# SUMMARY OF TARIFF INFORMATION

1921

RELATIVE TO THE BILL

H. R. 7456

---

PREPARED BY  
THE UNITED STATES TARIFF COMMISSION  
FOR THE USE OF  
THE SENATE COMMITTEE ON FINANCE

WASHINGTON  
GOVERNMENT PRINTING OFFICE  
1922

## INTRODUCTION.

---

The following compilation has been prepared by the United States Tariff Commission pursuant to a request by the Committee on Finance of the Senate for a summary of pertinent information upon the bill H. R. 7456 (the Fordney bill) as passed by the House of Representatives and now pending in the Senate.

Treatment naturally falls into two main divisions, as follows:

1. Descriptive and economic data on commodities mentioned in the bill, covering description and uses of the articles, and information concerning their production, importation, and exportation.

2. Discussion of the form of the bill, including mention of important changes in classification made by the Committee on Ways and Means and the reasons therefor, notation of some provisions which appear to be inconsistent, and the suggestion of certain textual changes.

The principal sources of information have been the commodity surveys and reports of the Tariff Commission, especially the "Summary of Tariff Information, 1920." The material in the latter has been amplified and brought up to date.

General statistics were obtained for the most part from official publications or directly from Government departments, as follows: Statistics of manufactures from the United States Census; of minerals and earth products from the Geological Survey; of agricultural products from the Department of Agriculture; of imports and exports from the Department of Commerce.

The special commodity surveys to which reference has been made above should be consulted for more extended discussion of the subjects appearing in this volume. Under the various subtitles will be found references to these surveys, as, for example:

### BLEACHING POWDER.

(See Survey A-5.)

This means that bleaching powder is treated at length in the commission's Tariff Information Survey A-5. The reports cited in this manner may be obtained in most cases from the Superintendent of Documents at the Government Printing Office or directly from the commission to a limited extent.

In a few cases other abbreviations have been used. "T. I. S." refers to "Tariff Information Series," "M. S." refers to "Miscellaneous Series" (unnumbered), and "W. M." to "Reports to Committee on Ways and Means" (unnumbered).

The tabulated import and export statistics cover calendar years, those in the text fiscal years, unless otherwise indicated. "Imports" are "imports for consumption," except in some instances where "general imports" are specifically mentioned. The term "tons" used in relation to imports and exports means "long tons." Statistics of production, without definite reference to country, relate to the United States.

Statistics of imports and exports, classified in "Commerce and Navigation" according to the paragraphs of the tariff act of 1913, have been brought as far as possible under the new classification of the bill H. R. 7456, but in a number of cases the figures could not be made to apply exactly to the items in the new bill. Statistics of duties for 1921 were not available and were therefore necessarily omitted from the tables and elsewhere.

Under the heading "Suggested changes" obvious reasons for such suggested changes are omitted.

At the end of the free list on page 1485 is a tabulation of articles transferred from the free list of the act of 1913 (as modified) to the dutiable schedules of the bill H. R. 7456, and of articles transferred from the dutiable schedules of the act of 1913 to the free list of the bill H. R. 7456.

# SUMMARY OF TARIFF INFORMATION, 1921.

---

## H. R. 7456.

## SENATE AMENDMENTS.

AN ACT To provide revenue, to regulate commerce with foreign countries, to encourage the industries of the United States, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,*

### TITLE I.—DUTIABLE LIST.

SECTION 1. That on and after the day following the passage of this Act, except as otherwise specially provided for in this Act, there shall be levied, collected, and paid upon all articles when imported from any foreign country into the United States or into any of its possessions (except the Philippine Islands, the Virgin Islands, and the islands of Guam and Tutuila) the rates of duty which are prescribed by the schedules and paragraphs of the dutiable list of this title, namely:

#### ACT OF 1909.

An Act To provide revenue, equalize duties and encourage the industries of the United States, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That on and after the day following the passage of this Act, except as otherwise specially provided for in the second section of this Act, there shall be levied, collected, and paid upon all articles when imported from any foreign country into the United States or into any of its possessions (except the Philippine Islands and the islands of Guam and Tutuila) the rates of duty which are by the schedules and paragraphs of the dutiable list of this section prescribed, namely:

*Suggested changes.*—Importations into the Philippine Islands from foreign countries are subject to the rates of duty prescribed in the Philippine tariff act of August 5, 1909 (ch. 8, 36 Stat., 130). The act of March 3, 1917 (ch. 171, sec. 4, 39 Stat., 1133), made im-

#### ACT OF 1913.

An Act To reduce tariff duties and to provide revenue for the Government, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That on and after the day following the passage of this Act, except as otherwise specially provided for in this Act, there shall be levied, collected, and paid upon all articles when imported from any foreign country into the United States or into any of its possessions (except the Philippine Islands and the islands of Guam and Tutuila) the rates of duty which are by the schedules and paragraphs of the dutiable list of this section prescribed, namely:

portations into the Virgin Islands subject to the laws in force there at the time of cession to the United States by Denmark. Products of the United States are admitted free into both of those possessions. Duties are collected upon importations into Guam and Tutuila under a tariff administered by the Navy Department, there having been no legislation governing imports into those islands. Products of the United States shipped to Tutuila are subject to duty or exempt from duty the same as like importations from foreign countries. Products of the United States going into Guam are exempt from duty. Under existing laws merchandise can not be shipped to Tutuila or to Guam for drawback of duties nor be withdrawn from bonded warehouses in the United States for shipment thereto without payment of duties. (Art. 200, Cust. Regs. of 1915.)

The Panama Canal Zone is not a possession of the United States but is a place subject to its jurisdiction for maintenance of the canal. (27 Op. Atty. Gen., 594, of 1909.) Shipments between the United States and the Canal Zone are treated in all respects as shipments to and from foreign countries. (Act of Mar. 2, 1905; *Kaufman v. Smith*, 216 U. S., 610, of 1910.) The customs administration of said Zone is under the jurisdiction of the War Department. (Art. 201, Cust. Regs. of 1915.)

Section 401 (p) of Title IV of H. R. 7456 defines the term "United States" for the purposes of the whole act, and therefore applies to Title I, the dutiable list, and Title II, the free list, of H. R. 7456. The purpose of the definition, as suggested by the Tariff Commission in its report of August 26, 1918, upon the customs administrative laws, was to give the President authority in the absence of legislation to treat the insular possessions and the Panama Canal Zone as foreign or domestic, according to the needs for administrative purposes. Unless, therefore, the word "act" in section 401 (p) of Title IV of H. R. 7456 shall be changed to "title" there will be a conflict with the above provision in section 1 of Title I of H. R. 7456, and also with the first part of section 201 of Title II of H. R. 7456.

# DUTIABLE LIST.

## SCHEDULE 1.—CHEMICALS, OILS, AND PAINTS.

[NOTE.—The United States Tariff Commission, in response to a request from the Committee on Ways and Means of the House of Representatives, transmitted on March 28, 1921, to that committee a report entitled "Suggested reclassification of chemicals, oils, and paints." This document, referred to in the following pages as the "Reclassification Report," was confined to matters of wording, arrangement, and classification of the provisions dealing with chemicals, oils, and paints of the acts of 1913 and 1916. No attempt was made to transfer articles from the dutiable to the free list, or the reverse, nor to recommend rates of duty. The suggested reclassification was adopted by the committee as a basis of schedule 1 of H. R. 7456.]

### PARAGRAPH 1.

H. R. 7456.

SENATE AMENDMENTS.

PARAGRAPH 1. Acids and acid anhydrides: Acetic acid containing not more than 65 per centum of acetic acid, three-fourths of 1 cent per pound; containing more than 65 per centum, 2 cents per pound; acetic anhydride, 8 cents per pound; boric acid, 2 cents per pound; chloroacetic acid, 5 cents per pound; citric acid, 12 cents per pound; lactic acid, containing by weight of lactic acid less than 30 per centum, 1½ cents per pound; 30 per centum or more and less than 55 per centum, 3 cents per pound; and 55 per centum or more, 5 cents per pound: *Provided*, That any lactic-acid anhydride present shall be determined as lactic acid and included as such: *And provided further*, That the duty on lactic acid shall not be less than 25 per centum ad valorem; tannic acid, tannin, and extracts or decoctions of nutgalls, containing by weight of tannic acid less than 50 per centum, 4 cents per pound; 50 per centum or more and less than 80 per centum, 10 cents per pound; and 80 per centum or more, 20 cents per pound; tartaric acid, 6 cents per pound; arsenic acid, arsenious acid or white arsenic, formic acid, gallic acid, oleic acid or red oil, oxalic acid, phosphoric acid, pyrogallic acid, stearic acid, and all other acids and acid anhydrides not specially provided for, 25 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

SCHEDULE A.—CHEMICALS, OILS, AND PAINTS.

SCHEDULE A—CHEMICALS, OILS, AND PAINTS.

PAR. 1. Acids: Acetic or pyroligneous acid, not exceeding the specific gravity of one and forty-seven one-

PAR. 1. Acids: Boracic acid, ¾ cent per pound; citric acid, 5 cents per pound; formic acid, 1½ cents per

thousandths, three-fourths of one cent per pound; exceeding the specific gravity of one and forty-seven one-thousandths, two cents per pound; acetic anhydrid, two and one-half cents per pound; boracic acid, three cents per pound; \* \* \* citric acid, seven cents per pound; lactic acid, containing not over forty per centum by weight of actual lactic acid, two cents per pound; containing over forty per centum by weight of actual lactic acid, three cents per pound; oxalic acid, two cents per pound; \* \* \* tannic acid or tannin, thirty-five cents per pound; gallic acid, eight cents per pound; tartaric acid, five cents per pound; all other acids not specially provided for in this section, twenty-five per centum ad valorem.

PAR. 482. Acids: Arsenic or arsenious, \* \* \* phosphoric, \* \* \* prussic, silicic, \* \* \* [Free].

PAR. 22. \* \* \* extract of nutgalls, aqueous, one-fourth of one cent per pound and ten per centum ad valorem; \* \* \*.

pound; gallic acid, 6 cents per pound; lactic acid, 1½ cents per pound; oxalic acid, 1½ cents per pound; pyrogallic acid, 12 cents per pound; \* \* \* tannic acid and tannin, 5 cents per pound; tartaric acid, 3½ cents per pound; all other acids and acid anhydrides not specially provided for in this section, 15 per centum ad valorem.

PAR. 2. Acetic anhydrid, 2½ cents per pound.

PAR. 387. Acids: Acetic or pyroligneous, arsenic or arsenious, \* \* \* phosphoric, \* \* \* prussic, silicic, \* \* \* [Free].

PAR. 30. Extracts and decoctions of nutgalls, \* \* \* not containing alcohol and not medicinal, ⅔ of 1 cent per pound.

#### ACETIC ACID.

(See Survey A-2.)

*Description and uses.*—Acetic acid is that chemical constituent which gives vinegar its sour taste. The common grades of the commercial acid contain 28, 56, and 80 per cent of acetic acid. The most concentrated form, which contains over 99 per cent, is known as glacial acetic acid. The largest use is in manufacturing the pigments, white lead, and verdigris. Other uses are in printing and dyeing textiles; in the leather industry; in the manufacture of insecticides, inks, dyes, and drugs; and for laundry purposes. Pyroligneous acid is the crude acetic-acid solution obtained in the destructive distillation of wood. It does not enter commerce to any great extent, but is usually refined by conversion into calcium acetate. (See par. 1540.)

*Production* of acetic acid in 1914 was 75,303,375 pounds, valued at \$1,272,294, and in 1919 (preliminary figures) 46,821,000 pounds, valued at \$2,816,300. In 1919 the output of glacial acetic acid was 5,050,000 pounds, valued at \$869,200. Acetic acid is usually made from acetate of lime or of soda, and its manufacture is rather widespread. As a result of large war demands for acetone a process has been developed in Canada which gives acetic acid as an intermediate product and uses the raw material, calcium carbide. Productive capacity of the Canadian plant is about 650 tons per month of 100 per cent acetic acid.

*Imports* of acetic acid increased after the act of 1913, but from 1910 to 1917 were never more than 1 per cent of domestic production. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918 .....	297,323	\$83,907	\$0.28
1919 .....	1,850,427	219,826	.12
1920 .....	2,862,068	365,741	.13
1921 (9 months) .....	28,042	2,315	.08

In 1919 over 90 per cent of imports came from Canada. The 1920 import was about 5 per cent by quantity and by value 10 per cent of the 1919 domestic output.

*Exports* of acetic acid are not shown. It is usually exported in the form of calcium acetate. (See par. 1540, p. 1267.)

*Important changes in classification.*—"Acid anhydrides" added to the heading of this paragraph. Acetic or pyroligneous acid is exempt from duty under paragraph 387 of the act of 1913.

*Suggested changes.*—Page 2, line 3, of H. R. 7456: Insert the words "by weight" after the word "containing."

#### ACETIC ANHYDRIDE.

(See Survey A-2.)

*Description and uses.*—Acetic anhydride, a colorless liquid with a strong acetic odor, is derived from acetic acid by the removal of water. It is used in the manufacture of acetyl salicylic acid (aspirin) and cellulose acetate. (See par. 28.)

*Production.*—Acetic anhydride is made by treating anhydrous sodium acetate with phosphorus chloride or sulphur chloride. Prior to the war little, if any, was made in this country. The war demand for airplane "dopes" and the expiration of the patents on "aspirin" caused a great stimulus to the industry. The production in 1919 (preliminary figures) was 1,213,200 pounds, valued at \$578,600.

*Imports* prior to 1915 were from Germany, and amounted to about 1,200,000 pounds in 1910 and 1911. They declined to about 300,000 pounds in 1913, and during the war were negligible. There have been no imports from 1919 to September 30, 1921, inclusive.

*Exports.*—Statistics not available.

*Important changes in classification.*—Acetic anhydride has been transferred to this paragraph from paragraph 2, act of 1913, so as to bring all acids and acid anhydrides together.

#### BORIC ACID.

(See Survey A-1.)

*Description.*—Boric acid is a white crystalline substance which has very weak acid properties and is a mild antiseptic. Borax refined, or borate of soda, closely allied to boric acid, is assessed a duty of one-eighth cent per pound under paragraph 78 of H. R. 7456. Crude borax and crude borate minerals from which boric acid and refined borax are made are on the free list, paragraph 1533.

*Uses.*—The principal uses of boric acid and borax are: (a) In making enamels for iron and steel (kitchen ware, sanitary ware, equipment for chemical factories, watch dials, etc.). (b) As an ingredient for glazes on earthenware and pottery. (c) In the manu-

facture of some varieties of glass, especially lamp chimneys and chemical laboratory ware. (d) As a flux for welding and brazing metals. (e) As an ingredient for some varieties of soap, principally laundry soap for use with hard water. (f) In the tanning of some varieties of leather. (g) As an antiseptic in eye lotions, cosmetics, and washes for wounds. (h) In Europe as a food preservative, especially in dairy products, dried and smoked meat, and sausages. In the United States this use is prohibited by the food and drugs act, except in products intended for export.

*Production.*—Boric acid and borax are made from crude borate minerals which are mined commercially in California and Nevada, and Chile, Italy, Turkey, and Germany. The United States produces about one-half of the world's total supply and Chile about one-third. The domestic production of these minerals has grown from 50,609 tons in 1914 to 108,875 tons in 1917. Refined boric acid and borax is manufactured in California, New York, New Jersey, Pennsylvania, and Illinois. Production in the United States in 1914 was 4,295 tons, valued at \$588,981, and in 1917 was 5,888 tons, valued at \$1,383,783. The production for 1919 (preliminary figures) was 7,227 tons, valued at \$1,754,600.

*Imports* have been less than 5 per cent of the American production since 1908. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	259,096	\$26,436	\$0.10	\$1,943	7.35
1919.....	276,795	20,716	.07	2,076	10.02
1920.....	189,667	9,733	.05	1,422	14.63
1921 (9 months).....	248,233	18,392	.07		

*Exports.*—Statistics are not available, but were probably negligible before the war. An important export trade has developed since 1914.<sup>1</sup>

#### CHLOROACETIC ACID.

*Description and uses.*—Of the various chloroacetic acids, the most important is monochloroacetic acid (obtained by treating glacial acetic acid with chlorine), an important intermediate in the manufacture of the coal-tar dye indigo.

*Production.*—Little or no chloroacetic acid was produced in the United States prior to the war, because of the absence of a synthetic dye industry. The necessary raw materials—acetic acid and chlorine—are available in large quantities and the manufacture of the acid on a commercial scale was coincident with that of coal-tar dyes. Statistics of production are not available but the output is known to be large.

*Imports* are recorded for 1914 (fiscal year) only, when commercial grades of monochloroacetic acid amounted to 12,834 pounds, valued at \$2,756.

*Exports.*—Statistics not available.

*Important change in classification.*—New specific provision.

<sup>1</sup> See Tariff Commission report, "Acids of paragraph 1 and related materials in the tariff act of 1913," for detailed import and export information.

## CITRIC ACID.

(See Survey A-1.)

*Description and uses.*—Citric acid is a white crystalline substance obtained as a by-product of the lemon industry. Its principal use is in the manufacture of beverages and pharmaceutical preparations. Citrate of lime (dutiable at 7 cents per pound, par. 46) is the intermediary chemical in the manufacture of citric acid from lemon juice. Citrate of lime is used exclusively for the manufacture of citric acid.

*Domestic production.*—The greater part of the citric acid manufactured in the United States is from the citrate of lime imported from Sicily; a small amount is made from lemon and lime juice imported (free under par. 1604) from the West Indies; the remainder is obtained as a by-product of the lemon industry in California.

Citric acid is made from "cull" (inferior or damaged) lemons, not salable as fresh fruit. A by-product obtained at the same time is essential oil of lemon, which is dutiable at 20 per cent under paragraph 54. The cultural methods in California are so superior to those commonly used in Sicily that a smaller proportion of the crop is converted into by-products. There is a large acreage of young, nonbearing lemon trees in California, and a substantial increase in the crop may be expected in the near future. In spite of this expansion in total output of lemons, the American demand for citric acid can not be met from domestic sources unless overproduction forces lemons of good grade into by-products.

Besides the California producers, a group of manufacturers located near Atlantic ports are engaged in making citric acid, principally from imported citrate of lime. These firms are concerned chiefly with the margin of duty between citrate of lime and citric acid. The production of citric acid in the United States grew from 2,729,943 pounds in 1914 to 4,032,897 pounds in 1917, but decreased in 1919 (preliminary figures) to 3,163,700 pounds, valued at \$3,047,400.

*Imports of citric acid in 1913 were only 8,677 pounds, valued at \$2,916, on which a revenue of \$607 was collected. After the passage of the act of 1913 they increased greatly, although they remained small in comparison with imports of citrate of lime. The imports of 1915 amounted to 722,434 pounds, valued at \$447,131, and yielded a revenue of \$36,121. This increase was not due entirely to the change in the tariff, but in part to the erection of citric-acid factories in Italy. Later statistics follow:*

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	332,269	\$217,027	\$0.65	\$16,613	7.66
1919.....	1,224,591	1,187,267	.97	61,229	5.16
1920.....	1,317,467	1,142,842	.87	65,873	5.76
1921 (9 months).....	610,249	378,495	.62	.....	.....

Imports of 1919 and 1920 were from six to ten times imports from 1908 to 1913, and about double the 1915 imports.

*Exports.*—Statistics not available.

*Suggested changes.*—See paragraph 46, page 133.

## LACTIC ACID.

(See Survey A-1.)

*Description.*—Lactic acid is the acid formed in souring milk, although commercial supplies are obtained from other sources. Pure lactic acid is a colorless, odorless liquid which mixes with water in all proportions. It attacks iron, and must therefore be shipped in wood or glass containers. It comes on the market in three grades of purity and in several degrees of strength. Technical lactic acid contains impurities which give it a dark color and an unpleasant odor. It is customarily sold either in 22, 44, or 66 per cent strength, and is graded according to whether it is "light" or "dark" in color. Edible lactic acid is free from impurities which give an objectionable odor and flavor, is nearly colorless, and is usually about 50 per cent in strength. Medicinal lactic acid (United States Pharmacopœia) is a refined article of not less than 85 per cent of acid and with only traces of impurities.

*Uses.*—Technical lactic acid is used principally in tanning for the "bating" and "plumping" of hides and also in the dyeing and printing of textiles. Edible lactic acid has been on the market in considerable amounts only since the summer of 1918. A large market will probably develop for it in beverages, especially in nonalcoholic imitation beers and soft drinks. A use which may develop is that of bread making. It has been found that the addition of this acid to dough improves the quality of bread. Lactic acid and several of its salts are used in medicine.

*Production.*—The acid is made from corn or other starchy material and from vegetable-ivory scrap obtained from button factories. The raw material is heated with sulphuric acid to make glucose, fermented to lactic acid, then concentrated and refined. The industry began to develop in the United States in 1881 and has steadily grown. There were five manufacturers in 1917, with an output of over 1,900,000 pounds, calculated as 100 per cent lactic acid. The output of American factories increased rapidly during the war. The production in 1919 (preliminary figures) was 5,054,500 pounds (strength not stated), valued at \$781,500. In 1896 manufacture was begun in Germany, where the industry grew more rapidly than in the United States. No figures on production in Germany are available, but German exports before the war were about equal to the 1919 domestic output. The German acid is made from potatoes.

*Imports.*—The largest during any one year (1912) were 335,335 pounds, valued at \$25,267, yielding a revenue of \$9,732. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	200	\$461	\$2.30	\$3	0.65
1919.....	11,023	3,927	.36	165	4.21
1920.....	133,756	65,354	.49	2,006	3.07
1921 (9 months).....	853,545	29,212	.08		

*Exports.*—Export statistics are not given, but it is known that at least one American firm exported lactic acid before the war, and that exports have increased substantially.

*Important changes in classification.*—Since lactic acid appears on the market in many grades varying in strength, quality, or purity, and in price, a single specific duty, as imposed by the act of 1913, bears unevenly on the different grades. Distinction between the various grades aside from strength could not be stated in language simple enough for incorporation in the tariff law. Suggestion of the commission to divide lactic acid into three grades by percentage content of lactic acid for tariff purposes was adopted by the Ways and Means Committee.

The fact that lactic acid always contains lactic acid anhydride in varying amounts made necessary the provision that any lactic acid anhydride present shall be determined as lactic acid and included as such. (Reclassification Report, p. 9.)

#### TANNIC ACID, TANNIN, AND EXTRACT OF NUTGALLS.

(See Survey A-1.)

*Description and uses.*—The term “tannin” in scientific usage is a class name covering a large number of similar substances. As used in commerce and in the tariff the term applies to only one member of this class, namely, that known to chemists as gallotannic acid. A highly purified grade conforming to the specifications of the United States Pharmacopœia, is known as “tannic acid, U. S. P.,” and a less pure grade as “technical tannic acid.”

The technical grades of tannic acid and extracts of nutgalls are used as a mordant in the dyeing and printing of textiles, in the manufacture of color lakes, in ink making, and for the manufacture of gallic acid. Other materials are both cheaper and better for tanning leather. Tannic acid, U. S. P., is used for medicinal purposes and for the clarification of wines and fruit juices.

*Production.*—Tannic acid is made from nutgalls, obtained almost entirely from China, Japan, and Asia Minor. In 1914 the domestic production by five firms was 853,830 pounds, valued at \$287,142. Foreign statistics are not available, but before the war Germany was the largest producer, German exports exceeding the total American production.

*Imports* under the tariff act of 1909, which imposed a duty of 35 cents per pound, were negligible, the maximum during any fiscal year being 8,071 pounds, valued at \$3,864. The act of 1913, reducing the duty to 5 cents per pound, was followed by an increase in imports in 1915 to 49,493 pounds, valued at \$17,047, or about 6 per cent of the American production during 1914. Imports from 1915 to 1918 (fiscal years) were negligible, probably because of the blockade of Germany. Recent statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	48,256	\$21,139	\$0.44	\$2,413	11.41
1919.....	68,336	31,470	.46	3,417	10.86
1920.....	28,669	15,489	.54	1,433	9.25
1921 [9 months].....	45,384	10,150	.22		

Postwar imports have been from three to eight times the prewar imports.

*Important changes in classification.*—The act of 1913, in paragraph 1, provides for “tannic acid and tannin, 5 cents per pound;” while paragraph 30 provides for “extracts and decoctions of nutgalls \* \* \* three-eighths of 1 cent per pound.” There is no clear and sharp distinction between a solid extract of nutgalls and tannic acid, technical. These provisions have caused litigation. An importation of nutgall extract in solid form, which on analysis was found to contain 78.34 per cent tannic acid, was held without evidence of the process of manufacture to be dutiable as tannic acid. (*East Asiatic Co. v. United States*, 10 Ct. Cust. Appls., 207, of 1920.)

The suggestion of the commission that tannic acid and tannin be combined with the provision for extract of nutgalls and that the duties be levied according to percentage content of tannic acid or tannin was adopted by the Committee on Ways and Means. (Reclassification Report, p. 10.)

*Suggested changes.*—After the indorsement of manufacturers and importers had been secured as to the percentage limitations suggested by the Tariff Commission, and after the passage of the bill H. R. 7456 by the House of Representatives, a representative of one of the manufacturers who had previously agreed to the commission's classification stated to the Finance Committee of the Senate that the limit of 80 per cent would not include U. S. P. tannic acid, intended to be included. His statement was based upon analyses made in the manufacturer's laboratory. Upon receipt of these analyses, the commission had additional samples of tannic acid analyzed, and its conclusion was that much of the U. S. P. tannic acid would fall below the 80 per cent limit and that higher grades of technical tannic acid have a tannin content approaching that of the U. S. P. tannic acid. It is therefore evident that it would be extremely difficult to distinguish the two grades for tariff purposes by tannic-acid content but that other tests specified in detail in the United States Pharmacopœia must be used. It is now believed that if the following classification be substituted for the present provision for tannin or tannic acid in paragraph 1 of Title I of H. R. 7456 the two grades will be easily distinguishable:

tannic acid, tannin, and extracts or decoctions of nutgalls containing by weight of tannic acid less than 50 per cent, [rate]; 50 per cent or more and not medicinal, [rate]; 50 per cent or more and medicinal, [rate].

This classification would divide the various grades of tannic acid above 50 per cent into medicinal and nonmedicinal, according to specifications of the United States Pharmacopœia, regarded by customs officials and the trade as authoritatively distinguishing between medicinal and nonmedicinal grades of chemicals.

#### TARTARIC ACID.

(See Survey A-1.)

*Description and uses.*—Tartaric acid is present in grapes and is obtained commercially from wine lees, argols, or crude tartar, by-products of the wine and grape-juice industries. It is closely allied

in origin, manufacture, and use to cream of tartar or potassium acid tartrate (par. 9). It is used in the manufacture of baking powder, in beverages, jellies and preserves, in pharmaceutical products, in the dyeing and printing of textiles, and in the manufacture of various salts of tartaric acid used in photography, medicine, silver plating, and chemical laboratories.

*Domestic production* of crude tartar materials is very small. Either the crude tartar materials or the refined tartaric acid and cream of tartar are imported to supply the demands. Production in 1919 (preliminary figures) of tartaric acid, chiefly from imported raw materials, was 5,313,000 pounds, valued at \$4,262,400.

*Imports* of tartaric acid have varied greatly. They decreased prior to the war from 331,538 pounds, valued at \$72,204, in 1911 to 78,942 pounds in 1913. In 1914 and 1915 imports exceeded 800,000 pounds, and from 1916 to 1918, inclusive, they were between 200,000 and 400,000 pounds annually. Recent statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	316,818	\$200,145	\$0.63	\$11,089	5.54
1919.....	654,736	447,571	.70	22,916	5.12
1920.....	1,367,103	850,369	.62	47,849	5.63
1921 (9 months).....	1,615,203	531,914	.33	.....	.....

*Exports.*—Statistics for tartaric acid or cream of tartar are not available, but probably were not large. However, exports of baking powder containing these materials have been extensive.

#### ARSENIC ACID AND ARSENIOS ACID OR WHITE ARSENIC.

(See Survey FL-6.)

*Description and uses.*—Arsenious acid or white arsenic, the most important and the commonest form of arsenic in commerce, is an acid anhydride rather than a true acid. It is also known simply as "arsenic" or as arsenic trioxide. Arsenious acid is a white insoluble powder with a slightly metallic taste and vaporizes without melting when heated in the open. Arsenic acid is chemically different and is obtained by oxidation of white arsenic. It occurs in commerce as a true acid, a thick sirupy liquid packed in steel drums, and in the form of the acid anhydride—arsenic pentoxide, which by the addition of water forms arsenic acid. Both of these acids, as well as all soluble salts of arsenic, are extremely poisonous.

Arsenious acid is used in the manufacture of insecticides, chiefly lead and calcium arsenates, in plate-glass manufacture, as a preservative for green hides, and in the manufacture of arsenic acid and arsenic salts. Arsenic acid is used in the preparation of organic medicinal chemicals containing arsenic, and its salts have medicinal uses.

*Production.*—The domestic production of white arsenic has increased from 1,497 short tons in 1910 to 6,323 short tons, valued at

\$1,213,000, in 1918. The 1919 output was 6,029 tons. White arsenic is obtained chiefly in the United States as a by-product of smelting copper and lead ores. Arsenic acid is manufactured by oxidizing white arsenic by means of either nitric acid or chlorine.

*Imports* of arsenic and arsenious acids from 1908 to 1918 have averaged 2,725,575 pounds, valued at \$126,828, and have come chiefly from Germany, Canada, England, and Belgium. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.
	<i>Pounds.</i>			
1918.....	3,694,084	\$441,212	\$0.12	.....
1919.....	8,778,218	624,494	.07	.....
1920.....	7,479,485	532,635	.07	.....
1921 (9 months).....	2,705,625	216,276	.08	.....

*Exports.*—Statistics not available.

*Important changes in classification.*—The act of 1913 provides for arsenious acid in paragraph 387 and for arsenic in paragraph 403. Information furnished the commission by the collector of customs at New York indicates that importations of "white arsenic," which is the same as "arsenious acid," were included in the statistics for "arsenic and sulphide of arsenic, or orpiment" under paragraph 403.

As both of these chemicals were then on the free list, the confusion of the one product with the other had little tariff significance. By including the term "white arsenic" with "arsenious acid" the possibility of this confusion under H. R. 7456 is obviated.

#### FORMIC ACID.

(See Survey A-1.)

*Description and uses.*—Concentrated formic acid is a corrosive, fuming, colorless liquid with a characteristic and irritating odor. It mixes with water in all proportions and appears in commerce in strength varying from 50 per cent to almost 100 per cent. It is serviceable in the dyeing and tanning industries, but other competing acids have, as a rule, been cheaper, and its use has therefore been restricted to a few cases for which it has peculiar advantages. Formic acid forms esters with various alcohols which are used in perfumes and as solvents. Recent technical advances in its domestic manufacture and commercial development indicate that under normal conditions it may be put on the market at a lower price. These new discoveries will probably have indirectly a marked influence on the manufacture of oxalic acid.

*Production.*—Formic acid is made by two processes, one of which—developed in Germany and controlled before the war by German patents, but since developed in the United States—depends on heating caustic soda with carbon monoxide under pressure, yielding sodium formate, from which either formic acid or oxalic acid may be made by subsequent treatment. This process has attained commercial production. By the other process, an American invention developed during the war, the first stage is to make cyanide of soda from soda, coke, and air. The cyanide of soda is then decomposed by steam, yielding

ammonia and sodium formate. This latter process has not been a commercial success up to the present time (December, 1921).

*Imports.*—The largest were in 1914 when 1,119,745 pounds of formic acid and 1,843,245 pounds of sodium formate were imported, almost entirely from Germany. Later statistics of formic acid follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....					
1919.....	132,333	\$29,604	\$0.22	\$1,985	6.70
1920.....	173,019	41,426	.24	2,595	6.26
1921 (9 months).....	415,617	51,212	.12		

*Exports.*—Statistics not available.

#### GALLIC ACID.

(See Survey A-1.)

*Description and uses.*—Gallic acid is found in many plants and commercially is made directly from nutgalls by boiling tannic-acid solutions with sulphuric or hydrochloric acid, the yield being only about two-thirds of the tannic acid used. This acid, appearing in commerce in two grades—refined, conforming to the specifications of the United States Pharmacopœia, and less pure or technical—is an intermediate for making several dyes, including Gallocyanine Blue, formerly much used for dyeing wool for Navy uniforms; also in making ink, and in medicine, and as a raw material for the manufacture of pyrogallic acid. The output increased greatly during the war, principally on account of the enlarged demand for dye making. It is made by four firms in the United States.

*Imports* before the war (chiefly from Germany) averaged about 50,000 pounds per year. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	2,242	\$2,748	\$1.22	\$135	4.90
1919.....	22	26	1.18	1	5.08
1920.....					
1921 (9 months).....	20	9	.45		

*Exports.*—Statistics not available.

#### OLEIC ACID OR RED OIL.

*Description and uses.*—Oleic acid, commercially known as “red oil,” is a clear, dark-red, fatty acid. It is obtained from fats and oils in the manufacture of soap. There are three grades of oleic acid, one a medicinal grade, conforming to specifications of the United

States Pharmacopœia, and the other two, commercial grades, known as "saponified" and "distilled" red oil. The principal consumption of oleic acid is in the manufacture of textile soaps, which are usually made at the textile mills by neutralizing the oleic acid with soda ash. Other important uses include the manufacture of oil-soluble colors, certain kinds of patent leather, polishing preparations, and lubricating and screw-cutting compounds.

*Production* of the larger part of oleic acid or "red oil" is at soap and candle factories, although numerous small factories make this product only. The domestic output of 1912 was 27,494,000 pounds, but from 1914 to 1920, inclusive, it ranged between 38,000,000 and 43,000,000 pounds annually. Production for the first nine months of 1921 (preliminary figures) was about 22,000,000 pounds.

*Import* figures are available for the fiscal year 1914 only, and were 367,070 pounds, valued at \$24,662. This is approximately 1 per cent of the domestic production.

*Exports*.—Statistics not available.

*Important changes in classification*.—New specific provision.

#### OXALIC ACID.

(See Survey A-1.)

*Description and uses*.—Oxalic acid is a white crystalline solid which occurs naturally in many plants, especially *Oxalis acetosella* (wood sorrel), but commercial supplies are obtained by chemical processes rather than by extraction from natural sources. Oxalic acid has a great variety of uses, the largest probably in commercial laundries for rinsing out the last traces of alkali or soap and for removing iron stains. It is also employed in textile dyeing and printing, for bleaching leather, cork, wood, straw, and shellac, and as an ingredient in metal polishes. It serves as a reagent in chemical laboratories. Some of its salts are used in medicine and in photography.

*Production*.—Before the war there was only one producer in the United States who used a process dependent on heating sawdust with caustic potash, followed by elaborate chemical treatment. This firm had severe competition from German producers, who have developed a newer and apparently cheaper process by heating caustic soda with carbon monoxide under pressure, forming sodium formate, which on further heating yields sodium oxalate, and this in turn is converted into oxalic acid. During the war several firms in the United States undertook its manufacture by the new method, but they are still in the infant-industry stage of development. In 1919 (preliminary figures) the output of oxalic acid was 2,103,500 pounds, valued at \$545,600.

*Imports*—Prewar imports of oxalic acid, chiefly from Germany, but partly from Norway and Great Britain, varied from about seven to eight million pounds per year, despite a duty of 2 cents per pound. It is estimated that the imports were several times greater than American production. Imports declined during the war, averaging less than 1,000,000 pounds per year. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad. valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	576,000	\$218,336	\$0.38	\$8,640	3.96
1919.....	651,690	183,968	.28	9,775	5.31
1920.....	1,789,452	604,922	.34	26,842	4.44
1921 (9 months).....	1,016,471	151,497	.15	.....	.....

*Exports.*—Statistics are not available.

#### PHOSPHORIC ACID.

(See Survey FI-1.)

*Description and uses.*—The pure acid is a white solid, which absorbs moisture rapidly. It is usually sold as a sirupy liquid containing 85 per cent or less of the acid, produced technically by treating calcium phosphate with sulphuric acid. The pure acid is made by treating pure phosphorus with nitric acid or by burning phosphorus to phosphoric anhydride, followed by treatment with water. The principal uses of phosphoric acid are in medicine, dental cements, and beverages.

*Production* of phosphoric acid in 1914 was 12,420,191 pounds, valued at \$680,239, and in 1919 (preliminary figures) increased slightly to 13,379,500 pounds, valued at \$1,711,100.

*Imports* have been quite small and decreased from 528,826 pounds in 1914 to 17,711 pounds in 1918 (fiscal year). Of the 1914 import, 65 per cent was from England. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	4,501	\$4,101	\$0.91
1919.....	10,925	4,068	.37
1920.....	308,974	89,280	.29
1921 (9 months).....	50,338	18,487	.37

The maximum postwar import (1920) was less than 3 per cent of the 1919 domestic production.

*Exports.*—Statistics not available.

*Important changes in classification.*—Phosphoric acid is exempt from duty under paragraph 387 of the act of 1913.

#### PYROGALLIC ACID.

(See Survey A-1.)

*Description and uses.*—Pyrogalllic acid, or pyrogallol, is a white crystalline solid made by heating gallic acid. It is the oldest photographic developer and is probably used more than any other. Pyrogalllic acid and several products made therefrom are employed in medicine. Another use is in the dyeing of fur and hair; also in the manufacture of some dyes. It is an important reagent in the chemical laboratory as an absorbent for oxygen gas in gas analysis.

*Production.*—It is made by three firms in the United States, whose output has shown a substantial increase during the war.

*Imports* have been larger in proportion to American production than have the closely allied substances, tannic acid and gallic acid. Prewar imports with the exception of 1913 ranged between 22,000 and 37,000 pounds. During and since the war imports have been negligible. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1920.....	888	\$2,069	\$2.33	\$107	5.15
1921 (9 months).....	22	45	2.05		

NOTE.—No imports during the calendar years 1918 and 1919.

*Exports.*—Statistics not available.

#### STEARIC ACID.

*Description and uses.*—Stearic acid, a hard white waxlike substance, is a fatty acid obtained from the same sources as oleic acid (see *supra*). The latter may be converted into stearic acid by treatment with hydrogen in the presence of a nickel catalyzer. Commercial stearic acid is usually slightly yellow or gray in color and the grades include the medicinal (U. S. P.) and technical; the latter is further divided into single, double, and triple pressed.

Stearic acid is sometimes erroneously confused with “stearin” in commerce, whereas, correctly, stearin applies to certain solid fats which have not been split into their constituent fatty acids and glycerin. The chief use of stearic acid is for making candles, with or without the addition of paraffin. Considerable amounts are used in the manufacture of wax matches and in the production of metallic stearates, which serve as paint driers, waterproofing compounds and, in the case of zinc stearate, in the manufacture of cosmetics.

*Production.*—Stearic acid is obtained simultaneously with oleic acid or “red oil” from various oils and fats. The domestic production has not been so constant as that of oleic acid, but has ranged from 3,773,000 pounds in 1912 to 18,571,000 pounds in 1918. The output increased to 24,372,395 pounds in 1920, but during the first nine months of 1921 amounted to only about 12,000,000 pounds.

*Imports* of stearic acid increased from 36,610 pounds, valued at \$3,451, in 1911, to 119,519 pounds, valued at \$12,160, in 1913. Only 538 pounds were imported in 1917. Statistics for later years follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....					
1919.....	3,737	\$799	\$0.21	\$120	15
1920.....	2,350	466	.20	70	15
1921 (9 months).....	27,678	2,452	.89		15

*Exports.*—Statistics not available.

*Important changes in classification.*—New specific provision.

## ALL OTHER ACIDS AND ACID ANHYDRIDES.

*Description.*—Other acids and acid anhydrides mentioned elsewhere, and therefore not dutiable under this provision, include: Glycerophosphoric acid, dutiable under paragraph 24; acids of coal-tar origin, dutiable under paragraph 25 or 26; and chromic acid, hydrofluoric acid, hydrochloric or muriatic acid, nitric acid, sulphuric acid or oil of vitriol, and mixtures of nitric and sulphuric acids, valerianic acid, and all anhydrides of the foregoing, exempt from duty under paragraph 1501.

*Imports* under this provision prior to the war ranged between \$50,000 and \$90,000. They decreased to \$36,430 in 1916, and then increased to \$500,091 in 1918 (fiscal year). Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	45,324	\$110,755		\$16,613	15
1919.....	63,822	31,759	\$0.70	4,764	15
1920.....	147,355	16,202	.25	2,430	15
1921 (9 months).....		41,099	.28	6,165	15

*Exports.*—Statistics not available.

*Important changes in classification.*—The more important acids dutiable under this provision in the act of 1913 (par. 1) have been mentioned specifically in H. R. 7456. These include chloroacetic acid, oleic acid or red oil, and stearic acid. Prussic (hydrocyanic) acid and silicic acid are exempt from duty under paragraph 387, act of 1913; specific mention of these acids is omitted from H. R. 7456, and they therefore come within the provision in this paragraph for "all other acids and acid anhydrides" n. s. p. f.

## SENATE AMENDMENTS.

PAR. 2. Acetaldehyde, aldol or acetal-dol, aldehyde ammonia, butyraldehyde, crotonaldehyde, paracetaldehyde, ethylene chlorhydrin, ethylene dichloride, ethylene glycol, ethylene oxide, glycol monoacetate, propylene chlorhydrin, propylene dichloride, and propylene glycol, 6 cents per pound and 30 per centum ad valorem.

## ACT OF 1909.

## ACT OF 1913.

PAR. 3. \* \* \* chemical compounds, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*

PAR. 5. \* \* \* chemical \* \* \* compounds, \* \* \* not specially provided for in this section, 15 per centum ad valorem.

## ACETALDEHYDE, ALDOL OR ACETALDOL, ALDEHYDE AMMONIA, BUTYRALDEHYDE, CROTONALDEHYDE, PARACETALDEHYDE.

*Description and uses.*—Acetaldehyde is a colorless liquid boiling at about 21° C. Its largest use is as an intermediate product in manufacturing acetic acid (par. 1). On account of the low boiling point of acetaldehyde, it is usually polymerized to form paracetaldehyde, which has promising use in the manufacture of synthetic resins, and when combined with amines (a group of coal-tar products), as an accelerator in vulcanizing rubber. Aldehyde ammonia is acetaldehyde combined with ammonia; it has been employed chiefly as a rubber accelerator. Aldol or acetaldol, formed by condensing 2 molecules of acetaldehyde, has promising future uses in the flotation process of ore concentration, particularly of copper ores.

*Production.*—The manufacture of these various compounds depends upon acetaldehyde, which prior to the war, was obtained by oxidizing ethyl alcohol or by fractional distillation from the first runnings of alcohol stills. During the war a process was developed for the production of acetaldehyde from acetylene gas, which is produced from calcium carbide. In America this process was developed commercially at Shawinigan Falls, Canada, where a plant was erected with a capacity of 25 tons of acetaldehyde daily—the larger portion of this output is converted to acetic acid.

*Import statistics* are not available, with the exception of those for paraldehyde in 1914, 10,339 pounds, valued at \$3,003, all from Germany.

*Exports.*—None recorded.

*Important changes in classification.*—None of these chemical compounds was specially provided for in the act of 1909 or 1913.

## ETHYLENE CHLOROHYDRIN, ETHYLENE DICHLORIDE, ETHYLENE GLYCOL, ETHYLENE OXIDE, GLYCOL MONOACETATE, PROPYLENE CHLOROHYDRIN, PROPYLENE DICHLORIDE, AND PROPYLENE GLYCOL.

*Description and uses.*—The products listed above are derived from ethylene or propylene gas. Until very lately they were not used commercially to any extent, and were of scientific interest only. Recent development of these products has been due to the commercial availability of the gases—ethylene and propylene—either from the waste gases given off in certain petroleum cracking processes or from other hydrocarbon gases, or in the case of ethylene, from alcohol. Of these products, probably ethylene dichloride will be the first to assume commercial importance. This is a colorless liquid, with a chloroform-like odor, boiling at 83.5° C. It dissolves oils, fats, and greases, and has the advantage over similar volatile solvents in that it does not hydrolyze with water to form hydrochloric acid. Ethylene chlorohydrin may be used as a solvent, and its great chemical activity makes it valuable in the synthesis of other organic chemicals. Ethylene glycol can be used to replace glycerine for many purposes.

*Production* of these commodities is being developed on the semi-commercial scale at the present time (December, 1921) by at least two firms in this country. Ethylene dichloride is produced by com-

bining ethylene and chlorine gas. Ethylene chlorohydrin is formed by treating ethylene with hypochlorous acid, and in turn is converted into ethylene glycol by treatment with a mild alkali. Ethylene oxide is made by treating a solution of ethylene chlorohydrin with strong caustic alkali.

*Imports* are not recorded except for dichlorohydrin in 1914—782 pounds, valued at \$500.

*Exports.*—None recorded.

*Important changes in classification.*—None of these chemical compounds was specially provided for in the act of 1909 or 1913.

### PARAGRAPH 3.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 3. Acetone, acetone oil, and ethyl methyl ketone, 25 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 3. \* \* \* chemical compounds, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*.

PAR. 3. Acetone, 1 cent per pound.

ACETONE, ACETONE OIL, AND ETHYL METHYL KETONE.

(See Survey A-2.)

*Description and uses.*—Acetone (dimethyl ketone) is a clear, colorless, and highly inflammable liquid. It is used primarily as a solvent for fats, resins, rubber, and other gums, nitrocellulose (cordite, gun-cotton, pyroxylin plastics), tannins, and acetylene, and in the manufacture of chloroform, but for the last-named purpose has a strong competitor in carbon tetrachloride.

Acetone oil (crude ethyl methyl ketone) is a residue obtained in the purification of acetone produced from acetate of lime. It possesses the same solvent properties as acetone and on account of its higher boiling point is preferred in some cases. It is also purified by distillation to obtain ethyl methyl ketone, which is sold also as ketone.

Methyl acetone is the first portion of the distillate in refining crude wood alcohol. It is a mixture of acetone, wood alcohol, and methyl acetate.

*Production* of acetone by eight firms in 1914 was 10,425,817 pounds, valued at \$1,099,585, but decreased in 1919 (preliminary figures) to 6,045,900 pounds, valued at \$767,000. Prior to the war acetone was made exclusively from acetate of lime, a product of the hardwood distillation industry. During the war the large demand for the manufacture of the British explosive, cordite, led to the development of several new processes, one of which is by the fermentation of various substances—corn, molasses, and kelp. Plants employing these fermentation processes, except the fermentation of corn, have closed

since the signing of the armistice. The plant at Terre Haute, Ind., built by the United States and British Governments to produce acetone by fermentation of corn, was purchased by the Commercial Solvents Corporation and reopened in March, 1920. The productive capacity by this process in the latter part of 1920 was about 300,000 pounds per month.

Another process, developed solely by the Canadian Electro Products Co., at Shawinigan Falls, Canada, produced acetone from calcium carbide. This process was abandoned for acetone, but for the manufacture of acetic acid it is still used. A third method in process of development during the war produced acetone from a by-product of the Burton method of cracking petroleum oils. This process, still largely in experimental stages, has promising commercial features.

The domestic production of ethyl methyl ketone in 1919 (preliminary figures) was 1,158,000 pounds, valued at \$167,700.

Imports of acetone have been sporadic and negligible when compared with domestic production. In 1918 the former were 148,082 pounds. In 1914 the imports of acetone oil were 155,210 pounds, valued at \$14,609, chiefly from Canada. Later statistics showing the importation of acetone follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	351,366	\$66,460	\$0.19	\$3,514	5.29
1919.....	240,223	41,442	.17	2,402	5.80
1920.....	6,600	303	.17	66	21.78
1921 (9 months).....	54	8	.15	.....	.....

*Exports.*—Statistics not available.

*Important changes in classification.*—Acetone oil, obtained in the purification of acetone, was declared dutiable under the *eo nomine* provision for acetone in paragraph 3. (*McEnany v. United States*, 8 Ct. Cust. Appls., 329, of 1918.) Ethyl methyl ketone is the chief chemical compound contained in acetone oil and is obtained from acetone oil by fractional distillation. Like acetone oil, it is used for solvent purposes. Because of its commercial importance it has been mentioned specifically. Close chemical relation between acetone oil and ethyl methyl ketone and administrative difficulties in distinguishing them, render advisable a single rate of duty. (Reclassification Report, pp. 11, 12.)

#### PARAGRAPH 4.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 4. Alcohol: Amyl, butyl, isopropyl, and fusel oil, 6 cents per pound; methyl or wood (or methanol), 15 cents per gallon; and ethyl for nonbeverage purposes only, 15 cents per proof gallon.

## ACT OF 1909.

PAR. 36. Fusel oil, or amylic alcohol, one-fourth of one cent per pound.

PAR. 300. \* \* \* spirits manufactured or distilled from grain or other materials, and not specially provided for in this section, two dollars and sixty cents per proof gallon.

PAR. 480. \* \* \* articles manufactured, in whole or in part, not provided for in this section, \* \* \* twenty per centum ad valorem.

## ACT OF 1913.

PAR. 33. Fusel oil, or amylic alcohol,  $\frac{1}{4}$  cent per pound.

PAR. 237. \* \* \* spirits manufactured or distilled from grain or other materials, not specially provided for in this section, \$2.60 per proof gallon.

PAR. 393. Alcohol, methyl or wood [Free].

## AMYL ALCOHOL AND FUSEL OIL.

(See Survey A-9.)

*Description and uses.*—Commercial fusel oil consists chiefly of two different forms of amyl alcohol, and varying amounts of other alcohols, traces of acids, and considerable water. There is a crude grade which is light amber to straw colored, having a persistent, disagreeable odor, and a refined grade which is nearly colorless and free from water, made by redistilling crude fusel oil. The chief use of fusel oil is in the manufacture of amyl acetate, largely used as a solvent in the nitrocellulose industry. Pure amyl alcohol is obtained by refining and purifying fusel oil. It is converted into amyl esters, which are used as flavors and perfume materials, and as a solvent in the arts.

*Production.*—Fusel oil is obtained as a by-product of fermentation processes, chiefly from distilled liquors and industrial alcohol or cologne spirits. The output as a by-product of distilleries in 1918, about 830,000 pounds, supplied but an inconsiderable portion of the domestic requirements for this oil. The production decreased to about 500,000 pounds in 1919 and 1920 (fiscal years).

*Imports* from 1910 to 1914, inclusive, averaged about 5,300,000 pounds per year, 75 per cent coming from Russia, the United Kingdom, and Germany in about equal proportions. Imports declined to about 1,600,000 pounds in 1917, accounted for in part by the cessation of those from Russia. In 1918, Canada, which furnished only a small quantity in the past, supplied over 50 per cent of the total. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	2,155,923	\$609,974	\$0.28	\$5,390	0.88
1919.....	3,481,965	820,260	4.24	8,705	1.06
1920.....	3,887,303	879,206	.23	9,718	1.11
1921 (9 months).....	713,210	159,931	.22	.....	.....

*Exports.*—Statistics not available.

*Important changes in classification.*—Amyl rather than amylic is the term now generally used.

## BUTYL ALCOHOL.

(See Survey A-9.)

*Description and uses.*—Butyl alcohol ( $C_4H_{10}O$ ) occurs in four isomeric forms. Of these only normal butyl alcohol is of any great commercial importance. The principal use of butyl alcohol is as a solvent in the manufacture of pyroxylin plastics, such as celluloid. It is also used to prevent "blushing" and precipitation of pyroxylin in photographic films and pyroxylin varnishes and lacquers. It may also be employed for other solvent purposes, such as in the manufacture of paint and varnish removers, imitation leather, and as solvent for gum resins, fats, oils, and waxes. Butyl alcohol is competitive with fusel oil or amyl alcohol, which has been largely imported, chiefly from Russia (see Fusel oil, p. 27).

*Production.*—Prior to the war butyl alcohol was of scientific interest only and had no commercial use. The large war demand for acetone led to the development of a process of fermenting corn which produced both acetone and butyl alcohol in the ratio of two parts butyl alcohol to one part acetone. A large plant was erected at Terre Haute, Ind., by the United States and British Governments, and following the war it was purchased by the Commercial Solvents Corporation and reopened in March, 1920. The ability of this process to operate in peace time was due to the development of the use of butyl alcohol in pyroxylin plastics. The process is patented and controlled by the Commercial Solvents Corporation. The output of butyl alcohol during the latter part of 1920 approximated 600,000 pounds per month.

*Imports* since 1919 are reported in combination with those for fusel oil or amyl alcohol. In 1914, the only year for which figures are available, imports of butyl alcohol were only 482 pounds, valued at \$287, all of which came from Germany.

*Exports.*—Statistics not available.

*Important changes in classification.*—Butyl alcohol is mentioned specifically for the first time because of its commercial importance.

## ISOPROPYL ALCOHOL.

*Description and uses.*—Isopropyl alcohol occurs in fusel oil, the latter being a by-product of alcoholic fermentation. Isopropyl alcohol is made from propylene by absorption in sulphuric acid and subsequent hydrolysis with water. This method is of recent development and is now operated on a semicommercial scale. It is a colorless liquid used as a solvent and in the preparation of organic compounds. Its properties resemble those of ethyl alcohol, but it is nonpotable, and its use for denaturing alcohol has recently been legalized, for which purpose it is extremely valuable, owing to its lack of odor and possibility of industrial use where wood alcohol and pyridine can not be employed as denaturants.

*Production* figures are not available, but it is known that at least two firms are making it.

*Imports and exports.*—Statistics not available.

*Important changes in classification.*—First specific mention of isopropyl alcohol.

*Suggested changes.*—There are two forms of propyl alcohol, one discussed above—isopropyl alcohol—and the other normal propyl alcohol. The latter is separated from fusel oil by distillation and is used as a solvent and for the preparation of esters and other organic compounds. It is suggested that the term “propyl alcohol” be substituted for “isopropyl alcohol,” as it includes both forms.

## FUSEL OIL.

(See Amyl alcohol, p. 27.)

## METHYL OR WOOD ALCOHOL (METHANOL).

(See Survey A-2.)

*Description and uses.*—Methyl or wood alcohol, or methanol, is one of the primary products of the hardwood-distillation industry. The commercial grades vary from 82 per cent to pure methyl alcohol, acetone being the chief impurity. The largest uses of wood alcohol are in the manufacture of formaldehyde and of dimethylaniline, an important intermediate for coal-tar dyes, both uses requiring pure methanol. Next in importance is its use as a solvent in manufacturing pyroxylin plastics. It has many other uses as a solvent and is used for denaturing grain alcohol.

*Production.*—The distillation of wood produces a raw liquor containing acetic acid and alcohol; the acid is neutralized with lime and the alcohol distilled from the solution, and then purified by redistillation. The output of crude wood alcohol in 1909 and 1914 was slightly in excess of 9,000,000 gallons with a marketed output in 1914 of 7,197,000 gallons valued at \$1,605,900. The marketed production of refined wood alcohol in 1914 was 6,235,113 gallons, valued at \$2,709,369. Production increased during the war because of the demands by the dye industry and a larger production of formaldehyde. Preliminary figures for 1919 indicate a marketed output practically equal to that of 1914; the value in 1919 however was about  $3\frac{1}{2}$  times that in 1914. Michigan, Pennsylvania, and New York have been the principal producers of wood-distillation products. During the war large plants were erected in the Southern Appalachian Mountains.

*Imports* in 1914 and since the war have been less than 1 per cent of domestic production.

*Exports* of wood alcohol in 1909 were 11.8 per cent of domestic production and 16.6 per cent in 1914. Prior to the war, exports were about 1,500,000 gallons, chiefly to Germany, the United Kingdom, and the Netherlands. Between 1914 and 1918 they decreased somewhat, due to the blockade of Germany. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (gallons).....	2,624,312	718,427	703,064	308,287
Value.....	\$2,035,950	\$750,167	\$1,244,197	\$368,670

In postwar years exports were chiefly to England, Switzerland, Japan, and the Netherlands.

*Important changes in classification.*—Methyl or wood alcohol is now exempt from duty under paragraph 393, act of 1913.

#### ETHYL ALCOHOL FOR NONBEVERAGE PURPOSES.

*Description and uses.*—Industrial alcohol includes the various grades of ethyl alcohol, both pure and denatured, used in the arts and industries. The commercial grades of ethyl alcohol include: "Absolute alcohol," which is free from water; "cologne spirit," a high-purity ethyl alcohol; "grain alcohol," which contains about 95 per cent alcohol by volume. Completely denatured and specially denatured alcohol is ethyl alcohol which has been rendered unfit for beverage purposes under formulæ allowed by the Commissioner of Internal Revenue. Both of these varieties when of domestic origin are exempt from internal revenue taxes, but the "specially denatured" can be used only under heavy bond. Pure alcohol for non-beverage purposes (not denatured) is subject to an internal revenue tax of \$2.20 per proof gallon (a proof gallon contains 50 per cent alcohol by volume).

The largest use of industrial alcohol is as a solvent, as in lacquers, shellac, essences, tinctures, etc., while other important applications are in "solid alcohol" for domestic purposes, pharmaceutical preparations, the manufacture of certain dyes, chemicals, and other products. It has limited use as a fuel in internal combustion engines and for illuminating.

*Production.*—Alcohol is prepared by fermentation from materials containing sugar or starch. In the case of starchy materials the starch is first converted to sugars by malt or acid before fermentation. The alcohol is separated after fermentation and concentrated by distillation. The chief raw materials are molasses and corn (usually frozen or injured). In Europe potatoes, rice, corn, and molasses are used.

The United States produces more industrial alcohol than any other country. This development was primarily due to the law allowing tax-free denatured alcohol for industrial purposes. War needs were the chief factor in the recent expansion of the industry to its present size. The following table shows production since 1917:

Calendar year.	Total ethyl alcohol for nonbeverage purposes (including denaturing).	Completely denatured.	Specially denatured.
	<i>Wine gallons.</i>	<i>Wine gallons.</i>	<i>Wine gallons.</i>
1918.....	75,181,931.0	10,328,454.6	39,834,561.4
1919.....	49,077,946.0	9,976,720.6	28,294,219.0
1920.....	49,283,326.0	13,528,403.0	15,307,947.1

*Imports.*—The tariff on industrial alcohol has practically prohibited imports. A maximum of 44,654 proof gallons was imported in 1913, and since 1916 the imports have varied from nothing to 312 proof gallons.

Exports of "alcohol" increased from 25,440 proof gallons in 1912 to a maximum of 51,941,634 proof gallons in 1917, or 25 per cent of the total output. This was due to the war needs for smokeless gunpowder. The exports since 1917 are shown in the following table:

Calendar year.	Quantity.	Value.
	<i>Proof gallons.</i>	
1918.....	8,557,165	\$4,704,743
1919.....	20,311,166	8,966,819
1920.....	25,213,539	10,860,328

*Important changes in classification.*—Ethyl alcohol has been mentioned specifically; it is dutiable under paragraph 237 of the act of 1913 at \$2.60 per proof gallon.

### PARAGRAPH 5.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 5. All chemical elements and all chemical and medicinal compounds, preparations, mixtures and salts, and combinations thereof, all the foregoing obtained naturally or artificially and not specially provided for, 25 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 3. Alkalies, alkaloids, \* \* \* and all combinations of the foregoing, and all chemical compounds, mixtures and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*.

PAR. 28. Iodoform, seventy-five cents per pound.

PAR. 62. \* \* \* iodate of potash, twenty-five cents per pound.

PAR. 65. \* \* \* all other medicinal preparations not specially provided for in this section, twenty-five per centum ad valorem: \* \* \*.

PAR. 70. \* \* \* alkalies containing fifty per centum or more of bicarbonate of soda, five-eighths of one cent per pound.

PAR. 76. \* \* \* alkaline silicate, three-eighths of one cent per pound.

PAR. 248. \* \* \* sugar of milk, five cents per pound.

PAR. 639. Oils: \* \* \* ichthyol, \* \* \* [Free].

PAR. 5. Alkalies, alkaloids, and all chemical and medicinal compounds, preparations, mixtures and salts, and combinations thereof not specially provided for in this section, 15 per centum ad valorem.

PAR. 17. Chemical and medicinal compounds, combinations and all similar articles dutiable under this section, except soap, whether specially provided for or not, put up in individual packages of two and one-half pounds or less gross weight (except samples without commercial value) shall be dutiable at a rate not less than 20 per centum ad valorem: \* \* \*.

PAR. 38. Iodoform, \* \* \* 15 cents per pound.

PAR. 67. \* \* \* alkalies containing 50 per centum or more of bicarbonate of soda; \* \* \*  $\frac{1}{4}$  cent per pound; \* \* \*.

PAR. 449. Chromium, hydroxide of, crude [Free].

PAR. 547. \* \* \* sugar of milk [Free].

PAR. 561. Oils: \* \* \* ichthyol, \* \* \* [Free].

Imports reached a maximum of \$4,804,036 in 1913 and yielded a revenue of \$1,201,009. During the war the imports decreased to a

minimum of \$637,261 in 1916 and increased to \$1,235,112 in 1918, yielding a revenue of \$185,267. This large decrease during the war may be accounted for by the shutting off of imports from Germany, a country especially successful in producing the rarer chemicals. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....		\$1, 130, 733		\$169, 610	15
1919.....	4, 673, 131	1, 088, 415	\$0. 23	163, 363	15
1920.....	10, 710, 840	1, 828, 992	. 17	274, 349	15
1921 (9 months).....	8, 458, 520	934, 925	. 11		15

*Exports.*—Statistics not available.

*Important changes in classification.*—The words “alkalies” and “alkaloids” have been omitted. Alkalies and alkaloids that are not specifically provided for are covered by the provision for chemical and medicinal compounds and preparations in paragraph 5. A specific provision for chemical elements was inserted in this paragraph in order to include such chemical substances as chlorine, oxygen, argon, and similar chemical elements which do not come within the provision for chemical compounds.

The words “all the foregoing obtained naturally or artificially,” were added so as to make provision for all chemical elements, chemical compounds and salts, and medicinal preparations and mixtures thereof, whether derived from natural sources or manufactured. (Reclassification Report, p. 13.)

*Suggested changes.*—“Chemical” should modify “compounds” and “salts”, and “medicinal” should modify “preparations.” Paragraph 5 might accordingly be changed to read as follows:

All chemical elements, all chemical salts and compounds, all medicinal preparations, and all combinations and mixtures of any of the foregoing, all the foregoing obtained naturally or artificially and not specially provided for [rate].

## PARAGRAPH 6.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 6. Aluminum hydroxide or refined bauxite, one-half of 1 cent per pound; potassium aluminum sulphate or potash alum and ammonium aluminum sulphate or ammonia alum, 1 cent per pound; aluminum sulphate, alum cake or aluminous cake, containing not more than 15 per centum of alumina and more iron than the equivalent of one-tenth of 1 per centum of ferric oxide, three-tenths of 1 cent per pound; containing more than 15 per centum of alumina or not more iron than the equivalent of one-tenth of 1 per centum of ferric oxide, three-eighths of 1 cent per pound; all other aluminum compounds not specially provided for, 25 per centum ad valorem.

## ACT OF 1909.

PAR. 4. Alumina, hydrate of, or refined bauxite, containing not more than sixty-four per centum of alumina, four-tenths of one cent per pound; containing more than sixty-four per centum of alumina, six-tenths of one cent per pound. Alum, alum cake, patent alum, sulphate of alumina, and aluminous cake, containing not more than fifteen per centum of alumina and more than three-tenths of one per centum of iron oxide, one-fourth of one cent per pound; alum, alum cake, patent alum, sulphate of alumina, and aluminous cake, containing more than fifteen per centum of alumina, or not more than three-tenths of one per centum of iron oxide, three-eighths of one cent per pound.

PAR. 3. \* \* \* chemical compounds, mixtures and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*.

## ACT OF 1913.

PAR. 6. Alumina, hydrate of, or refined bauxite; alum, alum cake, patent alum, sulphate of alumina, and aluminous cake, and all other manufactured compounds of alumina, not specially provided for in this section, 15 per centum ad valorem.

## ALUMINUM COMPOUNDS.

(See Survey A-3.)

## ALUMINUM HYDROXIDE OR REFINED BAUXITE.

*Description and uses.*—Hydrate of alumina, or refined bauxite, is the oxide of the metal aluminum chemically combined with water. It is used principally in the preparation of metallic aluminum and other aluminum compounds; also for waterproofing fabrics and to some extent in medicine. It forms a constituent of many color lakes.

*Production.*—The raw material for the manufacture of alumina hydrate is bauxite (dutiable at \$1 per ton, par. 207, H. R. 7456).

Most of the hydrate of alumina used in this country is of domestic manufacture from domestic bauxite. This substance is made on a large scale as an intermediate product in the manufacture of metallic aluminum, and aluminum compounds from bauxite.

*Imports* during the five years immediately preceding the war ranged from about 1,500,000 pounds to 2,000,000 pounds annually, but since 1914 have greatly decreased, amounting to only 202,968 pounds in 1915 and 418 pounds in 1916. No imports are recorded for 1917. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	672	\$1,884	\$2.80	\$283	15
1919.....	2,549	964	.38	145	15
1920.....					

*Exports.*—Statistics not available.

## ALUMS, ALUM CAKE, AND ALUMINUM SULPHATE.

*Description and uses.*—These names refer to various similar articles all of which contain aluminum sulphate as their essential ingredient. The different varieties or grades differ in the other ingredients present and may be classified as follows:

(1) Alums or crystal alums contain less than 15 per cent of oxide of aluminum (usually 10 to 12 per cent), and in addition either potassium sulphate or ammonium sulphate and water of crystallization (about 45 per cent), and not more than a few hundredths of 1 per cent of ferric oxide (iron oxide). They are usually made by dissolving refined hydrate of alumina in sulphuric acid, filtering, adding the potassium or ammonium sulphate and crystallizing the alum. The most important crystal alums are potash alum (potassium aluminum sulphate) and ammonia alum (potassium ammonia sulphate).

(2) Burnt alums, made from crystal alum by the elimination of most of the water. They contain more than 15 per cent of alumina.

(3) Iron-free aluminium sulphate, containing from 16 to 22 per cent of oxide of alumina and not more than a few hundredths of 1 per cent of ferric oxide. This grade is usually made from refined hydrate of alumina, but also directly from bauxite by a secret process for the elimination of the iron always present in the crude mineral.

(4) Aluminum sulphate, containing from 16 to 22 per cent of oxide of alumina and from about 0.2 per cent up to 0.75 per cent of ferric oxide. This grade is made directly from the crude mineral bauxite by solution in dilute sulphuric acid, followed by filtration from insoluble matter and evaporation. If the content of alumina is over 21 per cent, it is called "concentrated alum."

(5) Alum cake, or aluminous cake, contains less than 15 per cent of alumina, but rarely less than 14 per cent, and from about 0.2 per cent up to 0.75 per cent of ferric oxide, together with insoluble or earthy matter up to 10 per cent. It is made by the treatment of crude bauxite, or even clay, with strong sulphuric acid without any evaporation or attempt to eliminate insoluble matter. It is the lowest quality of all.

Alums are used largely in the preparation of sizing material in paper manufacture, as a mordant in dyeing, for the purification of water and sewage on a large scale, for tanning skins, for deodorizing mineral oils, and for hardening plaster casts. They are also used in the manufacture of color lakes, in medicine, and as an ingredient of some baking powders.

*Production.*—In the United States these substances are produced on a large scale from bauxite. Most of that consumed is of domestic manufacture. As many municipal and industrial waterworks produce sulphate for their own consumption a large part of the output does not enter the market. The production of aluminum sulphate and alums in the United States has been as follows:

Year.	Alums.		Aluminum sulphate.	
	Quantity.	Value.	Quantity.	Value.
	<i>Short tons.</i>		<i>Short tons.</i>	
1915.....	24,915	\$699,256	169,153	\$3,224,495
1916.....	27,257	1,177,881	153,860	4,410,741
1917.....	19,714	1,017,083	178,738	5,746,427
1918.....	20,286	1,051,419	209,079	6,473,086
1919.....	17,019	879,198	200,034	6,763,06.
1920.....	16,824	999,259	234,003	\$,228,712

*Imports* have not been large and there has been a decrease since 1915. In 1914, 152,808 pounds of lump alum were imported, 92 per cent of which came from England. Imports of sulphate of alumina have averaged less than 1 per cent of the domestic production.

Imports of alums, aluminum sulphate, and other manufactured compounds of aluminum since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	465,996	\$14,751	\$0.03	\$2,213	15
1919.....	686,579	21,877	.03	3,282	15
1920.....	2,678,846	68,035	.02	10,205	15
1921 (9 months).....	1,280,329	33,285	.03	.....	15

*Exports.*—None recorded.

*Important changes in classification.*—The two important true alums—potassium aluminum sulphate or potash alum, and ammonium aluminum sulphate or ammonia alum—have been mentioned specifically because of their commercial importance and because they sell for nearly twice as much as aluminum sulphate (with which they are classified in previous acts) even when the latter was free.

The term "aluminum sulphate" has been substituted for "sulphate of alumina," and "patent alum" (paragraph 6, act of 1913), now obsolete, has been omitted. The word "alum" has also been omitted because the principal true alums have been mentioned specifically.

The act of 1913 (par. 6) made no distinction between the various grades of aluminum sulphate; the act of 1909 divided them into two classes according to their content of iron oxide and alumina. A classification similar to that of 1909 was adopted in H. R. 7456, except that the limiting iron oxide content was reduced from three-tenths of 1 per cent to one-tenth of 1 per cent to accord with commercial grades. The phraseology "oxide of iron" was changed to "ferric oxide" to give a more precise chemical meaning. (Reclassification Report, p. 14.)

#### OTHER ALUMINUM COMPOUNDS.

*Description and uses.*—Other aluminum compounds of commercial importance are the acetate, known as "red liquor," used as a mordant in calico dyeing and printing and in waterproofing and fireproofing fabrics; and aluminum chloride, used for refining mineral oils, for carbonizing wool, and in the manufacture of certain organic compounds.

*Production.*—In 1914 three plants were reported to be manufacturing aluminum chloride with a total output for the year of 4,702 short tons, valued at \$311,900, in 1919 an output of 4,806 short tons valued at \$371,850, and in 1920, 3,571 tons valued at \$297,550.

*Imports* included under alums, etc., *supra*.

*Exports.*—None recorded.

*Suggested changes.*—It is suggested that the phrase "all other aluminum compounds" in paragraph 6 be changed to "all other aluminum salts and compounds," since the tariff acts have long distinguished "salts" and "compounds."

## PARAGRAPH 7.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 7. Ammonium carbonate,  $1\frac{1}{2}$  cents per pound; ammonium chloride,  $1\frac{1}{4}$  cents per pound; ammonium nitrate, ammonium perchlorate, and ammonium phosphate, 25 per centum ad valorem; ammonium sulphate, three-fifths of 1 cent per pound; liquid anhydrous ammonia,  $2\frac{1}{2}$  cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 5. Ammonia, carbonate of, one and one-half cents per pound; muriate of, or sal ammoniac, three-fourths of one cent per pound; liquid anhydrous, five cents per pound.

PAR. 3. \* \* \* chemical \* \* \* salts, \* \* \* twenty-five per centum ad valorem; \* \* \*.

PAR. 490. Ammonia, sulphate of [Free].

PAR. 7. Ammonia, carbonate of, and muriate of,  $\frac{3}{4}$  of 1 cent per pound; phosphate of, 1 cent per pound; liquid anhydrous,  $2\frac{1}{2}$  cents per pound; \* \* \*.

PAR. 395. Ammonia, sulphate of, perchlorate of, and nitrate of [Free].

## AMMONIUM COMPOUNDS.

(See Survey A-3.)

## GENERAL.

The largest use of ammonia in normal times is in the form of ammonium sulphate for fertilizer purposes. Liquid anhydrous ammonia is extensively used for refrigeration, ammonium nitrate and ammonium picrate as explosives, aqua ammonia for household cleaning, and other ammonium compounds chiefly for chemical purposes.

During the war ammonia was used in large amounts in Germany for the manufacture of nitric acid, which, in turn, was used for making explosives. A beginning was made in the development of this industry in the United States during the war, but only a small fraction of the nitric acid consumed in the United States was made in this way.

Commercial supplies of ammonia came from three sources: (a) From coal as a by-product in the manufacture of coke and coal gas; (b) from calcium cyanamide (made by heating calcium carbide in an electric furnace in the presence of atmospheric nitrogen), which is converted into ammonia under the action of steam; (c) by direct combination of nitrogen and hydrogen (Haber process).

Before the war commercial supplies of ammonia in the United States were obtained entirely from coal, but during the war plants to operate both the cyanamid process and the direct synthetic process were built by the Government near Muscle Shoals, Ala. The cyanamid plant (designed to produce 41,500 tons of fixed nitrogen annually) was in successful operation, in part, at the signing of the armistice, but the synthetic plant (built to produce 8,500 tons of fixed nitrogen) had not been completed and put in to successful operation when the war came to an end. These plants have been idle since the signing of the armistice, but have not been scrapped or sold by the Government.

The Haber process, which has been very successful, was developed to a large extent in Germany. One of the two plants in Germany, located at Oppau, was destroyed by an explosion during 1921.

The first production of fixed nitrogen by a commercial firm was announced in August, 1921, by the Atmospheric Nitrogen Corporation (a subsidiary of the Allied Dye and Chemical Corporation), at Solvay, N. Y. The output of the first unit of this plant is 20,000 pounds of ammonia per day, or about 2,500 tons of fixed nitrogen annually.

## AMMONIUM CARBONATE.

*Description and uses.*—Commercial ammonium carbonate, a mixture of ammonium carbonate and ammonium carbamate containing about 31 per cent of ammonia ( $\text{NH}_3$ ), is a white crystalline salt smelling strongly of ammonia, volatile when heated, and sometimes known as sal volatile. It is used in wool scouring, in some baking powders, smelling salts, and certain domestic cleaning powders.

*Production.*—It is made by heating a mixture of ammonium sulphate and chalk (calcium carbonate). The vapors of ammonia, carbon dioxide, and water, on cooling, condense to form the solid mixture of ammonium carbonate and ammonium carbamate. The crude product is usually purified by sublimation. The domestic output is unknown.

*Imports* prior to 1915 averaged about 370,000 pounds per annum, doubling in 1915. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	6,802	\$6,802	\$1.00	\$51	0.75
1919.....	147,952	17,264	.12	1,110	6.43
1920.....	298,126	35,467	.12	2,236	6.30
1921 (9 months).....	327,792	20,549	.06		

*Exports.*—Statistics not available.

*Important changes in classification.*—Ammonium sulphate is exempt from duty under paragraph 395 of the act of 1913.

## AMMONIUM CHLORIDE.

*Description and uses.*—Ammonium chloride or muriate of ammonia is a combination of ammonia and hydrochloric acid. It is also called sal ammoniac. The crude material is usually more or less dark in color, owing to tarry impurities. Ammonium chloride comes in cakes (sal ammoniac), white and translucent, or in crystals (muriate of ammonia). It is used in pharmacy, in soldering, galvanizing iron, tinning, dyeing of textiles, and in electric dry batteries.

*Production* in 1914 was 11,511,934 pounds, valued at \$641,040, supplying less than 60 per cent of domestic consumption. The output in 1919 (preliminary figures) was 12,120,000 pounds valued at \$1,426,100. Ammonium chloride can be made by treating aqua ammonia with hydrochloric acid, by distilling ammoniacal liquor and

absorbing the ammonia gas in hydrochloric acid or by crystallization from a saturated solution of sulphate of ammonia and ordinary salt (sodium chloride).

*Imports* from 1910 until 1915 were between 9,000,000 and 14,000,000 pounds. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	218,404	\$19,618	\$0.09	\$1,638	8.35
1919.....	2,011,028	245,738	.12	15,083	6.14
1920.....	6,699,359	698,320	.10	50,245	7.20
1921 (9 months).....	3,444,146	237,936	.07		

Imports in postwar years have been chiefly from England and Germany.

*Exports.*—Statistics are not available.

#### AMMONIUM NITRATE.

*Description and uses.*—Ammonium nitrate is a white crystalline salt. When heated it decomposes into water and nitrous oxide ("laughing gas"), widely used as an anæsthetic during the war. Its largest application is in explosive mixtures, 90 per cent of which may be ammonium nitrate.

*Production* greatly increased during the war to supply the demand for explosives.

*Imports* in 1915 were 3,666,880 pounds, valued at \$193,907. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	77,101	\$4,813	\$0.06
1919.....	509,208	34,630	.07
1920.....	28,476,593	2,141,580	.07
1921 (9 months).....	30,724,090	1,987,490	.06

*Exports.*—Statistics not available.

*Important changes in classification.*—Ammonium nitrate is exempt from duty under paragraph 395 of the act of 1913.

#### AMMONIUM PERCHLORATE.

*Uses.*—Ammonium perchlorate has been used technically as an oxidizing agent and in the manufacture of explosive mixtures.

*Imports* in 1914 and 1915 were about 70,000 pounds, valued at about \$6,300. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	625	\$155	\$0.25
1919.....	118,316	16,236	.14
1920.....	3,458,544	349,934	.10
1921 (9 months).....	3,580,714	325,678	.09

*Exports.*—Statistics not available.

*Important changes in classification.*—Ammonium perchlorate is exempt from duty under paragraph 395 of the act of 1913.

#### AMMONIUM PHOSPHATE.

*Description and uses.*—There are two important ammonium phosphates, the monammonium phosphate and the diammonium phosphate. These are of little commercial importance compared with the other ammonium compounds, but are used in the manufacture of fireproof cloth and paper and for medicinal purposes. The sodium salt of acid ammonium phosphate has important analytical uses. There is a fertilizer known as Ammo-Phos sold in two grades; one grade contains 13 per cent ammonia and 47 per cent “available phosphoric acid,” the other contains 20 per cent ammonia and 20 per cent “available phosphoric acid.” This article is undoubtedly crude ammonium phosphates.

*Production* in this country is from calcium acid phosphate and ammonia, but the output is not known.

*Imports* decreased from a maximum of 68,039 pounds in 1911 to about 7,000 pounds in 1913, increasing sharply to 205,742 pounds in 1914. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1920 <sup>1</sup> .....	12,917	\$1,509	\$0.12	\$129	8.56
1921 (9 months).....	1,976	418	.21	.....	.....

<sup>1</sup> No imports in calendar years 1918 and 1919.

*Exports.*—Statistics not available.

#### AMMONIUM SULPHATE.

*Description and uses.*—Ammonium sulphate or ammonia gas combined with sulphuric acid forms the larger part of the world's trade in ammonia. Commercial transactions are based on a standard content of 25 per cent of ammonia (NH<sub>3</sub>). The largest use in normal times is in the manufacture of fertilizers. Such application was greatly curtailed during the war on account of the need to convert ammonia into ammonium nitrate for explosive purposes. It is also used in the preparation of other ammonium salts.

*Production* of ammonia (expressed as sulphate of ammonia) increased from 191,000 short tons in 1913 to 378,000 tons in 1918. Preliminary figures for 1920 indicate an output approaching 500,000 tons. About 90 per cent of the output in this country is obtained as a by-product in the manufacture of coke. In England the principal source is from illuminating gas works using the coal-gas process. Other countries obtained supplies from both sources in fairly equal quantities. Germany, since 1910, has been the largest producer; from 1910 to 1913 her exports were from 40,000 to 70,000 tons in ex-

cess of imports. England, prior to the war, ranked second, and exported about three-fourths of her output, thus leading as an exporter. The United States, prior to the war, ranked third in production, with France fourth, but the increase in the United States during and since the war gives this country an output nearly equal to that obtained in Germany from by-product sources. Germany, however, has developed large synthetic ammonia plants with a capacity of about double the by-product output.

*Imports* reached a maximum of 103,251 short tons in 1911, then decreased steadily to 3,983 tons in the fiscal year of 1918. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Tons.</i>		
1918 .....	2,993	\$425,881	\$142.29
1919 .....	2,354	313,873	133.34
1920 .....	1,993	247,495	124.18
1921 (9 months).....	3,089	180,965	58.58

*Exports* are not shown prior to 1920, in which year (calendar) they were 66,714 short tons, valued at \$7,433,350, and for nine months of 1921, 67,422 tons, valued at \$4,119,858. They have been chiefly to Dutch East Indies, Cuba, and Spain. The 1920 export was about 13 per cent of the domestic output.

#### LIQUID ANHYDROUS AMMONIA.

*Description and uses.*—The term ammonia refers to a colorless gas composed of one part of nitrogen and three parts of hydrogen by volume. It is a weak alkali and has a strong, pungent, penetrating odor. Under pressure it becomes a liquid, which is then stored and shipped in steel cylinders, commonly containing about 100 pounds of ammonia. Liquid ammonia expands and vaporizes when the pressure is removed, and absorbs a large amount of heat, which gives anhydrous ammonia its wide use for refrigeration and ice making.

*Production* in 1914 was 16,659,789 pounds, valued at \$3,140,848, and increased greatly, to 54,700,000 pounds, valued at \$10,861,600, in 1919 (preliminary figures).

*Imports* are negligible, the largest being 26,506 pounds, valued at \$10,404 in 1920 (calendar year).

*Exports.*—Statistics not available.

### PARAGRAPH 8.

H. R. 7456.

SENATE AMENDMENTS.

Par. 8. Antimony: Oxide, 2 cents per pound; tartar-emetic or potassium-antimony tartrate, 5 cents per pound; sulphides and other antimony compounds, not specially provided for, 25 per centum ad valorem.

## ACT OF 1909.

PAR. 173. \* \* \* antimony, oxide of, one and one-half cents per pound and twenty-five per centum ad valorem.

PAR. 3. \* \* \* chemical compounds, \* \* \* and salts, \* \* \* twenty-five per centum ad valorem; \* \* \*.

## ACT OF 1913.

PAR. 144. \* \* \* antimony oxide, salts, and compounds of, 25 per centum ad valorem.<sup>2</sup>

PAR. 5. \* \* \* chemical \* \* \* compounds, \* \* \* 15 per centum ad valorem. [G. A. 7899, T. D. 36364 of 1916; *United States v. Innis*, 7 Ct. Cust. Appls. 3, of 1916.]

## ANTIMONY COMPOUNDS.

(See Survey C-17.)

*Description and uses.*—Antimony oxide is composed of metallic antimony and oxygen. The most important commercial oxide is antimony trioxide. Because of the scarcity and high price of tin oxide during the war antimony tetraoxide was used as a substitute pigment in the manufacture of ceramic enamels. It is not so satisfactory as tin oxide for pure white enamels, as it tends to produce a yellow or cream color. Antimony trioxide serves in the manufacture of tartar emetic and as a coloring agent in glass manufacture. Potassium antimony tartrate (tartar emetic) is used as a mordant in dyeing vegetable fibers and is the only official antimony compound in the United States Pharmacopœia. Antimony sulphide, a chemical combination of antimony and sulphur, occurs naturally as the mineral stibnite, which is the most important source of antimony. Natural sulphide obtained by the liquation of the mineral is not suitable for pigment purposes, and therefore artificial antimony sulphide is usually prepared. It is used chiefly as a pigment in the manufacture of red-rubber goods and to a lesser extent in the manufacture of matches, percussion caps, and in pyrotechnics. As it produces a dense white smoke, it was utilized during the war in "range-finding" shells.

*Production.*—Antimony compounds are manufactured from metallic antimony obtained from the ore (free under par. 1509), which is imported chiefly from China. Antimony oxide is prepared by burning metallic antimony in air or oxidizing it by means of nitric acid; antimony trisulphide by precipitating a solution of antimony chloride with hydrogen sulphide; antimony pentasulphide from the trisulphide by boiling with an alkali in sulphur; and tartar emetic by treating antimony trioxide with cream of tartar (potassium acid tartrate). The output of antimony salts in 1919 (preliminary figures) was 4,045,600 pounds, valued at \$1,190,000.

*Imports* in 1914 were: Antimony oxide, 386,558 pounds, valued at \$20,476; antimony sulphide, 321,379 pounds, valued at \$54,191; and tartar emetic, 55,744 pounds, valued at \$6,336. Imports of "antimony oxide, salts, and compounds of," decreased steadily to about 37,000 pounds in 1918. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	36,910	\$11,904	\$0.32	\$2,976	25
1919.....	252,785	9,501	.04	2,375	25
1920.....	595,474	25,260	.04	6,315	25
1921 (9 months).....	301,190	14,134	.05	.....	25

<sup>2</sup> Salts and compounds of antimony oxide are not articles of commerce.

*Exports.*—Statistics not available.

*Important changes in classification.*—Tartar emetic, chemically potassium-antimony tartrate, is an important compound used chiefly for its antimony content as a mordant in dyeing fibers. The Tariff Commission suggested that it be mentioned specifically, and also that the provision for antimony compounds in paragraph 144 of the act of 1913 be transferred from Schedule C to Schedule 1 and assigned a separate paragraph.

The provision for "antimony oxide, salts, and compounds of" the Court of Customs Appeals has held (*United States v. Innis*, 7 Ct. Cust. Appls., 3, of 1916) is not to be read as if there were a "comma" after the word "antimony" and antimony sulphide was declared not classable as a salt or compound of antimony oxide under this paragraph, but dutiable as a chemical compound or salt under paragraph 5. The legislative history shows that when the tariff bill of 1913 was passed by the House of Representatives there was a comma after the word "antimony" and none after the word "oxide"; that the comma after the word "antimony" was stricken out in the Senate; and that a comma was inserted by the conference committee after the word "oxide," thereby making the law read "antimony oxide, salts, and compounds of." (G. A. 7688, T. D. 35142, of 1915.) Antimony oxide has also been held not within this paragraph. (G. A. 7899, T. D. 36364, of 1916.) To remedy this situation it was suggested that antimony oxide and antimony sulphide be mentioned specifically with all other antimony compounds and be included in this paragraph by a general provision. (See Reclassification Report, pp. 15-17.)

*Suggested changes.*—It is suggested that the phrase "antimony compounds" be changed to read "antimony salts and compounds," as salts and compounds have long been distinguished in tariff acts. The hyphen between "tartar" and "emetic" should be omitted.

## PARAGRAPH 9.

### H. R. 7456.

### SENATE AMENDMENTS.

PAR. 9. Argols, tartar, and wine lees, crude or partly refined, containing not more than 90 per centum of potassium bitartrate, 5 per centum ad valorem; containing more than 90 per centum of potassium bitartrate, cream of tartar, Rochelle salts or potassium-sodium tartrate, 5 cents per pound; calcium tartrate, crude, 5 per centum ad valorem.

### ACT OF 1909.

### ACT OF 1913.

PAR. 6. Argols or crude tartar or wine lees crude, five per centum ad valorem; tartars and lees crystals, or partly refined argols, containing not more than ninety per centum of bitartrate of potash, and tartrate of soda or potassa, or Rochelle salts,

PAR. 8. Argols or crude tartar or wine lees crude or partly refined, containing not more than 90 per centum of potassium bitartrate, 5 per centum ad valorem; containing more than 90 per centum of potassium bitartrate, cream of tartar, and Rochelle salts or

three cents per pound; containing more than ninety per centum of bitartrate of potash, four cents per pound; cream of tartar and patent tartar, five cents per pound.

PAR. 3. \* \* \* chemical compounds, \* \* \* and salts, \* \* \* twenty-five per centum ad valorem; \* \* \*.

tartrate of soda and potassa, 2½ cents per pound; calcium tartrate crude, 5 per centum ad valorem.

#### TARTRATE MATERIALS, CRUDE AND REFINED.

(See Survey A-1; also tartaric acid, p. 16.)

*Description and uses.*—Argols or crude tartar is a crystalline deposit which forms on the sides of wine casks during fermentation and contain about 50 to 85 per cent of acid potassium tartrate and 6 to 12 per cent of calcium tartrate. Wine lees are a similar deposit on the bottom of the casks and contain from 20 to 35 per cent of potassium acid tartrate and up to 20 per cent of calcium tartrate. Argols and wine lees (together with crude calcium tartrate referred to below) are the raw materials from which tartaric acid and all salts of tartaric acid, including cream of tartar, Rochelle salts, and tartar emetic, are prepared.

Cream of tartar is refined potassium bitartrate. The better grades contain more than 99.5 per cent of potassium bitartrate and less than five parts per million of lead or other heavy metals. It is used principally as an ingredient in one variety of baking powder; in the dyeing and printing of textiles; in medicines and in food products, especially jellies, preserves, and beverages; in photographic developing and printing; in the deposition of silver on glass for mirrors and ornaments; and as a laboratory reagent.

Rochelle salts or potassium-sodium tartrate is made from cream of tartar and soda ash, and is used in medicine, photography, and in chemical laboratories.

Crude calcium tartrate is also a by-product of the wine industry and a raw material for the manufacture of tartaric acid.

*Production.*—Small quantities have been produced in the past by the wine industry and relatively insignificant amounts are now obtained from unfermented grape juice. Domestic production has probably never exceeded 1 per cent of the world's supply, and probably will be still further reduced as a result of the constitutional amendment prohibiting the manufacture and sale of intoxicating beverages. Although no reliable statistics of production are available, Italy and France are undoubtedly the chief sources of the raw materials of the tartar industry and together produce more than three-fifths of the world's supply. Spain, Portugal, and French Africa are also important producers. Austria-Hungary and Germany are minor sources of supply. In recent years Argentina has produced argols.

*Imports* of argols and wine lees containing not more than 90 per cent of potassium bitartrate for the fiscal years 1910-1918, inclusive, have averaged 28,670,615 pounds, valued at \$3,416,326, and yielded an average revenue of \$170,815; while those containing more than

90 per cent of potassium bitartrate were negligible. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
CONTAINING NOT MORE THAN 90 PER CENT POTASSIUM BITARTRATE.					
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	28,041,454	\$4,777,789	\$0.17	\$238,889	5
1919.....	25,758,868	4,296,837	.17	214,842	5
1920.....	35,347,074	4,414,470	.12	220,724	5
1921 (9 months).....	11,388,890	898,864	.08	.....	5
CONTAINING MORE THAN 90 PER CENT POTASSIUM BITARTRATE.					
1918.....	39,236	\$4,478	\$0.11	\$981	21.90
1919.....	50,462	14,773	.29	1,262	8.54
1920.....	105,381	37,958	.36	2,635	6.94
1921 (9 months).....	33,458	5,595	.17	.....	.....

Imports of crude calcium tartrate for 1914-1918 (fiscal years), inclusive, have averaged 693,150 pounds, valued at \$75,435; and have yielded an average revenue of \$3,771. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	78,383	\$14,584	\$0.19	\$729	5
1919.....	.....	.....	.....	.....	.....
1920.....	267,270	28,048	.10	1,402	5
1921 (9 months).....	168,189	8,509	.05	.....	5

Imports of cream of tartar during 1913 were 66,718 pounds, valued at \$11,798, and yielded a revenue of \$3,335. From October 4, 1913, to June 30, 1914, they were 812,421 pounds, valued at \$156,886, and yielded a revenue of \$20,310. Imports since 1914 have declined to 68,586 pounds in 1918, valued at \$16,067. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	13,597	\$3,355	\$0.25	\$340	10.13
1919.....	23,652	10,879	.46	591	5.44
1920.....	218,887	83,903	.38	5,472	6.52
1921 (9 months).....	830,950	207,862	.25	.....	.....

Imports of Rochelle salts have been variable, reaching a maximum in 1915 of 253,609 pounds, valued at \$19,244, yielding a revenue of \$6,340. In 1916 imports declined to 187 pounds. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	15,480	\$4,948	\$0.32	\$387	7.82
1919.....	29,142	9,537	.33	729	7.64
1920.....	117,377	29,013	.25	2,934	10.11
1921 (9 months).....	279,205	47,097	.17	.....	.....

*Exports.*—Statistics not available.

*Important changes in classification.*—Rochelle salts are chemically potassium sodium tartrate. "Potassa," used in the act of 1913 is obsolete both for commercial and scientific use. (Reclassification Report, p. 17.)

*Suggested changes.*—Page 4, line 16, of H. R. 7456: Insert the words "5 cents per pound" followed by a semicolon before the words "cream of tartar" and after the comma following "bitartrate."

## PARAGRAPH 10.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 10. Balsams: Copaiba, fir or Canada, Peru, tolu, styrax, and all other balsams, all the foregoing which are natural and uncompounded, 10 per centum ad valorem: *Provided*, That no article containing alcohol shall be classified for duty under this paragraph.

ACT OF 1909.

ACT OF 1913.

PAR. 20. Drugs, such as \* \* \* balsams, \* \* \* which are natural and uncompounded drugs and not edible, and not specially provided for in this section, but which are advanced in value or condition by any process or treatment whatever beyond that essential to the proper packing of the drugs and the prevention of decay or deterioration pending manufacture, one-fourth of one cent per pound, and in addition thereto ten per centum ad valorem: *Provided*, That no article containing alcohol, or in the preparation of which alcohol is used, shall be classified for duty under this paragraph.

PAR. 684. Storax, or styrax [Free].

PAR. 559. Drugs, such as \* \* \* balsams, \* \* \* any of the foregoing which are natural and uncompounded drugs and not edible and not specially provided for in this section, and are in a crude state, not advanced in value or condition by any process or treatment whatever beyond that essential to the proper packing of the drugs and the prevention of decay or deterioration pending manufacture: *Provided*, That no article containing alcohol, or in the preparation of which alcohol is used, shall be admitted free of duty under this paragraph [Free].

PAR. 9. Balsams: Copaiba, fir or Canada, Peru, tolu, and all other balsams, which are natural and uncompounded and not suitable for the manufacture of perfumery and cosmetics, if in a crude state, not advanced in value or condition by any process or treatment whatever beyond that essential to the proper packing of the balsams and the prevention of decay or deterioration pending manufacture, all the foregoing not specially provided for in this section, 10 per centum ad valorem; if advanced in value or condition by any process or treatment whatever beyond that essential to the proper packing of the balsams and the prevention of decay or deterioration pending manufacture, all the foregoing not specially provided for in this section, 15 per centum ad valorem: *Provided*, That no article containing alcohol shall be classified for duty under this paragraph.

### BALSAMS.

(See Survey A-3.)

*General.*—The term "balsam" as used in commerce has no exact chemical significance, although chemical authorities have endeavored to limit it to resins and oleoresins containing free or combined cin-

namic or benzoic acids. Resins and oleoresins, including those commercially and technically classed as balsams, are exudations of plants, sometimes occurring naturally in cavities in the plant, or obtained by wounding the plant. The balsams are used for medicinal purposes, in perfumery and cosmetics, and occasionally for technical purposes, such as the manufacture of varnishes.

#### COPAIBA BALSAM.

*Description and uses.*—Copaiba balsam is a liquid oleoresin and not a true balsam, chemically speaking. Its principal uses are in medicine and in the manufacture of varnish, lacs, and tracing paper.

*Production.*—Brazil and to a less extent Venezuela, Colombia, and Guiana, produce copaiba balsam in commercial quantities. It is obtained by the natives from wild trees.

*Imports* are given for both crude and advanced copaiba balsam but for the latter are quite insignificant. Imports of crude copaiba balsam averaged 199,919 pounds, valued at \$62,724, in 1909–1913. In 1914–1918 (fiscal years), the annual average was 281,084 pounds, valued at \$105,819, the average revenue since 1913 being \$10,170. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918 .....	348,680	\$183,937	\$0.53	\$18,394	10
1919 .....	342,185	126,796	.37	12,680	10
1920 .....	434,515	160,628	.37	16,063	10
1921 (9 months).....	160,602	28,766	.13	.....	10

Imports of all balsams are chiefly from Brazil, Colombia, Venezuela, and England.

*Exports.*—Statistics not available.

#### FIR OR CANADA BALSAM.

*Description and uses.*—This is also an oleoresin rather than a true balsam. It is chiefly used in microscopy and to some extent in medicinal preparations such as plasters.

*Production.*—The tree yielding Canada balsam occurs through Canada and northeastern United States along the Appalachian Range, and is chiefly valued as a source of cheap lumber and paper pulp. The balsam is principally collected for commerce by the Indians of Quebec and is not sufficiently remunerative to attract higher classes of labor, although some is collected by Indians in Maine. Production in the United States is much less than in Canada. No statistics are available.

*Imports* are small and variable, consisting chiefly of crude balsams. For 1909–1918 average annual imports of 9,200 pounds, valued at \$5,788, are reported, the revenue for 1914–1918 averaging \$726. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	2,902	\$2,475	\$0.85	\$248	10
1919.....	2,602	3,235	1.24	324	10
1920.....	1,693	2,914	1.72	291	10
1921 (9 months).....	1,084	1,337	1.23	.....	10

*Exports.*—Statistics not available.

## PERU BALSAM.

*Description and uses.*—This is a true balsam used in medicines and perfumery and to some extent as a cheap substitute for vanilla.

*Production.*—Peru balsam comes wholly from the Republic of Salvador. The United States is said to take normally about half of the annual production, the other half going chiefly to Germany, where an artificial "Peru balsam" is also produced.

*Imports* for the fiscal years 1909–1914 averaged 39,332 pounds of crude balsam, valued at \$46,065. Imports for 1915–1918 averaged 42,794 pounds, valued at \$108,849. For the years 1915–1918 Peru balsam yielded an annual revenue of \$10,885. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	64,742	\$167,711	\$2.59	\$16,771	10
1919.....	51,812	131,494	2.54	13,149	10
1920.....	53,642	174,276	3.25	17,428	10
1921 (9 months).....	43,582	59,676	1.35	.....	10

*Exports.*—Statistics are not available.

## TOLU BALSAM.

*Description and uses.*—Tolu is a true balsam, used in medicine, pharmacy, perfumery, cosmetics, and chewing gum. It comes from a forest tree of South America, and is collected chiefly in Colombia and to a less extent in Venezuela and Peru.

*Imports* for 1909–1913 averaged 39,333 pounds, valued at \$10,581, chiefly from Colombia. For 1915–1918 the average was 54,004 pounds, valued at \$18,369, the revenue averaging \$1,469. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	61,011	\$42,620	\$0.70	\$4,262	10
1919.....	69,920	69,688	1.00	6,969	10
1920.....	54,051	57,537	1.06	5,754	10
1921 (9 months).....	33,531	22,082	.66	.....	10

*Exports.*—Statistics not available.

## STYRAX AND OTHER BALSAMS.

*Description and uses.*—Styrax is a true balsam. Its principal use is for flavoring tobacco. It is also used in medicine, perfumery, and cosmetics. Other balsams are included under this paragraph without specific mention, but appear to be without individual importance.

*Production.*—Styrax is obtained from Asia Minor; it is valued in oriental medicines, and chiefly consumed in India and China. A product resembling styrax and yielded by the sweet gum tree occurs in the United States, but does not give a profitable yield. Tropical America produces larger amounts of balsam, which have appeared on the American market.

*Imports* of styrax for 1909–1916 averaged 18,634 pounds, valued at \$2,932. In 1917–18 they averaged 12,840 pounds, valued at \$24,583. In 1914–1918 the average revenue was \$1,132. Importations of other balsams averaged 44,085 pounds, valued at \$17,041, in 1909–1918 (fiscal years). Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
----------------	-----------	--------	-------------	-------	------------------

## STYRAX BALSAM.

	Pounds.				Per cent.
1918.....	2,526	\$10,110	\$4.00	\$1,011	10
1920.....	8,494	7,493	.88	749	10
1921 (9 months).....	5,661	3,702	.65	.....	10

## ALL OTHER BALSAMS.

1918.....	61,391	\$95,429	\$1.55	\$9,543	10
1919.....	12,706	8,364	.66	836	10
1920.....	37,148	31,854	.86	3,185	10
1921 (9 months).....	5,210	6,181	1.19	.....	10

*Exports.*—Statistics not available.

*Important changes in classification.*—Styrax is the most important balsam included in the act of 1913 within the provision for "all other balsams." As imports since 1909 have averaged about 15,000 pounds, this balsam is mentioned specifically in H. R. 7456.

The phrase "not suitable for the manufacture of perfumery and cosmetics," as applied to balsams (par. 9, act of 1913), was omitted, since any balsam of salable quality can be used for making perfumes and cosmetics.

As practically all balsams are imported in a crude state, the provision in the act of 1913 which reads, "if advanced in value or condition by any process," etc., is practically inoperative. All balsams are crude articles within the meaning of paragraph 9 of the act of 1913, as when advanced beyond this condition they lose their identity as balsams.

The Tariff Commission suggested in its Reclassification Report, pages 17–18, that both of these phrases be omitted.

## PARAGRAPH 11.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 11. Barium carbonate, precipitated, 1 cent per pound; barium chloride, 1½ cents per pound; barium dioxide, 4 cents per pound; and barium nitrate, 2 cents per pound.

ACT OF 1909.

PAR. 3. \* \* \* chemical compounds, \* \* \* and salts, \* \* \* twenty-five per centum ad valorem; \* \* \*.

ACT OF 1913.

PAR. 10. Barium, chloride of, ¼ cent per pound; dioxide of, 1½ cents per pound; carbonate of, precipitated, 15 per centum ad valorem.

PAR. 5. \* \* \* chemical \* \* \* compounds, \* \* \* and salts, \* \* \* 15 per centum ad valorem.

## BARIUM COMPOUNDS.

(See Survey A-4.)

*General.*—The barium chemicals mentioned and others not mentioned are made chiefly from barytes dutiable under paragraph 64. Witherite, on the free list, is imported and can be used as the raw material for barium chemicals. Until 1915 about 35 per cent of the domestic consumption of crude barytes was imported for the manufacture of lithopone and as the raw material for a very limited quantity of barium chemicals. The domestic production, chiefly from Missouri, supplied the market for ground and floated barytes.

During the war the production of barytes more than quadrupled, owing to lack of imports from Germany, the consequent establishment of a barium chemical industry in the United States, and the increase in the demand for barytes in the lithopone and rubber industries. The greatest State output shifted from Missouri to Georgia in 1916.

Germany and England are large producers of barytes and barium chemicals and will be the chief competitors of the domestic industry.

## BARIUM CARBONATE, PRECIPITATED.

*Description and uses.*—Barium carbonate exists in nature as the mineral witherite. (See par. 1681, p. 1467.) Precipitated barium carbonate is a white powder practically insoluble in water. It is used chiefly in the ceramic industry in making face brick to prevent a white efflorescence, for optical glass and some kinds of enameled ironware, in the preparation of other barium chemicals, in flat wall paints, and as a rat poison.

*Production.*—Practically the entire supply was imported from Germany before the war. With the establishment here of a barium chemicals industry the production increased from 2,746 short tons in 1915 to 8,238 tons in 1917; it then decreased slightly to 7,135 tons in 1919 and 7,484 tons in 1920.

Barium carbonate is produced by passing carbon dioxide over heated barium sulphide or by treating a solution of barium sulphide or barium chloride with soda ash. The precipitated barium carbonate is then filtered, washed, and dried.

An investigation by the Tariff Commission<sup>3</sup> showed that to the three firms from which data were obtained the average cost in 1919 of making barium carbonate was \$0.0316 per pound.

*Imports*, first shown in 1912, were 950,000 pounds, increasing to nearly 5,000,000 pounds in 1914, but fell to 106,288 pounds in 1918. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....					
1919.....	8,549	\$2,666	\$0.31	\$400	15
1920.....	951,501	37,462	.04	5,619	15
1921 (9 months).....	1,973,352	38,083	.02		15

*Exports.*—Statistics not available.

#### BARIUM CHLORIDE.

*Description and uses.*—Barium chloride is a white crystalline substance, containing about 15 per cent of water of crystallization. It is used principally for preparing other barium chemicals, chiefly precipitated barium sulphate, and as a mordant in manufacturing color lakes. It is also employed in the purification of salt, as a water softener, as an analytical reagent in sulphur determinations, and to some extent in the ceramics industry.

*Production.*—Barium chloride is prepared by treating barium carbonate (witherite) with hydrochloric acid or by heating barium sulphide with calcium chloride. Prior to the war barium chloride was practically all imported from Germany, but after a domestic industry was established, the production increased from 2,106 short tons in 1915 to 4,870 short tons in 1917. About 4,500 short tons were made in 1918 and in 1919, but in 1920 the output declined to 3,084 tons.

The cost of production of barium chloride in the United States in 1919, as determined by the Tariff Commission, was \$0.0539 per pound (average of four firms).

*Imports* prior to 1914 were practically constant at about 2,800,000 pounds per year, increasing sharply to about 6,000,000 pounds in 1914. There were about 5,000,000 pounds in 1915. There were no imports in 1918. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1919.....	1,099,686	\$19,846	\$0.02	\$2,749	13.85
1920.....	3,190,255	151,778	.05	7,976	5.25
1921 (9 months).....	2,798,700	147,930	.05		

*Exports.*—Statistics not available.

<sup>3</sup> For further detail see "Barytes, barium chemicals, and lithopone" (Survey A-4), pp. 75-79.

## BARIUM DIOXIDE.

*Description and uses.*—Barium dioxide, barium peroxide, or barium binoxide is a compound of barium and oxygen. When pure it is a white powder insoluble in water. The crude product is usually green in color. It is used chiefly in the production of hydrogen peroxide, but also as a bleaching agent and as a source of oxygen. It was used during the war in tracer bullets.

*Production.*—Barium dioxide is made by heating barium nitrate or barium carbonate, first in a closed vessel and then in a current of air. Prior to the war Germany supplied our barium dioxide, but when imports from that country ceased, a domestic barium chemicals industry was established, the production of which reached a maximum of 2,555 short tons in 1917 and then declined to 858 tons in 1919.

The cost of production of barium dioxide in 1919, as determined by investigation of the Tariff Commission, was \$0.197 per pound (average of 3 firms).

*Imports* prior to the war were about 3,700,000 pounds per year, increasing in 1914 to about 6,000,000 pounds. Imports ceased by 1917-18. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1920 <sup>1</sup> .....	501,673	\$34,447	\$0.13	\$7,525	11.68
1921 (9 months).....	904,713	91,192	.10	.....	.....

<sup>1</sup> No imports in 1918 and 1919.

*Exports.*—Statistics not available.

## BARIUM NITRATE.

*Description and uses.*—Barium nitrate is made by treating barium chloride with sodium nitrate or Chile saltpeter. It is an important barium chemical used in explosive mixtures and for making other barium products, fireworks, detonators, and railroad signals.

*Production* was 971 short tons in 1915, followed by a steady decline to 137 tons in 1918. The 1919 production increased sharply to 784 tons.

*Imports* of barium nitrate in 1914 (only year for which statistics are available) were 1,040,772 pounds, valued at \$38,728, chiefly from Germany.

*Exports.*—Statistics not available.

*Important changes in classification.*—Barium nitrate, an important compound, imported in large quantities before the war, and now being made in the United States, is specifically provided for. (Reclassification Report, p. 18.)

## PARAGRAPH 12.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 12. Blackings, powders, and creams for cleaning or polishing, not specially provided for, 25 per centum ad valorem: *Provided*, That no preparations containing alcohol shall be classified for duty under this paragraph.

ACT OF 1909.

ACT OF 1913.

PAR. 7. Blacking of all kinds, twenty-five per centum ad valorem; all creams and preparations for cleaning or polishing boots and shoes, twenty-five per centum ad valorem.

PAR. 11. Blacking of all kinds, polishing powders, and all creams and preparations for cleaning or polishing, not specially provided for in this section, 15 per centum ad valorem: *Provided*, That no preparations containing alcohol shall be classified for duty under this paragraph.

## CLEANING AND POLISHING PREPARATIONS.

(See Survey A-5.)

*Description and uses.*—This paragraph covers all articles used as blacking, polishes, and cleaning preparations, such as shoe blacking, leather polishes, stove polishes, floor polishes, furniture polishes, auto body polishes, metal polishes, and scouring compounds used for cleaning, and wall-paper cleaners.

*Production* in 1914 of blacking, stains, and dressings was valued at \$10,259,617; of polishing preparations, \$5,228,178; and of cleaning preparations, \$5,565,846. In 1919 the output of blacking, stains, and dressings was (preliminary figures) \$25,279,000, and of cleansing and polishing preparations \$26,215,000.

*Imports* from 1911 to 1913, inclusive, of blanco polish were valued between \$15,000 and \$35,000 per annum; in 1917 at \$53,458, and in 1918 at \$24,821. All other blacking, polishing, and cleaning preparations from 1910 to 1914 ran from \$35,000 to \$45,000 per year and decreased to \$26,724 in 1918. The imports of blacking in 1914 came chiefly from England and were valued at \$32,424. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
----------------	--------	-------	------------------

## BLANCO POLISH.

			Per cent.
1918.....	\$21,893	\$3,284	15
1919.....	22,089	3,313	15
1920.....	33,742	5,061	15
1921 (9 months).....	17,127	.....	15

## ALL OTHER.

1918.....	\$28,186	\$4,228	15
1919.....	39,025	5,854	15
1920.....	34,361	5,154	15
1921 (9 months).....	13,943	.....	.....

*Exports* of blacking, including shoe pastes and polishes, prior to 1917 were fairly constant between \$500,000 and \$780,000, and then increased steadily to \$2,933,448 in the calendar year 1920; for 9 months in 1921 they were only \$965,320. Exports in 1920 were chiefly to Mexico, Argentina, and Cuba.

### PARAGRAPH 13.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 13. Bleaching powder or chlorinated lime, three-fifths of 1 cent per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 8. Bleaching powder, or chloride of lime, one fifth of one cent per pound.

PAR. 12. Bleaching powder, or chloride of lime,  $\frac{1}{10}$  cent per pound.

#### BLEACHING POWDER.

(See Survey A-5.)

*Description and uses.*—Bleaching powder or chlorinated lime, incorrectly called chloride of lime, is a white powder which, when treated with an acid, evolves chlorine. It is sold on the basis of the "available chlorine" content. It is primarily a bleaching agent used for bleaching pulp and paper stock, and cotton and linen in textile mills and laundries. Liquid chlorine, however, is fast replacing it for the purification of public water supplies.

*Production* in 1914 was 310,380,000 pounds, valued at \$2,916,225, nearly twice that in 1909. Production in 1919 (preliminary figures) had decreased to 177,140,000 pounds, valued at \$3,418,500, or about one-half the 1914 output. This decrease may be attributed to competition from liquid chlorine. The commercial manufacture of chlorinated lime was promoted by a duty of one-fifth cent per pound in the act of 1897, and the industry subsequently developed rapidly, supplying the greater part of domestic consumption.

Bleaching powder is produced from lime and chlorine gas. The chlorine, which is a joint product in the manufacture of electrolytic caustic soda, is largely made at Niagara Falls, N. Y. It is also manufactured by two firms in Michigan and by one firm in California. Large consumers are installing electrolytic chlorine plants in order to produce their own bleach in liquid form.

*Imports* previous to 1914 were between 40,000 and 50,000 short tons a year; the United Kingdom supplied from 70 to 80 per cent, most of the remainder coming from Germany. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	540,131	\$11,446	\$0.02	\$540	4.72
1919.....	341,812	6,787	.02	342	5.04
1920.....	2,474,617	89,873	.03	2,475	2.85
1921 (9 months).....	6,154,912	131,368	.02		

*Exports* in 1918 (fiscal year) were 13,060,401 pounds, valued at \$558,066, shipped chiefly to Argentina, Canada, Brazil, Chile, and Spain, in the order given. South America consumed about 50 per cent of the total. These markets formerly were supplied by Germany and England. Later statistics (for calendar years) follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	9,450,793	21,019,736	48,826,348	12,045,336
Value.....	\$310,268	\$517,317	\$1,480,142	\$343,074

In postwar years exports were chiefly to Canada, British India, Sweden, and China.

*Important changes in classification.*—"Chloride of lime" as used in the act of 1913 (par. 12) is an incorrect designation for bleaching powder and confuses it with calcium chloride. "Chlorinated lime" is a term used in the trade and in the United States Pharmacopœia. (Reclassification Report, p. 19.)

#### PARAGRAPH 14.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 14. Caffeine, \$1.50 per pound; compounds of caffeine, 25 per centum ad valorem; impure tea, tea waste, tea siftings and sweepings, for manufacturing purposes in bond, pursuant to the provisions of the Act of May 16, 1908, entitled "An Act to amend an Act to prevent the importation of impure and unwholesome tea, approved March 2, 1897," and the Act of May 31, 1920, entitled "An Act making appropriations for the Department of Agriculture for the fiscal year ending June 30, 1921," 1 cent per pound.

#### ACT OF 1909.

PAR. 65. \* \* \* all other medicinal preparations not specially provided for in this section, twenty-five per centum ad valorem: \* \* \*

PAR. 559. Drugs, \* \* \* not advanced \* \* \* [Free].

#### ACT OF 1913.

PAR. 13. Caffein, \$1 per pound; compounds of caffeine, 25 per centum ad valorem; impure tea, tea waste, tea siftings or sweepings, for manufacturing purposes in bond, pursuant to the provisions of the Act of May sixteenth, nineteen hundred and eight, 1 cent per pound.

#### CAFFEINE AND TEA WASTE.

(See Survey A-5.)

*Description and uses.*—Caffeine is an alkaloid obtained principally from the leaves of tea, and also occurring in coffee, kola nut, guarana, and in several other plants and plant products. Caffeine forms white, odorless, flexible crystals of a bitter taste. It is chiefly used in the preparation of soft drinks of the Coca-Cola type and also in medicine as a cerebral stimulant. In medical practice it is being displaced to a considerable extent by the related alkaloids, theobromine, and theophylline. The first named occurs in cocoa and the sec-

ond in tea, but both, especially theophylline, are manufactured synthetically.

The principal compounds of caffeine are citrate, effervescent citrate, sodium benzoate, and sodium salicylate. These find application in medicine.

Tea siftings, sweepings, waste, etc., are the inferior qualities of tea leaves unfit for beverage purposes. The average content of caffeine in imported tea waste is about 2 per cent. For the most part they are waste products swept up from warehouses, docks, and vessels. In addition, low grades of tea, not salable for beverage uses, are denatured with lime or other substances and sold for caffeine manufacture.

*Production.*—Caffeine is manufactured in the principal European countries, especially Germany, and also in Japan. In the United States it is made chiefly from tea waste and to a lesser extent from the refuse of coffee-roasting establishments. After a preliminary treatment with lime, the caffeine is extracted with such a solvent as benzol, and the product purified by recrystallization. About 50 pounds of tea waste are required for 1 pound of caffeine. No statistics of domestic manufacture are available, but imports of tea waste suffice for the manufacture of about 150,000 pounds annually. Caffeine has been made in Germany as a by-product of the synthesis of theophylline and theobromine from uric acid, derived from South American guano deposits.

*Imports.*—Prior to 1914 caffeine and its compounds were dutiable at 25 per cent ad valorem. For 1909–1914 an average annual import of caffeine of 49,278 pounds, valued at \$143,105, was reported. The rate of \$1 per pound imposed by the act of 1913 was equivalent to practically 30 per cent ad valorem during 1914–15. For 1916–1918 the highest ad valorem rate was 10.03 per cent. Importations have decreased markedly during the war, owing to the shutting off of imports from Germany, which supplied about 98 per cent of the imports in 1914. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	7,226	\$72,201	\$9.99	\$7,226	10.01
1919.....	1,720	13,718	7.98	1,720	12.54
1920.....	2,332	11,445	4.91	2,332	20.37
1921 (9 months).....	7,235	34,048	4.71		

Imports of caffeine compounds have not been shown since 1916.

Imports of tea waste and siftings in 1913 had reached 7,168,410 pounds, valued at \$215,938, and during the war ranged between 5,000,000 and 10,000,000 pounds. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	9,857,029	\$759,734	\$0.08	\$98,570	12.97
1919.....	8,572,030	537,893	.06	85,720	15.94
1920.....	11,915,732	787,508	.07	119,157	15.13
1921 (9 months).....	6,957,606	378,943	.05		

*Exports.*—Statistics not available.

## PARAGRAPH 15.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 15. Calcium carbide, 1 cent per pound.

## ACT OF 1909.

## ACT OF 1913.

PAR. 3. \* \* \* chemical compounds,  
\* \* \* and salts, \* \* \* not  
specially provided for in this section,  
twenty-five per centum ad valorem;  
\* \* \*

PAR. 440. \* \* \* calcium carbide  
\* \* \* [Free].

## CALCIUM CARBIDE.

(See Survey FL-8.)

*Description and uses.*—Calcium carbide is a compound of calcium and carbon. It is a solid, usually gray, which is energetically decomposed by water, evolving acetylene gas. The commercial carbide yields from 4.5 to 4.7 cubic feet of acetylene for each pound of carbide. It is made in the electric furnace and has the property of absorbing nitrogen at a red heat to form calcium cyanamide, used as a fertilizer. The raw materials are lime and carbon, usually coke or anthracite coal. The principal use is in making acetylene for artificial lighting and for welding and cutting of metals; also in manufacturing acetic acid from acetylene by the aid of catalysis. Large quantities of the carbide are consumed in making calcium cyanamide.

*Production* of calcium carbide for sale in this country is, in the main, by one company, that going into calcium cyanamide being largely consumed where made and not entering the market. Domestic production is sufficient to supply the home demand.

*Import* statistics are shown in combination with those for other articles. Official Canadian export statistics show that for the fiscal years (ended March 31) 1916 to 1921 between 90,000,000 and 130,000,000 pounds of Canadian carbide were exported annually to this country, except in 1920, when only 63,000,000 pounds were shipped out.

*Exports*, chiefly to Cuba, South America, Mexico, and Canada, average a little over 30,000,000 pounds and have varied little from 1912 to 1917. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	18,146,239	23,900,239	23,369,534	9,674,905
Value.....	\$1,347,458	\$1,404,870	\$1,111,587	\$479,801

*Important changes in classification.*—Transferred from the free list of the act of 1913. (Par. 440.)

## PARAGRAPH 16.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 16. Calomel, corrosive sublimate, and other mercurial preparations, 30 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 65. \* \* \* calomel, corrosive sublimate, and other mercurial medicinal preparations, thirty-five per centum ad valorem; \* \* \*.

PAR. 14. Calomel, corrosive sublimate, and other mercurial preparations, 15 per centum ad valorem.

## CALOMEL AND CORROSIVE SUBLIMATE.

(See Survey A-5.)

*Description and uses.*—These compounds, the most important mercurials, are composed of mercury and chlorine. Corrosive sublimate or mercury bichloride contains about 74 per cent of mercury and about 26 per cent of chlorine. It is either a white transparent mass or forms lustrous crystals, which are soluble in water and extremely poisonous. It is used in medicine and has valuable antiseptic properties. It is also used in calico printing, for the preservation of wood and of anatomical specimens, for embalming, disinfecting, and as a fixing agent in photography.

Calomel or mercury monochloride is a chemical compound composed of about 85 per cent of mercury and 15 per cent of chlorine. It is an impalpable powder, usually yellowish white, and insoluble in water. Its chief use is medicinal. Its technical uses are small and unimportant.

*Production.*—Both calomel and corrosive sublimate are prepared from metallic mercury or quicksilver, the latter metal being subject to a duty of 35 cents per pound (par. 333, H. R. 7456). Mercury is first converted into the sulphate by heating with sulphuric acid. The sulphate of mercury is then sublimed with salt (sodium chloride) and a little manganese dioxide, thereby producing corrosive sublimate. Calomel is usually prepared from corrosive sublimate by heating with metallic mercury. The product is then purified by washing with dilute nitric acid and water.

The production of mercurial salts in 1914 was 605,701 pounds, valued at \$518,023, and in 1919, according to preliminary figures, increased to 1,143,800 pounds, valued at \$1,775,000. This quantity supplies a large part of the domestic consumption, as imports are small.

*Imports* of calomel and corrosive sublimate prior to the 1918 calendar year have been combined with other mercurial preparations (see pp. 58 and 59). Statistics from July 1, 1918, are as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
CALOMEL.					
	<i>Pounds.</i>				<i>Per cent.</i>
1918 <sup>1</sup> .....	500	\$852	\$1.70	\$128	15
1919.....	325	538	1.65	81	15
1920.....	3,301	3,607	1.09	541	15
1921 (9 months).....	120	138	1.15	.....	15
CORROSIVE SUBLIMATE.					
1920 <sup>2</sup> .....	3,971	2,941	.74	441	15

<sup>1</sup> Six months only, July 1 to Dec. 30.

<sup>2</sup> Included in "Other mercurial preparations" in 1918 and 1919.

*Exports.*—Statistics not available.

#### OTHER MERCURIAL PREPARATIONS.

(See Survey A-5.)

The other important mercurials, which are, however, of lesser importance than calomel and corrosive sublimate, are mercuric sulphate, blue mass (U. S. P.), red precipitate, white precipitate, and mercury iodide.

Mercuric sulphate is a white crystalline powder used chiefly for the preparation of calomel and corrosive sublimate. It is also used with potassium bisulphate for filling galvanic batteries.

Blue mass (U. S. P.) is a mercurial medicinal. The United States Pharmacopœia specifies that it shall contain not less than 32 per cent nor more than 34 per cent of mercury.

Red precipitate or mercuric oxide is a compound of mercury and oxygen, usually prepared by heating mercuric nitrate. An oxide having the same chemical composition, but a yellow color, is obtained by adding an alkali to a cold solution of a mercury salt. It is sometimes preferred, as it is usually a finer powder. Red precipitate is used for medicinal purposes, for preparing other mercurials, in paint for ship bottoms, and for diluting pigments used on porcelain.

White precipitate or ammoniated mercury chloride is obtained by treating a solution of mercuric chloride (corrosive sublimate) with an excess of ammonia, and is marketed as a white amorphous powder or as pulverulent pieces. It is insoluble in water and is used as an ointment for sores and skin diseases. This white precipitate should not be confused with the French "white precipitate" (*précipité blanc*), which is calomel containing not less than 75 nor more than 80 per cent of mercury.

Mercury iodide in commerce has two forms, known as yellow (or green) and red. The yellow product is mercurous iodide, while the red is mercuric iodide. They are used both internally and externally for medicinal purposes.

*Imports* of calomel, corrosive sublimate, and other mercurial preparations prior to 1915 were valued between \$30,000 and \$42,000. The

imports decreased to \$2,124 in 1918. Later statistics of "other mercurial preparations" follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918 <sup>1,2</sup> .....	16	\$30	\$1.87	\$5	15
1919 <sup>1</sup> .....	10	33	3.30	5	15
1920.....	9,887	11,240	1.14	1,686	15
1921 (9 months).....	1,902	1,420	.75	.....	15

<sup>1</sup> Includes corrosive sublimate.

<sup>2</sup> Six months only, July 1 to Dec. 30.

*Exports.*—Statistics not available.

### PARAGRAPH 17.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 17. Carbon tetrachloride, 2½ cents per pound; chloroform, 8 cents per pound; tetrachloroethane and trichloroethylene, 25 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 14. Chloroform, ten cents per pound.

PAR. 19. Chloroform, 2 cents per pound; carbon tetrachloride, 1 cent per pound.

PAR. 3. \* \* \* chemical compounds, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*.

PAR. 5. \* \* \* chemical \* \* \* compounds, \* \* \* not specially provided for in this section, 15 per centum ad valorem.

### CARBON TETRACHLORIDE.

(See Survey A-6.)

*Description and uses.*—Carbon tetrachloride or tetrachloromethane is a liquid the vapors of which are very effective in extinguishing fire. It is used in fire extinguishers known as Pyrene, J. M., and Fyr-Fyter, and also for dry cleaning of fabrics and gloves. It is a valuable solvent, an important raw material for making chloroform, and was largely used during the war in producing smoke screens.

*Production.*—Increased use as a solvent and cleanser, great demand for fire extinguishers since 1909, large war needs, and cessation of imports during the war have greatly developed the industry. In 1919 the output (preliminary figures) reached 9,811,800 pounds, valued at \$803,600.

The raw materials necessary in its production are coke (carbon), sulphur, and chlorine gas, all available in this country. Sulphur chloride is a by-product and may be used for the production of more carbon tetrachloride. Carbon tetrachloride is manufactured at Midland, Mich.; Charleston, W. Va.; Niagara Falls, N. Y.; and Pittsburg, Calif.

*Imports* in 1914 were 572,910 pounds; in 1915, 342,854 pounds; valued, respectively, at \$28,300 and \$18,139, and were almost entirely from Germany. After 1915 imports ceased, until in 1921 (9 months) when 12,196 pounds, valued at \$387, entered.

*Exports*.—Statistics not available.

#### CHLOROFORM.

(See Survey A-6.)

*Description and uses*.—Chloroform is a colorless liquid with a characteristic ethereal odor, its vapors, when inhaled, producing anæsthesia, a property giving it its largest use. It is employed also as a solvent and as an antiseptic, about 1 per cent of grain alcohol being added to prevent decomposition.

*Production* in 1914 was 1,333,954 pounds, valued at \$295,317, a decrease of more than 500,000 pounds compared with 1909, probably due to the increased use of ether in anæsthesia. The 1919 output (preliminary figures) was 1,677,600 pounds, valued at \$516,600. Chloroform is one of many articles which requires chlorine in its manufacture. It is made from three different raw materials—carbon tetrachloride, acetone, or grain alcohol—all of which are produced in the United States in sufficient quantities. The war demand for acetone greatly stimulated the production of chloroform from carbon tetrachloride.

*Imports* in 1914 were 2,444 pounds, valued at \$990. Since the war they have been less than 100 pounds annually.

*Exports*.—Statistics not available.

#### TETRACHLOROETHANE AND TRICHLOROETHYLENE.

*Description and uses*.—These two products are organic solvents derived from acetylene by treatment with chlorine in the presence of a catalyst. Tetrachloroethane is formed first by the direct chlorination of acetylene, and may then be converted into trichloroethylene by digesting with an alkali at an elevated temperature.

Tetrachloroethane is used primarily as a solvent in the manufacture of artificial silk, airplane "dopes," and noninflammable films. Trichloroethylene is used chiefly as a solvent for the extraction of various medicinal alkaloids, such as caffeine, and in the preparation of decaffeinated coffee. These two solvents are preferred to carbon tetrachloride and chloroform, as in the presence of water they do not hydrolyze and give off hydrochloric acid as readily as these latter products.

*Production* in the United States is a result of war conditions; domestic requirements were supplied by imports prior to the war. They are manufactured by those firms which make chlorine.

*Imports* in 1914 (only year statistics are available) were 93,581 pounds of tetrachloroethane, valued at \$5,636 (68 per cent of which was from England), and 18,316 pounds of trichloroethylene, valued at \$4,393 (85 per cent from England). Prices of imported products in April, 1921, were about 16½ cents per pound for tetrachloroethane and about 20 cents per pound for trichloroethylene.

*Exports.*—Statistics not available.

*Important changes in classification.*—Tetrachloroethane and trichloroethylene—important chlorine products used for solvent purposes similar to carbon tetrachloride and chloroform—are specially provided for.

## PARAGRAPH 18.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 18. Chalk or whiting or Paris white: Dry, ground, bolted, or precipitated, 15 per centum ad valorem; ground in oil (putty), or put up in the form of cubes, blocks, sticks, or disks, or otherwise, including tailors', billiard, red, and manufactures of chalk not specially provided for, 25 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 13. Chalk, when ground, bolted, precipitated naturally or artificially, or otherwise prepared, whether in the form of cubes, blocks, sticks or disks, or otherwise, including tailors', billiard, red, \* \* \* one cent per pound; manufactures of chalk not specially provided for in this section, twenty-five per centum ad valorem.

PAR. 54. Whiting and Paris white, dry, one-fourth of one cent per pound; ground in oil, or putty, one-half of one cent per pound.

PAR. 15. Chalk, precipitated, suitable for medicinal or toilet purposes; chalk put up in the form of cubes, blocks, sticks, or disks, or otherwise, including tailors', billiard, red, and other manufactures of chalk not specially provided for in this section, 25 per centum ad valorem.

PAR. 60. Whiting and Paris white, dry, and chalk, ground or bolted,  $\frac{1}{10}$  cent per pound; whiting and Paris white, ground in oil, or putty, 15 per centum ad valorem.

### CHALK, WHITING, OR PARIS WHITE.

(See Survey A-5.)

*Description and uses.*—Chalk is a soft earthy form of calcium carbonate composed mainly of small marine organisms and shells. It is generally yellowish or grayish, but is sometimes snow white. It occurs abundantly along the southern coast of England and in the north of France.

Ground chalk, whiting, and Paris white are merely different grades of the same material—natural chalk, ground, washed, and bolted. The quality and price are quite variable and dependent on the purity, color, fineness, and freedom from grit.

Precipitated chalk is artificially prepared by chemical means from calcium chloride and soda ash. It can be secured free from grit and in finely divided condition more easily and perfectly than the natural chalk, and it is therefore preferred for toilet and medicinal purposes.

Chalk has a great variety of uses. The crude chalk is sometimes used as a fertilizer for clayey or acid soils, and in England in the manufacture of sodium carbonate and for producing carbon dioxide in quantity. It is an ingredient of whiting and Paris white, which

enter into rubber goods, linoleum, paints, calcimine, and putty. The finer grades are used in the preparation of metal polishes, in tooth powders and pastes, and to a certain extent in medicine as an antacid. Chalk is also used in the manufacture of crayons, artists' pastel colors, and paints.

*Production.*—There are no known deposits of chalk in the United States which are equal to those of England and France, though some pure forms of limestone are ground for whiting and Paris white. England and France produce nearly all the crude chalk used in this country. Considerable quantities of crude chalk imported from these countries are purified in the United States.

Whiting and Paris white reach the American market from three sources: (1) Imports, constituting 1 to 2 per cent; (2) manufactures from domestic crude material (limestone), 10 to 15 per cent; and (3) manufactures from imported crude chalk, about 85 per cent of the total.

*Imports* in 1914 from England amounted to 84,361 tons of crude chalk and from France 43,203 tons. By 1916 the imports from France practically ceased, while those from England increased to 127,536 tons in 1917. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Long tons.</i>		
1918.....	83,933	\$113,985	\$1.36
1919.....	97,969	140,614	1.44
1920.....	159,146	267,138	1.68
1921 (9 months).....	38,597	85,361	2.21

Imports of whiting and Paris white, dry, in 1913 were 3,536,747 pounds, valued at \$14,000. The maximum import during the war was over 5,000,000 pounds in 1915. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	2,446,180	\$16,949	\$0.01	\$2,446	14.43
1919.....	1,529,668	12,098	.01	1,530	12.64
1920.....	17,749,441	175,743	.01	17,749	10.10
1921 (9 months).....	11,350,266	70,761	.01		

Imports of chalk, ground or bolted, and precipitated chalk suitable for medicinal or toilet purposes have been comparatively small. Since the war those of ground or bolted chalk have not exceeded 2,500,000 pounds, valued at \$63,000, in 1920; and the precipitated chalk in 1919 reached a maximum of 1,350,000 pounds, valued at \$38,610. Imports of putty have been sporadic and negligible, the maximum since the war being 467,220 pounds, valued at \$10,859, during the first nine months of 1921. Imports of manufactures of chalk have been practically negligible.

*Exports* in 1910 were valued at \$110,647; in 1914, at \$40,154; in 1918, manufactures of chalk were valued at \$186,711. They have increased since the war to \$458,868 in 1920 (calendar year).

*Important changes in classification.*—The act of 1913 has separate provisions for ground chalk and whiting or Paris white and for precipitated chalk suitable for medicinal or toilet purposes at different rates of duty. Although it is possible to form a judgment of quality, and therefore price, based upon the fineness, color, and purity, there is no method to determine with certainty the process of manufacture. The Tariff Commission therefore suggested to the Committee on Ways and Means that all varieties of chalk, whiting, or Paris white, whether ground, bolted, or precipitated, be placed together in the same paragraph at the same rate of duty. As there is a wide variation in price between the poorest and highest grades, an ad valorem rate has advantages over a specific rate of duty. (Reclassification Report, p. 21.)

---

PARAGRAPH 19.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 19. Chemical compounds, mixtures, and salts, of which gold, platinum, rhodium, or silver constitutes the element of chief value, 15 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 3. \* \* \* chemical compounds, mixtures and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*

PAR. 65. Salts and all other compounds and mixtures of which \* \* \* gold, platinum, rhodium, silver, \* \* \* constitute the element of chief value, 10 per centum ad valorem.

## CHEMICAL COMPOUNDS OF GOLD, PLATINUM, RHODIUM, AND SILVER.

(See Survey A-17.)

*Description and uses.*—The metals named in this paragraph occur in nature in relatively small amounts and their salts and compounds are among the most expensive chemicals of mineral origin which find technical or medicinal use. The evident purpose of this paragraph is to impose a lower rate of duty on the relatively expensive substances than would be imposed under the general provision for salts, compounds, and mixtures not otherwise more specifically provided for (par. 5). Gold, platinum, and silver salts are used chiefly in photography. Technical or medicinal uses for salts of rhodium are not recorded.

*Production.*—Separate figures for the production of salts of rhodium are not available, but in 1914 and 1919 the production of the other salts included in this paragraph was as follows:

	1914.		1919.	
	Quantity.	Value.	Quantity.	Value.
Gold salts..... ounces..	28,817	\$291,658	14,844	\$143,079
Platinum salts..... do.....	365	6,998		
Silver salts..... do.....	2,563,238	846,059		2,441,7

*Imports* (including bismuth and tin salts mentioned in the act of 1913) have not been large and have shown a decided decrease since the beginning of the war. The total imports in 1915 were valued at \$24,685. Imports of silver salts amounted in 1914 to about 306 pounds, mostly from England. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
1918.....		\$7,695	\$770	10
1919.....		3,745	375	10
1920.....		22,944	2,294	10
1921 (9 months).....		13,534	.....	10

*Exports.*—Statistics not available.

## PARAGRAPH 20.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 20. Chemical compounds, salts, and preparations, of bismuth, 25 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 3. \* \* \* chemical compounds, mixtures and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*

PAR. 65. Salts and all other compounds and mixtures of which bismuth, \* \* \* constitute the element of chief value, 10 per centum ad valorem.

### CHEMICAL COMPOUNDS AND PREPARATIONS OF BISMUTH.

(See Survey A-17.)

*Description and uses.*—The chief use of bismuth salts is in medicine and cosmetics. The Pharmacopœia of the United States lists various bismuth salts. Bismuth chromate and bismuth oxychloride are used to a limited extent as pigments. Other salts and compounds have less important uses.

The above compounds are made from bismuth chloride or bismuth nitrate, which are obtained by the action of hydrochloric and nitric acids, respectively, on metallic bismuth.

*Production.*—Separate figures for the production of salts of bismuth are not available prior to 1919, when the output of bismuth salts was 502,300 pounds, valued at \$1,235,500 (preliminary figures).

*Imports* of bismuth salts during 1914 amounted to 588 pounds, most of which came from Germany. Later statistics are included with those of gold, silver, platinum, and rhodium salts. (Par. 19.)

*Exports.*—Statistics not available.

*Important changes in classification.*—Separated from gold, silver, platinum, and rhodium salts, etc., because not a precious or rare metal.

*Suggested changes.*—The substitution of the word “mixtures” for “preparations” would make this paragraph agree with paragraph 19 of H. R. 7456 and with paragraph 65 of the act of 1913.

### PARAGRAPH 21.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 21. Chemicals, drugs, medicinal and similar substances, whether dutiable or free, when imported in capsules, pills, tablets, lozenges, troches, ampoules, jubes, or similar forms, shall be dutiable at not less than 25 per centum ad valorem.

#### ACT OF 1909.

PAR. 65. \* \* \* all other medicinal preparations not specially provided for in this section, twenty-five per centum ad valorem: *Provided*, That chemicals, drugs, medicinal and similar substances, whether dutiable or free, imported in capsules, pills, tablets, lozenges, troches, or similar forms, and intended for medicinal purposes, shall be dutiable at not less than the rate imposed by this section on medicinal preparations.

#### ACT OF 1913.

PAR. 17. \* \* \* *Provided*, That chemicals, drugs, medicinal and similar substances, whether dutiable or free, imported in capsules, pills, tablets, lozenges, troches, ampoules, jubes, or similar forms, shall be dutiable at not less than 25 per centum ad valorem.

#### CHEMICALS, DRUGS, ETC., WHEN IMPORTED IN CAPSULES, ETC.

*Imports* (under paragraph 17 of the act of 1913) in packages of 2½ pounds or less from 1914, when first shown, to 1918, inclusive, have been valued between \$455,491 and \$711,016 per year, and have yielded a yearly revenue varying from \$91,357 to \$142,203. Imports in the form of capsules, etc., amounted to \$800,000 in both 1914 and 1915, and yielded a yearly revenue of about \$200,000. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
CHEMICAL AND MEDICINAL COMPOUNDS, ETC., IN PACKAGES OF 2½ POUNDS OR LESS.				
1918.....		\$383,925	\$76,785	<i>Per cent.</i> 20
1919.....		491,591	98,318	20
1920.....		741,360	148,272	20
1921 (9 months).....		318,668		20
CHEMICAL AND MEDICINAL COMPOUNDS, ETC., IN CAPSULES, PILLS, TABLETS, ETC.				
1918.....		\$356,598	\$89,150	25
1919.....		483,787	120,947	25
1920.....		684,286	171,072	25
1921 (9 months).....		491,334		25

*Exports.*—Statistics not available.

*Important changes in classification.*—The first portion of the corresponding 1913 paragraph, relating to articles in 2½-pound packages or less, has been omitted from H. R. 7456, owing to the litigation which has arisen in its administration. (Reclassification Report, pp. 24, 25.)

*Suggested changes.*—Page 6, paragraph 21, line 13: Insert “including powders put up in medicinal doses” after “forms.”

## PARAGRAPH 22.

### H. R. 7456.

PAR. 22. Chemical elements, and chemical and medicinal compounds, preparations, mixtures, and salts, distilled and essential oils, expressed and extracted oils, animal oils and greases, ethers and esters, flavoring and other extracts, and natural or synthetic fruit flavors, fruit esters, oils and essences, all the foregoing and their combinations when containing alcohol, and all articles consisting of vegetable or mineral objects immersed or placed in, or saturated with, alcohol, except perfumery and spirit varnishes, and all alcoholic compounds not specially provided for, if containing 20 per centum of alcohol or less, 20 cents per pound and 25 per centum ad valorem; containing more than 20 per centum and not more than 50 per centum of alcohol, 40 cents per pound and 25 per centum ad valorem; containing more than 50 per centum of alcohol, 80 cents per pound and 25 per centum ad valorem.

### ACT OF 1909.

PAR. 2. Alcoholic compounds, including all articles consisting of vegetable, animal or mineral objects immersed or placed in, or saturated with, alcohol, not specially provided for in this section, sixty cents per pound and twenty-five per centum ad valorem.

PAR. 3. \* \* \* chemical compounds, mixtures and salts containing alcohol or in the preparation of which alcohol is used, and not specially provided for in this section, fifty-five cents per pound, but in no case shall any of the foregoing pay less than twenty-five per centum ad valorem.

PAR. 65. Medicinal preparations containing alcohol or in the preparation of which alcohol is used, not specially provided for in this section, fifty-five cents per pound, but in no case shall the same pay less than twenty-five per centum ad valorem; \* \* \*.

### SENATE AMENDMENTS.

### ACT OF 1913.

PAR. 16. Chemical and medicinal compounds and preparations, including mixtures and salts, distilled oils, essential oils, expressed oils, rendered oils, greases, ethers, flavoring and other extracts and fruit essences, all the foregoing and their combinations when containing alcohol, and all articles consisting of vegetable or mineral objects immersed or placed in, or saturated with, alcohol, except perfumery and spirit varnishes, and all alcoholic compounds not specially provided for in this section, if containing 20 per centum of alcohol or less, 10 cents per pound and 20 per centum ad valorem; containing more than 20 per centum and not more than 50 per centum of alcohol, 20 cents per pound and 20 per centum ad valorem; containing more than 50 per centum of alcohol, 40 cents per pound and 20 per centum ad valorem.

## CHEMICAL COMPOUNDS, MIXTURES AND SALTS, ALCOHOLIC.

Imports of chemical compounds have been chiefly in the class containing 20 per cent of alcohol or less and in 1918 (fiscal year) were valued at \$30,387 and yielded a revenue of \$6,893. In 1918 imports of the class containing between 20 and 50 per cent of alcohol were valued at \$15,382 and yielded a revenue of \$7,859; those containing more than 50 per cent of alcohol, at \$850, with a revenue of \$709.

Imports of medicinal compounds have also been chiefly in the class containing 20 per cent of alcohol or less, and in 1918 were valued at \$63,579 and yielded a revenue of \$18,422. In 1918 (fiscal year) imports of the class containing between 20 and 50 per cent alcohol were valued at \$26,002 and yielded a revenue of \$18,400; those compounds containing more than 50 per cent of alcohol were valued at \$10,789, with a revenue of \$13,284.

Imports of vegetable or mineral objects immersed in alcohol are practically negligible.

Statistics of alcoholic compounds have not been separately reported since 1914. Before then imports decreased from 1,272 pounds, valued at \$1,585 in 1910, to 643 pounds, valued at \$749 in 1913.

Imports of chemical compounds, mixtures, and salts since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
CONTAINING 20 PER CENT OR LESS OF ALCOHOL.					
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	5,023	\$25,055	\$4.99	\$5,513	22.00
1919.....	1,187	2,662	2.24	651	24.46
1920.....	2,573	3,469	1.35	951	27.42
1921 (9 months).....	2,607	4,720	1.81		
CONTAINING MORE THAN 20 PER CENT AND NOT MORE THAN 50 PER CENT ALCOHOL

*Exports.*—Statistics not available.

*Important changes in classification.*—The phraseology of this paragraph has been slightly modified to agree with changes made in other paragraphs for these articles when not containing alcohol. (Reclassification Report, p. 23).

*Suggested changes.*—Page 6, lines 16, 17: "And," between "distilled" and "essential" oils and between "expressed" and "extracted" oils should be changed to "or" to avoid a possible construction requiring that the oils shall be both distilled and essential or both expressed and extracted.

### PARAGRAPH 23.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 23. Chicle, crude, 15 cents per pound; refined or advanced in value by drying, straining, or any other process or treatment whatever beyond that essential to the proper packing, 20 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 30. Chicle, ten cents per pound.

PAR. 36. Gums: \* \* \* chicle, crude, 15 cents per pound; refined or advanced in value by drying, straining, or any other process or treatment whatever beyond that essential to the proper packing, 20 cents per pound;  
\* \* \*

### CHICLE.

(See Survey A-9.)

*Description and uses.*—Gum chicle is a dried milky juice derived from *Archas sapota*, a tree whose habitat extends from Mexico to Guiana, the principal source of supply being Yucatan. The milky juice derived from incisions in the bark is boiled and allowed to

harden in molds. First-class chicle is nearly white when well cooked, fresh and clean, but turns reddish when overcooked. Certain trees also yield a primarily reddish gum. Crude chicle as it leaves Mexico contains about 50 per cent water, some of which is lost in transportation, and as imported, contains about 40 per cent water. Its chief use is in the manufacture of chewing gum, for which it is refined by grinding, straining, and drying.

*Imports.*—Prior to the act of 1913 all chicle was dutiable at a uniform rate. In 1913 the import was 6,920,415 pounds, valued at \$3,059,116, and yielded a revenue of \$692,041. From July 1 to October 3, 1913, 7,998,186 pounds, but for the remainder of the fiscal year 1914 only about 1,500,000 pounds of both crude and refined chicle were imported. Since 1914 the imports of crude chicle have increased from 2,465,400 pounds in 1915 to 4,580,501 pounds, valued at \$2,076,143, and yielding a revenue of \$687,075 in 1918. The import of refined chicle increased from 1,934,760 pounds in 1915 to 3,935,093 pounds, valued at \$2,371,834, and yielded a revenue of \$787,018 in 1917. In 1918 (fiscal year) the import of refined decreased to 2,028,367 pounds. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
<b>CRUDE CHICLE.</b>					
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	5,674,724	\$2,649,440	\$0.47	\$851,209	32.13
1919.....	7,515,265	4,769,601	.63	1,127,290	23.63
1920.....	7,035,915	4,868,368	.69	1,055,387	21.68
1921 (9 months).....	3,936,145	2,464,968	.63		
<b>REFINED CHICLE.</b>					
1918.....	1,262,670	\$1,005,138	\$0.80	\$252,534	25.12
1919.....	566,039	698,598	1.23	113,208	16.20
1920.....	237,665	298,883	1.26	47,533	15.90
1921 (9 months).....	102,799	117,199	1.14		

*Exports.*—Statistics not available.

*Suggested changes.*—Attention is called to the classification of various gums used as substitutes in part or as adulterants for chicle in the manufacture of chewing gum. These gums would be exempt from duty under paragraph 1577, in H. R. 7456, whereas chicle is dutiable under this paragraph. Such treatment of these gums, related to chicle, in paragraph 1577, would tend to encourage the importation of these inferior gums.

## PARAGRAPH 24.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 24. Chloral hydrate, terpin hydrate, thymol, urea, and glycerophosphoric acid, and salts and compounds of glycerophosphoric acid, 25 per centum ad valorem.

## ACT OF 1909.

PAR. 1. \* \* \* all other acids not specially provided for in this section, twenty-five per centum ad valorem.

PAR. 3. \* \* \* all chemical compounds, \* \* \* and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; chemical compounds, \* \* \* and salts containing alcohol or in the preparation of which alcohol is used, and not specially provided for in this section, fifty-five cents per pound, but in no case shall any of the foregoing pay less than twenty-five per centum ad valorem.

PAR. 65. Medicinal preparations \* \* \* in the preparation of which alcohol is used, not specially provided for in this section, fifty-five cents per pound, but in no case shall the same pay less than twenty-five per centum ad valorem: \* \* \*

## ACT OF 1913.

PAR. 18. Chloral hydrate, \* \* \* urea, terpin hydrate, \* \* \* glycerophosphoric acid and salts and compounds thereof, \* \* \* thymol, 25 per centum ad valorem.

## CHLORAL HYDRATE.

(See Survey A-6.)

*Description and uses.*—Chloral hydrate is a white crystalline solid of sharp taste used chiefly as a sleep-producing drug. Chloral is converted into chloral hydrate by the addition of water, and is also combined with other substances to form various drugs used for neuralgia and as sleep producers.

*Production.*—Chloral hydrate is manufactured by treating ethyl alcohol (grain alcohol) with chlorine gas and subsequently with sulphuric acid and water. The use of denatured alcohol is lawful for this purpose.

Prior to the war its manufacture was attempted here from tax-paid alcohol but discontinued because of the reduction in price of the German product. After the war its manufacture was resumed at St. Louis, Mo., and at Midland, Mich., upon a scale sufficient to supply domestic needs.

*Imports* in 1914 were 644 pounds. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	1,032	\$746	\$0.72	187	25
1921 (9 months).....	1,905	1,758	.92		25

*Exports.*—Statistics not available.

## TERPIN HYDRATE.

(See Survey A-6.)

*Description and uses.*—Terpin hydrate is prepared by the action of nitric acid and alcohol on turpentine oil. It crystallizes in colorless, rhombic prisms, has a slightly aromatic odor and a bitter taste, and is used chiefly as a medicinal.

*Production.*—Terpin hydrate is manufactured in the United States by several firms, but data on production are lacking.

*Imports.*—The largest imports during any one year (1914) were 6,929 pounds, valued at \$1,020, yielding a revenue of \$255. Over 92 per cent of these imports came from Germany. A few small shipments only have been imported in 1921.

*Exports.*—Statistics not available.

#### THYMOL.

(See Survey A-6.)

*Description and uses.*—Thymol is a chemical derived from ajowan seed, native to India, Egypt, Persia, and Afghanistan. It is used in the treatment of disease, as an antiseptic wash, in some brands of tooth pastes, in preparations to destroy molds and certain parasites, as the hookworm, and as an embalming fluid for corpses and anatomical specimens.

*Production.*—Thymol has been produced domestically from imported ajowan seed, although before the war it was chiefly imported from Germany, which had a virtual monopoly in its manufacture. Because of the scarcity of ajowan during the war, experiments have been undertaken on several American plants with the view to obtaining a domestic supply. Present production is not known. Thymol is manufactured to some extent in England and India.

*Imports* for 1914-1918 show an average of 12,199 pounds, valued at \$33,336; revenue, \$8,334. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	33,743	\$105,829	\$3.14	\$26,457	25
1919.....	10,747	82,470	7.67	20,613	25
1920.....	9,557	66,353	6.94	16,533	25
1921 (9 months).....	7,078	34,799	4.92		25

*Exports.*—Statistics not available.

#### UREA.

(See Survey A-6.)

*Description and uses.*—Urea is the commercial name for the substance which is found naturally in the urine as well as in the blood, milk, and other animal fluids. It crystallizes in transparent, colorless, four-sided prisms. Urea forms salts such as the nitrate, oxalate, acetate, citrate, and hydrochloride, used chiefly as medicinals.

Its largest use is as a stabilizer in pyroxylin plastics.

*Production.*—Urea has been manufactured in the United States only since the latter part of 1916. It is made by treating calcium cyanamide with water in the presence of a mineral acid. It may also be prepared from phosgene gas and ammonia.

Calcium cyanamide, the raw material of urea, is manufactured by an American firm with a plant located in Canada. Successful manufacture requires cheap electric power.

Domestic manufacture of urea resulted from the failure of German supplies. The annual production is not known, but is estimated not to exceed 200,000 pounds.

Urea is made in Germany from ammonium cyanate—a by-product of the cyanide industry—by treating with boiling water.

*Imports.*—The largest quantity of urea imported since 1914 was 79,192 pounds, valued at \$32,498, with a revenue of \$8,125 in 1916.

Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	9,929	\$8,149	\$0.82	\$2,037	25
1919.....	14,290	9,741	.68	2,435	25
1920.....	23,693	14,085	.59	3,521	25
1921 (9 months).....	8,800	2,399	.27	.....	25

*Exports.*—None recorded.

#### GLYCEROPHOSPHORIC ACID, AND SALTS AND COMPOUNDS THEREOF.

(See Survey A-6.)

*Description and uses.*—Glycerophosphoric acid is the substance formed when glycerol (glycerin) and phosphoric acid are heated together. It is a clear, colorless liquid when made, but decomposes rapidly and changes color. It is rarely obtained pure and is of little importance commercially, but its salts—sodium, calcium, and potassium glycerophosphates—are used as medicinals. Glycerophosphoric acid is also used in medicine when combined with iron, manganese, quinine, and strychnine.

*Production.*—The production of glycerophosphoric acid and its salts is carried out by several manufacturers of a general line of pharmaceuticals, there being two companies in New York State, two in St. Louis, and one in Philadelphia.

*Imports* show a decrease in quantity since 1914, but an increase in value. In 1917, 5,853 pounds of the acid and its salts were imported as compared with 24,789 pounds in 1914, 15,933 pounds in 1915, and 7,668 pounds in 1916. The revenue obtained during the maximum year, 1914, was \$5,767. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	209	\$849	\$4.06	\$212	25
1919.....	3,840	10,274	2.68	2,569	25
1920.....	7,521	10,958	1.46	2,740	25
1921 (9 months).....	6,595	8,169	1.24	.....	25

*Exports.*—None recorded.

*Important changes in classification.*—Items omitted from this paragraph but contained in paragraph 18, act of 1913, have been transferred to the coal-tar paragraph.

## PARAGRAPH 25.

H. R. 7456.

ACT OF 1916.

PAR. 25. Coal-tar products: Acetanilide not suitable for medicinal use, alpha-naphthol, aminobenzoic acid, aminonaphthol, aminophenetole, aminophenol, aminosalicylic acid, aminoanthraquinone, aniline oil, aniline salt, anthraquinone, arsanilic acid, benzaldehyde not suitable for medicinal use, benzal chloride, benzanthrone, benzdine, benzidine sulfate, benzoic acid not suitable for medicinal use, benzoquinone, benzoyl chloride, benzyl chloride, benzylethylaniline, beta-naphthol not suitable for medicinal use, bromobenzene, chlorobenzene, chlorophthalic acid, cinnamic acid, cumidine, dehydrothiolumidene, diaminostilbene, dianisidine, dichlorophthalic acid, dimethylaniline, dimethylaminophenol, dimethylphenylbenzylammonium hydroxide, dimethylphenylenediamine, dinitrobenzene, dinitrochlorobenzene, dinitronaphthalene, dinitrophenol, dinitrotoluene, dihydroxynaphthalene, diphenylamine, hydroxyphenylarsinic acid, metanilic acid, methylanthraquinone, naphthylamine, naphthylenediamine, nitroaniline, nitroanthraquinone, nitrobenzaldehyde, nitrobenzene, nitronaphthalene, nitrophenol, nitrophenylenediamine, nitrosodimethylaniline, nitrotoluene, nitrotoluylenediamine, phenol, phenylenediamine, phenylhydrazine, phenylnaphthylamine, phenylglycine, phenylglycineortho-carboxylic acid, phthalic acid, phthalic anhydride, phthalimide, quinaldine, quinoline, resorcinol not suitable for medicinal use, salicylic acid and its salts not suitable for medicinal use, sulfanilic acid, thiocarbanilide, thiosalicylic acid, tetrachlorophthalic acid, tetramethyldiaminobenzophenone, tetramethyldiaminodiphenylmethane, toluene sulfochloride, toluene sulfonamide, tribromophenol, toluidine, tolidine, tolylenediamine, xylydine, anthracene having a purity of 30 per centum or more, carbazole having a purity of 65 per centum or more, metacresol having a purity of 90 per centum or more, naphthalene which after the removal of all water present has a solidifying point of seventy-nine degrees centigrade or above, orthocresol having a purity of 90 per centum or more, para-cresol having a purity of 90 per centum or more; all the foregoing products in this paragraph whether obtained, derived, or manufactured from coal tar or other source; all distillates of coal tar, blast-furnace tar, oil-gas tar, and water-gas tar which

## TITLE V.—DYESTUFFS.

SEC. 500. That on and after the day following the passage of this Act, except as otherwise specially provided for in this title, there shall be levied, collected, and paid upon the articles named in this section when imported from any foreign country into the United States or into any of its possessions, except the Philippine Islands and the islands of Guam and Tutuila, the rates of duties which are prescribed in this title, namely:

Group I. \* \* \* quinolin \* \* \* [Free].

Group II. Amidonaphthol, amidophenol, amidosalicylic acid, anilin oil, anilin salts, anthracene having a purity of twenty-five per centum or more, anthraquinone, benzoic acid, benzaldehyde, benzylchloride, benzdine, binitrobenzol, binitrochlorobenzol, binitronaphthalene, binitrotoluol, carbazol having a purity of twenty-five per centum or more, chlorophthalic acid, cumidine, dimethylanilin, dianisidin, dioxynaphthalene, diphenylamin, metacresol having a purity of ninety per centum or more, methylanthraquinone, metanilic acid, naphthalene having a solidifying point of seventy-nine degrees centigrade or above, naphthylamin, naphthol, naphthylenediamin, nitrobenzol, nitrotoluol, nitronaphthalene, nitranilin, nitrophenylenediamin, nitrotoluylenediamin, orthocresol having a purity of ninety per centum or more, paracresol having a purity of ninety per centum or more, phenol, phthalic acid, phthalic anhydride, phenylenediamin, phenylnaphthylamin, resorcin, salicylic acid, sulphanilic acid, toluidin, tolidin, tolylenediamin, xylydin, or any sulphoacid or sulphoacid salt of any of the foregoing, all similar products obtained, derived, or manufactured in whole or in part from the products provided for in Group I, and all distillates which on being subjected to distillation yield in the portion distilling below two hundred degrees centigrade a quantity of tar acids equal to or more than five per centum of the original distillate, all the foregoing not colors, dyes, or stains, photographic chemicals, medicinal, flavors, or explosives, and not otherwise provided for in this title, and provided for in the paragraphs of the Act of October third, nineteen hundred and thirteen, which are here-

on being subjected to distillation yield in the portion distilling below one hundred and ninety degrees centigrade a quantity of tar acids equal to or more than 5 per centum of the original distillate; all similar products by whatever name known, which are obtained, derived, or manufactured in whole or in part from any of the products provided for in this paragraph, or from any of the products provided for in paragraph 1546; all mixtures, including solutions, consisting in whole or in part of any of the foregoing products provided for in this paragraph, except sheep dip and medicinal soaps; all the foregoing products provided for in this paragraph, not colors, dyes, or stains, color acids, color bases, color lakes, leuco-compounds, indoxyl, indoxyl compounds, ink powders, photographic chemicals, medicinals, synthetic aromatic or odoriferous chemicals, synthetic resinlike products, synthetic tanning materials, or explosives, and not specially provided for in paragraph 26 or 1546, 30 per centum ad valorem and 7 cents per pound.

inafter specifically repealed by section five hundred and two, fifteen per centum ad valorem.

SEC. 501. That on and after the day following the passage of this Act, in addition to the duties provided in section five hundred, there shall be levied, collected, and paid upon all articles contained in Group II a special duty of 2½ cents per pound. \* \* \*

During the period of five years beginning five years after the passage of this Act such special duties shall be annually reduced by twenty per centum of the rate imposed by this section, so that at the end of such period such special duties shall no longer be assessed, levied, or collected; but if, at the expiration of five years from the date of the passage of this Act, the President finds that there is not being manufactured or produced within the United States as much as sixty per centum in value of the domestic consumption of the articles mentioned in Group II \* \* \* of section five hundred, he shall by proclamation so declare, whereupon the special duties imposed by this section on such articles shall no longer be assessed, levied, or collected.

SEC. 502. That paragraphs \* \* \* twenty-one, twenty-two, and twenty-three and the words "salicylic acid" in paragraph one of Schedule A of section one of an Act entitled "An act to reduce tariff duties and to provide revenue for the Government, and for other purposes," approved October third, nineteen hundred and thirteen, and paragraphs \* \* \* four hundred and fifty-two, \* \* \* and the words "carbolic" and "phthalic," in paragraph three hundred and eighty-seven of the "free list" of section one of said Act, and so much of said Act or any existing law or parts of law as may be inconsistent with this title, are hereby repealed.

#### ACT OF 1909.

PAR. 1. \* \* \* salicylic acid, five cents per pound; \* \* \*

PAR. 15. \* \* \* all other products or preparations of coal tar, not colors or dyes and not medicinal, not specially provided for in this section, twenty per centum ad valorem.

PAR. 482. Acids: \* \* \* benzoic, carbolic, \* \* \* phthalic, \* \* \* [Free].

PAR. 491. Aniline salts [Free].

PAR. 498. Arseniate of aniline [Free].

PAR. 536. \* \* \* products of coal tar known as \* \* \* naphthalin,

#### ACT OF 1913.

PAR. 1. \* \* \* salicylic acid, 2½ cents per pound; \* \* \*

PAR. 18. \* \* \* acetanilid, \* \* \* 25 per centum ad valorem.

PAR. 21. All other products or preparations of coal tar, not colors or dyes, not specially provided for in this section, 15 per centum ad valorem.

PAR. 22. Coal-tar distillates, not specially provided for in this section; \* \* \* naphthol, resorcin, \* \* \* all the foregoing not medicinal and not colors or dyes, 5 per centum ad valorem.

\* The Treasury Department held on Feb. 9, 1922, that the reduction of specific duties begins on Sept. 9, 1922. (T. D. 39007.)

\* \* \* phenol, cresol, toluidine, xyloidin, cumidin, binitrotoluol, binitrobenzol, benzidin, tolidin, dianisidin, naphtol, naphtylamin, diphenylamin, benzaldehyde, benzyl chloride, resorcin, nitro-benzol, and nitrotoluol, naphtylaminsulfoacids and their sodium or potassium salts, naphtolsulfoacids and their sodium or potassium salts, amidonaphtolsulfoacids and their sodium or potassium salts, amidosalicylic acid, binitrochlorbenzol, diamidostilbendisulfoacid, metanilic acid, paranitranilin, dimethylanilin; all the foregoing not medicinal and not colors or dyes [Free].

PAR. 639. Oils: \* \* \* aniline.  
\* \* \* [Free].

PAR. 23. Coal-tar products known as anilin oil and salts, toluidine, xyloidin, cumidin, binitrotoluol, binitrobenzol, benzidin, tolidin, dianisidin, naphtylamin, diphenylamin, benzaldehyde, benzyl chloride, nitro-benzol and nitrotoluol, naphtylaminsulfoacids and their sodium or potassium salts, naphtolsulfoacids and their sodium or potassium salts, amidonaphtolsulfoacids and their sodium or potassium salts, amidosalicylic acid, binitrochlorbenzol, diamidostilbendisulfoacid, metanilic acid, paranitranilin, dimethylanilin; all the foregoing not medicinal and not colors or dyes, 10 per centum ad valorem.

PAR. 387. Acids: \* \* \* carbolic, \* \* \* phthalic, \* \* \* [Free].

PAR. 452. \* \* \* products of coal tar known as anthracene \* \* \* naphthalin, phenol, and cresol [Free].

#### COAL-TAR INTERMEDIATES.

(See Reports T. I. S.—6, 11, 15, 22, and 23.)

*Description and uses.*—Paragraph 25 includes a class of coal-tar chemicals commonly known as “intermediates.” They do not occur as such in coal tar, but are prepared from the “crudes” by chemical treatment, such as that with sulphuric acid, nitric acid, alkalis or chlorine, and other chemicals. The “crudes” are compounds, such as benzene, toluene, naphthalene, separated by simple methods from coal tar, and are exempt from duty under paragraph 1546.

Intermediates are the raw materials which, by complex chemical processes are converted into dyes, drugs, perfumes, flavors, photographic chemicals, synthetic resins, and tanning materials. They are also used to accelerate the vulcanization of rubber, as camphor substitutes, in the direct production of dyes on the fiber, and for increasing fastness of dyed colors in which case they are known as “developers.” On purification many intermediates are used directly as drugs, perfumes, and flavors.

*Production.*—Previous to the war the small requirements of the domestic dye industry were supplied by importation. Production of a single intermediate, aniline, was organized in 1910 and reached in 1914 an output of 18,000,000 pounds. Production of all intermediates since 1916 is given in the following table. The large reduction in 1919 was due to the decreased output of intermediates required in the manufacture of military explosives and poisonous gases. In 1920 there were 119 firms making 236 intermediates:

	1917	1918	1919	1920
Quantity (pounds).....	322,745,858	357,662,251	177,362,426	257,726,911
Value.....	\$106,966,750	\$124,382,892	\$63,210,079	\$95,291,686

*Imports.*—The prewar supply of intermediates was imported from Germany, a relatively small amount coming from England. In the calendar year 1913 Germany exported to the United States 9,328,000 pounds of intermediates. Imports since 1917 are shown in the following table:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	358,034	\$99,830	\$0.28	\$23,925	23.97
1919.....	178,697	84,815	.47	17,089	20.15
1920.....	4,810,505	751,448	.16	232,980	21.00
1921 (9 months).....	1,329,376	325,587	.24		

*Exports.*—Statistics not available.

*Important changes in classification.*—On December 12, 1918, the Tariff Commission transmitted to the Committee on Ways and Means a report entitled "Dyes and Other Coal-Tar Chemicals." This report recommended amendments to Title V of the act of September 8, 1916, repealing provisions of the tariff act of 1913 relative to coal-tar products. These recommendations have been incorporated in H. R. 7456. (See also Reclassification Report, p. 32.)

Phenol, anthracene, cresol, and naphthalin were exempt from duty under paragraph 452, and phthalic and carbolic acids were admitted free under paragraph 387 of the act of 1913. Cresol is free under the act of 1916. Quinolin, exempt from duty under the act of 1916, is also transferred to the dutiable schedule of H. R. 7456. The provision "after the removal of all water present" has been added relative to the solidifying point of naphthalene.

*Suggested changes.*—Page 8, lines 12, et seq., of H. R. 7456: Arrange alphabetically.

Page 8, line 16, of H. R. 7456, "toluylenediamine" should be spelled "tolylenediamine," without the letter "u."

Page 9, line 1, of H. R. 7456: Insert a comma after "water-gas tar."

## PARAGRAPH 26.

H. R. 7456.

ACT OF 1916.

PAR. 26. Coal-tar products: All colors, dyes, or stains, whether soluble or not in water, color acids, color bases, color lakes, leuco-compounds, whether colorless or not, indoxyl and indoxyl compounds; ink powders; photographic chemicals; acetanilide suitable for medicinal use, acetphenetidine, acetylsalicylic acid, antipyrine, benzaldehyde suitable for medicinal use, benzoic acid suitable for medicinal use, betanaphthol suitable for medicinal use, guaiacol and its derivatives, phenolphthalein, resorcinol suitable for medicinal use, salicylic acid and its salts suitable for medicinal use, salol, and other medicinals; sodium benzoate; saccharin; artificial musk, benzyl ace-

TITLE V.—DYESTUFFS.

SEC. 500. That on and after the day following the passage of this Act, except as otherwise specially provided for in this title, there shall be levied, collected, and paid upon the articles named in this section when imported from any foreign country into the United States or into any of its possessions, except the Philippine Islands and the islands of Guam and Tutuila, the rates of duties which are prescribed in this title, namely:

Group II. \* \* \* benzoic acid,  
\* \* \* salicylic acid \* \* \* 15 per centum ad valorem and 2½ cents per pound.

tate, benzyl benzoate, coumarin, diphenyloxide, methyl anthranilate, methyl salicylate, phenylacetaldehyde, phenylethyl alcohol, and other synthetic odoriferous or aromatic chemicals, including flavors, all of these products not marketable as perfumery, cosmetics, or toilet preparations, and not mixed and not compounded, and not containing alcohol; synthetic phenolic resin and all resinlike products prepared from phenol, cresol, phthalic anhydride, coumarone, indene, or from any other article or material provided for in paragraph 25 or 1546, all of these products whether in a solid, semisolid, or liquid condition; synthetic tanning materials; picric acid, trinitrotoluene, and other explosives except smokeless powders; all of the foregoing products provided for in this paragraph, when obtained, derived, or manufactured in whole or in part from any of the products provided for in paragraph 25 or 1546; natural alizarin and natural indigo, and colors, dyes, stains, color acids, color bases, color lakes, leuco-compounds, indoxyl, and indoxyl compounds, obtained, derived, or manufactured in whole or in part from natural alizarin or natural indigo; natural methyl salicylate or oil of wintergreen or oil of sweet birch; natural coumarin; natural gauliacol and its derivatives; and all mixtures, including solutions, consisting in whole or in part of any of the articles or materials provided for in this paragraph, excepting mixtures of synthetic odoriferous or aromatic chemicals, 35 per centum ad valorem and 7 cents per pound: *Provided*, That the specific duty of 7 cents per pound herein provided for on colors, dyes, or stains, whether soluble or not in water, color acids, color bases, color lakes, leuco-compounds, indoxyl, and indoxyl compounds, shall be based on standards of strength which shall be established by the Secretary of the Treasury, and that upon all importations of such articles which exceed such standards of strength the specific duty of 7 cents per pound shall be computed on the weight which the article would have if it were diluted to the standard strength, but in no case shall any such articles of whatever strength pay a specific duty of less than 7 cents per pound: *Provided further*, That beginning six months after the date of passage of this Act no package containing any such color, dye, stain, color acid, color base, color lake, leuco-compound, indoxyl, or indoxyl compound shall be admitted to entry into the United States unless such package and

Group III. All colors, dyes, or stains, whether soluble or not in water, color acids, color bases, color lakes, photographic chemicals, medicinals, flavors, synthetic phenolic resin, or explosives, not otherwise specially provided for in this title, when obtained, derived, or manufactured in whole or in part from any of the products provided for in Groups I and II, natural alizarin and indigo, and colors, dyes, or color lakes obtained, derived, or manufactured therefrom, thirty per centum ad valorem.

SEC. 501. That on and after the day following the passage of this Act, in addition to the duties provided in section five hundred, there shall be levied, collected, and paid \* \* \* upon all articles contained in Group III (except natural and synthetic alizarin, and dyes obtained from alizarin, anthracene, and carbazol; natural and synthetic indigo and all indigoids, whether or not obtained from indigo; and medicinals and flavors), a special duty of 5 cents per pound.

During the period of five years beginning five years after the passage of this Act such special duties shall be annually reduced by twenty per centum of the rate imposed by this section, so that at the end of such period such special duties shall no longer be assessed, levied, or collected; but if, at the expiration of five years from the date of the passage of this Act, the President finds that there is not being manufactured or produced within the United States as much as sixty per centum in value of the domestic consumption of the articles mentioned in Groups \* \* \* III of section five hundred, he shall by proclamation so declare, whereupon the special duties imposed by this section on such articles shall no longer be assessed, levied, or collected.

SEC. 502. That paragraphs twenty, twenty-one, \* \* \* and the words "salicylic acid" in paragraph one of Schedule A of section one of an Act entitled "An Act to reduce tariff duties and to provide revenue for the Government, and for other purposes," approved October third, nineteen hundred and thirteen, and paragraphs three hundred and ninety-four, \* \* \* and five hundred and fourteen, \* \* \* of the "free list" of section one of said Act, and so much of said Act or any existing law or parts of law as may be inconsistent with this title, are hereby repealed.

<sup>5</sup> The Treasury Department held on Feb. 9, 1922, that the reduction of specific duties begins on Sept. 9, 1922 (T. D. 39007).

the invoice shall bear a plain, conspicuous, and truly descriptive statement of the identity and percentage, exclusive of diluents, of such color, dye, stain, color acid, color base, color lake, leuco-compound, indoxyl, or indoxyl compound contained therein: *Provided further*, That on and after the passage of this Act no package containing any such article shall be admitted to entry into the United States if it or the invoice bears any statement, design, or device regarding such article or the ingredients or substances contained therein which is false, fraudulent, or misleading in any particular; in the enforcement of the foregoing provisos the Secretary of the Treasury shall adopt a standard of strength for each dye or other article which shall conform as nearly as practicable to the commercial strength in ordinary use in the United States prior to July 1, 1914: *Provided further*, That any article or product which may come within the terms of other paragraphs of this Act, as well as within the terms of paragraph 25, 26, or 1546, shall be assessed for duty or exempted from duty as the case may be, under paragraph 25, 26, or 1546.

## ACT OF 1909.

PAR. 15. Coal-tar dyes or colors, not specially provided for in this section, thirty per centum ad valorem; all other products or preparations of coal tar, not colors or dyes and not medicinal, not specially provided for in this section, twenty per centum ad valorem.

PAR. 3. \* \* \* essential oils, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*

PAR. 18. Coloring for brandy, wine, beer, or other liquors, fifty per centum ad valorem.

PAR. 25. Indigo extracts or pastes, three-fourths of one cent per pound; indigo, carmined, ten cents per pound.

PAR. 26. \* \* \* ink powders, twenty-five per centum ad valorem.

PAR. 65. \* \* \* medicinal preparations \* \* \* not specially provided for in this section, twenty-five per centum ad valorem: \* \* \*

PAR. 218. Saccharine, sixty-five cents per pound.

PAR. 435. \* \* \* all explosive substances used for mining, blasting, artillery, or sporting purposes, when valued at twenty cents or less per pound, two cents per pound; valued above twenty cents per pound, 4 cents per pound.

## ACT OF 1913.

PAR. 20. Coal-tar dyes or colors, not specially provided for in this section, 30 per centum ad valorem.

PAR. 1. \* \* \* salicylic acid, 2½ cents per pound; \* \* \*

PAR. 5. \* \* \* all \* \* \* medicinal compounds, \* \* \* 15 per centum ad valorem.

PAR. 18. \* \* \* salol, phenolphthalein, \* \* \* acetanilid, acetphenetidjn, antipyrine, \* \* \* acetylsalicylic acid, aspirin, guaiacol carbonate, \* \* \* 25 per centum ad valorem.

PAR. 21. All other products or preparations of coal tar, not colors or dyes, not specially provided for in this section, 15 per centum ad valorem.

PAR. 26. Coloring for brandy, wine, beer, or other liquors, 40 per centum ad valorem.

PAR. 37. \* \* \* ink powders, 15 per centum ad valorem.

PAR. 46. \* \* \* essential and distilled oils \* \* \* not specially provided for in this section, 20 per centum ad valorem: \* \* \*

PAR. 49. \* \* \* all natural or synthetic odoriferous or aromatic sub-

PAR. 482. Acids: \* \* \* nitropic.  
\* \* \* [Free].

PAR. 487. Alizarin, natural or artificial, and dyes derived from alizarin or from anthracin [Free].

PAR. 536. \* \* \* resorcin \* \* \* [Free].

PAR. 592. Indigo [Free].

PAR. 617. Madder and munjeet, or Indian madder, ground or prepared, and all extracts of [Free].

stances, preparations, and mixtures used in the manufacture of, but not marketable as, perfumes or cosmetics; all the foregoing not containing alcohol and not specially provided for in this section, 20 per centum ad valorem.

PAR. 67. Soda: Benzoate of, 5 cents per pound; \* \* \*

PAR. 179. Saccharin, 65 cents per pound.

PAR. 394. Alizarin, natural or synthetic, and dyes obtained from alizarin, anthracene, and carbazol [Free].

PAR. 501. \* \* \* all explosive substances, not specially provided for in this section, used for mining, blasting, and artillery purposes [Free].

PAR. 514. Indigo, natural or synthetic, dry or suspended in water, and dyes obtained from indigo [Free].

PAR. 538. Madder and munjeet, or Indian madder, ground or prepared, and all extracts of [Free].

#### COAL-TAR FINISHED PRODUCTS.

(See Reports T. I. S.—6, 11, 15, 22, and 23.)

#### DYES AND COLORS.

All colors, dyes, or stains, whether or not soluble in water, color acids, color bases, color lakes, leuco-compounds, whether colorless or not, indoxyl, and indoxyl compounds, ink powders.

*Description and uses.*—Under paragraph 26 is included a variety of products made by chemical processes from the coal-tar intermediates enumerated in paragraph 25. They are used in dyeing, coloring, or staining of vegetable and animal fibers, paper, leather, wood, feathers, varnishes, soaps, fats, foods, and other products; and in the preparation of inks and color lakes, a class of paint pigments. The color bases, leuco-compounds, and indoxyl are either nearly finished dyes or products which are closely related and readily converted into dyes by simple treatment.

*Production.*—Previous to the war the domestic synthetic dye industry was restricted to assembling a limited quantity of dyes from intermediates imported from Germany. In 1914, 6,619,729 pounds of "coal-tar dyes," valued at \$2,470,096, were made from imported intermediates (aniline in part excepted).

During the war the failure of the foreign supply and the great needs of the domestic consumer, combined with great initiative on the part of the dye makers, gave rise to the rapid development of dye manufacturing. In 1917, 45,977,246 pounds were produced, increasing to 88,263,776 pounds in 1920.

Production since 1914 has been as follows:

	1914	1917	1918	1919	1920
Quantity (pounds).....	6,619,729	45,977,246	58,464,446	63,402,194	88,263,776
Value.....	\$2,470,096	\$57,796,228	\$62,026,390	\$67,598,855	\$95,613,749

*Imports* of dyes were 45,950,895 pounds in the fiscal year 1914, at which time the United States depended largely on Germany for a supply of dyes. During the war, when the supply from Europe was shut off, the domestic production rapidly increased. Imports have shown a permanent decrease since 1914. The following table gives the imports of coal-tar dyes and colors since 1917:

Calendar year.	Quantity.	Value.	Unit value.	Duty.
	<i>Pounds.</i>			
1918.....	2,542,039	\$2,578,976	\$1.01	\$865,122
1919.....	2,625,946	3,339,722	1.27	1,104,173
1920.....	3,743,318	5,458,593	1.46	1,795,909
1921 (9 months).....	2,790,095	3,708,336	1.33	.....

*Exports.*—The rapid increase in dye production, during a period when Germany was shut off from the foreign export markets, led to the establishment of an export trade in coal-tar dyes. In 1918 the value of exports of “aniline dyes” was \$8,629,611, and of “all other dyes” (not including logwood extract), \$6,636,099. In 1920, the maximum export year, the exports of “aniline dyes” reached \$22,450,480, and of “all other” \$7,373,111.

For the first nine months of 1921 exports decreased to \$4,089,897 for “aniline dyes” and \$956,074 for “all other.” This great reduction in exports, while attributable in part to the general business depression, was largely due to the appearance of German dyes in the large foreign markets, such as China, India, and Japan. Exports for the calendar years 1918–1921 are given in the following table:

Dyes.	1918	1919	1920	1921 (9 months).
Aniline dyes.....	\$8,629,611	\$10,724,071	\$22,450,480	\$4,089,897
All other dyes and dyestuffs <sup>1</sup> .....	6,636,909	5,004,428	7,373,111	956,074

<sup>1</sup> The domestic exports of dyes, as shown by the Commerce Department, are divided into 3 groups—(1) aniline dyes, (2) logwood extract, and (3) all other dyes and dyestuffs.

The third classification may include both natural dyes (other than logwood extracts, shown separately), as well as coal-tar dyes. Since logwood extract, however, is the most important natural dye exported from the United States, it is reasonable to assume that a considerable portion of “all other dyes and dyestuffs” represents coal-tar dyes.

#### ALIZARIN AND INDIGO.

*Important changes in classification.*—Natural or synthetic alizarin and dyes obtained from alizarin, anthracene, and carbazol (par. 394), and natural or synthetic indigo, dry or suspended in water, and dyes obtained from indigo (par. 514) are on the free list of the act of 1913. They are dutiable under Group III of the act of 1916. Madder and munjeet, or Indian madder, ground or prepared, and all extracts of, are free of duty under paragraph 538, act of 1913. See also paragraph 25, page 76.

#### PHOTOGRAPHIC CHEMICALS.

*Description and uses.*—These important coal-tar chemicals are strong reducing agents and are used as “developers” in photography.

*Production* is given in the following table:

	1917	1918	1919	1920
Quantity (pounds).....	263, 068	316, 749	335, 509	440, 759
Value.....	\$602, 281	\$823, 915	\$1, 059, 340	\$1, 015, 948

*Imports* since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad-valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	14, 550	\$108, 537	\$7. 46	\$33, 289	30. 67
1919.....	12, 059	77, 876	6. 46	23, 966	30. 77
1920.....	21, 808	67, 640	3. 10	21, 382	31. 61
1921 (9 months).....	27, 585	64, 617	2. 34		

*Exports*.—Not separately recorded.

*Important changes in classification*.—See paragraph 25, page 76.

#### MEDICINALS.

*Description and uses*.—From the viewpoint of national welfare the production of a variety of synthetic coal-tar drugs is of great importance. These products have a diversified application in the treatment and diagnosis of disease. The majority of them are of recent introduction in medicine. The most important from the medical standpoint is arsphenamine (salvarsan).

*Production* is shown in the following table:

	1917	1918	1919	1920
Quantity (pounds).....	2, 418, 274	3, 623, 352	6, 777, 988	5, 184, 989
Value.....	\$5, 639, 867	\$7, 792, 984	\$7, 883, 071	\$5, 726, 776

*Imports* since 1917 are given in the following table:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
				<i>Per cent.</i>
1918.....		\$301, 074	\$90, 322	30
1919.....		168, 466	50, 540	30
1920.....		165, 055	49, 517	30
1921 (9 months).....		215, 998		

*Exports* are not separately shown.

*Important changes in classification*.—See paragraph 25, page 76.

*Suggested changes*.—Page 11, line 3, of H. R. 7456: "Guaiaicol" should be "guaiacol."

#### FLAVORS AND PERFUME MATERIALS.

*Description and uses*.—Coal-tar flavors and perfumes are not sharply differentiated, as many are used interchangeably. These classes of coal-tar chemicals constitute a natural and essential branch

of a well-rounded dye industry. They are used as a flavoring material in foods, pharmaceuticals, and tobacco. In addition, many of them are valuable perfumes, serving as satisfactory substitutes for the more costly natural products.

*Production* is given in the following table:

Calendar year.	Flavors.		Perfumes.	
	Quantity.	Value.	Quantity.	Value.
	<i>Pounds.</i>		<i>Pounds.</i>	
1918.....	458,256	\$4,925,627	116,263	\$584,695
1919.....	610,825	1,318,654	41,419	164,302
1920.....	166,884	527,493	99,740	332,008

*Imports* of perfume materials are not shown separately, and imports of flavors have been negligible since 1918.

*Exports.*—Statistics are not available.

*Important changes in classification.*—See paragraph 25, page 76.

#### SYNTHETIC TANNING MATERIALS.

*Description and uses.*—Synthetic tanning materials constitute a new branch of the coal-tar industry, which has been developed since 1918. They are made by the condensation of certain coal-tar derivatives with formaldehyde in the presence of an acid. These products are usually applied in tanning in conjunction with the natural tanning agents.

*Production* figures are not available prior to 1920, when 3,142,861 pounds, valued at \$233,674 were reported.

*Imports* are not separately shown.

*Exports* figures are not available.

*Important changes in classification.*—See paragraph 25, page 76.

#### SYNTHETIC RESINS.

*Description and uses.*—These products are prepared by condensing phenol or cresol or para-coumarone with formaldehyde and ammonia or with hexamethylenetetramine. They are used as an amber substitute in mouth pieces for pipes, for cigarette holders, and similar articles. They are of especial importance as electrical insulating materials and in the manufacture of varnishes and lacquers.

*Production* has increased from 3,094,534 pounds, valued at \$2,311,358 in 1919 to 4,659,680 pounds, valued at \$3,410,119 in 1920.

*Imports* since 1918 are shown below:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1919.....	1,114	\$2,860	\$2.57	\$914	31.95
1920.....	2,479	2,681	1.08	928	34.63
1921 (9 months).....	658	966	1.47	.....	.....

*Exports* are not separately recorded.

*Important changes in classification.*—See paragraph 25, page 76.

COAL-TAR EXPLOSIVES.

*Description and uses.*—Explosives made from coal-tar derivatives are used as high-explosive shell fillers in military shells, torpedoes, and grenades.

Picric acid is a trinitro derivative of phenol. It is a pale yellow solid substance which melts to a liquid at 122° C. It is one of the most powerful explosive shell fillers. The raw materials from which picric acid is made are phenol (carboic acid) or monochlorbenzol and nitric and sulphuric acids. Ammonium picrate is also largely used for the same purposes as picric acid.

Trinitrotoluene, also known as trotyl and T. N. T., is a high explosive used principally in shells. It is preferable to picric acid for most purposes. It is made by the nitration of toluene.

Tetranitroaniline, or tetryl, is a more powerful explosive than picric acid, and is also somewhat more sensitive. It is a solid crystalline substance made by the nitration of dimethylaniline. It has much the same use as picric acid and T. N. T.

*Production* figures are not available; during the war large quantities of picric acid and T. N. T. were produced, and also considerable amounts of the new explosive tetryl.

*Imports* of picric acid in 1918 were 3,240,500 pounds, valued at \$254,385.

*Exports* of picric acid are shown for calendar years in the following table:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	39,584,858	2,474	9,480	1,366
Value.....	\$23,231,892	\$2,684	\$4,022	\$705

*Important changes in classification.*—Explosive substances used for mining, blasting, and artillery purposes are exempt from duty under paragraph 501 of the act of 1913. (See par. 25, p. 76.)

*Suggested changes.*—Page 12, lines 15–19 of H. R. 7456: The provision “That any article or product which may come within the terms of other paragraphs of this Act, as well as within the terms of paragraph 25, 26, or 1546, shall be assessed for duty or exempted from duty, as the case may be, under paragraph 25, 26, or 1546” is too broad. It is therefore suggested that the following phrasing, in which conflicting paragraphs are referred to by number, be adopted:

That any article or product which may come within the terms of paragraph 1, 5, 35, 37, 56, 63, 79, or 1578 of this act, as well as within the terms of paragraph 25, 26, or 1546, shall be assessed for duty or exempted from duty, as the case may be, under paragraph 25, 26, or 1546.

## PARAGRAPH 27.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 27. Cobalt: Oxide, 20 cents per pound; sulphate, linoleate, and all other cobalt compounds, 25 per centum ad valorem.

## ACT OF 1909.

PAR. 16. Cobalt, oxide of, twenty-five cents per pound.

PAR. 3. \* \* \* chemical compounds, \* \* \* and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*

## ACT OF 1913.

PAR. 24. Cobalt, oxide of, 10 cents per pound.

PAR. 5. \* \* \* chemical \* \* \* compounds, \* \* \* and salts, \* \* \* 15 per centum ad valorem.

## COBALT OXIDE.

(See Survey A-6.)

*Description and uses.*—Two grades of cobalt oxide are found on the market, the black and the gray.

The oxide is usually produced directly from the ore, but if the pure substance is wanted the metal is first obtained and then changed to the oxide. Zaffer (par. 1690, free list) is an impure cobalt oxide.

Cobalt oxide is used in the preparation of cobalt salts, in the manufacture of smalt and of enameled ironware, for producing blue enamels and glazes on porcelain, and as a drier for paints and varnishes.

*Production.*—Since Canada began producing cobalt in quantity the production of the oxide in the United States has been very small. Canada furnishes nearly all of the world's supply. The output in 1919 (preliminary figures) of cobalt salts was valued at \$104,970.

*Imports* are almost entirely from Canada. They increased from 28,729 pounds in 1913 to 109,484 pounds in 1914 and to 238,934 pounds in 1916. The import during 1918 was 220,863 pounds.

The large increase in imports of cobalt oxide has been accompanied by a marked decrease in imports of cobalt ore, which was free of duty under the acts of 1909 and 1913. With cobalt oxide dutiable at 25 cents per pound, considerable ore was imported and converted into the oxide in the United States. Since the passage of the act of 1913 plants have been built in Canada; these treat the ore and ship oxide and metal into this country. Imports of cobalt oxide since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	208,596	\$291,699	\$1.40	\$20,860	7.15
1919.....	131,424	184,751	1.41	13,142	7.11
1920.....	202,724	399,605	1.97	20,272	5.07
1921 (9 months).....	85,441	188,721	2.21		

*Exports.*—Statistics not available.

## COBALT SULPHATE.

*Description and uses.*—Cobalt sulphate is a red powder derived by the action of sulphuric acid on cobalt oxidé. Its chief use is in ceramics.

*Production.*—Statistics not available.

*Imports* of cobalt sulphate in 1914 (only year available) were 54,389 pounds, valued at \$15,960.

*Important changes in classification.*—New specific provision.

## COBALT LINOLEATE AND OTHER COBALT COMPOUNDS.

*Description and uses.*—Cobalt linoleate is one of the most important driers used in the paint, varnish, and printing ink industries, owing to the accelerated drying effect which it produces. It is sold largely admixed with linseed or soya-bean oil, in paste or liquid form, ready for direct mixing with paints.

*Production.*—Statistics are not available. Considerable quantities, however, are made in this country. It is produced by heating together solutions of cobalt sulphate and sodium linoleate.

*Imports.*—Statistics are available for 1914 only, when 18,933 pounds, valued at \$4,677, were imported, almost entirely from Germany. It is known that several shipments have come from England during 1921.

*Exports.*—Statistics are not available.

*Important changes in classification.*—New specific provision. The provision for "other cobalt compounds" is also new.

*Suggested changes.*—It is suggested that the words "cobalt salts and compounds" be substituted for the term "cobalt compounds," since tariff acts have long distinguished salts from compounds.

---

**PARAGRAPH 28.**

H. R. 7456.

SENATE AMENDMENTS.

PAR. 28. Cellulose esters, collodion and other liquid solutions of pyroxylin, of other cellulose esters or ethers, or of cellulose, 35 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 17. Collodion \* \* \* forty cents per pound; \* \* \*.

PAR. 25. Collodion and all other liquid solutions of pyroxylin, or of other cellulose esters, or of cellulose, 15 per centum ad valorem; \* \* \*.

## CELLULOSE ESTERS AND SOLUTIONS OF PYROXYLIN.

(See Survey A-6.)

*Description and uses.*—Pyroxylin is a name applied to the soluble nitrates of cellulose. Collodion is a solution of pyroxylin in alcohol and ether. It is used in surgery and to some extent in photography.

Of the other cellulose esters the acetates are the most important. They are made by treating cellulose with acetic anhydride and sulphuric acid. Cellulose acetate is used for making one variety of artificial silk and replaces nitrocellulose where noninflammability is important, as in "dope" or varnish for airplane wings and for moving picture films, when for use in the home or small theaters.

*Production.*—The materials used in the manufacture of pyroxylin are cellulose in some form, nitric acid, and sulphuric acid. These liquid solutions of pyroxylin are made by a group of manufacturers other than those making compounds of pyroxylin (par. 29).

*Imports* of collodion and other liquid solutions of pyroxylin since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....		\$51		\$8	15
1919.....	226	344	\$1.52	52	15
1920.....	996	1,580	1.59	237	15
1921 (9 months).....	2,350	2,180	.93		15

Imports of cellulose esters are not listed separately.

*Exports.*—Statistics not available.

*Important changes in classification.*—Cellulose esters have been specifically mentioned in this paragraph, and the liquid solutions of cellulose esters have been distinguished from compounds of pyroxylin. (See p. 88 and Reclassification Report, p. 37.)

## PARAGRAPH 29.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 29. Compounds of pyroxlin, of other cellulose esters or ethers, or of cellulose, by whatever name known, in blocks, sheets, rods, tubes, or other forms, and not made into finished or partly finished articles, 40 cents per pound; made into finished or partly finished articles, of which any of the foregoing is the component material of chief value, 65 cents per pound and 25 per centum ad valorem: *Provided*, That all such articles, whether or not more specifically provided for elsewhere, shall be dutiable under this paragraph.

ACT OF 1909.

ACT OF 1913.

PAR. 17. \* \* \* all compounds of pyroxylin or of other cellulose esters, whether known as celluloid or by any other name, forty cents per pound; if in blocks, sheets, rods, tubes, or other forms, not polished, wholly or partly, and not made up into finished or partly finished articles, forty-five cents per pound; if polished, wholly or partly, or if in finished or partly finished articles, except moving-picture films, of which collodion or any compound of pyroxylin or of other cellulose esters, by whatever name known, is the component material of chief value, sixty-five cents per pound and thirty per centum ad valorem.

PAR. 25. \* \* \* compounds of pyroxylin or of other cellulose esters, whether known as celluloid or by any other name, if in blocks, sheets, rods, tubes, or other forms not polished, wholly or partly, and not made into finished or partly finished articles, 25 per centum ad valorem; if polished, wholly or partly, or if finished or partly finished articles, of which collodion or any compound of pyroxylin or other cellulose esters, by whatever name known, is the component material of chief value, 40 per centum ad valorem.

## PYROXYLIN PLASTICS.

(See Survey A-6.)

*Description and uses.*—Pyroxylin is a name applied to the soluble nitrates of cellulose.

Pyroxylin plastics are substances composed of pyroxylin, camphor, and a solvent, and are sold under trade names such as "celluloid," "fiberoïd," "viscoloid," "pyralin," and "nixonoid." They are used for making combs, mirror and brush backs, knife-handles, buttons, toys, rims for eyeglasses, and many other articles. Pyroxylin is used also in the manufacture of artificial leather and silk.

*Production.*—The materials used in the manufacture of pyroxylin are cellulose in some form, nitric acid, and sulphuric acid. A stabilizer, usually urea, is added; also pigments and dyes for opaque or colored products.

The domestic production of pyroxylin plastics has increased greatly, its value being in 1899, \$1,526,572; in 1909, \$5,682,379; in 1914, \$8,876,509; and in 1919 (preliminary figures), \$30,169,000.

Germany was formerly the largest producer of pyroxylin and our strongest competitor. England and France were extensive manufacturers of pyroxylin plastics before the war. When the factories were largely given over to the making of explosives the production of plastics in those countries greatly diminished, with a consequent increase in exports from the United States. Japan will probably become the leading competitor under normal conditions, since she controls the world's supply of camphor and is growing in experience in manufacture.

Synthetic camphor was manufactured in this country during the war, but its manufacture was discontinued because of the low prices of natural camphor. It is now reported (December, 1921) that manufacture is to be resumed at an early date.

*Imports* of pyroxylin plastics not made into finished or partly finished articles have not averaged more than 1 per cent of the domestic production, even though a marked increase followed the act of 1913. Imports of the partly or wholly finished manufactured articles in 1914 were about 10 per cent of the domestic production. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
NOT FINISHED.					
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	4,977	\$4,489	\$0.90	\$1,122	25
1919.....	5,234	6,217	1.19	1,554	25
1920.....	7,615	14,210	1.87	3,553	25
1921 (9 months).....	29,445	35,311	1.20		25
POLISHED OR FINISHED.					
1918.....		\$44,846		\$17,938	40
1919.....	26,482	51,340	\$1.94	20,536	40
1920.....		110,843		44,337	40
1921 (9 months).....		71,332			40

*Exports* of celluloid and manufactures in 1910 were valued at \$1,189,080; in 1914, at \$1,387,541; in 1918, at \$3,744,745. In postwar years exports increased to \$9,046,302 in 1920 (calendar year) and then declined to \$1,771,299 during the first nine months of 1921. They have gone chiefly to France, England, Canada, and Italy.

*Important changes in classification.*—The words “or ethers, or of cellulose,” have been added, as compounds are made of cellulose or of cellulose ethers similar to those of pyroxylin.

Compounds of pyroxylin are now dutiable (par. 25, act of 1913) at different rates, depending upon whether or not they are polished, those polished carrying the same rate of duty as manufactured or finished articles composed in chief value of pyroxylin. As this division has caused some litigation, arising from the facts that the polishing constitutes a comparatively slight advance in the value of pyroxylin, and that the surfaces are given finishes other than polishing, this distinction was omitted in H. R. 7456. (Reclassification Report, p. 37.)

### PARAGRAPH 30.

#### H. R. 7456.

#### SENATE AMENDMENTS.

PAR. 30. Compounds of casein, known as galalith, or by any other name, in blocks, sheets, rods, tubes, or other forms, not made into finished or partly finished articles, 25 cents per pound; made into finished or partly finished articles of which any of the foregoing is the component material of chief value not specially provided for, 40 cents per pound and 25 per cent ad valorem.

#### ACT OF 1909.

#### ACT OF 1913.

[No corresponding provision.]

[No corresponding provision.]

#### CASEIN COMPOUNDS.

*Description and uses.*—Galalith, a product of casein, is a hornlike material made largely into fine-toothed combs and other toilet articles. It competes to a certain extent with celluloid articles, but is not so strong and is subject to warping. It is fire resistant, however. The process of manufacture consists in hardening casein with formaldehyde.

*Production.*—The domestic industry manufacturing galalith articles from casein is small. The industry is confined mainly to France, and, to a lesser extent, to Germany. A few manufacturers in this country make finished articles from sheets, rods, tubes, etc. In 1914 the German production amounted to 10 metric tons daily, with the year's output valued at 10,000,000 marks.

Imports since 1917 are as follows:

Calendar year.	Value.	Duty.	Ad valorem rate.
1918.....	\$67,671	\$10,151	15
1919.....	96,284	14,443	15
1920.....	114,515	17,177	15
1921 (9 months).....	70,578		15

Exports.—Statistics not available.

Important changes in classification.—New provision. Now dutiable according to the kind of article.

### PARAGRAPH 31.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 31. Drugs, such as barks, beans, berries, buds, bulbs, bulbous roots, excrescences, fruits, flowers, dried fibers, dried insects, grains, herbs, leaves, lichens, mosses, roots, stems, vegetables, seeds (aromatic, not garden seeds), seeds of morbid growth, weeds, and all other drugs of vegetable or animal origin; any of the foregoing which are natural and uncompounded drugs and not edible, and not specially provided for, but which are advanced in value or condition by shredding, grinding, chipping, crushing, or any other process or treatment whatever beyond that essential to the proper packing of the drugs and the prevention of decay or deterioration pending manufacture, 10 per centum ad valorem: *Provided*, That the term "drug" wherever used in this Act shall include only those substances having therapeutic or medicinal properties and chiefly used for medicinal purposes: *And provided further*, That no article containing alcohol shall be classified for duty under this paragraph.

ACT OF 1909.

PAR. 20. Drugs, such as barks, beans, berries, \* \* \* buds, bulbs, bulbous roots, excrescences, fruits, flowers, dried fibers, dried insects, grains, \* \* \* herbs, leaves, lichens, mosses, nuts, nutgalls, roots, stems, spices, vegetables, seeds (aromatic, not garden seeds), seeds of morbid growth, and woods used expressly for dyeing or tanning; any of the foregoing which

ACT OF 1913.

PAR. 27. Drugs, such as barks, beans, berries, buds, bulbs, bulbous roots, excrescences, fruits, flowers, dried fibers, dried insects, grains, \* \* \* herbs, leaves, lichens, mosses, roots, stems, vegetables, seeds (aromatic, not garden seeds), seeds of morbid growth, and weeds; any of the foregoing which are natural and uncompounded drugs and not edible, and not specially pro-

are natural and uncompounded drugs and not edible, and not specially provided for in this section, but which are advanced in value or condition by any process or treatment whatever beyond that essential to the proper packing of the drugs and the prevention of decay or deterioration pending manufacture, one-fourth of one cent per pound, and in addition thereto ten per centum ad valorem: *Provided*, That no article containing alcohol, or in the preparation of which alcohol is used, shall be classified for duty under this paragraph.

PAR. 504. Balm of Gilead [Free].

PAR. 666. Salep, or salop [Free].

vided for in this section, but which are advanced in value or condition by shredding, grinding, chipping, crushing, or any other process or treatment whatever beyond that essential to the proper packing of the drugs and the prevention of decay or deterioration pending manufacture, 10 per centum ad valorem: *Provided*, That no article containing alcohol shall be classified for duty under this paragraph.

PAR. 592. Salep, or salop [Free].

PAR. 409. Balm of Gilead [Free].

#### BOTANICAL DRUGS.

(See Survey A-7.)

*Production.*—The drugs listed under this paragraph and under paragraph 1562 of the free list are extremely numerous and for the most part are of strictly foreign production. Most of those produced domestically are not grown elsewhere. During the war a number of medicinal staples formerly imported were successfully cultivated in this country. American producers, however, use valuable agricultural land and a high type of labor; foreign materials are collected from plants growing wild, by the cheapest classes of labor. The quality of American drugs excels that of imported products, because of scientific research and methods of cultivation. Among such domestic drugs are belladonna, digitalis, cannabis, henbane, valerian, insect flowers, and Levant wormseed. Important products not commercially cultivated here are senna, rhubarb, quassia, orris root, scammony, squills, and colocynth.

*Imports* were 1,776,386 pounds, valued at \$113,165 in 1914. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	332,319	\$98,652	\$0.30	\$9,865	10
1919.....	731,506	218,789	.30	21,879	10
1920.....		346,335		34,634	10
1921 (9 months).....		125,286			10

Imports of such drugs not advanced in value were valued at \$726,675 in 1914, and reached a maximum of \$1,710,566 in 1918 (fiscal year).

Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....		\$870,829	
1919.....	5,512,940	1,256,307	\$0.23
1920.....	13,102,419	1,505,662	.01
1921 (9 months).....	4,627,735	402,843	.09

Exports of ginseng amounted to \$1,832,686 in 1914. Statistics for the calendar years 1918-1921 follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	226,731	307,585	160,050	105,570
Value.....	\$1,372,586	\$3,338,531	\$1,875,348	\$879,666

Exports of ginseng have been chiefly to Hongkong, Canada, and China.

Exports of all other roots, herbs, and barks were valued at \$476,837 in 1910 and at \$513,071 in 1914. A maximum of \$1,632,281 was reached in 1919 (calendar year). Exports then decreased to \$401,282 during the first nine months of 1921. These exports have been chiefly to England, Canada, and Japan.

*Important changes in classification.*—As the term “drugs” has under past acts been interpreted in different ways, it has been defined as applying only to articles having chief use in medicine. Gums were omitted, as they are seldom used medicinally. The provision for all other drugs was expanded to include those of animal origin. (Reclassification Report, p. 39.)

Balm of Gilead and salep or salop, not mentioned in H. R. 7456, are on the free list of the act of 1913 (pars. 409 and 592).

### PARAGRAPH 32.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 32. Aconite, aloes, asafetida, cocculus indicus, ipecac, jalap, manna, marshmallow or althea root, leaves and flowers, maté, and pyrethrum or insect flowers, all the foregoing which are natural and uncompounded, but which are advanced in value or condition by shredding, grinding, chipping, crushing, or any other process or treatment whatever beyond that essential to proper packing and the prevention of decay or deterioration pending manufacture, 10 per centum ad valorem: *Provided*, That no article containing alcohol shall be classified for duty under this paragraph.

#### ACT OF 1909.

- PAR. 483. Aconite [Free].
- PAR. 503. Asafetida [Free].
- PAR. 538. Cocculus indicus [Free].
- PAR. 594. Ipecac [Free].
- PAR. 597. Jalap [Free].
- PAR. 620. Manna [Free].

PAR. 480. \* \* \* articles manufactured, in whole or in part, not provided for in this section, \* \* \* twenty per centum ad valorem.

PAR. 20. Drugs, \* \* \* advanced \* \* \* one-fourth of one cent per pound, and in addition thereto, ten per centum ad valorem: \* \* \*

#### ACT OF 1913.

- PAR. 388. Aconite [Free].
- PAR. 405. Asafetida [Free].
- PAR. 454. Cocculus indicus [Free].
- PAR. 516. Ipecac [Free].
- PAR. 519. Jalap [Free].
- PAR. 541. Manna [Free].

PAR. 385. \* \* \* articles manufactured, in whole or in part, not provided for in this section, \* \* \* 15 per centum ad valorem.

PAR. 27. Drugs, \* \* \* advanced \* \* \* 10 per centum ad valorem: \* \* \*

## ACONITE.

(See Survey FI-2.)

*Description and uses.*—Aconite is a crude drug. Both the roots and the leaves of the plant are used; the former, however, are more important. Although the chief use of aconite is as a sedative, it is also an important therapeutic. The alkaloid aconitine is also prepared from aconite.

*Production.*—The chief producing countries are Germany, Austria-Hungary, England, Spain, and Japan. As a rule aconite is collected from wild plants chiefly, although it is occasionally cultivated. It has not been commercially produced in the United States because of the small demand and low price.

*Imports* of aconite are small and variable in amount. From 1911 to 1917 they averaged 13,769 pounds, valued at \$1,992. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1919.....	28,712	\$6,283	\$0.22
1920.....	32,476	8,811	.27
1921 (9 months).....	5,168	884	.17

*Exports.*—Statistics not available.

*Important changes in classification.*—Aconite advanced, is transferred from paragraph 388 of the free list of the act of 1913 and made dutiable like other advanced drugs in paragraph 31.

## ALOES.

(See Survey A-7.)

*Description and uses.*—Aloes, the dried juice of a tropical plant, is commonly classed as a gum. It comes in several varieties from Curacao, Dutch West Indies, and from Africa. It is a cathartic and an ingredient of many proprietary pills.

*Production.*—There is no domestic production.

*Imports* of crude aloes from 1909 to 1919 averaged, per annum, 1,059,300 pounds, valued at \$85,351. Statistics for the years 1918-1921 follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	1,750,080	\$146,660	\$0.08
1919.....	1,686,800	176,162	.10
1920.....	1,144,009	99,215	.09
1921 (9 months).....	628,495	44,290	.07

*Exports.*—None recorded.

*Important changes in classification.*—First specific mention of aloes.

## ASAFETIDA.

(See Survey FL-2.)

*Description and uses.*—Asafetida, a crude drug, is a gum resin obtained from the root of *Ferula fetida*. It is an ancient medicinal, not now highly valued, but still used in nervous affections.

*Production.*—Asafetida is collected from a wild plant native to the deserts of Persia and Afghanistan. No attempts have been made to cultivate it. The product comes chiefly by way of India.

*Imports* of asafetida for 1909–1917 averaged 100,734 pounds, valued at \$40,808. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	41,346	\$30,581	\$0.74
1919.....	91,553	179,485	1.96
1920.....	68,694	133,759	1.95
1921 (9 months).....	145,956	241,072	1.65

*Exports.*—Statistics not available.

*Important changes in classification.*—Asafetida advanced, is transferred from paragraph 405 of the free list of the act of 1913, and made dutiable at the rate on other advanced drugs in paragraph 31.

## COCCLUSUS INDICUS.

(See Survey FL-2.)

*Description and uses.*—Cocculus indicus is a berry used in India as a fish poison and in the United States and Europe chiefly in the preparation of ointments for destruction of skin parasites and other purposes. Picrotoxin, used in medicine, is a derivative.

*Production.*—It is derived from a wild plant occurring in India and Ceylon. It is also found in the Philippines.

*Imports* recorded are very small. From 1909 to 1917 they are reported only four times, the total amounting to 24,788 pounds, valued at \$3,445. There is reason to believe, however, that larger imports, invoiced as "fish berries," are not tabulated here. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1919.....	4,097	\$580	\$0.14
1920.....	1,908	213	.11
1921 (9 months).....	21,952	1,383	.06

*Exports.*—Statistics not available.

*Important changes in classification.*—Cocculus indicus advanced is transferred from paragraph 454 of the free list of the act of 1913, and made dutiable at the rate on other advanced drugs in paragraph 31.

## IPECAC.

(See Survey FL-2.)

*Description and uses.*—Ipecac is a crude root drug. It is used in medicine as an emetic and expectorant; also in the manufacture of its alkaloids, of which emetine is the most important.

*Production.*—Ipecac grows wild in South American forests and is collected by Indians. Attempts have been made to cultivate this important and high-priced drug in other tropical regions, but only in India and the Straits Settlements has commercial success on a small scale been attained. American supplies are derived from Colombia and Brazil.

*Imports* of ipecac for 1909–1918 (fiscal years) averaged 76,131 pounds, valued at \$135,248. In recent years its commercial value has increased largely, owing to the demand for emetine. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	137,150	\$267,049	\$1.95
1919.....	118,873	292,046	2.46
1920.....	93,515	230,548	2.47
1921 (9 months).....	50,799	85,005	1.67

*Exports.*—Statistics not available.

*Important changes in classification.*—Ipecac advanced is transferred from paragraph 516 of the free list of the act of 1913 and made dutiable at the rate on other advanced drugs in paragraph 31.

## JALAP.

(See Survey FL-2.)

*Description and uses.*—Jalap, the tuberous root of *Exogonium purga*, is a crude drug. It is used in medicine as a cathartic.

*Production.*—Jalap (from Jalapa, a city in Vera Cruz) is native to Mexico, where it grows wild, and is also cultivated by the Indians. Cultivation on a small scale exists in India, but only the Mexican product reaches America.

*Imports* of jalap for 1909–1917 averaged 183,126 pounds, valued at \$28,574. Quantitatively jalap is one of the chief drug roots imported. Prices in the New York market increased more than five-fold from 1915 to 1919. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	111,873	\$44,833	\$0.40
1919.....	107,838	56,678	.53
1920.....	175,038	85,261	.49
1921 (9 months).....	18,766	3,187	.17

*Exports.*—Statistics not available.

*Important changes in classification.*—Jalap advanced is transferred from paragraph 519 of the free list of the act of 1913 and made dutiable at the rate on other advanced drugs in paragraph 31.

## MANNA.

(See Survey FL-2.)

*Description and uses.*—Manna, the concrete saccharine exudation of the European flowering ash (*Fraxinus ornus*), is a crude drug. It is employed in medicine as a laxative and is a source of mannite, which may also be derived from tagua-nut waste.

*Production.*—Manna is the product of a variety of ash cultivated in Sicily, at present the only commercial source of the drug. It is largely exported to Central and South America. Porto Rico takes considerable quantities; it is little used in the United States.

*Imports* of manna for 1909–1918 averaged 65,415 pounds, valued at \$30,182. Statistics for the years 1918–1921 follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	44,100	\$23,386	\$0.53
1919.....	82,712	47,678	.58
1920.....	76,778	32,397	.42
1921 (9 months).....	20,583	10,626	.52

*Exports.*—Statistics not available.

*Important changes in classification.*—Manna advanced, is transferred from paragraph 541 of the free list of the act of 1913, and made dutiable at the rate on other advanced drugs in paragraph 31.

## MARSHMALLOW OR ALTHEA.

(See Survey FL-2.)

*Description and uses.*—Marshmallow (or althea) root, leaves, and flowers, crude drugs with mucilaginous properties, used chiefly in pharmacy, are not related to the confectionery marshmallows.

*Production.*—These drugs under normal conditions are imported chiefly from Germany, but during the war came from Italy, Spain, and France. The plant is cultivated in Europe and, though introduced here, low prices have deterred growth for drug purposes.

*Imports* of althea root prior to 1917 averaged less than 8,000 pounds. In 1917 the imports were 23,120 pounds, valued at \$5,846. Imports of leaves in 1917 were 21,713 pounds. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
ROOT.			
	<i>Pounds.</i>		
1918.....	10,153	\$2,839	\$0.28
1919.....	32,921	9,579	.29
1920.....	52,904	15,613	.29
1921 (9 months).....	15,218	2,199	.14
LEAVES AND FLOWERS.			
1918.....	14,287	\$1,659	\$0.12
1919.....	17,823	3,908	.22
1920.....	34,475	7,788	.23
1921 (9 months).....	11,287	744	.07

*Exports.*—Statistics not available.

*Important changes in classification.*—First specific mention of marshmallow or althea roots, leaves, or flowers advanced.

*Suggested changes.*—Page 14, line 10 of H. R. 7456: Change the comma after the word “manna” to a semicolon, and in line 11, the comma after the word “flowers” to a semicolon. This change is necessary to make it clear that the words “marshmallow or althea” modify “leaves and flowers” as well as “root.”

#### PYRETHRUM OR INSECT FLOWER.

(See Survey A-7.)

*Description and uses.*—Pyrethrum is a perennial plant growing wild in northern Africa, the Levant, and the Mediterranean coast of Europe, is also cultivated. The root is collected and dried as the valuable portion. It is a powerful irritant and local stimulant.

*Production.*—Gathering of pyrethrum is confined to the localities mentioned above.

*Imports* in 1914 were 503,189 pounds, valued at \$90,435, principally from Austria-Hungary and Germany. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	2,438,939	\$415,484	\$0.17
1919.....	6,183,977	1,717,006	.28
1920.....	5,055,187	2,482,207	.49
1921 (9 months).....	1,911,951	710,375	.37

*Exports.*—Statistics not available.

*Important changes in classification.*—New specific provision.

#### MATÉ.

*Description and uses.*—Maté is a shrub native to Paraguay, an infusion of the prepared leaves of which also called maté is extensively consumed as a beverage in the interior of South America. It contains among other substances a peculiar tannin and the alkaloid caffeine.

*Production.*—The leaves of the shrub are gathered at intervals of two or three years by the natives in South America, and large quantities are annually shipped to the countries of that continent.

*Import and export statistics* not available.

*Important changes in classification.*—New specific provision.

#### PARAGRAPH 33.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 33. Buchu leaves, 10 cents per pound; coca leaves, 10 cents per pound; gentian, one-fourth of 1 cent per pound; licorice root, one-half of 1 cent per pound; sarsaparilla root, 1 cent per pound; belladonna, digitalis, henbane, and stramonium, 25 per centum ad valorem.

## ACT OF 1909.

PAR. 41. \* \* \* coca leaves, five cents per pound; \* \* \*.

PAR. 20. Drugs, \* \* \* advanced \* \* \* one-fourth of one cent per pound, and in addition thereto, ten per centum ad valorem: \* \* \*.

PAR. 559. Drugs, \* \* \* not advanced \* \* \* [Free].

PAR. 611. Licorice root, unground [Free].

## ACT OF 1913.

PAR. 39. Leaves and roots: Buchu leaves, 10 cents per pound; coca leaves, 10 cents per pound; gentian,  $\frac{1}{4}$  cent per pound; licorice root,  $\frac{1}{4}$  cent per pound; sarsaparilla root, 1 cent per pound.

PAR. 27. Drugs, \* \* \* advanced \* \* \* 10 per centum ad valorem: \* \* \*.

PAR. 477. Drugs, \* \* \* not advanced \* \* \* [Free].

## BUCHU LEAVES.

(See Survey A-10.)

*Description and uses.*—Buchu leaves are a crude drug, used in medicine, especially for genito-urinary diseases, but not highly valued in modern therapeutics.

*Production.*—British South Africa is the only commercial source of buchu leaves. The plant is a native shrub which grows wild; owing to extensive collection, it is becoming rare and cultural experiments are being made. In order to conserve the supply an export duty has been placed on buchu by British South Africa. The United States consumes 50 to 80 per cent of the total output.

*Imports* for 1911-1917 averaged 119,168 pounds per year, valued at \$110,544. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	55,549	\$50,677	\$0.91	\$5,555	10.96
1919.....	108,190	133,866	.12	10,819	8.08
1920.....	98,502	218,642	2.22	9,850	4.51
1921 (9 months).....	44,659	42,805	.96		

*Exports.*—Statistics not available.

## COCA LEAVES.

(See Survey A-10.)

*Description and uses.*—Coca leaves are a crude drug used chiefly in the manufacture of cocaine. The Harrison Act as recently amended, and also the war revenue act, provide stringent regulations of traffic in coca leaves. Decocainized coca leaves are used to some extent in the manufacture of soft drinks. This product is in no way related to cocoa.

*Production.*—Coca leaves are commercially produced in South America and to a lesser extent in India and Dutch East Indies. The plant is native to Peru, Bolivia, and Ecuador, and is cultivated in those countries by the natives, who chew the leaves. Successful experimental cultivation has recently been reported in Florida.

*Imports* for 1909–1918 averaged 979,312 pounds, valued at \$136,680. Revenue has practically doubled with an increase in duty from 5 cents to 10 cents a pound. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	1,346,013	\$219,153	\$0.16	\$134,601	61.42
1919.....	795,074	167,957	.21	79,507	47.34
1920.....	634,356	161,643	.25	63,435	39.24
1921 (9 months).....	104,129	15,320	.15		

*Exports.*—Statistics not available.

#### GENTIAN.

(See Survey A-10.)

*Description and uses.*—Gentian is a crude drug root used as a bitter tonic in proprietary medicine. It is the most important of the nonalkaloid bitters.

*Production.*—Gentian plants grow wild in the mountainous portions of central and southern Europe, where they are collected by very cheap labor—women, children, and old men. France is the chief source of our supplies, lesser amounts coming from other European countries.

*Imports* for 1909–1918 averaged 1,376,841 pounds, valued at \$81,063. The average annual revenue on gentian since 1914 has been \$2,676. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	275,747	\$35,913	\$0.13	\$689	1.92
1919.....	603,594	66,238	.11	1,509	2.28
1920.....	1,205,763	98,933	.08	3,014	3.05
1921 (9 months).....	267,381	19,874	.07		

*Exports.*—Statistics not available.

#### LICORICE ROOT.

(See Survey A-10.)

