GUN POWDER!
Dupont's Rifle, Sporting and
Blasting Powder.

THE MOST POPULAR POWDER IN USE!
 DUPONT'S GUNPOWDER MILLS, established in 1802,
 have maintained their great reputation for seventy-
 eight years. Manufacture the following celebrated
 brands of powder:

Dupont's Diamond Grain.—Nos. 1 (coarse)
 to (fine) unequalled in strength, quickness and
 cleanliness; adapted for glass-ball and pigeon
 shooting. Packed in 1 lb. canisters.

Dupont's Eagle Ducking.—Nos. 1 (coarse)
 to 2 (fine); burns slowly, strong and very clean;
 adapted for glass-ball, pigeon, duck and other shooting,
 with either muzzle or breech loaders. Packed in 1
 lb. and 5 lb. canisters and 67 $\frac{1}{2}$ and 124 lb. kegs.

Dupont's Chokey Hore.—Specially adapted
 for "chokey bore" guns, and particularly for prairie
 and upland shooting. Burns slowly, strong and
 moist; does not cake or burn on the barrels; gives
 both a good penetration and a close pattern; will
 be found well adapted for glass-ball and pigeon
 shooting. Made of two sizes, only No. 7 and No. 8,
 No. 7 being the coarsest. Packed in 6 $\frac{1}{2}$ lb. kegs and
 1 lb. canisters.

Dupont's Eagle Rifle.—A quick, strong and
 clean powder, of very fine grain, for pistol shooting.
 Packed in 1 lb. canisters and 6 $\frac{1}{2}$ lb. kegs.

Dupont's Rifle Fg. "Sea-Shooting."—
 FFG and FFG. The Fg. for long-range rifle shoot-
 ing, the FFG and FFG for general use, burning
 strong and moist. Packed in 1 $\frac{1}{2}$ lb., 1 lb. and 6 lb.
 canisters, 6 $\frac{1}{2}$, 12 $\frac{1}{2}$ and 25 lb. kegs. Fg. coarse, FFG,
 fine.

Dupont's Sporting, Mining, Smpress and Blasting
Powders of all sizes and descriptions. Special
Grades for Export. Also Rifle, Cartridge, mus-
 ket, Cannon, Mortar, Mammot, Hexagonal, Cubic
 and Pellet Powder, U. S. Government Standard.
 Powder manufactured to order of any required
 grain or proof.

Agencies in all the cities and principal towns
 throughout the United States. Represented by
F. L. KNEELAND, 87 Beaver St., N. Y.
 N. B.—Use none but DUPONT'S Fg. or FFG for
 long-range rifle shooting.

The Hazard Powder Co.,
MANUFACTURERS OF
Gunpowder

Hazard's "Electric Powder."
 Nos. 1 (fine) to 6 (coarse). Unsurpassed in point
 of strength and cleanliness. Packed in square can-
 isters of one pound only.

Hazard's "American Sporting."
 Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and
 6 $\frac{1}{2}$ lb. kegs. A fine grain, quick and clean, for up-
 land prairie shooting. Well adapted to shot-guns.

Hazard's "Duck Shooting."
 Nos. 1 (fine) to 6 (coarse). In 1 and 6 lb. canisters
 and 6 $\frac{1}{2}$ and 124 lb. kegs. Burns slowly and very
 clean, shooting remarkably close and with great
 penetration. For field, forest or water shooting it
 ranks any other brand and it is equally serviceable
 for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."
 FFG, FFG and "Sea Shooting" FG in kegs of
 25, 12 $\frac{1}{2}$ and 6 $\frac{1}{2}$ lbs. and cans of 4 lbs. FFG is also
 packed in 1 and $\frac{1}{2}$ lb. canisters. Burns strong and
 moist. The FFG and FFG are favorite brands for
 ordinary sporting and the "Sea Shooting" FG is the
 standard rifle powder of the country.

Superior Mining and Blasting Powder.

TO CORRESPONDENTS.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are invited from every part of the country.

Anonymous communications will not be regarded. No correspondent's name will be published except with his consent. The Editors cannot be held responsible for the views of correspondents.

Subscriptions.

Subscriptions may begin at any time. The subscription price is \$4 per year; \$3 for six months. Remittances should be sent by registered letter, money order, or draft payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada; and is on sale in Europe by The American Exchange, 49 Strand, W. C., London, Eng; and by Em. Terquem, 15 Boulevard, St. Martin, Paris, France.

Advertisements.

Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices 50 cents per line-eight words to the line, and twelve lines to one inch. Advertisements should be sent in by the Saturday of each week previous to the issue in which they are to be inserted.

Address: Forest and Stream Publishing Co., Nos. 39 and 40 Park Row, New York City.

FOREST AND STREAM.
Thursday, August 4.

Specimen copies of this paper will be sent free upon application. We will esteem it a favor if our readers will call the attention of their friends to the merits of the FOREST AND STREAM.

JORDAN'S MANUAL OF THE VERTEBRATES.

A THIRD edition of this valuable work has been issued, and those who wish to identify beasts, birds, reptiles or fishes which may be found in the district east of the Mississippi River and north of North Carolina and Tennessee, exclusive of marine species, cannot afford to be without it. It has been enlarged and improved, and all species which have been added to the fauna since the former editions appear here.

The fishes include forms found beyond the lines mentioned and include the Salmonidae of the Pacific coast and many Southern forms. Professor Jordan is too well known to our readers to need any introduction and his work needs no praise. Former editions have been thoroughly reviewed in our columns, and we have said that we use it constantly as a book of reference, especially in the department of fishes. Each edition improves upon the former ones and is therefore welcome. The author is a constant worker and embodies the results of his recent labors in a new edition of his "Manual." It is published by Jansen, McClurg & Co., Chicago. Price, \$2.50.

THE NOVA SCOTIA LICENSE FEE for non-residents has been reduced from \$50 to \$30.

HOW FISH EGGS DIFFER.

THE communication from Mr. John A. Ryder, Embryologist of the United States Fish Commission, which we publish to-day, will be found to be of interest to the general reader as well as to fishculturists and zoologists. It will give the general reader who has no knowledge of fish-culture an idea of the troubles that may beset the fish-culturist when he attempts to hatch a fish whose embryology is new to him.

That fishes differ in their modes of reproduction as widely as birds and mammals do is not generally known outside of those who have given special attention to it. The facts are that the treatment which will hatch a trout egg will not do at all for the egg of the shad, and each family of fishes, and sometimes each species in a family, require to be studied and special devices discovered whereby they may be hatched. To bring this forcibly to the mind of those who may have supposed that the eggs of fishes were as nearly alike as those of birds, and might therefore receive the same general attention, we will say that young shad placed in a trough where trout are reared would probably not live an hour, or longer than a young cod would if it were placed under ground where the fox is reared.

Mr. Ryder's investigations are very valuable to the student of embryology and to naturalists in general, and his notes on viviparity of the cyprinodonts (the common "killy-fishes" of brackish water) are of a nature to stimulate our anxiety to learn more of these curious fishes.

BOOK OF THE BLACK BASS.

DOCTOR HENSHALL has given the angler a book which, as the oystermen say, is "full measure and solid meat."

It is a large 12 mo. of 460 pages, all of which are filled with both scientific and practical information, and none are given to fancy writing or the poetry of the art. Part I. includes the terminology, morphology and physiology of the species; part II., tools, tackle and implements, and part III., angling and fly-fishing. In the first part a change is made in the nomenclature. The small-mouthed bass is called *Micropterus dolomieu*, instead of *M. salmoides*, and the latter name is applied to the big mouth, which has been recently called *paludis*. This raises questions of priority which we had hoped were definitely settled, but it need not affect the angler in the least. The names of "big mouth" and "small mouth," which are so descriptive, will stand for ages, while the learned men wrangle about which fish Lacepede, Cuvier and Valenciennes intended the name for half a century and more ago. The reasons for these changes are too long to give here, and we will carefully watch to see what naturalists say on this subject and who are inclined to follow the Doctor.

This book will have a large sale in all parts of the country and will help to kill off those abominable local misnomers which obtain in some parts for these fishes, as "trout," "club," "Oswego bass," etc., as well as that other notion that one is a "true" black bass and the other a false or fraudulent one. These things are dying out among the better informed anglers, but still feebly live in isolated sections. Two original figures are given by which any observant angler can distinguish which species he has caught, if he will notice the relative extension of the mouth to or beyond a line dropped from the posterior portion of the eye. As an angler Dr. Henshall is enthusiastic on the subject of his favorite fishes, and regards them as the great fresh water game fishes of the future, after the trout streams are depopulated, which he thinks will be before long. He gives as a reason for the black bass having been ignored so long the fact that we have derived our notions of game fish and fishing from British writers who, not having the subject of our story in their land, naturally class the salmon and the trout as the best of game. Dr. Henshall boldly proclaims the bass to be the peer of any fish for game qualities, and whether one agree with him or not he cannot help admiring the manner of his entering the lists as a champion of the one on whom he pins his faith.

* Book of the Black Bass (comprising its complete Scientific and Life History) together with a practical treatise on Angling and Fly Fishing; and a full description of Tools, Tackle and Implements by James A. Henshall, M. D. 1—1 1/2 am. 81r, a brother of the Angler.—Frank Walton 1—1 Fully Illustrated (Cincinnati) Robert Clarke & Co. 1881

The angling portion of the book is without doubt the best thing ever written upon these fishes, for there are two distinct fishes, although the Doctor usually speaks of them as "black bass" without distinguishing them. It is clear and covers the whole ground of the different modes of fishing, and is accompanied by cuts of the manner of holding the rod, casting, and diagrams of the mode of throwing the fly, that it seems to us as if the merest tyro could soon become an expert by carefully reading this book and following its instructions. Not only is it a book for the beginner, but it is one that no angler can afford to do without. It fills a place too long vacant and one that we would not allow to remain vacant long on our own shelves.

The Book of the Black Bass will be found to contain much that is new and original on these fishes, and we have long believed with Dr. Henshall that the big mouth, when under three pounds weight, is just as gamy and as hard a fighter as his brother, although popular prejudice declares that this is not so. A great charm in the book is the author's freedom from conventionality and from the echoing of sentiments which have become in sort orthodox opinions of angling writers. Taking it as a whole we cannot speak too highly of it.

THE SALMONIDÆ OF THE UPPER COLUMBIA.

FROM advance sheets of "Proceedings of the United States National Museum" we learn that our correspondent, Capt. Chas. Bendire, U. S. A., has published notes on the salmon family of the Upper Columbia.

Our readers will remember that Capt. Bendire was foremost in working up the so-called "red fish" of Idaho, figures of which we published. He has recently sent the National Museum a fine series of fish from the neighborhood of Fort Walla Walla, which is pronounced by Prof. Jordan to be by far the most valuable collection of fishes ever made in the waters of the Upper Columbia. The series shows that the blue-backed salmon or "red fish," which was supposed to be a land-locked species and described as *Oncorhynchus kennerlyi*, is merely the young breeding male or grilse of the *Oncorhynchus nerka*, a fact not before suspected, according to Jordan.

Capt. Bendire says that every one out there now concedes that the red fish is not a resident of the lakes wherein it is found, and he is perfectly satisfied that they are anadromous and not land-locked. How they get rid of the hump and hooked nose, after going back to salt water, troubles him, as he thinks they can't all die after spawning, for many of them are of ten pounds weight and must have made more than one trip to sea. A cut of the male fish accompanies the report and shows a moderate lump and an enormous hooking of the jaws.

THE WARWICK CLUB.

A LARGE party of gentlemen left Jersey City on Saturday morning last to attend the flag raising at the new club house of the Warwick Club, in the Warwick Woodlands, Greenwood Lake. The officers of the club are: C. Olcott, M. D., Brooklyn, President; Mr. A. S. Roe, of Chamberlin, Roe & Co., New York, Vice-President; Mr. H. C. Cooke, of Cooke Bros., New York, Treasurer; Mr. Wm. O. McDowell, of McDowell Bros. & Co., bankers, New York, Secretary. Prominent among the numerous members are Hon. Abram S. Hewitt, Hon. Frederick A. Potts, of New Jersey; Hon. Gennett A. Hobart, of New Jersey; Rev. Dr. Chas. F. Deems, of New York; Hon. John W. Taylor, Newark, N. J.; Mr. P. W. Millsbaugh, New York; Mr. Bird W. Spencer, Treasurer Erie Railway, N. Y.; Mr. C. N. Jordan, Treasurer New York, Ontario and Western Railroad; Mr. E. V. W. Taylor, the well known architect, Newark, N. J., and Dr. J. A. Osborn, of Newark, N. J.

The club house is a very handsome Gothic structure, situated on a rocky bluff about fifty feet above the lake, and about one-eighth of a mile north of the landing. The dimensions of the two-story building are 64x42 feet, with handsome piazzas and projections, which give it a froutage of 80 feet on the lake with a depth of 48 feet.

The party upon their arrival scattered through the rough timbered grounds of the famous Warwick Woodland to ad-

mire the scenery and the model structures in process of erection. Dinner was served in the large tent of the hotel which has a seating capacity for 300, the President at the head of the centre table with the Secretary opposite. It certainly was a rare sight to see such a number of talented gentlemen of mature years, many of them gray-haired veterans, but all bearing a healthy and substantial look. The bill of fare was carried out to the letter.

DINNER.

Saturday, July 30, 1881.

| | |
|--------------------------|--------------------------------------|
| SOUP. | |
| Mock Turtle. | Couscous. |
| FISH. | |
| Greenwood Lake Bass. | |
| BOILED. | |
| Mutton (caper sauce.) | Chicken (paraley sauco.) |
| ROAST. | |
| Spring Chicken. | Ham (champagne sauco.) |
| GAME. | |
| Caracas-back Duck. | |
| COLD. | |
| Pickled Lamb Tongues. | |
| ENTREES. | |
| Filet de Boef (braized). | Lamb Chops (breaded, Italian sauco.) |
| Macaroni (au gratin.) | Calves' Head (brain sauco.) |
| VEGETABLES. | |
| Plain Potatoes. | Beets. |
| Green Corn. | Mashed Potatoes. |
| | Stewed Tomatoes. |
| RELISHES. | |
| Mixed Pickles. | Worcestershire Sauco. |
| | Raw Tomatoes. |
| | Cucumbers. |
| PASTRY AND DESSERT. | |
| | Snow Pudding. |

| Plum Pie. | Cabinet Pudding. |
| Castard Pie. | Lemon Pudding. |
| Almonds. | Laver Raisins. |
| | Pecan Nuts. |
| | Cheese. |
| | Milk. |
| | Tea. |
| | Coffee. |
| ICE CREAM. | |
| Chocolato. | Strawberry. |
| | Vanilla. |

The after-dinner speeches in response to the following toasts were as happy, witty and brilliant as might have been expected from the gentlemen present. The following toasts were responded to as called for by the President: "Wm. Henry Herbert, better known as 'Frank Forester.'" Dr. J. D. Osborn, in response to this, recalled his acquaintance with "Forester," and gave many incidents of his worth as well as of his amusing escapades. Judge D. L. Tiltzworth was next called with the toast "Greenwood Lake." He gave the history and many interesting reminiscences of that locality. Next, "Gentlemen sportsmen," T. C. Banks, followed with "Warwick Woodlands," by Mr. McDowell; "Literature and sport, twin sisters," by Mr. J. A. Beecher; "Long life and success to the club," by Mr. E. L. Joy; "New York and New Jersey linked together by Greenwood Lake and the membership of the Greenwood Lake Association," by the Hon. Wm. A. Righter.

This closed the pleasing ceremonies, which consumed about three hours, after which the party repaired to the boat and sailed for the Brandon House, where they were well entertained for half an hour in the dining-room. The first toast was to the "Brandon House," which was responded to by Mr. Braidout and afterward by the present proprietors. "The Press" received a hearty response from Col. Edwards, of Orange County. The boat whistled for a return, and nearly the whole party took the train for home in the best of spirits.

THE ENCAMPMENT HOTEL.

The hotel of canvas at the Warwick Woodlands, Greenwood Lake, is a new and novel feature of camp life. Upon nearing the landing, on a recent visit, we noticed a large number of pure white tents and supposed that a camp meeting was in progress. The office of the hotel is a tent, with all the paraphernalia of an ordinary hotel office. Upon inquiry as to where the hotel was the answer was that those tents were the rooms of the house and could accommodate two hundred guests. The idea was new and novel. We were assigned to room 10, a cosy tent on the margin of the lake, which was so very comfortable that our stay was prolonged an extra day. The hotel has up and down fifty tents 14x14, with a fly over each one to keep out the rain and the heat of the sun. They are all furnished with clean beds, and are neatly kept. The dining pavilion is a large striped tent near the office, with a seating capacity for three hundred persons. The kitchen is over 40 feet long, and a marvel of neatness; it has a very large hotel range, with an abundant corps of cooks, who understand their business, as the meals served bore ample evidence.

The proprietor and manager of the hotel, Mr. L. Y. Jenness, is a veteran in that line and has done a large business in Florida during the winter for the past four years. We urged him to take all his tents to Florida and start a hotel there on the same principle, which he may do, as this is an assured success. Families get the full benefit of camp life, with the table d'hôte attendance of a first-class hotel at less expense than in the usual hotel.

The Warwick Woodlands are owned by the Greenwood Lake Improvement Company and consist of 1,000 acres of rough timber land. They were first brought into notice by Frank Forester's book, the "Warwick Woodlands," published in 1846, in which he says:

"This is the Greenwood Lake, called by the monsters here Long Pond; in my mind prettier than Lake George by far, though, known to few except chance sportsmen like myself. Full of fish, perch of a pound in weight, and yellow bass in the deep waters and a good sprinkling of trout toward one end! Ellis Ketchum killed a five-pounder there this spring! and heaps of summer-dick, the loveliest in plumage of the genus, and the best, too, me Ju-

dice, excepting only the inimitable canvas-back. There are a few deer, too, in the hills, though they are getting scarce of late years. There, from that headland, I killed one three summers since: I was placed at a stand by the lake's edge, and the dogs drove him right down to me: but I got too eager, and he heard or saw me and so fetched a turn; but they were close upon him, and the day was hot, and he was forced to soil. I never saw him till he was in the act of leaping from a bluff of ten or twelve feet into the deep lake, but I pitched up my rifle at him, a snap shot! as I would my gun at a cock in a summer brake, and by good luck sent my ball through his heart."

Mr. James R. Boyd, the Manager, gave us much more information about present and future arrangements. Suffice it to say that the tract is in the hands of capitalists who intend making it one of the finest resorts in the State, regardless of cost. The elevation is 1,000 feet above the level of the sea, and it is only forty-two miles from Jersey City. They have already constructed an auditorium which will comfortably seat five hundred people. The building is about sixty-five feet square and forty feet high, built in the Queen Anne style. The timbers are of yellow pine, stained, and the windows in either end are of fine stained glass, and the sides will be covered by elegant lattice work so as to give plenty of air. The finish will be polychromic style, and the large roof supported by four trusses, leaving the main floor entirely clear. The first concert given there this season brought nearly five hundred persons from New York and New Jersey combined, and some two hundred who remained over night were carefully provided for at the Encampment Hotel. With the lavish expenditures now being made it certainly must become a favorite resort.

BYE-WAYS OF THE NORTHWEST.

SECOND PAPER.

NO one can pass through Echo and Webber Cañons, on the Union Pacific Railroad without being greatly impressed by their grand beauty, but I think that to fully appreciate their magnificence one must have seen them a number of times. Like most scenes of great natural beauty the first view gives one only a general impression, and subsequent study is needed for any just appreciation of the grandeur of these cañons. To satisfactorily take in all the details of these natural wonders it would be necessary to travel through them on horseback or by wagon, and examine them at leisure as one passes slowly along under the overhanging cliffs. As one flies through them by train many of the most fascinating bits of scenery escape the eye, and others are passed so quickly that the mind fails to receive more than a blurred and indistinct impression of something beautiful, missed now and to be looked for more carefully on a succeeding journey.

I shall not attempt to give any description of the beauties of the ride, which have been so often detailed in the exuberant language of guide-books. I may, however, say a few words in this spot where they are shown very clearly what our Western country—no matter how barren it now appears—may become whenever it shall have been supplied with water. I do not mean to say that the Salt Lake Basin furnishes the only instance of this kind, for there are certainly many others, but nowhere else in the sage "deserts"—so far as I know—has the raising of large crops been so extensively carried on as here.

The Basin of the Great Salt Lake was, when first settled, nothing more than a sage plain. In some places it is flat, in others gently rolling, and its level is approximately the same up to the benches of the mountains by which it is surrounded. In many respects it reminds one of the "parks" of the Rocky Mountains, these being in fact nothing more than extensive plains surrounded by a wall of mountains.

The Salt Lake Basin, of which the Great Salt Lake now occupies but a comparatively small portion, is simply the bed of that older and grander sheet of water, called by geologists Lake Bonneville; and the terraces, which show the level at different periods of the waters of that ancient inland sea, can still be seen, by whoever cares to look for them, running along the mountain sides, hundreds of feet above the level of the plain. Lake Bonneville was far larger than any body of water now existing on this continent. Its outlet was in Idaho, toward Snake River, and it extended southward for several hundred miles.

The plain of the Salt Lake Basin, as I have said, was formerly, and is still, in some places, a mere sage desert. At some points, where the land is but slightly higher than the lake, the low flats are covered with saline and alkaline incrustations, which whiten the ground, and of course render it wholly infertile. But a large portion of the soil which is not subject to overflow by the lake has been so thoroughly irrigated by water brought down from the surrounding hills, that it produces crops which the most highly cultivated farms of the East might be proud to acknowledge. Far-extending fields of wheat, rye, barley and oats, bright green stretches of graceful corn, and long rows of potatoes, now just commencing to blossom, carry one back, in imagination at least, to the well-tilled prairies of Iowa or Illinois. Every farm has its orchard of thrifty fruit trees, and its hay and pasture fields, where the clover and the timothy grow thick and high. The air is filled with the fragrance of the new-mown hay and the scent of the clover. One hears the familiar song of many of the birds of the timber, and sees their graceful forms and bright colors as they move among the trees. The clear, fresh

water which hurries down from the snow-clad peaks to make a garden of the parched prairies, shines and glistens, and its murmur and rush as it dashes onward make music delightful to the ear. Sights and sounds such as these are inexpressibly grateful to the weary traveler, and he cannot fail to wonder at and admire the indomitable industry and perseverance which have built up in the desert an oasis. The most careless observer can gain—by comparing this region with the country through which he has just passed—some slight conception of the change which has been brought about in the Salt Lake Basin. To fully appreciate it, however, one must be an old mountain man; must have spent days, weeks and months in riding over prairies such as this one was, have been parched by the hot winds and scorched by the blazing sun of summer, have looked longingly at the eternal snows of the loftier peaks of the mountains, which, visible but unattainable, told him their story of cool airs and icy waters. To one who has been through these experiences Salt Lake City and its environs tell their own story, and for such a one they have an unspeakable charm.

Every one who stops here goes to the Tabernacle, the Temple and the Museum. The two former are both very wonderful in their way, but of the Museum perhaps the less said the better. It is by no means so interesting now as it was some years ago, though it contains some very interesting specimens of ores from various Utah mines. A visit to the Warm Springs ought by all means to be made, and then, after a dip in the lake, one feels ready to resume his journey. A little narrow-gauge railway—the Utah Western—runs bathing trains daily to Black Rock and Lane Point, which wait for a couple of hours, affording ample time for a bath and the lounge one feels like indulging in after his immersion in these extremely buoyant waters, which are so dense that it is almost impossible to sink in them. One can float without any effort with the whole head out of water, and diving to any considerable depth is almost an impossibility. Most bathers avoid submerging the head, as, if the water reaches the mucous membrane, the effects are extremely unpleasant for the time being. It is necessary after leaving the lake to take a *douche* of fresh water, otherwise one finds one's self coated with a crust of salt. During our excursion to the lake a number of interesting birds were observed, some of which were new to the Eastern eyes of our party. High in the air and rosy in the light of the setting sun a number of great white pelicans were slowly fanning their way southward, directing their course, no doubt, to some distant breeding place. In the marshes which border the lake we saw long-billed curlews, willets and great blue herons, while on the mountain, at whose base the track runs, were various magpies and a number of hawks.

I made some inquiries while in this place with regard to the California quail, liberated here some years ago, but was unable to obtain any very definite information as to how they are doing. I was told, however, that they were numerous to the south of the city, and they seemed to be well known to the inhabitants, some of whom did not seem to be aware that the birds had been introduced, but regarded them as indigenous.

If one desires, during the overland journey from New York to San Francisco, to stop off and visit the famous Comstock mines of Nevada, he should stop at Reno. From there the Virginia and Truckee Railroad will take him to Carson City, Gold Hill and Virginia, all of which places are worth a visit. We chose the last-mentioned town, and, through the kindness of Mr. W. H. Patton and Mr. Lanman, of the Consolidated Virginia, were enabled to make a most interesting tour through the mills and mine. The process of reducing the ore is so well known that I will not go into it, but the descent into the mine afforded me a novel experience.

It is not every day that one has an opportunity to spend an hour in a temperature not far from 120 deg. Fahrenheit, and knowing that the mines in question are unquestionably the hottest places "on or about" the surface of the earth, we were all anxious to go through them. The lowest level yet worked in the C. and C. V. mine is 2,550 feet below the surface of the earth. The temperature varies greatly in different parts of the same level, but it may be safely asserted that everywhere it is hot. At these great depths the men can only work for a few minutes at a time, and are then obliged to retire to the cooling rooms. They drink great quantities of ice water, and pour it over their bodies continually. Of course they perspire enormously. The water which trickles from the roofs and walls of the tunnels is hot, so hot that one cannot bear the hand in it; the air is full of steam given off by this almost boiling water, and every object that one touches feels warm or hot. We were told that the hottest place through which we passed had a temperature of 120 deg., but there is said to be a place in the 2,200 feet level where it is 155 deg. No one who has not been through something of this kind can quite appreciate what such a temperature means, and what it means to be surrounded by air so hot as this. It is one thing to stand for a moment at the door of a blast furnace and feel the glow of the molten metal on your unprotected face and hands, and quite another to be enveloped in and to breathe air at 120 deg. The heat is intense and all pervading; at first it is difficult to breathe, and one feels suffocated; the perspiration pours down like rain. I heard one of my companions, as we passed along, express his sincere commiseration for Shadrach, Meshach and Abednego. Now that he was going through what they had experienced he could understand what their feelings must have

been and sympathize with them. The cold bath which immediately followed our return to the regions of day was delightful and refreshing, but the debilitating effects of the great heat did not pass away until the following day.

Returning to Carson City we took the stage for Glenbrook, a little settlement on the shores of Lake Tahoe, from which a steamer crosses the lake to Tahoe City, eleven miles from Truckee. The stage ride from Carson to the lake was hot and dusty, and the sight of the mountains, absolutely stripped of timber, was to me a very sad one. From miles and miles of mountain the timber has all been cut off, until now there is nothing left standing but a few dead and rotting tree-trunks. Springs have dried up and brooks gone dry, still the work goes on, and unless some steps are at once taken to check this wholesale destruction of our forests, the day will surely come when the water supply of the region, now none too large, will be materially decreased. It is not as if the timber were cut with judgment, the older sticks being taken and the younger left to increase in size, and in the meantime to shade the earth and diminish evaporation: everything is cut down and in the most wasteful manner. Let us hope that this will not continue.

Lake Tahoe has been well called the "Gem of the Sierras." It is indeed a beautiful lake with beautiful surroundings, but already they have commenced to strip the mountains of their timber, and to defile these pure mountain waters with sawdust and the refuse of the lumber mills. Nevertheless, as a whole, the spot is still most lovely. The waters, long famous for their wonderful purity, reflect the blue of the clear sky above or mirror the dark-green hills and snow-capped mountains which on all sides surround them. Near the shore, where the water is forty, fifty, or sixty feet deep, one can distinguish very minute objects on the bottom, and can see the trout swimming or resting quietly near the bottom. These fish are caught for the most part either by trolling or by hand lines, using minnows for bait. They are said to run up to twenty-nine pounds in size, and captures of fish of over seventeen pounds seem to be well authenticated. I was unable, owing to engagements in San Francisco, to try the fish with a fly.

The ride from Tahoe to Truckee is a delightful one and, being taken in the evening when the sun is low and the shadows long, we enjoyed to the full the lovely scenery through which we passed. The road follows the Truckee River and runs for the whole distance through a beautiful pine forest. The destruction of timber, so noticeable on the other side of the lake, has begun here also, and before long the magnificent forests through which we now pass will give place to an arid waste, on which no green thing larger than a manzanita hush will have been left standing.

From Truckee to San Francisco is only about twelve hours and, unfortunately, the most beautiful scenery on the ride is passed during the night. We thus lose many of the most interesting features of the Sierra Nevada Mountains and find ourselves, when daylight breaks, on the level plains of the Sacramento Valley, in a country which, though fertile and in many respects interesting, presents to the eye no striking beauties.

Our stay in San Francisco is short. There are certain things, of course, that one feels bound to do. A visit to the Cliff House, taking by the way the beautiful Golden Gate Park, should be made at once, and there are, near the city, a number of places which should be seen. But San Francisco in summer is not nearly so attractive as at some other seasons, and besides, we have seen all this before, so taking steamer we sail swiftly out of the Golden Gate and are fairly on our way to the North.
Victoria, B. C.

THE DOG ON THE ISLAND in the rapids at Niagara has been joined by three other unfortunate curs, which, it is claimed, have been purposely put there as an advertising dodge by enterprising hotel proprietors. It is reported that a recent attempt to rescue the unhappy dogs, which would have been entirely successful, was frustrated by the interference of a gang of roughs, who openly blustered that the dogs should not be released, as they were a good lure for the curiosity-seekers. An indignant visitor to the Falls writes to the *Buffalo Courier*: "As a member of a society for the prevention of cruelty to animals, I have to ask you, sir, whether it is allowable that these helpless animals should be imprisoned on a barren heap, bereft of all the liberty and domesticity to which they have been accustomed and brought to the verge of madness in order that a set of showmen, guides and hack-drivers may reap benefit from the credulity of a defrauded public?" If this is the truth in the case the sooner the yelping canine castaways are released the better it will be for all concerned in the cruel fraud.

PERSONAL.—Mr. T. B. Mills, of the firm of Wm. Mills & Son, sailed last Saturday in the *Baltic* for Europe. He will remain abroad several weeks and proposes to try some of the famous salmon streams on the other side.

Among those who called at the office of the FOREST AND STREAM during the past week were Messrs. J. B. Graham, Secretary of the Toronto Gun Club; A. McGregor, R. Morrison, G. A. Burns, John Dill and S. Staneland, all of the Toronto Gun Club and enthusiastic devotees of the sports of field and flood. We are always glad to welcome our old friends and the latchstring of this office is always out; in fact, the door is wide open for visitors from out of town. Give us a call.

THE SAVAGE BLOODHOUNDS of the playbills, in the "only original Uncle Tom's Cabin" are inoffensive beasts on the stage. Just now we are reading of a hunt for human prey in the northwestern forests of Wisconsin, where the genuine article of bloodhound is employed to track the game. This is savage hushness, although the exigencies of the case appear to call for rough measures. But imagine the predicament of an unsuspecting sportsman in those forests, mistaken by the dogs for the outlaws. We shall take our turn for game in some other section of the country if Wisconsin woods are to be overrun with bloodhounds. Let us hope that the outlawed wretches may be cleared out, and the dogs with them, before the deer season opens.

THAT 'POSSUM promises to be perennial. The interest is still alive, and when it shall have decreased we shall for a long time lie in uncertainty as to whether it is really dead or only pretending to be. We had no thought when we broached this culinary query that the topic would prove so fruitful of tracny and entertaining writing. The lawyers especially appear to have taken kindly to the argument of 'possum hot and 'possum cold. Two-thirds of the letters on the subject have come to us from the legal fraternity. It speaks well for the disciples of Blackstone that a large part of our general correspondence is with them. We will trust our case every time with a lawyer who has an intelligent appreciation of the dignity and value of field sports.

Dr. J. H. HENSHALL and our correspondent, Mr. C. L. Jordan, of Texas, are contemplating a Florida angling campaign next winter, when the latter, we understand, will take lessons in the art of fly-fishing for the black bass. He is the enthusiast referred to, if we mistake not, by Dr. Henshall in his "Book of the Black Bass," who dubbed a bass-fly "a fish-hook poetized," and thought the fish "should take it through a loop of the beautiful, if not thing else."

THE LEONBERG DOG has gained much esteem among the residents of St. John, Newfoundland. In our issue of July 21 we published a warm commendation of the breed, written by our correspondent at that place; and the high opinion expressed by the writer of that article is shared by other owners of the huge animals.

PRAIRIE CHICKEN SHOOTING is the sport toward which many scores of shooters are now turning their eyes. The season opens shortly in the West and the reports of the game supply are very encouraging. Elsewhere will be found notes of some good centres for the sport. We shall be pleased to receive regarding other resorts any information which will be of practical benefit to our readers.

THE CAR "CITY OF WORCESTER" starts West on a shooting trip the sixth of next month, Mr. Jerome Marble, of Worcester, accompanying the party. There is room, we understand, for four more in the company, and those desiring to join the car should make early application to Mr. Marble, at Worcester, Mass.

ILLUSTRATIONS of many of the localities mentioned by Mr. Fay, in his itinerary of a trip from Mooshead Lake to the Main St. John, are to be found in Mr. Steele's book, "Canoe and Camera." A map of the country is also contained in that volume.

PRAIRIE CHICKEN SHOOTING.—A correspondent wishes to secure, or hotel in the first of next September, board in farmhouse or hotel in Iowa, where prairie chickens are numerous and of easy access from the house. Address A. P. V., this office.

THE ILLINOIS STATE SPORTSMEN'S ASSOCIATION is holding its tournament at Kiehman Park this week. A report of the proceedings will be given in a succeeding issue.

PROFESSOR HUXLEY's lecture on "The Herring," which we print to-day, is worthy of careful study.

THE WOODCOCK SEASON in this State opened last Monday.

We are obliged to defer the sparrow poem until next week.

AN INDOREMENT WE VALUE.

THAT we have the approval and good will of the seafaring and nautical portion of the community in our efforts to have the sailing machine displaced by a healthier style of craft and yachting elevated from baby's play on a mill-pond to the same manly standard of amateur seamanship which the sport occupies in British waters, we have been convinced from the start. It is with pleasure, therefore, that we give space to the following indorsement coming from one of the most experienced and able men who ever sailed a fisherman out of the port of Gloucester, Massachusetts. To draw from a practical seaman such lines of fellow-feeling is enough to counterbalance a hundred adverse opinions from sources far less qualified. Man who "has been there" is earnest we have never known to hesitate in the choice between a ship and a sham:

Editor Forest and Stream: I have a great desire to write something for your yachting columns. I would like to "shake the rudder's hand" which writes those articles in favor of deep boats, whoever he may be, and assure him that his efforts to have vessels substituted for shabs are appreciated by one who has had the unpleasant experience of seeing his vessel spraved out on her beam ends more than once in a gale and who feels that there is as much need for a change of model in our fishing vessels as there is in our yachts. A GLoucester CAPTAIN.

The Sportsman Tourist.

THE PROSPECTOR'S DINNER.

IN CAMP ON JAMES' PRAIRIE.
By JEROME BURNETT.

WAIT, pard, until I load my pipe an'nu
And stir the fire. The cold's a niftie winaer
It 'tis the tenth of June; I'll tell you, then,
What old Bill Joo and I had once for dinner.

The lay-out wasn't big, but all the same
We had a meal, and more'n we intended—
A dozen eggs without toast, and game
And trout, the grub that makes a man feel splendid.

And we was hungry for it, Bill and me;
Prospect'n the appetite a f'ctin',
And when we find such truck as that, you see,
'The way it kind o' fades is just surpri'in'.

Here's how it was: We'd come across the range
And took the trail that leads you down to Boulder,
For we was off to tackle, just for change,
The carbonat's before we'd got much older.

'Bout twelve o'clock Bill d'ush'd a mountain quail,
And found a set with eggs, as I'm a slunner;
And then we caught some trout, and near the trail
Corralled a grouse! You bet we had a dinner!

You oughter seen Bill play his fork and dirk,
A-flirt' up his engine like a sucker,
Until, to keep along, I had to work,
And draw to fill, as players do at poker.

We worked the lead as long as color showed;
Cashed every egg, and all the meat and fitters;
Then ambled on to strike the Boulder road,
And stopped at Jake McCall's to get some bitters.

For on the search we never drink a drop;
It doesn't help in this yer-kind o' tracing;
But back among the ranches, then we stop
And smile a little, 'cause it's kind o' bracing.

Jake took our measures, then he hustled round
To get up what we wanted, strong and pleasant,
The while we told about the eggs we found
And had for dinner, 'long with fish and pheasant.

A tenderfoot was snoozing in a chair,
And when he heard us talk of eggs it raised him;
He seemed to think we had 'em then and there,
'Tween me and you the racket kind o' dazed him.

"Beg pardon, men," he said, and stopped a spell;
'T'pears to me, sirs, if I undersand you,
You have some mountain quail's' eggs leze to sell;
If so, I've got the ready cash to hand you.

"These quails, the partridge, are scarce, you know,
And scintille men down East, who rate 'em
As very curious birds, they want to show
That by some care they may domesticate 'em.

"And now, if you've the eggs, here's what I say:
I'll give you—well, ten dollars each to set 'em,
For that's the price I'm authorized to pay,"
Then put in Bill: "Why, darn it mate, we've 'em!"

"Taint any use to tell you how we sware,
Nor how we laughed, al-though it wasn't funny;
Then Bill declared he'd go and get some more,
But, sirs, he's never c-elled to get the money.

In fact, we haven't seen him since that day,
And though at Chubbie's he was no beginner,
It's my opinion, pard, he's gone to stray,
And all because we had them eggs for dinner.

A JOPLY FISHING PARTY ON KEUKA LAKE.

THE true time to go to a "summer resort" is when nobody else is summer resorting, and therefore it is the knowing ones junker "all in the mawrie mouth of May" or saunter in September. Curled cozily up in home hammocks during the fiercely heating heat of July and August, they can placidly smile at the antics of the "madding crowd" who wildly tear from place to place, sweating in steam-boats, baking in Pullman cars or huddled in hotels, making half-brut offerings of themselves on the red-hot altar of the insubstiable sun! There is a monarch-of-all-I-survey feeling, too, in being the first or last guest at a country hotel, a certain distinction in being the only one. You have a disolately grand sensation as you kick your heels through marble corridors haunted by the rustling ghosts of last season's Worth gowns and the phantoms of dead flirtations. The exquisite flavor of this feeling is intensified if you arrive a few days ahead of your own small and select party who are coming to fish with you, and you get well acquainted with the clever captain of the smart little steamer which runs upon the lake, and you find out just where the best fishing is, and you learn the first name of all the boys on the dock, and get all the local fish stories pat on the end of your tongue, and "know the ropes" generally, and have a heapin' store of shiny bait in an old starch box with lumps of ice to keep it dead and dainty for that twenty-pound salmon-trout you're going to haul in sure as fate to-morrow, when the best and jolliest fish commissioner in the world arrives, with his spectacles and his tackle and his jovial comradery.

The first guest is like the first swallow, the first baby, the first flower. He is a conquering hero. He doesn't know exactly whether he feels more like Christopher Columbus stopping ashore on Adam I. in the garden. Unconsciously he takes the pose he has seen Christy adopt in the drop curtain of the Grand Opera House where he is "shooting" the Indians into the proscenium boxes and planting the flag in the sand. The first guest is as the long-lost brother of the cheery landlord, and the pretty hostess smiles kindly and even graciously passes at his table to see that he is well served. On him the waiter beams and widely grins; on the bar a shiner polly comes upon the burnished glass; in his honor the shy chambermaid crimpeth her long tucks by candle-light in the silent watches of the night; and as with lordly tread he leads the way to the dining-room through the echoing halls, his now newly arrived friends patterning meekly after him, why, for the moment he is "a bigger man than Old Gray."

The first week of fragrant May last saw Seth Green the

Game Bag and Gun.

FOREST AND STREAM GAME TABLE.

OPEN SEASONS.

The seasons, in which it is lawful to shoot game in the several States and Territories, open as designated in the following table.

Table with columns: States, Deer, Woodcock, Quail, Ruffed Grouse, Pinnated Grouse (Prairie Chicken), Wild-fowl, Wild Turkey. Rows list various states and their corresponding hunting seasons.

tion of one granger member, that if the crow was driven away the country would be visited by a small white worm that would reduce the State to a howling desert.

This season promises to be a good one for the sportsman in this vicinity. Quail are very numerous, comparatively few being killed last year.

The chicken makes its home on the high prairie during the summer months, and parties in from those sections report them very numerous.

When the season fairly opens I shall give you some further notes. Just now there is nothing to hunt except squirrels, and they are not very numerous.

THE PROSPECTS IN IOWA.

MORNING STAR, Iowa, July 27.

Editor Forest and Stream:

The chickens are here in fair numbers, and as the law is off the 15th of August, we expect some sport in that line soon.

