HOSPITAL.—(1) Junior House-Surgeon. (2) Casualty House-Surgeon. Salary, £100 per annum each, and £5 per month *vis bonus*.
SHEFFIELD ROYAL INFIRMARY.—House-Surgeon. Salary, £100 per annum.
SOUTHAMPTON: FREE EYE HOSPITAL.—House-Surgeon. Salary, £100 per annum.
WEST BROMWICH AND DISTRICT HOSPITAL.—Assistant House-Surgeon. Salary, £120 per annum.
WEST HAM AND EASTERN GENERAL HOSPITAL, Stratford.—(1) Resident Medical Officer. (2) House-Physicians and House-Surgeons. Salary for (1) £160 per annum, and for (2) £120 and £100 per annum respectively.
WIGAN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Junior House-Surgeon. Salary, £150 per annum.
WORCESTER GENERAL INFIRMARY.—Resident Medical Officer (male or female). Salary, £150 per annum.
CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointments: Laurence Kirk, 6, Greenock.

To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

KERR, J. M.B., Ch.B., Glasg., Honorary Assistant Surgeon to the Ashton Infirmary.
KEESLAKE, Mrs. Maude, L.M.S.S.A., Tuberculosis Officer for the County Borough of Northampton.
OGILVIE, W. M., M.B., Ch.B., Glasg., Medical Superintendent of the Ipswich Mental Hospital.
RICHMOND, G. M.B., Ch.B., Glasg., Medical Officer of W-arkhouse and Medical Superintendent of Infirmary of Ashton-under-Lyne Union.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 8s., which sum should be forwarded in Post Office Orders or Stamps with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

DEATH.

STUMBLE.—On Saturday, September 25th, at a nursing home, Henry Marty Stumbles, M.D., of 5, Wilbury Gardens, Hove, aged 42. No flowers, by request.

DIARY FOR THE WEEK.

FRIDAY.

EXHIBITION OF APPARATUS FOR TREATMENT OF FRACTURES IN WAR. 1, Waterloo Street.—To be opened, at 3 p.m., by Sir Alfred Keogh, K.C.B., D.G. Demonstration by Sir Almoth Wright, F.R.S. The exhibition will remain open on the following day and Monday, October 11th, from 10 a.m. to 10 p.m.

WEST LONDON MEDICO-CHIRURGICAL SOCIETY, West London Hospital, Hammersmith, 8.30.—Opening meeting. Presidential address: Progress in Treatment.

ROYAL SOCIETY OF MEDICINE.—The Section of Obstetrics and Gynaecology will not meet until Thursday, December 9th.

DIARY OF THE ASSOCIATION.

Date. Meetings to be Held.

OCTOBER.

6 Wed. London: War Emergency Committee, 2 p.m.
7 Thur. London: Insurance Acts Committee.
8 Fri. London: Central Ethical Committee, 2 p.m.
12 Tues. London: Organization Committee, 2 p.m.
13 Wed. London: Medico-Political Committee.

INSURANCE.

OFFICIAL DOCUMENTS.

QUARTERLY LIST.*

THE JOURNAL publishes the documents issued by the Commissioners which are of general interest to insurance practitioners and available for the purpose, but there are some which are not placed on sale, and others which for various reasons cannot be published. The following is the Association's quarterly list of documents issued by the Commissioners concerning matters of interest to insurance practitioners. Information as to those documents mentioned which are neither on sale nor have been printed in the JOURNAL may be obtained on application to the Medical Secretary of the Association, 429, Strand. Those on sale may be purchased through any bookseller, where a number preceded by "Cd." is given. It is advisable to quote this when ordering.

JUNE, 1915.

Circular A.S. 639 (Scotland) states that, as difficulties had arisen in connexion with the use of the ordinary form (Form Med. 40) for the certification of inmates of institutions for the insane, a special form of certificate had been prepared for use in such cases, and encloses copy of new certificate. (829.)

Form Med. 406 (Scotland). Certificate above referred to. The nature of the incapacity does not need to be specified, the certificate evidently to be signed by the Superintendent or Medical Officer of the Asylum, and is to the effect that "So and so" is at present under care and treatment in that Asylum. (830.)

Circular 637 I.C. (Scotland) states that the Military Authorities, owing to the large number of soldiers on short terms of furlough who obtain extensions thereof on medical certificates given by insurance practitioners, desire that the necessity should be impressed upon practitioners for the closest scrutiny being exercised in cases of such soldiers coming before them, and of it being borne in mind that the Military Authorities are entitled to the benefit when the question of any soldier's fitness for duty is in doubt. (June 10th, 1915.) (817.)

JULY, 1915.

Memorandum No. 603 (Scotland). A circular on Model Scheme of Arrangements for Domiciliary Treatment. (July 31st, 1915.) (827.)

Form 603, a Model Scheme of Arrangements for Domiciliary Treatment of Tuberculosis accompanying foregoing. (July, 1915.) (828.)

Form 301 S.S./A.G.D. (England). To be filled up by all soldiers invalidated from the Army in order that the Commissioners may determine which of them are to

be treated for the purpose of Insurance Benefit as members of the Navy and Army Insurance Fund. (831.)

Form 146 I.C. (England), a leaflet issued by the English Commissioners in connexion with foregoing Form 301 S.S./A.G.D. as regards Medical Benefit of discharged soldiers who were insured during service. If members of an Approved Society they should, in addition to filling up above form, ask their society to arrange with the local Insurance Committee for their Medical Benefit without delay. If not members of an Approved Society and entitled to Medical Benefit, the Commissioners would arrange for the issue of a medical card, provided the above-mentioned Form 301 S.S./A.G.D. was filled up and sent them immediately. (832.)

Memo. No. 648 I.C. (Scotland), as to the necessity for practitioners exercising economy in use of drugs; (July 31st, 1915.) (835.)

AUGUST, 1915.

Circular 53 A.I.C. (Scotland), informing Insurance Committees that the arrangements for accelerating the provision of sanatorium treatment of disabled soldiers, as set forth in previous Circular 53 I.C., applied equally to seamen and marines. (August 25th, 1915.) (702.)

Reports of decisions on appeals and applications under Sections 67 of the 1911 Act and 27 of the 1913 Act issued by English Commissioners. [Cd. 8040.] Part II, price 3s. An instructive document containing much of interest to insurance practitioners and especially to members of Panel Committees.

SEPTEMBER, 1915.

Form Med. 33 (Scotland), approving certain rural areas in Scotland with a view to the application thereto of the provisions of Rule 8 of the Medical Certification Rules. Practitioners in the approved areas will now be permitted, in the case of patients residing more than 2 miles from their residence, instead of having to see the patient again, to give a Special Final Certificate in those cases where, although the insured patient is not fit to resume work immediately, he will be fit to resume not more than three days after the examination. (836.)

LOCAL MEDICAL AND PANEL COMMITTEES.

LIVERPOOL.

Proposed Commercial Drug Tariff.—A meeting of the Panel Committee was held at the Medical Institution on September 17th, when Mr. F. CHARLES LARKIN was in the chair. The memorandum from the British Medical Association (SUPPLEMENT, September 11th, p. 117) on possible changes of medical benefit regulations connected with the placing of the drug tariff on a commercial

* For previous lists see SUPPLEMENTS to JOURNAL of February 15th, 1915, and June 12th, 1915.

basis was considered, and the following resolution was unanimously adopted:

"That inasmuch as the practitioners' fund was guaranteed to be used solely as a remuneration for professional services, the Liverpool Panel Committee is of opinion that the profession should refuse to agree to any portion of it being diverted from this purpose and used as a fund for the purchase of materials.

The various items of the memorandum were considered in detail, and replies were given to the questions submitted.

NOTTINGHAM.

Proposed Commercial Drug Tariff.—A meeting of the Panel Committee was held at Nottingham on September 28th, when Dr. A. FULTON was in the chair. The memorandum issued by the British Medical Association (SUPPLEMENT, September 11th, p. 117) was considered, and it was agreed to accept a commercial tariff on the lines laid down in the memorandum, subject to the following reservations:

1. That the whole of the 1s. 6d. be pooled throughout the country.
2. That additional liabilities in the way of drugs and appliances be not imposed without the consent of the profession.
3. That the profession be not subjected to liability in respect of increase due to the war in prices of drugs and appliances.
4. That consideration by way of additional financial allowance be made in respect of the inclusion of soldiers and others who, as due to the war, are permanently disabled or are rendered chronic invalids, or are lowered in standard of health.
5. That a continuous analysis be made by the respective Insurance Committees, and that local reports be issued by them monthly, so that practitioners in each area may be made at all times aware of the average cost per person and per script of all persons on their respective panels.

WILTSHIRE.

A MEETING of the Panel Committee was held at Trowbridge on September 22nd, when Dr. J. T. GORDON was in the chair.

Proposed Commercial Drug Tariff.—The Memorandum issued by the British Medical Association (SUPPLEMENT, September 11th, p. 117) was considered, and replies agreed to.

Tracing Removals.—The CLERK made a statement with reference to the number of accepted persons whose addresses could not be traced, and asked the medical men to assist him in his work, as, until the names were placed upon the register, no payment was made to the medical fund for them. The Clerk was thanked, many members testifying to the cordial relations existing between the office and the medical profession.

MONMOUTHSHIRE.

A MEETING of the Local Medical and Panel Committees was held on September 14th, when Dr. J. D. O'SULLIVAN was in the chair.

Proposed Commercial Drug Tariff.—The Circular M.4 (1915-16) (SUPPLEMENT, September 11th, page 117), sent out by the British Medical Association, was considered; it was decided to answer the first and second questions in the negative, and with regard to the sixth to express a preference for an automatic surcharge of every practitioner the total cost of whose prescriptions exceeded the maximum of 2s. per insured person, with power to the Panel Committee on appeal to grant a certificate of indemnity entitling such practitioner to relief out of the Drug Fund of the area. A report was presented showing the expenditure of each panel doctor on prescribed drugs for the year 1914. From it it appeared that seven panel doctors, attending between 7,000 and 8,000 panel patients, had spent £1,143 in excess of the maximum 2s. per insured person. The matter was referred to the Drug Subcommittee for report with a view to those cases in which there had been such an undue expenditure being recommended for surcharge.

PERTH AND PERTHSHIRE.

At a meeting of the Local Medical and Panel Committees on September 17th, a letter was read from the Commissioners to the Clerks of Insurance Committees with regard to "persons who, in an emergency, outside of office hours or on Sundays, may find it necessary to apply direct to a practitioner," and suggesting that in such an event "it should be arranged that the practitioner will either agree to take the person on his list, or will give the treatment

immediately required until he has arranged with another practitioner to accept the person, or communicate with the Clerk, notice of any arrangement arrived at being made to the Clerk in due course." It was decided not to approve of any clause binding panel practitioners to the procedure above suggested, as it would be liable to serious abuse, and lead to the exploitation of the services of practitioners, owing to the carelessness of patients in not having already chosen a doctor.

KIRKCALDY.

At a meeting of the Local Medical Committee on August 31st, when Dr. CURROE was in the chair, the following list of medical comforts was drawn up: Milk and cream, eggs, butter, meat extract, whisky, brandy, or medicated wines.

CORRESPONDENCE.

THE PROPOSED COMMERCIAL TARIFF.

DR. JAMES HARRISON, M.D. (Chairman, Medical Benefit Subcommittee, Tynemouth Insurance Committee) writes: Naturally in face of the present national emergency the medical profession is somewhat apathetic regarding its own interests, but the question of the suggested introduction of the new commercial tariff into the regulations for 1916 is one of vital importance, and should, even at the present time, be thoroughly discussed in your columns. Dr. Taylor, of Salford, did right in drawing attention to this matter in the JOURNAL of September 25th.

The position is this: 2s. is the maximum amount allowed in the drug fund per assured person. In more than a quarter of the insurance areas in the country this amount is insufficient, and so far as these areas are concerned the drug fund is bankrupt, and cannot pay its way. Its deficiency amounts to over £50,000, and this amount has been discounted from the bills of the unfortunate chemists who work the Act in these districts. In the great majority of the 126 areas in England which have not exceeded the 2s. the amount has been perilously near that sum. Evidently, then, the maximum of 2s. is none too much for drug allowance.

With a view of arresting this annual deficiency of £50,000 it is coolly suggested that the medical profession should shoulder this colossal burden, and agree to pay the chemists any deficiencies which may occur in future. We are told that the 15 per cent. reduction to be made in chemists' tariffs will safeguard us from any deduction in the amounts paid to us for the treatment of the insured population. Those of us who have a knowledge of the administrative as well as the medical aspect of the case, are very sceptical upon this point. After the war, the balance of the Act will be radically changed. Many good sound lives, removed from our lists, will unfortunately never return. Others will return as broken men requiring the closest attention which will be ungrudgingly given them, but which will cause increased demands upon the drug fund. The period of trade depression which follows all great wars will, as it always does, cause an increased sick rate. Prices of drugs must keep high for a long time to come, and for us to assume such responsibility on the slender margin which the 2s. a head allows, would be absolute folly on our part, and should not be entertained for a moment. The multitudinous alterations in the Regulations of the Act are already beginning to make the 7s. a head per assured person on our lists shrink considerably before it reaches our pockets, and further attenuation is certain if we foolishly permit any of these suggested alterations of medical benefit to follow on the introduction of the proposed commercial tariff for 1916.

DR. FERDINAND REES (Wigan) writes: I should like to say a few things to our members.

1. We must not allow our 7s. minimum to be interfered with in any way.
2. We must not take away from the Government the responsibility for providing sufficient money to pay the chemists adequately.
3. The prescribing by doctors at the present time is rapidly sinking below the level of the old club practice.
4. There will soon be great dissatisfaction with the medical benefits.
5. Advanced reformers, especially among the Labour Party, will after the war be clamouring for increased medical benefits, and it would be suicidal for the profession to

saddle themselves with the liability to provide these out of the present 9s.

6. Do not let us interfere between the chemists and the Government. Let them fight it out between themselves.

7. We must strike before we allow any interference with our 7s.

8. The question of whether the Government will be compelled to find any more money than the 9s, must lie between them and the public putting pressure on their Parliamentary representatives to alter the present state of things. Why should we go out of our way to relieve them of the disagreeableness of being liable to this outside pressure?

9. Let us stick to our 7s, and let the Government make amends for their bad actuarial miscalculations in the best way they can. We must not allow them to shift any public dissatisfaction on to us.

Dr. D. ROBERTS (Swadlincote, Burton-on-Trent) writes: I beg to enter a protest against the general practice of giving away the "floating sixpence" by assumption (vide Insurance Acts Committee, the Drug Tariff, SUPPLEMENT, September 11th, 1915). In today's JOURNAL again the same thing obtains (vide Synopsis of London Panel Committee, Birmingham and Wigan Committees). This assumption of two shillings will tend to establish the cost of drugs at that figure, and thus nullify the "floating sixpence" for all time and locality.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Fleet Surgeon R. S. Bennett to the *Fox*; Staff Surgeons F. E. Bolton and A. Schofield, M.B., to the *Verid*, additional, for disposal; G. D. Welch to the *Empire*, additional; J. H. E. Page to the *Victory*; Surgeon J. S. Wael to the *Victory*, additional, for Royal Naval Division; Temporary Surgeons J. F. Ouligley and H. M. Scott to the *Victory*, additional; A. W. Gunn, M.B., to the *Juno*; W. H. S. Hodges to the *For*; D. H. Finch to the *For*, additional, for disposal; D. A. P. Larkie, M.B., to the *St. Vincent*; D. W. K. Moody to the *Naird*; R. G. Moran to the *Colossus*; P. P. Peacock, C. H. Gov. F. L. Cunningham to the *Victory*, additional, for Royal Naval Division; M. B. A. Roy, M.B., to the *Teretian*, M.D. F. C. Newman and H. F. Percival to the *Victory*, additional, for Hospital; R. E. Hallwood to the *Empire*, additional, for Clatham Hospital; To be temporary Surgeons: C. G. Ainsworth, T. J. Hartigan, M.B., G. M. Johnson, M.B.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon Probationers B. A. Meswiny to the *Starach*, vice Piddock; J. M. Matheson to the *Lurcher*, vice Cobb; J. Davidson to the *Unity*, vice McKee. To be Surgeon Probationers: R. H. Rose-Jones, G. N. Wardle, W. E. Heats, R. P. Smith, J. Leonard, T. S. Stirling.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

To be temporary Majors: H. M. Chassaud, M.D., temporary Captain A. T. Duke, D.S.O.

To be temporary Captains: G. A. Finlayson, M.B., late Captain Singapore Volunteer Corps; E. P. N. Curry. The names of temporary Captain Henry G. Peake, M.B., and temporary Lieutenant Robert John Kee, M.B., are as now described, and not as stated in the *London Gazette* of September 6th and August 17th respectively.

Temporary Lieutenants to be temporary Captains: T. H. Pettit, M.B., L. C. E. Murphy, P. E. Adams, M.D., W. B. G. Angus, M.B., J. P. Charles, M.B., J. Higgins, W. V. Ingram, M.B., E. B. Jardine, P. J. Marshall, M.B., A. B. Roy, M.B., G. G. Fendley, M.B., A. Venables, G. Whittington, M.B., G. T. Whyte, F.R.C.S.I., J. G. Brown, M.B., E. C. Cooke, P. Northcote, M.B., S. G. Luker, M.D., J. H. Fether, J. C. Dyer, B. A. Manol, M.B., E. H. Jones, M.B., C. D. Faulkner, C. E. Herkells, G. Harding, G. D. M. Hunter, M.B., J. M. Mitchell, M.B., J. Mowat, M.B., J. M. Moyes, M.B., A. E. Roberts, M.B., E. C. Hobbs, T. H. Ravenhill, M.B., J. A. Andrews, M.D., J. B. Hain, M.B., R. G. Smith, M.B., J. S. Arkle, M.B., H. J. Condamine, M.B., E. Gordon, M.B., J. G. Gustardize, F. W. Harlow, M.B., G. B. Holroyde, B. S. A. Heathcote, M.B., G. D. McLean, M.D., D. MacIntyre, M.B., L. A. Mornin, M.D., M. C. McClatchie, M.B., W. E. Oliver, M.B., F.R.C.S., H. W. Paris, M.D., G. Stiel, H. H. Stevens, E. Sealy, M.B., F. E. Thillyard, M.B., H. W. White, M.B., G. D. H. Wallace, R. E. Cree, M.D., R. G. Alphonsus, M.B., R. M. Allan, M.B., J. H. Barry, A. E. Chisholm, M.B., F. C. G. Coed, M.B., G. D. Eccles, G. J. H. Fox, M.B., J. B. A. W. Hendry, M.D., R. A. Jones, J. R. Marrack, M.B., B. B. Noble, J. B. T. Burns-Price, R. E. Roberts, M.B., R. C. Robertson, M.B., P. Smith, J. A. Smith, M.B., F.R.C.S., W. B. Hagenman, A. Abraham, M.D., O. Paton, A. G. Welsford, M.D., F.R.C.S. (late Captain the Bedfordshire Regiment).

Lieutenants of the Canadian A.M.C. to be temporary Lieutenants: V. G. Williams, M.D., F. Keiller, M.B. To be temporary Lieutenants: D. Whyte, M.B., J. R. Lee, M.D., F.R.C.S.E., W. H. E. Beard, M.B., M. T. Cassidy, M.B., C. M. Stubbs, M.B., J. H. J. L. Dalby, G. F. Fawc, R. Park, M.D., W. N. Gilmore, M.D., J. Rosenthal, M.B., temporary Lieutenants: G. Ramsay, M.D., from I.M.S., W. A. Costain, J. D. Graham-Jones, M.B., G. Marshall, M.B., N. Bradley, M.D., W. H. Harris, M.B., R. L. Norman, F. L. Pelly, M.B., H. J. Bell, F. F. Shackleton, C. J. N. A. Christie, M.B., G. E. Oldershaw, M. D., W. Shanks, M.B., G. Macdonald, G. O. Cooney, M.B., P. J. Kirkness, M.B., A. G. Mowat, M.B., A. A. Miller, M.D., H. P. Crampton, M.D., R. W. Shegog, M.B., J. F. Hoare, A. C. T. Woodward, M.B., F.R.C.S., J. L. Hendry, G. W. Charsley, M.B., W. Fairclough

M.B., W. B. Thompson, M.R., R. E. B. Yelf, M.B., T. B. Riddall, M.D., F. Simpson, W. E. Huff Hewitt, M.B., J. R. Dobbins, M.B., A. Gardner, M.B., J. MacKinnon, M.B., C. C. Irvine, L. M. Rowledge, S. A. Van R. Harwood, M.B., C. R. E. Eyre, J. D. O'Connor, M.B., J. Donohue, M.B., A. W. H. C. B. E. E. F. Footen, F.R.C.S.I., A. C. G. Dickson, R. L. Eay, M.B., O. A. J. J. Marriot, M.B., H. H. Marshall, M.D., T. Kelly, S. Henson, M.B., H. J. Flanagan, F.R.C.S.I., W. W. Usher, M.B., G. H. Towell, C. A. Everett, F. MacKee, M.B., H. M. Harty, M. Davidson, M.B., N. Leonard, M.D., H. G. M. Grant, M.B., J. F. Bullar, M.B., F.R.C.S., R. O. Wilson, M.B., G. M. Grant, M.B., H. I. G. Rutherford, M.B., E. Doherty, M.B., C. S. Pantin, M.D., F.R.C.S., W. H. Peet, G. E. Lloyd, M.D., J. M. Anderson, M.B., W. Warburton, M.B., W. H. Wale, G. W. Walker, M.D., G. Langford-Kelch, A. Stoddard-Walker, M.B., Lieutenant C. McKerron, M.D., from Reserve of Officers (substituted for notice published in the *London Gazette* of July 15th), R. Maclean. Temporary Lieutenants receive their commissions: R. R. Kerr, M.B., C. H. Brookes, M.D., R. Bright, W. T. Milton, M.D., H. McLean, H. M. Harrison, and J. M. Glasse, M.B. To be temporary Honorary Lieutenants: G. C. Lindor, D. H. Derry.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

London (City of London) General Hospital.—A. J. Walton to be Captain, whose services will be available on mobilization. F. D. S. Jackson to be Lieutenant. *London General Ambulance*.—Lieutenant F. L. Golla, M.B., to be Captain. *London Mounted Brigade Field Ambulance*.—Captain J. P. MacLulich, M.D., resigns his commission on account of ill health. *London Sanitary Company*.—To be Lieutenants: P. E. Lender, A. M. Brown, M.B., J. Chalmers, M.B. *London Sanitary Field Ambulance*.—Lieutenant W. Cummings, M.B., to be Captain. *Welsh Casualty Clearing Station*.—Major R. T. Turner, M.D., from Attached to Units other than Medical Units, to be Major; Lieutenant J. H. Robinson, from Attached to Units other than Medical Units, to be Lieutenant. *Wessex Field Ambulance*.—To be Captains: Captain J. G. Macindoe, M.B., from the Devonshire Regiment, Lieutenant H. W. Spaight, H. J. Bechell, M.B., late Captain T.R.B. *Southern General Hospital*.—R. Hitchings to be Lieutenant. *East Anglian Field Ambulance*.—Lieutenants to be Captains: T. A. Flynn, B. B. Hinde, M.B., F.R.C.S., E. A. Goulden, M.B., B. F. Morrison, M.B., N. Johns, Cadet, F. D. Langford-Kelch (from University of London Contingent, Senior Division O.T.C.), to be Lieutenant. *Eastern General Hospital*.—Lieutenant C. C. Messiter to be Captain. *Eastern Mounted Brigade Field Ambulance*.—Lieutenant J. M. O'Neira, M.B., to be Captain. *South Midland Field Ambulance*.—Lieutenants to be Captains: H. E. McCready, M.D., W. Howarth, M. Wilks, M.B., H. P. Thomson, M.B., A. A. Broderick, M.B., W. C. B. Pitt, R. G. M. G. Murray, A. E. P. McConnell, M.B., J. P. L. Harty, M.B., H. J. D. Snythe, R. I. Dacre, W. J. Hirst, M.B., Staff Sergeant J. Bannerman from the Edinburgh University Contingent, Senior Division O.T.C.), to be Lieutenant. *South Midland Casualty Clearing Station*.—Lieutenant to be Captains: L. Bell, M.B., R. G. Langdale-Smith, M.B., L. J. Meir, M.B., South Midland Mounted Brigade Field Ambulance. To be Lieutenants: S. P. Johnson, M.B., (late Surgeon-Lieutenant, 1st Warwickshire R.G.A. Coy.), W. C. Rutherford. *North Midland Mounted Brigade Field Ambulance*.—Lieutenant E. H. Davies, M.B., to be Captain. *Western General Hospital*.—Lieutenant Colonel J. W. Smith, M.D., from the permanent personnel, to be Lieutenant Colonel whose services will be available on mobilization. Lieutenant M. Morris, M.B., to be Captain. *East Lancashire Field Ambulance*.—Lieutenants to be Captains: R. S. Young, M.B., F. G. Prestwich, A. M. Mackay, M.B., J. Morley, M.B., F.R.C.S., S. S. Evans, G. Bailey, C. A. Webster, G. B. Jameson, F. C. Bantz, M.B., J. Turner, M.B., G. Gibson, M.B., J. J. Cowan, J. J. Hummel, M.B., A. M. Johnson, M.D., N. N. H. Haskins, M.B., O. H. Blackley, M.D., J. A. Tomb, M.B., F. B. Smith, H. Wilson, M.B. *West Lancashire Field Ambulance*.—Lieutenant J. Walker, M.B., to be Captain. *Northern General Hospital*.—Major W. A. Carlisle, M.B., to be Lieutenant Colonel whose services will be available on mobilization. H. W. Shadwell to be Lieutenant Colonel. *West Riding Field Ambulance*.—Captain H. W. Shadwell, from Attached to Units other than Medical Units, to be Captain (substituted for notice published in the *London Gazette* of August 5th). *Scottish General Hospital*.—Lieutenant I. G. Bisset, M.B., to be Captain. *Lowland Field Ambulance*.—Lieutenants to be Captains: A. H. Downes, M.B., W. C. Gunn, M.B., R. S. Taylor, M.B., A. W. Sutherland, M.B., F. R. C. S. G. M. D. E. J. Blair, M.B., H. G. Marston, M.D., J. W. Burton, M.B., A. J. Brown, W. Greer, M.D., F.R.C.S.E., R. G. Walker, M.B., A. J. G. Hunter, M.D., F.R.C.S.E., A. M. Stewart, M.B., C. H. K. Smith, M.B. To be Lieutenants: W. Goube, M.B. *Highland Field Ambulance*.—Lieutenants to be Captains: J. Strathburn, M.D., F.R.C.S.E., G. B. Kilob, M.B., D. M. Grant, M.B., J. S. McConnachie, M.B., R. G. Beveridge, M.B., A. C. Mallice, M.B., G. Henderson, H. E. Brown, M.B., G. S. Melvin, M.B., R. T. Bruce, M.D., M. C. Collie, M.B., P. C. W. M. M. M. M. B. *Highland Mounted Brigade Field Ambulance*.—Major J. W. MacKenzie to be temporary Lieutenant Colonel; Captain L. M. V. Mitchell, M.B., to be temporary Captain. *Units other than Medical Units*.—Lieutenants to be Captains: A. S. M. Macgregor, M.D., W. T. Garrioch, M.B., F.R.C.S.E., E. F. Rose, J. A. Parsons, M.D., G. M. Mitchell, H. V. Farnon, G. L. Pundling, M.D., D. P. Monroe, M.B., T. G. Campbell, M.B., C. W. Whitman, M.D., F.R.C.S., G. Whitehead, M.B., C. G. Fenech, M.B., T. J. Thompson, M.D., P. S. H. Burton, G. A. Child, W. A. Phillips, M.D., E. Osborne, W. S. McCune, M.B., A. S. Hopner, M.B., A. N. Crawford, F. E. Bell, M.B., E. R. Bell, M.B., J. H. Davidson, M.D., W. M. Walker, M.D., P. F. Fitz rald, M.B., P. N. Creagh, R. D. Cran, G. Crawshaw, M.D., R. L. Thomas, L. W. Sparrow, M.B., R. A. Kerr, M.D., R. D. Wilkinson, M.B., M. A. Morris, P. H. Sprague, E. P. Finlay, M.B., D. M. B. B. Smith, M.B., J. R. G. Mackay, M.B., M. G. H. H. H. H. H. H. H. H. H. G. R. E. G. Mackay, M.B., To be Lieutenants: H. Smith, Major J. S. Swain, officially attached to Depot or Administrative Centre at St. John's Hill, London, S.W.

TERRITORIAL FORCE RESERVE.

Lieutenant J. C. Jefferson, M.B., F.R.C.S., from 1st Lancashire Field Ambulance, to be Lieutenant.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

In the ninety-six largest English towns 7,209 births and 4,872 deaths were registered during the week ending Saturday, October 2nd. The annual rate of mortality in these towns, which had been 14.0, 13.8, and 13.5 per 1,000 in the three preceding weeks, rose to 14.0 per 1,000 in the week under notice. In London the death-rate was 14.6, while among the ninety-five other large towns it ranged from 5.2 in Hford and 5.4 in Bath, 6.6 in Leyton, 7.2 in Wallasey, 7.5 in Ipswich, and 7.9 in Bournemouth, to 18.2 in Birkenhead, 18.8 in Sunderland, 19.2 in Gateshead, 20.8 in Rotherham, and 21.3 in Bristol. Males died at the rate of 1.2 in Stockport, 1.7 in Hastings, 1.9 in Barnsley, and 2.6 in Bury; scarlet fever 1.2 in Derby and 1.4 in Warrington; and whooping-cough 1.2 in Leyton. The deaths of children (under 2 years) from diarrhoea and enteritis, which had been 64, 63, and 76 in the three preceding weeks, rose to 808, and included 209 in London, 45 in Liverpool, 43 in Manchester and in Sheffield, 39 in Birmingham, and 30 in West Ham. The mortality from enteric fever and diphtheria showed no marked excess in any of the large towns, and no fatal case of small-pox was registered during the week. The causes of 27 or more deaths were ascertained, and of this number, 7 were recorded in Liverpool, 3 in Birmingham, and 2 each in Blackpool, Sunderland, South Shields, and Gateshead. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 2,443, 2,590, and 2,656 at the end of the three preceding weeks, further rose to 2,78 on Saturday, October 2nd; 382 new cases were admitted during the week, against 385, 429, and 372 in the three preceding weeks.

HEALTH OF IRISH TOWNS.

During the week ending Saturday, September 18th, 538 births and 330 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 512 births and 389 deaths in the preceding period. These deaths represent a mortality of 16.8 per 1,000 of the aggregate population in the districts in question, as against 16.7 per 1,000 in the previous period. The mortality in these Irish areas was 1.2 to 1.000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate, on the other hand, was equal to 23.1 per 1,000 of population. As for mortality of individual localities, that in the Dublin registration area was 20.1 (as against an average of 16.5 for the previous four weeks), in Dublin city 20.8 (as against 18.2), in Belfast 14.6 (as against 14.8), in Cork 22.4 (as against 17.1), in Londonderry 13.9 (as against 12.9), in Limerick 10.8 (as against 13.9), and in Waterford 9.5 (as against 13.3). The zymotic death-rate was 2.6, as against 1.8 in the previous period.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notice re Appointments) appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

BETHNAL GREEN INFIRMARY.—Assistant Medical Officer. Salary, £280 per annum.

BIRMINGHAM FIRST SOUTHERN GENERAL HOSPITAL.—Resident Medical Officers.

BRISTOL ROYAL INFIRMARY.—(1) House-Physicians. (2) House-Surgeons. (3) Dental House-Surgeon. Salary, £120 per annum in each case.

CAMBRIDGESHIRE ASYLUM, Fulbourn.—Junior Assistant Medical Officer. Salary, £200 per annum, rising to £250.

DORCHESTER COUNTY ASYLUM.—Second Assistant Medical Officer. Salary, £500, rising to £560.

EXETER: ROYAL DEVON AND EXETER HOSPITAL.—Assistant House-Surgeon. Salary, £150 per annum.

GREAT YARMOUTH HOSPITAL.—House-Surgeon (male). Salary, £200 per annum.

HAMMERSMITH PARISH.—Second Assistant Medical Officer for the Infirmary and Workhouse. Salary, £170 per annum, rising to £192.

IPSWICH MENTAL HOSPITAL.—Locum-tenent. Salary, 65 6s. a week.

LABORATORIES OF PATHOLOGY AND PUBLIC HEALTH, 38, New Cavendish Street, W.—Bacteriologist.

LEIDS PUBLIC DISPENSARY.—Lady Resident Medical Officer. Salary, £150 per annum.

LONDON HOMOEOPATHIC HOSPITAL, Great Ormond Street, W.C.—Resident Medical and Surgical Officer. Salary at the rate of £80 per annum.

LONDON TEMPERANCE HOSPITAL, Hampstead Road, N.W.—Medical Registrar. Honorarium, 40 guineas per annum.

MANCHESTER CORPORATION.—Medical Officer to hold Consultations and Infant Clinics at the Maternity and Child Welfare Centres. Salary, £350 per annum.

PORTSMOUTH: ROYAL PORTSMOUTH HOSPITAL.—House-Surgeon. Salary, £150 per annum.

PUNNEY HOSPITAL, S.W.—Resident Medical Officer. Salary, £150 per annum.

QUEEN'S HOSPITAL FOR CHILDREN, Hackney Road, N.E.—House-Surgeon. Salary, £100 per annum.

ROYAL FREE HOSPITAL, Gray's Inn Road, W.C.—Male and Female House-Physician and House-Surgeon.

ROYAL HOSPITAL FOR DISINFECTS OF THE CHEST, City Road, W.C.—Resident Medical Officer.

SHEFFIELD ROYAL INFIRMARY.—House-Surgeon. Salary, £100 per annum.

SHETLAND: WHALSAY PARISH.—Medical Practitioner. Guaranteed Income £50 by the Highlands and Islands (Medical Service) Board.

SOUTHAMPTON: FREE EXE HOSPITAL.—House-Surgeon. Salary, £100 per annum.

SOUTHAMPTON: ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL.—Junior House-Surgeon. Salary, £120 per annum.

STAFFORDSHIRE, WOLVERHAMPTON, AND DUDLEY JOINT COMMITTEE FOR TUBERCULOSIS.—Resident Medical Officer (male) for Moxley Sanatorium. Salary, £350 per annum.

TRURO AUXILIARY NAVAL HOSPITAL.—Resident Assistant Medical Officer. Salary, £150 per annum.

WARWICKSHIRE AND COVENTRY JOINT COMMITTEE FOR TUBERCULOSIS.—Tuberculosis Medical Officer. Salary, £500 per annum.

WELSH METROPOLITAN WAR HOSPITAL, Whitechurch.—Resident Physician.

WEST BROMWICH AND DISTRICT HOSPITAL.—Assistant House-Surgeon. Salary, £120 per annum.

WEST HAM AND EASTERN GENERAL HOSPITAL, Stratford.—(1) Resident Medical Officer. (2) House-Physicians and House-Surgeons. Salary for (1) £160 per annum, and for (2) £120 and £100 per annum respectively.

WEST MIDLAND ASYLUM, Monston.—Temporary Assistant Medical Officer.

WIGAN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Junior House-Surgeon. Salary, £150 per annum.

WOLVERHAMPTON AND STAFFORDSHIRE GENERAL HOSPITAL.—House-Surgeon. Salary, £150 per annum.

WORCESTER COUNTY AND CITY ASYLUM.—Second Assistant Medical Officer. Salary, £275 per annum.

WORCESTER GENERAL INFIRMARY.—Resident Medical Officer (male or female). Salary, £150 per annum.

WREKHAM INFIRMARY.—Resident House-Surgeon. Salary, £120 per annum.

CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointment: **Stansley (Queen's County).**

To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

CODD, H. R., M.R.C.S.Eng.—District Medical Officer of the Promo Union.

FENTON, James, M.D., Birmingham.—Medical Officer and School Medical Officer for the Borough of Shrewsbury.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s., which sum should be forwarded in Post Office Orders or Stamps with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

BIRTH.

PARKER-HARRISON.—On September 26th at Shawmut, Windlesham Road, Brighton, the wife of Walter Parker-Harrison, Surgeon, R.N.V.R., of a daughter.

DEATHS.

BAILEY.—On Monday, October 4th, at Oakleigh, Skipton, Fred Bailey, M.R.C.S., Ch.B., Assistant Medical Officer, Askeaton Asylum, Bridgend, South Wales, aged 51.

COFFE.—On the 4th inst., suddenly, after a short illness, at 2, Calogon Court Gardens, Cadogan Place, S.W., Surgeon-General Sir Charles MacDonagh Coffe, K.C.B., J.P., F.R.C.S., L.R.C.P., F.I.D., late Army Medical Staff, and 11th P.A.O. Hussars. Aged 73. R.I.P. No flowers by request.

DIARY FOR THE WEEK.

MONDAY.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W., 8 p.m.—Annual Meeting, 8.30 p.m., Presidential Address by Dr. William Fester. Mr. J. T. J. Morrison (Birmingham) will relate his experiences in Serbia in 1914-15.

WEDNESDAY.

HUNTERIAN SOCIETY, at Royal Society of Medicine, 1, Wimpole Street, W.—First Hunterian Society Lecture: Bright's Disease in some of its Clinical Aspects, by Dr. S. A. J. West.

FRIDAY.

SOCIETY OF TROPICAL MEDICINE AND HYGIENE, 11, Chandos Street, W., 8.30 p.m.—Presidential Address by Dr. F. M. Sandwith: Pellagra considered from the point of view of a Disease of Insufficient Nutrition.

THE WAR EMERGENCY.

MEETING OF THE COMMITTEE FOR ENGLAND AND WALES.

THE memorandum published in the BRITISH MEDICAL JOURNAL of October 9th, p. 539, was received by the Committee. The memorandum, it will be remembered, was forwarded by the Directors-General Army Medical Service, and expressed the regret of Surgeon-Generals Sir G. H. Makins, and Sir Anthony A. Bowly, and Colonels Sir J. Rose Bradford, F. F. Burghard, Sir W. P. Herringham, and Cathbert Wallace that recent *Gazettes* contained the names of many medical men who had resigned their temporary commissions in the Royal Army Medical Corps, and pointed out the necessity for maintaining the staff of medical officers at full strength. It was reported that, of 172 Divisions in England and Wales, 137 had appointed local committees; as in two instances the area had been subdivided and two committees appointed, the number of local committees was 139. A report also made on the result of the appeal made to medical men of military age and capacity showed that much remained to be done before the demands of the War Office were met.

A deputation from the Insurance Commission attended to express its view with regard to the steps that had been or should be taken to protect the interests of the civil population in respect to medical attendance. The deputation consisted of Mr. C. H. Roberts, M.P. (chairman), Sir Robert Morant (vice-chairman), and Dr. J. Smith Whitaker (member of the Joint Committee of Insurance Commissioners), and Mr. J. Anderson (secretary of the English Commission). The members of the deputation laid their views before the Committee, which promised to give careful consideration to them. The reference to the Committee is to organize the profession in such a way as to enable the Government to use every medical practitioner fit to serve the country in such a manner as to turn his qualifications to the best possible use. This, it was pointed out to the deputation, included the safeguarding of the interests of the civil population.

The Executive Subcommittee reported that it had considered the third report of the Select Committee on Naval and Military Services (Pensions and Grants) (JOURNAL, September 18th, p. 437), and that the special attention of the Director-General had been drawn to paragraph 10 of that report, stating that the "proposals relate primarily to officers holding combatant commissions in the navy and army." It was understood that the matter would engage his personal attention.

The Committee also recommended that representations should be made to the Army Medical Department as to the urgent necessity of investigating every case in which a medical officer was unwilling, or unable, to renew his services at the expiration of his year's engagement, with the purpose of retaining all efficient officers in military

medical service. Major Galloway reported that he had been informed by the War Office that officers re-engaging for a second term of service were entitled to a gratuity in respect of such second term, but not to any further allowance for kit.

IRELAND.

Dispensary Medical Officers.

A good example has been set in the case of Dr. H. R. Irvine, dispensary medical officer for districts in Belfast and Castlereagh, who has obtained leave from the guardians, and offered his services to the military authorities.

On the other hand, the Clones Board of Guardians has refused the application of Dr. S. A. D'Arcy, medical officer of Rosslea dispensary district, for one year's leave of absence in order to place his services at the disposal of the War Office. He had made arrangements with a substitute, which would have involved no cost to the guardians. Although the clerk pointed out that the average number of red ticket cases attended by Dr. D'Arcy was only two a month, the guardians considered that the substitute should reside in the district, and for this reason refused the application.

* Various letters on the subject of the War Emergency will be found in the correspondence column of the JOURNAL, p. 587.

INSURANCE.

INSURANCE ACTS COMMITTEE.

A MEETING of the Insurance Acts Committee was held at the office of the British Medical Association on Thursday, October 7th, when Dr. J. A. MACDONALD, LL.D., was in the chair. The other members present were:—*England and Wales*: Dr. T. Ridley Bailey (Bilston), Mr. H. B. Brackenbury (London), Dr. T. Campbell (Wigan), Dr. Olive Claydon (Oldham), Dr. J. Divine (Hull), Lieutenant E. R. Fothergill (Hove), Dr. Major Greenwood (London), Dr. P. V. Fry (Sowerby Bridge), Professor A. Bostock Hill (Birmingham), Dr. W. A. Hollis (Brighton), Dr. I. W. Johnson (Bury), Mr. P. Napier Jones (Crowthorn), Dr. B. A. Richmond (London), Mr. Harding H. Tomkins (Leyton), Dr. W. E. Crawford Treasure (Cardiff), Dr. T. Jenner Verrall (Bath), *Scotland*: Dr. John Adams (Glasgow), Dr. J. R. Drever (Glasgow), *Ireland*: Dr. J. S. Darling (Lurgan). *Ex officio*: Mr. E. B. Turner (Chairman of Representative Meetings), Dr. Edwin Rayner (Stockport), Treasurer. On the nomination of the Society of Medical Officers of Health, the Committee appointed Professor A. Bostock Hill (Birmingham) to be a member of the Committee for the ensuing session.

Suspension from Medical Benefit.

It was decided to suggest to Panel Committees that the medical representatives on the Local Insurance Committees should bring to the notice of such Committees the desirability of pressure being brought to bear upon approved societies to notify as early as possible all cases of insured persons who become ineligible for medical benefit.

Munition Workers.

The Committee agreed to make representations to the Insurance Commissioners suggesting that they should advise Insurance Committees that in those areas in which large bodies of the insured population were moved in connexion with the working of the Munitions Act, they should be treated as temporary residents until they had spent three months in the new area.

Drug Tariff.

It was decided to send a communication to the Insurance Commissioners stating that "the British Medical Association welcomed the report of the Departmental Committee on the drug tariff in so far as it (a) justifies the contention of the Association that the present drug tariff was full of the most extraordinary anomalies, and resulted in great injustice; (b) it recommended the adoption of the main principles for which the Association contended; and (c) it suggested that these principles should be carried out, in the main, by methods which were identical with, or consistent with, those put forward by the Association." The Association was willing, under proper conditions, to accept a commercial tariff on the lines laid down in the Departmental Committee's report, provided such arrangements were made by regulation or otherwise as should ensure that there should be no reduction below the minimum which was promised by the Chancellor of the Exchequer in 1912, as the assured basis of payment for doctors' services—namely, 7s. per insured person per annum. With regard to matters of detail, the replies the Committee had obtained from Local Medical and Panel Committees provided abundant opportunities for discussion if and when the Committee was assured that the one outstanding principle emphasized in all the answers would be conceded—namely, that the profession should be guaranteed that the 7s. would not be encroached upon.

The Executive Subcommittee was authorized to hold a conference with the Commissioners should they so request, and as the result of subsequent correspondence it was arranged that the conference should take place on October 14th.

It was resolved to continue the arrangement for the monthly pricing of the drugs in the supplementary drug tariff at present carried out by Dr. Richmond and Captain Lilley in conjunction with the Medical Secretary and the technical adviser of the Committee.

Signing of Medical Certificates.

With reference to a resolution passed by a local insurance committee requiring all medical certificates to be signed in the presence of the insured person, the Committee expressed the opinion that such a resolution would be *ultra vires*, and should be ignored by the local profession. The Committee decided to communicate this opinion to the Insurance Commissioners.

Payments to Medical Practitioners.

The Committee decided to make renewed representations to the Insurance Commissioners with regard to the excessive deductions from the quarterly cheques of medical practitioners, and to the present unsatisfactory position with regard to payments made to insurance practitioners.

Scottish Central Bureau for Checking Prescriptions.

In reply to a communication from the Scottish Committee, it was decided to advise Scottish Panel Committees to hold their hands for a while as regards contributing towards the cost of the Scottish central bureau until it was able to furnish results showing that its work would be of considerable advantage to the drug fund, and that if any Scottish panel committee contributed to the expense of the bureau the contribution should be one quarter of the total, one quarter being found by the Pharmaceutical Committee and the remainder by the Insurance Committee.

PROPOSED AMALGAMATION OF INSURANCE
COMMISSIONERS.

The *Scotsman* states that it is generally understood that one of the recommendations of the Retrenchment Committee in regard to the National Insurance Act is the amalgamation of the Scottish and Welsh Insurance Commissioners with the English Insurance Commission. The grounds for the proposal are that the change would contribute to efficiency and economy. According to the *Scotsman*, it has been generally conceded that the administration of the Act in Scotland has been more efficient than in any other part of the United Kingdom. The approved societies are mainly interested in the proposal from the point of view of the accessibility of the controlling authority. The Scottish Commission has readily given assistance in matters of difficulty, and has discussed in a friendly and helpful way questions of administration which have arisen from time to time. Edinburgh is very convenient of access, and it is objected that the removal of Scottish business to London would not only be inconvenient, but would entail much expense in journeys to and fro. For the decision of many questions a knowledge of local conditions and Scottish difficulties is essential. It is pointed out also that the abolition of the Scottish Commission would not imply any appreciable diminution of the present staff. Societies have a right to a separate Scottish triennial valuation, which might be taken away if the Scottish fund were amalgamated with that of England and Wales. A number of provisions in the original Act were introduced with a view to meeting special circumstances and special cases, but in many instances experience has shown that the complexity thereby set up has been out of all proportion to any convenience or benefit secured by these provisions. It was recently announced that there was a probability of the appointment of a committee of inquiry, which would consider the elimination of such provisions. It is understood that definite proposals in this direction will be submitted to an early meeting of the Edinburgh, Leith, and District Friendly Societies' Council. They include the suggestions that there should be two classes only of contributors, namely, men and women, with one right of benefit for all male and one for all female contributors, and the abolition of varying rights of contributors such as those relating to low wages, that (a) the sickness benefit of members without dependants, in sanatoriums, should be placed on the same footing as that of similar members in hospitals; (b) that benefits of members who die in hospitals should be paid to their relatives; and (c) that the question of payments to dependants should be placed on a more definite basis, and that a more exact method of dealing between societies and Insurance Committees should be adopted.

At a meeting of the Edinburgh Insurance Committee on October 7th a resolution protesting against the abolition of the Scottish Insurance Commission was adopted unanimously, and the Administrative Subcommittee was given power to bring before the Prime Minister, the Chancellor of the Exchequer, the "Minister for Insurance," members of Parliament, and others, the paramount necessity for retaining in Scotland the special administration of National Insurance.

THE FUTURE OF THE INSURANCE SYSTEM.

Mr. Charles Roberts on the Need for Economy.

At a recent meeting of the North Riding Insurance Committee, Mr. Charles Roberts, M.P., Chairman of the Joint Committee of Insurance Commissioners, was present by invitation of one of the members, and delivered a short address. He said that had the times been ordinary two subjects might have been engaging the attention of Insurance Committees: the one was the possibility of extending the Act, especially in reference to medical and sanatorium benefit, and the other had regard to problems met with in the ordinary course of administration. Those engaged in special work, such as the treatment of tuberculosis, had, a year or two ago, hoped for further opportunities, but a great change had come. Any extension of work under the Act must entail increased financial grants, and with a war expenditure of three and a half millions a day it was idle to think of any possibility of extension which involved additional expense; it would be as futile as unpatriotic

to ask the Treasury for any extra grant at the present time. Still considerable revenues were at disposal, and the best use must be made of them by the practice of the strictest economy. He appealed to all Insurance Committees to practise economy with goodwill, for if they did not he felt sure that the Retrenchment Committee would impose that unpleasant duty upon them. In the first place, he thought that London could save them from being snowed up by the huge quantity of literature that had fallen upon committees in the early days. He did not suggest that his predecessors had done more than necessary work, but when the initial difficulties had been got over he thought that it was right to diminish, as far as possible, the rain of circulars in regard to the administration of the Act, so that only what was indispensable should be sent out. He knew that committees had suffered under the complexity of the present system, and he hoped that something would shortly be done to reduce within manageable compass the regulations which had had to be issued. A revision of the index register system could not now be undertaken, principally for the reason that it would mean the employment of an extra staff, but he hoped that something would be done in reference to the chemists as a result of the conference with the British Medical Association and the Pharmaceutical Society. He paid a high tribute to the patriotism which the medical profession was exhibiting in the national crisis, and when a request came from that quarter he was inclined to look at it with the utmost sympathy, but he did not think it would be wise to make an application for an increase of the mileage grant.

TREATMENT OF INSURANCE PATIENTS DISCHARGED FROM THE ARMY.

New provisional regulations, dated September 30th, 1915, have been made by the Insurance Joint Committee, acting with the Insurance Commissioners, to deal with the case of soldiers returning to civil life. The regulations may be cited as the National Health Insurance (Medical Benefit) Regulations, 1915, and are to be read as one with the Medical Benefit Regulations, 1913 (referred to as the "principal Regulations") and 1914. The Regulations are as follows:

1. An insured person whose name is included in the list of a practitioner on the panel who is on the 30th day of November, 1915, absent on military service shall not be entitled to select another practitioner or method of treatment at the end of the medical year ending on the 31st day of December, 1915, unless, in addition to giving notice to the Committee in the manner and within the period required by paragraph (1) of Article 30 of the principal Regulations, he satisfies the Medical Service Subcommittee of the Committee that he has reasonable grounds for desiring to be removed from the list of the absent practitioner, and paragraphs (1) and (3) of Article 30 shall be modified accordingly.

2. The expression "practitioner who is absent on military service" means any practitioner on the panel who, by reason of his serving with the naval or military forces of the Crown, is unable to practise, whether under his agreement with the Committee or otherwise, within the area in which he has undertaken treatment.

3. Nothing herein contained shall affect the right of an insured person under Articles 25 and 45 of the principal Regulations to be transferred to the list of another practitioner on the panel subject to the conditions contained in those Regulations.

The new Regulations, which can be purchased (price 1d.), also contain a paragraph regulating the amount to be deducted from the payment to an institution in respect to the provision of treatment for insured members should an institution in any quarter cease to provide such treatment.

LOCAL MEDICAL AND PANEL COMMITTEES.

SOUTHAMPTON.

A MEETING of the Southampton Panel Committee was held at the offices of the Southampton Insurance Committee on September 29th.

Stock Mixtures.—A letter was read from the Commissioners with regard to the stock mixtures suggested for use in Southampton, stating that No. 1, Mist. alba, and No. 2, Mist. ferri aper., could be stocked without deterioration, and were agreed to, but that the other four suggested would deteriorate and therefore could not be allowed.

Expenses of Delegates.—It was agreed that delegates on business connected with the Committee should be paid

first class travelling expenses—2 guineas a day and 1 guinea for each night that they were away.

Interpretation of "Confinement."—After consultation between the Insurance Committee and the Local Medical and Panel Committees, it was agreed that the term "confinement" should mean attendance at the birth and for fourteen days after.

Proposed Commercial Drug Tariff.—The new suggested scheme for a commercial drug tariff (SUPPLEMENT, September 11th, p. 117) was rejected, as in the opinion of the Committee it was inequitable and unlikely to promote economy.

BIRMINGHAM.

At a meeting of the Panel Committee on October 5th, it was reported that several panel practitioners had been interviewed with regard to alleged over-prescribing since the last meeting with a promise of good results. A report as to the result of the checking and analysis of prescriptions for the early part of the year was referred to the Pharmacopoeia Subcommittee for consideration.

COUNTY OF HEREFORD.

Attendance on Insured Persons.—At a meeting of the Local Medical and Panel Committee on September 27th it was decided to adopt the suggestion of the Commissioners that Clause 3 of the Arrangements agreed to by the Committee and the Insurance Committee under Articles 21 (4) and 35 (1) of the Medical Benefit Regulations, 1913, should read as follows: "A practitioner shall not be under any obligation to afford treatment to an insured person if he is not satisfied that the applicant is in fact an insured person entitled to medical benefit."

Pricing of Prescriptions.—A letter was read from the Insurance Committee stating that the Commissioners had approved the adoption of a flat rate of 9d. for pricing prescriptions dispensed by panel practitioners in respect of temporary residents and holders of travellers' vouchers for the current year, and this rate was agreed to.

Payments to Panel Practitioners.—In view of the fact that it has been repeatedly stated that panel practitioners are paid quarterly according to the number of persons for whom they held "index" cards on the first day of the quarter, it was resolved to advise all panel practitioners to count their "index" cards on the first day of the next quarter and compare the number held with the number upon which they are paid at the end of the quarter. (An index card is that received from the Insurance Committee's offices acknowledging that a person has been duly placed on a doctor's list.)

Proposed Commercial Drug Tariff.—It was decided to support the acceptance of a tariff on a commercial basis. The Committee was in favour of each Insurance Committee being credited in respect of drugs and appliances on the same basis as at present (2s. per insured person per annum), of there being an automatic surcharge of every practitioner the total cost of whose prescriptions exceeded the maximum of 2s. per insured person, with power to the Panel Committee on appeal to grant certificates of indemnity entitling such practitioner to relief out of the Drug Fund of the area, and of there being a continuous scrutiny and surcharging as at present provided, except that the Pharmaceutical Committee would not be concerned therein.

LANCASHIRE.

A MEETING of the County of Lancashire Panel Committee was held in the County Offices, Preston, on September 15th, when Dr. H. F. OLDHAM was in the chair.

Deductions from Doctors' Lists.—A communication was read from the Commissioners with regard to transfers during the year. It was to the effect that the consent is required, not only of the practitioner upon whose list the insured person has been placed, but also of the practitioner to whom the insured person desires to transfer, and that in these circumstances it would appear that the practitioners themselves can prevent such transfers during the year without the issue of new regulations dealing with the matter. As regards the right conferred on insured persons by Article 30 (1) of the Medical Benefit Regulations to change their doctor at the end of the year, on giving the notice specified in the regulations, it did not appear to the Commissioners that insured

persons would desire to avail themselves of the right merely because the doctors they had previously chosen were on active service. The Commissioners added that they would be prepared to meet the convenience of practitioners so far as possible by means of any simplification of the existing arrangements, or by the adoption of any special machinery which may appear desirable.

Rules for the Administration of Medical Benefit.—It was decided to ask the Insurance Committee that a rule should be printed on the medical cards to the effect that "an insured person shall not call upon the services of the practitioner on Sundays except in cases of serious emergencies"; also that such a rule be inserted in the rules for the administration of medical benefit for 1916.

Proposed Commercial Drug Tariff.—The memorandum issued by the British Medical Association (SUPPLEMENT, September 11th, p. 117) was considered, and it was decided to ask members of the Panel Committee to call meetings of their respective areas with a view to obtaining the opinion of the profession with regard to this question, and informing them that, whilst prepared to accept a commercial tariff in the light of the resolution passed by the Insurance Acts Committee (contained in paragraph 10 of M. 4) the Committee considered that the information at hand was insufficient, and that the time was inopportune for the consideration of this question.

LINDSEY.

A MEETING of the Local Medical and Panel Committee was held at Lincoln on October 1st, when Dr. F. J. WALKER was in the chair. Payment of the expenses (£15 7s. 10d.) of the Pharmaceutical Committee for the six months ending July 15th was sanctioned, and the clerks were asked to deduct 3d. per insured person from the medical fund to pay the expenses of the Panel Committee. With regard to the proposed commercial tariff it was decided not to recommend any change in the Drug Fund, as the time was inopportune and there was not sufficient data to work upon.

YORK.

At a meeting of the Panel Committee on September 21st, the HONORARY SECRETARY reported that he had looked into the matter with reference to persons admitted to a cottage hospital being seen by the honorary medical officers who received payment for them as temporary residents, and that in view of this undue depletion of the medical benefit fund he had asked the Clerk of the Insurance Committee to inquire into the matter, and, if necessary, to bring it before the Commissioners.

It was decided to allow the whole amount of the expenses of the Pharmaceutical Committee to be paid out of the Drug Fund.

The HONORARY SECRETARY expressed the opinion that the plan of the Renfrewshire Insurance Committee in relying on receiving the notification of discharge from the army of insured persons was unsatisfactory, and he had arranged that the question should be brought to the notice of the Insurance Acts Committee.

In consequence of the receipt of a letter from Dr. Cox advising that it was worth while to secure recognition of the Local Medical and Panel Committee, it was decided to take steps to that effect by circularizing all the medical practitioners resident in the York area, stating the personnel of the Panel Committee and the nature of the proposed scheme, whereby these should be identical with the Local Medical Committee, and asking them, if they had any objection to this scheme, to state it by a certain date. Failing the receipt of any such objection, the Honorary Secretary was instructed to state the result of the inquiry to the Commission.

The Committee was emphatically of the opinion that it would be most unwise to introduce a commercial tariff on the lines suggested until the drug market shall have settled down from the present most unstable condition due to the war.

WEST RIDING OF YORKSHIRE.

At the meeting of the Local Medical and Panel Committees at Wakefield on September 10th the memorandum of the British Medical Association as to the proposed commercial drug tariff was referred to the general subcommittee with an instruction to reply. A letter was read from the Clerk of the Insurance Committee addressed to

a practitioner in regard to three enclosed intermediate certificates given by the practitioner to an insured person, upon which the approved society had withheld payment of sick benefit on the ground that the practitioner had not clearly specified the name of the complaint from which the insured was suffering. The Secretary was directed to inform the Clerk that, in the opinion of the Committee, the terminology made use of by the doctor is precise and the information conveyed in the certificates is adequate to establish the fact of the patient's incapacity.

EDINBURGH.

A MEETING of the Burgh of Edinburgh Panel Committee was held on September 28th, when Dr. DEWAR occupied the chair.

Proposed Commercial Drug Tariff.—The memorandum issued by the British Medical Association (SUPPLEMENT, September 11th, p. 117) was considered. The Committee, by the casting vote of the Chairman, expressed its willingness to accept the commercial tariff provided that the matters concerned in questions 1, 2, and 3 were read as a whole. With regard to guarantees, the Committee was prepared to accept the recommendations provided that the individual practitioners whose prescriptions were shown to be the cause of the deficit were surcharged, and that where excess could be shown to be due to war prices the practitioners' fund did not pay such excess.

Providing Substitutes during Temporary Absence.—It was resolved to inform the Insurance Committee that as responsibility for the treatment of insured persons had been undertaken by contract with the Committee, there was no need for any further guarantee.

Share of Expenses of Central Bureau.—The resolutions of March 31st, April 14th, and May 8th, 1914, supported by the resolutions of an insurance practitioners' meeting held on December 17th, 1914, that no contribution be made to the administrative expenses of a central bureau, were confirmed.

PERTH.

A SPECIAL meeting of the Local Medical and Panel Committees of the Burgh of Perth was held on October 3rd to discuss the recent payments to account to panel practitioners by the Burgh Insurance Committee at the rate of only 1s. per insured person. The Clerk to that Committee explained that certain amounts were credited quarterly to practitioners in accordance with the number of insured persons on their lists, after deductions for enlistments, etc., but that it was impossible to pay the whole of these amounts at the time, as sufficient money had always to be kept back to meet such contingencies as deaths, changes of address, duplications, etc. This would, however, be made up for at the end of the year when the books were balanced and the final payments adjusted, and there was every probability that the next quarter's payments would be again at the former rate of 1s. 3d. per insured person. It was resolved:

That this meeting strongly protest against the serious deduction made from the provisional credits of the Medical Benefit Fund for the current quarter, amounting to 27 per cent. as compared with 1913. From information given by the approved societies to the Insurance Committee the deduction for enlistments should not have exceeded 10 per cent., there being a large preponderance of female labour in Perth. Under the circumstances the panel practitioners of the burgh will take into serious consideration whether it will be worth their while to renew their contracts for the succeeding year.

Meetings of Branches and Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

BRITISH GUIANA BRANCH.

At a meeting of the British Guiana Branch, held at the Public Hospital, Georgetown, on August 28th, Dr. ROSE read a paper on the histology of filarial lymphatic glands. Clinical notes on a case of tetanus treated by carbolic injections, and on a case of diphtheria with complications were also read.

MEMBERS ELECTED TO THE BRITISH MEDICAL ASSOCIATION

(JANUARY 15TH, 1915, TO AUGUST 31ST, 1915.)

(FIRST LIST.)

BY THE COUNCIL.

Beattie, William Forbes, Surgeon R.N., M.B. Catuthers, Victoria, Theodora, Captain R.A.M.C., M.B., F.R.C.S. Edin.
 James, Joseph Francis, Captain I.M.S., M.B., Ch.B., Edin.
 Kulkady, Krishnaji Vishnoo, Major I.M.S., L.M.S.C. Bombay, L.R.C.P. & S. Edin.
 L'Amendes, Douglas Victor, Staff Surgeon R.N., L.S.A.
 Mukherji, Saiyendra Nath, F.R.C.S. Edin., Wellington Square, Calcutta
 Praymester, Shilav Ardisher B., Lieut. I.M.S., L.M.S.C. Bombay
 Pheasant, Ernest Cyril, Captain R.A.M.C., M.B., B.Ch., B.A.O. (I.C.D.)
 Ryan, Martin Owen, Surgeon R.N., M.R.C.S., L.R.C.P.
 Robinson, Francis Aidan, Captain R.A.M.C., M.B., B.S.
 Walker, Charles Derwent, M.B., Ch.B. Edin., Casillas 24 Carahue, Chile

BY BRANCH COUNCILS.

Association Notices.

ELECTION OF MEMBERS OF COUNCIL, 1916-17, BY BRANCHES OUTSIDE THE UNITED KINGDOM.

NOTICE is hereby given that in accordance with By-law 49 nominations of candidates for election as members of Council by the grouped Branches outside the United Kingdom for a period not exceeding three years as prescribed by By-law 52 (2) must be forwarded in writing so as to reach me on or before February 15th, 1916.

Nomination papers may be signed by not less than three members of any Branch comprised in the group, and must be in the form prescribed below or in a form to the like effect.

Election will be by voting papers, which will contain the names of all duly nominated candidates, and will be issued from the head office in London to each member of every Branch comprised in the group.

By order of the Council,
GUY ELLISTON,
Financial Secretary and Business Manager.

429, Strand, London, W.C.
October 16th, 1915.

NOMINATION FORM.

BY NOT LESS THAN THREE MEMBERS OF THE GROUPED BRANCHES.

We, the undersigned, hereby nominate

.....
of.....

[Full name and address must be given]

as a candidate for election by the (here state the names of the Branches in the group) Branches as a member of the Council of the Association.

Names and addresses of nominators, and Branches to which they belong.

Signature and Address.....	Branch.....
.....
.....
Date....., 19.....	

This form should be forwarded to the Financial Secretary and Business Manager, 429, Strand, London, W.C. so as to be received not later than February 15th, 1916.

Not later than the second week in June, 1916, a notice of the result of the election will be published in the JOURNAL.

N.B.—The foregoing notice is not intended to apply to the African grouped Branches, the New South Wales and Queensland grouped Branches, or the New Zealand Branch, which have appointed their respective Members of Council for a period of three years under By-law 52 (2).

By-laws 49 and 52 (2) are as follows:

BY-LAW 49.

Mode of Election by Groups not in the United Kingdom.

49. (1) The election of seven members of Council by the groups of Branches not in the United Kingdom shall be conducted in the manner prescribed by this By-law.

(2) All nominations of candidates shall be in writing sent to the Association so as to be received at the head office on or before such day, not being later than the 15th of February in each year, as shall be specified for the purpose by a notice published in the JOURNAL during the second or third week of October in the preceding year, and no nomination paper received after the day so specified shall be valid.

(3) The said notice shall prescribe a form in which the nominations are to be made, and the nominations shall be made in the form so prescribed, or in a form to the like effect. Nomination papers may be signed by not less than three members of any Branch comprised in the group.

(4) As soon as may be after the 15th day of February in each year:

(a) In the case of any group for which one candidate only has been duly nominated, there shall be published in the JOURNAL a notice that such candidate has been elected as member for that group; and

(b) In the case of any group for which more candidates than one have been duly nominated, a voting paper shall be sent by post from the head office to each member of every Branch comprised in that group.

(5) Every voting paper shall contain a statement that the same must be returned to the Association so as to be received at the head office on or before a specified day (not being later than the succeeding 15th of May), and no voting paper received after the day so specified shall be counted.

(6) Not later than the second week in the succeeding month of June, a notice of the result of the elections shall be published in the JOURNAL.

BY-LAW 52 (2) and (3).

Term of Office of Members of Council.

52. (2) Each member of Council elected by a Branch or Group not in the United Kingdom or elected to represent the Royal Navy Medical Service, the Army Medical Service, or the Indian Medical Service, shall hold office for such period not exceeding three years as the electing body may determine and at the expiration of such period shall be eligible for re-election provided that no such member shall be re-elected so as to make his period of continuous service as the Representative on the Council of one and the same Branch or Group exceed six years.

(3) Each of the terms of office mentioned in this By-law shall be calculated from the close of an Annual Representative Meeting.

GROUPING OF BRANCHES NOT IN THE UNITED KINGDOM FOR REPRESENTATION ON COUNCIL OF ASSOCIATION, 1916-17.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Staff Surgeon R. S. Rowson, M.B., to the *Essex*, temporary; Surgeon G. F. Syms to the *Pembroke*, additional. Temporary Surgeons E. M. Thompson to the *Victory*, additional; F. J. F. Barrington, M.B., A. B. Hamilton, M.B., to the *Frigate*, additional; for Plymouth Hospital: P. U. Mawer to the *Pembroke*, for R.N. Barracks, vice Judson; C. O. H. Jones to the *Dunwich*, vice MacEwan; D. K. Adams to the *Superseuse*, vice Gerrard; T. J. Harrigan, M.B., to the *Pembroke*, additional, for Chatham Hospital; G. M. Johnson, M.B., to the *Victory*, additional, for Haslar Hospital.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon W. J. Gerrard, M.B., to the *Pembroke*, additional, for Hospital, Surgeon Probationers C. L. Cottle to the *Tiger*, vice Kane; W. M. Mitchell to the *Zeiger*, vice Ward; for C. Mitchell to the *Express*, vice Ross. To be Surgeon Probationers: J. Donald, P. C. Livingstone, and D. M. Watson. To be Dental Surgeon: A. G. D. Priddan, and appointed to the *Cyclops*, additional.

ARMY MEDICAL SERVICE.

Colonel H. J. Barratt, on completion of four years' service in his rank, is retained on the active list under the provisions of Article 120, Royal Warrant for Pay and Promotion, and to be supernumerary.

rate of mortality in these towns, 2,586 had been 14.0, 13.7, and 14.3 per 1,000 in the three preceding weeks, was again 14.3 in the week under notice, and was 0 per 1,000 above that recorded in the ninety-six largest English towns. Among the several towns the death-rate ranged from 8.2 in Colchester, 8.4 in Letch, and 8.8 in Perth, to 15.3 in Kirkcaldy, 15.6 in Dundee, and 16.5 in Coatbridge. The mortality from the principal infective diseases averaged 1.8 per 1,000, and was highest in Falkirk and C. and A. bridge. The 38 deaths from all causes in Glasgow included 15 from infantile diarrhoea, 7 from measles, 4 from scarlet fever, 2 from diphtheria, and 1 from whooping-cough. Two deaths from enteric fever were recorded in Dundee; from scarlet fever, 4 deaths in Aberdeen, and from infantile diarrhoea, 3 deaths in Dundee.

HEALTH OF IRISH TOWNS

During the week ending Saturday, September 26th, 533 births and 381 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 528 births and 390 deaths in the preceding period. These deaths represent a mortality of 16.4 per 1,000 of the aggregate population in the districts in question, as against 18.8 per 1,000 in the previous period. The mortality in these Irish towns was therefore 2.9 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate in the urban districts was equal to 22.9 per 1,000 of population. As for mortality of individual localities, that in the Dublin registration area was 19.6 (as against an average of 17.9 for the previous four weeks), in Dublin city 22.56 (as against 21.4), in Dublin suburbs 15.09, in Cork 19.7 (as against 18.0), in Londonderry 20.2 (as against 19.3), in Limerick 13.5 (as against 14.6), and in Waterford 9.5 (as against 15.2). The zymotic death-rate was 2.8 as against 2.6 in the previous period.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice see Index to advertisements. Important Notice re Appointments appearing in our advertisement columns giving particulars of vacancies as to which inquiries should be made before applying.

VACANCIES.

MANCHESTER CHILDREN'S HOSPITAL.—Resident Medical Officer. Salary, £100 per annum.

NEWCASTLE-UPON-TYNE ROYAL VICTORIA INFIRMARY.—(1) Four House-Physicians; (2) Four House-Surgeons; (3) Accident Room House-Surgeon; (4) House-Surgeon to Aural and Ophthalmic Department; (5) House-Surgeon to Skin and Gynaecological Department; (6) House-Surgeon to Out-patient Dressing Department.

NEW HOSPITAL FOR WOMEN, Easton Road, N.W.—(1) Temporary Assistant Surgeon; (2) Obstetric Assistant; (3) Resident Medical Officer at Home of Recovery, New Barnet.

PADDINGTON GREEN CHILDREN'S HOSPITAL, W.—(1) House-Physician; (2) House-Surgeon. Salary, £80 per annum each.

PITTSMOUTH ROYAL SOUTHSMOOTH HOSPITAL.—House-Surgeon. Salary, £150 per annum.

PITNEY HOSPITAL, S.W.—Resident Medical Officer. Salary, £150 per annum.

ROCHDALE UNION INFIRMARY.—Temporary Assistant Resident Medical Officer.

ROYAL LONDON OPHTHALMIC HOSPITAL, City Road, E.C.—Senior House-Surgeon. Salary, £100 per annum.

SHEFFIELD ROYAL INFIRMARY.—House-Surgeon. Salary, £150 per annum.

SHEFFIELD WHALSAY PARISH.—Medical Practitioner. Guaranteed income £300 by the Highways and Islands (Medical Service) Board.

SOUTHAMPTON FREE EYE HOSPITAL.—House-Surgeon. Salary, £100 per annum.

SOUTHAMPTON ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL.—Junior House-Surgeon. Salary, £100 per annum.

TURRO AUXILIARY NAVAL HOSPITAL.—Resident Assistant Medical Officer. Salary, £150 per annum.

WARINGTON INFIRMARY AND DISPENSARY, Junior House-Surgeon. Salary, £120 per annum.

WARRINGTON LORD HENRY WAR HOSPITAL.—Resident Surgeons. Pay, £1 per diem.

WELSH METROPOLITAN WAR HOSPITAL, Whitechurch.—(1) Resident Physician. (2) Junior Surgeon.

WEST END HOSPITAL FOR DISEASES OF THE NERVOUS SYSTEM, Wellbeck Street, W.—Honorary Ophthalmic Surgeon.

WEST HAM AND EASTERN GENERAL HOSPITAL, Stratford.—(1) Resident Medical Officer. (2) House-Physicians and House-Surgeons. Salary for (1) £160 per annum, and for (2) £120 and £100 per annum respectively.

WIGAN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—(1) Resident Surgical Dresser; salary, £28 a week. (2) Lady House-Surgeon; salary, £150 per annum.

WILLESDEN URBAN DISTRICT COUNCIL.—Assistant Medical Officer of Health and Assistant School Medical Officer. Salary, £93 8s. per week.

WORCESTER COUNTY AND CITY ASYLUM.—Second Assistant Medical Officer. Salary, £275 per annum.

WORRESTER GENERAL INFIRMARY.—Resident Medical Officer (male or female). Salary, £150 per annum.

MEDICAL REFEREES.—The Home Secretary announces a vacancy as Medical Referee under the Workmen's Compensation Act, 1906, for the Birmingham County Court in Circuit No. 21. Applications to the Private Secretary, Home Office, S.W., by November 3rd.

To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

HUGHES, W. H., M.B., M.C., Edin.—Certifying Factory Surgeon for the Ashton-under-Lyne District, co. Lancaster.

NEWINGTON, C. W. H., M.R.C.S., L.R.C.P.—Certifying Factory Surgeon for the Edinburgh District.

EDINBURGH ROYAL INFIRMARY.—The following appointments have been made: J. G. Cattauch, F.R.C.P.E., Temporary Assistant Physician. Resident Physicians: W. T. Patterson, M.B., Ch.B., Professor Graham; R. N. Phesse, M.B., Ch.B., to Dr. Graham Brown; H. J. C. Gibson, M.A., M.B., Ch.B., to Dr. Fleming; Ernest O. A. Singer (final year student), to Dr. F. D. Boyd (for one month only); Thomas C. Bowie (third year student), to Dr. Harry Rastoy; Edward W. Kirk, M.B., Ch.B., to Mr. Cathcart; J. W. Matthews, M.B., Ch.B., to Mr. Hodson; J. W. Potter, M.B., Ch.B., to Mr. Wallace; T. F. Corbick, John Dick, and R. L. Ingleby (final year students), at the Surgical Out-patient Department, A. Keith Gibson (final year student), to Dr. A. H. F. Barbour (three months only). Non-Resident House-Surgeons: Miss Mary D. Rankine, M.B., Ch.B., to Dr. J. V. Peterson; M. B. Barton, M.B., Ch.B., to Dr. J. Malcolm Farquharson, Clinical Assistant; Harold Chaffer, M.R.C.P. and S., to Dr. Logan Turner (three months only).

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 8s., which sum should be forwarded in Post Office Orders or Money orders to the notice writer under the first post on Wednesday morning in order to ensure insertion in the current issue.

BIRTH.

FRIDMAN.—On October 9th, at Chesterfield, Stanhope Road, Darlington, the wife of F. C. Fridman, F.R.C.S.E., of a daughter.

MARRIAGE.

AUSTIN-WILSON.—On September 14th, at Christ Church, Travancore, Travancore, by Rev. W. Johnston, Dean of Travancore, Thomas Austin, I.C.S., son of Rev. Thomas Austin, M.A., R.N., retired Chaplaincy, Bodmin, Cornwall, to Cristina Wilson, M.B., Ch.B., Medical Officer in charge Government Hospital for Women and Children, Travancore, and adopted daughter of George Wilson, Esq., Broomhill Road, Aberdeen.

DEATHS.

BRINTON.—Killed in action in France on October 8th, Lieutenant Edward H. P. Brinton, R.A.M.C., attached to the 4th Battalion Grenadier Guards, younger son of Sir Lauder Brinton, Bt., M.D., F.R.S., aged 25.

CAST.—On October 7th, at White Cross, Lincoln, William John Cast, M.B., Ch.B., M.R.C.S., L.R.C.P., L.S.A., aged 59 years, R.I.P. The funeral at St. Peter's-in-Eastgate Church on Saturday, October 9th, at 10.30 a.m.

DIARY FOR THE WEEK.

MONDAY.

ROYAL COLLEGE OF SURGEONS, Lincoln's Inn Fields, W.C. 5 p.m.—Demonstration by Mr. Shattock, Ricketts, Cretinism, etc.

TUESDAY.

ROYAL SOCIETY OF MEDICINE.
SECTION OF MEDICINE, OBSTETRICS AND PEDIATRICS, 4.30 p.m.—Discussion on Treatment of Cerebro-spinal Meningitis, opened by Professor Sir William Osler, Bt., M.D., F.R.S. Members of other Sections are invited to be present.

WEDNESDAY.

ROYAL COLLEGE OF SURGEONS, Lincoln's Inn Fields, W.C. 5.30 p.m.—Mr. J. F. Colyer: Injuries and Diseases of the Teeth of the Anterior Abcess.

THURSDAY.

ROYAL SOCIETY OF MEDICINE.
SECTION OF DERMATOLOGY 4.30 p.m.—Cases.

DIARY OF THE ASSOCIATION.

Date. Meetings to be held.

OCTOBER.

20 Wed. London: War Emergency Committee, 2 p.m.

LONDON: SATURDAY, OCTOBER 23RD, 1915.

INSURANCE.

DEDUCTIONS FROM ACCOUNTS.

QUESTIONS IN PARLIAMENT.

SIR PHILIP MAGNUS asked the Chairman of the Joint Committee of Insurance Commissioners, on October 14th, whether the payment of the balance due to medical practitioners from insurance committees could be accelerated. Mr. Dixon asked the reasons which justified the deductions insisted upon by the Insurance Commissioners (England) in Circular I.C./L. 124, of one-third of the quarterly accounts of panel practitioners, chemists, and institutions after services had been rendered and an agreement entered into with each party, why there had been no advance on account nor adjustment of the deductions of 10 per cent. made in the accounts of doctors, chemists, and institutions for the year 1914, and if the Government would instruct the Commissioners to deal with the reductions owing to enlistments upon a less arbitrary and more generous basis by a temporary increase of the Treasury grant, if necessary, considering that the medical profession had undertaken the free treatment of soldiers' wives and families and other dependants, and had lost the most healthy portion of their panel. Mr. C. Roberts, in reply, referred to the answer given by him to Mr. Hancock on July 27th, and added that every effort was being made to overcome the difficulty arising out of the war, to which reference was there made. In his answer on the date mentioned, which was reported in the BRITISH MEDICAL JOURNAL of July 31st, p. 189, Mr. Roberts said that the final settlement for 1914 had been unavoidably delayed by certain difficulties arising out of the present state of war. The balance due would be ascertained and paid as soon as practicable. In the case of the chemists, who might otherwise have suffered hardship, steps were taken in April last to effect an emergency settlement, which was now in progress. He did not admit that the deductions owing to enlistments were made upon an arbitrary and ungenerous basis, and could not contemplate the suggestion that a further sum should be provided by the Exchequer.

WHERE THE SHOE PINCHES.

A TEMPORARY LIEUTENANT'S WIFE writes: Before finally deciding to take a temporary commission my husband and I counted the cost, and although we knew by past experience (my husband having been a civil surgeon in the South African campaign) that the private practice would vanish with his personality, there were still the appointments left, a large share of which was represented by a fairly large panel. Believing in the bait which was held out to medical men to induce them to go on the panel, namely, "the State are always the safest payers," we agreed to face the loss of the private practice (a no small thing in these days of increased cost of living, and children to feed, clothe, and educate), and do that which seemed plainly our duty—my husband applied for a temporary commission, got it, and in due time went to France.

Now, every Saturday morning I pay the lieutenant seven guineas (and keep a good table for him all through the week) and the chauffeur 35s. (it is quite impossible to work this practice without a conveyance); there is also the

wages of the two maidservants, the maintenance of the household, the children's school bills, their clothes, rent, rates, upkeep of car, firing, lighting, and so on *ad infinitum*, all of which are cash-down transactions.

Now let us turn to the Insurance Committee and see how they have helped and encouraged in this great national emergency.

For the quarter ending December 30th, 1914, they kept back 50 per cent. of the money due to us, for the quarter ending March 30th last 20 per cent., for the quarter ending June 30th 35 per cent. The foregoing percentages are still retained in spite of many letters to the Insurance Committee asking for a settlement, and I fully expect the same thing will happen for the quarter ending September 30th. Their excuse is that "it takes time to find out what men have joined the forces from each doctor's panel." I dare say it does, but a system or method which cannot "find out" by now is no method or system, but a chaotic muddle. I know pretty well every man who has gone from this district, and I know that it nothing near like warrants the deduction made; in fact, I have sent in fresh acceptances to more than balance those gone. Patriotism is a very fine thing, but it will not pay our bills. Thanks to the Insurance Committee, I am paying my hills now by dipping into our savings. Could not the British Medical Association endeavour to make the Insurance Committee see that they also have a duty to perform—namely, to pay for services faithfully rendered as per the agreement signed and stamped?

ENTER THE MONEY-LENDER.

It was generally said and believed at the time when the Insurance Act was coming into force that it would have many effects which nobody could then foresee. Among the high lights in the rosy picture drawn by its friends of its effect upon the income of doctors was not included, so far as we recollect, the encouragement of money-lenders. A correspondent, however, sends us a neatly typewritten letter he received last week, which would appear to have been widely distributed in London. The writer of this letter states that, being aware that the Insurance Commissioners have reduced the amount payable to panel doctors, he is making a speciality of substantial advances to doctors on very reasonable terms. He does not charge money-lenders' rates, and invites a call or 'phone from the doctor addressed, should he be in temporary need of financial assistance. Milton imagined a place of which the denizens

feel by turns the bitter change
From beds of raging fire to starve in ice
. . . and there to pine
Immovable, infixed, and frozen round
Periods of time.

On the whole, it will probably be found a lesser evil to be infixed and frozen round by an Insurance Committee for a period of time than to enter the fiery furnace of the money-lender.

PROPOSED AMALGAMATION OF INSURANCE COMMISSIONS.

THE proposal, which, as was mentioned last week, is attributed to the Retrenchment Committee, for the amalgamation of the Scottish and Welsh Insurance Commissioners

with the English Insurance Commission, is exciting much opposition in Scotland.

At a meeting of the Edinburgh and Leith Division held on October 15th, Dr. W. Stewart, chairman of the Division, presiding, a circular was read from the Scottish Committee stating that it was understood that the Parliamentary Retrenchment Committee had suggested that the Scottish Insurance Commission should be abolished. The Division unanimously passed resolutions "to oppose strongly the transference of the Scottish Insurance Commission to London," and "that the amalgamation of several small Insurance Commissions into one Central Commission must be deprecated chiefly on the ground of loss of local interest in the administration of medical benefit." The Senior Secretary was instructed to send copies of these resolutions to local members of Parliament and others.

At the monthly meeting of the Leith Burgh Insurance Committee a resolution was adopted, submitted from the meeting of the chairman, vice-chairman, conveners of subcommittees, and representatives of the doctors and chemists, declaring that the proposed amalgamation should be opposed on the ground that experience had justified the wisdom of the constitution of a separate commission for Scotland, and that administration from a centralized office in London would lead to loss of efficiency prejudicial to insured persons, without any adequate compensation in economy.

The Executive Committee of the Scottish Association of Insurance Committees is to consider the proposal at a meeting at Dundee on October 30th. Judging from the reference to the matter in its report the Committee is opposed to the suggestion. It is urged that the abolition of the Scottish Commission would not result in any substantial saving, for even if all the members of the Commission were displaced, the staff—both indoor and outdoor—would not be diminished in number, as was clear from the fact that the cost of the Scottish staff was in proportion to population, and, having regard to the extent and character of the area administered, no higher than in England, and less than half that in Ireland. The Midlothian Insurance Committee has adopted unanimously a resolution maintaining that in the interest of the insured population of Scotland and of efficiency and economy of administration, the Scottish Insurance Commissioners should be continued with unimpaired powers, and protesting against any attempt to reopen the question settled by the compromise of 1913.

The General Council of Panel Chemists (Scotland), at a meeting on October 15th, approved the decision of the Pharmaceutical Standing Committee (Scotland) to offer an uncompromising opposition to what it described as the retrograde proposal for the abolition of the Scottish Commission and the centralization of the insurance administration in London.

The Edinburgh district of the Ancient Order of Foresters at its forty-fifth annual meeting adopted a resolution stating that it viewed with alarm the proposed transfer of the Scottish Commission to London, and calling upon the Scottish members of Parliament to resist such transfer as being detrimental to the best interests of Scotland. Meanwhile the unofficial Liberal members of Parliament, at a meeting in the House of Commons on October 14th, adopted the following resolution:

That in view of the widespread belief in Scotland that a proposal for the abolition of the Scottish Insurance Commission is in contemplation, the Scottish unofficial Liberal members are glad to know that such a proposal has not been considered by the Committee on retrenchment of public expenditure. In the event of any such proposal being made from any quarter, they will feel bound to meet it with strenuous opposition.

LIMITATION OF RIGHT OF TRANSFER OF INSURED PATIENTS OF A PRACTITIONER ABSENT ON MILITARY SERVICE.

THERE was an error in the title and introduction to the copy of the Medical Benefit Regulations, 1915 (SUPPLEMENT, October 16th, p. 159), in which it was inadvertently stated that they applied to soldiers returning to civil life. As will have been seen from the text, they refer to the insured patients of doctors on active service. They require that an insured person whose name is on the list of a practitioner on the panel on November 30th, 1915, such

practitioner being absent on military service, shall not be entitled to select another practitioner at the end of the medical year, December 31st, 1915, unless he satisfies the Medical Service Subcommittee that he has reasonable grounds for desiring to be removed from the list of the absent practitioner. A practitioner absent on military service is defined as meaning any practitioner on the panel who by reason of his serving with the naval or military forces of the Crown is unable to practise, whether under his agreement with the Committee or otherwise, within the area in which he has undertaken treatment.

THE PROPOSED COMMERCIAL DRUG TARIFF.

OPPOSITION BY SCOTTISH CHEMISTS.

At a largely attended meeting of the General Council of Panel Chemists (Scotland) at the Pharmaceutical Society's House, Edinburgh, on October 15th, resolutions were adopted refusing to undertake pharmaceutical service under the Insurance Acts on the terms of the drug tariff as framed by the Departmental Committee, on the ground that it was financially unsound and that its application to about 5,000 consecutive insurance prescriptions indicated a reduction of about 20 per cent. on present drug tariff rates. While not objecting to the general principles that the remuneration should be based on the cost price of material, with allowance for establishment charges and a dispensing fee, the opinion was expressed that the proposed average amount, namely, 0.8d., was quite inadequate in existing war conditions: in view of the limited time available, Scottish panel chemists were recommended to continue the existing arrangements, with satisfactory adjustment of prices, for 1916.

INSURANCE ACT IN PARLIAMENT.

WELSH INSURANCE COMMISSION.

MR. ELLIS DAVIES asked on October 14th whether it was contemplated to abolish the Welsh Insurance Commission, and, if so, on what grounds, and on whose suggestion was the decision of Parliament to be reversed. Mr. C. Roberts, Chairman of the Joint Committee of Insurance Commissioners, said he had nothing to add to the reply given by the Prime Minister on September 29th, when it was stated that the organization of the department as a whole was under consideration by the Retrenchment Committee; no statement could be made until the report of the Committee has been received.

SMALL PANELS.

On October 19th Mr. Currie asked whether cases existed in England and Scotland of panel doctors whose panel consisted of less than half a dozen persons; what total remuneration was payable to such doctors; whether his attention had been drawn to the case of a panel doctor in Edinburgh who received £76 14s. 2d. sterling for the solitary patient on his panel who required no medical attendance whatever from one end of the year to the other; whether the amount paid to this doctor was in any way subject to the control or discretion of the Commissioners in Scotland, or whether under the Act they had no option but to sanction the payment. Mr. C. Roberts said that such cases as were referred to in the first part of the question no doubt existed, though he had no precise information on the point. The remuneration of a doctor under the capitation system was governed by the terms of his agreement with the Insurance Committee, and included not only his liability in respect of the persons actually on his list, but also the responsibility which he undertook in common with other doctors on the panel for giving treatment to persons who had not selected a doctor for themselves. The payment made in the specific case referred to under the agreement entered into at the beginning of the year covered this liability.

LOCAL MEDICAL AND PANEL COMMITTEES.

RENFREWSHIRE.

At a meeting of the Renfrewshire Panel Committee on September 22nd it was decided to ask the Insurance Committee (1) to continue for 1915 the arrangement for 1914 whereby the whole of the Practitioners' Fund was divided among practitioners in proportion to the number of insured persons upon their lists at the commencement of each quarter; and (2) to see that no permanent reduction was made from the payments due to practitioners in

respect of any failure to submit records for 1914 due to their absence on active service.

With regard to the proposed commercial drug tariff, it was decided to oppose any alteration which would expose the Practitioners' Fund to the risk of being charged to any extent with the cost of drugs.

LANARKSHIRE.

At a meeting of the Local Medical and Panel Committees for the county of Lanark on September 22nd, a scheme for the distribution of the balance of the Medical Fund, and for arrangements for enabling insured persons to be assigned to practitioners on the line of last year's resolution was approved, and it was resolved to recommend the Commissioners that the scheme for recomposing doctors for attending temporary residents should have regard to and meet the expenses of any mileage involved.

The Secretary of the Insurance Committee reported that payment for the quarter of 1s. 4d. for medical attendance and 3/6. for medicine would be made, but that as the deduction of 5,000 for enlistments was believed to be inadequate the final accounting would yet fall to be made.

With regard to discharged soldiers, it was suggested that when restored to a doctor's list an intimation should be placed on the medical card to the effect that the holder had been restored, and would remain on the doctor's list unless intimation of objection was received within a week.

WEST RIDING OF YORKSHIRE.

A meeting of the Local Medical Committee and Panel Committee was held on October 8th, when a resolution was adopted expressing the opinion that the Drug Tariff ought to be revised, but that the 7s. derived from the Medical Benefit Fund and belonging to the doctors must not under any circumstances be encroached upon in the payment of the pharmacists' accounts.

During the temporary absence of Dr. Eardley on military service, the secretarial work will be carried on by his deputy, Mr. Cyril R. Townsend, A.C.A., Carlisle Chambers, Goole.

THE WAR EMERGENCY.

SOUTH ESSEX DIVISION.

DR. JOHN WALKER, Honorary Secretary of the South Essex Division and Local War Emergency Committee, has compiled a statement showing the response of the profession in the district to the appeal of the army:

South Essex Division:

Total number of members and non-members	114
Members and non-members who have joined	49
Number over military age	23
Women	2
Rejected for physical reasons	1
Doctors who have left the Division	3
	85
	31

Of the 31 thus shown to be possibly eligible 3 do not practice, 1 is the medical officer of health whom the Local Government Board decline to set free, and 1 is a woman. This appears to leave 26, and in two instances the doctors have allowed their partners to go, so that they may be said to be represented by them in the army.

Dr. Walker also gives separately the statistics for the County Borough of Southend-on-Sea as follows:

County Borough of Southend-on-Sea:

Total number of men in practice	47
Doctors who have joined	13
Doctors over military age	15
	31
Of these 16 left—	16
One is M.O.H.	1
Two have sent their partners	2
	3
	13

Thus leaving 13 possibles.

EDINBURGH AND LEITH DIVISION.

A MEETING of the Edinburgh and Leith Division was held on October 15th, when Dr. W. STEWART, Chairman of the Division, presided.

Dr. STEVENS, the Secretary of the Edinburgh and Leith Medical War Committee, gave an account of the work done for medical recruiting, and mentioned that the number apportioned to this Division by the Scottish Medical Service Emergency Committee had been provided, including the August and September contingents, and that there was every probability of obtaining the

final contingent for October. The Senior Secretary and Treasurer was given general powers to deal with the expenses of the Edinburgh and Leith Medical Emergency and the Edinburgh and Leith Medical War Committees. It was agreed to call an early meeting of the Edinburgh and Leith Medical Emergency Committee to consider grievances arising from the gratuitous treatment of dependants of men serving with the colours, and to make representations to the Soldiers' and Sailors' Families Association.

Meetings of Branches and Divisions.

ABERDEEN BRANCH.

The annual meeting of the Branch was held on October 15th, when Sir ALEXANDER OGGSTON, K.C.V.O., President, occupied the chair. The report of the Branch Council for the previous year, which was read and approved, gave a summary of the various meetings held during the year which were mainly connected with war emergency work and the formation of a Bureau Committee and a Local War Committee. The Treasurer's report, having been circulated, was taken as read and approved.

It was decided that owing to present war conditions the office-bearers be re-elected for another year as follows:

- President: Sir Alexander Oggston, K.C.V.O., M.D.
- President-elect: L. B. Beddie, M.B., Fraserburgh.
- Vice-Presidents: John Gordon, M.D., Aberdeen, and C. C. Greig, M.B., Fyvie.
- Honorary Secretaries: Thomas Fraser, M.D., and F. K. Smith, M.B., Aberdeen.
- Honorary Treasurer: J. R. Levack, M.B., Aberdeen.
- Representatives on Council of Association: John Gordon, M.D., Aberdeen, and J. Munro Moir, M.D., Inverness.
- Branch Council: L. B. Beddie, M.B., A. T. Gordon Beveridge, M.D., R. Bruce, M.D., J. F. McIntosh, M.B., R. Rannie, M.B., G. Sinclair, M.D., J. F. Robertson, M.D., George Williamson, M.B., and J. D. Wyness, M.D.

The revised ethical rules governing procedure of a Branch were considered, and the meeting unanimously agreed to adopt them.

Dr. GORDON gave a short report of the work of the Bureau Committee, and pointed out how great an advantage it had been in Aberdeen during the last five months.

Association Notices.

STAFFORDSHIRE BRANCH.—Dr. Harold Hartley, Honorary General Secretary, Basford, Stoke-on-Trent, gives notice that the first general meeting of the session will be held at the North Stafford Hotel, Stoke-on-Trent, on Thursday, November 18th. The President, Dr. F. M. Rowland, will take the chair at 4 p.m. Business.—Resolution: That the Staffordshire Branch hereby adopts the revised rules governing procedure in ethical matters of a Branch composed of several Divisions as approved by the Annual Representative Meeting, 1915, without modification and in substitution for any ethical rules now in use by the said Branch. Exhibition of living Cases. Papers:—W. Mitchell Smith: Alimentary Hygiene in Children. G. A. Carter: Nose Bleeding. S. McMurray and E. E. Young: A Case of Intra-cranial New Growth simulating Miness' Nystagmus. Exhibition of pathological specimens, etc. Dinner at 6.15 p.m. Charge, 5s.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Fleet Surgeon O. Rees, M.D., to the *Dominion*, vice Cocke; G. J. E. Cocke to the *Kowarfal*, vice Rees; F. A. Cappel to the *Defence*, vice Durston; J. C. Durston to the *Colleen*, additional, for Hanborough and Dockyard; C. B. Fairbank to the *Centurion*, vice Gill; H. H. Gill to the *Triad*, additional, for disposal; G. G. Borrett to the *Embrose*, additional, for disposal; F. J. Mahon to the *Achilles*, vice Borrett. Staff Surgeons: A. Schofield, M.B., to the *Southampton*, vice McCoy; A. McCoy to the *Hedra*, vice Fairbank; G. H. Vickery, M.B., to the *Victa*, additional, for disposal. Temporary Surgeons: A. T. McDonald to the *Warrior*, vice Scott; A. D. E. Bayliss, M.D., to the *Pembroke*, additional, for disposal. To be temporary Surgeons: A. C. Barker, M.B., H. C. C. Veltch, A. R. S. Varden, G. L. Hoce, M.B.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon Probationer E. P. Smith to the *Oak*.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

TEMPORARY Major H. H. Guest relinquishes his commission. Captain B. A. Odium from seconded list is restored to the establishment. The name of temporary Captain Edward Henry Roberts is as now stated, and not as stated in the London Gazette of April 12th. To be temporary Captains: C. E. Lee, M.D., J. G. Sims, M.B., R. H.

Strong, M.B., J. Whigham, M.B., A. H. Carter, M.D., T. G. Lusk, M.B., late Captain, R.A.M.C.(F.), J. A. Arkwright, M.D.

Temporary Lieutenants to be temporary Captains: F. A. Gatson, M.D., R. P. N. M., H. Martyn Clarke, W. P. K. Cole, D. Lowth, M.D. To be temporary Lieutenants: H. W. Fiegon, M.D., A. H. Coleman, M.B., A. R. Hobbs, M.D., P. Rendall, M.D., D. J. McAfee, M.D., A. G. Faulds, M.B., G. Coats, C. Robertson, M.B., A. G. Bisset, M.B., E. G. Evans, E. Brock, M.D., F. B. Snell, M.B., E. A. Pywell, A. L. Robinson, H. A. Butt, C. B. Cervis, M.D., A. C. Falkiner, M.B., E. M. Polson, M.B., R. Felton, M.D., N. McFarlane, M.B., M. Fager, E. Brown, H. H. Stokes, M.B., V. M. Fisher, M.B., W. Milneick, D. P. Macdonald, M.B., R. A. Awenis, M.B., S. R. Lane, M.D., G. L. Parsons, F. Dillon, M.B., J. A. Brown, M.D., H. M. Robertson, M.B., J. Gardner, M.R., J. Mouries, M.B., A. Pennington, M.B., S. A. McGivney, M.R., E. F. M. M. D., W. L. Crowe, M.D., W. C. Downs, M.B., W. H. Anderson, M.D., W. A. Clayton, M.B., M. Gavin, F.R.C.S.F., F. L. Brown, M.D., W. E. Bracey, D. R. Campbell, M.D., A. MacLure, M.B., E. G. D. Milson, H. W. Nott, W. J. Soussville, M.D., J. F. Biachick, M.D., W. G. Macdonald, M.B., J. G. Kerr, J. F. E. Heury, J. MacP. Lang, M.B., G. W. Riddell, M.B., F. N. Brown, A. Budd, M.B., N. F. Lock, M.B., F. R. C. S. F., H. Young, M.B., T. E. Malvany, L. R. Thomson, M.P., R. A. Cheddie, M.B., K. W. L. Sharp, A. F. G. Kerr, M.D., G. D. McQueen, G. E. Bruce, M.B., J. G. Scammell, A. C. West, M.B., R. C. MacQueen, M.B., F. R. C. S. F., J. S. Christie, M.B., E. H. Sheehan, M.B., A. B. MacLenn, M.B., F. G. Hopkins, M.D., B. C. Scott, W. H. Hayner, N. Gowman, D. Dunlop, M.B., G. B. Hanna, D. Welsh, P. McDougall, M.B.

The name of temporary Lieutenant James Philip is as now described, and not as stated in the *London Gazette* of September 20th.

Vacancies and Appointments.

INSURANCE.

INSURANCE ACTS COMMITTEE.

A MEETING of the Insurance Acts Committee was held at the office of the British Medical Association on Tuesday, October 19th, when Dr. J. A. MACDONALD, LL.D., was in the chair. The other members present were:—*England and Wales:* Dr. T. Ridley Bailey (Bilston), Mr. H. B. Brackenbury (London), Dr. T. Campbell (Wigan), Major A. C. Farquharson (Newcastle-upon-Tyne), Dr. P. V. Fry (Sowerby Bridge), Dr. Major Greenwood (London), Mr. R. Harding (New Radnor), Dr. W. Ainslie Hollis (Brighton), Mr. P. Napier Jones (Crowthorne), Dr. B. A. Richmond (London), Mr. H. H. Tomkins (Leyton), Dr. W. B. Crawford Treasure (Cardiff). *Scotland:* Dr. John Adams (Glasgow), Dr. J. Hunter (Coarstorphine). *Et officio:* Mr. E. B. Turner (Chairman of Representative Meetings). [The name of Mr. R. Harding was accidentally omitted in the list of persons present at the meeting of the Committee on October 7th, reported in the SUPPLEMENT of October 16th.]

Drug Tariff.

The Committee, having considered a memorandum as to the proposals put before the Executive Subcommittee at the interview with the Commissioners on October 14th with respect to possible changes in the regulations affecting the drug tariff, it was resolved to address a communication to the National Health Insurance (Joint) Committee in the following terms:

(a) That the Committee expresses its approval of the method suggested by the Commissioners for the purpose of meeting the new position created by the proposed arrangements in connection upon the Drug Tariff, and will advise Local Medical and Panel Committees to accept the proposed arrangements;

(b) That the Committee will do all in its power to render effective the existing safeguards against extravagant prescribing, as embodied in Article 40 of the Regulations, subject to the elimination of the functions of the Pharmaceutical Committee in the matter;

(c) That the Committee's approval of the proposed arrangements is dependent on the understanding that no extra cost will be thrown upon the Panel Committees in connexion with the carrying out of the new administrative details;

(d) That the Commissioners be asked to inform the Committee as soon as possible as to the constitution and functions of the "some other body or authority" referred to in paragraph 10 (iii) of the Memorandum;

(e) That the Commissioners be requested to amend Article 40 of the Regulations so as to provide that there might be an automatic liability to surcharge every practitioner, the total cost of whose prescriptions exceeds the maximum of 2s. per insured person, with power to the Panel Committee, on appeal, to grant a certificate of indemnity which shall entitle such practitioner to relief.

The following reply has since been received from the Commissioners:

National Health Insurance Commission (England),
Buckingham Gate, London, S.W.

27th October, 1915.

Sir,—I am directed by the National Health Insurance Commission (England) to state that they have taken due note of the resolutions of the Insurance Acts Committee of the Association set forth in your letter of October 23th, and believe that the amending Regulations to be issued immediately will be found to be in practical accord with the views of the Committee expressed in those resolutions.

With reference to the resolution marked (c), the Commissioners are satisfied that it will be possible for Panel Committees to carry out the duties resting upon them under Article 40 in its amended form without incurring greater expenses than those entailed by the effective discharge of their functions under the present Article.

On a closely related subject on which it is understood that there is some anxiety on the part of Panel Committees, the Commissioners desire me to assure you that they have every reason to anticipate that under the arrangements to be made for the pricing, arithmetical analysis, and sorting of prescriptions such information as it has previously been the duty of the Pharmaceutical Committees to place before the Panel Committees in connexion with any representations under Article 40 will continue to be made available to Panel Committees in at least as convenient a form as heretofore.—I am, Sir, your obedient servant,

(Signed) JOHN ANDERSON.

The Secretary,
British Medical Association,
429, Strand, W.C.

LOCAL MEDICAL AND PANEL COMMITTEES.

SOMERSET.

At a meeting of the Local Medical and Panel Committees held at Weston-super-Mare on September 30th a resolution was adopted expressing willingness to accept a commercial tariff, provided that the Commissioners gave a guarantee that the promise of the Government contained in the Memorandum as to medical benefit, Section 2, Clause 10 (SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL, December 7th, 1912, p. 622), should be adhered to. It was also agreed that each insurance area should be credited with an amount for drugs and appliances as at present, but that if the Commissioners considered some change essential, a part, or the whole of the amount, which some areas might be able to save below 1s. 6d., should be placed to a central fund, to be available for areas which were unable with due economy to work under 2s., but that the medical practitioners who did their own dispensing should continue to receive the 2s. as before.

INSURANCE NOTES.

PROPOSED AMALGAMATION OF INSURANCE COMMISSIONS.

Dumfries and Galloway.

At a meeting of the Dumfries and Galloway Division of the Border Counties Branch of the British Medical Association the principal business was the consideration of the proposal for the amalgamation of the Scottish Insurance Commission with the English. The meeting expressed itself in favour of the proposed change, the reasons being the unsatisfactory administration of the Insurance Act and resultant chaos, the advisability of appointing whole-time clerks to Insurance Committees, and the irregularity of payments to medical men.

Dundee.

The proposed amalgamation of the Scottish Insurance Commission with the English was warmly debated at the quarterly meeting of the Dundee Insurance Committee on October 20th. The resolution to oppose the abolition was carried by 26 to 6, but only after several speakers had taken the opposite view, mainly on the ground that the

Scottish Commissioners could not introduce any reform without consulting the London authorities.

SALFORD INSURANCE COMMITTEE.

After numerous delays, some of which were quite unavoidable, the Salford Insurance Committee has decided, *nonne contradicente*, to accept the report of the Panel Committee, which recommended that no surcharge should be made on any of the sixteen doctors who were alleged to have been guilty of excessive prescribing during the year 1913, and these doctors will now be paid moneys that had been kept back from them till the question was settled. The first report of the Panel Committee the Insurance Committee considered did not afford sufficient information on which to base any decision, and it was referred back, but the Panel Committee simply repeated its recommendation. The report was then referred to the Commissioners by the Insurance Committee, with a request that the Commissioners should say whether they considered the report was adequate. In view of the reply of the Commissioners to the effect that the report was not adequate, the Panel Committee again considered the question, and in July last sent in a more detailed report. The Insurance Committee was still in doubt, and again referred it to the Commissioners, whose reply pointed out that the question was entirely one for the Insurance Committee to decide, with the result that the Committee has now decided to make no surcharge in any of the cases. In 1913 the chemists in Salford only received about 66 per cent. of their accounts, but the Insurance Committee has now been informed that a grant will be made out of the special fund at the disposal of the Commissioners for the purpose which will bring the total to 85 per cent., so that the chemists will only suffer a reduction of 15 per cent. on their accounts for that year. For the year 1914 they will receive their accounts in full.

INSURANCE ACT IN PARLIAMENT.

PROPOSALS FOR RETRENCHMENT.

SIR J. D. RIES asked, on October 26th, what steps, if any, were being taken to reduce the cost to the State of the National Insurance Act. Mr. Charles Roberts, Chairman of the Joint Committee of Insurance Commissioners, said that a number of administrative changes, which it was hoped would result in substantial savings, had been carried out in the department since the outbreak of war. Proposals for further economies, the majority of which could only be effected by legislation, had been submitted to the Committee on Public Retrenchment, and were under their consideration. He was unable to say whether the necessary legislation would be introduced, and in reply to Mr. Hogge, who asked whether any alteration in the Scottish Commission was involved, Mr. Roberts said that he could make no statement about proposals which had been submitted to the Retrenchment Committee.

Meetings of Branches and Divisions.

CAMBRIDGE AND HUNTINGDON BRANCH:

ISLE OF ELY DIVISION.

The annual general meeting of the Isle of Ely Division was held at March on October 12th, when Dr. C. H. GIBSON was in the chair.

Election of Officers.—The following officers for 1915-16 were appointed:

Chairman: Dr. H. Clapham.

Vice-Chairman: Dr. C. H. Harding.

Secretary: Dr. A. C. S. Walters.

Executive Committee: Drs. R. H. Barrett, F. H. Beckett, H. Clapham, H. F. Carl, C. H. Gunson, A. Hamilton, C. H. Harding, P. A. Hendley, C. W. Howe, G. H. Lucas, F. G. Martiu, F. M. Mawby, F. E. W. Rogers, M. Tylor, C. E. Stephens, J. J. Waddelow, A. C. S. Walters.

Financial Statement.—The balance sheet for the year ending December 31st, 1914, showing a deficit of 14s. 8½d., was passed.

War Emergency.—A letter was read from the Central Medical War Committee asking the Division to use its best endeavour to find three more men to take commissions in the R.A.M.C. A local committee was appointed, with Dr. A. C. S. Walters (March) as honorary secretary.

DORSET AND WEST HANTS BRANCH.

The autumn meeting of the Branch was held at Bournemouth on October 20th, Dr. VINCENT MILNER, Vice-President, in the chair, when a vote of sympathy with the Honorary Secretary, Dr. Fowler, was passed by the members standing.

Election of Officers.—The following were elected officers of the Branch for the year 1916-17:

President: Dr. W. H. L. Marriner.

Vice-Presidents: Dr. U. Grey-Edwards and Dr. J. Miller.

Honorary Secretaries: Dr. F. Fowler and Mr. P. A. Ross.

Scientific Proceedings.—Dr. BRASCOE, of Alton, introduced by Dr. MANORÉ, showed some coloured photographs of a case of compound fracture of the tibia which had been united by Arbuthnot Lane's method. He shortly explained the nature of the colouring process, ordinary methylene blue being the material used. Dr. NORMAN FLOWER, of Yeovil, read a paper on gastrostaxis, which was discussed by the CHAIRMAN, Dr. MANORÉ, Mr. BELDEN, Dr. MOORHEAD, Dr. HYLIA GREVES, and Dr. MIDDLTON.

Ethical Rules.—At a special meeting of the Branch, held at the same place on the same day, Dr. VINCENT MILNER, Vice-President, in the chair, the new code of ethical rules approved by the Annual Representative Meeting held July, 1915, was adopted unanimously.

YORKSHIRE BRANCH:

WAKEFIELD, PONTEFRAC, AND CASTLEFORD DIVISION.

At a meeting of the Division held at Clayton Hospital, Wakefield, on October 12th, when Dr. MAY was in the chair in the absence of the chairman, Dr. Hillman, on military service, and of the vice-chairman, Dr. Selby of Doncaster. The revised ethical rules approved by the Annual Representative Meeting were adopted in substitution for those already in use. Dr. Lister (Sandal) was appointed Acting Honorary Secretary for Dr. Eardley, who has received a temporary commission in the R.A.M.C.

Association Notices.

STAFFORDSHIRE BRANCH.—Dr. Harold Hartley, Honorary General Secretary, Basford, Stoke-on-Trent, gives notice that the first general meeting of the session will be held at the North Stafford Hotel, Stoke-on-Trent, on Thursday, November 18th. The President, Dr. F. M. Rowland, will take the chair at 4 p.m. **Business.**—**Resolution:** That the Staffordshire Branch hereby adopts the revised rules governing procedure in ethical matters of a Branch composed of several Divisions as approved by the Annual Representative Meeting, 1915, without modification and in substitution for any ethical rules now in use by the said Branch. Exhibition of living cases. Papers:—W. Mitchell Smith: Alimentary Hygiene in Children. G. A. Carter: Nose Bleeding. S. McInurray and E. E. Young: A Case of Intraocular New Growth simulating Miners' Nystagmus. Exhibition of pathological specimens, etc. Dinner at 6.15 p.m. Charge, 5s.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

In the ninety-six largest English towns 7 419 births and 4 845 deaths were registered during the week ended Saturday, October 16th. The annual rate of mortality in these towns, which had been 13.5, 14.0, and 14.9 per 1,000 in the three preceding weeks, fell to 13.9 per 1,000 in the week under notice. In London the death-rate was equal to 14.6, while among the ninety-five other large towns it ranged from 3.8 in Oxford, 4.5 in Bath, 5.9 in Ealing, 6.1 in Wimbledon, and 6.4 in Hove; to 19.2 in West Ham, 19.3 in Isleworth, 20.6 in Beale, 21.4 in Gateshead, and 23.2 in Stockport. The deaths of children (under 2 years) from diarrhoea and enteritis, which had been 765, 826, and 717 in the three preceding weeks, further fell to 508, and included 166 in London, 37 in Liverpool, 27 in Birmingham, 17 in Manchester and in Sheffield, and 16 in West Ham. Measles caused a death-rate of 1.2 in Stockport and 2.1 in Gloucester. The mortality from the remaining infective diseases showed no marked excess in any of the large towns, and no fatal case of small-pox was registered during the week. The causes of 38, or 0.5 per cent., of the total deaths were not certified by a registered medical practitioner or by a coroner; of this number 8 were recorded in Liverpool, 7 in Birmingham, 3 in Gateshead, 2 in Leicester, and 2 in Stockport. The number of certified fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 2,656, 2,758, and 2,933 at the end of the three preceding weeks, had further increased to 3,014 on Saturday, October 16th; 453 new cases were admitted during the week, against 372, 382, and 468 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In the sixteen largest Scottish towns 953 births and 733 deaths were registered during the week ended Saturday, October 16th. The annual

Lieutenants to be Captains: J. G. Hill, M.B., J. P. Race. To be Lieutenants: J. F. Sinson, M.B.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s., which sum should be forwarded in Post Office Orders or Stamps with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

MARRIAGE.

DAVIS—HUNTER.—On October 12th, at St. Michael's Parish Church, Linsithgow, by the Rev. R. Coupar, minister of the parish, assisted by the Rev. Peter Dunn Dalmeny and the Rev. Douglas Bruce, Cozzy, Captain H. Greenhalgh, Dr. W. R. A. M. C., attached 4th South Lancashire Regiment, to Gwendolyn Gleadowing Hunter, M.B., Ch.B. Edin., eldest daughter of Dr. and Mrs. Hunter, Linsithgow, Scotland.

DEATH.

BONNY.—At Manchester, on the 15th October, following an operation, Dr. Arthur E. Bonn, late of Sidney Sussex College, Cambridge, aged 55.

DIARY FOR THE WEEK.

MONDAY.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W., 8.30 p.m.—Adjourned discussion on Gunshot Wounds of the Peripheral Nerves, to be continued by Sir Frederic Eve, Dr. Faroukh Buzzard, Dr. P. Modi, Mr. Jocelyn Swan, Mr. F. E. Roth, and Dr. S. A. E. Wilson.

ROYAL COLLEGE OF SURGEONS, Lincoln's Inn Fields, W. 5, p.m.—Demonstration by Mr. Shattock.—Actinomycosis; Leprosy.

TUESDAY.

ROYAL COLLEGE OF PHYSICIANS, Pall Mall East, S.W., 5 p.m.—Bradshaw Lecture, by Dr. Mitchell Clarke: Nervous Affections of the Sixth and Seventh Decades of Life.

WEDNESDAY.

HUNTERIAN SOCIETY, 1, Wimpole Street, W., 9 p.m.—President's Address, Dr. W. H. Kelton: Diseases of the Throat, Nose and Ear, and their Treatment in Hunter's Time; to be followed by a discussion.

ROYAL SOCIETY OF MEDICINE.—SECTION OF OPHTHALMOLOGY.—8 p.m., Cases. 8.30 p.m., Papers.—Dr. C. W. Daniels: Eye Lesions as a Point of Importance in directing Suspicion to possible Trypanosome Infection. Mr. Sidney Stephenson: A Fallacy in the Diagnosis of Glaucoma Retinæ. Dr. A. H. Thompson: Late Results of the Operative Treatment of High Myopia.

THURSDAY.

ROYAL COLLEGE OF PHYSICIANS, Pall Mall East, S.W., 5 p.m.—First FitzPatrick Lecture, by Dr. W. H. B. Rivers: Medicine, Magic, and Religion.

FRIDAY.