*Description and uses.*—Licorice root is a plant product used in tobacco manufacture and in the preparation of licorice paste. The root yields about 20 per cent or more of its weight in paste. It has been considered indispensable in the manufacture of chewing tobacco, but on account of the shortage during the war, flavoring substitutes containing little or no licorice were developed.

*Production.*—Licorice plant is grown extensively in southern Europe and Asia Minor, and American supplies are normally drawn chiefly from Asiatic Turkey. The licorice plant has also been intro-

duced into America and grows readily in localities where severe frosts do not occur. Occasional attempts at commercial production have been made, but the costs of raising and curing the product have been too high to enable it to compete with imports. Imports of licorice from China have been noted during the war.

*Imports* for 1909-1917 averaged 85,225,819 pounds, valued at \$1,693,014. Since 1914 the average annual revenue has been about \$138,000. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	27,068,489	\$1,985,796	\$0.07	\$67,671	3.41
1919.....	49,487,602	3,815,989	.08	123,719	3.24
1920.....	56,449,621	3,581,469	.06	141,124	3.94
1921 (9 months).....	38,531,788	1,724,826	.04		

*Exports.*—Statistics not available.

#### SARSAPARILLA ROOT.

(See Survey A-10.)

*Description and uses.*—Sarsaparilla is a crude drug used chiefly in proprietary medicines, such as blood purifiers and tonics. It may be, but usually is not employed in soft drinks known as “sarsaparillas.”

*Production.*—Sarsaparilla is chiefly derived from wild plants growing in the forests of Mexico, Central America, and northern South America. Small amounts are cultivated in Jamaica and Ceylon, but products of these localities rarely reach the United States.

*Imports* have tended to decrease in recent years, owing presumably to a lessened medicinal demand. The average import from 1909 to 1918 was 328,748 pounds, valued at \$41,064. Between 1913-1918 sarsaparilla yielded an average annual revenue of \$1,903. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	256,424	\$72,584	\$0.28	\$2,564	3.53
1919.....	211,259	62,568	.30	2,113	3.38
1920.....	220,358	68,915	.31	2,204	3.20
1921 (9 months).....	57,755	14,290	.25		

*Exports.*—Statistics not available.

#### BELLADONNA, DIGITALIS, HENBANE, AND STRAMONIUM.

(See Survey A-7.)

*Description and uses.*—The herbs belladonna, digitalis, henbane, and stramonium are natural exotic drugs which are gathered because of the valuable medicinal properties due to the alkaloids which they contain. Both the leaves and roots of belladonna are used.

The alkaloid atropine, which is derived from it, is of great importance in surgery of the eye, and is also used as a sedative and in the manufacture of pain-relieving plasters. Henbane and stramonium are closely related to belladonna and their uses are much the same. Digitalis, or "foxglove," is used chiefly as a heart tonic. All of these products are official in the United States Pharmacopœia.

*Production.*—Experimental cultivation of these drugs has been carried on in the United States for a number of years, but has assumed commercial importance only since the commencement of the war. While their commercial value is small, nevertheless they are indispensable to the practice of modern medicine. Production of belladonna in 1918 was estimated at 166,000 pounds of herbs, stems, and leaves, and 22,000 pounds of roots. Sixty growers were engaged in its cultivation and utilized 274 acres. California, Michigan, Pennsylvania, and Indiana ranked in acreage in the order mentioned. Michigan has been the chief source of henbane. Stramonium grows wild in the southern Appalachians, where it has been collected to a limited extent. It has been cultivated in California and elsewhere. Digitalis is cultivated in California, Oregon, Virginia, South Carolina, and other States. It now grows wild in the Pacific northwest, where considerable quantities were collected during the war. Its production in 1917 was estimated at 10,000 pounds.

Owing to the care received in cultivation, domestic crude drugs are of superior quality to the imported articles, which grow wild in southern Europe and parts of Asia. But owing to the cheap labor employed in gathering the herbs, the imported drugs constitute the chief source of supply for domestic requirements. The domestic cultivation is not likely to be successful except in the hands of those possessing adequate equipment for proper curing and botanical knowledge of the characteristics of the drugs.

*Import* figures are available for 1914 only, when they were: Belladonna, 141,074 pounds of leaves and 65,886 pounds of roots; digitalis, 22,371 pounds, valued at \$1,874; henbane, 136,429 pounds, valued at \$10,609; and stramonium, 171,574 pounds.

*Exports.*—Statistics not available.

*Important changes in classification.*—These drugs are given specific mention for the first time. Under the act of 1913 (par. 477) they are exempt from duty when not advanced.

#### PARAGRAPH 34.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 34. Ergot, 10 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 562. Ergot [Free].

PAR. 28. Ergot, 10 cents per pound.

ERGOT.

(See Survey A-7.)

*Description, uses, and production.*—Ergot is a crude botanical drug having important and legitimate uses, especially in obstetrics, but employed criminally to produce abortion. It is a fungous growth

on the rye plant, occurring erratically throughout the rye-growing section of the United States, notably in Minnesota and the Dakotas. On account of its poisonous nature, removal from the rye is essential. As ergot grains are two or three times larger than rye grains, passing the rye through a screen removes all but the imperfect or broken ergot. Rye flour containing more than one-tenth of 1 per cent of ergot is held to be adulterated under the Pure Food and Drugs act. Ergot removed from rye by screening is mixed with other refuse, and since machine methods for its separation and collection are not available, it has not proved commercially profitable in the United States. Ergot occurs in all rye-growing countries and is collected chiefly in Russia, Spain, Germany, Austria, and Sweden by cheap hand labor.

*Imports* have come principally from Spain and Russia. For the years 1909-1918 (fiscal) an annual average of 164,642 pounds, valued at \$99,193, is reported. The act of 1913 yielded an average annual revenue of \$14,689. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	97,647	\$61,523	\$0.63	\$9,765	15.87
1919.....	171,950	346,707	2.02	17,195	4.96
1920.....	226,835	789,895	3.48	22,684	2.87
1921 (9 months).....	31,334	51,660	1.65		

*Exports.*—Statistics not available.

### PARAGRAPH 35.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 35. Ethers and esters: Diethyl sulphate and dimethyl sulphate, 25 per centum ad valorem; ethyl acetate, 4 cents per pound; ethyl chloride, 15 cents per pound; ethyl ether, 6 cents per pound; and ethers and esters of all kinds not specially provided for, 25 per centum ad valorem: *Provided*, That no article containing more than 10 per centum of alcohol shall be classified for duty under this paragraph.

ACT OF 1909.

ACT OF 1913.

PAR. 21. Ethers: Sulphuric, eight cents per pound; spirits of nitrous ether, twenty cents per pound; \* \* \* ethers of all kinds not specially provided for in this section, fifty cents per pound; ethyl chloride, thirty per centum ad valorem: *Provided*, That no article of this paragraph shall pay a less rate of duty than twenty-five per centum ad valorem.

PAR. 29. Ethers: Sulphuric, 4 cents per pound; amyl nitrite, 20 per centum ad valorem; amyl acetate and ethyl acetate or acetic ether, 5 cents per pound; ethyl chloride, 20 per centum ad valorem; ethers and esters of all kinds not specially provided for in this section, 20 per centum ad valorem: *Provided*, That no article containing more than 10 per centum of alcohol shall be classified for duty under this paragraph.

## ETHERS AND ESTERS.

(See Survey A-7.)

## GENERAL.

Ether when used as a name alone, without special designation, always signifies ethyl ether or diethyl oxide. The term also serves as a class name to designate a group of organic chemical compounds which are oxides of hydrocarbon alkyl radicals. Esters are products of the action of acids on alcohols with the elimination of water. They are analogous to inorganic salts. Many compounds which are strictly esters are often and incorrectly called ethers.

Of the articles mentioned in this paragraph ethyl ether is the only true ether. The other commodities are, strictly speaking, esters.

## DIETHYL SULPHATE AND DIMETHYL SULPHATE.

*Description and uses.*—Diethyl sulphate and dimethyl sulphate are sulphuric esters of ethyl alcohol and methyl alcohol, respectively. Diethyl sulphate is a fragrant, colorless liquid, inflammable, and boils at 96° C. It is used chiefly as an ethylating agent for introducing the ethyl group in organic compounds, especially in the manufacture of coal-tar dyes. Recent developments in its manufacture indicate that its use for this purpose will increase. It has advantages over other ethylating agents—such as ethyl chloride and ethyl bromide—due to its lower volatility and the ease with which it can be stored, handled, and shipped.

Dimethyl sulphate is very similar chemically to diethyl sulphate, and boils at about 188° C. It is used chiefly as an agent to introduce the methyl group in organic compounds. In the past it has had a wider use as a methylating agent than has diethyl sulphate as an ethylating agent, due to the fact that it was cheaper. With an improved and cheaper process of manufacture, diethyl sulphate will probably assume an increased importance as compared with dimethyl sulphate.

*Production.*—Both of these products are prepared by passing sulphuric anhydride or sulphur trioxide into the corresponding alcohol; that is, ethyl alcohol for diethyl sulphate and methyl alcohol for dimethyl sulphate. Within the last two or three years a new process has been developed for producing diethyl sulphate from the gas ethylene, the latter being obtained from the waste gases of petroleum-cracking processes, from other hydrocarbon gases, or from ethyl alcohol. Diethyl sulphate is produced by passing ethylene into sulphuric acid at a temperature approximating the boiling point of diethyl sulphate. Dimethyl sulphate is produced by passing sulphuric trioxide into methyl alcohol below 0° C. and distilling off the dimethyl sulphate under vacuum. Production statistics are not available.

*Import statistics* are available for dimethyl sulphate only in 1914, when they were 9,134 pounds, valued at \$2,331, chiefly from Germany.

*Exports.*—Statistics not available.

*Important changes in classification.*—Diethyl sulphate and dimethyl sulphate are mentioned specifically for the first time (Reclassification Report, p. 42).

## ETHYL ACETATE.

*Description and uses.*—Ethyl acetate is the acetic ester of ethyl alcohol, and is a colorless liquid boiling at 77° C. It is used chiefly when mixed with amyl acetate as a solvent for pyroxylin plastics. The use of ethyl acetate for this purpose has increased greatly since the introduction of tax-free denatured alcohol. Pure ethyl acetate finds extensive use in the manufacture of artificial fruit essences or flavors.

*Production.*—It is produced by boiling under reflux condensation a mixture of ethyl alcohol, fused sodium acetate, and sulphuric acid, and then distilling off the ethyl acetate. Statistics of production are not available prior to 1919, when the output was 2,251,000 pounds, valued at \$340,000 (preliminary figures).

*Imports* since 1918 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	80	\$39	\$0.49	\$1	10.26
1920.....	400	493	1.23	20	4.06
1921 (9 months).....	30	8	.27		

*Exports.*—Statistics not available.

*Important changes in classification.*—The term “acetic ether,” used as a synonym for ethyl acetate in the act of 1913, has been omitted, since ethyl acetate is an ester. (Reclassification Report, p. 42.)

## ETHYL CHLORIDE.

*Description and uses.*—Ethyl chloride is the hydrochloric ester of ethyl alcohol and is known by many pharmaceutical names. It is a very low-boiling liquid and is put up in mechanically sealed glass or metal tubes. It is used chiefly as a local anesthetic.

*Production.*—Ethyl chloride is usually prepared by treating ethyl alcohol with hydrochloric acid in the presence of a dehydrating agent, such as anhydrous zinc chloride or phosphorus pentoxide. It is also formed by the action of chlorine on ethane and by the action of hydrochloric acid on ether in sealed tubes. Production in 1919 (preliminary figures) was 248,100 pounds, valued at \$166,200.

*Imports* prior to the war averaged about 8,000 pounds per year. Imports in 1917 were about 9,000 pounds, but during the other war years was considerably below the average. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1919.....	22,495	\$2,250	\$0.10	\$450	20.00
1920.....	3,373	3,218	.95	644	20.00
1921 (9 months).....	4,566	4,002	.88		20.00

*Exports.*—Statistics not available.

## ETHYL ETHER.

*Description and uses.*—Ethyl ether, also known as sulphuric ether, is a colorless liquid with a pleasant odor. Inhaled vapors produce anesthesia, the property which gives ether its chief use in surgery. It is also used to some extent as a local anesthetic. Technically ether is largely used in combination with alcohol as a solvent for nitrocellulose (guncotton, collodion, pyroxylin plastics); it also dissolves other substances such as resins, fats, waxes, and alkaloids; and is used in some formulas for denaturing alcohol.

*Production.*—Ether is produced by heating ethyl or grain alcohol with sulphuric acid. Its production in 1914, excluding the explosives industry, was 2,120,082 pounds, valued at \$278,816, or double the production of 1909. The output in 1919 (preliminary figures) was double that of 1914, or 4,111,800 pounds, valued at \$1,103,700. Domestic production supplies the consumption, imports being sporadic and negligible.

*Imports* in 1912 were 1,435 pounds, valued at \$207, decreasing to less than 100 pounds a year, 1915–1918. Since 1918 imports have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	8	\$7	\$0.88	.....	4.57
1919.....	282,576	28,253	.10	\$11,303	40.00
1920.....	100	34	.34	4	11.76

*Exports.*—Statistics not available.

*Important changes in classification.*—The term ethyl ether has been used in place of sulphuric ether (act of 1913), which is not an accurate description of the article. (Reclassification Report, p. 42.)

## ALL OTHER ETHERS AND ESTERS.

*Production.*—The production of all other ethers in 1919 (preliminary figures) was valued at \$225,100.

*Imports* have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	120	\$210	\$1.75	42	20
1919.....	22,796	2,464	.11	493	20
1920.....	249	757	3.04	151	20
1921 (9 months).....	7,654	1,452	.19	.....	20

*Exports.*—Statistics not available.

*Important changes in classification.*—Amyl nitrite and amyl acetate have been omitted and now fall within the provision for "ethers and esters of all kinds" n. s. p. f.

## PARAGRAPH 36.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 36. Extracts, dyeing and tanning: Chestnut, cutch, chlorophyll, divi-divi, fustic, hemlock, logwood, mangrove, myrobalan, oak, Persian berry, quebracho, valonia, wattle, and other extracts, decoctions, and preparations of vegetable origin used for dyeing, coloring, staining, or tanning, not specially provided for, and combinations and mixtures of the foregoing articles in this paragraph, 11 per centum ad valorem: *Provided*, That no article containing alcohol shall be classified for duty under this paragraph.

ACT OF 1909.

ACT OF 1913.

PAR. 22. Extracts and decoctions of logwood and other dyewoods, and extracts of bark, such as are commonly used for dyeing or tanning, not specially provided for in this section, seven-eighths of one cent per pound; \* \* \* extract of Persian berries, twenty per centum ad valorem; chlorophyll, twenty per centum ad valorem; extracts of quebracho, not exceeding in density twenty-eight degrees Baumé, one-half of one cent per pound; exceeding in density twenty-eight degrees Baumé, three-fourths of one cent per pound; extracts of hemlock bark, one-half of one cent per pound; extracts of sumac, and of woods other than dyewoods, not specially provided for in this section, five-eighths of one cent per pound; all extracts of vegetable origin suitable for dyeing, coloring, staining or tanning, not containing alcohol and not medicinal, and not specially provided for in this section, fifteen per centum ad valorem.

PAR. 18. Coloring for brandy, wine, beer, or other liquors, fifty per centum ad valorem.

PAR. 605. Lac dye, \* \* \* [Free].

PAR. 30. Extracts and decoctions of \* \* \* Persian berries, sumac, logwood, and other dyewoods, and all extracts of vegetable origin suitable for dyeing, coloring, or staining, not specially provided for in this section; all the foregoing not containing alcohol and not medicinal,  $\frac{3}{8}$  of 1 cent per pound.

PAR. 26. Coloring for brandy, wine, beer, or other liquors, 40 per centum ad valorem.

PAR. 31. Extract of chlorophyll, 15 per centum ad valorem; \* \* \*

PAR. 526. Lac dye \* \* \* [Free].

PAR. 624. Tanning material: Extracts of quebracho, and of hemlock bark; extracts of oak and chestnut and other barks and woods other than dyewoods such as are commonly used for tanning not specially provided for in this section; \* \* \* [Free].

## EXTRACTS, DYEING AND TANNING.

(See Survey A-8.)

*General.*—Dyeing and tanning materials of vegetable origin bear a close relationship as to origin and process of manufacture and use. The extracts are prepared from barks, woods, and fruits by treatment with hot water followed by evaporation to a liquid of desired density or a solid. Tanning and dye extracts are frequently made in the same plant with the same equipment. In the tanning agents the active ingredient is tannin, while in the dyeing materials coloring matter is sought. Most of the extracts contain both coloring

matter and tannin and many are used for both tanning and dyeing; hence any tariff classification based on use involves administrative difficulties and results in litigation.

All raw materials for manufacture of these extracts are free under the act of 1913 (par. 624). The extracts received in that act a different tariff treatment, depending on their use as a dyeing or tanning material. "Extracts of vegetable origin suitable for dyeing, coloring, or staining, not specially provided for," are dutiable at three-eighths of one cent per pound under paragraph 30, while extracts of vegetable origin, "such as are commonly used for tanning" not specially provided for, are free of duty under paragraph 624. This attempt to classify on basis of use has resulted in litigation.

To facilitate customs classification and to avoid litigation these very similar products were given uniform tariff treatment in H. R. 7456. (Reclassification Report, p. 44.)

#### CHESTNUT EXTRACT.

(See Survey A-8.)

*Description and uses.*—Chestnut extract is the most important domestic tanning agent. It is made from the wood of the chestnut (*Castanea dentata*), a tree of abundant occurrence in the Appalachians, although the blight threatens the entire stand. The liquid extract contains 25 per cent tannin and the solid extract about 60 per cent. They are used in tanning (principally on heavy leathers), and have a small application in dyeing.

*Production* of chestnut extract is not separately shown prior to 1919, when it was 444,735,000 pounds, valued at \$17,287,700 (preliminary figures).

*Imports* of chestnut bark extract (not identical with above) in 1914 were 256,078 pounds, valued at \$4,234, chiefly from France. Imports have been negligible since 1916.

*Exports* of chestnut extract before the war were small. During the war extract was exported to England, amounting to approximately 1,200 tons a month in 1918.

*Important changes in classification.*—Chestnut extract is exempt from duty under the act of 1913 (par. 624).

#### CUTCH EXTRACT.

(See Survey A-8.)

*Description and uses.*—Cutch or catechu is an extract prepared from the wood of the *acacia catechu*. This tree is cultivated in India and Burma, and also occurs in the East Indies and East Africa. The extract is sold in blocks or cakes of dark brown color, brittle and glossy when broken. Cutch is used principally in dyeing and textile printing for the production of the well-known "cutch brown." It is also used to a small extent in tanning.

*Production* in 1919 (preliminary figures) was 525,000 pounds, valued at \$66,500. As this extract is not of domestic origin these figures undoubtedly represent imported solid extract dissolved and sold as liquid extract.

*Imports* in 1914 were 328,940 pounds, valued at \$16,187. Later statistics are not available.

*Exports.*—None recorded.

## EXTRACT OF CHLOROPHYLL.

*Description and uses.*—Chlorophyll, known as leaf green, is the green coloring matter of the leaves and stalks of growing plants. Being soluble, it may be extracted from plants by volatile solvents. The extracts are of minor importance and are used to color liqueurs and cordials, confectionery, food preserves, fats, oils, and soaps.

*Production.*—Chlorophyll is made by extracting the coloring matter of the green plant with alcohol or other solvents. The solvent is then usually recovered by distillation, and a small amount of an alkaline carbonate is added to preserve the color.

*Imports* for 1910–1918 averaged 4,031 pounds annually, valued at \$3,393, with revenue of \$619. The following table shows imports since 1917:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1919.....	371	\$525	\$1.42	\$79	15
1920.....	57	258	4.53	39	15
1921 (9 months).....	1,570	2,592	1.65	.....	15

*Exports.*—Not recorded.

## DIVI-DIVI EXTRACT.

(See Survey A-8.)

*Description and uses.*—Divi-divi (free under par. 1563) is the dried pod of *Caesalpinia coriaria*, a small tree found in the neighborhood of Maracaibo, South America, and also in the West Indies and Central America. The pods are 2 to 3 inches long, red to black brown in color, and after drying frequently resemble the letter "S." They have a tannin content of 40 to 45 per cent, are used as a tanning agent, and are usually leached directly by the tanner. A liquid extract containing 25 per cent tannin is an article of commerce.

*Production* of extract is not separately shown.

*Imports* of the extract are not separately shown, but imports of divi-divi during 1909–1918 averaged 5,459,181 pounds annually, valued at \$98,190. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	22,092,927	\$423,421	\$0.02
1919.....	28,341,366	669,436	.02
1920.....	15,528,823	371,747	.02
1921 (9 months).....	4,051,418	45,190	.01

*Exports.*—Not recorded.

*Important changes in classification.*—Extract of divi-divi is exempt from duty under paragraph 624 of the act of 1913.

## FUSTIC.

(See Survey A-8.)

*Description and uses.*—Fustic wood (free under par. 1563) is a yellow dyewood from the tree *Morus* or *Maclura tinctoria*. The wood is imported from West Indies, Mexico, Central and South America. The extract is made from the heart wood. It occurs as a liquid extract of 51° and as a solid extract, both of which are used in textile and leather dyeing. On cotton it is used extensively for khaki shades.

*Production* in 1914 of fustic extract was 4,509,943 pounds, valued at \$222,804; and in 1919 (preliminary figures) 3,896,000 pounds, valued at \$355,000.

*Import* statistics of fustic extract are not available, but it is understood that this extract is not imported to any extent. Imports of fustic wood during 1909-1915 ranged from 2,466 to 7,121 tons. The maximum import was 17,469 tons in 1916. Fustic wood imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Tons.</i>		
1918.....	11,866	\$280,813	\$23.67
1919.....	696	15,091	21.68
1920.....	1,304	25,033	19.20
1921 (9 months).....	2,378	33,876	14.25

## HEMLOCK-BARK EXTRACT.

(See Survey A-8.)

*Description and uses.*—This extract is obtained from the bark (free under par. 1563) of the eastern hemlock (*Tsuga canadensis*) native to North America. Previous to 1900 hemlock was the most important domestic tanning material; it now ranks second in importance to chestnut. It is used on sole and heavy leather; in combination with oak it produces "Union" tanned leather. The extract is marketed as liquid (25 per cent tannin) and as powder (50 per cent tannin).

*Production* of extract in 1914 was 18,978,013 pounds, valued at \$340,402, and in 1919 (preliminary figures), 19,706,000 pounds, valued at \$879,400.

*Imports* of hemlock bark, which originate in Canada, decreased from a maximum of 20,311 cords in 1909 to only 270 in 1918 (fiscal year). Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Cords.</i>		
1918.....	670	\$5,726	\$8.55
1919.....	904	10,655	11.79
1920.....	3,813	42,912	11.25
1921 (9 months).....	1,434	18,044	12.58

Imports of extract in 1915 were 5,263,296 pounds, valued at \$173,998, chiefly from Canada; in 1920, 45 pounds, valued at \$10; and in 1921, first nine months, 306,557 pounds, valued at \$11,742.

*Exports* are not separately recorded. It is estimated that total exports of extract before the war (to England, Russia, and Canada) did not exceed 10,000 barrels per year.

*Important changes in classification.*—Extract of hemlock bark is exempt from duty under the act of 1913 (par. 624).

## LOGWOOD EXTRACT.

(See Survey A-8.)

*Description and uses.*—Logwood (free under par. 1563) is the most important natural dye. This tree (*Hematoxylin campechianum*) is indigenous to Central and South America, Mexico, and West Indies. Extracts are prepared from the wood by hot-water treatment. Extract is sold as a thick liquid of 51° Tw. and as a solid. A chemically different extract is obtained from the liquid by a chemical process in which the coloring matter is oxidized to hematine, of which there are several commercial grades. These include liquid hematine extracts of 42° and 51° Tw., crystalline hematine paste, and solid hematine or hematine crystals; all of these grades are sometimes known as oxidized logwood extracts. The various forms are used for the dyeing of blacks on wool, silk, cotton, leather, hair, straw, and wood. They serve also as a weighting agent in dyeing silk.

*Production* in 1914 was 28,989,962 pounds, valued at \$1,311,966, and in 1919, 32,727,000 pounds (preliminary figures), valued at \$3,292,500.

*Imports* of logwood ranged from 30,000 to 39,000 tons per year in the period 1910-1915.

Imports since 1917 of logwood and of logwood and other dyewood extracts are given in the following table:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
----------------	-----------	--------	-------------	-------	------------------------

## LOGWOOD AND OTHER DYEWOOD EXTRACTS.

	Pounds.				Per cent.
1918.....	277,748	\$45,895	\$0.16	\$1,042	2.27
1919.....	539,252	62,601	.12	2,022	3.23
1920.....	545,892	50,313	.09	2,047	4.07
1921 (9 months).....	29,867	4,992	.17		

## LOGWOOD.

	Tons.				
1918.....	33,168	\$776,735	\$23.42		
1919.....	29,022	549,885	18.95		
1920.....	72,830	2,179,891	29.93		
1921 (9 months).....	22,655	563,961	24.89		

*Exports* of logwood extracts since 1918 (calendar years) have ranged from \$1,355,936 in 1919 to \$2,605,060 in 1920, and in nine months of 1921 were \$436,849.

## MANGROVE.

(See Survey A-8.)

*Description and uses.*—Mangrove bark (free under par. 1563) on account of its abundance, wide distribution, rapid growth, and low cost is one of the world's most important tanning materials. The mangrove tree occurs in the tidal swamps of tropical countries. The bark is brown, hard, and heavy. It has a tannin content up to 48 per cent; the average of commercial grades is about 35 per cent. The extract known as "mangrove extract" and "mangrove cutch," imported in large blocks, is of a reddish-brown color, and has a tannin content of about 55 per cent. Liquid extracts contain 25 per cent tannin. Extract is manufactured in East Africa, Madagascar, East Indies, Venezuela, and Colombia.

*Imports of mangrove extract in 1914* (only year statistics are available) were 1,981,266 pounds, valued at \$59,899. During the period 1909-1913 imports of mangrove bark ranged from 12,200 to 23,700 tons. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Tons.</i>		
1918.....	2,363	\$96,867	\$40.99
1919.....	2,523	87,869	34.83
1920.....	6,312	260,666	41.30
1921 (9 months).....	2,192	118,393	54.01

*Exports.*—Not recorded.

*Important changes in classification.*—Mangrove extract is exempt from duty under paragraph 624, act of 1913.

## MYROBALAN EXTRACT.

(See Survey A-8.)

*Description and uses.*—Myrobalans (free under par. 1563) are the dried fruit of different species of *Terinmalia* growing in India and China. The most important variety is the Chebullic or black myrobalan. The dried fruit is hard, about 1 inch in length, and resembles a slightly shriveled plum. The peel surrounding the kernel contains most of the tannin. The extracts are used in tanning and to a limited extent in dyeing. The liquid extracts contain 25 and 30 per cent tannin, and the solid extract about 50 per cent tannin.

*Production statistics are not separately given.*

*Imports of myrobalans (fruit) for 1909-1918* averaged 25,302,519 pounds, valued at \$284,442, chiefly from India. Figures since 1917 are given in the following table:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
Myrobalans (fruit):			
1918.....	3,863,382	\$90,798	\$0.02
1919.....	39,898,549	721,153	.02
1920.....	47,766,473	728,208	.02
1921 (9 months).....	16,944,725	125,592	.01
Myrobalan extract and valonia extract:			
1918.....	531,923	19,070	.02
1919.....	2,221,201	53,221	.02
1920.....	2,010,202	53,891	.03
1921 (9 months).....	1,028,960	18,929	.02

*Exports.*—None recorded.

*Important changes in classification.*—Myrobalan extract is exempt from duty under the act of 1913 (par. 624).

## OAK EXTRACT.

(See Survey A-8.)

*Description and uses.*—Oak bark (free under par. 1563) is one of the oldest tanning materials used for sole and heavy leathers. In the eastern United States oak extract is made chiefly from the bark of the chestnut-oak (*Quercus prinus*), while on the Pacific coast extract is prepared from the tan bark oak (*Quercus densiflora*). Barks of other domestic oaks are used to a limited extent. The extract is marketed as a liquid extract, containing 25 per cent tannin, and as a solid extract.

*Production* of oak extract in 1914 was 8,797,218 pounds, valued at \$192,844. Consumption in 1918 was 3,815,056 pounds of solid oak extract and 34,380,396 pounds of liquid oak extract. The production in 1919 (preliminary figures) was 27,726,000 pounds, valued at \$1,390,000.

*Imports* of bark are not separately given. Imports of oak bark extract in 1914 were 143,094 pounds, valued at \$6,539; and in 1915, 65,293 pounds, valued at \$2,628. There were no imports of oak extract 1918-1919. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1920.....	50,165	\$3,549	\$0.07
1921 (9 months).....	1,556,367	87,101	.06

*Exports* are not shown separately.

*Important changes in classification.*—Oak extract is exempt from duty under the act of 1913 (par. 624).

## PERSIAN BERRY EXTRACT.

(See Survey A-8.)

*Description and uses.*—Persian berries (free under par. 1563) are the half dried fruit of different buck-thorn (*Rhamnus*) species. The berries are yellowish green in color, about the size of a pea and possess an intensely bitter taste. They are gathered in France, Spain, Italy, Hungary, and Asia Minor. The extract made by water treatment of the berries is used as a dye in cotton printing. It is also used to a small extent as a stain and for an artist's pigment.

*Imports* during 1910-1917 averaged 70,677 pounds per year, valued at \$8,112, yielding an average annual revenue of \$1,015. Imports of extract after 1918 are given in the following table:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1919 <sup>1</sup> .....	5,209	\$2,691	\$0.52	\$20	0.73
1920.....	11,357	3,631	.32	43	1.17
1921 (9 months).....	2,671	426	.16	.....	.....

<sup>1</sup> No imports of persian berry extract in 1918.

*Exports.*—None recorded.

## QUEBRACHO.

(See Survey A-8.)

*Description and uses.*—Quebracho extract is prepared from a hardwood tree belonging to the genus *Quebrachia*, found in Argentina, Paraguay, and Uruguay. This wood (free under par. 1563) is a natural monopoly of South America. The heart wood is dark red, dense, and is one of the hardest known woods. A cubic foot weighs about 78 pounds. The wood averages about 22 per cent tannin. It is one of the world's most important tanning assets. In 1914 quebracho constituted 38 per cent of the total tanning agents consumed. Liquid quebracho extract contains 35 per cent and the solid extract about 65 per cent tannin. The extracts are sold as untreated and as chemically treated. The latter process increases the solubility.

*Production* of extracts of quebracho averaged in the period 1914-1917, 48,400,000 pounds per year, based on imports of logs. In 1919 the output was 71,412,000 pounds (preliminary figures), valued at \$7,123,800. As only 3,962 tons of logs were imported, this probably includes the imported extract, which was dissolved or chemically treated in this country.

*Imports* of quebracho logs in the period 1908-1918 ranged from 49,000 to 107,000 tons per year. Imports of extract in the period 1908-1918 varied from 62,000,000 to 125,000,000 pounds per year. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
QUEBRACHO LOGS.			
	<i>Tons.</i>		
1918.....	23,986	\$373,188	\$15.56
1919.....	3,962	53,679	13.55
1920.....	56,064	850,284	15.17
1921 (9 months).....	6,547	108,119	16.51
QUEBRACHO EXTRACT.			
	<i>Pounds.</i>		
1918.....	131,264,979	\$5,698,618	\$0.04
1919.....	144,496,648	6,902,947	.05
1920.....	108,897,440	6,700,216	.06
1921 (9 months).....	118,900,294	5,397,612	.04

*Exports* of quebracho extract are chiefly small shipments to Canada.

*Important changes in classification.*—Quebracho extract is exempt from duty under paragraph 624, act of 1913.

## VALONIA EXTRACT.

(See Survey A-8.)

*Description and uses.*—Valonia consists of the acorn cups and beards (free under par. 1563) of certain species of oak. Smyrna, Greece, and Asia Minor export large amounts of valonia. The solid extract is imported and contains about 60 per cent tannin. Valonia and valonia extracts are used in tanning high-grade leathers of light color.

Imports of valonia extract are combined with myrobalan (see p. 110).

Imports of valonia during 1912-1915 ranged from 1,200,000 pounds to 6,300,000 pounds annually. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1919 <sup>1</sup> .....	1,508,849	\$87,098	\$0.06
1920.....	19,760,940	749,171	.04
1921 (9 months).....	17,495,469	320,303	.02

<sup>1</sup> No imports of valonia in 1918.

*Exports.*—Not recorded.

*Important changes in classification.*—Valonia extract is exempt from duty under the act of 1913 (par. 624).

#### WATTLE EXTRACT.

(See Survey A-8.)

*Description, uses, and production.*—The wattle barks (free under par. 1563) are of abundant occurrence and are obtained from a variety of trees in Australia and South Africa. This tanning agent is of comparatively recent development and promises to be of considerable importance. The solid extracts imported contain 60 per cent of tannin.

*Imports of wattle bark and extract* are not separately given.

*Exports.*—None recorded.

*Important changes in classification.*—New specific provision.

#### OTHER EXTRACTS—REDWOODS.

(See Survey A-8.)

*Description and uses.*—The redwoods are divided into "soluble," as Brazil, Peach, Sapan, Pernambuco, and Lima wood. Brazil wood, the most important of this class, is imported from South America; the extract known as hypernic is sold as a liquid of 51° and as a solid. It is principally used in leather dyeing and to a small extent in textile dyeing.

The insoluble redwoods include sanders, cam, bar, calistur, and are of small importance in textile dyeing.

*Production of Brazil and other redwood extracts in 1919* (preliminary figures) was 1,553,000 pounds, valued at \$246,000.

*Imports and exports.*—Statistics are not available.

#### OTHER EXTRACTS—SUMAC.

(See Survey A-8.)

*Description and uses.*—Among "other extracts" is included one of importance prepared from the dried leaves and leaf stems of sumac (free under par. 1563), a plant embracing several species of the *Rhus*, of wide distribution. Italy, United States, Greece, and Spain are large producers of sumac. The domestic harvest is gathered in Vir-

ginia, West Virginia, North Carolina, Maryland, and Pennsylvania. Domestic leaf has an average tannin content of about 22 per cent. The imported leaf (ground and unground) comes from Sicily and yields a lighter colored extract. Extracts occur as liquids of 42° and 51°, containing about 22 and 26 per cent tannin. Sumac extracts are used as a mordant in textile dyeing and as a tanning agent.

*Production* in 1914 of sumac extract (from both domestic and foreign leaf) was 4,512,361 pounds, valued at \$129,631; and in 1919 (preliminary figures), 3,507,000 pounds, valued at \$253,100.

*Imports* of sumac "ground" varied from about 10,000,000 to 20,000,000 pounds per year during the period 1909-1919. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
GROUND SUMAC.					
	<i>Pounds.</i>				<i>Per cent.</i>
1919.....	9,695,500	\$385,201	\$0.04		
1920.....	10,702,849	343,424	.03		
1921 (9 months).....	2,981,500	70,643	.02		
UNGROUND SUMAC.					
1918.....	5,727,288	196,872	\$0.03		
1919.....	5,029,031	173,276	.04		
1920.....	2,293,762	85,098	.04		
1921 (9 months).....	1,243,246	28,867	.02		
SUMAC EXTRACT.					
1918.....	23,706	2,616	\$0.11	\$89	3.40
1920.....	44,049	3,273	.07	165	5.05
1921 (9 months).....	1,886	203	.11		

*Suggested changes.*—Sumac extract is an extract of sufficient importance to be specifically mentioned, as it has been for upward of half a century. Its place in paragraph 36 is between "quebracho" and "valonia."

#### ALL OTHER EXTRACTS.

(See Survey A-8.)

*Description and uses.*—Two important natural dyes of domestic origin are quercitron and osage orange. Quercitron and the related dye—flavine—are prepared from the bark of the black oak (*Quercus velutina*), found in the Appalachians. Osage orange extracts are derived from the wood of the osage orange or bowwood tree (*Toxylon pomiferum* or *Maclura pomiferum*) occurring in Oklahoma, Arkansas, and Texas. These natural extracts are used chiefly in textile and leather dyeing.

*Production* of quercitron in the period 1916 to 1919 varied from 7,600,000 to 15,900,000 pounds (51° extract). The production of osage orange extract in 1919 was 4,827,701 pounds (51° extract). The output of "other natural dye extracts" in 1919 (preliminary figures) was 896,000 pounds, valued at \$425,000, and of "other vegetable tanning extracts" 34,805,000 pounds, valued at \$3,124,000.

Imports of "extracts for tanning, not containing alcohol," since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
ALL OTHER EXTRACTS OF VEGETABLE ORIGIN SUITABLE FOR DYEING, ETC. (CHLOROPHYLL, LOGWOOD, AND OTHER DYEWOODS, NUTGALLS, PERSIAN BERRIES, AND SUMAC ARE SHOWN SEPARATELY).					
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	2,889,865	\$234,375	\$0.08	\$10,837	4.62
1919.....	443,749	80,079	.18	1,664	2.08
1920.....	381,537	75,613	.20	1,431	1.89
1921 (9 months).....	390,767	27,248	.07		

## EXTRACTS OF BARK OTHER THAN HEMLOCK.

1918 <sup>2</sup> .....	6,729,118	\$191,584	\$0.03		
1919.....	1,762,578	92,270	.05		
1920.....	4,497,530	256,087	.06		
1921 (9 months).....	5,354,257	305,138	.05		

## EXTRACTS OF WOODS OTHER THAN DYEWOODS.

1918.....	1,668,942	\$67,890	\$0.04		
1919.....	2,145,120	122,204	.06		
1920.....	859,379	48,624	.06		
1921 (9 months).....	57,508	2,013	.03		

## OTHER EXTRACTS FOR TANNING, N. S. P. F.

1918.....	224,224	\$7,423	\$0.03	\$1,113	15
1919.....	26,354	2,372	.09	356	15
1920.....	134,840	12,830	.10	1,925	15
1921 (9 months).....	8,353,654	160,413	.02		15

<sup>1</sup> Equivalent ad valorem rate.

<sup>2</sup> Includes hemlock bark.

Exports of "All extracts for tanning" since 1918 ranged from \$3,125,842 in 1918 to \$5,598,134 in 1919. During the first 9 months of 1921 they were valued at \$807,325.

## OTHER DYEWOODS AND CRUDE TANNING MATERIALS.

Imports have been as follows:

Calendar year.	Quantity.	Value.	Unit value.
DYEWOODS, OTHER THAN LOGWOOD AND FUSTIC WOOD.			
	<i>Tons.</i>		
1918.....	15,966	\$401,190	\$2.55
1919.....	922	23,286	2.53
1920.....	2,653	51,904	1.96
1921 (9 months).....	1,258	29,936	2.38
ALL OTHER ARTICLES IN A CRUDE STATE USED IN TANNING (HEMLOCK BARK, MANGROVE BARK, MYROBOLANS FRUIT, QUEBRACHO WOOD, AND VALONIA, EXCEPTED).			
	<i>Pounds.</i>		
1918.....		\$48,925	
1919.....	31,748,511	737,367	\$0.02
1920.....	48,602,728	1,188,968	.02
1921 (9 months).....	8,353,654	160,413	.02

*Exports of barks for tanning since 1918 have been as follows:*

	1918	1919	1920	1921 (9 months).
Quantity (tons).....	513	668	300	231
Value.....	\$18,807	\$47,741	\$18,237	\$13,305

*Important changes in classification.*—Lac dye, exempt from duty under the act of 1913 (par. 526), is not mentioned in H. R. 7456. If imported it will probably fall under paragraph 36.

### PARAGRAPH 37.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 37. Flavoring extracts and natural or synthetic fruit flavors, fruit esters, oils, and essences, all the foregoing not containing alcohol, and not specially provided for, 25 per centum ad valorem.

#### ACT OF 1909.

PAR. 3. \* \* \* chemical compounds, mixtures \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*.

PAR. 21. \* \* \* fruit ethers, oils, or essences, one dollar per pound; \* \* \*.

#### ACT OF 1913.

PAR. 49. \* \* \* flavoring extracts, \* \* \* 20 per centum ad valorem.

PAR. 5. \* \* \* chemical \* \* \* compounds, \* \* \* mixtures \* \* \* not specially provided for in this section, 15 per centum ad valorem.

PAR. 46. \* \* \* fruit ethers, oils, and essences, \* \* \* not specially provided for in this section, 20 per centum ad valorem: \* \* \*.

#### FLAVORING EXTRACTS, ETC.

(See Survey A-14.)

*Description and uses.*—Flavoring extracts have been defined by the United States Department of Agriculture as alcoholic solutions of the flavoring and odorous principles of plants. They are extracted from the fruits, seeds, leaves, and roots by using alcohol or by dissolving essential oils in strong alcohol. A second class of extracts consists of solutions of different synthetic aromatic chemicals which possess odors and flavors similar to the natural products. The Department of Agriculture requires that the latter extracts be labeled "imitations" or "substitutes." These synthetic chemicals may be coal-tar products (dutable under par. 26), such as coumarin (the flavoring principle of tonka beans), or methyl salicylate (artificial oil of wintergreen) or benzaldehyde (artificial oil of bitter almonds), or they may be similar synthetic chemicals prepared from natural products isolated from essential oils. Other products, especially the so-called "fruit esters and essences," are made from fusel oil and other alcohols.

The two most important flavoring extracts are vanilla and lemon, and it has been estimated by the Department of Agriculture that they represent more than 95 per cent of the domestic consumption. Vanilla extract alone probably constitutes between 80 and 90 per cent of the total.

In addition to the well-known uses of flavoring extracts in the home these products are extensively employed in the manufacture of ice creams and ices, confectionery of all kinds, fruit sirups and beverages, patent medicines and medicinal compounds, perfumery, and cosmetics, jellies and gelatin, and in many other manufactured food products.

Alcoholic flavoring extracts are dutiable under paragraph 22, according to their alcoholic content rather than under this paragraph.

*Production.*—It is not known that any natural nonalcoholic flavoring extracts are manufactured in this country. Large amounts, however, are manufactured from the so-called fruit esters, and the United States is one of the largest, if not the largest, producer of flavoring extracts. The production of all flavoring extracts was valued at \$11,380,423 in 1914. Census figures for 1919 are not as yet available. Domestic production of coal-tar flavors during 1917–1919 has averaged about 600,000 pounds annually, valued at about \$2,000,000.

*Imports* of all alcoholic flavoring extracts totaled only about \$4,000 for the six-year period 1914–1919, or less than 1 per cent of the exports.

Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
NONALCOHOLIC FLAVORING EXTRACTS.					
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	2,353	\$6,889	\$2.93	\$1,378	20
1919.....	4,364	10,002	2.29	2,000	20
1920.....	10,235	18,704	1.83	3,741	20
1921 (9 months).....	42,116	24,210	.57	.....	20
NONALCOHOLIC FRUIT OILS OR ESSENCES, N. S. P. F.					
1918.....	122	\$347	\$2.84	\$69	20
1919.....	207	6,049	29.22	1,210	20
1920.....	4,423	8,347	1.89	1,669	20
1921 (9 months).....	1,928	3,429	1.78	.....	20

*Exports* of both alcoholic and nonalcoholic flavoring extracts, chiefly to Canada, England, and Cuba, were valued at \$967,421, \$1,341,656, \$1,428,262, and \$705,852 in 1918, 1919, 1920 (calendar years), and the first nine months of 1921, respectively.

*Important changes in classification.*—Flavoring extracts not containing alcohol have been transferred from paragraph 49 (act of 1913) and given a new provision in this paragraph along with “fruit ethers, oils, and essences” (par. 46, act of 1913). The term “fruit ethers” has been changed to “fruit esters,” which is a more proper designation of these compounds. It is impossible commercially to prepare flavoring extracts from certain common fruits, and it is necessary to reproduce these flavors by artificial means. Therefore, a provision has been inserted in this paragraph for “natural or synthetic fruit flavors.” (Reclassification Report, p. 74.)

## PARAGRAPH 38.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 38. Formaldehyde solution or formalin, solid formaldehyde or paraformaldehyde, and hexamethylenetetramine. 25 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 65. \* \* \* medicinal preparations not specially provided for in this section, twenty-five per centum ad valorem: \* \* \*

PAR. 32. Formaldehyde solution containing not more than 40 per centum of formaldehyde, or formalin. 1 cent per pound.

PAR. 5. \* \* \* medicinal \* \* \* preparations. \* \* \* not specially provided for in this section. 15 per centum ad valorem.

## FORMALDEHYDE.

(See Survey A-2.)

*Description and uses.*—Formaldehyde at ordinary temperatures and pressures is a gas, but enters commerce (1) as formalin, a water solution containing about 40 per cent formaldehyde, and (2) as paraformaldehyde, a solid form containing about 95 per cent. It is used as an antiseptic, disinfectant, and preservative; as a reducing agent in the silvering of mirrors; and, with hexamethylenetetramine (made from formaldehyde), industrially in the manufacture of synthetic resinlike products (Bakelite, Condensite, Redmanol).

*Production* of formaldehyde by three firms in 1914 was 8,426,247 pounds, valued at \$655,174. Production was stimulated during the war, and in 1919 had increased to 19,663,800 pounds, valued at \$3,938,300 (preliminary figures). Formaldehyde is made by passing a mixture of air and wood alcohol over a heated copper gauze, a very pure grade of wood alcohol being used, an adequate supply of which is available in the United States from the wood distillation industry. The principal manufacturers of formaldehyde are at Niagara Falls, N. Y., and in New Jersey.

*Imports* prior to and during the war were sporadic and negligible, less than 1 per cent of domestic production. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	148,798	\$25,548	\$0.17	\$1,488	5.82
1919.....	502	113	.23	5	4.44
1920.....	428,444	210,191	.49	4,284	2.04
1921 (9 months).....	85,769	16,547	.19		

The maximum import since the war (1920) is equivalent to slightly more than 2 per cent of the domestic output.

*Exports* in 1918 were valued at \$866,038, about 50 per cent going to France and the remainder largely to the United Kingdom, Italy, and Japan. They increased to \$2,640,225 in 1920 (calendar year), about

50 per cent going to England. The first nine months of 1921 show a decrease to \$275,901. The 1919 exports were one-third the value of the domestic output for the same year.

*Important changes in classification.*—There is no apparent necessity for the restricting clause "containing not more than 40 per cent of formaldehyde" in connection with formaldehyde solution (par. 32, act of 1913). For technical reasons it is not feasible to make a solution of formaldehyde containing more than 40 per cent by weight of formaldehyde. Hence the phrase was omitted. The proper trade name "formalin" was substituted for "formaline."

Paraformaldehyde, or solid formaldehyde, is another important commercial form of formaldehyde. Because of the additional cost of manufacturing the solid formaldehyde from formaldehyde solution, the value of the solid formaldehyde is three or four times that of the solution. That commodity was specially provided for. (Reclassification Report, p. 46.)

#### HEXAMETHYLENETETRAMINE.

*Description and uses.*—Hexamethylenetetramine is an organic compound obtained by treating formaldehyde (see p. 118) with ammonia. When first introduced it was used under various trade names as an important medicinal chemical. In recent years it has assumed commercial importance for accelerating the vulcanization of rubber and as a raw material in the manufacture of the synthetic resin "Redmanol."

*Production.*—Hexamethylenetetramine is obtained as a white crystalline product by evaporating a solution of formaldehyde which has been saturated with ammonia. Statistics of output are not available, but it is known that production has increased greatly in recent years.

*Imports* are available for 1914 only, when they were 11,470 pounds, valued at \$21,136—49 per cent from Germany and 42 per cent from Switzerland.

*Exports.*—Statistics not available.

*Important changes in classification.*—Hexamethylenetetramine, because of its industrial importance, is mentioned specifically.

### PARAGRAPH 39.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 39. Gelatin, glue, and glue size, 20 per centum ad valorem and 1½ cents per pound; manufactures, wholly or in chief value of gelatin; casein glue; isinglass, and other fish sounds, cleaned, split, or otherwise prepared, and agar-agar, 25 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 23. Gelatin, glue, isinglass or fish glue, including agar-agar or Japanese isinglass, and all fish bladders and fish sounds other than crude or

PAR. 34. Gelatin, glue, and glue size, valued not above 10 cents per pound, 1 cent per pound; valued above 10 cents per pound and not above 25 cents per

dried or salted for preservation only, valued at not above ten cents per pound, two and one-half cents per pound; valued at above ten cents per pound and not above thirty-five cents per pound, twenty-five per centum ad valorem; valued above thirty-five cents per pound, fifteen cents per pound and twenty per centum ad valorem; gelatin in sheets, emulsions, and all manufactures of gelatin, or of which gelatin is the component material of chief value, not specially provided for in this section, thirty-five per centum ad valorem; glue size, twenty-five per centum ad valorem.

pound, 15 per centum ad valorem; valued above 25 cents per pound, 25 per centum ad valorem; manufactures of gelatin or manufactures of which gelatin is the component material of chief value, 25 per centum ad valorem; isinglass and prepared fish sounds, 25 per centum ad valorem; agar-agar, 20 per centum ad valorem.

#### GELATIN, GLUE, ISINGLASS, AND AGAR-AGAR.

(See Survey A-9.)

*Description and uses.*—Glue and gelatin are extracted from properly prepared animal tissues, such as hide cuttings and bones of animals, and the skins and heads of fish. Glue and gelatin resemble each other closely in chemical nature, the distinction between them being chiefly a matter of quality. Broadly speaking, glue is impure gelatin, or gelatin is high-grade glue.

Commercial supplies may be classified as follows:

(a) Fish glues, made from fish skins, bones, and heads, usually sold in liquid form.

(b) Bone glues, made from bones of cattle, usually sold in solid form.

(c) Hide glue, made from untanned trimmings of skins and hides, ears, tails, etc. Hide glues have greater adhesive power than the other grades. The better grades of hide glue can hardly be distinguished from technical gelatin.

(d) Technical gelatin, a high-grade product, usually made from hide.

(e) Edible gelatin, made usually from hide, and conforming to the specifications of the Bureau of Chemistry promulgated under the Pure Food and Drugs Act, which require that the gelatin shall be clean and free from odor, that only traces of heavy metals, such as arsenic, copper, and zinc shall be present, and that the manufacture shall be carried out in a sanitary manner.

(f) Photographic or emulsion gelatin, suitable for use in the manufacture of photographic plates and films. The requirements for photographic gelatin are more exacting than for any other use, requiring greater care in manufacture, so that the cost of manufacture and selling price of photographic gelatin exceeds even that of food gelatin.

Glues are used primarily as an adhesive in the manufacture of furniture, toys, and many other articles, plywoods and veneers, leather belts, for the sizing of paper, for bookbinding, for fastening emery, sand, or other abrasives in the manufacture of abrasive paper and cloths. Glue is also an essential ingredient in the composition of match heads. Gelatin is used for stiffening straw hats and cloths, in the manufacture of ice cream and other food preparations, in the

manufacture of capsules for the administration of medicine, and in court-plasters, inks, and photographic plates, and for many other purposes.

Other preparations with adhesive properties like glue are loosely called glues—for example, marine glue, which is a resinous preparation; starch and dextrin glues; and casein glues. The casein glues are the strongest competitor of gelatin glues.

Glue size is made by dissolving solid glue in water, or it may be the water solution of glue obtained by treating the animal matter with water. It is used chiefly for sizing paper.

Isinglass is a preparation of the "sound" or swimming bladder of the sturgeon and other fish. The principal ingredient of isinglass is converted into gelatin on boiling with water. Russian isinglass is the most valued kind. It has been used chiefly for clarifying wine, beer, and other liquids.

Agar-agar, commonly called Bengal or Japanese isinglass, is a dried seaweed obtained largely from Singapore. It is soluble in hot water, and on cooling the solution forms a thick gelatinous jelly. It is used chiefly as a culture media for bacteria. Agar-agar differs from other products in paragraph 39 in that it is a vegetable, not an animal product.

Casein glue is prepared from casein (par. 1598). It is of recent introduction, being used largely during the war on airplanes because of its water-resisting properties. The strength of casein glue is equal to that of medium grade animal glues.

*Production.*—The material used in the manufacture of glue may be divided into three classes—hide, bone, and fish stock. The glue made from fish stock is always sold in liquid form, and is obtained from these prepared materials by extraction with hot water. The glue solution is clarified, concentrated if necessary, and allowed to cake or "jell" in rectangular tanks. These cakes are then cut into the desired sizes and dried in an oven. The dried glue is cut, broken, or pulverized as desired.

The capital of 57 establishments engaged primarily in the manufacture of glue in 1914 was \$17,162,000; output was valued at \$13,733,000. Of this value 80 per cent was produced in Illinois, Massachusetts, New York, and Pennsylvania. Glue to the value of \$5,992,879 was produced by firms engaged in other manufactures, making a total of \$19,725,879 in 1914. The present output is estimated at 10,000,000 pounds annually. Of the output of glue in 1914, slaughtering and meat-packing concerns produced 15.7 per cent and fertilizer manufactures 5.75 per cent. The production supplies at least 85 per cent of the domestic consumption. In 1919, according to preliminary figures, the output of 61 establishments was valued at \$32,084,000, or about double the 1914 production.

*Imports* of glue for 1910 to 1913, inclusive, have been between 6,000,000 and 8,000,000 pounds, increasing sharply to over 22,000,000 in 1914. The imports decreased to about 2,000,000 pounds in 1918 (fiscal year). The import of gelatin prior to 1914 averaged a little over 1,000,000 pounds per year. In 1914 and 1915 over 2,000,000 pounds were imported. The combined import of glue and gelatin in 1914 was in value 13 per cent of the domestic production.

Imports of glue during the calendar year 1920 were largely in the classes "valued at not above 10 cents per pound" and "valued above

25 cents per pound," the imports in each class being about 1,000,000 pounds. Imports of gelatin since 1918 have been almost wholly in the class valued above 25 cents per pound. In recent years imports of glue were chiefly from Belgium, Chile, and India, and imports of gelatin from the Netherlands, Belgium, and France.

Imports of glue size since 1918 have been negligible.

Imports of isinglass and other fish sounds between 1914 and 1918 ranged from 11,906 pounds in 1915 to 85,896 pounds in 1914. Those of agar-agar from 1915 to 1918 averaged per year about 330,000 pounds, valued at a little more than \$100,000.

Imports of manufactures of which gelatin is the component material of chief value reached a maximum of \$492,493 in 1913. During the war they were valued at less than \$100,000. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
GLUE.					
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	741,778	\$173,498	\$0.57	\$37,778	.....

MANUFACTURES OF WHICH GELATIN IS THE COMPONENT MATERIAL OF CHIEF VALUE.					
1918.....		\$11,341		\$2,835	25
1919.....		19,372		4,843	25
1920.....		77,490		19,373	25
1921 (9 months).....		23,095		.....	25

*Exports.*—The export of glue from 1910 to 1915, inclusive, averaged about 2,600,000 pounds per year, and during 1916–1918 were between 4,000,000 and 5,000,000 pounds. It was in value 1.3 per cent

of the domestic production of glue and gelatin in 1914. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months)
Quantity (pounds) .....	5,809,605	8,486,167	13,565,481	1,526,081
Value.....	\$1,110,837	\$1,450,777	\$2,414,657	\$300,075

Exports in recent years have been chiefly to Canada, England, and Germany.

*Important changes in classification.*—Casein glue has been mentioned specifically for the first time.

In the act of 1913 (par. 34) the duty on glue and gelatin is based on the value of the imported product. During the times of fluctuating prices this specification causes a change in the tariff treatment of the various grades and is a temptation to undervalue imports. It is impracticable to write a definition suitable for incorporation in the tariff law which would distinguish glue and gelatin. It was therefore suggested by the Tariff Commission that no attempt be made to distinguish glue from gelatin and that a compound rate of duty be applied to these products. This suggestion was incorporated in H. R. 7456.

The phrase "prepared fish sounds" in paragraph 34, act of 1913, was changed to "fish sounds, cleaned, split, or otherwise prepared" in order to include fish sounds so treated, which had been held exempt from duty under paragraph 419, act of 1913 (*United States v. Brown*, 10 Ct. Cust. Appls., 47, of 1920). (Reclassification Report, p. 48.)

## PARAGRAPH 40.

### H. R. 7456.

### SENATE AMENDMENTS.

PAR. 40. Glycerin, crude, 1 cent per pound; refined, 3 cents per pound.

### ACT OF 1909.

### ACT OF 1913.

PAR. 24. Glycerin, crude, not purified, one cent per pound; refined, three cents per pound.

PAR. 35. Glycerin, crude, not purified, 1 cent per pound; refined, 2 cents per pound.

## GLYCERIN.

(See Survey A-9.)

*Description and uses.*—Glycerin is a heavy, sweet, sirupy liquid. The tariff classification recognizes two grades—crude and refined. There are, however, several divisions of these grades in commerce. The most important grades of the crude are "soap-lye crude glycerin," containing about 80 per cent of glycerin, and "crude saponification glycerin," containing about 85 to 90 per cent. The two important grades of the refined are "dynamite glycerin" and

"chemically pure glycerin." The dynamite grade has a slightly yellowish color and is obtained from crude glycerin by one purification or distillation. The chemically pure grade is water white and has been purified by repeated distillation. The largest use of glycerin is in the manufacture of nitroglycerin for making dynamite. It is used as a solvent, preservative, medicinal, sweetening agent, in nonfreezing liquids, and in the arts.

*Production.*—Glycerin is obtained exclusively as a by-product of the soap, candle, and stearic-acid industries. The raw material for these industries (fats and fatty oils) contain glycerin in chemical combination with fatty acids.

The domestic production of refined glycerin in 1914 was 60,944,799 pounds, of which 59,810,405 pounds were sold at \$10,779,204. The domestic production of crude glycerin is less than one-half the output of the refined. The marketed crude glycerin in 1914 was 16,568,920 pounds, valued at \$2,278,976. This does not include the quantity refined in the plants where produced. The marketed production in 1919 (preliminary figures) was: Refined glycerin, 64,342,800 pounds, valued at \$20,724,000, and crude glycerin, 21,304,300 pounds, valued at \$2,961,600.

*Imports.*—The normal imports of crude glycerin have been between 30,000,000 and 40,000,000 pounds annually, 50 per cent coming from England and France. Since the war the imports of crude glycerin have decreased to 1,875,531 pounds in 1918. From 1910 to 1918 the imports of refined glycerin were very small, amounting to less than 500,000 pounds per year. This indicates that with the existing differential in the duties on the two grades it is cheaper to import crude glycerin and do the refining in this country than to import the refined. The imports of crude glycerin are supplementary to, rather than competitive with, the domestic product, as the demand is much larger than the domestic output. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
CRUDE.					
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	1,087,163	\$467,418	\$0.43	\$10,872	2.33

1921 (9 months).....	510,171	95,104	.19		

*Exports* in 1918, the first recorded, were 21,045,991 pounds, valued at \$10,587,531. 90 per cent going to Italy. This was chiefly a war condition, as shown in the following table which gives statistics for calendar years.

	1918	1919	1920	1921 (9 months).
Quantity.....pounds..	21,754,728	3,963,392	1,742,708	1,156,146
Value.....	\$11,766,636	\$1,190,984	\$429,116	198,417

In postwar years exports were chiefly to Japan, Canada, China, and Cuba.

#### PARAGRAPH 41.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 41. Ink and ink powders not specially provided for, 20 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 26. Ink and ink powders, twenty-five per centum ad valorem.

PAR. 37. Ink and ink powders, 15 per centum ad valorem.

#### INK AND INK POWDERS.

(See Survey A-9.)

*Description and uses.*—The most important ink is black printing ink used in newspaper and book printing. It is composed of finely divided lampblack ground in a varnish composed of linseed oil, rosin oil, a drier, a thinner, and other materials such as soap. In colored inks for printing and lithographing the lampblack is replaced by a color lake, a pigment derived from a coal-tar dye, or in the case of some blues, by a mineral pigment such as Prussian blue. Black writing inks are usually composed of tannate of iron and a gum dissolved in water. Blue writing inks or fluids are usually composed of a mineral pigment such as Prussian blue (which has been chemically treated to make it water soluble) dissolved in water and oxalic acid. Writing inks, other than blacks and most blues, are composed of a coal-tar dye and a gum dissolved in water. In inks used for fountain pens the gum is usually omitted. Ink powders or tablets are soluble coal-tar dyes, and upon the addition of water form a writing fluid. These powders may also be used in other products where a soluble color is required.

*Production* of writing inks in 1914 amounted to over \$2,500,000, and printing inks valued at approximately \$14,000,000 were also produced by American manufacturers. In 1919, according to preliminary figures, the output of writing inks was \$6,434,000 and of printing ink \$26,238,000.

*Imports.*—The average annual import of writing inks for 1910-1918 was valued at \$21,983 (revenue of \$4,402) and of printer's ink, for the same period, at \$11,155 (revenue \$1,899). The import of

writing and printing inks in 1914 was less than one-tenth of 1 per cent of domestic production. Later statistics follow:

Calendar year.	Value. <sup>1</sup>	Duty.	Ad valorem rate.
WRITING AND COPYING INKS.			
1918.....	\$13,363	\$2,004	Per cent. 15
1919.....	15,116	2,267	15
1920.....	15,505	2,326	15
1921 (9 months).....	3,096	.....	15
PRINTERS' INK.			
1918.....	\$4,154	\$623	15
1919.....	199	30	15
1920.....	15,228	2,284	15
1921 (9 months).....	4,595	.....	15
ALL OTHER INKS AND INK POWDER.			
1918.....	\$6,342	\$951	15
1919.....	8,143	1,221	15
1920.....	10,657	1,599	15
1921 (9 months).....	9,176	.....	15

<sup>1</sup> Quantity is not given.

*Exports* of printing ink for 1910-1918 have averaged \$525,106, and the average export of all other inks for the same period was valued at \$242,418. Later statistics follow:

Calendar year.	Printing inks.	All other inks and ink powder.
1918.....	\$1,040,882	\$448,181
1919.....	1,712,926	356,217
1920.....	1,892,752	936,719
1921 (9 months).....	775,127	355,214

Exports of printing inks are chiefly to China, Argentina, and Brazil, and of all other inks chiefly to Cuba, the Philippines, and Canada.

*Important changes in classification.*—Ink powders have been limited to those not specially provided for; those of coal-tar origin are provided for in paragraph 26.

## PARAGRAPH 42.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 42. Iodine, resublimed, 20 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 27. Iodine, resublimed, twenty cents per pound.

PAR. 515. Iodine \* \* \* resublimed [Free].

## IODINE.

(See Survey A-9.)

*Description and uses.*—Iodine, a nonmetallic element, is a grayish or purplish-black solid which volatilizes easily, giving off a violet-colored vapor. It does not occur free in nature, but its salts are widely distributed in small amounts and are always present in sea water and in some mineral springs. The principal source of iodine is found in sodium nitrate beds of Chile. Iodine is used directly and in the form of iodine compounds in medicine. The compounds are also employed in photography. About 80 per cent of the domestic consumption is probably made into sodium and potassium iodides. Crude iodine is provided for in paragraph 1588, page 1335.

*Production* of iodine is not commercially important in the United States, although small amounts have been produced from kelp on the Pacific coast. Exports of iodine from Chile prior to the war were about 1,000,000 pounds, increasing to a maximum of 3,000,000 pounds in 1916 and then decreasing to 2,000,000 pounds in 1918. Chile's potential production as a by-product of nitrate refining is three to four times these amounts. Output in Japan tripled from 1913 to 484,138 pounds in 1917.

*Imports* of crude iodine are chiefly from Chile. These increased from 195,030 pounds in 1914 to 1,726,723 pounds in 1917, but dropped to 200,448 pounds in 1918. Imports from Japan were 1,500 pounds in 1915, but increased to 53,092 pounds in 1918. Recent statistics of imports of crude iodine follow:

Calendar Year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	391,783	\$793,719	\$2.03
1919.....	1,251,086	2,385,226	1.91
1920.....	291,171	547,679	1.88
1921 (9 months).....	639,186	1,411,533	2.21

Imports of resublimed iodine have been negligible; the maximum was 15,550 pounds in 1918 (calendar year), valued at \$49,583.

*Exports.*—Statistics not available.

*Important changes in classification.*—Resublimed iodine is exempt from duty under the act of 1913 (par. 515).

## PARAGRAPH 43.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 43. Bromine and all bromine compounds not specially provided for, 10 cents per pound.

ACT OF 1909.

PAR. 3. \* \* \* chemical compounds, \* \* \* and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*

ACT OF 1913.

PAR. 433. Bromin [Free].  
PAR. 5. \* \* \* chemical \* \* \* compounds, \* \* \* not specially provided for in this section, 15 per centum ad valorem.

## BROMINE AND BROMINE COMPOUNDS.

(See Survey FI-8.)

*Description and uses.*—Bromine is one of the chemical elements. It is a dark reddish-brown, highly corrosive liquid, giving off heavy, irritating vapors. It is produced here almost entirely from natural brine in connection with the salt industry. Bromine is used in the manufacture of certain coal-tar dyes and bromine compounds; the latter are employed principally in photography and medicine. During the World War bromine and some of its compounds were used in gas warfare.

Owing to the corrosive nature of bromine and consequent dangers attending transportation, it enters commerce largely in the form of its salts—sodium bromide, potassium bromide, and ammonium bromide.

*Production* of bromine in the United States in 1913 was 572,000 pounds, increased to a maximum of 1,854,971 pounds, valued at \$1,234,969, in 1919, and then decreased to 1,160,584 pounds, valued at \$745,381, in 1920. Germany is the only other important producer and prior to the war ranked first, with an output in 1912 of 1,909,184 pounds. Domestic figures include bromine content of various bromine compounds, such as sodium and potassium bromide. Production in the United States is as a by-product of the salt industry, and in Germany a by-product of refining potash salts at Stassfurt.

The output of sodium bromide from 1918 to 1920 has been around 500 short tons, valued at \$500,000. It is produced by absorbing free bromine in a solution of sodium carbonate. The production of potassium bromide in 1918 was 666,119 pounds, of which 616,232 pounds, valued at \$551,079, were sold.

*Import* statistics of bromine and its compounds are not available except for 1914, when only 361 pounds of potassium bromide, valued at \$200, were imported.

*Exports.*—Large quantities of bromine were exported to Great Britain, France, and Italy in 1918 during the war, at which time these countries were largely dependent on the United States.

*Important changes in classification.*—Bromine is provided for specifically in the free list of the act of 1913 as "bromin" (par. 433). Because of its corrosive nature, bromine is usually shipped in the form of its various compounds. The provision for bromine was broadened by amendment on the floor of the House of Representatives so as to include the various compounds of bromine.

## PARAGRAPH 44.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 44. Lead: Acetate, white, 3½ cents per pound; acetate, brown, gray, or yellow, 2½ cents per pound; nitrate, 2½ cents per pound; arsenate, resinate, and all other lead compounds not specially provided for, 30 per centum ad valorem.

## ACT OF 1909.

PAR. 58. Lead: Acetate of, white, three cents per pound; brown, gray, or yellow, two cents per pound; nitrate of, two and one-fourth cents per pound; \* \* \*.

PAR. 3. \* \* \* chemical compounds, \* \* \* and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*.

## ACT OF 1913.

PAR. 57. Lead, acetate of, white, and nitrate of,  $1\frac{1}{4}$  cents per pound; acetate of, brown, gray, or yellow, 1 cent per pound; all other lead compounds not specially provided for in this section, 20 per centum ad valorem.

## LEAD COMPOUNDS.

(See Survey A-15.)

## LEAD ACETATE.

*Description and uses.*—Lead acetate, often called sugar of lead, is the most soluble of the common lead salts. It is on the market as (1) "white" or pure acetate of lead and (2) "brown" (also "gray" or "yellow") acetate of lead, an impure grade of the lead salt. White acetate of lead is also known and sold as "crystals," while the brown grade is called "granular." Other qualities of both the white and brown acetate of lead are sold as "broken" or "broken cakes." Lead acetate is one of the most important of lead salts. It is used in the manufacture of pigments and in the preparation of alum mordants for dyeing cloth and some fibers; in medicine, in the preparation of insecticides, and in chemical laboratories as a reagent. The basic lead acetate is used to some extent for weighting silk.

*Production.*—Lead acetate is usually made by the action of acetic acid upon litharge. In the production of "brown" sugar of lead, pyroligneous acid (crude acetic acid or wood vinegar) is used. The brown color is due to the dissolved impurities in pyroligneous acid. Lead acetate may also be made directly from metallic lead or white lead. Basic lead acetate is prepared by dissolving litharge in acetic acid. The output in 1919 (preliminary figures) was 4,183,600 pounds, valued at \$552,400.

*Imports* of lead acetate prior to the war were sporadic and negligible compared with domestic production. They reached a maximum of 128,433 pounds in 1914. During the war and through the first nine months of 1921 there were practically no imports of lead acetate.

*Exports.*—Statistics not available.

## LEAD NITRATE.

*Description and uses.*—Lead nitrate is the compound formed by the action of nitric acid on litharge, and usually costs more than lead acetate, due to the higher cost of nitric acid. It is used in dyeing and calico printing, for the production of mordants, in insecticides, in the manufacture of matches and lead chromate pigments.

*Production.*—Lead nitrate is made by dissolving some form of lead, usually litharge, in dilute nitric acid and crystallizing the lead nitrate from the solution. Statistics are combined with "all other lead compounds," page 130.

*Imports* of lead nitrate prior to the war were less than 200,000 pounds, and during the war years practically ceased. Since the war, the maximum import has been about 4,000 pounds during the first nine months of 1921.

*Exports.*—Statistics not available.

#### LEAD ARSENATE.

*Description and uses.*—Lead arsenate is a white, crystalline compound, which is extremely poisonous, and hence is used chiefly in the manufacture of insecticides.

*Production.*—It is made by the action of a soluble lead salt on a solution of sodium arsenate, with subsequent concentration and crystallization. Domestic production in 1914 amounted to 8,641,900 pounds, valued at \$511,700. In 1919 (preliminary figures) the output was 11,465,800 pounds, valued at \$2,090,300.

*Imports and exports.*—Statistics not available.

*Important changes in classification.*—Mentioned specifically for the first time.

#### LEAD RESINATE.

*Description and uses.*—Lead resinate is one of the most important of the paint and varnish driers. It is a yellowish white, poisonous paste, and is used also as a drier in printing inks. Contrasted with manganese and cobalt driers, lead resinate gives toughness of film with no darkening effect, rather than speed in drying. There are two grades, precipitated and fused.

*Production.*—The precipitated grade is made by heating a solution of lead acetate and rosin oil. The fused grade is made by heating litharge and rosin. Since the war domestic manufacturers have been able to fill all demands.

*Imports* in 1914 were 61,107 pounds of precipitated lead resinate, valued at \$1,099, and 56,560 pounds of the fused resinate, valued at \$4,799. Imports for recent years are not available, but the quantity has not been large.

*Exports.*—Statistics not available.

*Important changes in classification.*—New specific provision.

#### ALL OTHER LEAD COMPOUNDS.

Forty-six different lead compounds were imported during 1914, but only 13 of these in amounts greater than \$100 in value. There are a few salts of lead not specially provided for in the act of 1913 which are commercially important. Lead salts are used as reagents in chemical laboratories, in paint driers, and for the manufacture of rubber, but the quantities required are usually small.

*Production* in the United States of lead acetate, lead nitrate, and other lead compounds for the calendar year 1914 was 7,290,936 pounds, valued at \$474,430. In 1919 (preliminary figures) the output of lead salts (exclusive of arsenate and acetate) was valued at \$335,500. Germany, Great Britain, Belgium, and France manufacture lead salts and other lead components in considerable quantities.

*Imports* of all other lead compounds in 1914 were 102,899 pounds, valued at \$9,348. Imports decreased greatly during the war, and since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	4,510	\$242	\$0.05	\$48	20
1919.....	6,970	1,039	.14	208	20
1920.....	14,053	2,307	.16	461	20
1921 (9 months).....	275	61	.22	.....	20

*Exports.*—Statistics not available.

## PARAGRAPH 45.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 45. Licorice, extracts of, in pastes, rolls, or other forms, 25 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 29. Licorice, extracts of, in paste, rolls, or other forms, two and one-half cents per pound.

PAR. 40. Licorice, extracts of, in pastes, rolls, or other forms, 1 cent per pound.

### LICORICE EXTRACT.

(See Survey A-10.)

*Description and uses.*—Licorice extract is a dried decoction of licorice root. It is sold as a "paste" in cases of 250 to 400 pounds and as stick or roll licorice in small cylinders 6 to 9 inches long and one-half to 1 inch in thickness. The paste is used almost entirely in chewing tobacco, and the roll and stick forms in pharmacy and confectionery.

*Production.*—Licorice extract is extensively produced in Italy. Lesser amounts are manufactured in Russia, Spain, Turkey, and other European countries. It is also extensively manufactured in America from the imported root, and it is prepared chiefly by tobacco manufacturers for their own use. American production is characterized by a higher type of mechanical process than that used abroad, which is chiefly dependent upon cheap hand labor. The root yields about one-fifth of its weight in extract. The production of extract in the United States may be estimated from the root imported to be about 17,000,000 pounds annually. Imports of licorice extract are usually of a high grade, and are used mainly in pharmacy.

*Imports* come chiefly from Spain. They have continued to increase under the successively decreasing rates of recent acts. Trade in this product has also grown at the expense of that of licorice root, owing to the greater bulk of the latter and the shipping restrictions imposed

under war conditions. During the year 1909, when it was dutiable at  $4\frac{1}{2}$  cents a pound, 520,446 pounds of licorice extract entered. For the years 1910-1913, at  $2\frac{1}{2}$  cents a pound, the average annual amount was 820,205 pounds. During the years 1915-1918, when it was dutiable at 1 cent per pound, the average annual imports increased to 1,162,437 pounds. Revenues have decreased with the diminution in rate. For 1909-1913 they averaged \$22,244 annually; for 1915-1918, \$11,624. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	399,146	\$159,698	\$0.40	\$3,991	2.50
1919.....	871,178	581,909	.67	8,712	1.50
1920.....	1,796,358	730,793	.41	17,964	2.46
1921 (9 months).....	802,468	225,078	.28		

*Exports.*—Statistics not available.

#### PARAGRAPH 46.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 46. Lime, citrate of, 7 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 613. Lime, citrate of [Free].

PAR. 41. Lime, citrate of, 1 cent per pound.

#### CITRATE OF LIME.

(See Survey A-1.)

*Description and uses.*—Citrate of lime is an intermediate substance obtained in the manufacture of citric acid from the juice of lemons or other citrus fruits. It is used only for the manufacture of citric acid.

*Domestic production.*—Citrate of lime is produced in California from cull lemons, but in amounts much below imports. (See par. 1, p. 13.)

*Imports* for the fiscal year 1913 amounted to 5,526,954 pounds, valued at \$756,309. Imports increased in 1916 to 8,127,364 pounds, valued at \$1,763,652, and yielding a revenue of \$81,273. Imported citrate of lime comes almost entirely from Sicily. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	2,961,395	\$773,812	\$0.26	\$29,614	3.83
1919.....	3,864,330	1,583,261	.41	38,643	2.44
1920.....	12,490,196	3,027,823	.24	124,902	4.13
1921 (9 months).....	754,966	116,157	.15		

*Exports.*—Statistics not available.

*Suggested changes.*—The rates of duty between citrate of lime (7 cents per pound) and citric acid in paragraph 1 (12 cents per pound) are maladjusted. Citrate of lime is a raw material used for the manufacture of citric acid, 2 pounds of citrate of lime being required to produce 1 pound of citric acid; hence a duty of 7 cents per pound on citrate of lime is equivalent to 14 cents per pound on the citric-acid content, which is 2 cents greater than the duty provided for citric acid. Therefore manufacturers engaged in converting citrate of lime into citric acid are placed at a disadvantage of 2 cents per pound in purchasing their raw material, as compared with imported citric acid.

## PARAGRAPH 47.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 47. Magnesium: Carbonate, precipitated,  $2\frac{1}{2}$  cents per pound; chloride, three-fourths of 1 cent per pound; sulphate or Epsom salts, one-half of 1 cent per pound; oxide, medicinal, 7 cents per pound; calcined magnesia not suitable for medicinal use and calcined magnesite, including dead burned and grain, three-fourths of 1 cent per pound; and magnesite, crude or ground, one-half of 1 cent per pound.

ACT OF 1909.

PAR. 31. Magnesia and carbonate of, medicinal, three cents per pound; calcined, medicinal, seven cents per pound; sulphate of, or Epsom salts, one-fifth of one cent per pound.

PAR. 3. \* \* \* chemical compounds, \* \* \* and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*

PAR. 618. Magnesite, crude or calcined, not purified [Free].

ACT OF 1913.

PAR. 42. Magnesia: Calcined,  $3\frac{1}{2}$  cents per pound; carbonate of, precipitated,  $1\frac{1}{2}$  cents per pound; sulphate of, or Epsom salts,  $\frac{1}{10}$  cent per pound.

PAR. 5. \* \* \* chemical \* \* \* compounds, \* \* \* and salts, \* \* \* not specially provided for in this section, 15 per centum ad valorem.

PAR. 539. Magnesite, crude or calcined, not purified [Free].

## MAGNESIUM COMPOUNDS.

(See Survey A-10.)

### MAGNESIUM CARBONATE, PRECIPITATED.

*Description and uses.*—Magnesium carbonate is a white insoluble substance. The pure product is used in medicine, in tooth and face powders, metal and glass polishes, and in some paints. Crude carbonate is used extensively as an insulating covering for furnaces and steam pipes.

*Production* in 1919 (preliminary figures) was 2,064,700 pounds, valued at \$85,700.

*Imports* in 1914 were 58,683 pounds, chiefly from England. They decreased during the war, and since then have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....					
1919.....	5,094	\$1,101	\$0.22	\$76	6.94
1920.....	14,930	1,512	.10	224	14.81
1921 (9 months).....	15,172	1,701	.11		

*Exports.*—Statistics not available.

#### MAGNESIUM CHLORIDE.

*Description and uses.*—Magnesium chloride—an important magnesium compound—is used as a raw material for the manufacture of metallic magnesium, which is fast becoming of great industrial importance. It is also used along with calcined magnesia in making oxychloride cement, which serves for floors, artificial marble, and stucco work.

*Production.*—It was not produced in this country prior to the war. Our needs were supplied by imports from Germany, where it is obtained as a by-product in the purification of potash salts at Stassfurt. A large production was developed in the United States during the war, chiefly as a by-product of the salt industry, particularly from the salt brines in Michigan. Statistics of production are not available.

*Imports* for 1914 were as follows: Commercial crystals, 2,515,752 pounds, valued at \$11,233, 75 per cent from Germany; chemically pure crystals, 3,030,936 pounds, valued at \$34,180, and chemically pure anhydrous, 35,438 pounds, valued at \$1,513, all from Germany. Imports since 1918 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	13,076	\$1,619	\$0.12	243	15
1919.....	11,200	537	.05	81	15
1920.....	454,334	7,098	.01	1,065	15
1921 (9 months).....	4,263,941	48,518	.01		15

*Exports.*—Statistics not available.

*Important changes in classification.*—Because of its importance for industrial uses and the fact that it was imported in large quantities prior to the war, magnesium chloride was specially provided for.

#### MAGNESIUM SULPHATE (EPSOM SALTS).

*Description and uses.*—Magnesium sulphate (Epsom salts) is a white, crystalline salt which is readily soluble in water. It is used extensively for sizing cotton goods and for weighting silks, paper,

and leather. The purified magnesium sulphate is used in the manufacture of laxative mineral water and for medicinal uses.

*Production* in 1914 was 29,265,115 pounds, valued at \$297,000. The 1919 production was double that of 1914, or 58,696,000 pounds, valued at \$1,497,000 (preliminary figures). Some natural deposits of Epsom salts, which before the war could not compete with the imported product, are now being worked. Germany produces enormous quantities as a by-product from the Stassfurt potash deposits.

*Imports* in 1914 were 13,549,599 pounds, chiefly from Germany. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds</i>				<i>Per cent.</i>
1918.....	2,045	\$196	\$0.10	\$2	1.05
1919.....	17,647	1,473	.08	18	1.20
1920.....	1,803,769	66,944	.04	1,804	2.69
1921 (9 months).....	8,282,870	69,221	.01		

*Exports.*—Statistics not available.

#### MAGNESIUM OXIDE AND CALCINED MAGNESIA.

*Description and uses.*—The term magnesia refers to magnesium oxide. The term calcined magnesia is sometimes confused with calcined magnesite because of similar chemical composition. Strictly speaking, calcined magnesia is restricted to those grades of magnesium oxide obtained from other magnesium salts, or by chemical processing of dolomite rather than to the more impure product obtained by calcination of magnesite (see calcined magnesite, p. 136). Magnesium oxide, medicinal, is prepared by calcination of precipitated magnesium carbonate and must conform to specifications of the United States Pharmacopœia. Technical calcined magnesia is used largely as an insulating material.

*Production* of magnesium oxide, calcined, in 1919 (preliminary figures) was 9,031,600 pounds, valued at \$1,176,860. It is likely that this production was chiefly from magnesite.

*Imports* of calcined magnesia before the war ranged between 60,000 and 110,000 pounds per year. They decreased greatly during the war to about 12,000 pounds in 1918 (fiscal year). Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	423	\$312	\$0.74	\$15	4.74
1919.....	22,637	11,358	.50	792	6.93

*Exports.*—Statistics not available.

*Important changes in classification.*—Calcined magnesia (par. 42, act of 1913) was changed to "magnesium oxide, medicinal," because of the difficulty in distinguishing the technical grades of calcined magnesia from calcined magnesite, which is free of duty under para-

graph 539, act of 1913. Under the act of 1909, calcined magnesia was restricted to the medicinal grade. Because of their similar chemical composition, calcined magnesia and calcined magnesite have been given the same tariff treatment. (Reclassification Report, pp. 52, 53.)

*Suggested changes.*—Page 16, paragraph 47, line 21: Insert "or calcined magnesia" after "oxide," so as to provide specifically for both the medicinal and the nonmedicinal forms.

Page 16, paragraph 47, line 22: Insert "oxide or" before "calcined magnesia not suitable."

MAGNESITE, CRUDE, GROUND, AND CALCINED.

(See Survey FL-24.)

*Description and uses.*—Magnesite is a natural carbonate of magnesium. When pure it contains 52.4 per cent carbon dioxide ( $\text{CO}_2$ ) and 47.6 per cent magnesia ( $\text{MgO}$ ). It is harder and heavier than limestone, which it most nearly resembles. Calcined magnesite is a highly refractory material which has no thoroughly satisfactory substitute in the open-hearth process for making steel. Caustic magnesite is the calcined product which still contains 3 to 8 per cent of carbon dioxide. It is used chiefly with magnesium chloride (see *supra*) in oxychloride cement for floors, artificial marble, and stucco work. Dead-burned magnesite has had all traces of carbon dioxide removed. It comes in the form of brick and grains and is used as lining for furnaces. We consume the largest amount, having used 50 per cent of the world output in 1913.

*Production.*—Before the war fully 90 per cent of the domestic supply of crude magnesite was imported. In 1917 the domestic consumption was over 355,000 tons, valued at more than \$3,700,000. Eighty-nine per cent was of domestic origin, valued at \$2,899,818 at the mines. A new industry was developed in Washington, while that of California was greatly expanded. Production in 1919 decreased to 162,000 tons, due to competition from Canada, and a more general use of substitutes, notably burnt dolomite, in metallurgical plants and even in the paper-pulp trade. In 1920 there was an increase to 275,000 tons.

*Imports* of crude magnesite are from Canada, Austria-Hungary, Greece, Mexico, and Venezuela. Prior to the war they were fairly constant at about 16,000 tons annually, but in 1917 they reached a maximum of 89,646 tons, valued at \$748,951. Imports of calcined magnesite prior to the war reached a maximum of 172,661 tons, valued at \$1,731,443. They decreased to only 4,724 tons in 1917. Statistics since 1917 are as follows:

Calendar year.	Quantity.	Value.	Unit value.
Crude magnesite:	<i>Tons.</i>		
1918.....	4,319	\$71,871	\$16.64
1919.....	5,697	103,311	18.13
1920.....	29,955	406,204	13.56
1921 (9 months).....	37,789	412,930	10.93
Calcined magnesite:			
1918.....	17,539	\$55,384	48.77
1919.....	8,456	270,721	32.02
1920.....	13,196	373,165	28.28
1921 (9 months).....	4,697	179,561	38.23

*Exports.*—Statistics not available.

*Important changes in classification.*—(See magnesium oxide and calcined magnesia, p. 135.)

*Suggested changes.*—Magnesite in any form is an earthy or mineral product and not a chemical, as are the other products in this paragraph. Provision for "calcined magnesite, including dead-burned and grain [rate]; and magnesite, crude or ground [rate]," might therefore be transferred to Schedule 2 and given a separate paragraph to follow paragraph 204.

#### MANGANESE COMPOUNDS.

*Suggested changes.*—Manganese resinate, of which 351,809 pounds, valued at \$8,593, were imported during 1914, is a paint drier of considerably more importance than lead resinate (par. 44), and is not mentioned in H. R. 7456. It is manufactured by a large number of domestic concerns. Manganese sulphate, crude, was imported in 1914 to the extent of 37,981 pounds, valued at \$1,448, and is not mentioned in the proposed tariff. Manganese borate, of which 176,384 pounds, valued at \$15,733, were imported in 1914, is also not mentioned in H. R. 7456.

It is suggested that the following paragraph covering manganese salts be inserted to follow paragraph 47, covering magnesium compounds:

Manganese borate, [rate]; manganese resinate, [rate]; manganese sulphate, [rate]; and other manganese compounds and salts, not specially provided for, [rate].

#### PARAGRAPH 48.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 48. Menthol, 25 per centum ad valorem; camphor, crude, natural, 1 cent per pound; camphor, refined or synthetic, 6 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 65. \* \* \* medicinal preparations \* \* \* twenty-five per centum ad valorem: \* \* \*

PAR. 43. Menthol, 50 cents per pound.

PAR. 12. Camphor, refined, and synthetic camphor, six cents per pound.

PAR. 36. Gums: \* \* \* camphor, crude, natural, 1 cent per pound; camphor, refined and synthetic, 5 cents per pound; \* \* \*

PAR. 527. Camphor, crude, natural [Free].

#### MENTHOL.

(See Survey A-10.)

*Description and uses.*—Menthol, or peppermint crystals, is a medicinal obtained from peppermint oil. The pure product is sold as colorless crystals; these have the odor and taste of peppermint. Menthol is employed chiefly in solution, including its use in various throat and nasal sprays, as a salve (when mixed with petrolatum or other greases), and in cough drops.

*Production.*—Most of the menthol used in the United States is imported from Japan, notwithstanding the fact that the United States produces over half of the world's supply of peppermint oil. Japanese peppermint oil contains a larger proportion of menthol than the American and European oils and is, therefore, used for menthol production rather than for flavoring purposes. Japanese production of menthol has increased rapidly from 149,135 pounds, valued at \$275,540, in 1910, to a maximum of 497,318 pounds, valued at \$958,259, in 1915, and since then (through 1918) has exceeded 400,000 pounds annually. The total exports of menthol from Japan for 1910–1917 averaged 304,764 pounds a year. The United States has been the largest consumer.

*Imports.*—Before 1913 menthol was not specifically provided for in the tariff, but was dutiable at 25 per cent under one of the general clauses. In the act of 1913 a specific duty of 50 cents per pound was imposed. This duty was equivalent to an ad valorem rate of only 16.66 per cent in 1914, and this reduction in rates was followed by a striking increase in the imports. From 1910 to 1913 the imports had averaged only 43,801 pounds per year and had yielded an average revenue of \$40,987. For 1914–1918 imports averaged 145,873 pounds, and the average annual revenue for the same period was \$74,804. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	150,879	\$412,448	\$2.73	\$75,440	18.29
1919.....	296,179	1,583,430	5.34	148,090	9.35
1920.....	205,911	1,564,982	7.60	102,956	6.58
1921 (9 months).....	119,686	661,488	4.99	.....	.....

*Exports.*—Statistics not available.

#### CAMPHOR.

(See Survey A-9.)

*Description and uses.*—Camphor is a chemical compound derived either from the distilled wood or other parts of the camphor tree, or by synthetic processes from turpentine. The act of 1913 recognizes the classes described as follows:

Crude camphor is obtained by the first distillation of camphor wood; it contains camphor oil and other impurities and is redistilled or sublimed to produce refined camphor and camphor oil. Synthetic camphor is usually produced from pinene, the chief constituent of turpentine oil.

Camphor is used chiefly in the manufacture of pyroxylin plastics and allied products, such as photograph films; it is also employed in pharmacy and medicine, and achieved an extraordinary consumption during the influenza epidemic.

*Production.*—Commercial camphor is chiefly produced by the Japanese in Formosa through a Government monopoly which practically

controls the world trade. Formerly much exported in a crude condition, it is now usually refined in Formosa or Japan. Annual exports of Japanese camphor in recent years are estimated at between 5,000,000 and 7,000,000 pounds, of which about five-sixths is from Formosa. Camphor is also commercially produced in China, but wasteful methods have diminished its supply. The camphor tree has been introduced into India, Java, southern Europe, and also into Florida, but without important commercial results in camphor production. Refining is carried on in this country chiefly by the manufacturers of pyroxylin plastics, the principal consumers. Camphor oil, a by-product of refining, is important in perfume manufacture. Synthetic camphor has been rather extensively manufactured in Germany, and about 1907 was also produced here; but the fall of camphor prices eliminated the American industry and probably damaged that abroad. Production of synthetic camphor in this country was established again during the war, but was discontinued following the signing of the armistice, due to low prices of natural camphor. It is now reported (December, 1921) that production will be resumed again.

*Imports* of crude camphor, 1909-1913, averaged 2,875,396 pounds, valued at \$861,029. During 1915-1918 an average of 4,658,483 pounds, valued at \$1,427,311, is reported. Imports of refined camphor, 1909-1913, averaged 425,403 pounds, valued at \$148,112; and for 1915-1918, 2,281,035 pounds, valued at \$996,145. Insignificant amounts of synthetic camphor were imported in 1915 and 1917. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
CRUDE CAMPHOR.					
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	3,474,282	\$1,547,180	\$0.44	\$34,743	2.25

## PARAGRAPH 49.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 49. Oils, animal: Sod, herring, and menhaden, 8 cents per gallon; whale, seal, and sperm, 10 cents per gallon; cod and cod-liver, 12½ cents per gallon; and all fish oils, not specially provided for, 20 per centum ad valorem; wool grease, crude, including that known commercially as degreas or brown wool grease, one-half of 1 cent per pound; wool grease, not crude, including adeps lanæ, hydrous and anhydrous, 1 cent per pound; all other animal oils and greases, not specially provided for, 20 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 40. Seal, herring, whale, and other fish oil including sod oil, not specially provided for in this section, eight cents per gallon.

PAR. 290. \* \* \* wool grease, including that known commercially as degreas or brown wool grease, crude and not refined, or improved in value or condition, one-fourth of one cent per pound; refined, or improved in value or condition, and not specially provided for in this section, one-half of one cent per pound.

PAR. 3. \* \* \* rendered oils \* \* \* and all greases, not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*.

PAR. 34. Cod-liver oil, fifteen cents per gallon.

PAR. 580. Grease, \* \* \* and oils (excepting fish oils), such as are commonly used in soap making or in wire drawing, or for stuffing or dressing leather, and which are fit only for such uses, and not specially provided for in this section [Free].

PAR. 44. Oils, rendered: Sod, seal, herring, and other fish oil, not specially provided for in this section, 3 cents per gallon; whale oil, 5 cents per gallon; sperm oil, 8 cents per gallon; wool grease, including that known commercially as degreas or brown wool grease, crude and not refined, or improved in value or condition, ¼ cent per pound; refined or improved in value or condition, and not specially provided for in this section, ½ cent per pound; lanolin, 1 cent per pound; all other animal oils, rendered oils and greases, and all combinations of the same, not specially provided for in this section, 15 per centum ad valorem.

PAR. 561. Oils: \* \* \* cod, cod liver. \* \* \* [Free].

PAR. 498. Grease, \* \* \* and oils (excepting fish oils), not chemically compounded, such as are commonly used in soap making or in wire drawing, or for stuffing or dressing leather, not specially provided for in this section [Free].

## OILS AND FATS.

(See Survey A-11.)

## GENERAL.

The "rendered oils" (animal) in paragraph 49 resemble in chemical composition and use the "expressed oils" (vegetable) in paragraph 50. Therefore a general discussion of these two paragraphs and of paragraph 1626 of the free list is desirable.

There is no essential difference between a vegetable oil and a fat. Both are mixtures of chemical compounds known as glycerides, which are a combination of glycerin with various fatty acids, such as stearic, oleic, palmitic, and others. Those combinations which are liquid at ordinary temperatures are known as oils, while those which

are solid at ordinary temperatures are known as fats. Although most of the so-called oils are obtained either from the fruit or the seed of plants (for example, olive, peanut, and linseed oils), not all vegetable glycerides are oils; some are solid fats or butters, as cacao and nutmeg butter and palm-kernel and coconut oil, which, although liquid in tropical countries, whence they come, are fairly solid in the Temperate Zones. On the other hand, animals as a rule produce fats which are hard at ordinary temperatures (for example, lard, suet, and wool grease). There are, however, exceptions to this generalization, as fish and whale oils are liquid. The differences between the various fats and fatty oils are due primarily to the variation in the relative proportions of the fatty acids present. These fats and fatty oils have the following general properties and uses:

(1) If of a good quality, most of them are edible, and, in fact, are an essential part of the diet of man and the food of animals.

(2) Soap and glycerin are formed by the action of caustic soda or caustic potash on fats and fatty oils.

(3) Some of the fatty oils when spread out in a thin layer absorb oxygen from the air, thereby being converted into a hard, elastic, waterproof film. This property accounts for the large use of oils in the manufacture of paint and varnish, oilcloth, linoleum, patent leather, and various waterproofing coatings.

(4) The liquid oils when treated with hydrogen under suitable conditions combine chemically with the hydrogen and are thereby converted into solid fats, which are more suitable than the original oils for soap making and for food purposes, as lard substitutes, or in the manufacture of butter substitutes. (The manufacture of such "hydrogenated" or hardened oils has developed on a large scale in the past decade, both vegetable and fish oils being used.)

(5) Other minor uses include the softening of leather, lubrication, burning for illumination, tempering steel, manufacture of "vulcanized oils" used by the rubber industry, the manufacture of textiles, and in medicine.

The relation between the duty on the raw material (seeds) and the duty on the finished product (oils) should be given attention when considering duties on these products.

All fish oils of American fisheries are admitted free of duty under that portion of paragraph 1624 which reads: "\* \* \* Spermaceti, whale, and other fish oils of American fisheries, and all fish and other products of such fisheries."

#### SOD OIL.

*Description and uses.*—Chamois and similar leathers are saturated with whale or fish oil during manufacture, allowed to ferment, and part of the oil pressed out. The oil remaining in the leather is removed with alkali and then liberated with an acid. This recovered oil is known as sod oil, and in Europe as *degras*. It is in great demand for treating leather.

*Production.*—Statistics not available.

*Imports and exports.*—Combined with "other fish oils," pages 145 and 146.

## HERRING OIL.

*Description and uses.*—Herring oil is obtained from several species of herring; found principally in the North Sea, near Japan, and to some extent in American waters. Its uses are somewhat like those of menhaden oil, such as a substitute for linseed oil in the manufacture and stuffing of leather and similar products.

*Production* of herring oil since 1912 has been as follows:

Year.	Pounds.	Gallons. <sup>1</sup>	Year.	Pounds.	Gallons. <sup>1</sup>
1912.....	1,888,000	245,200	1918.....	774,000	100,520
1914.....	1,512,000	196,370	1919.....	1,431,230	185,874
1916.....	1,476,000	191,690	1920.....	2,852,840	370,500
1917.....	1,637,000	212,600	1921 (9 months) <sup>2</sup> .....	1,512,073	196,373

<sup>1</sup> Converted at 7.7 pounds per gallon.

<sup>2</sup> Preliminary figures subject to revision.

*Imports and exports* are combined with "other fish oils," pages 145 and 146.

## MENHADEN OIL.

*Description and uses.*—Menhaden oil is the principal fish oil produced in this country along the Atlantic coast. The fish is cooked with water or steam and then pressed to separate the oil. The residual press cake is sold as fertilizer. Menhaden oil is used in tempering steel and as a substitute for linseed oil in the manufacture of paints, patent leather, and similar products.

*Production* of menhaden oil since 1912 has been as follows:

Year.	Pounds.	Gallons. <sup>1</sup>	Year.	Pounds.	Gallons. <sup>1</sup>
1912.....	33,009,000	4,287,000	1918.....	12,370,000	1,606,500
1914.....	16,265,000	2,112,000	1919.....	12,827,541	1,666,000
1916.....	20,598,000	2,675,000	1920.....	27,573,401	3,581,000
1917.....	18,640,000	2,421,000	1921 (9 months) <sup>2</sup> .....	21,111,135	2,742,000

<sup>1</sup> Converted at 7.7 pounds per gallon.

<sup>2</sup> Preliminary figures subject to revision.

*Import and export* figures are combined with "other fish oils," pages 145 and 146.

## WHALE OIL.

*Description and uses.*—Whale oil is used for illumination, making leather dressing, and when hydrogenated produces edible and soap fats. In Norway hydrogenated whale oil is of great importance and is used in the manufacture of olemargarine. In pressing whale oil a by-product of stearin is obtained, which is used principally in the manufacture of soap and as a lubricant.

*Production* of whale oil in the United States since 1912 has been as follows:

Year.	Pounds.	Gallons. <sup>1</sup>	Year.	Pounds.	Gallons. <sup>1</sup>
1912.....	931,000	120,910	1918.....	431,000	55,975
1914.....	632,000	82,080	1919.....	8,712,308	1,132,000
1916.....	1,691,000	219,620	1920.....	23,051,811	2,994,000
1917.....	1,193,000	154,940	1921 (9 months) <sup>2</sup> .....	1,018,820	132,315

<sup>1</sup> Converted at 7.7 pounds per gallon.

<sup>2</sup> Preliminary figures subject to revision.

Imports in 1914 were 373,500 gallons (including some sperm oil), nearly 75 per cent coming from Canada. Imports increased to 1,134,021 gallons in 1918. Imports of whale oil alone since 1918 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Gallons.</i>				<i>Per cent.</i>
1918.....	318,609	\$285,347	\$0.89	\$15,930	5.58
1919.....	521,035	572,747	1.09	26,052	4.55
1920.....	86,788	75,176	.86	4,339	5.77
1921 (9 months).....	366,277	135,212	.37		

Exports are combined with "other fish oils," page 146.

## SEAL OIL.

*Description and uses.*—Seal oil is obtained from the blubber of various species of seal. It is used as a lubricant, as illuminating oil in lighthouses, and as an adulterant of cod-liver oil. Poorer qualities are used in the manufacture of soft soaps and in the leather industry.

*Production* is small in the United States. There are legal restrictions on the killing of seals.

*Imports* have been somewhat irregular. In 1914 the import, chiefly from Newfoundland, was 179,734 gallons; for 1915–1917 the average was about 500,000 gallons. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Gallons.</i>				<i>Per cent.</i>
1918.....	625,839	\$647,785	\$1.03	\$18,775	2.90
1919.....	23,121	21,598	.93	694	3.21
1920.....	13,085	11,761	.90	393	3.34
1921 (9 months).....	399,010	109,357	.27		

Exports.—Statistics combined with "other fish oils," page 146.

## SPERM OIL.

*Description and uses.*—Sperm oil is obtained from the blubber and head cavity of the sperm whale. The head oil is considered more valuable than the body oil, but the two are frequently mixed. On standing, a solid portion separates, which is pressed out and sold as spermaceti.

Arctic sperm oil is obtained from the bottlenose whale. This oil gums more easily than sperm oil, and therefore does not command so high a price. Sperm oil, because of its great viscosity, is valuable as a lubricant for light, rapid-running machinery; it is also used for illumination, for leather dressing, and for tempering steel.

*Production* of sperm oil in the United States since 1912 has been as follows:

Year.	Pounds.	Gallons. <sup>1</sup>	Year.	Pounds.	Gallons. <sup>1</sup>
1912.....	4,083,000	559,320	1918.....	743,000	101,782
1914.....	2,495,000	341,790	1919.....	649,701	89,000
1916.....	4,560,000	624,660	1920.....	3,125,525	428,153
1917.....	3,567,000	488,632	1921 (9 months) <sup>2</sup> .....	52,421	7,181

<sup>1</sup> Converted at 7.3 pounds per gallon.

<sup>2</sup> Preliminary figures subject to revision.

*Imports* during 1914 were 157,142 gallons, not including that listed as whale oil under the old law. Imports decreased to 48,178 gallons in 1917 and 60,288 gallons in 1918. Imports since 1918 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Gallons.</i>				<i>Per cent.</i>
1918.....	60,238	\$70,223	\$1.16	\$4,819	6.66
1919.....	124,747	124,511	.99	9,980	8.02
1920.....	99,783	98,033	.98	7,983	8.14
1921 (9 months).....	1,739	637	.37		

*Exports.*—Combined with “other fish oils,” page 146.

#### COD AND COD-LIVER OILS.

*Description and uses.*—Genuine cod and cod-liver oils are derived from the liver of the cod, a fish found chiefly along the coasts of Norway, Scotland, North America, Japan, and Siberia. The best grades of oil are medicinal, and known as cod-liver oil; inferior grades, known simply as cod oil, are used in currying leather and for other purposes.

*Production.*—To recover the medicinal oil the livers are treated with live steam in tin-lined vessels, causing the oil to exude. The large demand for oil of unobjectionable taste induced this modern method. These oils are by-products of the food-fish industry. The production of cod and cod-liver oil since 1912 has been as follows:

Year.	Pounds.	Gallons. <sup>1</sup>	Year.	Pounds.	Gallons. <sup>1</sup>
1912.....	372,000	48,320	1918.....	712,000	92,468
1914.....	394,000	51,170	1919.....	968,339	125,758
1916.....	367,000	47,663	1920.....	1,470,812	191,015
1917.....	439,000	57,013	1921 <sup>2</sup> (9 months).....	235,207	30,546

<sup>1</sup> Converted at 7.7 pounds per gallon.

<sup>2</sup> Preliminary figures subject to revision.

*Imports* of cod and cod-liver oils in 1914 were 14,198,000 pounds; in 1916, 10,973,000 pounds; in 1917, 16,618,000 pounds. Imports of cod oil in 1913 were 466,494 gallons, valued at \$135,969, with a revenue of \$37,319. This increased in 1918 to 1,747,791 gallons, valued

at \$1,526,332. Imports of cod-liver oil in 1913 were 262,516 gallons, valued at \$137,872, with a revenue of \$39,377. Imports are chiefly from Newfoundland, Labrador, and Canada. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
COD OIL.			
	<i>Gallons.</i>		
1918.....	1,007,508	\$1,172,397	\$1.16
1919.....	1,152,252	1,107,221	.96
1920.....	1,044,624	979,891	.94
1921 (9 months).....	952,059	361,348	.38
COD-LIVER OIL.			
1918.....	184,390	\$459,840	\$2.49
1919.....	235,805	665,080	2.82
1920.....	445,167	892,965	2.01
1921 (9 months).....	214,472	174,527	.81

*Exports.*—Included in statistics of “other fish oils,” page 146.

*Important changes in classification.*—Cod and cod-liver oils are exempt from duty under the act of 1913 (par. 561).

#### OTHER FISH OILS.

*Description and uses.*—Other fish oils include chiefly sardine and salmon oils, which are obtained principally as by-products of the fish-canning industry. The various fish oils are used extensively in the leather industry, some for adulterating linseed oil and others are hydrogenated to produce a solid fat, which may be used in the manufacture of soap.

*Production* of “all other fish oils” since 1912 has been as follows:

Year.	Pounds.	Gallons. <sup>1</sup>	Year.	Pounds.	Gallons. <sup>1</sup>
1912.....	1,001,000	130,000	1918.....	954,000	123,900
1914.....	1,333,000	173,120	1919.....	8,332,412	1,082,132
1916.....	1,931,000	250,780	1920.....	7,952,464	1,032,788
1917.....	3,078,000	399,740	1921 (9 months) <sup>2</sup> .....	3,076,388	399,530

<sup>1</sup> Converted at 7.7 pounds per gallon.

<sup>2</sup> Preliminary figures, subject to revision.

*Imports* of herring and other fish oils, including sod oil, in 1914 were 386,743 gallons, chiefly from Great Britain and Canada. Imports increased to 2,280,013 gallons in 1917, and decreased to 1,532,512 gallons in 1918. Imports since 1918 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Gallons.</i>				<i>Per cent.</i>
1918.....	1,763,045	\$1,197,239	\$0.68	\$52,891	4.42
1919.....	542,112	437,836	.81	16,263	3.71
1920.....	575,842	402,335	.70	17,275	4.29
1921 (9 months).....	149,308	45,534	.30		

*Exports.*—Exports of all fish oils since 1917, principally to Scotland, Canada, and Cuba, have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (gallons).....	566,763	1,085,551	423,292	47,972
Value.....	\$638,757	\$976,831	\$406,966	\$46,706

WOOL GREASE (DEGRAS) AND ADEPS LANAE.

*Description and uses.*—Wool grease is the fatty substance which is present in raw wool. It may be recovered either by extraction with naphtha or from the wool scouring by means of either centrifugal or acid treatment. In this country the centrifugal process is the one used in most plants. In the United States crude, brown wool grease is also known as degrass.

Lanolin, a highly purified wool grease, is a yellowish white mass which takes up water readily. It is used principally in pharmacy as a basis for salves, ointments, emulsions, and cosmetics. Crude wool grease is used principally for dressing leather; sometimes as a lubricating grease; also, to some extent, in making printing ink and in the varnish industry.

*Production.*—Complete figures for the production of wool grease in the United States are not available, but partial figures indicate the annual production to be about 10,000,000 pounds.

*Imports* of crude wool grease in 1914 were 12,284,248 pounds. Imports of partly refined wool grease have decreased from 2,691,591 pounds in 1914 to 31,268 pounds in 1918. Imports of lanolin have been quite variable. In 1914 they were 91,477 pounds; in 1916, 13,342 pounds.

Practically all of the lanolin and most of the wool grease imported in 1914 came from Germany, while England sent more crude wool grease than any other country. In the European wool-scouring mills purification of the effluent is required by law; wool grease is one of the products of this process.

Imports since 1918 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
----------------	-----------	--------	-------------	-------	--------------------------------

WOOL GREASE, CRUDE.

	Pounds.	Value.	Unit value.	Duty.	Per cent.
1918.....	1,051,118	\$135,507	\$0.13	\$2,628	1.94
1919.....	249,320	27,562	.11	623	2.26
1920.....	4,067,303	214,588	.05	10,168	4.74
1921 (9 months).....	1,953,578	69,955	.04		

WOOL GREASE, REFINED OR IMPROVED IN CONDITION.

	Pounds.	Value.	Unit value.	Duty.	Per cent.
1918.....	50	\$3	\$0.06		8.33
1919.....	44,685	1,702	.03	\$223	13.13
1920.....	20,402	1,332	.06	102	7.66
1921 (9 months).....	57,874	3,370	.06		

## LANOLIN.

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	1,310	\$316	\$0.24	\$13.00	4.15
1919.....	18	7	.39	.18	2.57
1920.....	2,891	604	.21	29.00	4.79
1921 (9 months).....	1,544	244	.16		

*Exports.*—Statistics not available.

*Important changes in classification.*—The act of 1913, in addition to a provision for “wool grease, crude,” contains two other provisions for “refined or improved in value or condition” and “lanolin.” The provision for the intermediate grade between crude wool grease and lanolin has been omitted, as it is of small commercial importance. The term “adepts lanae, hydrous and anhydrous,” has been substituted for “lanolin,” which was found to be too restricted in its application to include all the highly purified forms of wool grease used in the pharmaceutical trade. (Reclassification Report, pp. 55, 56.)

## OTHER ANIMAL OILS AND GREASES.

*Imports* since 1918 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
----------------	-----------	--------	-------------	-------	------------------

## OTHER RENDERED OILS AND COMBINATIONS.

	<i>Gallons.</i>				<i>Per cent.</i>
1918.....	20,518	\$20,107	\$0.98	\$3,016	15
1919.....	11,350	8,452	.74	1,268	15
1920.....	3,447	2,081	.60	312	15
1921 (9 months).....	816	1,688	2.07		15

## OTHER GREASES, N. S. P. F.

1918.....		\$43,262		\$6,489	15
1919.....	2,700	620	\$0.23	93	15
1920.....	9,076	1,708	.20	256	15
1921 (9 months).....	27,511	2,146	.08		15

*Exports.*—Statistics not available.

*Important changes in classification.*—The provision for all combinations of animal oils (par. 44, act of 1913) has been omitted from this paragraph and given separate treatment in paragraph 53, H. R. 7456. Grease and oils such as are commonly used in soap making and wire drawing or for stuffing or dressing leather, exempt from duty under the act of 1913 (par. 498), will probably fall under the provision in this paragraph for “other animal oils and greases.”

*Suggested changes.*—Add “fats” to the last provision, making it read “all other animal oils, greases, and fats.”

## PARAGRAPH 50.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 50. Oils, expressed or extracted: Castor oil,  $4\frac{1}{2}$  cents per pound; cottonseed oil, coconut oil, and soya-bean oil, 2 cents per pound; hempseed oil,  $1\frac{1}{2}$  cents per pound; linseed or flaxseed oil, raw, boiled, or oxidized,  $2\frac{1}{2}$  cents per pound; olive oil, weighing with the immediate container less than forty-four pounds,  $7\frac{1}{2}$  cents per pound on contents and container; olive oil, not specially provided for,  $6\frac{1}{2}$  cents per pound; peanut oil,  $2\frac{1}{2}$  cents per pound; poppy-seed oil, raw, boiled, or oxidized, 2 cents per pound; rapeseed oil,  $1\frac{1}{2}$  cents per pound; all other expressed and extracted oils, not specially provided for, 20 per centum ad valorem.

## ACT OF 1909.

PAR. 33. Castor oil, thirty-five cents per gallon.

PAR. 35. Flaxseed, linseed, and poppyseed oil, raw, boiled, or oxidized, fifteen cents per gallon of seven and one-half pounds weight.

PAR. 37. Hempseed oil, ten cents per gallon; rapeseed oil, ten cents per gallon.

PAR. 38. Olive oil, not specially provided for in this section, forty cents per gallon; in bottles, jars, kegs, tins, or other packages, containing less than five gallons each, fifty cents per gallon.

PAR. 293. \* \* \* refined deodorized coconut oil, \* \* \* three and one-half cents per pound.

PAR. 639. Oils: \* \* \* coconut (not refined and deodorized), cottonseed, \* \* \* nut oil or oil of nuts, soya-bean, \* \* \* [Free].

PAR. 3. \* \* \* expressed oils, \* \* \* and all combinations of the foregoing. \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*.

PAR. 580. \* \* \* oils (excepting fish oils), such as are commonly used in soap making or in wire drawing, or for stuffing or dressing leather, and which are fit only for such uses, and not specially provided for in this section [Free].

## ACT OF 1913.

PAR. 45. Oils, expressed: \* \* \* castor oil, 12 cents per gallon; flaxseed and linseed oil, raw, boiled, or oxidized, 10 cents per gallon of  $7\frac{1}{2}$  pounds; poppy-seed oil, raw, boiled, or oxidized, rapeseed oil, and peanut oil,<sup>6</sup> 6 cents per gallon; hempseed oil, 3 cents per gallon; \* \* \* olive oil,<sup>7</sup> not specially provided for in this section, 20 cents per gallon; olive oil,<sup>7</sup> in bottles, jars, kegs, tins, or other packages having a capacity of less than five standard gallons each, 30 cents per gallon; all other expressed oils and all combinations of the same, not specially provided for in this section, 15 per centum ad valorem.

PAR. 232. \* \* \* refined deodorized coconut oil, \* \* \*  $3\frac{1}{2}$  cents per pound.

PAR. 561. Oils: \* \* \* coconut,<sup>8</sup> \* \* \* cottonseed,<sup>8</sup> \* \* \* soya-bean,<sup>8</sup> \* \* \* [Free].

PAR. 498. \* \* \* oils (excepting fish oils), not chemically compounded, such as are commonly used in soap making or in wire drawing, or for stuffing or dressing leather, not specially provided for in this section [Free].

<sup>6</sup> Emergency tariff act of 1921, par. 11: 26 cents per gallon.

<sup>7</sup> Emergency tariff act of 1921, par. 11: 40 cents per gallon in bulk, 50 cents per gallon in containers of less than 5 gallons.

<sup>8</sup> Emergency tariff act of 1921, par. 11: 20 cents per gallon.

## EXPRESSED OR EXTRACTED OILS.

(See Survey A-11.)

(For a general discussion of Oils and Fats see p. 140.)

## CASTOR OIL.

*Description and uses.*—Castor oil is obtained from castor beans, which are assessed a duty of one-half cent per pound (par. 760). On large-scale crushing about 45 per cent of the weight of the seed is obtained as castor oil.

The principal use of castor oil prior to the war was in the manufacture of alizarin assistants. It is also used as a purgative in medicine, in the manufacture of transparent soaps, and as a leather dressing. In India the oil is largely employed as a lubricant for locomotive bearings. It is also used for lubricating marine engines, for the manufacture of blended lubricating oils, and during the war it was in great demand for use as a lubricant for high-speed airplane motors.

In the preparation of the medicinal oil the outer shell of the bean is removed, and the kernels which remain are cold pressed. The cake from this expression is pressed a second and third time, and the oil obtained is used for technical purposes. The cake or meal, known as castor pomace, contains a poisonous substance, preventing its use for cattle feed, but it is a good fertilizer.

*Domestic production* from 1912 has been as follows:

Year.	Pounds.	Year.	Pounds.
1912.....	23,359,000	1918.....	14,184,000
1914.....	20,423,000	1919.....	24,637,203
1916.....	22,766,000	1920.....	24,187,085
1917.....	22,902,000	1921 <sup>1</sup> (9 months).....	13,966,449

<sup>1</sup> Preliminary, subject to revision.

*Imports* were less than 10,000 gallons prior to 1914, but increased in that year to about 190,000 gallons, valued at about \$88,000, yielding a revenue of about \$23,000. Since 1915 the imports have increased gradually until in 1918 (fiscal year) they reached 1,175,064 gallons, valued at \$1,366,573, and yielded a revenue of \$141,008. The imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Gallons.</i>				<i>Per cent.</i>
1918.....	1,097,544	\$1,518,042	\$1.38	\$131,705	8.68
1919.....	375,033	504,969	1.34	45,004	8.91
1920.....	171,482	209,384	1.22	20,578	9.83
1921 (9 months).....	16,183	24,128	1.49		

*Exports.*—Statistics not available.

## COTTONSEED OIL.

*Description and uses.*—Cottonseed oil is the most widely used vegetable oil, due to its suitability for both table and cooking purposes and to the fact that it forms the bulk of lard substitutes and is used in large quantities in oleomargarine, in soap, and for other technical purposes. In 1917 the lard-substitutes industry consumed 1,069,214,000 pounds; the soap industry, 126,390,000 pounds; and the oleomargarine industry, 68,652,000 pounds of cottonseed oil. Its use for lard substitutes represented about 80 per cent of the total output in 1917.

*Production* of cottonseed oil depends on the cotton crop and not on the demand for the oil. To secure the oil the seed is first screened and sieved to remove foreign material and passed through delinters to remove short cotton hairs. These linters are sold to mattress makers, paper makers, or guncotton manufacturers. The seeds are then hulled to separate the outer shell, thus liberating the soft oil-containing meats, which are heated and pressed in either hydraulic or expeller presses. The residual cake is a valuable cattle feed and fertilizer. Production since 1912 has been as follows:

Year.	Pounds.	Year.	Pounds.
1912.....	1,435,401,000	1918.....	1,283,823,000
1914.....	1,789,777,000	1919.....	1,430,002,962
1916.....	1,492,430,000	1920.....	1,141,389,742
1917.....	1,343,849,000	1921 (9 months) <sup>1</sup> .....	779,049,528

<sup>1</sup> Preliminary, subject to revision.

*Imports* of cottonseed oil in 1914 were 17,293,201 pounds, valued at \$1,044,834, about 54 per cent from China. Imports since 1917, chiefly from China, Japan, Hongkong, and Canada, have been as follows:

Calendar year.	Quantity.	Value.	Unit value
	<i>Pounds.</i>		
1918.....	18,967,857	\$2,282,441	\$0.12
1919.....	27,805,784	3,672,984	.13
1920.....	9,457,924	1,305,154	.14
1921 (9 months).....	668,386	58,166	.09

*Exports* have been from seven to ten times the imports. Exports in 1912 were 28 per cent and in 1918 about 8 per cent of domestic production. Normal prewar exports reached over 300,000,000 pounds in 1913; they were 192,963,079 pounds in 1914; 318,366,525 pounds, valued at \$21,872,948 in 1915. Forty per cent of the 1918 exports went to Canada; normally, the bulk goes chiefly to Europe. Exports since 1917, for calendar years, have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	119,067,376	193,133,201	184,753,824	220,275,089
Value.....	\$23,184,329	\$40,890,268	\$34,874,790	\$21,503,175

*Important changes in classification.*—Cottonseed oil was on the free list of the act of 1913 (par. 561); it is now dutiable under the emergency tariff act of 1921 (par. 11).

## COCONUT OIL.

*Description and uses.*—Coconut oil, extracted from the kernel of the coconut, at ordinary temperature is a solid fat, but melts to an oil with a slight increase of temperature. The dried kernel is known as copra. This is shipped in large quantities and the oil then extracted. The coconut palm flourishes in most tropical countries. Coconut oil goes mainly into soap, and is also used as a food in certain butter substitutes and cooking fats. It is also used in pharmacy as a substitute for cod-liver oil and as a base for ointments. The pulp from which the oil has been expressed is a cattle feed.

*Production.*—Large quantities of oil are extracted from imported copra, which comes chiefly from the Dutch East Indies, the Straits Settlements, and the Philippines. The output since 1912 has been as follows:

Year.	Pounds.	Year.	Pounds.
1912 <sup>1</sup> .....	31,729,000	1918 <sup>1</sup> .....	341,235,000
1914.....	38,272,000	1919.....	215,542,157
1916.....	104,727,000	1920.....	131,218,048
1917.....	188,488,000	1921 <sup>2</sup> (9 months).....	77,400,782

<sup>1</sup> Figures from 1912 to 1918 are for edible and inedible oil. Those for later years are for crude coconut oil.

<sup>2</sup> Preliminary, subject to revision.

*Imports of coconut oil* have increased greatly since 1914. Preceding 1914 the imports averaged about 50,000,000 pounds annually. In 1914 they were 74,386,213 pounds.

Imports since 1917, chiefly from the Philippine Islands, Dutch East Indies, and Cuba, have been as follows:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	359,196,590	44,562,715	\$0.12
1919.....	281,063,213	35,380,099	.16
1920.....	214,014,521	32,812,428	.15
1921 (9 months).....	77,636,349	7,593,708	.10

*Exports.*—The exports of coconut oil since 1918 have been mainly to Canada, Netherlands, and Belgium, and were as follows:

	1919 <sup>1</sup>	1920	1921 (9 months).
Quantity (pounds).....	118,611,743	25,694,794	5,761,005
Value.....	\$24,601,143	\$4,908,443	\$541,461

<sup>1</sup> Last six months, not previously shown.

*Important changes in classification.*—Coconut oil was exempt from duty under the act of 1913 (par. 561); it is dutiable under the emergency tariff act of 1921 (par. 11).

## SOYA-BEAN OIL.

*Description and uses.*—This oil is expressed from the seeds of a plant indigenous to China, Manchuria, Korea, Japan, Formosa, and Indo-China. There are many varieties of these beans with varying oil content, but the average is about 18 per cent, the oil extracted ranging from 10 to 13 per cent. Previous to 1908 this oil was not much used here or in Europe. It is a semi-drying oil used in paint either as a substitute for or mixed with linseed oil. Its greatest use is in soap making, for which it has largely replaced cottonseed oil, but the purified oil is edible. After the oil is expressed the cake becomes a feed for dairy cattle or a fertilizer.

*Production* of soya beans has increased greatly, but only a small portion of the crop is used for oil. In 1915 approximately 100,000 bushels of American-grown beans were pressed for oil. The domestic output of oil (inedible and edible) increased from 2,764,000 pounds in 1914 to 42,074,000 pounds in 1917 and 79,861,000 pounds in 1918. Reports of the Bureau of the Census show that no crude soya-bean oil has been produced either from domestic or imported beans in this country from 1919 to September 30, 1921, inclusive. The oil is imported in the crude state and refined in this country.

*Imports* have increased from 16,360,452 pounds in 1914 to 336,824,646 pounds in 1918, the great bulk coming from China and Japan. Imports since 1917, almost wholly from Kwangtung, China proper, and Japan, have been as follows:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	343,358,948	\$39,309,261	\$0.11
1919.....	195,808,421	24,019,226	.12
1920.....	112,549,075	13,767,917	.12
1921 (9 months).....	16,342,321	677,328	.04

*Exports.*—Exports since 1918, chiefly to Italy, France, and Austria, have been as follows:

Calendar year.	Quantity.	Value.
	<i>Pounds.</i>	
1919 (last 6 months).....	27,714,764	\$6,097,692
1920.....	43,511,862	9,412,431
1921 (9 months).....	1,933,746	176,296

*Important changes in classification.*—Soya-bean oil was exempt from duty under the act of 1913 (par. 561); it is dutiable under the emergency tariff act of 1921 (par. 11).

## HEMPSEED OIL.

*Description and uses.*—This oil is obtained from the seeds of the hemp plant, cultivated in France, Belgium, Germany, northern Italy, Turkey, Algeria, North America, India, Manchuria, and Japan. The yield is about 30 per cent. Hempseed oil is used principally in paint. It is a drying oil, but does not have the pronounced drying properties of linseed oil. It is also used for making a soft soap of a dark-

green color. The low-grade oils are used for certain varnishes. The press cake contains sharp bits of shell which make it unfit for cattle feed.

*Production.*—Figures for the domestic production of hempseed oil are not available. Some hemp is raised in this country, principally for its fiber; probably little of the oil is expressed.

*Imports* in 1910 were 471,002 gallons, valued at \$154,866; they were insignificant for 1914–1917. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Gallons.</i>				<i>Per cent.</i>
1918.....	124,401	\$120,589	\$0.97	\$3,732	3.09

#### LINSEED OR FLAXSEED OIL.

*Description and uses.*—Linseed oil belongs to the class known in the paint and varnish industry as drying oils. It is very satisfactory for the purpose, and this accounts for the fact that in the calendar year 1914 that industry alone consumed 24,481,623 gallons of linseed oil, costing over \$12,000,000. Linseed oil is also used in the manufacture of soaps, lithographic inks, linoleum, oilcloth, and patent leather. It is the best oil for making putty and enters into the manufacture of the so-called “vulcanized oils.” Cold-pressed linseed oil has a pleasant taste, and considerable quantities are used for edible purposes in Russia, Hungary, Germany, and India.

Boiled linseed oil is one to which certain quantities of lead or manganese oxides have been added and dissolved by heat. Other substances, such as resinates, oleates, and linoleates of various metals, are also used.

High prices during the war induced the substitution of other drying oils for linseed oil, especially in the paint industry, where soya bean, menhaden, perilla, and China-wood oil have been used to an appreciable extent, the last-named most extensively as an improvement on linseed oil in certain varnishes.

*Production.*—Flaxseed, from which linseed oil is obtained, and flax fiber, from which linen is made, are both from the flax plant. It can not, however, be grown for both fiber and seed at the same time. If harvested at a time to yield fiber, the seeds are immature and useless for oil production. If harvesting is delayed until the seeds are ripe enough to yield oil, the stalks are no longer suitable for the recovery of the fiber. The principal countries in which the flax plant is grown for the seed are Argentina, India, the United States, Canada, and Russia. The oils expressed from the Russian and Indian seeds are superior to those obtained from the American and Argentine seeds. However, seed grown in Canada from imported Russian flaxseed yields an oil equal in quality to the Russian oil.

The oil is obtained by three different methods known as hot-pressed, cold-pressed, and extraction. All of the flaxseed oil produced in the United States is hot-pressed in hydraulic presses. The oil obtained by the pressing process is usually refined by treatment with strong sulphuric acid. The refined oil is similar to the crude oil in its properties, except that it is less viscous and lighter colored. The press cake or residue is a valuable cattle feed.

The average yield is about 2.5 gallons of oil per bushel of seed. The duty on flaxseed under H. R. 7456 is 25 cents per bushel of 56 pounds. This is equivalent to a duty of 1.33 cents per pound ( $7\frac{1}{2}$  pounds per gallon) on the oil content as against  $2\frac{1}{2}$  cents per pound on linseed oil. This gives a differential of  $1\frac{1}{4}$  cents per pound of oil in favor of the domestic crusher.

The domestic production of linseed oil since 1912 has been as follows:

Year.	Pounds.	Year.	Pounds.
1912.....	461,656,000	1918.....	375,452,000
1914.....	507,422,000	1919.....	452,927,798
1916.....	531,586,900	1920.....	485,271,517
1917.....	482,199,000	1921 (9 months) <sup>1</sup> .....	345,283,876

<sup>1</sup> Preliminary, subject to revision.

*Imports* of linseed oil prior to the war decreased from 3,958,961 gallons in 1911 to 172,522 gallons in 1913. The maximum imports between 1913 and 1918 were 535,601 gallons in 1915, valued at \$248,344, and yielding a revenue of \$53,560. Imports since 1917, chiefly from England, Netherlands, Japan, and Belgium, have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Gallons.</i>				<i>Per cent.</i>
1918.....	45,620	\$51,876	\$1.14	\$4,562	8.79
1919.....	2,135,706	3,018,725	1.41	213,571	7.07
1920.....	4,693,410	6,488,817	1.38	469,341	7.23
1921 (9 months).....	3,116,411	1,589,249	.51		

*Exports* of linseed oil since 1914 have been about 1,200,000 gallons, with the exception of 1916, when the export was only about 700,000 gallons. Previously the export was only about 200,000 gallons per year, except in 1913, when over 1,700,000 gallons were exported. The quantity of exported linseed oil made from imported flaxseed and on which a drawback is paid has varied greatly. In 1915 a drawback of \$115,649 was paid on 533,023 bushels of imported flaxseed, from which were produced and exported 1,585,081 gallons of linseed oil. Exports (for calendar years) since 1917, mainly to Cuba, Mexico, and Canada, have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (gallons).....	774,192	1,502,178	715,450	376,651
Value.....	\$1,162,054	\$2,606,885	\$1,239,633	\$334,393

## OLIVE OIL.

*Description and uses.*—Olive oil is the oil obtained from the fruit of the olive tree. Its chief use is as a salad oil, but large quantities of inferior grades and second pressings (olive-oil foots) are used for making castile soap.

*Production.*—California produces practically the entire domestic supply of olive oil, and this supply—966,000 pounds in 1912 and 1,461,000 pounds in the record year, 1916—is only about 2 per cent of the consumption. Approximately 40 per cent of the olive crop is crushed for oil, nearly all of the balance being subjected to the pickling process, which produces the familiar ripe olive. Special varieties are cultivated for pickling and for oil, the latter usually being grown without irrigation. The culls and injured stock of the pickling varieties are also used for oil. While the area in olives in the year 1916 (36,800 acres) was about double that of four years before, this increase is almost entirely in the pickling varieties. According to testimony submitted by growers at hearings before the Tariff Commission (1918) the average price received for oil olives on trees was \$42.50 per ton for the period 1915–1917, and the price received for pickling olives was \$110 per ton. This is offset by a considerable difference in costs of production. Partly because of fluctuation in the quality of the crop, and also because the olive tree usually alternates heavy and light yields, the annual output varies considerably.

*Processes.*—The fleshy part of the olive contains the oil. The fruit is ground, usually pits and all, and the oil expressed by hydraulic pressure. The residue is again ground and pressed for an inferior grade of oil, and the pomace sometimes subjected to a third pressing, which produces “foots oil,” used in the United States for industrial purposes, and provided for in the free list of the tariff act of 1913 (par. 561). The edible oil is then placed in tanks and cured in order to eliminate the tannic acid with which it is highly charged. While two or three years are generally allowed for the curing process in Europe, in California it has not been profitable to age the product for more than a year. This difference in the aging or curing process gives rise to differences in quality, the heavier foreign oils being usually preferred to the more bitter domestic product. Ordinarily the domestic oils are not shipped east of Chicago, because of freight charges and the competition of the foreign oils. In California the pickling of ripe olives and oil processing is carried on by specially equipped packing plants; in the Mediterranean countries olives are usually grown in small groves and cured or pressed on a household basis, the product being sold to brokers at gathering stations.

*Imports* of edible olive oil have increased rapidly, in 1907 amounting to over 3,100,000 gallons (of 7.56 pounds), and in 1917 to over 7,700,000 gallons. The duties collected ranged between \$1,500,000 and \$2,200,000 annually. In 1907 about 75 per cent of the imports were dutiable at the higher rate applying on shipments in containers of less than 5 gallons; by 1917 this proportion had dwindled to about 40 per cent. Imports since 1917, chiefly from Spain, Italy, France, and Belgium, have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
IN BOTTLES, ETC., CONTAINING LESS THAN 5 GALLONS.

*Exports.*—Statistics not available.

## PEANUT OIL.

*Description and uses.*—This oil, which is also known as arachis oil, earthnut oil, and groundnut oil, is obtained from the peanut. The nuts contain from 38 to 50 per cent of oil, and yield about 30 per cent on pressing. The United States and China probably lead in the production of peanuts, although large quantities are also produced in Africa, Argentina, the East Indies, Japan, Java, Sicily, and Spain.

The finest oil is cold pressed, though a much larger yield can be obtained by hot pressing. The cold-pressed oil needs no refining if made from good, clean nuts. It is used as a salad oil, as an adulterant for olive oil, as an ingredient of margarine, and for soap making. The cake from which the oil is expressed makes an excellent cattle feed; if high-grade blanched nuts are used, it can be ground and used with wheat flour for certain kinds of bread.

*Production.*—The cultivation of peanuts and the expression of edible oils are increasing in the United States, especially in districts where ravages of the cotton boll weevil have been especially severe. More peanuts are crushed and more oil extracted in Marseille, France, than elsewhere in the world, about 15,500,000 gallons of edible oil and 23,000,000 gallons of inedible oil being produced in 1912.

The output in the United States since 1911 has been as follows:

Year.	Pounds.	Year.	Pounds.
1912 <sup>1</sup> .....	454, 000	1918 <sup>1</sup> .....	95, 934, 000
1914.....	1, 005, 000	1919.....	87, 606, 844
1916.....	28, 534, 000	1920.....	13, 085, 262
1917.....	50, 499, 000	1921 (9 months) <sup>2</sup> .....	28, 291, 836

<sup>1</sup> Figures for 1912-1918 are for edible and inedible oil. Those for later years are for "Virgin and crude" peanut oil.

<sup>2</sup> Preliminary, subject to revision.

*Imports* prior to 1915 far exceeded the domestic production. The imports for 1914 were 1,332,108 gallons, France supplying more than any other country, Germany ranking second. In 1916 imports amounted to 1,466,043 gallons and in 1917 to 3,018,468 gallons. Lately China has entered the market and is shipping large quantities of a rather poor grade to this country. Imports since 1917, chiefly from Japan, China, Hongkong, and the Philippines, have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Gallons.</i>				<i>Per cent.</i>
1918.....	9,110,901	\$8,498,308	\$0.93	\$546,654	6.43
1919.....	20,520,958	21,984,678	1.07	1,231,257	5.60
1920.....	12,676,743	16,991,731	1.34	760,605	4.48
1921 (9 months).....	259,078	209,148	.81		

*Exports* of peanut oil, which since 1918 have gone largely to England, France, and Norway, have been, by calendar years, as follows:

	1919 <sup>1</sup>	1920	1921 (9 months).
Quantity (pounds).....	4,341,803	1,425,225	1,253,999
Value.....	\$1,043,117	\$291,257	\$132,379

<sup>1</sup> Last 6 months.

#### POPPY-SEED OIL.

*Description and uses.*—Poppy-seed oil is obtained from the seed of two different varieties of the plant. The seeds are dutiable at 32 cents per 100 pounds (par. 760, H. R. 7456).

There are two grades of poppy-seed oil on the market. One, a cold-drawn oil obtained from the first pressing of the seeds, is almost colorless and is known in commerce as white poppy-seed oil; the other, which is obtained from a second pressing of the seed at a higher temperature, is inferior in quality and is known commercially as red poppy-seed oil. The best grade is used for edible purposes, chiefly as salad oil, and in the preparation of the finest artist's paint. The lower grade is used in the manufacture of potash soaps and is added to olive oil in manufacturing castile soap to make it "softer." Poppy-seed oil is often adulterated with sesame oil, and in turn is used to adulterate olive oil and bitter-almond oil.

*Production.*—The poppy plant is grown to a large extent in Asia Minor, Persia, India, Egypt, the southern part of Russia, and in the north of France. The Levant seeds are preferred to the Indian seeds, as they yield, when pressed twice on a large scale, 39 to 40 per cent of oil as against 36 to 38 per cent from the Indian seeds. The oil is produced in a manner similar to other vegetable oils. By far the largest quantity of seed is crushed in France, although poppies are cultivated in California for this purpose.

*Imports.*—The maximum import of poppy-seed oil was in 1911 and amounted to 18,686 gallons, valued at \$14,071, yielding a revenue of \$2,802. Imports decreased to an average of about 9,000 gallons per year for 1912–1915. Since 1917 they have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Gallons.</i>				<i>Per cent.</i>
1918.....	1,297	\$1,956	\$1.51	\$78	3.98
1919.....	259	1,087	4.20	16	1.43
1920.....	716	1,897	2.65	43	2.26
1921 (9 months).....	776	1,173	1.51	.....	.....

*Exports.*—Statistics not available.

#### RAPESEED OIL.

*Description and uses.*—Rapeseed or colza oil is obtained from the seeds of the plant *Brassica campestris*, which is grown in almost all European countries, particularly in East India. The soap industry in 1917 consumed 5,972,000 pounds of rapeseed oil. Smaller quantities are used for lubricating purposes and for quenching steel. It is used as a food in India.

*Production* since 1912 from imported seed has been as follows:

Year.	Pounds.	Year.	Pounds.
1912.....	90,000	1918.....	139,000
1914.....	19,000	1919.....	1,236,743
1916.....	223,000	1920.....	408,840
1917.....	232,000	1921 (9 months) <sup>1</sup> .....	127,905

<sup>1</sup> Preliminary figures, subject to revision.

The maximum production in 1919 was only about 15 per cent of the imports for the same year.

*Imports* in 1913 were 1,564,659 gallons (about 12,000,000 pounds), valued at \$784,750, yielding a revenue of \$156,465. Imports since 1917, chiefly from Japan, England, Hongkong, and China, have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Gallons.</i>				<i>Per cent.</i>
1918.....	3,078,045	\$3,096,827	\$1.01	\$184,683	5.96
1919.....	1,116,696	1,306,305	1.17	67,002	5.13
1920.....	1,721,006	1,921,579	1.12	103,260	5.37
1921 (9 months).....	600,347	533,702	.89	.....	.....

*Exports.*—Statistics not available.

#### ALL OTHER EXPRESSED AND EXTRACTED OILS.

*Imports* since 1917, chiefly from Japan, Kwantung, Brazil, and France, have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....		\$202,246		\$30,337	15
1919.....	891,095	148,539	\$0.17	22,281	15
1920.....	552,034	106,368	.19	15,955	15
1921 (9 months).....	296,553	44,124	.15		15

*Exports* since 1918 (calendar years), chiefly to Canada, Italy, and Mexico, reached \$18,507,128 in 1919 and then decreased to \$448,311 during the first nine months of 1921.

### PARAGRAPH 51.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 51. Alizarin assistant, Turkey red oil, sulphonated castor or other sulphonated animal or vegetable oils, soaps made in whole or in part from castor oil, and all soluble greases; all of the foregoing in whatever form, and used in the processes of softening, dyeing, tanning, or finishing, not specially provided for, 25 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 32. Alizarin assistant, sulphoricinoleic acid, and ricinoleic acid, and soaps containing castor oil, any of the foregoing in whatever form, in the manufacture of which fifty per centum or more of castor oil is used, thirty cents per gallon; in the manufacture of which less than fifty per centum of castor oil is used, fifteen cents per gallon; all other alizarin assistants and all soluble greases used in processes of softening, dyeing or finishing, not specially provided for in this section, thirty per centum ad valorem.

PAR. 45. Oils, expressed: Alizarin assistant, sulphoricinoleic acid, and ricinoleic acid, and soaps containing castor oil, any of the foregoing in whatever form, and all other alizarin assistants and all soluble greases used in the processes of softening, dyeing, or finishing, not specially provided for in this section, 25 per centum ad valorem; \* \* \*

ALIZARIN ASSISTANTS AND SOLUBLE GREASES.

(See Survey A-11.)

*Description and uses.*—The wording in this paragraph describing alizarin assistants, soaps, and soluble greases used in the processes of softening, dyeing, and finishing covers a variety of products manufactured from vegetable and animal oils and used by the textile industry. In dyeing cotton with alizarin dyes the use of a fatty acid or alizarin assistant increases the brilliancy of the dye, in the case of unbleached cotton producing a more level and uniform shade. The most widely used alizarin assistant is turkey-red oil, which was originally made by treating olive oil with sulphuric acid. It was soon found that an alizarin assistant produced from castor oil gave better results, and the bulk of the alizarin assistants are now made from

that oil. Some are made also from olive, peanut, and cottonseed oils. The group of alizarin assistants made by treating oils with sulphuric acid is also known as sulphated or sulphonated oils.

Other soluble greases, which are really oil soaps, are used in various processes in the textile industry. They are usually potash or soda soaps prepared from vegetable oils, although tallow soaps can be used for some purposes. They are used in scouring raw wool, woolen yarns, in the scouring and milling or fulling of woolen cloth; in degumming silk; and in treating cotton fabrics in three operations—cleansing before, during, and after dyeing—and in calico printing. Some of the so-called soluble oils are turkey-red oil, others are soaps dissolved in water.

*Production.*—These products are manufactured by various firms in this country specializing in chemicals used in the textile industry and by the large textile manufacturers. The production of turkey-red oil in 1914 was 11,681,884 pounds (about 1,370,000 gallons), valued at \$820,491.

*Imports* of alizarin assistants have shown a gradual increase prior to the war from 97,097 gallons, valued at \$38,600, in 1910, to 186,234 gallons, valued at \$72,430, in 1914. The imports since then have decreased until in 1918 only 24 gallons were imported. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
<i>Alizarin assistants and turkey-red oil:</i>					
1919.....	<i>Gallons.</i> 46,915	\$32,124	\$0.69	\$8,031	25
1920.....	282	204	.72	51	25
1921 (9 months).....	1,229	718	.58	.....	25
<i>Other soluble greases, etc.:</i>					
1918.....	<i>Pounds.</i> 4,330	598	.13	150	25
1919.....	575	106	.18	27	25
1921 (9 months).....	651	67	.10	.....	25

*Exports.*—Statistics not available.

*Important changes in classification.*—These products differ widely from the expressed oils with which they are combined in paragraph 45 (act of 1913), and therefore they have been given a separate paragraph in H. R. 7456. The phrase “sulphoricinoleic acid and ricinoleic acid” was omitted because these terms are not used in the trade. “Alizarin assistant” is all inclusive, and therefore the provision for “all other alizarin assistants” in paragraph 45 (act of 1913) was omitted. (Reclassification Report, p. 60.)

*Suggested changes.*—Attention is called to the adjustment of rates between alizarin assistant, the duty on which is 25 per cent ad valorem in this paragraph, and castor oil, the raw material, upon which the duty is  $4\frac{1}{2}$  cents per pound in paragraph 50. Castor oil, No. 3, in barrels, was quoted at  $10\frac{1}{2}$  cents per pound on December 12, 1921, and has not been quoted at less than 8 cents during 1921. The duty on castor oil is therefore equivalent to about 45 per cent ad valorem, as against a duty of 25 per cent ad valorem on alizarin assistant, which is 80 to 90 per cent castor oil.

In order to adjust these rates it is also necessary to know the relation between the rates on castor oil and castor beans, upon which there is a duty of one-half cent per pound under paragraph 760. In crushing about 45 per cent of the weight of the bean is obtained as castor oil. Therefore the duty on castor beans is equivalent to slightly more than 1 cent per pound on the oil contained therein. This gives a differential between castor beans and castor oil of somewhat less than 3½ cents per pound in favor of the oil.

### PARAGRAPH 52.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 52. Hydrogenated or hardened oils and fats, and other oils and fats, the composition and properties of which have been changed by vulcanizing, oxidizing, chlorinating, nitrating, or any other chemical process, and not specially provided for, 20 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

[No corresponding provision.]

[No corresponding provision.]

#### CHEMICALLY TREATED OILS AND FATS.

##### GENERAL.

This paragraph covers a variety of products obtained by chemical treatment and processing of various oils and fats, the most important of which are the hydrogenated or hardened oils. These products may be distinguished from those made by compounding various fats and oils, by the fact that the chemical composition and properties of the original oil or fat have been altered by chemical means.

##### HYDROGENATED OILS AND FATS.

*Description and uses.*—Hydrogenated or hardened oils are obtained by treating chiefly vegetable oils with hydrogen in the presence of a nickel catalyst; the hydrogen combines with the oil increasing the density and is usually carried to a point where a solid fat is formed. Hydrogenated oils are used chiefly in the manufacture of lard substitutes for which purpose principally cottonseed and coconut oils are used. It is possible by hydrogenation of fish oils to convert them into odorless solid fats suitable for the manufacture of soaps.

*Production.*—The production of hydrogenated oils and fats is an industry of recent establishment, the hydrogenation of oils having been introduced in the United States in about 1907. Since 1912 the industry has grown rapidly to a large size. The manufacture involves the production of hydrogen on a large scale either by electrolysis of water or by passing steam over red-hot iron filings. The combination of hydrogen with the oil is effected by means of a nickel catalyst which, however, does not enter into the finished product. In 1915 patent litigation was begun, which was of far-reaching impor-

tance and resulted in 1920 in the declaration that the basic United States patents were invalid. Thus, the manufacture of hydrogenated oils became public property.

Statistics of production are not available prior to 1919, when the output was 120,444,589 pounds and increased to more than 180,000,000 pounds in 1920. The output for the first 9 months of 1921 was 159,000,000 pounds. These figures may be regarded as the minimum production since hydrogenated oil is confounded by some manufacturers and reported as vegetable stearin to the Bureau of the Census.

*Imports and exports* are not shown.

*Important changes in classification.*—New specific provision. (Reclassification Report, p. 60.)

#### OTHER CHEMICALLY TREATED OILS AND FATS.

*Description and use.*—Probably the next most important class of chemically treated oils and fats included in this paragraph is the vulcanized oils, which are used as rubber substitutes. These products are obtained by vulcanizing various vegetable oils by means of sulphur monochloride. Vulcanization results in a slightly elastic rubbery mass, which is used to adulterate cheap mechanical rubber goods, and as a filler in the manufacture of pneumatic tires. These vulcanized oils are also known as "factice," two varieties of which "white" and "brown or black" are produced.

The industrial use of chlorinated oils has been only slightly developed. They are claimed to be used in conjunction with calcium albuminate in the manufacture of paints, and it is believed that a small quantity of chlorinated cottonseed oil is used as a rubber substitute.

Nitrated oils are obtained by treating linseed or castor oil with a nitrating mixture of sulphuric and nitric acids. The most important use of nitrated oils is that of mixing with nitrocellulose to produce a product resembling ebonite. Acetone solutions of nitrated oils have been used as varnishes, as a basis for paint, and for enameling leather. It is not known definitely that any nitrated oils are produced in the United States.

*Production* in 1914 of rubber substitutes was valued at \$428,600, and in 1919 (preliminary figures) at \$1,456,000. It is not known that chlorinated or nitrated oils are produced in this country.

*Imports and exports.*—Statistics not available.

*Important changes in classification.*—New specific provision.

---

### PARAGRAPH 53.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 53. Combinations and mixtures of animal, vegetable, or mineral oils or of any of them (except combinations of essential or distilled oils or both), with or without other substances, and not specially provided for, 25 per centum ad valorem: *Provided*, That no article containing alcohol shall be classified for duty under this paragraph.

## ACT OF 1909.

PAR. 3. \* \* \* oils, and all combinations of the foregoing, \* \* \* twenty-five per centum ad valorem; \* \* \*.

## ACT OF 1913.

PAR. 44. \* \* \* and all combinations of the same [animal oils, rendered oils, and greases], not specially provided for in this section, 15 per centum ad valorem.

PAR. 45. \* \* \* all combinations of the same [expressed oils], not specially provided for in this section, 15 per centum ad valorem.

## COMBINATIONS AND MIXTURES OF OILS, N. S. P. F.

*Description and uses.*—This paragraph includes a great variety of oil mixtures which are compounded for special purposes, and comprise lubricating greases and oils, tanning greases, stuffing greases, and polishing compounds.

*Production, imports, and exports.*—Statistics not available.

*Important changes in classification.*—This is a new specific provision. It replaces the provision for combinations of animal oils (par. 44, act of 1913), and for combinations of expressed oils (par. 45, act of 1913), and includes combinations of these with other oils.

*Suggested changes.*—Page 18, paragraph 53, line 14: Change “of” to “containing,” after “combinations,” to agree with paragraph 56, page 19, line 24.

Page 18, paragraph 53, line 13: Insert “or mixtures” after “combinations” to agree with line 12.

Page 18, paragraph 53, line 14: Strike out “or both” after “oils.”

## PARAGRAPH 54.

## H. R. 7456.

## SENATE AMENDMENTS.

PAR. 54. Oils, distilled or essential: Lemon and orange, 20 per centum ad valorem; clove, eucalyptus, peppermint patchouli, sandalwood, and all other essential and distilled oils not specially provided for, 25 per centum ad valorem: *Provided*, That no article mixed or compounded or containing alcohol shall be classified for duty under this paragraph.

## ACT OF 1909.

## ACT OF 1913.

PAR. 3. \* \* \* distilled oils, essential oils, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*.

PAR. 39. Peppermint oil, twenty-five cents per pound.

PAR. 639. Oils: \* \* \* amber, crude and rectified ambergris,<sup>o</sup> \* \* \* cajeput, \* \* \* cedrat, chamomile, \* \* \* civet,<sup>o</sup> \* \* \* fennel, \* \* \* juglandium, juniper, \* \* \* lemon, \* \* \* mace, \* \* \* valerian; \* \* \* [Free].

PAR. 46. Oils, distilled and essential: Orange and lemon, 10 per centum ad valorem; peppermint, 25 cents per pound; mace oil, 6 cents per pound; \* \* \* amber; ambergris<sup>o</sup>; \* \* \* camomile; \* \* \* cedrat; \* \* \* civet<sup>o</sup>; fennel; \* \* \* juniper; \* \* \* valerian; all the foregoing oils, \* \* \* and essential and distilled oils, \* \* \* not specially provided for in this section, 20 per centum ad valorem: *Provided*, That no article containing alcohol shall be classified for duty under this paragraph.

PAR. 561. Oils: Birch tar, cajeput, \* \* \* juglandium, \* \* \* [Free].

<sup>o</sup> Oils of ambergris and civet are not articles of commerce.

## OILS, DISTILLED OR ESSENTIAL.

(See Survey A-12.)

## GENERAL.

*Description and uses.*—A scientific definition of the term “essential or distilled oils” is not possible, but the oils may be described as substances of an oily nature obtained, as a rule, from vegetable sources, possessed usually of an agreeable odor, characteristic of or resembling that of the plants yielding the oils. They are generally liquid, although sometimes semisolid at ordinary temperatures, and volatile without decomposition. Essential oils are used as flavors and perfumes, while a few possess medicinal properties.

*Production.*—The essential oils occur in various parts of the plant; in some instances distributed throughout the plant, in others restricted to a particular portion—for example, in the petal of the flower, as in the rose; in the bark and leaves, as in the cinnamon; and in the flower and rind of the fruit, as in the orange and lemon.

The methods of producing essential oils may be divided into three principal classes: (1) Distillation of the plant or of an oleo-resinous exudation. (2) Mechanical processes. (3) Extraction by solvents.

*Distillation.*—This method is used in the preparation of most of the essential oils. The usual procedure is to pass steam through the material, suitably arranged on trays, since all of the essential oils are readily volatile by means of steam. Many are distilled under reduced pressure, which enables the distillation to be carried out at a much lower temperature, thus avoiding decomposition of the oils. The distillation of an oleo-resin is illustrated in the manufacture of turpentine and copaiba.

*Mechanical production.*—Mechanical processes are employed in the preparation of lemon, orange, bergamot, grapefruit, and lime oils, which are obtained from the peel or rind of the fruit. The most primitive example of this method is employed in Sicily in the preparation of orange and lemon oils. The peel is removed from the fruit and is pressed by hand against a sponge, which absorbs the oil. Various other mechanical processes are employed in Italy and France for the production of these oils, especially that of bergamot. Orange oil and lemon oil are produced from cull fruit in California. The whole fruit is shredded by a machine and the juice and oils are separated from this pulp by presses. The oils are then separated from the juice of the fruit by a centrifugal machine.

*Extraction by solvents.*—This method of extraction is employed for the preparation of delicate floral essences, which would be decomposed by distillation. This process is used in preparation of jasmine and tuberose. Three kinds of extraction processes are used: (1) Those in which a volatile solvent is used; (2) those in which a non-volatile oil or fat is employed; (3) those in which a current of moist air is used.

Volatile solvents commonly used are alcohol, benzine, ether, chloroform, light petroleum oil, carbon disulphide, acetone, and tetrachlorethane. The simplest form of extraction is to allow the solvent to percolate either cold or hot over the crude material. On the removal of the solvent a mixture of oil, resin, and coloring matter is

obtained from which "absolute floral essences" or "concretes" are prepared by extraction with alcohol.

The extraction by nonvolatile solvents is known as the "enfleurage process." This is both a hot and a cold process. In the hot process a pure neutral fat, such as purified lard, is melted in trays; the flowers are placed in the melted grease, which is kept at about 65° C. This mixture is then pressed, which separates the grease pomade containing the essential oil from the flower petals. In the cold process the flowers are placed on wire netting over which a grease-covered glass plate is suspended. The flowers and plates are placed in alternate layers. The first flowers after a time are removed and replaced by more fresh flowers until the fat has become saturated with the oils. The fat containing the oil is removed and sold as "pomades," which are employed in the manufacture of perfume.

In the moist-air process hot air is passed through a series of wet sponges, then over the flower, and then into a volatile solvent. The solvent retains the perfume and is afterwards removed, leaving a perfume which contains only the oil and no coloring matter or resins.

The domestic production of essential oils in 1914 was valued at \$1,289,482. About 50 per cent of this value is represented by peppermint oil. In addition to the oils mentioned above, there were produced other essential oils, amounting in value to \$348,552, which includes sassafras, cedar, pennyroyal, tansy, sandalwood, camphor, cloves, parsley, patchouli, lemon, and orange. In 1919, according to preliminary figures, the output was valued at \$4,411,775.

Imports of all essential and distilled oils prior to the war had increased from \$2,118,102 in 1910 to \$4,905,157 in 1913. The imports declined until 1916, from which time they show a gradual increase to \$3,948,059 in 1918. Of the total imports of essential oils in 1913, about 70 per cent is represented by seven oils—citronella, lemon grass, lemon, orange, bergamot, attar of roses, and lavender or aspic. These same oils in 1918 represented 56.5 per cent of the value of the total imports of essential and distilled oils. The value and percentage of the total imports of each of these for 1913 and 1918 are shown in the following table:

	1913		1918	
	Value.	Per cent.	Value.	Per cent.
Citronella and lemon grass.....	\$885,846	18.1	\$900,853	22.8
Lemon.....	794,215	16.2	404,568	10.2
Attar of roses.....	791,370	16.1	89,049	2.2
Bergamot.....	310,835	6.3	241,465	6.1
Orange.....	155,299	3.2	330,506	8.4
Lavender or aspic.....	482,779	9.8	373,466	6.9
Total of 7 oils.....	3,420,344	69.7	2,239,907	56.6
Total essential and distilled oils.....	4,905,157		3,948,059	

#### LEMON AND ORANGE OILS.

*Production.*—The lemon and the orange are usually cultivated in the same localities. The greater part of both lemon oil and orange oil is produced in Sicily, chiefly in the district of Messina. These oils are produced in the United States, chiefly in California, from cull fruits.

*Imports* of lemon oil prior to the war were constant at a little over 400,000 pounds, but the value shows an increase from about \$300,000 in 1911 to nearly \$800,000 in 1913. The import decreased somewhat in 1914, but has shown an increase to 577,600 pounds, valued at \$404,568, yielding a revenue of \$40,456, in 1918.

*Imports* of orange oil have been much less than those of lemon oil, in 1913 being 79,797 pounds, valued at \$155,299, and yielding a revenue of \$38,824. In 1918 there was an increase to 196,846 pounds, valued at \$330,506, and yielding a revenue of \$33,050. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
LEMON OIL.					
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	535,868	\$387,475	\$0.72	\$38,748	10
1919.....	503,758	494,223	.98	49,422	10
1920.....	662,565	900,914	1.36	90,091	10
1921 (9 months).....	483,616	435,444	.90	.....	10
ORANGE OIL.					
1918.....	172,832	\$278,974	\$1.61	\$27,897	10
1919.....	227,453	491,822	2.16	49,182	10
1920.....	192,675	914,863	4.75	91,486	10
1921 (9 months).....	160,346	397,473	2.48	.....	10

*Imports* of lemon oil since 1918 have been chiefly from Italy, France, England, and Turkey in Europe.

*Exports.*—Statistics not available.

#### CLOVE OIL.

*Description and uses.*—Oil of cloves is obtained by the distillation of the buds of the clove tree, which grows abundantly in the East Indies, the West Indies, Madagascar, Zanzibar, and Pamba. Its chief use is in the production of eugenol, which in turn is used to produce artificial vanillin.

*Production.*—Statistics for the United States are not available, although some is made in this country.

*Imports and exports.*—Statistics not available.

*Important changes in classification.*—New specific provision.

#### EUCALYPTUS OIL.

*Description and uses.*—Eucalyptus oil is the volatile oil obtained by steam distillation of the leaves of the eucalyptus tree, of which there are many varieties, divided into two general classes: (1) Those valued for their content of eucalyptol. (2) Those valued for their content of phellandrene. The first class is in great demand for pharmaceutical purposes, and the second for separation of metallic sulphides by the flotation process in Australian mines.

*Production.*—Eucalyptus species were introduced into California, and since that time the distillation of the oil has become of con-

siderable importance in the southern part of the State, though ranking far below the peppermint and turpentine oil industries in importance. Production statistics are not available.

*Imports* since 1918 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	162,538	\$57,571	\$0.35	\$11,514	20
1919.....	152,284	64,734	.43	12,947	20
1920.....	319,700	148,871	.47	29,774	20
1921 (9 months).....	63,640	27,825	.44	.....	20

*Exports.*—None recorded.

*Important changes in classification.*—New specific provision.

#### PEPPERMINT OIL.

*Description and uses.*—Oil of peppermint is a volatile oil distilled from the leaves and flowering tops of the peppermint herb. It is a popular flavoring agent and finds an extensive use in chewing gum, confectionery, and pharmaceutical preparations. The Japanese oil is used in the preparation of menthol. (See par. 48, p. 137.)

*Production.*—Peppermint oil is produced chiefly in the United States, England, Germany, Japan, and Russia. The United States supplies about 50 per cent of the world's production. The domestic output in 1914 was 363,991 pounds, valued at \$601,617. The major part of the crude oil is produced in Michigan and is refined in New York.

*Imports* have been practically negligible as compared with domestic production, the largest since 1910 being 29,360 pounds, valued at \$28,953, yielding a revenue of \$7,340 in 1918. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	39,687	\$46,768	\$1.18	\$9,922	21.21
1919.....	200,420	302,186	1.51	50,105	16.58
1920.....	62,426	110,703	1.77	15,607	14.10
1921 (9 months).....	8,587	10,886	1.27	.....	.....

*Exports* in 1910 amounted to 110,407 pounds, valued at \$215,845; in 1914, 117,809 pounds, at \$397,050; and in 1918, 76,247 pounds, at \$233,899. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months)
Quantity (pounds).....	59,606	97,880	61,847	64,938
Value.....	\$202,856	\$654,282	\$457,395	\$181,822

Since 1918 exports have been chiefly to England, Canada, France, and Germany.

*Suggested changes.*—Page 18, line 19, paragraph 54, H. R. 7456: Insert a comma after the word peppermint.

PATCHOULI OIL.

*Description and uses.*—Patchouli oil is a brownish-yellow, viscous, volatile oil of fragrant, persistent odor, used for making certain perfumes. It is derived by distillation of the leaves of *Pogostemon patchouly*, with subsequent purification by rectification. The chief sources of supply are India and the Straits Settlements.

*Imports* are included in "all other essential or distilled oils," *infra*.

*Exports.*—Statistics not available.

*Important changes in classification.*—Mentioned specifically for the first time.

SANDALWOOD OIL.

*Description and uses.*—Sandalwood oil is a thick, yellow, volatile oil, of spicy taste and aromatic odor, used chiefly in medicine and perfumery. It is derived by distillation of the wood of *Santalum album*. The chief source is French Guiana. West Indian sandalwood oil, which is not a true sandalwood oil, has been substituted for it to a certain extent.

*Imports.*—Included in "all other essential or distilled oils," *infra*.

*Exports.*—Statistics not available.

*Important changes in classification.*—New specific provision.

ALL OTHER ESSENTIAL OR DISTILLED OILS.

*Imports* are tabulated as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....		\$740,709		\$148,142	20
1919.....	364,916	2,043,050	\$5.60	408,610	20
1920.....	785,175	2,827,464	3.60	565,493	20
1921 (9 months).....	288,350	1,148,065	3.93		20

*Exports*, chiefly to Canada, England, Cuba, and France, in 1918 (calendar year) amounted to \$744,997, and increased to \$1,571,415 in 1920. During the first nine months of 1921 they amounted to \$419,724.

*Important changes in classification.*—The provision "that no article mixed or compounded \* \* \* shall be classified for duty under this paragraph" has been inserted and the provision in paragraph 46 (act of 1913) for "all combinations of" essential or distilled oils omitted so as to make such combinations of essential or distilled oils dutiable under paragraph 56, H. R. 7456, as they are intermediate products used in the manufacture of perfumes. (Reclassification Report, p. 65.)

Birch tar, cajeput and juglandium oils (exempt from duty in the act of 1913, par. 561) are not mentioned specifically in H. R. 7456 and therefore fall within the provision for "Other essential and distilled oils" in this paragraph.

## PARAGRAPH 55.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 55. Opium containing not less than 8.5 per centum of anhydrous morphine, crude or unmanufactured and not adulterated, \$3 per pound; powdered, or otherwise advanced beyond the condition of crude or unmanufactured, and containing 15 per centum or less of moisture, \$4 per pound; morphine, morphine sulphate, and all opium alkaloids and salts, esters, and other derivatives thereof, \$3 per ounce; cocaine, ecgonine, and salts, esters, and other derivatives thereof, \$2 per ounce; tincture of opium, such as laudanum, and other liquid preparations of opium, not specially provided for, 60 per centum ad valorem; opium containing less than 8.5 per centum of anhydrous morphine, \$6 per pound: *Provided*, That nothing herein contained shall be so construed as to repeal or in any manner impair or affect the provisions of an Act entitled "An Act to prohibit the importation and use of opium for other than medicinal purposes," approved February 9, 1909, as amended by an Act approved January 17, 1914.

## ACT OF 1909.

PAR. 41. Opium, crude or unmanufactured, and not adulterated, containing nine per centum and over of morphia, one dollar and fifty cents per pound; opium of the same composition, dried, powdered, or otherwise advanced beyond the condition of crude or unmanufactured, two dollars per pound; morphia or morphine, sulphate of, and all alkaloids of opium, and salts and esters thereof, one dollar and fifty cents per ounce; cocaine, ecgonine, and all salts and derivatives of the same, one dollar and fifty cents per ounce; \* \* \* aqueous extract of opium, for medicinal uses, and tincture of, as laudanum, and other liquid preparations of opium, not specially provided for in this section, forty per centum ad valorem; opium containing less than nine per centum of morphia, six dollars per pound; but preparations of opium deposited in bonded warehouses shall not be removed therefrom without payment of duties, and such duties shall not be refunded: *Provided*, That nothing herein contained shall be so construed as to repeal or in any manner impair or affect the provisions of an Act entitled "An Act to prohibit the importation and use of opium for other than medicinal purposes," approved February ninth, nineteen hundred and nine.

## ACT OF 1913.

PAR. 47. Opium, crude or unmanufactured, and not adulterated, containing 9 per centum and over of morphia, \$3 per pound; opium of the same composition, dried to contain 15 per centum or less of moisture, powdered, or otherwise advanced beyond the condition of crude or unmanufactured, \$4 per pound; morphia or morphine, sulphate of, and all alkaloids of opium, and salts and esters thereof, \$3 per ounce; cocaine, ecgonine, and all salts and derivatives of the same, \$2 per ounce; aqueous extract of opium, for medicinal uses, and tincture of, as laudanum, and other liquid preparations of opium, not specially provided for in this section, 60 per centum ad valorem; opium containing less than 9 per centum of morphia, \$6 per pound; but preparations of opium deposited in bonded warehouses shall not be removed therefrom without payment of duties, and such duties shall not be refunded: *Provided*, That nothing herein contained shall be so construed as to repeal or in any manner impair or affect the provisions of an Act entitled "An Act to prohibit the importation and use of opium for other than medicinal purposes," approved February ninth, nineteen hundred and nine.<sup>10</sup>

<sup>10</sup> Supplementary acts: Jan. 17, 1914, ch. 9, 38 Stat., 275; Dec. 17, 1914, ch. 7, 38 Stat., 785; Feb. 24, 1919, ch. 18, secs. 1006, 1007, 40 Stat., 1057, 1130, 1132.

## OPIUM.

(See Survey A-13.)

*Description and uses.*—Opium is a drug consisting of the air-dried juices of the poppy plant. It is used in medicine to induce sleep and insensibility to pain, and in the manufacture of alkaloids, of which morphine, heroin, and codeine are of chief importance. One pound of opium supplies about 7,000 medicinal doses.

*Production.*—Commercial opium, derived mainly from Asiatic Turkey and Persia, has an alkaloid content which is higher than that from other important producing countries, rendering it unfit for smoking purposes. Smoking opium, which is used chiefly or wholly by addicts, contains less than 9 per cent morphine and was formerly produced in large quantities in India and China. East Indian cultivation of the poppy has recently been much restricted. It has also been prohibited in China for some years, although governmental disturbances in that country have aided illicit production. Greece, Bulgaria, and a number of other countries produce small amounts of opium. It has been produced experimentally in the United States also, but the costs of production are at present considered prohibitive. The poppy is extensively raised for seed in California and elsewhere. The seed, which contains no alkaloid, is used for the expression of oil and for culinary purposes. Poppy culture in the tropical possessions of the United States has been discouraged.

The consumption of opium in the manufacture of "druggist preparations and patent medicines and compounds" in 1919 (preliminary figures) was 102,761 pounds, valued at \$956,354.

*Imports of opium are tabulated under three classes:*

(1) *Crude opium containing 9 per cent or over of morphine.*—This is the chief grade used in medicine and manufacture. For the years 1909–1915 imports averaged 428,634 pounds, valued at \$1,787,162. During three succeeding years imports decreased largely, owing to war conditions. In 1918 only 21,342 pounds of crude opium, valued at \$265,283, are recorded. Since the signing of the armistice, large amounts of opium are understood to have been imported. Since 1918 imports of crude opium containing 9 per cent or more of morphine, chiefly from Turkey in Asia, Turkey in Europe, France, and England, have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	15,254	\$240,738	\$15.78	\$45,762	19.01
1919.....	316,713	3,818,725	12.06	950,139	24.83
1920.....	224,152	1,795,207	8.01	672,456	37.46
1921 (9 months).....	65,231	262,768	4.02		

(2) *Dried or advanced opium.*—This is normally negligible in amount as compared with the crude grade, but has increased largely during the war, 98,498 pounds, valued at \$1,514,127, being imported in 1918. Imports since then have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	137,713	\$2,337,278	\$16.97	\$550,852	23.57
1919.....	27,702	505,408	18.24	110,808	21.92
1920.....	1,376	5,757	4.18	5,504	95.61
1921 (9 months).....	149	436	2.93	.....	.....

(3) *Opium containing less than 9 per cent morphine.*—This grade includes smoking opium. The importation of low-grade opium has been prohibited by act of Congress since 1909. Import revenues from opium and its derivatives greatly exceed those of all other drug products combined. For the years 1909–1916 crude opium yielded an average annual revenue of \$671,969; that dried or advanced beyond the condition of crude, for 1910–1918, an average of \$178,093.

Imports under recent high tariffs have been small as compared with American manufacture and have consisted mainly of the rarer alkaloids and salts. War conditions caused demand for opium products virtually regardless of price, and considerable increase in imports took place in 1917–18. That increase was not larger is doubtless due to universal scarcity and export restrictions of other nations rather than to high prices or present tariff duties. The duty of \$3 per pound on 9 per cent opium is equivalent to a tax of \$2.07 per ounce on the contained alkaloid, leaving a margin in favor of the American manufacturer of 93 cents per ounce. This, together with the profit gained from codeine and other by-products, and the application of legal restrictions beyond the purview of the tariff, considerably hampered foreign competition in the American markets. Imports of morphine fell off under the present tariff rates from an annual average (1910–1913) of 18,004 ounces to (1914–1917) 2,805 ounces. In 1918 imports rose to 25,215 ounces, valued at \$202,263. Other alkaloids have pursued a very irregular course. The maximum (1917) is 34,179 ounces, valued at \$165,028. Imports of laudanum and other preparations have in recent years passed the \$5,000 mark only in 1915. Under the tariff of 1909 opium alkaloids yielded an average annual revenue of \$5,393. The tariff of 1913 has yielded (1915–1918) an annual average of \$49,233.

The only imports recorded since 1918 are 951 pounds, valued at \$4,542, in the first nine months of 1921.

*Exports.*—Statistics not available.

*Important changes in classification.*—The United States Pharmacopœia in the most recent revision changed the specifications for opium by stating the morphine content on the basis of anhydrous morphine rather than the crystalline morphine. This necessitated changing the 9 per cent limitation as to morphine content of opium to 8.5 per cent.

The phrase “dried to contain 15 per cent or less of moisture” (act of 1913) has been changed to “containing 15 per cent or less of moisture” in order to obviate the difficulty which customs authorities encountered in determining whether opium had been artificially dried.

The provision for “aqueous extract of opium, for medicinal uses” in paragraph 47 (act of 1913) has been omitted because the Commissioner of Internal Revenue (Int. Rev. T. D. 1982) has ruled that

aqueous extract of opium is smoking opium, and its importation is therefore prohibited by the act of February 9, 1909, as amended by the act of January 17, 1914.

The clause "but preparations of opium deposited in bonded warehouses shall not be removed therefrom without payment of duties, and such duties shall not be refunded," has been omitted, because it is believed that it serves no purpose at the present time. (Reclassification Report, pp. 67, 68.)

#### MORPHINE AND OTHER OPIUM ALKALOIDS.

(See Survey A-13.)

*Description and uses.*—The derivatives and preparations of opium are considered for tariff purposes in two categories—(1) opium alkaloids and their derivatives, and (2) medicinal preparations of opium. Morphine, codeine, and heroin, or diacetylmorphine, are the most important of opium alkaloids. Morphine occurs in medicinal opium in amounts of 9 per cent or more; codeine rarely exceeds 3 per cent. Heroin is an artificial product obtained from morphine. These preparations are used in medicine to relieve pain and induce sleep. Morphine is perhaps the most important single agent in the *Materia Medica*, both as regards its legitimate use and in its capacity as a habit-forming drug. The uses of heroin are similar to those of morphine. It was introduced as a nonhabit-forming substitute, but was speedily found to be even more dangerous in this respect than morphine itself. Heroin and cocaine may probably be considered as most subject to vicious misuse of any of the habit-forming drugs. Because of this fact and because heroin possesses no medicinal superiority to morphine, modern therapeutic authorities have advocated the prohibition of its manufacture and traffic. The use of codeine is similar to that of morphine. It is considered less habit-forming than morphine and therefore better suited to repeated administration. The secret use of the opium alkaloids and opium preparations in proprietary remedies has been regulated by the Food and Drugs Act. These materials also come within the scope of the Harrison Narcotic Act. Medicinal preparations, salts, and various combinations of opium are of considerable importance in domestic pharmaceutical manufacture, but the high ad valorem rate (60 per cent) has virtually eliminated them from our imports. Their use is similar to that of opium. Among the principal preparations may be mentioned laudanum, paregoric, and Dover's powder. The consumption of opium alkaloids in 1919 (preliminary figures) in the manufacture of "druggists' preparations and patent medicines and compounds" was: Morphine and salts, 3,984 pounds, valued at \$635,912; heroin and salts, 702 pounds, valued at \$178,585; codeine and salts, 2,312 pounds, valued at \$296,392.

*Production.*—Opium alkaloids are extensively manufactured in England, Germany, and the United States. England and Germany led in production prior to the war. Germany, in particular, produced a large variety of the rarer alkaloids and salts. Morphine has been extensively manufactured in America for a number of years. No statistics of production are available, but the average annual opium import before the war was equivalent to about 69,000 ounces, or 2,500,000 medicinal doses of morphine. Considerable amounts

of opium, however, are not manufactured into the alkaloid. Codeine was formerly produced chiefly in Germany. Under war conditions it has been extensively manufactured in the United States from Persian opium, which contains a comparatively large amount of this alkaloid. Heroin was until recently made only in Germany, but is now manufactured in this country.

*Imports* since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem
MORPHINE OR MORPHINE SULPHATE.					
	<i>Ounces.</i>				<i>Per cent.</i>
1918.....	30,385	\$226,349	\$7.45	\$91,155	40.27
1919.....	13,760	83,451	5.48	47,280	54.69
1920.....	4,000	11,445	2.86	12,000	104.85
1921 (9 months).....	951	4,542	4.78		
OTHER OPIUM ALKALOIDS.					
1918.....	59,270	\$341,771	\$5.77	\$177,810	52.03
1919.....	31,909	189,476	5.94	95,727	50.52
1920.....	6,522	30,537	4.68	19,566	64.07
1921 (9 months).....	2,180	6,093	2.79		

*Exports.*—Statistics not available.

*Important changes in classification.*—The act of 1913 provided for "alkaloids of opium and salts and esters thereof." The language has been changed so that "thereof" refers to "alkaloids" and not to "opium," since there are no salts and esters of opium. (*Merck v. United States*, 6 Ct. Cust. Appls., 41, of 1915.) The term "derivatives" has been added so as to correspond to the provision for cocaine and ecgonine.

#### COCAINE, ECGONINE, AND DERIVATIVES THEREOF.

(See Survey A-13.)

*Description and uses.*—Cocaine is an alkaloid derived from coca leaves. It is used chiefly as a local anesthetic in minor surgical operations and dentistry, and is the most important medicinal of this class. It has other less important legitimate uses. Large quantities are used as an exhilarant by drug addicts. The cocaine habit is considered by medical authorities to be the most vicious and difficult to deal with of any narcotic addiction. Ecgonine and its derivatives are alkaloidal substances occurring with cocaine in coca leaves, and from them cocaine may be derived by chemical processes. They have no recognized medicinal use.

*Production.*—Cocaine used in the United States is practically all of domestic manufacture. Statistics are lacking, but the normal import of coca leaves is sufficient for the annual production of 100,000 or more ounces. Owing to the habit-forming properties of cocaine, a host of synthetic local anesthetics have been developed as substitutes. These were formerly chiefly imported from Germany, but under the trading with the enemy act a number of German patents have been licensed to American manufacturers. While these products

have attained a considerable vogue, apparently they have not decreased the demand for cocaine. The manufacture of cocaine, like that of most alkaloids, is a specialized industry, requiring a high type of chemical skill, and is carried on by only a few firms. The limitations imposed by the Food and Drugs Act, the Harrison Narcotic Act, and various other laws, have further tended to centralize the industry. Cocaine is also produced commercially in Germany, England, and other European countries. Considerable amounts of the crude product are produced in Peru and exported to Europe for purification.

The consumption of cocaine and salts in the manufacture of "Druggist preparations and patent medicines and compounds" in 1919 (preliminary figures) was 516 pounds, valued at \$90,454, a marked decrease from about 26,000 pounds in 1914.

*Imports* for the years 1910-1914 have averaged 3,239 ounces per year. After the imposition of the specific rate of \$2 per ounce only insignificant amounts of cocaine entered until 1916 and 1917 when, on account of war conditions, imports rose to 4,275 ounces and 19,388 ounces, respectively. American cocaine imports normally consist largely of rare salts, which are not manufactured in this country. The revenues yielded by cocaine have never been large, reaching a maximum of \$46,933 in 1910, and since then have decreased.

Commodities included in paragraph 55 embrace the chief narcotic and habit-forming drugs. The high rates of duty imposed by previous tariffs were presumably designed to limit imports and consumption rather than to raise revenue, although in the case of opium and its products the revenue has been comparatively large. The testimony brought out in various hearings on narcotic legislation indicates that the average annual amount of opium (and its products) and cocaine consumed within the United States is enormously in excess of medicinal use. Estimates of actual medicinal need of opium have varied from 50,000 pounds to 100,000 pounds annually. Under war conditions imports have been about 120,000 pounds annually, and much of this has been absorbed directly or indirectly by the Army. Recent investigations of opiumism and cocainism indicate that these addictions are on the increase. Legislation has tended to drive illicit trade in narcotic drugs into underground channels, but not to extirpate it. Statistics indicate that past tariff levies have been insufficient to exert any marked influence on the use of or demand for narcotics.

Imports of cocaine, ecgonine, and their salts, esters, etc., since 1917, have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad- valorem.
	<i>Ounces.</i>				<i>Per cent.</i>
1918.....	18,389	\$80,652	\$4.38	\$36,778	45.60
1919.....	12,464	29,035	2.33	24,928	85.86
1920.....	8,642	27,324	3.16	17,284	63.26
1921 (9 months).....	6,309	16,978	2.69		

*Exports.*—Statistics not available.

## PARAGRAPH 56.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 56. Perfume materials: Anethol, citral, geraniol, heliotropin, ionone, rhodinol, safrol, terpineol, vanillin, and all natural or synthetic odoriferous or aromatic chemicals, all the foregoing not mixed and not compounded, and not specially provided for, 35 per centum ad valorem; all mixtures or combinations containing essential or distilled oils, or natural or synthetic odoriferous or aromatic substances, 40 cents per pound, and 40 per centum ad valorem: *Provided*, That only materials not marketable as perfumery, cosmetics, or toilet preparations, and not containing more than 10 per centum of alcohol, shall be classified for duty under this paragraph: *Provided further*, That all of the foregoing materials containing more than 10 per centum of alcohol shall be classified for duty under paragraph 58 as toilet preparations.

ACT OF 1909.

PAR. 83. Vanillin, twenty cents per ounce.

PAR. 3. \* \* \* chemical compounds, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*.

ACT OF 1913.

PAR. 70. Vanillin, 10 cents per ounce; \* \* \*.

PAR. 49. \* \* \* all natural or synthetic odoriferous or aromatic substances, preparations, and mixtures used in the manufacture of, but not marketable as, perfumes or cosmetics; all the foregoing not containing alcohol and not specially provided for in this section, 20 per centum ad valorem.

PAR. 46. \* \* \* all combinations of the same [essential and distilled oils], not specially provided for in this section, 20 per centum ad valorem: \* \* \*.

## PERFUME MATERIALS.

(See Survey A-14.)

*Description and uses.*—This provision covers various odorous substances and preparations used in the manufacture of perfumes and cosmetics. The first portion of the paragraph, including the specific mention of various chemicals and the phrase "all natural or synthetic odoriferous or aromatic chemicals," embraces odoriferous chemicals obtained directly from the essential oils (paragraphs 54 and 1624, H. R. 7456), or which are prepared from such products by further chemical treatment.

Other materials used in the manufacture of perfumery and cosmetics, and specially provided for elsewhere in H. R. 7456, include the following: Synthetic odoriferous chemicals of coal-tar origin

(dutiable under paragraph 26); several animal products (free under paragraph 1506); essential oils (some free under paragraph 1625 and others dutiable under paragraph 54); enfleurage greases, floral essences, and floral concretes (free under paragraph 1566); and balsams (dutiable under paragraph 10).

The perfumery business is divided into two distinct branches—(1) manufacturers of and dealers in natural odoriferous materials or synthetic odoriferous chemicals; (2) firms which mix or blend these odoriferous materials with each other and with alcohol, or other material, to make finished perfumery and cosmetic articles in accordance with their own private formulas, and distribute the product to the wholesale or retail trade.

Some foreign manufacturers of perfumery, however, do all of the blending or mixing abroad, except the addition of alcohol, and ship the mixture to agents or branch houses in the United States, who add the necessary alcohol to convert these into finished perfumery, and bottle and distribute it. Since the composition of such mixtures is not disclosed and is very difficult, if not impossible, to ascertain by chemical tests, it is practically impossible for the appraisers to ascertain their dutiable value. Under the existing tariff this is in effect an evasion of the duties intended to be collected on finished perfumes. These complex compounds are covered by the provision in this paragraph for "all mixtures or combinations containing essential or distilled oils, or natural or synthetic odoriferous or aromatic substances," which, in H. R. 7456, are assessed a duty of 40 cents per pound and 40 per centum ad valorem, which is only slightly less than the duty on finished perfumes. (Par. 57.) This arrangement will tend to discourage the importation of such mixtures instead of the pure unmixed and uncompounded perfume materials which are more easily appraised.

*Production.*—Practically none of the aromatic chemicals, including those made from coal tar (see par. 26, p. 79), were manufactured in this country prior to the war. The domestic consumption was supplied largely by imports from Germany. Anethol is obtained by separation from anise or fennel oils. Citral is separated from lemon grass oil and is the raw material for ionone, which is the basis of synthetic violet perfume. Geraniol is obtained from palma rosa or Indian geranium oil. Rhodinol is a mixture of geraniol, citronellol, and other related alcohols present in oil of rose. Safrol is separated from camphor oil and is converted by oxidation to heliotropin. Terpineol is made from terpin hydrate (par. 24, H. R. 7456), which is obtained from oil of turpentine. Vanillin is made from eugenol, which is separated from oil of cloves. Vanillin may be made also from coal-tar products, although this process is not used in the United States. The domestic output of vanillin in 1914 amounted to 120,619 pounds, valued at \$525,219. Vanillin is also produced in foreign countries, including Switzerland and France. Domestic production of vanillin in 1919 (preliminary figures) was 134,700 pounds, valued at \$1,365,900.

Imports of the articles mentioned specifically (vanillin excepted) are available only for the fiscal year 1914 and are as follows:

Article.	Quantity.	Value.	Article.	Quantity.	Value.
	<i>Pounds.</i>			<i>Pounds.</i>	
Anethol.....	495	\$890	Ionone.....	139	\$1,178
Citral.....	1,771	3,867	Rhodinol.....	181	1,493
Geraniol.....	2,727	6,338	Safrol.....	161,194	35,001
Heliotropin.....	10,219	8,715	Terpineol.....	141,745	32,962

Imports of vanillin during 1908-1915 averaged per annum 5,408 ounces, valued at \$1,072, with a revenue of \$909. No imports of vanillin are recorded for 1918 and 1919. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Ounces.</i>				<i>Per cent.</i>
1920.....	20,303	\$15,341	\$0.76	\$2,030	3.23
1921 (9 months).....	26,456	11,525	.44		

Imports of "all natural or synthetic odoriferous or aromatic substances, preparations and mixtures" from 1915-1918 have averaged about \$500,000, producing a revenue of about \$100,000 annually. Recent statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....		\$556,624		\$111,325	20
1919.....	60,870	752,093	\$12.36	150,419	20
1920.....	226,276	1,720,213	7.60	344,043	20
1921 (9 months).....	128,401	579,912	4.52		20

*Exports.*—Statistics not available.

*Important changes in classification.*—Perfume materials provided for in paragraph 49 (act of 1913) have been separated into two natural groups according to degree of manufacture. The more important aromatic chemicals of noncoal-tar origin have been mentioned specifically in paragraph 56 (H. R. 7456). The provision for "all combinations of" of essential and distilled oils in paragraph 46 (act of 1913) has been combined with this paragraph. (Reclassification Report, p. 72.)

*Suggested changes.*—Page 20, line 1, of H. R. 7456: Strike out comma after "pound." Page 20, line 7, of H. R. 7456: Change "58" to "57."

Page 19, paragraph 56, line 24: Transpose "combinations" and "mixtures" to agree with paragraph 53.

## PARAGRAPH 57.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 57. Perfumery, including cologne and other toilet waters, articles of perfumery, whether in sachets or otherwise, and all preparations used as applications to the hair, mouth, teeth, or skin, such as cosmetics, dentifrices, tooth soaps, pastes, theatrical grease paints, pomades, powders, and other toilet preparations, all the foregoing, if containing alcohol, 40 cents per pound and 60 per centum ad valorem; if not containing alcohol, 60 per centum ad valorem.

## ACT OF 1909.

PAR. 67. Perfumery, including cologne and other toilet waters, articles of perfumery, whether in sachets or otherwise, and all preparations used as applications to the hair, mouth, teeth, or skin, such as cosmetics, dentifrices, including tooth soaps, pastes, including theatrical grease paints and pastes, pomades, powders, and other toilet articles, all the foregoing; if containing alcohol, or in the manufacture or preparation of which alcohol is used, sixty cents per pound and fifty per centum ad valorem; if not containing alcohol, or in the manufacture or preparation of which alcohol is not used, sixty per centum ad valorem; \* \* \* not specially provided for in this section, twenty per centum ad valorem.

## ACT OF 1913.

PAR. 48. Perfumery, including cologne and other toilet waters, articles of perfumery, whether in sachets or otherwise, and all preparations used as applications to the hair, mouth, teeth, or skin, such as cosmetics, dentifrices, including tooth soaps, pastes, including theatrical grease paints, and pastes, pomades, powders, and other toilet preparations, all the foregoing, if containing alcohol, 40 cents per pound and 60 per centum ad valorem; if not containing alcohol, 60 per centum ad valorem; \* \* \*.

## PERFUMERY AND COSMETICS.

(See Survey A-14.)

*Description and uses.*—Perfumes and cosmetics include liquid perfumes, such as toilet waters and cologne, and dry perfumes, such as sachet and talcum. They also include preparations for the care of the skin, such as emulsions, crèmes, and nail powders; for the care of the hair, such as oils, washes, tonics, and pomades; for the care of the mouth, such as tooth pastes and powders; and cosmetics, such as face paints, powders, lip sticks, eyebrow pencils, and theatrical greases and paints. This paragraph covers perfumery and cosmetics in finished form. These products are made by mixing perfume materials (see par. 56) with other substances. The materials are mixed with alcohol in the case of liquid perfume, toilet waters, and hair tonics; with talc in the case of talcum powders; with greases and pigments in the case of face paints; and with many other substances. The manufacture and the sale of these finished articles are, as a rule, by firms other than those dealing in the raw materials.

*Production.*—France is probably the leading producer of perfume material, finished perfumes, and cosmetics. This is partly due to natural advantages in growing flowers which produce the perfume

odors and to the large use of these commodities by the French people. The domestic production of perfumery and cosmetics in 1914 was valued at \$16,899,000. The State of New York produced nearly one-half of the total output. Illinois and Massachusetts each produced over \$1,000,000 worth; New Jersey ranks with these two States.

In 1919 (preliminary figures) the values of the output of perfumery and cosmetics was \$59,592,000.

*Imports* of perfumery, cosmetics, and all toilet preparations have shown a steady increase from \$1,214,792 in 1910 to \$3,806,699 in 1917. Between 80 and 90 per cent of the imports have been from France. In 1913 the import of perfumery, cosmetics, and all toilet preparations containing alcohol was 285,553 pounds, valued at \$818,942, and yielded a revenue of \$580,803. The import of perfumery, cosmetics, and all toilet preparations not containing alcohol in 1913 was valued at \$1,025,200, and yielded a revenue of \$615,120. The imports increased to \$1,688,256 in 1917, with a revenue of \$1,012,954. Imports of the above articles since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
PERFUMES, INCLUDING COLOGNE AND OTHER TOILET WATERS (ALCOHOLIC).					
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	259,068	\$960,515	\$3.71	\$679,936	70.79
1919.....	356,553	1,925,225	5.40	1,297,756	67.41
1920.....	725,684	2,108,996	2.91	1,555,671	73.76
1921 (9 months).....	364,698	1,391,810	3.82		

PERFUMES, INCLUDING COLOGNE AND OTHER TOILET WATERS (NONALCOHOLIC).					
1918.....		\$1,537,691		\$922,615	60.00
1919.....	974,197	1,893,874	\$1.94	1,136,324	60.00
1920.....	1,082,763	1,175,690	1.09	705,414	60.00
1921 (9 months).....	980,618	1,296,052	1.32		60.00

PREPARATIONS USED AS APPLICATIONS TO HAIR, MOUTH, TEETH, ETC.  
(ALCOHOLIC).

1918 <sup>1</sup> .....					
1919.....	19,878	\$21,048	\$1.06	\$20,580	97.78
1920.....	29,931	84,453	2.82	62,644	74.18
1921 (9 months).....	12,082	42,193	3.49		

PREPARATIONS USED AS APPLICATIONS TO HAIR, MOUTH, TEETH, ETC.  
(NONALCOHOLIC).

1918 <sup>1</sup> .....					
1919.....	864,529	\$369,786	\$0.43	\$221,872	60.00
1920.....	914,930	599,869	.66	359,921	60.00
1921 (9 months).....	695,259	542,300	.78		

<sup>1</sup> Included with perfumes, cosmetics, etc.

*Exports* of perfumery, cosmetics, and toilet preparations have steadily increased from \$824,460 in 1910 to \$3,965,465 in 1918. England and Canada have been the chief consumers of our exports. Australia, Cuba, and the Philippines have taken a considerable portion in recent years. Exports were valued at \$7,324,422, \$8,739,593, and \$3,515,070 in 1919, 1920, and in the first nine months of 1921, respectively.

## PARAGRAPH 58.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 58. Floral or flower waters containing no alcohol, not specially provided for, 20 per centum ad valorem; bay rum or bay water, whether distilled or compounded, 40 cents per pound and 60 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 67. \* \* \* floral or flower waters containing no alcohol, not specially provided for in this section, twenty per centum ad valorem.

PAR. 305. Bay rum or bay water, whether distilled or compounded, of first proof, and in proportion for any greater strength than first proof, one dollar and seventy-five cents per gallon.

PAR. 48. \* \* \* floral or flower waters containing no alcohol, not specially provided for in this section, 20 per centum ad valorem.

PAR. 242. Bay rum or bay water, whether distilled or compounded, of first proof, and in proportion for any greater strength than first proof, \$1.75 per gallon.

## FLORAL OR FLOWER WATERS.

(See Survey A-14.)

*Description and uses.*—Floral or flower waters are obtained as a by-product of the steam distillation process of recovering the essential oils of various flowers. (See par. 54.) The flowers are distilled with steam and the essential oil of the flower separates from the condensed steam or water, but the water is left perfumed with the odor of the flower. An illustration of this is the well-known rose water which is produced in Bulgaria as a by-product of the production of oil of rose.

*Imports* from 1910 to 1913 were valued at \$31,413. In 1914 the value was \$50,297 and yielded a revenue of \$10,059. Imports decreased to \$22,216 in 1915. Imports since 1917 have been as follows:

Calendar year.	Value.	Duty.	Ad valorem rate.
			<i>Per cent.</i>
1918 .....	\$33,735	\$6,747	20
1919 .....	14,868	2,974	20
1920 .....	54,334	10,877	20
1921 (9 months) .....	28,945		

*Exports.*—Statistics not available.

*Important changes in classification.*—Floral waters are included with perfumery in paragraph 48 of the act of 1913. Their chief use is other than in perfumery (for flavoring medicines), and therefore they were given a separate paragraph.

## BAY RUM.

(See Survey A-14.)

*Description.*—Bay rum or bay water is a fragrant liquid, usually made by mixing the oil of bay leaves with alcohol and water; it may be obtained by distilling the leaves with rum.

*Imports* were 483 gallons, valued at \$619 in 1914; nearly all came from France and the Virgin Islands. Imports of raw materials in 1914 were 168,165 pounds of bay leaves, valued at \$5,370; and 1,631 pounds of bay oil, valued at \$2,393, chiefly from France and French West Indies, respectively.

Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Proof gallons.</i>				<i>Per cent.</i>
1918.....	12	\$34	\$2.83	\$21	61.76
1919.....	18	51	2.83	32	61.76
1920.....	9,322	8,675	.93	(1)	.....
1921 (9 months).....	1	12	12.00	.....	.....

<sup>1</sup> From the Virgin Islands, free of duty.

*Exports.*—Statistics not available.

*Important changes in classification.*—Bay rum is transferred from paragraph 242, schedule H, act of 1913, to this schedule.

## PARAGRAPH 59.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 59. Paris green and London purple, 15 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 57. Paris green, and London purple, fifteen per centum ad valorem. PAR. 569. Paris green and London purple [Free].

### PARIS GREEN AND LONDON PURPLE.

(See Survey FL-8.)

*Description and uses.*—Paris green, a compound containing both copper and arsenic, is light green in color, insoluble in water, and very poisonous. It is manufactured from salts of copper and arsenic, and is used principally as an insecticide, but not as much as formerly, being replaced to a great extent by arsenate of lead (par. 44). It is employed also as a pigment. London purple, a by-product of the arsenic-acid method for the manufacture of fuchsine, is essentially calcium arsenite and arsenate colored by fuchsine and is insoluble in water and poisonous. The arsenic-acid method for the manufacture of fuchsine is now little used, hence London purple is nearly obsolete. It formerly served as an insecticide. Calcium arsenate is so used, but is not called London purple.

*Imports* of Paris green and London purple in 1914 were 33,373 pounds, more than two-thirds from England, the remainder from Germany. Imports decreased during the war and since 1916 have been negligible; the maximum was 772 pounds in 1920 (calendar year).

*Exports.*—Statistics not available.

*Important changes in classification.*—These products are exempt from duty under the act of 1913 (par. 569).

## PARAGRAPH 60.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 60. Phosphorus, 10 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 59. Phosphorus, eighteen cents per pound.

PAR. 575. Phosphorus [Free].

## PHOSPHORUS.

(See Survey FL-1.)

*Description and uses.*—Phosphorus is one of the nonmetallic elements. As calcium phosphate, it is an important constituent of bones, and its salts are necessary to all plant growth. It appears in commerce as yellow and red phosphorus. The yellow variety takes fire readily in the air and is poisonous, while the red is not nearly so inflammable and is nonpoisonous. Yellow phosphorus was formerly much used in the manufacture of matches, a use practically discontinued because of the imposition of internal-revenue taxes which are, in effect and in intent, prohibitive. The importation and exportation of matches so manufactured are also prohibited. (Act of Apr. 9, 1912, ch. 75, sec. 10, 37 Stat., 81, 83.) Phosphorus sesquisulphide and red phosphorus are both made from yellow phosphorus and are now used in matches in place of the latter. Phosphorus is also employed in the manufacture of phosphor bronze, in rat poison, and in phosphorus compounds, including phosphoric anhydride and phosphorus trichloride.

*Production* in 1914 was approximately 1,315,000 pounds. Phosphorus is a product of the electric furnace, the raw materials being calcium phosphate, sand, and carbon. During the war production in this country, as well as in Europe, multiplied four or five times, but since the war-time demand has abated, output has declined, leaving idle a large productive capacity.

*Imports* of phosphorus in 1914 were 605 pounds; in 1917, 4,010 pounds. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	584,081	\$222,250	\$0.38
1919.....	54,916	17,283	.31
1920.....	291,747	55,077	.19
1921 (9 months).....	228,962	46,090	.20

*Exports.*—Statistics not available.

*Importation changes in classification.*—Phosphorus is exempt from duty under the act of 1913 (par. 575).

**PARAGRAPH 61.**

**H. R. 7456.**

**SENATE AMENDMENTS.**

PAR. 61. Plasters, healing or curative, of all kinds, and court-plaster, 15 per centum ad valorem.

**ACT OF 1909.**

**ACT OF 1913.**

PAR. 66. Plasters, healing or curative, of all kinds, and court-plaster, twenty-five per centum ad valorem.

PAR. 50. Plasters, healing or curative, of all kinds, and court-plaster, 15 per centum ad valorem.

**PLASTERS, HEALING OR CURATIVE.**

(See Survey A-14.)

*Description and uses.*—Healing and curative plasters are intended for external application. They are usually pliable at the temperature of the body. The plastic material may be "lead plaster" (a lead soap made by beating together equal parts of lead oxide, olive oil, and lard), a mixture containing crude rubber, or a mixture of resinous substances with fats and waxes. The substances are spread upon linen, muslin, paper, or leather before using. The active principle used in the plaster depends upon the curative action desired.

Adhesive plasters are used in surgery to keep dressings in place, to cover ulcers, and to strengthen weak muscles. Court-plaster is made by applying to silk a coating of isinglass and tincture of benzoin.

*Imports* for four years prior to the war averaged a little less than \$5,000 in value. The value of imports was \$10,929 in 1914, and \$8,094 in 1916. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
			<i>Per cent.</i>
1918.....	\$7,353	\$1,103	15
1919.....	6,137	921	15
1920.....	10,048	1,507	15
1921 (9 months).....	9,754		15

*Exports.*—Statistics not available.

**PARAGRAPH 62.**

**H. R. 7456.**

**SENATE AMENDMENTS.**

PAR. 62. Paints, colors, and pigments commonly known as artists' paints or colors, whether in tubes, pans, cakes, or other forms, 25 per centum ad valorem.

**ACT OF 1909.**

**ACT OF 1913.**

PAR. 56. \* \* \* all paints, colors, and pigments, commonly known as artists' paints or colors, whether in tubes, pans, cakes or other forms, thirty per centum ad valorem.

PAR. 63. \* \* \* all paints, colors, and pigments commonly known as artists' paints or colors, whether in tubes, pans, cakes, or other forms, 20 centum ad valorem; \* \* \*.

## ARTISTS' PAINTS OR COLORS.

(See Survey A-15.)

*Description, uses, and production.*—The paints commonly known as artists' paints or colors consist of pigments, such as burnt sienna, burnt umber, cobalt oxide, white chromes, etc., ground in oil and put up in tubes for artists' use. No figures have been published for the domestic production of artists' colors, but it is thought that their manufacture does not represent a large industry.

*Imports.*—The importation in 1915 was \$186,728 and yielded a revenue of \$37,345. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....		\$85,207		\$17,041	20
1919.....	99,993	102,987	\$1.03	20,597	20
1920.....		205,007		41,001	20
1921 (9 months).....		143,571			

*Exports.*—Statistics not available.

*Important changes in classification.*—The provision in paragraph 63, act of 1913, for artists' colors has been given a separate paragraph.

## PARAGRAPH 63.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 63. Pigments, colors, stains, and paints, including enamel paints, whether dry, mixed, or ground in or mixed with water, oil, or solutions other than oil, not specially provided for, 25 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 51. \* \* \* enamel paints made with varnish, thirty-five per centum ad valorem; \* \* \*.

PAR. 56. All paints, colors, pigments, stains, lakes.<sup>11</sup> \* \* \* whether crude or dry or mixed, or ground with water or oil or with solutions other than oil, not otherwise specially provided for in this section, thirty per centum ad valorem; \* \* \*.

PAR. 63. Enamel paints, and all paints, colors, pigments, stains, \* \* \* whether crude, dry, mixed, or ground with water or oil or with solutions other than oil, not specially provided for in this section, 15 per centum ad valorem; \* \* \* all color lakes.<sup>12</sup> whether dry or in pulp, not specially provided for in this section, 20 per centum ad valorem.

PIGMENTS, COLORS, STAINS, AND PAINTS, N. S. P. F.

(See Survey A-15.)

*Description and uses.*—Pigments are mineral or organic substances which, when finely ground and mixed with the proper vehicle, will form paint. It is essential that the pigment be insoluble in the

<sup>11</sup> Lakes not of coal-tar origin are unprovided for in H. R. 7456 except as colors n. s. p. f.

vehicle and opaque, since these properties determine the body and covering power of the paint. The manufacture of pigments is the most important branch of the paint industry, but considerable quantities are used for other industrial purposes, such as fillers in rubber, paper, linoleum, and oilcloth. Other pigments, especially lampblack and the color lakes, are used in lithographic inks.

The inorganic pigments may be classified according to their origin into three groups: (1) Natural mineral pigments, such as ocher, umber, sienna, hematite, siderite, and ground shale or slate; (2) pigments made directly from ores, e. g., zinc oxide, leaded zinc oxide, and basic sulphates of lead; and (3) chemically manufactured pigments, e. g., basic carbonate white lead, litharge, red lead, Venetian red, lithopone, vermilion, color lakes, and the chromium colors.

The different pigments and related paint materials are discussed under their respective headings in the order and in the groups provided for in H. R. 7456, paragraphs 63 to 74, inclusive.

Enamel paints, consisting of oil varnishes ground with finely divided pigments and thinned with turpentine, are decorative paints. Statistics for the production of enamel paints are not published, but the industry is large. Stains, being thinner than paint, are absorbed by the pores of the material to which applied instead of forming a coating on the surface. Those used for staining shingles usually contain a creosote or pine oil which has the effect of preserving the wood. The stains used for interior decorating, such as floor stains, are of greater commercial importance.

*Production.*—The products of the domestic paint industry in 1914 were valued at \$112,408,700 and in 1919 (preliminary figures) at \$256,714,300.

*Imports* of "all other paints, colors, pigments, stains, smalts, and frostings" prior to 1914 averaged about \$500,000 annually. They then decreased steadily to \$43,523 in 1918 (fiscal year). The maximum imports of "enamel paints" from 1910 to 1918 was in 1914 and amounted to about \$17,000. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
----------------	-----------	--------	-------------	-------	------------------

"ALL OTHER PAINTS, COLORS, PIGMENTS, STAINS, SMALTS, AND FROSTINGS."

	Pounds.	Value.	Unit value.	Duty.	Per cent.
1918.....		\$51,507		\$7,726	15
1919.....	548,278	109,492	\$0.20	16,424	15
1920.....		282,338		42,351	15
1921 (9 months).....		151,903			

ENAMEL PAINTS.

	Pounds.	Value.	Unit value.	Duty.	Per cent.
1918.....	1,841	\$525	\$0.28	\$79	15
1919.....	7,313	5,638	.77	846	15
1920.....	60,478	26,122	.43	3,918	15
1921 (9 months).....	9,453	2,991	.32		

*Important changes in classification.*—Smalts, frostings, ceramic and glass fluxes, enamels and colors, now classified in the paragraph with pigments (par. 63, act of 1913), have been transferred to schedule 2 (par. 231), and crayons, including charcoal crayons or fusains, in the same paragraph, have been transferred to schedule 14 (par. 1449, H. R. 7456).

The provision for color lakes (par. 63, act of 1913) has been omitted because all of the more important color lakes are of coal-tar origin and are provided for in paragraph 26 (H. R. 7456); others not of coal-tar origin would fall within the provision for colors in this paragraph. (Reclassification Report, p. 85.)

## PARAGRAPH 64.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 64. Barytes ore, crude or unmanufactured, \$4 per ton; ground or otherwise manufactured, \$7.50 per ton; precipitated barium sulphate or blanc fixe, 1 cent per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 42. Baryta, sulphate of, or barytes, including barytes earth, unmanufactured, one dollar and fifty cents per ton; manufactured, five dollars and twenty-five cents per ton.

PAR. 44. Blanc-fixe, \* \* \* one-half of one cent per pound.

PAR. 51. Baryta, sulphate of, or barytes, including barytes earth, unmanufactured, 15 per centum ad valorem; manufactured, 20 per centum ad valorem; blanc-fixe, or artificial sulphate of barytes, \* \* \* 20 per centum ad valorem.

### BARYTES ORE AND GROUND BARYTES.

(See Survey A-4.)

(For a general discussion of Barium Compounds, see p. 49.)

*Description and uses.*—Barytes ore is also called "barite," "heavy spar," and "tiff." It is usually a white opaque to translucent mineral, but is also found stained pink when containing oxides of iron. The commercial grades of crude barytes contain 90 to 95 per cent of barium sulphate. Of the barytes ore consumed in the United States about one-half goes into the pigment lithopone (see par. 74, p. 209) and the remainder is used in manufacturing ground barytes and barium chemicals (see par. 11, p. 49).

The natural mineral ground fine or crushed is known as unbleached barytes or barytes "off color," and is employed in the preparation of dark-colored paints, and as a filler in the paper industry, chiefly in the manufacture of heavy and stiff materials, such as used for playing cards and bristol board. Bleached ground barytes which has been treated with acid to dissolve out the iron and thereby improve its color is known as "prime white" and "floated" barytes. It is

used in white paints and as a filler in paper and rubber goods where a white product is desired.

*Production of crude barytes in the United States since 1912 has been as follows:*

Year.	Quantity (short tons).	Value.	Year.	Quantity (short tons).	Value.
1912.....	37,478	\$153,313	1917.....	206,888	\$1,171,184
1913.....	45,298	156,275	1918.....	155,368	1,044,905
1914.....	52,747	155,647	1919.....	209,330	1,727,822
1915.....	108,547	381,032	1920.....	228,113	2,142,464
1916.....	221,952	1,011,232			

Prior to the war practically all of the barytes mined in the United States came from Missouri, and supplied the ground-barytes trade of the Middle West. In 1916 the largest State production of crude barytes was shifted from Missouri to Georgia. This was due to the development of the Georgia deposits by the eastern manufacturers of barium chemicals and lithopone, who had previously depended on Germany for this raw material. Barytes is now mined chiefly in Georgia, Missouri, Tennessee, Kentucky, and Virginia. The mining operations in the East are on a larger scale than those of Missouri, those in the latter State being conducted primarily by individuals on a small scale. This difference is due to the development of the eastern fields by large consumers.

The output of ground barytes from 1915 to 1920 has been between 52,000 and 58,000 short tons, except in 1916 and in 1920 when it was in excess of 65,000 tons.

*Foreign production.*—Up to the beginning of the war Germany, which has unlimited deposits of barytes of an exceedingly good grade, was one of the largest producers. In 1913, for example, she exported about four times as much as was produced in the United States in the same year. Since the war, however, production in this country has increased until the present output is greater than the exports of Germany previous to 1914. The United Kingdom also has large high-grade deposits.

*Imports.*—Prior to 1915 from 35 to 45 per cent of our consumption of crude barytes was imported, chiefly from Germany. During the war importation was practically negligible. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Long tons.</i>				<i>Per cent.</i>
1919.....	35	\$245	\$7.00	\$37	15
1920.....	22,209	146,858	6.61	22,029	15
1921 (9 months).....	6,315	39,495	6.40	.....	15

The 1920 importation approaches the prewar figure and is about 11 per cent of the 1920 domestic output.

Imports of ground or manufactured barytes have always been small and practically negligible.

*Exports.*—Statistics not available.

*Important changes in classification.*—The term “sulphate of baryta” is inconsistent with correct chemical nomenclature and is not used in commerce to designate barytes. The term “barytes” alone signifies barium sulphate. Barytes ore is usually known as crude barytes, and therefore the term “crude” was used in connection with the unmanufactured product.

Manufactured barytes is crude barytes which has been ground and any color present removed by bleaching with sulphuric acid. This product is sold as “ground barytes.” The term “ground” was therefore used in connection with manufactured barytes. (Reclassification Report, p. 75.)

#### PRECIPITATED BARIUM SULPHATE OR BLANC FIXE.

*Description and uses.*—Precipitated barium sulphate or blanc fixe refers to barium sulphate which has been precipitated by chemical means from a solution of a soluble barium salt. This is the best grade of barium sulphate on the market and is used as an inert pigment and filler for paints and paper when a white product is desired. A special grade is largely used by the rubber industry. It is also used in the manufacture of printing inks.

*Production.*—Statistics of the domestic production of blanc fixe are not available prior to 1915. Production increased steadily from 1,229 short tons in 1915 to 9,522 short tons in 1918. The output declined to 5,227 tons in 1919, but was 8,046 tons in 1920.

Blanc fixe is prepared by treating a solution of crude barium sulphide (which is made from barytes by fusion with coal) with sodium sulphate or salt cake; and a by-product of sodium sulphide is obtained. It is also prepared by treating barium chloride with sodium sulphate.

*Imports.*—Prior to 1914 imports of blanc fixe and satin white or artificial sulphate of lime were between 5,000,000 and 6,000,000 pounds per year. Since then imports declined rapidly to less than 500,000 pounds in 1916 and 1917 and to about 180,000 pounds in 1918. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1919.....	1,285	\$90	\$0.07	\$18	20
1920.....	329,299	8,485	.03	1,697	20
1921 (9 months).....	1,035,452	16,652	.02	.....	20

*Exports.*—Statistics not available.

*Important changes in classification.*—Precipitated barium sulphate was used to describe blanc fixe, as it is more accurate than artificial sulphate of barytes, the term used in paragraph 51 (act of 1913). Barytes refers to barium sulphate, and therefore the term “sulphate of barytes” is redundant. (Reclassification Report, p. 76.)

## PARAGRAPH 65.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 65. Blue pigments and all blues containing iron ferrocyanide or iron ferricyanide, in pulp, dry, or ground in or mixed with oil or water, 12 cents per pound; ultramarine blue, dry, in pulp, or ground in or mixed with oil or water, wash and all other blues containing ultramarine, 3 cents per pound.

## ACT OF 1909.

## ACT OF 1913.

PAR. 43. Blues, such as Berlin, Prussian, Chinese, and all others, containing ferrocyanide of iron, in pulp, dry or ground in or mixed with oil or water, eight cents per pound.

PAR. 50. Ultramarine blue, whether dry, in pulp, or mixed with water, and wash blue containing ultramarine, three cents per pound.

PAR. 52. Blues, such as Berlin, Prussian, Chinese, and all others, containing ferrocyanide of iron, in pulp, dry or ground in or mixed with oil or water, 20 per centum ad valorem; ultramarine blue, whether dry, in pulp, or ground in or mixed with oil or water, and wash blue containing ultramarine, 15 per centum ad valorem.

## FERROCYANIDE AND FERRICYANIDE BLUES.

(See Survey A-15.)

*Description and uses.*—The terms Berlin blue, Prussian blue, and Chinese blue, used in the act of 1913, are commercial names given to blue pigments made from iron ferrocyanide or iron ferricyanide. Many other names are used commercially for very similar pigments. The name Berlin blue is practically obsolete. These articles are sold in pulp, dry or ground in or mixed with oil or water in varying percentages. Ferrocyanide blues are used as pigments in prepared paints and dry colors; printing, lithographing, and writing inks; japans, enamel paints, soluble laundry blues; and mixed with other pigments, in the manufacture of other dry colors.

*Production.*—Ferrocyanide blues in general are made by mixing ferrocyanide of potash or soda with a soluble iron salt, such as copperas, and oxidizing the insoluble white product formed with a suitable chemical under carefully controlled conditions. The insoluble blue material formed in the process is then filtered, washed, and dried. Ferrocyanide blues are made on a large scale in the United States, and prior to 1914 the domestic production supplied over 75 per cent of the total needs, but about half of the sodium or potassium ferrocyanide used as a raw material was imported. Over 1,000,000 pounds of Prussian blue, valued at \$387,077, were manufactured in the United States in 1914; and in 1919 (preliminary figures), 944,650 pounds, valued at \$645,200. It is also manufactured in Germany, France, and England.

*Imports* for the period 1910-1917 have averaged 263,549 pounds, valued at \$76,840, yielding a revenue of \$19,623. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	2,923	\$3,100	\$1.06	\$820	20
1919.....	16,055	5,862	.36	1,172	20
1920.....	465,119	204,845	.44	40,969	20
1921 (9 months).....	108,093	40,908	.38	.....	20

*Exports.*—Statistics not available.

*Important changes in classification.*—The blue pigments containing as their essential constituent iron ferrocyanide or iron ferricyanide are sold under various trade names. Those in paragraph 52 (act of 1913) are only a few of the names under which these blue pigments are sold. There was no special reason why those names should be continued. (Reclassification Report, p. 76.)

The phrase "and all blues" was added after "blue pigments" in order to cover articles such as "bleachers' blue," containing iron ferrocyanide, which was held to be dutiable as a nonenumerated manufactured article. (*De Ronde v. United States*, 1 Ct. Cust. Appls., 104 of 1910; Abstract 26014, T. D. 31744; of 1914; and Abstract 40916, of 1917.)

#### ULTRAMARINE BLUE.

(See Survey A-15.)

*Description and uses.*—Ultramarine is the commercial name given to the blue pigment obtained from the mineral lapis lazuli and to the artificial product obtained by a chemical process; the artificial process has almost entirely replaced dependence upon the more expensive natural color. Ultramarine is sold as dry powder (which is insoluble in water), in pulp, or ground in or mixed with water or oil. It is used in large quantities in paints, inks, soaps, and paper, and for many other purposes, including the manufacture of laundry blues.

*Production.*—Artificial ultramarine is made by heating a mixture of clays, soda ash or Glauber salts, coal, and sulphur in specially constructed furnaces, followed by grinding and lixiviating the product in water. Over 2,500,000 pounds of ultramarine, with a value of \$222,769, were manufactured in the United States in 1914, and in 1919 (preliminary figures) 2,800,000 pounds, valued at \$630,000. It is also manufactured in the principal countries of Europe, chiefly in England and Germany.

*Imports* of ultramarine for 1911-1917 averaged 636,907 pounds, valued at \$59,251, yielding a revenue of \$14,362. Imports before the war were obtained chiefly from England and Germany. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
ULTRAMARINE.					
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	287,520	\$29,490	\$0.10	\$4,424	15

*Exports.*—Statistics not available.

### PARAGRAPH 66.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 66. Bone black or bone char, blood char, and decolorizing and deodorizing chars or carbons, 20 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 10. \* \* \* bone char, suitable for use in decolorizing sugars, and blood char, twenty per centum ad valorem.

PAR. 45. Black, made from bone, \* \* \* by whatever name known, including bone black \* \* \* dry or ground in oil or water, twenty-five per centum ad valorem.

PAR. 447. \* \* \* blood char, bone char, or bone black, not suitable for use as a pigment [Free].

PAR. 53. Black pigments, made from bone, \* \* \* by whatever name known; \* \* \* dry or ground in or mixed with oil or water, 15 per centum ad valorem.

PAR. 423. Bones \* \* \* burned, calcined, \* \* \* [Free].

DECOLORIZING AND DEODORIZING CHARS OR CARBONS.

(See Survey A-15)

*Description and uses.*—Bone black or bone char and blood char are produced by heating dried blood and bones in closed retorts until all volatile matter is driven off. Bone char contains about 10 per cent carbon and 90 per cent mineral matter. Both of these substances are sometimes called animal charcoal. Bone char to be used for decolorizing purposes differs from that used as a pigment only in that it should be in lumps or grains, while the pigment must be very finely ground. The principal use of these substances is as decolorizers in the refining of sugar, and in the purification of vegetable oils and paraffin. Other uses are in the purification of drinking water and in casehardening steel. Decolorizing and de-

odorizing chars or carbons include other forms of carbons, largely of vegetable origin, which have become of commercial importance. They were imported prior to the war and are now being made in this country.

*Production.*—Most of the animal charcoal used domestically is produced here. Output of bone black (includes that used as a pigment) in 1914 was 44,509,000 pounds, valued at \$1,532,000. In 1919 production figures were combined with other black pigments (see par. 68).

*Imports* have been mostly of bone char. In 1913 imports were valued at \$12,484; in 1914, at \$77,717; in 1915, at \$120,715. Imports since 1918 have been valued at \$36,594, \$137,561, \$524,172, and \$170,206 in the calendar years 1918, 1919, 1920, and the first nine months of 1921, respectively.

Imports of blood char since 1918 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1919.....	10,732	\$441	\$0.04
1920.....	84,762	1,182	.01
1921 (9 months).....	17,094	555	.03

*Exports.*—Statistics not available.

*Important changes in classification.*—The phrase “and decolorizing and deodorizing chars or carbons,” has been added, and the phrase “not suitable for use as a pigment,” omitted from H. R. 7456.

“Blood char, bone char, or bone black, not suitable for use as a pigment,” are exempt from duty (par. 447, act of 1913).

## PARAGRAPH 67.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 67. Chrome yellow, chrome green, and other colors containing chromium, in pulp, dry, or ground in or mixed with oil or water, 25 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 46. Chrome yellow, chrome green, and all other chromium colors in the manufacture of which lead and bichromate of potash or soda are used, in pulp, dry, or ground in or mixed with oil or water, four and three-eighths cents per pound.

PAR. 54. Chrome yellow, chrome green, and all other chromium colors in the manufacture of which lead and bichromate of potash or soda are used, in pulp, dry, or ground in or mixed with oil or water, 20 per centum ad valorem.

## CHROMIUM PIGMENTS.

(See Survey A-15.)

*Description and uses.*—Chrome yellow is a pigment obtained by mixing solutions of sodium or potassium bichromate with a soluble lead salt (such as the acetate), filtering the insoluble lead chromate

formed, and washing and drying to a powder. Shades from deep orange to light canary yellow may be obtained by varying the chemical conditions.

Chrome green is a mixture of chrome yellow and Prussian blue.

Chrome red is sometimes known as vermilion red or American vermilion. It is a basic lead chromate made by digesting chrome yellow with caustic soda.

Zinc yellow is a pigment containing zinc and chromium.

The chrome colors are used in the manufacture of paints and for other purposes where a color pigment is desired. Chrome green is also used in the manufacture of lithographic inks. These colors are sold dry, in pulp, or ground in or mixed with oil or water.

*Production.*—In 1914 the United States produced 5,747,317 pounds of chrome yellow, valued at \$641,534. Production of orange and green pigments (including chrome orange and green) in the same year was 8,024,409 pounds, valued at \$677,329. The output of chrome yellow, orange, and green in 1919 (preliminary figures) was 9,431,870 pounds, valued at \$2,081,400.