LINCOLN, Neb., July 27.

Editor Forest and Stream:

There is good plover shooting in the vicinity of the city. Two of us went out the other afternoon and bagged between thirty and forty.

The shooting season opens Aug. 15. I fear the game laws here are not very strictly observed.

THE MINNESOTA SEASON.

MINNEAPOLIS, Minn., July 28, 1891.

Editor Forest and Stream:

The open season on prairie chicken in Minnesota commences Sept. 1. The Legislature changed the date to Sept. 1 at its last session, 1880-81.

Prairie chicken are reported quite plenty in this vicinity, and we anticipate good sport, if the coveys are not broken by farmers' boys and unprincipled gunners who style themselves sportsmen.

I saw a party from the Rice Lakes (about fifteen miles or less) here, and famous for its grand "pass" shooting, who says there is more rice in the lakes this year than there has been for fifteen years.

MORRIS, Minn., July 28, 1891.

Editor Forest and Stream:

Chickens are more plentiful than before for years. Ducks also in large numbers.

OUR DETROIT LETTER.

THERE is consternation in the camp of the pigeon shooters. The place where the Michigan State Medical Association does its shooting is a part of the Hamtramck race track inclosure called Hurlingham Park.

Mr. Voorhees yesterday received from James Forsyth, Secretary of the Society for the Prevention of Cruelty to Animals, a letter notifying him that the Society had finally resolved to enforce the law with respect to pigeon shooting.

Mr. Voorhees is not anxious to go into a wrangle with the law, and some of them are more than half inclined to think that after all they deserve the appellation "pigeon murderers," which has frequently been applied to them heretofore.

It is not quite know how this will strike the readers of FOREST AND STREAM, but if facts are what they want, they may possibly thank me for writing and this journal for publishing the naked truth.

The law in relation to woodcock shooting takes effect in this State August 1, but in the meantime the pot-luckers are baying away, and woodcock are selling at \$4 to \$4.50 a dozen.

That bear, which two hunters of Rogers' Lake presented to E. H. Gillman a few months ago, and which was sent over to Belle Isle by the latter, escaped soon after its arrival.

The fourth annual tournament of the Howell Gun Club will be held at Howell, Mich., on the Detroit, Lansing and Northern Railroad, August 9, 10 and 11.

My Dear Fellow: Of course not; you will not own up that you were ever what you now style a "greenhorn."

The law in relation to woodcock shooting takes effect in this State August 1, but in the meantime the pot-luckers are baying away, and woodcock are selling at \$4 to \$4.50 a dozen.

At Point Monille Marsh, President Colburn informs me, mallard, blue-winged teal, and woodcock are breeding lively, and the promise for September 1 is uncommonly gorgeous.

That bear, which two hunters of Rogers' Lake presented to E. H. Gillman a few months ago, and which was sent over to Belle Isle by the latter, escaped soon after its arrival.

The fourth annual tournament of the Howell Gun Club will be held at Howell, Mich., on the Detroit, Lansing and Northern Railroad, August 9, 10 and 11.

Table with columns: States, Deer, Woodcock, Quail, Ruffed Grouse, Pinnated Grouse (Prairie Chicken), Wild-fowl, Wild Turkey. Rows list various states and their corresponding hunting seasons.

In those States there are special county laws. a Deer law applies to sale or possession. b Wildfowl not protected on the coast. c In Upper Peninsula deer season opens Aug. 15.

THE MINNESOTA PRAIRIE CHICKEN SEASON does not open until Sept. 1.

PRAIRIE CHICKEN SHOOTING.

THE reports which have come to us of the pinnated grouse, or prairie chicken, shooting in the West this season are very promising.

REPORTS have come to us during the past week as follows, and we hope that our friends at the West may supplement these letters with news of the game supply in other localities.

POINTS OF THE CHICAGO AND NORTHWESTERN RAILWAY, THE CHICAGO AND NORTHWESTERN RAILWAY CO., CHICAGO, Ill., July 25.

I am advised that the chickens are plentiful on our Winona and Nicollet River line, west of Rochester, and on our Iowa Division, west of Da Witt.

REPORTS have come to us during the past week as follows, and we hope that our friends at the West may supplement these letters with news of the game supply in other localities.

A LARGE ADIRONDACK TROUT.—Mr. Edward Everett Emmons, of the firm of B. B. Claffin & Co., caught in Lake Mechouen, in the Adirondacks, on June 26, a trout weighing two and one-half pounds, and safely landed him. His guide was Al. Burr. This is the largest trout caught there this season.—A.L.

TROUT KILLED BY A CLOUD BURST.—On July 24 a cloud burst in the head of Mill Creek Cañon, San Bernardino County, Cal. It tore trees up by the roots and moved huge boulders from their beds, sending them crashing down the cañon. An innumerable quantity of trout was killed.—*Virginia City Enterprise.*

THE HERRING.

BY PROFESSOR T. H. HUXLEY.

[Abridged from "Nature."]

LIKE most fishes, the herring is propelled mainly by the sculling action of the tail-fin, the rest serving chiefly to preserve the balance of the body, and to keep it from turning over, as it would do if left to itself, the back being the heaviest part of the fish.

The mouth of the herring is not very large, the gape extending back only to beneath the middle of the eye, and reaching to the upper and lower jaws as small as to be hardly visible. Moreover, when a live herring opens its mouth, or when the lower jaw of a dead herring is depressed artificially, the upper jaw, instead of remaining fixed and stationary, travels downward and forward in such a manner as to guard the sides of the gape. This movement is the result of a curious mechanical arrangement by which the lower jaw pulls upon the upper, and I suspect that it is useful in guarding the sides of the gape when the fish gulps the small living prey upon which it feeds.

The only conspicuous teeth, and they are very small, are disposed in an elongated patch upon the tongue, and in another such patch, opposite to these, on the forepart of the roof of the mouth. But, if the mouth of a herring is opened widely, there will be seen, on each side, a great number of fine, long, bristle-like processes, the pointed ends of which project forward. These are what are termed the gill-rakers, inasmuch as they are fixed, like the teeth of a rake, to the inner sides of those arches or bones on the sides of the head which are called the gill-arches. The sides of the throat of a herring, in fact, are, as it were, cut by four deep and wide clefts, which are separated by these gill arches, and the water which the fish constantly gulps in by the mouth flows through these clefts, over the gills and out beneath the gill-covers, aerating the blood, and thus effecting respiration, as it goes. But, since it would be highly inconvenient, and indeed injurious, were the food to slip out in the same way, these gill-rakers play the part of a fine sieve, which lets the water strain off, as when it keeps a sieve full of food. The gill-rakers of the front side are much longer than those of the hinder arches, and as each is stiffened by a thread of bone developed in its interior, while, at the same time, its sides are beset with fine, sharp teeth, like thorns on a briar, I suspect that they play some part in crushing the life out of the small animals on which the herrings prey.

Between these arches there is, in the middle line, an opening which leads into the gullet. This passes back into a curious conical sac which is commonly termed the stomach, which has more the appearance of a crop. On a certain extent from the under side of the sac and communicating with it by a narrow opening, there is an elongated tubular organ, the walls of which are so thick and muscular that it might almost be compared to a gizzard. It is directed forward, and opens by a narrow prominent aperture into the intestine, which runs straight back to the vent.

The chief food of the herring consists of minute crustacea, some of them allied to the shrimps and prawns, but the majority belonging to the same division as the common *Cyclops* of our fresh waters.

Everybody must have noticed the silvery air-bladder of the herring, which lies immediately under the backbone, and stretches from close to the head to very near the vent, being wide in the middle and tapering off to each end. In its natural state it is distended with air; and, if it is pricked, the elastic wall shrinks and drives the air out, as if it were an india-rubber ball. When the contents of this air-bladder are fully explored, it turns out to be one of the most curious pieces of mechanism of which the whole animal is composed.

In the first place, the perforated end of the sac or crop into which the gullet is continued runs back into a very slender duct which turns upward and eventually opens into the middle of the air-bladder. The canal of this duct is so very small and irregularly twisted, that, even if the air-bladder is squeezed, the air does not escape into the sac. But, if air is forced into the sac by means of a blowpipe, the air passes without much difficulty the other way, and the air-bladder becomes fully distended. When the pressure is removed, however, the air-bladder diminishes in size to a certain extent, showing that the air ceases somewhere. And, if the blowing up of the air-bladder is performed while the fish is under water, a fine stream of air-bubbles may be seen to escape close to the vent. Careful anatomical investigation, in fact, shows that the air-bladder does not really end at the point where its silvery coat finishes, but that a delicate tube is continued thence to the left side of the vent, and there ends by an opening of its own.

Now, if the air-bladder of all fishes is, to begin with, an outgrowth from the front part of the alimentary canal, and there are a great many fishes in which, as in the herring, it remains throughout life in permanent communication with the gullet. But it is rare to find the duct so far back as in the herring; and, at present, I am not aware that the air-bladder opens externally in any fishes except the herring and a few of its allies.

There is a general agreement among fishermen that herrings sometimes make a squeaking noise when they are first taken out of the water. I have never heard this sound myself, but there is so much concurrent testimony to the fact that I do not doubt it; and it occurs to me that it may be produced, when the herrings are quickly brought up from some depth, by means of this arrangement. For under these circumstances the air which the air-bladder contains expands to such a degree, on being relieved from the pressure of the water, that deep-sea fishes with a closed air-bladder which is brought to the surface rapidly are sometimes fairly burst inside of their thin muscular coats, or even bursting of the air-bladder. If the same thing should happen to the herring, the like misfortune would not befall it, for the air would be forced out of the opening in question, and

might readily enough produce the squeak which is reported.

At the opposite end of the air-bladder there is an even more curious arrangement. The silvery coat of the air-bladder ends in front just behind the head. But the air-bladder itself does not terminate here. Two very fine canals, each of which is not more than one-twentieth of an inch in diameter, however, are surrounded by a relatively thick wall of cartilage, pass forward, one on each side, from the air-bladder to the back of the skull. The canals enter the walls of the skull, and then each divides into two branches. Finally, each of these two dilates into a bag which lies in a spheroidal chamber of corresponding size and form; and, in consequence of the air which they contain, these bags may be seen readily enough shining through the side-walls of the skull, the bone of which has a peculiar structure over it surrounds them. Now, these two bags, which constitute the termination of the air-bladder on each side, are in close relation with the organ of hearing. Indeed, a process of that organ projects into the front chamber on each side, and is separated by only a very delicate partition from the terminal sac of the air-bladder. Any vibrations of the air in these sacs, or any change in the pressure of the air in them, must thus tell upon the hearing apparatus.

There is no doubt about the existence of these structures, which, together with the posterior opening of the air-bladder, were most accurately described by me, more than sixty years ago, by the use of the microscope. Whether they are of use was not much valued regarding their meaning then we were when they were first made known. In fishes in general there can be little doubt that the chief use of the air-bladder is to diminish the specific gravity of the fish, and by rendering its body of nearly the same weight as so much water, to render the business of swimming easier. In those fishes in which the passage of communication between the air-bladder and the alimentary canal is closed, the air is no doubt secreted into the air-bladder by the vessels, which are often very abundant. In the herring the vessels of the air-bladder are very scanty; and it seems probable that the air is swallowed and forced into the air-bladder just as the loach swallows air and drives it into its intestine. And, as I have already suggested, it may be that the narrow posterior canal which leads from the air-bladder to the exterior is a sort of safety-valve allowing the air to escape, when the fish, rapidly ascending or descending, alters the pressure of the water upon the contained air.

The hypothesis may be put forward with some show of probability, that I can only find it difficult to suggest anything with respect to the physiological meaning of the connection between the air bladder and the ear. Nevertheless such an elaborate apparatus must have some physiological importance; and this conclusion is strengthened by the well-known fact that there are a great many fishes in which the air-bladder and the ear become connected in one way or another. In the earp tribe, for example, the front end of the air-bladder is connected by a series of little bones with the organ of hearing, which is, as it were, prolonged backward to meet these bones in the hinder end of the skull. But here the air-bladder, which is very large, may act as a resonator; while in the herring the extreme narrowness of the passages which connect the air-bladder with the ear renders it difficult to suppose that the organ can have any such function.

In addition to the singular connection of the ear with the exterior by the roundabout way of the air-bladder, there are membranous spaces in the walls of the skull by which vibrations can more directly reach the herring's ear. And there are good reasons to think that these vibrations are often heard in a dark night, when the water is phosphorescent, or, as the fishermen say, there is plenty of "merveire," it is a curious spectacle to watch the effect of sharply tapping the side of the boat as it passes over a shoal. The herrings scatter in all directions, leaving streaks of light behind them, like shooting-stars.

Probably 10,000 is an under-estimate of the number of ripe eggs shed in spawning by a moderate-sized female herring. But I think it is safer than the 30,000 of some estimates, which appear to me to be made in forgetfulness of the very simple anatomical considerations that the roe consists of an extensive vascular framework as well as of eggs; and, moreover, that a vast number of the eggs which it contains remain immature, and are not shed at the time of spawning.

Herrings which have attained maturity, and are distended by the greatly enlarged milk or roe, are ready to shed the contents of these organs, or, as it is said, to spawn. In 1862 we found a great diversity of opinion prevailed as to the time at which this operation takes place, and we took a general view of the question. The question, with the result which is thus stated in our report:

"We have obtained a very large body of valuable evidence on this subject, derived partly from the examination of fishermen and of others conversant with the herring-fishery; partly from the inspection of the accurater records kept by the fishery officers at different stations, and partly from other sources; and our clear conclusion from all this evidence is, that the herring spawns at two seasons of the year. In the spring and in the autumn. We have hitherto met with no case of full spawning herrings being found in any locality, during what may be termed the solstitial months—namely, June and December; and it would appear that such herrings are never (or very rarely) taken in May, or the early part of July, in the latter part of November or the early part of January. But a spring spawning certainly occurs in the latter part of January, in February, in March and in April; and an autumn spawning in the latter part of July, in August, September, October, and even as late as November. The spring months, therefore, are February and March are the great months for the spring spawning, and August and September for the autumn spawning. It is not at all likely that the same fish spawn twice in the year; on the contrary, the spring and the autumn shoals are probably perfectly distinct; and if the herring, according to the hypothesis advanced above, come to maturity in a year, the shoals of each spawning season would be the fry of the twelve-month before. However, no direct evidence can be adduced in favor of this supposition, and it would be extremely difficult to obtain such evidence."

I believe that these conclusions, confirmatory of those of previous careful observers, are fully supported by all the evidence which has been collected, and the fact that this species of fish has two spawning-seasons, one in the hottest and one in the coldest months of the year, is very curious.

Another singular circumstance connected with the spawning of the herring is the great variety of the conditions, apart from temperature, to which the fish adapts itself in performing this act. It is known to spawn in the most shallow waters, in water of ten to twenty fathoms, and even at greater depths, and in a sea of full oceanic saltiness. Nevertheless, herrings spawn just as freely not only in the narrowest of

Baltic, such as the Great Belt, in which the water is not half as salt as it is in the North Sea and in the Atlantic, but even in such long inlets as the Scheldt in Schleswig, the water of which is quite drinkable, and is furnished by fresh-water fish from the herrings deposit their eggs in two or three feet of water, and there are found, along with the eggs of fresh-water fish, sticking in abundance to such fresh-water plants as *Polypogon*.

Nature seems thus to offer us a hint as to the way in which a fish like the shad, which is so closely allied to the herring, has acquired the habit of ascending rivers to deposit its eggs in purely fresh water.

If a full female herring is gently squeezed over a vessel of sea-water, the eggs will rapidly pour out and sink to the bottom, to which they immediately adhere with so much tenacity that, in half an hour, the vessel may be inverted without their dropping out. When spawning takes place naturally, the eggs fall to the bottom and attach themselves in a similar fashion, but at this time the assembled fish dart wildly about, and the water becomes cloudy with the shed fluid of the milk. The eggs thus become fecundated as they fall, and the development of the young within the ovum sticking to the bottom commences at once.

The first definite and conclusive evidence as to the manner in which herring-spawn is attached and becomes developed that I know of was obtained by Professor Allman and Dr. MacBain in 1862, in the Firth of Forth. By dredging in localities in which spent herring were observed on the 1st of March, Professor Allman brought up spawn in abundance at a depth of fourteen to twenty-one fathoms. It was deposited on the surface of the stone, shingle and gravel, and on old shells and coarse shell-sand, and even on the shells of small living crabs and other crustacea, adhering tenaciously to whatever it had fallen on. No spawn was found to be abundant on both the east and the west sides of the Isle of May up to the 13th of March, at which time the incubation of the ovum was found to be completed in a great portion of the spawn, and the embryos had become free. On the 25th scarcely a trace of spawn could be detected, and nearly the whole of the adult fish had left the Forth.

Within the last few years a clear light has been thrown upon this question by the labors of the West Baltic Fishery Commission, to which I have now often had occasion to refer. It is well known that artificial fecundation is easily practiced, and that the young fish may be kept in aquaria for as long as five months. Thus a great body of accurate information, some of it of a very unexpected character, has been obtained respecting the development of the eggs and the early condition of the young herring.

It turns out that, as is the case with other fishes, the period of incubation is closely dependent upon warmth. When the water has a temperature of 53 deg. Fahr., the eggs of the herring hatch in from six to eight days, the average being seven days. And this is a very interesting fact when we bear in mind the conclusion to which the inquiries of the Dutch meteorologists, and, more lately, those of the Scottish Meteorological Society appear to tend—namely, that the shoals prefer water of about 55 deg. At 50 deg. Fahr., the period of incubation is lengthened to eleven days, at 46 deg. to fifteen days, and at 38 deg. it lasts forty days. As the Forth is usually tolerably cool in the month of March, it is probable that Professor Allman's estimate comes very near the truth for the particular case which he investigated.

The well-known "whitebait" of the Thames consists, so far as I have seen, almost exclusively of herrings under six months old, and as the average size of whitebait increases, from March and April onward, until they become suspiciously like sprats in the late summer, it may be concluded that they are the progeny of herrings which spawned early in the year in the neighborhood of the estuary of the Thames, up which these tiny little fish have wandered. Whether it is the general habit of young herring, even of those which are spawned deep water, to migrate into the shallow parts of the sea, or even into completely fresh waters, when such are accessible, is unknown.

Fishermen distinguish four states of the herring. Fry or sile, when not larger than sprats; maties, when larger than this, with undeveloped roe or milk; full fish, with largely developed roe or milk; and spent or shotten fish which have recently spawned.

Herring-fry of the size of sprats are distinguished from full fish not merely by their size, but, in addition, by the development of the gills, the milk or roe, and by the accumulation of fat in the abdominal cavity. Bands of fat are found in the mesentery alongside the intestine, and filling up the interspaces between the pyloric ceca.

Maties (the name of which is a corruption of the Dutch word for a maiden) resemble the fry in these particulars; but, if they are well fed, the deposit of fatty and other nutritive matter takes place, not only about the abdominal viscera, but also beneath the skin and in the interstices of the flesh.

As the fish passes from the matie to the full condition, the milk and roe begin to grow at the expense of the nutriment thus stored up, and as these organs become larger and occupy more and more space in the abdominal cavity the excess of nutritious substance is transferred to them. The fatty deposit about the intestine and pyloric ceca gradually disappears and the flesh becomes poorer. It would appear that by degrees the fish cease to feed at all. At any rate there is usually no food in the stomach of a herring which approaches maturity. In all these respects there is a close resemblance between the history of the herring and that of other fishes, such as the salmon—the part corresponding to the herring-fry or sile, the grise under the "clean fish" of larger size to the maties.

At length spawning takes place, the accumulated nutriment, transformed into eggs or spermatid fluid, is expelled, and the fish is left in that lean and depauperated state which makes a "shotten herring" proverbial. In this condition it answers to the term "lean" in the "lean and fat" of an unknown depth, and faecid and can be blown up with air like empty bags. If the spent fish escapes its myriad enemies, it doubtless begins to feed again and once more passes into the matie state in preparation for the next breeding season. But the nature of this process of recuperation has yet to be investigated.

When they have reached the matie stage, the herrings, which are at all times gregarious, associate together in conspicuous assemblages, which are called shoals. These are sometimes of prodigious extent—indeed, eight or nine miles in length, two or three leagues wide, with an unknown depth, are dimensions which are credibly asserted to be sometimes attained. In these shoals the fish are closely packed, like a flock of sheep straying slowly along a pasture, and it is probably quite safe to assume that there is at least one fish for every cubic foot of water occupied by the shoal. If this be

A FINE SEA BOAT.—It is notoriously a fact that every yacht ever built, no matter of what form and rig, is, in the builder's and owner's opinion, invariably "a fine sea boat." Here is one of them. The well-known racing sloop Fanny, some 70 odd ft. long—big enough, goodness knows, to cruise around the world, if of proper model—strikes into a little squall of Mountauk, July 18, carries away spars, has boats stove in, and is wrecked generally, whereupon it is immediately up helm, cut and run for the nearest life shelter, which was found at New London, where repairs were undertaken. Yet if one were to tell the builder, Richmond, of Mystic, that Fanny is a machine and a violent, dangerous craft at sea, he would have laughed outright and held a sermon upon the value of light draft and beam to make a fine, safe sea boat. So thoroughly have most builders become divorced from the sense of practice, and so completely are they under the spell of hearsay theories, that we hardly expect Fanny's recent exploit in a little bit of a sea will have any effect in removing the scales from the eyes of her huller. He will continue to inform his customers, as of yore, that the yacht is "the finest sea boat imaginable," until some half dozen of dupes are split some today and drowned like so many flies. The Fanny has no business outside of a mill pond.

A NARROW BEAM.—This is the impression the Viola, a sloop of reasonable beam, made upon one capable of judging, who observed her during the recent Atlantic Y. C. cruise. *Editor Forest and Stream:* Speaking of narrow boats you should have seen the Viola on the A. Y. C. cruise. She is one of the best boats I have seen. Of moderate beam with very small rig she sails with the best hull of her length. It is the finest sea boat imaginable I have been re-built you should take a look at her. I do not know what her draft is, but if she is deep she is about as near my idea of a comfortable, speedy boat, as anything we have. For a smaller boat give me the Kangaroo or Elephant any time. But objections to this latter type become apparent when as large as the Etna, for both spars and sails make them very heavy to handle. The Fautia is, however, the natural product of our length measurement just as I think the very narrow cutters in England over their small beam solely to their own peculiar rule which penalizes beam as to length.

TORONTO CANOE CLUB.—A race open to the club was sailed under the rules of the American Canoe Association, July 23. S. L. Ticks won the paddling race of one mile in a canoe of his own build; H. W. Kent, second; both using double blades. In the best hull of her length. It is the finest sea boat imaginable I have been re-built you should take a look at her. I do not know what her draft is, but if she is deep she is about as near my idea of a comfortable, speedy boat, as anything we have. For a smaller boat give me the Kangaroo or Elephant any time. But objections to this latter type become apparent when as large as the Etna, for both spars and sails make them very heavy to handle. The Fautia is, however, the natural product of our length measurement just as I think the very narrow cutters in England over their small beam solely to their own peculiar rule which penalizes beam as to length.

HULL YACHT CLUB.—The second annual regatta was sailed July 23. Eighteen started, but the wind being very light, only five and a half miles were sailed. The boats were: Volante, a cutter, 35 ft. beam, Walter Arnold, won with a slight wind. Teletone, Hugh Nelson, 28 ft. beam, was second, and Sadie N. F. M. Nicholson, third. The Bishop broke her rudder gear, and the Fairy gave up. Another race is fixed for a month hence.

NEW YORK YACHT CLUB.—Mr. C. J. Osborn has presented the club with a cup to be sailed for in a sloop of a handicap during the cruise. Open to N. Y. Y. C. E. Y. C. and N. H. Y. C. The squadron sailed from New London, Aug. 3, for the annual cruise, under the command of Judge J. H. Donald, P. E. Patterson, A. Howe, C. B. Otterhell, Peleg Ahorn, C. B. Southard and C. A. Merrill. Next regatta is the club July 30, and the Union Regatta Aug. 13, when about \$500 will be given in prizes.

THOSE HARD NAMES.—We hold ichthyologists in some measure to blame for the hard names it has pleased them to bestow on the objects of their study. The practice, we believe, is mainly due to Cuvier. In the range for words of Greek or Latin origin, which was so curious a feature of the great Revolution, it was rather a merit than not that a term, especially a scientific term, should have a classical or semi-classical derivation. Cuvier followed the prevailing fashion, and hence extraordinary compounds, which scarcely any grammarian would have countenanced, were introduced by him into this science, and *Chondrosteus*, *Scomberoides*, *Leptobrama* and *Cyphocharax* seem to have issued glibly from French mouths in a way that ours find impossible. As a nomenclaturist, Cuvier was immeasurably inferior to Linnaeus, who was nearly always careful to continue, if practicable, an ancient name, and would rather misapply an old appellation to a new discovery than invent for it one of his own composition. Yet Cuvier's names, for the most part stand, and are hardly to be found, despite the difficulty of pronouncing them; and his successors have continued to tread in his footsteps, till ichthyological nomenclature has become, what it certainly is, an intolerable jargon—a dialect hard to be uttered by an articulately speaking man—a language that is forbidden.—*The Spectator.*

THE OLD WANDERER.—Perhaps some of our readers can furnish the desired information to the following inquiries:
Editor Forest and Stream:
May I ask for some particulars of the famous schooner yacht Wanderer? If I remember rightly she was built at S-tauket, L. I., about the year 1837 for a member of the N. Y. Y. C., afterward becoming notorious as a slave. During the war she came into possession of the U. S. Government, serving for a time as tender to a steamer of the E. O. B. Squadron. But the lumber was much the faster vessel, and she is to be a splendid sea boat, and many stories were told of her wonderful performances. The navy officials shortened her spars ten feet—presumably to reduce her speed—and she became at last only a powder boat at Key West, and at the close of the war, being very rotten, was sold and taken to New York.

The Wanderer was of peculiar appearance, with good rake to her masts, low in the waist and aft, and remarkably high foreward. Can you give her builder's name, dimensions, spars, tonnage, etc., and do you know if her model was preserved? STEVEL.

RUSHTON'S PRIZE CANOE.—The canoe offered by Rushton as a prize for the Lake George contest will be the finest ever turned out by an establishment noted for its excellent work. It will be nearly like the American travelling canoe, but will be one and a half inches deeper on the bow and a little change made in the rake of stems and gunwale line. These changes, though trifling, improve the looks of the canoe—before it was called the handsonest canoe afloat—and it is expected will make it a dryer boat in heavy water. To Mr. Linden of the C. C. C., and the builder being the credit for whatever improvement there is. This canoe has Spanish cedar top streak and deck, with hack wale, trimmings and white cedar siding—a beautiful piece of workmanship. Those going to Lake George will see many fine canoes there and will have a chance to learn more of canoes and canoeing in three days than in a whole year in most any other way. The conditions of the contest for this canoe will be made known at the meeting. They will be broad enough to give to all an equal chance to win it.

WALKER HILL YACHT CLUB.—The thirteenth annual regatta was sailed July 30 in a brisk northeast wind. Classes for boats over and under 24 ft. E. G. came to the line and finished a very spirited race as under:

| Name and Owner. | FIRST CLASS. | | SECOND CLASS. | |
|--|--------------|--------------|---------------|--------------|
| | Length. | Actual Time. | Length. | Actual Time. |
| Grace M. J. C. Musgrave..... | 25 00 | 4 07 | 30 00 | 8 20 |
| Edith, Hodgkins & Rich..... | 36 00 | 4 35 | 60 00 | 8 50 |

POCAHONTAS.—The *Bellville Intelligencer* questions the accuracy of the dimensions of the new "flag officer's sloop," building by Kirby, as given in the *World* recently. The dimensions were copied from a report drew upon his imagination, never having been near Kirby's yard. The delay in finishing the Atlanta has been explained by its obtaining ship-carpeters at reasonable rates. The Atlanta is to be about by the end of August. She is to carry 250 sq. ft. of canvas in lower sail, gut and jib aloft. Many persons interested have seen the photo of the new sloop in our office, and their opinions have been unanimous as to her beauty of model as far as it can be judged from a perspective.

CAPIZING RIGS.—Mr. John McLeod has just fitted his capizing rig to Mr. Whitlock's canoe Cloche in an improved form. The pressure under which the mast spines is regulated by a nut and spring, which can be varied at will. It is proposed to have one of the rigs at the Lake George meet, where it will be put to a thorough test, and we will report more fully. In the meantime Mr. McLeod's address will be 79 W. Horatio street, N. Y., where letters will reach him.

VALKYR.—The trial sails of Dr. Dawson's fine cutter, Valkyr, have proved very satisfactory, realizing the expectations of both owner and designer. She carries iron inside besides the six tons lead on keel. When her owner returns from Europe, seven tons of lead will be substituted for the iron, and Valkyr will be tried for speed when the chance offers. She is a long way ahead of the flat-bottom tribe, being safe, easy and able, and will not "go back" on her crew in dirty weather.

More health, sunshine and joy in Hop Bitters, than in all other remedies.

Answers to Correspondents.

C. C. Mass.—Write to Drey, book publisher, Jacksonville, Fla.
F. P. J. Plattburgh, N. Y.—The Governor has not yet signed the bill. We are not aware of any bill in the State.
M. S. C. Fairbairn, Minn.—The grade of gun is a fair article and of good reputation. It ought to be safe and serviceable.
E. H. Brooklyn, N. Y.—Where can I obtain a purely bred Newfoundland bitch puppy? Where can I purchase a good second-hand Ossage canvas boat? Ans. I. We do not know at this time; perhaps some of our readers can inform you. 2. Advertise for one—you will get plenty of answers.

W. H. H. Aurora, Ill.—Does the fish called tarpon, or tarpon, ever range as far north as New York and Boston? Ans. Yes, occasionally, but they are accidental. The fish is essentially a southern one, but many fish-owners whose home is on the Gulf stream stray out of it in summer and visit our northern coast.

E. A. M., Toledo, Ohio.—From your description we presume your dog is afflicted with the mange. We suggest that you rub him with the mixture recommended to H. T. W. in last issue, giving one quart of Epsom salts once a week and a teaspoonful of sulphur and magnesia in food every morning. Avoid feeding meat. As the disease is contagious you must quarantine him. Write result after sufficient trial.

A. G. G. New Brighton.—Boll down linned out of the best quality until it becomes thick and glutinous. Boll to earthen pot in open air, for two or three hours, and be sure that the coat of the pot fits tightly, so that the oil will not catch fire. When boiled, set away in tin vessels with tight-fitting covers. To use it: Select small, dry sticks, as thick as a straw, and eight inches long. Sharpen the edges, smear them with the linc, and fasten the sticks into grooves cut in a stake stuck into the ground. Place a "call card" as a lure. When the birds alight upon the sticks they pull them out from the mat, awake, and when flying, the wings, coming in contact with the linc, are plucked to the sides.

C. F. P. Brooklyn, N. Y.—My red setter pup has had for the last two weeks what I should call distemper. He is about nine weeks old, and first his eyes began to mature, then his nose became dry, and then running. I gave him two grains of quinine daily and broths with no solid food. Bathed his eyes with an eye wash. Since your last issue I have tried egg and boiled milk, which have not stopped the diarrhea, which is quite bad, and consequently he is very weak. Saturday he was quite chipper, but Sunday after eating well of broth he began to vomit and was very sick. Previous to that I gave him egg and brandy, which did not help him much; then tried strong coffee and milk. To-day he is a shade heavier, but won't eat broth with tapeworm in it, but seems inclined for solid food, meat only, which I hesitate to give him. Can you give me any remedy, or to whom can I send him to be cured at a reasonable charge? His left ear seems to have swollen and is very itchy. Ans. Give two grains of quinine three times a day until his strength returns, and control his diarrhea by giving injections of lincumum and starch water. A teaspoonful of the former in a tablespoonful of the latter. The dog is out of condition, resulting from a want of proper care. The condition of his ear points to cancer. See answer to M. O. S., February 23, 1881.

M. W. Ridgewood, N. Y.—My pointer, six months old, has had five fits in which he runs zigzag and in circles, usually about a mile, partly barking and yelping. It does not know when a approach him, but runs from me and cannot get near him. He does not try to bite. The fits occurred July 1st, 3d, 4th, 7th and 9th. I have noticed him scratching his ears and shaking his head a great deal. Even when barking or following me he will frequently stop to scratch his ears, but I have examined them inside thoroughly several times and have failed to discover inflammation or anything wrong. I allow him to run loose. I see nothing in Srouthenge's case, and I rather doubt that America is to answer his case. Can you tell me what to do for him through your paper or by note? Will "Homo" who remarks breeding grounds of woodcock at Kresgeville, Pa., in your July 7th number, please inform me if a railroad runs from Weisport to Kresgeville and in what part of the county does the railroad terminate? I should also be pleased to hear if there are any other new railroads in Monroe or Pike counties leading to a good trout stream? By so doing he will confer a great favor on a novice desirous of making a trip there and knowing the localities where game is the most abundant. Ans. Keep his towels open and feed and exercise him regularly, and he will soon grow out of the fits, to which young dogs are very subject.

SIMPSON'S NEW FISHING-TACKLE CASE.

A want long felt for by sportsmen. All Anglers will acknowledge that the most vexatious thing that can happen him is to have his Spoons, Hooks and Lines all tangled up. This case will prevent any such disaster, as it is so arranged that the most careless fisherman can keep his Tackle in shape. They are made of the best material and handsomely ornamented and furnished with a lock and key. This case is approved of by the practical piscatorial professors who have investigated its perfections. Size—box: Length 12, width 7 1/2, depth 4 1/2 inches; trays (5): Length 7 1/2, width 4, depth 1 to 1 1/2 inches; top tray: Length 12, width 7, depth 1 1/2 inches. Three parts long in ea. 1 small tray, eight in large tray, two compartments in box, making twenty-four places for lines, hooks, sinkers, spoons, reels, fly-book, and each case packed in a neat box and sent on receipt of \$4.00. To clubs taking it at one time, \$24.00. Send for Catalogue of FISHING-TACKLE AND SPORTSMAN'S GOODS. R. SIMPSON, 96 Fulton Street, New York.

REMASKETT KENNEL, Richmond & Vaughan, Proprietors, Middleboro, Mass.—Sporting dogs boarded, broken and handled by men of experience. Setters, Pointers, Fox Hounds and Beagles trained for their respective work. Satisfaction guaranteed. Also, a number of well-trained setters and pointers for sale. Address BOX 333, Middleboro, Mass. B. RICHMOND, N. H. VAUGHAN. June 2, 1881

GORDON SETTERS.—A few young bitches from the "White" Kennel to dispose of on the most reasonable terms. For the field qualities of this strain of dogs refer to Mr. H. Malcolm, Baltimore, Md., Col. Albert W. C. Wood, Ltd., Col. Jas. Gordon, Pontotoc, Miss. Address THE GORDON SETTER KENNEL, Locust Valley, Long Island. July 14, 1881

FOR SALE CHEAP, a litter of fine Irish setter pups, 10 weeks old, having one cross of Elcho and two of Punker. Address E. J. O'NEILL, Wethersfield, Conn. July 21-1881

LEONARD'S Split Bamboo Rods, WITH PATENT WATERPROOF AND PATENT SPLIT FERRULES.

No. 1 SHOWS WATERPROOF CUP IN FERRULE (PATENTED OCTOBER 26, 1876). This prevents any moisture from reaching the wood, and the ferrule from becoming loose. The constant wetting and drying of the bamboo must rot the wood, and make other makes of rods less durable than Leonard's.

No. 2 SHOWS SPLIT FERRULE (PATENTED SEPTEMBER 3, 1879). This prevents any moisture from reaching the wood, and the ferrule from becoming loose. The constant wetting and drying of the bamboo must rot the wood, and make other makes of rods less durable than Leonard's.

No. 3 SHOWS SPLIT FERRULE WHIPPED WITH SILK as IT APPEARS ON THE ROD. This split thoroughly strengthens where the ferrule is joined to the wood, which is the weakest part of a rod, and where so many of other makes of rods (bamboo especially) break. Mr. Leonard has yet to hear of a single instance of breakage at this point since the PATENT SPLIT FERRULE has been made. We consider this the GREATEST IMPROVEMENT that has been introduced in rod making since rods have been made.

EVERY ROD WARRANTED.

THE GREAT SINGLE BREECH-LOADER.

FOREHAND & WADSWORTH'S NEW BREECH-LOADER has so completely distanced all the others that it stands alone. There is no second. It is the only single gun worth having. As described in the above cut it is now complete, with rebounding lock, pistol lever, fore-end, nickel-plated frame, and is beautifully finished throughout. The barrels are either steel or twist. When steel they are bored out of a solid bar of steel, differing in this respect from all others, which are merely old musket barrels reformed. When twist they are the best imported barrels and of very fine grain. They are bored either cylinder for use in the field, or choked for very close shooting. When choked the targets will not suffer in comparison with Greeney's, Janco's, or even Colt's. Hitherto we have been far behind our orders, but having greatly increased the production we can fill orders immediately. The cost of these guns is a mere trifle. We are sole agents at New York for Colt's Club Guns, and also for Enos James & Co., Birmingham. We offer a small 402 for the celebrated Wobley Guns of all sorts at about half price.

P. O. BOX 4,309.

H. & D. FOLSOM, 30 Warren St., New York.

The Kennel.

Hotels and Routes for Sportsmen

"THE FISHING LINE."

TAKE THE Grand Rapids & Indiana R. R. THE ONLY ROUTE TO THE Trout, Grayling & Black Bass Fisheries, AND THE FAMOUS SUMMER, HEALTH AND GAME RESORTS AND LAKES OF NORTHERN MICHIGAN.

The waters of the Grand Traverse Region, and the Michigan North Woods are unsurpassed, if equaled, in the abundance and great variety of fish contained.

Brook Trout abound in the streams, and the famous AMERICAN GRAYLING is found only in these waters. The THIOG season begins May 1 and ends Sept 1. The GRAYLING season opens June 1 and ends Nov. 1.

BLACK BASS, PIKE, PICKEREL and MUSCALONGE, also abound in large numbers in the many lakes and lakelets of this territory. The Sportsman can readily send trophies of his skill to his friends or "club" at home, as ice for packing fish can be had at nearly all points.

TAKE YOUR FAMILY WITH YOU. The scenery of the North Woods and Lakes is very beautiful. The air is pure, dry and bracing. The climate is peculiarly beneficial to those suffering with

Hay Fever and Asthma Affections. The hotel accommodations are excellent, and will be largely increased in time for the sea on of 1881 by new buildings and additions.

During the season ROUND TRIP EXCURSION TICKETS WILL BE SOLD AT LOW RATES, and attractive train facilities offered to Tourists and Sportsmen.

Dogs, Guns and Fishing Tackle Carried Free at owners' risk.

It is our aim to make sportsmen feel "at home" on this route. For Tourists' Guide a handsomely illustrated book of 160 pages sent free. Time cards, folders and further information, address

A. B. LEET, Gen'l Pass' Agent, Grand Rapids, Mich.

Fishing Season at Rangeley Lakes Again Open. EXCURSION TICKETS VIA BOSTON AND MAINE RAILROAD.

Table with 2 columns: Destination and Price. Includes routes to Andover, Middle Dam, Upton, Mountain View House, Indian Lake, Indian Lake and return via Andover, Phillips, Indian Rock and return (via Andover) Bemis Stream and return, Moosehead Lake and return (Mt. Ringo House), Foris of the Kennebec and return, Dead river and return, Grand Falls, St. Andrews, N. B., and return.

Also tourists' tickets to all Sporting and Pleasure Resorts in Maine and the Province. Tickets for sale at all principal ticket offices and at 250 WASHINGTON STREET, BOSTON. DEPT. OF HAY MARKET SQ., J. BOSTON. Send for list of excursions.

D. J. FLANDERS, Gen. Pass. and Ticket Agent.

Hotels and Routes for Sportsmen.

TO SPORTSMEN:

The Pennsylvania R. R. Co., Respectfully invite attention to the SUPERIOR FACILITIES

afforded by their lines for reaching most of the TROUTING PARKS and RACE COURSES in the Middle States. These lines being CONTINUOUS FROM ALL IMPORTANT POINTS, avoid the difficulties and dangers of reshipment, while the excellent cars which run over the smooth steel tracks enable STOCK TO BE TRANSPORTED without failure or injury.

THE LINES OF Pennsylvania Railroad Company also reach the best localities for

GUNNING AND FISHING

in Pennsylvania and New Jersey. EXCURSION TICKETS are sold at the offices of the Company in all the principal cities to KANE, RENOVIA, BEDFORD, GIBBSBURG, RALSTON, MINNEQUA, and other well-known centers for

Trout Fishing, Wing Shooting, and SHOT Hunting. \$150.00

TUCKERTON, BEACH HAVEN, CAPE MAY, EQUAN, and points on the NEW JERSEY COAST, renowned for SALT WATER SPORT AFTER FIN AND BEATHEER.

L. P. FARMER, Gen'l Pass. Agent. FRANK THOMSON, Gen'l Manager. 10bt1-44

Chesapeake & Ohio R'y.