ROYAL SOCIETY OF MEDICINE.—SECTION OF LARYNGOLOGY.—4 p.m., Cases and Specimens.

DIARY OF THE ASSOCIATION.

Date.	Meetings to be Held.
	NOVEMBER.
10 Wed.	London: Central Medical War Committee, 2 p.m.
18 Thur.	Staffordshire Branch, Stoke-on-Trent, 4 p.m.; Dinner, 6.15 p.m.

INSURANCE.

INQUIRIES BY THE INSURANCE COMMISSIONERS INTO CHARGES AGAINST PRACTITIONERS.

CAMBRIDGE.

WE have received from the Insurance Commission, England, a communication dated October 15th, stating with regard to the inquiry held at Cambridge on August 30th, upon representations made by the Cambridgeshire Insurance Committee with reference to Dr. Robert Elwell Naish, of 125, Newmarket Road, Cambridge, that the Commissioners, being satisfied that the continuance of Dr. Naish on the list would be prejudicial to the efficiency of the medical service of the insured, have, in pursuance of the provisions of Section 15 (2) (b) of the National Insurance Act, 1911, and of the regulations made thereunder, removed his name from the list.

The communication from the Insurance Commission was accompanied by a report of the Inquiry Committee, which concludes as follows:

The following inferences of fact may in the opinion of the Committee be drawn:

(a) That Dr. Naish in breach of his contract with the Insurance Committee did not supply drugs or appliances to insured persons to whom he had agreed to supply them, and with knowledge of his omission received the payment from the Insurance Committee as if he had duly fulfilled his contract.

(b) That Dr. Naish habitually allowed insured persons to be attended at his surgery by an unqualified person, and authorized that person to prescribe medicines and to sign certificates of incapacity for work in his (Dr. Naish's) name, in cases where he (Dr. Naish) had not himself seen the patient.

LIVERPOOL.

WE have received a communication, dated October 21st, from the Insurance Commission, England, stating, with regard to the inquiry held in Liverpool on May 18th, 1915, with reference to Dr. J. D. McFeely, that the Commissioners upon consideration of the report of the Inquiry Committee, have decided not to remove his name from the list.

The Commissioners communicated their decision to the Liverpool Insurance Committee in a letter a copy of which they forwarded to us on October 21st. As it deals with matters of principle, it seems well to reproduce it in full:

National Health Insurance Commission (England),
Buckingham Gate, London, S.W.,
20th July, 1915.

Sir,

I am directed by the National Health Insurance Commission (England) to state that they have had under their consideration the report of the Inquiry Committee constituted under Part VI of the Medical Benefit Regulations to inquire into the representation made by the

Liverpool Insurance Committee with respect to the continuance on the panel of Dr. J. D. McFeely.

I am to inform you that on a full review of the facts stated, and subject to what is further set out below, the Commissioners are not satisfied that the continuance of Dr. McFeely upon the panel would be prejudicial to the efficiency of the medical service of the insured, and they have decided therefore not to order his name to be removed from the panel.

In communicating this decision, however, the Commissioners desire to make clear that this decision has regard to evidence which was given by Dr. McFeely before the Committee of Inquiry but had been withheld by him from the Insurance Committee, and that in the opinion of the Commissioners the Insurance Committee were fully justified on the facts at that time before them, in making the representation which they made to the Commissioners.

Further, the Commissioners are of opinion that the facts ascertained by the Inquiry Committee, while not collectively establishing a sufficient case for the removal of Dr. McFeely from the panel, nevertheless show that he committed a grave error of judgement, resulting in a serious disregard of the welfare of the patient for whose medical care he had accepted responsibility. It is clear that, through Dr. McFeely's persistent refusal to give direction as to the treatment of the case, the patient, whose injured finger was in such a condition that at the end of five weeks it required amputation, was throughout the greater part of that period without medical supervision, although he presented himself regularly to Dr. McFeely and received from him prescriptions and certificates, these being given without any attempt by Dr. McFeely to ascertain the condition of the wound. It is further clear that Dr. McFeely, while thus refusing to direct the treatment himself, took no effective steps to secure that the patient was placed under the care of another practitioner, and that he was aware at the same time that the patient was under no medical care.

In justification of this course of action Dr. McFeely represented that he was guided by what he stated to be the principles of medical ethics, and that, if he were at fault under his agreement with the Committee, it would only be because the obligations of that agreement are, as he would appear to suggest, incompatible with due observance of those rules of professional conduct which are generally accepted by the medical profession. Having regard to the importance of the defence thus offered, as affecting the professional position of all practitioners who enter into agreements with Insurance Committees for the treatment of insured persons, the Commissioners think it well to state that, on a careful review of the evidence given in the present case, it appears to afford no foundation for the suggestion that the obligations of a panel practitioner under his agreement are incompatible with the proper discharge of those duties towards his professional brethren and towards the community which are connoted by the term "medical ethics." Doubtless the procedure which may be appropriate for compliance with the principles of medical ethics, under the special conditions of practice

under the Insurance Act, must differ in points of detail from the procedure which would be appropriate under other conditions, just as, in the varying conditions of medical practice apart from insurance, different forms of procedure are doubtless suitable in different sets of circumstances.

In the present case Dr. McFeely appears to have been actuated by the desire to free himself from responsibility for the further treatment of a patient who, while under his care, had obtained treatment without his knowledge from another practitioner. It is recognized by the Commission, as it is also recognized not only by members of the medical profession but by all who have given due consideration to the subject, that the duties of a medical practitioner in the treatment of his patient cannot be satisfactorily performed unless, so long as he is held responsible, the medical direction of the case is left entirely with him, and any advice or treatment from other practitioners obtained under his advice or in co-operation with him. Any other procedure would not only be unjust to the doctor but may be highly prejudicial to the patient; and there will be no disposition to question not only the right but the duty of a doctor, when improper interference with his treatment has occurred, to take suitable steps, consistent with his duty to his patient, to free himself from the false position of continuing to accept a nominal responsibility for treatment of which he has not a corresponding control. If the case is one, such as may often occur in private practice, in which the relation of doctor and patient is terminable at a moment's notice, without injustice to either, it will be possible for the doctor to withdraw immediately from the case. Even, however, in private practice conditions of urgency or difficulty in obtaining other advice, or other circumstances, must often be such as to preclude a doctor, alike in professional and in lay opinion, from withdrawing at short notice; and wherever, whether in private practice, in practice under the Insurance Act, or under the conditions of tenure of appointments of various kinds, the doctor has entered into special obligations, the procedure adopted must obviously be consistent with the discharge of those obligations; clearly nothing less than this would be consonant with the ethics of any profession.

Now a panel practitioner has entered into an agreement under which he takes on himself the obligation to give treatment to any patient whom he has accepted on his list unless and until the relation thus created between them is terminated in any of the ways defined in the agreement. One of these ways is that the Insurance Committee may, on the application of the doctor, and if satisfied as to the propriety of so doing, transfer the patient to the care of another practitioner. Other provisions of a disciplinary character are also open to the Committee under the Medical Benefit Rules if they are satisfied that a patient has behaved improperly towards his doctor. It appears to the Commissioners that these provisions afforded Dr. McFeely full and sufficient opportunity for relieving himself of the responsibility for the further treatment of the patient in question, if he considered that it was his duty as a medical practitioner, in view of all the circumstances, to seek relief from that responsibility. In fact, however, Dr. McFeely, while refusing to treat the case, omitted to take any such steps as were open to him to relieve himself of the responsibility, and simultaneously to secure that the patient should receive at other hands the medical care to which he was entitled. It is not clear to the Commissioners on what ground it can be suggested that medical or other ethics required Dr. McFeely to act in this manner, or that any principle of medical ethics would have been contravened by the observance of his obligations to his patient under his agreement. On the contrary, it would seem clear that medical, no less than other ethics, imposed on him the plain duty of fulfilling his professional obligations to the man so long as the latter was his patient.

On a review of the facts as a whole, the Commissioners consider that Dr. McFeely failed on this occasion in his plain duty to his patient, committing thereby a serious breach of his agreement and of the terms of service by which the Eschequer grant to the Insurance Committee is conditioned. In pursuance therefore of the duty laid upon them by the conditions of that grant, the Commissioners have decided, in respect of this breach, to withhold from the grant payable to the Liverpool Insurance Committee the sum of £20, which it will be open to the Committee under the terms of their agreement with Dr. McFeely to deduct from the remuneration payable to him.

I am, Sir,

Your obedient servant,
(Signed) JOHN ANDERSON.

The Clerk,
Liverpool Insurance Committee.

The Insurance Committee for the city of Liverpool in publishing the above letter added thereto a schedule which reads as follows:

SCHEDULE.

Case of Dr. Joseph Daniel McFeely.

The following relevant facts appear to the Committee to have been established at the inquiry:

Dr. McFeely is a medical practitioner who has been about eleven years in practice in Liverpool. He was formerly in practice in Ireland, and was at one time Coroner for the County of Donegal and a member of the Council and the Court of Examiners of the Royal College of Surgeons in Ireland, and the holder of several surgical appointments in Irish hospitals. He is on the Liverpool panel, and is now 58 years old.

Dr. McFeely had accepted as a panel patient an insured person named Joseph Edward Fletcher Hartley, a pawnbroker's assistant, and a member of the National Pawnbrokers' Assistants' Approved Society. Hartley was employed by Mr. R. W. Perkins, a pawnbroker, of 97, West Derby Road, Liverpool. On Good Friday, the 10th April, 1914, Hartley cut the first finger of his left hand with his penknife, while trying to cut a piece of chocolate. Hartley did not see a doctor till Monday, 20th April, 1914, when he went to see Dr. McFeely. Dr. McFeely painted the finger with iodine, in order, as he explained, to prepare it for opening and to determine where would be the most suitable place to open it. Hartley went away, and a day or two later he went back to Dr. McFeely, who lanced the finger. Hartley continued to attend the doctor each day, and on the morning of the 30th April, after leaving Dr. McFeely's surgery, he went to the shop where he was employed. Hartley fainted in the shop, and his employer sent him to the out-patient department of the Liverpool Royal Infirmary. At the Infirmary, Hartley was attended by Dr. Arthur Henry Turner, at that time the Senior House-Surgeon. The finger was in a bad septic condition, and much swollen. Hartley was asked if he had been sent by a doctor, and replied that he had not. Dr. Turner thought the case should have immediate attention, and administered an anæsthetic and opened the finger in two places and scraped the bone and applied a fomentation. Hartley was then directed to attend his panel doctor. On the following day Hartley went in the evening to Dr. McFeely's surgery and asked him to dress his finger. Hartley did not tell Dr. McFeely that he had fainted in the shop, but he did tell him that his employer had sent him to the Royal Infirmary, and that he had had his finger treated there. Dr. McFeely then said: "If that is so, I will have nothing more to do with it." Hartley returned to the Royal Infirmary to have the finger dressed, and again saw Dr. Turner. Dr. Turner declined to treat him, and Hartley was instructed to go back to Dr. McFeely. On the 2nd May Hartley went to the Queen Victoria District Nurse, and the finger was treated every day for about three weeks with bandages and fomentations by the staff of that institution. During this period, Dr. McFeely gave certain prescriptions to Hartley to enable him to obtain dressings, and he also gave him certificates of incapacity so that he might draw sickness benefit, but Dr. McFeely refused to look at the finger. On the 21st May, Hartley again went to the Royal Infirmary with a nurse from the district, and the finger was examined, which was in a worse condition than when he first saw it. Dr. Turner opened the finger a second time, and scraped the bone, and Hartley was told to return on the 25th May. Hartley returned on the 25th May, when Dr. Turner found the finger still in a serious septic condition. Shortly afterwards, on the 2nd June, it was arranged by the Liverpool Insurance Committee that Hartley should be, and he was in fact, transferred from Dr. McFeely's panel, and was accepted as a patient by Dr. John Robert Henry Dubourg. Dr. Dubourg advised Hartley to see Mr. Jeans, one of the Honorary Surgeons at the Royal Infirmary, and on the 8th June Dr. Dubourg attended at the Infirmary with Hartley. After a consultation with Mr. Jeans, Dr. Dubourg amputated the finger.

On 28th May the Liverpool Insurance Committee received a complaint from Hartley, through the Secretary of his Approved Society. A copy of the complaint was forwarded to Dr. McFeely, who sent the following reply: "My answer to this is: This boy attended me from 19th April and was dressed daily. On or about the 30th he was absent for two days. On his return I informed me he had seen another doctor. I declined to have anything more to do with his finger, as he took the case out of my hands. I also informed him I declined to be dresser for the Royal Infirmary or any other institution or person." On 17th June the matter came before the Medical Service Sub-Committee, when it was adjourned. At a further meeting of the Sub-Committee, which was fixed for the 14th October, and Dr. McFeely was asked to attend. This he declined to do, stating in a letter to the Clerk of the Committee, written on or about the 8th October, that the question was one of medical ethics, and adding that neither the provisions of the Insurance Act nor the opinion of the Medical Service Sub-Committee would interfere with his private practice, either in person or otherwise. The Medical Service Sub-Committee, at their meeting on the 14th October, found that Dr. McFeely was guilty of negligence in not affording the medical treatment necessary, and had showed discourtesy in refusing to appear before the Sub-Committee, and recommended that representation should be made to the Insurance Commissioners that the continuance on the panel of Dr. McFeely would be prejudicial to the efficiency of the medical service of insured persons. This recommendation was adopted by the Insurance

Committee, and communicated to Dr. McFeely. After some correspondence, Dr. McFeely's solicitors, on the 10th February, 1915, wrote to the Clerk to the Insurance Committee stating that Dr. McFeely only acted in accordance with the usages of the medical profession in refusing to dress the finger after an operation performed by another man for which Dr. McFeely was not responsible, that he regarded the case as having been taken out of his hands, that they were instructed by Dr. McFeely to express his sincere regret that he did not wait upon the Committee, as he perceived that his failure to do so was open to misconstruction, and to state that he would in future strictly observe his agreement and the regulations incorporated therewith; they added that Dr. McFeely hoped that the Committee would accept this explanation and expression of regret, and would withdraw the representation to the Insurance Commissioners. This letter was laid before the Medical Service Sub-Committee, who reported to the Insurance Committee suggesting that no action should be taken. The letter itself was not, apparently, laid before the Insurance Committee.

INSURANCE ACTS COMMITTEE.

DRUG TARIFF.

The following letter from the Insurance Acts Committee has been sent to the Secretaries of Local Medical and Panel Committees in England, Scotland, and Wales:

28th October, 1915.

Dear Sir,

Proposed Changes in the Regulations affecting the Drug Tariff.

1. You have already been informed in our circular letter of September 7th of the proposals made by the Commissioners for alterations in the Regulations consequent upon the publication of the Report of the Departmental Committee on the Drug Tariff. The Insurance Acts Committee gave very careful consideration to the replies of the Local Medical and Panel Committees to the circular letter, and these showed that Local Medical and Panel Committees were practically unanimous in their opposition to any proposals which entailed the risk of a reduction in the remuneration of practitioners below the minimum which was promised by the Chancellor of the Exchequer in 1912—namely, 7s. per insured person per annum.

2. The Commissioners were informed of the result of this consultation of the Committees and they thereupon asked the Insurance Acts Committee to meet them in Conference on October 14th to consider the whole subject. At this meeting certain proposals were made by the Commissioners which were afterwards embodied in their Memorandum which is appended to this letter, and I am instructed to urge that your Committee should study this Memorandum very carefully. Your attention is specially directed to paragraph 10, which summarizes the proposals of the Commissioners for meeting the deadlock caused by the refusal of the chemists to continue to submit to the risk of disapproval, and the refusal of the doctors to consent to any arrangement whereby the drug bills should be made a first charge on the 9s. per head allowed for medical benefit.

3. It will be seen

(1) That the Government will guarantee (a) the doctors' minimum of 7s., and (b) the payment in full (on a commercial tariff) of the chemists' bills. The Government expects to cover this risk by the saving which it is believed will follow from the lowering of the total cost of drugs owing to the adoption of the Commercial Tariff.

(2) That the chance of the doctors in any area getting the whole part of the "floating 6d." remains exactly as at present. Prescriptions will in future require to be priced under both the present and the new tariff the former for the purpose of calculating the proportion of the Drug Fund that is to go into the Practitioners' Fund, and the latter for the purpose of paying the chemists. The additional administrative work involved will be paid for by the Commissioners.

For full particulars of the scheme I must refer you to the Memorandum of the Commissioners, but the Insurance Acts Committee has convinced itself both by a study of the Memorandum and by discussion with the Commissioners that the proposals do not in any way prejudice the position of the doctors, and that they constitute a very fair solution of an exceedingly difficult problem, namely, how to reconcile the conflicting claims of doctors and chemists.

4. It will be noted that in paragraph 11 of the Commissioners' Memorandum it is indicated that the Commissioners could not ask the Government to undertake the risk of the arrangement unless they could be assured on behalf of the profession that doctors would do all that lies in their power "to render effective the existing safeguards against extravagant prescribing as embodied in Article 40, subject to the elimination . . . of the functions

of Pharmaceutical Committees in this matter." This seemed to the Insurance Acts Committee to be a reasonable and necessary precaution. Under the present system it is to the interest of the Pharmaceutical Committee to see that the attention of the Panel Committee is drawn to cases of suspected extravagance in prescribing. But under the new system the Pharmaceutical Committee will no longer have any financial interest in preventing extravagance. Therefore unless the Government were assured by some responsible body that the remaining safeguards of the Drug Fund would be rigidly enforced the risk which it has undertaken might be a very serious one. The Insurance Acts Committee has forwarded to the Commissioners the following resolution on this question:

That the Committee will do all in its power to render effective the existing safeguards against extravagant prescribing as embodied in Article 40 of the Regulations, subject to the elimination of the Pharmaceutical Committee in the matter.

It will be realized that in giving this undertaking the Committee believed that it could rely upon the Local Medical and Panel Committees to back it up.

5. The Committee desires to point out most earnestly that the interests as well as the honour of the profession are involved in this undertaking. In the first place, experience shows that Panel Committees, by careful attention to the methods and standard of prescribing in their areas, can do much to protect the Drug Fund from abuse. In many areas they have secured to the local panel a considerable proportion of even the whole of the floating 6d. without in any way raising on the rights of insured persons to a proper supply of drugs and appliances. There is no reason why this should not be done in many other areas. Further, under the new arrangement any sums obtained from the surcharging of doctors proved to have been guilty of extravagant prescribing will go not to the chemists, as before, but into the Practitioners' Fund of the area.

6. But quite apart from the natural desire to secure if possible a share of the floating 6d. we are bound to look ahead to what may happen when the whole of the system comes under review, and it is evident that the best interests of the profession are bound up in proving that representative bodies of the profession like Panel Committees can be trusted to carry out efficiently duties which can only be properly carried out by some professional body. If as the result of the working of the promised compromise it should turn out that Panel Committees generally have not taken seriously the responsibility thrown on them under the Regulations, of preventing any abuse of the local Drug Fund, it is probable that the duties of the Panel Committee in this connexion, irksome as they are, may be replaced by some other arrangement which would be even less acceptable to the profession. For it is quite certain that no Government could allow a system of Drug Finance to be perpetuated which was proved to be wasteful.

7. We are informed by the Commissioners that Panel Committees can rely upon receiving in the future statistics as regards the prescribing in their areas at least as good as they have received in the past under the most efficient local arrangements. Thus the Panel Committee will receive periodically full information as to the cost and character of the prescribing in the area. But instead of such information coming from the Pharmaceutical Committee in the form of complaints against particular practitioners, it will be presented simply as information on which the Panel Committee must take appropriate action. Such action might or might not involve proceedings against individuals under Regulation 40, but it would necessarily involve some process of investigation into the general nature of the prescribing in the area so as to satisfy the Committee that there was or was not ground for further action.

8. It will be noted that in paragraph 10 (iii) of the Commissioners' Memorandum reference is made "to some other body or authority" which will be charged with the functions hitherto discharged by the Pharmaceutical Committees. The Insurance Acts Committee has asked the Commissioners what this "some other body or authority" will be, and gathers that it will probably be the Insurance Committee or a combination of Insurance Committees which will, however, not occupy the position of complainant as the Pharmaceutical Committee at present does, but will simply present to the Panel Committee the material on which it can proceed with its work of investigation and general supervision.

9. The Insurance Acts Committee's approval of the proposed new arrangement was subject to the understanding

that no extra cost would be thrown upon the Panel Committees in connexion with the carrying out of the new administrative details, and as regards this, satisfactory assurances have been received.

10. The new scheme, which is of course only intended to be a stop-gap during the war, was placed by the Commissioners before a meeting of the Advisory Committee composed of the medical members and those members appointed to represent Insurance Committees, and it is understood received general approval as a temporary measure. The Regulations embodying the proposed arrangements have not yet been issued, but will be carefully considered by the Insurance Acts Committee as soon as they appear, and a further communication will be sent to the Local Medical and Panel Committees if there seems to be any new point arising on which comment should be made. In the meantime the Committee trusts that Local Medical and Panel Committees generally will approve the compromise arrived at with the Commissioners, not only because of the inherent reasonableness of the arrangements, but also because the Insurance Acts Committee, after most careful consideration of the answers of the Local Medical and Panel Committees to its previous communication, has assured the Commissioners that it believes the proposed arrangement will meet with general approval.

I am, yours faithfully,

ALFRED COX,

Medical Secretary.

To Secretaries of Panel Committees,
in England, Scotland, and Wales.

APPENDIX.

MEMORANDUM FROM NATIONAL HEALTH INSURANCE (JOINT) COMMITTEE AS TO PROPOSALS WITH RESPECT TO THE POSSIBLE CHANGES OF THE REGULATIONS AFFECTING THE DRUG TARIFF.

Memorandum.

1. The time has now arrived for considering the arrangements to be made for the administration of medical benefit next year in the light of the situation created by the Report of the Departmental Committee upon the Drug Tariff.

2. That Report, in recommending certain rates of remuneration to chemists as commercial, has necessarily had important consequences as regards the present structure of the drug supply finance. If the new rates of payment are commercial, no chemist obviously can be expected to accept less; and payment of bills in full is therefore a logical and inevitable condition of commercial prices. The present financial arrangements, however, as settled for the three years, 1913-15, do not provide for payment of chemists in full. As these arrangements are based upon the principle of the distribution of a single fund among both doctors and chemists, the fact that the doctors have a prior claim upon that fund to the extent of a minimum 7s. (apart from surcharges) in each area has necessarily involved a corresponding maximum limit to the amount available in respect of chemists' bills, viz., 2s. It becomes necessary therefore, in order to secure the advantages offered by the system of commercial pricing, to provide for payment in full by abolishing the maximum limit of 2s. which at present operates in each area.

3. Under the present financial arrangements whereby the whole of the medical funds of the area are distributed among doctors or chemists, the abolition of the maximum limit of 2s. upon the chemists' share of the pool necessarily implies the corresponding abolition of the doctors' minimum limit of 7s. The effect of these changes would be that, in lieu of the doctors' minimum of 7s. being guaranteed, as at present, and the chemists taking the risk of being discounted, the doctors would be called upon to guarantee to the chemists payment in full at commercial prices for the medicines which they prescribe for insured persons.

4. Such an arrangement has been the subject of careful consideration by the Joint Committee, and of discussion between them and the British Medical Association. The Joint Committee arrived at the conclusion, as they have previously intimated to the British Medical Association, not only that such a system was sound in principle and administratively convenient but that, having regard to the substantial reduction of prices afforded by the commercial tariff, and the greater care and economy in prescribing which was bound to result from the incidence of the charges for drugs, the risk of any encroachment upon the minimum 7s. was theoretical except in the case of sheer extravagance, against the consequences of which the doctor's 7s. had never, of course, been guaranteed.

5. The British Medical Association in virtue of the relations which they had recently established with Panel Committees issued a circular to those Committees in which the nature of the problem and of its possible solutions was analytically examined,

and a series of questions asked in order to elicit the attitude of each Panel Committee towards the proposals outlined above, or any alternative suggestions. The Joint Committee are now informed by the British Medical Association that the replies received are practically unanimous in their rejection of any proposal for the abolition of the minimum of 7s.

6. These events have placed the Joint Committee in a somewhat difficult position. They are still convinced that the proposal submitted to the Panel Committees was one which practitioners might reasonably have been expected to accept if not to welcome. They recognise however that the present circumstances do not lend themselves to the necessary full discussion of any such proposals and in view of the definite opinion which has been expressed by the Panel Committees the Joint Committee have come to the conclusion that they would not be justified in now pressing their proposal upon an unwilling profession, if any alternative solution of the present difficulty would be likely to meet with general acceptance.

7. As the doctors, by insisting upon the minimum of 7s., have declined to take upon themselves the responsibility involved in conceding to chemists that assurance of payment in full which is the essential condition of commercial prices, they cannot reasonably, and, as the Joint Committee understand, they do not expect to secure for themselves the benefit of the reduction in prices under a new commercial tariff. The conclusion arrived at by the Panel Committees has thus rendered abortive the original proposal designed to secure the introduction of the commercial tariff at the beginning of 1916; and the obvious course, in the special circumstances of urgency, would have been to postpone the introduction of a commercial tariff and the further consideration of its financial basis, and to continue for the present all the existing arrangements with doctors and chemists intact, not only as regards the tariff prices, but also as regards the guaranteed minimum of 7s., together with its inevitable consequences of the discounting of chemists' bills.

8. But against this, grave difficulties of another kind present themselves. It is a matter of common knowledge that ever since the commencement of medical benefit great and increasing dissatisfaction has been evinced by the pharmaceutical profession at the discounting clause. The growing pressure against its retention was suspended upon the appointment of the Departmental Committee, and the recommendations of that Committee in favour of the abolition of discounting were hailed by the whole body of pharmacists as one reform which is indispensable to any continuance of the service of pharmacists upon the Insurance Panel. Moreover, the very recommendations of the Departmental Committee as to prices have reinforced the objections of pharmacists by enabling them to demonstrate that a continuance of the present arrangement is bound to result in the chemists in many areas receiving a lower rate of remuneration than that pronounced by the Departmental Committee to be commercial, and in many other chemists being subjected to a serious risk of similar treatment.

9. It was without surprise therefore that the Joint Committee recently received an intimation from the Pharmaceutical Society of Great Britain reaffirming the position of the Pharmaceutical profession in the matter of discounting, and emphasising the settled intention of pharmacists not to continue service any longer under any system in which discounting found a place. But the attitude in this respect of pharmacists, in conjunction with the similar attitude of the medical profession as already explained, has created a position of considerable gravity. The medical profession demand that their minimum remuneration shall be a prior charge upon the medical fund of the area; the pharmaceutical profession demand, on the other hand, that their remuneration shall have priority. The position thus arising appears to constitute a complete deadlock, and has placed the Joint Committee, in view of their desire to proceed, so far as possible, with the general consent of both parties, in a position of extreme difficulty. At other times and in other circumstances, the obvious duty of the Joint Committee would have been, after carefully balancing the considerations on the one side and the other, to decide upon the merits of the conflicting claims of the two professions, and to determine accordingly the arrangements for 1916. But short of action which would necessitate the abatement or withdrawal of the demands of one profession or the other, there appears to be one course only which will afford a solution of the deadlock; and it is this course which, with great reluctance, the Joint Committee now put forward for consideration.

10. The deadlock consists, as has been seen, in the fact that both the doctors and the chemists are demanding guarantees the responsibility for which neither side are willing to undertake. Clearly these conflicting claims can only be reconciled by some third party who is willing to give guarantees to both doctors and chemists. If the Government on full consideration could see its way to step into the breach and give the

requisite guarantees to both parties the following might be the arrangements:—

(i.) The doctors could be guaranteed their minimum of 7s. the present arrangement continuing whereby any part of the "floating" sixpence remaining after deduction of the cost of chemists' accounts, calculated on the basis of the existing tariff, is added to the minimum 7s. up to a maximum 7s. 6d.

(ii.) By pooling the balances of the drug fund in each area, remaining after deduction of any sum accruing to the doctors of that area as their share of the "floating" sixpence under (i.) above, the Joint Committee would accumulate a Central Fund out of which they would guarantee the payment of the chemists' bills in full under a new commercial tariff, the Government taking the risk of the total fund so accumulated proving insufficient for this purpose.

(iii.) Under such arrangements, since the chemists would no longer be affected by the results of any extravagance on the part of doctors in their prescribing, the local Pharmaceutical Committees would cease to discharge the functions hitherto fulfilled by them under Article 40 of the Regulations, and some other body or authority would be charged with those functions.

(iv.) It would also follow logically that any sums recovered from individual doctors by the process of surcharging should be paid in every case into the practitioners' fund of the area.

11. The Joint Committee desire to make it clear that they are not at present in a position to offer the arrangements roughly outlined above to the profession for their acceptance. They are prepared to submit to the Government that, in the exceptional circumstances, these arrangements, with the financial liabilities which they involve, should be adopted for the ensuing year. They feel, however, that they cannot in any event hope for an affirmative decision from the Government unless they can be assured on behalf of the profession that doctors, who would thus be continued through 1916 in their present position, will do all that lies in their power to render effective the existing safeguards against extravagant prescribing as embodied in Article 40 subject to the elimination as indicated above of the functions of Pharmaceutical Committees in this matter.

12. The Joint Committee take this opportunity of stating that they have now been informed by the Treasury that Parliament will be asked to vote for the year 1916 the Exchequer Grant of 2s. 6d. per insured person which has hitherto been included in the Annual Estimates under the promise given in 1914 for a period of three years.

National Health Insurance Joint Committee,
16th October, 1915.

The Committee has also addressed the following letter to the National Health Insurance (Joint) Committee:

November 1st, 1915.

Sir,

The Insurance Acts Committee has received from several Panel Committees the following resolution, or one on similar lines:—

That the Panel Committee strongly objects to the excessive deductions from the quarterly cheques, and seeing that the payments for 1914 are still unpaid therefore gives warning of the danger of combined refusal of the doctors in the county of to continue to work the Act.

The feeling of dissatisfaction conveyed by the above resolution is very widespread, as shown by a constant stream of letters from individual panel practitioners and secretaries of Panel Committees, and the Insurance Acts Committee would most earnestly press upon the attention of the Commissioners the desirability if possible of some reassurance as to the financial position both as regards arrears and future payments being given to panel practitioners before they are invited to say whether they will renew their agreements for 1916 or not.

It is evident that practitioners are not satisfied that the deductions made during the present year from the usual advances have been made on a basis which can be justified. The deduction of 30 per cent. that has been made in many areas, presumably mainly on account of recruiting, appears to be extravagant to those on the spot who have a good general notion of the rates of recruiting. Even if all the recruits obtained during the past year had been insured persons (which, of course, they were not) a 30 per cent. deduction seems to our correspondents to be indefensible.

Many panel practitioners have entered into financial commitments on the strength of the payments due to them by Insurance Committees, and the greatly reduced

income they are now receiving from this source is a very serious matter for some of them. It is freely asserted that the reduction in the payments is far in excess of any reduction in the work that is being called for by panel patients, and, in view of the fact that so many good lives have been withdrawn from the doctors' lists, even if the full amount per quarter were being paid for every insured person actually resident in an area, the relation of the payment to the work done would be greatly to the disadvantage of the doctor as compared with normal times.

On all these grounds, and more particularly because of its knowledge of a strong undercurrent of serious (and the Committee believes justifiable) discontent, the Committee would urge the great desirability, indeed necessity, of some statement being made at the present time which will allay apprehensions that panel doctors have formed as regards the future, owing to their experience during the past eighteen months. The Committee would suggest that, if possible, some statement should be made that doctors need not fear that their periodical advances will fall in 1916 below some definite rate per insured person on their lists. It is also very important that prompt steps should be taken to make a settlement for 1914.

I am, Sir, your obedient Servant,
ALFRED COX,
Medical Secretary.

The Secretary,
National Health Insurance (Joint) Committee,
Buckingham Gate, London, S.W.

IRELAND.

PAYMENT OF SICKNESS BENEFITS UNDER THE INSURANCE ACT.

THE master reported to the North Dublin Union, in reply to a letter from the Secretary of the Transport Union Approved Insurance Society, that the approved societies in Ireland had not carried out Subsection C of Section 12 (1) of the Insurance Act by making arrangements with the Dublin hospitals for the maintenance and treatment of sick insured. Section 12 (1) of the Insurance Act provides:

No payment shall be made on account of sickness disabling or materially benefit to or in respect of any person during any period when the person to or in respect of whom the benefit is payable is an inmate of any workhouse, hospital, asylum, convalescent home, or infirmary supported by any public authority or out of any public funds or by a charity or voluntary contributions.

In Subsection C workhouses, including their hospitals, were omitted from the list of institutions with which approved societies could make arrangements for the medical treatment of their sick members. The guardians complain that the approved societies have failed to make arrangements for the treatment of their sick in the city hospitals, and, contrary to the provisions of the Insurance Act, have paid sickness benefits to insured persons while undergoing treatment in the workhouse hospitals, and that consequently these institutions are overcrowded by insured persons, who, while receiving their full sickness benefits, contribute nothing to maintenance and medical treatment. The guardians recommend that the approved societies which make illegal payments of sickness benefits to their insured members while in the workhouses should be surcharged, in the hope that when insured persons found that they could not be paid their sickness benefits they would not be so ready to enter the workhouses.

ADMINISTRATION OF SANATORIUM BENEFIT.

At a recent meeting of the Dublin County Council a letter was read from the Secretary of the County Dublin Insurance Committee stating there was a grave discrepancy between the figures supplied by the Insurance Committee's estimate and that of the Insurance Commissioners for the administration of sanatorium benefit, and suggesting that a system could be devised whereby each Insurance Committee would be informed by the Insurance Commission at the commencement of each year of the approximate amount on which it could safely base its expenditure for that year. The Chairman warmly supported the suggestion, and stated that at the present time nobody was in a position to know whether the Committee had a balance to credit or whether it was in debt; in these circumstances he could not sign the recommendation of the medical officer for extended treatment for thirty patients, as it would make the Committee responsible for a sum of £150, and he did not know whether there were funds to meet such an expenditure. It was decided to

appoint a deputation, consisting of the Chairman and three other members of the council, to interview the Insurance Commissioners.

INSURANCE COMMITTEES.

LONDON.

Sanatorium Benefit and Finance.—At the meeting of the London Insurance Committee on October 28th, the principal matter debated was the report of the deputation recently appointed to interview the Insurance Commission on the finances of London insurance, which, as reported at the previous meeting (*BRITISH MEDICAL JOURNAL, SUPPLEMENT, October 2nd, 1915*), are in danger of breaking down. So far as the income of the Committee for institutional and other forms of treatment except "domiciliary" was concerned, the opinion of the deputation was that the sum available (9d. a head per annum) was insufficient; and it was further pointed out that whatever might be said as to the legal right of insured persons to sanatorium treatment, such persons were undoubtedly under the impression that they had a claim to this treatment if their medical practitioner advised it. On this point the view of the Commission was to the effect that many cases which under the system hitherto obtaining had been recommended for treatment in sanatoriums would in future be treated at dispensaries; and, furthermore, that "chronic" cases would probably have to stand aside as regards admission to sanatoriums, and be referred to the Poor Law or public health authorities in order to admit of treatment being afforded to "early" cases, in whom permanent benefit was probable. On the whole subject the Chairman of the Insurance Joint Committee (Mr. Charles Roberts, M.P.) said that it would be futile to go to the Treasury under existing circumstances for a grant of further funds. The Committee had a limited income, and must accordingly cut down or adjust its expenditure both on benefits and administration. On the motion to receive the report, some discussion took place upon the propriety of having previously issued it to the press, and Dr. Lauriston Shaw expressed the opinion that it would have been well had a statement been formulated representing a mutual agreement before anything was published. Mr. Handel Booth, M.P., warmly contested Dr. Shaw's position, and referred to the dismay and horror with which he read, in the deputation's report, the statement of the Commission with regard to placing chronic cases of tuberculosis under the Poor Law authorities. That statement did not appear in the Commission's report, and he could not understand any member of the medical profession being a party to suppressing it. The sanatorium benefit was one of the things most advertised when the Act was passed. Anybody who could make the suggestion contained in the report had failed to grasp the first principles of National Insurance. He appealed to the medical profession not to lend themselves to manoeuvring of this description. The people did not come in under the Act in order to go on the Poor Law. Dr. B. A. Richmond said that although the Act provided sanatorium benefit, that term did not necessarily mean residence in a sanatorium in every case and for any period, and Dr. Shaw explained that his own desire in suggesting an agreed report was to tie the Commission down upon certain understood facts and principles. An amendment that the report be taken back and an endeavour made to secure an agreed report was lost, and ultimately it was decided that the deputation should again be authorized to interview the Commission.

Payments to Panel Practitioners.—On the recommendation that, for the last quarter of 1915, payment be made to the practitioners at the rate of 1s. 2d. for each capitation fee, in two instalments of 8d. and 6d., an amendment by the representatives of the Panel Committee that the instalments be 10d. and 4d., in view of the fact that the second instalment would not be paid until January, was negatived.

LOCAL MEDICAL AND PANEL COMMITTEES.

LONDON.

Payment to Practitioners.—At the meeting of the Panel Committee for the County of London on October 26th some discussion arose on the question of advance payments to practitioners. The Panel Service Subcommittee recommended concurrence in the proposal of the Insurance

Committee to make to each panel practitioner during the fourth quarter of 1915 two payments in advance of the amount due to him at the rate of 8d. and 6d. in respect of each capitation fee. Dr. A. SALTER objected, on the ground that, according to his information, the funds available to the Insurance Committee for distribution would justify a larger payment. He agreed that large numbers of insured persons had been removed owing to enlistment, but, on the other hand, large numbers also had come on to the panel, including a great many women entering industrial occupations for the first time. He demanded a first payment of 10d., instead of 8d., if only because this would be forthcoming before Christmas, when practitioners, like other people, had special financial obligations. He moved an amendment embodying this demand; this was seconded by Dr. A. WELPLY, and carried by a large majority.

Alleged Excessive Ordering of Drugs.—Five practitioners were invited to attend the meeting of the Committee (four of whom accepted the invitation) to answer charges relating to the excessive ordering of drugs. Before the cases were brought forward, however, Dr. SALTER moved that the entire report of the Pharmacy Subcommittee dealing with these cases be referred back on the ground that the charges in question were fifteen or eighteen months old, and that it was grossly unfair to ask a practitioner to justify prescriptions bearing so remote a date. Moreover, when the prescriptions were written eighteen months ago, the Panel Committee had given no idea as to the quantities or items considered reasonable and sufficient. The voting on Dr. Salter's amendment resulted in 23 in its favour and 23 against, and by the casting vote of the chairman it was decided that the report should not be referred back. The investigation of the cases then proceeded. In most cases excess in quantity was alleged, but there were also instances of the use of proprietary names. In every case the explanation of the practitioner was accepted as sufficient.

At a special meeting on November 2nd some private and confidential figures were given as to the funds available for distribution by the Insurance Committee; but the Finance and General Purposes Subcommittee recommended that before reconsidering the question of concurrence the Panel Committee should request the Insurance Committee to furnish the figures necessary to enable a judgement to be formed. Dr. COWIE moved an amendment concurring in the Insurance Committee's proposal, but requesting that in future when concurrence was asked as to advance payments, all information pertaining to the registers and Medical Benefit Fund on which estimates were based should be submitted to the Panel Committee. Refusal to concur would mean distress to many practitioners owing to postponed payments. Dr. MAJOR GREENWOOD seconded the amendment. Dr. SALTER supported the original recommendation, and strongly opposed the policy of acquiescing in every demand or imposition the Insurance Committee chose to make. The situation could only be met by determined resistance on the part of the doctors. Dr. PARINSON also supported the recommendation. Dr. LAURISTON SHAW pleaded for a policy of mutual forbearance; and Dr. Cowie's amendment was carried by 36 votes to 11.

Medical Benefit Regulations, 1916.—The draft regulations issued by the Insurance Commissioners were then considered, and the Chairman (Dr. CARDALE) said that the first, relating to the commercial drug tariff, might be said to have the consent of the medical profession, through the British Medical Association; but in respect to the other two provisions there had been no consent, nor even consultation. These were (1) the provision enabling the Insurance Committee, after consultation with the Panel Committee, to require practitioners not to order drugs or appliances in such a form as to necessitate a reference back on the part of the chemist to a previous order; and (2) the addition to the medical certification rules that all certificates should be written indelibly, and the practitioner's signature written by his own hand. The recommendation of the subcommittee expressed the view that no regulation of the Commissioners affecting terms and conditions of service should be considered *intra vires* until the consent of the profession had been obtained. Dr. SALTER moved the inclusion of words, affirming that the proposed new regulations constituted a serious breach of faith on the part of the Commission, having regard to the

pledge that no contentious alterations were to be initiated or contemplated during the war. Dr. Pring seconded, but the amendment, however, was lost, and the recommendation of the subcommittee agreed to. The Committee also approved the action of the subcommittee in circularizing the practitioners, strongly advising them to make no communication in writing to the Insurance Committee as to whether they accepted or rejected the altered forms of service.

Revision of Drug Tariff.—A recommendation was carried unanimously expressing the opinion that the British Medical Association should seek for certain modifications to be made in the existing tariff prior to its use as the basis for determining the amount to be transferred from the Drug Fund to the Practitioners' Fund.

SURREY.

At a meeting of the County of Surrey Panel Committee held on October 15th it was reported that the Surrey United Friendly Societies Council and the county representatives of the Prudential Insurance Society had agreed, in the case of chronic patients, to recognize monthly instead of weekly medical certificates. The report of the Special Finance Subcommittee recommending the Panel Committee to apply to have its expenses paid out of the Medical Benefit Fund was approved.

EAST SUFFOLK.

A MEETING of the Panel Committee was held on October 12th.

Election of Chairman.—Dr. T. C. Askin (Alderton) was elected Chairman of the Committee, in the place of Dr. H. P. Helsham, resigned.

Proposed Pharmacopoeia.—The proof was approved, and it was decided that the pharmacopoeia be printed, and that a copy be sent to each practitioner on the panel.

"Open Arrangements."—The scale of fees in the fifth schedule of the Medical Benefit Regulations was adopted.

Mileage Grant for 1913.—It was reported that the basis of payment in respect of the special mileage grant, 1913, to each panel practitioner who submitted a return was 8.496d. in the shilling.

Certificates.—It was decided to communicate with the Commissioners and with the East Suffolk Insurance Committee expressing disapproval of the decision of that Committee on September 15th to inform a doctor that in future he should fill up and sign all certificates in the presence of the insured member.

ISLE OF ELY.

At a meeting of the Panel Committee held on October 12th a statement was read by the Clerk of the Insurance Committee detailing the steps taken to bring about a settlement of the balance of the 1913 accounts due to practitioners and chemists. The figures produced by the Clerk were investigated and accepted as satisfactory.

The proposed scheme for placing the drug tariff on a commercial basis was rejected, the Committee being of opinion that the practitioners' 7s. must on no account be endangered by a deficit in the drug fund.

EXETER.

At a meeting of the Panel Committee held on October 29th the Committee expressed the opinion that the Memorandum from the Insurance (Joint) Committee as to proposals with respect to possible changes of the regulations affecting the drug tariff was a fair compromise between the rival claims of the doctors and chemists.

INSURANCE NOTES.

MEDICAL BENEFIT REGULATIONS.

THE Joint Committee of Insurance Commissioners has issued draft regulations, dated October 27th, with regard to the revision of the drug tariff discussed in the communication of the Insurance Acts Committee to the Committees in England, Scotland, and Wales, and also in the letter to the Joint Committee of Insurance Commissioners, published at page 177. The regulations may be cited as the National Health Insurance (Medical Benefit) Regulations (England and Wales), 1916 (price 1d.) The draft regulations are accompanied by a Memorandum 217.1.C., addressed to Insurance Committees in England, setting out the procedure as to revision for 1916 of arrangements with practitioners on the panel and with chemists and other persons for the supply of drugs and appliances, together with a draft circular letter for transmission by Insurance Committees to practitioners.

PROPOSED AMALGAMATION OF INSURANCE COMMISSIONS.

Aberdeen.

The proposed amalgamation of the Scottish Insurance Commission with the English was discussed at the last meeting of the Aberdeen Burgh Insurance Committee, when the Finance Committee presented a report to the effect that the expenses of administration for all the countries was excessive, and that steps should be taken to reduce the costs within reasonable limits. Dr. John Gordon said that the chief economies that could be made by greater centralization would be in respect of the salaries of the officials and the cost of the central administrations. The central administration in England cost ls. 7-10d., in Scotland ls. 4d., per insured person; the salaries in England cost 59-10d., and in Scotland 83-10d. Adding these two items together, the cost in England was ls. 6d. and a fraction, and in Scotland 2s. and a fraction, or 6d. more per insured person. As the insured persons in Scotland numbered a million and a half, the 6d. meant a total of about £37,500 per annum in Scotland. If this 6d. could be saved by some method of unification, there would still be ls. 6d. per insured person for a reduced administration and salary bill in a Scottish office in Edinburgh. The Retrenchment Committee had not formulated any scheme. Proposals for retrenchment would be welcomed, but no matter what changes such economies might entail, the Government would always keep an office in Edinburgh with very considerable powers. That might be taken for granted. Such a proposition as was indicated in a resolution to be submitted at the meeting of the Scottish Association of Insurance Committees at Dundee on Saturday—namely, "That in Scotland we should be controlled by a body without knowledge of our laws and institutions"—was unthinkable. He saw no advantage in dealing with a resolution which was not based on any known facts, and he thought that it would be to choose the higher patriotism to suggest a constructive proposal, and ask for careful consideration of how economies could be practised in the administration of an Act which had admittedly been most expensive in its working.

INSURANCE ACT IN PARLIAMENT.

OVERDUE BALANCES (PAYMENTS TO PANEL DOCTORS).

SIR PHILIP MAGNUS asked the Chairman of the Joint Committee of Insurance Commissioners on October 27th whether, having regard to the reduced advanced payments to panel doctors consequent upon the depletion of the lists by virtue of the number of insured persons who had enlisted, the gratuitous treatment of necessitous dependants, and the burdens thrown upon doctors in meeting military requirements, he could see his way to accelerate the payment of balances due to medical practitioners for services rendered in the year 1914; and whether he could name a date when these overdue balances were likely to be paid. Mr. Roberts said that the special difficulties arising out of the state of war which attended the final settlement of medical practitioners' accounts for 1914 had been fully explained to representatives of those practitioners. The Insurance Commissioners were using their best endeavours to expedite the settlement by all the means within their power. Sir P. Magnus: Cannot the hon. gentleman give approximately any date when these claims will be settled? Mr. Roberts: I do not like to bind myself down to a date even approximately, but I can assure the hon. gentleman that I will do my best.

Association Notices.

STAFFORDSHIRE BRANCH.—Dr. Harold Hartley, Honorary General Secretary, Basford, Stoke-on-Trent, gives notice that the first general meeting of the session will be held at the North Stafford Hotel, Stoke-on-Trent, on Thursday, November 13th. The President, Dr. F. M. Rowland, will take the chair at 4 p.m. Business.—Resolution: That the Staffordshire Branch hereby adopts the revised rules governing procedure in ethical matters of a Branch composed of several Divisions as approved by the Annual Representative Meeting, 1915, without modification and in substitution for any ethical rules now in use by the said Branch. Exhibition of living cases. Papers.—W. Mitchell Smith: Alimentary Hygiene in Children. G. A. Carter: Nose Bleeding. S. McMurray and E. E. Young: A Case of Intracranial New Growth simulating Minera's Nystagmus. Exhibition of pathological specimens, etc. Dinner at 6.15 p.m. Charge, 5s.

GENERAL COUNCIL

OF

MEDICAL EDUCATION AND REGISTRATION.

WINTER SESSION, 1915.

Tuesday, November 2nd, 1915.

Sir DONALD MACALESTER, K.C.B., President,
in the Chair.

THE one-hundred and second session of the General Council of Medical Education and Registration began at the offices of the Council, 299, Oxford Street, W., on Tuesday, November 2nd, 1915, at 2 p.m.

PRESIDENT'S ADDRESS.

GENTLEMEN.—The President and Treasurers, acting under your instructions, have arranged that this meeting of the Council shall take place at an earlier date than usual. We hope that by next month the new building in Hallam Street may be ready for your partial occupation. It is necessary that the officers of the Council should after this week be free from other duty, in order that the transfer of our archives may be carried out with the least possible interruption to the public work of the Registration Office. Some difficulties, arising from the present industrial conditions, have delayed the completion of the building, but these are being surmounted by the efforts of our architect and builders. We are assured that the staff will be able to move into the new offices before the date now arranged for the surrender of the old. It may therefore be assumed that the present is our last session in these premises. They are associated with memories of over half a century of public service, but they have ceased to be sufficient for our growing activities, and most of us will part from them without grave regret.

The Registrar, Major King, is still on service. He is in command of a battalion of his regiment now in England, but we look for his attendance here during a part of the session.

No change has actually taken place in our membership since last June. We have, however, received intimation that our valued colleague, Sir Thomas Fraser, is about to retire after ten years' service as representative of the University of Edinburgh. As Chairman of the Pharmacopœia Committee, I may be allowed to say how greatly that body has been strengthened by the fact that it included him among its pharmacologists. He will carry with him the gratifying knowledge that the merits of the new *Pharmacopœia*, in whose preparation he bore a responsible part, are acknowledged at home and abroad, and that its adoption throughout the Empire is assured. It has already attained a circulation of some 25,000 copies.

Sir Thomas Fraser's place will be taken by Dr. Harvey Littlejohn, Dean of the Edinburgh Faculty of Medicine. We hope to welcome him at our next meeting. Dr. Sandby's term of office has expired, and for the moment he is not a member of the Council; but he has been duly nominated for reappointment, and will, I understand, rejoin us to-morrow.

ARRANGEMENTS FOR ELECTIONS.

A recent emergency Act of Parliament has made provision for postponing certain elections to public bodies which would otherwise fall to be held within the next year. The need for economy, and the absence on service of many electors, have made a measure of this nature desirable at the present time. In the case of the General Medical Council these two considerations apply with special force. The Executive Committee has accordingly called the attention of the Lord President to the fact that, in the ordinary course, two single elections at least would have to be held before the next general election of direct representatives at the end of the year 1916. It will be remembered that in the bill for amending our election procedure which was approved by the Council and passed the House of Lords, it was provided, among other things, that the sitting members should continue in office till the end of 1916, in order that thereonforth the elections of direct representatives should recur regularly at intervals of five years. This particular improvement can in the present instance be effected by an Order

of the Privy Council, as the public department concerned with the regulation of our elections. An Order dealing with the subject was issued on October 27th. It applies the Act in such a way that, even in the case of unexpected vacancies, no isolated election need be held in 1916. The Council and its branches will thus be saved the expense, and the registered medical practitioners of the United Kingdom the distraction, of such elections during the coming year. Under the arrangement set forth in the Order, the next term of office of each of the six direct representatives will begin with the year 1917; and, unless casual vacancies occur thereafter, the succeeding general elections will be brought into line once more. We are much indebted to the Lord President and the Privy Council for the consideration they have given to the Council's special difficulties arising from the unamended provisions of the Medical Act (1886).

THE WAR, THE PROFESSION, AND THE PATIENT.

The medical problems of the war continue to press on the thoughts and energies of the profession. As more men and still more answer the call of the King to take arms in the new forces, more and more surgeons are required for military service. We have it on the highest authority that, within the next few months, every qualified man of suitable age who is fit for the work of an officer in the Medical Corps will be needed. Civil practice in many of its branches must yield place to practice with the troops and in the military hospitals. The Medical War Committees in Scotland and England, which have undertaken the organization of the profession to this end, are making progress with their difficult but imperative task. They are calling on the younger practitioners throughout the country to give up their practice and prospects for war service. They are calling on the practitioners who remain behind to undertake increased labour and responsibility, that the civil population may not go unattended. They look to these civil practitioners to further and to guard, as an honourable trust, the interests of their brethren in the field. They look to the public to lighten the sacrifices and the burdens, which all practitioners must endure in these days, both by loyalty to the absent, and by consideration for those who meantime take their place. The Insurance Commissioners have recognized that certain reasonable claims made in peace times, such as that for a "free choice of doctor," can no longer be pressed; and that in the common interest of all some of the customary privileges of the insured must be restricted. When the actual situation is better realized, the public outside the insurance scheme will no doubt be ready to make similar allowances. I am informed that in the rural districts the position is better understood than in the towns; and that the proportion of country practitioners who have been set free for military service is higher than that from the large centres of population.

Safeguarding the Interests of Brother Practitioners.

It has been suggested to me that, owing to the somewhat loose attachment of the town patient to his medical man, the latter has an uneasy apprehension that if he goes into the army his patients may be alienated, and his practice absorbed by his neighbours, and that he is thereby deterred from offering himself as a volunteer. If there is any ground for this apprehension, the local Medical War Committees are endeavouring to remove it by promoting equitable agreements between practitioners who remain on civil duty and their colleagues on active service, with a view to the conservation of their respective interests. It is on every ground desirable that an arrangement of this kind should be generally adopted. The failure of any practitioner to observe it, in letter and in spirit, would certainly be "regarded as dishonourable by his professional brethren of good repute and competence." It would, therefore, according to the dictum of the Lords Justices of the Queen's Bench, form a proper subject of inquiry by this Council. But I am fain to believe that our corporate sense of obligation to those who now enter His Majesty's service, for the national defence, will be an all-sufficient safeguard of what they have committed to the trust of their fellow practitioners. The country calls for the unselfish co-operation of all ranks and classes in the common task. The profession to which we are proud to belong has given abundant proofs that it will not be found wanting in duty or in self-denial.

Canada.

As to the future supply of persons duly qualified to fill our depleted ranks, the prospects are dubious. From the British Dominions and from other countries about 240 practitioners have this year been registered in the *Colonial List* and the *Foreign List*. Orders in Council have applied the Medical Act (1886) to Ontario and Saskatchewan; and communications are daily expected from the three Western Provinces of Canada in which that Act is not yet operative, that will enable us to establish reciprocity with them. There is reason to think that, when the arrangements with the Dominion are complete, a consummation which we devoutly wish to hasten, the number of Canadian practitioners on the *Medical Register* will be considerably increased. The new men will be as heartily welcome as those who have already come to our aid from Eastern Canada, Australasia, and South Africa. But in case my words should reach any intending applicants for registration who are still in Canada, I would impress upon them the necessity of ensuring that they not only hold a recognized diploma from their provincial university or college, but are legally entitled to practise in the province itself. This last is required, as a condition of reciprocity, both by Canadian and Imperial law. The neglect of the condition has in some cases caused delay in registration, which the Registrar regrets but cannot avoid.

Medical Students.

Though the War Office authorities recognize that the withdrawal from professional instruction of large numbers of medical students, of the first three years, will have a serious effect on the future, they have deemed it inadvisable to discourage any junior student who chooses to offer himself for combatant service. There is accordingly much uncertainty among junior students as to their immediate duty. They are naturally eager to serve with their comrades in the army, but they are told that no considerable proportion of them should give up their preparation for qualified service by and by. The individual student is thus at a loss to decide between apparently conflicting claims. It is much to be desired that the army authorities should give clearer guidance on this perplexing question. I hope to have the support of the Council in the efforts I am making to procure a definite pronouncement which will set the question at rest. Many young men, who were registered as students before the war began, are meanwhile leaving the medical schools to accept commissions or to enlist in the ranks. The result is that the prospective shortage of 250 qualified practitioners per annum, which I mentioned in my last address as probable during the coming years, will almost certainly be exceeded. Women students continue to increase in number, and members of other professions are entering on the study of medicine; but the numbers of these do not make up for the loss of students already registered, who have sacrificed the prospect of early qualification in order to join the King's forces.

Probationers R.N.

In one branch of the service, to which my attention was directed by members of the Council and others, it appears likely that some economy of medical students may be effected by suitable arrangements. Our fleets include many minor vessels which are attendant on or auxiliary to certain larger units. The larger ship carries a proper surgical staff and equipment. It is thought necessary that on the auxiliary vessel a surgical "probationer" should be stationed, capable of rendering "first aid" to the injured until they can be transferred to the parent ship. For this work medical students, who have completed their physiological and anatomical studies, and have been instructed in surgical dressing, are preferred. They have joined in considerable numbers, and have approved themselves to the Admiralty as capable of valuable service of a temporary and provisional character. But it is recognized that they will be still more valuable when fully qualified for commissioned service, and that the interruption of their studies ought not to be unduly prolonged. The Medical Director-General authorizes me to make it known that any "probationer" who, after (say) six months' service, desires to present himself for a professional examination, or to resume his studies with a view to qualification, will be granted leave of absence, or be demobilized, at his own request. A less senior student

may then be appointed "probationer" in his place for a similar period of service, and at its expiry he can return to his studies in like manner. By such a rotation of service a succession of students might continue to be employed in war work that is relevant to their future profession, and the qualification of none would be unduly delayed. The requirement of the licensing bodies, that every student should act for six months as "surgical dresser," may be deemed to be fulfilled by corresponding service as a surgical "probationer."

Training of Midwives.

The absence on military duty of medical men in family practice, particularly in the country districts, will almost certainly lead to the fuller employment of certificated midwives. It is the more important that the training of these women should be adequate for the work they will be called to undertake. The Central Midwives Board for England has framed new rules providing for an extension of the course of instruction proscribed for its certificate. The rules have been transmitted by the Privy Council for the opinion of the English Branch Council, in accordance with the statute, and will be duly considered by it during the present session.

In Scotland there is as yet no corresponding statute. No official certificate of fitness can be obtained by midwives in Scotland, and no central or local supervising authority regulates their practice. A woman trained in Scotland may obtain the Central Board's certificate by examination in England, but when she returns to practise in Scotland she ceases to be under the English Board's rules and supervision. The Council has urged the importance of legislation that will apply to Scotland the principles of the English Midwives Act, and it has carefully considered and approved a bill for the purpose which has for some time been before Parliament. The need for the bill was apparent from the fact that the ratio of maternal deaths to registered births in Scotland is half as large again as it is in England. The conditions created by the war, more especially in the Highland and rural districts, have made the need more apparent than before. Strong representations have been made to the Government by leading members of the profession, in favour of proceeding with the Scottish bill in the current session of Parliament, on the ground that an emergency exists which ought to be provided for without delay. When, as your President, I was consulted on the subject by the authorities, I reminded them of the declarations on the Scottish bill which were communicated to the Lord President by this Council. I did not hesitate to express my conviction, based on some knowledge of the Highlands and Islands Medical Service, that the claim for urgency was well founded, and my belief that the Council would welcome the speedy passing of the bill into law.

DISCIPLINARY CASES.

A case which will come before you for inquiry, at the instance of the Central Midwives Board, raises an important question concerning the responsibilities of practitioners in relation to women whose certificates as midwives have been withdrawn. Most of the facts of the case have been ascertained in another court; it will remain for the Council to pronounce on their professional bearing. The other penal cases arise from repeated convictions for misdemeanour, and will involve no prolonged judicial investigation on your part.

Instances have come to the knowledge of the Registrar in which persons whose names have on account of misconduct been erased from the *Register* have migrated to other parts of the empire, and have there succeeded in obtaining registration in virtue of qualifications they no longer possessed. It has been the regular practice of the Council to forward, through the Colonial Office, copies of the *Erasure List* for confidential use by Government officers of the Overseas Dominions. It appears that, owing to administrative and other changes, the List did not in all cases reach the medical registration authorities concerned, and that these were therefore unaware of the action taken by this Council. The Acting Registrar, in consultation with the Colonial Office, has now succeeded in making arrangements which will ensure that all the registration authorities of the empire shall be regularly notified of your judicial decisions regarding the removal of names from the *Register*. A necessary check upon

fraudulent misrepresentations will thus be placed at the disposal of our medical colleagues beyond the seas.

DENTAL EDUCATION AND EXAMINATION.

The preoccupations occasioned by the war have probably prevented some of the licensing and teaching bodies from giving full attention to the important question of dental education and examination, raised last year by Dr. Newsholme. The returns asked for by your authority are still incomplete in some respects. Such as they are, they have been transmitted to your Standing Committee for consideration and report at this session.

THE APOTHECARIES' HALL, DUBLIN.

The deliverance of the Council regarding the course of study and examinations required for the qualification of licentiates of the Apothecaries' Hall, Dublin, made in terms of Section 20 of the Medical Act (1858), was duly communicated to that body by your direction. A reply has been received which I have referred to the Examination Committee for its information. The Committee may, if it thinks fit, prepare a report on the reply; or it may advise that the reply should be laid before the Council for immediate consideration. In either case copies will be placed in the hands of all the members of the Council.

FINANCE.

In conclusion, I note with satisfaction that the financial position of the Council and its branches, notwithstanding the times of stress through which we are passing, appears to be sound. Your treasurers and the Finance Committee, with the help of the solicitor, have had some anxious and delicate negotiations to carry through, in reference to the investments and other property of the Council, and to the funds for the erection of the new building. But the difficulties have been surmounted, thanks largely to skilful administration on the part of your trustees and treasurers, with the result that we have been able to bear a share of the national burden by making a substantial contribution to the recent war loan. To attain this result, certain readjustments of our assets and liabilities have been made. These will be explained to you *in camera*. They necessitate a very careful husbandry of our resources for some time to come; but in view of the public exigencies, I feel sure that members will cheerfully acquiesce in the limitations imposed by "war-time economy."

INSTRUCTION IN MEDICAL ETHICS.

Dr. McVAIL moved:

That it be remitted to the Education Committee to report to the next meeting of Council on the education of medical students in the ethical relationships of medical practitioners to the State, to their patients, and to each other.

Dr. McVail said that the subject of the education of medical students in medical ethics was obviously within the sphere of the General Medical Council, and his reason for bringing it before the Council at that moment was his experience of the importance of the teaching of medical ethics in the Public Health Service, and more recently under the Insurance Act. Its importance was growing. When notification of infectious disease was first introduced the profession were brought into relation with the State more closely than ever before. When the notification was made compulsory in all areas throughout the country, the relation of the doctor to the State became still closer. Notification of infectious disease cost the community a large amount of money. Its purpose was the prevention of infectious disease. It was manifestly important that notification should be so used and the money should be so spent as to achieve the best possible results. These results depended on the action, on the one hand, of the notifying practitioner, and on the other, of the officers of the Public Health Service. Promptitude and accuracy of notification were of the first importance with regard to the prevention of disease. When a teacher had before him a group of students, he had to recognize that some of them would become general practitioners, others would become medical officers of health, or officers of public institutions, including hospitals for the prevention of infectious disease. It was desirable that teachers should point out to students, whether in one capacity or the other, that they had a duty towards the State. In the case of the general practitioner it was promptitude and accuracy. In the case of the medical officer of health or officer to a hospital for infectious disease the duty was so

to deal with his professional brother who had made the notification that the practitioner should receive no harm from an occasional error. In his own experience he had found that a practitioner in his anxiety to prevent the spread of infection had notified, no doubt somewhat prematurely, a case of infectious disease, or had notified a case of illness as being of an infectious character, and the case turned out not to be as notified; the patient was sent home incontinently, and that brought discredit on the practitioner who in all good faith had been trying to help the public authority. That same doctor some time afterwards sent at one time by one post notification of several cases of enteric fever in one house. He was asked why he had not notified the first case earlier. He replied that he was going to take very good care not to notify any case until absolutely certain; he would rather risk disease than have his reputation attacked as it had been previously when he had been somewhat early in his notification. That was one instance among others he might quote. Sometimes there was a question as to the fitness of a patient to be removed to hospital. In that case the M.O.H. and the general practitioner should be brought into proper relationship. The general practitioner might have been partly influenced by the desire that the patient should stay at home and not be taken to hospital, and not have taken into full consideration the influence of the spread of disease if the case remained. There, if possible, the M.O.H. should in a town meet the general practitioner, or in the country should try to get in touch with him. In Scotland the medical officer of health had a right of entry to any house where there was reason to suspect the existence of infectious disease. In that case it was also important that both the M.O.H. and the general practitioner should be brought into contact so that no ill feeling might exist between them. Those were only details, and the importance of them depended partly on whether the medical officer was a whole-time or part-time official. When tuberculosis became notifiable, first pulmonary tuberculosis and then all forms, there was a manifest increase in the closeness of the relation of the doctor to the State. The doctor of a sanatorium had recently deplored to him the fact that nearly 75 per cent. of the cases notified in the particular area were notified after the disease was advanced. It was very important that teachers should impress on medical students the desirability, in the interests of the public welfare, of early notification. But even there it was conceivable that a little difficulty might arise, for the practitioner had to think of his patient's personal welfare besides the welfare of the public, and it might be an ethical question of some delicacy whether he was bound to notify at once. That was not for discussion now, but it was a point on which there should be education. It might be a question of the interest of the patient *versus* the public interest. Under the Insurance Act there had been a further extension of the contact between the practitioner and the State. The question of certification had seemed so important to the General Medical Council that in its wisdom it had added to its notices by calling attention to certification under the Insurance Act, and that was a matter *vis à vis*, not properly dealt with, might bring the individual under the cognizance of the Council. Here again a practitioner might be in a difficulty. He had to protect the funds of the approved society (of which he was not an official on the one hand, and he had to think of the relation of the doctor and patient on the other. Those were obvious cases. Sir Clifford Allbutt, in an introduction to an encyclopædia of medicine, had dealt with the indiscriminate use of drugs in this country, and the view indicated was that there was far too much drugging; that applied alike to the insured and uninsured population. Whether Sir Clifford Allbutt thought it was a question of medical ethics with regard to what medical men should do to limit the desires of the patient in the matter of the consumption of drugs was not clear; but obviously there was room for a good deal of difference looking to the comparatively small quantity of drugs used in Scotland as against those used in England. The General Medical Council had an interest in the whole subject, because it was very important that penal cases should be diminished, and if by education of students this could be brought about the Council would be doing a good turn to its successors in office. Generally it would be of importance, looking to the constantly increasing

duities of the general practitioner, in some way or other the desirability of acquiring business habits could be inculcated into his mind. Those were his reasons for the moving of the recommendation. What was suggested was that the Education Committee should find out in the first place what were the facts. What kind of education was being given on the subject in the different schools of medicine in the country? What was the scope of the education, and by whom was it being given, by the holder of what chair, by what lecturers? Having found the facts the Education Committee might consider whether the education should be compulsory or optional. His own feeling was that it should be compulsory, but that was subject to what the Education Committee might report. If that were so the question would further arise, Should it be the function of one chair or lectureship or divided among several lectureships? So far as the State was concerned it appeared that the subject had a natural relationship to the chair of medical jurisprudence, and where it happened, as in some teaching schools, that medical and public health students were taught by the same man, the relation of the subject to the chair was even closer. The question would arise, How much education, in an already overcrowded curriculum, should be given to the subject? That was a matter on which the Education Committee might advise the Council. From a considerable experience of examination in medical jurisprudence and public health he thought that in jurisprudence something less might be done in toxicology, as analysis of the contents of the stomach in suspected cases of poisoning was really outside the future work of the ordinary practitioner.

Dr. VERELL, as one of the direct representatives on the Council, representing a large number of practitioners doing general practice for the most part, had great pleasure in seconding the motion. In the form the motion was put before the Council it proposed nothing more than to establish a *prima facie* case for inquiry to be conducted by the Education Committee. He did not think there would be any one in England in consulting practice, general practice, or any other form of practice, who did not feel that few were able to decide in difficult cases without instruction what was the right course to adopt towards their patients, their brothers, and themselves. Many sources of friction would be avoided if some general standard could be attained by instruction such as was suggested, and if, on the other hand, patients could understand that there were some general principles by which the profession generally and all its members were prepared to abide, and although they could not control the acts of their patients it should be understood that any departure from those principles were not departures that the Council would be prepared to support.

On the motion of Dr. MACKAY, seconded by Dr. MACDONALD, the discussion of the motion was adjourned.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

In the ninety-six largest English towns 7,404 births and 4,616 deaths were registered during the week ended Saturday, October 23rd. The annual rate of mortality in these towns, which had been 14.9, 14.9, and 15.9 per 1,000 in the three preceding weeks, fell to 13.6 per 1,000 of the week under notice. In London the death-rate was equal to 13.8, while among the ninety-five other large towns it ranged from 6.1 in Wimbledon, 6.2 in Leyton, 6.6 in Edmonton, 7.4 in Hain, 7.5 in Ipswich, and 7.6 in Lincoln, to 17.5 in Bury, 18.5 in Abingdon, 19.0 in Liverpool, 19.1 in Sunderland, 20.2 in Stockton-on-Tees, and 21.0 in Blackpool. Measles cause 1 death-rate of 2.9 in Barnsey and diphtheria of 1.5 in Coventry. The deaths of children under 2 years from diarrhoeal diseases and the London Fever Hospital, which had been 2,758, 2,333, and 3,014 at the end of the three preceding weeks, and further risen to 3,110 on Saturday, October 23rd; 462 new cases were admitted during the week, against 382, 468, and 453 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In the sixteen largest Scottish towns 1,060 births and 708 deaths were registered during the week ended Saturday, October 23rd. The annual rate of mortality in these towns, which had been 14.3, 16.3, and 15.5 per 1,000 in the three preceding weeks, rose to 15.7 in the week under notice, and was 2.4 per 1,000 above that recorded in the ninety-six large English towns. Among the several towns the death-rate ranged from 5.0 in Motherwell, 8.9 in Kirkcaldy, and 10.3 in Perth, to

19.9 in Clydebank, 24.5 in Hamilton, and 24.7 in Greenock. The mortality from the principal infectious diseases averaged 1.8 per 1,000, and was highest in Hamilton and Greenock. The 323 deaths from all causes in Glasgow included 14 from infantile diarrhoea, 8 from scarlet fever, 4 from measles, 4 from diphtheria, and 2 from enteric fever. Five deaths from measles were recorded in Edinburgh, 5 in Greenock, 5 in Hamilton, and 2 in Ayr; from scarlet fever 7 deaths in Aberdeen; from whooping-cough 2 deaths in Aberdeen; from diphtheria 2 deaths in Dundee; and from infantile diarrhoea 5 deaths in Greenock and 4 in Dundee.

HEALTH OF IRISH TOWNS.

During the week ending Saturday, October 9th, 517 births and 375 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 659 births and 426 deaths in the preceding period. These deaths represent a mortality of 16.0 per 1,000 of the aggregate population in the districts in question, as against 18.3 per 1,000 in the previous period. The mortality in these Irish towns was therefore 1.1 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate, on the other hand, was equal to 22.2 per 1,000 of population, as for mortality of individual localities, that in the Dublin registration area was 18.7 (as against 19.6 for the previous four weeks), in Dublin city 20.5 (as against 21.2), in Belfast 16.3 (as against 14.6), in Cork 19.0 (as against 20.5), in Londonderry 17.7 (as against 15.9), in Limerick 8.1 (as against 14.3), and in Waterford 5.7 (as against 14.7). The zymotic death-rate was 2.5, as against 3.2 in the previous period.

During the week ending Saturday, October 16th, 609 births and 345 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 517 births and 375 deaths in the preceding period. These deaths represent a mortality of 14.8 per 1,000 of the aggregate population in the districts in question, as against 16.0 per 1,000 in the previous period. The mortality in these Irish towns was therefore 0.9 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth rate, on the other hand, was equal to 26.2 per 1,000 of population, as for mortality of individual localities, that in the Dublin registration area was 18.5 (as against an average of 19.7 for the previous four weeks), in Dublin city 19.7 (as against 21.5), in Belfast 12.6 (as against 14.6), in Cork 11.6 (as against 19.7), in Londonderry 21.5 (as against 16.4), in Limerick 16.2 (as against 17.1), and in Waterford 17.1 (as against 12.8). The zymotic death-rate was 1.8, as against 2.5 in the preceding period.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Staff Surgeon R. L. Jones to the *Flyde*, additional, for disposal. Temporary Surgeon P. R. Murphy, M.B., to the *Albatross*, A. C. Veitch, A. C. Barker, M.B., A. R. S. Warder, H. E. B. Finlayson, G. G. Menbury, M.D., T. Gwynne Jones, S. L. Baker, and E. I. Caldwell-Smith to the *Victory*, additional, for Haslar Hospital; R. W. Brander, M.B., to the *Columbine*, D. M. G. St. John, M.B., to the *Albatross*, W. H. St. John, M.B., to the *Defence*, vice Milligan; W. H. Steel, M.B., to the *Penbroek*, additional, for Chatham Hospital.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon Probationer G. Burton to the *Melina*. To be Surgeon Probationers: J. H. L. Shapiro, H. S. Flewiler, B. Donovan.

ARMY MEDICAL SERVICE.

Colonel H. O. Trevor, on completion of four years' service in his rank, is retained on the active list under the provisions of Article 129 Royal Warrant for the Army Medical Service, and to be supernumerary.

ROYAL ARMY MEDICAL CORPS.

Major F. S. Irvine, M.B., to be temporary Lieutenant Colonel whilst Commandant of the Training Establishment. Temporary Major G. E. Miles to be temporary Lieutenant Colonel. Captain R. E. Kelly, M.D., F.R.C.S., R.A.M.C.(T), to be temporary Major. Major T. Mackenzie, M.D., the King's (Liverpool Regiment) (T.F.), to be temporary Major. Surgeon P. G. S. Hayes, Reserve of Officers, to be temporary Major whilst in command of a field ambulance. Temporary Lieutenant R. T. McKenzie, M.D., to be temporary Major. W. M. Flack, M.B., is granted temporarily the honorary rank of Captain. To be temporary Captains: B. H. Slater, M.B., F.R.C.S., G. D. Laing, M.D., H. Upcott, F.R.C.S., temporary Lieutenant J. A. Longley, M.B., F.R.C.S.E.

To be temporary Honorary Lieutenants to be temporary honorary Captains whilst serving with No. 1 British Red Cross (Duchess of Westminster's) Hospital: J. S. Burn, D. M. Stone, J. Erlank. Temporary honorary Captain W. S. Armstrong, from the Australian Voluntary Hospital, to be temporary Captain. To be temporary Lieutenants to be temporary Captains: E. J. Wyler, M.D., N. P. Boulton, M.B., S. P. Stoker, M.B., P. C. Link, M.B., E. E. Holden, W. C. Horton, M.B., S. F. C. St. E. Wilson, M.B., F.R.C.S.E., W. H. Smith, M.B., R. W. Fussell, M.B., J. H. Richards, M.B., M. Melland, M.D., J. B. Heygate, R. C. Verley, M.B., J. Gully, G. D.R., Carr, D. H. Hadden, M.B. To be temporary Lieutenants: D. Meek, M.B., A. H. Bentoni, M.D., F. G. Smith, J. J. W. Jones, M.B., A. F. Hewitt, M.B., V. Shipton, M.B., T. Woodman, M.D., G. J. Marsh, F. L. Sessions, O. Pitt, I. N. Fraser, M.B., A. M. Drennan, W. B. J. Templeton, A. Snow, Macphail, M.B., E. W. Wright, M.B., S. Svensson, M.B., H. B. Macleod, M.B., G. Stenhouse, M. H. Richmond, M.B., M. Turbhill, M.B., J. H. Iles, M.B., W. Landsborough, M.B., H. Barr, M.B., T. B. Dakin, W. F. Gibb, H. C. Addison, J. H. Legge, M.B., G. M. Murray, M.B., M. A. Macdonald, W. Astin, M.B., W. E. Dinwood, W. H. Flewiler, M. B. Brown, M.B., G. M. Gilliam, M.B., Pages, D. P. Price, M.B., A. Naismith, M.B., J. W. Miller, M.B., G. C. Neilson, M.B., R. D. Hodge, M.B., W. Hamilton, M.B., F. C. Merrall, M.B., A. Muir, M.B., T. Macphail, M.B., W. B. Mackenzie, M.B., M. G. G. G. G. Buchanan, M.D., W. L. Partridge, T. H. Gandy, M.B., H. B. Smyth, R. C. McMillan, M.B., S. S. Devere, M.B., W. J. Greshy, J. Boyd, F. R. C. E. G. A. Barres, M.D., W. J. Rutherford, M.D., Temporary Second Lieutenant C. H. H. Jackson, M.B., M. G. G. G. Fenwick, M.B., J. C. Poulden, M.D., J. A. Jones, M.B., F.R.C.S.E., G. Henderson, M.B., F. J. Morris, M.B., H. D. Wyatt, A. C. Norman, M.D., F. R. Barwell, B. E. A. Bell, M.B., C. L. S. James, F. J. A. Keane, M.D., P. W. Stocks, E. Caudwell, B. Brew, M.B., E. A. Anderson, M.B.,

H. Mitchell, M.B., W. F. Wilson, M.D., W. L. Scott, M.D., G. Bateman, M.B., W. E. C. Mason, W. F. Moore, M.D.
 Lieutenant J. C. Micklethorp, M.B., from the Prince of Wales's Volunteers (South Lancashire Regiment), Special Reserve, to be temporary Lieutenant substituted for the notification published in the *London Gazette* of July 13th.
 Temporary Honorary Lieutenants to be Lieutenants: G. C. Wells-Cole, G. D. East, H. J. Bower.
 G. S. Marshall to be temporary honorary Lieutenant substituted for the notice regarding this officer published in the *London Gazette* of September 8th.
 The notifications regarding temporary Lieutenants J. I. Johnson and C. Mckerrow published in the *London Gazette* of September 20th and October 5th respectively are cancelled.
 To be temporary honorary Lieutenants: E. G. Barker, G. W. Juggins, F. K. Marriott, G. E. Spicer, G. M. Vecvers.

INDIAN MEDICAL SERVICE.

The services of Major W. C. Rosa, M.B., are placed at the disposal of the Government of Bihar and Orissa for employment in the Sanitary Department.

Lieutenant-Colonel W. H. B. Robinson is appointed to be temporary Colonel whilst Deputy Director, Medical Services, in Egypt, with effect from January 16th, 1915.

Colonel T. G. Dawson, I.M.S., to be Deputy Director of Medical Service, vice Colonel H. Headley, I.M.S.

Major E. J. Morgan, M.B., has been permitted to retire from the service, with effect from October 1st.

Lieutenant P. J. Walsh, M.B., was killed in action in France on September 20th, 1915.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Lieutenant T. D. Inch, M.B., to be Captain (substituted for notice published in the *London Gazette* of September 9th).

Lieutenants on probation continued in their rank: R. F. Walker, M.B., J. P. Scobie, M.B., B. B. Mackenzie, M.B., A. L. Mackenzie, M.B., W. W. Blair, M.B., to be Lieutenants on probation.

Lieutenant D. Mackie to be Captain, with seniority next below J. Taylor substituted for notification published in the *London Gazette* of July 26th.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Lieutenant (City of London General Hospital)—E. C. Hughes, F.R.C.S., to be Captain, whose services will be available on mobilization.

Home Counties Field Ambulance.—To be Captains: Lieutenant H. T. N. Merrick, M.B., Lieutenant (temporary Captain) C. Killick, M.D., F.R.C.S.

North Midland Field Ambulance.—T. E. A. Carr, M.B. (late temporary Lieutenant, R.A.M.C.), to be Lieutenant.

South Western Mounted Brigade Field Ambulance.—Lieutenant W. A. Miller to be Captain.

Wessex Field Ambulance.—Lieutenant E. H. Schofield, M.B., to be Captain.

West Lancashire Field Ambulance.—Major C. H. Lindsay, M.B., to be temporary Lieutenant-Colonel.

East Lancashire Field Ambulance.—Lieutenants to be Captains: W. L. Cokeroy, J. Cowan.

West Riding Cavalry Clearing Station.—Major J. Mackinnon to be temporary Lieutenant-Colonel. Lieutenant P. McEwan, M.B., F.R.C.S.E., to be Captain.

West Riding Field Ambulance.—Major J. Mackinnon to be temporary Lieutenant-Colonel.

Scottish General Hospital.—Lieutenants to be Captains: H. J. A. Longmore, M.B., D. W. Berry, M.B., C. M. Nicol, M.D.

Attached to Units other than Medical Units.—Major A. C. Hartley, M.B., is seconded. Lieutenants to be Captains: W. D. Frew, D. C. Freeman, M.B. To be Lieutenants: W. C. D. Hills.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements)—Important Notice re Appointments appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

BRISTOL ROYAL INFIRMARY.—(1) House-Physicians. (2) House-Surgeons. (3) Dental House-Surgeon. Salary, £120 per annum in each case.

BURLEY: VICTORIA HOSPITAL.—House-Surgeon. Salary, £135 per annum.

CHESTER ROYAL INFIRMARY.—House-Surgeon. Salary, £125 per annum.

DEYSBRIE HOSPITAL FOR SICK CHILDREN. Lady Resident Medical Officer. Salary, £150 per annum.

DUDLEY: GUEST HOSPITAL.—(1) Senior Resident Medical Officer; salary, £150 per annum. (2) Assistant House-Surgeon; salary, £120 per annum.

FOLKSTONE ROYAL VICTORIA HOSPITAL.—House-Surgeon. Salary, £200 per annum.

GREAT YARMOUTH HOSPITAL.—House-Surgeon (male). Salary, £200 per annum.

GREENHITHE: INGRESS ABBEY MILITARY HOSPITAL.—House-Surgeon. Salary, £200 per annum.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton.—(1) Assistant Resident Medical Officer; salary, £100 per annum. (2) House-Physician; honorarium, 30 guineas for 12 months.

HOSPITAL FOR WOMEN, 50 Square, W. Resident Medical Officer. Salary at the rate of £80 per annum.

KIRKHAMBECK PARISH.—Medical Officer. Salary, £40 per annum.

LEAMINGTON SPA: WARNEFORD GENERAL HOSPITAL.—Resident Medical Officer. Salary, £300 per annum.

LUDDS PUBLIC DISPENSARY.—Lady Resident Medical Officer. Salary, £130 per annum.

LONDON COUNTY COUNCIL.—Assistant Organizers of Children's Care Work. Salary, £100 per annum, rising to £130.

LONDON EYE HOSPITAL, 100, Strand, W.C.—Assistant Resident Medical Officer. Salary, £200 per annum.

NORTHUMBRELAND COUNTY ASYLUM, Morpeth.—Junior Assistant Medical Officer (female). Salary, £250 per annum.

QUEEN CHARLOTTE'S LIVING-IN HOSPITAL, Marylebone Road, N.W.—Assistant Resident Medical Officer. Salary, £50 per annum, rising to £80 on promotion to senior.

SHETLAND: WHALSAY PARISH.—Medical Practitioner. Guaranteed income £300 by the Highlands and Islands (Medical Service) Board.

SHREWSBURY DISPENSARY.—Medical Officer.

SOUTHAMPTON: FREE EYE HOSPITAL. House-Surgeon Salary, £100 per annum.

SUNDERLAND: MONKWEARMOUTH AND SOUTHWICK HOSPITAL. House-Surgeon. Salary, £150 per annum.

VICTORIA HOSPITAL FOR CHILDREN, 17, St. Street, S.W.—(1) Senior Resident Medical Officer. (2) House-Physician. Salary, £250 and £200 per annum respectively.

WEST HAM AND EASTERN GENERAL HOSPITAL, Stratford.—House-Physicians and House-Surgeons. Salary, £120 and £100 per annum respectively.

WIGAN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Lady House-Surgeon. Salary, £150 per annum.

CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointment: Todmorden (York), West Riding.
 To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

COHEN, Eveline R., M.B., Ch.B., Edin., temporary Resident Medical Officer of the Brighton Borough Sanatorium.

KENNETT, T. M.B., Certifying Factory Surgeon for the Ballyfeard District, Co. Cork.

MACMAHON, Grant, M.B., Ch.B., Aberd., Chief Medical Officer to the Great Eastern Railway Company, and Medical Officer to the Employers' Liability Assurance Corporation, Limited.

MCRAGGAN, D. F., M.B., Ch.B., R.C.I., Certifying Factory Surgeon for the Letterkenny District, Co. Donegal.

NASH, R. E., M.B., B.C., Cantab., Honorary Physician to the Sheffield Royal Hospital, vice Dr. Burgess, resigned.

NELSON, J. L., B.C., Edin. & S.I., Certifying Factory Surgeon for the Monmouth District, Queen's County.

O'KEEFE, C. E., L.R.C.P. & S.I., Certifying Factory Surgeon for the Trip District, Co. Herts.

SAYED, F. H., M.R.C.S., J.R.C.P., Resident Medical Officer of the Molesey Sanatorium of the Staffordshire, Wolverhampton, and Dudley Joint Tuberculosis Committee.

SCOTT, W. Macgregor, L.A.H. (Irel.), L.M., Certifying Medical Officer to the Lancashire Asylums Board under the Mental Deficiency Act, 1913, vice William Whitford, M.D., resigned.

SIBBALD, T. R. S., M.D. Edin., Certifying Factory Surgeon for the Bankfoot District, Co. Perth.

SPEICER, C. S., I.M.S.S.A., District Medical Officer of the Ashton-under-Lyne Union.

EDINBURGH ROYAL INFIRMARY.—The following appointments have been made: Resident Physicians; John McGarrity, M.B., Ch.B., to Professor Russell; A. Fraser Campbell, M.B., Ch.B., to Sir R. W. Philip; Resident Surgeons; Edward J. Clark, M.B., Ch.B., to Dr. A. H. F. Harbour; C. F. Macdonald, M.B., Ch.B., to Professor Thomson; A. J. M'IVOR (final year student), to Mr. Dowden; R. B. Eadie, M.B., Ch.B., to Mr. Miles; Miss Mary M. M'Turpie, M.B., Ch.B., non-resident House-Surgeon to Dr. Sym.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s., which sum should be forwarded in Post Office Orders or Stamps with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

DEATH.

THORP.—On October 22nd, 1915, at Dolroyd, Todmorden, Charles William Thorp, M.D., F.R.C.S., J.P., aged 73 years.

DIARY FOR THE WEEK.

TUESDAY.

MEDICO-LEGAL SOCIETY, 11, Chandos Street, W., 5 p.m.—After some opening remarks by the President, Professor Harvey Littlejohn, a discussion on "Drunk" in the eyes of the law will be opened by Dr. F. Smith.

ROYAL COLLEGE OF PHYSICIANS, Fall Meeting East, S.W., 5 p.m.—Second FitzPatrick Lecture by Dr. W. H. R. Rivers: Medicine, Magic, and Religion.

WEDNESDAY.

HUNTERIAN SOCIETY, 1, Wimpole Street, W.—Paper: Dr. Russell Wells: Clinical Electro-cardiography.

DIARY OF THE ASSOCIATION.

Date. Meetings to be Held.

NOVEMBER.

10 Wed. London: Central Medical War Committee, 2 p.m.

13 Thur. Staffordshire Branch, Stoke-on-Trent, 4 p.m.; Dinner, £15 p.m.

GENERAL COUNCIL

OF

MEDICAL EDUCATION AND REGISTRATION.

WINTER SESSION, 1915.

Sir DONALD MACALISTER, K.C.B., President,
in the Chair.

INSTRUCTION IN MEDICAL ETHICS.

The discussion on Dr. McVail's motion (SUPPLEMENT, November 6th, p. 182) to instruct the Education Committee to report on the education of medical students in the ethical relationships of medical practitioners to the State, to their patients, and to each other, was resumed on November 4th.

Dr. MACKAY said that he thought the medical man's duties to the State were well defined, and in every medical school in the country it was explained to the students in the classes of medical jurisprudence and public health. The motion seemed to look at the ethical side of the relation of the medical man to the State in general as a special kind of citizen, and then to his fellow practitioners and to his patients. The moral relations of the medical man were hardly susceptible of special treatment. The principles of ethical or moral behaviour were as old as the days of the New Testament, and those principles depended upon kindness of heart and gentlemanly feeling, which was summed up in the words "Do unto others as you would they should do to you." Many of the public were already inclined to believe that medical etiquette was a system of rules comparable to trade union rules, designed for the purpose of enabling the medical man to make as much as he possibly could out of the public, and any step which would show that special classes were required to teach medical men morality would be strengthening that view. Unhappily there were many medical men who did not live up to the standard of medical etiquette, and for many reasons, not confined to the medical profession, here and there were found citizens who had fallen away from the ideal that should lie before them. If the Council thought it would be an advantage to give special instruction in ethics, the Education Committee would do all it could; but he was a little doubtful as to the advisability of the course proposed.

Dr. MACDONALD agreed with Dr. Mackay, and thought it would be wasting the time of the Education Committee to ask it to bring up a report on the subject.

Dr. KNOX, while agreeing as to the uselessness of teaching or lectures on the subject, sympathized very strongly with the underlying idea which had prompted Dr. McVail to propose the motion. The proper method to meet the desire of Dr. McVail would be to embody the various points in a pamphlet which would be bought by students and studied by them; the influence of the information would not be so fleeting as if it were heard at a lecture.

Dr. CASH thought teaching necessary and Dr. McVail's form of procedure the best. It would make a much greater impression if students attended lectures than if they had a twopenny pamphlet put into their hands. He most heartily supported the proposal that the matter should be referred to the Education Committee.

Mr. HOODSON was in complete accordance with Dr. McVail's motion, which opened up a case for inquiry,

but suggested that Dr. McVail and Dr. Newsholme should be added to the Committee for this purpose, and the addition at the end of the motion of the words, "and that the Committee have power to make such inquiries on the subject as it deems advisable."

Sir CLIFFORD ALBUTT seconded the amendment. The general principles of medical ethics, he said, should be inculcated into students at some part of their career, but he would be very sorry indeed if a formal matter of that kind should in any way postpone or diminish directly or indirectly that which was far more important. So much depended upon the whole tone of the schools, and the way in which lectures were given, the tone of good feeling, loyalty, and service, which the lecturer carried with his work. That was really the vital thing. He would be very sorry if the Council hastily were disposed to rely upon any formal letter, as compared with what he thought ought to be the spirit.

Dr. NORMAN MOORE said a student came into personal relation with physicians and surgeons in the hospitals. The physician or surgeon made a friend of a student who was his dresser or clinical clerk. He almost invariably invited the student to his house, and all sorts of questions relating to the conduct of a man in his profession turned up naturally in conversation between the physician or surgeon and the student. That was the true and best way of instruction. The right thing to do was far better learnt by example and association with men who had devoted their lives to the improvement of medicine and surgery than by a course of lectures, which, he thought, would be waste of time. The student knew the general principle guiding the conduct of his instructors, and from that his own intelligence would enable him to know how to act. Such a course of lectures would be an unwise addition to an already overburdened curriculum.

Dr. NEWSHOLME, speaking from the point of view of the Department of Public Health, said that the great majority of practitioners were doing their duty to the State and to one another. The question was whether anything could be done in regard to the minority. He shared the views expressed by Sir Clifford Albutt, that it was a matter of moral texture in the schools; but although that was so there were cases of difficulty which arose in relation to practice in which the making of rules was important. It was quite wrong in the public interest to wait before notifying to be "quite certain." This was true of diphtheria as well as typhoid fever. Hundreds of lives were lost every year owing to delay to verify diagnosis by bacteriological examination; if a proper relationship between the medical officer of health and the practitioner were established those lives would be saved by prompt action. He would support the reference to the Education Committee in a general form to consider the matter as a whole. As the Council had already committed itself to the practice of issuing warning notices on certain points, it did not seem to be going very much further to commit itself, if so advised by the Committee, to certain rules for difficult cases.

Dr. SAUNDY gladly supported Dr. McVail's proposal. If Dr. Norman Moore's argument were right, no need for any special instruction would be shown and the question would not arise.

Sir JOHN MOORE looked on lectures on ethics as quite unnecessary, and dreaded any further overloading of the

curriculum. Medical ethics were taught in hospitals and medical schools, as stated by Dr. Norman Moore.

Sir THOMAS FRASER supported Dr. Mackay. In the present crisis, when so many doctors had temporarily to give up their practice, their places being filled by others, those others might take advantage of their position; but did a man require to be taught that that was wrong? What would a course of lectures do to make a man conduct himself properly? He would rather agree with those speakers who had said that the true training and teaching were to be found in the atmosphere surrounding the student. If there were that atmosphere in the profession, any faults such as had been referred to would be corrected. He was strongly of opinion that it was almost an insult to the profession and to the students for the Council to take up the position that their young men in medicine, of all callings on earth, required to have their morality improved by special teaching of ethics.

Dr. LATIMER moved as an amendment the omission of the words, "to the State." Dr. LINGLEY BROWSE seconded, but the amendment was lost.

Mr. TOMES remarked that there was an obvious divergence of opinion in the Council, and he hoped Dr. Mackay would accept the motion with Mr. Hodson's amendment embodied in it.

Sir HENRY MORRIS said Dr. McVail had clearly pointed out that, owing to recent legislation, there did arise questions which were difficult, and unless instruction was given, it was almost impossible for a student or young man just entering the profession to know how properly to conduct himself.

Dr. McVAIL, in reply, called attention to the precise terms of the motion. It said nothing about the desirability or undesirability of lectures. Nothing was said as to the correct course being to issue a small pamphlet on the subject, or to issue rules, nor whether the right course was to do nothing at all. That would all depend on the report of the Education Committee. His whole anxiety was to get facts to ascertain what was being done in the medical schools throughout the country. Those facts, with any observations the Education Committee might choose to make on them, the Council would be in a position to discuss. Dr. Mackay seemed to assume that classes were necessary; Dr. Knox said lectures were useless; Sir John Moore said a course of lectures was a waste of time. The motion said nothing about those things. Sir Thomas Fraser had said it was almost an insult to the medical profession to suggest that there should be education in medical ethics. Was it suggested because a boy had passed a preliminary examination which entitled him to be put on the list of medical students that it was an insult to the medical profession as a whole?

The motion was then put to the meeting and carried. Sir HENRY MORRIS demanded a count, which, on being taken, showed 24 voting for, 8 voting against.

RECRUITING OF MEDICAL STUDENTS.

After the Council had sat in *camerâ*, the PRESIDENT made the following public statement:

The President of the General Medical Council is requested by the Council to inform the Licensing Bodies, Medical Schools, and approved Teaching Institutions, that the Director-General of the Army Medical Service has intimated to the Council his entire agreement with the Earl of Derby's decision regarding the recruiting of medical students, namely, that it is the duty of medical students (other than those in the fourth and fifth years of study) to join His Majesty's forces. The President hopes that in every medical school steps will be taken to convey this information to the students who are eligible for military service.

PHARMACOPOEIA COMMITTEE.

The British Pharmacopoeia, 1914.

The report of this Committee, presented by the PRESIDENT, stated that the number of copies of the *British Pharmacopoeia, 1914*, sold between January 1st and October 31st, 1915, was 24,434. The second impression, in which certain typographical corrections were incorporated, was issued in June, and of this about 5,500 remained in stock.

Laudanum.

The report also dealt with a letter from the Lord President of the Council with reference to the recom-

mendation of the Council of the Pharmaceutical Society made in January, 1915:

That the policy to be advocated by the Council in regard to the sale of laudanum should be that when "Laudanum" is asked for the 1914 preparation should be supplied and the poison book signed; but where the 1898 preparation is demanded great care should be taken to label it accordingly, and the attention of the purchaser should be called to the fact that it is the 1898 preparation.

It was further stated in the communication that:

In the Lord President's view, the question to be determined is whether the society is acting properly in assisting the sale of any preparation of opium that does not comply with the requirements of the new edition of the *British Pharmacopoeia*.

Upon this subject the General Medical Council resolved to reply to the Lord President to the following effect:

The Council have reason to think that the form of the recommendation published by the Council of the Pharmaceutical Society gave rise to misapprehensions as to its intention and effect. Having regard to the discussions concerning "Laudanum" that took place during the months immediately preceding the publication of the *British Pharmacopoeia, 1914*, the latter part of the recommendation might be taken as conveying to persons who desired to obtain "Laudanum" without signing the "poison book" information which might enable them to effect their purpose. This would appear to be one ground of the remonstrance addressed by His Majesty's Coroner for the City of London and Borough of Southwark to the Lord President. In the opinion of the Council such inferences would have been avoided if an intimation had been addressed to pharmacists by the Council of the Pharmaceutical Society, stating that:

When *Tincture of Opium or Laudanum* is asked for no preparation other than that described under these names in the *British Pharmacopoeia, 1914*, may be supplied, and the poison book must be signed by the purchaser. When a tincture of different strength or composition is expressly demanded the prescriber or applicant must indicate clearly the formula for the special preparation he requires.

In view of the fact that the "1898 preparation" is apparently still in demand, and is publicly sold by pharmacists with a label bearing that designation, the Council are further of opinion that this preparation should be included in the same part of the Schedule of Poisons as that which now comprehends *Tincture of Opium or Laudanum*. This result would be attained if the proportion of morphine specified in the part of the schedule in question were reduced from "1 per cent." to "0.75 per cent."

(Other proceedings of the Council will be reported in a subsequent issue.)

INSURANCE.

INSURANCE ACTS COMMITTEE.

The following is the reply of the Commissioners to the letter sent them on November 1st as to advances to doctors, which was published in the SUPPLEMENT of last week (p. 177):

National Health Insurance Commission (England),
Buckingham Gate, London, S.W.

November 4th, 1915.

Sir,
In reply to your letter of the 1st instant, I am directed by the National Health Insurance Commission (England) to state as follows:

Advances to Doctors.

1. The Commissioners desire to assure the Insurance Acts Committee that in their consideration of this matter they have at all times been desirous of securing that the advances should not be calculated on an unnecessarily conservative basis. It is, however, essential in the interests not only of Insurance Committees but of the doctors themselves that care should be taken to avoid, so far as possible, the risk of overpayment and subsequent recovery from the doctors.

2. The Commissioners have issued general advice to Insurance Committees as to the procedure to be adopted in calculating the amount available for the purpose of making advances. The Association will recognize that it is not open to the Commissioners to afford to the Association or to Panel Committees any detailed particulars of the information as to entitlements upon which the Commissioners' advice was based. With regard, however, to the criticisms referred to in your letter, it appears to the Commissioners that it may conduce to a better appreciation of the general position and of the advice given by the Commissioners if the Commissioners indicate briefly certain general misapprehensions which appear to underlie those criticisms.

3. In the first place, the amount available for advances, though stated in the form of a ratio to the counts of the Committee's Index Register, was calculated upon independent data in the possession of the Commissioners. The Association are aware, from the discussions and

correspondence which have taken place between the Commissioners and representatives of the Association, that for various reasons the registers of Insurance Committees are at the present time inflated; and they will appreciate that in these circumstances the ratio of any deduction for enlistments to the inflated Registers must be considerably higher than the ratio of such deduction to the effective insured population.

Consequently, if it is entirely erroneous to assume that the percentage difference, between the amounts which the committees have been advised to advance, and the amounts calculated on the inflated Registers, represents a reflection solely on account of enlistment. This difference includes not only the necessary allowance for enlistments but also the allowance required to be made in normal circumstances for the inflation above referred to, and, in addition, the usual margin for purposes of ease values and other adjustments which may be necessary in connexion with the final settlement of accounts at the end of the year.

4. Further, the general advice issued by the Commissioners necessarily had reference to the circumstances of the country as a whole, and was unavoidably based upon average enlistment figures. If, however, as appears to be suggested in your letter, any local information is available for the purpose of demonstrating with reasonable conclusiveness that the rate of enlistment in any particular area is below the average, the Commissioners are prepared, and have always been prepared, to give their best consideration to any facts put before them which would justify the Insurance Committee in adopting a higher rate of advances than the average rate.

Settlement for the Year 1914.

5. The Commissioners have at no time overlooked the importance of securing a settlement as regards the past year as soon as possible, and they regret that the abnormal circumstances have hitherto precluded them from taking effective steps in this direction. They have, however, recently applied to Insurance Committees for certain additional information, and they hope that it will be possible to proceed at a comparatively early date with the calculations necessary to enable a settlement to be effected.

Change of Doctor at the end of the Year.

6. The Commissioners desire me to take this opportunity to inform you that they have given their careful consideration to the representations of the Association with regard to the Draft Regulation previously issued on the subject of the right of insured persons to transfer at the end of the year. In order to meet the point raised by the Association, the Regulation will be amended to read as follows:

An insured person whose name is included in the list of a practitioner on the panel who is at any time during the month of November, 1915, holding a commission in the naval or military forces of the Crown shall not be entitled to select another practitioner or method of treatment at the end of the medical year ending on the 31st day of December, 1915, unless, in addition to giving notice to the Committee in the manner and within the period required by paragraph (1) of Article 30 of the principal Regulation, he satisfies the Medical Service Subcommittee of the committee that he has reasonable grounds for desiring to be removed from the list of the practitioner holding a commission as aforesaid, and paragraphs (1) and (5) of Article 30 shall be modified accordingly.

The substantive Regulations will be made on or about the 10th November, and will replace the Provisional Regulations on the subject previously issued.

7. A copy of a circular letter which has been issued to Insurance Committees on the subject of the Regulation is enclosed herewith for the information of the Association.*

I am, Sir,

Your obedient servant,
(Signed) S. P. VIVIAN.

A. Cox, Esq., M.B.,
British Medical Association,
429, Strand, W.C.

This letter, dated November 2nd 1915, we have not space to print on the present occasion.

SURCHARGING.

AN INJUNCTION AGAINST AN INSURANCE COMMITTEE.

A CASE of considerable interest to panel practitioners and Panel Committees was decided in the King's Bench Division on November 3rd, before Mr. Justice Rowlatt, when Dr. Charles W. Moore, of Leicester, obtained an injunction against the Borough of Leicester Insurance Committee to restrain them from deducting £31 7s. from the money due

to him under the National Health Insurance Acts by way of surcharge. It appears that in 1914 the Leicester Pharmaceutical Committee reported that too many drugs had been ordered by doctors, in consequence of which the local Drug Fund had been insufficient to pay for all the drugs that had been ordered. The Panel Committee, after conference with the Pharmaceutical Committee, made an arrangement by which £200 was transferred from the Medical Fund to the Drug Fund. The question then arose as to how this £200 was to be allocated among the doctors on the panel, and it was decided to make a calculation of the average cost of drugs ordered by each doctor, and require any doctor who had ordered drugs in excess of that average to make a rateable contribution, so that the total amount so procured should be £200. This contribution was called a surcharge, and Dr. Moore's share came to £31 7s. Notice was given to him that he was to be debited with this amount, and this was the first he had heard of the matter. He had no opportunity of attending any investigation. To those who have studied the question of the very delicate and important responsibilities laid upon Panel Committees in connexion with these surcharging inquiries it will come as a shock to find that at this time of day such a very rough-and-ready, not to say inequitable, method should have been adopted by any Panel Committee, which might well be expected to realize that no just decision as to over-prescribing can be reached without full consideration of the circumstances of each individual case. It is gratifying to find, therefore, that the judge emphasized this point in giving judgement, when he said that the finding of the Panel Committee was not a "report" within the meaning of the regulation. The fact that the Committee adopted a system of average seemed to him conclusive that it had never addressed itself to the question of extravagance; because one doctor's order for drugs was greater than the average that did not prove that that doctor was extravagant. We are glad to note these remarks, for they are in strict accordance with the advice the Insurance Acts Committee has given to Panel Committees. Short cuts in connexion with a serious charge such as that which virtually amounts to a waste of public money cannot be tolerated, and every doctor whose methods and cost of prescribing may come to the attention of the Panel Committee should be able to feel confidence that, though proved extravagant will be dealt with rigorously, exceptional circumstances and legitimate reasons for seeming excess will meet with sympathetic consideration from a body of men who understand. It is interesting to note that the attitude taken up by Mr. Justice Rowlatt is also in accord with the indications already given by the Insurance Commissioners in dealing with surcharging appeals. In a case reported recently they showed their disapproval of any system of "averaging" or mere mathematical surcharging.

The judge was also asked to rule that the regulation dealing with surcharging was *ultra vires* as the Commissioners had no power to make regulations to deprive a doctor of that to which he was entitled by the terms of the Acts and his agreement with the Insurance Committee. Mr. Justice Rowlatt, however, ruled that the regulation in question was *intra vires* and valid. Seeing that the regulation puts into the hands of a professional body the power of largely determining a professional question, and in view of the fact that the profession has always been solid on this point, it was not to be desired that this contention of the plaintiff should succeed. The Panel Committee is by the Acts and Regulations a partner with the Insurance Committee and Commissioners in protecting public funds from being wasted by extravagance, and moreover in protecting panel practitioners as a class from charges of indifference or worse in regard to this matter. The professional aspects of these inquiries could not be discussed to any useful purpose except by a professional body, and we are glad to find that the court has upheld the right of both Committees to fulfil their duty under the Acts, and to assume that the logical sequence of that action will follow—namely, that the Insurance Committee will surcharge in cases where extravagance has been proved.

A list of periodical publications, official reports, and Blue Books in the Library of the British Medical Association available for issue to members on loan has been printed, and copies can be obtained free on application to the Librarian, at the house of the Association, 429, Strand, W.C.

Association Notices.

SOUTHERN BRANCH.—Mr. James Green, Honorary Secretary, gives notice that a special meeting of the Branch will be held at the Royal Hotel, Above Bar, Southampton, at 2.30 p.m. on Thursday, November 25th. The business will be to consider and it is proposed to adopt as recommended by the Branch Council—the revised Ethical Rules of the Association. At the conclusion of this business, the meeting will resolve itself into the ordinary half-yearly general meeting, when the routine business of the Branch will be transacted. Afterwards a short paper will be read by Dr. H. D. Rolleston, senior physician, St. George's Hospital (Temporary Surgeon-General, R.N., Haslar Hospital), on war diseases, and it is hoped that a discussion will ensue. Tea will be served during or after the meeting.

STAFFORDSHIRE BRANCH.—Dr. Harold Hartley, Honorary General Secretary, Basford, Stoke-on-Trent, gives notice that the first general meeting of the session will be held at the North Stafford Hotel, Stoke-on-Trent, on Thursday, November 18th. The President, Dr. F. M. Rowland, will take the chair at 4 p.m. Business:—Resolution: That the Staffordshire Branch hereby adopts the revised rules governing procedure in ethical matters of a Branch composed of several Divisions as approved by the Annual Representative Meeting, 1915, without modification and in substitution for any ethical rules now in use by the said Branch. Exhibition of living cases. Papers:—W. Mitchell Smith: Alimentary Hygiene in Children. G. A. Carter: Nose Bleeding. S. McMurray and E. E. Young: A Case of Intracranial New Growth simulating Miners' Nymphs. Exhibition of pathological specimens, etc. Dinner at 6.15 p.m. Charge, 5s.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements) important Notice re Appointments appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

BENGAL, India.—Chief Sanitary Officer for the Assam Mines Field of Health and Mining Settlement. Salary, Rs. 1,200 (£80), rising to Rs. 1,500 (£100) a month.

BRISTOL ROYAL INFIRMARY.—(1) House-Physicians. (2) House-Surgeons. (3) Dental House-Surgeon. Salary, £120 per annum in each case.

BURGH OF PAISLEY.—Resident Medical Officer for Infectious Diseases Hospital. Salary, £200.

BURNLEY: VICTORIA HOSPITAL.—House-Surgeon. Salary, £135 per annum.

CHELSEA HOSPITAL FOR WOMEN.—Anaesthetist. Honorarium, £21 per annum.

CHESTER ROYAL INFIRMARY.—Lady House-Physician and Lady House-Surgeon. Salary, £115 and £100 per annum respectively.

CITY OF BRADFORD.—Two Temporary Women Medical Officers. Salary, 28 sh. per week.

COUNTY BOROUGH OF STOKE-ON-TRENT.—Resident Assistant Medical Officer at the Stanfield Sanatorium. Salary, £359 per annum inclusive.

DERBYSHIRE HOSPITAL FOR SICK CHILDREN.—Lady Resident Medical Officer. Salary, £200 per annum.

DERBYSHIRE ROYAL INFIRMARY.—House-Surgeon. Salary, £250 per annum.

DEVONSHIRE HOSPITAL, Exton.—Assistant House-Physician, Salary, £100 per annum.

DUDLEY: GLEN HOSPITAL.—(1) Senior Resident Medical Officer; salary, £150 per annum. (2) Assistant House-Surgeon; salary, £120 per annum.

GREAT NORTHERN CENTRAL HOSPITAL, Holloway Road, N.—House-Surgeon. Salary, £100 per annum.

GREAT YARBROUGH HOSPITAL.—House-Surgeon (male). Salary, £200 per annum.

JESSOP HOSPITAL FOR WOMEN, Sheffield.—Senior and Junior Lady House-Surgeons to the Gynaecological and Maternity Departments. Salaries, £100 and £80 respectively.

LEDS PUBLIC DISPENSARY.—Lady Resident Medical Officer. Salary, £10.

LONDON FEVER HOSPITAL, Liverpool Road, N.—Assistant Resident Medical Officer. Salary, £200 per annum.

LONDON TEMPERANCE HOSPITAL, Hampstead Road, N.W.—Assistant House-Surgeon. Salary at the rate of £105 a year.

LONDON TREAT HOSPITAL, Great Portland Street, W.—House-Surgeon. Salary, £50 per annum.

MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN, Cheetham Hill Road.—Lady House-Surgeon. Salary, £120 per annum.

MANCHESTER ROYAL INFIRMARY.—Resident Medical Officer at the Convalescent Hospital, Cheadle. Salary, £225 per annum.

NEW HOSPITAL FOR WOMEN, Foston Road, N.W.—House-Physician, Two House-Surgeons, Obstetric Assistant, and Pathologist. Also Senior Clinical Assistant and an Anaesthetist.

PASSMORE EDWARDS HOSPITAL, Willesden.—Honorary Anaesthetist.

THORNDALE URBAN DISTRICT COUNCIL.—Temporary Assistant Medical Officer of Health and school Medical Officer. Salary, £50 per annum.

ST. GEORGE-IN-THE-EAST DISPENSARY FOR PREVENTION OF CONSUMPTION.—Temporary Medical Officer. Salary, £500 per annum.

ST. PAUL'S HOSPITAL FOR SKIN AND GENITO-URINARY DISEASES, Red Lion Square, Holborn, W.C.—Honorary Casualty Out-patient Surgeon.

SHETLAND: WHARFSA PARISH.—Medical Practitioner. Guaranteed income £50 by the Highlands and Islands (Medical Service) Board.

SOUTHAMPTON: FREE EYE HOSPITAL.—House-Surgeon. Salary, £100 per annum.

STAFFORDSHIRE GENERAL INFIRMARY, Stafford.—House-Surgeon. Salary, £50 per annum.

VICTORIA HOSPITAL FOR CHILDREN, The Street, S.W.—(1) Senior Resident Medical Officer. (2) House-Physician. Salary, £250 and £200 per annum respectively.

WEST HAM AND EASTERN GENERAL HOSPITAL, Stratford.—House-Physicians and House-Surgeons. Salary, £120 and £100 per annum respectively.

WEST HAM AND EASTERN GENERAL HOSPITAL, Stratford, E. House-Physicians' Salary, £120 per annum.

WIGAN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Lady House-Surgeon. Salary, £50 per annum.

YORK COUNTY HOSPITAL.—Resident Medical Officer. Salary, £150 per annum.

CERTIFYING FACTORY SURGEONS. The Chief Inspector of Factories certifies the following vacant appointments: Bungay (Suffolk), Preston, West (Lancaster).

To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

BROWN, W. E., M.B., C.M. (Aberd.), Certifying Factory Surgeon for the Aboyne District, co. Aberdeen.

CORCORAN, P. J., M.B. Ch.B., N.U.I., Certifying Factory Surgeon for the Ballinrobe No. 2 District, co. Mayo.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s., which sum should be forwarded in Post Office Orders or Stamps with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

BIRTHS.

McNAB.—On the 3rd inst., at Withington Cottage, Withington, Manchester, the wife of Dr. McNeil, of a son.

WARNER.—On the 4th inst., at Bräel, Woodford Green, the wife of Harold P. Warner, M.B., B.S., of twin sons.

DEATHS.

DOXAL.—On the 7th inst., suddenly, at Inleside, Abinger Common, Robert Doxall, M.D., formerly of 40, Portland Place.

BUCHANAN.—At 13, Berkeley Terrace, Glasgow, W., on the 9th inst., Alexander Macgregor Buchanan, M.A., M.D., F.R.F.P.S.G., Professor of Anatomy, Anderson College Medical School, Funeral private. No flowers by request.

ROSLTON.—Passed away on the 24th September, on board the City of Swarth, five days from Cape Town, and buried at sea, Robert John Roslton, M.D., M.Ch., F.R.C.S.I., for twelve years M.O.H. of East London, Cape Colony, and formerly of Newtownstewart, Ireland.

DIARY FOR THE WEEK.

MONDAY.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, Cavendish Square, W., 8.30 p.m.—A discussion on "Gunshot Wounds of the Head," to be introduced by Lieutenant Colonel P. Sarrent, R.A.M.C., F.R.C.S., and Lieutenant Colonel Gordon Holmes, R.A.M.C., M.D., to be followed by Mr. L. B. Rawling, Dr. Wilfred Harris, Mr. W. H. H. Jessop, Major W. Pearson, R.A.M.C., and others.

TUESDAY.

ROYAL COLLEGE OF PHYSICIANS, Pall Mall East, S.W., 5 p.m.—First Goulstonian Lecture by Dr. Gordon Holmes: Acute Spinal Lesions with Special Reference to those of Warfare.

WEDNESDAY.

ROYAL COLLEGE OF PHYSICIANS, Pall Mall East, S.W., 5 p.m.—Dr. Russell Wells will open a discussion on "Clinical Electrocardiography."

ROYAL SOCIETY OF MEDICINE: SECTION OF HISTORY OF MEDICINE. 5 p.m.—Books, MSS., etc., on view at 4.30 p.m.

THURSDAY.

ROYAL SOCIETY OF MEDICINE: SECTION OF DERMATOLOGY. 4.30 p.m.—Exhibition of Cases. **ROYAL COLLEGE OF PHYSICIANS,** Pall Mall East, S.W., 5 p.m.—Second Goulstonian Lecture by Dr. Gordon Holmes.