*Imports* prior to 1915 averaged about 155,000 pounds, valued at approximately \$25,000. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	37	\$10	\$0.27	\$2	20
1919.....	6,791	2,733	.40	547	20
1920.....	70,868	38,910	.55	7,782	20
1921 (9 months).....	28,957	16,573	.57	.....	20

*Exports.*—Statistics not available.

*Important changes in classification.*—The chrome colors dutiable under paragraph 54, act of 1913, are limited to those in the manufacture of which lead and bichromate of potash or soda are used. Although these are the principal chromium colors, there are other chromium pigments which do not require lead and bichromate of potash or soda in their manufacture. For example, oxide of chromium containing no lead or potassium bichromate has been declared dutiable as a color under paragraph 63 (act of 1913) rather than as chrome green under paragraph 54 (same act). (Abstract 37081, of 1914.) Zinc chromate or "zinc yellow" is another important chromium color. There being no apparent reason why all chromium colors should not receive the same tariff treatment, as the chromium content is the item of chief value, the phrase "in the manufacture of which lead and bichromate of potash or soda are used," was omitted. (Reclassification Report, p. 78.)

## PARAGRAPH 68.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 68. Gas black, lampblack, and all other black pigments, by whatever name known, dry or ground in or mixed with oil or water, and not specially provided for, 20 per centum ad valorem.

## ACT OF 1909.

## ACT OF 1913.

PAR. 45. Black, made from \* \* \* ivory, or vegetable substance, by whatever name known, including \* \* \* lampblack, dry or ground in oil or water, twenty-five per centum ad valorem.

PAR. 53. Black pigments, made from \* \* \* ivory, or vegetable substance, by whatever name known; gas black and lampblack, dry or ground in or mixed with oil or water, 15 per centum ad valorem.

## GAS BLACK, LAMPBLACK, AND OTHER BLACK PIGMENTS.

(See Survey A-15.)

*Description and uses.*—Carbon is the base of nearly all black pigments, which may be divided into five groups:

(1) Soot blacks, which include lampblack, carbon black, gas black, acetylene black, benzol black, and other black pigments obtained by the incomplete combustion of many substances, such as natural gas, crude petroleum oil, dead oil (obtained from coal-tar distillation and from resinous woods, tar, and pitch). Carbon black, one of the most important of the class, is generally made by burning natural gas so that the flame impinges on a metal surface, where the carbon is deposited and later removed by scraping. It is largely used as a filler in rubber, in the manufacture of printing ink, in stove polishes, and in paints.

(2) The animal blacks, which form the second group, are principally obtained by calcining bones. Certain high grades are made from ivory chips or from carefully selected bones. These are known as ivory black and drop black to distinguish them from the other forms of bone black (par. 66).

(3) The charcoal blacks are obtained by charring willow, maple, bass, and similar soft woods. A special grade, known as vine black, is obtained by charring grape vines.

(4) The mineral blacks are powdered shale or slate and appear in commerce under the name of mineral black, slate black, black chalk, etc. Powdered coal, graphite, manganese ores, and asphaltum are occasionally used as black pigments.

(5) The fifth class are the black lakes, which consist of coloring matter precipitated on an inert base such as barytes and aluminum hydroxide. Logwood and nigrosine and other coal-tar dyes are largely used.

*Production* of bone, carbon, and lampblack increased from \$1,464,000 by 27 firms in 1914 to \$6,194,000 by 36 firms in 1919 (preliminary figures). In 1914 the output was: Bone black, \$1,532,000; carbon black, \$918,091; and lampblack, \$503,856. The 1919 output of carbon black from natural gas was 52,056,940 pounds, valued at \$3,816,000 and in 1920 was 51,321,892 pounds, valued at \$4,032,286.

*Imports* have been small as compared with the domestic production. The average value for the five years preceding the war was

about \$26,000. Since 1915 the imports have been quite small. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....		\$2,743	.....	\$411	15
1919.....	67,617	2,769	\$0.04	415	15
1920.....	609,047	46,754	.08	7,013	15
1921 (9 months).....	205,054	16,426	.08	.....	15

*Exports* of carbon, bone, and lamp black have been much larger than imports, reaching a value of \$1,111,265 in 1918. Since 1918 (calendar year) the exports have increased to \$2,288,884 in 1920 and during the first nine months of 1921 were valued at \$905,608.

*Important changes in classification.*—The provision “Black pigments, made from bone, ivory, or vegetable substance,” in paragraph 53 (act of 1913), has been omitted and the wording “Gas black, lampblack, and all other black pigments” has been inserted in H. R. 7456. Bone black, also used as a pigment, has been mentioned specifically in paragraph 66. (Reclassification Report, p. 77.)

## PARAGRAPH 69.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 69. Lead pigments: Litharge, orange mineral, red lead, and white lead, 2½ cents per pound; all pigments containing lead, dry or in pulp, or ground in or mixed with oil or water, not specially provided for, 30 per centum ad valorem.

### ACT OF 1909.

PAR. 58. Lead: \* \* \* litharge, two and one-half cents per pound.

PAR. 48. Orange mineral, three and one-fourth cents per pound.

PAR. 49. Red lead, two and five-eighths cents per pound.

PAR. 53. White lead, and white pigment containing lead, dry or in pulp, or ground or mixed with oil, two and one-half cents per pound.

PAR. 52. Vermilion reds, \* \* \* when not containing quicksilver but made of lead or containing lead, four and seven-eighths cents per pound.

### ACT OF 1913.

PAR. 56. Lead pigments: Litharge, orange mineral, red lead, white lead, and all pigments containing lead, dry or in pulp, and ground or mixed with oil or water, not specially provided for in this section, 25 per centum ad valorem.

PAR. 59. Vermilion reds, \* \* \* when not containing quicksilver but made of lead or containing lead, 25 per centum ad valorem.

### LEAD PIGMENTS.

(See Survey A-15.)

#### LITHARGE.

*Description and uses.*—Litharge is the commercial name given to the yellow monoxide of lead which is formed when melted lead is heated to about 900° C. and oxidized in a current of air. It is used

in the manufacture of paints; as a drier for drying oils, such as linseed oil; in glass and pottery manufacture; in the preparation of numerous lead salts, such as lead acetate; and for various other purposes.

*Production.*—Litharge is made by melting lead in rotating drums or reverberatory furnaces and blowing air through it. The melted litharge is allowed to run over iron plates, when it is chilled with water; this produces the "yellow" litharge of commerce. Slow cooling favors the formation of a red flaky variety. The flakes are separated from the lumps by sifting and are sold as "flake." The solid material is ground wet, settled in water, and dried. It is marketed as "levigated" or "buff" litharge. Production in the United States has been steadily increasing—37,739 short tons, valued at \$5,853,543, in 1916; 46,739 pounds, valued at \$6,431,801, in 1919; and 62,329 tons, valued at \$12,386,185, in 1920.

*Imports.*—The average annual import for 1910–1916 was 35,500 pounds, valued at \$1,787, yielding a revenue of \$782. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	100	\$12	\$0.12	\$3	25
1919.....					
1920.....	21,002	2,647	.13	662	25
1921 (9 months).....	100	7	.07		25

*Exports.*—Statistics not available.

#### ORANGE MINERAL.

*Description and uses.*—Orange mineral is a tetraoxide of lead which has been prepared with special care and is therefore more expensive than red lead. It is used as a pigment and for other purposes, including the manufacture of rubber.

*Production.*—Orange mineral is made by heating white lead in the presence of air. It is usually made from the scum which collects on the surface of wash waters used in levigating white lead. The production figures of orange mineral in the United States have been included with the figures for red lead since 1915. Prior to 1915 the production of orange mineral averaged about 600 short tons.

*Imports.*—The average annual import for 1910–1917 was 317,205 pounds, valued at \$20,098, yielding a revenue of \$9,373. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1919.....	39,781	\$5,082	\$0.13	\$1,271	25
1920.....	52,094	5,352	.10	1,338	25
1921 (9 months).....	72,232	7,386	.10		

*Exports.*—Statistics not available.

## RED LEAD.

*Description and uses.*—Red lead, the name given to the tetraoxide of lead, is a heavy, orange-red pigment having good covering power. Red lead is used in the manufacture of flint glass and cut-glass tableware, in the manufacture of preservative paints, and for various other purposes, including the manufacture of rubber goods and storage batteries, and as a lute in pipe fittings.

*Production.*—Red lead is made by heating litharge under carefully controlled conditions to about 375° C. Production has steadily increased in the United States, amounting to 23,035 short tons of red lead and orange mineral, valued at \$3,933,566, in 1916, and in 1918 and also in 1919 to an excess of 30,000 tons, valued at more than \$5,000,000. In 1920 the output was 34,431 tons, valued at \$7,523,089.

*Imports.*—The average annual import for 1910-1917 was 370,351 pounds, valued at \$16,075, yielding a revenue of \$9,743. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	5	\$1	\$0.20		25
1919.....	7,199	1,136	.16	\$284	25
1920.....	23,076	1,789	.08	447	25
1921 (9 months).....	6,176	339	.05		25

*Exports* in 1918 (fiscal year) were 4,792,330 pounds, valued at \$567,854. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	5,739,819	6,227,797	3,063,030	949,290
Value.....	\$662,584	\$735,177	\$365,575	\$101,628

## WHITE LEAD.

*Description and uses.*—White lead is the commercial name given to the artificial white pigment consisting of a mixture of carbonate and hydroxide of lead, and is the most important of the paint pigments, being impervious to light and possessing the highest covering power. It is sold dry or in pulp, ground or mixed with oil or water. White lead used alone or mixed with other pigments is a constituent of almost all mixed paints, and is used for the production of other lead compounds and salts.

*Production.*—White lead is manufactured chiefly by a method known in the trade as the "Dutch process," which consists essentially in corroding cast lead "buckles" by means of acetic acid and converting the acetate of lead produced into a mixture of lead carbonate and hydroxide of lead. This is accomplished by the action of carbon dioxide gas, obtained from fermentation of spent tan bark. Several other processes are employed which have distinct advantages, but the bulk of the white lead produced in this country is made by the Dutch process.

The average annual domestic production for 1910-1916 was 142,986 short tons, valued at \$18,260,727. The output in 1919 and 1920 was about 140,000 tons. It is manufactured in many countries, among them England, Germany, Austria-Hungary, Russia, Italy, Belgium, and Holland. Prior to 1915 it was produced in France, but manufacture was discontinued on account of lead poisoning.

*Imports* prior to the war were about 700,000 pounds—less than 1 per cent of the domestic production—and yielded a revenue averaging about \$4,000. They were negligible during the war, and have since been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1919 <sup>1</sup> .....	21,213	\$2,490	\$0.12	\$623	25
1920.....	159,977	19,449	.12	4,862	25
1921 (9 months).....	123,616	12,545	.10	.....	25

<sup>1</sup> In 1918 imports were combined with all other pigments containing lead.

*Exports* since 1913 have averaged about 7 or 10 per cent of the domestic production, and since 1918 (calendar years) have been as follows:

	1918	1919	1920	1921 (9 months)
Quantity (pounds).....	15,588,916	28,033,485	29,801,557	8,647,947
Value.....	\$1,756,739	\$3,037,292	\$3,195,101	\$863,848

#### SUBLIMED WHITE LEAD.

*Description and uses.*—Sublimed white lead (basic lead sulphate) is an amorphous white pigment with excellent covering properties. It is composed of about 75 per cent lead sulphate, 20 per cent lead oxide, and 5 per cent zinc oxide. Basic lead sulphate is used in paints, and in the manufacture of oilcloth, stained paper, and rubber goods.

*Production.*—Sublimed white lead is made directly from the ore (silver-free galena) by mixing finely ground ore with coal and heating in a furnace. Blue fume or “sublimed blue lead,” which has some use as a pigment, is a by-product. The production of sublimed white lead in 1910 was 9,951 short tons, valued at \$1,002,010. Since 1910 the production figures of this commodity have been grouped with the figures for other lead pigments, chiefly leaded zinc oxides. Sublimed white lead is made in England and Australia and elsewhere abroad.

*Import* statistics for this commodity are not shown in official publications.

*Exports.*—Statistics not available.

#### OTHER LEAD PIGMENTS.

*Imports* of all other pigments containing lead since 1918 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918 <sup>1</sup> .....	508	\$202	\$0.40	\$51	25
1919.....	115	46	.40	12	25
1920.....	1,757	341	.19	85	25
1921 (9 months).....	34,529	2,922	.08	.....	25

<sup>1</sup> Includes white lead.

## PARAGRAPH 70.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 70. Ochers, siennas, and umbers, crude or not ground, one-fourth of 1 cent per pound; washed or ground, three-eighths of 1 cent per pound; iron-oxide and iron-hydroxide pigments not specially provided for, 20 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 47. Ocher and ochery earths, sienna and sienna earths, and umber and umber earths, not specially provided for in this section, when crude or not powdered, washed or pulverized, one-eighth of one cent per pound; if powdered, washed or pulverized, three-eighths of one cent per pound; if ground in oil or water, one cent per pound.

PAR. 55. Ocher and ochery earths, sienna and sienna earths, and umber and umber earths, 5 per centum ad valorem; Spanish brown, venetian red, Indian red, and colcothar or oxide of iron, not specially provided for in this section, 10 per centum ad valorem.

PAR. 56. All \* \* \* pigments \* \* \* not otherwise specially provided for in this section, thirty per centum ad valorem; \* \* \*.

### OCHER, SIENNA, AND UMBER.

(See Survey A-15.)

*Description.*—Ocher, sienna, and umber are natural pigments consisting essentially of clay colored by the hydrated oxides of iron and manganese. Ordinary ocher rarely contains more than 30 per cent of the hydrated oxide of iron. The composition of sienna and umber is similar to that of ocher, although they invariably contain manganese and frequently more iron. Ocher is the cheapest of the common yellow pigments. UMBER and sienna are of brown color, due to manganese content.

When ocher is calcined the color is changed to an orange or red, but these varieties, known as burnt ochers, are less important pigments than the untreated and natural yellows. UMBER and sienna are marketed both raw and burnt, but the burnt pigments, which are darker in color, are the more important. Burnt sienna is reddish brown, while burnt umber is a rich, warm brown.

*Uses.*—Coarse ocher is used as a filler for linoleum, the finer grade as a pigment in tinted paints or as a stain for the pulp of brown paper. Siennas and umbers are used principally as paint pigments.

Ground sienna is used in lithographic printing and widely as a stain and filler for wood. Umber paints have good covering power, and umber is an essential ingredient in many weather-proof paints.

*-Production.*—France provides the world's greatest output of ocher. Large quantities are also mined in England and the United States. The French colors are considered more brilliant and finer than those from other countries and are generally recognized as standard grades. Prior to the war the United States annually consumed between 20,000 and 25,000 tons of ocher, of which about two-thirds was of domestic origin. Georgia, Pennsylvania, and Florida furnished most of the American product.

Neither sienna nor umber is produced in large amounts in the United States, the average domestic output before the war being less than 1,000 tons annually. In 1914, the last year for which complete data are available, the combined imports of umber and sienna were 7,581 short tons, valued at \$109,238, as compared with a domestic output of only 790 short tons, valued at \$21,070. Umber is produced in practically all countries, but the finest qualities are found in Cyprus, Sicily, Asia Minor, and the Netherlands. Turkish umber, chiefly from the island of Cyprus, is the standard. Italian sienna, produced in Tuscany, has the same preeminence in its field as Turkish umber in the world market. The Harz Mountains are the only other important source of supply, although small amounts of sienna are produced in many parts of the world.

*Imports* of ocher prior to the war were 6,000 to 9,000 tons annually. Approximately three-fourths came from France. Sienna and umber are imported in three forms: (1) Crude or unpulverized, (2) powdered or washed, and (3) paste (ground in oil or water). Imports have been principally in crude form. Imports of umber of all classes in 1914, which is a fairly representative year, amounted to 2,303 short tons, valued at \$35,570; imports of sienna during the same period were 3,245 tons, with a value of \$55,925. Imports of these materials since 1917 are given in the following table:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
OCHERS, CRUDE.					
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	8,321,892	\$193,647	\$0.02	\$9,682	5
1919.....	9,137,187	219,805	.02	10,990	5
1920.....	29,595,091	375,672	.01	18,784	5
1921 (9 months).....	7,088,974	118,055	.02	.....	5

1921 (9 months).....	2,157,947	88,002	.04	.....	5
UMBERS, CRUDE.					
1918.....	487,623	\$13,859	\$0.03	\$693	5
1919.....	2,315,377	23,244	.01	1,162	5
1920.....	7,643,235	85,424	.01	4,271	5
1921 (9 months).....	2,617,169	29,485	.01	.....	5

*Exports.*—Statistics not available.

*Important changes in classification.*—The term “earths” has been omitted in connection with ochers, siennas, and umbers (par. 55, act of 1913).

#### IRON-OXIDE AND IRON-HYDROXIDE PIGMENTS.

(See Survey A-15.)

*Description and uses.*—These pigments, consisting chiefly of red and brown oxides of iron, are known by the general term metallic paint. They were described in the act of 1913 as “Spanish brown, Venetian red, Indian red, and colcothar or oxide of iron.” Commercially the brown colors are called metallic browns to distinguish them from ochers, umbers, and siennas. Spanish brown is the product imported from Spain. The nomenclature of the reds is much more involved, and describes shade and quality rather than origin or method of production.

Venetian red has been loosely applied to a variety of red pigments, but is correctly applicable only to a combination of iron oxide and calcium sulphate. All Venetian reds are of the familiar brick color, are paler than other iron reds, and not so brilliant, are permanent, work well with oil, can be mixed with other pigments, and are cheap.

Indian red is doubtless the best known of the natural iron oxide pigments, and in the trade bears various names, such as bole, raddle, oxide red, and rouge. Native Indian red contains about 90 per cent of iron oxide.

Colcothar is the obsolete name for iron oxide formed by the calcination of copperas—iron sulphate crystals produced from iron wastes and from pickling liquors in wire works and galvanizing mills.

Oxide of iron is the commercial term used to describe the artificial oxide obtained by calcination of copperas. The name is not used to describe natural pigments or those made direct from ore, although red hematite and calcined carbonate iron ore may have the same chemical composition.

Crocus martis is a trade designation for the purple or deep-red pigment produced by calcining certain iron salts. It is rarely used as a pigment but chiefly for polishing powder.

One of the most extensive uses of iron paints is for the protection of structural steel and iron, for which purpose it has proved more satisfactory than either graphite or red lead; it is also much cheaper in first cost. Large quantities are used for painting freight cars, barns, and houses.

In addition to being used as a pigment the best grade of iron oxide is an important abrasive. Iron oxide, of natural and artificial origin, is prepared in extremely fine form and used for polishing plate glass and lenses, gold, silver, and other metals.

*Production.*—The chief source of natural iron paints in the United States is the Clinton hematite found in various places throughout the Appalachian region. There is also a small output from the Lake Superior district. Accurate statistics of production are practically impossible to secure, because of the diversity of the products and the difficulty of classification. Data, reported by the United States

Geological Survey for the years 1907 to 1914, show an average domestic output of about 25,000 short tons, valued at approximately \$180,000. These figures do not include material of similar composition used as mortar colors or all of the oxide paints from the metallurgical waste liquors. The marketed production of Venetian red in 1914 was 7,445 short tons, valued at \$119,895.

*Imports.*—The United States is the largest consumer of iron paints in the world. The consumption is increasing rapidly, and is supplied chiefly by domestic production. Spanish iron ores, however, notably the brown hematites, are important imports. Special qualities of reds, chiefly of artificial origin, are imported from Europe, especially from England; and, before the war, were brought from Germany. The values of the imports of oxides of iron for consumption are the only data shown in Commerce and Navigation. From 1910 to 1918 the annual imports of Spanish brown, Indian red, and colcothar or oxide of iron, n. s. p. f., averaged about \$180,000, increasing from \$82,514 in 1911 to \$335,176 in 1918. Imports of Venetian red from 1910 to 1913 average annually about 2,620,000 pounds, valued at \$23,410. They increased to 3,858,611 pounds in 1914, and then decreased steadily to 433,368 pounds in 1918. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
SPANISH BROWN, INDIAN RED, AND COLCOTHAR OR OXIDE OF IRON.					
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....		\$311,425		\$31,143	10
1919.....	9,971,744	307,413	\$0.03	30,741	10

1921 (9 months).....	255,997	5,360	.02		10

*Exports.*—Statistics not available.

*Important changes in classification.*—The terms "Spanish brown, venetian red, Indian red, and colcothar or oxide of iron" (par. 55, act of 1913) have been replaced with "iron-oxide and iron-hydroxide pigments."

## PARAGRAPH 71.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 71. Satin white and precipitated calcium sulphate, one-half of 1 cent per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 44. \* \* \* satin white, or artificial sulphate of lime, one-half of one cent per pound.

PAR. 51. \* \* \* satin white, or artificial sulphate of lime, 20 per centum ad valorem.

## SATIN WHITE AND PRECIPITATED CALCIUM SULPHATE.

(See Survey A-15.)

*Description, uses, and production.*—Satin white is gelatinous aluminum hydroxide mixed with calcium sulphate. It is made by precipitating a concentrated solution of sulphate of aluminum with an excess of lime. Precipitated calcium sulphate is the pure product obtained by precipitation from a solution of calcium chloride by means of sodium sulphate. It is also obtained as a by-product of certain chemical processes. Calcium sulphate also exists in nature as gypsum. (See par. 205, p. 265.) Satin white and artificial sulphate of lime are used synonymously in the act of 1913; in reality they are distinct commodities. Satin white is used largely in the coating of paper. Precipitated calcium sulphate, as well as natural calcium sulphate (gypsum), is used as an inert pigment and filler in the manufacture of paints.

*Imports.*—These two commodities are combined with “blanc-fixe or artificial sulphate of barytes,” in the statistics of imports. (See par. 64, p. 187.)

*Exports.*—Statistics not available.

*Important changes in classification.*—Satin white and artificial calcium sulphate are distinct articles of commerce, satin white being a gelatinous aluminum hydroxide mixed with calcium sulphate and some free lime, and produced by precipitating a solution of aluminum sulphate with an excess of lime, while precipitated (artificial) calcium sulphate is obtained by precipitation from a solution of calcium chloride by means of sodium sulphate. Satin white and precipitated calcium sulphate have no relation (other than being pigments) to the other articles in paragraph 51 (act of 1913); therefore they were provided for in separate paragraphs. (Re-classification Report, p. 76.)

## PARAGRAPH 72.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 72. Spirit varnishes containing less than 5 per centum of methyl alcohol, \$2.20 per gallon and 25 per centum ad valorem; spirit varnishes containing 5 per centum or more of methyl alcohol, and all other varnishes not specially provided for, 25 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 51. Varnishes, including so-called gold size or japan, twenty-five per centum ad valorem; \* \* \* spirit varnish containing five per centum or more of methyl alcohol, thirty-five cents per gallon and thirty-five per centum ad valorem; spirit varnish containing less than five per centum of methyl alcohol, one dollar and thirty-two cents per gallon and thirty-five per centum ad valorem.

PAR. 58. Varnishes, including so-called gold size or japan, 10 per centum ad valorem: *Provided*, That spirit varnishes containing less than 10 per centum of methyl alcohol of the total alcohol contained therein, shall be dutiable at \$1.32 per gallon and 15 per centum ad valorem.

## VARNISHES.

(See Survey A-15.)

*Description and uses.*—Varnish is a homogeneous liquid which dries (when applied to a surface) by evaporation of the volatile solvent or by evaporation of the solvent and oxidation of the oil and resins to a more or less impervious elastic film. Varnishes in the drying of which heat is applied in a closed compartment to expel the solvent and the residual layer is fused to a glasslike uniformity are termed japans. In the trade the term is loosely used. Gold size is a varnish used in preparing surfaces to which gold leaf is to be applied. Lacquers are highly transparent varnishes used to produce a thin film on metals to preserve their luster; some are finished by heating; others by drying in the air. The term is used somewhat interchangeably with "japan."

Varnishes may be divided into three classes: (1) Spirit varnishes, which are a solution of a gum resin in a volatile solvent, such as grain or wood alcohol or a mixture of the two; for example, shellac. (2) Oil varnishes, which contain a gum resin, a drying oil (linseed, China wood), a thinner, and a drier. (3) Pyroxylin varnishes, which consist of cellulose nitrate dissolved in a solvent, usually amyl acetate. Pyroxylin varnishes are often classed as spirit varnishes, but are quite different chemically.

*Production.*—In 1914 there were engaged primarily in the manufacture of varnishes 215 establishments, with a capital of \$29,860,798, with 5,610 employees, and an output valued at \$33,214,949, an increase of about \$3,000,000 over 1909. The chief producing States are New York, Illinois, New Jersey, and Ohio. In 1919, according to preliminary figures, there were 229 establishments with an output valued at \$83,632,400, two and one-half times the value of the 1914 output.

*Imports* from 1910 to 1917, inclusive, have ranged from a minimum of \$55,787 in 1913 to a maximum of \$70,073 in 1916. In 1914 the imports were less than 0.2 per cent of domestic production. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
SPIRIT VARNISHES, CONTAINING LESS THAN 10 PER CENT METHYL ALCOHOL.					
	<i>Gallons.</i>				<i>Per cent.</i>
1918.....	867	\$1,046	\$1.21	\$1,301	124.41
1919.....	48	272	5.67	104	38.29
1920.....	86	630	7.33	208	33.02
1921 (9 months).....	341	1,484	4.35		
SPIRIT VARNISHES, CONTAINING 10 PER CENT OR MORE OF METHYL ALCOHOL.					
1918.....	91	\$775	\$8.52	\$78	10.00
1919.....	380	1,622	4.27	162	10.00
1920.....	798	2,886	3.62	289	10.00
1921 (9 months).....	161	883	5.48		

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
GOLD SIZE OR JAPAN.					
1918.....		\$105		\$11	10.00
1919.....	2,426	9,099	\$3.75	910	10.00
1920.....	1,006	3,131	3.11	313	10.00
1921 (9 months).....	572	2,890	5.05		

## ALL OTHER VARNISHES, N. S. P. F.

1918.....	284	\$1,127	\$3.97	\$113	10.00
1919.....	18,712	59,130	3.16	5,913	10.00
1920.....	15,391	51,650	3.36	5,165	10.00
1921 (9 months).....	15,482	58,378	3.77		

*Exports* from 1910 to 1915 were practically constant at about \$1,000,000, decreasing to \$682,352 in 1915 and increasing to prewar figures in 1917 and 1918. In 1914 exports were 3 per cent of the domestic production. Exports since 1917 (calendar years) have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (gallons).....	698,152	1,418,267	1,623,754	
Value.....	\$1,213,710	\$2,713,727	\$3,228,350	\$2,671,668

*Important changes in classification.*—Spirit varnishes in the act of 1913 (par. 58) were dutiable at different rates, according to whether or not they contained less than 10 per cent of methyl alcohol. This division at the time of the passage of the act of 1913 was in accordance with the denaturing formula in use in the United States. The limit has been changed to 5 per cent in H. R. 7456 to correspond to present denaturing formula of the Bureau of Internal Revenue.

“Varnishes, including so-called gold size or japan,” in paragraph 58, act of 1913, has been omitted and instead the phrase, “other varnishes not specifically provided for,” has been inserted in H. R. 7456. (Reclassification Report, p. 81.)

## PARAGRAPH 73.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 73. Vermilion reds containing quicksilver, dry or ground in or mixed with oil or water, 33 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 52. Vermilion reds, containing quicksilver, dry or ground in oil or water, ten cents per pound; \* \* \*.

PAR. 59. Vermilion reds, containing quicksilver, dry or ground in oil or water, 15 per centum ad valorem; \* \* \*.

## VERMILION RED.

(See Survey A-15.)

*Description and uses.*—Vermilion red ordinarily refers to the red sulphide of mercury which is suitable for use as a pigment. It is so expensive on account of a large content of quicksilver (mercury) that substitutes are extensively used for the true vermilion. "American vermilion" is basic-lead chromate and is more generally known as chrome red. (See par. 67, p. 193.) Another so-called vermilion is eosine vermilion or "vermillionette," which is a color lake produced by precipitating eosine, a coal-tar dye, on inert white bases, such as barium sulphate, lead sulphate, or white lead.

*Production.*—True vermilion may be of natural or artificial origin. It exists in nature as the mineral cinnabar, but this source is of minor importance. Practically all of the quicksilver vermilion is now manufactured from quicksilver and sulphur, both produced in this country. In H. R. 7456 quicksilver is assessed a duty of 35 cents per pound (par. 383); sulphur is free (par. 1663).

The production of vermilion reds is one of the minor branches of the paint industry. The total output of true vermilion as reported by the census in 1914 was 322,759 pounds, valued at \$200,134; and in 1919 (preliminary figures), 327,500 pounds, valued at \$237,800.

Vermilion is manufactured in various European countries, Germany and England being the most important. These countries depend on Spain, Austria, and Italy for their supply of quicksilver.

*Imports* in 1913 of vermilion red containing quicksilver were 84,294 pounds, valued at \$44,420, and yielded a revenue of \$8,429. The imports in 1914 were about 72,000 pounds, and in 1915 increased to 94,164 pounds, valued at \$58,464, yielding a revenue of \$8,769. Imports then decreased to 7,181 pounds in 1918. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	2,368	\$3,134	\$1.32	\$470	15
1919.....	13,764	21,122	1.53	3,168	15
1920.....	46,863	57,223	1.22	8,583	15
1921 (9 months).....	4,289	3,785	.88	.....	15

The imports of vermilion red not containing quicksilver, but made of lead or containing lead, have been sporadic and practically negligible.

*Exports.*—Statistics not available.

*Important changes in classification.*—The language in paragraph 59, act of 1913, "when not containing quicksilver but made of lead or containing lead," is in conflict with the language in paragraph 54, "all other chromium colors in the manufacture of which lead and bichromate of potash or soda are used." The only pigment which could possibly be classified under this provision in paragraph 59 is "American vermilion." This pigment is a basic-lead chromate, distinctly a chromium color, and within the language of paragraph 54. "Vermillionette" is a coal-tar lake which comes within the act of September 8, 1916. The clause for vermilion reds not containing quicksilver was therefore omitted. (Reclassification Report, p. 82.)

## PARAGRAPH 74.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 74. Zinc oxide and leaded zinc oxides containing not more than 25 per centum of lead, in any form of dry powder,  $1\frac{1}{2}$  cents per pound; ground in or mixed with oil or water, 2 cents per pound; lithopone, and other combinations or mixtures of zinc sulphide and barium sulphate,  $1\frac{1}{2}$  cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 55. Zinc oxide of, and white pigment containing zinc, but not containing lead, dry, one cent per pound; ground in oil, one and three-fourths cents per pound; sulphid of zinc white, or white sulphide of zinc, one and one-fourth cents per pound; \* \* \*.

PAR. 61. Zinc oxide of, and pigments containing zinc but not containing more than 5 per centum of lead, ground dry, 10 per centum ad valorem; when ground in or mixed with oil or water, lithopone and white sulphide of zinc, 15 per centum ad valorem.

## ZINC OXIDE AND LEADED ZINC OXIDE.

(See Survey A-15.)

*Description and uses.*—Zinc oxide is a white, insoluble compound of zinc and oxygen. It is the most important pigment containing zinc as the principal ingredient, and is sold in various grades, determined by the quality and method of manufacture, all grades containing not less than 99 per cent of oxide of zinc. When mixed with other pigments it is used in the manufacture of paint. It is also used as an ingredient in vulcanized rubber goods, in the manufacture of oilcloth, linoleum, and printing inks. An especially high-grade zinc oxide is used in medicine and in many pharmaceutical preparations.

Leaded zinc oxide consists of zinc oxide and basic lead sulphate. This pigment is made by roasting an ore containing zinc and lead and converting the lead to basic sulphate by the action of the combustion gases in the furnace. The leaded zinc oxides contain from 3 to 25 per cent of lead.

*Production.*—Zinc oxide is made by two processes—the American and the French. The American process consists essentially of blowing air through a heated mixture of oxidized or roasted zinc ore mixed with coal and collecting the fume. This process requires an extremely high-grade pure ore in order to obtain a product that will compete with that made by the French process, which method is also used in the United States. The French method consists in oxidizing the vapor given off by a boiling bath of spelter and collecting the fume. This gives a high-grade product and is the process chiefly used in Europe. The output of American-process oxide is in excess of the domestic consumption and leaves a small margin for export. Zinc oxide is produced in Germany, Belgium, Holland, and France. The output of zinc oxide and leaded zinc oxide in the United States since 1912 has been as follows:

Year.	Zinc oxide.		Leaded zinc oxide.	
	Quantity (short tons).	Value.	Quantity (short tons).	Value.
1912.....	81,002	\$7,482,409	11,410	\$953,800
1913.....	75,700	7,161,528	9,421	745,698
1914.....	82,809	7,850,350	11,317	977,431
1915.....	109,261	11,984,470	18,758	1,724,145
1916.....	100,339	18,816,378	23,003	3,053,060
1917.....	107,586	21,589,976	23,450	3,728,976
1918.....	100,286	20,560,247	26,714	4,480,565
1919.....	117,639	20,591,877	27,591	4,009,024
1920.....	99,444	17,859,736	30,460	4,467,532

*Imports* of dry zinc oxide for the period 1910-1917 have averaged 4,236,109 pounds, valued at \$282,883, yielding a revenue of \$39,911. Zinc oxide is imported chiefly from Belgium; the decrease of about 4,000,000 pounds in 1915 over the previous year was caused by interruptions to shipping. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	323,127	\$62,703	\$0.19	\$6,270	10
1919.....	209,653	44,338	.21	4,434	10
1920.....	2,861,136	289,890	.10	28,989	10
1921 (9 months).....	955,060	59,084	.06	.....	10

*Imports* of zinc oxide ground in oil prior to 1914 ranged between 300,000 and 500,000 pounds annually. They were negligible during the war, and since have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	7,074	\$1,043	\$0.15	\$156	15
1919.....	6,727	1,351	.20	203	15
1920.....	27,899	3,596	.13	539	15
1921 (9 months).....	68,713	8,460	.12	.....	15

*Exports.*—The average annual exports of zinc oxide and leaded zinc oxide for 1910-1917 were about 31,000,000 pounds. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months.)
Quantity (pounds).....	24,841,747	29,405,334	22,327,830	3,591,142
Value.....	\$2,779,507	\$3,059,276	\$2,151,544	\$317,072

Exports have been chiefly to Canada, England, and Italy.

*Important changes in classification.*—Paragraph 61, act of 1913, limited other pigments containing zinc to those containing not more

than 5 per cent of lead. Leaded zinc oxides, an important group of zinc-oxide pigments, which contain between 3 and 25 per cent of lead, were therefore dutiable under paragraph 56, act of 1913, as pigments containing lead. These leaded zinc oxides are in chief value of zinc oxide; and since there is no apparent reason why all zinc-oxide pigments should not receive the same tariff treatment, the limiting lead content was increased to 25 per cent. (Reclassification Report, p. 83.)

## LITHOPONE.

(See Survey A-4.)

*Description and uses.*—Lithopone is a coarse-grained, brilliant, white pigment which has excellent covering powers. The quality depends largely upon the method of manufacture. It is used as a pigment chiefly in the manufacture of paints known in the trade as "flat paints"; also as a filler in the manufacture of such articles as linoleum, table oilcloth, window shades, and vulcanized rubber goods.

*Production.*—Lithopone is manufactured by mixing solutions of zinc sulphate and barium sulphide. The resultant insoluble mixture of zinc sulphide and barium sulphate is filtered, washed, dried, roasted, quenched, and powdered. Production in the United States has increased steadily from 25,330,000 pounds, valued at \$916,512, in 1910, to 178,746,000 pounds, valued at \$12,484,925, in 1920. The output in the first six months of 1921 was about 45,000,000 pounds. Domestic production since 1912 has supplied 90 per cent or more of the consumption.

The Tariff Commission investigated the cost of production in the lithopone industry for 1919 and for the first six months in 1921.<sup>12</sup> The total cost in 1921 was 6.26 cents per pound, a slight increase over the average cost in 1919. Investigation showed that during the first half of 1921 only about one-third of the entire capacity of the domestic industry was in actual operation. This inactivity, however, must be attributed to reasons other than active competition from foreign sources, as imports were slightly less than 2 per cent of the domestic output.

*Imports* of lithopone for 1911–1916 have averaged 6,000,000 pounds, valued at \$217,000, yielding a revenue of \$57,700. During 1917 and 1918 imports were negligible, and since have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1919 <sup>a</sup> .....	1,477,296	\$122,708	\$0.08	\$18,406	15
1920.....	3,427,321	263,240	.08	39,486	15
1921 (9 months).....	4,561,750	206,072	.04	.....	.....

<sup>a</sup> No imports of lithopone in 1918 (calendar year).

<sup>12</sup> See reports of the Tariff Commission: "Barytes, Barium Chemical and Lithopone Industries, Including Costs of Production 1919," Tariff Information Series No. 18, and "Production Costs in the Lithopone Industry, First Six Months in 1921," Tariff Information Series No. 24.

*Exports.*—Statistics not available.

*Important changes in classification.*—Lithopone in the United States is a standard product containing approximately 30 per cent zinc sulphide and 70 per cent barium sulphate. In Europe, however, lithopone is made with a content of zinc sulphide varying from 11 to 42 per cent. These European grades are sold under various trade names and in order to prevent evasion of the duty intended for lithopone the phrase "and other combinations or mixtures of zinc sulphide and barium sulphate" has been added. (Reclassification Report, p. 83.)

## PARAGRAPH 75.

### H. R. 7456.

### SENATE AMENDMENTS.

PAR. 75. Potassium: Chromate and dichromate,  $2\frac{1}{4}$  cents per pound; chlorate and perchlorate, 1 cent per pound; ferricyanide or red prussiate of potash, 7 cents per pound; ferrocyanide or yellow prussiate of potash, 4 cents per pound; iodide, 25 cents per pound; bromide, 10 cents per pound; bicarbonate, carbonate, hydroxide or caustic potash, nitrate or saltpeter, and permanganate, 25 per centum ad valorem: *Provided*, That for a period of five years beginning on the day following the passage of this Act, there shall be levied, collected, and paid in addition thereto on all the foregoing a duty of 15 per centum ad valorem.

### ACT OF 1909.

PAR. 64. Prussiate of potash, red, eight cents per pound; yellow, four cents per pound; \* \* \*

PAR. 60. Bichromate and chromate of potash, two and one-fourth cents per pound.

PAR. 61. Caustic potash, or hydrate of, refined, in sticks or rolls, one cent per pound; chlorate of, two cents per pound.

PAR. 62. Hydriodate, iodide, \* \* \* of potash, twenty-five cents per pound.

PAR. 63. Nitrate of potash, or saltpeter, refined, one-half of one cent per pound.

PAR. 3. \* \* \* all chemical compounds, \* \* \* and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*

PAR. 655. \* \* \* carbonate of potash, crude or refined; hydrate of, or caustic potash, not including refined in sticks or rolls; nitrate of potash or saltpeter, crude; \* \* \* [Free].

### ACT OF 1913.

PAR. 64. Potash: Bicarbonate of, refined, and chlorate of,  $\frac{1}{2}$  cent per pound; chromate and bichromate of, 1 cent per pound; nitrate of, or saltpeter, refined, \$7 per ton; permanganate of, 1 cent per pound; prussiate of, red, 2 cents per pound; yellow,  $1\frac{1}{4}$  cents per pound.

PAR. 38. \* \* \* potassium iodide, 15 cents per pound.

PAR. 5. \* \* \* all chemical \* \* \* compounds, \* \* \* and salts, \* \* \* not specially provided for in this section, 15 per centum ad valorem.

PAR. 580. Potash: \* \* \* carbonate of; \* \* \* hydrate of, when not containing more than 15 per centum of caustic soda; nitrate of, or saltpeter, crude; \* \* \* [Free].

## POTASSIUM COMPOUNDS.

## POTASSIUM CHROMATE AND DICHROMATE.

(See Survey A-18.)

*Description and uses.*—These two salts of chromic acid have similar uses, and are readily converted into each other. Both crystallize well, but the dichromate, being much less soluble in cold water, crystallizes better and is the one usually prepared. Both crystallize more readily than the corresponding sodium salt and are therefore more readily purified. Potassium dichromate is used to a much greater extent than the potassium chromate, owing to its greater richness in chromic acid and the fact that it is more easily crystallized and purified. It is a strong oxidizing agent. The chief uses of these salts are in the chrome tanning of leather, textile dyeing and printing, manufacture of chrome pigments and colors, pickling of brass, and the electro-engraving of copper plates. They are also used in bleaching oils and fats, for other oxidation purposes, and as a chemical reagent. Wherever possible the cheaper sodium salt is now substituted for the potassium salt.

*Manufacture.*—Potassium chromate and dichromate are prepared from chrome iron ore or chromite, the larger portion of which is imported. The ore is pulverized and mixed with lime and potassium carbonate. This mixture is then heated to a bright red in a strong current of air. The fused mass is then lixiviated with water, forming a solution of calcium and potassium chromates. Additional potash, usually potassium sulphate, is added to the solution to convert the calcium chromate into potassium chromate. The clear solution of potassium chromate is then drawn off and treated with sulphuric acid, thus producing potassium dichromate, which is crystallized from the solution.

*Domestic production.*—Figures were not available prior to 1918, when the output of potassium chromate and dichromate was 681,346 pounds and sales were 1,003,598 pounds, valued at \$407,793.

*Imports* since 1910 have been not more than 40,000 pounds in any year and were negligible during 1915-1918. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad- valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	20	\$8	\$0.40		2.50
1919.....	15,450	4,271	.28	\$155	3.62
1920.....	4,414	2,690	.61	44	1.64
192 (9 months).....	1,120	271	.24		

*Exports.*—Statistics not available.

## POTASSIUM CHLORATE AND PERCHLORATE.

(See Survey A-16.)

*Description and uses.*—Potassium chlorate or chlorate of potash is a white crystalline substance not readily soluble in water. It is a strong oxidizing agent and when mixed with sulphur and charcoal forms an explosive powder. It is used in the manufacture of matches, fireworks, percussion caps, and explosive powders, in dyeing, and in medicine. Potassium perchlorate contains one more atom of oxygen than the chlorate, and therefore possesses greater oxidizing capacity per unit of quantity and is more stable than the chlorate. Its uses are similar to the chlorate.

*Production.*—Potassium chlorate is made by subjecting a solution of potassium chloride to the action of a direct current of electricity in an electrolytic cell. The perchlorate is made by electrolytic oxidation of the chlorate or by treating sodium perchlorate with potassium chloride. In 1914 the combined production of sodium and potassium chlorates was 8,304 short tons, valued at \$1,131,316. The output of potassium chlorate in 1918 by three firms was 9,753,424 pounds, valued at \$2,837,892. Production of potassium perchlorate was reported in 1918 by one firm only.

*Imports* of potassium chlorate have been rather sporadic, the largest before 1920 being over 1,200,000 pounds in 1913. During the war the import declined to a minimum of 27,000 pounds in 1915, increasing to about 1,000,000 pounds in 1918 (fiscal year). Japan has been active recently in the production of potassium chlorate and it is likely that these imports originated in that country. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	709,805	\$248,160	\$0.35	\$3,549	1.43
1919.....	199,077	31,996	.18	995	2.84
1920.....	1,484,948	162,417	.11	7,425	4.57
1921 (9 months).....	2,523,206	137,444	.05		

*Exports* of potassium chlorate are first shown in Commerce and Navigation in 1918, when 1,564,662 pounds, valued at \$681,128, were exported, chiefly to Australia and British Africa. Since then exports, chiefly to England, Japan, and Canada, have been as follows (calendar years):

	1918	1919	1920	1921 (9 months)
Quantity (pounds).....	1,391,663	1,982,194	2,819,459	241,354
Value.....	\$539,491	\$524,193	\$445,243	\$33,781

*Important changes in classification.*—Potassium perchlorate is mentioned specifically for the first time.

## POTASSIUM FERRICYANIDE (RED PRUSSIAE OF POTASH).

(See Survey A-18.)

*Description and uses.*—Potassium ferricyanide is also known commercially as red prussiate of potash. It crystallizes from water in large red anhydrous crystals. It is poisonous, readily soluble in water, and is used in calico printing, in the manufacture of blue-print paper, and the production of blue pigments.

*Production.*—Red prussiate of potash is manufactured by treating a solution of yellow prussiate of potash with chlorine. Production by two firms in 1918 was reported to the Geological Survey.

*Imports* in 1914 were 89,976 pounds, chiefly from Germany and Austria-Hungary. In 1915 the import was slightly less, but in 1916 declined to 2,040 pounds. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	15,516	\$29,201	\$1.88	\$310	1.06
1919.....	34,007	18,096	.53	680	3.6
1920.....	101,361	64,686	.64	2,027	3.14
1921 (9 months).....	25,178	4,878	.19		

*Exports.*—Statistics not available.

## POTASSIUM FERROCYANIDE (YELLOW PRUSSIAE OF POTASH).

(See Survey A-18.)

*Description and uses.*—Potassium ferrocyanide, known as yellow prussiate of potash, crystallizes from water in large yellow crystals containing water of crystallization. When heated or exposed to dry air, the crystals become a white powder. It is used in the preparation of Prussian blue, in calico printing, for dyeing silk, for case-hardening of iron, and for making potassium cyanide and ferricyanide. Small amounts are used in the manufacture of some explosives and as a reagent in analytical chemistry. Within the last few years sodium ferrocyanide has replaced potassium for most purposes because it is much cheaper.

*Production.*—Formerly the method of manufacture was to fuse nitrogenous animal matter (hides, hoofs, hair, blood, or other animal waste) with potassium carbonate and iron borings. At present potassium ferrocyanide is produced almost entirely as a by-product of the manufacture and purification of coal gas. The exhausted purifying agent is first treated with water to dissolve out ammonia and soluble salts, then dried, the sulphur extracted with carbon bisulphide, and the residue mixed with lime. This is then heated with steam and forms calcium ferrocyanide, and on treatment with potassium chloride a double calcium potassium ferrocyanide is produced. When the latter is treated with potassium carbonate, calcium carbonate separates and potassium ferrocyanide remains in

solution and may be recovered by evaporation. Late figures for production are not available. In 1914 the United States produced 3,204,684 pounds, which probably represented a little less than half of the total consumption. Production in 1918 by three firms was 457,267 pounds and sales were 306,535 pounds, valued at \$204,190. This decrease from 1914 was due to substitution of sodium ferrocyanide (see par. 78, p. 232).

*Imports* for 1914 amounted to 3,508,229 pounds, more than 50 per cent of which came from Germany and about 27 per cent from England. In 1915 the imports were 2,316,736 pounds, but dropped the next year to 44,156 pounds. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	129,441	\$112,729	\$0.87	\$1,618	1.44
1919.....	515,236	122,372	.24	6,440	5.26
1920.....	762,857	105,962	.14	9,536	9.00
1921 (9 months).....	306,521	68,644	.22		

*Exports.*—Statistics not available.

POTASSIUM IODIDE.

(See Survey A-9.)

*Description and uses.*—Potassium iodide is a white crystalline salt, easily soluble in water, used in medicine and photography and as a reagent in analytical chemistry. By far the greatest consumption is in medicine.

*Production.*—It is produced from iodine and potassium carbonate, both raw materials being obtained almost entirely by importations from Chile and Germany, respectively. During the war potassium iodide has been largely replaced by sodium iodide, owing to the scarcity of potash. More than half of the iodine consumed in the United States is used for making potassium and sodium iodide. In 1918 the output of potassium iodide by eight firms was 521,678 pounds, and sales were 481,301 pounds, valued at \$1,587,656.

*Imports* have averaged less than 100 pounds annually until 1917. For the fiscal year ending June 30, 1917, the imports were 24,357 pounds and for the same period in 1918, 65,992 pounds. The source of these imports is not indicated in Commerce and Navigation, but as the Japanese annual returns of foreign trade report 38,600 pounds of potassium iodide exported to the United States in 1917, it is probable that these imports were almost wholly from Japan. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	64,392	\$142,324	\$2.21	\$9,659	6.79
1919.....	18,218	54,250	2.98	2,733	5.04
1920.....	5,184	14,872	2.87	773	5.23
1921 (9 months).....	226	580	2.57		

*Exports.*—Statistics not available.

*Important changes in classification.*—Potassium iodide is provided for with iodoform in paragraph 38 of the act of 1913; it has been transferred to this paragraph, which covers other potassium salts.

POTASSIUM BROMIDE.

(See also Bromine and Bromine Compounds, p. 128.)

POTASSIUM BICARBONATE.

(See Survey A-16.)

*Description and uses.*—Potassium bicarbonate is a white crystalline substance which evolves carbon dioxide on treatment with an acid. It is used for making potassium carbonate of high purity, as an antacid, and in the preparation of effervescing salts.

*Production.*—Potassium bicarbonate is prepared by saturating a solution of potassium carbonate with carbon dioxide and crystallizing the resulting bicarbonate. Production by one firm in 1918 is included with potassium carbonate, *infra*.

*Imports* prior to 1914 had increased to about 300,000 pounds per year, valued at about \$15,000, yielding a revenue of about \$4,000. In 1914 the import increased to about 480,000 pounds, and in 1916 decreased to 2,062 pounds. Later import statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	72,188	\$34,279	\$0.47	\$361	1.05
1919.....	47,354	8,921	.19	237	2.65
1920.....	387,331	93,565	.24	1,937	2.07
1921 (9 months).....	239,891	29,214	.10		

*Exports.*—Statistics not available.

POTASSIUM CARBONATE.

(See Survey A-16.)

*Description and uses.*—Potassium carbonate was formerly obtained from wood ashes, but little now comes from this source except that derived from the immense forests in Russia. Much is manufactured from the Stassfurt salts and some from the distillery waste of molasses in beet-sugar manufacture. It is used in soft soaps, Bohemian and flint glass, and in dyeing and wool washing.

*Production.*—A small quantity of crude carbonate of potash was produced here during the war chiefly from wood ashes—1,035 tons of crude material in 1917 and 438 tons in 1920. In 1918 the output of refined potassium carbonate and bicarbonate was 229,287 pounds, of which 201,574 pounds, valued at \$104,432, was sold.

*Imports* of carbonate of potash formerly averaged about 20,000,000 pounds, chiefly from Germany, falling to a minimum of about

2,000,000 pounds in 1916. In 1918 the imports were over 90 per cent from Russia.

Imports since 1917 are shown in the following tables:

Calendar year.	Quantity.	Value.	Unit value.
POTASSIUM CARBONATE, CRUDE.			
	<i>Pounds.</i>		
1918.....	8,593,268	\$2,273,202	\$.25
1919.....	515,373	104,744	.20
1920.....	16,903,554	510,700	.03
1921 (9 months).....	2,985,661	158,783	.05
POTASSIUM CARBONATE, REFINED.			
1918.....	207,055	\$65,974	\$.32
1919.....	45,640	9,665	.21
1920.....	1,764,117	290,354	.16
1921 (9 months).....	139,497	14,952	.11

*Exports.*—Statistics not available.

*Important changes in classification.*—Carbonate of potash is exempt from duty under paragraph 580 of the act of 1913.

#### POTASSIUM HYDROXIDE (CAUSTIC POTASH).

(See Survey A-16.)

*Description and uses.*—Potassium hydroxide, also known as caustic potash, readily absorbs water and carbon dioxide from the air and is very easily soluble in water, giving a strongly caustic solution. The usual method of manufacture is by the electrolysis of a solution of potassium chloride, chlorine being a by-product. It is used in soft soaps, in the preparation of oxalic acid, in some dyes, in preparing caustic lyes, and as a chemical reagent. Owing to the great advance in the price of potash salts, it has been replaced wherever possible by sodium hydroxide.

*Production.*—Previous to the war, according to the only domestic manufacturer at that time, 75 per cent of the domestic consumption was imported from Germany. The output of this firm was reported as 6,504,000 pounds in 1914.<sup>13</sup>

Production in 1919 (preliminary figures) was 12,625,000 pounds, valued at \$2,163,400.

*Imports*, which in 1913 amounted to 8,896,805 pounds, declined to 68,095 pounds in 1917.

Since 1917 imports, chiefly from Germany, Sweden, and Austria, have been as follows:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1919.....	484,290	\$134,166	\$.28
1920.....	1,712,319	451,274	.26
1921 (9 months).....	7,084,767	359,389	.05

<sup>13</sup> Hearings before the Committee on Ways and Means, 1921, Pt. I, pp. 335-337.

*Exports.*—Statistics not available.

*Important changes in classification.*—Hydrate of potash when not containing more than 15 per cent of caustic soda is exempt from duty under the act of 1913 (par. 580).

POTASSIUM NITRATE OR SALTPETER.

(See Surveys A-16; A-18.)

*Description and uses.*—Potassium nitrate, or saltpeter, when pure, is a white crystalline substance and is readily soluble in water. It is used in the manufacture of gunpowder and other explosives and in fireworks. It is also used in curing meats and as a reagent in assaying.

*Production.*—Formerly potassium nitrate was obtained almost exclusively from niter earths, which occur chiefly in India. Much of it is now produced by treating sodium nitrate with potassium chloride. Before the war large quantities were made in this manner in Germany from potassium chlorides of Stassfurt and sodium nitrate imported from Chile. Since the beginning of the war considerable amounts have been separated by crystallization from crude Chilean sodium nitrate. There are no commercial deposits of potassium nitrate in the United States. In 1914 there were produced from imported raw materials 29,480,000 pounds, valued at \$1,244,051. The output in 1918 by four firms was 16,250,433 pounds, of which 8,176,382 pounds, valued at \$2,206,788, was sold.

*Imports* of refined nitrate of potash just prior to the war were less than 200 tons, valued at about \$20,000. Since then the import declined to 2 tons in 1916 and increased to 288 tons, valued at \$35,143, in 1917. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
REFINED NITRATE OF POTASH.					
	<i>Tons.</i>				<i>Per cent.</i>
1918.....	2	\$730	\$365	\$14	1.92
1919.....	33	8,168	247	231	2.83
1920.....	563	107,154	190	3,941	3.68
1921 (9 months).....	74	16,503	223	.....	.....
CRUDE POTASSIUM NITRATE.					
	<i>Pounds.</i>				
1918.....	9,344,825	\$906,549	\$.10	.....	.....
1919.....	37,652,334	1,107,313	.03	.....	.....
1920.....	37,632,131	1,599,346	.04	.....	.....
1921 (9 months).....	16,593,849	590,200	.04	.....	.....

Imports of crude potassium nitrate since 1917 have been chiefly from Chile, British India, and England.

*Exports.*—Statistics not available.

*Important changes in classification.*—Nitrate of potash or saltpeter, crude, is exempt from duty under the act of 1913 (par. 580).

## POTASSIUM PERMANGANATE.

(See Survey A-16.)

*Description and uses.*—Potassium permanganate forms purplish black crystals with a greenish metallic luster which dissolve in water, giving a deep purple-red solution. It is used largely as an oxidizer, and when mixed with organic matter may cause spontaneous combustion. It is also used for bleaching; in dyeing shoe leather; for coloring wood a deep brown; to some extent in medicine, especially as a local disinfectant and germicide; and as an important reagent in analytical chemistry. It is estimated that over 50 per cent of the domestic production of potassium permanganate during the war was used in the manufacture of saccharin.

*Production.*—The usual method of manufacture is to mix a solution of potassium hydroxide with powdered manganese ore and potassium chlorate or potassium nitrate, evaporate to dryness, and fuse the residue until it becomes pasty. This forms potassium manganate, which is then dissolved in water and treated with sulphuric acid, chlorine, or carbon dioxide. The permanganate crystallizes on evaporation.

Another method in use is to fuse manganese ore with caustic soda, producing sodium manganate. This is electrolytically oxidized to sodium permanganate and caustic soda and then treated with carbon dioxide, forming soda ash, which crystallizes on evaporation, leaving the sodium permanganate in solution. The sodium permanganate is now treated with a potassium salt, preferably the carbonate, which produces the potassium permanganate, which is separated by crystallization. Sodium permanganate does not crystallize.

Prior to the war no permanganate was produced in this country. The shutting off of imports, the requirements for war purposes, and the large demand for the manufacture of saccharin have greatly stimulated the industry in the United States, several firms manufacturing permanganate of potash during the war. In 1918 the output by nine firms was 562,416 pounds, of which 530,837 pounds, valued at \$922,746, was sold.

*Imports* in 1914 were 1,351,855 pounds, nearly all of which came from Germany, but by 1916 imports had fallen to 208,979 pounds, and in 1917 to 5,605 pounds. Some came from Japan, but when prices fell these imports were reduced, as Japan was not able to ship to this country at the lower prices. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Pcr cent.</i>
1918.....	53,798	\$128,438	\$2.39	\$538	0.42
1919.....	4,000	10,163	2.54	40	.39
1920.....	53,358	29,748	.56	534	1.79
1921 (9 months).....	223,266	51,738	.23		

*Exports.*—Statistics not available.

## PARAGRAPH 76.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 76. Santonin, and salts of, 75 cents per pound.

## ACT OF 1909.

## ACT OF 1913.

PAR. 68. Santonin, and all salts thereof containing eighty per centum or over of santonin, fifty cents per pound.

PAR. 594. Santonin, and its combinations with acids not subject to duty under this section [Free].

## SANTONIN.

(See Survey FL-2.)

*Description and uses.*—Santonin is a chemical compound used as a vermifuge. It is derived from Levant wormseed, or santonica, a wild shrub occurring in Russia and Turkestan, where santonin was manufactured under supervision of the Russian Government and was practically a monopoly. Before the war the article had no large domestic use, but about 1917 it was developed considerably in veterinary medicine for the treatment of hogs, and is now in great demand. The elimination of intestinal worms from swine induces a much more rapid growth without an increase of feed, therefore santonin is considered indispensable by many hog raisers.

*Production.*—Prior to the war it commanded a price of about \$15 per pound, but during the war reached \$70, and in December, 1921, was \$147 per pound. Even at this price its cost is said to be negligible as compared with the increased value of treated hogs. The high price and increasing demand have stimulated interest in American production, and santonica has been grown experimentally with favorable results. Santonin content of Levant wormseed runs about 2 per cent, and it must be obtained and purified by an expensive process.

*Imports* of santonin before the war were mostly from Germany and averaged about 5,000 pounds, valued at \$40,000. Imports reached a maximum of 20,925 pounds in 1916, but decreased to 223 pounds in 1918. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	1	\$25	\$25.00
1919.....	3,463	174,111	50.28
1920.....	2,124	187,518	88.28
1921 (9 months).....	2,711	258,736	95.44

*Important changes in classification.*—The articles covered by this paragraph are exempt from duty under the act of 1913 (par. 594).

*Suggested changes.*—Page 23, line 12: Insert a period after "pound."

## PARAGRAPH 77.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 77. Soap: Castile, 15 per centum ad valorem; toilet, 30 per centum ad valorem; all other soap and soap powder not specially provided for, 20 per centum ad valorem.

## ACT OF 1909.

PAR. 69. Castile soap, one and one-fourth cents per pound; medicinal or medicated soaps, twenty cents per pound; fancy or perfumed toilet soaps, fifty per centum ad valorem; all other soaps not specially provided for in this section, twenty per centum ad valorem.

## ACT OF 1913.

PAR. 66. Soaps: Perfumed toilet soaps, 30 per centum ad valorem; medicinal soaps, 20 per centum ad valorem; castile soap, and unperfumed toilet soap, 10 per centum ad valorem; all other soaps and soap powder not specially provided for in this section, 5 per centum ad valorem.

## SOAPS.

(See Survey A-17.)

*Description and uses.*—The term “soap” is ordinarily confined to the water-soluble potassium and sodium salts of the fatty acids, although the water-insoluble soaps of lead, magnesium, manganese, and aluminum are used for technical purposes.

Pure castile soap is supposed to be made from olive oil and soda lye only, but much of the soap marketed as such is made from other oils as well.

The term “toilet soap” is used to distinguish toilet soaps from household and laundry soaps. As certain soaps are suitable for both toilet and laundry purposes, the term “toilet soap” is rather vague and has caused considerable litigation. The tariff act of 1913 makes a distinction between perfumed and unperfumed toilet soap. Soap stocks, as a rule, have an unpleasant odor which prevents their use for toilet purposes. Some substance, usually a perfume material, is added to neutralize the odor of the stock or to give the soap a decidedly pleasant smell. Medicinal soaps contain some substance possessing antiseptic or healing properties.

*Production.*—The chief raw materials used in making soap are tallow, grease, and other fats; coconut, cottonseed, soya-bean, palm, corn, peanut, and other vegetable oils; vegetable waxes and resin; perfumes, naphthas, and other materials. Large quantities of caustic soda are used in converting the materials into soap and lesser quantities of caustic potash in making soft soaps, wool-scouring soaps, and shaving soaps. Certain fillers, such as silicate of soda (water glass), borax, and soda ash, and for scouring soaps different abrasive materials are used.

Manufacture involves the action of a caustic alkali, usually caustic soda, on fatty acids or more often on fats or fatty oils. This operation, known as saponification, produces an alkali salt (soap) and an important by-product, glycerin. Manufacture is by three processes, giving boiled, half-boiled, and cold-process soaps. The names are descriptive of the condition under which the soap is made. Boiled soaps are by far the most important class.

The capital invested in 371 establishments in 1914 was over \$92,000,000, the materials consumed cost \$88,866,786, and the value of the finished product was \$127,942,441. In 1919 (preliminary figures) output of the "soap industry" reached \$317,163,000. Domestic production supplies over 99 per cent of consumption. The principal States producing soap are New York, Illinois, New Jersey, Ohio, and Pennsylvania.

*Imports* have been valued at less than \$850,000. About 50 per cent of the imports is castile soap. Foreign manufacturers of well-known brands have branch factories in this country. Statistics of imports in recent years follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.

1918.....		\$15,229		\$761	5
1919.....	210,004	9,756	\$0.05	488	5
1920.....	184,442	12,770	.07	639	5
1921 (9 months).....	152,303	8,238	.05	.....	5
ALL OTHER SOAPS, N. S. P. F.					
1918.....		\$16,285		\$814	5
1919.....	236,457	22,579	\$0.09	1,129	5
1920.....	230,618	28,745	.12	1,437	5
1921 (9 months).....	288,765	29,908	.10	.....	5

*Exports* have shown a steady increase from \$3,620,546 in 1910 to \$6,291,790 in 1918. The export in 1914 was about 4 per cent of the value of domestic production. The increase has been largely in the export of varieties other than toilet soap. The export of "toilet" or "fancy" soap has been chiefly to the United Kingdom, Canada, Argentina, Australia, and Cuba. Prior to 1917 the United Kingdom took between 15,000,000 and 25,000,000 pounds of soap other than

toilet soap. Since 1916 Mexico has taken the largest quantity of this variety, importing over 27,000,000 pounds, valued at more than \$2,000,000, in 1918. Later statistics follow:

Calendar year.	Toilet soaps (value).	All other soaps.	
		Quantity.	Value.
1918.....	\$2,567,614	<i>Pounds.</i> 116,986,623	\$10,871,335
1919.....	6,034,230	157,749,605	15,266,696
1920.....	5,839,146	123,821,428	13,315,691
1921 (9 months).....	2,147,892	55,093,340	4,697,818

Toilet soaps, perfumed and unperfumed, were exported chiefly to Cuba, England, and Canada. All other soaps, except toilet, went chiefly to Mexico, Cuba, and Canada.

*Important changes in classification.*—The distinction between perfumed and unperfumed toilet soaps in the act of 1913 (par. 66) is omitted, as is also specific mention of medicinal soaps. (Reclassification Report, p. 89.)

## PARAGRAPH 78.

### H. R. 7456.

### SENATE AMENDMENTS.

PAR. 78. Sodium: Arsenate, 1 cent per pound; bicarbonate or baking soda, five-eighths of 1 cent per pound; borate or borax, refined, one-eighth of 1 cent per pound; bromide, 10 cents per pound; carbonate, calcined, or soda ash, hydrated or sal soda, and monohydrated, one-fourth of 1 cent per pound; chlorate,  $1\frac{1}{2}$  cents per pound; chloride or salt, in bags, sacks, barrels, or other packages, 11 cents per one hundred pounds; in bulk, 7 cents per one hundred pounds; chromate and dichromate,  $1\frac{3}{4}$  cents per pound; formate, 25 per centum ad valorem; ferrocyanide or yellow prussiate of soda, 2 cents per pound; hydroxide or caustic soda, one-half of 1 cent per pound; nitrite, 3 cents per pound; phosphate, one-half of 1 cent per pound; sesquicarbonate, one-fourth of 1 cent per pound; sulphate, crystallized, or Glauber salt, \$1 per ton; sulphate, anhydrous, \$2 per ton; sulphide, containing not more than 35 per centum of sodium sulphide, three-eighths of 1 cent per pound; containing more than 35 per centum, three-fourths of 1 cent per pound; silicate, sulphite, bisulphite, meta-bisulphite, and thiosulphate, three-eighths of 1 cent per pound.

## ACT OF 1909.

PAR. 70. Bicarbonate of soda, or supercarbonate of soda, or saleratus, \* \* \* five-eighths of one cent per pound.

PAR. 71. Bichromate and chromate of soda, one and three-fourths cents per pound.

PAR. 72. Crystal carbonate of soda, or concentrated soda crystals, or monohydrate, or sesquicarbonate of soda, one-fourth of one cent per pound; chlorate of soda, one and one-half cents per pound.

PAR. 73. Hydrate of, or caustic soda, one-half of one cent per pound; nitrite of soda and yellow prussiate of soda, two cents per pound; sulphide of soda containing not more than thirty-five per centum of sulphide of soda, and hyposulphite of soda, three-eighths of one cent per pound; sulphide of soda, concentrated, or containing more than thirty-five per centum of sulphide of soda, three-fourths of one cent per pound.

PAR. 74. Sal soda, or soda crystals, not concentrated, one-sixth of one cent per pound.

PAR. 75. Soda ash, one-fourth of one cent per pound; arseniate of soda, one cent per pound.

PAR. 76. Silicate of soda, \* \* \* three-eighths of one cent per pound.

PAR. 77. Sulphate of soda, \* \* \* one dollar per ton.

PAR. 3. \* \* \* all chemical compounds, \* \* \* and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*

PAR. 11. Borax, two cents per pound; borates of \* \* \* soda, \* \* \* not otherwise provided for in this section, two cents per pound.

PAR. 295. Salt in bags, sacks, barrels, or other packages, eleven cents per one hundred pounds; in bulk, seven cents per one hundred pounds: *Provided*, That imported salt in bond may be used in curing fish taken by vessels licensed to engage in the fisheries and in curing fish on the shores of the navigable waters of the United States under such regulations as the Secretary of the Treasury shall prescribe; and upon proof that the salt has been used for either of the purposes stated in this proviso, the duties on the same shall be remitted: *Provided further*, That exporters of meats, whether packed or smoked, which have been cured in the United States with im-

## ACT OF 1913.

PAR. 67. Soda: \* \* \* chlorate of, and nitrite of,  $\frac{1}{2}$  cent per pound; bicarbonate of, or supercarbonate of, or saleratus, \* \* \* hydrate of, or caustic; phosphate of; hyposulphite of; sulphid of, and sulphite of,  $\frac{1}{4}$  cent per pound; chromate and bichromate of, and yellow prussiate of,  $\frac{3}{4}$  cent per pound; borate of, or borax refined; crystal carbonate of, monohydrate, and sesquicarbonate of; sal soda, and soda crystals,  $\frac{1}{2}$  cent per pound; and sulphate of soda crystallized, or Glauber salts, \$1 per ton.

PAR. 593. Salt [Free].

PAR. 605. Soda, arseniate of, \* \* \* soda ash, silicate of, \* \* \* [Free].

PAR. 5. \* \* \* all chemical \* \* \* compounds, \* \* \* and salts, not specially provided for in this section, 15 per centum ad valorem.

ported salt, shall, upon satisfactory proof, under such regulations as the Secretary of the Treasury shall prescribe, that such meats have been cured with imported salt, have refunded to them from the Treasury the duties paid on the salt so used in curing such exported meats, in amounts not less than one hundred dollars.

#### SODIUM COMPOUNDS.

##### SODIUM ARSENATE.

(See Survey A-18.)

*Description and uses.*—Sodium arsenate is a white solid substance, soluble in water, and very poisonous. It is usually prepared by heating together white arsenic (arsenious acid, par. 1) and nitrate of soda, the product being purified by crystallization from solution. Its principal use is in insecticides, chiefly lead arsenate (par. 44). It is also used in dyeing and calico printing.

*Production* is by a few companies only; figures are not available.

*Imports* in 1913 were 1,267,998 pounds, but in 1914 only 228,270 pounds, all from England. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	35	\$88	\$2.51
1919.....			
1920.....	15,976	1,481	.09
1921 (9 months).....	127,537	11,613	.09

*Exports.*—Statistics not available.

*Important changes in classification.*—Sodium arsenate (arseniate of soda is free of duty under paragraph 605, act of 1913. (Reclassification Report, p. 123.)

##### SODIUM BICARBONATE (BAKING SODA).

(See Survey A-18.)

*Description and uses.*—Sodium bicarbonate or acid sodium carbonate, a white opaque powder soluble in water, is the mildest of the alkalis. In pure form it is the ordinary baking soda or saleratus. When sodium bicarbonate is treated with an acid it evolves carbon dioxide, a property which gives it a large use for industrial and household purposes. Sodium bicarbonate is the cheapest and most convenient form of storing carbon dioxide. It is used in the manufacture of baking powders, Seidlitz powders, effervescing drinks, and in medicine as an antacid. A very pure product is demanded for household and medicinal uses; one of less purity for carbonating waters, charging fire extinguishers, and prevention of timber mold.

Mixtures of sodium bicarbonate and sodium carbonate are sold for cleaning purposes.

*Production.*—Practically all of the bicarbonate of soda is produced by the "ammonia-soda" process, the raw materials being salt in the form of brine, limestone, ammonia, and coal. The ammonia is used over and over. The limestone is burned at the plant so that the carbon dioxide evolved is available for use in the process, and the lime produced is used in the regeneration of the ammonia and in the making of caustic soda. (See *infra*.) The brine solution is saturated with ammonia gas and then subjected to the action of carbon dioxide in high towers, producing sodium bicarbonate. This crude product is converted by heating into sodium carbonate, which is then dissolved in water and carbon dioxide passed through the solution, giving a refined bicarbonate of soda.

A small quantity of sodium bicarbonate is made from the alkaline waters of Owens Lake, Calif. It is made by the "ammonia-soda" process at Syracuse, N. Y.; Saltville, Va.; Detroit and Wyandotte, Mich.; and Hutchinson, Kans.

Production has been as follows:

Year.	Short tons.	Value.
1914.....	90,169	\$1,439,014
1916.....	115,177	2,303,540
1917.....	119,177	4,029,499
1918.....	118,535	3,293,153
1919 <sup>1</sup> .....	134,962	3,486,635
1920 <sup>1</sup> .....	188,906	4,256,715

<sup>1</sup> Sales rather than production.

*Imports* are small compared with the domestic production, the maximum since 1910 being 129,414 pounds, valued at \$2,867, in 1916. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	12,383	\$629	\$0.05	\$3	4.92
1919.....	17,122	3,616	.21	43	1.18
1920.....	5,828	593	.10	15	2.46
1921 (9 months).....	3,251	201	.06	.....	.....

*Exports* are not shown separately prior to 1920 (calendar year), in which year they were 20,642,201 pounds, valued at \$616,261, and for the first nine months of 1921, 8,371,534 pounds, valued at \$225,819. They have gone chiefly to Canada, Cuba, and Hongkong.

*Important changes in classification.*—The term "supercarbonate," used in the act of 1913 (par. 67) in connection with sodium bicarbonate, has been omitted from H. R. 7456, as it is obsolete. The term "baking soda" has been inserted as a synonym for sodium bicarbonate. (Reclassification Report, p. 92.)

## SODIUM BORATE OR BORAX, REFINED.

(See Survey A-1.)

*Description and uses.*—Crude borax and borate materials used in the manufacture of refined borax are free of duty under paragraph 1533. Sodium borate, or borax refined, is the most important derivative of boric acid. It comes on the market in two forms, common or prismatic borax, which contains 10 molecules of water of crystallization, and octahedral borax, which contains only 5 molecules.

The largest use of borax is in making enamel coating for cast and wrought iron sanitary and kitchen ware. It is also used in the manufacture of glass and soap, for sizing paper, in the soaking and cleaning of hides in tanneries, in the textile industry as a mordant and for rendering certain cloths fireproof, and as a flux in welding and brazing.

*Production.*—It is now made from colemanite, which is calcined; the calcium borate is separated mechanically from the minerals, and boiled with a solution of soda ash, forming sodium borate and insoluble calcium carbonate.

Domestic production has been as follows:

Year.	Short tons.	Value.
1914.....	26,501	\$2,071,774
1917.....	32,089	4,717,532
1918.....	26,673	3,909,565
1919 <sup>1</sup> .....	28,518	4,351,891
1920 <sup>1</sup> .....	35,281	5,674,012

<sup>1</sup> Sales, not production.

*Imports*, prior to 1920, have been less than 0.01 per cent of the domestic production; the maximum was 11,768 pounds, valued at \$882, in 1913. Since 1917 imports have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>	<i>\$</i>			<i>Per cent.</i>
1918.....	2	\$1	\$0.50		1.00
1919.....	378	155	.41	\$0.47	.30
1920.....	30,563	2,451	.08	38.00	1.56
1921 (9 months).....	226,240	12,477	.05		

*Exports* before the war were small and chiefly to the Orient. During the war a substantial export trade to Europe was developed. Exports in 1920 (calendar year) were 14,325,037 pounds, valued at \$1,026,936, and for the first nine months of 1921, 2,750,392 pounds, valued at \$191,616. They have gone chiefly to Japan, Canada, and England.

## SODIUM BROMIDE.

(See Survey FL-8. For discussion, see Bromine and Bromine Compounds, p. 128.)

*Important changes in classification.*—Sodium bromide has been mentioned specifically for the first time because it is one of the important forms in which bromine is marketed. (Reclassification Report, p. 92.)

## SODIUM CARBONATE, CALCINED (SODA ASH).

(See Survey A-18.)

*Description and uses.*—Soda ash, or calcined sodium carbonate, is the most important industrial alkali. It is not as strong as caustic soda, but is cheaper, easier to handle and ship, and is ordinarily used in preference to caustic soda wherever possible. There are two commercial grades containing 48 and 58 per cent of actual alkali ( $\text{Na}_2\text{O}$ ). The 58 per cent grade is sold as "light" and "dense." The dense product is twice as heavy per unit as the light and is used in glass, soap, wood pulp and paper, caustic soda, and other sodium chemicals; in the dye and textile industries; in the manufacture of drugs, enamel ware, and cleaners; and for softening water.

*Production.*—Practically all of the soda ash manufactured is made from sodium bicarbonate (see *supra*) derived from salt by the ammonia-soda process. A small quantity of soda ash is made from the natural soda brines of the Western States, but this source is of little importance. Sodium bicarbonate is converted into soda ash by simply heating continuously in a revolving furnace. Some soda ash is also made by the Hargreaves-Bird process, which produces caustic soda electrolytically in an atmosphere of carbon dioxide, which immediately converts the caustic soda into soda ash. This process is used by several paper mills in this country. The domestic production has been as follows:

Year.	Short tons.	Value.
1914.....	935,305	\$10,937,945
1916.....	1,324,208	18,283,866
1917.....	1,390,625	38,028,000
1918.....	1,390,628	35,635,520
1919 <sup>1</sup> .....	981,054	29,895,343
1920 <sup>1</sup> .....	1,238,149	38,908,726

<sup>1</sup> Sales, not production.

*Imports* have been less than 1 per cent of production, and since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	1,445	\$29	\$0.02
1919.....	829,266	12,998	.02
1920.....	1,515,278	37,161	.02
1921 (9 months).....	11,734,363	158,103	.01

*Exports* in 1918 (fiscal year) were 198,752,457 pounds, valued at \$6,074,879, about 40 per cent to Japan and 35 per cent to Canada. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	238,434,992	100,961,927	166,761,603	26,402,330
Value.....	\$7,805,550	\$2,656,608	\$4,689,591	\$644,311

Exports in recent years have been chiefly to Sweden, Netherlands, and Canada.

*Important changes in classification.*—Sodium carbonate, calcined, or soda ash, is free of duty under paragraph 605, act of 1913. This article is designated only as "soda ash" in the act of 1913. The term "sodium carbonate, calcined," has been added in order to include the correct chemical name. (Reclassification Report, p. 124.)

HYDRATED SODIUM CARBONATE (SAL SODA)—MONOHYDRATED SODIUM CARBONATE—SODIUM SESQUICARBONATE.

(See Survey A-18.)

*Description and uses.*—Soda crystals is an indefinite term applied to several crystalline sodium carbonates. These compounds may be sodium carbonate or a mixture of sodium carbonate and sodium bicarbonate, containing water of crystallization. Sal soda refers to crystals of completely hydrated sodium carbonate which contain 10 molecules of water ( $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ ), also known as washing soda. Monohydrated sodium carbonate is a crystalline compound of sodium carbonate containing one molecule of water ( $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ ). Sesquicarbonate of soda is a mixture of chemically equivalent parts of sodium carbonate and sodium acid carbonate crystallized with two molecules of water ( $\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$ ). These crystalline products are used chiefly for washing and cleansing purposes, particularly in the laundry and household.

*Production.*—Sal soda is prepared by dissolving soda ash (sodium carbonate) in hot water to form a solution of a definite specific gravity. On allowing this solution to cool, the sodium carbonate crystallizes out with 10 molecules of water. The addition of a little sodium sulphate to the solution is necessary to obtain the proper crystal form. This fact, however, is sometimes taken advantage of to dilute the finished product with a cheaper inert material which has no cleaning properties. Sodium sesquicarbonate is formed by crystallization from a hot solution containing chemically equivalent quantities of sodium carbonate and sodium acid carbonate. For many purposes this product is preferred to the other soda crystals.

Production in 1914 was 106,591 short tons of sal soda, including monohydrate crystals. The output since then has been as follows:

Year.	Sal soda.		Monohydrated sodium carbonate and sodium sesquicarbonate.	
	Short tons.	Value.	Short tons.	Value.
1917.....	77,939	\$1,698,520	55,035	\$1,262,875
1918.....	82,465	2,020,271	22,678	482,958
1919 <sup>1</sup> .....	80,090	2,229,994	31,278	714,930
1920 <sup>1</sup> .....	62,857	2,128,937	12,876	459,167

<sup>1</sup> Sales, not production.

*Imports.*—The maximum imports of crystal carbonate, monohydrate, and sesquicarbonate were 354,609 pounds in 1912, which is less than 0.2 per cent of the domestic production. Imports declined to 60,000 pounds in 1917. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent valorem.
SODA CRYSTALS.					
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	25	\$2	\$0.08		1.50
1919.....	45,060	1,182	.03	\$56.00	4.77
1920.....	4,796	577	.12	6.00	1.04
1921 (9 months).....	68,779	1,652	.02		

## MONOHYDRATED SODA, OR SESQUICARBONATE.

1918.....	44,800	\$1,281	\$0.03	\$56	4.37
1919.....					
1920.....	3,342	106	.03	4	3.94
1921 (9 months).....	71,132	2,176	.03		

*Exports* of sal soda in 1918 (fiscal year) were 14,076,264 pounds, valued at \$205,489. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	12,716,453	11,126,370	12,030,193	7,750,741
Value.....	\$213,865	\$178,285	\$220,487	\$154,191

Exports have been chiefly to Canada, Cuba, and Argentina.

*Important changes in classification.*—The wording “crystal carbonate of, monohydrate, and sesquicarbonate of; sal soda and soda crystals”, paragraph 67, act of 1913, describes three separate chemical and commercial articles. These have been corrected in this paragraph as (1) sodium carbonate, hydrated, or sal soda; (2) sodium carbonate, monohydrated; and (3) sodium sesquicarbonate. (Reclassification Report, p. 92.)

## SODIUM CHLORATE.

(See Survey A-18.)

*Description and uses.*—Sodium chlorate is a colorless crystalline compound composed of sodium, chlorine, and oxygen, readily soluble in water. It is used as an oxidizing agent in the manufacture of coal-tar dyes, in dyeing and printing textiles, and in large quantities in the manufacture of matches and explosives. It was formerly believed that only potassium chlorate could be used for matches, since sodium chlorate is hygroscopic, but the high price of potassium salts during the war led to methods permitting such use. Sodium chlorate has generally replaced the higher-priced potassium salts.

*Production* in 1917 was large, but statistics are not available. It is generally manufactured by subjecting a solution of sodium chloride (salt) to the action of a direct current of electricity. The apparatus for its manufacture electrolytically is quite expensive. It was formerly made by treating milk of lime with chlorine gas and converting the calcium chlorate formed into sodium chlorate by treatment with sodium sulphate (salt cake).

*Imports* from 1915 to 1918 have been between 22,000 and 45,000 pounds a year, and since have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	44,810	\$8,066	\$0.18	\$224	2.78
1919.....	39,022	3,814	.10	195	5.12
1920.....	561,513	50,266	.09	2,808	5.59
1921 (9 months).....	267,390	15,485	.06		

*Exports.*—Statistics are not available.

SODIUM CHLORIDE (SALT).

(See Survey A-18.)

*Description and uses.*—Salt, or sodium chloride, is one of the most common minerals. Besides its well-known uses, it is employed in the manufacture of chemicals, such as sodium bicarbonate, soda ash, caustic soda, and chlorine, and in the dye industry for diluting dyes.

*Production* of salt has shown a steady increase from about 3,000,000 tons in 1900 to about 6,000,000 tons in 1916, and nearly 7,000,000 tons in 1920. Since 1914 it has supplied over 99 per cent of domestic consumption. Michigan and New York produced over one-half of the output, with Ohio and Kansas also contributing largely. About 50 per cent of the salt is used as brine for the manufacture of chemicals.

*Imports* of salt are negligible, and chiefly from England and the British West Indies. Since 1917 they have been as follows:

Calendar year.	Quantity.	Value.	Unit value.
IN BAGS.			
	<i>100 pounds.</i>		
1918.....	205,180	\$148,128	\$0.72
1919.....	193,529	137,627	.71
1920.....	591,348	240,923	.40
1921 (9 months).....	558,928	284,012	.51
IN BULK.			
	<i>100 pounds.</i>		
1918.....	606,627	\$133,340	\$0.22
1919.....	996,753	105,077	.10
1920.....	2,161,736	435,576	.20
1921 (9 months).....	802,096	148,465	.18

*Exports* of salt increased from 41,908 short tons, valued at \$286,363 in 1910, to 97,075 tons, valued at \$726,761 in 1917. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (short tons).....	136,783	119,416	139,272	75,484
Value.....	\$1,677,577	\$1,396,625	\$1,901,593	\$994,817

Exports have been chiefly to Canada, Cuba, and Mexico.

*Important changes in classification.*—Transfer from the free list (par. 593) of the act of 1913.

SODIUM CHROMATE AND DICHROMATE.

(See Survey A-18.)

*Description and uses.*—Sodium dichromate is a red crystalline compound containing about 67 per cent of chromic acid ( $\text{Cr}_2\text{O}_3$ ). It is about ten times as soluble as the corresponding potassium salt and is frequently preferred. The sodium salt is also much cheaper and has replaced potassium salt to a large extent. Sodium chromate is a yellow crystalline compound containing only 29.2 per cent of chromic acid. The dichromate is therefore generally preferred, owing to its greater richness in chromic acid, which is the active constituent.

Chromates and dichromates are used for the chrome tanning of leather; in textile dyeing and printing; in the manufacture of chrome colors and pigments, especially lead and barium chromates; for pickling brass; in the electro-engraving of copper plates; as laboratory reagents; and in the bleaching of oils and fats.

*Production.*—All of the chromium salts are prepared from chrome iron ore or chromite. (See par. 1544.) The ore is pulverized and mixed with lime and soda ash and roasted in a strong current of air. Calcium chromate, which is produced with sodium chromate, is converted into sodium chromate by means of more soda ash. Sodium chromate is usually converted directly in solution to sodium dichromate by treatment with sulphuric acid. Sodium dichromate when used in oxidation processes is reduced to chromium sulphate, which may be reconverted into sodium dichromate and used again.

Domestic production of sodium dichromate and chromate has been as follows:

Calendar year.	Short tons.	Value.
1914.....	11,824	\$1,125,398
1917.....	22,446	9,045,133
1918.....	28,334	9,868,118
1919 <sup>1</sup> .....	26,526	6,233,566
1920 <sup>1</sup> .....	25,973	5,531,954

<sup>1</sup> Sales, not production.

*Imports* of dichromate and chromate of soda have been insignificant since 1910. There were no imports from 1919 through nine months of 1921.

*Exports.*—Statistics not available.

SODIUM FORMATE.

*Description, uses, and production.*—Sodium formate is an important chemical compound used as an intermediate material in the manufacture of formic and oxalic acids. It is produced by passing carbon monoxide into a solution of sodium hydroxide under pressure. The sodium formate thus produced may be converted into formic

acid by treatment with an acid or into sodium oxalate by heating, which in turn can be converted into oxalic acid by means of acid. The establishment of the manufacture of oxalic and formic acids in the United States by this process is discussed under paragraph 1.

*Import* figures are available for 1914 only, when they were 1,843,245 pounds, valued at \$44,693.

*Exports*.—Statistics not available.

*Important changes in classification*.—Sodium formate has been mentioned specifically for the first time. (Reclassification Report, p. 92.)

SODIUM FERROCYANIDE (YELLOW PRUSSATE OF SODA).

(See Survey A-18.)

*Description and uses*.—Sodium ferrocyanide, or yellow prussiate of soda, is a lemon-yellow crystalline compound containing 10 molecules of water of crystallization. It is similar to the potassium salt which it has largely replaced on account of the high price of that compound. It is used in the manufacture of blue pigments, in calico printing and dyeing, for the casehardening of iron, for making sodium ferricyanide, and as a chemical reagent.

*Production*.—Sodium ferrocyanide, or yellow prussiate of soda, is prepared in this country as a by-product of the purification of coal gas; also from sodium cyanide by lixiviating with hot water in the presence of iron.

In 1917 the production was 8,346,000 pounds, valued at \$2,577,667; in 1918 it was 9,050,000 pounds, valued at \$2,690,110. The output then decreased to 5,860,000 pounds, valued at \$1,318,049 in 1920.

*Imports* prior to the war had reached about 1,900,000 pounds in 1913. In 1914 they increased to about 2,300,000 pounds, and steadily declined until 1918 (fiscal year), when no imports appeared. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	271,063	\$98,505	\$0.36	\$2,033	2.06
1919.....	1,299,521	218,222	.17	9,746	4.47
1920.....	2,201,662	400,873	.18	16,512	4.12
1921 (9 months).....	1,421,113	179,429	.13	.....	.....

*Exports*.—Statistics not available.

*Important changes in classification*.—The correct chemical name, sodium ferrocyanide, has been used in connection with yellow prussiate of soda in this paragraph. (Reclassification Report, p. 92.)

SODIUM HYDROXIDE (CAUSTIC SODA).

(See Survey A-18.)

*Description and uses*.—Sodium hydroxide, or caustic soda, in industrial importance ranks second only to soda ash. The commercial product is a white opaque solid having strong caustic properties, sold by content of sodium oxide ( $\text{Na}_2\text{O}$ ). The common grades are 60, 70,

74, and 76 per cent sodium oxide. The method of stating this content is, however, based on erroneous atomic weights. The so-called New York and Liverpool test, figured from the actual content, is used in the United States. The difference between the actual content and that calculated by this test is shown for the ordinary grades of caustic soda:

Sodium oxide.	
Actual.	New York and Liverpool test.
<i>Per cent.</i>	<i>Per cent.</i>
58.12	60
67.81	70
71.68	74
73.62	76

Caustic soda has a wide variety of uses in the manufacture of soap, wood pulp and paper, chemicals, dyes, and drugs, in refining vegetable and mineral oils, in mercerizing cotton, for water softening, bottle washing, and in the preparation of cleaners. The largest single use is in the manufacture of soap. The war caused a large demand for caustic soda for phenol, the raw material of explosive picric acid.

*Production.*—It is made from salt or soda ash, the raw material depending on the method of manufacture. Soda ash is converted into caustic soda by treatment with lime. Caustic soda is also made directly from salt, a solution being subjected to the action of direct electric current.

Production has been as follows:

Year.	Short tons.	Value.	Year.	Short tons.	Value.
1914.....	212,539	\$6,657,514	1918.....	513,363	\$31,854,470
1916.....	391,597	17,426,066	1919 <sup>1</sup> .....	311,388	20,091,978
1917.....	488,056	29,402,689	1920 <sup>1</sup> .....	382,680	25,894,641

<sup>1</sup> Sales, not production.

In 1917 there were 8 firms using the soda-ash method and 28 companies using the electrolysis of salt method. About 28 per cent of the output in 1917 and 1918 was produced electrolytically from salt.

*Imports.*—The largest importation was in 1911, 1,500 short tons. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	2,002	\$193	\$0.10	\$5	2.60
1919.....	42,724	6,888	.16	107	1.55
1920.....	97,798	11,970	.12	244	2.04
1921 (9 months).....	645,694	32,060	.05	.....	.....

*Exports* in 1918 (fiscal year) were 67,365 short tons, valued at \$8,629,086. Japan, Italy, Brazil, and Canada were the chief countries of destination. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	97,378,334	164,235,420	224,137,406	26,810,058
Value.....	\$5,602,813	\$6,748,762	\$10,944,017	\$1,094,970

In recent years exports have been chiefly to Japan, Italy, and the Netherlands.

*Important changes in classification.*—The term “hydrate” used in connection with caustic soda in paragraph 67, act of 1913, is not in accordance with correct chemical nomenclature; therefore, the name “sodium hydroxide” has been used. (Reclassification Report, p. 92.)

#### SODIUM NITRITE.

#### SODIUM NITRITE.

*Description and uses.*—Sodium nitrite is a chemical compound composed of sodium, nitrogen, and oxygen. It differs from nitrate of soda in that it contains one atom less of oxygen. When pure it is a white crystalline salt, containing commercially 96 to 98 per cent of sodium nitrite. It is used chiefly in the manufacture of coal-tar dyes, in the dyeing of textiles, and has minor laboratory and pharmaceutical uses.

*Production.*—Sodium nitrite was usually prepared by the reduction of sodium nitrate (Chile saltpeter) by means of lead; also from atmospheric oxygen. In the fixation of nitrogen by the arc process the oxides of nitrogen produced are absorbed in sodium carbonate (soda ash), forming sodium nitrite. Ammonia gas produced from by-product coke ovens or synthetically from atmospheric nitrogen can be oxidized to form a similar mixture of oxides of nitrogen which are converted into sodium nitrite as described above.

The domestic production of sodium nitrite in 1917 was 1,722,000 pounds, valued at \$480,145, and in 1918 increased to 3,402,000 pounds, valued at \$609,779. The output in 1919 and 1920 was about 2,400,000 pounds for each year.

*Imports* increased from 1,696,567 pounds in 1915 to 3,675,179 pounds in 1917, the imports in 1917 being more than twice the domestic production. The increase in imports was caused by the development of the American dye industry, now the largest consumer of sodium nitrite. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	2,857,631	\$289,182	\$0.10	\$14,288	4.94
1919.....	2,550,689	246,729	.10	12,753	5.17
1920.....	11,690,142	1,378,992	.12	58,451	4.24
1921 (9 months).....	3,007,151	227,016	.07		

*Exports.*—Statistics not available.

## SODIUM PHOSPHATE.

(See Survey A-18.)

*Description and uses.*—There are a number of sodium phosphates, the most important in commerce being disodium phosphate, also known as “neutral phosphate” and “secondary phosphate,” usually the product referred to when only sodium phosphate is specified. It is used in the textile industries (especially the silk industry in the weighting of the material in dyeing), in the manufacture of baking powder, in the preparation of enamels, in tinning and soldering, and pharmaceutically. The other sodium phosphates, monosodium and trisodium phosphate, are of minor importance.

*Production.*—It is obtained from dicalcium phosphate by treatment with soda ash. It is also prepared from bone ash or phosphorite by digestion with sulphuric acid followed by treatment with soda ash and crystallization of the sodium phosphate from the clear solution.

Production has been as follows:

Year.	Short tons.	Value.
1914.....	15,397	\$853,528
1917.....	13,305	711,283
1918.....	15,620	1,427,947
1919.....	14,760	1,733,996
1920 <sup>1</sup> .....	30,515	3,233,896

<sup>1</sup> Sales, not production.

*Imports* prior to the war were small and sporadic, the maximum in 1914 being 1,364,767 pounds. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	56	\$22	\$0.39	\$0.14	0.64
1919.....	66	19	.29	.17	0.89
1920.....	483,130	15,773	.03		
1921 (9 months).....					

*Exports.*—Statistics not available.

## SODIUM SESQUICARBONATE.

[See Hydrated Sodium Carbonate, p. 228.]

## SODIUM SULPHATE ANHYDROUS AND GLAUBER SALT.

(See Survey A-18.)

*Description and uses.*—Sodium sulphate, crystallized, was discovered by a chemist named Glauber and is known commercially as Glauber salt. It is sodium sulphate crystallized with 10 molecules of water. It is used as an assistant in dyeing, for diluting dyes, and for the preparation of cooling mixtures. Ordinarily most sodium sul-

phate is used in the anhydrous form and only a small portion is converted into the crystallized Glauber salt. It is more economical to ship the anhydrous salt.

*Production.*—Glauber salt is a by-product of the manufacture of hydrochloric acid. Domestic production of Glauber salt has been as follows:

Year.	Short tons.	Value.
1914.....	34,537	\$427,808
1917.....	47,757	732,403
1918.....	50,715	1,041,070
1919.....	47,730	877,060
1920 <sup>1</sup> .....	50,655	990,541

<sup>1</sup> Sales, not production.

*Imports* have never been large and are negligible compared with domestic production.

*Exports.*—Statistics not available.

*Important changes in classification.*—"Sodium sulphate, anhydrous," has been mentioned specifically, as it was held that calcined sodium sulphate, in powdered form, is dutiable as a chemical compound or mixture, and not within the provisions of paragraph 67, act of 1913, for sulphate of soda, crystallized, or Glauber salts. (Reclassification Report, p. 92.)

#### SODIUM SULPHIDE.

(See Survey A-18.)

*Description and uses.*—Sodium sulphide is composed of sodium and sulphur. There are two commercial articles, the "crystal" sulphide of soda, containing about 30 per cent of sodium sulphide, and the "fused" or "concentrated," containing about twice as much sodium sulphide as the crystal product. It is used chiefly in the manufacture and dyeing of sulphur colors and as a depilatory agent in leather manufacture.

*Production.*—Sulphide of soda was formerly manufactured from sodium sulphate (salt cake). The war caused the establishment of a barium chemical industry from which part of the sodium sulphide now comes as a by-product. Domestic production supplies practically the entire consumption and has been as follows:

Year.	Short tons.	Value.
1914.....	20,263	.....
1917.....	49,494	\$1,905,473
1918.....	43,490	2,293,304
1919 <sup>1</sup> .....	45,448	2,645,181
1920 <sup>1</sup> .....	42,952	2,962,033

<sup>1</sup> Sales, not production.

The increased output since 1914 was due to the establishment of an American dye industry—a large outlet for this product.

*Imports.*—The maximum import of sodium sulphide was in 1914, and was about 6 per cent of domestic production. Since 1917 imports have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad-valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	112,821	\$4,673	\$0.04	\$282	6.04
1919.....	1,668,562	54,251	.03	4,171	7.69
1920.....	1,038,181	47,064	.04	2,595	5.51
1921 (9 months).....	2,474,057	78,584	.03		

*Exports.*—Statistics not available.

#### SODIUM SILICATE.

(See Survey A-18.)

*Description and uses.*—Silicate of soda, “water glass” or “soluble glass,” is a chemical compound produced from silica (sand) and an alkali salt, usually soda ash. It is marketed in water solution largely, but also to some extent in a solid form, and is used chiefly as an adhesive in the manufacture of various forms of fiber and paper board and as a filler in soap.

Production has increased from 169,049 tons in 1914 to 254,011 tons in 1917, and has been in excess of 300,000 tons from 1918 to 1920. The production of silicate of soda of the 40° Baumé grade has been estimated by a leading manufacturer as 295,000 tons in 1917 and 335,500 tons in 1918. The process of making is comparatively simple and calls for inexpensive equipment. Some of its uses, however, require considerable accuracy in composition, involving large equipment and much technical skill in its manufacture. The industry is rather widespread, plants being located near large markets, as it is more economical to ship the raw materials (sand and soda ash) than the water solution of silicate of soda.

*Imports* from 1910 to 1917 have averaged about 600 short tons per year. Since 1918 these have been as follows:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	463,461	\$9,902	\$0.02
1919.....	931,086	25,421	.03
1920.....	658,658	15,162	.02
1921 (9 months).....	688,606	22,661	.03

*Exports.*—Since the war the United States has developed an export trade, which since 1917 has been chiefly to Canada, Mexico, and Cuba. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	28,250,360	24,300,567	34,095,542	13,375,800
Value.....	\$404,796	\$338,818	\$450,770	\$169,345

*Important changes in classification.*—Sodium silicate is free of duty under paragraph 605, act of 1913.

## SODIUM SULPHITE, BISULPHITE, AND METABISULPHITE.

(See Survey A-18.)

*Description and uses.*—There are three sulphites of soda, the normal sulphite, the bisulphite or acid sulphite, and the metabisulphite. These compounds are white crystalline salts more or less soluble in water. The sulphites are employed in various industries as antiseptics, reducing agents, and sources of sulphur dioxide. Sulphite of soda is used industrially as an antichlor in bleaching processes, and as a bleaching agent for delicate fabrics, such as silk and wool. Both the normal and metabisulphite are used in the preparation of photographic developers. Bisulphite of soda is a more energetic antichlor and bleaching agent than the sulphite. It is also used as an antiseptic in steeping and preserving grain, and a strong solution is used for sterilizing brewer's casks. Bisulphites of calcium and magnesium are made for the manufacture of sulphite pulp for paper. Sodium hydrosulphite (see par. 79) is another reducing agent, used chiefly in dyeing and printing textiles, which is even more energetic than the sulphites, and should not be confused with them.

*Production.*—Bisulphite of soda is the starting point for the manufacture of all of the sodium sulphites. It is produced by saturating a solution of soda ash with sulphur dioxide. The acid sulphite thus produced can be separated from the solution or an additional quantity of soda ash can be added, thus forming the normal sulphite of soda, which crystallizes from the solution with seven molecules of water. Carbon dioxide is evolved in this process and in some cases it is purified and compressed in cylinders for sale. Sodium sulphite is also a by-product of the manufacture of phenol.

Domestic production of sodium sulphite, bisulphite, and metabisulphite since 1917 has been as follows:

Year.	Short tons.	Value.
1917.....	13,707	\$300,668
1918.....	16,362	478,482
1919 <sup>1</sup> .....	11,819	687,750
1920 <sup>1</sup> .....	25,837	1,226,155

<sup>1</sup> Sales, not production.

*Imports* of sulphite of soda have not been large compared with the domestic production, being less than 1 per cent in 1917. Since 1917 they have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad-valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	30,450	\$1,287	\$0.04	\$76	5.92
1919.....	58,524	2,376	.04	146	6.16
1920.....	119,805	5,388	.04	300	5.56
1921 (9 months).....	511,394	14,015	.03		

*Exports.*—Statistics not available.

*Important changes in classification.*—The act of 1913 (par. 67) provided only for sulphite of soda, whereas there are three important sodium sulphites, namely, (normal) sodium sulphite, sodium bisulphite, and sodium meta-bisulphite. These three compounds have been provided for specifically in this paragraph. (Reclassification Report, p. 92.)

## SODIUM THIOSULPHATE.

(See Survey A-18.)

*Description and uses.*—Sodium thiosulphate, incorrectly called hyposulphite of soda, is a white crystalline substance containing about 27 per cent of water of crystallization, soluble in water, and a strong reducing agent. It is used as a fixer in photography, when it is usually designated hypo; as an antichlor in bleaching to destroy the last traces of chlorine bleach; as a reducing agent in the chrome tanning of leather; and for iodine determinations in analytical work.

*Production.*—Sodium thiosulphate is produced by boiling a solution of sodium sulphite with sulphur. In Europe it is obtained as a by-product from the sulphide residues of the Le Blanc soda process. The output since 1917 has been as follows:

Year.	Short tons.	Value.
1917.....	26,598	\$717,924
1918.....	26,868	1,051,623
1919 <sup>1</sup> .....	32,212	1,709,223
1920 <sup>1</sup> .....	24,868	1,290,697

<sup>1</sup> Sales, not production.

*Imports* have increased from prewar imports of about 8,000 pounds per year to over 900,000 pounds in 1914 and 1,800,000 pounds in 1915. Imports in the war years declined to less than the prewar imports and since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	1,120	\$975	\$0.87	\$3	0.29
1919.....	27,616	6,312	.23	69	1.09
1920.....	17,174	11,989	.70	43	0.36
1921 (9 months).....	199,707	2,933	.01	.....	.....

*Exports.*—Statistics not available.

*Important changes in classification.*—Hyposulphite of soda (par. 67, act of 1913) is a commercial term used incorrectly to designate "sodium thiosulphate," the term which has been used in this paragraph. (Reclassification Report, p. 92.)

## PARAGRAPH 79.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 79. Sodium hydrosulphite, hydrosulphite compounds, sulphonylate compounds, and all combinations and mixtures of the foregoing, 35 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 3. \* \* \* all chemical compounds, mixtures and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*.

PAR. 5. \* \* \* all chemical \* \* \* compounds, \* \* \* mixtures and salts, not specially provided for in this section, 15 per centum ad valorem.

## HYDROSULPHITES AND SULPHOXYLATES.

(See Survey A-18.)

*Description and uses.*—Under this heading are included several related chemicals, which are energetic reducing agents. They are marketed as gray to white crystalline powders. Their chief use is in the textile trade in certain dyeing, printing, and bleaching operations, and also to a lesser extent in the bleaching of soaps, oils, sirups, fibers, and in the preparation of pharmaceuticals. Sodium hydrosulphite, anhydrous, is used in the application of indigo and the different vat dyes.

Sulphonylate of soda formaldehyde is used with or without the addition of other agents for the "discharge of dyes" and for the application of vat dyes in textile printing. The double compound sulphonylate of soda formaldehyde and bisulphite of soda formaldehyde is used for discharges on dyed cotton. The basic sulphonylate of zinc formaldehyde is used for stripping dyes from colored fabrics.

*Production and imports.*—The capacity of the American plants exceeds the imports of 1914, the latter totaling 872,500 pounds, valued at \$288,314. Sodium hydrosulphite is made by reducing sodium bisulphite by means of zinc with the addition of sulphur dioxide followed by separation of the hydrosulphite by "salting out." The other compounds are made from the sodium hydrosulphite.

*Exports.*—Statistics not available.

*Important changes in classification.*—A new specific provision.

## PARAGRAPH 80.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 80. Starch: Potato, 1½ cents per pound; and all other starches not specially provided for, 1 cent per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 296. Starch, made from potatoes, one and one-half cents per pound; all other starch, including all preparations, from whatever substance produced, fit for use as starch, one cent per pound.

PAR. 234. Starch, made from potatoes, 1 cent per pound; all other starch, including all preparations, from whatever substance produced, fit for use as starch, ½ cent per pound.

## STARCHES.

(See Survey G-33.)

*Description and uses.*—Starch occurs more or less abundantly in all forms of vegetable life, but commercially the most important sources are corn, potatoes, rice, wheat, and cassava. Starch is white, odorless, and tasteless, and is marketed in powdered, granular, or lump form. Cornstarch is by far the most important in this country; potato starch, the most important in Europe, ranks second in consumption. Of the domestic output in 1914, approximately 93 per cent was from corn, 3.8 per cent from potatoes, and the balance from wheat, rice, and cassava.

Starch is used for edible purposes in various flours, and in pastries, puddings, confectionery, etc.; and for laundry and manufacturing purposes, e. g., sizing of paper and cotton goods, thickening of colors and mordants used in textile printing, in making dextrin, soluble starch, and glucose. Its physical properties vary slightly with its sources, and thus cause the specific uses of different varieties. In the textile industry and in the manufacture of dextrin, potato starch has certain advantages which give it a market even at a higher price. Means have been found to make varieties of cornstarch suitable for use in the textile industry; these are severely competitive with potato starch.

*Production* of cornstarch increased from 574,247,697 pounds, valued at \$13,784,654, in 1914, to 727,962,000 pounds, valued at \$40,558,000, in 1919; potato starch decreased from 23,540,472 pounds, valued at \$718,006, in 1914, to 16,477,000 pounds, valued at \$1,099,000, in 1919; the output of other starches increased from 22,976,000 pounds, valued at \$1,281,000, in 1914, to 39,074,000 pounds, valued at \$2,746,000, in 1919. (Figures for 1919 are preliminary.) The number of establishments decreased from 82 in 1914 to 56 in 1919.

*Imports* of starch for 1909-1913 averaged 13,730,665 pounds, valued at \$375,767; for 1914-1918 they averaged 15,143,778 pounds, valued at \$684,714, approximately 95 per cent being potato starch. Before the war Germany and the Netherlands supplied practically all; in the last two years great quantities came from Japan, viz, 18,008,666 pounds in 1917 and 21,806,975 pounds in 1918. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
POTATO STARCH.					
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	20,416,589	\$1,590,574	\$0.08	\$204,166	12.84
1919.....	2,031,403	151,883	.07	20,314	13.37
1920.....	14,134,454	726,586	.05	141,345	19.45
1921 (9 months).....	4,101,561	159,583	.04		
ALL OTHER STARCHES, N. S. P. F.					
1918.....	443,813	\$64,794	\$0.17	\$2,219	3.42
1919.....	659,349	72,073	.11	3,297	4.57
1920.....	659,615	78,241	.12	3,298	4.22
1921 (9 months).....	483,560	57,276	.12		

*Exports* of starch for 1914-1918 averaged 122,848,429 pounds, valued at \$3,913,104, practically all cornstarch. Over one-half goes to England and Scotland, while before the war the Netherlands and Belgium also took large quantities. Later statistics follow:

Calendar year.	Cornstarch.		All other starch.	
	Quantity.	Value.	Quantity.	Value.
	<i>Pounds.</i>		<i>Pounds.</i>	
1918.....	33,619,821	\$1,758,557	16,083,388	\$1,020,071
1919.....	179,436,736	10,219,799	89,703,821	5,342,366
1920.....	116,462,841	6,891,607	31,480,284	2,053,917
1921 (9 months).....	136,179,599	3,411,599	21,580,140	616,137

*Exports.*—Statistics not available.

*Important changes in classification.*—The words “including all preparations from whatever substances produced fit for use as starch” have been omitted and “not specially provided for” added.

### PARAGRAPH 81.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 81. Dextrine, made from potato starch or potato flour,  $1\frac{1}{2}$  cents per pound; dextrine, not otherwise provided for, burnt starch or British gum, dextrine substitutes, and soluble or chemically treated starch,  $1\frac{1}{4}$  cents per pound.

ACT OF 1909.

PAR. 297. Dextrine, dextrine substitutes, soluble starch or chemically treated starch, burnt starch, gum substitute, or British gum, one and one-half cents per pound.

ACT OF 1913.

PAR. 36. Gums: \* \* \* dextrine, made from potato starch or potato flour,  $1\frac{1}{4}$  cents per pound; dextrine, not otherwise provided for, burnt starch or British gum, dextrine substitutes, and soluble or chemically treated starch,  $\frac{3}{4}$  of 1 cent per pound.

DEXTRINE, BRITISH GUM, SOLUBLE STARCH.

(See Survey A-9.)

*Description and uses.*—Dextrine is a substance produced by heating starch or by treating starch with dilute acid. It is sometimes considered an intermediate product between starch and dextrose. It is soluble in water and has strong adhesive properties. Dextrine is used extensively in the textile industry for thickening mordants, for printing calicos and other fabrics, and in finishing textiles; in the manufacture of paper boxes and wall paper; for gumming stamps and envelopes; in inks, felts, etc.

British gum is a name given to the commercial product. There are different grades, depending on the methods of manufacture and the botanical sources of the starch.

Soluble starch is starch rendered soluble by chemical treatment. It is intermediate between starch and dextrine and is used as an emulsifying agent, in the textile industry, and in volumetric chemical analysis.

*Production* of dextrine in 1914 was 18,931,641 pounds, valued at \$705,584. Domestic production of dextrine has increased greatly since 1914, the United States now having the largest plants and producing more tapioca dextrine than foreign countries; also large quantities from potato starch and cornstarch. The tapioca used is imported from Java.

*Imports.*—Before the war about 5,000,000 pounds of dextrine were imported, usually from Germany, Holland, and England, but these imports decreased during the war to less than 100,000 pounds in 1918. Imports of soluble starch in 1914 were 1,697,392 pounds, decreasing greatly since, with none reported in 1918. Recent imports of dextrine have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
----------------	-----------	--------	-------------	-------	--------------------------------

## DEXTRINE FROM POTATO STARCH OR FLOUR.

	Pounds.				Per cent.
1918.....	376,177	\$35,032	\$0.09	\$4,702	13.42

1921 (9 months).....	66,138	3,257	.05		

*Exports.*—Statistics not available.

*Important changes in classification.*—Dextrines, included with gums and resins in the act of 1913, are given a separate paragraph in H. R. 7456.

## PARAGRAPH 82.

## H. R. 7456.

## SENATE AMENDMENTS.

PAR. 82. Strontium: Carbonate, precipitated, nitrate, and oxide, 25 per centum ad valorem.

## ACT OF 1909.

## ACT OF 1913.

PAR. 3. \* \* \* all chemical compounds, \* \* \* and salts, not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*

PAR. 5. \* \* \* all chemical \* \* \* compounds, \* \* \* and salts, not specially provided for in this section, 15 per centum ad valorem.

PAR. 685. Strontia, oxide of, and protoxide of strontian, \* \* \* [Free].

Par. 615. Strontia, oxide of, protoxide of strontian, \* \* \* [Free].

## STRONTIUM COMPOUNDS.

(See Survey FL-22.)

*Description and uses.*—Strontium compounds are prepared from the minerals celestite or strontianite, free of duty in paragraph 1662. The two most important compounds are strontium nitrate and strontium carbonate; both—but chiefly the nitrate—are used in the manufacture of pyrotechnics (fireworks and signal lights). The largest demand prior to the war was for the manufacture of railway signal flares.

Strontium salts were in demand for use in night signals and signal shells during the war. Strontium oxide after being converted into the hydroxide is used in certain European countries, especially Germany, for beet-sugar refining.

*Production* of strontium salts increased from 2,006,000 pounds in 1916 (first available figures) to 4,927,000 pounds in 1918, and then decreased to 1,971,519 pounds in 1919. The output in 1920 by 2 firms only exceeded that of any previous year, except 1918. Domestic manufacture is chiefly from imported materials, principally celestite from England.

*Imports* prior to the war—chiefly from Germany—supplied the requirements of the United States for strontium salts. In 1914 (only year figures are available) there were imported 1,941,103 pounds of strontium salts, of which 1,834,733 pounds were strontium nitrate and 52,179 pounds strontium carbonate.

Later statistics for imports of strontium nitrate and precipitated strontium carbonate are not available, but it is known that considerable quantities have been brought in during 1921. Imports of strontium oxide are combined with those of the strontium minerals (par. 1662).

*Exports.*—Statistics not available.

*Important changes in classification.*—Precipitated strontium carbonate and strontium nitrate are specifically mentioned for the first time. Strontium oxide (strontia, oxide of, protoxide of strontian) has been transferred from the free list, act of 1913 (par. 615).

---

 PARAGRAPH 83.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 83. Strychnine, and salts of, 15 cents per ounce.

ACT OF 1909.

ACT OF 1913.

PAR. 80. Strychnia, or strychnine, and all salts thereof, fifteen cents per ounce.

PAR. 616. Strychnia or strychnine, and its combinations with acids not subject to duty under this section [Free].

## STRYCHNINE AND SALTS.

(See Survey FL-2.)

*Description and uses.*—Strychnine is an alkaloid manufactured from nux vomica (par. 1621). It is also sold in combination with various acids, the most important salts being the acetate, nitrate,

phosphate, and sulphate. It is used as a stimulant in medicine and as a poison for vermin and predatory animals. One ounce of strychnine corresponds to 17,500 medicinal doses.

*Production.*—Our strychnine is derived from nux vomica imported from India. Production figures are not available, but the annual import of nux vomica is equivalent to 400,000 to 600,000 ounces of strychnine. It is also manufactured in England and Germany, but no commercial production has been noted in India. In 1919 (preliminary figures) 16,414 pounds of strychnine and salts, valued at \$372,304, were consumed in "druggist's preparations, patent medicines, and compounds."

*Imports of strychnine and its combinations with acids* from 1909 to 1913 were negligible. During 1914-1918 an average of 29,305 ounces, valued at \$17,946, was reported. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Ounces.</i>		
1918 .....	180	\$345	\$1.92
1919 .....	6,006	9,390	1.56
1920 .....	20,950	37,370	1.78
1921 (9 months) .....	54,852	83,039	1.51

*Exports.*—Statistics not available.

*Important changes in classification.*—This provision has been transferred from the free list of the act of 1913 (par. 616) and modified in language.

#### PARAGRAPH 84.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 84. Thorium nitrate, thorium oxide, and other salts of thorium not specially provided for, cerium nitrate, cerium fluoride, and other salts of cerium not specially provided for, and gas-mantle scrap consisting in chief value of metallic oxides, 25 per centum ad valorem.

#### ACT OF 1909.

PAR. 183. \* \* \* thorium, oxide of and salts of, \* \* \* and gas mantle scrap consisting in chief value of metallic oxides, forty per centum ad valorem.

PAR. 3. \* \* \* all chemical compounds, mixtures and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*

#### ACT OF 1913.

PAR. 154. \* \* \* thorium, oxide of and salts of; \* \* \* and gas-mantle scrap consisting in chief value of metallic oxides, 10 per centum ad valorem.

PAR. 5. \* \* \* all chemical \* \* \* compounds, \* \* \* mixtures and salts, not specially provided for in this section, 15 per centum ad valorem.

#### THORIUM COMPOUNDS.

(See Survey C-22)

*Description and uses.*—Thorium nitrate is the most important of the salts of thorium. The commercial product is a white crystalline material containing 48 to 50 per cent of the oxide of thorium. It is

used primarily in incandescent gas mantles, which contain approximately 99 per cent of thoria. Thorium oxide is the chief ingredient of gas-mantle scrap (see *infra*).

*Production.*—Thorium nitrate is obtained from monazite sand by a long and tedious chemical process. The manufacture before the war was virtually controlled by German and Austrian interests. After imports ceased domestic production increased greatly, in 1918–19 supplying American needs and permitting large exportations to France and England. There were five manufacturers of thorium nitrate producing 439,304 pounds in 1917, as compared with 149,850 pounds in 1913. In 1919 the output had decreased to 239,163 pounds.

*Imports* of thorium nitrate reached a maximum of 144,413 pounds, valued at \$309,760, in 1914, with approximately 99.5 per cent from Germany. Imports of thorium oxide in 1914 amounted to 2,448 pounds, valued at \$4,095. Imports of thorium nitrate since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....					
1919.....	3,307	\$7,250	\$1.59	\$1,313	25
1920.....	35,496	42,857	1.21	10,714	25
1921 (9 months).....	44,444	89,559	2.01		25

The only recorded imports of other thorium compounds, including thorium oxide, were 28 pounds in 1918, valued at \$124.

*Export* statistics are wanting, but information from the manufacturers indicates that exports during the war approximated prewar imports.

*Important changes in classification.*—Thorium salts have been transferred from paragraph 154, Schedule C (act of 1913), to the chemical schedule. The paragraph has been amplified by mentioning thorium nitrate specifically.

#### CERIUM COMPOUNDS.

(See Survey C-22.)

*Description and uses.*—Cerium is a soft, steel-gray metal occurring in more than sixty minerals. Of the entire list of cerium-bearing minerals, two may be regarded as commercial sources. These are the phosphate (monazite sand) and the silicate (orthite). Cerite, a hydrous silicate occurring in Sweden, was for some time the only commercial source of cerium compounds. Monazite sand, the most important cerium ore, is mined for its content of thoria, which is used in incandescent gas mantles. Cerium is a by-product and is obtained in excessively large amounts. No commercial use has been found for the pure cerium metal, but certain of its alloys and compounds have a fairly extended range of application. The quantity consumed, however, is only a small fraction of the crude cerium salts obtained as a by-product in making thorium nitrate. Incandescent gas mantles

contain 98-99 per cent of thoria and 1-2 per cent of ceria. Certain cerium alloys, e. g., pyrophoric alloys, throw off glowing particles when scratched by a hard metal, a property utilized in automatic cigarette and gas lighters. Other alloys are used as reducing agents and as deoxidizers in the manufacture of high-grade iron and steel castings. Cerium fluoride is used extensively in carbon electrodes for "flaming" electric arc lamps. Cerium salts are also used in medicine.

*Production* statistics of cerium are not available, but consumption of monazite sand indicates an output of at least 250 tons of ceria. At least 10,000 tons of ceria are estimated to have accumulated at the gas-mantle factories.

*Imports* of cerium compounds are not shown since 1918.

*Exports*.—Statistics not available.

*Important changes in classification*.—First specific mention of cerium salts.

#### GAS-MANTLE SCRAP.

(See Survey C-22.)

*Description and uses*.—Imperfect mantles and those damaged in manufacture or left over as refuse are reduced to ashes by a firing process and sold to thorium manufacturers for the recovery of the valuable thorium and cerium oxides. Practically 90 per cent of the gas-mantle scrap is obtained in this way and about 10 per cent is collected from gas companies and other large consumers.

*Imports* of gas-mantle scrap in 1914 amounted to 60,435 pounds, valued at \$3,305, and decreased to 4,175 pounds in 1915 and to 2,291 pounds in 1918. Imports since 1917 follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	44	\$111	\$2.52	\$11	10
1920.....	144	364	2.53	36	10

*Exports*.—Statistics not available.

*Important changes in classification*.—Gas mantle scrap, in chief value metallic oxide (thorium oxide), has been transferred to this schedule from paragraph 154, Schedule C, act of 1913.

### PARAGRAPH 85.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 85. Tin bichloride, tin tetrachloride, and all other chemical compounds, mixtures, and salts, of which tin constitutes the element of chief value, 20 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 3. \* \* \* all chemical compounds, mixtures and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*.

PAR. 65. Salts and all other compounds and mixtures of which \* \* \* tin constitute the element of chief value, 10 per centum ad valorem.

PAR. 606. Lac spirits [Free].

## TIN COMPOUNDS.

(See Survey A-17.)

*Description and uses.*—There are two important chlorides of tin, bichloride of tin and tin tetrachloride. The bichloride of tin as sold to the trade under the name of tin crystals, contains about 53 per cent of tin. It is used for weighting silk, in dyeing and calico printing. Tin tetrachloride contains about 45 per cent of tin. It is used for weighting silk, and as a mordant in dyeing. The silk industry requires about 3,000 tons of tin tetrachloride per year. It was used during the war for producing smoke screens.

*Production.*—The preparation of tin chlorides has developed almost exclusively into the detinning of scrap tin by means of chlorine gas. The process originated in the plant of the Goldschmidt chemical works at Essen, Germany, and was soon established in this country. In 1918 three companies were producing tin chlorides in the United States. The growth of the industry is dependent upon the growth of the silk industry which is the largest consumer.

In 1914, census reports give the production of all-tin salts as 8,291,200 pounds, valued at \$2,028,500. In 1919 (preliminary figure) the output of tin chlorides was 8,999,200 pounds, valued at \$2,986,500, and of oxide of tin, 1,352,600 pounds, valued at \$900,240.

*Imports.*—Statistics are combined with those of gold, platinum, silver, and rhodium salts.

*Exports.*—Statistics not available.

*Important changes in classification.*—Tin bichloride and tin tetrachloride are mentioned specifically for the first time and the tin salts and compounds put in a separate paragraph.

## PARAGRAPH 86.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 86. Titanium potassium oxalate, and all compounds and mixtures containing titanium, 25 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 3. \* \* \* all chemical compounds, mixtures and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*.

PAR. 5. \* \* \* all chemical \* \* \* compounds, \* \* \* mixtures and salts, not specially provided for in this section, 15 per centum ad valorem.

## TITANIUM COMPOUNDS.

*Description and uses.*—Titanium potassium oxalate is used as a mordant for fixing certain coal-tar and natural dyes on vegetable and animal fibers and on leather. With tannic acid it is used as a self-color. Other titanium compounds have, to some extent, uses

similar to that of the above compound. Titanium chloride is a powerful reducing agent and is used in stripping dyes.

*Production.*—Statistics are not available. Titanium potassium oxalate is prepared by dissolving the mineral Rutile or Ilmenite in sulphuric acid, followed by precipitating and purifying it as a hydroxide. The latter is dissolved in oxalic acid with the subsequent addition of potash.

*Imports* for the fiscal year 1914 were 3,328 pounds of titanium trichloride and 1,213 pounds of titanium sulphate.

*Exports.*—Not recorded.

*Important changes in classification.*—This is a new specific provision.

---

### PARAGRAPH 87.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 87. Vanilla beans, 30 cents per pound; tonka beans, 25 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 559. Drugs, \* \* \* not advanced \* \* \* [Free].

PAR. 697. Tonquin, tonqua, or tonka beans [Free].

PAR. 70. \* \* \* vanilla beans, 30 cents per pound; tonka beans, 25 cents per pound.

#### VANILLA BEANS.

(See Survey A-19.)

*Description and uses.*—Vanilla beans are the fruit of a tropical plant and are used in the preparation of the alcoholic extract or "essence" ordinarily sold as vanilla, used in flavoring chocolate, confectionery, various foods, liquors, and in pharmaceutical preparations. Vanillin, which is the chief aromatic constituent of vanilla beans, is now prepared synthetically. (See Vanillin, par. 56.)

*Production.*—Vanilla beans are not produced commercially in the United States, the industry requiring tropical climatic conditions and specially trained cheap labor. The vanilla plant is native to certain localities in Mexico, where it still occurs wild, although the vanilla bean of commerce is chiefly cultivated. The cultivation of vanilla has reached commercial importance only in the French insular colonies; a few British possessions, notably the Seychelles and Mauritius; and in the Java and other Dutch colonies.

The quality of vanilla varies greatly with its geographical source, no doubt due both to climate and method of culture and curing. Mexican, Bourbon, Seychelles, and Tahiti vanilla beans rank in quality in the order named.

*Imports* since 1910 have been between 800,000 and 1,150,000 pounds per year, valued at from \$1,500,000 to \$2,500,000. Imports have shown no appreciable decline during the war. Since 1917 imports,

chiefly from France, Mexico, and French Oceania, have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	846,060	\$1,308,470	\$1.55	\$253,818	19.40
1919.....	1,037,865	2,104,048	2.03	311,360	14.80
1920.....	1,192,757	2,344,703	1.97	357,827	15.26
1921 (9 months).....	750,130	1,087,517	1.45		

*Exports.*—Statistics not available.

#### TONKA BEANS.

(See Survey A-19.)

*Description and uses.*—Tonka beans are seeds used in perfuming tobacco (especially snuff), to adulterate vanilla extract, and in the manufacture of perfumery. They have been used in the preparation of coumarin, but this product is now more extensively manufactured synthetically. Extracts of tonka beans are sometimes used in pharmacy to mask the odor of iodoform. The beans contain about 25 per cent of a fatty substance which is extracted as tonquin butter.

*Production.*—Tonka beans are not produced in the United States or its possessions. The trees are native to South America, chiefly in the Guianas, northern Brazil, and Venezuela. The beans are prepared for market by soaking in rum or alcohol and drying in the sun.

*Imports* for the years 1909 to 1914 have averaged 358,313 pounds, valued at \$406,696. For the years 1915 to 1918, during which period the duty was 25 cents per pound, the average annual import was 224,863 pounds, valued at \$137,026. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	112,137	\$60,384	\$0.54	\$28,034	46.43
1919.....	99,973	88,543	.89	24,993	28.23
1920.....	316,288	280,510	.89	79,072	28.19
1921 (9 months).....	47,995	32,060	.67		

*Exports.*—Statistics not available.

#### PARAGRAPH 88.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 88. Zinc chloride,  $1\frac{3}{4}$  cents per pound; zinc sulphate, three-fourths of 1 cent per pound; and zinc sulphide,  $1\frac{1}{2}$  cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 55. \* \* \* sulfid of zinc white, or white sulphide of zinc, one and one-fourth cents per pound; chloride of zinc and sulphate of zinc, one cent per pound.

PAR. 61. \* \* \* white sulphide of zinc, 15 per centum ad valorem.

PAR. 62. Zinc, chloride of and sulphate of,  $\frac{1}{2}$  cent per pound.

## ZINC COMPOUNDS.

(See Survey A-15.)

## ZINC CHLORIDE.

*Description and uses.*—Zinc chloride, a chemical compound composed of zinc and chlorine, is a white to grayish-white solid. It is sold in solution or as a powder, also in porcelainlike masses, and cast in the form of pencils and tablets for pharmaceutical purposes. The preservation of wood, chiefly railroad cross-ties, is its largest use, the annual consumption for this purpose being about 30,000,000 pounds, or about 65 per cent of the domestic production. It is also used in the manufacture of vulcanized fiber board and for pharmaceutical purposes as a caustic, astringent, antiseptic, disinfectant, and deodorant.

*Production* of "zinc salts" in the United States in 1914 was 40,786,886 pounds, valued at \$1,130,959, which supplies the major part of the consumption in this country. The output of zinc chloride in 1919 (preliminary figures) was 74,089,000 pounds, valued at \$4,349,100. It is made from zinc scrap or roasted zinc ores by treatment with hydrochloric acid and is obtained as a by-product of galvanizing sheet iron.

*Imports* prior to 1914 were over 1,000,000 pounds, declining to about 6,000 pounds in 1917. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	195,522	\$15,177	\$0.08	\$978	6.44
1919.....	2,016	192	.10	10	5.25

*Exports.*—Statistics not available.

## ZINC SULPHATE.

*Description and uses.*—Zinc sulphate (white vitriol) occurs as colorless transparent crystals or as granular crystalline powder. It contains about 44 per cent of water. It is used for preserving and clarifying glue solutions, as a disinfectant, as a mordant in the dyeing and printing of textiles, as an astringent and emetic in medicine, and in electroplating. It is also the intermediate salt used in the electrolytic production of metallic zinc and of the pigment lithopone.

*Production.*—Zinc sulphate may be produced from zinc dross, zinc scrap, and roasted zinc ores. The production of zinc sulphate is closely allied with the zinc industry. Production figures in 1914 were combined with other zinc salts, but in 1919 (preliminary figures) showed an output of 7,325,500 pounds, valued at \$267,000.

*Imports* reached a maximum of 108,065 pounds, valued at \$2,176, in 1914. During the war imports were negligible and since have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1919.....	231	\$152	\$0.66	\$1	0.76
1920.....	100,269	3,038	.03	501	16.50
1921 (9 months).....	11,604	455	.04		

*Exports.*—Statistics not available.

#### ZINC SULPHIDE.

*Description and uses.*—Zinc sulphide is a white, or yellowish insoluble compound of zinc and sulphur. When combined with barium sulphate it constitutes the pigment lithopone (par. 74). Zinc sulphide alone is seldom used as a pigment but is used primarily in the manufacture of dental cements, as is also lithopone containing 50 per cent of zinc sulphide.

*Production.*—Statistics are not available.

*Imports* have been shown only since 1914. They decreased from 282,356 pounds valued at \$8,979 in 1915, to about 7,000 pounds in 1918 (fiscal years). Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	2,670	\$993	\$0.37	\$149	15
1919.....	10,035	4,413	.44	662	15
1920.....	45,482	15,027	.33	2,254	15
1921 (9 months).....	34,503	4,479	.13		

*Exports.*—Statistics are not available.

*Important changes in classification.*—Zinc sulphide has been transferred from the paragraph covering lithopone and other zinc pigments, as it is used chiefly for purposes other than as a pigment. (Reclassification Report, p. 84.)

# SCHEDULE 2.—EARTHS, EARTHENWARE, AND GLASS-WARE.

## PARAGRAPH 201.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 201. Fire brick, weighing not more than 10 pounds each, not glazed, enameled, ornamented, or decorated in any manner, and brick other than fire brick, 10 per centum ad valorem; glazed, enameled, ornamented, or decorated, 20 per centum ad valorem; weighing more than 10 pounds each and not specially provided for, not glazed, enameled, ornamented, or decorated in any manner, 17 per centum ad valorem; glazed, enameled, ornamented, or decorated, 20 per centum ad valorem; magnesite brick, three-fourths of 1 cent per pound and 10 per centum ad valorem; chrome brick, not glazed, enameled, painted, vitrified, ornamented, or decorated in any manner, 20 per centum ad valorem; if glazed, enameled, painted, vitrified, ornamented, or decorated in any manner, 23 per centum ad valorem; bath brick, 23 per centum ad valorem.

### ACT OF 1909.

SCHEDULE B.—EARTHS, EARTHENWARE, AND GLASSWARE.

PAR. 84. Fire-brick, weighing not more than ten pounds each, not glazed, enameled, ornamented, or decorated in any manner, one dollar and twenty-five cents per ton; glazed, enameled, ornamented, or decorated, thirty-five per centum ad valorem; weighing more than ten pounds each and not specially provided for in this section, not glazed, enameled, ornamented, or decorated in any manner, thirty per centum ad valorem; glazed, enameled, ornamented, or decorated, thirty-five per centum ad valorem; magnesite brick, chrome brick, and brick other than fire-brick, not glazed, enameled, painted, vitrified, ornamented, or decorated in any manner, twenty-five per centum ad valorem; if glazed, enameled, painted, vitrified, ornamented, or decorated in any manner, thirty-five per centum ad valorem.

PAR. 95. Articles and wares composed \* \* \* of earthy or mineral substances, \* \* \* not decorated \* \* \* thirty-five per centum ad valorem; \* \* \* [Covered bath brick.]

### ACT OF 1913.

SCHEDULE B.—EARTHS, EARTHENWARE, AND GLASSWARE.

PAR. 71. Fire brick, magnesite brick, chrome brick, and brick not specially provided for in this section, not glazed, enameled, painted, vitrified, ornamented, or decorated in any manner, 10 per centum ad valorem; if glazed, enameled, painted, vitrified, ornamented, or decorated in any manner, and bath brick, 15 per centum ad valorem.

## REFRACTORY BRICKS.

(See Survey B-1.)

*Description and uses.*—Refractory bricks or fire bricks, made of burned clay, have a melting point high enough to withstand the temperatures of metallurgical operations. They are used in all metallurgical and furnace work exposed to intense heat. Those known as silica, magnesite, and chrome bricks are composed of quartz sand, calcined magnesite, and chromic iron ore, respectively. In addition to being refractory each will successfully resist the corrosive action of certain metallurgical slags.

*Production.*—Domestic deposits of suitable clays are widely distributed, and the native industry supplies our needs, besides large quantities for export. The industry is generally local in character, because of the low price of the product, but certain bricks composed of very highly refractory clays have a wide market. Manufacture is concentrated in the large metallurgical and industrial centers.

Refractory brick production is an important economic factor in Germany, Great Britain, France, and Belgium.

The domestic refractory manufacturing industry is independent of foreign competition in the ordinary grades and shapes used by the metallurgical industries. The following tabulation shows the fire brick marketed in the United States in specified years.

	1914	1916	1919 <sup>1</sup>	1920 <sup>1</sup>
Quantity (thousands).....	816,784	1,376,000	943,942	1,131,000
Value.....	\$16,427,547	\$30,800,000	\$36,170,000	\$52,750,000

<sup>1</sup> Estimated.

*Imports* of refractory brick are largely supplementary to the domestic production. Ordinary grades are imported in small amounts for use in the large metallurgical plants located on the New York and New Jersey seaboard, but most of the importations are standard and special shapes composed of highly refractory English and Scotch clays. The high melting point of these goods is the controlling factor, since they can be used under conditions where more easily fusible brick would be quickly destroyed.

Imports of fire brick during the period 1910–1919 fluctuated between \$75,000 and \$128,000 per annum. Unglazed fire brick weighing less than 10 pounds each are the main item. These were separately listed by the Department of Commerce prior to the tariff act of 1913, but have since been included with unglazed brick weighing more than 10 pounds each. During the war period the imports of both classes of unglazed fire brick dropped to a minimum of 8,100 tons, valued at \$62,293, in the fiscal year 1916, but again increased in 1917 and 1918.

The imports of chrome, magnesite, and other special brick, however, show a rapid increase since 1916, amounting in 1919 to \$87,385, which, owing to enhanced prices, is three times the average for the five years immediately preceding the outbreak of the war in 1914.

Later statistics follow:

*Fire brick.*

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
NOT GLAZED, ENAMELED, PAINTED, VITRIFIED, ORNAMENTED, OR DECORATED.				
	<i>Tons.</i>			<i>Per cent.</i>
1918.....	12,769	\$156,059	\$15,606	10
1919.....	6,436	89,925	8,992	10
1920.....	11,445	163,811	16,381	10
1921 (9 months).....	2,527	35,473

1920.....	16,322	166,442	16,644	10
1921 (9 months).....	5,086	57,298		

*Exports.*—Prewar annual exports of fire brick averaged about \$1,000,000. Later statistics follow:

*Fire brick not glazed, enameled, painted, vitrified, ornamented, or decorated.*

	1918	1919	1920	1921 (9 months).
Quantity..... thousands..	89,608	51,252	82,570	29,838
Value.....	\$5,001,057	\$2,747,512	\$4,200,266	\$1,985,938

The exports shown above were principally to Canada, Cuba, and Mexico, with smaller shipments to Italy and Chile.

Exports of other kinds of fire brick are negligible.

OTHER BRICK.

(See Survey B-1.)

*Description and uses.*—Building bricks are classified into (1) common brick, and (2) ornamental brick, the latter including front brick having an attractive finish, enameled brick, and all kinds of fancy brick. Vitrified bricks are clay bricks which have been made harder and less porous by fusion, for example, paving bricks, which constituted 80 per cent of the vitrified bricks used in 1917. "Semivitrified" is an unscientific term used in the trade to describe articles ranging between porous and vitrified. Bath brick is an abrasive used for scouring and polishing.

*Production.*—Structural bricks are manufactured from a wide variety of common clays, and numerous grades are recognized in the trade. The color ranges from buff to almost black, according to the iron content. The hardness and porosity of the product is an important factor, and generally a hard-burned brick is considered most desirable. Special bricks for ornamental purposes are manufactured in presses; their production involves considerable hand work.

Structural brick is the most important clay product manufactured in the United States. The production surpasses in value the total production of pottery and chinaware or of all other clay products.

Suitable clays are widely distributed, and bricks are produced in every State and Territory except Hawaii and Alaska. The industry is local in character, very few bricks being shipped more than a few miles. Local demand is enormous near the large centers of population.

*Brick (other than fire brick) produced in United States in specified years.*

	1914	1919 <sup>1</sup>	1920 <sup>1</sup>
Common brick:			
Quantity (thousands).....	7,145,809	4,552,667	4,709,000
Value.....	\$43,763,554	\$58,220,000	\$81,330,000
Face brick:			
Quantity (thousands).....	2,810,395	778,190	728,000
Value.....	<sup>2</sup> \$9,289,623	\$15,240,000	\$19,050,000

Vitrified brick or block:			
Quantity (thousands).....	931,324	485,139	442,000
Value.....	\$12,500,866	\$11,210,000	\$12,020,000
Sand lime:			
Quantity (thousand).....	172,629		
Value.....	\$1,058,512		

<sup>1</sup> Estimated; marketed.

<sup>2</sup> Front, including fancy colored.

*Imports.*—Imports of common brick are negligible and are confined to shipments from Canadian plants to points in the United States near the international boundary. Imports of bath brick amounted to \$9,000 in 1919 and \$6,000 in 1920.

*Exports* of building brick, mostly to Canada, have in the past been unimportant. Statistics for the calendar years 1918–1921 are as follows:

	1918	1919	1920	1921 (9 months) <sup>1</sup> .
Quantity (thousands).....	6,679	12,169	12,863	16,965
Value.....	\$117,263	\$248,690	\$382,814	\$369,267

#### GENERAL NOTES ON PARAGRAPH.

*Suggested changes.*—Page 25, line 17, H. R. 7456: “Or” should be inserted before “ornamented” and the comma after “ornamented” stricken out, since “ornamented” and “decorated” are interchangeable terms and so treated elsewhere.

Page 25, line 18: Transfer the words “and brick other than fire brick” to line 17 after the word “each.”

Page 26, line 2: Strike out "if" before "glazed" to agree with similar provisions elsewhere.

### PARAGRAPH 202.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 202. Tiles, unglazed, glazed, ornamented, hand painted, enameled, vitrified, semivitrified, decorated, encaustic, ceramic mosaic, flint, spar, embossed, gold decorated, grooved and corrugated, and all other earthenware tiles and tiling by whatever name known, except pill tiles and so-called quarries or quarry tiles, but including tiles wholly or in part of cement, valued at not more than 40 cents per square foot, 8 cents per square foot, but not less than 35 nor more than 50 per centum ad valorem; valued at more than 40 cents per square foot, 38 per centum ad valorem; mantels, friezes, and articles of every description or parts thereof, composed wholly or in chief value of earthenware tiles or tiling, except pill tiles, 38 per centum ad valorem; so-called quarries or quarry tiles, red or brown in color, 3 cents per square foot, but not less than 20 per centum ad valorem.

#### ACT OF 1909.

#### ACT OF 1913.

PAR. 85. Tiles, plain unglazed, one color, exceeding two square inches in size, four cents per square foot; glazed, encaustic, ceramic mosaic, vitrified, semivitrified, flint, spar, embossed, enameled, ornamented, hand painted, gold decorated, and all other earthenware tiles and tiling, by whatever name known, except pill tiles and so-called quarries or quarry tiles, valued at not exceeding forty cents per square foot, eight cents per square foot; exceeding forty cents per square foot, ten cents per square foot and twenty-five per centum ad valorem; so-called quarries or quarry tiles, forty-five per centum ad valorem; mantels, friezes, and articles of every description, composed wholly or in chief value of tiles or tiling, sixty per centum ad valorem.

PAR. 72. Tiles, plain unglazed, one color, exceeding two square inches in size, 1½ cents per square foot; glazed, ornamented, hand-painted, enameled, vitrified, semivitrified, decorated, encaustic, ceramic mosaic, flint, spar, embossed, gold decorated, grooved and corrugated, and all other earthenware tiles and tiling, except pill tiles and so-called quarries or quarry tiles, but including tiles wholly or in part of cement, 5 cents per square foot; so-called quarries or quarry tiles, 20 per centum ad valorem; mantels, friezes, and articles of every description or parts thereof, composed wholly or in chief value of earthenware tiles or tiling, except pill tiles, 30 per centum ad valorem.

#### TILES.

(See Survey B-1.)

*Description and uses.*—Tiles, like bricks, are clay products. Portland and Sorel cements, instead of clay, are also used in their manufacture. The chief uses are for roofing, flooring, and wall finishing. Roofing tiles, made from natural clays, sometimes mixed with other

materials, are usually vitrified and may be self-finished or glazed. Flooring tiles are practically all vitrified and unglazed. The term "quarry tiles" refers to square, unglazed, flooring tiles made of natural clays. Ceramic mosaics are smaller and of better material than quarry tiles. Wall tiles generally have a white body composition of clay and other minerals, such as feldspar and flint. They are seldom vitrified, but are usually coated with glaze. Mantels are sometimes built of wall tile. "Semivitrified" is not a scientific term, but is used in the trade to describe articles ranging between porous and vitrified.

*Production* of tiles (other than drain tile) was valued at \$5,705,583 in 1914 and at \$6,821,221 in 1917. The estimated value of the product in 1919 was \$7,250,000; in 1920, \$10,930,000. Ohio reported over one-third the total output, with New Jersey second. All grades and varieties are produced in sufficient quantities to supply the domestic market and leave a substantial surplus for export.

Tiles used for roofs and flooring are manufactured in pug mills and presses that thoroughly mix the clay and shape the green tile. After these are dried they are burned in round or oval coal-fired kilns.

Decorated tiles are manufactured from china clay or from refractory clay covered on one face with a layer of high-grade clay. The prepared surface is decorated and glazed to produce any desired finish.

All necessary raw materials (except high-grade china clay), together with all machinery and structural materials, are produced in the United States.

The manufacture of tile is an important industry in various parts of Europe. England is the chief producer on account of her large deposits of coal and suitable clays.

The large sale of quarry tiles in the United States is due to their fine quality and pleasing color rather than to price. Foreign manufacturers of roofing and flooring tiles specialize on finish and color. This custom gives the imported ware a slight advantage. Tiles are brittle and require careful packing to endure shipment.

*Imports* in 1914 were valued at \$111,566. Importers state that most of the quarry tile (over 50 per cent of the imports) and roofing tile come from England. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.

### PARAGRAPH 203.

H. R. 7456.

SENATE AMENDMENTS

PAR. 203. Roman, Portland, and other hydraulic cement, in barrels, sacks, or other packages, 5 cents per 100 pounds, including weight of barrel or package; in bulk, 4 cents per one hundred pounds; other cement, not specially provided for, 17 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 86. Roman, Portland, and other hydraulic cement, in barrels, sacks, or other packages, eight cents per one hundred pounds, including weight of barrel or package; in bulk, seven cents per one hundred pounds; other cement, not otherwise specially provided for in this section, twenty per centum ad valorem.

PAR. 444. Cement, Roman, Portland, and other hydraulic [Free].

PAR. 74. \* \* \* all other cements not specially provided for in this section, 10 per centum ad valorem.

## CEMENT.

(See Survey B-2.)

*Description and uses.*—Hydraulic cements are complex anhydrous silicates of lime and aluminum which possess the property of absorbing water and setting in a hard rocklike mass of complex hydrous silicates. Roman cement is a quick-setting variety of natural cement distinguished by high percentages of iron and alumina. Natural cements are all made by burning natural mixtures of clay and limestone; they are rarely as dependable as artificial cement. Portland cement is cement made by calcining limestone with a clayey matter or from blast-furnace slag, followed by fine grinding. Pozzuolana or puzzolan cement is a hydraulic cement made by mixing a volcanic ash (granulated blast-furnace slag, broken brick, and burned clay may also be used), with slaked lime. Cement is a most important building material, and is rapidly replacing brick and cut-stone construction. The United States was the pioneer in concrete building and industrial construction, and the production and consumption per capita exceed that of any other nation.

*Production.*—Deposits of all necessary raw materials and fuel are widely distributed; and domestic costs, owing to cheap domestic fuel supplies and to the utilization of labor-saving excavating and conveying methods, compare favorably with those in Europe. The industry is conducted in large plants, which must operate continuously at full capacity to show a profit. The margin between manufacturing cost and selling price is normally very small, and a rapid turnover is necessary.

The bulk of our production originates north of the Potomac and Ohio Rivers and east of the Mississippi River. The Pacific coast and western Mississippi Valley produce sufficient to satisfy the local demand. New England States are supplied by water and rail from the eastern Pennsylvania producing centers.

Domestic production exceeds consumption. Considerable quantities of domestic cement were used in the Panama Canal, and during the war exports to Cuba and to South American ports reached several million barrels per year. Exports, however, have never exceeded 4 per cent of production.

Germany, Great Britain, France, Belgium, and Italy are large cement producers. The industry is highly organized abroad and prior to the war a considerable percentage of the output was exported to South America and to other undeveloped countries. The Canadian industry is expanding rapidly and can compete in domestic markets located at some distance from domestic producing centers.

*Principal hydraulic cements produced in the United States in specified years.*

Year.	Natural cement.		Portland cement.	
	Quantity (barrels).	Value.	Quantity (barrels).	Value.

1918.....	(1)	(1)	71,514,629	114,132,002
1919.....	(1)	(1)	81,306,524	138,713,823
1920 (estimated).....	(1)	(1)	100,917,000	202,572,000

<sup>1</sup> Figures for puzzolan cement are included with those for natural cement.

*Imports.*—During the first 10 years of the twentieth century, Germany, Belgium, France, Great Britain, and, at times, Canada, exported large quantities of cement to the United States. During the period 1911 to 1913 imports decreased rapidly, and at the time of the last tariff revision European producers had ceased to be factors in the domestic market. Imports from Germany increased sharply when cement was placed on the free list. Imports of hydraulic cement in 1914 were 37,447,094 pounds, valued at \$163,460. German shipments ceased entirely on the outbreak of the war. Importations have increased since the armistice. The bulk of the increase is Canadian cement from plants located near the border. The Canadian industry is expanding and will be of increasing importance in the domestic market. Most Canadian plants operate at a disadvantage, however, since fuel must, in most cases, be imported from the United States. Over 2,000,000 pounds of cement was imported from Austria-Hungary during the fiscal year 1919. It is probable that this was caustic magnesia for use in Sorel cement, since the value (\$36) per ton is higher than any commercial grade of Portland cement. Imports from 1918-1921 were as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.

1921 (9 months).....	246,017	237,240		

## ALL OTHER CEMENT, N. S. P. F.

1918.....		\$10,849	\$1,085	10
1919.....		9,981	998	10
1920.....		49,105	4,910	10
1921 (9 months).....		21,064		

Exports of hydraulic cement in 1914 were 2,391,453 barrels, valued at \$3,382,282. Later statistics for the calendar years 1918-1921 follow:

	1918	1919	1920	1921 (9 months).
Quantity (barrels).....	2,252,446	2,463,573	2,985,807	933,639
Value.....	\$5,912,166	\$7,513,389	\$10,045,369	\$3,529,456

The principal countries to which shipments were made were Cuba, Brazil, Mexico, Argentina, Peru, Colombia, and Panama.

*Important changes in classification.*—Roman, Portland, and other hydraulic cement is exempt from duty under the act of 1913 (par. 444).

*Suggested changes.*—Page 26 of H. R. 7456, in line 22, "100 pounds" is in figures. In line 24 "one hundred pounds" is in words. The figures should be changed to words to agree with practice elsewhere.

#### PARAGRAPH 204.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 204. Limestone (not suitable for use as monumental or building stone), crude, or crushed but not pulverized, 5 cents per one hundred pounds; lime, not specially provided for, 10 cents per one hundred pounds, including weight of barrel or package; hydrated lime, 12 cents per one hundred pounds, including weight of barrel or package.

#### ACT OF 1909.

PAR. 87. Lime, five cents per one hundred pounds, including weight of barrel or package.

[No corresponding provision for the other commodities.]

#### ACT OF 1913.

PAR. 73. Lime, 5 per centum ad valorem.

PAR. 614. \* \* \* limestone, unmanufactured and not suitable for use as monumental or building stone; all of the foregoing not specially provided for in this section [Free].

#### LIMESTONE.

(See Survey B-2.)

*Description and use.*—Limestone is natural calcium carbonate formed under pressure of overlying sediments from the accumulated remains of marine shellfish. It is a soft, porous, even-grained white rock which often contains fossil impressions of shells and other marine growths, and may be colored red, green, or gray by iron or granite impurities. Limestone includes a great variety of stones. Although there are no chemical differences, it is customary to call those limestones possessing especial value in fine building or decora-

tive work marbles (see par. 232), and the ordinary dull-colored non-crystalline and oolitic varieties, suitable only for building and lime-burning, limestones.

*Production.*—The following table shows the amount and disposition of limestone sold in the United States in 1918 and 1920:

Use.	1918		1920	
	Quantity.	Value.	Quantity.	Value.
Building stone.....cubic feet..	3,698,035	\$2,266,654	7,542,150	\$8,197,866
Curbing, flagging and paving.....do..	37,698	37,836	41,870	22,841
Rubble.....short tons..	106,327	109,369	274,630	425,279
Riprap.....do..	1,118,109	969,276	892,610	907,616
Crushed stone.....do..	19,120,858	16,273,184	25,807,800	30,608,799
Fluxing stone.....long tons..	23,862,029	23,427,736	22,301,060	26,475,763
Alkali works.....short tons..	3,437,066	2,263,821		
Sugar factories.....do..	435,555	649,589	637,090	1,200,394
Glass works.....do..	202,211	332,744	196,150	400,873
Paper mills.....do..	100,247	117,829	139,880	256,278
Agriculture.....do..	1,091,918	1,626,292	1,364,260	2,724,209
Other uses <sup>1</sup> .....do..	1,216,633	1,378,676	4,432,170	4,435,432
Total (quantities approximate, in short tons).....	53,868,200	49,453,006	59,290,000	75,655,260

<sup>1</sup> Includes stone sold as a filler for asphalt, paint, rubber, soap, and other material; stone sold for the manufacture of basic magnesium carbonate; stone sold to alcohol works and calcium carbide works; dolomite sold for use in making refractory products; stone sold for chicken grit and other products.

*Imports* of limestone are not given separately, but are included with freestone, granite, and sandstone, unmanufactured, and unsuitable for monumental or building stone. The total imports of these materials were in 1919 \$42,185 and in 1920 \$97,199.

*Exports.*—None recorded.

*Important changes in classification, etc.*—See General Notes on Paragraph, page 265.

#### LIME.

(See Survey B-2.)

*Description and uses.*—Lime is a white, infusible material made by calcining relatively pure limestone. Quicklime and hydrated lime are the two general classes of lime on the market. Pure quicklime is the oxide of calcium, but all commercial limes contain magnesia and other oxides, sometimes as much as 45 per cent. Hydrated lime, as its name implies, has been slaked or hydrated by the addition of water. In the chemical action between quicklime and water the calcium oxide is converted to calcium hydroxide. Hydrated lime possesses the advantages of keeping better and of being more easily handled than quicklime. Its principal use, for building purposes, accounted for about 35 per cent of the total consumption in 1917. The chemical industry consumed 20 per cent and agriculture 13 per cent in 1917.

Quicklime may be shipped in bulk, in wooden barrels of about 200 pounds capacity, or in iron casks holding 400 pounds. Hydrated lime is sold in 100-pound burlap sacks or in 40-pound paper sacks.

*Production.*—Pennsylvania by a large margin is the largest producing State. Ohio, with a production over half of that of Pennsylvania, is then followed by Virginia and West Virginia. Pennsylvania and Ohio together produce a little over one-third of the total production of the United States. The greatest increase in State production since 1910 is that of West Virginia, whose output has been tripled. Virginia has also shown a large increase.

The tendency in recent years has been to concentrate the manufacture of lime in larger and more economically operated plants. The railroads have been a large factor in bringing about this centralization of the industry into a comparatively few advantageous positions. The greatest improvement in marketable lime is that of hydrated lime, which is increasing in use and in the favor of the consumer. The following table shows the amount and value of lime sold in the United States in 1916–1920.

Year.	Quantity (short tons).	Value. <sup>1</sup>	Average value per ton.	Number of plants in oper- ation.
1916.....	4, 073, 433	\$18, 509, 305	\$4. 54	778
1917.....	3, 786, 364	23, 807, 877	6. 29	595
1918.....	3, 206, 016	26, 808, 909	8. 36	496
1919.....	3, 330, 347	29, 448, 553	8. 84	539
1920.....	3, 570, 141	37, 543, 840	10. 52	515

<sup>1</sup> The value given represents the value of bulk lime f. o. b. at point of shipment and does not include cost of barrel or package.

*Imports* have been less than 1 per cent of the domestic production. Of these imports, approximately 90 per cent has come from Canada and the remainder, a special grade of high-priced lime, from Europe. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>100 pounds.</i>			
1918.....	132, 998	\$73, 458	\$3, 673	5
1919.....	173, 576	128, 519	6, 426	5
1920.....	453, 769	392, 137	19, 607	5
1921 (9 months).....	176, 904	190, 350		

*Exports* have been less than 1 per cent of production, 90 per cent going to Canada. This exchange of lime has caused severe competition between producers in British Columbia and the State of Washington. Washington, however, has furnished less than 1 per cent of domestic production since 1911. Exports for calendar years since 1917 follow:

	1918	1919	1920	1921 (9 months).
Quantity (barrels).....	71, 907	63, 719	59, 211	38, 595
Value.....	\$105, 803	\$108, 370	\$128, 296	\$86, 308

## GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Limestone, unmanufactured, and not suitable for use as monumental or building stone is exempt from duty under the act of 1913 (par. 614).

*Suggested changes.*—Page 27, line 6: Strike out “barrel or package” and insert “container.” The word “package” includes contents; the word “container” stands for barrel or any other kind of container.

## PARAGRAPH 205.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 205. Plaster rock or gypsum, crude, 25 cents per ton; if ground or calcined, \$1.40 per ton; white non-staining Portland cement, 8 cents per one hundred pounds, including weight of barrel or package; Keene's cement, or other cement of which gypsum is the component material of chief value, if valued at \$14 per ton or less, \$3.50 per ton; if valued above \$14 and not above \$20 per ton, \$5 per ton; if valued above \$20 and not above \$40 per ton, \$10 per ton; if valued above \$40 per ton, \$14 per ton.

## ACT OF 1909.

## ACT OF 1913.

PAR. 88. Plaster rock or gypsum, crude, thirty cents per ton; if ground or calcined, one dollar and seventy-five cents per ton; pearl hardening for paper makers' use, twenty per centum ad valorem; Keene's cement, or other cement of which gypsum is the component material of chief value, if valued at ten dollars per ton or less, three dollars and fifty cents per ton; if valued above ten dollars and not above fifteen dollars per ton, five dollars per ton; if valued above fifteen dollars and not above thirty dollars per ton, ten dollars per ton; if valued above thirty dollars per ton, fourteen dollars per ton.

PAR. 86. \* \* \* Portland \* \* \* cement, in barrels, sacks, or other packages, eight cents per one hundred pounds, including weight of barrel or package; \* \* \*

PAR. 74. Plaster rock or gypsum, crude, ground or calcined, pearl hardening for paper makers' use; white, non-staining Portland cement, Keene's cement, or other cement of which gypsum is the component material of chief value, \* \* \* 10 per centum ad valorem.

GYPSUM, KEENE'S CEMENT, ETC.

(See Survey B-2.)

*Description and uses.*—Plaster rock or gypsum is a naturally occurring form of calcium sulphate crystallized with two molecules of water. Gypsum when calcined at about 105° C. loses one molecule of water to form plaster of Paris; when heated further, it loses all

of its water of crystallization and also its property of hardening when treated with water. It is then known as "dead" or "over-burnt" plaster. Pearl hardening is the name applied to artificial or natural calcium sulphate used as a filler in writing paper; it is more commonly applied to artificial calcium sulphate, provided for in paragraph 71. About 500,000 tons of gypsum are sold annually without calcining. The bulk of this material is used as a retarder in Portland cement. White, nonstaining Portland cement is a white cement with a very low iron content. Minor quantities are used as a pigment base in making cold-water paints and crayons, as a filler for paper and cloth, as a base for insecticides, and as hand plaster or fertilizer. The calcined product is used for plaster casts and molds, and is an important ingredient in the manufacture of Keene's cement and plaster board and block. Small amounts are used for art statuary.

Keene's cement is a hard-finish wall plaster. Essentially it is completely calcined gypsum which has been heated with small quantities of alum or borax. It differs from ordinary gypsum wall plasters in the time required for setting and in superior hardness.

*Production.*—The United States possesses extensive deposits of high-grade gypsum, and domestic production is the largest in the world. The deposits are close to the surface and are mined very cheaply. The fact that only low temperatures are required for calcining and the habit of the mineral to disintegrate on heating both help to keep down the cost of the finished product. Plant and mining expenses and capital requirements are small as compared with other mining industries, consequently a large number of small operators compete keenly in the open market. Cement manufacturers often own gypsum mines. Gypsum is mined extensively in 18 States and in Alaska. New York, Iowa, Michigan, and Ohio lead in production. The general tendency is to decrease the amount used in a crude state and to increase the use of the calcined material as plaster and plaster board. France, Great Britain, and Canada lead as foreign producers.

Production of crude gypsum, 1912-1915, was constant at about 2,500,000 short tons. Later statistics of domestic production follow:

Year.	Crude mined (short tons).	Value of crude and calcined sold.
1916.....	2,757,730	\$7,959,032
1917.....	2,696,226	11,116,452
1918.....	2,057,015	11,470,854
1919.....	2,420,163	15,727,907
1920.....	3,129,142	24,533,065

*Imports* of gypsum and plaster of Paris before 1918 were less than 1 per cent of domestic production. They have been mostly from Nova Scotia and New Brunswick and are entered at various Atlantic ports. Large blocks of gypsum are occasionally received from England. Later statistics follow:

*Gypsum and gypsum products.*

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.

*Exports* of plaster of Paris have been small; the maximum value was \$28,144 in 1917. Small amounts are shipped to Canada. No exports of gypsum are recorded.

*Important changes in classification.*—Pearl hardening, provided for under that name in the act of 1913 (par. 74), is natural gypsum ground to a fine powder or precipitated calcium sulphate. As natural gypsum it comes within paragraph 205; as precipitated calcium sulphate it comes within paragraph 71 of H. R. 7456.

*Suggested changes.*—Page 27, line 10: Strike out “barrel or package” and insert “container.” The word “package” includes contents; the word “container” stands for barrel or any other kind of container.

Page 27, lines 10, 11: Change “or” to “and” between “cement” and “other.”

Page 27, lines 8, 12, 13, 14, 15: Strike out “if” as unnecessary and to agree with similar provisions elsewhere.

## PARAGRAPH 206.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 206. Pumice stone, unmanufactured, valued at \$15 or less per ton, two-tenths of 1 cent per pound; valued at more than \$15 per ton, three-tenths of 1 cent per pound; wholly or partly manufactured, fifty-five one-hundredths of 1 cent per pound; manufactures of pumice stone or of which pumice stone is the component material of chief value, not specially provided for, 26 per centum ad valorem.

## ACT OF 1909.

PAR. 89. Pumice stone, wholly or partially manufactured, three-eighths of one cent per pound; unmanufactured, valued at fifteen dollars or less per ton, thirty per centum ad valorem; valued at more than fifteen dollars per ton, one-fourth of one cent per pound; manufactures of pumice stone or of which pumice stone is the component material of chief value not specially provided for in this section, thirty-five per centum ad valorem.

## ACT OF 1913.

PAR. 75. Pumice stone, unmanufactured, 5 per centum ad valorem; wholly or partially manufactured,  $\frac{1}{4}$  cent per pound; manufactures of pumice stone, or of which pumice stone is the component material of chief value, not specially provided for in this section, 25 per centum ad valorem.

## PUMICE.

(See Survey B-3.)

*Description and uses.*—Pumice is a form of porous volcanic glass used as an abrasive, chiefly in metal polishes, scouring soaps, and lithographic work.

*Production.*—The domestic product prior to 1917 was principally a fine volcanic dust or ash, improperly called pumice. It is, for ordinary requirements, a satisfactory substitute for ground Italian pumice originating in the Lipari Islands as a massive, vesicular, glassy lava. The only domestic deposits of lump pumice approaching this product are located in California and Arizona. Difficulty of shipping from Mediterranean ports and an embargo on imports stimulated production of lump pumice in 1917. Production of volcanic dust increased from 27,591 tons, valued at \$59,172, in 1914, to 35,293 tons, valued at \$84,814, in 1917. Nebraska led in production until 1916, when Kansas took the lead.

Production statistics of pumice follow:

	1918	1919	1920
Quantity (short tons).....	30,637	36,051	41,841
Value.....	\$91,178	\$116,835	\$114,433

*Imports* of unmanufactured pumice in 1913 were 5,558 tons, valued at \$44,474. In 1913 imports of wholly or partially manufactured pumice were 3,845,326 pounds, valued at \$17,417; in 1917, 7,796,173

pounds. Imports of manufactures of pumice have been small—in 1913, \$12,231; in 1915, \$115. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equiva- lent ad valorem.
UNMANUFACTURED.				
	<i>Tons.</i>			<i>Per cent.</i>
1918.....	1,086	\$10,535	\$527	5.00

*Export statistics of pumice stone are not given.*

*Suggested changes.*—Page 27, line 20: Insert a comma after “stone.”

### PARAGRAPH 207.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 207. Clays or earths, unwrought or unmanufactured, including common blue clay and Gross-Almerode glass pot clay, not specially provided for, \$1 per ton; wrought or manufactured, not specially provided for, \$2 per ton; china clay or kaolin, \$2.50 per ton; bauxite or beauxite, crude, not refined or otherwise advanced in condition in any manner, \$1 per ton; fuller's earth, unwrought and unmanufactured, \$1.50 per ton; wrought or manufactured, \$3 per ton of 2,000 pounds; silica, crude, not specially provided for, \$4 per ton; silica, suitable for use as a pigment, not specially provided for, \$7.50 per ton; fluorspar, \$5 per ton of 2,000 pounds: *Provided*, That after the expiration of one year beginning on the day following the passage of this Act, the duty on fluorspar shall be \$4 per ton of 2,000 pounds.

## ACT OF 1909.

PAR. 90. Clays or earths, unwrought or unmanufactured, not specially provided for in this section, one dollar per ton; wrought or manufactured, not specially provided for in this section, two dollars per ton; china clay or kaolin, two dollars and fifty cents per ton; \* \* \* bauxite, or beauxite, crude, not refined or otherwise advanced in condition from its natural state, one dollar per ton; fuller's earth, unwrought and unmanufactured, one dollar and fifty cents per ton; wrought or manufactured, three dollars per ton; fluorspar, three dollars per ton.

PAR. 534. Clay: Common blue clay and Gross-Almerode glass-pot clay, in cases or casks suitable for the manufacture of crucibles and glass melting pots or tank blocks [Free].

PAR. 693. Terra alba, not made from gypsum or plaster rock [Free].

[No corresponding provision for silica, crude (in finest form might have been classified as sand); nor for silica suitable for use as a pigment (powdered silica was held free as sand; if suitable for use as pigment might have been classified under paragraph 56 as a pigment).]

## ACT OF 1913.

PAR. 76. Clays or earths, unwrought or unmanufactured, not specially provided for in this section, 50 cents per ton; wrought or manufactured, not specially provided for in this section, \$1 per ton; china clay or kaolin, \$1.25 per ton; fuller's earth, unwrought and unmanufactured, 75 cents per ton; wrought or manufactured, \$1.50 per ton; fluorspar, \$1.50 per ton: *Provided*, That the weight of the casks or other containers shall be included in the dutiable weight.

PAR. 411. Bauxite or beauxite, crude, not refined or otherwise advanced in condition from its natural state [Free].

PAR. 450. Common blue clay and Gross-Almerode glass-pot clay, in cases or casks, suitable for the manufacture of crucibles and glass melting pots or tank blocks [Free].

PAR. 629. Terra alba, not made from gypsum or plaster rock [Free].

[No corresponding provision for silica crude (in finest form might have been classified as sand); nor for silica, suitable for use as a pigment (powdered silica was held free as sand; if suitable for use as a pigment, it might have been classified under paragraph 63 as a pigment).]

## CLAYS OR EARTHS N. S. P. F.

(See Survey B-4.)

*Description and uses.*—Ball clay is impure china clay. It is usually off-color when green, but burns white in the kilns when used in a mixture with pure kaolin. Pure kaolin, or china clay, is not plastic, and for that reason can not be worked on the jiggers and other pottery machines. Ball clay makes the mass plastic without appreciably affecting the color.

Gross-Almerode, also known in the glass trade as glass-pot clay, is a highly refractory clay much used by glassmakers for the pots in which fine glass is melted. Clay for glass pots must be refractory, and, in addition, must be free from all metal salts which would color the mix. Iron and manganese are especially objectionable since their silicates are highly colored. Similar high-grade plastic clays are used by the manufacturers of pencils, crucibles, abrasives, and enamel ware.

Common refractory, or fire clay, includes all clays capable of withstanding high temperatures. It is manufactured into fire brick and other rough clay ware, and is used loose or raw for lining steel furnaces and other metallurgical apparatus.

*Production.*—Prior to the war the domestic glass industries depended largely upon foreign producers for their Gross-Almerode clay, but during the war period domestic deposits of high-grade fire clays were developed, which have been successfully substituted for the foreign material. The domestic deposits were known long before the war, but were not widely used as long as cheap supplies of high-grade foreign clays were available.

Fire clay is very widely distributed throughout the United States. As the deposits are of both high and low grade, practically any variety can be supplied from domestic pits. Thirty-three States reported fire clay production in 1918. Pennsylvania, Missouri, Ohio, and New Jersey were the largest producers, but enormous undeveloped resources exist in sections which at present mine very little clay. Geographical location is an important factor in the production and the important producing States are those which inclose or are near the large consuming centers.

The quality of the domestic material has been somewhat variable and not as satisfactory for some uses as the foreign article. This was particularly true of ball clays used by the pottery industry, in which slight irregularities in the clay mix frequently result in disastrous breakage and deformation losses in the kilns. Since 1916 the glass-pot and crucible clay used by domestic consumers has been almost entirely native, and appears to be satisfactory. Great Britain possesses large deposits of high-grade, uniform ball clay that is easily accessible for foreign shipment, while freight rates from point of export to consuming points in Ohio were, prior to the war, often lower than the rail rate from domestic clay pits to the same market. German glass-pot clay, known as Gross-Almerode, was formerly exclusively employed in certain operations in which domestic clays are now being used with good results. The competitive situation is complicated by the fact that the cost of clay is a minor item of expense, compared to possible breakage losses due to the use of inferior material, and unless the domestic clay is satisfactory in every respect the foreign producer will regain the market regardless of the cost of material. Statistics of production follow:

*Domestic clay marketed in the United States, 1913 and 1915-1920.*

Year.	Kaolin.		Paper clay.		Slip clay.		Ball clay.		Fire clay.

## CHINA CLAY OR KAOLIN.

(See Survey B-4.)

*Description and uses.*—China clay or kaolin is a white-burning clay of residual origin. This clay is largely used in the manufacture of white earthenware and china pottery, in high-grade tile, and as filler in paper, paint, rubber, and oilcloth. Kaolin forms from 20 to 50 per cent of the body in china, with varying proportions of ball clay, flint or quartz, and feldspar. The clay gives plasticity and working properties and acts as a bond during early stages of firing. Ball clay is the most plastic ingredient; kaolin, although less plastic, is used because of the whiteness it imparts. Much of the domestic paper clay and some of the ball clay have similar uses, though not called kaolin because of different geologic origin.

*Production.*—Domestic deposits of kaolin are extensive, but the crude product is generally regarded as inferior to that imported from England. The industry in this country has suffered from shortage and high cost of labor and from adverse transportation conditions, and yet has shown considerable progress both in increased output to regular customers and in the development of new markets.

It is doubtful if domestic kaolin can entirely replace the imported product, unless the quality improves, either through the discovery of new high-grade deposits or better systems of purifying and standardizing the product now mined. For production statistics see foregoing table under clays, not specially provided for.

*Imports* of kaolin, which include clays used in the paper, pottery, and other industries, were 241,935 short tons, valued at \$1,590,054 in 1914. Of the china clay used in American potteries, 56 per cent is imported from England, because it has been considered indispensable for the higher-grade ware. Some imports are from Canada. Recent statistics follow:

## BAUXITE, CRUDE.

(See Survey C-16.)

*Description and uses.*—Crude bauxite is a form of aluminum oxide, the commercial grade containing at least 52 per cent of alumina, although material is mined of varying content ranging from 40 to 70 per cent. The silica and iron should not run over 15 per cent. Bauxite is the chief ore of aluminum, but also has many other im-

portant uses. It is employed in the manufacture of artificial abrasives, and is also the crude material from which alum, aluminum sulphate, and several other chemicals for water purification, dyeing, and tanning are made. A rapidly growing application is in the manufacture of bauxite brick for furnace linings. In 1917 nearly 65 per cent of the domestic output went into metallic aluminum, nearly 13 per cent into aluminum salts, 19 per cent into bauxite abrasives, and 3 per cent into makers of bauxite refractories. The purest varieties are used in high-grade chemicals.

*Production.*—The principal bauxite deposits of the world are in the Provinces of Var and Herault, southern France; in the former Empire of Austria-Hungary; in Arkansas, Georgia, and Alabama; in British and Dutch Guiana; and in northwestern Ireland. Minor deposits are located in Germany, Russia, Venezuela, French Guiana, Brazil, Africa, Australia, and probably China. It is believed that the tropical countries contain immense reserves. The largest producing bauxite deposits are controlled politically by the United States and France. Great Britain rules a large share of the equatorial regions which probably contain most of the undeveloped deposits. Bauxite may also be found in the colonial possessions of Portugal and Belgium and in those formerly owned by Germany. The aluminum works of the world are controlled by the United States, Great Britain, France, Germany, Switzerland, Italy, and Norway.

*Bauxite produced and consumed in the United States, 1916-1920.*

Value.....	\$14,791	\$36,820	\$251,284	\$150,479

Imports above shown are chiefly from France and British Guiana. *Exports* consist largely of purified alumina, or bauxite concentrates, by one company to a Canadian subsidiary. Exports of bauxite concentrates since 1917 are shown as follows:

	1918	1919	1920	1921 (9 months).
Quantity (tons).....	19,711	17,701	22,257	4,455
Value.....	\$1,523,688	\$1,372,094	\$1,843,596	\$371,873

*Important changes in classification, etc.*—See General Notes on Paragraph, page 279.

#### FULLER'S EARTH.

(See Survey B-4.)

*Description and uses.*—Fuller's earth is a clay having the power of absorbing greasy substances and of decolorizing fats and oils. Its variations in chemical composition and in physical properties determine its value. It is used principally for bleaching, clarifying, or filtering fats, greases, and oils. Other uses are in pigments for printing wall paper, in detecting certain coloring matters in food products, and as a substitute for talcum powder. The domestic industry first assumed importance in 1895.

*Production.*—Domestic deposits of fuller's earth are of high grade, and home production could easily be made to supply the entire domestic demand. The industry is unorganized and some properties are idle a large part of the time. Almost 99 per cent of the output originates in the Southern States, but California yields sufficient material to supply the petroleum refineries located on the Pacific slope.

Great Britain and Germany are normally large producers, but the English product is the only one entering the domestic market to any extent.

The domestic industry occupies a strong position in all home markets except along the Atlantic seaboard from New Jersey to New England. Domestic material sent here must absorb a heavy rail

and water freight charge, while foreign material can in many cases be shipped direct from England to the consuming plant at a lower cost for transportation. Statistics of production of Fuller's earth produced and marketed in the United States follow:

Year.	Number of operators reporting sales.	Quantity (short tons).	Value.	Average price per ton.
1911-1915 (average).....		40, 178	\$390, 252	\$9. 71
1915.....	10	67, 822	706, 951	10. 42
1917.....	11	72, 567	772, 087	10. 64
1918.....	14	84, 468	1, 146, 354	13. 57
1919.....	10	106, 145	1, 998, 829	18. 83
1920.....	12	128, 487	2, 506, 189	19. 51

*Imports* are as follows: Unwrought or unmanufactured in 1913, 1,597 short tons, valued at \$10,359; in 1917, 975 short tons, valued at \$7,486. Wrought or manufactured have been greater, amounting in 1913 to 15,269 short tons, valued at \$135,229; in 1917 to 15,077 short tons, valued at \$159,071.

Imports amount to about 15 per cent of the domestic production. The material enters through New York and New England ports, and is consumed at the refining plants located in that section. Statistics of imports since 1917 follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.

#### FLUORSPAR.

(See Survey B-4.)

*Description and uses.*—Fluorspar or fluorite, chemically calcium fluoride (CaF<sub>2</sub>), contains 48.9 per cent fluorine and 51.1 per cent calcium. It is translucent to transparent and has about the same hardness as calcite. The general grades are lump, ground, and gravel spar. The principal uses in order of importance are (1) metallurgical work, (2) manufacture of opalescent glass and enameled ware, and (3) chemical manufactures, especially hydrofluoric acid. The

bulk of domestic production and practically all of the imported supply appear as gravel spar, 80 per cent of the domestic production being used in the basic open-hearth steel furnaces.

In metallurgy fluorite makes extremely fluid slags, with great solvent power for refractory substances. It has a comparatively low melting point, and at high temperatures it has a higher quantitative efficiency as a flux than limestone. In the making of ferromanganese and ferrosilicon it gives great fluidity to the slag without too high temperature and greatly reduces the amount of phosphorus, sulphur, and other impurities in the pig. The most important use is in basic open-hearth steel furnaces, where, with limestone, it is of value as a desulphurizing agent. It makes the melt more fluid and permits the use of greater quantities of lower grades and scrap. Very little lump is used for metallurgical purposes. Theoretically gravel spar runs in sizes from one-half inch down, but as a matter of fact it may vary from egg size to "fines."

The highest grade is white or clear, pale green, or blue and is the material used by glass, enameling, and chemical industries, including the manufacture of hydrofluoric acid, which accounts for the bulk of the consumption. Some sodium fluoride is used in the preservation of wood. For most chemical uses a purity of 95 to 98 per cent is necessary.

Miscellaneous uses for the mineral are as a binding agent in emery wheels and for carbon electrodes, in the extraction of potash from feldspar, and for increasing the volatilization of potassium in the recovery of potash from Portland cement clinker. As an electrode bond, fluorite increases the lighting efficiency and decreases the current required. Small amounts of fluorspar are used annually for optical purposes. Only the purest, clearest specimens—pieces as small as one-quarter inch in diameter—are used in making lenses.

*Production.*—Until 1916 over 90 per cent of the output of ground fluorspar was mined near Rosiclare, Ill. The field extends across the Ohio River into the adjoining counties of Kentucky. Fluorspar is also produced in New Hampshire, Arizona, and Colorado.

Prior to 1905 the domestic output was less than 50,000 tons annually and fluctuated considerably. In 1909, its use for open-hearth steel being more generally recognized, the mining and milling facilities in the Illinois-Kentucky fields expanded greatly, and production increased rapidly until 1912.

Fluorspar is mined by the usual underground methods. On account of the comparatively low value of the product, extensive or costly treatment is not possible, and only those deposits which furnish sufficiently pure material with a minimum of preparation can be worked advantageously.

The latest available records rank England next to the United States in production, with Germany third, and France fourth. A few hundred tons are annually produced in Spain. Austria-Hungary, which formerly produced 8,000 to 9,000 tons a year, had no output in 1911. Canada and Mexico possess deposits containing fluorspar, but little is known as to their grade or extent. Canada began to produce regularly in 1917.

With the English steel industry in normal state, more than 50 per cent of the fluorspar output of Great Britain was exported to the

United States, where it was able to compete with the American product as far west as Pittsburgh. The production from old mine dumps was cheaply obtained and exceeded English requirements. This material is rapidly disappearing, while the greatly expanded steel industry of the United Kingdom will continue to make larger demands on the output of spar. It is therefore doubtful if, in the future, there will be much excess for export. Domestic supplies are ample for any probable requirement for a great many years. The cost of mining exceeds that in foreign countries, but the material has a higher average purity.

*Fluorspar produced<sup>1</sup> in the United States, 1916-1920.*

Year.	Quantity (short tons).	Value.
1916.....	155,735	\$922,654
1917.....	218,828	2,287,722
1918.....	263,817	5,465,481
1919.....	138,290	3,525,574
1920.....	186,778	4,718,547
	2,126,409	24,001,045

<sup>1</sup> Figures represent shipments from mines.

*Imports*, until 1916, were from 100 to 300 tons annually of ground fluorspar from Germany. In recent years nearly all has been the medium-grade gravel spar, chiefly from England. The supply was derived largely from old mine dumps, and was purchased at the docks in Liverpool for about \$2 a ton and brought over as ballast. The lowest average valuation of the material at the port of entry was \$2.46 in 1911 (calendar year) and the highest, not including duty or freight, was \$15.10 in 1918.

Imports in 1910 were 42,488 short tons, valued at \$135,152; in 1914, 10,206 short tons, at \$38,943. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equiva- lent ad valorem.

*Exports.*—None recorded.

GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—The following articles covered by this paragraph are exempt from duty under the act of 1913: Common blue clay and Gross-Almerode glass-pot clay, in cases or casks, suitable for the manufacture of crucibles and glass-melting pots or tank blocks (par. 450); terra alba, not made from gypsum or plaster rock (par. 629); and bauxite or beauxite, crude, not refined or otherwise advanced in condition from its natural state (par. 411).

*Conflicting provisions.*—The provision in this paragraph for “silica, crude, not specially provided for, \$4 per ton” may be in conflict with the provision in paragraph 1661 exempting from duty “sand, crude or manufactured.” The provisions for silica are new.

*Suggested changes.*—Page 28, line 2: Strike out “or beauxite” to agree with paragraph 6.

### PARAGRAPH 208.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 208. Mica, unmanufactured, or rough trimmed only, 4 cents per pound and 17 per centum ad valorem; mica, cut or trimmed, mica splittings, mica plates, and built-up mica, and all manufactures of mica or of which mica is the component material of chief value, 10 cents per pound and 17 per centum ad valorem; ground mica, 4 cents per pound and 20 per centum ad valorem.

#### ACT OF 1909.

#### ACT OF 1913.

PAR. 91. Mica, unmanufactured, or rough trimmed only, five cents per pound and twenty per centum ad valorem; mica, cut or trimmed, mica plates or built-up mica, and all manufactures of mica or of which mica is the component material of chief value, ten cents per pound and twenty per centum ad valorem.

[No corresponding provision for ground mica.]

PAR. 77. Mica, unmanufactured, valued at not above 15 cents per pound, 4 cents per pound; valued above 15 cents per pound, 25 per centum ad valorem; cut mica, mica splittings, built-up mica, and all manufactures of mica, or of which mica is the component material of chief value, 30 per centum ad valorem; ground mica, 15 per centum ad valorem.

#### MICA.

(See Survey B-5.)

*Description and uses.*—Mica is a mineral marketed as cut or uncut blocks and sheets, as splittings, and in a ground form. Mica splittings is a form of rough-trimmed mica which has been separated into sheets. Cut mica is separated into sheets and accurately trimmed to size—either squares, oblongs, discs, or washers. The value of mica of same quality depends upon the size of the sheets and whether it is clear or stained. Sheet mica, nonflammable and insulating, is essential in the manufacture of electrical machinery. Other uses, including windows for stoves, goggles, and lanterns, are dependent upon its transparency and resistance to heat and shock. It is used in phonograph diaphragms. Built-up mica, or mica board, an insulating material having various trade names, utilizes the splittings. Ground mica is used in patent roofing, in annealing steel, in lubrication, and in decoration.

*Production.*—Deposits of mica of economic value may be found in small quantities in many parts of the world, but India, the United States, and Canada now produce 95 per cent of the world's output. Brazil, Argentina, the British East Africa Protectorate, and Australia are rapidly becoming important producers. Guatemala, the Union of South Africa, Madagascar, Nyasaland, China, and Ceylon have deposits which will undoubtedly be exploited in the near future.

In the United States, North Carolina and New Hampshire are the principal mica producers.

The following States contain mica deposits which are now being worked or which have been worked in recent years: North Carolina, Georgia, Virginia, South Carolina, Alabama, New Hampshire, Maine, South Dakota, Idaho, New Mexico, Colorado, and Texas.

The Appalachian region has usually produced the best quality of sheet mica, although good deposits are known in South Dakota and Idaho. In general, however, a greater percentage of scrap mica is taken from the western than from the eastern deposits. It is the relatively large quantity of good sheet mica in the deposits in the East that has made the mining of mica more profitable there than in the West. The following table shows the mica produced and sold in the United States, 1914-1919:

*Mica produced and sold in the United States, 1914-1919.*

Year.	Sheet mica.		Scrap mica.		Total quantity (short tons).	Total value.
	Quantity (pounds).	Value.	Quantity (short tons).	Value.		
1914.....	556,933	\$278,540	3,730	\$51,416	4,008	\$329,956
1915.....	553,821	378,259	3,959	50,510	4,236	428,769
1916.....	865,863	524,485	4,433	69,906	4,866	594,391
1917.....	1,276,533	753,874	3,429	52,908	4,067	806,782
1918.....	1,644,200	731,810	2,292	33,130	3,114	764,940
1919.....	1,545,709	483,567	3,258	58,084	4,031	541,651

Imports of unmanufactured mica in 1913 were 2,339,587 pounds, valued at \$819,902, an increase over previous years; but imports declined during the war period to about \$500,000 annually. Cut mica, mica splittings, and manufactures increased from \$398,580 in 1914 to \$1,002,821 in 1917. In 1917 unmanufactured mica, except the ground variety, was valued at \$453,978. Very little ground mica is imported. Imports of all kinds of mica are from India (directly and through England), Canada, Germany, and South America. Later statistics follow:

*Mica.*

1921 (9 months).....	69, 690	7, 213	.....	.....

*Exports* of unmanufactured mica declined from \$25,962 in 1914 to about \$4,000 in 1917, while exports of manufactures increased over 100 per cent to \$84,755 in 1917. Later exports of mica and manufactures of (by calendar years) have been valued as follows: 1918, \$74,529; 1919, \$109,348; 1920, \$316,169; 1921 (9 months), \$112,883. Exports have been destined chiefly to England, Canada, France, and Japan.

*Important changes in classification.*—The provisions in the act of 1909 (par. 91) for mica rough-trimmed only, for mica trimmed, and for mica plates are here revived.

*Suggested changes.*—It has been represented to the Tariff Commission that mica splittings are a material in the class with rough-trimmed block mica rather than with mica plates, built-up mica, and manufactures of mica.

## PARAGRAPH 209.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 209. Talc, steatite or soapstone, and French chalk, crude and unground, one-fourth of 1 cent per pound; ground, washed, powdered, or pulverized, except toilet preparations, one-half of 1 cent per pound; cut or sawed, or in blanks, crayons, cubes, disks, or other forms, 1 cent per pound; manufactures (except toilet preparations), of which talc, steatite or soapstone, or French chalk is the component material of chief value, wholly or partly finished, and not specially provided for, if not decorated, 25 per centum ad valorem; if decorated, 30 per centum ad valorem.

## ACT OF 1909.

## ACT OF 1913.

PAR. 13. \* \* \* French chalk, one cent per pound; \* \* \*.

PAR. 95. Articles and wares composed wholly or in chief value of

PAR. 69. Talcum, ground talc, steatite, and French chalk, cut, powdered, washed, or pulverized, 15 per centum ad valorem.

earthy or mineral substances, \* \* \* if not decorated in any manner, thirty-five per centum ad valorem; if decorated, forty-five per centum ad valorem; \* \* \*.

PAR. 480. \* \* \* articles manufactured, in whole or in part, not provided for in this section, \* \* \* twenty per centum ad valorem.

PAR. 626. Minerals, crude, \* \* \* [Free].

PAR. 81. Earthy or mineral substances wholly or partially manufactured and articles and wares composed wholly or in chief value of earthy or mineral substances, not specially provided for in this section, whether susceptible of decoration or not, if not decorated in any manner, 20 per centum ad valorem; if decorated, 25 per centum ad valorem; \* \* \*.

PAR. 621. Talcum, steatite, and French chalk, crude and unground [Free].

#### TALC—FRENCH CHALK.

(See Survey A-19.)

*Description and uses.*—Talc is a natural magnesium hydrous silicate. It has a greasy or soapy feel, and is one of the softest minerals known. The massive, compact variety is known as steatite or soapstone.

Talc has a great variety of uses. As soapstone it is cut into slabs and used for table tops in hospitals and laboratories; it is also made into sinks and laundry tubs and into vessels for storing acids. As a heat resistant it is used for griddles, foot warmers, and hearthstones; as an insulator, for electric switchboards and floors of electrical plants.

Ground or powdered talc is used as a filler in the manufacture of paper and paint and as a dressing for rubber, cloth, and leather. It is extensively employed in the manufacture of toilet powders; as a preservative coating for stonework and as a nonconductive material for covering steam pipes; and as an adulterant for soaps and other goods.

French chalk is high-grade talc in its natural state cut to shape and size for marking cloth, metals, slate, etc. Talc is used in making tips for gas burners, and some varieties are substituted for graphite in lubricants.

*Production.*—The United States produces more talc than all other countries; Italy and France produce the finest varieties. Before the war France ranked second to the United States in total production. Virginia produces all the soapstone mined in this country, and New York produces most of the fibrous talc used in paper making.

In 1915 the total production of talc and soapstone in the United States was 186,891 short tons and in 1917 it was 218,848 short tons. Later statistics follow:

*Talc mined and sold in the United States in 1918 and 1919, by States.*

State.	1918			1919		
	Quantity (short tons).	Value.	Average value per ton.	Quantity (short tons).	Value.	Average value per ton.

1920.....	30,955	137,388	( <sup>3</sup> )	( <sup>3</sup> )	<sup>3</sup> 167,594	<sup>3</sup> 2,174,453	198,549	2,311,841

<sup>1</sup> Includes slate pencils and metal workers' crayons and blanks used in making acetylene burners and other objects.

<sup>2</sup> For foundry facings, filler for paper, paint, and rubber goods, toilet powder, foot ease, lubricators for dressing skins and leather, etc.

<sup>3</sup> Figures for talc manufactured into pencils and blanks included under "Ground."

The total sales of soapstone in the United States in 1920 amounted to 24,175 short tons, valued at \$740,197, as compared with 15,330 short tons, valued at \$576,059 in 1918.

*Imports.*—Most of the talc, ground or prepared, imported before the war came from France and Italy, with smaller amounts from Canada and Austria-Hungary. After 1914 the imports from France fell, but those from Italy increased. The total imports during 1914 were 29,690,092 pounds, and during 1917 were 34,288,429 pounds.

In 1914 the imports of crude and unground talcum and French chalk amounted to 2,807,974 pounds. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
----------------	-----------	--------	-------	------------------

1918.....	.....	\$266	\$40	15
1919.....	6,313	323	48	15

<sup>1</sup> Includes French chalk.

Imports since 1918 have come principally from Canada and Italy.

*Exports.*—None recorded.

*Important changes in classification.*—Talcum, steatite, and French chalk, crude and unground, are exempt from duty under the act of

1913 (par. 621). The provisions for talc, cut or sawed or in blocks or other forms and manufactures, are new.

*Suggested changes.*—Page 28, line 21: Put the words “except toilet preparations” in parentheses to agree with line 24.

[See par. 1449, page 1200, in connection with crayons.]

### PARAGRAPH 210.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 210. Common yellow, brown, or gray earthenware made of natural, unwashed, and unmixed clay, plain or embossed; common salt-glazed stoneware; stoneware and earthenware crucibles; all the foregoing not ornamented, incised, or decorated in any manner, and manufactures wholly or in chief value of such ware, not specially provided for, 20 per centum ad valorem.

#### ACT OF 1909.

PAR. 92. Common yellow, brown, or gray earthenware, plain, embossed, or salt-glazed common stoneware, and earthenware or stoneware crucibles, all the foregoing not decorated in any manner, twenty-five per centum ad valorem; yellow earthenware, plain or embossed, coated with white or transparent vitreous glaze but not otherwise ornamented or decorated, \* \* \* forty per centum ad valorem.

#### ACT OF 1913.

PAR. 78. Common yellow, brown, or gray earthenware made of natural unwashed and unmixed clay; plain or embossed, common salt-glazed stoneware; stoneware and earthenware crucibles; all the foregoing, not ornamented, incised, or decorated in any manner, 15 per centum ad valorem; \* \* \* and manufactures wholly or in chief value of such ware, not specially provided for in this section, 20 per centum ad valorem; \* \* \*.

#### COMMON YELLOW, BROWN, OR GRAY EARTHENWARE.

(See Survey B-6.)

*Description and uses.*—Common earthenware, yellow, brown, or gray, includes kitchen and culinary utensils; common stoneware, crocks, butter jars, churns, fruit jars, water filters, etc.; red earthenware, flower pots, jardinières, vases, fern pots, window boxes, etc. Common stoneware is an opaque, highly fired, vitrified pottery, composed of plastic clay, the body being gray, buff, brown, or other color, caused by iron and other impurities present, with the natural color of the crude clay after being burned in the kiln. Red earthenware, usually porous, is made from red-burning clays; yellow, brown, or gray earthenwares are made from natural clays, the colors being brought out by burning.

*Production.*—In 1918 stoneware was made in 20 States, Ohio producing nearly one-half the output; red earthenware, in 31 States, Ohio being the largest producer. Statistics of production follow:

Year.	Stoneware and yellow and Rockingham ware	Red earthenware.	Total.
1914.....	\$3,349,301	\$1,059,904	\$4,409,205
1916.....	3,696,288	1,156,351	4,852,639
1918.....	4,454,164	906,861	5,361,025
1920.....	5,475,660	1,766,919	7,242,579

*Imports.*—From 1908 to 1913 the average value of imports was \$67,000, but decreased to \$27,173 in 1918 (fiscal year). Later statistics follow:

*Common yellow, brown, or gray earthenware, made of natural unwashed and unmixed clay, and plain or embossed common salt-glazed stoneware.*

Calendar year.	Value.	Duty.	Ad valorem rate.
NOT DECORATED, ORNAMENTED, OR INCISED IN ANY MANNER.			
			<i>Per cent.</i>
1918.....	\$5,251	\$788	15
1919.....	5,048	757	15
1920.....	14,248	2,137	15
1921 (9 months).....	12,087		
DECORATED, ORNAMENTED, OR INCISED IN ANY MANNER, AND MANUFACTURES OF SUCH WARE.			
1918.....	\$2,726	\$545	20
1919.....	4,829	966	20
1920.....	9,649	1,930	20
1921 (9 months).....	5,835		
CRUCIBLES OF STONE AND EARTHENWARE.			
1918.....	\$3,019	\$453	15
1919.....	7,486	1,123	15
1920.....	9,145	1,372	15
1921 (9 months).....	4,675		

*Exports.*—None recorded.

#### ROCKINGHAM EARTHENWARE.

(See Survey B-6.)

*Description and uses.*—Rockingham ware imported from England is of cheap brown, yellow, or reddish clay, often elaborately decorated; the domestic make is of yellow or buff clays. It is covered with a rich brown glaze which gives its distinctive characteristic, manganese being the chief color ingredient. Except for its glaze it is the same as other common ware made of domestic clays. It is used largely for teapots.

*Production.*—The statistics of production include stoneware and yellow ware with Rockingham earthenware. See common yellow, brown, or gray earthenware, *supra*.

*Import value* in 1908-9 was \$20,000; in 1911, \$89,692; in 1913, \$75,006. Later statistics follow:

Calendar year..	Value.	Duty.	Ad valorem rate.
			<i>Per cent.</i>
1918.....	\$43,137	\$12,941	30
1919.....	47,513	14,254	30
1920.....	99,931	29,979	30
1921 (9 months).....	62,949		

*Important changes in classification.*—The words “plain or embossed” qualify earthenware instead of stoneware, and provision for earthenware, ornamented or decorated or incised has been omitted. Separate provision for Rockingham ware was not made in H. R. 7456, because it is equal in all respects to other earthenware covered by paragraph 212.

---

PARAGRAPH 211.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 211. Graphite or plumbago, crude or refined, not specially provided for, 10 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 654. Plumbago [Free].

PAR. 579. Plumbago [Free].

## GRAPHITE OR PLUMBAGO.

(See Survey FL-24.)

*Description and uses.*—Plumbago, or graphite, is a soft, black variety of carbon. It occurs in nature in two forms, crystalline and amorphous, and is also produced artificially in the electric furnace from coal or other carbonaceous material. Graphite is employed for crucibles, as a lubricant, in paints, foundry facings, shoe polish, stove polish, dry batteries, electrodes, and boiler compounds, and for other purposes. For the making of good crucibles, its chief use, crystalline graphite, with flakes large enough to add to the binding power of clay, is essential.

*Production.*—In the order of their importance, the following lists show the principal graphite producing countries or those in which graphite deposits have been reported:

## CRYSTALLINE GRAPHITE.

(a) Vein graphite: Ceylon could produce up to 35,000 short tons per year, all grades; the United States, small production from Montana; Canada, small amount recently produced.

(b) Flake graphite: Madagascar could produce up to nearly 50,000 short tons per year; Bavaria produced 40,000 metric tons in 1917; the United States could readily produce 4,000 tons of flake, exclusive of dust; Rumania, important deposits recently reported; Greenland and Brazil, large deposits reported, very little development; German East Africa (former), deposits of supposed large extent reported.

## AMORPHOUS GRAPHITE.

German Austria and Czechoslovakia have long produced large amounts of graphite annually; Chosen could probably produce 12,000 tons per annum; Italy could probably produce 12,000 tons per annum; Mexico could probably produce 6,000 tons per annum; the United States could readily produce 6,000 tons of natural and 6,000 tons of artificial amorphous graphite; Siberia, large amounts available but undeveloped.

Amorphous graphite is so widely distributed that no serious difficulty is likely to be encountered by any of the great commercial nations in filling their vital needs. The most important deposits of crystalline graphite are controlled by Great Britain through her sovereignty over Ceylon and by France through sovereignty over Madagascar. Part of the Madagascar deposits are owned by a British company and part by Belgian capital. Japan controls the deposits of Chosen. American capital controls the deposits of the United States, of Mexico, and in part those of Canada. British interests own a part of the Italian and a part of the Spanish deposits.

The United States has heretofore not been considered independent in the matter of crucible graphite. Crucible makers, who use about 15,000 tons a year, have insisted on having Ceylon graphite. Montana produces a graphite that has been accepted by crucible manufacturers as equal to Ceylon material. The quantity ultimately available has not been proved, but may be sufficient to satisfy domestic demands for many years. It would appear that crucibles properly made from Alabama flake will give as good service as those made from the Ceylon material.

There is a larger degree of independence in the matter of amorphous graphite, of which the consumption is in the neighborhood of 15,000 tons annually. Practically all of this can be furnished from domestic sources, including both natural and artificial graphite, but during the war American-owned mines in Mexico and Canada were drawn upon to some extent and, more recently, Korean graphite has again been imported.

It is probable that Ceylon lump, regardless of price, will continue to be imported for some years as raw material for crucible manufacture on account of its established reputation. Extreme reluctance to use more than 20 per cent of domestic graphite in place of Ceylon is evinced by crucible manufacturers, but it is by no means clear as yet, either to those within the trade or without, that this is a necessary restriction. Foreign manufacturers were using up to 100 per cent Madagascar flake during the war period.

Production of natural graphite in the United States previous to 1914 was under 5,000 tons annually. Stimulated by war prices, the output rose to 8,088 tons in 1916 and to 13,593 tons valued at \$1,167,879 in 1917. In 1920 the production had declined to 9,510 tons valued at \$626,202; there were 17 producers. Operations in 1921 were practically discontinued at several mines. The following table shows the domestic natural graphite sold, 1916-1920:

Year.	Amorphous.		Crystalline.		Total.	
	Quantity (short tons).	Value.	Quantity (short tons).	Value.	Quantity (short tons).	Value.
1916.....	2,622	\$20,723	5,466	\$914,748	8,088	\$935,471
1917.....	8,301	73,481	5,292	1,094,398	13,593	1,167,879
1918.....	6,560	69,455	6,431	1,454,799	12,991	1,524,254
1919.....	3,379	47,716	4,043	731,141	7,422	778,857
1920.....	4,694	49,758	4,816	576,444	9,510	626,202

Imports of plumbago in 1917 amounted to 42,270 tons, valued at \$9,678,160. Later statistics follow:

	1918	1919	1920	1921 (9 months).
Quantity (tons).....	17,053	23,773	18,835	6,825
Value.....	\$2,983,250	\$2,978,096	\$1,711,300	\$424,261

The principal sources of importation, 1918-1921, were the British East Indies, England, and France.

Exports.—Some graphite is normally exported. The quantity in 1914 was 2,688 tons, valued at \$387,075. Later statistics follow:

	1918	1919	1920	1921 (9 months).
Manufactures of: (Value).....	\$731,518	\$788,755	\$610,261	\$530,203
Unmanufactured:				
Quantity (pounds).....	1,907,719	1,258,040	1,213,616	911,192
Value.....	\$121,555	\$90,185	\$112,771	\$59,904

The principal countries of destination were the United Kingdom, Canada, Mexico, Japan, and Denmark.

Important changes in classification.—Plumbago is exempt from duty under the act of 1913 (par. 579).

Suggested changes.—Page 29, lines 11, 12: Paragraph 211 is out of place. It should be renumbered 213; paragraph 212 should be renumbered 211, and paragraph 213 should be renumbered 212.

## PARAGRAPH 212.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 212. Earthenware and crockery ware composed of a nonvitrified absorbent body, including white granite and semiporcelain earthenware, and cream-colored ware, and stoneware, including clock cases with or without movements, pill tiles, plaques, ornaments, toys, charms, vases, statues, statuettes, mugs, cups, steins, lamps, and all other articles composed wholly or in chief value of such ware; if plain white, plain yellow, plain brown, plain red, or plain black, not painted, colored, tinted, stained, enameled, gilded, printed, ornamented, or decorated in any manner, and manufactures in chief value of such ware not specially provided for, 25 per centum ad valorem; if painted, colored, tinted, stained, enameled, gilded, printed, or ornamented or decorated in any manner, and manufactures in chief value of such ware, not specially provided for, 28 per centum ad valorem.

## ACT OF 1909.

PAR. 93. \* \* \* earthen, stone and crockery ware, including clock cases with or without movements, pill tiles, plaques, ornaments, toys, charms, vases, statues, statuettes, mugs, cups, steins, and lamps, all the foregoing wholly or in chief value of such ware; painted, colored, tinted, stained, enameled, gilded, printed, or ornamented or decorated in any manner; and manufactures in chief value of such ware not specially provided for in this section, sixty per centum ad valorem.

PAR. 94. \* \* \* earthen, stone and crockery ware, plain white, plain brown, including clock cases with or without movements, pill tiles, plaques, ornaments, toys, charms, vases, statues, statuettes, mugs, cups, steins, and lamps, all the foregoing wholly or in chief value of such ware, not painted, colored, tinted, stained, enameled, gilded, printed, or ornamented or decorated in any manner and manufactures in chief value of such ware not specially provided for in this section, fifty-five per centum ad valorem.

PAR. 96. \* \* \* filter tubes, thirty-five per centum ad valorem; \* \* \*.

PAR. 92. \* \* \* Rockingham earthenware, forty per centum ad valorem.

## ACT OF 1913.

PAR. 79. Earthenware and crockery ware composed of a nonvitrified absorbent body, including white granite and semiporcelain earthenware, and cream-colored ware, and stoneware, including clock cases with or without movements, pill tiles, plaques, ornaments, toys, charms, vases, statues, statuettes, mugs, cups, steins, lamps, and all other articles composed wholly or in chief value of such ware; if plain white, plain yellow, plain brown, plain red, or plain black, not painted, colored, tinted, stained, enameled, gilded, printed, ornamented or decorated in any manner, and manufactures in chief value of such ware not specially provided for in this section, 35 per centum ad valorem; if painted, colored, tinted, stained, enameled, gilded, printed, or ornamented or decorated in any manner, and manufactures in chief value of such ware not specially provided for in this section, 40 per centum ad valorem.

PAR. 82. \* \* \* filter tubes, 30 per centum ad valorem; \* \* \*.

PAR. 78. \* \* \* Rockingham earthenware, 30 per centum ad valorem.

## WHITE WARE.

(See Survey B-6.)

*Description and uses.*—Earthenware and crockery ware composed of a nonvitrified absorbent body, including white granite and semiporcelain earthenware, and cream-colored ware (and plain earthenware articles of corresponding grades made of mixed, washed, or prepared clays other than white) are known to manufacturers and the trade as earthenware. They are made of materials which result in an absorbent body usually covered with a brilliant transparent glaze.

The manufactured articles include plates, cups, saucers, dishes, toilet and kitchen ware, and other articles, made ordinarily in three grades, as follows: White earthenware, semiporcelain, and "cream color." These terms are used for the best quality of white earthenware. Queen's ware, ironstone china, and white granite ware are names used indiscriminately by the trade for the next grade of white earthenware. They are made of a superior quality of materials, and the body is slightly stained by a solution of cobalt, which gives it a bluish white cast. C. C. ware is a variety of goods made of low-grade china clays, the name being an abbreviation of the words "cream-colored ware." It is considered the cheapest quality of white pottery product. Fine stoneware, covered by the above paragraph, differs from common stoneware in the use of prepared clays and in greater care in the process of manufacture. Articles made of mixed, washed, or prepared clays, other than white, including fine yellow

carmelite and red white-lined cooking ware, jet ware teapots, and others as mentioned, are included in this classification.

*Production.*—In 1917–18 there were 55 potteries, with a capacity of 473 kilns. Sixty-five per cent of the total production was made in Ohio, nearly 20 per cent in West Virginia, and 15 per cent in seven other States. The principal materials used in the United States in the production of white ware are kaolin or china clay, ball clay, quartz, and feldspar. Nearly 39 per cent of white earthenware material is china clay, almost 15 per cent is ball clay, 32 per cent is flint, and 14 per cent feldspar. A large proportion of imported English china and ball clays is relied upon to bring American ware to the desired standard of quality. Before the war 56 per cent of the china clays and 77 per cent of the ball clays were imported from England. In 1917–18 about 50 per cent of the ball clays were imported, and this reduction in the proportion used resulted in a deterioration of the ware. The proportion of imported china clays has remained unchanged. Flint and feldspar are almost entirely of domestic origin. The domestic production of white ware, including C. C. ware, white granite, semiporcelain ware and semivitreous porcelain ware has been as follows: 1914, \$14,968,079; 1916, \$18,191,390; 1918, \$25,305,926; 1920, \$40,048,355. The great increase in value is due chiefly to an increase of about 100 per cent in cost rather than to an increase in quantity.

In the years prior to the war imports of white ware, of a competitive character, from France, Germany, Austria, and Japan were small. The better grades of English earthenware and of French, German, and Austrian china are not directly competitive with domestic production but do displace it indirectly. This was true also of a large proportion of German and Austrian china of a cheap character. Japanese chinaware at the present time also displaces American earthenware. In 1919 the exports from Japan of china were \$2,042,055 and of earthenware \$227,220 (foreign value). The exports of pottery to the United States in the calendar years immediately before the war were: 1913, from England, \$2,029,939, mainly earthenware; 1912, from Germany, china, \$3,017,364, earthenware, \$182,546; 1913, from Austria, china, \$458,825, earthenware, \$8,491; 1913, from France, \$1,704,440, china; 1912, from Japan, \$1,231,507, mainly china.

In 1913 an investigation of the cost of producing earthenware and chinaware in the United States and competing European countries was conducted, the full report of which is found in the Department of Commerce reports, Miscellaneous Series, No. 21, entitled "The Pottery Industry."

The comparative net value of the products of the various countries, based upon the cubic-foot measurement, is indicative of the total cost value of the glost-kiln (trade unit), as follows:

	United States.	England.	Germany.	Austria.
Earthenware ratio of values.....	\$377.08	\$239.00	\$213.81	.....
Ratio of direct labor values.....	126.97	65.91	67.10	.....
Chinaware ratio of values.....	701.47	.....	233.03	\$286.46
Ratio of direct labor values.....	206.39	.....	47.87	68.64

*Imports* in 1918 were valued at \$2,433,945. Prior to the act of 1913, import statistics of china and earthenware were combined. For the five years, 1909-1913, imports from Germany averaged \$3,942,057; from Japan, \$1,200,114; from Austria-Hungary, \$735,625. These values are largely for cheap chinaware competitive with American earthenware. During the same period imports from England averaged \$2,192,495, chiefly for earthenware. Shipments from Japan and from England have increased since the elimination of German and Austrian competition.

In 1914 indications were that foreign ware brought higher prices than domestic ware, and that the difference between the cost to the domestic retailer and his selling price was 66 per cent on American earthenware, 65 per cent on Austrian china, 78 per cent on German china, 89 per cent on French china, and 67 per cent on English earthenware. Later statistics follow:

*Earthen and crockery ware, etc.*

Calendar year.	Value.	Duty.	Ad valorem rate.

1921 (9 months).....	50,731		

<sup>1</sup> July 1 to Dec. 31, 1918.

The above imports were chiefly from England, Japan, and Canada.

*Exports* of earthen and stone ware, principally to Canada, Cuba, and Mexico, have been as follows: 1918, \$783,577; 1919, \$1,148,051; 1920, \$1,241,938; 1921 (first nine months), \$855,203.

## SANITARY EARTHENWARE.

(See Survey B-6.)

*Description and uses.*—Sanitary earthenware consists of bathtubs, lavatories, bowls, sinks, and other bathroom fixtures. The ware is composed of a mixture of china and other white clays throughout, or of high-grade fire clays coated with porcelain.

*Production.*—The domestic production is sufficient to supply the home market and furnishes a considerable volume of exports. The raw materials are all found in considerable quantities within the borders of the United States. High-grade china and ball clays are imported to a large extent, but domestic deposits of fire clays and coal are equal or superior to any found abroad. The equipment and structural materials necessary to the manufacturing process are all produced or manufactured in the United States. The manufacture of sanitary ware is largely handwork. Most of the material is built up and shaped by hand. The industries are operated in large plants usually located near sources of raw material and fuel. New Jersey is the largest producer of sanitary ware, while Ohio holds an important position.

Great Britain, France, Germany, and Austria are large producers. Sanitary ware was first developed in England, and continental potteries have brought the manufacture of porcelain ware to a high state of perfection. England formerly exported considerable quantities of sanitary ware to the United States; but with the improvement of the domestic product only small amounts, chiefly specialties, are now imported.

The domestic production of sanitary ware has been as follows: 1910, \$7,874,269; 1916, \$11,111,417; 1918, \$11,241,138; 1920, \$22,014,657.

*Imports* of sanitary earthenware (closet bowls, lavatories, sinks, and similar articles) are shown in the following table:

Calendar year.	Value.	Duty.	Ad valorem rate.
PLAIN WHITE, YELLOW, BROWN, RED, OR BLACK.			
1918.....	\$5,624	\$1,968	35
1919.....	4,307	1,507	35
1920.....	5,984	2,094	35
1921 (9 months).....	2,952		
COLORED, ETC.			
1918.....	\$12,710	\$5,084	40
1919.....	3,673	1,469	40
1920.....	4,983	2,834	40
1921 (9 months).....			

*Exports* of sanitary earthenware, principally to Cuba, Canada, Argentina, and the Philippines, have been as follows: 1918, \$377,527; 1919, \$563,734; 1920, \$778,714; 1921 (first 9 months), \$456,260.

#### FILTER TUBES.

*Description and uses.*—Filter tubes are usually made of porous earthenware and are used for filtering drinking water and solutions in chemical works.

*Imports* have varied in value from \$7,432 in 1914 to \$2,769 in 1916, \$3,394 in 1918, and \$3,096 in 1920.

*Exports.*—None recorded.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Filter tubes are not specifically provided for in H. R. 7456.

*Suggested changes.*—Page 29, lines 20, 24: Strike out "if," to agree with practice elsewhere.

Page 29, line 22: Insert "or" before "ornamented" and strike out the comma after "ornamented," to agree with line 25.

---

### PARAGRAPH 213.

#### H. R. 7456.

#### SENATE AMENDMENTS.

PAR. 213. China, porcelain, and other vitrified wares, including chemical porcelain ware and chemical stoneware, composed of a vitrified nonabsorbent body which when broken shows a vitrified or vitreous, or semivitrified or semivitreous fracture, and all bisque and parian wares, including clock cases with or without movements, plaques, ornaments, toys, charms, vases, statuettes, mugs, cups, steins, lamps, and all other articles composed wholly or in chief value of such ware, if plain white, or plain brown, not painted, colored, tinted, stained, enameled, gilded, printed, or ornamented or decorated in any manner, and manufactures in chief value of such ware not specially provided for, 35 per centum ad valorem; if painted, colored, tinted, stained, enameled, gilded, printed, or ornamented or decorated in any manner, and manufactures in chief value of such ware not specially provided for, 40 per centum ad valorem.

#### ACT OF 1909.

PAR. 93. China, porcelain, parian, bisque, \* \* \* ware, including clock cases with or without movements, pill tiles, plaques, ornaments, toys, charms,

#### ACT OF 1913.

PAR. 80. China and porcelain wares composed of a vitrified nonabsorbent body which when broken shows a vitrified or vitreous, or semivitrified or

vases, statues, statuettes, mugs, cups, steins, and lamps, all the foregoing wholly or in chief value of such ware; painted, colored, tinted, stained, enameled, gilded, printed, or ornamented or decorated in any manner; and manufactures in chief value of such ware not specially provided for in this section, sixty per centum ad valorem.

PAR. 94. China, porcelain, parian, bisque, \* \* \* ware, plain white, plain brown, including clock cases with or without movements, pill tiles, plaques, ornaments, toys, charms, vases, statues, statuettes, mugs, cups, steins, and lamps, all the foregoing wholly or in chief value of such ware, not painted, colored, tinted, stained, enameled, gilded, printed, or ornamented or decorated in any manner; and manufactures in chief value of such ware not specially provided for in this section, fifty-five per centum ad valorem.

semivitreous fracture, and all bisque and parian wares, including clock cases with or without movements, plaques, ornaments, toys, charms, vases, statues, statuettes, mugs, cups, steins, lamps, and all other articles composed wholly or in chief value of such ware, if plain white, or plain brown, not painted, colored, tinted, stained, enameled, gilded, printed, or ornamented or decorated in any manner; and manufactures in chief value of such ware not specially provided for in this section, 50 per centum ad valorem; if painted, colored, tinted, stained, enameled, gilded, printed, or ornamented or decorated in any manner and manufactures in chief value of such ware not specially provided for in this section, 55 per centum ad valorem.

#### CHINAWARE.

(See Survey B-6.)

*Description and use.*—China or porcelain is a fine, translucent ware having a white body. Domestic vitreous china, however, includes heavy, opaque hotel and club china of superior quality, besides a general line of translucent tableware rivaling the high-grade products of Europe in durability and beauty. High-grade bone china tableware is made in this country which equals in beauty, texture, and artistic decoration the china of famous English potteries. China and porcelain wares include dinner sets, kitchen, toilet, and art wares, and electrical porcelain. Parian and bisque are unglazed porcelain.

Chemical stoneware consists of hard-burned articles such as valves, crocks, digestors, and other objects which are used to contain or convey corrosive liquids.

*Production.*—Vitreous china is manufactured in the United States in 8 potteries, having 74 kilns capacity (1919). Seventy-eight per cent of the total production is made in the States of New Jersey and New York and 22 per cent in 3 other States. Vitreous china or porcelain is made from the same materials as earthenware by increasing the feldspar and decreasing the clay content; by firing to a higher temperature the transition from white earthenware to vitreous china is made. Bone china contains from 40 to 50 per cent bone ash, 20 to 30 per cent Cornish stone, and 25 to 30 per cent clay, and is a typical English product.

Statistics of foreign production of chinaware are not obtainable, but potential foreign competitive power is indicated in exports. For the year 1913, the total exports of chinaware from Germany, France, England, Japan, and Austria were valued at \$23,532,930, and of this the amount imported by the United States from these countries was approximately \$7,500,000, or 32 per cent. In that year we imported the following percentages of the total exports of

the countries mentioned: France, 62; Japan, 31; Germany, about 27; Austria, about 22; and England, about 52.

The Bureau of Foreign and Domestic Commerce made an international investigation of china pottery costs during the year 1913 and up to the outbreak of the war in 1914. The report shows that, per unit of product, the average cost of production f. o. b. factory of vitreous china not decorated was 129 per cent higher in four typical American china potteries than in Austrian china potteries, and 197.4 per cent higher than in German china potteries.

The increased costs of imported chinaware into the United States borne by the Austrian and German china potteries above the factory costs of production and above their selling prices were from 60 to 75 per cent and included the rate of duty of 50 per cent, local and ocean rates of transportation, package charges and duties, insurance, consular, and other fees.

The average labor cost per unit of product in the American vitreous china potteries was very much greater than in American earthenware potteries, owing to the slower processes of manufacture and the difficulty in firing and in manipulating the material in all stages. The American vitreous china labor cost was 73.3 per cent higher than in American earthenware, 182.3 per cent higher than in Austrian china, and 314 per cent higher than in German china potteries.

The average wage per full-time week of jiggermen (typical skilled workingmen) was \$23.87 in American vitreous china potteries, \$6.65 in German, and \$6.37 in Austrian china potteries. As an evidence of greater efficiency in production it was noted that while the labor cost per unit of production was 182 per cent higher than in Austrian potteries, the wage rate was 275 per cent higher in the typical occupation of jiggermen than in Austrian potteries. The contrary was true with regard to German china, for while the American vitreous china labor cost per unit was 314 per cent higher than for German china, the vitreous china wage rate was 259 per cent higher than for German china. The following table shows the value of the chinaware produced in the United States in specified years:

Year.	China.	Chemical stoneware and porcelain.	Porcelain electrical supplies.
1914.....	\$2,384,686	(1)	\$4,130,270
1916.....	3,478,372	\$1,054,061	7,034,420
1918.....	6,307,349	1,769,710	12,505,970
1920.....	9,466,662	{ <sup>2</sup> 1,014,623 <sup>3</sup> 258,888}	20,218,924

<sup>1</sup> Not separately classified prior to 1916.

<sup>2</sup> Chemical stoneware.

<sup>3</sup> Chemical porcelain.

*Import* value in 1913 from the five principal countries was about \$7,525,000; 49 per cent from Germany, 22 per cent from France, 14 per cent from Japan, 8 per cent from Austria, and 7 per cent from England. After the war the Japanese imports more than doubled. Japan, Germany, and France have remained the principal source of imports since 1918. Statistics for 1918-1921 are tabulated as follows:

*China, porcelain, parian, and bisque wares.*

1921 (9 months).....	386,971		

1 July 1 to Dec. 31, 1918.

Imports of clock cases, with or without movements, composed of china and porcelain, bisque and parian ware, plain, white, or brown, were negligible.

*Exports* of chinaware, chiefly to Canada, Cuba, and Mexico, have been as follows: 1914, \$166,635; 1918, \$318,448; 1919, \$523,861; 1920, \$816,817; 1921 (9 months), \$248,627.

*Suggested changes.*—Page 30, line 6: Insert a comma after “semi-vitreous.”

Page 30, lines 11 and 15: Strike out “if” to agree with similar provisions elsewhere.

As pill tiles are made of porcelain as well as of earthenware, but are mentioned only in paragraph 212 of H. R. 7456, they might be mentioned in paragraph 213 of H. R. 7456 between “movements” and “plaques,” page 30, line 8.