THE ROUTE of the SPORTSMAN AND ANGLER TO THE BEST HUNTING AND FISHING GROUNDS OF VIRGINIA AND WEST VIRGINIA.

Comprising those of Central and Piedmont Virginia Blue Ridge Mountains, Valley of Virginia, Alleghany Mountains, Greenbrier and New Rivers, Kanawha Valley, and including in their varieties of game and fish, bear, wild turkeys, wild duck, grouse, quail, snipe, woodcock, mountain trout, bass, pike, pickerel, etc.

The Route of the Tourist, through the most beautiful and picturesque scenery of the Virginia Mountains to the White Sulphur Springs and other famous summer resorts.

The C & O R'y is reached by rail at Huntington, W. Va., from the West, Northwest and Southwest; at Charlottesville, Va., from the North and East; and at Richmond, Va., from the South.

The completion of the Peninsula Extension in the summer of 1881 affords

THE ONLY ALL RAIL ROUTE TO THE "YORKTOWN CENTENNIAL," and establishes a continuous rail line, via Richmond, Va., to Huntington, W. Va., between the mouth of Chesapeake Bay and the Pacific Ocean.

Blasting Powder.

THE MOST POPULAR POWDER IN USE!
DUPONT'S GUNPOWDER MILLS, ESTABLISHED IN 1802,
have maintained their great reputation for seventy-
eight years. Manufacture the following celebrated
brands of powder:

Dupont's Diamond Grain.—Nos. 1 (coarse)
to 4 (fine) unequalled in strength, quickness and
cleanliness; adapted for glass-ball and pigeon
shooting. Packed in 1 lb. canisters.
Dupont's Eagle Ducking.—Nos. 1 (coarse)
to 3 (fine); burns slowly, strong and very clean;
great penetration, with a close pattern; adapted
with either muzzle or breech loaders. Packed in 1
lb. and 5 lb. canisters and 6 1/2 and 13 1/2 lb. kegs.
Dupont's Chokey Bore.—Specially adapted
for "chokey bore" guns, and particularly for prairie
and upland shooting. Burns slowly, strong and
moist; does not cake or burn on the barrels, gives
both a good penetration and a close pattern, will
be found well adapted for glass-ball and pigeon
shooting. Made of two sizes, only No. 1 and No. 2,
No. 1 being the coarsest. Packed in 6 1/2 lb. kegs and
1 lb. canisters.

Dupont's Eagle Rifle.—A quick, strong and
clean powder, of very fine grain, for pistol shooting.
Packed in 1 lb. canisters and 6 1/2 lb. kegs.
Dupont's Rifle Fg. for long-range shooting.—
FFg. and FFFg. The Fg. for long-range rifle shoot-
ing, the FFg. and FFFg. for general use, burning
strong and moist. Packed in 5 lb., 1 lb. and 5 lb.
canisters, 6 1/2, 13 1/2 and 25 lb. kegs. Fg. coarse, FFFg.
fine.

Dupont's Sporting, Mining, Snapping and Blasting
Powders of all sizes and descriptions. Special
grades for Export. Also Rifle, Cartridge, Musket,
Cannon, Mortar, Mammoth, Hexagonal, Cubical
and Pellet Powder, U. S. Government Standard.
Powder manufactured to order of any required
grain or proof.

Agencies in all the cities and principal towns
throughout the United States. Represented by
F. L. KNEELAND, 87 Beaver St., N. Y.
N. B.—Use none but DUPONT'S Fg. or FFg. for
long-range rifle shooting.

The Hazard Powder Co.,

MANUFACTURERS OF

Gunpowder

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point
of strength and cleanliness. Packed in square can-
isters of one pound only.

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and
6 1/2 lb. kegs. A fine grain, quick and clean, for up-
land prairie shooting. Well adapted to shot-guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 6 (coarse). In 1 and 5 lb. canisters
and 6 1/2 and 13 1/2 lb. kegs. Burns almost dead, very
clean, shooting remarkably close and with great
penetration. For field, forest or water shooting it
ranks any other brand and it is equally serviceable
for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFG, FFG and "Sea Shooting" FG in kegs of
25, 12 1/2 and 6 1/2 lbs. and cans of 5 lbs. FFG is also
packed in 1 and 5 lb. canisters. Burns strong and
moist. The FFG and FFG are favorite brands for
ordinary sporting and the "Sea Shooting" FG is the
standard Rifle Powder of the country.

Superior Mining and Blasting Powder.

TO CORRESPONDENTS.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are invited from every part of the country. Anonymous communications will not be regarded. No correspondent's name will be published except with his consent. The Editors cannot be held responsible for the views of correspondents.

Subscriptions.

Subscriptions may begin at any time. The subscription price is \$4 per year; \$2 for six months. Remittances should be sent by registered letter, money order, or draft payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada; and is on sale in Europe by The American Exchange, 49 Strand, W. C. London, Eng.; and by Em. Terquem, 15 Boulevard, St. Martin, Paris, France.

Advertisements.

Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices 50 cents per line—eight words to the line, and twelve lines to one inch. Advertisements should be sent in by the Saturday of each week previous to the issue in which they are to be inserted.

Address: Forest and Stream Publishing Co.,
Nos. 39 and 40 Park Row, New York City.

FOREST AND STREAM.
Thursday, August 11.

THE SNAKE CLIMBING QUESTION.

THE original question broached in FOREST AND STREAM was whether our venomous serpents could climb perpendicular trees. It is well known that all constrictors do so. None of our correspondents in relating their experiences say whether the black snake circled around the tree, went up it with the same serpentine motion which it uses on land, or whether it adopted a vermicular movement and pushed itself straight up by contraction and expansion, its abdominal plates holding into the roughness of the tree.

We have seen the water snake nearly helpless on a platform of henlock boards used to cover the resecway of a trout pond. It wriggled with an eel-like motion, but the slivers of the boards pointed the wrong way for it to get hold. On turning it around it went off rapidly, the plates of the abdomen holding in the wood enough to give it a point to push against.

We have seen the black snake ascend a sapling by twining about the trunk and going up with a spiral motion, but we have never seen them climb large tree trunks, although we have seen them in the trees. Will our Washington correspondent describe the motion of the snake he saw climb up a perpendicular wall? and will our Eldred correspondent tell us how the snake descended from the tree?

A MATTER OF MORALS.

MESSRS. WM. B. MERSHON, the Secretary of the Michigan Sportsmen's Association, and A. H. Mershon, the President of the East Saginaw Game Protection Club, recently attempted, by due process of law, to punish three men, Amos Coon, Charles Cary and John Hatfield, of Harrison, Mich., for having killed and had in possession venison out of season. It was positively proved in the trial that the deer had been killed out of season, and the ease was a clear one, but the jury, after a short deliberation, brought in a verdict of "not guilty," and afterward explained that "it might have been a tame deer; didn't prove it was wild."

The game clubs are naturally disgusted with such a farcical administration of justice, and are taking pains to report abroad the laxity of local morals in the county where men can kill tame deer all the year round in the woods. It seems that for one of the most brutal and outrageous of indecent crimes in the calendar the Clare County penalty is, as fixed by a jury recently, a fine of twenty-five dollars. This is clearly a matter of morals. Before the sportsmen of Michigan can hope to secure any respect for the game laws among these people they must mend the morals of the community, and instill into it some more healthy regard for the ordinary decencies of life than the verdicts of their juries indicate that they now possess.

A POT-LUCK DINNER.

THE "POT-LUCK CLUB" dined in honor of the birthday of its President. Its President is Hon. R. Barnwell Roosevelt. The name is familiar to our readers. He is suspected of being a Fish Commissioner of New York. He is accused of belonging to the fish-eating club with the jaw-breaking name. It is whispered that he presides at the Fish-cultural Association. And he is guilty of writing on the lateral motion of crabs. See our last issue. Therefore we are not going to tell you who he is. The Pot-Luckers are literary. They boil over with wit. Its Secretary is a gifted *Uteratense*. She gave the spread. She is called the Queen of the Pot-Luckers. The pot was in luck on August 6. It was a full pot. All had full hands. No one was high.

The President was a year older than he was ever known to be before. His age was announced. We won't tell it. We don't think him as old as he claims. He wants to overawe us by a claim of priority. Appearance is deceitful and we judge by acts. By this standard he is twenty-one.

Journalists, poets, and artists comprise the Pot-Luckers. Essays and clams. Poems and lobster salads. Pictures and chowders. Speeches and chicken fixings. Songs and green seal. This is the impression left by a pot-luck dinner. A President who don't preside too much. A hostess who entertains royally. These are the after-thoughts.

FISHCULTURE FOR LONG ISLAND.

AT a meeting of the New York Fish Commission, on the 4th inst., at the office of Mr. R. B. Roosevelt, it was decided to establish the long-talked-of station on Long Island. Our readers may remember that Mr. Blackford was added to the Commission because he favored the placing of a station for both fresh and salt water work on the island.

It is much to be regretted that the Legislature did not make a special appropriation for this purpose, but, as it did not do so, the Commissioners set apart \$3,000 to begin the work. This is a small amount to establish new works with, but it shows a disposition to begin. There is much that might be done on the island in the way of breeding and observation of the habits of our sea fishes. It is the best place in the State of New York to establish a carp pond, from whence young could be distributed to those fishless portions of the State where only little turtles and pollywogs grow. It is the home of the trout, which can be bred in most of its streams, and its bays formerly swarmed with valuable food fishes.

We hope that the Commission will take up the oyster, the scallop, the clam, lobster and crab and do for them what it has been done for the fishes—increase them and stily their habits. In fact Long Island offers many facilities for fish-

culture and for investigations, which have been neglected. A site for operations will soon be selected, and we invite those having knowledge of suitable locations to send them to this office. The Commissioners want a stream of good trout water, which never falls, near where it comes into clear salt water. They cannot buy such a place and must depend upon leasing it; or, better still, upon the offer of it by some public-spirited citizen, or of some village which would like such an institution near it. They would like to begin work next month, if possible.

TRANSPORTATION OF SHAD EGGS.

MANY of our readers will recollect that there have been several attempts to transport the eggs of shad, and to keep them at a low temperature in order to retard their hatching for a period long enough to get the fry across the Atlantic before they starved to death. The first attempt was made in 1874, by Mr. Mather, who lost his fish from starvation on the tenth day, just as the steamer reached Southampton. The impossibility of feeding shad fry and the lack of natural food in water which has been stored in the dark tanks of ships, renders a sea voyage much more difficult than one on land, where fresh supplies of river water containing infusoria can be obtained daily.

There has been great difficulty in handling shad eggs with a view to their transportation and the can designed for carrying them in water and securing aeration by motion of the ear, planned by Mr. Mather and tried by Prof. Milner the above mentioned year, did not work. Since then but little has been done in this direction except to experiment to determine how long the fry could live without food. This year, however, one of the most important results of the shad work has been an improved method of transporting the delicate shad egg, which cannot bear the rough treatment to which the ova of salmon and trout can be subjected, and which will certainly lead to great economy in the production of this valuable fish.

Heretofore the usual method has been to keep them in pans or buckets of water, which is frequently changed, after they are impregnated and have passed through the stage which fish culturists technically call "coming up"—*i. e.*, a hardening from an absorption of milt and water. The quantity of water required to be changed necessitated not only much labor but constant watchfulness, especially if, as often happened in the work of the U. S. Fish Commission, they had to be so kept from eight to twelve hours in this way before reaching the hatching station.

Col. McDonald, who has had charge of this work on the Virginia rivers, often found that there was a serious loss of eggs during this time, and set about to remedy it. He took one of the ordinary salmon egg trays, with a wire cloth bottom, such as is in general use, and on this placed a sheet of wet muslin. On the latter he put from one to two layers of shad eggs after they had remained long enough in the pans to "come up." A dozen of these trays were then placed in a stack and crated up, after which they were transported at convenience by the Launch to the Washington Navy Yard, a distance of twenty-one miles, during which time they received no attention whatever, only being kept out of the sunshine. They uniformly reached the hatching house in first-rate condition and sometimes were not placed in the hatching cones until twelve hours, and in one case seventeen hours, after impregnation. This would allow plenty of time to place them on ship board just before sailing, thereby making a gain of several days over those which started across the ocean in 1874 which were hatched at Holyoke, Mass., on Friday, and were delivered at Hoboken on the ship next morning. Eggs so treated could be hatched on the ship the fourth or fifth day out and might reach England before they suffered for want of food.

Under this plan the work under Col. McDonald was conducted upon a new principle. Instead of taking the stations to the eggs, as has been done, he now, and in future will, bring the eggs to the stations. These stations may now be placed at points convenient for the distribution of the fry instead of in inaccessible locations. For example; all the eggs taken on the Potomac River can be brought to Washington and hatched in the old Armory building, at no extra cost for engineers or machinery, and the young fish can then

be loaded on the cars almost at the door, which are to carry them to their destination.

Now that it is known that shad eggs can be so simply and cheaply transported it will greatly simplify the work of hatching, which can be done at a central point convenient to railroad, or other transportation.

A LOBSTER LAW NEEDED.

NEW JERSEY and Rhode Island need a law prohibiting the sale of lobsters under a certain size. The lobsters are getting smaller year by year, and the catching of them when young cannot be stopped as long as there are markets open to the violators of the laws whose catch is not seen until thrown upon the market.

In former years, lobsters of five and six pounds weight were plenty, but now are rare. Maine, Massachusetts and New York have laws forbidding the sale of them when less than ten and one-half inches in length. This is very well in its way, but the catchers sort out the smaller ones and send them to other States. The Newark, N. J., *Advertiser* sent a reporter to the market for information, and he learned from a large dealer there "that the great demand for this fish has induced fishermen to take, within the last two years, too many young ones from their pots, and as a consequence this has produced a depopulation of the lobster fishing grounds." The fact is that New Jersey gets those that dare not be offered in New York.

The Rhode Island Fish Commissioners say in their report:

The capture of small lobsters has gone on in Rhode Island since the first lobster pot was put in Rhode Island waters, the larger ones sent to market, and the smaller ones used for bait for black-fish. Now, our lobster fishery is a very valuable one. Very many men make out a living with their lobster pots, and all know the luxury of an abundance of fresh and cheap lobsters in our cities. For a number of years past the catch of lobsters has been steadily decreasing, not as to numbers but as to size. "All is fish that comes to the net" is the rule with lobster catchers. Those that are of a fit size to send to market, from half a pound upward, are sent, the balance, from five to six or seven inches in length, are sold for bait for tautog fishing, save a few that go to those most delicate palates that delight in chicken lobsters.

The Commissioners recommend the passage of a law forbidding the sale of lobsters less than twelve inches in length, and suggest that it would be admirable if a provision could be made forbidding the sale of female lobsters loaded with spawn. So far as the limit of size is concerned, the Commissioners are assured the law will be most popular.

The State of Rhode Island is at present the market for undersized lobsters from Massachusetts. They are sent here in barrels, the catchers on the Massachusetts coast and dealers in Boston, knowing that it would be unsafe to offer them for sale in Massachusetts, send them to us, and we get the full benefit of such poor and illegal supply.

It would be for the general welfare if all the inland States would pass a law regulating the sale of lobsters, for certainly Western cities are as much interested in this source of food supply as those on the sea coast.

OTAGO ACCLIMATIZATION SOCIETY.

WE have received the report of this New Zealand Society for 1881, and are pleased to note that it is upon a sound financial basis from money received from sporting licenses, particularly from fishing licenses, which have increased. The society has recommended a gun tax to the Government, but no reply to it has been received. They err in saying that such a tax exists in the United States.

The society not only introduces and protects beasts, birds and fish, but extends its protection to native species. Among the birds and animals introduced were "black game," four cocks and six hens; pheasants and partridges bred well, but are becoming scarce where shot. The poisoning of the rabbits, which had become a pest to agriculture, has proved fatal to many pheasants. California quail are reported numerous about Queenstown and Goodwood. Last April eighty Australian quins were purchased and liberated. Starlings are now numerous, as well as blackbirds. Thrushes are not plentiful, but are occasionally seen, and many other imported birds, as goldfinches, greenfinches, house sparrows, hedge sparrows, yellow hamsters and chaffinches, are numerous. Deer, both the red, fallow and axis, continue to thrive, while hares are plenty enough for coursing.

Of fish, the English and Californian salmon, introduced from 1876 to 1878, there is no reliable information, although there are reports of their being seen. American whitefish, *Coregonus albus*, were introduced, but it is too soon to look for results. Sea trout are illegally taken before they have become firmly established, but the brown trout are increasing, and English perch and tench are thriving.

We have also received from the Secretary of the Society, Mr. W. Arthur, his "No es on Some Species of Migratory Salmonidae," read before the Otago Institute. In this paper he quotes Professor Hind, in *FOREST AND STREAM*, on the use of the hook on the male salmon's jaw in breaking the hymen and thereby forcing the eggs, and suggests that the milt might also be liberated through the fighting of the males. Mr. Arthur gives plates showing the forms of the different species, and also the shape of the operculum.

Another paper, "On the Brown Trout Introduced into Otago," by the same author, is at hand, wherein he says: "In no river of Otago have these fish grown so rapidly, are so fat, or have become so heavy as in the Sheg, some in-

dividuals having been seen in Mr. Rich's property supposed to be 20 lbs. in weight."

A SENSIBLE EXPRESSION of sentiment was embodied in the resolution of the Illinois State Sportsmen's Association at Chicago, last week, to the effect that trap-shooting should hold its place as an incident only of the annual conventions. Let other associations follow the example. All true sportsmen will agree that the pigeon-shooting contests absorb so much time and attention at the meetings of some of our "game protective" societies that there is no opportunity nor inclination to attend to the legitimate purposes of the conventions. The time has come for a change of programme. It ought not to happen again, as it did at Concy Island, that such valuable and suggestive papers as were prepared to be read and discussed in the meetings of the sportsmen should go without a hearing because there was no time to attend to such matters. At one meeting Mr. Ira Wood, of Syracuse, moved that these papers be brought before the convention. The gentleman was ruled out of order. If the gentlemen who have control of the next convention of the New York Association will follow the spirit of this Illinois resolution, and act upon it, we can assure them of the cordial support of all the best sportsmen of the State, in the Association and out of it. Now is a good time to begin.

SOME SOUTHERN SCENERY.—It is our opinion, after a somewhat extensive series of travels over this big country, that in the mountain regions of Virginia, the Carolinas, Georgia and Tennessee is to be found some of the finest mountain scenery in the country. It is a great pity that more Americans do not travel through their own land instead of running off to Europe; it is a shame that so many Northern people are strangers to the charms of the natural scenery at the South. Some of the Southern railroad managers are making praiseworthy efforts to make known the attractions of their land; and while we are not inclined to puff the railroad, we are very earnest in our hope that travel may set in that direction more than at present. Sportsmen who go to the States named invariably return with glowing reports of both land and people. The "Associated Railways of Virginia and the Carolinas" have published a handsomely illustrated hand-book, giving needed information about routes, distances, fares, etc. This may be had on application at the office of the Piedmont Air Line, 229 Broadway, this city.

MR. HENRY BERGH might with reason devote his attention to the museum at the corner of Broadway and Ninth street, this city. In a cage in the basement of that institution are confined three monkeys, two pigeons, a bob-tailed hen and two rabbits, with a pair of young. The monkeys vary the usual indecent antics, which are common to their kind in captivity, by worrying and tormenting the other inmates of the cage. They pull the feathers out of the pigeons, gouge the eyes of the old rabbits and pinch and claw the young ones. The old hen has no tail feathers, knows how to use her beak and appears to be unmolested by the monkeys. A number of tortoises stolidly hold the fort within their shells, the monkeys evidently thinking them too hard nuts to crack. The small boy—outside the cage—enjoys the mimic wild beast show; and an eagle perched in a wire coop near by gazes fiercely at the sea lion and longs to take a hand in the fun. Six days in the week Mr. Bergh, or one of his agents, may find this show in progress, the monkeys gonging, the eagle glaring, the sea lion growling and the small boy grinning.

THE YELLOW DOG, which followed President Garfield's carriage in the inauguration procession last March, has come to the front again; this time, too, in a sensational way. According to the Alexandria, Va., *Gazette* the dog went to that city after the inauguration, where he remained until the Thursday before the President was shot, when he disappeared from Alexandria, to return one week later with a bullet wound in his back. The course of the ball, says the *Gazette*, was distinctly marked, and an examination has revealed the fact that the animal still carries the bullet. All the circumstances point to the bullet as the first one shot by the assassin at President Garfield, and of which all trace has been lost. The Washington papers chronicled the yellow dog's appearance at Washington just before the world-be assassin's assault on President Garfield. The famous and mysterious animal now wears a brass collar and enjoys immunity from the wiles of the Alexandria dog-catchers, Miss W. A. Penn, of that city, having paid his license fee.

THE NIAGARA DOGS.—In a letter published elsewhere our Suspension Bridge correspondent tells us how "Old Bull" was out to welcome his new companions on the island in the Niagara, and how the two castaways fought it out over their Sunday dinner. In a later note Mr. Lewis says that there is no truth in the report, to which we referred last week, that the dogs were purposely placed on the island, nor that attempts to rescue them have been interfered with by interested parties; but any one who wishes to capture them is at perfect liberty to do so. Well, a New York dog-catcher would have those dogs off the island and into his wagon before a crowd could collect to see the fun; and he would yank them up in much quicker time if he could be induced to believe that he was stealing them. The dog-catcher works quickly when he is also conscious of being a dog-thief.

THE PARADISE FISH.—We give this week a life-like cut of this Chinese fish. In Guenther's Catalogue of the Fishes of the British Museum we find it described as inhabiting the fresh waters of China and Cochinchina, with a note saying, "This may prove to be a domestic variety of a species of *Polyacanthus*." It is described by Lacepede under the name of *Macropodus viridi-auratus*. Mr. Mulert has reared this fish and gives a most interesting account of their habits in the department of fish culture. From his long acquaintance with pet fish he is naturally observant of the habits of them, and he regards the paradise fish as a great addition to our ornamental fishes. The plant which accompanies the fish in the drawing is claimed by Mr. M. to be superior to *Valisneria spiralis* as an aquarium plant.

THEY NAILED HIM.—A correspondent writes to us of the exploit of two country boys which deserves a niche in our columns: In the fall of '45 or '46, near Mr. Robertson's, twenty-two miles west of Catskill, two lads saw a bear in the woods and shot him with fine shot, of which he took no notice; and when they came to load again, they found that they had lost the shot bag. Having been to the store, they had bought a paper of heel nails (country boys had to, then), and after putting in a good charge of this novel shot, one of them blazed away and bagged the bear. This recalls the story told in these columns some months ago of the buck, in whose head were found some copper and silver coins, evidently having served as ammunition.

A RARE SPORTSMAN'S VOLUME was shown to us the other day. It was a book made up of the papers on sporting topics which have appeared in *Harper's*, *Scribner's* and *Lippincott's*; the series extending back for many years to the time when Mr. Charles Hallock wrote his famous sketches from Canada and Labrador—examples of tourist sketches which are perfect in their way. The papers collected and bound in this novel book cover a wide variety of subjects, and are written by many different authors, most of them illustrated, and all readable. Why cannot the publishers of *Scribner's*—or the *Century*—give us such a volume from their magazine?

THE SKETCH OF A SOUTHWEST VIRGINIA DEER DRIVE, published in another column, the writer tells us is a transcript from life, a faithful picture of just the experience narrated. Into it is woven some of the quaint superstition and some of the slang of the Southern backwoods hunter, and many of the phrases will be recognized as more firmly fixed in the common vocabulary of the people than are the more scientific terms affected by the sportsmen of some other localities. The story is thus something more than a mere recital of sport—it is a study of peculiar idioms and of some peculiar notions.

PLAYED 'POSTUM.—It will be conceded that one particular "postum" has been played—to use a slangy expression—for all it is worth. The original seeker after truth on the subject expresses himself as fully satisfied, and returns thanks to us; we are satisfied, and also return thanks to those of our friends who have so acceptably responded to our call. One or two communications on the subject are still unpublished, but they will be given in due time—

When the "postum" is in blossom.

OLD FORT McPHERSON, Neb., was sold at auction the other day, and so passes away another landmark. Many of our readers will remember the fort, and many a romantic story is connected with its history since it was built fifteen years ago. The town of McPherson will still preserve the name and memory of the gallant officer who fell before Atlanta in 1866. There is much of romance and of local history in the names of our towns in America, and an inquiry into the origin and meaning of such names will almost always repay the study.

In last week's issue we published in our kennel columns a paper from an old and esteemed correspondent relative to the castration of dogs. Since the first article of this writer appeared in the *FOREST AND STREAM*, June 6, 1878, he has never lost an opportunity of observing the effects of castration on the dog. He now says that he is fully persuaded that what he then presented is a truth, which, if put in practice by those interested and influential, would save for the country thousands of dollars annually.

RIFLES AND GLASS BALLS.—A correspondent suggests that when a club has become so expert at shooting glass balls with a shot gun that there is no longer much excitement about the sport, they take up a 22 calibre rifle and try the balls with that. Rifle shooting at the trap has been practiced to some extent, and many of the Boston marksmen are experts. It is an excellent form of practice for quick shooting. We endorse the suggestion of our correspondent.

"THE MAGIC NORTHLAND" is the title of a manual of information about the health, pleasure and game resorts of Minnesota, Wisconsin and Dakota. It is handsomely illustrated, and is full of practical directions for the sportsman tourist. Published by Hoppin, Palmer and Dimond, Minneapolis, Minn.

"Why," answered Whitteu for him, "a deer's claws are much more pointed, spread more, and its dew lumps are sharper and go into the ground. And," continued the graduate in woodcraft, "you ask why it got among the sheep. It is something in their nature that always makes them go among any kind of stock, when dodging, which sometimes loses a dog completely."

"Look here, Melton," said Pat, imitating, "you've bin outen this stand," when to the mortification of the Cold Spring hero, the dogs trailed in ten feet of him.

"Well," said Melton, "I did grow restless about an hour ago, and left this stand for just five minutes by my watch."

"Thunder and Tom Walker!" said the irate Pat, "hain't you got a grain of sense? Don't you know that's just long enough to let a deer pass? Just like you town fellers—the standers! I told you not to go back after your confounded old dog this morning, that you'd have had luck."

"Look here, Bowman, you are a little too personal; take care you don't make a donkey of yourself before this hunt ends."

The hounds passed to a slope facing the east, which was moist, and they became more eager. "Boys," said Whitteu, "is lying just over the cedar point."

"Well," said Melton, with the sharpness of ill humor, "I'll kill that dog yet and redeem myself or break my own or my horse's neck."

"Yes," said Pat, "you'll play thunder!" Such a roar! "Look yonder, boys, see that deer?" said Saurer. "Now Malney, Kendall, herd's to the slayer," and he cocked his double barrel and fairly rose from his saddle.

M-lon seemed no madder than his stormy hack, whose nostrils spread and showed his heated blood. Malney dashed to Melton as if to banter, and then the reckless rided out or deer! Dash over the rail fence, which flew right and left—sprang into the broad field. All took fire, for Kendall was close along with Saurer's careful eye, as Pat came thundering by on his now unmanageable horse. The froth flies from the mouth of the screaming tan pup as he leads out, stretching like a rubber string, fat on the heels of the poor distracted deer. One dash and Malney's steed has the letter of him and passes the deer. Poor Bowman's horse was now far off at a tangent, and with crazy fury approaching a precipice, and as he reached his edge turned short and over it hurled poor old Pat, and was out of sight. "My heavens!" cried Kendall, "poor Bowman's killed," and in a flash he turned from the chase to his rescue. With a vicious sharp crack from Melton's trusty gun the deer, without a struggle, fell amid gathered rustics, drivers, hounds and horses, and Melton had reclaimed himself.

But poor old Bowman! Where was he? With one accord all bounded to his relief. And where was he, sure enough? Below the cliff, where he was hurled, grew a luxuriant and bushy hornbeam, with its like branches, entwined in which was the thick growth of wild grape vines. Pat had fortunately struck this tree in his fall, and his legs were thrust up to his crotch among the tops. Melton's eyes were from some cause moist when he heard of his old friend's fall, but as he peered through the vines at Kendall exhorting the fallen hero with his knife he greeted him with "Hello, rooster, why don't you crow? we've got the deer." "Goodness!" Melton, there's no fun in this. I'm nearly split open. All I want is to get over this, and get out of sight. He then sent me over Pat," and Bow, was extricated with only such injuries as skinned knees and shins, and a stiff spine from the sudden jar.

A week passed off with hunts more or less varied in their results and excitement. The evening before the day fixed for our departure, Melton, Kendall and Saurer had spent in bagging pheasants. The day closed with a sleety rain, chilling the bird hunters severely, and on their entering the cheery sitting room they were confronted with a glowing wood fire. "Pat," said Saurer, "brush up the hearth and put a dozen good ripe apples before the fire to roast, and let's give Kendall a farewell with an old-fashioned Virginia today." "Enough said," chimed Pat, "maybe it will warm up my stove-pan," Melton, said Saurer, "have you any of that old peach brandy left?" "Yes, look in my valise, in a morocco covered quart flask, and you will find it full of brandy Bill Wallace made four years ago out of fine peaches, from which he extracted the seed before stilling." "Don't take the apples up yet, Pat; let them scorch a little," said Saurer. "Do you want anything else to make the stuff with," said Pat; "any other flavor?" "Get me a tea-kettle full of clean water and heat it hot, and some loaf sugar. I would like to know how you could improve the flavor of the peach and apple mixed?" said Saurer. "That's a mess, hot water, apples, sugar and liquor all mixed," said Pat. "You old scrub, take this glass and take back what you said about it or I'll throttle you in a minute," said Melton. A short interim passed and the moisture came on Bow's brow, and he said sprily, "Boys, it's better nor I tho't—let's have another," and he turned and tipped Kendall's glass. "Kindle," said he, "here's to all such Yankees as you; here's to them and their numerous children you talk of; come to my house every year, it shan't cost you a rod." "Yes, may he live to see you agin next fall, old coon," said Melton. "Yes, cuss you, you'd laugh if I broke my neck next fall; you've got no feelin' no how!" The cups were drained.

"Pat, do you know I'm the man who let you loose when wounded at Buchanan at the bridge burning you spoke of the other night?" said Kendall. "By golly, Kindle, I believe it. I believe you were bent to stay my life. I thought I've been you a time, but if you shot me that day and was a Yankee, all right." "I was a soldier, Bow; I have found men like you in the South do not harbor malice at us, and I shall always remember you with kindness and return to see you again." Pat mopped his brow, went weaving to the door with "Good night, boys."

The whip cracked over our teams by daylight next morning, and we went sailing homeward. Thus did the hunters of the Gray and Blue mix.

CARP IN TEXAS.—Kosse, Texas, July 23.—I now have a fine, never-failing carp pond, or two of them, and intend spending more time and money so that I can care for the young fishes. I have some beautiful carp, sent from the Government points here, before last, measuring about eighteen inches, and weighing six or seven pounds. I am in hopes that my pond is full of young carp, but so far have not been able to catch any.—S. B.

LAKE TROUT FISHING.—Fishing at Lake Keuka is good; it is said that a lake trout weighing 17lbs. was caught one day last week.—J. O. F.

TO MY SETTER, "SCOUT."

BY FRANK H. SELDEN.

YOU are a tried and loyal friend.

The end
Of life will find you here, unwary
Of tested bonds that naught can rend,
And even if years be sad and dreary
Our plighted friendship will extend.

A truer friend man never had.

That naught all earthly friends the fewest
Unfaithful ones should be, thus clad
In canine loveliness; yet, trust
They, by their treatment good or bad.

Within your eyes methinks I find

A kind
And thoughtful look of speechless feeling
That Meltry's loosened cords unbind,
And lend's the dreamy past come stealing
Through your dumb, reflective mind.

Scout, my trusty friend, can it be

You see
Again, in retrospective dreaming,
The run, the woodland and the sea,
With past Autumnal sunshine streaming
O'er every frost-dyed field and tree?

Or do you see now and again

The glen
And fern, the highland and the thistle?
And do you still remember when
We heard the orient-cry woodcock whistle
Down by the rippling shrub-edged fen?

I see you turn a listening ear

To hear
The quail upon the drowsy-plumed heather;
But, doubtless, wait till uplands pierce
And then the Autumn's waning weather
Will bring the sport we hold so dear.

Then we will hunt the loamy swale,

And trail
The snipe, their cunning wiles o'ercoming;
And oft will flush the bevil quail,
And hear the partridge slowly drumming
Dull echoes in the leaf-strewn dale.

When wooded hills with crimson light

Are bright,
We'll stroll where trees and vines are growing
And see birds warp their southern flight
At sundown, when the Day-king's throwing
Sly kisses to the Queen of Night.

But when the leaves of Life's fair dell

Have fell,
And Death comes with the Autumn's even
And separates us, who can tell
But that, within the realm of Heaven,
We both together there will dwell?

Modius, Conn., 1881.

A WEEK OF FRAGRANT MEMORIES.

IT was a quiet afternoon just at the close of June. In a boat on a little lake in Pennsylvania (no matter where) a man of middle age and two boys were seated; say, rather, three boys, for on such occasions the man becomes a boy; or, as one of the boys prettily said: "It is only a difference in years; we have much the same kind of hearts in us after all." In that boat three hearts beat fast—two with anticipation of the coming sport and one with anxiety that the others should not be disappointed in their expectations.

The boys were enthusiastic Waltonians, but hitherto their efforts had been confined to the smaller sorts of fish, and they were anxious to try their hands on black bass. The boys had seen some fine specimens, they had heard and read much of the gallant fight for life made by the fish, of the skill needed to take them with light tackle, and with the ardent nature of boys they were anxious to begin the sport. The trip had been long planned, in fact it was arranged last summer, and when the warm weather and lengthening spring days came and told of the approach of the fishing season, tackle shops were visited, questions asked, purchases made, and some dreams dreamed in which fish of unheard of size were taken only after inconceivable effort. And now at length the last recitations in school had been made, the examinations passed, and the boys were free.

Saturday night brought them to the place of rendezvous, where they were to join their older companion. The hour at which they rose on Monday morning no one knows. Certainly it was long before any one else in the family was astir. An early breakfast over, our traps were placed in the carriage which took us to the station, and never did a railway train carry a happier party than did the train that day. A few hours in the cars and one in a stage brought us to our destination. A hurried meal was taken, and a more hurried tramp to the water. A boat was secured for the entire stay. And now the three boys are in it, and off we go, one gallant little fellow managing the oars admirably. There is a thrill of pleasure as we push off, and the bright color mounts the cheeks of all the party. The senior boy is full of happiness; it is high pleasure for him to see the brightness and buoyancy of his young companions.

I had been at the lake before. I knew the easy manner and fastidious tastes of the bass there. Sometimes the wriggling worm is greedily taken, sometimes the minnow is the food they most want, while again grasshoppers are a tempting lure; and there are other lures when they will none of these, but greedily rush for black crickets; to the fly they never rise. Hence there must be some experimenting. Supplied with worms and crickets (the two most easily procured baits) we tried our luck, but crickets and worms alike proved failures, and the result of the afternoon's fishing was disappointing.

Next morning arrangements were made for a supply of minnows, and till they could be procured we determined to try grasshoppers and trolling spoons. Again disappointment attended our efforts. Some others, meeting with a similar lack of success, became discouraged and were preparing to leave. As we wound up for dinner, I said, "Boys, shall we follow their example and go too?" "No, sir," came the prompt reply; "not a bit of it; we came to fish, and we will not give it up so easily, No, sir; we will stay." And then we all

shook hands, and I said something about "the right spirit." Our minnows secured, we proceeded to try them. They proved to be just the needed bait. It was not long before I began a fight with a large bass. The whole performance was new to the boys, and their excitement can better be imagined than described. They fairly yelled when the fish gave his characteristic leap. At last he was secured in the landing net, and hence transferred to the boat. He was handled and admired, his size and weight speculated upon, and then came most naturally from both boys, "I wish I could take you out just like him." They had not long to wait for the fulfillment of their wish. Harry soon felt the peculiar tug at his line, and with a shout, "I've got him," stood up to begin the struggle. Breathless with excitement as the fish leaped wildly from the water, he almost forgot his part of the work; the line was allowed to run loose; the top of the rod was not kept up; again, he grasped the rod. He flue with both hands, so that the line could not run out. You wonder, kind reader? Do you remember the work you made with your first bass? And you were a man, too. Have seen men, more than one, break their rods with their first heavy fish. A word or two from his senior recalled Harry to his work, and right well he did it. Five minutes of battle and another fine fish lay in the boat. It would have been difficult to say which showed most signs of excitement, the captor or the captive; but, I know certainly I have not often seen a happier or a prouder boy, and he had a right to be; he acquitted himself most creditably. There were handshaking and congratulations.

And then came John's turn. John is usually a quiet boy, but under the quiet outside is hidden away a deal of force—force that will tell when he reaches man's years and enters his life work. But just then the quiet outside suddenly vanished, and with a shout like a war-whoop, John sprang to his feet; and then he grew pale as the color was forced out, and he trembled as the fish sprang from the water trying to shake the stinging hook from his mouth. But with some directions and a little aid he landed his fish, and the third fine bass graced our boat. Then came reverse, for Harry lost two—one just as it seemed ready for the landing net—John lost one and I lost two. There were some long and not very happy looking faces just then. But we did not lose courage; we kept right on, and when our fourth and last fish was carried to our hotel a goodly string of fish. I do not think any of the three happier hearts anywhere than the three hearts that night in the little country inn beside S—lake; two because of their first experience in bass fishing, and one in the enjoyment of the others.

Day by day for a week we repeated the work of this one afternoon. Nice strings were taken; boxes of fish packed in ice were sent to father and grandfather at home.

And we not only had the pleasure and comfort of innocent amusement, recreation and sport; we enjoyed to the full the beautiful country, with its high hills, its fields of ripening grain and its grand old forests. The mountains in the blue distance lent their charm. Light and shade followed each other over the lake and the peaceful fields as sunlight and cloud alternated in the sky. One night a grand thunder storm awed and yet thrilled us with its terror and magnificence.

We used to take supper with us and eat it in the boat in the quiet hush of the evening, amid the glories of the fading day as the sun went down behind the surrounding hills. What a delight was that quiet hour, spent in the midst of the waning splendors of the sinking sun.

But the end of that happy week came. Our lines were reeled up for the last time, our rods unjointed, traps packed and good-byes said to the kind people of the inn who had done so much for our enjoyment. We could not but be glad that our pleasure there was at an end, but we were glad and thankful that we had been allowed to have so much of it. We turned our faces homeward; the boys to finish their vacation in a beautiful country town; I to work. But there is in my life to-day a strain of music and a bit of brightness that was made there by a week with two bright, kindly, pure, affectionate boys. Dear young hearts, I wonder whether you know what a place you have made for yourselves in the older world, and whether you know how much of the joy of intercourse and constant association has endeared you to your companion. May we live to have many such "good times" together; and when I shall have unjointed my rod for the last time, may you, in the midst of your enjoyment, think of him who gave you your first lessons, and say in the words of dear old Walton, "May the blessing of St. Peter's Master rest upon mine." M.

August 4, 1881.

THE MAGALLOWAY COUNTRY.

MAGALLOWAY RIVER, Maine, July 26. AS I have been in different countries and in many parts for the past eight years I think I can safely say I have discovered a gold mine this season in the way of hunting and fishing. Large game is very plenty, embracing moose, caribou and deer, and small game is abundant. With a good fly-rod and landing-net you can have all the fun with the speckled beauties you desire. Our friend Eaton has just returned from Sunday pond with four fine trout, weighing respectively, 23, 34, 35 and 43 pounds. This little pond is in full view of our house, and is about an acre in extent. It is very shallow, either inlet or outlet, but is fed by springs and is kept well stocked by our landlord for the exclusive use of his patrons.

There are five or six ponds within a short distance, well stocked with trout, and up the river four miles is the large and beautiful sheet of water called Parnachewe Lake, to which the readers of the FOREST AND STREAM need no introduction. Deer can be seen nearly every day at sunset on the edge of the pond opposite our camp, and in June two moose came regularly down to the water to drink, but as the season advanced, fearing the guns about the pond, they left for some safer place in which to quench their thirst. Last Tuesday our guide, Flint and myself went to Upper Metallic Lake fly-fishing and on returning saw before us a large moose in the water. As I did not wish to try him with my fly-rod we had the pleasure of paddling up within about three rods of him before he knew of our presence, but when he saw us he gave me a mighty leap and away he went into the forest. In this section during the fall months one can have all the sport he desires in the way of hunting or fishing. If it were in the season for still hunting I could give your readers some of my experience in that line, but as it is out of season I will forebear. However, I can assure them if they will come to Flint Camp they can have all the sport they wish for.