FRIDAY.

ROYAL SOCIETY OF MEDICINE: SECTION OF ELECTRO-THERAPEUTICS. 8.30 p.m.—Dr. F. P. Cumberbatch: Methods of Testing the Reactions of Muscles. Dr. Eddie Sayer: Electrical Departments in Military Hospitals. **SECTION OF OBSTETRY,** 5 p.m.—Discussion on "Skin-grafting in Mastoid Operations," to be opened by Mr. H. J. Marriage. **SOCIETY OF TROPICAL MEDICINE AND HYGIENE,** 8.30 p.m.—Professor A. Castellani of Naples: "Combined Vaccinations"

LONDON: SATURDAY, NOVEMBER 20TH, 1915.

INSURANCE.

THE ADMINISTRATION OF THE INSURANCE ACT: DIFFICULTIES AND DUTIES.

ADDRESS BY DR. McVAIL.

THE annual conference of the Association of Scottish Insurance Committees was held in Dundee on Saturday, October 30th. Dr. McVail, Deputy Chairman of the Scottish Insurance Commission, had been invited to be present, and was asked to address it.

Dr. McVail, after thanking the Association for the invitation, said that had he been aware that the continued existence of the Scottish Insurance Commission was to be discussed at the congress, his modesty might have prevented him from the embarrassment of being present. On that subject his lips were sealed, but he was amused to note the effect which the newspaper paragraph that first called attention to the matter had had on the position in Scotland. It resembled nothing so much as the proverbial influence of the intrusion of someone who was regarded as an outsider into a family dispute. He had sometimes pondered on the question why, in the administration of the Insurance Act, there was so frequently variance of view between the Commission on the one hand and the other organizations which shared in the administration of the Act, on the other hand.

Statutes Negative and Positive.

In the first place the Act was new and it was complex, and it required time for every one, and for every central or local body, to find its own proper niche, and its relation to the other administrative agencies. Apart from that, the Insurance Act differed in one essential respect from various other Acts of Parliament. The relation of the citizen to the commoner statutes was mainly passive or negative. Under the Public Health Acts he was to refrain from creating a nuisance; under the Rivers Pollution (Prevention) Acts he was to avoid contaminating a stream; under the Food and Drugs Act he was not to be guilty of adulteration; under the Alkali Acts he was not to discharge certain gases or chemicals into the atmosphere; under the Factory Acts he was not to allow his employees to work more than a stated number of hours a day, and he was not to give them less than a certain minimum of air space; at common law he was not to be guilty of theft, nor to obtain money under false pretences. In short, a man leading a blameless life might travel from the cradle to the grave without ever coming into contact with such statutes or with the common law.

Under the Insurance Act his position was widely different. There his duties were not passive, but active; not negative, but positive. Employers had regular functions to perform in the way of stamping; so also had employees, and they were required to do many other things in relation to the Act—the choosing of a doctor, the intimation of changes of address, and so forth. The duties of the approved societies and Insurance Committees were numerous. Doctors had to perform certain functions in respect of medical attendance, the keeping of records, certification, and drug prescribing. Chemists had their share in the organization; in fact, for the absolutely

frictionless working of the Act the co-operation throughout the United Kingdom of some fifteen million persons was necessary, and these fifteen millions included many who had lived comparatively irresponsible lives and had hardly at all been under discipline. Such frictionless working was, of course, a counsel of perfection, but great progress was being made. It was the duty of the Commissioners not merely to perform their own functions, but to try to secure that all the other parties concerned performed theirs; and it had sometimes seemed to him that the Commissioners would require to possess the qualities attributed to Holy Writ—they ought to be profitable for doctrine and reproof and correction, and for instruction, not exactly in godliness, but in administrative rectitude, which for the purposes of the Insurance Act was equivalent to godliness. That being so, it was not surprising that differences of view emerged. It was clear, however, that the bodies with whom the Commissioners had to deal appreciated their efforts—at least to the extent that they were determined to protect the Commission against the fate which threatens those of whom all men speak well.

One curious fact was that while admonishing the bodies present at conferences the Commissioners were usually in the position of defending the bodies who were absent, and whom at other times they had to criticize. Whilst telling the Insurance Committees what they ought to do, they at the same time had to explain that approved societies were not so much to blame as the committees might think, and when they met to admonish societies they had to point out that even the doctors had a right to be classified amongst God's creatures, as an Oxford student is said to have once reluctantly admitted of a Cambridge student.

Economy under the Insurance Act.

Another important consideration in respect of the relations between the Commissioners and the Insurance Committees was that under the Insurance Act there is no ratepayer. The ratepayer, where economy is in question, is the ultimate court of appeal in the case of town councils, county councils, school boards and parish councils. Under the Insurance Act the taxpayer is interested, but his interest is somewhat remote. Therefore in practice up till now the Commissioners, though the central authority, had found it necessary in large measure to take on the duties of a ratepayer. It was not apparent that this really required to be the position. The representatives of the approved societies, which themselves were made up of the insured, had a majority on every Insurance Committee, and ought to realize that economy was just as necessary in insurance administration as in the ordinary departments of local government. Up till now there had been far too much reliance on the Treasury. There seemed to be a feeling that because Parliament had a share in the financial burden it ought to meet all deficits, and whenever difficulties arose the cry was apt to rise for another Government grant. That had never been a very hopeful resort, but now, in presence of the fact that the grants for such admirable purposes as medical referees, nursing, laboratories, and clinics had had to be withdrawn, it was surely obvious that the Treasury door was closed against applicants unless at least it could be shown that expenditure

was absolutely necessary, that deficit was absolutely unavoidable, and that the responsibility lay with Parliament. In future it might be taken that the financial effects of laxity would have to be borne locally and not centrally, and the sooner that position was realized the better it would be for all concerned.

The Drug Fund.

The next question was whether, as representing the admonitory function of the Commissioners, the speaker had any special admonition to address to the Insurance Committee representatives assembled that day. The answer was a most emphatic affirmative. The condition of the Drug Fund demanded the closest constant attention of all concerned, and the Insurance Committees were largely concerned. Three months ago the Commissioners had issued to the medical profession a circular letter, appended to which was a statement showing how the cost of many drugs had increased owing to the war. He had had the figures in that appendix revised up to date, and in a very large majority of cases the increase had mounted still higher. One drug, which three months ago had cost ten times as much as before the war now cost nearly seventeen times as much. On the other hand, strange to say, another drug belonging to the same class had somewhat fallen in price during the three months, and a fact of that kind was one which, of course, would be noted by the medical profession. It was not merely the doctors who were concerned in the matter; they, where alternative drugs equally efficacious for any given case were in question, would naturally prescribe the less expensive, and they would not prescribe such a quantity as would involve any risk of half of a bottleful being thrown away unused. Insured persons ought at the same time to realize that if their doctor were to tell them that a tonic which they had been taking for months was no longer necessary, or that a cough mixture less palatable than heretofore would be equally efficacious, it was their duty to accept the doctor's dictum without grumbling. The whole position, of course, was subject to the fundamental proposition that the insured person should not suffer for want of any obtainable drug, but in order that some drugs might continue to be obtainable the greatest care was required, otherwise the stock might be entirely exhausted. The extraordinary range in the cost of drugs per insured person as between one insurance area and another, and one country and another, indicated how much could be done without loss to the insured, by means of rigid care and economy continually exercised.

The Scottish Drug Accounts Bureau.

The interest of the Scottish Insurance Committees in the matter was wrapped up in the work of the National Drug Accounts Committee. The Bureau, which was the servant of all the Insurance Committees in Scotland, was doing admirable work, and was issuing monthly reports of the greatest value. These reports went to each Insurance Committee concerned. They were, however, merely reports of facts; it was not within the scheme of the Bureau that advice should be given or recommendations made. The Insurance Committees had to determine their own action in presence of the facts. Dr. McVail begged them to study carefully every such report, and to act definitely on the conclusions they might form. He quite recognized the difficult and delicate position which might arise in small areas with few doctors and few chemists. The Drugs Bureau, however, in collating and submitting the facts, had relieved such small committees of much of the difficulty which they might feel, and for the rest it was their duty to face frankly and effectively whatever difficulty might remain.

Complaints to Insurance Committees.

Another matter as to which he had a word of admonition for Insurance Committees was in regard to their dealing with complaints. When the Commissioners called before them representatives of approved societies, and when in reply to criticism the societies made statements of a nature which should properly form the subject of reference to Insurance Committees, the societies, on this being pointed out to them, were apt to reply that such representations to committees were less successful than they had expected, and that they were disinclined to resort to

that procedure. It was in the nature of things that a disappointed litigant should blame the tribunal which heard his case, but Dr. McVail wished to press on committees the importance of acting in such a way as to secure the confidence of complainers, whether societies or individuals, that their complaints were fairly and carefully considered and a decision always given on the merits.

Concluding Remarks.

In conclusion, Dr. McVail said that it had always seemed to him that one of the finest features of social responsibilities in this country was exhibited in the fact that when local government was required for the administration of any Act of Parliament, responsible men were always found willing to devote some part of their spare time to the public welfare. This was so in the case of town councils, county councils, parish councils, and the like, and so it had now been found in the case of the Insurance Act. The Insurance Act was well worth good administration. It was an Act whose objects included the supplementing of the thrift of those who were already thrifty, the compelling of the thriftless to make, throughout their working life, a regular weekly contribution to their own maintenance and medical attendance during illness, and the improvement of the national health, including what was now more than ever the important function of protecting both mother and infant at childbirth. The Commissioners were greatly indebted to their colleagues, the Insurance Committees of Scotland, for the attention which they were devoting to their important duties and for the ability with which the duties were being performed.

SURCHARGING.

In the note published in the SUPPLEMENT of November 13th, page 187, on the case in which Dr. Charles W. Moore obtained on November 3rd in the King's Bench Division an injunction against the Leicester Insurance Committee to restrain them from making a deduction by way of surcharge from the money due to him under the Insurance Acts, it was stated that "the judge was also asked to rule that the regulation dealing with surcharging was *ultra vires*, as the Commissioners had no power to make regulations to deprive a doctor of that to which he was entitled by the terms of the Acts and his agreement with the Insurance Committee. Mr. Justice Rowlatt, however, ruled that the regulation in question was *intra vires* and valid."

Since the note was published we have had an opportunity of perusing the full text of Mr. Justice Rowlatt's judgement, and find that his observations did not establish the point in question. The passage in the judgement relating to this matter reads as follows:

Now the first point taken by Mr. Gore-Browne is that the regulation upon which the whole thing is founded (Regulation 40) is *ultra vires*. It is said, on the other side, that it is *intra vires*, and, whether it is *intra vires* or not, that I have no jurisdiction to decide upon that point, because the mere fact of the regulation being made is enough under the special words of the Act. I shall assume that the regulation is valid and binding, whether because it is *intra vires* in fact, or whether because no question of *intra vires* arises. I shall assume that the regulation is valid.

Mr. Justice Rowlatt did not, therefore, decide the question as to whether or not the regulation was *ultra vires*.

Counsel for the plaintiff were Mr. Gore-Browne, K.C., and Mr. Alexander Neilson, instructed by Messrs. Hempsion for the Medical Defence Union. Counsel for the defendant were Mr. Clavell Salter, K.C., and Mr. R. A. Wright.

LOCAL MEDICAL AND PANEL COMMITTEES.

BERMINGHAM.

At a meeting of the Birmingham Panel Committee on November 2nd it was reported that the Insurance Committee and the Local War Emergency Committee were willing to adopt the suggested agreement with regard to the carrying on of the practices of those who had undertaken military duty.

It was decided that vaccination of insured persons was not included in the agreement entered into between practitioners and the Insurance Committee, as vaccination

could be obtained free of charge and vaccines were not provided for in the Drug Fund.

The proposed alterations in the new agreement for 1916 were agreed to.

EAST SUSSEX.

At a meeting of the Local Medical and Panel Committees on November 3rd, approval was expressed of the compromise arrived at by the British Medical Association with the Commissioners as to the proposed new arrangements in regard to the Drug Tariff, but strong objection was expressed to the shortness of the time allowed by the Commissioners for considering the alterations.

The following scale for treatment of dependants suffering from tuberculosis was approved for submission to the Insurance Committee:

SCALE.

(a) For full medical report (including consultation at the surgery or visit)	s. d.
(b) Extra for first visit with consulting tuberculosis officer	5 0
(c) Continuous record (per quarter)	2 6
(d) Quarterly reports	5 0
(e) Attendance on patient at doctor's residence or surgery	5 0
(f) Visit at patient's home	2 0
(g) Night visit—that is, visit paid between 8 p.m. and 8 a.m. in response to call within these hours	5 0
(h) Special visit—that is, visit paid in response to call sent after 10 a.m. and before 8 p.m.	3 6
(i) Injection of vaccines (vaccines to be provided by local authority)	2 6
(j) Mileage	2 6

1. For every visit paid to a patient residing more than three miles from the doctor's residence measured along the nearest convenient road, the sum of 1s. for each complete mile of the distance after the first two.
2. Residing more than 2 mile from a metalled road (in addition to any fee payable under 1) the sum of 1s. for the first quarter of a mile and the sum of 1s. for each succeeding 5 mile. A metalled road shall be taken to include any road, whether public or private, which is made with macadam, flints, sandstone, or other hard material, and which is under ordinary circumstances suitable for carriage or motor traffic throughout the year. The distance from a metalled road shall be measured along the shortest route from the nearest accessible point on a metalled road to the residence of the patient, regard being also had to the route usually taken by the patient.

BUCKINGHAMSHIRE.

At a meeting of the Local Medical and Panel Committee on October 29th it was decided to recommend practitioners to agree to the amended agreement for 1916.

At a general meeting of practitioners in Buckinghamshire, held on October 29th, a resolution was adopted pledging those present to safeguard the interests of those serving with the colours. It was decided to send a copy of the following resolution to all Relief Committees and Committees of the Soldiers' and Sailors' Families Association in the county:

That this meeting of medical practitioners of Buckinghamshire considers that vouchers for free attendance on dependants of soldiers and sailors are being issued too freely, and that they should only be given in cases in which the weekly receipts are less than before the war.

LANCASHIRE.

Final Certificates.—At a meeting of the Lancashire County Local Medical and Panel Committees held on October 20th a memorandum was submitted by the Lancashire Insurance Committee pointing out that if an insured person does not apply for a final certificate in accordance with the instructions of the Commissioners and the requirements of his society, but goes to his doctor for a final certificate some days after he has resumed work, or has become fitted to resume work, the doctor cannot properly sign the final certificate in the form printed, and therefore the provision is made therein that the words "you have remained incapable of work up to and including to-day" may be struck out, and the words "you are fit to work to-day" inserted in their place. The memorandum was approved.

INSURANCE NOTES.

STAFFS OF APPROVED SOCIETIES AND INSURANCE COMMITTEES.

The Insurance Commission (Scotland) issued on November 2nd, with the full concurrence of the Director-General of Recruiting, a circular letter to approved societies and Insurance Committees in reply to representations that, owing to the fact that a considerable proportion of their staffs had already joined the army, there was a danger of serious dislocation of State Insurance work should their trained staff be further depleted. The Commissioners, after stating that they appreciated the difficult position in

which societies and committees may find themselves, continued as follows:

On the one hand, it is of supreme importance that the requirements in the matter of men needed for the army should be met; but, on the other hand, the Government require that the essential work of national health insurance should be continued. In these circumstances, the best advice which the Commissioners can give to societies and committees (all of whom they feel sure are anxious to afford every possible facility to their employees who are in a position to respond to the call for recruits), is that they should inform the members of their staffs that any men who are prepared to enlist should offer themselves for service under the new scheme which is now in operation. By this scheme men who express their willingness to serve are classified in groups according to age and other conditions, and are called up for service in such groups as they are required.

INSURANCE ACT IN PARLIAMENT.

IRISH INSURANCE COMMISSIONERS.

Mr. LUNDON asked the Secretary to the Treasury whether any agreement has yet been come to between the Irish Insurance Commissioners and the Medical Association with regard to the working of the National Insurance Act, and if so, on what terms; and, if not, what was the cause of the delay in completing the agreement? Mr. C. ROBERTS said that the adjustment of details in regard to the proposed scheme of medical certification in Ireland was proceeding through conferences between the Irish Insurance Commissioners, the medical profession, and the approved societies, and he understood that satisfactory progress is being made.

Mr. CREAN asked the Chief Secretary for Ireland whether the salaries due July 31st, 1915, to the late panel doctors of the city of Cork were still unpaid; if so, what was the cause of the delay; and whether the present difficulty with the Irish medical profession was mainly due to the dilatory way in which the business of the Department has been conducted? Mr. ROBERTS replied that he was communicating with the Irish Insurance Commissioners.

SANATORIUM FUNDS.

In the course of his reply to a question by Mr. CURRIE, Mr. ROBERTS said that, apart from the temporary diminution in the income of insurance committees due to enlistment, the position of insured persons who applied for sanatorium benefit had not in any way been altered to their detriment in consequence of war conditions. In reply to a question by Mr. BOOTH, he said that the number of persons in London on the waiting list for treatment in residential institutions was 210. The Insurance Commissioners had not done more than recommend the proper classification of applicants for the different forms of sanatorium treatment, now rendered possible by the institution of a general scheme of dispensary treatment in London.

Meetings of Branches and Divisions.

BOMBAY BRANCH.

AN ordinary meeting was held in the University Library on July 29th, when Lieutenant-Colonel ASHTON STREET, I.M.S., was in the chair. Dr. F. BANA read notes on cases of idiopathic rhinorrhoea and enlargement of the lingual tonsils. Dr. R. ROW showed cultures of the spirochaete of relapsing fever, with photographs and microscopic slides, and described the methods by which the cultures had been prepared. Cases and specimens were shown by Professor Y. G. NADIR, Lieutenant-Colonel ASHTON STREET, and Dr. S. B. NAYAR (skiagrams).

EDINBURGH BRANCH:

SOUTH-EASTERN COUNTIES DIVISION.

At a meeting of the Division held at Newton St. Boswells on October 29th, when Dr. J. YOUNG was in the chair, it was resolved to inform the Scottish Committee of the British Medical Association, in reply to its inquiries—(1) that the Division did not approve of the abolition of the Scottish Insurance Commission; (2) that the Division favoured the amalgamation of the smaller insurance areas to the extent that the total census population as combined should not exceed 50,000. The ethical rules approved by the Representative Meeting, 1915, were adopted.

The question of the indiscriminate distribution of books entitling dependants of soldiers and sailors to medical attendance was again raised, and it was decided to inform the Secretary of the Soldiers' and Sailors' Families Association that the doctors would prefer to provide charitable attendance individually and at their own discretion, unless arrangements were put in force by which there would be a proper check on the persons to whom the books were issued.

YORKSHIRE BRANCH.

At the autumn meeting of the Yorkshire Branch held in York on October 9th Dr. Bedford France delivered an address on the absence of proper facilities for the treatment of mental disorders in their early stages.

The revised ethical rules approved by the Representative Meeting were adopted.

IRISH COMMITTEE OF THE BRITISH MEDICAL ASSOCIATION.

Illegal Conditions of Advertisements for Poor Law Dispensary Doctors.

In a letter, dated October 21st, 1914, the Irish Committee of the British Medical Association drew the attention of the Local Government Board (Ireland) to an advertisement in the press for a dispensary doctor in the Castlebar Union containing an illegal condition of election—namely, that candidates will be called upon by the guardians to agree to be bound by a graded scale of fees for private patients.

The Local Government Board replied stating that it had written to the Castlebar Board of Guardians pointing out that the proposed condition of appointment complained of by the Irish Committee of the British Medical Association would not be binding on the medical officers appointed. Notwithstanding this definite ruling, some boards of guardians still endeavour to make it a condition of election that the medical officers appointed should attend private patients at fees prescribed by the guardians. That boards should persist in trying to make an illegal condition such as this can only be accounted for by assuming that in some instances at least they misunderstand the recommendation of the Local Government Board with regard to the adoption of scales of fees for a certain class of persons at present receiving free treatment under the Medical Charities Act in Ireland who could not, in any sense, be considered destitute or so poor that they could not pay a moderate fee. There are families in Ireland receiving in wages as much as £2 or £3 a week who receive under the Medical Charities Acts free medical treatment; this is apparently a hereditary privilege based on the fact that their grandparents, who only received two or three shillings a week, had free medical treatment provided for them under the Medical Charities Acts. Though it is true that in a few districts in Ireland the adoption of a scale of reduced fees to meet such cases has met with some success, the great majority of dispensary doctors, while admitting the soundness of the principle underlying the scheme as recommended by the Local Government Board, have found from experience that patients who, previous to the adoption of such a scheme, paid their ordinary fees, attempted and succeeded in getting treatment under the reduced scale of fees adopted to prevent some of the more gross abuses of well-to-do patients receiving free treatment at the hands of the dispensary doctor.

Association Notices.

SOUTHERN BRANCH.—Mr. James Green, Honorary Secretary, gives notice that a special meeting of the Branch will be held at the Royal Hotel, Above Bar, Southampton, at 2.30 p.m. on Thursday, November 25th. The business will be to consider, and if approved to adopt—as recommended by the Branch Council—the revised Ethical Rules of the Association. At the conclusion of this business, the meeting will resolve itself into the ordinary half-yearly general meeting, when the routine business of the Branch will be transacted. Afterwards a short paper will be read by Dr. H. D. Rolleston, senior physician, St. George's Hospital, temporary Surgeon-General, R.N., Haslar Hospital, on war diseases, and it is hoped that a discussion will ensue. Tea will be served during or after the meeting.

RECRUITING FOR THE MEDICAL SERVICES.

THE SCOTTISH MEDICAL EMERGENCY COMMITTEE RECOGNIZED AS A TRIBUNAL.

We are informed that the Scottish Medical Service Emergency Committee, which for the last six months has been actively engaged in recruiting medical officers for the army, has now been appointed the "Tribunal" for Scotland to deal with questions affecting the liability of medical men to undertake military service. The following is an excerpt from the letter of appointment addressed to the Convener of the Committee at the Royal College of Physicians, Edinburgh, by the Assistant Director-General Army Medical Services:

War Office, Whitehall, S.W.

November 12th, 1915.

I have been directed by Sir A. Keogh to acknowledge your letter of the 9th November, and, in reply, am to say that your Committee is to be regarded as a "Tribunal" for medical purposes, and that you are empowered to issue letters of excuse to medical men whom you think it would be undesirable to call upon to undertake military service.

The Committee will shortly make a public announcement of the manner in which they propose to discharge this important national duty. The Committee is constituted as follows:

- Dr. A. H. Freeland Barbour, President of the Royal College of Physicians.
- Mr. J. W. B. Hodsdon, President of the Royal College of Surgeons.
- Dr. Ebenezer Duncan, President of the Royal Faculty of Physicians and Surgeons of Glasgow.
- Professor Knoch, Dean of the Faculty of Medicine, University of St. Andrews.
- Professor Bryce, Dean of the Faculty of Medicine, University of Glasgow.
- Professor Shennan, Dean of the Faculty of Medicine, University of Aberdeen.
- Professor Littlejohn, Dean of the Faculty of Medicine, Edinburgh University.
- Dr. John Adams, Glasgow, Vice-Chairman Scottish Committee, British Medical Association.
- Dr. G. C. Anderson, Methil, Secretary Fife Branch, British Medical Association, and of the Fife County Local Medical and Panel Committees.
- Dr. J. R. Currie, Edinburgh, Senior Medical Officer, Scottish National Insurance Commission.
- Dr. John Gordon, Aberdeen, President Aberdeen Branch, British Medical Association.
- Dr. J. R. Hamilton, Hawick, Chairman Scottish Committee, British Medical Association.
- Dr. John C. McVail, Deputy Chairman Scottish National Insurance Commission.
- Dr. John Playfair, President of the Edinburgh Medical Guild.
- Dr. John Stevens, Secretary Edinburgh Branch, British Medical Association.
- Dr. Norman Walker, Edinburgh, Direct Representative for Scotland on the General Medical Council (Convener).
- The Secretary to the Committee is Mr. T. H. Graham, Royal College of Physicians, 9, Queen Street, Edinburgh.

RECRUITING FOR THE NAVAL AND MILITARY SERVICES: ENGLAND AND WALES.

On August 17th last the Central Medical War Committee advised all the local War Committees in England and Wales that, acting on the urgent request of the Director-General of the Army Medical Services to provide an additional large number of military medical officers, the Committee had resolved that each area should be asked to furnish a number calculated on the basis of the proportion the medical population of the area bore to the total number required.

The following is a list of the areas which, up to the present date (November 15th) have furnished their quota or more. The Committee in publishing this list is anxious to make it clear that the appearance of an area in this list does not necessarily mean that it is not likely to be called upon to furnish more medical officers, as the quota was a provisional one which may be increased or diminished in the future according to local conditions:

Barnsley	Great Yarmouth
Birkenhead	Guildford
Blackpool	Halifax
Blyth	Hartlepool
Dudley	Hexham
Gateshead	Holland

Horsham	Oldham
Huddersfield	Preston
Isle of Man	Richmond
Lewisham	Rochdale
Manchester	Shropshire and Mid-Wales
North Carmarvon and	Tower Hamlets
Anglesea	Trowbridge
Norwich	Warwick and Leamington
Nottingham	West Suffolk.

PUBLIC AUTHORITIES AND MEDICAL RECRUITING.

SEVERAL reports have recently been received which seem to show that some members of public bodies are not inclined to make due allowance for the difficulties in which medical men are placed when they consider it their duty to join the R.A.M.C. According to the *Worcestershire Echo* of November 10th, a medical officer of the Droitwich Board of Guardians, who was unable to obtain his discharge as an officer of the Yeomanry and also unable to obtain a locumtenent applied that a neighbouring doctor who was quite willing should be appointed to take over his duties temporarily. After some discussion the board granted the request, but the chairman, with a regrettable want of consideration, suggested that the medical officer ought to have resigned his position so that the board could make another appointment, though it was pointed out that to resign the appointment would have practically involved giving up practice altogether in the district. Again, from the *Worcestershire Chronicle* of November 6th, it appears that a doctor on the panel of the Worcestershire Insurance Committee applied that his panel patients should be temporarily transferred while he was serving with the army. The chairman of the committee said they could not agree to that, and if the patients went to another doctor they would have to remain until the changing period, as they could not force the patients to have any doctor. A medical member of the committee assured it that the doctors had arranged that the transfer should only be temporary, as it seemed to be impossible to obtain a satisfactory locumtenent, and the committee decided to ask the local doctors to formulate a scheme.

In this case there ought to be none of the difficulty, which the chairman raised, in making an arrangement fair both to the doctor and his patients. Repeated appeals from high authorities have from time to time been made to employers of labour to offer every facility to their workmen to join the forces without any unnecessary damage to their prospects, and it surely cannot be asking too much of public bodies that they should willingly do the same for medical men who desire to serve their country. If this is not done the efforts of the Medical War Committees to obtain a full complement of medical officers for the army will be seriously hindered, and the Local Government Board and the Commissioners and other authorities would be quite justified in forcibly reminding local authorities that, without any neglect of their ordinary duties, they share with all the community the added duty of at least not placing unnecessary difficulties in the way of medical practitioners who desire to join the medical forces.

KENSINGTON DIVISION.

A MEETING of the whole profession in the Divisional area was held at Kensington Town Hall on November 15th.

Dr. HERBERT CHAMBERS, Chairman of the Division, who presided, drew the attention of the meeting to the gravity of the present shortage of medical officers in the army.

Mr. E. B. TURNER moved:

That this meeting elects a committee representative of the profession in the areas of Kensington, Paddington, and Hammer-smith to carry out the objects for which the present meeting has been called.

Mr. Turner said that the Central Medical War Committee, as the result of an interview with the Director-General of Recruiting and the Director-General, Army Medical Service, had been recognized as a committee responsible for supplying the necessary number of new officers for the R.A.M.C., thus acting towards the profession as one of Lord Derby's recruiting committees. If therefore their efforts were not crowned with success, the authorities would come to the inevitable conclusion that voluntary effort had failed and that methods of compulsion must be resorted to, methods which would mean that men would be taken from their practices by authorities unacquainted

with the needs of different districts, or of the difficulties of individual doctors. Mr. Turner therefore exhorted the meeting to elect a strong committee in order that the situation might be thoroughly met. He said that the first class to be called upon would consist of unmarried men of military age in institutional practice—hospital, public health, school, and tuberculosis dispensary officers, and the like; the second class would consist of single men in general practice, and then married men in institutional and in general practice.

Dr. A. J. RICE-OSLEY seconded the motion.

A general discussion took place, in which Drs. F. G. LLOYD, LAURANCE, WARE, GORDON WILSON, TURTLE, CHATBERTON, SINGTON, WHITE, KINGDON, BURNHILL, and others took part, the points taken being (a) that from practical experience of some who had had temporary commissions and the information which others had received from friends on active service, there was at present very little need for additional medical officers in France; (b) that rank in the R.A.M.C. should be given according to age and experience; (c) that the navy being at present overstaffed with medical men, a number of medical officers should be transferred from the navy to the R.A.M.C.; (d) that a special fund should be earmarked by the War Office out of which men could be helped when they returned to their practices (or rather the remnants of the same) after the war.

Mr. TURNER, in reply, stated that every objection which the meeting had raised had been already put before the Director-General by the Central Medical War Committee. The 5th army was in urgent need of medical officers, and although it was true that many men at the front at present had little to do, the authorities had to be ready for the enormous increase in casualties which would occur when the final march on Berlin began. He did not think that the question of rank was felt by many to be a grievance; he knew of cases in which surgeons were serving under their former house-surgeons, and glad to be doing it. No doubt the navy was very fully provided with medical officers, but they might all be needed. With regard to the compensation fund, Mr. Turner said that the necessity for such a fund has been urgently pressed upon the authorities, but the Treasury appeared to be the stumbling block.

The CHAIRMAN then put the motion, which was carried unanimously.

It was proposed, seconded, and carried that the following conveners of the meeting be elected as the committee, with power to add to their number: Drs. T. GUNTON Alderton, Charles Buttar, Herbert Chambers, Leonard Dobson, J. Herbert Menzies, A. J. Rice-Osley, G. Crawford Thomson, E. B. Turner, G. de B. Turtle, F. J. Walde, and Walter E. Fry.

The meeting terminated with a vote of thanks to the Chairman.

The number of medical men present was 102.

TEMPORARY COMMISSION OR TERRITORIAL FORCE.

WHICH SHALL I JOIN?

THOSE who are considering in which branch of the Army Medical Service they should seek to obtain a commission for war service find considerable difficulty in obtaining any real data upon which to base their preference. When there is some local interest, such as that held out by joining a territorial unit composed by one's friends, that is often sufficient to determine the balance. Others who have no preference of this sort naturally apply to the War Office, and thereon find themselves commissioned as temporary Lieutenants of the R.A.M.C.

Following some notes and correspondence published recently in our columns we have received many letters on the subject of pay and the different conditions attaching to territorial and other rank.

On the matters of pay the territorial officer is still at a disadvantage as compared with his brother doctor who takes service as a temporary Lieutenant in the R.A.M.C. But it would appear that this factor is not always the weightiest in the minds of some men, even though it is one that has of necessity most engaged the attention of the Central Medical War Committee.

The different points of view from which these two orders of commissions are regarded is well expressed in the two following letters which have been received almost by the same post, and from the same part of the country.

Welsh Border Mounted Brigade Field Ambulance.—W. Morgan to be Captain.
 South Midland Field Ambulance.—Lieutenant E. Whiteho, M.B., to be Captain.
 East Lancashire Casualty Clearing Station.—Captain T. B. Wolstonbush, M.B., to be Temporary Major.
 East Lancashire Field Ambulance.—F. W. Marsden (late Major, East Lancashire Brigade, R.F.A.), to be Major.
 Northern General Hospital.—Captain J. E. Alderson, M.D., from Services to Units other than Medical Units, to be Captain whose services will be available on mobilization.
 Northampton Casualty Clearing Station.—Lieutenants to be Captains: F. Phillips, M.B., S. McColl, M.B.
 Light Brigade Field Ambulance.—R. W. C. Macdonald, M.D., late Surg-on-Lieutenant 8th V.B. Royal Scots, to be Captain.
 Attached to Units other than Medical Units.—Lieutenant L. H. H. Boys to be Captain.

Vital Statistics.

VITAL STATISTICS OF LONDON DURING THE THIRD QUARTER OF 1915.

[SPECIALLY REPORTED FOR THE BRITISH MEDICAL JOURNAL.]
 In the accompanying table will be found summarized the vital statistics of the City of London and of the metropolitan boroughs, based upon the Registrar-General's returns for the third quarter of the year. The mortality figures in the table relate to the deaths of persons actually belonging to the several boroughs and are obtained by distributing the deaths in institutions among the several boroughs in which the deceased persons had actually resided. The 24,000 births registered in the quarter under notice were equal to an annual rate of 21.3 per 1,000 of the population, estimated at 4,518,021 persons: in the corresponding quarters of the three preceding years the birth-rates were 24.6, 24.7, and 24.9 per 1,000 respectively. The lowest birth-rates last quarter were 10.3 in the City of Westminster, 12.5 in Holborn, 13.2 in Hackney, 15.5 in Chelsea, and 15.9 in Stoke Newington; among the highest rates were 25.8 in Deptford, 25.9 in Bermondsey, 26.5 in Stepney, 27.2 in the City of London, 27.8 in Poplar, and 31.8 in Finsbury.
 During the quarter the deaths of 15,337 London residents were registered, equal to an annual rate of 12.4 per 1,000; in the corresponding quarters of the three preceding years the rates were 11.5, 11.8, and 13.3 per 1,000. The death-rates last quarter ranged from 8.6 in Hampstead, 8.9 in Lewisham, 9.1 in Wandsworth, 9.8 in the City of Westminster, 10.5 in Hammersmith, and 10.8 in Kensington, to 25.3 in Bermondsey, 25.6 in Deptford, 25.9 in Southwark, 26.4 in Poplar, 26.5 in Finsbury, and 27.4 in Greenwich.

The 15,337 deaths from all causes included 26 from enteric fever, 131 from measles, 59 from scarlet fever, 193 from whooping-cough, 136 from diphtheria, and 1,299 from diarrhoea and enteritis among children under 2 years of age. Enteric fever was proportionally most fatal in St. Pancras, Stoke Newington, Lambeth, Battersea, and Wandsworth; measles in Finsbury, Shoreditch, Stepney, Poplar, Southwark, Bermondsey, and Greenwich; scarlet fever in Fulham, St. Marylebone, Finsbury, Shoreditch, and Bethnal Green; whooping-cough in Finsbury, Shoreditch, Stepney, Poplar, Deptford, and Greenwich; and diphtheria in the City of London, Shoreditch, Stepney, Poplar and Wandsworth. The mortality from diarrhoea and enteritis among children under 2 years of age in proportion to the births registered during the quarter was greatest in Shoreditch, Bethnal Green, Stepney, Poplar, Bermondsey, and Deptford.

The deaths from pthisis among London residents last quarter

numbered 1,361, and were equal to an annual rate of 0.98 per 1,000; in the corresponding quarters of the three preceding years the rates were 1.18, 1.07, and 1.23 per 1,000 respectively. The death-rates from this disease last quarter ranged from 0.58 in Lewisham, 0.79 in Hammersmith, 0.82 in Wandsworth, 0.87 in Stoke Newington, 0.88 in Paddington, and 0.89 in Kensington, to 1.1 in St. Marylebone, 1.41 in Bermondsey, 1.49 in Holborn, 1.51 in Chelsea, 1.63 in Southwark, 1.70 in St. Pancras, 1.81 in Shoreditch, and 1.83 in Finsbury.

Infant mortality, measured by the proportion of deaths among children under 1 year of age to registered births, was equal to 11.3 per 1,000 last quarter, against 81, 105, and 127 per 1,000 in the corresponding quarters of the three preceding years. Among the lowest rates recorded last quarter were 52 in the City of London, 61 in the City of Westminster, 63 in Hammersmith, 70 in Hammersmith, 71 in Woolwich, and 81 in Chelsea; while the highest rates were 143 in Stepney, 144 in Bethnal Green and in Southwark, 149 in Deptford, 157 in Bermondsey, 159 in Poplar, and 169 in Shoreditch.

HEALTH OF ENGLISH TOWNS.

In the ninety-six largest English towns 7,337 births and 4,810 deaths were registered during the week ended Saturday, October 30th. The annual rate of mortality in these towns, which had been 14.9, 13.9, and 13.3 per 1,000 in the three preceding weeks, rose to 13.8 per 1,000 in the week under notice. In London the death-rates were 14.2, 14.2, and 14.2, while among the ninety-five other large towns it ranged from 4.9 in Acton, 5.7 in Ilford, 7.0 in Wimsledon and in Leyton, 8.8 in Ealing and in Aberdare, and 9.0 in Wilsden and in Wallasey, to 12.1 in Sunderland, 18.3 in Gateshead, 18.5 in Stockton-on-Tees, 19.1 in Brighton, 19.9 in Burnly, and 20.2 in West Hartlepool. Diphtheria caused a death-rate of 1.3 in Stoke-on-Trent, 1.7 in Rochdale, and 2.6 in Hastings. The deaths of children under 2 years from diarrhoea and enteritis, which had been 717, 508, and 364 in the three preceding weeks, further fell to 285, and included 65 in London, 24 in Liverpool, 13 in Manchester, and 8 in Birmingham. The mortality from the remaining infective diseases showed marked excess in any of the large towns, and no fatal case of small-pox was registered during the week. The causes of 52, or 1.1 per cent., of the total deaths were not certified by a registered medical practitioner or by a coroner; of this number, 9 were recorded in Birmingham, 9 in Liverpool, 3 in London, and 3 in Gateshead. The number of scarlet fever cases under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 2,955, 3,014, and 3,110 at the end of the three preceding weeks, were again 3,110 on Saturday, October 30th; 378 new cases were admitted during the week, against 468, 453, and 462 in the three preceding weeks.

In the ninety-six largest English towns 7,629 births and 4,945 deaths were registered during the week ended Saturday, November 6th. The annual rate of mortality in these towns, which had been 13.9, 13.3, and 13.8 per 1,000 in the three preceding weeks, rose to 14.2 per 1,000 in the week under notice. In London the death-rate was equal to 14.4, while among the ninety-five other large towns it ranged from 4.9 in Ilford, 5.2 in Wimbledon, 7.0 in Walthamstow, 7.2 in Wallasey, 8.1 in Southend-on-Sea, and 8.4 in Wilsden, in Gillingham, and in East-ham, to 12.4 in Ipswich, 19.0 in Middlesbrough, 20.1 in Blackpool, 23.3 in Walsall, 24.5 in Barrow-in-Furness, and 26.1 in Barnsley. Measles caused a death-rate of 3.0 in Swindon, 3.9 in Barnsley, and 7.2 in Gloucester; diphtheria of 1.3 in Stoke-on-Trent, 1.5 in Birmingham, and 2.4 in Barrow-in-Furness; and whooping-cough of 2.1 in East Ham. The deaths of children (under 2 years) from diarrhoeal diseases, which had been 508, 364, and 255 in the three preceding weeks, further fell to 226, and included 56 in London, 20 in Liverpool, 10 in Birmingham, and 9 in Manchester. The causes of 49, or 1 per cent., of the total deaths were not certified by a registered medical practitioner or by a coroner; of this number 10 were recorded in Birmingham,

Analysis of the Vital Statistics of the Metropolitan Boroughs and of the City of London after Distribution of Deaths occurring in Public Institutions during the Third Quarter of 1915.

* No correction is made for births in lying-in institutions; the boroughs principally affected are marked thus (*).

8 in Liverpool, 5 in Gateshead, 3 in Southport, and 3 in South Shields. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 3,014, 3,110, and 3,110 at the end of the three preceding weeks, fell to 3,065 on Saturday, November 6th; 544 new cases were admitted during the week, against 453, 462, and 378 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In the sixteen largest Scottish towns 951 births and 727 deaths were registered during the week ended Saturday, October 30th. The annual rate of mortality in these towns, which had been 16.5, 15.5, and 15.7 per 1,000 in the three preceding weeks, rose to 16.2 in the week under notice, and was 2.4 per 1,000 above the rate recorded in the ninety-six large English towns. Among the several towns the death-rate ranged from 8.1 in Haddington, 8.8 in Motherwell, and 10.5 in Clydebank, to 18.0 in Glasgow, 19.1 in Kirkcaldy, and 19.8 in Kilmarnock. The mortality from the principal infective diseases averaged 1.7 per 1,000 from all causes in Glasgow, included 14 from infantile diarrhoea, 9 from scarlet fever, 7 from measles, 2 from enteric fever, 1 from whooping-cough, and 1 from diphtheria. Six deaths from measles were recorded in Edinburgh, 4 in Greenock, and 2 in Leith; from scarlet fever 2 in Aberdeen; from diphtheria 5 deaths in Edinburgh, 5 in Kirkcaldy, and 3 in Dundee; and from infantile diarrhoea 3 deaths in Dundee.

HEALTH OF IRISH TOWNS.

During the week ending Saturday, October 23rd, 488 births and 371 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 659 births and 345 deaths in the preceding period. These figures represent a mortality of 16.0 per 1,000 of the aggregate population in the districts in question, as against 14.8 per 1,000 in the previous period. The mortality in these Irish areas was therefore 1.2 per 1,000 higher than the corresponding rate in the ninety-six English towns, which was ending on the same date. The birth-rate, on the other hand, was equal to 21.0 per 1,000 of population. As for mortality of individual localities, that in the Dublin registration area was 20.5 (as against an average of 19.5 for the previous four weeks), in Dublin city 21.2 (as against 21.0), in Belfast 14.5 (as against 14.1), in Cork 10.9 (as against 17.0), in Londonderry 12.7 (as against 18.3), in Limerick 9.5 (as against 14.5), and in Waterford 1.5 (as against 14.7). The zymotic death-rate was 2.4, as against 1.3 in the preceding period.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notice re Appointments) appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

BALDOVAN CERTIFIED INSTITUTION FOR THE EDUCATION AND TREATMENT OF THE FEEBLE-MINDED.—Resident Medical Superintendent. Salary, £500 per annum.

BENGAL.—India.—Chief Sanitary Officer for the Assam Mills Board of Health and Mining Settlement. Salary, Rs. 1,200 (£80), rising to Rs. 1,500 (£100) a month.

BIRKENHEAD: BOROUGH HOSPITAL.—Junior House-Surgeon. Salary, £180 per annum.

BIRMINGHAM: MIDLAND FREE HOSPITAL FOR SICK CHILDREN.—Radiographer. Honorarium, £40 per annum.

BRADFORD CITY.—Two temporary Women Medical Officers. Salary, 28 8s. per week.

BRISTOL ROYAL HOSPITAL FOR SICK CHILDREN AND WOMEN.—House-Physician and Anaesthetist. Salary, £150 per annum.

BRISTOL ROYAL INFIRMARY.—(1) House-Physicians. (2) House-Surgeons. Salary, £120 per annum in each case.

BURNLEY: VICTORIA HOSPITAL.—House-Surgeon. Salary, £135 per annum.

CHELSEA HOSPITAL FOR WOMEN.—Anaesthetist. Honorarium, £21 per annum.

COUNTY OF PEMBROKE.—Assistant County Medical Officer and Assistant School Medical Officer. Salary, £300 a year, with £100 for travelling expenses.

DERBYSHIRE HOSPITAL FOR SICK CHILDREN.—Lady Resident Medical Officer. Salary, £200 per annum.

DEVONSHIRE HOSPITAL, Buxton.—Assistant House-Physician. Salary, £100 per annum.

DORCHESTER COUNTY ASYLUM, Dorset.—Medical Superintendent. Salary, £200, rising to £300 per annum.

DUDEY: GUEST HOSPITAL.—(1) Senior Resident Medical Officer; salary, £150 per annum. (2) Assistant House-Surgeon; salary, £120 per annum.

HAMPSHIRE GENERAL HOSPITAL, Haverstock Hill, N.W.—Resident Medical Officer. Salary, £200 per annum.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton.—House-Physician. Honorarium, 30 guineas for six months.

LEEDS GENERAL INFIRMARY.—Resident Aural Officer. Salary, £100 per annum.

LEEDS PUBLIC DISPENSARY.—Lady Resident Medical Officer. Salary, £130.

LIVERPOOL: DAVID LEWIS NORTHERN HOSPITAL.—House-Surgeon and Radiographer. Salary, £100 per annum.

LONDON THROAT HOSPITAL, Great Portland Street, W.—House-Surgeon. Salary, £50 per annum.

MANCHESTER: NORTHERN HOSPITAL FOR WOMEN AND CHILDREN, Chetbam Hill Road.—Lady House-Surgeon. Salary, £120 per annum.

NEW HOSPITAL FOR WOMEN, Easton Road, N.W.—House-Physician, Two House-Surgeons, Obstetric Assistant, and Pathologist. Also Senior Clinical Assistant and an Anaesthetist.

OMAGH DISTRICT ASYLUM.—Temporary Assistant Medical Officer. Salary, £4 4s. a week and travelling expenses.

PARISH OF INVERAVON, Banffshire.—Medical Officer. Salary, £75 per annum.

ROYAL COLLEGE OF PHYSICIANS, London.—Milroy Lecturer for 1916.

SHEFFIELD: JESSOP HOSPITAL FOR WOMEN.—Senior and Junior Lady House-Surgeons for the Gynaecological and Maternity Departments. Salaries, £100 and £80 respectively.

SHEPHERD: WHALSAY PARISH. Medical Practitioner. Guaranteed income £300 by the Highlands and Islands (Medical Service) Board.

SOUTHAMPTON: FREE EYE HOSPITAL.—House-Surgeon. Salary, £100 per annum.

SOUTHPOIT INFIRMARY.—Senior House-Surgeon. Salary at the rate of £20 per annum.

STAFFORDSHIRE GENERAL INFIRMARY, Stafford.—House-Surgeon. Salary, £250 per annum.

STORTHERS HALL ASYLUM, Kirkburton, near Huddersfield.—Locum Tenens. Salary, 46 6s. per week.

SURREY COUNTY COUNCIL.—School Dentist. Salary, £300, rising to £350, per annum.

VICTORIA HOSPITAL FOR CHILDREN, Tite Street, S.W.—(1) Senior Resident Medical Officer. (2) House-Physician. Salary, £250 and £200 per annum respectively.

WEST HAM AND FETTERING GENERAL HOSPITAL, Stratford, E.—House-Physicians. Salary, £120 per annum.

WIGAN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Lady House-Surgeon. Salary, £150 per annum.

YORK COUNTY HOSPITAL.—Resident Medical Officer. Salary, £200, plus 40s. per annum.

To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

ROYAL FREE HOSPITAL, Gray's Inn Road, W.C.—The following appointments have been made: Resident Medical Officer, Military Block: G. F. Norbury, L.S.A. House-Physicians: Miss Pandy, M.R.C.S., L.R.C.P., Miss Jobson, M.R.C.S., L.R.C.P. House-Surgeon: Miss Joll, M.B.S., Miss Chick, M.R.C.S., L.R.C.P. Assistant Anaesthetist: Miss Pillingham, M.R.C.S., L.R.C.P. Senior Obstetric Assistant: Miss Brooks, M.R.C.S., L.R.C.P. Junior Obstetric Assistant: Miss Andrews.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s., and the form should be forwarded in Post Office Order or Stamps with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

MARRIAGE.

POLLARD-FRASER.—On November 12th, at Moffat Parish Church, Dumfriesshire, John McFarlane Pollard, West African Medical Staff, to Mary Campbell Fraser.

DEATHS.

MACBINE.—On 12th instant, at 55, Cadogan Street, S.W., Robert Macbaine, M.D., F.R.C.P., aged 58 years.

WRIGHT JOHN.—On the 12th November, 1915, suddenly, at Edinburgh, John Wright Grant, M.B., C.M.Edin., late of Wolburn Sands, aged 55.

DIARY FOR THE WEEK.

MONDAY.

ROYAL SOCIETY OF MEDICINE: SECTION OF ODONTOLOGY, 8 p.m.—Paper: Mr. J. Howard Mummery: Comparative Studies in Calcification.

TUESDAY.

ROYAL COLLEGE OF PHYSICIANS, Pall Mall East, S.W. 5 p.m.—Third Goulstonian Lecture by Dr. Gordon Housley.

ROYAL SOCIETY OF MEDICINE: SECTION OF MEDICINE, 5.30 p.m.—Adjourned Discussion on Paratyphoid Fever; to be reopened by Sir William Osler, F.R.S.

WEDNESDAY.

HUNTERIAN SOCIETY, 4 p.m.—Clinical Afternoon, National Hospital for Diseases of the Heart, W. Williams Gordon.

THURSDAY.

HARVEIAN SOCIETY OF LONDON, Stafford Rooms, Titchborne Street, Edgware Road, W. 8.30 p.m.—A Discussion on the Organization of the Medical Profession for War Service will be opened by Dr. James Galloway and Dr. Charles Butler.

ROYAL SOCIETY OF MEDICINE: SECTION OF BALNEOLOGY AND CLIMATOLOGY, 5.30 p.m.—Presidential Address by the Hon. Dr. William Gordon.

SECTION OF NEUROLOGY, 9 p.m.—Clinical Meeting.

FRIDAY.

ROYAL SOCIETY OF MEDICINE: STUDY OF DISEASE IN CHILDREN, 4.30 p.m.—Cases and Specimens.

SECTION OF EPIDEMIOLOGY AND STATE MEDICINE, 8.30 p.m.—Dr. J. Middleton Martin: An Analysis of Gloucestershire Statistics, 1914.

POST-GRADUATE COURSES AND LECTURES.

The following Post-graduate Course will be given next week: THE POST-GRADUATE COLLEGE, West London Hospital, Hammer-smith, W.—Clinical work; graduates only.

GENERAL COUNCIL

OF

MEDICAL EDUCATION AND REGISTRATION.

WINTER SESSION, 1915.

Sir DONALD MACALISTER, K.C.B., President, in the Chair.

SHORTAGE OF DENTAL PRACTITIONERS.

At the meeting of the Council on November 26th, 1914, the question of the large amount of practice of dentistry by unqualified persons, and the fact that the number of dentists on the *Dentists Register* had not increased since the register was formed, was raised by Dr. Newsholme and Mr. Verrall. The matter was referred to the Dental Education and Examination Committee, which was authorized to communicate with the licensing authorities on the subject. A letter was accordingly sent on March 11th to the licensing bodies granting dental qualifications, to the British Dental Association, and to the principal dental schools. The Committee now presented an interim report stating that it had made inquiries and had asked a series of questions. The replies were summarized as follows, the nature of the question being indicated by the italic headings:

1. *Defects in the Law as a Cause of Shortage.*—There is unanimity in attributing mainly to this cause any deficiency in the supply of students, some bodies going so far as to say that it is the sole cause. All express themselves without hesitation on this point, which is somewhat more fully discussed in the remarks summarized in Table D.

2. *The Influence of the Preliminary Examination.*—There is more diversity in the answers to this question. Nearly half of the bodies consider its effect to be negligible, whilst others, though thinking it of some effect, qualify their answer by deprecating any general lowering of the standard. One body alone, the Glasgow Incorporated Dental Hospital, holds that the examination is too stringent.

3. *The Influence of the Length and Stringency of the Curriculum.*—A good many consider this a negligible factor; others, in more guarded answers, hold it to be insignificant as compared with the legal position. Some touch upon the expense of the curriculum in this connexion.

4. *The Advisability of Modifying the Curriculum.*—Although in Table C a good many suggestions for alterations in the curriculum are offered, it would be premature to discuss these at present, inasmuch as the Royal College of Surgeons of England, the body which licenses the largest number of dentists, is making a very careful inquiry into the matter, which has not yet been completed.

The only conclusion which so far comes out clearly is that in the opinion of these bodies, who are in the best position to judge of the matter, no appreciable increase in the numbers of those entering the profession can be looked for whilst the law affords so little protection to the qualified man.

On the motion of Mr. TOMES, the Chairman of the Committee, seconded by Sir HENRY MORRIS, the question raised by the report was referred to the Dental Education and Examination Committee with a view to the preparation of definite recommendations for the consideration of the Council.

DENTAL BUSINESS.

Unqualified Practitioners and the Public.

Dr. MAGENNIS moved:

That as it is expedient that the public should be enabled to distinguish between qualified and unqualified practitioners of medicine or of dentistry, and as a large number of persons who are unqualified are practising dentistry under such conditions as to lead the public to believe they are qualified dentists, the General Medical Council do refer the question to the Dental Education and Examination Committee to take into consideration the best methods for preventing the public from being deceived by such persons.

It was unnecessary to point out to the Council the great injustice and hardship that the public suffered from persons practising who were not qualified. All modes and methods were adopted to deceive the public. Limited companies were formed, calling themselves any name they liked. The most deceptive method was that of putting up a brass plate with the name of the individual, and underneath it "Dental Surgery." Even medical men might be deceived by that, and it was well that the public should be warned that a person having such a designation under his name must be looked upon with suspicion. The Irish Branch of the British Dental Association had taken the very wise precaution of having printed a list of the qualified and registered dentists in Ireland. This list was circulated not only to members of the medical and dental professions, but was also sent to a great number of public institutions so that they might be able to distinguish between qualified and unqualified dentists. Something should be done to prohibit unqualified persons from performing any dental operation, or administering any anesthetic such as gas or ether.

Sir BERTRAM WINDLE, in seconding, said that the art of deception was carried to the highest possible point in this connexion. How could people distinguish between a dental surgery and a dental surgeon? They could not distinguish which was the proper and which was the improper practitioner.

The motion was carried.

APOTHECARIES HALL OF IRELAND.

Sir JOHN MOORE moved:

That the Irish Branch Council be authorized to appoint for a period of one year a deputy to attend and be present on behalf of the General Medical Council at the professional examinations held by the Apothecaries' Hall for the purposes set forth in Section 18 of the Medical Act, 1858; that the deputy so appointed present to the Council a report on the general character of such examinations; and that he be paid a salary of £50 for the year in question.

Dr. LITTLE seconded.

Dr. MAGENNIS moved to postpone the question for one year, but this was not seconded, and Dr. Magennis then moved as a further amendment:

That the Irish Branch Council be authorized to appoint for a period of one year a deputy to attend and be present on behalf of the General Medical Council at the professional examinations held by the Apothecaries' Hall for the purposes set forth in Section 18 of the Medical Act, 1858, and

that the deputy so appointed shall be either an Englishman or a Scotchman who shall present to the Council a report on the general character of such examination, and that he be paid an adequate salary for the year in question.

It was not, Dr. Magennis said, right that a deputy should be appointed from a rival examining body and that the Apothecaries' Hall should be subjected to reports to the Council by men who had an evident prejudice against them. He appealed to the sense of justice of the Council to say he was not unreasonable in asking that an Englishman, Scotsman, or Welshman be appointed as a deputy to inspect the examinations, and if the sum of £50 were not sufficient to cover expenses, then on behalf of the Apothecaries' Hall he offered to supply any deficiency. The amendment not being seconded fell to the ground.

The motion was then put and carried.

Recommendations by the Council.

The Examination Committee presented a voluminous report on various matters relating to the Apothecaries' Hall of Ireland, together with reports as to the examinations held in January and February by Sir William Taylor, M.B., F.R.C.S.I., instructed to attend the examinations and to present a return thereon, and by Dr. James Little and Sir John Moore, who attended the examinations in June as members of the Irish Branch Council.

The Council adopted the following recommendations of the Examination Committee:

1. That, inasmuch as the Court of Directors of the Apothecaries' Hall of Dublin have expressed their utmost willingness to comply in every respect with the requirements of the General Medical Council in regard to the course of study and the examinations at Apothecaries' Hall, it be referred to the Examination and Education Committees, acting conjointly, to prepare for the Executive Committee a statement of the respects in which the said course of study and the said examinations have been found to be defective or insufficient; and of the suggestions they desire to make for amendment in these respects. That, further, it be delegated to the Executive Committee to communicate to the Court of the Hall the statement so prepared on behalf of the Council.

2. That the reports as to the examinations of the Apothecaries' Hall of Ireland held in January, February, and June, 1915, having been remitted to the Apothecaries' Hall, that body be requested to favour the Council with any remarks thereon which they may deem fitting.

Dr. MAGENNIS said that the Apothecaries' Hall of Ireland would carefully carry into effect every suggestion of the Council in order that it might attain to the standard the Council desired.

INDIAN MEDICAL SERVICE.

A table showing the results of examinations in July, 1915, for commissions in the Indian Medical Service was received and directed to be entered on the minutes. It appeared that ten vacancies were advertised, but only seven candidates qualified. Of these, four held the diplomas of the Conjoint Board, London; one was a graduate of the National University of Ireland, and one of the Queen's University, Belfast.

PUBLIC HEALTH COMMITTEE.

Sir JOHN MOORE, Chairman, presented a report from the Public Health Committee giving the statistics as to public health examinations during the ten years ending 1914. The Council resolved to send copies of the statistics to the universities and other licensing bodies which hold, either singly or jointly, examinations for the diploma in public health, with a request for their observations.

DISCIPLINARY CASES.

Alleged Covering of an Unregistered Midwife.

The case of Herbert Midgley Reeve, registered as of 1, Bournemouth Park Road, Southend-on-Sea, M.R.C.S. Eng. 1899, L.R.C.P.Lond. 1899, M.B.U.Lond. 1899, was considered on November 3rd. He had been summoned to appear before the Council on the following charge:

That being a registered medical practitioner you knowingly enabled one Mary Ann Preece, whose name had been removed by the Central Midwives Board from the roll of midwives, to practise as a midwife in contravention of the provisions of the Midwives Act, 1902, as if the said Mary Ann Preece were duly certified under the said Act. And that in relation thereto you have been guilty of infamous conduct in a professional respect.

The complainants were the Central Midwives Board.

Mr. Julius Bertram, solicitor, appeared for the com-

plainants. Mr. George Elliot, K.C., and Mr. Howard Wickham, appeared for Dr. Reeve.

Mr. BERTRAM said the Central Midwives Board was charged with certain statutory duties for the purpose of purging the roll of midwives of unsuitable or dangerous practitioners. The Board could remove midwives from the roll and also had power to restore them to it. In November, 1913, Mrs. Preece was removed from the roll of midwives. In 1914, after she had made applications for the restoration of her name to the roll, it was reported to the Midwives Board that she had been acting as midwife under the aegis of a registered medical practitioner in Southend, and these proceedings were the result of that information coming before the Board. The Board was not actuated by any spirit of vindictiveness against Dr. Reeve. It would be for him to tell the Council the reasons which induced him to act as he did, and for the Council to decide what degree of culpability, if any, his action merited. The charge was one of covering. In regard to that offence the following notice had been issued after deliberation to the members of the medical profession: "In regard to the practice commonly known as covering the Council gives notice that any registered medical practitioner who by his presence, countenance, advice, assistance or co-operation knowingly enables an unqualified or unregistered person, whether described as an assistant or otherwise, to attend or treat any patient, to procure or issue any medical certificate or certificate of death, or otherwise to engage in any medical practice as if the said person were duly qualified and registered, is liable to be judged guilty of infamous conduct in a professional respect." He submitted that the notice imposed upon a medical man under the most severe penalties the duty of abstaining in any way from assisting a woman who was not upon the register of midwives to attend women in childbirth as if her name was upon that register. The practice in which Mrs. Preece was engaged was only possible by the intervention of Dr. Reeve. The ex-midwife was proceeded against before the Southend magistrates, who found as a fact that she was contravening the statute, and she was convicted and punished. At the magisterial inquiry Dr. Reeve's conduct was commented upon by the magistrate. He came forward and said what he could to excuse the woman Preece from her breach of the law. He (Mr. Bertram) did not suggest that Dr. Reeve was actuated by any base motives of achieving a large number of small pecuniary benefits at the expense of his fellow medical practitioners, but all the inseparable incidents of a really bad case of covering were present. First of all the doctor assisted an unregistered person to practise. The patient who was the subject of the practice was not attended in the confinement by the doctor at all. The patient did not engage the doctor's services. She was in each case a woman who had previously engaged the midwife in former confinements. The woman would go to the midwife and ask her to attend her. Mrs. Preece replied that she could not do it without a doctor, but Dr. Reeve would attend. Again, the doctor's fee was not paid to him by the patient; it was in each case paid to him by the midwife. The doctor did not conduct the confinements, and in each case the doctor's conduct of confinement cases was described by himself as being of a perfunctory kind. Four women were attended; he did not attend any one of the confinements; in each case he paid only one visit. At that visit he omitted to make any examination of the patient and took the nurse's word for it, or the patient's word, that there was no damage or laceration to bother about. The doctor did not examine the patient or take her pulse or temperature; but he did two things—he signed the maternity benefit card and issued to the local authority the necessary notification of birth. Mr. Bertram suggested that the visit was paid immediately after the confinement, mainly if not solely in order that the birth might be notified to the local supervising authority within the time prescribed by the Act of Parliament, and it would be plain to every member of the Council that the circumstance that the doctor in each of the four cases was the person to notify the birth had the effect of preventing the supervising authority from tracing the practice of this unauthorized person Mrs. Preece. The occurrence in one of the cases on the fifteenth day of untoward symptoms was the only circumstance which put the authorities on the track. The

offence might have been committed by Dr. Reeve from the best of motives, but, as the Council would realize, the inevitable consequence, if such a practice were condoned, would be that the work with which the Central Midwives Board was charged would become worthless and might not be performed.

The statutory declaration of George William Duncan, Secretary of the Central Midwives Board, was read, which bore out the statements set forth by Mr. Bertram. Declarations were also read made by the four women who were attended by Mrs. Prece.

Dr. PUGH (M.O.H. Southend), in answer to Mr. GEORGE ELLIOT, said that from his constant association with Dr. Reeve he was of opinion that he carried on his practice in a perfectly honourable and straightforward manner.

Mr. GEORGE ELLIOT said Dr. Reeve did not attempt and did not wish to justify his conduct. Putting the case shortly he desired to present to the Council the case of Dr. Reeve as an unfortunate error of judgement, but under circumstances which entitled him to the sympathy of the Council. While the Council might think that there had been conduct which under some circumstances justly would be regarded as deserving of very severe censure and penal remedies, yet he submitted the present was a case, having regard to the high character of the man, in which the Council might take a lenient view of the matter, and not proceed to the extreme course which might be taken.

Dr. REEVE, in answer to Mr. GEORGE ELLIOT, said he had no intention of departing from the normal practice; he had no idea at all that he was assisting an unregistered midwife. He considered the patients referred to belonged to him, and looked upon himself as responsible for them.

This concluded the case for Dr. Reeve.

The Council went into camera to deliberate on the case on November 4th. Strangers withdrew. On readmission, the PRESIDENT announced the judgement of the Council as follows:

Mr. Herbert Midgley Reeve, the Council has considered the charge made against you, namely, that being a registered medical practitioner, you knowingly enabled one Mary Ann Prece, whose name had been removed by the Central Midwives Board from the roll of midwives, to practise as a midwife, in contravention of the provisions of the Midwives Act, 1902, as if she said Mary Ann Prece were duly certified under the said Act. This charge the Council has found to be proved. Your offence was committed notwithstanding the fact that you were in possession of the following warning notice: "Any registered practitioner who by his presence, countenance, advice, assistance, or co-operation, knowingly enables an unqualified or unregistered person, whether described as an assistant or otherwise, to attend, treat, or perform any operation upon a patient in respect of any matter requiring professional discretion or skill, or otherwise to engage in professional practice as if the said person were duly qualified and registered, is liable on proof of the facts to have his name erased from the Register." The Council takes a very grave view of the action of any medical practitioner who "covers" the practice of unqualified or uncertified women, under whatever pretext they practise midwifery or otherwise attend and treat women in labour. But in order to give you an opportunity of reconsidering your position in relation to this matter, the Council has postponed judgement in your case till the next session, in May, of which you will receive due notice. You will then be required to attend and to produce testimony from your professional brethren as to your character and conduct in the interval.

In the case of Ulick Joseph Burke, registered as of 205, Vicarage Lane, Stratford, London, E., L.M. 1896, R.C.P.Irel., L., I.M. 1896, R.C.S.Irel., Mr. Harper, the Council's solicitor, on November 3rd, proved three convictions for drunkenness, in one instance associated with disorderly conduct. Mr. Burke denied the charge of disorderly conduct. The Council having considered the matter in private, the PRESIDENT, when strangers were readmitted, said:

Mr. Burke, I have to inform you that it has been proved that you have been convicted of the misdemeanours alleged against you in the notice, and that the Acting Registrar has been directed to erase your name from the *Medical Register*.

On the same day the Council considered the case of Edmund Lyall Haynes, registered as of 6, Queen's Club Terrace, West Kensington, London, W., L.S.A.Lond. 1888, M.R.C.S.Eng. 1888, L.R.C.P.Lond. 1888.

Mr. Haynes did not appear, and Mr. HARPER formally proved two convictions for being drunk, one for obtaining money by false pretences, and one of wearing military uniform without lawful authority. The Council having considered the matter in private, the PRESIDENT made the following announcement:

That Edmund Lyall Haynes having been proved to have been convicted of the misdemeanours alleged against him on the notice of inquiry, the Acting Registrar has been directed to erase his name from the *Medical Register*.

In the case of William Shaw, registered as of Larne, co. Antrim, L.R.C.P.Edin. 1886, L.R.C.S.Edin. 1886, Mr. HARPER proved a conviction of indecent behaviour and two convictions for drunkenness. Mr. SHAW, who appeared in person, stated that he would do anything that the Council would ask him to do. He was trying to walk straight, and he would be glad if the Council would postpone sentence till the next session.

Strangers and parties withdrew. On readmission, the PRESIDENT announced the judgement of the Council as follows:

Mr. Shaw, I have to inform you that the Council has found, after careful consideration, that the convictions alleged against you in the notice of inquiry have been proved. That it takes a very grave view of the misdemeanours of which you have been proved guilty and of the public scandal which is caused by such convictions; but, in order that you may have an opportunity of redeeming your position, the Council has postponed its judgement in your case until the November session next year, when you will be expected to produce testimonials as to your good conduct in the interval from your professional brethren. I have further to inform you that, in the event of any other conviction being reported before the next session of the Council in May, you will be liable to be called upon to attend to receive the judgement of the Council at that session instead of in that of November, 1916.

REMOVAL FROM THE REGISTER.

A report from the Executive Committee was received stating that Mr. Dhanpat Rai, registered on February 8th, 1901, with the address Lahore, India, had ceased to be a licentiate of the Royal College of Physicians of London and a member of the Royal College of Surgeons, England, for his conduct in respect to advertising. The Council directed that the name of Mr. Dhanpat Rai should be erased from the *Medical Register*, "he having no longer any registrable qualifications."

Meetings of Branches and Divisions.

STAFFORDSHIRE BRANCH.

SOUTH STAFFORDSHIRE DIVISION.

At a meeting of the Division held at Wolverhampton on November 16th, when Dr. J. A. COBB was in the chair, resolutions of condolence were passed with the President-elect of the Staffordshire Branch, Dr. Malet, and with Dr. W. H. T. Winter, a member of the Division, on the deaths in action of their oldest sons in the Dardanelles.

The new ethical rules were adopted and the Executive Committee of the Division was appointed to be the Medical War Committee.

After a discussion of the question of free medical attendance on the dependants of soldiers and sailors, it was unanimously resolved that the separation allowance was now so much more liberal that the time had come for the free attendance on the dependants of soldiers and sailors to be discontinued.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

KENT BRANCH.—Dr. E. A. Starling, Honorary Secretary (Chillingworth House, Taubridge Wells), gives notice that a special meeting of the Branch will be held on Wednesday, December 1st, at 3.15 p.m., at the Royal Star Hotel, Maidstone. Agenda: To consider and, if thought advisable, to adopt the new ethical rules and the new organization rules.

METROPOLITAN COUNTIES BRANCH: CITY DIVISION.—Dr. McNaboe, Honorary Secretary, gives notice that a meeting of the Division will be held on Wednesday, December 1st, at 4 p.m., at Balsour Hall, Kingsland Road, N., when Dr. Cox will explain the position as to the War Emergency.

A list of periodical publications, official reports, and Blue Books in the Library of the British Medical Association available for issue to members on loan has been printed, and copies can be obtained free on application to the Librarian, at the house of the Association, 429, Strand, W.C. The regulations governing the loan of these publications are stated in the introduction to the list. The Library is open for consultation from 10 a.m. till 5 p.m. (on Saturdays till 2 p.m.).

RECRUITING FOR THE NAVAL AND MILITARY SERVICES :

ENGLAND AND WALES.

On August 17th last the Central Medical War Committee advised all the local War Committees in England and Wales that, acting on the urgent request of the Director-General of the Army Medical Services to provide an additional large number of military medical officers, the Committee had resolved that each area should be asked to furnish a number calculated on the basis of the proportion the medical population of the area bore to the total number required.

The following is a list of the areas which, up to the present date (November 22nd) have furnished their quota or more. The Committee in publishing this list is anxious to make it clear that the appearance of an area in this list does not necessarily mean that it is not likely to be called upon to furnish more medical officers, as the quota was a provisional one which may be increased or diminished in the future according to local conditions :

Barnsley	Hartlepool	Oldham
Birkenhead	Hexham	Preston
Blackpool	Holland	Reigate
Blyth	Hersham	Richmond
Bolton	Huddersfield	Rochdale
Chester	Isle of Man	Shropshire and
Dudley	Lewisham	Mid-Wales
Finchley and Hendon	Manchester	Stratford
Gateshead	North Carmarvon	Tower Hamlets
Gloucester	and Anglesey	Tromsberg
Great Yarmouth	North Lincolnshire	Warwick and
Guildford	Norwich	Leamington
Halifax	Nottingham	West Suffolk.

A CENTRAL COMPENSATION FUND.

Mr. ROBERT JACQUES, F.R.C.S. (Plymouth), writes : Now that the Central Medical War Committee has definitely informed us that the Treasury declines to provide a compensation fund for doctors engaged on active service it appears to be high time for the medical profession itself to endeavour to provide such a fund.

Our colleagues who have answered their country's call are in many cases facing heavy financial sacrifices in addition to the hardships and dangers of warfare. We who remain in comfort and security at home should at least be willing to bear a large share of the financial burden.

If every medical man who stays at home will agree to contribute a percentage of his receipts, a large fund can soon be raised. In this way we shall give practical proof that, though unable for various reasons to take our place with the troops, we are willing and anxious as patriotic citizens to bear our share of the burden laid upon the medical profession.

INSURANCE.

SCOTTISH PANEL CHEMISTS.

A STATE of matters which either is or threatens soon to be a deadlock has arisen in Scotland in connexion with the rates for the dispensing of drugs under the National Insurance Act. Ever since the Act came into force there has been a difference between the condition of its working in this respect in Scotland as compared with England. It can hardly be doubted that but for the war the whole finance of the Act, and particularly that part of it which relates to the remuneration of the chemists working under it, would be the subject of discussion in Parliament. In Scotland it is claimed that the Act, which in England brought a considerable accession of business to the chemists—medical men in that country having before the Act done a large part of their own dispensing—benefited the Scottish chemists hardly at all; that, in fact, the financial situation in Scotland had been difficult from the very first; and that, but for the war, the Scottish chemists would long ere this have stated their case to the Scottish Commissioners, and would possibly have had their circumstances bettered. Meantime, by the aid of a system of central checking devised by the Scottish Insurance Commissioners, excessive prescribing has been reduced to the minimum in that country, with as a consequence a comparatively good state of the Drug Fund. In England, the Scottish chemists state that as matters have not gone so well, it has been decided to lower the rate of the chemists' remuneration and to make the reduction applicable to Scotland as well. The English chemists, it is stated, accustomed to heavy discounting of their

bills, and anticipating little falling off in their incomes have agreed to the new tariff; but the Scottish chemists, already faced by a difficult financial situation, and looking forward to greater difficulty under the new rate, are anxious to press their claims, but are deterred by the circumstances of the war, and are therefore willing to maintain the *status quo* on the basis of existing agreements. But Mr. Charles Roberts, M.P., Chairman of the Joint Insurance Committee, if he has not explicitly intimated that lower terms than the present minimum rates will be enforced on July 1st next in Scotland, has certainly stated that a new drug tariff will be introduced then. It is proposed that meantime for the first six months of 1916 the Scottish chemists should accept service on the old terms and prepare a statement based on a complicated, difficult, expensive, and possibly a futile investigation as to establishment charges, cost of materials, dispensing fees, etc., to be completed by the end of April. It is suspected that whatever the result of the investigation may be the situation will not be made easier for the Scottish chemists; for if it brings out that the rates offered are too low they will at the best only obtain confirmation of the existing tariff, while if it is shown that they have put their claims too high they will be compelled to accept the new rates. Under the circumstances a good deal of dissatisfaction is making itself evident in the form of notices of withdrawal, which if at all general will arrest the working of the Act. The situation may be eased considerably if it can be shown that it is not intended that an expected surplus in Scotland shall be diverted to meet deficiencies in English and Welsh areas, where the expenditure on drugs has been abnormally high.

CERTIFICATES IN RESPECT OF INSURED PERSONS IN ASYLUMS.

CIRCULAR A.S. 175 issued by the Commissioners for England and Wales states that the Commissioners understand that approved societies find no difficulty in practice in obtaining from the medical officers of asylums certificates as to the admission to and discharge from asylums of their members. As to periodical certificates while such members are in the asylums, it is suggested that it ought not usually to be necessary to trouble the medical officers for them, seeing that if the member has no dependants there is no question of the payment of benefits until he leaves the asylum, though the societies might reasonably desire to be informed at intervals of, say, three or six months that the person is still an inmate. Where the member has dependants, the society, having to pay the benefit to the dependants, has to satisfy itself that the member is still an inmate, and it will usually be sufficient for the society to obtain a declaration signed by the dependants that the member is still an inmate of the institution. False declarations would subject the dependants to penalties under Sect. 69 (1) of the 1911 Act. Societies would also be well advised to obtain a certificate from a responsible officer of the institution at intervals of perhaps three months. The above refers to asylums supported by public authorities or by a charity or voluntary subscriptions.

In the case of a member who is an inmate of a private asylum, the benefit is payable weekly, and Sect. 12 of the Act does not apply. In these cases, as the benefit cannot be paid to the members themselves, societies may appoint some person to receive the money on behalf of and for the benefit of the member, and the same procedure should then be adopted as to certificates and declarations as in the case of members who are in public asylums.

LOCAL MEDICAL AND PANEL COMMITTEES.

LONDON.

At the meeting of the London Panel Committee on November 23rd, the chairman (Dr. H. J. CARDALE) said that the proposed revision of the terms of service went to the root of their contract with the Insurance Committee. Upon the question of "Rep. mist." and that of the method of signing certificates (unlike the other question of drug finance) the profession had not been consulted. It was decided to take steps to define their position, and to take counsel's opinion on the point whether the panel practitioners were prejudicing their position by delay.

A recommendation was before the meeting proposing to ask Lord Derby to receive a deputation with a view to placing before him the position of panel practitioners with regard to army recruiting. On the suggestion of

Dr. GALLOWAY it was agreed to approach the Central Medical War Committee instead.

The Committee considered a case in which during three months a practitioner had issued 6,280 prescription forms for 1,506 patients; the average cost per insured person on his list was reported to be 1s. 1d. The Pharmacy Subcommittee estimated the excess at about £60, but thought the case would be met by recommending that an excessive demand was made upon the drug fund to the extent of 10 per cent. of the total cost of the drugs (£251) ordered by the practitioner during the period under review, and this was agreed to. The practitioner was invited to attend the Committee, but failed to do so.

ESSEX.

SINCE the opening of the new session four general meetings and one emergency meeting of the Local Medical and Panel Committees have been held.

The total cost of checking prescriptions, together with the expenses of the Joint Drug Committee, amount to £384 5s. 6d., of which the Panel Committee paid £128 1s. 10d. for 1914.

Subcommittees of the Local Medical and Panel Committees in the twenty-one areas in Essex were arranged on the lines of the parent Committee, the Commissioners agreeing to allow the Panel Committee to defray the expenses of such meetings as are strictly required for the administration of the Panel Committee.

The interpretation of the new regulations as to "Rep. mist." is believed to be that any reasonable arrangement, such as that in Essex, will be looked upon favourably by the Commissioners. The Panel Committee decided that it could not accept any alteration of the present arrangements during 1916.

GLOUCESTERSHIRE.

At a meeting of the Local Medical and Panel Committee held on November 10th it was proposed to augment the checker's salary by £20, provided he supplied the returns required in the Insurance Acts Committee's circular M.5 for the examination of each doctor's expenditure in prescribing.

With regard to the terms of service for 1916 it was agreed that, after consultation with the Panel Committee, a practitioner may be required not to give any repeat order for any drug or appliance without specifying the date of the original prescription or a reference number for the same.

In view of the attempt to withdraw the domiciliary 6d., it was decided to circulate doctors on the panel to certify every case of tuberculosis.

ISLE OF WIGHT.

At a meeting of the Local Medical and Panel Committees held on November 12th it was decided to protest most strongly against the abolition of the method of prescribing by the use of "Rep. mist."

The terms of service for 1916 were considered, and it was decided that as a large percentage had been deducted from the payments due to doctors for the last six quarters and was still unpaid, and taking into account that the chemists were, under pressure, to be paid in full, unless the same safe guarantee be soon given there was a great danger of the local medical profession refusing to work the Insurance Act.

BURGH OF EDINBURGH.

At a meeting of the Panel Committee held on November 9th a statement was submitted as to the undertaking entered into last year between the Soldiers' and Sailors' Families Association for attendance upon the necessitous dependants of soldiers and sailors on service. Since it appeared that the Soldiers' and Sailors' Families Association was under the impression that panel doctors had agreed to attend the families of their panel patients, the matter had been considered by the Medical Emergency Committee and a suitable letter sent to the secretary of the Association.

It was reported that of 89 practitioners on the Edinburgh panel who had been asked to subscribe towards the expenses of the Committee, 75 had paid their subscriptions. Of the 14 who had not subscribed, 5 were absent on service with His Majesty's forces, 2 had promised to pay, and 4 had refused.

INSURANCE ACT IN PARLIAMENT.

SANATORIUM BENEFIT FUNDS.

IN reply to Mr. CURTIO (Leith Burghs), Mr. C. Roberts, Chairman of the Joint Committee of Insurance Commissioners, said, on November 18th, that he could not admit the validity of the calculation that the three cases receiving domiciliary treatment for tuberculosis in the county of Renfrew in 1913 had cost on an average £327 each. It was correct that there was a large deficit in the Renfrew Committee's Sanatorium Benefit Fund, and that the Treasury had agreed to pay half of this deficit, and requisitions from other quarters to the same effect had also been agreed to by the Treasury. Mr. Roberts pointed out that the 6d. specifically allocated to the panel doctors in respect of their responsibility for domiciliary treatment of tuberculosis could not be applied in meeting expenditure sanctioned in accordance with Section 17 (2) and (3) of the 1911 Act, and that such expenditure had been sanctioned in 14 cases altogether in Scotland. He did not think that the facts supported any general expression of a view adverse to domiciliary treatment of tuberculosis. The particular form of treatment had to vary with the condition and surroundings of the patient, and, as was pointed out by the Departmental Committee on Tuberculosis, it was of primary importance to the success of any scheme that it should enlist the hearty co-operation and stimulate the interest of general practitioners.

Mr. Roberts further said, in reply to Sir Henry Craik, that it was not the case that one of the inducements to the passage of the Insurance Act was that the domiciliary treatment of tuberculosis would come to an end, as both domiciliary and institutional treatment were equally part of sanatorium benefit. He agreed that in deciding which form of treatment should be given the welfare of dependants of the victim should be considered.

In reply to additional questions by Mr. Currie, Mr. Roberts said that his attention had been drawn to the statement of the Kilmarnock Insurance Committee that the cost of certain cases had averaged over £63 each. This referred to the year 1914. He added that he must not be understood to accept the implications drawn from the statement of the Kilmarnock Committee. The arrangement in respect to domiciliary treatment formed part of the general terms of remuneration of the panel practitioners, and had been fully explained to the House by Mr. Lloyd George on October 23rd, 1912. Asked further whether any general effort was being made to reduce expenses, Mr. Roberts repeated his previous reply that "it is impossible to revise the arrangements sanctioned by the medical profession, in view of the absorption of the medical profession in the war."

MEDICAL BENEFIT REGULATIONS.

Sir Philip Magnus asked whether, having regard to the official circular of the Insurance Commissioners (201.1.C.) issued in September 1914, to the effect that, owing to the war and to the additional duties now undertaken by the doctors, no substantial revision of the regulations would be made, and having regard, further, to Sir Robert Morant's letter of March 17th, 1915, addressed to the Secretary of the British Medical Association, confirming the above-mentioned statement, and adding that no changes of any kind had been under consideration for adoption during the present year, any explanation could be offered of the action of the Commissioners in having drafted new regulations, to come into operation on January 1st, 1916, which materially modified the agreement entered into by medical practitioners, who were now required to accept the new conditions or to withdraw from the panel.

Mr. C. Roberts replied: The reference in the documents cited to modifications in the agreements between medical practitioners or chemists and Insurance Committees related only to the question of modifications during the course of the year 1915, under special powers taken for the purpose by regulations introduced at the end of 1914. These special powers have not, in fact, been used. A revision under the ordinary powers of the regulations as from January 1st, 1916, was necessitated by the new terms of service for chemists. The consequential changes affecting doctors were, in view of the special circumstances of the war, carefully devised so as to secure that the doctors' financial position should be left untouched in all respects, and were fully discussed beforehand with representatives

of the medical profession, and recommended by them to the profession for acceptance.

Sir P. Magnus: Were these the only alterations introduced into the regulations in 1914?

Mr. C. Roberts: There were two minor regulations in reference to rubber stamps, and one other point, which can be exactly connected with the financial terms of the doctors, but they also were not objected to. They were discussed beforehand with the medical profession.

CORRESPONDENCE.

SURCHARGING PANEL PRACTITIONERS.

Dr. J. F. COWNIE (Cardiff) writes: I see every week discussions and resolutions reported as to surcharging doctors in different areas. In Cardiff I myself was asked to show reason why I should not be surcharged some £54 for 1914. The average cost of my prescriptions for 1914 was 9.5d. In Edinburgh, where the floating stipend has been saved for the doctors, the average price of prescriptions for 1914 was 10.5d. The general average paid to each doctor in Edinburgh in 1914 was 2s. 8d. for each attendance and in 1913, 3s. 4d. (SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL, July 24th, p. 45). My average fee was 1s. 5d. It is evident from these figures that the incidence of illness is very much higher in Cardiff than in Edinburgh, and must vary in different areas. It is therefore very unjust to try to penalize doctors who exceed their drug allowance in districts where there is so much illness. It is also unfair, and surely there should be some scheme whereby the money available for drugs should be fairly distributed in the United Kingdom. The doctor who does the most work is underpaid, and worried by Panel Committees as well. Of course I quite agree that prescriptions for proprietary drugs, and extravagant prescriptions should be surcharged where proved.

Recent decisions of the courts have made it fairly clear that it is good law as well as common sense that a panel doctor must not be surcharged simply on the consideration that the cost of his prescribing has exceeded that of other doctors in his area. Neither can surcharges be made simply to supplement a drug fund which has proved to be insufficient to pay the chemists in full, it being necessary to prove definitely and specifically that the doctor has been extravagant in his prescribing. The system of pooling the balances of drug funds that will come into operation with the commercial tariff in 1916 will meet Dr. Cownie's suggestion so far as the chemists are concerned, but it in no way meets, but rather aggravates, the fact that doctors in unhealthy areas who have a large amount of work to do only receive the same total amount of money as doctors in healthy areas where there is much less work to do.

"ENQUIRER" says that eight months after 1914 he was informed that his prescriptions exceeded the 2s. allowed for drugs, and though so far no action has been taken against him, seeing that the record cards have now been divided into two halves so that the identity between patients and illnesses is lost, he asks how excessive prescribing could be proved against him.

There is no doubt that the Panel Committee in the first instance and the Commissioners later in case of appeal, would find themselves unable to prove matters which depended on knowing what disease any particular patient suffered from. It might, for example, be difficult, if not legally impossible, to prove that too much medicine or too many dressings had been ordered; and, so far, part of the case against "Enquirer" might be unprovable. But in other cases it would not be necessary to know anything about the patient or the illness to prove that particular prescriptions were extravagant, as containing, for example, an excessive amount of expensive colouring or flavouring agents of no medicinal value, or drugs ordered under proprietary names, and costing a large amount, where similar *L.P.* preparations could have been ordered of equal efficiency. "Enquirer" should note that the mere fact that he has exceeded the 2s. would not by itself be held as proof of excessive prescribing.

UNFAIR BALANCES.

Dr. R. S. BURD (Oaken, Wolverhampton) suggests that the British Medical Association should inform the Government that in the event of the 1914 accounts remaining unpaid on January 31st, 1915 (sic) the Association would advise its members "to look to take on any work beyond their own. He adds that there is no reason to extend charity to the Insurance Committees in addition to the other charitable work now being done by the profession.

* Apparently 1916 was intended to be written instead of 1915. If so, Dr. Burd is not unreasonable in allowing thirteen months for the payment of accounts.

ECONOMY IN POSTAGE.

Dr. CHARLES STANDRING (Broadway, Worcestershire) writes, suggesting that a great saving in postage might be effected by Insurance Committees if the pink cards notifying changes of the addresses of panel patients, marriages of women insured, etc., were sent to the doctors in batches at the end of each quarter instead of singly, as is often done.

* That a great saving in postage by Insurance Committees is both possible and urgently advisable there can be no doubt; but in the special matter referred to complaints would probably arise if the pink cards were not sent as early as possible, without waiting for the end of the quarter.

Dr. McFEELEY'S CASE.

Dr. G. PRICE (Kineton, Warwick) writes suggesting that the contract between panel doctor and his panel patient is a mutual contract, that the patient broke it by going to another doctor, and that this relieved Dr. McFeeley altogether from the contract.

"FIAT JUSTITIA" expresses his opinion that Dr. McFeeley was unjustly treated by the Commissioners and is entitled to apologies from the patient and his employer and from the doctor who took over the case without first communicating with him.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

In the ninety-six largest English towns 6,728 births and 5,363 deaths were registered during the week ended Saturday, November 13th. The annual rate of mortality in these towns, which had been 13.3, 13.8, and 14.2 per 1,000 in the three preceding weeks, rose to 15.4 per 1,000 in the week under notice. In London the death-rate was equal to 17.3, while among the ninety-five other large towns it ranged from 5.2 in Ilford, 6.6 in Gillingham, 8.5 in Enfield, 8.7 in Southend and in Barrow, and 8.9 in Sneythwick and in Waketield, to 20.4 in Burnley, 24.0 in Middleton, 24.0 in Glasgow, 24.0 in Bradford, 24.0 in Hartlepool, 2.8 in St. Helens, and 25.1 in Barnsley. Measles caused a death-rate of 3.0 in Swindon, 3.5 in Hastings, 3.9 in Barnsley, and 6.2 in Gloucester. The deaths of children under 2 years from diphtheria and enteritis, which had been 24.25, and 22.6 in the three preceding weeks, further fell to 17.5, and included 48 in London, 13 in Liverpool, and 7 each in Birmingham, Manchester, and Gateshead. The mortality from the remaining infective diseases showed no marked excess in any of the large towns, and no fatal case of small-pox was registered during the week. The cases of 39, or 0.7 per cent., of the total deaths were not certified by a registered medical practitioner or by a coroner; of this number 7 were recorded in Birmingham, 4 in Liverpool, and 2 each in London, Stoke-on-Trent, St. Helens, Warrington, Manchester, Preston, South Shields, and Gateshead. The number of deaths under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 3,110, 3,110, and 3,065 at the end of the three preceding weeks, fell to 3,061 on Saturday, November 13th; 339 new cases were admitted during the week, against 462, 376, and 344 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In the sixteen largest Scottish towns 1,029 births and 726 deaths were registered during the week ended Saturday, November 6th. The annual rate of mortality in these towns, which had been 15.5, 15.7, and 16.2 per 1,000 in the three preceding weeks, fell to 16.1 in the week under notice, and rose to 19.9 per 1,000 in the two following weeks. The large English towns. Among the several towns the death-rate ranged from 6.1 in Falkirk, 11.3 in Kilmarnock, and 11.7 in Clydebank, to 17.8 in Paisley, 18.0 in Greenock, and 22.0 in Leith. The mortality from the principal infective diseases averaged 1.4 per 1,000, and was highest in Aberdeen and Ayr. The 354 deaths from all causes in Glasgow included 9 from scarlet fever, 6 from measles, 4 from infantile diarrhoea, and 2 from enteric fever, 2 from diphtheria, and 1 from whooping-cough. These deaths from measles were recorded in Greenock, 2 in Edinburgh, and 2 in Ayr; from scarlet fever 2 deaths in Aberdeen; from whooping-cough 2 deaths in Aberdeen; from diphtheria 5 deaths in Edinburgh and 2 in Aberdeen; and from infantile diarrhoea 5 deaths in Dundee.

HEALTH OF IRISH TOWNS.

During the week ended Saturday, October 31st, 559 births and 392 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 488 births and 371 deaths in the preceding period. These deaths represent a mortality of 16.9 per 1,000 of the average population, and are in question, as against 15.8 per 1,000 in the previous period. The mortality in these Irish areas was therefore 3.1 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week under notice. The birth-rate, on the other hand, was equal to 24.0 per 1,000 of population. As for mortality of individual localities that in the Dublin registration area was 17.6 (as against an average of 19.5 for the previous four weeks), in Dublin city 18.5 (as against 20.7), in Belfast 17.1 (as against 19.9), in Cork 15.6 (as against 14.8), in Londonderry 19.0 (as against 16.4), in Limerick 21.7 (as against 13.5), and in Waterford 2.8 (as against 16.2). The zymotic death-rate was 2.3, as against 2.3 in the preceding period.

During the week ended Saturday, November 6th, 540 births and 367 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 529 births and 393 deaths in the preceding period. These deaths represent a mortality of 15.8 per 1,000 of the average population in the districts in question, as against 16.9 per 1,000 in the previous period. The mortality in these Irish areas was therefore 1.1 per 1,000 less than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate, on the other hand, was equal to 23.2 per 1,000 of population. As for mortality of individual localities that in the Dublin registration area was 15.6 (as against an average of 18.6 for the previous four weeks), in Dublin city 16.5 (as against 20.0), in Belfast 15.8 (as against 15.1), in Cork 16.3 (as against 13.8), in Londonderry 24.0 (as against 17.7), in Limerick 6.6 (as against 13.9), and in Waterford 2.8 (as against 15.2). The zymotic death-rate was 1.2, as against 2.3 in the preceding period.

Southern General Hospital.—Major J. T. J. Morrison, M.B., F.R.C.S., to be Lieutenant-Colonel; G. R. Girdlestone, M.B., F.R.C.S., to be Captain, whose services will be available on mobilization; F. Norton, M.D., (late Surgeon-Lieutenant 3rd V.B. South Staffordshire Regiment), and J. Gardiner to be Captains, whose services will be available on mobilization.

South Midland Mounted Brigade Field Ambulance.—The date of appointment of Lieutenant S. P. Johnson, M.B., is September 24th, 1915, and not as stated in the *Gazette* of October 1st, 1915.

South Midland Casualty Clearing Station.—Lieutenant A. B. Fyoster, M.B., to be Captain.

South Midland Field Ambulance.—Surgeon-Captain G. Mackie (from South Midland Brigade, R.F.A.) to be Captain; Captain G. Mackie to be temporary Major; Captain R. D. Moore, from Attached Units (late Chief Medical Officer, 1st South Staffordshire Regiment), to be Captain.

Sanitary Service.—R. G. Fleming, M.B., to be Captain, whose services will be available on mobilization.

South-Western Mounted Brigade Field Ambulance.—Transport Officer and Honorary Lieutenant T. Shaw relinquishes his commission on account of ill health.

Wessex Divisional Sanitary Section.—W. H. Biggs to be Lieutenant. **Wessex Casualty Clearing Station.**—Major A. Draper, from Yorkshire Mounted Brigade Field Ambulance to be Major; C. Telfer to be Lieutenant.

Wessex Field Ambulance.—Captain F. E. Stokes, M.B., to be temporary Major; J. B. Kelly to be Lieutenant.

Welsh Field Ambulance.—Lieutenants T. P. Edwards, M.D., and J. W. Dale, M.B., to be Captains; Lieutenant-Colonel A. L. Jones, from the T.F.R., to be Lieutenant-Colonel; Lieutenant-Colonel A. L. Jones is second for duty as a senior medical officer.

Western General Hospital.—Captain R. H. Kelly, M.D., F.R.C.S., is second.

West Riding Field Ambulance.—The date of promotion of Lieutenant F. White to Captain is April 1st, 1915, and not as stated in the *Gazette* of September 20th, 1915.

West Riding Field Ambulance.—C. H. Heppenstall, M.B., to be Lieutenant.

Attached to Units other than Medical Units.—Major P. McK. Terry, from Wessex Casualty Clearing Station, and A. Butler-Harris, M.B., (late Major Essex Regiment), to be Majors. The date of promotion of Captain J. N. Macmillan to Major is August 5th, 1914, and not as stated in the *Gazette* of June 26th, 1915. The date of resignation of Captain W. M. Ferguson is June 1st, 1915, and not as stated in the *Gazette* of June 26th, 1915.

North Midland Field Ambulance.—Lieutenants from North Midland Field Ambulance, to be Captain. Lieutenants to be Captains: J. F. Ward, M.B., A. L. McCully, M.B., E. S. Johnson, R. P. Pollard, M.B., W. Brown, M.D., A. H. Fullerton, M.B., Lieutenant W. L. Carls, M.D., F.R.C.S., relinquishes his commission on account of ill health. To be Lieutenant: G. Johnston, M.B. Lieutenants T. A. Fisher, T. S. Allan, W. M. Cox, P. H. G. Gosse, W. H. Calvert, M.D., and H. W. Lance, M.B., to be Captains.

TERRITORIAL FORCE RESERVE.

ROYAL ARMY MEDICAL CORPS.

Major H. F. Berry, M.B., from Attached to Units other than Medical Units, to be Major.

Major T. Dushby, M.B., from Western General Hospital, to be Major.

The transfer of Captain E. P. Minnett from London Field Ambulance, announced in the *London Gazette* of January 18th, is cancelled.

Surgeon-Captain B. W. Eranthwaite, from the London Regiment, to be Surgeon-Captain.

UNATTACHED LIST FOR THE TERRITORIAL FORCE.

OFFICERS' TRAINING CORPS.

Major H. H. Littlejohn, F.R.C.S., M.D., R.A.M.C.(T.F.), to command medical unit of the Edinburgh University Contingent, Senior Division.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notice re Appointments) appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

ASHTON UNDER-LYNE UNION.—Assistant Resident Medical Officer. Salary, £250 per annum.

BALDOVAN CERTIFIED INSTITUTION FOR THE EDUCATION AND TREATMENT OF THE FEEBLE-MINDED.—Resident Medical Superintendent. Salary, £300 per annum.

BENGAL, India.—Chief Sanitary Officer for the Assam Nosils Board of Health and Mining Settlement. Salary, Rs. 1,200 (£80), rising to Rs. 1,500 (£100) a month.

BIRKENHEAD BOUROUGH HOSPITAL.—Junior House-Physician. Salary, £180 per annum.

BRISTOL ROYAL INFIRMARY.—(1) House-Physicians; (2) House-Surgeons. Salary, £120 per annum in each case.

BURGH OF PAISLEY INFECTIOUS DISEASES HOSPITAL.—Resident Medical Officer. Salary, £200.

CANNING TOWN WOMEN'S HOSPITAL, Plaistow, E.—Senior Resident Medical Officer (Lady). Salary, £120 per annum.

COUNTY OF ANGLESEY.—Temporary County Medical Officer of Health and School Medical Officer. Salary at the rate of £300 per annum.

DEVONSHIRE HOSPITAL FOR SICK CHILDREN.—Lady Resident Medical Officer. Salary, £300 per annum.

DEVONSHIRE HOSPITAL, Buxton.—Assistant House-Physician. Salary, £100 per annum.

DORCHESTER COUNTY ASYLUM, Dorset.—Medical Superintendent. Salary, £300, rising to £350 per annum.

DURLEY GUEST HOSPITAL.—Senior Resident Medical Officer; salary, £150 per annum. (2) Assistant House-Surgeon; salary, £150 per annum.

GLAMORGAN COUNTY ASYLUM, Bridgend.—Temporary Assistant Medical Officer. Salary, £250 per annum.

HAMPSTEAD GENERAL HOSPITAL, Haverstock Hill, N.W.—Resident Medical Officer. Salary, £200 per annum.

LEEDS PUBLIC DISPENSARY.—Lady Resident Medical Officer. Salary, £130 per annum.

LIVERPOOL: DAVID LEWIS NORTHERN HOSPITAL.—House-Surgeon and House-Physician. Salary, £100 per annum each.

LONDON TEMPERANCE HOSPITAL, Hampstead Road, N.W.—Assistant Resident Medical Officer. Honorarium at the rate of £120 a year.

LORD DERBY WAR HOSPITAL, Warrington.—(1) Chief Resident Surgeon. (2) Pathologist. Salary for (1) £1 3s. 6d. per day; for (2) £1 per day.

MANCHESTER: NORTHERN HOSPITAL FOR WOMEN AND CHILDREN, Cheetham Hill Road.—Lady House Surgeon. Salary, £120 per annum.

PARTH COUNCIL OF TYRHE, Aberdeenshire.—Medical Officer. Salary, £30 per annum.

PUTNEY HOSPITAL, S.W.—Resident Medical Officer. Salary, £150 per annum.

QUEEN'S HOSPITAL FOR CHILDREN, Hackney Road, E.—Temporary Medical Officer. Honorarium, £25 per annum.

RHONDDA IFRAN DISTRICT COUNCIL.—Temporary Assistant Medical Officer of Health and School Medical Officer. Salary, £350 per annum.

ROYAL COLLEGE OF PHYSICIANS, London.—Milroy Lecturer for 1917.

ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL.—Junior House-Surgeon. Salary, £120 per annum.

SHEPHERD: WALSALE PARISH.—Medical Practitioner. Guaranteed income £300 by the Highlands and Islands (Medical Service) Board.

SOUTHAMPTON: FREE EYE HOSPITAL.—House-Surgeon. Salary, £200 per annum.

SOUTH LONDON HOSPITAL FOR WOMEN.—Assistant Physician and Temporary Assistant Surgeon.

STAFFORDSHIRE GENERAL INFIRMARY, Stafford.—House-Surgeon. Salary, £250 per annum.

WIGAN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Lady House-Surgeon. Salary, £50 per annum.

CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointments: Cleator (Cumberland), Crevkerm (Somerset), Woleston (Warwick).

To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

ROBERTS, D. R., M.B. Durh., District Medical Officer of the Bedwelly Union.

St. THOMAS'S HOSPITAL.—The following appointments have been made:—Casualty Officers and Resident Anaesthetists: W. H. C. Ronalds, F. B. Cantab., M.R.C.S., L.R.C.P.; G. T. Gimlette, B.A. Oxon., M.R.C.S., L.R.C.P.; G. M. Vevers, M.R.C.S., L.R.C.P.; C. Gardiner Hill, B.A. Cantab., M.R.C.S., L.R.C.P.; W. Thomas, B.Sc. Lond., M.R.C.S., L.R.C.P.; G. C. Berg, M.R.C.S., L.R.C.P.; G. H. C. Byrne, M.R.C.S., L.R.C.P. Obstetric House-Physicians (Senior): W. H. Marshall, B.A. Cantab., M.R.C.S., L.R.C.P.; (Junior): F. E. Higgins, B.A. Cantab., M.R.C.S., L.R.C.P. Clinician, Children's Medical Department: G. L. Bhatia, B.A. Cantab., M.R.C.S., L.R.C.P.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s., which sum should be forwarded in Post Office Orders or Stamps with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

BIRTH.

CRESSWELL.—On November 15th, at 24, Windsor Place, Cardiff, the wife of F. P. S. Cresswell, F.R.C.S., of a son.

DEATHS.

MASON.—On November 18th, at 49, George Street, Portman Square, London, George Armitage Mason, M.A., M.B., B.C. Cantab., aged 58 years.

MASER.—On November 18th, at "The Yews," Longford, Coventry, Herbert Charles Pearce Maser, M.R.C.S., L.S.A. Lond., aged 75 years.

ROBERTS.—At High Burton, Tisbury, on Thursday, November 18th, Robert Barker Robson, M.B., M.R.C.S., 20, Bondgate Without, Alnwick. Interred at Alnwick on Saturday, November 20th.

DIARY FOR THE WEEK.

MONDAY.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, Cavendish Square, W., 8.30 p.m.—Paper: Gas Poisoning, Physiological Symptoms and Clinical Treatment, by Dr. Leonard Hill.

FRIDAY.

ROYAL SOCIETY OF MEDICINE: SECTION OF LARYNGOLOGY, 4 p.m.—Specimens and Cases.

POST-GRADUATE COURSES AND LECTURES.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.

THE POST-GRADUATE COLLEGE, West London Hospital, Hammersmith, W.—Clinical work; graduates only.

RECRUITING FOR THE NAVAL AND MILITARY MEDICAL SERVICES.

ENGLAND AND WALES.

The Central Medical War Committee for England and Wales has held several conferences with representatives of the Insurance Commissioners for England to consider the manner in which the interests of insured persons should be safeguarded while enabling the medical profession to make an adequate response to the demands of the military services of the country for medical officers. On Wednesday last both parties had a conference at the offices of the Local Government Board with representatives of that body. The steps which should be taken in the interests of the public as a whole, including the public health and tuberculosis services, were discussed and a preliminary understanding was reached on many details. The result will, it may confidently be anticipated, materially facilitate the task of the Central and of the local Medical War Committees.

AGE OF CANDIDATES FOR COMMISSIONS.

We are requested to state that medical men under 45 years of age are not now eligible for commissions unless physically fit for service at home and abroad.

VISUAL TESTS FOR TEMPORARY COMMISSIONS.

CANDIDATE writes: Is it not time the present visual standard was relaxed in view of the need of medical men in the army? At present a man is accepted whose vision without glasses is worse than that of a rejected candidate. A candidate with defective vision in one eye is rejected if this defect is not due to a refractive error, notwithstanding that his vision with the other eye is perfect. At the same time a candidate who requires glasses to perform any delicate operative work is accepted. A surgeon who is daily performing the most delicate operative work without glasses is rejected, whilst he would be accepted as a private in the combatant ranks, and, moreover, his effective vision may be perfect.

DRUGGISTS' TRAVELLERS.

DR. C. GORDON ROBERTS (Halstead, Essex) writes: Are druggists' travellers a luxury or necessity to the profession? Undoubtedly the former, for which we indirectly have to pay, therefore at a time like this, when every man is of importance to the nation, they should be dispensed with and set free for other purposes. Many dispensers are still required for the army; those, therefore, of military age should volunteer for this, and the older men take their places in the laboratory or workshop. The chief difficulty raised by those to whom I have spoken is one of finance, but if the profession will combine, refuse to deal with any traveller, whether of or over military age, and agree to send their orders to the same firms as heretofore, the firms on their part should be ready to pay half salaries during their absence, and keep their berths for them on their return. If organized properly it should benefit the country and press harshly on none.

MEDICAL VACANCIES.

NOTICE TO ADVERTISERS.

The attention of advertisers is drawn to the fact that, in view of the urgent need of His Majesty's Forces for medical men, no advertisement will, so far as possible, be accepted, until further notice, for insertion in the *BRITISH MEDICAL JOURNAL* which it appears would probably, if published, result in there being relegated to civil practice a practitioner who, in view of the national emergency, should be serving with the colours.

INSURANCE.

AN OFFICIAL HANDBOOK TO ADMINISTRATION.

THE Scottish Insurance Commissioners have issued a very timely and necessary *Handbook for the Use of Insurance Committees in Scotland*.¹ As stated in the introduction, it is primarily for the assistance of members of Insurance Committees, and is not intended as an exhaustive or technical exposition of the powers and duties of committees. As a matter of fact, though it may be at times of value to even the best informed clerks of committees, neither for clerks nor for ordinary members well up in the Act will this book prevent the need for frequent reference to the Commissioners. The introduction takes up four pages with an account of what is called "the general scheme of administration of National Health Insurance." This is simply a bare list of the authorities concerned in the working of the Act with a summary of a small fraction of the functions of each, and in its present form it seems useless unless it be regarded as a very incomplete part of the index of the book. Next follow eight chapters dealing with the constitution, powers, and duties of Insurance Committees and of their sub-committees, and of the Panel, Pharmaceutical, and Local Medical Committees, and the administration for deposit contributors. Lengthy chapters also deal with the administration of medical and sanatorium benefits and with the complex finance and accounting of Insurance Committees. The chapters dealing with the constitution and duties of the various committees are fairly full and detailed, though the powers of the different committees are often, perhaps of set purpose, left so indefinite that it cannot be a matter of surprise that committees often first decide on and act and ask for permission afterwards, trusting that an accomplished fact will be allowed to pass, even though not in order.

The accounts given of medical and sanatorium benefits contain a large amount of detail, and will be of the greatest value not only to members of Insurance Committees, but to members of Panel and Pharmaceutical Committees. The long chapter dealing with financial arrangements, and with

¹ Issued by the Scottish Insurance Commissioners for official use October 1st, 1915. (1s.)

the keeping of the numerous registers and account books cannot be said to be satisfactory. For ordinary members of committees this chapter might have been condensed to occupy one half the space, while for the practical purposes of clerks of committees it is little more than a mere outline of the work to be done, leaving constant need for a frequent reference to various circulars or regulations only barely named in the *Handbook*. In other words, the chapter, in trying to hit a medium, will fail to satisfy all parties.

In an appendix dealing with finance, there is a curiously complicated diagram showing the tortuous passages and repassages of medical benefit moneys through the labyrinthine accounts of the committees. It goes some distance towards explaining why medical practitioners have to wait so many months for a final settlement of their accounts. This is contained in one of twenty-five appendices containing various documents issued from time to time by the Commissioners, lists of approved sanatoria in Scotland, of Panel and Pharmaceutical Committees, and addresses of clerks and Insurance Committees throughout the kingdom. In addition to a table of contents there is also a good index of all the subjects dealt with.

The first thing that strikes one in the book is the enormous, bewildering, if not gratuitous complexity that has been introduced into the working of the Insurance Acts. Much of this was, of course, inevitable, but it is quite clear from a study of the *Handbook* that with better co-ordination between the different sections a simpler and easier working might have been and may yet be brought about, involving less of those irritating delays of which there are so many complaints, while at the same time vastly reducing the cost of working. On what ought to be quite simple matters it is evident that clerks of committees will often have to refer to the Commissioners, not only on new points that arise, but because the regulations are ambiguous or difficult to understand, or to reconcile with other regulations, orders, or circulars. If unnecessary expense is to be prevented and the full benefit of the Act obtained, the *Handbook* demonstrates that, though the Act has only been in force about three years, a full and complete codification of the circulars, orders, and regulations has already become necessary.

INSURANCE COMMITTEES.

LONDON.

Admission of Tuberculous Insured Persons to Poor Law Infirmarys.—At the meeting of the Insurance Committee for London on November 25th it was stated that the Metropolitan Asylums Board were proposing to approach the Local Government Board with a view to arrangements being made whereby destitute and infirm persons might obtain immediate admission to an infirmary on leaving a general hospital or sanatorium. Mr. HANDEL BOOTH denounced the proposal as a contravention of the promises made to insured persons when the Act was passed. Dr. LAURISTON SHAW said that chronic tuberculous persons should not be taken or kept in sanatoriums, which should be reserved for cases likely to be permanently benefited. In the other and chronic cases the alternatives were a return to the patient's home, often a miserable one, or admission to a Poor Law infirmary where constant and skilled attention would be available. Mr. W. S. BROWN, one of the representatives of insured persons, suggested that the financial position would have borne the strain had it not been for the overweening demands of the medical men at the beginning. Dr. B. A. RICHMOND said that officially no patient had been sent into a Poor Law infirmary, but it was known that unofficially this had been done, perhaps two or three times a week. He vigorously contested the suggestions of Mr. Brown. On a vote, 20 were in favour of a motion that the Insurance Committees make no representations to the Local Government Board favouring a transference to the Poor Law infirmary, and 16 against. The CHAIRMAN of the Finance Committee denied certain allegations implying improper and improvident administration of the sanatorium benefits. Applications had only been granted on the advice of the applicant's medical attendant, reinforced by the decision of the Committee's medical officer. Unfortunately there were over 200 insured persons on the

waiting lists at the same time that the Committee was, as opportunity arose, reducing the number of beds.

The Medical List and the War.—Dr. H. H. MILLS stated that there were 1,549 doctors on the medical list in the service of the Insurance Committee, but of these 106 were attached to institutions, leaving 1,443 in personal relationship with insured persons. Of this number 169 were engaged in the army or navy; nearly all the others were very fully engaged, and, in common with munition workers, claimed to be conducting work of national importance. The sickness incidence among insured persons would be at least as high as before the war in spite of enlistments, for the men enlisted represented the more healthy lives, and their places had largely been taken by women, representing a higher sickness incidence.

Allegation against a Panel Practitioner.—The Committee passed censure on a practitioner against whom it was alleged that he had allowed prescriptions to be given by unqualified persons, not always, as the Medical Service Subcommittee judged, with his knowledge, and that he had resided so far from his surgery that he had to enter into arrangements with his neighbouring practitioners for the provision of medical attendance at night. It was also stated that he was serving another insurance committee and it was decided to require him to seek permission to alter the hours so as to fulfil his agreement personally, and that he should secure the assistance of a partner before March, 1916.

LOCAL MEDICAL AND PANEL COMMITTEES.

SOMERSET.

At a meeting of the Local Medical and Panel Committee, on November 11th, Dr. J. A. MACDONALD gave a summary of the new regulations with regard to the proposed changes in the drug tariff, and assured the meeting that the introduction of a new drug tariff would have no prejudicial effect upon the payments to be made to the doctors. He referred to the new regulation which insisted on certificates being signed by the doctor's own hand, and expressed the opinion that when any alteration in the regulations was under consideration by the Commissioners, such change should be submitted to some body of medical men for their consideration, due time being allowed for the purpose.

It was decided to send the following resolution to the Director-General of the Army Medical Service and to the Central Medical War Committee:

That while we recognize that the army has the first call on the medical profession, it is obvious that a serious position for the civilian population will arise if the number of medical practitioners, especially in rural areas, is unduly depleted, and we trust that the Director-General of the Medical Service will earnestly consider whether any re-arrangement of his present staff surgeons can be made which will at least delay the need for further heavy calls on the profession.

YORK.

At a meeting of the Panel Committee on November 10th, it was reported that the York Local Medical Committee had been recognized to July 15th, 1916.

Prescribing.—The terms of service for panel practitioners for 1916 were considered. It was reported that the chemists would be prepared to continue to dispense *Rep. Mist.* prescriptions so long as the term was only used within the current month, but that they wished to dispense aqua destillata in every prescription where aqua was ordered, and to charge a fee of 3d. when the prescriptions were marked "urgent," by the doctor and dispensed out of hours. It was decided to inform the Pharmaceutical Committee that the Panel Committee could not consent to the dispensing of aqua destillata where aqua was ordered.

Deduction.—Attention was drawn to the fact that a large sum of money was still owing to the doctors for 1914 and to the large deductions being made every quarter from the payments to doctors to cover the enlistment of insured persons, while at the same time numbers of names were deducted from the lists owing to this enlistment. The Committee considered the reply of the Commissioners to the representations of the British Medical Association on these matters to be eminently unsatisfactory, and it was decided to urge the Insurance Committee to represent to the Commissioners the serious dissatisfaction which the present state of affairs was causing.

INSURANCE NOTES.

DEDUCTIONS FROM PANEL PAYMENTS.

DR. J. H. LYELL, HONORARY SECRETARY of the British Branch, British Medical Association, and Joint Secretary of the Perth Panel Committee, writes drawing attention to the "possibility of deductions from panel money in the case of doctors mobilized or volunteering for service and unable to fill in and sign their record cards." He also forwards copy of correspondence relating to a case in which such a deduction had been threatened. The matter commenced with a letter from the Clerk of the Perth Insurance Committee to the wife of a Perth practitioner who is now serving at the front. The Clerk stated that it was necessary either for her or the doctor to make arrangements for the keeping of records for the current year, and if such records were not duly furnished, a deduction would be made from the amount to be paid to the doctor for the year. He said he knew that in some cases between 1s. and 2s. per insured person had been deducted, and it might reach a maximum of 2s. 6d. per insured person on the doctor's list. The Clerk therefore desired to be informed what arrangements the doctor or she had made for the keeping and furnishing of records. This letter was brought to the notice of Dr. Lyell, who sent a copy to the Scottish Commissioners, pointing out that the panel patients of the doctor in question were by arrangement being attended by his colleagues who remained in Perth, and that they were filling up the records for him to be duly furnished to the authorities at the end of the year along with the rest of the cards. In reply, the Commissioners said that, as respects 1914, the maximum rate of deduction from the Special Parliamentary Grant in respect of the failure to furnish adequate medical records was 1s. per insured person on the list, and this was imposed only where no records at all had been furnished for 1914, and where, in addition, these for 1913 were incomplete. When full returns for 1913 had been received, the rate of deduction was on the general basis of $\frac{1}{2}$ d. per insured person for each month in 1914 for which records were not furnished. The Commissioners' letter then proceeds:

In regard to the mobilized doctors, deduction has not been made in any case. Where records for two months prior to mobilization only were in question, or where information could be obtained from the representatives of the doctors that the records were in order although they had not been submitted, the Commissioners were of opinion that the records could be accepted as complete, and payment was made in full. It may be added that every effort was made to elicit information which would justify such action, but it was not deemed advisable to trouble the doctor himself if on active service. In cases where no information was obtainable the Commissioners were precluded by the terms of the Special Parliamentary Grant from making payment, but a sum has been retained and deducted to keep the matter open until the doctor's return, when he will be afforded every opportunity of forwarding records and making any explanations. In conclusion, I am to state that as regards the records for treatment after the date when any doctor was mobilized or volunteered, the records fall to be submitted by the deputy or locum with the other records for 1915. There is no question of a doctor himself who is on service being asked to furnish them. Obviously he is not in a position to do so.