Omission of the words “vitrified nonabsorbent” before “body,” in line 5, page 30, would avoid conflict with the words “semivitrified or semivitreous,” in line 6, page 30, before “fracture.”

### PARAGRAPH 214.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 214. Earthy or mineral substances wholly or partly manufactured and articles, wares, and materials, crude or advanced in condition, composed wholly or in chief value of earthy or mineral substances, not specially provided for, whether susceptible of decoration or not, if not decorated in any manner, 21 per centum ad valorem; if decorated, 28 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 95. Articles and wares composed wholly or in chief value of earthy or mineral substances, not specially provided for in this section, whether susceptible of decoration or not, if not decorated in any manner, thirty-five per centum ad valorem; if decorated, forty-five per centum ad valorem; \* \* \*.

PAR. 81. Earthy or mineral substances wholly or partially manufactured and articles and wares composed wholly or in chief value of earthy or mineral substances, not specially provided for in this section, whether susceptible of decoration or not, if not decorated in any manner, 20 per centum ad valorem; if decorated, 25 per centum ad valorem; unmanufactured carbon, not specially provided for in this section, 15 per centum ad valorem; \* \* \*.

EARTHY AND MINERAL SUBSTANCES, N. S. P. F.

(See Surveys B-4 and B-7.)

GENERAL.

*Description and use.*—These include too many items for special description.

*Production.*—The classification is too general for statistics.

*Imports* of plain articles and wares were valued at \$90,326 and of decorated articles and wares at \$22,089 in 1914. Later statistics follow:

*Earthy and mineral substances, n. s. p. f.*

## SEWER PIPE, DRAINTILE, AND FIREPROOFING TILE OR BLOCK.

(See Survey B-7.)

*Description and uses.*—Sewer pipe is salt-glazed clay pipe used for conveying water or sewage and as conduit pipe for subsurface electric cables. Draintile are unglazed clay pipes used for draining the surplus water from marshy or flooded farm lands. Fireproofing tile or block are solid or hollow blocks of burned clay used in place of brick or concrete for walls and floors. Combustible material, such as straw, sawdust, or coal, is often added to the clay mix, so that the burned product is light in weight and very porous.

*Production.*—The domestic industry manufactures practically the entire domestic supply of these products. All machinery and equipment are produced or manufactured in the United States, and the domestic processes are at least as efficient as those used in any foreign country. Sewer pipe is produced in heavy presses, which shape the article from a clay slug; draintile and fireproofing block are made by forcing the clay through a die at the discharge end of the mixing or pug mill. In this manner finished green tile are produced in one operation.

The industry is widely distributed throughout the United States. There was \$70,900,000 invested therein in 1914, divided among 769 establishments manufacturing sewer pipe and draintile, and 115 establishments manufacturing fireproofing tile or block. Ohio, New Jersey, Pennsylvania, Illinois, Missouri, Indiana, and Iowa are the most important producing States.

The manufacture of sewer pipe and draintile originated in England and continental Europe, but fireproofing tile is an American development growing out of the local steel-construction practice. The manufactures of sewer pipe and draintile are local industries in all foreign countries, the domestic industries producing enough to satisfy the home market.

The cost of these articles per unit of weight is small, and the careful packing necessary when long-distance shipments are to be made restricts the market of the domestic plants and practically prohibits international shipments. The production of specified clay products in the United States in specified years has been as follows:

	1914	1918	1919 <sup>1</sup>	1920 <sup>1</sup>
Drain tile.....	\$8,522,039	\$8,196,199	\$10,420,000	\$13,080,000
Hollow building tile or block:				
Quantity (tons).....		<sup>2</sup> 1,953,392	2,310,450	2,457,000
Value.....	<sup>3</sup> \$8,385,337	<sup>2</sup> \$13,037,102	\$16,620,000	\$25,900,000
Sewer pipe.....	14,014,767	15,333,673	16,170,000	22,240,000

<sup>1</sup> Estimated.

<sup>2</sup> Includes "fireproofing."

<sup>3</sup> Includes fireproofing and terra-cotta lumber.

*Imports.*—No statistics are available, but the amount is negligible. At times small amounts of Canadian pipe and tile are imported from plants close to the international boundary.

*Exports.*—Small shipments of sewer pipe and building tile are exported to Canada, but the amount is usually negligible.

*Important changes in classification.*—"Materials, crude or advanced in condition," have been added to cover materials not "substances wholly or partly manufactured" nor "articles and wares" within the meaning of this provision.

*Suggested changes.*—Strike out comma after "materials" in line 20, page 30.

## PARAGRAPH 215.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 215. Gas retorts, 15 per centum ad valorem; lava tips for burners, and magnesia clay supporters, consisting of rings, rods, and other forms for gas mantles, 35 per centum ad valorem.

ACT OF 1909.

PAR. 96. Gas retorts, twenty per centum ad valorem; lava tips for burners, ten cents per gross and fifteen per centum ad valorem; \* \* \*.

ACT OF 1913.

PAR. S2. Gas retorts, 10 per centum ad valorem; lava tips for burners, 15 per centum ad valorem; \* \* \*.

PAR. S1. Earthy or mineral substances wholly or partially manufactured and articles and wares composed wholly or in chief value of earthy or mineral substances, not specially provided for in this section, whether susceptible of decoration or not, if not decorated in any manner, 20 per centum ad valorem; \* \* \*.

## GAS RETORTS.

*Description and use.*—Gas retorts for use in the manufacture of coal gas are made usually of fire clay or silica.

*Production* figures are not available, but most of the retorts used are of domestic manufacture.

*Imports* have been small—in 1914, 455 retorts, valued at \$17,627; in 1915, 152 retorts.

*Exports.*—None recorded.

## LAVA TIPS FOR BURNERS.

*Description and uses.*—Lava tips for burners are not made of lava, but of talc.

*Imports* before the war were almost entirely from Germany, amounting in 1913 to 17,148 gross, valued at \$9,759. In 1914, 2,955 gross were imported, and in 1915, 1,680 gross. Imports are not shown separately since 1915.

*Exports.*—None recorded.

*Important changes in classification.*—Magnesia clay supporters are for the first time specifically provided for.

*Suggested changes.*—Page 31, line 3: Insert comma after "forms."

## PARAGRAPH 216.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 216. Carbons and electrodes, of whatever material composed, and wholly or partly manufactured, for producing electric arc light; electrodes, composed wholly or in part of carbon or graphite, and wholly or partly manufactured, for electric furnace or electrolytic purposes; brushes, of whatever material composed, and wholly or partly manufactured, for electric motors, generators, or other electrical machines or appliances; plates, rods, and other forms, of whatever material composed, and wholly or partly manufactured, for manufacturing into the aforesaid brushes; and articles or wares (composed wholly or in part of carbon or graphite), wholly or partly manufactured, not specially provided for, 35 per centum ad valorem.

## ACT OF 1909.

PAR. 95. \* \* \* carbon, not specially provided for in this section, twenty per centum ad valorem; electrodes, brushes, plates, and disks, all the foregoing composed wholly or in chief value of carbon, thirty per centum ad valorem.

PAR. 96. \* \* \* carbons for electric lighting, wholly or partly finished, made entirely from petroleum coke, thirty-five cents per hundred feet; if composed chiefly of lamplblack or retort carbon, sixty-five cents per hundred feet; \* \* \* porous carbon pots for electric batteries, without metallic connections, twenty per centum ad valorem.

## ACT OF 1913.

PAR. 81. \* \* \* electrodes for electric furnaces, electrolytic and battery purposes, brushes, plates, and disks, all the foregoing composed wholly or in chief value of carbon, 25 per centum ad valorem; manufactures of carbon not specially provided for in this section, 20 per centum ad valorem.

PAR. 82. \* \* \* carbons for electric lighting, wholly or partly finished, made entirely from petroleum coke, 15 cents per hundred feet; if composed chiefly of lamplblack or retort carbon, 40 cents per hundred feet; carbons for flaming arc lamps, not specially provided for in this section, \* \* \* 30 per centum ad valorem; porous carbon pots for electric batteries, 15 per centum ad valorem.

## CARBON PRODUCTS.

(See Surveys B-8 and C-31.)

## GENERAL.

*Description and uses.*—Carbon products in recent years have been rapidly increasing in importance. While carbon arc lamps for street lighting are now becoming obsolete, new fields have developed, chief among which are the manufacture of steel, ferro-alloys, aluminum, and chemical products, electrolytically or in the electric furnace. Other important uses are for the telephone, dry batteries, motion-picture projection, photography, searchlights, brushes for motors and generators, and many miscellaneous purposes.

*Production.*—The bulk of production in the United States is by the aluminum industry, manufacturing electrodes for its own use, and by two other large producers, which specialize in the graphitic and amorphous types. There are a considerable number of smaller manu-

facturers. Our export trade in certain lines was considerable before the war, and was generally increased by the large European war demands.

The chief foreign producers are Germany, England, and France. English and French competition in the domestic market is almost entirely in brushes; that of Germany largely in electric-lighting carbons. Carbon products are also made in other countries of Europe and in Japan. Foreign manufacturers have no advantage in obtaining materials. Success depends largely on careful supervision, requiring relatively highly paid labor. Labor forms a large proportion of the total cost. In the case of large electrodes, running in size up to 24 inches in diameter, labor is a smaller part of the total cost than in lighting carbons of half-inch size.

Production of all classes of carbons in 1919 amounted to \$13,292,000, included in which were furnace carbons, \$5,846,594; brushes, battery, and miscellaneous carbons, \$5,342,633; and lighting carbons, \$1,248,683. Brushes alone, produced during 1914-1919, were valued as follows:

1914-----	\$822, 226. 80		1917-----	\$2, 336, 462. 44
1915-----	1, 572, 449. 18		1918-----	2, 834, 249. 90
1916-----	1, 768, 773. 39		1919-----	4, 088, 411. 40

## ELECTRIC-LIGHT CARBONS.

(See Survey B-8.)

*Description and uses.*—Electric lighting carbons are cylindrical rods used for the production of the arc light. Two carbons, connected to a source of current, are brought together, end to end, completing the circuit and starting a current, and are then separated slightly; a portion of the carbon is vaporized, and the current continues across the bridge of carbon vapor, called the arc. Carbon arcs are of two general types, (a) the ordinary arc, in which the light is produced by the high temperature to which the end of one or both of the carbons is raised, and (b) the flaming arc, in which the light is produced by the arc itself. In the ordinary arc, the arc of carbon vapor gives very little light, but by adding to one or both of the carbon rods certain salts, the hot vapor becomes very luminous, producing the flaming arc.

Each of the types of arc mentioned requires a carbon of a special composition; and further, there is required a large variety of carbons the choice of which depends upon the purpose for which the light is to be used. Petroleum coke carbons, used for the open arc lamp, are nearly obsolete, though still employed to some extent for old type locomotive headlights and for street lighting. Lampblack carbons, solid or having a core containing neutral salts, are widely used for motion-picture projection. Lampblack carbons, with core containing flaming salts, are adapted to projectors used with certain types of current, and also to indoor photography and photoengraving. Homogeneous mixtures of carbons and flaming salts are now little used.

*Production.*—The value of carbons for electric lighting produced in the United States in 1914 was about \$800,000.

*Imports* have been principally of carbon composed chiefly of lamp-black or retort carbon. These amounted in 1913 to 17,600,380 feet; in 1914 to 15,690,763 feet. Imports of carbons made entirely from petroleum coke amounted in 1913 to 642 feet; in 1914 to 51,950 feet.

Imports of carbons for recent years, for electric lighting, chiefly from Germany and England, have been as follows:

Calendar year.	Quantity	Value.	Duty.	Equiva- lent ad valorem.
FOR FLAMING ARC LAMPS, N. S. P. F.				
	<i>100 feet.</i>			<i>Per cent.</i>
1918.....	4	\$13	\$4	30.00
1919.....	3	24	7	30.00
1920.....	42	45	13	30.00
1921 (9 months).....	50	218		
MADE ENTIRELY FROM PETROLEUM COKE.				
1918.....				
1919.....				
1920.....	500	\$3,517	\$84	2.39
1921 (9 months).....	42	170		
COMPOSED CHIEFLY OF LAMPBLACK OR RETORT CARBON.				
1918.....	24	\$101	\$10	9.51
1919.....	3,224	20,967	1,290	6.15
1920.....	41,868	217,947	16,747	7.68
1921 (9 months).....	555,723	177,428		

*Exports.*—See below, electrodes, brushes, etc.

*Important changes in classification.*—The separate provisions for three types of lighting carbons in the act of 1913, two of which carried a specific and the other an ad valorem duty, have been replaced by a single classification, covering all electrodes for electric lighting, of whatever material composed, and providing an ad valorem duty.

#### ELECTRODES, BRUSHES, PLATES, DISKS.

(See Survey B-8.)

*Description and uses.*—Carbon electrodes are rods of carbon, ordinarily ranging from 3 to 24 inches in diameter, but sometimes as small as 1 inch in diameter. They are used either in (1) the electric furnace, or (2) electrolytic processes.

Furnace electrodes are used in furnaces of the arc type, in which a high temperature is produced by the passage of a current through an arc formed between two carbons or between a carbon and the conducting contents of an electric furnace. Carbon is the only material suitable for this purpose on account of its high vaporizing temperature and its electrical conductivity. Owing to their resistance to chemical action, carbon electrodes are used for the manufacture of chemicals by electrolytic processes.

Carbon brushes are small pieces of carbon which convey electrical current to revolving parts of machines by bearing against the

revolving surface. The greater number of the articles classed as carbon plates, disks, and specialties are used for electrical equipment, some of the more important of which are granulated carbon and disks for telephones, battery carbons, carbon contacts, and packing rings.

*Production.*—The materials used in the manufacture of these articles are anthracite coal, coal-gas coke or petroleum coke, lampblack, graphite, hard and soft pitch, and coal tar. For electrical brushes, copper powder is sometimes mixed with the carbon to increase the conductivity. The coke is ground, the ingredients mixed, pressed into the desired shape by hydraulic pressure, and then baked to drive off volatile products.

Graphite electrodes are graphitized by the heat of the electric furnace instead of being baked, as in the amorphous forms.

*Imports* of brushes, electrodes, disks, and plates in 1914 were valued at \$147,771. The value was slightly lower in 1915.

Recent imports have been principally from France and the United Kingdom. Statistics of imports since 1917 follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
----------------	-----------	--------	-------	------------------

## BRUSHES.

	Number.			Per cent.
1918.....	1 677,754	\$55,004	\$13,751	25
1919.....	1,766,730	173,122	43,281	25
1920.....	2,704,774	140,791	35,198	25
1921 (9 months).....	740,998	82,478		

## ELECTRODES FOR ELECTRIC FURNACES, ELECTROLYTIC AND BATTERY PURPOSES.

1918.....	1 108,512	\$27,406	\$6,851	25
1919.....	71,385	6,209	1,552	25
1920.....	216	229	57	25
1921 (9 months).....	13,436	3,196		

## PLATES AND DISKS.

1918.....	1 772,354	\$21,666	\$5,416	25
1919.....	579,759	11,867	2,967	25
1920.....	526,805	13,323	3,331	25
1921 (9 months).....	111,620	2,498		

<sup>1</sup> July 1 to Dec. 31, 1915.

*Exports* of electrical carbons, principally to Canada, Japan, Italy, and England, have been as follows (calendar years): 1918, \$1,600,920; 1919, \$1,391,765; 1920, \$1,477,831; 1921 (9 months), \$347,306.

*Important changes in classification.*—The provision for electrodes has been broadened to include those in part of carbon as well as those in chief value of carbon. All electric brushes of whatever material composed have been included in this paragraph, as well as all wholly or partly manufactured material for manufacture into brushes. This is of importance, as material for brushes has been imported as manufactures of metal.

## ALL OTHER MANUFACTURES OF CARBON.

*Imports.*—In 1913 Germany contributed nearly 50 per cent of the total imports (\$38,863). Since 1915 the imports have been mostly from France, Japan, and Canada. The value in 1917 was \$135,424.

“All other manufactures” were reported as follows:

Calendar year.	Value.	Duty.	Ad valorem rate.
1918.....	\$107,480	\$21,496	20
1919.....	51,255	10,251	20
1920.....	98,644	19,729	20
1921 (9 months).....	46,356		

Imports of porous carbon pots for batteries were valued at less than \$100 a year since 1914.

*Important changes in classification.*—The paragraph has been broadened to include all manufactures in part of carbon.

*Suggested changes.*—The parentheses near the end of the paragraph inclosing the words “composed wholly or in part of carbon or graphite” have no effect, and should be omitted.

## PARAGRAPH 217.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 217. Plain green or colored, molded or pressed, and flint, lime, or lead glass bottles, vials, jars, and covered or uncovered demijohns, and carboys, any of the foregoing, filled or unfilled, not specially provided for, and whether their contents be dutiable or free (except such as contain merchandise subject to an ad valorem rate of duty, or to a rate of duty based in whole or in part upon the value thereof, which shall be dutiable at the rate applicable to their contents), shall pay duty as follows: If holding more than one pint, 1 cent per pound; if holding not more than one pint and not less than one-fourth of a pint,  $1\frac{1}{2}$  cents per pound; if holding less than one-fourth of a pint, 50 cents per gross: *Provided*, That none of the above articles shall pay a less rate of duty than 28 per centum ad valorem: *Provided further*, That the terms “bottles,” “vials,” “jars,” “demijohns,” and “carboys,” as used herein, shall be restricted to such articles when suitable for use as and of the character ordinarily employed as containers for the holding and transportation of merchandise, and not as appliances or implements in chemical or other operations.

## ACT OF 1909.

PAR. 97. Plain green or colored, molded or pressed, and flint, lime, or lead glass bottles, vials, jars, and covered or uncovered demijohns, and carboys, any of the foregoing, filled or unfilled, not otherwise specially provided for in this section, and whether their contents be dutiable or free (except such as contain merchandise subject to an ad valorem rate of duty, or to a rate of duty based in whole or in part upon the value thereof which shall be dutiable at the rate applicable to their contents), shall pay duty as follows: If holding more than one pint, one cent per pound; if holding not more than one pint and not less than one-fourth of a pint, one and one-half cents per pound; if holding less than one-fourth of a pint, fifty cents per gross: *Provided*, That none of the above articles shall pay a less rate of duty than forty per centum ad valorem: *Provided further*, That the terms bottles, vials, jars, demijohns, and carboys, as used herein, shall be restricted to such articles when suitable for use as and of the character ordinarily employed as containers for the holding or transportation of merchandise, and not as appliances or implements in chemical or other operations.

## ACT OF 1913.

PAR. 83. Plain green or colored, molded or pressed, and flint, lime, or lead glass bottles, vials, jars, and covered and uncovered demijohns, and carboys, any of the foregoing, filled or unfilled, not otherwise specially provided for in this section, and whether their contents be dutiable or free (except such as contain merchandise subject to an ad valorem rate of duty, or to a rate of duty based in whole or in part upon the value thereof which shall be dutiable at the rate applicable to their contents), 30 per centum ad valorem: *Provided*, That the terms bottles, vials, jars, demijohns, and carboys, as used herein, shall be restricted to such articles when suitable for use as and of the character ordinarily employed as containers for the holding or transportation of merchandise, and not as appliances or implements in chemical or other operations.

## GLASS CONTAINERS, ETC.

(See Survey B-9.)

*Description and uses.*—Molded, pressed, or other glass containers, which may be plain green or colored, include fruit jars, milk bottles, medicine bottles, and bottles for liquors, preserves, and other food-stuffs. Lime glass is used for ordinary large bottles; small vials are usually made of lead glass. The principal materials used are sand, soda ash, ground limestone, salt cake, lead oxide, and small amounts of arsenic, all of domestic origin.

*Production.*—The number of establishments engaged in the manufacture of glass bottles, jars, etc., was, in 1914, 150; in 1919, 139. The total value of the product in 1914 was \$51,959,000, and in 1919, \$87,762,000.

In 1918, 45 per cent of the output came from automatic machines, 35 per cent from semiautomatic machines, and about 20 per cent from hand labor. In 1914 the output was 4,893,416 gross druggist's bottles, etc., 4,573,610 gross beer, soda, and mineral-water bottles, 2,689,022 gross liquor bottles and flasks; 1,198,952 gross fruit jars, 1,188,891 gross milk bottles, 1,384,689 gross patent-medicine bottles, 3,271,184 gross food-preserving and packer's containers; 79,211 gross battery jars and electric goods; and 160,796 dozen demijohns and carboys. The value of production increased 54.5 per cent between 1904-1914, this form of glass constituting 42 per cent in value of the total production.

Statistics of foreign production are not available. For the year 1913, however, the figures of imports of bottles by 82 foreign countries show that in value they amounted to \$14,051,082, and of this amount the exports from the United States amounted to \$808,327. Of the total, the principal glass-producing countries imported from each other a total of \$5,775,620, including Germany, Austria, France, Netherlands, Italy, and the United Kingdom. The same year the exports of hollow glassware from Germany were valued at 15½ millions of dollars, from Austria 7½ millions, from France 6½ millions, Belgium 4½ millions, United Kingdom 3 millions, Netherlands 600 thousand. In none of these countries is domestic consumption indicated, but to some extent their potential power is indicated by the above figures.

A report on the condition of the Belgian glass industry by Consul Charles Roy Nasmith, Brussels, under date of March 13, 1919, states that "there was only one bottle factory in 1914 and that was at Jumet, where two furnaces were in operation. They were in operation during the war and continue to work. A new factory is being constructed at Merxem, near Antwerp."

The makers of bottles by automatic machines apparently have no fear of foreign competition. They expect to hold the domestic market by the superior quality of their bottles made in modernly constructed factories, with improved methods for the systematic factory handling of their product.

The makers of bottles by hand, however, are depending upon a protective tariff upon the ground of labor cost.

*Imports*, including filled and empty bottles, were valued at \$1,185,015 in 1914. Imports are chiefly from France and Germany. Later statistics follow:

*Bottles, vials, and jars, plain green or colored, molded or pressed, and flint, lime, or lead, n. s. p. f.*

## PARAGRAPH 218.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 218. Bottles, and all articles of every description, composed wholly or in chief value of glass or paste, blown or partly blown in the mold or otherwise, colored, cut, engraved, etched, frosted, gilded, ground (except such grinding as is necessary for fitting stoppers or for purposes other than ornamentation), painted, printed in any manner, sand-blasted, silvered, stained, or decorated or ornamented in any manner, whether filled or unfilled, or whether their contents be dutiable or free, 40 per centum ad valorem: *Provided*, That the foregoing containers of merchandise subject to an ad valorem rate of duty or to a rate of duty based in whole or in part upon the value thereof, shall be dutiable at the rate applicable to their contents, but not less than the rate provided for in this paragraph: *Provided further*, That for the purposes of this Act, bottles with cut-glass stoppers shall with the stoppers be deemed entireties.

## ACT OF 1909.

PAR. 98. Glass bottles, decanters, and all articles of every description composed wholly or in chief value of glass, ornamented or decorated in any manner, or cut, engraved, painted, decorated, ornamented, colored, stained, silvered, gilded, etched, sand blasted, frosted, or printed in any manner, or ground (except such grinding as is necessary for fitting stoppers or for purposes other than ornamentation), and all articles of every description, including bottles and bottle glassware, composed wholly or in chief value of glass blown either in a mold or otherwise; all of the foregoing, not specially provided for in this section, filled or unfilled, and whether their contents be dutiable or free, sixty per centum ad valorem: *Provided*, That for the purposes of this Act, bottles with cut glass stoppers shall, with the stoppers, be deemed entireties.

## ACT OF 1913.

PAR. 84. Glass bottles, decanters, and all articles of every description composed wholly or in chief value of glass, ornamented or decorated in any manner, or cut, engraved, painted, decorated, ornamented, colored, stained, silvered, gilded, etched, sand blasted, frosted, or printed in any manner, or ground (except such grinding as is necessary for fitting stoppers or for purposes other than ornamentation), and all articles of every description, including bottles and bottle glassware, composed wholly or in chief value of glass blown either in a mold or otherwise; all of the foregoing, not specially provided for in this section, filled or unfilled, and whether their contents be dutiable or free, 45 per centum ad valorem: *Provided*, That for the purposes of this Act; bottles with cut-glass stoppers shall, with the stoppers, be deemed entireties.

## BLOWN AND PRESSED GLASSWARE, ETC.

(See Survey B-9.)

*Description.*—The principal groups of blown and pressed glassware are pressed table and lighting glassware, blown tumblers, stem ware and bar goods, lamps and lamp chimneys, cut glass, and decorated ware, pressed jelly glasses, tumblers, and goblets.

*Production.*—The number of establishments manufacturing pressed and blown glass in 1914 was 107 and in 1919, 130. The value of the product in the corresponding years was \$30,279,000 and \$70,708,000. In 1917, 8,282 skilled workmen were employed in this industry. The raw materials used are sand, soda ash, lime, lead oxide (all of domestic origin), and carbonate of potash, nitrate of soda, manganese, antimony compounds, arsenic, and powdered blue (partly or wholly of foreign origin). Red lead, saltpeter, and barium carbonate also are used in crystal and cut glassware. Lime glass is used for the cheapest pressed ware, but the better grades are made of lead glass.

Statistics of foreign production are not available. The export trade of the European glass-producing countries is an index of their competitive power. Their exports in 1913 of all kinds of glassware were \$93,500,000, those from Germany representing 30.3 per cent; Belgium, 21.6; Austria, 18.8; France, 10; Netherlands, 9.8; and the United Kingdom, 9.5 per cent. Forty per cent of the European exports were of hollow glassware. The exports of all glass products to the United States were a little over 4 per cent of the total.

*Imports* were valued at \$2,223,387 in 1914. Little pressed tableware has been imported, while other pressed ware consisted largely of door knobs. Imports of fine grades of blown ware, both decorated and undecorated, were considerable. Cut or ornamental glassware, valued at \$1,151,875, was imported in 1914, 34.5 per cent from Austria, 28 per cent from Germany, 14 per cent from Belgium, 10 per cent from France, 9.6 per cent from England, and about 4 per cent from other countries. Competition has been particularly felt in the

fine grades of blown ware and decorated blown ware, 34 per cent of these imports coming from Austria and 28 per cent from Germany. Later statistics follow:

*Glassware, blown either in mould or otherwise, n. s. p. f.*

1921 (9 months).....		695,648		

<sup>1</sup> July 1 to Dec. 31, 1918.

*Exports* were valued at \$2,671,164 in 1914 and at \$5,411,995 in 1917. The increase, due to cessation of European production, was: To Canada, 41 per cent; to Cuba, 228 per cent; to South America, 372 per cent; to Asia, 556 per cent; and to Australia and other countries, 80 per cent.

Exports of cut or engraved glassware have been as follows (for calendar years): 1918, \$139,449; 1919, \$269,125; 1920, \$422,864; 1921, \$146,698.

Exports of chemical glassware have been: 1918, \$179,682; 1919, \$200,969; 1920, \$262,391; 1921 (9 months), \$189,008.

Exports have been largely to Canada, England, Cuba, China, Mexico, and Brazil.

*Important changes in classification.*—The provision for partly blown glassware and also the first proviso in paragraph 218 are new. The word "paste" has also been inserted to correspond with the language in paragraph 230.

*Suggested changes.*—The word “or” inserted before “colored” would make the provision applicable to blown or partly blown glassware whether or not colored, etc., and also to glassware colored, etc., whether or not blown or partly blown.

To prevent the possible restriction of paragraph 218 to containers the first proviso might be changed by striking out in line 22, page 32, of H. R. 7456 the words “containers of” and inserting the words “when imported containing.”

### PARAGRAPH 219.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 219. Cylinder, crown, and sheet glass, by whatever process made, unpolished, not exceeding one hundred and fifty square inches,  $1\frac{1}{2}$  cents per pound; above that, and not exceeding three hundred and eighty-four square inches,  $1\frac{3}{4}$  cents per pound; above that, and not exceeding seven hundred and twenty square inches,  $2\frac{1}{4}$  cents per pound; above that, and not exceeding eight hundred and sixty-four square inches,  $2\frac{3}{4}$  cents per pound; above that, and not exceeding one thousand two hundred square inches,  $3\frac{1}{4}$  cents per pound; above that, and not exceeding two thousand four hundred square inches,  $3\frac{3}{4}$  cents per pound; above that, 4 cents per pound: *Provided*, That none of the foregoing shall pay less duty than 35 per centum ad valorem: *Provided further*, That unpolished cylinder, crown, and sheet glass, imported in boxes, shall contain fifty square feet, as nearly as sizes will permit, and the duty shall be computed thereon according to the actual weight of glass.

ACT OF 1909.

ACT OF 1913.

PAR. 99. Unpolished, cylinder, crown, and common window glass, not exceeding one hundred and fifty square inches, valued at not more than one and one-half cents per pound, one and one-fourth cents per pound; valued at more than one and one-half cents per pound, one and three-eighths cents per pound; above that, and not exceeding three hundred and eighty-four square inches, valued at not more than one and three-fourths cents per pound, one and three-fourths cents per pound; valued at more than one and three-fourths cents per pound, one and seven-eighths cents per pound; above that, and not exceeding seven hundred and twenty square inches, valued at not more than two and one-eighth cents per pound, two and one-fourth cents per pound; valued at more than two

PAR. 85. Unpolished, cylinder, crown, and common window glass, not exceeding one hundred and fifty square inches,  $\frac{2}{3}$  of 1 cent per pound; above that, and not exceeding three hundred and eighty-four square inches, 1 cent per pound; above that, and not exceeding seven hundred and twenty square inches,  $1\frac{1}{4}$  cents per pound; above that, and not exceeding one thousand two hundred square inches,  $1\frac{1}{2}$  cents per pound; above that, and not exceeding two thousand four hundred square inches,  $1\frac{3}{4}$  cents per pound; above that, 2 cents per pound: *Provided*, That unpolished, cylinder, crown, and common window glass, imported in boxes, shall contain fifty square feet, as nearly as sizes will permit, and the duty shall be computed thereon according to the actual weight of glass.

and one-eighth cents per pound, two and three-eighths cents per pound; above that, and not exceeding eight hundred and sixty-four square inches, two and three-fourths cents per pound; above that, and not exceeding one thousand two hundred square inches, three and one-fourth cents per pound; above that, and not exceeding two thousand four hundred square inches, three and three-fourths cents per pound; above that, four and one-fourth cents per pound: *Provided*, That unpolished cylinder, crown, and common window glass, imported in boxes, shall contain fifty square feet, as nearly as sizes will permit, and the duty shall be computed thereon according to the actual weight of glass.

#### COMMON WINDOW GLASS, ETC.

(See Survey B-9.)

*Description.*—Common window glass is usually blown into cylinder form, by hand or machine, and afterwards flattened into sheets, annealed, and cut to desired commercial sizes. A method of drawing the glass in a continuous flat sheet is still in an experimental stage in the United States, but is said to be successfully employed in Belgium. The materials used—silica sand, crushed limestone, carbonate of soda or soda ash, ground carbon, sulphate of soda or salt cake, are all of domestic origin. Manganese dioxide or pyrolusite and white arsenic are used in relatively small amounts. The use of crown glass for glazing is practically obsolete, but there is still a limited production for special purposes. It is made by blowing a hollow ball, which is opened and then flattened to a disk by centrifugal force.

*Production* statistics of window glass are as follows: Quantity, square feet, 1914, 400,998,893; 1919, 368,912,209. Value, 1914, \$17,496,000; 1919, \$41,106,000.

Sixty per cent of the total of about 9,000,000 50-foot boxes of window glass of the blast of 1916-17 was made in 27 factories by the machine method, and the remaining 40 per cent was made in 55 factories by the hand method. The present machine factories might readily produce all the window glass needed and eliminate the hand-blowing factories, but fear of a price war deters.

Statistics of foreign production are not obtainable. The question of foreign rivalry centers around the efficiency of the machine versus the hand process. It is believed that the American machine-made glass can compete favorably with the European handmade article. European competition is keenest in the smaller sizes of glass.

*Imports* were a little over 34,073,429 pounds, valued at \$1,259,497 in 1906, but decreased almost constantly until 1913, when they were only 20,458,970 pounds, valued at \$804,731. They increased to 31,197,530 pounds, valued at \$1,212,536, in 1914; for some years thereafter they were almost negligible. Of the imports during the period

1906-1914, from 80 to 95 per cent was of the small sizes, 8 by 16 to 16 by 21 inches, and mostly from Belgium. Later statistics follow:

*Cylinder, crown, and common window glass, unpolished.*

1920.....	16,037	1,021	321	31.41
1921 (9 months).....	323,825	21,615		

The principal countries of origin of the above imports were the United Kingdom, Belgium, and Japan.

*Exports*, which in 1914 amounted to \$311,339, increased notably during the war, production in Belgium and in northern France having ceased and supplies from central Europe having failed. In 1915 the export trade was over \$1,000,000. Increases during the war to noncombatant countries and to Canada and Australia were notable. Exports of common window glass, since 1917 (calendar years),

largely to Canada, Mexico, Brazil, Cuba, and Argentina, have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (boxes of 50 square feet).....	683, 215	965, 970	593, 808	53, 989
Value.....	\$3, 812, 653	\$6, 492, 608	\$4, 097, 133	\$430, 264

*Important changes in classification.*—A minimum rate of duty is added.

“Sheet glass” has been substituted for “common window glass.”

### PARAGRAPH 220.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 220. Cylinder, crown, and sheet glass, by whatever process made, polished, not exceeding three hundred and eighty-four square inches, 5 cents per square foot; above that, and not exceeding seven hundred and twenty square inches, 6 cents per square foot; above that, and not exceeding one thousand four hundred and forty square inches, 12 cents per square foot; above that, 15 cents per square foot.

ACT OF 1909.

ACT OF 1913.

PAR. 100. Cylinder and crown glass, polished, not exceeding three hundred and eighty-four square inches, four cents per square foot; above that, and not exceeding seven hundred and twenty square inches, six cents per square foot; above that, and not exceeding one thousand four hundred and forty square inches, twelve cents per square foot; above that fifteen cents per square foot.

PAR. 86. Cylinder and crown glass, polished, not exceeding three hundred and eighty-four square inches, 3 cents per square foot; above that, and not exceeding seven hundred and twenty square inches, 4 cents per square foot; above that, and not exceeding one thousand four hundred and forty square inches, 7 cents per square foot; above that, 10 cents per square foot.

CYLINDER AND CROWN GLASS, POLISHED.

(See Survey B-9.)

*Description and uses.*—Cylinder and crown glass, blown in thick sheets which are subsequently ground down and polished in the same manner as plate glass, is superior to ordinary cylinder glass in that it is free from the wavy irregularities caused by flattening. A much thinner plate glass can be made at less expense by this process than by casting, as little material is wasted in the grinding and polishing. Polished cylinder glass is used where exceptionally clear but thin sheets are required—automobile wind shields, etc.

*Production.*—Polished cylinder and window glass is a minor product as compared to plain window glass and polished plate. There is a slight bow in window glass no matter how carefully the sheet is flattened and this causes a large amount of breakage during the polishing operation, unless most of the grinding is done by hand. No cylinder glass is polished in domestic plants, but domestic manufacturers of machine window glass are now producing thin glass of a grade satisfactory to most of the consumers who formerly used the polished product.

Thin, unpolished cylinder glass is a much cheaper product than any glass which has been polished, and now that domestic manufacturers are producing high-grade thin unpolished glass domestic consumers will use this in many places where polished glass was used before the war.

*Imports* prior to the war averaged about 600,000 square feet annually, amounting to 615,337 square feet, valued at \$121,814, in 1914. No imports are recorded for 1918 and 1919. Later statistics follow:

*Cylinder and crown glass, polished.*

*Exports.*—None recorded.

*Important changes in classification.*—“Sheet glass” has been added so as to include drawn glass.

## PARAGRAPH 221.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 221. Fluted, rolled, ribbed, or rough plate glass, or the same containing a wire netting within itself (not including crown, cylinder, or sheet glass), not exceeding three hundred and eighty-four square inches, three-fourths of 1 cent per square foot; all above that,  $1\frac{1}{2}$  cents per square foot; and all fluted, rolled, ribbed, or rough plate glass, weighing over one hundred pounds per one hundred square feet, shall pay an additional duty on the excess at the same rates herein imposed: *Provided*, That all of the above plate glass, when ground, smoothed, or otherwise obscured, shall be subject to the same rate of duty as cast polished plate glass unsilvered.

## ACT OF 1909.

PAR. 101. Fluted, rolled, ribbed, or rough plate glass, or the same containing a wire netting within itself, not including crown, cylinder, or common window glass, not exceeding three hundred and eighty-four square inches, three-fourths of one cent per square foot; above that, and not exceeding seven hundred and twenty square inches, one and one-fourth cents per square foot; all above that, one and three-fourths cents per square foot; and all fluted, rolled, ribbed, or rough plate glass, weighing over one hundred pounds per one hundred square feet, shall pay an additional duty on the excess at the same rates herein imposed: *Provided*, That all of the above plate glass, when ground, smoothed, or otherwise obscured, shall be subject to the same rate of duty as cast polished plate glass unsilvered.

## ACT OF 1913.

PAR. 87. Fluted, rolled, ribbed, or rough plate glass, or the same containing a wire netting within itself, not including crown, cylinder, or common window glass, not exceeding three hundred and eighty-four square inches,  $\frac{1}{2}$  cent per square foot; all above that, 1 cent per square foot; and all fluted, rolled, ribbed, or rough plate glass, weighing over one hundred pounds per one hundred square feet, shall pay an additional duty on the excess at the same rates herein imposed: *Provided*, That all of the above plate glass, when ground, smoothed, or otherwise obscured, shall be subject to the same rate of duty as cast polished plate glass unsilvered.

## ROUGH PLATE GLASS, ETC.

(See Survey B-9.)

*Description and use.*—Rough plate glass is an intermediate product which seldom enters the open market. Plastic glass is poured on the casting table, rolled to any desired thickness, and then annealed. In the ordinary course the rough slab is sent direct to the polishing room, but small amounts enter the market as substitutes for obscured glass. Rough or rolled plate glass is one of the cheapest forms of glazing where heavy glass is required. Fluted, ribbed, or other figured un-

polished plate glass is that which has had a pattern impressed upon one surface during the rolling. Flaws can not be detected in this product, and hence a grade of glass cheaper than that in polished plate may be used. Wire netting embedded in plate glass renders it much less susceptible to shattering from vibration or fire. Glass made translucent or opaque after the rolling is known as "obscured" glass. This is frequently used for windows in office partitions, etc. Rolled plate glass is consumed in large quantities for skylights, factory windows, and, in fact, for all work where transparency is unnecessary or objectionable. The product has many advantages not possessed by polished plate. It is cheaper than either polished or ground glass, because no material is lost through a polishing operation and the entire cost of grinding or polishing is eliminated. The rough surface acts similarly to a large number of prisms which disperse the light into an even illumination. The material is translucent and is ideal for all uses where transparency is not important.

*Production.*—The batch materials for rolled plate are sand, limestone, and salt cake, and other substances varying according to the quality of glass desired. The processes are almost entirely mechanical. The molten glass is poured upon an iron table and flattened by an iron roller; large sheets can thus be made as easily as small ones.

Domestic manufacturers are in a position to manufacture rolled plate glass very efficiently. Machine processes are largely employed. Rolled plate glass competes with polished plate glass, ground glass, and cylinder glass, is cheaper than the first two, but more expensive than common window glass. Rolled glass is produced by the plate and window glass manufacturers, and the production figures are not kept separate. In 1917, 21 companies operating 25 factories in 7 States were engaged in the manufacture of rough rolled, wire glass, and other flat glass specialties. The production is considerable and is increasing. Other statistics of production, although but partly applicable in some cases, are as follows:

	1914	1919
Obscured glass, including cathedral and skylight:		
Quantity (square feet).....	43,040,079	33,822,302
Value.....	\$2,417,000	\$4,300,000
Rough wire glass:		
Quantity (square feet).....	13,980,996	
Value.....	\$1,056,612	
Wire glass (total):		
Quantity (square feet).....	15,688,844	15,691,486
Value.....	\$1,591,000	\$2,907,000
Rough plate glass:		
Quantity (square feet).....	131,492	
Value.....	\$25,859	

*Imports* averaged about 1 per cent of the quantity and about 4 per cent of the value of obscured glass produced, amounting to 614,012 square feet, valued at \$126,917 in 1914. Rough and figured rolled plate glass, including wire glass, amounted to 436,586 square feet, valued at \$15,207, in 1914. Later statistics follow:

*Plate glass, fluted, rolled, ribbed, or rough, or the same containing a wire netting.*

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.

1920.....	284,735	194,932	34,168	17.53
1921 (9 months).....	51,758	41,870		

*Exports are not separately stated.*

*Important changes in classification.*—“Sheet glass” has been substituted for “common window glass” in the exception in paragraph 221.

*Suggested changes.*—Page 34, line 5: Change “or” to “and.”

## PARAGRAPH 222.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 222. Cast polished plate glass, finished or unfinished, and unsilvered, not exceeding three hundred and eighty-four square inches, 11 cents per square foot; above that, and not exceeding seven hundred and twenty square inches, 12½ cents per square foot; all above that, 20 cents per square foot. Plate glass described in this paragraph containing a wire netting within itself, not exceeding three hundred and eighty-four square inches, 12 cents per square foot; above that, and not exceeding seven hundred and twenty square inches, 15 cents per square foot; all above that, 25 cents per square foot.

## ACT OF 1909.

## ACT OF 1913.

PAR. 102. Cast polished plate glass, finished or unfinished and unsilvered, not exceeding three hundred and eighty-four square inches, ten cents per square foot; above that, and not exceeding seven hundred and twenty square inches, twelve and one-half cents per square foot; all above that, twenty-two and one-half cents per square foot.

PAR. 88. Cast polished plate glass, finished or unfinished and unsilvered, or the same containing a wire netting within itself, not exceeding three hundred and eighty-four square inches, 6 cents per square foot; above that, and not exceeding seven hundred and twenty square inches, 8 cents per square foot; all above that, 12 cents per square foot.

## POLISHED PLATE GLASS, ETC.

(See Survey B-9.)

*Description and uses.*—The essential properties of polished plate glass are transparency, homogeneity, and strength. For some years it has been in general use for glazing in first-class buildings. It is practically the only glass used for mirrors. It is also used for tables, desks, and other furniture, for wind shields, ship lights, and many other purposes.

*Production.*—In 1917 there were nine companies operating 15 plate-glass factories. The production of plate glass in 1914 was 60,515,008 square feet (11.6 per cent of all building glass), valued at \$14,800,000. In 1919 it was 57,612,491 square feet, valued at \$33,519,000. Since its development the plate-glass industry has made inroads upon other branches of building glass manufacture. Besides the batch materials, its production requires finishing and other essential materials, such as carbon, copperas, grinding sand, rouge, felt, emery, gypsum, and pot clay. Turkish emery and German pot clay were prewar imports. Statistics of foreign production of plate glass are not obtainable, but the competitive power of European countries is indicated in their exports, which for six countries in 1913 were valued at \$11,493,122, of which Belgium exported 49 per cent; Germany, 25 per cent; England, 17 per cent; France,

4 per cent; Netherlands, 3 per cent; and Austria, 2 per cent. Of this the total imports into the United States were but \$247,015, with a revenue of \$156,017. Apparently the imports of much of the plate glass were to meet the requirements of American mirror manufacturers for high grades. Belgium has a plate-glass syndicate which regulates production, following the world's markets closely to prevent overproduction and to give stability to selling prices.

*Imports* are mainly of the finer and more expensive grades used for mirrors; 75 per cent of this glass is imported. In 1914 imports were valued at \$631,618, which was 4.27 per cent of the domestic production. In 1914, 73.68 per cent of the polished plate glass imported was of sizes not exceeding 720 square inches. No imports are reported for 1918. Later statistics follow:

*Plate glass, cast, polished, unsilvered, finished or unfinished, or the same containing a wire netting.*

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
NOT EXCEEDING 384 SQUARE INCHES.				
	<i>Square feet.</i>			<i>Per cent.</i>
1919.....	705	\$488	\$42	8.67
1920.....	262,808	167,913	15,768	9.39
1921 (9 months).....	363,605	194,104		
ABOVE 384 AND NOT EXCEEDING 720 SQUARE INCHES.				
1919.....	287	\$228	\$23	10.07
1920.....	442,904	363,554	35,432	9.75
1921 (9 months).....	592,730	448,292		
ABOVE 720 SQUARE INCHES.				
1919.....	3,181	\$2,339	\$382	16.32
1920.....	1,825,991	1,697,205	219,119	12.91
1921 (9 months).....	806,957	684,795		

In 1919 Canada, in 1920 Belgium and the Netherlands were the principal source of imports.

*Exports* in 1914 were valued at \$35,767; in 1917 they increased to \$2,223,329. Later statistics (for calendar years) of plate glass, unsilvered, follow:

	1918	1919	1920	1921 (9 months).
Quantity (square feet).....	6,022,083	7,318,099	4,140,985	1,855,174
Value.....	\$3,155,627	\$4,221,360	\$2,853,666	\$1,125,854

The above exports were chiefly to Japan, Canada, Cuba, Australia, and Mexico.

*Important changes in classification.*—The provision for plate glass containing a wire netting within itself is new.

## PARAGRAPH 223.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 223. Cast polished plate glass, silvered, cylinder and crown glass, silvered, and looking-glass plates, exceeding in size one hundred and forty-four square inches and not exceeding three hundred and eighty-four square inches, 11 cents per square foot; above that, and not exceeding seven hundred and twenty square inches, 13 cents per square foot; all above that, 22½ cents per square foot: *Provided*, That no looking-glass plates or glass, silvered, when framed, shall pay a less rate of duty than that imposed upon similar glass of like description not framed, but shall pay in addition thereto upon such frames the rate of duty applicable thereto when imported separate.

## ACT OF 1909.

PAR. 103. Cast polished plate glass, silvered, cylinder and crown glass, silvered, and looking-glass plates, exceeding in size one hundred and forty-four square inches and not exceeding three hundred and eighty-four square inches, eleven cents per square foot: above that, and not exceeding seven hundred and twenty square inches, thirteen cents per square foot; all above that, twenty-five cents per square foot: *Provided*, That no looking-glass plates or plate glass, silvered, when framed, shall pay a less rate of duty than that imposed upon similar glass of like description not framed, but shall pay in addition thereto upon such frames the rate of duty applicable thereto when imported separate.

## ACT OF 1913.

PAR. 89. Cast polished plate glass, silvered, cylinder and crown glass, silvered, and looking-glass plates exceeding in size one hundred and forty-four square inches, shall be subject to a duty of 1 cent per square foot in addition to the rates otherwise chargeable on such glass unsilvered: *Provided*, That no looking-glass plates or glass silvered, when framed, shall pay a less rate of duty than that imposed upon similar glass of like description not framed, but shall pay in addition thereto upon such frames the rate of duty applicable thereto when imported separate.

## SILVERED GLASS.

(See Survey B-9.)

*Description and uses.*—Ordinary grades of silvered glass are made of cylinder glass, but for high-grade mirrors plate glass is used (imported before the war). The glass is seldom manufactured by the silvering concerns. Formerly there was used for the backing of mirrors a compound of mercury and tin. This has now been superseded by silver, which increases reflectivity from 20 to 25 per cent and is applied by chemical processes. Ornamental mirrors and looking-glasses comprise the larger part of the product under this paragraph, but silvered glass has many industrial and scientific uses.

*Production* of mirrors, framed and unframed, has been as follows: Number of establishments, 1914, 182; 1919, 186; value of products, 1914, \$10,189,000; 1919, \$20,831,000. These figures include the silvered glass under paragraphs 224 and 230. There is little

foreign competition in silvered glass, because of the additional tariff and liability to damage in transit.

*Imports* of silvered glass amounted to \$24,398 in 1914 and to \$21,618 in 1915—unprecedented records, as imports in former years averaged about \$300. Silvered plate glass imported in 1914 amounted to \$4,861, which was above the average. Later statistics follow:

*Plate glass, cast, polished, silvered, and looking-glass plates.*

-----------	-------	---------	-------	------

Imports of cylinder, crown, and common window glass, unpolished, silvered, are negligible.

Exports were slight during the war, and to markets formerly supplied by Germany, France, and England. None are recorded since.

### PARAGRAPH 224.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 224. Cast polished plate glass, silvered or unsilvered, and cylinder, crown, and sheet glass, by whatever process made, silvered or unsilvered, polished or unpolished, when bent, ground, obscured, frosted, sanded, enameled, beveled, etched, embossed, engraved, flashed, stained, colored, painted, ornamented, or decorated, shall be subject to a duty of 5 per centum ad valorem in addition to the rates otherwise chargeable thereon.

ACT OF 1909.

PAR. 104. Cast polished plate glass, silvered or unsilvered, and cylinder, crown, or common window glass, silvered or unsilvered, polished or unpolished, when bent, ground, obscured, frosted, sanded, enameled, beveled, etched, embossed, engraved, flashed, stained, colored, painted, ornamented, or decorated, shall be subject to a duty of five per centum ad valorem in addition to the rates otherwise chargeable thereon.

ACT OF 1913.

PAR. 90. Cast polished plate glass, silvered or unsilvered, and cylinder, crown, or common window glass, silvered or unsilvered, polished or unpolished, when bent, ground, obscured, frosted, sanded, enameled, beveled, etched, embossed, engraved, flashed, stained, colored, painted, ornamented, or decorated, shall be subject to a duty of 4 per centum ad valorem in addition to the rates otherwise chargeable thereon.

GLASS, BENT, GROUND, OBSCURED, ORNAMENTED, ETC.

(See Survey B-9.)

*Description and uses.*—The processes enumerated in this paragraph are applied principally to ornamented glass. Certain industrial uses, however, depend on these processes, e. g., colored glass for signal lights, concave reflectors for headlights and searchlights, and magnifying and reducing mirror lenses in instruments. Enamel is usually applied to glass in designs, portions of the surface remaining uncovered. Patterns may be made in the glass by etching with hydrofluoric acid, by engraving with copper disks, or by sand blasting. In the process of blowing, a thin layer of colored glass is sometimes applied; this is known as “flashing.” To obtain colored glass, coloring materials (usually metal oxides) are introduced into the molten mass. Beveled glass, used for heavy plate-glass mirrors and doors, has the edges ground at an angle of from 45 to 60°. (See also par. 221.)

*Production* of obscured glass, including cathedral and skylight glass, has been as follows:

	1914	1919
Quantity (square feet).....	43,040,079	33,822,302
Value.....	\$2,417,000	\$4,300,000

The following figures relate to the cutting, staining, and ornamenting of glass: Number of establishments, 1914, 635; 1919, 607; value of products, 1914, \$16,446,000; 1919, \$48,583,000.

Imports of "unpolished, unsilvered cylinder, crown, and common window glass, bent, ground, etc.," were usually the largest of the group, amounting, in 1914, to 1,703,186 square feet, valued at \$149,203; while "polished unsilvered cylinder, etc." were 147,482 square feet, valued at \$36,116; "polished, silvered cylinder, etc.," 138,158 square feet, valued at \$33,034; "polished, unsilvered plate, etc.," 140,805 square feet, valued at \$62,228; and "polished, silvered plate, etc.," 19,659 square feet, valued at \$5,854. Later statistics follow:

*Cylinder, crown, and common window glass, unpolished—Bent, ground, obscured, frosted, sanded, enameled, beveled, etched, embossed, engraved, flashed, stained, colored, painted, ornamented or decorated.*

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
NOT EXCEEDING 150 SQUARE INCHES.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	5,159	\$1,429	\$102	7.16

1921 (9 months).....	16,320	11,126		

The imports of the silvered glass of the above type are negligible.

*Exports.*—Statistics not available.

*Important changes in classification.*—“Sheet glass” has been substituted for “common window glass.”

## PARAGRAPH 225.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 225. Spectacles, eyeglasses, and goggles, and frames for the same, or parts thereof, finished or unfinished, valued at not over 65 cents per dozen, 20 cents per dozen and 15 per centum ad valorem; valued at over 65 cents per dozen and not over \$2.50 per dozen, 60 cents per dozen and 20 per centum ad valorem; valued at over \$2.50 per dozen, 40 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 105. Spectacles, eyeglasses, and goggles, and frames for the same, or parts thereof, finished or unfinished, valued at not over forty cents per dozen, twenty cents per dozen and fifteen per centum ad valorem; valued at over forty cents per dozen and not over one dollar and fifty cents per dozen, forty-five cents per dozen and twenty per centum ad valorem; valued at over one dollar and fifty cents per dozen, fifty per centum ad valorem.

PAR. 91. Spectacles, eyeglasses, and goggles, and frames for the same, or parts thereof, finished or unfinished, 35 per centum ad valorem.

## SPECTACLES, EYEGLASSES, GOGGLES, ETC.

(See Survey B-10.)

*Description and uses.*—Spectacles are flat or toric glasses, prisms, and spherical or cylindrical lenses, mechanically adjusted to the eye to correct defects of vision. They are usually made of crown glass or rock crystal, the latter being somewhat lighter and cooler to wear. Spectacles and eyeglasses are usually mounted in rigid steel wire, shell or horn (real or imitation), or metal frames. Goggles have projecting eye tubes with plain glass to protect against dust, etc., or colored ones to soften the light.

*Production.*—Exact figures are not available. The estimated output for 1912 was valued at about \$8,500,000, produced by between 25 and 30 manufacturers, capitalized at \$7,500,000, and located mainly in Massachusetts, New Hampshire, Rhode Island, Connecticut, New York, Pennsylvania, and Michigan.

*Imports* in 1914 amounted to \$68,370, mostly from France, Germany, and England. They decreased to \$10,916 in 1916. Later statistics follow:

*Spectacles, eyeglasses and goggles, and frames therefor, or parts thereof, finished or unfinished.*

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Dozen.</i>			<i>Per cent.</i>
1918.....	5,517	\$20,294	\$7,103	35
1919.....	2,414	11,480	4,018	35
1920.....	8,625	20,508	7,178	35
1921 (9 months).....	2,445	7,590		

Imports are chiefly from France, Germany, and England.

*Exports* before the war consisted of styles and qualities superior to foreign goods, comprising less than 10 per cent of the production. The export figures are consolidated with those for optical instruments.

## PARAGRAPH 226.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 226. Lenses of glass or pebble, molded or pressed, or ground and polished to a spherical, cylindrical, or prismatic form, and ground and polished plano or coquill glasses, wholly or partly manufactured, with the edges unground, 40 per centum ad valorem; with the edges ground or beveled, 10 cents per dozen pairs and 35 per centum ad valorem; strips of glass not more than three inches wide, ground or polished on one or both sides to a cylindrical or prismatic form, including those used in the construction of gauges, and glass slides for magic lanterns, 35 per centum ad valorem.

## ACT OF 1909.

PAR. 106. Lenses of glass or pebble, molded or pressed, or ground and polished to a spherical, cylindrical, or prismatic form, and ground and polished plano or coquill glasses, wholly or partly manufactured, with the edges unground, forty-five per centum ad valorem; if with their edges ground or beveled, ten cents per dozen pairs and forty-five per centum ad valorem.

PAR. 107. Strips of glass, not more than three inches wide, ground or polished on one or both sides to a cylindrical or prismatic form, including those used in the construction of gauges, and glass slides for magic lanterns, forty-five per centum ad valorem.

## ACT OF 1913.

PAR. 92. Lenses of glass or pebble, molded or pressed, or ground and polished to a spherical, cylindrical, or prismatic form, and ground and polished plano or coquill glasses, wholly or partly manufactured, strips of glass, not more than three inches wide, ground or polished on one or both sides to a cylindrical or prismatic form, including those used in the construction of gauges, and glass slides for magic lanterns, 25 per centum ad valorem.

## LENSES.

(See Survey B-10.)

*Description and uses.*—Lenses of glass are fashioned from rough optical glass and used chiefly in the manufacture of scientific, professional, and optical instruments and goods.

A pebble lens is a spectacle lens made of rock crystal, which is harder than glass. A plano lens is a flat plane of glass, while a coquill lens is a piece of glass of uniform thickness with concentric spherical surfaces.

*Production* figures for the particular items of paragraph 226 are not available, because part or parts of each are reported under "Instruments, professional and scientific," and "Optical goods." Statistics for these industries are as follows:

	Instruments, professional and sci- entific.	Optical goods.
Number of establishments:		
1914.....	307	314
1919.....	350	506
Value of products:		
1914.....	\$17,495,000	\$18,188,000
1919.....	58,135,000	53,718,000

*Imports* totaled \$169,951 in 1914, \$120,297 in 1915, \$54,483 in 1916, and \$40,971 in 1917. The decrease followed the war, with a consequent stimulation of domestic production. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
LENSES OF GLASS OR PEBBLE AND GROUND AND POLISHED PLANO OR COQUILL GLASSES, WHOLLY OR PARTLY MANUFACTURED.				
	Number.			Per cent.

1921 (9 months).....		103,718		

STRIPS OF GLASS, NOT MORE THAN 3 INCHES WIDE, GROUND OR POLISHED TO A CYLINDRICAL OR PRISMATIC FORM, ETC.

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
1918.....		\$34,362	\$8,540	Per cent. 25
1919.....		28,051	7,013	25
1920.....		91,793	22,948	25
1921 (9 months).....		18,925		

*Exports* not recorded.

### PARAGRAPH 227.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 227. Optical glass, or glass used in the manufacture of lenses or prisms for spectacles, or for optical instruments or equipment or optical parts, scientific or commercial, in any and all forms, 35 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 577. Glass plates or disks, rough-cut or unwrought, for use in the manufacture of optical instruments, spectacles, and eyeglasses, and suitable only for such use: [Free] *Provided, however,* That such disks exceeding eight inches in diameter may be polished sufficiently to enable the character of the glass to be determined.

PAR. 494. Glass plates or disks, rough-cut or unwrought, for use in the manufacture of optical instruments, spectacles, and eyeglasses, and suitable only for such use: [Free] *Provided, however,* That such disks exceeding eight inches in diameter may be polished sufficiently to enable the character of the glass to be determined.

OPTICAL GLASS, ETC.

(See Survey B-10.)

*Description and uses.*—Optical glass is the essential element in the making of microscopes, field glasses, range finders, gun sights, periscopes, aiming circles, photographic lenses, etc. It is indispensable in directing and controlling the firing of modern artillery in general, but the quantities needed for range finders, gun sights, trench periscopes, etc., are not great in any country, even in time of war. However, its commercial uses will cause a steady and increasing, though limited, demand.

*Production* prior to 1918 was negligible. The failure of German imports and the necessities of the allied Governments practically exhausted our supply. In 1917 four manufacturers, assisted by Government and other scientists, succeeded in making certain varieties of optical glass for the Army and Navy, and factories were built and equipped to produce in sufficient quantities to supply domestic requirements. The principal materials used are silica sand, soda, potash, lime, lead oxides, baryta, zinc oxide, and borax. In seven months (April to October, 1918) the production of eight classes of optical glass was 475,924 pounds.

Statistics of foreign production are not available, but the potential power of foreign competitors is indicated in their export trade and in the great advantages they have had in the earlier scientific development of this product. The statistics of exports of this particular kind of glass are meager and not reported at all for some countries.

In 1913 Germany exported optical glass of various kinds, valued at \$7,900,172, classified as follows: Rough optical glass, \$271,320; lenses, \$2,528,274; and other optical glass, \$5,100,578. In the same year France exported lenses valued at \$493,887, and other optical glass, \$18,760.

The manufacture of optical glass requires scientific knowledge of a high order as well as exceptional skill. It is one of peculiar technical difficulties, both chemical and mechanical.

English, French, and German producers are offering optical glass of all grades and in any quantity for export to the United States.

Imports of optical glass plates and disks, rough cut and unwrought, were valued at \$499,364 in 1913 and \$612,830 in 1914, falling in 1916, 1917, and 1918 to less than one-half, partly the result of the new domestic industry. In 1913 and 1914 imports from Germany were 50 per cent and from England 27 per cent of the total. In 1918 the imports from England were 73 per cent, 40 per cent more than in 1913. Imports from France in 1913 were 18 per cent of the total; in 1918, 26 per cent. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity, (pounds).....		562,983	941,860	572,667
Value.....	\$341,734	\$410,775	\$980,289	\$525,940

The above imports are chiefly from the United Kingdom and France.

*Exports* not reported.

*Important changes in classification.*—Transferred from free list (par. 494), act of 1913, and rewritten.

*Suggested changes.*—Page 36, lines 14–16: Provision is here made for glass for optical parts but none in paragraph 228 for parts of optical instruments, etc., n. s. p. f.

#### PARAGRAPH 228.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 228. Photographic and projection lenses, opera and field glasses, surveying instruments, telescopes, microscopes, and other optical instruments, and frames and mountings for the same; all the foregoing not specially provided for. 35 per centum ad valorem.

## ACT OF 1909.

## ACT OF 1913.

PAR. 108. Opera and field glasses, telescopes, microscopes, photographic and projection lenses and optical instruments, and frames or mountings for the same; all the foregoing not specially provided for in this section, forty-five per centum ad valorem.

PAR. 93. Opera and field glasses, optical instruments and frames and mountings for the same; all the foregoing not specially provided for in this section, 35 per centum ad valorem.

PAR. 94. Surveying instruments, telescopes, microscopes, photographic and projection lenses, and frames and mountings for the same, 25 per centum ad valorem.

## PHOTOGRAPHIC AND PROJECTION LENSES.

(See Survey B-10.)

*Description and uses.*—Optical instruments are primarily used to aid or supplement human vision; they also include apparatus which depend for their operation on the passage of light through prismatic or lenticular glass.

Lenses and prisms are the primary constituents of optical instruments. Lenses are used for three purposes: (1) To concentrate and direct a ray of light (searchlight and automobile lenses); (2) to project a perfectly clear image on a sensitized plate (photography) or screen (motion pictures); (3) to magnify an image so that greater detail may be observed by the eye. The instrument which enlarges small objects at short range is known as the microscope, while those used for examining larger fields of vision located at a distance are known as telescopes or field or opera glasses. Eyeglasses are simple magnifying or field glasses composed of a single lens for each eye instead of the combination of lenses found in the adjustable instrument.

*Production.*—Prior to the war domestic manufacturers confined their operations to the production of those instruments which could be marketed in considerable quantities, and manufactured the special apparatus used by research organizations on special order only, if at all. They depended upon foreign producers for practically the entire supply of optical glass and in a great majority of cases imported finished lenses which could be inserted in domestic mounting without further manufacture.

Available production statistics are as follows:

Industry.	Number of establishments.		Value of products.	
	1914	1919	1914	1919
Optical goods.....	314	506	\$18,188,000	\$53,718,000
Instruments, professional and scientific.....	307	350	17,495,000	58,135,000
Cameras.....			1,254,331	

The optical goods listed above consist of spectacle, eyeglass, and goggle lenses and mountings. The bulk of the scientific and professional instruments produced fall outside the scope of this paragraph. The total includes, besides surveying instruments, tele-

scopes, microscopes, and like articles, a large variety of electrical, thermal, and various measuring instruments, some of which were sold in large numbers. The value of cameras produced included the value of the mounting as well as the lens, but in the better grades of cameras the lens is an important part of the total value, and large quantities of auxiliary lenses were produced, the value of which is included in that of other photographic materials.

Many optical instruments required in war time have little or no market during peace times. Manufacturers of miscellaneous apparatus are admirably situated to manufacture this material because the work is largely hand labor, and their plants can change from one class of work to another without loss of time. Some of the machinery used in the manufacture of bulk lines can be utilized to advantage, but the operatives do not usually possess the broad experience necessary for such a radical change in product. The free entrance of instruments for educational purposes deprives the hand manufacturer of a large part of his market and must eventually force him to restrict production to the lines which can be produced by machine.

*Imports* are shown in the following tables:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
SURVEYING INSTRUMENTS, TELESCOPES, MICROSCOPES, PHOTOGRAPHIC AND PROJECTING LENSES, AND FRAMES AND MOUNTINGS FOR THE SAME.				

	Number.			Per cent.
1915 <sup>1</sup> .....		\$160,193	\$40,048	25
1914 <sup>2</sup> .....		117,183	29,295	25
1918.....		29,460	7,365	25
1919.....	209,273	74,727	18,682	25
1920.....		284,495	71,105	25
1921 (9 months).....		273,921		

OPERA AND FIELD GLASSES, OPTICAL INSTRUMENTS, AND FRAMES AND MOUNTINGS FOR THE SAME.

1915 <sup>1</sup> .....		\$333,387	\$116,685	35
1914 <sup>2</sup> .....		186,592	63,307	35
1918.....		79,144	27,700	35
1919.....	52,668	188,569	65,857	35
1920.....		523,141	183,099	35
1921 (9 months).....		415,314		

<sup>1</sup> Oct. 4, 1913, to June 30, 1914.

<sup>2</sup> Fiscal years.

*Exports* of optical instruments in 1914 were valued at \$865,074, of which England took 54 per cent, Canada 13 per cent, and South America 10 per cent. The 1915 figures show a value of \$1,018,016; 1916, \$2,593,500; and 1917, \$2,945,920. Of the 1918 total, \$1,073,339, 28 per cent went to England, 14 per cent to Canada, 17 per cent to South America, and 15 per cent to Russia. Export figures for the greater part of the articles covered by paragraphs 225 and 228 are included above, no separate figures being available.

Exports of optical instruments for scientific purposes were valued in 1919 (calendar years) at \$1,540,979, in 1920 at \$1,355,002, and for 9 months in 1921 at \$698,799. The United Kingdom, Argentina, and Canada were the principal countries of destination.

*Important changes in classification.*—Two paragraphs (93 and 94) of the act of 1913 have been combined in H. R. 7456.

*Suggested changes.*—Page 36, line 19: Paragraph 228 provides for surveying instruments not specially provided for at 35 per cent ad valorem. Paragraph 360, page 64, line 20, provides for surveying instruments wholly or of chief value of metal at 40 per cent ad valorem. Paragraph 360, furthermore, requires marking, while paragraph 228 does not. It might be better to have one provision for surveying instruments, irrespective of the component material of chief value and to treat all alike with respect to marking. If paragraph 360 should be left as it is, there will probably be controversies respecting the value of the chief component, and, furthermore, a question will arise whether any of the instruments provided for in paragraph 228 must be marked, although all of them are susceptible of being marked and are usually marked.

Azimuth mirrors, octants, and sextants are not within this paragraph. (*United States v. Bliss*, 6 Ct. Cust. Appls. 433, of 1915.)

## PARAGRAPH 229.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 229. Incandescent electric-light bulbs and lamps, with or without filaments, 35 per centum ad valorem.

### ACT OF 1909.

### ACT OF 1913.

PAR. 109. \* \* \* manufactures of glass \* \* \* or of which glass \* \* \* is the component material of chief value not specially provided for in this section, forty-five per centum ad valorem.

PAR. 95. \* \* \* incandescent electric-light bulbs and lamps, with or without filaments, \* \* \* 30 per centum ad valorem.

PAR. 199. Articles or wares not specially provided for in this section, composed wholly or in part of \* \* \* metal, and whether partly or wholly manufactured, forty-five per centum ad valorem.

### INCANDESCENT ELECTRIC LAMPS.

(See Surveys B-9 and C-31.)

*Description and uses.*—An incandescent electric lamp is a vacuum (or gas filled) glass bulb containing filaments of some material with high melting point which an electric current will heat to incandescence. According to the nature of the filaments, the lamps are called carbon, metallized carbon, tantalum, and tungsten. The tungsten filament can be operated at a temperature which gives the maximum amount of light in proportion to the electrical energy used, and has practically superseded all the other forms.

*Production.*—Manufacturers of incandescent lamps do not always make the glass bulbs. In 1916 the bulbs were made by five plants, with an estimated production of 20,000,000 per month. The bulbs

are blown into iron molds coated with carbonaceous paste. A high polish is effected by rotating the blank in the mold during the blowing. Mechanical processes simulating the hand method of blowing have been devised. Many operations are required to complete the lamp, which, besides the bulb, consists of the base, the filament, the inside stem upon which the filament is mounted, and the leading-in wires. A number of companies make the finished lamps. In 1914, 74,434,059 tungsten lamps, valued at \$11,886,354, and 14,092,055 carbon lamps, valued at \$1,397,572, were produced. The production of "Gem, vacuum, and vapor, nitrogen, glowler, and tantalum lamps" was valued at \$2,363,730 in 1914, decreasing about 12 per cent from 1909. In 1919 the production of all types amounted to \$59,372,000, of which by far the greater part was of the tungsten filament type.

*Imports* in 1914 were 1,374,697 carbon lamps, valued at \$78,409, and 6,809,535 metal filament lamps, valued at \$552,663, about 10 per cent of the number of carbon lamps and 9 per cent of the tungsten lamps produced in the United States. Imports of metal filament lamps were fairly constant during the war, amounting to 5,154,579 in 1917, though the valuation, \$198,025, was small. "All other," which includes bulbs, amounted to \$88,686 in 1914. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
----------------	-----------	--------	-------	------------------

INCANDESCENT LAMPS, INCLUDING BULBS—CARBON FILAMENT.

	Number.			Per cent.
1918.....	797,130	\$16,131	\$4,839	30
1919.....	2,985,005	81,454	24,436	30
1920.....	7,229,784	224,690	73,407	30
1921 (9 months).....	3,782,802	97,238		

INCANDESCENT LAMPS, INCLUDING BULBS—METAL FILAMENT

1918.....	1,163,295	\$32,140	\$9,642	30
1919.....	5,133,638	116,570	34,971	30
1920.....	5,735,737	177,743	53,323	30
1921 (9 months).....	2,541,168	96,083		

ALL OTHER, INCLUDING BULBS.

1918.....		\$7,034	\$2,110	30
1919.....		17,147	5,144	30
1920.....		41,934	12,580	30
1921 (9 months).....		66,306		

Imports consist principally of miniature lamps and, since the war, have been derived chiefly from Japan, the Netherlands, Canada, and the United Kingdom. More recently both Austria and Germany have resumed exports to this country. Much dissatisfaction has been expressed with the Japanese product.

*Exports* of carbon lamps amounted to 1,285,858, valued at \$172,064 in 1914, about 25 per cent of the production; those of all metal fila-

ments numbered 849,261, and were valued at \$219,439. Later statistics, for the calendar years 1918-1921, follow:

	1918	1919	1920	1921. (9 months)
Carbon filament:				
Number.....	627,867	1,097,665	469,428	455,851
Value.....	\$102,872	\$202,590	\$114,542	\$115,396
Metal filament:				
Number.....	14,585,166	17,071,960	16,142,663	9,513,695
Value.....	\$3,369,192	\$4,674,317	\$4,051,835	\$2,815,163

The principal countries of destination were Canada, Cuba, Brazil, Mexico, Argentina, and Australia.

*Important changes in classification.*—Electric bulbs and lamps have been removed from paragraph 95, act of 1913, including other manufactures of glass, and are provided for in a separate paragraph.

*Conflicting provisions.*—Incandescent electric-light bulbs and lamps having tungsten filaments might take the cumulative rate imposed in paragraph 305 on articles containing tungsten. There are administrative difficulties in the enforcement of such a provision.

## PARAGRAPH 230.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 230. Stained or painted glass windows, or parts thereof, and all mirrors, not exceeding in size one hundred and forty-four square inches, with or without frames or cases; and all glass or manufactures of glass or paste, or of which glass or paste is the component material of chief value, not specially provided for, 30 per centum ad valorem.

### ACT OF 1909.

PAR. 109. Stained or painted glass windows, or parts thereof, and all mirrors, not exceeding in size one hundred and forty-four square inches, with or without frames or cases, and all glass or manufactures of glass or paste or of which glass or paste is the component material of chief value, not specially provided for in this section, forty-five per centum ad valorem.

### ACT OF 1913.

PAR. 95. Stained or painted glass windows, or parts thereof, and all mirrors, not exceeding in size one hundred and forty-four square inches, with or without frames or cases; \* \* \* and all glass or manufactures of glass or paste or of which glass or paste is the component material of chief value, not specially provided for in this section, 30 per centum ad valorem.

### STAINED OR PAINTED GLASS WINDOWS AND SMALL MIRRORS.

(See Survey B-9.)

*Description and uses.*—The color may be produced (1) by metal oxides in the melting, (2) by flashing (par. 224), (3) by applying, under fire, a solution of silver, and (4) by painting the surface with

enamels afterwards fused. Stained-glass windows are usually made of small pieces of glass colored in any of the ways mentioned and held together by strips of lead. Sometimes pictorial effects are obtained by painting on single pieces of glass. (See par. 1447, p. 1195.)

*Production.*—Gross production in 1912 is estimated at about \$7,000,000, which would include articles other than stained-glass windows. Competition is principally from Germany and Austria. (For mirrors, see par. 223, p. 323.)

*Imports* of stained glass, or parts, and small mirrors amounted to \$418,425, the maximum, in 1914. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
			<i>Per cent.</i>
1918.....	\$24,173	\$7,252	30
1919.....	26,999	8,100	30
1920.....	94,861	28,458	30
1921 (9 months).....	92,640		

*Exports.*—Not recorded.

#### MANUFACTURES OF GLASS OR PASTE N. S. P. F.

*Description and uses.*—Paste is specially prepared glass, known also as "strass," from which imitation gems are manufactured. The requisite qualities of purity, transparency, and high refractivity are comprised in the highest degree in lead-flint glass of unusual density because of the large percentage of lead it contains.

*Imports* represent the combined figures for manufactures of glass and of paste n. s. p. f., amounting to \$427,391 in 1914. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
			<i>Per cent.</i>
1918.....	\$117,794	\$35,329	30
1919.....	121,834	36,550	30
1920.....	273,295	81,988	30
1921 (9 months).....	260,863		

*Exports* of glass and glassware n. s. p. f. have been as follows (calendar years): 1918, \$5,401,395; 1919, \$8,328,944; 1920, \$12,874,614; and the first 9 months of 1921, \$6,295,511.

Exports have been principally to Canada, the United Kingdom, Cuba and Mexico.

## PARAGRAPH 231.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 231. Smalts, frostings, and all ceramic and glass colors, fluxes, glazes, and enamels, all the foregoing, ground or pulverized, 23 per centum ad valorem; in any other form, 35 per centum ad valorem; opal enamel or cylinder glass tiles, tiling, and rods, 35 per centum ad valorem.

## ACT OF 1909.

PAR. 56. \* \* \* smalts and frostings, whether crude or dry or mixed, or ground with water or oil or with solutions other than oil, not otherwise specially provided for in this section, thirty per centum ad valorem; all glazes, fluxes, enamels, and colors used only in the manufacture of ceramic, enameled, and glass articles, thirty per centum ad valorem; \* \* \*

PAR. 110. Fusible enamel, twenty-five per centum ad valorem; opal or cylinder glass tiles or tiling, sixty per centum ad valorem.

PAR. 576. Glass enamel, white, for watch and clock dials [Free].

## ACT OF 1913.

PAR. 63. \* \* \* smalts, and frostings, and all ceramic and glass fluxes, glazes, enamels, and colors, whether crude, dry, mixed, or ground with water or oil or with solutions other than oil, not specially provided for in this section, 15 per centum ad valorem; \* \* \*

PAR. 96. Fusible and glass enamel, not specially provided for in this section, 20 per centum ad valorem; opal or cylinder glass tiles or tiling, 30 per centum ad valorem.

PAR. 493. Glass enamel, white, for watch and clock dials [Free].

## SMALTS AND FROSTINGS.

(See Survey A-15.)

*Description and uses.*—Smalt is a deep-blue pigment made by fusing the oxide of cobalt with silica and potash to form a glass. This product is reduced to a powder and used in the arts, although at present it is largely replaced by cobalt blue and artificial ultramarine. Frostings are made from coarsely powdered, thin flakes of glass and are used for decorative work, signs, and the like.

*Imports and exports.*—Separate statistics not given.

## CERAMIC AND GLASS COLORS, GLAZES, AND FLUXES.

(See Survey A-15.)

*Description and uses.*—The ceramic colors, a distinct article of commerce and essentially different from the paint pigments, are used in the manufacture of glass, for the coloring of glaze on pottery and other earthenware, and for coloring enamels. They are all of inorganic nature and must be able to withstand the temperature in firing the ware. They are chiefly metallic oxides, in general the same as for coloring enamels. Pottery or earthenware is colored by one of three methods: (1) By applying the coloring materials to the body of the ware, which is afterwards glazed, a process known as "underglaze"; (2) by placing the coloring materials on an already glazed article and refiring the ware, a process known as "overglaze"; and (3) by mixing the color with the glaze and applying the two simultaneously, known as the "colored glaze" method. The glazes

used in ceramic manufacture are either silicates of the alkali or alkaline earths, with or without lead. In other words, they are simply a glass. The proportion of lead affects chiefly the melting point of the glaze. The materials used chiefly for glazing are certain natural silicates, such as feldspar, china clay or kaolin mixed with flint or sand, chalk, borax, soda, and lead.

*Production.*—Data as to domestic production have not been obtained, but it is not large. This is due partly to the comparatively small output of hand-decorated china and to the use of imported ceramic colors and decalcomanias (see par. 1306) for decorating domestic pottery. England, France, and Germany have developed the manufacture of these colors to a high degree.

*Imports.*—Reduction of duty (1913) from 30 per cent to 15 per cent was followed by an increase in imports of fluxes, glazes, enamels, and colors, ceramic and glass. The average import during the three years, 1911 to 1913, was \$13,589, and the average annual revenue for the same period under the 30 per cent rate was \$4,077. In 1915–16 the average was valued at \$67,460, and the revenue was \$10,119 per year. In 1917–18, owing to war conditions, the imports and consequently the revenue were considerably lower. Later statistics follow.

*Glazes, fluxes, enamels, and colors, ceramic and glass.*

	<i>Pounds.</i>			<i>Per cent.</i>
1918.....		\$21,864	\$3,280	15
1919.....	25,841	30,137	4,521	15
1920.....	63,202	63,588	9,538	15
1921 (9 months).....	25,791	31,510		

*Exports.*—None recorded.

ENAMEL.

(See Survey A-15.)

*Description and uses.*—Enamel is glass applied by fusion as a coating to any substance which will bear the necessary heat, especially to metals and to pottery. Commercial fusible enamel comes in the form of cakes, plates, lumps, or powder, and is of various colors according to the amounts of various metallic oxides used in its composition. Its use may be decorative or to reduce porosity or to protect the surface from oxidation or other chemical action. The art of enameling pottery, glass, gold, silver, and copper is very old, but industrial applications to iron and steel are comparatively recent. The process, however, has rapidly developed, especially in making kitchen and hospital utensils, bathtubs, and stationary washstands. Although enamels may be used with pottery, the term is usually understood to mean an application to metallic bodies, usually steel or cast iron. The fact that enamel must adhere to steel and resist the abuse common to cooking utensils, makes necessary other qualities besides those of ordinary glass. For example, the requirement that it should adhere firmly to a metal body necessitates as nearly

as possible a similar coefficient of expansion. Enamels are used chiefly as a protective coating, which will resist the action of alkalis, acids, or other chemicals, and withstand the strain of impact and rapid changes of temperature. They are also used for decorative purposes. Enamels are complex silicates or boro-silicates of sodium, potassium, calcium, and aluminum. In addition they contain various metallic oxides to produce opacity or color. The principal materials are quartz and flint, which supply the silica; fluorspar, which supplies calcium or lime; feldspar, which is a complex double silicate of aluminum with sodium, potassium, or calcium; borax or boric acid. The ingredients of the enamel vary with the result desired, and materials other than those enumerated are used in special cases. Tin oxide is one of the most important and expensive materials and usually constitutes from 5 to 10 per cent of white enamels. Cobalt is used for blue; manganese for violet and brown; nickel for gray; copper or chromium for green; uranium or titanium for yellow; and iron, selenium, or gold for red enamels.

*Production.*—In 1914 there were 77 establishments engaged in enameling with a production valued at \$2,166,000; in 1919 the corresponding figures were 74 and \$2,645,000.

*Imports* amounted to \$18,028 in 1914 and to \$8,052 in 1918. The largest amount in the period 1908–1918 was \$21,431 in 1909. Later statistics follow. (See also ceramic and glass colors, glazes and fluxes, p. 338, and white glass enamel, *infra*.)

Calendar year.	Value.	Duty.	Ad valorem rate.
			<i>Per cent.</i>
1918.....	\$4,106	\$821	20
1919.....	17,727	3,545	20
1920.....	31,331	6,266	20
1921 (9 months).....	9,478		

*Exports.*—None recorded.

#### WHITE GLASS ENAMEL.

(See Survey A-15.)

*Description and uses.*—White glass enamel, a fusible enamel, is suitable for watch and clock dials, and is often used for scale dials, thermometers, faces of steam gauges and speedometers, novelties, and for lettering signs on glass.

*Production.*—Before the war enamel for watch and clock dials was obtained chiefly from Switzerland and France; other white enamel has been made here for some years. Some dial enamel was produced during the war. Figures, however, are not available.

*Imports* of white enamel for watch and clock dials in 1914 were valued at \$13,284. In 1918 the value was \$10,465; in 1919 (calendar year), \$16,778; in 1920, \$5,349; and in nine months of 1921, \$2,006.

*Exports.*—None recorded.

## GLASS TILES.

*Description and uses.*—Glass tiles are used for walls and for floors, especially where the transmission of light is desired. Opal tiles have a white opacity, imparted usually by cryolite, feldspar, or aluminium compounds.

*Production.*—There are several domestic manufacturers of glass tiles and opal glass, but no statistics are available.

*Imports* have not exceeded \$500 in any one year.

*Exports.*—None recorded.

## GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Glass enamel, white, for watch and clock dials is exempt from duty under the act of 1913 (par. 493). That paragraph and the provision for fusible and glass enamel (par. 96) are combined in this paragraph with paragraph 63 of the act of 1913.

*Suggested changes.*—Page 37, line 10: Insert comma after “opal.”

## PARAGRAPH 232.

H. R. 7456.

SENATE AMENDMENTS

PAR. 232. Marble, breccia, and onyx, in block, rough or squared only, 65 cents per cubic foot; marble, breccia, and onyx, sawed or dressed, over two inches in thickness, \$1 per cubic foot; slabs and paving tiles of marble, breccia, or onyx, containing not less than four superficial inches, if not more than one inch in thickness, 8 cents per superficial foot; if more than one inch and not more than one and one-half inches in thickness, 10 cents per superficial foot; if more than one and one-half inches and not more than two inches in thickness, 13 cents per superficial foot; if rubbed in whole or in part, 3 cents per superficial foot in addition; mosaic cubes of marble, breccia, or onyx, not exceeding two cubic inches in size, if loose, one-fourth of 1 cent per pound and 17 per centum ad valorem; if attached to paper or other material, 5 cents per superficial foot and 26 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 111. Marble and onyx, in block, rough or squared only, sixty-five cents per cubic foot; marble and onyx, sawed or dressed, over two inches in thickness, one dollar per cubic foot; slabs or paving tiles of marble or onyx,

PAR. 97. Marble, breccia, and onyx, in block, rough or squared only, 50 cents per cubic foot; marble, breccia, and onyx, sawed or dressed, over two inches in thickness, 75 cents per cubic foot; slabs or paving tiles of marble

containing not less than four superficial inches, if not more than one inch in thickness, eight cents per superficial foot; if more than one inch and not more than one and one-half inches in thickness, ten cents per superficial foot; if more than one and one-half inches and not more than two inches in thickness, twelve and one-half cents per superficial foot; if rubbed in whole or in part, two cents per superficial foot in addition; mosaic cubes of marble or onyx, not exceeding two cubic inches in size, if loose, one-fourth of one cent per pound and twenty per centum ad valorem; if attached to paper or other material, five cents per superficial foot and thirty-five per centum ad valorem.

or onyx, containing not less than four superficial inches, if not more than one inch in thickness, 6 cents per superficial foot; if more than one inch and not more than one and one-half inches in thickness, 8 cents per superficial foot; if more than one and one-half inches and not more than two inches in thickness, 10 cents per superficial foot; if rubbed in whole or in part, 2 cents per superficial foot in addition; mosaic cubes of marble or onyx, not exceeding two cubic inches in size, if loose, 20 per centum ad valorem; if attached to paper or other material, 35 per centum ad valorem.

#### MARBLE, BRECCIA, ONYX.

(See Survey B-11.)

*Description and uses.*—This paragraph covers marble, breccia, and onyx used for monumental and structural work. Marble is a crystalline limestone; onyx, used in building, is a marble having the appearance of real onyx. Breccia consists of fragments cemented together by natural processes. It usually is (but may not be) marble in chemical composition, but it is included in the group because of similarity of use. Marble slabs of superior quality are used for ornamental purposes, but inferior grades are also largely used for interior finishing, as sanitary or fireproof material. Breccia and onyx are used almost entirely for decorative purposes. Mosaics and paving tiles are flooring materials competitive with ceramic mosaics and other flooring tiles (par. 202).

*Production of building and monumental marble in 1914 was valued at \$7,871,978 and in 1917 at \$6,100,280. Competition is chiefly on the stones used for interior work. Separate statistics are not given for mosaic marble, which is included in "all other." Breccia is not reported separately in domestic production; onyx marble in 1915 amounted to 4,574 cubic feet, valued at \$19,270, and came from Utah, Kentucky, and New Mexico.*

Detailed statistics for 1918 and 1920 are given in the following table:

*Marble sold in the United States in 1918 and 1920.*

Use.	1918			1920		
	Quantity.	Value.	Average value.	Quantity.	Value.	Average value.

<sup>1</sup> Building stone figures may be somewhat less than given and monumental stone somewhat more, as some of the Tennessee producers were unable to divide their product according to use.

<sup>2</sup> Approximately.

The marble industry is represented by quarrymen who sell their product in all stages from the rough block to the article ready for use, and by the manufacturers who buy either domestic or foreign raw material. It is between these two classes that competition is most severe, as very little manufactured marble is imported.

The domestic marble deposits of commercial value are confined to the northeastern and southeastern United States and to limited areas on the Pacific slope. Deposits of onyx exist in the Mississippi Valley, but high-grade material is rare. The quarrying process is simple and requires no permanent buildings, and only a small amount of equipment, unless the material is dressed by the producer. In this case rough sheds are erected and pneumatic machinery installed. The tendency is toward large production units with manufacturing facilities located at the quarry.

European deposits of marble are of high grade, and contain many fancy varieties not available in the United States. The quarries of Italy and Greece have been operated for centuries, but the product is still considered the best for certain ornamental and sculptural work. There are extensive deposits of onyx marble in Mexico, but development has been slow.

Imports of marble, breccia, and onyx, rough, dressed, and in slabs, were valued at \$1,068,132 in 1914. During the war shipping restrictions and export embargoes reduced foreign trade in these articles to a minimum.

Imports of rough blocks were valued at \$997,734 in 1914 and un-rubbed slabs at \$47,841. Dressed marble and rubbed slabs are imported in comparatively small amounts.

The imports in 1914 equaled 13 per cent of the domestic production of building and monumental marble and 32 per cent of that used for interior work. From 1910 to 1914 there was a slight annual decrease in imports. Italy furnishes fully 80 per cent of the marble imported, the remainder coming from France, Greece, Belgium, Spain, and other countries. Onyx is now imported mainly from

Mexico. Imports of loose mosaic cubes were valued at \$42,945 in 1914 and those attached to some material at \$976. Later statistics follow:

### PARAGRAPH 233.

#### H. R. 7456.

#### SENATE AMENDMENTS.

PAR. 233. Marble, breccia, onyx, alabaster, and jet, wholly or partly manufactured into monuments, benches, vases, and other articles, and articles of which these substances or any of them is the component material of chief value, and all articles composed wholly or in chief value of agate, rock crystal, or other semiprecious stone, except such as are cut into shapes and forms fitting them expressly for use in the construction of jewelry, not specially provided for, 40 per centum ad valorem.

#### ACT OF 1909.

PAR. 112. Marble, breccia, onyx, alabaster, and jet, wholly or partly manufactured into monuments, benches, vases, and other articles, or of which these substances or either of them is the component material of chief value, and all articles composed wholly or in chief value of agate, rock crystal, or other semiprecious stones, except such as are cut into shapes and forms fitting them expressly for use in the construction of jewelry, not specially provided for in this section, fifty per centum ad valorem.

#### ACT OF 1913.

PAR. 98. Marble, breccia, onyx, alabaster, and jet, wholly or partly manufactured into monuments, benches, vases, and other articles, or of which these substances or either of them is the component material of chief value, and all articles composed wholly or in chief value of agate, rock crystal, or other semiprecious stones, except such as are cut into shapes and forms fitting them expressly for use in the construction of jewelry, not specially provided for in this section, 45 per centum ad valorem.

## ARTICLES OF MARBLE, BRECCIA, ONYX, ETC.

(See Survey B-11.)

## GENERAL.

Stone manufactures include, besides tombstones and monuments made of marble and kindred stones, a large and diverse list such as commercial and religious statuary, paper weights, inkwells, table tops, and jet spangles for ornamenting textiles and millinery goods. The manufacturing industry aside from the production of monuments is of very minor importance. Stone monuments are produced in all parts of the United States. The plants are usually located close to burial grounds, but some large quarry organizations ship to distant domestic markets. Desk and novelty articles are produced as a side line by manufacturers of monuments, as well as by makers of novelties, and also on special order. The manufacture of jet is an important industry in many parts of Europe, but not here. The stone-working industries of Greece and Italy have been famous for centuries because of their fine marble and excellent workmanship.

Tombstones, monuments, and grave markers can usually be cut and finished by stone-working machinery, which eliminates handwork to a large extent. Up to this point the domestic industry can compete favorably with European goods, but in carving, which is entirely handwork, European producers possess a considerable advantage because of their lower-priced labor. There are standard ornaments, such as stone urns; cherubs, angels, and other symbolic figures of foreign manufacture, which command a ready sale, but a large part of the ornamentation of plain monumental work is done on special consignment, which can not be anticipated, and so foreign competition in this branch of the trade is not serious.

In 1914 there were in the United States 4,901 establishments engaged in marble and stone work, with an output valued at \$107,055,000; in 1919 the corresponding figures were 4,208 and \$127,993,000. The production of monuments and tombstones was valued at \$40,976,682 in 1914.

## ARTICLES OF MARBLE AND BRECCIA.

*Description and uses.*—Large articles, such as monuments, benches, and mantelpieces, are frequently made of marble and breccia. (For sculptures, see pars. 1447 and 1685, pp. 1195 and 1478, respectively.)

*Production.*—The only available statistics are for marble monuments and tombstones, which in 1914 were valued at \$40,977,000.

*Imports,* derived chiefly from Italy and France, were valued at \$224,742 in 1914. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
1918.....	\$30,863	\$13,888	45
1919.....	46,622	20,980	45
1920.....	83,768	37,694	45
1921 (9 months).....	86,617		

*Exports* of manufactures of stone, including marble, n. s. p. f., are destined chiefly for Canada, Cuba, and the United Kingdom. Statistics have been as follows (calendar years): 1918, \$1,208,164; 1919, \$1,508,997; 1920, \$2,158,764; 1921 (9 months) \$1,355,335.

## ARTICLES OF ONYX.

*Description and uses.*—Similar articles are made from “onyx marble” as from marble and breccia, but the use of real onyx (banded chalcedony) is confined to smaller ornaments.

*Production* figures are not available. (See “Articles of agate,” p. 348.)

*Imports* were valued at \$1,902 in 1914. France is the principal source of supply. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
			<i>Per cent.</i>
1918.....	\$305	\$137	45
1919.....	2,053	924	45
1920.....	2,960	1,332	45
1921 (9 months).....	8,707		

*Exports.*—Not recorded separately.

## ARTICLES OF ALABASTER.

*Description and uses.*—Vases, lamps, and other interior ornaments are made of alabaster, a translucent gypsum. It is too soft for exterior decoration.

*Production.*—There is no domestic alabaster. Values of articles made from imported material are not available.

*Imports*, mainly from Italy, averaged about \$15,000, but were \$51,065 in 1914. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
			<i>Per cent.</i>
1918.....	\$5,304	\$2,387	45
1919.....	3,713	1,671	45
1920.....	14,355	6,460	45
1921 (9 months).....	17,462		

*Exports.*—Not recorded separately.

## ARTICLES OF JET.

*Description and uses.*—See paragraph 1592.

*Imports* in 1914 were valued at \$15,790 (more than double any year since 1908) and in 1918 at \$2,160. Imports from France represent the largest values. Imports in 1920 (calendar year) were \$26,149, and in nine months of 1921 \$18,557. In the latter year small amounts were received from Germany and Czechoslovakia.

## ARTICLES OF AGATE.

(See Survey B-11.)

*Description and uses.*—Besides ornaments, many industrial articles are made of agate (a variegated chalcedony), such as scale bearings, mechanical bearings and supports, mortars, and balls for water meters.

*Production* of agate and other varieties of chalcedony averages about \$9,000 annually. In 1915, however, the value increased to \$23,262, but was only \$7,580 in 1918. These figures represent the value of chalcedony, not of the manufactured articles. It is estimated that most of the domestic agate is used for jewelry.

*Imports* of articles (other than jewelry) made of agate were valued at \$20,165 in 1914. Germany normally supplies about 80 per cent, most of the remainder being derived from England and France. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
			<i>Per cent.</i>
1918.....	\$5,275	\$2,374	45
1919.....	6,826	3,072	45
1920.....	52,099	23,445	45
1921 (9 months).....	26,243		

*Exports.*—Not recorded separately.

## ARTICLES OF ROCK CRYSTAL.

(See Survey B-11.)

*Description and uses.*—Rock crystal is a clear and colorless quartz. Wedges and prisms in some optical instruments, ornamental jars, boxes, and vases are frequently made from it. Because of its purity, it is used in the manufacture of special glasses where cost is not considered.

*Production* was valued at \$4,046 in 1914 and at \$2,022 in 1918. No statistics of the manufactured articles are available.

*Imports* of articles made of rock crystal averaged about \$4,000 until 1913, when they increased to \$19,982, falling to \$1,846 in 1914. France and Germany usually supplied the greater part, but in 1913 over \$11,000 worth came from England. More recently there have also been imports from China and Japan. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
			<i>Per cent.</i>
1918.....	\$62	\$28	45
1919.....	1,904	857	45
1920.....	3,989	1,795	45
1921 (9 months).....	1,509		

*Exports.*—Not recorded separately.

## OTHER SEMIPRECIOUS STONES.

*Description and uses.*—There is no scientific differentiation between precious and semiprecious stones. Specimens of the same mineral species vary so widely that one may be “precious” and another “semiprecious.” Corundum, of which the ruby and sapphire are varieties, represents over 50 per cent of the value of all gems produced in the United States. A large proportion of the corundum minerals finds industrial use as abrasive material and for mechanical bearings and pivot supports, especially in watches.

*Production* statistics can not be given, as there is no definite classification.

*Imports* of “other semiprecious stones” were valued at \$985 in 1909, \$18,528 in 1913, \$3,405 in 1914. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
1918.....	\$5,935	\$2,671	<i>Per cent.</i> 45
1919.....	4,752	2,138	45
1920.....	14,038	6,317	45
1921 (9 months).....	8,987		

*Exports.*—Not recorded separately.

## PARAGRAPH 234.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 234. Burrstones, manufactured or bound up into millstones, 13 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 113. Burrstones, manufactured or bound up into millstones, fifteen per centum ad valorem.

PAR. 438. Burrstones, manufactured or bound up into millstones [Free].

## BURRSTONES, MILLSTONES, ETC.

(See Survey B-3.)

*Description and uses.*—Burrstones or millstones and the closely related quarry products, chasers and dragstones, are natural quarried stones which are used for grinding purposes. Millstones were formerly used for grinding grain, but have been replaced by modern grain-milling machinery. This has been somewhat offset by the growing use of chasers and dragstones for grinding mineral products, such as feldspar, quartz, and pigments. Chasers are similar in composition to millstones, but are larger in size and by being made to run on edge curl the material; millstones are run horizontally and the materials are ground between two stones.

*Production* of millstones (burrstones) and related quarry products has varied widely. New York and Virginia are the chief producers.

The value of the output in successive years has been as follows: 1912, \$71,414; 1917, \$43,489; 1918, \$92,514; 1919, \$66,972; 1920, \$63,325.

*Imports* of millstones since 1913 have varied from \$15,000 to \$20,000; in 1917 they were about 40 per cent of the domestic production. Recently, at least, the imports have come principally from France. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity.....tons..		143	873	45
Value.....	\$3,347	\$17,360	\$11,947	\$9,678

*Exports* not recorded separately.

*Important changes in classification.*—Transferred from the free list, act of 1913 (par. 438).

### PARAGRAPH 235.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 235. Freestone, granite, sandstone, limestone, lava, and all other stone suitable for use as monumental or building stone, except marble, breccia, and onyx, not specially provided for, hewn, dressed, or polished, or otherwise manufactured, 40 per centum ad valorem; unmanufactured, or not dressed, hewn, or polished, 15 cents per cubic foot.

ACT OF 1909.

ACT OF 1913.

PAR. 114. Freestone, granite, sandstone, limestone, and all other monumental or building stone, except marble, breccia, and onyx, not specially provided for in this section, hewn, dressed, or polished, or otherwise manufactured, fifty per centum ad valorem; unmanufactured, or not dressed, hewn, or polished, ten cents per cubic foot.

PAR. 551. Curling stones, \* \* \* [Free].

PAR. 99. Freestone, granite, sandstone, limestone, lava, and all other stone suitable for use as monumental or building stone, except marble, breccia, and onyx, not specially provided for in this section, hewn, dressed, or polished, or otherwise manufactured, 25 per centum ad valorem; unmanufactured, or not dressed, hewn, or polished, 3 cents per cubic foot.

PAR. 470. Curling stones, \* \* \* [Free].

### SANDSTONE AND FREESTONE.

(See Survey B-11.)

*Description and use.*—Sandstone is a sedimentary rock composed of sand (usually accumulated under water) and a calcareous or silicious cement, deposited from subsurface waters. White, gray, and red are the principal color variations. The value varies with the color and the uniformity and size of the individual sand grains. Freestone is a variety of sandstone, or sand-lime stone so called.

because it can be cut and shaped easily. Among the important stones sandstone ranks third as a building stone, first for flagging, and second for paving and curbing.

The following table shows the uses of sandstone sold in the United States in 1918 and 1920:

Use.	1918		1920	
	Quantity.	Value.	Quantity.	Value.
Building stone..... cubic feet.....	973,990	\$536,474	1,812,580	\$1,619,724
Approximate equivalent in short tons.....	75,650		149,890	
Paving blocks..... number.....	2,188,419	148,091	3,599,580	304,476
Approximate equivalent in short tons.....	21,900		37,650

1921 (9 months).....		27,947		

Exports.—Not separately recorded. (See par. 232, p. 345.)

## GRANITE.

(See Survey B-11.)

*Description and use.*—Granite is an igneous rock, formed from liquid material after a long period of slow cooling. It consists of a mixture of crystals of quartz, feldspar, mica, and other minerals, and the color ranges from gray white to gray black. The combination of light and dark minerals gives the rock a mottled appearance that varies with the percentages of the different minerals and the size of the individual crystals. Granite is very durable, and takes a high polish that brings out the beauty of the crystal structure. It is the most important monumental and building stone. The quantity and value of granite sold for various uses in 1918 and 1920 are shown as follows:

Use.	1918		1920	
	Quantity.	Value.	Quantity.	Value.
Building stone (rough and dressed).....cubic feet..	2,771,013	\$2,349,796	4,895,880	\$4,492,482
Approximate equivalent in short tons.....	232,270		411,170	
Monumental stone.....cubic feet..	3,358,431	6,964,879	3,379,330	11,543,255
Approximate equivalent in short tons.....	282,000		283,910	
Paving.....number of blocks..	25,923,526	1,547,612	32,230,270	2,582,934
Approximate equivalent in short tons.....	272,200		351,260	
Curbing and flagging.....cubic feet..	382,000	324,381	997,950	755,540
Approximate equivalent in short tons.....	33,600		62,100	
Rubble.....short tons..	140,472	151,408	90,760	154,036
Riprap.....do....	624,954	480,666	525,470	478,128
Crushed stone.....do....	2,069,473	2,583,449	3,016,960	4,831,776
Other stone.....do....	171,944	64,232	18,370	116,757
Total (quantities approximate, in short tons).....	3,827,400	14,466,423	4,760,000	24,954,908

*Production.*—The granite deposits of present economic importance are located near the Appalachian continental plateau, the most valuable occurring at the northern and southern extremities of this area. Another area of growing importance includes the western Lake States. Granite production was reported from 31 States in 1919; Vermont, Massachusetts, North Carolina, Maine, Wisconsin, Minnesota, and New Hampshire produced the bulk of the supply.

The following table gives statistics of production:

	Quantity.	Value.
	<i>Short tons.</i>	
1914.....		\$11,225,179
1916.....	9,270,800	17,456,838
1917.....	5,564,200	15,544,957
1918.....	3,827,400	14,466,423
1919.....	4,221,220	19,345,714

*Imports* in 1914 were valued at \$157,211, nearly all hewn granite for monumental work, chiefly from Scotland. Later statistics follow:

## Granite.

Calendar year.	Quantity.	Value.	Duty.	Equiva- lent ad valorem.
UNMANUFACTURED OR NOT DRESSED, HEWN, OR POLISHED.				
	<i>Cubic feet.</i>			<i>Per cent.</i>
1918.....	28,240	\$14,554	\$847	5.82
1919.....	23,240	17,796	697	3.92

1920.....	108,193	27,048	25.00
1921 (9 months).....	89,296		

*Exports.*—Not separately stated. (See par. 232, p. 345.)

## LIMESTONE.

[See par. 204, p. 262.]

## LAVA: TRAP ROCK (BASALT AND RELATED ROCKS).

*Description and use.*—All rock of volcanic origin is lava, of which there are many varieties. (See also par. 206, p. 268.)

Trap rock is an igneous rock formed by a rapid cooling of the molten lava. The rock is fine grained and shows little or no crystal structure. The color ranges from white to black. The name is applied to any fine-grained lava or dike rock.

The chief use of trap rock is in crushed form for road metal or ballast. Small amounts are used for rough building stone, although not if other materials are available, as this rock has no definite cleavage planes and breaks with a jagged fracture. It finds some use in paving.

*Production.*—Trap rock for building material is produced irregularly by several States, but Massachusetts and Connecticut are the only localities reporting continuous operation.

Statistics of production of basalt and related rocks (trap rock) are given in the following table:

	Quantity.	Value.
	<i>Short tons.</i>	
1916.....	10,233,640	\$7,666,297
1917.....	9,103,580	7,570,885
1918.....	6,859,200	7,782,280
1919.....	7,410,770	8,944,686
1920.....	9,219,200	12,260,148

*Imports.*—(See Sandstone and Freestone, p. 351.)

*Exports.*—Not separately recorded. (See par. 232, p. 345.)

## GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—The provision for curling stones, exempt from duty under the act of 1913 (par. 470), has been dropped.

## PARAGRAPH 236.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 236. Grindstones, finished or unfinished, \$2 per ton.

ACT OF 1909.

ACT OF 1913.

PAR. 115. Grindstones, finished or unfinished, one dollar and seventy-five cents per ton.

PAR. 100. Grindstones, finished or unfinished, \$1.50 per ton.

## GRINDSTONES.

(See Survey B-3.)

*Description and uses.*—The term "grindstone" usually refers to the natural quarried stone. Pulpstones are heavy grindstones used for grinding wood in making pulp and paper, and weigh from 2 to 4 tons.

*Production.*—The value of grindstones and pulpstones produced in 1917 was \$1,147,784 as compared with \$766,140 in 1916. Ohio has always produced 85 to 90 per cent of the total. Grindstones have a serious competitor in grinding wheels made from artificial abrasive. (See par. 1415, p. 1121.) Later statistics of domestic production are as follows:

	1918	1919	1920
Quantity.....short tons..	63,339	46,865	53,484
Value.....	\$1,776,282	\$1,336,015	\$1,707,004

*Imports* were \$139,386 in 1913. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equiva- lent ad valorem.
	<i>Tons.</i>			<i>Per cent.</i>
1918.....	2,134	\$55,283	\$3,201	5.79
1919.....	1,628	50,551	2,442	4.83
1920.....	2,076	77,046	3,114	4.04
1921 (9 months).....	1,373	67,633		

*Exports* largely to Canada and Cuba have been for calendar years as follows: 1918, \$210,889; 1919, \$297,068; 1920, \$424,322; 1921, \$222,349.

## PARAGRAPH 237.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 237. Slates, slate chimney pieces, mantels, slabs for tables, roofing slates, and all other manufactures of slate, not specially provided for, 17 per centum ad valorem.

ACT OF 1909.

PAR. 116. Slates, slate chimney pieces, mantels, slabs for tables, roofing slates, and all other manufactures of slate, not specially provided for in this section, twenty per centum ad valorem.

ACT OF 1913.

PAR. 101. Slates, slate chimney pieces, mantels, slabs for tables, roofing slates, and all other manufactures of slate, not specially provided for in this section, 10 per centum ad valorem.

## SLATES.

(See Survey B-11.)

*Description and uses.*—Slate is a fine, compact rock with easy parallel cleavage, much used where smooth slabs are required. About three-fifths of the slate quarried in 1917 was used for roofing. Mill stock, slates 1 to 3 inches thick used for structural and sanitary purposes, is second in importance. Other uses are for electrical switchboards, blackboards, and billiard-table tops. Ground slate is made of slate-cutting waste. The granules are used as a coating for composition tar shingles, and the flour goes into linoleum, paint, and wall finishes.

*Production.*—Domestic slate deposits are of a high grade, and besides supplying the home market furnish a considerable tonnage for export. Over 99 per cent of production originates in the States north and east of Virginia. The quarries require little machinery, as it is more economical to split the rough blocks by hand. The dressing sheds contain trimming knives for finishing shingles and rotary planers for truing the surfaces of thick slabs. The industry was formerly conducted by many small operators, but the present tendency is toward extensive organization. Although slate quarrying is a domestic industry in most countries, Welsh slates have long been exported. They meet active American competition, however, in the foreign markets.

The value of the slate sold by quarrymen in 1920 was the largest yet recorded for this material, but this fact does not indicate any decided revival in the slate industry as a whole, for the quantity of roofing slate sold was only 8 per cent more than in 1879, the year of the lowest recorded sales (367,857 squares), and 72 per cent less than in 1902, the year of the largest recorded sales (1,435,168 squares). The average value per square, however, was \$3.35 in 1879, \$3.45 in 1902, and \$8.90 in 1920.

The total quantity of mill stock sold in 1920 was an increase of 33 per cent over the quantity sold in 1919, but 24 per cent less than that sold in 1913, the record year.

The slate sold in 1920 was produced at well-established quarries in Maine, Maryland, New York, Pennsylvania, Vermont, and Virginia.

*Slate sold in the United States, 1916-1920, by uses.*

Year.	Roofing slate.			Mill stock. <sup>1</sup>			Other uses (value).	Total value.
	Number of squares (100 square feet).	Value.	Average value per square.	Quantity (square feet).	Value.	Average value per square foot.		
1916.....	835, 873	\$3, 408, 934	\$4. 08	5, 782, 842	\$1, 177, 260	\$0. 20	\$752, 643	\$5, 338, 837
1917.....	703, 667	3, 411, 740	4. 85	5, 478, 151	1, 277, 249	. 23	1, 060, 977	5, 749, 966

<sup>1</sup> For 1919 and 1920 total output of mill stock is given. Prior to 1919 bulletin, blackboard, and school slate material was included under "Other uses."

*Imports* were greatest in 1912, \$11,042. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
1918.....	\$531	\$53	10
1919.....	691	69	10
1920.....	4, 512	451	10
1921 (9 months).....	2, 864		
			<i>Per cent.</i>

*Exports* of slate, other than roofing, for the year 1917 were valued at \$204,590, over 80 per cent being for school slates and pencils. Exports of roofing slate, principally to Canada, Australia, and the United Kingdom, have been as follows: 1914, \$188,057; (calendar years 1918-1921) 1918, \$65,224; 1919, \$55,164; 1920, \$122,105; 1921 (9 months), \$64,818.

### PARAGRAPH 238.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 238. Watch crystals, 40 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 192. \* \* \* parts of watches,  
\* \* \* forty per centum ad valorem;  
\* \* \*

PAR. 161. \* \* \* parts of watches,  
\* \* \* 30 per centum ad valorem;  
\* \* \*

### WATCH CRYSTALS.

(See Survey C-26.)

*Description and use.*—Watch crystals are too familiar to require description.

*Production.*—Before the European war watch crystals were not made in the United States, the American supply being received chiefly from France, Germany, Switzerland, and Austria. After the war began they were received from Japan and Switzerland, the former country being the chief source of supply.

In 1915 the Macbeth-Evans Glass Co., Pittsburgh, Pa., undertook the manufacture of watch crystals, but with poor success, and subsequently discontinued their manufacture. Shortly afterwards the Waterbury Clock Co., Waterbury, Conn., built a plant and began the manufacture of crystals, with fair success. The crystals made by this company are said to be accepted by the trade as equal to the European crystals and as better in quality than those imported from Japan. In 1918 the Waterbury Clock Co. manufactured 14,070,960 watch crystals.

There are said to be certain difficulties attending the production of watch crystals that explain why the industry has never progressed in this country.

"Glass is of such a nature that uniformity of product can not be counted on, making most uncertain the cost of the material itself.

"The grinding and shaping of the crystal in its manufacture is not on such positive lines that the required size can be obtained.

"The more extended the business the greater the opportunity of utilizing off sizes, otherwise valueless."

*Imports.*—None separately recorded since 1918.

*Exports.*—None recorded.

*Important changes in classification.*—New specific provision.

## SCHEDULE 3.—METALS AND MANUFACTURES OF.

### PARAGRAPH 301.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 301. Iron in pigs, iron kentledge, spiegeleisen containing more than 1 per cent of carbon, wrought and cast scrap iron, and scrap steel, including scrap tin plate, \$1.25 per ton: *Provided*, That spiegeleisen for the purposes of this Act shall be an iron manganese alloy containing less than 45 per centum of manganese: *Provided further*, That nothing shall be deemed scrap iron or scrap steel except secondhand or waste or refuse iron or steel fit only to be remanufactured.

ACT OF 1909.

ACT OF 1913.

SCHEDULE C—METALS AND MANUFACTURES OF.

SCHEDULE C—METALS AND MANUFACTURES OF.

PAR. 118. Iron in pigs, iron kentledge, spiegeleisen, \* \* \* two dollars and fifty cents per ton; wrought and cast scrap iron, and scrap steel, one dollar per ton; but nothing shall be deemed scrap iron or scrap steel except waste or refuse iron or steel fit only to be remanufactured by melting, and excluding pig iron in all forms.

PAR. 518. \* \* \* iron in pigs, iron kentledge, spiegeleisen, wrought iron and scrap and scrap steel; but nothing shall be deemed scrap iron or scrap steel except second-hand or waste or refuse iron or steel fit only to be remanufactured; \* \* \* [Free].

### PIG IRON, SCRAP AND SPIEGELEISEN.

(See Surveys FL-21 and C-1.)

*Description and use.*—Pig iron is classified as Bessemer, basic, low phosphorus, foundry, malleable, forge, and the ferroalloys. The first three are usually manufactured into steel; the next three into castings or into wrought iron; and the last are used to purify and give certain desirable qualities to steel. Spiegeleisen is an alloy of iron and manganese, having a manganese content between 10 and 45 per cent, the commercial grade in this country being about 20 per cent; a 10 to 12 per cent alloy, however, is also marketed in Europe. Iron kentledge is pig iron shipped on a vessel as ballast. Wrought iron is the purest form of iron used and can be forged, rolled, or welded. It is made by puddling pig iron. Cast iron is pig iron run into molds when molten or reheated and allowed to cool. Waste or old wrought iron and old cast iron, as well as waste or old steel, constitute scrap. Scrap tin plate is old or waste tin plate, a form of steel scrap consisting mainly of clippings and valuable principally for the tin which may be recovered

from it. Scrap is largely used in open-hearth furnaces in the manufacture of steel.

*Production.*—Domestic pig-iron production in 1913 was 30,966,152 long tons out of an estimated world total of 72,400,000 tons. In 1918 it was 39,054,644 long tons, valued at \$1,180,759,565, and in 1920, 36,925,987 long tons. The leading States are Pennsylvania, Ohio, Illinois, Indiana, and New York. The output of spiegeleisen in 1913 amounted to 110,338 gross tons; in 1918, to 283,853 gross tons; and in 1920, to 111,449 gross tons.

In 1913 the pig-iron production of Germany was 18,987,039 tons; of the United Kingdom, 10,316,265 tons; and of France 5,227,378 tons. In 1917 the output of Germany was 12,932,338 gross tons and of the United Kingdom 9,640,936 gross tons. These countries are also large producers of spiegeleisen and ferromanganese, Germany's output in 1917 aggregating 316,577 gross tons.

*Imports* during the calendar years 1918–1921 were as follows:

	1918	1919	1920	1921 (9 months).
Pig iron (all other): <sup>1</sup>				
Quantity (tons).....	361	58,171	107,547	20,258
Value.....	\$15,828	\$1,651,185	\$4,029,210	\$596,442
Iron kentledge:				
Quantity (tons).....	20			
Value.....	\$326			
Spiegeleisen:				
Quantity (tons).....	1,969	27	5,234	269
Value.....	\$228,012	\$1,018	\$277,900	\$9,260
Scrap iron and scrap steel:				
Quantity (tons).....	63,218	177,293	134,209	27,984
Value.....	\$1,221,765	\$3,249,322	\$2,831,048	\$306,922
Scrap tin plate:				
Quantity (pounds).....	14,973,723	11,771,218	2,6436	2,962
Value.....	\$119,591	\$91,281	\$84,541	\$8,635

<sup>1</sup> "All other" means pig iron proper—i. e., pig iron other than spiegeleisen, ferromanganese, iron kentledge, and during some years, ferrosilicon.

<sup>2</sup> Tons.

Imports of pig iron come chiefly from England and Canada; and scrap iron and steel, largely from Canada.

*Exports* in the calendar years 1918–1921 of pig iron and of scrap iron and steel were as follows:

	1918	1919	1920	1921 (9 months).
Pig iron:				
Quantity (tons).....	261,891	316,718	212,742	20,801
Value.....	\$10,327,178	\$11,722,033	\$9,390,750	\$666,405
Scrap iron and steel:				
Quantity (tons).....	2,160	27,275	219,250	27,201
Value.....	\$83,626	\$717,325	\$6,411,534	\$430,479

No exports of iron kentledge, spiegeleisen, or scrap tin plate are recorded.

The pig iron goes mainly to Canada, Italy, the Netherlands, and Belgium, and the scrap iron and scrap steel, to Canada, the United Kingdom, China, Hongkong, and Japan.

*Important changes in classification.*—Iron in pigs, iron kentledge, spiegeleisen, wrought iron and scrap iron and scrap steel are exempt

from duty under paragraph 518 of the act of 1913. In the act of 1913 ferromanganese as well as spiegeleisen was placed with pig iron, but in H. R. 7456 it has been transferred to the paragraph which deals with the ferroalloys. The dividing line between spiegeleisen and ferromanganese was fixed by the War Industries Board at 45 per cent manganese content. This dividing line had never been definitely determined in trade practice, as standard spiegeleisen has a manganese content from 18 to 22 per cent and standard ferromanganese, a manganese content from 70 to 80 or 82 per cent. Tiemann, an authority, makes the dividing line 30 per cent manganese.

*Suggested changes.*—Spiegeleisen is a ferroalloy as much as ferromanganese and ferrosilicon, which are included in the paragraph devoted to the ferroalloys. It is suggested, therefore, that spiegeleisen be transferred from this paragraph to the following one. (See Ferromanganese, par. 302, p. 367.)

The Treasury Department held that the provision for scrap tin in paragraph 631 of the act of 1913 includes scrap tin plate. The provision for scrap steel might be construed to include alloy steel, especially tungsten steel, a much more expensive material than ordinary scrap steel. In order to obviate this construction a proviso reading somewhat as follows might be inserted: "*Provided further, That alloy steels valued at 7 cents per pound or more shall not be classed as scrap iron or scrap steel.*"

Page 39, line 3, H. R. 7456: Change "per cent" to "per centum" to agree with usage elsewhere in H. R. 7456.

## PARAGRAPH 302.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 302. Manganese ore or concentrates containing in excess of 30 per centum of metallic manganese, 1 cent per pound on the metallic manganese contained therein; molybdenum ore or concentrates, 75 cents per pound on the metallic molybdenum contained therein; tungsten ore or concentrates, 45 cents per pound on the metallic tungsten contained therein; ferromanganese containing more than 1 per centum of carbon, 2½ cents per pound on the metallic manganese contained therein: *Provided, That ferromanganese for the purposes of this Act shall be such iron manganese alloys as contain 45 per centum or more of manganese; manganese metal, manganese silicon, manganese boron, and ferromanganese and spiegeleisen containing not more than 1 per centum of carbon, 2½ cents per pound on the manganese contained therein and 28 per centum ad valorem; ferromolybdenum, metallic molybdenum, molybdenum powder, calcium molybdate, and all other compounds and alloys of molybdenum, \$1.25 per pound on the molybdenum contained therein and 17 per centum ad valorem;*

## H. R. 7456.

## SENATE AMENDMENTS.

ferrotungsten, metallic tungsten, tungsten powder, tungstic acid, and all other compounds of tungsten, 72 cents per pound on the tungsten contained therein and 15 per centum ad valorem; ferrochromium tungsten, chromium tungsten, chromium cobalt tungsten, tungsten nickel, and all other alloys of tungsten not specially provided for, 72 cents per pound on the tungsten contained therein and 17 per centum ad valorem; ferrosilicon, containing 8 per centum or more of silicon and less than 30 per centum,  $2\frac{1}{2}$  cents per pound on the silicon contained therein; containing 30 per centum or more of silicon and less than 60 per centum,  $2\frac{1}{2}$  cents per pound on the silicon contained therein; containing 60 per centum or more of silicon and less than 80 per centum,  $3\frac{1}{2}$  cents per pound on the silicon contained therein; containing 80 per centum or more of silicon and less than 90 per centum, 4 cents per pound on the silicon contained therein; containing 90 per centum or more of silicon, and silicon metal, 8 cents per pound on the silicon contained therein; ferrochrome or ferrochromium containing 3 per centum or more of carbon,  $3\frac{1}{2}$  cents per pound on the chromium contained therein; ferrochrome or ferrochromium containing less than 3 per centum of carbon, and chrome or chromium metal, 30 per centum ad valorem; ferrophosphorus, ferrotitanium, ferrovanadium, ferrouanium, ferrocerium, ferrozirconium, ferrosilicon, ferroboron, titanium, zirconium, tantalum, chromium nickel, vanadium nickel, zirconium nickel, chromium vanadium, chromium silicon, zirconium silicon, calcium silicide, and all alloys used in the manufacture of steel not specially provided for, 30 per centum ad valorem.

## ACT OF 1909.

PAR. 184. Chrome or chromium metal, ferrochrome or ferrochromium, ferromolybdenum, ferrophosphorus, ferrotitanium, ferrotungsten, ferrovanadium, molybdenum, titanium, tantalum, tungsten, or wolfram metal, valued at two hundred dollars per ton or less, twenty-five per centum ad valorem; valued at more than two hundred dollars per ton, twenty per centum ad valorem; ferrosilicon containing not more than fifteen per centum of silicon, five dollars per ton; ferrosilicon containing more than fifteen per centum of silicon, twenty per centum ad valorem.

PAR. 183. \* \* \* metals unwrought, whether capable of being wrought or not, not specially provided for in this section, twenty per centum ad valorem; \* \* \*.

## ACT OF 1913.

PAR. 102. Chrome or chromium metal, ferrochrome or ferrochromium, ferromolybdenum, ferrophosphorus, ferrotitanium, ferrotungsten, ferrovanadium, molybdenum, titanium, tantalum, tungsten or wolfram metal, and ferrosilicon, and other alloys used in the manufacture of steel, not specially provided for in this section, 15 per centum ad valorem.

PAR. 154. \* \* \* metals unwrought, whether capable of being wrought or not, not specially provided for in this section, 10 per centum ad valorem; \* \* \*.

## ACT OF 1909.

PAR. 118. \* \* \* ferro-manganese, two dollars and fifty cents per ton; \* \* \*.

PAR. 619. Manganese, oxide and ore of [Free].

PAR. 626. Minerals, crude \* \* \* [Free].

PAR. 190. Tungsten-bearing ores of all kinds, ten per centum ad valorem.

PAR. 3. \* \* \* chemical compounds, mixtures and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*.

## ACT OF 1913.

PAR. 518. \* \* \* ferromanganese \* \* \* [Free].

PAR. 540. Manganese, oxide and ore of [Free].

PAR. 549. Minerals, crude \* \* \* [Free].

PAR. 633. Tungsten-bearing ores of all kinds [Free].

PAR. 5. \* \* \* chemical \* \* \* compounds, \* \* \* mixtures and salts, \* \* \* not specially provided for in this section, 15 per centum ad valorem.

## FERROALLOYS AND ORES OF FERROALLOYS.

(See Surveys C-1 and FL-28.)

## MANGANESE ORES.

*Description and uses.*—Manganese is not found in the metallic state in nature; it occurs only in combination with other elements as an oxide, carbonate, or silicate, oxides being the most common. Manganese ore is the raw material for ferromanganese and spiegeleisen, products employed in the manufacture of steel. Minor amounts of the ore are used in chemical and other industries, but 96 per cent goes into the making of steel. Practically all steel contains manganese, and of all alloys ferromanganese is used in the largest quantity. Manganese alloys when added to steel in proper proportions impart the essential qualities of toughness and hardness.

*Production.*—Prior to the war we produced less than 1 per cent of our manganese requirements, the output rarely exceeding 4,000 tons of high-grade ore. In 1915 production of high-grade ore (metallic content 35 per cent or more) increased to nearly 10,000 tons; in 1916, to 31,000 tons; in 1917, to 129,000 tons; and in 1918, to approximately 305,869 tons. In 1919 it fell to less than 56,000 tons, but in 1920 increased to about 94,000 tons. During the war the production of manganese ore was a profitable industry in many localities, but only because prices were from three to four times prewar quotations. Foreign ores are of a better general grade and more easily mined, averaging from 45 to 55 per cent manganese, as compared with domestic "high grade" running from 35 to 45 per cent. Operating costs here are much higher than abroad, American mines being situated far from points of consumption, and often at considerable distances from railroads. Domestic resources have been carefully estimated and found to be insufficient to supply our requirements for more than a few years. Under normal trade conditions, with a free movement of ore from foreign countries, domestic manganese mining can not continue except on a limited scale.

*Imports.*—Before the war nearly all foreign manganese ore came from British India, Brazil, and Russia. In 1914 these countries supplied 99 per cent—British India, 40 per cent; Brazil, 25 per cent; and Russia, 34 per cent. After 1915 imports from Russia ceased, the British India supply was greatly reduced, and Brazil showed large increases. The mining of manganese ore in Cuba began in 1915; it

was promoted by American capital, and the entire production was sent here, 550 tons in 1915 and 67,780 tons in 1918, one-ninth of our imports. Total imports in 1914 were 288,837 long tons, valued at \$1,841,472. Imports since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (tons).....	491,157	333,933	606,937	341,074
Value.....	\$15,090,920	\$11,261,021	\$12,230,922	\$3,023,533

The imports during 1920 came from Brazil, India, and Russia.

*Exports.*—None reported.

*Important changes in classification.*—Manganese ore is exempt from duty under paragraph 540 of the act of 1913. In H. R. 7456, it is for the first time placed in the same paragraph with the ferro-alloys and alloying metals.

Manganese oxide occurring as a natural mineral and exempt from duty under paragraph 540 of the act of 1913 is covered by the provision in this paragraph for manganese ore and concentrates. Manganese oxide made by chemical means, also exempt from duty under paragraph 540 of the act of 1913, is included in the suggestion under paragraph 44 that manganese salts and compounds be specially provided for.

#### MOLYBDENUM ORE.

*Description and uses.*—The most important molybdenum ore is molybdenite, a sulphide of molybdenum. It is a flaky mineral resembling graphite in appearance. Molybdenum is used in the steel industry in the manufacture of stainless steel and high-speed steel and in the chemical industry in the production of ammonium molybdate and other molybdenum compounds.

Wulfenite is another molybdenum ore containing 26.2 per cent molybdenum. It is rarer than molybdenite and is now relatively unimportant as a source of molybdenum.

*Production.*—In 1918 there were sold in the United States 861,637 pounds of molybdenum ore or concentrate, valued at \$1,253,700, and in 1919, 297,926 pounds, valued at \$341,814.

*Imports* since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	140,222	106,743	15,639	24,218
Value.....	\$123,924	\$77,572	\$9,707	\$9,999

*Exports.*—None recorded. It is reported that some molybdenite concentrate is exported, but no figures are available.

*Important changes in classification.*—Molybdenum ore is exempt from duty as a crude mineral under paragraph 549 of the act of 1913. In H. R. 7456 it is for the first time placed in the same paragraph with the ferro-alloys and alloying metals.

## TUNGSTEN-BEARING ORES.

*Description and uses.*—Tungsten metal is found only in the form of tungstates of iron, manganese, or calcium. Except in the United States it is usually accompanied by tin ore. There are four commercial tungsten minerals—scheelite, ferberite, huebnerite, and wolframite. Scheelite is the tungstate of lime. The other three are frequently grouped together as the wolframite series, and range in composition from ferberite (tungstate of iron) to huebnerite (tungstate of manganese). The pure minerals of the wolframite series contain over 76 per cent tungsten trioxide ( $WO_3$ ); scheelite contains about 80 per cent ( $WO_3$ ). The tungsten ore of commerce, however, contains a certain amount of nontungsten-bearing material in addition to one or more of the above minerals. The standard ore contains 60 per cent ( $WO_3$ ), and this tenor is usually obtained by concentration of low-grade ore. Although the occurrence of tungsten is widespread, the individual deposits are never of large extent. The ore comes in lenticular shoots and masses, in veins, or irregularly distributed along contacts. The deposits of Boulder County, Colo., are narrow stringers; the lodes of the Southwest are usually wider and can be worked on a larger scale. Lode mining of tungsten does not differ essentially from the mining of other ores, except that tungsten rarely is found in sufficient amounts or in shoots regular enough to permit of systematic extraction. The ores are concentrated to 60 per cent or more tungsten-trioxide, but the recovery of so rich a product from ore, usually containing only 2 to 10 per cent, results in high losses and much waste of tungsten. To increase the extraction, many mills make two grades of concentrate—a high-grade sand concentrate, containing approximately 60 per cent, and suitable for making ferrotungsten in the electric furnace, and a slime concentrate of lower grade, containing about 20 per cent and suitable only for chemical process.

Of all the tungsten ore now produced, 90 to 95 per cent goes into the manufacture of tungsten powder and ferrotungsten for use in the manufacture of high-speed tool steels. The addition of tungsten to steel gives it the property of holding its temper at a much higher heat than that at which simple carbon steels and most other alloy steels become soft and worthless. Molybdenum has somewhat similar properties, and is used to some extent, especially in Europe, but it has never proved so satisfactory and is now generally used in conjunction with tungsten, which it replaces only in part.

*Production.*—The maximum domestic production of tungsten ore was, in 1917, 6,144 short tons of concentrates, containing 60 per cent ( $WO_3$ ), and in 1916, 5,923 short tons, valued, respectively, at \$6,783,162 and \$12,075,417. The 1918 output was 5,061 short tons. In 1920 the estimated production had dropped to 216 short tons. The tungsten industry was characterized by a large number of small independent producers with only a few well-financed companies. A considerable number of the stronger operators had connections with manufacturers or consumers of tungsten metal and ore. The largest producer, operating in California, had a prewar output about 30 per cent of the total. Fully 75 per cent of the prewar output was by four large companies, one in California and three in Boulder County, Colo. The remainder came from a large and constantly shifting group of

small operators. Domestic production was slightly over 50 per cent of this country's requirements in 1917, about 30 per cent in 1918, and in 1919, less than 5 per cent. In 1916 and 1917 the combined production of Colorado and California was 4,582 and 5,488 short tons, 77 and 89 per cent of the total output in these years. Nevada came third with an output considerably less. Arizona was a small but regular producer. The small production in 1919 (330 short tons) was distributed among the States of California, Arizona, Colorado, and South Dakota.

The metallurgical treatment of tungsten ores is as efficient in this country as elsewhere and far in advance of most other countries, though the foreign ore is decidedly more easily mined. American labor is superior to that in any other large tungsten-producing region, and it is also much better paid. Where the output depends on a large amount of handwork, as in mines of the Boulder County type, there is no possibility of producing ore as cheaply as in countries of low wages. The main dependence of the United States therefore is on the probably extensive but low-grade deposits of the Southwest.

*Imports of tungsten-bearing ores are large.* Before the war Germany furnished about two-thirds, besides large amounts of tungsten metal and ferro-alloy; but most of these shipments were from ore of other countries, either made into metal or ferrotungsten in Germany, or better grades reshipped through brokerage to the United States. In 1913 (fiscal year) a total of 766 long tons of tungsten ore came in, 600 long tons from Germany. In 1917 (calendar year) total imports were 4,876 short tons of 60 per cent ( $WO_3$ ), or 44 per cent of the total consumption. Statistics for later calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (tons).....	10,491	8,400	1,740	1,287
Value.....	\$11,552,218	\$6,261,190	\$779,593	\$239,413

Imported ore or concentrates came from Hongkong, China, Japan, and Bolivia.

*Exports.*—No tungsten-bearing ores are exported. In the prewar period some ore was exported to Germany.

*Important changes in classification.*—Tungsten-bearing ores of all kinds are exempt from duty under paragraph 633 of the act of 1913.

In H. R. 7456, tungsten ore is, for the first time, placed in the same paragraph with the ferro-alloys and alloying metals.

*Suggested changes.*—Page 39, line 16, of H. R. 7456: Tungsten ores and concentrates are customarily sold on the basis of their content of tungsten trioxide ( $WO_3$ ) rather than on their content of metallic tungsten. The assessment of duties on the basis of the tungsten trioxide content would, therefore, be more in accord with commercial practice.

Tungsten trioxide contains 79.31 per cent of metallic tungsten. On the basis of tungsten trioxide the duty equivalent to 45 cents per pound on the metallic tungsten content would be forty-five times 0.7931, or 35.7 cents per pound.

## FERROMANGANESE.

*Description and uses.*—Ferromanganese is an alloy of manganese and iron, the content of the former being 45 per cent or more. Standard ferromanganese contains from 70 to 80 per cent manganese.

The bulk of the ferromanganese produced has a carbon content varying from 5 to 7 per cent, and is used in the manufacture of soft steel both as a deoxidizing and as an alloying agent. Ordinary carbon steel contains from 0.4 to 0.6 per cent manganese. Manganese steel, however, contains a much larger percentage of manganese (11 to 15 per cent) and ferromanganese is largely used in adding the manganese to the steel.

Ferromanganese containing less than 1 per cent carbon is much more expensive than the high carbon product and is made in smaller quantities. One grade with about 85 per cent manganese content is used in the manufacture of certain types of resistance wire for electric purposes, and also in the manufacture of certain nonferrous alloys. Another grade is called ferromanganese, but properly is "spiegeleisen," because it contains only 20 per cent manganese. It is employed in the manufacture of nickel silver. Both of these low carbon grades are high priced, ranging from about 60 to 80 cents per pound.

*Production* in 1913 amounted to 119,495 long tons, and in 1918, to 333,027 tons. In 1920 the country's output of high carbon ferromanganese was 295,447 gross tons, and of low carbon ferromanganese, about half a ton.

*Imports* since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (tons).....	26,906	33,022	59,254	6,605
Value.....	\$4,300,604	\$4,283,541	\$7,775,278	\$748,194

Imported ferromanganese comes mainly from England. During the years above tabulated, small amounts were contributed by Japan, Canada, British India, and Brazil.

*Exports*, which are small compared with imports, were, for the calendar years 1918-1921, as follows:

	1918	1919	1920	1921 (9 months).
Quantity (tons).....	3,577	2,999	3,454	604
Value.....	\$806,087	\$445,840	\$642,570	\$88,853

The exported product goes largely to Canada, South America, and Italy.

*Important changes in classification.*—Ferromanganese is free under paragraph 518 of the act of 1913. In H. R. 7456 it is placed with the ferroalloys, instead of with "iron in pigs" as heretofore.

The dividing line between spiegeleisen and ferromanganese has been fixed at 45 per cent manganese content. Iron-manganese alloys containing 45 per cent or more manganese, are called ferromanganese,

and those having a smaller percentage of manganese, spiegeleisen. There is also a division between low carbon (1 per cent and less), and high carbon (above 1 per cent) grades, the former having a higher rate of duty.

*Suggested changes.*—Statements have been made to the Tariff Commission that 45 per cent is too high a percentage of manganese to distinguish ferromanganese and spiegeleisen. As the production of iron-manganese alloys containing over 25 and less than 70 per cent of manganese is small, the precise dividing line is unimportant. Forty-five per cent in H. R. 7456 is that adopted by the War Industries Board. Tiemann, an authority, puts the dividing line at 30 per cent manganese.

#### MANGANESE METAL, MANGANESE-SILICON, AND MANGANESE-BORON.

*Description.*—Manganese metal ordinarily contains 90 to 97 per cent manganese with a small percentage of iron, carbon and other ingredients. It is used largely in the nonferrous industries. Manganese-boron is a high-priced alloy containing from 19 to 25 per cent boron. Its principal use is in deoxidizing bronzes and brasses. Manganese-silicon or silico-manganese has a manganese content ranging from 55 to 70 per cent and a silicon content averaging about 25 per cent. Its use is practically the same as that of ferromanganese but it sells at a higher price per ton. It is made in Europe but its production in this country is very spasmodic.

*Production.*—There are no statistics concerning this country's output of these metals and alloys. The production, however, is known to be very small.

*Imports.*—Not separately recorded. Imports since the war, derived mainly from France, have not been large.

*Exports.*—None recorded.

*Important changes in classification.*—Manganese metal, manganese-silicon and manganese-boron are specifically mentioned in H. R. 7456 for the first time. Under the act of 1913 the second is governed by the provision referring to "other alloys used in the manufacture of steel" (par. 102), and the first and third, by the provision for "metals unwrought" (par. 154).

#### MOLYBDENUM AND FERROMOLYBDENUM.

*Description.*—Molybdenum is a heavy, white, malleable, tenacious metal, softer than steel, and with an exceptionally high melting point. Ferromolybdenum is an alloy of iron and molybdenum and is used in making molybdenum steel. Very little pure metal is used. Practically all the molybdenum added to steel is first reduced to the form of ferro-alloy. Where pure molybdenum is used it is generally in the form of powder. Calcium molybdate is a compound of calcium and molybdenum generally containing approximately 40 per cent molybdenum; it may be used in the manufacture of steel.

*Uses.*—Ferromolybdenum is added in definite proportions to steel in open-hearth, crucible, and electric furnaces in the production of molybdenum steel. It raises the elasticity and tensile strength of steel and gives it toughness. The addition of 0.25 per cent increases the elongation of steel from 4 per cent to 45 per cent. Molybdenum, either alone or in conjunction with tungsten, has been recommended

for giving high-speed cutting qualities to steel, but many manufacturers have found it unsatisfactory for this purpose. Considerable molybdenum steel is used for rear-axle and crank-shaft material in automobiles. Molybdenum and calcium molybdate are similarly used to add molybdenum to steel.

*Production.*—The United States is probably the world's greatest producer of ferromolybdenum, but no adequate statistics are available. The output, however, amounts to several hundred tons a year.

*Price.*—Ferromolybdenum was quoted (November, 1921) at \$2.25 per pound of molybdenum content.

*Imports.*—The imports of molybdenum and ferromolybdenum, which are small compared with the domestic production, were valued at \$203 in 1916. Statistics for later years follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	72,925	\$19,280	\$2,892	15
1919.....	102,700	40,759	6,114	15
1921 (9 months).....	250	292		

*Exports.*—Some molybdenum is exported, the greater part in the form of molybdenite concentrate.

*Important changes in classification.*—In H. R. 7456 calcium molybdate is specially provided for.

#### TUNGSTEN AND FERROTUNGSTEN.

*Description.*—Pure tungsten is almost white and is largely used in powdered form. It is also employed as an alloy with iron (ferrotungsten), with a tungsten content of about 70 per cent or over. The value of the ferroalloy rises as the tungsten content increases and the carbon content diminishes. In August, 1919, the quotations on ferrotungsten, 70 to 80 per cent grade, ranged from \$1.35 to \$1.60 per pound of tungsten content. In November, 1921, the quoted price was 40 to 45 cents per pound of tungsten content.

Tungstic acid is a chemically prepared oxide or hydroxide. The name, however, is often erroneously applied to tungsten trioxide ( $WO_3$ ) contained in ore.

*Uses.*—The principal use of ferrotungsten and tungsten metal is its addition to tool steel, especially for "high-speed" tools. When employed in small amounts (2 to 5 per cent), the steel becomes self-hardening; used in larger amounts (10 to 25 per cent), the steel remains hard even after becoming red-hot.

*Production.*—In 1918 the United States was the largest producer of this important tool-steel alloy. Complete statistics are not available, but six companies reported their production for 1917 as 1,270 gross tons. For 1918 the Geological Survey reported shipments of ferrotungsten of domestic manufacture amounting to 2,142 gross tons. In 1919, production declined to something over 1,000 tons. A further decline is reported for 1920. It is manufactured in France, England, and Germany. Prior to the war, the bulk of the world's output was made in Germany.

*Price.*—Ferrotungsten is a high-priced alloy, the standard grades selling (1917-1919) at over \$2 per pound, a large part of which represents the price of the tungsten ore concentrate. In 1917 the average price (f. o. b. Pittsburgh) of ferrotungsten containing 75 to 85 per cent tungsten was \$2.37 per pound, the tungsten ore concentrate alone costing \$1.60. In December, 1920, the price of ferrotungsten was between \$0.68 and \$0.79 per pound of contained tungsten and a year later had fallen to \$0.40 and less per pound of metal content. The cost of the raw material—tungsten-bearing ores—is an important factor in the American competitive position.

*Imports.*—The imports of tungsten metal and ferrotungsten have varied greatly during the period 1913-1921. The imports were 654 long tons in 1913, and 31 long tons in 1915. Imports increased greatly after the close of the war and were as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....		\$8	\$1	15
1919.....	396,460	287,981	43,197	15
1920.....	1,997,719	1,180,829	177,124	15
1921 (9 months).....	507,206	180,371		

*Exports* increased greatly during the war. In 1916 they were 128,718 pounds, valued at \$184,876. During the calendar years 1918-1921 exports were as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	1,232,260	38,130	4,989	
Value.....	\$2,545,087	\$113,276	\$5,913	

*Important changes in classification.*—In H. R. 7456 tungstic acid is given special mention.

#### OTHER TUNGSTEN ALLOYS.

*Description and uses.*—Other alloys of tungsten mentioned in the proposed tariff law are ferrochromium tungsten, chromium tungsten, chromium cobalt tungsten, and tungsten nickel. These alloys when produced are made in limited quantities; while they may be employed in making high-speed steel, their principal use is in making other alloys, e. g., stellite. Chromium cobalt tungsten which contains no steel is used as a substitute for tool steel.

*Production* of these alloys is very small.

*Imports and exports* not recorded.

*Important changes in classification.*—The words “or wolfram metal” have been omitted after “tungsten” as unnecessary. The tungsten alloys above named are specifically mentioned for the first time in this act.

## FERROSILICON.

*Description.*—Ferrosilicon is an alloy of iron and silicon used in the manufacture of steel. The silicon acts as a deoxidizing agent, reducing blowholes and purifying the steel. The silicon content varies from 10 to 90 per cent and determines the grade. Ferrosilicon containing 10 to 15 per cent silicon is largely manufactured in blast furnaces, but is also produced in the electric furnace; the higher grades are produced only in electric furnaces.

Where the percentage of silicon rises above 90 per cent, especially when over 95 per cent, the product is known as silicon metal. Silicon metal is employed in the manufacture of aluminum castings and to some extent in the manufacture of other nonferrous alloys.

*Production.*—The production in 1918 was 297,940 gross tons and was larger than heretofore, owing to war demands. An estimate in May, 1918, for ferrosilicon with 50 per cent silicon content was from 100,000 to 110,000 tons per annum. Production in 1920 amounted to 235,526 tons. Ferrosilicon is made in Canada, and much is exported to this country. It is also produced in France, Germany, Switzerland, Austria, Norway, and Sweden.

*Price.*—Ferrosilicon with 50 per cent silicon content was quoted in 1919 at an average price of \$105.75 per gross ton. In 1920 the price averaged \$85.50, and in November, 1921, it had fallen to about \$58.00.

*Imports* in 1917 were 8,715 long tons. For later years they were as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Tons.</i>			<i>Per cent.</i>
1918.....	5,540	\$424,932	\$63,740	15
1919.....	10,445	629,362	94,404	15
1920.....	13,909	719,446	107,917	15
1921 (9 months).....	3,883	203,198		

The bulk of the imported ferrosilicon comes from Canada.

*Exports*, which are relatively small, are shown in the following table for the calendar years 1918-1921:

	1918	1919	1920	1921 (9 months).
Quantity (tons).....	4,107	1,544	632	221
Value.....	\$443,456	\$145,310	\$41,057	\$11,325

The exported ferrosilicon goes principally to Chile, Argentina, Canada, and the United Kingdom.

*Important changes in classification.*—Ferrosilicon has been graded according to silicon content with an increasing scale of duties. These grades are five in number.

*Conflicting provisions.*—Ferrosilicon containing 8 per cent or more of silicon is provided for twice in this paragraph, once upon a graduated scale of specific duties and the other time at 30 per centum ad valorem. Possibly the latter is intended to be for zirconium-ferrosilicon, for which no specific provision is made in H. R. 7456.

## CHROME AND FERROCHROME.

*Description.*—Chrome or chromium occurs chiefly as an oxide in combination with iron or other elements. The pure metal is hard, steel-gray in color, and not readily oxidized. It alloys with iron in all proportions and is used principally in the form of ferrochrome which is sold on a basis of its chromium and carbon contents, the price increasing with the chromium and decreasing with the carbon content.

*Uses.*—Ferrochrome is used extensively in the manufacture of armor-plate steel, armor-piercing projectiles, bullet-proof steel, high-speed steel and alloys, high-grade castings, stamp-mill shoes and dies, safe steel, wire, tires, springs, razors, file and cutlery steel, and for other minor purposes. Hardness and toughness are the principal characteristics of steels containing chromium.

*Production.*—An incomplete outline by the Geological Survey of production of ferro-alloys in the United States gives sales of 3,524 gross tons of ferrochrome, ferromolybdenum, ferrotungsten, and ferrovanadium in 1916, and 6,066 gross tons of ferrochrome, ferromolybdenum, ferrotitanium, ferrozirconium, and ferrovanadium in 1919. These figures, however, include only a fraction of the production, as an incomplete survey made by the Tariff Commission showed an output in excess of the figures given.

*Price.*—Ferrochrome containing 6 to 8 per cent carbon was quoted in August, 1919, at 32 to 40 cents per pound of chromium content, and ferrochrome containing 2 to 4 per cent carbon, at 70 cents per pound of contained chromium. The prices later declined, and in November, 1921, the high carbon grades were quoted as low as 11 cents per pound of contained chromium.

*Imports* of ferrochrome were 208 long tons in 1914 and 10 tons in 1917. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1919.....	926,616	\$100,404	\$15,061	15
1920.....	3,922,514	428,619	64,293	15
1921 (9 months).....	999,077	104,738		

*Exports.*—Some ferrochrome has been exported, but the figures are not available.

*Important changes in classification.*—Ferrochrome is classified with regard to carbon content in grades containing 3 per cent or more of that material and those containing less than 3 per cent. The latter grades become rapidly more expensive as the carbon content is reduced.

## FERROPHOSPHORUS.

*Description and uses.*—Ferrophosphorus is a chemical combination of iron and phosphorus with smaller amounts of other ingredients. Its principal use is in making basic open-hearth pipe, screw stock, and sheet bars. Ferrophosphorus restores the phosphorus content in open-hearth steel to the point desired and increases the tensile strength and welding quality of pipe steel. In screw steel more uniform and cleaner cut threads are made possible by the

addition of phosphorus. About 75 or 80 per cent of the ferrophosphorus now used goes into sheet bars, tin plate, and sheets; manufacturers find that the stripping or tearing apart of the plates or sheets can be accomplished with the minimum loss when ferrophosphorus is used.

*Production.*—No reliable figures are published concerning the production of ferrophosphorus in this or other countries. Sales, as reported by the Geological Survey, in 1916 aggregated 12,966 gross tons, and in 1919 6,706 gross tons.

*Imports* since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	22,400	\$1,055	\$158	15
1919.....	170,806	5,846	877	15
1920.....	14,000	780	117	15

*Exports.*—None recorded.

#### TITANIUM AND FERROTITANIUM.

*Description.*—Titanium is abundant in nature. Pure metallic titanium has found no domestic applications of commercial importance. Ferrotitanium, an alloy of iron and titanium, is the form generally used. The two most prominent varieties of this alloy, and the only ones of domestic manufacture, are ferrocobalttitanium, containing from 15 to 18 per cent titanium, and carbon-free ferrotitanium, containing about 25 per cent titanium and some 5 to 6 per cent aluminum.

*Uses.*—Titanium has been employed in the treatment of steel rails made by the Bessemer process, but since the increased use of open-hearth steel in heavy rails the demand for titanium for rail use has decreased. A much larger use, however, has been found in the making of sheet steel, as steel treated with titanium is well suited for galvanizing. The estimated tonnage of steel treated with titanium was 2,200,000 in 1917.

*Production.*—The United States is the chief producer of ferrotitanium and titanium. No statistics, however, are available.

Before the war ferrotitanium was made by 15 manufacturers in Germany, 3 in Great Britain, and 2 in France. Switzerland and Sweden also manufactured some of this ferroalloy, and pure titanium was made in Norway.

*Imports and exports.*—There are practically no exports of metallic titanium or ferrotitanium. The imports have been small and sporadic. The maximum importation was 48 tons, valued at \$21,656 in 1912. Importation is principally from England. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	10	\$10	\$1	15
1919.....	12,000	3,317	498	15
1920.....	1,367	713	107	15
1921 (9 months).....	3,035	801		

## FERROVANADIUM.

*Description.*—Ferrovanadium is an alloy of iron and vanadium. American manufacturers report a product containing from 30 to 40 per cent vanadium.

*Uses.*—The vanadium in this ferroalloy acts as a cleanser and deoxidizer of a steel bath. It is employed after ferromanganese and ferrosilicon have been added and carries deoxidization beyond the point obtained by these alloys. Ferrovanadium is also used to add vanadium to the steel; in proportions up to 0.3 per cent the vanadium toughens and adds to the tensile strength of the steel. Steels so treated are unusually resistant to shock and alternate stresses, and hence are very useful for axles, cranks, piston rods, and similar steels. The automobile is a much stronger machine because of vanadium.

*Production.*—Schedules returned to the United States Tariff Commission by manufacturers show a yearly output of over 2,700 short tons during the period 1916 to 1918, inclusive, production having increased between 700 and 800 per cent since 1910. More ferrovanadium is produced here than abroad, but some is manufactured in Germany and England. The world's output is practically under American control. Vanadium deposits in Peru, Colorado, and Utah are controlled by American companies. South Africa has lately produced some vanadium.

*Price.*—Ferrovanadium containing 30 to 40 per cent vanadium was quoted during 1919 at \$5.50 to \$7 per pound of vanadium contained, and during 1920 at \$5.50 to \$8.25 per pound. By November, 1921, the price ranged from \$4.25 to \$4.50 per pound of contained vanadium.

*Imports* since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent</i>
1919.....	11,200	\$21,923	\$3,738	15
1920.....	7,989	14,331	2,150	15

*Exports* amounted to over 1,300 short tons in 1917. For the calendar years 1918 to 1921 they are shown in the following table:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	1,512,737	64,626	387,060	192,933
Value.....	\$1,774,062	\$95,560	\$705,385	\$388,378

## TANTALUM.

*Description.*—Tantalum is a metallic element associated with columbium in the minerals tantalite, ytrotantalite, columbite, and other heavy rare minerals. It is obtained chiefly from tantalite. Tantalum is black in color, assuming an iron-gray luster under a burnisher.

*Uses.*—Wrought tantalum is exceedingly hard and tough and has been used in the manufacture of pen nibs. It resists all ordinary acids, even aqua regia, hence its great usefulness for chemical purposes. It was formerly employed for electric-light filaments.

*Production.*—There are no published statistics, but the output is known to be very limited. Because of their close similarity, the separation of tantalum from columbium is a long and complicated process.

*Imports* are small; in 1917 they were valued at \$2,000. No imports are recorded for the calendar years 1918 and 1919. In 1920, 60 pounds valued at \$54, were imported, and during nine months of 1921 there were received 1,229 pounds, valued at \$788, from England.

*Exports.*—There are no statistics. Exports are probably negligible.

#### OTHER ALLOYS USED IN THE MANUFACTURE OF STEEL.

*Description and uses.*—Such alloys include a vast number of metals and alloys used either in very limited amounts or experimentally. Some alloys enumerated in the act are the following:

*Ferrouanium.*—Uranium is a heavy and extremely active element. It is added to steel in the form of ferrouanium. The influence of uranium on steel is not completely known, but it is said to give a decided strengthening power and resistance to shock. The high price of uranium has deterred experimentation, uranium oxide having brought \$3.25 to \$3.60 per pound in 1918, and ferrouanium \$7 to \$7.50 per pound of contained metal. Even in the fall of 1921 the latter was quoted at \$6 per pound of metal content.

*Ferroboron.*—The qualities of ferroboron are not fully determined. Boron occurs in the form of borax. Borax is very difficult to reduce to the elemental state, and only small quantities of ferroboron have been manufactured. Experiments in France showed that remarkably strong steels are made by using 0.5 to 2 per cent of boron. Its action is much like that of vanadium.

*Ferrozirconium.*—This alloy carries 30 to 40 per cent zirconium metal and sells for \$4 to \$4.50 per pound of metal contained. Zirconium-bearing steel is reported to be adapted for bullet-proof sheets, armor plate, and armor-piercing projectiles. Investigations of its steel-hardening qualities, its fitness for light armor plate on tanks, aeroplanes, etc., are still under way in the trade.

*Ferrocervium.*—This alloy, 30 per cent iron and 70 per cent cerium, is employed as tinder in pocket cigar lighters, gas lighters, and as igniters for mine lamps. During the war it was also used in hand grenades and projectiles. Its domestic production probably runs from 1,000 to 2,000 pounds per month—prior to 1917 under Austrian patents, now under licenses granted American manufacturers by the Alien Property Custodian. The manufacture of ferrocervium is part of the pyrophoric-alloy industry, of which the incandescent gas mantle is a widely known product. The use of ferrocervium for making stronger iron castings has been recommended.

In addition to these alloys are chromium nickel, vanadium nickel, zirconium nickel, chromium vanadium, chromium silicon, zirconium silicon, and calcium silicide. None of these compounds are made in steady quantities since they are in an experimental stage of production.

*Production* is small and no reliable statistics exist.

*Imports* of ferroalloys and metals used in making alloy steels other than those for which figures have been tabulated above, are grouped in the tables of the Bureau of Foreign and Domestic Commerce under the caption "All other alloys used in the manufacture of steel, n. s. p. f." The largest single item is calcium silicide or silicon-calcium, which is imported from France by several concerns that are endeavoring to introduce this alloy into American steel practice as a substitute for ferromanganese and ferrosilicon. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	31,920	\$5,025	\$754	15
1919.....	19,178	2,504	376	15
1920.....	241,029	23,053	3,644	15
1921 (9 months).....	134,661	15,209	.....	.....

#### NOTE ON FERROALLOYS AND STEEL-ALLOYING METALS.

*Metals and alloys produced in steady quantities.*—Many of the ferroalloys or alloying metals mentioned in this paragraph are produced only spasmodically and for experiment. The following are manufactured in steady quantities:

Ferromanganese (high and low carbon grades); ferrosilicon; ferrochrome (high and low carbon grades); ferrotungsten; ferrovanadium; ferromolybdenum; ferrophosphorus; ferrotitanium; metallic manganese; calcium molybdate; manganeseboron; metallic tungsten; chromium tungsten; silicon metal; and ferrocerium.

In addition to these, ferrouanium is quoted regularly on the market and some authorities say that ferrozirconium is a coming alloy of importance.

#### PARAGRAPH 303.

##### H. R. 7456.

##### SENATE AMENDMENTS.

PAR. 303. Muck bars and bar iron, square iron, rolled or hammered, comprising flats not less than one inch wide nor less than three-eighths of one inch thick, round iron not less than seven-sixteenths of one inch in diameter, one-fourth of 1 cent per pound; round iron, in coils or rods, less than seven-sixteenths of one inch in diameter, and bars and shapes of rolled or hammered iron, not specially provided for, five-tenths of 1 cent per pound; iron in slabs, blooms, loops, or other forms less finished than iron in bars, and more advanced than pig iron, except castings, two-tenths of 1 cent per pound: *Provided*, That all iron bars, blooms, billets, slabs or loops in the manufacture of which charcoal is used as fuel shall be subject to a duty of three-tenths of 1 cent per pound.

## ACT OF 1909.

PAR. 119. Bar iron, muck bars, square iron, rolled or hammered, comprising flats not less than one inch wide nor less than three-eighths of one inch thick, round iron not less than seven-sixteenths of one inch in diameter, three-tenths of one cent per pound.

PAR. 120. Round iron, in coils or rods, less than seven-sixteenths of one inch in diameter, and bars or shapes of rolled or hammered iron, not specially provided for in this section, six-tenths of one cent per pound:

*Provided*, That all iron in slabs, blooms, loops, or other forms less finished than iron in bars, and more advanced than pig iron, except castings, shall be subject to a duty of four-tenths of one cent per pound:

*Provided further*, That all iron bars, blooms, billets, slabs or loops, in the manufacture of which charcoal is used as fuel, shall be subject to a duty of eight dollars per ton.

## ACT OF 1913.

PAR. 103. Muck bars, bar iron, square iron, rolled or hammered, round iron, in coils or rods, bars or shapes of rolled or hammered iron not specially provided for in this section, 5 per centum ad valorem.

PAR. 518. \* \* \* iron in slabs, blooms, loops or other forms less finished than iron bars, and more advanced than pig iron, except castings, not specially provided for in this section [Free].

## BAR IRON.

(See Survey C-2.)

*Description.*—Bar iron is wrought iron in the form of bars. The rough iron bloom coming from the puddling furnace is first rolled into a flat bar, known as a muck bar or puddle bar. It is then cut into short lengths and the pieces piled together to be reheated. After reheating and rerolling the material is known as refined iron, refined bars, or, more commonly, merchant bars. There is sometimes a second and third reheating and rerolling to improve the grade. In the process of rolling iron is reduced to simple forms, such as squares, rounds, and flats. These forms resemble the cross sections of the material from which they are made—blooms, billets, or slabs—and their final section determines their nomenclature.

The terms "slabs," "blooms," "loops," and "billets," as applied to wrought iron, represent earlier stages of production than those of bars and indicate the shapes the iron assumes before being made into bars.

Where charcoal is used in the manufacture of bars, blooms, billets, etc., a purer product is usually obtained, but the cost is much greater.

*Production* of merchant iron bars in 1917 amounted to 983,926 gross tons and in 1920 to 663,032 gross tons. Wrought-iron bars in recent years have maintained an unequal competition with soft steel, which is occasionally used in the place of wrought iron. The labor cost of iron bars is greater than that involved in the production of steel bars.

*Imports* may be tabulated under three general heads: (1) Muck bars; (2) Bar iron, including flat and square iron and iron in rods or coils, and shapes or rolled or hammered iron, n. s. p. f.; (3) Slabs, blooms, loops, etc.

Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
MUCK BARS.				
	<i>Tons.</i>			<i>Per cent.</i>
1919.....	760	\$122,078	\$6,104	5
1920.....	717	62,283	3,114	5
1921 (9 months).....	347	37,573		

BAR IRON, INCLUDING FLAT, SQUARE, ROUND IRON, ETC.

1919.....	1,049	\$86,205	\$4,310	5
1920.....	3,906	562,231	28,111	5
1921 (9 months).....	938	87,720	4,386	5

IRON SLABS, BLOOMS, LOOPS, ETC.

	<i>Pounds.</i>			
1918.....	510,684	\$15,607		
1919.....	401,263	11,457		
1920.....	463,765	13,733		

Most of the imported iron entering the country in the form of bars comes from England, Sweden, and Canada.

Exports of bar iron for the calendar years 1918 to 1921 have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	141,942,462	135,624,896	104,445,766	26,195,249
Value.....	\$6,576,362	\$5,634,398	\$4,651,224	\$1,143,736

Exports go mainly to Japan, Canada, United Kingdom, Brazil, and Cuba.

*Important changes in classification.*—Iron in the form of blooms, slabs, loops, etc., is transferred from the free list of the act of 1913 (par. 518). A distinction is made between iron in the manufacture of which charcoal is used as a fuel and iron produced with the use of other fuel.

*Suggested changes.*—All iron bars, blooms, billets, slabs, etc., in the manufacture of which charcoal is used are subject to a duty of three-tenths of 1 cent per pound. Round iron in coils or rods less than seven-sixteenths of 1 inch in diameter and bars and shapes of rolled or hammered iron not specially provided for are subject to a rate of five-tenths of 1 cent per pound. All charcoal iron coming under this paragraph is, therefore, subject to a lower rate of duty than certain kinds of wrought iron which are more cheaply manufactured.

In order to obviate the imposition of higher duties on the cheaper than on the more expensive irons, the proviso in the paragraph might be made to read as follows:

*Provided,* That all iron bars, blooms, billets, slabs, or loops in the manufacture of which charcoal is used as a fuel, shall be subject to a duty of not less than [rate] per pound.

## PARAGRAPH 304.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 304. Steel ingots, cogged ingots, blooms and slabs, by whatever process made; die blocks or blanks; billets and bars; shafting; pressed, sheared, or stamped shapes, not advanced in value or condition by any process or operation subsequent to the process of stamping; hammer molds or swaged steel; gun-barrel molds not in bars; alloys not specially provided for used as substitutes for steel in the manufacture of tools; all descriptions and shapes of dry sand, loam, or iron molded steel castings; sheets and plates and steel not specially provided for; all of the foregoing valued at not over 1 cent per pound, two-tenths of 1 cent per pound; valued above 1 cent and not above  $1\frac{1}{2}$  cents per pound, three-tenths of 1 cent per pound; valued above  $1\frac{1}{2}$  and not above  $2\frac{1}{2}$  cents per pound, five-tenths of 1 cent per pound; valued above  $2\frac{1}{2}$  and not above  $3\frac{1}{2}$  cents per pound, eight-tenths of 1 cent per pound; valued above  $3\frac{1}{2}$  and not above 5 cents per pound, 1 cent per pound; valued above 5 and not above 8 cents per pound,  $1\frac{1}{2}$  cents per pound; valued above 8 and not above 12 cents per pound, 2 cents per pound; valued above 12 and not above 16 cents per pound,  $2\frac{1}{2}$  cents per pound; valued above 16 and not above 20 cents per pound,  $3\frac{1}{2}$  cents per pound; valued above 20 and not above 24 cents per pound, 4 cents per pound; valued above 24 and not above 32 cents per pound, 5 cents per pound; valued above 32 and not above 40 cents per pound, 6 cents per pound; valued above 40 cents per pound, 20 per centum ad valorem: *Provided*, That on steel circular saw plates there shall be levied, collected and paid an additional duty of one-fourth of 1 cent per pound.

## ACT OF 1909.

PAR. 131. Steel ingots, cogged ingots, blooms, and slabs, by whatever process made; die blocks or blanks; billets and bars and tapered or beveled bars; mill shafting; pressed, sheared, or stamped shapes, not advanced in value or condition by any process or operation subsequent to the process of stamping; hammer molds or swaged steel; gun-barrel molds not in bars; alloys used as substitutes for steel in the manufacture of tools; all descriptions and shapes of dry sand, loam or iron-molded steel castings; sheets and plates and steel not specially provided for in this section, all of the above valued at three-fourths of one cent per pound or less, seven-fortieths of one cent per pound; valued above three-fourths of one cent

## ACT OF 1913.

PAR. 613. Steel ingots, cogged ingots, blooms and slabs, die blocks or blanks, and billets, if made by the Bessemer, Siemens-Martin, open-hearth or similar processes, not containing alloy, such as nickel, cobalt, vanadium, chromium, tungsten, or wolfram, molybdenum, titanium, iridium, uranium, tantalum, boron, and similar alloys, [Free].

PAR. 110. Steel bars, and tapered or beveled bars; mill shafting; pressed, sheared, or stamped shapes, not advanced in value or condition by any process or operation subsequent to the process of stamping; hammer molds or swaged steel; gun-barrel molds not in bars; all descriptions and shapes of dry sand, loam, or iron molded steel castings, sheets, and

## ACT OF 1909.

and not above one and three-tenths cents per pound, three-tenths of one cent per pound; valued above one and three-tenths cents and not above one and eight-tenths cents per pound, five-tenths of one cent per pound; valued above one and eight-tenths cents and not above two and two-tenths cents per pound, six-tenths of one cent per pound; valued above two and two-tenths cents and not above three cents per pound, eight-tenths of one cent per pound; valued above three cents per pound and not above four cents per pound, one and one-tenth cents per pound; valued above four cents and not above seven cents per pound, one and two-tenths cents per pound; valued above seven cents and not above ten cents per pound, one and nine-tenths cents per pound; valued above ten cents and not above thirteen cents per pound, two and three-tenths cents per pound; valued above thirteen cents and not above sixteen cents per pound, two and seven-tenths cents per pound; valued above sixteen cents and not above twenty-four cents per pound, four and six-tenths cents per pound; valued above twenty-four cents and not above thirty-two cents per pound, six cents per pound; valued above thirty-two cents and not above forty cents per pound, seven cents per pound; valued above forty cents per pound, twenty per centum ad valorem.

PAR. 137. \* \* \* on steel circular saw plates there shall be paid one-fourth of one cent per pound in addition to the rates provided in this section for steel plates.

PAR. 171. \* \* \* ingots, cogged ingots, blooms, or blanks for the same, without regard to the degree of manufacture, one cent per pound: \* \* \* ["The same" refers to wheels for railway purposes or parts thereof made of steel and steel locomotive car or other railway tires or parts thereof.]

## ACT OF 1913.

plates; all the foregoing, if made by the Bessemer, Siemens-Martin, open-hearth, or similar processes, not containing alloys, such as nickel, cobalt, vanadium, chromium, tungsten or wolfram, molybdenum, titanium, iridium, uranium, tantalum, boron, and similar alloys, 8 per centum ad valorem; steel ingots, cogged ingots, blooms and slabs, die blocks or blanks; billets and bars and tapered or beveled bars; pressed, sheared, or stamped shapes not advanced in value or condition by any process or operation subsequent to the process of stamping; hammer molds or swaged steel; gun-barrel molds not in bars; alloys used as substitutes for steel in the manufacture of tools; all descriptions and shapes of dry sand, loam, or iron molded castings, sheets, and plates; \* \* \* and steel not specially provided for in this section, all the foregoing when made by the crucible, electric, or cementation process, either with or without alloys, and finished by rolling, hammering, or otherwise, and all steels by whatever process made, containing alloys such as nickel, cobalt, vanadium, chromium, tungsten, wolfram, molybdenum, titanium, iridium, uranium, tantalum, boron, and similar alloys, 15 per centum ad valorem.

PAR. 105. \* \* \* crucible plate steel and saw plates, cut or sheared to shape or otherwise, or unheated, \* \* \* 12 per centum ad valorem.

PAR. 109. \* \* \* metal sheets decorated in colors \* \* \* 15 per centum ad valorem.

## CRUDE STEEL, ETC.

(See Surveys C-4 and C-7.)

*Description.*—The steel ingot is the first solid form which pig iron takes when converted into steel. When made by the Bessemer or open-hearth process, it is usually a block about 6 feet long, 1½ feet wide, and 1½ feet thick. Blooms, billets, and slabs are usually modifications of the ingot after being subjected to rolling. Blooms and billets have a rectangular cross section and are square or nearly so. Slabs are rectangular, with a width at least twice their thickness. Blooms and billets are rolled into structural shapes, bars, and the like, and slabs, into plates and sheets. Ordinary steel bars are rolled

products made from billets and are classified as rounds, flats, squares, hexagons, ovals, half rounds, or half ovals, according to section. A die block or blank is a mass of metal attached to a hammer which falls or is driven violently against a piece to be worked, or is the anvil block on which the piece is placed. Shafting, pressed and stamped shapes, and hammer and gun-barrel molds represent forms of finished iron and steel which have received little or no treatment beyond rolling, pressing, hammering, or stamping. Hammer molds or swaged steel is steel shaped by a hammer and swage. Steel castings are steel forms shaped by molds into which the molten metal is poured and allowed to solidify. They may be annealed or machined, or both, but they do not receive any rolling or forging. Alloys which can be used as substitutes for steel in the manufacture of tools are not at present numerous. The most promising is stellite, which is composed of cobalt, chromium, and tungsten (or molybdenum), already provided for in paragraph 302. Sheets and plates are pieces of iron and steel ranging generally from 6 to 200 inches in width and cut to various lengths. Plates have a thickness of one hundred and forty-one thousandths of 1 inch. This thickness corresponds to No. 10 wire gauge. Circular-saw plates are plates made under certain specifications, circular in form and intended for use as saws.

*Production.*—The production of steel is usually given in terms of ingots and castings. In 1914 this production was 23,513,030 gross tons. The country's output of steel in 1920 amounted to 42,132,934 gross tons, of which 40,881,392 tons constituted ingots and 1,251,542 tons, castings. Over three-fourths of the steel output was open-hearth and about one-fifth Bessemer, the greater part of the remainder consisting of electric steel. Of the steel produced in 1920, 6,130,240 gross tons were rolled into merchant bars and 9,337,680 gross tons were rolled into plates and sheets. The leading foreign producers of steel are Germany, the United Kingdom, and France, whose output in 1918 was 14,874,000 tons, 9,591,000 tons, and 1,912,000 tons, respectively.

*Imports.*—Imports of articles enumerated in this paragraph are in some instances difficult to state, because they overlap articles mentioned in other paragraphs. This is particularly true with reference to steel plate. Roughly speaking, imports may be divided into eight distinct classes:

- (1) Steel ingots made by the Bessemer and open-hearth processes.
- (2) Cogged ingots, blooms and slabs, die blocks and blanks, billets and bars, made by the Bessemer and open-hearth processes.
- (3) Steel ingots, cogged ingots, blooms and slabs, made by the crucible, electric, or cementation process.
- (4) Shafting, hammer molds, gun-barrel molds, etc.
- (5) Sheets and plates not containing alloys, made by the Bessemer and open-hearth processes.
- (6) Saw plate.
- (7) Sheets and plates, either with or without alloys, finished by rolling, hammering, or otherwise, made by the crucible, electric, or cementation process.
- (8) Crucible plate steel.

## Statistics of imports since 1917 follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.

1920.....	236	429	51	12
1921 (9 months).....	25	13		
SHEETS AND PLATES, EITHER WITH OR WITHOUT ALLOYS, FINISHED BY ROLLING, HAMMERING, OR OTHERWISE.				
1918.....	218,006	\$56,639	\$8,496	15
1919.....	531,322	136,614	20,492	15
1920.....	1,325,979	251,737	37,761	15
1921 (9 months).....	232,392	48,262		
CRUCIBLE PLATE STEEL.				
1918.....	41,893	\$9,690	\$1,163	12
1919.....	171,598	35,904	4,668	12
1920.....	191,256	34,940	4,193	12
1921 (9 months).....	49,403	4,306		

1 Includes steel ingots.

In addition to the above there were imported into the United States a few tons of crucible-steel ingots in 1919 for the construction of vessels and in 1918 and 1920 similar amounts of shafting, shapes, etc., for the same purpose.

The greater part of the imported steel in these forms comes from the United Kingdom, Canada, and Sweden.

*Exports.*—The United States is a great exporter of steel but most of the exported material goes abroad in forms more highly finished than those enumerated in this paragraph. Exports of billets, ingots, and blooms in the calendar years 1918–1921 were as follows:

	1918	1919	1920	1921 (9 months).
Quantity (tons).....	1,786,189	258,424	216,873	8,091
Value.....	\$150,568,151	\$19,370,787	\$12,645,950	\$416,267

During 1920 and 1921 the greater part of this steel went to the United Kingdom, Canada, Italy, Belgium, and Japan. In 1918–19 much steel in these forms went also to France.

*Important changes in classification.*—Steel ingots, clogged ingots, blooms and slabs, die blocks or blanks, and billets, if made by the Bessemer, Siemens-Martin, open-hearth or similar processes, not containing alloys, are free under paragraph 613 of the act of 1913. In H. R. 7456 the distinction between steel made by the open-hearth and Bessemer processes and steel made by the crucible, electric-furnace, and cementation processes in the act of 1913 is no longer retained. A graduated scale of duties is employed for steels varying in quality. Specific mention of crucible plate steel is also omitted but is by implication retained in the provisions for the duties on high-grade plate steel. The specific provision for saw plate contained in the act of 1913 is limited in the proposed tariff act to steel "circular saw plates."

*Suggested changes.*—The provisions for sheets and plates, including circular saw plates, in this paragraph might be transferred to a separate paragraph including all sheets and plates of the character designated. Paragraph 304 deals with crude and half-finished steel material, and from the viewpoint of the steel manufacturer plates and sheets constitute finished material.

#### PARAGRAPH 305.

## SENATE AMENDMENTS.

lybdenum, or any other metallic element used in alloying steel, there shall be levied, collected, and paid 15 per centum ad valorem: *Provided*, That manganese and silicon shall not be considered as alloying material unless present in the steel in excess of 1 per centum manganese or silicon: *Provided further*, That an additional cumulative duty of \$1.25 per pound on the molybdenum content in excess of  $1\frac{1}{2}$  per centum, and 72 cents per pound on the tungsten content in excess of  $1\frac{1}{2}$  per centum shall be levied, collected and paid on any articles containing molybdenum and tungsten.

## ACT OF 1909.

PAR. 131. [Specific rates according to value up to 40 cents per pound, above which 20 per centum ad valorem. No distinction between alloy steels and carbon steels of similar value.]

## ACT OF 1913.

PAR. 110. \* \* \* and all steels by whatever process made, containing alloys such as nickel, cobalt, vanadium, chromium, tungsten, wolfram, molybdenum, titanium, iridium, uranium, tantalum, boron, and similar alloys, 15 per centum ad valorem.

## ALLOY STEELS.

(See Survey C-7.)

*Description and uses.*—Certain elements or metals are capable of purifying steel, and when alloyed therewith, of giving it certain desirable qualities. These metals are generally rare but add materially to the value of the steel. Alloy steels vary in character and value. The principal ones are the following:

- (1) Nickel steel, with a nickel content from 2 to 4 per cent, used mainly in the manufacture of high-class structural steel, forgings, and plates.
- (2) Chrome nickel steel, with a chromium content of  $1\frac{1}{2}$  per cent, used in the manufacture of forgings like axles.
- (3) Tungsten steel, ordinarily containing either 14 or 18 per cent tungsten, used in the manufacture of high-speed steel tools, and with a smaller percentage of tungsten, in the manufacture of other tools.
- (4) Vanadium steel, containing less than 1 per cent vanadium, used for automobile parts, subject to repeated stresses.
- (5) Molybdenum steel, for the same uses as vanadium steel.
- (6) Chrome steel used in small quantities in the manufacture of ball bearings.
- (7) Manganese steel employed in the making of rolls and rails and other products subject to abrasion.

In addition to these steels there are copper steels which resist corrosion, silicon steel employed in the manufacture of springs, electric transformers, etc., and zirconium steel which may come into competition with vanadium steel.

*The production* of alloy steels in 1920 amounted to 1,660,292 gross tons. The output in 1910 amounted to 567,819 gross tons or

about one-third of that produced in 1920. Of the output in 1920, 1,591,939 gross tons consisted of ingots and 68,353 gross tons of castings. In 1920, 1,283,646 gross tons were made by the open-hearth process and over half of the remainder by the electric furnace method.

*Imports.*—Much of the imported alloy steels come into the country in the forms of bars, rods, plates and the like. Some alloy steel is imported under the general designation “steel in all forms and shapes by whatever process made, n. s. p. f.,” statistics of the importation of which are given in the table below. (This imported material, however, includes much steel that does not come under the designation of alloy.)

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	151,424	\$55,548	\$8,332	15
1919.....	204,457	122,964	18,445	15
1920.....	883,740	371,147	55,672	15
1921 (9 months).....	209,950	60,049		

*Important changes in classification.*—A new provision.

*Suggested changes.*—Insert a comma after “collected”, in line 17, on page 43 of H. R. 7456.

In the second proviso, the word “articles” may apply to tools made from tungsten or molybdenum steels, and particularly high-speed steel twist drills, reamers, and milling cutters. These articles are not specially provided for and will therefore be dutiable as manufactures of metal, n. s. p. f. under paragraph 393. They are sold by the piece and the value per pound varies between wide limits (say from \$1 to \$10 or more), and the actual percentage of tungsten may also vary from as low as 10 per cent to 18 per cent or more. The collection of a specific duty on the tungsten content would involve the weighing of the articles and the ascertainment of the percentage of tungsten. In order to secure a representative sample it would be necessary to destroy the article or at least injure it by drilling in such a manner as to lower materially the value of any part actually examined. The average value of these articles is probably considerably in excess of \$3 per pound, hence the duty at 35 per cent would amount to more than \$1 per pound of metal. The duty collected on the tungsten content (a maximum of about 18 per cent) would amount to less than 13 cents per pound, or, say, an additional 4 per cent ad valorem.

There is some doubt concerning the scope of this paragraph. The expression “steel in all forms and shapes not specially provided for in this Act,” is a catchall phrase in paragraph 135 of the act of 1897, which was omitted from the acts of 1909 and 1913. Paragraph 305 is evidently intended to embrace more than that provision in the act of 1897. If the intention is to limit the provision to the steels enumerated in paragraph 304, the words “the immediately preceding paragraph” might be substituted for “this title” in line 4, page 43.

The word “articles” would make the second proviso applicable to any product whatsoever, whether unfinished or finished, containing more than 1½ per cent of tungsten or molybdenum.

## PARAGRAPH 306.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 306. All metal produced from iron or its ores, which is cast and malleable, of whatever description or form, without regard to the percentage of carbon contained therein, whether produced by cementation, or converted, cast, or made from iron or its ores, by the crucible, electric, Bessemer, Clapp-Griffith, pneumatic, Thomas-Gilchrist, basic, Siemens-Martin, or open-hearth process, or by the equivalent of either, or by a combination of two or more of the processes, or their equivalents, or by any fusion or other process which produces from iron or its ores a metal either granular or fibrous in structure, which is cast and malleable, excepting what is known as malleable-iron castings, shall be classed and denominated as steel.

## ACT OF 1909.

PAR. 139. All metal produced from iron or its ores, which is cast and malleable, of whatever description or form, without regard to the percentage of carbon contained therein, whether produced by cementation, or converted, cast, or made from iron or its ores, by the crucible, Bessemer, Clapp-Griffith, pneumatic, Thomas-Gilchrist, basic, Siemens-Martin, or open-hearth process, or by the equivalent of either, or by a combination of two or more of the processes, or their equivalents, or by any fusion or other process which produces from iron or its ores a metal either granular or fibrous in structure, which is cast and malleable, excepting what is known as malleable-iron castings, shall be classed and denominated as steel.

## ACT OF 1913.

PAR. 117. All metal produced from iron or its ores, which is cast and malleable, of whatever description or form, without regard to the percentage of carbon contained therein, whether produced by cementation, or converted, cast, or made from iron or its ores, by the crucible, Bessemer, Clapp-Griffith, pneumatic, Thomas-Gilchrist, basic, Siemens-Martin, or open-hearth process, or by the equivalent of either, or by a combination of two or more of the processes, or their equivalents, or by any fusion or other process which produces from iron or its ores a metal either granular or fibrous in structure, which is cast and malleable, excepting what is known as malleable-iron castings, shall be classed and denominated as steel.

## STEEL, PROCESSES OF MANUFACTURE.

(See Survey C-7.)

This paragraph is descriptive only, and its definition of steel is rather more inclusive than the usual trade acceptance. As defined in this paragraph, steel may have no carbon whatsoever, whereas in trade practice iron with a carbon content less than 2.2 per cent, generally less than 1.5 per cent, but more than a mere trace of that element constitutes steel. Steel is characterized by relative toughness, and, when tempered, by hardness and elasticity. It differs from cast iron in that it has a smaller percentage of carbon and from wrought iron by its freedom from slag. Ordinarily, steel has also a smaller percentage of silicon than pig iron, although in the case of certain alloyed steel the silicon content may be relatively high.

At the present time, there are five recognized processes in manufacturing steel: The Bessemer, the open-hearth, the crucible, the electric-furnace, and the cementation processes. The Bessemer process consists in blowing air through molten pig iron contained in a suitable vessel, whereby its impurities are oxidized and removed. The open-hearth process consists in the oxidation and removal of the impurities contained in a bath of metallic iron lying on a hearth of a regenerative furnace, the product being tapped in a fluid condition. The crucible process produces a steel particularly free from imperfections by melting in air-tight crucibles various grades of iron or steel with or without the addition of carbon, ore, or other metals. The electric-furnace process is distinguished by the use of electricity as the source of heat for the various reactions. The cementation process consists in impregnating bars of wrought iron or soft steel with carbon at a temperature below their melting point, and is used (chiefly in England) for the production of high-carbon bars for the manufacture of steel or shear steel.

The Bessemer and open-hearth processes may each assume one of two forms—the acid or the basic—according to the lining of the furnace. In the acid process, the silicon, manganese, and carbon contained in the pig iron are acted upon, but not the phosphorus and sulphur. In the basic process, phosphorus is largely, and the sulphur to a considerable extent, eliminated, as well as the silicon, manganese, and carbon. The basic-Bessemer process is seldom employed in the United States, owing to the relatively low phosphorus content of American pig iron. For the acid-Bessemer process, the phosphorus content of the pig iron should not be greater than 0.1 per cent, whereas a typical analysis of pig iron adapted to the basic-Bessemer process would show a phosphorus content of about 2.5 per cent. Most of the non-Bessemer domestic pig iron is thus manufactured into steel by the basic open-hearth process, which does not require so high a phosphorus content. On account of the greater uniformity and reliability of the steel produced by the open-hearth process much of the pig iron suitable for the Bessemer process is now converted by the acid open-hearth method. Two or more of these processes may be combined. Thus in the duplex process the metal is partly purified in Bessemer converters and finally purified in basic open-hearth steel furnaces.

The Clapp-Griffith process is one form of the Bessemer, wherein the Clapp-Griffith converter is employed. The pneumatic process is an obsolete term for the Bessemer and is also applied to a special form of the Bessemer process for the making of wrought iron (the Champion pneumatic process). The names "Thomas," "Thomas-Gilchrist," and "basic" are used in Europe synonymously with the basic-Bessemer process, although the term "basic," as has just been noted, is also used more broadly to include the basic open-hearth process. The Siemens-Martin process, as the term is ordinarily used, signifies open-hearth.

*Importance of steel.*—At the present time most of the pig-iron output of the world is converted into steel, the domestic proportion being between 80 and 90 per cent.

In the calendar year 1920 the United States produced 42,132,934 gross tons of steel. Of this output, 32,671,895 tons were made by the open-hearth process; 8,883,087 were made by the Bessemer; 72,265

tons by the crucible; 502,152 tons by the electric furnace; and 3,535 tons by miscellaneous processes or processes not named.

*Suggested changes.*—In enumerating the methods of steel manufacture it is suggested that the five processes now used by commercial nations be named without the addition of the others. The terms "Clapp-Griffith," "pneumatic," and "Thomas-Gilchrist" represent certain specialized types of the Bessemer process, and the term "Siemens-Martin" is synonymous with open-hearth. If these terms are included in the paragraph, there is no apparent reason for the omission of 30 or 40 other variations of the Bessemer, open-hearth, and other processes. The phrase "or by any fusion or other process which produces from iron or its ores a metal either granular or fibrous in structure, which is cast and malleable, excepting what is known as malleable-iron castings, shall be classed and denominated as steel" sufficiently provides for any other possible method of manufacturing steel.

### PARAGRAPH 307.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 307. Boiler or other plate iron or steel, except crucible plate steel and saw plate steel, not thinner than one hundred and forty one-thousandths of one inch, cut or sheared to shape or otherwise, or unshaped, and skelp iron or steel sheared or rolled in grooves, valued at 1 cent per pound or less, seven-twentieths of 1 cent per pound; valued above 1 cent per pound and not above 3 cents per pound, five-tenths of 1 cent per pound; valued at over 3 cents per pound, 20 per centum ad valorem: *Provided*, That all sheets or plates of iron or steel thinner than one hundred and forty one-thousandths of one inch shall pay duty as iron or steel sheets.

ACT OF 1909.

ACT OF 1913.

PAR. 122. Boiler or other plate iron or steel, except crucible plate steel and saw plates hereinafter provided for in this section, not thinner than number ten wire gauge, cut or sheared to shape or otherwise, or unshaped, and skelp iron or steel sheared or rolled in grooves, valued at eight-tenths of one cent per pound or less, three-tenths of one cent per pound; valued above eight-tenths of one cent and not above one cent per pound, four-tenths of one cent per pound; valued above one cent and not above two cents per pound, five-tenths of one cent per pound; valued above two cents and not above three cents per pound, six-tenths of one cent per pound; valued at over three cents per pound, twenty per centum ad valorem: *Provided*, That all sheets or plates of iron or steel thinner than number ten wire gauge shall pay duty as iron or steel sheets.

PAR. 105. Boiler or other plate iron or steel, \* \* \* not specially provided for in this section; sheets of iron or steel, common or black, of whatever dimensions, whether plain, corrugated or crimped, \* \* \* and skelp iron or steel, whether sheared or rolled in grooves, or otherwise, 12 per centum ad valorem.

## IRON AND STEEL PLATES AND SKELP.

(See Survey C-4.)

*Description and uses.*—Plates are pieces of iron or steel, principally steel, ranging in thickness from No. 10 wire gauge (approximately  $\frac{9}{32}$  inch) to  $2\frac{1}{2}$  inches, and in width over 7 inches, and cut to various lengths. No. 10 wire gauge has been used as a line of division between plates and sheets, the latter being the thinner, but No. 12 wire gauge ( $\frac{7}{16}$  inch) is probably the more common. These divisions, however, are not in all cases sharply drawn. The principal uses of plates are for boilers, tanks, steel cars, buildings, bridges, etc. Boiler plates may be subdivided into flange, fire-box, and extra-soft steel. Skelp iron or steel consists of long strips used in the manufacture of tubes and pipes.

Plates and sheets, before special preparation for their several uses, represent a relatively low stage of steel manufacture. Additional rolling, cutting, smoothing, polishing, galvanizing, etc., carry further the process of production.

*Production.*—Statistics concerning plates and sheets included in this paragraph are not in all cases available. The production of plates and sheets, divided almost equally, exceeded 8,000,000 gross tons in 1917 and 1918. In 1920 production amounted to 9,337,680 gross tons, of which 4,755,133 gross tons consisted of plate. In addition to this figure is a small amount of nail plate. A considerable part of this plate tonnage consists of material covered by other paragraphs.

*Imports* of plates and sheets partly covered by this paragraph are insignificant compared with the domestic production. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	145,318	\$10,832	\$1,300	12
1919.....	6,596	797	96	12
1920.....	21,386	2,548	306	12
1921 (9 months).....	16,472	1,575	.....	.....

In addition to the above there were imported into the United States for the construction and equipment of vessels 482,790 pounds valued at \$26,318 in 1918, and in 1920, 58,620 pounds valued at \$8,290.

*Exports* in general far exceed imports. The export figures, however, do not divide plates and sheets according to use or degree of finish, except in the cases of galvanized and tinned sheets and plates. The exports of steel plates are shown for the calendar years 1918-1921 in the following table:

	1918	1919	1920	1921 (9 months.)
Quantity (pounds).....	1,236,405,731	1,590,428,674	2,062,947,743	679,537,763
Value.....	\$61,678,628	\$56,701,651	\$72,995,717	\$21,780,121

In addition to these exports are those of iron sheets and plates, amounting in 1920 to 72,032,603 pounds valued at \$1,411,143.

The exported material goes mainly to Japan, Canada and the United Kingdom.

In addition to these exports ship and tank plates, punched and shaped, were shipped in the calendar years 1918-1921 as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	65,519,432	30,661,005	95,937,353	19,503,683
Value.....	\$4,321,268	\$1,497,202	\$4,380,360	\$920,373

The principal countries of destination of the above exports were Japan, Cuba, and Mexico.

*Important changes in classification.*—This paragraph excludes crucible plate steel and saw-plate steel. The proviso, omitted in the act of 1913, has been incorporated with the designated thickness given in fractions of an inch instead of by wire gauge.

*Suggested changes.*—As plate iron and steel may be divided broadly into plates with specifications and plates without specifications, such a division might be made in this paragraph. Ordinary tank plate is plate without specifications. Boiler plate and saw plate are plates with specifications. These and other plates could be specifically mentioned with the duties applicable to each; and other plates provided for under a general ad valorem duty. The most important plates made according to specifications are boiler plate, saw plate, crucible or electric furnace steel plates, and alloy plates. The last consist of material of greatly varying chemical constitution and value.

### PARAGRAPH 308.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 308. Sheets of iron or steel, common or black, of whatever dimensions, and skelp iron or steel, valued at 3 cents per pound or less, thinner than one hundred and forty one-thousandths and not thinner than thirty-eight one-thousandths of an inch, forty-five one-hundredths of 1 cent per pound; thinner than thirty-eight one-thousandths and not thinner than twenty-two one-thousandths of an inch, fifty-five one-hundredths of 1 cent per pound; thinner than twenty-two one-thousandths and not thinner than ten one-thousandths of an inch, seventy-five one-hundredths of 1 cent per pound; thinner than ten one-thousandths of an inch, eighty-five one-hundredths of a cent per pound; corrugated or crimped, seventy-five one-hundredths of 1 cent per pound; all the foregoing when valued at more than 3 cents per pound, 20 per centum ad valorem: *Provided*, That all sheets or plates of common or black iron or steel not thinner than one hundred and forty one-thousandths of an inch shall pay duty as plate iron or plate steel.

## ACT OF 1909.

PAR. 127. Sheets of iron or steel, common or black, of whatever dimensions, and skelp iron or steel, valued at three cents per pound or less, thinner than number ten and not thinner than number twenty wire gauge, five-tenths of one cent per pound; thinner than number twenty wire gauge and not thinner than number twenty-five wire gauge, six-tenths of one cent per pound; thinner than number twenty-five wire gauge and not thinner than number thirty-two wire gauge, eight-tenths of one cent per pound; thinner than number thirty-two wire gauge, nine-tenths of one cent per pound; corrugated or crimped, eight-tenths of one cent per pound; all the foregoing valued at more than three cents per pound, thirty per centum ad valorem: *Provided*, That all sheets or plates of common or black iron or steel not thinner than number ten wire gauge shall pay duty as plate iron or plate steel.

## ACT OF 1913.

PAR. 105. Boiler or other plate iron or steel, \* \* \* not specially provided for in this section; sheets of iron or steel, common or black, of whatever dimensions, whether plain, corrugated or crimped, including crucible plate steel and saw plates, cut or sheared to shape or otherwise, or un-sheared, and skelp iron or steel, whether sheared or rolled in grooves, or otherwise, 12 per centum ad valorem.

## IRON OR STEEL SHEETS, COMMON OR BLACK.

(See Survey C-4.)

*Description and use.*—Sheets are wide, thin pieces of steel (rarely iron) used for roofing, stovepipes, cans and other receptacles, etc. The ordinary thicknesses range from No. 10 wire gauge ( $\frac{9}{64}$  inch) to No. 30 ( $\frac{1}{80}$  inch). The term "black sheets" is used to differentiate uncoated sheets from sheets coated with zinc, tin, etc.

Skelp iron or steel constitutes the material used for the manufacture of tubes and pipes.

*Production* of iron and steel sheets in the United States in 1920 amounted to 4,582,547 gross tons. The country's output of skelp during the same year was 3,220,289 gross tons. In 1912 the production of sheets aggregated 2,839,880 gross tons, and of skelp, 2,446,816 gross tons.

*Imports* may be divided into groups as given in the following table:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
COMMON OR BLACK SHEETS AND SKELP IRON OR STEEL.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	6,610	\$1,774	\$213	12
1919.....	20,066	1,287	154	12
1920.....	217,621	12,957	1,555	12
1921 (9 months).....	530	53		.....

## CORRUGATED OR CRIMPED SHEETS OF IRON OR STEEL, COMMON OR BLACK, AND SKELP IRON OR STEEL.

1919.....	513	\$104	\$12	12
1920.....	187	33	4	12

The imports of sheets of iron or steel come mainly from the United Kingdom, Sweden, and Canada.

*Exports* of iron sheets are published by the Bureau of Foreign and Domestic Commerce with those of iron plate. These figures and those for steel sheets may be tabulated for the calendar years 1918-1921 as follows:

	1918	1919	1920	1921 (9 months).
Iron plates and sheets:				
Quantity (pounds).....	91,293,392	89,358,285	72,032,603	23,644,896
Value.....	\$6,315,095	\$4,837,547	\$4,036,239	\$1,411,143
Steel sheets:				
Quantity (pounds).....	366,062,623	397,525,194	379,105,922	226,664,879
Value.....	\$25,646,749	\$21,214,529	\$21,199,524	\$11,489,281

The exports of steel sheets and iron sheets and plates go mainly to Japan, Canada, and South America.

*Important changes in classification.*—This paragraph covers a group of material which has been taken out of a paragraph in the act of 1913 embracing comparatively unrelated articles.

*Suggested changes.*—In the proviso contained in this paragraph, the dividing line between plates and sheets is fixed at one hundred and forty one-thousandths of an inch in thickness. This is approximately equal to No. 10 wire gauge. There is no hard and fast line of division recognized in the steel trade between plates and sheets but there is a tendency to make the line of division No. 12 wire gauge or one hundred and nine one-thousandths of an inch in thickness. If it is desirable to follow what seems to be a general tendency in trade practice, it is suggested that the dividing line between plates and sheets be changed from one hundred and forty one-thousandths of an inch in thickness to one hundred and nine one-thousandths of an inch in thickness. In other words, the material having a thickness of one hundred and nine one-thousandths of an inch or over would, according to this suggestion, be designated as plates and material having a thickness less than one hundred and nine one-thousandths of an inch would be designated as sheets. The dividing line in this paragraph of H. R. 7456, however, was made in accordance with a Treasury decision rendered after some inquiry (T. D. 34694 of 1914). In the act of 1909 it was No. 10 wire gauge. (See pars. 122 and 127.)

### PARAGRAPH 309.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 309. All iron or steel sheets, plates, bars, and rods, and all hoop, band, or scroll iron or steel, excepting what are known commercially as tin plates, terne-plates, and taggers tin, when galvanized or coated with zinc, spelter, or other metals, or any alloy of those metals, shall pay two-tenths of 1 cent per pound more duty than if the same was not so galvanized or coated; sheets or plates composed of iron, steel, copper, nickel, or other metal with layers of other metal or metals imposed

## H. R. 7456.

## SENATE AMENDMENTS.

thereon by forging, hammering, rolling, or welding, 28 per centum ad valorem; sheets and plates of iron or steel, polished, planished, or glanced, by whatever name designated, 1½ cents per pound: *Provided*, That plates or sheets of iron or steel, by whatever name designated, other than polished, planished, or glanced, herein provided for, which have been pickled or cleaned by acid, or by any other material or process, or which are cold-rolled, smoothed only, not polished, shall pay two-tenths of 1 cent per pound more duty than the rates provided on corresponding thicknesses of common or black sheet iron or steel.

## ACT OF 1909.

## ACT OF 1913.

PAR. 128. All iron or steel sheets or plates, and all hoop, band, or scroll iron or steel, excepting what are known commercially as tin plates, terneplates, and taggers tin, and hereinafter provided for, when galvanized or coated with zinc, spelter, or other metals, or any alloy of those metals, shall pay two-tenths of one cent per pound more duty than if the same was not so galvanized or coated; sheets or plates composed of iron, steel, copper, nickel, or other metal with layers of other metal or metals imposed thereon by forging, hammering, rolling, or welding, forty per centum ad valorem.

PAR. 129. Sheets of iron or steel, polished, planished, or glanced, by whatever name designated, one and one-half cents per pound: *Provided*, That plates or sheets of iron or steel, by whatever name designated, other than the polished, planished, or glanced herein provided for, which have been pickled or cleaned by acid, or by any other material or process, or which are cold-rolled, smoothed only, not polished, shall pay two-tenths of one cent per pound more duty than the corresponding gauges of common or black sheet iron or steel.

PAR. 109. All iron or steel sheets, plates, or strips, and all hoop, band, or scroll iron or steel, when galvanized or coated with zinc, spelter, or other metals, or any alloy of those metals; sheets or plates composed of iron, steel, copper, nickel, or other metal with layers of other metal or metals imposed thereon by forging, hammering, rolling, or welding; sheets of iron or steel, polished, planished, or glanced, by whatever name designated, including such as have been pickled or cleaned by acid, or by any other material or process, or which are cold rolled, smoothed only, not polished, and such as are cold hammered, blued, brightened, tempered, or polished by any process to such perfected surface finish or polish better than the grade of cold rolled, smoothed only; \* \* \* metal sheets \* \* \* coated with nickel or other metals by dipping, printing, stenciling, or other process, 15 per centum ad valorem.

## GALVANIZED SHEETS, PLATES., ETC.

(See Survey C-4.)

*Description and uses.*—The greater part of the iron and steel rolled into sheets, plates, etc., goes through further stages preparatory to ultimate use. Sheets to be galvanized are annealed and pickled

before being passed through the galvanizing pot. Tin plate passes through the processes of black pickling or first pickling, black annealing or first annealing, cold rolling, white annealing, and white pickling or second annealing and pickling before being coated with tin. Almost no sheets are marketed as they come from the hot rolls, but are annealed and sold as black plate or subjected to further treatment before being put on the market.

In the process of annealing the material is heated to soften the steel and make it more ductile, to remove any strain set up by too rapid cooling, and to refine the grain. Pickling is a treatment with dilute acids to obtain a clean surface by removing the scale (oxide). Cold rolling and cold hammering are forms of cold working by straining the cold metal slightly beyond its elastic limit. It may consist in (1) slightly reducing the cross-sectional area by rolling, hammering, or drawing; (2) distorting the material by bending or twisting; and (3) punching or shearing. After cold rolling, the metal is sometimes again annealed to restore the original softness and ductility reduced by cold rolling. Polishing and planishing consist of applying various abrasives (such as emery, rouge, etc.) of successive degrees of fineness.

Galvanized plates and sheets are those coated with zinc by passing through a bath of that metal molten. Layers of metal are also imposed upon sheets and plates by forging, hammering, welding, etc. Certain brass-plated and nickel-plated steel sheets which are used, especially in Europe, for cooking utensils and for various other purposes (e. g., candy molds), together with the more costly thermostatic metal, come under this provision.

*Production.*—The country's output of iron and steel galvanized sheets in 1920 amounted to 889,668 long tons, or 2,015,255,681 pounds. About 7 per cent of this total includes sheets galvanized after first being stamped or formed into various shapes. Concerning the output of plates and sheets which have been pickled or cleaned by acid or by any other material or process or which are cold rolled and smooth only, no statistics are available, except in the case of tin and terneplate covered by paragraph 310. The production of galvanized sheets in 1914 amounted to 1,939,270,738 pounds, of which 131,603,609 pounds consisted of galvanized formed products.

*Imports.*—In 1913 the importation of plates, sheets, etc., covered by this paragraph amounted to 28,345,141 pounds, valued at \$973,005, and in 1914 to 49,640,360 pounds, valued at \$1,508,843. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
GALVANIZED SHEETS, PLATES, HOOPS, ETC.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	386,580	\$193,085	\$28,963	15
1919.....	158,614	41,432	6,215	15
1920.....	631,769	179,922	26,989	15
1921 (9 months).....	3,649,125	206,065	.....	15

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
----------------	-----------	--------	-------	------------------

## PLATES OR SHEETS, COLD-ROLLED, AND SMOOTH ONLY.

	Pounds.			Per cent.
1918.....	423,701	\$198,453	\$29,768	15
1919.....	317,574	94,958	12,504	15
1920.....	188,312	43,139	6,471	15
1921 (9 months).....	75,867	21,431	3,215	15

## SHEETS AND PLATES OF IRON OR STEEL, POLISHED, PLANISHED, OR GLANCED.

1918.....	59,151	\$12,410	\$1,862	15
1919.....	200,431	49,373	7,406	15
1920.....	40,903	7,702	1,155	15
1921 (9 months).....	8,171	846		

## PLATES OF IRON OR STEEL PICKLED OR CLEANED BY ACID OR BY ANY OTHER PROCESS.

1920.....	445	\$54	\$8	15
1921 (9 months).....	5,329	765		

METAL SHEETS DECORATED IN COLORS OR COATED WITH NICKEL OR OTHER METALS BY DIPPING, PRINTING, STENCILING, OR OTHER PROCESS.<sup>1</sup>

1918.....	650	\$424	\$64	15
1920.....	88	68	10	15
1921 (9 months).....	147,699	13,669		

## SHEETS OR PLATES COMPOSED OF IRON, STEEL, COPPER, NICKEL, WITH LAYERS OF OTHER METAL OR METALS IMPOSED THEREON BY FORGING, HAMMERING, OR WELDING.

1920.....	650	\$65	\$10	15
1921 (9 months).....	6,796	816		

<sup>1</sup> Includes other than iron and steel sheets with nickel or other metals, or decorated in colors. Such sheets under H. R. 7456 would be classed under par. 391 or 393.

In addition to these imports and those of plates and sheets in paragraphs 304, 307, and 308, there were imported in 1919, 70,314 pounds of iron or steel plates or sheets made by the Bessemer and open-hearth processes for the construction of vessels.

Exports greatly exceed imports. During the calendar years 1918-1921, the exports of galvanized iron and steel sheets and plates have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	153,982,456	227,669,237	242,745,308	102,074,891
Value.....	\$12,609,628	\$15,223,289	\$16,727,590	\$6,709,611

The principal countries receiving this export material were Canada, Cuba, Argentina, and Mexico. In addition there are other exports not separately tabulated by the Bureau of Foreign and Domestic Commerce.

*Important changes in classification.*—In this paragraph galvanized sheets are separated from tin and terne plate with which they are classified in the act of 1913. The provision in paragraph 109 of that act for “metal sheets decorated in colors” has been omitted and the provision for metal sheets “coated with nickel or other metals by dipping, printing, stenciling, or other processes” is confined to iron and steel sheets in paragraph 309 and zinc sheets in paragraph 391.

*Suggested changes*—The attention of the Tariff Commission has been called to the recent development of the manufacture of thermostatic metal in the United States. Under the act of 1913 and under H. R. 7456 this metal is “sheets or plates composed of iron, steel, copper, nickel, or other metal, with layers of other metal or metals imposed thereon by forging, hammering, rolling, or welding.” Thermostatic metal is composed of two plates, welded together, one of nickel steel (36 per cent nickel) and the other of brass. The principal use of thermostatic metal is the regulation of temperature in houses, gas ovens, electric ovens, hot water heaters, etc. It is also used for compensating for changes in temperature where changes in temperature would affect measurements, as in speedometers. The process of manufacture consists of welding the metals in thick plates and rolling them down to commercial thicknesses. The chief difficulty is in securing an absolutely perfect union of the dissimilar metals. This product is much more costly than other products within the foregoing provision, and might be specially provided for.

---

### PARAGRAPH 310.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 310. Sheets or plates of iron or steel, or taggers iron or steel, coated with tin or lead, or with a mixture of which these metals, or either of them, is a component part, by the dipping or any other process, and commercially known as tin plates, terneplates, and taggers tin,  $1\frac{1}{10}$  cents per pound.

ACT OF 1909.

PAR. 130. Sheets or plates of iron or steel, or taggers iron or steel, coated with tin or lead, or with a mixture of which these metals, or either of them, is a component part, by the dipping or any other process, and commercially known as tin plates, terneplates, and taggers tin, one and two-tenths cents per pound.

ACT OF 1913.

PAR. 109. \* \* \* and sheets or plates of iron or steel, or taggers iron or steel, coated with tin or lead, or with a mixture of which these metals, or either of them is a component part, by the dipping or any other process, and commercially known as tin plates, terneplates, and taggers tin, and tin plates coated with metal, and metal sheets \* \* \* coated with nickel or other metals by dipping, printing, stenciling, or other process, 15 per centum ad valorem.

### TIN OR TERNE PLATE.

(See Survey C-4.)

*Description and uses.*—Tin plate consists of black plate coated with tin; terneplate, of black plate coated with a mixture of tin and lead—generally in the proportion of one to two. Taggers tin, or

"taggers," is tin plate which is undersized, i. e., below the gauge of the box. The amount of tin in tin plate will average about 2 per cent of the total weight.

*Production.*—The production of tin and terne plates in 1917 aggregated 1,512,145 long tons, less than 5 per cent consisting of terneplate. The country's output in 1920 was 1,436,686 long tons.

The United States now leads the world in the production of tin and terne plate. England, the next greatest producer, formerly supplied the bulk of the world output.

*Imports.*—The importation of tin and terne plate in 1913 amounted to 28,345,141 pounds (12,654 long tons), valued at \$973,005. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	71,403	\$5,964	\$895	15
1919.....	541,912	66,944	10,041	15
1920.....	878,073	127,168	19,075	15
1921 (9 months).....	718,905	103,332		

The great bulk of this imported material comes from the United Kingdom and Canada.

*Exports* of tin and terneplate and taggers tin in 1913 amounted to 164,362,281 pounds (73,376 gross tons), valued at \$5,767,043. Exports since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	579,125,457	458,127,594	507,159,211	189,667,759
Value.....	\$55,850,294	\$36,997,634	\$40,545,291	\$14,695,703

A large part of this exported material went to Japan and Canada.

*Important changes in classification.*—Tin and terne plates are classified separately from galvanized sheets and other sheets on which metal is imposed.

*Suggested changes.*—As paragraph 311 is practically a proviso to paragraph 310, it is suggested that 311 be made a part of paragraph 310.

### PARAGRAPH 311.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 311. No article not specially provided for which is wholly or partly manufactured from tin plate, terneplate, or the sheet, plate, hoop, band, or scroll iron or steel, or of which such tin plate, terneplate, sheet, plate, hoop, band, or scroll iron or steel shall be the material of chief value, shall pay a lower rate of duty than that imposed on the tin plate, terneplate, or sheet, plate, hoop, band, or scroll iron or steel from which it is made, or of which it shall be the component thereof of chief value.

## ACT OF 1909.

PAR. 136. No article not specially provided for in this section, which is wholly or partly manufactured from tin plate, terneplate, or the sheet, plate, hoop, band, or scroll iron or steel herein provided for, or of which such tin plate, terneplate, sheet, plate, hoop, band, or scroll iron or steel shall be the material of chief value, shall pay a lower rate of duty than that imposed on the tin plate, terneplate, or sheet, plate, hoop, band, or scroll iron or steel from which it is made, or of which it shall be the component thereof of chief value.

## ACT OF 1913.

PAR. 115. No article not specially provided for in this section, which is wholly or partly manufactured from tin plate, terneplate, or the sheet, plate, hoop, band, or scroll iron or steel herein provided for, or of which such tin plate, terneplate, sheet, plate, hoop, band, or scroll iron or steel shall be the material of chief value, shall pay a lower rate of duty than that imposed on the tin plate, terneplate, or sheet, plate, hoop, band, or scroll iron or steel from which it is made, or of which it shall be the component thereof of chief value.

---

 PARAGRAPH 312.

## H. R. 7456.

PAR. 312. Beams, girders, joists, angles, channels, car-truck channels, tees, columns and posts, or parts or sections of columns and posts, deck and bulb beams, and building forms, together with all other structural shapes of iron or steel, not assembled, manufactured, or advanced beyond hammering, rolling, or casting, seven-twentieths of 1 cent per pound; any of the foregoing if machined, drilled, punched, assembled, fitted, fabricated for use, or otherwise advanced beyond hammering, rolling, or casting, 25 per centum ad valorem.

## SENATE AMENDMENTS.

## ACT OF 1909.

PAR. 121. Beams, girders, joists, angles, channels, car-truck channels, TT, columns and posts or parts or sections of columns and posts, deck and bulb beams, and building forms, together with all other structural shapes of iron or steel, not assembled, or manufactured, or advanced beyond hammering, rolling, or casting, valued at nine-tenths of one cent per pound or less, three-tenths of one cent per pound; valued above nine-tenths of one cent per pound, four-tenths of one cent per pound.

## ACT OF 1913.

PAR. 104. Beams, girders, joists, angles, channels, car-truck channels, TT, columns and posts or parts or sections of columns and posts, deck and bulb beams, \* \* \* and building forms, together with all other structural shapes of iron or steel, whether plain, punched, or fitted for use, or whether assembled or manufactured, 10 per centum ad valorem.

## STRUCTURAL SHAPES.

(See Survey C-3.)

*Description and uses.*—Structural shapes are iron or steel rolled for structural purposes. They are classified into heavy and light—the latter being those with the leg or web less than 3 inches—and are given commercial names, e. g., I-beams, channels, joists, girders, angles, tees, and zees, names largely descriptive of their cross-section appearance. Nearly 90 per cent of the country's production consists of heavy structural shapes. They are used in buildings, bridges, ships, cars, etc. Light shapes are used in the manufacture of agri-

cultural implements, bedsteads, fences, safes, automobiles, and other articles requiring light sections.

*Production.*—The annual output of structural shapes in 1916 and 1917 amounted to over 3,000,000 gross tons. In 1918 and 1919 production declined, but in 1920 it rose again to 3,306,748 gross tons. Germany, England, and France are important producers, Germany producing over 1,000,000 tons of girders in 1914. The output of Canada increased rapidly during the war, and in 1920 amounted to over 200,000 gross tons.

The prices of light structural shapes are generally higher per unit of weight than those of heavy shapes, and under a system of specific duties the rate should ordinarily be higher to give the same ad valorem duty. Cost of transportation is a more important element in the prices of heavy than of light shapes. In remote markets the cost of shipping structural material may be an important factor in determining the relative competitive strength of American and foreign producers. Before the war ocean freight rates from western Europe to the Pacific coast of the United States were less than the rail rates from the steel-manufacturing States of the East to the same destination, a circumstance which favored European producers in Pacific coast markets. During the war ocean freight rates increased enormously, altering this situation to the advantage of the home industry.

*Imports* in 1913 amounted to 6,738 gross tons, valued at \$245,156. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	7,766,735	\$394,902	\$39,490	10
1919.....	2,695,638	131,669	13,167	10
1920.....	3,771,611	284,167	28,417	10
1921 (9 months).....	1,232,389	110,470		

In 1918, 45,973,264 pounds, valued at \$2,427,739, were imported for the construction and equipment of vessels; in 1919 there were 32,220,604 pounds, valued at \$1,881,019, imported for this purpose. In 1920 and 1921 the amounts were negligible.

In addition to this imported material, a small amount of structural shapes entered the country free of duty under the Panama Canal act.

*Exports* of structural shapes vastly exceed imports. In 1913 these exports amounted to 366,654 long tons, valued at \$16,054,788. In the calendar years 1918–1921 exports have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (tons).....	232,729	360,787	493,633	266,008
Value.....	\$21,468,452	\$28,956,816	\$38,384,690	\$24,499,610

The bulk of the exported material goes to Japan, Canada, and Cuba.

*Important changes in classification.*—Sashes and frames are omitted because they are not structural shapes. (*Ackerson v. United States*, 178 Fed., 1003, of 1910.)

"Structural shapes of iron or steel, not assembled, manufactured, or advanced beyond hammering, rolling, or casting," are separated from the material which is "assembled, fitted, fabricated for use, or otherwise advanced beyond hammering, rolling, or casting."

The expression "tees" in line 21, page 46, of H. R. 7456, was "T-T" in the act of 1913 (par. 104), and "TT" in the act of 1909 (par. 121).

*Suggested changes.*—Page 46, line 24, of H. R. 7456: Change "or" to "nor" before "advanced."

Page 47, line 1: Strike out "if" before "machined," to agree with practice elsewhere.

---

### PARAGRAPH 313.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 313. Hoop, band, and scroll iron or steel, not specially provided for, valued at 3 cents per pound or less, eight inches or less in width, and thinner than three-eighths and not thinner than one hundred and forty one-thousandths of one inch, twenty-five one-hundredths of 1 cent per pound; thinner than one hundred and forty one-thousandths and not thinner than thirty-eight one-thousandths of one inch, thirty-five one-hundredths of 1 cent per pound; thinner than thirty-eight one-thousandths of one inch, fifty-five one-hundredths of 1 cent per pound: *Provided*, That barrel hoops of iron or steel, and hoop or band iron, or hoop or band steel, flared, splayed, or punched, with or without buckles or fastenings, shall pay no more duty than that imposed on the hoop or band iron or steel from which they are made, bands and strips of iron or steel, whether in long or short lengths, not specially provided for, 20 per centum ad valorem.

### ACT OF 1909.

PAR. 124. Hoop, band, or scroll iron or steel, not otherwise provided for in this section, valued at three cents per pound or less, eight inches or less in width, and less than three-eighths of one inch thick and not thinner than number ten wire gauge, three-tenths of one cent per pound; thinner than number ten wire gauge and not thinner than number twenty wire gauge, four-tenths of one cent per pound; thinner than number twenty wire gauge, six-tenths of one cent per pound: *Provided*, That barrel hoops of iron or steel, and hoop or band iron or hoop or band steel flared, splayed or punched, with or without buckles or fastenings, shall pay one-tenth of one cent per pound more duty than that imposed on the hoop or band iron or steel from which they are made; bands and strips of steel, exceeding twelve feet in length, not specially provided for in this section, thirty-five per centum ad valorem.

### ACT OF 1913.

PAR. 105. \* \* \* strips of iron or steel, not specially provided for in this section; \* \* \* 12 per centum ad valorem.

PAR. 107. Hoop, band, or scroll iron or steel not otherwise provided for in this section, and barrel hoops of iron or steel, wholly or partly manufactured, 10 per centum ad valorem.

## HOOPS AND BANDS.

(See Survey C-4.)

*Description.*—Hoops and bands are of great length compared with their width and thickness, the width being not more than 8 inches and the thickness less than three-eighths of an inch. The term "hoop" is applied to flats having a thickness varying from No. 13 B. W. G. ( $\frac{3}{32}$  inch) to No. 23 B. W. G. ( $\frac{9}{320}$  inch) and a width from three-eighths inch to 8 inches. Owing to their great length, they are coiled like wire rods. Subsequently they are annealed, cut to length, and shipped in bundles. If bent backward on itself like a flattened letter S, the material is called a scroll or scroll bundle. No clear line of distinction exists between hoops, bands, and strips.

Hoop or band iron or steel, cut to length, wholly or partly manufactured into hoops or ties used for baling cotton or any other commodity, comes under paragraph 314. Paragraph 313 applies to barrel hoops of iron or steel and such hoops or bands as are not otherwise provided for.

*Production* figures of hoops and bands described in paragraph 313 are not available. In 1917 the entire output of hoops amounted to 347,186 gross tons; of bands and cotton ties, to 490,893 gross tons. In 1920 the output of these products aggregated 333,440 and 388,862 gross tons, respectively.

*Imports.*—Imports of hoop, band, and scroll iron and steel are small. In 1913 they amounted to 2,004 gross tons, valued at \$300,161. These figures include some galvanized material. Since 1917 imports have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
HOOP, BAND, AND SCROLL IRON OR STEEL, N. S. P. F.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	26,667	\$2,086	\$209	10
1919.....	55,207	5,399	540	10
1920.....	5,410	718	72	10
1921 (9 months).....	153,719	6,995		
STRIPS OF IRON OR STEEL, N. S. P. F.				
1918.....	81,085	\$22,478	\$2,697	12
1919.....	40,312	7,823	939	12
1920.....	315,293	64,460	7,735	12
1921 (9 months).....	272,129	85,778		

In addition to this imported material, there was a small amount of barrel hoops, fully or partly manufactured, coming into the country.

*Exports* of hoop, band and scroll iron and steel in 1913 amounted to 41,019,908 pounds (6,259 gross tons), valued at \$798,974. Exports in later calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	113,508,597	113,871,668	119,725,535	35,376,925
Value.....	\$7,711,195	\$6,875,586	\$6,445,155	\$1,656,892

A large part of the exported material goes to Canada and British India.

*Important changes in classification.*—In the act of 1913 no line of demarcation with reference to width is drawn between hoop, band, and scroll iron or steel, on the one hand, and sheets and plates, on the other hand. In H. R. 7456 a graduated scale of specific duties is provided for in the case of hoop, band, and scroll iron or steel, 8 inches or less in width. In the proviso of the paragraph 20 per centum ad valorem is imposed on bands and strips of iron or steel, whether in long or short lengths, not specially provided for, without any limitation as to width.

*Suggested changes.*—Page 47, line 18, of H. R. 7456: Change comma to a semicolon after "made" to separate the provision for bands and strips from the proviso.

Dividing lines between hoops, bands, and strips and sheets and plates are advisable for purposes of administration; there is none carefully drawn in the steel trade.

It is also important to recognize the difference between hot-rolled strips and bands and cold-rolled strips and bands, the latter being a more expensive material.

#### PARAGRAPH 314.

##### H. R. 7456.

PAR. 314. Hoop or band iron, and hoop or band steel, cut to lengths, or wholly or partly manufactured into hoops or ties, coated or not coated with paint or any other preparation, with or without buckles or fastenings, for baling cotton or any other commodity, one-fourth of 1 cent per pound.

##### ACT OF 1909.

PAR. 125. Hoop or band iron, or hoop or band steel, cut to lengths, or wholly or partly manufactured into hoops or ties, coated or not coated with paint or any other preparation, with or without buckles or fastenings, for baling cotton or any other commodity, three-tenths of one cent per pound.