For the benefit of those, if any there be, who may wish to come to this place, I will give full directions for getting here from Boston. Start from the Boston and Lowell depot with

an excursion ticket to Colebrook, N. H., and return via Concord, Boston & Montreal R. R.; take the stage at Colebrook through Dixville Notch to Errol Dam, Bragg's Hotel; thence by steamer up the Magalloway River to Brown's farm; from there by private conveyance to Fred Flint's camp at the head of Eschsch Falls. There you will find guide F. L. Mason, who will take you by boat up the stream, twenty-five miles, to Flint's Landing on the "Island" or "Islet," and after thirty minutes' walk you will be here where I now sit, and you will, in season, find a good, hot supper of moose or deer steak awaiting you, which I have no doubt you will enjoy.

S. H. B.

FROM MOOSEHEAD LAKE TO THE MAIN ST. JOHN.

IN THREE PARTS—PART III.

ON the morning of June 4th we bade adieu to our log camp and hastened on our journey. A pull of thirteen miles took us to

DEPOT FARM.

before described. Here we tarried for an hour with a veritable Robinson Crusoe with his little dog, although he answered to the name of John Harvey. He and his dog are the sole occupants of the forest hereabouts. In a little log hut he lives, and since last fall he had seen no human face till the day before we came, when a party of three came across from "Soren Island" or "Islet," and after thirty minutes' walk you will be here where I now sit, and you will, in season, find a good, hot supper of moose or deer steak awaiting you, which I have no doubt you will enjoy.

SQUARE LAKE.

and two more through it, into the third section of the Allegash.

From here (the foot of Square Lake) it is three miles to a good log camp. (As log camps are very important to a sportsman in his journeyings I have been very particular to locate all I am familiar with.) It is a comfortable camp, except the roof has been removed from one side to furnish material to build an oat-bin hard by; the remaining roof, however, is tight and in good condition. It is on the left bank, about fifteen rods from the shore, at the foot of the second pitch of water after leaving Square Lake, opposite a big eddy, and may be seen from the river if you look sharp. During the night, while sleeping here, I was awakened by Newt's melodious voice, shouting, "Sam! Sam! Sam!" each time louder. I thought at first he had the night-hoarse. Then I heard Alf mutter, "Dod butter it!" What ails him? Sam, however, awoke finally (but I declare I thought he never would), and grunted out, "What you want?" "What's that, gnawing?" answered Newt. By this time we were all awake, and distinctly heard a loud gnawing outside the door. "Something trying to get our stores," shouted Ned, as he grabbed the rifle, and "Dod butter it!" lighted a match. As the match was struck a large rabbit slipped lively away, but he was not the disturber of our peace; outside was a big hedgehog, trying to get at our salt; but before Ned could get a bead on him he got!

The next morning, June 5, was lowery, with occasional light rain, which continued in light showers till the middle of the afternoon. We, however, broke camp at an early hour. About a mile and a half below, on the right bank, we passed

MESQUAGOC STREAM.

which affords fine trout fishing, and some three miles below this is

FIVE FINGER BROOK.

which empties in on the left. The latter stream I have never seen on any published map. It deserves attention as furnishing fine fishing ground in the summer and fall. From our camp of last night it is about twelve miles to the border of civilization, which announces itself by a little log hut on the left bank, occupied by Joseph Gilbane. We were advised this is not the most promising place to stop at, but

FINLEY McCLellan's.

whose house is somewhat larger and whose possessor is rich! which means here from two to three thousand dollars. McC's is a few rods below on the same bank.

From this point to Allegash Falls it is about three miles, and if a few scattered log houses along the bank of a river constitute civilization, then indeed we are out of the wilderness. But I confess it hardly seems so to me. Between here and the Falls are four log houses, three on the left and one on the right bank. The water hereabouts is quiet, with occasionally quick water, but after leaving McCellan's it is mostly quick till you reach Allegash Carry. We tarried at McC's for half an hour or so and chatted with the old folks while we warmed our shins before a huge cooking stove, for it was quite cold in the humid atmosphere outside. About noon we continued our journey, and made the run of three miles to

ALLEGASH CARRY.

in thirty-three minutes. At the head of the carry we got up a fine dinner of corned beef hash, and then dragged our luggage over the carry (a fair road) some forty rods, on a wooden sled or skid which is kept there for that purpose.

"THE FALLS OF THE ALLEGASH"

are decidedly picturesque and impressive. The river narrows up at this point and discharges a large volume of water through a very narrow gorge cut through a solid ledge. The falls is directly precipitous only some thirty or forty feet, but it has a final fall of some seventy feet, covering a space of some fifteen rods in its whole decline, reminding one strongly of Trenton Falls.

Below the falls we again embarked. There are several pitches of water between the fall and the St. John, but none dangerous, only a little lively. There is much shoal water also, and we scraped and bumped along at times, but got over them without much trouble. About 5 P. M. we made our junction with the

MAIN ST. JOHN.

where the whole feature of the country changes. The banks of the St. John from here down are mostly cleared, and from scattered huts you come to small settlements and extensive farms, with fenced lots, growing crops and waving grain.

Before leaving the Allegash I must note two or three scenes that impressed us all strikingly, which was the sudden falling off of the river bed at times when a long, straight gorge of a quarter of a mile presented itself before us. Sometimes it would appear we were riding down a steep hill on the face, as apparently was the current. This was especially noticeable at the mouth of the Allegash. At

first we thought it an optical illusion, but we found it not to be so. At this point the decline of the bed of the river is very great, and the water runs with exceeding swiftness, yet the surface is almost unbroken, and from the upper point you look down the incline as you would if you were sliding down hill, and the sensation of running this quiet water is a peculiar but pleasant one. About half a mile below the junction of the Allegash—the on the St. John—is the worst pitch of water we encountered on the river. It is a long, low, rocky ledge, quite sharp and choked with rocks on every side so there is hardly a channel anywhere.

The birches went ahead and chose the south shore, which happened to be the proper channel, hard in shore.

Expecting to find the best water, we took the very middle. We had just entered the seething current when a native shouted to us from the shore, "You can't get through there, the channel is on this shore." This was indeed pleasant to contemplate, dashing as we were rapidly toward rocks which threatened destruction. "What shall we do, John?" said Sam. John passed for a second only, for time was indeed precious, when he replied, "I guess he's right; I don't see any way through here."

"Shove her across, then, with all your might, if you get a chance, and try for the channel," shouted Sam.

And a moment after John headed her for the south shore, but, alas! it was of no use, we were lemmued in. "It's no use," ejaculated John, "we must go through straight, somehow." At the same moment, Thump!—and we brought up on top of our rock; for an instant our staunch bateau shivered and trembled, while the maddest waters piled up around us; but, thanks! they proved our salvation, for they finally got under us and lifted us off the rock, and we took a new start and ran safely out of the vortex.

I learned that evening that a boatman was drowned on that pitch last spring. As an Irishman would remark, "The next time I run that pitch I'll go around it."

A mile lower down and you reach

JOHN CASBY'S.

where sportsmen always tie up if they delay here, and where we tied up for the night. His house is on the left bank.

They make no pretensions to accommodations, and we found them poorly off in the way of provisions. Could give us pork and potatoes, but ham, eggs, bread—no. We might borrow their stove, and they could furnish a little milk and some butter. So Ned pulled off his coat, and while talking honey to a pretty French servant girl, he got up a good supper; but, O! such biscuit as he made with milk.

"O, I'm what you call him, that rises on top the milk," he replied, when we praised those puffy biscuits.

But patient reader, will you excuse my patience much longer? I have been willing to know, but have endeavored to give an accurate history of this trip in detail, that you might profit by it if you should ever desire to make it. The distances and other statements of facts are as true as my poor ability can furnish.

In a few words I will take you to the end of our trip.

June 6 we resumed our journey down the St. John, reaching

ST. FRANCIS PLANTATION.

ten and a half miles from Casby's below and a half hour, passing through two or three strong roads, but plenty of water, and drew our boat ashore at Martin Savage's, opposite St. Francis River, where we hoped to get dinner. It is a large farm, with a large and pretentious house and inviting surroundings and where formerly travelers were heartily received and provided for, but Mr. Savage was away and the lady of the house said they had not entertained of late, as they had a large family of workmen to care for, so we re-embarked and stopped off at

NEEDHAM CASBY'S.

three miles below, on the left bank. They did not keep public house, but would get us a dinner; and they did—a good one—but would make no charge. We, however, remembered the servants.

Mr. Connor is quite well off and very hospitable, it is said, but he was away on a "drive." He is building quite an elegant house here, for these parts, and may live long to enjoy it.

Leaving Connor's, log-houses a more frequent and small settlements appear. Seven or eight miles below we arrived upon the left bank attracted our attention, so picturesque was it, nestled among the rude habitations about, with green fields setting it off to good advantage. From Red Church to

PORT KENT

is five miles and mostly quick, but good water. We made the distance in a little less than one hour. Fort Kent is on the right bank and consequently in Maine. On the opposite bank is Miraflo St. Francis, a Canadian settlement. We stopped at Sumner's Store hotel in Fort Kent, a jolly place to tie up to, with comfortable beds and a good table. Fort Kent is very prettily situated at the confluence of Fish River, which makes in from the south, and the St. John. It is quite a thrifty little village, with a store, post-office and Catholic church. We found the church open and entered. It was a rustic affair, but somehow impressed us wonderfully. In the body of the church were rude wooden seats, without cushions, paint or ornament of any kind. A rough stairway, without railing, led to the gallery, which we mounted, and a primitive bell-rung hung idly by, but we refused to touch the tongue of the little bell a-awing, but we profaned not the solemn stillness that reigned within. Descending the stairs we approached the altar, around which imitation wax candles stood ready for lighting. Here and there hung cheap prints of the Saviour nailed to the cross, Mary and the saints. With noiseless step we retreated from this hallowed precinct, closing carefully the heavy door behind us, that we might not disturb the holy silence that prevailed. We next visited the Block House, hardly, which plays an important part in the history of Fort Kent. It was built some forty years ago as a fort, in anticipation of a war with Great Britain, over the boundary line between Maine and Canada, but the matter was finally settled by treaty in 1842 without bloodshed. It is built of heavy timber, with loopholes for rifle and cannon, and is situated on an eminence overlooking the St. John and Fish rivers and near their junction. At Fort Kent we sold our bateau, agreeing to deliver it at Edmundston.

At five the next morning, June 7, we resumed our journey in order to reach Edmundston, the terminus of the New Brunswick R. R., in time for the train, which we were told left at 10:30, as we were also advised it would require five hours to reach there—twenty miles. We, however, did some good pulling, and reached there in three and one-half hours—viz., at 8:30, and were there informed the train would leave at 11:30, thus giving us three hours to spare. The ride from Fort Kent to Edmundston comprises one of the most

interesting sections of the whole trip. The wilderness has now disappeared from the banks of the river, and log huts have given place to more modern structures, although many rude affairs are still frequent. The soil along its borders, however, is rich and fertile and picturesque in appearance, and I was more than once reminded of the Rhine of Fatherland as I saw it ten years ago. Much of the way, on either side, the land is level for a distance back from the borders of the river, when it gradually slopes upward till it rises with a graceful incline several hundred feet above the bed of the river. In many places along it is entirely cleared of wood and subdued into fillage, pasture and mowing lands.

The most charming scene which engaged my attention along this section was at a point on the south bank of the river called

FRENCHVILLE.

where near the bank is a small settlement, a rustic village with a neat little church and open spire. In the background is a long, high range entirely subdued, and mostly devoted to grass and grain, thus presenting different shades of green to the eye. From the summit of the range to the village, long stretches of fences appear, running mostly one way only—i. e., from the top down, as is chiefly the case on the Rhine.

A solemn quiet prevailed as we passed this secluded spot, giving the whole picture a dreamy aspect, which was at once charming and impressive. There are but few rapids between Fort Kent and Edmundston, and in this respect the trip grows so exciting and more monotonous, although the scenery all along is inviting to the lover of nature.

We encountered some logs *en route*, but got through without difficulty.

EDMUNDSTON.

Little Falls, or Madawaska, as you please, are one and the same place, and is situated on the left bank of the St. John and right bank of the Madawaska at the confluence of the Madawaska River, which comes in from the north, and the St. John. The railroad station is on the same side of the St. John, but the left bank of the Madawaska. The village is small, with a hotel which is passable—i. e., you had better pass it. At Edmundston we bade good-bye to the river, delivered our bateau, got our canoes and luggage to the station, and at 11:30 started for Grand Falls, thirty-nine miles distant. The road is a very rude affair, and slow time a necessity. We made the distance in three and one-half hours, or about twelve miles an hour.

GRAND FALLS, N. B.

are two hotels, the Grand Falls Hotel and the American. We found the former, which is the better, and which we stopped exceedingly good, considering their facilities. Grand Falls is quite a romantic place, with a population of some 500, on elevated ground overlooking the falls, which are some seventy-five feet high and quite picturesque. Below the falls is a suspension bridge for ordinary travel, from which you get a fine view of the falls and river below. Below the falls is a deep chasm with beetling cliffs on either side. On the west side is a rustic stairway leading to a small ledge overlooking the river. In the summer season Grand Falls is a favorite resort of summer boarders. A great drawback to an American would be the want of facilities for reaching it, for, while they have a railroad, they make short runs and long stops. From Edmundston they run to Aroostook, twenty miles below here, fifty-nine miles in all, returning as far Grand Falls the same day. You reach Aroostook at 4:20, and must remain here over night. At 9:30 next morning you leave Aroostook and reach Woodstock about 2 P. M., where you must remain until the next morning, when you leave at 9 A. M., and thus reach Bangor in time to take the evening train for Boston, hence three days from Grand Falls to Bangor, 253 miles! So tedious are they that even the Government sends its mails by a one-horse wagon, which runs night and day, and thus beats the railroad one day out of three!

In our haste to get along we took a wagon at 6 A. M., June 8, from Grand Falls to Aroostook, eighteen miles for \$10, reaching there at 9 A. M. in time for the train, and arrived at Woodstock that night, stopping at the Gibson House, which is the best in the place.

On June 9, we left Woodstock, reaching McAdam Junction on the E. N. A. R. R. at noon. At the station we got a miserable dinner. At 6:15 we reached Bangor and took a coach to "Bangor House," where we got a first-rate supper. At 7:45 we took a sleeper for Boston, arriving there at 6:30 the next morning.

GENERAL REMARKS.

And now, patient reader, after the manner of a minister toward the end of a long-winded sermon, I will draw my discourse to a close.

Regarding the best time to make this trip: If the objective feature is hunting and fishing, decidedly September and October are the better months, as there are few or no flies; fly-fishing is in its prime and both lake and feather game is more readily found. Partridges are very plentiful at this season. Running the rivers is not as easy then as in the spring, unless the fall rains have raised the streams; yet there will be no great difficulty in that direction. As to the place to rendezvous for the best hunting for large game, Eagle, Churchill and Long Lakes stand pre-eminently, although there is not a mile of territory between Chamberlain Lake and the mouth of the Allegash that does not abound in game. Deer, which a few years ago were almost extinct in this State, have lately been increasing rapidly and now are quite plenty. Trout, it is hardly necessary to add, are abundant, at the mouths of nearly every stream that flows into the main river, as also in the still waters about the falls and rapids.

As to provisions it is better to take some kinds with you as can get a better quality and variety at home than on the lakes. This we found notably so regarding salt pork, an almost indispensable article in the woods. There is plenty there, but not nearly so choice as we carried in. The same is true of meal, hardback, coffee, and so on. Onions are sometimes difficult to get *en route*, and they play no mean part at one's dinner; in chowder they are a *sine qua non*; while cut up in vinegar they are a great appetizer (although perhaps a superfluous in that respect). Potatoes, good butter, flour, sugar, etc., can be procured readily at Greenville, but after leaving there they are more uncertain—especially butter, make sure of that at Greenville. Sugar should always be taken in the lump, as it never wastes in this shape. If you get them at Bangor, where you can also if you wish get everything.

After leaving Greenville we got short of butter and were placed on short rations with that article for several days. Potatoes, pork, etc., however, we found at Suncook and Chamberlain farm. As to the quantity of provisions to take, that is a conundrum, as appetites are so uncertain, and while

gorge a trout seven inches long. I am quite sure the fish was dead when he took him, as I saw two dead ones that morning...

HOW DID THE FISH GET THERE?

I HAVE for four or five months been making a carp pond by digging out a piece of ground below two small springs...

The springs run some fifteen feet before they get to the pond, and do not run a stream large enough for a minnow to go in...

ALBINO SWALLOW—SIOUX LAKEVILLE, N. Y., Aug. 5.—Seeing mention of an albino swallow at Newport, in a recent issue of FOREST AND STREAM...

WRIGHT OF WOODCOCKS.—Horseshoekville, N. Y.—A perfectly black, full-grown woodcock was killed here last week...

Hotbird Shooting Suits. Uplandgrove & McLellan, Valparaiso, Ind. Bad Dreams, Disturbed Sleep, Indigestion, Stomach Gas, all vanishes before Hot Birds.

Game Bag and Gun.

THE ILLINOIS SPORTSMEN.

THE annual convention of the Illinois State Sportsmen's Association was held at the Palmer House, Chicago, last week...

Mr. Abner Price, the Secretary, presided to the Convention a report of the Magnus case...

Resolved, That it is the sense of this association that trap-shooting is not an incident connected with our annual convention...

The following are the new officers for the coming year: President, Dr. F. B. Norcom...

The following are the new officers for the coming year: President, Dr. F. B. Norcom, South End Gun Club, Chicago...

It gives me to see this whole class insulted and maligned solely for the wickedness of one of their number.

These noble fellows have hard work and none too much pay for their services.

FOREST AND STREAM GAME TABLE.

OPEN SEASONS.

The seasons, in which it is lawful to shoot game in the several States and Territories, open as designated in the following table.

Table with columns: States, Deer, Woodcock, Quail, Ruffed Grouse, Pinnace Grouse (Prairie Chickens), Wild Fowl, Wild Turkey. Rows list various states and territories with their respective seasons.

Antelope—Col., Sept. 1; Idaho, Aug. 1; Neb., Oct. 1; Nev., Aug. 1; N. Mex., Sept. 1; Utah, Aug. 1; Wyo., Aug. 1. B. G. C. Me., Oct. 1; N. H., Sept. 1. Ducks—Ala., Aug. 1; Cal., July 1; Ga., Oct. 1; Kan., Aug. 1; Miss., Sept. 1; Mo., Aug. 1; N. C., Oct. 1; N. D., Sept. 1; Or., July 1; Pa., Sept. 1; S. C., Sept. 1; Tex., Aug. 1; Va., Sept. 1; W. Va., Sept. 1; Wis., Sept. 1; Wyo., Aug. 1.

In these States there are special county laws. a The deer law applies to sale or possession. b Wildfowl not protected on the coast. c In Upper Peninsula deer season opens Aug. 15. d California quail prohibited to 1888. e In Cook County deer season opens Aug. 1; in other parts of the State, Sept. 1. f In Illinois, deer season opens July 1; in Wisconsin, Aug. 1. g Quail shooting prohibited to Nov. 1, 1882, in counties of Montgomery, Schenectady, Saratoga and Albany. h Wildfowl season in Lake Michigan waters opens Oct. 1. i Woodcock shooting in Dutchess County prohibited during August. j Deer law relates to female deer only.

NEBRASKA GAME GROUNDS.

IN THE Birchwood Creek country, twenty-three miles from here, reached by wagon or horseback ride, sportsmen can find deer, elk, and an abundance of ducks and grouse.

After staying here a few days the hunters can pull up and go to Cody's ranch, and to North's ranch on the Dismal River, sixty miles from North Platte. They will find an abundance and variety of game there...

It costs little to hunt here. They may think the boys a little rough; but we are big-hearted and always do all in our power to make our friends enjoy their stay.

A GOOD WORD FOR ADIRONDAK GUIDES.

I have lately seen paragraphs in the daily papers which speak harshly in a general way of the Adirondack guides. The Evening Mail said: "Adirondack guides would seem to be a class of men to be let severely alone."

Now, from all that I have been able to learn, the only act that has been committed by a guide that would give any cause for this paragraph was the atrocious assault by a guide named Parker upon a lady he was guiding from Forked Lake to Long Lake...

But because one man has sinned, are they all to be put under the ban?

In my wanderings through the Adirondacks, which have extended through a good many years, I have met and become intimate with many of these guides and, while there are great differences between them as to talents and ability, I do not know of one in all my circle of acquaintance that I would hesitate to tramp the woods or paddle upon the lakes with at any time or under any circumstances.

These noble fellows have hard work and none too much pay for their services. Don't let anything be said or done that will hurt our customers to look upon them with distrust or suspicion.

POT-HUNTING BLACKBIRDS.

A LONG the Delaware River below Chester the market hunters are killing blackbirds by the hundreds, having adopted a new and most deceptive method for their destruction. A blind is built in the course of the morning and evening flights of the bird, and the gunner patiently waits its appearance.

We are having a long spell of dry weather here. All the small streams are dried up, and the woodcock, in order to exist, has taken up his quarters in the river bank cripples, where the ground is kept moist and in boring condition by the rise and fall of the tide.

Grass plover have appeared in the fields around Philadelphia, and their note is heard every evening as they wing their way over our city.

SHOOTING AT PORT JEFFERSON.

WHILE roaming around the fields and through the woods surrounding this growing country resort I came to this conclusion: that quail shooting is going to be grand this fall.

While conversing with Mr. W. H. Raynor, of the firm of B. R. & W. H. Raynor, proprietors of the Port Jefferson Hotel, or in other words, the Sportsman's Retreat, he informed me that they have spared no pains to set up every thing first-class for the accommodation of city sportsmen.

Adjoining the hotel is a shady lawn for playing croquet and lawn tennis, and their terms are very reasonable—only \$7 to \$12 per week, with any guests who may favor them with a call, whether it be of long or short duration, and there are no mosquitoes to trouble you, and the evenings are delightfully cool.

Wild ducks are in abundance, and no one need go two or three hundred miles to find good duck shooting. It is an every-day occurrence to see a quail, come up with the bag with the early ducks, on a morning's shoot during the fall of the year.

A BRACE OF WOODCOCK.

FOUR of us had been settling in the latter part of July, and had found some "patches" which promised excellent shooting. In fact, as late as July 25 in one patch the dogs would put them up on every side.

A counsel of war is held, and we determine to try another patch, but our high hopes are "petering out." By chance I happen to cast my eye on the old dog a few rods away in the grass; he is as stiff as a saw horse. I step that way and give him the word and we have two.

A counsel of war is held, and we determine to try another patch, but our high hopes are "petering out." By chance I happen to cast my eye on the old dog a few rods away in the grass; he is as stiff as a saw horse.

shower; but we had the birds—who cares for weather? Crossing the N. Y. C. R. R., we discovered a hunter, from Syracuse, worn and weary, and with empty bag. His forlorn condition aroused our sympathies, and we handed him a brace to keep him from suiciding.

This letter may be lacking in quantity of game when compared with those which appear in your columns from week to week, nevertheless I believe it excels them in truth, and that is desirable.

I believe the man who approves of August 1 as an open season for woodcock is just a month too late for this section of the country.

I hear of many woodcock being shot the last week in July, and kept on ice for Monday, the 1st of August, but don't know of any. I believe the law is very generally respected. Yours for earlier season, NOVOIE.

WILD CELERY.

IN THE FOREST AND STREAM of July 7, 1881, inquiry was made concerning the cultivation, sowing or transplanting of wild celery (*Valeriana spiralis*) in waters to serve as food for wild fowl.

Although I am not prepared now (others may be) to give all the information solicited, yet in a cause of so much interest to sportsmen in the food attractions of wild fowls in your locality, I should be glad to see the experiment of transplanting tried and will cheerfully give all the information and aid I can.

It grows in enormous quantities on the grounds of the Winous Point Shooting Club, in Sandusky Bay, where the canvas-back, red-head, wiggon and other water fowls resort in great numbers to live and fatten on its nutritious roots. The seed blossom is produced upon a small spiral stem and floats upon the surface of the water; but I think seeds could not be gathered in condition or quantity for sowing. But as it grows annually from its roots these can be gathered in any quantity desired, and no doubt would readily grow and spread if transplanted in suitable grounds. The water may be from six inches to six feet deep over a mud deposit of at least two inches deep above the clay or hard bottom where the plant is made.

I think it should be planted in the fall, after the bulbs are matured and before ice is formed—somewhere between Oct. 15 and Nov. 15; and if any one desirous of trying the experiment will address a letter on the subject before the 15th of November I will endeavor to have the roots gathered, packed in moss and forwarded. There will be no expense out of boxing and transportation. D. W. Cross.

488 Euclid avenue, Cleveland, O.

PRAIRIE CHICKEN SHOOTING.

OSAKA, MINN., August 2.

Editor Forest and Stream:

I think the law prohibiting the killing of prairie chickens before Sept. 1 is a good one, although many object to it. From my observation (and I have shot in this State several seasons) I have found many coveys not full grown on Sept. 1, especially when their nests had been destroyed by burning prairies, or other causes. But in many sections of the State, I am sorry to say, the law is a "dead letter," and many chickens are killed in the early part of August. Indeed, some have been killed in this section already. And what is one, who is here seeking his health, an ardent sportsman, desirous of getting all the exercise and pure air possible, to do under the circumstances? Would you advise him to passively abide his time till Sept. 1 and then go out to find no chickens, or to endeavor to enforce the law and get kicked out of town?

But enough of this. I did not expect you to answer these questions, but as I had frequently thought over my position here and what I should do, the same thoughts come into my mind now. The prospect for chickens is good throughout the State and some are two-thirds grown already. The writer is from St. Louis, seeking health, and will be in the State till about Nov. 1. About Sept. 1 he will probably go to Kandigohi, in the county bearing that name, where there is said to be an abundance of game and few hunters. In fact, one can find game plentiful away from any of the larger towns. Geo. G. Cole.

PHILADELPHIA NOTES.

THE fall season of the Germantown Hare and Hounds Club will open in September with a drag hunt. Mr. Wall's packs of imported English fox-hounds will make their first American appearance on this occasion. Much is expected from these dogs, as they came from some of the finest kennels abroad. A better lot than a drag hunt would be the participation of Reynard himself, but it is not always a live fox can be had so near Philadelphia.

Philadelphians at Atlantic City say the fishing there has never been better for many years. This is the effect of the prohibition by law of early seine fishing. It is likewise felt at Great and Little Egg Harbors and at Barnegat, N. J. Our friend Kinzey labored arduously for the passage of this law, and deserves the thanks of all lovers of "the gentele art" of angling.

The Philadelphia schooner-rigged yacht Vega is in the Gulf of St. Lawrence with a party of Philadelphians on board.

The extreme dry weather for twenty miles around Philadelphia during the two past weeks has driven the woodcock to the river creeks and drifts, and quite a number have been killed along shore by market shooters. As all the wet feeding places inland have become parched and dry the birds are obliged to seek the thickets bordering tide-water streams, as the only ones remaining where food can be had. By-the-by, speaking of woodcock, we noticed in last week's Forest and Stream a letter from a correspondent, in which it was stated that one of these birds was seen in company with some sparrows in your Reservoir Park "pecking about." Can it be that a woodcock was seen pecking as sparrows do? Surely your correspondent, if he was acquainted with the woodcock at all, must have known that their bill can only be used for boring, and then only in soft ground. Perhaps the bird he saw was woodpecker.

On the 2nd last week a son of Mr. John L. Bullock, of our city, while endeavoring to throw a ground nut into the monkey cage was caught by the finger by one of the monkeys and the first joint bitten entirely off. There should be a close wire screen at the bottom of the cage to protect children from just such accidents as this, or the monkeys should not be allowed to be fed by visitors at all, and the peanut

vendors deprived from offering their stock in trade for sale within the enclosure. A suit for damages might result from just such accidents as this, and the management should attend to the matter.

Last week a resident of Trout Run, north of Williamsport, Pa., while out berrying, accompanied by his dog, was attacked by a huge bear and two cubs. With nothing but a pine-knot, hastily picked up, the bear was kept off until the dog in the rear, snapping at her heels, attracted her attention and the frightened countryman made tracks for a tree and saved himself. It has been many years since a bear has been seen so near Williamsport.

The woodcock shooting in the neighborhood of Philadelphia has been very poor this July. Few have been shot. On Tinicum Island during the first week of the month the market shooters bagged a respectable number; but since that time, I learn, "it has hardly been worth while to go after them, besides, it is too hot." Grass plover have shown themselves over our meadows, and every night their mellow whistle is heard as they wing their way over the city. This is early for the field plover to appear. We hardly look for him here until August 1, and therefore is not the fat, plump bird he is about the last of the month. Home.

OSAKA, MINN.

Editor Forest and Stream:

In answer to your inquiry as to a good point to camp, etc., I would recommend Osakis, Minn. It is a town of about 300 inhabitants, on the St. P. M. & M. R. R., 130 miles from St. Paul. It is situated on the south end of a lake fourteen miles long, abounding in fish. On the south is a boundless prairie and on the north heavy timber. The prairie furnishes chicken and duck shooting and the timber deer and ruffed grouse. There were 2,000 deer killed within fifteen miles of this place last fall, with an occasional bear. The prospect this fall is just as good. The duck and chicken shooting never looked more favorable than for this season.

I have spent fourteen years in Minnesota in different locations, and, taking all things together, I like this point the best. Should any of the readers of FOREST AND STREAM want to visit Minnesota this fall, I can recommend it for good fishing, shooting and a good hotel. Any letter of inquiry directed to me will be cheerfully answered.

S. W. SCOTT, Osakis, Minn.

DUCK SHOOTING RESORTS.

CHILLICOTHE, Peoria County, Ill.

IN your issue of July 28 is a letter from J. W. B. desiring to be put in communication with some one who is a professional duck shooter in the West. Should our location suit him (on the Illinois River, 140 miles south of Chicago) I shall be pleased to enlighten him in regard to Western duck shooting. He may address Box K, Chillicothe, Peoria County, Ill.

Our prospects for shooting are better than usual this season. The lakes are full of rice and other feed for ducks. Prairie fowl have done well, and quail, notwithstanding the last severe winter, are seemingly as numerous as ever. I have hunted for the last twenty years, am well acquainted with all the duck country for 400 miles below this place, and think that Chillicothe is the best point for ducks I ever saw.—LEOY.

CLEAN GUNS.—The gun cleaner devised by Dr. T. Yardley Brown, of Reading, Pa., is attracting much attention. The doctor has a large practice and confides his killing to game only, sparing his patients. He has sent out a great number of the cleaners, which consist of a brush with one end and patch for oiling and loosening the dirt in the barrel, and a rubber cone with patch called the cleaner to remove it. The cones on cleaners are nicely fitted to the caliber of the gun, and are readily covered with circular flannel patches, which are removed when dirty and clean ones substituted. The cleaner is ceased in a neat leather pocket book, four and one-half inches long and two and one-half inches wide, containing patches and a couple of cleaners.

On Wednesday, the 8th, Dr. Brown—who has in his possession a large number of testimonials from such men as Gen. George Crook, the Indian fighter, and poor Major Thornburgh, who was killed several years since, and who purchased fully a dozen of them for his friends—took advantage of the opportunity afforded to display the merits of the article and went to the Potstown encampment. He secured an audience with Adjutant General Latta, Major General Hartman, Brigadier General Snowden, Major Ryan and quite a number of other notable old soldiers and exhibited the appliance. The doctor shot a blank, showed the foul gun to Gen. Hartman, made two draws with his cleaner, and then exhibited the inside of the rifle as bright as a dollar. When the report for the day was made the gun cleaner was incorporated among the recommendations, and it is likely the Pennsylvania Guard will be fitted out with them before long, each man being supplied. At present but three companies in Potstown commands—and they would not part with them on any pretense. The invention would prove invaluable in keeping the State Arms in trim.

The cleaners are made for all styles of shotgun and rifles of all the various calibers.

EAGLES AND DEER.—Until within a year or two I have tried to protect that "noble bird" from all attempts on his life by my "breathing" of the gun, but I've been converted, and he may number me now among his enemies. I have had many talks with a Florida ship-lumber man, and found him thoroughly posted. He informed me that great numbers of deer were killed by wild animals and human hunters, but that the destruction by man and beast combined was nothing compared to the bloody work of the eagles. He says they will sit on a tree in the swamp for hours watching a doe and fawn, and when they find them separated a few feet swoop down on the fawn, and its fate is sealed.—DIXIEY.

AMMUNITION WITH A RECORD.—ROCHESTER, Mich., Aug. 2.—Editor Forest and Stream:—I would like to see and find a quantity of the best of the best proof gun caps, the history of which is this: They were bought by Wm. Billingshurst, of Rochester, N. Y., in the year 1856, by Dr. F. M. Wilcox, and carried by him on a trip of several months into the northern Canadian wilderness. By chance part of a box of these caps have been retained by the Doctor until now; and have been taken by him on numerous trips, so that they

have seen more than a year of camp life altogether. In 1873 they were, by a railway accident, submerged in a trunk in the Walland Canal, lying in the water twenty-two hours. They were then taken on to New York State, and with the other contents of the trunk unpacked and dried. The caps were completely melted, the box not being waterproof. Now please examine these caps, which have been exposed in long camping trips besides the submerging they got in the canal, and are at least a quarter of a century old, and see if they are good. We find here that every one goes.—G. F. WILCOX.

We have tried the caps and find them all right.

A WEEK AT GOOD GROUND.—On Monday, August 1, I started for a week's cruise after the bay birds at Shinnecock Bay, Long Island. I boarded the 3:20 P. M. train on the Long Island Railroad, and, after a ride of two hours, arrived at Good Ground, where I was met by Mr. Lane's son John, who conveyed me to that haven for sportsmen, William N. Lane's. Bill was as jolly as ever, and informed me that the prospects for shooting were good. Although there were several foggy days during the week, the average bag was about twenty-five birds, and if the weather had been favorable I would have done much better. I had for a guide St. Foster, better known as the "Baby." He weighs about two hundred and fifty pounds and is one of the oldest and best guides on the bay. The flight of willet are expected every day, and when they come you will hear of some big bags. The prospect for ducks and quail were never better, and good shooting may be expected this fall. Any sportsman who wants good shooting within a hundred miles of New York cannot do better than to go to Lane's.—THAT OFFICE BOY.

WORCESTER SPORTSMEN have always had a good name, not only in Massachusetts but through all New England. Just now the clubs there are making themselves known in an energetic manner, and we shall take great pleasure in recording the fact, whenever they run their quarry to earth. The papers of Worcester contain the following advertisement:

ATTENTION, SPORTSMEN!

Information Wanted—\$50 Reward.

The above reward will be paid for information that will lead to the conviction of the party that is known to have shot Partridges on Bailey Hill, Tuesday afternoon, Aug. 2.

One of said party was a short, thick man, drove a gray horse and Concord buggy.

Also, a liberal reward will be paid by the undersigned for information which will lead to the conviction of any violation of the Game Law of the present season.

J. S. F. KINNEY, Pres't. Wor. Gun Club.

E. S. KNOWLES, Pres't. Wor. Sportsmen's Club.

Sea and River Fishing.

FISH IN SEASON IN AUGUST.

FRESH WATER.

- Salmon, *Salmo salar*.
- Brook Trout, *Salvelinus fontinalis*.
- Rainbow Trout, *Salmo trutta*.
- Dolly Varden Trout, *Salvelinus malma*.

AND now I leave you, with this injunction; and, though I have mentioned it before, I do so at parting that it may be the more impressive:

ALWAYS KILL YOUR FISH AS SOON AS TAKEN FROM THE WATER, AND NEVER BE SATISFIED WITH A MODERATE CREEP.

By so doing your angling days will be happy, and your sleep undisturbed, and you and I, and the fish we may catch, can say, with the sweet singer of Israel: "The lines are fallen to me in pleasant places," DR. J. A. HENSBALL, "Book of the Black Bass."

AN INTERNATIONAL FISHERY EXHIBITION.

WE have announced that it was proposed to hold an international fishery exhibition in Edinburgh in 1882. Those interested in fishery matters in England are now asking Scotland to hold off and to unite and have a grand one in England the year following. It is claimed that if one is held in the United Kingdom that England is the proper place for it and London the proper city.

We can say that we do not believe that the United States would care to exhibit as soon as next year. Congress does not meet until winter, and an appropriation could not be made in time. It is doubtful if our country would care to make an exhibit at all. We know that the U. S. Fish Commission did not wish to at Berlin, and that Prof. Baird never would have asked for a cent for that purpose. It so happened that the Berlin Exhibition was gotten up by the German Fishery Association, an enthusiastic body of fishculturists, many of whom are members of the German Parliament, and that our Secretary of State at that time, Hon. Carl Schurz, was a German. The Prime Minister of Germany daily telegraphed Mr. Schurz on the subject until he got a bill before Congress making an appropriation for the purpose. Then Professor Baird was appointed Commissioner and deputized Professor Goode to go and represent him.

We know that neither of these gentlemen care to make

THE DOG GASTAWAYS.

SUSPENSION BRIDGE, N. Y., Aug. 2. THERE are now three dogs on Taylor Island. First is the original old bull dog (he was thrown from the bridge). Next is a large-sized water spaniel that undertook to retrieve a stick from the water at the mouth of the West Landing, in the Suspension Bridge. He got too far out into the current and seemed determined to secure the stick, and I believe did secure it, but could not, owing to the strong current, reach the shore; so down he went and landed on the island. Several lads were on shore watching him, and soon as he here was lost they ran on to the bridge to see him reach the island. "Old Bull" was out to meet him, and gave him a hearty welcome.

CHINESE PARADISE FISH (Macropodus).

WATER-PLANT (Sagittaria natans)—BOTH NATURAL SIZE.

THE PARADISE FISH.

MACROPODUS VENUSTUS.

THE paradise fish, like the German canary bird, is a product of cultivation, as there is no place known where it is found in a wild state. It is a native of China. There they are cultivated and kept in aquaria as ornamental fish only. The male, the larger of the two sexes, measures when full grown, from the month to the end of the caudal-fin, three and a half inches. The body is shaped very much like that of the pumpkin-seed or sunfish. Its colors surpass in brilliancy any fish heretofore ontivated for the aquarium. The head is ash gray, mottled with irregular dark spots. The gills are azurine blue, bordered with brilliant crimson. The eyes are yellow and red, with a black pupil. The sides of the body and the crescent-shaped caudal-fin are deep crimson, the former having ten or twelve vertical blue stripes, while the latter is bordered with blue. The under surface of the body is continually changing color—sometimes it is white, at others gray or black. The dorsal and anal fins are remarkably large, hence the generic name of the fish—macro, large; podus, the foot or fin. Both fins are shaped alike. They are striped and dotted with brown and white and bordered with blue. The dull-colored ventral fins are protected by a brilliant scarlet-colored spine, extending three-fourths of an inch behind the fins. The pectorals, situated directly above the ventral fins, are well shaped, but being transparent, show no color. All these colors above described are most brilliant when the fish is excited. For instance, when engaged in combat for the possession of a female, or when courting, he shows the most brilliant colors in order to attract the attention of his lady-love, she being specially fond of bright colors.

On such occasions he expands all of his fins to their greatest extent; the caudal-fin appears then to be covered with little pearls, like the eyes on a peacock's tail, and the under surface of the fin becomes jet black. The colors of the dorsal-fin change constantly from brilliant green to indigo blue, now and then showing white spots; and the whole body is in a tremulous motion, radiating colors of every conceivable hue. The entire body of the paradise fish, from the mouth to the beginning of the caudal-fin, is covered with small round scales.

Their mode of living, when compared to American fishes, resembles that of the marbled dace and the rainbow darter. Like the former, they go to the surface for air. They are also fully as inquisitive as the dace, and like to stay near the glass side of the aquarium, and observe what is going on outside of the water. Like the rainbow darter they are fond of resting on rocks, or on the branches of water plants. In fact I have frequently seen them lie down, as a person would on a lounge, with their head upright and their body resting sideways on the bottom. They are graceful swimmers and peaceable and agree well with other fishes. Their food is the same as that used for goldfish, but it should be given to them oftener. I imported a few pairs of these interesting fish last fall, and having succeeded in breeding them, I am enabled to add to the above description of the fish their mode of reproduction.

The Paradise fish is a nest builder, to a certain extent. Its nest is not so complicated as that of the stickleback, nevertheless it is a receptacle on which it places the eggs to be hatched. As soon as the warm weather approaches the males commence fighting with each other for the possession of the females. The victor leads off his female to a suitable corner in the aquarium, and here their family life begins. The nest is constructed by the male, in building it he takes a position about an inch below the surface, and frequently takes air into his mouth, which he ejects in shape of little bubbles. These bubbles seem to be covered with some viscid substance, which makes them last for several hours. He keeps this up until a little floating platform is formed of about six inches in circumference and one-fourth of an inch in thickness. When the nest has reached the sufficient size, the female approaches and swims around him several times until he notices her. He follows her now round in a circle, immediately under the bubble platform, and all at once, with a very graceful motion, he seizes her by folding his entire body and his around her, at the same time treading himself with her in the middle of the water, so that the ventral parts point toward the nest. Now he presses against her and causes the eggs to flow, which in passing, he becomes fertilized and rise to the surface. This act being over, the male's attention is occupied by gathering the eggs with his mouth and placing them on the platform. Should one accidentally fall to the bottom, he carries it up again immediately. When

all the eggs are eared for the female makes her appearance and repeats the operation until about a thousand eggs are laid. The eggs are of the size of a period used in ordinary type, and of creamy-yellow color. Thirty-six hours after the eggs are laid the young fish make their appearance. They are very small and have the shape of tadpoles. The father takes special care of them by keeping away all enemies—he even attempted to attack my hand when on the side of the aquarium, looking upon it as a enemy coming to devour his little ones. During the first three days his object seems to be to keep his young near the surface, where he can see them all; after that he scatters them by blowing among them. He is now seen very busy everywhere in the tank, and often gathers some weak ones with his mouth and spits them to the surface. This may be to instruct them how to breathe. (?)