APPROVED SOCIETIES AND COMPENSATION CLAIMS.

Skelton v. Baxter.

A question of importance to insured persons and approved societies came before the Master of the Rolls, Lord Justice Bankes, and Lord Justice Warrington, in the Court of Appeal last week when an appeal was heard from an award of the judge of the Essex County Court, who retained no doubt under the Workmen's Compensation Act. It appeared that Annie Skelton, a domestic servant, had met with an accident and compensation being claimed, the judge decided in her favour. In the course of the county court proceedings the question was raised whether the application was really an arbitration at the instance of Skelton or proceedings by the Prudential Approved Society under Section 11 of the National Insurance Act, 1911, which provides that where an insured person has been entitled to compensation in respect of an injury but unreasonably refuses or neglects to take proceedings to enforce the claim, it shall be lawful for the approved society at its own expense to take such proceedings in the name and on behalf of such person. On the evidence it was shown that Skelton had signed a retainer in the name of the National Insurance Society, the Prudential Society, and had been promised that the society had a financial interest in the matter she would be indemnified against any costs. The judge decided that the proceedings were really brought by Skelton and made an award in her favour, against which the respondent appealed.

In the Appeal Court, the Master of the Rolls said that he did not consider it necessary to discuss the very obscure provisions of Section 11 or the precise position of approved societies with regard to "maintenance." Skelton had signed a retainer, and

it made no difference that the Prudential Society had given her a partial indemnity and found the money for the court fees and counsel's fees. That might or might not be "maintenance" in the eyes of the law, and might or might not expose the society to an action based on "maintenance," but the circumstance that the plaintiff had been "maintained" by a third person would be no defence to the proceedings. He did not think it had been made out that the Prudential Society had attempted to escape the liability to pay costs which is imposed on a society acting under Section 11. It had been held in the county court that a society had no right to take proceedings until it had been proved that the insured person had unreasonably refused or neglected, but it was plain in the present case that there was no such neglect or refusal, and Section 11 had really nothing to do with the present case. He was of the same opinion as the county court judge, that the application was in truth Skelton's application, and the appeal should be dismissed with costs. The Lords Justices delivered judgement dismissing the appeal.

INSURANCE ACT IN PARLIAMENT.

MEDICAL BENEFIT REGULATIONS.

MR. WILES asked whether the introduction of the new medical benefit regulations was regarded by many members of the medical profession as a breach of the promises made by Sir Robert Morant in his letter to the British Medical Association, dated March 17th, as well as of the terms of the official circular 201/I.C. Mr. Roberts, in reply, said there had been no breach of any promises given, the documents in question referred to contingencies contemplated during the year 1915, which had not in fact arisen, but he had taken steps to remove any misapprehension on the part of the London Panel Committee and the mass meeting of practitioners held at Bristol on November 11th. He had not previously heard that the Kent Panel Committee had invited doctors to withdraw their services after December 31st, but if any doctor had doubts as to the facts of the position he could obtain full information either from the Insurance Committee or the Commissioners. (See also reply to Sir Philip Magnus, SUPPLEMENT, November 27th, p. 201.)

SCOTLAND AND THE COMMERCIAL DRUG TARIFF.

In reply to a number of questions by Mr. Currie (Leith Burghs), Mr. Roberts, Chairman of the Joint Committee of Insurance Commissioners, said that the Departmental Committee on the Drug Tariff had given four out of eleven days on which evidence was taken to evidence as to Scottish conditions, two days being occupied in hearing the secretary of the body which represents Scottish chemists. But as that body desired to amplify its views, he had undertaken to receive such statement within a period which would allow the position in Scotland to be re-examined before July 1st, 1916; the existing tariff would remain in force in Scotland until that date, although the Pharmaceutical Society of England and Wales had recommended chemists in England and Wales to accept the commercial tariff as from January 1st. So far no proof had been given that the commercial tariff would be inequitable in Scotland. The English Commissioners had no organization corresponding to the central checking bureau of Scotland. With regard to the 1913-14 Treasury grant of £60,000 for excessive sickness, it was voted to meet any need arising in any part of Great Britain. No such need had arisen in Scotland, except for a small sum granted in 1914 to meet the enhanced cost of certain drugs under war conditions. In order to remove misconceptions on the whole subject, he had arranged to send a communication to each panel chemist in Scotland.

TUBERCULOUS SOLDIERS.

MR. R. McNeill on November 25th made inquiries as to soldiers invalided from the front suffering from tuberculosis. He suggested that men discharged from the Brompton Hospital were obliged to return to their own homes, and asked whether, being contributors under the Insurance Act, the Insurance Commissioners would place one or more of the sanatoriums at present empty at the disposal of the War Office for the reception of such men. The Chairman of the Joint Committee of Insurance Commissioners said that the military authorities were responsible for the treatment of tuberculous soldiers up to the date of their discharge from the army. Special administrative and financial arrangements had been in operation for a considerable time which secured that the necessary

residential treatment on re-entry into civil life was made available without delay. It was not the case that a large number of men discharged from the army before they were cured of tuberculous disease were thrown upon their own resources, as there was a special fund to deal with such cases, and the arrangements were believed to be working satisfactorily. In reply to a question by Mr. Booth on the same day, Mr. Roberts said that the grant

of £100,000 voted in the Supplementary Estimates for 1914-15, £50,000 was paid into the special account for credit to the several insurance funds. The balance was surrendered and revoted in the Estimates for 1915-16. Payments out of the grant were being made in connexion with the special arrangements for the treatment of soldiers and sailors invalided from service and discharged suffering from tuberculosis.

MEMBERS ELECTED TO THE BRITISH MEDICAL ASSOCIATION

(JANUARY 15TH, 1915, TO AUGUST 31ST, 1915).

of Medical Services, to be Assistant Director of Medical Services, Welsh Division (temporary).
 Captain Temporary Major H. J. Dunbar, M.R., from Welsh Field Ambulance, to be Deputy Assistant Director of Medical Services, Welsh Division (temporary).

ROYAL ARMY MEDICAL CORPS.

East Anglian Casualty Clearing Station.—Lieutenant R. C. S. Smith, M.B., to be Captain.
East Lancashire Casualty Clearing Station.—W. Briggs, M.B., and J. Ramsay, M.D., to be Lieutenants.

East Lancashire Field Ambulance.—Lieutenant G. Stevenson, M.B., to be Captain; B. Hobsbawm, to be Lieutenant.

Home Counties Casualty Clearing Station.—H. B. Parslow to be Lieutenant.

Home Counties Field Ambulance.—Major A. T. Falwasser to be temporary Lieutenant-Colonel. The date of promotion of Major H. G. O. Mackenzie, M.D., to be temporary Lieutenant-Colonel is May 21st, 1915, and not as stated in the Gazette of September 10th, 1915.

London Casualty Clearing Station.—Captain C. H. S. Frankau, M.B., F.R.C.S., to be temporary Major.

London (City of London) Field Ambulance.—Captain L. Courtauld, M.B., is seconded.

London Mounted Brigade Field Ambulance.—H. Fulton (Honorary Major), retired Special Reserve, late Captain London Signal Companies (Army Troops), B.E., to be Major.

London (City of London) Sanitary Company.—J. P. Elias, M.D., to be Lieutenant.

London Sanitary Company.—Lieutenant E. J. Messent to be Captain; Second Lieutenant K. B. Williamson, from the Unattached List for the T.F.; H. J. L. Marfoot, and Sergeant H. S. Tibbitt, from 1st London Sanitary Company, to be Lieutenants.

Northern General Hospital.—Captain W. R. Higgins, M.B., is seconded; Captain J. le F. C. Borrow, M.B., is seconded for duty with North Midland Mounted Brigade Field Ambulance; Captain J. E. Hall is seconded for duty with East Anglian Casualty Clearing Station. Lieutenants to be Captains: H. J. Smith, M.B., C. W. Sharpey.

North Midland Casualty Clearing Station.—J. A. Young, M.B., to be Lieutenant.

Northumbrian Field Ambulance.—Lieutenant W. H. Morrison, M.B., from Attached Units other than Medical Units, to be Lieutenant.

Southern General Hospital.—Lieutenant-Colonel E. C. Board resigns his commission on account of ill health. Lieutenants A. P. Phillips and A. C. Tibbitts to be Captains.

South Midland Casualty Clearing Station.—Captain E. B. Landon, from Attached to Units other than Medical Units, and C. C. Lavington, M.B. (late Captain in this unit), to be Captains.

Welsh Border Mounted Brigade Field Ambulance.—Lieutenant F. L. Newton, M.B., to be Captain.

Welsh Casualty Clearing Station.—Lieutenant J. Anderson, M.B., to be Captain.

West Lancashire Field Ambulance.—Lieutenant L. E. Stott, M.B., to be Captain.

Attached to Units other than Medical Units.—Captain J. Cook, from Welsh Field Ambulance, to be Captain. Lieutenants to be Captains: F. U. Moffat, G. H. M.D., F. Macdon, M.B., P. W. Downes, J. E. Pearce, H. W. Case, M.B., F. W. A. Stott, M.B., T. Porter, M.B., B. J. J. Marsh, A. Oliver, M.D., G. R. Wilson, M.B. (late Captain East Lancashire Regiment), to be Captain. H. G. Ludolf (late Lieutenant West Riding Divisional Train, A.S.C.) to be Lieutenant.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

In the ninety-six largest English towns, 7,354 births and 5,519 deaths were registered during the week ended Saturday, November 20th. The annual rate of mortality in these towns, which had been 15.8, 16.2, and 15.4 per 1,000 in the three preceding weeks, rose to 17.3 in the week under notice. In London the death-rate was equal to 16.2, while among the ninety-five other large towns it ranged from 4.3 in Enfield, 5.6 in Gillingham, 7.5 in Eastbourne, 7.6 in Hornsey, 9.2 in Ilford, and 9.8 in Wolverhampton, to 20.5 in Wigao, 22.6 in Liverpool, 22.5 in Middleburgh, 23.6 in Gloucester, and 24.1 in Dudley. Measles caused 16 deaths, and influenza 15, in St. Helens; 7 in Bromwich, 1.7 in Hastings and in Lincoln, 1.9 in Blackburn, 2.1 in Stockport, 2.6 in Bury, and 4.1 in Gloucester; whooping-cough, 1.1 in Birkenhead, 1.2 in Bournemouth and in Derby, and 2.2 in Norwich; and diphtheria 1.2 in St. Helens. The deaths of children (under 2 years) from diarrhoea and enteritis, which had been 255, 226, and 175 in the three preceding weeks, further fell to 120, and included 21 in London, 12 in Liverpool, 11 in Manchester, 6 in Birmingham, and 6 in Sheffield. The mortality from enteric fever and scarlet fever showed no marked excess in any of the large towns, and no fatal case of small-pox was registered during the week. The causes of 67 per cent. of the total deaths were not certified by a registered medical practitioner or by a coroner; of this number, 11 were recorded in Birmingham, 11 in Liverpool, 5 in Gateshead, 3 in London, and 3 in Blackburn. The number of scarlet fever patients under treatment at the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 3,110, 3,056, and 3,061 at the end of the three preceding weeks, fell to 3,027 on Saturday, November 20th; 356 new cases were admitted during the week, against 378, 354, and 339 in the three preceding weeks.

HEALTH OF SCOTCH ISLANDS.

In the sixteen largest Scotch towns 887 births and 778 deaths were registered during the week ended Saturday, November 13th. The annual rate of mortality in these towns, which had been 15.7, 16.2, and 16.1 per 1,000 in the three preceding weeks, rose to 17.3 in the week under notice, and was equal to the rate in the ninety-six largest English towns. Among the several towns the death-rates ranged from 8.2 in Clydebank, 8.3 in Coatbridge, and 12.2 in Falkirk, to 21.9 in Dundee, 21.7 in Ayr, 21.6 in Ayr, and 22.1 in Perth. The mortality from typhoid fever was 1.5 in Glasgow, 1.7 in Glasgow, 1.7 in Glasgow, and was highest in Greenock and Hamilton. The 350 deaths from all causes in Glasgow included 14 from infantile diarrhoea, 6 from measles, 5 from scarlet fever, 3 from diphtheria, 2 from enteric fever, and 2 from whooping-cough. Four deaths from measles were recorded in Edinburgh, 6 in Greenock, 5 in Hamilton, and 2 in Ayr; from scarlet fever, 3 deaths in Edinburgh and 2 each in Dundee and Aberdeen; from diphtheria, 5 deaths in Edinburgh and 2 each in

Dundee and Paisley; and from infantile diarrhoea, 6 deaths in Dundee and 5 in Aberdeen.

In the sixteen largest Scotch towns 887 births and 778 deaths were registered during the week ended Saturday, November 20th. The annual rate of mortality in these towns, which had been 15.7, 16.2, and 16.1 per 1,000 in the three preceding weeks, rose to 17.3 in the week under notice, and was 1.7 per 1,000 above the rate in the ninety-six largest English towns. Among the several towns the death-rate ranged from 8.2 in Clydebank, 8.3 in Coatbridge, and 12.2 in Falkirk, to 21.9 in Dundee, 21.7 in Ayr, and 22.1 in Perth. The mortality from the principal infective diseases averaged 1.4 per 1,000, and was highest in Paisley and Ayr. The 402 deaths from all causes in Glasgow included 14 from infantile diarrhoea, 6 from measles, 5 from scarlet fever, 4 from infantile diarrhoea, and 2 from whooping-cough. Four deaths from measles and 3 from scarlet fever were recorded in Edinburgh; 5 deaths from diphtheria in Perth and 4 in Paisley; and 5 deaths from infantile diarrhoea in Dundee.

HEALTH OF IRISH TOWNS.

During the week ending Saturday, November 13th, 469 births and 391 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 540 births and 367 deaths in the preceding period. These deaths represent a mortality of 16.8 per 1,000 of the aggregate population in the districts in question, as against 15.8 per 1,000 in the previous period. The mortality in these Irish areas was therefore 1.4 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate on the other hand, was equal to 21.0 per 1,000 of population. As for mortality in individual localities, 19 in the Dublin registration area was 20.3 (as against an average of 18.0 for the previous four weeks) in Dublin city, 23.0 (as against 13.0), in Belfast, 16.0 (as against 15.0), in Cork 24.0 (as against 14.3), in Londonderry 19.0 (as against 13.0), in 19.0 as against 13.0, and in Waterford 9.5 (as against 15.0). The zymotic death rate was 1.6, as against 1.2 in the preceding period.

During the week ending Saturday, November 20th, 503 births and 478 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 499 births and 391 deaths in the preceding period. These deaths represent a mortality of 20.6 per 1,000 of the aggregate population in the districts in question, as against 16.8 per 1,000 in the previous period. The mortality in these Irish areas was therefore 4.7 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate, on the other hand, was equal to 21.0 per 1,000 of population. As for mortality in individual localities, 19 in the Dublin registration area was 22.1 (as against an average of 12.8 for the previous four weeks), in Dublin city 25.7 (as against 13.8), in Belfast 20.3 (as against 15.9), in Cork 20.0 (as against 14.3), in Londonderry 19.0 (as against 13.0), in 13.5 (as against 14.3), and in Waterford 2.8 (as against 14.7). The zymotic death-rate was 1.4, as against 1.6 in the preceding period.

Quarterly Returns.

From the Registrar-General's quarterly return it appears that during the quarter ended September 30th there were registered in the 83 notified districts in Ireland 22,779 births (11,700 boys and 11,079 girls), equal to an annual rate of 17 in every 1,000 of the estimated population. The average number of births registered during the corresponding quarter of the ten years 1905 to 1914 was 25.5 per 1,000, as against 17 in the quarter of the present year. The mean population of those years was 2,134,000. The birth-rate per 1,000 in the various provinces was: Leinster 21.4, Munster 20.7, Ulster 20.8, and Connaught 19.3. The highest birth-rate was 29.5 for Dublin county borough, and the lowest for Donegal county. The number of deaths registered during the quarter was 14,670 (7,418 males and 7,252 females), affording an annual rate of 13.4 per 1,000 of the estimated population; the average rate for the corresponding quarter of the ten years 1905 to 1914 was 15.1 per 1,000. The death-rate in the various provinces was: Leinster 14.3, Munster 13.1, Ulster 13.7, and Connaught 11.1. The county or county borough death-rates range from 12.9 in Leitrim to 18.7 in Dublin county borough. In the first quarter 3,511 persons emigrated. The birth-rate is therefore 2.1 below the average rate for the corresponding quarter of the previous ten years, and 1.4 below the rate for the third quarter of 1914. The deaths, on the other hand, are 1.7 below the rate for the corresponding quarter of the ten years, and 0.9 below the average for the third quarter of the last ten years.

In comparison with the data of the corresponding quarter in 1914, the returns of pauperism furnished by the Local Government Board show a decrease of 4,392 in the average number of workhouse inmates on Saturdays during the quarter, and a decrease of 625 in the average number of persons on the streets on Saturdays. The number in the third quarter of the previous ten years the number of workhouse inmates shows a decrease of 7,885, and the number of persons on outdoor relief shows a decrease of 12,255, the total under both heads being 20,140 in 1914. The Roman Catholic population of the country, with the average population for those years, is 0.1 per cent. The marriages 66,179 registered during the second quarter of 1915 are equivalent to an annual rate of 62.7 per 1,000 of the estimated population, being 0.75 above the rate for the corresponding quarter of 1914 and 0.75 above the average rate for the second quarter of the last ten years. These marriages correspond to an annual rate of 5.26 per 1,000 of the estimated population. The number of persons in the first quarter of the present year who are members of all other religious persuasions. It is to be borne in mind that in many parts of the country the greater portion of the annual number of Roman Catholic marriages is contracted in the first quarter, while the number of marriages of other religions in the first quarter is generally less than that for any of the other quarters of the year.

ENGLISH URBAN MORTALITY IN THE THIRD QUARTER OF 1915.

[SPECIALLY REPORTED FOR THE "BRITISH MEDICAL JOURNAL."] In the accompanying table will be found summarized the vital statistics of ninety-six of the largest English towns, based upon the Registrar-General's returns for the third quarter of the year. The 97,900 births registered in these towns during the quarter under notice are equivalent to an annual rate of 17.3 per 1,000 of the population, estimated at 18,136,180 persons. In London the birth-rate last quarter was 21.4 per 1,000, while among the other large towns it ranged from 12.0 in Bourneouth, 12.6 in Hastings, 12.6 in Eastbourne, 12.6 in Southampton, 12.6 in Hull, 12.6 in Southampton, 12.6 in Middleburgh and in Sunderland, 27.5 in Birkenhead, 27.5 in Bootle, 27.5 in Newcastle-on-Tyne, 29.5 in Gateshead, and 30.2 in Barrow-in-Furness. The zymotic death-rate was 1.6 per 1,000 of the population, or 12.5 per 1,000; in London the rate was 12.4 per 1,000, while among the other towns the lowest rates were 7.2 in Ilford, 7.5 in Hornsey, 8.2 in Wimbledon, and 8.5 in Willesden, in Eastbourne, in Southend-on-Sea, and in Swindon.

The deaths from all causes included 142 from enteric fever, 831 from measles, 299 from scarlet fever, 372 from whooping-cough, 540 from diphtheria, and 1,000 from treated diarrhoea and enteritis among children under 2 years of age. The 142 deaths from enteric fever were equal to an annual rate of 0.03 per 1,000; in London the death-rate from this disease was slightly lower, 0.01. Among the other large towns it ranged upwards to 0.11 in Ealing and in Portsmouth, 0.13 in Blackrook, 0.17 in Rhondda, 0.19 in Southampton, 0.20 in Tynemouth, and 0.21 in Great Yarmouth. The 831 fatal cases of measles caused a death rate equal to 0.19 per 1,000; in London the rate was only 0.12 per 1,000, while among the other towns the rates were as high as 0.68 per 1,000 in Rhondda, 0.72 in Bradford 1.08 in Bury, 1.10 in West Bromwich, 1.11 in Bath, 1.17 in Middlesbrough, 1.60 in Manchester, and 1.79 in Barnsey. The 299 deaths from scarlet fever were equal to an annual rate of 0.05 per 1,000; in London the rate was 0.05 per 1,000; while among the other large towns the highest rates were 0.30 in Stockton-on-Tees, 0.23 in Ealing and in Carlisle, 0.25 in South Shields, 0.31 in Ipswich, and 0.71 in Warrington. The 572 fatal cases of whooping-cough were equal to an annual rate of 0.13 per 1,000; in London the death-rate from this cause was 0.17 per 1,000, while among the other large towns it ranged upwards to 0.32 in Shields and in Middlesbrough, 0.33 in Lincoln, 0.34 in Edinboro, 0.37 in Rotherham, 0.41 in Birkenhead, 0.43 in South Shields, and 0.56 in West Hartlepool. The 540 deaths from diphtheria were equal to an annual rate of 0.12 per 1,000, the rate in London being equal to the mean for all the large towns. The highest death-rate from this cause were 0.27 in Preston and in Stockton-on-Tees, 0.29 in Middlesbrough, 0.30 in Coventry, 0.33 in Tole-on-Trent, 0.34 in Wintlecomb, 0.40 in Harrow, 0.45 in Burnley, and 0.53 in Northampton. The fatal cases of diarrhoea and enteritis among children under 2 years of age numbered 5,322, and were in the proportion of 54.36 per 1,000 to the births registered during the quarter; in London the proportion was 44.01 per 1,000, while among the other large towns the proportions ranged upwards to 100.11 in Gateshead, 109.18 in Rotherham, 116.65 in Birkenhead, 136.90 in Bootle, and 147.93 in Barnsley. Infant mortality, measured by the proportion of deaths among children under 1 year of age to registered births, was equal to 118 per 1,000; in London the rate was 113 per 1,000; while among the other large towns the lowest rates recorded were 29 in Swindon, 33 in Southampton, 47 in South Shields, 54 in Barnsley, and 55 in Northampton, and 55 in Gillingham and in Gateshead; the highest rates were 151 in Hull, 155 in Leeds and in Sberfeld, 162 in Birkenhead, 164 in Rotherham and in Gateshead, 183 in Bootle, 186 in Burnley, 193 in Barnsley, and 200 in South Shields, 4.2 in Tyne-mouth, 4.6 in South Shields, 5.4 in Dudley and in Gateshead, and 15.0 in Gillingham.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a notice (see Index to Advertisements) important Notice re Appointments appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

ASHTON-UNDER-LYNE.—Resident Medical Officer. Salary, £250 per annum.

BENGAL, India.—Chief Sanitary Officer for the Assam Mines Board of Health and Mining Settlement. Salary, Rs. 1,200 (£80), rising to Rs. 1,500 (£100) a month.

BETHNAL GREEN INFIRMARY.—Assistant Medical Officer. Salary, £280 per annum.

BIRKENHEAD BOROUGH HOSPITAL.—Junior House-Surgeon. Salary, £180 per annum.

BOLTON INFIRMARY AND DISPENSARY.—Third House-Surgeon. Salary, £180 per annum.

BRISTOL ROYAL INFIRMARY.—(1) House-Physicians; (2) House-Surgeons. Salary, £120 per annum in each case.

CITY OF LONDON RED CROSS HOSPITAL, Finsbury Square, E.C.—Resident Medical Officer. Salary at the rate of £200 per annum.

DERBYSHIRE HOSPITAL FOR SICK CHILDREN.—Lady Resident Medical Officer. Salary, £200 per annum.

DERBYSHIRE ROYAL INFIRMARY.—House-Surgeon. Salary, £200 per annum.

DUDLEY GUEST HOSPITAL.—(1) Senior Resident Medical Officer; salary, £150 per annum. (2) Assistant House-Surgeon; salary, £50 per annum.

EAST-END MISSION TO THE JEWS.—Medical Man.

KESTEVEN COUNTY ASYLUM, near Sleaford.—Assistant Medical Officer.

KING EDWARD VII HOSPITAL FOR OFFICERS.—Resident Medical Officer.

LEEDS GENERAL INFIRMARY.—Resident Aural Officer. Salary, £100 per annum.

LEEDS PUBLIC DISPENSARY.—Resident Medical Officer (lady). Salary, £130 per annum.

LINCOLN GENERAL DISPENSARY.—Resident Medical Officer. Salary, £50 per annum.

LONDON LOCK HOSPITAL, Harrow Road and Dean Street, W.—Honorary Anaesthetist.

LONDON TEMPERANCE HOSPITAL, Hamstead Road, N.W.—Assistant Resident Medical Officer. Honorarium, £120 a year.

LONDON THROAT HOSPITAL, Great Portland street, W.—House-Surgeon. Salary, £50 per annum.

LIVERPOOL: DAVID LEWIS NORTHERN HOSPITAL.—House-Surgeon and House-Physician. Salary, £100 per annum each.

LIVERPOOL MEDICAL MISSION.—Assistant Medical Officer.

LIVERPOOL ROYAL INFIRMARY.—House-Surgeon. Salary, £50 a year.

MANCHESTER: NORTHERN HOSPITAL FOR WOMEN AND CHILDREN, Cheetham Hill Road. Lady House-Surgeon. Salary, £120 per annum.

NATIONAL SANATORIUM, Beenden, Kent.—Assistant Medical Officer. Salary, £150 per annum.

NORTH DEVON INFIRMARY, Barnstaple.—House-Surgeon. Salary, £100 per annum.

NORTH STAFFORDSHIRE INFIRMARY, Stoke-on-Trent.—House-Physician. Salary, £200 per annum.

PITNEY HOSPITAL, S.W.—Resident Medical Officer. Salary, £150 per annum.

QUEEN'S HOSPITAL FOR CHILDREN, Hackney Road, E.—Temporary Medical Officer Honorarium, £25 per annum.

ROYAL NATIONAL HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Ventnor.—Senior Resident Medical Officer. Salary, £250 per annum.

ROYAL PORTSMOUTH HOSPITAL.—House-Surgeon. Salary, £150 per annum.

ROYAL SOCIETY.—Government Grants for Scientific Investigations.

ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL.—Junior House-Surgeon. Salary, £20 per annum.

SHEFFIELD JESSIE HOSPITAL FOR WOMEN.—Junior Lady House-Surgeon for the Gynaecological and Maternity Department. Salary, £80 per annum.

SHEPHERD: WHALSAY FAIRHIS.—Medical Practitioner. Guaranteed income £300 by the Highlands and Islands (Medical Service) Board.

SHIP SURGEON.—Salary, £25 per month.

SOUTHAMPTON: FREE EYE HOSPITAL.—House-Surgeon. Salary, £100 per annum.

STAFFORDSHIRE GENERAL INFIRMARY, Stafford.—House-Surgeon. Salary, £250 per annum.

WARRINGTON: THE LORD DERBY WAR HOSPITAL.—Chief Resident Surgeon. Salary, £1 3s. 6d. per day.

WEST HAM UNION.—Assistant Medical Officer. Salary, £300 per annum.

WILKIN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Lady House-Surgeon. Salary, £150 per annum.

CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointments: Millom (Cumberland).

To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

BUTLER, W. B., M.R.C.S., L.R.C.P., Certifying Factory Surgeon for the Hereford District, Co. Hereford.

KELLY, I. P., L.R.C.P. and S.L., District Medical Officer of the Cleburne Mortuary Office.

RYAN, W. S., F.R.C.S. Edin., District Medical Officer of the Wisbech Union.

St. THOMAS'S HOSPITAL.—The following appointments have been made.—Resident Assistant Physician: Geoffrey Hoffman, B.A., M.B., B.C. Ch. Oxon., M.R.C.P. Edin., Medical Registrar; J. L. Birley, M.A., M.B., B.Ch. Oxon., M.R.C.P. Lond., surgical Registrar; P. H. Mitchell, M.B., M.S. Lond., F.R.C.S. Eng. Obstetric Registrar; J. M. Wyatt, M. B., B.S. Lond., F.R.C.S. Eng. Ophthalmic Registrar; P. G. Doyno, B.A., M.B., B.Ch. Oxon., F.R.C.S. Eng.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s., which sum should be forwarded in Post Office Orders or Stamps with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

BIRTHS.

SCOTT.—At 6, Rensick Street, Cavendish Square, London, W., on November 27th, the wife of S. Gilbert Scott, M.R.C.S., L.H.C.P., had a daughter.

TENNENT.—On October 22nd, at Kulim, South Kedah, Malaya, the wife of J. Hall Tennent, M.B., Ch.B. Edin., of a daughter.

DIARY FOR THE WEEK.

TUESDAY.

Röntgen Society, Institution of Electrical Engineers, Victoria Embankment, 8.15 p.m.—Mr. L. A. Levy on Screens; Mr. G. G. Blake on Localisation.

WEDNESDAY.

HUNTERIAN SOCIETY, 1, Wimpole Street, W., 9 p.m.—Clinical and Pathological Evening. Dr. A. G. Buchanan: Demonstration of Treatment by Hypnotic Suggestion.

THURSDAY.

ROYAL SOCIETY, 4.30 p.m.—Croonian Lecture on Respiratory Process in Muscle, and the Nature of Muscular Motion. Dr. W. M. Fletcher and Professor F. G. Hopkins.

FRIDAY.

ROYAL SOCIETY OF MEDICINE:
CLINICAL SECTION, 3 p.m.—Cases. Paper.—Dr. F. Parkes Weber: sequel to Cases of Chronic Splenomegaly.

POST-GRADUATE COURSES AND LECTURES.
NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.
THE POST-GRADUATE COLLEGE, West London Hospital, Hammer-smith, W.—Clinical work; graduates only.

RECRUITING FOR THE NAVAL AND MILITARY MEDICAL SERVICES.

The following letter has been issued to the Secretaries of local Medical War Committees by the Central Medical War Committee for England and Wales:

Dear Sir,

1. At the interview between Lord Derby and representatives of this Committee and the Scottish Emergency Committee on November 5th, 1915, Lord Derby made the following pronouncement for issue to the press:

It is officially announced that Lord Derby yesterday received representatives of the War Emergency Committees, which have been formed with a view to organizing the civil medical profession and making arrangements which would facilitate the setting free of younger men from their practices in order to undertake military service with our armies in the field. The representatives explained to the Director-General of Recruiting the system under which the Committees have been working and the measure of success which had hitherto resulted from their efforts.

Lord Derby informed them that he fully approved of the scheme and expressed a wish that this work should be continued, and that the War Emergency Committees should undertake the whole of the arrangements for procuring medical men for the army, and he agreed that, on the recommendation of the Director-General, Army Medical Service, the Committees should be recognized as the means of organizing the medical profession with regard to military service.

2. It will be seen that this statement puts on the Central Medical War Committee the same responsibility for recruiting medical men of military age as is placed on the local Recruiting Committees, so far as concerns the rest of the population. Therefore, it is essential that a canvass should be carried out by every local Medical War Committee among the medical men of 45 and under, the limit of age fixed by the War Office for general service.

3. The following is the plan suggested for adoption:

Canvass of Men of Military Age.

(a) The cards of the group No. 41 in Lord Derby's scheme relate to the medical practitioners. The blue

cards for men of military age under Lord Derby's scheme—that is, for those under 40 years of age—are at the chief local recruiting office. On representations from the Chairman of the local Medical War Committee these cards can be obtained, provided the applicant will guarantee to make the necessary canvass of the men whose cards are handed over. The necessary steps are:

1. A personal application of the chairman (or, failing him, the secretary) of the local Medical War Committee.
2. The registration of the applicant as an official canvasser under the scheme.
3. Receipt of the official white card authorizing the holder to call upon the men.

(b) In districts where the number of medical men is considerable it is obviously not possible for one man to do the canvass. In one such district the local Medical War Committee has appointed no fewer than twenty canvassers all of whom are senior medical men of the district. Each of these is to be registered as an official canvasser, so that the responsibility for the safety of the blue cards is distributed.

(c) In some districts the number of medical men will be few, and the work each of these is doing, and the possibility of enlisting those of military age, may be so well known that the possession of the blue cards will present no advantage to the officers of the local Medical War Committee. In such cases it is suggested that the chairman of the Committee should notify the chief local recruiting officer that the arrangements as regards the medical men of the district are in the hands of his committee.

(d) It is particularly urged that notifications of willingness to serve should be sent by the local Medical War Committee to the office of the Central Medical War Committee, which will communicate with the practitioners concerned, and issue to them a certificate of enrolment. It is of the utmost importance that the Central Committee should be able to correlate the requirements of the civil population and the military services, and only by the careful selection of the men from the districts where they most abound can this be done. From some districts offers of service will be held over until the relative plethora of other districts has been drawn upon.

4. The Central Medical War Committee wishes it to be clearly understood that if a local Medical War Committee

does not canvass the medical men of military age in its area it will be reported that we are unable to carry out the duty devolved on us by Lord Derby so far as that area is concerned. The result will be that the canvass will then be carried out by the local Recruiting Committee, or, should Lord Derby's organization be no longer working, by whatever authority is then responsible for general recruiting.

Recording of information ascertained from Blue Cards.

5. It is important that the information gained from the cards as regards age and whether married or single should be filed for reference. The local list should be corrected by it and all such corrections sent to us at the first convenient opportunity.

It is essential that the Committees in the metropolitan area should forward full information as regards ages of the "blue card" men as soon as possible to this office, as our record of the ages of men in that area is incomplete.

Classification of Men.

6. The next step will be the local grouping and classification of the men, not only of the men up to 40 but also of those up to 45. A list of these, as far as we have been able to ascertain the facts, has already been sent to local Medical War Committees.

For this purpose the appended system of classification will be found useful. Attention is directed to the note prefixed to the classification system, as it is very important that no area should use that system as a reason for not supplying its fair share of medical officers on the ground that some of the earlier mentioned classes are not represented in the area.

7. On receipt of the grouping from each area, the Central Medical War Committee will proceed to apply to all the men of military age to fill up a form of application for a commission. Those who do so may rely on the Committee calling on them for service only as and when required, and giving them at least one month's notice in which to make their arrangements.

8. Those medical men of military age who claim to be physically unfit should obtain from a duly authorized military medical examiner a certificate of unfitness. No other certificate can be recognized as a legitimate claim for exemption on this ground.

9. It is specially requested that there should be no slackening in the attempt to get those men who can do so to go *now*, that is to say, as soon as possible. The number of medical men for which the War Office last appealed is far from complete, and the last thing the Central Medical War Committee wishes to do is to allow the classification and enrolment system (which is mainly for use in *future* calls) to be used as an excuse for stopping the flow of medical officers who are wanted *now*.

We are, yours faithfully,

N. BISHOP HARMAN, M.B.
ALFRED COX, M.B.

Secretaries.

429, Strand, W.C.,
December 8th, 1915.

APPENDIX.

In response to requests from local Medical War Committees, the Central Medical War Committee has drawn up the following scheme of classification as an indication of its views as to the order in which, generally speaking, the individual practitioners in any area may advisedly be urged by the local Committees to leave their practices for the purpose of undertaking military service. The general principle underlying the classification is that the necessary withdrawals of medical men for military purposes should take place in such a manner as to cause

as little disturbance as possible of the medical service essential to the needs of the area.

The classification is not to be taken as a time table, indicating that the whole of any one group throughout the country will be called up before later groups are drawn upon. But where any question arises as to which of two or more men should accept service first, it is thought that a reference to the classification may be found of use in settling the difficulty.

Each area is expected to try to release as many men as possible for military service, consistent with the needs of the local community. Whether any particular area can or cannot spare more men is, in the opinion of the Central Committee, a question that can only be equitably settled after due consultation between the central and local Committees. The former will know the needs of the War Office and what other areas have done, while the latter will know the difficulties peculiar to the locality.

Married or Single.	{	1. All newly qualified men who are physically fit.
		2. Junior medical officers employed by public authorities, such as assistant school medical officers, assistant medical officers of health, assistant asylum medical officers, tuberculosis officers, etc.
Single.	{	3. Junior resident medical officers at institutions.
		4. Assistants to private practitioners, and partners where no other partner has gone.
		5. Men in single-handed urban or semi-urban practices. For exceptions see Class 6.
		6. Men in urban or semi-urban areas who have assumed sole responsibility for some man who is already serving. Wherever possible such a man should be replaced by one who is ineligible for military service on age or other grounds.
		7. Married men in single-handed urban or semi-urban practices.
		8. Single men in rural areas where there are no other practices.
		9. Married men in rural areas where there are no other practices.

NOTE.—It is to be understood that any medical man engaged in service for the efficiency of which any central Government department has any responsibility cannot be called up for military service if the consent of the Government department concerned is withheld.

CONSULTANTS AND SPECIALISTS.

The Committee is of opinion that, with regard to Consultants and Specialists of military age, the opinion of the local Medical War Committees, and of the Hospitals to which they are attached, must be ascertained as to whether the services of these men can be spared before they are accepted for commissions. But as such local Committees will doubtless be glad to receive guidance, the Central Medical War Committee calls attention to the following classification. The basis of the valuation was held to be the ultimate necessity of the specialist to the community. If his work could be easily done by another and more necessary member of the profession, then he was held to be relatively unnecessary. In all cases the evaluation is for pure consultants or specialists only.

Order.

1. Anaesthetists, Radiographers, Dermatologists.
2. Dentists with medical qualification.
3. Gynaecologists.
4. Alienists.
5. Aurists, Ophthalmologists, and Laryngologists.
6. Physicians.
7. Surgeons.
8. Clinical Pathologists attached to recognized institutions.

NOTE.—Consultants and Specialists are required to offer for General Service, and not for special work only.

MARYLEBONE.

A MEETING of the Marylebone Medical War Committee was held November 17th, 1915. It was reported that the additional members co-opted at the previous meeting had accepted service. The committee now includes fourteen members. Mr. Chas. Ryall is Chairman, and Mrs. Charlton Briscoe, M.B., Honorary Secretary. The Honorary Secretary reported that of the 1,050 doctors in the borough 275 were on commissioned service (number at date is 295).

Mr. Bishop Harman made a statement as to the relation between Lord Derby's Committees and the Medical War Committees. General leave had, he said, been given for local medical war committees to use the "blue cards" for canvassing purposes. Major Galloway read the official statement put out after the conference between the Central Medical War Committee, the War Office and Lord Derby, in which the position of the local medical committees was clearly shown.

The Chairman stated that he had already applied for and obtained the "blue cards" of all the medical men under 40 years of age registered in the borough. The cards had been handed to him personally under guarantee that the canvassing was carried out by the committee or their delegates. It was thereon agreed that the committee take the responsibility for the blue cards and the canvassing thereof.

Dr. Frederick Taylor, Major Galloway, and Major MeAdam Eccles were appointed a recruiting subcommittee to instruct the canvassers on their work. A list of possible canvassers, all senior men of the profession, was drawn up; of these the following have since agreed to serve:

Dr. Dyke Acland.
Dr. Mitchell Bruce.
Sir Thomas Barlow.
Sir Francis Champney, Bt.
Sir Anderson Critchett, Bt.
Sir Frederic Eve.
Sir David Ferrier.
Dr. Dundas Grant.
Sir A. Pearce Gould, K.C.V.O.
Sir James Goodhart, Bt.
Dr. de Havilland Hall.

Dr. Handfield Jones.
Mr. William Lang.
Sir Henry Morris, Bt.
Sir Malcolm Morris, K.C.V.O.
Mr. C. Mansell Moulin.
Dr. Norman Moore.
Dr. Newton Pitt.
Sir Seymour Sharkey.
Dr. Frederick Taylor.
Dr. Samuel West.

On the matter of classification of the profession Mr. Bishop Harman proposed that the committee consider the order in which consultants and specialists could be spared from the service of the civil community for army service. A list was drawn up; this and the principles underlying it will be found in the recruiting scheme of the Central Committee (see page 213).

STRATFORD.

At a meeting of practitioners in the Stratford area held at the Town Hall on November 19th, it was reported that 51 practitioners from the area had joined the navy and army, including 16 who had joined since August, 1915. A vote of condolence was passed with the relatives of Drs. Eric Wright and Alexander Graham, both of whom have died on active service.

The following resolution with regard to the conduct of the practices of those absent on war service was adopted, and has been circulated to all practitioners in the area by the Local Medical War Committee:

That the doctors who have gone on war service or who do so in future be invited to draw up a list of their bona-fide patients and appointments for circulation to the neighbouring practitioners by the Local War Medical Committee, and that they shall be attended or held on behalf of the absentee, and shall be restored to him on his return to practice, and not be taken for twelve months afterwards by any doctor who attended during his absence. All fees except midwifery fees to be equally divided with the absentee. This arrangement is to hold good whether a locumtenent is in charge or not. All differences of opinion as to patients, or appointments, or other matters to be decided by the local War Medical Committee, with an appeal if desired to the Central War Medical Committee.

The following resolution with regard to medical attendance on dependants was also passed:

That the medical practitioners of the area do not consider it is necessary to continue after December 31st, 1915, the scheme for the gratuitous medical attendance on dependants of those serving with the colours.

A list of periodical publications, official reports, and Blue Books in the Library of the British Medical Association available for issue to members on loan has been printed, and copies can be obtained free on application to the Librarian, at the house of the Association, 429, Strand, W.C. The regulations governing the loan of these publications are stated in the introduction to the list. The Library is open for consultation from 10 a.m. till 5 p.m. (on Saturdays till 2 p.m.).

INSURANCE.

SUGGESTED PARLIAMENTARY INQUIRY INTO THE INSURANCE ACTS.

THE following letter has been addressed to the Prime Minister, and Chairman of National Health Insurance (Joint) Committee:

Sir,

The attention of the British Medical Association has been drawn to a notice which appeared in the *Times* of November 26th stating that the Council of Approved Societies under the National Insurance Acts has decided to press for a parliamentary inquiry into the working of the Act and of its various Commissions, with a view to steps being taken to bring about more economical working.

Expressions of opinion made by persons with more or less claim to represent insured persons or Insurance Committees to the effect that some sort of inquiry should be made into the working of the Insurance Act have also been noted.

I am instructed to say that while the British Medical Association would welcome at an appropriate time an impartial inquiry into the working of the Insurance Acts, it considers the present moment to be most inopportune. For the proper conduct of such an investigation it would be necessary to secure suitable medical representatives to serve on the Inquiry Committee, the attendance of medical witnesses from various parts of the country, and the collection of a great deal of evidence. For none of this work has the medical profession now adequate leisure or opportunity. Many of its members directly affected are on military service with the army or navy abroad or at home, and those that are left are hard pressed in many areas to give the requisite attendance on the civilian population.

The Association would most respectfully urge, therefore, that no encouragement should be given to those who wish to occupy the time of public men and of representatives of the medical profession in a subject of great but at the moment of secondary interest, for in the present emergency their energies are most fully and usefully occupied in other ways.

I am, Sir,

Your obedient Servant,

ALFRED COX,

Medical Secretary.

THE INSURANCE ACT IN SALFORD.

THE Salford Panel Committee has just sent to all panel practitioners in the area a circular stating that after full consideration of the revised medical benefit regulations for the coming year, the Committee has no hesitation in recommending the profession to accept the same and to continue the contracts with the Insurance Committee. This is, of course, done on the distinct understanding that the Government guarantees to the doctors the minimum payment of 7s. per insured person, and that the chance of getting the whole or part of the floating 6d. remains exactly as at present. For the year 1913 the drug fund in Salford showed a very serious deficit, being only sufficient to pay the chemists about two-thirds of their bills; and even with the special grant from the Government, the chemists had to be content with only 85 per cent. of the money due to them. In 1914, however, owing to the special arrangements in Salford, there is a sum of about £700 from the floating 6d. available for distribution among the doctors, after paying the chemists' bills in full, and it is practically certain that there will also be a fair sum in 1915 to be distributed among the doctors, though not quite so much as in 1914. The Panel Committee makes an urgent appeal to all panel practitioners to take seriously the responsibility thrown on them under the new regulations of preventing any abuse of the drug fund, stating that the Committee will not hesitate to make surcharges where it is satisfied that extravagant prescribing has taken place. No serious objection is taken to the new regulations referring to the use of the term "Rep. mist." and to the signing of certificates, but there is a very general feeling that in simple fairness to the profession the Commissioners ought to have given the profession generally sufficient time in which to consider the new regulations and to suggest modifications, and it is

freely stated that if the Commissioners persist in springing regulations on the profession at the last moment, they can hardly complain if the profession in its turn imitates such dilatory tactics and instead of widely advertising its intentions, quietly postpones any future decision to refuse service to a period which would seriously embarrass the Commissioners. On the present occasion following the recommendation of the Panel Committee it is practically certain that no practitioners will leave the panel, except for unavoidable reasons.

PANEL CHEMISTS IN SCOTLAND.

REPORTS of meetings of panel chemists in various areas of Scotland appear to show that at least in some parts of the country the concessions made by the Commissioners with regard to the drug tariff are not sufficient to satisfy the chemists. As stated by Mr. Roberts in Parliament, it is not intended to bring the commercial tariff into force in Scotland before July 1st, 1916, and the Commissioners will be prepared to consider any evidence brought forward before April 30th to prove the inadequacy of the establishment charges which the chemists are allowed to make under the new tariff. Well-attended meetings of panel chemists have been held in Edinburgh and Leith, East Lothian, Glasgow, Ayr, Perth, etc., to protest against the new arrangements, and in each case all, or nearly all, the chemists of the areas have signed notices terminating their contracts of service as from December 31st unless the *status quo* is conceded for 1916. In each case the chemists are willing to continue service on the present tariff, to withdraw their demands for increased remuneration during the period of the war, to run the risk meantime that the money available may not be sufficient to pay their bills in full, and to consider the proposals of the Departmental Committee on the Drug Tariff as soon as is reasonably practicable. Mr. Roberts, however, refuses to promise that the commercial tariff will not be introduced in Scotland on July 1st, and he demands a report from the chemists before April 30th. The Pharmaceutical Society has issued a long statement of the whole position, giving a number of reasons why the proposals connected with the commercial tariff ought not to apply to Scotland. In reply to this the Commissioners have issued a circular to every panel chemist dealing with the various objections of the Pharmaceutical Standing Committee, and challenging it to show cause why the conclusions of the Departmental Committee should not be accepted.

INSURANCE COMMITTEES.

LEICESTERSHIRE.

At a meeting of the Leicestershire Insurance Committee, a resolution was carried, to be forwarded to the county council with a covering letter, stating that just as under the Insurance Acts it was considered reasonable that the insurance committees should contain representatives of various interests such as doctors, nurses, chemists, county councils, etc., as well as representatives of approved societies. In the same way the committee suggested that the interests of tuberculosis cases would best be consulted if county councils invited a few practical insurance workers to serve on their sanitary committees when dealing with matters of tuberculosis; that where this had been done nothing but favourable results had followed. The advantage of insured persons with the increased power available by joint action of the insurance committee and the county council were the chief reasons for the request.

The remaining matters of general interest also came before the various subcommittees. The Sanatoriums Subcommittee recommended that rules for the conduct of insured persons in receipt of domiciliary sanatorium benefit, on the lines of the rules for persons receiving medical benefit, should be submitted to the Commissioners for approval. Rules in respect of institutional treatment were not submitted, as the committee had already approved the rules for patients in force in the institutions of the local authority to which tuberculosis cases were sent. It was decided to take no action on the circular letter sent round by the Ayrshire Insurance Committee, which suggested that the payment to medical practitioners of the capitation fee of 6d. per person for the treatment of insured persons recommended for domiciliary treatment should be discontinued.

In the Medical Benefit Subcommittee it was stated that the Commissioners had informed the committee that generally if an insured person applying for treatment as a temporary resident was unable to produce a medical card or other evidence of his title to medical benefit, there would appear to be no objection to the practitioner making a charge for his services on the understanding that the amount would be refunded when the patient's title to medical benefit was established by the production of the medical card, but it was essential that the patient should be fully made to understand the nature of this arrangement. With regard to the payments to doctors and chemists the Finance Subcommittee recommended that in respect to the last quarter of the year the chemists should be paid in full, and that payments be made at the rate of 1s. 10d. to prescribing doctors, 2s. 10d. to doctors dispensing, and 1s. 10d. to approved institutions.

LOCAL MEDICAL AND PANEL COMMITTEES.

LANCASHIRE.

At a meeting of the Lancashire County Local Medical and Panel Committee, held on November 10th, the revised arrangements for the administration of medical benefit for 1916 (Memo. 217, I.C.) were considered. There was some doubt as to the exact position, under Article 6 of the amended Regulations, of those practitioners who undertake to supply drugs and appliances to insured persons, and it was decided that the Secretary of the British Medical Association be asked for a full explanation. With this exception, the revised arrangements for 1916 were approved.

Excessive Prescribing.—As a result of a scrutiny of the prescriptions for 1914 it was found that 120 doctors had exceeded the amount allocated under the regulations out of the Medical Benefit Fund Account. It was recommended that no action be taken in the following cases: Doctors who had signed (1) prescriptions in their own names when doing work for doctors on active service; (2) signed prescriptions in their own names when acting for other doctors; (3) who are on active service; (4) who had many cases of long duration, or who had many cases during an epidemic.

LIVERPOOL.

At a meeting of the Panel Committee, on November 9th, the compromise arrived at by the Commissioners with regard to the proposed changes in the regulations affecting the drug tariff was approved, and it was decided to endeavour to render effective the existing safeguards against extravagant prescribing, as embodied in Article 40 of the regulations, subject to the elimination of the Pharmaceutical Committee in the matter.

The revised arrangements for the administration of medical benefit for 1916 were approved.

MONMOUTHSHIRE.

At a meeting of the Local Medical and Panel Committees, on November 9th, a resolution was adopted approving of the amalgamation of the English and Welsh National Health Commissions, and it was decided to forward a resolution to the President of the Local Government Board and to the other bodies concerned calling upon the Monmouthshire County Council and other public bodies in the county employing whole time medical officers, to at once place them at the disposal of the War Office, and requesting the Local Government Board not to place any obstacles in the way.

At a meeting of the Monmouthshire panel doctors held on November 12th the following resolutions were adopted:

1. That we do not accept any alteration in the present agreement.
2. That this meeting of the Monmouthshire panel doctors wholeheartedly approve of the suggested amalgamation of the English and Welsh National Health Commissions into one central body.
3. That we, the members of the medical profession on the panel for the county of Monmouth, being desirous of keeping the drug account within the 2s. per head for the year 1915, are giving medicines at our surgeries to insured persons at our own expense, and we ask the Government to amend the Insurance Acts so that panel practitioners may be allowed the dispensing fee for those insured persons who desire to have their medicines direct from their own medical advisers.

PERTH AND PERTHSHIRE.

A MEETING of the Panel Committees of Perth and Perthshire was held on November 26th. It was decided to send a resolution to the Secretary of the Pharmaceutical Standing Committee (Scotland) expressing the sympathy of medical practitioners with the chemists in Scotland in the present crisis with regard to the drug tariff. Under the advice of the Scottish Committee of the British Medical Association it was resolved meanwhile to make no contribution towards the expense of the Central Checking Bureau. In view of a communication from the Commissioners to the effect that no payment could be made for unallocated persons unless practitioners accepted responsibility for "persons who, in an emergency, outside of office hours, or on Sundays, may find it necessary to apply direct to a doctor," it was decided that such responsibility should be accepted. It was agreed that the terms of the new agreement should be accepted, as recommended by the British Medical Association.

INSURANCE ACT IN PARLIAMENT.

REGULATIONS AND EXPLANATORY CIRCULARS.

Mr. BOOTH asked (1) how many regulations had been issued since the beginning of the Act; (2) what was the average number of copies printed of each regulation; (3) how many had been amended or withdrawn; (4) how many had required explanatory circulars; and (5) whether, in view of the depletion of the staffs owing to the war, any assurance could be given that the stream of communications would be reduced to a reasonable size. In reply, Mr. ROBERTS said the figures asked for could not be given without laborious calculations which were not required for administrative purposes, but he was fully in sympathy with the suggestion in the fifth part of the question, and hoped that societies and committees would be materially assisted by the considerable progress made with the consolidation of regulations. Mr. BOOTH and Mr. CURRIE pressed for a more precise reply to the questions, but Mr. ROBERTS repeated his inability to answer without a considerable amount of work, which he hesitated to throw on the staff for no particular purpose.

UNTRACKED CONTRIBUTION CARDS.

Mr. ROBERTS said, in reply to Mr. BOOTH, that the number of unclaimed contribution cards bearing stamps in the hands of the Commissioners in Great Britain was about 300,000. Any card belonging to a member of an approved society was transmitted to the society on application, and societies could now place a distinctive mark on cards before issuing them to members. Sums representing the value of stamps on cards ultimately unclaimed were for the present being carried to a special account in the National Health Insurance Fund. The loss of cards dated back to the early days of the system, and the difficulty did not now arise.

TUBERCULOSIS CASES.

Referring to the statement that the cost of certain tuberculosis cases for the county of Renfrew worked out at £327, Mr. CURRIE asked if it was incorrect, and, if so, how far. Mr. ROBERTS repeated his former reply that he accepted the mere arithmetical sum, but did not accept the inference which seemed to be drawn from it (see BRITISH MEDICAL JOURNAL, November 27th, p. 787).

TUBERCULOUS SOLDIERS.

In reply to Mr. R. McNEILL, Mr. C. ROBERTS said that he was not aware of any cases referred to the Insurance Commissioners by the military authorities under the arrangements he had explained in reply to an earlier question (SUPPLEMENT, BRITISH MEDICAL JOURNAL, December 4th, p. 207) for which residential accommodation had not been secured without delay. In answer to another question by Mr. McNEILL the Financial Secretary to the War Office said that no soldier suffering from tuberculosis was, under the regulations, discharged from a military hospital unless he was fit to travel and fit for sanatorium treatment. When so discharged they were civilians, and came under the arrangements made with the Insurance Commissioners. In the great majority of cases the disease was not due to military service. He was not aware that, as suggested by Mr. BOOTH, men of the kind were coming upon the funds of approved societies all over the country in increasing numbers.

DRUG FUND.

In reply to Mr. BOOTH, Mr. ROBERTS said that the revised arrangements about the Drug Fund were being brought into operation in 1916, after consultation with and on the recommendation of the Medical and Insurance Committee representatives of the Advisory Committee, and the clerical labour involved, for which special arrangements were being made, was not expected to entail on balance any additional expenditure.

CERTIFICATION IN IRELAND.

On December 1st Sir John Lonsdale asked a question as to the present position of affairs in regard to the new scheme of certification in Ireland; whether the proposal to appoint part-time referees had been suspended during the war, and if care would be taken to ensure that all appointments would be decided solely on grounds of merit and experience. Mr. CHARLES ROBERTS said that a conference was being held to consider the position in the light of the revised proposals and that no referees would be appointed until the end of the war.

Meetings of Branches and Divisions.

PERTH BRANCH.

The annual winter meeting of the Perth Branch was held on November 26th, when the reports for 1915 of the Council and Treasurer were submitted and approved, and the new ethical rules were accepted by the meeting in the name of the Branch.

Highlands and Islands Schemes.—Dr. Beatty reported that a Representative of the Board had met the various practitioners of the Highland area of the Branch, with the view of adjusting the terms of individual agreements, and, as far as he could learn, satisfactory arrangements were being arrived at.

THE LIBRARY OF THE BRITISH MEDICAL ASSOCIATION.

BOOKS NEEDED TO COMPLETE SERIES.

The Librarian will be glad to receive any of the following volumes, which are needed to complete series in the Library:

- American Association of Genito-Urinary Surgeons. Transactions, 1906.
- American Climatological Associations. Vols. 1, 4, 5, 6.
- American Dermatological Association Transactions. Vols. 5, 7, 8, 11, and 29.
- American Journal of the Medical Sciences. New series, vols. 4, 5, 1842-3; vols. 14, 15, 1847-8; vols. 18-30, 1850; vol. 35, 1857; vol. 46, 1864-5; vol. 59; or any parts of these vols.
- Society of Tropical Medicine and Hygiene, London, Transactions, Vol. 2.
- South African Medical Journal. February and April, 1895. Titles, Vols. 3 and 4.
- United States Department of Agriculture, Bureau of Animal Industry. Reports 1-7, 10-14.
- United States Hygienic Laboratory Bulletins. Nos. 3, 8, 9, 10, 11, 12, 15, 17, 18, 19, 24, 29, 43.

- Watt. Bibliographia Britannica, 4 vols., 1824.
- Yearbook of Pharmacy, 1912.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following announcements are made by the Admiralty: Fleet Surgeons E. Follitt to the *Africa*, and L. E. Dartnell to the *Fleet*, additional. Staff Surgeons W. H. Edgar, M.D., to the *Thames*; W. Le. Hewitson to the *Victory*, and L. S. Whitman, M.B., to the *Fleet*, both additional, for disposal; G. H. S. Mills, M.B., to the *Bellona*; Surgeon R. H. Hole, M.B., to the *President*, for special service. Temporary Surgeons A. I. Eslemont to the *Penelope*, additional, for Chatham Hospital; L. S. Goss, B.A., H. P. S. McCintock, M.B., and L. W. Gemmill, M.B., to the *Victory*, additional, for Haslar Hospital; G. G. Mennery, M.D., to the *Cochrane*; J. Matheson, M.B., and P. L. O'Driscoll, M.B., to the *Victor*, additional, for Plymouth Hospital. To be temporary Surgeons: L. W. Gemmill, M.B., J. A. R. Robinson, C. D. Banes, R. F. Ninidie, M.B.

ROYAL NAVAL VOLUNTEER SERVICE.

Surgeon-probationers T. N. D'Arcy to the *Jackal*, and F. Wilson to the *Laurel*. To be Surgeon-probationers for temporary service: R. E. Bleton (re-entry), W. T. Hewick, G. Buchanan, H. R. S. Bowker, A. T. Harrison, C. A. Kirton, T. Anderson.

ARMY MEDICAL SERVICE.

Colonel W. W. Pike, D.S.O., F.R.C.S., to be temporary Surgeon-General whilst holding the appointment of Director of Medical Services of an Army.

Colonel R. H. Firth is retained on the active list under Articles 120 and 522, Royal Warrant for Pay and Promotion, 1914, and to be supernumerary.

Major F. Maclean, M.B., to be a Deputy Assistant Director-General.

T. Sinclair, M.D., F.R.C.S., to be temporary Colonel.

ROYAL ARMY MEDICAL CORPS.

R. J. Morris, M.D., late Surgeon-Major King's Own (Royal Lancaster Regiment), Territorial Force, to be temporary Lieutenant-Colonel.

W. Wrangham, M.D., to be temporary Lieutenant-Colonel whilst employed at the Bradford War Hospital.

To be temporary Majors: H. J. Neilson, M.D., A. C. O'Sullivan, M.B., H. Jeff, M.B., F.R.C.S.

To be temporary Majors whilst employed with the Bradford War Hospital: W. H. Thompson and J. Phillips, F.R.C.S.

Temporary Captain K. B. Mahon, M.D., F.R.C.S., relinquishes his commission.

The following paragraph is substituted for the one appearing in the Supplement of November 27th, paras 203:—To be temporary Captains: Captain E. L. Dobson, Honourable Artillery Company, Infantry, Territorial Force; W. H. Payne, M.D., F. P. Maitland, R. C. T. Evans, M.B., late Captain 1st London Regt. (Vol.), A. D. Vernon-Taylor, G. G. Ferguson.

South-Eastern District, to be temporary Captains: J. L. Leitch, Royal Militia of the Island of Jersey; temporary Lieutenants J. N. Clark, W. G. Hiett, A. Waugh, M.B., G. E. Vivandier.

Temporary Lieutenants: J. H. H. Robertson, M.B., C. H. Robson, M.B., J. Leung, M.B., A. G. Mossop, C. G. Colyer, H. C. Colyer, S. A. Riddett, C. Waller, F. W. Broderick, G. G. Timson, H. A. Cutler, M.B., R. P. Rosser, M.B., C. E. H. Smith, R. G. J. Ross, F. R. C. S. Edin., H. L. Hatch, M.B., J. B. Gie, M. Drummond, M.B., D. J. Evans, M.B., W. A. J. Dunlop, D. McKelvey, M.B., C. L. Graham, M.B., C. D. P. Ye-Smith, M.B., F.R.C.S., W. A. Hislop, M.B., J. Alexander, M.B., T. B. Johnston, C. M. Bernays, R. S. Renwick, M.B., W. Dewdney, M.B., W. Trezona, R. Thomson, M.B., H. V. White, M.D., S. Jacob, O. S. Mansell, W. F. Neil, M.B., F.R.C.S., A. R. Mair, W. B. Clark, M.B., T. S. G. Mariner, M.B., F. R. C. S. Edin., R. S. McEwen, M.B., A. A. Tucker, M.B., J. M. Beronstein, M.B., M. Culpin, M.B., F.R.C.S., C. F. Constant, H. M. Blair, M.D., C. Yorke, M.D., F.R.C.S., J. Stevenson, M.B., R. J. Hean, A. C. Forbes, M.B., A. E. W. H. Smith, M.B., F. E. F. Buckell, G. W. Mitchell, T. M. Newton, M.B., L. Crombie, M.B., S. J. Cullum, M.D., J. H. Dancy, A. E. Cottrill, C. W. Smith, M.B., F.R.C.S. Edin., R. Craig, M.B.

To be temporary Captains: V. T. Ohlmus, J. R. Collins, M.D., J. J. R. Braine-Hartnell, F.R.C.S. Edin., T. Walcot, M.D.

Temporary Lieutenants: H. J. Thomson, M.B., and G. Cooper, M.D., relinquish their commissions.

Temporary honorary Lieutenant R. C. Thomas to be temporary Lieutenant (substituted for the notification which appeared in the Gazette of November 5th, 1915).

Temporary Lieutenants: relinquishing their commissions: R. W. Davies, M.B., A. S. Allan, M.B., D. G. Greenfield, M.D., F.R.C.S., A. F. Wright, M.B., E. F. Palgrave, D. J. M. Legge, F.R.C.S. Edin., J. N. Glaister, A. G. Gilchrist, M.B., A. E. F. H. Smith, M.B., E. J. Cairns, M.D., G. H. Corbett, M.B., D. A. R. V. Cowan, M.B., S. P. Lynch, F.R.C.S., E. P. Evans, M.D., W. Fraser, M.B., H. S. Forsdick, M.D., C. R. Verling-Brown, M.D., E. F. Holloway, W. Wood, M.B., J. H. Thornley, M.B., R. Gibbs, M.D., W. Dewdney, W. O. P. Ivemeyer, M.B., H. Cadling, T. F. Murphy, A. H. Clough, H. S. Berry, A. W. Owen, M.D., T. Hutchison, W. E. N. Dunn, M.B.

To be temporary Lieutenants: N. F. Hallows, M.B., M. B. R. Forbes, M.B., D. J. Jones, H. B. Bess, M.D., H. K. Macdonald, M.B., C. C. Lord, C. C. Vigurs, M.D., F. de G. Keogh, M.B., W. Jameson, C. Rannigan, M.B., J. A. MacLean, M.B., F. W. Hobbs, F. B. Hawes, H. J. Byers, M.B., J. Ferguson, W. H. Lamplough, D. R. A. G. Elliott, M.B., W. L. Dibb, M.B., J. MacRae, T. H. Edey, D. D. Newland, E. H. Roberts, M.B., F. B. Julian, M.B., J. A. B. Thompson, M.B., W. G. F. Johnson, A. C. Taylor, R. E. Thomas, M.D., A. E. L. Farber, E. P. Titterton, T. Davidson, M.B., G. A. Gordon, M.D., P. G. H. Vyan, M.D., M. L. Lovells, R. W. P. Jackson, R. T. Todd, M.B., W. R. P. McNeill, M.D., J. Ogilvie, A. E. Schockman, E. W. N. Wooler, M.B., A. G. H. Moore, J. L. Smith, M.B., M. B. Harman, M.B., M. S. Mearns, A. Siegel, R. Kenyon, M.B., J. McNeil, M.B., J. Crawford, W. Blument, M. B. W. Walker, F. W. Lee, R. W. Macpherson, M.D., J. C. W. Ryan, M.B., L. S. C. Roche, A. Rutherford, M.B., C. W. M. Macdonald, M.B., M. B. Bames.

Temporary Quartermaster and honorary Lieutenant T. Brito relinquishes his commission on account of ill health.

To be temporary Quartermasters, with the honorary rank of Lieutenant: P. Cunningham, E. H. Gann, G. E. Town, A. E. Shaw, A. W. Ward, G. Jackson, A. Allen, W. A. Poucher.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Lieutenants on probation: W. V. Blair, M.D., and P. B. Corbett, M.B., are confirmed in their commissions.

Cadet Surgeon: T. R. Davies, University of London Contingent, O.T.C., to be Lieutenant (on probation).

TERRITORIAL FORCE.

ARMY MEDICAL SERVICES.

Major C. C. Fleming, D.S.O., M.B., retired pay (Reserve of Officers), to be Assistant Director of Medical Services, Highland Division, with the rank of Colonel.

The following announcement is substituted for that which appeared in the Gazette of January 12th, 1915: Captain W. McC. Wanklyn, from the Sanitary Service, is appointed Deputy Assistant Director of Medical Services, North Midland Division.

ROYAL ARMY MEDICAL CORPS.

East Anglian Field Ambulance.—Captain J. Arthur, M.D., to be temporary Major.

Eastern General Hospital.—Captain W. Tyson, M.D., is seconded.

Eastern Mounted Brigade Field Ambulance.—Transport Officer and honorary Lieutenant J. Ashurst resigns his commission.

Highland Field Ambulance.—Transport Officer and honorary Lieutenant D. D. Dudge is seconded for duty with a Provisional Brigade Field Ambulance.

Home Counties Casualty Clearing Station.—Captain W. M. Parham, M.D., to be temporary Major.

Home Counties Field Ambulance.—Lieutenant H. T. Jones, M.B., from 2nd Home Counties Field Ambulance, to be Lieutenant; Lieutenants H. T. Jones, M.B., and B. A. Bull, to be Captains.

London City of London Field Ambulance.—The date of promotion of Lieutenant A. D. Griffith, M.D., F.R.C.S., to Captain is April 1st, 1915, and not as stated in the Gazette of June 26th, 1915.

London (City of London) Sanitary Company.—Second Lieutenant J. Davison, from Royal Irish Rifles, to be Lieutenant.

London Field Ambulance.—Quartermaster and honorary Lieutenant W. Ramsay, from London Field Ambulance, to be Quartermaster, with the honorary rank of Lieutenant.

London General Hospital.—Lieutenant A. T. Swan, M.B., to be Captain.

Lowland Field Ambulance.—C. S. P. Black, M.D. (late Lieutenant, Highland Light Infantry), to be Captain.

North Midland Mounted Brigade Field Ambulance.—Lieutenants to be Captains: R. Harzeaves, W. R. Kingston, M.B.

Southern General Hospital.—Major J. Mortimer, M.B., resigns his commission on account of ill health. Lieutenant W. A. Stokes to be Captain.

Superannuary for Service with the O.T.C.—Lieutenant A. D. Clinch, M.D., to be temporary Captain, whilst serving with the O.T.C. in the Dublin University Contingent, Senior Division, O.T.C.

Wessex Casualty Clearing Station.—H. J. Furler to be Quartermaster, with the honorary rank of Lieutenant.

West Lancashire Field Ambulance.—Major W. A. Smith, M.B., to be Captain. Temporary Major J. D. Perry to be Captain. The following announcement is substituted for that which appeared in the Gazette of September 10th, 1915: Captain G. D. Perry resigns his commission on account of ill health.

West Lancashire Field Ambulance.—Major J. D. Perry to be Quartermaster, with the honorary rank of Lieutenant.

West Lancashire Field Ambulance.—H. N. Felly (late Lieutenant R.A.M.C.) to be Captain. The date of appointment of Quartermaster and honorary Lieutenants W. H. Bell is August 28th, 1915, and not as stated in the Gazette of October 23rd, 1915.

Attached to Units other than Medical Units.—W. A. Smith, M.B. (late Major East Lancashire Regiment), to be Major; W. Y. Martin, M.B. (late Captain Manchester Regiment), H. C. Barr (late temporary Lieutenant R.A.M.C.), Lieutenants G. H. H. Waylen and J. E. Mansford to be Captains; G. C. Walker, M.D., and J. Muir, M.B., to be Lieutenants.

TERRITORIAL FORCE RESERVE.

ROYAL ARMY MEDICAL CORPS.

Home Counties Casualty Clearing Station.—Captain G. W. C. Hollis, from Attached to Units other than Medical Units, to be Captain.

Northern General Hospital.—Lieutenant-Colonel J. F. Dobson, M.B., F.R.C.S., is placed on temporary half-pay on account of ill health.

South Midland Mounted Brigade Field Ambulance.—Captain A. G. S. Lewis, M.D., is seconded for duty with Highland Mounted Brigade Field Ambulance.

West Lancashire Field Ambulance.—Major T. Holt, M.D., from Attached to Units other than Medical Units, to be Major.

Vital Statistics.

EPIDEMIC MORTALITY IN LONDON DURING THE THIRD QUARTER OF 1915.

(SPECIALLY REPORTED FOR THE "BRITISH MEDICAL JOURNAL.")

THE accompanying diagram shows the mortality from each of the principal epidemic diseases during each week of the third quarter of 1915, and shows also the average mortality in the corresponding periods of the five preceding years, except in the case of diarrhoea and enteritis among children under 2 years of age, for which the average mortality figures are not available. Enteric Fever.—The fatal cases of enteric fever, which had been 32, 37, and 24 in the three preceding quarters, rose again to 26 last quarter, but were considerably below the corrected average number of 49. The five preceding quarters, with the exception of last quarter in St. Pancras, Stoke Newington, Lambeth, Battersea, and Wandsworth. The number of enteric fever patients under treatment in the Metropolitan Asylums Hospital, with the exception of the first quarter of last quarter, 108 new cases were admitted during the quarter, against 115 and 126 in the two preceding quarters.

Diphtheria.—The deaths from diphtheria were registered last quarter and are of this disease was admitted to any of the Metropolitan Asylums Hospitals during the quarter.

Measles.—The deaths from measles, which had been 479, 1,120, and 965 in the three preceding quarters, further fell last quarter to 131, and were less than one-half of the corrected average number. This disease was proportionally most fatal last quarter in Finsbury, Shoreditch, Stepney, Poplar, Southwark, Farnoodsey, and Greenwich.

Scarlet Fever.—The fatal cases of scarlet fever, which had been 108, 100, and 90 in the three preceding quarters, fell last quarter to 69, but were 9 in excess of the average for the corresponding quarter of the five preceding years. The greatest proportional mortality from this disease last quarter was recorded in Finsbury, Metropolitan Asylums Hospital, with 2,732 scarlet fever patients at the end of last quarter, against 4,131, 2,514, and 2,411 at the end of the three preceding quarters; 4,228 new cases were admitted during the quarter, against 7,340, 3,558, and 3,853 in the three preceding quarters.

Whooping-cough.—The deaths from whooping-cough, which had been 121, 378, and 417 in the three preceding quarters, fell last quarter to 123, but were 18 in excess of the average for the corresponding quarter. The highest death-rates from this disease last quarter were recorded in Finsbury, Shoreditch, Stepney, Poplar, Deptford, and Greenwich.

Dysentery.—The fatal cases of dysentery, which had been 214, 199, and 156 in the three preceding quarters, were again 156 last quarter, and were 27 above the corrected average number. The epidemic in the northern mortality area of the third quarter occurred in the City of London, Shoreditch, Stepney, Poplar, and Wandsworth. The

DEATHS FROM EPIDEMIC DISEASES IN LONDON DURING THE THIRD QUARTER OF 1915.

NOTE.—The black lines show the recorded number of deaths from each disease during each week of the quarter. The dotted lines show the average number of deaths in the corresponding weeks of the five preceding years, 1910-14. Under the heading "Diarrhoea" are given the deaths from diarrhoea and enteritis among children under 2 years of age; the corrected average number of these deaths is not available.

number of diphtheria patients under treatment in the Metropolitan Asylums Hospitals at the end of last quarter was 1,418, against 1,362 and 1,019 at the end of the two preceding quarters; 2,227 new cases were admitted during the quarter, against 2,778, 2,038, and 1,719 in the three preceding quarters.

Diarrhoea.—The 1,299 deaths under this heading are those attributed to diarrhoea and enteritis among children under 2 years of age; measured in proportion to the births registered during the quarter, the mortality from this cause was greatest in Shoreditch, Bethnal Green, Stepney, Poplar, Bermondsey, and Deptford.

In conclusion, it may be stated that the aggregate mortality last quarter from these epidemic diseases, excluding diarrhoea, was 16.9 per cent. below the average.

THE REGISTRAR-GENERAL'S QUARTERLY RETURN.

[SPECIALLY REPORTED FOR THE "BRITISH MEDICAL JOURNAL."]

The Registrar-General has just issued his return relating to the births and deaths in the third quarter of the year, and to the marriages in the three months ending June last. The marriage-rate during that period was equal to 29.3 per 1,000 of the population, and was 4.7 per 1,000 above the mean rate in the ten preceding second quarters; it was the highest marriage-rate in the second quarter of any year since civil registration was established.

The 127,492 births registered in England and Wales during the third quarter of the year were equal to an annual rate of 21.0 per 1,000. This rate was 4.5 per 1,000 below the mean rate in the corresponding quarters of the ten preceding years, and was the lowest rate on record for that quarter of the year. The birth-rates in the several counties last quarter ranged from 14.6 in Sussex, 15.3 in Rutlandshire, 15.8 in Carnarvonshire, 16.1 in Herefordshire, 16.2 in Devonshire, and 16.5 in Somersetshire, to 25.1 in Carmarthenshire, 25.2 in Northumberland, 25.6 in Monmouthshire, 25.7 in Glamorganshire, and 26.5 in Durham. In ninety-six of the largest towns the birth-rates averaged 21.7 per 1,000, and ranged from 12.0 in Bournemouth, 12.4 in Hastings, 12.6 in Eastbourne, and 13.2 in Southport, to 27.5 in Birkenhead, 27.6 in Bootle, 27.8 in Newcastle-on-Tyne, 29.5 in Gateshead, and 30.2 in Barrow-in-Furness; in London the birth-rate was 21.4 per 1,000.

The excess of births over deaths last quarter was 88,079, against 117,552, 112,065, and 111,577 in the third quarters of the three preceding years. From a return issued by the Board of Trade it appears that the passenger movement between the United Kingdom and places outside Europe resulted in a net balance inwards of 7,776 persons of British nationality, and a net balance outwards of 1,635 aliens. Between the United Kingdom and European or Mediterranean ports there was a net balance inwards of 459 persons. Thus in the aggregate there was a net balance inwards of 6,500 persons.

The 109,415 deaths registered in England and Wales during the quarter under notice were equal to an annual rate of 11.6 per 1,000, against an average rate of 12.9 per 1,000 in the corresponding period of the ten preceding years. The death-rates in the several counties last quarter ranged from 7.1 in Huntingdonshire, 7.3 in Rutlandshire, and 7.5 in Middlesex, 8.4 in Surrey, and 9.6 in Berkshire, in Herefordshire, and in Essex, to 13.4 in Cardiganshire and in Merionethshire, 13.5 in the West Riding of Yorkshire, in Northumberland, and in Cumberland, 13.6 in Durham, and 13.7 in the North Riding of Yorkshire. In the ninety-six largest towns the death-rate averaged 12.3 per 1,000, and ranged from 7.2 in Ilford, 7.5 in Hornsey, and 8.2 in Wimbledon, to 15.6 in Liverpool, 15.8 in Bootle, and in Middlesbrough, 16.4 in South Shields, 16.9 in Gateshead, and 17.8 in Barnsley; in London the death-rate was 12.4 per 1,000.

The deaths from all causes included 332 from enteric fever, 2,099 from measles, 458 from scarlet fever, 1,113 from whooping-cough, 1,074 from diphtheria, and 679 from influenza, besides the cases of children under 2 years of age. The mortality from measles was 22 per cent. above the average; that from diphtheria was equal to the average; while from enteric fever, whooping-cough, and scarlet fever the mortality was below the average.

The rate of infant mortality, measured by the proportion of deaths among children under 1 year of age to registered births, was equal to 58 per 1,000, or 28 per 1,000 below the average rate in the ten preceding quarters. The several counties furnished the rates of infant mortality ranged from 24 in Rutlandshire, 39 in Radnorshire, 42 in Wiltshire, 46 in Huntingdonshire, 50 in Cambridgeshire, 52 in Hert-

fordshire, and 53 in Somersetshire, to 110 in Warwickshire, 117 in Lancashire, 122 in Northumberland, 123 in the East Riding of Yorkshire, 126 in the West Riding, and 127 in Durham. In the ninety-six large towns the rate of infant mortality averaged 116 per 1,000, and ranged from 3.5 in Ilford, 4.1 in Hornsey and in Gloucester, 5.1 in Walsall, and 5.2 in Walthamstow, to 9.5 in Liverpool, and in South Shields, 9.6 in Barnsley, 9.8 in Sunderland, 9.9 in Gateshead, and 10.2 in Middlesbrough. Among persons aged 65 years and upwards the death-rate averaged 64 per 1,000, the lowest rates in the large towns being 39.6 in Eastbourne, 42.7 in Enfield, 43.0 in Exeter, 43.6 in Bath, and 44.0 in Edmonston; the highest rates were 83.3 in Oxford, 84.3 in Carlisle, 85.1 in Halifax, 85.8 in Barrow-in-Furness, and 92.6 in South Shields.

The mean temperature of the air during the quarter was appreciably lower than in the corresponding period of the preceding year, and was slightly below the average in most districts; the rainfall exceeded the average, except in the North-West and the South-West; and the duration of bright sunshine was above the average in all districts.

HEALTH OF ENGLISH TOWNS.

In the ninety-six largest English towns 7,107 births and 5,805 deaths were registered during the week ended Saturday, November 27th. The annual rate of mortality in these towns, which had been 15.4, 15.4, and 15.9 per 1,000 in the three preceding weeks, further rose to 16.7 per 1,000 in the week under notice. In London the death-rate was equal to 17.1, while among the ninety-five other large towns it ranged from 6.5 in Ilford, 7.5 in Eastbourne, 7.7 in Oxford, 8.5 in Acton, 9.5 in Ealing, and 9.6 in Wimbledon, to 22.8 in St. Helena, 23.2 in Liverpool, 23.4 in Wigan, 24.2 in Salford, and 25.1 in West Hartlepool. Measles caused a death-rate of 2.6 in Hastings, 4.3 in Lincoln, and 5.1 in Gloucester; whooping-cough of 2.0 in Southwick; and diphtheria of 1.1 in East Ham. The mortality from the remaining infective diseases showed no marked excess in any of the large towns, and no fatal case of small-pox was registered during the week. The causes of 71, or 12 per cent. of the total deaths were not certified by a registered medical practitioner or by a coroner; of this number 14 were recorded in Birmingham, 14 in Liverpool, 4 in Preston, and 3 each in London, St. Helena, Warrington, Manchester, and Dartington. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 3,065, 3,061, and 3,027 at the end of the three preceding weeks, further fell to 2,927 on Saturday, November 27th. Two new cases were admitted during the week, against 344, 339, and 336 in the three preceding weeks.

In the ninety-six largest English towns 6,793 births and 6,430 deaths were registered during the week ended Saturday, December 4th. The annual rate of mortality in these towns, which had been 15.4, 15.3, and 16.7 per 1,000 in the three preceding weeks, further rose to 18.5 per 1,000 in the week under notice. In London the death-rate was equal to 19.6, while among the ninety-five other large towns it ranged from 8.5 in Ennismore, 10.7 in Newcastle, 10.7 in Glasgow, 11.4 in Wimbledon, and 11.5 in Ilford, and in Bournemouth, to 23.9 in South Shields, 24.0 in Gateshead, 24.3 in Liverpool, 26.9 in Stockport, 27.3 in Walsall, and 27.7 in Blackpool. Measles caused a death-rate of 1.3 in Cardiff, 2.4 in Eastbourne, 4.6 in Stockport, and 5.1 in Gloucester; diphtheria of 2.7 in Great Yarmouth; and whooping-cough of 2.0 in Southwick. The mortality from the remaining infective diseases showed no marked excess in any of the large towns, and no fatal case of small-pox was registered during the week. The causes of 62, or 1.0 per cent. of the total deaths were not certified by a registered medical practitioner or by a coroner; of this number 14 were recorded in Birmingham, 12 in Liverpool, 5 in London, 3 in Southend, 3 in Preston, and 2 each in Warrington, Bury, Manchester, and Harrow. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 3,051, 3,027, and 2,927 at the end of the three preceding weeks, further fell to 2,811 on Saturday, December 4th; 278 new cases were admitted during the week, against 339, 336, and 318 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In the sixteen largest Scottish towns 921 births and 1,020 deaths were registered during the week ended Saturday, November 27th. The annual rate of mortality in these towns, which had been 16.1, 17.5, and 17.6 per 1,000 in the three preceding weeks, further rose to 22.7 in the week under notice and was 4.0 per 1,000 above that recorded in the ninety-six large English towns. Among the several towns the death-rate ranged from 8.5 in Kilmarnock, 13.9 in Aberdeen, and 14.5 in Leith, to 28.5 in Paisley, 29.5 in Coatbridge, and 29.7 in Hamilton. The mortality from the principal epidemic diseases averaged 1.8 per 1,000, and was highest in Falkirk and Hamilton. The 525 deaths from all causes in Glasgow included 8 from infantile diarrhoea, 7 from diphtheria, 6 from scarlet fever, 3 from measles, 3 from whooping-cough, 1 from infantile enteric fever, 1 from influenza, 1 from measles, 5 from scarlet fever, and 3 from diphtheria were recorded in Edinburgh; 2 deaths from measles and 2 from diphtheria in Greenock, and from measles 8 deaths in Hamilton, and 3 in Glasgow.

In the sixteen largest Scottish towns 1,000 births and 1,006 deaths were registered during the week ended Saturday, December 4th. The annual rate of mortality in these towns, which had been 17.5, 17.6, and 22.7 per 1,000 in the three preceding weeks, fell to 22.6 in the week under notice, but was 3.9 per 1,000 above that recorded in the ninety-six large English towns. Among the several towns the death-rate ranged from 13.7 in Glasgow, 14.4 in Edinburgh, and 16.5 in Motherwell, to 25.6 in Paisley, 24.0 in Greenock, and 37.8 in Hamilton. The mortality from the principal epidemic diseases averaged 1.9 per 1,000, and was highest in Greenock and Hamilton. The 465 deaths from all causes in Glasgow included 8 from diphtheria, 7 from scarlet fever, 7 from infantile diarrhoea, 3 from measles, 2 from enteric fever, and 1 from whooping-cough. Six deaths from measles, 3 from scarlet fever, and 2 from diphtheria were recorded in Edinburgh; 9 deaths from measles in Hamilton, 6 in Greenock, and 4 in Coatbridge, and 5 deaths from diphtheria in Paisley.

HEALTH OF IRISH TOWNS.

During the week ending Saturday, November 27th, 555 births and 467 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 503 births and 478 deaths in the preceding period. These deaths represent a death-rate of 20.1 per 1,000 of the aggregate population in the districts in question, as against 20.6 per 1,000 in the previous period. The mortality in these Irish areas was therefore 3.4 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate, on the other hand, was equal to 23.9 per 1,000 of population. As for mortality of individual localities, that in the Dublin registration area was 21.1 (as against an average of 19.0 for the previous four weeks), in Dublin city 25.3 (as against 20.8 in Belfast, 16.1 (as against 17.3), in Cork 21.8 (as against 16.2), in Londonderry 20.2 (as against 16.8), in Limerick 24.4 (as against 15.5), and in Waterford 22.8 (as against 16.6). The zymotic death-rate was 2.0, as against 1.4 in the preceding period.

During the week ending Saturday, December 4th, 447 births and 507 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 555 births and 467 deaths in the preceding period. These deaths represent a mortality of 21.8 per 1,000 of the aggregate population in the districts in question, as against 20.1 per 1,000 in the previous period. The mortality in these Irish areas was therefore 3.5 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth-rate, on the other hand, was equal to 19.2 per 1,000 of population. As for mortality of individual localities, that in the Dublin registration area was 21.9 (as against an average of 20.7 for the previous four weeks), in Dublin city 26.5 (as against 22.6), in Belfast 21.1 (as against 17.6), in Cork 23.8 (as against 18.2), in Londonderry 17.7 (as against 17.1), in Limerick 25.5 (as against 15.5), and in Waterford 25.5 (as against 16.6). The zymotic death-rate was 2.2 as against 2.0 in the preceding period.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notice re Appointments) appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

ASHTON-UNDER-LYNE UNION.—Assistant Resident Medical Officer. Salary, £250 per annum.

AUSTRALIAN COMMONWEALTH.—Officer in Control of Institution for the preparation of Vaccines and Antitoxins. Salary commencing at £650, rising to £750 per annum.

BIRKENHEAD BOROUGH HOSPITAL.—House-Surgeon and Junior House Surgeon. Salaries, £200 and £170 respectively.

BOLTON INFIRMARY AND DISPENSARY.—Third House-Surgeon. Salary, £180 per annum.

BRISTOL ROYAL INFIRMARY.—(1) House Physicians; (2) House-Surgeons. Salary, £120 per annum in each case.

DERBYSHIRE HOSPITAL FOR SICK CHILDREN.—Lady Resident Medical Officer. Salary, £200 per annum.

DUDLEY GUEST HOSPITAL.—Senior Resident Medical Officer; salary, £150 per annum. (2) Assistant House-Surgeon; salary, £150 per annum.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.—Two House-Surgeons. Salary at the rate of £60 per annum, with £5 washing allowance.

LEEDS PUBLIC DISPENSARY.—Resident Medical Officer (lady). Salary, £130 per annum.

LINCOLN GENERAL DISPENSARY.—Resident Medical Officer. Salary, £200 per annum.

NORWICH POOR LAW INFIRMARY.—Lady Resident Medical Officer. Salary, 5 guineas weekly.

PADDINGTON INFIRMARY.—(1) First Assistant Medical Officer; remuneration, 7 guineas a week. (2) Second Assistant Medical Officer; remuneration, 6 guineas per week.

PUTNEY HOSPITAL, S.W.—Resident Medical Officer. Salary, £150 per annum.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—Member of Court of Examiners.

ROYAL FREE HOSPITAL, Gray's Inn Road, W.C.—Medical and Surgical Registrars (ladies).

ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL.—Junior House-Surgeon. Salary, £120 per annum.

ST. MARY'S HOSPITAL FOR CANCER, FISTULA, AND OTHER DISEASES OF THE RECTUM, City Road, E.C.—House-Surgeon. Salary, £150 per annum.

ST. PANCRAS, LONDON.—Senior Assistant Medical Superintendent and Senior Assistant Medical Officer. Salary, £225 per annum.

SHETLAND: WHALSA PARISH.—Medical Practitioner. Guaranteed income £300 by the Highlands and Islands (Medical Service) Board.

SOUTHPORT INFIRMARY.—Senior House-Surgeon. Salary, £200 per annum, and fees of £10.

WIGAN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Lady House-Surgeon. Salary, £150 per annum.

CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointment: Levenwick (Shetland).

To ensure notice in this column—which is compiled from our advertisement columns where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

BUTCH, T. M.B., Ch.B. Edin., Certifying Factory Surgeon for the Launceston Kirk District, co. Kincardine.

EVANS, G. C. J., M.D. Durh., Certifying Factory Surgeon for the Riddermint District, co. Worcester.

LEGG, D. J. M., F.R.C.S. Edin., District Medical Officer of the Shifnal Union.

MORTON, John, M.B., C.M., Visiting Surgeon to the Western Infirmary, Glasgow.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s., which sum should be forwarded to Post Office Orders or Stamps with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

MARRIAGE.

EAGLETON—WOOD.—On November 23rd (very quietly), at Goring-on-Thames, by the Rev. H. E. Sand, great-nephew of the bridegroom, Arthur Joseph Eagleton, M.B., Captain R.A.M.C., son of the late J. G. Smith, Barrister-at-Law, Chief Justice, Court Small Causes, Madras, and Mrs. Smith, Herkiss, Goring-on-Thames, grandson of the late Joseph Eagleton, M.D., and the late Arthur Smith, of The Grotto, Basildon, Helms, to Mabel, youngest daughter of the late Mr. and Mrs. W. Wood, of Barnsey, Yorks. Indian and American papers please copy.

DEATHS.

BARRETT.—On November 4th, at Hinkley Cottage Hospital, after a long illness, Charles William Sessions Barrett, M.B., of Appleton House, Hinkley, son of the late Dr. Charles Albert Barrett, of Hinkley, Leicestershire, aged 58 years.

LAKE.—Mildred, wife of Richard Lake, of St. Bickenhall Mansion, and of 6, Cavendish Place, on December 8th.

DIARY FOR THE WEEK.

TUESDAY.

ROYAL SOCIETY OF MEDICINE:
PSYCHIATRY SECTION, 4.30 p.m.—Clinical Meeting at the Bethlem Royal Hospital, S.E.

WEDNESDAY.

ROYAL SOCIETY OF MEDICINE:
HISTORY OF MEDICINE SECTION, 5 p.m.—Dr. Raymond Crawford: Superstition: Concerning Monstrous Births. Mr. D'Arcy Power: Edmund Harman, "King's Barber" to Henry VIII.

THURSDAY.

ROYAL SOCIETY OF MEDICINE:
DERMATOLOGY SECTION, 1, Wimpole Street, W., 4.30 p.m.—Exhibition of Cases, followed by Papers.

FRIDAY.

ROYAL SOCIETY OF MEDICINE:
ELECTRO-THERAPEUTIC SECTION, The King George Hospital, Watling Road, S.E., 8.30 p.m.

SOCIETY OF TROPICAL MEDICINE AND HYGIENE, 11, Chandos Street, Cavendish Square, London, W., 5.30 p.m.—A Series of Papers on Tropical Subjects will be read by Dr. G. C. Low, A. F. J. Kerr, W. M. Strong, and J. O. Scurce.

POST-GRADUATE COURSES AND LECTURES.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.

THE POST-GRADUATE COLLEGE, West London Hospital, Hammer-smith, W.—Clinical work; graduates only.

RECRUITING FOR THE NAVAL AND MILITARY MEDICAL SERVICES.

CENTRAL MEDICAL WAR COMMITTEE.

CO-ORDINATION OF RECRUITING FOR MILITARY MEDICAL SERVICES AND THE NEEDS OF THE CIVILIAN POPULATION.

The following letter, drafted in accordance with proposals made at a conference with the Insurance Commissioners on December 10th, has been issued to the honorary secretaries of local Medical War Committees in England and Wales:

Offices: 429, Strand,
London, W.C.,
December 14th, 1915.

Dear Sir,

The Central Medical War Committee wishes to call the attention of the local Medical War Committees to an aspect of their work which in the anxiety to secure medical officers for the army has not perhaps received all the attention it deserves, namely, the duty of guarding as far as possible civilian interests while finding medical men for military service. The reference to the Central Committee is "to organize the medical profession in England and Wales in such a way as will enable the Government to use every medical practitioner fit to serve the country, in such a manner as to turn his qualifications to the best possible use and to deal with all matters affecting the medical profession arising in connexion with the war." This obviously throws on the Central Medical War Committee the duty of considering in all its aspects the organization of the profession for the present needs of the country.

If we are to provide the army with a steady and sufficient supply of medical officers—our primary duty—we must arrange that the work of those who go is carried on in their absence. The interests of our colleagues demand this as well as the interests of the nation. Any unnecessary ground of complaint on the part of the civilian population occasioned in the process of obtaining the necessary supply of medical men for the army would obviously tend to prejudice recruiting, and to make the work of local Medical

War Committees throughout the country more difficult. Therefore, in the interests of the men who have gone or are going, of their patients, of future recruiting, and of the country in general, it behoves us to conduct our recruiting with careful regard to the needs of every locality.

The Central Medical War Committee has been in conference with various Government departments on this question, and particularly with the National Health Insurance Commissioners, who are responsible to Parliament for the medical treatment of a very great proportion of the industrial population of the country. The Committee agrees with the opinion expressed by these bodies, that, taking the country generally, there is an ample supply of doctors of military age to meet any demands that seem likely to be made on the profession in the immediate future. But these men are unequally distributed. Some are in areas never too well supplied with doctors at any time, in which the withdrawal of comparatively few might cause serious difficulties. Some are in areas where the proportion of doctors to the population is such that a large number could be spared with comparatively little inconvenience to the community. The task before the Central Medical War Committee is to so adjust the demands in each area as to convince both doctors and the general public that these demands are equitable. How is this to be done?

The Central Medical War Committee, in conjunction with the National Health Insurance Commissioners, is closely studying figures that have been worked out to show the proportion of doctors (and especially of general practitioners) to population in every area. It has, moreover, the advantage of a large amount of information received from callers and correspondents and through the Commissioners. But it feels it must rely very much on the activity, foresight, and local knowledge of the local Committees.

In answer to recent inquiries re the War Register, a great deal of valuable local information has been sent in, but the Central Medical War Committee is of opinion that the need of taking a comprehensive view of the medical needs of the area is not yet sufficiently before local Committees. This is shown by the fact that quite accidentally cases have come to our notice where really serious difficulties have arisen as regards attendance on the local population, as to which the means of information of the local Committees appears to have been defective, since they have neither acted themselves nor warned the Central Committee. Local Committees are, or should be, in possession of information as to the conditions in every part of their area, and it is imperative that careful

consideration should at once be given by the local Committees to those districts in their area where there seems to be a risk that if further men be withdrawn there might be serious consequences to the community and to the doctors who are left. The Committee should not wait until mischief has actually occurred, but should act in time. This action, taken with a full sense of responsibility, should take the form of a careful consideration of the needs of each district and its capacity for releasing more doctors, assisting, where necessary, in working out any rearrangements of work among the remaining practitioners. The public must not be led to expect that in respect of medical attendance it is entitled to "business as usual." All sections of the public must be prepared to economize in this as in other directions. But the amount of sacrifice required of both public and the profession should both now, and as recruiting progresses, be kept as equal as possible throughout all districts of an area and throughout all areas of the country.

When a Committee has made this careful survey (which, if not already made, should be pushed through as rapidly as possible), if it finds there are any weak districts in its area, it should at once warn the Central Medical War Committee that commissions should not be given to practitioners in the districts named without further consideration, and it should increase its pressure on the men of military age in those other districts, if any, which seem able to spare more doctors.

The needs of the various districts in its area and of every kind of practice should be considered by the local Committee, which should take advantage of all possible sources of reliable information as to the necessities of private practice which the members of the Committee will be able to furnish. Again, the Committee should be in close touch with the Panel Committees in its area; the secretaries or other representatives of such might very usefully be on the local Medical War Committee. The Panel Committee should in its turn be in equally close touch with the Insurance Committee. The local Medical War Committee should also be in touch with any body employing any considerable number of medical men, such as institutions and hospitals.

On its part the Central Medical War Committee will make use of all information given to it by its local Committees and by central authorities, and will be in close touch with the Insurance Commissioners. It is believed that by such a local and general system of inquiry and intercommunication between Panel and local Medical War Committees there should be no danger of inequitable treatment of the doctors or population of any area.

The Committee wishes to state its conviction that such a system of safeguards need not, and in fact must not, prejudice the supply of medical men for the army. But since some areas will have to watch very jealously, and at once, the release of a few or even any men, other areas must be called upon to furnish much greater supplies than have hitherto been asked from them, and the local Committees are asked to believe that the demands on them will be made as judiciously as possible, with a due regard to their own advice as to the needs and capabilities of their areas, and with a careful study of what other parts of the country can do and are doing in the way of recruiting.

The Central Medical War Committee is well aware that, in asking local Committees to deal at once with this aspect of the matter, they are asking a great deal of bodies already burdened with considerable responsibilities. But a very great compliment has been paid to the profession in leaving, as the War Office and Lord Derby have done, the organization of the profession for military purposes to a purely professional committee. The reputation of the profession for organizing capacity and public spirit is at stake, and the Central Medical War Committee feels sure that the confidence of the authorities that these qualities would be shown by the profession will not be found to have been misplaced.

We are,

Yours faithfully,

N. BISHOP HARMAN,

ALFRED COX, M.B.,

Secretaries.

To the Honorary Secretaries of
Local Medical War Committees.

WAR SERVICE FOR TOWN DOCTORS.

One of the chief hindrances in the way of medical men in big cities and towns volunteering for commissions in the R.A.M.C. is the difficulty they find in arranging for the carrying on of their practices during their absence. There are many most anxious to go to the front who point with justice to the liabilities they have contracted, and to the almost certain loss of the goodwill of their practices if they leave them without any security. A heavy rent on a house taken for a term of years, or a debt still owing on the purchase money of a practice, are not liabilities that can be lightly treated; neither is the prospect of a return home after the war with no certainty of regaining a reasonable share of the accustomed work one that a married man with a family can view without apprehension. There should be some way or ways of meeting these difficulties quite irrespective of the usual, but now almost impracticable, method of securing the service of a locum-tenent. We put forward some suggestions which seem to offer practicable solutions of the difficulties.

1. Many men state that they could leave their work for a period of six months without any great risk of loss. For example, in certain watering places many could be spared during the winter months, while in some inland urban districts the need for doctors is reduced in summer. We have known of not a few cases where two men were willing to take service turn and turn about, one doing the home work of both whilst the other was away at the war. At present the authorities of the Army Medical Service have not seen their way to accept such offers of joint service. But we may hope that as the reservoir from which the supply of medical officers must be drawn is reduced in plenitude they may see their way to reconsider the position. The army authorities point out that the initial months of a newly commissioned medical officer's service are not so fruitful of effect as the later months, for a man has to learn his work in relation to military conditions, so that with two men working out one year of service the period of relatively barren service would be increased out of reasonable proportion. Yet it would seem that with a great variety of medical work there might be room for these men in some capacity so little removed from the usual methods of civil practice as would reduce the possible loss of efficiency to a minimum.

2. Another suggestion which has been made is for a system of multiple war partnerships, which, it is held, might be a feasible way of securing the practices of men on service. The idea is that several men, say half a dozen, near neighbours to each other, should unite in partnership for the duration of the war and for five years after. The practice of each man joining in such a partnership would be valued on the usual basis; assets and liabilities would be pooled. Two or three men of the half-dozen would be released for war service; during their absence their practices would be worked by the home partners. The military pay of the men on service would be paid into the general account of the firm. Periodically the receipts would be divided in the agreed proportion. Such a scheme, it is suggested, holds out two advantages. First, any loss on the practices of the absentees would be counterbalanced by the bringing in of their military pay, and the considerable economies that could be effected, for example, by the reduction of two or three motor cars. Secondly—and this is the more important feature of the scheme—the goodwill of their practices would be secure, for during the five years after the war they would have full opportunity to regain any loss that had arisen from the withdrawal of their personal attention. Many medical men do not like partnerships; they prefer complete independence in their work, but this is a time when personal preferences should be waived if by so doing the country's necessities can be better met. There is room for some of our professional colleagues who have expert knowledge of large partnerships and their working to publish the details of a model scheme.

3. A third method of dealing with the difficulty has been put into operation in one of the metropolitan urban areas. The constitution of the scheme was reported in the SUPPLEMENT of last week, p. 215. The Stratford Medical War Committee resolved:

That the doctors who have gone on war service or who do so in future be invited to draw up a list of their bona-fide patients and appointments for circulation to the neighbouring practitioners by the local Medical War Committee, and

that they shall be attended or held on behalf of the absentees, and shall be restored to him on his return to practice, and not be taken for twelve months afterwards by any doctor who attended during his absence. All fees except midwifery fees to be equally divided with the absentees. This arrangement is to hold good whether a locumtenent is in charge or not. All differences of opinion as to patients, or appointments, or other matters to be decided by the local Medical War Committee, with an appeal if desired to the Central Medical War Committee.

That is a scheme well worth trial in other areas, and is particularly suitable to districts where there is a fair equality in the type of practice carried on by the several practitioners.

4. Yet another method of co-operation might be found in the establishment of a central clinic, to which the panel patients and their dependants under the care of several doctors in any particular area might be required to resort for treatment.

The data now in the hands of the Central Medical War Committee as to the distribution of doctors throughout the country show that the number of doctors in the cities and towns is much greater in proportion to the population than it is in the country districts. Further, there are many more doctors in what are known as the "residential" districts of the towns than in the working-class districts, both actually and relatively to the population. The causes that produce these effects are subject to reasonable explanation; not the least of these is the custom of treating the sick in their own homes when their circumstances permit, and not by promptly removing them to a private hospital, as is often done in American cities. Our home method requires a greater personnel than the American hospital method, and the treatment of the working classes conforms more to the American method.

In the near future the country must look to the town practitioners to volunteer in increasing numbers for war service. The difficulties of the town practitioners are considerable, but these are not insurmountable, if, in the face of the foe, they will forget the common rivalries of practice, and, with a strength born of unity, put into practice the Pauline injunction, "Bear ye one another's burdens."

MEDICAL STUDENTS.

The Students' Representative Council of the University of London has received, in response to inquiries, the following letter, which, though it does not contain anything which has not been published in the JOURNAL several times already, seems worthy of reproduction, because it expresses very plainly in the last sentence the course which medical students are advised by the War Office now to take:

24/General No./3323 (A.G. 2E) (R).

War Office,
7th December.

Sir,
With reference to your letter of the 17th November, I am directed to inform you that students who at or before the close of the present winter session will be qualified for entry to one of the examinations for the third year students in medicine and duly enter for the examination for which they are studying, will not be affected until after its conclusion, and if they are successful will be included in the class of fourth year men under Lord Derby's scheme.

I am to point out that fourth and fifth year medical students should continue their studies, and should be advised to join the medical unit of their University Officers' Training Corps. They should be given a copy of this letter to show to the recruiting canvassers, who will indicate on their cards the reason for their not enlisting.

I am, Sir, your obedient servant,
(signed) R. J. STRACHEY,
Colonel for Director of Recruiting.

The Hon. Secretary,
Students' Representative Council,
University of London.

In the House of Commons, on December 13th, Mr. Pringle and Sir Philip Magnus asked questions with regard to the employment of senior medical students as surgical dressers and clerks in military hospitals, and whether their services in these capacities would be taken into account as hospital attendance for the purpose of their medical qualification. Mr. Tennant said that he was informed that medical students were not being so employed. In reply to a further question as to whether a saving of qualified medical men might not be made if senior medical students were so employed, Mr. Tennant expressed the opinion that it was really better that medical students who

were in their last year of study should join the combatant forces of the Crown. Those who were approaching completion of their medical curriculum should proceed with it and become doctors. He considered that medical students should not be employed as orderlies, but admitted that as dressers they might get some amount of clinical practice which would be of value, but in a subordinate capacity, not being members of the R.A.M.C., they would not receive it. Mr. Tennant's answer as to medical students joining the combatant forces has to be read in connexion with the above letter, which states the view of the War Office in more precise terms.

OFFICERS' TRAINING CORPS.

In the House of Commons, on December 8th, Mr. Tennant said, in reply to Sir George Scott Robertson, that it was not considered that Officers' Training Corps in this country had completed their usefulness, and it was not considered that it was necessary to transfer any of them to France, as arrangements existed there already for training young officers. In reply to Mr. Peto, he said that it was not now the practice to give first commissions to candidates who have not served in the ranks. Previous service in the Officers' Training Corps, with the military experience it brought, put the individual in a better position than those who had not had such experience. Members of Officers' Training Corps of 18 years old and upwards should, if not accepted for commissions, be attested under Lord Derby's scheme.

Association Intelligence.

MEDICAL PRACTITIONERS AND DENTAL TREATMENT OF SOLDIERS.

At the last meeting of the Medico-Political Committee consideration was given to representations by the Glasgow and West of Scotland Branch that one of its members, who practised solely as a dentist, had been refused payment by the local military authorities of his account for dental treatment given to soldiers on the ground that a Scottish Command Order of June, 1915, directed that none but registered dental surgeons were to be employed to render dental treatment to the troops.

The Medico-Political Committee, being of opinion that this action of the military authorities was an interference with the rights given to medical practitioners by the Dentists Act, immediately communicated with the War Office upon the matter, and is pleased to be able to report the extremely satisfactory result of its action as shown by the following correspondence:

British Medical Association,
October 29th, 1915.

Sir,
Medical Practitioners and Dental Treatment of Soldiers.

The attention of the Association has been drawn through one of its Scottish Branches to the Scottish Command Order 1316, dated June 7th, 1915, based, it is understood, upon instructions from the War Office, to the effect that none but registered dental surgeons are to be employed to render dental treatment to the troops.

This Association desires to draw your attention to the fact that notwithstanding anything contained in the Dentists Act, the privilege of practising dentistry has always been held to be preserved for registered medical practitioners. The only offence under the Act which is subject to a penalty—namely, the use of professional titles by unregistered persons—is expressly stated in the Act not to apply to legally qualified medical practitioners.

The Association is in entire sympathy with the efforts of the War Office to see that dental treatment is only given by thoroughly competent persons, but I am instructed to point out that on the strength of the privilege given to registered medical practitioners under the Dentists Act there are a certain number of medical practitioners who have devoted themselves entirely to dentistry, though their names do not appear on the Dental Register. It appears to the Association to be an injustice that such men should not be allowed to give dental treatment to soldiers, and I am instructed to urge that the War Office should so vary its instructions in this matter as to allow of payment being made in respect of dental treatment of soldiers to those medical practitioners who practise dentistry solely.—I am, Sir, your obedient servant,

ALFRED COX,
Medical Secretary.

The Secretary,
War Office, Whitehall, S.W.

War Office, London,
19th November, 1915.

24, General Number, 3926 (A.M.D. 2).

Sir,

With further reference to your letter of the 29th October, 1915, I am commanded by the Army Council to inform you that it was not intended that registered medical practitioners should be held to be ineligible to give dental treatment to soldiers.

The letter to the effect that none but registered dental surgeons were to be so employed was issued in order to prevent soldiers being sent for treatment to unqualified dentists.

A circular letter has now been despatched to all Commands informing them that the term "Registered Dental Surgeons" does not exclude the employment of registered medical practitioners who are practising dentistry.

I am, Sir, your obedient servant,
(Signed) B. B. CUBITT.

The Medical Secretary,

INSURANCE.

IRELAND. MEDICAL CERTIFICATION.

Sir,

May we let the medical men of Ireland and others interested in the settlement of the medical certification question know through your columns that the Irish Medical Committee had under discussion to-day the agreement which has been recently sent to every medical man in Ireland by the Irish Insurance Commissioners?

A number of criticisms and suggestions were made in connexion with this document and the deputation which has carried on negotiations with the Commissioners up to the present was instructed to meet them again to press these amendments upon them, and to report the result to the profession at as early date as possible.

We are pleased to be able to state that at our interview the Commissioners met us in a very friendly spirit, and accepted the majority of our amendments, which they promised to embody in a memorandum to be circulated to the profession in a few weeks. Under these circumstances we feel it our duty to recommend the acceptance of the agreement as meeting the demands of the profession expressed at the delegates' meeting held on September 17th, 1915, and as a fair attempt to establish an equitable scheme of certification. We hope that those members of the profession who intend to share in the work of certification will sign the agreement pending the issue of the memorandum.

We are, yours faithfully,

R. J. JOHNSTONE, F.R.C.S.E.,
Chairman,

T. HENNESSY,
Medical Secretary,
Irish Medical Committee.

December 10th, 1915.

SCOTLAND.

OPPOSITION OF SCOTTISH CHEMISTS TO THE COMMERCIAL DRUG TAXIFF.

At the meeting of the Glasgow Insurance Committee on December 8th the Medical Benefit Subcommittee reported that all persons and firms on the pharmaceutical list of the Committee, with two exceptions, had intimated their desire to have their names removed from the list at the close of the present year. The correspondence between the chairman of the Joint Committee of Insurance Commissioners and the Pharmaceutical Standing Committee for Scotland showed that the chemists had expressed their willingness to continue for another year on the present conditions. The chairman of the Subcommittee stated that further negotiations had taken place, and he hoped that a settlement would be effected.

The Dundee Insurance Committee at its meeting on the same day, without expressing any opinion on the merits of the dispute, renewed the contracts with the chemists on the basis of those for the current year. It was agreed to intimate this decision to the Scottish Commissioners, and to inform them that if the arrangement did not receive their approval it was for them to devise ways and means for the supply of drugs to insured persons.

It was reported to the Stirling County Insurance Committee on December 9th that all the panel chemists in the county had given notice to withdraw after December 31st. The Medical Benefit Subcommittee, considering that the position of the chemists was reasonable, recommended the Insurance Committee to invite the chemists to renew their contract for 1916 on the same basis as obtained in 1915, but advised that if an arrangement with the chemists were come to on a different basis the Insurance Committee should concur. The recommendations were adopted after discussion.

THE DRUGS ACCOUNTS COMMITTEE OF SCOTLAND.

A memorandum has been issued, signed by the Superintendent of the Central Checking Bureau, Glasgow, and recommendations to secure uniformity and efficiency in the system of pricing and checking prescriptions throughout Scotland. After scrutiny and checking of over a million prescriptions sent in by the fifty six Insurance Committees

of Scotland, various points have emerged which have led to some important suggestions summarized below.

Uniform Price Lists.

At present different committees have different wholesale price lists on which to base the prices of ex-tariff drugs, and the differences are often very great. For example, "*Elizir Aceto-morph. et terpin*" is priced at 3½d. per ounce in some areas, 4d. in others, and 4½d. in others, and as many chemists are on more than one panel it often happens that they are paid at different prices for the same drug or article, and great confusion results.

Emergency List.

The lists of emergency drugs and appliances vary considerably in different areas, and the method of dealing with them also varies. For example, one area refuses to pay for anything not on the list or for quantities in excess of that allowed, while other areas will pay for articles not on the list. Some important areas, such as Glasgow, have no emergency list, and the disadvantage of such variety is great.

Disallowed Items.

It often happens that panel practitioners prescribe appliances and toilet articles which are disallowed by the Bureau—such as atomisers, respirators, toilet soaps, various secret remedies, medicated wines, and so on—and it is suggested that steps be taken to make the position quite clear to both doctors and chemists.

Different committees have adopted very different methods with regard to the prescribing of proprietary articles, some allowing none, others having a list of articles which should not be prescribed, though nothing is said as to their being disallowed, while others have a list of articles which are disallowed. In some cases there are arrangements between doctors and chemists that the chemist may supply official preparations even when the doctor prescribes a corresponding proprietary article; for example, by arrangement, when nrotropine at 6d. an ounce is prescribed the chemist may supply the equivalent, hexamine, which is only 1d. an ounce. The confusion thus caused often depletes the drug fund to a great extent.

Late Receipt of Prescriptions.

Considerable trouble and labour is often caused by chemists and Insurance Committees not sending in prescriptions on the dates fixed, and in many cases they are sent in instalments long after the proper date.

Recommendations.

In view of the above facts, the following recommendations are made in the memorandum:

1. That all insurance committees in Scotland adopt the same wholesale price list for pricing ex-tariff drugs.
2. That each area adopt an emergency list of drugs and appliances approved by the Commissioners, and that articles not on the list and orders in excess of the quantities sanctioned shall be disallowed.
3. That "repeat" orders be abolished and each prescription be written in full and signed.
4. That proprietary preparations according to a given list be disallowed; that the chemical equivalents and official preparations of similar composition be prescribed and dispensed, and under no circumstance shall secret remedies be paid for.
5. That large supplies of medicines or appliances intended for a long period be not ordered for a patient at one time.
6. That prescriptions shall be signed by the practitioner in the proper space, and that deputies or locumtenents shall sign the name of their principal and add their own initials.
7. That the date, name and address of the patient be always put in the proper space.
8. That the writing out of prescriptions by chemists be disallowed, and any alteration on a prescription be initialled by the practitioner. The use of a facsimile rubber stamp renders it doubtful if the prescription is a proper voucher.
9. That a uniform style of prescribing forms on white paper be adopted, each area being distinguished by a conspicuous letter or number.
10. That the dates of sending in prescriptions by chemists and transmission to the Bureau be strictly

adhered to, and those sent in late be delayed till the following month.

Repeat Prescriptions.

Following the above recommendations there is an appendix dealing with "repeat" prescriptions bearing alterations and additions by chemists. The difficulty of checking "repeats" is so great, and so much needless labour is imposed on the chemists who have to search for the originals, often without any date or reference, that it appears necessary to do away with the use of the term "Rep. mist." The use of the term compels the patient to go to the same chemist, and interferes with the free choice of chemist contemplated in the Act, and quotations are given from the Act, the regulations, and the doctors' agreements that make it appear that the term is not really allowable. Evidence is also brought to show that the use of the term tends to excessive prescribing, as in every area where the drug accounts are abnormally high there was a large proportion of repeat orders. It is also shown how the use of the term may lead to serious doubts as to what is intended, and chemists have often had to ask the patient what was really wanted. These and similar difficulties have led to great waste of time of the chemists and of the Checking Bureau, and often left doubt as to whether the patients had received the proper medicines or appliances. It is therefore strongly urged that the term "Rep. mist." be entirely abolished. It is also urged that practitioners should in every case give full details as to what they desire, and not leave it to the chemist to decide, for example, as to what kind of bandages should be supplied. The official prescription is a voucher attested by the signature of the doctor, and it is improper that any writing should be put on the form after it has left the hands of the doctor, who is presumed to have vouched for what is written thereon.