##### SENATE AMENDMENTS.

##### ACT OF 1913.

PAR. 509. Hoop or band iron, or hoop or band steel, cut to lengths, or wholly or partly manufactured into hoops or ties, coated or not coated with paint or any other preparation, with or without buckles or fastenings, for baling cotton or any other commodity [Free].

#### HOOPS AND BANDS CUT TO LENGTHS—COTTON TIES, ETC.

(See Survey C-4.)

*Description and uses.*—This paragraph applies particularly to the standard cotton tie, a strip of steel  $\frac{1}{8}$ -inch wide by  $\frac{3}{100}$ -inch thick (20 gauge) and  $11\frac{1}{2}$  feet long, chiefly used in tying bales of cotton. Once used, they are rerolled and used again.

*Production* is part of the output of rolling mills making also hoops, wire nails, smooth wire, barbed wire, woven-wire fence, bars, spikes, and similar products. Four plants are located in Pennsylvania, one in Georgia, and one in Alabama. The annual production is estimated at 2,000,000 to 3,000,000 bundles of 45 pounds each, approximately two-thirds of the world's output. England and Germany are the principal foreign producers.

Imports of hoop or band iron, etc., in 1915 were 1,416,538 pounds, valued at \$22,552. Later statistics follow:

Calendar year.	Quantity.	Value.
1920.....	<i>Pounds.</i> 131,370	\$5,952
1921 (9 months).....	1,055,366	32,883

*Exports* are irregular; they depend almost entirely upon the cotton crop and English competition. It is roughly estimated that in recent years they have ranged somewhat over 1,500,000 pounds annually.

*Important changes in classification.*—Hoop or band iron or steel used for baling cotton or any other commodity has been transferred from the free list of the act of 1913 (par. 509).

### PARAGRAPH 315.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 315. Wire rods: Rivet, screw, fence, and other iron or steel wire rods, whether round, oval, or square, or in any other shape, nail rods and flat rods up to six inches in width ready to be drawn or rolled into wire or strips, all the foregoing in coils or otherwise, valued at not over 4 cents per pound, three-tenths of 1 cent per pound; valued over 4 cents per pound, six-tenths of 1 cent per pound: *Provided*, That all round iron or steel rods smaller than twenty one-hundredths of one inch in diameter shall be classed and dutiable as wire: *Provided further*, That all iron or steel wire rods which have been tempered or treated in any manner or partly manufactured shall pay an additional duty of one-fourth of 1 cent per pound: *Provided further*, That on all iron or steel bars and rods of whatever shape or section which are cold rolled, cold drawn, cold hammered, or polished in any way in addition to the ordinary process of hot rolling or hammering, there shall be paid one-eighth of 1 cent per pound in addition to the rates provided on bars or rods of whatever section or shape which are hot rolled; and on all strips, plates, or sheets of iron or steel of whatever shape, other than polished, planished, or glanced sheet iron or sheet steel, which are cold hammered, blued, brightened, tempered, or polished by any process to such perfected surface finish or polish better than the grade of cold rolled, smoothed only, there shall be paid two-tenths of 1 cent per pound in addition to the rates provided on plates, strips, or sheets of iron or steel of common or black finish of corresponding thickness or value.

## ACT OF 1909.

PAR. 134. Wire rods: Rivet, screw, fence, and other iron or steel wire rods, whether round, oval, flat, or square, or in any other shape, and nail rods, all the foregoing in coils or otherwise, valued at four cents or less per pound, three-tenths of one cent per pound; valued over four cents per pound, six-tenths of one cent per pound: *Provided*, That all round iron or steel rods smaller than number six wire gauge shall be classed and dutiable as wire: *Provided further*, That all iron or steel wire rods which have been tempered or treated in any manner or partly manufactured shall pay an additional duty of one-half of one cent per pound.

PAR. 137. On all iron or steel bars or rods of whatever shape or section which are cold rolled, cold drawn, cold hammered, or polished in any way in addition to the ordinary process of hot rolling or hammering, there shall be paid one-eighth of one cent per pound in addition to the rates provided in this section on bars or rods of whatever section or shape which are hot rolled; and on all strips, plates, or sheets of iron or steel of whatever shape, other than the polished, planished, or glanced sheet iron or sheet steel hereinbefore provided for, which are cold hammered, blued, brightened, tempered, or polished by any process to such perfected surface finish or polish better than the grade of cold rolled, smoothed only, hereinbefore provided for, there shall be paid four-tenths of one cent per pound in addition to the rates provided in this section upon plates, strips, or sheets of iron or steel of common or black finish of corresponding gauge or value; \* \* \*.

[No corresponding provision for horseshoe nail rods.]

## ACT OF 1913.

PAR. 113. Rivet, screw, fence, nail, and other iron or steel wire rods, whether round, oval, or square, or in any other shape, and flat rods up to six inches in width ready to be drawn or rolled into wire or strips, all the foregoing in coils or otherwise, including wire rods and iron or steel bars, cold rolled, cold drawn, cold hammered, or polished in any way in addition to the ordinary process of hot rolling or hammering, not specially provided for in this section, 10 per centum ad valorem: *Provided*, That all round iron or steel rods smaller than twenty one-hundredths of one inch in diameter shall be classed and dutiable as wire.

PAR. 109. \* \* \* sheets or plates composed of iron, steel, \* \* \* and such as are cold hammered, blued, brightened, tempered, or polished by any process to such perfected surface finish or polish better than the grade of cold rolled, smoothed only; \* \* \* 15 per centum ad valorem.

PAR. 110. \* \* \* rolled wire rods in coils or bars not smaller than twenty one-hundredths of 1 inch in diameter \* \* \* when made by the crucible, electric, or cementation process, \* \* \* and finished by rolling, hammering, or otherwise, \* \* \* 15 per centum ad valorem.

PAR. 554. \* \* \* horseshoe nail rods, \* \* \* [Free].

## WIRE RODS AND BLUED, BRIGHTENED, AND POLISHED PLATES AND SHEETS.

(See Surveys C-8 and C-4.)

*Description.*—Iron and steel wire rods are produced by rolling, and generally serve as a raw material, chiefly for the drawing of wire; they are also used for rivets, horseshoe nails, and other articles. Strips, sheets, and plates which have been blued, brightened, tempered, or polished, etc., have been subjected to annealing or reheating.

*Production* in 1918 of iron and steel wire rods was 2,562,390 long tons; in 1920, 3,136,907 long tons. Wire rods are but one among the numerous semifinished forms produced by the rolling mills located for the most part in the iron regions centering around Pittsburgh; the industry is one of large-scale ownership. Germany, Great Britain, and France are the principal European producers.

*Imports* of wire rods in the prewar period were much greater than during and since the war. In 1913 they amounted to 17,352 tons,

valued at \$837,326. Later imports of the articles grouped in this paragraph are shown as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
WIRE RODS, RIVET, SCREW, FENCE, AND OTHER.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	16,802,840	\$578,114	\$57,811	10
1919.....	296,655	22,766	2,277	10
1920.....	9,111,168	527,514	52,751	10
1921 (9 months).....	870,697	50,441		
ROLLED WIRE RODS IN COILS OR BARS.				
1918.....	131,356	\$12,678	\$1,902	15
1919.....	20,839	3,732	560	15
1920.....	738,208	63,247	9,487	15
1921 (9 months).....	41,274	10,445		
BARS AND RODS, COLD ROLLED, COLD DRAWN, COLD HAMMERED, OR POLISHED.				
1918.....	255,332	\$31,606	\$3,161	10
1919.....	449,546	37,074	3,707	10
1920.....	2,426,461	155,887	15,589	10
1921 (9 months).....	290,023	14,251		
HORSESHOE NAIL RODS.				
1920.....	40	\$2		
1921 (9 months).....	1,276	70		
IRON OR STEEL BARS, COLD ROLLED, COLD DRAWN, ETC.				
	<i>Tons.</i>			
1918.....	90	\$5,060	\$506	10
1919.....	131	12,585	1,258	10
1920.....	275	39,225	3,923	10
1921 (9 months).....	34	6,912		
PLATES OR SHEETS, COLD HAMMERED, BLUED, BRIGHTENED, ETC.				
	<i>Pounds.</i>			
1918.....	13,818	\$5,898	\$84	15
1919.....	506	213	31	15
1920.....	14,481	5,651	848	15
1921 (9 months).....	2,083	1,354		

Imported wire rods come mainly from England, Sweden, and Canada.

Exports of wire rods in 1913 aggregated 74,823 tons. Statistics for the calendar years 1918-1921 follow:

	1918	1919	1920	1921 (9 months).
Wire rods, steel:				
Quantity (pounds).....	332,691,869	264,342,316	261,575,518	26,823,022
Value.....	\$12,469,715	\$8,374,716	\$8,884,854	\$824,230
Bars and rods of steel, all other:				
Quantity (pounds).....	1,297,517,621	1,241,433,750	1,409,075,183	362,882,607
Value.....	\$64,575,140	\$48,297,598	\$53,841,518	\$12,662,959

The exports go principally to Japan, Canada, and the United Kingdom.

*Important changes in classification.*—Horseshoe nail rods are exempt from duty under the act of 1913 (par. 554). Plates or sheets of iron or steel which are cold hammered, blued, brightened, tempered, or polished, of a grade better than that of cold rolled and smooth material have been placed in this paragraph with wire rods and bars.

*Suggested changes.*—As this paragraph is concerned primarily with rods and bars, it is suggested that the provision with reference to strips, sheets, and plates be transferred to a paragraph devoted to such articles. See paragraphs 307, 308, 309, and 313, "Suggested changes."

Page 48, line 9, of H. R. 7456: Change "classed" to "classified" to agree with practice elsewhere.

---

### PARAGRAPH 316.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 316. Round iron or steel wire, not smaller than ninety-five one-thousandths of one inch in diameter, three-fourths of 1 cent per pound; smaller than ninety-five one-thousandths and not smaller than sixty-five one-thousandths of one inch in diameter,  $1\frac{1}{4}$  cents per pound; smaller than sixty-five one-thousandths of one inch in diameter,  $1\frac{1}{2}$  cents per pound: *Provided*, That all of the foregoing valued above 6 cents per pound shall pay a duty of 20 per centum ad valorem; all wire composed of iron, steel, or other metal, not specially provided for, except gold, silver, or platinum; all flat wires and all steel in strips not thicker than one-quarter of one inch and not exceeding sixteen inches in width, whether in long or short lengths, in coils or otherwise, and whether rolled or drawn through dies or rolls, or otherwise produced, and all other wire not specially provided for, 20 per centum ad valorem: *Provided*, That all wire of iron, steel or other metal coated by dipping, galvanizing, sherardizing, electrolytic or any other process with zinc, tin, or other metal, shall pay a duty of two-tenths of 1 cent per pound in addition to the rate imposed on the wire of which it is made; telegraph, telephone, and other wires and cables composed of iron, steel, or other metal except gold, silver, or platinum, covered with or composed in part of cotton, jute, silk, enamel, lacquer, rubber, paper, compound, or other material, with or without metal covering, 30 per centum ad valorem; wire rope and wire strand, 30 per centum ad valorem; spinning and twisting ring travelers, 30 per centum ad valorem; wire heddles and healds, 25 cents per thousand and 30 per centum ad valorem.

## ACT OF 1909.

PAR. 135. Round iron or steel wire, not smaller than number thirteen wire gauge. one cent per pound: smaller than number thirteen and not smaller than number sixteen wire gauge, one and one-fourth cents per pound; smaller than number sixteen wire gauge, one and three-fourths cents per pound: *Provided*, That all the foregoing shall pay duty at not less than thirty-five per centum ad valorem; all wire composed of iron, steel, or other metal except gold or silver, covered with cotton, silk, or other material, \* \* \* and all flat wires, and steel in strips, not thicker than number fifteen wire gauge and not exceeding five inches in width, whether in long or short lengths, in coils or otherwise, and whether rolled or drawn through dies or rolls, or otherwise produced, and all other wire not specially provided for in this section, shall pay a duty of not less than thirty-five per centum ad valorem: on iron or steel wire coated by dipping, galvanizing, or similar process with zinc, tin, or other metal, there shall be paid two-tenths of one cent per pound in addition to the rate imposed on the wire of which it is made: *Provided further*, That articles manufactured wholly or in chief value of any wire or wires provided for in this paragraph shall pay the maximum rate of duty imposed in this section upon any wire used in the manufacture of such articles and in addition thereto one cent per pound: *And provided further*, That no article made from or composed of wire shall pay a less rate of duty than forty per centum ad valorem; telegraph, telephone, and other wires and cables composed of metal and rubber, or of metal, rubber, and other materials, forty per centum ad valorem; \* \* \* wire heddles or healds, twenty-five cents per thousand, and in addition thereto, forty per centum ad valorem.

PAR. 199. Articles or wares not specially provided for in this section, composed wholly or in part of \* \* \* metal, \* \* \* forty-five per centum ad valorem.

## ACT OF 1913.

PAR. 114. Round iron or steel wire; wire composed of iron, steel, or other metal, except gold or silver, covered with cotton, silk, or other material; \* \* \* and all flat wires and steel in strips not thicker than number fifteen wire gauge and not exceeding five inches in width, whether in long or short lengths, in coils or otherwise, and whether rolled or drawn through dies or rolls, or otherwise produced; telegraph, telephone, and other wires and cables composed of metal and rubber, or of metal, rubber, and other materials; iron and steel wire coated by dipping, galvanizing, or similar process with zinc, tin, or other metal; all other wire not specially provided for in this section and articles manufactured wholly or in chief value of any wire or wires provided for in this section; all the foregoing 15 per centum ad valorem; wire heddles and healds, 25 per centum ad valorem; wire rope, 30 per centum ad valorem.

PAR. 167. Articles or wares not specially provided for in this section; \* \* \* if composed wholly or in chief value of \* \* \* metal \* \* \* 20 per centum ad valorem.

## WIRE AND WIRE PRODUCTS.

(See Survey C-8.)

*Description and uses.*—A large portion of the round iron and steel wire produced in this country is converted into some other form, such as wire nails, barbed wire, wire rope, etc.

Of the wire made from nonferrous metals, that of copper is the most important. Bronze and brass wires also find extended use. Aluminum wire has to some extent been employed as a substitute for copper wire for electrical purposes. Examples of other wires and their many uses are wire of alloys containing nickel used for electrical

resistance and for purposes in which resistance to corrosion is important; tungsten wire for incandescent filaments of electric bulbs; and wire made of an alloy of platinum and rhodium used in pyrometers.

Much of the wire of nonferrous metals is used in the manufacture of wire cloth. Wire with a cross section other than round is drawn for special purposes. Thus triangular and lozenge-shaped wire is used in wire rope to some extent and pinion wire is drawn wire that may be cut up into gears for clock mechanisms, etc.

Telegraph, telephone, and other wires and cables include insulated wire and cables—submarine, underground and other—in which rubber insulation is used.

Wire rope consists of several strands of wire and is used as guy rope in construction and engineering works and on shipboard. It is also employed in hoisting and hauling, and in the transmission of power. Construction work, mining, and logging are industries which consume large quantities, but nearly every industry of importance uses wire rope to some extent. American engineering has tended to throw the burden on the rope to a much greater extent than the more conservative European practice would allow.

Covered wire consists of ordinary metallic wire covered with cotton, silk, paper, or other materials and is used extensively in the manufacture of millinery, novelties, tags, artificial flowers, clothing, and electrical manufactures.

Spinning and twisting ring travelers are metal rings and bars of high resiliency used in cotton spinning. Wire heddles or healds are part of the harness of a loom, the mechanism by which some of the threads of the warp are raised and others lowered upon each passage of the shuttle. The heddles themselves are formed by wire or string attached at each end to the shafts of the hammers and having a loop in the center through which the warp threads are passed. It is estimated that about one-third of the loom harness in use in the United States is equipped with wire heddles.

*Production.*—A preliminary statement of the 1920 census of manufactures with respect to wire-drawing mills shows that the value of the output of 117 establishments for the year 1919 was \$409,058,300. Of this output \$401,376,400 represents wire and manufactures of wire. The value of the output of steel and iron wire and manufactures thereof was \$264,778,000, and that of copper wire and its manufactures \$114,234,200. The output of brass wire was valued at \$16,024,500.

The total production of steel and iron wire in 1919 was 2,508,890 short tons, an increase of but 3 per cent over that of 1914. The production of coated wire for sale as such in 1919, chiefly galvanized wire, was 392,925 tons as compared with 374,480 tons in 1914. The country's output of bare copper wire in 1919 was 193,370 tons. The total production of insulated wire and cable for the same year was valued at \$129,623,100, of which the major portion was reported by insulating establishments that purchased the wire. The output of brass wire was reported in 1919 as 50,521,000 pounds, valued at \$16,024,050, a quantity increase of 28 per cent. The output of wire of other metals amounted to 14,596,000 pounds, valued at \$6,339,700. Included in this total are wires of copper-clad steel, Monel metal, nickel silver, other nickel alloys, zinc, etc. The production of wire

rope, cable, and strand in 1919 amounted to 103,010 tons, valued at \$29,825,500. The production in 1914 aggregated 52,740 tons, valued at \$7,973,500.

*Imports.*—Imports of wire and wire manufactures included in this paragraph have been since 1917 as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
ROUND IRON OR STEEL WIRE.				
	<i>Pounds.</i>			<i>Per cent.</i>

1921 (9 months).....	68,486	102,660		

In addition to this imported material, there were some imports of wire and wire manufactures for use in the construction and equipment of vessels.

A considerable part of the manufactures of wire come from the United Kingdom, Canada, Germany, and France.

*Exports.*—The exports for the calendar years 1918–1921 of wire and wire products have been as follows:

	1918	1919	1920	1921 (9 months).
<b>Copper wire:</b>				
Quantity (pounds).....	15,689,554	55,551,602	41,812,713	10,146,666
Value.....	\$4,750,942	\$14,810,357	\$10,191,273	\$1,973,754
<b>Brass wire:</b>				
Quantity (pounds).....	1,748,883	1,115,908	1,159,087	368,874
Value.....	\$707,287	\$403,899	\$398,328	\$132,119
Wire rope.....	\$4,225,019	\$4,379,478	\$2,148,294	\$1,203,047
Insulated wire and cables.....	\$5,604,929	\$8,815,212	\$8,208,539	\$7,621,996
<b>Wire, n. s. p. f.:</b>				
Quantity (pounds).....	352,177,754	426,074,277	427,769,910	130,554,482
Value.....	\$20,704,503	\$24,641,881	\$25,371,776	\$7,730,872
<b>Other manufactures of wire, n. s. p. f.....</b>	<b>\$3,677,127</b>	<b>\$5,090,491</b>	<b>\$6,765,429</b>	<b>\$2,541,442</b>

Of the exported material, copper wire goes largely to the United Kingdom, the Netherlands, Norway, and some other European countries; brass wire, to the United Kingdom, Canada, France, and Brazil; wire rope, to Mexico, Canada, and Cuba; wire, n. s. p. f., to Argentina, Canada, Australia, and Brazil; and other manufactures of wire to Canada, Cuba, Argentina, and the United Kingdom.

*Important changes in classification.*—Corset clasps, corset steels, etc., which are included in the corresponding paragraph of the act of 1913 (par. 114), are omitted here, and given a separate paragraph (336). Spinning and twisting ring travelers mentioned in this paragraph are not in the wire paragraph of the act of 1913 (par. 114). The provision for “wire strand” is also new, as are also the enumerations of various materials, including “compound,” in connection with cables, etc.

*Suggested changes.*—As there is no fixed line of division between hoops, bands, and strips of iron and steel, and as strips of iron and steel are mentioned in the proviso to paragraph 313, it is suggested that the difference between the strips included in this paragraph and those mentioned in paragraph 313 be more clearly indicated. (See “Suggested changes,” par. 313.)

There is a provision in this paragraph for “all wire composed of iron, steel, or other metal, not specially provided for, except gold,

silver, or platinum," and another for "and all other wire not specially provided for." These provisions may be in conflict; in any event, as the rate of duty is the same, no necessity is seen for both.

Page 49, lines 19 and 20, of H. R. 7456: Insert a comma after the word "steel" in line 19 and after "electrolytic" in line 20.

---

PARAGRAPH 317.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 317. All galvanized wire not specially provided for, not larger than twenty one-hundredths and not smaller than eight one-hundredths of one inch in diameter, of the kind commonly used for fencing purposes, galvanized wire fencing composed of wires not larger than twenty one-hundredths and not smaller than eight one-hundredths of one inch in diameter; and all wire commonly used for baling hay or other commodities, one-half of 1 cent per pound.

ACT OF 1909.

PAR. 135. \* \* \* all other wire not specially provided for in this section, shall pay a duty of not less than thirty-five per centum ad valorem; on iron or steel wire coated by dipping, galvanizing or similar process with zinc, tin, or other metal, there shall be paid two-tenths of one cent per pound in addition to the rate imposed on the wire of which it is made: *Provided further*, That articles manufactured wholly or in chief value of any wire or wires provided for in this paragraph shall pay the maximum rate of duty imposed in this section upon any wire used in the manufacture of such articles and in addition thereto one cent per pound: *And provided further*, That no article made from or composed of wire shall pay a less rate of duty than forty per centum ad valorem; \* \* \*

ACT OF 1913.

PAR. 645. \* \* \* galvanized wire not larger than twenty one-hundredths of one inch in diameter and not smaller than eight one-hundredths of one inch in diameter of the kind commonly used for fencing purposes, galvanized wire fencing composed of wires not larger than twenty one-hundredths of one inch in diameter nor smaller than eight one-hundredths of one inch in diameter, and wire commonly used for baling hay or other commodities [Free].

GALVANIZED WIRE FOR FENCING AND WIRE FOR BALING HAY.

(See Survey C-8.)

*Description and uses.*—Wire provided for in this paragraph is that used for fencing purposes and for baling hay and other commodities. The fencing wire is limited to galvanized, while the baling wire may or may not be galvanized. Barbed wire is provided for in paragraph 1680 and hence is not included in this paragraph.

*Production.*—The country's output of woven wire fencing and poultry netting, plain and coated, in 1919, amounted to 312,150 tons, valued at \$30,527,000. In 1914 the corresponding figures were 411,460 tons, and \$19,795,800.

*Imports.*—Imports of wire included in this paragraph have been, since 1917 by calendar years as follows:

	1918	1919	1920	1921 (9 months).
Galvanized wire:				
Quantity (pounds).....	63,645	392,526	392,978	500
Value.....	\$4,839	\$17,989	\$23,222	\$31
Galvanized-wire fencing:				
Quantity (pounds).....	62,657	78,733	140,095	7,200
Value.....	\$3,368	\$3,366	\$6,865	\$510
Baling wire:				
Quantity (pounds).....	3,050	85,175	421,849	13,790
Value.....	\$185	\$5,069	\$25,532	\$1,022

*Exports.*—Exports of woven wire fencing since 1917 by calendar years have been as follows: 1918, \$1,036,730; 1919, \$933,143; 1920, \$903,272; 1921 (9 months), \$451,823. The principal destinations of this exported material were Cuba, Canada, Mexico, Argentina, and New Zealand.

*Important changes in classification.*—Wire coming within this paragraph has been transferred from the free list (par. 645) of the act of 1913.

### PARAGRAPH 318.

#### H. R. 7456.

#### SENATE AMENDMENTS.

PAR. 318. Woven-wire cloth: Gauze, fabric, or screen, made of wire composed of steel, brass, copper, bronze, or any other metal or alloy, not specially provided for, with meshes not finer than thirty wires to the lineal inch in warp or filling, 20 per centum ad valorem; with meshes finer than thirty and not finer than ninety wires to the lineal inch in warp or filling, 30 per centum ad valorem; with meshes finer than ninety wires to the lineal inch in warp or filling, 40 per centum ad valorem.

#### ACT OF 1909.

PAR. 199. Articles or wares not specially provided for in this section, composed wholly or in part of \* \* \* metal, \* \* \* forty-five per centum ad valorem.

#### ACT OF 1913.

PAR. 114. \* \* \* and articles manufactured wholly or in chief value of any wire or wires provided for in this section; all the foregoing 15 per centum ad valorem; \* \* \*.

PAR. 167. Articles or wares not specially provided for in this section; \* \* \* if composed wholly or in chief value of \* \* \* metal, \* \* \* 20 per centum ad valorem.

### WOVEN-WIRE CLOTH.

(See Survey C-8.)

*Description and uses.*—Woven-wire cloth consists of gauze fabrics, screens, etc., composed of wire with fine meshes and is used largely for straining and for protection against insects and the like. "Four-

drinier wires," or wire cloth used in paper making, are one of the most important items.

*Production.*—In the figures of the Federal Census the country's output of woven-wire cloth is included with that of other woven-wire products. Excluding woven-wire fencing and poultry nettings, the output of woven-wire products in the United States in 1919 amounted to 26,610 short tons, valued at \$4,274,200. In 1914 the country's output was 22,720 tons, valued at \$2,822,700.

*Imports and exports.*—The imports and exports of woven-wire cloth are not separately tabulated by the Bureau of Foreign and Domestic Commerce.

*Important changes in classification.*—Woven-wire cloth was not separately specified in the act of 1913, but was classified among "articles manufactured wholly or in chief value of any wire or wires provided for" in this section under paragraph 114, or as "articles or wares not specially provided for \* \* \* if composed wholly or in chief value of \* \* \* metal" under paragraph 167.

---

### PARAGRAPH 319.

#### H. R. 7456.

#### SENATE AMENDMENTS.

PAR. 319. Iron or steel anchors and parts thereof; forgings of iron or steel, or of combined iron and steel, not machined, tooled, or otherwise advanced in condition by any process or operation subsequent to the forging process, not specially provided for, 25 per centum ad valorem.

#### ACT OF 1909.

PAR. 123. Iron or steel anchors or parts thereof, one cent per pound; forgings of iron or steel, or of combined iron and steel, but not machined, tooled, or otherwise advanced in condition by any process or operation subsequent to the forging process, not specially provided for in this section, thirty per centum ad valorem; \* \* \*.

#### ACT OF 1913.

PAR. 106. Iron or steel anchors or parts thereof; forgings of iron or steel, or of combined iron and steel, but not machined, tooled, or otherwise advanced in condition by any process or operation subsequent to the forging process, not specially provided for in this section, 12 per centum ad valorem; \* \* \*.

#### ANCHORS.

(See Survey C-5.)

*Description.*—The making of anchors, once a formidable piece of smith work, is a simple operation with the use of the steam hammer. The shank of a large anchor is built up by welding together bars of iron. Although many anchors are forged, cast-steel anchors are used to a considerable extent.

*Production.*—There are no reliable statistics as to output, but even during the war-time expansion in shipbuilding domestic needs were amply supplied by American plants. Certain manufacturers reported to the Tariff Commission that the output in 1920 was only about one-quarter the quantity and only one-seventh the value of the 1918 total. England is the largest producer.

Imports for consumption are small, amounting in 1917 to about 48,133 pounds (about 21.5 gross tons), valued at \$2,611. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	37,344	\$1,616	\$194	12
1919.....	84,483	7,216	866	12
1920.....	51,064	3,127	375	12
1921 (9 months).....	5,323	2,036		

In addition to these imports there was a larger importation of anchors for vessel supplies, construction and equipment of vessels, and a small amount for the repair of vessels. In 1918, 105,971 pounds, valued at \$4,420, were imported as supplies of vessels; 501,420 pounds, valued at \$35,936, for the construction and equipment of vessels; and 120 pounds, valued at \$20, for the repair of vessels. These were imported duty free. In 1919 such importations fell off greatly, but 456,449 pounds, valued at \$51,432, were imported for the construction and equipment of vessels.

*Exports.*—None recorded. Certain firms, however, do some export business—especially in smaller anchors—with the Far East, Latin America, and even in Europe.

#### FORGINGS.

(See Survey C-5.)

*Description and uses.*—Forgings are metals which have undergone the process of hammering or pressing into special shapes while hot. Originally forging was solely a hammering process, but with large masses to be treated, pressing has come into use, especially for making heavy forgings of steel.

Many small articles of common use, such as balls, screws, rivet blanks, nuts, nails, etc., are forged by machinery. Many articles of intricate patterns are drop-forged, i. e., a heated piece of metal is put on a lower die placed on the anvil of a drop hammer which, falling from a height, carries the upper die and stamps the plastic metal into shape. Such drop forgings are largely used in motor vehicles for levers, treadles, connecting rods, and the like.

The "finishing process" consists in annealing or tempering the forged material and then machining it.

*Production.*—Forgings represent a vast variety of articles. According to the American Metal Market the country's output of forged work done in rolling mills and steel works amounted to 1,295,566 gross tons in 1918 and to 534,346 gross tons in 1919. This product involves such items as anchors, armor plate, axles, eyebars, gun carriages, etc.

*Imports* of ordinary forged iron and steel, i. e., not finished or advanced beyond the forging process, are not large. In 1917 they amounted to only \$37,302. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	351,045	\$394,566	\$47,348	12
1919.....	184,096	51,312	6,157	12
1920.....	141,364	35,103	4,212	12
1921 (9 months).....		23,618		

In addition to these imports other forgings for the construction and equipment of vessels, for the United States Government and for diplomatic officers came into the country free of duty. In 1919, 485,777 pounds, valued at \$79,152, were imported for the construction and equipment of vessels; 6,583,124 pounds, valued at \$754,706, for the Government of the United States; and in 1918, 43,383,685 pounds, valued at \$2,576,831, for diplomatic officers.

*Exports.*—Exports since 1917, by calendar years, have been as follows: 1918, \$27,679,680; 1919, \$1,881,814; 1920, \$1,833,925; 1921 (9 months), \$358,299. Some of the important countries receiving this exported material are Canada, France, the United Kingdom, Japan, Italy, Spain, and Mexico.

### PARAGRAPH 320.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 320. Electric storage batteries and parts thereof, storage battery plates and storage battery plate material, wholly or partly manufactured, all the foregoing not specially provided for, 30 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

[Classable according to component material of chief value.]

[Classable according to component material of chief value.]

#### ELECTRIC STORAGE BATTERIES AND PARTS.

(See Survey C-13.)

*Description and uses.*—An electric battery is an apparatus, consisting of one or more cells, used for the generation of voltaic electricity. A storage battery—also called secondary battery and accumulator—is for the so-called storage of electricity. In storage batteries the electrodes are commonly lead plates surrounded by dilute sulphuric acid. During the discharge lead sulphate is formed on the plates, the action being similar to that of the primary battery. The action of the storage battery is, however, reversible, since, by passing a current through the battery in the opposite direction, the plates are restored to their original state, and are again capable of delivering a current.

One cell usually contains several plates. The automobile industry is a large user of storage batteries. The manufacture of plates and connections for storage batteries has become a very important outlet for lead.

In the storage cell invented by Edison the plates are perforated cases of nickel, containing nickel oxide and finely divided iron, surrounded by an alkaline solution.

*Production.*—In 1919 the production of storage batteries was valued at \$56,648,347, and of parts for storage batteries, at \$3,387,805. The corresponding figures for 1914 were \$10,615,150 and \$2,465,814.

*Imports.*—None recorded.

*Exports.*—Exports of batteries for recent calendar years were as follows: 1918, \$3,178,437; 1919, \$5,998,337; 1920, \$6,633,542; and 1921 (9 months), \$3,267,726. This exported material goes principally to the United Kingdom, Argentine, Australia, and Cuba.

*Important changes in classification.*—New specific provision; the rate of duty under the act of 1913 depends upon the component material of chief value.

*Suggested changes.*—Page 51, line 5, of H. R. 7456: Insert comma after "plates."

## PARAGRAPH 321.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 321. Antifriction balls and rollers, metal balls and rollers commonly used in ball or roller bearings, metal ball or roller bearings, and parts thereof, whether finished or unfinished, for whatever use intended, 10 cents per pound and 35 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 123. \* \* \* antifriction balls, ball bearings, and roller bearings, of iron or steel or other metal, finished or unfinished, forty-five per centum ad valorem.

PAR. 106. \* \* \* antifriction balls, ball bearings, and roller bearings, of iron or steel or other metal, finished or unfinished, and parts thereof, 35 per centum ad valorem.

## ANTIFRICTION BALLS AND BEARINGS.

(See Survey C-5.)

*Description and uses.*—Antifriction bearings consist of metal balls or rollers fitted between two metal cases in such a way that a shaft may be inserted into the inner case, and the outer case into the bearing frame, the contact between the two cases being through balls or rollers. This arrangement substitutes a rolling contact for the sliding contact of the ordinary bearing and thus reduces friction.

The automobile industry is the largest consumer of ball and roller bearings; the bicycle affords examples of the use of ball bearings. Some antifriction bearings are used in screw jacks, many machine tools, elevators, etc.

*Production.*—The domestic industry has gone extensively into both types of bearing—roller and ball. The European industry has given attention chiefly to the ball bearing.

*Imports.*—Imports of antifriction bearings in 1917 amounted in value to over \$1,500,000, of which over \$1,488,000 consisted of ball bearings as distinguished from balls, parts, and roller bearings. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
----------------	--------	-------	------------------

## ANTIFRICTION BALLS.

			Per cent.
1918.....	\$27,619	\$9,667	35
1919.....	23,817	8,336	35
1920.....	474,176	165,962	35
1921 (9 months).....	10,344		

## BALL BEARINGS.

1918.....	\$519,486	\$181,820	35
1919.....	49,222	17,228	35
1920.....	784,030	274,410	35
1921 (9 months).....	101,671		

## ROLLER BEARINGS.

1918.....	\$18,636	\$6,523	35
1920.....	248	87	35
1921 (9 months).....	9,679		

## ANTIFRICTION BEARINGS, ETC., PARTS THEREOF.

1918.....	\$33,439	\$11,704	35
1919.....	8,950	3,132	35
1920.....	177,589	62,156	35
1921 (9 months).....	9,638		

Some of the most important contributing nations were Sweden, Canada, and lately Germany.

*Exports.*—None recorded.

*Important changes in classification.*—Antifriction balls and bearings are treated in a single paragraph instead of being combined as in the act of 1913 with anchors and forgings of iron or steel.

## PARAGRAPH 322.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 322. Railway fishplates or splice bars, made of iron or steel, one-fourth of 1 cent per pound; all other railway bars made of iron or steel, and railway bars made in part of steel, T rails, and punched iron or steel flat rails, seven-fortieths of 1 cent per pound.

## ACT OF 1909.

PAR. 126. Railway bars, made of iron or steel, and railway bars made in part of steel, T rails and punched iron or steel flat rails, seven-fortieths of one cent per pound; railway fish-plates or splice-bars, made of iron or steel, three-tenths of one cent per pound.

## ACT OF 1913.

PAR. 108. Railway fishplates or splice bars made of iron or steel, 10 per centum ad valorem.

PAR. 587. Railway bars, made of iron or steel, and railway bars made in part of steel, T rails, and punched iron or steel flat rails [Free].

## RAIL SPLICE BARS AND BRACES.

(See Survey C-6.)

*Description and uses.*—Splice bars, fishplates, tie plates, etc., are used for connecting endwise and holding in place rails on a roadbed. They embrace the general group of rail joints and fastenings, but not spikes, bolts, nuts, and similar material.

*Production* in 1917 amounted to 528,403 gross tons, and in 1920 to 575,830 gross tons.

*Imports* in 1917 of railway fishplates and splice bars amounted to 350 gross tons, valued at \$13,116. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	127,080	\$5,678	\$568	10
1919.....	1,033,031	29,831	2,983	10
1920.....	1,731,787	51,385	5,138	10
1921 (9 months).....	14,980	1,142		

*Exports* are much larger. In 1917 the exports of railway track material, excluding rails and spikes, amounted to \$9,108,617. Statistics for the calendar years 1918-1921 have been as follows: 1918, \$5,582,860; 1919, \$9,280,725; 1920, \$7,570,236; 1921 (9 months), \$5,751,897. The principal countries of destination were Cuba, Japan, France, Brazil, and European Russia.

*Suggested changes.*—In view of the importance of tie plates, these should be mentioned, as well as railway fishplates or splice bars, and "all other railway bars made of iron or steel," designated by the term "rail braces." The latter term is more specific than the phrase "all other railway bars made of iron or steel," and is sufficiently inclusive to describe with precision what is intended to be covered in this part of the paragraph.

## RAILS.

(See Survey C-6.)

*Description and uses.*—Rails for steam and electric railways are heavy or light, the former 50 pounds or more per linear yard, and the latter less than 50 pounds. Rails with a weight of 85 to 125 pounds are standard for the leading railroads; light rails go mostly into mining, lumbering, and other industrial operations. Practically all rails are now made of steel. The raw material of heavy rails is the steel ingot; and of light rails, largely old heavy rails. Old heavy

rails constitute the raw material for splice bars. Most rails, light and heavy, are T rails. About 3 to 5 per cent of the production of the rail mills of the United States consists of girder and high T rails for electric and street railways.

*Production* of rails in 1913 amounted to 3,502,780 gross tons, and in 1920 to 2,604,116 gross tons, nearly 90 per cent heavy rails. Formerly Germany manufactured over 1,000,000 tons of rails per year, and Great Britain between 800,000 and 1,000,000 tons, France, Belgium, Russia, and Canada following.

*Imports*.—Imports of bars and rails for railways, small compared with exports, are shown for the period 1918-1921 as follows:

	1918	1919	1920	1921 (9 months).
Iron rails and bars for railways:				
Quantity (tons).....	3	200	886	167
Value.....	\$96	\$14,014	\$28,183	\$5,522
Rails and bars for railways, steel or part steel:				
Quantity (tons).....	8,336	17,008	44,798	17,455
Value.....	\$319,380	\$651,830	\$1,894,226	\$697,926

Imported rails come mainly from Canada, a few from Mexico.

*Exports*.—Exported rails consist of steel. For the calendar years since 1917 exports have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (tons).....	453,537	652,443	594,628	282,162
Value.....	\$26,402,864	\$38,986,855	\$36,193,689	\$16,863,894

These exports went mainly to Japan, the Dutch East Indies, Brazil, and China. During the war period a large tonnage of steel rails was shipped to France and Russia. In the fiscal year 1916 over half the steel rails exported from the United States were shipped to European and Asiatic Russia.

*Important changes in classification*.—Rails, including railway bars made of iron or steel, have been transferred from the free list of the act of 1913 (par. 587).

### PARAGRAPH 323.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 323. Axles and parts thereof, axle bars, axle blanks, and forgings for axles, of iron or steel, without reference to the stage or state of manufacture, not specially provided for, valued at not more than 6 cents per pound, six-tenths of 1 cent per pound: *Provided*, That when iron or steel axles are imported fitted in wheels, or parts of wheels, of iron or steel, they shall be dutiable at the same rate as the wheels in which they are fitted.

## ACT OF 1909.

PAR. 142. Axles, or parts thereof, axle bars, axle blanks, or forgings for axles, whether of iron or steel, without reference to the stage or state of manufacture, not otherwise provided for in this section, valued at not more than six cents per pound, three-fourths of one cent per pound: *Provided*, That when iron or steel axles are imported fitted in wheels, or parts of wheels, of iron or steel, they shall be dutiable at the same rate as the wheels in which they are fitted.

## ACT OF 1913.

PAR. 121. Axles, or parts thereof, axle bars, axle blanks, or forgings for axles, whether of iron or steel, without reference to the stage or state of manufacture, not otherwise provided for in this section, 10 per centum ad valorem: *Provided*, That when iron or steel axles are imported fitted in wheels, or parts of wheels, of iron or steel, they shall be dutiable at the same rate as the wheels in which they are fitted.

## AXLES AND AXLE BLANKS.

(See Survey C-10.)

*Description and use.*—Iron and steel axles for every purpose are included. Axles inserted in wheels come under paragraph 324 or other paragraphs covering wheels.

*Production* of 89,436 long tons, valued at \$3,407,271, reported in 1914, relates to that of rolling mills. Of this amount 1,160 tons were of axles other than car and locomotive. In 1919 the output of axles, rolled or forged, amounted to 97,800 gross tons, valued at \$9,753,000. Railway axles are rolling-mill products. A small per cent of automobile axles was thus made in 1914. These axles, bicycle axles, and wagon and carriage axles of iron and steel are made chiefly in factories manufacturing the vehicles.

*Imports* of iron and steel axles in 1914 were 136 long tons, valued at \$17,083. They decreased steadily after 1911 until 1918. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	785	\$50	\$5	10
1919.....	56,286	2,113	211	10
1920.....	316,936	107,119	10,712	10
1921 (9 months).....	767	109		

*Exports.*—None recorded.

## PARAGRAPH 324.

## H. R. 7456.

## SENATE AMENDMENTS.

PAR. 324. Wheels for railway purposes, and parts thereof, of iron or steel, and steel-tired wheels for railway purposes, wholly or partly finished, and iron or steel locomotive, car, or other railway tires and parts thereof, wholly or partly manufactured, 1 cent per pound: *Provided*, That when wheels for railway purposes, or parts thereof, of iron or steel, are imported with iron or steel axles fitted in them, the wheels and axles together shall be dutiable at the same rate as is provided for the wheels when imported separately.

## ACT OF 1909.

## ACT OF 1913.

PAR. 171. Wheels for railway purposes, or parts thereof, made of iron or steel, and steel-tired wheels for railway purposes, whether wholly or partly finished, and iron or steel locomotive, car, or other railway tires or parts thereof, wholly or partly manufactured, one and one-fourth cents per pound; ingots, cogged ingots, blooms, or blanks for the same, without regard to the degree of manufacture, one cent per pound: *Provided*, That when wheels for railway purposes, or parts thereof, of iron or steel, are imported with iron or steel axles fitted in them, the wheels and axles together shall be dutiable at the same rate as is provided for the wheels when imported separately.

PAR. 142. Wheels for railway purposes, or parts thereof, made of iron or steel, and steel-tired wheels for railway purposes, whether wholly or partly finished, and iron or steel locomotive, car, or other railway tires or parts thereof, wholly or partly manufactured, 20 per centum ad valorem: *Provided*, That when wheels for railway purposes, or parts thereof, of iron or steel, are imported with iron or steel axles fitted in them, the wheels and axles together shall be dutiable at the same rate as is provided for the wheels when imported separately.

## WHEELS FOR RAILWAY PURPOSES.

(See Survey C-15.)

*Description.*—The car wheels in general domestic use are either of chilled cast iron, cast steel, or rolled steel. A car wheel made with a cast or forged center piece, about which a steel tire is shrunk, is used to some extent. Locomotive drive wheels are of this type.

*Production.*—It has been estimated that 3,000,000 chilled cast-iron wheels, valued at \$40,000,000, were produced in 1917. According to the 1920 Census there were produced in 1919, 117,700 gross tons of car and locomotive wheels, rolled or forged, valued at \$17,044,700.

Pennsylvania has a larger number of manufacturers than any other State; Michigan, New York, and Ohio follow. European concerns have not developed the chilled cast-iron or rolled-steel wheels which are the predominant types here. The bulk of foreign production has been the steel-tired wheel. Such wheels are likewise made here, and (according to report) before the war could be produced as cheaply as in Europe.

*Imports* of wheels for railway purposes in 1918 (fiscal year) were valued at \$194,316, over five times the value of the imports in 1914. These figures include wheels, tires, and axles inserted in wheels. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	1,358,263	\$69,444	\$13,889	20
1919.....	936,006	32,440	6,488	20
1920.....	258,360	8,392	1,678	20
1921 (9 months).....	7,520	821		

*Exports.*—Exports of car wheels have been as follows<sup>1</sup>: 1916, \$741,542; 1917, \$2,384,973; 1918, \$6,889,084; 1919, \$11,843,738; 1920, \$9,061,305; and 1921 (9 months), \$2,577,671. These exports went chiefly to France, Cuba, Canada, Japan, and Italy.

<sup>1</sup> 1916 and 1917, fiscal years; 1918-1921, calendar years.

## PARAGRAPH 325.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 325. Anvils of iron or steel, or of iron and steel combined, by whatever process made, or in whatever stage of manufacture,  $1\frac{3}{8}$  cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 140. Anvils of iron or steel, or of iron and steel combined, by whatever process made, or in whatever stage of manufacture, one and five-eighths cents per pound.

PAR. 118. Anvils of iron or steel, or of iron and steel combined, by whatever process made, or in whatever stage of manufacture, 15 per centum ad valorem.

## ANVILS.

(See Survey C-9.)

*Description.*—Anvils may be either cast or wrought (forged). They are of several types, the ordinary blacksmith's anvil, the small anvils used by jewelers, and heavy blocks for power hammers.

*Production* of wrought anvils in 1911 was estimated at 2,600,000 pounds. An increase in domestic production has followed the declining imports since the beginning of the war and the demand created by military operations. Columbus, Ohio is the center of manufacture in this country. England, Germany, and Sweden are the principal foreign producers.

*Imports* of anvils were 727,502 pounds in 1914. A considerable portion of the imports consists of Swedish cast anvils. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	10,863	\$1,161	\$174	15
1919.....	88,961	14,458	2,169	15
1920.....	275,805	33,820	5,073	15
1921 (9 months).....	34,650	3,471		

*Exports.*—None recorded.

*Suggested changes.*—Duty at the rate of  $1\frac{3}{8}$  cents per pound on jewelers' anvils would be practically negligible.

## PARAGRAPH 326.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 326. Blacksmiths' hammers, tongs, and sledges, track tools, wedges, and crowbars, of iron or steel,  $1\frac{3}{8}$  cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 143. Blacksmith's hammers and sledges, track tools, wedges, and crowbars, whether of iron or steel, one and three-eighths cents per pound.

PAR. 122. Blacksmiths' hammers, tongs, and sledges, track tools, wedges, and crowbars, whether of iron or steel, 10 per centum ad valorem.

## BLACKSMITHS' TOOLS.

(See Survey C-9.)

*Production.*—No data are available as to the domestic output of blacksmiths' hammers, tongs, and sledges, track tools, wedges, and crowbars, but these manufactures are known to have been large.

*Imports* are small, aggregating in 1914, 23,340 pounds, valued at \$1,661. Later statistics are as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	9,668	\$751	\$75	10
1919.....	2,911	593	59	10
1920.....		5,318	532	10
1921 (9 months).....		1,502		

*Exports.*—Exports of hammers and hatchets are large compared with imports. During the calendar years 1918–1921 they were as follows: 1918, \$484,679; 1919, \$973,547; 1920, \$1,303,185; 1921 (9 months), \$597,793. The principal countries of destination were Cuba, Brazil, Argentina, and Australia.

## PARAGRAPH 327.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 327. Cast-iron pipe of every description, cast-iron andirons, plates, stove plates, sadirons, tailors' irons, hatters' irons, but not including electric irons, and castings and vessels wholly of cast iron, including all castings of iron or cast-iron plates which have been chiseled, drilled, machined, or otherwise advanced in condition by processes or operations subsequent to the casting process but not made up into articles, or parts thereof, or finished machine parts; castings of malleable iron not specially provided for; cast hollow ware, coated, glazed, or tinned, but not including enameled ware or hollow ware containing electrical elements, 10 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 146. Cast-iron pipe of every description, one-fourth of one cent per pound.

PAR. 147. Cast-iron andirons, plates, stove plates, sadirons, tailor's irons, hatter's irons, and castings and vessels wholly of cast iron, eight-tenths of one cent per pound. All castings of iron or cast-iron plates which have been chiseled, drilled, machined, or otherwise advanced in condition by processes or operations subse-

PAR. 125. Cast-iron pipe of every description, cast-iron andirons, plates, stove plates, sadirons, tailor's irons, hatter's irons, and castings and vessels wholly of cast iron, including all castings of iron or cast-iron plates which have been chiseled, drilled, machined, or otherwise advanced in condition by processes or operations subsequent to the casting process but not made up into articles or finished machine parts; castings of malleable iron not spe-

## ACT OF 1909.

## ACT OF 1913.

quent to the casting process but not made up into articles, shall pay two-tenths of one cent per pound more than the rate imposed upon the castings of iron and cast-iron plates hereinbefore provided for.

PAR. 148. Castings of malleable iron not specially provided for in this section, seven-tenths of one cent per pound.

PAR. 149. Cast hollow ware, coated, glazed, or tinned, one and one-half cents per pound.

cially provided for in this section; cast hollow ware, coated, glazed, or tinned, 10 per centum ad valorem.

## IRON CASTINGS.

(See Survey C-11.)

*Description and uses.*—These articles include (1) a variety of familiar commodities made of cast iron, (2) castings of malleable iron, and (3) cast hollow ware, coated, glazed, or tinned. Malleable cast iron is a crude form of wrought iron obtained by decarbonization. The castings are made in the ordinary way from low silicon iron with little phosphorus and sulphur; they are embedded in oxide of iron or peroxide of manganese and heated to a red heat until most of the carbon is removed from the surface.

*Production.*—Available statistics cover only cast-iron pipe, including fittings, with an output in 1913 of 1,266,245 net tons; in 1916 of 1,214,333 tons; in 1918 of 619,673 tons; and in 1920 of 886,515 tons.

*Imports.*—During the fiscal year 1918 the imports of iron castings amounted to 3,324,002 pounds, or 1,662 short tons, valued at \$181,258. More than one-half of this imported material consisted of cast-iron plates, stove plates and irons, sadirons, tailors' irons, hatters' irons and castings, and vessels wholly of cast iron. Only a little over 10 per cent consisted of cast-iron pipe and about 25 per cent of malleable iron castings, n. s. p. f. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
----------------	-----------	--------	-------	------------------

## CAST-IRON PIPE.

	Pounds.			Per cent.
1918.....	269,364	\$5,074	\$507	10
1919.....	164,945	6,226	623	10
1920.....	670,224	41,074	4,107	10
1921 (9 months).....	27,294	2,052		

## CAST-IRON ANDIRONS, PLATES, STOVE PLATES, ETC.

1918.....	1,631,225	\$103,309	\$10,331	10
1919.....	1,559,012	147,607	14,761	10
1920.....	2,383,842	225,863	22,586	10
1921 (9 months).....	739,783	61,719		

## IRON OR CAST IRON PLATES, CHISELED, DRILLED, ETC.

1918.....	381,592	\$24,884	\$2,488	10
1919.....	47,247	4,307	431	10
1920.....	129,181	13,147	1,315	10
1921 (9 months).....	12,724	861		

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
CAST-IRON HOLLOW WARE, COATED, GLAZED, OR TINNED.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	5,317	\$461	\$46	10
1919.....	3,575	425	42	10
1920.....	214,632	15,066	1,507	10
1921 (9 months).....	12,690	1,702		

## CASTINGS OF MALLEABLE IRON, N. S. P. F.

1918.....	681,423	\$71,235	\$7,123	10
1919.....	1,319,233	107,163	10,716	10

1921 (9 months).....	1,867,154	186,416		

*Exports.*—Exports, a large proportion of which is in the form of cast-iron pipe and fittings, are much greater than imports. Statistics for the calendar years 1918–1921 are as follows:

	1918	1919	1920	1921 (9 months).
Cast-iron pipe fittings:				
Quantity (pounds).....	125,352,066	88,379,704	153,254,227	96,080,663
Value.....	\$6,665,597	\$5,177,752	\$9,753,446	\$6,617,832
Iron and steel castings, n. e. s.....	\$4,535,553	\$4,508,044	\$6,810,511	\$3,414,253

The principal countries of destination are Cuba, Mexico, and Canada.

*Important changes in classification.*—The exclusion of electric irons and the limitation relative to electrical elements are new.

*Suggested changes.*—Page 52, line 25, and page 53, line 1, of H. R. 7456: If the word “or” connecting “enameled ware” and “hollow ware” is not intended to make the words “enameled ware” and “hollow ware” apply to the same thing, it should be changed to “and.”

## PARAGRAPH 328.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 328. Lap-welded, butt-welded, seamed, or jointed iron or steel tubes, pipes, flues, and stays, not thinner than sixty-five one-thousandths of an inch, if not less than three-eighths of an inch in diameter, three-fourths of 1 cent per pound; if less than three-eighths and not less than one-fourth of an inch in diameter, 1½ cents per pound; if less than one-fourth of an inch in diameter, 1¾ cents per pound: *Provided*, That no tubes, pipes, flues, or stays made of charcoal iron shall pay a less rate of duty than 1½ cents per pound; cylindrical and tubular tanks or vessels, for holding gas, liquids,

## H. R. 7456.

## SENATE AMENDMENTS.

or other material, whether full or empty; welded cylindrical furnaces, tubes and flues made from plate metal, whether corrugated, ribbed, or otherwise reinforced against collapsing pressure, and all other finished or unfinished iron or steel tubes not specially provided for, 20 per centum ad valorem; flexible metal tubing or hose, whether covered with wire or other material, including any appliances or attachments affixed thereto, not specially provided for, and rigid iron or steel tubes or pipes prepared and lined or coated in any manner suitable for use as conduits for electrical conductors, 25 per centum ad valorem.

## ACT OF 1909.

## ACT OF 1913.

PAR. 151. Lap-welded, butt-welded, seamed, or jointed iron or steel tubes, pipes, flues, or stays, not thinner than number sixteen wire gauge, if not less than three-eighths of an inch in diameter, one cent per pound; if less than three-eighths of an inch and not less than one-fourth of an inch in diameter, one and one-half cents per pound; if less than one-fourth of an inch in diameter, two cents per pound: *Provided*, That no tubes, pipes, flues, or stays, made of charcoal iron, shall pay a less rate of duty than one and one-half cents per pound; cylindrical or tubular tanks or vessels, for holding gas, liquids, or other material, whether full or empty, thirty per centum ad valorem; flexible metal tubing or hose, not specially provided for in this section, whether covered with wire or other material, or otherwise, including any appliances or attachments affixed thereto, thirty per centum ad valorem; welded cylindrical furnaces, tubes or flues made from plate metal, and corrugated, ribbed, or otherwise reinforced against collapsing pressure, two cents per pound; all other iron or steel tubes, finished, not specially provided for in this section, thirty per centum ad valorem.

PAR. 127. Lap-welded, butt-welded, seamed, or jointed iron or steel tubes, pipes, flues, or stays; cylindrical or tubular tanks or vessels, for holding gas, liquids, or other material, whether full or empty; flexible metal tubing or hose, not specially provided for in this section, whether covered with wire or other material, or otherwise, including any appliances or attachments affixed thereto; welded cylindrical furnaces, tubes or flues made from plate metal, and corrugated, ribbed, or otherwise reinforced against collapsing pressure, and all other iron or steel tubes, finished, not specially provided for in this section, 20 per centum ad valorem.

## TUBES, PIPES, AND TANKS.

(See Survey C-12.)

*Description.*—This paragraph covers pipes, tubes, cylinders, tanks, etc., made of iron and steel, excepting cast-iron pipes. While cast-iron pipes are cast in molds and the center is cored out, welded pipes are made from narrow plates of steel or wrought iron called skelp, which is rolled into shape and the edges welded together. When the edges simply come together, the welding is called butt-welding, and when they overlap, lap-welding. Riveted pipe, ordinarily made only in large sizes, is frequently formed in spirals of sheet iron or steel or by simply curling the sheet so as to make a

horizontal joint, the overlapping edges, in either case, being riveted together.

*Production.*—The domestic output of wrought iron and steel pipe and boiler tubes in 1916 amounted to 2,651,058 gross tons and in 1920 to 3,002,725 gross tons. In 1914 there were 36 establishments engaged in the manufacture of wrought-iron pipe alone, with an aggregate capital of \$39,407,625, employing 8,745 wage earners whose output was valued at \$37,655,229. In 1919 there were 51 establishments with an output valued at \$84,011,000. Other great iron and steel producing countries, like Great Britain and Germany, also have a large output.

*Imports.*—Imports are insignificant compared with production and exports. Since 1917 they have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
TUBES, PIPES, FLUES AND STAYS, LAP WELDED, BUTT WELDED, ETC.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	778,798	\$45,458	\$9,092	20
1919.....	2,076,179	87,519	17,504	20
1920.....	527,122	39,886	7,977	20
1921 (9 months).....	63,508	9,272		

TANKS OR VESSELS, CYLINDRICAL OR TUBULAR, ETC.

	<i>Number.</i>			
1918.....		\$148,587	\$29,649	
1919.....	26,235	263,878	52,775	
1920.....		535,156	107,031	20
1921 (9 months).....		162,054		

FURNACES, WELDED, CYLINDRICAL, ETC.

	<i>Pounds.</i>			
1918.....	103,474	\$15,237	\$3,047	20
1919.....	92,806	17,103	3,421	20

ALL OTHER FINISHED IRON OR STEEL TUBES, N. S. P. F.

1918.....		\$17,471	\$3,494	20
1919.....	119	76	15	20
1920.....	104,012	13,976	2,795	20
1921 (9 months).....	295,050	46,031		

FLEXIBLE METAL TUBING, HOSE, ETC.

1918.....		\$1,221	\$244	20
1919.....		231	46	20
1920.....		25,458	5,092	20
1921 (9 months).....		21,392		

In addition to these, there were some importations of furnaces, welded, cylindrical, etc., and flexible metal tubing or hose, for the equipment of vessels. In 1919, 627,071 pounds, valued at \$151,041 of the former were imported; in 1920 the imports amounted to 59,580 pounds, valued at \$8,777.

*Exports.*—Exports in the form of boiler tubes have been since 1917 (calendar year) as follows: 1918, \$6,405,728; 1919, \$7,916,665; 1920, \$6,077,930; 1921 (9 months), \$3,149,345. Exports of pipes and fittings have been as follows:

	1918	1919	1920	1921 (9 months).
Pipes and fittings, wrought:				
Quantity (pounds).....	201,560,061	528,819,507	637,888,077	689,031,930
Value.....	\$14,993,957	\$35,229,750	\$43,774,296	\$44,889,023

The principal countries of destination were Canada, Japan, Cuba, Mexico, and France.

*Important changes in classification.*—A minimum rate is fixed for tubes, pipes, flues, or stays made of charcoal iron, as in the act of 1909. Special mention is also made of “rigid iron or steel tubes or pipes prepared and lined or coated in any manner suitable for use as conduits for electrical conductors.”

*Suggested changes.*—The Tariff Commission has received suggestions that a special provision should be made for large pipes of 25 inches or more in diameter which are made by curling sheets and plates and welding the joint. These articles are distinctly different, both as regards method of manufacture and even uses, from the usual forms of pipes and tubes. As regards manufacture they are doubtless more similar to tanks, which are dutiable in this paragraph at 20 per cent ad valorem. Such articles could be provided for by inserting “less than 25 inches in diameter and” after “if” in line 5, page 53, and by inserting the words “pipes and” after “tubes” in line 17, page 53.

In lines 4 and 10, page 53, tubes, pipes, flues, and stays, are named, whereas in line 14, tubes and flues, in line 17, tubes, and in line 21, tubes or pipes only are mentioned. “Or” between “tubes” and “pipes” in line 21 indicates the use of two terms for one class of merchandise, but this inference is negated by the absence of “or” between “tubes” and “pipes” in line 4.

If tubes and pipes are to be treated as distinct articles for tariff purposes, and the foregoing recommendation for a special provision for pipes of 25 inches or more in diameter, should be adopted, the words “and pipes” should be inserted in line 17 at page 53.

On page 53, lines 5, 7, and 8, of H. R. 7456, strike out “if” to agree with similar provisions elsewhere.

### PARAGRAPH 329.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 329. Chain and chains of all kinds, made of iron or steel, not less than three-fourths of one inch in diameter, 1 cent per pound; less than three-fourths and not less than three-eighths of one inch in diameter,  $1\frac{1}{4}$  cents per pound; less than three-eighths and not less than five-sixteenths

## H. R. 7456.

## SENATE AMENDMENTS.

of one inch in diameter,  $2\frac{1}{8}$  cents per pound; less than five-sixteenths of one inch in diameter, 4 cents per pound; chain and chains of all kinds, of iron or steel, not specially provided for, 25 per centum ad valorem; sprocket and machine chains, of iron or steel, and parts thereof, 30 per centum ad valorem; anchor or stud link chain, two inches or more in diameter,  $1\frac{1}{2}$  cents per pound; less than two inches in diameter, 2 cents per pound: *Provided*, That all articles manufactured wholly or in chief value of chain shall not pay a lower rate of duty than that imposed upon the chain of which it is made, or of which chain is the component material of chief value.

## ACT OF 1909.

PAR. 150. Chain or chains of all kinds, made of iron or steel, not less than three-fourths of one inch in diameter, seven-eighths of one cent per pound; less than three-fourths of one inch and not less than three-eighths of one inch in diameter, one and one-eighth cents per pound; less than three-eighths of one inch in diameter and not less than five-sixteenths of one inch in diameter, one and six-eighths cents per pound; less than five-sixteenths of one inch in diameter, three cents per pound; but no chain or chains of any description shall pay a lower rate of duty than forty-five per centum ad valorem.

## ACT OF 1913.

PAR. 126. Chain or chains of all kinds, made of iron or steel, not specially provided for in this section, 20 per centum ad valorem; sprocket and machine chains, 25 per centum ad valorem.

## CHAINS.

(See Survey C-12.)

*Description and uses.*—Structurally, chains made of iron or steel may be divided into (1) those with each link a single piece of metal and (2) those with each link made of several pieces of metal. The first are used generally for fastening objects together or supporting or lifting weights. Such chains, if small, are chiefly made by machinery, but larger sizes are usually handmade. Chains for cranes, ships' cables, dredges, etc., have each link welded by hand, often both formed and welded from the rolled bar iron. Those of the second class are known as sprocket or driving chains and are used for transmitting power. In certain of these each link is made of several pieces of metal connected by rivets, bolts, or steel screws, and so formed as to engage with the teeth of a sprocket wheel. The bicycle chain is a familiar example.

Stud-link chains are those with a bar or rod across the width of the link.

*Production.*—The United States is a large producer of chains made of iron or steel, but statistics are not available. A representative of an important producer estimated the investment in the chain industry in 1918 at \$5,000,000 and the country's normal output at \$10,000,000.

*Imports.*—Imports of chains are small compared with exports. During the years 1918 and 1919 there was a large importation for the construction and equipment of vessels. In the tabulation below imports are given both by kinds and uses:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
CHAIN AND CHAINS, OTHER THAN SPROCKET AND MACHINE, OF IRON OR STEEL, N. S. P. F.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	517,927	\$40,936	\$8,187	.....
1919.....	141,885	16,704	3,341	20
1920.....	449,403	44,555	8,911	20
1921 (9 months).....	165,547	20,257		

CHAIN AND CHAINS, OTHER THAN SPROCKET AND MACHINE, FOR THE CONSTRUCTION AND EQUIPMENT OF VESSELS.

1918.....	5,595,583	\$553,612		
1919.....	9,507,189	785,869		
1920.....	827,486	69,503		
1921 (9 months).....	9,934	595		

CHAIN AND CHAINS, OTHER THAN SPROCKET AND MACHINE FOR SUPPLIES OF VESSELS.

1918.....	81,848	\$5,155		
1919.....	341,221	26,160		

CHAIN AND CHAINS, ETC., FOR THE UNITED STATES, N. E. S.

1919.....	2,103,508	\$172,624		
-----------	-----------	-----------	--	--

SPROCKET AND MACHINE CHAINS OF IRON AND STEEL AND PARTS THEREOF.

1918.....	129,237	\$16,763	\$4,191	25
1919.....	42,447	11,827	2,957	25
1920.....	61,774	24,802	6,200	25
1921 (9 months).....	32,257	19,035		

SPROCKET AND MACHINE CHAINS FOR THE CONSTRUCTION AND EQUIPMENT OF VESSELS.

1918.....	50,687	\$3,634		
1919.....	26,844	2,850		

*Exports.*—Exports of chains have been since 1917 by calendar years as follows: 1918, \$1,940,000; 1919, \$3,318,565; 1920, \$3,335,637; 1921 (9 months), \$1,950,797. The principal countries of destination were Canada, Japan, and Cuba.

*Important changes in classification.*—There is special mention of anchor or stud-link chain and a minimum duty for articles manufactured wholly or in chief value of chain.

*Suggested changes.*—Sprocket and machine chains and parts thereof, and anchor and stud-link chain, being provided for *eo nomine*, would naturally precede chain and chains of all kinds in the order of arrangement of the articles in this paragraph.

A provision for weldless chains might be advisable unless it is intended that they should come within the specific provisions for chain and chains of all kinds of certain diameters at specific rates of duty.

If specific provision should be made for weldless chains, it should follow the provision for anchor or stud-link chain.

### PARAGRAPH 330.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 330. Nuts, nut blanks, and washers, of wrought iron or steel, six-tenths of 1 cent per pound; bolts, with or without threads or nuts, and bolt blanks, of iron or steel, 1 cent per pound; spiral nut locks, and lock washers, of iron or steel, 30 per centum ad valorem.

#### ACT OF 1909.

#### ACT OF 1913.

PAR. 144. Bolts, with or without threads or nuts, or bolt blanks, \* \* \* whether of iron or steel, one and one-eighth cents per pound.

PAR. 123. Nuts or nut blanks, and washers, 5 per centum ad valorem; bolts of iron or steel, with or without threads or nuts, or bolt blanks, \* \* \* 10 per centum ad valorem; spiral nut locks and lock washers, whether of iron or steel, 30 per centum ad valorem.

PAR. 162. \* \* \* nuts, and washers, \* \* \* of wrought iron or steel, three-fourths of one cent per pound.

### BOLTS, NUTS, AND WASHERS OF IRON OR STEEL.

(See Survey C-11.)

*Description and uses.*—These articles—nuts, bolts, washers, spiral nut locks, etc.—and their uses are for the most part well known. The word “blank” used in connection with nuts and bolts signifies a piece of metal that has been prepared for manufacture into these various forms. The term “washer” denotes a ring of metal or perforated plate used to distribute pressure to prevent motion or play. Spiral nut locks are special devices for locking a nut, as on a bolt, so that it may not be loosened by jarring.

*Production.*—In 1914 the output of bolts, nuts, rivets, and washers was valued at \$23,403,000, in addition to that of builders' hardware which was valued at \$24,280,000.

*Imports.*—Imports are small compared with exports, and since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
<b>NUTS, NUT BLANKS, AND WASHERS OF WROUGHT IRON OR STEEL.</b>				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	36,338	\$11,512	\$576	5
1919.....	65,399	15,207	760	5
1920.....	78,924	12,601	630	5
1921 (9 months).....	147,734	9,075		

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
<b>BOLTS, WITH OR WITHOUT THREADS OR NUTS, OR BOLT BLANKS, AND FINISHED HINGES OR HINGE BLANKS, ETC.</b>				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	110,306	\$8,253	\$825	10
1919.....	147,369	17,433	1,743	10
1920.....	618,444	57,761	5,776	10
1921 (9 months).....	310,205	32,194		

**SPIRAL NUT LOCKS AND LOCK WASHERS.**

1918.....	200	\$18	\$5	30
1919.....	700	28	8	30
1920.....	1,566	761	228	30
1921 (9 months).....	816	219		

*Exports.*—Exports of bolts, nuts, rivets, and washers have been since 1917 by calendar years as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	63,465,111	89,023,056	87,235,028	47,974,367
Value.....	\$5,687,998	\$7,769,893	\$7,274,411	\$4,468,912

The principal countries of destination were Canada, the United Kingdom, Cuba, Argentina, Mexico, and British India.

*Important changes in classification.*—Hinges and hinge blanks, which are included in the corresponding paragraph of the act of 1913 (par. 123), are omitted. The phrase “of wrought iron or steel” is added and applied to “nuts, nut blanks, and washers.”

*Suggested changes.*—Hinges and hinge blanks might be classified with the articles mentioned in this paragraph.

**PARAGRAPH 331.**
**H. R. 7456.**
**SENATE AMENDMENTS.**

PAR. 331. Cut nails and cut spikes, of iron or steel, exceeding two inches in length, four-tenths of 1 cent per pound; cut tacks and brads, hobnails and cut nails, of iron or steel, not exceeding two inches in length, 20 per centum ad valorem; horseshoe nails, and other iron or steel nails, not specially provided for, 2 cents per pound; nails, spikes, tacks, brads, and staples, made of iron or steel wire, not less than one inch in length nor smaller than sixty-five one-thousandths of one inch in diameter, four-tenths of 1 cent per pound; less than one inch in length and smaller than sixty-five one-thousandths of one inch in diameter, three-fourths of 1 cent per pound; spikes, tacks, brads, and staples, not specially provided for, six-tenths of 1 cent per pound.

## ACT OF 1909.

PAR. 159. Cut nails and cut spikes of iron or steel, four-tenths of one cent per pound. ■

PAR. 160. Horseshoe nails, hob nails, and all other wrought-iron or steel nails not specially provided for in this section, one and one-half cents per pound.

PAR. 161. Wire nails made of wrought iron or steel, not less than one inch in length and not lighter than number sixteen wire gauge, four-tenths of one cent per pound; less than one inch in length and lighter than number sixteen wire gauge, three-fourths of one cent per pound.

PAR. 162. Spikes, \* \* \* of wrought iron or steel, three-fourths of one cent per pound.

PAR. 163. Cut tacks, brads, or sprigs, not exceeding sixteen ounces to the thousand, five-eighths of one cent per thousand; exceeding sixteen ounces to the thousand, three-fourths of one cent per pound.

## ACT OF 1913.

PAR. 554. Cut nails and cut spikes of iron or steel, horseshoe nails, \* \* \* hobnails, and all other wrought-iron or steel nails not specially provided for in this section; wire staples, wire nails made of wrought iron or steel, spikes, \* \* \* of iron or steel, and cut tacks, brads, or sprigs [Free.]

## NAILS, TACKS, AND SPIKES.

(See Survey C-8.)

## CUT NAILS AND SPIKES.

*Production* of cut nails during the past three decades has been decreasing with the extending use of wire nails. In 1918 it amounted to 418,811 kegs of 100 pounds each, and in 1920 to 844,583 kegs.

*Imports* are small, and since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	683,167	1,142,970	1,331,678	90,253
Value.....	\$39,380	\$56,216	\$74,699	\$8,745

*Exports* in the fiscal year 1918 were 116,406 kegs (100 pounds each); for 1915-1918 they were 16 per cent of production; for the four preceding years, 20 per cent. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	8,566,751	6,542,341	8,642,668	1,456,058
Value.....	\$40,281	\$393,284	\$573,990	\$91,496

The principal countries of destination were Chile, Cuba, China, and Mexico.

## HORSESHOE NAILS.

*Description.*—The tariff classification embraces horseshoe nails, the product of a distinct industry (the horseshoe nail manufacturers generally make no other nail product), hobnails, and shoe nails to a great extent made in tack mills.

*Production* of horseshoe nails in 1904 was valued at \$2,345,762. In 1918 there were six factories located in New York, Connecticut, Pennsylvania, and Illinois. The raw material used is nail rods or wire of soft steel or iron. One company has imported nail rods from Sweden, an important producer of horseshoe nails.

*Imports* in the fiscal year 1918 amounted to 310,295 pounds, valued at \$39,279; in 1913, approximately one-eighth of this amount. Imports since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	656,465	275,792	1,224,343	251,878
Value.....	\$59,008	\$35,753	\$81,975	\$10,768

*Exports* were not reported.

## WIRE STAPLES.

*Production.*—The census heretofore did not specify wire staples separately. In 1914 the production of wire tacks, brads, and staples, made in establishments drawing wire, was valued at \$1,324,948. A portion of the product of wire staples is manufactured in the tack mills. In the 1920 census wire staples figures were separated from those of wire tacks and brads and the 1919 output was shown as 68,221,300 pounds, valued at \$2,745,000.

*Imports* in the fiscal year 1918 were 97,559 pounds, valued at \$14,590. For the calendar years 1918–1921 they were as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	250	6,830	129,960	105
Value.....	\$35	\$735	\$7,954	\$29

*Exports* were not reported.

## WIRE NAILS.

*Production* in 1920 was 16,449,506 kegs (100 pounds) of wire nails, as against 13,559,727 in 1913 and 13,132,814 in 1917. Wire nails are merely one product of the wire industry. In 1914 only 6.6 per cent of the total value produced was made by establishments which did not draw wire; 69 per cent was made in the wire departments of rolling mills, and other concerns. In 1914 Pennsylvania led in the annual capacity of its wire-nail machines; Ohio, Illinois, Colorado, Alabama, and Indiana followed.

*Imports* for 1914-1917 averaged 4,314 kegs (100 pounds); since 1917 by calendar years they were as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	6,797,442	6,810,813	27,856,608	606,678
Value.....	\$372,629	\$346,636	\$1,688,774	\$39,299

*Exports* in the fiscal year 1918 were 2,440,098 kegs (100 pounds), the bulk going to Asia and Europe. Later figures for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	176,346,045	201,104,501	208,719,508	43,020,325
Value.....	\$9,921,123	\$10,744,696	\$11,880,398	\$2,445,515

The principal countries of destination were Japan, United Kingdom, and China.

## SPIKES.

*Description and use.*—Spikes are, in general (1) large nails, or, more specifically (2) nails produced by forging from a bar. Cut spikes are included with cut nails in the tariff specification; wire spikes are not so included, but, together with forged spikes, fall under the designation "spikes." The bulk of the forged spikes made are railway-track spikes.

*Production* in 1914 by rolling mills was 1,389,145 kegs (200 pounds) of forged spikes. They are sometimes handmade—in hand forges as required. In 1914 Pennsylvania was the chief producer. In the census report for 1919 (preliminary report) the figures for wire nails and spikes are given together, and were 12,429,200 kegs (100 pounds). The greater part of this output, however, consisted of wire nails.

*Imports* for 1915-1917 averaged 142 kegs (200 pounds). Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	523,222	86,699	120,968	6,585
Value.....	\$16,778	\$3,020	\$4,742	\$344

*Exports* in the fiscal year 1918 of railway-track spikes amounted to 174,160 kegs (200 pounds). Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	22,330,104	55,487,231	37,185,246	15,600,713
Value.....	\$1,229,083	\$2,896,073	\$1,607,672	\$819,387

The bulk of the exports went to Cuba, Japan, and Brazil.

## CUT TACKS, BRADS, AND SPRIGS.

*Description and use.*—Tacks and brads are of two kinds, cut and wire. Cut tacks and brads fall under this designation; those of wire (if of iron or steel) are included under "all other wrought-iron and steel nails." "Sprig" is an obsolete word in the trade, formerly applied to sharp-pointed shoe-heel nails.

*Production* of cut tacks and small nails in 1918 was estimated at from 50,000,000 to 60,000,000 pounds, valued at approximately \$6,600,000. The establishments making cut tacks also manufacture small nails cut from sheets, and to some extent wire tacks. Massachusetts leads in production of cut tacks.

*Imports* in the fiscal year 1918 amounted to 97,049 pounds, valued at \$14,512. In the calendar years 1918–1921 they were as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	151,252	151,138	160,410	72,755
Value.....	\$19,493	\$19,352	\$21,028	\$8,161

*Exports* in 1913 were estimated as 10 per cent of the production. Most of these exports were shoe nails, going to South America principally Argentina. Later statistics for the calendar years 1918–1921 follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	26,414,285	36,364,528	27,857,043	8,403,071
Value.....	\$3,336,570	\$4,638,093	\$3,068,120	\$972,041

These exports went mainly to Argentina, France, Brazil, and Australia.

*Important changes in classification.*—Most of the articles enumerated in this paragraph have been transferred from the free list of the act of 1913 (par. 554); spikes, tacks, brads and staples, n. s. p. f. are exceptions. It will be noted that most classes of upholstery nails and other nails and tacks made of or plated with brass or other metal not iron or steel are still provided for only as manufactures of metal, n. s. p. f. Such nails and tacks covered with leather or other material would be classable according to the component of chief value.

There is uncertainty concerning thumb tacks.

## PARAGRAPH 332.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 332. Rivets, studs, and steel points, lathed, machined, or brightened, and rivets or studs for nonskidding automobile tires, 25 per centum ad valorem; rivets of iron or steel, not specially provided for, 1 cent per pound.

## ACT OF 1909.

PAR. 167. Rivets, studs, and steel points, lathed, machined, or brightened, and rivets or studs for nonskidding automobile tires, forty-five per centum ad valorem; rivets of iron or steel, not specially provided for in this section, one and one-fourth cents per pound.

## ACT OF 1913.

PAR. 138. Rivets, studs, and steel points, lathed, machined, or brightened, and rivets or studs for nonskidding automobile tires, and rivets of iron or steel, not specially provided for in this section, 20 per centum ad valorem.

## RIVETS, STUDS, AND STEEL POINTS.

(See Survey C-11.)

*Description.*—A rivet is a headed pin or bolt of metal used to unite two or more pieces by passing it through them and heading the plain end. Ordinary bolts of iron or steel are provided for in paragraph 123. A stud is a small pin or rod for holding members together or fitting parts to one another. The term steel points is nontechnical and self-explanatory.

*Production.*—In Government statistical publications statistics of rivets, studs, etc., are not separated from the general class of bolts, nuts, washers, and rivets. (See par. 330, p. 431 for census figures for 1914.)

*Imports.*—Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty	Ad valorem rate.
RIVETS, STUDS, STEEL POINTS, ETC.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	1,519	\$344	\$69	20
1919.....	60,355	3,709	742	20
1920.....	3,330	681	136	20
1921 (9 months).....	3,900	325		
RIVETS OF IRON OR STEEL, N. S. P. F.				
1918.....	48,381	\$4,887	\$977	20
1919.....	65,901	5,928	1,186	20
1920.....	25,600	2,718	544	20
1921 (9 months).....	6,566	544		

*Exports.*—None separately recorded.

## PARAGRAPH 333.

## H. R. 7456.

## SENATE AMENDMENTS.

PAR. 333. Horse, mule, or ox shoes, of wrought iron or steel, six-tenths of 1 cent per pound.

## ACT OF 1909.

PAR. 162. \* \* \* horse, mule, or ox shoes, of wrought iron or steel, three-fourths of one cent per pound.

## ACT OF 1913.

PAR. 554. \* \* \* horse, mule, or ox shoes, of iron or steel, \* \* \* [Free].

## HORSE, MULE, AND OX SHOES.

*Description.*—The factory horse or mule shoe usually requires further working by the horseshoer to fit it to the hoof. Formerly he made the entire shoe from a bar; some shoes are still so produced.

*Production* of horse and mule shoes by rolling mills, etc., was valued at about \$9,000,000 in 1914. Hand production from bar iron (not recorded) was very small. In 1917 horse and mule shoes were produced by nine establishments, located in Pennsylvania, Ohio, New York, Illinois, and other States, as their principal or only product, two large companies (one iron and one steel) are included in this number. Horse and mule shoes are formed by a series of rolling, bending, and pressing operations, and, to a lesser extent and at a higher cost, by drop forging. The latter method is used chiefly in France, Belgium, and Great Britain. Germany and Canada manufacture by a process similar to ours.

*Imports* of horse, mule, and ox shoes were valued at \$16,517 in 1917. They came from Canada. Statistics of imports since 1917 by calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	52,994	25,674	43,776	7,945
Value.....	\$4,185	\$2,796	\$3,496	\$629

*Exports.*—Exports of horseshoes for the calendar years 1918–1921 are as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	6,399,934	7,581,585	4,108,908	1,048,461
Value.....	\$424,208	\$539,452	\$260,583	\$83,791

The principal countries of destination were, in 1919, Asiatic Russia, Belgium, British South Africa, Canada; in 1920, Canada, Cuba, British South Africa, and Mexico.

*Important changes in classification.*—Transferred from the free list in the act of 1913 (par. 554) and separated from cut nails, etc.

## PARAGRAPH 334.

## H. R. 7456.

## SENATE AMENDMENTS.

PAR. 334. Steel wool, 10 cents per pound; steel shavings, 5 cents per pound; and in addition thereto, on all of the foregoing, 30 per centum ad valorem: *Provided*, That in computing the duty the weight and value of the package shall be included and the net weight of the contents shall be plainly marked upon each package.

## ACT OF 1909.

PAR. 132. Steel wool or steel shavings, forty per centum ad valorem.

## ACT OF 1913.

PAR. 111. Steel wool or steel shavings, 20 per centum ad valorem.

## STEEL WOOL AND SHAVINGS.

(See Survey B-3.)

*Description and use.*—Steel wool consists of long steel fibers resembling curled hair. The fibers are of triangular cross section, and are graded according to fineness from coarse shavings to wool. Steel wool is used as an abrasive, and is a substitute for sandpaper and emery cloth or pumice stone, being regarded as superior to them for certain purposes. It is used in shipbuilding, in other building, in factories, and in the household.

*Production.*—No accurate figures of production are available. In 1917 the yearly consumption was estimated at between 1,000,000 and 1,500,000 pounds, which (imports being cut off) virtually represented domestic production. Germany and Switzerland are also producers.

*Imports.*—During the war very little steel wool was imported. In 1913 imports were 41,436 pounds, valued at \$5,177, and in 1914, 27,113 pounds, valued at \$3,698.

During recent years there have been no importations of steel wool, with the exception of a small amount, valued at \$116, which was imported during the first nine months of 1921.

*Exports.*—None recorded.

*Important changes in classification.*—The proviso is new.

## PARAGRAPH 335.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 335. Grit, shot, and sand of iron or steel, in any form, 1 cent per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 133. Grit, shot, and sand made of iron or steel, that can be used only as abrasives, one cent per pound.

PAR. 112. Grit, shot, and sand made of iron or steel, that can be used as abrasives, 30 per centum ad valorem.

## GRIT, SHOT, AND SAND OF IRON AND STEEL.

(See Survey B-3.)

*Description and uses.*—Grit, shot, and iron sand are chilled iron shot made by heating scrap or pig iron to a fluid state and spraying it with steam as it runs into a large vat of water. The grit is used in grinding rough surfaces of granite, marble, and other stones.

*Production* figures are not available. Before the war domestic consumption was estimated at 3,200 tons. England is an important producer of these abrasives.

*Imports* of grit, shot, and sand in 1914 amounted to 228,454 pounds. Since 1917 they have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	489,015	\$13,389	\$4,017	30
1919.....	1,020,804	17,718	5,315	30
1920.....	893,804	16,320	4,896	30
1921 (9 months).....	192,800	4,774	.....	30

*Exports.*—None recorded.

*Important changes in classification.*—The limitation “that can be used as abrasives” has been omitted, and the words “in any form” have been added.

### PARAGRAPH 336.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 336. Corset clasps, corset steels, and dress steels, whether plain or covered with cotton, silk, or other material, 25 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 135. \* \* \* corset clasps, corset steels, dress steels, \* \* \* shall pay a duty of not less than thirty-five per cent ad valorem; \* \* \*

PAR. 114. \* \* \* corset clasps, corset steels, dress steels, \* \* \* all the foregoing 15 per centum ad valorem; \* \* \*

### CORSET CLASPS, STEELS, ETC.

(See Survey C-8.)

*Description and uses.*—A corset-clasp consists of two short pieces of flat steel, one having a flat metal eyelet and the other having firmly affixed a small metal post so arranged that the eyelet can be hooked over it. Corset steels and dress steels are short strips of flat steel wire covered with cotton gauze or other material. The former is employed as a stiffening for corsets; the latter as a stiffening for dresses. Flat wire and strip steel are used for making springs and hands of watches and clocks, corset and dress steels, in the manufacture of pens, and for many other purposes.

*Production.*—Approximately 15 establishments manufacture these products. The large industrial centers of New York, Pennsylvania, Connecticut, and Massachusetts are the important producers.

*Imports* for the fiscal year 1918 were valued at \$17,238; they were over four and one-half times that amount in 1914. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
1918 .....	\$206,389	\$30,958	<i>Per cent.</i> 15
1919 .....	159,190	23,878	15
1920 .....	809,745	121,462	15
1921 (9 months) .....	450,069		

*Exports.*—None recorded.

*Important changes in classification.*—The articles in this paragraph are classified with round iron or steel wire, etc., in the act of 1913. The words “whether plain or covered with cotton, silk, or other material” have been added.

## PARAGRAPH 337.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 337. Card clothing not actually and permanently fitted to and attached to carding machines or to parts thereof at the time of importation, when manufactured with tempered or untempered round iron or steel wire, or with plated wire, or other than round iron or steel wire, or with felt face, wool face, or rubber-face cloth containing wool, 35 per centum ad valorem.

## ACT OF 1909.

PAR. 145. Card clothing not actually and permanently fitted to and attached to carding machines or to parts thereof at the time of importation, when manufactured with round iron or untempered round steel wire, twenty cents per square foot; when manufactured with tempered round steel wire, forty-five cents per square foot; when manufactured with plated wire or other than round iron or steel wire, or with felt face, wool face, or rubber-face cloth containing wool, fifty-five cents per square foot.

## ACT OF 1913.

PAR. 124. Card clothing not actually and permanently fitted to and attached to carding machines or to parts thereof at the time of importation, when manufactured with round iron or untempered round steel wire, 10 per centum ad valorem; when manufactured with tempered round steel wire, or with plated wire or other than round iron or steel wire, or with felt face, or wool face, or rubber-face cloth containing wool, 35 per centum ad valorem.

## CARD CLOTHING.

(See Survey C-8.)

*Description and use.*—Card clothing is a wire-toothed cloth or leather used for covering the cylinders, rollers, doffers, etc., of a carding machine. Carding is the process of cleaning and disentangling the fibers of cotton or wool by action of wire-toothed cylinders, and is the first important mechanical operation in the treatment of fibers preparatory to yarn making. The cloth is measured by the square foot in the trade.

*Production.*—The carding machines (including card clothing) used in cotton-spinning mills are for the most part of domestic production, but no statistics are available. Much of the carding machinery for woolen yarn is imported from England, although more than one-half of that used by domestic manufacturers is produced at home.

*Imports* for the fiscal year 1918 amounted to 200,035 square feet, valued at \$307,343. England and the United States are the main producing countries, the former the only important source of imports. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
CARD CLOTHING MANUFACTURED WITH UNTEMPERED ROUND IRON OR STEEL WIRE.				
	<i>Square feet.</i>			<i>Per cent.</i>
1918.....	583	\$448	\$45	10
1919.....	1,860	3,495	349	10
1920.....	4,241	11,863	1,186	10
1921. (9 months).....	984	4,299		

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
MANUFACTURED WITH TEMPERED WIRE.				
	<i>Square feet.</i>			<i>Per cent.</i>
1918.....	207,153	\$344,520	\$120,582	35
1919.....	176,169	356,546	124,791	35
1920.....	258,837	490,405	171,642	35
1921 (9 months).....	208,153	394,189		

CARD CLOTHING \* \* \* WHEN MANUFACTURED WITH PLATED WIRE.

1918.....	22,062	\$48,336	\$16,918	35
1919.....	35,020	48,379	16,933	35
1920.....	48,887	82,275	28,796	35
1921 (9 months).....	43,689	84,943		

*Exports.*—None recorded.

*Important changes of classification.*—Card clothing of all kinds is classified in a single paragraph in H. R. 7456 instead of in two brackets, as in the act of 1913 (par. 124).

PARAGRAPH 338.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 338. Screws, commonly called wood screws, of iron or steel, more than two inches in length, 10 cents per gross; over one inch and not over two inches in length, 8 cents per gross; over one-half inch and not over one inch in length, 5 cents per gross; one-half inch and less in length, 3 cents per gross: *Provided*, That each package or carton shall have conspicuously marked thereon the number of screws contained therein and the duty shall not be assessed upon a less number than so marked.

ACT OF 1909.

PAR. 169. Screws, commonly called wood screws, made of iron or steel, more than two inches in length, three cents per pound; over one inch and not more than two inches in length, five cents per pound; over one-half inch and not more than one inch in length, eight cents per pound; one-half inch and less in length, 10 cents per pound.

ACT OF 1913.

PAR. 140. Screws, commonly called wood screws, made of iron or steel, 25 per centum ad valorem.

WOOD SCREWS.

(See Survey C-8.)

*Description and use.*—Screws known in the trade as "wood screws," because intended for use in wood, are of mild steel or iron; or of brass, copper, and zinc when protection from rust is desirable.

*Production.*—In 1914 wood screws, including those made of brass and bronze, were valued at \$6,217,000, the output of 12 establishments. In 1919 the value was \$16,462,000, the output of the same number of establishments.

*Imports of wood screws are small compared with production. Since 1917 they have been as follows:*

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	11,411	\$927	\$232	25
1919.....	1,798	507	127	25
1920.....	9,945	2,595	649	25
1921 (9 months).....	5,481	1,781	.....	.....

*Exports.*—Exports for the calendar years 1918–1921 are as follows:

	1918	1919	1920	1921 (9 months).
Quantity (gross).....	8,876,249	10,461,923	9,002,439	4,106,472
Value.....	\$2,368,264	\$2,737,716	\$1,968,496	\$932,603

*Important changes in classification.*—H. R. 7456 divides screws into four groups according to the length, with a specific rate of duty for each group. The proviso is new.

### PARAGRAPH 339.

#### H. R. 7456.

#### SENATE AMENDMENTS.

PAR. 339. Table, household, kitchen, and hospital utensils, and similar hollow or flat ware, not specially provided for; composed of iron or steel and enameled or glazed with vitreous glasses, 5 cents per pound and 30 per centum ad valorem; composed wholly or in chief value of aluminum, 28 per centum ad valorem; and in addition thereto, upon any of the foregoing articles containing electrical heating elements as constituent parts thereof, 10 per centum ad valorem.

#### ACT OF 1909.

PAR. 158. Table, kitchen, and hospital utensils, or other similar hollow ware, of iron or steel, enameled or glazed with vitreous glasses, but not ornamented or decorated with lithographic or other printing, forty per centum ad valorem.

PAR. 199. Articles or wares not specially provided for in this section, composed wholly or in part of \* \* \* \* aluminum, or other metal, \* \* \* forty-five per centum ad valorem.

#### ACT OF 1913.

PAR. 134. Table, kitchen, and hospital utensils or other similar hollow ware composed of iron or steel, enameled or glazed with vitreous glasses; table, kitchen, and hospital utensils or other similar hollow ware composed wholly or in chief value of aluminum; all the foregoing not specially provided for in this section, 25 per centum ad valorem.

## HOUSEHOLD AND HOSPITAL UTENSILS AND HOLLOW WARE.

(See Surveys C-15 and C-16.)

*Description and use.*—The names of the articles enumerated in this paragraph sufficiently indicate their description and uses.

*Production* statistics indicate production of enameled ware to the value of about \$20,000,000 in 1914, consisting mainly of enameled kitchen ware and similar articles.

Aluminum articles, other than castings, manufactured in the United States in 1914 were valued at \$19,597,465, and nearly the whole amount was consumed at home.

*Imports.*—From 1910 to 1913 the imports of table, kitchen, and hospital utensils of iron and steel declined, but after the passage of the act of 1913 increased nearly 25 per cent—from \$667,831 in 1913 to \$833,251 in 1914. After 1914 imports again decreased, due probably to the blockade of Germany and Austria-Hungary, whence came three-fourths of the imports in previous years.

Imports in the last nine months of 1914 (fiscal year) of the above articles made of aluminum were \$507,349, but decreased rapidly until 1918. The war demand by European countries for aluminum metal was largely responsible for the decreased importation. Imports have come from Germany, Great Britain, France, and Switzerland—mostly from Germany. Imports since 1917 are shown below.

Calendar year.	Value.	Duty.	Ad valorem rate.
ENAMEL WARE, TABLE, HOUSEHOLD, KITCHEN, AND HOSPITAL UTENSILS, ETC.			
1918.....	\$19,497	\$4,874	25
1919.....	65,828	16,457	25
1920.....	366,238	91,559	25
1921 (9 months).....	249,295		

TABLE, HOUSEHOLD, KITCHEN, AND HOSPITAL UTENSILS, \* \* \* COMPOSED WHOLLY OR IN CHIEF VALUE OF ALUMINUM.

Calendar year.	Value.	Duty.	Per cent.
1918.....	\$1,049	\$262	25
1919.....	1,855	464	25
1920.....	422,024	105,506	25
1921 (9 months).....	551,214		

*Exports* of "enameled ware, all other," were valued at \$448,789 in 1913. They declined to \$271,426 in 1915, and then rose sharply to \$1,282,262 in 1916 and to \$2,266,641 in 1917. The leading countries of destination in 1913 were Canada, Argentina, Mexico, England, and Cuba. During the war period England became less important in the export trade.

Domestic exports of aluminum utensils are not reported separately. Exports of all aluminum manufactures other than ingot metal, plates, and sheets amounted to \$1,804,632 in the fiscal year 1918 and to \$2,563,164 in the calendar year 1920. More than half of the exports during the latter year was destined to American countries. Included in these exports are motor castings, rods, leaf, wire, and other forms not properly belonging to this paragraph.

Exports of electrical heating and cooking apparatus during recent calendar years were as follows: 1918, \$686,339; 1919, \$1,579,757; 1920, \$1,801,127; 1921 (9 months), \$1,419,175.

*Important changes in classification.*—All the articles in this paragraph were classified together in the act of 1913. H. R. 7456 classifies the articles in two groups: The first, those composed of iron or steel, enameled or glazed with vitreous glasses, and second, those composed wholly or in chief value of aluminum. "Household," in the first line, and "flatware," in the second line, and the words "and in addition thereto, upon any of the foregoing articles containing electrical heating elements as constituent parts thereof, 10 per centum ad valorem," are new.

### PARAGRAPH 340.

#### H. R. 7456.

PAR. 340. Crosscut saws, mill saws, pit and drag saws, circular saws, steel band saws, finished or further advanced than tempered and polished, hand, back, and all other saws, not specially provided for, 15 per centum ad valorem; jewelers' or piercing saws, 40 cents per gross.

#### SENATE AMENDMENTS.

#### ACT OF 1909.

PAR. 16S. Crosscut saws, five cents per linear foot; mill saws, eight cents per linear foot; pit and drag saws, six cents per linear foot; circular saws, twenty per centum ad valorem; steel band saws, finished or further advanced than tempered and polished, five cents per pound and twenty per centum ad valorem; hand, back, and all other saws, not specially provided for in this section, twenty-five per centum ad valorem.

#### ACT OF 1913.

PAR. 139. Crosscut saws, mill saws, pit and drag saws, circular saws, steel band saws, finished or further advanced than tempered and polished, hand, back, and all other saws, not specially provided for in this section, 12 per centum ad valorem.

#### SAWS.

(See Survey C-4.)

*Description and uses.*—Crosscut saws of the hand-manipulated type vary greatly in character. They are used in logging and in sawing wood for fuel. Drag-saws are similar to crosscut saws, but are operated by machinery, and are usually used in mills for cutting defective logs or for cutting logs into shorter lengths. Pit saws are handsaws used for sawing boards directly from the log. Mill saws are upright saws operated by machinery and used for rift sawing. The circular saw of disk shape is commonly used in sawmills and for sawing wood for fuel. Band saws are continuous bands run over pulleys and used in sawmills; they require the highest grade of steel and the greatest care in manufacture of any of the saws mentioned. A backsaw is a small variety of handsaw. It is used for very fine cutting requiring a straight or even saw cut. The blade is so thin that a strip of metal, usually steel or brass, is necessary along the back to prevent its buckling. Handsaws, broadly speaking, include

such saws as buck, hack, keyhole, plumbers', back, pruning saws, and many others for special purposes. The most common is the familiar handsaw used by carpenters and other woodworkers. A jeweler's saw has a very thin blade, tempered hard throughout, for cutting metal, and is used in a frame. Metal-splitting saws, whether of carbon or high-speed tool steel, are classed as saws, although they more closely resemble thin milling cutters.

*Production.*—In 1914 there were 100 establishments manufacturing saws in the United States. Wage earners numbered 4,560; capital was \$15,860,000; wages paid, \$3,019,000; cost of materials, \$4,714,000; and value of product, \$12,517,000. In 1919 there were 112 establishments, and the value of the product was \$31,473,000. The States leading in production in 1914 were Illinois, New York, Ohio, and Pennsylvania.

*Imports* of saws embraced in this paragraph were valued at \$63,570 in 1914. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
			<i>Per cent.</i>
1918.....	\$18,473	\$2,217	12
1919.....	51,645	6,196	12
1920.....	126,906	15,228	12
1921 (9 months).....	78,075		

*Exports* in 1914 were valued at \$1,474,077, more than half of which went to Canada, Australia, England, and Germany, the rest being widely distributed. Later exports by calendar year have been valued as follows: 1918, \$3,790,416; 1919, \$4,851,791; 1920, \$4,455,639; 1921 (9 months), \$2,020,723. The principal countries of destination were, in 1919, United Kingdom, Japan, Australia, Brazil; in 1920, United Kingdom, Japan, Canada, Australia.

*Important changes of classification.*—Jewelers' or piercing saws are added.

#### PARAGRAPH 341.

##### H. R. 7456.

##### SENATE AMENDMENTS.

PAR. 341. Steel plates, stereotype plates, electrotypes plates, halftone plates, photogravure plates, photo-engraved plates, and plates of other materials, engraved for printing, and plates of iron or steel engraved or fashioned for use in the production of designs, patterns, or impressions on glass in the process of manufacturing plate or other glass, 15 per centum ad valorem; lithographic plates of stone or other material engraved, drawn, or prepared, 20 per centum ad valorem.

## ACT OF 1909.

PAR. 166. Steel plates engraved, stereotype plates, electrotype plates, and plates of other materials, engraved for printing, twenty per centum ad valorem; plates of iron or steel engraved or fashioned for use in the production of designs, patterns, or impressions on glass in the process of manufacturing plate or other glass, twenty-five per centum ad valorem; lithographic plates of stone or other material, engraved, drawn, or prepared, \* \* \* fifty per centum ad valorem.

## ACT OF 1913.

PAR. 137. Steel plates engraved, stereotype plates, electrotype plates, halftone plates, photogravure plates, photo-engraved plates, and plates of other materials, engraved for printing, plates of iron or steel engraved or fashioned for use in the production of designs, patterns, or impressions on glass in the process of manufacturing plate or other glass, 15 per centum ad valorem; lithographic plates of stone or other material engraved, drawn, or prepared, \* \* \* 25 per centum ad valorem.

PAR. 612. Steel engraved forms for bonds, debentures, stock certificates, negotiable receipts, notes and other securities; and engraved steel plates, \* \* \* suitable for use in engraving or printing bonds, stock certificates or other securities [Free].

## STEEL PLATES FOR PRINTING, DESIGNS, ETC.

(See Survey C-15.)

*Description and uses.*—These articles include plates engraved or prepared for printing or used for making impressions on glass in process of manufacture. They may be divided into three classes: (1) Steel plates engraved for printing and plates of iron and steel engraved or fashioned for use in the production of plate or other glass; (2) plates, electrotyped, stereotyped, photo-engraved, etc., and plates of other material than steel engraved for printing; and (3) lithographic plates, drawn or prepared, and wet transfer paper prepared wholly or partly with glycerin and containing imprints taken from lithographic plates.

*Production.*—The latest available figures cover only part of these materials. In 1914 the country's output of engraved steel and copper plate, including plate printing, amounted to \$13,786,000; photoengraved plates not done in printing establishments, to \$15,359,000; and stereotype and electrotype plates, to \$8,154,000. The figures for the output of lithographic plates include so much other material as to be valueless in this connection. England and Germany are large producers of the several articles embraced in this paragraph.

*Imports* in 1914 approximated \$50,000. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
ENGRAVED PLATES, STEEL, N. E. S.			
1918.....	\$5,139	\$771	15
1919.....	587	88	15

1921 (9 months).....	1,903		

*Exports* in 1914 amounted to \$72,752. Exports of plates and cuts, electrotype, stereotype, or engraved, for later calendar years have been valued as follows: 1918, \$181,020; 1919, \$389,048; 1920, \$535,597; 1921 (9 months), \$299,431. The principal countries of destination were, in 1919, Canada, United Kingdom, Cuba, Brazil; in 1920, Canada, United Kingdom, Cuba, Argentina.

*Important changes in classification.*—Steel engraved forms for bonds, stock certificates, etc., now included in this paragraph are exempt from duty under paragraph 612 of the act of 1913.

*Suggested changes.*—The plates named in this paragraph are not strictly engraved plates. The words “or otherwise prepared” might be inserted in line 6, page 57, of H. R. 7456, after “engraved.” The provision is evidently intended to apply to plates, irrespective of material, for printing; a specific provision, therefore, for steel plates and the words “and plates of other materials” appear to be unnecessary.

#### PARAGRAPH 342.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 342. Umbrella and parasol ribs and stretchers, composed wholly or in chief value of iron, steel, or other metal, in frames or otherwise, and tubes for umbrellas, wholly or partly finished, 35 per centum ad valorem.

## ACT OF 1909.

PAR. 170. Umbrella and parasol ribs and stretchers, composed in chief value of iron, steel, or other metal, in frames or otherwise, and tubes for umbrellas, wholly or partially finished, fifty per centum ad valorem.

## ACT OF 1913.

PAR. 141. Umbrella and parasol ribs and stretchers, composed in chief value of iron, steel, or other metal, in frames or otherwise, and tubes for umbrellas, wholly or partially finished, 35 per centum ad valorem.

## UMBRELLA RIBS AND TUBES.

(See Survey C-8.)

*Description and uses* are indicated by the articles themselves.

*Production.*—The United States is a large producer of umbrella and parasol ribs and tubes. The value of the annual production is estimated at from \$1,250,000 to \$2,000,000. Although figures regarding the extent of the output of parts are not available, the production of umbrellas, parasols, and canes in 1914 was valued at \$13,813,353, and in 1919 at \$22,199,000. These completed articles are provided for in paragraph 1454.

*Imports.*—In the calendar year 1918 the imports of metallic ribs, stretchers, and tubes for umbrellas and parasols were valued at \$14, the smallest annual importation on record since 1884. In the fiscal year 1914, the amount was \$28,985. After that year the annual imports decreased steadily until 1918.

Statistics for the years 1919-1921 are as follows:

Calendar year.	Value.	Duty.	Ad valorem rate.
1919.....	\$7,809	\$2,733	<i>Per cent.</i> 35
1920.....	18,063	6,322	35
1921 (9 months).....	26,539		

*Exports.*—The total amount and value of the annual exportation of umbrella hardware is difficult to ascertain. It is known, however, that exports of the domestic product to foreign markets have increased since 1914.

## PARAGRAPH 343.

## H. R. 7456.

## SENATE AMENDMENTS.

PAR. 343. Spring-beard needles, and other needles for knitting, sewing, shoe, or embroidery machines of every description, not specially provided for, and crochet needles, \$1.15 per thousand and 25 per centum ad valorem; latch needles, \$2 per thousand and 35 per centum ad valorem; tape, knitting, and all other needles, not specially provided for, bodkins of metal, and needle cases or needle-books furnished with assortments of needles or combinations of needles and other articles, 30 per centum ad valorem.

## ACT OF 1909.

PAR. 164. Needles for knitting or sewing machines, one dollar per thousand and twenty-five per centum ad valorem; latch needles, one dollar and fifteen cents per thousand and thirty-five per centum ad valorem; crochet needles and tape needles, knitting and all other needles, not specially provided for in this section, and bodkins of metal, twenty-five per centum ad valorem; but no articles other than the needles which are specifically named in this section shall be dutiable as needles unless having an eye, and fitted and used for carrying a thread. Needle cases or needle books furnished with assortments of needles or combinations of needles and other articles, shall pay duty as entireties according to the component material of chief value therein.

## ACT OF 1913.

PAR. 135. Needles for knitting or sewing machines, latch needles, crochet needles, and tape needles, knitting and all other needles not specially provided for in this section, bodkins of metal, and needle cases or needle books furnished with assortments of needles or combinations of needles and other articles, 20 per centum ad valorem; but no articles other than the needles which are specifically named in this section shall be dutiable as needles unless having an eye and fitted and used for carrying a thread.

PAR. 555. \* \* \* needles for shoe machines [Free].

## NEEDLES.

(See Survey C-15.)

*Description and uses.*—The dutiable needles used in the largest quantities are knitting-machine needles, sewing-machine needles, hand-crochet and hand-knitting needles, and tape needles or bodkins.

The latch and the spring-beard are the two important kinds of knitting-machine needles. A knitting-machine needle has no eye. The latch needle carries the thread by a tiny hook over which the latch, a proportionately small piece of metal held in place by a rivet, alternately opens and closes to form each stitch or loop in the operation of knitting. The spring-beard needle is made of one piece of wire, one end of which is drawn out extremely fine and bent back along the shank, forming a hook much longer and more delicate than the hook on a latch needle.

Sewing-machine needles are sufficiently familiar.

Crochet needles have at one end a small hook with which the thread is pulled through successive loops. Hand-knitting needles have neither eye nor hook. These needles are frequently made of other material than steel.

Tape needles, made with an elongated eye through which the tape may be easily threaded, have a blunt end designed merely to carry the tape in and out of holes already provided. The term "bodkin" is also applied to tape needles, but may mean a small puncher or stiletto without an eye, used simply to puncture the material.

Shoe-machine needles are extensively used in this country and are of two kinds—wax-thread and dry-thread—which differ widely. The wax-thread needle is eyeless, curved to almost a half circle, and has a hook near the point, closely resembling the hook of a crochet needle. It is used exclusively in a machine for sewing the sole to the upper with a waxed thread. The dry-thread needle is straight, with an eye near the point, and closely resembles an ordinary sewing-machine needle in appearance and use. The machine using this needle differs from the ordinary sewing machine only in the shape of the table holding the article. A dry or unwaxed thread is used

ordinarily, hence its name. The use of this needle is confined, practically, to the sewing of uppers of shoes; it is not employed for sewing soles to uppers.

*Production.*—The two principal classes of knitting-machine needles involve so many differences in construction—chiefly in labor and factory equipment—that they are distinct industries. In 1914 the domestic production of latch needles amounted to 46,165,000, valued at \$492,387, while spring-beard needles amounted to 47,934,000, valued at \$129,397; in 1919 latch needles amounted to 121,000,000, valued at \$3,845,000, and spring-beard needles amounted to 43,000,000, valued at \$341,000. Reports of manufacturers of spring-beard needles show production for 1919 to have been over 80,000,000 needles, valued at more than \$600,000. Germany is the largest producer of knitting-machine needles.

The Census includes sewing-machine needles in "all other needles," and gave the production for 1914 as 74,635,000, valued at \$656,660; for 1919, as 100,000,000 valued at \$1,829,000. According to figures submitted by manufacturers, this is less than one-half the actual production in 1914. Returns made by three of these companies, not included in the Census reports, added to those figures, give a total for 1914 of 173,214,000 needles, with an estimated value of \$1,500,000. This represents closely the entire domestic output of sewing-machine needles in 1914. The United States, Germany, and England produce practically the world supply. Some crochet hooks are manufactured here. England and Germany are the leading manufacturers of hand crochet and knitting needles, but nearly all the shoe machine needles are a domestic product.

*Imports.*—The largest annual importation since 1910 was in 1913 (fiscal year), 26,751,000 needles, and in 1917 (fiscal year) imports were less than 1,000,000 needles. Prewar imports averaged about 50 per cent of the domestic output and were increasing. Spring-beard needles have been imported less extensively. Most knitting needles imported come from Germany.

Imports of sewing-machine needles are small, estimated in 1914 as about 5 per cent of domestic production.

Hand-crochet needles, hand-knitting needles, and tape needles or bodkins are grouped together with "all other" in statistics of imports which in 1918 (fiscal year) showed a value of \$139,455. The largest annual importation since 1908 was in 1917 (fiscal year), \$171,983, and the smallest in 1908 (fiscal year), \$50,044.

*Imports of shoe-machine needles in 1918 (fiscal year) amounted to \$3,038, and in 1915 (fiscal year) to \$3,217, the maximum.*

Imports since 1917 of the various kinds of needles have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
NEEDLES, ALL KINDS.				
1918.....	.....	\$388,432	\$77,686	Per cent. 20

1921 (9 months).....	275,402	38,468		

<sup>1</sup> Spring-beard needles and other needles for knitting, sewing, shoe, or embroidery machines.

*Exports.*—It is estimated that somewhat less than one-half of the domestic sewing-machine needles are exported; other classes of needles exported are insignificant. Some domestic shoe-machine needles are exported, but the extent is unknown.

Exports for the calendar years 1918 to 1921 are valued as follows: 1918, \$321,651; 1919, \$535,656; 1920, \$548,783; 1921 (9 months), \$270,749. Principal countries of destination were, in 1918, Canada, Brazil, Argentina; in 1919, Canada, Brazil, Mexico; in 1920, Canada, Argentina, Brazil.

*Important changes in classification.*—Shoe-machine needles are transferred from the free list of the act of 1913 (par. 555), and spring-beard needles and needles for embroidery machines are specifically mentioned. The provision in paragraph 135 of the act of 1913 for needles not specifically named, having an eye and fitted and used for carrying a thread, has been omitted.

## PARAGRAPH 344.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 344. Fishhooks, fishing rods and reels, artificial flies, artificial baits, snelled hooks, leaders or casts, and all other fishing tackle and parts thereof, fly books, fly boxes, baskets or creels, finished or unfinished, not specially provided for, except fishing lines, fishing nets, and seines, 35 per centum ad valorem: *Provided*, That any prohibition of the importation of feathers in this Act shall not be construed as applying to artificial flies used for fishing, or to feathers used for the manufacture of such flies.

## ACT OF 1909.

PAR. 165. Fish hooks, fishing rods and reels, artificial flies, artificial baits, snelled hooks and all other fishing tackle or parts thereof, not specially provided for in this section, except fishing lines, fishing nets and seines, forty-five per centum ad valorem.

## ACT OF 1913.

PAR. 136. Fishhooks, fishing rods and reels, artificial flies, artificial baits, snelled hooks, and all other fishing tackle or parts thereof, not specially provided for in this section, except fishing lines, fishing nets and seines, 30 per centum ad valorem: *Provided*, That any prohibition of the importation of feathers in this section shall not be construed as applying to artificial flies used for fishing.

## FISHING TACKLE.

(See Survey C—15.)

*Description and uses.*—This includes the equipment of the man who fishes for diversion or on a limited scale. Fishing nets and seines used for more extensive operations are provided for in paragraph 1006.

Practically the only items in this paragraph that are used in quantity by commercial fishermen are hooks, especially those used in marine fisheries for trawling and hand-lining.

*Production.*—The United States, like Canada, England, and some other countries of a considerable fishing industry, is a large producer of fishhooks, fishing rods and reels, and similar equipment. Statistics are not available.

*Imports.*—The average annual imports during the five-year period, 1910 to 1914, were valued at \$160,101. Over 95 per cent of the total foreign fishing tackle sold in the United States comes from the United Kingdom and Norway. Imports since 1917 have been as follows:

Calendar year.	Value.	Duty.	Ad valorem rate.
FISHHOOKS, FISHING RODS AND REELS, ARTIFICIAL FLIES, ETC.			
1918.....	\$202,211	\$60,663	30
1919.....	227,307	68,192	30
1920.....	313,234	93,970	30
1921 (9 months).....	434,365		
FISHHOOKS, ETC.—FOR THE EQUIPMENT OF VESSELS, ETC.			
1918.....	\$2,342		
1919.....	1,332		
1920.....	3,052		
1921 (9 months).....			

*Exports.*—None reported.

*Important changes in classification.*—Leaders or casts, fly books, fly boxes, baskets or creels, finished or unfinished, are added. Feathers used for the manufacture of flies, prohibited in former acts, are specifically exempted from the prohibition.

*Suggested changes.*—Page 58, line 3: Insert "fishing" before "baskets" to prevent a conflict with paragraph 413.

---

### PARAGRAPH 345.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 345. Saddlery and harness hardware: Buckles, rings, snaps, bits, swivels, and all other articles of iron, steel, brass, composition, or other metal, commonly or commercially known as saddlery or harness hardware, 35 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

[No corresponding provision.]

[No corresponding provision.]

#### SADDLERY AND HARNESS HARDWARE.

(See Survey N-18.)

*Description and uses.*—The phrase "saddlery and harness hardware" is applied to buckles, rings, etc., made of metal and used on bridles, saddles, and harness.

*Production.*—In 1914 there were 58 establishments in the United States manufacturing saddlery hardware, with an output valued at \$4,040,000. In 1919 the number of establishments had declined to 37, but the value of the product had increased to \$14,137,000.

*Imports and exports.*—No separate statistics.

*Important changes in classification.*—This is a new paragraph.

---

### PARAGRAPH 346.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 346. Belt buckles, trouser buckles, and waistcoat buckles, shoe or slipper buckles, and parts thereof, made wholly or partly of iron or steel, valued at not more than 20 cents per hundred, 5 cents per hundred; valued at more than 20 and not more than 50 cents per hundred, 10 cents per hundred; valued at more than 50 cents per hundred, 15 cents per hundred; and in addition thereto, on all of the foregoing, 20 per centum ad valorem.

## ACT OF 1909.

PAR. 425. Trousers buckles and waistcoat buckles, made wholly or partly of iron or steel, or parts thereof, valued at not more than fifteen cents per hundred, five cents per hundred; valued at more than fifteen cents per hundred and not more than fifty cents per hundred, ten cents per hundred; valued at more than fifty cents per hundred, fifteen cents per hundred; and in addition thereto on each and all of the above buckles or parts of buckles, fifteen per centum ad valorem.

[No corresponding provision for belt buckles, shoe and slipper buckles; classable according to kind or component material of chief value.]

## ACT OF 1913.

PAR. 151. Belt buckles, trousers buckles, waistcoat buckles, \* \* \* any of the foregoing made wholly or in chief value of iron or steel; \* \* \* all the foregoing and parts thereof, not otherwise specially provided for in this section, 15 per centum ad valorem.

[No corresponding provision for shoe or slipper buckles; classable according to kind or component material of chief value.]

## BUCKLES.

(See Survey C-20.)

*Description and uses.*—These articles include various kinds of fastening devices used chiefly on men's clothing. Other fasteners belonging to this general group are provided for in paragraph 349.

*Production.*—No separate figures are published for buckles, but production of garment buckles amounts to approximately \$1,000,000 annually.

*Imports in 1908 of buckles*—belt, trouser, and waistcoat—made wholly or partly of iron or steel, amounted to \$19,304, and decreased until 1918. Germany, Austria, and France are the principal countries exporting to this country. Imports since 1917 by calendar years have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Gross.</i>			<i>Per cent.</i>
1918.....		\$484	\$73	15
1919.....	2,524	17,880	2,682	15
1920.....	14,688	7,349	1,095	15
1921 (9 months).....	642	793		

*Exports* are not reported.

*Important changes in classification.*—Hooks and eyes, etc.; snap fasteners, etc.; and steel trouser buttons, etc., which are classified with belt buckles, etc., in the act of 1913 with an ad valorem rate of duty, have each been given a separate paragraph, 347, 348, and 349, respectively, in H. R. 7456.

Shoe and slipper buckles have been inserted in this paragraph, and all articles have been classified into groups according to value with a specific rate of duty and an additional ad valorem duty.

*Suggested changes.*—Page 58, line 17: Substitute a comma for "or" between "iron" and "steel" and add the words "of other base metal" after "steel" to make the paragraph include buckles, etc., made of any base metal.

## PARAGRAPH 347.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 347. Hooks and eyes, wholly or in chief value of metal, whether loose, carded, or otherwise, including weight of cards, cartons, and immediate wrappings and labels,  $4\frac{1}{2}$  cents per pound and 15 per centum ad valorem.

ACT OF 1909.

PAR. 180. Hooks and eyes, metallic, whether loose, carded, or otherwise, including weight of cards, cartons, and immediate wrappings and labels, four and one-half cents per pound and fifteen per centum ad valorem.

ACT OF 1913.

PAR. 151. \* \* \* hooks and eyes, metallic; \* \* \* all the foregoing and parts thereof, not otherwise specially provided for in this section, 15 per centum ad valorem.

## HOOKS AND EYES.

(See Survey C-20.)

*Description and uses.*—Hooks and eyes are used as dress fasteners.

*Production* in 1914 of hooks and eyes amounted to 1,076,177 great gross, valued at \$1,394,745; and in 1919 to 4,098,000 great gross, valued at \$2,354,000, according to the census report. An important manufacturer of hooks and eyes estimates the value of production in 1914 at \$4,000,000.

*Imports.*—No imports of hooks and eyes are reported for 1918, but in 1917 they amounted to 1,061 pounds, valued at \$374; and in 1914 to 86,710 pounds, valued at \$27,878. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1919.....	16	\$50	\$8	15
1920.....		3,401	510	15
1921 (9 months).....		3,533		

*Exports.*—None reported.

*Important changes in classification.*—Hooks and eyes are classified with belt buckles, etc., in the act of 1913 with an ad valorem rate of duty.

H. R. 7456 provides a specific and an ad valorem rate of duty on the articles, whether loose, carded, or otherwise, including weight of cards, cartons, and immediate wrappings and labels as in 1909.

## PARAGRAPH 348.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 348. Snap fasteners and clasps, and parts thereof, by whatever name known, or of whatever material composed, not plated with gold, silver, or platinum, and not mounted on tape, 40 per centum ad valorem; mounted on tape, 45 per centum ad valorem.

## ACT OF 1909.

PAR. 427. \* \* \* snap fasteners, or clasps, or parts thereof, by whatever name known, fifty per centum ad valorem; \* \* \*.

## ACT OF 1913.

PAR. 151. \* \* \* snap fasteners and clasps by whatever name known, any of the foregoing made wholly or in chief value of iron or steel; \* \* \* all the foregoing and parts thereof, not otherwise specially provided for in this section, 15 per centum ad valorem.

[Snap fasteners and clasps composed of metal other than iron or steel, dutiable as manufactures of metal, Par. 167, 20 per centum ad valorem.]

## SNAP FASTENERS AND CLASPS.

(See Survey C-20.)

*Description and uses.*—These articles are fastening devices chiefly for clothing, and are used as a substitute for buttons, hooks, and eyes, buckles, and pins.

*Production.*—In 1914 snap fasteners and clasps, or parts of, amounted to 91,957 great gross, valued at \$714,492. Production was estimated by a well-informed manufacturer in July, 1919, to be at the rate of about 1,500,000 great gross annually, valued at approximately \$6,000,000.

*Imports.*—The value of imports increased steadily from \$11,064 in 1910 to \$130,078 in 1914. Then came a sharp drop to \$18,994 in 1915, a slight further decline in 1916, and a recovery to \$34,315 in 1917.

Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
SNAP FASTENERS AND CLASPS, AND PARTS THEREOF, ETC.				
	<i>Number.</i>			<i>Per cent.</i>
1918.....		\$1,513	\$227	15
1919.....		778	117	15
1920.....		26,351	3,953	15
1921 (9 months).....		7,000		

## BRASS SNAP FASTENERS AND CLASPS, OR PARTS OF.

1918.....		\$524	\$105	20
1919.....	864	18	4	20
1920.....		11,114	2,223	20
1921 (9 months).....		65,578		

*Exports.*—Official statistics of exports are lacking, but it is stated in Commerce Reports, March 1, 1918, that exports to Brazil reached a large volume in 1917.

*Important changes in classification.*—Snap fasteners and clasps are classified with belt buckles, etc., in the act of 1913 (par. 151), with a limitation to such as are made wholly or in chief value of iron or steel.

The restriction to mounting on tape is new.

*Suggested changes.*—If snap fasteners mounted on tape are distinguished from those in bulk, it is suggested that snap fasteners

mounted on cards be similarly distinguished. The mounting on cards is common with respect to the style of fasteners imported in the past. The mounting of the cheaper grades abroad is done by machinery while in the United States all mounting is done by hand.

### PARAGRAPH 349.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 349. Metal trouser buttons, except steel and nickel bar buttons, one-twelfth of 1 cent per line per gross; steel trouser buttons, one-fourth of 1 cent per line per gross; buttons of metal, not specially provided for, three-fourths of 1 cent per line per gross; and in addition thereto, on all of the foregoing, 10 per centum ad valorem; metal buttons embossed with a design, device, pattern, or lettering, 35 per centum ad valorem: *Provided*, That the term "line" as used in this paragraph shall mean the line button measure of one-fortieth of one inch.

ACT OF 1909.

ACT OF 1913.

PAR. 427. \* \* \* metal trousers buttons (except steel), and nickel bar buttons, one-twelfth of one cent per line per gross; \* \* \* steel trousers buttons, one-fourth of one cent per line per gross; \* \* \* buttons of \* \* \* metal, not specially provided for in this section, three-fourths of one cent per line per gross, and in addition thereto, on all the foregoing articles in this paragraph, fifteen per centum ad valorem; \* \* \* buttons of metal, embossed with a design, device, pattern, or lettering, forty-five per centum ad valorem; \* \* \*.

PAR. 151. \* \* \* steel trousers buttons, and metal buttons; all the foregoing and parts thereof, not otherwise specially provided for in this section, 15 per centum ad valorem.

### METAL BUTTONS.

(See T. I. S.-4.)

*Description and use.*—The industry includes practically every kind of metal button, from the most ordinary button of sheet iron, made automatically, to the expensive gold button, made by hand. There are sew-on trouser buttons; tack buttons, put on by machine; bachelor buttons, put on by hand; uniform buttons; and buttons for women's and children's clothing.

*Production.*—Connecticut, New Jersey, New York, Massachusetts, and Rhode Island are the leading States in the manufacture of metal buttons. Production in 1914 of steel trouser buttons amounted to 535,207 gross, valued at \$307,802; other metal trouser buttons, to 252,248 gross, at \$44,150; metal buttons, not including trouser or collar or cuff buttons, to 872,563 gross, at \$455,485.

*Imports.*—Before the war trouser buttons were imported from Germany and Austria. They were inferior in quality and workmanship, but were 30 per cent cheaper than the domestic product. Gold-plated collar and link buttons were also imported from Germany. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
METAL BUTTONS, TOTAL, ALL KINDS.				
	<i>Gross.</i>			<i>Per cent.</i>
1918.....	7,495	\$1,567	\$235	15
1919.....	4,150	4,141	622	15
1920.....	70,746	27,684	4,153	15
1921 (9 months).....	31,877	17,765		

METAL TROUSER BUTTONS, EXCEPT STEEL AND NICKEL BAR BUTTONS, ETC., OTHER METAL.

1918.....	2,400	\$60	\$9	15
1919.....	23	37	6	15
1920.....	16,299	4,335	650	15
1921 (9 months).....	22	13		

STEEL TROUSER BUTTONS.

1918.....	445	\$201	\$30	15
1919.....	344	291	44	15
1920.....	895	644	97	15
1921 (9 months).....	2,269	1,560		

ALL OTHER METAL BUTTONS, N. S. P. F.

1918.....	3,738	\$1,094	\$164	15
1919.....	3,783	3,813	572	15
1920.....	53,552	22,705	3,406	15
1921 (9 months).....	29,586	16,192		

*Exports.*—All kinds of metal buttons were being exported in 1918, but doubt was expressed as to whether this trade could be held in competition with the cheaper foreign goods after the war. In 1918 (fiscal year) exports of buttons, other than pearl, amounted to \$1,503,865. These figures, of course, cover more than metal buttons.

*Important changes in classification.*—The provision in the act of 1913 (par. 151) has been enlarged.

*Suggested changes.*—"Except steel" should be put in parentheses as in paragraph 427 of the act of 1909, unless nickel bar buttons are also intended to be excepted, as appears by paragraph 427 of the act of 1909 not to be the case.

The duties on some embossed buttons might be less than the duty on plain buttons under this paragraph. In the absence of a specific provision therefor in this paragraph, parts of buttons of metal would come within paragraph 1411 which imposes a rate of 38 per centum ad valorem. This rate might be more than the rates imposed in paragraph 349 on finished metal buttons.

## PARAGRAPH 350.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 350. Pins with solid heads, without ornamentation, including hair, safety, hat, bonnet, and shawl pins; and brass, copper, iron, steel, or other basic metal pins, with heads of glass, paste, or fusible enamel; all the foregoing not plated with gold or silver, and not commonly known as jewelry, 28 per centum ad valorem.

## ACT OF 1909.

## ACT OF 1913.

PAR. 188. Pins with solid heads, without ornamentation, including hair, safety, hat, bonnet, and shawl pins; any of the foregoing composed wholly of brass, copper, iron, steel, or other base metal, not plated with gold or silver, and not commonly known as jewelry, thirty-five per centum ad valorem.

PAR. 158. Pins with solid heads, without ornamentation, including hair, safety, hat, bonnet, and shawl pins; any of the foregoing composed wholly of brass, copper, iron, steel, or other base metal, not plated with gold or silver, and not commonly known as jewelry, 20 per centum ad valorem.

## PINS.

(See Survey C-8.)

*Production* of common or toilet pins in 1914 amounted to 641,121 pounds plus 1,825,673 packs of 3,360 pins of steel wire, and 1,186,397 pounds plus 1,638,035 packs of 3,600 pins of brass wire, with a combined value of \$1,248,757. Some firms report output in pounds and others in packs. Production of hairpins was 9,242,012 gross, valued at \$528,362; and of safety pins, 4,744,303 gross, valued at \$936,663. Production of common or toilet pins in 1919 amounted to 2,799,000 pounds plus 1,342,000 packs of 3,360 pins of steel wire, valued at \$1,521,000; and 741,000 pounds plus 1,089,000 packs of 3,600 pins of brass wire, valued at \$1,269,000.

Production of hair pins was 24,310,000 gross, valued at \$1,481,000; and of safety pins, 8,428,000 gross, valued at \$2,977,000.

The total value of common pins, hairpins, and safety pins produced in 1914 was \$2,713,782, and in 1919 was \$7,248,000. Connecticut leads in the manufacture of articles covered by this paragraph. The leading foreign producers are France, Germany, and England.

*Imports* of all pins covered by paragraph 350 amounted to \$235,571 in 1914. Imports have been mainly from England and Germany.

Imports of pins with solid heads, without ornamentation, etc., have been, since 1917, as follows:

Calendar year.	Value.	Duty.	Ad valorem rate.
			<i>Per cent.</i>
1918.....	\$104,081	\$20,816	20
1919.....	130,165	26,033	20
1920.....	161,142	32,228	20
1921 (9 months).....	156,175		

*Exports.*—Before the war American manufacturers produced some pins for export, but England and Germany held most of the export trade. After 1915 there was a better foreign market for American pins, but American producers had difficulty in supplying the domestic demand and made little effort to develop the foreign trade.

*Important changes in classification.*—The first clause of this paragraph enumerates pins, but does not mention the material or materials of which they are made. The second clause classifies brass, copper, iron, steel, or other "basic" metal pins with heads of glass in the same group.

*Suggested changes.*—Page 59, line 20 of H. R. 7456: Change "basic" to "base."

### PARAGRAPH 351.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 351. Pens, metallic, not specially provided for, 12 cents per gross; with nib and barrel in one piece, 15 cents per gross.

#### ACT OF 1909.

PAR. 186. Pens, metallic, except gold pens, twelve cents per gross; with nib and barrel in one piece, fifteen cents per gross.

#### ACT OF 1913.

PAR. 156. Pens, metallic, not specially provided for in this section, 8 cents per gross; with nib and barrel in one piece, 12 cents per gross.

### PENS.

(See Survey C-24.)

*Description and uses.*—This paragraph relates to metallic pens other than gold. Pens are made principally of steel, but there is a growing demand for gold pens, because more flexible and of greater durability. "Fountain pens" have attained wide use in recent years.

*Production.*—The domestic manufacture of steel pens began in 1860, when the knowledge of the quality of metal best adapted for their manufacture was acquired. Most of the steel used has been imported from England and Sweden. Five establishments, with a capital of \$870,601 and 573 wage earners, manufactured steel pens in 1914. Materials used were worth \$117,113, wages amounted to \$243,043, and the value of the product was \$513,498. Steel pens valued at \$160,068 were also produced by establishments classified under other industries. The value of the product of five establishments in 1919 was \$1,706,000. A prewar estimate credited domestic production with 2,500,000 gross.

*Imports.*—Imports of metallic pens, n. s. p. f., in 1914 were 698,642 gross, valued at \$174,044. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
PENS, METALLIC, WITH NIB AND BARREL IN ONE PIECE.				
	<i>Gross.</i>			<i>Per cent.</i>
1918.....	942	\$2,839	\$113	3.98
1919.....	12,066	12,202	1,448	11.87
1920.....	5,142	9,091	617	6.79
1921 (9 months).....	1,740	3,770		
ALL OTHER METALLIC PENS, N. S. P. F.				
1918.....	546,969	\$193,040	\$43,758	22.67
1919.....	572,604	265,066	45,808	17.28
1920.....	923,597	390,920	73,888	18.90
1921 (9 months).....	384,169	166,036		

*Exports* in 1914 were 295,525 gross, valued at \$116,501, going to the United Kingdom, British India, Germany, and Canada. Later exports of metallic pens (except gold) have been as follows (calendar years):

	1918	1919	1920	1921 (9 months).
Quantity (gross).....	465,028	1,098,677	968,809	129,740
Value.....	\$231,345	\$569,239	\$489,826	\$83,165

The principal countries of destination were: In 1919, United Kingdom, British India, Brazil, Cuba; in 1920, United Kingdom, Brazil, British India, and Cuba.

### PARAGRAPH 352.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 352. Penholder tips, penholders and parts thereof, gold pens, combination penholders comprising penholders, pencil, rubber eraser, automatic stamp, or other attachments, 25 cents per gross and 20 per centum ad valorem; mechanical pencils made of base metal and not plated with gold, silver, or platinum, 45 cents per gross and 20 per centum ad valorem: *Provided*, That pens and penholders shall be assessed for duty separately.

ACT OF 1909.

ACT OF 1913.

PAR. 187. Penholder tips, penholders and parts thereof, five cents per gross and twenty-five per centum ad valorem; gold pens, twenty-five per centum ad valorem; \* \* \* combination penholders, comprising penholder, pencil, rubber eraser, automatic stamp, or other attachment, forty per centum ad valorem: *Provided*, That pens and penholders shall be assessed for duty separately.

PAR. 157. Penholder tips, penholders and parts thereof, gold pens, \* \* \* combination penholders, comprising penholder, pencil, rubber eraser, automatic stamp, or other attachment, 25 per centum ad valorem: *Provided*, That pens and penholders shall be assessed for duty separately.

### PENHOLDERS, ETC.

(See Survey C-24.)

*Description and uses.*—A penholder tip is the end of a penholder designed for holding a pen, and made as a separate part of the penholder.

Gold pens are superior to steel pens in flexibility and durability and are essential in fountain pens, the gold being alloyed with silver and copper and protected by an iridium point.

Combination penholders consist of tubes made to hold a reversible tube at either end, in one of which is a penholder tip with or without pen and in the other a lead pencil, rubber eraser, or other attachment.

Mechanical metal pencils have a hollow center throughout the length for insertion of pencil lead, one end of which protrudes to form the point of the pencil which may be regulated mechanically.

*Production.*—In 1914 there were 12 manufacturers of gold pens, with 246 wage earners, a capital of \$408,228, wages of \$174,209, cost of materials \$301,893, and value of product \$642,461. In 1919 there were 15 manufacturers, with an output valued at \$1,801,000.

*Imports.*—In 1914 imports of penholder tips were 15,420 gross, valued at \$16,615; and of combination penholders, \$11,257. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
PENHOLDER TIPS, PENHOLDERS, AND PARTS THEREOF.				
	<i>Gross.</i>			<i>Per cent.</i>
1918.....	8,054	\$4,419	\$1,105	25
1919.....	8,141	6,505	1,626	25
1920.....	9,515	9,737	2,434	25
1921 (9 months).....	8,133	7,224		

COMBINATION PENHOLDERS COMPRISING PENHOLDERS, PENCIL, RUBBER, ERASER, ETC.

	<i>Gross.</i>			<i>Per cent.</i>
1918.....		\$1,424	\$356	25
1919.....	310	357	89	25
1920.....	1,441	2,589	647	25
1921 (9 months).....	361	606		

Very few gold pens are imported. In 1920 there were but 19 recorded, valued at \$362.

*Exports.*—In 1914 exports of penholders were 79,648 gross, valued at \$88,056, of which \$57,446 worth went to Europe (mainly England), \$19,914 to North America, \$7,576 to South America, and \$3,120 to all other countries. Exports of penholders for the calendar years 1918 to 1921 have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (gross).....	59,666	112,674	107,042	59,542
Value.....	\$114,031	\$200,354	\$223,376	\$146,045

The principal countries of destination were: In 1919, United Kingdom, Canada, Brazil, Argentina; in 1920, United Kingdom, Canada, Argentina, British India.

*Important changes in classification.*—A provision for mechanical pencils, not plated with precious metals, is added. (Other mechanical pencils are dutiable under par. 1449 or par. 1428.)

## PARAGRAPH 353.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 353. Fountain pens, fountain-pen holders, stylographic pens, and parts thereof, valued at not more than \$2 per dozen, 72 cents per dozen; valued at more than \$2 and not more than \$6 per dozen, \$1.50 per dozen; and in addition thereto, on all of the foregoing, 25 per cent ad valorem: *Provided*, That the value of cartons and fillers shall be included in the dutiable value.

## ACT OF 1909.

PAR. 187. \* \* \* fountain pens, stylographic pens, thirty per centum ad valorem; \* \* \*

## ACT OF 1913.

PAR. 157. \* \* \* fountain pens, and stylographic pens; \* \* \* 25 per centum ad valorem: \* \* \*

## FOUNTAIN PENS, ETC.

(See Survey C-24.)

*Description and uses.*—Stylographic pens, like fountain pens, have a reservoir to hold the ink. The point of a stylographic pen is tubular and pencil shaped, with a needle playing in it which releases the ink when pressed on the paper. This form of pen is especially useful for manifolding with carbon paper.

*Production.*—In 1914 there were 55 manufacturers of fountain and stylographic pens, with 1,154 wage earners, a capital of \$3,269,809, wages of \$717,533, cost of material \$1,614,145, and value of product \$6,865,074. In 1919 there were 56 manufacturers with an output valued at \$15,997,000.

*Imports* in 1914 of fountain and stylographic pens were valued at \$51,526; later imports of fountain pens, fountain-pen holders, stylographic pens, and parts thereof have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Gross.</i>			<i>Per cent.</i>
1918.....		\$4,408	\$1,102	25
1919.....	817	12,169	3,042	25
1920.....	1,861	70,083	17,521	25
1921 (9 months).....	2,360	51,482		

*Exports.*—In 1914 the exports of fountain pens were 332,935, valued at \$326,966, about two-thirds going to England and most of the rest to Canada, France, and Brazil. Exports of fountain pens for the calendar years, 1918–1921 have been as follows:

	1918	1919	1920	1921 (9 months)
Quantity (number).....	161,399	423,906	465,300	147,023
Value.....	\$123,952	\$409,517	\$513,410	\$197,569

The principal countries of destination were, in 1919, Canada, British India, Denmark, Spain; in 1920, Italy, British India, France, Spain.

*Important changes in classification.*—Fountain-pen holders, are specifically provided for, also "parts". Cartons and fillers are included in the dutiable value. The value of these pens has been limited to \$6 per dozen.

*Suggested changes.*—No provision has been made for fountain pens, etc. valued at more than \$6 per dozen.

### PARAGRAPH 354.

H. R. 7456.

SENATE AMENDMENTS

PAR. 354. Penknives, pocketknives, clasp knives, pruning knives, budding knives, erasers, manicure knives, and all knives by whatever name known, including such as are denominatively mentioned in this Act, which have folding or other than fixed blades or attachments, valued at not more than 40 cents per dozen, 40 per centum ad valorem; valued at more than 40 and not more than 50 cents per dozen, 1 cent each and 30 per centum ad valorem; valued at more than 50 cents and not more than \$1.25 per dozen, 5 cents each and 30 per centum ad valorem; valued at more than \$1.25 and not more than \$3 per dozen, 10 cents each and 30 per centum ad valorem; valued at more than \$3 and not more than \$8 per dozen, 20 cents each and 30 per centum ad valorem; valued at more than \$8 per dozen, 30 cents each and 30 per centum ad valorem; blades, handles, or other parts of any of the foregoing knives or erasers shall be dutiable at not less than the rate herein imposed upon knives and erasers valued at more than 50 cents and not exceeding \$1.25 per dozen; cuticle knives, corn knives, nail files, tweezers, hand forceps, and parts thereof, finished or unfinished, by whatever name known, 40 per centum ad valorem: *Provided*, That any of the foregoing, if imported in the condition of assembled, but not fully finished, shall be dutiable at not less than the rate of duty herein imposed upon fully finished articles of the same material and quality, but not less in any case than 15 cents each and 35 per centum ad valorem: *Provided further*, That all the articles specified in this paragraph, when imported, shall have the name of the maker and beneath the same the name of the country of origin die sunk conspicuously and indelibly on the shank or tang of at least one or, if practicable, each and every blade thereof.

## ACT OF 1909.

PAR. 152. Penknives, pocketknives, clasp knives, pruning knives, budding knives, erasers, manicure knives, and all knives by whatever name known, including such as are denominatively mentioned in this section, which have folding or other than fixed blades or attachments, valued at not more than forty cents per dozen, forty per centum ad valorem; valued at more than forty cents per dozen and not exceeding fifty cents per dozen, one cent per piece and forty per centum ad valorem; valued at more than fifty cents per dozen and not exceeding one dollar and twenty-five cents per dozen, five cents per piece and forty per centum ad valorem; valued at more than one dollar and twenty-five cents per dozen and not exceeding three dollars per dozen, ten cents per piece and forty per centum ad valorem; valued at more than three dollars per dozen, twenty cents per piece and forty per centum ad valorem: *Provided*, That any of the foregoing knives or erasers, if imported in the condition of assembled, but not fully finished, shall be dutiable at not less than the rate of duty herein imposed upon fully finished knives and erasers of the same material and quality, but not less in any case than ten cents each and forty per centum ad valorem: *Provided further*, That blades, handles, or other parts of any of the foregoing knives or erasers shall be dutiable at not less than the rate herein imposed upon knives and erasers valued at more than fifty cents per dozen and not exceeding one dollar and twenty-five cents per dozen; \* \* \* *Provided further*, That on and after October first, nineteen hundred and nine, all the articles specified in this paragraph shall when imported have the name of the maker or purchaser and beneath the same the name of the country of origin die-sunk conspicuously and indelibly on the shank or tang of at least one or, if practicable, each and every blade thereof. \* \* \*

[No corresponding provision for the other commodities.]

## ACT OF 1913.

PAR. 128. Penknives, pocketknives, clasp knives, pruning knives, budding knives, erasers, manicure knives, and all knives by whatever name known, including such as are denominatively mentioned in this section, which have folding or other than fixed blades or attachments, \* \* \* all the foregoing, whether assembled but not fully finished or finished; valued at not more than \$1 per dozen, 35 per centum ad valorem; valued at more than \$1 per dozen, 55 per centum ad valorem: *Provided*, That blades, handles, or other parts of any of the foregoing knives, \* \* \* or erasers shall be dutiable at not less than the rate herein imposed upon the knives, \* \* \* and erasers, of which they are parts. \* \* \* *Provided further*, That all articles specified in this paragraph shall, when imported, have the name of the maker or purchaser and beneath the same the name of the country of origin die-sunk conspicuously and indelibly on the blade, shank, or tang of at least one or, if practicable, each and every blade thereof.

[No corresponding provision for the other commodities.]

## PENKNIVES, POCKETKNIVES, ETC.

(See Survey C-13.)

*Description and uses.*—The distinctive feature of the pocketknife is that the blade folds into the handle. All such knives, as well as other knives named, are included under paragraph 354.

*Production* of penknives and pocketknives was valued at \$4,177,000 in 1914. Domestic manufacturers ordinarily specialize in a particular article, and generally all stages in manufacturing are performed in the same establishment, though there is some trade in parts. Factories in Germany and Great Britain, on the other hand,

specialize in the parts, and the final manufacturer is often simply an assembler of parts. The structure of these knives is complicated, and they are demanded in almost endless variety. In addition, the industry is one requiring highly skilled hand labor which commands higher wages than are paid in Europe. The nature of the product, which largely resists the use of machine processes, renders inapplicable our characteristic advantages in production.

New York, Connecticut, Ohio, and Pennsylvania lead in the domestic manufacture of penknives and pocketknives. Germany, Great Britain, and France, each sending some output to our market, are the principal foreign producers.

Imports in 1914 were valued at over \$1,300,000 (31 per cent of the domestic production), and at \$57,000 in 1918. Preceding the war Germany furnished 80 per cent and Great Britain 16 per cent of these imports. Very cheap knives, retailing from 5 to 10 cents, form the bulk of the imports. Importation of the best grades, penknives particularly, is also important. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
<b>PENKNIVES, POCKETKNIVES, ETC., FINISHED—TOTAL, ALL KINDS.</b>				
	<i>Dozen.</i>			<i>Per cent.</i>
1918.....	85,641	\$82,189	\$37,975	46.20

1921 (9 months).....	5,290	2,626	.....	.....

*Exports.*—Exports are very small and statistics are not available.

*Important changes in classification.*—The articles are separated into six classes, according to value, and compound rates of duty are provided which increase with the value of each class. Cuticle knives, corn knives, nail files, tweezers, hand forceps, and parts thereof, are specifically provided for. Razors and razor blades and handles have been classified in a separate paragraph (358). Scissors and shears, and blades also have been classified in a separate paragraph (357). A provision has been made that if any of the articles in this paragraph be imported in the condition of assembled, but not fully finished, they shall be dutiable at not less than the rate of duty herein imposed upon fully finished articles of the same material and quality, but not less in any case than 15 cents each and 35 per centum ad valorem. There is also a provision that blades, handles, or other parts of the knives and erasers enumerated in this paragraph shall be dutiable at not less than the rate imposed upon knives and erasers valued at more than 50 cents and not exceeding \$1.25 per dozen, while the act of 1913 provides that these articles shall be dutiable at not less than the rate imposed upon the knives and erasers, of which they are parts. Provision in the second proviso for the name of the purchaser has been omitted.

## PARAGRAPH 355.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 355. Table, butchers', carving, cooks', hunting, kitchen, bread, cake, pie, slicing, cigar, butter, vegetable, fruit, cheese, canning, fish, carpenters' bench, curriers', drawing, farriers', fleshing, hay, sugar-beet, beet-topping, tanners', plumbers', painters', palette, artists', shoe and similar knives, forks, and steels, and cleavers, all the foregoing, finished or unfinished, not specially provided for, with or without handles of mother-of-pearl, shell, ivory, deer, or other animal horn, silver, nickel silver, or other metal than iron or steel, 16 cents each; with handles of hard rubber, solid bone, celluloid, or any pyroxylin, casein, or similar material, 8 cents each; with handles of any other material, if less than four inches in length, exclusive of handle, 3 cents each; if four inches in length or over, exclusive of handle, 8 cents each; and in addition thereto, on all of the foregoing, 35 per centum ad valorem: *Provided*, That all articles specified in this paragraph when imported, shall have the name of the maker and beneath the same the name of the country of origin die-sunk legibly and indelibly upon the blade in a place that shall not be covered.

## ACT OF 1909.

PAR. 154. Table, butchers', carving, cooks', hunting, kitchen, bread, butter, vegetable, fruit, cheese, carpenters' bench, curriers', drawing, farriers', fleshing, hay, tanners', plumbers', painters', palette, artists', and shoe knives, forks and steels, finished or unfinished; if imported with handles of mother-of-pearl, shell, ivory, silver, nicked silver, or other metal than iron or steel, fourteen cents each; with handles of deerhorn, ten cents each; with handles of hard rubber, solid bone, celluloid, or any pyroxyline material, four cents each; with handles of any other material than those above mentioned, one cent each, and in addition, on all the above articles, fifteen per centum ad valorem; any of the knives, forks or steels, enumerated in this paragraph, if imported without handles, forty per centum ad valorem: *Provided*, That none of the above-named articles shall pay a less rate of duty than 40 per centum ad valorem: *Provided*, That all the articles specified in this paragraph when imported on and after October first, nineteen hundred and nine, shall have the name of the maker or purchaser and beneath the same the name of the country of origin indelibly stamped or branded thereon in a place that shall not be covered thereafter.

## ACT OF 1913.

PAR. 130. Table, butchers', carving, cooks', hunting, kitchen, bread, butter, vegetable, fruit, cheese, carpenters' bench, curriers', drawing, farriers', fleshing, hay, tanners', plumbers', painters', palette, artists', and shoe knives, forks and steels, finished or unfinished, without handles, 25 per centum ad valorem; with handles, 30 per centum ad valorem: *Provided*, That all the articles specified in this paragraph, when imported, shall have the name of the maker or purchaser, and beneath the same the name of the country of origin indelibly stamped or branded thereon in a place that shall not be covered thereafter.

## TABLE AND OTHER CUTLERY.

(See Survey C-13.)

*Description and uses.*—The name of the article indicates its use.

*Production.*—The Census recorded the production of "table" and "other" cutlery at \$8,863,000 in 1914. Later figures for these classes of cutlery are not yet available. Preliminary Census figures for all classes of cutlery and edge tools for 1919 show an output valued at \$62,526,000. About 30 or 40 per cent of this value is covered by articles in this paragraph. New York, Connecticut, and Massachusetts are important producing States.

Steel cutlery is largely superseded by plated ware, for the manufacture of which the American factory methods are better adapted than to that of steel table cutlery. Domestic production of the latter does not supply the entire market.

*Imports* in 1914, of which table cutlery formed the bulk, were valued at \$333,576. Prior to the war Germany and Great Britain together (about equally) furnished 80 per cent and France almost all the rest of the imports. In 1920 these ratios were not greatly different, except that Japan furnished a rather considerable amount. Later imports of cutlery have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
----------------	-----------	--------	-------	------------------

## TABLE, CARVING, COOKS', KITCHEN, ETC., WITH HANDLES.

	Dozen.			Per cent.

1921 (9 months).....	45,531	87,913	.....	.....

## BUTCHERS', HUNTING, CARPENTERS', BENCH, CURRIERS', DRAWING, FARRIERS', FLESHING, HAY, TANNERS', PLUMBERS', PALETTE, ARTISTS', AND SHOE KNIVES—WITHOUT HANDLES.

1918.....	69	\$214	\$53	25
1919.....	267	721	180	25
1920.....	5,791	6,354	1,588	25
1921 (9 months).....	1,358	2,672	.....	.....

*Exports* of table cutlery were valued at only \$168,623 in 1914. Exports since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Table cutlery.....	\$831,744	\$2,379,848	\$3,458,756	\$1,082,660
All other cutlery.....	2,499,775	3,606,376	3,999,082	1,072,282

The principal countries of destination of table cutlery were, in 1919, Brazil, Argentina, and Norway; in 1920, Brazil, Argentina, and Sweden.

The principal countries of destination of all other cutlery were, in 1919, Canada, Brazil, Argentina; in 1920, Canada, Cuba, Brazil.

*Important changes in classification.*—Cake, pie, slicing, cigar, canning, fish, sugar-beet, beet topping, and similar knives, and cleavers are added. The articles are divided into four classes, according to kind or length of handles, and compound, instead of ad valorem, rates of duty are given to each class; provision for the name of the purchaser is omitted, and the name of the maker is required to be die sunk, instead of stamped or branded, on the article.

### PARAGRAPH 356.

#### H. R. 7456.

#### SENATE AMENDMENTS.

PAR. 356. Planing-machine knives, tannery and leather knives, tobacco knives, paper and pulp mill knives, roll bars, bedplates, and all other stock-treating parts for pulp and paper machinery, shear blades, circular cloth cutters, circular cork cutters, circular cigarette cutters, meat slicing cutters, and all other cutting knives and blades used in power or hand machines, 35 per centum ad valorem.

#### ACT OF 1909.

#### ACT OF 1913.

[No corresponding provision.]

[No corresponding provision.]

#### POWER, OR HAND MACHINE KNIVES.

*Description and uses.*—Planing-machine knives are used mainly on wood-working machines, and rarely for metalworking. Tannery and leather knives are employed to remove the flesh and hair from leather skins, and to split leather. These knives are known as fleshing, shaving, whitening blades, and bark knives. Paper and pulp mill knives are made of a straight piece of steel and used on "roll" or "fly" bars of beater engines, and on chippers and cutters. Slitter knives are of circular form and used in paper machines for slitting, or cutting, the paper lengthwise. A roll bar is a metal

cylinder about 4 or 5 feet in diameter with heavy knives parallel with the shaft fitted into its face. A bedplate is a series of steel plates standing on edge and bolted together. The "stock," or rough paper material, passes between the revolving "roll bar" and the stationary "bedplate" to be cut up. The names of the other kinds of knives mentioned in the paragraph indicate the kinds and their uses.

*Production, imports, and exports.*—No data available.

*Important changes in classification.*—A new provision.

### PARAGRAPH 357.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 357. Steel laid scissors and shears, and blades for the same, finished or unfinished, 10 cents each and 30 per centum ad valorem; all other scissors and shears, and blades for the same, finished or unfinished, valued at not more than 50 cents per dozen, 3 cents each and 35 per centum ad valorem; valued at more than 50 cents and not more than \$1.75 per dozen, 15 cents each and 35 per centum ad valorem; valued at more than \$1.75 per dozen, 20 cents each and 35 per centum ad valorem: *Provided*, That all articles specified in this paragraph, when imported, shall have the name of the maker and beneath the same the name of the country of origin die-sunk conspicuously and indelibly on the outside of the blade between the screw or rivet and the handle.

#### ACT OF 1909.

PAR. 152. \* \* \* *Provided further*, That on and after October first, nineteen hundred and nine, all the articles specified in this paragraph shall when imported have the name of the maker or purchaser and beneath the same the name of the country of origin die-sunk conspicuously and indelibly on the shank or tang of at least one or, if practicable, each and every blade thereof. Scissors and shears, and blades for the same, finished or unfinished, valued at not more than fifty cents per dozen, fifteen cents per dozen and fifteen per centum ad valorem; valued at more than fifty cents and not more than one dollar and seventy-five cents per dozen, fifty cents per dozen and fifteen per centum ad valorem; valued at more than one dollar and seventy-cents per dozen, seventy-five cents per dozen and twenty-five per centum ad valorem.

#### ACT OF 1913.

PAR. 128. \* \* \* Scissors and shears, and blades for the same, finished or unfinished, 30 per centum ad valorem: *Provided further*, That all articles specified in this paragraph shall, when imported, have the name of the maker or purchaser and beneath the same the name of the country of origin die-sunk conspicuously and indelibly on the blade, shank, or tang of at least one or, if practicable, each and every blade thereof.

## SCISSORS AND SHEARS.

(See Survey C-13.)

*Description and use.*—Shears are distinguished from scissors only by their greater length.

*Production* of scissors and shears, including clippers, was valued at \$2,500,000 in 1914. Manufacturers are located in Connecticut, New Jersey, New York, and other States. The domestic producers of shears supply the domestic market and export as well. The making of "laid" shears—attaching a steel cutting edge to backs and handles of malleable iron—is an American process, not successfully applied abroad. Of scissors, except cheap cast scissors, domestic manufacturers supply only a small portion of the market. Germany was the most important producer of scissors prior to the war.

*Imports* were valued at \$775,000 (31 per cent of domestic production) in 1914. Before the war Germany was the source of 96.5 per cent of the imports, while 83 per cent of the 1918 imports, largely scissors, came from Japan. In 1920 (calendar year), however, 90 per cent of the quantity and 87.5 per cent of the value of the total imports came from Germany. Recent imports of all kinds of scissors and shears, and blades for the same, finished or unfinished, have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Dozen.</i>			<i>Per cent.</i>
1918.....	25,350	\$91,317	\$27,395	30
1919.....	71,330	168,340	50,502	30
1920.....	211,969	518,153	155,446	30
1921 (9 months).....	404,632	787,105	.....	.....

*Exports.*—American-made shears are exported to all parts of the world. No figures are available.

*Important changes in classification.*—Steel-laid scissors and shears, and blades for the same, are separately provided for. Other kinds are divided, according to value, into three classes. The act of 1913 fixes a straight ad valorem rate of duty on scissors and shears, and parts thereof, regardless of kind or class. The requirements concerning marking are different.

*Suggested changes.*—Nail clippers, barbers' clippers, animal clippers, sheep shears, and pruning shears might be added.

Was it intended to impose a specific rate on each of the two blades constituting a part of scissors or shears while the same specific rate would be imposed on the finished article? In other words, was it intended to make the specific duties on the blades alone twice that on the scissors or shears?

Does "outside of the blade," in lines 12 and 13, page 63, mean one blade or both blades?

## PARAGRAPH 358.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 358. Razors, finished or unfinished, valued at less than \$2 per dozen, 10 cents each; valued at \$2 and less than \$3 per dozen, 12 cents each; valued at \$3 and less than \$4 per dozen, 16 cents each; valued at \$4 or more per dozen, 20 cents each; and in addition thereto, on all of the foregoing, 30 per centum ad valorem: *Provided*, That handles, unfinished razors and blades (except for safety razors), safety razors, and safety-razor handles and frames, shall pay no less duty than that imposed on finished razors valued at \$2 per dozen: *Provided further*, That finished or unfinished blades for safety razors shall pay a duty of 1 cent each and 30 per centum ad valorem: *Provided further*, That all articles specified in this paragraph, when imported, shall have the name of the maker and beneath the same the name of the country of origin die-sunk conspicuously and indelibly on the blade or shank or tang of each and every blade and on safety razors and parts thereof.

## ACT OF 1909.

PAR. 152. \* \* \* razors, finished, valued at less than one dollar per dozen, thirty-five per centum ad valorem; valued at one dollar and less than one dollar and fifty cents per dozen, six cents each and thirty-five per centum ad valorem; valued at one dollar and fifty cents and less than two dollars per dozen, ten cents each and thirty-five per centum ad valorem; valued at two dollars and less than three dollars per dozen, twelve cents each and thirty-five per centum ad valorem; valued at three dollars or more per dozen, fifteen cents each and thirty-five per centum ad valorem: *Provided*, That blades (except for safety razors), handles, and unfinished razors shall pay no less duty than that imposed on finished razors valued at two dollars per dozen: *Provided further*, That on and after October first, nineteen hundred and nine, all the articles specified in this paragraph shall when imported have the name of the maker or purchaser and beneath the same the name of the country of origin die-sunk conspicuously and indelibly on the shank or tang of at least one or, if practicable, each and every blade thereof. \* \* \*

## ACT OF 1913.

PAR. 128. \* \* \* razors, all the foregoing, whether assembled but not fully finished or finished; valued at not more than \$1 per dozen, 35 per centum ad valorem; valued at more than \$1 per dozen, 55 per centum ad valorem: *Provided*, That blades, handles, or other parts of any of the foregoing \* \* \* razors, \* \* \* shall be dutiable at not less than the rate herein imposed upon the \* \* \* razors, \* \* \* of which they are parts. \* \* \* *Provided further*, That all articles specified in this paragraph shall, when imported, have the name of the maker or purchaser and beneath the same the name of the country of origin die-sunk conspicuously and indelibly on the blade, shank, or tang of at least one or, if practicable, each and every blade thereof.

## RAZORS.

(See Survey C-13.)

*Production* of razors (safety and straight) was valued at over \$5,000,000 in 1914, New York leading among manufacturing States. Germany and Great Britain are the chief foreign producers.

The best German and English straight razors have a reputation for superiority, which rests on the great technical proficiency of Solingen and Sheffield. Since the war, however, American manufacturers have produced a razor of comparable quality. But the safety razor, by methods of quantity production not fully applicable to the straight razor, has offset any disadvantage America has suffered in producing the latter.

Imports in 1914 were valued at \$473,000. The bulk of these in quantity was of the cheapest grades, not manufactured here; in point of value, the imports of the highest grades were of more importance. Both the cheap and the better grades come from Germany, but only the better grades from Great Britain. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
RAZORS, FINISHED AND UNFINISHED—TOTAL, ALL KINDS.				
	<i>Dozen.</i>			<i>Per cent.</i>
1918.....	5,318	\$24,085	\$13,243	54.98
1919.....	9,312	47,523	26,011	54.73
1920.....	73,296	380,132	208,181	54.77
1921 (9 months).....	101,411	357,886		

RAZORS, FINISHED—VALUED AT MORE THAN \$1 PER DOZEN.				
1918.....	5,294	\$24,066	\$13,236	55
1919.....	8,358	46,889	25,789	55
1920.....	67,516	375,675	206,621	55
1921 (9 months).....	87,687	345,108		

RAZORS, FINISHED—VALUED AT NOT MORE THAN \$1 PER DOZEN.				
1918.....	24	\$19	\$7	35
1919.....	954	634	222	35
1920.....	5,780	4,457	1,500	35
1921 (9 months).....	13,724	12,778		

RAZOR HANDLES, UNFINISHED RAZORS, AND BLADES, ETC.—TOTAL, ALL KINDS.				
1918.....	9,469	\$44,436	\$24,300	54.69
1919.....	6,724	22,939	12,224	53.29
1920.....	15,943	48,832	26,604	54.48
1921 (9 months).....	33,181	15,691		

HANDLES, UNFINISHED RAZORS, AND BLADES, ETC.—VALUED AT MORE THAN \$1 PER DOZEN.				
1918.....	8,489	\$43,739	\$24,056	55
1919.....	4,480	20,979	11,538	55
1920.....	10,192	47,566	26,161	55
1921 (9 months).....	3,226	11,489		

HANDLES, UNFINISHED RAZORS, AND BLADES, ETC.—VALUED AT NOT MORE THAN \$1 PER DOZEN.				
1918.....	980	\$697	\$244	35
1919.....	2,244	1,960	686	35
1920.....	5,751	1,266	443	35
1921 (9 months).....	29,955	4,202		

*Exports.*—Exports in 1914 were valued at \$472,000; in 1918, at \$2,355,000, largely of safety razors. Although straight razors are exported, production in the United States does not satisfy the domestic demand. The values of exports for the calendar years 1918 to 1921 are as follows: 1918, \$1,905,385; 1919, \$4,150,803; 1920, \$5,715,089; 1921 (9 months), \$1,134,956. The principal countries of destination in 1920 were France, Belgium, United Kingdom, and Denmark.

*Important changes in classification.*—Razors are divided, according to value, into four classes, as against two classes in the act of 1913. Safety razors and safety-razor handles and frames have been included in this paragraph and shall pay no less duty than that imposed on finished razors valued at \$2 per dozen. Blades for safety razors are classified separately. There is a provision that "handles, unfinished razors, and blades," etc., shall pay no less duty than that imposed on finished razors valued at \$2 per dozen, while the act of 1913 provides that blades, handles, or other parts shall be dutiable at not less than the rate imposed upon the razors of which they are parts.

*Suggested changes.*—Page 64, line 3: Insert "or indelibly etched" after the words "die-sunk" because if the name of the maker and country of origin is die-sunk on a safety-razor blade, it spoils the blade. Strike out hyphen between die and sunk to agree with paragraphs 354 and 361.

---

### PARAGRAPH 359.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 359. Surgical and dental instruments, or parts thereof, composed wholly or in part of iron, steel, copper, brass, nickel, aluminum, or other metal, finished or unfinished, valued at not more than \$5 per dozen, 60 cents per dozen; valued at more than \$5 per dozen, 12 cents per dozen for each \$1 per dozen of such value; and in addition thereto, on all of the foregoing, 35 per centum ad valorem: *Provided*, That all articles specified in this paragraph, when imported, shall have the name of the maker and beneath the same the country of origin die-sunk conspicuously and indelibly on the outside, or if a jointed instrument on the outside when closed.

ACT OF 1909.

PAR. 199. Articles or wares not specially provided for in this section, composed wholly or in part of iron, steel, lead, copper, nickel, pewter, zinc, gold, silver, platinum, aluminum, or other metal, and whether partly or wholly manufactured, forty-five per centum ad valorem.

ACT OF 1913.

PAR. 167. Articles or wares not specially provided for in this section; if composed wholly or in part of platinum, gold, or silver, and articles or wares plated with gold or silver, and whether partly or wholly manufactured, 50 per centum ad valorem; if composed wholly or in chief value of iron, steel, lead, copper, brass, nickel, pewter, zinc, aluminum, or other metal, but not plated with gold or silver, and whether partly or wholly manufactured, 20 per centum ad valorem.

## SURGICAL INSTRUMENTS.

(See Survey C-30.)

*Description and use.*—The bulk of the surgical instruments made in the United States prior to 1914 was what is known as soft-metal goods, i. e., those composed of brass, copper, or nickel silver. Steel instruments were never produced in this country in quantities before the war.

*Production.*—Manufacturers of surgical instruments must produce a large number of different styles of each class of instrument and, therefore, can not place production of any one type on a quantity basis. Surgical instruments in 1914 were produced by about 40 establishments, and the total value of the production was roughly \$1,400,000; of this amount \$1,000,000 represents the value of soft-metal goods and \$400,000 the value of steel instruments. The war caused a great expansion in the industry in this country, as no German instruments had been received since the early months of 1916. The product of American factories in 1917 was valued at \$3,385,000, of which \$1,927,000 represented soft-metal goods and \$1,458,000 steel instruments. The number of workmen employed increased from 958 in April, 1914, to 2,128 in April, 1918.

*Imports.*—Practically 80 per cent of the steel instruments used in the United States were of foreign manufacture, chiefly German. The war caused a shortage which has been somewhat relieved since the beginning of 1917 by the importation of steel instruments from Japan. Japanese instruments are on the whole of inferior quality and often are defective.

*Exports.*—In the fiscal year 1914 exports of surgical and medical instruments amounted to \$206,421, of which nearly three-fourths went to Canada. During the war there was at times a considerable demand from Europe for certain classes of instruments, and exports to other parts of the world also increased rapidly. Statistics for the calendar years 1918 to 1921 follow:

1918.....	\$771, 282
1919.....	854, 279
1920.....	848, 370
1921 (9 months).....	422, 516

About one-half of the exports have gone to Canada; the remainder has been rather widely distributed.

## DENTAL INSTRUMENTS.

(See Survey B-10.)

*Description and use.*—Dental instruments are made almost exclusively of steel and include a large number of standard tools. Although there is some demand for instruments of special design, it is not comparable to that for surgical instruments.

*Production.*—The dental appliance, instrument, and supply industry produces sufficient material to furnish the home market, and exports large quantities of its products to all the world's markets. Dental instruments are more nearly standardized than surgical instruments and can therefore be manufactured in quantity.

*Imports.*—There is practically no importation of dental instruments.

*Exports.*—The export business absorbs a considerable proportion of the entire production, a proportion which is estimated at over 35 per cent. These exports amounted to over \$1,100,000 in 1913, and to almost \$10,800,000 in 1919.

*Important changes in classification.*—A new provision.

*Suggested changes.*—It has been represented that because of different competitive positions surgical and dental instruments might be separated.

“The country of origin die sunk” should be made to read “the name of the country of origin die sunk.”

To assure the classification in this paragraph of scissors and other surgical instruments, specially provided for elsewhere in H. R. 7456, it is suggested that the words “of all kinds whatsoever” be inserted after the word “instruments” and before the comma in line 6 at page 64.

Page 64, line 6: Change “or” to “and” before “parts.”

Page 64, line 15: Strike out hyphen between die and sunk to agree with paragraphs 354 and 361.

### PARAGRAPH 360.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 360. Philosophical, scientific, and laboratory instruments, apparatus, utensils, appliances (including drawing, surveying, and mathematical instruments), and parts thereof, composed wholly or in chief value of metal, and not plated with gold, silver, or platinum, finished or unfinished, not specially provided for, 40 per centum ad valorem: *Provided*, That all articles specified in this paragraph, when imported, shall have the name of the maker and beneath the same the country of origin die-sunk conspicuously and indelibly on the outside, or if a jointed instrument on the outside when closed.

ACT OF 1909.

ACT OF 1913.

PAR. 650. Philosophical and scientific apparatus, utensils, instruments, and preparations,<sup>2</sup> including bottles and boxes containing the same, specially imported in good faith for the use and by order of any society or institution incorporated or established solely for religious, philosophical, educational, scientific, or literary purposes, or for the encouragement of the fine arts, or for the use and by order of any college, academy, school, or seminary of learning in the United States, or any state or public library, and not for sale, subject to such regulations as the Secretary of the Treasury shall prescribe [Free].

PAR. 573. Philosophical and scientific apparatus, utensils, instruments, and preparations,<sup>2</sup> including bottles and boxes containing the same, specially imported in good faith for the use and by order of any society or institution incorporated or established solely for religious, philosophical, educational, scientific, or literary purposes, or for the encouragement of the fine arts, or for the use and by order of any college, academy, school, or seminary of learning in the United States, or any State or public library, and not for sale, and articles solely for experimental purposes, when imported by any society or institution of the character herein described, subject to such regulations as the Secretary of the Treasury shall prescribe [Free].

<sup>2</sup> Preparations classable under H. R. 7456 according to component materials.

## ACT OF 1909.

PAR. 653. \* \* \* vases, retorts, and other apparatus, vessels, and parts thereof, composed of platinum, for chemical uses [Free].

PAR. 199. Articles or wares not specially provided for in this section, composed wholly or in part of iron, steel, lead, copper, nickel, pewter, zinc, gold, silver, platinum, aluminum, or other metal, and whether partly or wholly manufactured, forty-five per centum ad valorem.

## ACT OF 1913.

PAR. 578. \* \* \* vases, retorts, and other apparatus, vessels, and parts thereof, composed of platinum, for chemical uses [Free].

PAR. 167. Articles or wares not specially provided for in this section; if composed wholly or in part of platinum, gold, or silver, and articles or wares plated with gold or silver, and whether partly or wholly manufactured, 50 per centum ad valorem; if composed wholly or in chief value of iron, steel, lead, copper, brass, nickel, pewter, zinc, aluminum, or other metal, but not plated with gold or silver, and whether partly or wholly manufactured, 20 per centum ad valorem.

## PHILOSOPHICAL, SCIENTIFIC, AND LABORATORY INSTRUMENTS.

(See Survey B-10.)

*Description and uses.*—The term “scientific instruments” covers a large variety of articles intended for the accurate observation and measurement of natural phenomena. Most important among them are engineering, physical, chemical, and medical instruments of various kinds, used for the measurement of weight, volume, length, heat, temperature, light, color, and time.

*Production* in 1914, excluding medical and surgical instruments, was reported as valued at \$15,000,000. In general those instruments which before the war had a sufficiently large market to permit large-scale production were produced here successfully; but certain instruments of high precision, for which the demand was not large and for which skillful hand labor was necessary, were imported. Germany, with a world-wide reputation based upon skilled hand labor trained for generations, was the chief producer. During the war, however, foreign competition was removed and domestic production expanded in volume and variety.

*Imports* in 1914 were valued at \$704,496. These figures include certain articles in addition to scientific instruments, such as chemical ware and exclude scientific instruments not admitted free; hence they can not properly be used in comparison with production and export figures. Of the imports in 1914, 80 per cent came from Germany; the remainder mainly from England and France. In 1918 about 84 per cent of the imports came from England, Japan, and Canada. In 1914 imports of vases, retorts, and other apparatus, vessels, and parts of, composed of platinum, for chemical uses were valued at \$82,000; total imports of platinum and manufactures of platinum, including a small quantity of ore, were valued at \$3,982,708. Later imports have been as follows (calendar years):

	1918	1919	1920	1921 (9 months).
Platinum vases, retorts, and other apparatus, vessels, and parts of, for chemical use:				
Quantity (ounces, Troy).....		22	781	58
Value.....	\$2,750	\$2,672	\$78,697	\$6,718
Philosophical and scientific apparatus, etc., all other, value.....	\$51,972	\$71,453	\$151,334	\$142,314

*Exports of scientific instruments, other than those used for medical, surgical, and optical purposes, in 1914, amounted to \$689,366, more than one-half of which went to Canada; the remainder was widely distributed. In 1918 the exports were destined mainly to Canada, England, France, Russia, Chile, Japan, and Spain.*

Exports of manufactures of platinum in 1914 were valued at \$71,172, about 75 per cent of which went to Canada, and nearly all the rest to Germany. Exports of scientific instruments for recent calendar years have been valued as follows: 1918, \$2,921,474; 1919, \$3,550,261; 1920, \$3,995,484; 1921 (9 months), \$2,266,598.

*Important changes in classification.*—This paragraph makes dutiable philosophical or scientific instruments for institutions. Laboratory instruments, apparatus, and appliances (including drawing, surveying, and mathematical instruments), and parts thereof, composed of metal, finished or unfinished, and not plated with gold, silver, or platinum, have been added. The proviso is new.

*Conflicting provisions.*—Surveying instruments are mentioned in both paragraphs 228 and 360; parts of surveying instruments are provided for only in paragraph 360.

*Suggested changes.*—"Surveying" might be stricken out of paragraph 360. This might, however, restrict the specific provision for surveying instruments to those that are optical. If it should be desired to have all surveying instruments wholly or in chief value of metal specially provided for, the word "surveying" should be taken out of paragraph 228 and left in paragraph 360.

"The name of" should be inserted just before "the country of origin."

Under the wording of this paragraph, philosophical, scientific and laboratory instruments, etc., wholly or in chief value of gold, silver, or platinum, would be included although such instruments, etc., plated with precious metals are excluded. If it should be desired to make the exclusion complete, insertion of the word "base" before "metal" in line 21, page 64, would accomplish the purpose.

Page 65, line 1: Strike out the hyphen between die and sunk to agree with paragraphs 354 and 361.

---

### PARAGRAPH 361.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 361. Pliers, pincers, and nippers of all kinds, finished or unfinished, four inches in length and under, 8 cents each; over four and not over six inches in length, 10 cents each; over six inches in length, 12 cents each; and in addition thereto on all of the foregoing 25 per centum ad valorem: *Provided*, That all articles specified in this paragraph, when imported, shall have the name of the maker and beneath the same the name of the country of origin die sunk conspicuously and indelibly on the outside of the joint.

## ACT OF 1909. ACT OF 1913.

PAR. 198. Nippers and pliers of all kinds (except blacksmiths' tongs, surgical and dental instruments or parts thereof), wholly or partly manufactured, eight cents per pound and forty per centum ad valorem.

PAR. 166. Nippers and pliers of all kinds wholly or partly manufactured, 30 per centum ad valorem.

## NIPPERS AND PLIERS.

(See Survey C-9.)

*Description and uses.*—Nippers and pliers are tools ordinarily having two lever handles and two jaws working on a pivot, for grasping or cutting small objects. Pliers have numerous forms and sizes for many purposes. Two of the most important uses are in bending and cutting wire and in screwing or unscrewing gas burners or gas pipes. They are much employed by linemen, electricians, plumbers, mechanics, farmers, and in the household. Weavers' nippers are composed of two narrow strips of steel welded together at one end and having sharp cutting jaws on the other, and are used by weavers while the cloth is in the loom or to clear the cloth of loose ends after it comes from the loom. Nippers differ from pliers generally in having cutting jaws approximating semicircles in form and meeting only at the ends. A pincer differs but little in form from a nipper, but is commonly distinguished from it in trade. A pincer is designed only for grasping and not for cutting, as, for example, carpenters' pincers and farriers' pincers. Pincers and nippers are less extensively used than pliers.

*Production.*—There are, according to nonofficial report, 32 firms manufacturing pliers and 16 firms making pincers, but no official figures of output are available. The value of domestic production has been estimated at from \$2,000,000 to \$3,000,000 for 1914, and \$8,000,000 to \$10,000,000 for 1918.

*Imports* in 1914 of nippers and pliers of all kinds amounted to \$144,818. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	Number.			Per cent.
1918.....		\$10,065	\$3,019	30
1919.....		40,302	12,091	30
1920.....	100,103	194,445	58,333	30
1921 (9 months).....		226,457		

*Exports.*—Export statistics are lacking, but all classes of nippers, pliers, and pincers have been exported in recent years. It is estimated that 2½ per cent of domestic production is exported.

*Important changes in classification.*—Pincers are added. Pliers, pincers, and nippers are divided into three groups, according to length. The proviso is new.

## PARAGRAPH 362.

## H. R. 7456.

## SENATE AMENDMENTS.

PAR. 362. Files, file blanks, rasps, and floats of all cuts and kinds, two and one-half inches in length and under, 25 cents per dozen; over two and one-half and not over four and one-half inches in length, 47½ cents per dozen; over four and one-half and under seven inches in length, 62½ cents per dozen; seven inches in length and over, 77½ cents per dozen.

## ACT OF 1909.

## ACT OF 1913.

PAR. 155. Files, file-blanks, rasps, and floats, of all cuts and kinds, two and one-half inches in length and under, twenty-five cents per dozen; over two and one-half inches in length and not over four and one-half inches, forty-seven and one-half cents per dozen; over four and one-half inches in length and under seven inches, sixty-two and one-half cents per dozen; seven inches in length and over, seventy-seven and one-half cents per dozen.

PAR. 131. Files, file blanks, rasps, and floats, of all cuts and kinds, 25 per centum ad valorem.

## FILES, FILE BLANKS, RASPS, AND FLOATS.

(See Survey C-13.)

*Description and uses.*—Files are made in varying sizes. Those with raised points, instead of lines, are technically known as rasps, and are used by carpenters, horseshoers, and shoemakers.

Files grade according to fineness. The "cuts" in general use for 12-inch files are classified as follows: First, or coarsest, rough; second, middle; third, bastard; fourth, second cut; fifth, smooth; the finest, dead smooth. Files are used for abrading, reducing, or smoothing metal, ivory, wood, marble, or other resistant materials.

Floats are single cut files of the coarse grades for use on soft metals, wood, or ivory.

*Production.*—In 1914 there were 48 establishments manufacturing files, with 4,349 wage earners, a capital of \$11,327,000, wages of \$2,135,000, cost of materials \$1,595,000, and value of product \$5,608,000. In 1909 there were 57 establishments and the value of product \$5,691,000. In 1919 there were 50 establishments and the value of product \$17,617,000. Pennsylvania, Rhode Island, and New Jersey are among the leading producing States.

*Imports.*—Imports have been small compared with domestic production and exports. The greatest from 1907 to 1920 were in 1914, when imports amounted to \$101,949, which was 1.82 per cent of domestic production. Most of the files entered at New York during the six months from July to December, 1919, came from Switzerland, which country is admittedly the source of files of high quality. Sweden and, more recently, Germany, are also important sources of imports. Later imports of files, file blanks, rasps, and floats of all cuts and kinds have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Dozen.</i>			<i>Per cent.</i>
1918.....	31,713	\$41,384	\$10,346	25
1919.....	33,129	49,855	12,464	25
1920.....	83,197	100,471	25,118	25
1921 (9 months).....	83,396	96,278		

*Exports* for many years have been large. Official statistics are not available prior to the fiscal year 1918, when exports of files and rasps were valued at \$3,681,457, of which \$1,653,933 went to Europe. The five leading countries of destination were: Italy, British India, Australia, England, and Russia in Europe. Exports of files and rasps for recent calendar years have been valued as follows: 1918, \$3,285,385; 1919, \$5,181,792; 1920, \$5,550,619; 1921 (9 months), \$2,155,940. The principal countries of destination were, in 1919, British India, Australia, United Kingdom, Brazil; in 1920, Brazil, United Kingdom, Denmark, British India.

*Important changes in classification.*—H. R. 7456 divides files into four groups.

### PARAGRAPH 363.

#### H. R. 7456.

#### SENATE AMENDMENTS.

PAR. 363. Sword blades, and swords and side arms, irrespective of quality or use, wholly or in part of metal, 40 per centum ad valorem.

#### ACT OF 1909.

#### ACT OF 1913.

PAR. 153. Sword blades, and swords and side arms irrespective of quality or use, in part of metal, fifty per centum ad valorem.

PAR. 129. Sword blades, and swords and side arms, irrespective of quality or use, in part of metal, 30 per centum ad valorem.

### SWORDS AND SWORD BLADES.

(See Survey C-13.)

*Description and uses.*—The term swords, sword blades, and side arms includes bayonets, daggers, foils and foil blades for fencing, and other small arms, but not revolvers and parts thereof, which are specifically enumerated in the provision in paragraph 366 for "pistols, whether automatic, magazine or revolving, or parts thereof and fittings therefor."

*Production.*—Figures for production are not available. The most essential of these articles is the bayonet.

*Imports* have been continuous, but small—in 1914 (fiscal year) valued at \$15,212. Later imports have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Number.</i>			<i>Per cent.</i>
1918.....		\$2,737	\$821	30
1919.....	460	969	289	30
1920.....	6,641	8,084	2,425	30
1921 (9 months).....	39,026	20,543		

*Exports.*—Not recorded. During the war there were large exports of bayonets to Europe.

## PARAGRAPH 364.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 364. Muzzle-loading muskets, shotguns, rifles, and parts thereof, 20 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 156. Muskets, muzzle-loading shotguns, rifles, and parts thereof, twenty-five per centum ad valorem.

PAR. 132. Muskets, \* \* \* muzzle-loading shotguns and rifles, and parts thereof, 15 per centum ad valorem.

## MUZZLE-LOADING GUNS AND RIFLES.

(See Survey C-14.)

*Description, uses, and production.*—The musket, muzzle-loading shotgun, and muzzle-loading rifle are old forms of firearms whose domestic manufacture has been practically discontinued.

*Imports.*—Imports since 1917 have been as follows:

Calendar year.	Value.	Duty.	Ad valorem rate.
1918.....	\$321	\$123	<i>Per cent.</i> 15
1919.....	1,214	182	15
1920.....	12,670	1,900	15
1921 (9 months).....	3,691		

*Exports.*—None recorded.

*Important changes in classification.*—Air rifles were included in the corresponding paragraph (132) of the act of 1913, and are classified with toys in paragraph 1414 of H. R. 7456.

## PARAGRAPH 365.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 365. Double or single barreled sporting breech-loading and repeating shotguns, rifles, and combination shotguns and rifles, valued at not more than \$5 each, \$1.50 each; valued at more than \$5 and not more than \$10 each, \$4 each; valued at more than \$10 and not more than \$25 each, \$6 each; valued at more than \$25 each, \$10 each; and in addition thereto, on all of the foregoing, 35 per centum ad valorem; barrels for sporting breech-loading shotguns and rifles, further advanced in manufacture than rough bored only, \$4 each; stocks for sporting breech-loading shotguns and rifles, wholly or partly manufactured, \$5 each; and in addition thereto, on all of the foregoing, 40 per centum ad valorem; on all parts of such guns or rifles, and fittings for such stocks or barrels, finished or unfinished, 45 per centum ad valorem: *Provided*, That all sporting breech-loading shotguns and rifles imported without a lock or locks or other fittings shall be subject to a duty of \$10 each and 40 per centum ad valorem.

## ACT OF 1909.

PAR. 157. Double-barreled, sporting, breech-loading shotguns, combination shotguns and rifles, valued at not more than five dollars, one dollar and fifty cents each and in addition thereto fifteen per centum ad valorem; valued at more than five dollars and not more than ten dollars, four dollars each and in addition thereto fifteen per centum ad valorem each; valued at more than ten dollars, six dollars each; double barrels for sporting breech-loading shotguns and rifles, further advanced in manufacture than rough bored only, three dollars each; stocks for double-barreled sporting breech-loading shotguns and rifles wholly or partially manufactured, three dollars each; and in addition thereto on all such guns and rifles, valued at more than ten dollars each, and on such stocks and barrels, thirty-five per centum ad valorem; on all other parts of such guns or rifles, and fittings for such stocks or barrels, finished or unfinished, fifty per centum ad valorem: *Provided*, That all double-barreled sporting breech-loading shotguns and rifles imported without a lock or locks or other fittings shall be subject to a duty of six dollars each and thirty-five per centum ad valorem; single-barreled breech-loading shotguns, or parts thereof, except as otherwise specially provided for in this section, one dollar each and thirty-five per centum ad valorem; \* \* \*

## ACT OF 1913.

PAR. 133. Breech-loading shotguns and rifles, combination shotguns and rifles, and parts thereof and fittings therefor, including barrels further advanced than rough bored only; \* \* \* 35 per centum ad valorem.

## BREECH-LOADING SHOTGUNS AND RIFLES.

(See Survey C-14.)

*Description and use.*—Commercial firearms may be divided broadly into three classes—rifles, shotguns, and pistols. Rifles fire a single bullet and may be equipped with a magazine carrying a number of cartridges, which are fed into the firing chamber by the return motion of the breech mechanism after the exploded cartridge case is ejected. Their distinguishing feature is the spiral grooving of the barrel.

Shotguns fire a charge of several small shot. They may be single-barreled, double-barreled, or magazine repeating, and are used almost entirely for sporting purposes.

*Production* of shotguns, rifles, pistols, and parts thereof, in 1914 amounted to \$10,544,000, and is known to have increased enormously during the war. Exports alone in 1918 were valued at nearly five times the entire domestic output in 1914. The value of firearms produced doubled in the 15 years previous to 1914 and increased 25 per cent in the 10 years prior to 1914. At the beginning of the war practically all production of commercial firearms was stopped, and during its progress the supply became exhausted. Practically the entire industry is located in Connecticut, Massachusetts, and New York.

*Imports.*—Imports in general have decreased since 1902, at which time they reached a maximum. Since 1917 they have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
----------------	-----------	--------	-------	------------------

DOUBLE-BARRELED AND COMBINATION SHOTGUNS AND RIFLES.

	Number.			Per cent.
1918.....	22	\$1,619	\$567	35
1919.....	184	9,195	3,218	35
1920.....	2,423	53,607	18,762	35
1921 (9 months).....	1,021	58,376	.....	.....

SINGLE BARRELED, ETC.

1918.....	18	\$228	\$80	35
1919.....	244	5,907	2,067	35
1920.....	7,678	68,535	23,987	35
1921 (9 months).....	2,179	39,719	.....	.....

ALL OTHER PARTS OF GUNS, PISTOLS, OR RIFLES, AND FITTINGS FOR STOCKS, ETC

1918.....	.....	\$10,931	\$3,826	35
1919.....	.....	1,969	689	35
1920.....	.....	6,041	2,114	35
1921 (9 months).....	.....	9,884	.....	.....

BARRELS FOR SPORTING BREECH-LOADING SHOTGUNS AND RIFLES, FURTHER ADVANCED IN MANUFACTURE THAN ROUGH-BORED ONLY.

1919.....	72	\$601	\$210	35
1920.....	3	253	89	35
1921 (9 months).....	4	9	.....	.....

STOCKS FOR SPORTING BREECH-LOADING SHOTGUNS AND RIFLES, WHOLLY OR PARTLY MANUFACTURED.

1920.....	125	\$91	\$32	35
1921 (9 months).....	48	30	.....	.....

*Exports.*—Exports during the four years previous to the war amounted to between three and four million dollars annually, of which approximately one-half went to Latin American countries. In the fiscal year 1914, the exports amounted to over 30 per cent of the production. Exports of rifles and shotguns for the fiscal year 1918 amounted to \$37,299,450, and those of all other firearms were valued at \$11,541,913. Statistics for the calendar years 1918 to 1921 follow:

	1918	1919	1920	1921 (9 months).
Rifles and shotguns.....	\$21,014,509	\$13,414,932	\$3,456,431	\$980,639
All other firearms.....	8,635,963	419,221	711,697	321,098

The principal countries of destination of rifles and shotguns were, in 1918, England, Russia in Asia, France; in 1919, Russia in Asia, Russia in Europe, Belgium, Canada; in 1920, Canada, Australia, Argentina, and Brazil.

*Important changes in classification.*—Shotguns, rifles, and combination shotguns and rifles are divided into four classes according to value, with specific duties for each class and an additional ad valorem duty on all classes.

Repeating shotguns and stocks for shotguns and rifles are mentioned in H. R. 7456, and pistols, which are in the same paragraph with shotguns and rifles in the act of 1913, are provided for in paragraph 366 of H. R. 7456. The provision for repeating shotguns is new.

*Suggested changes.*—Provision is made for shotguns and repeating rifles and combination shotguns and rifles, and for barrels for sporting breech-loading shotguns and rifles, but none for barrels for repeating shotguns, etc. Nor is provision made for shotguns, rifles, and combination shotguns and rifles that are not sporting. If it should be desired to have the paragraph apply as well to arms of those descriptions, the word "sporting" should be omitted from page 66 of H. R. 7456, lines 1, 8, 10, and 15.

There is doubt whether "repeating" embraces more than shotguns.

### PARAGRAPH 366.

#### H. R. 7456.

#### SENATE AMENDMENTS.

PAR. 366. Pistols: Automatic, magazine, or revolving, and parts thereof and fittings therefor, valued at not more than \$4 each, \$1.25 each; valued at more than \$4 and not more than \$8 each, \$2.50 each; valued at more than \$8 each, \$3.50 each; and in addition thereto, on all of the foregoing, 25 per centum ad valorem.

#### ACT OF 1909.

#### ACT OF 1913.

PAR. 157. \* \* \* pistols, automatic, magazine, or revolving, or parts thereof, seventy-five cents each and twenty-five per centum ad valorem.

PAR. 153. \* \* \* pistols, whether automatic, magazine, or revolving, or parts thereof and fittings therefor, 35 per centum ad valorem.

#### PISTOLS.

(See Survey C-14.)

*Description and uses.*—Pistols fire a single bullet and are rifled. They may be single shot (used chiefly for target practice), revolving (called revolvers), or automatic, in which the used shell is ejected, a new cartridge inserted from the magazine, and the arm cocked automatically by the action of the recoil.

*Production.*—There are no separate figures of production of pistols.

*Imports* of pistols and parts thereof for the calendar years 1918 to 1921, have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Number.</i>			<i>Per cent.</i>
1918.....	21	\$165	\$58	35
1919.....	2,270	13,421	4,697	35
1920.....	36,597	169,217	59,226	35
1921 (9 months).....	127,703	452,302		

In 1921, Spain supplied the bulk of the imports and smaller quantities came from Germany and Belgium.

*Exports of revolvers and pistols for the calendar years 1918 to 1921 have been as follows:* 1918, \$592,078; 1919, \$512,145; 1920, \$1,337,400; 1921 (9 months), \$446,059. The principal countries of destination were, in 1918, Italy, England, Canada; in 1919, Canada, United Kingdom, Argentina, Brazil, Japan; in 1920, Argentina, Brazil, Cuba, Uruguay, and Canada.

*Important changes in classification.*—In the act of 1913 pistols were included with shotguns and rifles at the same rate of duty. They are divided into three classes according to value, with a specific rate of duty for each class and an additional ad valorem duty.

---

### PARAGRAPH 367.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 367. Watch movements, whether imported in cases or otherwise, assembled or knocked down for reassembling, if having less than seven jewels, 75 cents each; having seven and not more than eleven jewels, \$1.25 each; having more than eleven and not more than fifteen jewels, \$2 each; having more than fifteen and not more than seventeen jewels, unadjusted, \$2.75 each; having seventeen jewels and adjusted to temperature, \$3.50 each; having seventeen jewels and adjusted to three positions, \$4.75 each; having seventeen jewels and adjusted to five positions, \$6.50 each; having more than seventeen jewels, adjusted or unadjusted, \$10.75 each; watchcases and parts of watches, chronometers, box or ship, and parts thereof, 35 per centum ad valorem; all jewels for use in the manufacture of watches, clocks, meters, or compasses, 10 per centum ad valorem; enameled dials for watches or other instruments, 3 cents per dial and 35 per centum ad valorem: *Provided*, That all watch and clock dials, whether attached to movements or not, when imported shall have indelibly painted or printed thereon the name of the country of origin, and that all watch movements and plates, lever clock movements with jewels in the escapement, assembled or knocked down for reassembling, and cases shall have the name of the manufacturer and the country of manufacture cut, engraved, or die-sunk conspicuously and indelibly on the plate of the movement and the inside of the case, respectively, and the movement and plates shall also have marked thereon by one of the methods indicated the number of jewels and adjustments, said numbers to be expressed both in words and in Arabic numerals, and if the movement is not adjusted, the word "unadjusted" shall be marked thereon by one of the

## H. R. 7456

## SENATE AMENDMENTS.

methods indicated, and none of the aforesaid articles shall be delivered to the importer unless marked in exact conformity to this direction: *Provided further*, That only the number of the jewels which serve a mechanical purpose as frictional bearings shall be marked as herein provided.

## ACT OF 1909.

PAR. 192. Watch movements, including time-detectors, whether imported in cases or not, if having not more than seven jewels, seventy cents each; if having more than seven jewels and not more than eleven jewels, one dollar and thirty-five cents each; if having more than eleven jewels and not more than fifteen jewels, one dollar and eighty-five cents each; if having more than fifteen and not more than seventeen jewels, one dollar and twenty-five cents each and twenty-five per centum ad valorem; if having more than seventeen jewels, three dollars each and twenty-five per centum ad valorem; watch cases and parts of watches, chronometers, box or ship, and parts thereof, forty per centum ad valorem; \* \* \* all jewels for use in the manufacture of watches or clocks, ten per centum ad valorem; enameled dials for watches or other instruments, three cents per dial and forty per centum ad valorem: *Provided*, That all watch and clock dials, whether attached to movements or not, shall have indelibly painted or printed thereon the country of origin, and that all watch movements, lever clock movements with jewels in the escapement, and cases of foreign manufacture shall have the name of the manufacturer and country of manufacture cut, engraved, or die-sunk conspicuously and indelibly on the plate of the movement and the inside of the case, respectively, and the movements shall also have marked thereon by one of the methods indicated the number of jewels and adjustments, said number to be expressed both in words and in Arabic numerals; and none of the aforesaid articles shall be delivered to the importer unless marked in exact conformity to this direction.

## ACT OF 1913.

PAR. 161. Watch movements, whether imported in cases or not, watch cases and parts of watches, chronometers, box or ship, and parts thereof \* \* \* all jewels for use in the manufacture of watches, clocks, or meters, 10 per centum ad valorem; \* \* \* enameled dials and dial plates for watches or other instruments, 30 per centum ad valorem: *Provided*, That all watch and clock dials, whether attached to movements or not, shall have indelibly painted or printed thereon the name of the country of origin, and that all watch movements, and plates, lever clock movements with jewels in the escapement, whether imported assembled or knocked down for reassembling, and cases of foreign manufacture, shall have the name of the manufacturer and country of manufacture cut, engraved, or die-sunk conspicuously and indelibly on the plate of the movement and the inside of the case, respectively, and the movements and plates shall also have marked thereon by one of the methods indicated the number of jewels and adjustments, said numbers to be expressed either in words or in Arabic numerals; and if the movement is not adjusted, the word "unadjusted" shall be marked thereon by one of the methods indicated; and none of the aforesaid articles shall be delivered to the importer unless marked in exact conformity to this direction.

## WATCHES, CHRONOMETERS, DIALS, AND PARTS.

(See Survey C-26.)

## WATCHES AND CHRONOMETERS.

*Description and uses.*—The chronometer, a timepiece of great accuracy, is used on ships or wherever precise measurements of time are required. It differs from the watch in its escapement, which is so constructed that the balance is free from the wheels during the

greater part of its vibration; and also in being fitted with a compensating adjustment to prevent expansion by heat or contraction by cold from affecting the movements. Its balance spring is helicoidal; that of the watch is spiral.

The watch is a small portable timepiece or timekeeper that may be worn on the person. It is operated by power stored in a coiled spring, and is capable of keeping time when held in any position.

Modern watch movements require the use of gold, nickel, brass, steel, and jewels of sapphire, ruby, and garnet. Watch cases are made of gold, silver, nickel, brass, and gun metal, and of various alloys known under trade names as silveroid, nickel silver, and the like.

*Production.*—The principal watch-producing centers are in Massachusetts and Illinois; most of the clocks are manufactured in Connecticut and New York. In 1914 there were 119 establishments, employing 23,328 wage earners, manufacturing watches and clocks and their parts. The capital invested was \$62,470,000, and the value of the product \$35,237,431, of which \$23,267,620 represented the value of watches and parts. Of the 119 establishments, 15 were engaged primarily in the manufacture of watches with a total capital invested of \$36,388,700, 31 establishments were engaged in the manufacture of watch cases with a total capital invested of \$11,220,024, and 25 establishments were engaged in the manufacture of parts of watches and clocks with a total capital invested of \$1,296,290. The consumption of watches in 1914 was approximately \$1,200,000 more in value than the domestic production.

*Imports* of watches and parts of watches for 1911–1915 averaged \$2,729,898 annually. The largest importation of chronometers since 1907 was in 1914, amounting to \$11,109, and the smallest in 1907, valued at \$1,738. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
----------------	-----------	--------	-------	------------------

1918.....		\$21,974		
1919.....		56,151		
1920.....		46,932		
1921 (9 months).....		23,759		

Foreign watches come chiefly from Switzerland.

*Exports.*—From 5 to 7 per cent of American-made watches is exported, chiefly to the United Kingdom and Canada. Exports increased a little in 1919 and 1920, but fell off in 1921.

Exports since 1917 of watches and parts thereof have been by calendar years as follows: 1918, \$1,804,388; 1919, \$2,273,045; 1920, \$2,145,463; 1921 (9 months), \$659,999. The principal countries of destination were: In 1918, Canada, England, Australia; in 1919, Canada, United Kingdom, Argentina, China, Australia; in 1920, Canada, United Kingdom, Cuba, Argentina, and Australia.

## JEWELS.

*Description.*—Jewels used in the manufacture of watches, clocks, and meters include various kinds of stones—agate, garnet, sapphire, diamond, ruby, and also the synthetic or manufactured ruby and sapphire.

*Production.*—Scarcely any jewels are produced in the United States, chiefly because of the lack of skilled workers and experience in jewel manufacture. Fully 95 per cent of the consumption of watch and clock jewels is imported, principally from Switzerland, Germany, and Italy.

*Imports* are from England and France in addition to the countries mentioned. The annual average for the 12-year period 1907–1918, was \$707,932. Imports in later years of jewels for use in the manufacture of watches, clocks, meters, or compasses have been as follows:

Calendar year.	Value.	Duty.	Ad valorem rate.
1918.....	\$943,077	\$94,308	10
1919.....	1,341,473	134,147	10
1920.....	1,853,115	185,311	10
1921 (9 months).....	1,217,772		

*Exports.*—None recorded.

## DIALS.

*Description and uses.*—A dial is the plate or face on which the pointer or index moves for the purpose of indicating time, revolutions, pressure, points of the compass, etc.

*Production.*—Most domestic dials are produced in Waltham, Mass.

*Imports.*—Between 70 and 95 per cent of the annual imports come from Switzerland.

Imports since 1917 of enameled dials for watches or other instruments have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Number.</i>			<i>Per cent.</i>
1918.....		\$7,286	\$2,186	30
1919.....	38,108	14,035	4,211	30
1920.....	52,784	18,487	5,546	30
1921 (9 months).....	139,594	44,559		

*Exports.*—None recorded.

## WATCH CRYSTALS.

[For discussion see par. 238, p. 356.]

## GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—In H. R. 7456, watch movements, whether imported in cases or otherwise, assembled or knocked down for reassembling, have been divided into eight classes, according to the number of jewels and adjustment of each movement, with specific rate of duty on each class and an additional ad valorem rate of duty; watchcases and parts of watches, chronometers, box or ship, and parts thereof, are classed together.

Lever clock movements, etc., which were classed with the above articles in the act of 1913, have been provided for in paragraph 368 of H. R. 7456.

Time detectors have been omitted from paragraph 367 of H. R. 7456, but might be said to be covered by paragraph 368.

Jewels for compasses are specifically mentioned in H. R. 7456 (par. 367).

H. R. 7456 has an additional provision that only the number of jewels which serve a mechanical purpose as frictional bearings shall be marked.

*Conflicting provisions.*—Paragraphs 367 and 368: The provisos to these two paragraphs contain in part similar provisions, but differing in some requirements.

*Suggested changes.*—This paragraph includes in the first proviso "lever clock movements with jewels in the escapement, assembled or knocked down for reassembling," but omits them from the purview of the paragraph. Paragraph 368 relates to clock movements.

Page 67, lines 4-8 of page 67 of H. R. 7456: There is apparently no provision for 16 jewels adjusted. If it is intended to include them with the 17 jewels, "having seventeen jewels and" might be stricken out in lines 6, 7, and 8.

"For reassembling" requires determination of use, which is difficult "assembled or knocked down" appears sufficient for the purpose in view.

## PARAGRAPH 368.

## H. R. 7456.

## SENATE AMENDMENTS.

PAR. 368. Clocks and clock movements, and clockwork mechanisms, cased or uncased, whether imported complete or in parts, and any device or mechanism having an essential operating feature intended for measuring time, or the flowage of water, gas, electricity, or similar uses, or for regulating or controlling the speed of arbors, drums, disks, or similar uses, or for recording, indicating, or performing any operation or function at a predetermined time or times, any of the foregoing whether wholly or partly complete or knocked down for reassembling (in which condition they shall be appraised at the valuation of the complete article); cases and casings for clockwork mechanisms imported separately; all the foregoing, 35 per centum ad valorem; and in addition thereto, upon any of the foregoing articles or parts thereof, having jewels, but not more than two jewels, in the escapement, \$1 each; having more than two but not more than four jewels, \$2 each; having more than four jewels, \$4 each; if without jewels in the escapement and valued at not over \$1.10 each, 35 cents each; valued at more than \$1.10 and not more than \$2.25 each, 70 cents each; valued at more than \$2.25 but not more than \$5 each, \$1 each; valued at more than \$5 but not more than \$10 each, \$2 each; valued at more than \$10 each, \$3 each; all parts and materials for use in any of the foregoing if imported separately, and not specially provided for, 40 per centum ad valorem: *Provided*, That all dials and the front or back plate of the movement frame of any of the foregoing when imported shall have the name of the maker, the country where manufactured, and the number of jewels, if any, indelibly stamped on the most visible part of same; but if such markings are in whole or in part sufficiently similar to the trade name of an established American manufacturer as to be liable to deceive the user in the United States, entry thereof shall be denied if such trade name or trademark has been placed on file with the collector of customs.

## ACT OF 1909.

PAR. 192. \* \* \* lever clock movements having jewels in the escapement, and clocks containing such movements, one dollar each and forty per centum ad valorem; all other clocks and parts thereof, not otherwise provided for in this section, whether separately packed or otherwise, not composed wholly or in chief value of china, porcelain, parian, bisque, or earthenware, forty per centum ad va-

## ACT OF 1913.

PAR. 161. \* \* \* lever clock movements having jewels in the escapement, and clocks containing such movements, all other clocks and parts thereof, not otherwise provided for in this section, whether separately packed or otherwise, not composed wholly or in chief value of china, porcelain, parian, bisque, or earthenware, 30 per centum ad valorem; \* \* \* time detectors, 15 per centum

## ACT OF 1909.

## ACT OF 1913.

lorem; \* \* \* \* \* enameled dials for ad valorem; enameled dials and dial watches or other instruments, three cents plates for watches or other instruments, per dial and forty per centum ad valorem: 30 per centum ad valorem: \* \* \*

[See proviso to par. 367, H. R. 7456.]

[See proviso to par. 367, H. R. 7456.]

## CLOCKS.

(See Survey C-26.)

*Description and use.*—Modern clock movements require the use of gold, nickel, brass, steel, and jewels of sapphire, ruby, and garnet. Clock cases are made of wood, metal, china, porcelain, parian, bisque, marble, earthenware, stoneware, and crockery ware.

*Production.*—Most of the clocks are manufactured in Connecticut and New York. In 1914 there were 48 establishments engaged in the manufacture of clocks, with a total capital invested of \$13,564,482, and 25 establishments engaged in the manufacture of parts of watches and clocks, with a total capital invested of \$1,296,290. The production of clocks and parts for 1914 amounted to \$11,969,811. The production of clocks exceeded the consumption by about \$600,000. In 1919 there were 46 establishments with a total output valued at \$23,380,000.

*Imports.*—Before the war clocks were received chiefly from Germany, and since the war mainly from France, Switzerland, and the United Kingdom. The importation of clocks and parts of clocks during the five year period 1911 to 1915 shows an annual average of \$794,389; of this amount clocks and parts received from Germany averaged \$586,407, or 73 per cent. After 1915 the imports decreased rapidly until the fiscal year 1918. The imports from Germany in 1918 were valued at only \$12. However, by 1920 the imports from that country increased to \$115,023. Statistics for the years 1918 to 1921 follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
----------------	-----------	--------	-------	------------------

LEVER CLOCK MOVEMENTS HAVING JEWELS IN THE ESCAPEMENT, AND CLOCKS CONTAINING SUCH MOVEMENTS.

	Number.			Per cent.
1918.....	602	\$4,629	\$1,389	30
1919.....	81	2,291	687	30
1920.....	1,520	5,986	1,796	30
1921 (9 months).....	2,691	2,465		

ALL OTHER CLOCKS AND CLOCK MOVEMENTS, ETC., AND PARTS OF (EXCEPT DIALS).

1918.....		\$48,223	\$14,467	30
1919.....		140,537	42,161	30
1920.....		500,831	150,249	30
1921 (9 months).....		739,886		

*Exports.*—A large percentage of the exports of clocks and parts of clocks has gone to the United Kingdom and Canada. The exports from 1910 to 1915 averaged about \$1,500,000, and from 1916 to 1918 about \$2,500,000. Exports since 1917 have been by calendar years as follows: 1918, \$2,147,980; 1919, \$3,920,514; 1920, \$4,897,972; and 1921 (9 months), \$2,136,505.

Exports of gas and water meters were: 1918, \$473,001; 1919, \$763,691; 1920, \$705,037; 1921 (9 months), \$629,269; and of electrical meters and measuring instruments, 1918, \$1,887,925; 1919, \$2,891,307; 1920, \$2,676,538; 1921 (9 months), \$2,347,921.

The principal countries of destination for clocks and parts of clocks were Canada, Australia, the United Kingdom, and Argentina. Electrical meters and measuring instruments went principally to Japan, Canada, the United Kingdom, Brazil, and Australia.

*Important changes in classification, etc.*—See General Notes on Paragraph below.

#### TIME DETECTORS.

*Description and use.*—A time detector is a watch or clock used for obtaining time records of watchmen's rounds.

*Production.*—Time detectors are largely made by hand. The variety in styles and sizes, and the small number sold, preclude the use of automatic machinery in their manufacture.

*Imports.*—During the nine months October 4, 1913, to June 30, 1914, imports were valued at \$27,476. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Number.</i>			<i>Per cent.</i>
1918.....		\$5,058	\$759	15
1919.....	19	527	79	15
1920.....	151	1,324	199	15
1921 (9 months).....	4,601	35,251		

*Exports.*—None recorded.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Lever clock movements having jewels in the escapement, and clocks containing such movements, all other clocks and parts thereof, etc., are classified with watch movements, etc., in paragraph 161 of the act of 1913. Clocks and clock movements are given a separate paragraph in H. R. 7456, with the special mention of cases and casings for clockwork mechanisms, which were omitted in the act of 1913. The following clause is also inserted in this paragraph: "any device or mechanism having an essential operating feature intended for measuring time, or the flowage of water, gas, electricity, or similar uses, or for regulating or controlling the speed of arbors, drums, disks, or similar uses, or for recording, indicating, or performing any operation or function at a predetermined time or times."

Clock movements, which were all in one class in the act of 1913, have been divided into three groups according to the number of jewels in the movement; and of movements without jewels, into five groups

according to value. Each group or class has in addition to an ad valorem rate of duty, a specific rate of duty.

The provision in the proviso "but if such markings are in whole or in part sufficiently similar to the trade name of an established American manufacturer as to be liable to deceive the user in the United States, entry thereof shall be denied if such trade name or trade-mark has been placed on file with the collector of customs" is new.

*Suggested changes.*—The proviso states that "dials, etc., \* \* \* when imported shall have the name of the maker, the country where manufactured, and the number of jewels, if any, indelibly stamped on the most visible part of same; \* \* \*." This clause might be as follows: "Provided, That all dials, whether attached to movements or not, when imported, shall have indelibly painted, printed, or stamped thereon the name of the country of origin, and the front or back plate of the movement frame of any of the foregoing, when imported, shall have the name of the maker, the name of the country where manufactured, and the number of jewels, if any, indelibly stamped on the most visible part of same; but if such markings are in whole or in part sufficiently similar to the trade name of an established American manufacturer as to be liable to deceive the user in the United States, entry thereof shall be denied, if such trade name or trade-mark has been placed on file with the collector of customs."

If the name of the maker and name of country of origin are to be marked upon clock cases, provision should also be made therefor.

"For reassembling" requires determination of use, which is difficult; "assembled or knocked down" appears sufficient for the purpose in view.

### PARAGRAPH 369.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 369. Automobiles, automobile bodies, automobile chassis, and parts of automobiles, not including tires, 25 per centum ad valorem: *Provided*, That if there be imported into the United States any of the foregoing articles manufactured in or exported from any country which imposes a duty greater than 25 per centum ad valorem upon similar articles exported from the United States, there shall be levied, paid, and collected upon such articles a duty equal to the duty imposed by such country upon such articles imported from the United States, but not to exceed in any case 50 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 141. Automobiles, \* \* \* and finished parts of any of the foregoing, not including tires, forty-five per centum ad valorem.

PAR. 119. Automobiles, valued at \$2,000 or more, and automobile bodies, 45 per centum ad valorem; automobiles valued at less than \$2,000, 30 per centum ad valorem; automobile chassis, and finished parts of automobiles, not including tires, 30 per centum ad valorem.

## AUTOMOBILES.

(See Survey C-10.)

*Description and use.*—Automobiles may be divided into two general classes—passenger and commercial. Unofficial reports gave registered motor vehicles in the United States (Dec. 1, 1921) as 10,000,000, of which 1,000,000 were trucks or commercial cars, and the remainder passenger cars. In 1921, 83 per cent of the cars in use in the world were in the United States. The license fees paid amounted to \$102,034,000. The domestic gasoline production for 11 months of 1918 is officially given as 3,278,568,498 gallons.

*Production.*—The summary of the Census Bureau concerning the automobile industry for 1919 states that reports were received in 1919 from 315 establishments with products valued at \$2,387,834,000, as compared with 300 establishments in 1914 with products to the amount of \$503,230,000. Of the total value of products in 1919, about 56 per cent, or \$1,332,076,000, was reported by the 68 establishments located in Michigan. The total number of automobiles manufactured in 1919 was 1,683,938, valued at \$1,555,129,000, as compared with 537,039 in 1914, valued at \$465,058,000, an increase nearly three fold in number and more than that in value. In 1919 the total number of automobiles included only 3,034 electric and 406 steam propelled machines, while in 1914 there were 4,669 electric and 401 steam automobiles manufactured. The \$533,068,000 reported as the value of bodies and parts represents only such bodies and parts as were produced for sale by establishments engaged in the manufacture of complete automobiles, and does not include the value of bodies and parts made by establishments making no automobiles. Relative production figures are given in the following table:

Type.	1914		1919	
	Number.	Value.	Number.	Value.
Passenger vehicles.....	534,438	\$413,696,000	1,553,349	\$1,318,038,000
Business vehicles.....	24,172	40,278,000	120,914	212,204,000
All other vehicles.....	5,429	11,084,000	9,675	14,887,000
Total.....	573,039	\$465,058,000	1,683,938	\$1,555,129,000
Total product of industry.....		503,230,000		2,387,834,000

Furthermore, in 1919, the manufacture of 5,012 automobiles and 80 trailers to the value of \$8,067,562, and in 1914, 4,258 automobiles valued at \$6,296,558, were reported by establishments engaged primarily in other industries.

*Imports.*—The imports of automobiles and parts reached a maximum in 1907; thereafter it declined until 1918. Since 1918 imports have increased rapidly, amounting in 1920 to over \$2,000,000, which, nevertheless, is only about one-tenth of 1 per cent of the domestic production for that year. Before the war the principal sources of

imports were France (which furnished about half), Great Britain, Germany, and Italy. Imports for later years have been as follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
AUTOMOBILES, VALUED AT LESS THAN \$2,000.				
	<i>Number.</i>			<i>Per cent.</i>
1918.....	72	\$21,134	\$9,340	30
1919.....	97	32,130	9,639	30
1920.....	811	659,975	197,992	30
1921 (9 months).....	222	233,302		
AUTOMOBILES VALUED AT \$2,000 OR OVER.				
1918.....	3	\$8,175	\$3,679	45
1919.....	18	79,907	35,958	45

1920.....		238,781	71,607	30
1921 (9 months).....		152,585		

In 1920 Canada supplied about one-third of the imports: one-third came from England, and consisted almost entirely of parts. A considerable portion of the remainder was from France.

The importations of automobile engines are small, being in 1919 and 1921 as follows: 1919, 3 valued at \$185; 1921 (9 months), 2 valued at \$1,232.

*Exports.*—Exports for the year 1916, the last year before the United States entered the war, were \$122,633,710, amounting to about 13 per cent of the domestic production. In the fiscal year 1918 they had declined to \$114,266,875, or about 9 per cent of the production. In the fiscal year 1920 exports had increased to \$298,219,875, or 13 per cent of production. Parts of automobiles, other than engines and tires, exported in the calendar year 1920, show a value of \$86,198,013, as compared with \$6,624,232 in 1914. Export statistics for the calendar years 1918 to 1921 follow:

	1918	1919	1920	1921 (9 months).
Commercial automobiles:				
Quantity (number).....	10,308	15,585	17,686	3,541
Value.....	\$26,814,952	\$35,425,437	\$27,588,544	\$5,033,362
Passenger automobiles:				
Quantity (number).....	36,936	67,145	130,711	21,401
Value.....	\$36,278,292	\$73,700,527	\$152,694,024	\$24,138,756
Commercial chassis:				
Quantity (number).....	( <sup>1</sup> )	( <sup>1</sup> )	11,450	2,404
Value.....			\$19,187,237	\$3,681,261
Passenger chassis:				
Quantity (number).....	( <sup>1</sup> )	( <sup>1</sup> )	11,797	2,499
Value.....			\$12,561,897	\$2,239,856
Automobile engines, gasoline:				
Quantity (number).....	30,813	31,358	30,581	6,577
Value.....	\$4,188,675	\$4,738,341	\$5,031,856	\$1,390,148
Parts of automobiles (not including engines and tires).....	\$33,607,050	\$42,562,186	\$86,198,013	\$31,126,453

<sup>1</sup> Included in "automobiles, parts of," prior to 1920.

The principal countries of destination in 1920 were, in order of magnitude, the United Kingdom, Canada, Australia and New Zealand, Cuba, Argentina, and Brazil.

*Important changes in classification.*—In H. R. 7456, "automobiles, automobile bodies, automobile chassis, and parts of automobiles, not including tires," are classed together. A new proviso is as follows: If there be imported into the United States any of the foregoing articles manufactured in or exported from any country which imposes a duty greater than 25 per centum ad valorem upon similar articles exported from the United States, there shall be levied, paid, and collected upon such articles a duty equal to the duty imposed by such country upon such articles imported from the United States, but not to exceed in any case 50 per centum ad valorem.

The word "finished" in paragraph 119 of the act of 1913 is omitted before "parts of automobiles."

*Suggested changes.*—Page 70, lines 1 and 2, of H. R. 7456: Change "levied, paid, and collected," to "levied, collected, and paid" to agree with usual practice.

If it shall be desired to have unfinished bodies and other parts of automobiles come within this paragraph instead of being classified according to component material of chief value, it is suggested that the words "all the foregoing, whether finished or unfinished," be inserted after the word "automobiles" in line 21, page 69.

### PARAGRAPH 370.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 370. Airplanes, hydroplanes, motor boats, and parts thereof, 30 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

[No corresponding provision; classable according to component material of chief value.]

[No corresponding provision; classable according to component material of chief value.]

## AIRPLANES.

*Production.*—Statistics of the Bureau of the Census show that reports were received from 31 establishments engaged in the aircraft industry in 1919 with products valued at \$14,372,643, as compared with 16 establishments in 1914 with products valued at \$789,872. Of the 31 establishments reporting for the year 1919, 10 were located in New York, 4 in Ohio, 2 each in California, Massachusetts, and Missouri.

*Summary of statistics of the aircraft industry, 1919.*

Number of establishments.....	31
Total value of products.....	\$14,372,643
Airplanes:	
Number.....	432
Value.....	\$3,466,452
Seaplanes:	
Number.....	230
Value.....	\$4,580,016
Value of work done during year on airplanes and seaplanes not completed.	\$1,658,670
All other products, including parts and repair work.....	\$4,667,505

## MOTOR BOATS.

In 1919 there were built by private establishments 1,159 motor boats of 5 gross tons or less, valued at \$1,797,000, as compared with 3,706 boats, valued at \$2,001,284 in 1914. The production of motor boats in 1919 was as follows:

	Number launched.	Gross tonnage.	Value.
Motor boats of over 5 gross tons, including sailing vessels equipped with auxiliary motor power.....	195	32,400	\$4,773,000
Motor boats of less than 5 gross tons.....	1,159	.....	1,797,000

*Imports.*—Imports of airplanes for the fiscal year 1918 were valued at \$423,980. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
1917.....	.....	.....	.....	.....
1918.....	.....	.....	.....	.....
1919.....	.....	.....	.....	.....
1920.....	.....	.....	.....	.....
1921 (9 months).....	.....	.....	.....	.....

## AIRPLANES.

	Number.	Value.	Duty.	Per cent.
1918.....	3	\$119,218	\$23,844	20
1919.....	7	18,202	3,640	20
1920.....	78	178,028	35,606	20
1921 (9 months).....	14	30,495	.....	.....

## PARTS OF AIRPLANES; METAL CHIEF VALUE.

	Value.	Duty.	Per cent.
1918.....	\$437,897	\$87,579	20
1919.....	44,090	8,818	20
1920.....	146,270	29,254	20
1921 (9 months).....	17,467	.....	.....

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
PARTS OF AIRPLANES, METAL—FOR THE CONSTRUCTION AND EQUIPMENT OF VESSELS.				
1918.....		\$20,500		<i>Per cent.</i>
1919.....		5,062		
AIRPLANES AND PARTS OF, FOR THE UNITED STATES, N. E. S.				
1918.....		\$1,656,148		
1919.....		467,061		
AIRPLANES AND PARTS OF, FOR DIPLOMATIC OFFICERS (C. R. ART. 377).				
1918.....		\$30,966		
AIRPLANES AND PARTS OF, WOOD CHIEF VALUE.				
1918.....		\$72,151	\$10,823	15
1919.....		419,481	62,922	15
1920.....		61,567	9,235	15
1921 (9 months).....		17,749		

In addition, there were imported "parts of airplanes, wood chief value," valued at \$51,275 for the construction and equipment of vessels.

Imports of motor boats are not separately classified; they are probably small.

*Export statistics for the calendar years 1918 to 1921 follow:*

	1918	1919	1920	1921 (9 months).
Airplanes:				
Quantity (number).....	48	44	65	43
Value.....	\$607,255	\$215,300	\$598,274	\$271,940
Parts of airplanes.....	\$14,670,269	\$3,249,226	\$554,375	\$132,534
Motor boats:				
Quantity (number).....	206	140	298	146
Value.....	\$3,663,912	\$358,851	\$1,008,872	\$656,069

The principal countries of destination in 1920 were as follows: Of airplanes, Peru, Brazil, France, and Argentina; of airplane parts, the United Kingdom, Hongkong, Brazil, and Canada; of motor boats, about one-half went to Latin-American countries.