As the young increase in size his duty is to teach them how to find their food. For that purpose he takes a mouthful of young ones from a freshly scalded place and carries them to an unfrequented spot where food is more likely to be found. In short, he has a system about raising a crop of children. During all this time the female is kept in a far-off corner. He does not allow her to go near the nest, although I have never seen a female injure any of the young, which were sometimes close around her, some even nibbling at her nose. When they are ten or twelve days old the young have the shape of the old ones and can support themselves. They are then one-sixteenth of an inch in length. Now, while I am writing this, my first crop of young paradise fish are six weeks old, and some measure as much as one inch in length and show some of the brilliant colors of their parents.

Hugo Mulzarrt, Cincinnati, Ohio.

A GERMAN BOOK ON GENERAL FISHCULTURE.

Mr. von dem Borne has given the public a new edition of his valuable book, which is rendered more valuable by his experience at the late International Fishery Exhibition at Berlin. We wish for the benefit of our readers who do not read German, that it be printed in English. This is a volume, of 74 pages, with 61 illustrations of apparatus and fish. The fact that it is written by one of the leading fish culturists of Germany is a guarantee that the author has a practical knowledge of his subject.

Here von dem Borne compresses much valuable information in a small compass, and shows his familiarity with fishculture in all lands by giving the prominent inventions in use in them. He covers the whole ground of pond building, spawning, rearing and the general care of fishes, as well as giving some space to the literature of the subject. The only thing which we were disappointed in is the absence of an account of the breeding of our favorite grayling. This fish has a place among our author's descriptions of fishes, but we miss it among the directions for spawning and rearing. We have watched carefully in all European accounts of this fish for differences in habit from our American species. Here von dem Borne tells us that it lives in large brooks and rivers, with strong streams and stony or gravelly bottoms; and that it does not love spring water. "Therefore," he says, "it does not go so high in the spring brook as the trout does, although it lives in some portions of the stream with that fish. It grows considerably big, but not so fast as the trout, and grows to only 3 lbs. weight. It spawns in March and April. The eggs can be taken by hand, but the fish do not ripen them in confinement, and therefore they must be obtained near their natural spawning places."

This account tallies with our observations on the grayling, except that portion which says that they do not ascend brooks as high as the trout do, and on this point observations have been incomplete in America, owing to their restricted and distant habitat. The culture of the grayling is not carried on to a great extent in Germany, but a few of the fish culturists have propagated them. The price of the book is 25 marks, about 60 cents, in cloth.

* Die Fischzucht | von Max von dem Borne, | Rittbergratsbesitzer in der Neumarkt. | — | Zweite, um bearbeitete Auflage. (Seroll) | mit 61 in den Text gedruckten Holzschnitten. | Berlin. | Verlag von Paul Parey, | Verlagshandlung für Landwirthschaft, Gartenbau und Forstwesen | 1881 | (Wiegand Hempel & Parey.)

Far, far better for you than Beer, Ale or Porter, and free from the intoxicating effects is Hop Bitters.

PREVENTIVES OF HYDROPHOBIA.

Editor Forest and Stream: PHILADELPHIA, July, 1881. The following article appeared in one of our daily papers some years ago, and I believe was copied by only one journal, and that a daily in the Southern States. The writer of the article, deeming it his duty to make known this remedy widely as possible, has determined to publish it in the form I send it you. He is a very highly respected citizen of our city, and a doer as to the veracity of his statements cannot for one moment be entertained. Since the publication of this remedy for hydrophobia many cures have been effected by it. Although the remedy has been used for a long time, and most of their time in wandering about. Last Sunday a terrible battle took place on the island between the spaniel and bull dog. The little dog acted as referee. They fought for some time in plain sight, but finally got too far under the cliff and could not be seen. They were fighting over the top of the cliff. I saw them both the next day, and they appeared to be as good friends as ever, so I presume it was a draw.

Two young men of this place are building a large box trap to be lowered to the island. They intend to put it down there at 11 P. M. I will report their success. C. E. LEWIS.

PREVENTING HYDROPHOBIA.

Mr. Editor: My attention was called to a pamphlet many years since as a preventive of hydrophobia. The active medicinal principle of this plant is found in the root, and is called Eucampia. From my experience I believe this is the only true remedy for hydrophobia. Allow me to give a few instances where this remedy has been used. My own nephew, when a small boy, was bitten badly in the face by a dog unmistakably mad. This occurred within a few miles of this city. The father of the lad came immediately to town to obtain medical advice. We called on an eminent physician (now deceased), who at once recommended the Eucampia root. One of the men nearby, after directed. No symptom of hydrophobia appeared, and the lad, now a hale, hearty farmer in Montgomery County, lives to show the scar of the wound in the face.

The physician above referred to related to me a number of instances in which the remedy had been used, and always with success. He, in fact, remarked, "I never knew it to fail when properly administered." I will give but two cases: First—Two men living near this city were bitten in the hand, by the same dog, and those who had heard of the case, at once removed the dog, and drove it away. They were secured and imprisoned to await an owner. The next day he showed unmistakable signs of madness, and finally died with hydrophobia. Alarmed for their safety, both men came to the city and waited on the physician quoted above. He prescribed the Eucampia root. One of the men remarked, "That is an old woman's remedy," and refused to take it. This man, returning to his home, placed himself under the care of his own doctor, who cauterized the wound and administered medicine to soothe him. On the ninth day he was seized with spasms, and died in agony. The other used more of the Eucampia root. The Eucampia was prescribed, and never suffered in the least degree from the dreaded disease.

Second—A number of cows feeding in a pasture were all bitten by a mad dog. The owner, by the coming to the knowledge of those who had heard of this Eucampia remedy, thought it a good opportunity to give it a trial. The cows were accordingly separated. To one-half the number the root was administered (in form of decoction), and not one of the cows suffered from hydrophobia, which is all that could be asked for. The remaining half, who were effects or were shot. In quite a number of cases coming under my own observation of persons bitten by dogs supposed to be mad I have recommended the use of Eucampia, and have yet to learn that the root was not used. I have good reason to have confidence in the remedy as a preventive.

Whether, after a manifestation of the disease, it would have a good effect, or any effect at all, I am unable to say; I doubt whether it would. But the remedy is simple and so readily obtained that it would be almost criminal not to employ it. Having said this much, allow me to give the mode of using the remedy. To one and one-half ounces of good, sound Eucampia root, bruised in a mortar, add one pint of new milk; boil to half pint, strain off, and when cold, add the following: One ounce of No. 60. The root should be taken for from three to five hours after being kept the dose on the third morning, following one morning to intervene, and again on the fifth morning. The above quantity is for an adult; for children, given in proportionate doses, say to one of twelve years, half the quantity. R. S.

DETOIR, Mich, July 16, 1881.

Editor Forest and Stream: My attention being called to the article in the FOREST AND STREAM relating to the fearful death by hydrophobia of a little

shooters had but little to contend with, and succeeded in rinning up excellent records. The following scores were made in the regular match at 20 balls, 15 yards rise, Hudson trap: Grubb, 20, Brookings 12, Brewster 12, Keating 12, Eaton 10, Wilcox 10, Stewart 10, Sawyer 14, Smith 14, Maylen 14, Gately 14, The honors of the match and hand-pump were gathered in by Ray, Wilbert and Kirkwood, in the order named.

SACRAMENTO ASSOCIATION. Bath, Me., Aug. 2.—The Sacramento Association held their 25th annual meeting at the Revolving Arms Hotel. The gold badge was again won by Chas. H. Venable of this city. The second prize for the year, a silver cup, was won by H. A. Stetson of Portland, Me. The third prize, silver cup, was won by A. Q. Goad of Portland. The following are the scores, fifteen balls thrown from a double revolving trap at 15 yards: Goad, Keys and Venable handicapped to 15; Venable, 11; Goad, 11; Keys, 15; B. Maylin, 12; M. C. Hill, 12; A. Q. Goad, 12; Keys, 15; W. Williams, 11.

FALL BATTLES, MASS., AUG. 4.—The Fall River Gun Club held its regular semi-monthly shoot for gold badge, 20 balls, hand-pump, etc. The following were the winners:

NEW YORK YACHT CLUB.

LOWLY but surely we are extending the limits of our cruising, and with it we are glad to see a gradual improvement in model and in man's equipment. There was a time, not so many years ago, when New London was considered purely well east, and a cruise to such a far off place was taken as a novelty and was highly regarded.

LEONARD'S Split Bamboo Rods, WITH PATENT WATERPROOF AND PATENT SPLIT FERRULES.

No. 1 SHOWS WATERPROOF CUP IN FERRULE (PATENTED OCTOBER 26, 1875). This prevents any moisture from reaching the wood, and the ferrule from becoming loose.

No. 2 SHOWS SPLIT FERRULE (PATENTED SEPTEMBER 2, 1878). This split thoroughly strengthens where the ferrule is joined to the wood, which is the weakest part of a rod.

No. 3 SHOWS SPLIT FERRULE WHIPPED WITH SILK AS IT APPEARS ON THE ROD. EVERY ROD WARRANTED.

GUN POWDER!

Dupont's Rifle, Sporting and
Blasting Powder.

THE MOST POPULAR POWDER IN USE!
DUPONT'S CUSTOMERS, as established in 1802,
have maintained their great reputation for seventy-
eight years. Manufacture the following celebrated
brands of powder:

Dupont's Diamond Grain.—Nos. 1 (coarse)
to 4 (fine) unequalled in strength, quickness and
cleanliness; adapted for glass-ball and pigeon
shooting. Packed in 10 canisters.

Dupont's Eagle Ducking.—Nos. 1 (coarse)
to 3 (fine); burns slowly, strong and very clean;
great penetration, with a close pattern; adapted
for glass-ball, pigeon, duck and other shooting,
with either muzzle or breech loaders. Packed in 1
lb. and 5 lb. cart. tins and 6½ and 12½ lb. kegs.

Dupont's Clack Bore.—specially adapted
for "choke bore" guns, and particularly for prairie
and upland shooting. Burns slowly, strong and
moist; does not clog or burn on the barrels, gives
both a good penetration and a close pattern; will
be found well adapted for glass-ball and pigeon
shooting. Made of two sizes, only No. 1 and No. 3,
No. 1 being the coarsest. Packed in 1½ lb. kegs and
1 lb. canisters.

Dupont's Eagle Rifle.—A quick, strong and
clean powder, of very fine-grain, for rifle shooting.
Packed in 1 lb. canisters and 5½ lb. kegs.

Dupont's Rifle & E. G. "Sea-Shooting."—
FFG. and FFG. The Fg. for long-range rifle shoot-
ing, the FFG. and FFG. for general use, burning
strong and moist. Packed in 1½ lb., 1 lb. and 5 lb.
canisters, 6½, 12½ and 25 lb. kegs. Fg. coarse, FFG.
fine.

Dupont's Sporting, Mining, SHIPPING and Blasting
Powders of all sizes and descriptions. Special
Grades for Export. Also Rifle, Carriage, Mus-
kets, Cannon, Mortar, Mammoth, Hexagonal, Cyl-
indrical and Pellet Powder, U. S. Government Standard.
Powder manufactured to order of any required
quantity or kind.

Agencies in all the cities and principal towns
throughout the United States. Represented by
P. L. KNEELAND, 87 Beater St., N. Y.
N. B.—Use none but DUPONT'S Fg. or FFG. for
long-range rifle shooting.

"Hazard's Electric Powder."
Nos. 1 (fine) to 6 (coarse). Unsurpassed in point
of strength and cleanliness. Packed in square can-
isters of one pound only.

"Hazard's American Sporting."
Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and
6½ lb. kegs. A grain, rapid and clean, for up-
land prairie shooting. Well adapted to shot-guns.

"Hazard's Duck Shooting."
Nos. 1 (fine) to 6 (coarse). In 1 and 5 lb. canisters
and 6½ and 12½ lb. kegs. Burns slowly and very
clean, shooting remarkably close and with great
penetration. For field, forest or water shooting it
ranks any other brand and it is equally serviceable
for muzzle or breech-loading.

"Hazard's Kentucky Rifle."
FFG. FFG and "Sea Shooting" Fg. in kegs of
5, 12½ and 6½ lbs. and cans of 5 lbs. FFG is also
packed in 1 and 5 lb. canisters. Burns strong and
moist. The FFG and FFG are favorite brands for
ordinary sporting and the "Sea Shooting" Fg. is the
standard rifle powder of the country.

BRADFORD & ANTHONY,

FISHING TACKLE

374 Washington Street, Boston, Mass.,
Importers of English Fish Hooks, English
Reels, Swivels, Silver Fishing Gimp, Arti-
ficial Baits, Spanish Silver Run Gut,
Calcutta and Japan Bamboo
Poles.

Sole selling agents for United States Fish
Hook Works.

Sole selling agents for the Fishing Lines bear-
ing the Trade Mark "Best Quality Hand-Laid
Linen and Silk Lines," which received Centen-
nial Medal for "strength and care taken in
manufacture."

Sole selling agents for the Patent Adjustable
Flots and Sinkers.

Sole selling agents for Braided Fishing Lines,
Trade mark, GLOBE.

Sole selling agents for Enamelled Waterproof
Braided Fishing Lines. Trade mark, a silver medal.
Selling agents for the best manufactured Jointed
Fishing Rods.

Selling agents for the best Trade List, Brass,
Nickel Plated and Rubber Fishing Reels.
Selling agents for Skinner's, Buell's, McHarg's
and Mack's Trolling Bait.

Selling agents for Union Web Hammocks.

FASTWARD BOI or, Adventures at Rangeley
Lakes. A capital story of sport and adventure
in the wilds of Maine. Interesting alike to old and
young. Has received the highest commendations
from the most prominent press. Has recently found
in cloth, and contains 80 pages, 4 illustrations.
Sent by mail, postpaid, on receipt of price, \$1.50.
CHARLES A. J. FARRAR, Jamaica Plain, Mass.

The Baker Guns.

OUR DOUBLE GUN:
The Best Gun made for
DURABILITY
—AND—
SHOOTING QUALITIES

**OUR NEW MODEL
THREE BARREL
GUN.**

PRICE, BEST ENGLISH TWIST BARRELS, \$40
DAMASCUS STEEL, \$55 to \$200

PRICE, \$75 to \$250

This gun is light and compact, from 9 to 10 lbs. weight. The rifle is perfectly accurate.

YACHTING AND CANOEING..... 56

ANSWERS TO CORRESPONDENTS..... 58

TO CORRESPONDENTS.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen.

Communications upon the subjects to which its pages are devoted are invited from every part of the country.

Anonymous communications will not be regarded. No correspondent's name will be published except with his consent. The Editors cannot be held responsible for the views of correspondents.

Subscriptions.

Subscriptions may begin at any time. The subscription price is \$4 per year; \$2 for six months. Remittances should be sent by registered letter, money order, or draft payable to the Forest and Stream Publishing Company. The paper may be obtained of newsmen throughout the United States and Canada; and is on sale in Europe by The American Exchange, 449 Strand, W. C., London, Eng.; and by Em. Terquem, 15 Boulevard, St. Martin, Paris, France.

Advertisements.

Inside pages, nonpareil type, 95 cents per line. Special rates for three, six and twelve months. Reading notices 50 cents per line—eight words to the line, and twelve lines to one inch. Advertisements should be sent in by the Saturday of each week previous to the issue in which they are to be inserted.

Address: **Forest and Stream Publishing Co.,**
Nos. 39 and 40 Park Row, New York City.

FOREST AND STREAM.

Thursday, August 18,

Specimen copies of this paper will be sent free upon application. We will esteem it a favor if our readers will call the attention of their friends to the merits of the FOREST AND STREAM.

HISTORICAL.—A correspondent is informed that the first number of the AMERICAN SPORTSMAN was published by the Parker Brothers at West Meriden, Conn., in October, 1871. It was a monthly until October 1873, when it was changed to a weekly. The publication office was removed to this city and the name changed to "ROD AND GUN" in 1875.

The first number of the FOREST AND STREAM was issued from No. 103 Fulton street, Aug. 14, 1873. The ROD AND GUN and the FOREST AND STREAM were consolidated in 1877, the first number of the new form appearing May 3d of that year. Our inquirer is further informed that the words "Forest" and "Stream" are not the names of individuals who have been connected with the paper.

TWO OF THE NIAGARA CASTAWAYS have been rescued, as related by our correspondent elsewhere, and "Old Bull" it is hoped, will be present at the London, Ont., Bench Show. "Old Bull" ought to join a circus.

MALARIA IN THE WHITE HOUSE.

THAT the residence of the President of the United States is an unwholesome place in summer is well known. Now that he is lying on a sick bed from an assassin's bullet, various newspapers have called attention to the pestilential flats which have poisoned the air so that several of his attendants have been stricken down with those complaints called malarial. These flats have been complained of for years and various projects have been broached to mitigate their evils.

Other Presidents have been able to escape. One made his summer home at Long Branch and another on the heights of the Soldiers' Home Park, but President Garfield is obliged to stay.

Former Presidents have complained, but the District of Columbia is not a Congressional district, and, having no member of Congress, has no one to urge the members to make an appropriation for this purpose. A short time ago it was reported that the Potomac flats were to be raised from their marshy condition by covering them with a deposit dredged from the river channel. This was claimed to be no remedy at all by Washington physicians, who declared that the deposit from the river bottom contained matters which would decay and prove as vicious as the swamps. This would no doubt be the case, for the river bottom is covered with a deposit from the sewers of the city.

We would call the attention of those interested in this matter to the fact that the old canal and swamp near the Monument, which for years bred malaria and mosquitoes, is now a beautiful carp pond. There is much of the swampy flat in question which might also be made to produce carp instead of miasma, not to mention the beauty of a sheet of water in place of muddy flats.

THE ST. LAWRENCE GAME CLUB.

A STRONG society, of which the membership numbers nearly one hundred, has been formed at Ogdensburg, N. Y., under the name of the St. Lawrence Game Club. Its objects are to stock the St. Lawrence River and the lakes, streams and ponds of St. Lawrence county with food fishes, and to protect the fish and game for the public good. The membership of the club is open to all citizens of the county, the annual fee being but a trifle; and it is hoped to enlist the cordial support of the land owners.

Game protective associations have been so long established in this country, and methods of work have been so fully tested that newly formed societies may readily avail themselves of the experience thus gained by workers in the cause; and there can be no excuse for the adoption by a new society of impracticable or inefficient ways of work. The St. Lawrence Club has started right; and we hope to chronicle its entire success.

WASHINGTON GUN CLUB EXCURSION.—The Washington Gun Club, of Brooklyn, are going on an excursion to Lake Hopatcong, New Jersey, next Thursday. This beautiful lake, famous as a health resort and well known to anglers because of its fine bass fishing, is up among the Schooley's range of mountains, and a more attractive spot for such an excursion as our Brooklyn friends propose it were hard to find. It usually takes two and one-half hours to reach the lake from this city, but the Washington Club and guests are to go by a special train in much shorter time. There is to be a bountiful repast—we have had a peep at the bill of fare—rowing and rifle prize contests, fishing and the various diversions always in order in such a pleasure trip. All the Brooklyn sportsmen are invited by the Washingtons to join the party and share the pleasure. Tickets (\$5 each) are to be had of Mr. Henry Altendbrand, the president of the club, Mr. H. H. Deinan, corner of Division avenue and Sixth street, Brooklyn, E. D., and at the headquarters of the Brooklyn Gun Club, Harry Miller's, Flatbush avenue. The special train which is to convey the party on the Delaware, Lackawanna and Western Railroad leaves at 8:15 Thursday morning, August 25.

BRYANT'S SPARROW POEM is printed in another column. We should like to supplement it at once with a poetical obituary of the last bird of that race in America.

FROG CULTURE.

DOUBTLESS our readers have seen the item which has appeared in the local papers, from Maine to California, for the past year, on frog culture. One paper has copied it from another, and it has been sent us by a dozen correspondents. It tells how a thrifty agriculturist near Elgin, Illinois, has bred frogs for market and thereby accumulated much lucre. We have explained the impossibility of feeding large numbers of froglets, in ponds or in brooklets, and how the large frog had accommodations in his interior for the smaller ones, which he usually kept full.

We do not want a reader of FOREST AND STREAM to spend time or money in the culture of anything which is neither profitable nor ornamental, and we have pronounced frog culture a delusion and a snare. But the aforesaid article still goes the rounds of the rural papers. To pin down the Elgin "frogist" we wrote to Dr. Pratt, a former fish commissioner residing at Elgin, and, inclosing the slip, asked for information. What he gives us we lay before our readers in the following note:

ELGIN, Ill., Aug. 4.

Editor Forest and Stream:

The man who started that frog-breeding story and gave it to a reporter is a "dead beat." I understand that he is now in State prison in Michigan. It is singular that it was not inquired into before, so many papers copied the article.—W. A. PRATT.

We trust that every paper which has been imposed on by the frog story will do its readers the justice to publish Mr. Pratt's letter, and not let any simple-minded person invest in a frog pond as a source of revenue. An adult bull frog is a cannibal, and a given piece of water will only yield a certain number of adult frogs, no matter how many tadpoles are hatched.

The Toy Pistol is just now a frequent cause of coroners' inquests. The latest case is that of a little boy in Newark, N. J., who was "playing forfeits" with a number of children, and when it came his turn to pay a forfeit, handed over a toy pistol to a little girl. He "thought it wasn't loaded," but it went off and killed the girl. The jury returned a verdict of accidental killing, censuring the boy's carelessness, and adding: "We further feel that we cannot too strongly condemn the reckless use of all kinds of weapons of this character by children and youth, and we suggest that the sale thereof be discontinued by the public and suppressed by proper authority." Perhaps it was out of the jury's sphere to have ascertained the name of the toy-dealer who sold this deadly firearm to the unhappy boy and to ensure him too; but the sooner parents and guardians of youth hold the toy-dealers personally responsible for all the woe caused by these infernal machines, the sooner will the nuisance be abated. The sale of toy-pistols must be put down by law.

"BIRD-NESTING" is a more heinous offense in England than in this country. A man who robbed a nest at Wadsworth, Eng., was fined the other day 4s, and in default was sentenced to twenty-one days' imprisonment. A heavy enough penalty, but light compared to the trouble which followed the robbing of a mocking-bird's nest in Alexandria Co., Virginia, not long ago. It seems that a Justice of the Peace had had his eye on these particular birds, and had the capture of them all planned out so soon as they should be ripe. Some other bird catcher stole a march on him, whereupon the disappointed J. P. straightaway made out a warrant, and the sheriff arrested the bird thief. The trial, we are told, resulted in a verdict of guilty, carrying with it a fine of \$10 and the costs of the case. The costs were immediately paid, but the fine was not. When the attempt was made by a colored constable to arrest the capturer of the bird's nest, who is deaf and otherwise afflicted, he declined to go with him, and the wife of the accused seeing her husband dragged along by the constable rescued him from the hands of his captor. They were then arrested on the charge of assault and battery, waived an examination, paid the costs, and removed the case to the County Court. "A neighbor who defended the accused in very strong words was fined \$5 for contempt of court. He refused to pay the fine, stating that he was in the Post Office Department and did not recognize the authority of the Justice. The Justice then made out a

mittimus committing him to jail for the non-payment of the fine, and placed it in the hands of the sheriff, who attempted to make the arrest. The sheriff, being resisted, called on several gentlemen to assist him, who refused to interfere. He then called in his son to assist him, who responded, and a scuffle ensued, in which the sheriff's son had two of his teeth knocked loose and received a severe laceration in the eye. The difficulty ended by a third neighbor making his appearance and paying the fine." We are not told what became of the mocking-birds.

PLASTER CASTS OF DOGS.—Mr. Palmer, the modeler of the United States Natural History Museum, has succeeded in making some excellent plaster casts of dogs, and the Museum proposes to have a series of such casts prepared to show the characteristics of the various breeds. Skeletons of typical dogs will be mounted for the Museum and these, with the painted casts, will make the collection a most valuable one. It is hardly to be presumed that any of our prominent fanciers are such devotees to the science of dog-breeding that they will be willing to sacrifice their animals to the cause; but it will certainly be a most sensible and satisfactory disposition of a dead dog to forward him to Washington, where his points may be permanently preserved. For modeling purposes, at least, a dead dog is better than a living lion; and the Smithsonian Institution offers to pay the express charges on such finely-bred dogs as may be sent to them.

ADIRONDACK GUIDES are much exercised lest the odium of "Parker's" crime should attach to themselves as a class. Visitors to the North Woods will bear us into the assertion that the guides there have a record for honorable conduct, which should relieve them from any such unjust imputations. Before the Parker affair transpired, the Adirondack guide was thought to be worthy of the confidence of parties of ladies and gentlemen. To-day he is no worth different. The New York daily paper paragraphs, who dub the Adirondack guides as fellows to be severely let alone, probably never saw an Adirondack guide in their lives, and don't know what they are talking about.

SKYLARKS ON LONG ISLAND.—Those who have been interested in the importation of the English skylark into this country will be glad to know that the experiment made some years ago on Long Island has proved a success. A number of birds were put out at Flatlands, Long Island, near the County Houses, some years ago, before the war we believe, and these birds and their progeny have been seen almost every year since. Mr. Edmund Orgill has frequently seen them there and heard them sing. One remarkable thing about their annual return is that they have always come back to the exact locality where they were at first put out.

WE BEG YOUR PARDON, Mr. Wm. Gale, English pedestrian, for failing to note your performance of walking 6,000 quarter-miles in as many consecutive ten-minute in a Boverly Lager-beer saloon, this city. To tell the truth, we think the feat a stupid and useless one. Now we propose that all the long-distance walking idiots and all the fasting lunatics join hands and start off after the fellow who set out a year or two ago to walk around the world in six years. And there are the crazy fellows, too, who sail for Europe in dorées—we can spare each and all of these deluded seekers after notoriety and shekels.

ARE THEY MONOPOLIES?—Our correspondent "Didymus," in a late issue, called attention to the fact that many of the most favored game localities of this country are coming into the possession of clubs, and it was suggested that such clubs were in a sense monopolies. We are much mistaken if a great deal of argument cannot be adduced on each side of this question. In a letter published elsewhere to-day it is shown that at least one club has found exclusiveness essential to the protection of its game. Perhaps there is yet a golden mean yet attained. We invite expressions of experience and opinion on the subject.

THE FRANK FORESTER CLUB.—At a meeting of the Greenwood Lake Association, Frank Forester Club, held at the office of Messrs. McDowell & Co., this city last Friday, Mr. J. B. Wortendyke, of Midland Park, N. J., and Hon. John J. Blair, of Blairstown, N. J., who is eighty years old, and says he has twenty years more of fishing in him yet, were elected members. Mr. T. C. Banks, of the FOREST AND STREAM, was elected an honorary member, this being the first such election on the records of the club. The annual meeting and presidential dinner will be held at the new club house, Warwick Woodlands, on the first Tuesday in September.

A FOX HUNT was on the programme of sports at Cottage City, Mass., last week, but the S. F. P. C. A. told the projectors of the entertainment that the society would chaso them if they ran the fox, whereupon a drag hunt was substituted. We are of opinion that the fox chasers had the strong side of the case, and it is to be regretted that they should have yielded to the officers of the Society.

WANTED.—A file of the "Old Sport" and of "Porter's Spirit." We shall esteem it a favor if any one knowing of such a file which is procurable will inform the editor of this paper.

GREY-EYED MEN, it is often claimed, are the best marksmen. At the Chicago shooting tournament the other day it was noticed that among the most expert shots grey eyes predominated.

LAKE GEORGE MEET.

THE annual meeting of canoeists on Lake George, Aug. 11, 12 and 13, was an event in the history of the paddle in America of which we may well be proud. It brought together a larger number of men devoted to this fascinating sport than had ever before assembled on American waters. The success of the meet places the American Canoe Association upon a sound, permanent footing, and henceforth the camp fires will glow every year on the charming islets reserved for the knights of the double blade and their friends. The meeting gave evidence enough of the rapid strides in popularity the sport is making, and shows that it has taken root all over the land. Many new clubs sent delegations from the West and from Canada, while the older organizations from the East were on hand in force. New York was represented by the parent institution, the N. Y. C. C., and its youngest sister, the Knickerbocker C. C., while the ranks were filled with many sturdy veterans whose names are borne on the books of the Ottawa C. C., Toronto C. C., Cincinnati C. C., Cleveland C. C., Peterborough C. C., Whitehall C. C., Lake George C. C., and others with "poor L.," who may be said to have invented the first canoe, likewise on hand in black barks of native make, which they propelled after the aboriginal plan with a single roughly cut blade. If they and their craft were fair samples of the genus and the genus of the red man, his pale-face brother has got a long lead on the copper skias, and can discount him in the canoe business badly. The old romance about no one being able to improve upon the Indian canoe was forever dispelled upon actual comparison of the work of both races. After the seventy odd canoes had been heached, tents raised and duflie unpacked, a meeting was called in the evening and the election of officers taken in hand. The old board, so long the head and front of the sport, declined re-election, and after some canvassing the following were chosen to serve as officers of the American Canoe Association for the year: Commodore, Judge Nicholas Longworth, of the Cincinnati C. C.; Vice-Commodore, J. Edwards, of the Peterborough C. C., Ontario; Rear-Commodore, Arthur Brentano, Knickerbocker C. C., and Dr. C. A. Neide, of the Lake George C. C., for Secretary and Treasurer. The various races were well contested, Cincinnati carrying the palm through the water starting representatives, Dr. Helgway, whose victories were well celebrated upon the club island "Cincinnati" in a joyous manner, which left no doubt as to where the honors rested. A banquet on the third day at the Crosskeys brought the meeting to a close, the canoeists being bound on cruises, single and in company, many spending their summer vacation swinging the paddle, returning to their desks and toll with nut-brown tan and freshly invigorated constitutions. Concerning the racing and the details of the three days' meet, we prefer to let our special correspondent speak at greater length next week.

The Sportsman Tourist.

A STORY OF THE JUNIPER SWAMPS.

WHILE stopping for a rest at the "Hygee Hotel" at Old Point, on my way from Florida last summer, I met an old gentleman named Nixon, from Perquimans Co., N. C., who informed me that before the war slave owners were always very anxious to hire their hands to the shingle cutters in the juniper and cypress swamps, as they always came home at the end of the year in "good condition," and while at work in the swamps always enjoyed perfect health. An officer of the Navy who was present said that the juniper water was always used by United States vessels going out from the Navy Yard at Norfolk on a long foreign cruise, because it kept clear and fresh for years, and the officers and men who used it usually enjoyed good health. Soon afterward I took a trip out on the Dismal Swamp Canal from Norfolk and visited Lake Drummond in the Dismal Swamp. I was surprised to find it a clear, dark lake, margined by a thick forest of beautiful green juniper, and the contrast between the claret-colored water and the evergreen foliage makes a beautiful picture. The lake is deep and full of fish which are peculiar to these waters, and the robin, perch and chub grow to a very large size and are as sweet as any fish I ever ate. A few days' use of the water satisfied me that it was good for me. I drank freely of it and bathed in it. It seemed to have a tonic effect and was very pleasant and agreeable to drink. I think the time is not far distant when the health-giving quality of the water and the pure atmosphere, with an entire freedom from insects of all kinds, and the advantages for bathing, sailing and fishing, will make this a very popular place of resort for invalids.

One would imagine that these swamps were a dismal charnal house. On the contrary, they are the healthiest places on the American Continent. There is no decomposed wood—juniper timber never rots. The trees fall to the ground, but they do not decompose but turn to peat and lie, indistinguishable by air and water, for ages. There is no miasma in these swamps to create miasma—the rising of the tides and decomposition of rank vegetation, no marshes exposed to the burning rays of the sun; all is fresh and pure, and the air is laden with sweet odors. I afterward visited the swamps in Dare County and found them like the Dismal Swamps. East Lake, near the mouth of the Alligator River, about ten miles west of here, and the waters of the Alligator River are identical with Lake Drummond in their natural features.

The country between here and there is a perfect wilderness, excepting a few small clearings on the Croatan Sound. I have visited different portions of it, and found many things to interest one. The woods are full of game. Bear and deer go in herds. The bear feeds on the gum and huckleberries in their season, and their paths to their feeding grounds are as well defined as cattle paths through the woods in the North. I saw on one occasion seven bears—a family led by an old she bear, so my guide said. She would occasionally stand against a tree and tear the bark, leaving a blaze similar to the marks made by woodmen to mark roads through the wilderness. The young bears would do this by the old bear's nose, and my guide declared that he had seen some feeding ground to another. I had nothing with me but small shot, and did not waste that on such big game. The natives hunt them at night, paddling silently through the bayous and

creaks and listening for the noise of the bears in the gum trees, as they feed on tender gum nuts; and my guide, a regular Leather Stocking named Bill Basnight, and a man named Grant killed seven in two nights last year, and also a deer.

Basnight is the Nimrod of North Carolina, and his experience would make an interesting volume. He has had numerous hawk-to-hand fights with hawks, and he has even had a very ordinary affair to settle one of them with his hunting knife. He has a great respect, however, for the swamp panther, or "painter," as he calls them. This seems to be a cross between the wildcat and the American panther, judging from the skin of one I saw at Basnight's. They are very fierce. Basnight has shot several, and seldom "saved one" without damage to his dogs. About two years ago, while hunting for deer near his home on Roper's tract, his dogs attacked a painter. One of the dogs had been dismembered and another scalped, and Basnight thought it about time to interfere. He fired at the painter, which fell behind an old log cypress. He was in the act of climbing over the log, when he was confronted by the fierce whiskered face of the animal as it climbed up the opposite side of the log, apparently none the worse for the shot. He had just time to draw his double-bladed heavy hunting knife, and brought it down on the skull of the animal with all his strength, and was fortunate enough to cleave its head open; but he still bears the scars of a sharp claw that plowed his shoulder as the painter struck him in its dying struggle.

It was told that Basnight was the man to go to for information about the famous pitcher plant, which is said to be a powerful diuretic and good to use with the juniper water. I found him in his fish camp near East Lake, on the Little Alligator River. We left the sloop and took a small skiff and went up a narrow "gut" about half a mile long and not over eight feet wide at any point, but deep. The gut opened out into a lake of dark juniper water about five acres in extent, at the head of which we found Basnight in his fish camp. The hounds bayed out as we approached the landing and he came out with lightwood torch in hand and invited us into his camp. It was a small, low-pitched building, about sixteen feet square, with bunks from floor to ceiling on three sides, a big fire-place and the door occupying the other. We found Basnight to be a sturdy, native-looking man with an honest, weatherbeaten countenance and his blue eye and light hair indicated pure Anglo-Saxon descent. He gave us a hearty welcome, and now the air was filled with the fragrant odors of broiling venison, frying club, corn bread and coffee.

After a hearty supper we reclined on the rushes in one of the bunks and smoked a new corn-cob pipe while we listened to the hunter's yarns. The other bunks were filled with shoe-headed men and boys who belonged to Basnight's fish crew. A two-foot snapping turtle lay on the floor on its back vainly reaching out its claws for a purchase to turn over. Two hounds lay on the floor quietly watching the turtle's struggles. Basnight sat in his arm-chair, smoking his pipe, with his bare feet to the fire. He told me of many hairbreadth escapes from bear, "cat" and moccasin, and wound up with a rather interesting account about the Basnight fish pound.

The Basnight family came into possession, during the last century, by purchase from the Indians, of all the land about this fish pond or lake, and for many generations it had been zealously guarded from interlopers. About forty years ago, in an evil hour, it came temporarily under the control of a member of the family known as a "Wild Ben" who was a pisen hater, a "bluffer" and an "improvident cuss." One spring, when the pond was full of herring, which had come there to spawn, as they had been in the habit of doing for "no man can tell how long," this foolish "Wild Ben," while the pound was so full of fish that one could stand on shore and shovel them out by the cart-load, stopped up the "gut" and started for home for some of the "niggers" to save the fish. He fell by the wayside into evil company and forgot, in the sweet delights of applejack and straight huff, enjoyed in the company of some good fellows, the poor little captives imprisoned in the dark waters of the Basnight herring pond. After a few days' good time he awoke one morning sober and suddenly remembered his forgotten business and the crop of ungathered fish.

But it was too late. When he hastened to the lake with "the boys" it was a stinking, hideous nuisance.

From that day spring after spring came round and none of the finny tribe could be found in the dark waters of Basnight's herring pond. "Wild Ben" went to the bad. He died more fiercely than ever on applejack and bluff. His negro slave after negro slave went to the block to keep him out of the jaws of Banterpity, but at last the last pinning had been sold, and the ill-fated "Wild Ben," his birthright squandered, died like Lord Banister—

He took a pistol from his belt,
All loaded with powder and ball,
An' he blew a hole thru' his head
An' on the floor did fall.

About five years ago the present head of the Basnight family, "Hunter Bill," brought some fish garbage from some point below, where they had been cutting fish, and threw it into the lake, and, baited in this rough way, the lake was restocked and once more the house of Basnight "has come to its own again."

Basnight told me some remarkable stories of the wild cranberries that are found all over the ground on thousands of acres in the Roper tract, and of alligators, big snakes, and immense oysters on the rafters of the log huts, in deep waters about the swamps; and he told me of a black and white brant that "placed" on the shoals on Panlico—and I mean to examine them all at my leisure. JOHN BROOKER.

Nags Head Hotel, N. C.

TEXAS ATTRACTIONS.

SAN ANTONIO, Texas, July, 1891.

AS a resort for camping, hunting and fishing I feel sure sportsmen, especially those seeking health as well as pleasure, would enjoy our climate, which is so pure, mild and breezy that I hardly know which season most to recommend. Many of our ladies and gentlemen of leisure have, of late gone to the mountains, coast, or to the bayous, big snakes, of immense size, and in each Texas is noted. We hardly feel the necessity for a change, as with an elevation of over six hundred feet we have the purity of the mountain air, and the beautiful San Antonio River, with its continuous line of bath-houses, in a measure furnishes a substitute for surf bathing. And why should we seek other waters when our own springs are marvelous to all tourists? Four miles

above this city one can stand upon the bank of the San Antonio River, and see crystal waters as they well up twelve feet below the surface from a rocky cavern in the bank. The stream flows swiftly, and widens until just a few rods below this immense spring. Its width is one hundred feet, while its depth is only two. Its course through the city forms the letter S, and it is spanned by many fine bridges.

Just one mile above the city is San Pedro Park, enclosing a large spring of the same name, and numerous smaller ones, which send forth little sparkling streams that finally unite and form the San Pedro Creek that also flows through the city.

Attempts have been made to introduce new fish into these waters, with what success I hardly know. At the head of the river is a fish hatchery for stocking the river with salmon, while carp have been put in the lakes in the park. I have caught different kinds of fish from the streams that flow from these lakes. One was so large that several guests enjoyed it with us, and while we did not take up twelve baskets full yet all were bountifully supplied.

I will not make a pen-picture to you of the strangely wonderful old missions in and near this place of which so much has already been written, and volumes might be.

If travelers fail to see these and other interesting surroundings of San Antonio they will miss the Mecca of their pilgrimage.

A. G. S.

DREAMING UNDER THE PINE.

By XL YORKER.

We are such stuff as dreams are made of, And our little life is rounded with a sleep.—SHAKESPEARE.

THE father of Vivian St. Clair lives near the banks of Cheat River, where it flows through a broad, beautiful valley near the base of the mountains. He is a graduate of our college history and botany in the university of his native State, he suddenly acquired a princely fortune by the sale of mountain lands, a little time before he considered comparatively worthless. He would come out to this wilderness during the summer vacations to angle for the speckled trout and study the wild flora of the mountains. The estate consisted only of barren sands covered with dark pine forests. Great cliffs, moss-covered and pierced with caverns—the home of the lynx and the rattlesnake—were piled up on the river banks, their bases hidden by the rhododendron and azaleas. But he found flooding on the waters of spring and pool, for under these rugged rocks, barren sands and dark pine wood was a great platinum lake. So the place was sold, the chair in the university given up, a beautiful farm purchased on the banks of the Cheat and an elegant villa erected by the crystal river at the foot of the great mountains.