LOCAL MEDICAL AND PANEL COMMITTEES.

PORTSMOUTH.

At a meeting of the Panel Committee held on December 2nd, a resolution was passed in favour of the acceptance of an emergency settlement of practitioners' accounts for 1914 if a satisfactory offer were made by the Insurance Commissioners.

OLDHAM.

A meeting of the Local Medical and Panel Committees held on December 9th decided that there was no present necessity to contribute towards the expenses of the Joint Checking Board.

The clerk to the Oldham Insurance Committee reported that the Pharmaceutical Committee had made a strong representation to the effect that chemists could not supply emergency dressings to the order of doctors on the prices of the new tariff, and had suggested that an addition of 33½ per cent. to the prices of the new tariff should be made to chemists' bills for emergency dressings. The Commissioners had suggested that they would be prepared to approve an arrangement by which each doctor was paid for emergency drugs and dressings a flat rate of 1s. per annum for every 100 persons on his list, but it was decided not to accept either the suggestion made by the Pharmaceutical Committee or that made by the Commissioners.

EAST SUFFOLK.

At a meeting of the Panel Committee held on November 9th, it was resolved to ask the Insurance Committee to request the chemists on the panel not to supply dressings in any case when the quantity required was not stated, and to write to those doctors who had prescribed cod-liver oil preparations for patients not on the domiciliary list, pointing out that in many instances the cases may have been overlooked and should have been marked "domiciliary," but that it was in the interests of economy that as many patients as possible should be placed on the domiciliary list.

It was also resolved that a communication should be addressed to the Insurance Committee strongly protesting against the ordering of proprietary articles by doctors, and stating that the Panel Committee was of opinion that doctors doing so should be surcharged for such articles.

The revision of the flat rate arrangement of 1s. for two days' supply of drugs and appliances to temporary residents outside the chemists' areas and for emergency drugs and

appliances was further considered, and it was decided to press for the continuance of a flat rate.

It was announced that the sum of £220 had been allocated to that area from the Special Mileage Fund for 1914.

COUNTY OF GLAMORGAN.

At a meeting of the Panel Committee, on December 7th, 1915, a resolution was adopted approving of the suggested amalgamation of the English and Welsh Insurance Commissioners into one central body.

A communication was received from the Pharmaceutical Committee requesting an inquiry under Regulation 40 in the cases of 138 practitioners who had exceeded the amount allocated per insured person for 1914, and the matter was referred to the Subcommittee.

INSURANCE ACT IN PARLIAMENT.

CRITICISMS OF ADMINISTRATION.

In the House of Commons on December 1st, on the motion for adjournment, Mr. Currie (Leith Burghs) raised the question of an inquiry into the administration of the Insurance Act. He complained that in reply to questions as to the working of the Act only evasive answers had been given, and on several occasions Mr. Roberts had simply referred him to blue books dealing with actuarial questions. On referring to these books he found that the actuaries said that the claims on the older friendly societies dealing with male members were, on the whole, within the actuarial calculations, but they regarded it as evident that some revision of the finances of the Act would be required with respect to women, and on the question of sickness among male unskilled lives the Chief Actuary said that the "uniform rate of contribution which in the case of men appears to be sufficient on the general average will tend to be too low and the adoption of corrective measures will be necessary." It was thus clear that the actuaries could not give a certificate that the Insurance Act as a whole and in each separate department was financially sound. The business of the London Insurance Committee was notoriously in a state of chaos, and representations were pouring in from men originally biased in favour of the Act who made themselves responsible for its administration. The condition of sanatorium benefit was really one of partial paralysis partly due to the fact that the Local Government Board stopped expenditure. Questions asked as to the amount of money paid to panel practitioners for the treatment of tuberculosis cases, had been parried by Mr. Roberts, who said he accepted the figures, but could not accept the inferences drawn from them. Mr. Roberts had dodged questions as to whether opinions of officials engaged in the working of the Act would be collected with a view to putting it on a more satisfactory basis. Further, the trouble that has arisen with the chemists in Scotland had been caused not so much by the substance of what Mr. Roberts proposed, as by the indefensible manner in which he had put his proposals forward and his refusal to be guided by the Scottish Commissioners. Referring to the cost of administration and the benefits under the Act, there was a widespread feeling that working men who had to pay the premiums were not getting back enough out of the Act. It was understood that the Retrenchment Committee was considering the operations of the Act, and it was rumored that it would recommend the abolition of the Scottish Commission. The present time was really a good time for the appointment of a committee to inquire into the working of the Act. An inquiry would take a long time, but the officials must have a great fund of information which would enable a better state of things to be brought about.

Reply.

Mr. C. Roberts, in reply, said that apart from any personal questions, an inquiry was asked for on the ground of the financial unsoundness of the Act, which, it was alleged, was rapidly going from bad to worse. Mr. Roberts repudiated the suggestion that there was anything which he wished to conceal. It was quite impossible at present to state the total amount payable to panel practitioners, because he did not know, and no one knew the number of persons who had enlisted at the end of 1914. The question of the chemists had been forced on him.

The Pharmaceutical Society of Great Britain claimed that there were grievances in both England and Scotland which required remedy; a Departmental Committee was appointed to consider the question, and suggested certain alterations to meet the grievances. Mr. Currie suggested that he had dealt with the Scottish chemists in an autocratic manner, but he entirely denied it. Better terms had been proposed to the Scottish chemists than the English chemist had been willing to accept, and he had promised that if the Scottish chemists could prove, not by vague statements but by ascertained facts, that the Scottish conditions justified higher remuneration, he was quite willing to consider it and to allow the existing tariff to remain in force for six months, when fresh terms would be considered. Mr. Currie had suggested that the guidance of the Scottish Commissioners ought to have been taken, but in administrative questions of this sort there was no distinction of policy to be drawn between the Minister responsible to Parliament and the department which carried out the policy. It was suggested that the present time was opportune for an inquiry, but as a matter of fact not only the approved societies but his own department were at present working with depleted staffs. In a little time there might be as many as 70 per cent. of the men of military age in the army, and with a staff so depleted the extra burden of a great roving inquiry could not be borne, and every approved society was in the same position. With regard to the abolition of the Scottish Commission, the Retrenchment Committee had come to no decision, and it was supposed that the question was still under consideration. With regard to the soundness of the finance of the Act, vague opinions might be formed, but there was only one way to answer the question satisfactorily—that was, a full and proper inquiry. regard must be paid to the general financial position of the country at the present time. The whole question of benefits would come up and the question as to the treatment of deposit contributors, medical benefit in Ireland, the extension of medical referees, and other questions which might involve Government help. At a time when it could not be said within a thousand million pounds what the National Debt was going to be, it would be difficult and most inopportune to set up a roving commission which would raise all these questions as to the possible extension of the Insurance Acts, but a record was being kept of all suggestions made. Mr. Roberts was proceeding to refer to what had been called the partial paralysis of sanatorium benefit and improper payments to doctors, when Mr. Currie interposed to say that he had not suggested that 6d. for domiciliary treatment was too much, but it was the bad distribution of the money that was the object of his criticism. Mr. Roberts said the arrangement with the doctors was for three years, but it was impossible to deal with the arrangement at present when so many doctors were at the front, and so many were conducting their practices in circumstances of great pressure. With regard to the alleged paralysis of sanatorium benefit, the position in London had been greatly exaggerated. The funds would certainly be diminished by enlistments, but there were large funds, amounting to £800,000 or something of the sort, for the country as a whole, and, in addition, a sum of £150,000 resulting from pre-war surpluses. It was granted that more money could well be spent in the fight against tuberculosis, but Insurance Committees, whether in London or elsewhere, must use sums at their disposal, and learn, as other people have, to live within their income at present; and though the problem might not be wholly solved, a vast amount of good might still be done. It was true that the income had been diminished by enlistments, but it might be remembered that the large accumulation of funds going on was being accompanied by a higher rate of interest than the actuaries estimated, and that would be of considerable value in the future. In addition, the fall in sickness claims by both men and women was great and remarkable. In London, for example, sickness benefit has fallen by 33 per cent. for men and 25 per cent. for women, and this at a time when it was said that the Act was tottering on the verge of a precipice; a sum of more than £29,000,000 had been invested in Government securities, and already during the period of the war between eight and nine million pounds had been invested as a result of accumulation under the Act in Government securities almost entirely, and a very large proportion had gone into the war loan.

W. V. N. Dunn, M.B., to be temporary honorary Lieutenant whilst serving with the British Red Cross Hospital, Netley.
The date on which temporary Quartermaster and honorary Lieutenant F. Brian relinquished his commission is December 7th, 1915, and not as stated in the *Gazette* of December 6th, 1915.
G. A. Sumner to be temporary Quartermaster, with the honorary rank of Lieutenant.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Lieutenants to be Captains: R. Thompson, J. H. Bayley, J. Lawson, M.P., N. Graham, M.B., A. F. Richmond, F. L. P. O. C. Bennett, M.B., F. A. Clements, M.B., G. P. Edgerton, M.B., R. G. C. Thomson, M.B., W. Murdoch, M.B., D. W. J. Andrews, W. J. Webster, M. G. G. Cook, M.B.
Lieutenant (on probation) M. J. Graham, M.B., is confirmed in his rank.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

East Lancashire Casualty Clearing Station.—T. W. Leighton, M.B., to be Lieutenant; J. W. Cottrell to be Quartermaster, with the honorary rank of Lieutenant.

East Lancashire Field Ambulance.—Major S. Nesfield, from Attached to Units other than Medical Units, to be Major. The date of promotion of Lieutenant R. S. Young, M.B., to Captain, is May 31st, 1915, and not as stated in the *Gazette* of October 1st, 1915. Lieutenant T. Hayhurst, M.B., to be Captain. N. C. Frye to be Quartermaster, with the honorary rank of Lieutenant.

Home Counties Cavalry Station.—Captain R. W. Brimacombe, from Attached to Units other than Medical Units, to be Captain; Captain D. H. Scott, M.B., from Highland Field Ambulance, to be Captain.

London Field Ambulance.—O. Gleeson to be Lieutenant.
London Sanitary Company. E. B. Argles, S. L. Bartholomew, and M. S. Briggs, to be Lieutenants.

Northern General Hospital.—Lieutenant J. D. Lickley, M.D., to be Captain.
North Midland Field Ambulance.—D. A. Wilson, M.B., and J. Howard, to be Lieutenants.

Northumbria Field Ambulance.—Lieutenant C. D. Rogers, M.B., R. Kettle, M.B., J. Steadman, M.B., to be Captains.
Sanitary Service.—A. N. Stevens to be Captain, whose services will be available on mobilization.

Southern General Hospital.—Lieutenant A. B. Newton, M.B., to be Captain; J. E. F. Palmer to be Captain, whose services will be available on mobilization.

South Midland Mounted Brigade Field Ambulance.—Lieutenant F. P. Davies, from Attached to Units other than Medical Units, to be Lieutenant.

Welsh Dwydd Mounted Brigade Field Ambulance.—Transport Officer and honorary Lieutenant R. G. Cockrill resigns his commission on appointment to A.S.C.

Wessex Field Ambulance.—F. J. M. Kennedy and T. J. Costello, M.B., to be Lieutenants.

Western General Hospital.—F. H. Lacey, M.B., late Lieutenant East Lancashire Divisional Train, A.S.C.; V. W. Sankey, M.D., and R. Willan, M.B., to be Lieutenants.

West Lancashire Field Ambulance.—R. Findlay, M.B., and N. McCaff-Smith, M.D., to be Lieutenants. Quartermaster and honorary Lieutenant J. Bennett is seconded whilst holding a temporary commission in the A.S.C.

West Riding Field Ambulance. H. A. Peetham, M.D., to be Lieutenant.

Attached to Units other than Medical Units.—Lieutenants G. S. Glass, M.B., and W. R. Collingridge to be Captains; A. L. Eodley, F. W. White, and T. N. Walsh to be Lieutenants.

Vital Statistics.

HEALTH OF IRISH TOWNS.

During the week ending Saturday December 11th, 494 births and 464 deaths were registered in the twenty-seven principal urban districts of Ireland, as against 447 births and 507 deaths in the preceding period. These deaths represent a mortality of 20.0 per 1,000 of the aggregate population in the districts in question, as against 21.8 per 1,000 in the previous period. The mortality in these Irish areas was therefore 2.9 per 1,000 higher than the corresponding rate in the ninety-six English towns during the week ending on the same date. The birth rate, on the other hand, was equal to 21.2 per 1,000 of population. As for mortality of individual localities, that in the Dublin registration area was 22.6 (as against an average of 23.2 for the previous four weeks), in Dublin city 23.5 (as against 25.1), in Belfast 21.0 (as against 18.9), in Cork 22.4 (as against 20.1), in Londonderry 17.7 (as against 15.9), in Limerick 12.2 (as against 16.6), and in Waterford 7.6 (as against 20.9). The zymotic death-rate was 1.6 as against 2.2 in the preceding period.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements) important Notice re appointments appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

AUSTRALIAN COMMONWEALTH.—Officer in Control of Institution for the preparation of Vaccines and Antitoxins. Salary commencing at £650, rising to £750 per annum.

BIRENHEAD BOROUGH HOSPITAL.—House-Surgeon and Junior House-Surgeon. Salaries, £200 and £170 respectively.

BIRMINGHAM.—CITY EDUCATION COMMITTEE.—Temporary Assistant School Medical Officer. Commencing salary, £300 per annum, with 85 travelling expenses.

BIRMINGHAM.—CITY FEVER HOSPITAL.—Resident Lady Medical Officer. Salary, £250 per annum.

BOLTON INFIRMARY AND DISPENSARY.—Sector House-Surgeon (ineligible for military service). Salary, £230 per annum.

BRISTOL ROYAL INFIRMARY.—(1) House-Physicians; (2) House-Surgeons. Salary, £120 per annum in each case.

DERBYSHIRE HOSPITAL FOR SICK CHILDREN.—Lady Resident Medical Officer. Salary, £200 per annum.

EAST HAM: COUNTY BOROUGH EDUCATION COMMITTEE.—Temporary Assistant School Medical Officer. Salary, £200 per annum.

HOSPITAL FOR SICK CHILDREN. Great Ormond Street, W.C.—Two House-Surgeons. Salary at the rate of £60 per annum, with 45 washing allowance.

LEASOWE HOSPITAL FOR THE TREATMENT OF SURGICAL TUBERCULOSIS IN CHILDREN. Cheshire.—Resident Medical Officer (ineligible for military service).

LEEDS PUBLIC DISPENSARY.—Lady Resident Medical Officer. Salary, £200.

NORTH STAFFORDSHIRE INFIRMARY. Hartshill, Stoke-on-Trent.—House Physician. Salary, £200 per annum.

OLDHAM UNION.—Resident Assistant Medical Officer. Salary, £300 per annum.

PUTNEY HOSPITAL, S.W.—Resident Medical Officer. Salary, £150 per annum.

ROYAL EYE HOSPITAL. Southwark, S.E.—House-Surgeon (ineligible for H.M. Forces). Salary at the rate of £150 per annum.

ST. MARYLEBONE INFIRMARY. St. Charles Square, North Kensington.—Two Temporary Assistant Medical Officers.

SHREWSBURY DISPENSARY.—Medical Practitioner.

SHREWSBURY: SALOP COUNTY ASYLUM.—Assistant Medical Officer. Salary, 7 guineas per week or £350 per annum.

SOUTHPORT INFIRMARY.—Senior House-Surgeon. Salary, £200 per annum, and fees of £10.

WOLAN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Lady House-Surgeon. Salary, £150 per annum.

CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointments: Bala (Merioneth), Horamonden (Kent), Leadhills (Lanark).

To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

DRUMMOND, W. B., M.B., C.M. Edin., Resident Medical Superintendent of Baldovan Certified Institution for the Treatment and Education of the Feeble-Minded, Dundee.

GRANT, P. N., M.B., C.M. Glasg., Surgeon to the Out-patient Department for Diseases of the Throat and Nose, Royal Infirmary, Glasgow.

MACNAUGHTON, Miss M., M.B., B.Ch. Edin., Assistant Medical Officer to the Southampton Park Infirmary.

VICARY, R. H., M.R.C.S., L.R.C.P., District Medical Officer of the St. Marylebone Parish.

WHITE, S. B., M.B., B.Ch., M.R.C.S., L.R.C.P., District Medical Officer of the New Forest Union.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s., which sum should be forwarded in Post Office Orders or Stamps with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

BIRTH.

BLETCHLY.—On the 10th December, at Hazelwood, Nailsworth, Gloucestershire, the wife of George Playns Bletchly, M.B. Lond., of a son.

MARRIAGES.

HUNTER-GREENWAY.—On 27th November, at St. Martin-in-the-Fields, Trafalgar Square, by the Rev. Wilfred Parker, Major J. E. Hunter, I.M.S., to Marjorie Phyllis, daughter of Mr. and Mrs. C. Greenway, 2, Whitehall Court, London, S.W.

MACINTYRE—WILKES.—December 11th, at the Parish Church, Darlington, by the Rev. W. G. Davison, Fred Ross Macintyre, elder daughter of Richard M. Wilkes, M.A., B.C.L., Solicitor, Darlington.

DEATH.

RATNER.—On December 7th, at 18, Dunsire Road, Stamford Hill, N., John Alexander Ratner, B.A., M.R.C.S., late of 36, Kingsland Road, in his 71st year.

DIARY FOR THE WEEK.

MONDAY.

ROYAL COLLEGE OF SURGEONS, LINCOLN'S INN FIELDS, W. 5, 9 a.m.—Breakday Lecture by Surgeon-General Sir Anthony A. Dowbig: Wounds in War.

TUESDAY.

LONDON DERMATOLOGICAL SOCIETY (St. John's Hospital, 49, Leicester Square, W.C.1.)—4.30 p.m.: Cases and Specimens. 5.30 p.m.: Dr. Prosser White—Occupational Dermatitis.

POST-GRADUATE COURSES AND LECTURES.

NORTH-EAST LONDON POST GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham.
THE POST GRADUATE COLLEGE, West London Hospital, Hammer-smith, W.—Clinical work; graduates only.

RECRUITING FOR THE NAVAL AND MILITARY MEDICAL SERVICES.

THE ENROLMENT SCHEME.

The Central Medical War Committee published its scheme of enrolment for the medical profession in the Supplement of December 11th, and stated that Lord Derby had informed the Committee that he fully approved of the scheme, that he hoped the War Emergency Committees for England and Wales, Scotland, and Ireland respectively would undertake the whole of the arrangements for procuring medical men for the army, and that he recognized the Committees as a means of organizing the medical profession with regard to military service.

The enrolment scheme of the Committee is, therefore, as far as concerns the medical profession, equivalent to Lord Derby's scheme of attestation; as is the latter for the general public, so is the enrolment scheme of the Medical War Committee the last effort of the voluntary system. It gives to the medical profession an opportunity which will not recur of organizing itself to meet the demands of the military services of the Crown. If it fails compulsion seems to be the only alternative. If compulsion has eventually to be applied to the medical profession it will be due to failure now to respond to this last appeal to maintain the voluntary system.

The terms and conditions of services of temporary lieutenants R.A.M.C. can be obtained on application to the Central War Committee, and have been fully stated in the JOURNAL on several occasions. On October 30th, p. 662, a table will be found comparing the emoluments of temporary lieutenants R.A.M.C. and lieutenants and captains of the R.A.M.C. Territorial. The contract with a temporary lieutenant R.A.M.C. is for a year, at the end of which he receives a gratuity of £60; his consolidated pay is 24s. a day, and in addition he receives free rations or an allowance in lieu. The total emoluments, therefore, are at the rate of £500 a year, rather more than less.

RESIDENTIAL DISTRICTS.

At a meeting of the profession of Chelsea and Fulham, held at Fulham Town Hall on December 16th, when Dr. J. C. Jackson, Chairman of the British Medical Association Division, presided, Mr. Bishop Harman, who attended on behalf of the Central Medical War Committee, gave an account of the work of the Central and local War Committees. At the present time the main effort must be to rouse the "residential" town areas to a livelier sense of their responsibilities and to so arrange their work that they could spare more men for the army service. In these districts medical men were actually and relatively much more numerous than in the rest of the country on a population basis, and it was necessary to tap this source of supply before more men were allowed to go from country and industrial areas. The difficulties of the town men were great, for their practices were almost entirely personal. But it was possible to make such arrangement as would safeguard the practices

of the absentees and yet fully meet the necessities of their patients. He discussed the various schemes which had been suggested (see SUPPLEMENT, December 18th, p. 222), and, in reply to questions, said that many civil practitioners were being employed by the War Office, but that the supply was greater than the demand. A committee for Chelsea and Fulham was appointed.

ACTION BY THE LOCAL GOVERNMENT BOARD IN IRELAND.

At the last meeting of the Swinford Board of Guardians a letter was read from the Local Government Board relative to the appointment of Dr. Sweeney to the medical officership of the Charlestown Dispensary district. The letter suggested that in view of the present urgent necessity for additional doctors for the army and navy, the guardians might endeavour to make some temporary arrangement whereby Dr. Sweeney, who is 27 years of age, would be enabled to volunteer for active service until the termination of the war. The guardians could keep the post open until Dr. Sweeney's return. The guardians replied that the appointment was made before the issue of the Local Government Board's circular letter of November 26th, and that as Charlestown, with a population of over 9,000, was one of the largest dispensary districts in the county, and as temporary arrangements would not be desirable, it was hoped that the Local Government Board would sanction the appointment.

HOSPITALS AND THE ALLEGED WASTE OF MILITARY MEDICAL OFFICERS.

At a meeting of the Worcester Infirmary Committee on December 20th a long discussion took place on the question of the arrangements to be made to cover the surgical and other work at the infirmary in the absence of two further members of the staff on war service. In the absence of Dr. Tom Bates, jun., and Dr. Slinger, the honorary medical staff recommended that the services of Drs. Legge, Coombs, and Corder should be accepted. Dr. Seymour subsequently offered his services, saying that it was unlikely that he would have the good fortune to be able to join the army, but the honorary medical staff, reporting that provision had been made to cover the work, did not add to their former recommendation.

A member having moved that Dr. Seymour's services also be accepted, Dr. Tom Bates, sen., said that the Central War Committee had expressed the view that it was the duty of every eligible doctor to apply for a commission in the R.A.M.C. He thought that the honorary medical staff, having approved of five members leaving, were perfectly justified in declining the offer of services of men of military age. If they had acted otherwise they would have stultified themselves. He thought that they should be supported in the action they had taken, which was founded, not on personal grounds, but on true patriotism.

The Dean of Worcester said that during the last three months he had had a good deal of correspondence with the Medical Board, the Advisory Board, the War Office, Mr. McKenna, and the Secretary of the British Medical Association on the question of the supply of doctors. He entered into correspondence with the authorities because it seemed to him that there was waste in calling up for service a very large number of doctors, and then making no use of them. There were hundreds of doctors

who had sacrificed their practices, and rightly so, in what they believed to be the interests of the country, but the War Office left them to waste their time, and did not make use of their services. He had applied to the War Office a number of instances. He himself had a son who gave up a very good practice. He went to the War Office and was told that he would be wanted, but for four months he did nothing but play golf. When he was given some work to do, it was work an orderly could do, or some elderly medical man. When the question of the need of medical men was considered it was most important that men who had already offered their services should be adequately used before a very large number of others were called up. He had urged the War Office and the medical authorities that, instead of taking men, they should take the offer of their services, and leave them until they were actually wanted. Any man who was married and had a family, before going, should be assured that the War Office would really utilize the services of the men who had already gone.

Dr. Bates, sen., said, in reply, that the War Office required many more doctors for the new armies of two million men, and asked whether these new armies were to be sent to face the enemy without sufficient doctors.

The Mayor of Worcester asked whether the motion meant that the hospital was going to engage no doctors who were under military age, and the Chairman replied in the affirmative. This answer caused dissent, and the Chairman said that the proposal before the meeting was to accept the offer of the services of the three doctors over military age. An amendment accepting Dr. Seymour's services in addition was carried by 8 votes to 1.

SOLDIERS SUMMONED TO SICK RELATIVES.

REQUEST BY THE WAR OFFICE TO DOCTORS.

We have received the following communiqué from the War Office:

In February last it was brought to the notice of the Army Council that instances had occurred where soldiers had been put to considerable expense, which they could ill afford, on account of having been summoned to their homes owing to the serious illness or death of a near relative.

It was therefore decided that a free railway warrant might be issued in such cases, the concession being restricted to cases of grave and urgent illness, or death, of a parent, wife, or child, and the genuineness of each case to be duly certified by a medical attendant.

Experience has shown that the concession is open to abuse, and that soldiers may be summoned to their homes at the public expense when the urgency of the illness does not justify it. This may happen through the fact that medical practitioners are unacquainted with the conditions underlying the concession, and the Army Council therefore appeal to the medical profession to assist the military authorities in preventing the abuse of the privilege.

A specimen form of certificate, which it is requested may be taken into general use, is appended, and medical practitioners are asked to exercise the greatest caution in signing these certificates, which should only be issued when there is reason to anticipate serious results from the illness of the relative concerned.

Form of Medical Certificate which must be used when it is necessary to Summon a Soldier to his Home owing to the Dangerous Illness of a Parent, Wife, or Child.

I hereby certify that (patient's name) of (patient's address) the of (Number) (Rank) (Name) (Regiment) is under my professional care, and is dangerously ill.

(Signature of Medical Attendant).

* Insert whether parent, wife, or child.

Meetings of Branches and Divisions.

METROPOLITAN COUNTIES BRANCH:

CHELSEA DIVISION.

At a meeting of the Chelsea Division at Fulham Town Hall on December 16th the existing officers of the Division were re-elected for the ensuing year and the revised official rules were adopted.

On the proposition of Dr. E. W. HAMLTON, it was resolved to send a letter of condolence to the relatives of the late Dr. J. H. Meers, who had lost his life in the service of his country, having been killed in action in France. He had been for some years a member of the Division.

INSURANCE.

THE PRICING OF PRESCRIPTIONS UNDER THE COMMERCIAL TARIFF.

ABOUT a month ago the chairmen and clerks of the various insurance committees of Lancashire met in conference with the Commissioners in London to consider the additional duties falling on insurance committees in the pricing, checking, and analysing of prescriptions in the coming year under the commercial tariff. The Commissioners suggested that in the interests of efficiency and economy the committees should consider the desirability of co-operating for the purpose of carrying out their additional duties, and the representatives of committees undertook to report further to the Commissioners. Since then the various chairmen and clerks have held two meetings at Manchester and Preston, and passed resolutions to the following effect: First, that the extra cost involved in the checking of prescriptions under the new system should be borne by an additional grant from the Commissioners, and should not form a charge on the existing revenues of the insurance committees; secondly, that the grouping of committees is desirable, as some committees might find difficulty in providing independently efficient and economical arrangements for the new duties; and thirdly, the following groups were suggested for the county of Lancashire:

- Group 1.—Lancashire Comty.
- Group 2.—Manchester and Salford.
- Group 3.—Liverpool, Birkenhead, Bootle, St. Helens, Southport, Stockport, Wallasey, Warrington, and Wigan.
- Group 4.—Barrow, Blackburn, Blackpool, Bolton, Burnley, Bury, Oldham, Preston, Rochdale.

It was further decided that each group should appoint a convener, and that after particulars had been obtained from each, and its representatives had met to decide on a scheme, a general meeting of the groups should be held in order to secure as far as possible uniformity of method. The proposals have been submitted to the Commissioners, who have now announced that they see no objection to the groups as provisionally arranged, and that they have decided to take steps to make available such sum of money towards the administrative expenses of the committees as will fairly represent the additional cost imposed on committees by the new system. They further express the hope that committees will, in the interests of national economy, take every means to keep the cost as low as possible.

SCOTLAND.

SCOTTISH CHEMISTS AND THE DRUG TARIFF.

AS the result of conferences in Edinburgh and London between the Executive of the Scottish Association of Insurance Committees, acting with the Pharmaceutical Standing Committee (Scotland) on the one part and Mr. Charles Roberts, M.P., Chairman of the Joint Committee of Insurance Commissioners, on the other, an understanding has been reached in connexion with the deadlock threatened by the fact that some 99 per cent. of Scottish panel chemists had intimated that they could not continue their agreements after December 31st. The result is expressed in the following letter addressed to the Pharmaceutical Standing Committee (Scotland). It appears to show that the offer originally made by the Scottish panel chemists has been accepted, and that there will be no interruption in the service for medicines and appliances for insured persons during 1916.

Pharmaceutical Standing Committee (Scotland),
36, York Place, Edinburgh,
December 14th, 1915.

Dear Sir—I am instructed to say that your letter of December 13th with reference to our interview with Mr. Charles Roberts on December 9th was considered by my Committee yesterday, and I have now to confirm my telephone message to you, and to say that the offer made by the Pharmaceutical Standing Committee (Scotland) on the one part and Mr. Charles Roberts, M.P., Chairman of the Joint Committee of Insurance Commissioners, on the other, an understanding has been reached in connexion with the deadlock threatened by the fact that some 99 per cent. of Scottish panel chemists had intimated that they could not continue their agreements after December 31st. The result is expressed in the following letter addressed to the Pharmaceutical Standing Committee (Scotland). It appears to show that the offer originally made by the Scottish panel chemists has been accepted, and that there will be no interruption in the service for medicines and appliances for insured persons during 1916.

2. The Pharmaceutical Standing Committee (Scotland) to undertake by August 31st, 1916, to furnish to the Scottish

Insurance Commissioners a report on their objections to the new proposals embodying evidence on the points as to which they are at issue with the recommendations of the Departmental Committee.

In accordance with this settlement we have to-day issued a letter to each panel chemist in Scotland recommending them to continue service during the year 1916 under the terms specified.

I am, yours faithfully,
(Signed) J. RUTHERFORD HILL,
Secretary.

SURCHARGING.

O'Neill v. County of Middlesex Insurance Committee.

THE case of *O'Neill v. The County of Middlesex Insurance Committee*, which was decided by Mr. Justice Romallie in the King's Bench Division on December 20th last, raised several points of considerable interest to the profession. In the spring of this year an investigation was held into the character and amount of the drugs and appliances ordered for insured persons" by the plaintiff, with a view to his being surcharged, and the amount credited to the Drug Fund. This investigation was in the first instance carried out by a subcommittee to which the duty had been delegated by the Panel Committee. The subcommittee, with the assistance of an expert, closely scrutinized the plaintiff's prescriptions, and notified the plaintiff of the course which was being pursued against him. The plaintiff duly appeared before this subcommittee, and in due course a report was made to the Insurance Committee, and the Insurance Committee made an order surcharging him to the extent of £325 odd.

It was then seen that an order had been made against the plaintiff without his having had any opportunity of appearing before the Panel Committee itself or of putting his case, as he was entitled under the terms of Regulation 40, which creates the procedure under which these orders are obtained, nor had the Pharmaceutical Committee appeared before the Panel Committee, as provided by the Regulation, and, indeed, was not represented even at the hearing before the subcommittee, and for this reason the order which the Insurance Committee had made was invalid.

In order, therefore, to get over the difficulty the matter was reopened by the Panel Committee, which formally notified the plaintiff to that effect, and summoned him to attend before them, and the Pharmaceutical Committee was communicated with. The Pharmaceutical Committee again were not represented before the Panel Committee, but contented itself with forwarding its views in a written memorandum. The plaintiff did attend, but, although given every opportunity to state his case, he declined to do so or to answer questions. In the result the Panel Committee confirmed the report of the subcommittee, and the Insurance Committee again made an order against the plaintiff in the same terms as before.

In these circumstances the plaintiff contended: First, that the Insurance Commissioners having once made an order against him which was invalid were *functus officio*, and therefore incompetent to make a second order in respect of the same matter. Secondly, that the investigation was not conducted in a fair judicial spirit, and he further contended that in law Regulation 40 was void as being a regulation which the Insurance Act itself did not authorize.

The judge held that the Insurance Committee were perfectly entitled to cure the defect in the order which it made in the first instance by securing for the plaintiff a hearing before the Panel Committee and making a fresh order upon its report, and that the fact that the Pharmaceutical Committee was not represented at either of the hearings was not a matter as to which the plaintiff was entitled to complain. He emphasized the importance in inquiries of this character of perfect bona fides and a spirit of fairness throughout, and that although "the investigation need not be attended at every step by the practitioner affected by it... he must undoubtedly be heard before the report is sent in, and must be heard on the ground which the investigation covers, and substantially must be allowed to challenge the result to which the investigation ultimately led and the steps which led to it." These essentials had, in his judgement, been complied with. As regards the question as to the validity of the regulation itself, he pointed out that power was given to the Commissioners by Section 65 of the Insurance Act, 1911, to make regulations "generally for carrying this part of this Act into effect." It was argued that this regulation was contrary to the general scheme of the Act, which gave insured persons a right to the unfettered judgement of a medical practitioner whom they could select, but this the judge said was erroneous. The Act did not say in terms that the doctor was to exercise his uncontrolled will, and

from the fact that funds were created to pay doctors and to buy drugs, and that these funds must be limited showed that this was so. The duty of prescribing involved a duty of prescribing according to the available resources, and without extravagance; and, in order to carry out the provisions of the Act, it was obviously necessary to make rules to curb extravagance. He therefore decided against the plaintiff on all the points raised and gave judgement for the defendants.

INSURANCE NOTES.

DRAFT STANDING ORDERS FOR PANEL COMMITTEES.
THE Insurance Commissioners (England) have prepared and issued in a leaflet a set of draft standing orders for panel committees. It is pointed out that they are not necessarily exhaustive, but it is thought that they will be of assistance to panel committees in framing such orders.

CORRESPONDENCE.

"REP. MIST."

DR. W. JOHNSON (Wolverhampton) writes: "The proposal to abolish the practice of writing 'Rep. mist.' in panel prescriptions is one which will give a lot of unnecessary work to panel doctors, and this at a time when there is a shortage of doctors, and some are doing the work of two or three men. 'Rep. mist.' by itself may mean anything, but if the date of the required prescription is added it is easy for the chemist to find it. It is absurd to write out a cough mixture or a prescription for some chronic complaint every time the patient comes up for more."

INSURANCE ACT IN PARLIAMENT.

NUMBER OF PANEL DOCTORS.

In reply to Sir Edward Cornwall, Mr. Roberts stated, on December 20th, that the figures showing the number of doctors on the panel in London and the provinces on July 1st, 1914, were not available, but the figures for January 1st, 1914, which would not differ materially, were: London, 1,400; English areas, 14,600, including doctors on more than one panel. The corresponding figures for doctors who would be on the panel for 1916 were, approximately: In London, 1,440; in other English areas, 14,400. These figures included a number of doctors on military service whose names remained on the panel whilst some other doctor or doctors were undertaking to carry out their duties.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are made by the Admiralty: Fleet Surgeon J. Chambe's, B.A., M.B., to the *Pembroke*, additional, for Chatham Hospital; temporary Surgeons B. A. Playne, M.B., D.S.O., to the *Fleet*, additional, for disposal; T. Gwynne-Jones to the *Victory*, for R.N. Barracks.

ROYAL NAVAL VOLUNTEER RESERVE.

To be Surgeon-probationer for temporary service: J. H. Kerr.

ARMY MEDICAL SERVICE.

Colonel E. H. L. Lynden-Bell, C.B., is retained on the active list, under the provisions of Articles 120 and 522, Royal Warrant for Pay and Promotion.

Lieutenant-Colonels to be temporary Colonels whilst holding the appointments of Assistant Directors of Medical Services: F. W. Hardy, M.B., C. E. Pollock, L. Way, F. A. Symonds, D.S.O., M.B.

ROYAL ARMY MEDICAL CORPS.

Major Sir E. S. Worthington, Kt., C.M.G., M.V.O. to be temporary Lieutenant-Colonel whilst Commandant, Officers' Convalescent Home, Cimiez.

J. C. G. Ledingham, M.B., to be temporary Lieutenant-Colonel. The following are granted temporary rank whilst employed with the Halifax War Hospital:—As Lieutenant-Colonel: J. F. Woodvatt, M.D. As Majors: A. Drury, M.B., J. C. Wright, M.B., T. H. Hunt, M.D. Temporary Major T. Mill, M.B., F.R.C.S., having resigned his appointment at the Beaufort War Hospital, relinquishes his commission.

Temporary Captain T. W. Eden, M.D., F.R.C.S., to be temporary Major.

Temporary Lieutenants to be temporary Captains: W. W. Deans, E. R. G. Greville, D. Thomson, M.B., J. R. P. Allen, G. Hadfield, M.D., J. H. Aikman, M.B., W. C. Jardine, M.B., W. H. Laslett, M.B., M. A. MacDonald, M.B., T. Feilly, M. Bates, M.D., F.R.C.S., J. A. Glover, M.D., N. Beeder, M.B., W. V. Macintosh, M.B., G. Jackson, M.B., E. A. Pearson, M.B., W. J. Nisbet, M.B., M. J. Murray, M.B., F. W. McMillan, M.B., T. O. Williams, M.B., J. E. Cox, C. J. Kelly, D. W. Reid, M.B., C. H. Thompson, R. Williams, T. R. Scullion, E. R. Westhead, M.B., W. W. Littlewood, M.B., J. I. Russell, M.B., J. R. Fisher, M.B., D. C. Ashton, M.B., C. Lunde, M.B., W. Ansdan, C. A. Kenny.

To be temporary Captains: C. C. Butmore, A. T. Smith, M.D., J. Burnell, M.B., F.R.C.S., J. S. Morrow, M.D., J. F. R. Gardiner, M.B., W. Rankin, M.B., N. H. Oliver, W. P. H. Mouch, M.D., J. L. Bentall, M.B., A. E. Knight, M.B., G. C. Chubb, M.B., F.R.C.S.

The names of the undermentioned temporary Lieutenants are as now described, and not as stated in the Gazette of September 15th, 1915, and of November 19th, 1915, respectively: E. Seely, M.B., N. Devereux, F. W. Martin, M.B.

The following relinquish their commissions: Temporary Captain G. A. C. Mitchell, M.B.; temporary Lieutenants D. J. G. Grant, M.B., A. H. Flannery, M.B., J. Matheson, M.B.

The appointment to a temporary Lieutenancy of W. R. S. Watkins is cancelled by December 15th.

Temporary Lieutenant J. M. J. A. Levins is removed from the army for absence without leave.

Temporary Lieutenants relinquish their commissions on account of ill health: E. G. Cameron, H. F. W. White, M.B.

Lieutenant F. J. Cleminson, F.R.C.S., Royal Army Medical Corps, Territorial Force, to be temporary Lieutenant substituted for the notification which appeared in the *Gazette* of November 19th, 1915.

Lieutenants of the Canadian Army Medical Corps to be temporary Lieutenants: C. E. Wilson, M.B., H. C. Sutton, M.B., H. B. Moyle, M.B., H. F. Rogers, M.B., A. V. MacCallum, M.B., S. MacCallum, M.D., Berker, M. B. T. R. Phipps, M.D., E. N. Drier, M.D., F.R.C.S. Edin., G. W. Carleton, M.B., W. W. Cruise, M.B., F. A. Ross, M.B., E. H. McVicker, M.B., A. B. Moffat, M.B., J. McE. Kilgour, M.B., V. F. Cartwright, M.B., A. E. McKibbin, D. A. Warren, W. A. McLeod, M.D., E. S. Russell, M.D., C. R. Young, M.B., E. Bryceon, T. P. Devlin, J. B. Christian, M.B., J. F. Macdonald, M.D., J. J. Hamelin, M.D., W. E. H. Fraser, M.D., R. W. Halsey, M.D., B. T. MacLaren, M.D., E. H. Freeman, M.D., E. S. Moorhead, M.B., M. B. Roberts, J. B. Brown, M.B., C. S. Wynne, M.B., H. W. Piddell, A. D. E. Rommel, J. D. Shields, M.B., A. F. Laird, M.D., W. L. Evans, M.B.

Temporary honorary Lieutenants to be temporary Lieutenants: C. C. Brewis, A. H. Morley, T. W. Molhuise, W. D. Cruickshank, M.B.

To be temporary honorary Lieutenants: L. G. Jacob, S. B. Prall, W. Thomas.

Temporary honorary Lieutenant J. P. S. Dunn, M.B., having ceased to serve with the British Red Cross Hospital, Netley, relinquishes his commission.

G. E. Ingo and C. W. Atkins to be temporary Quartermasters, with the honorary rank of Lieutenant.

OVERSEA CONTINGENTS.

AUSTRALIAN ARMY MEDICAL SERVICE.

Colonel N. E. Howse, V.D., to be temporary Surgeon-General.

CANADIAN ARMY MEDICAL CORPS.

Major J. E. Davey to be temporary Lieutenant-Colonel.

A. G. McLeod to be temporary Captain.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

East Anglian Field Ambulance.—Sergeant-Major H. G. Aldis, from *East Anglian Field Ambulance*, to be Quartermaster, with the honorary rank of Lieutenant.

Eastland Field Ambulances.—Lieutenants J. M. Chrystie and A. R. Moodie, M.B., to be Captains.

Home Counties Field Ambulance.—Lieutenants W. T. Henderson, M.B., and W. W. Maxwell, M.D., to be Captains.

London (City of London) Field Ambulance.—E. N. Buter Gate Captain, *East African Medical Service* to be Lieutenant.

London (City of London) Sanitary Company.—S. A. Mann and E. A. Atkins, M.D., to be Lieutenants.

London Field Ambulance.—Captain (temporary Major) J. R. Holmes, M.B., relinquishes his temporary rank on alteration in posting.

Captain J. B. Hines, M.B., is seconded for duty with *London Regiment*. Captain W. Cowie, M.B., to be temporary Major.

London General Hospital.—Major (temporary Lieutenant-Colonel) H. F. Hawkins, M.D., from *London General Hospital*, to be Major.

Major H. P. Hawkins, M.D., to be Lieutenant-Colonel on the permanent personnel. Captain F. H. Mitchiner, M.B., F.R.C.S., from the list of officers superannuated for service with the O.T.C., to be Captain on the permanent personnel. Lieutenant L. B. Clarke, to be Captain.

London Sanitary Company.—Lieutenant A. G. Williams, M.B., to be Captain.

Lowland Field Ambulance.—Captain W. A. Burns, M.B., to be Major.

North Midland Field Ambulance.—Lieutenant C. S. Lee to be Captain.

Southern General Hospital.—Captain J. G. McLannahan, from *South Midland Field Ambulance*, to be Captain, whose services will be available on mobilization. Lieutenants to be Captains: H. A. B. Whitelocke, W. Stobie, M.B. To be Captains, whose services will be available on mobilization: D. A. W. Stone, M.B., A. A. Purrell, M.B.

South-Western Mounted Brigade Field Ambulance.—J. W. A. Cooper to be Lieutenant.

West Lancashire Casualty Clearing Station.—Major (temporary Lieutenant-Colonel) E. W. Barnes, from *West Lancashire Field Ambulance*, to be Major.

Lieutenant-Colonel J. G. H. Mervin, to be temporary Lieutenant-Colonel; Lieutenant B. K. Merson to be Captain.

West Lancashire Field Ambulance.—Transport Officer and honorary Lieutenant J. N. P. Holt resigns his commission.

Attached to *Units other than Medical Units*.—Lieutenant-Colonel R. C. Hichet, M.D., retired list, T.F. (late Fort R.G.A.), to be Major; Lieutenants C. C. Fitzgerald, C. B. Alexander, and H. D. McCrossan, M.B., to be Captains. T. E. Saunt and J. E. S. Wilson to be Lieutenants.

TERRITORIAL FORCE RESERVE.

ROYAL ARMY MEDICAL CORPS.

Captain D. C. L. Leyland, M.D., F.R.C.S., from *London (City of London) Field Ambulance*, to be Captain.

Vacancies and Appointments.

NOTICES REGARDING APPOINTMENTS.—Attention is called to a Notice (see Index to Advertisements—Important Notice re Appointments) appearing in our advertisement columns, giving particulars of vacancies as to which inquiries should be made before application.

VACANCIES.

AUSTRALIAN COMMONWEALTH.—Officer in Control of Institution for the Preparation of Vaccines and Antitoxins. Salary commencing at £500 per annum.

BIRMINGHAM BOROUGHS HOSPITAL.—House-Surgeon and Junior House-Surgeon. Salaries, £200 and £170 respectively.

BIRMINGHAM: CITY FEVER HOSPITAL.—Resident Lady Medical Officer. Salary, £250 per annum.

BOLTON INFIRMARY AND DISPENSARY.—Senior House-Surgeon (ineligible for military service). Salary, £230 per annum.

BRIGHTON ROYAL INFIRMARY.—(1) House-Physicians; (2) House-Surgeons. Salary, £120 per annum in each case.

DERBYSHIRE HOSPITAL FOR SICK CHILDREN.—Lady Resident Medical Officer. Salary, £200 per annum.

DERBYSHIRE ROYAL INFIRMARY.—House-Physician and Casualty Officer (ineligible for military service). Salary, £200 per annum.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.—Two House-Surgeons. Salary at the rate of £60 per annum, with £5 washing allowance.

LEEDS PUBLIC DISPENSARY.—Lady Resident Medical Officer. Salary, £120 per annum.

NEWCASTLE-UPON-TYNE: ROYAL VICTORIA INFIRMARY.—Assistant House Officer (male ineligible for military service, or female). Salary, £100 per annum, and lodging allowance of 30s. per week until indoor accommodation is provided.

NORTH STAFFORDSHIRE INFIRMARY, Hartshill, Stoke-on-Trent.—House Physician. Salary, £200 per annum.

NORWICH POOR LAW INFIRMARY.—Lady Resident Medical Officer. Salary, 5 guineas weekly.

OLDHAM HOSPITAL.—Resident Assistant Medical Officer. Salary, £300 per annum.

PUTNEY HOSPITAL, S.W.—Resident Medical Officer. Salary, £150 per annum.

ROYAL EYE HOSPITAL, Southwark, S.E.—House-Surgeon (ineligible for military service). Salary at the rate of £150 per annum.

ST. BANCRA'S DISPENSARY, Oakley Square, N.W.—Honorary Physicians.

SHEFFIELD: ROYAL INFIRMARY.—House-Surgeon (male ineligible for military service, or female). Salary, £100 per annum.

SHREWSBURY DISPENSARY.—Medical Practitioner.

SHREWSBURY: SALOP COUNTY ASYLUM.—Assistant Medical Officer. Salary, 7 guineas per week or £350 per annum.

TUNBRIDGE WELLS GENERAL HOSPITAL.—House-Surgeon (ineligible for military service). Salary, £250 per annum.

WEST HAM AND EASTERN GENERAL HOSPITAL, Stratford, E.—Casualty Officer (ineligible for military service). Salary at the rate of £150 per annum.

WIGAN: ROYAL ALBERT EDWARD INFIRMARY AND DISPENSARY.—Lady House-Surgeon. Salary, £150 per annum.

CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announced the following vacant appointments: Edinburgh (North), Edinburgh (South); Lytham (Lancashire).

To ensure notice in this column—which is compiled from our advertisement columns, where full particulars will be found—it is necessary that advertisements should be received not later than the first post on Wednesday morning. Persons interested should refer also to the Index to Advertisements which follows the Table of Contents in the JOURNAL.

APPOINTMENTS.

ANDERSON R. M.D., B.S.Durh., District Medical Officer of the Working Union.

BUSTED, J. H., L.R.C.P. and F.R. Edin., L.F.P.S. Glasg., Certifying Factory Surgeon, Hungay District, co. Norfolk and Suffolk.

CONNOR, C. J., M.B., C.M. Aberd., District Medical Officer of the 16th Division.

FULTON, Miss J. M., M.B., Ch.B., R.U.I., Assistant Medical Officer, Barking Heath Lunatic Asylum, Maldstone.

GRAVES, A. J., M.E.C.S., L.R.C.P. Lond., Certifying Factory Surgeon, Cleator District, co. Cumberland.

GREVESE, F. Ailcock, M.B., B.S. Lond., F.R.C.S. Eng., Assistant Surgeon to the Royal London Ophthalmic Hospital, Moorfields.

KERR, James Rutherford, Ch.M. Glasg., Head Surgeon to the Allies Hospital, Yvetot, France.

WALSH, M. J., M.B., B.Ch., N.U.I., Assistant Medical Officer of the Stebbing Hill Hospital of the Stockport Union.

WILKES, Miss L. S., L.R.C.P., L.R.C.S. Edin., L.F.P.P.S. Glasg., District Medical Officer of the Newcastle-upon-Tyne Union Infirmary.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s., which sum should be forwarded in Post Office Order or Stamp with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

MARRIAGE.

KILNER-BROWN.—On December 14th, at the Whalley Range Presbyterian Church, by the Rev. J. T. Middlemiss, Thomas Fourtree, Captain R.A.M.C. (T.F.), East Lancashire Casualty Clearing Station, eldest son of Thomas Kilner, Blackburn, to Olive Mary, eldest daughter of Mrs. Brown, 219, Chester Road, Manchester, and of the late Frederick Brown, Largo, Ayrshire.

DEATHS.

CHILD.—On the 14th December, at his brother's residence, Cranleigh, Kent-road, Southsea, Lieutenant-Colonel Lectorchild Frederick Childie, I.M.S., M.B. Lond., M.I.C.S., of Roundhay, Banbury Road, Leeds, in the 56th year of his age.

FRASER.—On the 14th December, at the Victoria Hospital, Professor of Medicine, Grant Medical College, Bombay. Funeral St. Jude's, Southsea, 24.5 to-morrow (Saturday). Indian and South African papers, please copy.

TRAVERS-SMITH.—On the 16th inst., at Tramore, Hartfield Road, Tramore, Victoria Edward Travers-Smith, M.D., Trinity College, Dublin, aged 55.

THE
British Medical Journal.

THE JOURNAL OF THE BRITISH MEDICAL ASSOCIATION.

EPITOME

OF

Current Medical Literature.

JULY TO DECEMBER, 1915.

London :

PRINTED AND PUBLISHED AT THE OFFICE OF THE BRITISH MEDICAL ASSOCIATION,
429, STRAND, W.C.

INDEX TO THE EPITOME FOR VOLUME II, 1915.

READERS in search of a particular subject will find it useful to bear in mind that the references are in several cases distributed under two or more separate but nearly synonymous headings—such, for instance, as Brain and Cerebral; Heart and Cardiac; Liver and Hepatic; Renal and Kidney; Cancer and Epithelioma, Malignant Disease, New Growth, Sarcoma, etc.; Child and Infant; Bronchocele, Goitre, and Thyroid; Diabetes, Glycosuria and Sugar; Eye, Ophthalmia, and Vision, etc.

The Figures in this Index refer to the Number of the Paragraph, NOT the Page.

A

- Abderhalden reaction in cancer (Isaac Leven and D. D. Van Slyke), 125
 Abdomen, perforating gunshot wounds of (Giberry), 129
 Abscess of spleen, pneumococcal (N. Pans), 139
 Abscesses drained with steel springs (Max Tieghe), 46
 ACOSTA-SIEN: The female pelvis in the Philippines, 75
 Adipose tissue, deformity reduced by graft of (H. Moresini), 158
 Adrenal, action of arsenicals on (Wade H. Brown and Louise Pearce), 185
 Air, compressed, causing rupture of intestine (Stauff), 52
 Alcohol injections in trigeminal neuralgia, 39
 Alcoholism, chronic, cerebral oedema in (Seeletz and Beifeld), 99
 ALLEN: Prolonged fasting in diabetes, 148
 Aluminium plates to make good cranial defects (Pierre Duval), 102
 Amaraotic family idiocy (Isador H. Coriat), 170
 Amputation by the flap method (Savariand), 171
 Anaemia, pernicious, x rays and (Ch. Anberlin), 3
 Anaesthesia of the internal pudic nerve during labour (K. Hollas), 20
 Anaesthesia, intratracheal (C. H. Watt), 136
 Anæsthetic, traumatic (Anvray), 48
 Antrix pectoris and Reynaud's disease (Schott), 128
 Antrum, maxillary, radiography of (N. S. Finzi and Seconbine Hett), 75
 Anus, congenital defects of (Brenner), 33
 Appendicitis, pathological changes in (Stanton), 13
 Appendicitis in typhoid fever (Gage), 144
 Arachnoid, calcareous and osseous deposits in the (Harvey Cushing and Lewis H. Weed), 186
 ARUCK: The forceps in the nineteenth century, 120
 Arsenicals, action of on the adrenals (Wade H. Brown and Louise Pearce), 185
 Arterial murmurs and peripheral resistance (L. Bard), 16
 Arterio-sclerosis of intestine, fatal (J. A. Hedlund), 62
 Arterial rheumatism. See Rheumatism
 ASCH: Novocain in epididymitis, 82
 Atopian rash (Kissmeyer), 141
 Atropine and permanent bradycardia (E. Cohn), 96
 ALBERTIN, Ch.: X rays and pernicious anaemia, 3—Haematology of mumps, 42
 Autoinfection in obstetrics (Zansemeler and Kirscht), 77
 AVYAT: Traumatic aneurysms, 48
 AXENFELD: Ethylhydrocuprein (optochin) in pneumococcal infections, 108
 BABBETT: Mortality of the newborn, 50
 BACIGALCOP, J.: Intracardial injections of tuberculin in tuberculous meningitis, 40
 Bacillus, Bulgarian, in the treatment of cystitis (Hagner), 97
 BAER, J. L.: Scopalamine-morphine in labour, 8
 BALFOUR: Toxicology, 19
 BARD: Identification of the typhoid bacillus in stools, 167
 BARD, L.: Arterial murmurs and peripheral resistance, 16
 BAUDOUIN: The magnetic compass in first aid, 47
 BEERMAN: Precocious maturity in girls, 87
 BEER: High-frequency current for bladder papillomata, 118
 BEIFELD: Cerebral oedema in chronic alcoholism, 99
 BERGONE: Combined x-ray and radium treatments of inoperable uterine cancer, 121—Electro-magnet as an aid in localization of foreign bodies, 173
 BENICULLA: Noviform in the ambulant treatment of eye diseases, 25
 BERTIN-SANS: Rapid x-ray localization of foreign bodies, 17
 BISHOP: Chenopodium in ucinariasis, 183
 BLAGRENET, R. A.: Operations for prolapsus of uterus, 177
 Bladder papillomata, high-frequency current for (Beer), 118
 Bladder symptoms in gynaecology, neglect of (C. E. Josephson), 80
 Blood in pregnancy (J. B. Miller, N. M. Keith, and L. G. Rowntree), 134
 Blood transfusion, a clinical study of (Solomon Strouse, Irving F. Stein, and Alan Wiseloy), 44
 Blood transfusion by citrate method (Levisohn), 83
 BOLLAG, K.: Anaesthesia of the internal pudic nerve during labour, 20
 Bone fractures, end-results of (W. L. Estes), 112
 BONNEFOY: Iodine vapour in ophthalmic therapeutics, 41
 BONNET, Edmond: Quinine after operation, 88
 BORCHERSKYNE: Nephritis stimulating renal calculus, 5
 BORDEN: Comparison of Wassermann and iuslin tests, 122
 Bradycardia, permanent, and atropine (E. Cotton), 96
 BRAMWELL, BYRON: Pancreatic infantilism, 57
 BRENZER: Hydro-nephrosis of a pelvic kidney, 159
 BRENNER: Congenital defects of the anus and rectum, 33
 Bronchitis without dyspnoea, fibrinous (Israel-Rosenthal), 112
 BROUSI: Chenopodium in ucinariasis, 183
 BROWN, Wade H.: Action of arsenicals on the adrenals, 185
 Bulgarian bacillus in the treatment of cystitis (Hagner), 97
 BUNSON (M. S. Henderson), 157
 BURNHAM: Glucose solutions as prophylactic against shock, 123
 C.
 Caesarian section after ventrifixation of the uterus (G. Nyström), 64
 Calcareous and osseous deposits in the arachnoid (Harvey Cushing and Lewis H. Weed), 186
 Calcium salt in treatment of hay fever (R. Emmerich and O. Loew), 11
 Calculus, renal, simulated by nephritis (Borcherskyne), 5
 CALDWELL: Treatment of placenta previa caesarian, 174
 Cancer, Abderhalden reaction in (Isaac Levin and D. D. Van Slyke), 125
 Cancer of breast under 20 (R. H. Fowler), 18
 Cancer of cervix (S. M. D. Clark), 162
 Cancer, extension of from breast to ovary (V. Franque), 155
 Cancer of cervix, hysterectomy for (Maurer), 9
 Cancer, inoculated, parabiosis and (M. B. Morpurgo), 56
 Cancer, intravenous injections of colloidal copper and ca-sein in (M. Clurg, Sweek, Lyon, Fleisher, and Loeb), 53
 Cancer, partial resection of the lower jaw for (Focke), 59
 Cancer of uterus, inoperable, combined x-ray and radium treatment of (Bergonié and Spéler), 121
 Carcinoma. See Cancer
 Cardiac compensation, broken, strychnine in (Newburgh), 10
 Caruncle of the female urethra (Young), 22
 Casein and colloidal copper in cancer, intravenous injections of (M. Clurg, Sweek, Lyon, Fleisher, and Loeb), 53
 Cerebral oedema in chronic alcoholism (Seeletz and Beifeld), 99
 Cerebro-spinal fever, recurrent (Ponticacci), 150
 Cervix, incision of rigid (Enriquez), 51
 CHARANIEV, H.: Haematology of mumps, 42
 CHENEY: Gastric headaches, 2
 Chenopodium in ucinariasis (Bishop and Bronsht), 183
 CHERRILL: Post-partum retrodisplacement of the uterus, conservative treatment, 36
 Chorion-epithelioma perforating uterus. See Uterus
 Chorion-epithelioma of testicle (Cooke), 26
 Cithric method in blood transfusion (Levisohn), 83
 CLARK, S. M. D.: Cancer of cervix, 162
 CLEVELAND, A. H.: Quinine siter operation, 88
 Colloidal copper and casein in cancer, intravenous injections of (M. Clurg, Sweek, Lyon, Fleisher, and Loeb), 53
 Colloidal gold and infected wounds (B. Cunéo and P. Rolland), 4
 Colloidal sulphur in acute articular rheumatism, intravenous injections of (Loeper and Vahram), 124
 Colon exclusion (Small), 116
 Concnchivilla, gonococcal, lead normal salt solution in (Edward P. Hecker), 184
 COOKE: Chorion-epithelioma of testicle, 26
 COLEDER, V.: Spontaneous meningeal haemorrhage in young subjects, 1
 COMAR, Isador H.: Anaraotic family idiocy, 170
 COTTIN, Mdlle. E.: The sitting position in pneumonia, 38
 COTTIN, E.: Permanent bradycardia and atropine, 96
 COUETAUD: Projectiles within the knee-joint, 39
 Cranial decompression (A. Sharpe), 115
 Cranial defects, aluminium plates to make good (Pierre Duval), 102
 CREUZ, C. G.: Indiscret paracentesis abdominis, 7
 CUNEO, B.: Colloidal gold and infected wounds, 4
 CUSHING, Harvey: Calcareous and osseous deposits in the arachnoid, 186
 Cystitis, Bulgarian bacillus in the treatment of (Hagner), 97
 D.
 Dablia, use of in infections (Ruhrlüh), 12
 DASSERT: Treatment of neuritis in the wounded, 81
 Deafness (war) from lesions of internal ear (A. Gode), 92
 Decompression, cranial (Sharpe), 115
 Deformity reduced by graft of adipose tissue (H. Moresini), 158
 DELBERG: Treatment of neuritis in the wounded, 81
 DE MONTET: Tumour of the bulbar olive, 115
 Diabetes, prolonged fasting in (Allen), 148
 Diabetes mellitus, the duodenum in (N. Mutch), 111

Diarrhoea, trench (Remlinger and Duinas), 14
 Digital tendon, subcutaneous rupture of (A. Trolé), 104
 Disinfection of surgeon's hands (Elicke McDonald), 35
 Drainage of abscesses with steel springs (Max Tiesel), 46
 Drainage tubing, oil impregnation of (McArthur), 6
 DRESSER, W. E.: Treatment of wounds, 60
 Drug habits in sucklings (Lichtenstein), 164
 DUCOSTE, Maurice: Peripheral nerve lesions and muscular contractures, 140
 DUMAS: Trench diarrhoea, 14
 Duodenum in diabetes mellitus (N. Mutch), 111
 DUYAL, Pierre: Aluminium plates to make good cranial defects, 102
 Dysenteric polyneuritis (A. V. Mueller-Dehann), 28

E.

Ear, internal, wax deafness from lesions of (A. Gob), 142
 EASTMAN: Tuberculosis of trachea, 19
 EMBURY: Salvarsan poisoning, 163
 Ectoparasita, detachment of placenta in (Zarare), 34
 EDELL, L.: Family periodic paralysis, 87
 Electrical examination of sectioned and compressed nerves (Hendelsohn), 70
 Electrical treatment of nerve injuries (Larat and Lehmann), 122
 Electro-diagnosis of traumatized nerves (Leri), 58
 Electro-diastem as an aid in localization of foreign bodies (Berzonik), 175
 EMMERICH, R.: Treatment of hay fever with calcium salts, 11
 ENTERTON: Infection of rigid cervix, 51
 Enteric fever, See Fever
 Enteritis diagnosed by x rays (Fahler and Steindl), 51
 Erysipelas, management of (Newlin), 182
 Epididymitis, novocain in (Aschi), 162
 Epitaphs, incarceration of (C. Peschardt), 90
 Erythema induratum, severe tuberculous reaction in a case of (K. Frenzier), 181
 ESTES, W. L.: End results of bone fractures, 172
 Ethylhydrocuprein (optochin) in pneumococcal infections (Axenfeld and R. Plocher), 108—In scarlatina and measles (Hirschfelder and Schütz), 165—Bacterial action of on pneumococci (Henry F. Moore), 181
 Eye diseases, noviform in the ambulant treatment of (Bernoulli), 25

F.

FARGES, Fernand: Lactose in glycosuria, 24
 Fever, enteric, appendicitis in (Gage), 144
 Fever, enteric, effects of on the soldier's heart (Rehmer), 109
 Fever, typhus, recurrent (A. F. Piquet), 72
 Fibrous bronchitis, See Bronchitis
 Filoid polyposis in virgin, delivered by forceps (Wagner), 180
 Fibromyoma of uterus weighing 92 lb. (Fetty and Pittfield), 73
 FISHBURN: Emotional shock following shell explosion, 27
 FINZL, N. S.: Radiography of the maxillary antrum, 74
 FIRE, aid, the magnetic compass in (Baudouin), 47
 Fistula, ureteral, dilatation in (Townsend), 78
 FITZGERIBB: Tuberculous salpingitis depicted through toxic iridocyclitis, 52
 FLEISHER: Intravenous injections of colloidal copper and casein in cancer, 53
 FOOT: Partial resection of the lower jaw for cancer, 89
 Forces in the nineteenth century (Arluck and Girdbank), 142
 Foreign bodies, rapid x-ray localization of (Bert-Sens and Leenhart), 17—Electromagnet as an aid to localization of (Berzonik), 175
 Fournel (H. Morestin), 68
 FORTNER, R.: Symptoms following accidental vaccination of an infant, 127
 FORTWELL: Rupture of uterus, prompt hysterectomy, 66
 FOWLER, R. H.: Cancer of the breast under 20, 18
 Fractures, end results of bone (W. L. Estes), 172
 FRANCOE, V.: Haematometra and haematocolpos simulating gonorrhoea of the uterine appendages, 107—Extension of cancer from breast to ovary, 155
 Frontal sinus, tuberculous (J. B. Thomas), 59
 FRUTKIN, J.: Severe tuberculous reaction in a case of erythema induratum, 58

G.

GAGE: Appendicitis in typhoid fever, 144
 Gangrene, infective, treatment of (L. Ombredane), 29
 Gastric headaches (Cheney), 2
 Gastro-jejunostomy, the stomach after (Webb and Kingsbury), 49
 GAYLORD, P.: Identification of the typhoid bacillus in the stool, 167
 Gestation in women, normal period of (Robertson), 29
 GIBBS, J.: Gonorrhoeal maturity in (Beekman), 67
 GIBSDANBY: The torques in the nineteenth century, 120
 GIBLAND: Obscure gangrene of a testicle, 107
 GILLESPIE: Glycosuria in chronic intestinal stasis (Alfred C. Jordan), 43
 Glycosuria, lactose in (Fernand Farges), 24
 Goitre treated by interstitial disinfection (Fr. Messeri), 110
 Goitre in pregnancy (Thaler), 176
 Gold, colloidal, and infected wounds (B. Cuneo and P. Rolland), 4
 Gonococcal conjunctivitis, iced normal salt solution in (Edward B. Hecke), 184
 Gonorrhoea of the uterine appendages simulated by haematometra and haematocolpos (v. Franque), 107
 GOTZ, A.: War deafness from lesions of internal ear, 142
 GOUDRY, Gabriel: Some curious complications of mumps, 101
 GREY: Perforating gunshot wounds of abdomen, 123
 GYNAECOELOGY, neglect of bladder symptoms in (C. E. Josephson), 80

H.

Haematuria of mumps (Ch. Aubertin and H. Chabautier), 42
 Haematometra and haematocolpos simulating gonorrhoea of the uterine appendages (v. Franque), 107
 Haemolysis in obstetric cases (Rudolph Holms), 146
 Haemorrhage, spontaneous meningeal, in young subjects (V. Cordier, L. Levy, and L. Nové-Josseraud), 1
 Haemorrhagic nephritis due to novocain, 108
 Hand infections and tonsillitis (Mock), 168
 HAGNER: Bulgarian bacillus in the treatment of cystitis, 97
 Hand disinfection of the surgeon's (Elicke McDonald), 31
 HARPE, DE LA: Tumour of the bulbar olive, 13
 HARRIGAN: Nephrectomy during pregnancy, 119
 HART, C.: Idiopathic necrotic tracheo-bronchitis, 86
 Hay fever treated with calcium salts (R. Emmerich and O. Luew), 11
 Headache, gastric (Cheney), 2
 HEANEY: Nitrous oxide and oxygen in labour, 133
 Heart muscle in pneumonia (L. H. Newburgh and W. T. Porter), 71
 Heart, soldier's, effect of enteric fever on (Rehmer), 109
 HECKEL, Edward B.: Iced normal salt solution in gonococcal conjunctivitis, 184
 HECKEL, V.: Chronic inversion of the uterus, abdominal operation, 35
 HEDECK, J. A.: Fatal arterio-sclerosis of the intestine, 62
 HENDERSON, M. S.: Bunions, 157
 HETT, Seccombe: Radiography of the maxillary antrum, 74
 HEYMAN, J.: Extracranial complicating intracranial pregnancy, 76
 High frequency current for bladder papilloma (Beer), 116
 HILFELDORF: Ethylhydrocuprein in scarlatina and measles, 165
 HOLMS, Rudolph: Haemolysis in obstetric cases, 146
 HOLT: Mortality of the newborn, 50
 HUNT: Paralytic and persistent sequelae of migraine, 15
 HUNTER: Distortion of uterus by chorion-epithelioma simulating ruptured ectopic sac, 94
 Hydrophrenon, experimental (Keith and Smith), 159
 Hydronephrosis of a pelvic kidney (Brenizer), 159
 Hysterectomy for cancer of cervix (Maurer), 9

I.

Idiocy, amaurotic family (Isador H. Coriati), 170
 Indirect paracutis abdominalis (C. G. Creutz),

Inflammation, pancreatic (Byron Bramwell), 57
 Infant's stools, examination of (McClanahan and Moore), 15
 Infection, the use of dahlia in (Ruhrah), 12
 Infantile typhoid fever (Thaler and Zuckermann), 175
 Intestinal disinfection in treatment of goitre (Fr. Messeri), 110
 Intestinal obstruction (A. McGlannan), 131
 Intestinal stasis, chronic, glycosuria in (Alfred C. Jordan), 43
 Intestinal, fatal arterio-sclerosis of (J. A. Hedlund), 62
 Intestine, rupture of by compressed air (Stauff), 35
 Intracranial medication with mercuric chloride for general paralysis (Ireland and Stuart Wilson), 138
 Intracranial anaesthesia (C. H. Wate), 136
 Intravenous injections of colloidal sulphur in acute articular rheumatism (Loeper and Vabram), 124
 Intravaginal medication complicating the puerperium (G. Nyström), 145
 Iodine vapour in ophthalmic therapeutics (Bonney), 41
 Iodic potassium in treatment of onychia (Vos Hugo), 55
 IRELAND: Intracranial medication with mercuric chloride for general paralysis, 138
 IRACE: Essential: Fibrous bronchitis without dyspnoea, 112

J.

JORDAN, Alfred C.: Glycosuria in chronic interstitial stasis, 43
 JOSEPHSON, C. E.: Neglect of bladder symptoms in gynaecology, 80

K.

KAARBERG, I.: Leucoplakia of the cervix, 179
 KAHLMEYER, G.: Tumour of the pituitary body stimulating labes or general paralysis, 152
 KEITH, N. M.: Experimental hydronephrosis, 139
 KEITH, N. M.: The blood in pregnancy, 154
 KEISER: Inhibitive effect of x rays upon malignant cells, 165
 Kidney, hydronephrosis of a pelvic (Brenizer), 159
 KREBSER: The stomach after gastro-jejunostomy, 49
 KIRK, E. G.: Nerve repair, 103
 KIRSTEN: Antiseptic infection in obstetrics, 77
 KREBSER: Atrophied sac, 141
 Knee-joint, projectiles within (Outeaend), 30
 KOLMER: Serum studies in pregnancy, 63
 KREFTING, R.: Recurrent syphilitic infection, 151

L.

Labour, anaesthesia of the internal pudic nerve during it, Bollé, 70
 Labour, nitrous oxide and oxygen in (Heaney), 133
 Labour, scopalamine-morphine in (J. L. Beer), 8
 Lactose in glycosuria (Fernand Farges), 24
 LAMBERT: Treatment of narcotic addiction, 54
 LARAT: Electrical treatment of nerve injuries, 122
 Leather-bottle stomach (Porter), 156
 LE BOUTILLIER: Hypertrophy of thymus, thymus death, 45
 LEENHART: Rapid x-ray localization of foreign bodies, 17
 LEHMANN: Electrical treatment of nerve injuries, 122
 LENACHOW: Haemorrhagic nephritis due to novocain-adrenalin, 29
 LERI: Electro-diagnosis of traumatized nerves, 58
 Leucoplakia of the cervix (I. Kaarberg), 179
 LEVIN: Alderhalden reaction in cancer, 125
 LEVISON: Injections of alcohol in trisetal neuritis, 39
 LEVY, L.: Spontaneous meningeal haemorrhage in young subjects, 1
 LEWIS, D.: Nerve repair, 103
 LEWISON: Blood transfusion by citrate method, 83
 LILAN, Camille: Therapeutic use of the oculo-corneal reflex, 117
 LICHTENSTEIN: Drug habit in sucklings, 164
 LOEB: Intravenous injections of colloidal copper and casein in cancer, 53
 LOEPER: Intravenous injections of colloidal sulphur in acute articular rheumatism, 124

LOEW, O.: Hay fever treated with calcium salts, 11
 LUNN: Falx unilateralis in utero dyelpho, 92. See also *uterus didelphys* in *JOURNAL*, *Index*
 Luetin and Wassermann tests, comparison of (Vedler and Borden), 132
 LYON: Intravenous injections of colloidal copper and casein in cancer, 53

M.

McARTHUR: Oil impregnation of drainage tubing, 6
 McCLANAHAN: Examination of infants' stools, 15
 McLEOD: Intravenous injections of colloidal copper and casein in cancer, 53
 McDONALD, Ellice: Disinfection of surgeon's hands, 31
 McGLANAN, A.: Intestinal obstruction, 131
 Magnetic compass in first aid (Baudouin), 47
 Malignant cells, inhibitive effect of x rays on (Kempster), 166
 MALONE, R. H.: Diagnosis of pregnancy, 105
 Maturity, precocious in girls (Beekman), 67
 MATHER: Hysterectomy for cancer of cervix, 9
 Maxillary antrum. See *Antrum*
 MEANS: Family periodic paralysis, 87
 Measles, ethylhydrocuprein in (Hirschfelder and Schlutz), 165
 MENDELSCHEW: Electrical examination of sectioned and compressed nerves, 70
 Meningeal haemorrhage. See *Haemorrhage*
 Meningitis, tuberculous, intradural injections of tuberculin in (F. Baciagano), 40
 Mercuric chloride in general paralysis (Ireland and Stuart Wilson), 138
 MESSERLI, Fr.: Treatment of goitre by internal disinfection, 180
 Migraine, paralytic and persistent, sequelae of (Humb), 154
 MILLER, J. B.: The blood in pregnancy, 134
 Mink. F.: Pilonitis and hand infections, 168
 MOORE: Examination of infants' stools, 15
 MOORE, Henry F.: Bactericidal action of ethylhydrocuprein on pneumococci, 181
 MOURNIN, H.: Femoral, 68—Deformity reduced by graft of adipose tissue, 158
 Morphine habit. See *Narcotic addiction*
 MORTON, M. B.: Parabiosis and inoculated cancer, 56
 Mortality of the newborn (Holt and Babbitt), 50
 MURKOWITZ, L.: Sympathetic parotitis, 73
 MUELLER-DEHAM, A. v.: Dysenteric polyneuritis, 28
 Mumps, haematology of (Ch. Aubertin and H. Chabrier), 42
 Mumps, some ocular complications of (Felix Ramond and Gabriel Goubert), 101
 MURCH, N.: The duodenum in diabetes mellitus, 111

N.

Narcotic addiction, treatment of (Lambert), 54
 NATHAN: Autoplastic transplantation of human ovary, 37

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

1. Spontaneous Meningeal Haemorrhage in Young Subjects.

V. CORBIER, L. LEVY, and L. NOVÉ-JOSSERAND (*Ann. de méd.*, Tome II, No. 2, 1914, discuss that form of meningeal haemorrhage which occurs in young people who are apparently in perfectly good health, for which there is no known cause, and which ends as a rule in complete recovery or in apparently complete recovery, so that the patient leaves the hospital and is lost sight of. The number of cases on record is not very large, but typical cases of this kind have been reported and discussed by a number of different writers. The authors report a case in a man 22 years of age, whom they had under observation in two attacks of meningeal haemorrhage, the second following the first at an interval of ten months. The first attack was exactly of the type described above, the second appeared to be of the same nature, but it was followed very quickly by a haemorrhagic encephalitis, which proved to be fatal. An autopsy was made and the case was thus more completely investigated than was possible in the cases previously reported. At the autopsy signs of the two subarachnoid haemorrhages could be seen, the second haemorrhage having ended in a ventricular inundation. In addition to the haemorrhages there was a recent haemorrhagic encephalitis. The encephalitis was suspected of being toxic-infectious, but the most careful search failed to show the presence of any microbe. With regard to the relation existing between the haemorrhagic encephalitis and the two haemorrhages which preceded it, the authors conclude (1) that the so-called spontaneous meningeal haemorrhage of young people should be considered at least in certain cases as the expression of a subarachnoid localization of a toxic-infection or of an unknown latent intoxication; (2) the localization is, as a rule, almost exclusively meningeal at the outset—at all events, if, as is probable, the cortex is also involved, it is to so small an extent as to pass unperceived clinically. The special susceptibility of the meninges in young people perhaps explains the predominance of the subarachnoid lesions. (3) At some moment the toxic-infection which has become latent, once more becomes active, passes beyond the meninges and attacks the nervous parenchyma; acute encephalitis, with its grave or fatal prognosis, then results. (4) The distinction between the meningeal haemorrhage and the haemorrhagic encephalitis is only a difference of anatomical localization. (5) The prognosis of the spontaneous meningeal haemorrhage of young people should be revised. While the prognosis remains good for the immediate attack it should be reserved with regard to the future.

2. Gastric Headaches.

CHENEY (*Amcr. Journ. of Med. Sciences*, May, 1915) calls attention to a certain class of headaches due to disturbance of the stomach, of not infrequent occurrence, presenting typical characteristics, and in which it is possible to prove the existence of stomach disorder to the exclusion of other disease, the headaches being cured by therapy directed against the underlying gastric disturbance. Such headaches are usually periodic, and commence suddenly as a hemicrania of a boring character after a period of good health. Of varying severity they may be so severe as to incapacitate for all work, but more usually they are not so violent as to prevent the patient following his usual occupation. Sometimes nausea and vomiting accompany the pain, but often there is no symptom pointing to the digestive organs. In all cases, whether indigestion is complained of or not, a test meal and gastric analysis should be carried out. The most frequent trouble is one of motility, the significant feature being delay of food in the stomach through weakness of its muscular wall. Other cases may show a hyperchlorhydria, the pain following food which is too acid or spicy, while others may be due to a low grade chronic gastritis with abundant mucus. Although gastric analysis renders the cause of the headaches reasonably certain, all other possible causes must be eliminated before this can be accepted as a basis for treatment. Notes are given of three cases typical of the different kinds of gastric disorder which may cause chronic headaches, and the frequent coincidence of constipation with the headaches and gastric findings is noted,

the question arising whether intestinal stasis is not the primary trouble, the headaches being autotoxic, and the stomach condition reflex. Against this is the fact that laxatives do not remove the symptoms in the cases under consideration, the essential feature in the treatment being the adoption of a proper dietary suitable for the gastric condition discovered. It is frequently found that such dietary, and other measures to overcome gastric atony and faulty secretion, are sufficient to regulate the bowels without recourse to laxatives.

3. X Rays and Pernicious Anaemia.

CH. AUBERTIN (*Maladies du coeur, des vaisseaux, et du sang*, September, 1914) discusses a case of pernicious anaemia in a radiologist. He has previously shown that in radiologists the white corpuscles are often modified and show leucopenia, hypopolynucleosis, and eosinophilia. The history of the present case, as far as this was available, was supplied by Gavazzini and Minelli of Bergamo, colleagues of the patient, Dr. Tiraboschi, aged 49 years, who had been for fourteen years radiologist at the Maggiore Hospital, Bergamo. Tiraboschi was specially occupied with osseous radiography, and always used a hard tube with very penetrating rays. During the first years of his work he took no special protective measures; he then suffered from a radio-dermatitis of the left hand and left part of the face, but this never went beyond the stage of slight pigmentation. For several years afterwards he was in perfect health, except that he complained of a slight diminution in acuity of vision, which he considered to be due to x rays. The symptoms of anaemia became noticeable three years before his death, and the disease ran a fairly typical course, but the patient continued at work up to the day before his death, and no examination of the blood was made. At the autopsy the spleen was found to be greatly reduced in size and to measure only 5 centimetres (1.9 in.) in length, 4 centimetres (1.5 in.) in width, and 2 centimetres ($\frac{3}{8}$ in.) in thickness. On cutting it was hard and the pulp was diminished. The bone marrow of the ribs was red and scanty. The testes were atrophied. The bone marrow showed the following abnormalities: Few normoblasts; absence of megaloblasts; red corpuscles diminished in number and much deformed, with a few megalocytes; polynuclears diminished in number; lymphocytes increased; few myelocytes and eosinophiles. Sections of the spleen were sent for examination to Aubertin, who found that the Malpighian corpuscles were for the most part greatly atrophied, the arteries were thickened as a result of periarteritis and endarteritis, and in some cases were obliterated; the Malpighian corpuscles were made up of lymphocytes, which were normal but rarefied, and by a few very voluminous mononuclear cells; the pulp was extraordinarily loaded with iron cells. Gavazzini, Minelli, and Daina, who, with Minelli, conducted the autopsy, look upon the medullary aplasia as the characteristic feature of the anaemia and have no doubt that the cause was the harmful action of x rays. Aubertin points out that the medullary aplasia is not very characteristic in type and bears only a very distant resemblance to that found in animals after strong doses of x rays. Nevertheless, the condition of the spleen, taken in conjunction with the fact that blood changes are known to occur in radiologists, inclines him to agree with their view. In no other case of pernicious anaemia examined by him has the atrophy of the spleen been so extreme nor the amount of iron pigment so abundant, and in a number of peculiarities the condition of the spleen recalls that seen in animals which have been irradiated for a long time and have not immediately succumbed. The case calls attention to the necessity for radiologists to take greater precautions against penetrating rays until the question of the possibility of an x-ray pernicious anaemia has been finally settled.

SURGERY.

4. Colloidal Gold and Infected Wounds.

B. CUNEO and P. ROLLAND (*Bull. et mémoires de la Soc. de Chir. de Paris*, No. 13, 1915) have made use of colloidal gold in the treatment of 300 cases of infected wounds

during the present war. The gold may be employed either by intravenous or intramuscular injection, or by subcutaneous injections into the peripheral zone of the infected region. The dose for intravenous injection is from 2 to 6 c.cm., for intramuscular injection 50 c.cm., and the injection can in either case be repeated on each of several successive days. The intravenous method gives the quickest result, and is indicated for strong patients with resistant cases, and it produces a reaction so violent as in some cases to cause a tendency to cardiac collapse; and though in the dose suggested above it is free from any danger, and the heart condition is easily overcome by means of the usual remedies, yet for weakly and depressed patients the intramuscular injection which acts more slowly but causes no general reaction is to be preferred. In making subcutaneous injections at the periphery of the infected zone injury to the vessels is to be carefully avoided, lest the violent reaction of the intravenous method should result. The authors have tried the effect of colloidal gold in a large variety of cases. The most valuable results were seen in the treatment of extensive injuries infected with anaerobic organisms. In such cases severe toxic symptoms persist even after surgical treatment and the most energetic use of antiseptics. If, however, colloidal gold was then injected, there followed, after the reaction already described, a fall of temperature, a slowing of the rate of the pulse, and an improvement in its quality, together with a return of the arterial pressure almost to normal, a point which merits considerable attention. In addition to the general improvement, local improvement was noticeable, there being a diminution of fetid odour or discharge, lessening of the oedema, and more rapid elimination of parts already mortified. In a number of cases in which subcutaneous injections were made, the appearance of the wound seemed to improve and the extension of the infection to be arrested. In pyogenic infections the benefit from the use of colloidal gold seemed less clear, perhaps because the cases in which it was tried were specially cases of infections of serous membranes, where the production of a sufficiently strong local reaction could not be depended on. Even in such cases, however, marked temporary improvement sometimes occurred. In cases of penetrating wounds of the abdomen treated on conservative lines, injections of colloidal gold were given as a preventive treatment against infection, but it was not possible to pronounce definitely as to their effect. The authors have used other colloidal metals (silver, palladium, rhodium) in the treatment of surgical infections, but colloidal gold has seemed to them to give results definitely superior to those given by the other metals. Notes of four typical cases are given in the article.

5. Nephritis Simulating Renal Calculus.

The difficulties encountered in the differential diagnosis of painful chronic nephritis and renal calculus are discussed by BORCHGREVINK (*Norsk Maagazin for Laegevidenskaben*, January, 1915), who records the following case: A nurse, aged 26, felt weakness and pain in the lumbar region. Micturition was painful and frequent, and whenever her feet got cold she had to pass water every half-hour. She had to give up active work, and she awoke one night with violent pain in the lumbar region and the lower abdomen. An hour later the pain was confined to the left costal arch, whence it radiated to the bladder. Next day the urine was bloody. The pain continued, and was accompanied by vomiting and marked tenderness in the left hypochondrium and lumbar region and a slight tenderness in the left iliac fossa. The urine contained pus, albumin, and blood, and the temperature was normal. For about four years the patient was partially invalided by attacks of pain in the left inguinal and epigastric regions, vomiting, haematuria, and dysuria. A catheter specimen of urine was sterile, and cystoscopy showed nothing amiss. Catheterization of the right ureter showed active secretion of urine, which contained no sediment nor microbes and only a trace of albumin. The excretion from the left kidney was sluggish and the urine contained a considerable amount of albumin and a scanty sediment consisting of epithelial cells, leucocytes, a few red cells, and one hyaline cast. The Roentgen rays showed no calculi nor other abnormality. Nephrotomy showed the capsule of the kidney to be firmly adherent to the surrounding fatty tissue by fibrous bands. The surface of the kidney was smooth, and on section it showed little amiss apart from a pale, fibrous patch in the deeper part of the cortex. There was a double ureter, one limb of which was kinked close to the kidney. The left kidney was removed, for, though there seemed little amiss with its structure at the operation, it was obvious that the alarming and exhausting

symptoms were due to this organ. A microscopic examination showed nephritis in a few parts. Some of the tubules contained a hyaline exudate, and the outlines of the cells were blurred. At one point the straight tubules were interspersed with very oedematous interstitial tissue. The patient felt better after the operation than she had done during the past five years. The urine was now normal in quantity and contained only a trace of albumin. The author points out the discrepancy between the violent symptoms, including renal colic and haematuria, and the absence of any gross lesion in the kidney from which these symptoms came. Particularly in the early period of the disease was it difficult to accept any other diagnosis than that of renal calculus.

6. Oil Impregnation of Drainage Tubing.

McARTHUR (*Surgery, Gynaecology, and Obstetrics*, May, 1915) reports that a properly prepared rubber tube impregnated in oil is of high service in post-operative drainage where sero-fibrinous or haemorrhagic exudate is ordinarily expected within the first three days. He drained the cavity in a partial thyroidectomy a few years ago, making use of the usual small rubber drain. He saw how the tubing became plugged every few hours with a fibrin coagulum, resulting in distressing retention in the wound from an excessive serous exudate from the cut surface of the gland. The strain on the "cosmetic" skin-stitches is a special disadvantage in thyroidectomy. After this and similar experiences McArthur kept some pure gum tubing in liquid petroleum for a week. At the end of that time it had become considerably swollen, the calibre had almost doubled, and the walls had become gelatinous in consistence. It acted admirably for draining all sero-fibrinous discharging cavities, as coagulation did not take place until after all flow had ceased. Oil-impregnated tubing is now extensively employed in two Chicago hospitals. This material is strongly recommended for use after amputation of the mammary gland, removal of cysts and other growths in bones, and operations on the abdominal cavity, where the softness of the tubing precludes pressure ulceration and perforation of the bowel. It is also a good substitute for the cigarette drain in bile-tract surgery. The fact that no clotting occurs allows the surgeon to employ a tube of very small calibre. Granulations do not develop and become adherent, so that the tubing may be withdrawn without difficulty, the patient being saved much pain. Pressure necrosis is greatly diminished, and, above all, the non-coagulation of serum in the lumen allows of thorough drainage. The author gives precise directions for the preparation of oil-impregnated drainage.

7. Indiscreet Paracentesis Abdominis.

To illustrate the dangers of performing paracentesis abdominis without an intimate knowledge of the condition of the abdominal organs, C. G. CREUTZ (*Finsk Läkarsällskapets Handlingar*, January, 1915) records the case of a woman who was admitted to Professor Engström's hospital for severe abdominal distension. Three weeks earlier a doctor had performed paracentesis abdominis elsewhere, and after he had withdrawn a large quantity of fluid he had told the patient she had a tumour of the reproductive organs, necessitating a further operation. She did not at once follow his advice, and a few days later her abdomen was again much distended. In hospital she was found to be much emaciated, while the abdomen was enormously distended and fluctuating. It was everywhere dull on percussion, and there was no demonstrable resonance in the upper side of the abdomen when she lay on one side. The urine was clear, and contained neither albumin nor sugar. There was no oedema of the feet, nor abdominal tenderness. The uterus was retroflexed and prolapsed. A general anaesthetic was given and a vertical incision made between the umbilicus and the symphysis. Through the opening in the abdominal wall a large amount of fairly thick, slightly blood-stained, colloid fluid escaped. A multilocular, pseudo-mucous cyst of the size of a man's head was found secured by a pedicle to the left ovary. The cyst, which was freely movable, was removed after its pedicle had been ligatured. In the anterior wall of the cyst there was a sharply cut hole, 1 cm. in diameter. Through this hole some of the contents of the cyst had prolapsed, and close to it was an irregular tear, about 7 cm. long, which had been made during the operation. Masses of colloid were adherent to the body of the uterus and to several sections of the intestine. The size and shape of the hole in the cyst and its position relative to the abdominal wall, suggest that it was made by an ordinary sized trocar during paracentesis.

It is therefore practically certain that the ill-advised paracentesis abdominis, performed elsewhere three weeks before the operation, was responsible for the dissemination of masses of colloid with proliferating cells throughout the abdominal cavity and for the fatal pseudo-myxoma of the peritoneum found at the operation.

OBSTETRICS.

8. Scopolamine-Morphine in Labour.

A REPORT, based on a critical analysis of 60 cases, treated in the obstetric service of Frankenthal and Cary at Michael Reese Hospital, Chicago, is given by J. L. BAER in the *Journal of the American Medical Association*, May 22nd, 1915. The dosage varied from $\frac{1}{2}$ to 1 grain morphine, and from $\frac{1}{32}$ to $\frac{1}{16}$ and $\frac{1}{8}$ grain scopolamine hypodermically. Twenty-six cases are described as not successful; in 7 there was little success, in 3 partial success, in 5 fair success, in 8 good success, and in 6 the treatment was completely successful. The average duration of the so-called first stage exceeded that of a series of the same number of cases of one year ago taken for comparison by about seven hours, while the second stage in the two series was about equal. The total number of bimanual examinations made in all the 60 cases was only 77. Every patient admitted to the Michael Reese Maternity is examined once bimanually as soon as prepared after admission, and not afterwards unless there is the most distinct indication for it; hence the onset of the second stage had to be determined in most cases by other means, such as rupture of membranes, bearing-down pains, etc., and as a result the seven-hour retardation period should be considered as applying to the combined first and second stages. Pituitary extract was apparently not employed, as its use in the Michael Reese Maternity service is limited sharply to the end of the second stage, when it will be of most benefit and least disadvantage. Memory tests were carried out conscientiously, without necessarily disturbing patients seemingly somnolent. In 26 it remained throughout labour, 39 were cloudy, but the 26 had a greater total of the drug than the 39; 22 complained bitterly of a distressing thirst, and headache and vertigo were present in 27 and 31 cases respectively, the former sometimes intense and lasting several days; 43 patients slept part of the time. Pain was diminished in 39 cases, absent in 1, and average in 19, and increased in 19. Post-anaesthetic was present in 18 cases and delirium in 9, and caused the most annoying phase of the whole investigation, calling for unremitting watchfulness. The risk of self-infection during labour was a source of constant anxiety, and it was next to impossible to keep the birth parts clean. In 1 case rupture of the uterus occurred, an accident which had been thought possible. Birth in all cases but 4 was spontaneous. Amnesia at birth was entirely absent in 28, present in 26, and marked in 5. Analgesia was present in 4, slight in 5; pain was average in 37, and marked in 8. Perineal tears occurred in 12 cases, and were repaired immediately, according to the routine at the hospital. Respirations in the baby were spontaneous in 46 cases, and aid was needed in 13. One stillbirth occurred in Case lxii, rupture of the uterus, with escape of the fetus into the abdominal cavity and prompt death of the mother. Of the late lasting symptoms most complaint was made of blurred vision. Two had marked delirium for two and four days *post partum*. After-pains were noteworthy in 8 cases. Spontaneous delivery of the placenta occurred only twice. Baer says in conclusion: "The prolongation of labour, the increase in the number of fetal asphyxias, the excessive thirst and intense headaches that are so distressing, the difficult control of patients, and avoidance of infection by soiling of the genitals, the more frequent *post-partum* haemorrhages, the blurred vision, the ghastric deliriums persisting far into the puerperium, the inability to recognize the onset of the second stage unless by risk of more frequent examinations, the masking of early symptoms such as *ante-partum* haemorrhage, rupture of the uterus and even eclampsia, the violence and uncertainty of the whole treatment, the general bad impression given to our patients who are being taught to approach the 'horrors of labour' in fear and trembling, constitute so severe an arraignment of this treatment of labour cases that we feel compelled to condemn it, leaving open the question of the merit of a single dose of morphine and scopolamine in those cases in which we have hitherto given morphine and atropin."

GYNAECOLOGY.

9. Hystereotomy for Cancer of Cervix.

MAURER (*Rev. de gynéc. et de chir. abdom.*, August, 1914) has issued a very complete report of 60 cases of abdominal hysterectomy for cancer of the cervix, all in Pozzi's clinic in the Hôpital Broca from November, 1905, to November, 1913. The operators were Pozzi, Proust, Bender, Dartigues, and Rouhier. Thirty of the operations were registered as "complete," and 30 as "extended" (*élargie*). Maurer admits that the later "extended" cases were very much more extended than the earlier. The dissecting away of the parametrium grew more and more complete, and in nine instances bilateral ligation of the internal iliacs was practised. Hence, even in a series under observation in a first-class hospital, statistics, Maurer admits, must always be carefully scrutinized. Pozzi and Proust operated on 46 cases, with 13 fatal results, (28.2 per cent.); 4 more fatalities occurred, making 17 deaths in the whole 60, the percentage being 28.3. Maurer reminds us that hospital patients often apply when the malignant disease is advanced. Hence the results are not so satisfactory as in private practice, where intelligent women are easily persuaded to submit to early operation. Ligation of the internal iliac arteries has answered well under Proust. One out of eight patients in this series where ligation was undertaken died, but the bladder was involved, and part of its wall had to be resected. Proust further admits that he has lost another such case since November, 1913. This method of preliminary ligation of the internal iliac artery greatly simplifies the operation, the patients suffer much less from shock, for the good reason that the field of operation is exsanguinated so that there is practically no bleeding, and the ureters can be isolated and the parametrium dissected away with ease and with the least possible handling. After bearing in mind, Maurer observes, that hitherto the extended operation has been mainly performed on advanced cases, it is relatively less dangerous than the less extensive procedure, as the knife passes through healthy tissues all the way round the diseased organs, so that no cancerous focus is opened up and partially left behind, nor does the knife carry malignant or septic germs into healthy tissues. Notwithstanding all precautions the ureters were occasionally damaged. In one case a ureter was accidentally caught up by the pressure forceps. When the instrument was removed the duct apparently resumed its natural calibre and colour, but it sloughed and a fistula developed. In another case a secondary uretero-vaginal fistula developed. In 3 cases the bladder was wounded, twice in delicate resection of the bladder. Maurer adds that preliminary cystostomy was not practised in any of the three cases; it is a good practice, since it will reveal highly characteristic appearances when the vesical walls are involved. A very bad accident reported in 3 of the 60 cases was rupture of the new growth. All occurred in non-extended operations, where the uterine, being less freely isolated, is subjected to much traction. In one instance the uterus was torn off through the isthmus and pus escaped from the uterine cavity into the pelvic cavity; 2 out of the 3 cases died of the operation. By the beginning of 1914, when Maurer's report was published, 7 patients had survived and were doing well over two years after the operation, which was "complete" in 3 and "extended" in 4 of this subspecies. It will be found on consulting Maurer's summary that the 2 cases living over six years and the 1 living over four years after the hysterectomy all underwent the un-"extended" operation. A clinical report of the 60 cases forms the greater part of Maurer's monograph.

THERAPEUTICS.

10. Strychnine in Broken Cardiac Compensation.

NEWBURGH (*Amer. Journ. of Med. Sciences*, May, 1915) shows, from an unbiased examination of the evidence, that there is no sound basis for the generally accepted belief that the use of strychnine in acute and chronic heart failure increases the work of the heart and slows and steadies the pulse. The laboratory observations of other investigators show that doses permissible in man can have no direct effect in the treatment of heart disease, while clinically no benefit is obtained from single doses in cases of heart failure. The possible effect of the prolonged use of strychnine in large doses over a period of several days in persons suffering from chronic heart failure was studied, the patients being kept in bed on a diet of liquids and soft solids, the liquids being limited to 1,000 c.c. in

the twenty-four hours. Since many patients will entirely recover their compensation as a result of such treatment alone, without the aid of drugs, the clinical course of the infection was watched for the first few days in order to eliminate such cases from the series studied, only those patients who did not recover their compensation after three or four days being given strychnine, the effect upon pulse, respiration, urinary output, systolic and diastolic pressures, weight, and subjective symptoms being noted. Finally, digitalis bodies and directed therapy were given in order that the effect of strychnine might be compared in the same patient under otherwise uniform conditions with the effect of remedies whose efficiency is established. Eight cases of broken cardiac compensation were thus studied, and none were benefited by strychnine, compensation not being improved in the slightest, while subsequently recovered when given digitalis; 2 others died in hospital, and 2 were discharged unimproved. This failure of strychnine cannot be explained on the assumption that the patients were beyond therapeutic aid, because half did recover when given digitalis, and the reasons they did not recover during the time strychnine was being administered was because strychnine does not improve the work of the heart. It is concluded, therefore, that there is no pharmacological or clinical evidence justifying the use of strychnine in the treatment of acute or chronic heart failure.

11. Treatment of Hay Fever with Calcium Salts.

In confirmation of their earlier report on the beneficial action of calcium salts in hay fever, R. EMMERT and O. LOEW (*Munch. med. Woch.*, January 12th, 1915) give further details of their earlier cases, adding a report of 2 new cases thus treated. The 5 patients whose hay fever had been banished by a prolonged course of calcium chloride in the summer of 1913, were immune to this disease also in the summer of 1914, during which the treatment was continued. The calcium chloride was dissolved in distilled water, 1.0 grams of crystallized calcium chloride to the half litre. Three teaspoonsful of this solution were given every day at meals, the dose of calcium chloride being 3 grams of the crystallized salt, which are equivalent to 1.5 grams of the salt in the anhydrous state. The treatment should be continued throughout the year, but from October to February the dosage may be halved. In addition to the administration of calcium chloride in the pure state, the authors gave their patients large quantities of vegetables and cheese, as they contain a relatively greater quantity of salts than meat and the cereals. Among their more recent cases was that of an accountant, age 47, who for more than fifteen years had suffered from severe hay fever from the middle of May to the beginning of July. His eyes smarted and there was a free nasal discharge with attacks of sneezing, forty successive sneezes often occurring at one attack. The nose became so obstructed at night that respiration and sleep were disturbed. The treatment with calcium chloride was begun on March 14th, 1914, and during the following summer there were no symptoms of hay fever. The results in the other 7 cases were also strikingly successful. No harm resulted from this treatment in any case, and even when prolonged there were no signs of renal irritation. Both authors have taken 2 to 3 grams of calcium chloride every day for the past six years without showing any signs of renal disease. The harmful action of calcium salts on the kidneys is confined to large doses; and, according to Wolf-Eisenner, the inhibitory action of calcium on the kidneys is observed only when they already show inflammatory changes. The treatment, which was apparently discussed in their earlier communication published in the *Munch. med. Woch.*, Nr. 48, 1913.

12. The Use of Dahlia in Infections.

RUHRÄH (*Amer. Journ. of Med. Sciences*, May, 1915), after reviewing the work of previous investigators upon the antiseptic action of certain anilin dyes, gives his experience in the use of dahlia as an efficient local application for streptococcal infections of the throat. Commencing with weak solutions, it was found that saturated solutions, about 4 per cent., could be applied to the mucous membranes of the throat, or other parts of the body, without producing pain or subsequent irritation. The effect of its use is most marked for superficial involvement of the mucous membranes, whether the infection is streptococcal or due to other organisms; but, as the drug only penetrates to short distances, it is useless in deep-seated affections. It generally produces distinct lessening of the intensity of the inflammation, and of the consti-

tutional symptoms; and, while being painless and non-irritating, it is markedly antiseptic, its colour being the only disadvantage, though stains of fabrics can be removed if immediately washed out in cold water. Applications of the mouth may be treated, either by the application of a saturated solution, or by using a mouth wash from 1 in 1,000 to 1 in 10,000, the stronger solutions not being often required. Not only does the dahlia kill the infecting organisms, but it stimulates healing, and its use is beneficial upon external skin ulcerations and lesions caused by, or accompanied with, pure organisms. The author has used it successfully in the treatment of vaccinations which are slow in healing, and upon infected abraded surfaces; while others report upon its value in the treatment of erysipelas, acute and chronic eczema, herpes, tinea tonsurans, tinea sycosis, and furunculosis.

PATHOLOGY.

13. Pathological Changes in Appendicitis.

STANTON (*Amer. Journ. of Med. Sciences*, April, 1915) records the results of microscopic examination of 539 appendices removed during ten days following an acute attack, together with the gross pathology observed at operation in more than 1,500 cases. He classifies the pathological data with reference to the duration of the symptoms previous to the time of examination, and this method of grouping the appendices as part of a disease process according to the day of the disease in which they are removed shows how fundamentally alike are the specimens removed during each succeeding day of the attack. The sequence of changes in the complicating peritonitis are even more uniform, for, if studied as a disease process, it is found that the lesions at any given time present features essentially similar in each case. During the first twenty-four hours of an attack the pathological changes are similar in nearly all cases, a definite obstruction of the lumen of the appendix being always present, distally to which the organ is distended. Following on the first eight or ten hours of the attack, fibrin is found on the peritoneal surface, and towards the close of the first twenty-four hours a considerable proportion of the appendices show commencing gangrene macroscopically. Microscopically, there is an intense diffuse polynuclear leucocytic infiltration with focal areas of haemorrhages and necrosis involving all coats, the peritoneal lesion being a fibrinous or sero-fibrinous exudate. Surgically, this peritoneal involvement of the first day may be ignored and the abdomen closed without drainage. On the second day, owing to the coalescence of the microscopic necrotic areas, macroscopic areas of gangrene are noticeable, and perforation, if it is going to occur, usually takes place on this day. There is intense leucocytic infiltration of all coats with ulceration of the mucosa, and in the majority of cases a definite fibrino-purulent exudate on the peritoneal surface. By the third day the destructive process in the appendix itself has usually reached its maximum both as regards macroscopic and microscopic evidences, the most striking histological feature now being evidence of commencing repair, as seen by the presence of fibroblasts in all sections, which evidences of repair are increased on the fourth day. On the fifth day the necrosis and polynuclear leucocytic infiltration still predominates in the cases presenting macroscopic evidences of gangrene, although the repair process is well advanced, while in the non-gangrenous cases the polynuclear leucocytic infiltrates have almost disappeared except at the surfaces of the ulcerations in the mucosa and of the periappendicular exudates. Decided advance in these repair processes are seen on the sixth and seventh day, while in the second week they are so far advanced as to present microscopic pictures of a subacute or chronic character, and if acute recurrences, following dietary or other causes, occur at this stage they result in the engrafting of a new acute lesion upon the histological picture of partial repair. The protection of the general peritoneal cavity from infection depends upon the maintenance of the integrity of the fibrinous periappendicular adhesions rather than upon the bacterial impermeability of the appendicular walls. In cases of diffuse peritonitis the peritoneal surfaces are put at rest by withholding all food and cathartics by mouth, and the subsequent changes tend to the resolution of the lesion or the formation of circum-scribed abscesses. After the first thirty-six to forty-eight hours of a diffuse peritoneal infection the lesions met with are essentially undrainable and not suited to surgical interference until the period of localized abscess formation.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

14. Trench Diarrhoea.

REMLINGER AND DUMAS (*Rev. d'hygiène et de police sanitaire*, March 20th, 1915) say that the term "trench diarrhoea" covers some very different conditions: infectious by typhoid and paratyphoid bacilli, mucous-membranous enteritis, diarrhoea connected with improper action of the stomach. In most cases it is simply a more or less acute form of dysentery—a complaint from which no troops in the field are exempt. Diarrhoea and dysentery have prevailed with particular severity among the troops in the Argonne. They appeared at the end of the hot weather, when hostilities began in that district, and were but little checked by the cold of winter. Of the several hundred cases, some were dyspeptics of long standing, others were cases of mucous-membranous enteritis, easily produced by the coarse army diet, consisting largely of meat, independently of any stay in the trenches. Another was a case of paratyphoid. In most of the cases, however, the patient had never suffered from gastric or intestinal trouble. Soon after he entered the trenches, where he felt the fatigue and cold intensely, the diarrhoea appeared, beginning with four or five soft yellowish stools in the twenty-four hours. Gradually the number increased, especially at night; the faeces became more liquid and clear, and greenish instead of yellow. At the same time colicky pains preceded defaecation, which produced no feeling of relief. Tenesmus supervened, and the number of stools increased to twelve or fifteen, some of them greasy or bloody, and two-thirds of them at least occurring during the night. There was never any fever, but slight constitutional disturbance in the way of loss of strength and appetite, slight frontal headache, and sometimes nausea and vomiting. The only treatment required was to keep the patient warm and quiet in bed, which a few days effected a complete cure in the majority of cases. In a few cases serious, but rarely fatal, dysentery occurred. In the fatal cases the autopsy showed lesions of the large intestine and by ptrophy of the mesenteric ganglia. The small intestine was healthy, and Peyer's patches were neither ulcerated nor hypertrophied. The spleen was hard and shrunken, thus excluding all action by Eberth's bacillus or paratyphoid bacilli. Microscopic examination of the stools showed the features characteristic of dysentery, and animal parasites, such as the eggs of ankylostomata, were never found. The causes of trench diarrhoea are said to be exposure to cold and wet, and to the want of warm food. In the case of the large numbers of men unaccustomed to much meat, the fact that the rations consist almost exclusively of beef was certainly a contributory cause. Few of the patients attributed their malady to water. Although a few admitted they had drunk water from shell holes or from sources of doubtful purity, most of them said that the cold enabled them to a large extent to do without drinking anything but wine, tea, or coffee. Now, all the causes above mentioned must be regarded as predisposing only. The presence of a special bacillus is essential, but it seems to have little effect alone, as it has been found in the faeces of men who have not been exposed to the predisposing conditions, and who have remained in perfect health. The bacillus seems to be derived from the trench mud contaminated with faecal matter. This gets on to the boots, thence on to the hands and the food. In the summer dust and flies also carry the infection. Moreover, the infection, even if it does not occur in the trenches, may take place in the villages hard by where the men go to rest, after five or ten days in the trenches, for about an equal period. The result is that the villages are crowded, and it is impossible to secure proper sanitary precautions. Further, most of the food for the men in the trenches is cooked in these villages, so that the bacilli may also be carried to the trenches from the kitchens. What is now called "trench diarrhoea" has always been rife in the Argonne, and presented no difference of character in the summer of 1914 from what it has been in previous summers.

15. Examination of Infants' Stools.

MCCLEANAHAN AND MOORE (*Amer. Journ. of Med. Sciences*, June, 1915) record their routine examination of 125 infants' stools, believing that the procedure ranks in importance

with blood counts and urinalysis, and is the only accurate method of determining the disturbing food element in infants with intestinal indigestion, the conclusions drawn from the examination giving information of practical value. The stool is collected on a diaper or square of gauze and then put in a jar with screw top to prevent drying before examination, the main features of which consist in recording the number of stools; their colour, reaction, odour, and consistency; the presence of blood, mucus, or curds; the estimation of neutral fats, fatty acids, soaps, and total fat; the reaction to Lugol's solution, and the predominance of either Gram-negative or Gram-positive bacilli. While the colour of the normal stool is light yellow, malt renders it brown, condensed milk light yellow, skimmed milk very pale, and excessive soap whitish. Various infections cause green stools, from the conversion of bilirubin to biliverdin, from excessive acidity or alkalinity of intestinal contents, or from some oxidizing ferments, or due to the *Bacillus pyocyaneus*. If due to the latter, treatment with nitric acid causes the colour to disappear, while if due to biliverdin the characteristic bile reaction results. High acidity is usually due to relative excess of carbohydrate, whereas an alkaline stool may be due to a relative excess of protein or the presence of soap. An excess of neutral fats indicates either a lowered tolerance for fats or an excess in the food, and excess of fatty acids and soap shows that the neutral fat has been broken up by digestion, but has failed to be absorbed. While examination of the stools is a very important point in all bottle-fed infants, it must not be solely relied upon to the exclusion of other clinical symptoms, weight curve, and energy quotient.

16. Arterial Murmurs and Peripheral Resistance.

L. BARD (*Archives des maladies du cœur, des vaisseaux, et du sang*, May, 1915) deals with the possible clinical value of a study of the arterial murmurs which under certain conditions can be heard on auscultation. If the stethoscope is placed over a normal artery, without causing compression of the artery, no murmur is heard, though certain arterial "tones" may at times be detected. But if the artery is compressed by the stethoscope a murmur, contemporaneous with the diastole of the artery or the systole of the heart, is heard over the larger arteries. Under certain conditions the murmur is produced with special ease, as, for instance, in all the important arteries in cases of aortic insufficiency, in the thyroid arteries in exophthalmic goitre, in the carotid arteries in anaemia, and in even the smaller arteries in cases of pernicious anaemia. The author has carried out a series of investigations on the sounds produced in the brachial artery just below a compression armlet, such as is used for the determination of arterial pressure. The procedure is the same as in Korotkow's method for the determination of arterial pressure. A small phonoscope is used instead of a stethoscope; it is placed without pressure on the chest just above the bend of the elbow and just below the armlet, and the pressure of the armlet is first increased progressively up to the point of suppression of the circulation, and then is diminished slowly and progressively. Murmurs, if present, are noticed during both the rise and the fall of pressure, but always more readily during the fall. Near to the point of maximum systolic pressure the murmurs are replaced by a short phase of simple arterial "tones," and as the pressure decreases, while it is still well above the minimum diastolic pressure, they are replaced by vibrant "tones." Since the murmurs are not heard during the whole period of compression of the artery, it is clear that while narrowing of the calibre of the artery may be a necessary factor in the production of arterial murmurs, it is not in itself a sufficient cause. The murmur does not correspond in the different cases to a particular stage of narrowing of the artery. The murmur always ceases a little below the maximum systolic pressure, whatever that may happen to be, and it does not therefore correspond to any actual degree of pressure in the narrowed vessel. The consistency of the arterial walls is not an essential factor, since in both positive and negative cases the vessel walls may be normal. The degree of density of the blood is far from being an essential factor in a case of pernicious anaemia with precordial jugular and ocular murmurs, auscultation of the brachial artery by the method

described revealed only a murmur of feeble intensity. In the author's opinion the essential factor in the production of the murmurs is the degree of emptiness of the peripheral segment of the artery below the narrowing, this being dependent upon the blood flow in the capillaries, and therefore upon the peripheral resistance. A fact which is in itself suggestive of this hypothesis is that some of the best marked murmurs are heard in certain cases of aortic insufficiency, while they are totally absent in cases of dilatation of renal origin. Again, it is to some extent confirmatory of this explanation that the murmur is less distinct during the period of progressive compression than during that of relaxation, for it is clear that the emptiness of the peripheral segment of the artery is more complete during the latter operation. A direct proof of the theory of causation here put forward is given by placing a second armlet on the forearm, and demonstrating, as can be done with ease, that a murmur when present will invariably disappear if the flow of blood is obstructed in the region of distribution of the artery under consideration. It thus results that the production of arterial murmurs by compression depends upon the state of the peripheral resistance, and the presence or absence of the murmurs, their greater or less intensity, the length of the period during which they are produced, etc., would all furnish information as to the state of the peripheral circulation. Moreover, the method of observation will not only have a diagnostic significance, but observations of the varying conditions made on the same patient from day to day would have a bearing on prognosis and on the results of any method of treatment employed.

SURGERY.

17. Rapid X-Ray Localization of Foreign Bodies.

A RAPID method of x-ray localization for use in the military hospitals of Montpellier has been elaborated by BERTIN-SANS and LEENHARDT (*Arch. d'electr. m'ed.*, No. 387, 1915), who state that, without demanding the time and complex material of the methods of precision, it gives sufficiently exact results, and has a special value for the trunk and thick parts of the body. Having found, approximately, the region in which the foreign body is situated, a cross in cardboard is stuck on the anterior part of the subject, and a similar cross on the posterior. Each branch of these crosses is 8 or 10 cm. in length, and at every space of 2 cm. there is placed a minute piece of metal, a grain of lead for example, care being taken to differentiate the shape of these marks as between the two crosses. The subject is made to lie upon the photographic plate in such a manner that the posterior cross is, if possible, in juxtaposition with the plate. The anticathode of the tube is placed vertically above the centre of the anterior cross, and two exposures are made, the second after displacing the tube for a known distance. The two crosses are then removed, and their situations marked with silver nitrate. On the plate there appear two shadows of the projectile, two of the anterior cross, and one (if there has been juxtaposition) of the posterior. With the result of the first exposure, representing the ray of normal incidence, we are for the moment only concerned. From this it is possible to trace immediately the point of entrance of the rays which formed the shadow of the projectile, its exact situation on the skin being ascertained by a reference to its co-ordinates, or, in other terms, its distance from each of the two branches of the cross within the angle of which it lies. The fact that each branch has a 2 cm. scale enables one quickly to estimate these two distances of the projectile, at least to a refinement of 5 mm., which is sufficient in practice. This point having been marked on the skin, the same procedure is followed with the posterior cross, the point in this case marking the egress of the rays intercepted by the projectile. The projectile, therefore, lies along the line between these two points, and it remains to determine the distance at which it is situated from either of them. Its distance from the plate is given by the formula:

$$x = \frac{h \cdot d}{D - d}$$

where h is the distance between plate and anticathode, D the displacement of the cross, and d the displacement of the shadow of the foreign body, measured by taking the distance between the same points of the projectile in the two images. A ready reckoner may be established, furnishing for given values of h and D , the value of x corresponding to various values of d . If

the height h of the anticathode above the plate is 65 cm., and the displacement D of the tube is 10 cm. between the two exposures, we have the following, which can be multiplied indefinitely and intermediately:

Values of d , Distance of Projectile from Shadow.	Values of x , Distance of Projectile from Plate.	Values of d , Displacement of Shadow.	Values of x , Distance of Projectile from Plate.
0.1 cm.	0.64 cm.	2.6 cm.	13.41 cm.
0.5 ..	3.09 ..	2.9 ..	14.61 ..
1 ..	5.90 ..	3.2 ..	15.75 ..
1.3 ..	7.47 ..	4.4 ..	19.86 ..