*Important changes in classification.*—This is a new paragraph. Under the act of 1913 they are classified according to the component material of chief value.

*Suggested changes.*—The word "thereof" in line 7, page 70, might be changed to "of the foregoing" to prevent possible restriction to motor boats, the immediately preceding commodity. Consideration might also be given to the discussion of finished and unfinished parts under paragraph 369 and paragraph 371.

## PARAGRAPH 371.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 371. Bicycles, motor cycles, and finished parts of bicycles and motor cycles, 30 per centum ad valorem: *Provided*, That if there be imported into the United States any of the foregoing articles manufactured in or exported from any country which imposes a duty greater than 30 per centum ad valorem upon similar articles exported from the United States, there shall be levied, paid, and collected upon such articles a duty equal to the duty imposed by such country upon such articles imported from the United States, but not to exceed in any case 50 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 141. \* \* \* bicycles, and motor-cycles, and finished parts of any of the foregoing, not including tires, forty-five per centum ad valorem.

PAR. 120. Bicycles, motor cycles, and finished parts thereof, not including tires, 25 per centum ad valorem.

## BICYCLES AND MOTOR CYCLES.

(See Survey C-14.)

*Description and uses.*—Bicycles and motor cycles are used to a considerable extent by workmen and others as a means of transportation to and from work. Both are used commercially for the delivery of messages and small parcels of merchandise, and by police organizations for patrol and special duty. Motor cycles are of great value for military as well as police purposes. Four-cylinder machines of 20 horsepower are made, and side cars are provided with a seating capacity of two or more, and are equipped with tops, wind shields, and upholstery.

*Production* of bicycles in 1914 was 398,899 machines, valued at \$5,361,230. The output in the year ended August 31, 1918, was estimated by the War Industries Board as 507,207. The production of motor cycles for the same period was estimated as 53,700. In the calendar year 1914 the output was 62,793 machines, valued at \$12,306,447. The production of bicycles in 1919 was 470,675 machines, valued at \$12,277,341, and the number of motor cycles was 59,214, valued at \$16,176,055. During the period 1914 to 1919 the bicycle industry again showed rapid growth, much greater than that of the motor cycle. The total value of the product of the bicycle industry was \$22,234,262 in 1914 and \$53,105,995 in 1919. Other industries produced \$4,647,798 in 1914 and \$2,205,743 in 1919.

*Imports.*—Imports of bicycles increased up to the time of the war; they were chiefly from England, but a portion came from Germany.

Imports in 1914 of bicycles and finished parts were valued at \$205,062, motor cycles and finished parts at \$55,869.

Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
----------------	--------	-------	------------------

## BICYCLES AND FINISHED PARTS THEREOF, NOT INCLUDING TIRES.

	Value.	Duty.	Per cent.
1918.....	\$3,920	\$980	25
1919.....	10,953	2,738	25
1920.....	48,193	12,048	25
1921 (9 months).....	38,695		

## MOTOR CYCLES AND FINISHED PARTS THEREOF, NOT INCLUDING TIRES.

	Value.	Duty.	Per cent.
1918.....	\$1,278	\$319	25
1919.....	2,016	505	25
1920.....	15,472	3,868	25
1921 (9 months).....	6,658		

*Exports.*—Exports of bicycles, tricycles, etc., in the fiscal year 1918 amounted to \$1,366,747 and in 1914 to \$608,931, which was 10 per cent of domestic production. Motor cycles exported in 1918 numbered 10,599, valued at \$2,364,785, having increased from 6,410, valued at \$1,234,194, in 1914. The exports in 1914 equaled 10 per cent of the domestic production. In the year 1919, 42 per cent of the domestic production of motorcycles and about 21 per cent of domestic production of bicycles were exported. Exports of bicycles, tricycles, etc., for the calendar years 1918 to 1921 have been valued as follows: 1918, \$1,540,920; 1919, \$3,234,915; 1920, \$4,725,643; 1921 (9 months), \$1,353,234. The principal countries of destination were, in 1918, Japan, Norway, Canada, Italy; in 1919, United Kingdom, Japan, Denmark, Netherlands, in 1920, Japan, Sweden, United Kingdom, Netherlands. Exports of motorcycles for the calendar years 1918 to 1921 have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (number).....	9,212	24,481	37,622	9,240
Value.....	\$2,169,385	\$6,687,436	\$10,756,580	\$3,011,256

The principal countries of destination were, in 1918, Australia, Italy, British South Africa; in 1919, Netherlands, Australia, Norway, British South Africa; in 1920, Sweden, Netherlands, Australia, United Kingdom.

*Important changes in classification.*—The words “not including tires” are omitted, and the proviso is new.

*Suggested changes.*—Page 70, line 14, of H. R. 7456: Change “levied, paid, and collected” to “levied, collected, and paid” to agree with usual practice.

If the suggestion under paragraph 369 that both finished and unfinished parts of automobiles be specially provided for should be adopted, there is a question whether unfinished parts of bicycles and motor cycles should not be specially provided for in this paragraph.

Bicycles and motor cycles in line 9, page 70, might be changed to “the foregoing,” if the suggestion under paragraph 370 should be adopted.

## PARAGRAPH 372.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 372. Steam engines and steam locomotives, 15 per centum ad valorem; machine tools and parts of machine tools, embroidery machines, including shuttles for sewing and embroidery machines, lace-making machines, machines for making lace curtains, nets and nettings, and all other machines or parts thereof, finished or unfinished, not specially provided for, 35 per centum ad valorem: *Provided*, That machine tools as used in this paragraph shall be held to mean any machine operating other than by hand power which employs a tool for work on metal.

## ACT OF 1909.

PAR. 197. \* \* \* jute manufacturing machinery, \* \* \* machine tools, printing presses, sewing machines, \* \* \* and all steam engines, thirty per centum ad valorem; embroidery machines and lace-making machines, including machines for making lace curtains, nets, or nettings, forty-five per centum ad valorem: *Provided, however*, That all embroidery machines and Lever or G-through lace-making machines, machines used only for the weaving of linen cloth from flax and flax fiber, \* \* \* shall, if imported prior to January first, nineteen hundred and eleven, be admitted free of duty.

## ACT OF 1913.

PAR. 165. All steam engines, steam locomotives, printing presses, and machine tools, 15 per centum ad valorem; embroidering machines, and lace-making machines, including machines for making lace curtains, nets, or nettings, 25 per centum ad valorem; machine tools as used in this paragraph shall be held to mean any machine operated by other than hand power which employs a tool for working on metal.

PAR. 441. \* \* \* sewing machines, cream separators valued at not exceeding \$75, \* \* \*, whether imported in whole or in parts, \* \* \*. [Free].<sup>3</sup>

PAR. 167. Articles or wares not specially provided for in this section; \* \* \* if composed wholly or in chief value of iron, steel, lead, copper, brass, nickel, pewter, zinc, aluminum, or other metal, but not plated with gold or silver, and whether partly or wholly manufactured, 20 per centum ad valorem. [Covering parts of machine tools.]

## STEAM ENGINES, STEAM LOCOMOTIVES, MACHINE TOOLS, ETC.

*Description.*—Steam engines may be described as prime movers which utilize the heat energy, pressure, or kinetic energy of steam to generate power; reciprocating and rotary engines and steam turbines are included in this designation. Steam locomotives are of two general classes, standard railroad engines and industrial locomotives. Railroad engines are further distinguished as passenger, freight, and switching engines. The machines enumerated in this paragraph are certain specialized types producing widely varying commodities or utilities. The term "machine tools" has no very definite or fixed meaning. One class of power-driven machines is designed to produce a single type of article in great numbers with a considerable

<sup>3</sup> Exempt under Par. 1504 if held to be agricultural implements; otherwise possibly dutiable as machines not specially provided for, Par. 372, H. R. 7456.

degree of automatic action, i. e. screw-making machines, bolt threaders, nut tappers, gear cutters, and spring-making machines. These are styled "special" machines. They usually turn out a completed product or one requiring little subsequent finishing. The other class, properly called machine tools, consists of power-driven forming or shaping machines which are not special, but are adaptable for all kinds of work within their sphere on all shapes of metal stock or raw material. Machine tools are so defined in the act of 1913 as to include both the above classes.

"Metal-working machinery" is a term applied to power-operated machines for working metals in the form of bars, rods, wire, plates, sheets, or casting, but excluding machinery used in the production of the metal in the forms mentioned. Metal-working machinery, as ordinarily understood, does not include machines or tools for use in the hand trades, like plumber's and tinsmith's tools and watch-maker's lathes, nor rolling-mill machinery, cranes, hoists, etc.

Embroidering and lace-making machines and machines for making lace curtains, nets, or net curtains are highly specialized forms of textile machinery. Other kinds of textile machinery which are provided for under the basket clause and constitute one of the largest imports in the machinery group, are included in the new paragraph under "All other machines." Printing machinery, calculating machines, electrical machinery, cream separators, cigarette machinery, baker's machinery, and candy-making machinery may also be mentioned as of competitive interest in this group.

*Production.*—In 1914 steam locomotives, valued at \$46,968,144, were manufactured in 33 establishments, and all other steam engines, valued at \$30,498,638, in 243 establishments. The value of all steam engines made in 1919 was \$72,047,000. The production of printing presses in 1914 amounted to \$8,396,508, the output of 88 establishments. Manufactured metal-working machinery for 1914 was valued at \$48,866,186, of which \$31,446,660 represented machine tools. The census figures for 1919 show an output of metal-working machines valued at \$212,225,000. The census reports a production of textile machinery valued at \$30,437,689 in 1914 and \$121,006,000 in 1919, but gives no separate figures for embroidering and lace-making machinery and machines for making lace curtains, nets, or net curtains. Lace and embroidery machines are not made in the United States.

Both England and Germany are important producers of the articles in this paragraph. Before the war Germany had a large foreign trade in machine tools and exported to the United States. England was a great producer and exporter of textile machinery.

*Imports.*—The imports of steam engines in recent years have been negligible as compared with the domestic production. Imports were \$183,539 in 1912 and \$13,945 in 1917. Imports of steam locomotives have been negligible, ranging from 1, valued at \$3,324, in 1915 to 21, valued at \$170,037, in 1918 (fiscal year). Imports of machine tools were \$306,096 in 1914 and \$100,685 in 1915. Imports of embroidery and lace-making machines, etc., were \$1,792,216 in 1911 and \$434,041 in 1914. Imports of printing presses were

\$88,301 in 1914 and \$3,305 in 1917. Later imports are shown in the tables below:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.

## MACHINES, ETC., FOR THE UNITED STATES, N. E. S.

1918.....				
1919.....		\$3,419,509		
1920.....		500,041		
1921 (9 months).....		23,982		

*Exports.*—Exports of steam engines were \$2,112,337 in 1913, and \$594,916 in 1915. Exports of steam locomotives were \$6,442,674 in 1913, and \$2,115,866 in 1915. Those of machine tools were \$14,011,359 in 1914, and \$84,835,410 in 1917. Exports of printing presses were \$2,487,277 in 1914. In 1914 the exports of textile machinery aggregated \$1,611,279. There were no exports of embroidery and lace-making machines, etc. Exports have been as follows:

	1918	1919	1920	1921 (9 months).
Steam locomotives:				
Quantity (number).....	1,062	959	1,711	794
Value.....	\$27,064,042	\$30,275,728	\$53,629,847	\$25,449,500
Machine tools.....	\$11,626,360	\$12,490,600	\$13,961,243	\$4,140,439
Textile machinery.....	\$7,296,607	\$14,986,369		
Cotton carding and spinning machinery.....			\$7,314,511	\$6,987,331
Cotton looms:				
Quantity (number).....			2,569	786
Value.....			\$840,788	\$281,210
Textile machinery, all other.....			\$12,764,335	\$7,590,714
Cream separators:				
Quantity (number).....	21,822	22,480	24,915	7,342
Value.....	\$841,171	\$1,093,821	\$1,106,298	\$374,417
Printing presses.....	\$1,462,834	\$3,827,038	\$9,253,711	\$6,515,123
All other machinery and parts of.....	\$42,299,866	\$73,426,726	\$96,657,650	\$58,503,723

The exports of steam locomotives have been principally to the Far East and Latin America, but some number has been sent to France, and formerly both Spain and Russia were important customers. Machine tools are exported to most of the manufacturing centers of Europe and to Canada and Japan. Textile machinery is exported to China and Japan and also (special types) to Canada and the United Kingdom. Canada, Argentina, France, Australia, and New Zealand are the principal markets for the cream separators exported. In addition to the above classes of machinery, there are a great many different kinds of machinery that figure largely in our export trade, but which are not imported in sufficient quantity to warrant the publication of separate statistics. The destinations of these different classes vary, of course, according to the nature of the machine, but most of the items listed in the following table of exports by calendar year are consigned to Canada, Great Britain, Japan, or France:

*Miscellaneous machinery.*

	1918	1919	1920	1921 (9 months).
Electrical machinery: <sup>1</sup>				
Dynamos or generators.....	\$3,363,349	\$5,799,885	\$7,796,305	\$6,105,247
Magnetos, spark plugs, etc.....	2,749,705	3,034,775	3,601,419	1,129,733
Motors.....	8,225,197	10,635,476	13,421,550	13,472,631
Rheostats and controllers.....	288,757	514,760	707,719	886,628
Switches and accessories.....	2,195,300	3,564,772	4,438,773	3,670,045
Telegraph apparatus, including wireless.....	378,806	830,887	713,798	893,297
Telephones.....	2,687,483	3,783,398	3,898,987	4,073,155
Transformers.....	3,528,673	3,787,851	4,803,158	6,979,976
All other.....	17,845,641	27,827,128	32,868,433	23,419,052
Machinery, n. e. s.:				
Adding and calculating machines.....	1,974,250	3,863,217	6,790,407	2,325,498
Air-compressing machinery.....	2,694,755	3,761,290	5,490,397	3,431,129
Brewers' machinery.....	130,357	213,590	522,194	238,004
Concrete mixers.....	315,337	246,631	967,440	510,802
Elevators and elevator machinery.....	2,214,537	2,601,543	1,517,537	1,772,407
Engines and parts of—				
Electric locomotives.....	183,200	835,978	880,430	1,506,877
Internal-combustion engines—				
Gas-stationary.....	478,871	692,584	817,925	268,357

Kerosene engines.....	8,536,113	7,824,599		
Traction.....			8,319,004	2,326,813
All other.....			2,270,783	1,410,576
Steam engines—				
Marine.....	1,337,349	1,228,845	819,535	370,869
Stationary.....	1,056,884	1,321,247	2,381,445	950,173
Traction.....	1,408,977	1,096,294	808,245	105,558
All other engines.....	5,450,418	3,406,891	4,431,019	1,804,985
Parts of engines—				
Boilers.....	4,415,467	6,361,229	8,006,288	4,320,854
All other.....	24,420,286	26,872,412	22,159,874	10,222,849
Excavating machinery.....	1,274,926	1,165,763	2,042,727	2,044,264
Flour and grist mill machinery.....	1,435,211	2,375,802	1,886,201	1,365,832
Laundry machinery—				
Power machines.....	420,696	796,053	1,136,770	787,213
All other.....	269,136	393,736	903,978	312,401
Lawn mowers.....	239,836	478,583	455,921	395,073
Metal-working machinery—				
Lathes.....	9,853,507	10,136,877	7,575,123	2,643,649
Sharpening and grinding machines.....	6,161,876	5,494,050	3,945,490	1,000,958
All other.....	23,978,554	30,380,405	18,830,377	9,724,201
Mining machinery—				
Oil-well machinery.....	2,759,286	3,613,972	6,229,284	9,978,887
All other.....	8,730,338	9,265,319	8,990,992	6,583,540
Paper and pulp mill machinery.....	1,667,622	3,958,873	3,048,697	2,262,015
Pump and pumping machinery.....	6,008,010	9,067,458	13,684,468	10,690,224
Refrigerating machinery.....	1,435,110	2,141,110	3,820,062	1,415,789
Windmills.....	772,003	1,091,543	2,256,750	1,574,734

<sup>1</sup> Includes in addition to machines a few items (e. g., telephones and electrical apparatus) that are strictly not classed as machines but rather as manufactures of metal (par. 333).

*Miscellaneous machinery—Continued.*

	1918	1919	1920	1921 (9 months).
Machinery, n. e. s.—Continued.				
Woodworking machinery—				
Sawmill.....	1,154,789	1,141,248	1,220,028	953,948
All other.....	1,049,595	2,603,407	3,754,823	2,290,279
Cars, automobiles, and other vehicles—				
Motor, warehouse and motor-station trucks.....	349,403	492,543	317,137	229,385
Wheelbarrows, pushcarts, and hand trucks.....	480,914	774,280	1,528,217	755,901
All other vehicles and parts of.....	20,432,996	33,345,238	8,963,724	3,696,559

*Important changes in classification.*—The provisions for parts of machine tools, for shuttles for sewing or embroidery machines, and for all other machines or parts thereof, are new. Printing presses, which are specially provided for in paragraph 165 of the act of 1913, and cream separators valued at not exceeding \$75, which are specially provided for in paragraph 441 of that act, are not mentioned in H. R. 7456. Shuttles for sewing machines have been transferred from the free list (parts of sewing machines).

There is doubt as to how far-reaching the term "all other machines or parts thereof, finished or unfinished," is intended to be. Many inquiries have been received in regard to the inclusion of certain articles in the provision, such as printing presses, combination typewriter and adding machine, and cream separators.

Electrical, telegraph, and telephone apparatus, appliances, etc., have also been the subject of numerous inquiries. In the absence of a more specific enumeration such articles will come within paragraph 393 of H. R. 7456 as manufactures wholly or in chief value of metal, unless classable as machines within this paragraph.

## PARAGRAPH 373.

## H. R. 7456.

## SENATE AMENDMENTS.

PAR. 373. Shovels, spades, scoops, and drainage tools, and parts thereof, composed wholly or in chief value of iron, steel, lead, copper, brass, nickel, aluminum, or other metal, whether partly or wholly manufactured, 25 per centum ad valorem.

## ACT OF 1909.

PAR. 199. Articles or wares not specially provided for in this section, composed wholly or in part of iron, steel, lead, copper, nickel, pewter, zinc, gold, silver, platinum, aluminum, or other metal, and whether partly or wholly manufactured, forty-five per centum ad valorem.

## ACT OF 1913.

PAR. 167. Articles or wares not specially provided for in this section; \* \* \* if composed wholly or in chief value of iron, steel, lead, copper, brass, nickel, pewter, zinc, aluminum, or other metal, \* \* \* and whether partly or wholly manufactured, 20 per centum ad valorem.

PAR. 391. \* \* \* all other agricultural implements of any kind and description, whether specifically mentioned herein or not, whether in whole or in parts, including repair parts [Free].<sup>4</sup>

<sup>4</sup> Exempt under Par. 1504 if held to be agricultural implements; otherwise possibly dutiable as machines not specially provided for, Par. 372, H. R. 7456.

## SHOVELS, SPADES, SCOOPS, ETC.

*Production.*—Statistics of the Bureau of the Census as to the production of these articles are not available, although the production of shovels, spades, scoops, and hoes was estimated at \$4,714,000 in 1914. The following figures were obtained from the tariff hearings in 1921 before the Committee on Ways and Means. The productive capacity of the 20 plants scattered throughout the country is from 1,000,000 to 1,250,000 dozens per annum, which at the present average market price of shovels would amount to between \$10,000,000 and \$12,000,000.

*Imports.*—Statistics are not available. Apparently there has been some importation from Canada, as Canadian shovels when polished are admitted free of duty as agricultural implements. (Tariff hearings, W. & M., 1921.)

*Exports.*—The principal countries of destination of exports of shovels and spades were: In 1918, Chile, Mexico, Argentina, Peru, Cuba; in 1919, Argentina, Brazil, Chile, Mexico; in 1920, Argentina, Mexico, Cuba, and the Philippine Islands. Exports since 1917 by calendar years have been valued as follows: 1918, \$680,591; 1919, \$1,398,101; 1920, \$1,294,291; 1921 (9 months), \$500,030.

*Important changes in classification.*—A new provision.

---

 PARAGRAPH 374.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 374. Aluminum, aluminum scrap, and alloys of any kind in which aluminum is the component material of chief value, in crude form, 5 cents per pound; in plates, sheets, bars, rods, circles, disks, blanks, strips, rectangles, and squares, 9 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 172. Aluminum, aluminum scrap, and alloys of any kind in which aluminum is the component material of chief value, in crude form, seven cents per pound; in plates, sheets, bars, and rods, eleven cents per pound; \* \* \*.

PAR. 143. Aluminum, aluminum scrap, and alloys of any kind in which aluminum is the component material of chief value, in crude form, 2 cents per pound; aluminum in plates, sheets, bars, strips, and rods, 3½ cents per pound; \* \* \*.

## ALUMINUM.

(See Survey C-16.)

*Description and uses.*—Aluminum is the lightest of the common metals. It is white, strong, very malleable, slightly softer than silver, and can be drawn, punched, rolled, extruded, or spun into almost any form. Highly noncorrodible, it is but slightly affected by the atmosphere or by vegetable acids. One of the important uses of aluminum is as a deoxidizer in steel manufacture; another is in the form of wire for transmission lines and other electrical purposes. Large quantities are consumed in automobile manufacture, partly as sheet

and partly in the form of castings. Aluminum vessels and utensils are used in the household and in breweries, sugar refineries, and chemical works. There is a considerable consumption in the making of novelties. Aluminum foil is used to some extent as a substitute for tin. The metal is used in important alloys, notably, with magnesium, tin, copper, zinc, and nickel.

*Production.*—All the aluminum now manufactured is made from purified bauxite (see par. 207) in electric furnaces. The production is a matter of companies rather than of nations. The North American output comes from one American company, which developed its process of manufacture, introduced the metal on the market, and has built up an enormous business. Three large financial groups, involving French, British, and German capital, control some 14 producing companies in Europe. There is also a small independent company in Italy and another in Norway. Prior to the war the European producers were well organized and controlled production and prices on the Continent. The outstanding feature of the present situation is the war-time expansion in all producing countries, and especially in Germany.

The successful production of aluminum involves heavy expenditure for plant and requires dependable supplies of raw materials (especially bauxite), adequate transportation facilities, and cheap electric power. The American company has all these essentials, but is at some disadvantage compared with the foreign companies in the cost of assembling its bauxite and coal at East St. Louis for purification and the subsequent transportation of the purified material to the various eastern reduction works, where it is made into metal. In addition to its large holdings of bauxite deposits in Arkansas, the Aluminum Co. of America owns extensive deposits in Guiana. Utilization of these South American ores, which may be refined at Baltimore, should reduce the disadvantage of the domestic producer as regards the supply of raw material. Extensive deposits of high-grade bauxite in southern France afford cheap raw material for most of the European plants, whose operating cost in many works is probably a little less than in the United States.

The war demand for aluminum resulted in an expansion of capacity here, which now exceeds normal demands. Prior to the war the domestic consumption exceeded production. Continental countries, notably France and Great Britain, are equipped to produce in excess of European requirements.

There is a large quantity of secondary metal produced from scrap, amounting in 1917 to about 25 per cent of the total consumption.

Plates, sheets, bars, strips, and rods can be grouped together as semifinished shapes obtained either by rolling or extrusion.

The production of aluminum grew from 60,000 pounds in 1890 to 7,000,000 pounds in 1900, 40,000,000 pounds in 1910, 90,000,000 pounds in 1915, 110,000,000 pounds in 1916, and approximately 130,000,000 pounds in 1920. The value of the product amounted to \$2,000,000 in 1900, about \$30,000,000 in 1915, and approximately \$40,000,000 in 1920. This exceptionally rapid increase in production placed the United States far in the lead of all the aluminum-producing countries. Fully one-half of the world's output is produced in this country.

Imports prior to 1914 were largely from Canada and represented merely interplant relations of the one American large-scale producer. Most of this was ultimately exported with benefit of drawback. There was also some importation of competitive metal from European countries. During the war imports of all classes of aluminum were cut off, except for a small amount of scrap derived from near-by countries and exported, after remelting, with benefit of drawback. Imports of plates, sheets, bars, strips, and rods, chiefly from Germany and England, reached 2,775,804 pounds, valued at \$654,765, in 1914. Those of ingot were 113,113,755 pounds in 1908 and 26,958,354 pounds, valued at \$4,315,233, in 1913. Since the armistice imports of aluminum have increased fairly steadily except for a few months in 1919 and early in 1920 when European requirements temporarily expanded so as to exceed production and leave no surplus for export. Imports of aluminum metal since 1918 have been derived principally from England and France; small quantities come from Switzerland, Norway, and Germany. Germany has furnished the bulk of the more or less highly manufactured forms of aluminum. Total imports from all countries since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.
<b>ALUMINUM, IN CRUDE FORM, SCRAP, AND ALLOYS OF ANY KIND, ETC.</b>			
	<i>Pounds.</i>		
1918.....	1,690,146	\$532,754	\$33,780
1919.....	13,326,595	4,290,749	266,525
1920.....	35,971,122	10,788,414	719,422
1921 (9 months).....	26,014,687	6,002,674	.....
<b>ALUMINUM IN BARS, STRIPS, AND RODS.</b>			
1918.....	432	\$315	\$15
1919.....	44,149	21,133	1,545
1920.....	345,367	165,981	12,088
1921 (9 months).....	265,036	79,549	.....
<b>ALUMINUM PLATES AND SHEETS.</b>			
1918.....	10	\$11	.....
1919.....	481,321	218,697	\$16,846
1920.....	2,982,160	1,229,496	104,376
1921 (9 months).....	1,632,425	579,300	.....

In addition to the imports listed above a fair amount of aluminum circles are imported from Germany. These are, however, included in the statistics of "All other manufactures of aluminum" as given under paragraph 393.

*Exports.*—Aluminum in crude or semifinished form was not exported in any considerable quantity prior to 1914. In that year the exports of all kinds of aluminum metal and manufactures were valued at \$1,101,920. The enormous demand and high prices abroad resulted in a large increase in exports during the war. In the fiscal year 1918, 21,207,628 pounds of aluminum "ingot, metal, and alloys," valued at \$8,611,447, were exported. The exports of plates and sheets amounted to 1,633,854 pounds, with a value of \$783,836, and of all other manufactures of aluminum, \$1,804,632. Practically all the ingot metal was sold to the allied Governments.

Later export figures for the calendar years 1918 to 1921 are given in the tables below.

	1918	1919	1920	1921 (9 months).
Aluminum, ingot metal and alloys:				
Quantity (pounds).....	20,152,798	4,458,195	7,381,874	1,024,346
Value.....	\$7,478,149	\$1,495,659	\$2,244,559	\$293,696
Aluminum, plates and sheets:				
Quantity (pounds).....	3,982,173	562,157	2,023,757	927,873
Value.....	\$1,500,903	\$249,237	\$823,058	\$423,758

The principal countries of destination were as follows: Of ingot metal and alloys—in 1918, France, Italy, Japan; in 1919, Japan, France, Canada, Italy; in 1920, United Kingdom, Japan, Canada, Netherlands. Of plates and sheets—in 1918, Italy, France, Canada; in 1919, Denmark, France, British India, Brazil; in 1920, United Kingdom, British India, Germany, Canada.

*Important changes in classification.*—Aluminum in circles, disks, blanks, rectangles, and squares has been added.

*Suggested changes.*—No provision is made for aluminum foil, which is imported in large quantities. This product is thinner than sheets but not so thin as leaf (provided for in par. 379) and is used for wrapping chocolate, etc.

#### PARAGRAPH 375.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 375. Metallic magnesium and metallic magnesium scrap, \$1 per pound; magnesium alloys, powder, sheets, ribbons, tubing, wire, and all other articles, wares, or manufactures of magnesium, not specially provided for, \$1 per pound on the metallic magnesium content and 20 per centum ad valorem.

#### ACT OF 1909.

PAR. 172. \* \* \* magnesium, \* \* \* and alloys of which said metals are the component material of chief value, three cents per pound and twenty-five per centum ad valorem.

#### ACT OF 1913.

PAR. 143. \* \* \* magnesium, \* \* \* and alloys of which said metals are the component material of chief value, 25 per centum ad valorem.

#### METALLIC MAGNESIUM, METALS AND ALLOYS.

*Description and uses.*—Magnesium is the lightest of the known metals that withstand atmospheric corrosion. It is silver-white, tough, malleable, and, when heated, ductile. There are three forms on the market: (1) A silvery powder or gray granular substance, (2) narrow ribbon, and (3) round or square sticks. Flashlight powder used in photography comes in the first class, and powdered magnesium, on account of its intense white light, rich in chemical rays,

is much used in various pyrotechnical mixtures and in explosives. Ribbon is used chiefly in chemical laboratories and for the ignition of thermite. Magnesium in stick form is used in alloys, both as a constituent and as a deoxidizer or scavenger (especially for nickel-copper alloys), as a dehydrating agent for oils and coal-tar derivatives, and in various electrolytic processes (as cathode). The growth in the quantity and diversity of the consumption has been very rapid, and is likely to continue with the lessening of production cost. The most important alloys of magnesium are those containing aluminum, widely used in airplane and automobile construction. Elektron metal, an alloy containing nearly 95 per cent magnesium and a little zinc, has found a variety of applications in Germany and has been introduced into the United States.

*Production* of metallic magnesium is a new industry in America. Prior to the war the limited demand was supplied from Germany, the sole producer on a commercial scale. Domestic production by three firms began in 1915, with 87,500 pounds, valued at \$440,000, and sold at an average price of \$5 per pound. The price declined a little in the following year, and production decreased slightly. But in 1917 the quantity increased to 115,813 pounds, and in 1918 to 284,188 pounds, valued at \$615,217. The latter output included considerable magnesium powder, which increased the average value to \$2.16 per pound, whereas magnesium in stick form was sold at from \$1.85 to \$2 per pound.

*Imports.*—Prior to the war the entire supply of this country came from Germany. Imports since 1918 of metallic magnesium, metals, and alloys have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1919.....	13,239	\$13,583	\$3,396	25
1920.....	29,275	25,055	6,264	25
1921 (9 months).....	26,041	23,158		

*Exports.*—There are no published statistics of exports of magnesium. Reports of producers to the Geological Survey indicate that there were sold to the Allies in 1918 between 50,000 and 60,000 pounds, which probably constitutes almost the total export of domestic material.

*Important changes in classification.*—“Magnesium and alloys,” bearing an ad valorem rate of duty, were grouped with barium, etc., in paragraph 143 of the act of 1913.

*Suggested changes.*—Unless barium, calcium, sodium, and potassium and their alloys, provided for in paragraph 143 of the act of 1913, were intentionally omitted they should be added to this paragraph.

## PARAGRAPH 376.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 376. Antimony, as regulus or metal, 1½ cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 173. Antimony, as regulus or metal, one and one-half cents per pound; \* \* \*

PAR. 144. Antimony, as regulus or metal, \* \* \* 10 per centum ad valorem; \* \* \*

## ANTIMONY.

*Description and uses.*—Metallic antimony unalloyed has few industrial uses, since it is very brittle; but it enters into many valuable alloys, especially with lead and with tin, into such as type metal (par. 389), pewter and Britannia metal, and in bearing metals. Its chief importance is as a hardening agent for lead and in shrapnel bullets. The term regulus, a relic of alchemy, although still used to describe refined antimony metal, is superfluous.

*Production.*—The chief sources of the domestic antimony supply are China and Japan, but there is a considerable production of antimonial lead in domestic lead smelters. The annual requirements of antimony prior to the war were, roughly, 7,000 tons, about one-third being supplied by the silver-lead smelters, the remainder from imports consisting chiefly of metal. During the war the consumption increased to 20,000 tons, of which slightly more than one-third was derived from antimonial lead and antimony metal smelted in the United States.

The production of antimony metal from domestic ores and antimony metal contained in antimonial lead produced by domestic smelters is as follows: 3,898,000 pounds in 1912, 11,050,000 pounds in 1915, and 6,034,000 pounds in 1917. In 1917 the production of antimony from domestic ores was 517,013 pounds; from antimonial lead, 5,518,000 pounds; and from foreign ores, 4,880,419 pounds, making a total from all sources of 10,915,432 pounds.

China dominates the antimony situation by its large and cheaply mined deposits. The Chinese companies, together with a few Japanese smelters which also treat a portion of the Chinese ore, contribute 60 per cent of the world output.

*Imports.*—Prior to the war over 60 per cent of our antimony supply came from Great Britain, whereas in 1918–19 it came almost wholly from the Far East. The imports of antimony metal (including also a very little needle antimony) amounted to 13,110,426 pounds, valued at \$736,420 in 1914. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	28,292,934	\$3,065,619	\$306,562	10
1919.....	14,318,793	1,021,587	102,159	10
1920.....	19,633,904	1,216,376	121,638	10
1921 (9 months).....	14,994,842	593,923		

The principal countries of origin were China, Japan, and Canada.

*Exports.*—There are no appreciable exports of domestic antimony. Foreign exports, however, have been an important item, especially during the war period, when New York became an important secondary market. The exports in 1916 were 3,018,251 pounds and only 989,477 pounds in 1917.

*Important changes in classification.*—Antimony, as regulus or metal, has been separated from antimony matte. Antimony matte is not provided for as such in H. R. 7456, but a provision appears in paragraph 1509 for "needle or liquated antimony, but only as to the antimony content."

### PARAGRAPH 377.

#### H. R. 7456.

#### SENATE AMENDMENTS.

PAR. 377. German silver, or nickel silver, unmanufactured, 20 per centum ad valorem.

#### ACT OF 1909.

#### ACT OF 1913.

PAR. 174. Argentine, albata, or German silver, unmanufactured, twenty-five per centum ad valorem.

PAR. 145. Argentine, albata, or German silver, unmanufactured, 15 per centum ad valorem.

#### GERMAN SILVER.

(See Survey C-19.)

*Description and uses.*—German silver and nickel silver are names applied to an alloy of nickel, copper, and zinc which is prepared largely as a base metal for electroplating (especially in the better class of silver-plated ware) and as a substitute for silver. Considerable quantities are also used in the form of sheets, wire, and rods where a strong, white, rust-resisting metal is required. Nickel silver exists under a great number of names. The proportions of the constituents vary considerably, but nickel or copper is generally of chief value.

*Production.*—The United States is the principal producer and consumer of nickel alloy; England and Germany, also important producers, use a large part of the product in silver-plated ware for export. The chief item of cost of this alloy is the raw material, but the price of virgin metals is not a handicap to domestic manufacturers as compared with foreign producers.

No estimates of total production are available, as it is ordinarily prepared from the constituent metals at the plant of the consumer and is therefore not a common commercial product except in manufactured forms, such as sheet, rods, etc.

*Imports* of unmanufactured German silver consist almost exclusively of scrap from Canada, amounting to \$4,014 in 1916. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....		\$51	\$8	15
1919.....	3,074	429	64	15
1920.....	200	330	50	15
1921 (9 months).....	2,448	527		

*Exports* in 1914 were valued at \$38,691, increasing in 1917 to \$410,295, of which over 75 per cent went to Canada. Exports for the calendar years 1918 to 1921 were valued as follows: 1918, \$227,439; 1919, \$389,000; 1920, \$589,508; 1921 (9 months), \$395,952. The principal countries of destination in 1918 were Canada, Japan, and Brazil; in 1919 and 1920, Canada, Denmark, and Argentina.

*Important changes in classification.*—"Argentine" and "albata" have been omitted. They are practically obsolete terms. Nickel silver has been inserted in this paragraph.

---

### PARAGRAPH 378.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 378. Copper in rolls, rods, or sheets, 2½ cents per pound; copper engravers' plates, not ground, and seamless copper tubes and tubing, 7 cents per pound; copper engraver's plates, ground, and brazed copper tubes, 11 cents per pound; brass rods, sheet brass, brass plates, bars, and strips, Muntz or yellow metal sheets, sheathing, bolts, piston rods, and shafting, 4 cents per pound; seamless brass tubes and tubing, 8 cents per pound; brazed brass tubes, brass angles and channels, 12 cents per pound; bronze rods and sheets, 4 cents per pound; bronze tubes, 8 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 176. Copper, \* \* \* called braziers' copper, sheets, rods, pipes, and copper bottoms, two and one-half cents per pound; sheathing or yellow metal of which copper is the component material of chief value, and not composed wholly or in part of iron ungalvanized, two cents per pound.

PAR. 199. Articles or wares not specially provided for in this section, composed wholly or in part of \* \* \* metal, and whether partly or wholly manufactured, forty-five per centum ad valorem.

PAR. 147. Copper, \* \* \* called braziers' copper, sheets, rods, strips, pipes, and copper bottoms, sheathing or yellow metal of which copper is the component material of chief value, and not composed wholly or in part of iron ungalvanized, 5 per centum ad valorem.

PAR. 167. Articles or wares not specially provided for in this section; \* \* \* if composed wholly or in chief value of \* \* \* brass \* \* \* and whether partly or wholly manufactured, 20 per centum ad valorem.

### COPPER.

(See Survey C-19.)

*Description and uses.*—The definitions of plates, sheets, and strips of copper are the same as those of similar products of steel (par. 307). Copper rods and copper wire have been noted (par. 316). Copper and yellow metal (brass) sheathing for wooden vessels was once an important outlet for copper, but the increased use of iron in ship-building has reduced this consumption to a negligible fraction of the total consumption of sheet copper and brass. Wire, rods, and rolled plates are the most important forms, since these are used in the electrical industry, which consumes 50 to 60 per cent of all the

copper used. Sheet copper is used in the manufacture of cooking utensils. Copper pipes are used in stills, water heaters, and condensers.

*Production.*—The United States is the leading producer of copper, and refines large quantities of foreign ore and metal. The total production of new refined copper in 1917 was 2,432,385,290 pounds, more than two-thirds from domestic ore. There are no data as to sheets and plates, but the quantity is doubtless 10 per cent of the total. The total output of copper products in 1914 was \$82,841,246, divided approximately as follows: Wire, \$53,000,000; rods, over \$6,000,000; sheets and tubing, over \$17,000,000; all other manufactured products, about \$5,000,000. The quantity of copper produced at smelters, as compiled by the Geological Survey, aggregated 1,310,972,580 pounds in 1919, compared with 1,150,137,192 pounds in 1914. Primary copper of domestic origin produced at refineries was 1,441,643,000 pounds in 1919, compared with 1,210,423,000 pounds in 1914, while total refined copper, primary and secondary, of both domestic and foreign origin, is reported at 1,863,580,000 pounds for 1919, compared with 1,565,708,000 pounds for 1914, a five-year increase of 297,872,000 pounds, or 19 per cent. The copper products of both smelters and refineries, the gold, silver, and other metallic contents of ore and bullion treated, and the sundry by-products of the respective establishments, were valued, in 1914, at \$444,022,000, and in 1919 at \$632,897,000, an increase of \$188,875,000, or 42.5 per cent.

*Imports.*—Imports of rolled copper plates, sheets, pipes, and copper bottoms were \$62,176 in 1914 and \$81,446 in 1917. Imports of copper since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
----------------	-----------	--------	-------	------------------

COPPER IN ROLLED PLATES, CALLED BRAZIERS' COPPER, SHEETS, RODS, STRIPS, ETC.

	Pounds.	Value.	Duty.	Per cent.
1918.....	347	\$143	\$7	5
1919.....	1,031	713	36	5
1920.....	3,549	1,463	73	5
1921 (9 months).....	33,510	5,901		

COPPER PLATES, ROLLED, ETC., SHEETS, ETC., FOR SUPPLIES, CONSTRUCTION AND EQUIPMENT OF VESSELS.

1918.....	23,216	\$7,306		
1919.....	11,552	4,482		

COPPER RODS AND STRIPS.

1918.....	200	\$126	\$5	5
1920.....	2,373	989	49	5
1921 (9 months).....	8,712	2,390		

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
COPPER PIPES.				
1919.....	<i>Pounds.</i> 10,217	\$4,618	\$231	<i>Per cent.</i> 5
1920.....	4,529	1,618	81	5
1921 (9 months).....	800	227		

## COPPER PIPES FOR SUPPLIES, CONSTRUCTION, AND EQUIPMENT OF VESSELS.

1918.....	64,163	\$24,112		
1919.....	14,848	6,132		

*Exports.*—Exports for 1913 were: Copper plates and sheets, 61,050,138 pounds, valued at \$10,028,960; copper rods and wire, 41,459,901 pounds, valued at \$7,217,166. Exports of copper sheets, pipes, plates, braziers, and copper bottoms were \$8,753,920 in 1914 and \$32,976,942 in 1917. Exports went to all the manufacturing countries of Europe. Germany was the largest buyer of plates and sheets. The United Kingdom has been the largest buyer of domestic copper wire. Since 1913, however, important markets have been developed in South America and the Far East. Exports since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Copper plates and sheets:				
Quantity (pounds).....	19,471,584	13,764,425	22,799,148	4,118,195
Value.....	\$5,677,408	\$4,090,491	\$6,685,858	\$1,090,651
Copper pipes and tubes:				
Quantity (pounds).....	4,109,226	5,993,959	4,899,223	2,002,628
Value.....	\$1,845,222	\$2,206,895	\$1,757,382	\$599,518

Exports of copper rods were not recorded before July 1, 1921. During July, August, and September there were exported 7,322,267 pounds valued at \$976,032.

## BRASS AND BRONZE.

*Description and use.*—Brass and bronze are the most important alloys of copper and zinc. They are made up into a large number of forms, and as sheet, strip, rod, wire, pipe, tubes, or castings they enter into practically every important industry. These alloys are easily machined, spun, and stamped, and resist corrosion. They are therefore suitable for use in many places where it is impossible to use iron or steel. Brass and bronze find a multitude of uses in the trade. They are used for boiler and condenser tubes, for bearing bushings, for railings on passenger ships and war vessels. They are also used in the plumbing trade, in the manufacture of builders' and cabinet hardware, in the manufacture of brass bedsteads, in the brass-spinning industries producing cartridges, ornamental articles, and in an extensive line of electrical fixtures. The consumption of this class of material is increasing yearly.

*Production.*—In 1914 the capital invested in all branches of the industry amounted to \$95,827,707 and the manufacturing establishments gave employment to 37,627 persons. In that year, out of a total of \$131,503,724 in brass and bronze products, 26 millions was in plates and sheets, 16 millions was in ingots and rods, 6 millions was in wire, 10 millions was in pipe and tubing, and the rest was in other manufactured products. Estimates of production in brass-rolling mills in 1919, furnished the United States Tariff Commission by manufacturers, range between 200,000,000 and 1,000,000,000 pounds. The value of the output was doubtless in the neighborhood of \$250,000,000. The Census Bureau reports that all classes of brass, bronze, and copper products from 992 establishments in 1914 amounted to \$162,199,000, and from 1,119 establishments in 1919 amounted to \$487,707,000.

*Imports.*—Imports of brass and bronze rolling-mill products were \$598,841 in 1914, \$264,725 in 1916, and \$620,881 in 1920.

*Exports.*—The value of the exports of brass bars, plates, sheets, etc., averaged \$1,000,000 during the fiscal years 1912 to 1914, inclusive, and the value of the exports of all other manufactures of brass averaged \$4,500,000 a year during the same period. The exports of brass bars, plates, sheets, etc., were \$6,149,183 in 1915 and \$121,368,019 in 1917. The exports of all other manufactures of brass were \$12,819,373 in 1915 and \$259,980,247 in 1917. The exports of manufactures of bronze were \$333,589 in 1915 and \$1,586,553 in 1917. In 1920, Canada, Netherlands, and Brazil and Argentina were the principal countries of destination. During the war period large quantities were shipped to France, Italy, and even England, but with the resumption of European production on a peace basis, this trade largely disappeared. Statistics for the calendar years 1918 to 1921 follow:

	1918	1919	1920	1921 (9 months).
Brass bars, plates, sheets, etc.:				
Quantity (pounds).....	30,989,717	7,770,671	5,810,733	2,425,680
Value.....	\$9,522,934	\$2,310,561	\$1,671,608	\$649,724
Brass pipes and fittings.....	\$1,137,336	\$1,413,875	\$2,141,217	\$892,984

Principal countries of destination were: In 1918, Italy, France, Canada, United Kingdom; in 1919, Canada, Italy, Denmark, Brazil, France; in 1920, Canada, Netherlands, Argentina, Brazil.

*Important changes in classification.*—All of the articles in paragraph 147 of the act of 1913 appear in one classification. In H. R. 7456 there are eight groups. Copper strips, pipes, and copper bottoms have been omitted. All of the paragraph beginning with copper engravers' plates, not ground, except sheathing, has been added.

*Suggested changes.*—Page 71, line 25, of H. R. 7456: Change "engraver's" to "engravers'" to agree with usual practice.

Specific provision might be made in this paragraph for nickel silver sheets and strips and rods

## PARAGRAPH 379.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 379. Bronze powder, powdered tin, brocades, flitters, and metallics, 16 cents per pound; bronze, or Dutch metal, or aluminum, in leaf, 8 cents per one hundred leaves. The foregoing rate applies to leaf not exceeding in size the equivalent of five and one-half by five and one-half inches; additional duties in the same proportion shall be assessed on leaf exceeding in size said equivalent.

## ACT OF 1909.

PAR. 175. Bronze powder, brocades, flitters, and metallics, twelve cents per pound; bronze, or Dutch-metal or aluminum, in leaf, six cents per one hundred leaves.

## ACT OF 1913.

PAR. 146. Bronze powder, brocades, flitters, and metallics; bronze, or Dutch-metal or aluminum, in leaf, 25 per centum ad valorem.

## BRONZE POWDER, ETC.

*Description and uses.*—Bronze powder is a pulverized metal varying in color from pale yellow to dark red; the color depends chiefly upon the proportions of the copper and zinc. It is sometimes made from brass clippings, or "schrote," which are hammered for hours to reduce them to a powder. Brocades are of the same quality with the same uses. (G. A. 5113, T. D. 23635, of 1902.) Metallics or metallic flitters consist of small particles of lame, used chiefly for the manufacture of wall paper. Flitters are made by reducing thin sheets of brass to flakes; this material is sprinkled over surfaces to produce a sparkling effect. They differ from bronze powder only in that the latter has been hammered for a much longer period and is, therefore, more finely divided and more expensive. Aluminum bronze powder is a silvery pigment made by powdering aluminum foil; this foil is often substituted for tin foil for wrapping food products, teas, soap, chewing gum, and similar articles. The powder is used in the manufacture of certain explosives. The various bronze powders are used chiefly with a size or in oil, as a pigment in finishing brass beds, gilt frames, radiators, and other articles in imitation of gold or silver. Dutch metal in leaf is produced from Dutch metal, a high-copper brass containing about 80 per cent of copper, by rolling or beating into sheets of the required thinness; it is also used as an imitation of gold leaf.

*Production.*—Prior to the war about one-half the domestic supply of bronze powders came from five plants, most of which were situated near New York; the remainder was imported. During the war, domestic production increased so as to supply all domestic requirements and leave a small surplus for export. The number of plants increased from five to nine. Whereas, normally, American plants have the advantage as regards cost of raw material, large accumulations of scrap metals have since the war given an added advantage to the German producers, who shipped large quantities of bronze powder to this country in 1920 and 1921 at prices materially lower than American costs of production as reported to the Tariff Commission by the manufacturers. It has been stated that 65 to 70 per

cent of the cost of bronze powder is represented by the cost of producing the schrote or thin brass clippings.

The production of bronze and aluminum leaf in this country is negligible. Germany is the center of the industry which is largely a household occupation. Aluminum leaf was made in the United States prior to 1911, but its manufacture was discontinued before the outbreak of the war and was not revived even when prices increased.

*Imports* of bronze powder, etc., in 1914 were 1,403,091 pounds, valued at \$406,849. The import of Dutch metal in leaf was 792,578 packs (100 leaves to the pack), valued at \$110,316. The 1914 figures are fairly representative of the prewar importations. The imports of aluminum leaf decreased after 1910 to only \$141 in 1914. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
----------------	-----------	--------	-------	------------------

BRONZE POWDER, BROCADES, FLITTERS, AND METALLICS.

	Pounds.			Per cent.
1918.....	34,412	\$19,105	\$4,776	25
1919.....	16,596	24,038	6,009	25
1920.....	511,133	229,293	57,323	25
1921 (9 months).....	545,302	185,586		

BRONZE OR DUTCH METAL IN LEAF.

	100 leaves.			
1918.....	313,748	\$96,914	\$24,228	25
1919.....	157,258	46,698	11,674	25
1920.....	296,000	87,595	21,899	25
1921 (9 months).....	103,243	19,267		

ALUMINUM LEAF.

1918.....	68,545	\$15,193	\$3,798	25
1919.....	74,665	15,382	3,846	25
1920.....	263,389	69,233	17,308	25
1921 (9 months).....	83,785	18,741		

*Exports.*—None recorded.

*Important changes in classification.*—The act of 1913 provided an ad valorem rate of duty on all these articles, which were grouped together. Powdered tin has been inserted in H. R. 7456, and the paragraph has been divided into two groups with a specific rate of duty for each, and the size of the leaf specified.

PARAGRAPH 380.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 380. Gold leaf, 50 cents per one hundred leaves. The foregoing rate applies to leaf not exceeding in size the equivalent of three and three-eighths by three and three-eighths inches; additional duties in the same proportion shall be assessed on leaf exceeding in size said equivalent.

## ACT OF 1909. ACT OF 1913.

PAR. 177. Gold leaf, thirty-five cents per one hundred leaves. The foregoing rate applies to leaf of not exceeding in size the equivalent of three and three-eighths by three and three-eighths inches; additional duties in the same proportion shall be assessed on leaf exceeding in size said equivalent.

PAR. 148. Gold leaf, 35 per centum ad valorem.

## GOLD LEAF.

*Description and use.*—Gold leaf is obtained by hammering thin sheets of gold between the leaves of a book. Ten or more colors are produced by melting pure gold with various alloying metals. The resulting bullion is cast into bars, which are rolled out into ribbon-like strips; these ribbons are cut into pieces of the requisite size (1 inch square), placed between leaves of vellum, and the whole, bound in leather covers, is beaten with a hammer. The thin sheets are then taken out, cut to a size, interleaved with goldbeater's skin, bound in a goldbeater's mold (par. 1574), and again beaten. There are three such beatings, all by hand. The finished leaf is cut into sheets  $3\frac{3}{4}$  inches square, and 25 leaves are placed in a book, which measures  $3\frac{1}{4}$  by  $3\frac{1}{2}$  inches. Twenty of these books make a pack (500 leaves). The leaf is used for gilding, especially for window signs, decorating, bookbinding, and dental purposes.

*Production.*—There were 79 establishments producing gold leaf in 1914, about one-half in New York. Certain of these manufactured some silver leaf, also some composition leaf. The total value of the product, gold and silver leaf, was \$2,432,000, and the cost of materials used was \$1,452,000. Manufacturers state that because of high wages they can not beat the gold out thin, and that the cost of making bullion is therefore greater here than in the foreign countries.

*Imports of gold leaf* were \$32,482 in 1914. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>100 leaves.</i>			<i>Per cent.</i>
1918.....	2,110	\$1,160	\$406	35
1919.....	59	43	15	35
1920.....	44,502	31,858	11,154	35
1921 (9 months).....	38,000	50,063	.....	.....

*Exports.*—No domestic gold leaf is exported, but some foreign leaf is made up into rolls and exported to Canada, with benefit of drawback.

*Important changes in classification.*—The provision for size of leaf is new.

## PARAGRAPH 381.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 381. Silver leaf, 5 cents per one hundred leaves.

ACT OF 1909.

ACT OF 1913.

PAR. 178. Silver leaf, ten cents per one hundred leaves.

PAR. 149. Silver leaf, 30 per centum ad valorem.

## SILVER LEAF.

*Description and uses.*—Silver leaf or foil is made by beating, as in manufacturing gold leaf (par. 380), but is in much less common use. Statistics of domestic production are included in those for gold leaf, as the entire output is from establishments producing gold leaf.

*Production.*—Silver leaf is now a minor product, as aluminum leaf is used instead.

*Imports* of silver leaf in 1914 were 6,814 packs, valued at \$4,353, double the quantity for 1913. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>100 leaves.</i>			<i>Per cent.</i>
1919.....	705	\$595	\$179	30
1920.....	11,525	3,931	1,179	30
1921 (9 months).....	375	254		

*Exports.*—No silver leaf is exported.

*Suggested changes.*—Page 72, line 20 of H. R. 7456: Should there not be a provision for the size of the leaf as in the case of leaves provided for in paragraphs 379 and 380?

## PARAGRAPH 382.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 382. Tinsel wire, lame or lahn, made wholly or in chief value of gold, silver, or other metal, 10 cents per pound and 30 per centum ad valorem; bullions and metal threads made wholly or in chief value of tinsel wire, lame or lahn, 10 cents per pound and 35 per centum ad valorem; ribbons, beltings, toys, and other articles made wholly or in chief value of tinsel wire, lame or lahn, and india rubber, bullions, or metal threads, not specially provided for, 45 per centum ad valorem; woven fabrics, fringes, and tassels, made of any of the foregoing, 55 per centum ad valorem.

## ACT OF 1909.

PAR. 179. Tinsel wire, lame or lahn, made wholly or in chief value of gold, silver, or other metal, five cents per pound; bullions and metal threads, made wholly or in chief value of tinsel wire, lame or lahn, five cents per pound and thirty per centum ad valorem; fabrics, \* \* \* ribbons, beltings, \* \* \* toys, or other articles, made wholly or in chief value of tinsel wire, lame or lahn, bullions, or metal threads, fifteen cents per pound and sixty per centum ad valorem.

## ACT OF 1913.

PAR. 150. Tinsel wire, lame or lahn, made wholly or in chief value of gold, silver, or other metal, 6 per centum ad valorem; bullions and metal threads, made wholly or in chief value of tinsel wire, lame or lahn, 25 per centum ad valorem; fabrics, ribbons, beltings, toys, or other articles, made wholly or in chief value of tinsel wire, lame or lahn, or of tinsel wire, lame, or lahn, and india rubber, bullions, or metal threads, not specially provided for in this section, 40 per centum ad valorem.

## TINSEL WIRE, ETC.

*Description and uses.*—Tinsel wire, lame or lahn, and bullion: “The testimony discloses the fact that both lame or lahn, and bullions, begin their existence in the form of tinsel wire. This is round wire composed principally of copper or brass, and usually coated with a bright metal, such as gold, silver, bronze, or foil. The article in this form is well known under the name of tinsel wire in trade and commerce and also in tariff nomenclature, and is devoted to various distinctive uses.

“Lame or lahn is produced by drawing the round tinsel wire through metal rollers, whereby it is flattened into various widths. At the same time it is generally subjected to an ornamental corrugating process, or to a coating or coloring process. When thus flattened and corrugated, or coated or colored, the article no longer bears the name of tinsel wire in trade and commerce or in tariff nomenclature, but is known as lame or lahn.

“Bullion is produced by subjecting lame or lahn to a twisting process whereby it is permanently brought to a hollow spiral form. In this form the article no longer bears the name of lame or lahn in trade and commerce or in tariff nomenclature, but passes under the name of bullion only. When imported into this country it is said to come in lengths of a yard or less. When applied to use, it is strengthened by means of a core of cotton or other fibrous thread running lengthwise through its center.” (*United States v. Veit*, 8 Ct. Cust. Appls., 290, 292, 293, of 1918.)

Tinsel thread and string are lame or lahn wound around a cotton or silk core. They are used in the manufacture of tinsel fabrics. Tinsel fabrics, products, etc., are articles in which tinsel products, usually lahn or thread, are used to produce a metallic effect in the finished work. The tinsel thread gives a glistening effect and throws the pattern into sharp relief.

Tinsel wire is manufactured into lame or lahn, bullion, threads, and the very flexible electric drop cords. Lame or lahn is wound around a cotton core in the manufacture of tinsel string used to tie fancy bundles, and tinsel thread is used in the manufacture of fabrics and trimmings. It is used direct in the manufacture of Christmas tree ornaments and tinsel decorations for the theatrical profession. Bullions are used in the manufacture of fringes, tassels, and military uniform insignia. Tinsel fabrics and trimmings are used in the manufacture of uniforms and women's wearing apparel, especially in dresses to be worn on the stage.

*Production.*—There is only a small domestic production of tinsel wire or lame, the consumption being largely supplied by France and Germany. A large proportion of the more finished products is factory made in this country. In Europe much of this work is done in the homes. Prior to the war almost the entire supply of tinsel wire, lames, tinsel threads, and a large part of the toys, ornaments, fabrics, and trimmings were imported. All of these products are now produced in considerable quantities in the United States. There is now one large manufacturer of tinsel wire and two large manufacturers of lames and tinsel thread. The domestic Christmas-tree ornament industry is now capable of supplying the domestic demand for this class of goods.

*Imports.*—Prior to the war all the tinsel wire and lame, and a large part of the fabrics, toys, and ornaments, made wholly or in part of tinsel, were imported. The imports in 1914 of tinsel wire, lame or lahn were \$146,793; of bullion, metal thread, etc., \$89,448, of fabrics, ornaments, toys, etc., \$657,490. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.

1921 (9 months).....		1,293,939		

*Exports.*—None.

*Important changes in classification.*—In the act of 1913 there are three groups: first, tinsel wire, lame or lahn, made wholly or in chief value of gold, silver, or other metal; second, bullions and metal threads, made wholly or in chief value of tinsel wire, lame or lahn; and third, fabrics, ribbons, beltings, toys, or other articles, made wholly or in chief value of tinsel wire, lame or lahn, or of tinsel wire, lame, lahn, and india rubber, bullions, or metal threads, not specially provided for. Each group bears an ad valorem rate of duty.

H. R. 7456 places specific and ad valorem rates of duty on each of the first two groups, but retains an ad valorem duty on the third

group. Fabrics are omitted from the third group and classified with the following articles which have been added to the paragraph, all bearing an ad valorem rate of duty; woven fabrics, fringes, and tassels, made of any of the foregoing.

*Suggested changes.*—Strike out “lahn” because omitted elsewhere in the bill. The act of 1913 provides for articles of tinsel wire or lame, or of tinsel wire, lame and india rubber, bullions or metal threads. Paragraph 382 leaves out articles made wholly or in chief value of tinsel wire or lame.

In this paragraph there is one rate of duty on ribbons, beltings, toys, etc., and another rate on woven fabrics, fringes, and tassels “made of any of the foregoing.” It is suggested that these two be combined with one rate of duty, particularly as the cost of manufacture of ribbons and beltings is usually more and not less than that of woven fabrics. In general, the narrower a fabric is made the higher the cost per square yard, and ribbons should, therefore, carry fully as high a rate as woven fabrics. In the act of 1909 (par. 179) specific provision was made for laces, embroideries, braids, galloons, trimmings, and ornaments made wholly or in chief value of tinsel wire, lame or lahn, bullions or metal threads. These enumerations were omitted in the corresponding provision (par. 150) of the act of 1913 and are omitted from paragraph 382 of H. R. 7456. The suggested exclusion of this paragraph from the operation of paragraph 1430 of H. R. 7456 makes advisable specific provision in paragraph 382 for those articles. The absence of the words ornaments or trimmings in paragraph 150 of the act of 1913 led to a decision that trimmings in chief value of lame or bullions, were dutiable as articles composed in chief value of metal (*United States v. Veit*, 8 Ct. Cust. Appls., 290, of 1918).

---

### PARAGRAPH 383.

#### H. R. 7456.

#### SENATE AMENDMENTS.

PAR. 383. Quicksilver, 35 cents per pound: *Provided*, That the flasks, bottles, or other vessels in which quicksilver is imported shall be subject to the same rate of duty as they would be subjected to if imported empty.

#### ACT OF 1909.

PAR. 189. Quicksilver, seven cents per pound. The flasks, bottles, or other vessels in which quicksilver is imported shall be subject to the same rate of duty as they would be subjected to if imported empty.

#### ACT OF 1913.

PAR. 159. Quicksilver, 10 per centum ad valorem. The flasks, bottles, or other vessels in which quicksilver is imported shall be subject to the same rate of duty as they would be subjected to if imported empty.

#### QUICKSILVER.

*Description and uses.*—Quicksilver or mercury, although a metal, is liquid at ordinary temperatures. Practically all the supply comes from sulphide ore, notably cinnabar. The ore is invariably reduced at the mine, therefore is not an article of commerce. In 1917 one-half

of our mercury was used in making blasting caps for high explosives and for drugs and chemicals. It is also extensively used in the hat and fur industry, in thermometers and barometers, in gold and silver amalgamation, and for other purposes.

*Production.*—Owing to foreign competition, production before the war was decreasing, but war prices again led to an expansion of the industry. In 1905 the United States was the leading producer, with 30,534 flasks of 75 pounds each; this fell to 16,548 flasks in 1914, and rose to 36,159 flasks in 1917. About 66 per cent of the production in 1917 was in California and 33 per cent in Nevada, Oregon, Idaho, Arizona, and Texas. Estimated production for 1921 was 6,339 flasks, of which all but 101 flasks were produced in Texas and California, each State furnishing about one-half of the total. The world's supply in 1913 was about 117,000 flasks, of which Spain produced 31.3 per cent, Italy 25.2 per cent, Austria 20.6 per cent, the United States 17.3 per cent, and other countries 5.6 per cent.

The cost of domestic production before the war was greater than in Spain, Italy, and Austria, because of lower-grade ores and higher labor costs. The domestic ore averages not over 0.5 per cent quicksilver, while that of Spain runs 8 per cent, that of Italy 0.9 per cent, and that of Austria 0.65 per cent.

*Imports* of quicksilver before 1911 were small, but in 1914 aggregated 444,373 pounds, valued at \$192,609. Later statistics follow.

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	503,053	\$533,408	\$53,341	10
1919.....	797,613	791,226	79,123	10
1920.....	1,062,647	971,510	97,151	10
1921 (9 months).....	528,003	329,145		

*Exports.*—Prior to 1910 the United States made rather large exports of mercury. This situation was reversed in 1911. Exports dwindled to about 300 flasks, compared with an average of over 4,200 flasks shipped annually during the preceding four years. Soon after the outbreak of the war exports began to increase rapidly. The exports in 1917 of 850,603 pounds were the greatest in the history of the industry. Exports since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	232,346	683,004	116,493	16,067
Value.....	\$338,620	\$817,328	\$129,993	\$10,992

The principal countries of destination were: In 1919, Japan, Hongkong, Sweden, Canada, Denmark; in 1920, Japan, Canada, British India, Cuba, Peru.

## PARAGRAPH 384.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 384. New types, 15 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 191. \* \* \* new types, twenty-five per centum ad valorem.

PAR. 160. \* \* \* types, 15 per centum ad valorem.

## TYPES.

*Description and use.*—Types are slugs of metal containing on one end raised dies of letters, figures, or typographical signs. They are used for setting up type composition for printing, or as a form from which a stereotype or electrotype impression is taken.

*Production.*—There were 31 establishments engaged in type founding in 1914, with a production valued at \$2,320,000. Domestic output exceeds consumption.

*Imports.*—Imports of type from all sources are small, and consist mainly of special fonts for foreign-language publications. They are derived principally from Germany, Japan, and China. Imports of new type in 1914 were 50,343 pounds, valued at \$9,866. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	15,600	\$4,069	\$610	15
1919.....	17,657	5,749	862	15
1920.....	35,016	10,694	1,604	15
1921 (9 months).....	22,633	12,021		

*Exports* of type amounted to 614,421 pounds, valued at \$219,491, in 1914. Later statistics by calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	276,091	626,634	646,639	434,352
Value.....	\$143,428	\$320,715	\$341,697	\$298,430

The principal countries of destination were: In 1919, Canada, Mexico, Cuba, United Kingdom, Argentina; in 1920, Canada, Mexico, Cuba, Philippine Islands, and Peru.

*Important changes in classification.*—"Types" has been changed to "new types," and "type metal" has been transferred to paragraph 389.

## PARAGRAPH 385.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 385. Nickel, nickel oxide, alloy of any kind in which nickel is the component material of chief value, in pigs or ingots, or similar forms, 5 cents per pound; in bars, rods, plates, sheets, strips, strands, anodes, or electrodes, 30 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 185. Nickel, nickel oxide, alloy of any kind in which nickel is a component material of chief value, in pigs, ingots, bars, rods, or plates, six cents per pound; sheets or strips, thirty-five per centum ad valorem.

PAR. 155. Nickel, nickel oxide, alloy of any kind in which nickel is a component material of chief value, in pigs, ingots, bars, rods, or plates, 10 per centum ad valorem; sheets or strips, 20 per centum ad valorem.

## NICKEL.

*Description and uses.*—The principal use of nickel is in alloys of which nickel steel is the most important, absorbing one-half the output. Nickel is also used in cheap jewelry (particularly watches), in German silver, nickel plating, laboratory appliances, and cooking and table utensils. Nickel oxide is used in Edison storage batteries and in the manufacture of glass. The salts are largely used in electroplating; also in the hydrolysis of fats into solids suitable for soap making, etc. Nickel ingots, bars, rods, and plates are the raw materials from which wire (round, square, and flat) is made. Plates are used also in electroplating. Sheets and strips are the relatively thin forms of nickel. To distinguish sheets from strips arbitrary lines of demarcation have been adopted by the Treasury Department, as follows: Sheet, over 7 inches in width and 0.14 inch or less in thickness; strip, 7 inches and under in width and  $\frac{3}{16}$  inch and under in thickness. Thin sheets of nickel are welded on sheet iron and steel, and are said to wear better than electroplated sheets.

*Production.*—The United States produces no nickel from domestic materials except as a by-product of copper refining. The production from this source in 1918 was 882,000 pounds, valued at \$401,000. This country is, however, the greatest producer of refined nickel in the world, with an output of about 70,000,000 pounds per year by one eastern company which easily dominates the industry through the ownership of the largest Canadian mines and smelters and by its large refining works in New Jersey. In 1918 the company began refining some of its nickel in Canada. Canadian nickel is also refined in Wales, and French company produces nickel from New Caledonian ores and matte. The latter is also employed by a smaller American producer of the metal. The production of nickel in 1914 was 35,098,958 pounds, valued at \$12,284,625, and in 1915 was 56,566,890 pounds, valued at \$22,626,756. The production of nickel oxide in 1914 was 1,692,000 pounds and in 1915 was 2,764,000 pounds. The production of nickel as a by-product in the electrolytic refining of copper was 846,000 pounds in 1914, valued at \$413,000 and 1,644,000 pounds in 1915, valued at \$538,222.

*Imports.*—In 1914 nickel, nickel oxide, alloy of any kind in which nickel is a component material of chief value, in pigs, ingots, bars,

rods, or plates, was imported to the amount of 109,213 pounds, valued at \$44,146. Imports of sheets and strips amounted to \$6,851 in the fiscal year 1914. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
NICKEL OXIDE.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	10,902	\$3,221	\$322	10
1919.....	1,078	324	32	10
1920.....	215	65	6	10
1921 (9 months).....	22,347	6,432		

NICKEL AND ALLOYS OF ANY KIND, ETC., IN PIGS, INGOTS, BARS, RODS, OR PLATES.

1918.....	40	\$8	\$1	10
1919.....	7,256,992	2,553,030	255,303	10
1920.....	6,905,753	2,193,256	219,326	10
1921 (9 months).....	1,463,503	482,381		

NICKEL SHEETS OR STRIPS.

1918.....		\$6,881	\$1,376	20
1919.....	10,152	4,889	978	20

*Exports.*—Exports in 1914 amounted to 28,895,242 pounds, valued at \$9,403,708. Prior to 1914, exports went chiefly to the Netherlands, France, and the United Kingdom. Exports of nickel, nickel oxide, and matte since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	17,469,500	3,810,656	1,215,232	425,439
Value.....	\$6,927,041	\$1,097,544	\$574,845	\$103,244

The principal countries of destination were, in 1919, France, Japan, United Kingdom, Belgium, Italy; in 1920, Belgium, Japan, Switzerland, France, United Kingdom.

*Important changes in classification.*—In the act of 1913 (par. 155) the articles mentioned in this paragraph are classified in two groups as follows: First, nickel, nickel oxide, alloy of any kind in which nickel is a component material of chief value, in pigs, ingots, bars, rods, or plates; and second, sheets or strips. In H. R. 7456, bars, rods, and plates have been transferred from the first group into the second group. "Or similar forms" has been added to the first group, and strands, anodes, and electrodes have been added to the second group.

*Suggested changes.*—Wire is a form of nickel not mentioned here. It has also been suggested that tubes be provided for in this paragraph.

Nickel shot, an important commercial product, might also be mentioned in this paragraph unless it shall be desired to exempt it from duty.

## PARAGRAPH 386.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 386. Tin in bars, blocks or pigs, and grain or granulated and scrap tin, 2 cents per pound.

## ACT OF 1909.

## ACT OF 1913.

PAR. 695. \* \* \* tin in bars, blocks, pigs, or grain or granulated: \* \* \* [Free].

[See also paragraph 1670, H. R. 7456.]

PAR. 631. \* \* \* tin in bars, blocks, pigs, or grain or granulated, and scrap tin: \* \* \* [Free].

[See also paragraph 1670, H. R. 7456.]

## TIN IN BARS, BLOCKS, PIGS, OR GRAIN, OR GRANULATED.

*Description and uses.*—Tin in bars, blocks, and pigs is commercial tin cast into convenient shapes, and only partially refined. Grain or granulated tin has been tested for its purity at the smelter and is a finer grade. Tin is used chiefly as a protective coating for other metals and in the making of alloys, especially bearing metals and solders. A considerable quantity of pure tin oxide goes into white enamel. By increasing the proportions of lead, aluminum, zinc, antimony, copper, cadmium, and bismuth in alloys of these metals with tin, the latter has been considerably conserved. A complete substitute for tin is not known.

*Production.*—This is one of the few metals not found in the United States in deposits of sufficient purity and extent to justify a domestic mining industry. Domestic smelters depend upon Bolivian ore and lacking this source of supply would probably be obliged to suspend operations. Ores from all other known deposits of workable size are either inaccessible or are not exported because of prohibitive export taxes or local transportation charges. Less than 100 tons of tin are annually recovered from domestic ore—all of which is from Alaska, whereas the smelter output from imported ores may be taken at about 12,000 tons.

*Imports* in 1914 of tin in bars, blocks, pigs, or grain or granulated were 100,177,962 pounds, valued at \$39,422,479. Prior to 1915 about one-half were transshipments from England, and only since 1914 have shipments come direct from the Dutch East Indies, with increasing amounts from the Straits Settlements. Later statistics by calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	142,678,763	\$9,718,525	125,590,278	34,083,996
Value.....	\$92,259,799	\$50,906,126	\$73,440,872	\$11,175,081

These imports came mainly from the Straits Settlements, United Kingdom and Dutch East Indies.

*Exports.*—Exports of tin in pigs and oxide of tin were 301,213 pounds in 1915; and 798,288 pounds in 1917. Exports of tin in pigs, bars, etc., since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	40,033	611,778	1,411,151	2,125,725
Value.....	\$31,952	\$415,921	\$770,375	\$695,007

The principal countries of destination were, in 1919, Russia in Asia, Canada, Mexico, Sweden; in 1920, Canada, Mexico, Cuba, Rumania.

## SCRAP TIN.

*Description and uses.*—Considerable tin is recovered from scrap metals, bronze, solder, pewter, and electrotype metal, and some from old tin cans and containers. Tin plate scrap, now admitted as scrap tin, is specially mentioned in par. 301 of H. R. 7456.

*Production.*—Practically no clean tin scrap or tinplate clippings are wasted, but it is difficult to collect and transport old tin cans and containers, and with no sale for the residue (black tin plate) the output from this source is greatly curtailed. The tin content of the average tin can and container is about 2 per cent. Detinners formerly recovered from 60 to 70 pounds of tin from a long ton of scrap, but only 40 to 45 pounds are now regained, and from used cans only 29 to 30 pounds. The production of secondary tin was 4,535 tons in 1914 and 7,142 tons in 1918. The production of secondary tin in the form of alloys was 7,912 tons in 1914 and 16,695 tons in 1918. The total value was \$8,887,158 in 1914 and \$41,381,000 in 1918.

*Imports* in 1914 were 10,778,343 pounds, valued at \$61,490; in 1918, 17,718,044 pounds, valued at \$115,963. These imports, which came mainly from Canada and Mexico, consisted almost wholly of scrap tin-plate (see paragraph 301), and since 1918 have been so designated by the Department of Commerce.

*Exports* in 1914 were valued at \$75,426; in 1917, at \$140,996. Prior to 1914 scrap tin was exported chiefly to Germany and Belgium; the 1917 exports practically all went to Japan.

*Important changes in classification.*—These articles were transferred from the Free List of the act of 1913 (par. 631).

---

**PARAGRAPH 387.**
**H. R. 7456.****SENATE AMENDMENTS.**

PAR. 387. Bottle caps of metal, collapsible tubes, and sprinkler tops, if not decorated, colored, waxed, lacquered, enameled, lithographed, electroplated, or embossed in color, 25 per centum ad valorem; if decorated, colored, waxed, lacquered, enameled, lithographed, electroplated, or embossed in color, 40 per centum ad valorem.

**ACT OF 1909.****ACT OF 1913.**

PAR. 196. Bottle caps of metal, if not colored, waxed, lacquered, enameled, lithographed, or embossed in color, one-half of one cent per pound and forty-five per centum ad valorem; if colored, waxed, lacquered, enameled, lithographed, or embossed in color, fifty-five per centum ad valorem.

PAR. 164. Bottle caps of metal, collapsible tubes, and sprinkler tops, if not decorated, colored, waxed, lacquered, enameled, lithographed, electroplated, or embossed in color, 30 per centum ad valorem; if decorated, colored, waxed, lacquered, enameled, lithographed, electroplated, or embossed in color, 40 per centum ad valorem.

## BOTTLE CAPS, COLLAPSIBLE TUBES, ETC.

*Description and uses.*—Bottle caps may be made of paper or metal. Metal bottle caps may be those familiar on beer and soda-water bottles or the decorative foil caps wound around the cork and tops of wine bottles to keep them air-tight. It is this fine foil cap, made largely of lead, that is referred to here.

Collapsible tubes are the metal containers for tooth paste, photographer's paste, shaving cream, etc., which may be pinched together and rolled up at the bottom to force out the contents at the top.

Sprinkler tops are perforated metal caps or stoppers for bottles from which liquids, such as perfumery and toilet waters, are sprinkled.

*Production.*—In 1913 four domestic factories, none of them west of Chicago, were manufacturing bottle caps. There were about 100 factories in all Europe—25 each in Germany, France, and Austria. Seven American factories in 1913 manufactured collapsible tubes; two, sprinkler tops; and two others, both collapsible tubes and sprinkler tops. Consumption of bottle caps is estimated to be from 25,000,000 to 50,000,000 caps annually. Production of collapsible tubes was estimated at about \$500,000 in 1913 and in 1920 from \$15,000,000 to \$20,000,000. Production of sprinkler tops was estimated at about \$300,000 in 1913, and at several million dollars in 1920. Automatic machines are used in American bottle-cap factories, but much skilled labor is said to be required in coloring.

*Imports.*—In 1914, imports of bottle caps, collapsible tubes, and sprinkler tops amounted to \$597,458. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
BOTTLE CAPS, COLLAPSIBLE TUBES, AND SPRINKLER TOPS; NOT DECORATED, COLORED, ETC.			
1918.....	\$2,666	\$300	30
1919.....	254	76	30
1920.....	1,238	371	30
1921 (9 months).....	1,203

1921 (9 months).....	40,057		

*Exports.*—None recorded.

## PARAGRAPH 388.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 388. Lead-bearing ores and mattes of all kinds,  $1\frac{1}{2}$  cents per pound on the lead contained therein: *Provided*, That such duty shall not be applied to the lead contained in copper mattes until after two thousand tons of such lead shall have been imported in any one year, to be allocated under rules and regulations to be prescribed by the Secretary of the Treasury: *Provided further*, That on all importations of lead-bearing ores and mattes of all kinds the duties shall be estimated at the port of entry and a bond given in double the amount of such estimated duties for the transportation of the ores or mattes by common carriers bonded for the transportation of appraised or unappraised merchandise to properly equipped sampling or smelting establishments, whether designated as bonded warehouses or otherwise. On the arrival of the ores or mattes at such establishments they shall be sampled according to commercial methods under the supervision of Government officers, who shall be stationed at such establishments, and who shall submit the samples thus obtained to a Government assayer, designated by the Secretary of the Treasury, who shall make an assay of the sample by wet assay without deduction and report the result to the proper customs officers, and the import entries shall be liquidated thereon. And the Secretary of the Treasury is authorized to make all necessary regulations to enforce the provisions of this paragraph.

ACT OF 1909.

PAR. 181. Lead-bearing ore of all kinds, one and one-half cents per pound on the lead contained therein: *Provided*, That on all importations of lead-bearing ores the duties shall be estimated at the port of entry, and a bond given in double the amount of such estimated duties for the transportation of the ores by common carriers bonded for the transportation of appraised or unappraised merchandise to properly equipped sampling or smelting establishments, whether designated as bonded warehouses or otherwise. On the arrival of the ores at such establishments they shall be sampled according to commercial methods under the supervision of government officers, who shall be stationed at such establishments, and who shall submit the samples thus obtained to a government assayer, designated by the Secretary of the Treasury, who shall make a proper assay of the sample and

ACT OF 1913.

PAR. 152. Lead-bearing ores of all kinds containing more than 3 per centum of lead;  $\frac{3}{4}$  cent per pound on the lead contained therein: *Provided*, That on all importations of lead-bearing ores the duties shall be estimated at the port of entry, and a bond given in double the amount of such estimated duties for the transportation of the ores by common carriers bonded for the transportation of appraised or unappraised merchandise to properly equipped sampling or smelting establishments, whether designated as bonded warehouses or otherwise. On the arrival of the ores at such establishments they shall be sampled according to commercial methods under the supervision of Government officers, who shall be stationed at such establishments, and who shall submit the samples thus obtained to a Government assayer, designated by the Secretary of the Treasury,

## ACT OF 1913.

report the result to the proper customs officers, and the import entries shall be liquidated thereon, except in case of ores that shall be removed to a bonded warehouse to be refined for exportation as provided by law. And the Secretary of the Treasury is authorized to make all necessary regulations to enforce the provisions of this paragraph.

who shall make a proper assay of the sample and report the result to the proper customs officers, and the import entries shall be liquidated thereon, except in case of ores that shall be removed to a bonded warehouse to be refined for exportation as provided by law. And the Secretary of the Treasury is authorized to make all necessary regulations to enforce the provisions of this paragraph.

## LEAD-BEARING ORES AND MATTES.

(See Survey C-21.)

*Description and uses.*—The typical lead ore is complex. Most mines produce lead with silver, zinc, and various other metals. Besides supplying metallic lead, the ores are used as carriers in the smelting process for the recovery of gold and silver. Lead sulphate and similar lead pigments are made to an increasing extent directly from the ore. Mattes are mixtures of artificial sulphides produced in smelting. Lead-bearing mattes invariably contain iron and sulphur and generally copper, silver, gold, and other metals in such amount as to exceed the value of the lead contained.

*Production.*—The United States is the leading producer of lead ore. Australia, Spain, Germany, and Mexico are next in order named. These five countries produce fully 80 per cent of the world's output.

The United States is also the largest consumer of lead metal. Before the war, consumption practically equaled the production. In addition, however, American smelting and refining works produce refined lead derived from foreign (chiefly Mexican) ore and base bullion for export, the output of this lead amounting to about 25 per cent of the domestic business. By virtue of the provision for bonded smelting, this traffic, although frequently carried on with the smelting of domestic ores, is entirely distinct, as far as the tariff is concerned.

Since 1870 production of lead has increased steadily. The output from domestic ores in short tons was, in 1880, 97,825; in 1890, 143,630; in 1900, 270,824; in 1910, 395,313; in 1918, 539,905; and in 1920, 424,433. The capacity of domestic furnaces for smelting lead ore was rated in 1918 at 5,521,000 tons.

*Imports and exports.*—The lead content of ore imported, 1910 to 1918, inclusive, averaged over 38,000,000 pounds annually. Less than 12½ per cent was imported for consumption by payment of duty, and more than one-half of this amount was exported with benefit of drawback. The average net consumption, therefore, amounted annually to only slightly more than 2,225,000 pounds of lead. Thus in this nine-year period less than 6 per cent of the total lead content of imported ore was actually used in the United States. The total net revenue in the nine-year period was only \$187,766.29, and the average yearly revenue was less than \$21,000.

Practically no lead ore of either domestic or foreign origin is exported from the United States. The lead imported in the form of ore for treatment in bonded works for export does not compete with the

product of domestic mines, except in foreign markets. Until the war, however, practically no lead of domestic origin was exported. The large exports of domestic lead during the war period were a result of war conditions, the curtailment of European supplies from Australia and Spain, and the unprecedented demand.

Broadly speaking, the only countries that compete with domestic output in the domestic ore market are Mexico, Canada, and Chile. Except locally, serious competition comes only from Mexico, but this is becoming less of a factor since the development of smelters in Mexico nearer to the sources of supply. Mexican lead ore, however, is a potential factor. It is of high grade, generally rich in silver, and, except for the duty, can be obtained cheaper than domestic ore. Mexican lead deposits are controlled almost entirely by American companies, chief among which are the American Smelting & Refining Co. and the American Metal Co. Mexico is the only country having large known deposits of lead that is not producing to practically its full economic limit, and which can, therefore, largely increase production.

Imports of lead ore containing more than 3 per cent of lead (lead content) have been, since 1917, as follows:

Calendar year.	Quantity.	Value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	6,064,902	\$344,080	\$45,476	.....
1919.....	4,106,823	196,363	30,801	15.69
1920.....	13,700,499	908,619	102,754	11.31
1921 (9 months).....	5,471,833	254,762	.....	.....

These imports came mainly from Canada and Mexico.

*Important changes in classification.*—The act of 1913 provides for lead-bearing ores of all kinds containing more than 3 per centum of lead. H. R. 7456 provides for lead-bearing ores of all kinds, and includes "mattes" in the paragraph and also in the proviso. The proviso omits the following words: "except in case of ores that shall be removed to a bonded warehouse to be refined for exportation as provided by law" after the words: "and the import entries shall be liquidated thereon." The following is a new provision: "*Provided*, That such duty shall not be applied to the lead contained in copper mattes until after 2,000 tons of such lead shall have been imported in any one year, to be allocated under rules and regulations to be prescribed by the Secretary of the Treasury."

The provision for wet assay without deduction is new. This change will be considered in connection with Title III, Section 315.

## PARAGRAPH 389.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 389. Lead bullion or base bullion, lead in pigs and bars, lead dross, reclaimed lead, scrap lead, antimonial lead, antimonial scrap lead, type metal, Babbitt metal, solder, all alloys or combinations of lead not specially provided for,  $2\frac{1}{2}$  cents per pound on the lead contained therein; lead in sheets, pipe, shot, glazier's lead, and lead wire, lead in any article or material not specially provided for,  $2\frac{3}{8}$  cents per pound.

## ACT OF 1909.

PAR. 182. Lead dross, lead bullion or base bullion, lead in pigs and bars, lead in any form not specially provided for in this section, old refuse lead run into blocks and bars, and old scrap lead fit only to be remanufactured; all the foregoing, two and one-eighth cents per pound; lead in sheets, pipe, shot, glaziers' lead and lead wire, two and three-eighths cents per pound.

PAR. 191. Type metal, one and one-half cents per pound on the lead contained therein; \* \* \*

PAR. 649. Pewter and britannia metal, old, and fit only to be remanufactured [Free].

PAR. 702. Types, old, and fit only to be remanufactured [Free].

## ACT OF 1913.

PAR. 153. Lead dross, lead bullion or base bullion, lead in pigs and bars, lead in any form not specially provided for in this section, old refuse lead run into blocks and bars, and old scrap lead fit only to be remanufactured: lead in sheets, pipe, shot, glaziers' lead, and lead wire; all the foregoing, 25 per centum ad valorem, on the lead contained therein.

PAR. 160. Type metal, \* \* \* 15 per centum ad valorem.

PAR. 572. Pewter and britannia metal, old, and fit only to be remanufactured [Free].

PAR. 637. Type, stereotype metal, electrototype metal, linotype composition, all of the foregoing, old and fit only to be remanufactured [Free].

## LEAD.

(See Survey C-21.)

*Description and uses.*—The chief consumption of lead is in the form of white lead for paint. Large quantities are used in pipe and sheet, and in shot and bullets; lesser quantities in bearing metals, solders, and other white-metal alloys.

The market grades are (1) desilverized, (2) "soft," and (3) antimonial lead. Lead bullion or base bullion is metallic lead containing gold and silver, differing from market lead in that it must be desilverized or refined. Lead pigs and bars—usually about 3 feet long and weighing from 80 to 110 pounds—includes all merchantable forms of pig lead whether virgin (produced direct from ore) or of secondary origin, and whether soft, desilverized, or base bullion. Lead dross, made in recovering the metal from its ores, is valueless except as a source of lead and the minor amounts of other metals which it may contain. The chief source of antimonial lead (provided for in the act of 1913 as "type metal") is from the refining of lead bullion; as the name implies, it is lead alloyed with a certain amount of antimony. Type metal is an alloy of lead and antimony with small amounts of tin and is used for the manufacture of type. Babbitt metal is representative of a large group of bearing metals

containing lead and antimony to which may be added copper, zinc, or other metallic substances. Solder, an alloy of tin and lead, is used for joining metals together.

*Production.*—The United States is the largest producer and consumer of lead. Since 1875 it has been practically independent of foreign supplies, with a domestic production very nearly equal to consumption. Although large amounts appear in the import statistics, little foreign lead is ultimately absorbed in the United States, as most of the ore and base bullion imported is treated in bonded works without payment of duty, and the larger part of the imports upon which duty is paid is eventually reexported, generally with benefit of drawback. For instance, we carry on a large smelting and refining business in bond, treating by far the greater part of the Mexican output. In 1918 more than 550,000 tons of lead were obtained from domestic ore, and 109,159 tons from foreign ore, the total output being 659,888 tons, valued at more than \$97,000,000. The 1917 output was 635,669 tons, worth about \$112,000,000. The value of the products of the lead smelting and refining industry, including the gold, silver, and copper contents of the ores and bullion treated, was \$171,579,000 in 1914 and \$192,655,000 in 1919, an increase of \$21,076,000, or 12.3 per cent. The value of products of smelting only was \$64,695,000 in 1914 and \$70,973,000 in 1919. The value of products of refining was \$107,884,000 in 1914 and \$121,862,000 in 1919. Primary lead smelted or refined was valued at \$563,810 in 1914, as compared with \$485,112 in 1919. Utah is the leading State in the industry.

Smelting and refining are centralized in a few strong companies, almost one-half the output of refined metal being controlled by one large producer. The independent producing companies are highly integrated, have ample capital, and substantial ore supplies.

The production of antimonial lead from domestic ore was 19,371 tons in 1915 and 10,777 tons in 1918. Production from foreign ores for the same years was 3,853 tons and 7,793 tons, respectively. The production of alloys of lead in 1914 was valued at \$19,179,976.

*Imports.*—Of the various forms in which lead is imported, the most important is base bullion. In the fiscal year 1918 the maximum importation of pigs, bars, etc., was over 19,000,000 pounds, which compares with 150,000,000 pounds of lead in base bullion. In 1913 and 1914 only a few hundred thousand pounds were imported, showing an enormous fluctuation in the imports of both classes of the metal. This was due largely to political conditions in Mexico, the only important country of origin of both classes of imports. The imports from all other countries are small and, excepting those from Canada, sporadic. Mexican lead is refined in bond and shipped chiefly to Great Britain.

Practically the entire imports of antimonial lead or type metal are produced in bonded smelting works from the refining of imported lead base bullion, mainly from Mexico. The type metal is withdrawn for consumption, as provided for in Section IV, paragraph N, subsection 1, of the act of 1913. Imports have fluctuated widely; the maximum was in 1907, nearly 12,000 tons of antimonial lead, valued at more than \$1,300,000. There were no imports in 1916, and 105 pounds, valued at \$20, in 1918. The imports of type metal fit only to be remanufactured were 329,825 pounds, valued at \$20,822, in

1913, and 16,964 pounds, valued at \$1,621, in 1918. The imports of sheets, pipes, shot, glaziers' lead, lead wire, and other manufactures were \$63,512 in 1915 and \$13,841 in 1918. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.

TYPE, STEREOTYPE AND ELECTROTYPE METAL, AND LINOTYPE COMPOSITION, OLD AND FIT ONLY TO BE REMANUFACTURED.

1918.....	100	\$3	.....	.....
1919.....	10,968	1,088	.....	.....
1920.....	11,312	1,194	.....	.....
1921 (9 months).....	32,279	66,690	.....	.....

<sup>1</sup> These imports came principally from Mexico, Canada, and France.

<sup>2</sup> Canada and Mexico furnished the greater part of these imports.

*Exports.*—For 10 years prior to 1914 there are no records of the export of domestic pig lead. However, domestic smelters were treating and exporting a considerable tonnage of foreign lead. A large amount of domestic lead was exported during the war period. In the fiscal year 1918, more than 107,000 tons of pig lead (from both foreign and domestic ore), valued at \$17,400,000, were exported, the maximum of domestic lead being 96,500 tons in 1915.

No appreciable quantity of antimonial lead or type metal is exported. The exports of Babbitt metal were 1,010,651 pounds, valued at \$181,958 in 1914. Later exports for the calendar years 1918 to 1921 have been as follows:

	1918	1919	1920	1921 (9 months).
Lead pigs, bars, etc., produced from domestic ore:				
Quantity (pounds).....	83,662,322	21,019,605	5,459,713	976,321
Value.....	\$5,889,381	\$1,471,256	\$462,223	\$63,340
Lead pigs, bars, etc., produced from foreign ore:				
Quantity (pounds).....	108,568,854	81,016,588	33,663,553	28,371,805
Value.....	\$7,605,403	\$4,479,723	\$2,486,576	\$1,292,649
Babbitt metal:				
Quantity (pounds).....	2,240,193	2,188,164	2,371,906	631,961
Value.....	\$559,332	\$718,223	\$697,476	\$169,936

The principal countries of destination in 1920 were Brazil, Japan, Canada, the United Kingdom, Cuba, the Netherlands, Argentina, Mexico, and the Philippine Islands.

*Important changes in classification.*—Antimonial lead, antimonial scrap lead, type metal, Babbitt metal, and solder have been included in this paragraph. Type metal is transferred from a separate paragraph in the act of 1913 (par. 160). The rate of duty has been changed from ad valorem to specific.

Pewter and Britannia metal, old and fit only to be remanufactured (par. 572), and type, stereotype metal, electrotype metal, linotype composition, old and fit only to be remanufactured (par. 637), are transferred from the free list of the act of 1913.

The provision for "lead in any article or material not specially provided for" is new.

*Conflicting provisions.*—The added provision "lead in any article or material not specially provided for" conflicts with the provision in paragraph 393 for manufactures wholly or in chief value of lead, not specially provided for.

*Suggested changes.*—No provision is made for duties on alloys used with lead in any of the articles provided for in this paragraph. One-half of solder is ordinarily tin.

There is doubt whether the 2½ cents per pound is to be imposed on the lead or on the total weight of the sheets and pipe and articles thereafter enumerated. The main bracket specifically imposes duty on lead in pigs, etc., on the lead content. If the intention is to impose duty on the lead content of lead in sheets, etc., it is suggested that the words "on the lead contained therein" be inserted after the word "pound" in line 6, page 75. If, on the other hand, the intention is to impose duty on the gross weight, it is suggested that the words "on the gross weight of the sheets or other articles or materials" be inserted after the word "pound" in line 6, page 75.

## PARAGRAPH 390.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 390. Zinc-bearing ore of all kinds, containing less than 10 per centum of zinc, shall be admitted free of duty; containing 10 per centum or more of zinc and less than 20 per centum, one-half of 1 cent per pound on the zinc contained therein; containing 20 per centum or more of zinc and less than 25 per centum, 1 cent per pound on the zinc contained therein; containing 25 per centum of zinc, or more,  $1\frac{1}{2}$  cents per pound on the zinc contained therein: *Provided*, That on all importations of zinc-bearing ores the duties shall be estimated at the port of entry, and a bond given in double the amount of such estimated duties for the transportation of the ores by common carriers bonded for the transportation of appraised or unappraised merchandise to properly equipped sampling or smelting establishments, whether designated as bonded warehouses or otherwise. On the arrival of the ores at such establishments they shall be sampled according to commercial methods under the supervision of Government officers, who shall be stationed at such establishments, and who shall submit the samples thus obtained to a Government assayer, designated by the Secretary of the Treasury, who shall make an assay of the sample by wet assay without deduction and report the result to the proper customs officers, and the import entries shall be liquidated thereon. And the Secretary of the Treasury is authorized to make all necessary regulations to enforce the provisions of this paragraph.

## ACT OF 1909.

## ACT OF 1913.

PAR. 193. Zinc-bearing ore of all kinds, including calamine, containing less than ten per centum of zinc, shall be admitted free of duty; containing ten per centum or more of zinc and less than twenty per centum, one-fourth of one cent per pound on the zinc contained therein; containing twenty per centum or more of zinc and less than twenty-five per centum, one-half of one cent per pound on the zinc contained therein; containing twenty-five per centum of zinc, or more, one cent per pound on the zinc contained therein: *Provided*, That on all importations of zinc-bearing ores the duties shall be estimated at the port of entry, and a bond given in double the amount of such estimated duties for the transportation of the ores by common carriers bonded for the transportation of appraised or unappraised merchandise to properly equipped sampling or smelting establishments, whether designated as bonded warehouses or otherwise. On the arrival of

PAR. 162. Zinc-bearing ores of all kinds, including calamine, 10 per centum ad valorem upon the zinc contained therein: *Provided*, That on all importations of zinc-bearing ores the duties shall be estimated at the port of entry, and a bond given in double the amount of such estimated duties for the transportation of the ores by common carriers bonded for the transportation of appraised or unappraised merchandise to properly equipped sampling or smelting establishments, whether designated as bonded warehouses or otherwise. On the arrival of the ores at such establishments they shall be sampled according to commercial methods under the supervision of Government officers, who shall be stationed at such establishments, and who shall submit the samples thus obtained to a Government assayer, designated by the Secretary of the Treasury, who shall make a proper assay of the sample and report the result to the proper custom officers, and the import entries

## ACT OF 1909.

the ores at such establishments they shall be sampled according to commercial methods under the supervision of government officers, who shall be stationed at such establishments, and who shall submit the samples thus obtained to a government assayer, designated by the Secretary of the Treasury, who shall make a proper assay of the sample, and report the result to the proper customs officers, and the import entries shall be liquidated thereon, except in case of ores that shall be removed to a bonded warehouse to be refined for exportation as provided by law. And the Secretary of the Treasury is authorized to make all necessary regulations to enforce the provisions of this paragraph.

## ACT OF 1913.

shall be liquidated thereon, except in case of ores that shall be removed to a bonded warehouse to be refined for exportation as provided by law. And the Secretary of the Treasury is authorized to make all necessary regulations to enforce the provisions of this paragraph.

## ZINC-BEARING ORES.

(See Survey C-17.)

*Description and uses.*—Zinc ores separate into the following classes: (1) Calamine or carbonate ore and concentrates, approximately 40 per cent zinc with small amounts of other metallic elements; (2) blende or sulphide ores and concentrates, approximately 60 per cent zinc with small amounts of other metallic elements; (3) sulphide ores and concentrates, Rocky Mountain products averaging between 38 and 50 per cent zinc with relatively high content of iron and sulphur; (4) complex sulphide ores containing up to 35 per cent zinc, but averaging about 20 to 25 per cent of zinc associated with other metals besides iron, and including lead or copper. Unusual varieties of zinc minerals are found in important quantities only at Franklin Furnace, N. J., a deposit unique in the character of its ores which are used in the production of zinc oxide and of zinc metal of exceptional purity. It is operated by one company and is not a factor in the general consideration of the industry.

Ores of the first two classes rarely have any precious-metal value; class 3 usually contains some precious metal; while class 4 almost invariably carries precious metal. The first three classes are smelted for the production of spelter; the fourth class is a middling product usually sold to concentrating plants for further mechanical separation. More recently a market has begun to develop for such ores in making electrolytic zinc and for igneous concentration. In the Missouri ore schedule only two classes of ore are distinguished. Blende is sold on the basis of a 60 per cent zinc content, calamine on a basis of 40 per cent. The chief use of zinc ores is in the manufacture of spelter (zinc metal), but an increasingly large amount is used domestically for the direct manufacture of zinc oxide and other pigments and zinc dust. A large tonnage of sulphuric acid is derived as a by-product in the making of spelter from blende.

*Production.*—The United States is the largest producer of zinc ore, as well as of metal, other countries producing in the following order in 1917: Germany, Australia, Mexico, Canada, Italy, Japan, Spain, Siberia, and India. The greater part of the zinc resources as well as reduction works of Germany are transferred to the new State of Poland. Domestic proportion of the world's output has increased

from about 20 per cent in the early nineties to about 60 per cent during the war. The output of domestic zinc mines in 1917 was 710,972 short tons—eight times the annual output of 25 years ago, increasing by over 50 per cent since 1914. It was estimated at 627,100 short tons in 1918.

Zinc mining as well as smelting has been peculiarly free from large combinations of capital, and with the exception of perhaps a half dozen exceptionally large producers, most of the zinc mines are operated independently. Zinc production was reported from 23 States in 1917. Over 80 per cent of the total output, however, came from six districts, namely: (1) Missouri, Kansas, and Oklahoma; (2) New Jersey; (3) Montana; (4) Wisconsin; (5) Colorado; and (6) Idaho. The first is the largest producing region in the world, in recent years yielding about one-seventh of the total output.

Since the location of zinc-reduction works is determined by availability of fuel and labor supply rather than by proximity to ore deposits, zinc ore and concentrates are transported long distances. The ore from North American mines must be transported largely by rail, the ores of other countries by water, thus Australian concentrates normally go to European works for treatment. Geographical position constrains Mexico and Canada—until very recently the only countries shipping us ore—to market their ores in the United States. Except for South America, whose resources are not yet gauged, they alone are likely to compete actively in our zinc-ore markets. Few of the Canadian mines possesses advantages over those located adjacently in the United States, costs of labor and supplies being nearly the same. The Canadian mines are not much richer and are a little farther away from smelting centers. In Mexico, however, there are large deposits of high-grade zinc ore which eventually may provide enormous supplies at extremely low cost. Despite the high freight rates, the low cost of production makes it possible to deliver the ore at Mississippi Valley smelteries for less than much of the output from our mines, even of that section.

*Imports.*—Mexico is the most important exporter of ore to the United States. The quantity greatly increased until the disturbances in 1911. The most important factor aside from market conditions is the Mexican situation, which involves large potential tonnage. The average annual customs on the zinc contents of all ore during 1910–1918 was \$146,136.72, deducting the drawbacks. The average annual net consumption of foreign ore (zinc content) during this nine-year period was 16,698 short tons, the average general import being 44,742 tons. In the fiscal year 1918 the total was 24,809 short tons of which 18,426 tons came from Mexico and 5,173 tons from Canada. The general imports were 7,242 tons in 1914, and 127,433 tons in 1916. Later imports of zinc ore, including calamine (zinc contents) have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	17,001,220	\$291,449	\$29,145	10
1919.....	5,956,481	119,540	11,954	10
1920.....	13,942,878	198,156	19,816	10
1921 (9 months).....	18,512,603	246,034	.....	.....

The imports came mainly from Mexico and Canada.

*Exports.*—All the domestic ore exported is high-grade willemite from New Jersey, used for high-grade spelter in Europe. From 1910 to 1915 exports of zinc ore ranged from 15,000 to 20,000 tons; in 1915 they declined to some 3,000 tons, and in the fiscal year 1917 to 71 tons, but increased in 1918 to 1,203 tons.

*Important changes in classification.*—"Calamine" has been omitted from this paragraph as unnecessary and the following words have been omitted from the proviso: "except in case of ores that shall be removed to a bonded warehouse to be refined for exportation as provided by law." The duty is ad valorem in the act of 1913. H. R. 7456 provides a graduated scale of specific rates depending upon the per centum of zinc contained in the ores, zinc ores containing less than 10 per cent of zinc to be admitted free of duty.

The provision for wet assay without deduction is new.

*Suggested changes.*—It has been represented to the Tariff Commission that a provision might be inserted in this paragraph for zinc-bearing ore containing 40 per cent or more of zinc, since the zinc in excess of such percentage is more valuable per pound than ore containing a smaller percentage of zinc.

## PARAGRAPH 391.

### H. R. 7456.

PAR. 391. Zinc in blocks or pigs and zinc dust,  $1\frac{3}{8}$  cents per pound; in sheets,  $1\frac{1}{2}$  cents per pound; in sheets coated or plated with nickel or other metal, or solutions,  $1\frac{1}{2}$  cents per pound; old and worn-out, fit only to be remanufactured, 1 cent per pound: *Provided*, That for a period of two years beginning on the day following the enactment of this Act the rates of duty shall be as follows: On zinc in blocks, pigs, or slabs, and old and worn-out zinc fit only to be remanufactured, 2 cents per pound; zinc in sheets, plates, strips, or coils, plated with nickel or other base metals, or in fabricated form, and zinc dust,  $2\frac{1}{4}$  cents per pound.

### ACT OF 1909.

PAR. 194. Zinc in blocks or pigs and zinc dust, one and three-eighths cents per pound; in sheets, one and five-eighths cents per pound; in sheets coated or plated with nickel or other metal, or solutions, one and three-fourths cents per pound; old and worn-out, fit only to be remanufactured, one cent per pound.

### SENATE AMENDMENTS.

### ACT OF 1913.

PAR. 163. Zinc in blocks, pigs, or sheets, and zinc dust; and old and worn-out zinc fit only to be remanufactured, 15 per centum ad valorem.

PAR. 109. \* \* \* metal sheets \* \* \* coated with nickel or other metals by dipping, printing, stenciling, or other process, 15 per centum ad valorem.

### ZINC IN BLOCKS, PIGS, AND SHEETS.

(See Survey C-27.)

*Description and uses.*—The zinc of commerce, more or less impure, cast from molten metal into slabs, blocks, plates, or ingots, etc., is called spelter. The chief uses of zinc are for galvanizing, brass making, and sheet rolling. Sheet zinc is used in large amounts for dry

batteries in automobile ignition, telephones, etc., and is of growing importance as a building material. In most structural uses zinc sheet may be replaced by the cheaper zinc-coated (galvanized) iron sheet; but where resistance to the atmosphere is the important requirement, pure zinc is claimed to be ultimately cheaper. An important amount of spelter is consumed in the desilverization (refining) of silver-lead bullion. Zinc in the form of shavings (from sheets) or as zinc dust is used for the precipitation of gold and silver in the cyanide process. A certain amount is used in the making of zinc white (French process oxide) and other pigments, although these are more often in this country prepared directly from the ore. The salts of zinc are also made from the metal, although generally from metallurgical by-products and scrap.

*Production.*—The United States is the world's largest producer and consumer of zinc, its prewar output (300,000 tons) being about one-third of the total. The supply is derived almost exclusively from domestic sources, and, except during the war, exports have been small, although the bonded smelting privilege is extended to zinc ores and large supplies of cheap raw materials are available in Mexico. The American industry is highly competitive. Over 75 per cent of the zinc smelting is by nine companies, four of which control 48.7 per cent of the total. There is a large excess of smelting facilities in the United States, but they are not favorably situated for conducting a bonded-smelting business on foreign ores, and because of the higher cost of domestic ore—due in part to railroad freights—little export business in the metal produced from this ore is probable. The European smelteries, located at or near seaboard, have an advantage as regards cost of ore delivered at their plants, although the ore is derived in large part from distant regions, notably Australia. The spelter they produce is the main feature in the world trade.

Domestic production of spelter reached its maximum in 1917, when the total was 669,573 tons. At the average price for the year this output approximated \$119,184,000. Production decreased to 517,927 tons in 1918. The total capacity is about 864,000 short tons per year. Approximately 40 per cent of the output is in the vicinity of the Joplin district, centering in southwest Missouri and extending into Oklahoma, Kansas, and Arkansas. Illinois ranks next, with from 25 to 35 per cent of the output. Large individual plants are located in Pennsylvania, Colorado, Montana, and other States.

The Federal census shows that the production of spelter in 1909 amounted to \$34,206,000, in 1914 to \$53,538,000, and in 1919 to \$103,103,000, which is an increase of \$49,565,000, or 92.6 per cent over 1914. The production of zinc sheets and strips was 90,425,811 pounds in 1915 and 117,252,951 pounds in 1917. Primary zinc produced at the smelters, as reported by the Geological Survey, increased from 353,049 tons in 1914 to 465,743 tons in 1919, an increase of 31.9 per cent. Illinois is the leading producing State with Oklahoma a close second.

*Imports* of zinc have averaged less than 1 per cent of the domestic production since about 1900. The imports of 1912 (10,866 short tons) were exceptional, due to a generally prosperous state of the domestic zinc industry, high prices, increasing consumption, and a slight lag in

production. Imports before the war were chiefly from Germany; smaller amounts came from Belgium, but shipments from both were sporadic. The large imports in 1921 came in mostly in March and April from England, Belgium, and Germany (via Holland). Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
ZINC IN BLOCKS OR PIGS.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	22,760	\$2,897	\$435	15
1919.....	64,397	2,284	343	15
1920.....	101	17	3	15
1921 (9 months).....	13,064,016	552,256		
ZINC SHEETS.				
1918.....	142	\$29	\$4	15
1919.....	2,072	249	37	15
1920.....	7,572	614	92	15
1921 (9 months).....	13,057,221	477,617		

Exports were not large prior to the war. They went to Canada, with occasionally large shipments, representing excess production, to Great Britain. Exports approximated 5,000 tons per year for the five years immediately preceding the war, the maximum being 9,730 tons in 1912. The maximum exportation of spelter produced from domestic ore was 183,656 short tons in the fiscal year 1917, as well as 54,209 tons from foreign ore smelted in bond. England has been one of the best customers for American spelter and sheets. France, Italy, and even Belgium have bought spelter since 1917, and since 1918 Japan has also absorbed some quantity, while Canada has been in the market from time to time. Zinc sheets are shipped to all the above countries and also to South Africa and Latin America. Exports for the calendar years 1918 to 1921 have been as follows:

	1918	1919	1920	1921 (9 months).
Zinc, cast in pigs, slabs, etc., produced from domestic ore:				
Quantity (pounds).....	132,736,529	219,491,933	148,091,432	2,257,468
Value.....	\$12,469,622	\$17,524,153	\$12,495,144	\$131,925
Zinc, cast in pigs, slabs, etc., produced from foreign ore:				
Quantity (pounds).....	40,045,871	24,338,265	56,262,876	1,280,002
Value.....	\$3,554,608	\$1,929,487	\$4,331,529	\$48,090
Zinc, rolled in sheets, strips, etc.:				
Quantity (pounds).....	27,750,910	39,524,516	23,704,197	2,605,634
Value.....	\$4,566,756	\$5,212,002	\$2,832,993	\$322,900

*Important changes in classification, etc.*—See General Notes on Paragraph, page 549.

#### ZINC DUST.

*Description and uses.*—Zinc dust consists of metallic zinc in the form of very fine, almost impalpable, powder. The most important type is ordinary furnace blue powder, a by-product of the retort smelting of zinc ores. Furnace blue powder contains 80 to 90 per cent; "standard" fumed dust, 92 to 94 per cent; while "atomized" averages 98 to 99 per cent. The last two are made from spelter.

The important use of zinc dust is for sherardizing, a process of coating other metals with zinc. Large quantities are used in the dye industries and in the cyanide process for the extraction of gold and silver from ores. Zinc dust has a variety of minor uses through its extraordinary chemical activity as a reducing agent.

*Production* began in 1910, amounting to only 69 tons. The output increased steadily to over 1,000 tons in 1914. In 1918 it was 6,995 tons. Twelve companies make zinc dust, always as a by-product. Most manufacturers make only blue powder. A New Jersey zinc company makes a fumed product from spelter. There are only four producers of atomized zinc. With the exception of one plant in Colorado, the whole output comes from the Eastern or Middle Western States.

Most European zinc smelters sell zinc dust as a by-product. Germany and Belgium were the chief producers before the war, with smaller amounts produced in France, England and other zinc-smelting countries. Germany was the dominant exporter to the world market as well as to the United States. The domestic industry is fairly established and its future rests on the same basis as does that of spelter.

*Imports*.—Before 1909 the domestic supply was imported chiefly from Germany. Even in 1913, 85 per cent of the supply was imported. Imports (all in the form of blue powder) were 2,808 tons in 1913. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	31,155	\$3,552	\$533	15
1919.....	103,562	5,753	863	15
1920.....	33,364	6,207	931	15

The principal countries of origin were: In 1918, Japan; in 1919, United Kingdom, Canada; in 1920, United Kingdom.

*Exports*.—No exports reported.

*Important changes in classification, etc.*—See General Notes on Paragraph, page 549.

#### OLD AND WORN-OUT ZINC FIT ONLY TO BE REMANUFACTURED.

*Production and uses*.—Large quantities of secondary spelter are recovered from old metal and drosses. The output of secondary zinc, including that recovered in the form of brass, was 116,200 tons in 1917, equaling 17.3 per cent of the domestic output of primary spelter. Part of this secondary metal is recovered by smelters which mix these secondary materials with low-grade ore. There are two such smelters in New Jersey, two in New York, and one each in Pennsylvania and California. The largest recoveries of secondary zinc metal now are in the form of resmelted brass. Zinc drosses and skimmings (derived chiefly from galvanizing works) are important articles of commerce. They are not all used for spelter, but large quantities are consumed in the production of zinc chloride and other salts and lithopone.

*Imports.*—Except in abnormal years, receipts of old zinc fit only to be remanufactured and derived from various nonproducing countries exceeded the imports of virgin metal. From 1914 to 1921 old zinc was almost the only zinc metal imported. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.
	<i>Pounds.</i>		
1918.....	47,792	\$2,056	\$291
1919.....	74,785	2,216	297
1920.....	28,954	1,065	157
1921 (9 months).....	11,121	341	.....

Japan, Canada, and Cuba were the principal countries of origin.

*Exports.*—No exports have been reported.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Zinc sheets, which were classified with zinc in blocks, pigs, and zinc dust in the act of 1913, have been given a separate classification. Sheets coated or plated with nickel or other metal, or solutions, has been added to the paragraph. A provision has been made that for two years after the enactment of the act, zinc in blocks, pigs, or slabs, and old and worn-out zinc shall bear a duty of 2 cents per pound; and zinc in sheets, plates, strips, or coils, plated with nickel or other base metals, or in fabricated form, and zinc dust shall bear a duty of 2½ cents per pound.

The provision in paragraph 109 of the act of 1913, "metal sheets decorated in colors," has been omitted.

*Suggested changes.*—No provision is made for zinc in slabs after two years, and also none for zinc in plates, strips, or coils if the provision for them should be held to be a part of the proviso. Consideration might also be given to the relative differences in rates of duties. If these materials are not intended to be a part of the proviso, such intention should be made clear. The part of the proviso beginning with line 14, page 76, might be made to read "the rates of duty on zinc in blocks, pigs, or slabs, and old, worn-out zinc fit only to be remanufactured, shall pay 2 cents per pound" (then the semicolon). In any event, the provisions beginning with the word "Provided" in line 12, and ending with the word "pound" in line 18, might be reconstructed to conform more closely to the language of the purview contained in lines 8 to 12. Special reference may be made to the words "coated or plated" in lines 9 and 10 as against the word "plated" only in line 17, in connection with sheets and the words "metal or other solutions" in line 10, and "base metals, or in fabricated form," in lines 17 and 18.

There is doubt whether the proviso continues to the end of the paragraph. If it does, no provision is made therein for slabs, plates, strips, or coils, imported after two years from the enactment of H. R. 7456. If, on the other hand, the proviso ends with the semicolon after "2 cents per pound" in line 16, page 76, there are two provisions carrying different rates of duty on zinc dust and zinc in sheets plated with nickel or other base metal.

Zinc in sheets, not coated or plated, will be subject to a duty of 1½ cents per pound, as against 2 cents per pound on zinc in blocks, pigs, or slabs, and old worn-out zinc fit only to be remanufactured, for a period of two years following the enactment of H. R. 7456.

## PARAGRAPH 392.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 392. Print rollers and print blocks used in printing, stamping, or cutting designs for wall or crêpe paper, linoleum, oilcloth, or other material, not specially provided for, composed wholly or in chief value of iron, steel, copper, brass, or any other metal, 30 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 199. Articles or wares not specially provided for in this section, composed wholly or in part of iron, steel, lead, copper, nickel, pewter, zinc, gold, silver, platinum, aluminum, or other metal, and whether partly or wholly manufactured, forty-five per centum ad valorem.

PAR. 167. Articles or wares not specially provided for in this section; if composed wholly or in part of platinum, gold, or silver, and articles or wares plated with gold or silver, and whether partly or wholly manufactured, 50 per centum ad valorem; if composed wholly or in chief value of iron, steel, lead, copper, brass, nickel, pewter, zinc, aluminum, or other metal, but not plated with gold or silver, and whether partly or wholly manufactured, 20 per centum ad valorem.

## PRINT ROLLERS AND PRINT BLOCKS.

*Description and uses.*—Print rollers and print blocks have the pattern carved or engraved on blocks—generally of wood—with the patterns outlined in copper or brass ribbon, and the solid surface filled with felt. They are used in printing, stamping or cutting designs for wall or crêpe paper, linoleum, oilcloth, or other material. In-block printing each color dries before the next is applied, while in roller printing all the colors follow one another immediately. The best wall papers are printed from blocks manipulated by hand. The cheaper wall papers are printed by machinery.

*Production.*—None recorded separately.

*Imports.*—None recorded.

*Exports.*—None recorded.

*Important changes in classification.*—New paragraph.

## PARAGRAPH 393.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 393. Articles or wares not specially provided for, if composed wholly or in chief value of platinum, gold, or silver, and articles or wares plated with platinum, gold, or silver, or colored with gold lacquer, whether partly or wholly manufactured, 45 per centum ad valorem; if composed wholly or in chief value of iron, steel, lead, copper, brass, nickel, pewter, zinc, aluminum, or other metal, but not plated with platinum, gold, or silver, or colored with gold lacquer, whether partly or wholly manufactured, 35 per centum ad valorem.

## ACT OF 1909.

PAR. 199. Articles or wares not specially provided for in this section, composed wholly or in part of iron, steel, lead, copper, nickel, pewter, zinc, gold, silver, platinum, aluminum, or other metal, and whether partly or wholly manufactured, forty-five per centum ad valorem.

PAR. 135. \* \* \* *Provided further*, That articles manufactured wholly or in chief value of any wire or wires provided for in this paragraph shall pay the maximum rate of duty imposed in this section upon any wire used in the manufacture of such articles and in addition thereto one cent per pound: *And provided further*, That no article made from or composed of wire shall pay a less rate of duty than forty per centum ad valorem; \* \* \*.

PAR. 144. \* \* \* finished hinges or hinge blanks, whether of iron or steel, one and one-eighth cents per pound.

PAR. 551. \* \* \* quoits, and curling-stone handles [Free].

PAR. 653. Platinum \* \* \* in \* \* \* sheets, wire, \* \* \* [Free].

## ACT OF 1913.

PAR. 104. \* \* \* sashes, frames, \* \* \* of iron or steel, \* \* \* 10 per centum ad valorem.

PAR. 114. \* \* \* articles manufactured wholly or in chief value of any wire or wires provided for in this section; all the foregoing 15 per centum ad valorem; \* \* \*.

PAR. 167. Articles or wares not specially provided for in this section; if composed wholly or in part of platinum, gold, or silver, and articles or wares plated with gold or silver, and whether partly or wholly manufactured, 50 per centum ad valorem; if composed wholly or in chief value of iron, steel, lead, copper, brass, nickel, pewter, zinc, aluminum, or other metal, but not plated with gold or silver, and whether partly or wholly manufactured, 20 per centum ad valorem.

PAR. 470. \* \* \* quoits, and curling-stone handles [Free].

PAR. 578. Platinum \* \* \* in \* \* \* sheets, wire, \* \* \* [Free].

PAR. 612. \* \* \* engraved steel \* \* \* dies and rolls, suitable for use in engraving or printing bonds, stock certificates or other securities [Free].

## FINISHED OR PARTLY FINISHED ARTICLES MADE OF METAL NOT SPECIALLY PROVIDED FOR.

(See Surveys C-29; C-30; and C-31.)

Paragraph 393 embraces all finished and partly finished articles manufactured wholly or in chief value of metal and not specially provided for in the other paragraphs of Schedule 3 of Title.

*Production.*—The United States is a large producer of most of the articles included in this paragraph. Thus there were recorded in the census of 1914 values of such products as follows: Stoves and ranges, \$55,108,000; gas and oil stoves, \$21,449,000; steel springs, car and carriage, not made in steelworks or rolling mills, \$11,595,000; products of boiler shops, \$27,140,000; brass and bronze products, \$123,580,000; silverware, \$19,786,000; and silver-plated ware, \$18,484,000.

England, Germany, France, and Japan are important producers of iron and steel manufactures; France, Germany, and Japan, of bronze; and France and England, of articles made of gold and silver.

*Imports* for the fiscal year 1918 were valued at over \$6,000,000, the most important item being airplanes (metal chief value), \$423,980; other manufactures of iron and steel n. s. p. f., \$1,741,205; manufactures of brass n. e. s., \$241,293; manufactures of bronze n. s. p. f., \$196,660; manufactures of nickel n. e. s., \$116,858; metals and metal composition n. s. p. f., \$752,950; and manufactures of silver n. e. s., including metals plated with silver, \$200,997.

Most of the manufactures of aluminum under this provision have come from Canada and the United Kingdom, but since 1920, Germany has been the main source of supply while increased quantities have also been imported from Switzerland. The statistics for brass as

given below also include some brass manufactures that are now specifically provided for in paragraph 378 although most of the imports in the spring of 1921 consisted of art metal goods and miscellaneous articles such as oil cups. Canada, the United Kingdom, and France furnished the greater part of these products. Imports of bronze manufactures, n. s. p. f., are derived principally from Japan, France, and Germany and consist mainly of statuary and art metal goods. The copper manufactures in this group are diverse in character and in 1921 were imported from France, Switzerland, Italy, Canada, China, and the Netherlands. Both the gold and silver manufactures n. s. p. f. (including a variety of tableware, ornaments, etc., but not jewelry) come mainly from France and England. The lead manufactures imported are almost wholly of English origin whereas manufactures of tin (and tin-plate) are imported from England and Germany in about equal proportions with small amounts from France. Nickel manufactures include various nickel-plated wares imported from Germany, France, and Switzerland. The small imports of railway cars and of carriages n. s. p. f. have in recent years been derived wholly from Canada. The largest item in the group is that for other manufactures of iron and steel, which comprises a heterogeneous variety of tools, locks, lighting fixtures, and miscellaneous articles of iron or steel and derived from every country of the earth.

Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
----------------	-----------	--------	-------	------------------

ALUMINUM—ALL OTHER MANUFACTURES OF.

				Per cent.
1918.....		\$4,640	\$928	20
1919.....		20,779	4,156	20
1920.....		401,537	80,307	20
1921 (9 months).....		483,587		

BRASS—ALL OTHER MANUFACTURES OF.

1918.....		\$236,025	\$47,200	
1919.....		252,978	50,495	
1920.....		322,492	64,488	
1921 (9 months).....		356,132		

BRASS—MANUFACTURES OF, N. S. P. F., FOR SUPPLIES, REPAIRS, CONSTRUCTION, AND EQUIPMENT OF VESSELS.

1918.....		\$99,905		
1919.....		187,344		
1920.....		45,187		
1921 (9 months).....		9,374		

BRASS—MANUFACTURES OF, N. S. P. F.—FOR THE UNITED STATES, N. E. S.

Exports coming within the scope of this paragraph vastly exceed imports. Brass manufactures exported in the fiscal year 1918 were more than \$56,000,000; manufactures of gold and silver, other than jewelry, \$565,406; and of platinum, \$33,557. These figures do not correspond with the tariff classifications, and some do not wholly apply to the articles described. They are given to illustrate the large exportation of products included in this paragraph.

Exports for the calendar years 1918 to 1921 have been as follows:

	1918	1919	1920	1921 (9 months).
Aluminum—all other manufactures of.....	\$1,890,336	\$2,145,430	\$2,563,164	\$1,906,363
Arc lamps.....	14,139	16,836	25,098	9,153
Brass—all other manufactures of.....	\$17,071,694	\$9,438,554	\$10,541,116	\$4,974,209
Bronze—manufactures of, n. s. p. f.....	\$1,267,032	\$1,508,086	\$1,390,141	\$832,286
Cars for steam railways, passenger:

Carriages:				
Quantity (number).....	1,100	1,352	1,123	500
Value.....	\$56,255	\$112,505	\$154,154	\$57,356
Copper—all other manufactures of, n. s. p. f.....	\$5,286,143	\$4,557,812	\$6,040,069	\$3,654,646
Hardware, builders':				
Hinges and other.....	2,091,812	3,268,435	4,870,974	1,840,190
Locks.....	2,191,702	4,145,325	6,387,214	1,927,279
Other.....	2,304,408	4,267,125	6,216,636	3,006,350

	1918	1919	1920	1921 (9 months).
Interior-wiring supplies, including fixtures.....	\$1,428,615	\$2,319,498	\$3,386,068	\$1,594,163
Iron and steel—all other manufactures of.....	\$41,160,907	\$48,035,213	\$55,672,396	\$29,642,839
Lead—manufactures of.....	\$1,824,126	\$2,155,392	\$3,586,251	\$1,084,374
Metals and metal compositions—all other man- ufactures of.....	\$3,645,838	\$3,400,849	\$4,314,897	\$1,822,040
Nickel—manufactures of.....	\$2,152,692	\$2,412,287	\$1,875,991	\$256,606
Radiators and house-heating boilers.....	548,800	779,259	1,337,032	438,591
Safes.....	401,294	738,269	1,429,535	866,665
Scales and balances.....	1,359,142	2,278,921	3,242,459	2,311,661
Shells and projectiles, empty.....	22,112,293	3,228,454	75,344	4,976
Stoves and ranges.....	1,703,724	2,609,715	5,937,301	2,476,599
Tinware.....	\$530,571	\$863,447	\$877,179	\$302,267
Tin plates—all other manufactures of.....	\$2,467,481	\$3,644,268	\$4,735,138	\$1,878,193
Tools, n. e. s.:				
Augers, bits, and drills.....	2,545,074	4,402,039	4,425,507	2,303,369
Axes.....	1,006,848	1,613,862	1,478,935	1,187,790
All other.....	9,140,700	14,382,767	16,945,325	7,318,722
Zinc—all other manufactures of.....	\$722,671	\$538,133	\$1,057,676	\$335,120

*Important changes in classification.*—The following words have been inserted: “platinum” after the words “and articles or wares plated with”; “or colored with gold lacquer” after the words “gold, or silver” and in the third and seventh lines; and “platinum” after the words “but not plated with.”

#### PARAGRAPH 394.

##### H. R. 7456.

##### SENATE AMENDMENTS.

PAR. 394. No allowance or reduction of duties for partial loss or damage in consequence of rust or of discoloration shall be made upon any description of iron or steel, or upon any article wholly or partly manufactured of iron or steel, or upon any manufacture of iron or steel.

##### ACT OF 1909.

##### ACT OF 1913.

PAR. 138. No allowance or reduction of duties for partial loss or damage in consequence of rust or of discoloration shall be made upon any description of iron or steel, or upon any article wholly or partly manufactured of iron or steel, or upon any manufacture of iron or steel.

PAR. 116. No allowance or reduction of duties for partial loss or damage in consequence of rust or of discoloration shall be made upon any description of iron or steel, or upon any article wholly or partly manufactured of iron or steel, or upon any manufacture of iron or steel.

## SCHEDULE 4.—WOOD AND MANUFACTURES OF.

### PARAGRAPH 401.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 401. Timber, hewn, sided or squared otherwise than by sawing (not less than eight inches square) and round timber used for spars or in building wharves, one-half of 1 cent per cubic foot.

#### ACT OF 1909.

#### ACT OF 1913.

##### SCHEDULE D.—WOOD AND MANUFACTURES OF.

##### SCHEDULE D.—WOOD AND MANUFACTURES OF.

PAR. 200. Timber, hewn, sided or squared otherwise than by sawing (not less than eight inches square) and round timber used for spars or in building wharves, one-half of one cent per cubic foot.

PAR. 647. Wood: \* \* \* timber \* \* \* hewn or sawed, sided or squared; \* \* \* [Free].

PAR. 713. Woods: \* \* \* red cedar (Juniperus Virginiana) timber, hewn, sided, squared, or round; \* \* \* [Free].

PAR. 648. Woods: \* \* \* red cedar (Juniperus virginiana) timber, hewn, sided, squared, or round; \* \* \* [Free].

#### TIMBER.

*Description and uses.*—Hewn timber is timber squared and dressed with the axe or adz. It was formerly much used in the construction of the walls, posts, and floor beams of buildings, and is still occasionally so used. Archaic houses are still seen with solid walls of hewn timbers piled one above the other and with clay stuffed between the joints to keep out the cold, wind, and rain. The chief use at the present time is for railroad ties. Logs are also often roughly dressed with the axe to fit them for ocean transportation.

*Production.*—No figures available.

*Imports* of hewn timber not segregated from imports of sawed timber.

*Exports* for the calendar years 1918–1921 are shown in the following table:

	1918	1919	1920	1921 (9 months).
Quantity (M feet).....	6,086	8,499	10,394	2,055
Value.....	\$203,648	\$414,513	\$439,734	\$149,361

*Important changes in classification.*—The act of 1913 placed “timber, round, unmanufactured, hewn or sawed, sided or squared” on the free list. In H. R. 7456 “timber, hewn, sided or squared other-

wise than by sawing (not less than 8 inches square)" is made dutiable, thus returning to the classification of the act of 1909. Specific provision was not made in either the act of 1909 nor in H. R. 7456 for sawed timber nor for timber less than 8 inches square.

*Suggested changes.*—Explicit provision might be made for sawed timber and for all timber less than 8 inches square. If it is desired to make these items dutiable, a provision might be added to paragraph 401. If it is desired to place them on the free list, they could be specifically mentioned in paragraph 1683.

#### ROUND TIMBER USED FOR SPARS OR IN BUILDING WHARVES.

*Description and uses.*—Use and description indicated in the title.

*Production.*—No data available.

*Imports.*—Not segregated.

*Exports.*—Not segregated.

*Important changes in classification.*—This item is not specifically provided for in the act of 1913. Such timber is exempt from duty under the provision in paragraph 647 "for logs, timber, round, unmanufactured." The classification in H. R. 7456 is a return to the classification of the act of 1909.

### PARAGRAPH 402.

#### H. R. 7456.

#### SENATE AMENDMENTS.

PAR. 402. Logs of fir, spruce, cedar, or Western hemlock, \$1 per one thousand feet board measure: *Provided*, That any such class of logs cut from any particular class of lands shall be exempt from such duty if imported from any country, dependency, province, or other subdivision of government which has, at no time during the twelve months immediately preceding their importation into the United States, maintained any embargo, prohibition, or other restriction (whether by law, order, regulation, contractual relation or otherwise, directly or indirectly) upon the exportation of such class of logs from such country, dependency, province, or other subdivision of government, if cut from such class of lands.

#### ACT OF 1909.

PAR. 712. Wood: Logs and round unmanufactured timber, including pulp woods, \* \* \* not specially provided for in this section [Free].

#### ACT OF 1913.

PAR. 647. Wood: Logs, \* \* \* round, unmanufactured. \* \* \* pulp woods, \* \* \* [Free].

#### LOGS OF FIR, SPRUCE, CEDAR, WESTERN HEMLOCK, ETC.

*Description and uses.*—The woods enumerated in paragraph 402 are softwoods furnishing lumber for general building construction; especially is this statement true of the Douglas fir. Aside from general construction work, spruce is by far the most important of the

pulp woods, hemlock is also an important pulp wood, and cedar, because of its high power of resistance to decay, is especially adapted to use as shingles and telegraph, telephone, trolley, and electric-light poles. The red cedar is also used for manufacturing chests for storing clothing, its pungent odor affording a protection against moths.

*Production.*—Douglas fir (the most important commercially of the firs), western hemlock, and western red cedar are woods found chiefly in Washington, Oregon, and some other parts of the inland empire. Spruce is widely distributed throughout the whole northern portion of the United States. There are also other species of cedar having a wide distribution. On the whole, however, the paragraph relates to woods of concern to the Pacific Northwest. The following table<sup>1</sup> shows in board feet for the year 1918 the total cut of each of the woods mentioned in paragraph 402 and also in board feet and in percentages the cut in the States of Washington and Oregon.

Species.	Total cut (board feet).	Cut in Washington and Oregon.	
		Board feet.	Percentage.
Douglas fir.....	5, 819, 141, 000	5, 476, 911, 000	94. 1
Spruce.....	980, 561, 000	491, 654, 000	50. 1
Cedar.....	230, 476, 000	148, 176, 000	64. 3
Western hemlock.....	348, 117, 000	343, 852, 000	98. 8
Total.....	7, 378, 295, 000	6, 460, 593, 000	87. 6

*Imports* of logs of fir, spruce, cedar, and western hemlock are not segregated from the imports of other logs. The distribution of these species in Canada, however, is somewhat similar to that of the United States. Douglas fir, western hemlock, and western red cedar grow for the most part in British Columbia, and hence importations of logs of these species would presumably compete with logs of the same species in Washington and Oregon. Spruce, however, and other varieties of cedar grow also between the Rockies and the Atlantic seaboard and are imported into States all along the northeast boundary. Especially are large quantities of spruce logs imported as pulp wood, many of the pulp and paper mills in the Northeast being dependent in whole or in part upon such importations for their supply of raw material.

*Exports* of fir for the calendar years 1918-1921 are shown in the following table. Export of logs of the other species specified are not segregated.

	1918	1919	1920	1921 (9 months).
Quantity (M feet).....	8, 216	4, 924	14, 986	9, 405
Value.....	\$128, 627	\$114, 939	\$454, 760	\$209, 443

<sup>1</sup> Figures from Bulletin No. 845, United States Department of Agriculture, Production of lumber, lath, and shingles in 1918.

*Important changes in classification.*—Logs of spruce, one of the most important of the pulp woods, are provided for in paragraph 402 of H. R. 7456, with logs of fir, cedar, and western hemlock in a new provision.

Pulp woods, specifically exempted in paragraph 647 of the act of 1913, are made conditionally free of duty in this paragraph.

### PARAGRAPH 403.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 403. Briar root or briar wood, ivy, or laurel root, and similar wood unmanufactured, or not further advanced than cut into blocks suitable for the articles into which they are intended to be converted, 10 per centum ad valorem.

#### ACT OF 1909.

#### ACT OF 1913.

PAR. 202. Briar root or briar wood, ivy or laurel root, and similar wood unmanufactured, or not further advanced than cut into blocks suitable for the articles into which they are intended to be converted, fifteen per centum ad valorem.

PAR. 168. Briar root or briar wood, ivy or laurel root, and similar wood unmanufactured, or not further advanced than cut into blocks suitable for the articles into which they are intended to be converted, 10 per centum ad valorem.

#### BRIER ROOT.

(See Survey N-26.)

*Description, uses, and production.*—Brier root or briarwood, used in making tobacco-smoking pipes, is the root of the white or tree heath (*Erica arborea*) of southern Europe. Ivy root is the American laurel which grows in the southern United States. The briar root is exclusively an imported wood. Attempts have been made to use the ivy or laurel root, growing chiefly in North Carolina, as a substitute. It has not proved satisfactory.

*Imports* in 1914 were valued at \$241,493. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
1918.....	\$825,695	\$82,569	<i>Per cent.</i> 10
1919.....	1,156,371	115,637	10
1920.....	982,852	98,285	10
1921 (9 months).....	105,655		

*Exports.*—None.

*Suggested changes.*—Page 78, line 6, of H. R. 7456: Omit the comma after "ivy," as ivy is the same thing as "laurel root."

## PARAGRAPH 404.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 404. Cedar commercially known as Spanish cedar, *lignum-vitæ*, lancewood, ebony, box, granadilla, mahogany, rosewood, satinwood, Japanese white oak, and Japanese maple, in the log, 10 per centum ad valorem; in the form of sawed boards, planks, deals, and all other forms not further manufactured than sawed, 15 per centum ad valorem; veneers of wood and wood unmanufactured, not specially provided for, 20 per centum ad valorem.

## ACT OF 1909.

PAR. 203. Sawed boards, planks, deals, and all forms of sawed cedar, *lignum-vitæ*, lancewood, ebony, box, granadilla, mahogany, rosewood, satinwood, and all other cabinet woods not further manufactured than sawed, fifteen per centum ad valorem; veneers of wood, and wood unmanufactured, not specially provided for in this section, twenty per centum ad valorem.

PAR. 713. Woods: Cedar, *lignum-vitæ*, lancewood, ebony, box, granadilla, mahogany, rosewood, satinwood, and all forms of cabinet woods, in the log, rough, or hewn only, \* \* \* [Free].

## ACT OF 1913.

PAR. 169. Cedar commercially known as Spanish cedar, *lignum-vitæ*, lancewood, ebony, box, granadilla, mahogany, rosewood, and satinwood; all the foregoing when sawed into boards, planks, deals, or other forms, and not specially provided for in this section, and all cabinet woods not further manufactured than sawed, 10 per centum ad valorem; veneers of wood, 15 per centum ad valorem.

PAR. 648. Woods: Cedar, including Spanish cedar, *lignum-vitæ*, lancewood, ebony, box, granadilla, mahogany, rosewood, satinwood, and all forms of cabinet woods, in the log, rough, or hewn only, \* \* \* [Free].

## CABINET WOODS.

(See Survey D-1.)

*Description, uses, and production.*—Cedar, commercially known as Spanish cedar, is not, strictly, a cedar (*Cedrus*), but the *Cedrela odorata*, a large tree growing in Mexico, Cuba, and the West Indies. The trunk may attain a diameter of 5 feet. It bears panicles of pale yellow flowers and a fruit somewhat like pecan nuts, and suggests the walnut rather than the cedar. The wood, however, resembles cedar. It is brownish red, soft, fragrant, porous, and durable. The Cuban supply is rapidly vanishing, and Mexico is now the chief source. It is imported in logs, flitches, and bolts, and used for cigar boxes, boats, and to some extent for cabinet-work. Its porous structure assists the cigar to season and its odor improves the flavor.

*Lignum-vitæ* is wood derived from the *Guaiacum officinale*, a slow-growing tree of Jamaica, Trinidad, St. Lucia, and the West Indies. The heartwood is of a dark greenish brown; the sapwood, yellow. It is remarkable for its hardness, toughness, and heaviness. Each layer of fibers crosses the preceding diagonally, obscuring the annual rings. It weighs 76 pounds to the cubic foot—heavier than water (62.5)—and is imported in billets about 3 feet long and 1 foot in diameter, chiefly from Cuba, Jamaica, and Santo Domingo. It is used in making sheaves for pulleys, rulers, pestles, tenpin balls, ship

blocks, and various articles of turnery, and, in the Bahamas, for door hinges.

Lancewood is from two small, slim West Indian trees (*Bocagea virgata* and *Bocagea lancifolia*) growing about 30 feet high and 1 foot in diameter, and from several other trees. It is remarkable for its strength and elasticity, and is used for carriage poles and shafts, fishing rods, and bows. It is imported chiefly from Cuba, Guiana, and Brazil, principally in the form of poles, frequently 20 feet long and 6 to 8 inches in diameter.

"Ebony" applies commercially to several hard, black woods. The best ebony is derived from the *Diospyros ebenum*, a large tree of India, Ceylon, and other tropical countries. Logs from 10 to 15 feet in length and with the heartwood 2 feet in diameter are common in this species. Bastard ebony (*Jacaranda ovalifolia*) comes from Brazil. "Ebonies" come also from Mauritius, Egypt, Zanzibar, Madagascar, and Jamaica. A fairly good quality is obtained from the American species (*Diospyros virginiana* and *Diospyros texana*). It is used for inlaid work, veneers, and the black keys of pianos.

Box is a small tree (*Buxus sempervirens*) growing wild in the south of Europe and parts of Asia, attaining a height of 20 feet. The wood is heavy (68 $\frac{3}{4}$  pounds per cubic foot when dry), of a pale-yellow color, remarkably hard and strong, and of a fine, regular, compact texture susceptible of a beautiful polish. It is apt to split in drying, hence is seasoned in dark cellars for from three to five years. Wood for delicate ware is soaked in clear, fresh water, boiled, wiped, and buried in sand or bran. It is valued by the turner and carver for flutes, flageolets, mathematical instruments, etc., and for wood engraving. It is imported from Spain, Portugal, Circassia, Georgia, and elsewhere. An inferior variety, the Minorca or Balearic box (*Buxus balearica*), is imported in large quantities from Minorca, Sardinia, Corsica, and Turkey. The root is also used.

Granadilla wood (not the vine, granadilla, bearing fruit) is derived from a large tree, 80 feet high and 2 feet in diameter, in British Honduras. The name is also applied to the wood of the Jamaican or West Indian ebony tree (*Brya ebenus*) and to woods of uncertain origin from northern South America. It is a hard, dark-red wood with a beautiful fine grain, easy to work, and is used for furniture, house decorations, and especially for flutes.

Mahogany is the name given to the wood of a considerable number of trees, the most highly esteemed being the *Swietenia mahogany*, a large tree of the family Meliaceæ, which attains a height of from 60 to 100 feet and a diameter of 6 feet or more. It flourishes in Cuba, Jamaica, the West Indies, Central America, and sparingly in southern Florida. It grows either on rich, moist soils, or on rocky land. In the former case the wood is coarse grained and inferior; in the latter case it is a rich, reddish brown, varying widely in its shades and markings, and susceptible of high polish. It is used extensively in cabinetmaking, both solid and as a veneer. The name is also applied to woods resembling "true" mahogany—e. g., African mahogany (*Khaya senegalensis*), having a tinge of pink, in contrast with the American variety; the padouk (*Pterocarpus indicus*) of India and Burma; the Cedrela Toona of India; some species of Eucalyptus in Australia; and the "mountain" and "valley" mahogany of the western United States. Importations come chiefly from England (in

transit). and from Mexico, Cuba, British Honduras, and British West Africa.

Rosewood comes from various trees, such as the Brazilian Mimosa, several species of Dalbergia, and woods found in Jamaica, Africa, Burma, Malabar, and Australia. The principal supplies are from Brazil, the Canary Islands, East Indies, and Africa. Rosewood, when sawed or cut, yields the odor of roses, and varies in color from a reddish brown to purple or almost black, often beautifully marked. Because of its oily character it is difficult to fix with glue. It is second only to mahogany as an imported furniture wood, and is used as a veneer for pianoforte cases, table tops, and expensive furniture. Light, artistic drawing-room furniture and musical instruments are made of the solid wood.

Satinwood is the name given a wood of white color and fine grain, susceptible of a high polish. The best variety is derived from a tree (*Parinarium guianensis*) of the West Indies. It is also derived from the East Indian tree *Chloroxylon swietenia*, and from the *Zanthoxylum cribosum*, growing in Florida, Santo Domingo, Porto Rico, and the Bermudas. Satinwood is much used by cabinetmakers and for marquetry.

*Imports.*—The cabinet and other woods mentioned in paragraph 404 are virtually all foreign woods imported largely from Central and South America, from Japan, and from the West Indies. They are imported both in the log and as sawed lumber. Imports in the log for the fiscal years 1914 and 1918 are shown by the following table:

Species.	1914		1918	
	Quantity.	Value.	Quantity.	Value.
	<i>M feet.</i>		<i>M feet.</i>	
Box.....		\$49, 446		\$24, 317
Cedar, including Spanish cedar.....	17, 144	977, 746	12, 431	842, 068
Ebony.....		86, 786		8, 812
Granadilla.....		206		
Lignum-vitæ.....		72, 632		171, 844
Mahogany.....	70, 112	4, 919, 368	50, 303	3, 736, 688
Rosewood.....		73, 551		53, 716
Satinwood.....		10, 345		596
Walnut.....	2, 626	382, 940	408	28, 295
All other.....		539, 780		193, 686
Total.....		7, 112, 800		5, 060, 922

When imported as sawed lumber they are not segregated by species. Total importations of boards, planks, deals, and other forms of sawed and cabinet woods from all sources are shown in the following table:

	1914		1916		1918	
	Quantity.	Value per M.	Quantity.	Value per M.	Quantity.	Value per M.
	<i>M feet.</i>		<i>M feet.</i>		<i>M feet.</i>	
Cuba.....	1, 570	\$48. 20	5, 732	\$34. 20	1, 857	\$44. 00
Japan.....	1, 423	31. 20	10, 545	36. 20	164	57. 10
Central America (including Mexico).....	649	37. 10	1, 529	55. 50	2, 004	79. 75
All other.....	664	56. 30	185	71. 90	140	93. 80
Total (or average).....	4, 306	42. 10	17, 991	37. 60	4, 165	63. 30

Observe: (1) The large proportion of the trade with Cuba, Japan, and Central America; (2) the great increase from 1914 to 1916 and the falling off in 1918; and (3) the increase in imports from Japan in 1916 and the falling off in 1918.

Later statistics of the imports of the woods mentioned in paragraph 404, both in the log and as sawed lumber, follow:

*Cabinet woods in the log, rough or hewn only.*

1921 (9 months).....	6,509	652,281	100.00	

<sup>1</sup> Of these imports, a considerable part came in free of duty from the Philippines—about 20 per cent in 1920

*Exports.*—None recorded.

*Important changes in classification.*—This paragraph is in part a transfer from the free list (par. 648) of the 1913 act. The words "rough, or hewn only" are omitted after the word "log." Red cedar (*Juniperus virginiana*), mentioned in the previous acts, is not mentioned in H. R. 7456; on the other hand, Japanese white oak and Japanese maple, not mentioned in the previous acts, are added to the list in H. R. 7456. The term "cabinet woods," comprehending woods of that nature not specially provided for, is omitted.

#### VENEERS OF WOOD.

(See Survey D-1.)

*Description and uses.*—A veneer is a thin sheet of wood, often a valuable cabinet wood, used for gluing to the surface of an inferior wood to improve the appearance of the exterior. Veneers are also used for manufacturing ply wood. Two or more layers of veneer are glued together, the grain of each layer running crosswise to the grain of the layer to which it is glued, thus increasing the strength and preventing warping and splitting. Ply wood is much used in

the manufacture of furniture and boxes. Veneers of cheap woods are used in the manufacture of baskets. There are three methods of making veneers, (1) by a peripheral slicing, (2) by longitudinal slicing, (3) by sawing.

*Production.*—The census shows, for 1909, 637 establishments engaged in the manufacture of veneers, consuming 435,981,000 board feet of lumber for this purpose, and for 1919, 362 establishments consuming 637,520,000 board feet of lumber. These figures include veneers of both imported and domestic woods. Of the domestic woods one of the most important is red gum—30 per cent of the total in 1909 and 41 per cent in 1919. The industry is widespread. Among the most important States may be mentioned in order of rank—Arkansas, Delaware, Wisconsin, Florida, Alabama, Mississippi, Tennessee, New York, North Carolina, Illinois, Indiana, Kentucky, Missouri, Georgia, Washington, Michigan, Maine, Louisiana, and South Carolina.

*Imports* of veneers of wood declined during the war from \$23,981 in 1914 to \$8,567 in 1916 and to \$5,669 in 1918 (fiscal year). Later statistics follow :

Calendar year.	Value.	Duty.	Ad valorem rate.
			<i>Per cent.</i>
1918.....	\$17, 118	\$2, 568	15
1919.....	18, 526	2, 779	15
1920.....	48, 890	5, 844	15
1921 (9 months).....	34, 544		

*Exports.*—Not segregated.

WOOD UNMANUFACTURED NOT SPECIALLY PROVIDED FOR.

*Description, uses, and production.*—No data.

*Imports* are shown in the following table :

Calendar year.	Value.	Duty.	Equivalent ad valorem.
			<i>Per cent.</i>
1918.....	\$14, 424	\$1, 314	9. 112
1919.....	34, 448	3, 282	9. 527
1920.....	108, 783	10, 614	9. 754
1921 (9 months).....	43, 435		

*Important changes in classification.*—The provision for “wood unmanufactured, not specially provided for,” is new.

Spanish cedar, lignum-vitæ, etc., further manufactured than sawed, are not specifically provided for. Spanish cedar, lignum-vitæ, etc., further manufactured, than sawed, would be covered by a provision for “wood manufactured, not specially provided for,” which might be inserted before “and manufactures of wood” in paragraph 414.

*Suggested changes.*—Page 78, line 16 of H. R. 7456: Insert a comma after “veneers of wood” and omit the comma after “unmanufactured.”

## PARAGRAPH 405.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 405. Paving posts, railroad ties, and telephone, trolley, electric-light, and telegraph poles of cedar or other woods, 10 per centum ad valorem.

## ACT OF 1909.

## ACT OF 1913.

PAR. 204. Paving posts, railroad ties, and telephone, trolley, electric light, and telegraph poles of cedar or other woods, ten per centum ad valorem.

PAR. 170. Paving posts, railroad ties, and telephone, trolley, electric-light, and telegraph poles of cedar or other woods, 10 per centum ad valorem.

## PAVING POSTS.

*Description, uses, and production.*—No data available.  
*Imports* have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Number.</i>				<i>Per cent.</i>
1920.....	17,357	\$4,142	\$0.24	\$414	10
1921 (9 months).....	1,791	1,696	.95		

*Exports.*—Not segregated.

*Suggested changes.*—It is suggested that "paving posts" may be omitted from separate enumeration and assessed for duty as "posts" under paragraph 406. There will be no change in the rate of duty—10 per centum.

## POLES.

(See Survey D-2.)

*Description and uses.*—The most important wood used for posts and poles—about two-thirds of the total—is cedar, including northern white, western red, and southern white. Other woods used are chestnut, oak, pine, cypress, Douglas fir, tamarack, redwood, osage orange, spruce, juniper, hemlock, and locust. Cedar is preferred because of its resistance to decay in the ground. Poles are from 20 to 60 feet and upward in length. Top diameters, always specified, vary from 4 to 6 inches in 20 to 30 foot lengths, and from 6 to 10 inches in lengths of 40 feet and over. Steel and concrete poles and steel towers compete to some extent. Underground conduits for wires and trolley systems also serve as substitutes.

Western red cedar grows in mixed stands with the Douglas fir in Montana, Idaho, and the Pacific Northwest. Northern Idaho produces more poles than any other region of equal extent. Northern white cedar is found distributed over New England and the Lake States, and furnishes the major portion of cedar poles. Southern white cedar is found along the Atlantic coast. Cypress, with high resistance to decay, is found abundantly in the Gulf States, especially Louisiana and Florida. Competition is active between the regions mentioned. Shipments of western red-cedar poles compete with the northern white-cedar poles of New England and the Lake States in

the middle western and eastern markets. In Tennessee, Kentucky, Virginia, and Pennsylvania western red cedar competes with the locally produced chestnut and pine poles, even finding its way to the Southeastern States to compete with the eastern red cedar, cypress, and pine.

The only foreign competition of consequence is with Canada. In British Columbia western red cedar grows in pure stands, making the logging of cedar poles less dependent upon conditions in the Douglas-fir trade. The extent of this competition is affected by the policy of the Provinces of Canada imposing restrictions upon the exportation of logs. Intermittently these restrictions are practically abolished in British Columbia, thus subjecting the logging interest to more active competition, but tending to the advantage of shingle manufacturers and others using cedar logs.

*Production.*—An estimate made by the Forest Service places the number of poles annually produced at 4,250,000, consuming 55,000,000 board feet of hardwood and 200,000,000 board feet of softwood timber. Poles are quoted per linear foot, according to the length and top diameter. In May, 1921, prices of western red-cedar poles in the Nelson market ran from  $4\frac{1}{2}$  cents per linear foot for a pole 10 to 20 feet long and 5 inches in diameter at the top to 12 cents per linear foot for a pole 55 to 60 feet long and 8 inches in diameter at the top. Assuming for an average pole a length of 30 feet and a top diameter of 7 inches and a price of  $8\frac{1}{2}$  cents per linear foot, the total value of the poles produced would be \$10,625,000.

*Imports* of paving posts, railroad ties, and telephone, trolley, electric-light, and telegraph poles (not separately enumerated) in 1914 were valued at \$409,449; in 1916, at \$145,799; in 1918 (fiscal year), at \$347,910. Virtually all came from Canada. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
PAVING POSTS, RAILROAD TIES, AND TELEPHONE, TROLLEY, ELECTRIC LIGHT, AND TELEGRAPH POLES.					
	<i>Number.</i>				<i>Per cent.</i>
1918.....		\$273,069		\$27,185	
POLES, TELEPHONE, TROLLEY, ELECTRIC LIGHT, AND TELEGRAPH.					
	<i>Number.</i>				<i>Per cent.</i>
1919.....	69,537	\$182,412	\$2.62	\$18,241	10
1920.....	158,255	500,300	3.16	50,030	10
1921 (9 months).....	129,683	499,363	3.85		

*Exports* are not segregated from logs and round or hewn timber.

#### RAILROAD TIES.

(See Survey D-2.)

*Description and use.*—Railroad ties are the pieces of timber laid in the ground crosswise to the rails and attached to them by spikes. They are made either of hewn or sawed timber, the former being

much the more generally employed. They are either treated or untreated with preservative before being used. If untreated, comparatively few woods possess sufficient resistance to wear and decay, but by far the best is white oak. Other woods used are locust, osage orange, cypress, chestnut, and the heartwood of long-leaf pine.

When treated by being inclosed in large steel cylinders and subjected, under heavy pressure, to solutions of zinc chloride or creosote until thoroughly impregnated, the list may be greatly extended and will include the black and red oaks, beech, birch, maple, elm, gum, ash, hickory, sassafras, hackberry, poplar, cottonwood, sycamore, loblolly, short-leaf pine, Douglas fir, tamarack, hemlock, and white cypress. Thus preservatives make possible the utilization of much inferior timber, release the more valuable woods, and greatly extend the average life of ties. Untreated ties last on an average for 7 or 8 years; treated ties, from 20 to 30 years.

Whether treated or untreated, oak still holds first place, about one-half the ties being of this wood. Oak, southern pine, Douglas fir, cedar, chestnut, and cypress compose about 85 per cent of the total.

Railroad ties are the only wood products of first-class commercial importance for which there are no satisfactory substitutes. Concrete, steel, and leather waste have been tried, only to be abandoned. Some of the patent steel ties are satisfactory, but the expense is prohibitive.

*Production* can only be estimated. An estimate (1915) based on consumption, after making allowance for imports and exports, places the number at 126,000,000, with a value of \$63,000,000. A recent estimate made by the Forest Service (year not stated) places the number of hewn ties at 87,500,000 ties, consuming 2,100,000,000 board feet of hardwood and 525,000,000 board feet of softwood. The quantity of timber consumed for railroad ties exceeds that for any single use except lumber. The proportion of treated ties increased from 17 per cent in 1909 to 38 per cent in 1915. As the life of treated ties is much longer than that of the untreated ties, this movement is in the interest of the conservation of one of our most valuable hardwoods—white oak. The economy of treated ties is evidenced by the steady falling off in the total demand—148,231,000 in 1910, 126,000,000 in 1915, 87,500,000 according to the recent estimate by the Forest Service.<sup>2</sup>

*Imports* of railroad ties were not segregated from paving posts and telephone, trolley, electric-light, and telegraph poles until 1919. For the years 1919, 1920, and 1921 they are shown in the following table:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Ad valorem rate.
	<i>Number.</i>				<i>Per cent.</i>
1919.....	462,368	\$355,257	\$0.77	\$35,526	10
1920.....	1,384,026	1,185,887	.86	118,589	10
1921 (9 months).....	732,593	695,924	.95	.....	.....

<sup>2</sup> The Forest Service estimate, however, does not include sawed ties.

*Exports* of railroad ties in 1914 were 5,123,004, valued at \$2,564,543. The most important country of destination was Canada—3,492,928. Other countries of importance were Mexico, Peru, and Honduras. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (number).....	2,681,823	4,699,902	4,246,238	2,794,471
Value.....	\$2,308,171	\$4,178,525	\$5,565,604	\$3,917,868

*Suggested changes.*—A judicial decision (*Mitchell Co. v. United States*, 10 Ct. Cust. Appls., 104 of 1920) makes advisable insertion of the words “finished or unfinished” after “woods.”

### PARAGRAPH 406.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 406. Hubs for wheels, posts, heading bolts, stave bolts, last blocks, wagon blocks, car blocks, heading blocks, and all like blocks or sticks, roughhewn, sawed or bored, 10 per centum ad valorem.

### ACT OF 1909.

### ACT OF 1913.

PAR. 206. Hubs for wheels, posts, heading bolts, stave bolts, last blocks, wagon blocks, oarblocks, heading blocks, and all like blocks or sticks, roughhewn, sawed or bored, twenty per centum ad valorem.

PAR. 647. Wood: \* \* \* fence posts, \* \* \* hubs for wheels, posts, heading bolts, stave bolts, last blocks, wagon blocks oar blocks, heading blocks, and all like blocks or sticks, rough hewn, sawed, or bored; \* \* \* not specially provided for in this section [Free].

PAR. 565. Fence posts of wood [Free].

### HUBS FOR WHEELS, POSTS, ETC.

(See Survey FL-37.)

*Description and uses.*—The items in paragraph 406 are rough, unshaped bolts or blocks of a size and kind of wood suitable for the purposes enumerated.

*Production.*—No data available.

*Imports* are shown in the following table:

Calendar year.	Quantity.	Value.	Unit value.
FENCE POSTS.			
	<i>Number.</i>		
1914 <sup>1</sup> .....	433,207	\$22,901	\$0.08
1918.....	880,119	85,933	.10
1919.....	1,435,252	137,475	.10
1920.....	1,546,744	201,756	.13
1921 (9 months).....	383,295	39,790	.10

<sup>1</sup> Fiscal year.

### HUBS FOR WHEELS, POSTS, HEADING BOLTS, ETC.

1914 <sup>2</sup> .....		\$16,549	
1918.....		136,816	
1919.....	1,381,190	144,768	\$0.10
1920.....		147,527	
1921 (9 months).....		93,909	

<sup>2</sup> Fiscal year. Dutiable from July 1, to Oct. 3, 1913. Duty collected, \$636.

*Exports.*—Not separately enumerated.

*Important changes in classification.*—Fence posts, specifically enumerated in the act of 1913, are not mentioned in H. R. 7456 and would probably come within the general term "posts." All of the items mentioned in paragraph 406, H. R. 7456, are on the free list, paragraph 647, of the act of 1913.

*Suggested changes.*—In the acts of 1909 (par. 206) and 1913 (par. 647) the provision is for *oar* blocks rather than *car* blocks.

### PARAGRAPH 407.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 407. Pickets, palings, hoops, and staves of wood of all kinds, 10 per centum ad valorem.

#### ACT OF 1909.

PAR. 208. Pickets, palings and staves of wood, of all kinds, ten per centum ad valorem.

PAR. 215. \* \* \* manufactures of wood \* \* \* not specially provided for in this section, thirty-five per centum ad valorem.

#### ACT OF 1913.

PAR. 176. \* \* \* manufactures of wood \* \* \* not specially provided for in this section, 15 per centum ad valorem.

PAR. 647. Wood: \* \* \* pickets, palings, staves, \* \* \* [Free].

#### PICKETS, PALINGS, HOOPS, AND STAVES.

(For staves see also Survey D-2 and par. 409, p. 574.)

*Description and uses.*—Pickets and palings are the upright pieces used in making wood fences and for other purposes. Hoops and staves are used in making barrels, hogsheads, casks, etc.

*Production.*—A recent estimate by the Forest Service places the annual production of tight staves at 286,000,000 staves, of tight heading at 21,000,000 sets; of slack staves at 1,010,000,000 staves; of slack heading at 61,000,000 sets; of hoops at 333,000,000 hoops. Data as to pickets and palings not available.

*Imports* in 1914 and in recent years are shown in the following table:

Calendar year.	Quantity.	Value.	Unit value.	Duty.
PICKETS AND PALINGS.				
	<i>Thousands.</i>			
1914 <sup>1</sup> .....	15,634	\$78,390	\$5.01	\$7.84
1914 <sup>1</sup> .....	23,539	110,239	4.67	.....
1918.....	34,077	273,921	8.04	.....
1919.....	41,214	342,976	8.32	.....
1920.....	52,645	586,644	11.14	.....
1921 (9 months).....	21,782	231,857	10.64	.....
WOOD STAVES.

1921 (9 months).....	1,857,000	20,410	0.01	.....

<sup>1</sup> Fiscal year.

*Exports* of staves in 1914 were 77,150,535, valued at \$5,852,230. Exports of pickets and palings are not enumerated. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (number).....	53,373,526	81,657,792	82,583,710	27,646,177
Value.....	\$3,605,332	\$13,160,377	\$15,408,334	\$3,078,531

*Important changes in classification.*—The items mentioned in this paragraph, except hoops, are on the free list, paragraph 647 of the act of 1913.

### PARAGRAPH 408.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 408. Shingles, 50 cents per thousand.

ACT OF 1909.

ACT OF 1913.

PAR. 209. Shingles, fifty cents per thousand.

PAR. 647. Wood: \* \* \* shingles,  
\* \* \* [Free].

### SHINGLES.

(See Survey FL-37.)

*Production.*—Shingles are among the important wood products and have given rise to considerable tariff controversy. They are produced from several kinds of wood and in nearly all the States, but over 70 per cent of the output is of western red cedar in the State of Washington alone. In 1912 the total output was 12,037,685,000; of these 9,500,908,000 were of cedar (western red and white) and 1,311,750,000 were of cypress, two woods particularly suitable because of their resistance to decay. Other woods in order of importance (amounts in millions of shingles) were: Yellow pine, 578 (i. e., 578,000,000 shingles); redwood, 447; white pine, 69; chestnut, 45; western pine, 30; hemlock, 29; and spruce, 8. In 1911 the States producing over 100,000,000 shingles were (amounts in millions) Washington, 7,745 (i. e., 7,745,000,000 shingles); Louisiana, 800; Maine, 559; Michigan, 510; California, 404; Oregon, 392; Wisconsin, 324; Georgia, 256; Florida, 167; North Carolina, 161; Alabama, 148; and Arkansas, 146. It will be seen that the industry centers in the Pacific Northwest, the South, the Lake States, and the State of Maine. The four States, Washington, Louisiana, Maine, and Michigan, each typical of these regions, produce about 80 per cent of the total output. In recent years the production has declined. The year of maximum production was 1909 (14,907,371 thousand). In 1919 the production had fallen to 9,453,000 thousand. In Washington alone production has fallen from 8,879,000 thousand in 1909 to 6,133,000 thousand in 1919. Production in British Columbia is increasing (725,000 thousand in 1908; 2,412,000 thousand in 1919).

In the United States the red cedar grows in mixed stands with the Douglas fir. As the cutting of Douglas fir is the preponderant logging interest, cedar bolts and logs are somewhat of the nature of a by-product. The supply of raw material for the shingle mills therefore depends upon conditions in the fir trade. Other factors are the proportion of cedar in the timber being logged and the proportion of cedar logs used for other purposes than shingles. When there is a curtailment of output on the part of loggers, because of the low price of fir, cedar logs become scarce. It also sometimes happens that there is a strong demand for cedar logs for siding or other purposes. In either case the shingle manufacturers have difficulty in obtaining raw material, and at times have been compelled to shut down. A considerable proportion of the shingles are made from bolts derived from dead stumps left in cut-over land. This is especially true in the "straight shingle mills" (mills producing shingles only). Logs are more extensively used in the "combination mills" (mills producing other products as well as shingles).

Imports were 895,038 thousand, valued at \$2,190,170 in 1914 and 1,878,465 thousand, valued at \$5,453,951 in 1918 (fiscal year), virtually all from Canada. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Thousand.</i>		
1918 .....	1,797,610	\$5,626,932	\$3.10
1919 .....	1,987,480	8,720,032	4.39
1920 .....	1,963,597	11,260,189	5.73
1921 (9 months) <sup>1</sup> .....	1,708	7,453	4.26
Do. <sup>2</sup> .....	1,594,995	4,274,568	-2.68

<sup>1</sup> White pine.

<sup>2</sup> All other.

Exports in 1914 were 46,964 thousand shingles valued at \$112,463. Later statistics for calendar years follow:

	1918	1919	1920	1921 9 months).
Quantity (thousand).....	19,892	16,143	34,237	16,985
Value.....	\$95,892	\$89,480	\$196,638	\$103,548

*Competitive conditions.*—There is active competition between shingle producers in Washington and British Columbia. Costs of production are about the same, American producers having an advantage in some respects and Canadian producers in others. In both regions there is great difference in the costs of production among individual mills.

*Important changes in classification.*—Shingles have been transferred from the free list, paragraph 647, of the act of 1913.

## PARAGRAPH 409.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 409. Casks, barrels, and hogsheads (empty), sugar-box shooks, and packing boxes (empty), and packing-box shooks, of wood, not specially provided for, 15 per centum ad valorem.

## ACT OF 1909.

## ACT OF 1913.

PAR. 210. Casks, barrels, and hogsheads (empty), sugar-box shooks, and packing-boxes (empty), and packing-box shooks, of wood, not specially provided for in this section, thirty per centum ad valorem.

PAR. 171. Casks, barrels, and hogsheads (empty), sugar-box shooks, and packing boxes (empty), and packing-box shooks, of wood, not specially provided for in this section, 15 per centum ad valorem.

## CASKS, BARRELS, AND HOGSHEADS.

(See Survey D-2.)

*Description and uses.*—Casks, barrels, and hogsheads are classified as tight or slack cooperage, according as they are designed to hold liquids or solids. Semitight cooperage for butter, lard, paste, paint, mincemeat, etc., is also recognized. For tight cooperage, especially for alcoholic liquids, white oak was until recently almost the only wood used for staves. With the growing scarcity of white oak, coopers have tried other woods, as cypress, red oak, and gum. As late as 1911, however, white oak constituted over 60 per cent of the total. For slack cooperage there is a much wider choice, red gum, pine, beech, elm, chestnut, spruce, ash, maple, and oak being in the lead. The wood used depends much upon the purpose of the container; e. g., the wood for butter tubs must be free from odor or taste, and for flour and sugar must be superior to that for fruit, vegetables, or cement. For headings the preferred woods are bass, gum, pine, and elm; and for hoops 86 per cent are of elm, other woods used being birch, red oak, maple, ash, and hickory. Substitutes are becoming increasingly important. Crude petroleum was formerly transported in wooden barrels. Use is now made of the pipe line, steel tank car, tin case, steel barrels, etc. For tight cooperage an annual release thereby of 5,700,000 barrels is estimated. In slack cooperage, cotton and jute sacks replace barrels for flour and sugar. Carton packages are also gaining favor. The total annual substitution is estimated at 35,000,000 barrels.

*Production* in 1914 follows: Establishments, 1,259; wage earners, 17,128; capital, \$36,690,031; wages, \$9,160,583 (\$468 per capita); value of products, \$50,017,320; value added by manufacture, \$17,073,637. Tight cooperage appears to have increased from 1905 to 1911, the output of staves rising from 240,000,000 to 360,000,000. Allowing 21 staves to the barrel, this gives 17,133,000 barrels in 1911. Output has declined since 1911. Slack cooperage increased until 1909, and then decreased, the number of staves in 1911 being 1,328,968,000, which, allowing 15 staves to the barrel, accounts for 88,597,800 barrels. In the manufacture of casks, barrels, and hogsheads the leading States are New York, Illinois, Virginia, Ohio, and Pennsylvania; but

for the manufacture of cooperage stock (staves, hoops, and heading) the States producing the timber lead—i. e., staves for tight cooperage, Arkansas, Tennessee, New Hampshire, West Virginia, Mississippi; staves for slack cooperage, Arkansas, Missouri, Pennsylvania, Virginia; for headings, Arkansas, Michigan, Pennsylvania, Wisconsin; for hoops, Ohio, Indiana, Michigan. The different parts of a barrel are assembled from widely separated regions.

In recent years there has been a decline in the output, both of tight and slack cooperage. The decline in tight cooperage is doubtless chiefly due to prohibition. The decline in slack cooperage is probably chiefly due to the substitution of other forms of containers. The following tables, showing this decline, are from the preliminary comparative reports of the census.

## TIGHT COOPERAGE.

Number of establishments in 1919, 449; in 1909, 533.

*Production.*

Kind.	1919		1909	
	Staves (pieces).	Heading (sets).	Staves (pieces).	Heading (sets).
Aggregate.....	353,825,000	24,274,000	379,231,000	20,691,000
Sawed, total.....	348,812,000	24,265,000	341,259,000	19,736,000
Oil and tierce.....	208,776,000	13,034,000	158,457,000	9,172,000
Spirit and wine.....	20,211,000	1,215,000	38,933,000	2,208,000
Bourbon.....	5,040,000	107,000	11,991,000	1,290,000
Half-barrel and keg.....	68,786,000	6,842,000	19,356,000	1,680,000
Pork.....	10,246,000	500,000	13,457,040	393,000
All other.....	35,753,000	2,567,000	99,065,000	4,993,000
Bucked and split.....	1,193,000		15,104,000	
Hewed.....	3,269,000		6,321,000	
Beer and ale.....	551,000	9,000	16,547,000	955,000

## SLACK COOPERAGE.

Number of establishments, 1919, 744; 1909, 1,506.

*Production.*

Kind.	1919	1909
Staves (number of pieces).....	1,121,324,000	2,029,593,000
Heading (number of sets).....	87,581,000	140,234,000
Hoops (number of pieces).....	141,571,000	375,793,000

*Imports* in the fiscal years 1914 and 1918 were as follows:

	1914	1918
Barrels, casks, and hogsheads (empty).....	\$2,180	\$41,220
Barrels, casks, and hogsheads, containing mineral water.....	135	4
Barrels or boxes of foreign manufacture, containing fruit.....	485,976	375,222
Barrels or boxes of growth and manufacture of United States, containing fruit....	2,778	.....

Importations of barrels, casks, and hogsheads, as such (unused), are insignificant. Those imported as containers of fruit may be used again, and so add to the supply. It is impossible to say just how important this trade is, as the barrels are not segregated from the boxes. Imports of staves are increasing. Later statistics follow:

*Barrels, casks, and hogsheads, empty.*

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Number.</i>				<i>Per cent.</i>
1918.....		\$52,314		\$7,847	15.00
1919.....	11,776	6,290	\$0.53	941	14.96
1920.....	36,758	39,165	1.06	5,847	14.93
1921 (9 months).....	2,765	5,407	1.95		

*Exports for the fiscal years 1914 and 1918 were as follows:*

	1914	1918
Hogsheads and barrels, empty.....	\$914,493 (1)	\$471,280
Cooperage and shooks.....		3,278,180
Heading.....	332,662	440,525

<sup>1</sup> Not segregated.

Exports greatly exceed imports, indicating that in cooperage production the United States has a comparative advantage. The export trade in barrels is widely distributed, going to Argentina, Mexico, the East and West Indies, Canada, and Cuba. Exports of staves and headings much exceed the value of completed barrels. This trade also is widely distributed, going to France, the United Kingdom, West Indies, Spain, Italy, Netherlands, Germany (before the war), and Canada. Statistics for the calendar years 1918-1921 follow:

	1918	1919	1920	1921 (9 months).
HOGSHEADS AND BARRELS, EMPTY.				
Value.....	\$633,102	\$821,841	\$1,925,790	\$521,446
COOPERAGE SHOOKS.				
Quantity (number).....	1,542,150	2,856,771	1,746,903	305,715
Value.....	\$4,427,935	\$8,489,009	\$6,916,140	\$1,616,194

SUGAR-BOX SHOOKS, PACKING BOXES, PACKING-BOX SHOOKS.

(See Survey D-2.)

*Description and uses.*—The term “shook” applies to a bundle of staves ready for assembling into cooperage or of boards shaped and ready for nailing into boxes, the object being convenience in ship-

ment. Substitutes for wooden boxes and shooks are the fiber container and veneer package or box. It is estimated that the fiber box in 1914 removed the need of approximately 1,070,000,000 feet (board measure) of wood for wooden containers, and the veneer box replaced 750,000,000 feet suitable for box shooks.

*Production* in 1914 was as follows: Establishments making wooden packing boxes, 1,174; wage earners, 38,548; capital, \$66,693,856; wages, \$18,206,067 (\$432 per capita); value of products, \$86,566,807; value added by manufacture, \$33,727,160. States of most importance, producing together about 56 per cent of the output, were Illinois, New York, Massachusetts, Wisconsin, Pennsylvania, New Hampshire, New Jersey, and Virginia.

*Imports* of sugar-box shooks, empty packing boxes, and packing-box shooks in 1914 were valued at \$36,165; in 1918 (fiscal year), at \$49,145. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Number.</i>				<i>Per cent.</i>
1918.....		\$111,047		\$16,655	15.00
1919.....	488,603	184,636	\$0.38	27,695	15.00
1920.....	1,038,409	203,087	.19	30,388	14.97
1921 (9 months).....	89,072	47,446	.53		

*Exports* of box shooks in 1914 numbered 1,270,477, and in 1918 (fiscal year) were 2,511,223, shipped mainly to Cuba, Mexico, United Kingdom, Canada, and Argentina. Records of exports of containers carrying merchandise, were they available, should be added to these figures. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
<b>BOX SHOOKS.</b>				
Value.....	\$2,737,865	\$2,820,541	\$4,248,761	\$2,136,102
<b>ALL OTHER SHOOKS.</b>

### PARAGRAPH 410.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 410. Boxes, barrels, and other articles containing oranges, lemons, limes, grapefruit, shaddocks or pomeles, 20 per centum ad valorem: *Provided*, That the thin wood, so called, comprising the sides, tops, and bottoms of orange and lemon boxes of the growth and manufacture of the United States, exported as orange and lemon box shooks, may be reimported in completed form, filled with oranges

## H. R. 7456.

## SENATE AMENDMENTS.

and lemons, by the payment of duty at one-half the rate imposed on similar boxes of entirely foreign growth and manufacture; but proof of the identity of such shooks shall be made under regulations to be prescribed by the Secretary of the Treasury.

## ACT OF 1909.

PAR. 211. Boxes, barrels, or other articles containing oranges, lemons, limes, grapefruit, shaddocks or pome-los, thirty per centum ad valorem: *Provided*, That the thin wood, so called, comprising the sides, tops and bottoms of orange and lemon boxes of the growth and manufacture of the United States, exported as orange and lemon box shooks, may be reimported in completed form, filled with oranges and lemons, by the payment of duty at one-half the rate imposed on similar boxes of entirely foreign growth and manufacture; but proof of the identity of such shooks shall be made under regulations to be prescribed by the Secretary of the Treasury.

## ACT OF 1913.

PAR. 172. Boxes, barrels, or other articles containing oranges, lemons, limes, grapefruit, shaddocks, or pome-los, 15 per centum ad valorem: *Provided*, That the thin wood, so called, comprising the sides, tops and bottoms of fruit boxes of the growth and manufacture of the United States, exported as fruit box shooks, may be reimported in completed form, filled with fruit, without the payment of duty; but proof of the identity of such shooks shall be made under regulations to be prescribed by the Secretary of the Treasury.

## BOXES, BARRELS, ETC., CONTAINING CERTAIN FRUITS.

(See Survey D-2.)

*Production.*—Previous to 1909 a considerable business had developed, especially in Maine, of manufacturing wood fruit-box shooks (sides, tops, and bottoms) and exporting them in a knocked-down condition. They were assembled by foreign fruit merchants, the ends and the middle piece added, and then filled with fruit. Estimates of the manufacturers placed the business at about 3,000,000 bundles, which were valued at \$150,000. This business has greatly declined in recent years.

*Imports*, “when of the growth and manufacture of the United States,” in 1907 were valued at \$109,088; in 1909, at \$64,323; in 1913, at \$15,815; in 1914, at \$2,778. “When of foreign growth and manufacture,” in 1907, \$204,160; in 1909, \$247,819; in 1913, \$348,620; in 1914, \$535,974. Later statistics follow:

*Barrels or boxes containing oranges, lemons, limes, grapefruit, shaddocks or pomelos of foreign growth or manufacture.*

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Number.</i>				<i>Per cent.</i>
1918.....		\$374,826		\$55,916	14.92
1919.....	1,144,217	522,195	\$0.45	77,357	14.82
1920.....	1,632,805	508,149	.31	75,415	14.85
1921 (9 months).....	135,379	240,863	.33		

In the years 1918–1921 there were no imports of the specified fruits in boxes or barrels of domestic manufacture.

*Exports.*—No data.

*Suggested changes.*—Page 79, line 9, of H. R. 7456: Insert “or” between “limes” and “grapefruit,” strike out “shaddocks or pome-los,” and make one word of “grape fruit” to agree with paragraph 743 of schedule 7.

Should not thin wood of boxes for limes and grapefruit be included if it is desirable to continue the proviso at all?

This paragraph requires wood for orange and lemon boxes to be grown in the United States as well as that the boxes shall be manufactured in the United States, whereas paragraph 1514 does not require that articles to be exempt from duty shall be both of the growth and manufacture of the United States.

### PARAGRAPH 411.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 411. Reeds wrought or manufactured from rattans or reeds, whether round, flat, split, oval, or in whatever form, cane wrought or manufactured from rattan, cane webbing, and split or partially manufactured rattan, not specially provided for in this section, 20 per centum ad valorem. For the purpose of assessing duties, hand-made reeds or cane shall be held to be comparable in value to machine-cut reeds or cane of corresponding size. Furniture made with frames wholly or in part of wood, rattan, reed, bamboo, or malacca, and covered wholly or in part with rattan, reed, grass, or fiber of any kind, 50 per centum ad valorem: split bamboo, 2 cents per pound: osier or willow, including chip of and split willow, prepared for basket maker's use, 25 per centum ad valorem: all articles not specially provided for, wholly or partly manufactured of rattan, bamboo, osier, or willow, 40 per centum ad valorem.

#### ACT OF 1909.

PAR. 212. Chair cane or reeds wrought or manufactured from rattans or reeds, ten per centum ad valorem; osier or willow, including chip of and split willow, prepared for basket makers' use, twenty-five per centum ad valorem; manufactures of osier or willow and willow furniture, forty-five per centum ad valorem.

PAR. 215. House or cabinet furniture wholly or in chief value of wood, wholly or partly finished, and manufactures of wood \* \* \* not specially provided for in this section, thirty-five per centum ad valorem.

PAR. 713. Woods: \* \* \* rattan, reeds manufactured, \* \* \* in the rough or not further advanced than cut into lengths suitable for sticks for umbrellas, parasols, sunshades, whips, fishing rods, or walking canes [Free].

#### ACT OF 1913.

PAR. 173. Chair cane or reeds wrought or manufactured from rattans or reeds, 10 per centum ad valorem; osier or willow, including chip of and split willow, prepared for basket makers' use, 10 per centum ad valorem; manufactures of osier or willow and willow furniture, 25 per centum ad valorem.

PAR. 176. House or cabinet furniture wholly or in chief value of wood, wholly or partly finished, and manufactures of wood \* \* \* not specially provided for in this section, 15 per centum ad valorem.

PAR. 648. Woods: \* \* \* rattan, reeds unmanufactured, \* \* \* in the rough, or not further advanced than cut into lengths suitable for sticks for umbrellas, parasols, sunshades, whips, fishing rods, or walking canes [Free].

## RATTAN, WILLOW, AND MANUFACTURES OF.

(See Survey D-3.)

*Description and uses.*—Rattan and willow may often be used for similar purposes.

Rattan is the trade name for the long, slender, trailing stems of plants of the genus *Calamus* of the family *Palmaceæ*. These stems vary from the size of a goose quill to more than 3 inches in diameter. They sometimes grow to a length of over 200 feet, climbing the loftiest trees by means of recurved spines beneath the leaf stalks. The smaller sizes are called "rattans" in commerce; the larger, Malacca canes. The rattan flourishes in southern Asia and adjacent islands, some species in Australia and Africa. Its fibers are extraordinarily tough and strong. The surface of the stem is of a tawny yellow or brownish color, covered with a flinty deposit of silica capable of resisting acid, making it valuable for covering containers of sulphuric acid. When split into strips, it is used for caning chairs, couches, etc.

The inner fibrous tissue, known as "reed," is of a dull-gray or reddish white color. It may be split into strips of great tensile strength and elasticity, when it is used in basketry and braided work. Rattan is gathered from the forests by natives, cut into lengths of 12 or 16 feet, seasoned, doubled, and tied in bundles in lots of 100 canes, the unit of commerce. It finds domestic use in the manufacture of baskets for fruit dealers, gardeners, florists, hucksters, potters, and grocers; also for clothes and coal baskets, cars for balloons, rustic chairs, latticework, doormats, brooms, and whips. When impregnated with caoutchouc, it is a substitute for whalebone in corsets. The larger canes are used for walking sticks, whip, and umbrella handles, and light furniture.

There are some 200 species of willow, several of which, suitable for making baskets and furniture, are known as "basket willow." It is cultivated in this country to a considerable extent, especially near Liverpool, N. Y., whence comes about 90 per cent of the willow clothes baskets. The withes are reaped in the autumn and, for basket or furniture work, may be either "sap peeled" or "steam peeled." The former, of a beautiful, pure white color, are preferred for fine wares, white steam-peeled withes, of a dull reddish color, are cheaper and involve less hand labor. As the greater part of the American product is steam peeled, hand-peeled willow is imported in considerable quantities, though domestic rods of as good quality could be produced by equal care in peeling and sorting.

*Production in 1914.*—*Rattan and willow furniture:* Factories, 85; persons engaged in industry, 2,559 (2,262 laborers); capital, \$3,371,218; wages, \$1,281,141 (\$566 average per capita); value of products, \$5,022,089; value added by manufacture, \$3,008,310. *Baskets and rattan and willow ware:* Factories, 419; persons engaged in industry, 5,302 (4,574 laborers); capital, \$4,590,515; wages, \$1,922,965 (\$421 average per capita); value of products, \$6,578,468; value added by manufacture, \$3,579,183.

About one-third of the output is from New York. Other important States are Michigan, Indiana, Ohio, California, and Pennsylvania. Of the \$6,578,468 given as the value of "baskets and rattan and

willow ware," it is estimated that approximately \$3,000,000 is for "splint" baskets and \$1,500,000 for baskets of rattan and willow; the rest, for small wares. The factories are few, the manufacture of rattan and willow baskets being a "household industry," often carried on by "putting out" on contract the material to be made into baskets. Machinery is little used; a jackknife and a scroll saw to fashion the wooden bottom are about all required. Because of the hand labor necessary and the general high wages, manufacturers find it difficult to compete with foreign makers. Before the war importations came chiefly from Germany, and in the United States the industry is largely carried on by families of German or other European descent. In the case of small fancy baskets, raffia, sweet grass, and some other substances may be regarded as substitutes for rattan and willow; at the other extreme, the cheap splint basket is a substitute. Each of these types, however, has its own field. As between willow and rattan, willow serves well when great strength is not required, as for the clothes basket. For coal baskets, the tough fiber of the rattan is preferable. Rattan and willow furniture compete with each other and with furniture of other materials.

*Imports* for the fiscal years 1914 and 1918 were as follows:

	1914	1918
Rattan and reeds (unmanufactured).....	\$1,210,390	\$1,781,239
Chair canes or reeds wrought from rattan or reeds.....	450,813	202,585
Osier or willow:		
Prepared for basket makers' use.....	95,434	144,629
Manufactures of, except furniture.....	25,821	10,836
Willow furniture.....	26,061	2,844

Rattan and reeds are imported unmanufactured from the East Indies and split, cut, and prepared by factories, chiefly in Massachusetts, New Jersey, and New York, for the manufacture of baskets, furniture, and for other wares in Massachusetts, New York, Chicago, etc. The split and otherwise prepared cane is also imported, and comes in competition with the product of factories splitting and preparing the cane in the United States. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
----------------	--------	-------	------------------

RATTAN AND REEDS, UNMANUFACTURED.

			<i>Per cent.</i>
1918.....	\$1,308,465

1919.....	13,845	3,461	25
1920.....	30,067	7,258	25
1921 (9 months).....	38,428		

*Exports* of items mentioned in paragraph 411 are not segregated.

*Important changes in classification.*—This is partly a rephrasing of paragraphs 173 and 648 of the act of 1913, and partly new. The new provisions concern cane webbing, the basis of duties, furniture, and split bamboo.

*Conflicting provisions.*—The omission from H. R. 7456 of the specific provision in paragraph 173 of the act of 1913 for willow furniture raises a doubt whether such furniture will come within paragraph 411 as a manufacture of willow or within paragraph 414 as house or cabinet furniture.

*Suggested changes.*—Page 79, line 20, of H. R. 7456: Strike out the “s” from “rattans.”

Page 79, line 24: Strike out “in this section” to agree with practice throughout the title.

Page 79, line 24, and page 80, lines 1–3, of H. R. 7456: The meaning of this sentence is not clear. Ad valorem duties are assessed upon the value of the imported articles themselves as returned by the appraising officers.

Page 80, line 8, of H. R. 7456: Change “basket maker’s” to “basket makers’.”

## PARAGRAPH 412.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 412. Toothpicks of wood or other vegetable substance, 25 per centum ad valorem; butchers' and packers' skewers of wood, 25 cents per thousand.

ACT OF 1909.

ACT OF 1913.

PAR. 213. Toothpicks of wood or other vegetable substance, two cents per one thousand and fifteen per centum ad valorem; butchers' and packers' skewers of wood, forty cents per thousand.

PAR. 174. Toothpicks of wood or other vegetable substance, 25 per centum ad valorem; butchers' and packers' skewers of wood, 10 cents per thousand.

## TOOTHPICKS AND SKEWERS.

(See Survey D-3.)

*Description and uses.*—Toothpicks of the most familiar form have a square or rectangular cross-section. The imported toothpicks, often made of orange wood, have a circular cross-section and are of a higher grade. Skewers are used for holding meat together.

*Production.*—Both wood toothpicks and skewers are manufactured in large quantities by comparatively few establishments making use of highly specialized machinery. The birthplace of the wood-toothpick industry is Dixfield, Me., and Maine is still the most important producing State. There are also factories in Massachusetts, Vermont, New York, and some other States. The lumber annually consumed is estimated at 10,850,000 feet, of which 51.4 per cent is basswood, 32.9 per cent is paper birch, 11.1 per cent sugar maple, and 4.6 per cent yellow poplar. The annual production is estimated at 54,000,000,000.

The principal skewer factories are located in Maine, Massachusetts, New York, and Tennessee. The best woods are hickory and oak, though other woods are used.

*Imports* of toothpicks were valued at \$4,551 in 1914, and at \$3,421 in 1918; of skewers, at \$20 in 1914 and \$992 in 1918 (fiscal year). Toothpicks come chiefly from Japan, Portugal, and Italy. Many of the imported toothpicks are of orangewood, of a circular cross-section, polished, and of a higher grade than the American product. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
WOOD TOOTHPICKS.					
	<i>Thousand.</i>				<i>Per cent.</i>
1918.....		\$1,832		\$458	25.00
1919.....		227		57	25.00
1920.....		2,091		523	25.00
1921 (9 months).....		177			

## BUTCHERS' AND PACKERS' SKEWERS.

1918.....	755	\$519	\$0.69	\$75	14.55
1919.....	50	33	.66	5	15.15
1920.....	584	682	1.17	58	8.56
1921 (9 months).....	228	181	.79		

*Exports* not segregated.

*Suggested changes.*—Page 80, line 13, of H. R. 7456: Change “and” to “or” between “butchers’” and “packers’.”

## PARAGRAPH 413.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 413. Porch and window blinds, baskets, curtains, shades, or screens of bamboo, wood, straw, or compositions of wood, not specially provided for, 25 per centum ad valorem; if stained, dyed, painted, printed, polished, grained, or creosoted, 30 per centum ad valorem.

## ACT OF 1909.

PAR. 214. Porch and window blinds, baskets, curtains, shades, or screens of bamboo, wood, straw, or compositions of wood, not specially provided for in this section, thirty-five per centum ad valorem; if stained, dyed, painted, printed, polished, grained, or creosoted, forty per centum ad valorem.

## ACT OF 1913.

PAR. 175. Blinds, curtains, shades, or screens any of the foregoing in chief value of bamboo, wood, straw, or compositions of wood, not specially provided for in this section, 20 per centum ad valorem; if stained, dyed, painted, printed, polished, grained, or creosoted, and baskets in chief value of like material, 25 per centum ad valorem.

## BLINDS, CURTAINS, SHADES, AND SCREENS.

(See Survey D-4.)

*Description and uses.*—Blinds, curtains, shades, and screens are made here in large quantities and in many forms. The paragraph includes the well-known wooden blinds with rigid slats; Persian blinds with movable slats which rotate to control the light and view; Venetian blinds, or flexible inside window screens, that may be raised or lowered, having horizontal slats, fastened on a webbing, that may be turned to admit or exclude light; wooden frames supporting screens of muslin, paper, etc., usually movable, so that they may be placed before a window, a fire, or an object which it is desired to conceal; porch screens constructed of parallel lengths of bamboo hung with small spaces between them, permitting a limited view, from the porch, but not from the street; and other forms made from bamboo, wood, or straw, excluding view and light.

*Production.*—Figures are not available for blinds, curtains, shades, and screens. Of varied types, and produced in connection with numerous other articles, their segregation would be difficult. Observation, however, indicates that the annual production is very large and an element of much importance in the woodworking industries.

*Imports of porch and window blinds, curtains, shades, or screens of bamboo, wood, straw, or compositions of wood in 1914 were valued at \$543,500, and in 1918 at \$29,320. Later statistics follow:*

## PLAIN.

Calendar year.	Value.	Duty.	Ad valorem rate.
1918.....	\$5,747	\$1,146	<i>Per cent.</i> 20
1919.....	10,108	2,022	20
1920.....	23,282	4,653	20
1921 (9 months).....	10,936		

STAINED, DYED, PAINTED, PRINTED, POLISHED, GRAINED, OR CREOSOTED.

Calendar year.	Value.	Duty.	Ad valorem rate
1918.....	\$7,931	\$1,955	<i>Per cent.</i> 25
1919.....	21,559	5,388	25
1920.....	46,800	11,700	25
1921 (9 months).....	22,667		

*Exports* for these items are not segregated.

*Important changes in classification.*—The wording of paragraph 175, act of 1913, is “blinds, curtains, shades, or screens, any of the foregoing in chief value of bamboo, wood, straw, or compositions of wood.” H. R. 7456, reverting to the wording of the act of 1909, reads “porch and window blinds, \* \* \* curtains, shades, or screens of bamboo,” etc. The phrase “in chief value” has been omitted.

*Suggested changes.*—The words “wholly or in chief value” might be inserted after the word “screens” in line 16, page 80, H. R. 7456, to make the provision more specific.

## BASKETS.

(See Survey D-4.)

*Description and uses.*—Baskets are made in many forms and for divers purposes, including wood baskets, coal baskets, market baskets, clothes baskets, and ladies' work baskets. Various materials are used—willow, rattan, and “splints” of ash, maple, oak, beech, birch, etc. They are classified in the trade as (1) fancy baskets, such as silk-lined sewing baskets, jewel cases, and baby bassinets; (2) “staple” baskets of willow or rattan; and (3) “splint” baskets made of a thin wood veneer and used as containers for fruit or as cheap market baskets.

*Production.*—In the census for 1914, baskets and rattan and willow ware are united in a single classification. The total output is placed at \$6,578,468, of which it is estimated about \$3,000,000 represents splint baskets, \$1,500,000 baskets of rattan and willow, and the remainder other articles of rattan or willow ware. Preliminary figures of the census of 1919 place the value of the combined output of “baskets and rattan and willow ware” at \$11,831,000.

Splint baskets are made, as a rule, by small factories, using ash, maple, oak, beech, birch, and gum. The pieces are prepared and fitted and made ready to be nailed together near the wood supply, and to save freight are sent in “knocked down” form to shops near the retail market. Splint baskets are a peculiarly American product, with little or no foreign competition. Canada is the only source from which they might be imported, and it is doubtful if manufacturers there possess any advantages over domestic makers.

The making of willow and rattan baskets is largely a handicraft or household industry, few establishments properly being termed factories. Some of the work is done by “putting out” material on contract, or in little shops in the rear of stores where sold; very little machinery is used. Willows equal to those imported are grown in

America, but are usually not so thoroughly dried or so carefully sorted, and are steam peeled, which gives a brown color after a brief time. French willows are sap peeled, a process which is laborious but causes them to remain a brilliant white. The American manufacturer is therefore compelled to import the raw material for the better grades of baskets. Much handwork is required in weaving, and it is difficult to obtain American labor at wages permitting competition with foreign production.

Imports of baskets of bamboo, wood, straw, or compositions of wood were valued at \$853,409 in 1914 and at \$479,803 in 1918 (fiscal year). Germany was the chief manufacturing country. During the war Japan began to take the place of Germany. Imports come also from France, Belgium, Austria, England, and China. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.
BASKETS, BAMBOO. <sup>1</sup>				
	<i>Number.</i>			
1918.....		\$261,994		\$63,671
1919.....	1,855,104	187,372	\$0.10	45,840
1920.....	4,550,373	729,478	.16	180,644
1921 (9 months).....	3,959,779	622,887	.16	.....
BASKETS, STRAW.				
1919.....	159,756	\$28,885	\$0.18	\$7,035
1920.....	900,995	129,674	.14	32,113
1921 (9 months).....	658,575	94,221	.14	.....
BASKETS, WOOD AND COMPOSITIONS OF WOOD.				
1919.....	1,479,524	\$375,282	\$0.25	\$91,343
1920.....	8,029,788	1,378,203	.17	340,294
1921 (9 months).....	4,142,028	761,946	.18	.....

<sup>1</sup> Figures for 1918 include "baskets of bamboo, wood, straw, and compositions of wood."

*Important changes in classification.*—Baskets are included in both parts of the paragraph.

*Suggested changes.*—Page 80, lines 15–17, of H. R. 7456: Baskets of palm leaf have been held in the absence of a specific provision therefor classable as manufactures of palm leaf. As palm leaf is of the same class as bamboo, wood, and straw, would it not be well to add palm leaf to the enumeration of materials of which the articles in this paragraph may be made?

This provision placing a different rate of duty on merchandise when stained, dyed, etc., makes it very difficult of administration, especially in the case of baskets. Baskets are received in a large variety of designs and sizes and in order to ascertain whether dutiable under the first or last part of the paragraph an examination of every number is necessary.

One rate for baskets, blinds, etc., whether plain or stained, dyed, painted, etc., would facilitate the examination and appraisalment of this class of merchandise.

Page 80, line 16, of H. R. 7456: Change "or" to "and" between "shades" and "screens" and insert a comma after "screens."

## PARAGRAPH 414.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 414. House or cabinet furniture wholly or in chief value of wood, wholly or partly finished, and manufactures of wood or bark, or of which wood or bark is the component material of chief value, not specially provided for in this section, 25 per centum ad valorem.

## ACT OF 1909.

PAR. 215. House or cabinet furniture wholly or in chief value of wood, wholly or partly finished, and manufactures of wood or bark, or of which wood or bark is the component material of chief value, not specially provided for in this section, thirty-five per centum ad valorem.

PAR. 603. Kindling wood [Free].

PAR. 712. Wood: \* \* \* hop poles, \* \* \* ship planking; all the foregoing not specially provided for in this section [Free].

## ACT OF 1913.

PAR. 176. House or cabinet furniture wholly or in chief value of wood, wholly or partly finished, and manufactures of wood or bark, or of which wood or bark is the component material of chief value, not specially provided for in this section, 15 per centum ad valorem.

PAR. 647. Wood: \* \* \* kindling wood, \* \* \* hop poles, hoop poles, \* \* \* ship planking, broom handles, sawdust, and wood flour; all the foregoing not specially provided for in this section [Free].

## HOUSE OR CABINET FURNITURE.

(See Survey D-4.)

*Description and uses.*—The term “furniture” includes a considerable number of familiar articles of household or office use, as chairs, tables, lounges, bedsteads, dressers, etc. It is classified by use as bedroom furniture, kitchen furniture, dining-room furniture, drawing-room furniture. It is also classified by styles, as Old Colonial, Chippendale, Morris, and Mission.

*Production.*—The furniture industry takes high rank among domestic manufactures. The following table, giving figures for 1914, segregates material and certain kinds of articles, such as metal, rattan, and willow, to show the relative importance of these “substitutes.” Store and office fixtures and refrigerators are included, though not always classified as furniture.

Items.	Wood other than rattan and willow.	Rattan and willow.	Metal.	Store and office fixtures.	Refrigerators.	Total.
Establishments.....	2,251	85	173	3	134	3,326
Persons in industry.....	108,143	2,559	14,980	19,945	6,481	152,108
Wage earners.....	96,417	2,262	12,560	16,642	5,617	133,498
Amount paid in wages.....	\$51,674,815	\$1,281,141	\$7,953,682	\$10,904,278	\$3,572,334	\$75,388,250
Average annual wage.....	\$536	\$567	\$633	\$655	\$636	\$565
Capital.....	\$196,819,858	\$3,371,218	\$35,231,002	\$32,462,705	\$14,511,158	\$282,395,941
Value of products.....	\$187,926,556	\$5,022,089	\$34,439,087	\$38,318,031	\$15,051,794	\$280,757,557
Value added.....	\$102,483,512	\$3,008,310	\$16,403,098	\$22,324,347	\$7,708,402	\$151,927,669

Preliminary figures from the 1919 census place the number of establishments at 3,153 and the value of products at \$573,785,000.

The lumber consumed in the manufacture of furniture in 1916 was 944,677,807 board feet, oak being 45.6 per cent of the total. Other woods used were, in order of importance, red gum, maple, birch, yellow poplar, chestnut, basswood, and beech. In all, 71 different kinds are employed. The most important foreign woods were mahogany (1.7 per cent), lignum-vitæ (0.06 per cent), satinwood, and rosewood (each representing less than 0.01 per cent of the total). Foreign woods, of considerable importance in the finest grades of furniture, are insignificant with respect to the industry as a whole. The producing States rank as follows: With respect to value of furniture produced, New York, Illinois, Michigan, Pennsylvania, Indiana, Wisconsin, Ohio, Massachusetts; with respect to board feet of lumber consumed, North Carolina, Illinois, New York, Indiana, Michigan, Pennsylvania, Wisconsin, Ohio.

*Imports* fell in value from \$1,017,201 in 1914 to \$333,358 in 1918 (fiscal year). The chief sources are France, Italy, the United Kingdom, Canada, Hongkong, and Japan. Formerly Austria-Hungary and Germany exported largely the cheapest grades, France and Italy the finest grades. Later statistics follow:

Calendar year.	Value.	Duty.
1918.....	\$219,441	\$32,120
1919.....	469,648	68,142
1920.....	1,866,623	275,522
1921 (9 months).....	1,395,742	.....

*Exports* of nonmetal furniture in 1914 were valued at \$6,529,249; in 1915, at \$2,923,203; in 1918 (fiscal year), at \$3,938,778. Exports fell off greatly during the war, reaching low ebb in 1915. The markets of chief importance are Canada, Argentina, Cuba, Mexico, Panama, Brazil, Chile, the United Kingdom, British South Africa, Australia, France, and Italy. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Chairs.....	\$1,201,267	\$1,503,766	\$2,400,335	\$935,770
Office and store furniture.....	501,478	872,170	1,744,683	899,874
All other.....	1,831,481	2,559,493	4,416,539	1,909,933
Total.....	3,534,226	4,935,429	8,561,557	3,745,627

It will be seen that imports are considerably smaller than exports, indicating ability of American manufacturers to compete, but that imports are increasing relatively to exports—about 6 per cent in 1918 to about 37 per cent in 1921 (nine months). This gain in imports may be due in part to the rapid depletion of our hardwood forests and consequent increase in price of domestic hardwoods.<sup>3</sup>

It will also be noted that exports and imports, while considerable in the aggregate, are both small as compared with domestic production. In 1919 exports are less than 1 per cent of production.

<sup>3</sup> See report on Senate resolution 311 (1920), "Timber depletion, lumber prices, lumber exports, and concentration of timber ownership," p. 9.

Foreign trade in furniture is small compared with the domestic trade, because (1) furniture is bulky and, rates being charged by space, expensive to transport: (2) in transshipment, in shifting cargo in rough weather, and in passing through hot and moist areas it is liable to breakage and deterioration, especially the finish: (3) most countries have raw material and competent artisans; and (4) high-grade furniture is little used in other countries as compared with the United States.

## MANUFACTURES OF WOOD OR BARK, N. S. P. F.

*Imports and exports.*—The following tables show the imports and exports of certain articles for which no special provision was made in the act of 1913:

*Imports.*

All other manufactures of wood.....	9,360,888	14,748,109	19,961,221	8,677,073

*Suggested changes.*—Were kindling wood, hop poles, hoop poles, ship planking, broom handles, sawdust, and wood flour, in paragraph 647 of the act of 1913, intentionally omitted from H. R. 7456?

A provision for "wood manufactured, not specially provided for." inserted before "and manufactures of wood" in this paragraph would cover wood manufactured but not advanced to the stage of an article having a distinct name or use.

Page 80, line 24: Strike out "in this section" to agree with practice elsewhere.

# SCHEDULE 5.—SUGAR MOLASSES, AND MANUFACTURES OF.

## PARAGRAPH 501.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 501. Sugars, tank bottoms, sirups of cane juice, melada, concentrated melada, concrete and concentrated molasses, testing by the polariscope not above seventy-five sugar degrees, and all mixtures containing sugar and water, testing by the polariscope above fifty sugar degrees and not above seventy-five sugar degrees,  $1\frac{5}{100}$  cents per pound, and for each additional sugar degree shown by the polariscopic test, four one-hundredths of 1 cent per pound additional, and fractions of a degree in proportion.

### ACT OF 1909.

SCHEDULE E.—SUGAR, MOLASSES, AND MANUFACTURES OF.

PAR. 216. Sugars not above number sixteen Dutch standard in color, tank bottoms, sirups of cane juice, melada, concentrated melada, concrete and concentrated molasses, testing by the polariscope not above seventy-five degrees, ninety-five one-hundredths of one cent per pound, and for every additional degree shown by the polariscopic test, thirty-five one-thousandths of one cent per pound additional, and fractions of a degree in proportion; and on sugar above number sixteen Dutch standard in color, and on all sugar which has gone through a process of refining, one cent and ninety one-hundredths of one cent per pound; \* \* \*

[No corresponding provision for all mixtures containing sugar and water.]

[For drainings and sweepings see par. 503, H. R. 7456.]

### ACT OF 1913.

SCHEDULE E.—SUGAR, MOLASSES, AND MANUFACTURES OF.

PAR. 177. Sugars, tank bottoms, sirups of cane juice, melada, concentrated melada, concrete and concentrated molasses, testing by the polariscope not above seventy-five degrees, seventy-one one-hundredths of 1 cent per pound, and for every additional degree shown by the polariscopic test, twenty-six one-thousandths of 1 cent per pound additional, and fractions of a degree in proportion:<sup>1</sup> \* \* \* *Provided*, That the duties imposed in this paragraph shall be effective on and after the first day of March, nineteen hundred and fourteen, until which date the rates of duty provided by paragraph two hundred and sixteen of the tariff Act approved August fifth, nineteen hundred and nine, shall remain in force: *Provided, however*, That so much of paragraph two hundred and sixteen of an Act to provide revenue, equalize duties, and encourage the industries of the United States, and for other purposes, approved August fifth, nineteen hundred and nine, as relates to the color test denominated as Number Sixteen Dutch standard in color, shall be and is hereby, repealed: *Provided further*, That on and after the

<sup>1</sup> Sugars, tank bottoms, sirups of cane juice, melada, concentrated melada, concrete and concentrated molasses, testing by the polariscope not above seventy-five degrees, one and sixteen one-hundredths of 1 cent per pound, and for every additional degree shown by the polariscopic test, four one-hundredths of 1 cent per pound additional, and fractions of a degree in proportion: Par. 20, emergency tariff act of 1921.

first day of May, nineteen hundred and sixteen, the articles hereinbefore enumerated in this paragraph shall be admitted free of duty. [The last proviso was repealed by the act of April 27, 1916, ch. 93.]

[No corresponding provision for all mixtures containing sugar and water.]

[For drainings and sweepings see par. 503, H. R. 7456.]

#### SUGAR.

(See Reports T. I. S.-9 and 16, and Survey E-1.)

This paragraph embraces refined sugar and raw or unrefined sugar in any form which might be used commercially for the manufacture of refined sugar.

*Description and uses.*—Pure sugar (sucrose) is a definite chemical compound ( $C_{12}H_{22}O_{11}$ ) derived from the juices of several plants, especially the cane, beet, maple, and palm. Sucrose, in varying degrees of purity, is the sugar of commerce and the tariff. There are, however, more than 100 substances known to chemical science as "sugars," but differing from sucrose in composition and properties. Of these, the most important commercially are dextrose and levulose ( $C_6H_{12}O_6$ ), found in certain fruits and in honey. Dextrose is also manufactured from starch as a constituent of glucose and grape sugar. Tank bottoms are the settlings from sugar solutions and are the impurities found in molasses tanks. Melada is another name for cane sirup, and, like molasses, may be "concentrated" by boiling down to a thick granulous mass, which hardens upon cooling. The United States consumes (1920) over 4,500,000 tons of sugar per year (more than one-fifth of the world's consumption), about one-sixth of which is beet sugar. The per capita consumption in the United States, which has increased from 18.2 pounds in 1865 to 91.5 pounds in 1920, ranks high, and is now exceeded but slightly, if at all, by only a few countries—the United Kingdom, Mexico, Denmark, Australia, and New Zealand. About three-fourths of the American consumption is used directly in the household; the remainder in various forms of manufacturing, e. g., soft drinks, condensed milk, bakers' products, canned fruits, and tobacco.

Raw and refined sugar: Nearly all the sugar produced by the factories in Cuba, Porto Rico, and Hawaii and about two-thirds of the product of the factories in Louisiana are raw sugar—that is, it still contains molasses and other impurities adhering to the crystals. An increasing proportion of the Louisiana product is carried beyond the raw stage and marketed as "yellow clarified," "plantation granulated," and other forms suitable for final consumption. The great bulk of the sugars imported from Cuba consists of raw centrifugal sugar, the polariscopic test of which ranges approximately from  $92^\circ$  to  $97^\circ$ . The selling basis is  $96^\circ$ , with allowances up or down from the basic price, according to test. By far the greater portion is purchased by the refineries and after being purified and decolorized becomes "refined" sugar. Refined sugars as turned out by the large cane-sugar refineries consist of two general classes—hard refined sugars, such as granulated, powdered, cube, loaf, etc., the polariscopic test of which will approximate  $100^\circ$ , and soft refined sugars ranging

from about 80° to 90° in polariscopic test. The latter sugars vary in color from a light yellow to brown and have some of the sirup or molasses adhering to the crystals. They include the "brown" sugar of commerce. The beet-sugar factories produce hard sugars only.

*Production.*—Before the war the world production had reached 20,603,000 short tons, 11,169,000 tons of cane and 9,434,000 tons of beet sugar. The chief sources of supply were, in order, for cane sugar, Cuba, India, United States (including insular possessions), Java, Japan, Argentina, Australia, Mauritius, Brazil, the West Indies; for beet sugar, Germany, Austria-Hungary, Russia, France, the United States, Italy, and other (chiefly European) countries. War conditions caused a decrease in the production of beet sugar and an increase of cane sugar. By 1919-20 the production of beet sugar had decreased to 3,665,689 tons and the production of cane sugar had increased to 13,425,230 tons, a net decrease from the prewar total of 3,512,081 tons. From 45.8 per cent of the total, the production of beet sugar had decreased to 21.4 per cent. The present world production (1920-21) is 18,490,308 tons—13,200,163 tons cane, 5,290,145 tons beet.

The United States derived (1921) 53.9 per cent of its supply from domestic production and 46.1 per cent from importations.<sup>2</sup> Average annual production for the five-year period, 1915-1919, was as follows (figures represent thousands of tons and percentage of total consumption): Cane sugar, continental United States, 245.3 (5.8 per cent); Porto Rico, 379.2 (9.0 per cent); Philippine Islands, 119.6 (2.8 per cent); Hawaiian Islands, 587.7 (14.0 per cent); Virgin Islands, 9.0 (0.2 per cent). Beet sugar, continental United States, 788.6 (18.8 per cent); total, 2,129.4 (50.6 per cent). Cane sugar in continental United States is produced almost exclusively in Louisiana and Texas; beet sugar in California, Colorado, Utah, Idaho, Michigan, and 13 other States. The proportions of domestic sugar increased from 13 per cent in 1865 to 48.8 per cent in 1918, falling to 37.3 per cent in 1920.

The following table shows the number of establishments, number of wage earners, capital investment, amount paid in wages, average annual wage, value of products, value added, tons of sugar produced, and value of sugar produced in the cane and beet sugar industry in the continental United States, as reported by the census of 1914:

	Continental United States.	Beet sugar.	Cane sugar.	Refining.
Establishments.....	259	60	181	18
Wage earners.....	22,882	7,997	3,632	11,253
Capital.....	\$315,677,669	\$142,181,326	\$32,995,524	\$140,499,819
Wages.....	\$15,990,957	\$6,605,204	\$1,561,376	\$7,823,377
Average annual wage.....	\$670	\$825	\$430	\$695
Value of products.....	\$373,639,298	\$62,695,210	\$21,635,373	\$289,398,715
Value added.....	\$52,196,351	\$21,205,849	\$5,677,155	\$25,313,357
Tons of sugar produced.....	4,341,408	743,473	264,801	3,333,134
Value of sugar produced.....	\$363,034,123	\$58,590,466	\$18,947,683	\$285,495,974

Preliminary figures from the census for 1919, showing a comparison between the output of the industry in that year and in 1914, follow:

<sup>2</sup> Derived from Weekly Statistical Trade Journal, Jan. 12, 1922, p. 15.

## MANUFACTURE OF CANE SUGAR.

Reports were received from 202 establishments in 1919; from 181 establishments in 1914. Of the 202 establishments reporting in 1919, 189 were located in Louisiana, 6 in South Carolina, 3 in Florida, 2 in Georgia, and 1 each in Mississippi and Texas. The following table shows the manufacture of cane-sugar products in 1914 and 1919.

Product.	Quantity.		Value.	
	1919	1914	1919	1914
Total cane-sugar products .....			\$57,741,320	\$21,635,373
	<i>Pounds.</i>	<i>Pounds.</i>		
Sugar.....	450,955,838	529,601,993	46,659,085	18,947,685
Refined.....	71,627,346	107,187,416	9,547,378	4,228,860
Clarified.....	258,293,878	182,149,649	26,563,156	6,742,266
Raw.....	113,154,404	229,646,354	9,898,958	7,615,147
Brown.....	7,880,210	10,618,574	649,593	361,410
	<i>Gallons.</i>	<i>Gallons.</i>		
Molasses.....	20,058,248	29,675,260	4,868,740	2,021,547
Sirups.....	6,739,978	2,420,633	4,185,199	609,696
All other products.....			2,024,296	56,477

## MANUFACTURE OF BEET SUGAR.

Reports were received from 85 establishments in 1919, from 60 establishments in 1914. Of the 85 establishments reporting in 1919, there were 16 each in Michigan and Utah, 14 in Colorado, 10 in California, 8 in Idaho, 5 in Ohio, 4 each in Nebraska and Wisconsin, and 1 each in Illinois, Indiana, Iowa, Kansas, Minnesota, Montana, Washington, and Wyoming. The following table shows the output of various beet-sugar products in 1914 and 1919.

Product.	Quantity.		Value.	
	1919	1914	1919	1914
Total beet-sugar products .....			\$149,155,892	\$62,605,210
	<i>Pounds.</i>	<i>Pounds.</i>		
Sugar.....	1,426,891,315	1,486,947,817	138,099,693	58,590,466
Granulated.....	1,421,914,425	1,479,466,899	137,852,387	58,351,324
Raw.....	4,976,890	8,480,918	247,306	239,142
	<i>Gallons.</i>	<i>Gallons.</i>		
Molasses.....	18,841,429	26,461,291	2,364,563	1,536,192
	<i>Tons.</i>			
Pulp.....	2,082,531		5,798,412	2,094,863
Dried.....	976,501		4,829,568	1,510,759
Moist.....	1,106,030		968,844	384,104
All other products.....			2,893,224	353,689

## SUGAR REFINING.

Reports were received from 20 establishments in 1919, and from 18 establishments in 1914. Of the 20 establishments reporting in 1919, 5 were located in New York, 4 in Pennsylvania, 3 in Louisiana, 2 each

in California, Massachusetts, and New Jersey, and 1 each in Texas and Georgia. The following table shows the product of sugar refining in 1914 and 1919.

Product.	Quantity.		Value.	
	1919	1914	1919	1914
Total for the industry.....			\$730,986,706	\$289,398,715
Refined sugar.....	<i>Pounds.</i> 7,042,905,337	<i>Pounds.</i> 6,666,268,045	713,567,395	285,495,974
Molasses.....	<i>Gallons.</i> 5,916,668	<i>Gallons.</i> 35,802,995	678,771	3,284,278
Molasses and sirup.....			14,637,830	
Sirup.....	38,144,320		2,102,710	618,463
All other products.....				

*Imports.*—Formerly sugar was imported from many sources, among the most important of which were Cuba, Java, and Germany. Since 1903, when, in connection with the reciprocity treaty, a preferential rate was given to Cuba, imports from other sources have dropped off. Now over 95 per cent of the imported sugar comes from Cuba. Importations consist almost exclusively of raw sugars, ranging in polariscopic test from 75° upward, over 90 per cent, however, being of sugars testing between 95° and 97°. In 1914 imports were: Beet sugar, 1,184 tons, valued at \$70,829; cane sugar, 2,531,179 tons, valued at \$101,415,499. Later statistics follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
----------------	-----------	--------	-------------	-------	------------------------

## BEET SUGAR.

	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	380	\$35	\$0.09	\$4	12.83
1919.....	1,180	108	.09	14	12.96
1920.....	36,332,165	6,315,687	.17	492,961	7.81
1921.....	7,970	849	.11		

CANE SUGAR.<sup>1</sup>

1918.....	5,147,328,431	\$241,093,900	\$0.05	\$50,392,991	
1919.....	6,989,676,648	390,677,144	.06	67,908,807	
1920.....	7,702,780,240	959,206,556	.12	78,170,330	
1921 (9 months).....	4,771,427,650	216,689,423	.04		

<sup>1</sup> Included in the imports of cane sugar shown in the above table are the following imports admitted free of duty from the Philippine and Virgin Islands:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	151,568,106	\$7,103,712	\$0.05
1919.....	196,319,609	9,328,574	.05
1920.....	318,156,663	46,636,117	.14
1921 (9 months).....	209,289,374	12,455,518	.06

In 1920, it will be noted, imports of beet sugar rose to 36,332,165 pounds from only 1,180 pounds in 1919 and 380 pounds in 1918. In the same year imports of full-duty cane sugar showed a noteworthy increase—from 137,228,883 pounds (about 2 per cent of the total) in 1919 to 1,948,358,618 pounds (about 25.3 per cent of the total) in 1920. These heavy importations of full-duty sugar (cane and beet) were made possible by the high prices prevailing in 1920. Ordinarily the Cuban preference of 20 per cent has been nearly sufficient to exclude all but Cuban sugars. The exceptional conditions of 1920 made it profitable to import sugars from other sources over the duty.

The following table shows by months the quantity and value of dutiable cane sugar imported during 1921:

Month.	Quantity.	Value.	Month.	Quantity.	Value.
	<i>Pounds.</i>			<i>Pounds.</i>	
January.....	254,505,311	\$15,553,984	July.....	237,718,074	\$6,604,752
February.....	592,279,208	28,457,466	August.....	509,504,947	14,721,202
March.....	821,904,235	39,525,122	September.....	281,485,513	7,744,241
April.....	841,168,244	40,511,233	October.....	303,002,856	7,605,968
May.....	643,268,005	26,445,919	November.....	475,706,063	9,861,890
June.....	356,385,734	12,389,733	December.....	358,177,684	7,894,514

*Exports.*—None of the domestic product (unless Philippine Island sugar is regarded as domestic) and no raw sugars are exported. A portion of the imported raw is refined for export, the refiners using the imported sugar rather than the domestic product in order to obtain the benefit of the drawback. This business, only 1 per cent of sugar receipts in normal times, became important during the war, rising to 12 per cent of the total receipts in the period 1915-1917. Exports of refined sugar in 1914 were 25,448 tons, valued at \$1,839,983; in 1916, 815,075 tons, valued at \$79,309,147; in 1918 (fiscal year), 288,241 tons, valued at \$38,761,686.

In normal times the countries of chief importance in the export trade were the United Kingdom, Panama, Mexico, and Newfoundland. During the war several European countries, which had previously relied upon domestic production or importation from the Central Powers and Russia, became important purchasers from American refineries. Statistics for the calendar years 1918-1921 follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	407,296,324	1,475,407,678	924,192,385	785,984,488
Value.....	\$27,038,667	\$114,737,491	\$94,877,045	\$42,961,931

The above exports are of refined sugar, including maple sugar, which, as already stated, had previously been imported as raw sugar, the exporter receiving the benefit of drawback. Drawback is also obtained on the export of other products than refined sugar in the preparation of which imported raw sugar has been used. Among

such products are chewing gum, cocoa, confectionery, preserved fruits, dairy products, and tobacco. The magnitude of this business may be judged from the following table, showing exports of raw sugar subject to drawback and drawback received thereon for the calendar years 1918-1920:

	1918	1919	1920
Exports of imported raw sugar (pounds).....	372,930,943	1,497,019,239	1,388,396,876
Drawback received.....	\$3,772,814	\$14,987,183	\$13,456,823

*Important changes in classification.*—Sugar drainings and sugar sweepings, specifically mentioned in the acts of 1909 and 1913, are not so mentioned in H. R. 7456. In their place and more inclusive is a new item for “all mixtures containing sugar and water, testing by the polariscope above 50° and not above 75°.” Mixtures containing sugar and water, testing by the polariscope 50° or less, are not specifically provided for.