Prof. St. Clair was a lover of nature, and everywhere about his farm and home were objects curious, beautiful and rare. On a table under a great bell glass were two little trees of coral, one white and the other red as blood. Around them were shells that had been dyed in the colors of the rainbow, and staisued with the glories of the sunset. They were filled with the music of the sea, and murmured all day long the songs of the ocean in voices sweet and low. Over a bookcase were the antlers of deer, and on them was sitting, with half-opened wings, a great Virginia owl, whose big eyes seemed always watching one. When Vivian was a little child he would forget that they were only glass and something that he would creep from his perch upon the beautiful canaries that sang for him every day from their cage in the ivied windows. In warden cases were growing miniature forests, feathery ferns, silver green and gold, waved their delicate fronds over little mountains and grotesques formed of mingled moss and crystals, mirrors half-hidden among vines looked like the lakes on the mountains fringed with the rhododendron, and white pebbles were built up like the river eggs. In aquaria were banded sunfish, silver dace and graceful eels; and little islands of cork, cased with ocean shells and studded with aquatic plants, floated about on the water beautiful as the river gardens of the East. Birds of brilliant plumage from the far Southlands were grouped in their houses of glass, some looking as if they were about to warble a love song, others seemingly ready to mount on beautiful wings to heaven. Showcases were filled with their nests, some simple and coarse, others wonderfully wrought, and with eggs white as snow, blue as the sky, or painted like the autumn leaves, and polished like the ocean pearl. In preserved minerals from all quarters of every land; the Amazon stone and the ruby, silvers gleaming among masses of opal, amethyst and beryl. On the lawn were growing the rarest trees and the most beautiful flowers. The evergreens and lilies of Japan, the shrubs and roses of China, were mingled with the bulbs of Holland and the ivies of England, and down by the river the balsam fir and the holly tree were growing in their native sands. The conservatories were filled with the rarest plants of the tropics, and the marble fountains played all day long in the summer.

Surrounded thus from his earliest years by the beautiful in nature, the boy learned to love the great book whose pictured pages are mountains and meadows, woodlands and prairies, lakes and oceans, planets and suns. Every summer when he came home to spend his college vacation he would wander alone through the forest, learning the secrets of the squirrels and studying the language of the birds. He saw the father collecting the material, and the mother weaving it into the nest. This twig is too large, this hair too long, and both are rejected. "I will preserve this bird as careful builder; everything must be perfectly adapted to the place it is to fill." He wondered why the female never warbled a song.

"Is not music," he said, "the language of love, and was not the art of song acquired by the males in endeavoring to attract the attention of their mates? Imperfect at first, it has been cultivated for long, improved and transmitted with all these additional modulations of tone through countless generations, just as our own language has been perfected out of the guttural mutterings of savages. He saw himself why one was so richly dressed and the other in plain attire. Then he thought that sitting all day long upon her nest, or hovering over her young, brilliant plumage would only serve to attract the glittering eyes of the serpent, or the keener ones of the hawk.

and he knew that it must be scentless. "The All-Father," he said, "has given the feeblest creature some protection from its enemies."

"You are right," replied the hunter, "neither wolf nor hound can scent a fawn while the spots are on."

"Wandering deeper and deeper among the mountains they came to a shallow stream, whose rocky bed was covered with the footprints of animals. "The river was not here," said Vivian, "and these rocks were only a bar of sand; now they have hardened into a page of stone in the great book, printed, perhaps, thousands of years ago, but easy enough to read. Here are the tracks of a wild deer, and close behind an Indian hunter followed in pursuit. It was wounded, too, and in the right fork. See, that foot has never touched the sand, and leaves no mark; the others are all quite plain. And it was raining. Here are the fossil drops, and they came from a cloud in the west."

"You have a fine eye," said the mountaineer, "and would never lose a deer's track in the ferns; you would make a famous hunter."

"I would rather be a famous naturalist," replied Vivian, "and he should have an eye far keener than the chaser of the deer."

When home during the Christmas holidays he would wander alone into the forest when the ground was covered with snow, and the little pines were bending under a weight of starry snows, white and beautiful as his own byrnie. The leafless trees were all in bloom—blossoms that would never ripen into fruit—they were only flowers of snow. The impress of little feet are everywhere, and he knew at a glance what animal had nided each one. "Here by this mossy rock," he said, "a squirrel has just been digging for the nuts that he hurried long ago in the golden autumn. There a hare has danced a merry round in the moonbeams under the thorn, and a wood-mouse has gone to its home in the heart of the hollow pine. A fox crept into this hazel thicket, paused a moment, behind the little cedar at its edge, then hurried fortrand. Did he find a supper there spread out before him on a table-cloth of snow? No; here are the prints of little feet flying away over the hill. But here on the river bank is blood; a white hare has dashed wildly through the laurel; here is scattered fur; there a spot of blood. How red it looks upon the snow! She staggered here, and her steps have been irregular and slow. Ah! here she lies beside the fallen pine, cold and dead. And here are other tracks going away over the windy hill. A mink has ridden the head-wind-race, and the white teeth were in the throat of his siced. Murder was done last night in the dark pine wood!

"This is a pictured page in the great book, too, only it will never harden into stone; the bright sun will burn up every letter, for it is only written in the snow. But does not," he continued, "every event transpiring in the universe write its own history in letters of fire that will burn forever? I drop a pebble into a mountain lake, and the waves grow larger and larger until they have covered all the water; so it is with the waves of light, and if the subterranean fires should burst the solid crust of the earth in fragments and scatter them to pieces, this moonlit forest picture—the laughing fox, the dying hare, the footprints in the snow—would remain spread out forever before the eyes of the Heaven-Father! Light will travel seven times round the earth in a second, yet if our planet could be seen from the most distant star from us it would appear to dwellers there not as it now is, but as it was millions of years ago. There would he seen no man, or bird, or flower upon its surface; only the tree ferns waving their feathery crowns in the moist and heated air, and the club mosses, tall as the mountain pines, every where in rightful replicas, battling with moisters as hideous as themselves, and all the seas and lakes and reedy ponds are dyed in blood. There has been war upon the earth from the first appearance of life upon its surface; the strong and cunning destroy the weak and foolish. The history of the earth is written in the anubians. Every bird, every flower, every ocean shell that ever saw the sunlight; every city, every battle, every individual action is painted there forever. The universe is the encyclopedia of the Eternal Mind; everything is printed there—the leaves are never closed, the history never finished, the drama never ended; but the picture-pages containing your heart's history and mine are open before the All-Seeing Eye forever and forever."

In the happy summer time Vivian, the lover of nature, would lie down upon the mossy carpet spread out like a fairy garden under the pines, and the song of the mocking-bird and the oriole would lull him to sleep, and the Queen of the meadows would rise to ride in his dreams, and he would ride away in her chariot, all of gold and gems over the earth and under the sea. Now it is sunset, and he is in the wild Northland. The snow-cold mountains are tinged with all the glory of color, and the clouds are painted over with colors of gold. The brilliant moon will circle round the dreamy horizon for days, never setting until the sun has run her bright course under the stars. The aurora bursts forth with magical splendor; the sky seems changed into a phosphorescent sea, and the snow is something red as blood and the ice is as green as forest leaves. A broad band spans the horizon, ever brilliant than a thousand rainbows; streams of many-colored light burst from it, filling all the heavens, passing through all the intermediate shades, from violet and bluish white to green and purple red. The stars shine dimly through the golden haze, and all seems like the unreal world of dreams. It is winter in the trackless waste, and the silence is broken only by the hooting of the snowy owl, or the yelping of the Arctic fox. Most of the animals have followed the sea birds eastward or are sleeping in their burrows under the snow. The icebergs are beautiful as palaces of Parian marble sprinkled with rubies and emeralds and flooded with golden fire.

But the fairy chariot flies through the air like a meteor, and all changes into new forms of beauty. The dreamer is in

"That land where the lemon trees bloom,
Where the gold orange grows in the deep thicket gloom,
Where a wild ever soft from the blue heaven blow,
And the groves are of myrtle and laurel and rose—
Knowest thou it?"

Birds and butterflies are everywhere; some seen only flowers, so like are they to blossoms, and many flowers seem ready to soar on snowy wings to Cloudland, so like as they are to doves. Scattered beautiful in shells on a ocean shell or mountain gem, wind slowly among the tangled reeds with motions graceful as the sunlit waves of a rivulet. The evergreen trees are covered with giant creepers, binding together all the forest, and throwing over it a drapery of many-

colored flowers, filling all the woodland with perfume. Beetles, glittering with metallic brilliancy, and beautiful as any gem, illuminate the fragrant forest all the night, and fill the air with drowsy music. Trees taller than our Northern pines bear flowers beautiful as lilies, or furnish man with all that he requires—milk, wine, butter, honey, wax, oil, bread, cabbage, melons, gaudies, beds, ropes and clothing! The magnificent Victoria Regia, yellow, violet and white—queen of the floral world—floats on the waves of sunny rivers, sinking at night into her couch of waters. The great vault of heaven is spread out before him with all its wealth of moons and suns and constellations, from polo to pole.

But again the fairy-chariot bears him onward over hazy radiant lands, and sets him down at last in the garden under the sea. The liquid crystal of the Indian Ocean is gleaming over him, and the sea anemones cover the rocks with their waving crowns, beautiful as beds of mingled lily and rose, and the medusae, and the microscopic crustaceans shine in the obscurity like fairy stars. The humming birds of the ocean, small, gleaming fishes, some bright with a metallic splendor of azure or vermilion, some gilded green or dazzling silver lustre, play around the coral bushes, light as spirits of the abyss. As the day declines and the darkness of night sinks into the depths, this radiant garden of life and light breaks up. The white or blue bells of the medusae float through this enchanted world, and every angle beams and shines with living light. All things, which in their lively of brown or gray are unillumined in daylight in the universal radiation of bright colors, now shine with the most charming red, yellow or emerald lustre; and to complete the marvels of the enchanted night, the large silver disk of the sea moon gently moves through the whirl of tiny stars. The luxuriant vegetation of the tropics has no such richness of forms or glory of color as these artificial gardens of life and light. The rocks and walls are covered with sparkling diamonds, and the ocean floor is strewn with silver sand and paved with radiant shells.

But what hideous monster is this clinging to the rocks! It reaches out its serpent arms and touches his face. A thrill of horror passes along his nerves and he awakens with a start—it was only the cold nose of his dog pressed against his cheek, and the mocking-bird and the oriole were still singing in the pine. "How rapidly," he said, "the mind flies over the earth in our dreams! I have only slept for a moment, and yet I seem to have traveled through radiant lands for years."

"The lower animals dream and reason too," he continued, musingly; "my hounds chase the wild deer over the snow in their dreams, and many animals have the gift of language—utter sounds of warning, delight and pain, and are dumb only to the ignorant and the unobserving. The joyful bark of our faithful dog as he welcomes us home we understand—the thoughts that illumine his countenance and glorify his eyes we cannot always read, and yet his busy mind is ever planning, thinking, dreaming, and reasoning.

Inferior animals differ greatly from each other in mental power. Some are possessed of marvelous talents, others of the same family are intellectually feeble. Some are idiotic or insane. Like ourselves, they have their kings, queens, soldiers, masons, carpenters, farmers, hunters and sailors. And the agricultural art of Texas cultivates the soil, sows the seed and reaps the harvest; owns slaves and milks its cows."

TROUT FISHING IN NEW MEXICO.

SANTA FE, N. M.

SO many people are now coming West into this new country, among whom are doubtless many lovers of the "gentle art," that a few remarks on sport to be obtained with the trout here, according to my own experience, may be read with interest by some of your numerous subscribers. I immediately in the vicinity of Santa Fe there is little or no sport to be had, owing to the absence of streams, but by going some twenty miles northeast or west far trouting is obtainable. On the north side the various streams from the main range of mountains are get-able, as also the Rio Grande, Chama, etc., on the west another point of the Rio Grande, and on the east the Pecos. The mountains are filled with small trout streams, where with worm or grasshopper a large number of small fish may be had, but this is not the place that although the popular cry is that water is scarce article in New Mexico, by traveling a few miles some fun is within our reach, provided we know a little of the country. To give a good idea of what one may expect to meet with, I will relate how a friend and I spent two very pleasant days on the Pecos.

To commence with, I am from the Old Country, where I was initiated into the mysteries of fly fishing some fifteen years ago, which fascinating sport I have followed wherever I had time and opportunity in rivers, streams and lakes of England, Scotland, Ireland, Germany, Switzerland, etc., so that, young in years, without egotism I may call myself an elderly fisherman. On coming to America and settling for a time in the Eastern States, I found I had not sufficient time to pursue my favorite sport, so that there my experience has been limited to a few off-days.

Very different ideas are held by English and American fishermen with regard to tackle, especially with regard to size of fly. My stock of two well mixed boxes was unanimously voted much too small, of no use at all by the Eastern fisherman; and also here I was told I must tie them on larger hooks to meet with success. In spite of these warnings, however, I persevered with the little "uns" and had no cause to repent doing so. I certainly am an advocate of small flies and fine tackle. In the almost virgin streams of America I do not think the matter is of such vital importance, but in rivers where the water is shipped from the beginning to the end of the season and flies are used in a large number of English rivers, the trout, without doubt, being more educated and can discern between a real and artificial fly pretty readily. Now, the natural insect one wishes to represent are, as a rule, small; so it seems to stand to reason that by tying them small we more nearly approach nature in our imitations, consequently are more likely to lure the trout. If any one doubts the soundness of this argument let him try, if he has the opportunity, the large-sized flies on some thoroughly shaggy water in England, and he will find that at every throw he will see the fish making off in all directions, and "divil a fish" will rise. Or else let him give the small ones a fair trial on American streams. Now, I do not wish to be misunderstood. I do not maintain that small flies are invariably superior—for in lakes, by way of example, a larger fly is required—my remarks having special reference to streams not exceeding twenty-five yards in width—in fact

trout streams. One instance I will quote to illustrate the theory: When fishing in the Black Forest some few years ago I always had a crowd of anglers about me, although a perfect stranger to the river, with my small flies I could double the take of the professional fisherman who used large hooks and had fished the same stream for a living for several years. One objection I have heard raised to small hooks is that one loses so many fish after they are seemingly well hooked. All I have to say is to use a pliant rod and plenty of patience. Landing a large fish on fine tackle requires some amount of skill and gentle handling, which considerably increases the pleasure and excitement. But I must apologize for this digression and return to the subject in hand.

"How far is it to the Pecos?" was the question we asked of every person likely to know, and numerous and various were the answers obtained; but it all ended in our being led to suppose it was twenty-eight miles by the road and eighteen by the trail. We determined therefore to take the latter road. At bedtimes in the morning with the indispensable "burro" or donkey, to carry our blankets and camp outfit, ready saddled, we started over a high saddle and started on our journey after taking the precaution, Bro Sawyer like, to leave word that we had important and pressing business out of town, and would not return for some days, leaving the business to take care of itself. Ten miles up the Santa Fe cañon to start with, then cross the mountains to the southeast were all the directions we had, but luckily falling in with two Mexicans who were going the same way, we joined ourselves to them, aired our meagre stock of Spanish, supplied them with tobacco and kept on the right trail. Three hours' walking brought us to the spot where the trail leads over the mountains. A steep, very steep road, and equally rough, lay before us, but after three-quarters of an hour's hard work we arrived at the top and rested for a few minutes to smoke a pipe and enjoy the view. Down another hill, where we found some water in a hole dug by some one, we concluded to have lunch, after which our road lay up and down steep, rough hills for three hours, and then three more miles took us to a small settlement on the Pecos. During the last two hours of the road the rain came down hard, so that by the time we reached the spot where the trail was offered to take us in, we were pretty wet and tired. After a bit of supper and the inevitable pipe we were glad to lay our weary bones on a wool mattress spread for us in the covered shed in front of the house.

Six A. M. saw us busy at breakfast, after which I ran down to the river to ascertain its condition after the heavy rain of the preceding night. "Water thick, but just fishable," was my report, so I at once proceeded to clear for action. Rods, flies, lings, landing net all in readiness, then after donning a pair of Knickerbockers and old shoes in lieu of pants and good boots, I went straight to the river and commenced operations. Hour after hour I fished all I knew, changing flies, but it would not do; the water was too much colored, although fluing rapidly. By noon I had but half-a-dozen small fish. I was fishing in part of the river below the house so densely overgrown with bushes that it was unfeasible from the bank, but I knew that by wading I could manage it. So there I was, up to my knees in water, walking down the centre of the river with nothing but six small fish in my creel. "This won't do," I thought. Looking round for a neutral fish. "That's the one!" I exclaimed to myself, seeing a small yellow willow-fly glide by me, only to be snatched up by a lusty trout some fifteen yards below. So wading out on to the bank I changed a "March brown" for a yellow willow, a black gnat for a yellow crowding, leaving the leader a red hackle with woodcock wings where it was. Throwing lightly over the fish I had secured, the first cast rewarded me with success, for up came the old fellow and sucked in the willow without hesitation. A strong stream helped him to fight well, but at length I succeeded in netting him—a good half-pound trout, as broad as he was long. Now the fun began to grow apace, so that by 3 o'clock I had three dozen nice fish, besides about 100 small ones which I had returned.

By 5 o'clock my basket was full, and thinking it time to go home I walked leisurely along the side of the stream where the water was not deep. A thick dead log against the bank, right in the full force of the stream, looked a likely place for a big one, and after three or four throws of the line I saw a flash, and a "big one" was a regular picture, as a "big one," too," thought I, preparing for another try. "There he is again!" I mentally ejaculated, striking the instant he rose. "Got him this time, though." Then I learned what a New Mexican trout can do if put to it. First of all he made straight for the log, but I induced him to come out of that, when off he rushed down stream, making the reel huzz round at a rare pace, then back again; and, in short, kept me nearly ten minutes trying to get the net under him, which at last I succeeded in doing. He only weighed three-quarters of a pound, but he was a regular picture, as a "big one," too, thought I, preparing for another try. The prime condition he was in and the rushing stream explains the reason of such a fish making so prolonged a fight. Well satisfied to have a goodly sized one on the top I now determined to make for home in earnest, so forced my way through the thick bushes on the bank, and was rejoiced to find I had not a mile to walk. So good was the water that it took me all day to fish scarcely a mile of river. If any of your readers have ever experienced the doubtful pleasure of carrying a full basket of fish weighing some 18 or 20 pounds, for four or five hours, they are not likely to forget it. This time on relieving myself of the burden I discovered I could but with difficulty raise my arms above my head, and that a lump the size of my fist was raised where the broad web strap pressed on my collar bone.

After getting rid of my wet things and waiting for an hour or so the Mexican fishermen returned together with my companion. The Mexicans had all suddenly taken the idea into their heads that they would also wade a line that day, presumably after seeing me wading. A goodly quantity of fish, however, was but a dozen. My friend had but very poor sport, owing in a great measure, I suppose, to having so many satclites round him, as he kept to the open water frequented by the natives. My take amounted to over sixty trout, ranging from one-quarter to three-quarters of a pound, besides the countless number of small ones I returned. The fish, as will be seen, do not run large, but they are "gamey" and as sweet as a peach. A goodly number of them are a *varia* from each side of the river, (about twenty-five miles from their source), but lower down they are heavier.

A few fresh caught trout were soon hissing and spluttering in the pan, you may easily conceive, and were devoured with much relish by the two hungry fishermen. This is the true way to enjoy trout, "first catch him (yourself) and then eat him" (yourself also).

The second day's sport was but a repetition of the first, so a few words will suffice to relate the adventures. Unfortunately I was induced to try a upper or open water, but after fishing until about 8 P. M. with but sorry sport, having taken but a few small ones, I was disgusted with that part, as I had not seen a decent fish move at all, except once when from my want of success I was fishing carelessly, a big swirl, a few determined struggles, followed by a sudden slackening of the line, told me I had missed a good trout. After this I decided upon again visiting the scene of the last day's work, and reeled up and went for it. My good name was at stake, for if I failed in making a basket this time the reputation I had with the Mexicans would be gone. Two hours and a half to fill a big creel is not much, but it must be done. Half an hour brought me to the place, and in ten minutes more half a dozen decent trout were kicking in the basket. Throw how and where I would I was nearly sure of a rise at one of my flies—viz., coachman for leader, claret and crowding for droppers. At one pool I took six fish in three consecutive casts, only two of them, however, I retained, showing how they were out. In short, by six o'clock my basket was full, and home I went with untarnished reputation, another good haul and a good appetite. This time my take amounted to upward of fifty trout I retained, my friend having but few. The following morning we returned over the same trail to Santa Fe, having enjoyed two of the pleasantest days imaginable, amid delightful scenery and hospitable people, and after many vows relative to repeating the dose on the first opportunity, we tenderly and regretfully laid away our rods and tackle with poor old Wamba's passport, *Pax vobiscum.* WESTWARD HO!

Natural History.

THE OLD-WORLD SPARROW—1858.

BY WILLIAM O. BRANT.

WE hear the note of a stranger bird,
That comes from Mexican haunts,
A winged settler has taken his stand:
With Tentons and men of the Celtic race,
He has followed their path to our hemisphere—
The Old-World sparrow at last is here.

He meets not here, as beyond the main,
The Fowler's snare and the peevish grain;
But on the hill-tops and in the friendly trees,
And groves for his chirping family
Are strown when the winter fields are dear;
For the Old-World sparrow is welcome here.

The insect legions that sting our fruit,
And strip the leaves from the growing shoot,—
A swarming, skulking, ravenous tribe,
Which Harris and Fish so well describe,
But cannot destroy,—may quail with fear;
For the Old-World sparrow, their foe, is here.

The sparrow, in the summer ray,
May ripen now on the loaded spray;
And the nectarine on the garden-walk,
Keep firm its hold on the present stalk;
And the plum its fragrant fruitage rear;
For the Old-World sparrow, their friend, is here.

The post of gardens—the little Turk
Who signs with the crescent his wicked work,
And evades the half-crown fruit to fall—
Shall be seized and swallowed, in spite of all
His sly devices of cunning and guile;
For the Old-World sparrow, his foe, is here.

And the army-worm and the Hessian fly
And the dreaded canker-worm shall die;
And the thrip and slug and fruit-moth seek
In vain to escape that busy beak;
And fairer harvests shall crown the year;
For the Old-World sparrow at last is here.

THE OLD WORLD NUISANCE—1881.

AFTER BRANT—TWENTY YEARS AFTER.

WE've listened long to this stranger's note
And watched it spreading to places remote,
Till the turbulent vagabond has taken the place
Of our valuable song-birds, and driven the race
From our cities and towns by eating the food
Provided by Nature for nobler brood.

He has come to our shores with the murderous gang
Of Nihilists, who emigrated sooner than hang;
Paupers and raggeds, red in the hand,
Wreak Europe continually sent to our land,
Vagabonds feathered, clothed, white and black,
Good Dame Europa please beckon them back.

The insect army keeps stinging our fruit,
We have still to fight them and the sparrows to boot;
The quarrelsome, nosy, too scolding thugs,
They eat up our fruit, and never touch bugs.
A glance at their bill shows ever so plain
That their food is not insects but fruits and good grain.

The Poet may sing in the sparrow's praise,
But our great ornithologist, Dr. Coues, says,
In language of truth and in very plain prose,
That the sparrow's a nuisance, and the sooner he goes
The better we're off, so none of us quite clear
That the Old World sparrow is not needed here.

He denies our perches, there's no denying that;
He has ruined my wife's dress and spoiled my best hat,
He hangs round the bird cage to plier the seed,
And gives the canary a foul insect feed.
He never eats worms, let us tell it abroad,
This Old World sparrow is a terrible fraud.

American freedom has been much abused;
A home for the homeless we've here cut up,
And the poor honest man can never cast his lot;
Bring his wife and his babies and his family cot,
But our long suffering people some morning will see,
Communists and sparrows thrown into the sea.

FRED MATHER.

Bryant's poem on the English sparrow was written at the line of the introduction of that bird into this city by the Reich Bros., a firm of bird dealers. A number of the sparrows were purchased by Mr. W. H. Schieffelin and liberated in the garden of his Madison avenue residence. It was after spending an evening with Mr. Schieffelin that the poet wrote the verses printed above. Of this incident the poet wrote, Mass., correspondent says: "I know so much about the English sparrow as the majority of folks, and I

have no hesitation in saying that they will not eat insects if they can get grain, much less a hairy caterpillar. They are essentially a grass-eating bird, although they prefer the macerated oats in fresh horse manure to any thing else. They will give the choicest bird seed the go-by and go for the manure.

"The introduction of the sparrow was a money making speculation, because those who introduced them were in a position to understand all about them, and could not be excused on grounds of ignorance.

"If any one had asked the person that brought them to your city if a mocking bird or a robin or thrush could live on grass seed he would very likely have considered the inquiry a fool or grossly ignorant as regards the food of birds. To me it seems equally absurd to import a seed-eating, hard-billed bird and expect that when it came to a new country it would change its habits and turn insectivorous.

"In conclusion I venture the opinion that the little Turk Hessian fly, slug, grub and canker-worm mentioned in the poem has nothing to fear from the English sparrow."

The bird is rapidly making his way over the continent. In some parts of Virginia, as we have already noted, the campaign against him is assuming a serious character. A writer in the Charlottesville, Va., *Chronicle* treats his mind after this manner: "If there is one single redeeming quality possessed by these unmitigated nuisances, the English sparrows, we do not know what it is. No one ever saw one of them destroy an insect. They are neither insectivorous nor carnivorous—strict vegetarians—and about as disagreeable every way as some of the human species that we have known who affect vegetables. They increase very rapidly. One pair of birds may be counted on as certain if undisturbed, to produce three broods, or twelve birds, each. And their reproduction is as sure as fate. Break them up to-day and to-morrow they will have built in the identical spot. The writer of this broke up a nest at 8 o'clock in the morning, destroying nest and eggs; at 2 o'clock of the same day the pair had rebuilt the nest and one egg occupied it. It was again broken up, and the place visited early next morning, and the result was precisely as before. A determination to get rid of them, which was quite as strong as their determination to stay, finally drove them from their nest elsewhere. But they were not conquered—only repulsed. And although every effort short of shooting and poisoning has been adopted to drive them away they yet remain with their incessant, insufferable, arrogant chatter—a perfect curse. It is said you cannot trap them. One gentleman tried repeatedly and in many ways and failed."

DO GARTER SNAKES EAT FISH?

WELL, if you will allow me a point and consider crayfish in the category, I can answer you. While on the Upper Allegheny, not long since, I stepped out upon a log which projected into the river and began washing my hands in the water. Suddenly I perceived a quick movement in the river just beneath my hands, which was followed by the appearance of a large, healthy crayfish, which seemed to rise out of the water in a strange sort of way, which I could not understand, but in a moment more the mystery was solved by the head of a snake popping up and showing that it had just caught the crayfish by the tail.

I kept perfectly quiet, while the snake watched me for a minute or two and then, concluding that I looked too good natured to hurt it, it commenced on its meal. It was a garter snake about sixteen inches long and slender for its length. I could not see what it could possibly want with a crayfish, for I did not suppose it was insane enough to imagine that it could swallow such a huge meal and claw. But it went right at it as though it understood its business. Swaying its head (which remained on a level with the surface of the water) from side to side, it worked its jaws as though with a sucking motion, rubbed its throat occasionally upon a little stone in the water and the tail and part of the body of the crayfish was soon comfortably past the Rühlion.

But now came the tug of war, for here was the head and shoulders and huge large claws which were incessantly disposed off. The snake seemed to realize that it had need of all its powers in order to complete his enterprise. It paused for a rest and a breathing spell, and I could readily imagine that it was spitting on its hands for the finish. Then it commenced again, and such a swelling and swaying and contorting would have made a circus clown sick with envy. And all this time the poor crayfish didn't utter a single objection. It simply looked out into space with a vacant stare and didn't seem to have the least interest in the proceeding. I had doubtless been crossed in love at some no distant period and considered the world a hollow mockery, from which it was a blessing to be freed.

Gradually its shoulders were drawn into the cavity, then its head sunk slowly out of sight and the last thing we saw of that luckless cray-fish was one of its huge sharp claws illustrating a dissolving view as it was drawn into its living grave. Then that snake's jaws closed like a rat trap; it worked its body, pushing its victim down further—just as you have seen a boy work his throat when choking on an overdose of drap-acum—and in a few minutes he was gone. A few times, wide as his eye as me as though to say, "There, you can't do that, old man," and then wrigled away under the log to digest its well-earned meal. ORANGE PRAZER, Columbus, O.

"THE WAY OF A SEIPENT ON A ROCK."

THE movement of a snake in climbing a perpendicular surface, as I have observed it, is a vermicular, undulating motion, not spiral, but straight up the face of the surface. I have seen a black snake thus glide up a beech tree with such easy, careless grace of movement, over horizontal surfaces, that it snaked when moving over horizontal surfaces. The bark of the beech affords few inequalities into which the edges of the gastrolite's bands could thrust claw-fashion, and I have no doubt that atmospheric pressure is the force that holds the snake against such surfaces in climbing, sucker fashion, as the boy lifts the brick with the piece of wet leather. I once knew a black snake to ascend a stucco wall to the second story window, and another I saw go to the eaves of a carriage-house to the swallows' nest; straight up the up and down boards. I have seen them glide from tree to tree and leap down boards from the top of a large tree, but never saw one descend by climbing down a smooth, perpendicular surface. I have no doubt of their ability to do so, however. I do not believe that this power is enjoyed by the copperhead or rattlesnake, or any venomous sort with which I am familiar, they being heavy and sluggish in their movements.

I have seen them go up on leaning trees and crawl into the foliage of bushes, however. M. G. E. Washington, D. C.

It is well known to residents of vicinities where black snakes abound that they do climb trees, and that they climb large trees perpendicularly by clinging to the bark; in fact they can even climb the smooth, barkless trunk of a tree, rapidly and readily, in almost a straight line upward. As for descending, I once saw a large black snake attached to the bark of a huge oak, perpendicularly and in almost a straight line, and lying there motionless, head upward, and on throwing a stone at its snakespeare it took the shortest possible mode of descent by letting go all holds and dropping in a heap at the base of the tree, from whence it glided rapidly away. Columbus, Ohio. ORANGE FRAZER.

A short time ago I walked into a stable, and leaning against a post which supported a girder overhead, I proceeded calmly to consider the "points" of a horse haltered in an adjacent stall. A slight sound caused me to glance upward, and behold, a black snake, which I instantly glided with great rapidity down the post, thence over my shoulder and down my back to the ground, and disappeared through a crevice in the wall. I make no professions of bravery or cowardice, but I freely confess I was nearly disarmed with terror. Had I been duly informed of the snake's presence, and that it would adopt this novel and unexpected method of descent the effect might have been different.—M. Northside, Va.

THE MOCKING BIRD'S TRIUMPH.

SPEAKING of singing reminds me that before the summer has left us I wish to lift up my voice in behalf of the mocking bird. No bird on earth ever had a more unfortunate name, and no genius was ever more misunderstood than this artist of the woodlands. He is not a mocking bird at all, as we take no lessons from any creature under the blue vault. He imitates no sounds in nature, and never mimics anything. This is a broad statement, and these are strong words. Now for the proof: Having watched these feathered singers for many years and in many longitudes, both in captivity and in their own wildwood haunts, I suspected that the versatility of the bird was not appreciated, and that his talent and genius were not fully known. We took a young mocking bird out of his nest before he had feathers sufficient to cover him, and I was anxious to understand anything about the exhibition of a chirp from his parent, which I interpreted to be a signal for opening his mouth, which he always obeyed to the extent of almost turning himself inside out for fear he should miss a morsel. It was late in the season, and it should be noted that the martins had gone away, and few birds sing after July in the latitude of St. Louis. We shut the bird up in the dining room, and he neither saw nor heard a chirp or song from any of that innumerable company which he so perfectly imitates the next year. It was September, and I was about to shut him up. During the latter part of the following February he one day perched himself on a wire and, twisting his head in a very thoughtful way tried to "imitate" the liquid note of martins in springtime. It was a miserable failure of course. We laughed at him, and he hopped down; but soon tried it again. After three days of steady practice he succeeded; then he undertook the cry of the jay bird, and after many patient attempts and numerous failures he succeeded. After that he began on the very difficult and otherwise imitable "chirp" of the blue bird. In two days he mastered it, but he had never seen or heard a blue bird, and this rare genius evolved from his inner life the marvelous power that he had inherited. What has usually been set down as the "mocking" of this bird is only the exercise by way of suggestion of the talent he possesses, but a first-class singer of this species invariably excels that which he is popularly supposed to be imitating, and other birds recognize and acquiesce in this without any exception.

It is a well known fact that the best bird-fish, the cardinal bird, is some others and also "mocking birds" in a limited way. One day I stole quietly under a tree to listen to the varied and exquisite rendering of a difficult piece of bird-music, classic indeed, by a red-bird. Conscious of his success he paused and struck attitudes as though admiring himself in a mirror, and as he poured out his song other birds thereabout were hushed into silence. All at once a regular "mocking bird" took a position on a tree near by, and in a very few moments he sang the same piece of music, struck the note on the first effort exactly where the red-bird was doing his very best, but the song of the "mocker" was so much sweeter than his own that the red-bird merely glanced in the direction of the great star performer and closed his beak in an instant. Aware of his triumph, and unafraid of interruption, the wonderful mocking-bird ran over all the notes easily and then towering in his matchless song, charged over the great field of music, known only to himself, weaving into harmony and melting into symmetry all the bird-voices ever heard or imagined. He had a great audience that day and knew himself equal to their highest expectations. The red-bird merely hopped to a lower branch and with mute reverence listened. An old fussy, awing crowd stopped and was silent. The little wrens spoke never a word to each other, while the doves forgot to whisper love, and a squirrel, poking his head half-way out of a knot-hole far up in a great oak, rested his chin on his hands and closing his eyes enjoyed it in his own unobtrusive way. Not one of the audience moved or stirred an eyelid, and no comment was made by any of the singers. Criticism was disarmed and we were all together caught up into the third heaven.—ROBERT WEST in the Advocate.

AN IOWA MASTODON'S REMAINS.—The bones of what is known as a behemoth were found on the farm of Jerry Hopping, in Washington County, Iowa, a few days ago. Mr. Hopping's boys were bathing in a small creek on their father's farm, when they rasped their knees over something they supposed was the ragged edge of an old stump. They threw the chunk out upon the bank, and, upon striking it a few blows with a hatchet, found it was bone and not wood. It is said to be the shoulder bone of a behemoth. The piece was three feet long and the joint between the ends by six inches thick. When Jerry detected its true character he began explorations. He got out several ribs 5 to 6 feet long, 2 1/2 inches wide, and 1 1/4 inches thick; two molar teeth, the largest weighing 264 pounds, 1 1/2 inches long on the grinding surface, 4 1/2 inches wide and 1/4 inches deep, with portions of the socket or jaw attached; several joints of vertebrae in the neck 17 inches long, 9 wide and 4 thick; an axis joint, 14 by 7 1/4 inches; parts of the horn or tusk 8 to 10 inches in

diameter and 6 feet 2 inches long, and very brittle, the inner substance crumbling like lime. The lower part under ground was smooth as a cow's horn, and tapered in the same way. It was broken off, and was 23 inches around at the base. He has the thigh bone, 3 feet long and 1 1/2 inches thick. From the order in which the bones were found Hopping says the animal must have tired down and died with head up stream. He has traced the rotches for a distance of fifteen to twenty feet, apparently lying as they fell apart, the horn being under a spur of a bank ten feet high, which he shaved down. The neck bones were under the roots of an elm of good size that was undetermined by the late freshets; the shoulder blade was in water about 2 1/2 feet deep.—Dubuque [Iowa] Times.

HABITS OF THE HERMIT CRAB.—Glen Island, Aug. 11.—Imagine my surprise this morning on finding a lot of small periwinkle shells occupied by young lobsters! I have often wondered how the young lobster protected itself from the festive bass and blackfish, but my discovery certainly explains the problem. The little lobster first eats the periwinkle and then steals his shell, occupying it for his own protection.

Put one of them out of the shell and place both back into the water and you will see him kick into the shell again. Now, I wish to ask you if my observations are correct, and if so, is it generally known that the young lobster appropriates small shells for a home until his own shell is hard enough to protect it from being food for larger fish? T. J. M.

You have mistaken the hermit crab, sometimes called soldier crab, for the young lobster. The hermit crab never has a shell on its abdomen, and all through life protects it in the manner you mention. There are several species of them, some growing larger than our American species. They do not always eat the inhabitant of the shells, if they ever do, but as they grow they find a larger empty shell and exchange. There is a land species found in Bermuda.

CO CROWS EAT FISH?—Paddling down the stream one day I saw a crow lopping along on the stones at the river's edge, and looking curiously into the water as though it had lost something. Surprised at the strange actions of the bird, I drew my canoe to one side and patiently observed the manergeric. The bird hopped along for perhaps two minutes, looking sharply into the shallow water the while, and then suddenly splashed in and quickly emerged with a good-sized minnow in its beak, which it swallowed with evident relish and then began to look for more. I watched it until it caught and swallowed two fish, when it flew away. A few days afterward I saw another crow perform the same operation of catching a minnow and swallowing it. The only parts of the bird which entered the water were the legs and head. And now, if any one asks you "Do crows eat fish?" answer yes.—ORANGE FRAZER.

Columbus, O.

WHO CAN ANSWER THIS?—South Keene, N. H., June 14.—As I was fishing with a party in Kobb's Reservoir a short time ago I saw what seemed to me to be a young duck on the water some three rods from the bow and twenty-five rods from land. Some of the boys proposed that we give chase and, after some puffing and blowing, we captured the duck, which turned out to be a white mouse. After he had been interviewed he was released, and running out on the top of one of the oars he dove into the water like a school boy and swam away perfectly at home. Now, I have hunted and fished in the wilds of Maine, New Hampshire and Vermont and never seen anything like it before. Will some one tell me what species of the mouse tribe it belonged to, and oblige. MARK.

Game Bag and Gun.

AN ARKANSAS TURKEY HUNT.

THE communications that appear from time to time in the columns of FOREST AND STREAM on the subject of turkey hunting remind me of the hours that I have spent in the pursuit of that kind of game birds. In the month of February, 1880, B. and I organized a night attack upon the turkeys that we had been told roosted in great numbers in the timber that grows in the overflow and swamps of Cache River.

It is a very sluggish stream in many places, having no channel, its waters creep slowly through thick trunks ofypress timber. In the summer during the dry season one can almost step across it, while during the overflow in the winter or spring it spreads out in places to the width of a mile. It rises in Missouri and flows southward into the White River near Clarendon, Ark., passing in its course through the eastern portion of this county.

It is a fact known to hunters that wild turkeys that live in a low swampy country nearly always roost in the cypress or other timber that grows in the overflow and along the edges of shallow lakes or sluggish streams. They seem to love to roost over water. In mountainous or hilly countries it is said that they generally roost in the timber on the sides of the steepest hills. Safety is perhaps the ruling motive in both cases. A full moon was necessary for the success of our hunt, but, after watching it impatiently for several nights, we decided that it would do, and started with but little more than a half moon. We rode that afternoon to the house of a settler who lived on the west bank of the river. The settler's dwelling-house consisted of a one-room log cabin. As we rode up we noticed a number of coon skins stretched on sticks hanging from the walls of the house, telling that the settler was waging vigorous war against the "varnents" that surrounded him. The settler and the hired man expressed a desire "to see them britch-lokers shoot," and, as it lacked an hour to sundown, we took a walk around the cornfield, bagging several squirrels on the round. When we returned we found that the settler's wife had supper ready. That being soon dispensed with we hastily inspected our shell sacks to see that our "turkey" shells were in proper order. We had loaded them with five drams of Dupont's No. 1 ducking powder and one and one-fourth ounces of BB shot. The settler and hired man had fired off their muzzle-loaders, and were now busy reloading for the turkeys. I noticed the hired man pour about a handful of fine rifle powder down each barrel of his gun, and, after ramming down upon it heavy wads of newspaper, he put in about the same

quantity of OO shot. Everything being ready B. and I stepped out into

"The evening air, In the beauty of a thousand stars."

We noticed, too, that the moon was promptly on hand to fulfill her part of the programme. We were soon tramping along up the edge of the overflow. The settler and hired man were to follow us in the dug-out. We had gone perhaps a mile and a half up the river when we halted for a moment. So far we had not seen or heard a turkey. Though neither of us spoke a doubtful word, and both expressed the opinion that the turkeys had only roosted further up the stream than they usually did and that we would be certain to find them further up, yet I knew intuitively that our thoughts were the sane, and that we were both beginning to doubt some of those turkey stories that had induced us to take this hunt. Moving on again, we had not gone twenty steps, when suddenly we heard the well-known, sharply-uttered "quit! quit! quit!" from the tree-tops overhead. Then came the heavy flapping of wings and shaking of branches, as the frightened turkeys flew from one tree to another.

"Just listen!" said I. "My goodness, there must be a hundred of them, from the fuss they make!" said B.

With finger upon the trigger, we peered intently into the tree-tops, endeavoring to distinguish a turkey from the immense number of knots and crooked limbs of every conceivable shape. "I wish," said B., "that the moon was just a little fuller." "It would be better, but I think we shall get them yet," said I.

B. did not respond, but I saw him suddenly bring his gun to his shoulder—a blinding flash shot up into the air, followed by a crash and a roar that echoed and resounded far away up the river and through the forest. My heart gave a thump, and I listened to hear the turkey fall, but no turkey came, only a quantity of leaves and twigs pattered on the ground.

"Did you kill him?" "Kill! Thunder! I'll be switched if I didn't shoot at a squirrel's nest. It looked exactly like a turkey."