If the posterior cross is in contact with the plate, the distance x gives immediately the depth of the bullet from the point traced on the posterior part of the subject. The depth of the projectile from the point traced on the anterior surface is found in an analogous manner. It suffices to discover on the plate the mark of the anterior cross, to measure the distance between the two shadows of this cross, taking the point nearest the projectile, and to deduce, with the aid of the formula just given, the distance from this point to the plate. By subtracting from this distance the value already obtained for x , one arrives at the depth of the projectile from the anterior point. The same rule must be followed if, by reason of the conformation of the region, the posterior part of the subject is not in close juxtaposition with the plate, with the result that there is a double shadow of the posterior cross.

18. Cancer of the Breast under 20.

R. H. FOWLER (*New York Medical Record*, May, 1915) reports three cases of carcinoma in subjects under 20 years of age. In the first, carcinoma of the rectum, quite inoperable, developed in a boy aged 15, and rapidly proved fatal. The second patient, a boy aged 14, was struck on the right nipple by a golf ball, and scirrhous carcinoma developed. The breast was removed on February 6th, 1913, and there is no after-history. The third patient was a Russian Jewess, aged 19, admitted into hospital for recurrence of cancer on September 17th, 1914. She had observed a swelling in the left breast when 17½ years of age. She married at 18, and immediately became pregnant: the growth increased rapidly, and the breast was amputated, by the radical method, in February, 1914, when "scirrhous carcinoma" was reported. Recurrence proved rapid, and on admission, seven months after the operation, into hospital, recurrences were detected in the main scar, and also in a number of scars resulting from incisions made to drain the axillary flap—two recurrences rather than implantation carcinoma. There was invasion of the opposite breast, with enlargement of the axillary lymphatic glands upon that side, and invasion of the left lung and right humerus. Death occurred on November 16th, 1914, hardly eighteen months after the tumour was first observed.

19. Tonsillectomy.

BALFOUR (*Annals of Surgery*, March, 1915) discusses tonsillectomy in children from the standpoint of the general surgeon, urging the complete removal of both glands where they are visibly diseased, obstructively enlarged, or the possible atrium of infection. While guillotine operations are inefficient in a varying percentage of cases a properly performed dissection will always be satisfactory. It is essential for success that the anaesthetic should be administered by one accustomed to producing an ideal anaesthesia sufficiently deep to prevent unalloyed reflexes interfering with the dissection, yet so light that the patient is returning to consciousness by the time the operation is completed. With the child's head lying free over the head of the table and supported by an assistant at one side with another assistant on the opposite side for tongue traction, sponging, etc., the surgeon stands between the two and introduces his index finger behind the posterior pillar, and by firm upward traction puts the anterior pillar on the stretch, and with blunt dissecting scissors frees it from the tonsil without breaking through the capsule. The tonsil is then held with a tenaculum forceps and freed from the posterior pillar by blunt dissection, which usually enables the tonsil to be rolled out of its bed. By this method the operator sees exactly what he is doing, and the technique when once acquired possesses distinct advantages as a precise and safe operation in the hands of a competent general surgeon.

OBSTETRICS.

20. Anaesthesia of the Internal Pudic Nerve during Labour.

K. BOLLAG (*Muench. med. Wochn.*, February 23rd, 1915) points out that there is not yet any satisfactory method for abolishing the principal pain of labour, but the lesser pain, due to irritation of the internal pudic nerve, can be abolished by the injection of novocaine-suprarenin into this nerve. He has carried out this treatment in more than 225 cases at Professor O. v. Herff's gynaecological hospital. The internal pudic nerve gives off three important branches, which supply the anus, the muscles and skin of the perineum, a portion of the labia, and the region of the clitoris. Fortunately the trunk of the nerve is easily reached, but some practice is necessary in order to anaesthetize this nerve properly. The author uses a 2 per cent. solution of novocaine-suprarenin, supplied by Höchst in ampullae containing 5 c.cm. The contents of one ampulla were usually sufficient, but sometimes two were used. At first there were several failures due to faulty technique and the difficulties of finding the nerve in fat subjects. A plain Record 5 c.cm. syringe was used with a needle at least 6 cm. long. The patient was placed on her back with the legs flexed at the hips. The tuber ischii was then located and the needle was inserted between it and the middle of the perineum and directed towards the lesser sciatic foramen so as to strike the nerve which passes under the ligamentum sacro-tuberisum on the posterior surface of the ischium. About 2 c.cm. of the solution were injected as the needle was slightly withdrawn, and when the needle was almost withdrawn 2.5 c.cm. was injected under the skin of the perineum. The remaining 2.5 c.cm. of the solution were then injected in a similar manner into the internal pudic nerve and perineum of the opposite side. A double dose was given when difficulty was experienced in finding the nerves in fat patients. The injections were sometimes facilitated by introducing a finger or two into the vagina, where they acted as a guide to the spine of the ischium. The subcutaneous injection into the perineum was undertaken in order that, even if the trunk of the nerve was missed, the perineum would still be anaesthetized. The injection should be given at the beginning of the second stage of labour, when the passage of the head is causing pain. The anaesthesia begins five to ten minutes after the injection, and lasts at least two and often more than three hours. In some cases the injections were given too late, and in others too early. It is advisable to give the injections a little too early rather than too late. The relief was often so great that patients who were almost wild with pain remained perfectly quiet after anaesthesia had been induced. It was also beneficial when the perineum had been ruptured, as it enabled the operator to suture the perineum at once without pain. In seven cases the treatment was ineffective on account of faulty technique or because it was given too late. In five other cases, although the perineum and vulva were obviously quite anaesthetic, the patients complained of pain during the passage of the head. The author concludes by claiming that, thanks to its simplicity, this treatment can be as well employed at home as in a hospital.

21. Osteoplastic Operation for Contracted Female Pelvis.

FRANKLAND SMITH (*Medical Record*, April 3rd, 1915) has made a series of experiments on animals, with the bold object of endeavouring to widen a contracted pelvis by transplantation of bone. Many border-line cases, he insists, could be permanently relieved by an increase of not more than 1.5 to 2 cm. in the conjugate diameter. It is possible, he believes, to obtain the result by permanently spreading the pelvic bones. The transplant is obtained from the inner surface of the tibia near its upper extremity, being of sufficient width or length for the purpose. The periosteum can be removed with the transplant, which must be absolutely fresh. An incision is then made over the symphysis pubis, carried at once down to the bone. The fibro-cartilaginous tissues must be completely removed, and the little villous-like projections on the bone which run into the hyaline cartilage must be curetted. The bones are then separated for a certain distance by an instrument made for the purpose, and the transplant set in place. It may be held in position either by grooves made in the pubic bones or by a heavy kangaroo tendon bound about the graft and the bones. After the incision through the integuments has been closed with catgut a properly fitting plaster cast is applied. The progress and position of the transplant can be watched by the use of the Roentgen rays.

GYNAECOLOGY.

22. Caruncle of the Female Urethra.

YOUNG (*Boston Med. and Surg. Journ.*, June 3rd, 1915) describes a series of cases of urethral caruncle operated upon in the Genito-Urinary Service of the Massachusetts General Hospital. The pathological reports of 19 cases where sections were made and examined by an expert illustrate a fact that has struck other observers, but seems never to have been so clearly made out before. Though caruncle is a common disease, and is generally held to be an innocent neoplasm, it is also known to recur and prove troublesome to extricate; whilst, on the other hand, cancer of the female urethra does not appear to be common. Yet, on section, a caruncle often appears malignant. In those taken from Edward L. Young's 19 cases a large proportion showed irregularity of epithelial cell growth in crypts and in foldings from the surface, and of islands of epithelial cells included in the tissue. On further inspection, with Whitney as pathologist, one more section showed irregularity of cell growth, suggesting carcinomatous degeneration; and, besides in these five, there were very irregularly lined epithelial surfaces in three others. The age range in these cases was wide—namely, 6 to 63 years. Young was able to follow up three of the five patients where the growth seemed histologically malignant. One of the three, examined four years after operation, and the second eight years after, showed no signs of recurrence, and there were no symptoms. The third was once more under Young's care six years after the removal of the caruncle. Her general health was good, except that she was a little run down, but the symptoms had recurred. A tumour, about one-fourth of an inch in diameter at its thickest part, surrounded the meatus. The whole urethra felt lard, thickened, and indurated. No enlarged glands could be detected. This patient refused to undergo a second operation. Thus, caruncle seems often clinically innocent, though histologically malignant—in appearance, at least. Young, turning to symptoms in his entire series, found that in 26, or 35 per cent., the patients had no symptoms of any kind pointing towards the caruncle. Even a caruncle of the size of a strawberry was discovered quite accidentally, and in 35, or half the entire series, there were no urinary symptoms. In 23, or one-third, the patients had already undergone various operations in other institutions for the removal of similar growths—namely, 3 "several," 5 two, and the others one surgical procedure. Age had no relation to recurrence, nor had the nature of the operation, excision, actual cautery, or chemicals. In all patients where there had been a strictured urethra not remedied at the first operation, the caruncle returned. Young gives statistics showing a close relation between stricture and caruncle. No definite facts as to the etiology of caruncle could be founded on the cases under observation. If, however, an operation is undertaken, whether it be the touching of a minute caruncle with the thermo-cautery or resection of the urethra, Young considers that the whole urethral canal should be sounded and explored, lest a stricture be overlooked.

THERAPEUTICS.

23. Serum Treatment of Pneumonia.

ROPER (*Conn. Univ. Med. Bull.*, April, 1915) gives his experience in the treatment of 20 cases of pneumonia with a serum derived from a horse which had been treated with a vaccine containing five strains of pneumococci, including typical and atypical types. Two series of cases were treated, the first receiving very small doses subcutaneously, while in the second the doses approximated more nearly those advised at the present time given intravenously. In the first series there was no noticeable immediate effect, 13 out of 14 patients recovering, and, though there seemed to be an improvement in the general condition, the temperature curve showed no material change, and there was no shortening of the course of the disease. Of the 6 cases in the second series 3 died, and the total mortality of the two series was 20 per cent., which approximates the average hospital mortality. The same serum which was used in the first series was used for the first 3 of the second series, 2 of which defervesced immediately, while the third showed no immediate effect, though eventually recovering. The last 3 were treated with a serum from a horse treated as before with a vaccine containing five strains of pneumococci (including Neufeld I) and a *Streptococcus mucosus* isolated from

one of the cases, but no defervescence occurred. Of the 6 cases in the last series (with the exception of the 2 cases already mentioned) no defervescence occurred after injection, but some developed striking phenomena. Four had chills following within two hours after the administration of the serum, the temperature rising to 103 in one, and 106 in two of the cases, and dropping in a few hours to 98 and 99 respectively, but in all four cases the temperature returned in a short time to a high level, and the course of the disease was unaffected. Leucocyte counts were unaffected. Pneumonias may be divided into those due to typical and atypical organisms, the former being common and the latter uncommon. A polyvalent serum active against the typical varieties should show results in the great majority of cases. Although in two of the cases the abrupt termination of the disease on the administration of the serum was very striking, the probability that this was merely coincident with a natural defervescence must be borne in mind. While it is possible that in the cases having chills the serum had furnished bacteriostatics enough to cause phagocytosis and consequent lysis of the pneumococci, thus liberating sufficient endotoxins to cause the disturbance, so many factors enter into the interpretation of the result of therapy with a polyvalent serum that no conclusion can be arrived at. For the present attention should be confined to the action of high value serum on typical cases only until value in typical cases has been established, and strains from cases resisting treatment should be identified and classified.

24. Lactose in Glycosuria.

The extent to which lactose can be usefully employed in the diet of patients suffering from glycosuria is still in debate. Bourquelot and Troisier concluded, from a single case of a diabetic patient in the last stage of phthisis, that the ingestion of increasing doses of lactose led to the excretion of increasing quantities of sugar in the urine, sometimes up to the amount ingested. On the other hand, Lepine holds that, of the two constituents of lactose, the galactose but not the glucose is assimilated. Lafon recognizes a favourable action of milk upon glycosuria, and established that 25 per cent. of the lactose ingested was assimilated. Denegés found that in certain forms of glycosuria the addition of sugar of milk to the diet diminished the amount of sugar excreted, and sometimes caused its total disappearance. Chelle found that the administration of lactose could temporarily restore a patient from diabetic coma. FERNAND FARGES (*Gazette hebdomadaire des sciences médicales de Bordeaux*, June 6th, 1915) has investigated the effect of a milk diet and of the addition of lactose to an ordinary diet upon the urine and the blood in diabetes. The conclusions as to the effect upon the urine are given in the article under consideration, the discussion of the blood changes being reserved for a later article. Notes of severe cases are given. In one case the patient when first seen was found to pass 2.1 litres of urine in twenty-four hours with a total of 42 grams of sugar; 20 grams of lactose per day were added to the diet for eight days, no other change being made; the urine was again examined. The total quantity passed was now 2 litres, and of sugar 16.77 grams. The patient was put on 2 litres of milk per day and 100 grams of lactose. Four days later the amount of urine passed in a day was 1.150 c.c.m., and sugar had disappeared. From this time on, eggs, fish, chicken, and gluten bread were added to the diet, and later half a litre of wine, and the patient was kept under observation for seven weeks. The amount of urine passed was 1,200 and 1,300 c.c.m. per day, and sugar remained absent. An even more striking case was the total disappearance of glycosuria in a patient suffering from diabetic gangrene who at the beginning passed 90.66 grams of sugar per day. In all the cases described 2 litres of milk was given per day and an amount of lactose of 100 grams was given per day and an amount of lactose which varied from 25 to 200 grams per day. In each of the first 5 cases described sugar altogether disappeared from the urine; in the sixth the amount of sugar excreted daily had fallen from 336 grams to 7 grams, when the patient ceased attendance at the hospital. In 4 cases there was a marked diminution in the amount of urine passed. The seventh case is illustrative of a further series of cases in which the author found that the amount of sugar excreted diminished under treatment and then continued to show slight variations about a limiting figure, but did not completely disappear. In the case described the amount of sugar excreted was 87 grams before treatment, and later varied between 3 and 5 grams daily. Among the conclusions arrived at are: (1) That lactose is completely assimilated by the diabetic patient; (2) that in certain diabetes there

is a limited improvement, no further decrease in the amount of sugar excreted being obtained by further increasing the dose of lactose; (3) that lactose aids the assimilation of other carbohydrates; (4) that lactose, which is ordinarily strongly diuretic, has a contrary action in diabetics. The author proposes to carry out further investigation of the subject from the theoretical as well as the clinical point of view.

25. Noviform in the Ambulant Treatment of Eye Diseases.

BERNOULLI (*Muench. med. Woch.*, January 19th, 1915) is an enthusiastic advocate of the use of noviform in a strength of 3, 5, or 10 per cent. in various inflammatory diseases of the eye and its appendages. Usually diseases of the eyelids and cornea are treated by the general practitioner with boracic lotion and yellow ointment. But since noviform was introduced in 1912 in the treatment of these conditions it has deservedly displaced the older remedies in the opinion of many ophthalmists. The author has used noviform for two years, and has found it act rapidly in cases of blepharitis which had proved refractory to weeks and months of treatment with boracic lotion and white or yellow precipitate ointment. Both these ointments can, in fact, be dispensed with in the squamous and ulcerative forms of blepharitis, but the yellow ointment is still to be recommended for ezeematous and phlyctenular conjunctivitis. Noviform is non-irritant, and as it causes no burning or pain, the patient can be trusted with it for home use. In chronic blepharo-conjunctivitis it is advisable to give the eye zinc baths before the noviform is applied in the form of a 5 to a 10 per cent. dilution in vaseline, which is applied two or three times a day. Ezeema of the face, accompanied by ezeematous conjunctivitis, rapidly disappears when treated with a 20 per cent. noviform ointment. Again, when foreign bodies have been removed from the cornea, the application of a 3, 5, or 10 per cent. noviform ointment reduces the risk of infection. Since he began using noviform the author has seldom seen ulceration of the cornea follow the removal of a foreign body from the eye. In some cases it is advisable to combine the noviform vaseline with 1 per cent. of atropine, so as to hasten painless recovery.

PATHOLOGY.

26. Chorion epithelioma of Testicle

COOKE, of San Francisco (*Johns Hopkins Hospital Bulletin*, June, 1915), tabulates 47 cases, including his own, reported for the first time, in which tumours developing in the testicle were found histologically similar to chorion epithelioma in women. COOKE's patient was a powerful built man aged 26, limited comatose into hospital. There was no family history, and all that could be found out about him was that five days before admission he had been seized with cramp, followed by haematemesis, headache, disordered vision, and loss of consciousness. The mammary glands were prominent, and the left nipple enlarged and surrounded by a fairly well developed glandular base. Pressure of the breasts caused the escape of a few drops of colostrum-like fluid. The right testis measured $\frac{4}{8}$ in. by 3 in. by $\frac{2}{8}$ in., being converted into a large firm ovoid tumour. Melæna and haematemesis, and ultimately rise of temperature, were noted before the patient's death on the fifth day. At the necropsy chorion-epithelioma of the right testis was discovered, and there were metastases in the brain, liver, kidneys, stomach, peritoneum, and thyroid. The haemorrhage which had obscured diagnosis was traced to the ulceration of a metastatic nodule in the stomach. The spleen weighed 190 grams and was enlarged, but bore no metastatic growths. The tumour of the left testicle showed the appearances seen in chorion-epithelioma, largely broken up by haemorrhages, and the normal tubuli had entirely disappeared. The histology of the metastatic nodules was similar. The left mammary gland, examined under the microscope, showed fairly numerous tubules lined with normal epithelium. The right gland was not examined. In another case of chorion-epithelioma of the testicle, quite recent (Wartlin), there was, as in this instance, hyperplasia of the mammary glands. The age of the 47 patients ranged from 16 to 46, the large majority being adults between 20 and 40. In 2 the affected testicle was undescended, 29 cases ended fatally, and in 17, where the testis was removed, no post-operative results were reported. The left testis was a little more frequently affected than the right.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

27. Emotional Shock following Shell Explosion.

FIESSINGER (*Journ. des praticiens*, February 15th, 1915) gives an account of a number of cases of emotional shock following shell explosion. One case was that of a non-commissioned officer of heavy artillery, who had received a severe bruise—but no more serious damage—on the left thigh. The patient had been a bright and cheerful man with no antecedent nervous manifestations, family or personal. To any inquiries he replied in monosyllables, and after a few questions his expression and manner indicated profound fatigue. His memory appeared normal, but there was a marked alteration of intelligence. He preserved absolute silence, appeared to be extremely melancholy, and suffered from insomnia, intense headache, and distaste for food. The reflexes were normal, and muscular power was retained. Subcutaneous injections of strychnine resulted in some improvement. A similar case was that of a lieutenant of artillery. There was no trace of a wound in this case. The patient appeared to be in a state of stupor; he refused all nourishment and preserved a fixed stare. After two days there was a phase of nervous excitement, followed by one of melancholy and intense depression. The author points out that the explosion of heavy shells provokes a terrifying impression on nervous subjects, and that this shock is less marked on those who have been seriously wounded otherwise. With regard to the nature of the attack, the author states emphatically that in none of the cases referred to was there any evidence of simulation, and that the condition was to be regarded as a traumatic neurosis, only occurring in those of susceptible nervous system. Rest treatment and suggestion were beneficial, and there were few ultimate ill effects.

28. Dysenteric Polyneuritis.

A. V. MUELLER-DEHAM (*Wien. med. Woch.*, April 17th, 1915) has observed many cases of polyneuritis during an epidemic of dysentery, which broke out in the autumn of 1914 in Kagran. Among the complications of dysentery, "rheumatic" symptoms were by far the most common and affected the majority of the patients. The pain was most frequent and troublesome in the legs, was often increased by movement, and was of a shifting character. Although the patients had been exposed to wet and cold, and had led a strenuous life in the open, the pain was traced, not to "rheumatism," but to neuritis directly traceable to the dysentery. This view was supported by the facts that (1) these symptoms were much less common among soldiers suffering from wounds or diseases other than dysentery, (2) true articular rheumatism is a very rare disease among the class of patients under discussion, and (3) the symptoms were characteristic of true neuritis. Every form of neuritis was observed. In some cases there was extreme muscular atrophy, and the electrical reaction to degeneration was present. In some cases there was typical sciatica, in others there was polyneuritis with extreme tenderness and thickening of the nerve trunks, with hyperaesthesia and anaesthesia of the skin. In other cases, again, there was paresthesia without any demonstrable anatomical lesion. The reflexes were often absent, and acro-paraesthesia was common. "Vascular spasm" and trophic disturbances of the nails and skin were also observed. The author considers these manifestations of neuritis were not due to any specific poison produced by the bacillus of dysentery, this material included only cases of bacillary dysentery, but to the nocera condition of the intestine, which permitted the absorption of imperfectly digested substances into the system. In this connexion he points out that polyneuritis may also be a sequel to tuberculous ulceration of the intestine. The coincidence of neuritis and other forms of intestinal ulceration is so common that intestinal ulceration should be suspected in every case of neuritis. As the patients improved and the dysenteric ulceration disappeared, the symptoms of neuritis also passed off. Many of the patients suffered from oedema on admission to hospital when, though the pulse was usually good, the patients were much exhausted. It was not clear whether this oedema was a cachectic, toxic phenomenon, or due to vasomotor influences connected with the neuritis. The latter view was supported by the frequency with which other vaso-

motor abnormalities, pain and paraesthesia, were associated with this oedema. The neuritis were unaffected by salicylates, but it disappeared in most cases simultaneously with the other symptoms of dysentery.

29. Haemorrhagic Nephritis due to Novocain-Adrenalin.

LENSCHOW (*Norsk Magazin for Laegevidenskaben*, May, 1915) records the case of a man, aged 21, who had never undergone a serious illness. On September 10th, 1914, he was operated on for inguinal hernia on the right side. A general anaesthetic was dispensed with, and a subcutaneous, subaponeurotic injection of novocain-adrenalin was given. A 1 per cent. stock solution of novocain was boiled, and then adrenalin was added, and altogether 70 c.c.m. of the novocain solution and 14 minims of adrenalin were used. The dosage of the former was 70 cg. and of the latter 0.7 mg. The operation was satisfactorily completed and the wound healed by first intention. On the day following the operation the patient complained of dull pain in both lumbar regions. The urine was blood-stained, and a heavy brown-red deposit was found under the microscope to consist of red cells and a great quantity of hyaline and blood cell casts. The kidneys were not palpable and there was no rise of temperature. The haematuria gradually diminished, and when the patient was discharged, sixteen days after the operation, the macroscopic appearance of the urine was normal, and it contained no albumin. There were, however, still a few red cells to be seen under the microscope, but no casts. The author points out that there has apparently been no previous record of nephritis following an injection of novocain-adrenalin. The cases of poisoning by this preparation have been distinguished exclusively by symptoms referable to the vascular and central nervous systems. Subcutaneous and subfocal injections of such a small quantity and of such a dilute solution of novocain-adrenalin as given in the author's case have not hitherto caused any toxic symptoms. It may be suggested that the haematuria was independent of the anaesthetic and that the association of the two was purely accidental. The author dismisses this hypothesis, and considers that the rapid development of the haematuria after the operation and the absence of fever as indicative of a toxic effect. But he does not know which of the components of the novocain-adrenalin was to blame; he suggests that in the future the urine should be examined when large injections of novocain-adrenalin have been given.

SURGERY.

30. Projectiles Within the Knee-joint.

COUETAUD (*Bull. et mém. de la Soc. de Chir. de Paris*, April 7th, 1915) has collected notes of 17 cases of projectiles within the knee-joint, the projectiles being within the cavity of the joint in 9 cases and parietal in 8. He found that the intercondyloid space was the site of predilection for projectiles with only a small penetrating force—that is, round balls or large fragments of shells. For making an exact diagnosis radiology appeared to be superior to radiography, but mistakes in the interpretation of the radioscopic appearances had occurred, probably as the result of the inability of some of the patients to adopt the most suitable position for a good result. As a rule, the most serious anatomical lesions were found in the cases in which the projectile was within the cavity of the joint. Moreover, the nature of the projectile largely determined the severity of the wound, and as a rule the severity increased progressively according as the projectile was a rifle bullet, a round ball, or a fragment of a shell. In addition to the danger from the presence of the projectile within the joint there are frequently added those from fissures of the bone and intra-articular spicules of bone. The majority of the patients had suffered from great exertions in the trenches, and the wounds, soiled with mud, were almost always infected when they came under treatment. The first 6 cases recorded were examples in different degrees of osteomyelitis, giving rise to the general phenomena of septicæmia, phlebitis, diarrhoea, nephritis, etc. Operative intervention is obviously required in all cases except in those few in which the foreign body is

small, encysted, and without reaction on the joint. With regard to the operation to be performed the author believes that most frequently the best treatment is by a large crescentic incision, as for suture of a fractured patella. In this way alone can all necessary explorations be made, and foreign bodies which may be multiple removed. An arthrotomy often proves insufficient for dealing adequately with the condition, and has to be followed later by a resection or amputation. Thus in the present series of 17 cases a preliminary arthrotomy had been performed in each of the 3 cases in which resection was needed, in each of 2 cases of amputation, one ending fatally, and in one fatal case in which the general condition of the patient contraindicated a later amputation. The results obtained in the 17 cases were: 2 deaths, 1 recovery after amputation, 3 recoveries after resection, 4 other recoveries with ankylosis, and 7 absolute cures with complete or almost complete restoration of movements. Of the 7 cases of cure no operative treatment was undertaken in 3, in each of which the projectile was embedded in bone; in one the projectile had already been extracted before the patient reached the hospital; in one arthrotomy was able to be performed almost immediately after the infliction of the wound; in 2 no operation was performed at the time, but after an interval of four weeks in one case and eight weeks in the other. Good effects were observed from immobilization of the limb, especially by means of plaster-of-Paris splints with metal clamps, the knee being left uncovered.

31. Disinfection of Surgeon's Hands.

ELLICE McDONALD (*Surgery, Gynaecology, and Obstetrics*, July, 1915) employs a solution of forty parts of acetone, sixty of methylated spirit, and two of pyxol as a germicide for washing of the surgeon's hands before an operation. Acetone need not be chemically pure, and may be obtained from oil and colourmen's shops, as it is used in the arts for removal of varnish. The solution is poured into a vessel big enough to admit the hands, which are immersed in it for one minute. A nailbrush is also employed, and penetration of every crevice. The solution is inexpensive, unirritating to the skin, and efficient. It may be used repeatedly, and though it acquires a sediment, this detritus in no way impairs its efficiency. After obtaining, through laboratory experiments, clear evidence of its bactericidal qualities, McDonald has employed this solution for the surgeon's hands, and for the sterilization of the skin of the abdomen, for over a year with uniformly satisfactory results. In consequence he has found that operation wounds heal more perfectly than after any of the methods of disinfection current among great operators at the present date. McDonald has discarded rubber gloves, but fortifies the skin with a hand varnish which is easily applied.

32. Rupture of the Intestine by Compressed Air.

STAFER (*Munch. med. Wochn.*, March 9th, 1915) records the case of a lad, aged 15, who was cleaning a machine with compressed air when, unintentionally, he blew dust into the eyes of his companion. In a passion his companion forced the nozzle, through which the compressed air was escaping under a pressure of 6 to 8 atmospheres, into the lad's anus. This happened between 10 and 11 a.m. At 2 p.m. the lad was admitted to hospital much cyanosed and with an anxious expression. Respiration was laboured and superficial and the whole body was bathed in sweat. The lungs were displaced upwards, the action of the heart very regular, its sounds were normal, and the pulse was small and 120. The abdomen was distended like a drum, and was everywhere tympanic. There was some blood about the anus, but a rectal examination was negative. The temperature was 37.2° C. and the urine was normal. The patient was perfectly conscious and complained of severe abdominal pain. The history of the case and the condition of the patient indicated rupture of the intestine. Laparotomy was therefore performed under general anaesthesia, an incision being made in the middle line between the umbilicus and the symphysis. When the peritoneum was divided offensive gas escaped with a loud hissing sound and the abdomen collapsed. The intestines and peritoneum were inflamed and masses of blood were found in the pelvis. Faecal peritonitis was diagnosed and the abdominal wound was enlarged upwards to ensure a better view. Between the pelvic colon and the splenic flexure fifteen ruptures of the serosa were found and sutured. The serosa of the transverse colon was completely torn longitudinally and, just below the hepatic flexure, there was a longitudinal rupture extending for about 6 cm. Through this rupture faeces had escaped into

the abdominal cavity. The caecum and the colon were resected almost as far as to the middle of the pelvic colon, with which the ileum was connected by a termino-lateral anastomosis. The abdominal cavity was cleaned, a Mikulicz tampon was inserted, and the wound partially closed. The patient rallied after the operation, but next day fever, vomiting, and hiccup came on and he died at 3 p.m.

33. Congenital Defects of the Anus and Rectum.

BRENNER (*Surgery, Gynaecology, and Obstetrics*, May, 1915) publishes a report, with comments, of 61 cases of atresia of the anus and rectum under his observation. The varieties were as follows: Atresia ani simplex 27 cases, 17 reported as in males, 6 reported as in females, and 4 where sex was not reported; atresia of the anus and vulval outlet 10 females; atresia ani with complete occlusion by a membranous diaphragm 3 cases, 2 male and 1 female; atresia ani with perineal outlet 2, 1 male and 1 female; atresia ani with serotal outlet 2 males; atresia recti 12, 9 in males, 1 in female, 2 sex unreported; atresia recti with vaginal outlet 3 females; atresia recti with urethral outlet 1 male and 1 female. The operative treatment is also tabulated. Perineoplasty (mostly proctoplasties) 29, of which 19 proved successful, 6 died of the operation, 4 died after more or less perfect recovery, the surgical mortality being 24 per cent. Inguinal colostomy 11 cases, 2 successful, 4 died of the operation, 5 later, surgical mortality 66.6 per cent.; perineal dissection for fistulous openings 10 cases, 9 successful, 1 died after recovery, the surgical mortality being nil. Lastly, in two cases colostomy and proctoplasty were combined, one dying of the operation. Brenner observes that this procedure, a novel and unique technique, promises good results in selected cases. He notes that his statistics demonstrate that perineal dissection for fistulous openings gives excellent results, and is a safe procedure. The 29 proctoplasties for anal or ano-rectal obstruction show a mortality of 24 per cent., which is, after all, much lower than before the era of aseptic surgery. Inguinal colostomy, though advised by some authorities as the procedure *ob initio*, is attended with high mortality, 66 per cent., and therefore must be condemned excepting as a last resource.

OBSTETRICS.

34. Detachment of Placenta in Eclampsia.

ZARATE (*Ann. de gynéc. et d'obstét.*, August, 1914-April, 1915) notes how utero-placental apoplexy is known to be a result of puerperal eclampsia, and is probably overlooked in many cases. Essen-Müller detected retroplacental haematoma in 2 out of 23 cases of eclampsia. Zarate, in a Buenos Aires institution, detected and described the same pathological condition in 2 out of 25 cases of eclampsia. He believes that, on the other hand, it is the eclampsia that is overlooked in many cases of detachment of the normally attached placenta. In reports of that complication, more than two-thirds had marked albuminuria. Zarate describes in full the two instances of detachment where eclampsia was recognized, and notes that both mothers and children were lost. The first patient applied for hospital relief in the middle of the eighth month, because she had suffered from a fit a few days previously. The uterus was not tense, the vertex presented, and the patient not seeming very ill was advised to come again three days later. Next day, early in the morning, a second fit occurred and the patient was admitted. In the afternoon, when straining during defaecation, the patient vomited blood. The midwife then noted that there was great dyspnoea, with a pulse of 130, the uterus was perfectly rigid and the fetal heart sounds inaudible. Yet the patient was not anæmic and at first acute hydramnion was diagnosed. The resident medical officer dilated the cervix, the membranes broke, and about two pints and a half of clear amniotic fluid escaped, followed by a pint and three-quarters of syrup-like blood mixed with fresh blood. Basiotripsy was performed, and after delivery the placenta, completely detached, slipped out, with a quantity of clot. The tampon was applied, but in vain, and the patient died although she rallied for a time after an intravenous injection of serum. The second patient was admitted comatose after about ten attacks of eclampsia, the tongue bitten, the lower extremities oedematous, and the urine scanty, dark, and loaded with albumin. Dilatation was complete fourteen hours after admission. The uterus from the first was very tense. An hour after the dilatation delivery occurred, a great mass of coagula coming away. Post-

partum haemorrhage proved very obstinate and therefore hysterectomy was performed, but the patient died under the operation. Zarate figures the uterus. The uterine wall showed great hyperplasia of the connective tissue, with degeneration of the muscle cells. Between the bundles of cells were numerous areas of haemorrhage, some old, others recent. The blood had pushed aside the parallel bundles of muscle cells and there was no line of demarcation between the muscosa and decidua, where the decidua cells were broken up into islets by the haemorrhages. Thus marked local pathological changes may be associated with eclampsia.

35. Chronic Inversion of Uterus: Abdominal Operation.

HEDLEY (*Journ. Obstet. and Gyn. of the British Empire*, January, 1915) reports two cases where inversion occurred during labour and was not reduced for several months. In both he opened the abdominal cavity. A ring was then seen in the normal position of the cervix at its attachment to the vaginal walls, large enough to admit the tip of the forefinger. The Fallopian tubes and broad ligaments were drawn into the ring. Manual attempts proving of no avail in the first case, the ring was divided posteriorly in the middle line with scissors, so that there was a vertical incision involving the posterior wall of the uterus, the vaginal portion of the cervix, and the posterior vaginal wall. The assistant was immediately able to reduce the inversion by very slight pressure from the vagina. The wound was closed with catgut sutures from above downwards. Ventral fixation of the fundus was considered advisable. In the second case Hedley, having opened the abdominal cavity, was able to replace the uterus quite easily by pressing on it through the bladder walls. The drawbacks of making a vaginal examination when the peritoneal cavity was open were thus avoided. The fundus was fixed to the parietes with catgut. Perfect recovery followed both operations. Hedley maintains that the abdominal operation is, as a rule, the proper treatment for chronic inversion. The repositer is slow, tedious, and painful in its action, and the patients are already anaemic, whilst stretching and cutting the cervix from below is only possible in a minority of cases.

GYNAECOLOGY.

36. Post-partum Retroposition of the Uterus: Conservative Treatment.

CHERRY (*New York Med. Journ.*, May 1st, 1915) found that at the Columbus Hospital, New York, out of 2,315 patients applying for treatment within four years, 455 had retro-deviation of the uterus, out of which 325, or 70 per cent., followed abortion or labour. These are of far more frequent occurrence than is generally believed, and would be less seldom overlooked if patients were followed up through the entire period of involution, by bimanual explorations carried on to the sixth or eighth week. Breast-feeding must be insisted upon for at least two months, the tight application of the binder avoided, and small doses of ergot administered. A great many displacements can be prevented by these precautions, and postural treatment must be undertaken later on. The patient must not be kept in the dorsal position. She must be encouraged to lie on her side and abdomen, and as the fundus nears the brim of the pelvis the assumption of the exaggerated lateral prone position with elevation of the hips upon pillows should be practised. Mild exercises must be enforced several times daily so as to hasten involution by increasing the general muscular tone. They should begin on the second or third day after delivery, beginning with the arms, then the lower extremities, and, later, the abdominal muscles. The result of this preventive, conservative treatment is that the patient is saved from permanent pessary life and from operations which do not by any means give permanently satisfactory results.

37. Autoplastic Transplantation of Human Ovary.

NATRASS (*Med. Journ. of Austral.*, January 16th, 1915) performed Caesarian section on a woman, aged 17, subject to great pelvic contraction owing to disease of the right hip joint, which was still in an active condition, as a sinus over the great trochanter discharged pus freely. The operation was undertaken on March 7th, 1911. A full-time female child, weighing 6 lb. and measuring 19 in., was extracted alive. In order to prevent further conception, the ovaries were excised and transplanted into the anterior abdominal wall. The ovaries after amputation were

dropped into normal saline solution at 98.4° F., and divided longitudinally through the hilum. As much of the stroma as possible was cut away with curved scissors, as Natrass found from previous experience in transplantation in the lower mammals that the transplanted ovary degenerated in direct proportion to its thickness and density, as abundance of fibrous stroma arrests the free permeation of nutritive fluid. The sheath was then separated from the anterior surface of the left rectus abdominis muscle, and when the outer border was quite free the operator grafted on to it the partially split left ovary. The ovary was fixed to the muscle, the edge of the latter lying within the split in the former, with a few catgut sutures. The cut surface of the right ovary was placed on the right external oblique muscle, about two inches from the middle line and fixed with catgut sutures. It was thus quite subcutaneous. The patient weaned her child in August, 1911. On September 24th the catamenia returned, lasting three days, moderate and painless. The periods continued fairly regular, always moderate in amount, and usually quite painless; but sometimes the patient knew when they were due by tenderness in the grafted ovaries, usually most marked in the right, which was subcutaneous. On September 6th, 1914, three years and a half after the operation, Natrass saw the patient and found her in good health; the uterus was of normal size and the periods were regular. The right or subcutaneous graft could be easily felt, the left could only be defined by the sickening sensation which the patient felt when it was pressed.

THERAPEUTICS.

38. The Sitting Position in Pneumonia.

MILLE. E. COTTIN (*Rev. méd. de la Suisse romande*, May 20th, 1915) has made an extensive study of the results of allowing pneumonic patients to leave their bed for part of the day. She tells how this plan came to be adopted by C. Widmer (*Munch. med. Woch.*, May 26th, 1914); he was surprised to find that in eight severely delirious patients of his who left their beds the delirium disappeared, fever diminished, and there was rapid disappearance of the pneumonic symptoms; none of these patients died. Later, he treated 55 cases by this method, and advised early resort to it; he found that the patients realized the benefit of sitting on a sofa or taking a short walk in the room; they felt they were free from the notion of being ill, and their pain was relieved. A period of four hours' sitting daily was found sufficient; temperature fell from 3° to 2°, the frequency of respiratory and cardiac movements diminished, blood pressure increased, and a feeling of euphoria was experienced. Mille. Cottin has treated a large number of cases thus: She selects for description 20 of the gravest cases, ranging in age from 20 to 80. Some were allowed to get up on the day after their entry into hospital; others a few days later. As a rule, the hours from 2 till 6 p.m. were selected, owing to their convenience. The patients, clothed in a dressing-gown and a covering for the legs, were helped by a nurse on to an armchair close to the bed. On being comfortably settled, they were encouraged to give their impressions of the change of posture, and especially to give warning when they wished to return to bed. Only one asked this after two hours' sitting. He said he "did not feel bad, but he had had enough." The others would gladly have remained seated beyond 6 p.m. had it been possible. No one made any complaint; all wished to renew the experiment on the following days; some even swore when bedtime came, especially one patient, who felt a stitch in his side only when recumbent. Asked what they thought of the sitting treatment, they said they breathed much more easily, expectoration was more abundant and less painful, sweating ceased, and they enjoyed a pleasant euphoria; they also appreciated the relief from the incessant need to arrange their pillows comfortably. Objectively, Mille. Cottin noted that cyanosis became much less intense, respiration slower and deeper, pulse fuller and often slowed by 10 to 20 beats a minute. In a fat, delirious, alcoholic pneumonic, aged 55, it was found that his pulse, which was very irregular during recumbency, became perfectly regular every time he was seated. The same thing was seen in a case of double pneumonia, where the patient's cardiac state was so grave that the physician hesitated momentarily as to the wisdom of trying the treatment. Usually the temperature fell from some tenths of a degree to 1°, and it was lower in the evening after sitting than in the morning during recumbency in bed. In no case

was any cardiac faintness or weakness induced by sitting. The author thinks that sitting for part of the day should be adopted more often in pneumonia than it has hitherto been, and even in other acute respiratory affections, but she would not try it in all pneumonias. The earlier it is tried the better, and she specially urges its use in those who are dyspnoic, congested, and arrhythmic, and in those whose hearts are nearest to exhaustion, for she finds that cases of cardiac insufficiencies gain more relief by it than any other cases. The benefit she attributes partly to derivation of blood to the lower limbs and partly to increase of diaphragmatic breathing. In support of this belief, she found that after sitting for two hours there was an increase of $\frac{1}{2}$ cm. in the thigh and calf of one patient, and in another patient, while sitting in bed with the legs extended, there was on the sound side a pulmonary expansion of $\frac{1}{2}$ cm., whereas with the legs hanging over the edge of the bed it rose to 3½ cm. (It seems probable that the mere hanging of the legs out of bed might well be tried in cases in which sitting up out of bed appeared inadvisable.) The results obtained were as good in women as in men, but it was found that pneumonias of the upper lobe were less influenced in their evolution than those of the lower lobe.

39. Injections of Alcohol in Trigeminal Neuralgia.

LEIVISON (*Hospitalstidende*, May 5th, 1915) has treated 28 patients, suffering from trigeminal neuralgia, with injections of alcohol. In 12 cases the observation period was sufficiently long for an estimate to be made of the permanent effects of this treatment. Of the 7 who were "cured," 4 were given only one injection each, and 3 required several injections. The remaining 5 patients were relieved of pain for periods ranging from three to twelve months. Of the 16 patients whose treatment had been started only about a year earlier, 11 had shown no relapse, 2 had relapsed, 1 had benefited only slightly, and 2 had derived no benefit from the treatment. The author has practised injecting alcohol into the Gasserian ganglion in the dead body, and has twice succeeded in the living subject, the injection into this ganglion on one occasion being unintentional. The danger of wounding blood vessels is slight, and only on two occasions did blood escape from the needle and a haematoma develop. But, though the patients in both these cases were debilitated, no complications ensued. It was difficult to limit the injections of alcohol to the trigeminal nerve, and in 1 case headache and paralysis of the oculo-motor and abducens nerves were provoked, probably because the needle had penetrated to the cranial cavity. In 2 cases the needle entered the pharynx. But, in spite of these accidents, the author considers the difficulties and dangers of this treatment are no greater than those of other operations on the trigeminal nerve. One drawback to the treatment is the difficulty experienced in locating the nerve affected. In some cases patients suffering from marked supraorbital neuralgia obtained no relief till the second branch of the trigeminal nerve was treated. Patients frequently complained of pain in areas supplied both by the second and third branches, and in areas where the first and second branches approach each other. The author confines this treatment to severe cases, but he considers the prognosis is best in those cases which have not lasted many years. The treatment was of no use in the neuralgia of patients suffering from neurasthenia, hysteria, or melancholia. In one case the neuralgia was traced to malaria and was quickly cured by quinine. Although no stringent antiseptic precautions were taken, no infection followed the injections, probably because of the antiseptic action of the alcohol. As a rule, the benefit derived from the injections lasted longer than that derived from resection.

40. Intradural Injections of Tuberculin in Tuberculous Meningitis.

J. BACIGALUPO (*Muevich. med. Voch.*, February 16th, 1915) has cured 2 cases of tuberculous meningitis by intradural injections of tuberculin. A series of experiments showed him that even in tuberculous meningitis there is free communication between the intradural space and the blood vessels. It would, therefore, at first sight seem sufficient to treat intradural disease with remedies which could reach this space through the blood. In spite of this consideration the author decided to abandon the subcutaneous injection of tuberculin in favour of direct injection of tuberculin into the intradural space. The first injection was given in a case of tuberculous meningitis, which was regarded as hopeless as it was complicated by military tuberculosis. Twenty-four hours later some of the cerebral symptoms abated, but the child died on the third

day after the first injection. A little later, 2 cases of pure tuberculous meningitis were treated in the same way, the diagnosis in these cases being confirmed by the demonstration of tubercle bacilli in the cerebro-spinal fluid. In the course of twenty days both patients recovered completely, two injections having been given in one case and three in the other. In all these 3 cases the intradural injections had the unexpected effect of reducing the temperature by about 1° C. and keeping the temperature at this relatively low level. As there are, apparently, only 22 published cases of recovery from tuberculous meningitis, and as all other methods of treating this disease offer little prospect of success, the intradural injection of tuberculin deserves further trial. Indeed, as this method of giving tuberculin seems harmless, the author recommends it in cases in which tubercle bacilli have not been found in the cerebro-spinal fluid and the diagnosis of tuberculous meningitis is not absolutely certain. The dosage of tuberculin is the same as for other methods of administration. A little more than 1 mg. of old tuberculin may be given in the first injection in a child of 5. If the symptoms are unaffected by the first injection, a somewhat larger dose of tuberculin suspended in cerebro-spinal fluid may be injected twenty-four hours later into the intradural space.

41. Iodine Vapour in Ophthalmic Therapeutics.

BONNEFOY reports his experiences of the use of vapours of iodine in various eye diseases (*Congrès de la Soc. Française d'Ophthalmol.*, Paris, May 4th to 7th, 1914). He obtains the nascent vapour of iodine by heating iodoform in a special ampoule. Iodine vapours have a marked reaction on the eye, provoking pain, conjunctival oedema, and sometimes a fibrinous exudation with congestion of the free borders of the eyelids and a secretory reaction of the lacrimal sac. The vapour has a modifying action on chronic affections of the lacrimal sac, and favourably influences diseases of the eyelids, especially ulcerating blepharitis, as well as corneal ulcers and trachoma with pannus.

PATHOLOGY.

42. Haematology of Mumps.

CH. AUBERTIN and H. CHABANIER (*Archives des maladies du coeur, des vaisseaux, et du sang*, January-February, 1915) have been led to make a study of the haematology of mumps by the fact that the five articles which up to the present have been published on the subject by different workers agree in stating that a mononucleosis is the dominant change, whereas, as a rule, in infectious diseases the essential phenomenon is a neutrophile poly-nucleosis followed by a certain degree of mononucleosis at the time of the crisis and of eosinophilia at convalescence. The authors have investigated 16 cases of mumps. In each case the blood was examined four times a day, and cases were chosen for examination at as early a stage as possible of the disease. The conclusions at which they arrived were that at the beginning of an attack of mumps a condition of polynucleosis is present. The polynucleosis attains relatively high proportions—70 to 79 per cent.—the absolute numbers being in some cases above 7,000 per cubic millimetre. The polynucleosis is only seen on the first, second, or, at latest, the third day of the disease, and it lasts for a very short time at most. If one gland is affected later than the other there is a return of the polynucleosis at the time of swelling of the second gland, even although there may be no return of fever. The polynucleosis is, indeed, to a certain extent independent of rise in temperature and may be sufficiently clearly marked even when the temperature is almost normal. The polynucleosis gives place quickly to a mononucleosis, in which the proportion of mononuclears may be as high as 70 per cent., and their absolute number be 4,500 per c.m.m. There is increase in the three forms of non-granular cells, but the most interesting is the increase in the lymphocytes, which may on certain days reach a proportion of 25, 30, or 40 per cent. At the same time as the mononucleosis is an eosinophilia which may go beyond 10 per cent. This eosinophilia is not one of convalescence, but occurs early and lasts as long as the mononucleosis. Orchitis is accompanied generally, but not always, by a marked polynucleosis, and the fever which may precede any symptom of orchitis is also accompanied by polynucleosis, as was shown in one of the cases here recorded. The discrepancies between the results arrived at by the authors and those by other workers are due to the early stage at which the polynucleosis is seen and to its short duration.

AN EPTOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

43. Glycosuria in Chronic Intestinal Stasis.

ALFRED C. JORDAN (Reprint from the *Proceedings of the Royal Society of Medicine*, 1915, vol. viii, Electro-Therapeutical Section) draws attention to the connexion between glycosuria and chronic intestinal stasis and the changes in the pancreas which occur as the result of the chronic intestinal stasis, causing it to become nodular, a condition of chronic pancreatitis which yields to successful treatment of the stasis. In glycosuria we have usually to deal with the subjects of chronic intestinal stasis, and it is frequently associated with long-standing gastro-intestinal disorders, and occurs in the subjects of rheumatoid arthritis and of Graves's disease, etc. Notes of two cases are given. The first, an officer aged 22, had an attack of appendicitis four months previously, and an abscess in the right iliac fossa was opened, and a pint of pus let out, with a small leaden shot, thought to have been swallowed with some game. A fortnight later phlebitis of the left leg and thrombosis of the femoral vein developed, but he eventually made a good recovery. Ten days prior to examination he became constipated and suffered from flatulence, and the bismuth meal showed extreme delay in the lower end of the ileum, the last coils of which were enormously dilated, and subsequently great retardation in its passage through the large intestine, practically the whole of the bismuth being in the transverse colon after ninety-eight hours. Prior to operation a large percentage of sugar was found in the urine, and the patient died soon after in diabetic coma without the operation having been performed. The second case was that of a woman, aged 47, who at the age of 30 had had Graves's disease, which yielded to treatment by rest, diet, and aperients. Beyond being the subject of chronic rheumatism, she remained in fairly good health till five months before coming under observation, when she complained of thirst, loss of appetite, occasional nausea, and wasting. She became constipated, and the urine was found to contain a large percentage of sugar. Six hours after a bismuth meal half was still in the stomach and half in the lower ileum, the terminal coil of which was tortuous, hyperrophied, and felt like a thick cord, and was firmly tied down in the right iliac fossa. At the end of twenty-three hours the lower ileal coils were still well filled, indicating extreme ileal stasis, and the ileal kink was present. At the end of thirty hours all the bismuth was in the large intestine, but after forty-seven hours none had advanced beyond the middle of the transverse colon, only a little having entered the descending colon, thus pointing to an extreme degree of stasis. This patient died a few days later in diabetic coma, no operation having been possible. On several occasions in other patients slight or transitory glycosuria has been present in the subjects of stasis, and the above two cases point to the very definite relation which exists between diabetes mellitus and chronic intestinal stasis.

44. Clinical Study of Blood-Sugar.

SOLOMON STROUSE, assisted by IRVING F. STEIN and ALAN WISELEY (*Bull. Johns Hopkins Hosp.*, June, 1915), gives an account of the newer methods of determining the amount of sugar present in the blood in health and in disease by the use of small amounts of blood. They give a full description of their technique, which is a modification of Kowarsky's method. They conclude that the method affords an efficient and accurate means of studying blood-sugar in man; that the normal blood-sugar, as shown by a study of 61 determinations, varies from 0.04 to 0.12 per cent. (in one instance 0.14 per cent.), with an average of 0.084 per cent.; that these variations are due to the varying factors in the ordinary day of any normal individual, especially to the diet factor; that carbohydrate in the diet raises the blood-sugar; that the blood-sugar of a normal man describes a curve, reaching its lowest limits before breakfast and before dinner, and invariably showing a rise one hour after meals; and that blood-sugar determinations, to be of any value, must be performed before and after an ordinary meal containing carbohydrate. They relate a case which illustrates the value of blood-sugar determination: A young man had for about thirty

days multiple furuncles which refused to heal despite active surgical intervention. Physical examination showed a very healthy man with no obvious cause for the persistent furunculosis. The urine for several days gave, for a twenty-four hour specimen: Amount 2,500 c.cm., specific gravity 1012; no albumin, no sugar; microscopically nil; certainly not the kind of urine to make one suspect a disturbance of carbohydrate metabolism. Yet because the persistence of the furunculosis suggested diabetes and because the patient's mother had died from diabetes, a study of his blood-sugar was made and a definite alimentary hyperglycaemia was found. The surgeon handed the case over for medical treatment, and a strict carbohydrate-free diet was given. In twenty-four hours the furuncles then present had begun to heal; within forty-eight hours no new ones had developed; and by the end of a few days all the old ones had healed. "In this case the test, as applied by us, was of distinct therapeutic value, whereas had we done only a single examination without relation to diet, we might have missed the post-prandial hyperglycaemia."

45. Hypertrophy of Thymus: Thymus Death.

LE BOUTILLIER (*Archives of Pediatrics*, May, 1915) discusses hypertrophy of the thymus gland and thymus death, with a report of 4 cases. At birth the average normal weight of the gland appears to be about 7.4 grams, but in determining this average the nutritional condition of the infant is of importance, since in healthy infants dying shortly after birth the thymus is much larger than in those who show signs of malnutrition, for in these latter the gland shows decided atrophy in common with other bodily structures. During the first four years of life the gland increases in size, after which it gradually decreases until puberty, when it either disappears or remains in a much atrophied state. While some regard a gland weighing over 30 grams as abnormal, others allow normality up to 15 or 20 grams. Anatomically, the phrenic nerves and pericardial phrenic artery border the thymus on both sides, while its lower pole rests on the pericardium, reaching to the fifth costal cartilage. The posterior surface lies upon the right auricle and ascending aorta, reaching sometimes to the bifurcation of the trachea, and it is in contact on the right with the superior vena cava and right innominate vein, resting above the left innominate vein and upon the trachea, the pneumogastric and recurrent laryngeal nerves bordering it on the left. The gland shares in every disturbance of the general circulation, having a rich arterial supply, but only a single network of veins emerging from it, and from its position its varying shape may cause severe pressure symptoms. Five conditions may result from an enlarged thymus—namely, (1) tracheal stenosis, (2) pressure upon the circulatory system and nerves, (3) status lymphaticus, (4) laryngospasm, (5) dyscrasias caused by its functional disturbances. Of the four recorded cases illustrative of these conditions, one was a case of status thymolympathicus, the direct cause of death being probably pressure on the base of the heart and its ganglions by an enormously enlarged thymus, there being no tracheo-stenosis and no pressure on the aorta or great vessels. The general condition of infants so dying is one of good nourishment with a moderate anaemia, and is the type most frequent in newborn infants or those dying shortly after birth. The second case showed marked pressure on the trachea and a severe degree of tracheo-stenosis, the cause of death being a sudden cutting off of the air supply owing to posture causing absolute compression of an already stenotic trachea. The third case was typical of thymic asthma with paroxysmal attacks of dyspnoea; while the fourth showed the associated condition of enlarged thymus and goitre. Treatment consists of partial or complete removal, the mortality-rate of which is high, but α -ray treatment affords more favourable results, and is the most rational method at the present time. All infants and young children coming under observation, especially those showing slight dyspnoea or cyanosis without obvious cause, should be carefully examined to determine whether there is an enlargement of the thymus, and where the diagnosis is uncertain α rays should be employed to this end. As to the action of the secretion of

the gland, much further study is needed before we can state what part this plays in the causation of sudden death.

SURGERY.

46. Drainage of Abscesses with Steel Springs.

MAX TIEGEL (*Archiv f. Klin. Chir.*, vol. cvi, No. 2, 1915) raises many objections to the use of tampons in abscess cavities. The tampon often obstructs the flow of pus when it has permeated the tampon and has dried on its surface. Pus which has thus been prevented from escaping may be under a considerable pressure in the abscess cavity, the patient's general condition may become worse, and the suppuration may extend further, particularly when tendon sheaths and the interstitial spaces between muscles are involved. A further objection to the use of tampons is the practice of impregnating them with various antiseptics which are toxic and interfere with the formation of granulation tissue. This harmful action of antiseptics is most noticeable when tissues, such as tendons, which necrose readily, are affected. Tampons, again, prevent the satisfactory collapse of an abscess cavity, which, when it has been kept open for some time by a tampon, becomes rigid, owing to the formation of connective tissue, and consequently loses its original tendency to collapse. It follows in such cases that the cavity has to be filled exclusively by granulation tissue. On account of all these objections to tampons the author has devised a new method for the drainage of pus, the margins of the wound being kept automatically open by a weak steel spring, on which small oblong metal plates are fixed so as to grip the tissues with which they come in contact. The strength and size of the spring must naturally vary with the size and character of the wound into which it is to be fitted. The margins of the wound need not be held as far apart as possible, and as a rule a slight degree of separation is sufficient. The pressure exerted by the spring on the wound is very slight, and does not in the least interfere with its healing. As a rule, no appliances are required to keep the spring in place, and it has to be secured by sticking plaster only when the margins of the wound are very flaccid and undermined. When the margins of the wound have been separated by the spring, the discharge is carefully syringed away with normal saline solution or 1 in 1,000 sublimate. The wound is then covered lightly with dry gauze, which is kept in place by a dry bandage. In a few cases there may be a free hæmorrhage that plugging for twelve hours with a tampon may be necessary. After the spring has been in place for twenty-four hours it is removed and the dressing is changed. The wound is subsequently dressed daily, and pus is wiped off. While in place the spring causes no discomfort, but its removal is not altogether painless. This treatment is especially useful in superficial, smooth-walled abscesses, in connexion with the glands of the neck, axilla and inguinal region. It is also excellent in phlegmon of the hand and whitlow. Under this treatment the author has never seen phlegmon of the hand extend beyond the wrist.

47. The Magnetic Compass in First Aid.

BAUDOUIN (*Arch. d'Electr. méd.*, May, 1915) points out that the German bullets, consisting of a core of lead sheathed thinly with ferromnickel, are able, by virtue of this magnetic envelope, to influence the needle of the compass. At a distance of 1 cm. such a bullet made the needle to deviate by as much as 60 degrees. Although Lippmann some months ago recommended the employment of the old Hughes induction balance for detecting the presence of these projectiles in the tissues, no one seems to have thought of using the much simpler compass, which is an instrument largely employed for other purposes in the field. Applied to the wound, it is possible to recognize immediately the presence of this foreign body, at least when the projectile is situated superficially, and especially when it is subcutaneous. The needle may also serve to indicate, by being applied in various situations, more or less the position in which the bullet lies. The author thinks it not a matter of indifference to distinguish at once the nature of the projectile which has entered the tissues. It is well known that the wounds made by these rifle bullets, if the projectiles have not been "dum-dumized," are much less susceptible to infection than the wounds caused by shrapnel, splinters of shell, and so forth. At the base hospitals, of course, more precise methods of detection and localization will be adopted, but in the meantime it is important, if for no other reason than that of sustaining the resistance of the wounded man, that he—

supposing him to be intelligent and well informed—should know that his wound has been caused by the ordinary rifle bullet, and not by a splinter of shell, etc., which would increase the likelihood of infection.

48. Traumatic Aneurysms.

AUVRAY (*Bull. et mém. de la Soc. de Chir. de Paris*, April 20th, 1915) has operated on 15 cases of traumatic aneurysm during the course of the war. Of these, 7 were arterial aneurysms, the arteries affected being the radial artery in 3 cases, the brachial in 2, the ulnar and the superficial temporal arteries each in 1 case. Seven were arteriovenous aneurysms, 2 of which were situated in the axilla, 1 in the upper part of the brachial, 1 at the bend of the elbow, 1 on the superficial femoral towards the apex of Scarpa's triangle, 1 at the level of the popliteal space, 1 in the carotid region, the communication in this case being between the external carotid artery and the internal jugular vein. The diffuse aneurysm occupied the axilla. The arterial aneurysms were not true aneurysms, but were in fact hæmatomata. Sometimes the aneurysm was completely closed, sometimes it communicated with the exterior by one of the openings made by the projectile, and in 3 such cases the author has seen the fistulous opening become the starting point of an infection, resulting in severe secondary hæmorrhages. The treatment in all the cases was by extirpation. In no case was the author satisfied with simple ligation of the vessels, with the accompanying danger of relapse. The injuries in all the 15 cases were too complex and extensive to make it possible to carry out lateral suture in order to preserve the permeability of the arterial trunks. An essential condition for the performance of extirpation of arteriovenous aneurysms is to have a wide opening on to the aneurysm; thus, for aneurysms in the axilla the pectoralis major was divided vertically; for aneurysms in the carotid region the sterno-mastoid was divided horizontally. These large divisions of muscle do not give rise to any serious functional trouble later if the divided ends are accurately sutured together at the end of the operation. In certain cases a tourniquet was applied to prevent loss of blood and to facilitate the dissection. But where the position of the aneurysm made this impossible temporary ligation or compression of the large vessels, as close to the sac as possible, proved of service in lessening the hæmorrhage. The dissection of the sac included the separation of nerve trunks implicated in its walls. The only one of the cases in which the result of operation was thoroughly unsatisfactory was the one of diffuse aneurysm of the axilla. This case did not come under the author's care until three weeks after the injury, and had in the meantime been mistaken for cellulitis. The axilla was packed with cloths and inflamed. Gangrene supervened after the operation, and the arm had to be amputated through its upper third. In another case, in which the nerves of the axilla were included in the walls of the aneurysm and a radial paralysis was present before the operation, the paralysis has persisted up to the present, and a purulent arthritis of the phalangeal joint of the thumb has appeared, with an inflammatory state of the surrounding parts, such that it is not possible yet to say what will be the functional value of the thumb in the future. The results in the other 13 cases were uniformly good.

49. The Stomach after Gastro-jejunostomy.

WEBB AND KINGSBURY (*Archives of Middlesex Hospital, Clinical Series*, No. xiv, December, 1914) have published tables to illustrate an inquiry into the radiographic appearances of the stomach after gastro-jejunostomy. In 8 out of 25 cases examined no bismuth was seen passing out of the gastro-jejunostomy opening. All was apparently passed through the pylorus. Of these eight, four were instances of pyloric stenosis which had so far recovered as to allow of the passage of food through a previously diseased pylorus, despite the presence of an artificial short-circuit. Of eight males who had regained their normal health after the operation, in no less than five, or 62.5 per cent., the food was passing out of the stomach wholly through the pylorus. Among the females, the best clinical results were noted when the pylorus alone was acting, or where the pylorus transmitted the greater proportion of the food taken by the patient. When the gastro-jejunostomy opening was alone patent, five out of eight females were clinically no better for the operation. The patients were asked as to their appetite for fats and carbohydrates, and whether they were able to digest these articles of diet, but no conclusive result could be obtained, so that the investigators were unable to make sure that fats and carbohydrates were better tolerated by those where the pylorus was still patent.

OBSTETRICS.

50. Mortality of the Newborn.

HOLT AND BABBITT (*Journ. Amer. Med. Assoc.*, January 23rd, 1915) issue a report on 10,000 consecutive births at the Sloane Hospital for Women, New York. One-third of the deaths of the first year occur in the first month of life, and seven-eighths of these deaths come within the first two weeks. The hospital receives but few waiting women, nearly all being admitted after labour has begun, and they are regularly discharged on the fourteenth day. Sickly infants are retained beyond that term. The living births amounted to 9,318, the stillbirths (viable fetus 37.50 cm. or over in length) to 499, and the abortions (non-viable fetus under 37.50 cm. in length) to 253. In the first fourteen days 291 infants died, 159 (54.6) were premature—a notable fact; 27 died during the first two hours, such cases not being registered in the Sloane Hospital as stillbirths; 2.5 per cent. died under one week, precisely the same percentage as Kerners of Munich reported in 1912, out of 9,610 living births. The causes of death during the first fourteen days were: Congenital weakness 143, obstetrical accidents not fatal at birth 33, pneumonia 28, atelectasis 25, congenital syphilis 13, malformations 12, haemorrhage 10, sepsis 9, asphyxia 8, accidental 2, undetermined 8. Thus congenital weakness and atelectasis together made up 58 per cent. of the total deaths. The mortality from conditions intimately connected with parturition, namely, obstetrical accidents, haemorrhage, sepsis, and asphyxia made up but 20 per cent. of the deaths of the first fourteen days. The only important disease developing after birth was pneumonia. Stillbirths are one and a half times as many as the deaths from all causes during the first two weeks. Except for the larger part played by syphilis, the causes of stillbirth in no way differ from those which produce death during the first days of life. The great number of deaths from congenital weakness can only be reduced by care of the mother during gestation, whilst the number of stillbirths and deaths from causes connected with parturition may largely be reduced by good obstetrics. The close watching of the infants in a maternity institution renders statistics on early mortality more reliable than statistics based on cases in extreme maternity work or private practice.

51. Incision of Rigid Cervix.

ENRIQUEZ (*Thèse de Paris*, 1915) advocates lateral incisions when labour is solely retarded by rigidity of the cervix, and states that it has been practised for some time in Potocki's wards. He finds that bimanual dilatation, Tarnier's instrument, Champetier de Ribes's bags, and Bossi's dilator which may be an inch or even more in depth. For anatomical and mechanical reasons Potocki makes out a rule. When the fetal head is well engaged, bearing down on the portio vaginalis so that on digital exploration of the fornices the finger can be passed around the entire circumference of the head, then the head has passed beyond the level of the vaginal insertion of the cervix. The rigidity of the vaginal portion being thus made evident, by the time that the os has become dilated to a diameter of 3 cm. (1.17 in.) deep lateral incisions reaching in all cases to the vaginal insertion of the portio will be sufficient. The anatomically uppermost limits of each incision will lie in soft normal tissue above the zone of cicatrix. The fact that the level of the vaginal insertion lies above the cicatricial zone is proved by the examination of a portio which has been avulsed by circular laceration. Enriquez finds that there is no fear of haemorrhage, bleeding only occurring in one recorded case where the upper limit of the incision had been extended above the level of the vaginal insertion. The upper end may be extended by the passage of the fetal head, but as the incisions are lateral there can be no fear of damage to neighbouring viscera. An anterior incision down the portio, on the other hand, may extend into the bladder. There is no special risk of infection. All necessary precautions are taken during and after the operation. In spontaneous labours away from special hospitals, or even from any kind of medical assistance, more or less laceration of the vulva externally occurs in about nine-tenths of the cases, yet bad results are relatively rare. Potocki does not apply sutures, but touches the surface of the incisions with tincture of iodine, and prescribes two vaginal injections daily. Natural cicatrization goes on remarkably well in Potocki's wards and, on the other hand, sutures do not seem to answer well. The forceps is sometimes used after the lateral incisions have

been made, and when the child has died the incisions may be made before the os has become dilated to the extent advisable to await in more normal labours. Basiotripsy can then be performed. Enriquez adds fifteen original reports and five more prepared by other observers.

GYNAECOLOGY.

52. Tuberculous Salpingitis detected through Toxic Irido-cyclitis.

FITZGIBBON (*Journ. Obstet. and Gyn. of the Brit. Empire*, January, 1915) relates that a single lady consulted C. E. Fitzgerald of Dublin in February, 1912, for failing eyesight, and one month later obstinate irido-cyclitis developed in the left eye, greatly impairing vision. Relapses occurred frequently, notwithstanding appropriate treatment, and the patient complained of rheumatic pains whenever the eye symptoms were most marked. In February, 1914, the right eye showed signs of irido-cyclitis. The Wassermann test proved negative and the patient was referred to the author. She was then 37 years of age. On rectal examination, the pelvis was found to be completely blocked by a firm mass, irregular in outline. It pushed the uterus forwards. The catamenia were normal and there was no pain. Abdominal section was performed on April 29th, 1914. Both Fallopian tubes were as big as hen's eggs and all the pelvic structures united into a single mass by dense adhesions. Both the bladder and the rectum were unavoidably laid open during the extirpation of the entire mass. The operation began on the left side, dissecting across the pelvis through the uterus. About the third day the rheumatic pains completely disappeared, and when the patient recovered from the operation the sight had improved. In October, 1914, C. E. Fitzgerald reported that vision had greatly improved in the left eye, and the right eye was also better; the patient could read small type by the aid of correcting glasses and was able to work again, the pain in the eyes, troublesome before the operation, having disappeared. Thus the eye complication was of toxic origin, the tubes being the seat of tuberculous salpingitis.

THERAPEUTICS.

53. Intravenous Injections of Colloidal Copper and Casein in Cancer.

MCCLURG, SWEET, LYON, FLEISHER, AND LOEB (*Arch. of Internal Medicine*, June 15th, 1915) studied the general and localized effects of intravenous injections of colloidal copper and casein in cases of human cancer. Injection of casein solutions were tolerated by almost all the patients without any resulting changes in the veins, but some changes resulted from the injection of colloidal copper, and the more intimate contact of the colloidal particles of metal with the wall of the vein the more marked were the changes, which consisted in an injury to the endothelial cells, rendering them more permeable to fluid constituents of the blood. This endothelial reaction seemed to depend on a sensitiveness variable in different individuals. Dosage commenced with 100 or 150 c.cm. of colloidal copper, being gradually raised to 400 c.cm. or more, the number of injections varying between twenty-five and seventy-three, four or five being given each week. A rise of temperature, accompanied by chill, usually followed, varying directly with the quantity injected, and becoming less marked as the number of injections became greater. The temperature following an intravenous injection of casein was higher than that following the copper injection. An immunity against the effects of casein was produced through repeated injections immediately after injections of colloidal copper. The effects of colloidal copper on the number of erythrocytes varied, pointing to the conclusion that a certain number were destroyed, but that in some cases the reparatory changes sufficed to replace them, while no noticeable alteration followed injections of casein. Leucocytosis often follows injections of colloidal copper and of casein, that following injections of casein being usually more marked than that following injections of colloidal copper. While the transitory effect consists in an absolute increase in the number of polymuclear neutrophils, the long continued effect of such injections given through a considerable period of time produces a relative decrease, with a relative increase in lymphocytes. Two classes of changes on the tumours and their surrounding tissues follow the intravenous injection of colloidal copper and casein, (1) those not repre-

senting healing processes, being characterized as a localized inflammation caused by substances introduced into the circulation at a place distant from the place of injection, and (2) those representing a healing process or a process bringing relief to the patient, as decrease in pain, secretion and putrefaction, and diminution in the swelling in the tissues or in the tumours themselves. Intravenous injections of colloidal copper have a definite effect in a certain number of tumours, while in others they are without any noticeable effect. A measurable reduction in size and shrinking of the ulcerated area may result, leaving no doubt as to the definite effect of the injections on the tumour, while in some cases there may be no appreciable effect on the tumour but marked diminution in the swelling of the surrounding tissues, thus producing a sharp demarcation of the tumour, thereby rendering a previously inoperable condition operable. A diminution in size was also seen in the metastases in some cases, with in others reduction in pain and discharge. In a considerable number, however, no other objective nor subjective improvement took place, and in almost all cases any improvement after a temporary period of progress came to a standstill. Injections of casein were not followed by any such results, or more than a partial destruction of the tumour when the injection had produced an unusually marked general effect, and this partial destruction may result in a localized process of healing. As far as the character and intensity of the local reaction is concerned three periods can generally be distinguished: In the first the inflammatory signs are most prominent, in the second there is a marked decrease in inflammatory reactions, and the third is a period of immunity against the effects of the injections. At present nothing can be positively asserted as to whether an actual destruction of tumour tissue takes place directly or indirectly as the result of the injections.

54. Treatment of Narcotic Addiction.

LAMBERT (*Cornell Univ. Med. Bull.*, April, 1915) urges that patients cannot break the morphine habit on their own volition unless some treatment is at hand to relieve the suffering following upon withdrawal of the drug. The essentials of treatment to obliterate the craving are the persistent administration of a belladonna mixture and the thorough elimination by some form of mercury as a cathartic. In detail, the treatment begins by giving five compound cathartic pills and 5 grains of blue mass, followed by a saline six hours later if necessary. After free action of the bowels the patient is given, either by mouth or hypodermically, in three divided doses, at half-hour intervals, two-thirds or three-fourths of the total daily twenty-four hour dose of morphine or opium to which he has been accustomed, with careful observation after the second dose, which equals four-ninths or one-half of the total twenty-four hour dose. Six drops from a dropper (about 3 minims) of the belladonna mixture are given every four hours for six hours, after which the dosage is increased two drops. The belladonna mixture consists of tinct. belladonnae $\frac{5}{16}$, fluid extract of xanthoxyly and fluid extract of hyoscyamus $\frac{5}{16}$, and this is continued every hour day and night throughout the treatment, increasing two drops every six hours until sixteen drops are being taken. It is continued at this dosage, only being diminished or discontinued if at any time belladonna symptoms develop, and being begun again in reduced doses when such symptoms have subsided. If, however, no dryness of the throat follows after twelve consecutive hours of the full 16 drop dosage this may be raised to 18 or 20 drops every hour until symptoms occur, and then reduced. Ten hours after the initial dose of morphine the five compound cathartic pills and 5 grain blue mass are repeated, and if no action occurs in six or eight hours a vigorous saline is given. When the bowels have acted thoroughly the second dose of morphine is given, which is usually about the eighteenth hour, and the dose should be half the original dose, that is, one-third or three-eighths of the original twenty-four hour daily dose. Ten hours after this second dose the aperient treatment is repeated, and after the bowels have acted thoroughly, at about the thirty-sixth hour, the third dose, and usually the last needed, of morphine is given, which is one-sixth or three-sixteenths of the original dose. Ten hours after this third dose, the cathartic pills and blue mass are again repeated and followed in eight hours by a saline, by which time bilious green stools appear and, when this is so and the bowels have moved thoroughly, 2 oz. of castor oil are given to clear out the intestinal tract. The withdrawal pains and aching are relieved by codein or diionin. The best hypnotic is muscular fatigue, and regular exercise should be begun as soon as possible. Similarly catharsis and the

belladonna mixture are of use in alcoholism, and though the treatment is not offered as a cure for either morphinism or alcoholism it obliterates the craving which accompanies slow withdrawal without medication and so assists in the cure, but it is clearly insisted upon that as long as a man lives after his cure he can never again take any alcohol for any purpose whatever without the risk of going again to excess. Each case has its own individual problems, and the treatment is the best means of unpoisoning the patient and of putting him into a position where we can deal with him with a clear unpoisoned mind.

55. Treatment of Onychia by Ionic Medication.

VOS HUGO (*Arch. Twentgen Day*, May, 1915) has applied ionic medication with good results in the treatment of onychia. The treatment has consisted of soaking the part for a couple of hours by means of a pad moistened with a 5 per cent. solution of zinc sulphate. A thread of lint soaked in a 2 per cent. solution of the zinc salt is gently insinuated within the nail fold, and a pad, zinc terminal, and current are then applied in the usual way. By the following day (in two cases) the angry skin had become pale, and the purulent discharge had given place to a thin sanious fluid, and a few days later recovery was complete. In a more severe case, which for eighteen months had involved practically the loss of the use of the hand, two applications of zinc ions, separated by a ten days' interval, were given. The discharge altered in character after the first application; within six weeks a new nail, with a well-formed lunula, had taken the place of the deformed nail, and there was no further trouble.

PATHOLOGY.

56. Parabiosis and Inoculated Cancer.

M. B. MORPERGO (*Ann. de méd.*, Tome II, No. 3, April, 1915) has carried out a series of experiments on rats in order to determine the influence of parabiosis on the development of inoculated cancer. In the first two experiments rats of the same race, each of which had previously been successfully inoculated with sarcoma, were united by a wide lateral colostomy. In the first experiment the rate of growth of the tumour was at the average rate for one animal, and at above the average rate for the other. In the second experiment one of the artificially united rats remained in a state of good nutrition until shortly before its death, and in this one the rate of growth of the tumour was normal; the other animal fell into a state of general atrophy after the operation, and the growth of the tumour was definitely retarded. In each of the next three experiments a rat which had been successfully inoculated with tumour was joined to one of the same race which had proved refractory to the tumour. In two instances the artificial union was musculo-cutaneous; in the third union animal was again inoculated with the tumour at the time of the operation at a point near to the line of union from which the body fluids could pass from one animal to the other. In one of these experiments the susceptible rat died on the day after the operation; the immune one was separated and lived without any development of the inoculated tumour. In the other two experiments the susceptible animals survived the operation for between two and three weeks; the animals were much wasted and the rate of growth of the tumours was retarded. There was no development of the inoculated tumours in the resistant animals, one of which survived separation. The next four experiments concerned the artificial union of animals of a very receptive race with resistant members of a race of small susceptibility. In no case did the tumour develop in the resistant animal. The conclusions from the experiments are: That artificial symbiosis does not exercise any influence on the development of the tumour, nor on the individual susceptibility of the animal, nor on the degree of susceptibility of which it is possessed by virtue of belonging to a particular race. The retardation of growth in the development of particular tumours is always connected with the progressive atrophy which is observed in the weaker of the couples. Ehrlich's hypothesis with regard to the existence of special nutritive substances on which the receptivity of an organism to a tumour would depend is not confirmed by the experiments, which show that interchange of body fluids between the receptive and non-receptive animals which have been united does not modify the receptivity of either, and that the limit between the receptive and the resistant tissues is exactly the line of union.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

57. Pancreatic Infantilism.

BYRON BRAMWELL records (Reprint from *Edinburgh Medical Journal*, May, 1915) a case of pancreatic infantilism due to defective or arrested pancreatic secretion, and associated with chronic diarrhoea, which was cured by the administration of pancreatic extract, and he gives reference to other cases which have been recorded since he first drew attention to the condition as a definite clinical entity in 1902. The characteristics of pancreatic infantilism are arrested bodily and sexual development, chronic diarrhoea, flatulent distension of the abdomen, and arrested or defective pancreatic secretion, probably due to chronic pancreatitis, the intelligence being good without signs of either mental defect, deformity of bones, or visceral disease. In some cases the chronic diarrhoea and infantilism are completely cured by the administration of pancreatic extract and by that treatment alone. The disease is extremely rare. The patient, a youth aged 18½, had the appearance of a boy of 10, being only 4 ft. 4½ in. in height and weighing 4 st. 7½ lb., the bodily development having been apparently arrested at the age of 10. He was perfectly formed and mentally bright and intelligent. Skiagrams showed that the epiphyseal lines, which should close between the 16th and 18th years, were still unclosed. There were no signs suggestive of cretinism, no inherited syphilis, and no suspicion of rickets or tubercle. He averaged five or six copious, liquid, yellowish-brown stools in the twenty-four hours, and the pancreatic secretion was shown to be defective or completely absent by three separate tests. One drachm of Armour's liquor pancreaticus with 1 drachm of a glycerine extract of steapsin was administered three times daily, and this, with a milk diet for three months, constituted the only treatment, which commenced at the end of 1901. During 1902, 1903, and 1904 the patient took the medicine regularly (except during the autumn of 1902) three times daily, and during 1905 and 1906 twice daily. From 1907 to 1914 inclusive he has been quite well and has not taken the medicine at all. In March, 1915, he reported ten years of good health, regularly at work as a tailor. His height now is 5 ft. 3 in. (an increase of 10½ in.), and his weight, stripped, 7 st. 13 lb. (an increase of 3 st. 5½ lb.), and during the past nine years his bowels have been very regular, averaging one formed motion a day. Before treatment the patient had not grown at all for eight years, but after treatment he began growing, and the sexual development, which was formerly quite infantile, gradually became complete, the patient losing his child-like appearance, and developing a manly voice. Notes of five similar cases reported by others are given, together with notes of two cases of infantilism associated with diarrhoea which were not pancreatic in origin, one associated with anaemia and cured on its removal, and the other with dilatation of the stomach, absence of free hydrochloric acid, and recurring attacks of severe gastric tetany, the infantilism disappearing under gastric treatment.

58. Severe Tuberculin Reaction in a Case of Erythema Induratum.

K. FRUMERIE (*Hygien*, vol. lxxvii, No. 8, 1915) records the case of a patient, aged 18, two of whose nodules had died of pulmonary tuberculosis. She suffered from tuberculous glands of the neck. Since November, 1912, she had been subject during the winter to an exacerbating erythema, which was confined to both legs below the knees, and which was most marked on the outer side of the calves of the legs. Here the skin was cyanosed at certain areas, where cutaneous nodules of various sizes and of fairly firm consistency could be felt. An exploratory excision and a microscopic examination of one of these nodules showed them to consist of much hypertrophied subcutaneous arteries. There was also evidence of chronic inflammation in these nodules. The patient, who presented no signs of a generalized disease, was given tuberculin. Intracutaneous injections at points where the skin was healthy provoked a most violent cutaneous reaction, with haemorrhagic vesicles and ulcerations, at the site of injection. This reaction followed the injection of not only 0.1 mg. of old tuberculin, but also of one-tenth of this dose. The author considers both the erythema induratum and the violent cutaneous reaction to tuberculin as signs of

hypersensibility of the skin to the toxin of tuberculosis, and he regards the erythema induratum as a direct result of the tuberculous glands of the neck.

59. Frontal Sinus Tuberculosis.

J. B. THOMAS (*Journ. Amer. Med. Assoc.*, July 24th, 1915) says that tuberculosis of the frontal sinus must be very rare, judging from the small number of reported cases. It is generally agreed that tuberculosis of the sinuses is secondary in practically all cases to a general or localized tuberculosis of the neighbouring parts, or to both. Perforation of the sinus wall occurs, as a rule, during acute attacks, with damming back of the discharge, pressure necrosis, and thrombosis of the small vessels. Osteomyelitis, or infection of the orbit or cranium, may follow. He gives brief abstracts of the five hitherto reported cases of tuberculous frontal sinusitis, and then reports his own cases. In the first the outer table became perforated and the patient recovered after operation. She attended her mother during a number of years of chronic phthisis and had herself suffered from Pott's disease of the spine, which had left her somewhat deformed. In the second case with osteomyelitis, epidural, subdural, and cerebral abscesses, death resulted. In conclusion, Thomas says there are several factors that tend to protect the frontal sinus from infection; its high position and better drainage, the bactericidal action of the mucosa, cilia, mucus and tears, but a study of the statistics in sinus disease in *post-mortem* examinations of tuberculous patients strongly suggests the probability that it occurs more often than it is recognized. The diagnosis depends on careful bacteriological examination of the sinus secretion, using as large a quantity as possible and employing sedimentation. The so-called anti-forming method is a good one. Animal inoculation may be employed, care being taken to remove the secretion as directly from the sinus as possible. Tuberculin may be of value in the diagnosis. The other sinuses are apt to be involved and complicate the case. The brain complications are chiefly cerebral abscess, with or without meningitis. The treatment after the diagnosis should be early and surgical.

SURGERY.

60. Treatment of Wounds.

W. E. DRENNEN (*Journ. Amer. Med. Assoc.*, July 24th, 1915) records his experiences while serving as a surgeon at the American Ambulance Hospital in Paris in the latter part of 1914 and the early part of 1915. He first mentions the better mental attitude of soldiers than is seen in civilians suffering from similar injuries. The soldiers were also uniformly well nourished and healthy in appearance, showing that they had been well fed, which goes far towards minimizing shock. The modern sharp-pointed steel-jacketed bullet is, despite claims to the contrary, far from being a humane missile. These bullets, he says, are all potentially dum-dums, and, as a rule, turn sideways in the wound on account of the centre of gravity being situated far back, and the least deflection of the point after striking makes the ball turn sidewise, and gives it a wobbling motion, or even makes it rotate on the transverse axis. Modern field artillery consists for the most part of 3-in. field guns and 6-in. howitzers, and the wounds are from the fragments of the shell and the shrapnel. The iron envelope of the shrapnel shell is shattered into thousands of pieces and the wounds are often severe and lacerated, and carry more clothes than dirt into the wound. The region of distribution of injuries shows a greater number of wounds of the extremities and the head. The mortality is greatest with those perforating the spine and abdomen, and next to these, the head. Wounds of the extremities give a comparatively small mortality, the same in both the upper and lower. The battle injuries are estimated as follows: Killed, 20 per cent.; non-transportable, 8 per cent.; requiring transportation, 32 per cent.; slightly wounded and able to walk, 40 per cent. At the base hospital there were no fresh gunshot wounds of the abdomen to be seen. Occasionally a patient with an abscess or other complications was sent in for operation. Acute appendicitis was fairly common. At no time did Drennen see a bayonet wound. The main routine was: First, a radiographic examination to be used

as guides for future operations, many of which were simply dressings under ether. Irrigation with normal salt solution was much resorted to, but he prefers a 5 per cent. solution of bicarbonate of soda. The main point in the treatment of the wound consisted in establishing free drainage. The great complications most feared in military surgery are tetanus and gas gangrene. Cultures were teeming with microbes, and more than 95 per cent. of the wounds suppurated. One point especially noticed in this war, he believes, for the first time, is that infection by tetanus bacilli is apt to recur when operative procedure is carried out on an old wound previously the site of a tetanic infection. A patient may become a tetanus carrier, differing from a typhoid carrier in that he is only dangerous to himself. The other serious complication was gas gangrene, which, contrary to moist gangrene, begins at the edges of the wound. Dr. Jablonski demonstrated to Drennen a phenomenon first observed by himself—namely, the presence of very small subperitoneal blebs, mostly on the intestines but also beneath the peritoneal peritoneal membranes, making their appearance from four to five hours after death. In operating on compound infected fracture, Drennen makes the following recommendations: (1) To make large incisions; it is usually best to make the incision so that it will be dependent. (2) To remove all foreign bodies. (3) To remove all loose or detached pieces of bone. The fingers form a good guide. All pieces that can be removed by the fingers without undue effort should be taken away. (4) To maintain drainage; this is best done by the insertion of large fenestrated rubber tubes. (5) To use absolutely no foreign material of any kind in the wound, such as wire, chromicized gut, or bone plates; the use of these means nothing but trouble. (6) As to the question of amputation, the tendency is rightly more and more toward conservatism. It is now possible to save limbs and restore them as useful members, whereas formerly it would have been entirely correct to amputate. If the economic status of the patient is not to be considered, the question of amputations becomes more and more identical with the question of the limb's viability. With the recent additions to our knowledge in the realms of bone grafting and transplanting, many wonderful results are being obtained. The important points in the after-treatment of compound infected fractures are the maintenance of drainage and extension. In conclusion, Drennen speaks of the amount of plastic surgery that will be required in after-years. All Europe, he says, will be one great laboratory for such constructive surgery, and he who can will do well to avail himself of the opportunity.

61. Self mutilation by Injection of Petroleum.

At a meeting of the Paris Société de Chirurgie held on July 21st, HENRY REYNES (*Progress médical*, August, 1915) reported a case which had come under his observation at Verdun in which a soldier had produced inflammation about the knee-joint by means of injection of petroleum with the object of getting himself sent back from the front. There was no sign of disease or wound. The injections had set up violent inflammation of the tissues, points of softening or suppuration alternating with solid patches of yellowish tissue, mortified by the action of the petroleum, which were gradually disintegrated and eliminated. The smell of the petroleum in the wound, in the pus and in the loosening shreds, are characteristic; it lasts several days. Men who disable themselves in this way are liable to be court-martialled. Similar cases have been observed in civil practice in convicted criminals and accused persons awaiting trial.

62. Fatal Arterio-sclerosis of the Intestine.

J. A. HEDLUND (*Hygien*, vol. LXXVII, No. 9, 1915) records the case of a workman, aged 61, who had been subject for some years to attacks of abdominal pain, which bore no relation to meals. On July 28th he had a severe attack of pain and constipation, which passed off when an aperient was given. But the symptoms recurred on August 3rd, when they were accompanied by vomiting. Frequent emetics afforded some relief, but in the afternoon of August 4th the pain again became severe, and there was complete retention of faeces and flatulence. Examination on August 5th showed diffuse abdominal rigidity and peristaltic movements of the intestine below the umbilicus. An examination with the sigmoidoscope was negative, the liver dullness was normal, and there was only slight hypertrophy of the heart. The pulse was 62, and the radial arteries were somewhat rigid. At long intervals the horizontal outline of a section of the intestine could be detected through the abdominal wall below the umbilicus. A laparotomy, performed on August 6th, showed the surfaces of the ileum and large intestine to be

of a greyish-white colour, thickened and rigid. The ileum was at some points compressed or deformed by adhesions, but these did not actually occlude the intestine. The lower part of the ileum was resected for a length of about 14 metres, and a termino-lateral anastomosis was made between the ileum and the upper part of the sigmoid flexure. The rigid and distended large intestine, thus short-circuited, was tapped at three points, and some gas and faeces were withdrawn. The patient died next day. At the necropsy slight calcareous changes were found in the aorta, the pulmonary artery, and the mitral valve. There were only slight sclerotic and atheromatous changes in the aorta, and the coronary arteries were practically unaffected. The jejunum looked normal except for a few small greyish-white spots scattered over its surface. The large vessels of the mesentery were not macroscopically arterio-sclerotic, but as the vessels were traced towards the intestine they were found to be more and more rigid. In the sub-serosa, which looked milky white, and consisted largely of fibrous tissue undergoing hyaline changes in many places, the blood vessels were much calcified, and at some points their lumen was completely obliterated. The muscular walls of the intestine were hypertrophied as well as infiltrated with fibrous tissue. The mucosa was atrophied, and the submucosa was in some places completely fibrous. The author suggests that the intestinal obstruction was due to lack of peristaltic movements in the rigid sections of the intestine. The disease is exceedingly rare, but one case was reported by Ortner in 1903, and another by Warburg in 1905.

OBSTETRICS.

63. Serum Studies in Pregnancy.

KOLMER AND WILLIAMS (*Lancet*, *Journ. Obstet.*, June, 1915) publish results of experiments conducted by them in the University of Pennsylvania. A placentin, No. 1, prepared by concentration of expressed placental juice, preserved with 1 per cent. glycerine and 0.5 per cent. tricresol, and injected intra-cutaneously, yielded skin reactions characterized by erythema, infiltration, and pain, in 87 per cent. of pregnant and recently delivered women, and in 66 per cent. of women who had borne children but were not pregnant at the time these tests were made. This extract also caused 20 per cent. of the men tested to react slightly. When diluted 1 in 10 with normal salt solution, this extract yielded 80 per cent. positive reactions among pregnant or recently delivered women, and 50 per cent. positive among women who had borne children. A placentin, No. 4, prepared in the same manner as the first extract, except that glycerine was not used in its preparation or preservation, yielded 40 per cent. positive reactions among pregnant or recently delivered women, and 34 per cent. positive reactions among women who had borne children. It is probable that glycerine itself acts as an irritant, especially in the over-sensitive skin of pregnant women. A placentin, No. 2, prepared from the residuum resulting from the concentration of expressed placental juice, yielded 55 per cent. positive reactions among pregnant or recently delivered women. This placentin produced slightly positive results in 20 per cent. of the men tested. A glycerine extract, placentin No. 5, upon cutaneous inoculation, yielded 50 per cent. positive reactions among pregnant and recently delivered women. Of several multiparous and nulliparous women tested, all reacted negatively. "Nephrius," or extracts of male and female kidney prepared in the same way as the placentins, produced a number of positive reactions among pregnant, periparous, multiparous, and nulliparous women. The most marked reactions were observed with the extract of human female kidney. The intra-cutaneous injection of a 1 per cent. solution of a placental extract did not produce reactions among pregnant and recently delivered women.

64. Caesarean Section after Ventrifixation of the Uterus.

G. NYSTRÖM (*Finska Läkaresällskapets Handlingar*, March, 1915) records the case of a married woman, aged 38, on whom ventrifixation of the uterus was performed in March, 1913, for retroflexion and endometriosis. At this operation the right ovary, which was surrounded by adhesions, was removed. The anterior portion of the fundus of the uterus was secured by a silk suture passing through all the layers of the abdominal wall. The serosa of the uterus was not removed at the point of fixation. The patient was discharged on March 28th. Her last menstruation occurred in April of the same year. On February 3rd, 1914,

regular labour pains began, and on the following day, at 6 p.m., the liquor escaped, and the pains became much more severe. About six hours later the cord was found prolapsed, and could not be replaced. On February 5th, at 8.30 a.m., the patient's general condition was satisfactory, the head was freely movable in the pelvis, the back of the fetus was directed towards the right, and the thumbs towards the left. The fetal heart sounds were 130, and only just audible. The external os, which admitted three fingers, occupied a high position in the back of the pelvis; and while its posterior border was thin and yielding, its anterior border was thick and very rigid. The prolapsed cord was pulsating, and all attempts to replace it failed. The risks involved in the use of forceps at this stage were too great, and the chances of rupturing the uterus by performing version were considerable. As reposition of the cord was impracticable, and the fetal heart sounds were unsatisfactory, Caesarean section was undertaken for the sake of both mother and child. At the operation, which was performed on February 5th at 11 a.m., the tubes and round ligaments were found attached low down to the anterior surface of the uterus. This was secured to the anterior abdominal wall by a wide, short adhesion. The hypertrophy of pregnancy was practically confined to the back and fundus of the uterus. It was opened in the middle line, and the incision was carried through the back and fundus of the uterus, where its wall was almost as thin as paper, being only 2 to 3 mm. thick. There was no haemorrhage, and the fetus was removed in a state of asphyxia, which soon passed off. The placenta was detached without great loss of blood from the upper right corner of the uterus. The patient made a satisfactory recovery. The author suggests that the wide, short adhesion between the uterus and the abdominal wall must have been a sequel to injury to the uterus by forceps at the time of the ventrifaction. Or it may have been due to a haemorrhage caused by the needle on which the silk suture was threaded.

65. Normal Period of Gestation in Women.

ROBERTSON (*Inter. Journ. Obstet.*, June, 1915), from a statistical investigation of 511 normal confinements of married women of the labouring classes in a maternity hospital in Adelaide, South Australia, made out the following facts: 247 labours yielded male and 264 female children. The mean length of gestations yielding males was 282.5 days, with a probable error of ± 0.55 days and a variability of 4.47 per cent., while the mean of periods of gestation yielding females was 284.5 days, with a probable error of ± 0.57 and a variability of 4.82 per cent. Hence the periods of gestation yielding females are longer than those yielding males, the probability of the truth of the conclusion based on these estimates being 142 to 1. There is but one, namely, the "normal" period at which the percentage of infants delivered by normal mothers attains a maximum. Subsequently to a very early period in the development of the fetus there is no evidence of a "critical period" in the intrauterine growth of man, such as occurs in the uterine growth of guinea-pigs. The deviation of normal periods of gestation from the mean are fortuitous in origin. The chances are a million to one against a male child being delivered at the termination of an otherwise normal pregnancy before 224 days or a female child before 222 days after the onset of the last menstruation. Hence all seven months children (210 days) may legitimately be regarded as the fruit of pathological pregnancies. The length of the period of gestation is very much less variable in normal females than the weight of the infant which is delivered. From this fact it is inferred that the length of the period of gestation in normal women is primarily determined not by the fetal development, but by a maternal cycle of events which is to a considerable extent independent of the stage of development attained by the fetus.

GYNAECOLOGY.

66. Rupture of Uterus: Prompt Hysterectomy.

FOTHERGILL (*Journ. of Obstet. and Gyn. of the British Empire*, January, 1915), contends that two-thirds of the really serious cases of rupture of the uterus can be saved by prompt abdominal hysterectomy. At St. Mary's Hospital, Manchester, this practice was established just ten years ago: 17 such operations have been performed there with no less than 12 recoveries. The condition of the cases was such that it is doubtful if any of the twelve would have recovered but for the removal of the lacerated organ. Of the 5 fatal cases, Fothergill relates one in full. The

patient was 41 years old. She had already passed safely through fourteen pregnancies, including five abortions. The final, or fifteenth pregnancy, ended five years after the last delivery at term, and four and a half before the last miscarriage. The presentation was transverse, and the patient's doctor turned and delivered. Afterwards, when removing the placenta, he felt a rent in the right side of the uterine wall. She was sent into hospital at once in a state of collapse, pulseless and gasping, and haemorrhage had been free. Abdominal section was performed at once. The lower part of the abdominal wall, in front of the parietal peritoneum, contained much extravasated blood, yet there was relatively little in the peritoneal cavity. The drainage was extensive, the peritoneum was lacerated as far forward as the anterior abdominal wall and the right side of the bladder, and the rent reached backwards nearly to the lower pole of the kidney. The bladder had been detached from all the adjacent structures, except the trigone and lowest part of its left lateral portion. The uterus remained attached to its left anatomical relations, but the lower segment and the cervix on the right side were represented by shreds of tissue and clot. The caecum and appendix and the adjacent colon and ileum were torn from their bed, and the haematoma extended on to the abdominal wall far beyond the infundibulo-pelvic ligament. The uterus was removed, the peritoneum drawn together as well as possible, and a gauze drain left over the seat of injury for forty-eight hours. The patient died on the sixth day, and an abscess cavity, well shut off from the peritoneum, was found in the pelvis, the pus tracking towards both kidneys. As version had been performed and the placenta removed by hand, it was not surprising, Fothergill concludes, that the lacerated wound was infected, yet a fair chance of life was given to the patient by the hysterectomy.

67. Precocious Maturity in Girls.

BEEKMAN of New York (*Arch. of Ped.*, January, 1915) reports an instance where the patient was a girl 6½ years of age, brought to a hospital for impetigo and ringworm. The child looked like a girl of 16, the hair of the scalp thick and long, the mammae well developed with inverted nipples, which were surrounded by a wide pigmented area. An accessory nipple projected under each breast. There was much subcutaneous fat under the integuments of the thorax and abdomen. The pendula showed the conditions seen after puberty. The uterus could be defined on recto-abdominal palpation, whilst the thyroid gland was not enlarged. The child's height was nearly 4 ft. 7 in., her weight 71 lb. Her mother stated that the child was born normally, weighing about 7½ lb. The first teeth erupted at seven months, and she could walk when 9 months old. When 4 years of age and physically quite healthy she commenced to have peculiar fits of laughing, which at times lasted for an hour; consciousness was never affected. Then enlargement of the mammae occurred and menstruation was established and continued, but not with perfect regularity. The child's teachers at school found her as bright as other girls; she was fond of dolls, and played with older children than herself, her younger playmates being frightened at her fits of laughing. Beekman publishes some instructive radiograms showing union of the epiphyses at the elbow-joint and advanced development of the carpal and tarsal bones. Still more important is a radiogram of the skull, where the sella turcica is seen to be deep and the sinuses well developed. There was no evidence, on the other hand, of a hyper-nephroma. Thus this case supports the theory that precocious puberty is due to a secretion of the interstitial cells of the ovaries stimulated to premature activity by the pituitary body, which, according to the radiogram, appears to be hypertrophied. Beekman refers to other cases of this type. The prognosis is unfavourable; such subjects seem particularly susceptible to the exanthemata and the leucosis, because of lowered vitality, and a number have died of neoplastic growths in the brain or ovaries. Yet others have lived to a healthy normal adult life.

THERAPEUTICS.

68. Formol.

H. MORESTIN (*Bull. et ann. de la Soc. de Chir. de Paris*, March 30th, 1915), has, during the last three years, made constant use of a mixture of equal parts of formol, alcohol, and glycerine in the treatment of a large number of septal lesions. The addition of glycerine is of great importance in preventing the too rapid diffusion of formol in the tissues and in reducing the vaporization of the formol.

He finds that formol is specially suited for the treatment of the most severe cases of diffuse suppuration or of gas gangrene. The first case described dated from before the war, and was a case of severe laceration of the soft tissues of the thigh caused by a motor accident. The skin was torn and injured over all the anterior part of the thigh, the muscles were torn and dissociated, the upper part of the femur and the hip-joint were laid bare, and the femoral vessels showed almost uncovered. The patient had lost much blood, and the general condition was bad. Although the patient came under treatment almost immediately after the accident, and the wound was thoroughly opened up, inundated with tincture of iodine and then plugged, yet it suppurated very freely, the torn muscles became swollen and formed projecting masses, and the patient's general condition rapidly grew worse. At this stage formol applications were tried; all the surface of the wound, except in the region of the femoral vessels, was swabbed over with the formol mixture. From the first application the whole aspect of the wound changed, and it gradually diminished in size and depth. Grafting became possible. Recovery was steady, but just when cicatrization was almost complete, the patient looked well and was able to walk about, he left the hospital and was lost sight of. In this case the author believes that, but for formol, death would have ensued. The majority of the other cases described are severe cases of sepsis or gas gangrene, in which formol was used preparatory to amputation. A good example is that of a soldier who was brought in, two days after being wounded, suffering from an open and comminuted fracture of the left leg. Gas gangrene had developed, and the wound had an almost unbearably fetid smell. The general prostration was very great, and he vomited all food. Amputation was clearly inevitable, but was impossible in the present conditions. Under anaesthesia a thorough opening up of the wound was carried out and multiple incisions made in the surrounding tissues. The limb was then treated with formol, which was made to penetrate into all the interstices, and was finally enveloped in formol compresses with an impermeable outer covering. The process was repeated daily until complete analgesia had arrived at. From the third day onward gas was no longer to be detected in the tissues, and the leg and foot were in the cadaveric condition without any trace of putrefaction. Five days later, when the patient's general condition had altogether changed for the better, amputation was performed through the middle of the thigh, and healing took place without any complication. The author looks upon formol as a resource in cases otherwise hopeless. The use of formol is not without drawbacks, and care is needed in its application. It is painful, though the pain yields to morphine. When applied in large quantities and concentrated solution, it leads to mortification of the tissues, and thus might be dangerous if it were left for a long time in close contact with a large vessel. Suppuration may occur under the hard dry scabs, unless careful watch is kept. From the author's experience it would appear that formol may be applied to wounds in as large quantities as may be desired, without any disadvantage resulting from formol gaining access to the circulation. In spite of its inconveniences, the author looks upon formol as one of the most valuable agencies at our disposal.

69. The Treatment of Sciatica by Continuous Extension.

I. SVINDT (*Tjeskrift for Læger*, April 22nd, 1915) reports on the results of continuous extension on sciatica in the Frederiksberg Hospital, where this treatment has been practised during the last five years in every severe case. Twenty-six patients were thus treated, the procedure adopted being the same as for the extension treatment of a fracture of the neck of the femur. A wide strip of sticking plaster was carried down from a point just above the great trochanter to a point a little beyond the external malleolus, and a similar strip was carried down the inner side of the leg from the sulcus gluteo-femoralis to the internal malleolus. Small spiral strips were carried round the leg without encroaching on the knee. A stirrup was fitted to the plaster, and extension was made by a sand-bag hanging over the foot of the bed, which was somewhat raised. After a weight of 4 kilos had been used for a day, it was increased to 7 or 8 kilos, beyond which the adherence of American sticking plaster was found to be ineffective. During the first day of extension it was sometimes necessary to give morphine or aspirin to relieve the pain, which usually disappeared when the weight was increased to 7 kilos. The extension usually lasted three weeks, at the end of which massage and vapour baths were given for eight to ten days before the patients, who

were mainly recruited from the working classes, were discharged. The immediate results of the treatment were on the whole very satisfactory. But one patient could not tolerate the sticking plaster, which provoked a rash, and two patients relapsed even before they were discharged from hospital. Inquiries addressed to patients thus treated were answered by nineteen, of whom seventeen had remained perfectly well since their discharge. A few of these had occasional "sensations" in the leg when the weather changed, but none of them limped. One patient had relapsed six weeks after the treatment, and had been treated at home by extension and massage for about two months, after which he had remained perfectly well. Another patient had relapsed after about six months, but the pain had been much less and had seldom interfered with his work. There were thus seventeen successes and only two partial failures in spite of an observation period which, in some cases, was as long as four and a half years. The results were all the more satisfactory as only the worst cases of sciatica were treated in this way. It may be claimed for the treatment that it is simple, short, cheap, and easily carried out in general practice. Its effect is probably due rather to the absolute rest which it ensures the inflamed parts than to the tension on the nerve, which, considering the weight used, cannot be very great.

PATHOLOGY.

70. Electrical Examination of Sectioned and Compressed Nerves.

IN view of the numerous nerve lesions occurring among the wounded in war, MENDELSSOHN (*Arch. d'élect. méd.*, No. 389, 1915) thinks it desirable to determine the precise diagnostic and prognostic value of electrical examination in cases of divided or compressed nerve. He insists that the reaction of degeneration is a purely muscular and not a nervous reaction, and that the quantitative alterations in electrical excitability observed in a traumatized nerve present nothing like the characteristics of the R.D. syndrome. It is probable that the total section of a nerve causes an immediate and temporary exaggeration of the neuro-muscular excitability in the territory of that nerve. Not until the end of the first week does the peripheral extremity of the sectioned nerve show a notable lessening of galvanic and faradic excitability. The response of the nerve then diminishes progressively, and during this period the paralysed muscles tributary to the nerve may present partial or complete R.D., which in incurable cases gives place to the cessation of all reaction to electrical stimulus. Compression of the nerve, also, introduces modifications in the electrical reaction. These modifications generally follow some little time after the compression, and vary in intensity according to the degree of striction. It is in the compressed part of the nerve that electrical excitability is diminished. The portion of nerve situated above the compressed region also reacts feebly or not at all, while the nerve segment subject to this region reacts normally. Electrical examination can thus furnish a differential diagnosis between compression and complete section, the altered excitability in the first case referring to the portion of nerve situated above the lesion, and, in the second, to the peripheral segment; but it is difficult, if not impossible, to make a differential diagnosis between compression and incomplete section. Thus the diagnostic value of electrical examination is only relative, serving as a means of corroborating functional examination in sections and compressions of complex symptomatology. The prognostic value, however, is of capital importance. Prognosis is favourable when nerve excitability ceases to diminish, and shows a tendency to return to the normal. It is less favourable, though it may still be good when the persistent diminution is accompanied by partial R.D. of the muscle. Even when R.D. becomes complete, the *restitutio ad integrum* is still possible. Only when the abolition of electrical excitability in the nerve becomes persistent at the same time that the muscle, after presenting R.D., ceases to react to all electric stimulus, is the prognosis grave. The prognosis of paralysis by compression with simple diminution of electrical excitability is generally favourable. When the excitability for both currents is sensibly diminished or abolished for the whole length of the nerve, above and below the region compressed, the prognosis is then more serious. Restitution may still be made, but after a longer time. When, however, there is non-excitability of the traumatized nerve, together with complete non-excitability of the muscles served by that nerve, the prognosis is grave, and the case should be considered incurable.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

71. The Heart Muscle in Pneumonia.

L. H. NEWBURGH and W. T. PORTER combat the widely held opinion that the heart muscle is seriously injured in pneumonia and that heart failure from this source is a frequent cause of death in this affection (*Journ. of Exper. Med.*, August, 1915). The experiments performed by them show that the cardiac ventricle from dogs that have died from pneumonia contracts as well as the ventricle from healthy dogs, provided the pneumatic muscle is fed with normal blood. When a normal ventricle is fed with pneumatic blood the contractions are much impaired. If, however, the ventricle from a pneumatic dog is fed with pneumatic blood, the contractions are almost normal in extent and may be normal in duration. Thus, in pneumonia the heart muscle is essentially normal, whereas the pneumatic blood is distinctly poisonous to heart muscle suddenly fed with it. In the body, during the gradual course of the disease, the blood is progressively affected and the heart muscle gradually adjusts itself to the poison with striking success. The authors' experiments consisted of four series of ten dogs each. In the first series the normal ventricle was fed with normal blood; in the second the pneumatic ventricle was fed with normal blood; in the third the normal ventricle was fed with pneumatic blood; in the fourth the pneumatic ventricle was fed with pneumatic blood. The organism employed was the *Bacillus pneumoniae* (Friedländer). The method of administering the culture to dogs is described, and a table is given which shows the average duration of contraction and the total weights of the contraction areas in the four series of ten dogs each. (The conclusions reached by the authors from this experimental study are on all fours with the clinical finding of Mdlle. Cottin (*Rev. méd. de la Suisse Romande*, May, 1915) that the adoption of the sitting position for four hours a day benefits pneumatic patients, especially those in whom the pulse and cardiac state appear to be very feeble.)

72. Recurrent Typhus.

A. F. PLIQUE (*Journ. de méd. et de chir. pratiques*, April 10th, 1915) discusses typhoid infections, and especially deals with the symptoms, treatment, causation, and diagnosis of recurrent or relapsing typhus. He suggests the following four points as a help to diagnosis: (1) Stupor and apathy are much less marked than in the typhoid and paratyphoid infections; often there is excitement at the outset, and delirium towards the fifth day. (2) The pulse is remarkably quick, and may be 120 from the outset, even with a temperature not up to 40° C. (104° F.). (3) The spleen is much enlarged, and is often painful or tender on palpation. The splenic tissue is much softened, so that the enlargement is more perceptible on percussion than on palpation, but both percussion and palpation need to be carried out with some circumspection. (4) Jaundice and bilious vomiting are much more frequent than in other typhoid affections, but even in severe jaundice there is no retention of bile, and the faeces remain coloured. The motile spirillum of Obermeier is present in the blood in large numbers during the febrile period, and examination of a drop of freshly taken blood settles the diagnosis. In the afebrile periods the spirillum can still be recognized in fresh blood from the spleen, but as haemorrhage from the spleen or spontaneous rupture are among the gravest complications of the disease, it is safer to wait for the next febrile attack. Where the diagnosis is not certain, the general treatment of typhoid fever is applicable. Antipyretic drugs are of no use except in the very rare cases in which the temperature remains above 40° C. (104° F.), and they should only be used very cautiously. Quinine has no effect on the parasite, and is only useful where malaria is also present. The application of an ice-bag to the spleen is useful if there is pain in this region, and it might be continued in the afebrile period if the spleen remains enlarged. In the afebrile period the patient must be protected from all fatigue or excess of any kind. Where the diagnosis is clear, specific treatment by arsenic is indicated, and recovery will be speedy. Salvarsan in a dose of 1 centigram per kilogram (0.16 grain per 2.2 lb.), given by intravenous injection either at the beginning or towards the end of an attack, will lead to the disappearance of spirilla from the blood and recovery within a few hours. The dosage of salvarsan is not

without difficulty. Too small a dose appears to immunize the spirilla against larger doses given later, while too large a dose may give rise to a violent reaction which tends to be more violent the more severe the attack. Neo-salvarsan is to be preferred as being equally efficacious and less toxic. Consell and Bienassil have given the very large dose of 1 gram 0.45 per kilogram (22.3 gr. per 2.2 lb.) without inconvenience. A very simple contrivance for the preparation and injection of neo-salvarsan is due to Robert. The method is as follows: The tube in which the neo-salvarsan is delivered has a capacity of 10 c.c.m. When the injection is to be made the tube is broken, and the necessary quantity of water is poured on the powder. The water, which is sterilized and twice distilled, is contained in an ampule of hard glass. The solution is rapidly formed, and when it is complete it is aspirated by a filter aspirator which is adapted to the syringe, and contains in its interior a plug of gauze. This fine filtration has been shown by experience to be absolutely necessary. By use of the ampoules, water which has been distilled several weeks earlier is still available for use. The method of preparation greatly simplifies the use of neo-salvarsan when no special apparatus is at hand. If albuminuria or haematuria be present the dose of neo-salvarsan should be slightly diminished and measures taken to obtain good diuresis. Specific treatment is indicated even for spirillosis occurring in pregnancy, because of the unfavourable prognosis both for mother and child when it is not given. The prophylaxis of recurrent typhoid resembles that for typhus fever, since the transmission of disease is specially due to body lice, though other parasites (head lice, fleas, bugs, ticks, mosquitos, flies) also play an important part. The exhaustion brought about by poverty and by long wars favours the spread of the disease. The mortality from the disease is often not more than 1 to 3 per cent., but in the large epidemics in war it may reach 26 per cent.

SURGERY.

73. Sympathetic Parotitis.

L. MOSKOWICZ (*Der Militärarzt*, No. 8, 1915) records the case of a soldier, aged 26, who was wounded in the right cheek by shrapnel on November 23rd, 1914. A great number of splinters penetrated the cheek in the neighbourhood of the right parotid, where they remained. Soon after he was wounded saliva began to flow from a small wound at the anterior border of the masseter. This flow was greatest while the patient was eating, and it ceased at night. Four days after the infliction of the wound the region of the left parotid, which had not been touched, became swollen. The only discomfort complained of was dryness of the mouth. On November 29th an examination in hospital showed swelling of the right parotid and a little redness of the overlying skin. There was a flow of saliva from a small fistula at the anterior border of the masseter. The swelling of the left parotid was less than that of the right. A firm dressing and a non-stimulating diet effected the closing of the fistula in a week, and it was thus clear that only a small lobe of the parotid, not one of its ducts, had been wounded. The swelling of both parotids persisted, however, for a long time, and gradually the swelling on the left side became greater than that on the right. On January 17th an x-ray photograph taken from behind the head showed fragments of shrapnel only in the right cheek. On a fluid diet the patient gradually lost these parotid swellings, and was ultimately able to eat a certain amount of solid food without provoking them. On January 30th they were scarcely noticeable. Throughout his stay in hospital his temperature was almost invariably normal, and occasional rises to 99.5° F. were due to furunculosis and a hordeolum of the left eye. Discussing this case, the author argues that it is improbable that the patient suffered from mumps, for a bilateral swelling of the parotids, lasting two months and unaccompanied by any appreciable rise of temperature, does not resemble the picture of epidemic parotitis, which, in the absence of suppuration, seldom lasts more than a week or two. The absence of other cases of mumps in the patient's neighbourhood is also against the diagnosis of mumps in his case. The swelling of the left parotid was never painful, and was therefore probably not inflam-

matory. The swelling suggested a condition which, though not described in the textbooks, has already been observed in three cases by the author. Without any apparent provocation, such as a stone in the duct, a swelling of the parotids developed in these three cases at every meal. The only discomforts were the sense of distension and the comical appearance presented by this swelling, which seldom lasted long when the diet was fluid only. In the soldier's case the wound of the right parotid evidently started a bilateral sympathetic parotitis analogous to bilateral sympathetic affections of the eyes.

74. Radiography of the Maxillary Antrum.

The most important view, when examining the maxillary antrum by x rays, is the anterior one, for which the plate is placed against the anterior surface of the head. N. S. PINZI and SECCOMBE HETT (*Archives of Radiology and Electrotherapy*, July, 1915) state that the best angle for this examination is obtained when the normal incident ray passes parallel to the base of the skull and about $\frac{1}{2}$ in. below it. To obtain this view the most convenient procedure is to place the patient flat on his back, with a sand-bag $\frac{1}{2}$ in. to 2 in. thick beneath the occiput, the head being tilted forward. The screen is so arranged as to press just a little on the patient's forehead while at the same time touching his nose. For the oblique view, which also has its importance, the head is rotated a little to one side until the shadow of the zygoma is seen on that side, crossing a rectangular clear space, which is the shadow of the orbit. The position in which the zygoma bisects the clear space will give the two antrums side by side and not overlapping. The antrum best seen in this oblique view, however, is on the opposite side to that on which the teeth are shown. The authors point out that, in the examination of the antrum, radiography and transillumination must not be regarded as substitutes the one for the other. An antrum which appears clear both to x rays and transillumination is unlikely to be the seat of disease. The antrum appears dark by both methods when it contains pus, when there is chronic degeneration of the mucous membrane with pus, sometimes when the antrum has been operated upon, and also when there is a neoplasm. An antrum will be clear on transillumination but dark to x rays when it contains polypi, when there has been a radical operation but the antrum has become healthy, or, probably, when the antrum is occupied by a large dental cyst. An antrum dark on transillumination but light to x rays may mean that there is inflammation with mucous formation, but not old-standing disease; or it may mean merely that there are big face bones.