In the acts of 1909 and 1913 the dividing line between “sugars” and “molasses” is placed at 56 sugar degrees, whereas in H. R. 7456 (par. 501) this dividing line is lowered to 50 sugar degrees. Sugars, molasses and sirups are placed in the same paragraph in both the acts of 1909 (par. 216) and the act of 1913 (par. 177), whereas in H. R. 7456 they are separated, sugars and some sirups appearing in paragraph 501 and molasses and other sirups in paragraph 503.

*Conflicting provisions.*—There is a conflict between paragraph 501 and paragraph 503. The same material might come within the provisions of paragraph 501, “sirups of cane juice, melada, \* \* \* testing by the polariscope not above 75 sugar degrees,” and “all mixtures containing sugar and water testing by the polariscope above 50 sugar degrees and not above 75 sugar degrees,” and the provision of paragraph 503, “molasses and sirups \* \* \* testing above 48 per centum total sugars.” There is also a conflict between the provision in paragraph 501 for “sugars” and “all mixtures containing sugar and water,” and the provision in paragraph 504 for “maple sugar and maple sirup,” and the provision in paragraph 506 for “sugar candy and confectionery.”

*Suggested changes.*—The dividing line between raw sugars and molasses in the tariff laws has for many years been placed at 56 sugar degrees. This dividing line is lowered to 50 sugar degrees in H. R. 7456. No adequate reason for this change has been found, but on the other hand strong objection to it can logically be made because the edible grades of molasses will frequently test above 50 degrees. (See also discussion under par. 503, p. 599.)

Tank bottoms, sirups of cane juice, melada, concentrated melada, and concrete and concentrated molasses enumerated in this paragraph are mixtures of sugar and water with impurities and are therefore covered by the new provision in this paragraph for such mixtures, and might be omitted. It is suggested to avoid possible litigation that the words “sirups and other” be inserted before “mixtures” in line 5, page 81, of H. R. 7456, and the words “of, or” inserted after “mixtures.”

The words "all the foregoing not specially provided for" should be added after "seventy-five sugar degrees," page 81, line 7, H. R. 7456, to avoid conflict with paragraph 504, which provides for "maple sugar and maple sirup," and with paragraph 506, which provides for "sugar candy and confectionery."

With all these changes the paragraph would read:

PAR. 501. Sugars testing by the polariscope not above seventy-five sugar degrees, and all sirups and other mixtures of or containing sugar and water, testing by the polariscope above fifty-six sugar degrees and not above seventy-five sugar degrees, all the foregoing not specially provided for, cents per pound, and for each additional sugar degree shown by the polariscopic test, of 1 cent per pound additional, and fractions of a degree in proportion.

Page 81, line 1 (title of schedule 5): Insert a comma after "sugar."

### PARAGRAPH 502.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 502. Any person manufacturing or refining in the United States sugar, testing by the polariscope over ninety-nine degrees, produced from beet or cane grown in the continental United States, shall for each pound so manufactured or refined during any month in any State, Territory, or the District of Columbia, be permitted to import, at any time before the expiration of nine months after the last day of such month (for the sole purpose of being manufactured or refined by him in such State, Territory, or District), two pounds of sugar testing by the polariscope not above ninety-six degrees, at three-fourths of the rate of duty to which such sugar would otherwise be subject. The Secretary of the Treasury shall make all regulations necessary for the enforcement of this paragraph, including the taking of bonds to secure compliance with its provisions.

ACT OF 1909.

ACT OF 1913.

[No corresponding provision.]

[No corresponding provision.]

#### REDUCTION OF DUTY ON IMPORTED RAW SUGARS TO REFINERIES USING DOMESTIC RAW SUGARS.

*General comments.*—Paragraph 502 is new matter, having no corresponding provision in previous acts. The concession as to rate of duty provided for in the paragraph is open to refiners who make use of domestic raw sugar for the purpose of refining. Beet sugar manufacturers and Louisiana refiners could undoubtedly avail themselves of the privileges of the paragraph. Doubt has been expressed whether the seaboard refineries could do so. The imported sugar must be refined in the same State, Territory, or District

in which the domestic raw sugar is manufactured or refined, and some have interpreted the paragraph as requiring that the domestic raw sugar must also be produced in the same State, Territory, or District in which it is refined. If the latter interpretation holds, the seaboard refiners would be precluded from the benefits of the paragraph, as raw sugar is not produced in the Atlantic seaboard States. On the other hand the paragraph may be interpreted in such a way as to permit the seaboard refiners to import foreign sugars, under the concession as to duty, on the basis of Louisiana or other domestic raw sugars which they may have refined.

*Production.*—As the provision is new there are no previous statistics as to production under the paragraph. It has been suggested by members of the trade that some beet sugar factories in Michigan and some cane sugar factories in Louisiana might avail themselves of the privileges of the provision. It is thought that beet sugar manufacturers in other regions would be precluded from the benefits of the provision by freight costs on imported raws.

*Imports.*—The total beet-sugar production of Michigan averaged for the three years 1918–1920 about 284,000,000 pounds, and the total cane-sugar production of Louisiana and Texas averaged for the same years about 385,000,000 pounds, a total of 669,000,000 pounds, or about 300,000 long tons. If this domestic production were made the basis for importing foreign raws under the provisions of the paragraph, it would appear that the maximum tonnage of imported raws on which the concession could be allowed would be 600,000 long tons, or about 18 per cent of the total imports. As it is doubtful to what extent Michigan beet-sugar manufacturers could refine raw cane sugar without extensive changes in their machinery, and as it is unlikely that the total output of Louisiana raws would be made the basis of imports, it is probable that the actual imported tonnage subject to the concession in duty would be much less than the above figure.

*Exports.*—It is unlikely that there would be any exports under the provision, as refiners would find it to their advantage to export sugars refined exclusively from imported raws and obtain the drawback of 99 per cent of the entire duty paid, rather than to export refined sugar made partly from domestic raws.

*Important changes in classification.*—The provision is new.

*Suggested changes.*—Page 81, lines 14 and 21, of H. R. 7456: The word "sugar" should be inserted before the word "degrees" to make the reading conform to the wording of paragraph 501.

---

### PARAGRAPH 503.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 503. Molasses and sirups testing not above 48 per centum total sugars, twenty-five one-hundredths of 1 cent per gallon; testing above 48 per centum total sugars, two hundred and seventy-five one-thousandths of 1 cent additional for each per centum of total sugars and fractions of a per centum in proportion.

## ACT OF 1909.

PAR. 216. \* \* \* molasses testing not above forty degrees, twenty per centum ad valorem; testing above forty degrees and not above fifty-six degrees, three cents per gallon; testing above fifty-six degrees, six cents per gallon; sugar drainings and sugar sweepings shall be subject to duty as molasses or sugar, as the case may be, according to polariscopic test.

## ACT OF 1913.

PAR. 177. \* \* \* molasses testing not above forty degrees, 15 per centum ad valorem; testing above forty degrees and not above fifty-six degrees, 2½ cents per gallon; testing above fifty-six degrees, 4½ cents per gallon; sugar drainings and sugar sweepings shall be subject to duty as molasses or sugar, as the case may be, according to polariscopic test.<sup>3</sup> \* \* \*

## MOLASSES AND SIRUP.

(See Survey E-1.)

*Description and uses.*—Molasses is a by-product of the sugar industry. It is what remains of the juice after the principal impurities have been removed, the juice boiled down, and the greater part of the sugar content crystallized and removed by centrifugation. Sirup is a direct product of the cane juice, containing all the sugar, but freed from some impurities and boiled to the desired consistency.

An exception to the description given is to be noted in "fancy" and "extra fancy" molasses produced in the West India Islands, chiefly Barbados. In this variety cane juice is concentrated to a thick sirup after treatment which converts a portion of the sucrose content into invert sugar, but from which none of the sucrose has been extracted. The introduction of modern methods into the manufacture of raw sugar and consequent reduction in the supply of edible molasses resulted in the above-mentioned "fancy" product which is known commercially as molasses.

This product differs from sirup of cane juice in that the latter has been concentrated without any process of inversion and might profitably be converted into sugar by continuing the process of evaporation, while the former, by reason of the large percentage of invert sugar, would yield comparatively little crystallized sucrose.

Molasses is produced from both the beet and cane, that obtained from the beet being unsuitable for human food. Beet and low-grade cane molasses (blackstrap) are used in the manufacture of industrial alcohol and as a cattle feed. Cane molasses is also used in the manufacture of rum.

*Production.*—In 1914 20,675,260 gallons of cane molasses, valued at \$2,021,517, 2,420,633 gallons of cane sirup, valued at \$609,696, and 26,000,000 gallons of beet molasses were produced as by-products in factories whose principal output was sugar. Sirup is also manufactured as a major product in several of the Gulf States on farms and in small factories making no sugar. Later statistics follow:

<sup>3</sup> Molasses testing not above forty degrees, 24 per centum ad valorem; testing above forty degrees and not above fifty-six degrees, 3½ cents per gallon; testing above fifty-six degrees, 7 cents per gallon; sugar drainings and sugar sweepings shall be subject to duty as molasses or sugar as the case may be according to polariscopic test: Par. 20, emergency tariff act of 1921.

Commodity.	Year.	Unit.	Quantity.	Value.
Beet molasses <sup>1</sup> .....	1917-18	Ton.....	239, 338	\$7, 000, 000
Cane molasses <sup>2</sup> .....	1920-21	Gallon.....	54, 089, 867	.....
Cane sirup <sup>3</sup> .....	1920-21	.....do.....	43, 507, 000	.....

<sup>1</sup> Figures from completed schedules secured by the Tariff Commission.

<sup>2</sup> Figures from Statistical Abstract of United States, 1920, p. 229.

<sup>3</sup> Department of Agriculture estimate.

For preliminary figures from the census of 1919 showing production of sirup and molasses as by-products of the sugar industry, see under "Sugar," paragraph 501.

*Imports* have rapidly increased in recent years from 51,410,271 gallons in 1914, valued at \$1,774,719, to 130,730,861 gallons in 1918 (fiscal year), valued at nearly \$9,177,833. Imports of molasses for the calendar years 1918-1921 have been as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.
	<i>Gallons.</i>			
1918.....	142, 545, 811	\$10, 326, 611	\$0. 07	\$1, 193, 329
1919.....	118, 842, 094	4, 161, 210	.03	469, 166
1920.....	161, 177, 519	5, 081, 610	.03	507, 669
1921 (9 months).....	57, 633, 168	1, 443, 083	.02	.....

The above table shows total importations of all grades of molasses. If segregated by the grades provided for in the Act of 1913, the average annual importations for the three years 1918-1920 were: (1) Molasses testing not above 40 degrees, 139,289,062 gallons valued at \$5,670,762; (2) testing above 40 degrees and not above 56 degrees, 1,555,771 gallons valued at \$847,111; (3) above 56 degrees, 10,642 gallons valued at \$5,268.

A comparatively small quantity, 20,792 gallons in 1920, is imported free of duty—all from the Virgin Islands. Of the dutiable imports by far the greater part is from Cuba—148,084,934 gallons out of the total of 161,156,639 gallons in 1920. The imports from Cuba, however, are a low-grade molasses, blackstrap, used largely in the manufacture of industrial alcohol and as an ingredient of cattle feed. A high-grade molasses is imported in considerable quantities (728,925 gallons in 1920) from Barbados. Recent imports of sirups are as follows:

Calendar year.	Quantity.	Value.	Unit value.	Duty.
	<i>Pounds.</i>			
1918.....	153, 953	\$6, 483	\$0. 04	\$873
1919.....	753, 968	35, 069	.05	4, 600
1920.....	1, 658, 129	81, 102	.05	6, 013
1921 (9 months).....	346, 410	10, 033	.03	.....

*Exports.*—The most important countries of destination for molasses are the United Kingdom, Canada, and the West Indies. The United Kingdom, Norway, Denmark, Sweden, and the Netherlands are the most important purchasers of American sirup. Prewar exports (fiscal year 1914) are compared with shipments during the calendar years 1918-1921 in the following table:

	1911	1918	1919	1920	1921 (9 months).
MOLASSES.					
Quantity (gallons).....	1,002,441	5,413,982	6,685,784	4,828,149	4,438,904
Value.....	\$175,498	\$1,190,911	\$1,311,217	\$1,097,480	\$883,582
SIRUPS, INCLUDING MAPLE SIRUP.					
Quantity (gallons).....	11,630,528	3,184,290	16,731,846	6,594,835	4,322,652
Value.....	\$1,491,639	\$2,012,121	\$10,299,244	\$4,164,177	\$1,187,729

*Important changes in classification.*—In the acts of 1909 and 1913 molasses testing not above 40° by the polariscope was subject to an ad valorem duty. If testing above 40° it was subject to a specific duty, the specific rate being twice as high when the test was above 56° as the rate when the test was between 40° and 56°. In H. R. 7456 a new method of assessment for duty is introduced. The polariscopic test is abandoned, sirups, previously not coupled with molasses, are put in the same classification with that article, and the duty upon both is based upon total sugar content, a specific rate per gallon being levied when the total sugar content is not above 48 per cent, and an added specific rate for each percentage of sugar content above 48.

*Conflicting provisions.*—There is a conflict between the provision of paragraph 503 for “molasses and sirups” and that of paragraph 501 for “sirups” and “mixtures containing sugar and water” and the provision in paragraph 504 for “maple sugar.” The same article might be assessed for duty as a “sirup” or as a “mixture containing sugar and water.”

There are three fairly distinct articles of commerce to be provided for under the general head of “Molasses, sirup, and other mixtures containing sugar and water.” To make clear the distinction it is necessary to distinguish first between “sucrose” and “invert sugar.” Chemically speaking there are a considerable number of substances known as “sugars.” The sugar of commerce is sucrose ( $C_{12}H_{22}O_{11}$ ). The process of manufacturing sugar consists in the extraction and crystallization of sucrose from the juice of the cane or beet. After the extracting process has been carried as far as is economical there remains a liquor containing a small quantity of unextracted sucrose and a considerable quantity of “invert sugar.” “Invert sugar” is a mixture of two other sugars, “dextrose” and “levulose,” both having the formula  $C_6H_{12}O_6$ . Sucrose and dextrose both have the property of rotating a beam of polarized light to the right, while levulose rotates it to the left. The combination of dextrose and levulose in equal parts, i. e., invert sugar, rotates it to the left, and, if mixed with sucrose, tends to neutralize the action of the sucrose. It follows that a molasses or sirup may have a considerable percentage “total sugars” and yet show a low test by the polariscope. The polariscopic test alone, therefore, applied in previous acts, is not a proper test for molasses and sirup which contain invert sugar. The introduction of the test by content of total sugars is a step in the right direction, but the dividing lines in paragraphs 501 and 503 are

not so chosen as best to correspond with commercial practice. This leads to the three types of products referred to above.

(1) *Blackstrap*.—This is a by-product of the process of manufacturing sugar by the modern method of the vacuum pan and centrifugal machine. Blackstrap contains, besides the concentrated impurities remaining in the liquor after the sucrose has been extracted, a small amount of unextracted sucrose and a considerable amount of invert sugar. The polariscopic test therefore is low,  $26^{\circ}$  to  $36^{\circ}$ , but the total sugars may run as high as 56 per cent and usually run above 48 per cent. Blackstrap is not suitable for human food, but is valuable for cattle feed and for the manufacture of industrial alcohol. Since it is not customarily bought and sold at a price on a sliding scale based on the analysis but rather at a fixed price per gallon it may properly carry a specific duty. Paragraph 503 is faulty as it stands, as the dividing line, 48 per cent, cuts into the blackstrap instead of separating all blackstrap from the next general commercial grade, edible molasses and sirups. As blackstrap, for the purposes for which it is used, is not appreciably more valuable when its total sugars run above 48 per cent, while the rate of increase for assessment of duty is made very rapid (e. g., for only 1 per cent above 48 the rate of duty would be more than doubled) the practical effect of the provision would be to cause importers to have the blackstrap tested before shipment, and if the test ran above 48 per cent to dilute it until it was not above 48 per cent. The additional freight charge caused by useless water would be much less than the additional duty. If the importation is used in cattle feed the dilution increases the danger of fermentation.

(2) *Edible molasses and sirup*.—The quality and price of the edible grades of molasses and sirup are determined primarily by the flavor and color rather than by the percentage of total sugar. Therefore a fixed rate of duty expressed in cents per gallon would be more in accord with commercial practice than a sliding scale of duties based on the percentage of sugar as provided for in H. R. 7456 (paragraph 503). The recommendation given below as to the dividing lines between blackstrap molasses, edible molasses, and high-grade sirups from which granulated sugar might be made is based upon a study of the analyses of many typical samples.

(3) *Sirups of polariscopic test above  $56^{\circ}$* .—Only a small fraction (probably less than 1 per cent) of the edible molasses on the market tests more than 56 degrees by the polariscope. However, a concentrated cane juice containing little invert sugar and testing above 56 degrees might be imported for the purpose of making refined sugar, if the rates of duty on such sirups were substantially below the rate on raw sugar. They should therefore come under the same provision as that for raw sugar in paragraph 501. Actual experience under the acts of 1909 and 1913 demonstrates that there is no danger that the intended duty on raw sugar will be evaded by the importation of sirups testing below 56 degrees by the polariscope.

Although the polariscopic test is not suitable for distinguishing between blackstrap and edible molasses for reasons explained above, nevertheless it is a good method of testing sirups intended for or suitable for use in the preparation of granulated sugar. The specification recommended has been in use for tariff purposes for many years and is in accord with trade practice and should be retained.

The words "not specially provided for" should be added to avoid conflict with paragraph 504 "maple sirup."

In the last part of paragraph 503 as it now stands it is not clear whether the additional rate is *per gallon* for each *additional* per centum of total sugars.

*Suggested changes.*—Paragraph 503 might accordingly be changed to read:

Molasses and sirups and other mixtures of or containing sugar and water, not specially provided for, containing not above 56 per centum of total sugars, — cents per gallon; containing above 56 per cent of total sugars and testing by the polariscope not above 56 sugar degrees, — cents per gallon.

## PARAGRAPH 504.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 504. Maple sugar and maple sirup, 4 cents per pound; dextrose testing not above 99.7 per centum and dextrose sirup, 1½ cents per pound. Sugar cane in its natural state, or unmanufactured, \$1 per ton of two thousand pounds; sugar contained in dried sugar cane, or in sugar cane in any other than its natural state, 75 per centum of the rate of duty applicable to manufactured sugar of like polariscopic test.

## ACT OF 1913.

ACT OF 1909.

PAR. 217. Maple sugar and maple sirup, four cents per pound; glucose or grape sugar, one and one-half cents per pound; sugar cane in its natural state, or unmanufactured, twenty per centum ad valorem.

PAR. 178. Maple sugar and maple sirup, 3 cents per pound; glucose or grape sugar, 1½ cents per pound; sugar cane in its natural state, or unmanufactured, 15 per centum ad valorem: *Provided*, That on and after the first day of May, nineteen hundred and sixteen, the articles hereinbefore enumerated in this paragraph shall be admitted free of duty. [The proviso was repealed by the act of April 27, 1916, chapter 93.]

## MAPLE SIRUP AND MAPLE SUGAR.

(See Survey E-2.)

*Description and uses.*—Maple sirup and maple sugar are derived from the sap of the maple tree and contain sucrose, identical with that in the juices of the cane or beet. Refined maple sugar is indistinguishable from cane sugar. Maple sugar is prized, however, because of the impurities which give it a characteristic flavor, hence is not refined. Besides its well-known uses as a confection and for table purposes, a large part is employed in the manufacture of tobacco products. It is said that this industry consumed half the domestic crop in 1913.

*Production.*—Maple sirup and maple sugar are produced chiefly in New England and in the North Atlantic and Lake States—New York, Ohio, and Vermont leading. The total output in 1910 was 4,100,000

gallons of sirup and 14,100,000 pounds of sugar, valued at \$5,200,000; in 1918, 5,000,000 gallons of sirup and 13,000,000 pounds of sugar. In 1919, because of unfavorable weather conditions, there was a marked decline—3,900,000 gallons of sirup and 10,400,000 pounds of sugar. More detailed statistics are shown in the following table:

Year.	Maple sirup.	Maple sugar.	Total on sugar basis, 8 pounds to gallon.	Percentage in form of sugar.
	<i>Gallons.</i>	<i>Pounds.</i>	<i>Pounds.</i>	
1900.....	2,056,611	11,928,770	28,381,658	41.9
1910.....	4,106,118	14,060,206	46,911,530	30.0
1917.....	4,286,100	10,838,650	45,127,450	23.9
1918.....	4,905,264	13,270,865	52,512,977	25.3
1919.....	3,854,488	10,168,629	41,004,533	24.8
1920.....	3,605,555	7,528,640	36,373,080	20.7

It will be seen that the output fluctuated considerably from year to year, one reason being the dependence of the industry upon seasonal conditions, some years being much more favorable to the flow of sap than others. The table shows a tendency to market an increasing proportion of the product in the form of sirup.

*Imports* of sirup and sugar in 1914, chiefly from Canada, were 2,095,983 pounds, valued at \$163,047; in 1918 (fiscal year), 5,049,474 pounds, valued at \$909,412. Statistics for the period 1918-1921 follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	3,807,111	\$800,873	\$0.21	\$114,213	14.26
1919.....	4,277,300	1,189,695	.28	128,319	10.79
1920.....	7,607,634	1,812,102	.24	228,229	12.59
1921 (9 months).....	1,586,115	288,905	.18		

*Imports* are derived almost exclusively from Canada.

*Exports* are not segregated. Exports of maple sugar are included under the heading, "Sugar, refined, including maple sugar." Exports of maple sirup are included under the heading, "Sirup, including maple sirup."

#### DEXTROSE AND DEXTROSE SIRUP (REFERRED TO IN PREVIOUS ACTS AS GRAPE SUGAR AND GLUCOSE.)

(See Survey E-2.)

*Description and uses.*—Glucose and grape sugar are manufactured from starch and are therefore usually made by firms which also make starch for sale. In the United States the raw material for the combined starch-glucose industry is usually corn, although potatoes and wheat are used to some extent. In Europe potatoes are the most important raw material. In the process, starch is boiled with dilute hydrochloric acid thus causing the starch to combine chemically with water, which converts it into dextrin, maltose, and finally dextrose. The product is then neutralized, decolorized, and concentrated by

evaporation. If the boiling with acid and the concentration by evaporation are stopped at a relatively early stage a liquid sirup known as glucose is obtained, whereas if both these operations are prolonged, a solid sugar known as grape sugar is obtained.

Glucose is a colorless or slightly amber-colored sirup, with about one-half the sweetening power of sugar. Mixed with cane sirup or maple sirup, it is a familiar article of table use. It is also known as corn sirup. It is extensively used by tanners, bakers, and brewers, and in the manufacture of jellies and confectionery. Grape sugar is used in the manufacture of vinegar and in brewing; also, as a reducing agent in many industries, and in silvering glass.

*Production* of glucose in 1909 was 769,700,000 pounds, valued at \$17,900,000, and of grape sugar, 159,100,000 pounds, valued at \$3,600,000. Preliminary figures from the census of 1919 show the value of the glucose (including all sirups) produced in that year to have been, \$80,608,000; grape sugar (157,276,000 pounds) \$9,315,000. The industry flourishes chiefly in the corn belt—Illinois, Indiana, Iowa, and Missouri. The most important factories are in Argo, Ill., and Edgewater, N. J. Though less favorably located with respect to the domestic corn supply, Edgewater, in addition to being nearer eastern and European markets, is advantageously situated with respect to imported Argentine corn, which is often cheaper than the American grain and contains more oil—corn oil being an important by-product of the industry.

This industry lends itself to the economies of large-scale production and has been subject to persistent attempts at monopoly. A pool was arranged in 1885, which continued, with intermission, until 1890. Consolidations were effected in 1897, in 1902, and in 1906. The last consolidation, under the name of the Corn Products Refining Co., still remains the dominant figure in the industry. Its dissolution has been ordered by the courts.

*Imports.*—Imports of glucose are comparatively small, the largest since 1910 being 268,592 pounds, valued at \$8,345. in 1911. Later statistics follow.

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	104,557	\$6,331	\$0.06	\$1,176	18.58
1919.....	40,267	3,040	.07	453	14.90
1920.....	50	5	.10	.....	11.20

In only one year since 1910 have imports of grape sugar exceeded 500 pounds. No imports are recorded for 1918, 1919, or 1920.

*Exports.*—About one-eighth of domestic glucose is exported. In 1914 the exports were 162,680,378 pounds, valued at \$3,766,289; in 1916, 148,523,098 pounds, valued at \$3,772,860; in 1918, 80,970,749 pounds, valued at \$4,949,159. The exports decreased during the war to less than one-half, but the rise in price increased the value. The destination of the exports was widespread, including all the principal countries of Europe, several countries of South America, Canada, Cuba, Australia, New Zealand, and South Africa. From one-half to

four-fifths of the trade was with the United Kingdom. Exports of grape sugar in 1914 were 36,850,496 pounds, valued at \$799,635; in 1916, 37,883,089 pounds, valued at \$962,101; in 1918 (fiscal year), 16,887,557 pounds, valued at \$1,045,512. Over 90 per cent of the export trade was with the United Kingdom.

Statistics for the calendar years 1918-1921 follow:

	1918	1919	1920	1921 (9 months).
GLUCOSE.				
Quantity (pounds).....	42,740,417	220,380,761	144,760,031	169,479,032
Value.....	\$2,552,637	\$13,169,051	\$8,993,815	\$4,793,757
GRAPE SUGAR.				
Quantity (pounds).....	14,591,733	35,236,948	17,736,137	14,303,990
Value.....	\$906,290	\$1,970,893	\$1,074,015	\$463,444

*Important changes in classification.*—In previous acts the substances referred to in paragraph 504 as “dextrose testing not above 99.7 per centum” and “dextrose sirup” were called respectively “grape sugar” and “glucose.”

*Suggested changes.*—The term dextrose refers to a definite chemical substance ( $C_6H_{12}O_6$ ) and may properly apply to the substance referred to in paragraph 505 as “dextrose testing above 99.7 per centum.” The substances which will be assessed for duty under paragraph 504 and referred to as “dextrose testing not above 99.7 per centum” and “dextrose sirup” are commercial products, containing, it is true, dextrose, but containing also other substances. The first is known to the trade as “grape sugar” or “corn sugar”; the second as “glucose.” The normal composition of glucose, exclusive of water, is about 45 per cent maltose, 35 per cent dextrin, and 20 per cent dextrose. It is questionable whether in framing a tariff act which has to do with commercial products it is preferable to depart from commercial terminology, especially when the chemical term substituted represents only a minor ingredient of the commercial product in question.

The following wording is suggested: “Grape sugar or cereal sugar or corn sugar or potato sugar, and glucose or corn sirup or potato sirup, [rate] per pound.

#### SUGAR CANE.

*Production and uses.*—The cane from which sugar is obtained is a species of grass, requiring from 18 months to 2 years to mature sufficiently to yield the best results, and hence can be best produced in tropical climates. In no part of continental United States, except southern Florida (a sugar region of potential promise), is continuous growth of the cane through 12 months of the year possible. The other Gulf States, though growing cane, are somewhat at a disadvantage because the season is seldom longer than nine months. The superiority of a mature cane for sugar extraction is shown by

the fact that in Hawaii the average yield of sugar per ton of cane is 245.6 pounds; in Porto Rico, 221.9 pounds; in Cuba, 229.1 pounds, while in Louisiana it is only 143.3 pounds. Louisiana and Texas, however, are important sugar-producing States, furnishing 5 per cent of the total domestic consumption. Sugar cane is also grown in the other Gulf States, but mainly for making sirup, for which purpose a mature cane is not so necessary.

*Imports.*—Because of the bulk of cane in comparison with its value, it is unprofitable to transport it any considerable distance for manufacture. For this reason the foreign trade in cane is necessarily of small importance. Imports in 1918 (fiscal year) are given as having a value of \$639,392. Statistics for the period 1918–1921 follow:

Calendar year.	Value.	Duty.	Equivalent ad valorem.
1918.....	\$623,564	\$93,535	15.00
1919.....	398,284	59,743	15.00
1920.....	331,502	49,577	14.96
1921 (9 months).....	309,628		

*Exports.*—None recorded.

*Suggested changes.*—Page 82, line 12, paragraph 504. If the words “or unmanufactured” after the words “in its natural state” shall be considered necessary the same words should be inserted in line 14 after the words “in any other than its natural state.” The words “or unmanufactured” are apparently unnecessary in either place.

### PARAGRAPH 505.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 505. Adonite, arabinose, dulcete, galactose, inosite, inulin, levulose, mannite, d-talose, d-tagatose, ribose, melibiose, dextrose testing above 99.7 per centum, mannose, melitzitose, raffinose, rhamnose, salicin, sorbite, xylose, and other of the higher saccharides required for scientific purposes, 50 per centum ad valorem.

#### ACT OF 1909.

#### ACT OF 1913.

PAR. 665. Salicin [Free].

PAR. 3. \* \* \* all chemical compounds, mixtures and salts, \* \* \* not specially provided for in this section, twenty-five per centum ad valorem; \* \* \*.

PAR. 591. Salicin [Free].

PAR. 5. \* \* \* all chemical and medicinal compounds, preparations, mixtures and salts \* \* \* not specially provided for in this section, 15 per centum ad valorem.

#### VARIOUS “SUGARS.”

*Description and uses.*—The items enumerated in paragraph 505 are for the most part substances belonging to a class of carbohydrates chemically known as sugars. They are not, however, used as foods

nor do they have an industrial or economic relationship to commercial sugar. They are in fact highly refined chemicals, used primarily for bacteriological testing and medicinal diagnosis.

Two of the substances included in the list in paragraph 505 are not sugars at all; inulin is a variety of starch, and salicin is a glucoside.

*Production.*—These substances are extracted from various vegetable materials on a small laboratory scale and are commonly sold in bottles containing a fraction of an ounce. Before the war they were not produced for sale at all in the United States, but since the outbreak of the European war two American firms have undertaken the manufacture of some of them. The annual demand for these rare sugars is very small, probably not more than a few hundred pounds a year for any one of them, with the possible exception of salicin.

*Imports* during the fiscal year ended June 30, 1914, were as follows: Salicin, 4,200 pounds, valued at \$15,234; mannite, 451 pounds, \$1,129; dulcitol, 77 pounds, \$559; adonite, arabinose, inulin, raffinose, rhamnose, xylose, each less than \$100 worth imported. There is no record that any of the others were imported at all. With the exception of 1914, the several items in paragraph 505, excluding salicin, were imported under a basket clause and were not segregated. The following table shows the imports of salicin since 1917:

Calendar year.	Quantity.	Value.	Unit value.
	<i>Pounds.</i>		
1918.....	729	\$7,046	\$9.66
1919.....	365	4,254	11.65
1920.....	2,772	32,396	11.69
1921 (9 months).....	230	1,050	4.70

*Exports.*—Not recorded.

*Important changes in classification.*—The items in paragraph 505, with the exception of salicin, are for the first time specifically provided for. Salicin was on the free list (par. 591) of the act of 1913. The other items were assessed for duty under the general provisions of paragraph 5, "Alkalies, alkaloids, and all chemical and medicinal compounds, preparations and salts, and combinations thereof, not specially provided for in this section, 15 per centum ad valorem."

*Suggested changes.*—Paragraph 505, page 82, line 20: Strike out the word "melitzitose" and insert "melezitose" to correct a misspelling. It is suggested that these names be rearranged in alphabetical order for convenience in reference.

Paragraph 505, page 82, lines 21 and 22: The phrase "and other of the higher saccharides required for scientific purposes" is objectionable for several reasons. In the first place, the word "higher" would exclude some of the simpler saccharides known as "monosaccharides," which logically belong herein and which it is probably intended to include herein; and in the second place, the phrase "for scientific purposes" would require the customs authorities to determine the use for which the import is intended which always gives

difficulty in administration; and thirdly, and most important, this provision is probably too broad because it might be held to include maltose or malt sugar and lactose or milk sugar, which are not elsewhere more specifically provided for. Lactose or milk sugar was specifically provided for on the free list in the act of 1913 (par. 547), but was omitted from the present bill with the intention of throwing it into the basket clause in paragraph 5, dutiable at 25 per cent. In the absence of this provision in paragraph 505, malt sugar would probably also be dutiable under paragraph 5 at 25 per cent. Neither malt sugar nor milk sugar are, from an industrial point of view, in the same class with these rare sugars referred to in paragraph 505 and should not be classified with them. If specific mention for lactose or milk sugar and maltose or malt sugar is made elsewhere, then it is suggested that in lines 16 and 17 the phrase "and other of the higher saccharides required for scientific purpose" should be stricken out and there should be inserted the phrase "and other saccharides not specially provided for."

It is further suggested that the whole of paragraph 505 should be transferred to schedule 1 and inserted between paragraphs 81 and 82. Although the products provided for in paragraph 505 are chemically sugars, they are not used for food or confectionery and have no industrial or economic relationship to commercial sugar, but are highly refined chemicals used primarily for bacteriological testing and medicinal diagnosis and logically belong in schedule 1 with other chemicals and drugs.

---

### PARAGRAPH 506.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 506. Sugar candy and all confectionery not specially provided for, and on sugar after being refined, when tintured, colored, or in any way adulterated, 30 per centum ad valorem. The value of the immediate coverings other than the outer packing case or other covering shall be included in the dutiable value of the merchandise.

ACT OF 1909.

ACT OF 1913.

PAR. 219. Sugar candy and all confectionery not specially provided for in this section, valued at fifteen cents per pound or less, and on sugars after being refined, when tintured, colored or in any way adulterated, four cents per pound and fifteen per centum ad valorem; valued at more than 15 cents per pound, fifty per centum ad valorem. The weight and the value of the immediate coverings, other than the outer packing case or other covering, shall be included in the dutiable weight and the value of the merchandise.

PAR. 180. Sugar candy and all confectionery not specially provided for in this section, valued at 15 cents per pound or less, 2 cents per pound; valued at more than 15 cents per pound, 25 per centum ad valorem. The weight and the value of the immediate coverings, other than the outer packing case or other covering, shall be included in the dutiable weight and the value of the merchandise.

## SUGAR CANDY AND CONFECTIONERY, N. S. P. F., ETC.

(See Survey F-2.)

*Description.*—The distinction between confectionery and certain food products is not always easily drawn. The figures in the next paragraph follow the classification of the Census Bureau, and include under "confectionery" candy and confections, cake ornaments, popcorn balls and cake, chewing gum, salted nuts, and stuffed dates, but do not include the products of establishments making primarily chocolate and cocoa.

*Production.*—To the value of total output in 1914, \$154,000,000, may be added \$17,000,000 for the allied product, chewing gum.

The industry is widespread, but centers in New York, Massachusetts, Pennsylvania, and Illinois, four States producing a little more than one-half the entire domestic output.

Preliminary figures for the 1919 census show 3,148 establishments engaged in the manufacture of confectionery, with products valued at \$447,800,000. In value of output the rank of States was: New York, Massachusetts, Illinois, Pennsylvania, Ohio, Wisconsin, Missouri, California, Maryland, New Jersey.

*Imports* from Germany in 1912 aggregated 799,000 pounds and from Austria-Hungary 215,000 pounds, about 64 per cent of the whole. Other important sources are the United Kingdom, France, Netherlands, Spain, Italy, Russia, and several Asiatic countries. The total annual imports for 1911-1914 decreased from an average of 1,486,000 pounds, valued at \$265,000, to 714,000 pounds, valued at \$126,000, for 1915-1918. Imports for 1914 were 1,671,806 pounds, valued at \$294,019; for 1918 (fiscal year), 301,796 pounds, valued at \$64,588. Statistics for the period 1918-1921 follow:

Calendar year.	Quantity.	Value.	Unit value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>				<i>Per cent.</i>
1918.....	180,550	\$27,399	\$0.15	\$6,039	22.04
1919.....	839,376	195,515	.23	42,317	21.64
1920.....	1,229,325	371,796	.30	87,345	23.49
1921 (9 months).....	442,602	122,322	.28		

*Exports* increased during the war from an annual average of \$1,200,000 during the preceding four years to an annual average of \$1,800,000. The exports for 1914 were valued at \$1,329,147; for 1918 (fiscal year), \$1,856,751. The countries of chief importance in the export trade are the United Kingdom, Canada, Cuba, the Philippine Islands, Australia, South Africa, Panama, and Mexico. Statistics for later calendar years were as follows: 1918, \$1,225,928; 1919, \$12,305,082; 1920, \$6,255,476; 1921 (9 months), \$1,239,233.

*Important changes in classification.*—The act of 1913 divides confectionery into two classes. The clause "and on all sugar after being refined, when tintured, colored, or in any way adulterated," is added. The provision for "weight" in the case of outer covering is omitted as unnecessary.

*Suggested changes.*—Omit "on" before sugar in the second line of the paragraph.

Paragraph 506, page 82, line 25: A duty of 30 per cent on "sugar after being refined, when tintured, colored, or in any way adulterated," will be less than the duties imposed in paragraph 501 on raw or refined sugars whenever the dutiable value of sugar is less than 7.2 cents per pound. Pulverized sugar is sometimes mixed with a small percentage of starch for the purpose of preventing caking. Granulated sugar is sometimes colored for confectioners' use. Such adulterated sugars would come under the provisions of this paragraph. An addition of tincture or coloring matter or other adulterant might permit the importation of sugars at less than the rates imposed in paragraph 501.

Paragraph 506, page 83, lines 1-3: Strike out all of the paragraph after the words "ad valorem" in line 1. This entire sentence is unnecessary because coverings of goods carrying ad valorem duties are dealt with by general provisions, or if an exception shall be made in case of these goods the word "only" should be inserted after "coverings" in line 1, and the words "other than the outer packing case or other covering" should be stricken out of lines 1 and 2.

## SCHEDULE 6.—TOBACCO AND MANUFACTURES OF.

### PARAGRAPH 601.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 601. Wrapper tobacco, and filler tobacco when mixed or packed with more than 50 per centum of wrapper tobacco, and all leaf tobacco the product of two or more countries or dependencies when mixed or packed together, if unstemmed, \$2.10 per pound; if stemmed, \$2.75 per pound; filler tobacco of the kind known as Turkish, \$1 per pound; filler tobacco not specially provided for, if unstemmed, 45 cents per pound; if stemmed, 60 cents per pound: *Provided*, That filler tobacco, not specifically provided for, commonly used without removing the stem shall be subject to the same duty as stemmed.

#### ACT OF 1909.

#### SCHEDULE F.—TOBACCO AND MANUFACTURES OF.

PAR. 220. Wrapper tobacco, and filler tobacco when mixed or packed with more than fifteen per centum of wrapper tobacco, and all leaf tobacco the product of two or more countries or dependencies when mixed or packed together, if unstemmed, one dollar and eighty-five cents per pound; if stemmed, two dollars and fifty cents per pound; filler tobacco not specially provided for in this section, if unstemmed, thirty-five cents per pound; if stemmed, fifty cents per pound.

[No corresponding provision for tobacco of the kind known as Turkish.]

#### ACT OF 1913.

#### SCHEDULE F.—TOBACCO AND MANUFACTURES OF.

PAR. 181. Wrapper tobacco, and filler tobacco when mixed or packed with more than 15 per centum of wrapper tobacco, and all leaf tobacco the product of two or more countries or dependencies when mixed or packed together, if unstemmed, \$1.85 per pound;<sup>1</sup> if stemmed, \$2.50 per pound;<sup>2</sup> filler tobacco not specially provided for in this section, if unstemmed, 35 cents per pound;<sup>3</sup> if stemmed, 50 cents per pound.<sup>4</sup>

[No corresponding provision for tobacco of the kind known as Turkish.]

#### TOBACCO.

*Description and uses.*—Tobacco of commerce consists of the dried, cured leaves of *Nicotiana tabacum* and *N. rustica* (with or without the midrib or stem), commonly known as leaf tobacco, and its various manufactured products intended for smoking, chewing, or snuffing. The green leaves are subjected to curing, which removes most of the water, and usually to fermentation or aging in preparation for manu-

<sup>1</sup> \$2.35 per pound, par. 25, emergency tariff act of 1921.

<sup>2</sup> \$3 per pound, par. 25, emergency tariff act of 1921.

<sup>3</sup> 35 cents per pound, par. 25, emergency tariff act of 1921.

<sup>4</sup> 50 cents per pound, par. 25, emergency tariff act of 1921.

facture into cigars, cigarettes, plug, twist, and various types of granulated, fine-cut, and cut-plug tobaccos.

*Production.*—The United States is the largest producer and exporter of tobacco, growing nearly one-third of the world's crop, now estimated at 4,000,000,000 pounds; other leading countries are India, China, Russia, Austria-Hungary, the Dutch East Indies, the Philippines, Japan, Turkey, Cuba, and Brazil. World production in 1912 (latest complete figures) was as follows:

[In 1,000 pounds.]

United States (except Philippines) .....	979,355	Austria-Hungary .....	188,189
Brazil (1911) .....	54,468	Germany .....	85,741
France .....	49,884	Russia .....	237,406
Italy .....	39,683	British India .....	450,000
Turkey .....	68,894	Japan .....	93,696
Dutch East Indies .....	182,427	Other countries less than	
Philippine Islands .....	65,219	40,000,000 pounds .....	298,748
Cuba (estimated) .....	42,030	Total .....	2,835,740

The production of India and China is very great, but for the most part is consumed locally. In international trade the tobaccos of the United States, Cuba, the Dutch East Indies, Turkey, Bulgaria, Greece, the Philippines, and Brazil are of most significance. Tobacco culture is highly specialized in this country and several distinct types (for different uses) are grown in well-defined areas. Different types of foreign and domestic tobaccos are largely noncompetitive. In 1920 a crop of 1,508,000,000 pounds was produced on 1,894,000 acres, about 56 per cent in Kentucky and North Carolina, and 34 per cent in Virginia, Ohio, Wisconsin, Pennsylvania, South Carolina, and Tennessee. Establishments engaged in its manufacture in 1914 numbered 13,951, employing 178,872 wage earners, receiving wages of \$77,856,000; with capital of \$303,840,000; cost of materials, \$207,134,000; and value of products, \$490,165,000 (latest available figures). The number of retail tobacconists in 1918 was 823,000. In 1920 large cigars consumed 183,000,000 pounds; small cigars, 2,500,000 pounds; large cigarettes, 141,000 pounds; small cigarettes, 177,000,000 pounds; smoking tobacco, chewing tobacco, and snuff, 306,000,000 pounds.

*Revenues from tobacco.*—Manufactured tobacco is universally an important source of public revenue and in some 18 countries (including France, Italy, Spain, Japan, Austria-Hungary, and Sweden) State monopolies have been founded for this purpose. Great gains in the revenue are said to be thus realized without adding to the consumer's price. Distribution is concentrated in a single revenue agency, retaining the profits of wholesalers and retailers and saving the expenses incident to competition. In France ex-soldiers are preferred and given a fixed commission for the work of retail distribution in lieu of (or supplemental to) pensions. In the fiscal year 1921 our internal revenue from tobacco aggregated more than \$255,000,000—over \$135,000,000 from cigarettes, \$52,000,000 from cigars, and \$65,000,000 from “manufactured tobacco.” To offset the heavy internal taxes, compensatory duties are levied upon imports plus an additional percentage for protection. In 1920 these duties yielded \$34,000,000, of which \$30,000,000 was from unmanufactured tobacco. The ad valorem equivalents are sometimes over 180 per cent.

*Imports* of manufactured and unmanufactured tobacco in 1920 totaled 68,000,000 pounds, valued at \$75,000,000, leaf tobacco making up 88 per cent of the quantity and 78 per cent of the value of the whole. Generally our imports are high-grade leaf tobacco used in making cigars and cigarettes. From Cuba we receive chiefly cigar filler and relatively small quantities of cigar wrapper; from Turkey, Greece, and Bulgaria (Turkish or cigarette tobacco), the Dutch East Indies (cigar wrapper), and the Philippines (cigars and cheroots). Manufactured imports, other than from the Philippines, consist chiefly of high-priced cigars and cigarettes.

*Exports* in 1920 were valued at \$288,700,000, of which leaf tobacco constituted about \$245,000,000 and cigarettes about \$36,000,000. Leaf tobacco has been an important export since the settlement at Jamestown, averaging in recent years more than 400,000,000 pounds. The so-called "dark fire-cured" and "bright" or "flue-cured" types of Kentucky, Tennessee, Virginia, and the Carolinas constitute the greater portion of leaf exports. Their average valuation price is lower than that of the imported product, but the volume of exports is much larger. Exports have been chiefly to England, France, Italy, Germany, Australia, Spain, the Netherlands, Belgium, and Canada.

#### WRAPPER TOBACCO AND FILLER TOBACCO.

*Description and uses.*—The typical cigar-wrapper leaf—thin, light in weight, of fine texture, elastic, and of proper color, size, and burning properties—is readily distinguished from typical cigar-filler leaf and from the American cigarette tobacco. Wrapper, especially the lower grades, is not so easily distinguished from binder grades, and in the less typical grades it may be difficult even to distinguish wrapper and filler. As a rule, the same locality does not produce cigar wrapper, binder, and filler of equal excellence. The type of leaf required for domestic cigarettes is quite different from cigar leaf.

*Production.*—The Sumatra wrapper is conceded to be the standard of excellence, largely because of its "covering capacity," 1 pound providing wrappers for 500 or more cigars. A similar grade is grown in Java, and Cuba produces a fine cigar wrapper in limited quantities. The well-known "broadleaf" wrapper is extensively grown in the Connecticut Valley; the "Havana seed" wrapper is grown there also, and to a limited extent in other sections. The greater proportion of these types, however, is of the binder and filler grades. A high-grade wrapper (from Cuban seed) is extensively grown under artificial shade in the Connecticut Valley and in the vicinity of Quincy, Fla., the total production now averaging 6,000,000 to 8,000,000 pounds. Cigar binder and filler types are grown in large quantities in Cuba, the Philippines, and in Pennsylvania, Ohio, Wisconsin, and New York. "Turkish" tobacco of high aroma and excellent flavor produced in Macedonia, in Asiatic Turkey, and in the islands of the Aegean, bears a relation to the cigarette industry analogous to that of Cuban tobacco to the cigar industry. Typical cigarette leaf is grown in large quantities in Virginia, the Carolinas, and Georgia; burley also being used in increasing quantities in cigarettes and other types adapted to chewing and pipe-smoking tobaccos and for export are grown chiefly in Kentucky, Tennessee, Virginia, Ohio, and Maryland.

In recent years a relatively small amount of cigarette leaf has been grown in California from Turkish seed.

Imports of wrapper tobacco during 1910-1914 from Sumatra and Java (through Amsterdam) averaged about 6,000,000 pounds; filler leaf from Cuba, including some wrapper and binder grades, averaged 25,000,000 pounds. Before the war large and rapidly increasing quantities (reaching 20,000,000 pounds) of leaf, designated "Turkish tobacco," were imported from Macedonia and Asia Minor for cigarettes and fancy smoking mixtures. During the war notable quantities of cigarette tobacco came from Greece and China. Detailed statistics for the years 1918-1921 follow:

Calendar year.	Quantity.	Value.	Duty.
<b>WRAPPER TOBACCO, ETC., UNSTEMMED.</b>			
	<i>Pounds.</i>		
1918.....	4,393,631	\$5,888,695	\$7,707,471

1919.....	46,326,607	41,362,524	16,214,312
1920.....	39,590,757	34,545,169	13,891,765

<sup>1</sup> Includes Turkish-type tobacco.

<sup>2</sup> General imports from countries producing Turkish-type tobacco.

Under the emergency tariff act (par. 25) wrapper tobacco, and filler tobacco when mixed or packed with more than 15 per centum of wrapper tobacco, and all leaf tobacco the product of two or more countries or dependencies, when mixed or packed together are dutiable if unstemmed at \$2.35 per pound; if stemmed, at \$3 per pound.

The following table shows imports of leaf tobacco suitable for cigar wrappers during nine months of 1920 and 1921:

Months.	Quantity.		Value.	
	1920	1921	1920	1921
	<i>Pounds.</i>	<i>Pounds.</i>		
January.....	251,695	265,926	\$361,038	\$660,670
February.....	330,694	402,869	393,737	846,526
March.....	10,716	419,654	26,396	547,516
April.....	50,492	420,428	60,875	911,378
May.....	191,709	107,622	231,208	97,526
June.....	882,979	447,964	1,385,246	898,163
July.....	1,509,855	788,207	3,016,418	1,823,683
August.....	1,615,566	896,746	3,319,372	1,740,882
September.....	2,148,620	165,144	4,114,728	342,188

*Exports* of cigar leaf tobacco were inconsiderable until the war. There has been an expanding foreign demand for the bright flue-cured type; other exports have continued stable. England and continental Europe are the chief purchasers. It is estimated that fully 80 per cent of the country's production of fire-cured leaf and Maryland tobacco (about 60 per cent of the flue-cured) and nearly 50 per cent of the dark air-cured types are exported. Exports of leaf tobacco since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	403,871,275	765,913,164	467,662,124	403,880,003
Value.....	\$122,599,767	\$259,438,483	\$244,897,187	\$167,729,793

*Important changes in classification.*—The tariff acts of 1909 and 1913 provided that when a bale of mixed filler and wrapper tobacco contained more than 15 per centum of wrapper tobacco the entire bale should be dutiable at the wrapper rate, which at the present time is six times as high as the duty on fillers. H. R. 7456 changes the percentage of wrapper from 15 to 50 per cent. It does not, however, affect the present practice of assessing duties on mixed bales when the percentage of wrapper is within the prescribed amount; in such cases the wrapper and filler tobacco are assessed the rates of duty provided for each class. Mixed bales of wrapper and filler are imported almost entirely from Cuba where leaves suitable for wrapper are grown on the same plant with the filler grades and where it is not the general practice to sort these two kinds.

In addition to the foregoing alteration, two provisions have been added to this paragraph—one for “filler tobacco of the kind known as Turkish,” and another for “filler tobacco, not specifically provided for, commonly used without removing the stem.” Both provide for the cigarette tobaccos coming chiefly from Macedonia, Samsoun, Smyrna, and the islands of the Aegean.

*Suggested changes.*—There are two important changes to be considered here. One relates to the provision for “filler tobacco commonly known as Turkish,” which would be difficult of administration, and, moreover, includes substantially all tobacco used without re-

moving the stem. So-called Turkish tobacco is grown in Greece, Asia Minor, Bulgaria, and Roumania, and similar kinds are grown in South Africa, Italy, China, and California. Types of Turkish tobacco grown in the various producing sections differ so widely that it would be difficult precisely to define the term. Turkish tobacco is commonly used without removing the stem and without special provision therefor would take the rate for stemmed filler tobacco by virtue of the proviso to this paragraph. If, however, the provision for "filler tobacco commonly known as Turkish" were eliminated the rate on such tobacco would not be so high as that now given for it in this paragraph.

The other important change to be considered is the provision for wrapper tobacco. The tariff provisions regarding wrapper tobacco for many years have resulted in constant administrative difficulties, since it is almost impossible accurately to differentiate some types of wrapper from binder and filler. This is illustrated by the *St. Elmo* case (*St. Elmo Cigar Co. v. United States*, 7 Ct. Cust. Appls., 153, of 1916), wherein eight tobacco experts estimated the percentage of wrapper in identical bales at from 15 to 90 per cent. As a remedy for the difficulties arising from basing the duties upon any percentage of wrapper tobacco in bales containing both wrapper and filler, it is proposed that duties might be levied upon types of tobacco such as Sumatra and Cuban. This proposal will perhaps be more clearly understood if a suggested rephrasing of paragraphs 601 and 602 be submitted, as follows:

PAR. 601. Leaf tobacco of the type commonly known as Java or Sumatra; leaf tobacco the product of two or more countries or dependencies, when mixed or packed together; and wrapper tobacco not specially provided for; all the foregoing, unstemmed [rate]; stemmed [rate].

PAR. 602. Leaf tobacco of the type commonly known as Cuban, unstemmed [rate]; stemmed [rate]; filler tobacco not specially provided for, unstemmed [rate]; stemmed [rate].

PAR. 603. Turkish and other tobacco commonly used without removing the stem [rate].

*Reasons for suggested reclassification, i. e., for the adoption of new provisions for Cuban and Sumatra or Java tobacco and the omission of special duties on mixed bales of wrapper and filler.*

(1) Cuban and Sumatra or Java tobacco are distinctive; each type is *sui generis*. Only wrapper tobacco is imported from the Dutch East Indies, but of the imports from Cuba, such tobacco constitutes only about one-half of 1 per cent.

(2) Cuba produces relatively little of the grades of wrapper acceptable to the American trade. Cuba itself hardly produces sufficient of the better grades of wrapper for its own large export trade in fancy cigars. The Cuban climate and soil are not adapted to wrapper tobaccos, and attempts to produce wrapper under shade have met with little success. The production of "clear Havanas" in the United States has declined within recent years, and high-priced Connecticut wrapper has to a large extent replaced Havana wrapper in the finer grades of cigars.

(3) It is the relatively unimportant proportion of wrapper from Cuba that has caused most of the difficulty in the administration of the tobacco duties. The declared imports of wrapper tobacco are about 7,000,000 pounds: Cuba ships about 100,000 pounds, or 1.5

per cent and the Dutch East Indies nearly all of the remainder. The declared imports of wrapper from Cuba are only about one-half of 1 per cent of the domestic wrapper consumption. Of a total production of about 8,000,000,000 cigars they would cover only some 30,000,000. Cuba is virtually the sole source of imported cigar filler of the Cuban type. The Cuban type of filler is in great demand for blending with domestic tobaccos and for the manufacture of clear Havana cigars. There it is not the general practice to sort wrapper and filler; the same plant produces both. Moreover, no definite standard exists for wrapper tobacco. Nearly every Cuban bale contains a few leaves suitable for wrapper. Some are clearly of wrapper grade; others are of indeterminable quality, which manufacturers will variously appraise as wrapper, binder, or filler, according to the quality, size, and shape of cigars they produce. After the tobacco is baled in Cuba fermentative changes occur in the leaf which alter its quality. Moreover, manufacturers whose output consists of "seed and Havana cigars" use imported tobacco only for filler.

(4) The change from 15 to 50 per cent proposed in H. R. 7456 does not obviate the fundamental administrative difficulty of differentiating wrapper and filler.

(5) Under the existing law, if a bale contains not more than 15 per cent of wrapper, the wrapper and filler pay the duties respectively provided for each class. If, however, it is found to contain more than 15 per cent of wrapper, the entire bale takes the wrapper rate, six times as high as for filler. In such a contingency, after the customs appraisers have gone to the trouble and expense of examining 10 hands in every bale, in accordance with present requirements, the bales are often exported in preference to paying the wrapper rate on tobacco consisting largely of filler.

(6) If the indicated rephrasing of paragraphs 601 and 602 were adopted, the administration of the tobacco schedule would be greatly simplified; regulations under paragraph 602 of H. R. 7456, which would doubtless continue to require the examination of at least 10 hands in every bale of Cuban tobacco, would be rendered unnecessary. Only the first sentence of that paragraph, which defines wrapper, need be retained. In actual practice, the requirement that "at least one bale, box, or package in every ten" shall be examined, and "at least 10 hands in each examined bale, box, or package" is not carried out. In Turkish tobacco, for instance, the importations consist of anywhere from 2 to 50,000 bales covered by one invoice. It is unnecessary to examine 10 hands in every tenth bale of such shipments, wherein there is never any question as to classification, because Turkish tobacco is all of one type. Similarly, all the imported Java or Sumatra consists of wrapper; here also the examination is not necessary. In the case of Cuban tobacco, the Treasury regulations require the examination of every bale.

(7) The adoption of the Sumatra or Java classification will prevent similar complications from arising in the case of tobacco from the Dutch East Indies. It is in this type of tobacco that the tariff problem chiefly centers. There are indications that complications similar to those in the Cuban trade may here develop.

(8) Catch-all provisions are added for wrapper and filler tobacco not specially provided for: these general provisions would take care of the relatively small quantities of imported tobacco that do not fall under the three important distinctive classes, i. e., Java or Sumatra wrapper, Cuban filler, and Turkish leaf.

It has been suggested that the Cuban and Sumatra classification may be discriminatory between different countries. But the classifications refer to types, not to geographic boundaries; moreover, they merely continue ratios of duty long in effect and simplify the language of the bill.

*Reasons for the change in H. R. 7456 from 15 to 50 per cent as a dividing line between wrapper and filler tobacco.*—(1) Under paragraphs 601 and 602 of H. R. 7456 Cuban bales, like all other imported tobaccos containing less than 50 per cent of wrapper tobacco, would pay wrapper duty on the wrapper content and filler duty on the filler content; whereas the proposed reclassification would provide one rate only for Cuban leaf tobacco, regardless of the proportions of wrapper and filler. Separate duties for such tobaccos have been customary in the tariff legislation of this country.

(2) Unless the duty on Cuban tobaccos be raised above the present duty on Cuban filler, the change in classification will involve the abandonment of certain revenues heretofore collected upon the relatively small quantity of wrappers imported from Cuba.

(3) As in the case of the suggested reclassification, the change from 15 to 50 per cent provided in H. R. 7456 would permit the importation of the intermediate grade of Cuban tobacco and thereby increase the customs revenue and permit manufacturers to make a higher grades of cigars. At present only the typical wrapper and the typical filler grades of Cuban tobacco can be imported, because the bales of other Cuban tobacco when classified as wrapper are usually returned to Cuba or exported to some other country. The tobaccos that would be most affected by the change from 15 to 50 per cent as a dividing line between wrapper and filler tobacco are Cuban.

(4) Neither the suggested reclassification nor the change from 15 to 50 per cent would have any effect upon the importation of Sumatra tobacco, since virtually no Sumatra fillers are imported and Sumatra tobacco packed with other tobacco would be subject to the provisions in lines 7 and 8, page 53, of H. R. 7456, treating leaf tobacco the product of two or more countries or dependencies, when mixed or packed together, the same as wrapper.

If the distinction between wrapper and filler tobacco in paragraph 601 as passed by the House of Representatives shall be continued, the following changes should be made:

Page 83, line 13: Strike out comma after "tobacco" to agree with line 11, and change "specifically" to "specially" to agree with the usual form.

Page 83, line 14: Insert a comma after "stem."

Page 83, paragraph 601, lines 11, 12: The rate on stemmed filler tobacco is not proportionate to the rate on unstemmed filler tobacco in the ratio of 35 cents to 50 cents in the acts of 1909 and 1913. There is a loss in stemming of about 40 per cent between the weight of the

unstemmed and stemmed tobacco. One hundred pounds of unstemmed leaf tobacco when stemmed would weigh about 60 pounds. Sixty-five cents instead of 60 cents per pound would be a nearer equivalent to the existing rate.

### PARAGRAPH 602.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 602. The term "wrapper tobacco" as used in this title means that quality of leaf tobacco which has the requisite color, texture, and burn, and is of sufficient size for cigar wrappers, and the term "filler tobacco" means all other leaf tobacco. Collectors of customs shall permit entry to be made, under rules and regulations to be prescribed by the Secretary of the Treasury, of any leaf tobacco when the invoices of the same shall specify in detail the character of such tobacco, whether wrapper or filler, its origin and quality. In the examination for classification of any imported leaf tobacco, at least 1 bale, box, or package in every 10, and at least 1 in every invoice, shall be examined by the appraiser or person authorized by law to make such examination, and at least 10 hands shall be examined in each examined bale, box, or package.

ACT OF 1909.

PAR. 221. The term wrapper tobacco as used in this section means that quality of leaf tobacco which is suitable for cigar wrappers, and the term filler tobacco means all other leaf tobacco. Collectors of customs shall not permit entry to be made, except under regulations to be prescribed by the Secretary of the Treasury, of any leaf tobacco, unless the invoices of the same shall specify in detail the character of such tobacco, whether wrapper or filler, its origin and quality. In the examination for classification of any imported leaf tobacco, at least one bale, box, or package in every ten, and at least one in every invoice, shall be examined by the appraiser or person authorized by law to make such examination, and at least ten hands shall be examined in each examined bale, box, or package.

ACT OF 1913.

PAR. 182. The term wrapper tobacco as used in this section means that quality of leaf tobacco which has the requisite color, texture, and burn, and is of sufficient size for cigar wrappers, and the term filler tobacco means all other leaf tobacco. Collectors of customs shall not permit entry to be made, except under regulations to be prescribed by the Secretary of the Treasury, of any leaf tobacco, unless the invoices of the same shall specify in detail the character of such tobacco, whether wrapper or filler, its origin and quality. In the examination for classification of any imported leaf tobacco, at least one bale, box, or package in every ten, and at least one in every invoice, shall be examined by the appraiser or person authorized by law to make such examination, and at least ten hands shall be examined in each examined bale, box, or package.

*Suggested changes.*—See Suggested Changes, paragraph 601, page 616.

## PARAGRAPH 603.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 603. All other tobacco, manufactured or unmanufactured, including scrap tobacco, not specially provided for, 55 cents per pound.

## ACT OF 1909.

PAR. 222. All other tobacco, manufactured or unmanufactured, not specially provided for in this section, and scrap tobacco, fifty-five cents per pound.

## ACT OF 1913.

PAR. 183. All other tobacco, manufactured or unmanufactured, not specially provided for in this section, 55 cents per pound; scrap tobacco, 35 cents per pound.

## TOBACCO, N. S. P. F.

*Description and uses.*—The term scrap tobacco includes the broken fragments of leaves which are the by-product of stemmeries and also the clippings which accumulate in working cigars. "Scrap" denotes both raw and manufactured products. There is a marked increase in the production of chewing tobacco made from scrap, considerable quantities of cigar leaf being used for that purpose.

Various other types and forms of smoking and chewing tobaccos come under this paragraph—granulated, fine-cut, and long-cut, types used for rolling cigarettes; pipe smoking and chewing, made from various combinations and blends of domestic and imported tobaccos. The flat plug, heavily sweetened western plug, and twist are also important forms of manufacture in which large quantities of licorice, sugar, honey, and flavoring materials are used.

*Production* of scrap, plug, and other forms of smoking and chewing tobacco is very large. In 1920 there were produced 227,000,000 pounds of smoking tobacco, 139,000,000 pounds of plug, 12,000,000 pounds of twist, and 9,000,000 pounds of fine cut. With the exception of scrap, nearly all of these are made from the flue-cured, the burley, and the dark air-cured types (other than cigar leaf), together with certain quantities of imported tobacco. In general, this class of manufactures requires considerable special machinery and equipment. The demand for pipe and cigarette preparations seems to be increasing at the expense of chewing products.

*Imports* of scrap from Cuba and the Philippines are considerable. Imported Cuban scrap is used as filler in low-priced cigars to give them the distinctive "Havana" flavor. Limited quantities of manufactured tobacco used for a special class of trade are imported under this paragraph, mainly from the United Kingdom, Italy, China, and Hongkong. Imports of scrap in the fiscal year 1918 aggregated 3,829,834 pounds; the total value of "all other manufactures of" was about \$130,000. Detailed statistics of imports follow:

Calendar year.	Quantity.	Value.	Duty.
SCRAP TOBACCO.			
	<i>Pounds.</i>		
1918.....	3,748,354	\$898,270	\$246,070
1919.....	1,438,510	448,921	206,772
1920.....	2,526,151	759,116	369,169
1921 (9 months).....	1,216,271	456,077	.....

Calendar year.	Quantity.	Value.	Duty.
ALL OTHER TOBACCO, UNMANUFACTURED.			
	<i>Pounds.</i>		
1918.....	46,886	\$37,467	\$25,696
1919.....	32,784	14,858	17,664
1920.....	54,271	33,136	29,795
1921 (9 months).....	31,218	17,969	

## ALL OTHER TOBACCO, MANUFACTURED.

1918.....	189,684	\$104,863	\$102,491
1919.....	157,595	117,729	86,420
1920.....	205,697	178,075	112,880
1921 (9 months).....	173,247	126,593	

*Exports* since 1917 by calendar years are tabulated as follows:

	1918	1919	1920	1921 (9 months).
Smoking tobacco:				
Quantity (pounds).....	5,340,226	6,260,086	4,887,721	6,877,661
Value.....	\$2,960,992	\$3,260,789	\$2,196,713	\$1,847,416
Plug tobacco:				
Quantity (pounds).....	5,563,614	5,628,350	5,185,157	1,959,025
Value.....	\$2,067,969	\$2,745,484	\$2,878,015	\$1,073,848
All other tobacco, manufactured:				
Value.....	\$484,841	\$1,710,527	\$963,453	\$453,620

*Important changes in classification.*—Scrap tobacco, and tobacco, n. s. p. f., have been classed together, at the same rate. In the act of 1913 there was a difference of 20 cents between the duties upon these two classes.

*Suggested changes.*—Paragraph 603: The rate of 55 cents per pound on manufactured tobacco being lower than 60 cents per pound on filler tobacco, stemmed, might lead to the importation of manufactured tobacco for use as filler tobacco, and thereby to the escape from the difference of 5 cents per pound in the duty.

Manufacturers assert that the proposed duty upon scrap tobacco is disproportionately high, in comparison with filler tobacco.

## PARAGRAPH 604.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 604. Snuff and snuff flour, manufactured of tobacco, ground dry, or damp, and pickled, scented, or otherwise, of all descriptions, and tobacco stems, cut, ground, or pulverized, 55 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 223. Snuff and snuff flour, manufactured of tobacco, ground dry, or damp, and pickled, scented, or otherwise, of all descriptions, fifty-five cents per pound.

PAR. 696. Tobacco stems [Free].

PAR. 184. Snuff and snuff flour, manufactured of tobacco, ground dry, or damp, and pickled, scented, or otherwise, of all descriptions, 55 cents per pound.

PAR. 632. Tobacco stems [Free].

## TOBACCO SNUFF, ETC.

*Description and uses.*—Snuff is made chiefly from the darker grades of the heavy fire-cured type of tobacco admixed with stems and fats, pepper, sand, etc. The principal classes are (1) rappee or French snuff, used for inhaling; (2) maccaboy, for inhaling and chewing; (3) Scotch, Swedish, Polish, Copenhagen, etc., for chewing or dipping. The Scotch types are strong and practically free from added flavoring materials. Manufacture consists essentially in fermenting, drying, and grinding under special conditions.

*Production* was 37,000,000 pounds in 1918 and 26,000,000 in 1920. It is made in large quantities in France and in other countries.

*Imports* of snuff, chiefly from Italy, are fairly constant at about 30,000 pounds, valued at \$1 per pound. Imports since 1917 of snuff and snuff flour have been as follows:

Calendar year.	Quantity.	Value.	Duty.
	<i>Pounds.</i>		
1918.....	33,157	\$16,727	\$18,219
1919.....	26,244	13,039	14,430
1920.....	23,880	10,500	13,130
1921 (9 months).....	23,437	11,420	.....

*Exports* are not separately recorded.

*Important changes in classification.*—A new provision has been added for tobacco stems, cut, ground, or pulverized. When not so prepared, they remain free of duty (see par. 1671, p. 1457).

*Suggested changes.*—Page 84, paragraph 604, lines 10, 11: Strike out “of all descriptions” and insert in line 9 after “flour” making the paragraph read: “Snuff and snuff flour, of all descriptions, manufactured of tobacco, ground dry, or damp, and pickled, scented, or otherwise, and tobacco stems, cut, ground, or pulverized, 55 cents per pound.

## PARAGRAPH 605.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 605. Cigars, cigarettes, cheroots of all kinds, \$4.50 per pound and 25 per centum ad valorem, and paper cigars and cigarettes, including wrappers, shall be subject to the same duties as are herein imposed upon cigars.

ACT OF 1909.

ACT OF 1913.

PAR. 224. Cigars, cigarettes, cheroots of all kinds, four dollars and fifty cents per pound and twenty-five per centum ad valorem, and paper cigars and cigarettes, including wrappers, shall be subject to the same duties as are herein imposed upon cigars.

PAR. 185. Cigars, cigarettes, cheroots of all kinds, \$4.50 per pound and 25 per centum ad valorem, and paper cigars and cigarettes, including wrappers, shall be subject to the same duties as are herein imposed upon cigars.

## CIGARS, CIGARETTES, AND CHEROOTS.

*Description and uses.*—The cigar is made of three components, viz., the filler or body, the binder which serves to retain the form of the filler, and the wrapper which covers and imparts finish to the cigar.

Cigars are of many shapes and sizes, but average about 21 pounds of leaf to 1,000 cigars of the most popular size. The highest priced cigars are shaped and rolled by hand, whereas cheroots are usually made by machinery. Until recently, medium priced cigars were handmade, except the shaping of them in molds. Cuban tobacco is conceded to produce the finest cigar, and the "clear Havana," or all-Cuban cigar, is the standard of excellence. The "seed and Havana" cigar is made of Cuban filler, a domestic binder, and Connecticut broadleaf wrapper. The lower priced cigars have for filler a mixture of Cuban and domestic leaf or domestic leaf alone, a domestic binder, and, chiefly, a Sumatra wrapper. The domestic shade-grown wrapper has come into extensive use for both the higher and the medium priced cigars. Cheroots are largely made of tobacco not usually classed as cigar leaf.

The principal classes of American cigarettes are (1) those made entirely from domestic leaf, chiefly the bright flue-cured, and, to a lesser extent, burley; (2) the "Turkish blend," made of mixtures of domestic and imported cigarette tobacco; (3) the "Turkish" and "Egyptian" cigarettes, made from the products of Macedonia and Asia Minor, designated collectively as "Turkish tobacco." The manufacture of cigarettes involves elaborate and complex machinery, special and fancy brands being made by hand. Flavoring herbs, cascarilla bark, corn husk, etc., are sometimes used. Some cigarettes have mouthpieces of paper, cork, or other material. Cigarettes vary in weight, but the most popular size approximates 3 pounds to 1,000.

*Production* of large cigars amounted to about 7,000,000,000 and 7,917,000,000, and of small cigars to over 844,000,000 and 633,000,000 in 1918 and 1920, respectively. The greater portion consists of popular priced grades of domestic tobacco except, perhaps, the wrapper. The "seed or Havana" cigar also has accounted for an extensive branch of the industry. The manufacture of "clear Havana" cigars from Cuban leaf is an important industry in Tampa and Key West, Fla. Cigar production has not increased greatly in recent years, and manufacturers have declined in number. Domestic output of cigarettes, especially of the "Turkish blend" class, has grown remarkably, in 1908 being less than 7,000,000,000; in 1919 over 53,000,000,000. In 1920 the production was 47,000,000,000, a recession from the high point of the previous year.

*Imports* of cigars average per annum about 600,000 pounds from Cuba, with increasingly large quantities from the Philippines—about 4,200,000 pounds in 1918. Imports of cigarettes are small, averaging 75,000 pounds before the war, mostly from Mexico, the Philippines, and Egypt. Imports since 1917 have been as follows:

## CIGARS AND CHERROOTS OF ALL KINDS.

Calendar year.	Quantity.	Value.	Duty.
	<i>Pounds.</i>		
1918.....	5,071,360	\$8,658,138	\$2,233,657
1919.....	4,435,531	11,040,943	2,746,426
1920.....	6,103,381	16,175,037	3,334,960
1921 (9 months).....	1,431,814	4,284,036	.....

## CIGARETTES AND PAPER CIGARS, INCLUDING WRAPPERS.

Calendar year.	Quantity.	Value.	Duty.
	<i>Pounds.</i>		
1918.....	10,399	\$18,830	\$12,085
1919.....	9,888	25,862	18,260
1920.....	23,672	85,669	73,296
1921 (9 months).....	7,634	28,274	.....

*Exports* of cigars and cigarettes are unimportant, except to China and the Straits Settlements, these countries taking nearly 6,000,000,000 cigarettes in 1918. Exports since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
<b>Cigars and cheroots:</b>				
Quantity (M).....	22,600	50,056	52,361	4,018
Value.....	\$809,411	\$1,088,504	\$1,146,175	\$119,211
<b>Cigarettes:</b>				
Quantity (M).....	12,145,539	16,211,769	15,833,870	6,299,782
Value.....	\$23,723,922	\$38,070,451	\$35,977,374	\$12,070,837

## SCHEDULE 7.—AGRICULTURAL PRODUCTS AND PROVISIONS.

### GENERAL.

NOTE.—In a report entitled "Suggested reclassification and revision of tariff schedules relating to agricultural products and provisions," prepared by the United States Tariff Commission and printed by the Ways and Means Committee, many changes were suggested in the wording, sequence, and arrangement of the agricultural schedule. New provisions were inserted, unimportant or unnecessary clauses were eliminated, and the paragraphs were reframed in the light of customs litigation and decisions, as well as of changes in commercial nomenclature. Nearly all of these suggestions were embodied in the bill H. R. 7456. Attention is directed to the fact that the document above referred to explains these changes in greater detail than is here possible, and gives conversion equivalents and other incidental information that may be of use in the framing of a tariff bill. It also contains an appendix giving statistics of production, imports, and exports.

*Important changes in classification applicable to the entire schedule.*—With a view to a more logical and orderly presentation, the agricultural paragraphs have been entirely rearranged, under general captions such as "Meat animals and their products," "Fish and fish products," under which the particular paragraphs have been placed in alphabetical order.

*Suggested changes.*—The general headings referred to above have been omitted from the bill H. R. 7456. Without them the arrangement and sequence of the provisions are not so effective. It is therefore suggested that they be inserted in the appropriate places in this schedule. The headings in question are:

- Meat animals and their products.
- Dairy products.
- Birds, poultry, and poultry products.
- Other live animals and animal products.
- Fish and fish products.
- Cereals and cereal products.
- Fruits and fruit products.
- Nursery and greenhouse stock.
- Nuts.
- Seeds.
- Vegetables and vegetable products.
- Miscellaneous.

### PARAGRAPH 701.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 701. Cattle, less than two years old, 1 cent per pound; two years old or over, 1½ cents per pound; fresh beef and veal, 2 cents per pound; tallow, one-half of 1 cent per pound; oleo oil and oleo stearin, 1 cent per pound.

## ACT OF 1909.

SCHEDULE G.—AGRICULTURAL PRODUCTS  
AND PROVISIONS.

PAR. 225. Cattle, if less than one year old, two dollars per head; all other cattle if valued at not more than fourteen dollars per head, three dollars and seventy-five cents per head; if valued at more than fourteen dollars per head, twenty-seven and one-half per centum ad valorem.

PAR. 285. Fresh beef, veal, \* \* \* one and one-half cents per pound.

PAR. 290. Tallow, one-half of one cent per pound; \* \* \*

PAR. 3. \* \* \* expressed oils, \* \* \* twenty-five per centum ad valorem.

PAR. 640. Oleo stearin [Free].

## ACT OF 1913.

SCHEDULE G.—AGRICULTURAL PRODUCTS  
AND PROVISIONS.

PAR. 619. \* \* \* cattle, \* \* \* [Free].<sup>1</sup>

PAR. 545. Meats: Fresh beef, veal, \* \* \* [Free].<sup>2</sup>

PAR. 622. Tallow [Free].

PAR. 44. \* \* \* all other animal oils, \* \* \* 15 per centum ad valorem. [Covered oleo oil.]

PAR. 562. Oleo stearin [Free].

## CATTLE.

(See Survey FL-25.)

*Description and uses.*—The cattle industry is of two general types. One is primarily for the production of dairy products, with a secondary yield of beef and veal. The other concerns itself principally with beef production. The first type prevails throughout the farming regions, the second on both range and farm. Approximately equal proportions of the domestic beef supply are contributed by the western ranges and by the farming regions.

*Production.*—On January 1, 1921, the number of cattle (exclusive of calves) on farms and ranges was 66,191,000, of which 23,321,000 were milch cows. No other country possesses so many cattle, except British India, and the statistics for that country include a large number of water buffaloes. From 1907 to 1914 there was a steady decline in the number of beef cattle. In the West this decline resulted from the direct and indirect effects of homesteading; in the farming sections it was largely due to the competition of other types of agriculture. During the war the number of beef cattle greatly increased, but market statistics indicate that the present number is little larger than in 1914.

The distribution of beef cattle depends largely upon cheap feed and pasture, hence the region west of the Mississippi is more than twice as important as the country eastward. The Corn Belt shows the greatest density of cattle, largely because of the fact that feeder cattle from the West are shipped in for fattening.

In the number of dairy cattle there was a slow but steady growth during the period of the decline in beef cattle. Dairying has progressed at the expense of beef production, especially in or near areas of dense population, and to some extent elsewhere. Wisconsin, New York, Minnesota, Illinois, Iowa, Ohio, Pennsylvania, and Michigan rank in order in the number of dairy cows.

*Imports* of cattle were relatively small for a number of years prior to 1910; they consisted largely of feeders brought in from Mexico,

<sup>1</sup> Cattle, except for breeding, 30 per centum ad valorem. (Par. 12, emergency tariff act of 1921.)

<sup>2</sup> Fresh or frozen beef or veal, 2 cents per pound. (Par. 14, emergency tariff act of 1921.)

although pure-breds from England were also imported in some numbers. After 1910 the internal troubles of Mexico greatly stimulated shipments from that country. Of the 872,093 head imported in 1914, Mexico contributed 72 per cent and Canada nearly all of the remainder. Thereafter imports from Mexico fell off rapidly, Canadian shipments replacing them. The Canadian receipts consist largely of stockers and feeders. (For imports of pure-bred stock, see par. 1507, p. 1231.) Imports for the calendar years 1918-1921 have been as follows:

Cattle.	1918	1919	1920	1921 (9 months).
<b>Total:</b>				
Number.....	353,189	642,395	379,114	114,353

<sup>1</sup> "Cattle and sheep and other stock imported for breeding purposes shall be admitted free of duty" (par. 15, emergency tariff act of 1921). No separate classification for "Cattle for breeding purposes" from Oct. 3, 1913, to June, 1921.

Exports of cattle declined from 593,409 head in 1904 (of which 65 per cent went to Great Britain) to 18,000 in 1914. The latter went chiefly to Canada, Mexico, and Cuba. During the World War cattle exports were relatively unimportant, but since 1918 there has been a considerable increase. The largest numbers went to Mexico, owing to the depletion of the Mexican herds. Some shipments have

also gone to Europe. Exports since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Number.....	17,280	69,859	85,302	161,608
Value.....	1,082,758	\$6,439,521	\$10,752,525	\$10,318,513

*Important changes in classification, etc.*—See General Notes on Paragraph, page 632.

#### FRESH BEEF AND VEAL.

*Description and uses.*—Carcass beef is placed on the market in three conditions—chilled, frozen, or unrefrigerated. The greater part is chilled or frozen, according to the conditions of shipment. Chilled beef is kept in refrigerator cars and is shipped at temperatures ranging from 32° to 38° F. At these temperatures chemical and bacterial action are greatly retarded and beef sides and quarters may be kept in good condition for from 30 to 60 days. Meat is frozen solid at about 16° F., the growth and reproduction of bacteria being thereby arrested. Experiments indicate that it may be maintained in wholesome condition for three years and probably much longer.

On the average the weight of meat obtained is somewhat over one-half of the live weight of the animal, but the amount received for meat is usually about 80 per cent of the total value of products.

*Production* by packers in 1919 was 4,932,000,000 pounds of fresh beef, valued at \$847,000,000, greater in quantity and much greater in value than the output of 1909, 4,200,000,000 pounds, valued at \$327,000,000. Concentration of operation and control is pronounced in the packing industry, especially in cattle slaughtering. Of the total slaughter of cattle in 1916 by interstate slaughterers, 81 per cent was in 12 large packing centers—24.5 per cent in Chicago, 14.7 per cent in Kansas City, 10.2 per cent in Omaha, 8.7 per cent in St. Louis, and 5.2 per cent in New York City. In 1916 five great interests are reported to have handled 82.2 per cent of the cattle slaughtered by interstate slaughterers. These tendencies result from conditions in the raising and marketing of live stock and the very great economies in large-scale production, especially in the utilization of by-products. Location in the corn belt makes possible great saving in freight of finished products as compared with transportation of live animals.

*Imports* advanced from 4,150,139 pounds in 1913 to 175,740,155 pounds in 1914; this was just as the country was changing from a beef surplus to a beef deficiency. Imports increased to 182,000,000 pounds in 1915, 72 per cent coming from Argentina and most of the rest from Uruguay, Canada, and Australia. In 1916 and 1917 there were sharp declines in imports. It is reported that the large American packing interests controlled the production of 63.3 per cent of the chilled and frozen beef exported from Argentina in 1914. Imports since 1917 by calendar years have been as follows.

	1918	1919	1920	1921 (9 months).
Fresh beef:				
Quantity (pounds).....	22,501,954	33,588,241	40,520,057	18,518,540
Value.....	\$3,974,092	\$5,294,609	\$6,160,993	\$2,431,972
Fresh veal:				
Quantity (pounds).....	939,121	4,873,515	9,662,048	3,514,436
Value.....	\$199,353	\$1,013,472	\$1,896,277	\$466,981

About 80 per cent of the relatively small imports in recent years have come from Canada.

Below is given a comparison by months for 1920 and 1921 of beef and veal, which are provided for in paragraph 14 of the emergency tariff act of 1921:

Month.	Quantity.		Value.	
	1920	1921	1920	1921
	<i>Pounds.</i>	<i>Pounds.</i>		
January.....	2,717,414	4,273,228	\$409,353	\$613,510
February.....	2,276,408	1,167,706	338,459	222,093
March.....	2,951,915	1,741,384	483,039	266,946
April.....	5,195,400	2,571,947	1,056,606	373,038
May.....	4,138,798	3,293,252	739,915	408,906
June.....	5,819,305	1,855,874	914,044	225,212
July.....	2,778,844	1,922,531	471,342	208,168
August.....	5,618,896	3,141,482	971,937	346,102
September.....	5,808,068	2,065,569	926,754	234,978
October.....	5,251,153	3,561,848	728,779	337,674
November.....	5,437,271	3,361,417	736,808	353,624
December.....	2,158,633	3,421,681	300,234	354,477

*Exports.*—This country practically dominated the foreign trade in fresh, chilled, and frozen beef 15 years ago, but by 1914 only 6,300,000 pounds were exported, 5,500,000 to Panama. Argentine exports have steadily increased, displacing those of the United States which formerly supplied the United Kingdom. During the war American exports again increased under the stimulation of European war demands. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	514,341,529	174,426,999	89,649,148	9,590,116
Value.....	\$109,605,363	\$40,280,747	\$17,564,887	\$1,691,707

In 1919 the United Kingdom received over 40 per cent of our exports; in 1920 Belgium and Germany were the most important markets.

*Important changes in classification, etc.*—See General Notes on Paragraph, page 632.

#### TALLOW.

*Description and uses.*—The term "tallow" includes the fats from sheep and cattle. The larger part of the tallow produced in the United States comes from the fat of cattle, the yield being 50 pounds from a steer to 1 pound from a sheep or goat. The edible fats of

beef are handled much the same as hog fats. Oleo stock is merely a high grade of edible beef tallow, used in making oleo oil and stearin. Oleo oil is used in the manufacture of margarines and is also heavily exported, especially to Holland. Edible tallows are also used in making sausage, suet puddings, mincemeat, and similar products. The inedible tallows, produced from city butchers' scraps and from the fat of diseased and fallen animals, are used in soap, leather dressings, greases, and in the technical industries.

*Production.*—The output of tallows in the United States in 1917 was 259,509,000 pounds. If 153,188,000 pounds of oleo produced in 1917 are added, tallows rank fourth in production of all fats and oils. In 1920, 263,990,000 pounds of inedible and 37,353,000 pounds of edible tallow were produced.

*Imports* of tallow in the fiscal year 1918 were unprecedented, being 98,176,560 pounds, valued at \$14,365,676. The raw tallow imported (mostly from Canada) was over six times the exports. The average imports for 1911–1914 were only 1,299,025 pounds; in 1914, 3,371,833 pounds. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	51,885,808	12,096,189	14,874,637	1,058,429
Value.....	\$7,444,230	\$1,812,933	\$1,841,796	\$1,058,429

New Zealand, Australia, Argentina, and Canada were the principal sources of imports in 1919 and 1920.

*Exports* of tallow, as such, decreased from an average of 28,900,000 pounds for 1911–1914 to 5,014,000 pounds in 1918 (fiscal year.) Exportation of oleo oil, the most important tallow derivative, similarly decreased. Much more oleo oil is exported than raw tallow, the average being 113,759,000 pounds for 1911–1914. Holland, the largest importer of American oleo oil, manufactured it into margarines for the European trade. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	4,222,657	38,953,783	20,691,638	10,749,517
Value.....	\$745,977	\$6,370,112	\$2,950,675	\$835,154

Exports in 1919 and 1920 went largely to the United Kingdom, France, and the Netherlands.

*Important changes in classification, etc.*—See General Notes on Paragraph, page 632.

#### OLEO STEARIN AND OLEO OIL.

*Description and uses.*—Oleo stearin is a joint derivative with oleo oil from edible tallows. The stearin is separated from the oil by a "graining" process, which consists in running the melted tallow into large truck tanks; it is then wheeled into a graining room and kept for a day or so at the crystallizing temperature of stearin. After the solid stearin is removed, the mass is pressed in hydraulic or lever

presses. The oleo oil is used in margarines and the solid stearin as a base for lard substitutes and stiffening for lard compounds, also to a less extent in oleomargarines and candles. Most of the domestic stearin is produced by the large-scale packing establishments having special equipment for the purpose; the smaller packers do not ordinarily convert tallows.

*Production.*—In 1920 the production of oleo oil amounted to 132,000,000 pounds and that of edible animal stearin (mostly oleo stearin) to 69,000,000 pounds.

*Imports* of oleo stearin, principally from Argentina and Uruguay, ranged from about 900,000 pounds in 1916 to over 9,500,000 pounds in 1913. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	1,556,781	2,358,206	962,657	365,334
Value.....	\$250,122	\$475,156	\$180,590	\$28,171

*Exports.*—In late years the United Kingdom with its greatly enlarged oleomargarine industry has rivaled Holland in importance as a destination for our exports of oleo oil. Exports of "stearin from animal fats," largely consisting of oleo stearin, go mostly to Canada, Netherlands, the United Kingdom, and France. Exports for calendar years 1918 to 1921 have been as follows:

	1918	1919	1920	1921 (9 months).
Oleo oil:				
Quantity (pounds).....	69,106,350	75,585,164	74,368,344	106,150,316
Value.....	\$15,493,321	\$22,025,340	\$16,585,209	\$12,077,941
Stearin from animal fats:				
Quantity (pounds).....	10,550,241	20,854,724	17,512,978	22,258,559
Value.....	\$2,291,160	\$4,171,151	\$3,487,578	\$2,191,814

*Important changes in classification, etc.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Cattle and the principal cattle products (other than hides), separated in previous tariff acts, have been brought together in one paragraph. The duty on cattle, which in the act of 1909 was upon the per-head basis, according to age, is based in H. R. 7456 on weight (pound) and age (less than two years old and two years old or more). Most of the higher-priced heavy animals would come within the latter class.

Cattle were on the free list (par. 619) of the act of 1913 and are dutiable under paragraph 12 of the emergency tariff act of 1921.

Fresh beef and veal were on the free list (par. 545) of the 1913 act and are dutiable under paragraph 14 of the emergency tariff act.

A new provision is made for oleo oil; and oleo stearin is transferred from the free list (par. 562), act of 1913.

Tallow is exempt from duty under the act of 1913 (par. 622).

*Suggested changes.*—H. R. 7456 provides two sets of duties upon live cattle, based upon weight; one for animals below two years of age and the other for animals two years old or over. These rates are more flexible than the former rates per head. These duties, however, bear more heavily upon the lighter and cheaper Mexican cattle than upon those originating in Canada. If specific duties should be retained, another method would be to base the duties upon animals falling under certain weights; (1) one rate for animals weighing 1,050 pounds or more; (2) one rate for animals weighing less than 1,050 and not less than 725 pounds; and (3) a third rate for animals weighing less than 725 pounds. The first group takes in animals of feeder type which often are butchered immediately, as well as butcher cattle. Some feeder cattle that are not fleshy enough for immediate slaughter, except under unusual market conditions, also would be included, but this division deals with approximate fairness with the butcher and heavy feeder types. The second group would include light and medium weight feeders. It would also include relatively unimportant numbers of light butcher cattle. The third class covers stocker cattle—animals brought in for more or less prolonged grazing before finishing for slaughter.

With a duty of 2 cents per pound upon fresh beef and veal, a proportionate rate for the first class would approximately be 1.1 cents per pound live weight; for the second class 0.9 cent, and for the third class 0.8 cent, based on normal live-weight values.

In view of the fact that cattle and the principal products thereof are grouped in paragraph 701, provision might there be made for "beef and veal, prepared or preserved in any manner, not specially provided for." This would include such products as corned beef and canned beef, which otherwise would be dutiable under the general provision in paragraph 706.

## PARAGRAPH 702.

### H. R. 7456.

### SENATE AMENDMENTS.

PAR. 702. Sheep and goats, 1 cent per pound; fresh mutton, 1½ cents per pound; fresh lamb, 2 cents per pound.

### ACT OF 1909.

PAR. 228. Sheep, one year old or over, one dollar and fifty cents per head; less than one year old, seventy-five cents per head.

PAR. 229. All other live animals, not specially provided for in this section, twenty per centum ad valorem.

PAR. 285. Fresh \* \* \* mutton. lamb, \* \* \* one and one-half cents per pound.

### ACT OF 1913.

PAR. 619. \* \* \* sheep, and all other domestic live animals suitable for human food not otherwise provided for in this section [Free].<sup>3</sup>

PAR. 545. Meats: Fresh \* \* \* mutton. lamb. \* \* \* [Free].<sup>4</sup>

<sup>3</sup> Sheep: One year old or over, \$2 per head; less than one year old, \$1 per head. (Par. 13, emergency tariff act of 1921.)

<sup>4</sup> Fresh or frozen mutton, lamb, 2 cents per pound. (Par. 14, emergency tariff act of 1921.)

## SHEEP AND GOATS.

(See Report on the Wool-growing Industry.)

*Production.*—In actual number of sheep the United States ranks fourth among the countries of the world, but in the number relative to the population it is far below other countries, notably New Zealand, Australia, Uruguay, and Argentina. Since 1900 the number of sheep per capita has steadily decreased (barring a slight increase during the war). In 1900 there were 39,853,000 animals of shearing age, in 1920 only 34,985,000. The number of goats, on the other hand, rose from 3,000,000 in 1910 to 3,500,000 in 1920. In the far West the decline in the sheep population has primarily been due to the effects of homesteading; in the farming regions it has resulted largely from the competition of other farm enterprises.

Sheep are especially adapted to rough land; goats to dry shrubby regions. Goats do well where sheep can not exist unless fed. Texas leads in the number of goats with 1,707,000 head, New Mexico being second with 227,000. Texas also has the largest number of sheep, 2,552,000; it is followed by California with 2,356,000 and Ohio with 2,103,000. Michigan is the only other State east of the Mississippi that has more than 1,000,000 head.

*Imports* of sheep were negligible prior to 1914, when 223,729 were brought in, 92 per cent from Mexico and the remainder largely from Canada. During the later years they were for immediate slaughter and were chiefly from Canada, while the goats were mostly from Mexico and the West Indies. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
<b>Sheep:</b>				
Quantity (number).....	150,203	224,774	172,905	53,117
Value.....	\$1,653,717	\$2,473,386	\$1,730,272	\$306,071

dutiable.....		1,483		

<sup>5</sup> "Cattle and sheep and other stock imported for breeding purposes shall be admitted free of duty." No separate classification for "sheep, for breeding purposes," prior to June, 1921.

Exports of sheep and goats have never been more than negligible in amount. The average annual value of sheep exported during the period for 1913-1917 was \$99,606. The demoralized market of 1921 permitted the shipment of 106,000 head mainly to Mexico; the bulk of those exported in 1919 also went to that country. Exports of sheep since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Number.....	7,962	34,531	48,878	105,922
Value.....	\$120,882	\$339,974	\$571,690	\$555,283

*Important changes in classification, etc.*—See General Notes on paragraph, page 636.

#### FRESH MUTTON AND LAMB.

*Production* in 1914 was 629,232,690 pounds, valued at \$74,675,627, 495,000,000 pounds in 1909, 460,000,000 pounds in 1904, and 400,000,000 pounds in 1899. In 1919, production had declined to 501,201,000 pounds with a value of \$120,451,000. Of the sheep slaughtered in 1916 by interstate slaughterers, 86.4 per cent was handled by the five big packing companies, 63.4 per cent in Chicago, Kansas City, Omaha, and New York City.

*Imports.*—After the removal of the duty in 1913, imports of mutton in 1914 increased from 212,843 pounds in the previous year to 9,705,923 pounds and of lamb from 12,722 pounds to 3,026,372 pounds. These imports were about 2.5 per cent of the domestic production. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Fresh mutton:				
Quantity (pounds).....	22,145	3,357,424	23,468,107	6,192,139
Value.....	\$4,594	\$545,508	\$2,557,803	\$683,104
Fresh lamb:				
Quantity (pounds).....	585,741	4,851,758	77,700,214	15,241,200
Value.....	\$129,694	\$1,001,830	\$10,087,576	\$1,639,468

The greatly increased imports in 1920 consisted largely of British surplus stocks from New Zealand.

Below is given a comparison by months for 1920 and 1921 of imports of fresh mutton and lamb provided for in paragraph 14 of the emergency tariff act of 1921.

Month.	Quantity.		Value.	
	1920	1921	1920	1921
	<i>Pounds.</i>	<i>Pounds.</i>		
January.....	864,561	13,864,205	\$180,599	\$1,304,914
February.....	850,243	4,980,140	189,405	594,741
March.....	744,174	415,955	178,075	50,533
April.....	2,358,858	53,380	411,252	10,311
May.....	5,253,962	47,387	539,813	7,023
June.....	2,033,200	103,826	282,978	12,792
July.....	5,181,526	113,801	701,227	20,679
August.....	13,956,578	617,243	1,971,726	113,946
September.....	18,460,700	1,237,402	2,186,495	207,633
October.....	27,024,972	1,301,338	3,191,632	212,397
November.....	13,791,198	1,244,103	1,549,702	198,719
December.....	10,648,347	1,416,208	1,262,475	256,933

*Exports.*—Before the war the proportion taken by the United Kingdom decreased from 43 per cent in 1909 to 10 per cent in 1913; and that by Canada increased from 16 to 80 per cent. New Zealand is the most important exporter, shipping 212,000,000 pounds in 1911. Argentina, Australia, and Uruguay export more than this country. Exports of mutton (except canned) for the calendar years 1918–1921 have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	1,630,815	3,009,164	3,575,409	6,463,199
Value.....	\$387,132	\$632,667	\$758,526	\$1,193,286

In 1919 Canada took 86 per cent and in 1920, 51 per cent of the total exports.

*Important changes in classification, etc.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Mutton and lamb are put in the same paragraph with sheep in accordance with the general plan of grouping in this schedule. A new specific provision is made for goats, and the rate upon sheep is put upon a basis of live weight, rather than per head as in the act of 1909 (par. 228).

Fresh mutton and lamb were on the free list (par. 545) of the 1913 act and are dutiable under paragraph 14 of the emergency tariff act of 1921. Sheep were on the free list (par. 619) of the act of 1913 and are dutiable under paragraph 13 of the emergency tariff act of May 27, 1921.

*Suggested changes.*—Under the emergency tariff act sheep less than one year old are dutiable at \$1 per head, one year old or older at \$2 per head, while H. R. 7456 bases the duty upon live weight—1 cent per pound. There is much less need for a duty per pound of live weight in the case of sheep than of cattle. (See par. 701.) Owing to the character of the sheep and lamb market, a flat rate per head may be applied to both sheep and lambs; the much higher price paid for lambs per 100 pounds virtually offsets the lower price for sheep; the weight of which, per head, averages much greater than that of lambs.

The limited outlet for dressed mutton, compared with dressed lamb, also suggests a single classification for the two products. The same rates as on sheep and lambs may be applied to goats and the rate on fresh mutton and lamb may with approximate justice be applied to goat meat.

Provision might also be made for mutton and lamb, prepared or preserved, to take care of such products as canned mutton.

## PARAGRAPH 703.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 703. Swine, one-half of 1 cent per pound; fresh pork, three-fourths of 1 cent per pound; bacon, hams, and shoulders, of pork, prepared or preserved, 1½ cents per pound; lard, 1 cent per pound; lard compounds and lard substitutes, 20 per centum ad valorem.

## ACT OF 1909.

PAR. 226. Swine, one dollar and fifty cents per head.

PAR. 284. Bacon and hams, four cents per pound.

PAR. 285. Fresh \* \* \* pork, \* \* \* one and one-half cents per pound.

PAR. 288. Lard, one and one-half cents per pound.

[No corresponding provision for lard compounds and lard substitutes.]

## ACT OF 1913.

PAR. 619. Swine, \* \* \* [Free].

PAR. 545. Meats: Fresh \* \* \* pork,<sup>6</sup>

bacon and hams; \* \* \* [Free].<sup>7</sup>

PAR. 528. Lard, lard compounds, and lard substitutes [Free].

## SWINE.

*Production.*—The United States is by far the most important swine-producing country in the world, the number on farms, January 1, 1919, being estimated as 75,587,000, a steady increase from about 59,000,000 in 1914. This increase was influenced by demands during the war. By January, 1921, the number had decreased to 66,649,000. About one-half of the hogs are found in the corn belt—Iowa, Illinois, Missouri, Nebraska, Kansas, Indiana, and Ohio. These States convert corn into pork which, because of its much greater value, can better bear transportation charges.

*Imports.*—With the removal of the duty of \$1.50 per head, there was an increase from 1,547 head in 1913 to 96,429 head in 1914, valued at \$1,473,357. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Number.....	7,474	20,657	1,096	1,399
Value.....	\$185,617	\$758,259	\$22,868	\$35,218

In 1920, 86 per cent of the imports were from Canada.

*Exports.*—The export trade in live swine, except pure-bred stock, is confined for the most part to neighboring countries. Exports since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Number.....	10,308	24,745	55,250	93,855
Value.....	\$333,729	\$583,911	\$1,723,784	\$1,471,708

<sup>6</sup> Pork dutiable at 2 cents per pound. (Par. 14, emergency tariff act of 1921.)

<sup>7</sup> Meats of all kinds, prepared or preserved, n. s. p. f., 25 per centum ad valorem. (Par. 14, emergency tariff act of 1921.)

In 1920, 86 per cent of the exports went to Cuba.

*Important changes in classification, etc.*—See General Notes on Paragraph, page 642.

#### FRESH PORK.

*Production.*—Over 44,000,000 hogs were slaughtered in 1919 and the production of dressed pork was 2,112,000,000 pounds, valued at \$532,000,000, an increase from 1,877,000,000 pounds, valued at \$226,000,000 in 1914. Pork packing is well adapted to small establishments, therefore concentration is much less marked than in the slaughter of other food animals. Of the hogs handled in 1916 by interstate slaughterers, 18.4 per cent were slaughtered in Chicago, as compared with 24.5 per cent of the cattle.

*Imports* of fresh pork previous to 1914 ranged from 130,000 pounds to 260,000 pounds. With the removal of the duty in 1914 they rose to 4,700,000 pounds, and in 1915 to 16,200,000 pounds, almost all of which came from Canada. From 1916 to 1918 (fiscal year) imports declined to less than 2,000,000 pounds annually. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	1,716,989	2,779,361	1,541,009	435,193
Value.....	\$375,306	\$601,051	\$415,092	\$110,397

Below is given a comparison of imports, by months, for 1920 and 1921 of fresh pork, provided for in paragraph 14 of the emergency tariff act of 1921:

Month.	Quantity.		Value.	
	1920	1921	1920	1921
	<i>Pounds.</i>	<i>Pounds.</i>		
January.....	127,155	37,492	\$35,504	\$12,763
February.....	234,013	33,183	53,817	16,517
March.....	45,249	138,539	11,369	36,460
April.....	69,611	39,341	18,747	9,869
May.....	148,410	30,207	41,792	8,739
June.....	50,896	68,058	13,029	11,231
July.....	33,877	11,916	11,835	2,705
August.....	47,959	20,410	16,991	4,424
September.....	50,560	56,047	18,654	7,689
October.....	539,355	228,180	126,865	32,206
November.....	68,810	46,873	27,166	12,770
December.....	125,114	107,847	39,323	22,976

*Exports* of fresh pork are unimportant compared with exports of other pork products. Before the war they ranged from 1,040,000 to 2,597,000 pounds, but in 1916 expanded to 63,005,000 pounds. The United Kingdom took 26,402,000 pounds and Canada 32,962,000 pounds. Statistics for the calendar years 1918-1921 follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	11,632,635	26,776,978	38,305,236	49,466,515
Value.....	\$2,907,894	\$8,347,557	\$9,090,463	\$8,481,067

In 1919, 82 per cent of the exports went to Canada while in 1920 the United Kingdom took 51 per cent and Canada 33 per cent.

*Important changes in classification, etc.*—See General Notes on Paragraph, page 642.

## BACON AND HAMS.

*Imports* before 1914 ranged from 400,000 pounds to 650,000 pounds, but rose in 1914, with the abolition of the duty, to 2,131,000 pounds and in 1915 to 7,533,000 pounds (96 per cent from Canada). Later statistics, for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	1,877,387	2,646,235	754,735	182,412
Value.....	\$545,650	\$787,730	\$234,919	\$56,835

Nearly 90 per cent came from Canada in 1920.

Below is given a comparison of imports, by months, for 1920 and 1921 of bacon and hams<sup>2</sup> provided for in paragraph 14 of the emergency tariff act of 1921.

Month.	Quantity.		Value.	
	1920	1921	1920	1921
	Pounds.	Pounds.		
January.....	80,550	16,782	\$25,554	\$6,901
February.....	23,772	59,100	7,375	15,432
March.....	47,483	29,041	14,411	9,693
April.....	113,580	49,317	27,831	13,503
May.....	38,401	8,754	11,063	3,811
June.....	7,291	.....	3,522	.....
July.....	102,025	.....	31,218	.....
August.....	107,713	.....	33,051	.....
September.....	60,286	.....	22,537	.....
October.....	118,462	.....	35,467	.....
November.....	41,998	.....	16,917	.....
December.....	13,174	.....	5,953	.....

*Exports.*—The United States is by far the leading country in the export of hams and bacon; Denmark follows, but is far below, and Canada is next. Exports of bacon before the war ranged from 152,000,000 pounds in 1910 to 208,000,000 pounds in 1912. Exports of hams, shoulders, and bacon reached an unprecedented figure in 1918 (fiscal year). Statistics for the calendar years 1918–1921 follow:

	1918	1919	1920	1921 (9 months).
Bacon:				
Quantity (pounds).....	1,104,788,081	1,190,297,494	636,675,572	354,746,660
Value.....	\$315,968,064	\$373,913,227	\$156,296,908	\$60,622,950
Hams and shoulders, cured:				
Quantity (pounds).....	537,213,041	596,795,663	185,246,755	187,948,909
Value.....	\$145,674,883	\$189,428,837	\$50,887,588	\$39,929,857

<sup>2</sup> Included in "All other, prepared or preserved meats," after May, 1921.

In 1920, 63 per cent of the hams and shoulders and 54 per cent of the bacon exported went to the United Kingdom, France, Germany, and the Netherlands, and Belgium also received important amounts.

*Important changes in classification, etc.*—See General Notes on Paragraph, page 642.

## LARD.

*Description and uses.*—Lard is America's most important fat, butter excepted. The term includes prime steam, neutral, leaf, and all lards made from hog fat exclusively. By far the larger part of the output of big packing plants is prime steam lard, produced by the live-steam method of rendering the chopped fats. Leaf lard is kettle rendered from the leaf fats that surround the kidneys. Neutral lard, or "neutral," is kettle rendered, but at a lower temperature than ordinary lard, so that it retains practically no hog flavor, and is used largely in oleomargarine. Large quantities of lard are chilled and pressed to separate the stearin from the olein and palmitin. Stearin is mixed with ordinary lard to give it firmness in warm weather and to make a base for margarines; it is also used in making candles. Olein or lard oil is used in signal lights and miner's lamps and as a lubricant.

*Production* of lard in 1914 was 1,119,188,675 pounds, valued at \$120,414,007, a decrease of 10 per cent compared with 1909, coinciding with a greatly increased use of lard compounds and substitutes for culinary purposes. The figures given do not include the output of small butchers nor that of farmers, estimated at perhaps 1,000,000,000 pounds. Under favorable conditions the output can be quickly increased, as instanced by the increase in the number of swine on farms from 67,503,000 in 1917 to 71,374,000 in 1918. In 1919 production rose to 1,373,000,000 pounds, valued at \$416,000,000.

*Imports* of lard are insignificant compared with production or export, having reached the maximum of 1,131,998 pounds, including compounds and substitutes, in the fiscal year 1918, with 230,816 pounds as the average for the four years previous. Under a duty of 1½ cents per pound 4,117 pounds were imported in 1913 and 125,636 pounds came in duty free in 1914. Later imports of lard, lard compounds, and lard substitutes for calendar years are as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	800,777	3,845,865	14,456	3,955
Value.....	\$182,821	\$1,042,989	\$3,099	\$741

*Exports* of lard in 1920 (calendar year) were 612,000,000 pounds, valued at \$143,000,000, about 21 per cent going to the United Kingdom, 20 per cent to Germany, and 15 per cent to the Netherlands. Exports decreased during the war. The average for 1915–1918 was 434,954,000 pounds, compared with 502,211,000 pounds for 1911–1914. Higher prices, difficulties of trans-Atlantic shipping, and loss of exports to Germany (normally about 30 per cent) probably explain the decrease. Before the war lard was by far the most important export of the meat-packing industry. Exports of neutral lard were 6,307,000 pounds in 1918 (fiscal year) as compared with

the maximum of 62,317,909 pounds in 1912. Statistics of exports since 1917 by calendar years follow:

	1918	1919	1920	1921 (9 months).
<b>Lard:</b>				
Quantity (pounds).....	548,817,901	760,901,611	612,249,951	695,658,722
Value.....	\$144,933,151	\$237,983,449	\$143,371,441	\$93,454,373
<b>Neutral lard:</b>				
Quantity (pounds).....	6,307,164	22,957,137	23,238,071	20,515,126
Value.....	\$1,612,780	\$7,725,983	\$5,806,042	\$3,018,060

*Important changes in classification, etc.*—See General Notes on Paragraph, page 642.

#### LARD SUBSTITUTES AND LARD COMPOUNDS.

*Description and uses.*—Lard substitutes and lard compounds, are of two types—(1) those containing a base of animal fats, and (2) those made entirely from vegetable oils by a process of hydrogenation. The first is made by mixing heated vegetable oil with a proper proportion of melted hog or beef fats; this is quickly chilled and violently beaten to give it the appearance of natural lard. The second, from vegetable oils, is a recent development. The refined and bleached oil is subjected to a hardening process in which reduced nickel is employed to effect a combination of the hydrogen gas and liquid glycerides. The oleins of the oil are changed into stearins, which are solid at ordinary temperatures. By this process most of our tremendous production of cotton seed oil has been made available for use as a cooking fat.

*Production* of 1,173,446,000 pounds of lard substitutes was reported in 1917, an increase of 146,313,000 over 1916. The most important constituent of this lard substitute was cottonseed oil, of which 1,069,214,000 pounds were used; 55,000,000 pounds of stearin, 34,000,000 pounds of soy-bean oil, 17,000,000 pounds of vegetable stearin, and 12,000,000 pounds of peanut oil were also employed. Besides an enormous increase in the output of lard substitutes, the variety of oils used therein has also increased. Of the materials used in producing lard substitutes in 1918 less than 10 per cent were imported.

*Imports* of lard compounds and substitutes are combined in the statistics with the imports of lard.

*Exports* of lard compounds and substitutes decreased during the war, averaging 65,500,000 pounds for 1911–1914 and 52,500,000 for 1915–1918. Statistics of exports for the calendar years 1918–1921 follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	43,977,410	124,962,950	32,051,458	37,601,644
Value.....	\$10,258,536	\$31,605,885	\$7,218,845	\$4,302,920

In 1920 Cuba received 22 per cent of the total exports; Mexico, 19 per cent, and the United Kingdom, 13 per cent.

*Important changes in classification, etc.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Swine are transferred from the free list of the act of 1913 (par. 619). Several provisions for hogs and hog products have been combined in one paragraph. Necessarily their tariff problems require joint consideration. A new provision has been added for shoulders of pork. To avoid conflict, and because of possible substitution, lard compounds and lard substitutes exempt from duty under the act of 1913 (par. 528), are assessed the same duty as hydrogenated oils provided for in paragraph 52. Fresh pork and bacon and hams were on the free list (par. 545) of the act of 1913. The emergency tariff act of 1921 (par. 14) imposes a duty on meats of all kinds prepared or preserved, n. s. p. f.

*Suggested changes.*—Pickled or cured pork which is in part dutiable under paragraph 706 constitutes by far the largest item in our pork trade. To maintain the general plan of bringing together the principal hog products, it is suggested that "shoulders, of pork, prepared or preserved," be replaced by "all other pork, prepared or preserved, and not specially provided for."

#### PARAGRAPH 704.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 704. Reindeer meat, 20 per centum ad valorem; venison and other game not specially provided for, 1½ cents per pound.

#### ACT OF 1909.

PAR. 285. \* \* \* venison and other game, except birds, one and one-half cents per pound.

[No corresponding provision for reindeer meat.]

#### ACT OF 1913.

PAR. 227. Venison, and other game, 1½ cents per pound; \* \* \*

[No corresponding provision for reindeer meat.]

#### REINDEER MEAT.

*Description and uses.*—Within the last decade reindeer have become the principal source of meat supply for the natives of Alaska. The skin is highly prized for clothing on account of its frost-resisting qualities. The Alaskan reindeer is a domestic animal, which is able to live on the moss and other sparse vegetation of the Arctics. The average dressed weight of the carcass is 150 pounds. The meat is not a "game" variety, but has a distinctive, fine flavor and in quality has been classed with beef and mutton.

*Production and imports.*—Reindeer are not native to Alaska; imports from Siberia have formed the basis of herds which now number about 93,000 animals. Three-fourths of these are owned by natives. There is now an increasing surplus over local require-

ments. In 1920 shipments to the United States amounted to 1,600 carcasses, weighing about 250,000 pounds, valued at \$60,000. Reindeer are also produced in Scandinavian countries.

*Important changes in classification.*—See General Notes on Paragraph below.

## VENISON AND OTHER GAME.

Various Federal and State statutes place certain limitations on the commerce in game, defining hunting seasons, providing for hunting licenses and bag limits, and conditioning the possession, sale, and export of game. The Criminal Code of March 4, 1909 (35 Stat., 1137) prohibits the importation or interstate transportation of certain noxious animals and birds and of animals and birds illegally imported or killed or shipped in violation of State laws. The act of May 25, 1900, subjects foreign game to State laws prohibiting sale, etc., and paragraph 347 of the act of 1913 prohibits the importation of plumes, feathers, skins, etc., of wild birds, except for scientific or educational purposes. These laws tend to restrict the commerce in game.

*Imports* in 1913 of venison reached the maximum of 294,315 pounds, valued at \$46,739; of all other game except birds, 448,570 pounds, valued at \$31,763. In 1915 imports of "game birds, dressed," were valued at \$15,354. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
VENISON.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	16,979	\$2,546	\$255	10.00
1919.....	44,960	7,956	674	8.48
1920.....	167,823	41,545	2,517	6.03
1921 (9 months).....	47,400	16,569		
ALL OTHER GAME EXCEPT BIRDS.				
1918.....	96,042	\$8,979	\$1,441	16.05
1919.....	508,740	69,276	7,631	11.02
1920.....	370,272	96,987	5,554	5.76
1921 (9 months).....	390,476	107,595		

## GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—In this paragraph relating to game other than birds (par. 712) a new specific provision has been made for reindeer meat which resembles game in use.

*Suggested changes.*—Page 85, line 5, of H. R. 7456: Insert "except birds" after "game."

## PARAGRAPH 705.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 705. Extract of meat, including fluid, 15 cents per pound.

## ACT OF 1909.

## ACT OF 1913.

PAR. 287. Extract of meat, not especially provided for in this section, thirty-five cents per pound; fluid extract of meat, fifteen cents per pound, but the dutiable weight of the extract of meat and of the fluid extract of meat shall not include the weight of the packages in which the same is imported.

PAR. 228. Extract of meat, not especially provided for in this section, 10 cents per pound; fluid extract of meat, 5 cents per pound, but the dutiable weight of the extract of meat and of the fluid extract of meat shall not include the weight of the packages in which the same is imported.

## MEAT EXTRACT.

*Description and uses.*—Meat extract is obtained by boiling meat with water and concentrating the evaporated portion after the removal of fats. It is now largely a by-product of packing houses. In cooking, canning, and soaking meats, the meat juices are dissolved to a considerable extent in the water; by evaporating this water the meat extract is obtained. Fluid extract of meat is the same as meat extract, but less concentrated. A true meat extract contains only ingredients of meat soluble in hot water. A standard commercial variety shows 58.5 per cent organic matter, 21.5 per cent inorganic matter (salts), and 20 per cent water. Bouillon cubes, fluid, and semisolid extracts of meat are sold under various trade names. Gelatin, blood, albumen, or meat fiber are added to some extracts of beef, and sometimes the albumen is more or less peptonized. True meat extract has very little if any food value and can not be regarded as concentrated meat, but possesses marked stimulative and restorative properties. Being rich in cooked meat substances, it is used for flavoring soups.

*Imports* in 1918 (fiscal year) were 12 pounds of fluid and 1,401 pounds of all other meat extracts. Since 1912 imports have not exceeded 200,000 pounds. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
FLUID EXTRACT OF MEAT.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	43	\$71	\$2	3.03
1919.....	13,000	17,342	650	3.75
1920.....	2,542	2,367	127	5.37
1921 (9 months).....	133	162		
ALL OTHER EXTRACT OF MEAT.				
1918.....	5,585	\$8,747	\$558	6.39
1919.....	12,003	11,246	1,200	10.67
1920.....	62,592	43,990	6,259	14.23
1921 (9 months).....	37,465	23,733		

*Important changes in classification.*—The provisions for fluid extract of meat and all other meat extract, separately provided for in previous acts, are here grouped together. The exception concerning weight of packages in paragraph 228 of the act of 1913 is omitted as unnecessary, because, under a specific rate, net weight would be taken.

*Suggested changes.*—The words "including fluid" may be omitted, since the term "extract" appears to be sufficiently inclusive.

---

### PARAGRAPH 706.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 706. Sausage casings, weasands, intestines, bladders, tendons and integuments, not specially provided for; meats, fresh, prepared, or preserved, not specially provided for, 15 per centum ad valorem: *Provided*, That no meats of any kind shall be imported into the United States unless the same is healthful, wholesome, and fit for human food and contains no dye, chemical, preservative, or ingredient which renders the same unhealthful, unwholesome, or unfit for human food, and unless the same also complies with the rules and regulations made by the Secretary of Agriculture, and that, after entry into the United States in compliance with said rules and regulations, said meats shall be deemed and treated as domestic meats within the meaning of and shall be subject to the provisions of the Act of June 30, 1906 (Thirty-fourth Statutes at Large, page 674), commonly called the "Meat Inspection Amendment," and the Act of June 30, 1906 (Thirty-fourth Statutes at Large, page 768), commonly called the "Food and Drugs Act," and that the Secretary of Agriculture be and hereby is authorized to make rules and regulations to carry out the purposes of this provision, and that in such rules and regulations the Secretary of Agriculture may prescribe the terms and conditions for the destruction of all such meats offered for entry and refused admission into the United States unless the same be exported by the consignee within the time fixed therefor in such rules and regulations.

ACT OF 1909.

PAR. 512. Bladders, and all integuments, tendons and intestines of animals \* \* \* crude, dried or salted for preservation only, and unmanufactured, not specially provided for in this section [Free].

PAR. 23. \* \* \* fish bladders \* \* \* other than crude or dried or salted for preservation only, valued at not above ten cents per pound, two and one-half

ACT OF 1913.

PAR. 419. Bladders, and all integuments, tendons and intestines of animals \* \* \* crude, dried or salted for preservation only, and unmanufactured, not specially provided for in this section [Free].

PAR. 385. \* \* \* unmanufactured articles not enumerated or provided for in this section, a duty of 10 per centum ad valorem, \* \* \*.

## ACT OF 1909.

cents per pound; valued at above ten cents per pound and not above thirty-five cents per pound, twenty-five per centum ad valorem; valued above thirty-five cents per pound, fifteen cents per pound and twenty per centum ad valorem; \* \* \*

PAR. 286. Meats of all kinds, prepared or preserved, not specially provided for in this section, twenty-five per centum ad valorem.

PAR. 667. Sausages, bologna [Free].

## ACT OF 1913.

[Weasands fall within this provision. T. D. 35886 of 1915; United States v. White, 8 Ct. Cust. Appls., 115, of 1917. Sausage casings come within paragraph 419 above. (Abstract 19744, T. D. 29288, of 1908.)]

PAR. 545. \* \* \* meats of all kinds, prepared or preserved, not specially provided for in this section [Free] *Provided, however,* That none of the foregoing meats shall be admitted into the United States unless the same is healthful, wholesome and fit for human food and contains no dye, chemical, preservative, or ingredient which renders the same unhealthful, unwholesome or unfit for human food, and unless the same also complies with the rules and regulations made by the Secretary of Agriculture, and that, after entry into the United States in compliance with said rules and regulations, said imported meats shall be deemed and treated as domestic meats within the meaning of and shall be subject to the provisions of the Act of June thirtieth, nineteen hundred and six, (Thirty-fourth Statutes at Large, page six hundred and seventy-four), commonly called the Meat Inspection Amendment, and the Act of June thirtieth, nineteen hundred and six (Thirty-fourth Statutes at Large, page seven hundred and sixty-eight), commonly called the Food and Drugs Act, and that the Secretary of Agriculture be and hereby is authorized to make rules and regulations to carry out the purposes of this paragraph, and that in such rules and regulations the Secretary of Agriculture may prescribe the terms and conditions for the destruction for food purposes of all such meats offered for entry and refused admission into the United States unless the same be exported by the consignee within the time fixed therefor in such rules and regulations.<sup>9</sup>

## SAUSAGE CASINGS, ETC., AND MEATS PREPARED OR PRESERVED N. S. P. F.

*Description and use.*—Under this head fall pickled and cured beef, pickled pork, canned meats, sausage, sausage casings, scrapple, head cheese, livers, sweetbreads, etc. Beef that is dried, salted, or pickled has lost its former prominent position in trade in favor of chilled and frozen beef; pork is, however, most in demand when it is salted, pickled, cured, or otherwise preserved. Canned meats, of which there are many varieties, are increasing in commercial importance.

*Production* of pickled and cured beef for 1899–1914 showed a steady decline, from 137,000,000 pounds to 91,000,000 pounds; while pickled and cured pork remained fairly steady, amounting to 3,138,000,000 pounds in 1899 (including bacon and hams) and to 2,929,000,000

<sup>9</sup> Meats of all kinds, prepared or preserved, n. s. p. f., 25 per centum ad valorem. (Par. 14, emergency tariff act of 1921.)

pounds in 1914. The production of canned meats increased from 112,000,000 pounds in 1899 to 160,000,000 pounds in 1914. In 1919 790,703,000 pounds of sausage and 102,281,000 pounds of sausage casings were produced in packing houses.

Imports in this class of products are relatively much less important than exports. Imports of canned corned beef ranged in value from \$118,000 in 1915 to \$36,673,000 in 1918 (calendar years). In the latter year doubtless a large part of the imports consisted of American goods returned from Europe. Statistics of imports for the calendar years 1918-1921 follow:

	1918	1919	1920	1921 (9 months).
Bologna sausage:				
Quantity (pounds).....	5,417	71,722	156,735	81,511
Value.....	\$2,797	\$43,340	\$73,996	\$33,921
Canned beef:				
Quantity (pounds).....		16,731,826	3,979,073	264,281
Value.....	\$36,673,220	\$4,753,298	\$814,790	\$41,587
Other canned meats:				
Quantity (pounds).....		1,520,638	943,801	167,838
Value.....	\$1,156,337	\$453,732	\$295,072	\$60,952
Other prepared or preserved meats:				
Quantity (pounds).....		2,937,392	1,976,163	1,823,192
Value.....	\$379,076	\$631,668	\$500,119	\$328,517
Sausage casings—intestines, etc.:				
Quantity (pounds).....		11,234,028	12,137,901	7,712,056
Value.....	\$3,624,025	\$5,629,412	\$7,049,347	\$4,208,042
Sausage casings—weasands or ox gullets:				
Quantity (pounds).....		188,099	174,326	124,848
Value.....	\$43,973	\$132,263	\$120,019	\$80,590
Bladders, integuments, tendons, etc., crude and manufactured:				
Quantity (pounds).....		2,808,388	1,279,818	246,058
Value.....	\$389,311	\$198,933	\$251,423	\$34,767
Livers, sweetbreads, etc.:				
Quantity (pounds).....		3,532,074	3,389,507	763,578
Value.....	\$165,837	\$302,256	\$412,358	\$112,544
Frogs' legs and snails:				
Quantity (pounds).....		20,460	24,814	24,378
Value.....	\$4,436	\$7,065	\$10,627	\$7,013

Below is given a comparison by months for 1920 and 1921 of imports of several items provided for in paragraph 14 of the emergency tariff act of 1921:

Month.	Quantity.		Value.	
	1920	1921	1920	1921

BOLOGNA SAUSAGE.<sup>1</sup>

	Pounds.	Pounds.		
January.....	15,004	18,099	\$10,120	\$7,282

November.....	8,431	3,065
December.....	12,297	4,255

*Exports* of canned beef before the war ranged from 3,464,000 pounds (minimum) in 1914 to 14,804,000 pounds (maximum) in 1910. The United Kingdom is normally the largest purchaser; smaller amounts go to British Africa, the Philippines, Belgium, and Panama. Exports reached the unprecedented figure of 97,343,000 pounds in 1918 (fiscal year). Exports of pickled and other cured beef also rose during the war, reaching the maximum, 58,053,000 pounds, in 1917. Normally the United Kingdom takes about 25 per cent; Newfoundland and Germany rank next.

Exports of pickled pork fluctuated from 63,460,000 pounds in 1916 to 33,221,000 pounds in 1918 (fiscal years), with Canada and the United Kingdom the most important destinations. Exports of canned and other sausage increased to 15,026,449 pounds in 1918 (fiscal year). Most of this increase went to France, but normally more goes to Cuba. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Canned sausage:				
Quantity (pounds).....	6,349,602	8,198,336	7,158,291	2,060,392
Value.....	\$1,817,199	\$2,761,944	\$2,344,684	\$719,807
All other sausage:				
Quantity (pounds).....	6,029,354	13,889,285	10,509,095	4,886,143
Value.....	\$2,125,373	\$5,911,850	\$4,187,574	\$1,670,222
Beef, pickled, and other cured:				
Quantity (pounds).....	44,206,020	42,804,724	25,771,176	18,968,576
Value.....	\$7,921,220	\$8,739,141	\$3,659,815	\$2,128,557
Beef, canned:				
Quantity (pounds).....	141,457,163	53,867,327	23,766,000	5,171,518
Value.....	\$51,498,010	\$20,672,964	\$5,789,711	\$1,034,996
Pork, pickled:				
Quantity (pounds).....	36,671,660	34,113,875	38,708,841	25,647,520
Value.....	\$8,535,017	\$8,632,518	\$7,670,024	\$3,433,766
Pork, canned:				
Quantity (pounds).....	5,267,342	5,791,706	1,802,241	757,318
Value.....	\$1,776,392	\$2,422,364	\$752,120	\$220,800
Sausage casings:				
Quantity (pounds).....	4,037,391	25,477,023	25,238,187	25,568,832
Value.....	\$2,611,680	\$6,809,834	\$5,860,935	\$4,896,300
All other meat products, canned:				
Value.....	\$8,819,996	\$12,950,669	\$6,480,276	\$3,995,151
All other meat products—except canned:				
Value.....	\$6,943,692	\$11,642,612	\$7,169,589	\$3,894,830

*Important changes in classification.*—Specific provision is made for sausage casings (free under paragraph 419, act of 1913, Abstract 19744, T. D. 29288 of 1908) and weasands, dutiable as an unenumerated unmanufactured article (*United States v. White*, 8 Ct. Cust. Appls. 115, of 1917; T. D. 35886 of 1915). The other articles were on the free list (pars. 419 and 545) of the act of 1913.

*Suggested changes.*—To maintain the general plan of the rearrangement of the Agricultural Schedule, sausage casings, weasands, intestines, etc., might be provided for in a paragraph separate from meats n. s. p. f.

If specific provision should be made for prepared or preserved beef (par. 701), prepared or preserved mutton (par. 702), and prepared or preserved pork (par. 703) a provision might be inserted in this paragraph for sausage by insertion of the words "including sausage."

## PARAGRAPH 707.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 707. Milk, fresh, 1 cent per gallon; sour milk and buttermilk, one-half of 1 cent per gallon; cream, having less than 30 per centum of butter fat, 5 cents per gallon; having 30 per centum or more of butter fat, 10 cents per gallon.

ACT OF 1909.

ACT OF 1913.

PAR. 247. Milk, fresh, two cents per gallon; cream, five cents per gallon.

[No corresponding provision for sour milk and buttermilk.]

PAR. 547. Milk and cream, \* \* \* [Free].<sup>10</sup>

[No corresponding provision for sour milk and buttermilk.]

<sup>10</sup> Milk, fresh, 2 cents per gallon; cream, 5 cents per gallon. (Par. 23, emergency tariff act of 1921.)

## MILK AND CREAM.

(See Survey G-7.)

*Description and uses.*—Milk and cream are among the most important of foods, furnishing from 16 to 18 per cent of the nourishment of the average American family. In the value of its annual output the dairy industry approximates the production of wheat. International trade in unmanufactured milk and cream, however, is very small relative to the country's total supply and demand. Because of its limited keeping quality the maximum distance that milk can profitably be shipped is about 500 miles. The great bulk of the imports moves from eastern Canada to the New England States.

*Production of milk in 1920* was 89,658,000 pounds valued at about \$2,000,000,000. The number of milch cows increased from 18,150,000 in 1910 to 19,672,000 in 1919. Since that year there has been a slight decrease.

*Imports in 1913* of fresh cream amounted to 1,247,000 gallons valued at \$1,068,000; of fresh milk, 46,000 gallons valued at \$6,900. Statistics for the calendar years 1918–1921 follow:

	1918	1919	1920	1921 (9 months).
Fresh milk:				
Quantity (gallons).....	1,519,966	2,753,401	2,520,657	1,955,729
Value.....	\$341,584	\$739,073	\$622,407	\$354,781
Fresh cream:				
Quantity (gallons).....	704,031	931,416	1,597,160	1,533,573
Value.....	\$736,809	\$1,111,130	\$2,079,863	\$1,902,051
Cream—preserved or condensed or sterilized:				
Quantity (pounds).....	7,034	240,290	852,631	3,561
Value.....	\$677	\$32,927	\$136,030	\$906

Below is given a comparison by months for 1920 and 1921 of fresh milk and cream, provided for in paragraph 23 of the emergency tariff act of 1921:

Month.	Quantity.		Value.	
	1920	1921	1920	1921
	<i>Gallons.</i>	<i>Gallons.</i>		
January.....	196,159	145,924	\$76,970	\$69,662
February.....	141,196	126,363	52,226	43,022
March.....	169,958	160,167	75,367	72,892
April.....	221,966	234,179	119,045	129,131
May.....	343,116	427,244	211,120	270,370
June.....	473,853	726,006	377,799	468,446
July.....	457,614	545,464	313,260	372,699
August.....	703,150	588,925	512,648	425,633
September.....	525,078	540,030	371,373	404,977
October.....	383,823	424,003	283,674	314,091
November.....	301,230	389,044	197,092	248,553
December.....	200,674	310,660	111,696	171,098

*Exports of milk and cream, other than condensed, in 1913* were valued at \$474,000. Later exports by calendar years are as follows: 1918, \$528,607; 1919, \$1,729,884; 1920, \$381,626; 1921 (9 months), \$366,417.

*Important changes in classification.*—To avoid litigation, new specific provisions have been made for buttermilk and sour milk, although

little of either is imported. Milk that has soured in transit is sometimes sold for its butterfat content. Cream varies greatly in butterfat content and thus in value. The new provisions for a heavier duty on cream having more than 30 per cent butterfat content is an attempt to maintain specific rather than ad valorem rates, and yet distribute the duty more nearly according to the relative value of the products.

Milk and cream were free of duty under the act of 1913 (par. 547) and milk, fresh, and cream are dutiable under paragraph 23 of the emergency tariff act of 1921.

*Suggested changes.*—In view of the fact that imports of sour milk and buttermilk are insignificant, the specific provisions therefor might be dropped and the word "fresh" eliminated in connection with milk.

There are administrative difficulties in determining the percentage of butter fat in cream imported on the frontiers.

### PARAGRAPH 708.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 708. Milk, condensed or evaporated: In hermetically sealed containers, unsweetened, 1 cent per pound; sweetened, 1½ cents per pound; all other, 1¾ cents per pound; whole milk powder, 3 cents per pound; cream powder, 8 cents per pound; and skimmed milk powder, 1½ cents per pound; malted milk, and compounds of or substitutes for milk or cream, 20 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 248. Milk, preserved or condensed, or sterilized by heating or other processes, including weight of immediate coverings, two cents per pound; \* \* \*  
[No corresponding provision for the other commodities.]

PAR. 547. Milk and cream, including milk or cream preserved or condensed, or sterilized by heating or other processes, \* \* \* [Free].<sup>11</sup>  
[No corresponding provision for the other commodities.]

### CONDENSED OR EVAPORATED MILK AND RELATED PRODUCTS.

(See Survey G-7.)

*Description and uses.*—The tremendous growth in recent years in the production of preserved milk has resulted from the demand for milk without the bulkiness and perishability of the fresh product, and from the perfection of methods of manufacture. Water constitutes about 87 per cent of the weight of fresh milk. In contrast to the local distribution of fresh milk, there is an extensive domestic and foreign trade in the condensed, evaporated, and powdered forms. In 1919, nearly 5,000,000,000 pounds of milk, or over 10 per cent of the total amount used for manufacturing purposes, was used in the production of the condensed and evaporated article. This was more than the amount used for cheese and about one-seventh of that consumed for butter.

<sup>11</sup> Milk, preserved or condensed, or sterilized by heating or other processes, including weight of immediate coverings, 2 cents per pound. (Par. 24, emergency tariff act of 1921.)

Both skimmed and unskimmed milk are condensed and evaporated. Condensed milk is distinguished from evaporated milk largely by the fact that as a finished product the former contains about 40 per cent cane sugar. Evaporated and condensed milk are put up in small cans for household, hotel, and restaurant trade and also in bulk for ice-cream manufacturers, bakers, etc.

The value of the various milk products varies widely with the degree of concentration. The following table shows the relative amounts of various products obtained from 100 pounds of average (3.5 per cent butter fat) milk:

	Pounds.
Evaporated milk (unsweetened).....	40
Condensed milk (plus 16 pounds of sugar).....	36-40
Evaporated bulk milk.....	25-34
Whole milk powder.....	12.5
Cream powder.....	4.8
And skimmed-milk powder.....	7.6
Skimmed-milk powder.....	8.2
And butter.....	4.2

Milk powder is made by evaporating whole or skimmed milk to dryness. In appearance it closely resembles wheat flour. Skimmed-milk powder, because of its superior keeping qualities, is produced in larger quantities than the full-milk product.

*Production* of condensed and evaporated milk increased from 1,676,000,000 pounds in 1918 (fiscal year) to 2,094,000,000 pounds valued at \$293,000,000 in 1919. In 1920, with the falling off of both foreign and domestic demand, production declined to 1,559,000,000 pounds. The following table indicates that canned evaporated whole milk and condensed whole milk are the articles of outstanding importance in this group. In contrast to the general decline in 1920, it is interesting to note the increase in production of filled milk (evaporated skimmed milk modified with foreign fats) and also the increase in powdered milk.

*Production of milk preparations, 1918-1920.<sup>1</sup>*

November.....	978, 867	43, 390	147, 755	6, 133
December.....	962, 242	• 1, 491	146, 081	679

*Exports* of condensed milk increased tremendously, being 551,139,000 pounds, valued at \$72,825,000 in 1918 (fiscal year), as compared with an average of 15,773,900 pounds for 1910-1914. In 1918 (fiscal year) the United Kingdom, France, Belgium, and Cuba were the principal destinations of exports. Statistics for the calendar years 1918-1921 follow:

	1918	1919	1920	1921 (9 months).
Condensed and evaporated milk:				
Quantity (pounds).....	551, 139, 754	852, 865, 414	( <sup>1</sup> )	( <sup>1</sup> )
Value.....	\$72, 824, 897	\$121, 893, 337		
Sweetened condensed milk:

Value.....			\$999, 754	\$1, 124, 594

<sup>1</sup> Sweetened condensed, unsweetened evaporated, and powdered milk not separately reported until 1920

*Important changes in classification.*—Milk or cream preserved or condensed or sterilized by heating or other processes was free under paragraph 547 of the act of 1913, and milk, so prepared, including the weight of the immediate coverings, is dutiable under paragraph 24 of the emergency tariff act of 1921. In previous laws all milk

preparations, including products differing widely in value and in the amount of raw milk used per pound of product, were grouped together and were dutiable at the same rate. The present classification distinguishes them, and the duty is distributed more nearly according to value. The first two clauses cover condensed and evaporated canned milk. The "all other" clause covers condensed or evaporated bulk milk, which is usually condensed to a greater degree than the canned product. The last clause provides for "filled milk" (condensed skimmed milk in which other fat has been substituted for the butter fat) and for other milk preparations.

*Suggested changes.*—In view of judicial constructions narrowing the word "compound," it might be well to insert after the word "compounds," in line 21, page 86, of H. R. 7456, the words "or mixtures," making the phrase read "compounds or mixtures of or substitutes for milk or cream."

"All other" is indefinite; "in other containers" might be substituted.

for, six cents per pound.

PAR. 195. Butter and butter substi-  
tutes, 2½ cents per pound.<sup>12</sup>

### BUTTER AND OLEOMARGARINE.

(See Survey G-7.)

*Description and uses.*—Butter is by far the most important milk product. In 1919 it constituted two-thirds of the combined value of condensed milk, cheese, and butter. One hundred pounds of average milk (3.5 per cent butter fat) produce about 4.2 pounds of butter. In the large markets butter is carefully graded, the quality being determined according to certain standards based on flavor, body, color, amount of salt, and condition of package. Imports compete more directly with one or more of these well-defined grades according to their quality.

Oleomargarine, the legal term under the internal-revenue oleomargarine act of 1886 for all butter substitutes, may be divided into three classes—(1) that made exclusively of animal oils and fats (chiefly oleo oil and neutral lard), (2) that made of a mixture of animal and vegetable oils, and (3) that exclusively of vegetable oils (mostly coconut, peanut, and cottonseed oils). In 1920 about 1 per cent of the total production was of the first class, 46 per cent of the second class, and 53 per cent of the third class. An internal-revenue tax of 10 cents per pound is imposed on colored oleomargarine and one-fourth of 1 cent per pound on uncolored. In consequence the

<sup>12</sup> Butter and substitutes therefor, 6 cents per pound. (Par. 21, emergency tariff act of 1921.) Oleomargarine in packages of less than 10 pounds prohibited by act of Aug. 2, 1886, sec. 10.

latter makes up 96 per cent of the amount produced. The internal-revenue tax on imports of both colored and uncolored is 15 cents per pound in addition to the duty, and imports in packages containing less than 10 pounds are prohibited.

*Production.*—The quantity of butter manufactured in factories rose from 420,126,546 pounds in 1899 to 769,809,781 pounds in 1914 and to 938,505,382 in 1919. The leading States in 1914 were Wisconsin (116,149,000 pounds), Minnesota (111,165,000 pounds), and Iowa (92,405,000 pounds). Farm and factory output was about 1,706,000,000 pounds in 1914 and 1,649,000,000 pounds in 1919. The factory output has increased, while the farm production has diminished. Production of butter substitutes was 95,397,000 pounds in 1912 and 370,730,000 pounds in 1920.

*Imports of butter and butter substitutes* form a small part of our consumption. Normally Canada and Denmark are the chief sources. In 1917, 523,573 pounds, valued at \$197,767, were imported—from Canada, 311,257 pounds; from Denmark, 149,078 pounds; and from New Zealand, 50,400 pounds. Later statistics follows:

Calendar year.	Quantity.	Value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	1,479,114	\$516,175	\$36,978	7.16
1919.....	6,961,950	3,481,976	174,048	5.00
1920.....	37,626,045	18,793,055	940,651	5.01
1921 (9 months).....	12,006,610	5,122,147		

Over 50 per cent of the imports in 1920 came from Denmark. Canada, Argentina, and the Netherlands were the other important sources.

Below are statistics,<sup>13</sup> by months, for 1920 and 1921 of butter and butter substitutes provided for in paragraph 21 of the emergency tariff act of 1921:

Month.	Quantity.		Value.	
	1920	1921	1920	1921
	<i>Pounds.</i>	<i>Pounds.</i>		
January.....	334,135	3,811,905	\$194,643	\$1,831,708
February.....	1,095,813	1,896,938	633,162	867,883
March.....	3,151,640	4,265,581	1,764,935	1,796,751
April.....	5,065,020	1,370,222	2,666,339	355,944
May.....	1,710,519	54,637	797,700	17,973
June.....	3,186,559	33,884	1,565,911	18,750
July.....	8,311,404	191,748	4,166,032	60,925
August.....	2,737,265	149,886	1,252,427	65,211
September.....	2,574,064	397,929	1,125,445	142,950
October.....	2,455,315	1,858,409	1,104,944	695,982
November.....	2,798,684	1,925,560	1,419,528	711,008
December.....	4,033,754	2,601,689	1,955,393	827,162

*Exports.*—From 1909 to 1913 this country ranked twelfth among exporting countries. Denmark averaged 195,530,000; Russia, 150,-294,000; Australia, 77,859,000; the Netherlands, 75,133,000; and the United States, 4,125,000 pounds. Exports increased greatly

<sup>13</sup> Figures are for butter only, beginning July, 1921.

during the war, being 26,835,092 pounds in 1917, of which 20,839,000 pounds went to the United Kingdom and 1,323,653 to Canada. Exports of oleomargarine increased from 2,967,000 pounds in 1913 to 5,561,000 pounds in 1917, with the British West Indies the best customer. Exports since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Butter:				
Quantity.....pounds..	26, 194, 415	34, 556, 485	17, 487, 735	6, 636, 749
Value.....	\$10, 868, 953	\$17, 504, 446	\$10, 142, 403	\$2, 679, 809
Oleomargarine:				
Quantity.....pounds..	8, 909, 108	22, 939, 589	16, 557, 746	2, 642, 036
Value.....	\$2, 398, 908	\$6, 576, 760	\$4, 567, 120	\$543, 503

*Important changes in classification.*—"Oleomargarine" is used instead of "butter substitutes."

*Suggested changes.*—In order to assure the classification of all butter substitutes under this paragraph, the words "and other butter substitutes" should be added after "oleomargarine."

#### PARAGRAPH 710.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 710. Cheese, valued at less than 30 cents per pound, 5 cents per pound; valued at 30 cents or more per pound, 25 per centum ad valorem; cheese substitutes, 5 cents per pound.

ACT OF 1909.

ACT OF 1913

PAR. 246. Cheese, and substitutes therefor, six cents per pound.

PAR. 196. Cheese and substitutes therefor, 20 per centum ad valorem.<sup>14</sup>

#### CHEESE.

(See Survey G-7.)

*Description and uses.*—Cheese is made by separating the curd or casein and portions of the fat and other constituents of milk from the whey. There are more than 150 varieties. The principal kinds of hard cheese are Cheddar, English Cheshire and Stilton, the Dutch Edam and Gonda, the Schweitzer (Swiss), and the Italian Parmesan and Gorgonzola. Of the soft cheeses, the principal are Brie, Camembert, Neufchâtel, Limberger, Philadelphia cream, and cottage. Some fancy brands of cheese are made by mixing with cream, butter, or oils. Many foreign cheeses are now successfully made here, but more than nine-tenths is the familiar standard variety, Cheddar, of which there are three grades—"full cream," from whole milk; "skims," from skimmed or partly skimmed milk; and "filled," in which oleo or neutral lard is substituted for butter fat.

<sup>14</sup> Cheese, and substitutes therefor, 23 per centum ad valorem. (Par. 22, emergency tariff act of 1921.)

Filled cheese, marketed as full-cream cheese, was formerly a serious form of adulteration or substitution. An internal-revenue tax of 1 cent per pound is now levied on the manufacture of filled cheese and 8 cents per pound on imports. At present practically none is produced here, and none is imported.

Production in 1914 was 370,278,599 pounds of factory cheese, valued at \$50,377,018. Of this, 332,690,891 pounds were "full cream" and 18,318,437 pounds "part cream." In 1909, 97.1 per cent of the product was made in factories; in 1914 there were 2,843 factories. Wisconsin produced 55.6 per cent of the total in 1914 and New York 26.4 per cent. During 1909-1914 the total production increased by 59,152,282 pounds or 19.01 per cent; the increase in Wisconsin was 39.07 per cent and the decrease in New York was 7.2 per cent. In 1919, factory production amounted to 475,331,000 pounds, valued at \$137,281,000, while the amount produced on farms amounted to only 6,600,000 pounds, valued at \$2,300,000.

Imports of cheese from 1911 to 1915 averaged 50,499,356 pounds per annum. In 1918 (fiscal year) Argentina supplied 83.9 per cent, whereas before the war Italy and Switzerland led, nearly one-half coming from the former (Parmesan and Gorgonzola) and one-third from the latter (Schweitzer). A large proportion of these imports are fancy foreign varieties not extensively manufactured here. Imports increased from 48,449,902 pounds in 1913 to 64,497,471 pounds in 1914, with duties of \$2,906,947 and \$2,532,742, respectively. Later imports of cheese and substitutes therefor have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	6,931,975	\$2,740,146	\$547,995	20
1919.....	7,399,520	3,005,420	600,504	20
1920.....	14,592,403	5,237,844	1,047,564	20
1921 (9 months).....	15,510,764	5,196,274		

In 1920, 62 per cent came from Argentina, 10 per cent from France, and smaller amounts from Italy, Switzerland, and Canada.

Below is given a comparison<sup>15</sup> by months for 1920 and 1921 of cheese and substitutes therefor, provided for in paragraph 22 of the emergency tariff act of 1921:

Month.	Quantity.		Value.	
	1920	1921	1920	1921
	<i>Pounds.</i>	<i>Pounds.</i>		
January.....	1,155,278	1,844,115	\$458,429	\$661,438
February.....	667,497	713,324	221,492	226,663
March.....	1,335,924	1,342,192	483,155	466,874
April.....	740,158	1,558,123	187,130	505,871
May.....	2,307,554	1,469,677	810,232	465,717
June.....	1,822,027	1,691,860	661,205	528,964
July.....	1,042,791	1,253,505	381,814	353,666
August.....	660,963	3,091,008	241,689	1,057,019
September.....	961,450	2,570,827	328,180	847,964
October.....	1,780,698	3,952,650	629,866	1,203,140
November.....	1,739,351	3,980,147	640,186	1,215,689
December.....	1,780,034	3,398,876	618,607	1,144,207

<sup>15</sup> Figures are for cheese only, beginning July, 1921.

*Exports* increased from an average of 4,915,501 pounds for 1910-1914 to 52,527,576 pounds for 1915-1918. In 1912, an average year, the United Kingdom took 3,822,735 out of a total of 6,337,559 pounds. Other important purchasers were Canada, the British West Indies, Panama, Mexico, and Cuba. During the war most of the large increases went to the United Kingdom—55,399,101 out of 66,050,013 pounds in 1917. Exports since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	48,404,672	14,159,721	16,291,529	10,437,719
Value.....	\$11,735,266	\$5,349,577	\$5,054,253	\$2,363,072

*Important changes in classification.*—A specific duty is imposed on the cheaper varieties of cheese. Imports valued at less than 30 cents per pound are those which compete with the great bulk of domestic production. The many varieties of imported cheese have so wide a range in value that a simple specific duty might bear lightly on the most expensive and heavily on the cheapest. The method of different specific rates on different classes of cheese can not well be applied because there is no way of definitely classifying the varieties according to value.

#### PARAGRAPH 711.

##### H. R. 7456.

##### SENATE AMENDMENTS.

PAR. 711. Birds, live: Poultry, 2 cents per pound; all other, valued at \$5 or less each, 50 cents each; valued at more than \$5 each, 20 per centum ad valorem.

##### ACT OF 1909.

##### ACT OF 1913.

PAR. 289. Poultry, live, three cents per pound; \* \* \*.

PAR. 510. Birds and land and water fowls [Free].

PAR. 229. Poultry, live, 1 cent per pound; \* \* \*.

PAR. 416. Birds and land and water fowls, not specially provided for in this section [Free].

#### POULTRY.

*Description and uses.*—Most of the specialized poultry farms are in the Atlantic and Pacific coast sections, near the great centers of population. The demand is largely supplied by general farms, where poultry-raising is incidental to other farm operations. Cold-storage facilities and rapid transit have greatly influenced the poultry industry, in equalizing prices and making possible the importation of foreign products.

*Production* of poultry has increased but little in recent years. In 1909, 488,468,364 fowls of all kinds were raised. Of these 461,000,000, or 94 per cent, were chickens; the rest consisted of geese, ducks, turkeys, and pigeons. In 1920, 474,000,000 chickens were raised, which would indicate about 500,000,000 fowls of all kinds. About

half of the chickens were raised in the North Central States, i. e., in or adjacent to the corn belt. Four times as many chickens were raised in this region as in the North Atlantic and Pacific States, where the greater number of the specialized poultry farms are located.

*Imports.*—Following the reduction of the duty on live poultry from 3 cents to 1 cent, imports of live poultry in 1914 were 954,624 pounds compared with 366,854 pounds in 1913. There were large increases during the war. The annual receipt of live poultry during 1911–1914 averaged 602,418 pounds. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.
	<i>Pounds.</i>		
1918.....	676,765	\$160,842	\$6,768
1919.....	1,326,440	315,710	13,261
1920.....	1,592,952	425,222	15,929
1921 (9 months).....	373,498	89,267	.....

*Exports of poultry and game (not segregated)* amounted to 1,241,144 pounds in 1918 (fiscal year)—1,090,288 pounds of which went to the United Kingdom, 71,091 pounds to Panama, and 23,861 pounds to Canada. The value of exports for later calendar years was as follows: 1919, \$4,560,278; 1920, \$756,748; 1921 (9 months), \$936,873.

*Important changes in classification.*—See General Note on Paragraph below.

#### BIRDS, OTHER THAN POULTRY.

*Description and uses.*—The principal birds coming under this provision are canary birds, the imports of which are of relatively small value, and also some high-priced birds such as parrots.

*Production.*—No statistics available.

*Imports* have ranged in normal years from 300,000 to 500,000. About 60 per cent of these have been canary birds. Some of these birds are of so little value that it would be difficult to determine the basis for an ad valorem rate. Others are rare birds which are sold at high prices. Import values for recent calendar years have been as follows: Birds—1918, \$16,387; 1919, \$47,599; 1920, \$244,432; 1921 (9 months), \$182,253. Fowls, land and water—1918, \$507; 1919, \$4,762; 1920, \$9,217; 1921 (9 months), \$4,153.

*Exports* are not separately stated.

*Important changes in classification.*—See below.

#### GENERAL NOTE ON PARAGRAPH.

*Important changes in classification.*—A dutiable provision for live poultry (par. 229, act of 1913) has been combined with the free-list provision for “birds and land and water fowls” (par. 416 of the act of 1913) and the heading “Birds, live” added.

## PARAGRAPH 712.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 712. Birds, dead, dressed or undressed: Poultry, 4 cents per pound; all other, 20 per centum ad valorem; all the foregoing, prepared or preserved in any manner and not specially provided for, 22 per centum ad valorem.

## ACT OF 1909.

PAR. 289. Poultry, \* \* \* dead, five cents per pound.

[No corresponding provision for the other commodities.]

## ACT OF 1913.

PAR. 227. \* \* \* game birds, dressed, 30 per centum ad valorem.

PAR. 229. Poultry, \* \* \* dead, or prepared in any manner, including the weight of the immediate coverings or containers, 2 cents per pound.

[No corresponding provision for the other commodities.]

## BIRDS, DEAD.

*Description, uses, and production.*—See paragraph 711.

*Imports of dressed poultry during 1911–1914 averaged 419,940 pounds. Later statistics follow:*

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
POULTRY, DEAD OR PREPARED IN ANY MANNER.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	391,633	\$177,846	\$7,833	4.40
1919.....	412,297	230,771	8,246	3.57
1920.....	2,887,097	1,200,483	57,342	4.78
1921 (9 months).....	1,994,666	745,291		
GAME BIRDS, DRESSED.				
1918.....		\$1,047	\$314	30.00
1919.....	7,091	3,952	1,186	30.00
1920.....	14,413	9,871	2,961	30.00
1921 (9 months).....	9,634	3,194		

*Exports* are not separately stated.

*Important changes in classification.*—Parts of two paragraphs of the act of 1913 (227 and 229) have been combined, to avoid uncertainty with respect to the scope of “game” birds; the clause regarding containers has been eliminated as unnecessary and a separate provision has been made for poultry, etc., prepared or preserved, to take care of a wide range of high-priced specialties such as *paté de foie gras*, and also such products as canned chicken, goose liver paste, etc.

## PARAGRAPH 713.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 713. Eggs of poultry, in the shell, 6 cents per dozen; whole eggs, egg yolk, and egg albumen, frozen or otherwise prepared or preserved, and not specially provided for, 4 cents per pound; dried whole eggs, dried egg yolk, and dried egg albumen, 15 cents per pound.

## ACT OF 1909.

PAR. 256. Eggs, not specially provided for in this section, five cents per dozen.

PAR. 257. Eggs, dried, fifteen cents per pound; eggs, yolk of, twenty-five per centum ad valorem; albumen, egg or blood, three cents per pound; \* \* \*

## ACT OF 1913.

PAR. 4. Dried egg albumen, 3 cents per pound.

PAR. 203. Eggs frozen or otherwise prepared or preserved in tins or other packages, not specially provided for in this section, including the weight of the immediate coverings or containers, 2 cents per pound; frozen or liquid egg albumen, 1 cent per pound.

PAR. 204. Eggs, dried, 10 cents per pound; eggs, yolk of, 10 per centum ad valorem.

PAR. 478. Eggs of poultry, \* \* \* [Free].

## EGGS OF POULTRY.

*Production.*—The domestic production of eggs reaches enormous figures: In 1909, 1,575,000,000 dozen were reported, valued at \$281,000,000. Farm sales amounted to \$150,000,000. In 1919 production amounted to 1,654,000,000 dozens. Although egg production is usually a by-product enterprise, there are large numbers of poultry farms and ranches in regions climatically and economically favorable, and especially near dense populations, as in New Jersey, the southeastern counties of Pennsylvania, and at Petaluma, near San Francisco. Cold storage and refrigeration in transit have revolutionized the business, making possible the commercial shipment of eggs from Hungary, California, and even China, to Atlantic markets. Production is largely seasonal; a surplus is produced during the four months beginning with April, placed in cold storage, and marketed during the succeeding months of comparative scarcity and higher prices. The annual receipts of cities such as New York and Chicago approximate 150,000,000 dozens, and of St. Louis and Cincinnati 50,000,000 dozens.

*Imports* of eggs in the shell during 1911–1913 averaged about 1,000,000 dozens. The removal of the duty of 5 cents per dozen in 1913 was followed by a great increase in imports from Hungary, from Russia (via Germany), and especially from China, which subsequently became the chief source of foreign supplies with the loss of European sources during the war. From 1914 to 1921, inclusive, the average annual importation amounted to 1,906,000 dozens. In China 2 to 3 dozens can be bought at seaports for the price of 1 dozen here; when carefully selected and handled, these eggs can be placed on the American market and sold to bakers, who use principally cheaper grades known as “seconds.” Chinese

eggs are marketed chiefly at New York. Since 1917 imports of eggs in the shell have been, by calendar years, as follows:

	1918	1919	1920	1921 (9 months).
Quantity (dozens).....	1,244,728	1,247,355	1,708,701	2,707,923
Value.....	\$362,665	\$394,629	\$617,909	\$794,352

*Exports.*—The annual exports of eggs of poultry have varied from 15,400,000 dozens to 38,327,000 dozens between 1912 and 1921, and have averaged 28,600,000 dozens. Previous to the war they went principally to Cuba, Mexico, Panama, and Canada. A part of the exports to Canada were regraded and forwarded to England. During the war heavy shipments were made direct to England, but during 1921 these virtually ceased; Cuba, Mexico, and Canada again are the chief customers. Exports of eggs since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (dozens).....	20,938,278	38,789,470	26,841,772	21,195,249
Value.....	\$8,428,214	\$18,812,231	\$13,569,144	\$6,735,772

*Important changes in classification.*—See General Notes on Paragraph, page 664.

#### FROZEN EGGS.

*Description and uses.*—Of the three methods of preserving eggs removed from the shell—(1) freezing, (2) drying or desiccating, and (3) adding preservatives—the first two produce food if the material used is wholesome, while the third gives a product known as “liquid” eggs or liquid albumen and yolk, which, under the pure food and drugs act, must be denatured, or rendered unfit for other than industrial purposes.

Commercial frozen eggs, frozen albumen and yolk (eggs that are graded, broken, and frozen in large containers, the whites and yolk being first either mixed, when whole eggs are desired, or separated in the case of the other products) are extensively used by establishments (principally cake bakers) which consume large quantities of eggs. There is a large demand for the separated albumen and yolk, as well as for the whole egg. Apart from being cheaper, the frozen product has advantages over the shell egg in long distance transportation; its importation in this form saves space and storage, and eliminates breakage and other waste.

Liquid eggs, liquid yolk, and especially liquid and dried albumen are used in the industries, the first two in tanning leather, while albumen is extensively used in the textile industries, in finishing paper, sensitizing photographic plates, and thickening inks.

*Production.*—Most of the “egg-breaking” plants are located near the important sources of raw materials, chiefly in the Middle West. In manufacture, the commercial grade of “seconds” is employed.

The industry furnishes an outlet for, and prevents the loss of, millions of dozens of inferior eggs, which, though still wholesome, often may not be profitably transported or stored. Indicative of the importance of this industry may be cited the fact that 15,800,000 pounds of frozen eggs, equivalent to about 14,000,000 dozen fresh eggs, were reported in cold storage in September, 1918, at the close of the principal breaking season.

Imports of frozen eggs were negligible prior to 1914; in that year those of frozen eggs amounted to 2,647,974 pounds, valued at \$305,232, and of frozen albumen to 259,587 pounds, valued at \$4,067. Imports increased steadily thereafter until their prohibition effective from June, 1918, to February, 1919. After the removal of the prohibition the volume of imports again increased. Egg products are imported almost exclusively from China, where the industry has rapidly developed under American, European, and Japanese capital. England, the center of the egg trade, usually has taken the greater part of Chinese exports. American receipts are chiefly at New York, Seattle, and San Francisco.

Statistics of imports of eggs and egg products follow:

Calendar year.	Quantity.	Value..	Duty.	Equivalent ad valorem.
WHOLE EGGS, FROZEN.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	1,099,251	\$142,296	\$21,985	15.45
1919.....	3,104,687	519,784	62,094	11.95
1920.....	9,187,355	1,503,932	183,747	12.22
1921 (9 months).....	6,707,659	982,284	.....	.....
YOLK OF EGGS, FROZEN OR DRIED.

1921 (9 months).....	9,017,652	2,472,128	.....	.....
EGG ALBUMEN, FROZEN OR LIQUID.				
1918.....	1,424,128	\$150,189	\$14,241	9.48
1919.....	2,573,271	399,643	25,733	6.44
1920.....	3,113,008	582,426	31,130	5.34
1921 (9 months).....	4,004,356	528,997	.....	.....

*Exports.*—None recorded.

*Important changes in classification.*—See General Notes on Paragraph, page 664.

#### DRIED EGGS.

*Description and uses.*—Either the whole egg broken out of the shell, or the white and yolk separated, on being subjected to the application of heat, have the water content (about 73 per cent) reduced by more than 90 per cent; thus a pound of the dried product equals from 36 to 40 eggs in the shell.

From 10 to 11 eggs in the shell will make 1 pound of frozen or one-third pound dried egg. One pound of dried egg equals 3.5 pounds of

frozen or liquid whole egg, or 3 dozen shell eggs. One pound of dried albumen is equivalent to about 7 pounds of frozen or liquid albumen. One pound of dried yolk is equivalent to about 2 pounds of frozen or liquid yolk.

Dried eggs have a wider range of usefulness than frozen eggs, since the dried product can be used in the household, and in camps, etc., where fresh eggs and refrigerating facilities are not available. Dried eggs are also used somewhat in hospitals and other institutions. Dried whole eggs and yolks are mainly consumed by pie and pastry bakers; dried albumen by cake, pie, and pastry bakers and confectioners. Quantities are also used in the arts.

*Production.*—In the United States the drying industry is of little importance as compared with that of freezing eggs. It has virtually ceased since 1916 owing to competition with China.

*Imports* of dried-egg products, almost exclusively from China, increased enormously after the reduction of the import duties. American plants operating in China supply only a small part of domestic consumption. Prior to 1914 imports were negligible, the domestic demand being supplied by domestic manufacturers. In 1914 the total imports of dried-egg products amounted to about 1,700,000 pounds. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
DRIED EGGS.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	366,189	\$124,785	\$36,619	29.34
1919.....	2,643,302	1,562,587	264,330	16.92
1920.....	2,719,276	1,251,843	271,928	21.72
1921 (9 months).....	1,420,802	599,271		

DRIED EGG ALBUMEN.				
1918.....	2,311,979	\$1,533,107	\$69,359	4.52
1919.....	4,060,361	4,148,522	121,811	2.94
1920.....	2,719,582	3,041,968	81,587	2.68
1921 (9 months).....	1,958,609	1,626,199		

*Exports* of yolk and canned eggs have never been of more than slight importance. They were valued at less than \$50,000 in prewar years. Recent exports, which have gone largely to Great Britain, have been valued by calendar years as follows: 1918, \$718,066; 1919, \$131,747; 1920, \$309,651; 1921 (nine months), \$126,575.

*Important changes in classification.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Paragraphs 4 (chemical schedule), 203 and 204 (agricultural schedule), and 478 (free list) of the act of 1913, all relating to eggs and egg products, have been combined in one dutiable paragraph in the agricultural schedule of H. R. 7456. This combination is warranted by the nature and uses of these products. The more definite term "eggs of poultry, in the shell" has been substituted for "eggs of poultry" (par. 478, act of 1913) or

"eggs, not specially provided for in this section" (act of 1909), in order definitely to include all eggs in the shell, whether or not treated by a preservative. The adjective "whole" has been added to the provisions for dried and frozen eggs to differentiate them from the separated yolk and albumen; separate provision has been made for dried and frozen egg yolk, and the clause with respect to containers has been dropped as unnecessary.

### PARAGRAPH 714.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 714. Horses and mules, valued at not more than \$150 per head, \$30 per head; valued at more than \$150 per head, 20 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 227. Horses and mules, valued at one hundred and fifty dollars or less per head, thirty dollars per head; if valued at over one hundred and fifty dollars, twenty-five per centum ad valorem.

PAR. 186. Horses and mules, 10 per centum ad valorem.

### HORSES.

*Description and uses.*—This paragraph applies only to horses of common stock. Animals of recognized breed, immigrants' teams, and animals imported temporarily for show purposes are free. (See pars. 1507 and 1508.) The average farm price of horses reached \$104 in 1918, but declined to \$82 in 1921. Prices of five or six classes are quoted on the Chicago market, in 1920 ranging from an average of \$88 for "southern chunks" to \$242 for "drafters."

*Production.*—The total number of horses on farms and elsewhere declined from 23,016,000 in 1910 to 21,492,000 in 1920. Most of this decline was in the number not on farms. The decrease was no doubt chiefly due to the increased competition of motor cars, trucks, and tractors. The registration of motor cars in 1920 was 8,370,000 and of trucks 842,000, while in the same year 163,000 tractors were sold in the country.

*Imports* of horses, principally from Mexico, Canada, France, and Belgium, reached the maximum in 1914, after the reduction of the duty from 25 per cent to 10 per cent. In that year a total dutiable import of 23,866 horses was valued at \$924,417, producing a revenue of \$107,191. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Number.</i>			<i>Per cent.</i>
1918.....	3,376	\$432,221	\$43,214	10
1919.....	4,188	500,964	50,084	10
1920.....	3,835	562,036	56,131	10
1921 (9 months).....	2,237	343,346		

*Exports* reached 357,553 head in 1916. In that year France received 52.4 per cent of the horses, the United Kingdom, 13.6 per cent, and Canada, 23 per cent. The exports to France and Italy were large

during the war. Exports since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months)
Number.....	51,170	19,691	14,338	10,180
Value.....	\$9,858,475	\$2,856,396	\$2,716,400	\$1,365,620

In 1920, half of the exports went to Canada. Other important destinations were Mexico, Cuba, and the United Kingdom.

#### MULES.

*Production.*—Statistics show a steady increment in the number of mules on farms, the increase being from 4,210,000 in 1910 to 5,451,000 in 1920. The average farm value in January, 1921, was \$116. Texas has 792,000, and Missouri, Georgia, Mississippi, Arkansas, and Alabama each have over 300,000 mules.

*Imports* reached their maximum in 1914 after the reduction of duty, numbering 16,992, with a value of \$428,380. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Number.</i>			<i>Per cent.</i>
1918.....	1,426	\$41,946	\$4,195	10
1919.....	560	24,446	2,295	.....
1920.....	490	43,226	4,275	.....
1921 (9 months).....	132	16,245	.....	.....

*Exports* increased from an average of 5,125 for the years 1910-1914 to 136,689 in 1917. Canada, Cuba, and Mexico were the important destinations before the war, but in 1915 the United Kingdom received 61,160. Exports since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Number.....	17,319	7,122	9,089	5,015
Value.....	\$3,360,653	\$1,189,180	\$1,866,343	\$383,513

In 1920, of the total number exported, Mexico received 57 per cent and Cuba, 22 per cent.

#### PARAGRAPH 715.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 715. Black or silver foxes, \$350 per head.

ACT OF 1909.

ACT OF 1913.

PAR. 229. All other live animals, not specially provided for in this section, twenty per centum ad valorem.

PAR. 187. All live animals not specially provided for in this section, 10 per centum ad valorem.

## BLACK OR SILVER FOXES.

*Description and uses.*—The black or silver fox is raised in captivity for its beautiful and valuable pelt. The fur is especially prized for neckpieces and muffs. Only in recent years has the industry been developed in Michigan, Wisconsin, Minnesota, New York, Massachusetts, and other northern States, but it has flourished in Canada, especially in Prince Edward Island, Nova Scotia, New Brunswick, and Quebec for the last 40 years.

Ordinary pelts range in price from \$50 to \$200 or \$300, while the better pelts bring as much as \$1,000 to \$1,200. A common price for a pair of good breeding animals is \$2,500, although poorer animals are sold as low as \$500 per pair.

*Production.*—In April, 1921, there were over 200 fox farms in the United States, having about 5,000 breeding animals. The number was doubtless considerably increased during the year. In Canada there were 424 fox farms in 1919, possessing 7,181 silver foxes, valued at \$3,111,000.

*Imports* consist mostly of breeding animals from the eastern Provinces of Canada, where the breeders' association has established a stud book for pure-bred animals. No separate statistics of imports are available.

*Exports.*—None recorded.

*Important changes in classification.*—New specific provision.

## PARAGRAPH 716.

## H. R. 7456.

## SENATE AMENDMENTS.

PAR. 716. Live animals, vertebrate and invertebrate, not specially provided for, 15 per centum ad valorem.

## ACT OF 1909.

## ACT OF 1913.

PAR. 229. All other live animals, not specially provided for in this section, twenty per centum ad valorem.

PAR. 187. All live animals not specially provided for in this section, 10 per centum ad valorem.

PAR. 619. \* \* \* all other domestic live animals suitable for human food not otherwise provided for in this section [Free].

## LIVE ANIMALS, N. S. P. F.

*Production* figures are not available.

*Imports* were valued at \$153,373 in 1916 and \$152,983 in 1917, yielding revenues of \$15,337 and \$15,272, respectively. Detailed statistics for later years follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
ASSES AND BURROS.				
	<i>Number.</i>			<i>Per cent.</i>
1918.....	236	\$9,370	\$937	10
1919.....	45	361	9	.....
1920.....	39	616	34	.....

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
DOGS.				
1918.....	197	\$5,917	\$592	10
1919.....	840	28,489	2,849	10
1920.....	1,235	46,850	4,685	10
1921 (9 months).....	1,059	38,892	.....	.....

## ALL ANIMALS NOT SPECIALLY PROVIDED FOR.

1918.....	.....	\$91,316	\$9,132	10
1919.....	5,135	208,592	20,846	.....
1920.....	5,436	351,424	35,142	10
1921 (9 months).....	4,931	89,033	.....	.....

*Exports* of all other animals (including fowls), for calendar years, have been as follows: 1918, \$288,645; 1919, \$464,702; 1920, \$702,218; 1921 (9 months), \$797,318.

*Important changes in classification.*—The words “vertebrate and invertebrate” have been added to make the provision applicable to bees, snails, frogs, lizards, etc., as well as to quadruped animals. Domestic live animals for food are exempt from duty under paragraph 619 of the act of 1913.

## PARAGRAPH 717.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 717. Honey, 2½ cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 259. Honey, twenty cents per gallon. PAR. 206. Honey, 10 cents per gallon.

## HONEY.

*Description and uses.*—Commercial honey is divided into two classes—comb and extracted. Comb honey and the better grades of extracted honey are used for table purposes, while the darker and the poorer grades of extracted honey are used in the manufacture of fancy cakes and biscuits. Honey possesses a special property which preserves and extends the keeping qualities of foodstuffs. Invert sugar is the baker's substitute for honey.

*Production* on farms was 61,099,290 pounds in 1899, 54,814,890 pounds in 1909, and 55,224,061 pounds in 1919. These figures include only the farm production. If the production in small towns and on small farms be included, the total would approximate 150,000,000 to 200,000,000 pounds. Beekeeping is a side line with many farmers and gardeners, but is gradually becoming more important as a main enterprise.

*Imports* of honey for 1910–1914 averaged 104,517 gallons, valued at \$57,195, principally from Cuba, Mexico, and Haiti. Following the reduction of the duty from 20 cents to 10 cents per gallon,

imports in 1914 declined to 75,079 gallons, valued at \$38,665. They increased greatly during the war, but were in large part reexported. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.
	<i>Gallons.</i>		
1918.....	151,854	\$237,820	\$14,340
1919.....	211,346	279,860	19,304
1920.....	933,215	1,235,759	85,037
1921 (9 months).....	111,767	76,696	.....

In 1920, imports from Cuba amounted to over 40 per cent of the total; those from the Dominican Republic, to 16 per cent; from Haiti, to about 10 per cent.

*Exports* for 1910-1914 averaged \$154,325. They were \$135,669 in 1914, over 55 per cent going to Germany. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	11,598,857	9,075,602	1,539,878	1,147,049
Value.....	\$2,223,396	\$1,955,091	\$265,352	\$141,100

In 1920 the United Kingdom received 28 per cent of our exports; the Netherlands, 21 per cent.

*Important changes in classification.*—The unit for levying duty has been changed from “gallon” to “pound.”

## PARAGRAPH 718.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 718. All fish, fresh, frozen, or packed in ice, not specially provided for, 1 cent per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 271. Fresh-water fish not specially provided for in this section, one-fourth of one cent per pound.

PAR. 272. \* \* \*; herrings, fresh, one-fourth of one cent per pound; eels and smelts, fresh or frozen, three-fourths of one cent per pound.

PAR. 273. Fish, fresh, \* \* \* frozen, packed in ice or otherwise prepared for preservation, not specially provided for in this section, three-fourths of one cent per pound; \* \* \* mackerel, halibut, or salmon, fresh, \* \* \* one cent per pound.

PAR. 483. Fresh-water fish, and all other fish not otherwise specially provided for in this section [Free].

FISH, FRESH, FROZEN, OR PACKED IN ICE.

*Description and uses.*—Under this paragraph are included all fresh fish except shellfish, sea herring, and tuna. Because of the variable

habitat of many fish it is difficult to classify them, except arbitrarily, into the groupings of fresh-water or salt-water fish. The places of capture will, in a general way, determine whether they are of the fresh or salt-water varieties. Herring and cod are the world's most important fish.

The average consumption of fish per capita in various countries is as follows: The United States, about 20 pounds; Japan, 200; the United Kingdom, 65; Canada, 57; Sweden, 52; Norway, 44; and Denmark, 39 pounds. The United Kingdom leads the world in the amount and value of fisheries products; Japan, Norway, the United States, Canada, and France follow.

*Production* statistics are not uniformly available for recent years. It is estimated, however, that the present annual catch of United States fisheries amounts to 2,500,000,000 pounds, with a value of at least \$85,000,000. In 1908, the latest year for which detailed statistics have been obtained, the total was 1,893,454,000 pounds, valued at \$54,031,000. Oysters ranked first, comprising 29 per cent of the total value of the 1908 catch; the fish next in importance were salmon, cod, shad, lobsters, clams, squeteague, and halibut. The fisheries of the Atlantic coast division contributed nearly two-thirds of the value of products, an output which corresponds to the proportion credited to this division of the total national capital invested in fishing vessels and boats and to the number of persons engaged. Of the domestic fresh-water fish the more important are the carp, lake herring, catfish, trout, pike perch, yellow perch, and white fish. The lake herring or ciscoe is the most important fish of the Great Lakes region, the catch in 1908 being 41,118,000 pounds, valued at \$989,000. The carp led the fresh-water fish, with 42,763,000 pounds, valued at \$1,135,000.

In 1908 the catch of cod was 110,054,000 pounds, valued at \$2,914,000; of shad 27,641,000 pounds worth \$2,113,000; of the common weakfish or squeteague, which is abundant along the Atlantic coast, 49,869,000 pounds, valued at \$1,776,000. Halibut is found in the North Atlantic and Pacific Oceans, the 1908 catch being 34,441,000 pounds, valued at \$1,562,000. Menhaden, the most abundant fish found in domestic waters is valued mainly for oil and guano; the catch in 1908 was 394,776,000 pounds, valued at \$893,000. The mackerel catch was 12,103,000 pounds, valued at \$848,000; that of herring, 125,050,000 pounds, valued at \$796,000.

*Imports* of all fish, in the fiscal years 1913 and 1914, were valued at \$15,330,280 and \$18,758,743. In the calendar year 1920 the imports were 262,671,266 pounds, valued in foreign markets at \$34,122,423. Of this total, shellfish (chiefly crab meat from Japan and lobster from Canada) constituted \$6,345,233. Cured or preserved fish amounted to 168,723,182 pounds, valued at \$17,241,478, the principal items in this group consisting of cod, haddock, hake, and pollock, chiefly from Canada and Newfoundland; sardines, chiefly from Norway, Portugal, and France; herring and mackerel, chiefly from the United Kingdom, Canada, Newfoundland, and Holland. Fresh fish, exclusive of shellfish, amounted to 113,174,345 pounds, valued at \$10,535,712, and were received mostly from Canada. The great bulk of the imported salmon, halibut, and smelts are received in the fresh state; most of the imported cod, haddock, hake, and pollock are cured or preserved, and the herring and mackerel are pickled or salted.

More detailed information concerning imports since 1917 of fresh fish are given by calendar years in the following table:

	1918	1919	1920	1921 (9 months).
Fresh-water fish:				
Quantity (pounds).....	41, 442, 824	46, 790, 144	46, 316, 440	33, 395, 968
Value.....	\$3, 200, 435	\$3, 818, 607	\$4, 486, 248	\$2, 801, 917
Halibut, fresh, frozen, or packed in ice:				
Quantity (pounds).....	16, 783, 580	17, 471, 860	17, 585, 564	16, 636, 092
Value.....	\$2, 079, 694	\$2, 335, 086	\$2, 604, 813	\$2, 181, 832
Cod, haddock, hake, and pollock, fresh, frozen, or packed in ice:				
Quantity (pounds).....	11, 350, 424	9, 146, 618	8, 301, 218	7, 294, 426
Value.....	\$723, 513	\$468, 187	\$449, 176	\$321, 011
Smelts, fresh or frozen:				
Quantity (pounds).....	5, 154, 783	6, 202, 946	6, 284, 641	4, 357, 995
Value.....	\$637, 506	\$755, 696	\$747, 152	\$573, 814
Salmon, fresh, frozen, or packed in ice:				
Quantity (pounds).....	15, 192, 708	13, 746, 948	5, 649, 599	9, 401, 631
Value.....	\$916, 707	\$826, 067	\$664, 216	\$979, 237
Mackerel, fresh, frozen, or packed in ice:				
Quantity (pounds).....	6, 067, 238	6, 073, 698	5, 378, 544	4, 315, 860
Value.....	\$656, 107	\$548, 874	\$543, 807	\$400, 910
Eels, fresh or frozen:				
Quantity (pounds).....	388, 049	459, 059	665, 270	140, 787
Value.....	\$43, 206	\$47, 632	\$69, 058	\$14, 288
Other fish, n. s. p. f.—fresh, frozen, or packed in ice:				
Quantity (pounds).....	6, 910, 936	30, 086, 176	14, 973, 555	7, 108, 789
Value.....	\$538, 256	\$1, 206, 696	\$812, 651	\$586, 406
Total fresh fish (except shellfish):				
Quantity (pounds).....	113, 060, 793	135, 605, 168	113, 174, 345	87, 231, 399
Value.....	\$9, 073, 944	\$10, 129, 719	\$10, 535, 712	\$7, 964, 517

Of the 1920 imports of "fish, fresh, frozen, or packed in ice," fresh-water fish amounted to 41 per cent in quantity and 43 per cent in value. The following fish amounted to the specified percentages of quantity and value, respectively: Halibut, 16 and 25 per cent; cod, haddock, hake, and pollock, 7 and 4 per cent; herring, 7 and 2 per cent; smelts, 6 and 7 per cent; salmon, 5 and 6 per cent; mackerel, 5 and 5 per cent; and all other, n. s. p. f., 13 and 8 per cent.

Exports of all fish in the year 1914 amounted to \$12,842,173, of which salmon, chiefly canned and cured, constituted about 80 per cent and oysters 5 per cent. In 1920, exports were \$31,498,507, of which salmon was less than half. Between 1914 and 1920 a large export trade developed in other canned and cured fish, such as canned tuna and sardines, and cured or preserved cod, hake, haddock, and pollock, the prewar exports of which had been small.

Our exports of fresh fish have been relatively small. Exports of "fresh fish, except salmon" in 1914 were 6,534,460 pounds, valued at \$366,871, most of the shipments going to Canada and Cuba. Unknown quantities of fresh salmon are included in the export classification "salmon, except canned and pickled," under which was recorded in 1914 a total value of \$2,195,309. Later export returns, for fresh fish, follow:

	1918	1919	1920	1921 (9 months).
Fresh fish, except salmon:				
Quantity (pounds).....	8, 922, 615	10, 162, 596	9, 624, 692	7, 451, 706
Value.....	\$832, 968	\$919, 093	\$840, 641	\$575, 623
Salmon (except canned and pickled):				
Value.....	\$313, 637	\$842, 464	\$359, 364	\$320, 568

*Important changes in classification.*—The fish covered by this paragraph are exempt from duty under paragraph 483 of the act of 1913.

With a view to simplification, all fresh fish (except shellfish, sea herring, and tuna), whether fresh water or salt water varieties, have been provided for in this paragraph.

### PARAGRAPH 719.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 719. Salmon, pickled, salted, smoked, kippered, or otherwise prepared or preserved, 25 per centum ad valorem; finnan haddie, 25 per centum ad valorem; fish, dried, salted or unsalted, 1½ cents per pound; fish, skinned or boned, including herring skinned, in bulk, or in immediate containers weighing with their contents more than thirty pounds each, 2½ cents per pound, including the weight of the immediate container with the contents.

#### ACT OF 1909.

PAR. 273. Fish, \* \* \* smoked, dried, salted, pickled, \* \* \* or otherwise prepared for preservation, not specially provided for in this section, three-fourths of one cent per pound; fish, skinned or boned, one and one-fourth cents per pound; \* \* \* salmon, \* \* \* pickled, or salted, one cent per pound.

#### ACT OF 1913.

PAR. 216. \* \* \* all other fish, except shellfish, in tin packages, not specially provided for in this section, 15 per centum ad valorem; \* \* \* fish, skinned or boned, ¾ of 1 cent per pound.

PAR. 483. \* \* \* all other fish not otherwise specially provided for in this section [Free].

### SALMON.

(See Survey G-19.)

*Description and uses.*—Salmon, finnan haddie, herring, mackerel, cod, haddock, hake, and pollock, and other fish, dried, salted or unsalted, skinned or boned, and prepared or preserved, are included under this heading. The salmon is preeminent among canned fish, sardines and tuna ranking next. The two last named are dutiable under paragraph 721.

*Production.*—The salmon is caught in immense quantities in the rivers emptying into the Pacific, from San Francisco to the straits in Alaska, the industry centering in Alaska and on the Columbia River and Puget Sound. Five general species are packed, varying in size, in color and texture of the flesh, and in flavor. The red or sockeye and humpback or pink comprise over half of the canned salmon. Other brands are chum or keta, coho or silver, and king or spring. The prejudice against the paler varieties arises from appearance rather than quality.

In 1918 the domestic catch of salmon was 613,910,343 pounds, of which Alaska contributed 516,723,167 pounds and the Pacific coast States the remainder. The products of the salmon fisheries are either canned or mild cured, smoked, pickled, or sold fresh or frozen. The great bulk of the catch is canned, and of this canned salmon the United States packs about 90 per cent of the world's output. In the census year 1919, the domestic pack of canned salmon was approximately

300,000,000 pounds, valued at \$56,467,000; the production of mild cured salmon was about 13,747,000 pounds, and of smoked and dried salmon 5,574,273 pounds. The Alaskan output of pickled salmon in 1918 was about 11,370,000 pounds.

*Imports* in 1914 of salmon other than fresh, were 1,173,261 pounds, valued at \$90,783. Practically all of such imports were of pickled or salted salmon from Canada. Imports since 1917 by calendar years follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
SALMON, PICKLED OR SALTED.				
1918.....	<i>Pounds.</i> 637,622	\$81,984		<i>Per cent.</i>
1919.....	1,004,978	163,350		
1920.....	718,570	117,218		
1921 (9 months).....	505,898	97,279		

SALMON IN TIN PACKAGES.				
1918.....	2,393,566	\$346,556	\$51,983	15
1919.....	2,740,572	348,708	52,306	15
1920.....	1,509,319	237,026	35,554	15
1921 (9 months).....	80,166	19,896		

SALMON, DRIED OR SMOKED.				
1918.....	179,555	\$28,101		
1919.....	139,736	27,161		
1920.....	306,364	56,755		
1921 (9 months).....	193,279	47,556		

*Exports* of canned salmon in 1914 were 87,750,920 pounds, valued at \$7,799,293; and of all other salmon, fresh or cured, \$2,195,309. Later statistics of exports for calendar years follow:

	1918	1919	1920	1921 (9 months).
<b>Salmon, canned:</b>				
Quantity (pounds).....	91,101,734	169,750,672	64,832,363	28,402,776
Value.....	\$13,149,307	\$28,644,706	\$12,186,733	\$4,287,849
<b>Salmon, pickled:</b>				
Quantity (barrels).....	2,185	22,256	28,636	22,305
Value.....	\$55,097	\$947,694	\$1,402,681	\$1,155,011
All other salmon.....	\$313,637	\$842,464	\$359,364	\$320,568

*Important changes in classification.*—See General Notes on Paragraph, page 675.

#### FINNAN HADDIE.

*Description and uses.*—Finnan haddie is a lightly pickled and lightly smoked product of the haddock.

*Production* in 1919 was 6,707,687 pounds, valued at \$579,000, compared with 4,095,693 pounds, valued at \$2,759,000 in 1914.

*Imports and exports.*—Not separately stated.

## FISH, DRIED, SALTED, OR UNSALTED.

*Description and uses.*—This group includes chiefly the cod, haddock, hake, pollock, and cusk; they are generally known as ground fish, and are characterized by a low percentage of oil in the tissues, the oil being stored in the livers. Large quantities are further prepared by skinning and boning.

*Production* of all smoked or dried fish amounted in 1919 to 39,362,345 pounds, with a value of \$5,733,000. This census classification, however, appears chiefly to include smoked fish. The bulk of the dry salted fish seems to have been reported under "salted or pickled fish" (see Production, p. 679).

*Import* returns do not segregate dried and other cured forms. The chief items in the imports of dried fish, however, appear to be the cod and related fish, and herring. The following table gives a comparison for the fiscal year 1914 and for later calendar years of imports of dried fish, exclusive of salmon. (In a number of instances the import returns do not separate dried from other cured forms.)

	1914	1918	1919	1920	1921 (9 months).
Cod, haddock, hake, and pollock, dried, smoked, salted, or pickled:					
Quantity (pounds).....	38,446,163	83,458,448	79,460,202	49,141,413	32,465,066
Value.....	\$1,988,970	\$7,020,357	\$7,157,834	\$4,229,638	\$2,157,743
Halibut, dried or smoked:					
Quantity (pounds).....	36,683	40,565	74,348	97,231	85,514
Value.....	\$1,930	\$3,086	\$9,783	\$11,375	\$10,899
Herring, dried or smoked:					
Quantity (pounds).....	8,002,304	4,378,849	6,120,915	10,122,475	5,179,197
Value.....	\$218,897	\$297,044	\$397,265	\$626,168	\$160,735
Other fish, dried or smoked:					
Quantity (pounds).....	7,679,010	4,592,212	6,126,691	4,941,279	2,173,130
Value.....	\$517,150	\$589,966	\$1,066,587	\$723,300	\$1,342,246

*Exports*, likewise, do not segregate dried fish. The available data for recent years are quoted below:

	1918	1919	1920	1921 (9 months).
Cod, haddock, hake, and pollock, dried, smoked, or cured:				
Quantity (pounds).....	31,404,648	42,058,547	33,768,409	14,799,291
Value.....	\$4,221,858	\$6,560,673	\$4,818,693	\$1,427,698
Herring, dried, smoked, or cured:				
Quantity (pounds).....	4,295,251	5,164,727	7,863,518	3,469,290
Value.....	\$437,991	\$502,416	\$600,326	\$199,648

*Important changes in classification.*—See General Notes on Paragraph, page 675.

## FISH, SKINNED OR BONED.

*Description and uses.*—Fish falling under this class represent an advanced state of preparation, chiefly of the group cod, haddock, hake, and pollock. It is probable that the item of greatest importance under "fish, skinned or boned," is the cod.

*Production* of boned fish in 1908 amounted to 38,307,000 pounds, valued at \$3,526,000. The output of cod, boned, was 90 per cent in value and 84 per cent in quantity of the total. Herring and haddock

were the other two fish of some importance; pollock, hake, and cusk were reported in small amounts.

*Imports* increased from 2,382,914 pounds in 1913 to 3,154,899 pounds in 1914, and in value from \$176,742 to \$244,775, respectively, the greater part probably coming from Canada. Later statistics follow:

Calendar year.	Quantity.	Value	Duty.	Equivalent ad valorem
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	2,374,938	\$354,188	\$17,812	5.03
1919.....	2,871,551	436,442	21,587	4.93
1920.....	3,177,318	442,862	23,830	5.39
1921 (9 months).....	2,028,404	285,605		

*Exports.*—None recorded.

*Important changes in classification.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Most of the fish enumerated in this paragraph come within paragraph 483 of the free list of the act of 1913. The provision for salmon is intended to include salmon, whether canned, smoked, or prepared or preserved in any manner, except when packed in oil or oil and other substances (see par. 721). Fresh salmon is included in paragraph 718, with all other fresh fish n. s. p. f.

A new provision has been outlined for finnan haddie. This fish has not been specially provided for in former tariff acts.

The clause "fish, dried, salted or unsalted," is intended to cover the group, cod, haddock, pollock, hake, cusk, and stock fish (a Norwegian dried, unsalted product) and any other fish similarly prepared.

The clause "fish, skinned or boned, including herring skinned, in bulk, or in immediate containers weighing \* \* \*," includes fish listed in paragraph 718, in an advanced state of preparation. When packed in containers of 30 pounds or less, they would be dutiable under the second provision in paragraph 721; and when green or wet salted, under the last provision of paragraph 721.

*Suggested changes.*—The new plan of fixing duties upon gross weight may avoid some losses to importers through the occasional opening of barrels to verify the net weights stamped thereon. It has been represented to the Commission, however, that assessment of duty upon brine would tend to reduce the quantity of brine and impair the quality of the imported product.

#### PARAGRAPH 720.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 720. Herring and mackerel, pickled or salted, whether or not boned, when in bulk, or in immediate containers weighing with their contents more than thirty pounds each, 1½ cents per pound, including the weight of the immediate container and the brine, pickle, and salt.

## ACT OF 1909.

PAR. 272. Herrings, pickled or salted,  
\* \* \* one-half of one cent per pound;  
\* \* \*

PAR. 273. \* \* \* mackerel, \* \* \*  
pickled, or salted, one cent per pound.

## ACT OF 1913.

PAR. 483. \* \* \* all other fish not  
otherwise specially provided for in this  
section [Free].

## HERRING AND MACKEREL.

*Description and uses.*—Herring is sold fresh to a limited extent, only. The bulk of the catch is salted or pickled, and smoked, sold as bloaters, or hard smoked and dried. The last named are further prepared by skinning and boning. A small quantity is preserved by canning. The immature herring is the fish used for sardines in the Maine sardine industry. A cured herring industry using the Scotch method of salt curing has been developed in Alaska during the past few years. The product is the equal of the Scotch cured herring.

Mackerel, taken on the North Atlantic Coast, are extensively marketed as fresh fish. The surplus, after the fresh fish markets of this country are supplied, goes to the salters for preparation as salt mackerel. In localities remote from fresh fish markets the catches are generally salted. A relatively small quantity of mackerel is preserved by canning.

*Production.*—Herring are taken in greatest abundance on the North Atlantic coast and on the Pacific Northwest coast from Puget Sound to Alaska. Fresh herring taken off the New England coast in 1919 amounted to 97,630,195 pounds, valued at \$589,093. The catch off the Pacific coast was 2,906,033 pounds in 1915. The products of the herring fisheries in Alaska in 1917 amounted to \$562,002. The domestic catch of mackerel is taken chiefly off the New England coast. In 1919 the fresh mackerel from this region amounted to 14,527,950 pounds, valued at \$1,451,490.

The total production of salted or pickled herring for continental United States and Alaska in 1919 amounted to 18,823,979 pounds, valued at \$1,101,000, compared with 22,150,974 pounds, valued at \$669,000 in 1914. The total production of salted and pickled mackerel in 1919 amounted to 5,162,900 pounds, valued at \$1,006,000, compared with 6,224,313 pounds, valued at \$520,000 in 1914.

*Imports* in 1914 of herring, pickled or salted, amounted to 93,769,564 pounds, valued at \$3,373,249. In the same year imports of mackerel, pickled or salted, amounted to 31,496,847 pounds, valued at \$1,729,-718. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Herring, pickled or salted:				
Quantity (pounds).....	66,564,421	68,024,884	50,449,414	30,588,329
Value.....	\$3,761,616	\$4,663,693	\$3,157,010	\$1,929,169
Mackerel, pickled or salted:				
Quantity (pounds).....	15,086,402	19,129,330	19,864,291	6,330,533

*Exports.*—Not shown separately. See "Fish, n. s. p. f. pickled or salted" (par. 721).

*Important changes in classification.*—Fish covered by this paragraph are exempt from duty (unless boned) under paragraph 483 of the act of 1913. Paragraph 720 includes salt and pickled herring and mackerel, when in packages weighing more than 30 pounds each; these are usually packed commercially in half barrels and barrels, as the Scotch-cured herring. Herring and mackerel in barrels and half barrels also come from Norway and Holland. The paragraph is so worded as to obviate the necessity, in determining the dutiable weight, of opening the packages in order to weigh the fish, exclusive of the container, brine, pickle, and salt.

“Whether or not boned” has been added in order to include in this provision, rather than in paragraph 719, such products as Bismarck herring, rollmops, roulade, etc., in pickle or spiced pickle, when in packages conforming to the sizes specified.

When herring and mackerel of the above descriptions are imported in containers weighing 30 pounds or less, they are intended to come within paragraph 721.

*Suggested changes.*—The fish paragraphs have in general been arranged according to the degree of advancement in the preparation of the products. For this reason paragraphs 719 and 720 should be transposed. (See also *Suggested changes* on page 675.)

---

### PARAGRAPH 721.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 721. Fish (except shellfish), by whatever name known, packed in oil or in oil and other substances, 26 per centum ad valorem; all fish (except shellfish), pickled, salted, smoked, kippered, or otherwise prepared or preserved (except in oil or in oil and other substances), in immediate containers weighing with their contents not more than thirty pounds each, 20 per centum ad valorem; in bulk or in immediate containers weighing with their contents more than thirty pounds each, 1½ cents per pound, including the weight of the immediate container with the contents.

ACT OF 1909.

ACT OF 1913.

PAR. 270. Fish (except shellfish) by whatever name known, packed in oil, in bottles, jars, kegs, tin boxes, or cans, shall be dutiable as follows: When in packages containing seven and one-half cubic inches or less, one and one-half cents per bottle, jar, keg, box, or can; containing more than seven and one-half and not more than twenty-one cubic inches, two and one-half cents per bottle, jar, keg, box, or can; containing more than twenty-one and not more than thirty-three cubic inches, five cents per bottle, jar, keg, box, or can; containing more than thirty-three and not more than seventy cubic inches, ten cents per bottle, jar, keg, box, or can; all other fish (ex-

PAR. 216. Fish, except shellfish, by whatever name known, packed in oil or in oil and other substances, in bottles, jars, kegs, tin boxes, or cans, 25 per centum ad valorem; all other fish, except shellfish, in tin packages, not specially provided for in this section, 15 per centum ad valorem; \* \* \*

PAR. 483. \* \* \* all other fish not otherwise specially provided for in this section [Free].

## ACT OF 1909.

## ACT OF 1913.

cept shellfish) in tin packages, thirty per centum ad valorem; fish in packages, containing less than one-half barrel, and not specially provided for in this section, thirty per centum ad valorem; \* \* \*

PAR. 272. Herrings, pickled or salted, smoked or kippered, one-half of one cent per pound; \* \* \*

PAR. 273. Fish, \* \* \* smoked, dried, salted, pickled, \* \* \* or otherwise prepared for preservation, not specially provided for in this section, three-fourths of one cent per pound; \* \* \* mackerel, halibut, or salmon, \* \* \* pickled or salted, one cent per pound.

## CANNED FISH, EXCEPT SHELLFISH.

(See Survey G-19.)

*Description and uses.*—Sardines, tuna, and anchovies make up nearly all of the total of fish packed in oil, or in oil and other substances. The sardine is by far the most important. The Maine sardine is prepared from the small herring; the California sardine from the pilchard, a fish closely resembling the French pilchard. The sprat, pilchard, and brisling, used in Europe for sardines, are usually imported canned in oil. Anchovies packed in oil are imported in small amounts. The tuna is the only important American fish, except sardines, canned in oil.

Olive oil, peanut oil, and cottonseed oil are used in the preparation of the sardine, either as a frying substance or for canning. The variation in prices of sardines is largely due to varying methods of preparation, and to different costs of cottonseed oil and olive oils. Various sauces are also often added to impart flavoring.

*Production.*—The output of domestic sardines amounted to 5,012,199 cases in 1914, valued at \$6,238,933. In 1919 the output was 5,777,935 cases, valued at \$20,258,565. A small amount of the sardines is not canned in oil, the fish being smoked and prepared with sauces, usually mustard and tomato. The canning of tuna fish in oil has assumed considerable proportions recently, in 1914 amounting to 437,090 cases, valued at \$1,638,675, and in 1919, 874,380 cases, valued at \$5,710,188. About 63 per cent of the sardines were packed in Maine and the rest in California. All of the tuna is packed in California. Anchovies in oil are not packed in this country.

In 1919 the output of other canned fish (excluding clams, oysters, salmon, sardines, shrimp, and tuna, elsewhere separately given), was valued at \$2,234,000. Among the more important items in this group are canned shad and canned roe, mackerel, and herring.

*Imports* in 1914, of canned "fish in oil, or in oil and other substances" were \$3,220,696. These consisted largely of sardines from Norway, Portugal, France, and Spain, and of relatively small quantities of tuna and anchovies in oil.

Of other canned fish, imports in 1914 were: Canned herring, 4,643,158 pounds, \$373,648; canned mackerel, 579,239 pounds, \$41,514; other canned fish (excluding the fish above enumerated, as well as salmon and shellfish), \$761,100. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
CANNED SARDINES, TUNA, AND ANCHOVIES.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....		\$183,419	\$45,855	25
1919.....	5,406,454	1,946,154	486,538	25
1920.....	11,734,613	3,316,022	829,005	25
1921 (9 months).....	12,827,424	2,708,163		

## CANNED HERRING.

1918.....	343,468	\$30,172	\$4,526	15
1919.....	1,089,820	147,414	22,112	15

1921 (9 months).....	3,091,694	509,767		

Export statistics are not available for fish packed in oil. Canned fish (except salmon and shellfish) were valued at \$118,836 in 1914. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Canned fish, except salmon and shellfish: Value.....	\$8,609,313	\$6,755,074	\$8,183,729	\$1,043,276

## ALL FISH, PREPARED OR PRESERVED, N. S. P. F., IN BULK, ETC.

*Description and uses.*—This is a catch-all clause for such prepared or preserved fish, shipped in bulk, as do not fall under the more specific provisions of other paragraphs relating to fish. Among the chief items under this general provision are pickled or salted cod, hake, haddock, and pollock, as well as halibut similarly prepared.

*Production* of salted or pickled fish in 1919 was 119,613,388 pounds. Two of the largest items therein, herring and mackerel, are provided for in other sections (see pars. 720 and 721, fish in containers of less than 30 pounds); the production of cod was 63,551,903 pounds, valued at \$12,687,000; haddock, 7,491,146 pounds, \$815,000; and a group designated as "all other" 24,583,460 pounds, \$3,628,000. A large proportion of the fish classified as "salted or pickled" by the

Census appears to be of dry salted fish, especially cod, haddock, hake, and pollock. These are included under paragraph 719 on page 674.

Import statistics are not sufficiently detailed to segregate such fish as would fall under this provision. Recent statistics for some kinds of pickled fish follow:

Calendar year.	Quantity.	Value.
ALL FISH, N. S. P. F., PICKLED OR SALTED.		
	<i>Pounds.</i>	
1918 .....	4,470,352	\$272,523
1919 .....	7,823,567	696,478
1920 .....	4,995,532	389,040
1921 (9 months) .....	1,164,777	105,798
HALIBUT, PICKLED OR SALTED.		
1918 .....	680	\$106
1919 .....	70,316	8,030
1920 .....	246,678	17,016
1921 (9 months) .....	6,400	1,249

*Exports* are combined with other classifications.

*Important changes in classification.*—The words “in bottles, jars, kegs, tin boxes, or cans” have been omitted, since mention of the method of putting up “in oil, or in oil and other substances,” appears sufficient without specification of containers.

The clause “all fish (except shellfish), pickled, salted, smoked, kippered, or otherwise prepared or preserved (except in oil or in oil and other substances), \* \* \* is intended to include all fish not specially provided for.

Use of the term “canned” has been avoided because of possible difficulties of interpretation. A division at 30 pounds has been made, for the reason that while many of these products are packed in small containers, others, such as anchovies and herring, are packed in large hermetically sealed cans, and sold in such large cans to the retail trade, to grocers, etc.

The provision for fish in containers weighing over 30 pounds is intended to include fish in bulk, bundles, and large containers, and avoids the necessity of determining what weights constitute a half barrel or a barrel. Cod, hake, haddock, pollock, and cusk when green or wet salted, in bulk, come within this general provision.

*Suggested changes.*—See under *Suggested changes* on page 675.

## PARAGRAPH 722.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 722. Crab meat, packed in ice or frozen, or prepared or preserved in any manner, 26 per centum ad valorem; fish paste and fish sauce, 28 per centum ad valorem; caviar and other fish roe for food purposes, packed in ice or frozen, prepared or preserved, by the addition of salt in any amount, or by other means, 28 per centum ad valorem.

## ACT OF 1909.

PAR. 253. \* \* \* fish paste or sauce, forty per centum ad valorem.

PAR. 270. \* \* \* caviar, and other preserved roe of fish, thirty per centum ad valorem.

[No corresponding provision for crab meat.]

## ACT OF 1913.

PAR. 201. \* \* \* fish paste or sauce, 25 per centum ad valorem.

PAR. 216. \* \* \* caviar and other preserved roe of fish, 30 per centum ad valorem; \* \* \*

[No corresponding provision for crab meat.]

## CRAB MEAT.

*Description and uses.*—The demand for fresh crab meat, such as the lobster, has become so great that now only a limited quantity is canned. A few canneries are located around Norfolk, Va. The crab is first boiled, then the shells are cracked and the meat removed by picking, by centrifugal force, or by compressed air. It is packed in two grades, the large clear white meat and the mixture of small bits and of dark meat.

*Production* of canned crab meat in 1908 was 789,000 pounds, valued at \$166,000. The crab catch off the Pacific Coast States was 3,563,837 pounds, valued at \$196,715, in 1915; the South Atlantic catch was 458,065 pounds, valued at \$28,583, in 1918; and the New England catch was 1,869,866 pounds, valued at \$54,821, in 1919.

*Imports* of crab meat in 1913 amounted to 2,819,752 pounds, valued at \$448,247. Practically all crab meat now comes from Japan. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	3,154,183	2,689,915	4,078,980	1,723,719
Value.....	\$1,029,413	\$1,066,248	\$2,166,068	\$748,773

*Exports.*—None recorded.

*Important changes in classification.*—See General Notes on Paragraph, page 682.

## FISH PASTE AND FISH SAUCE.

*Description, uses, and production.*—Fish paste and sauce are condiments especially prepared as a seasoning or dressing for fish. Production statistics are not available.

*Imports* since 1917 have been as follows:

Calendar year.	Value.	Duty.	Ad valorem rate.
1918.....	\$16,009	\$3,941	<i>Per cent.</i> 25
1919.....	31,597	7,899	25
1920.....	54,105	13,526	25
1921 (9 months).....	32,792		

*Exports.*—Not separately recorded.

*Important changes in classification.*—See General Notes on Paragraph, page 682.

## CAVIAR, AND OTHER FISH ROE FOR FOOD PURPOSES.

*Description and uses.*—Caviar is the roe of the sturgeon and other large fish, prepared in several grades as a food. Next to the sturgeon, the spoonbill catfish or paddlefish yields the highest grade of caviar. The large demand has led to the use of the roe of other fish, principally the shad and herring. Many of these preserved roes resemble sturgeon caviar in color and texture, but are not labeled and sold as caviar without qualifying names to indicate their source. A product similar to caviar from the roe of pollock has recently been marketed.

*Production* statistics are not available for recent years. The sturgeon found in the Mississippi Valley, in the Great Lakes region, and on the Atlantic seaboard being almost extinct, the greater part of American "caviar" is necessarily the roe of other fish. In 1908 the domestic output amounted to 217,000 pounds, valued at \$95,000. Florida reported 135,000 pounds, valued at \$16,000. In 1919 a total of 26,768 cases of fish roe valued at \$174,268 was canned in this country.

Of foreign production the highest grades and the largest quantities of the cheaper grades have in the past been manufactured in Russia, principally on the Volga River. Besides the several varieties of sturgeon utilized, the roe of the pike perch is used in the manufacture of a red caviar, and of the dog salmon for what is known as keta caviar.

*Imports* of caviar in 1913 were valued at \$184,745 and of other preserved roes, \$13,180; they increased to \$213,320 and \$27,182 in 1914. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
CAVIAR.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....		\$34,097	\$10,229	30
1919.....	4,961	7,715	2,314	30
1920.....	41,601	65,793	19,733	30
1921 (9 months).....	12,286	26,755		
OTHER PRESERVED ROE OF FISH.				
1918.....		\$8,524	\$2,557	30
1919.....	131,966	35,804	10,741	30
1920.....	120,979	32,097	9,629	30
1921 (9 months).....	38,795	8,233		

*Exports* of caviar and other preserved roe of fish in 1909 (the last year they were separately given) were valued at \$14,883, and went mostly to Canada, Cuba, and Central American States.

*Important changes in classification.*—See below.

## GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—A new specific provision has been added for crab meat. This product is imported in large quantities, chiefly from Japan and from Norway.

"Fish paste and fish sauce" have been transferred from paragraph 253 of the act of 1909 (par. 201, act of 1913) with a view to including in this section of the tariff all dutiable fish and fish products.

The portion of the paragraph relating to caviar has been so worded as to include roe of fish other than the sturgeon, which is entitled to be called "caviar" without a qualifying name. It will include "Tarama" (Russian for red caviar, made from roe of the pike-perch), "Glossar" (name applied to fish roe preserved with the sac intact), and other fish roe, qualified by the name of the fish from which taken, when prepared or preserved for food purposes by any manner or means. The clause "by the addition of salt in any amount" in connection with the preparation and preservation of fish roe has been inserted to include cases where it has been held that 10 per cent of salt must be present to constitute preservation by salt (T. D. 37701, of 1918), and where the presence of a quantity of salt sufficient to preserve in New York during the winter but not during the summer was held not to constitute "preservation" (*Mascahledes v. United States*, 6 Ct. Cust. Appls. 399, of 1915).

---

### PARAGRAPH 723.

#### H. R. 7456.

#### SENATE AMENDMENTS

PAR. 723. Barley, hulled or unhulled, 15 cents per bushel of forty-eight pounds; barley malt, 40 cents per one hundred pounds; pearl barley and barley flour, 2 cents per pound.

#### ACT OF 1909.

#### ACT OF 1913.

PAR. 230. Barley, thirty cents per bushel of forty-eight pounds.

PAR. 188. Barley, 15 cents per bushel of forty-eight pounds.

PAR. 231. Barley malt, forty-five cents per bushel of thirty-four pounds.

PAR. 189. Barley malt, 25 cents per bushel of thirty-four pounds.

PAR. 232. Barley, pearled, patent, or hulled, two cents per pound.

PAR. 190. Barley, pearled, patent, or hulled, 1 cent per pound.

#### BARLEY.

(See Report T. I. S.-20.)

*Description and uses.*—The better grades of barley are required for malting purposes, and, to a small extent, in the manufacture of products such as pearl barley; the lower grades, which constitute the bulk of the crop, are largely fed on the farms where grown. While the malsters have taken most of the commercial crop, the great increase in barley production is due to its use as a feedstuff on farms.

*Production.*—The barley crop increased nearly threefold from 1891 to 1920 (average per annum, 1891-1895, 77,000,000 bushels; 1916-1920, 203,000,000 bushels). The 1921 production was 151,181,000 bushels. The principal producing regions, which also yield the best brewing barley, are the Dakotas, Wisconsin, Minnesota, and California.

*Imports of barley* are insignificant except when the domestic crop is short or of poor quality. Ontario produces a superior grade of

brewing barley, and formerly supplied us annually from 8,000,000 to 11,000,000 bushels; but the American tariff of 15 cents per bushel, being higher than the normal ocean freight, the Canadian surplus usually moves to England. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Bushels.</i>			<i>Per cent.</i>
1918.....	368,170	\$605,669	\$55,225	9.12
1919.....	14,941	17,296	2,241	12.96
1920.....	347,897	527,772	52,185	9.89
1921 (9 months).....	2,414	2,266		

*Exports of barley for 1909–1918 ranged from 1,500,000 to 27,000,000 bushels. Ordinarily over 90 per cent of these exports originate in the Pacific States. These produce excellent brewing barley, but the rail rates prevent a large eastern movement, except when prices are unusually high. Statistics for the calendar years 1918–1921 follow:*

	1918	1919	1920	1921 (9 months).
Quantity (bushels).....	18,805,219	37,611,840	17,854,227	20,410,876
Value.....	\$30,565,377	\$53,832,319	\$27,165,189	\$16,836,595

In 1920, the United Kingdom received about 80 per cent; Belgium, 8 per cent.

*Important changes in classification.*—See General Notes on Paragraph, page 686.

#### BARLEY MALT.

(See Report T. I. S.—20.)

*Description and uses.*—Barley malt is prepared by steeping the grain in water; this causes it to soften and swell. It is then allowed to germinate or grow sprouts, the germination being arrested by drying and curing in kilns. During germination the enzyme diastase is developed, the final malt being to some extent soluble. In the subsequent brewing processes the crushed malt is attacked by the enzymes and converted into soluble compounds. From 1 bushel of barley are produced 1.1 bushels of malt. Malt sprouts, a by-product, are used as a feedstuff.

Malt is used chiefly in the brewing of fermented liquors, and to a smaller extent in the manufacture of distilled liquors. Since the enactment of prohibition legislation it is finding a large and rapidly increasing outlet in the manufacture of near-beer and other non-intoxicating beverages. Small quantities are used in making various breakfast foods and malt preparations. The consumption in 1915–16 of malt and its equivalent in barley was as follows:

	Malt.	Equivalent in barley.
	<i>Bushels.</i>	<i>Bushels.</i>
Manufacture of fermented liquors.....	57,683,970	52,439,920
Manufacture of distilled liquors.....	4,480,588	4,073,258
Total.....	62,164,558	56,513,178

*Production.*—Imports being negligible (less than \$20,000), these 62,164,558 bushels of malt plus exports amounting to about 2,000,000 bushels may be assumed to represent the domestic production. While the greater part was made from barley, use was also made of corn, rye, wheat, and other cereals. In 1914 there were 97 malting establishments, whose materials cost \$39,000,000, and the value of whose products reached \$48,000,000. A considerable production of malt by brewers is not reported. In 1919, production of all malt (chiefly barley) was valued at \$39,340,000.

*Imports.*—No imports are recorded for 1919 and 1920. In 1918 and the first nine months of 1921 they were as follows: 10,847 bushels, valued at \$19,212, and 3,580 bushels, valued at \$2,026.

*Exports* of malt averaged about 210,000 bushels annually during 1910-1914 and moved chiefly to Canada. During the war the exports rose over tenfold. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (bushels).....	896,307	10,045,941	4,250,627	7,859,360
Value.....	\$1,694,651	\$16,694,614	\$7,595,396	\$10,205,56½

In 1920, Argentina received 19 per cent; Brazil, 15 per cent; the Netherlands, 8 per cent; Italy, 8 per cent.

*Important changes in classification.*—See General Notes on Paragraph, page 686.

#### BARLEY, PEARLED, PATENT, OR HULLED.

(See Report T. I. S.-20.)

*Description and uses.*—Hulled or pot barley is prepared by grinding off the outer cuticle or husk. When the grinding is carried further, so that the grain is reduced to small round pellets, it is termed pearl barley. Patent barley is pearled or pot barley reduced to flour. Pearled barley, the most important of these products, demands a high-grade grain—large, spherical, free from weather damage, and unbroken. Large, two-row varieties are grown for pearling.

*Production* statistics for barley products are not available, but pearled, patent, or hulled barleys amount to an insignificant proportion of the crop. Four bushels of barley (48 pounds per bushel) yield 100 pounds of pearl barley and approximately 90 pounds of feed.

*Imports* of pearled, patent, or hulled barley have increased steadily, coming from Europe, especially from Germany. From 489,244 pounds in 1907 they rose to 1,826,213 pounds in 1914. During the

war imports dropped to about one-half the prewar level. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	113,394	\$5,608	\$1,134	20.22
1919.....	142,819	28,539	1,428	5.00
1920.....	974,896	205,480	9,749	4.74
1921 (9 months).....	513,663	71,753		

*Exports* were not separately stated prior to 1918. The following statistics for barley flour are for the calendar years 1918-1920:

	1918	1919	1920
Quantity (barrels).....	1,360,073	255,845	20
Value.....	\$3,877,852	\$2,572,396	\$280

<sup>1</sup> Figures are for the period July 1 to Dec. 31, 1918.

In 1919, the United Kingdom took 62 per cent; Belgium, 19 per cent; Austria-Hungary, 9 per cent.

*Important changes in classification.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Three paragraphs of the act of 1913 (188-190) relating to barley and barley products have been combined; the provisions for barley have been extended definitely to include the whole grain, whether unhulled or hulled (pot barley), the husk being of no value; the duty upon barley malt has been changed from the bushel to a weight basis; and "barley flour," the commercial designation, substituted for patent barley.

#### PARAGRAPH 724.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 724. Buckwheat, hulled or unhulled, 30 cents per one hundred pounds; buckwheat flour and grits or groats, one-half of 1 cent per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 234. Buckwheat, fifteen cents per bushel of forty-eight pounds; buckwheat flour, twenty-five per centum ad valorem.

PAR. 435. Buckwheat and buckwheat flour [Free].

#### BUCKWHEAT, BUCKWHEAT FLOUR, ETC.

*Description and uses.*—Buckwheat is a quick maturing, poor soil crop. The grain is chiefly cultivated as a feed and for the production of buckwheat flour. A by-product in flouring (middlings) is esteemed by dairymen as feed for cows, because of the high protein

content. The plant is sometimes cultivated as a source of nectar for bees.

*Production.*—Buckwheat is native to Europe and Central Asia. It is found wild in China and Siberia and is grown wherever grain crops are cultivated. In 1908 the domestic yield on 803,000 acres was 15,874,000 bushels, valued at \$12,004,000; in 1921, on 671,000 acres, the yield was 14,079,000 bushels, valued at \$11,438,000.

*Imports* (grain) in 1913 amounted to 62,979 bushels, valued at \$38,829; in 1914, to 191,396 bushels, valued at \$152,350. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (bushels).....	403,373	322,791	227,182	190,864
Value.....	\$734,116	\$450,810	\$317,359	\$220,801

*Exports* of buckwheat in 1910 were 158,160 bushels, valued at \$103,138, but declined to practically nothing in 1911–1914. In 1915 exports, going chiefly to the Netherlands, rose to 413,643 bushels, valued at \$396,987. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (bushels).....	1,420	186,074	299,693	279,249
Value.....	\$3,021	\$307,454	\$543,468	\$411,310

Of the 1920 export, 80 per cent went to the Netherlands, 8 per cent to Belgium, and 5 per cent to Canada.

*Important changes in classification.*—See General Notes on Paragraph, page 688.

#### BUCKWHEAT FLOUR.

*Description and uses.*—In Europe buckwheat flour is consumed chiefly by the poor. In America it is generally popular in the form of buckwheat pancakes.

*Production* of buckwheat flour decreased from 176,081,891 pounds in 1909 to 125,622,189 pounds in 1914, valued at \$4,663,561 and \$3,754,857, respectively. New York and Pennsylvania mill more than two-thirds of the domestic grain: In 1919, buckwheat flour production was 90,137,407 pounds, valued at \$5,244,000.

*Imports* of flour increased from 35,788 pounds in 1913 to 402,966 pounds in 1914, valued at \$950 and \$10,282, respectively. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	233,673	280,557	751,118	195,933
Value.....	\$15,654	\$10,580	\$26,911	\$7,211

*Exports* are not separately stated.

*Important changes in classification.*—See page 688.

## GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Buckwheat and buckwheat flour are transferred from the free list of the act of 1913 (par. 435). The provision for buckwheat has been extended definitely to include the hulled as well as the unhulled grain upon the same dutiable basis; the unit has been changed from "bushel" to "hundred pounds;" and grits or groats are specifically mentioned.

## PARAGRAPH 725.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 725. Corn or maize, including cracked corn, 15 cents per bushel of fifty-six pounds; corn grits, meal, and flour, and similar products, 30 cents per one hundred pounds.

## ACT OF 1909.

## ACT OF 1913.

PAR. 235. Corn or maize, fifteen cents per bushel of fifty-six pounds.

PAR. 465. Corn or maize [Free].<sup>16</sup>

PAR. 236. Corn meal, forty cents per one hundred pounds.

PAR. 466. Corn meal [Free].

## CORN.

(See Survey FL-11.)

*Uses.*—It is estimated that 80 per cent of the domestic corn crop is consumed on farms and does not enter the channels of trade. The commercial crop is distributed in approximately the following proportions: Consumed in flour and grist mills, chiefly for human food, but also for stock feed (census of 1914), about 6.5 per cent (180,000-000 bushels); in glucose and starch factories (census of 1914), 1.6 per cent (44,000,000 bushels); in distilled spirits (1915), 1.2 per cent (32,000,000 bushels); in fermented liquors, 0.5 per cent (14,000,000 bushels); exports (average for 1911-1915), 1.4 per cent (39,000,000 bushels); fed to live stock not on farms, 5.4 per cent (about 150,000,000 bushels).

*Production.*—The United States produces over 70 per cent (3,000,000,000 bushels) of the corn crop of the world. Domestic consumption takes about 98 per cent of this. The 20 per cent which enters trade represents largely the surplus, over farm consumption, of the North Central States; the great bulk of this moves to the Eastern and Southern States. The eastern seaboard markets receive the imported corn. The commercial supply varies greatly, according to the price and volume of substitute feedstuffs, the merchantable quality of the crop, and the condition of the live-stock markets.

*Imports* of corn or maize during 1914-1918 (fiscal years) ranged from 2,000,000 to 11,000,000 bushels, almost entirely from Argentina. Later statistics for calendar years follow:

<sup>16</sup> Corn or maize, 15 cents per bushel of 56 pounds. (Par. 4, emergency tariff act of 1921.)

	1918	1919	1920	1921 (9 months).
Quantity (bushels).....	1,992,161	11,212,717	7,784,482	151,113
Value.....	\$1,976,960	\$10,966,911	\$9,296,991	\$179,159

In 1920, the imports from Argentina amounted to 90 per cent of the total.