We concluded, as most of the turkeys seemed to be over the water, to wait for the dug-out, and when it came one of us would go after the turkeys in the timber over the water, while the other remained on the bank to shoot any turkey that might fly in that direction. The settler and his hired man soon came up in the dug-out, picking their way carefully through the timber in the overflow.

The dug-out was just large enough to carry two men. Being long and narrow and round under the bottom, it threatened to have the least motion to turn over. Persons skilled in the use of these dug-outs suffer no fear of turning them over. Standing erect in the stern of the dug-out and using a long paddle, with a regular, sweeping stroke, they send them over the water at a fearful speed. Neither the settler nor the hired man was a skillful canoeist, neither having lived long on the river. As for B. and I, we could hardly sit in a dug-out without turning it over. It was decided that the hired man and I should have the privilege of going out on the water first. I took my seat in the bow with my gun in hand, while the hired man sat in the stern holding the paddle.

As we moved out into the overflow the "quit! quit! quit!" and the flapping of wings was heard on all sides, but I could not see a turkey. Still moving onward, we heard what seemed to be the cracking of a dead limb, then a splash as of something heavy dropping into the water. Steering in that direction we soon came upon an old gobbler quietly floating on the water, seeming to be utterly astounded at the unexpected situation in which he found himself. As he saw us approaching he struck off to swim at quite a lively rate. He never overhauled him. I was in favor of taking him alive, and so proposed, but the only answer I received from the hired man was: "Shoot! shoot! shoot! He'll fly! he'll fly! he'll fly!"

Such lungs as that hired man had! For fear of being deafened I leveled my gun and fired. I tried to shoot the turkey in the head, but found afterward that the charge had struck him full in the body. I knew then that so far as I was concerned shooting him would be a mere waste of powder. He proved to be an unusually fine bird. He was so heavy that we had to be very careful in lifting him into the dug-out to prevent capsizing. We were now in high glee, and pushing out nearer to the channel of the river where the timber was not so heavy, we obtained several shots at turkeys sitting in the tops of the straggling yepress trees that grew in the river. But I did not bag another turkey. I think I missed them, but the hired man assured me that he had several fall into the water after being shot. We were only guess work, and I am so sure that the hired man had good naturally told us this to prevent us from being chagrined by the repeated misses.

When I brought the gun to my shoulder I could not see the end of the barrel, and could not tell whether I held on the turkey or not. I several times requested the hired man to pull round till he placed the turkey in a line between me and the moon, telling him I could then easily hold on them. But the hired man was excitable, and though when not in sight of a turkey he would promise to obey the request, yet so soon as he came in sight of a turkey you could get nothing out of him but "Shoot! shoot! shoot! he'll fly! he'll fly! he'll fly!"

Whenever he opened up fully I threw my gun and fired, more to stop the hired man's mouth than with any hope of harming the turkey. I soon grew weary of that hired man's voice, and suggested to him that we pull to the shore and allow the others to use the dug-out awhile. Turning the bow of our boat shoreward we soon came in sight of the fire that B. and the settler had kindled as a beacon to guide us on our return. When we landed we found the hired man on the dug-out and hung him by his spurs from the limb of a sapling. There were various guesses as to his weight, but none below twenty-five pounds. On our return to the house we found that he weighed only twenty-one pounds. (Memo.—When you kill a gobbler of twenty-five or thirty pounds do not weigh him; they generally resent such a proceeding by falling off from five to ten pounds.)

The sight of that gobbler put B. in a fever to get in the boat and go out on the water for them. So far in the hunt he had not bagged a bird. He and the settler scolded like shadlows into the night, while the receding splash of the paddle told that they were moving far out into the overflow. While they were out on the water I determined to try a little hunt of my own on land. Striking off into the forest I endeavored to find a sleeping turkey by looking into the tree tops upon which the moon, which was now in the west, shone. I soon found that this was tedious work. Every crooked limb, knot, bunch of leaves, squirrel's nest assumed the shape of a turkey, and, as every plausible object between myself and the moon could I discover this cheat.

After some time spent in aimlessly wandering from one tree to another I concluded to start back, and soon came in sight of the fire. In a few moments the hired man came back from the hunt. With an air of practiced coolness he had been hunting he had seen several turkeys, but had failed to bag any. Not long afterward we could hear the dip of the canoe paddle. As the boat neared the shore a turkey was started from a tree-top. It flew past B. A crashing peal told that B. had given it a broadside as it passed. About the same instant was heard a splashing and struggling in the water, mingled with yells. "He's got 'im," said the hired man, as we both jumped from the log on which we had been seated. It seemed to me that B. had downed the biggest gobble of the season. An instant later when the turkeys had upset, and that was B. and the settler making the fuss in the water. Fortunately the water was not deep. Frequent remarks expressing emphatic opinions about turkey hunting, night hunting and dug-outs crested our ears, as B. wended his way to the shore. When he and the settler stood shivering near the fire, the water streaming from them, they made a sorry sight indeed. But, though the water was cold, the weather was unusually warm for the season, and they were both persons of vigorous constitutions. It was decided to start on the hunt immediately. We made the turkeys briskly to prevent a chill, were soon dressed in warm dry clothing, and, with pipes in their mouths and legs stretched toward the fire that flamed and roared in the huge fire-place, recounted amid peals of laughter the crowning event of the night, their late ducking, from which they now seemed to feel none the worse.

"Did the gun kick the boat over?"

"No. I heard the turkey, but did not see her till she had nearly passed me. Then, getting a glimpse of her, I threw my gun round and fired. Losing my balance, I caught at the side of the boat, and she was over in a second."

The next morning we sprang out of bed before light, and started up the river to lie wait for the turkeys as they flew from the trees. Arriving at the place where we had found the turkeys the day before, we made the distance to the edge of the overflow. There were four of us, and we took stations about two hundred yards apart. We faced the east, from which direction we expected the turkeys to come, as we knew that they were over the water. I held the extreme left; B. next to me, the hired man next to him, and the settler on the extreme right. The cast began to grow red. Objects became distinguishable. I saw several turkeys a hundred or two yards away, sitting in the trees over the overflow. They were badly seated, and soon began to fly and call to each other. As we had nothing to call with we kept as still as possible. Soon they began to fly down. Several reports to the right told that the turkeys were endeavoring to force our right wing, and that the hired man and the settler were making things lively with their muzzle-loaders. A quick double report a short distance to the right and I knew that B. had entered the fight. Would none of them come my way? I began to think that I would have to go back without a shot. The turkeys that I had seen in the trees in my position had gone. Looking at the dark, sluggish water, the overflow, studded with the trunks of huge trees and covered above by their interlacing boughs, I fell into a kind of reverie and had almost forgotten my purpose there, when, hearing a noise, I looked up. Not a hundred yards away, only ten or fifteen feet above the surface of the water, his wings curved in a steady sail, coming directly toward me, was a large gobble.

As he came like an arrow, till nearing the edge of the overflow he threw himself erect, and, bringing his wings square across the direction of the wind, he gave me a grand break on his speed, with a few strokes of his wings he came down just to the edge of the overflow, behind the top of a small tree that had fallen in the water at that place. In a moment he came stepping from behind the tree top, in full view, not forty yards away. What a beauty he was! The glossy plumage on his neck and sides fairly shone. Taking quick aim I lie drive at him with my right barrel, intending to give him the left if he attempted to run or fly. A dense volume of smoke shot out from the gun and hung between me and the turkey. It was so certain that I had killed him that I was in no hurry to go to him, but stood for a moment deliberately putting in another shell, so as to be ready, should another turkey come that way, to give him a right and left. I could hardly believe my eyes when I got to the place where I expected the turkey was and could not see him. I looked and looked, but he was not there. There were bunches of feathers, some with blood on them, scattered along the edge of the water in the line of the shot, but no further traces of that turkey could be found. The result of that shot made me full convinced of the theory that I had shot turkeys with small shot. Had my gun been loaded with No. 6 or 7 instead of BB, I should certainly have shot him dead, as at that distance, with small shot, I could have put several pellets through his head and neck. As it was I had doubtless given him a mortal wound, but allowed him to escape. This was worse than a clear miss. Soon B. came up with a turkey hen in his hand. Although he had shot at it with both barrels, putting several BB shot into its body, it kept on its course for about a hundred yards, then dropped dead. Going toward the house we came upon the settler and the hired man, both circling around through the woods, looking for the turkey which each believed he had killed but could not find. The settler and the hired man were both of opinion that the shot was too small. If large shot would not kill, they did not see how using smaller shot could help the matter any.

"They'll fly till the last breath is out'er 'em, and you have to shoot 'em wid shot as is big enough to knock the breath clear out'er 'em, then you'll get 'em," said the hired man. I told him that I had used smaller shot with better success. I prefer No. 6 to any other size for turkeys. 8-muzzets I load one barrel with No. 6 or 7 and the other barrel with No. 4.

Returning to the house we breakfasted, and, promising to come again, mounted our horses and galloped homeward. That old gobble, although he had treated his last several hours before, still showed fight. I could not tie him in any position but he would pull loose. I had stopped to tie him several times, and at each time he had had his head down, and when we went again in a lively gallop, when suddenly my horse began to rear and plunge and throw her heels in the air in a style that made it seem probable that I should collide with the earth. Casting my eye backward to ascertain the cause of these unusual capers, I saw that old gobble tugging with might and main at the strings which bound his feet and neck, at the same time digging his spurs into the side of the horse. Quieting the horse, I again tied the old

bird, but he did not cease his tussle till I landed him at home.

Mrs. R. was delighted. After admiring his size and plumpness he was carried over to the cock's orders to pick him nicely and then report for further orders.

I had finished recounting to Mrs. R. the exploits—the "moving accidents by flood and field"—connected with the hunt, and we had commenced to discuss the question as to the heat mode of cooking the turkey, when the cook suddenly appeared. I knew by the expression on the face of Patsy that she had something important to communicate.

"Miss R," she said, "who 'ber clean dat turkey forgot to took his craw out, an' he done soosed."

"We hurried into the kitchen. It was too true. When on our return from the hunt that night, assisted by the hired man, I had drawn the turkey. Being unused to such work, I had never once thought of the craw, and the weather being warm, he had, to use the cook's word, "soosed."

Did I discover in the dimmed and half shut eye of the old gobble a gleam of malignant satisfaction at the knowledge that his captor was foiled! But I did not count my labor lost. More than the juicy meat of the turkey do I prize the memory of that hunt. With it are involved pleasant visions of the dim wood, the quiet water, the moon-lighted shore, and of "the morn' in russet mantle clad."

Gainesville, Ark.

DELAWARE RAIL SHOOTING.

I HAVE been asked to send you for republication the comparative scores of remarkable rail shooting had at Chester, Delaware River, in the year 1846, and a like season of great tides and numerous birds at Port Penn, Delaware River, in 1873. Dr. Lewis, in his chapter on rail shooting, gives the first, but the shooting made at Port Penn I procured from Mr. Sir Lord, the proprietor of the hotel at the latter place. This may give those unacquainted with the sport of rail shooting an idea of what is done on our river at large, and when it is known that each bird is shot singly and on the wing almost as quickly as a cat and a mouse, the idea can be gained of the excitement accompanying the sport when numerous boats are being pushed through the reeds, each one endeavoring to be "high" at the finish.

At Chester in 1846.

Grand total, 8,473.

The shooting in 1846 at Chester was in muzzle-loading time, and the run of high tides occupied nine days; that at Port Penn in 1878 was in breech-loading time, and was done in three days. Many of the participants of the Chester shooting have long since "passed in their checks," but the names of those who enjoyed the remarkable shooting at Port Penn in 1873 are familiar to Philadelphia sportsmen.

Homo.

ARE THEY MONOPOLIES?

WHAT are monopolies, and what constitutes just such as we see in "Didymus" to wonder "if people tamely submit to it?" Are they our great railroads, extending from the commercial centres to and through remote and unsettled territories, holding the absolute right of property way over thousands of acres? No. Their stock is for sale in the open market to "Didymus" or any one with means to purchase from one share up to the controlling interest, and even the "Granger" had to admit them to be a great blessing to the farmer when he discovered that a firm in the wilds of Dakota, costing from five to five dollars per acre, could, by the rent of a rail car, compete profitably with a farm near commercial centres costing one hundred dollars per acre, in the sale of wheat, corn, rye, oats, potatoes, etc.

Are the telegraph and telephone companies the grievous monopolies that trouble "Didymus" so much that he fears this will cease to be a "free country?"

No. The grievance and monopoly which is cut off from the people every acre of good shooting ground and destroyed our boasted freedom is a little club of sporting gentlemen, incorporated in Ohio, and owning marshes, lands and waters, on Sandusky Bay, their object being, as set forth in their certificate of incorporation, "for the purposes of yachting, hunting, fishing, the protection of fish and game and for lawful sporting purposes, as provided by an act passed by the Legislature of the State of Ohio on the 15th of May, A. D. 1878." This club (which was first organized over twenty-five years ago) for nearly twenty years left its extensive hunting and fishing grounds open to all "outsiders" without any restriction or hindrance to hunt any fish, the club owning the land and paying annually a large amount for its protection of its shores from washing, and for extensive improvements generally.

When these grounds were purchased and these investments made by the club the marshes literally swarmed with geese, swan, heron and almost every variety of game ducks and waterfowl, and the owners of the property could be sure of a day or week of sport after a long and tedious journey. The members of the club were scattered through New York, Philadelphia, Pittsburgh, Cincinnati, Covington (Kentucky),

Cleveland, etc. But these grounds were open to the unselfish "outsider," who cleverly managed very after year to occupy before the flight of the eligible shooting points, to the exclusion of the less enterprising members of the club themselves, and who so persistently banged at and chased up on their feeding grounds, night and day, and indiscriminately slaughtered the game, that finally few game birds were left, and total extinction or protection became inevitable. Hence, after leaving their possessions open to wholesale slaughter of their game by "outsiders" for nearly twenty years, the club proceeded, under the laws of Ohio, to protect the fish and game found on their premises from indiscriminate slaughter out of season, and from ultimate extinction in the near future.

No game is allowed to be shot and no fish to be caught out of season or unlawfully, and none but owners of shares in the club are permitted to hunt on their premises. Any good citizen may become a member on the purchase of a share. It looks to me more like preservation and protection of property than a grievous monopoly.

"Didymus" magnanimously suggests that "if they would adopt the system of giving the privilege of a day's shooting occasionally to outsiders, keeping out all market shooters, they would not appear so glaringly obnoxious to the charge of selfishness. My wonder is, as it now stands, that people tamely submit to it."

Luckily for the rights of property and the peace and harmony of the world the people do submit to let every man gather, or have the first right to gather, the game, the fish and the fruits found and produced on his own premises. While "Didymus" was abashed, why not claim the privilege of one day for free shooting of game, one for digging potatoes (keeping out all diggers for the market), and one or two days' free feasting in the watermelon patch for himself, boys and pigs on the grounds belonging to the club? I think the club would rather prefer to yield the potato and melon patch (if compromise must be made to break the monopoly) to public plunder and preserve the game.

There are hundreds of such clubs established all over the United States and the Dominion of Canada by the best of honorable means for the purpose of the preservation of game and food fish—and it is sincerely hoped there will be many more.

Cleveland, Ohio, August, 1881.

IN DEFENSE OF THE ADIRONDACK GUIDES.

THE BRUTE "PARKER" NOT A GUIDE.
THIRD LAKE, FULTON CANTON, AUG. 8.

Editor Forest and Stream.

Am just in from the "other side," and find the all-absorbing topic here the Parker affair. The papers have got hold of it, and are running it for a sensational event, and all wrong. The *New York Mail* thinks the "Adirondack guides a class to be left severely alone." It happens that I was cruising in the vicinity where the thing happened, and was over the long carry at the foot of Forked Lake wihdui an hour of the last act of the tragedy which happened there last Friday. The simple facts of the case are that the man Charley Parker was a guide, never regarded to be one, and was not so considered by the guides on either side. The constable at Long Lake is a genuine guide, by the name of Warner Cole. He saw at once the importance of arresting Parker and bringing him to punishment, and he has followed the culprit like a sleuth hound. First, he followed the trail to Kingston, Canada, inveigled or kidnaped him, and brought him back to Long Lake. Pending the investigation Cole had to keep his prisoner over night, which he did by shackling the man to his own wrist. In the morning he placed himself in possession of his handcuffs and the prisoner gone. Again he started on the track, trailed his man to an island in Forked Lake, thence to the mainland, and lay for him on all likely carries, outlets and inlets. Had Parker possessed friends among the guides he might have kept out of the way indefinitely. The guides, however, almost to a man, were anxious for his arrest. They saw clearly that the affair was a ruinous blow to the guiding business, and they felt keenly the injustice of such articles as appeared in the papers.

From what I saw last Friday I infer that the man who was a camp at the foot of Forked Lake, and keeps a lean horse to draw boats over the carry at \$1.50 each, helped Parker. At all events, Parker hung around the Long Carry, and there, just after I passed up the carry, Constable Cole cornered him as he, in company with his wife, was launching a boat. Ordered to land, he refused, was fired on and hard hit "through the arm, which was broken," as the first report had it. "Although my hand and head were hurt," said a guide who came in before night. "Groaning and breathing his last" is the report of the next party. "Dead," is the last report. Any and all of these reports may be true. It is certain that he has got heavy punishment.

The main point is, after all, the way in which this affects the guides.

My acquaintances in the North Woods are largely of the guide class. I feel this thing as though I were one of their number. I have been in the woods night and day for seasons, and have not been ignorant of them and their ways in many long years. So far as the genuine guide of the Adirondacks is concerned, I would not hesitate to hang up a valuable watch or my pocketbook on a carry, outlet or inlet, merely appending my name, certain that my property would be safe as in the vaults of a bank—unless some outsider came across it. I can give the names of more than two hundred guides with whom I would trust my seventeen-year-old daughter as contentedly as I would with her mother.

A middle-aged man, first and foremost, to take care of his party—to defend, protect, feed, shelter and bring through safely his party, at the risk of his life, if need be. This is recognized as a first duty by every true guide. The man who "wets his party," or lets them suffer privation or inconvenience in any way that skill or industry can prevent, gets more ridicule from his compeers than he can well stand.

Had I time and space, I could give several instances that have come under my personal knowledge of energy, skill, surprising personal endurance and faithfulness not found in the ordinary walks of life.

To sum up: Charles Parker was no guide. He came into the Wilderness last summer for the first time, worked, fished and hunted for the hotels, and had since led the same desultory sort of life.

The guides say that Parker was an assumed name—that he was a convict who had served a term in the Penitentiary. They beg the public to understand that the Adirondack guides have no sympathy for, no adulation with, the rascal, Charles Parker.

NAGSHTV.

ASIATIC BIRDS FOR AMERICA.

FOREST AND STREAM GAME TABLE.

OPEN SEASONS. The seasons, to which it is lawful to shoot game in the several States and Territories, open as designated in the following table.

Table with columns: States, Deer, Woodcock, Quail,uffed Grouse, Pinnated Grouse (Chickadee), Wild-fowl, Wild Turkey. Rows list various states like Ala., Cal., Conn., Dak., Del., D. C., Ga., Idaho, Ind., Iowa, Kan., Ky., La., Me., Mass., Mich., Minn., Miss., Mo., Neb., N. H., N. J., N. Mex., N. Y., N. C., N. D., Or., Pa., R. I., S. C., Tenn., Tex., Utah, Vt., Va., Wis., Wyo.

treatment, but an unluckily heavy shower rain upset his mental equilibrium again. He mistook the drops for the blunt arrows of his tormentors and ran himself into a temporary hydrophobia. His master, of course—as is customary with foreigners, whether treaties be violated or dogs' tails docked—demanded compensation, and, failing to find a receipt of payment on the Satsuna side, instituted an action at law, laying the damages at \$350."

AN UNUSUAL PERIL OF THE CHASE is hinted at by the Oswego Times, which tells a story of the Hon. Sidney T. Holmes, well-known to many readers of the FOREST AND STREAM. Our contemporary says: "The Hon. Sidney T. Holmes, formerly of Madison County, represented this district in Congress for the term including the years 1865 and 1866. Judge Holmes, after the expiration of his Congressional term, became the business partner of the Hon. Roscoe Couling in Utah. A few years ago he located West, though in what State has escaped our recollection. Among his peculiarities was his fondness for hunting, and for this purpose he kept a fine pack of hounds, which, as occasion presented, he followed in the chase. Some weeks since his dogs, for some cause, engaged in a furious fight among themselves. The Judge, hearing the noise, went among them to stop the fighting, when they turned upon him and lacerated him so terribly that it was expected he could never recover from his wounds. While the bruises were tearing him with their mad and apparently blind fury, they seemed suddenly to discern who it was they were rending, and they commenced to lick his wounds, running around and jumping at and over him, whining piteously, and manifesting all the affection for him that it was possible for dumb animals to do. The Judge, after his rescue in the terrible condition in which he was left, refused to have any punishment whatever administered to the dogs, maintaining that they were in no sense blamable."

NORTH CAROLINA GAME—Monroe, N. C.—The extremely dry spell from June last till the present, has caused the largest yield of quail ever known in this section. The fields are literally alive with the young droves; all the eggs have all hatched and not one has been drowned as is usually the case. The close season expires Oct. 1st, and the few that hunt are looking forward to a gala day on that date. In my evening walks I have located fourteen young coveys, most of them two-thirds grown. My pointer, one and a half years old, seems eager for the fray; he was bought for me by Mr. John Davidson, is thoroughly broken and his equal I have never seen. I shall send FOREST AND STREAM in a few weeks a larger picture, 24x30, of my two dogs on a "point," as I have engaged an artist to go with me and take them and the scenery naturally, as they stand with a covey of quail at "bay." This will be a natural scene of our Southern quail hunting, two pointers, one back pointing the other, the coveys given, yet we have received donations from the American Artus Co., Boston, of one of their new summerless guns, from the American Powder Co., Boston, one keg "Dead Shot" powder; from T. Yardley, Brown, Reading, Pa., one-half dozen of his celebrated gun cleaners, and from E. W. Moore, Augusta, a life size crayon portrait of the champion.—F.

NEW HAMPSHIRE WOODCOCK—Nashua, Aug. 15.—Woodcock shooting has commenced with us, and so far has furnished sportmen with weary days' work and short bags of birds. There are more birds than last year, but they are not so plenty as the signs of July led us to expect. It is the opinion of a majority of old shooters that July should be the open month and August and September the close months for us in this latitude. They say that in July the old birds are strong of wing and in good condition, while the young are mature or well grown and able to take care of themselves; in August the old birds begin to moult and leave their feeding grounds for the pond, and are more scattered and harder to find. The only objection to July shooting applies equally to August—namely, the shooting of young grouse.—WEBB.

"FORESTER SCHOOL OF BATTLES."—"Nuff" writes from Washington: "About two years ago you published a capital editorial on the 'Forester School of Battlers.' You will remember, I believe, because so greatly was it needed that your readers just got up and 'screamed' when they read it. Most of us have been postal-carded fearfully about everything, etc. Where can this article be found?"

The article was published in our issue of December 13, 1879, and if its republication will gratify any of our readers, we shall take pleasure in giving it a place. It will be printed next week.

WILD RICE IN DEEP WATER—Harwood, Ontario.—A gentleman wrote a letter to your paper last fall saying wild rice would not grow in water deeper than one or two feet. I was passing through a rice bed here the other day which was about two miles in length and half a mile in breadth. I pulled a stalk up which I send you. I measured it, and it was nine and one-half feet in length; the water was seven and one-half feet in depth. Almost the whole rice bed was growing in that depth of water, and I could, I think, find stalks growing in ten feet of water.—CHAS. CHENESTER.

NEW JERSEY SHORE BIRDS.—Curlews, willets, brown backs, yellow legs and the other varieties of shore birds are making their appearance all along the Jersey coast, but the main body of them seem to be loath to tarry long until they pass the line of summer resorts, and the feeding grounds sought by them seem to be south of Atlantic City and north of Cape May, where the shores are not so much sought by summer sojourners.—Homo.

VIRGINIA GAME.—Henry Ashton, Esq., a prominent sportsman from Culpepper Co., Va., is in Philadelphia this week. He says quail in his section of the country were greatly reduced in numbers last winter. The season was remarkable for the quantity of hawks seen, and the birds that withstood the snow were killed by these winged robbers.—Homo.

Editor Forest and Stream:

I sincerely hope Gov. Denny's project will be taken up in earnest and a large number of those foreign birds imported; but I suggest that they be turned out, several pairs together, in some dense jungle as far South as the Carolinas, where they can breed unmolested by sportsmen and be safe from snow and cold. But it must be considered whether they are birds that live in cultivated, grain-raising districts in their native country. If they are they may not be able to find a living in uncultivated wilds.

I believe the lack of success in that was the cause of the failure to establish the grouse family on the Hempstead Plains of Long Island. I also think a great mistake was made when the great body of the Messina quail were turned out. Instinct leads them, on the approach of cold weather, to take a direct line South. Now, if most of those imported were turned out in the Eastern States they throw away their time and money in importing them. They should have been taken to Kentucky or Tennessee; then, if they choose to migrate at all—which I doubt—they need not necessarily drop into the sea. The mandarin duck is far more beautiful than even our wood duck, but as a game bird it would be of little consequence, as it is not heavier than a quail. Gov. Lyon succeeded in hatching some at Rosville, Staten Island, but they were devoured by rats.

As to the woodcock, it would be glorious sport to shoot those princely fellows; but, even if they could be brought over, it would be utterly folly to turn them out anywhere but in some such place as the Dismal Swamp, where they could fairly get a start in the world before being exterminated.

And with respect to the matter I suggest that it would not be a bad idea to ship a few jack rabbits from the West and let them out in some safe place. He is a noble fellow for the chase, but has a bad reputation for the table, which I believe to be merely the fault of the villainous stuff on which he is compelled to feed.

The sage hen (a large and splendid grouse) has the same fault, as everything must have that has nothing to live on but that concentration of nastiness, the "sage brush." I see no reason why this jack, if well fed, should not be a hare.

D. D. MUMS.

GAME IN DUTCHESS COUNTY.

WE have taken occasion before this to note the business-like and sensible way in which the sportsmen of Dutchess county, New York, have gone about the protection of game. As we so frequently have inquiries as to how a game protective society should be organized, we give herewith the form of a circular sent out by the gentlemen of that county, and suggest that it may serve as a good form for others to copy.

My dear Sir, Mr. P. E. Ackert, one of the signers of the circular, writes us that it is hoped to secure a county law prohibiting the marketing of game, thus striking at the root of one incentive to the illegal killing of the same. The following address has been sent to the farmers and sportsmen.

DEAR SIR:—The frequent violations of our game laws by unprincipled persons who kill and take game and fish out of season, make it necessary that some one should see to it that the laws are enforced and those who violate them dealt with as they deserve.

Game and fish are becoming so scarce, that in order that they may not be entirely exterminated, a law shortening the season in which they may be taken, and in this way protecting them in part, is a necessity.

To that end laws have been passed throughout the country; yet they are a dead letter unless enforced.

Fair and honest men do not violate them; but there is a large class who conscientiously do, partly through greed and partly through carelessness, and who regard it as their right, even those who wait until they have a legal right to hunt or fish.

Farmers and their sons and other persons who hunt and fish occasionally for the sport and pleasure they afford, as a rule, observe the laws and desire their enforcement.

The State is annually expending money for the replenishing of our depleted streams and lakes for a general benefit. It has also been found necessary to appoint State officers to enforce the game laws.

Each co-operator with them is essential in order that their money may be thorough. To that end nearly every county in the State has one or more associations. The county of Dutchess is as greatly in need of it as any.

Trespassers are committed regardless of posted notices, which are frequently torn down with impunity.

If our game laws are not enforced, it would be better if they were repealed; then all would have an equal chance at killing the little game that is left.

Each one who signs this matter, and after talking with many of our best citizens and leading farmers in different parts of the county, have adopted this course to secure at an early day a representation to meet at a time and place to be designated, for the purpose of perfecting such an organization and adopting by-laws for its government.

Please circulate the enclosed petition in your town, and secure the names of as many men as possible upon whom we can rely, say your local club, and arrange among yourselves to meet at a time and place to meet with us when notified, to adopt a constitution and by-laws.

The expense will be trifling in carrying out the purposes of the society. To assure and meet the expense of printing and postage, the sum of one dollar is named in the petition, to be collected by you and paid in the hands of the Treasurer of the County Association within ten days after the adoption of the by-laws and appointment of the officers of the society.

I enclose herewith a petition, and return the petition with the names of the signers, to P. E. Ackert, Peter E. Hayt, Guilford Dudley or E. B. Osborne, Poughkeepsie City, N. Y., within ten days, when notice will be given of the time and place of our first meeting.

Each one signing the petition and paying one dollar shall be a constituted member of the Association. Whether at our annual or stated meeting every member of the Association will vote or by representation, will have to be determined after organization.

A manifest objection, by presenting to the extent of the law its violators, will have a salutary effect.

This matter has been talked of for several years, yet nothing has been done. Let us make this attempt effectual.

The fact that it is the duty of the District Attorney to prosecute violations of the law and that the county gets the benefit of the penalties collected to a large extent, should greatly commend this purpose.

It is though the game laws are not as all of us would like to have them, but the only means to that we have and hope that through our united efforts they may be amended in the future more to our wishes.

IN these States there are special county laws. A deer law applies to sale or possession of a wildfowl not protected on the coast. In Utah, Kentucky, Iowa, and Wyo. deer season opens Aug. 1; Missouri, Sept. 1; N. H., Oct. 1; N. J., Sept. 1; N. Y., Oct. 1; N. C., Oct. 1; N. D., Oct. 1; Kan., Aug. 1; Miss., Sept. 15; Mo., Aug. 1; N. C., Oct. 1; S. C., Oct. 15. Elk—Colo., Sept. 1; Idaho, Aug. 1; Minn., Nov. 1; Neb., Oct. 1; Nev., Aug. 1; N. Mex., Sept. 1; Or., July 1; Utah, Aug. 1; Wyo., Aug. 15.

THE INU-O-MONO.

THE Empress and Emperor of Japan have just paid a visit to Mr. Shimadzu Tadayoshi, the head of the great southern clan of Satsuna, who received them with a display of princely hospitality unparalleled since the Restoration. The sum of \$100,000 was set apart for the Inu-o-mono and No-dances, and yet there was a balance on the wrong side after all. Everything prepared for the imperial household was innocent of previous service, and so far as was possible the furniture, apparatus and accessories were all new. What was old, however, was all the more valuable for its age. Thus the Imperial household's Imperial visitors were covered with brocades three centuries old.

The Inu-o-mono is "the game of shooting at dogs." All the most skillful archers of Kagoshima, it is learned from the Japan Weekly Mail, were summoned northward, and this meant a good deal, for the Inu-o-mono has long been a favorite pastime in the Island of the Nine Provinces; nay, indeed, has generally been regarded as a specialty of the Satsuna men. Two hundred dogs were provided for the performance, and from them were selected the fittest. Some thirty made their appearance in the arena. "General Grant," says the Mail, "they were dogs, not cur, like those that lay down on the sand and refused to be prodded or goaded into motion at the exhibition got up for General Grant's delectation." The Satsuna knights hunted in parties of eight. They were all provided with lacquered bows, except their chief, Shimadzu, whose bow was of milk-white wood with a golden string; the arrows were blunt. The horses were splendidly caparisoned—embroidered saddle-cloths, bluish stirrups, saddles crusted with gold, and helmets studded with gay tassels, while the riders wore bright silken doublets and trousers of deer or tiger skin. Over the whole arena was sifted fine, dark sand, that covering a small, slightly raised circular space in the centre being, however, white. To this central spot the dogs were led, one by one, and so soon as their bonds were cut they bounded off as though they quite enjoyed the sport, though they were "perpetually peppered." This went on from about 7 A. M. till noon, when a truce on the same scale as everything else was provided, and after lunch there was a display of wrestling.

Concerning this same Inu-o-mono, there is a funny story told. The Mail gives one version, as follows: "Shortly before the hunt the Secretary of the English Legation despatched a messenger from his home, in Shiba, with a letter for Mr. Shimadzu Tadayoshi. The messenger was followed by his master's favorite dog, which he tied up outside the Yashiki before seeking admittance. When he came out, a few minutes afterwards, the dog had disappeared and all inquiries failed to find out its 'deceitful'," says the Mail, "the hunter, however, the pup again made his appearance, but alas! his tail was gone and all his ancient sagacity had been concentrated into the accomplishment of scuffling about before mounted archers. In fact, so thoroughly had he assimilated his instructions that whenever he was not tied or held he would bound frantically off and perform a most animated Inu-o-mono on his own account. For a time after being restored to his master he seemed to recover the use of his faculties under the influence of regular diet and affectionate

THE QUINCY CLUB—Quincy, Ky., Aug. 9.—We have organized a sporting club here with the following officers: V. B. Morse, President; S. R. Morse, Treasurer; James Dupuy, Secretary. We call it the "Quincy, Ky., Club." The membership is small, but are all enthusiastic sportsmen. We are going on a camping expedition this fall in the interior of Kentucky, and anticipate a splendid time with wild turkeys, grouse and black bass.—J. D.

WANTS A TENNESSEE HEALTH RESORT—Orange, N. J.—Can some of your correspondents in that State tell me of a place in Eastern Tennessee where I could find good shooting and trapping and a climate that would benefit a person troubled with bronchitis. I would prefer a place not frequented by sportsmen and near some river or lake, also where board is not high.—W. R. B.

DELAWARE QUAIL—Wilmington, Del., Aug. 1881.—I believe, notwithstanding the very hard winter we had on the quail, that a great many birds have been left over and good shooting will be had. I have the best of reports from lower down the State. Reed birds and rail have begun to come already, which leads me to think we will have an early fall.

WISCONSIN—Waukesha.—Game has suffered some from the cold winter and is not so plenty as usual. Some wild pigeons in the woods. Squirrels plenty, etc.—H. W. Merrill.

ILLINOIS—Creston, Ill.—Grouse shooting bids fair. Many flocks of young ones are seen in the prairies and some quail.—H. W. M.

THE WOODCOCK SEASON in Dutchess County, this State, does not open until September 1.

THE MINNESOTA PRAIRIE CHICKEN SEASON opens September 1.

We learn from Messrs. Uptegrove & McEllan, of Valparaiso, Ind., that the demand for their Holland shooting suits this season is unprecedented. Using only the very best material, and engaged exclusively in the manufacture of these suits, enables them to give a perfect outfit.

Sea and River Fishing.

FISH IN SEASON IN AUGUST.

FRESH WATER.

The angler has in various ways been a prominent character in the affairs of men in all ages of the world. In the remotest times of mankind the fish was pursued by a primitive people with as much ardor as they are now by the most civilized. Savage tribes who have fashioned hooks out of human jaw-bones have been equally as enthusiastic and zealous votaries of the art as the most fastidious urbanite of modern days who "whips" the waters with a silver-mounted fly-rod. We find his praises celebrated in ancient lore and embalmed in Holy Writ. Men of all classes, races and conditions are among the ardent disciples of Isaac Walton. But especially from the busy throng of city and man from the giddy whirl of the metropolis, from its daily trudge and strife are men and women drawn by the fascinations and charms of wilderness, lake and stream. The ceaseless industry of the city requires some relaxations, and can we wonder that the indescribable charms and joys found in the "honest man's recreation" captivates these pent-up denizens? There has ever been a fascination in the sport which has captivated the greatest minds. The Pharaohs fished in the Nile; the Romans paid a bounty for red mullet.—J. F. SPRAGUE.

THE CARP IS GAME.

NASHVILLE, TENN., Aug. 5.

Editor Forest and Stream:
Messrs. Previtt, Spurr & Co., on the east side of the Cumberland River from Nashville, have beautiful artificial ponds for the rearing of fish. Last November I gave them twenty German carp which they placed in these waters. This morning I was invited over to see them, and in company with a few friends, consented and went over with hook and line and a No. 1 Kentucky reel. I baited the hook with a small piece of bread and in a few minutes hooked two as pretty fish as ever had fins, ripe and ready for the duties of the cook, and a sweet morsel for a hungry man if placed on the table before him. They were pretty to look at, one of them a daisy, with dorsal fin distended, with golden splashes and sides, like the golden flashes of an evening sun on a western sky, and bright, silvery scales, like the mail of a mail coach.
This beautiful fish, only one year old, now weighs one and a half pounds, and will take the hook as quick as our native bass, and I do say they are game. It requires a good hook to hold one, and I predict, from their wonderful fecundity, with due protection and feeding, that our anglers need only to visit our neighbors' ponds and have all the fish and sport they could wish for.
I am advised that a sufficient number of this year's batch will be ready by the first of next month to supply the thousands who write to me for this fish, and as the State gives me no appropriation for the distribution, not even postage, I will require those wanting carp to call in person.
Geo. F. AKERS.

JOHN ALBRO.

THE WICKED FISHING WHEEL.

THE San Francisco Evening Bulletin is responsible for the following story, which, if that paper has not been imposed upon, deserves immediate attention. We can hardly credit this account of a device which is simply devilish. The Bulletin says of it: "From an English gentleman who has lately traveled overland from British Columbia to this city, we learn that a new device, which has been patented, is now in operation taking salmon on the Columbia River. This device, or machine, is known as 'Williams' Patent Fishing Wheel,' and is located on the Oregon side of the Columbia River, about a mile and a half below the Cascades. This device consists of a jetty of rocks built out from a point on the shore of the river, outside of which is a plank sluiceway, in which an undershot wheel, with large tank buckets, revolves. The sluiceway was built when the river was at its lowest stage of water and the wheel is hung so that it can be raised or lowered as may be desired, according to stage of water.

"The instinct of the salmon is to run up the river alongside of the banks instead of mid-channel. By this the fish can take advantage of the eddies below jutting points of land. On these projecting points the Indians have from time immemorial taken salmon in large numbers by using dip-nets. The jetty built out from the point above named makes a larger and longer slack-water behind it, and the salmon rounding the point rush into the sluiceway to get up the river. In the sluiceway the wheel which revolves in the current in gauged so as to sweep within a foot of the bottom and the salmon are scooped up in the tanks or buckets, which latter let out the water as they ascend. On the wheel descending the fish are thrown out into a trough or gutter leading to a pen below, where they remain until taken away to be canned.

"The arrangement of the sluice, wheel, etc., is a most successful one, the catch of adult salmon, which are the only ones canned, running from 1,500 to 4,000 per day. There is virtually no expense in taking the fish save attending to the pen.

"As the fishermen who take salmon in boats in the Lower Columbia River demand and receive from 50 to 60 cents per fish from the canneries, one can readily see what a vast profit the use of the wheel makes to the cannery connected with it. In fact, if the use of this wheel increases on the Upper Columbia River the canneries located near Astoria and all others who depend on boat-fishing, will either have to give up business or run at a loss from a reduction in price of canned salmon, while their rivals will get rich.

There are about 3,000 men employed in the boats and making nets for salmon on the Columbia River which the general use of this wheel will throw out of work, and at the same time the permanent plant of the canneries, consisting of piers and buildings estimated at more than \$250,000, will become worthless. These two items, the non-employment of boatmen, etc., and permanent plant of canneries are, however, the least of the evils which will come from the use of Williams' patent fishing wheel.

"Our informant states that the wheel scoops up all sizes of salmon from one pound weight upward. That all fish below six pounds weight are not used in canning, but are thrown back into the river dead and float away. He states that at one emptying out of the pen which he witnessed several hundred of the young salmon were thrown away as above stated, and as this occurs three times daily many thousands of immature fish are destroyed weekly which would, in succeeding seasons, grow to a size fit for canning. In fact, it is wholly generally in use when salmon-canning on the Columbia River, which averages from \$2,500,000 to \$3,000,000 annually, will have to cease for want of adult fish to can.

"The use of this fishing wheel means the rapid destruction of salmon-canning in all rivers that have a quick current and

rocky shores. It is a patent which should be revoked on the ground of being 'adverse to public policy;' and its use, or kindred devices by which immature fish are destroyed, should be prevented under heavy penalties within the limits of the United States. It is time that the interests of those who are to come after the present generation should be protected from wasteful devices, and especially in all matters relating to natural sources of fish and game food, which the cupidity of individual man would destroy with a view solely to his present gain.

"The taking of fish in public waters is subject to regulation by law, and the Legislatures of both Oregon and Washington Territory should take prompt action by forbidding the use of this fishing wheel if they desire that the industry of canning salmon shall continue on their rivers in future."

IMPROVEMENT IN MACKEREL FISHING.

GLOUCESTER, Mass., July 28.
AMONG the recent improvements in fishing apparatus there are none, perhaps, that appear to be more important than one that was patented last April by H. E. Willard, of Portland, Maine—an article long used in the mackerel seine fishery and which has received from the fishermen the name of "mackerel pocket" or "spiller." It was first used by the patentee in 1878, and Capt. Geo. Merchant, Jr., of this place, invented and put into practical operation an improved "spiller" last year, though it was not until the present summer that the advantage of its use was known to the majority of the mackerel fishermen, who have hastened to adopt it, and now more than thirty of the vessels sailing from this port are each provided with one of the pockets.