OBSTETRICS.

75. The Female Pelvis in the Philippines.

ACOSTA-SISON (*Journ. Amer. Med. Assoc.*, May 29th, 1915) has made a study of pelvimetry and cephalometry among patients in the obstetric wards of the Philippine General Hospital at Manila, and published his researches in full in the *Philippine Journal of Sciences*, 1914. The average diameters of the pelvis of the Filipino woman are shorter than those of the pelvis of Europeans and Americans. The relation of one diameter to another is altered in such a way that the proportion of the crests with the spines in the Filipino pelvis is much smaller than the proportion of the same diameters in the European and American pelvis, and that the proportion of the diagonal conjugate with the other diameters in the Filipino is very slightly larger than in the American. These facts, elicited by measurement of 117 cases, would seem to show that the Filipino pelvis is narrower and relatively deeper than the American pelvis. This diminution may be explained by the smaller stature of the Filipinas. Yet, though the pelvis be smaller, the transverse diameter of the pelvic outlet is the same as in the European. This relative width of the outlet, Acosta-Sison believes, is the outcome of the habitual squatting position which the native assumes. The custom of carrying the child astride the mother's or nurse's hip may also play a share in this remarkable relative enlargement of the transverse diameter of the outlet in the Filipinas. The cephalic diameters of the Filipino children are smaller than those of Americans, and are thus in normal proportion with the smaller maternal pelvis.

76. Extruterine complicating Intrauterine Pregnancy.

J. HEYMAN (*Hygica*, vol. Ixxvii, No. 10, 1915) records the case of a married woman, aged 31, who had previously undergone two normal confinements, the last of which had

occurred five years earlier. Menstruation was normal, lasting four days, and recurring at intervals of four weeks. The last menstruation began on October 14th and ended on the 18th. On November 25th there was a scanty, light-coloured discharge of blood. At this date the patient suffered from nausea and vomiting. On December 9th another haemorrhage occurred, and on the following day a large quantity of blood escaped. The right lower abdomen became acutely painful, the patient became pale, and suffered from repeated attacks of fainting, as well as diarrhoea and vomiting. The pulse was over 140, and at times scarcely palpable; the temperature was 99.1°. She was very restless and groaned on the slightest movement. It was therefore difficult to make a thorough examination, but it was ascertained that the abdomen was diffusely distended; its wall, however, was not rigid. There was marked dullness in both flanks. The cervix was enlarged and spongy, and the cervical canal was somewhat dilated. The vulva and vagina were livid and boggy, there was a diffuse resistance in the right fornix, but the pouch of Douglas was empty. The uterus could not be palpated, and there was no secretion from the breasts. The acute abdominal symptoms pointed to extruterine pregnancy, while the condition of the vagina and cervix suggested the existence also of intrauterine pregnancy. It was, however, also thought possible that an intrauterine pregnancy might be complicated by diffuse peritonitis or torsion of an ovarian tumour. A laparotomy showed a large quantity of fluid blood in the peritoneal cavity. The uterus was soft, of the size of a fist, and obviously pregnant. Protruding from the right horn of the uterus was a semi-spherical swelling, almost as large as a walnut, the outlines of which were continuous with those of the uterus, without any distinct line of demarcation. A normal looking Fallopian tube passed out from this swelling, from which it was clearly defined. At the back of the swelling was a 3.5 cm. long rupture, within which an ovum, of the size of a cherry, was found, densely covered with villi. The left uterine appendages were healthy. The swelling in the right horn of the uterus and the right uterine appendages were removed, and the wound in the uterus was satisfactorily closed in spite of the friable state of its walls. The intrauterine pregnancy was not interrupted by the operation, and on January 24th was progressing satisfactorily. The excised tube looked perfectly healthy and was 5.6 cm. long. A probe could be passed from its fimbriated end to the point where the egg-sac, which measured 3.5 by 2.5 cm., united the tube to the uterus.

77. Autoinfection in Obstetrics.

ZANGEMEISTER and KIRSTEIN (*Archiv f. Gynaek.*, vol. civ, 1915) have carried out investigations which discredit the view, commonly held less than a decade ago, that bacteria found in the vagina of a pregnant woman not previously examined have nothing to do with puerperal infection. According to this view, infectious matter is always exogenous, and either the midwife or the doctor is to blame for every infection. But the use of sterilized rubber gloves for every examination and operation have not reduced puerperal infections; and the source of these infections must accordingly be looked for elsewhere. An examination by Kirstein of women in labour, not previously examined, showed the presence in every case of putrefying bacteria on the inner side of the labia majora and minora. In 89 per cent. he also found these bacteria in the lower section of the vagina. In 25 per cent. he found them in the upper section of the vagina and on the cervix. After examination with sterile gloves, a previously sterile vagina was usually found to be contaminated by putrefying bacteria. In other words, infection had been carried from the vulva to the vagina by the examining finger. Zangemeister has made three series of observations on this part played by streptococci in autoinfection. In the first series only 7 per cent. of the women were febrile during the puerperium, whereas 62 per cent. of the women with anaerobic streptococci in the vagina were febrile during the puerperium, and 50 per cent. of the women with haemolytic streptococci in the vagina were febrile during the puerperium. In the second series the respective percentages were 4, 14, and 75. In the third series the respective percentages were 4, 16, and 55. These figures show that streptococci, existing in the vagina before any examination is made, are of importance in the etiology of puerperal fever. Zangemeister insists that bacteria of both the vulva and the vagina may be rubbed into the surface of a wound by the fingers, either during an examination or an operation. Both authors attach great importance to autoinfection as a cause of puerperal fever.

and they define autoinfection as a process dependent on bacteria existing in the vagina at the beginning of labour, before an examination has been made. Kirstein holds that in 90 per cent. of all the cases of "intoxication" fever no one is to blame.

GYNAECOLOGY.

78

Dilatation in Ureteral Fistula.

TOWNSEND (*Surgery, Gynaecology, and Obstetrics*, August, 1915) reminds the operator that the fact that the distal segment of the damaged ureter, in cases where ureteral fistula develops, undergoes atrophic change within a relatively short period appears to indicate that the early trial of dilating the stump through the bladder in a rational attempt to preserve its integrity may save the kidney or at least render a ureteral anastomosis needless. In urethral fistula any stenosis will ensure its perpetuation, and so, Townsend insists, it is with ureteral fistula. He relates some cases which illustrate his teaching. A large uterine fibroma was removed by supravaginal hysterectomy. Severe bleeding occurring from an enlarged branch of the uterine artery, the bleeding area was clamped, the operator then separating the individual vessels and tying them off one by one. A week later the vaginal pads were found soaked with urine, which was seen on examination to issue from the stump of the cervix. Townsend used the cystoscope and catheterized the ureters. A No. 7 catheter passed readily up to the left kidney, and the same instrument could be introduced for an inch and a half along the right ureter till it met with obstruction. Within a few hours after this catheterization, it was found that much less urine came away. Further attempts at dilatation were therefore made. Townsend succeeded in slipping a No. 10 French catheter beyond the obstruction upwards into the renal pelvis. He desired to retain the catheter as in cases of urethral stricture, but to this the patient would not consent. Fortunately the drainage of urine through the vagina ceased at once, and cystoscopy with ureter catheterization showed an equal quantity of normal urine issuing from both ureters. Henceforth the patient had no more trouble, and was restored to perfect health. In another instance the right ureter was torn in the course of an ovariectomy. An end-to-end anastomosis was at once performed. Several days later urine began to soak the abdominal dressings, and the discharge of that fluid became very free. Townsend estimated the output of the left kidney, and then passed a catheter into the right ureter; it met an obstruction about $1\frac{1}{2}$ in. above its orifice. After careful moderate pressure the instrument passed above the point of resistance. A very free flow of urine came away through the catheter, indicating that hydronephrosis had developed. The catheter was retained. Immediately the escape of urine through the abdominal wound ceased. At the end of a week the catheter was removed. Within one hour urine began to issue once more from the abdominal wound. Townsend, who had not ordered the removal of the catheter, tried to reintroduce it, but failed, and ultimately it was found necessary to remove the right kidney. Extensive adhesions had developed, so that the precise pathological nature of the damage to the ureter and the subsequent changes could not be defined. Lastly, Townsend reports an instance of injury to the right ureter in an exploratory operation on a man suffering from an appendiceal abscess. It had been already opened and drained, the appendix being left untouched. In the second operation the right ureter was exposed; no injury was recognized, but five days later urine began to run out of the abdominal wound. Townsend catheterized the right ureter. He met with obstruction just 4 in. above the ureteral orifice in the bladder, but succeeded in getting the instrument to pass beyond the stricture. Urine came through the catheter, and two days later no urine escaped from the wound, which at once began to heal. Ultimately the patient recovered, and perfectly normal urine passed through both ureters. Thus catheterization, when skillfully undertaken, may save the patient from distressing complications, and obviate the necessity of a serious operation.

79. Fibromyoma of Uterus Weighing 92 lb.

PETTY AND PITFIELD (*New York Medical Record*, January 9th, 1915) describe an instance of neglected fibroid disease, adding a photograph of the patient, a widowed negroess aged 54, in Philadelphia. Her history was obscure; she had once been pregnant and aborted, and the abdomen had

been enlarging. She had undergone an exploratory operation, but the tumour was not removed. The patient was exhausted by the weight of the tumour and chronic ileocolitis. She could not lie on her back without support by a nurse. Yet until two months before her death she was able to get about her house. The tumour was a globular mass, freely fluctuating. It measured 48 in. in the plane parallel to the long axis of the body, and 52 in. around the umbilicus. The patient sank, after admission into hospital. The necropsy showed the right lung adherent and the seat of fibroid phthisis, the left completely collapsed, the pleura being filled with clear fluid. The right kidney was riddled with small abscesses, and there was a large collection of pus in the pelvis of the left kidney. The uterine tumour was a fibromyoma with central cystic degeneration; it weighed 92 lb., and the cystic cavity contained $7\frac{1}{2}$ gallons of turbid brown fluid. It adhered to the ovaries and bladder.

80. Neglect of Bladder Symptoms in Gynaecology.

C. E. JOSEPHIN (*Hygiea*, Nos. 5 and 6, 1915) points out that in an almost incredibly large proportion of cases pain in the lower abdomen is due to cystitis, associated in a few cases with pyelitis. The physician often neglects to make a further examination of the urine after failing to find albumin. But chronic cystitis, and even pyelitis, cannot thus be excluded. In every suspicious case a catheter specimen of urine should be obtained and centrifugized, the sediment being stained and examined under the microscope. In many cases there is a history of acute cystitis, which has been relieved by internal remedies. These are only palliative, whereas irrigation with silver nitrate or collargol is radically effective. In chronic cystitis the cystoscope shows a desquamating thickened patch in the trigonum. The urine contains many epithelial cells, but only a few leucocytes. Though pyelitis may not be excluded at first, it is advisable to delay catheterization of the ureters till the result of irrigation with silver nitrate is observed. If the sediment disappears under this treatment, catheterization of the ureters, which in cystitis is not free from danger, is superfluous. The author records the case of a 5-para, aged 39, who had been treated a year earlier for cystitis with drugs given by the mouth. Shortly after menstruation, and as the result of a chill, she developed fever, haematuria, and abdominal pain, which was most severe on the left side. She was kept in bed for a fortnight, and her medical attendant reported that the urine was normal. The author could find no explanation for her symptoms till the examination of a catheter specimen of urine revealed epithelial cells, leucocytes, and diplococci. Cystoscopy showed the thickening of the trigonum characteristic of chronic cystitis, and after the bladder had been irrigated for some time the symptoms disappeared. The author emphasizes the importance for the gynaecologist of the practical knowledge of cystoscopy, neglect of which has led to tumours and stone of the bladder being treated as haemorrhagic nephritis and impacted stone of the ureter being treated with futile irrigations of the bladder. The omission to examine the urine for sugar is also a common cause of mistaken diagnoses by the gynaecologist, and it is not generally realized that, even in young subjects, vague symptoms in the lower abdomen may be due to diabetes. The author confesses to failing to diagnose a case of diabetic neuritis in a young married woman, whose pain was regarded as hysterical till 6 per cent. sugar was found in the urine by a chemist to whom the patient's husband had sent a specimen for analysis.

THERAPEUTICS.

81. Treatment of Neuritis in the Wounded.

DISCUSSING the value of physical agents in the treatment of neuritis following wounds received in war, DELHEM and DUCSSET (*Paris medical*, June 26th, 1915) state that in those cases in which the traumatism has determined a neuritis exclusively sensory as distinct from a motor neuritis or a mixed neuritis, radioradiotherapy has proved very efficacious. The irradiation should take place more particularly in the region which is the site of the traumatism, as many ports of entry being utilized as possible on a length of some centimetres around the point where the nerve has been involved. It is the authors' practice to give on each region an amount of radiation equivalent to 5 Holzknecht units in three sittings, separated each by some days' interval, and after having received the full dose of rays the region is left alone for three

weeks. Among other procedures the authors recommend ionization, either with sodium salicylate or quinine. It is doubtful whether these medicaments exercise a marked action on the nerve trunks, but they may exercise a very real sedative action on the nerve endings at the skin. Diathermy also is efficacious, while the hot-air douche frequently has a sedative value for simple neuralgias. Of all the sedative methods, however, treatment by galvanization (of which ionization, indeed, is a variant) is frequently the most efficacious. The intensity is as high as the patient can support—20 to 50 milliamperes—with well-padded electrodes. When there is overexcitability of the skin, however, the galvanic current should be utilized at a feeble intensity or be replaced by another procedure. All the above may be classified as sedative methods. Of revulsive methods the simplest is faradization. To excite the nerve terminals with the maximum of effect it is essential that the skin should be dry, in order that the current may be localized to the tegument. The revulsive method, other examples of which are the static spark, high-frequency currents, and Hertzian friction, is not indicated in neuralgias with hyperaesthesia, trophic troubles, or too acutely painful manifestations. This is, however, the method of excellence in neuralgias which are torpid, or in the painful manifestations consecutive to traumatism only involving the small nerve filaments of a region. In the treatment of traumatic motor neuritis the continuous current is the best procedure, while mechanotherapy and thermolumino-therapy have their various indications.

82. Novocain in Epididymitis.

ASCH (*Amer. Journ. Surg.*, June, 1915) reports good results from the injection of novocain in acute gonorrhoeal epididymitis; 6 c.c.m. of a sterile 1 per cent. solution of novocain were injected directly into the epididymis with an ordinary hypodermic syringe with a very fine needle. The fluid was evenly distributed throughout the inflamed area by reinserting the needle in different parts without withdrawing it through the skin. One injection of 6 c.c.m. was usually sufficient, but in some cases two were given. Pain ceased directly, and the temperature became normal in forty-eight hours. The swelling subsided in two or three weeks. The author claims that this method is painless, and can be carried out without confining the patient to bed.

83. Blood Transfusion by Citrate Method.

LEWISOHN of New York (*Surgery, Gynaecology, and Obstetrics*, July, 1915) practises blood transfusion with the aid of sodium citrate. The donor is put on a table, a tourniquet applied to the arm, and the vein punctured with a cannula. The blood is received in a sterile graduated glass jar (500 c.c.m.) containing 25 c.c.m. of a 2 per cent. sterile solution of sodium citrate at the bottom. While the blood is running into the glass jar it is well mixed with the citric solution by means of a glass rod. After 250 c.c.m. of blood have been taken, another 25 c.c.m. of citrate solution are added. If less than 500 c.c.m. be taken as in infants, the amount of citrate solution added to the blood is reduced accordingly. In cases where Lewisohn expects to take more than 500 c.c.m. of blood, he has ready to hand another glass container (500 c.c.m. capacity) ready to be used in exactly the same manner. The glass jar containing the blood is then set aside and covered with a towel in order to safeguard against contamination. It is not necessary to immerse the jar in hot water or to surround it with an asbestos covering. The blood is then taken either into the recipient's room or the recipient is brought into the operation room. Thus more than one of the disadvantages of direct arm-to-arm transfusion are avoided. The recipient's vein is then punctured or exposed by a small incision; the cannula is next introduced and attached to a salvarsan flask or a glass funnel. It is advisable to fill the rubber tubing connexion between flask and cannula with some saline solution so as to prevent air from getting into the circulation. After the connexion is made, the blood is poured into the salvarsan apparatus. It is advisable, above all in free transfusions, to stop the flow of blood from time to time by compressing the rubber tubing. After the blood has been injected the cannula is removed, and the transfusion is thus complete. The whole procedure can be performed with the greatest ease and without any hurry, for, as experiments have shown, the citrated blood can be kept for two or three days in the glass jar without danger of clotting. The method has been employed by Lewisohn in 23 transfusions on 18 patients—operable carcinoma, 3 cases; pre-operative transfusions, 3; purpura haemor-

rhagica and allied conditions, 5; lymphatic leukaemia, 1; severe anaemia, 2; gastric haemorrhage, 2; actinomycosis, 1; puerperal sepsis, 1. Out of these 18, 4 were transfused twice within short intervals. Polyuria was noted in a few cases without any morbid changes in the urine. A marked rise of temperature was detected in five patients, associated in three cases with a chill after the transfusion. Though there were three chills in Lewisohn's own series, this complication, he reminds us, is yet more common after transfusion by other methods, Lindeman reporting no less than 22 chills in 62 cases where simple saline solution was injected. The results were fairly satisfactory, but the total was, as Lewisohn admits, too small for definite conclusions, and more than one patient neglected advice, or, in hospital cases, insisted on discharge before complete convalescence. Citrate transfusion seems, the author maintains, as good, on the whole, as any of the older methods, and is superior to them in its extreme simplicity. Lewisohn therefore feels assured that it has come to stay.

PATHOLOGY.

84. Urino-genital Tuberculosis in the Male.

ON a basis of 200 necropsies in which tuberculosis of the urino-genital system was found in the male, SIMMONDS (*Deut. med. Woch.*, January 21st, 1915) draws the following conclusions: Without exception, urino-genital tuberculosis is accompanied by tuberculosis of other organs. In 43 per cent. of all cases of urino-genital tuberculosis there is combined disease of the kidneys and bladder. (This combination occurs only in 8 per cent. of all cases of urino-genital tuberculosis in the female.) The disease almost invariably spreads from the kidney downwards, but the process may be reversed when the bladder is obstructed, and possibly also when antiperistaltic movements of the ureters are induced. In the genital system the disease may spread either way. When it spreads towards the testicle, antiperistaltic movements of the vas are usually to blame. The disease may spread from the genital to the urinary system, and from the urinary to the genital system; but it also happens in combined urino-genital tuberculosis that the disease has started simultaneously from different centres. In the genital system, the prostate is most often affected, being involved in 76 per cent. of all cases. The vesiculae seminales come next with 62 per cent., and the epididymis with 54 per cent. In 40 cases in which only one organ of the genital system was diseased, this organ was the prostate in 20 cases, the vesiculae seminales in 10 cases, and the epididymis also in 10 cases. In other words, in uncomplicated genital tuberculosis the prostate is affected in every other case, and the vesiculae seminales or epididymis in every fourth case. It is from these three centres that tuberculosis spreads in the genital system in either direction. The histological changes are usually the same, whether the disease has spread by the blood or by the ducts of the genital system. Only in the prostate—and then only in a few cases—are interstitial metastatic miliary nodules found. On the other hand, microscopic, subepithelial tubercles of the urethra are very frequently found associated with tuberculosis of the prostate. Tuberculosis of the testicle is either interstitial and metastatic, or the result of extension of the disease from the epididymis and through the lymphatic channels of the seminal vessels. The prognosis of genital tuberculosis is bad, and every third case ends fatally with miliary tuberculosis and tuberculous meningitis. The importance of the part played by genital tuberculosis in the causation of tuberculosis of the brain is shown by the fact that genital tuberculosis has been found in 50 per cent. of all men dying of tuberculous meningitis. The prognosis is worst for tuberculous necrosis of the vesiculae seminales and prostate. Spontaneous recovery from tuberculosis of the vesiculae seminales is exceedingly rare, whereas tubercles in the testicle often heal of themselves. In cases of bilateral disease of the epididymis, an operation should be confined to removal of the whole of one testicle and excision of the epididymis belonging to the other testicle, which should be left in place for the sake of its internal secretion. The author pleads for more frequent removal of the vesiculae seminales, in combination with castration, than is usually the case. In 20 cases in which castration had been performed before he made the necropsy, death being due to other tuberculous lesions in 19 of these cases, he found that the prostate was invariably diseased, and the vesiculae seminales involved in 17 cases.

AN EPILOGUE OF CURRENT MEDICAL LITERATURE.

MEDICINE.

90. Raynaud's Syndrome: Raynaud's Disease.

OSBORNE (*Amer. Journ. of Medical Sciences*, August, 1915) discusses Raynaud's disease, and gives notes of 11 cases illustrating the varying grades of severity of the syndrome, it being urged that this, as every disease, severe in its entirety, may occur in mild forms, or even in "missed" cases. The condition is one of such vascular disturbance as to cause more or less complete anaemia, or a prolonged passive hyperaemia of various parts of the body, internal as well as external. Though no definite cause has been discovered, the syndrome occurs mostly in women, and is frequently associated with disturbances that are recognized as due to disturbances of the thyroid gland or of the menstrual function. There may be a local spasm of the arterioles or venules, or of both, and, if of the arterioles, the cyanotic type of congestion occurs, preceded by an anaemia; while, if of the venules alone, a hot congested form simulating erythromelalgia may occur, the associated symptoms being pain, coldness, numbness, impaired function, and trophic disturbances, as evidenced by eczemas, blisters, ulcerations, or even gangrene. In a few instances the syndrome is the cause of abdominal and nervous disturbances. The grades of severity are as follows: (1) Cases so mild as not to be recognized, the patients suffering from cold hands and feet, irregular pains in various parts of the body, and there may be so much contraction of peripheral vessels as to cause dilatation of internal vessels, especially the abdominal, causing attacks of diarrhoea, albuminuria, ovarialgia, etc. (2) Cases of medium severity in which iciness of hands and feet, chilblains, sore fingers, headaches, and erythromelalgic symptoms of red face and red hands occur. Faintness, dizziness, disturbances of vision, and recurrent albuminuria or haematuria may be present. (3) Severe cases with deep ulcerations of fingers and toes, and serious cardiac, cerebral, or abdominal symptoms. (4) Rarely, more serious cases presenting such uncontrollable spasms of the blood vessels as to cause gangrene and sloughing, or even possibly fatal heart attacks. The disease is not a distinct entity but a syndrome caused by the disturbance of one or more internal secreting glands. Primarily there is no real disease of the blood vessels, but vasomotor control is so abnormally upset as to produce profound contraction of certain vessels, with possibly abnormal dilatation of others. Though probably more than one of the ductless glands is at fault, there always appears to be some disturbance of the thyroid secretion, and thyroid treatment improves the majority and cures some of these cases, while nitro-glycerine and local heat are among the remedies affording temporary benefit.

86. Idiopathic Necrotic Tracheo-bronchitis.

IN the last six years C. HART (*Berl. Klin. Woch.*, April 19th, 1915) has observed four cases of necrotic tracheo-bronchitis, to two of which he has applied the term "idiopathic." These cases were distinct from the necrotic tracheo-bronchitis of diphtheria, measles, and scarlet fever, and there was nothing in the history to suggest that steam or chemicals were responsible. One patient was a musician, aged 18, who was admitted to hospital much collapsed. The abdomen was very rigid, the temperature was 38.4, the respiration was weak and superficial, but there was only slight dullness on percussion over the lungs. Perforation of the gastro-intestinal tract was suspected, but a laparotomy revealed nothing amiss. The patient died soon after the operation, and a few hours before death he developed loud tracheal rales, and brought up about two teaspoonsful of blood. At the necropsy the pharynx and tonsils showed no disease. There was also no false membrane anywhere in the respiratory tract, but, from the glottis to the small bronchi, the lining of the respiratory passages was of a dirty grey colour, and yielded a little dirty matter when scraped with a knife. The microscopic examination showed this matter to consist of a homogeneous detritus and numerous diplococci. There was much blood-stained froth in the small bronchi, and the pleura of the right lower lobe was covered by a recent fibrinous exudate. The lungs were rigid, heavy, and dark red on section, and, on light pressure, yielded much frothy blood. Throughout the substance of the lungs there were

numerous areas, no larger than a small coin, which were more dark, firm, and prominent than the rest of the lung. They were not, apparently, identical with pulmonary infarcts, to which they bore a superficial resemblance. The tracheo-bronchial glands were softened and enlarged, and on section their appearance was moist and haemorrhagic. The lining of the aorta contained some small fatty foci, but the remaining organs were healthy, and there was no septic enlargement of the spleen. A microscopic examination of the trachea and bronchi showed complete necrosis of the mucosa. Even the subepithelial elastic fibres had been destroyed, as well as the ducts of the mucous glands as far as their course ran through the mucosa. In the submucosa the blood vessels were much dilated and congested, and were surrounded by an irregular, round-celled infiltration. The blood vessels of the lungs were also much congested, and clumps of leucocytes and masses of bacteria were found scattered throughout their substance. Though both his cases were rapidly fatal, the author believes the disease in its milder forms may be a precursor of bronchiolitis fibrosa obliterans, which runs a chronic course.

87. Family Periodic Paralysis.

EDSALL AND MEANS (*Amer. Journ. of Medical Sciences*, August, 1915) report their observations upon a case of family periodic paralysis as regards its chemical pathology, summarizing the results of former investigators upon the neurology, urinalogy, etc. The patient was a male, aged 35, presencing typical periodic attacks, lasting from six to forty-eight hours, of complete flaccid paralysis of all the skeletal muscles except those of the face, eyes, and deglutition. Normal respiration was not involved, but the accessory muscles were affected. The disease had been in the family for six generations. The patient came into hospital for a month merely for the purposes of investigation, the clinical aspect of the case having been already fully described by Taylor in 1898 in the *Journal of Nervous and Mental Diseases*. Save for an enlarged spleen, physical examination was negative, there being no signs of cardiac weakness during the attacks, such as is described by other observers. Examination of the urine gave negative results except for a rather high amount of indican, which increased during the attacks. The basal metabolism was determined, and, with a view to discovering whether any acidosis occurred during the attacks, the alveolar CO₂ tension was investigated, when a striking fall was noted which suggested the presence of an acidosis during the attacks. After leaving hospital he remained for four months on a low protein (no meat) diet, during which time he was singularly well and free from attacks. After returning to a general diet, he had several mild attacks during the first month, since when he has been better than ever in his life. Of all the observations the fall in CO₂ tension, as shown by two entirely different methods, was the most striking, and this is probably due to an increased sensitivity of the respiratory centre caused by some intoxication. Sufficient positive findings were obtained to warrant the hypothesis that the disease is one of metabolism rather than of nervous origin, and the question of acidosis and the hydrogen ion concentration of the blood require further investigation. A low protein diet is certainly worthy of a trial, and may, over a long period of time, have some influence over the number and severity of the attacks.

SURGERY.

88. Quinine after Operation.

EDMOND BONNET AND A. H. CLEVELAND (*Journ. Amer. Med. Assoc.*, August 7th, 1915) describe a method of administering quinine murate. Ten grains, dissolved in 2 oz. of water at 100° F., are given by the rectum immediately after operating; this is followed by saline proctoclysis or—in septic cases—by 6 oz. of olive oil. The quinine is repeated every six hours for from four to six doses. In large or stout individuals the first two doses are given four hours apart. If the saline proctoclysis is used it should follow the quinine in about thirty minutes for the best results. The post-operative backache has been practically eliminated, and only about 2 per cent. suffer

any gas pain to speak of, and, if so, one enema relieves. Post-operative nausea and vomiting are less frequent and reduced in duration, though vomiting occurs. Frequently a single stomach wash ends all nausea and vomiting permanently. Post-operative thirst is delayed, and is absent in 60 per cent. The patient usually has a free bowel reaction within twenty-four hours when morphiae has not been given. The treatment is of special advantage when there is much trauma, and did not interfere with pregnancy in a pregnant woman. It has been used in only 2 cases following chloroform. One did well, but in the other it had to be discontinued, as exsanguis appeared. When it is used after chloroform the authors advise waiting until the patient has regained consciousness. Patients feel comfortable after operation, and morphiae is seldom, if ever, required. Sodium bromide (20 grains) was associated with each dose of quinine in fifteen laparotomies with good results, and seemed to reduce the nausea and vomiting. The beneficial action of the bromide so administered was especially marked in 8 gaitre cases. The only complications observed were einchomism in 3 cases and 1 case of drug eruption lasting three days, but the patient did not suffer at all.

29. Partial Resection of Lower Jaw for Cancer.

FOOTE (*Amer. Journ. of Medical Sciences*, July, 1915) records his experience of partial excision of the lower jaw in fourteen patients. Three methods are described: (1) Resection from within the mouth, only suitable for tumours of not greater malignancy than an epulis, or for primary ones in an early stage and not involving the bone; (2) external resection without disarticulation, a course indicated in malignant tumours of the jaw itself, or of the mucous membrane or adjacent soft parts, in which the incision will lie outside the diseased area; and (3) external resection with disarticulation, suitable for malignant tumours situated far back, and especially if recurrent. The chief dangers of operation by external resection arise from (a) anaesthesia, rectal anaesthesia being the ideal, one part of ether (3 oz. to 25 lb. of body weight) mixed with two parts of paraffin oil being injected slowly into the empty rectum half an hour prior to operation; (b) excessive haemorrhage, which should be guarded against from the outset, large vessels being clamped before division; (c) blood in the throat, which can be prevented by a good sized pad of gauze in the mouth frequently changed and clamped as a safeguard against swallowing; and (d) falling backward of the tongue when its attachments are severed—a danger which can be prevented by traction on a heavy thread passed through the tongue. When the digastric and muscles anterior to it are divided the tongue sometimes almost snaps back into the throat, but if held forward for a few minutes this tendency grows less as the remaining muscles become accustomed to the change. For a few hours after operation the patient requires constant watching to guard against recurrent haemorrhage or a blocking of the throat by the loosened tongue, and no nourishment should be given by the mouth until he has shown his ability to swallow water. Several suggestions have been made for preventing the remainder of the jaw from swinging towards the operated side, but, since good functional results follow without resort to wiring or the insertion of a prosthesis, it is best to avoid the insertion of any foreign bodies provided the patient has been freed from the malignant disease. Of the 14 cases operated upon, 13 were males, and the ages varied from 50 to 75, more than half being between 45 and 55. The growth started in the mucous membrane of the jaw in 8 cases, in the cheek in 3 cases, in the angle of the jaw in 2, and probably from the periosteum in 1. Eleven resections were performed for recurrences, and though merely palliative in 4 cases the operation secured a clean mouth for varying periods of time. Ten resections were performed with the hope of a permanent cure, but although such a result is probably too much to expect, the prognosis following partial resection of the lower jaw for cancer is more hopeful than is generally supposed.

30.

Incarceration of the Epiglottitis.

F. PESCHARD (*Ugeskrift for Læger*, March 4th, 1915) records the case of a woman, aged 34, who had been treated for several years by various physicians for hysteria. For many years she had experienced difficulty in swallowing, and the food had often "gone the wrong way." She had to bend her head forward and press her lower jaw downwards towards the chest when eating, and by practising this manoeuvre and eating slowly, she could usually take nourishment without difficulty. She could drink only one mouthful of water at a time, and while

doing so she had to hold her head in the same position. While swallowing she sometimes felt and heard a little click. During the past two years she had also suffered from attacks of pain in the neck, which varied in intensity and were described as burning, stabbing, pricking, or cutting. Sometimes, particularly at night, they were accompanied by a sense of choking. The pain was often so violent, and came on so suddenly, that she had to jump out of bed and sit upright for the rest of the night, struggling with a sense of choking. These attacks occurred most often when she suffered from a cold in the head, on which occasions she usually felt a movable lump in the neck. An examination of the throat showed hypertrophy of the lingual tonsil, particularly the posterior portion, under which the free upper border of the epiglottis was hooked. The posterior surface of the epiglottis was very red, but there was only slight hyperaemia of the larynx. The author succeeded in liberating the epiglottis with a sound, but after the patient had swallowed twice, the epiglottis was again incarcerated. A solution of cocaine and adrenalin was, accordingly, applied, and a little strip of gauze was inserted between the epiglottis and the lingual tonsil, being secured by two strings passing out of the mouth. The patient held her tongue out while a large, flat galvano-cautery was applied to the lingual tonsil under the control of a laryngoscope. After this operation had been repeated three weeks later, the patient lost all her symptoms, the base of the tongue was perfectly flat, and the redness of the back of the epiglottis was diminishing. While most of the symptoms were due to the mechanical effect of the incarceration of the epiglottis, the attacks of choking were probably a reflex nervous symptom.

31. Enteroliths Diagnosed by X Rays.

PFÄHLER and STAMM (*Surgery, Gynaecology, and Obstetrics*, July, 1915) report the case of a woman, aged 40, who complained of soreness in the right inguinal region; she had already detected a rounded, freely movable mass in the right iliac region. Stamm found no abnormal condition of the abdominal or pelvic viscera. X-ray examination was undertaken by Pfähler, in order to eliminate movable kidney, renal tumour, or ureteral calculus. The mass was diagnosed as an enterolith; it transpired that the patient had been subject from childhood to chronic constipation, and had taken large doses of magnesium daily to overcome it. Stamm prescribed abdominal massage, with glycerine and olive-oil enemata taken twice daily in the genupectoral position. This treatment was continued for three months, at the end of which time Stamm removed the enterolith piecemeal from the rectum, as the patient could not expel it spontaneously. The authors add that Le Wald of New York has sent to them a report of a similar case. A girl, aged 17, had been constipated for years and was troubled with constant oozing of mucus from the rectum. A body was detected in the abdominal cavity suspected of being a movable kidney, a tuberculous or lymphadenomatous mass, or a sarcoma or carcinoma. An X-ray examination of the urinary tract gave negative results, but a bismuth meal study showed an elongated sigmoid flexure at the seventy-second hour. A cleansing enema was given, after which a skiagram showed a large globular mass 2½ in. in diameter. The enterolith was removed by rectal instrumentation. The authors also report a third instance where a single woman, aged 42, had been subject for over three years to headaches, nausea, and vomiting. There was constant pain in the left lumbar region, and occasional tenderness over the appendix. Jaundice set in at times. The X-rays showed two opaque bodies in the right iliac fossa, about two inches external to the normal track of the ureter. Injection of the colon showed the bismuth surrounding these bodies in the appendix, and they were removed accordingly. The enterolith taken from the first case was examined chemically, and, as was to be expected from the history, it was found to consist mainly of magnesium phosphate.

OBSTETRICS.

92. Partus Unilateralis in Utero Dydelpho.

V. LUCAS (*Wien. med. Woch.*, March 20th, 1915) records the case of a primipara, aged 29, who menstruated last in the middle of September, 1913, and whose labour began in July, 1914. On the evening of July 4th she sent for a medical man, who found the following condition: The uterus was displaced to the right, its fundus was between the umbilicus and the xiphoid process; fetal heart sounds

were audible above the symphysis, and to the left, above the os pubis, a small prominence, suggestive of the foot of the fetus, was palpable. A vaginal examination showed the head of the fetus to be covered with a thick membrane and displaced to the right. In the left side of the vagina was a channel leading up to the os, which barely admitted the tip of the finger. In spite of careful examination of the introitus vaginae no part of the head could be felt except through the membrane. The patient was admitted to hospital early next day, and when a speculum was introduced into the vagina a very small portion of the head, only about 1 cm. wide, could be seen on the right side, the rest of the head being covered by the membrane. On the left side of the vagina a channel was found, passing up to the os, out of which blood escaped. In the middle of the vagina was a septum, which extended completely across the vagina and formed the membrane covering the fetal head. It was now clear that there was a double uterus, that the right uterus was pregnant, and that the small prominence detected through the left abdominal wall was not a fetal limb, but the left, non-pregnant uterus, from which decidual blood escaped. Expectant treatment was adopted, as the general condition was satisfactory, the pains were adequate, and the rate and rhythm of the fetal heart sounds were normal. At 9 a.m., on July 5th, the patient suddenly became unconscious and convulsed. The pulse was 120, the temperature 100.8°, and the urine contained a trace of albumin. Episiotomy was therefore performed, forceps were applied, and an asphyxiated male child was born. The child recovered rapidly, but weighed only 2,000 grams, and was 40 cm. long. There was no post-partum haemorrhage, the uterus contracted satisfactorily, and the placenta was expelled two hours later. The course of the puerperium was normal, the patient got up on the eighth day, and left the hospital on the twelfth. The correct diagnosis was not made in this case till the vagina was illuminated with a strong light thrown through a speculum. On digital exploration, the finger invariably passed into the vagina of the non-pregnant uterus, for the vagina of the pregnant uterus was filled by the fetal head, which was almost completely covered by the vaginal septum. It is strange that, in spite of the child being small and the pains being strong, labour was not completed spontaneously.

93. Rupture of Gravid Uterus Bicornis Unicollis.

TOVEY (*New York Medical Journal*, April 17th, 1915) was called in consultation on a case of pregnancy at the fourth month in one horn of a gravid uterus. The patient, aged 29, had borne children, and her doctor's assistant had attempted to dilate the cervix and remove the fetus and membranes, but it was found that much difficulty was experienced owing to the abnormal condition of the uterus. The uterine cavity was packed with iodoform gauze. The gauze was removed next day, regular pains having come on, but the pains suddenly ceased and the patient's doctor found her collapsed. A sound was passed into the uterus, and then the ovum forceps was introduced; some omentum was brought down, much to the operator's alarm, but the fetus and placenta were extracted and the uterus irrigated with strong solution of iodine to cause contraction, and it was noted that all the solution came back. Tovey thought that it would be wiser to open the abdomen than to wait. He found a double uterus, and one cornu was gravid and was perforated, a hole of the size of a silver dollar lying close to the septum separating it from the other cornu. The cornual cavity contained a piece of placenta. The opposite non-gravid (right) cornu and its appendages were fully developed. The single cervical canal was perfect and dilated. The pains set up after the packing, when ergot was also administered, seemed in Tovey's opinion to have caused the rupture. The patient recovered.

GYNAECOLOGY.

94. Perforation of Uterus by Chorion-epithelioma simulating Ruptured Ectopic Sac.

HYDE (*Amer. Journ. Obstet.*, June, 1915) writes of a woman, aged 48, who was admitted into his hospital in a state of shock, the face pallid and anxious, whilst no pulse could be felt, and sighing respiration was marked. She was an Italian, and the necessary history could not be elicited. The last period had occurred two months previously, and the patient remained in good health until the day of admission, when she was seized with hypogastric pain while walking upstairs. Ruptured ectopic gestation was diagnosed by an Italian doctor, who sent her to the hospital. The uterus was of the size of a three months pregnancy,

and movable, the cervix large and in normal position, and remarkably tender. The lateral fornices were free, but exploration caused much pain. The patient was placed in the Trendelenburg position, and a morphine administered hypodermically. On the next day abdominal section was undertaken. There was much fluid and clotted blood in the peritoneal cavity. The tubes were found to be normal, but free haemorrhage was discovered issuing from a rent nearly 2 in. long in the posterior wall of the uterus below the left cornu. Perforation by a curette, employed to clear away the products of conception, was suspected, but the patient was in so alarming a condition that the laceration was simply closed with sutures, hysterectomy not being attempted. The patient died within twenty-one hours. The whole of the left side of the body of the uterus was found to be the seat of a new growth, and there were metastatic deposits in the lungs, all bearing the characters of chorion-epithelioma. After the patient's death a clear history was obtained. Sixteen months before the rupture of the uterus the patient was delivered of a vesicular mole, and her Italian doctor made use of the curette. The medico-legal aspect of the case was important, and the fact that there was amenorrhoea was very misleading.

95. Primary Syncytium of Ovary: Hypremestis.

RIES (*Amer. Journ. Obstet.*, July, 1915) reports an instance of deciduoma or syncytionoma of the ovary in a woman, aged 48. She had been about eight times pregnant; in all her four full-term gestations nausea and vomiting had continued from the beginning to the end, and the last ended ten years before the tumour was removed. There had been three, or possibly four, abortions; the last, which took place two years before the last full-term pregnancy, was brought on instrumentally at the second month. In August, 1914, after the patient had been subject for fifteen months to almost continuous uterine haemorrhages, always associated with nausea and vomiting, a tumour was detected in the abdomen. There was great loss of weight. The genital tract was in a prematurely atrophic condition. There was a fibroid as big as a goose's egg in the left horn of the uterus and right ovarian tumour. On September 14th, 1914, supravaginal amputation of the uterus was performed, the appendages being also removed. The ovarian tumour was of the size of a child's head and almost entirely solid. The typical syncytial masses and Langhans's cells, with extensive haemorrhagic and necrotic areas detected on microscopic examination, left no doubt that the tumour was a syncytionoma. No similar new growth was detected in the opposite ovary or in the uterus, nor was any evidence that other organs were involved made clear at the operation. Convalescence was slow, and the patient was discharged on the thirtieth day. Then she began to vomit, attacks occurring nine times on one day. The sickness was treated by the knee-chest position solely, and it ceased completely. Ries finds that his is the seventh authentic case of primary syncytionoma of the ovary on record. He gives summaries of the earlier cases. This kind of tumour is very malignant, yet Ries's case was alive and apparently free from metastases seven months after the operation. It is possible, he admits, that the haemorrhages preceding the appearance of the tumour originated in an abortion.

THERAPEUTICS.

96. Permanent Bradycardia and Atropine.

E. COTTIN (*Archives des maladies du coeur, des vaisseaux, et du sang*, June, 1915) describes two cases of permanent bradycardia—one of organic, the other of nervous origin. The second case is of much interest in view of the fact that up to quite recently it was generally held that true bradycardia of nervous origin was always paroxysmal, never permanent. The first case presented no very special features. The patient was a man 72 years of age suffering from cancer of the stomach. The pulse-rate varied between 38 and 40 per minute, and was regular. A series of tracings were taken. The auricles contracted at the rate of 85 a minute, and all relation between the contractions of auricles and ventricles was broken. Atropine had no effect upon the contractions of the ventricles, nor indeed upon those of the auricles. The absence of effect upon the auricles diminishes the value of the atropine test, but the same phenomenon has been observed by other workers, and in this case it may have been concerned with the advanced age of the patient. At the autopsy the auriculo-ventricular bundle of His was found to be completely invaded by a dense sclerotic tissue, and,

In addition, a small calcareous area was found at the level of the articular origin of the ventriculo-articular bundle. The other patient was a woman 54 years of age, who, since the age of 19, had been subject to so-called nervous crises. From about the same age also a gradual progressive enlargement of the thyroid gland had been observed. The slow pulse-rate was first noticed when she was 26 years of age. At that time the pulse-rate was found to vary between 45 and 55 per minute. Four years later she came under the care of Professor Bari. The pulse-rate was now between 45 and 50: from time to time an extrasystole occurred, and at times extra-systoles were frequent. The heart was not hypertrophied. The upright position, movements, and quick walking had a hardly perceptible and very transitory effect in quickening the pulse-rate. The venous pulse was very apparent, especially in the left jugular vein, sometimes there were three to four rises of the jugular vein to each cardiac contraction, sometimes there were small rises during the ventricular pause, and sometimes a sharp rise due to the simultaneous production of both contractions. At first sight the case appeared to be one of total articulo-ventricular block, but careful examination of the two tracings taken at this period showed that the block was incomplete. In one tracing there was a normal articular response to all the articular contractions. In the second, taken a few minutes later, the ventricular beat was at the rate of 38 a minute, the articular about at 85. The rise of the venous pulse was each time preceded by a wave P, so that the ventricular contraction was provoked by an articular contraction, but, in addition, small rises were observed, which corresponded to articular contractions without any ventricular response, and at one point there was a sharp rise consequent upon the superposition of the articular on the ventricular contraction. The interval of transmission, P-S, was very irregular in both tracings, and in one was found to increase from one cardiac revolution to another, until a length of twenty-six fiftieths of a second was reached instead of the normal ten fiftieths, thus showing a disturbance of conductivity. One of the tracings showed the presence of extra-systoles not followed by a compensating rest, a condition of things which Gallevardin considers to occur only in cases of total block, but which in this case occurred during the period of incomplete dissociation only. At this time the patient suffered from attacks of vertigo and semi-syncope attacks. Later, as in most cases of bradycardia, especially those of cardiogenic origin, the disease entered upon a second phase, in which tracings showed the dissociation to be complete and permanent. The syncope attacks still persisted, but became slightly less frequent, were of longer duration, and were accompanied by total loss of consciousness. During this stage tracings were taken a few minutes and forty-five minutes respectively after the injection of 2 mg. of atropine sulphate. In the first tracing the ventricle was beating at the rate of 38, the auricle at 95, and the independence between the two cavities of the heart was evident and complete. In the tracing taken after forty-five minutes no trace of block remained. The rate of contraction of both auricle and ventricle was 85: the normal length. The effect of atropine was the more striking since movements, walking, fever, all of them causes which lead, as a rule, to quickening of the pulse, had always been without marked influence on the heart rhythm. In this case the bradycardia was undoubtedly of nervous origin, but it is not easy to localize the nervous lesion. The author is inclined to attribute it to excitation of the pneumogastric nerve, possibly due to pressure, direct or indirect, by the goitre from which the patient had suffered for years. Extirpation of the goitre would have decided the point, but the patient energetically refused any kind of surgical intervention.

97. Bulgarian Bacillus in the Treatment of Cystitis.

HAGNER of Washington (*Surgery, Gynecology, and Obstetrics*, July, 1915) directs attention to the report, issued a year ago by Caulk of St. Louis, on the use of the Bulgarian bacillus in the treatment of encrusted cystitis. About ten years since, Young tried to cure alkaline cystitis by the implantation of the colon bacillus, expecting an acid reaction through its growth in the urine. At the same time Hagner himself attempted the cure of a case of cystitis with phosphate deposits of the ureter by Young's method, but the *B. proteus vulgaris* had been isolated before treatment, and it appeared that this germ killed the *Bacillus coli*. North reported the use of the Bulgarian bacillus (Massol's lactic acid bacillus) in 300 cases, but only two were bladder diseases. Caulk and

Hagner have found that the Bulgarian bacillus introduced into the bladder can effect that which the *Bacillus coli* usually fails to do—that is to say, it kills the *Bacillus proteus vulgaris*, the organism most commonly found in alkaline cystitis. A pure culture can be obtained by competent bacteriologists, so that there is no fear of introduction of other germs, nor can the Bulgarian bacillus multiply to a dangerous extent after introduction, as it does not resist its own acid products. Hagner first irrigates the bladder with sterile water. No antiseptic is added lest it should destroy the Bulgarian bacillus. Three or four tablets are then dissolved in an ounce of sterilized water, the mixture being well stirred, as these tablets are only in suspension. The solution is then injected into the bladder with a syringe and the patient is told to retain it as long as possible. Hagner used it with great success in a case where the patient was 76 and had just undergone prostatectomy. The urine was intensely alkaline, and the edges of the suprapubic wound were sloughy and covered with calcareous deposits. The *proteus vulgaris* abounded. The patient's constitutional condition was grave. The treatment was begun and repeated every four hours; a day later the patient's condition was much better, then the slough separated and the wound healed, the patient making an uninterrupted recovery. The treatment has also been adopted in several cases of hypertrophied prostate with frequent micturition, tenesmus, alkaluria, but not much residual urine, and the results have been satisfactory.

PATHOLOGY.

99. Electro-diagnosis of Traumatized Nerves.

LERI (*Paris médicale*, June 25th, 1915) gives the results of faradization applied to all the traumatized nerve cases which have come under his observation since January last. The lesions have had very different aspects in different cases: (1) Nerves normal except for some adhesions to the neighbouring tissues; (2) nerves presenting a thick fibrous sheath adhering to the neighbouring tissue, but conserving their continuity and normal cylindrical form; (3) nerves completely sectioned; (4) nerves crushed and flattened, with a spread-out fibrous membrane more or less thickened; (5) nerves interrupted by a neuroma occupying their entire diameter, or, more exactly, a fusiform, nodular, or moniliform thickening; (6) nerves having what the author calls a lateral neuroma, only occupying a part of their contour, while a more or less extensive portion of the nerve retains its continuity. As one result of his study of the electrical reactions, Leri states that all nerves which have fairly conserved their normal form, having been neither sectioned nor crushed, no matter how dense, thick, or old the fibrous cicatricial tissue which encloses them may be, almost always retain to a certain degree—frequently a very high one—their electrical conductivity. When a nerve has been crushed by a projectile and the two ends, more or less divided, are only kept together by a fibroid membrane or laminae, faradic electrization has proved that the nerve may be considered functionally as completely sectioned. A lateral neuroma, however, practically never interrupts the nerve altogether, and what is still more remarkable, in half the cases examined a central neuroma, or a neuroma total in appearance, was found to impede the electrical conductivity by no means entirely. The neuromas apparently still contain a sufficient number of nerve fibres to assure the nervous conduction in the different muscles. The practical results from the therapeutic point of view are summarized as follows: (1) Never resect a portion of a nerve enclosed in a fibrous or fibrocartilaginous gangue, no matter how hard, thick, or tight that sheath may be; (2) save in exceptional cases, and after careful electrical examination, never resect even total (central) neuromas, still less lateral neuromas; (3) resect only the fibrous membranes which connect the two divided ends of a nerve and suture these ends, as in the case of sections when completely independent; (4) neither in the case of nerves adherent and united, nor in fibromas, is degeneration complete, even at the end of five, six, or seven months. There are chances, therefore, of relieving the constriction and liberating the nerve. In complete sections, with or without any interposing fibroid membrane, the suture of the two ends of the divided trunk appears to be most frequently the only chance of a return to motility. The electro-diagnosis thus furnishes a means of knowing whether a nerve is completely sectioned or only sheathed and neuromatous.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

99. Cerebral Oedema in Chronic Alcoholism.

SCLEETH AND BEIFELD say (*Amer. Journ. Med. Sciences*, June, 1915) that after long-continued over-indulgence in alcohol (seven to ten years) an individual develops delirium tremens for reasons as yet undetermined. The disease usually manifests itself in three stages—the incipient form, the fully developed classical form, and the comatose form (wet brain). The writers, who see about 2,500 cases of alcoholism every year, find that about 10 to 15 per cent. of the cases of delirium tremens pass into the comatose form. The transition from delirium to cerebral oedema is fairly well marked. The semi-coma which succeeds the active delirium is striking, and the delirium now becomes the low muttering type. The symptoms of wet brain are essentially meningeal—semi-coma, generalized hyperaesthesia, and muscular rigidity (Kernig's sign and neck rigidity) standing out prominently; the more marked are the latter two features the graver is the prognosis. The cerebro-spinal fluid is to all appearances normal. The mortality is nearly 75 per cent. Associated with the cerebral oedema complex there is very often a patchy bronchopneumonia, which clouds the diagnosis and is usually responsible for death. Necropsy reveals no gross lesions apart from the more or less marked fluid accumulation in the pia arachnoid space, a widening of the sulci, and a narrowing of the convolutions, to account for the symptoms of changes in the brain. The differential diagnosis must concern itself particularly with the possibility of a concomitant skull fracture, which may easily be obscured by the nervous manifestations of comatose delirium tremens. Among other conditions from which "wet brain" has to be diagnosed are: (1) A grave asthenic form of delirium tremens characterized by profound asthenia, pallor, cold skin, a rolling of the eyes from side to side, and often subnormal temperature; (2) the various forms of meningitis, which can, however, usually be ruled out by the negative bacteriological, serological, and chemical cerebro-spinal fluid tests, according to the type present; (3) uraemic coma, which shows cardiovascular signs, retinal changes, commonly exaggerated knee-jerks, absence of hyperaesthesia, and occurrence of convulsions and vomiting; (4) cerebro-spinal lues; (5) cerebral haemorrhage, thrombosis, and embolism; and (6) certain conditions due to alcohol—namely, pachymeningitis haemorrhagica interna, and the acute superior poliomyelitis of Wernicke; in these, however, gross nervous changes are distinguishing characteristics. The duration of "wet brain" varies; commonly it is about three weeks, but may be from two to twelve. Apart from symptomatic treatment but little can be done. Cardiac stimulants are in order, and persistent efforts must be made to force liquids; in the severer cases nasal tube feeding may be needed. Elimination must not be neglected. The writers have found ergot harmful here, whereas it is useful in the asthenic form of delirium tremens which they have specially described in this paper. Lumbar puncture, praised by Dana, has failed to do good in their cases. They suggest a trial of scientific hydrotherapy whenever it is available.

100. The Effects of Typhoid Fever on the Soldier's Heart.

ROHMER (*Deut. med. Woch.*, July 22nd, 1915) has come to the conclusion that heart failure in patients suffering from typhoid fever is much more common among soldiers on active service than among civilians. The physical and mental strain imposed on the soldier in war are apt to cause more or less severe cardiac symptoms. In the healthy subject these symptoms usually disappear quickly with rest; but the prognosis is far worse when the soldier, suffering from these cardiac symptoms, develops an infectious disease, notably typhoid fever. The author was struck by the frequency with which the subjects of typhoid fever suffered from cardio-vascular symptoms, which often terminated fatally, even when the epidemic seemed in other respects to be running a mild course. Among fifteen fatal cases which came under his observation all but three presented the signs of progressive heart failure. Indeed, in many cases heart failure was the only cause of death. In other cases showing signs of pneumonia the pulmonary symptoms were so slight that the

author believed that death, even in these cases, was due rather to the cardiac than to the pulmonary condition. Some of his patients had continued on active service in the trenches after the development of symptoms; and in these cases the disease ran a particularly severe course, owing to the weakness of the heart. But even in cases admitted early cardiac symptoms were extraordinarily common, and it was exceptional to find a normal heart, even in the subject of a slight attack of typhoid fever. The signs of cardiac insufficiency included diminution or cessation of the first sound over the base of the heart, accentuation of the pulmonary as compared with the second aortic sound, a fall of blood pressure, increased frequency of the pulse, extension of the cardiac dullness, and various systolic adventitious murmurs. In times of peace the vascular symptoms induced by typhoid fever are mainly due to paralysis of the vasomotor centre, leading to relaxation of the blood vessels. The heart meanwhile is seldom directly affected. But under the conditions of modern warfare the symptoms point to a primary cardiac insufficiency, due, no doubt, to the detrimental action of physical and mental exhaustion on the heart. At first the author followed directions from head quarters, and gave early prophylactic doses of digitalis preparations, that is, "digipurat" and "digalen," by the mouth. But he abandoned this procedure because it seemed to do no good, and because it interfered with the intravenous injection of strophanthin when the patient's condition was critical. He found this intravenous medication most effective, and he was also satisfied with the effects of camphor, caffeine, and suprarenin.

101. Some Ocular Complications of Mumps.

FÉLIX RAMOND AND GABRIEL GOUBERT (*Bull. et mém. Soc. Méd. des Hôp. de Paris*, July 29th, 1915) record some little known ocular complications of mumps met with by them in a military hospital. It is not surprising that ocular complications should occur in mumps when we bear in mind the close connexion of the fundus of the eye with the meninges of the brain; in more than 50 per cent. of cases of mumps there is a more or less definite lymphocytosis present, according to some French observers. Out of 115 cases of mumps the writers found in 45 lachrymation of variable intensity, affecting chiefly the bulbar conjunctiva. Many patients complained of visual disturbances, ranging from mistiness of vision up to inability to read more than a line of the newspaper. In one case there was dactylo-adenitis. The fundi of 16 cases were examined; some showed a markedly increased rosy colour of the optic disc; others a softness of the disc, with disappearance of its contour; others an appreciable swelling of the retinal veins; one case showed a congested iris, with a disturbance of the aqueous secretion. In one case there was definite papillary stasis. All these ocular complications were temporary; usually they disappeared with the disappearance of the inflammation of the parotid gland. But sometimes they persisted for a month after the recovery from the mumps. The prognosis is always favourable. In no case was albuminuria seen.

SURGERY.

102. Aluminium Plates to make Good Cranial Defects.

PIERRE DUVAL (*Bull. et mém. de la Soc. de Chir. de Paris*, June 22nd, 1915) describes three cases in which he successfully introduced a metal plate to make good a loss of cranial bone. The loss of bone was very extensive, the dimensions of the gap in one case being 9.5 cm. by 7.5 cm. (3.7 in. by 2.9 in.). In two out of the three cases the operation was rendered to some extent more complicated because the original wound, followed by trephining, had left a large scar, which bound together skin, dura mater, and cortex. Duval employed the only metal at his disposal—namely, aluminium, intended for the making of military equipment, of a thickness of 0.4 mm. (0.015 in.), and this in spite of the fact that a certain amount of absorption was sure to occur. A surgeon dentist assisted by taking an impression of the cranial gap in each case and by preparing the plates. In two cases hammered metal was employed, a margin of untreated metal of 2

depth of 2 cm. (0.78 in.) being left all round the hammered area, which could be cut as required at the operation. In the third case unhammered metal was employed with excellent results, though this might possibly prove to be too malleable. In each case a very large incision was made, much larger than the gap in the bone, in order that the cutaneous suture might everywhere be far outside the edges of the plate. The periosteum was reflected with the skin to the borders of the bone. In the cicatrized area the incision was of a good depth, it being impossible to determine the level of the deep surface of the skin. At intervals round the metal plate small prolongations, 1 cm. by 5 mm. (0.39 in. by 0.19 in.) in area, were cut out, for the purpose, as it were, of hooking the plate on to the skull. The edges of the bone were freshened, and small openings were made in the diploë between the two tables of bone to receive the metal prolongations. Before being definitely put into position the plate was "flamed" at a Bunsen burner. In one case in which the supraorbital ridge was fractured and depressed the plate was shaped into a raised ledge and anchored to the osseous border at the two ends, and the result, when seen after four months, was perfect. In all three cases excellent results were obtained. In the first case—one of depressed fracture of the frontal bone, including the supraorbital ridge—the frontal lobe was found to be compressed. The depressed bone was removed and replaced by the metal plate. The patient had previously complained of violent and continuous headaches, giddiness, supraorbital neuralgia, and of a sense of impairment of memory. Complete recovery followed the operation and the headaches almost entirely disappeared. The second patient had had a complicated fracture of the skull, with infected wounds on the left temporal and parietal regions, with aphasia and right hemiplegia. Trephining had been done a few hours after the patient reached the base hospital; depressed bone in the temporo-parietal region and numerous fragments of bone which had penetrated into the cerebral substance had been removed. When first seen by the author, six months after the injury, the power of movement had returned to the lower limb, and to some extent to the upper limb, but there was much enfeeblement of the memory and of the intellectual faculties, and language remained very imperfect in spite of attempts at re-education. The loss of cranial bone was almost as great in extent as the palm of the hand, and the skin was adherent to the brain over the whole of this area. The plate was introduced according to the method already described, and recovery was complete at the end of five weeks. The third case presented the largest loss of bone, and involved the temporal bone. In this case the plate was curved into a sort of beak, which turned inwards and wedged into the base of the skull. The cases are of interest in view of the large surfaces of bone involved and the success attained.

103. Nerve Repair.

E. G. KIRK AND DEAN LEWIS (*Journ. Amer. Med. Assoc.*, August 7th, 1915), after noticing the uncertainty of results of attempts to repair severed nerves by the various methods in use, say that, while the best results in transplantation are obtained from tissues removed from the same individual, nerves and blood vessels frequently cannot be sacrificed to bridge defects in nerves. A tube formed of fascia that would not collapse and undergo secondary cicatricial contraction would be ideal as the supply is unlimited, and fascia, when appropriate conditions are provided, contracts no adhesions and remains viable. They have experimented with tubulization of the sciatic nerve in forty dogs. Ten of these are still living, from seven days to nineteen weeks after operation, and seven specimens have not been studied histologically. An account is given of the study of twenty-two specimens, the animals having been killed at periods varying from one day to sixteen and a half weeks after operation. After exposure of the nerve and the removal of a section of it, a rectangular piece of the fascia lata was taken. The smooth, shiny under-surface was used for the lining of the tube. Care was taken to avoid injury to the nerve fascia and surrounding tissue, and hæmorrhage was made as perfect as possible. The suture was applied loosely so as not to strangle any portion of the nerve, and hæmorrhage from the nerve ends controlled. The tube was made of sufficiently large lumen to be twice the size of the nerve end to guard against secondary contraction. Dogs of all ages were used. Immediately after death the nerves were excised, stretched on glass tubing, carefully oriented, and fixed. Usually two methods were employed in the histologic study, the most important being the Cajal silver method, as modified by Ranson. The criteria as to the success of bridging are stated. Recovery

of function, which will require months, cannot be used on account of some anatomical peculiarity of innervation in the dog, for fair function returns about as soon as the post-operative tenderness is gone. Improvement in the foot-drop is probably indicative of success, but a failure of it to appear in the earlier weeks does not mean that the defect has not been successfully bridged. The reaction to electric stimulation cannot always be depended upon in estimating the amount of repair, and the best criteria of regeneration are the gross appearance and the histologic findings. Kirk and Lewis give the details as observed after various periods in the experimental animals. The axis cylinders and medullary sheaths of the distal segment degenerate almost completely in the second and third weeks, while a solid downgrowth from the proximal stump gradually invades the pulpy material in the tube. The axis cylinders develop first, most rapidly along the side of the tube, and at the end of the fourth week the gap of 1 cm. or less in length is almost completely filled with a white substance longitudinally striated. By the fifth week the proliferative and regenerative changes are very marked. A serious objection raised against fascial tubulization is its tendency to contraction, but that it can be used successfully was shown by a patient operated on by one of the authors who had a complete return of function after its use. Their experiments showed them that defects in nerves can be successfully bridged by fascial tubes, the time required depending on the length of the defect and the age of the animal. They believe that the possibility of cicatricial contraction of the fascia is precluded when the proper technique is employed, and the fascia inserted only under proper conditions.

104. Subcutaneous Rupture of a Digital Tendon.

A. TROLLE (*Geskrift for Læger*, July 22nd, 1915) describes a case of subcutaneous rupture of the extensor tendon of the fourth finger at the point where the tendon is partly attached to the capsule of the last interphalangeal joint. The patient was a man, aged 37, who had previously been well. After playing tennis, he was pulling his stockings off, when he felt something snap in the fourth finger of the right hand, but he did not otherwise feel any discomfort. Later, he noticed the position of his finger was abnormal, and he could not extend it properly. The ungual phalanx of the fourth finger was held flexed at about an angle of 30 degrees, and it was impossible to extend the finger at the last interphalangeal joint. Under general anaesthesia a longitudinal incision was made, 3 cm. long, in the middle line, from a point just above the nail, upwards; the skin was drawn aside, and it appeared that the last interphalangeal joint was open, the capsule of the joint being transversely torn from one side to the other. The extensor tendon was torn a little above the capsule, and its proximal end was retracted about 1 cm. The tendon and the capsule were sutured with silk, and the incision through the skin was closed. After three weeks' immobilization with plaster-of-Paris, the bandage was removed and the wound was found to have healed. Massage and passive movements were prescribed. Eighteen days later the movements of the finger were normal. A subcutaneous rupture like this is very rare, and can probably only be provoked by sudden extension of the finger at the first interphalangeal joint, while the ungual phalanx is still kept extremely flexed. Even if the lesion be quite small, it must not be neglected, lest the finger become a hindrance to work. The alternatives are, therefore, either to acquire complete mobility by treatment, or else to remove the phalanx. The diagnosis is not difficult, as, on careful examination, the extreme phalanx is found slightly flexed, without being capable of active extension, whereas the passive movements are quite free, and there is no sign of fracture or dislocation. When the rupture is complete, the treatment consists of suture of the tendon.

OBSTETRICS.

105. Diagnosis of Pregnancy.

A SIMPLE method, based on the presence of specific enzymes in the urine, for the diagnosis of pregnancy, a modification of the method of Kiutsi, is described by R. H. MALONE (*Journ. Amer. Med. Assoc.*, May 15th, 1915). Kiutsi's method is the following: By filtering urine of a pregnant woman through animal charcoal, the urine is clarified and protein and peptone taken off. Let it filter through animal charcoal several times until the biuret reaction is no longer positive. Then 5 c.cm. of urine so treated is put into a test tube and 0.1 gram of Kiutsi's placenta is added. The mixture is left for from six to

fourteen hours. The entire liquid is then filtered through a filter paper into another test tube, and 2 c.c.m. of sodium hydroxide is added. After shaking the contents a little, the test tube is held in a slanting position and the copper sulphate solution, in a 1 c.c.m. pipette, is allowed to run slowly on the side of the tube. If, where the two liquids meet, a brilliant purple colour is formed, the reaction is positive; but if no such coloration takes place, the reaction is negative. Kiutsi claims that this method has never missed in his hands, and also claims that he has been able to diagnose cancer, nephritis, tuberculosis, renal glycosuria, and other diseases by this method, using the proper substrate in each case. While Kiutsi is careful not to give the details of his preparation of the dried substrate, which gives an unfavourable impression, Malone has found the method in general so reliable, using his own ways of preparation, that he thinks it of interest. The use of animal charcoal as recorded by Kiutsi for the purpose of removing bodies giving partial biuret reactions was found unsatisfactory, and shaking with kaolin was tried as a substitute. Experiments were made to determine the amount required, the optimum incubation period, the effect of acidity or alkalinity of the urine and of the bacterial growth on the reaction. His method is described: "A freshly-passed specimen of urine from a pregnant woman is tested for albumin by the biuret test. If the test be positive, 15 c.c.m. of urine are shaken with 0.3 gram of kaolin for ten minutes in a mechanical shaker, filtered and retested again; the biuret test should now be negative. If it be still positive, the process must be repeated. Ten c.c.m. of biuret-negative urine are then neutralized with either 1 per cent. acetic acid or 2 per cent. sodium carbonate solution, 0.2 gram of dried placenta added, and the whole well shaken. The shaking I find essential. Toluene 0.5 c.c.m. is added to restrict bacterial growth. The mixture is incubated for twelve hours, filtered, and 5 c.c.m. tested by the biuret test. If negative, the remaining 5 c.c.m. are left in contact with the substrate, incubated for four hours longer, and tested again." Control urines from males and non-pregnant females are also tested in the same way, with and without substrate, and the substrate is also tested in 10 c.c.m. of distilled water. The urine of the pregnant female should give a positive biuret reaction, and the controls negative ones. The colour of a positive test varies from deep purple to lilac or rose, in different cases. All blues and greens are negative. Up to the present 59 cases have been examined, and since using the kaolin method and taking the precautions mentioned, the results have been very satisfactory.

106. "Siamese Twins" Ten Months Old.

OBIEB (*Indian Medical Gazette*, January, 1915) reports an unusual case of "Siamese twins," adding a radiogram and two photographs. They were 10 months old and well-nourished when he reported the case, and of dark complexion, coming from the Central Provinces. They were joined together at a point corresponding to the pubes. The surface of the abdomen from each costal arch presented a perfectly level plane, with no vestige of external genitals. There was but one umbilicus. The twins when seen lying on their backs presented an absolutely straight line. Each possessed a separate pelvis, perfect save for the absence of the symphysis pubis. The pubic bones lay 4 inches apart. The lower extremities projected from the normal pelvic articulation. When each pair of legs was extended, the legs of the twin placed uppermost lay above those of the other, and crossed at the knee-joints. The heart and liver were normal in both. There was a common abdominal cavity, the recti diverged outwards from their attachment at the costal arch, each pair meeting the other at the termination of an imaginary line drawn across the common umbilicus, leaving between them a diamond-shaped area. On close inspection rudimentary labia minora with a meatus urinarius were detected, but there was no vaginal orifice. Each twin had a separate anus, and micturated and defaecated independently. The twins were remarkably similar and were distinguished by the ornaments which they wore. Both were happy and healthy; the mother nursed them simultaneously, one at each breast. She was mother of a normal child aged 5, and of another 3 years of age with hare-lip; both were living. The first twin presented at the vertex, and during delivery a pair of feet were seen pressing into its axillae; then the trunk came to both followed, and next the feet of the first fetus pressing on the corresponding axillae of the second. Lastly the shoulders and head of the second child were delivered. There was a common cord and umbilicus. The twins were, it appears, born in a perfectly straight line. The labour lasted from 8 a.m. on one day to 6 p.m. on the third day.

GYNAECOLOGY.

107. Haematometra and Haematocolpos simulating Gonorrhoea of the Uterine Appendages.

V. FRANÇÉ (*Deut. med. Woch.*, July 15th, 1915) records the case of an unmarried woman, aged 25, who had complained for six months of pain in the right side. She had for a long time been treated without effect by many physicians, who had all apparently mistaken the haematometra and haematocolpos for gonorrhoeal disease of the right uterine appendages. A laparotomy had been performed, a small ovararian tumour removed, and a uterus duplex separatus found by a surgeon, who, as the symptoms did not disappear after the operation, sent the patient to the author. Had not the duplication of the uterus been detected at the operation, its recognition by other means would have been very difficult, for a vaginal examination showed no sign of this malformation. The left uterus was, indeed, considerably displaced to the left, while to the right a tumour could be felt loosely attached to the single cervix. As the patient showed signs of chronic appendicitis, the author performed a laparotomy and removed a chronically inflamed appendix. On the right side a perfectly functional and well developed, but somewhat dilated, uterus was found at this operation. It opened into a vagina which was distended with blood, ball-shaped, and closed at its lower end. No difficulty was experienced in removing this accessory uterus and vagina, after the ligation of the blood vessels and the division of a thin solid strand of tissue passing from the accessory uterus and vagina to the cervix of the left uterus. The patient made an uneventful recovery. Discussing this case, the author points out that it would have been easy to open the haematocolpos from below, and to unite the vagina of the accessory uterus with that of the left uterus. This procedure was not adopted because the patient's one functionally active uterus was sufficient; whereas if she had retained the accessory uterus it might subsequently have given rise to complications during labour. Thus in Prague the author had once to perform Caesarean section on a patient whose second non-pregnant uterus had become fixed below the head of the child, from which position it could not be dislodged.

THERAPEUTICS.

108. Ethylhydrocuprein (Optochin) in Pneumococcal Infections.

FOR more than a year the German medical press has teemed with almost as many articles on Professor Morgenthau's drug as it did a few years ago with salvarsan articles. As far as pneumococcal infections of the eye, notably ulcus corneae serpens, are concerned, writers are almost unanimous in giving unstinted praise. It appears that the ophthalmologist is at last equipped with a drug which rapidly cures lesions that have proved refractory to every other form of treatment. And this cure is effected at little or no cost to the structures involved. In pneumococcal infections of the lungs, however, the action of this drug is less certain, and there seems to be a certain proportion of cases, particularly when treated late, in which the drug is totally ineffective. Of the most recent literature on the subject we would refer to a paper by Professor AXENFELD and Dr. R. FLOCHER (*Deut. med. Woch.*, July 15th, 1915) on the treatment of pneumococcal infections of the eye. They state that at the ophthalmological hospital of the University of Freiburg the instillation into the eye of a 2 per cent. solution of optochin in cases of ulcus corneae serpens was rapidly beneficial even in severe cases, the process of healing being accompanied by relatively slight scarring. As the optochin caused acute pain before its anaesthetic action came into play, it was found necessary to give a preliminary application of holocain; cocaine was unsuitable for this purpose, as it injured the epithelium. The authors are opposed to the use of optochin in the treatment of ulcus serpens in general practice; for, though it is permissible to give a preliminary instillation of optochin before sending a patient to hospital, it is only in an eye hospital that the satisfactory treatment of this condition with optochin can be carried out. The authors further suggest that the prophylactic instillation of optochin before operations on the eye are undertaken would do much to prevent infection of the wound. Two papers by Dr. GEORG ROSENOW (*Berl. Klin. Woch.*, April 19th, 1915; *Deut. med. Woch.*, July 15th, 1915) on the treatment of pneumonia with optochin, deal with a series of 60 cases. In his second paper, in which he

tabulates the details of his last 34 cases, he gives the following account of his observations. The drug was given by the mouth six times a day, 0.25 gram being given every four hours by night as well as by day. Thus, the total dose in twenty-fours was 1.5 grams. Other drugs were withheld, both because they were considered superfluous, and because they were apt to interfere with the chemio-therapeutic action of the optochin. Camphor, for example, has been shown to diminish the action of optochin on the pneumococcus; and when cardiac tonics are called for, digitalis, caffeine, or adrenalin should be given instead of camphor. The optochin was given for several days after the temperature had fallen, and the total amount given in each case ranged from 5.5 to 16 grams. Of the 34 cases, only 2 terminated fatally. In one of these cases the patient was not admitted to hospital until the fifth day of the disease, when he was exceedingly ill, and all the lobes of the right lung were involved. A blood culture yielded many hundred colonies of pneumococci. In the second fatal case there was also a very virulent infection, which was totally refractory to the optochin. In no case was the optochin given before the pneumococcus was found. In 24 cases the optochin was given within three days of the development of pneumonia, and its direct action on the temperature was clearly demonstrable in 14 cases. In 6 cases this action was doubtful, and in 4 cases the drug seemed totally inert. In 9 cases the drug was given relatively late; it had no effect in 4 cases, and in 5 cases it was definitely beneficial. This shows the importance of giving the drug at the earliest opportunity. But even when the drug was given early it occasionally seemed to be totally inert, and in some cases a slight fall of temperature was succeeded by a rise, the fever thenceforth being unaffected by further doses. In none of his 60 cases did the author observe any ocular symptoms, and only in 2 cases were transitory auditory disturbances provoked. In spite of occasional disappointments, the author is convinced that optochin marks a definite advance in the treatment of pneumonia.

109. Treatment of Infective Gangrene.

L. OMBRÉDANNE (*Bull. et mém. de la Soc. de Chir. de Paris*, January 19th, 1915) has had at the military hospital at Verdun a very large experience of cases of infective gangrene since the beginning of the war, the majority of the cases of infective gangrene from an army corps and from the troops defending Verdun having been sent to the hospital. Almost all the known methods of treatment have been tried with variable results. During January, however, as a result of the bacteriological findings of Michaux of Paris, ether has begun to be used for the wounds, and has given extraordinarily good results. The preliminary treatment remains the same. The wound is opened up, projectiles are removed, the foreign bodies and parallel incisions are made in all the area of crepitation. The wound is then washed with ether, gauze soaked in ether is passed under the bridges of skin, compresses of ether are applied on the skin, and then the whole rapidly enclosed with an impermeable covering which is itself covered with cotton-wool. The dressing is completely changed twice a day for three or four days. The results have been wonderfully beneficial. In all the cases treated, even in those in which crepitations and gangrene were already present, the infection has been checked in from three to six days. The author has published these facts promptly, without waiting to get together a body of statistics, because he is convinced that the treatment, if brought into use, will save many limbs and many lives.

110. Treatment of Goitre by Intestinal Disinfection.

FR. MESSÉLI (Rev. méd. de la Suisse Romande, March 20th, 1915) has made a second series of investigations as to the effect upon goitre of continuous intestinal disinfection. Eleven cases are described. The patients were recruits in the Army Medical Service. As before, the author in some of the cases gave benzo-naphthol 0.5 gram (7.7 grains) three times a day, but in other cases he gave either thymol 0.1 gram (1.5 grains) twice a day, salol 1 gram (15.4 grains) twice a day, cresote 0.05 gram (0.77 grain) three times a day, or, in two cases, laxative pills containing aloes, jalap, resin, and rhubarb; the pills last named were intended to disinfect the intestine mechanically by the light purgation they induced. The measurements of the thyroid were made at two levels in each case. The length of treatment varied in the different cases from twenty to thirty-eight days, but in most cases was thirty-eight days. The goitre in 8 cases was follicular hypertrophic goitre, in the remainder was parenchymatous. A large majority of the patients came from the country, and

had been accustomed to a country diet, with little meat and much potatoes. The results were definitely good. In one case treated by salol the two measurements of the thyroid came down from 45 cm. (17.5 in.) and 41 cm. (15.9 in.) to 40 cm. (15.6 in.) and 37.5 cm. (14.6 in.) respectively; in another case from 41 cm. (15.9 in.) and 35 cm. (13.6 in.) to 35.5 cm. (13.8 in.) and 34 cm. (13.2 in.). Thus the larger diameter was diminished in one case by 5 cm. (1.9 in.), in the other by 5.5 cm. (2.1 in.), and in a third case it was diminished by 3.5 cm. (1.3 in.). On the whole the three cases treated by salol gave the largest decreases in diameter, but falls of 4 cm. (1.5 in.) or of 4.5 cm. (1.7 in.) were obtained from each of the drugs employed. In one of the two cases treated by laxative pastilles the diameters fell by 4 cm. (1.5 in.) and 3 cm. (1.17 in.) respectively in twenty days, but in the other one only by 1 cm. (0.39 in.) and 1.5 cm. (0.58 in.) in thirty-one days—the poorest result obtained in any of the series. These examples of treatment of goitre appear to be sufficiently conclusive, and they agree with the results of the author's previous investigations, with the observations of Gaylor and of Plehn, and also with those of MacCarrison, who in India in each of several cases appeared to determine the onset of goitre by the administration of impure water, and to determine its disappearance by the administration of intestinal disinfectants. In four of the present series of cases the water which the patients had been in the habit of drinking came from streams which became turbid after heavy rains. The author concludes that the experiments strongly support the view that the cause of endemic goitre is related to the use of water to which the parasite or parasites giving rise to goitre have gained access. It is not yet decided whether intestinal antiseptics are beneficial in virtue of direct action upon the specific agent causing the disease, or in virtue of their action in diminishing the number of the ordinary intestinal organisms, and therefore diminishing their toxic products, which might lead to exaggeration of an already existent thyroid enlargement. The author proposes further to continue his investigations.

PATHOLOGY.

111. The Duodenum in Diabetes Mellitus.

N. MUTCH (*Practitioner*, May, 1915), brings forward evidence which, he thinks, shows that specific lesions are present in the duodenum of diabetic patients which probably precede the dissolution of the pancreas. In healthy subjects the vertical length of the duodenal shadow, measured orthodiagraphically after a bismuth meal, is less than $3\frac{1}{2}$ in. in adults. In nine severe cases of diabetes in adults the length varied from 4 in. to $5\frac{1}{2}$ in. But the duodenum is not only elongated but is also increased in calibre; and on examination after death the walls are seen to share the same change, being thick and fleshy and somewhat milky in appearance. The same structural alterations can be traced also in the upper jejunum. This enlargement is almost invariably associated with ileal or colonic stasis, and in some patients delay is so extreme, and the consequent modification of the lower bowel so advanced, that there can be no doubt but that alimentary stasis preceded the onset of diabetes. This was the case in a patient, mentioned by the writer, whose duodenum showed strong antiperistaltic movements. The increase in size of the upper part of the small intestine is held by Mutch to be the predominant change in the alimentary canal in these diabetic cases, while lower bowel delay and duodenal regurgitation, although present, are not sufficiently pronounced to account for the enlargement. He gives particulars of observations on the duodenal contents removed at laparotomy in a variety of conditions, and adds the following summary of the facts substantiated in his paper: (1) Diabetes mellitus is associated with great enlargement of the duodenum which cannot be accounted for wholly by coincident intestinal stasis. (2) A profuse growth of *Streptococcus brevis* was obtained from the duodenum of a boy suffering from severe diabetes. Such an infection has not been found in any other condition. (3) Ileal stasis is usually present in diabetes mellitus, and, in proportion to its severity, affects the prognosis adversely. (4) The urine of diabetic patients usually contains one or more products of the action of *B. coli* on tryptophane and tyrosin. In conclusion, Mutch suggests that the explanation of these phenomena is that chronic duodenitis is the determining factor in the production of diabetes mellitus, and that ileal delay increases the severity of the disease by causing stagnation in the duodenum.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

112. Fibrinous Bronchitis without Dyspnoea.

ISRAËL-ROSENTHAL (*Ugeskrift for Læger*, September 2nd, 1915) records the case of a boy, aged 6, admitted to hospital with the diagnosis of bronchitis. He had suffered for some years from otitis media, and had also undergone an attack of bronchopneumonia on the right side between two and three years earlier. He had recovered completely from this attack, during which von Pirquet's reaction, tested on three occasions, was invariably negative. A few months before admission to hospital he had developed dry pleurisy on the right side. On January 10th, 1915, he was discharged from hospital apparently cured. But from this date till his readmission to hospital on March 3rd he was febrile and subject to attacks of sweating. The temperature was 38.7° C., the pulse 120, and the respiration about 60. The scleræ were bluish, the veins of the skin were very transparent, and the appearance of the child was scrofulous. Von Pirquet's reaction was now positive. The spleen could be felt from one to two fingerbreadths below the costal arch. There were signs of generalized dry bronchitis, with numerous coarse and fine rales. The fingers were not clubbed, and the urine was normal. At first the temperature was high, exceeding 40° on one occasion; but it gradually fell, and the patient's general condition improved steadily. On March 15th he coughed up large, solid, white masses, which, when rinsed out in water, were seen to be fibrinous casts of the whole bronchial system, from the main bronchus to the smallest branches. The only micro-organism found in this cast was the *Staphylococcus pyogenes albus*, the examination for diphtheria and tubercle bacilli being negative. The patient continued to bring up similar casts without effort or dyspnoea. On March 16th slight dullness was found over the lower half of the right chest, where the respiratory sounds were diminished and somewhat bronchial. Over the rest of the chest only a few scattered rales were audible. The respiration was 36, the voice was weak, but not hoarse, and the temperature was but slightly raised. Although the patient continued to bring up two or three casts a day, the general condition improved; and as the casts were dwindling in size, and the temperature was practically normal, the prognosis seemed good. But on April 5th the patient suddenly collapsed, and died two minutes later. The necropsy showed death to be due to impaction of a fibrinous cast in the larynx and upper portion of the trachea. The absence of dyspnoea in connexion with the fibrinous casts was now explained, for the right lung was found to be practically out of action owing to fibrinous thickening of the pleura, and to a dense deposit of milium tubercles throughout its substance, the tubercles being most numerous in the lower lobe.

113. Tumour of the Bulbar Olive.

DE MONTËL AND DE LA HARPE (*Rev. méd. de la Suisse Romande*, June 20th, 1915) record a case of tumour of the inferior olive, in which the clinical picture was one of a typical thalamic syndrome. The clinical study by the writers was limited to a single examination in the year 1911: the patient died in 1912. The symptoms began in 1908 with paresis, hemianæsthesia, and pains on the left side, with certain fleeting cranial nerve palsies. In 1910 there were atetotic movements of the left hand; rubbing the skin by a piece of paper gave an intolerable sensation. In 1911 the writers found (1) complete loss of deep and other kinds of sensibility on the left side; in places there was imperfect perception of painful and thermal stimuli; (2) left paresis with exaggerated reflexes and left extensor plantar response; (3) left ataxy; (4) slight contracture of left arm with typical atetosis of left hand; (5) six weeks' pains in left half of body, "as if the arms were being twisted or squeezed by pliers." The fundi of eyes were normal, there were no cranial nerve palsies, arterial pressure was very high, there was no albuminuria, and no syphilis. The diagnosis made was either a haemorrhagic or vascular (softening) focus in the right thalamus or hypothalamic region. Necropsy revealed the right bulbar olive to be greatly increased in volume, forming a veritable tumour; its cells were degenerated, but its structure was preserved to a large extent. It extended forward to the pons at the level of exit of the trigeminal nerve, involving the sensory paths and compressing the pyramidal tract. It ended

anteriorly in two caps having an olivary structure, which bordered on a small vascular focus with extreme proliferation of the cells, giving the impression of a vascular endo- or peri-thelioma; there was proliferation of the neuroglia. There were no diseased foci whatever in either the cerebellum or the optic thalamus. As to the nature of the olivary tumour, the hypothesis of a glioma was rejected, and it seemed improbable that it was a case of heterotopia with secondary vascular transformation. It was held that the vascular focus must be primary, the olivary swelling secondary. The production of atetosis by a lesion situated so low down is exceptional; the writers regard it as an instance of "morphological modification at a distance."

114. Failure of Percussion in the Diagnosis of Apical Phthisis.

A. SCHNEIDER (*Deut. med. Wochs.*, August 5th, 1915) considers the confidence placed in the percussion of the apices of the lungs in the diagnosis of phthisis to be mistaken, and he holds the importance attached by Krönig to percussion of the apices to be much overrated. In many hundred cases in which there was no sign of phthisis he usually found the right apex less resonant than the left. In these cases the *x* rays frequently showed the right apex to contain a little less air than the left, but there was no actual shadow. It was therefore evident that consolidation of the apex, indicated by dullness on percussion, did not really exist. The author suggests that this dullness over the right apex may be due to slight scoliosis of the upper thoracic vertebrae towards the right. In the very few cases in which he found dullness over a healthy left apex there was invariably scoliosis towards the left. Owing to this common difference in the percussion note of the two healthy apices, early tuberculosis of the left apex is apt to be overlooked. Thus, disease of this apex may reduce its resonance just enough to make the percussion note on the two sides equal; and as these notes are often equal in health, the physician may fail to detect the incipient consolidation in the left lung. The author has frequently found definite tuberculous catarrh of the right apex unaccompanied by definite dullness or retraction of this apex. In some cases, again, of tuberculosis confined to the left apex, the right apex was found to be more dull and more retracted than the left. He therefore concludes: (1) That the first physical signs of apical tuberculosis are to be detected by auscultation. (2) The slight dullness and retraction of the right apex brought into prominence by Krönig must be taken with reserve in the diagnosis of tuberculosis. (3) It is never possible to exclude apical tuberculosis because the apex is neither dull nor retracted. There are cases of apical tuberculosis in which the results of percussion are perfectly negative, although there is considerable catarrh of the apex. (4) Apical tuberculosis is, as a rule, not demonstrable by percussion until it is also demonstrable by the *x* rays.

SURGERY.

115. Cranial Decompression.

SHARPE (*Amer. Journ. of Med. Sciences*, April, 1915) urges the value of the subtemporal method of cranial decompression as being an almost ideal operation for intracranial conditions which require the relief of increased pressure or an exploration. Its advantages consist in the facts that the underlying cortex of the temporo-sphenoidal lobe is a comparatively silent area of the brain; it exposes an area of the brain most frequently involved; the removal of the squamous bone is technically less difficult than that of other portions of the skull because of its relative thinness; and the opening made is amply protected by the overlying temporal muscle, so that, if the attachment of the muscle to the parietal crest is carefully preserved, a hernia cerebri is practically impossible. The operation is advisable for the relief of intracranial pressure as a preliminary to removal of cerebral tumours, to allow unlocalized tumours to become clinically localized, and for the prevention of secondary optic atrophy in irremovable tumours of the base and mid-brain. In fractures, indicated only when the fracture is associated with high intracranial

pressure. In brain abscess, particularly of either temporo-sphenoidal lobe, it is wise to perform a subtemporal decompression over the suspected lobe, thus relieving pressure, permitting of exploration, and, if an abscess is present, affording free drainage through the lower angle of the split temporal muscle. It is of value also in selected cases of spastic paralysis due to an intracranial haemorrhage at birth. Unless the clinical signs indicate a lesion of the left hemisphere, or the patient is left-handed, decompression should always be performed on the right side in order to avoid the motor speech area. The anaesthetic requires the most careful administration in order to avoid an extreme cyanosis and congestion, and to prevent coughing or laboured respirations, it being necessary to deepen the narcosis just prior to the incision of the dura, otherwise the sudden relief of pressure will allow the patient to show signs of consciousness by coughing, etc. The incision is made vertically upward from a point just above the zygoma and half an inch anterior to the external auditory meatus to the middle of the parietal crest, parallel with the fibres of the temporal muscle, which is separated from the underlying bone by a sharp periosteal elevator, care being taken not to destroy its attachment to the parietal crest. After removal of the underlying bone in a circular opening having a diameter of 2½ in. to 3 in. all oozing from the bony margins is stopped with sterilized bone wax before opening the dura on a grooved director. Before closing the opening a rubber tissue drain is inserted at the lower angle of the wound and inside the dura beneath the temporo-sphenoidal lobe. The opening in the dura is left unsutured, and the muscle, fascia, and subcutaneous tissues are brought together with fine black silk. Post-operatively hot saline is administered per rectum every four hours for the first day, the wound being dressed and the drain removed on the second day. The operative mortality is low, and as a rule there is but little if any shock.

116. Colon Exclusion.

SMALL (Surgery, Gynaecology, and Obstetrics, August, 1915), considering Lane's operation and the numerous modifications suggested and practised, finds that his own method seems the most advantageous. The resection of the terminal end of the ileum, caecum, and ascending colon is circumvented by the anastomosing of the ileum with the lower segment of the sigmoid. The operator first ligatures the ileo-colic, colica dextra, and a slender branch from the superior mesenteric artery, anastomosing in the terminal six inches of the ileum with the ileo-colic. The structures supplied with blood by these arteries are then separated from their attachments, "mobilized," and lifted out of the abdominal incision, where the bowel is clamped and resection completed with a negligible loss of blood. The raw base from which the structures have been removed is then covered by the parieto-mural flap made fast by interrupted catgut sutures to the opposing meso-peritoneal margin. In conclusion, an ileo-sigmoidostomy is performed. Small contends that by this method there is the least amount of manipulation of the intestines, and therefore the least amount of shock to the patient. It eradicates the fountain-head of infection in 90 per cent. of the extreme cases of intestinal stasis. It displaces the ileum in the least degree from its normal position and downwards, so that gravity aids rather than retards action; and, lastly, the omentum is left undisturbed.

117. Obscure Gangrene of a Testicle.

GJESTLAND (Norsk Magazin for Lægevidenskaben, September, 1915) records the case of a man, aged 37, who had contracted gonorrhoea ten years earlier. Though there was a family history of tuberculosis he showed no signs of this disease; there was also no history of syphilis or rheumatic fever. After an excursion on ski he developed pain on one side of the scrotum, which did not, however, prevent his dancing the same evening. When he reached his bedroom at 2 a.m. the pain became very severe, and lasted for the rest of the night. The scrotum became swollen, and after four days was as large as a fist. After he had been in bed a fortnight he consulted a doctor, who applied camphor and cotton-wool to the scrotum, which he secured in a suspensory bandage. The pain abated, but five weeks later a fistula developed in front of the scrotum. With the development of this fistula the pain ceased completely, and the patient felt perfectly well although the temperature was 99.5° in the evening. The pulse was 85, and an examination of the abdomen, lungs, and heart showed nothing amiss. The right side of the scrotum was somewhat swollen and oedematous behind, and the epididymis could not be distinguished from the rest of the swelling. Chocolate-coloured pus, containing a few

strands of tissue, escaped from two small perforations in front of the scrotum. There was apparently no urethral discharge. The diagnosis of tuberculosis of the right testicle and epididymis led to their removal, but when the right testicle was incised after the operation it showed no signs of tuberculosis. The testicle itself was completely gangrenous, while the swollen epididymis contained a few necrotic foci. On the anterior aspect of the epididymis there was a small abscess leading to the perforations. A microscopic examination also failed to show any sign of tuberculosis. Cocci, of no particular type, were found in the abscess, but no micro-organisms were demonstrable in the epididymis. A few days after the operation a little pus, containing Gram-negative cocci, was pressed out of the urethra. Wassermann's reaction was negative. The author is uncertain whether the gangrene of the testicle was the cause of, or the sequel to, the suppuration in the epididymis. At the operation there was no sign of torsion of the testicle, but this condition may possibly have existed some weeks earlier. Although the examination of the heart was negative, embolism of an artery above the level at which the cord was divided might have been responsible for the gangrene of the testicle. But both embolism and torsion would probably have caused thrombosis of the veins of the cord, yet no thrombi were found. The etiology of the gangrene was therefore obscure.

118. High-Frequency Current for Bladder

Papillomata.

BEER (Annals of Surgery, June, 1915) records his experience in the treatment of benign papillomata of the urinary bladder with high-frequency cauterization, urging the primary importance of obtaining specimens from the growths, since all malignant tumours should be excluded from this treatment. Although mistakes in diagnosis may occasionally occur, malignancy can usually be recognized by carefully weighing the evidence obtained by cystoscopy, response to cauterization, palpation, and microscopic examination of excised and voided specimens. Cases that are not definitely benign and all malign cases require treatment by wide excision. The Oudin, or unipolar, current is preferable to the d'Arsonval, or bipolar, current for the purpose of destroying the growths, since it produces a more marked focal action at the point of application of the electrode and a less marked distant action, being thus more controllable. Use of the bipolar current frequently causes annoyance from the fact that the dead tumour remains attached by its dead pedicle for a very long time, whereas the more explosive action of the Oudin current largely prevents this. Possibly a combination of both may be found to give more rapid results, a primary brief bipolar treatment followed by the unipolar current, thus combining the virtues of both. The size of the tumour is no contraindication for such treatment, as it can be used satisfactorily in the largest growths, one as large as a good-sized orange being destroyed at six sittings, enough tumour tissue being obtainable through the sheath of the cystoscope at the second sitting to fill a 60 c.c. bottle. Tumours situated at the neck of the bladder, especially those which bleed profusely when injured by the introduction of the cystoscope, will usually require to be operated upon by suprapubic cystostomy and papillomization. As to end results, the author feels certain that a definite cure can be brought about by high-frequency cauterization, there being no sign of recurrence after four years. By recystoscopy every three or four months satisfactory control can be obtained, and if at the first examination there is no sign of recurrence *in loco*, a local recurrence or recrudescence of the original tumour need scarcely be feared. Inaccessibility, traumatic severe haemorrhage, intolerance of the patient, and malignancy, are the important contraindications.

OBSTETRICS.

119. Nephrectomy during Pregnancy.

HARRIGAN (Surgery, Gynaecology, and Obstetrics, June, 1915) has collected 36 cases of removal of the kidney during pregnancy, giving short abstracts of each case. He adds a case in his own operative practice. A married woman, aged 21, suffered during the fourth month of her first pregnancy from an alveolar abscess. It was left to burst spontaneously, and unilateral haematogenous infection of the right kidney developed. Harrigan removed the diseased organ through a right lumbar incision parallel to and 1 in. from the last rib. Four months later the patient became restless and there was jaundice. The urine, never quite free from albumin since the operation, became more albuminous. Labour was induced, a healthy

and well-developed child was born, and the puerperium was uneventful. Two years after the nephrectomy the patient was in perfect health, suffering no inconvenience from the loss of the kidney. Of the 36 remaining cases six authors do not mention the immediate result. All the remaining 30 recovered excepting 2 (Lenger, hydro-nephrosis and eclampsia; Tuffler, ruptured kidney, death from embolism). Of the 28 remaining cases the obstetrical after-history is noted in 24. Twenty were delivered without accident or complications, 2 aborted spontaneously, and in the remaining 2 abortion was induced just as in Harrigan's case. Among the six incomplete histories is Oepfel's, where a kidney affected with pyonephrosis was removed in the seventh month of pregnancy and abortion occurred spontaneously on the same day. The pathological conditions for which the operation was undertaken were extremely varied. It was noted in 31 cases besides that of Harrigan. The conditions were: Rupture 1 case, secondary haemorrhage from nephromy 1, congenital pelvic kidney 1, echinococcus 1, "cyst" 2, adenomyosis 5, adenoma 2, multilocular fibrocystic adenoma 1, tuberculosis 4, persistent fistula secondary to a previous nephromy 1, interstitial nephritis 1, and lastly 11 cases of distinctly suppurative conditions.

120. The Forceps in the Nineteenth Century.

ARLUCK and GISDANSKY (*New York Med. Journ.*, May 22nd, 1915) have issued a report on the indications and contra-indications of the obstetric forceps, based on six thousand cases at the Jewish Maternity Hospital, New York. Since the introduction of pituitrin in 1909 the authors have been able to dispense with forceps in a large majority of cases. It is not a panacea, and the authors limit its use to cases where the cervix is dilated or dilatable, the presenting part well engaged, the bony outlet normal, and the fetal heart sounds audible. It acts best in dystocia due to dry labour, and posterior or parietal positions where no disproportion exists. The total percentage of forceps cases at the hospital was 5.3, or 334 out of 6,083 labours—a very low rate, but the patients as a rule were not pampered, and hence there were few "forceps of convenience" cases. The high forceps (32 cases) has been practically eliminated as an operative procedure, thereby materially decreasing the infant mortality. Caesarean section and pubiotomy have proved admirable substitutes, and with more experience and improved technique are giving better results. There were 63 Caesarean sections, the mortality 6.3 per cent., and 15 pubiotomies with a mortality of 6.6 per cent. In the hospital series of "twilight cases," introduced in 1914, the use of forceps was markedly increased. Induction of labour, the most rational procedure in the treatment of contracted pelvis, offering on the whole the best results to mother and child, was always substituted if possible for the use of the high forceps, when the case could be seen early. Krause's method (the passage of a bougie or large rectal catheter, uninked, between the posterior uterine wall and the membranes, which must not be ruptured) was usually practised. But hospital patients are not careful about coming back punctually to the date recommended to them after a careful examination, therefore statistics taken from public institutions are, excepting as regards technique, of little value to the practitioner.

GYNAECOLOGY.

121. Combined X-ray and Radium Treatment of Inoperable Uterine Cancer.

BERGONIÉ and SPÉDER (*Arch. d'électr. méd.*, No. 391, 1915) make use of a military analogy in comparing x-ray and radium applications in the treatment of uterine cancer. The x-rays, they say, may be likened to machine guns which, stationed on the crests of hills, concentrate their fire on enemy troops in the hollow, and are able also to rake isolated detachments distributed on the further side of the opposite slopes. Radium, on the other hand, has the effect of bombs exploding in the central positions of the enemy, leaving the outer ring unscathed. The authors find that the reaction on the skin after an exposure of five hours to the ultra-penetrating radiation of 18 eg. of radium placed 2 cm. away is about equal to that which follows an x-ray irradiation for twenty minutes, the rays being filtered through 3 mm. of aluminium, the anticathode placed 20 cm. from the skin, and the current being 3 ma. The x-ray intensity, therefore, is about 1,500 times greater than the intensity of the radium. The employment of radium, however, is of considerable value when the neoplastic tissue is of no great thickness, and

the extreme penetrability of the radium rays is advantageous from the point of view of homogeneity in the immediate distribution of the effect. The authors recommend a combined method of x-ray and radium applications. The x-rays are concentrated upon the same mass of tissue through a number of converging ports of entry. The anterior inferior abdominal wall is divided into four, six, or eight fields (according to the corpulence of the subject and the probable extent of the lesion), and the sacro-iliac region into four or six fields. These fields receive successively an x-ray dose of 15 to 18 Holzknecht units. The rays are filtered through 4 mm. of aluminium, and with these a very large dose may be given without a reaction beyond that of radio-epidermatitis, which requires for its evolution eight days at most. By means of a speculum further radiation is introduced by way of the vagina, the mucosa of which has a remarkable power of resistance to x-ray action. This means of irradiation by the vagina, through which a total amount of 50 Holzknecht may be given, enables one to act on the prolongation of the neoplasm in the large ligaments and in the walls of neighbouring organs. The treatment of the various fields and of the vagina may be spread over a period of ten or fifteen days, followed by another series of sittings at the end of a month. The authors have treated 5 cases of inoperable uterine cancer or relapses after operation by a combined method consisting of (1) local radium therapy, with 18 eg. of radium bromide, of which only the ultra-penetrating radiation is utilized, the total duration of the applications being 100 to 150 hours; and (2) deep radio-therapy. The cases are too recent to admit of a definite judgement, but in all of them within two months there has been an improvement locally, and the neoplasm itself, which in two cases had the character of a diffuse infiltration, has become limited to a hard mass. In one case of cancer of the neck of the uterus which was operable, but was treated by radiation because the patient refused surgical intervention, no trace of the trouble has been found for three months, and no induration is perceptible on palpating the uterus.

THERAPEUTICS.

122. Electrical Treatment of Nerve Injuries,

LABAT and LEHMANN (*Paris méd.*, June 26th, 1915) analyse the 1,500 cases of nerve injury and associated paralysis with which they have had to deal at the Val-de-Grâce military hospital in Paris since last October. They classify the paralyzes in the order of frequency as follows: Radial 27 per cent., median and cubital each 18 per cent., external popliteal 14 per cent., circumflex of brachial plexus 9 per cent., sciatic or internal popliteal 7 per cent., superior radicular of brachial plexus 2 per cent., facial 2 per cent. The radial paralyzes are generally unassociated, though at times they coincide with paralyzes of the circumflex. Those of the median and the cubital are often associated; the radial-cubital association is more rare. Clinical signs of nerve degeneration resulting from wounds in war are of the usual variety; motor disturbances, which are predominant, and of insidious onset, include paralysis of the injured territory, with diminution or abolition of the corresponding tendinous and cutaneous reflexes; sensory disturbances include anaesthesia or paraesthesia, pain of variable character, and sensations of superficial tingling; there are also trophic disturbances, such as muscular atrophy, and a peculiar appearance of the skin, which becomes tender, thin, and bright. The authors leave the delicate details of electrodiagnosis for more elaborate discussion, and confine themselves to the subject of treatment. The therapeutic purposes are of three descriptions: (1) To lessen the pain, if this exists; (2) to stay the degeneration of the muscular fibre in the territory of the wounded nerve; (3) to assist in the recovery of the nerve. For lessening pain the galvanic current is indicated. The ascending current should be used; that is to say, the positive should be placed at the extremities, while the negative is disposed towards the nerve root. The intensity may vary from 5 to 15 milliamperes. Whenever possible, the ordinary galvanic application should give place to diathermy. A very large electrode is applied to the spine at the point of emergence of the nerve, and another envelops the extremity of the member. The intensity is 300 to 1,000 milliamperes, according to the tolerance of the subject; the duration of the sitting is fifteen to twenty minutes. As to the second therapeutic indication, all electrotherapists are agreed in limiting the employment of the faradic current to cases where there is no neuromuscular degeneration, but relative anatomical integrity

of the tissues. The indications for faradization are recognized in abarticular paresis, and in paresis or paralysis which is purely functional or follows upon a severe contusion. Beyond these cases, and when the galvanic nerve itself is attacked, it is always to the galvanic current that one should have recourse. As to the third indication, which is fulfilled at the same time and by the same procedure as the muscular excitation, the authors raise the question as to the way in which the current may act in the regeneration of a sutured nerve. Their own cases are too recent for a useful comparison to be made with those which have had no electrical treatment, but, *a priori*, the utility of electrization would seem indicated by its undoubted efficiency in ordinary peripheral neuritis. As traumatic degenerations do not differ anatomically from ordinary neuritis, the authors conclude that the traumatized nerve recovers more quickly and thoroughly if it is submitted to methodical electrization. As to the duration of treatment, if the nerve degeneration is to be cured, the process may occupy, in the slightest and more favourable cases, three or four months, and in average cases eight or twelve months.

123. Glucose Solutions as Prophylactic against Shock.

BURNHAM (*Amer. Journ. of Med. Sciences*, September, 1915) urges the value of glucose solutions as a prophylactic against post-operative shock. It has been shown that fat administered to animals and presumably stored in the liver increases the susceptibility of the organ to the injurious action of chloroform, the fat determining the fixation of the chloroform and the occurrence of necrosis, while experiments with carbohydrates, on the contrary, show that they protect the body proteins from disintegration. It is therefore important that patients should be put through a course of forced carbohydrate feeding for a short period immediately preceding operation, and should receive them in an available form soon after operation. When there is no contraindication to oral feeding the patient should be given a meal containing a considerable quantity of carbohydrate food in the shape of bread or cereal eight to twelve hours before operation, and about three hours before anaesthesia is commenced a feed containing 100 to 200 calories in the shape of easily absorbable carbohydrate—for example, six ounces of coffee or orangeade to which has been added one ounce of lactose. By such means the organism is assured of a good store of readily available glycogen during the anaesthesia. Where oral feeding is impossible, as during or soon after anaesthesia, subcutaneous or rectal injections of glucose solutions afford a clinically available method for nutrition, the solutions being freshly prepared and sterilized as they are more easily contaminated than ordinary saline. For hypodermoclysis 4 per cent. to 5 per cent. solutions are recommended, as much as 2 to 3 litres, representing from 80 to 210 grams of glucose, being given in twenty-four hours according to symptoms. For protoctysis 12 to 16 oz. of a 5 per cent. solution dissolved in ordinary tap water may be given during the operation, and its administration continued by the Murphy drip method after the patient is back in bed. By either or both of these methods from 500 to 500 calories a day may be given without discomfort, and though the quantity is not sufficient to supply all the total energy requirement, it is of importance in the prevention of excessive nitrogen waste. Notes of three cases are given in which glucose solutions were administered as a routine procedure without regard to urinary findings or symptoms of acidosis, being used as a prophylactic against shock in cases where saline solution would be ordinarily used. When acidosis is suspected and acetone is present the administration of alkalis or of carbohydrates is indicated, sodium bicarbonate being given until the urine becomes neutral, often as much as 50 to 100 grams being needed before this takes place. To summarize: Glucose solution should be given (1) as a routine after every operation where post-operative shock is to be feared; (2) as a routine where post-operative oral feeding may be difficult or insufficient for a considerable time; and (3) either before or after operation as an emergency measure for the relief of an existing or threatened acidosis.

124. Intravenous Injections of Colloidal Sulphur in Acute Articular Rheumatism.

LOEPER AND VAHRAM have made more than 300 intravenous injections of colloidal sulphur in all kinds of acute and chronic rheumatic affections, whether articular, muscular, infective, or toxic (*Soc. Méd. des Hôp. de Paris*, July 16th, 1915). During recent years colloidal sulphur

has often given good results in articular rheumatism when given by mouth in doses of 0.20 gr., or by hypodermic injection in doses of 0.05 to 0.10 gr.; it diminishes pain and swelling and sometimes even bony deformity. For the intravenous method the writers use ampoules of 1 or 2 c.c.m. containing 0.33 to 0.66 mg. of colloidal sulphur. The injection is made slowly into a vein of the arm by a fine needle with the usual precautions. Apart from the resulting rigor and elevation of temperature, which varies in degree according to the patient, his previous state, and the dose injected, the writers have never seen any bad results. They give particulars of 17 cases of acute articular rheumatism thus treated; some were mild, others moderately bad, and others very severe. After the febrile reaction which follows the injection the temperature falls, and the pain is very soon greatly relieved, and also the swelling a little later. In the milder cases recovery occurs after one or two injections; in the moderate cases after four or five, and in severe ones after ten. Complications may disappear; thus, in one case a pleural effusion cleared up, in another a pulmonary congestion, and in another an albuminuria which had resisted salicylates. The writers begin with an injection of $\frac{1}{2}$ c.c.m., and increase this dose daily up to 2 c.c.m. in the severer cases; in less severe ones they give a daily dose for five days; and in the mildest one or two successive injections. It is uncertain whether the sulphur acts as a stimulant or an antiseptic. The writers think it acts as a specific for the joint, whatever be the nature of its acute inflammation, rather than as a specific for the disease itself. The early relief of the pain is very marked. At a later meeting of the same society (July 23rd, 1915) the writers, with BERTHOMIEU, described their experiences with this therapy in subacute and chronic rheumatic conditions: twenty six cases were treated, ranging from 20 to 60 years of age; pains and crackling were common; some cases had nodular thickenings, and several had bony deformities and calcareous infiltrations. In chronic cases the first two injections have often given a momentary increase of the pains; but the sedative action is as marked as in the acute cases, and the bony thickenings soon become less marked; the crackling is less influenced. Injections are given daily for a period of ten days; sometimes five or six will cure, but the majority need ten or more. In the subacute cases one period of ten days' injections is usually enough; the chronic may need two or more such periods in a year. The action is more marked than by the mouth or even hypodermic injection; it is more certain, deeper, and more constant. A reaction like that seen in the acute cases may occur, but is much milder, and is specially slight in the chronic cases. The treatment is avoided in patients who are feeble or affected by cardiovascular or renal disease. In the chronic cases, as in the acute, intravenous injections of colloidal sulphur give a temporary leucocytosis, the proportion of blood corpuscles increases progressively, and the arterial pressure rises temporarily. In the subacute and chronic cases the sulphur seems to act, as in the acute cases, as an elective agent on the joint, quite irrespective of the nature of the disease.

PATHOLOGY.

125. Aberhalden Reaction in Cancer.

ISAAC LEVIN and J. D. VAN SLYKE (*Journ. Amer. Med. Assoc.*, September 11th, 1915) report the results of applying a quantitative method reported a year ago by Van Slyke and Vinograd, for the detection of the ferment activities of the blood serum. The technique is described; the occurrence of proteolysis is shown, and its extent measured by the increase in ammoniogen. The results are given in tabulated form, as are also those in a second series of tests made on eight normal individuals and nine cancer patients with a slightly modified and more accurate technique. In both series the increase in nitrogen gas formation varied within the same limits in the normal as in the carcinomatous serum. The authors say the analysis of the results of the present investigation seems to indicate that the more accurate and objective test employed for the detection of the specific ferment reactions in the blood serum, the less difference can be detected between the reactions obtainable with normal and supposedly specific serums. They conclude that the diagnostic value of the Aberhalden reaction in cancer is, to say the least, doubtful, and it must be stated very emphatically that for the present the method belongs to the research laboratory and not to the clinic.

AN EPILOGUE OF CURRENT MEDICAL LITERATURE.

MEDICINE.

196 Radiological Types of Pulmonary Tuberculosis.

WALSHAM AND OVERTON (*Archives of Radiology and Therapeutic Radiology*, No. 181, 1915) make a provisional attempt to classify more definitely than has hitherto been done the various types of pulmonary phthisis as seen by means of radiography. 1. *Tuberculosis of bronchial glands:* (a) Fine shadow outside sternum in neighbourhood of vertebral ends of third, fourth, and fifth ribs is produced by swollen tracheo-bronchial glands; (b) a dim area at or just below the level of the vertebral end of the sixth right rib, joining that of the hilum, denotes enlargement of bifurcation glands; (c) normal hilum opacity is at level of vertebral ends of fifth, sixth, and seventh ribs, and when affected becomes abnormally dark, broad, and contains a number of circumscribed shadows; (d) isolated foci within pulmonary fields and apices, found in adults, are often entirely unconnected with hilum, and may represent residues of an early peribronchitis tuberculosa or of a localized aereogenous infection. 2. *Peribronchial phthisis*, in which the lymphatic ducts as well as the glands are implicated: (a) P. tuberculosa simplex, in which the tubercles unite to form small seed-like bodies of variable size, with a tendency to fibrosis or encapsulation by connective tissue; (b) P. tuberculosa exsudativa, in which bacillary processes are predominant, production of fibrous tissue deficient, the nodules increase in size, become cloudy in appearance, and irregularly rounded in outline, enlarging possibly to the size of a cherry and still remaining discrete; (c) P. tuberculosa disseminata, in which there is an extensive distribution of small peribronchial tubercles, as if there had been a sudden centrifugal dispersal of bacilli from deeper parts; (d) P. tuberculosa fibrosa, or chronic indurative or fibroid phthisis, in which proliferation of connective tissue is exuberant, and spreads to the interstitial and interlobular connective tissue, producing increased opacities and irregular, often honeycomb-shaped, outlines corresponding to the superficial lobular divisions. 3 and 4. *Bronchopneumonic and pneumonic phthisis*, the latter type being merely an extension of the former. The exudative and disseminated forms of tuberculous peribronchitis, especially the former, readily lead to the formation of consolidations in the vicinity of the hilum alone or within any of the lobes of the lung. 5. *Pleuritic phthisis*, cases of almost pure pleuritic involvement, where the invasion has spread either to the surface of the lung from a superficial peribronchial focus, or along the surface of the pleura from tuberculous tracheo-bronchial and bifurcation glands. On account of its density, when extensively developed, the condition of the deeper parts of the lung may be concealed. 6. *Apical phthisis:* (a) Peribronchial type, with deposition and scattering of nodules; (b) apical bronchopneumonic, with general or localized uniformity of shadow and great tendency to cavitation; (c) apical miliary; all these three varieties being liable to be obscured by (d) apical pleurisy, which leads to the formation of a dense pleural cap, to linear shadows which may be calcareous plates, or to atelectasis. 7. *Miliary tuberculosis*, which may at first be peribronchial and perivascular; the bacilli may come from extrapulmonary situations, as in tuberculous meningitis, when the dissemination becomes general. Types most liable to render clinical diagnosis dubious are (1) the purely glandular type, (2) the simplex and disseminated type of peribronchitis, (3) the pleuritic, and (4) the hilum-infiltrating (central phthisis).