General imports by months for 1920-1921 are as follows:

Month.	Quantity.		Value.	
	1920	1921	1920	1921
	<i>Bushels.</i>	<i>Bushels.</i>		
January.....	408,293	8,226	\$379,526	\$15,142
February.....	156,945	3,256	184,790	2,823
March.....	139,429	7,379	197,132	8,852
April.....	291,465	41,707	295,170	46,320
May.....	238,045	52,100	286,561	54,985
June.....	937,204	17,615	1,135,368	25,751
July.....	2,343,445	17,671	3,045,534	27,252
August.....	1,300,418	5,366	1,530,755	6,804
September.....	1,066,449	3,137	1,306,824	3,488
October.....	608,064	472	640,798	461
November.....	128,600	1,086	127,337	1,074
December.....	166,125	6,082	167,196	5,112

*Exports.*—Notwithstanding the preeminence of the United States in corn production, exports for 1909-1913 averaged only about 41,000,000 bushels, one-third of the exports of Argentina, which produces only one-sixteenth as much. The American crop influences the meat, rather than the grain, markets of the world. Our exports of pork and lard, which far exceed those of any other country, tend to keep prices of corn upon an export basis. Because of comparative softness and higher moisture content, corn of the United States is inferior in shipping qualities to the Argentine product. Exports since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (bushels).....	39,899,091	11,192,533	17,761,420	104,972,806
Value.....	\$69,269,329	\$18,624,386	\$26,453,681	\$78,064,228

In 1920, Canada received 57 per cent; Cuba, 11 per cent; and England, 10 per cent.

*Important changes in classification.*—See General Notes on Paragraph, page 690.

#### CORN MEAL.

*Description and uses.*—The character of the several corn products (corn meal, etc.) is affected by the content of the different parts of the kernel as in wheat milling. The skin or hull (about 6 per cent of the corn kernel by weight) contains about 51 per cent of the crude fiber in the kernel; the endosperm (about 84 per cent of the kernel) contains about 90 per cent of the starch; the germ (10 per cent of the kernel) about 80 per cent of the oil.

*Production.*—By the modern roller process the grain is first freed of chaff and foreign material, then the germ and part of the outer hull are removed, and the degerminated material passes through a series of rollers and screens. The various forms which the product may take as a result of the latter processes are fine flour, corn meal, fine grits, coarse grits, and hominy. The separated germ is crushed for the oil, which has a large and increasing market (see par. 45), and the by-product, germ meal, is a valuable live-stock feed. Owing to its high content of oil, the presence of the germ in corn meal tends to make the product rancid. The United States is by far the largest manufacturer of corn products. The absorption of corn by flour and grist mills in 1919 was 113,768,512 bushels. Among the products separately listed are corn meal, 10,683,878 barrels; hominy and grits, 288,525,592 pounds. The manufacture of fermented and distilled liquors absorbed about 759,000,000 pounds of grits and other corn products in 1916.

*Imports* of corn meal, prior to 1919, seldom amounted to \$1,000. Since 1917, by calendar years, they have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (100 pounds).....	130	38,467	4,593	30,757
Value.....	\$647	\$117,753	\$15,436	\$39,234

*Exports* during 1914–1918 (fiscal years) ranged between \$1,000,000 and \$20,000,000 in value. Later statistics (for calendar years) of “corn meal and corn flour” follow:

	1918	1919	1920	1921 (9 months).
Quantity (barrels).....	1,790,016	1,202,434	867,165	640,048
Value.....	\$18,761,103	\$10,920,487	\$7,478,398	\$3,150,545

In 1920 Egypt received 48 per cent; England, 7 per cent; and Jamaica, 7 per cent.

*Important changes in classification.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Corn or maize exempt from duty under the act of 1913 (par. 465), is dutiable under paragraph 4 of the emergency tariff act. Corn meal is transferred from the free list of the act of 1913 (par. 466). New specific provisions are added for cracked corn and corn grits, flour, and similar products.

## PARAGRAPH 726.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 726. Macaroni, vermicelli, noodles, and similar alimentary pastes, 1½ cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 237. Macaroni, vermicelli, and all similar preparations, one and one-half cents per pound.

PAR. 191. Macaroni, vermicelli, and all similar preparations, 1 cent per pound.

## MACARONI, VERMICELLI, NOODLES, ETC.

(See Survey G-3.)

*Description and uses.*—Macaroni, vermicelli, spaghetti, and similar edible pastes are made from the coarse flour or meal (called semolina) of hard varieties of wheat. As wheat of high gluten content is required, durum or macaroni wheat—grown principally in Russia, Algiers, Montana, and the Dakotas—is preferred. The semolina is mixed with hot water, worked into a stiff paste or dough, kneaded, then placed in a cylinder pierced with holes corresponding to the diameter of the desired product, forced through, cut into suitable lengths, and dried.

*Production.*—In 1914 there were 373 manufacturers of “macaroni, vermicelli, and noodles,” the output being about 300,000,000 pounds, valued at \$12,884,000, besides \$400,723 reported by bakers and other manufacturers. In 1920 production was estimated at about 450,000,000 pounds, which represented the product of about 500 separate establishments.

The manufacture of edible pastes is greatest in Italy and France. These foods are prepared in most Italian households, but there is a marked trend toward factory production. Durum wheat is imported from the United States and returned as edible paste.

*Imports* during 1910–1914 (fiscal years) ranged between 100,000,000 and 125,000,000 pounds, valued at from \$4,500,000 to \$5,500,000, with a customs revenue of about \$1,500,000. Over 95 per cent came from Italy, and most of the remainder from France. During the war imports dwindled to less than 1 per cent of the previous volume. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	406,931	\$41,226	\$4,069	9.87
1919.....	903,136	101,930	9,031	8.86
1920.....	805,168	107,187	8,052	7.51
1921 (9 months).....	1,079,396	122,921		

In 1920 the bulk came from Japan and Hongkong.

*Exports* are not separately stated.

*Important changes in classification.*—“Noodles” have been added because they are not prepared in the same manner as the other prod-

ucts enumerated in paragraph 726. "All similar preparations" of the act of 1913 has been changed to "similar alimentary pastes," a term generally applied to such preparations.

### PARAGRAPH 727.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 727. Oats, hulled or unhulled, 10 cents per bushel of thirty-two pounds; unhulled ground oats, 32 cents per one hundred pounds; oatmeal, rolled oats, oat grits, and similar oat products, 60 cents per one hundred pounds.

#### ACT OF 1909.

PAR. 238. Oats, fifteen cents per bushel.

PAR. 239. Oatmeal and rolled oats, one cent per pound; \* \* \*

[No corresponding provision for unhulled ground oats.]

#### ACT OF 1913.

PAR. 192. Oats, 6 cents per bushel of thirty-two pounds; oatmeal and rolled oats, 30 cents per one hundred pounds; \* \* \*

[No corresponding provision for unhulled ground oats.]

#### OATS.

(See Report T. I. S.-20.)

*Description and uses.*—Approximately 85 per cent of our oat crop is fed to live stock, principally horses; 4 per cent becomes oatmeal or some similar product; and the remainder is sown or exported. Oat straw is used for feeding purposes. The oat crop is sometimes cut for hay, or is pastured, or turned under for green manure. Nearly 70 per cent of the grain is consumed on the farm where produced; but the remaining 30 per cent, the commercial crop, exceeds in volume the world trade in oats. Its markets are very elastic, being dependent upon live-stock conditions and prices of corn, hay, and other competing feedstuffs.

*Production.*—The American crop is normally around 1,500,000,000 bushels, exceeding that of any other country; 75 per cent is grown in the North Central States, whose surplus, with the small excess grown in the Pacific Northwest, supplies the deficiencies of the South and East as well as the exports. In foreign countries oats are used to a larger extent for human food.

*Imports* for 1897-1913, principally from Canada, under a duty of 15 cents per bushel, exceeded 1,000,000 bushels only in years of domestic crop shortage. In 1914, under a duty of 6 cents per bushel, coinciding with a harvest of about 300,000,000 bushels less than the preceding year, about 22,000,000 bushels were imported, chiefly from Canada but also from Argentina. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Bushels.</i>			<i>Per cent.</i>
1918.....	1,461,527	\$1,256,183	\$87,692	6.98
1919.....	609,131	469,648	36,548	7.78
1920.....	6,728,134	6,549,111	403,658	6.16
1921 (9 months).....	3,081,109	1,328,003	.....	.....

In 1920, 95 per cent of the imports came from Canada, and 4 per cent from Argentina.

*Exports fluctuate greatly, according to domestic and foreign harvests. Although the domestic crop nearly doubled in 20 years, exports declined from over 40,000,000 bushels in 1900 to less than 3,000,000 bushels in 1914. Considerable exports from the Pacific States went to Europe in 1914. During the war exports increased enormously. Later statistics follow:*

	1918	1919	1920	1921 (9 months).
Quantity (bushels).....	114,462,932	55,294,479	12,877,874	2,474,291
Value.....	\$98,221,637	\$46,435,294	\$12,338,104	\$1,286,941

In 1920, France received 49 per cent; Belgium, 20 per cent; Cuba, 12 per cent; and Canada, 10 per cent.

*Important changes in classification.*—See General Notes on Paragraph, page 694.

#### OATMEAL AND ROLLED OATS.

*Description and uses.*—Oatmeal, rolled oats, and similar preparations are milled from hulled and kiln-dried oats, 10 bushels producing one barrel (180 pounds) of oatmeal. For these products high-grade, plump, heavy white oats with thin hulls are preferred. Oatmeal and similar products are consumed largely as breakfast foods and are also used for feeding stock.

*Production* of oatmeal by merchant flour mills in 1914 was 30,-451,581 pounds, valued at \$757,804, principally in New York and Wisconsin, and of rolled oats (including other breakfast foods) 92,676,085 pounds, valued at \$2,932,238. In 1914 approximately 50,000,000 bushels of oats went into merchant flour mills manufacturing oatmeal, and 23,000,000 bushels into meals prepared chiefly for live-stock feed; 10,000,000 to 15,000,000 bushels were consumed by custom mills. In 1920, oatmeal production was 28,120,649 pounds, valued at \$1,101,000.

*Import* values of oatmeal and rolled oats are normally less than \$50,000. Statistics of imports since 1917 follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>100 pounds.</i>			<i>Per cent.</i>
1918.....	104,217	\$557,089	\$31,265	5.61
1919.....	4,463	36,770	1,339	3.64
1920.....	6,812	53,958	2,044	3.79
1921 (9 months).....	3,784	30,613		

*Exports* of oatmeal and rolled oats for 1913-1918 (fiscal years) ranged from 16,000,000 to 347,000,000 pounds, valued at \$569,000 to \$17,500,000, and went principally to the United Kingdom and the Netherlands. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	299,198,015	220,966,637	65,920,515	79,445,962
Value.....	\$17,353,080	\$11,999,382	\$3,891,346	\$2,959,239

In 1920, the United Kingdom received 47 per cent; the Netherlands, 18 per cent.

*Important changes in classification.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—The words "hulled or unhulled" have been added; provisions have also been added for unhulled ground oats, oat grits (Scotch oatmeal) and similar oat products.

### PARAGRAPH 728.

#### H. R. 7456.

#### SENATE AMENDMENTS.

PAR. 728. Paddy or rough rice, 1 cent per pound; brown rice (hulls removed),  $1\frac{1}{4}$  cents per pound; milled rice (bran removed), 2 cents per pound; broken rice, and rice meal, flour, polish, and bran, one-half of 1 cent per pound; all the foregoing not specially provided for.

#### ACT OF 1909.

#### ACT OF 1913.

PAR. 240. Rice, cleaned, two cents per pound; uncleaned rice, or rice free of the outer hull and still having the inner cuticle on, one and one fourth cents per pound; rice flour, and rice meal, and rice broken which will pass through a number twelve wire sieve of a kind prescribed by the Secretary of the Treasury, one-fourth of one cent per pound; paddy, or rice having the outer hull on, three-fourths of one cent per pound.

PAR. 193. Rice, cleaned, 1 cent per pound; uncleaned rice, or rice free of the outer hull and still having the inner cuticle on,  $\frac{3}{8}$  of 1 cent per pound; rice flour, and rice meal, and rice broken which will pass through a number twelve sieve of a kind prescribed by the Secretary of the Treasury,  $\frac{1}{4}$  cent per pound; paddy, or rice having the outer hull on,  $\frac{3}{8}$  of 1 cent per pound.<sup>17</sup>

#### RICE.

(See Survey G-5.)

*Production.*—The domestic rice crop nearly doubled between the years 1908 and 1918. Of the 40,000,000 bushels harvested in 1918, Louisiana produced 18,000,000, and Texas, Arkansas, and California each more than 7,000,000 bushels. Rice culture has developed rapidly in these States, especially in California, but has been nearly discontinued in the South Atlantic division, where once was grown nearly all the domestic supply. It is a special form of agriculture, requiring unusual equipment and a considerable plant investment. Because of overproduction and low prices, the crop of 1921 was reduced to 35,105,000 bushels.

Growers generally market the product as "rough rice," that is, in the condition it leaves the thresher, retaining dirt and other foreign substances. Specially equipped mills in the growing regions take this rough rice, clean it, remove the outer shell or hull, the inner

<sup>17</sup> Rice, cleaned, 2 cents per pound, except rice cleaned for use in the manufacture of canned foods, on which the rate of duty shall be 1 cent per pound; uncleaned rice, or rice free of the outer hull and still having the inner cuticle on,  $1\frac{1}{4}$  cents per pound; rice flour, and rice meal, and rice broken which will pass through a number twelve wire sieve of the kind prescribed by the Secretary of the Treasury, one-fourth of 1 cent per pound; paddy, or rice having the outer hull on, three-fourths of 1 cent per pound. (Par. 9, emergency tariff act of 1921.)

cuticle or bran, and sometimes polish the grain. Table rice is usually retailed at standard prices which do not fluctuate with the price changes of rough rice. In 1914, 59 rice-cleaning establishments, capitalized at \$12,000,000, produced to the value of \$23,000,000. A bushel (45 pounds) of rough rice yields 28 or 30 pounds of clean or hulled rice; the remainder consists of chaff, polish or flour, bran, and other by-products. About 20 per cent of the grain weight is hull.

Compared with the enormous crops and exports of the Orient, the domestic production is insignificant. However, with the exception of certain kinds imported to meet special requirements, the American output supplies substantially the entire domestic demand, and permits an export of over 400,000,000 pounds.

*Imports.*—Of the 269,125,342 pounds imported for consumption in the fiscal year 1914, over one-half (140,649,985 pounds) falls under the tariff classification of "flour, meal, and broken rice, which will pass through a No. 12 wire sieve." This is known as brewers' rice, and was received, not from the growing regions, but principally from the rice mills of Germany and the Netherlands. This grade is a by-product of rice milling, the domestic production in 1914 being only 70,373,855 pounds (about 10 per cent of the total clean rice), the 1916 consumption reported by brewers being 141,219,292 pounds.

Imports of clean or table rice in 1914, following the reduction of the duty from 2 cents to 1 cent per pound, were 73,744,997 pounds, about four times those of the preceding year. They came largely from the Netherlands and China. The imports were due, in some degree, to the demands of our foreign population. Imports in 1914 of "uncleaned rice, or rice free of the outer hull and still having the inner cuticle on" (brown rice), totaled 52,677,863 pounds, and of "paddy, or rice having the outer hull on," 2,052,497 pounds, a large part going to Hawaii. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.

December.....	89,572	76,453	7,623	6,655

In 1920, the principal country of origin was Japan, which furnished us 93 per cent of our imports of uncleaned rice. The bulk of cleaned rice came from Hongkong (70 per cent); 22 per cent was from French Indo-China. Imports of rice flour, rice meal, and broken rice from Hongkong amounted to 50 per cent. from Canada to 20 per cent, and from Japan to 18 per cent of the total.

*Exports* of rice for the year 1914 were 18,223,264 pounds, chiefly to Cuba (under a preferential customs treatment) and to Mexico; and of rice bran and polish, 4,191,062 pounds. Toward the close of the war exports of rice rose tenfold. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	167,932,775	376,875,571	392,612,555	489,439,850
Value.....	\$12,424,710	\$34,775,622	\$37,469,175	\$16,733,322

In 1920, Cuba received 16 per cent of the exports; Germany, 14 per cent; the Dutch East Indies, 8 per cent; and Canada, 7 per cent.

*Important changes in classification.*—The provision has been shortened, simplified, and made to conform to general usage.

*Suggested changes.*—“All the foregoing not specially provided for” is an unusual phrase for the conclusion of a paragraph, and is apparently unnecessary in order to exclude from this paragraph rice cleaned for use in the manufacture of canned foods (par. 1643).

## PARAGRAPH 729.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 729. Rye, 10 cents per bushel of fifty-six pounds; rye flour and meal, 30 cents per one hundred pounds.

ACT OF 1909.

ACT OF 1913.

PAR. 241. Rye, ten cents per bushel; rye flour, one-half of one cent per pound.

PAR. 589. Rye and rye flour [Free].

## RYE.

*Description and uses.*—Rye is a cereal grain of relative unimportance in the United States compared with wheat, corn, or oats. The grain is used both for human food and for stock feed; the plant for soiling, occasionally as hay, as a cover crop, and for green manure; the straw as bedding for horses, in packing fruit trees, pottery, etc., in making straw articles, and in paper. Rye is often mixed with wheat, bran, or oats as a horse feed, and with dairy by-products as a satisfactory feed for hogs.

*Production.*—About 96 per cent of the world's rye crop has been produced and consumed in Europe. It is the principal cereal of the more northern regions whose climate is not well suited for wheat. In 1908, 1,948,000 acres, yielding 31,851,000 bushels, valued at \$23,455,000, were under cultivation here; this increased to 6,185,000 acres, yielding 89,103,000 bushels, valued at \$134,947,000, in 1918. In 1921, however, production declined to 57,918,000 bushels, valued at \$40,680,000.

*Imports of rye (grain)* rose from 45 bushels in 1913 to 36,156 in 1914, valued at \$61 and \$23,223, respectively. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (bushels).....	597,316	1,107,487	791,220	140,253
Value.....	\$1,382,822	\$1,647,879	\$1,430,818	\$182,103

*Exports of rye* were 2,222,934 bushels in 1914. The United Kingdom, Italy, and Norway were the principal buyers. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (bushels).....	7,631,639	32,898,166	57,070,490	25,191,887
Value.....	\$15,615,618	\$61,786,232	\$122,239,537	\$39,769,194

In 1920 France purchased 21 per cent; Belgium, 19 per cent; Germany, 12 per cent; Netherlands, 12 per cent; and Canada, 11 per cent.

*Important changes in classification.*—See General Notes on Paragraph, page 699.

## RYE FLOUR.

*Description and uses.*—Rye constitutes the chief bread grain of over one-third of the inhabitants of Europe. Its use in the United States is relatively small. About one-third of the domestic rye is made into flour.

*Production* increased from 1,532,139 barrels in 1909 to 1,937,385 barrels in 1914, valued at \$6,383,538 and \$7,845,213, respectively. Wisconsin, Minnesota, New York, Pennsylvania, and Illinois milled about 85 per cent of the output. In 1919, rye-flour production was 2,527,752 barrels, valued at \$21,236,000.

*Imports* of rye flour were 117 barrels in 1914. Later statistics for calendar years follow:

	1918	1919	1920
Quantity (pounds).....	813,992	2,089,025	1,645,944
Value.....	\$51,458	\$73,463	\$40,536

*Exports* were 8,293 barrels in 1914. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (barrels).....	1,446,075	1,266,030	363,746	47,825
Value.....	\$15,449,730	\$12,424,508	\$3,638,438	\$331,930

In 1920 Norway received 78 per cent; Germany, 6 per cent; and Belgium, 4 per cent.

*Important changes in classification.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Rye and rye flour are transferred from the free list of the act of 1913 (par. 589). Rye meal has been added.

### PARAGRAPH 730.

#### H. R. 7456.

#### SENATE AMENDMENTS.

PAR. 730. Wheat, 25 cents per bushel of sixty pounds; wheat flour, semolina, crushed or cracked wheat, and similar wheat products not specially provided for, 50 cents per one hundred pounds.

#### ACT OF 1909.

PAR. 242. Wheat, twenty-five cents per bushel.

PAR. 243. Wheat flour, and semolina, twenty-five per centum ad valorem.

#### ACT OF 1913.

PAR. 644. Wheat, wheat flour, semolina, and other wheat products, not specially provided for in this section [Free]: *Provided*, That wheat shall be subject to a duty of 10 cents per bushel, that wheat flour shall be subject to a duty of 45 cents per barrel of 196 pounds, and semolina and other products of wheat, not specially provided for in this section, 10 per centum ad valorem, when imported directly or indirectly from a country, dependency, or other subdivision of government which imposes a duty on wheat or wheat flour or semolina imported from the United States.<sup>18</sup>

<sup>18</sup> Wheat, 35 cents per bushel, par. 1; wheat flour and semolina, 20 per centum ad valorem. (Par. 2, emergency tariff act of 1921.)

## WHEAT.

(See Report T. I. S.-20.)

*Description and uses.*—Three principal kinds of wheat—hard, soft, and durum—are recognized commercially. Hard wheat is preferred for bread flours; soft wheat for pastry, biscuits, and crackers; and durum wheat, a very hard variety with a high gluten content, for macaroni and other edible pastes. In milling practice it is customary to mix different types of wheat to obtain flour of varying grades. Color, weight, and strength are the principal standards by which wheat is judged. In addition to its familiar uses, wheat is also employed for the edible pastes, in starch manufacture, in various breakfast foods, and especially in semolina; the low grades or "feed wheat" and the by-products of flour milling are used for live-stock feed. About 85,000,000 bushels are required annually for reseeding.

*Production.*—The average annual wheat crop during 1911-1919 was about 795,000,000 bushels, with a farm value of \$1,085,000,000. The United States is the world's largest wheat producer. Although wheat growing is widely distributed, about half the crop is from the west North Central States. Of the hard wheat, the spring varieties are produced chiefly in the Dakotas, Minnesota, and Montana, and the hard winter varieties largely in Kansas and parts of adjacent States. Durum wheat is grown principally in Montana and the western part of the Dakotas. Elsewhere soft wheats predominate. Of the world production of 3,500,000,000 to 4,000,000,000 bushels, Europe yields about one-half, but it also (excepting Russia, Hungary, and Roumania) absorbs the bulk of world exports. The world crop is largely of the soft varieties, that of the harder wheats being confined chiefly to Russia, Canada, and the United States.

*Imports fluctuate greatly.* They come almost entirely from Canada, which produces chiefly hard spring wheat of excellent quality. During 1897-1913, with a duty of 25 cents per bushel, imports exceeded 100,000 bushels only in years of shortage or poor quality in the domestic hard-wheat crop. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.
	<i>Bushels.</i>		
1918.....	17,025,947	\$30,427,417	\$474
1919.....	7,923,825	14,935,234	1,001
1920.....	35,808,668	75,359,246	9,663
1921 (9 months).....	18,809,264	30,868,156	.....

In 1920 imports from Canada amounted to 95 per cent of the total. General imports are given by months for 1920 and 1921:

Month.	Quantity.		Value.	
	1920	1921	1920	1921
	<i>Bushels.</i>	<i>Bushels.</i>		
January.....	756,228	4,504,856	\$1,739,399	\$7,604,877
February.....	534,692	4,403,712	1,672,270	7,457,382
March.....	665,154	2,671,043	1,528,246	4,564,020
April.....	227,284	4,451,304	463,665	6,825,112
May.....	474,891	1,902,667	1,358,871	3,016,994
June.....	283,010	89,807	611,017	132,568
July.....	100,334	713,669	200,642	1,177,964
August.....	364,827	239,559	615,892	389,154
September.....	1,842,397	81,031	4,672,925	113,995
October.....	9,802,149	878,115	22,656,037	1,061,777
November.....	9,522,578	1,184,776	19,561,500	1,246,454
December.....	11,235,112	2,052,247	20,278,756	2,142,868

*Exports of wheat* constitute from 11 to 37 per cent of the domestic production during normal years. An increasing proportion takes the form of wheat flour rather than of grain. Exports of grain move in considerable volume to many countries, chiefly to the United Kingdom, the Netherlands, and Germany. From 1910 to 1918 (fiscal years) they ranged from 34,118,853 to 259,642,533 bushels, valued at \$80,000,000 to \$333,000,000. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (bushels).....	111,177,103	148,086,470	218,287,334	237,444,930
Value.....	\$260,612,978	\$356,898,296	\$596,975,396	\$380,556,218

*Important changes in classification.*—See General Notes on Paragraph, page 703.

## WHEAT FLOUR.

(See Report T. I. S.—20.)

*Description and uses.*—In the modern flour mills wheat is first thoroughly cleaned and scoured, and then subjected to a succession of grindings or “breaks” between several sets of rollers (usually four), in which the grain is slowly broken and the outer layers of hull or skin (producing bran, middlings, shorts) sifted away. The flour produced in the various breaks is blended in standard grades. About 72 per cent of the wheat is usually received in the form of flour,  $4\frac{1}{2}$  bushels of No. 2 hard wheat (270 pounds) making 1 barrel of “straight” flour (196 pounds) and 70 pounds of feed, with 4 pounds of loss. Two main commercial types of flour are (1) the soft, starchy flours from soft wheats and (2) the granular flour from hard wheats, the latter producing a larger quantity of bread per unit of flour, as well as a lighter loaf. Graham flour is the unbolted wheat meal ground from the whole kernel, while whole-wheat flour contains all of the kernel except the bran.

*Production of wheat flour* in 1914 was 116,403,770 barrels, valued at \$543,839,000, from 546,000,000 bushels of wheat. The two principal milling States were Minnesota (27,132,153 barrels) and Kansas (12,777,582 barrels). While there were 6,876 wheat-flour mills in 1914, the industry is large-scale, over 60 per cent of the flour output being ground in 218 large mills, each producing 100,000 barrels or more. In 1919, domestic production of wheat flour was 132,478,513 barrels, valued at \$1,436,589,000.

*Import values of wheat flour* averaged \$500,000 in the years immediately preceding the World War. They were almost exclusively from Canada. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.
	<i>Barrels.</i>		
1918.....	170,962	\$1,518,027	\$472
1919.....	17,523	181,207	337
1920.....	800,788	8,669,300	195
1921 (9 months).....	779,754	6,708,943	.....

In 1920, imports from Canada amounted to 95 per cent of the total. General imports are shown below by months for 1920 and 1921.

Month.	Quantity.		Value.	
	1920	1921	1920	1921
	<i>Barrels.</i>	<i>Barrels.</i>		
January.....	29,011	220,443	\$305,189	\$1,979,933
February.....	27,362	202,324	294,836	1,766,510
March.....	11,524	174,464	148,008	1,475,533
April.....	22,044	118,944	257,246	1,022,174
May.....	20,948	47,851	237,559	317,070
June.....	39,283	6,287	474,584	48,874
July.....	26,397	2,270	344,301	17,534
August.....	17,871	3,697	229,958	27,110
September.....	14,556	3,519	175,687	24,693
October.....	163,327	45,756	1,784,186	282,381
November.....	201,667	82,605	2,144,866	446,624
December.....	226,798	57,839	2,272,880	287,453

*Exports* of flour for 1910-1918 (fiscal years) ranged from about 9,000,000 to nearly 22,000,000 barrels, valued at \$48,000,000 to \$245,000,000, going to many countries, in largest quantity to the United Kingdom. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (barrels).....	21,706,700	26,449,881	19,853,992	12,984,000
Value.....	\$244,653,422	\$293,452,748	\$224,472,448	\$94,808,672

In 1920 the United Kingdom received 16 per cent; Poland and Danzig, 11 per cent.

*Important changes in classification.*—See General Notes on Paragraph, page 703.

#### SEMOLINA.

(See Survey G-3.)

*Description and uses.*—Semolina is a coarse, granular meal with the bran removed, made from hard varieties of wheat. It is extensively used in macaroni, spaghetti, and other edible pastes. The term "semolina" is also applied to the particles retained in the bolting machine of the flour mill. Such particles are used in soups, puddings, etc. Some cereal breakfast foods are also made from semolina.

*Production* statistics are not available. This country is one of the largest producers and exporters of durum and hard wheats, and supplies most of the semolina for domestic use.

*Import* values of semolina rose from less than \$3,000 prior to 1914 to about \$30,000 in later years. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
SEMOLINA.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	345,800	\$18,923		
1920.....	1,775,455	104,323	\$470	
1921 (9 months).....	782,225	37,561		

## CRUSHED WHEAT.

1918.....	75	\$3	\$0.30	10
1919.....	680,351	15,132	73.00	
1920.....	41,474	1,152	111.00	
1921 (9 months).....	600	6		

*Exports are included in "All other breadstuffs."*

*Important changes in classification.—See below.*

## GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.—*Wheat, wheat flour, semolina, and other wheat products not specially provided for, were conditionally exempt from duty under paragraph 644 of the act of 1913. The products specifically enumerated are dutiable under paragraphs 1 and 2 of the emergency tariff act of May 27, 1921.

The duty upon wheat flour, semolina, and similar products has been changed to a weight basis.

This paragraph specifically includes crushed or cracked wheat. To avoid possible conflict with by-product feeds (par. 731), with cereal foods and preparations (par. 733), and with biscuits and other baked articles (par. 734), the word "other" before "wheat products" in paragraph 644 of the act of 1913 was changed to "similar" in this paragraph.

## PARAGRAPH 731.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 731. Bran, shorts, and other by-product feeds obtained in milling wheat or other cereals, 15 per centum ad valorem per ton; hulls of oats, barley, buckwheat, or other grains, ground or unground, 10 cents per one hundred pounds; dried beet pulp, malt sprouts, and brewers' grains, \$5 per ton; mixed feeds, consisting of an admixture of grains or grain products with oilcake or oilcake meal, or molasses, or other feedstuffs, 6 per centum ad valorem.

## ACT OF 1909.

PAR. 239. \* \* \* oat hulls, ten cents per hundred pounds.

[No corresponding provision for the other commodities.]

## ACT OF 1913.

PAR. 192. \* \* \* oat hulls, 8 cents per one hundred pounds.

[No corresponding provision for the other commodities.]

## BY-PRODUCTS OF MILLING. ETC.

*Description and uses.*—This provision covers the by-products of milling—such as bran, shorts, middlings—used chiefly as feed for animals; dried beet pulp; malt sprouts and brewers' grains; mixed feeds; and fillers such as hulls. Hulls are used as a filler or roughener in some grades of feed for live stock.

*Production* of bran and middlings in 1919 was 4,760,957 tons, valued at \$211,467,000; of feed and offal, 4,563,553 tons, valued at \$262,736,000. The domestic production of dried beet pulp in 1919 was 976,501 tons, valued at \$4,829,568.

*Import* values of bran and middlings from 1914 to 1918 (fiscal years) ranged from \$750,000 to \$2,250,000; imports of oat hulls from \$165,649 to \$220,000; Canada is the chief source of imports. Since 1917, imports of feedstuffs have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
BRAN AND MIDDLINGS.				
	<i>Tons.</i>			<i>Per cent.</i>
1918.....	1,157	\$45,507	\$1,606	.....
1919.....	59,955	2,625,213	3,871	.....
1920.....	30,427	1,097,917	7,533	.....
1921 (9 months).....	41,806	1,052,094	.....	.....
BREADSTUFFS, NOT SPECIALLY PROVIDED FOR (ANIMAL FOOD).				
	<i>Pounds.</i>			
1918.....		\$12,846	\$1,927	15.00
1919.....	6,943,270	90,120	13,446	15.00
1920.....	2,435,136	40,267	6,040	15.00
1921 (9 months).....	1,353,351	10,361	.....	.....
DRIED BEET PULP.				
1918.....	2,829,975	\$47,247	\$4,725	10.00
1919.....	23,469,958	492,022	49,202	10.00
1920.....	48,153,530	894,641	89,464	10.00
1921 (9 months).....	38,936,051	585,188	.....	.....
OAT HULLS.				
	<i>100 pounds.</i>			
1918.....	219,973	\$218,056	\$17,598	8.07
1919.....	343,603	381,759	27,488	7.20
1920.....	221,167	258,214	17,693	6.85
1921 (9 months).....	150,681	62,543	.....	.....

*Exports* of mill feed for 1910–1918 ranged between \$1,000,000 and \$4,000,000, in the earlier years going chiefly to Germany. Exports of bran and middlings varied in value from \$70,000 to \$400,000. Later statistics for calendar years follow.

	1918	1919	1920	1921 (9 months).
Bran and middlings:				
Quantity (tons).....	7,372	4,517	3,091	8,489
Value.....	\$327,285	\$233,114	\$182,958	\$196,216
Dried grains and malt sprouts:				
Quantity (tons).....	217	1,960	401	90
Value.....	\$13,394	\$125,886	\$23,949	\$4,852
Mill feed:				
Quantity (tons).....	9,652	12,124	10,481	9,771
Value.....	\$466,242	\$784,296	\$579,914	\$376,940

In 1920 the principal countries of destination for bran and middlings were Cuba (34 per cent), Canada (28 per cent), and Mexico (15 per cent); for dried grains and malt sprouts, Sweden (88 per cent), Denmark (6 per cent), and Canada (2 per cent); for mill feed, Cuba (66 per cent), Canada (13 per cent), and Mexico (6 per cent).

*Important changes in classification.*—To the present specific provision for oat hulls, transferred from paragraph 192 of the act of 1913, has been added a clause relating to hulls of other grains. A new specific provision has been made for dried beet pulp, malt sprouts, brewers' grains, mill feeds, and mixed feeds. The substantial extent of the import trade in these products and the fact that it has been difficult to determine their dutiable status, appear to warrant specific provisions.

*Suggested changes.*—In the clause "bran, shorts \* \* \* 15 per centum ad valorem per ton" the words "per ton" should be omitted.

Page 90, line 11, of H. R. 7456: Put "dried beet pulp" after "brewers' grains" to avoid a construction applying the word "dried" to malt sprouts and brewers' grains as well as to beet pulp. Strike out "and" before "brewers' grains" and insert it before "dried."

Page 90, line 13, of H. R. 7456: "Oilcake" in two places is set up as one word, whereas in paragraph 1623, page 191, line 21, "oil cake" appears as two words, and "oil-cake" qualifying "meal" is a compound word.

Page 90, line 14, of H. R. 7456: The rate upon mixed feeds composed of grain or grain products and other feeds is 6 per cent ad valorem. The rate upon dried beet pulp in the same paragraph is \$5 per ton, or 15 to 20 per cent ad valorem. As a result, it would be possible to mix beet pulp with by-product feeds of barley or other by-product feeds and ship them in at the lower rate.

### PARAGRAPH 732.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 732. Screenings, scalplings, chaff, or scourings of wheat, flaxseed, or other grains or seeds: Unground, 75 cents per ton; ground, \$1.50 per ton: *Provided*, That screenings, dirt, and other foreign matter mixed with grains or seeds provided for in this title shall pay the same rate of duty as the grains or seeds: *Provided further*, That when grains or seeds contain more than 5 per centum of any one foreign matter dutiable at a rate higher than that applicable to the grain or seed the entire lot shall be dutiable at such higher rate.

## ACT OF 1909.

## ACT OF 1913.

[No corresponding provision.]

[No corresponding provision.]

## SCREENINGS, ETC., OF WHEAT, FLAXSEED, ETC.

*Description and uses.*—Screenings, chaff, and scorings are by-products obtained by grain elevators, millers, and also from the farm thresher. They consist of foreign grains, underdeveloped kernels, weeds, wild buckwheat, flax, etc. They are used principally for live stock and poultry feed, either directly or after going through various stages of separation, or after being mixed with molasses or other feeds. In the large grain centers some companies specialize in the purchase, further separation, and distribution of elevator screenings.

*Production statistics are not available.*

*Imports since 1917 have been as follows:*

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
FLAXSEED OR LINSEED SCREENINGS.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	9, 049, 703	\$70, 902	\$7, 090	10
1919.....	24, 068, 061	142, 579	14, 258	10
1920.....	30, 612, 310	163, 480	16, 348	10
1921 (9 months).....	12, 782, 804	51, 131		
SCREENINGS NOT SPECIALLY PROVIDED FOR.				
1918.....	118, 686, 719	\$115, 149	\$11, 515	10
1919.....	81, 499, 446	671, 393	67, 139	10
1920.....	33, 144, 048	276, 469	27, 647	10
1921 (9 months).....	11, 034, 309	34, 565		
WHEAT SCREENINGS.				
1918.....	54, 933, 765	\$429, 521	\$42, 620	
1919.....	54, 264, 646	366, 557	35, 642	
1920.....	95, 838, 535	574, 843	56, 095	
1921 (9 months).....	35, 990, 253	86, 511		

<sup>1</sup> Figures cover period from July 1 to Dec. 31, 1918.

*Important changes in classification.*—The three clauses in this paragraph are new and designed to meet an increasing trade and certain trade practices that have developed. The provision as to allowance for dirt and impurities is an amplification and extension of a similar provision in paragraph 212 of the act of 1913, and the final provision as to mixed grains was adopted to prevent evasions of the duties in mixing separable grains.

*Suggested changes.*—Was it the intention in fixing the rate on screenings, etc., to make the rate higher on unground than on ground in order to discourage the importation of injurious weed seeds? If so, should not the rates be reversed?

## PARAGRAPH 733.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 733. Cereal breakfast foods, and similar cereal preparations, by whatever name known, processed further than milling, and not specially provided for, 17 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

[No corresponding provision.]

[No corresponding provision.]

## CEREAL BREAKFAST FOODS.

*Description and uses.*—This paragraph includes cereal foods processed further than milling. Milled products, such as cracked wheat, oat grits, and corn meal, are dutiable under other provisions. Cereal breakfast foods, in general, consist of an important integral part of the husked kernel or "meat," but in certain cases they may be more or less of a by-product of another preparation, to which heat is applied and slight amounts of seasoning added to give a desired flavor. Examples of the more important cereal breakfast foods are corn flakes and shredded wheat. A large number of cereal preparations are on the market. Usually they are sold under patented trade names.

*Production of breakfast foods of all kinds* amounted in 1914 to 92,676,085 pounds, valued at \$2,932,238, and in 1919 to 96,501,673 pounds, valued at \$4,350,000.

*Imports* are not separately stated.

*Exports* since 1917 by calendar years have been valued as follows:

	1918	1919	1920	1921 (9 months).
Cereal preparations (other than oatmeal and rolled oats).....	\$6,854,197	\$8,819,138	\$7,189,091	\$3,020,545
All other breadstuffs.....	5,751,037	3,803,972	4,754,450	2,097,306

In 1920 Germany received 28 per cent of the exports of "cereal preparations, other than oatmeal and rolled oats;" England, 21 per cent; and Canada, 6 per cent. Of "all other breadstuffs," 18 per cent went to Finland; 11 per cent each to Belgium and Canada; and 10 per cent each to England and the Netherlands.

## PARAGRAPH 734.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 734. Biscuits, wafers, cake, cakes, and similar baked articles, and puddings, all the foregoing by whatever name known, whether or not containing chocolate, nuts, fruits, or confectionery of any kind, 28 per centum ad valorem.

ACT OF 1909. ACT OF 1913.

PAR. 244. Biscuits, \* \* \* wafers, and similar articles, not specially provided for in this section, twenty per centum ad valorem; biscuits, wafers, cakes, and other baked articles, by whatever name known, composed in whole or in part of eggs, or any kind of flour or meal, or other material, when sweetened with sugar, honey, molasses, or other material, or combined with chocolate, nuts, fruit, or confectionery of any kind, or both so sweetened and combined, and without regard to the component material of chief value, valued at fifteen cents per pound or less, three cents per pound and fifteen per centum ad valorem; valued at more than fifteen cents per pound, fifty per centum ad valorem.

PAR. 708. Wafers, unleavened or not edible [Free].

PAR. 194. Biscuits, \* \* \* wafers, cakes, and other baked articles, and puddings, by whatever name known, containing chocolate, nuts, fruit, or confectionery of any kind, and without regard to the component material of chief value, 25 per centum ad valorem.

PAR. 417. Biscuits, \* \* \* and wafers, not specially provided for in this section [Free].

PAR. 640. Wafers, unleavened or not edible [Free].

## BISCUITS, WAFERS, CAKE, ETC.

*Description.*—This paragraph includes a large number of food specialties. Many of these preparations are not commercially produced in the United States. The statistics do not permit of comparison of the numerous products, nor are competitive and noncompetitive imports differentiated. Wafers, composed of wheat flour and water only, are used as a vehicle for pills and other nauseous medicines, and in sacramental observances.

*Production.*—In 1914 there were 166 manufacturers of biscuits and crackers, with an output valued at \$89,484,000; 25,797 other establishments, producing "all other bread and bakery products" (bread, pies, cakes, pastry, etc.), reported an output worth \$402,409,000.

*Imports of wafers, unleavened or not edible, in 1914 were \$32,816. Previous to the war Germany supplied about 60 per cent of the imports, and the Netherlands, France, and the United Kingdom most of the remainder.*

Imports of bread and biscuit before the war ranged in value from \$200,000 to \$300,000, chiefly from the United Kingdom, Germany, and Japan, but declined greatly after 1914. Imports since 1917 have been as follows:

BREAD, BISCUITS, AND WAFERS, N. S. P. F.<sup>1</sup>

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	879,746	\$62,381	.....	.....
1919.....	1,218,950	175,699	.....	.....
1920.....	882,881	283,848	.....	.....
1921 (9 months).....		170,659	.....	.....

<sup>1</sup> This classification includes par. 1522—Bread: *Provided*, That no article shall be exempted from duty as bread unless yeast was the leavening substance used in its preparation.

BREAD, BISCUITS, WAFERS, CAKES, AND OTHER BAKED ARTICLES, AND PUDDINGS, ETC., CONTAINING CHOCOLATE, NUTS, FRUIT, OR CONFECTIONERY OF ANY KIND, ETC.

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	46,325	\$9,825	\$2,456	25
1919.....	93,146	27,821	6,954	25
1920.....	267,101	87,030	21,757	25
1921 (9 months).....	160,138	38,956		

In 1920 the imports of "bread, biscuits, and wafers, n. s. p. f.," came principally from England (32 per cent), Canada (31 per cent), and Japan (25 per cent). Imports of "bread, biscuits, wafers, etc., containing chocolate, nuts, fruit, etc." were from England (40 per cent), Japan (23 per cent), and the Netherlands (15 per cent).

*Exports* in 1914 were valued at \$728,447. They moved to almost every country, but chiefly to Oceania, British Africa, and Canada. Later statistics of bread and biscuit follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	8,585,891	12,827,005	18,755,498	7,504,005
Value.....	\$1,277,704	\$2,506,447	\$3,731,879	\$1,295,138

In 1920, the exports went chiefly to Cuba (29 per cent), England (16 per cent), and Mexico (8 per cent).

*Important changes in classification.*—This paragraph combines three paragraphs of the act of 1913, paragraph 194 covering biscuits, wafers, cakes, etc., when containing chocolate, nuts, and fruit, and paragraphs 417 and 640 of the free list, covering biscuits, bread, and wafers, not specially provided for, and wafers, unleavened. Ordinary commercial bread, however, is kept on the free list (par. 1522).

*Suggested changes.*—Page 91, line 5, of H. R. 7456: "Fruit" would be better than "fruits" and in accord with prior acts.

## FRUIT AND FRUIT PRODUCTS.

### GENERAL.

*Important changes in classification.*—In provisions of the acts of 1909 and 1913 relating to fruits and fruit products, there are duplications and conflicts between provisions of a general character as well as between general and particular provisions. Furthermore, the general character of many of the clauses renders it difficult to obtain statistical information with regard to the conditions and volume of imports.

The reclassification has been made with a view to segregating the principal fruits by giving separate paragraphs to the more important ones; the general or basket clauses have been narrowed, and the wording of the provisions condensed and simplified.

The use of the word "canned" has been avoided throughout this schedule. It is believed that the more inclusive wording "prepared or preserved," adequately describes such products. For most prepared or preserved fruits ad valorem rates have been adopted because of the great variation in their values and because of the fact that when shipped in glass containers such containers would also require appraisal for tariff purposes.

### PARAGRAPH 735.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 735. Apples, green or ripe, 25 cents per bushel of 50 pounds; dried, desiccated, or evaporated, 2 cents per pound; otherwise prepared or preserved, and not specially provided for, 2½ cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 274. Apples, \* \* \* green or ripe, twenty-five cents per bushel; \* \* \* all edible fruits, \* \* \* when dried, desiccated, evaporated, or prepared in any manner, not specially provided for in this section, two cents per pound; \* \* \* fruits of all kinds preserved or packed in sugar, or having sugar added thereto, or preserved or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over ten per centum of alcohol, one cent per pound and thirty-five per centum ad valorem; \* \* \*.

PAR. 217. Apples, \* \* \* green or ripe, 10 cents per bushel of fifty pounds;<sup>19</sup> \* \* \* all edible fruits, \* \* \* when dried, desiccated, evaporated, or prepared in any manner, not specially provided for in this section, 1 cent per pound; \* \* \* fruits of all kinds preserved or packed in sugar, or having sugar added thereto or preserved or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over 10 per centum of alcohol, 20 per centum ad valorem; \* \* \*.

### APPLES, GREEN OR RIPE.

(See Survey G-20.)

*Description and uses.*—The apple is by far the most important fruit, being grown practically throughout the country. The cultivation of long-keeping varieties, increased storage facilities, and improved methods of distribution render apples available the entire year. Great quantities are evaporated or canned and a considerable portion is made into unfermented juice, vinegar, apple butter, and other products.

*Production.*—The estimated annual crop for the years 1910-1914, inclusive, averaged approximately 66,000,000 barrels. The greater part is consumed locally. Western New York, the Pacific Northwest, and the Shenandoah-Cumberland district grow over one-half the commercial crop. Canada is the principal foreign grower, the production of other countries having no important bearing on the world markets. Production since 1917 has been as follows:

<sup>19</sup> Apples, 30 cents per bushel. (Par. 26, emergency tariff act of 1921.)

Calendar year.	Quantity.		Value of commercial crop Dec. 1
	Total crop	Commercial crop.	
	<i>Barrels.</i>	<i>Barrels.</i>	
1918.....	56,542,000	24,743,000	\$126,684,000
1919.....	47,362,000	26,159,000	139,669,000
1920.....	74,559,000	33,905,000	126,800,000
1921.....	32,294,000	20,098,000	93,008,000

Imports for the prewar period 1910-1914, inclusive, amounted annually to about 42,000 barrels, valued at \$41,000. Imports for later years have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Bushels.</i>			<i>Per cent.</i>
1918.....	50,332	\$80,661	\$5,033	6.24
1919.....	464,528	710,435	46,453	6.54
1920.....	381,555	396,941	38,156	9.61
1921 (9 months).....	274,642	496,973		

Export values up to 1918 ranged between \$5,000,000 and \$8,000,000. Shipments went chiefly to the United Kingdom, Canada, and Norway. The United States is the largest exporter of apples. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (barrels).....	579,916	1,712,367	1,797,711	1,417,518
Value.....	\$3,135,203	\$14,471,282	\$14,088,733	\$9,966,657

*Important changes in classification.*—See General Notes on Paragraph, page 712.

#### APPLES, DRIED, DESICCATED, OR EVAPORATED.

(See Survey G-20.)

*Description and uses.*—Both the drying and canning of fruits are seasonal industries, and local in the sense that, owing to transportation charges, and the perishable character of fruit, factories are located in the producing sections and specialize in certain types of fruit. The preserving industries, whose output has doubled within the past 10 years, have helped to stabilize the market conditions for these fruits and have exerted a powerful influence in increasing the volume, improving the character, and enlarging our international trade in fruit. The basic principles of canning are sterilization, to kill decay germs, and sealing, to prevent contamination. Usually only the best grades of fruits are canned.

Apples are preserved extensively by various processes of drying and evaporating, the dried fruit being used largely by bakers and also in home consumption.

*Production* in 1914 was 54,957,003 pounds, valued at \$2,889,406, and in 1919, 50,309,702 pounds, valued at \$7,082,125. New York and California lead in output of dried apples.

*Imports* are usually insignificant in quantity and come almost entirely from Canada. Owing to a short domestic crop in 1921, imports were larger than usual. Figures for the years 1918-1921 follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	527	\$75	\$5	7.03
1919.....	158,085	27,942	1,581	5.86
1920.....	818,929	82,952	8,189	9.87
1921 (9 months).....	1,501,890	96,257		

*Exports* go chiefly to the United Kingdom and the countries of northern Europe. Statistics of exports since 1917 by calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	2,200,483	24,704,359	8,827,806	14,802,611
Value.....	\$311,350	\$4,109,828	\$1,508,987	\$1,473,336

*Important changes in classification.*—See General Notes on Paragraph below.

#### APPLES, PREPARED OR PRESERVED.

*Description and uses.*—Apples are preserved in large quantities by canning. The fruit is used for baking and as a desert.

*Production.*—New York, Maine, and the Pacific Coast States lead in the production of canned apples. In 1914 production was 1,514,939 cases, valued at \$2,392,289, and in 1919, 2,447,927 cases, valued at \$9,081,598. (The standard case contains 24 No. 3 cans, the net weight of the contents of the case being 44½ pounds.)

*Imports* are unimportant and come mostly from Canada.

*Export* figures are not available, being included with all other canned fruits.

*Important changes in classification.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Apples have been provided for in a separate paragraph, to which has been added specific provision for dried apples and for apples otherwise prepared or preserved, now dutiable as “all edible fruits when dried, desiccated, or prepared in any manner, or as fruits of all kinds preserved or packed in sugar, or having sugar added thereto, or preserved or packed in molasses, spirits, or their own juices.” The phrase “otherwise prepared or preserved” is especially designed to include canned apples. Fruit butter, jams, etc., of all kinds are specially provided for in paragraph 748.

## PARAGRAPH 736.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 736. Bananas, 2 cents per bunch; dried, desiccated, or evaporated, and banana flour, 4 cents per one hundred pounds.

## ACT OF 1909.

PAR. 571. Fruits \* \* \* green, ripe, or dried, \* \* \* not specially provided for in this section [Free].

## ACT OF 1913.

PAR. 488. Fruits \* \* \* green, ripe, or dried, \* \* \* not specially provided for in this section [Free].

PAR. 217. \* \* \* all edible fruits \* \* \* when dried, desiccated, evaporated, \* \* \* not specially provided for in this section, 1 cent per pound; \* \* \*

## BANANAS.

*Description and uses.*—The banana is imported almost entirely in its natural state and may be eaten raw or cooked. Usually it is the underripe fruit which is cooked before the starch has been converted wholly into sugar. The Martinique is the most common variety. Banana flour, meal, and dried banana are used to a limited extent. As most bananas are grown in the Tropics, the success of the industry is largely a question of transportation.

*Production.*—A few bananas are grown in Florida, Louisiana, and California; Florida produced 10,048 bunches, valued at \$5,638, in 1909, and 6,405 bunches, valued at \$8,010, in 1919. Statistics for the other States are not available. The great sources of supply are Central America, Jamaica, Mexico, Cuba, and Colombia. No figures are available for dried bananas or banana flour.

*Imports* in 1914 were 48,691,224 bunches, valued at \$16,397,623. Nearly one-third of the imports now comes from Honduras; Jamaica, Costa Rica, and Panama furnish nearly one-half; Colombia and Guatemala are also heavy exporters; Cuba furnishes about 5 per cent. Imports since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (bunches).....	32,137,683	36,993,095	39,319,562	33,702,910
Value.....	\$15,438,491	\$15,934,590	\$19,087,927	\$15,077,625

*Exports.*—None.

*Important changes in classification.*—Bananas were exempt from duty as fruit not specially provided for under the acts of 1909 and 1913 (pars. 571 and 488). New provisions have been added for dried bananas and banana flour.

*Suggested changes.*—Specific provision might be made for plantains, a species of banana, but commercially a different fruit. (See par. 749, p. 742.)

## PARAGRAPH 737.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 737. Berries, edible, in their natural condition or in brine, 1 cent per pound; dried, desiccated, or evaporated, 2½ cents per pound; otherwise prepared or preserved, and not specially provided for, 20 per centum ad valorem.

ACT OF 1909.

PAR. 274. \* \* \* berries, edible, in their natural condition, one cent per quart; cranberries, twenty-five per centum ad valorem; all edible \* \* \* berries, when dried, desiccated, evaporated, or prepared in any manner, not specially provided for in this section, two cents per pound; \* \* \* fruits of all kinds preserved or packed in sugar, or having sugar added thereto, or preserved or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over ten per centum of alcohol, one cent per pound and thirty-five per centum ad valorem; \* \* \*.

ACT OF 1913.

PAR. 217. \* \* \* berries, edible, in their natural condition, ½ cent per quart; cranberries, 10 per centum ad valorem; all edible \* \* \* berries, when dried, desiccated, evaporated, or prepared in any manner, not specially provided for in this section, 1 cent per pound; \* \* \* fruits of all kinds preserved or packed in sugar, or having sugar added thereto or preserved or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over 10 per centum of alcohol, 20 per centum ad valorem; \* \* \*.

## BERRIES EDIBLE IN THEIR NATURAL CONDITION.

*Description, uses, and production.*—Strawberries are extensively used as a fresh fruit, for canning, and in making preserves and marmalade. The fruit is kept frozen for use as flavoring in ice creams and at soda fountains. The juice is also used as a beverage, for flavoring, etc. The very perishable nature of the fruit necessitates quick utilization after it ripens. No other berry is so widely grown in America. The crop of 1909 amounted to over 255,000,000 quarts, valued at about \$18,000,000. In 1919 production was only 177,000,000 quarts. Maryland, New York, New Jersey, Missouri, Michigan, Tennessee, Arkansas, and California are the principal producing States. The commercial crop follows rather definite channels; thus, strawberries from Florida move northward during winter, but later are supplanted by the crop produced farther north.

The term "blackberry" usually includes, for market purposes, the dewberry, an early ripening variety. These berries are used primarily fresh, though considerable quantities are canned and made into jam, preserves, etc. They are widely grown, there being a number of centers of commercial production. The crop of 1909 amounted to over 55,000,000 quarts, valued at nearly \$4,000,000. In 1919 about 40,000,000 quarts were grown.

Three general types of raspberries are recognized—the red, black, and purple. They are used in the fresh state, for canning, and in making preserves, jams, etc. Black varieties are dried. Purple varieties are of particular value for canning, because they retain their form and color longer. The crop of 1919 amounted to nearly 50,000,000 quarts.

The loganberry is a hybrid between the Pacific coast trailing blackberry and the raspberry. It is too acid for use in the fresh state, but loses much of its acidity when cooked, and therefore is used in pies, etc. It is extensively canned and dried, and increasingly large quan-

tities are consumed in the manufacture of unfermented juice. The commercial culture of the loganberry is confined to the Pacific Coast States. In 1909 the production, including raspberries, was about 61,000,000 quarts, valued at over \$5,000,000. The production of loganberries alone in 1919 was about 12,000,000 quarts.

There are two types of gooseberries, the English varieties and those from the native wild species. The latter are superior in flavor, but the English berries, on account of their larger size, meet with greater favor in the market. The susceptibility of the English varieties to mildew has largely restricted their growth here. Gooseberries are used principally for the making of jelly, conserves, as pie filling, etc. The English berries, when fully ripe, are prized as a fresh fruit. (For quarantine regulations see "Currants, p. 716.") In 1909 the crop amounted to over 5,000,000 bushels, valued at \$417,000. The gooseberry is better adapted to the northern and middle latitudes; it does not thrive where the summer season is long and hot. There are some centers of commercial production in New York, at various points in the Northern States, and on the Pacific coast. The fruit is more widely grown for home uses than for commercial purposes.

Imports of this group of berries for 1911-1918 ranged from 1,000,000 to 2,000,000 quarts, valued at \$100,000 to \$150,000. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Quarts.</i>			<i>Per cent.</i>
1918.....	772,144	\$83,704	\$3,861	4.61
1919.....	1,829,823	249,371	9,149	3.67
1920.....	2,578,554	364,009	12,893	3.54
1921 (9 months).....	1,538,389	217,938		

Exports prior to 1918 were between \$500,000 and \$800,000, and went chiefly to Canada. Exports since 1917 by calendar years have been as follows: 1918, \$887,561; 1919, \$1,181,742; 1920, \$791,555; 1921 (9 months), \$621,504.

*Important changes in classification.*—See General Notes on Paragraph, page 717.

#### BERRIES, DRIED, DESICCATED, EVAPORATED, OR OTHERWISE PREPARED OR PRESERVED.

*Description, uses, and production.*—Statistics as to the quantities of berries dried are not available. In comparison with other dried fruits the amount is not large. Berries are usually preserved by canning. The States of California, Oregon, Washington, New York, and Michigan lead in this industry. Census returns for 1914 and 1919 show production figures as follows:

Canned berries.	1919		1914	
	Quantity.	Value.	Quantity.	Value.
	<i>Cases.<sup>1</sup></i>		<i>Cases.<sup>1</sup></i>	
Blackberries.....	910,657	\$5,080,397	452,161	\$788,614
Blueberries.....	150,350	913,821	151,636	320,508
Gooseberries.....	87,026	343,504	89,593	142,576
Loganberries.....	273,664	2,138,817	39,508	.....
Raspberries.....	551,419	4,278,939	414,632	1,137,207
Strawberries.....	374,097	3,693,648	185,919	557,519
Total.....	2,347,213	16,449,126	1,333,440	2,946,724

<sup>1</sup> Standard case contains 24 No. 2 cans and the net weight of contents is approximately 30 pounds.

*Imports* of canned berries are insignificant and not separately shown. *Imports* of dried berries are likewise small; detailed figures for the latter are given below:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	1, 800	\$377	\$18	4. 77
1919.....	33, 577	5, 506	336	6. 10
1920.....	177, 095	28, 822	1, 771	6. 14
1921 (9 months).....	15, 005	2, 007		

*Exports* of dried and canned berries are not shown.

*Important changes in classification.*—See General Notes on Paragraph, page 717.

#### CRANBERRIES.

*Description and uses.*—The cranberry is the fruit of a low bush growing naturally in moist locations, frequently in decidedly boggy regions. Commercial production is restricted to the North. It is used primarily for sauce or jelly.

*Production* centers chiefly in three districts—the Cape Cod region of Massachusetts, the eastern part of New Jersey, and central Wisconsin. Statistics of production for the years 1918–1921 have been as follows:

	1918	1919	1920	1921
Quantity (barrels).....	352, 000	549, 000	449, 000	373, 000
Value.....	\$3, 791, 000	\$4, 597, 000	\$5, 514, 000	\$6, 192, 000

*Imports* are extremely small in amount, being only \$4 in 1918, \$177 in 1919, and \$299 in 1920.

*Exports* are not separately shown.

*Important changes in classification.*—See General Notes on Paragraph, page 717.

#### CURRANTS.

*Description and uses.*—Currants are used principally in making jelly and small quantities are employed in making conserves. Spiced currants are used for pie filling, etc. Few are consumed fresh because of their sharp acidity. Because of the relation which currant and gooseberry plants of all varieties bear to the white-pine blister rust, stringent quarantine regulations limit the regions for growing currants or gooseberries. In the absence of these plants the disease is not perpetuated.

*Production* in 1909 was over 10,000,000 quarts, valued at \$790,000, and chiefly in the Central and Northern States. Production in 1919 amounted to about 7,700,000 quarts. The currant grows farther north than many other small fruits. It withstands drought fairly well, and is a home-garden fruit in the Great Plains area where lack of moisture restricts many other fruits and berries.

*Imports and exports* are not separately shown.

## GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Berries, green, ripe, or dried, have been transferred from the free list (par. 488, act of 1913). The rate upon the fresh berries has been changed from the quart to the pound basis in accordance with common usage in the trade.

Imports have been so small that the specific provision for cranberries has been dropped.

## PARAGRAPH 738.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 738. Cherries, in their natural state or in brine,  $1\frac{1}{2}$  cents per pound; maraschino cherries and cherries prepared or preserved in any manner, 20 per centum ad valorem.

## ACT OF 1909.

PAR. 274. \* \* \* cherries, \* \* \* green or ripe, twenty-five cents per bushel; \* \* \* fruits of all kinds preserved or packed in sugar, or having sugar added thereto, or preserved or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over ten per centum of alcohol, one cent per pound and thirty-five per centum ad valorem; \* \* \*

PAR. 571. \* \* \* fruits in brine, not specially provided for in this section [Free].

## ACT OF 1913.

PAR. 217. \* \* \* cherries, \* \* \* green or ripe, 10 cents per bushel of fifty pounds; \* \* \* fruits of all kinds preserved or packed in sugar, or having sugar added thereto or preserved or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over 10 per centum of alcohol, 20 per centum ad valorem; \* \* \*

PAR. 488. \* \* \* fruits in brine, not specially provided for in this section [Free].

## CHERRIES.

*Description and uses.*—Two distinct types of cherries are grown—the sweet and the sour. Too acid to be pleasing in the fresh state, the sour cherries are principally used for culinary purposes, for sauces, and especially for pies. A considerable portion of the crop is canned and distributed to restaurants, pie bakers, hotels, etc. Sweet cherries are consumed fresh, but large quantities are used in canning and in making maraschino cherries. Both sweet and sour cherries have various other food uses, as in ice creams, icings, and soda-fountain products. Food-preserving companies operate large plants in some of the cherry-growing regions.

*Production*, while extensive for home use, is restricted commercially to a few sections. The sour cherry, being hardier, is more largely grown. The crop in 1909 was about 4,126,099 bushels. Commercial production is now largely in New York, Ohio, Michigan, Wisconsin, Colorado, and the Pacific Coast States. In the Pacific States the crop is mostly sweet; elsewhere chiefly sour. In 1919 the domestic production of cherries was 3,945,749 bushels, valued at \$14,166,176.

The production of canned cherries in 1919 was 1,362,832 cases, valued at \$8,451,029; in 1914 production was 543,213 cases, valued

<sup>20</sup> Cherries in a raw state, preserved in brine or otherwise, 3 cents per pound. (Par. 27, emergency tariff act of 1921.)

at \$1,628,975. (A case consists of 24 No. 2 cans, the average weight of contents being about 31 pounds.)

*Imports* of fresh cherries are small and come chiefly from Canada. Cherries are usually imported in brine and such cherries constitute substantially all of the fruit in brine for which statistics for calendar years are given below. Exact quantities of glacé, candied, and maraschino cherries imported are likewise not separately shown, but it is estimated that approximately 2,500 tons are annually imported from Italy and Spain.

Imports of fruits in brine (except citron) have been, in calendar years, as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....		28,722,608	24,712,176	1,317,824
Value.....	\$945,326	\$2,677,868	\$1,877,291	\$52,834

Under the emergency tariff act (May 27, 1921) "cherries in a raw state, preserved in brine or otherwise," were made dutiable separately from all other fruits. From May 28 to September 30, 1921, 1,570,768 pounds, valued at \$285,585, were entered for consumption.

*Exports.*—None recorded.

*Important changes in classification.*—All the provisions for cherries have been combined in one paragraph. The provisions for "fruits in brine" (par. 488, act of 1913), rather than that for "cherries, green or ripe" (par. 217, act of 1913), has been held to be the proper classification for cherries in brine. There is, moreover, doubt concerning the percentage of brine under such classification. For these reasons specific provision is made for cherries in brine. A special provision is also included for maraschino cherries, dutiable under the act of 1913 (par. 217) as fruits preserved or packed in spirits.

*Suggested changes.*—Specific provision might be made for sulphured cherries, some of which are imported. The first bracket of paragraph 738 might be amended to read, "Cherries, in their natural state, sulphured, or in brine, [rate]."

## PARAGRAPH 739.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 739. Cider, 10 cents per gallon; vinegar, 6 cents per proof gallon: *Provided*, That the standard proof for vinegar shall be 4 per centum by weight of acetic acid.

### ACT OF 1909.

PAR. 255. Cider, five cents per gallon.  
PAR. 299. Vinegar, seven and one-half cents per proof gallon. The standard proof for vinegar shall be taken to be that strength which requires thirty-five grains of bicarbonate of potash to neutralize one ounce troy of vinegar.

### ACT OF 1913.

PAR. 202. Cider, 2 cents per gallon.  
PAR. 236. Vinegar, 4 cents per proof gallon. The standard proof for vinegar shall be taken to be that strength which requires thirty-five grains of bicarbonate of potash to neutralize one ounce troy of vinegar.

## CIDER.

*Description and uses.*—Cider is the juice of apples or other fruit, obtained by grinding the fruit to a pulp and pressing in a mill. It is chiefly used as a beverage and in the making of vinegar.

*Production.*—In 1914 there were 430 manufacturers of cider in the United States, with a product valued at \$2,244,618. New York, Illinois, and Kentucky lead in its manufacture. In 1919 a total of 522 establishments reported a product valued at \$7,243,000. Besides this, 19,400,000 gallons, valued at \$9,700,000, were made on farms. Many households manufacture for consumption or sale, but there has been a marked trend toward factory production.

*Imports of cider since 1917 have been as follows:*

Calendar year.	Quantity.	Value.	Duty.	Equiva- lent ad valorem.
	<i>Gallons.</i>			<i>Per cent.</i>
1918.....	2,737	\$2,852	\$55	1.92
1919.....	3,281	4,137	66	1.59
1920.....	99,825	110,148	1,997	1.81
1921 (9 months).....	14,197	3,890		

*Exports in 1912* (the last year in which they were separately given) were 63,882 gallons, valued at \$10,460. About 90 per cent went to the United Kingdom.

*Important changes in classification.*—See General Notes on Paragraph, page 720.

## VINEGAR.

*Description and uses.*—Vinegar is usually derived from beer, cider, malt, glucose, sugar, or wine, through bacterial action and the removal of the alcohol by oxidation. It consists essentially of dilute acetic acid and is used chiefly as a temporary preservative.

*Production on farms in 1909* was 7,246,632 gallons. Factory production was reported as worth \$5,566,274 in 1914. In 1919 vinegar made on farms amounted to 8,600,000 gallons, valued at \$2,600,000. There were 198 establishments engaged in factory production of vinegar in 1919 with a total output valued at \$17,437,000.

*Imports in 1913* were 303,376 gallons, valued at \$84,855. In 1920 over 40 per cent came from Great Britain, the other most important sources being Canada, Japan, and Hongkong. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equiva- lent ad valorem.
	<i>Pf. gallons.</i>			<i>Per cent.</i>
1918.....	53,323	\$30,401	\$2,133	7.02
1919.....	99,463	58,614	3,979	6.79
1920.....	192,638	89,626	7,706	8.60
1921 (9 months).....	109,331	52,048		

*Exports* in 1914 were 125,666 gallons, valued at \$25,112. They go chiefly to Canada, Panama, Mexico, the Philippine Islands, and the United Kingdom. Later export figures for calendar years are tabulated as follows:

	1918	1919	1920	1921 (9 months).
Quantity (gallons).....	318,975	469,316	290,912	137,350
Value.....	\$89,090	\$135,869	\$113,020	\$44,780

*Important changes in classification.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—The two paragraphs relating to cider and vinegar have been combined. The standard proof for vinegar, as given in the acts of 1909 and 1913, is antiquated. In the proposed substitute the present method of determining the strength of vinegar is utilized, and the standard given corresponds to that of the Department of Agriculture.

### PARAGRAPH 740.

#### H. R. 7456.

#### SENATE AMENDMENTS.

PAR. 740. Citrons and citron peel, crude, or in brine, 2 cents per pound; candied or otherwise prepared or preserved, 4 cents per pound; orange and lemon peel, crude, or in brine, candied, or otherwise prepared or preserved, 2 cents per pound.

#### ACT OF 1909.

PAR. 278. Orange peel or lemon peel, preserved, candied, or dried, \* \* \* two cents per pound; citron or citron peel, preserved, candied, or dried, four cents per pound.

PAR. 571. \* \* \* fruits in brine, not specially provided for in this section [Free].

PAR. 641. Orange and lemon peel, not preserved, candied, or dried [Free].

#### ACT OF 1913.

PAR. 221. Orange peel or lemon peel, preserved, candied, or dried, 1 cent per pound; \* \* \* citron or citron peel, preserved, candied, or dried, 2 cents per pound.

PAR. 488. \* \* \* fruits in brine, not specially provided for in this section [Free].

PAR. 563. Orange and lemon peel, not preserved, candied, or dried [Free].

#### CITRON OR CITRON PEEL, PRESERVED OR CANDIED.

*Description and uses.*—The citron is a lemonlike fruit, with rind thick and tender, and is preserved or candied for confectionery and for culinary purposes. The term "citron" is also applied to a variety of melon, the rind of which is used for preserves.

*Production.*—Citrons are grown in California and Florida, but more extensively in the West Indies and southern Europe. California produced 2,002 boxes of citrons, valued at \$8,008, in 1919. Production figures for Florida are not shown. Most of the candied citron comes from Mediterranean countries.

Imports in 1914 of citron in brine amounted to 2,482,940 pounds, valued at \$106,677; and of candied citron, 849,557 pounds, valued at \$66,849. Later figures follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
CITRON IN BRINE.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	3,021,982	\$171,214		
1919.....	2,845,762	292,152		
1920.....	3,342,624	566,112		
1921 (9 months).....	2,514,767	246,363		

## CITRON OR CITRON PEEL, PRESERVED, CANDIED, OR DRIED.

1918.....	421,681	\$36,231	\$3,434	9.73
1919.....	400,248	106,407	8,005	7.52
1920.....	875,653	314,618	17,513	5.57
1921 (9 months).....	237,446	53,489		

*Exports.*—None recorded.

*Important changes in classification.*—See General Notes on Paragraph, page 722.

## ORANGE AND LEMON PEEL.

*Description and uses.*—Orange and lemon peels are used in a candied or preserved state for confectionery and culinary purposes. The United States Pharmacopœia recognizes two varieties of orange peel. (1) Bitter, the dried rind of a sour, inedible fruit, deep orange in color, and with a thick and spongy rind. It is not grown here. The bitter orange peel is used for flavoring medicines. (2) Sweet, the outer rind of the ripe edible fruit. When dried it resembles bitter orange peel and it is used principally as an aromatic and as a source of essential oils. Lemon peel is also from the fresh fruit; it is usually not dried, but is valued for its oils and for its flavoring properties.

*Production.*—The domestic lemon and orange growing industries do not recover the by-products as extensively as in European practice; the peel is preserved to some extent in California and Florida, but statistics are not available.

Imports of dried orange and lemon peel were 563,666 pounds, valued at \$34,004 in 1914. Later statistics follow.

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
ORANGE AND LEMON PEEL, NOT PRESERVED, CANDIED, OR DRIED.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....		\$31,037		
1919.....	1,046,429	45,138		
1920.....	875,700	54,903		
1921 (9 months).....	321,461	10,630		

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
ORANGE AND LEMON PEEL, PRESERVED, CANDIED, OR DRIED.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	83,584	\$13,194	\$836	6.34
1919.....	193,724	31,463	1,937	6.16
1920.....	351,547	70,182	3,515	5.01
1921 (9 months).....	141,277	17,521		

*Exports.*—None recorded.

*Important changes in classification.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—The acts of 1909 and 1913 contain provisions for unprepared orange and lemon peel (par. 641, act of 1909, and par. 563, act of 1913), as well as provisions for prepared orange, lemon and citron peel, and citron (par. 278, act of 1909, and par. 221, act of 1913). Furthermore considerable quantities have been imported under the provision for "fruits in brine" (par. 571, act of 1909, and par. 488, act of 1913). The several paragraphs relating to peels have been combined, and duties imposed upon the crude peel and peels in brine as well as upon the prepared product.

*Suggested changes.*—Page 91, line 24; page 92, line 1: Insert "or dried" after "in brine."

#### PARAGRAPH 741.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 741. Figs, fresh or dried, 2 cents per pound; prepared or preserved in any manner, 20 per centum ad valorem; dates, 1 cent per pound.

#### ACT OF 1909.

#### ACT OF 1913.

PAR. 274. \* \* \* fruits of all kinds preserved or packed in sugar, or having sugar added thereto, or preserved or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over ten per centum of alcohol, one cent per pound and thirty-five per centum ad valorem; \* \* \*.

PAR. 275. Figs, two and one-half cents per pound; \* \* \* dates, one cent per pound; \* \* \*.

PAR. 217. \* \* \* fruits of all kinds preserved or packed in sugar, or having sugar added thereto or preserved or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over 10 per centum of alcohol, 20 per centum ad valorem; \* \* \*.

PAR. 218. Figs, 2 cents per pound; \* \* \* dates, 1 cent per pound; \* \* \*.

#### FIGS.

*Description and uses.*—Two types of figs are grown—the Adriatic, chiefly in the South Atlantic and Gulf States, and the Smyrna, in California. The Adriatic is also grown in California and is still a large proportion of the crop; the Smyrna, planted only in recent years, is becoming increasingly important. Small quantities, commercially negligible, are also grown in Arizona. The humid climatic conditions of the South Atlantic and Gulf States produce a very perishable fruit, fermentation setting in within a few hours after picking, unless

special precautions are taken. As it has been impracticable to ship the fresh fruit long distances except under effective refrigeration, it is used in the home or in near-by markets, large quantities being canned or otherwise preserved. In the Southern States east of Texas there is little orchard planting, but almost every rural and urban home raises a family supply, some of which is canned locally. In the Gulf coast region of Texas there are many fig orchards, the fruit of which is practically all canned. In California the crop is largely dried and packed for the trade.

*Production.*—California produces practically all of the figs grown commercially in this country. In 1909 her production amounted to 33,000,000 pounds, valued at \$716,000. In 1919 it was about 26,460,000 pounds, valued at \$2,762,000.

*Imports for 1915–1918* (fiscal years) averaged 12,103,184 pounds, valued at \$612,432, considerably less than the prewar average. Before the war most of the dried figs came from Smyrna in Asiatic Turkey. Large quantities are still received from Smyrna and also from Greece, Spain, Italy, and Portugal. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	9,913,732	\$702,368	\$198,275	28.23
1919.....	18,011,655	3,210,649	360,233	11.22
1920.....	31,074,933	3,890,782	621,499	15.97
1921 (9 months).....	9,246,157	875,476	.....	.....

*Exports.*—None.

*Important changes in classification.*—See General Notes on Paragraph, page 724.

#### DATES.

*Description and uses.*—Dates are raised in the warm, dry, interior valleys of California and Arizona, important producing sections being the Coachella and Imperial Valleys in California, and localities in the vicinity of Phoenix, Ariz. This is an infant industry and development is relatively slow, because of the difficulty in securing offshoots from desirable varieties.

*Production* does not justify shipments in carload lots. In 1919 California produced 144,992 pounds, valued at \$28,998. Arizona produced 42,812 pounds, valued at \$10,703.

*Imports* during 1913–1917 averaged 28,066,867 pounds. Asiatic Turkey has always been the chief source, supplying in 1920 about 75 per cent of the imports. Statistics of imports since 1917 are as follows:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	10,024,916	\$487,886	\$100,249	20.55
1919.....	20,606,205	989,970	206,062	20.81
1920.....	28,562,114	1,823,223	285,621	15.67
1921 (9 months).....	23,325,889	1,340,843	.....	.....

*Exports.*—None reported.

*Important changes in classification.*—See General Notes on Paragraph, page 724.

## GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Figs and dates have been brought together in one paragraph. The provision for figs has been made more specific to accord with the character of the trade and more nearly to reflect variations in value.

*Suggested changes.*—For dates, as in the case of figs, provision might be made for the fruit fresh or dried, and prepared or preserved.

## PARAGRAPH 742.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 742. Grapes in barrels or other packages, 25 cents per cubic foot of the capacity of the packages; raisins, 2 cents per pound; dried currants and other dried grapes, 2½ cents per pound.

## ACT OF 1909.

## ACT OF 1913.

PAR. 275. \* \* \* raisins and other dried grapes, two and one-half cents per pound; \* \* \* currants, Zante or other, two cents per pound; \* \* \*.

PAR. 218. \* \* \* raisins and other dried grapes, 2 cents per pound; \* \* \* currants, Zante or other, 1½ cents per pound; \* \* \*.

PAR. 276. Grapes in barrels or other packages, twenty-five cents per cubic foot of capacity of barrels or packages.

PAR. 219. Grapes in barrels or other packages, 25 cents per cubic foot of the capacity of the barrels or packages.

## GRAPES.

*Description and uses.*—The grapes produced in the United States are of three types. (1) Native bunch grapes, the most widely distributed; (2) the vinifera or European grapes, confined chiefly to California; (3) the muscadine grapes, raised principally in the South Atlantic and Gulf States. Growing the muscadine is primarily a home industry although some commercial vineyards have been maintained in the past for making wine. The regional distribution of these different types is determined by climatic adaptations.

*Production.*—The native American bunch grapes are widely grown outside of California and the South Atlantic and Gulf States, where the other types are chiefly produced. There are commercial producing centers, such as the Hudson River Valley, the lake regions in central and western New York, northwestern Pennsylvania, northern Ohio, southwestern Michigan, and smaller districts elsewhere. Home vineyards are general. There are no adequate statistics of the native bunch grapes or the muscadine. The vinifera represent a large investment in California. Data of acreage are difficult to secure, but the best estimates indicate about 50,000 acres of table grapes, 230,000 acres of raisin grapes, and 140,000 acres of wine grapes in California alone. Estimates of returns to the grape industry of California for the year 1919 are: Wine grapes, \$15,000,000; table grapes, \$18,000,000; raisin grapes, \$42,500,000; total, \$75,500,000. Shipments of fresh grapes from California were about 6,360 cars in 1913 and more than 22,068 in 1919. The total domestic production of all

kinds of grapes in 1919 was 1,258,420 tons, valued at \$95,586,021. Of this amount California produced 1,027,822 tons, valued at \$65,780,628. In 1919 a total of 87,644 cases of grapes, valued at \$514,219, were canned, mostly in California.

*Imports* of grapes amounted to an annual average of 1,048,815 cubic feet (packed in barrels), valued at \$1,227,171 for 1914-1918 (fiscal years). They have ranged from 2,237,730 pounds in 1908 to 533,599 pounds in 1919. These are largely late-ripening, long-keeping, European varieties, mostly from Spain. Some quantities are also brought in from Canada and the West Indies. Statistics of imports since 1917 follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Cubic feet.</i>			<i>Per cent.</i>
1918.....	667,851	\$992,747	\$166,963	16.82
1919.....	533,599	843,529	133,400	15.81
1920.....	991,554	1,484,568	247,889	16.70
1921 (9 months).....	191,489	376,431	.....	.....

*Exports.*—Not recorded separately.

*Important changes in classification.*—See General Notes on Paragraph, page 726.

#### RAISINS.

*Description and uses.*—Raisins are dried grapes of certain varieties of the vinifera or European type. While producible from many kinds of grapes, particular qualities are required for raisins of high grade, and few varieties possess these qualities in a sufficient degree. The raisins most prized are the Alexandria and the Sultanina.

*Production* is confined, commercially, to California, where conditions are favorable to desirable raisin varieties and where sun drying is feasible. Output has steadily increased for several years. The pack has ranged from 254,000,000 pounds in 1915 to 395,000,000 pounds in 1919. Production varied from 125,000,000 pounds in 1910 to 196,000,000 pounds in 1914. California produced 293,300,581 pounds in 1919 valued at \$35,544,262.

*Imports* in 1918 were only 949,285 pounds, valued at \$157,486, with an average of about 3,500,000 pounds during 1910-1914. Normally the imports, mostly from Spain and Asiatic Turkey, are unimportant compared with production or exports. In 1920 imports were unusually large; over 55 per cent came from Spain. Statistics of imports of raisins and other dried grapes follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	202,672	\$26,965	\$4,053	15.03
1919.....	1,357,545	391,018	27,141	6.94
1920.....	40,538,897	6,792,197	810,488	11.94
1921 (9 months).....	12,863,067	1,782,704	.....	.....

*Exports* rapidly increased, up to the enactment of the Federal prohibition law, reaching a maximum of 110,183,033 pounds in 1919.

Canada, the United Kingdom, Japan, and Australasia were the principal countries of destination. Exports of raisins and other dried grapes since 1917 by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	52,657,814	110,183,033	53,312,126	10,680,200
Value.....	\$4,668,021	\$13,089,366	\$9,505,202	\$1,979,694

*Important changes in classification.*—See General Notes on Paragraph below.

#### DRIED CURRANTS, ZANTE OR OTHER.

*Description and uses.*—The Zante or currants of commerce are in fact the dried product of certain varieties of European grapes, domestic production of which has been negligible. Recent experiments indicate that this type of grape can be grown commercially in California. The dried currant is used for culinary purposes.

*Production* has been inconsiderable, but small commercial plantings are being made.

*Imports* from 1907 to 1917 have ranged from about 30,000,000 pounds to 39,000,000 pounds. These imports came almost entirely from Greece. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	3,967,411	\$503,537	\$59,511	11.82
1919.....	13,567,066	2,108,482	203,506	9.65
1920.....	55,560,624	6,073,481	833,409	13.72
1921 (9 months).....	26,244,044	2,426,767		

*Important changes in classification.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Fresh grapes have been combined with dried grapes, raisins, and dried currants.

The provision here for dried currants covers only dried currant grapes of the Zante and other varieties, which are similar in nature to raisins. Garden currants are a different fruit, being more nearly related to berries. Trade in garden currants is unimportant. Such currants, in the absence of specific provision therefor, have been held to come within the provision for berries in their natural condition.

“Other dried grapes” consist mostly of wine grapes, imports of which have recently much increased.

The provision for assessing duty on grapes per cubic foot of the capacity of the package has been retained, because most of the imported grapes are packed in cork dust, making difficult the determination of the actual weight of fruit without spoiling the fruit.

## PARAGRAPH 743.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 743. Lemons, 2 cents per pound; limes, oranges, and grapefruit, 1 cent per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 277. Lemons, one and one-half cents per pound; oranges, limes, grape fruit, shaddocks, or pomelos, one cent per pound.

PAR. 220. Lemons,<sup>21</sup> limes, oranges, grapefruit, shaddocks, and pomelos in packages of a capacity of one and one-fourth cubic feet or less, 18 cents per package; in packages of capacity exceeding one and one-fourth cubic feet and not exceeding two and one-half cubic feet, 35 cents per package; in packages exceeding two and one-half and not exceeding five cubic feet, 70 cents per package; in packages exceeding five cubic feet or in bulk,  $\frac{1}{2}$  of 1 cent per pound.

## LEMONS.

*Description and uses.*—The lemon, even more than the orange, requires a warm climate, relatively free from frost. Lemons are picked at a certain size, varying from  $2\frac{1}{4}$  to  $2\frac{1}{2}$  inches in diameter, and stored in curing rooms, sometimes two or three months, until a typical yellow color is acquired. Great care must be exercised in picking, packing, and marketing. Besides the familiar uses of the fresh fruit, there are important by-products, including citrate of lime, and citric acid.

*Production.*—Commercial cultivation of the lemon is confined to California, where production increased from 2,756,000 boxes in 1909 to 6,551,000 boxes valued at \$19,000,000 in 1919. Florida also grows some lemons, chiefly for home use. Production in this State amounted in 1919 to 31,204 boxes valued at \$93,612.

*Imports* for 1913-1917 (chiefly from Sicily) fluctuated from 100,000,000 to 175,000,000 pounds, with values from \$2,062,030 to \$5,981,635. Lemons are entered in packages of varying size, but most of the imports are received in boxes whose contents exceed  $1\frac{1}{4}$  but do not exceed  $2\frac{1}{2}$  cubic feet. Statistics of imports since 1917 by calendar years follow:

	1918	1919	1920	1921 (9 months).
Value.....	\$1,857,588	\$2,437,802	\$2,904,529	\$1,044,872
Duty.....	360,519	352,586	542,076	.....

The following statistics show the value of lemons imported by months for 1920 and 1921 under the operation of the emergency tariff act.

<sup>21</sup> Lemons, 2 cents per pound. (Par. 10, emergency tariff act of 1921.)

Month.	1920	1921	Month.	1920	1921
January.....	\$156,229	\$67,232	July.....	\$337,543	\$304,058
February.....	82,251	32,369	August.....	456,387	242,440
March.....	343,526	85,768	September.....	67,754	100,116
April.....	305,747	38,517	October.....	131,635	105,639
May.....	357,870	78,678	November.....	44,142	54,669
June.....	537,102	94,630	December.....	84,343	24,491

*Exports* for 1914–1918 (fiscal years) ranged from 70,000 to 193,000 boxes, valued at \$308,707 to \$1,088,000. Over 85 per cent go to Canada. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (boxes).....	193,347	306,916	293,050	242,959
Value.....	\$1,088,823	\$1,371,848	\$1,188,053	\$1,023,696

*Important changes in classification.*—See General Notes on Paragraph, page 730.

#### LIMES.

*Description and uses.*—Limes are a variety of citron, and are used for the same purposes as the lemon. They also yield citrate of lime and citric acid. The trade demands sizes from  $1\frac{1}{4}$  to  $1\frac{1}{2}$  inches in diameter.

*Production.*—The tree, less hardy than the lemon tree, is commercially restricted to warm localities in Florida. California has successfully cultivated some home orchards, but produced only 136 boxes in 1919. Production in Florida for 1909 and 1919 was 11,302 and 27,725 boxes, valued at \$12,457 and \$97,040, respectively.

*Imports*, largely from the West Indies, are shown for calendar years in the following table:

	1918	1919	1920	1921 (9 months).
Value.....	\$66,754	\$95,588	\$84,249	\$91,789
Duty.....	6,528	17,224	16,747	.....

*Exports.*—None recorded.

*Important changes in classification.*—See General Notes on Paragraph, page 730.

#### ORANGES.

*Description and uses.*—The important orange-growing sections of this country are in California and Florida; smaller areas are in Arizona, Texas, Louisiana, Alabama, and Mississippi. The crop requires a warm climate, relatively free from frost. The trees begin to bear the third year, but not in commercial quantities until the fifth or sixth year; they bear profitably from 20 to 40 years. The industry is highly specialized. The fruit is picked very carefully, to avoid bruising, and is assorted into several grades in packing houses. By means of mechanical sizers the fruits of each grade are divided into the different commercial sizes. There are by-products, including orange marmalade, candied orange peel, orange vinegar, etc.

*Production of oranges in recent years has varied from approximately 10,000,000 to 24,000,000 boxes—7,000,000 to 17,000,000 boxes in California, 3,000,000 to 6,000,000 boxes in Florida; the remainder in Arizona, Texas, Louisiana, Mississippi, and Alabama. The quantity and value of the crop in the two States of California and Florida for later calendar years follow:*

	1918	1919	1920	1921
Quantity (boxes).....	24,200,000	22,528,000	29,700,000	30,700,000
Farm value, Dec. 1.....	\$84,480,000	\$60,202,000	\$64,908,000	\$63,850,000

*Imports of oranges for 1914–1917 varied from approximately \$50,000 to \$100,000. The heaviest shipments came from the West Indies and Japan. Later statistics for calendar years follow:*

	1918	1919	1920	1921 (9 months).
Value.....	\$107,206	\$52,790	\$58,371	\$8,389
Duty.....	23,591	12,359	12,256	.....

*Exports for 1914–1918 ranged from 1,500,000 to 1,800,000 boxes, valued at \$3,800,000 to \$4,480,000. The larger shipments were to Canada. Later statistics for calendar years follow:*

	1918	1919	1920	1921 (9 months).
Quantity (boxes).....	857,159	1,777,468	1,517,994	1,828,70
Value.....	\$4,279,429	\$7,638,450	\$7,518,638	\$6,644,21

*Important changes in classification.*—See General Notes on Paragraph, page 730.

#### GRAPEFRUIT.

*Description and uses.*—Florida is the most important grapefruit producer. This fruit is also raised commercially in California, but is of minor importance compared with orange and lemon holdings. It is grown commercially in Arizona to a small extent, and is also found in home orchards in Texas, Louisiana, Mississippi, and Alabama. Its important use is as a breakfast fruit.

*Production* in Florida has increased from 1,061,537 boxes in 1909 to 3,158,431 boxes in 1919, the latter crop being valued at \$6,158,941. California produced 122,515 boxes in 1909 and 465,085 boxes valued at \$930,170 in 1919.

*Imports*, practically all from Cuba, are shown for calendar years in the following table:

	1918	1919	1920	1921 (9 months).
Value.....	\$323,007	\$611,129	\$627,726	\$398,796
Duty.....	53,198	81,381	60,597	.....

*Exports.*—None recorded.

*Important changes in classification.*—See below.

GENERAL NOTE ON PARAGRAPH.

*Important changes in classification.*—The duty has been simplified by changing from the complicated package to the pound basis. The terms "shaddocks" and "pomelos" have been dropped because they are merely synonyms for grapefruit.

PARAGRAPH 744.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 744. Olives in brine, green, 20 cents per gallon; ripe, 20 cents per gallon; pitted or stuffed, 30 cents per gallon; dried ripe olives, 4 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 275. \* \* \* olives, in bottles, jars, kegs, tins, or other packages, containing less than five gallons each, twenty-five cents per gallon; otherwise, fifteen cents per gallon.

PAR. 218. \* \* \* olives, 15 cents per gallon.<sup>22</sup>

OLIVES.

*Description and uses.*—The products of the industry relating to this fruit are pickled olives (green or ripe), salt-cured olives, pitted or stuffed olives, and olive oil.

*Production.*—The fruit is grown in a warm, dry climate, free from frost, and its production requires skill and long experience in culture. The tree begins to bear commercially when 5 to 7 years old, and may be productive for several centuries.

Domestic olive culture is confined to California and small areas in Arizona, with a total acreage of about 1 per cent of the Spanish or Italian crop. Only recently has the industry been firmly placed, and its present status is due largely to improvements in growing and handling, especially in pickling the ripe olive, in which the United States has virtually a monopoly. Competing countries have not produced ripe olives, partly because of the presence of the olive fly, which honeycombs the ripe fruit. Domestic producers have had little success in pickling green olives.

Spain, the principal source of our imported olives, grows chiefly those used for pickling, while those grown for oil predominate in Italy, whence is normally derived most of the olive oil. In the domestic industry, pickles and oil are largely joint products, the culls and injured ripe olives being processed for oil and the better grades pickled. Olives for oil, usually grown without irrigation, are being abandoned for the more profitable ripe olives. The competition of foreign oils is a strong trade factor.

<sup>22</sup> Olives, in solutions, 25 cents per gallon; olives, not in solutions, 3 cents per pound. (Par. 23, emergency tariff act of 1921.)

In 1921 there were in the United States about 40,000 acres in olives, of which between 20,000 and 30,000 acres were bearing. About 50 per cent of the olives were pickled, and the remainder were salt-cured, pickled green, or crushed for oil. The pickled ripe olives amount to over 1,000,000 gallons annually. The output varies with fluctuations in yield and in the percentage suitable for pickling. In California production in 1909 was 16,132,412 pounds, valued at \$401,277, and in 1919, 17,564,020 pounds, valued at \$1,405,121. According to the California Olive Association production of pickled ripe olives and salt-cured olives for the last three calendar years was as follows:

	1918	1919	1920 <sup>1</sup>
Pickled ripe olives.....pounds..	8,910,000	10,791,000	6,930,000
Salt-cured olives.....do....	2,247,000	1,198,000	1,498,000

<sup>1</sup>Estimated.

Growers estimate the average value of present bearing lands, both good and bad, at \$750 per acre (for 1921) and nonbearing lands at \$500.

Both the pickling and the oil processing are performed in specially equipped packing plants, sometimes in connection with olive groves. There were 26 commercial processing plants in California and Arizona in 1921, and half of these were equipped for making olive oil. As the packing season lasts only three or four months, these establishments usually engage in canning other products. In the Mediterranean countries olives are generally grown and processed as a family enterprise, and brokers buy, assemble, and grade the product at gathering stations. The pickling process consists in first neutralizing with an alkali (usually lye) the tannic acid of the olive, after which the product is aerated to "settle" the color and impart the characteristic black tinge. The lye is then washed off, the olives placed in brine solutions, and later canned. The price varies with the size of the olives.

*Imports*, principally from Spain, ranged during 1910-1917 between 3,000,000 and 5,000,000 gallons, about five times the domestic crop. They consisted of the highest-priced product, green olives, mostly "queens" or large-sized olives, and included relatively but a small amount of the lower-priced Manzanilla or small olives. The shipments are largely in bulk, being bottled or packed here. The bottling and packing and the pitting and stuffing of imported olives is a considerable industry. The revenue ranged from \$500,000 to \$860,000 during 1910-1917. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Gallons.</i>			<i>Per cent.</i>
1918.....	2,558,245	\$1,207,475	\$383,704	32
1919.....	3,960,253	2,348,580	594,033	25
1920.....	4,195,384	4,286,244	629,307	15
1921 (9 months).....	3,374,960	2,249,597		

The following statistics show the quantity and value of olives imported by months for 1920 and 1921 under the operation of the emergency tariff act:

Month.	Quantity.		Value.	
	1920	1921	1920	1921
	<i>Gallons.</i>	<i>Gallons.</i>

*Exports.*—None recorded.

*Important changes in classification.*—Because of the distinctive trade in ripe, green, and pitted or stuffed olives, special provision has been made for each of these classes.

#### PARAGRAPH 745.

##### H. R. 7456.

##### SENATE AMENDMENTS.

PAR. 745. Peaches and pears, green or ripe, one-half of 1 per cent per pound; dried, desiccated, or evaporated, 1 cent per pound; otherwise prepared or preserved, and not specially provided for, 20 per centum ad valorem.

##### ACT OF 1909.

PAR. 274. \* \* \* peaches, \* \* \* and pears, green or ripe, twenty-five cents per bushel; \* \* \* all edible fruits, \* \* \* when dried, desiccated, evaporated, or prepared in any manner, not specially provided for in this section, two cents per pound; \* \* \* fruits of all kinds preserved or packed in sugar, or having sugar added thereto, or preserved or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over ten per centum of alcohol, one cent per pound and thirty-five per centum ad valorem; \* \* \*.

##### ACT OF 1913.

PAR. 217. \* \* \* peaches, \* \* \* and pears, green or ripe, 10 cents per bushel of fifty pounds; \* \* \* all edible fruits, \* \* \* when dried, desiccated, evaporated, or prepared in any manner, not specially provided for in this section, 1 cent per pound; \* \* \* fruits of all kinds preserved or packed in sugar, or having sugar added thereto or preserved or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over 10 per centum of alcohol, 20 per centum ad valorem; \* \* \*.

#### PEACHES, GREEN OR RIPE, DRIED AND CANNED.

*Description and uses.*—Peaches are dried and canned in large quantities, are used fresh, and are made into marmalade and other products. In California, the State of largest production, about 90 per cent of the crop is canned or dried.

*Production.*—The annual peach crop, about one-half of which is commercial, ranges between 35,000,000 and 53,000,000 bushels. Al-

though centers of production are widely distributed, California produces a much larger proportion of the commercial crop than any other one State; New York, Georgia, Arkansas, and Washington are also important peach-growing States. Canada, Argentina, and Germany are large producers. In 1919 production of canned peaches reached a total of 7,706,855 cases, valued at \$46,516,225, compared with 3,407,906 cases in 1914, valued at \$9,585,773. California produced practically all of the domestic dried peaches in 1919, the total output amounting to 73,379,193 pounds, valued at \$12,109,624.

Production figures by calendar years for peaches, green or ripe, are as follows:

	1918	1919	1920	1921
Quantity (bushels).....	34,133,000	53,178,000	45,620,000	32,733,000
Farm value, Dec. 1.....	\$55,092,000	\$100,485,000	\$95,970,000	\$52,176,000

*Imports* of fresh peaches are not separately shown. The geographical distribution and nature of the fruit make the Lake Ontario district in Canada the only source of import; but as the Ontario fruit ripens at a time when our markets are usually fully supplied, there is normally little to induce importation. Statistics of imports of peaches, quinces, cherries, plums, and pears, green or ripe, follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Bushels.</i>			<i>Per cent.</i>
1918.....	4,633	\$13,639	\$463	3.40
1919.....	21,692	119,806	2,169	1.81
1920.....	43,380	281,188	4,338	1.54
1921 (9 months).....	118,668	172,338		

<sup>1</sup> Cherries in a raw state were provided for in the emergency tariff act; hence are not included here from May 29 to Sept. 30, inclusive.

*Imports* of the various kinds of dried fruits, never large, have not been separately reported. Statistics for the group follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	69,139	\$11,868	\$691	5.83
1919.....	545,645	101,077	5,456	5.40
1920.....	947,088	162,266	9,471	5.84
1921 (9 months).....	784,804	108,960		

*Exports* of fresh peaches are insignificant, because of their perishable nature. However, dried and canned peaches are exported in considerable amount to the United Kingdom and in lesser amounts to Canada, France, and Cuba. Export statistics by calendar years for each follow:

	1918	1919	1920	1921 (9 months).
Peaches, dried:				
Quantity (pounds).....	4,839,598	9,022,334	7,924,831	4,188,603
Value.....	\$544,455	\$1,559,873	\$1,465,609	\$472,984
Peaches, canned:				
Value.....	\$1,178,547	\$9,489,850	\$6,342,319	\$2,487,694

*Important changes in classification.*—See General Notes on Paragraph below.

## PEARS.

*Description and uses.*—The pear is used principally fresh, although large quantities are canned or dried, the latter operation being conducted commercially only in California. Pear blight, a serious tree disease which can not be controlled by spraying, prevents the domestic cultivation of pears in considerable areas.

*Production.*—While pear trees are widely planted for home use, important commercial production is confined to about 11 States, nearly one-half of this crop being grown in California. Although the pear is grown throughout the world, it is produced primarily for domestic consumption. In 1919 production of canned pears reached a total of 1,951,374 cases, valued at \$14,202,963. California produced 5,750 tons of dried pears in 1919 and about 2,500 tons in 1920.

Production of pears, green or ripe, is given, for calendar years, in the following table:

	1918	1919	1920	1921
Quantity (bushels).....	12,993,000	15,101,000	16,805,000	10,705,000
Farm value, Dec. 1.....	\$17,902,000	\$27,852,000	\$27,865,000	\$18,342,000

*Imports.*—Not separately shown. (See p. 733.)

*Exports,* largely the Kieffer variety, now chiefly grown in New Jersey, Delaware, and some other sections, amount to about \$1,000,000, and go principally to the United Kingdom and Canada. Exports of green and ripe pears since 1917 by calendar years have been valued as follows: 1918, \$928,841; 1919, \$1,764,671; 1920, \$2,202,121; 1921 (9 months), \$1,134,223.

Canned pears to the value of \$5,113,738 were exported in 1920, and to the value of \$2,696,223 during the first nine months of 1921. Over half went to the United Kingdom; Cuba and Canada were the next largest purchasers.

*Important changes in classification.*—See below.

## GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—The specific provision for quinces has been eliminated. The total imports of the group—peaches, plums, cherries, and pears, green or ripe—are not large, and quinces are believed to constitute an insignificant proportion of the total.

A new provision is here made for dried peaches and pears, and for peaches and pears otherwise prepared or preserved, now dutiable under the provisions in paragraph 217 of the act of 1913 for fruits, dried, preserved or packed in sugar, etc.

## PARAGRAPH 746.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 746. Pineapples, three-fourths of 1 cent each; pineapples, prepared or preserved in any manner,  $3\frac{3}{4}$  cents per pound.

## ACT OF 1909.

## ACT OF 1913.

PAR. 274. \* \* \* fruits of all kinds preserved or packed in sugar, or having sugar added thereto, or preserved or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over ten per centum of alcohol, one cent per pound and thirty-five per centum ad valorem; \* \* \* pineapples preserved in their own juice, not having sugar, spirits, or molasses added thereto, twenty-five per centum ad valorem.

PAR. 279. Pineapples, in barrels and other packages, eight cents per cubic foot of the capacity of barrels or packages; in bulk, eight dollars per thousand.

PAR. 217. \* \* \* fruits of all kinds preserved or packed in sugar, or having sugar added thereto or preserved or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over 10 per centum of alcohol, 20 per centum ad valorem; \* \* \* pineapples preserved in their own juice, 20 per centum ad valorem.

PAR. 222. Pineapples, in barrels or other packages, 6 cents per cubic foot of the capacity of the barrels or packages; in bulk, \$5 per thousand.

## PINEAPPLES.

*Description and uses.*—Pineapple is used as fresh fruit, as a canned product and in several fruit drinks. It is usually packed in slices, chunks, or in crushed or grated form, with a sirup or with the juice of the fruit alone. The ordinary canned pineapple of commerce has water added to the juice and sugar. The cores are preserved and used by confectioners. The fruit varies greatly in size, flavor, and value.

*Production* commercially is in Hawaii, in Porto Rico, and in Florida. The cold weather of 1917-18 and a disease known as "pineapple wilt" reduced Florida's crop from 400,300 crates, valued at \$499,118 in 1914, to 26,016 crates, valued at \$110,569 in 1919. The planting of pineapple slips on virgin soil where possible, and the use of better cultural methods are gradually restoring the industry. Since 1900 production in Hawaii has rapidly increased. Beginning in 1901 with 2,000 cases of canned pineapple the output expanded to 5,071,976 cases, valued at \$18,997,975 in 1919. The value of the Porto Rico crop in 1919 was \$319,493. In 1919 a total of 156,755 cases of pineapple valued at \$1,365,484 were canned in continental United States, practically the entire amount being packed in Maryland. The largest foreign canning center is Singapore. The pineapple industry is also important in the Philippine Islands, Siam, and the West Indies.

*Import* values of fresh pineapple amounted to \$1,220,571 in 1913. Fresh fruit is received chiefly from Cuba. Imports of pineapples preserved in their own juices averaged \$112,354 from 1909 to 1913; in 1914 they were \$206,736. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
FRESH PINEAPPLES.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....		\$845,905	\$98,002	12
1919.....		1,045,882	110,125	11
1920.....		1,422,600	99,373	7
1921 (9 months).....		1,541,425		
PINEAPPLES PRESERVED IN THEIR OWN JUICE.				
1918.....		\$25,176	\$5,035	20
1919.....	213,293	10,717	2,143	20
1920.....	905,156	127,285	25,322	20
1921 (9 months).....	814,832	69,791		

It should be noted that the bulk of the preserved pineapples are imported under the classification "fruits preserved in sugar," etc. (see p. 741), which are not subdivided as to the various fruits.

*Exports* in 1920 were valued at \$3,025,522, and went chiefly to Canada, the United Kingdom, France, and Belgium.

Cannery waste (pulp, cores, etc.) consists of a variety of fruits, but is largely pineapple. In 1920 exports of this product amounted to 1,248,320 pounds, valued at \$76,634; these went chiefly to the United Kingdom, Canada, and the Netherlands.

*Important changes in classification.*—The two provisions of the act of 1913 relating to pineapples have been combined, the dutiable basis for fresh pineapples placed on a piece basis, and the descriptive provisions for the preserved fruit shortened and simplified.

*Suggested changes.*—At the hearings before the Finance Committee (vol. 7, pp. 3103 and 3107) it was stated that pineapples not in bulk are imported in standard crates of 1.96 cubic feet, containing from 18 to 48 pineapples. The larger pineapples are more valuable, sometimes selling for two or three times as much as the smaller sizes; a rate per pineapple therefore, bears more heavily upon the lower priced product. This paragraph might accordingly be changed to read—

Pineapples, [rate] per crate of 1.96 cubic feet; in bulk, [rate] per thousand.

#### PARAGRAPH 747.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 747. Plums, prunes, and prunelles, green or ripe, one-half of 1 cent per pound; dried, one-half of 1 cent per pound; otherwise prepared or preserved, and not specially provided for, 20 per centum ad valorem.

#### ACT OF 1909.

PAR. 274. \* \* \* plums, \* \* \* green or ripe, twenty-five cents per bushel; \* \* \* all edible fruits, \* \* \* when dried, desiccated, evaporated, or prepared in any manner, not specially provided for in this section, two cents per pound; \* \* \* fruits of all kinds preserved or packed in sugar, or having sugar added thereto, or preserved or

#### ACT OF 1913.

PAR. 217. \* \* \* plums, \* \* \* green or ripe, 10 cents per bushel of fifty pounds; \* \* \* all edible fruits, \* \* \* when dried, desiccated, evaporated, or prepared in any manner, not specially provided for in this section, 1 cent per pound; \* \* \* fruits of all kinds preserved or packed in sugar, or having sugar added thereto or preserved

## ACT OF 1909.

packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over ten per centum of alcohol, one cent per pound and thirty-five per centum ad valorem; \* \* \*

PAR. 275. \* \* \* plums, prunes, and prunelles, two cents per pound; \* \* \*

## ACT OF 1913.

or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over 10 per centum of alcohol, 20 per centum ad valorem; \* \* \*

Par. 218. \* \* \* plums, prunes, and prunelles, 1 cent per pound; \* \* \*

## PLUMS, GREEN OR RIPE.

*Description and uses.*—Three main types of plums are grown in America—the European or Domestica, the Japanese, and the numerous native species. The European and Japanese types are used principally fresh and for canning; the native plums, to a limited extent fresh, especially for culinary purposes, for canning, marmalades, jellies, etc. Certain European plums, the damsons, for example, are used entirely for preserves and marmalades.

*Production* of plums and prunes in 1909 was 15,480,170 bushels, the Pacific States yielding over 80 per cent. In 1919 production amounted to 19,500,000 bushels, valued at \$41,900,000. The types are somewhat regional, commercial production of the European varieties being chiefly in New York, Michigan, Ohio, California, and the Pacific Northwest. The native species are hardiest and more widely distributed.

In 1919 a total of 571,521 cases of plums, valued at \$2,228,183, was canned as compared with 288,326 cases, valued at \$438,238, in 1914. About two-thirds of the pack is canned in California.

*Imports* of plums, prunes, and prunelles are small, averaging about \$50,000 from 1910 to 1914, and come principally from Canada. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	15,096	\$4,180	\$151	3.60
1919.....	62,227	16,656	622	3.74
1920.....	145,956	35,786	1,490	3.97
1921 (9 months).....	47,765	10,705		

*Exports* of this group are not separately shown except for dried prunes. (See Prunes.)

*Important changes in classification.*—See General Notes on Paragraph, page 738.

## PRUNES.

*Description and uses.*—Prunes consist of certain varieties of Domestica or European plums, which can be dried without fermentation or removal of the pits—the horticultural characteristic which differentiates a prune from a plum.

*Production.*—Prunes for drying are grown chiefly in California and Oregon, and to a small extent in Washington. In California the fruit is largely sun dried; in Oregon and Washington, wholly by artificial heat. The crop varies widely—in 1919 the domestic production was

136,377,066 pounds valued at \$18,253,691, of which amount California produced about 85 per cent.

A total of 273,710 cases of prunes valued at \$1,271,410 was canned in 1919; of this amount Oregon put up over 40 per cent, and California and Washington most of the remainder.

*Import* statistics are not separately shown for prunes. (See Plums, p. 737.)

*Exports* averaged about 80,000,000 pounds from 1910 to 1914. They go chiefly to the United Kingdom, Canada, France, and the countries of northern Europe. Later statistics by calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	22,888,112	108,208,257	75,138,779	68,544,318
Value.....	\$2,177,976	\$15,721,951	\$11,738,312	\$1,821,167

*Important changes in classification.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Parts of two paragraphs relating to plums, prunes, and prunelles have been combined; and the apparently duplicate provision for plums in paragraphs 274 and 275 of the act of 1909 and paragraphs 217 and 218 of the act of 1913, has been corrected.

#### PARAGRAPH 748.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 748. Pickled fruits and nuts, and sauces of all kinds, not specially provided for; comfits, sweetmeats, and all jellies, jams, marmalades, fruit butters, and similar products, 28 per centum ad valorem.

#### ACT OF 1909.

PAR. 253. Pickles, including pickled nuts, sauces of all kinds, not specially provided for in this section, \* \* \* forty per centum ad valorem.

PAR. 274. \* \* \* comfits, sweetmeats, and fruits of all kinds preserved or packed in sugar, or having sugar added thereto, or preserved or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over ten per centum of alcohol, one cent per pound and thirty-five per cent ad valorem; if containing over ten per centum of alcohol and not specially provided for in this section, thirty-five per centum ad valorem and in addition two dollars and fifty cents per proof gallon on the alcohol contained therein in excess of ten per centum; jellies of all kinds, thirty-five per centum ad valorem; \* \* \*.

#### ACT OF 1913.

PAR. 201. Pickles, including pickled nuts, sauces of all kinds, not specially provided for in this section, \* \* \* 25 per centum ad valorem.

PAR. 217. \* \* \* comfits, sweetmeats, and fruits of all kinds preserved or packed in sugar, or having sugar added thereto or preserved or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over 10 per centum of alcohol, 20 per centum ad valorem; if containing over 10 per centum of alcohol and not specially provided for in this section, 20 per centum ad valorem, and in addition \$2.50 per proof gallon on the alcohol contained therein in excess of 10 per centum; jellies of all kinds, 20 per centum ad valorem; \* \* \*.

## PICKLES AND SAUCES.

Production of pickles and sauces was valued at \$45,303,671 in 1914; New York, Pennsylvania, and Illinois leading. In 1919 a total of 507 establishments reported a product valued at \$78,843,545.

Import values of pickles, including pickled nuts and sauces, of all kinds, not specially provided for (except fish paste or sauce), before the war ranged from \$915,549 to \$1,246,240. These products come chiefly from Japan, Italy, United Kingdom, and Hongkong. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
1918.....	\$329,527	\$82,324	<i>Per cent.</i> 25
1919.....	1,115,324	278,826	25
1920.....	1,468,927	367,214	25
1921 (9 months).....	1,246,062		

Exports of pickles, sauces, etc., amounted to \$928,611 in 1914. The United Kingdom, Canada, Mexico, and Cuba are the principal buyers. Later statistics (for calendar years) follow: 1918, \$1,129,918; 1919, \$2,039,641; 1920, \$2,273,059; 1921 (9 months), \$1,382,143.

Important changes in classification, etc.—See General Notes on Paragraph, page 740.

## COMFITS, SWEETMEATS, ETC., PRESERVED IN SUGAR, ETC.

Production of these commodities is not stated separately. In 1914, however, the value of preserves, jellies, and jams made in factories was \$15,033,346. Large quantities put up for consumption in the home are not included. In 1919 the value of all preserves, jellies, and jams put up in 205 establishments was \$65,458,000. This amount does not include the output of other factories that may manufacture these products in small quantity along with other products, or factories that may reclaim some of their by-products in this way.

Imports of comfits, sweetmeats, and fruits, etc., containing not over 10 per cent of alcohol, averaged \$639,576 during 1909–1913. Following the reduction of the tariff, imports amounted to \$818,435 in 1914. These came largely from France, England, Italy, and the West Indies. Later imports by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Value.....	\$352,913	\$641,371	\$1,352,676	\$562,494
Duty.....	68,752	126,676	267,966	

<sup>1</sup> Includes comfits, sweetmeats, etc., containing over 10 per cent of alcohol, as follows: \$180 value, \$101 duty, 56.11 per centum ad valorem.

<sup>2</sup> Includes \$100 worth of comfits, sweetmeats, etc., containing alcohol averaged 759 gallons valued at \$3,816 for 1909–1913. They declined after the war.

Exports.—Not separately stated.

Important changes in classification, etc.—See General Notes on Paragraph, page 740.

## JELLIES OF ALL KINDS.

Imports averaged \$53,545 from 1909 to 1913. Later statistics by calendar years follow:

	1918	1919	1920	1921 (9 months).
Value.....	\$72,721	\$774,557	\$423,051	\$106,184
Duty.....	13,965	79,547	82,962	.....

*Important changes in classification, etc.*—See below.

## GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—The provision in paragraph 201 of the act of 1913, for “pickles, including pickled nuts, and sauces of all kinds, not specially provided for in this section” has been changed to “pickled fruits and nuts, and sauces of all kinds, not specially provided for.” This changed provision has been combined with part of paragraph 217, act of 1913, for “comfits, sweetmeats, \* \* \*; jellies of all kinds \* \* \*.” The provision has been expanded to include “jams, marmalades, fruit butters, and similar products.”

*Conflicting provisions.*—H. R. 7456 has made separate provision for the more important fruits, including their dried and prepared or preserved forms; in consequence, there may be conflict between the provision for “pickled fruits” and the provisions for particular fruits prepared or preserved. Likewise “sauces,” although placed in a paragraph relating to fruits, consist largely of vegetable products such as soy, shoyu, and chutney. Further, the provision for comfits and sweetmeats may conflict with the several provisions for particular fruits prepared or preserved, as well as with the general provision in paragraph 749 for “fruits prepared or preserved” and “mixtures of two or more fruits.”

*Suggested changes.*—These conflicts might be avoided by striking out the provisions for “pickled fruits and nuts, and sauces of all kinds, not specially provided for; comfits, sweetmeats, and,” page 93, lines 3 and 4; by inserting the words “or pickled” after the word “brine” in paragraph 749, line 7, page 93; by substituting a semicolon for the colon after the word “pound” in line 7, page 95, paragraph 759, and inserting the words “pickled, or otherwise prepared or preserved, and not specially provided for,” followed by a colon, thereafter; by inserting the words “sauces of all kinds, not specially provided for,” followed by a semicolon in paragraph 773 after the words “not specially provided for” in line 12, page 97, and by omitting the words “comfits, sweetmeats, and” altogether from H. R. 7456.

It is furthermore suggested that the words “and similar products” in this paragraph, lines 5 and 6, page 93, be omitted. With these changes this paragraph would read:

All jellies, jams, marmalades, and fruit butters [rate].

## PARAGRAPH 749.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 749. Fruits in their natural state, or in brine, dried, desiccated, evaporated, or otherwise prepared or preserved, and not specially provided for, and mixtures of two or more fruits, 20 per centum ad valorem: *Provided*, That all provisions of this title for fruits and berries prepared or preserved shall include fruits and berries preserved or packed in sugar, or having sugar added thereto, or preserved or packed in molasses, spirits, or their own juices.

## ACT OF 1909.

PAR. 274. \* \* \* quinces, \* \* \* all edible fruits, \* \* \* when dried, desiccated, evaporated, or prepared in any manner, not specially provided for in this section, two cents per pound: \* \* \* fruits of all kinds preserved or packed in sugar, or having sugar added thereto, or preserved or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over ten per centum of alcohol, one cent per pound and thirty-five per centum ad valorem: \* \* \*

PAR. 571. Fruits or berries, green, ripe, or dried, and fruits in brine, not specially provided for in this section [Free].

## ACT OF 1913.

PAR. 217. \* \* \* quinces, \* \* \* all edible fruits, \* \* \* when dried, desiccated, evaporated, or prepared in any manner, not specially provided for in this section, 1 cent per pound: \* \* \* fruits of all kinds preserved or packed in sugar, or having sugar added thereto or preserved or packed in molasses, spirits, or their own juices, if containing no alcohol, or containing not over 10 per centum of alcohol, 20 per centum ad valorem: \* \* \*

PAR. 488. Fruits or berries, green, ripe, or dried, and fruits in brine, not specially provided for in this section [Free].

## ALL OTHER FRUITS, FRESH, DRIED, OR PRESERVED.

*Description and uses.*—This paragraph relates to a large number of fruits and fruit preparations, which individually enter into a small import trade.

*Production* statistics are given in the following table:

	1919		1914	
	Quantity.	Value.	Quantity.	Value.
Fruits, n. s. p. f.:				
Apricots.....pounds.....	24, 192, 628	\$6, 034, 697	39, 397, 294	\$3, 615, 857
All other dried fruits.....do.....	37, 852, 258	6, 384, 934	47, 189, 970	2, 408, 061
Canned fruits, n. o. p. f.:				
Apricots.....cases.....	3, 939, 768	25, 167, 772	1, 051, 816	3, 060, 626
Other canned fruits.....do.....	516, 558	2, 701, 348	86, 850	356, 082

*Imports* of "all other" fruits and berries, green, ripe, and dried, have been, by calendar years, as follows: 1918, \$65,424; 1919, \$139,379; 1920, \$127,665; 1921 (9 months), \$175,138.

*Exports* for calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
All other fruits, green or ripe.....	\$3, 396, 709	\$4, 713, 008	\$4, 187, 624	\$2, 974, 956
All other fruits, dried.....	\$752, 868	\$2, 557, 451	\$2, 168, 279	\$615, 582
Apricots, dried:				
Quantity (pounds).....	5, 262, 206	37, 143, 824	9, 881, 256	17, 784, 882
Value.....	\$754, 780	\$8, 505, 348	\$2, 581, 750	\$3, 351, 880
All other canned fruits.....	\$4, 134, 272	\$31, 985, 772	\$7, 032, 694	\$2, 599, 966
All other preserved fruits.....	\$1, 989, 945	\$4, 518, 343	\$1, 882, 180	\$453, 039

*Important changes in classification, etc.*—See General Notes on Paragraph below.

## PLANTAIN.

*Description and uses.*—The plantain is a species of banana. It has a coarse texture and is not so sweet as the ripe banana. In tropical countries it is used extensively. If specific provision is not made for it in other paragraphs (see Bananas, p. 713) it would be dutiable under this basket clause.

*Production.*—There is no production in the United States. British Honduras, via New Orleans, is our principal source.

*Imports* were valued at \$50,276 in 1914. Later statistics by calendar years follow:

	1918	1919	1920	1921 (9 months)
Quantity (bunches).....		115,806	193,026	179,976
Value.....	\$12,712	\$41,424	\$59,961	\$60,431

*Important changes in classification, etc.*—See below.

## GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—This paragraph combines two provisions of the act of 1913—paragraph 217, a dutiable catchall clause for edible fruits prepared or preserved, and paragraph 488, a free-list provision for fruits and berries, green, ripe, dried, or in brine. The last-named provision has given rise to much litigation.

A proviso has been added to the effect that the provisions for fruits and berries shall include such fruits whether preserved in sugar, molasses, etc.

A new provision has also been added for mixtures of two or more fruits.

*Conflicting provisions.*—The provision for “mixtures of two or more fruits” might be construed to include fruits in their natural state, n. s. p. f., and afford an opportunity for evading higher specific duties.

*Suggested changes.*—For the reasons stated under the subheading “Conflicting provisions,” under paragraph 748, the words “or pickled” might be inserted after the word “brine” in line 7, page 93. To agree with paragraph 773, the words “in any other way” should be inserted after the word “preserved” in line 8, page 93, and the word “otherwise” before “prepared” in line 8, page 93, be stricken out.

With a view to the avoidance of possible conflicts of this paragraph with *eo nomine* provisions for fruits, prepared or preserved, it is suggested that the word “specific” be inserted before “provisions” in line 10, page 93.

## PARAGRAPH 750.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 750. Berries and fruits, of all kinds, and similar products, prepared or preserved in any manner, containing 5 per centum or more of alcohol shall pay in addition to the rates provided in this title \$5 per proof gallon on the alcohol contained therein: *Provided, however,* That nothing in this Act shall be construed as permitting the importation of intoxicating liquor in violation of the eighteenth amendment to the Constitution, or any Act of Congress enacted in its enforcement.

## ACT OF 1909.

PAR. 274. \* \* \* fruits of all kinds preserved or packed in \* \* \* spirits, \* \* \* if containing \* \* \* not over ten per centum of alcohol, one cent per pound and thirty-five per centum ad valorem; if containing over ten per centum of alcohol and not specially provided for in this section, thirty-five per centum ad valorem and in addition two dollars and fifty cents per proof gallon on the alcohol contained therein in excess of ten per centum; \* \* \*.

## ACT OF 1913.

PAR. 217. \* \* \* fruits \* \* \* preserved or packed in \* \* \* spirits, \* \* \* if containing \* \* \* not over 10 per centum of alcohol, 20 per centum ad valorem; if containing over 10 per centum of alcohol and not specially provided for in this section, 20 per centum ad valorem, and in addition \$2.50 per proof gallon on the alcohol contained therein in excess of 10 per centum; \* \* \*.

## FRUITS PRESERVED IN ALCOHOL, ETC.

*Imports and exports.*—See paragraph 737, p. 716.

*Important changes in classification.*—A separate paragraph has been here provided for fruits preserved in alcohol, and the wording of these provisions has been changed more nearly to accord with prohibition legislation. Such legislation applies to intoxicating beverages, and not to fruits. Owing to natural fermentation, fruits may contain one-half of 1 per cent or more of alcohol. For this reason, and because of difficulties of administration, the penalty clause was applied to fruits containing 5 per centum or more of alcohol. The final proviso has been added to avoid conflict with laws respecting the enforcement of prohibition legislation.

*Suggested changes.*—It is suggested that the words "and similar products" be eliminated, being unnecessary. It is difficult to determine what products are "similar" to fruits and berries preserved in alcohol.

Because of the varying value of the alcoholic liquors in which fruits may be packed, and the difficulties of administration, an ad valorem rate appears preferable to the rate per proof gallon for the penalty clause.

## NURSERY AND GREENHOUSE STOCK.

## GENERAL.

Imports of all nursery and greenhouse stock provided for in paragraphs 751, 752, and 753 are admitted only under the license and inspection of the Federal Horticultural Board of the Department of Agriculture. Because of the danger of importing insect pests and plant diseases, this license is granted only for such stock as can not be produced in sufficient quantities within the United States. All other bulbs, seedlings, cuttings, and similar plant material are under an absolute quarantine. In view of these conditions, the specific tariff provisions relating to the items under quarantine have been eliminated; the small quantities of quarantined propagating stock that are allowed entry, under special regulations, would be dutiable under the basket clauses.

Specific duties are suggested by New York customs officials for most of this material because of difficulty in determining market values and in identifying different varieties of bulbs.

The two paragraphs in the dutiable list of the 1913 act relating to nursery and greenhouse stock have been rearranged into three paragraphs. The first paragraph covers bulbs and flowers, the second relates chiefly to ornamental shrubbery, and the third to fruit stocks.

Paragraph 489 of the act of 1913, relating to tropical and semi-tropical fruit plants, is eliminated from the free list, as this item is provided for in the suggested new paragraphs. The items in paragraph 595 of the act of 1913, "bulbs and bulbous roots, not edible and not otherwise provided for in this section; \* \* \* coniferous evergreen seedlings," are also provided for in the suggested reclassification. Paragraph 510 is also eliminated, since few hop roots have been imported for a number of years and none are likely to be imported.

---

 PARAGRAPH 751.

## H. R. 7456.

## SENATE AMENDMENTS.

PAR. 751. Tulip, narcissus, and hyacinth bulbs and lily of the valley pips, \$4 per thousand; lily of the valley clumps, \$10 per thousand; crocus bulbs, \$1 per thousand; lily bulbs, \$4 per thousand; all other bulbs and roots, root stocks, corms, tubers, and herbaceous perennials, imported for horticultural purposes, 20 per centum ad valorem; cut flowers, fresh or preserved, 25 per centum ad valorem.

## ACT OF 1909.

## ACT OF 1913.

PAR. 263. Orchids, palms, azaleas, and all other decorative or greenhouse plants and cut flowers, preserved or fresh, twenty-five per centum ad valorem; lily of the valley pips, tulip, narcissus, begonia, and gloxinia bulbs, one dollar per thousand; hyacinth, astilbe, dielytra, and lily of the valley clumps, two dollars

PAR. 210. Orchids, palms, azalea indica, and cut flowers, preserved or fresh, 25 per centum ad valorem; lily of the valley pips, tulips, narcissus, begonia, and gloxinia bulbs, \$1 per thousand; hyacinth bulbs, astilbe, dielytra, and lily of the valley clumps, \$2.50 per thousand; lily bulbs and calla bulbs or corms, \$5 per

## ACT OF 1909.

and fifty cents per thousand; lily bulbs and calla bulbs, five dollars per thousand; peony, *Iris Kämpferii* or *Germanica*, canna, dahlia, and amaryllis bulbs, ten dollars per thousand; all other bulbs, bulbous roots or corms which are cultivated for their flowers or foliage, fifty cents per thousand.

PAR. 588. Hop roots for cultivation [Free].

PAR. 668. \* \* \* bulbs and bulbous roots, not edible and not otherwise provided for in this section; \* \* \* [Free].

## ACT OF 1913.

thousand; herbaceous peony. *Iris Kaempferi* or *Germanica*, canna, dahlia, and amaryllis bulbs, \$10 per thousand; all other bulbs, roots, root stocks, corms, and tubers, which are cultivated for their flowers or foliage, 50 cents per thousand: *Provided*, That all mature mother flowering bulbs imported exclusively for propagating purposes shall be admitted free of duty.

PAR. 510. Hop roots for cultivation [Free].

PAR. 595. \* \* \* bulbs and bulbous roots; not edible and not otherwise provided for in this section; \* \* \* [Free].

## BULBS, ROOTS, ETC.

*Description, uses, and production.*—Tulip bulbs are used largely for outdoor bedding to give vivid spring-flower effects, and also by florists for forcing. Production to a limited extent has begun in the Pacific Northwest and Michigan. They can be grown in some sections on the Atlantic seaboard, but because of hand labor required, the European-grown stock is the cheaper. Domestic production of merchantable stocks in 1920 was not less than 1,000,000 bulbs. Most bulbs are grown in Holland.

Narcissus bulbs are used largely by florists for forcing as cut flowers, also in the indoor window garden and for outdoor planting, both in formal beds and in open woodlands and meadows. Many varieties are grown in increasing numbers along the Atlantic coast, in the Pacific Northwest, and in Michigan. They are native to various parts of Europe and Asia. Holland is the most important producer, but some imports are from Great Britain and one important variety comes from China. The most important early forcing varieties are of French origin. Cheap labor has undoubtedly determined the present trade relations, though less hand labor is required than in growing some other bulbs.

Hyacinths are low-growing bulbous plants used largely for spring bedding effects, and by florists in vast quantities for forcing for winter blooms. Three to five years are required to grow full-sized bulbs. A few bulbs have been grown experimentally in the Pacific Northwest, but great labor cost entailed by many handlings, has delayed commercial production. The one grower engaged in the production of the Dutch stocks operates on a small scale. Two classes are imported—the Dutch and the Roman; the former from the Netherlands and the latter from the south of France.

Lily of the valley is a small, dainty spring flower. It is grown as a hardy garden plant, but largely by florists, for forcing at all seasons. The "pip" is a bud capable of producing a flower stalk with its accompanying roots, while "clump" denotes several of these together, not separated and sorted. Production in this country is in its infancy, but is being attempted in several localities. From two to three years are required to produce a crop. The plants grow wild in many parts of Europe, but practically all commercial pips are

grown in two limited areas in Germany, on specially adapted soil under expert cultivation.

The crocus belongs to the same natural order as the iris but is a very different plant. It is grown mainly in beds and borders, is naturalized, and is adapted to cool greenhouse culture. The varieties are prized mostly for their gorgeous display and the earliness of their appearance in the spring. Some varieties blossom before the snow disappears, others produce flowers in autumn, but it is the spring flowering kinds that we import almost entirely. There is no domestic supply, although the stocks are easily produced.

The lily family contains many species prized for their size and the beauty of their flowers. The principal ones are *Lilium longiflorum*, called Bermuda or Easter lily, of which there are many varieties; *Lilium speciosum*, or show lily; and *Lilium candidum*, or Madonna lily. These and many other species are used for outdoor culture in a small way; they are also commonly forced by florists for spring flowers. Practically none of the bulbs used for forcing are grown here, but some for garden use are domestic. *Lilium longiflorum* is grown extensively in Bermuda and Japan; *Lilium speciosum*, mostly in Japan; and *Lilium candidum*, largely in southern France; many varieties, to a limited extent, in western Europe. Domestic production has been greatly stimulated in the past 2 years.

The calla lily is much used by florists for forcing, as a house plant, and as a common garden plant in the warmer sections of the country. The corms are grown on a large scale outdoors in California, where many of the blooms are also marketed. Domestic stocks are rapidly supplying the demands of the trade.

All other bulbs and roots, root stocks, corms, tubers, and herbaceous perennials including such flowering stocks as dielytra, astilbe, iris, begonia, canna, gladiolus, dahlia, amaryllis, and peony are now excluded from this country by quarantine regulations.

Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
<b>LILY OF THE VALLEY PIPS, TULIP, NARCISSUS, BEGONIA, AND GLOXINIA BULBS.</b>

Japan.....			6,275,666		9,120		
Total.....	5,514,805	22,568,891	22,490,533	3,606,746	77,956,195	55,075,343	4,756,369

Exports.—None recorded.

Important changes in classification, etc.—See General Notes on Paragraph, page 748.

## CUT FLOWERS.

*Description and uses.*—Fresh cut flowers are used in large quantities, the business in greenhouse flowers probably amounting to \$60,000,000. Preserved flowers, notably palm leaves, are used to some extent.

*Production.*—Cut flowers are extensively produced in the United States; a few concerns attempt putting preserved leaves on the market. Canada is the only country from which we import fresh flowers in quantity. Dried flowers come from southern France and Cape Colony; palm leaves from Japan, formerly via Germany, where they were dyed.

*Imports* were valued at \$24,681 in 1914. Later statistics follow:

Calendar year.	Value.	Duty.	Ad valorem rate.
			<i>Per cent.</i>
1918.....	\$8,705	\$2,176	25
1919.....	58,193	14,548	25
1920.....	39,254	9,813	25
1921 (9 months).....	16,886		

*Exports* of cut flowers were valued at \$121,287 in 1914. Practically all go to Canada. Later exports for calendar years have been as follows: 1918, \$173,991; 1919, \$171,407; 1920, \$180,789; 1921 (nine months), \$120,504.

*Important changes in classification, etc.*—See below.

## GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—“Tulip” has been substituted for “tulips” of the act of 1913 (par. 210). “Tulips” in the act of 1913 was applied to the flower (*Maltus v. United States*, 6 Ct. Cust. Appls., 525, of 1916; *United States v. American Express Co.*, 8 Ct. Cust. Appls., 195, of 1917).

Some varieties of bulbs and roots named in the act of 1913, but which are now under quarantine, are omitted. Imports of these have never been important and should the quarantine be lifted they would be caught by the general provision in paragraph 751. The provision in the free list of the act of 1913 (par. 510) for hop roots is also omitted.

The provision “all mature mother flowering bulbs imported exclusively for propagating purposes” has been eliminated in order to simplify administration. This term has no definite meaning in the trade and has been a source of litigation.

*Suggested changes.*—Nurserymen have suggested that hyacinth bulbs be not grouped with tulip, narcissus, and lily of the valley pips for the reason that hyacinth bulbs are considerably higher in price than the other three.

It is also suggested that the provision for lily of the valley clumps (groups of lily of the valley pips in earth), which are now excluded by quarantine, be eliminated. “Clumps” added to the general provision in paragraph 751 would catch any future importation of lily of the valley or other clumps.

The revised paragraph might read as follows:

PAR. 751. Tulip, lily, and narcissus bulbs, and lily of the valley pips, \$4 per thousand; hyacinth bulbs, \$— per thousand; crocus bulbs, \$1 per thousand; all other bulbs and roots, root stocks, clumps, corms, tubers, and herbaceous perennials, imported for horticultural purposes, 20 per centum ad valorem; cut flowers, fresh or preserved, 25 per centum ad valorem.

### PARAGRAPH 752.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 752. Seedlings and cuttings of Manetti, multiflora, brier, rugosa, and other roses, \$2 per thousand plants; cuttings, seedlings, and grafted plants of other deciduous or evergreen ornamental trees, shrubs, or vines, including greenhouse plants, 20 per centum ad valorem.

ACT OF 1909.

ACT OF 1913.

PAR. 264. Stocks, cuttings, or seedlings of \* \* \* Manetti multiflora and briar rose, three years old or less, one dollar per thousand plants; \* \* \* rose plants, budded, grafted, or grown on their own roots, four cents each; stocks, cuttings and seedlings of all \* \* \* ornamental trees, deciduous and evergreen shrubs and vines, and all trees, shrubs, plants, and vines commonly known as nursery or greenhouse stock, not specially provided for in this section, twenty-five per centum ad valorem.

PAR. 668. \* \* \* evergreen seedlings; \* \* \* [Free].

PAR. 211. Stocks, cuttings, or seedlings of \* \* \* Manetti multiflora and briar rose, Rosa rugosa, three years old or less, \$1 per thousand plants; \* \* \* rose plants, budded, grafted, or grown on their own roots, 4 cents each; stocks, cuttings, and seedlings, of all \* \* \* ornamental trees, deciduous and evergreen shrubs and vines, and all \* \* \* shrubs, plants, and vines commonly known as nursery or greenhouse stock, not specially provided for in this section, 15 per centum ad valorem.

PAR. 595. \* \* \* coniferous evergreen seedlings; \* \* \* [Free].

### ROSE PLANTS FOR STOCKS.

*Description, uses, and production.*—Manetti is a variety of rose used as a stock upon which to bud or graft other more desirable varieties, both for garden and greenhouse culture. Production is rare here because of the ease of securing cheap foreign-grown stocks from northern France, Belgium, and adjacent regions. Multiflora brier, and rugosa are roses used by some nurserymen instead of the Manetti as stocks on which to graft or bud named varieties of roses.

*Imports of Manetti for four years preceding the war averaged about 5,000,000. Other varieties are not stated separately. In the fiscal year ended June, 1920, of 3,514,636 rose plants were imported. Roses used as stocks including Manetti, multiflora, brier, and rugosa are imported under unlimited permits of the Department of Agriculture. All other varieties are imported only under special permit and in limited quantities for propagation.*

Imports of rose plants, budded, grafted, or grown on their own roots, are as follows:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Number.</i>			<i>Per cent.</i>
1918.....	818,235	\$69,091	\$32,729	47.37
1919.....	143,483	19,503	5,739	29.43
1920.....	28,585	3,151	1,143	36.29
1921 (9 months).....	18,976	5,018		

The following table indicates the number of rose stocks imported under the quarantine regulations for the fiscal year ended June 30, 1921:

Country of origin.	Rose stocks.	Country of origin.	Rose stocks.
England.....	1, 181, 100	Scotland.....	43, 000
France.....	2, 176, 282	Ireland.....	269, 800
Holland.....	2, 264, 010	Total.....	5, 934, 192

*Exports.*—None recorded.

*Important changes in classification, etc.*—See General Notes on Paragraph, page 751.

#### PLANTS.

*Description, uses, and production.*—The rugosa rose, an ornamental shrub for garden planting, in Europe is used as a stock for grafting. It is grown by all nurserymen handling ornamental shrubs.

Ornamental trees are used for street, park, and home-ground planting. They are produced here and in France and in other sections of western Europe. Many different kinds of ornamental shrubs are used for park, cemetery, and home ornamentation. These shrubs are generally produced here in nurseries, the kinds varying with the region. Western Europe, especially France, furnishes a supply for propagating purposes only. Various kinds of broad-leaved evergreens are found, mainly in the warmer sections. Most sections produce these shrubs in nurseries. France, Belgium, Holland, and other parts of western Europe cultivate them extensively.

*Imports* in 1916 of ornamental trees were over 2,000,000; of ornamental shrubs, over 4,000,000; and of evergreens, 2,500,000. The plant quarantine of the Department of Agriculture now prevents the importation of these plant materials.

*Exports* are insignificant. They are excluded from many European countries.

*Important changes in classification, etc.*—See General Notes on Paragraph, page 751.

#### NURSERY AND GREENHOUSE STOCK, N. S. P. F.

*Description and uses.*—“Nursery and greenhouse stock” is a blanket phrase, probably including many different plants grown in small quantities.

*Production.*—Many of these plants are grown to some extent in the United States. Western Europe and Japan are notable producers.

*Imports* since 1917 have been as follows:

*Fruit and ornamental trees, deciduous and evergreen shrubs and vines, and all trees, shrubs, plants, and vines commonly known as nursery or greenhouse stock, n. s. p. f.*

Calendar year.	Quantity.	Value.	Duty.	Ad valorem rate.
	Thousands.			Per cent.
1918.....		\$211, 575	\$31, 736	15
1919.....	4, 664	572, 554	85, 883	15
1920.....	316	12, 089	1, 813	15
1921 (9 months).....	701	26, 293		

*Exports of nursery stock* were valued at \$315,065 in 1914, and went for the most part to Canada. This stock is excluded from some European countries. Later exports have been as follows (calendar years): 1918, \$239,621; 1919, \$405,270; 1920, \$405,006; 1921 (nine months), \$266,363.

*Important changes in classification, etc.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Coniferous evergreen seedlings on the free list of the act of 1913 (par. 595) are made dutiable.

*Suggested changes.*—Page 94, line 7, of H. R. 7456: Change "other roses" to "other rose stocks." Strike out "plants" as redundant.

Page 94, line 8: Insert "or budded" after "grafted."

Page 94, lines 9, 10: Strike out "including greenhouse plants" and insert "and all nursery or greenhouse stock, not specially provided for." This change will cover nursery or greenhouse stock not specially provided for in paragraphs 751, 752, or 753.

The tariff and legislative committee of the Society of American Florists and Ornamental Horticulturists requests restoration of the three-year limitation for rose plants. The term "not more than three years old" would perhaps be better than "three years old or less." At present practically all imported rose stocks are less than three years old.

With the above changes, paragraph 752 would read:

Seedlings and cuttings of Manetti, multiflora, brier, rugosa, and other rose stocks, all the foregoing not more than three years old, \$2 per thousand; cuttings, seedlings, and grafted or budded plants of other deciduous or evergreen ornamental trees, shrubs, or vines, and all nursery or greenhouse stock not specially provided for, 20 per centum ad valorem.

#### PARAGRAPH 753.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 753. Seedlings, layers, and cuttings of plants for apple, cherry, pear, plum, quince, or other fruit stocks, \$2 per thousand plants; grafted or budded fruit trees, cuttings and seedlings of grapes, currants, gooseberries, or other fruit vines or bushes, 20 per centum ad valorem.

ACT OF 1909.

PAR. 264. Stocks, cuttings, or seedlings of Myrobolan plum, Mahaleb or Mazzard cherry, \* \* \* three years old or less, one dollar per thousand plants; stocks, cuttings, or seedlings of pear, apple, quince and the Saint Julien plum, three years old or less, two dollars per thousand plants; \* \* \* stocks, cuttings and seedlings of all fruit \* \* \* trees, deciduous and evergreen shrubs and vines, and all trees, shrubs, plants, and vines commonly known as nursery or greenhouse stock, not specially provided for in this section, twenty-five per centum ad valorem.

ACT OF 1913.

PAR. 211. Stocks, cuttings, or seedlings of Myrobolan plum, Mahaleb or Mazzard cherry, \* \* \* three years old or less, \$1 per thousand plants; stocks, cuttings, or seedlings of pear, apple, quince, and the Saint Julien plum, three years old or less, \$1 per thousand plants; \* \* \* stocks, cuttings, and seedlings, of all fruit \* \* \* trees, deciduous and evergreen shrubs and vines, and all trees, shrubs, plants, and vines commonly known as nursery or greenhouse stock, not specially provided for in this section, 15 per centum ad valorem.

## ACT OF 1909.

## ACT OF 1913.

PAR. 572. Fruit plants, tropical and semitropical, for the purpose of propagation or cultivation [Free].

PAR. 489. Fruit plants, tropical and semitropical, for the purpose of propagation or cultivation [Free].

## STOCKS, CUTTINGS, AND SEEDLINGS OF ALL FRUITS N. S. P. F.

*Description and uses.*—This collection of plant material includes the stock used by nurserymen in the propagation of fruits. Large numbers of seedlings used for budding or grafting stocks for apple, cherry, pear, plum, quince, or other fruits are imported by nurserymen, but under plant-quarantine regulations of the Department of Agriculture. These regulations restrict imports of grafted or budded fruit trees, vines, or bushes to new varieties or to those not available in this country.

*Production.*—Great numbers of apple and other seedlings from imported seed (largely from France) are grown here for stock purposes. The growing of fruit-tree seedling stocks other than peaches is chiefly by specialists, located principally near Topeka, Kans. We have a native supply of peach pits, and nurserymen who propagate peach trees grow their own seedlings.

*Import statistics* do not adequately segregate the different kinds of plants for detailed consideration. For a period of seven or eight years prior to 1915 the imports of pear, apple, quince, and St. Julien plum seedlings had ranged from 14,211,000 to 25,743,000; in 1918 imports were 3,606,000, valued at \$27,305; in 1919, 3,821,000, valued at \$35,269; and in 1920, 4,008,000, valued at \$90,752. Imports of myrobolan plum, mahaleb or mazzard cherry (*Manetti multiflora*), and brier rose (*Rosa rugosa*, see below) were 24,695,000, valued at \$128,314 in 1914; and 10,886,000, valued at \$82,118 in 1918; 8,144,000, valued at \$99,033 in 1919; and 9,141,000, valued at \$242,142 in 1920. The foregoing data for 1918 and later relate to calendar years.

Imports for consumption of the various fruit stocks since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
----------------	-----------	--------	-------	------------------------

## MYROBOLAN PLUM, MAHALEB OR MAZZARD CHERRY, MANETTI MULTIFLORA, AND BRIER ROSE, ROSA RUGOSA, 3 YEARS OLD OR LESS.

	Thousands.			Per cent.
1918.....	10,886	\$82,118	\$10,886	13.26
1919.....	8,144	99,033	8,144	8.22
1920.....	9,141	242,142	9,141	3.73
1921 (9 months).....	13,075	255,578		

## PEAR, APPLE, QUINCE, AND THE ST. JULIEN PLUM, 3 YEARS OLD OR LESS.

1918.....	3,606	\$27,305	\$3,606	13.21
1919.....	3,821	35,269	3,821	10.83
1920.....	4,008	90,752	4,008	4.42
1921 (9 months).....	9,485	172,694		

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
FRUIT PLANTS, TROPICAL AND SEMITROPICAL, FOR THE PURPOSE OF PROPAGATION OR CULTIVATION.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....		\$723		
1919.....	298	5,285		
1920.....	600	32,500		
1921 (9 months).....	70	1,256		

The following table indicates the number of fruit stocks of each kind imported under the quarantine regulations for the fiscal year ended June 30, 1921.

Country of origin.	Fruit stocks.					
	Apple.	Cherry.	Pear.	Plum.	Quince.	All other fruits.
Austria.....		1,018				
Czechoslovakia.....	150		50			3
Costa Rica.....						200
England.....	100					
France.....	4,396,450	8,003,698	3,214,104	2,000,375	1,036,250	344,890
Holland.....	584,100	884,648	469,070	285,133	29,000	25,000
Ireland.....						
Italy.....				103,000		35,309
Japan.....			3,000			
Mexico.....						1,500
Scotland.....						
Total.....	4,980,800	8,889,364	3,686,224	2,388,508	1,065,250	406,902

*Exports.*—None recorded.

*Important changes in classification.*—Fruit plants, tropical and semitropical, for the purpose of propagation or cultivation, on the free list of the act of 1913 (par. 489), are made dutiable.

All fruit-stock material has been combined in this paragraph. A few varieties of fruits named in prior acts are omitted. Special provision for material under quarantine has been dropped since the small quantity of quarantined propagating stock allowed entry under the special regulations will be dutiable under the general provision in this paragraph.

*Suggested changes.*—Page 94, line 11, of H. R. 7456: Strike out "plants for" and in line 13 strike out "plants" as redundant.

Page 94, line 12: Change "or" to "and" before "other."

Page 94, line 15: Insert "plants" after "vines."

### PARAGRAPH 754.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 754. Almonds, not shelled, 4 cents per pound; shelled, 12 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 280. Almonds, not shelled, four cents per pound; clear almonds, shelled, six cents per pound; \* \* \*.

PAR. 223. Almonds, not shelled, 3 cents per pound; almonds, shelled, 4 cents per pound; \* \* \*.

## ALMONDS.

(See Survey G-34.)

*Description and uses.*—Almonds are of two kinds, the bitter and the sweet. Bitter almonds are cultivated to a limited extent in the Mediterranean region. The nuts are used in making flavoring extracts and prussic acid. That which enters most largely into commerce is the sweet or edible almond, native to Mediterranean countries and southwestern Asia. The nuts contain a bland, fixed oil of agreeable flavor, and are used in confectionery (especially in sweet chocolate), in deserts, and also in emulsion that forms a pleasant diluent drink. It is as edible nuts, however, either as unshelled, shelled, or as "salted almonds," that they are chiefly used.

(For discussion of shelling percentages see Survey G-34.)

*Production* in the United States is limited to California, which reports, for 1920, 2,408,040 almond trees of bearing age and 1,407,901 trees not of bearing age. At 75 trees per acre, this is equivalent to 32,107 acres of bearing and 18,772 acres of nonbearing orchards. The acreage has increased largely in recent years. The present yield is low per acre, principally because many trees are just beginning to bear. Few domestic almonds are sold in the shelled form, while imports are for the most part received in this form. Statistics of production since 1917 are as follows:

	1918	1919	1920	1921
Quantity (pounds).....	10,200,000	15,699,748	12,000,000	12,000,000
Value.....		\$3,924,940		

<sup>1</sup> Preliminary.

*Imports* of shelled almonds in 1913 amounted to 12,655,057 pounds and to 13,896,621 pounds in 1914. Imports of almonds not shelled amounted to 5,501,059 pounds in 1914. Both kinds come mostly from Spain, Italy, and France. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equiva- lent ad valorem.
----------------	-----------	--------	-------	--------------------------------

## ALMONDS, SHELLED.

	Pounds.			Per cent.
1918.....	21,106,846	\$5,609,630	\$344,269	15.05
1919.....	26,517,377	9,739,287	1,060,695	10.89
1920.....	18,769,626	7,201,773	750,785	10.43
1921 (9 months).....	11,805,125	3,533,100		

## ALMONDS, NOT SHELLED.

1918.....	6,147,240	\$940,739	\$184,417	19.60
1919.....	6,316,059	1,098,714	189,482	17.25
1920.....	6,460,732	1,044,341	193,822	18.56
1921 (9 months).....	2,049,092	282,573		

*Exports.*—None recorded. (See par. 759.)

*Important changes in classification.*—The principal nuts have been given separate paragraphs; several that were formerly caught in the basket clause have been specifically named and the operation of the general or basket clause correspondingly limited. (See Survey G-34 entitled "Almonds, walnuts, pecans, and other nuts.")

### PARAGRAPH 755.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 755. Cream or Brazil nuts, 1 cent per pound; filberts, not shelled, 2½ cents per pound; shelled, 5 cents per pound; chestnuts, including marrons, in their natural state, dried, or baked, one-half of 1 cent per pound; prepared or preserved, and not specially provided for, 15 cents per pound; pignolia nuts, 1 cent per pound; pistache nuts, 1 cent per pound.

### ACT OF 1909.

PAR. 281. Filberts \* \* \* not shelled, three cents per pound; shelled, five cents per pound.

PAR. 283. Nuts of all kinds, shelled or unshelled, not specially provided for in this section, one cent per pound; but no allowance shall be made for dirt or other impurities in nuts of any kind, shelled or unshelled.

PAR. 635. Nuts: Brazil nuts, cream nuts, marrons crude, \* \* \* [Free].

### ACT OF 1913.

PAR. 224. Filberts \* \* \* not shelled, 2 cents per pound; shelled, 4 cents per pound.

PAR. 226. Nuts of all kinds, shelled or unshelled, not specially provided for in this section, 1 cent per pound; but no allowance shall be made for dirt or other impurities in nuts of any kind, shelled or unshelled.

PAR. 557. Nuts: Marrons, crude; \* \* \* [Free].

### CREAM OR BRAZIL NUTS.

(See Survey G-34.)

*Description and uses.*—The cream or Brazil nut, used largely on the table and in confections, is almost entirely imported.

*Production.*—The nut is a native of the Amazon and Rio Negro River valleys. The tree is too tender for cultivation in the United States.

*Imports* in 1914 amounted to 11,431,531 pounds. Practically all imports come from Brazil. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	12,401,091	\$697,687	\$124,011	17.77
1919.....	40,621,914	2,987,190	406,219	13.60
1920.....	13,035,436	1,734,555	130,354	7.52
1921 (9 months).....	29,910,910	1,436,800		

*Exports.*—None recorded.

*Important changes in classification.*—See General Notes on Paragraph, page 757.

## FILBERTS.

(See Survey G-34.)

*Description and uses.*—Filberts are also known as hazelnuts and cobnuts. Native hazels are rather widely distributed, but the European varieties are not cultivated to a great extent in the United States. Hazelnuts yield about 50 per cent of their weight in a bland, fixed oil, often called "nut oil," which has drying properties that make it useful to painters; it is also a base for expensive perfumes.

*Production.*—Some of the European varieties have been grown here experimentally but not as yet commercially.

*Imports* in 1914 of filberts, not shelled, were 10,836,072 pounds, valued at \$841,019 and yielded a revenue of \$220,669; of shelled nuts, 1,798,147 pounds, valued at \$278,974 and yielded a revenue of \$74,080. These came chiefly from Spain, Italy, and Turkey in Europe. Asiatic Turkey formerly was an important source of shelled nuts. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
FILBERTS, NOT SHELLED.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	8,295,565	\$988,641	\$165,911	16.78
1919.....	14,565,279	2,977,583	291,288	9.78
1920.....	14,884,604	2,100,184	297,615	10.67
1921 (9 months).....	5,847,210	510,044		
FILBERTS, SHELLED.				
1918.....	3,754,801	\$820,628	\$150,192	18.30
1919.....	3,393,256	1,092,050	135,730	12.43
1920.....	4,711,293	1,279,003	188,452	14.73
1921 (9 months).....	2,328,866	402,509		

*Important changes in classification.*—See General Notes on Paragraph, page 757.

## CHESTNUTS, INCLUDING MARRONS.

(See Survey G-34.)

*Description, uses, and production.*—Wild chestnuts are grown throughout the eastern part of the United States, and in some localities are marketed in relatively large quantities. In the last few years a fatal fungous disease has attacked chestnut trees in practically every section of the country. The chestnut is cultivated in Spain, Italy, and other southern European countries where the nut is very sweet, acquires a large size, and is known as the marron.

*Imports* of crude marrons amounted to 18,849,257 pounds in 1914. They now come chiefly from Italy; a few are imported from Spain. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	151,887	5,012,194	23,481,637	2,141,281
Value.....	\$7,946	\$393,803	\$1,716,181	\$105,169

*Exports.*—None recorded.

*Important changes in classification.*—See General Notes on Paragraph below.

#### PIGNOLIA NUTS.

(See Survey G-34.)

*Description, uses, and production.*—Pignolia or pine nuts are the seeds of a considerable number of both American and foreign pines. The nuts are marketed without the shell and in appearance somewhat resemble puffed rice. The kernels are very rich and form an important article of food in some countries. A few species of American pines yield edible nuts, but the domestic product is commercially not important. Southern Europe, Chile, and Mexico produce quantities of the nut.

*Imports.*—Some pignolia nuts are imported; statistics of imports are, however, lacking.

*Exports.*—None recorded.

*Important changes in classification.*—See General Notes on Paragraph below.

#### PISTACHE NUTS.

(See Survey G-34.)

*Description, uses, and production.*—The pistache is a small, green-fleshed nut used chiefly in flavoring and for coloring ice cream and confections. It is also excellent to eat when roasted and salted. The nut is grown only in a very limited way in California and certain semiarid regions of the Western States. It is cultivated chiefly in the Mediterranean countries and southwestern Asia.

*Imports* are not segregated from all other nuts; it is estimated they have amounted to about \$250,000 annually.

*Exports.*—None recorded.

*Important changes in classification.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Marrons, crude, are free of duty under paragraph 557 of the act of 1913. Parts of three paragraphs of the act of 1913 (224, 226, and 557) have been combined, so as to bring together such nuts as are produced to a small extent in the United States. The specific provision for cream or Brazil nuts, dropped in 1913, has been restored, since the trade is of considerable dimensions. Provisions have been added for prepared or preserved marrons, to include, among others, baked marrons, and for pignolia and pistache nuts. Imports of these nuts are of considerable proportions, and specific provision seems desirable.

## PARAGRAPH 756.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 756. Coconuts, one-half of 1 cent each; coconut meat, shredded and desiccated, or similarly prepared,  $4\frac{1}{2}$  cents per pound.

## ACT OF 1909.

## ACT OF 1913.

PAR. 278. \* \* \* cocoanut meat or copra desiccated, shredded, cut, or similarly prepared, two cents per pound; \* \* \*

PAR. 221. \* \* \* coconut meat or copra desiccated, shredded, cut, or similarly prepared, \* \* \* 2 cents per pound.

PAR. 635. Nuts: \* \* \* coconuts in the shell \* \* \* [Free].

PAR. 557. Nuts: \* \* \* coconuts in the shell \* \* \* [Free].

## COCONUTS.

(See Survey A-11.)

*Description and uses.*—The coconut is a tropical fruit of a species of the palm tree. The nut, both ripe and unripe, is used extensively as an edible fruit, the milky center as well as the outer meat being nourishing food. Most of the whole nuts imported are used in the manufacture of shredded coconut for confectionery and culinary purposes.

*Production* in continental United States in 1919 was limited to the Florida crop of 613,000 nuts, valued at \$43,000. In 1919 Porto Rico produced 24,608,000 coconuts, valued at \$1,001,460.

*Imports* of coconut in the shell in 1914 were valued at \$2,150,500, and in 1918 at \$2,792,165. Of the 1920 importation (91,164,605 coconuts), Panama furnished 21 per cent; Jamaica 17 per cent; Trinidad and Tobago, 24 per cent; and Honduras, 16 per cent. Importations since 1917 by calendar years of coconuts in the shell have been as follows:

	1918	1919	1920	1921 (9 months)
Quantity (number).....	68,255,512	85,081,922	91,164,605	42,495,984
Value.....	\$2,493,898	\$4,053,282	\$4,230,221	\$1,156,902

*Exports.*—None recorded.

*Important changes in classification.*—See General Notes on Paragraph, page 759.

## COCONUT MEAT, SHREDDED AND DESICCATED OR SIMILARLY PREPARED.

(See Survey A-11.)

*Description and uses.*—Coconut meat is prepared for food purposes by shredding and artificial drying, either with or without the addition of sugar. The domestic demand is made up of the package or household trade and the requirements of manufacturing bakers and confectioners for bulk goods. The package trade is supplied by domestic producers who manufacture and pack shredded coconut from nuts imported from the West Indies and Central America. Unsweetened

shredded coconut prepared in Ceylon enters largely into the bulk trade.

*Production.*—Domestic production is estimated at from 20,000,000 to 25,000,000 pounds annually.

*Imports* reached a total in 1914 of 9,307,924 pounds, valued at \$742,701. This product comes chiefly from the British East Indies. Statistics of imports since 1917 are as follows:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	19,987,575	\$2,462,513	\$399,751	16.23
1919.....	28,900,376	3,972,016	578,008	14.55
1920.....	30,631,022	4,879,685	612,620	12.55
1921 (9 months).....	21,351,135	1,914,122		

*Exports.*—None recorded.

*Important changes in classification.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Coconuts have been transferred from the free list (par. 557) of the 1913 act. "Copra" is omitted here because the word is not applied in trade to the shredded meat of the coconut, but is confined to the unshredded meat as oil material, which is covered by paragraph 1620 of H. R. 7456.

#### PARAGRAPH 757.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 757. Peanuts, not shelled, 3 cents per pound; shelled, 4 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 282. Peanuts or ground beans, unshelled, one-half of one cent per pound; shelled, one cent per pound.

PAR. 225. Peanuts or ground beans, unshelled,  $\frac{3}{8}$  of 1 cent per pound; shelled,  $\frac{3}{4}$  of 1 cent per pound.<sup>23</sup>

#### PEANUTS.

(See Survey G-36.)

*Description and uses.*—The bulk of the domestic peanut crop is used in the manufacture of peanut oil (see par. 45), peanut butter, confectioner's and baker's goods, and as roasted and salted peanuts. In 1916 approximately 4,000,000 bushels went into peanut butter, and about 7,000,000 bushels were crushed into 50,000,000 pounds of oil. Cottonseed oil mills manufacture peanut oil, using the same equipment. The meal left after extracting the oil serves as the basis for a high-grade cattle and dairy feed. The peanut is a soil im-

<sup>23</sup> Peanuts or ground beans, 3 cents per pound. (Par. 6, emergency tariff act of 1821.)

prover, and gives a valuable hay crop. Where the boll-weevil has interfered with the growing of cotton, the peanut production has increased rapidly; and its culture is possible on millions of acres of southern soils adapted to this crop.

*Production.*—From 1899 to 1918 the acreage in peanuts rose from 516,654 to 2,291,000 acres, the yield from 11,964,000 to 54,434,000 bushels, and farm values from \$7,270,515 to \$95,829,000. This increase was due chiefly to the growing market for peanuts and their products, to the realization of the usefulness of the crop as a soil improver, and to the handling of the crop by machinery. In Virginia and North Carolina peanuts are grown largely for confectionery purposes; farther South, for oil and for forage. In the Gulf States the increase in production has been very marked.

Production during recent years has been as follows:

	1919	1920	1921
Quantity (pounds).....	783,273,000	841,474,000	816,465,000
Value.....	\$73,094,000	\$44,256,000	\$32,288,000

*Imports* have greatly increased since 1913, notwithstanding the great expansion in domestic production. The increase of shelled peanuts coming from southern France, Spain, and Japan has been the more pronounced. Japan supplies about three-fourths of the unshelled nuts, chiefly absorbed in the Pacific States, far distant from important domestic sources. Larger imports are made in the form of peanut oil. Since 1917 imports have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Equiva- lent ad valorem.
----------------	-----------	--------	-------	--------------------------------

PEANUTS OR GROUND BEANS, NOT SHELLED.

	Pounds.	Value.	Duty.	Per cent.
1918.....	1,719,276	\$117,427	\$6,447	5.49
1919.....	5,383,828	368,184	20,189	5.48
1920.....	7,222,486	642,095	27,084	4.22
1921 (9 months).....	4,614,686	247,039		

PEANUTS OR GROUND BEANS, SHELLED.

	Pounds.	Value.	Duty.	Per cent.
1918.....	60,811,453	\$3,934,946	\$456,086	11.59
1919.....	25,521,105	2,000,776	191,408	9.57
1920.....	103,552,486	9,846,655	776,644	7.89
1921 (9 months).....	38,931,465	1,896,709		

The following statistics show by months the quantity and value of both unshelled and shelled peanuts imported in 1920 and in 1921 under the operation of the emergency tariff act:

Month.	Quantity.		Value.	
	1920	1921	1920	1921
PEANUTS, NOT SHELLED.				
	<i>Pounds.</i>	<i>Pounds.</i>		
January.....	158,844	354,951	\$15,249	\$16,192
February.....	760,781	84,656	66,246	5,063
March.....	1,062,153	361,916	86,830	14,420
April.....	2,794,879	818,783	263,330	43,517
May.....	1,094,887	1,582,460	100,694	68,572
June.....	1,468,136	794,991	137,695	32,099
July.....	797,933	38,574	58,989	2,273
August.....	260,561	329,987	21,663	11,944
September.....	165,599	67,005	12,651	3,135
October.....	32,610	59,610	2,248	3,013
November.....	27,010	2,598	1,993	267
December.....	79,726	28,310	4,624	1,845

## PEANUTS, SHELLED.

January.....	8,324,542	1,230,145	\$809,154	\$63,953
February.....	16,276,079	2,290,165	1,537,067	122,138
March.....	26,361,065	4,386,220	2,630,484	184,991
April.....	27,042,490	15,177,797	2,769,652	662,903
May.....	18,385,786	10,257,514	1,574,968	392,459
June.....	6,930,324	1,683,263	661,213	68,335
July.....	1,859,085	361,769	184,984	11,635
August.....	4,825,263	55,437	338,503	2,701
September.....	130,720	10,707	13,641	1,097
October.....	652,855	4,468	49,028	381
November.....	21,327	14,069	2,101	856
December.....	780	55,667	85	4,948

*Exports* range between 10,000,000 and 20,000,000 pounds and move chiefly to Canada. Figures for the calendar years 1918-1921 follow:

	1918	1919	1920	1921 (9 months)
Quantity (pounds).....	12,319,004	19,778,490	9,366,434	11,063,404
Value.....	\$1,602,657	\$2,123,411	\$1,115,351	\$728,856

*Important changes in classification.*—The term “ground beans” has been eliminated as unnecessary. The effectiveness of a duty upon peanuts is to a considerable degree conditioned by the duty upon peanut oil, for which the great bulk of the imported peanuts is used.

## PARAGRAPH 758.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 758. Walnuts of all kinds, not shelled, 2½ cents per pound; shelled, 7½ cents per pound; pecans, unshelled, 1 cent per pound; shelled, 2 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 281. \* \* \* walnuts of all kinds, not shelled, three cents per pound; shelled, five cents per pound.

PAR. 224. \* \* \* walnuts of all kinds, not shelled, 2 cents per pound; shelled, 4 cents per pound.

## ACT OF 1909.

PAR. 283. Nuts of all kinds, shelled or unshelled, not specially provided for in this section, one cent per pound; but no allowance shall be made for dirt or other impurities in nuts of any kind, shelled or unshelled.

## ACT OF 1913.

PAR. 226. Nuts of all kinds, shelled or unshelled, not specially provided for in this section, 1 cent per pound; but no allowance shall be made for dirt or other impurities in nuts of any kind, shelled or unshelled.

## WALNUTS OF ALL KINDS.

(See Survey G-34.)

*Description and uses.*—The Persian walnut, commonly called the English walnut, is very popular as a table nut and much used in cakes and confections.

*Production.*—Because of climatic requirements profitable commercial production is restricted to Pacific Coast States, chiefly to southern California. The California crop in 1919 amounted to 59,091,390 pounds, with approximate valuation of \$14,181,934. Total production in pounds has been as follows: 1918, 40,230,000; 1919, 59,091,390 (\$14,181,934); 1920, 4,000,000.

*Imports* of walnuts not shelled averaged for 1913-1917, 20,561,194 pounds per annum. Imports of shelled walnuts in the same time averaged 14,029,644 pounds. Imports came principally from France, Italy, and Chile, and recently in increasing quantities from China. Statistics of imports since 1917 are as follows:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
----------------	-----------	--------	-------	------------------------

## WALNUTS, NOT SHELLED.

	Pounds.			Per cent.
1918.....	3,875,315	\$509,311	\$77,507	15.22
1919.....	16,667,276	3,161,334	333,316	10.54
1920.....	17,339,096	2,662,268	346,782	13.03
1921 (9 months).....	10,980,108	1,192,093		

## WALNUTS, SHELLED.

1918.....	9,164,103	\$3,504,501	\$366,564	10.46
1919.....	9,800,762	5,001,569	392,030	7.84
1920.....	13,972,917	5,562,769	558,917	10.05
1921 (9 months).....	9,708,122	3,396,581		

*Exports.*—None recorded.

## PECANS.

(See Survey G-34.)

*Description and uses.*—The pecan is widely distributed throughout the Gulf States, and is one of the most important American nuts. Formerly a large proportion was gathered wild, but orchards of the better varieties are now cultivated and may be expected in the coming years to produce an increasing quantity of thin-shelled nuts.

*Production* in 1919 amounted to 31,808,548 pounds valued at \$7,792,086. Texas produced over half the crop; Oklahoma, Georgia and Louisiana had the next largest crops.

Imports of pecans in 1914 amounted to 2,621,161 pounds. They come almost entirely from Mexico. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	1,239,717	\$143,316	\$12,397	8.65
1919.....	1,794,265	226,529	17,943	7.92
1920.....	2,194,620	283,395	21,946	7.74
1921 (9 months).....	551,247	66,502		

*Exports.*—None recorded.

*Important changes in classification.*—Special provision has been made for pecans as the volume of the trade seems to warrant it.

*Suggested changes.*—In order to carry out the general plan of having separate paragraphs for the important nuts, in an alphabetical arrangement, it is suggested that pecans be taken out of this paragraph, and given a separate paragraph, between peanuts and walnuts.

### PARAGRAPH 759.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 759. Edible nuts, shelled or unshelled, not specially provided for, 1 cent per pound: *Provided*, That no allowance shall be made for dirt or other impurities in nuts of any kind, shelled or unshelled.

ACT OF 1909.

ACT OF 1913.

PAR. 283. Nuts of all kinds, shelled or unshelled, not specially provided for in this section, one cent per pound; but no allowance shall be made for dirt or other impurities in nuts of any kind, shelled or unshelled.

PAR. 226. Nuts of all kinds, shelled or unshelled, not specially provided for in this section, 1 cent per pound; but no allowance shall be made for dirt or other impurities in nuts of any kind, shelled or unshelled.

ALL OTHER NUTS, N. S. P. F.

(See Survey G-34.)

*Import statistics given below include pignolia and pistache nuts and all others not mentioned specifically in the tariff act of 1913.*

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
NUTS, SHELLED OR UNSHELLED, N. S. P. F.				
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	984,062	\$204,815	\$9,832	4.81
1919.....	2,163,097	581,100	21,612	3.72
1920.....	3,789,902	882,583	37,640	4.27
1921 (9 months).....	2,558,431	534,329		
OLIVE NUTS, GROUND.				
1918.....		\$17	\$3	15.00
1919.....		129	19	15.00
1920.....		132	20	15.00
1921 (9 months).....		161		

*Exports* go chiefly to Canada. They include almonds, walnuts, pecans, and all other nuts except peanuts. Exports of individual varieties have not in the past been large; in consequence, they have not been separated by customs authorities. Late statistics for calendar years follow: 1918, \$541,641; 1919, \$1,462,408; 1920, \$857,123; 1921 (9 months), \$526,548.

*Important changes in classification.*—"Edible" excludes from this paragraph nonedible oil nuts. Nearly all of such nuts are covered by specific provisions, with a general provision (par. 760) for oil-bearing materials.

*Suggested changes.*—For the reasons stated under the subheading "conflicting provisions" under paragraph 748, a semicolon might be substituted for the colon after the word "pound" in line 7, page 95, and the words "pickled, or otherwise prepared or preserved, and not specially provided for, [rate]" followed by a colon, be inserted thereafter.

#### SEEDS AND STOCKS.

##### GENERAL.

The dutiable and free provisions for seeds and stocks imported for industrial purposes, for replanting, or as spices have been rearranged into three dutiable paragraphs:

760. Oil-bearing materials.

761. Grass seeds.

762. Other field and garden seeds.

Seeds used chiefly as spices have been transferred to the spice paragraph (780); roots, root stocks, and seedlings to the paragraphs relating to nursery and greenhouse stock (pars. 750-752); and a number of new provisions have been added. For the details of these changes and additions see paragraphs 760, 761, 762, as well as the others cited.

#### PARAGRAPH 760.

##### H. R. 7456.

##### SENATE AMENDMENTS.

PAR. 760. Oil-bearing seeds and materials: Castor beans, one-half of 1 cent per pound; flaxseed, 25 cents per bushel of fifty-six pounds; poppy seed, 32 cents per one hundred pounds; sunflower seed, 2 cents per pound; apricot and peach kernels, 3 cents per pound.

##### ACT OF 1909.

##### ACT OF 1913.

PAR. 266. Seeds: Castor beans or seeds, twenty-five cents per bushel of fifty pounds; flaxseed or linseed \* \* \* twenty-five cents per bushel of fifty-six pounds; poppy seed, fifteen cents per bushel; \* \* \*

PAR. 280. \* \* \* apricot and peach kernels, four cents per pound.

PAR. 668. Seeds: \* \* \* flower \* \* \* seeds; \* \* \* [Free].

PAR. 212. Seeds: Castor beans or seeds, 15 cents per bushel of fifty pounds; flaxseed or linseed \* \* \*, 20 cents per bushel of fifty-six pounds; <sup>24</sup> poppy seed, 15 cents per bushel of forty-seven pounds; \* \* \*

PAR. 223. \* \* \* apricot and peach kernels, 3 cents per pound.

PAR. 595. Seeds: \* \* \* flower \* \* \* seeds; \* \* \* [Free].

<sup>24</sup> Flaxseed, 30 cents per bushel of fifty-six pounds. (Par. 3, emergency tariff act of 1921.)

## CASTOR BEANS OR SEEDS.

(See Survey A-11).

*Description and uses.*—Castor beans or seeds are employed principally for oil manufacture. The oil is used for industrial purposes, as a medicine, and as a lubricant for airplanes.

*Production* is cheaper perhaps in India and other Asiatic countries than elsewhere, and is insignificant here, chiefly because of the large amount of hand labor required, especially in harvesting. Efforts in 1918 to grow these beans to supply oil for airplanes met with little success, because of the inexperience of agriculturists, unseasonable conditions, and other causes.

*Imports* averaged annually 838,861 bushels for 1910-1913. They came mainly from India and parts of Asia. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Bushels.</i>			<i>Per cent.</i>
1918.....	858,157	\$2,327,051	\$128,638	5.52
1919.....	1,133,824	3,488,702	169,938	4.87
1920.....	1,259,307	2,937,148	188,893	6.43
1921 (9 months).....	540,318	664,032		

In 1920, about 65 per cent of the imports were from Brazil, and about 13 per cent were from England.

*Important changes in classification, etc.*—See General Notes on Paragraph, page 769.

## FLAXSEED OR LINSEED.

(See Report T. I. S.-20.)

*Description and uses.*—Flaxseed or linseed is used almost exclusively for making linseed oil. The by-product, oil cake, is a valuable feedstuff and fertilizer.

*Production* of flaxseed has been steadily declining. It has been essentially a frontier crop, thriving on the frontier and moving with it. It has been unpopular because of flaxwilt and other factors apart from the competition of more profitable crops. The domestic production declined from 25,856,000 bushels in 1909 to 8,112,000 bushels in 1921. The Dakotas, Montana, and Minnesota produce nearly all of the output of the United States.

*Imports* during 1910-1913 averaged 6,909,209 bushels per annum. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Bushels.</i>			<i>Per cent.</i>
1918.....	12,397,597	\$32,618,623	\$2,479,519	7.60
1919.....	14,042,542	44,382,395	2,808,508	6.33
1920.....	24,616,766	74,519,675	4,923,353	6.61
1921 (9 months).....	8,599,517	13,858,063		

In 1920, 92 per cent of the imports were from Argentina.

Flaxseed is dutiable at 30 cents per bushel of 56 pounds under paragraph 3 of the emergency tariff act of 1921. General imports by months for 1920 and 1921 have been as follows:

Month.	Quantity.		Value.	
	1920	1921	1920	1921
	<i>Bushels.</i>	<i>Bushels.</i>		
January.....	2,186,287	386,638	\$6,702,682	\$721,519
February.....	1,082,736	341,180	3,785,497	625,905
March.....	2,263,533	903,070	7,085,524	1,554,797
April.....	1,703,611	1,091,584	5,333,860	1,681,726
May.....	4,253,319	1,728,398	13,445,400	2,603,301
June.....	2,312,742	880,583	7,565,269	1,241,388
July.....	1,796,954	776,036	5,442,181	1,219,944
August.....	1,695,510	1,896,590	5,251,974	3,136,280
September.....	2,007,240	598,805	5,948,534	1,073,409
October.....	2,202,447	648,038	6,121,030	1,145,263
November.....	1,466,098	1,576,195	3,982,192	2,869,434
December.....	1,670,713	1,499,127	3,958,441	2,566,235

*Exports* are relatively insignificant. Statistics for the calendar years 1918-1921 follow:

	1918	1919	1920	1921 (9 months).
Quantity (bushels).....	25,508	16,595	15,753	262
Value.....	\$134,985	\$123,143	\$112,037	\$1,365

In 1920, 68 per cent of the exports went to Canada and 26 per cent to the United Kingdom.

*Important changes in classification, etc.*—See General Notes on Paragraph, page 769.

#### POPPY SEED.

*Description and uses.*—The most important is the white or oil poppy, noted for its yield of opium and the bland, fixed oil obtained from the seed by crushing. It is native to most warm countries. The seeds contain no opium and yield about 40 per cent oil. The oil cake is used for fertilizer and for feeding cattle.

*Production.*—The poppy plant is grown extensively in Asia Minor, Persia, India, Egypt, south Russia, and northern France. The seed from Manchuria is of low quality.

*Imports* for 1910-1914 averaged annually 56,084 bushels. France and Germany were the principal countries in which poppy seed was crushed. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Bushels.</i>			<i>Per cent.</i>
1918.....	4,438	\$24,581	\$666	2.71
1919.....	22,911	231,121	3,437	1.49
1920.....	59,582	468,131	8,937	1.91
1921 (9 months).....	65,012	272,231		

*Important changes in classification, etc.*—See General Notes on Paragraph, page 769.

## SUNFLOWER SEED.

*Description and uses.*—The seed is the product of the sunflower plant. It yields an oil that is an ingredient in certain high-class paints used by artists. It is also used for feeding purposes.

*Imports* are not separately stated but are included in "Flower seeds."

*Important changes in classification.*—See General Notes on Paragraph, page 769.

## APRICOT AND PEACH KERNELS.

*Description and uses.*—The principal use of these fruit kernels is in the production of apricot and peach kernel oil. In preparing the fruit for drying it is split open and the pit removed. The pits are used quite extensively in California for fuel, and during the war were employed in making charcoal for gas masks.

*Production.*—The source of these kernels is primarily the canning factories and, in California, the apricot and peach drying yards.

*Imports* averaged annually 22,874 pounds for 1912-1916. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	241,105	\$19,117	\$7,233	37.83
1919.....	38,416	7,847	1,152	14.69
1920.....	65,215	14,453	1,955	13.53
1921 (9 months).....	30,411	7,070		

*Important changes in classification, etc.*—See General Notes on Paragraph, page 769.

## OIL-BEARING SEEDS, N. S. P. F.

The following seeds, not specially provided for in H. R. 7456, are used chiefly for oil:

## COTTONSEED.

*Description and uses.*—Cottonseed, from the fibrous cotton plant, is used principally in making cottonseed oil; the residual cottonseed meal or cake is used for cattle feed and fertilizer. Cottonseed hulls, used chiefly for feeding cattle, and linters (for guncotton, mattresses, etc.) are less important by-products. About 540,000 tons of cottonseed for planting are required annually by farmers in the Southern States.

*Production* of cottonseed averages nearly 6,000,000 tons per annum in the United States.

*Imports* in 1914 were 4,446 tons, valued at \$66,035. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	36,946,885	67,051,897	76,597,283	49,371,380
Value.....	\$914,991	\$1,776,435	\$1,290,520	\$255,457

*Exports* of domestic cottonseed amounted in 1914 to 8,171 tons, valued at \$215,115. Before the war most of the exports went to Germany. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	1,741,499	1,918,848	5,270,382	2,447,673
Value.....	\$69,707	\$88,743	\$309,135	\$97,954

In 1920, about 75 per cent of the exports went to Mexico and about 9 per cent to the Barbados.

*Important changes in classification.*—See General Notes on Paragraph, page 769.

#### HEMPSEED.

*Description and uses.*—Hempseed when crushed yields an oil used in making soap and an oil cake serving as cattle feed. The seed is used also as feed for poultry and cage birds and for sowing.

*Production.*—Hemp is native to temperate Asia, but grows also in Europe, India, and Canada. Kentucky supplies practically all of the domestic output. In 1909, 5,416 bushels were gathered from 516 acres; the acreage increased to 42,000 in 1917. Further figures are unavailable. China and Japan furnish large quantities, of no value for seeding, which is used for poultry feed.

*Imports* in 1914 were 2,031,438 pounds, valued at \$38,315. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	20,512	3,108,047	6,036,608	816,019
Value.....	\$2,241	\$142,177	\$221,904	\$12,830

*Important changes in classification.*—See General Notes on Paragraph, page 769.

#### RAPESEED.

*Description and uses.*—Rapeseed is used for planting, oil, and feed. Rape produces an abundance of green forage, valued highly by farmers for feeding or grazing live stock and poultry. It is grown to some extent in practically every State. The seed, together with millet, canary, and hemp seed, is used also in bird-seed mixtures. Rapeseed is also crushed for oil.

*Production.*—It is not produced here commercially. Prior to the war our supply came from England; during the war it came from Japan, where large quantities of seed less desirable for planting purposes are produced.

*Imports* in 1914, an average year, were 5,970,937 pounds, valued at \$211,301. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	2,625,259	5,080,039	5,798,272	2,804,951
Value.....	\$175,357	\$317,262	\$368,012	\$140,575

*Important changes in classification, etc.*—See below.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—Three provisions relating to oil seeds and materials have been combined in this paragraph. The duty on castor beans and poppy seed has been changed from the bushel to the pound basis and a provision added for sunflower seed which is exempt from duty under the act of 1913 (par. 595).

*Suggested changes.*—It is suggested that provision be made by name for cottonseed, hempseed, rapeseed, Chinese or Japanese tung nuts, perilla and sesame seed, and soya beans, and that a general provision be added for oil seeds and oil-bearing vegetable materials not specially provided for. If these articles or any of them should be exempted from duty, they should come within paragraph 1620; if, however, a duty is imposed they should be provided for in this paragraph.

(See also pars. 762 and 1626.)

#### PARAGRAPH 761.

##### H. R. 7456.

##### SENATE AMENDMENTS.

PAR. 761. Grass seeds: Alfalfa, 2 cents per pound; alsike clover, 3 cents per pound; crimson clover, 1 cent per pound; red clover, 3 cents per pound; white clover, 3 cents per pound; clover, not specially provided for, 2 cents per pound; millet, one-half of 1 cent per pound; timothy, 2 cents per pound; hairy vetch, 2 cents per pound; spring vetch, 1 cent per pound; all other grass seeds not specially provided for, 2 cents per pound.

##### ACT OF 1909.

##### ACT OF 1913.

PAR. 668. Seeds: \* \* \* all \* \* \* grass seeds; \* \* \* not specially provided for in this section [Free].

PAR. 595. Seeds: \* \* \* all \* \* \* grass seeds; \* \* \* not specially provided for in this section [Free].

#### GRASS SEEDS.

##### ALFALFA SEED.

*Description and uses.*—The quantity of alfalfa seed used annually in the United States for planting is estimated as more than 25,000,000 pounds.

*Production* is very uncertain and is commercially localized in South Dakota, Nebraska, Kansas, Texas, Oklahoma, Colorado, Utah, Montana, Idaho, California, and Arizona. Excessive rains or drought

and injury to the crop inflicted by grasshoppers, alfalfa weevil, and other insects affect the production.

*Imports* in 1914 amounted to 7,439,261 pounds, valued at \$740,810. Much of it comes from Turkestan, but is inferior to the domestic seed. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	167,487	6,241,948	12,110,131	1,680,067
Value.....	\$41,762	\$1,328,581	\$3,203,845	\$231,481

*Exports.*—None specifically recorded.

#### CRIMSON CLOVER SEED.

*Description and uses.*—Crimson clover seed is used solely for planting. American farmers sowing annually over 4,000,000 pounds.

*Production* here of crimson clover seed, although greatly increased during late years, does not equal requirements. It is produced successfully in Tennessee (2,500,000 pounds in 1919) and lightly in Alabama, North Carolina, Virginia, Maryland, and Delaware.

*Imports* averaged annually 6,266,737 pounds for 1914–1917. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	938,323	5,837,948	5,429,770	4,681,792
Value.....	\$177,881	\$1,099,923	\$594,532	\$291,554

*Exports* are not separately stated. See statistics under "Clover seed, n. s. p. f.," page 772.

#### RED CLOVER SEED.

*Description and uses.*—In the United States red clover seed is used exclusively for planting, the estimated annual requirement being over 100,000,000 pounds.

*Production* is principally in Michigan, Illinois, Indiana, Ohio, Minnesota, Wisconsin, Iowa, Missouri, Oregon, and Idaho. The amount decreased during the war. Government officials and large seed dealers agree that there is a world shortage of red clover seed. The wholesale price has ranged from \$15 to \$50 per 100 pounds.

*Imports* for 1913–1917 averaged 11,989,767 pounds per annum. In 1918 (fiscal year) nearly all came from Italy, France, and Canada. Before the war Germany was the most important source. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	931,307	7,025,591	12,692,711	15,640,393
Value.....	\$176,111	\$2,410,056	\$4,627,485	\$2,233,565

In 1920 imports were chiefly from France, about 54 per cent, and from Italy, about 35 per cent.

*Exports* are not separately stated. See statistics under "Clover seed, n. s. p. f."

## ALSIKE CLOVER SEED.

*Description and uses.*—The seed of alsike clover, used primarily for planting, was employed more extensively in 1918 and 1919 than formerly, probably because of the scarcity and higher price of red clover seed.

*Production.*—Most of this seed is grown in Michigan, Illinois, Indiana, Ohio, Minnesota, Wisconsin, and Idaho, but production is not sufficient for domestic requirements.

*Imports* in 1914 were 5,349,156 pounds, valued at \$804,092, and came chiefly from Canada. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	6,078,038	7,071,548	2,170,884	4,504,619
Value.....	\$1,409,879	\$2,483,780	\$853,780	\$795,608

*Exports* are not separately stated. See statistics under "Clover seed, n. s. p. f."

## WHITE CLOVER SEED.

*Description and uses.*—White clover seed, used primarily for planting, is sown extensively in pastures and on lawns together with other clover and grass seed. Compared with the extent to which the crops are grown, however, little seed is required—probably not over 1,000,000 pounds per annum.

*Production.*—Wisconsin, Idaho, and Illinois produce most of this seed. In Illinois it is mainly a by-product of redtop seeds. Some of the supply is obtained from Canada.

*Imports* in 1914 were unusually large; 1,122,551 pounds, valued at \$207,088. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	84,412	329,585	540,825	1,151,417
Value.....	\$15,982	\$99,737	\$190,783	\$299,128

*Exports* are not separately stated. See statistics under "Clover seed, n. s. p. f."

## CLOVER SEED, N. S. P. F.

*Description and uses.*—Sweet clover, white flowered (*Melilotus alba*), is becoming important as a cultivated crop. It grows wild throughout most of the corn belt, portions of the Rocky Mountain States, and on the black lands of Alabama and Mississippi. It is valuable in restoring waste lands to profitable cultivation. Its increasing use for hay and pasture has created a strong demand for the seed.

*Production* is quite large, but data are not available. Sales by dealers in 1919 were double those of 1917 or 1918. This plant has a wide adaptation and produces seed abundantly. Seed is produced commercially in Oregon, Idaho, Utah, Colorado, Kansas, Nebraska, South Dakota, Kentucky, Mississippi, and to a less extent in some other States. Canada also produces sweet clover seed and during 1919 relatively large quantities were imported from that country for planting.

*Imports* of clover seed designated as "all other" amounted to 6,034,673 pounds, valued at \$515,143 in 1914. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	1,739,649	4,777,326	4,742,892	8,146,977
Value.....	\$307,756	\$1,308,468	\$1,299,306	\$738,529

In 1920, imports of all varieties of clover seed, except red, came principally from France (43 per cent), and Canada (33 per cent).

*Exports* of clover seed, for calendar years, since 1917 have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	5,985,526	7,943,749	4,985,695	3,990,790
Value.....	\$1,836,124	\$3,206,316	\$1,928,140	\$787,590

In 1920, exports went principally to Canada (about 21 per cent), to England (about 20 per cent), and to Denmark (about 19 per cent).

#### MILLET SEED.

*Description and uses.*—About 25,000,000 pounds of millet seed are annually sown for hay and forage. Large quantities are also used in poultry feed and bird-seed mixtures.

*Production* is sufficient for planting purposes. Kansas, Missouri, Texas, Oklahoma, Nebraska, the Dakotas, Iowa, Tennessee, and Colorado produce the bulk of the seed.

*Imports* from 1914 to 1918 were relatively small. The Orient supplies a part of domestic requirements for poultry and bird-seed mixtures. Statistics of imports since 1917 by calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	14,014	1,775,226	88,575	214,146
Value.....	\$553	\$30,549	\$3,653	\$5,628

#### TIMOTHY SEED.

*Description and uses.*—Timothy is America's greatest cultivated hay grass. The seed is used solely for planting.

*Production* of timothy seed annually exceeds our planting needs. Most commercial timothy seed is produced in Illinois, Indiana, Ohio, South Dakota, Minnesota, Wisconsin, Iowa, Missouri, Utah, and Idaho.

*Imports* were not separately stated prior to 1918, but were included in "All other grass seeds." Since 1917 imports by calendar years have been as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	88,435	85,443	4,119	117,207
Value.....	\$12,309	\$8,424	\$650	\$5,401

*Exports* in 1914 were 12,480,294 pounds, valued at \$688,118. They go mostly to Canada. Later statistics, for calendar years, follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	8,564,384	13,346,358	13,522,134	13,165,717
Value.....	\$881,154	\$1,633,271	\$1,666,332	\$944,693

## VETCH SEED.

*Description and uses.*—Vetch, both hairy (winter) and common (spring) are grown here for hay and forage, and the seed is used for planting. The hairy, or winter variety, is considered much more valuable, except perhaps on the Pacific coast, but high prices in recent years restrict its use.

*Production.*—Hairy, or winter vetch seed is difficult to grow, small quantities being produced only in Michigan in connection with, or as a by-product of, rye for grain. Most of the hairy vetch seed comes from Russia, but quantities have been small since 1914. The Willamette Valley in Oregon produces most of our common, or spring vetch seed. The demand for this species, although the price is lower, rarely exceeds production and little is imported.

*Imports* of hairy vetch in 1914 were 3,405,750 pounds, valued at \$135,875; and of spring vetch, 630,881 pounds, valued at \$24,085. Later statistics, for calendar years, follow:

	1918	1919	1920	1921 (9 months).
Hairy vetch seeds:				
Quantity (pounds).....	225,023	461,848	1,521,504	1,736,178
Value.....	\$20,381	\$62,194	\$213,150	\$101,410
Spring vetch seeds:				
Quantity (pounds).....	224,852	273,844	612,002	266,765
Value.....	\$10,850	\$17,432	\$44,195	\$11,105

## GRASS SEED N. S. P. F.

*Description and uses.*—A few other kinds of grass seeds n. s. p. f. included in this section are imported. Canada blue-grass seed, practically all from Ontario, Canada, is used for planting. It was formerly

used to adulterate Kentucky blue-grass seed. Kentucky blue-grass seed is used for sowing, principally in pastures. Sufficient is produced in Kentucky, Missouri, and Iowa for domestic requirements. Very little is imported. A mixture of alsike clover and timothy seed is extensively sown for hay. Although this mixture is largely imported, there is also a limited domestic production. Orchard grass seed, used for sowing in pastures and meadows, thrives in shady places. Kentucky, Indiana, Ohio, and Virginia produce the greater part of the requirements. Large quantities formerly were imported from New Zealand, but the strain is inferior. Redtop seed gives a valuable hay and pasture grass, especially on wet and acid soils. It is used mostly in mixtures with alsike clover and alsike and timothy, and is a constituent of lawn and turf grass mixtures. Illinois produces the greater portion of the supply; Iowa and Missouri also produce fairly large quantities. Very little is imported. English rye-grass seed is used in meadow and pasture mixtures and also in turf-grass mixtures. It is imported from Europe. Italian rye-grass seed, used for the same purpose as English rye grass, is normally imported from Europe; in recent years a variety has come in quantities from Argentina.

*Imports* of "all other" grass seed (including timothy, treated above) amounted to 23,350,147 pounds, valued at \$742,941 in 1914. Germany furnished the bulk in 1914, while in 1918 (fiscal year) Ireland, Russia, and Canada furnished about 75 per cent. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	5,345,659	6,771,617	6,777,120	7,563,758
Value.....	\$480,393	\$1,158,274	\$1,019,417	\$933,337

*Exports* in 1914 were 5,156,801 pounds, valued at \$600,368, chiefly to Germany, Canada, Great Britain, and the Netherlands. Later exports of grass seeds (except clover and timothy) for calendar years are shown as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	2,952,193	4,440,490	4,252,152	3,687,281
Value.....	\$542,704	\$717,102	\$812,801	\$514,598

In 1920, exports were principally to Canada (31 per cent) and to England (17 per cent).

#### GENERAL NOTE ON PARAGRAPH.

*Important changes in classification.*—New specific provision; the seeds covered by this paragraph are exempt from duty under the provision in paragraph 595 of the act of 1913 for "all grass seeds."

## PARAGRAPH 762.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 762. Other garden and field seeds: Sugar beet, 1 cent per pound; other beet, 4 cents per pound; cabbage, 12 cents per pound; canary, 1 cent per pound; carrot, 4 cents per pound; cauliflower, 25 cents per pound; celery, 2 cents per pound; kale, 6 cents per pound; kohlrabi, 8 cents per pound; mangelwurz, 4 cents per pound; onion, 20 cents per pound; parsley, 2 cents per pound; parsnip, 4 cents per pound; pepper, 15 cents per pound; radish, 4 cents per pound; spinach, 1 cent per pound; tree, 8 cents per pound; turnip, 4 cents per pound; rutabaga, 4 cents per pound; flower, 4 cents per pound; all other garden and field seeds not specially provided for, 20 per centum ad valorem: *Provided*, That the provisions for seeds in this title shall include such seeds whether used for planting or for other purposes.

## ACT OF 1909.

PAR. 668. Seeds: \* \* \* canary, \* \* \* cauliflower, \* \* \* cotton, \* \* \* fenugreek, hemp, hoarhound, mangelwurz, \* \* \* rape, Saint John's bread or bean, sugar beet, sorghum or sugar cane for seed; \* \* \* all flower \* \* \* seeds; \* \* \* all the foregoing not specially provided for in this section [Free].

PAR. 266. Seeds: \* \* \* oil seeds not specially provided for in this section, twenty-five cents per bushel of fifty-six pounds; \* \* \* mushroom spawn, and spinach seed, one cent per pound; beet, except sugar beet, carrot, corn salad, parsley, parsnip, radish, turnip and rutabaga seed, four cents per pound; cabbage, collard, kale and kohlrabi seed, eight cents per pound; egg plant and pepper seed, twenty cents per pound; seeds of all kinds not specially provided for in this section, ten cents per pound.

## ACT OF 1913.

PAR. 595. Seeds: \* \* \* cauliflower, celery, \* \* \* cotton, \* \* \* fenugreek, hemp, hoarhound, mangelwurz, \* \* \* rape, Saint John's bread or bean, sorghum, sugar beet, and sugar cane for seed; \* \* \* all flower \* \* \* seeds; \* \* \* all the foregoing not specially provided for in this section [Free].

PAR. 212. Seeds: \* \* \* oil seeds not specially provided for in this section, 20 cents per bushel of fifty-six pounds; \* \* \* mushroom spawn, and spinach seed, 1 cent per pound; canary seed,  $\frac{1}{2}$  cent per pound; \* \* \* beet (except sugar beet), carrot, corn salad, parsley, parsnip, radish, turnip, and rutabaga seed, 3 cents per pound; cabbage, collard, kale, and kohlrabi seed, 6 cents per pound; egg plant and pepper seed, 10 cents per pound; seeds of all kinds not specially provided for in this section, 5 cents per pound: *Provided*, That no allowance shall be made for dirt or other impurities in seeds provided for in this paragraph.

## OTHER GARDEN AND FIELD SEEDS.

## SUGAR-BEET SEED.

*Description and uses.*—The sugar beet, closely related to certain varieties of garden beet, is grown almost solely for the production of sugar. The roots yield sugar the first year, but seeds are not produced until the second year.

*Production* of sugar-beet seed in 1916 was 5,539,000 pounds. Because it was difficult to import seed during the war, the seed

acreage was increased; nevertheless the production of 1921 decreased to 3,575,000 pounds. Idaho, Colorado, Utah, California, and Michigan lead. Beet-sugar manufacturers, who control the supply, endeavor to carry sufficient seed to meet requirements for one or two years and thus provide against emergencies.

*Imports* in 1914 were 10,490,089 pounds, valued at \$804,209—86 per cent from Germany, 6 per cent from Austria-Hungary, and 3.5 per cent from Russia. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	4,298,375	9,830,068	23,446,067	6,385,999
Value.....	\$1,341,341	\$2,137,091	\$5,213,410	\$1,280,825

In 1920 about 40 per cent of the imports came from Germany, about 38 per cent from the Netherlands, and about 19 per cent from Denmark.

*Important changes in classification.*—Sugar-beet seed is transferred from the free list of the act of 1913 (par. 595).

#### BEE T SEED (EXCEPT SUGAR BEET AND MANGELWURZEL).

*Description and uses.*—Beet seed is used primarily for planting in this country, nearly 500,000 pounds of the garden variety being sown annually.

*Production* increased rapidly during the war—in 1916, 200,000 pounds; in 1918, 2,509,000 pounds, but in 1921 decreased to 180,000 pounds. California leads; smaller quantities come from Washington and Connecticut.

*Imports* in 1914 were 1,076,525 pounds. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	351,592	\$173,037	\$10,548	.....
1919.....	160,962	108,233	4,829	4.46
1920.....	238,111	50,353	7,143	14.19
1921 (9 months).....	152,864	23,940	.....	.....

#### CABBAGE SEED.

*Description and uses.*—Cabbage, one of our principal truck crops, is a common home garden product; over 500,000 pounds of seed are required annually.

*Production* commercially in 1916 was 217,000 pounds; in 1918, 157,000 pounds; and in 1921, 224,000 pounds. Long Island and Puget Sound are the cabbage-seed producing sections.

*Imports* averaged 251,927 pounds for 1910–1913. Denmark and Holland were normally the principal exporting countries. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	114,973	\$196,370	\$6,898	3.51
1919.....	168,951	357,853	10,137	2.83
1920.....	390,741	299,354	23,444	7.83
1921 (9 months).....	144,240	92,120		

## CANARY SEED.

*Description and uses.*—Canary seed, from an annual grass of that name, is native to the Canary Islands, southern Europe, northern Africa, and Asia. It has been naturalized in England and parts of the United States, and is cultivated as a food for cage birds in the south of Europe, especially in Germany and England. A fine flour prepared from this seed is used in sizing high-grade cotton and silk goods.

*Imports* were 4,503,280 pounds in 1914. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	3,244,697	\$292,302	\$16,223	5.55
1919.....	5,954,434	551,143	29,745	
1920.....	5,292,922	311,192	26,465	8.51
1921 (9 months).....	5,228,165	206,775		

## CARROT SEED.

*Description and uses.*—The carrot is a vegetable grown in home and market gardens. Some of the large-rooted varieties are grown under field culture for stock feeding. Probably 450,000 pounds of carrot seed are sown for these purposes.

*Production* increased from 534,000 pounds in 1916 to 2,125,000 pounds in 1918, but in 1921, declined to 76,200 pounds. Practically all domestic carrot seed is produced in California.

*Imports* averaged 144,056 pounds for 1910–1913.; they came chiefly from France. Statistics of imports since 1917 are as follows:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	27,758	\$23,904	\$833	3.48
1919.....	15,666	18,859	470	2.49
1920.....	69,428	15,807	2,083	13.18
1921 (9 months).....	33,633	9,464		

## CAULIFLOWER SEED.

*Description and uses.*—Cauliflower seed is used primarily for planting, about 7,500 pounds being used annually for home and market gardens.

*Production* of cauliflower seed is negligible, because of unfavorable climatic and soil conditions. It is produced more successfully in Holland and Denmark, where the domestic supply is obtained.

Imports averaged 9,834 pounds annually for 1913-1917. Statistics of imports since 1917 by calendar years are as follows:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	8,068	12,141	16,918	8,240
Value.....	\$37,008	\$146,071	\$138,882	\$73,919

*Important changes in classification.*—Cauliflower seed is transferred from the free list of the act of 1913 (par. 595).

#### CELERY SEED.

*Description and uses.*—Celery seed is used largely for planting, and also as a condiment.

*Production* of celery seed commercially has increased from 5,200 pounds in 1916 to 65,000 pounds in 1918, and in 1921 was 45,800 pounds, practically all in California. Market gardeners assert that imported French-grown seed of some varieties, notably Golden Self-Blanching, produces plants more nearly true to type.

*Imports* for 1910-1913 averaged 147,764 pounds annually. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	239,231	768,101	593,722	267,252
Value.....	\$90,948	\$312,636	\$116,361	\$37,354

*Important changes in classification.*—Celery seed is transferred from the free list of the act of 1913 (par. 595).

#### KALE SEED.

*Description and uses.*—Kale is grown in family and truck gardens and is used as a vegetable or "greens," also, especially the Siberian kale, as a forage plant for live stock and poultry. The quantity of seed required for planting is estimated at from 50,000 to 65,000 pounds.

*Production* is mainly in New York, Washington, California, and Connecticut. The commercial production in 1916 was 29,000 pounds; in 1918, 16,700 pounds; and in 1921, 29,700 pounds.

*Imports* were 31,806 pounds in 1913 and 38,073 pounds in 1914. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	9,858	\$7,419	\$591	7.97
1919.....	18,866	12,062	1,132	9.38
1920.....	77,069	20,572	4,624	22.48
1921 (9 months).....	29,190	8,499		

## KOHL-RABI SEED.

*Description and uses.*—Kohl-rabi is a vegetable forming an edible "bulb," popular in home gardens, and grown somewhat by truckers. Its seed are used solely for planting. The plants are stored in pits, or otherwise protected from freezing, as are cabbage, beets, carrots, etc.

*Imports* in 1914 were 15,612 pounds, valued at \$4,283, about an average quantity. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equiva- lent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	14,726	\$11,499	\$884	7.68
1919.....	17,109	10,938	1,027	9.39
1920.....	22,728	12,020	1,364	11.35
1921 (9 months).....	10,028	4,554		

## MANGELWURZEL (MANGEL BEET) SEED.

*Description and uses.*—Mangelwurzel seed is used in this country for planting. The root provides a succulent feed for dairy cows and other farm live stock.

*Production* of mangelwurzel seed, very small prior to 1918, was in that year 286,974 pounds. The seeding requirement is about 320,000 pounds. Commercial growers have had excellent success with this seed, and the industry seems fairly well established, California and Washington leading.

*Imports* are not separately stated.

*Important changes in classification.*—Mangelwurzel seed is transferred from the free list of the act of 1913 (par. 595).

## ONION SEED.

*Description and uses.*—Onion seeds are produced from the flower stem of the plant the second year. The bulb is usually set out in the spring of the second year and the seeds are harvested when mature.

*Production.*—In 1919, 2,618,000 pounds of onion seeds were produced. In 1920 and 1921 production declined sharply to 800,800 and 334,000 pounds, respectively.

*Imports* are not separately stated, but are included with "all other" seeds.

*Important changes in classification.*—New specific provision.

## PARSLEY SEED.

*Description and uses.*—Parsley is used for garnishing meats and other foods and as a condiment. The seed is also crushed for its oil.

*Production* is in California, the annual average being 88,000 pounds. In 1921, 27,500 pounds were produced.

*Imports* during 1916–1918 averaged 58,116 pounds, running somewhat below domestic production. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	64,595	\$12,754	\$1,938	15.19
1919.....	52,713	20,717	1,581	7.63
1920.....	179,774	21,475	5,393	25.11
1921 (9 months).....	136,118	16,287		

## PARSNIP SEED.

*Description and uses.*—Parsnip is a root crop grown in home and market gardens for table food and on farms for live stock. About 120,000 to 150,000 pounds of the seed are used annually for planting.

*Production*, mainly in California, amounted to 67,000 pounds in 1916, 167,000 pounds in 1918, and 25,700 pounds in 1921.

*Imports* averaged annually 102,557 pounds for 1913–1917. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	9,461	\$4,653	\$284	6.10
1919.....	43,817	26,457	1,815	4.97
1920.....	17,015	3,731	510	13.68
1921 (9 months).....	39,613	5,457		

## PEPPER SEED.

*Description and uses.*—Peppers are grown in home and market gardens for use in condiments, sauces, pickles, etc.

*Production.*—Pepper seed is easily cultivated in many sections of the country. The commercial output, omitting that retained for home sowing, was 17,000 pounds in 1916, 56,000 pounds in 1918, and 99,200 pounds in 1921. New Jersey, Georgia, Mississippi, and California lead in production.

*Imports* in 1914 were 11,536 pounds, valued at \$4,879. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	13,778	\$12,183	\$1,377	
1919.....	6,420	9,748	642	6.59
1920.....	2,050	2,245	205	9.13
1921 (9 months).....	5,415	4,185		

## RADISH SEED.

*Description and uses.*—The radish is grown extensively in home and market gardens. Over 800,000 pounds of radish seed, used solely for planting, are sold annually, not including the seed from home gardens for local use.

*Production* in 1916 was 720,000 pounds; in 1918, 1,935,000 pounds; and in 1921, 258,000 pounds. Radishes produce seed the first season. California and Michigan are the chief sources of supply.

*Imports* during 1910-1914 averaged annually 491,097 pounds. Much of the seed formerly came from France. When that supply was cut off, domestic growers planted larger acreages, and since 1918 considerable quantities have been available for export. Imports since 1917 have been as follows:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	82,334	\$55,664	\$2,470	4.44
1919.....	111,562	64,236	3,347	5.21
1920.....	320,487	76,924	9,615	12.50
1921 (9 months).....	144,492	31,672		

## SPINACH SEED.

*Description and uses.*—Spinach seed is used solely for planting; about 800,000 or 900,000 pounds are sown annually.

*Production* of commercial spinach seed increased from 45,000 pounds in 1916 to 1,650,000 pounds in 1918, but in 1921 decreased to 24,700 pounds.

*Imports* averaged 1,241,757 pounds annually during the period 1910 to 1914. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	1,067,039	\$353,931	\$10,670	3.01
1919.....	367,032	80,357	3,670	4.57
1920.....	1,139,143	132,574	11,391	8.59
1921 (9 months).....	527,760	52,231		

## TREE SEEDS.

*Description and uses.*—Tree seeds, both coniferous and hardwood, are largely produced in this country on a commercial scale for reforestation purposes, by either State or Federal organizations. Although occasionally florists or nurserymen are interested in the trade in tree seeds, the project in this country is largely under Government supervision.

*Production.*—No accurate statistics regarding the production of tree seeds are available.

*Imports* are not separately stated, but are included in "All seeds, n. s. p. f., page 784."

*Important changes in classification.*—New specific provision.

## TURNIP AND RUTABAGA SEEDS.

*Description and uses.*—Turnip and rutabaga are root crops grown extensively in home and market gardens for food purposes, and on farms for live stock. The seed is used solely for planting and about 2,000,000 pounds (1,500,000 pounds turnip and 500,000 pounds rutabaga) are required annually.

*Production.*—Washington, California, New York, and Connecticut are the leading producing areas. The commercial output of turnip seed increased from 20,000 pounds in 1916 to 200,700 pounds in 1918 but declined to 59,000 pounds in 1921. Production of rutabaga seed increased between 1916 and 1918 from 3,800 pounds to 27,300 pounds.

*Imports* for 1914 were 1,580,713 pounds compared with an average of 1,773,613 pounds for 1910–1913. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	1,751,876	\$580,388	\$52,556	9.06
1919.....	1,810,479	668,541	54,314	8.12
1920.....	1,846,607	420,724	55,398	13.17
1921 (9 months).....	1,997,304	289,642		

#### FLOWER SEEDS.

*Description and uses.*—Flower seeds are used for planting purposes.

*Imports* in 1914 were valued at \$295,195; in 1918, \$142,152; 1919, \$269,376; 1920, \$656,379; 1921 (nine months), \$189,577. (Statistics for 1918–1921 are by calendar years.)

*Important changes in classification.*—Flower seeds are transferred from the free list of the act of 1913 (par. 595).

#### COLLARD SEED.

*Description and uses.*—Collard, a favorite vegetable in some of the Atlantic and Gulf States, is used in much the same way as cabbage. The seed is used solely for planting.

*Production.*—Collard seed is easily produced wherever the plant is grown as a vegetable. Most commercial seed is produced in Georgia. Data are not available as to the output, but it appears to be sufficient to meet domestic requirements.

*Imports* averaged annually 2,359 pounds from 1915 to 1918. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1919.....	1,050	\$1,837	\$63	3.43
1920.....	50	13	3	23.08
1921 (9 months).....	112	21		

*Important changes in classification.*—Specific provision dropped, imports being small.

#### CORN-SALAD SEED.

*Description and uses.*—Corn salad is used as a garnish and for salad, as is parsley or cress. The seed is used in the United States primarily for planting. Only small quantities are imported.

Imports for 1915-1918 averaged annually 4,118 pounds, valued at \$741—somewhat less than the prewar average. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	3,347	\$1,276	\$100	7.87
1919.....	7,734	3,793	232	6.12
1920.....	13,624	6,124	409	6.67
1921 (9 months).....	1,488	939		

*Important changes in classification.*—Specific provision dropped, imports being small.

## EGGPLANT SEED.

*Description and uses.*—This vegetable produces a large, purple, egg-shaped fruit, and is grown extensively in family and market gardens. Seed for planting is produced here in sufficient quantity to meet domestic demands.

Imports in 1914 amounted to 886 pounds, valued at \$836. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	1,350	\$2,121	\$135	6.36
1919.....	958	2,105	96	4.55
1920.....	525	985	53	5.33
1921 (9 months).....	1,156	1,676		

*Important changes in classification.*—Specific provision dropped, imports being small.

## FENUGREEK SEED.

*Description and uses.*—Fenugreek, allied to clover, is cultivated as a fodder and for its strong-smelling, oily seed, used as a flavoring substance of patent stock feeds. It is native to eastern Europe and western Asia.

Imports in 1914 were 1,619,230 pounds, valued at \$29,601. Later statistics for calendar years follow:

	1918	1919	1920	1921 (9 months).
Quantity (pounds).....	1,502,968	1,118,083	1,199,978	159,225
Value.....	\$139,969	\$69,824	\$33,042	\$3,824

*Important changes in classification.*—Fenugreek seed is on the free list of the act of 1913 (par. 595). Since this paragraph, as revised in H. R. 7456, includes only seeds primarily used for sowing, fenugreek is not specifically mentioned here. It is apparently covered by paragraph 1562 as a drug seed.

## MUSHROOM SPAWN.

*Description and uses.*—Mushroom is the popular name for various species of edible fungi. It is the fruiting body of the fungus, the

result of a more or less matted growth called the spawn, consisting of numerous white threads disseminated through the soil. The commercial spawn comes in bricks or flakes; these are made of horse manure impregnated with the fungus. Parasitic fungi sometimes interfere with mushroom culture and cause serious losses.

Imports for 1910-1914 averaged annually 279,064 pounds. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
	<i>Pounds.</i>			<i>Per cent.</i>
1918.....	13,215	\$571	\$132	23.14
1919.....	23,275	925	233	25.17
1920.....	19,096	545	191	35.04
1921 (9 months).....	18,440	3,183		

*Important changes in classification.*—Specific provision dropped, imports being small.

#### SORGHUM SEED.

*Description and uses.*—Sorghum includes sweet sorghum and grain sorghum, the latter mostly kafir, feterita, and milo. Sweet sorghum seed is used only for planting; the seed of grain sorghum is used for feed and for making alcohol and yeast, as well as for planting.

*Production.*—Sorghums are grown extensively, principally in the southern half of the Great Plains area. Production in Kansas, Texas, Oklahoma, Colorado, New Mexico, and Arizona in 1915 was 114,460,000 bushels, with a farm value of \$51,157,000; in 1918 only 66,396,000 bushels, with farm value of \$99,848,000. It is cultivated in Europe, India, and other parts of Asia.

Imports are not separately stated.

*Important changes in classification.*—Sorghum seed is on the free list of the act of 1913 (par. 595). It is not mentioned specifically in H. R. 7456.

#### ALL SEEDS N. S. P. F.

Imports of all seeds not specially provided for under the act of 1913 are shown as follows:

Calendar year.	Quantity.	Value.	Duty.
	<i>Pounds.</i>		
1918.....	253,463	\$205,335	\$12,672
1919.....	338,310	254,267	16,915
1920.....	526,809	274,544	26,340
1921 (9 months).....	335,606	221,757	

Exports of seeds, except cotton, grass seeds, and flaxseed, for calendar years, are as follows: 1918, \$2,031,776; 1919, \$2,771,836; 1920, \$2,187,318; 1921 (9 months), \$795,856.

In 1920 about 29 per cent of these exports went to England and about 22 per cent to Canada.

#### SUGAR-CANE FOR SEED.

*Description and uses.*—Sugar cane does not yield much fertile seed. The seed is used principally for the development of new varieties and strains.

*Production* figures are unimportant.

*Import* statistics are combined with "seeds, including bulbs, and bulbous roots, etc.," and are insignificant.

*Important changes in classification.*—Sugar-cane for seed is on the free list of the act of 1913 (par. 595). It is not mentioned specifically in H. R. 7456, imports being small.

#### ST. JOHN'S BREAD OR BEAN.

*Description.*—St. John's bread or bean (also called locust bean and carob) is a brown, leathery fruit pod 4 to 10 inches long, containing a gummy pulp, about 60 per cent sugar. The seeds are bitter and of no use except for planting.

*Production.*—The locust tree bearing this fruit grows in the Mediterranean region, and is being introduced into California. No production figures are available.

*Imports* are not separately stated.

*Important changes in classification.*—St. John's bread or bean is on the free list of the act of 1913 (par. 595). It is not mentioned specifically in H. R. 7456.

#### GENERAL NOTES ON PARAGRAPH.

*Important changes in classification.*—The provisions for garden and field seeds, other than grass seed, that are used chiefly for replanting, have been combined and alphabetically arranged. (See pars. 212 and 595 of the act of 1913.) The provisions for cotton, hemp, and rape seed on the free list (par. 595) of the act of 1913 have been omitted. The provisions for collard, corn salad, eggplant, hoarhound, mushroom spawn, sorghum, and St. John's bread have been omitted from specific mention because relatively unimportant. Fenugreek, being chiefly used for medicinal or drug purposes in stock feeds, has likewise been omitted. It is apparently provided for in paragraph 1562 as a drug seed.

The proviso in paragraph 212 of the act of 1913, prohibiting allowance for dirt and impurities in seeds, has been eliminated, since it has been incorporated in paragraph 732, with a similar proviso for grains.

A clause has been added to the effect that the provision for seeds includes such seeds for whatever purpose used.

Provisions have been added for onion and tree seeds.

*Suggested changes.*—Provision for shrub seeds might be added to tree seeds, to avoid possible conflict.

The catch-all clause for all other garden and field seeds includes a wide range of seeds of minor importance, whose dutiable value it is difficult to determine. For this reason the American Seed Trade Association has requested that specific duties be retained. Figures submitted by a leading importer show imports under this group of 161,871 pounds, valued at \$53,099, average value per pound about 33 cents (from 1911 to 1921, inclusive).

Page 96, line 10, of H. R. 7456: Change "title" to "schedule."

(See also paragraph 760.)

## PARAGRAPH 763.

H. R. 7456.

SENATE AMENDMENTS.

PAR. 763. Beans, green or unripe, one-half of 1 cent per pound; dried,  $1\frac{1}{2}$  cents per pound; in brine, prepared or preserved in any manner, 2 cents per pound.

ACT OF 1909.

ACT OF 1913.

PAR. 249. Beans, forty-five cents per bushel of sixty pounds.

PAR. 251. Beans, \* \* \* prepared or preserved, or contained in tins, jars, bottles, or similar packages, two and one-half cents per pound, including the weight of immediate coverings; \* \* \*.

PAR. 197. Beans, \* \* \* not specially provided for, 25 cents per bushel of sixty pounds.<sup>25</sup>

PAR. 199. Beans \* \* \* prepared or preserved, or contained in tins, jars, bottles, or similar packages, including the weight of immediate coverings, 1 cent per pound; \* \* \*.

PAR. 606. Soya beans [Free].

## BEANS.

(See Survey G-8.)

## GENERAL.

*Description and uses.*—This group embraces principally dried, but also green and pod beans, soya beans, and canned or prepared beans.

Many varieties of beans, largely, serve special purposes: Lima beans, for cooking; the white or navy bean, for baking; large white beans for soups; cowpeas (par. 765) and broad beans for live-stock feed. Besides its uses for fodder, silage, and soiling, the bean plant is a valuable cover crop and soil renovator. The great bulk of the commercial crop, employed almost exclusively for human food, is marketed as dry beans; the culls are fed to live stock, and the straw is consumed as roughage or fertilizer. Green or unripe beans (including string beans) enter only into a rather local or seasonal trade when not canned or preserved in brine. White beans are preferred for food, most colored beans selling at lower prices. The chief use of soya beans is as a raw material for soya bean oil and cake. They also enter into certain oriental food preparations provided for in paragraph 773.

*Production.*—The United States ranks among the six largest bean-producing nations; the domestic harvest of dried beans in 1918, when production was greatly stimulated by war demands, was 17,397,000 bushels, with a farm value of over \$90,000,000; the planted area was 1,744,000 acres, about two and one-half times that of 1909. In 1921, only 9,118,000 bushels were produced. The commercial crop comes from a few sections of dense production; of the record crop of 1918, California produced approximately one-half, Michigan about one-fourth, New York and Colorado most of the remainder. In California, Limas and small whites are the principal varieties; in Colorado and the Southwest, pintos and pink beans; in Michigan and New York, the white or navy bean.

<sup>25</sup> Beans, 2 cents per pound. (Par. 5, emergency tariff act of 1921.)

In 1919 the commercial acreage in green beans was 71,970, and the harvest was valued at \$8,031,449; the harvested area of soya beans in 1921 was 186,000 acres, and the yield 2,815,000 bushels.

## BEANS, PREPARED OR PRESERVED.

*Description and uses.*—White, Lima, and string beans are those principally used in the canning industry. Baked beans are chiefly of the common white variety. Soya beans also are made into various food preparations, especially for use by orientals.

*Production* of canned beans rose from 77,640,450 pounds in 1904 to 401,350,000 pounds in 1919, valued at \$4,133,810 and \$39,408,603, respectively. About 73 per cent were baked beans; about 16 per cent, string beans; 4 per cent, Lima beans; and 7 per cent, all other. Canning factories are located in the regions of largest production. Baked beans are produced chiefly in Indiana, New Jersey, and Pennsylvania; string beans in New York, Maryland, and Wisconsin; and Lima beans in New Jersey, whence one-half of the total output is derived.

*Imports* of beans and lentils ranged around 1,000,000 bushels, valued at about \$1,500,000, during 1910–1914, chiefly from Europe. In the war period imports increased greatly, because of the demand from the Army; Japan was the principal contributor.

Imports of prepared beans declined from 3,461,541 pounds in 1908 to 800,264 pounds in 1913, valued at \$347,476 and \$49,933, respectively. Imports rose to 1,081,631 pounds in 1914 and 2,510,722 pounds in 1915, but decreased to 568,460 pounds in 1917. Later statistics follow:

Calendar year.	Quantity.	Value.	Duty.	Equivalent ad valorem.
----------------	-----------	--------	-------	------------------------

## BEANS AND LENTILS.

	Bushels.			Per cent.
1918.....	2,082,850	\$8,864,028	\$520,333	5.87