127. Symptoms following Accidental Vaccination of an Infant.

R. FORSUS (*Finska Läkaresällskapets Handlingar*, June, 1915) records the case of an infant, 5 weeks old, who had developed fever, vomiting, diarrhoea, and sores on the mouth a week earlier. There had been three to five green mucous motions a day for two days. Then constipation had followed, and had lasted four days. Vomiting had occurred after every breast feed; but as the sores on the mouth developed the child ceased to suck, and also to vomit. Finding some white spots on the lips of the infant, the mother suspected diphtheria, and consulted the author. An examination showed the child to be well developed and well fed, but somewhat flabby. Practically the whole of the upper lip, and the mucous membrane of the frontal

portion of the alveolar process, were covered by a thick, greyish-yellow mass. A smaller mass was found on the lower lip, and another on the right nostril. There were also partially ulcerating and slightly bleeding foci on the hard palate and dorsum of the tongue. Their size ranged from that of a lentil to that of a pea. The author was mystified until he detected a typical vaccine pustule, of the size of a small coin, behind the right ear. The glands at the angle of the jaw and the submaxillary glands were slightly swollen and very tender. The throat was unaffected, but the temperature was 38.2 C. Further investigations showed that, twelve days earlier, the infant's father and sister had been revaccinated. The patient had shared the father's bed, and had been nursed by the sister. Neither the father nor the sister had worn dressings over the sites of vaccination. The mother had not been revaccinated, as she was suckling the infant, who was considered too young to be vaccinated. Some days after the infant developed sores on the lips, large, partially ulcerating vaccine eruptions appeared on the nipples and areolar regions of both breasts, three on the right, and eight on the left. As suckling was painful for the mother, and difficult for the infant, it was fed on the mother's milk artificially withdrawn. The milk was contaminated with vaccine, but as the infant had obviously been immunized, this did not matter. Both mother and infant recovered. The author suggests that the gastro-intestinal symptoms may have been due to vaccine pustules in the digestive tract; but he also admits the possibility of these symptoms being due to the patient's general condition.

128. Angina Pectoris and Raynaud's Disease.

SCHOTT (*Deut. med. Woch.*, July 15th, 1915) records the case of a bricklayer, aged 37, who had not contracted syphilis, and who was a moderate drinker and smoker. He was employed for five months in an ammunition train, the jolting of which pulverized a yellow explosive. This was deposited on the patient's uniform and inhaled by him, causing him to cough up deep yellow sputum. The taste of this powder, which was probably nitro-toluol, was very bitter, and it made him cough, sneeze, and vomit. Though he had never been subject to chilblains, he noticed, after he had been employed in the ammunition train two to three weeks, that the little finger of the left hand was occasionally perfectly white and anaesthetic. This condition generally spread to several other fingers, and recurred more and more frequently. The anaemia sometimes lasted three-quarters of an hour, and when it was passing off the metacarpophalangeal joints became swollen and cyanosed. This condition did not pass off till the fingers had been rubbed for some time. Subsequently the toes were involved, and there was a sense of tension and tiredness in all the fingers. Meanwhile the temperature was normal and the pulse was 76. Later vesicles developed on the hands and fingers and broke down, leaving superficial ulcers. There was no atrophy of the muscles, no ataxia, and no sensory disturbances in the legs, except the toes, which were anaesthetic. The urine contained neither albumin nor sugar. After the patient had been in hospital several weeks inequality of the radial pulses was observed. Thus, the left radial pulse would be full and bounding, then it would become small and even cease to be palpable, while the right radial pulse, which had previously been normal, would become full. Again, the radial pulses would synchronize or they would follow each other. The arteries in the legs also showed marked variations in fullness from time to time. The physical signs over the heart varied much, and sometimes an adventitious murmur was audible over the tricuspid valve when the patient lay on his back. The blood pressure, however, was persistently high. An x-ray examination of the heart showed that within quite a short period it underwent changes in shape and volume independent of systole, diastole, and respiration. As the patient complained of pain in the middle of the sternum and increasing dyspnoea, nitro-glycerin and Naubain baths were prescribed. Great improvement was effected in the cardiac symptoms, whereas the Raynaud's disease was unaffected. The author traces these symptoms to the nitro-toluol, which was converted in the blood into nitrobenzoic acid. This was undoubtedly responsible for the reduction of the haemoglobin to 65 per cent., and for the headache, restlessness, and stabbing pains in the limbs of which the patient sometimes complained.

SURGERY.

120. Perforating Gunshot Wounds of Abdomen.

G. ERELY (*Annals of Surgery*, June, 1915) records the result of experience derived from a consecutive series of 27 cases of perforating gunshot wounds of the abdomen, with 3 deaths. The youngest case operated upon was 7 years of age, and the oldest 57; the average length of time elapsing between the shooting and the operation was eight or nine hours, the earliest being three hours and the latest thirty-six hours after injury. The average number of perforations was about nine, two being the smallest number and twenty-two the largest. In five of the cases the injury involved the upper abdomen only, and in three others both upper and lower abdomen were affected, while in the remaining nineteen the upper abdomen was uninjured. The ureter was divided in one case, and in about ten cases serious haemorrhage resulted from injury to the mesenteric vessels. Shock was more marked in the white than in the coloured races. Exploratory operation is advised in practically every case of gunshot wound of the abdomen, as it is the only certain way of determining whether or not perforations have occurred; and while this should be promptly done it should not be hurriedly done, as a fair number of these cases, especially where shock is present and haemorrhage not serious, will be rendered safer surgical risks by allowing them a reasonable time to react from the primary effects of the injury. Except where the injuries are unusually severe the ordinary case is a good surgical risk when operated upon from four to twelve hours after the injury, but if surgical treatment affords only one chance in a thousand for recovery any time limit should be considered artificial. It is important to get as correct an idea as possible as to the track of the bullet in order to save time and to avoid unnecessary handling of the abdominal viscera, all manipulation being as gentle as possible, since afferent impulses resulting therefrom have a more pronounced effect on the vasomotor centre than those resulting from the handling of the parietal peritoneum and skin in opening the abdomen and in retracting the edges of the wound. General irrigation of the abdominal cavity through a two-way irrigator was practised in practically every instance, and a Keith's glass drainage tube was placed into Douglas's pouch with the patient in the exaggerated Fowler position. Unless the large intestine had been injured the patient was given continuous rectal instillation of normal salt solution, and, as about 5 per cent. of such injuries die from tetanus, an immunizing dose of antitetanic serum was administered on the first, fourth, and sixth days following the injury. It is very important that any rent in the mesentery should be sutured to prevent the possibility of the occurrence through such rent of an incarcerated bowel with obstruction.

130. Pneumococcal Abscess of the Spleen.

N. PAUS (*Norsk Magazin for Laegevidenskaben*, August, 1915) records the case of a married woman, aged 38, who had contracted valvular disease of the heart after successive attacks of rheumatic fever. In October, 1914, she developed acute bronchitis, with pain in the chest and rigors. The sputum was blood-stained, and dullness and crepitation were demonstrable over the lower lobe of the left lung. Over the apex of this lung râles were also heard. The temperature was about 39.2 C., and fell by lysis. From December 7th to 25th the temperature was normal, but from the latter date it ranged about 38°. On November 12th the patient developed diarrhoea, lasting for three days; and an examination showed a painless swelling, of the size and shape of a pear, under the left costal arch. The tumour gradually became tender, and on December 7th it had extended to the umbilicus and was plainly fluctuating. A fortnight later an exploratory puncture of this tumour yielded a reddish-yellow fluid, in which many round cells were found. The tumour was now as big as a child's head, its surface was smooth, and its upper part disappeared under the left costal arch. It moved freely on respiration, and could also be displaced on palpation towards the middle line. Though fluctuation was easily elicited it was impossible to decide whether the fluid was under high pressure or not. An examination of the urine, bladder, ureters, and kidneys showed no abnormality. When the colon was distended by a rectal injection of gas it was found to lie median to, and partially in front of, the tumour. Although the examination of the urinary system was negative, the position of the tumour in the lumbar region suggested the presence of a renal tumour, and this view was supported by the absence of any marked degree of leucocytosis, which is usually associated with tumours

of the spleen. Accordingly, on January 7th, the left kidney was explored, but was found to be perfectly normal. The incision in the lumbar region was therefore closed, and the abdomen in the lumbar region was therefore opened in the position of the spleen. The tumour was then incised in order completely to evacuate the pus, which was under high pressure. The abscess cavity was then plugged and drained, and the patient recovered completely. A bacteriological examination of the pus revealed 4 pneumococci, which probably were derived from the endocardium, whence a bacterial embolus had passed into the spleen, giving rise to an infarct followed by suppuration.

131. Intestinal Obstruction.

A. McGLANNAN (*Journ. Amer. Med. Assoc.*, August 21st, 1915) says that though aseptic surgery has revolutionized the mortality statistics of acute intra-abdominal disease, the death rate from intestinal obstruction remains almost as high as it was thirty years ago. In the series of 276 cases studied by him the mortality was 45.7 per cent. In 161 cases the obstruction occurred in the small intestine, and 46.6 per cent. died. Seventy-five were cases of large intestine obstruction, and the mortality was 44 per cent. In 49 cases the exact position of the obstruction was not given, though probably it was in the small intestine. In the jejunum the obstruction was fatal in 52 per cent. of the cases. Much experimental work has been done to determine the cause of death, and it indicates that the secretion of the duodenal mucous membrane is involved in the fatal factor. Hartwell and Hoguet, in their experiment, show that dehydration is an important element in a fatal outcome. In pathological obstruction of the human intestine met in clinical work an intact mucous membrane is never seen. Earlier effect is shown in the altered nutrition of the bowel caused by interference with the circulation. The slow onset of toxæmia and its slight degree in chronic obstruction may be due to the development of a resistant epithelium with a compensatory hypertrophy, occurring in the loop of bowel above the obstruction; or it may be the result of the gradual development of a vicarious function of resistance by another organ. From the work so far done, McGlannan points out that the toxæmia arises from the duodenal secretion; all facts point to the absorption of a chemical compound of the cholin group of substances as the underlying essential cause of death in intestinal obstruction. The causes of death in the present series in the fatal cases were: Toxæmia, 75 per cent.; peritonitis, 12 per cent.; post-operative shock, 5 per cent.; miscellaneous, 8 per cent. In these 127 cases there were 20 in which the bowels were gangrenous. Fourteen of these patients died of toxæmia, 3 of peritonitis, and 3 others, fifteen, twenty-nine, and twenty-six days, respectively, after operation, from pneumonia, tuberculosis and embolism. The toxæmia is combated with great difficulty. Its main effects are on the heart and vasomotor system, and the secondary effects on the kidneys, liver, and other important organs tend to disaster. Early recognition and prompt treatment offer the only hope of reducing mortality. In the present series of cases the average duration of symptoms before operation in the cured jejunal obstruction was $\frac{1}{2}$ and two-thirds days. In the fatal jejunal cases two and five-sixths days; in the ileum cases the average duration of the curd was three and one-third days, of the fatal, six days. As a rule, the higher the obstruction the more fatal the outcome. McGlannan describes the symptoms of the three stages, which at the onset are pain, nausea and vomiting with or without constipation or diarrhoea coming on suddenly without regard to ingestion of food. Movements of the bowels or stomach washing will not relieve the pain, and with these symptoms the diagnosis should be promptly made and the operation performed. If there is any hesitation a second lavage should be done after one hour. The presence of nodular material in the washings at this time makes a diagnosis certain. In eighteen cases of operation made on these symptoms the obstruction was found, and the patient recovered. In the second stage there are persistent pain, distension, a visible and palpable spastic coil of intestine, visible peristalsis, with ladder pattern, and local tenderness; frequently, gangrene of the bowel and localized peritonitis. In the third stage toxæmia overshadows everything, and is the principal object in treatment. Sixty-three of the 276 cases were post-operative, and 20 of the patients died. Nearly 40 per cent. of these followed drainage after operation for appendicitis, which is a potent argument for early operation in those conditions when no drainage will be required. Operative methods vary with the stage of the disease. In

the third-stage entostomy will be the only method justified. When the toxæmia has developed it must be combated regardless of what must be done for the direct relief of the obstruction. After the entostomy a large quantity of water should be supplied, best by hypodermoclysis, to prevent dehydration. Epinephrin may be injected intravenously or with the subcutaneous water to counteract the effect of the toxin on the heart and blood pressure.

152. Comparison of Wassermann and Luetin Tests.

VEDDER and BORDEN (*Journ. Amer. Med. Assoc.*, November, 1914, p. 1750) have compared the Wassermann reaction with Noguchi's cutaneous reaction with luetin—an extract from pure culture of the *Spirochaeta pallida*. The two tests were applied to 744 discharged soldiers, with the object of detecting the percentage of those infected with syphilis. In the luetin test a very strong reaction was indicated by double plus, a strong reaction by plus, and a slight reaction by plus minus. Only the double plus and plus reactions were considered diagnostic of syphilis. In the Wassermann test a plus reaction was not considered diagnostic unless supported by history or clinical signs of syphilis. But, even if both plus and double plus reactions were counted as positive indications of syphilis and plus minus and negative reactions as negative indications in both tests, it was found that the luetin test gave 32 per cent. positives and the Wassermann only 20 per cent. Hence, the luetin test is the more delicate, or else it gives a number of false positives. The authors conclude that the former explanation is correct, and that, in tertiary, latent and treated cases, the luetin test is considerably more delicate in detecting syphilis than the most efficient Wassermann test.

OBSTETRICS.

133. Nitrous Oxide and Oxygen in Labour.

HEANEY (*Amer. Journ. Obstet.*, July, 1915) strongly advocated this anaesthetic mixture in a paper recently read before the American Gynaecological Society. Klekovich introduced it in 1880, and Clarence Webster, Lynch, and Heaney himself had recently made free use of it on a large scale in a public institution. They found that with a proper machine and a nasal inhaler nitrous oxide might be given to the extent that patients did not experience pain during labour yet maintained their consciousness, and could follow, when called upon, the directions of the doctor. When oxygen was administered at the same time this stage of analgesia was more easily maintained, and headache, frequent after the inhalation of pure nitrous oxide, was rare. The method was remarkably cheap. Manual dilatation of the cervix could be undertaken without the patient feeling any pain though quite conscious. The child was seldom cyanosed, the nose inhaler obviating to a great extent this danger. Thus the mixture was specially suitable in Caesarean section, as the operator could dismiss the child from his mind immediately after extraction, whilst when ether was given there must always be anxiety about it. Heaney declared that the mixture could be given in private just as in a hospital, for no expert anaesthetist was needed, since with a little instruction a layman might give the gas under the careful control of the obstetrician. In the discussion Vinberg stated that he had found out one objection to the nitrous oxide mixture in plastic surgery, for it made the blood almost black. Frank remarked that he had had much experience in the mixture in obstetrical practice, including three cases of Caesarean section. He disagreed, on the other hand, with Heaney as to the safety of administration. The mixture was the most dangerous of all anaesthetics in unskilled hands, whilst when given by skilled experts it was the safest.

134. The Blood in Pregnancy.

J. B. MILLER, N. M. KEITH, AND L. G. ROWNTREE (*Journ. Amer. Med. Assoc.*, August 28th, 1915) give the results of a study of the blood plasma in pregnancy. From the beginning to the middle of the nineteenth century it was believed that the total volume of circulating blood increased during pregnancy; hence the theory of the plethora of pregnancy and the treatment of outward symptoms by bleeding and cupping. Later it was shown that in the last months of pregnancy the red cells and albuminous contents of the blood decreased, while the white cells and water content increased; hence the theory of chlorosis of pregnancy was developed and increased diet replaced bleeding in the treatment. After describing the technique and methods

used, the authors say that the determinations of plasma and blood volumes were made before or after labour or both in a series of thirteen women. While they do not attempt to announce any far-reaching conclusions, they hold that their studies indicate that an absolute and relative increase in the volumes of both plasma and blood exists late in pregnancy with a slow return to normal during the puerperium. Their findings confirm the work of Zantz and of Heidenhain, Spiegelberg and Gschiedlen on animals.

GYNÆCOLOGY.

135. Treatment of Pelvic Inflammation.

G. GRAY WARD (*Amer. Journ. Obstet.*, June, 1915) notes how the treatment of pelvic inflammatory exudates has altered within fifty years. In Marion Sims's days the doctor waited anxiously for the formation of a well-defined area of fluctuation at the vaginal vault or inguinal fold, and then timidly made a little incision and allowed the abscess to drain. In later years Lawson Tait fearlessly opened the abdomen, and when he could not extract a suppurating sac entire he sutured the abscess wall to the abdominal incision and drained it extraperitoneally. The extreme of radical surgery was reached by Péan and Segond, who extirpated the uterus through the vagina so that the abscess might be the more readily reached and drained. Ward followed up 39 cases of pelvic abscess under his own observation and treatment, and they led him to infer that a large proportion of parametritic exudates resolve without abscess formation if let alone, and that if pus does form it may be absorbed in small quantity, frequently without prejudice to the functions of the pelvic organs. In a very large percentage of cases too ready resort to the curette or to other intrauterine manipulations at the onset of uterine infection is responsible for the formation of exudates. Unnecessary or premature operations promote dissemination of the infection, retarding convalescence, and sometimes causing fatal complications. Incision and drainage must not be employed until the indications of a localized collection of pus are well defined and associated with evidences of septic absorption. The selection of the proper form of drainage applicable to each case is important. In some instances rubber tubing and in others gauze are needed. In cases of well-defined abscess cavities which hold much pus a free and long maintained opening is required, and the drainage tube will be much more efficient than gauze. Failure to cure a pelvic abscess by vaginal incision and drainage is nearly always due to neglect in not keeping the incision open the necessary period. In acute pelvic suppurations, when the indications for interference are present, the operation of choice should be a simple incision and ample drainage with the object of conserving the organs.

THERAPEUTICS.

136. Intratracheal Anaesthesia.

C. H. WATT (*Journ. Amer. Med. Assoc.*, September 4th, 1915) states that since the introduction of intratracheal anaesthesia in 1909 it has been employed successfully in the Johns Hopkins clinic in all types of cases, but chiefly in operations about the head and neck and in the thorax and spinal canal. The distinguishing features of the method are that pure air is brought directly into the larger bronchi, while the vitiated air is forced out by the returning air streams, and the dead space in the mouth, pharynx, larynx, and trachea is eliminated. A practically continuous recurrent air stream prevents the invasion of indifferent or infectious foreign matter from the pharynx into the trachea. In perhaps no domain of surgery is a quiet, uniform anaesthesia so important as in that of the brain and cord. The increased intracranial pressure embarrasses the respiration through its centre, and cyanosis is likely to occur and may add enormously to the difficulties. Especially in cerebellar operations is this matter of cyanosis important. By the use of intratracheal anaesthesia the anaesthetist has been relieved almost entirely from the embarrassment due to cyanosis. Among the minor advantages of the method is that it permits ready manipulation of the head, and the anaesthetist may, undistracted, give himself wholly to the general condition of the patient. Up to December, 1914, the insufflation method was employed in the Johns Hopkins clinic 35 times in operations on the brain and cord. In all these

close attention has been given to all points in which it could be compared with the drop ether method. The difference in the effect on the pulse is marked. With intratracheal anaesthesia the average increase was 27 beats, as against 47 with the drop ether. The average duration of the intratracheal anaesthesia is two hours and thirty-four minutes; with the drop ether two hours and twelve minutes. In none of the 35 cases was there cyanosis, while in 4 of the drop ether cases it was so great as to cause apprehension, and in 2 of them the operation had to be abandoned on account of the haemorrhage and cyanosis. In one case in which the intratracheal method was used the operation was abandoned twice on account of haemorrhage, attributed to a spongy and vascular condition of the bone. There was no other case of haemorrhage in the series, while there was terrific haemorrhage in 6 cases with the drop ether method. It was noted repeatedly that the patients regained consciousness much more rapidly than after the drop ether. There were no cases of post-operative pneumonia. Local anaesthesia seems rarely used in America for such operations. The intratracheal method has all its advantages without its disadvantages. The chief point of advantage seems, to the author, to be the ease with which the intubation can be done. He sums up by saying that this method is much safer than the drop ether method, and the anaesthesia is smoother and offers the most efficient means of artificial respiration if needed.

137. Therapeutic Use of Oculo-Cardiac Reflex.

THE different proceedings usually recommended as treatment in attacks of tachycardia have for their object stimulation of the pneumogastric nerve, and CAMILLE LIAN (*Archives des maladies du coeur, des vaisseaux, et du sang*, July, 1915) recommends that in other simple measures should be added the therapeutic use of the oculo-cardiac reflex. It is known that strong compression of the ocular globes causes, in the majority of persons, a diminution of pulse-rate which varies greatly in degree in different persons; thus the diminution may be only one-twentieth or one-tenth of the former rate, or may even be one-half or two-thirds, a pulse of 60 falling to 30 or 20. As a rule, the slowing of pulse-rate does not appear for four or five seconds after the beginning of the compression, and it is found, on palpation of the radial pulse, to be due not to a uniform increase of the duration of the pulsations, but to the production of successive unequal pauses. Unfortunately, the author has not yet been able to test clinically the value of the proceeding in suitable cases of paroxysmal tachycardia. The only case in which he has tried it was a most severe case in which all the customary measures, such as the administration of ipecacuanha as an emetic, the swallowing of large caftels, etc., as well as the use of the oculo-cardiac reflex, all failed, and recovery only occurred when digitalis was injected intravenously. Points in favour of compression of the eyeballs as a therapeutic measure are that the proceeding is a safe one, easily carried out, and well borne by the patient. Although in healthy persons the diminution of pulse-rate is greatest during the actual compression, yet it persists to a less degree after compression has ceased; for example, when compression lasts a quarter of a minute the pulse-rate is often found to return to normal only after from one to two minutes, and since in paroxysmal tachycardia the paroxysms end abruptly, such a fall might easily determine the cessation of the attack. Moreover, the procedure can be repeated several times, or can be used in combination with other methods. A strong compression, lasting for from fifteen to thirty seconds, is found to have more effect upon pulse-rate than one of medium strength lasting one or two minutes or longer. The author recommends that there should be four or five strong compressions, with an interval of from a quarter of a minute to a minute between each, so that the cardio-inhibitory action of one compression shall merge into that of the next. In order to try to prolong the result obtained, the strong compressions might be followed by medium or light ones applied for several minutes. The treatment should be applied as soon as possible after the beginning of an attack.

138. Intradural Medication with Mercuric Chloride for General Paralysis.

IRELAND AND STUART WILSON (*Journ. Amer. Med. Assoc.*, September 25th, 1915), in Washington State, where the high cost of salvarsan and its scarcity in the market of the Western United States have prevented them from general use of the Swift and Ellis method, have adopted the Byrnes method, because of its apparent freedom from

danger and low cost. 40 c.c.m. of blood are taken from one of the veins of the forearm and the serum allowed to separate. To 12 c.c.m. of clear serum is added 1 c.c.m. of a sterile solution of mercuric chloride containing $\frac{1}{2}$ grain and 17 c.c.m. of sterile normal salt solution prepared from freshly distilled water. This total of 30 c.c.m. is heated to 56 C. in a water bath for thirty minutes. Lumbar puncture is performed, and from 15 to 30 c.c.m. of fluid are withdrawn, and the 30 c.c.m. of diluted mercurialized serum is slowly injected. A 25 c.c.m. Lührs syringe was employed for the purpose. The authors publish abstract notes of twenty-three patients under their care. The treatment has proved safe. Autogenous serum is found to be preferable to pooled serum. The reactions are found a little more severe than those which follow the Swift and Ellis 40 per cent. salvarsanized serum treatment. Seventy-five per cent. of the authors' cases showed a clinical improvement after four or five treatments, but a tendency to relapse to their former condition was noted in about 40 per cent. of those at first improved. The clinical is more marked and more rapid than the serologic improvement. The authors desire that it should be known that the after-histories of their cases are too short for them to count on permanent improvement, and that therefore they will publish a later report of the same series. The colloidal gold test is most resistant to change; it is possible to have clinical general paralysis with a negative Wassermann reaction in blood serum and spinal fluid, but in this series the colloidal gold test was uniformly positive.

PATHOLOGY.

139. Experimental Hydronephrosis.

KEITH and SNOWDEN (*Archives of Internal Medicine*, February 15th, 1915) studied the functional changes which occur from day to day in animals whose only deviation from normal was an increased intratracheal pressure. The work of previous investigators has shown that increased back pressure on the kidney causes definite functional changes, the amount of urine excreted varying with the degree of intratracheal pressure, there being an increased flow with low pressures and a diminished flow with higher pressures, but the effects resulting from back pressure extending over a longer period of time, and more nearly approaching conditions met with clinically, have not hitherto been investigated. In order, therefore, to study the effects of back pressure on the kidney over an extended period of time, an obstruction in one ureter was produced with removal of the other kidney, functional tests after a unilateral nephrectomy alone having previously shown no departure from the normal. A method for partially obstructing the ureter was devised by placing an elastic band loosely around it so that it was permeable at a pressure of from 20 to 30 cm. of water, which was considered to be the pressure most likely to produce the desired effects. During the first period following such an obstruction in dogs nothing objectively abnormal was noted, the only evidences of derangement being a mild polyuria, well-marked thirst, and certain cumulative phenomena in the blood. The animals were bright and lively, and such toxic symptoms as loss of appetite, vomiting, or diarrhoea appeared but rarely. The thirst was secondary to the polyuria, for the urinary output frequently exceeded the fluid intake. There was no sign of oedema or anaemia, but all the cases showed a steady gradual loss of weight. After a varying length of time a severe and rapidly fatal toxæmia set in, with loss of appetite, vomiting, progressive weakness, and frequent fluid stools containing mucus and traces of blood. Slight tremblings and muscular twitchings were present, but convulsions, drowsiness, or coma were absent. During this second period functional tests showed marked renal insufficiency with pyelocystitis. Determination of the amounts of incoagulable nitrogen showed a sharp initial rise with a relatively greater increase in the urea nitrogen content, the latter sometimes amounting to 90 per cent. of the total. Following the first sharp rise, the nitrogen generally maintained a fairly constant level to within a few days of death, when, coincident with the terminal symptoms, there was a great increase in the nitrogen content of the blood, and a very low phenolsulphophthalein output. In each of the eight experiments a hydronephrosis developed, causing the definite renal functional disturbances characterized by polyuria, traces of albumin, diminished output of phenolsulphophthalein, and delayed excretion of lactose, but no delay in the appearance of a glycosuria after the injection of phloridizin.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

110. Peripheral Nerve Lesions and Muscular Contractions.

MAURICE DUCOSTÉ (*Gaz. hebdomadaire de médecine et de chirurgie, Bordeaux*, July 18th, 1915) has made a study of the contractions which follow peripheral nerve lesions, and enunciates two laws with respect to them—the first the law of contraction upwards and the second the law of neuromatous contraction. The first law is as follows: That a lesion of a nerve below the point or points at which motor branches come off results in immediate and lasting contraction of the muscles supplied by the motor branches. The cause of the contraction is, in the present state of knowledge, inexplicable, but the author believes that it is a law without exceptions. A good example is to be found in lesions of the ulnar nerve. If the ulnar is injured below the points from which the branches to the flexor carpi ulnaris and the inner half of the flexor profundus digitorum are given off, the second phalanges of the fourth and fifth fingers are at once flexed, the fifth metacarpal is flexed, and carries with it the fourth metacarpal, and the hand rotates on its ulnar edge. No such flexion is observed if the lesion is in the upper arm—that is, above the muscular branches. That the flexion is the result of contraction, not of paralysis, is shown by anastomosis of the muscles, which give out the characteristic contraction sound, and by the elastic resistance which is experienced if an effort is made to overcome the flexion by traction upon the phalanges. Occasionally the middle finger also becomes flexed as a result of the injury, probably because in these cases the third head of the flexor profundus digitorum is supplied by the ulnar instead of the median. Where the injury to the nerve is incomplete the flexion of the fingers is only of moderate degree and is easily overcome. An apparent exception to the rule is in cases in which the nerve is injured in the upper arm but the flexion of the fourth and fifth fingers is not immediate but is retarded and progressive in character. The explanation in such cases is that the flexion is due to the flexor sublimis digitorum innervated by the median, not by the ulnar nerve, and is in accordance with the second law enunciated by the author—that of neuromatous contractions. The author's conclusions, with respect to his first law are: (1) That, in opposition to what has previously been taught, a lesion of sensory branches of mixed nerves not only results in disorders of sensation but also in certain constant disorders of motion. (2) That the constancy, the localization, and the similarity of these contractions make it impossible to attribute them to hysteria. (3) That treatment by electricity, by suggestion, or by blind surgical intervention are to be rejected as useless or injurious. (4) That in the case of contractions limited to a group of muscles it is necessary to seek, in accordance with the above law, for the nerve which might be the cause and to explore it; that it is not impossible that a nerve attacked by a non-traumatic neuritis might react in the same fashion. Before the second law of contraction can be followed certain facts with regard to neuromatous need consideration. When a nerve has been divided, either in the physiological or the anatomical sense, a neuroma develops at the seat of the lesion. The neuroma, as soon as it reaches a considerable size, is excitable, and if it is excited by rubbing or by light blows a sensation as of an electric current is felt along its course, the sensation not being limited to the extremity, as would be the case according to Müller's law. (This sequence of events does not always occur if the neuroma be situated on the median nerve.) If the nerve be compressed below the neuroma by means of a ligature, the sensation only descends as far as the ligature. But, in addition, and especially in the case of the ulnar nerve, a current may be felt in the ascending direction, which also may be checked by compression. Moreover, excitation of the nerve well above the lesion gives rise to both ascending and descending currents. Again, if the ulnar nerve is injured in the forearm or even the wrist, excitation of the neuroma or of the nerve above or below the lesion awakes the sensation of an ascending current up to the level of the elbow or even of the axilla. At the end of a variable length of time it will be found that excitation of the ulnar and also of the internal cutaneous in the arm well above the lesion gives rise to a descending

current; then the second and third intercostals are affected and give, on compression of the corresponding intercostal spaces, the same sensation. Thus some pathological process passes upwards, from the original point of injury, along the whole length of the ulnar nerve and invades all the nerves with which it anastomoses. The zone affected when the neuroma shows marked excitability is situated on the front of the thorax in the second, third, and fourth spaces, and it is as a rule accompanied by a not very extensive zone in which the characteristic features are less well marked. There are always present at the same time painful points which can be elicited by pressure on the posterior branches of the intercostal nerves and on the cutaneous branches anterior to their points of emergence. The pathological process may even be propagated symmetrically to the opposite side of the thorax. The muscular contractions take place in accordance with the author's second law, which is, however, subject to some exceptions still in need of explanation. This law is: The neuroma excites and contracts the muscles whose innervation comes from the same roots as the nerve on which it develops, and secondarily excites and contracts other muscle groups whose innervation comes from neighbouring roots, the effect being more marked the nearer the roots are to the original ones; the neuroma provokes hyper-reflectivity of the tendons and at the same time cutaneous hypo-reflectivity. The neuromatous contractions are late and develop gradually, as opposed to the upward contractions dealt with in the first law which are immediate and react their maximum almost at once. At first the neuromatous contractions do not modify the position of the limbs, but they gravely injure the force, precision and amplitude of movements, thus explaining cases in which certain movements are very imperfect although the muscles which give rise to them show exaggerated contraction. For a variable time the contractions can temporarily be easily overcome; later they become permanent, and the positions imposed upon the limbs by them become irreducible; finally the muscles atrophy. It appears that in the latest stages the neuroma disappears. The author points out how largely the two laws above enunciated will diminish the number of cases of contractions which can rightly be considered to be hysterical in nature and for which fatalism of the muscles is the right treatment.

141.

An Atophan Rash.

ACCORDING TO KISSMEYER (*Ugeskrift for Læger*, May 20th, 1915), atophan has been given during the last three or four years for arthritis urica with good results. The drug was introduced in 1908 by Nicolaier and Dohn, and the first results of treatment with this drug were published in 1910. Judging by the publications which have subsequently appeared, the drug seldom causes complications, and only in eight cases does it appear to have given rise to purpura, urticaria, or a scarlatiniform rash. The author records the case of a man, aged 70, who had suffered for many years from arthritis urica. During the past two years he had taken large quantities of atophan, from which he had greatly benefited without suffering any discomfort. Early in December, 1914, he took atophan for a gouty attack. He had not taken the drug for some time. After he had taken six tablets (the dose of each tablet is not stated) in the course of twenty-four hours, red spots appeared on the face and neck, and the lips and eyebrows became oedematous. The rash and oedema disappeared in a few days, at the end of which the patient again took three tablets in one dose. The rash flared up again at once and crusts appeared on the oedematous lips. The patient was accordingly admitted to hospital, where the forehead, cheeks, and neck were found to be covered by red plaques, varying in size from a 10 öre to a krone piece. They were partially confluent, but were sharply outlined against the normal skin. Several of the plaques showed a fine desquamation. There was slight conjunctivitis and the eyelids were red and swollen. The lips were very oedematous and fissured and were covered by a few black crusts. The rash did not invade the scalp or the mucous membranes. It disappeared in the course of a week, during which the patient was subfebrile. As several of the joints continued to be painful, 1 gram of atophan was given about six weeks after the last dose. Six hours later the rash recurred in the same places as before, and

in some places it was vesicular. A couple of black crusts appeared on the left upper eyelid and on the right cheek. There was no rise of temperature and no discomfort apart from itching, and the rash again disappeared in the course of a week. The author regards this case as an example of a condition which Jadassohn has called "geweichte Idiosyncrasie." Many features of this condition suggest anaphylaxis, and it occurs also after repeated doses of quinine, mercury, and salvarsan. H. THOMSEN (ibid., June 3rd) has observed a similar case in a woman, aged 30, after 4.5 grams of atophan had been given in the course of three days. The rash disappeared in five to six days and was unaccompanied by oedema or crusts.

SURGERY.

142. War Deafness from Lesions of Internal Ear.

A. GOT (Gaz. hebdomadaire, July, 1915) has had under observation since the beginning of the war about a hundred cases in which deafness was due wholly or in part to affections of the inner ear. He gives notes of 32 of these, in which he has been able to make detailed examination and which he has classified from the point of view of the cochlear and vestibular apparatus. All the cases showed cochlear hypoeccitability. Of 17 deaf as the result of explosions of shells, bombs, grenades, or mines, etc., 4 were hyperexcitable as regards the vestibule, 11 hypoeccitable, none were unexcitable, 2 normal. Of 13 deaf as the result of wounds in the neighbourhood of the ear, 5 were hyperexcitable, 4 hypoeccitable, 2 unexcitable, 2 normal. Of 2 cases in which the patients had been buried as the result of an explosion, 1 was normal, the second hypoeccitable. Of these cases, 1 out of the group of 17 and 2 out of the group of 13 were completely deaf, and showed hypoeccitability in each case, 1 out of the group of 17 was completely deaf and had normal excitability. Of the whole 32 cases, 4 presented cicatricial atresia of the auditory canal, 12 had lesions of the middle ear and 16 showed no objective lesion visible on otoscopy. From the etiological standpoint the cases fall into the two groups, one in which the injury is the result of explosions acting through the air as intermediary, the other in which it results from projectiles which inflict direct wounds on the head. Of these the injuries in the second group may be more severe and may, as in two of these cases, cause total destruction of the internal ear. Moreover, the nearer the wound to the petrous bone the more grave the lesion, even when it may be impossible to diagnose fracture of the bone. Anatomically, judging from what happens in the case of the eye, it seems probable that, apart from the cases of fracture of the petrous bone, the causative lesions are haemorrhages, more or less considerable, into different parts of the internal ear combined with detachment of Corti's membrane. In the cases due to shell explosion without a direct wound, the haemorrhages are probably less violent than in the other form, but there is probably concussion of the organs of Corti with or without disintegration of the membrane. Clinically the cases cannot be satisfactorily classified until later, when only the symptoms corresponding to the regions destroyed will remain. A positive diagnosis can as a rule be made rapidly from the presence of deafness, tinnitus, and vertigo, and examination will show nystagmus, spontaneous or able to be provoked, troubles of equilibrium and electrical reactions. In a hyperexcitable patient nystagmus is induced with the help of hot water at a temperature of 44° C. (111.2° F.); in a hypoeccitable one, cold water at 15° C. (59° F.), or better by cold air. To differentiate between organic and functional deafness the study of the voice resonance is most helpful, but only in the cases where the deafness is very marked or is absolute. In total deafness of organic origin the patient's voice very quickly acquires the characteristic of the deaf, while in functional lesions the voice remains normal. Where the deafness is absolute, the voice normal, and the cochlear and vestibular reactions normal, the question arises whether the case is one of simulation. In settling the question points of importance are—the history of onset, the attitudes and appearance of the patient, his willingness or otherwise to attempt lip reading, and the effects of psychotherapy, and as a last resource the patient in convalescence may be sent home under the control of gendarmes, who will keep watch as to the degree of deafness. With regard to prognosis, most cases improve fairly quickly, even with regard to the cochlear reaction, but the only cases in which the author has seen a complete cure are psychic cases. In organic cases, during improvement from the vestibular point of view, the vertigo is usually the first symptom to disappear along with the nystagmus, then little by little

the powers of equilibrium will become more normal; from the side of the cochlea symptoms will more or less persist. Time and rest are obviously the main factors in treatment. In addition there is counter-irritation or leeches to the mastoid, hypotensive drugs, spinal puncture for vertigo (as recommended by Babinski), and treatment by bromides and iodides for tinnitus.

143. Syphilis of the Stomach.

F. SMITHIES (Journ. Amer. Med. Assoc., August 14th, 1915) records the results of a clinical study of 26 cases of dyspepsia associated with positive Wassermann-Noguchi reactions. In all these the diagnosis of syphilis was highly probable or was confirmed by exploratory laparotomy. He remarks that gastric syphilis has by no means so rare as was formerly considered, as no fewer than 25 cases have been recorded in the United States during the past six years. Smithies's series of 26 are taken from the examinations of 7,545 cases, making a percentage of about 0.34. There were gastric symptoms in a much larger number, many of whom were syphilitic. The lesion may be congenital or acquired, and may produce several pathological types, which may be summarized as those associated with chronic gastritis, ulceration, gastric tumour, and perigastritis, often with involvement of adjacent organs. Fifteen of the patients were men, eleven women. The minimum age was 20, the maximum 66, the average age being slightly greater in the men than in the women. Difficulty was met in some in obtaining a history of the primary sore, especially so in females, and the period passed before gastric symptoms is only approximately correct. The minimum period was four years in both sexes, the maximum for men being thirty-eight years and for women forty-five years. There were no congenital cases, and in all but two the gastric disorder appeared in the tertiary stage. Only two of the whole number had had a thorough treatment of mercury and iodides. Three had taken salvarsan for "anaemia," within four years of their coming under observation. The average duration of the dyspepsia was 8.7 years for the group, with practically no difference in the two sexes. The cases are classed in three groups: (1) Those in which a persistent gastric derangement appeared in persons previously healthy; (2) cases in which a constant dyspepsia followed years of antecedent intermittent indigestion; and (3) cases in which continuous gastric upset occurred in persons who had had stomach trouble for some past period, but who had been free for some time. Each of these classes was studied in detail. In the second type the symptoms closely simulated gastric ulcer, but the gastric analysis revealed moderately high total and free hydrochloric acid with no increase above the normal formol index, and only irregular manifestations of positive Wolff tests. Even laparotomy sometimes left the matter in doubt. In the third group these symptoms were irregular, but the terminal stage laparotomy findings closely resembled those of the second type. Roentgenoscopy afforded no pathognomonic signs; but with a positive Wassermann-Noguchi test they afford a positively certain diagnosis. The best results in treatment were obtained by intravenous injection of salvarsan followed by a thorough mercurial course and iodides. Iron and arsenic are sometimes needed for the coincident anaemia, and the dyspepsia may also need attention. Smithies thinks one should be cautious in making any definite statements about the cure of gastric syphilis, but 4 patients of the total 26 were relieved for so long as a year; 12 patients appeared to be improved, and 3 were not benefited.

144. Appendicitis in Typhoid Fever.

GAGE (Annals of Surgery, August, 1915) reviews previous records of the association of acute appendicitis occurring in the course of typhoid fever, pointing out how easily a simple typhoid may be mistaken for an acute or subacute appendicitis, the differential diagnosis being rendered more difficult from the fact that the appendix shares to a greater or less extent in the intestinal lesions of typhoid. Notes are given of a case of acute gangrenous appendicitis occurring at the beginning of convalescence from an attack of typhoid. A youth, aged 19, complained of severe headache ten days after a possible exposure to typhoid infection. Five days later Vidal was positive, and on the tenth day typical rose spots and a palpable spleen were present. Defecation was gradual, the temperature being normal from the fourteenth to the nineteenth day, when he awoke with severe abdominal pain, most intense in the right quadrant and accompanied by spasm of the right rectus. He vomited once, and the leucocyte count, previously 7,000 to 8,000, rose to 18,000. On a diagnosis of probable

perforation the abdomen was opened, when a mass was felt in the region of the appendix containing an ounce of thin pus and an acutely inflamed appendix, gangrenous at one point and covered with a thick exudate, but unruptured. Convalescence was uneventful after removal. Microscopical sections showed everywhere marked polynuclear infiltration of all coats of the appendix, and those through the point of ulceration presented a characteristic lesion of typhoid, the lymphoid tissue of the mucosa showing areas infiltrated with endothelial leucocytes. Cultures from the appendix abscess showed *Bacillus typhosus* and *Bacillus coli*. The presence of the typhoid bacillus in the exudate and in the walls of the appendix indicate that it took an active part in the process, and it is probable that true typhoid appendicitis is more common than is generally supposed. When the condition occurs after the temperature has become normal, and the possibility is not much more difficult than in cases of simple uncomplicated appendicitis. For differential diagnosis the symptoms are not very unlike, and the indications for operation are identical, but the prognosis is more favourable when the lesion is in the appendix than when in the intestine, probably because there is less danger of faecal extravasation. A rising blood count is important, since the appearance of a leucocytosis in the course of typhoid fever points to an early stage of some inflammatory complication.

OBSTETRICS.

145. Intussusception Complicating the Puerperium.

G. NYSTRÖM (*Finska Läkarsällskapet Handlingar*, March, 1915) records the case of a 9-paræ, aged 43, who gave birth to a male child on February 14th, 1914. Labour was easy, but there was some liquor inæquus. The placenta came away normally soon after the completion of labour. On February 17th the patient got up in the morning to eat, and during the meal, which consisted of porridge and milk, she developed severe abdominal pain and felt very ill. Later in the day vomiting supervened, and there was complete retention of faeces and flatus. During the night the pain increased, and on the morning of February 18th an examination showed the abdomen to be somewhat distended and a little tender. The pulse was 85, and the rectal temperature 100.4°. Active peristaltic movements of the small intestine could be detected through the flaccid abdominal wall. Below and to the right of the umbilicus a swelling could be felt and was suggestive of invagination of the intestine at this point. A median laparotomy was therefore performed. A considerable amount of blood-stained exudate was found in the abdominal cavity. At a point about 10 cm. above the ilco-caecal valve there was an intussusception of the lowest section of the ileum, whose attachment to the posterior abdominal wall was re-epitoned and passed horizontally inwards from the caecum. No difficulty was experienced in reducing the invagination, and the patient made an uneventful recovery. Discussing this case, the author suggests that the evacuation of the uterine contents facilitated the development of the intussusception by relaxing the tension of the abdominal wall, and thus giving the intestines greater freedom of movement. A further, but less important, factor in the production of the intussusception might be the diminution in the volume of the abdomen caused by the contraction of the uterus. Finally, the character of the attachment of the ileum to the posterior abdominal wall at the point where the intussusception occurred has already been associated by some surgeons with intestinal invagination.

146. Haemolysis in Obstetric Cases.

RUDOLPH HOLMES (*Surgery, Gynaecology, and Obstetrics*, August, 1915) reports three instances of this complication. A parous woman, aged 32, was cured for profuse haemorrhage, the fact of an early abortion not being determined. Three months later she took a saline purgative, and it caused dizziness, emesis, pain in the back, and profuse purging. Next morning, when the periods were due, alarming haemorrhages occurred. The tampon was applied, and within an hour or so the skin and conjunctivæ became deeply bronzed, more so in Addison's disease than in any type of icterus. The liver was distinctly enlarged. By the second or third day the pigment had entirely disappeared and the skin had become of an alabaster whiteness. The temperature was 104°, no urine was of the colour of liquid extract of ergot, yet no blood cells could be detected, thus there was true haemoglobinuria. The pulse was very high, the temperature falling, and repeated small haemorrhages associated with hæmatemesis

occurred. Death ensued within three weeks. There was no necropsy, but, according to clinical findings, the cause of death was acute pneumococcal infection, a true bacteraemia, hepatitis, nephritis, and colitis. In the second case abortion had been induced. The resident medical officer, taking the patient's history on her admission into a hospital, noticed that her skin steadily changed colour, and within half an hour it became deeply bronzed. There was haemoglobinuria, as in the first case, and a blood smear showed streptococci in pure culture. Death occurred within twelve hours after admission, and decomposition advanced rapidly so that the viscera, and even the muscles of the leg, were softened and quite useless for examination. The third patient had an attack of gall-stone colic during a previous difficult instrumental labour. Two years later feverishness preceded an easy labour, with pain in the hepatic region. Some atypical hæmorrhages followed labour, and the tampon was applied twice, and the patient's skin became very pale but bluish-brown, just like the integuments in the first case when the bronzing was passing off. The blood appeared like watery port wine. Death occurred within a few hours. The infective process during the last days of pregnancy emanating from the biliary tract was the cause, in Holmes's opinion, of the failure of coagulation. As events followed on so quickly it was impossible to obtain specimens of blood and urine for examination, but if the process had not been so fulminating the peculiar discoloration of the skin would have developed into the same form of hæmolysis as in the first two cases.

GYNAECOLOGY.

147. Tuberculosis of Urachus.

EASTMAN (*Amer. Journ. Obstet.*, October, 1915) observed this condition in a married woman aged 19. She had been married two years and was the mother of one child; gestation and the puerperium were normal, and the child was alive. She had no signs of pulmonary or other form of tuberculosis. Ten months before she came under Eastman's observation she felt a pain between the umbilicus and the symphysis pubis, when working in her garden, and she then found that a lump had formed in that region. It was of the size of a small apple, and not very tender or painful. The lump remained stationary for three months, and then a pin-point opening appeared, discharging for a week a clear watery fluid. Then a crust appeared and closed the opening, and gave way and reformed several times within a few months. The lump did not increase in size, and the discharge was never fetid, and never, the patient declared, urinous. There were no signs of disease of the uterus, bladder, or intestines. Eastman found the patient in good health. There was a discharging sinus below the umbilicus, and a sound introduced into it could be passed downward below the symphysis. The fistulous tract was dissected up; it passed downwards from the discharging orifice, in front of the peritoneum, crossing the space of Retzius, and terminating in a thin cord attached to the anterior bladder wall in the median line and near to the junction of the urethra and bladder. When laid open, the definite tubercle structure was found to be thin-walled, showing no evidence of inflammation or pathological change excepting an ulcerated area on the dorsal wall of the tube near the orifice of the sinus. The tumour mass, the lump which had persisted for ten months, showed on section giant cells, lymphocytes, and epithelioid cells. Some granulation tissue in the ulcerated area was found on microscopic examination to be infiltrated with large round "epithelioid" cells, while several well-developed miliary tubercles were detected. By means of the cystoscope the mucosa and the ureteric openings; and trigone appeared normal, nor could any communication with the patent urachus be traced. The wound closed slowly but completely, and there have been no symptoms of disease of the genitourinary tract or of local or disseminated tubercle. Eastman notes that only one other case of tuberculosis of the urachus has been recorded (Bridson and Eliot), and in that instance the patient was, as in the above reported case, a young woman.

THERAPEUTICS.

148. Prolonged Fasting in Diabetes.

ALLEN (*Amer. Journ. of Med. Sci.*, October, 1915) records his experience in the treatment of 44 cases of severe diabetes by prolonged fasting, based upon experiments in animals, in whom it was found that the persistent

of glycosuria resulted in a downward sequence of lowered tolerance, emaciation, and death, with parallel degenerative changes in the islands of Langerhans, while the prevention of glycosuria resulted in the animals remaining lively and strong, though thin, the islands being spared. In even the severest types of the disease the glycosuria may be cleared up with advantage by an initial fast, which should last until that end is accomplished and then for one or two days longer, the subsequent diet being so regulated as to keep glycosuria and acidosis permanently absent, with as many interspersed fast days as may be found necessary for that purpose. The necessary duration of the fast may be as long as eight or ten days. Both the glycosuria and acidosis were known to be relieved by the occasional fasts which had been employed previously by some observers in the treatment of diabetes, but both conditions are found to be still further reduced by the more prolonged fasting suggested. Just as the fasting is continued as long as is necessary to produce sugar freedom, so the subsequent diet is governed, not by any theoretical standard of protein or calories, but by the amount of each food which each individual case can take, while keeping the urine free. Any trace of glycosuria is the signal for a fast day, and routine fast days are often used as frequently as once a week even though glycosuria is absent. In the management of severe cases two principles are evident—namely, the benefit of keeping the patient permanently below weight and the advisability of restricting the quantity of fat taken. By keeping severe diabetics permanently at a low level of weight and metabolism downward progress and the return of symptoms are prevented, and since the addition of fat to a fixed diet will cause a return of both glycosuria and ketonuria, the patient's tolerance for fat and calories should be followed in the same way as the tolerance for carbohydrate and protein. Under this treatment it is found that the diet, while not overtaxing tolerance, sufficiently satisfies the patient, so that he will follow it at home; that there is an absence of craving for carbohydrates and a contradiction of the idea that most diabetics cannot be trusted; that there is no need for alkalis for more than a few days, thus avoiding the disturbances due to acidosis or prolonged doses of soda; and that there is the advantage gained of clearing up the urine quickly, and thus being able to devote the greater part of the stay in hospital to educating the patient in the simple means of controlling his own condition through his diet, his weight, and the daily testing of his own urine with Benedict's solution. Reports from other clinicians agree that the results under this method of treatment are more favourable than those under the older methods, and its relative simplicity, together with the fact that it stops glycosuria without risk of acidosis, renders it available where hesitation existed as to withdrawing carbohydrate or stopping glycosuria in cases with any marked ketonuria. Two conclusions seem justified by present knowledge: (1) that the treatment removes glycosuria and acidosis more quickly and surely than has been the practice heretofore; and (2) that patients do better when glycosuria and acidosis are removed than when they are allowed to continue.

149. Sterilizatio Magna with Salvarsan.

DURING the last five years M. v. ZEISSL (*Berl. Klin. Woch.*, August 23rd, 1915) has treated more than 2,000 patients, suffering from syphilis, with old or new salvarsan; and he has been able to follow the subsequent course of the disease in almost all these cases, of which the following is the most instructive. A man, aged 24, had been infected in the beginning of June, 1910, and when he consulted the author on July 24th, a superficial syphilitic sore, of the size of a bean, was found in the retro-glandular sulcus. There were no eruptions on the skin or mucous membranes, but the inguinal glands on both sides were swollen. After an intramuscular injection on July 27th of 0.5 gram of old salvarsan, the patient suffered no discomfort apart from slight pain at the site of injection on the following day, and he returned to work on July 29th. He was under the author's daily observation until January 31st, 1911, during which period there was no symptom of generalized syphilis, and no antisyphilitic treatment was given. On August 15th, 1910, the chancre had completely healed. Wassermann's reaction was negative on January 18th, 1911, and also on August 18th, 1911; and from this date till April, 1915, he was perfectly well. He was wounded in April, 1915, and, after recovering, he was on leave in Vienna, where, on June 16th, he indulged in an extra-marital coitus. Three weeks later he noticed two erosions on the upper and outer surface of the prepuce. The lymphatic trunk on the dorsum of the penis felt like a hard strand,

and the inguinal glands on both sides were swollen. When, on July 20th, a coarsely papular syphilitic eruption on the limbs and trunk, a course of mercurial injections was resorted to, with the result that this eruption quickly faded. Both chancres rapidly healed under a dermatol plaster, and a course of neo-salvarsan, mercury, and iodides was given. It is evident in this case that the single intramuscular injection of 0.5 gram of old salvarsan completely cured the first infection. The second infection with syphilis in June, 1915, also showed that, when salvarsan is given soon after infection, *sterilizatio magna* is feasible. The author records other cases which show that by energetic antisyphilitic treatment, that is, a combination of salvarsan with mercury and iodides, Wassermann's reaction soon becomes negative. Although he succeeded in effecting *sterilizatio magna* with a single dose of old salvarsan, the author recommends the repetition of intramuscular injections of 0.45 gram every three or four weeks as being safer than the large single dose.

150. Treatment of Cerebro-spinal Fever.

PONTIGACCIA (*Pediatrics*, September, 1915) relates his experience in 9 cases of cerebro-spinal fever. In 1914 he had 2 cases, rather severe in type, both treated with intraspinal injections of antineurococcic serum and both recovering. In 1915 he had 7 cases giving a meningococcus in the cerebro-spinal fluid and in the pharyngeal mucus. Six of these were injected frequently and without any appreciable benefit. The seventh case concerned a boy, aged 10, suffering from symptoms of grave cerebro-spinal fever—violent headache, vomiting, rigidity, unconsciousness, etc. The first lumbar puncture gave 20 c.c.m. of turbid fluid containing intracellular meningococci. In spite of repeated puncture and injections of serum the patient showed no improvement. The author then (the sixth day) injected into the spinal canal 5 c.c.m. of a 20 per cent. solution of oxygenated water. This had a rapidly beneficial effect, and the patient slept for six hours as if he had been given a narcotic, the temperature fell and remained low for two and a half days, the general condition also improving. Next day the temperature went up and the symptoms returned. Another injection of peroxide solution was given with the same good effect. A third injection of 2.5 c.c.m. was given, after which improvement was so steady and continuous that no more were required. One case does not prove much, as the author points out, but the results in this case seemed fairly attributable to the H₂O₂ injections, and suggest a further trial of this remedy.

PATHOLOGY.

151. Recurrent Syphilitic Infection.

IN 1914 R. KRETTING prophesied that, owing to the efficacy of salvarsan, it would not be long before a case was observed in which a patient had been infected thrice, and had developed a new chancre on each occasion. Since then he has observed the following case (*Norsk Magazin for Laegevidenskaben*, October, 1915) which fulfils his prophecy. A business man, aged 26, first contracted syphilis in the summer of 1913 in Hamburg. The *Spirochaeta pallida* was found in the hard chancre on the penis. During the following six weeks he was given six injections of salvarsan and five of mercury. No rash developed, and Wassermann's reaction was negative in November, 1913. On March 5th, 1914, he presented himself to the author with two red and slightly infiltrated sores on the glans. A small, hard, lymphatic gland was palpable in the left inguinal region. Wassermann's reaction was negative, but the *Spirochaeta pallida* was again found in the sores. The person by whom the patient had been infected had also infected another patient under the author's care. The first patient was given four injections of salvarsan, of 0.4 gram each, at intervals of two to three weeks. Wassermann's reaction throughout this treatment was negative, and it was negative again on September 1st, 1914, and on February 10th, 1915. On April 7th, 1915, he again consulted the author for a characteristic indurated chancre near the frenulum. The left inguinal glands were swollen, and the *Spirochaeta pallida* was again found. Wassermann's reaction was now slightly positive. It was learnt that he had often been exposed to infection, and the author estimates that the actual infection had occurred about seven weeks earlier. Although this is the first recorded case of a second reinfection with syphilis, the author points out that there is nothing remarkable in such an event, seeing that a second infection is by no means rare. In fact, he has observed twelve undoubted cases of reinfection.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

152. Tumour of the Pituitary Body simulating
Tabes or General Paralysis.

The observation recently made by Oppenheim that the clinical picture of tumours of the pituitary body closely resembles that of tabes or general paralysis is confirmed by G. KAHLMEYER (*Hygica*, vol. lxxvii, No. 9, 1915), who records two cases. In the first case the patient was a man, aged 40, whose first symptom was a transitory paralysis of some of the ocular muscles a few years earlier. Subsequently simple atrophy of the optic nerve developed, and the patient complained of shooting pain in the limbs, progressive difficulty in maintaining his balance while walking, and impotence. An examination showed atrophy of the optic nerve resembling that of tabetic atrophy, and the patellar reflexes were absent. The diagnosis of tabes was maintained until the Roentgen rays showed disease of the sella turcica, and Wassermann's reaction was found to be negative. The second patient was a man, aged 50, who for some years had suffered from failing eyesight and glycosuria. Recently his character had undergone a striking change. Originally a quiet, modest man, he had become garrulous, boastful, and rough, and he suffered from alternate moods of exaltation and depression. An examination showed loss of patellar reflexes and simple atrophy of the optic nerve resembling that of tabetic atrophy. These symptoms led to the diagnosis of general paralysis, and this mistake was not rectified till the Roentgen rays showed erosion of the sella turcica and Wassermann's reaction was found to be negative. The glycosuria in this case was not incompatible with the diagnosis of general paralysis, for glycosuria occurs in 9 to 10 per cent. of all cases of general paralysis. Glycosuria is, however, also often associated with tumour of the pituitary body; and the coincidence is too common to be accidental. But the nature of the relation of the one condition to the other is not yet known. The difficulties of diagnosis in the author's second case were further increased by the possibility that all the symptoms might be traced to diabetes alone. For in diabetes the patellar reflexes may often be weak or absent, either as the result of peripheral neuritis or of degeneration in the posterior horns of the cord. Again, atrophy of the optic nerve has been associated with diabetes, both by Gräfe and Naunyn. Finally, the psychic phenomena might be interpreted as the result of diabetes as well as of general paralysis.

153. Williams's Sign in Early Pulmonary
Tuberculosis.

WALSHAM and OVEREND (*Archives of Radiology and Electrotherapy*, September, 1915) discuss the nature and causation of Williams's sign in early pulmonary tuberculosis. Williams's sign consists in a diminution in the extent of the inspiratory depression of the diaphragm on the affected side. The authors state that there are cases of undoubted early phthisis which do not exhibit a trace of Williams's sign. It is possible to discriminate three groups of movements: In the first the afferent nerves, those of the pleura in particular, escape, and the diaphragmatic movements are normal; in the second the contractacs are jerky and erratic, and perhaps not much curtailed. This may be due to simple afferent inhibition, accompanied by a spasmodic, incomplete, and irregular reciprocal reflex; in the third the latter is well established, and the activity of the recti and obliqui is easily discernible. The issue is then a reduction in the duration and amplitude of the inspiratory wave with a definite measure of protection and rest for diseased areas of the lung.

154. Paralytic and Persistent Sequelae of Migraine.

HUNT (*Amer. Journ. of Med. Sciences*, September, 1915) records his experience of a rare group of cases bearing out the clinical fact that migraine may occasionally be the cause of serious and permanent sequelae. Notes of 4 cases are given in which attacks of migraine were associated with ophthalmoplegia, two clinical types being recognized—namely, a recurrent or periodical palsy followed by complete recovery, and periodic exacerbations of a pre-existing paralysis of some branches of the third nerve. Two instances are recorded of migraine eventually

followed by permanent hemianopsia, and one in which hemiplegia followed a severe migrainous paroxysm occurring in a woman who had suffered from severe attacks of migraine since childhood. In association with lesions of the optic nerve a case is recorded of a woman, aged 31, subject to migraine since childhood, in whom a severe attack was followed by a unilateral retrobulbar neuritis with paracentral scotoma. In explanation of the symptomatology of migraine there appears to be a periodical recurrence of an auto-intoxication chiefly affecting the sympathetic and vascular systems, producing conditions of localized vasomotor spasm or dilatation of the cerebral circulation, such spasm being regarded as the cause underlying the frequently associated transient focal symptoms. The influence of recurring attacks of migraine upon an already existing arterial sclerosis is of importance when considering the permanent sequelae, since in the presence of even slight cerebral arterio-sclerosis crises of hemiparesis would be more liable to cause such vascular accidents as thrombosis or haemorrhage than would be the case in normal vessels. In the recognition of migraine paralysis the essentials points are: (1) A definite clinical history of genuine idiopathic migraine, and (2) a direct relationship of the paralysis or other complication to the migraine paroxysm.

SURGERY.

155. Extension of Cancer from Breast to Ovary.

V. FRANQUE (*Deut. med. Woch.*, July 22nd, 1915) records the case of a woman whose left breast was amputated in April, 1914, for carcinoma. The operation was radical, and was followed by energetic x-ray treatment of the scar. At the operation the fat in the axilla was found to be permeated by numerous milium nodules. In November the patient complained of pain in the area supplied by the left lateral cutaneous nerve, and a few weeks later she developed typical severe sciatica on the left side. At this date there were no abdominal symptoms. On December 24th a vaginal examination showed a small, coarsely nodular tumour of the left ovary. As it grew rapidly an operation was advised, and was performed on January 7th. Though the tumour was found to be somewhat firmly impacted in the pouch of Douglas, it was not actually fixed by adhesions. It was perfectly solid, of the size of a small fist, and studded with yellow nodules, visible both on the surface and on section. The uterus and right ovary were perfectly healthy, and no other cancerous deposit could be found at the operation. The patient died of progressive heart failure four days later. The necropsy showed a few carcinomatous lymphatic glands above the division of the aorta and to the left of the vertebral column. Two similar carcinomatous glands were also found under the left parietal pleura close to the sternum. Discussing this case, the author does not consider the tumour of the ovary was primary and independent of the tumour of the breast. His view that the tumour of the ovary was due to metastasis from the breast was confirmed by the microscopic examination, which showed the structure of the tumours of the breast, lymphatic glands and ovary to be essentially identical. The structure of the tumour of the ovary was characteristic of metastatic carcinoma of this organ. There were small, solid epithelial cell nuclei, and the carcinomatous cells were freely scattered in an oedematous loose network of connective tissue. The malignant cells were in many parts hydropic and vesicular, but they did not present the typical signet-ring structure which is often found in cancer of the ovary secondary to cancer of the digestive tract. The author points out that this case illustrates the wisdom of the old rule always to examine the vagina and rectum of the woman who complains of sciatica.

156. Leather-bottle Stomach.

PORTER (*Annals of Surgery*, July, 1915) records a case of leather-bottle stomach in which subtotal gastrectomy was done. Pathologically, the stomach walls become diffusely thickened and hardened, the condition being possibly precancerous and bearing somewhat the same relation to scirrhous cancer that gastric ulcer bears to gastric carcinoma. More common in men than in women, it is

essentially a disease of adult life, and, unless relieved by surgical means, it is invariably fatal. The patient, a man aged 46, complained of pain low down in the left side, which commenced about five weeks prior to observation, when it was localized just under the navel, and was described as feeling as though there was a heavy case there. All food tasted sour, and he was troubled with flatulence and dyspnoea on exertion and when the pain was present. There was no loss of weight. Physical examination revealed slight accentuation of the cardiac second sound and a large tender growth in the epigastrium extending down to the umbilicus and 3 in. to the left. At the operation practically the whole stomach was found to be involved in the tumour, and a subtotal gastrectomy was performed. There was no glandular enlargement, and the under surface of the liver was adherent to the pyloric end of the stomach over an area corresponding to an ulcerated area on the mucous surface. Operation afforded pronounced and satisfactory relief, with freedom from symptoms for some time. Later, a tumour in the epigastrium developed and the patient died six months after operation, no autopsy being made. With the exception of the fundus the whole of the stomach was involved, the walls being universally thickened and firm, and cutting almost like cartilage, and on the mucous surface there were several ulcers, and the capacity was diminished. The rapidity of the process was marked, as the patient considered himself quite well five weeks prior to operation, and he only lived seven and a half months from the onset of symptoms, notwithstanding the complete temporary relief from the gastrectomy. The dyspnoea on exertion, accentuation of the cardiac second sound, and presence of anaemia support Krompecher's theory that the stomach changes are due to cardio-vascular disease. Other points of particular interest in this case were the absence of glandular enlargement and the relative absence of adhesions, the operation being entirely free from difficulties when once the stomach had been separated from the liver, which was done without difficulty.

157.

Bunions.

M. S. HENDERSON (*Journ. Amer. Med. Assoc.*, October 16th, 1915), after defining a bunion as "a painful bursitis superimposed on a hallux valgus," describes an operation that has been used in the Mayo clinic and has given very satisfactory results. "A semilunar incision with the curve upwards is made at the metatarsal phalangeal joint of the great toe. The skin is dissected back, being careful not to puncture it. A flap including the bursa is then taken with its base attached to the proximal phalanx, having its convexity extending on to the head of the first metatarsal. The fat is then pushed back from around the head of the bone and a large bone-biter is introduced from without inward, aiming to take off most of the articulating surface of the head of the metatarsal bone, leaving sufficient of the enlarged end to serve as a weight-bearing portion. This bone-biter is introduced at an angle of about 75 degrees so that the outer side of the metatarsal bone is a little longer than the inner side after the piece is removed. With a rongeur bone-biter the prominence left on the inner side is smoothed down. The flap is then tucked in and the base of the flap sowed to the periosteum of the first metatarsal by two mattress sutures of chronic catgut. This serves to straighten the toe and put it in its proper line. The skin is then closed with one or two sutures of silk-worm gut and closer approximation is secured by interrupted horsehair sutures. A pad of gauze is inserted between the great and second toes to straighten the great toe. A dressing soaked with alcohol is applied and carefully bandaged." In the after-treatment no splints are required, but pressure from bedclothes is avoided by using half barrel-boops, and the wound and dressing are resoked with alcohol twice daily. Stitches are removed in a week, weight-bearing allowed in ten days, and use of the foot encouraged. A small pad between the first and second toes is advised, and a proper shoe with straight inner side is insisted on.

158. Deformity Reduced by Graft of Adipose Tissue.

H. MORESTIN (*Dull. et mém. de la Soc. de Chir. de Paris*, June 15th, 1915) describes a case of marked deformity of the face following injury by a fragment of a shell successfully treated by plastic operation and grafting of adipose tissue. The soft parts over a large area had been lacerated and the inferior maxilla broken at its angle. During healing much attention was given to the prevention of constriction of the jaws and cicatrization was obtained without any irregularity of the dental arcade and without difficulty in the articulation of the teeth; there was, however, a certain amount of limitation of movement of the

jaw. Six months after the injury a fistulous opening into the mouth persisted at the centre of the scar. The scar itself was thick, adherent, and very resistant. Morestin performed two operations. At the first he excised a part of the scar and dissected away all the edges of the fistulous opening. After having removed all that was possible of the scar tissue bordering on the lower jaw, he closed the opening in the mucous membrane by catgut sutures. To close the cutaneous wound it was necessary widely to separate the skin from the underlying tissues both on the side of the face and neck; the edges of the wound could then be brought into apposition, and healing was obtained by first intention. The cutaneous layer as thus constituted was not in exact apposition with the deeper layers, and the intervening space was drained by a tube inserted at the most dependent point. Good results were obtained, in so far that the fistula healed. Massage and movements were again undertaken to render supple the muscles of mastication and to obtain wider separation of the jaws. About seven weeks later a further excision of scar tissue was made, but even then it could not be completely removed. An extensive freeing of the skin was again undertaken. A mass of fat of suitable volume was taken from the gluteal region and insinuated into the cavity between the skin and the subjacent tissues and the wound hermetically closed. The result obtained was very satisfactory. The fistulous opening is now definitely closed, the cicatricial surface has been considerably reduced, and the scar is supple; the very marked depression resulting from the elimination of the soft parts of the cheek and of fragments of the inferior maxilla is perfectly filled out, the patient can open his mouth widely, and can energetically masticate solid food.

159. Hydro-neprosis of a Pelvic Kidney.

BRENIER (*Surgery, Gynaecology, and Obstetrics*, August, 1915) reports that a young man, aged 21, enjoyed good health till an attack of what was diagnosed as intermittent fever with pain in the left loin and hip when he had reached the age of 19. Thenceforth similar very acute attacks came on at short intervals, lasting for from two days to a week. A physician diagnosed "movable kidney." Skiagrams showed no calculus. The ureters were catheterized and the right ureter was found viable throughout, the left seemed to be obstructed 5 in. above its vesical orifice, but at length a No. 7 catheter was passed for an inch or two higher. On this occasion purulent urine dripped from the instrument. There was clearly an obstruction of the left ureter with a resulting hydro-neprosis. The obstruction was thought to be intra-abdominal, and tuberculous glands were suspected. An exploratory incision was made through the outer border of the left rectus abdominis. A retroperitoneal mass, lying on the sacro-iliac joint, was easily brought into view. On opening the retroperitoneal space and dissecting back the peritoneum, a thick-walled cystic structure, covering the whole anterior aspect of the mass, was found. The mass when opened was seen to be the dilated pelvis of the left kidney, with greatly thickened walls. The ureter was very short, and the operator easily stripped it down to the bladder; it was cut through and the distal end cauterized where it entered the bladder. The proximal end of the ureter serving as a guide, the mass was dissected from below upwards. The glandular part of the kidney was hardly a fourth of the mass, the remainder being the dilated renal pelvis. This ectopic kidney was supplied by three or four small vessels derived from the aorta and the left common iliac artery. The exact mechanism of the obstruction could not be accurately defined, but the opening from the pelvis into the ureter was very small and there was an abrupt angulation of the ureter on the pelvis.

OBSTETRICS.

160.

Twilight Sleep.

J. O. POLAK (*Journ. Amer. Med. Assoc.*, September 18th, 1915) defends the scopalamin-morphine treatment in labour. In over 400 labours in which it has been employed at several Brooklyn hospitals and which have been studied by R. M. Beach and himself, there has been no maternal mortality and less than the usual morbidity. No child has been born dead and no cases of post-partum haemorrhage followed any of the deliveries. A moderate degree of oligopnoea was present in 15 per cent.; real asphyxia was less frequent than after ordinary labour. Three children died within the first ten days, but in none of them was there any evidence that the deaths were in

any way due to the method. The cases might be called selected cases; over 50 per cent. were private patients, and "the records include 11 cases of cardio-vascular disease, in which there had been or was present a break in the cardiac compensation; 2 cases of exophthalmic goitre; 6 cases of pulmonary tuberculosis; 8 eclampsias and 22 borderline contractions in which a test of labour was given." To use the method properly a fundamental knowledge of the principles of obstetrics, a rational conception of the degree of anaesthesia wanted, the attendance of trained operators, willingness on the part of the operator to give the necessary amount of time to the work, and finally a proper hospital environment, are essential. Polak cannot explain the failures of others, unless they have done too little and expected too much to secure success. The same obstetric principles apply just as much to the conduct at labour according to this method as with any other method. Anaesthesia and a practically painless labour may be expected in from 70 to 80 per cent. of the cases. He considers the method applicable when there is no primary inertia, marked pelvic contraction, or presence of obstetric accidents. It is especially applicable to nervous women of the physically unfit type and valuable in the management of the border-line contraction. It is particularly useful in cardiac cases, as it relieves the nervous apprehension and secures dilatation with less effort. It diminishes the shock of labour, it does not diminish the milk supply or predispose to *post-partum* haemorrhage, but it does decrease the number of high-forceps operations, and has a distinct place in hospital obstetrics.

161. The "Octuplet" Twin Legend.

PARKER of Cambridge, Massachusetts (*Doston Medical and Surgical Journal*, April 22nd, 1915), has exposed the fallacy of a report published in the *Doston Medical and Surgical Journal*, vol. x, p. 224, 1872, where it was stated that a woman living in Ohio gave birth to eight twins in August, 1872, all living and healthy, "though quite small," about a month later. It was added that she was herself a triplet, her mother and father being twins and her grandmother the mother of five pairs of twins; she herself had given birth to two pairs of twins and now eight more, making twelve children in six years, that is since her marriage, when she weighed 275 lb. or nearly 20 stone. This case was afterwards quoted in the *American Journal of Anatomy* and other works. Parker has corresponded with the authorities at the place where the octuplets were reported to have been born, and they have assured him that there was no truth or foundation in the report whatever. A practical joker went into one of the newspaper offices in the town of Warren, Ohio, and set up an article which he succeeded in having printed. It was afterwards sent to a New York paper. The report was cleverly worded, yet it is strange that it was ever quoted as authentic. Among the latest cases of multiple twins, one most carefully reported, with a photograph of the five twins and the placenta, will be found in the *Journal of Obstetrics and Gynaecology of the British Empire*, vol. vi, 1904, p. 32, the author being Nijhoff of Groningen. That writer collected 27 cases of quintuplets reported within the last two centuries. Lloyd Roberts reported a quadruplet birth in 1903.

GYNÆCOLOGY.

162. Cancer of the Cervix.

S. M. D. CLARK (*Journ. Amer. Med. Assoc.*, October 2nd, 1915) says that until Percy experimentally proved that cancer cells would be destroyed when exposed to a temperature of 113° F. for twenty minutes while normal tissues lived in a temperature as high as 131.9° F., the application of heat could not be established on a rational basis. Percy worked out a method of applying heat to cervical cancer on a more elaborate scale than had been possible before, and thus marked a brilliant epoch in the cancer problem. Clark, however, does not think that it is a method to be used alone; it is rather a valuable adjunct. He gives his experience of a procedure involving extensive ligation of the arteries, cutting off the uterus from any blood supply except through one ovarian artery, thus retarding the growth in combination with the heat application. He divides cervical cancer into four groups: (1) Incipient cases, ulceration not extending beyond the cervix and no constitutional disturbance. (2) Growth extending to vaginal walls and bleeding copious, the uterus still movable, but there is secondary anaemia, and the patient is constitutionally below par. (3) There is either a crater or a large cauliflower mass in the vaginal vault, and the vaginal wall is involved at least an

inch from the cervix; mobility is decidedly impaired, there is pain in the side, and marked cachexia and anaemia. The fourth group is hopelessly advanced with metastases, and general cachexia and anaemia. His conclusions are summarized as follows: (1) The heat method alone has doubtful curative properties, and should be viewed in the light of a valuable adjunct in the treatment of cervical carcinoma. However, in extremely obese women it offers the best and only chance for a permanent cure. (2) Heat should be used as a routine in all types of cervical carcinoma except in hopelessly advanced cases (Group 4). (3) The ligation of both internal iliacs and one ovarian possesses definite merit, and, when combined with heat, furnishes the best means of converting the border line cases into frankly operable ones. (4) It cannot be too strongly emphasized that the combined application of heat and ligation of the vessels on the one hand and total extirpation on the other, in all except clearly operable cases, should be done as a two stage operation. (5) In the combination of heat with starvation we have a valuable means of markedly increasing the operability and of decreasing the primary mortality of radical extirpation. (6) Heat combined with extensive arterial ligation, followed by radical hysterectomy, offers the greatest possibilities for permanent cure.

THERAPEUTICS.

163. Salvarsan Poisoning.

EBERLY (*Journ. Amer. Med. Assoc.*, November 13th, 1915) publishes full details of a case where a man, aged 36, without a clear history of syphilis, was found to be suffering from typical early tabes. Through an error, 0.6 gram of salvarsan was mixed in 10 c.c.m. of freshly distilled water, only a part of it dissolving. This unneutralized solution of salvarsan was injected into the right cephalic vein, and the patient almost immediately complained of a choking sensation and constriction of the pharyngeal muscles, and there was dyspnoea, with small, weak, and rapid pulse. The needle was at once removed, about 5 c.c.m. having been injected. Prostration, with cough, vomiting, and pain in the region of the left kidney, followed, and $\frac{1}{15}$ grain of nitro-glycerine was administered by the mouth every twenty minutes until the pulse improved. Then there was suppression of urine, with general myalgia and phlebitis in the punctured vein, which became obliterated. Under alkaline therapy the toxic symptoms and anuria subsided almost immediately. Eberly did not feel sure that the marked toxic symptoms were due to the acidity of the solution or to the salvarsan independently of the reaction in this case.

164. Drug Habits in Sucklings.

LICHTENSTEIN (*New York Med. Journ.*, October 30th, 1915) reports the case of an infant under his care in a prison. The mother was 21 years of age; there was no history of any morbid condition, and the only relative with a drug habit was the husband, who had taken heroin and morphine for about a year. The child was born in a hospital, and when the mother returned home she was seized with abdominal pains. A friend gave her a sniff of a white powder, and she fell asleep. On awakening after a long slumber she vomited and was attacked with severe cramps. Yet she was persuaded to take another sniff, and she continued to inhale the powder till it became a confirmed habit. All the time that she inhaled the snuff she also nursed her infant. It slept for very long and when awake would curl up in cramps and cry until nursed. It desired to be nursed every hour. Whenever the mother felt the need of the drug heroin, which it appears was known to her as *yen yen*, the child would yawn and sneeze and perspire freely, cry, and suffer from cramps. It was subject to diarrhoea. The supply of milk never failed when the mother was taking the heroin, although it is generally taught that opium and its derivatives lessen the amount of milk. After seven months the mother was not able to get any heroin, and so began to use morphine hypodermically. Then the milk excretion steadily diminished, so that she had to nurse the infant more frequently. When arrested and imprisoned the mother's mammary glands were small, and little milk was excreted. The catamenia, completely suspended during the eight months that she took the drugs, returned two days after they were withdrawn. Lichtenstein also reports another instance in his experience in which an infant 16 months of age had contracted, so to speak, the drug habit in lactation. It was very anaemic, yet not emaciated, the pupils were contracted to a pin-point diameter and did not react to light. It slept all the afternoon and night, and next

day had strong cramps and sweated profusely. The author felt obliged to administer paregoric. Then the child was fed by the bottle, but the mother nursed it every twenty-four hours, preferably at night. The infant took three times daily a minim of tincture of nux vomica and five of camphorated tincture of opium to the drachm. At the end of four days the child seemed more cheerful and the cramps had ceased. Castor oil, 2 drachms, was given on the first and third night.

165. Ethylhydrocuprein in Scarlatina and Measles.

HIRSCHFELDER and SCHULTZ (*Zeit. Klin. Med.*, September 20th, 1915) have experimented with ethylhydrocuprein in cases of scarlatina and measles treated in Minnesota, U.S.A. In 7 cases of scarlatina the drug was given in doses of 0.1 to 0.5 gram, according to the age of the patient, three times a day. The average duration of the fever in these cases was 8.9 days. In 7 similar control cases of scarlatina in which the drug was not given the average duration of the fever was only 7.4 days. From this the authors conclude that the drug is of no use in scarlatina. In 11 cases of measles, chosen at random, the average duration of the fever of the patients treated with ethylhydrocuprein was 4.3 days. The average duration of the fever in the 10 control cases not treated with ethylhydrocuprein was 7.9 days. From this the authors conclude that the treatment of measles with ethylhydrocuprein deserves further study.

166. Inhibitive Effect of X Rays upon Malignant Cells

NEMPSTER (*Archives of Radiology and Electrotherapy*, No. 179, 1915), in discussing the action of x rays upon the morbid cells of an epitheliomatous area, states that while the action of x rays is such that any cell, whether malignant or non-malignant, young or old, can be completely destroyed, and in such order that the young cell is selected for destruction in preference to the old cell, and the malignant cell in preference to the healthy cell, yet in order to cause the disappearance of a new growth it is quite unnecessary to destroy a single cell. There is another influence which can be brought to bear and which is in the end more efficient and safer to the healthy tissues—this is the influence of inhibition of the power of division and subdivision of the cells; in other words, inhibition of proliferation, for there appears to be at this period of the life-history of the cell a greater susceptibility to the effect of x rays, resulting in its power of proliferation being checked or delayed. The quantity of irradiation required to accomplish this is not sufficient actually to kill the cells themselves, but is capable of destroying their power of reproduction.

PATHOLOGY.

167. Identification of the Typhoid Bacillus in the Stools.

BARD and P. GAUTIER (*Rev. méd. de la Suisse Romande*, July 20th, 1915) have tested for the presence of the typhoid bacillus in thirty cases, making use of the rapid method recently suggested by Carnot and Weill-Hallé. For carrying out this test glass tubes are employed of a U shape, the communicating branch being narrower than the parallel arms; the arms are 33 cm. long (12.8 in.) and 5 to 6 mm. in diameter (0.19 in. to 0.23 in.). Into one branch (Branch I) fine sifted, washed and calcined Voges sand is introduced to a height of 10 cm. (3.9 in.); this sand when it is quite dry can be manipulated like a fluid by means of a pipette. The apparatus is plugged with cotton-wool and sterilized by dry heat, all later operations being performed aseptically. Branch I is now completely filled with neutral red broth. The broth slowly penetrates through the sand and comes to rest at the same height in the two branches; it should be sufficient in quantity to be above the upper limit of the sand. If the broth has been too much decolorized by filtration through the sand, a further drop of the neutral red is added. In order to avoid the inclusion of many air bubbles, it is advisable that the broth inserted into the warm tubes should itself be warm. The fluid for the inoculation of the broth is obtained by irrigation of the intestine after a preliminary evacuant irrigation. The fluid obtained from the second irrigation should be almost clear, and contain only small particles of intestinal mucus, etc. A few drops of this fluid is added to the broth in Branch I of the U tube, and the apparatus is then put into an incubator at 37° C. (98.6° F.) for about 18 hours, when it will be found to be coloured a fluorescent yellow by the *E. coli* from the intestinal fluid. Of the numerous intestinal flora which will

develop in Branch I of the U tube only those which are motile will penetrate the sand and reach Branch II, and they will arrive in the order of their comparative motility. Since the typhoid bacillus is, as a rule, the most motile, in positive cases a pure culture of this bacillus will be obtained. In making use of the apparatus the following cases will arise: (1) Typhoid bacilli present. At the end of eighteen hours' incubation the fluid in Branch I is yellow in colour; that in Branch II red and slightly turbid. The turbidity is due to Eberth's bacillus, and if a drop of the broth is examined microscopically numerous motile bacilli are seen. (2) Paratyphoid bacilli present. After the same interval the broth in both tubes will be yellow, since the paratyphoid bacillus acts on neutral red like the colon bacillus, and is motile. Examination of a drop of broth from Branch II shows numerous motile bacilli. (3) No typhoid or paratyphoid bacilli. The broth in Branch I is yellow; that in Branch II is red and clear, and will be found to be sterile. Occasionally the colon bacillus may penetrate the sand and falsify the results obtained, and therefore absolute reliance cannot be placed upon the test. Carnot and Weill-Hallé recommended that to verify the results the bacillus isolated in Branch II should be agglutinated by an antityphoid or antiparatyphoid serum. The present authors have used the test in 30 cases. In none of the cases was a non-motile organism found in Branch II, so that the sand was an effective barrier against all such organisms. The cases tested fall into three groups: (1) Six out of 30 were cases diagnosed clinically as cases of typhoid; in each of these cases the test acted perfectly, the broth in Branch II was red in colour and slightly turbid, and contained motile bacilli which were agglutinated by an antityphoid serum. (2) Twelve cases were suffering from complaints other than typhoid, for example, pneumonia, influenza, etc.; Branch II was red in colour and sterile in 5 cases, red with motile bacilli in 6, yellow with motile bacilli in 1. (3) Twelve cases were without fever; in these Branch II was red in colour and sterile in 5, red with motile bacilli in 5, yellow with motile bacilli in 2. In only one instance, however, in the last two groups did the bacillus found agglutinate with antityphoid or antiparatyphoid serum, and in this case further laboratory tests showed the organism to be *Bacillus coli*. In those cases also in which agglutination did not take place the organism present was the *Bacillus coli*. The colon bacillus may, therefore, by its motility (although it is less motile than the typhoid bacillus) falsify the results. Although the proceeding is not infallible, it presents the great advantage of separating mechanically the motile from the non-motile bacilli. Once separated the agglutination tests can be applied or other laboratory tests, and identification will be more rapid than by other tests. This rapid and easy method will have the great advantage of permitting of more frequent tests being carried out.

168. Tonsillitis and Hand Infections.

Mock of Chicago (*Surgery, Gynaecology, and Obstetrics*, October, 1915) writes on the treatment of hand infections from an economic standpoint, based on a study of 1,600 cases, among stockyard workers, etc. Predisposing causes, such as anaemia and chronic disease, are taken into consideration. Mock finds that tonsillitis, one of the chief causes of sick disability among the workers, likewise plays a marked part in the cause of hand infections. In the winter months, when tonsillitis is most prevalent, infections are correspondingly high in the stockyard. Coincidence of tonsillitis and finger and hand infections was noted so often that Mock made bacteriological researches and found that as a rule the same germ was found to be the cause of both. In January and February, 1913, there were 327 cases of tonsillitis and 83 of hand infections. The total number of days of disability from hand infections was 63, and the number of hand infections associated with tonsillitis ("at time or just before infection developed") was 15—that is, 18 per cent. In 1914 an epidemic of streptococcal tonsillitis occurred in Chicago. The total number of cases of tonsillitis under Mock's observation in January and February of that year was 603, and the total of hand infections 117. The total days' disability from hand infections was 208. The number of hand infections associated with tonsillitis was 32, or 27.9 per cent. This greatly increased disability in 1914 was due to 24 very bad cases with marked lymphangitis and tenosynovitis; and Mock is careful to note that all had tonsillitis; 12 were traced to a haemolytic streptococcus, and the same germ was found in the patient's tonsils; 12 others had a marked lymphangitis, and though the organism was not ascertained, yet the infections were undoubtedly streptococcal and closely related to the tonsillitis.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

169.

Nephritis.

W. OPHÜLS of San Francisco (*Journ. Amer. Med. Assoc.*, November 13th, 1915) gives the results of his investigations on nephritis. The material comprised 8 cases of amyloid disease associated with chronic parenchymatous nephritis, 34 of general arterio-sclerosis with cardiac hypertrophy, in which the kidneys were slightly involved in 12, and moderately diseased in 22 cases. In addition there were 8 cases of general arterio-sclerosis, with more extensive renal lesions of the type described by the author in a previous paper as arterio-sclerotic nephritis. "The most interesting group was that of 32 cases of glomerulo-nephritis, of which 4 were acute, 8 subacute, 17 chronic; in addition, belonging to the last group, there were 3 cases in children which it was difficult to classify on account of the peculiar mixture of subacute and chronic lesions in them." The cases thus classified are discussed, with their symptoms, etiology, and so forth, and Ophüls summarizes his conclusions as follows: 1. Nephritis from an anatomic point of view may be best subdivided into: (a) acute, subacute, and chronic parenchymatous nephritis, which is very frequently associated with amyloid; (b) acute, subacute, and chronic glomerulo-nephritis, to which class belong most of the cases with continued definite urinary findings, renal hypertension, uraemia, and other definite symptoms of renal disease. 2. Hypertensive cardio-vascular disease may involve the kidneys more or less extensively, often causes certain functional disturbances in the kidneys, may cause contracted kidney, but should be segregated entirely from true nephritis. 3. The cause of true nephritis is continued bacterial septicaemia, and the lesions in the kidneys are probably due to rapid bacteriolysis and incidental liberation of large doses of toxic material in and about the affected glomeruli. 4. The lesions in the arterioles, in at least some of the more chronic cases, are due to the organization of a hyaline (thrombotic?) deposit on the inner surface of the arteries which at times is found underneath the endothelium.

170.

Amaurotic Family Idiocy.

ISADOR H. CORIAT (*Boston Med. and Surg. Journ.*, July 16th, 1915) records the occurrence of the following phenomena in amaurotic family idiocy which have been either completely overlooked hitherto or only briefly described: (1) Explosive laughter was observed in three cases; in two of these there was marked mental deterioration. It is uncertain whether the explosive laughter was a sign of the mental deterioration or was due to some lesion of the optic thalamus. (2) Hydrocephalus was seen in one of Coriat's cases, and it has been previously noted in a few instances. (3) Bulbar symptoms occurred in one of his cases; there was drooling of saliva, spells of choking, difficulty in swallowing, and attacks of dyspnoea. The child died suddenly from bulbar paralysis. (4) Nystagmus, lateral and rotary, occurred in three of his cases, and in one it persisted throughout the whole course of the disease. (5) Hypotonia was seen in two cases; the marked rigidity of the limbs resembled that of Oppenheim's amyotonia congenita; this feature was previously recorded by Kowarsky. (6) Abnormal reflex phenomena: increased reflex reactions to auditory, visual, and tactile stimuli. On plantar stimulation there was either marked tremor of the leg on the side stimulated or else a contralateral knee-jerk, but a contralateral extensor plantar reflex was never seen. Coriat invokes pathological irradiation of reflexes as an explanation of these excessive reactions to stimuli, and points out their resemblance to the reflex phenomena of strychnine poisoning.

SURGERY.

171.

Amputation by the Flap Method.

RAYNAUD (*Bull. et mém. de la Soc. de Chir. de Paris*, July 27th, 1915), who during the last five or six months has performed more than 150 operations by the flap method, advocates the use of this method rather than the different circular methods. Among the advantages of the flap method are: (1) It exteriorizes the infection as much as the circular method, always supposing that the flaps are not

sutured, but that they are kept separated and even raised by the dressing. (2) When the injury or the infection has spared one aspect of the limb, the making of a flap on this aspect permits of the preservation of a greater length of limb than would the circular method. (3) In the thigh the large anterior flap through the quadriceps is superior to the circular method. The advantage is most marked in amputation through the lower part of the thigh. (4) By having cutaneous, non-muscular flaps, the limits of conservation can be reached—amputation of the leg may suffice when musculo-cutaneous flaps would have necessitated amputation through the thigh, or a disarticulation through the hip may be possible, even when all the muscles are invaded, provided that several centimetres of skin are available to bring over the end of the bone. In the author's opinion the merits of flaps which are exclusively cutaneous are not sufficiently recognized in France. The principal advantage is to permit of extreme eradication of muscle while permitting the utilization of skin already affected. Even when the skin has been riddled with projectiles and shows inflammatory lesions, it will recover if it be dissected off from the deeper tissues to a certain height, turned back like a sleeve, and dressings applied in this position during several days. The author is in favour of a more conservative treatment of upper than of lower limb lesions, because of the much greater danger which accompanies infection in injuries of the calf or of the thigh. He is convinced that too temporizing methods with regard to the lower limb, though they will save some limbs, will lose many lives. Moreover, if amputation has to be performed, a primary amputation preserves more tissue. The flap method is suitable in all cases, though in a minority of the cases of primary amputation the circular method may be preferable. In amputation by the flap method the flaps will include muscle when the operation is through healthy tissue, but when through doubtful tissue it is safer to sacrifice the muscles and have only cutaneous flaps, especially in the region of the leg and the thigh. The author gives statistics dealing with 171 amputations which he has performed in the last six months, almost all of them secondary amputations undertaken because of gangrene: 30 of these were amputations of the upper limb, with 7 deaths, or a mortality of 20.33 per cent.; 3 of the deaths were altogether independent of the amputation, the remainder were principally due to spread of gangrene. 141 amputations of the lower limb resulted in 52 deaths, or a mortality of 37 per cent. The percentage mortality increased very noticeably in amputation through the femur the higher the operation was performed. Thus, 16 operations through the lower third of the thigh gave a mortality of 25 per cent., 21 amputations through the middle third gave one of 42.7 per cent., 45 through the upper third 44.5 per cent. The mortality for 16 disarticulations of the hip was the same as for amputation through the upper third of the thigh, or 44.75 per cent. The author believes that the total mortality could have been considerably reduced if earlier amputation had been performed. With regard to technique, almost all the operations, especially the disarticulations of the hip, were performed under cover of a preventive haemostasis. In each of the more serious cases the patient received an injection of 1 gram to 1.5 grams of physiological serum into the principal vein, and, thanks to this precaution and to the fact that operation was not begun till the pulse was palpable, no case was lost as a result of operation shock. Very painful dressings were done under ether or ethyl chloride anaesthesia.

172.

End Results of Bone Fractures.

In the *Annals of Surgery*, September, 1915, Dr. W. L. ESTES, Chairman of the Committee of the American Surgical Association for the investigation of the end results of bone fractures, gives the report and recommendations arrived at. The investigations were confined to fractures of the long bones, the three points more especially considered being: (1) To ascertain the average present-day anatomical and functional results of both simple and compound fractures, and the average time of disability in the several age groups; (2) the comparative value of the conservative or closed methods and the operative or open methods of treatment; and (3) the comparative value of immediate or delayed treatment. As a general principle, fractures should be treated by a skilled surgeon, and x rays should be employed by a competent

radiographer before the permanent dressing is applied, at least two skiagrams being taken from opposite perpendicular directions. Skiagrams should also be taken after the application of permanent dressings to prove proper reduction, and at the end of treatment to record the result. Statistics show markedly that better results follow when treatment is begun at once, so that fractures should be reduced immediately if the proper splints or retaining apparatus are at hand, it being not only useless but cruel to subject the patient to the pain of manipulation unless such proper fixation is at hand, and the patient is where a permanent dressing can be applied. Unless contra-indicated, general anaesthesia should be used to facilitate reduction and prevent pain. Neither the non-operative nor the operative method is recommended exclusively, each having its indication for employment according to the circumstances of the case. Non-operative methods are, generally speaking, more effectual under 15 years of age, but from then up to 60 operative methods are indicated when non-operative treatment has proved ineffectual in reduction or for controlling the fragments in position, the operation being delayed not longer than a week after injury. In operative cases the best fixation method appears to be some form of bone plating or an Albee inlay. Open operations for simple fractures should be undertaken only by experienced surgeons who are thoroughly equipped to meet all possible indications. The American Surgical Association is strongly urged to set its seal of approval upon the Committee's findings, so that they may form a part of the routine records of fracture patients, both for the protection of hospitals and surgeons, and for the collection of valuable material towards attaining better results in the treatment of fractures.

173. The Electro-magnet as an Aid to the Localization of Foreign Bodies.

BERGONIÉ's method of employing an electro-magnet (in practice the inductor of an X-ray coil) excited by an alternating current of 110-120 or 220-240 volts in order to bring about a vibratory action in a projectile of magnetizable nature (that is to say, a body having a base of iron, steel, nickel, or cobalt) embedded in the tissues has already been described in the BRITISH MEDICAL JOURNAL (June 5th, 1915, page 979). Bergonié now states (*Arch. d'élect. méd.*, No. 393, 1915) that the electro-vibrator, as it is called, is capable of making almost all metallic bodies vibrate, even those which are non-magnetizable. This it does by means of induced currents. For this purpose a more powerful instrument (one of 8 or 10 kilowatts) is necessary. The vibrations induced in the metal are more perceptible to the touch in inverse ratio to the product of the specific resistance of the metal multiplied by its density. Thus aluminium is found to vibrate most strongly in the series of non-magnetizable metals, copper and silver less strongly, gold and zinc still less, while it is difficult to get German silver, platinum and lead to vibrate at all, and almost impossible to get mercury. The vibration of aluminium, copper, brass, and zinc, therefore, is now a possibility, but the lead of shrapnel and the German silver which forms the envelope of revolver bullets present a more difficult problem, and in these cases, if the tactile sense of the surgeon is to be assisted by the electro-vibrator, the induction of the instrument must be still further increased. Writing from the surgeon's point of view as distinct from the electrician's, LE FUR (*ibid.*, No. 395) describes his experiences with the electro-vibrator at a military hospital. He states that although, after the first incision, the main operating work is done by the finger guided by the vibrations set up in the foreign body, yet when the projectile is deeply situated, retractors, dissecting and haemostatic forceps, and a cutting sound must be employed for dissociating aponeurosis and muscle, and all these instruments should be in bronze so as not to be the seat of conflicting vibrations. If ordinary nickel instruments are employed care must be taken that they are not brought into action at the same time as the vibrator. The operation in such a case will resolve itself into a series of alternate explorations with the finger and dissociation of the tissues by means of the instruments, the current being cut off while the instruments are in use. Sometimes a foreign body which was thought to be immediately below the skin or aponeurosis proves to lie beneath several muscle layers. The vibratory effect is much diminished, or may be effaced altogether, if the projectile is covered by an osseous surface, or even if it is situated deeply in the abdominal or lumbar region. The chief advantage of the method is the sureness and rapidity with which the projectile may be extracted. The author has extracted in thirty seconds a foreign body situated very deeply in the buttock, and in

six minutes one buried deeply in the nape of the neck. The possibility of extracting many small and scattered fragments with the least damage to the muscles and soft parts is a further advantage. The author has extracted by this method twenty or thirty small fragments of shell from one case. Other advantages are the ease with which the surgeon may extract foreign bodies enclosed in the muscular masses and moving with them, the ability it furnishes to correct the occasional error or inadequacy of radiographic localization, and to search with security for foreign bodies embedded in dangerous areas, such as the great vascular regions.

OBSTETRICS.

174. Treatment of Placenta Praevia Centralis.

CALDWELL (*Amer. Journ. Obstet.*, June, 1915) maintains, on the strength of experience in the Bellevue Hospital and the Manhattan Maternity New York, that the older treatment of placenta praevia by gauze packing should not be rejected in favour of dilating bags and Caesarean section. Five cases of placenta praevia centralis occurred within a year under Flint in the Bellevue Hospital and all were treated by gauze packing. Out of the 5 patients, 1 died from praecox coma on the ninth day, and the fatal result can hardly be charged to the misplaced placenta; the remaining 4 were all discharged in good condition. Of the infants, 2 were dead, 1 being macerated, 2 died within the first three days, and the fifth only lived for a few weeks. According to the statistics of the Manhattan Maternity Hospital, out of 11,435 births the total of placenta praevia was 67, including 13 cases of placenta praevia centralis, where 5 of the infants were stillborn and 5 died within a few days. Gauze packing was practised in the majority of the 13 cases, though in some the dilatation was finished with bags or manually. All were more than one finger dilated on admission. After the failure of both packing and bag, *accouchement forcé* was practised in one case. Many were packed in the outdoor service and the haemorrhage was not controlled, but when properly packed under an anaesthetic in the hospital the bleeding was checked for a considerable time—in two cases for more than twenty-four hours and in one for three days—before it became necessary to reach the gauze. In all except one the dilatation had reached four fingerbreadths when the gauze was removed. One case died during delivery. The hard, undilatable cervix is more frequently associated with marginal and partial than with central placenta praevia, in which variety dilatation will usually occur in a surprisingly short time when packing is properly managed, though the cervix is friable and readily torn. Packing must be done under anaesthesia, and is best performed by the manual method. Iodoform gauze is recommended by Caldwell both before and after delivery, as it can be allowed to remain in the uterus for five or six days without becoming septic. The risk of secondary haemorrhage when the patient is in the stage of reaction is rendered less, in Caldwell's experience, by leaving the gauze in place, even to the sixth day.

175. Influenzal Puerperal Fever.

THALER and ZUCKERMANN (*Wien. med. Woch.*, July 31st, 1915) report what they hold to be the first case in which Pfeiffer's bacillus was proved to be the cause of puerperal fever, and indeed the first case in which the diagnosis of influenza of the genitals has been established by a bacteriological examination. The examination of the vaginal secretions was made after the patient, a primipara aged 19, had been in hospital for eight days, and before labour had begun. Numerous influenza bacilli were found. Labour, which began thirty-eight hours later, was accompanied by headache, apathy, fever, and a feeling of heat. During the following seventeen hours the exhaustion and fever increased. Shortly after the membranes were ruptured a healthy child, weighing 2,650 grams and measuring 48 cm., was born. Although the symptoms of influenza persisted, the respiratory tract remained unaffected, and the child was quite well. Influenza bacilli were found in the lochia on the third and fifth days of the puerperium; but from the tenth day these bacilli were no longer demonstrable, and the patient's temperature was normal.

176. Operative Treatment of Goitre in Pregnancy.

THALER is an advocate of thyroidectomy when the normal course of pregnancy is interfered with by exophthalmic goitre. In support of this view he records (*Wien. med. Woch.*, July 31st, 1915) the case of a married woman, aged 25, whose last menstruation occurred on March 25th, 1914.

When, early in June, she noticed that her neck was considerably enlarged, an examination showed typical severe exophthalmic goitre, accompanied by mental symptoms. Large doses of bromide were tried, but were found of no use. The necessity for the induction of abortion was urged by the physicians and alienists consulted; but thyroidectomy was decided on in order to arrest the growth of the goitre and to maintain the pregnancy. The isthmus of the thyroid gland and wedge-shaped portions of the lateral lobe were removed. The pulse and nervous symptoms improved, weight was gained, and the patient was soon fit again for work. The improvement thus effected was maintained throughout the rest of the pregnancy, and on December 10th the patient gave birth to a healthy child weighing 3,600 grams.

GYNAECOLOGY.

477. Operations for Prolapse of the Uterus.

In the period 1897-1912 there were 300 cases of prolapse of the uterus operated on in the gynaecological hospital of the University of Helsingfors. The results of these operations are analysed by E. A. BJÖRKENHEIM (*Finska Lakarsällskapets Handlingar*, August, 1915), who finds the primary mortality was as low as 0.67 per cent. In 205 cases the subsequent fate of the patient was learnt, in most cases by correspondence and in a few cases by a medical examination. In 50 cases, or 24.4 per cent., the operation was followed sooner or later by relapse. Plastic operations on the vagina were performed in 59 cases, anterior colporrhaphy was performed by Hegar's method, without dissecting out the bladder, and colpoperineorrhaphy was performed either by Hegar's or Lawson Tait's method. The ultimate result of these operations was learnt in 32 cases, among which the percentage of relapses was 46.9. The Lawson Tait operation gave less satisfactory results than Hegar's. In 8 cases these operations were supplemented by amputation of the cervix. Of these 8 patients, 6 were subsequently examined, and 2 were found to have relapsed. Ventrifixation of the uterus, combined in most cases with plastic operations on the vagina and perineum, was performed in 118 cases. The Czerny-Terrier method of sero-serous ventrifixation was employed. In 8 cases the operation was confined to ventrifixation. The ultimate results of this operation were learnt in 80 cases, among which there were 21 relapses (26.3 per cent.). The results of ventrifixation, combined with Hegar's colpoperineorrhaphy, were decidedly better than those of ventrifixation combined with Lawson Tait's operation, the relapses in the first instance representing only 19.3 per cent., and in the second instance as much as 70 per cent. In 15 cases the patients subsequently underwent uncomplicated confinements, but in 6 of these cases the prolapse recurred. In 10 cases Schantz-Wertheim's operation was performed with only one relapse among the nine patients subsequently examined. In 3 cases the round ligaments were shortened by the Alexander-Adam method, and in 1 case by the Bldy-Webster method. In the 2 cases in which an examination was subsequently made no relapse was observed. In 92 cases hysterectomy per vaginam by Doyn's method was performed in combination with vaginal resection or a plastic operation on the perineum. In 6 of these cases a severe haemorrhage occurred within twenty-four hours of the operation, and necessitated the seizure of the bleeding parts with clamps and plugging of the vagina. The ultimate results for this operation were learnt in 68 cases, among which there were 9 relapses (13.2 per cent.). The author concludes that better results would have been obtained had the plastic operations on the vagina been performed with greater care and skill.

478. Micro-organisms and Infection of Ovarian Tumours.

WIENER (*Amer. Journ. Obstet.*, August, 1915), in describing in detail the complications of ovarian tumours, as an analysis of 240 operations, reports 6 cases of infected cysts (2.5 per cent.). Of these 1 was streptococcus infection, 1 a mixed infection of *Streptococcus pyogenes* and *Staphylococcus albus*, 1 typhoid infection, 1 a case where culture showed no growth, and 2 were cases where the organisms were unidentified. One of the six patients died. Infection had occurred from rupture of a loculus in parturition sixteen days before operation. There was a large adherent multilocular cyst, a pseudo-mucinous cystadenoma. In delivering the mass it was ruptured, and much pus escaped into the pelvis. Panhysterectomy was performed, and drainage established through the vagina, not through the abdominal wound. Death occurred in eighteen hours.

This case strongly indicates the necessity for ovariectomy during gestation, far less dangerous than when the operation is postponed as in this instance. A considerable number of micro-organisms have been found in infected ovarian tumours, according to recent authorities. They include those above noted, also the pneumococcus, gonococcus, tubercle bacillus, *Bacillus typhosus*, *Bacillus coli communis* and various saprophytic organisms. Pregnancy is by far the most common cause of infection, as in Wiener's experience, where five out of the six, including the case above noticed, had passed through labour, the exception having suffered from typhoid fever.

479. Leucoplakia of the Cervix.

I. KAARSBERG (*Hospitalstidende*, June 9th, 1915) records the case of an unmarried nullipara, aged 25, who had been treated at the age of 15 for gonorrhoea involving the urethra, the ducts of Bartholini, and the cervix, on which an erosion was found. At the age of 23 there was a recurrence of the gonorrhoea, accompanied by pain on micturition. On this occasion there was no discharge, and gonococci were not found. An examination of the cervix showed a slightly raised white patch, of the size and shape of a farthing, firmly attached to the underlying tissues near the external os. There was no hyperaemic zone, and there were perfectly healthy tissues surrounding this patch, which was uniformly smooth, dry, sharply defined, and slightly raised. Its margin was formed by a number of confluent, bow-shaped waves, some as small as a lentil and others as large as a pea, which formed a complete circle. The appearance of this patch suggested the use of a caustic, but this was denied by the patient. Attempts to cure this patch by applying various drugs, such as glacial acetic acid and zinc chloride (50 per cent.), failed, and an operation was accordingly advised. The patient, who refused to undergo an operation, absented herself for some time, but when she returned, eighteen months later, the leucoplakia, though no larger than before, was found to have broken up into a number of white filaments. In the meshes of these filaments normal mucous membrane was visible. Scattered over the cervix, a little distance from the main patch, were a few white dots no larger than a pin's head. The cervix looked as if chalk had been painted indiscriminately over it. There was now no sign of active gonorrhoea, and Wassermann's reaction was negative. Though the patient consented to an operation, it was apparently deferred a couple of months, during which no examination was made. On the operating table an examination of the cervix showed no leucoplakia, and there was nothing to be seen apart from a simple erosion. In spite of this unexpected change the cervix was amputated. Under the microscope it showed no sign of malignant disease, and the structure of the superficial layers of the cervix was not altogether characteristic of leucoplakia. Nor were the micro-organisms found, including a coliform bacillus and two other bacteria, identified with the micro-organisms sometimes associated with leucoplakia. Discussing the literature of leucoplakia of the cervix, the author points out that in the recorded cases the condition almost invariably terminated in cancer of the cervix.

480. Fibroid Polypus in Vagina: Delivered by Forceps.

WIENER (*Amer. Journ. Obstet.*, May, 1915) recently removed from a virgin, aged 22, a fibromyomatous polypus 104 in. in circumference. The pedicle was a flat band 1½ in. broad, springing from the uterine wall immediately above the internal os. Menstruation had been established at the age of 16, and was painful until six months before operation, then it ceased, no doubt owing to the dilatation of the cervix by the extrusion of the polypus. Very free haemorrhage soon set in, without any pain or pressure symptoms, dysuria, or difficulty in defaecation. The hymen was intact, and a smooth, rounded mass blocked the vagina. Obstetric forceps were found necessary, under anaesthesia. After several strong backward and downward tractions the finger could be passed between the tumour and the symphysis, and the pedicle was then reached. The rest of the procedure was a typical low forceps delivery, except that the tumour was hard and inelastic, very unlike a fetal head. The perineum was much distended, and the parts firm and unyielding. Episiotomy was not practised, and the perineum was torn laterally to a moderate degree. The pedicle was ligatured close to the uterine wall and divided. This method avoided a tedious morcellation with possible haemorrhage in a patient already exanguinated. The uterus after the removal of the polypus was found to be exceedingly small, the sound passing 1½ in.

THERAPEUTICS.

131. Bactericidal Action of Ethylhydrocuprein on Pneumococci.

HENRY F. MOORE continues his experimental studies on ethylhydrocuprein (*Journ. of Exper. Med.*, November 1st, 1915, p. 551). He showed previously that ethylhydrocuprein inhibits the growth of, and kills, pneumococci *in vitro* in very considerable dilutions of the drug, and that it exerts a considerable protective action in experimental pneumococcal infections in mice. The drug is a derivative of hydroquinone. The following are Moore's conclusions from his present experimental work: (1) The serum of rabbits which have been previously treated with a single dose of ethylhydrocuprein (optoquin) exerts a bactericidal action on, and, later, inhibits the growth of pneumococci in the test tube. (2) These actions are most evident in the serum of rabbits when the base (optoquin base) is given in oil subcutaneously; somewhat less when the hydrochloride of the drug is given in water subcutaneously; slight when the base is given in oil intramuscularly; and least evident, or absent, when the hydrochloride in water is introduced directly into the stomach. To get these effects by the intravenous route, toxic doses must be given, and, even with toxic non-fatal doses, the effects do not last long. (3) In the case of the base given in oil subcutaneously to rabbits in a dosage of 0.1 gram per kilo of body weight, the bactericidal action of the serum is at its maximum about one hour after administration, and it passes into an inhibitory effect about four hours after the drug has been given. (4) In man the same inhibitory and bactericidal actions of the serum are present when a single dose of 0.5 gram of the hydrochloride of the drug is given by the mouth or subcutaneously, but the bactericidal action is not so marked as in rabbits. (5) When the optoquin concentration in the serum has apparently diminished to a certain point in relation to the number of pneumococci present, the pneumococci which have survived the bactericidal action for a few hours acquire the power of growing freely.

132. The Management of Enuresis.

NEWLIN (*Archives of Pediatrics*, October, 1915) considers that the method of management of enuresis, whether diurnal or nocturnal, which gives the best results consists in anticipating the involuntary act by a voluntary emptying of the bladder, and though this is the usual accompaniment of any treatment, he finds that when carried out thoroughly systematically it precludes the use of any drug, and gives almost invariably successful results. The difficulty of impressing upon the child's attendant the necessity for carrying out instructions faithfully is the chief obstacle encountered, and she must be made to understand that in order to be successful she must devote herself exclusively to the child day and night for the first three or four days, after which the vigilance may usually be relaxed. The nurse is given a chart with the hours of the day and night in a vertical row at the left-hand margin under the heading of the day of the week. If enuresis averages every two hours she must put the child on the chamber every hour for the first twelve hours, and if at any such time the clothing is wet the hour is noted on the chart. The same treatment is carried out during the early hours of the night up to about midnight, after which every second hour is usually sufficient for the first night. By this means, at the end of the first twenty-four hours there is either a clear chart, or one with several hours marked when enuresis occurred, and on the second day, guided by the record of the previous day, the length of time between the voluntary urinations may be extended, always anticipating the hours marked "wet" on the previous day. Thus on each succeeding day longer intervals may be reached. The method is easy in diurnal cases, and though the first two nights are troublesome in nocturnal cases the intervals can almost always be lengthened on the following nights. It usually happens that by the end of a week under this method of treatment the child will go from 11 p.m. to 6 a.m. without wetting the bed.

133. Chenopodium in Uncinariasis.

BISHOP AND BROSIUS of Panama City (*Jeany. Amer. Med. Assoc.*, November 6th, 1915) have continued Levy's researches, which showed that oil of chenopodium, a proved vermifuge, was not dangerous as a drug. It was prepared from the fruit of *Chenopodium ambrosioides*, and it was long known as a remedy for ascariasis. The authors administered oil of chenopodium to 108 patients suffering

from hook-worm disease, of whom 92 took no other drug, while the remainder were treated alternately with thymol alone and with chenopodium, or with a chenopodium-thymol mixture alternated with pure thymol. In one instance 1,379 hook-worms were expelled in a first whole stool. The patients were in many instances very ill already, but the deaths that occurred were, in all cases, clearly due to other causes than the chenopodium. A treatment consists of 48 minims, often repeated at intervals of three days, without any of the prostration and weakness not rarely occasioned by thymol. The oil was put up in capsules of 8 minims, and the authors gave two capsules to the dose, including three doses to the treatment, given two hours apart. Each treatment was followed in four hours by two ounces of castor oil. Bishop and Brosius found that the method of administration of chenopodium was simple; that the drug could be given at shorter intervals than when thymol was used; that it caused far less pain and discomfort than thymol; and, in short, that it was a more efficient vermifuge in the treatment of uncinariasis.

134. Iced Normal Salt Solution in Gonococcal Conjunctivitis.

EDWARD B. HECKEL speaks very favourably of this new local treatment of virulent gonococcal conjunctivitis (*Med. Soc. State of Pennsylvania*, September 20th-25th, 1915). He refers to the fact that ice-pads have for a long time been used in the treatment of this disease, on the theory that cold would inhibit bacterial growth. In view of this, and on the assumption that gonococci are found only in superficial tissues, he has used iced normal saline solution in a few cases. He firmly believes that it is a specific mode of treatment for virulent gonococcal conjunctivitis. He has found it to be harmless, an effective germicide, easily applied, and well borne.

PATHOLOGY.

135. Action of Arsenicals on the Adrenals.

WADE H. BROWN and LOUISE PEARCE (*Journ. of Exper. Med.*, November 1st, 1915) have tested the action of arsenical compounds on male guinea-pigs weighing 400 to 500 grams, and also on rabbits and dogs, which were used in order to facilitate intravenous administration of the drugs. The compounds tested comprised arsenious and arsenic acids, sodium cacodylate, atoxyl, arsacetin, arsenophenyglycine, salvarsan, and neo-salvarsan. Sterile solutions of the substances were injected intraperitoneally. After some important observations on the histology of the normal adrenals of guinea-pigs, which differs markedly in black and in white animals respectively, the writers state their conclusions as follow: (1) Toxic doses of all arsenicals of which they have knowledge produce definite pathological changes in the adrenals of guinea-pigs. These include congestion, haemorrhage, disturbances in the lipid content, cellular degenerations and necroses, and reduction in the chromaffin content. (2) The character and severity of the injury produced by different arsenicals varies with the chemical constitution of the compounds. (3) From these facts they believe that adrenal injury is an important factor in arsenical intoxication, and we suggest that therapeutic doses of some arsenicals may produce adrenal stimulation.

136. Calcareous and Osseous Deposits in the Arachnoid.

HARVEY CUSHING and LEWIS H. WEEB (*Bull. of the Johns Hopkins Hospital*, November, 1915) find, as the result of a series of pathological studies on the cerebro-spinal fluid and its pathway, that calcareous depositions in the form of psammoma bodies or corpora amyloidea of varying stages of development and of varying size are of a common occurrence in the arachnoid of man and of the lower animals. Associated with this process of calcification there is apt to occur a hyperplasia of the arachnoid mesothelium. The deposits of lime salts are apparently laid down in cell bodies, and in this membrane can bear no relation to the blood vessels. The occurrence of true bone formation in the arachnoid of man should be regarded as a similar phenomenon, except that the process of ossification may be considered to be proliferative rather than degenerative. The so-called dural endotheliomas show histologically the small cellular arrangements with calcareous and osseous depositions that are commonly found in the arachnoid, and therefore take their origin in all probability from the mesothelium of the membrane.