The apparatus is a large net bar, 36 feet long, 15 feet wide and 30 feet deep; it is made of stout, coarse twine and is attached to the side of the vessel, where it is kept in position, when in use, by wooden poles or "outriggers," which extend out a distance of fifteen feet from the schooner's rail. When distended in this manner a spiller will hold over 200 barrels of mackerel, which can thus be kept alive, as in the well of a smack, until the crew who have captured them in the great purse seines have time to cure their catch. As is well known, it frequently happens that several hundred barrels of mackerel are taken at a single haul. Heretofore, when such a large quantity of fish were caught, but a comparatively small portion of them could be cured by the crew of the vessel to which the seine belonged. The result was that when a large catch was made a considerable percentage of the fish were generally "given away" to some other vessel, since if only a part of them were removed from the seine to the vessel's deck, the remainder being left in the net until the first lot were cured, the chances were nine to one that the fine twine of which the purse seines are made would be bitten in many places by the swarming dogfish (*Squalus americanus*), that bite noir of the mackerel fisher. In addition to the injury to the net, the inclosed body of fish were thus allowed to escape and went streaming out through the numerous holes made by the keen teeth of these voracious bloodhounds of the sea, which, in their fierce and ravenous pursuit of the imprisoned mackerel, usually succeeded in robbing the fisherman of a large portion of the fruits of his labors.

The "spiller," being made of coarse twine, though not entirely exempt from the ravages of the dogfish and sharks, is rarely injured by them; and now when a large school of mackerel are caught in a seine the fish are turned into the bag, from which they are "balled out" on to the schooner's deck only as fast as they can be dressed, and in this way it frequently happens that a full fare may now be secured from a single set of the net.

Perhaps no better instance could be cited to illustrate the old saw that "necessity is the mother of invention" than the introduction of this simple net bag, the use of which will undoubtedly save to our fishing fleet many thousands of dollars, even in this, the first season of its adoption.

J. W. C.

THE STARFISH AS A COMESTIBLE.

WHY have the vigilant scouts of the Ichthyophagists Club slumbered while the starfish grew? They have scoured the rivers, ponds, creeks and oceans for things to eat whose very names made the gorge of the average citizen rise, but the starfish has escaped their attention. Perhaps we may take part of the blame for this, for we went down the list of marine invertebrates and passed the starfishes as uneatable.

We know of but few things which will eat a starfish, and have wished that this destroyer of oyster beds had more enemies. We have smelled of the starfish while dissecting it, and for a right down disagreeable smell commend us to the "five fingers." Again, we did not see anything in its anatomy that was capable of digestion by a human stomach, and so passed the whole tribe as of no use to man, not even to the Ichthyophagi.

Now, a thing about which this Club won't eat may be accepted by the public as of no use whatever to hungry man. But now arises the steward of Glen Island. He conducted the cuisine of the late Ichthyophagical dinner. He publishes a recipe for a bisque of starfish, as "invented and composed" by himself. Here it is:

"Take twelve fresh starfish and cut them up into small pieces; put them into a saucpan, with a quarter pound of butter, one clove, one bayleaf, one root of parsley, a few leaves of soup celery and a pinch of thyme; cut up three carrots and two onions into small pieces; let all simmer together until the butter is melted and begins to sputter; then add one pint of Rhine wine; cover the saucpan and allow its contents to simmer for 15 minutes; boil a quarter of a pound of rice in two quarts of water; when done put it into a mortar and add the starfish to it; pound them both together and pass through a sieve into a clean saucpan; now strain the liquid and add it to the starfish and rice; place the saucpan on the fire; stir it well until ebullition; add a quart of hot fish stock and salt and cayenne to taste; before serving add a pint of rich, sweet cream, beaten up with the yolks of two eggs; stir all together and serve."

The reader will observe that he makes no comment on its future. Perhaps the less said on that point the better, but the Ichthyophagists cannot afford to let the starfish pass in future.

It is said that no man dare eat a radish if he will cut one up and let it lie in water over night and smell of it in the morning. Verily, he who has smelled a fresh starfish when opened is a brave man if he can eat it afterward.

THE SEVEN PONDS.

I WAS considerably interested, and like many more of your readers, no doubt, slightly amused by reading a short article entitled "Tim Pond and the Seven Ponds," in your issue of Aug. 11, in which it was said that the Seven Ponds were "stocked with trout which have enjoyed their homes unmolested since the history of trout-ery, all now Kennedy Smith has opened a backwood pathway for sportsmen to the waters where they dwell."

It seems to me, considering that some years have elapsed since Messrs. Grant & Richardson, of the Kennebec Lake House, have erected log camps and kept boats at the Seven Ponds for the convenience of their guests who might wish to go there, that the title of pioneer to that region can hardly belong to Mr. Kennedy Smith. I should like here to give most unqualified praise to Messrs. Grant & Richardson for the uniform kindness and hospitality which their guests enjoy at their camp. No better guides can be found through the whole lake region. Their table is unsurpassed at any point upon the lakes, and I have never known a dissatisfied guest. For parties wishing to camp out they have erected log cabins near the west end of the lake, which are supplied with stoves and the necessary cooking utensils. While it is undoubtedly true that the trout taken here average smaller in size than those of the lower lakes, it is also true that there is no other lake of the Rangeley chain where the fishing throughout the year is to be compared with that at Kennebecago. It is the only lake of the chain where trout will rise freely to the fly during July.

For beauty of scenery it has no equal, being entirely surrounded by mountains, and I think nobody who wishes to spend a few pleasant days' vacation in the woods can do better than try the hospitality of the Kennebec Lake House, and from there run up to Seven Ponds two or three days, where trout of small to medium size are certainly more abundant than elsewhere. B.

LARGE BLACK BASS.

HARWOOD, RICE LAKE, Ont., Aug. 11.

I SEND you-to-day by express a small mouthed black bass which weighed, when caught, six pounds, six ounces and five in stuffing. On Thursday, the 4th of this month, Mr. D. Murphy, a gentleman of Toronto, and myself started out for a fish at 5 o'clock p. m. In two and a half hours we caught twenty-five small mouthed black bass; eight of them weighed forty-one and a quarter pounds. The following is the exact score:

- 6 bass of 5 lbs. each.....30 lbs.
- 1 bass of 5 1/2 lbs.....5 1/2 lbs.
- 1 bass of 5 3/4 lbs.....5 3/4 lbs.

Total for the 8 (out of 25).....41 1/4 lbs.

Rice Lake is now full of fish, both muskungeon and large and small mouthed black bass. The large mouthed bass is called "yellow," or "mud bass" here.

CHAS. GILCHRIST.

The bass came to hand nicely stuffed and mounted, and is the small mouth species, and looks to have weighed six pounds.

RHODE ISLAND HAS A LOBSTER LAW.

PROVIDENCE, Aug. 12.

PLEASE put Rhode Island right on the lobster question. We have a law, passed at the last session of our Legislature (Jan. and Feb., 1881), limiting the catch to ten and a half inches, which, in the wisdom of our law givers, was enough to begin with. It is a good beginning, and we hope to raise it an inch soon.

A lobster was taken about July 1st half way up the bay (Narragansett) that weighed twelve and a fourth pounds in a sweep net. We sent one to the Smithsonian that measured one and a fourth inch, perfectly formed, caught off Narragansett pier. What is not known about the growth of lobsters in their early stage of development would fill a volume. Be sure the U. S. Commission will find it out.

NEWTON DEXTER,
Commissioner Inland Fisheries.

WORMS IN BLACK BASS—WATSONTOWN, Pa., Aug. 12.—Can you enlighten me on the cause of the black bass being literally alive with worms? It is not only one in a number, but all that are taken from our beautiful river—the West Branch of the Susquehanna—and I believe if the bass are dissected, it will be found that all are so at this time of the year in all waters. The worms will be found in great numbers along the back-bones; remove the skin and the worm will be easily found, and in nearly all will be found a small black egg. Can we hope for a disappearance of the worm after August? Can you explain the cause? If you wish I will send you a bass to dissect. I have an idea that all fish are more or less affected with this same worm at this season of the year. This has put a damper to our dreams of taking this grand game fish.—J. R. H.

The bass are often, if not always, wormy at this season. We eat them and never look for worms. The worms and the bass taste alike, the same as the worms in cherries or in cheese taste like the the thing that contains them. See Answers to Correspondents.

HOW TO MAKE A CLAM BAKE—Putnam, August 14.—First secure what clams you want, and a bushel or more of new rockweed, or seaweed so-called. Select a flat rock, then build the oven a fire, and also heat a half bushel or more of clean stones of about three pounds weight each, also one of ten or fifteen. When the rock is sufficiently heated then, having it possible with you a pair of tongs, take off the heated stones and sweep off the ashes from the rock. Now dash on some little water so the rock will not scorch the rock weed and make the clams taste smoky. Then have a clean barrel with both ends out. Set the barrel on the heated rock. Now put in six or eight inches of rockweed; then say half of your clams; then more rockweed; then the hot stones; then more rockweed; then the rest of the clams; then more rockweed. Now put the largest flat hot stone on top of them then put on the rockweed until the barrel is full; then cover up the barrel as tight as possible, so that no steam can escape; bank up a little round the bottom of the barrel. In a half or three-quarters of an hour your clams are done. I generally have a piece of old sail cloth to put over the top of the barrel.—G. F. W.

A FLY CASTING MATCH IN ENGLAND.—Mr. R. F. Merton, editor of the *Fishing Gazette*, is about to introduce this sport into England. He offers prizes and asks dealers to add to them. We will watch for its coming and hope that it may meet with the success which he deserves. It is interesting to note that his scale of 100 points differs slightly from ours. It is:

- Across the wind.....20
 - With the wind.....20
 - Style of delivery of flies.....20
 - Accuracy.....30
 - Total.....90
- The contest is to be for single-handed fly-casting; longest cast from the reel, "Nottingham style," and for longest cast with line coiled at the feet, "Thames style."

VERMONT BASS FISHING.—Montreal, Can., August 9, '81.—I have just returned from a ten-days' fishing tour at Bass Lake, Franklin, Vt., and at Lake Champlain, near Missisquoi Bay. Our catch was wholly black bass; the largest taken at five pounds. Bass fishing is all there this season. Friend Cassau, of Shelton, Vt., has captured, during the past month some six-pound mouthed bass at Bass Lake, and there are more left, even larger than those taken. These fish, on a Greencourt rod, give lively sport.

The writer and a couple of friends dropped into the Ottawa Hotel here to-day for dinner, and the courteous manner in which we were received by the manager, Mr. John Warner, who is a devoted disciple to the rod and gun, caused us to feel that our lines had fallen in a pleasant spot, and that the Ottawa is the hotel for sportsmen to patronize while in this city. No punn about this, but solemn truth.—STANSTRADE.

GREENWOOD LAKE TO BE RESTORED.—At a recent club meeting of the Greenwood Lake Association "Frank Forester Club," it was resolved: That the Treasurer of this Association be authorized to act as trustee for a fund of such voluntary contributions as shall be made, to wit, for the purpose of continually restocking Greenwood Lake and protecting the same; and that Elias Vindle, Samuel Garrison and John Hazen be and they are hereby appointed a committee with full and discretionary power as to the use of this fund, and the Treasurer is instructed to pay the same out on vouchers approved by them.

BIG CATFISH.—Mr. George Le Bar, of Bushkill, Pa., took out a fishing party on Saturday, July 24, from the Buena Vista House, consisting of Mr. Samuel Kay, and D. W. Robinson, of New York City, and on Aug. 31 he killed a black bass, one of which weighed five and one-quarter pounds and another four pounds. This is considered remarkable for this season of the year.—J. O. R.

DELAWARE RIVER NOTES.—Philadelphia, Aug. 11.—The season during which fishing on the Delaware River with nets less than two inch meshes is prohibited expired yesterday, but the fish wardens will still continue to enforce the law against fishing on Sunday.—HMO.

TROUT IN NORTH CAROLINA.—MR. ARRY, N. C.—Splendid trout fishing about twenty miles from here, and superb scenery. J. M. B.

Fishculture.

STRUCTURE AND OVARIAN INCUBATION OF THE TOP-MINNOW (*Zygogobius*).

By JOHN A. RIDER.

SINCE we have taken up our temporary residence at Cherrystone we have found this interesting genus of cyprinodonts in great abundance in fresh and brackish water streams, also in a fresh water pond in the vicinity, a few miles south of where our station is. One or two of these small, ten cent, goldfish-like creatures, all of which are in brooding condition—we will not say spawning condition, as they do not, as do most other fishes, commit their ova to the care of the element in which they live, but carry them about in the ovary, where they are impregnated and where they develop in a very remarkable manner.

Of the manner of impregnation we know little or nothing, except the evidence furnished by the conformation of the external genitalia of the two sexes. In the adult male, which measures one and one-eighth of an inch in length, the anal fin is strangely modified into an intromittent organ for the conveyance of the milt into the ovary of the female; a tubular organ appears to be formed by the three foremost anal rays, but one which is greatly prolonged and united by a membrane. At the apex these rays are somewhat curved toward each other, and thus form a blunt point, but the foremost one of the three rays is armed for its whole length with ridges at its base and with sharp recurved hooks at its tip, the other two at their tips similarly with hooks, and between their tips are two small processes or openings which possibly communicate directly with the sperm duct from the testes. The basal elements of the fin are aggregated into a cylindrical columnar truncated bony mass, which is prolonged upward into the cavity of the air-bladder for the distance of nearly the eighth of an inch; from it a series of fibrous bands pass to the dorsal and posterior wall of the air-bladder to insert into the median line. Whether this bony column serves to steady the fin in the act of copulation, or whether it serves to give passage to the sperm duct, is an unsettled question with the writer. The modified anal fin of the male measures a third of an inch in length. Other peculiarities of the male are noticeable—for instance, as the more abbreviated air-bladder or space which also occupies a more oblique position than in the female. The most remarkable difference presented by the male as compared with the female, however, is its inconceivably weight, which is only 180 milligrams, while that of the gravid female is 1,030 milligrams, or nearly six and one-half times the weight of the male.

The female, as already stated, is larger than the male, and measures one inch and three-fourths in length. The liver lies for the most part on the left side. The intestine makes one turn upon itself in the fore part of the body cavity and passes back along the floor of the abdomen to the vent. The air-bladder occupies two-fifths of the abdominal cavity, and at its posterior end the volvan duct traverses it vertically, to be enlarged near its outlet into a fusiform urinary bladder of very much the same form as in many embryo fishes, as demonstrated by Professor Kuppfer and myself. The ovary is a simple, impaired organ which lies somewhat to the right and extends from the anterior portion of the body cavity to the posterior end of the lower part of the abdomen when fully developed. The ova, when full grown, are each enveloped in a sac or follicle supplied with blood from a median vascular trunk which divides and subdivides as it traverses the ovary longitudinally in a manner similar to that of them to which general reference has been made above, and in such a way that each egg or ovum has its own independent supply of blood from the general vascular system of the mother, from which the material for the growth and maturation of the egg is derived, and which afterwards becomes incorporated with the nutritive material of the developing embryo is maintained while undergoing development in their respective follicles in the ovary or egg-bag. The

ova develop along the course of the main vessel and its branches, may be learned upon examining a hardened specimen, where the very immature ovum eggs are seen to be involved in a meshwork of connective fibrous tissue, which serves not only to strengthen the vessels but also afterward enters into the structure of the walls of the ovum, and apply very largely to the dorsal stalk. The very immature eggs measure from less than a hundredth of an inch up to a fifth, and on up to a twelfth of an inch, when they may be said to be mature. They develop along a narrow median rachis or stalk which extends backward and alightly downward from its bifurcation, and apply very largely to the dorsal stalk. The ova, after developing a little way, are each enclosed in a follicle, the Grefalon follicle, ovicell, ovarian capsule, *membrana granulosa* of von Baer, or *membrana cellulos*a of Costa. As the egg is matured there is a space developed about it which is said to be the blastoderm, or a layer of cells covering it. This space is filled with fluid, and in this fluid, which increases in quantity as development proceeds, the embryo of *Zygogobius* or top-minnow, is constantly bathed. There is no trace whatever in the egg of this fish of an independent egg membrane, as is the case with all known forms which apply directly into the water, and which is usually, if not in all cases, perforated by one or more microporular openings or pores for the entrance of the spermatozoon. This fact raises the question in our mind, whether the same principle holds true in all the viviparous species. Whether Rathke has recorded anything on this point in his account of the development of *Zoarcetes*, the viviparous blenny, I am not able to say at present, as I do not have access to his works. Since the follicles are filled with nutritive fluid in preparation, staining and dissection of the follicles enclosing the ova of *Zygogobius*, I have completely failed to discover what I could regard as an egg membrane, although personally familiar with the appearance of the coverings of the ova of many other aquatic species containing vitelline yolk and vitelline oil, and radiata or covering of the egg in other bony fishes is said to be secreted from the cells lining the follicles and is composed of a gelatinoid substance, and it is often perforated all over by a vast number of minute canaliculi. No such structure existing, therefore, in the egg of *Zygogobius*, we are in a position to ask the question why such a unique condition of affairs should exist in this case? The answer, it would appear to us, is not far to seek. In the first place, the ova are small, and the water in which they are kept, and which they should be supplied with a covering more or less firm and capable of protecting the contained embryo, which in the case of the top-minnow is not needed, because the embryo is developed so as to be quite competent to take care of itself as a very well fed animal when it hatches out of the water. If the mother will not waste her powers in an effort to make useless clothes for each of her children as do not need them; on the contrary, she is constantly utilizing structures economically, and often as to serve more than one purpose. This is the apparent answer to the question which we started with.

The follicles or sacs containing the ova are built up internally of flat, polygonal cells of pavement epithelium, and externally of a network of multipolar, fibrous, connective tissue cells and minute capillary blood vessels, with cellular matter, which radiate in all directions over the follicle from the point where the main arterial vessel joins the follicle, and which, together with its accompanying veins and investment of fibrous tissue, constitutes the stalk by which the follicle and its contained naked ovum is suspended to the main arterial trunk and vein. The capillary system that is a larger venous trunk, which also follows the course of the main median arterial trunk back to the heart by way of the Cuvierian ducts. The very intricate mesh-work of fine vessels which covers the follicle supplies the follicle with oxygen, and also serves to carry off the carbonic dioxide in much the same way as the placenta or after-birth performs a similar duty for the young mammal developing in the uterus of its parent. There is this great difference, however, between the fish and the mammal, in the former there is no placenta, and in the latter there is. In the follicle in which the eggs have grown and matured; there is no true placenta, but respiration is effected by a follicular mesh-work of blood vessels, and the interchange of oxygen and carbonic dioxide gases takes place through the intermediation of first of the main arterial trunk and vein. In many of the rays, and later when blood vessels and gills have developed in the embryo they, too, become accessories to aid in the oxygenation of its blood. In the mammal there is a uterus; the egg must leave its ovarian follicle, it convects to the uterine cavity where it is fertilized and where it develops until developed richly vascular placenta joined to the fetus, the villi or vascular loops of which are insinuated between those developed on the maternal surface of the uterine cavity. In both fish and mammal, however, this general blood-vascular system, that is, the immediate vascular connection between mother and embryo. In both the respiration of the embryo is effected by the transpiration of gases through the intermediation of membranes and fluids, oxygen being constantly applied and carbonic dioxide carried off by a specialized portion of the blood system of the maternal organism.

There is still another difference which distinguishes the developing fish from the mammal which has not been noticed. The body of the former is built up by a gradual reorganization of the substance of the ovum into the structures which make up its organization. In other words, the young fish obtains no nutrition from its parent; there is merely a reorganization of the stored protoplasm of the yolk sac. In the mammal, on the contrary, there is a placenta, and by its means the placental structures, though there is a yolk sac at an early stage; the largest proportion of the embryo is built up from the protoplasm supplied from the blood system of the parent. Judging from the large size of the young of some viviparous fishes, such as in *Embolospilus*, it is possible that there may be some exceptions to the rule indicated above.

Besides the very intricate network of capillary vessels which covers the follicles of the ovary of *Zygogobius* a large opening of a circular or oval form makes its appearance in the wall of each one or near the point of attachment of the vascular stalk by which they are supported. This opening appears to increase in size as the young fish develops; whether it is present during the earliest stages of its development, or whether it is present only when the young did not have an opportunity to see those phases. A branch from the main nutritive vessel frequently lies near the margin of the opening, curving around it. Whether this opening serves the same purpose as the micropyle of ova, provided with a membrane or not, and whether it is a channel by which nutritive material, in the manner the milt, which is probably introduced into the ovarian cavity by the male, could reach the ovum through the wall of its follicle. The opening into the follicle may be named the *follicular foramen*. Though it is nearly certainly the same in function, it is not in direct communication with the general ovarian space, which, singularly enough, appears to be occluded from without by a temporary closure or plugging up of the oviduct or canal from the posterior end of the ovarian sac, a state of affairs, however, which may vary according to the species. In other animals, the condition found to obtain in a pregnant mammal, where the uterine or mouth is temporarily occluded during gestation.

We found ourselves unable to determine the species of the form, the structure of which is described above; none of those described in Jordan's Mammal appear to agree with our species. It may be, as some of us have surmised, that the isolation of the form on the eastern peninsula of Virginia for a great length of time may have caused it to depart in its characteristics so far from the type, that we leave the determination of the species to the systematic ichthyologists.

Thus far our account has dealt only with the structure of the adults and the peculiar contrivances by means of which reproduction is effected; we will now take up the discussion of the egg and embryo.

The globular vitelline nucleus about a line in diameter includ-

river by the State Fish Commission, no sight of them has yet been seen, and I fear that our fondly-cherished hopes of royal sport with this kind of fish were vain; the Commission, I believe, has given over the same to introduce them here. They will, however, have thrived to our fullest expectations. The James, to which a few years back this fine fish was unknown, now affords to the lovers of the rod and line most glorious sport, especially in its upper waters.

As an enthusiastic fisherman I take deep interest in anything pertaining thereto, and Col. McDonald having kindly given me permission to shut down the gates of the ladder at Besler's for the purposes of investigation, thereby enabling me to stop the fish in the forebay and thus determine what kinds and quantities of fish go up it, I shall make full use of the permission whenever the stage of the water permits, and, if you think it would be of sufficient interest, will send you an occasional report. I've no doubt when the running season opens again I'll be able to make a most encouraging one.

J. W. B.

FISHERY CULTURAL NOTES.

THE MISSOURI COMMISSION is about to fit up an aquarum car to transport fish. It will be similar to the one that Commissioner Shaw, of Iowa, has used for a few seasons. Mr. Shaw has been invited to meet with them to explain the plans.

At Bucksport, Me., Mr. Atkins has enough salmon inclosed to yield about 2,000,000 eggs. At Grand Lake Stream he is enlarging the works to a capacity of 8,000,000 eggs, if it should prove necessary to provide for so many. Aquaducts are being laid out all over it. I shall make full use of the permission whenever the stage of the water permits, and, if you think it would be of sufficient interest, will send you an occasional report. I've no doubt when the running season opens again I'll be able to make a most encouraging one.

J. W. B.

Miss Ollie Shaw, daughter of the Iowa Commissioner, is sketching the fishes of the State, and is reported to have succeeded admirably. About twenty have already been transferred to her canvas.

George Eckardt, Jr., who arrived from Germany this spring, is engaged with our correspondent, Mr. Hugo Mulert, in making carp ponds near Cincinnati, Ohio. Mr. Eckardt's father is the largest carp breeder in Germany and he has had most experience. The carp farm will probably be made upon a large scale.

BLACK BASS IN NEW HAMPSHIRE.—Black bass fishing is doing considerable sport in the Merrimack River and a number of ponds in the closed season, fairly stocked and yearly increasing with the frisky fish. It was the writer's good fortune to gather in two last week, one weighing two and a quarter pounds, the other two and three quarter pounds. Suniper Lake has furnished most of the black bass to be found in New Hampshire where a few years ago they were unknown. So much for the Fish Commissioners; they deserve the good will of fishermen.

Dr. E. Spalding, of Nashua, has been appointed one of the Fish Commissioners of the State in place of Sam Webber, of Manchester, who has resigned. The doctor is a well known veteran fisherman, and well acquainted with the waters of the State.

W. E. M.

SALMON FOR TENNESSEE.—I am advised by Spencer P. Bost, United States Fish Commissioner, Washington, D. C., that after let proximo he can furnish me with any number of California salmon eggs at the expense of any one desiring to stock the streams of Tennessee, but it must be understood that the parties ordering shall have a hatching house. Yours, etc., Geo. F. Arkes, Fish Commissioner Middle Tennessee.

Answers to Correspondents.

NO NOTICE TAKEN OF ANONYMOUS COMMUNICATION.

J. E. Lawrence, Mass.—Will you be kind enough to prescribe for my pointer pup one year old? He seems well enough, but is very thin in flesh. "His appetite is good, but his stomach will not retain any food," is the complaint. The doctor says no sign of worms. Ans. Give him a little good meat three times a week, and a little sulphur now and again.

F. R. N. (Ohio), N. Y.—Can you answer me through your valuable paper? I am a sportsman and have heard the sound of several different times and thought it came from a bull frog, but the people around here say it is caused by a skink falling on its back for lack of air. Ans. It is impossible for us to say what causes the sound. To represent the sounds of animals even musical notes fail, and types do not express it at all.

C. T. Randolph, Mass.—Please tell me the kind of fish of which I have heard the sound. I have heard the sound of several different times and thought it came from a bull frog, but the people around here say it is caused by a skink falling on its back for lack of air. Ans. It is impossible for us to say what causes the sound. To represent the sounds of animals even musical notes fail, and types do not express it at all.

Pistol Practice, Montreal, Can.—In pistol shooting the usual range was formerly 12 paces, or 12 yards, the regular doubling distance, but now the standard is 50 yards, the regular doubling distance with Civil War matches has been increased to 60 yards. The ranges in the New York galleries is the regular 200 yards target reduced proportionately. Thus used at 100 yds. is 25, 150 yds. is 37 1/2, 200 yds. is 50, 250 yds. is 62 1/2, 300 yds. is 75, 350 yds. is 87 1/2, 400 yds. is 100, 450 yds. is 112 1/2, 500 yds. is 125, 550 yds. is 137 1/2, 600 yds. is 150, 650 yds. is 162 1/2, 700 yds. is 175, 750 yds. is 187 1/2, 800 yds. is 200, 850 yds. is 212 1/2, 900 yds. is 225, 950 yds. is 237 1/2, 1000 yds. is 250. We shall publish some valuable pistol practice.

L. F. C., Saratoga Springs, N. Y.—I wish to ask you a few questions in regard to the black bass in our lake. In 1874 we put thirty large bass into the lake which furnishes a water supply to the village. Since then the fish have multiplied, and I have been fishing in it ever since. I went up to the lake and fished a little while and caught a few, and in skinning them I discovered under the skin small black spots, like small black parasites, like sand hills. The bass caught in Saratoga Lake have a clear skin and flesh; no black spots. Our lake is the Loughery; the water comes from trout streams and springs; and in the spring the fish are full of black spots. The bass caught in Saratoga Lake have a clear skin and flesh; no black spots. Our lake is the Loughery; the water comes from trout streams and springs; and in the spring the fish are full of black spots. The bass caught in Saratoga Lake have a clear skin and flesh; no black spots. Our lake is the Loughery; the water comes from trout streams and springs; and in the spring the fish are full of black spots.

G. W. R. Hamilton, N. Y.—I have a pointer dog that was taken sick last Sunday. His symptoms are these: He is thin and weak through the suall of the back, and it is hard work for him to use hind parts. I gave him castor oil and nitre both worked well, and he seems to be all right Tuesday last, and Sunday this, but on Wednesday, Thursday he was all right, but Friday the lameness came back; if anything, worse than before. I had a better bitch that was sick, she spoiled the same way, died last winter. No one here knows what it is or what to do. The doctors say it does not lack poison. If you can help or advise me what the matter is, and how to cure her, I will be very glad to pay you for it. I have no other one except she is a pointer dog. The bitch has a white spot on the side of the face. A little sulphur occasionally, and a small teaspoonful of bicarbonate of soda once a day dissolved in water and poured down his throat will probably do good.

F. W. B., New York City.—Recently I came into possession of a very fine pointer dog, a female, named "Beauty." She has been hunted many times, although I think she has been very good to a certain degree, as she will retrieve, stand on a bird very good for a dog, and she has a very good nose. She is also a very good nose, but she has one very bad fault, that being gun shy. When I take her out with the gun she follows me until good opportunity offers, then she runs for me. When I take her out with the gun she follows me until good opportunity offers, then she runs for me. When I take her out with the gun she follows me until good opportunity offers, then she runs for me.

The disposition of the dogs must be studied, and an endless amount of trouble taken to thoroughly get them over it. Individually we would estimate before waiting five or six three-year old birds. But if you please to make the trial we cannot suggest a better treatment than those described in articles in FOREST AND STREAM, February 5, 1880, and April 8, 1880.

"That medicine goes right to the spot, refreshes and revives once."—A patient on Hop Bitters.

The Kennel.

FIXTURES.

BENCH SHOWS.

September 21, 22 and 23, at Franklin, Pa., Franklin Sportsmen's Club and Game Protective Society Bench Show. Entries close September 18. Thos. D. Adams, Superintendent; P. O. Box 61, Franklin, Pa.

September 27, 28, 29 and 30, at London, Ont., London Dog Show. Entries close September 18. Charles Linton, Superintendent; Tecumseh House, London, Ont.

FIELD TRIALS.

August 29 and 31, and at Norfolk, Neb., Nebraska Field Trials second annual meeting. J. F. McCartney, Secretary, Norfolk, Neb.

September 1, at Pittsburgh, Pa. Close of certain Pennsylvania Field Trials. First Annual Derby. J. R. Stuyton, Secretary, Pittsburgh, Pa.

September 18 and 19, at Pittsburgh, Pa. Collie Trials, held under the auspices of the Pennsylvania State Agricultural Society. Entries close September 9. Eldridge McConey, Secretary, Harrisburg, Pa.

October 1, at New York City. Close of certain Eastern Field Trials. Entries close September 25. Jacob Pentz, Secretary, P. O. Box 274, New York City.

November 1, at Gilroy, Cal. Field Trials of the Gilroy Rod and Gun Club. Entries close September 25. J. P. Laverick, Secretary.

November 25, Louisiana State Field Trials. Entries close November 1. Edward Odell, Secretary, New Orleans, La.

November 25, Grand National National American Kennel Club's Field Trials. Jos. H. Dew, Secretary, Columbia, Tenn.

TWO OF THE NIAGARA DOGS RESCUED.

SINCE I wrote you last two of the castaway dogs on Taylor Island have been rescued.

On Thursday of this week the report reached me that there was a man down on Taylor Island. I hastened to the bridge and found hundreds of anxious eyes watching a form that appeared from the bridge to be a person of about "Tom's Ham's" size. Upon investigation I learned that James F. Brown, a Deveraux College student, had ventured over from precipice and gone down to the island by means of a rope ladder.

On his reaching the island the spaniel came forward and welcomed him, and was so placed in a bag and drawn to the bank above.

Brown then spent some time in cutting his name on the rock, and finally went in search of the Monarch dog. After coaxing and feeding the old chap for some time he was allured into the sack and drawn up. I saw him landed and taken out of the sack, and a human hand would not more fully express gratitude than did this good natured old dog.

I was much surprised at seeing this so-called savage "bull-dog." He is a black and white dog of about forty pounds weight and about one-quarter Irish. He is good natured and fat as a seal, and looks as though he had been well fed on the island during the rapids of Niagara and a stay of four months on the island had done him good.

Brown was unable to secure the little dog, as he ran back under the rocks and did not come out while Brown was on the island.

The fact of the FOREST AND STREAM can form some idea of passing over Suspension Bridge on the cars how much of an undertaking it must be to reach Taylor Island. It is 700 feet below the railroad bridge in Niagara River, and is 225 feet from the overhanging rock above.

If I can get permission I shall send Old Bull to the coming London bench show.

C. E. LEWIS.

TRANSPORTATION OF DOGS.

A MUCH-NEEDED REFORM WANTED.

THERE seems to have been no end of trouble between dog-owners and the train baggage-masters since the dog rail was laid in this country, and the remote shooting was thus brought nearer to those who wanted none but the best and could afford to pay for it. At times a most flagrant carelessness on the part of a carrier, or a dishonesty on the part of the train manager, would for a moment stir up a war between the parties interested, but these flashings always ended in the same way—the dog-owner had to stand his losses, and the only consolation he had was in the writing long letters of his wrongs to the sporting press, and in the showing of his indignation with plodding industry in the dark without knowing what rights they had in the premises.

As the matter of dog travel in the United States has within the last few years increased wonderfully, it is full time that the railway managers should take some action, establish a uniform tariff, and extend some protection to those who patronize their lines. The dogs carried over the roads are in most cases valuable ones, and if they are not, their owners are interested with that belief, which amounts practically to the same thing. Therefore it would be well for every line to let dog-owners know before they start how much the transportation of their canines will cost, and the risks they will run if they are lost or injured after being placed in the care of the employees of the roads. This could easily be done by posting printed rules and regulations at the stations and in each baggage car, as the law requires hotel-keepers to do in their rooms.

At present, we are informed, that there is no responsibility assumed by the carriers, so that the owner of a valuable dog not only runs the chance of losing his dog, but is compelled at the same time to pay an extortionate fee for that privilege.

The rates for dogs are oftentimes disproportionately high when compared with the passenger's fare, but what is more to be regretted, they carry dogs over the roads which lead from this city. For instance: The charge for a dog from Jersey City to Newark, a distance of nine miles, is twenty-five cents, while the passenger has a cushioned seat to recline on, and has the consolation of knowing that if his dog is knocked off while on route, his family will receive some lucrative obituary for his remains from the company. For these privileges he pays twenty cents, or if he takes a return ticket, at the rate of fifteen cents per trip, the difference, therefore, being an average of twenty and forty cents more for the dog than the man. This is not only an enormous charge, but it is a most unjust one. It is not only an enormous charge, but it is a most unjust one. It is not only an enormous charge, but it is a most unjust one.

him for over a week, when we paid a reward and were fortunate enough to get him back. Of course, no one was responsible, but it set us at propounding all sorts of queries to the superintendent in charge of the baggage cars on this city.

Should a dog escape during a journey on your road do you consider your company liable for the value of the dog?

Can dogs be left in charge of baggage-masters in the baggage-rooms at stations on your line and are the baggage-masters responsible for their safe keeping?

If a dog is injured, while either on the cars or in the baggage-rooms, after being given in care of one of your employees, is your company responsible?

Subjoined are the replies which we have received within the last fortnight:

DELAWARE, LACKAWANNA AND WESTERN R. R. COMPANY,
Superintendent's Office, Morris and Essex Division,
HOBOKEN, N. J., August 1, 1881.

Editor Forest and Stream:
Baggage-masters in this division are allowed to charge twenty-five cents for each dog, and they are forbidden to charge more. This rule, however, applies only to this division (Morris and Essex); the baggage-masters of the other divisions have a right to make a charge also. A dog, for instance, going from New York to Oswego would pass over four separate divisions, and the baggage-master of each division would have a right to collect the amount it is allowed to charge.

If you know of any instance of a baggage-master on this division charging more than the amount above mentioned, you will confer a favor by reporting it to me.

Station men are not required to take charge of dogs, the owners are expected to deliver and receive them at the baggage-car door. The company makes no charge for transporting dogs and assumes no responsibility. The money baggage-masters receive there are so allowed to retain to remunerate them for their trouble with the dogs and the extremely disagreeable duty of cleaning their cars.

A. REASONER, Supt.

OFFICE GENERAL PASSENGER AGENT CENTRAL R. R. CO.
NEW JERSEY, NEW YORK, AUG. 3, 1881.

Editor Forest and Stream:
In regard to transportation of dogs over C. R. of N. J. system:
The rate to be charged for transporting a dog for any distance on any of our divisions or branches shall not exceed twenty-five (25) cents, the same being charged by the train baggage-master, and it is to pay him for his personal trouble.

If a dog escapes during a Journey the company do not hold themselves responsible. The money baggage-masters receive there are so allowed to retain to remunerate them for their trouble with the dogs and the extremely disagreeable duty of cleaning their cars.

If a dog is injured while on cars or in station, the company do not hold themselves responsible, the whole matter being a personal one between the train or station baggage-master and the owner of the dog. Yours, etc., H. P. BALDWIN, Gen. Pass'g. Agt.

NEW YORK, LAKE ERIE AND WESTERN R. R. CO.,
NEW YORK, AUG. 3, 1881.

Editor Forest and Stream:
I learn that there are no rules governing the transportation of sporting dogs on trains of this company other than what have heretofore existed, simply to arrange with the train men on the most favorable terms possible.—E. D. HAMMERS, Ass't Sec'y.

I have been very much interested in your articles, and if you can secure it, I will follow out the idea and have kennels built and located at the principal points to be telegraphed for and sent to intermediate stations at the request of anybody wishing to carry a dog, and will make schedule rates as well.

J. L. WOOD.

PENNSYLVANIA RAILROAD COMPANY, Passenger Department,
PHILADELPHIA, AUGUST 2, 1881.

JOHN T. GREEN, Esq., Assistant to the President:

Dear Sir—Returning letter from the FOREST AND STREAM and your intimation of July 20, would say that we have never had any arrangement for kenneling dogs on trains. We have merely allowed baggage-masters to charge a nominal sum, which was supposed to reimburse them for extra care while the dogs were in the car. I think perhaps it would be advantageous to try something similar to what is recommended by Mr. Satchelwhite and others, and to this end would like to have him, or somebody else who is more conversant with dogs than myself, to recommend a style of kennel or box which we could make for transportation of canines. It seems to me that we should at least have a small sized, full-sized or medium sized, but better than a solid kennel, and I might have the tops and bottoms solid and the sides and ends slatted. I would like to get a draft from some enthusiastic sportsman who takes a lively interest in such matters, and if you can secure it, I will follow out the idea and have kennels built and located at the principal points to be telegraphed for and sent to intermediate stations at the request of anybody wishing to carry a dog, and will make schedule rates as well.

Thus the matter stands, and we will be pleased to hear from our friend on the subject. We are in favor of very strong box kennels, made with solid tops and bottoms, with slats on the sides and have sketched out our plan and sent it to the company. It seems to me that we should at least have a small sized, full-sized or medium sized, but better than a solid kennel, and I might have the tops and bottoms solid and the sides and ends slatted. I would like to get a draft from some enthusiastic sportsman who takes a lively interest in such matters, and if you can secure it, I will follow out the idea and have kennels built and located at the principal points to be telegraphed for and sent to intermediate stations at the request of anybody wishing to carry a dog, and will make schedule rates as well.

NEBRASKA FIELD TRIALS.

We have just received a very pleasant letter of invitation addressed to all Eastern sportsmen, from Mr. J. F. McCartney, Secretary of the Nebraska State Agricultural Society. He desires us to say that he will guarantee all those who go West the finest chicken shooting in the world and a royal good time. "Mr. John Petty and other crack shots of Nebraska," he goes on to say, "will be on hand to make a good shooting." The Hon. C. P. Mathewson, the Norfolk banker, proposes with the assistance of Mr. McCarty and other citizens of Norfolk, to tender the visiting sportsmen a little banquet, at which dog meat will be served up in various styles, and some chat will be had on the dog.

After this kind invitation we cannot but suppose that there will be a large exodus from the East to attend this feast of reason and flow of speech. First think of the number of courses a greyhound can be served up with, and the variety of outlets for pointers and setters that will have run in the world. There should be one or two courses of a la Whitford, and potted dog meat from the New York pound, Fred V. fashion. As an entre-e we suggest the loin of Crow Dog, with Spotted Tail sauce. In place of fowl, a cocker from Cranford might do as a substitute, and the "solids" can be washed down with a wine of the Field Trial Jockeys brand.

We append the programme of the meeting:
The second annual field trials for pointers and setters will be held on the 1st and 2nd of September, at the Convention Association, commencing August 30, 1881, at Norfolk, Nebraska, and continuing for four days.

The trials will be conducted under the National Kennel Club rules of the 15th of July, and by the following judges:
All entries must be in writing, made by the owner of the dog entered, or by the person making such entry, and filed with the secretary, J. F. McCartney, Omaha, Nebraska.

The entry must contain the name and description of the dog

HUNSON VS. CATSKILL.—On Saturday, Aug. 6, a friendly contest took place between the Hudson and Catskill Trap and Kennel Clubs...

Table with 2 columns: Name and Score. Includes names like Boswicks, Raymond, Becker, etc., and scores for various categories.

SOUTH ABINGDON, MASS., AUG. 15.—The South Abington Sportsmen's Club opened the local hook and line fishing season at this place to-day.

Table with 2 columns: Name and Score. Includes names like W. Damon, G. A. Dean, J. W. Condit, etc., and scores for various categories.

MONDAY, AUG. 19.—The first shoot of the Gut City Gun Club for the 1881 medal. Handicap 20 balls:

Table with 2 columns: Name and Score. Includes names like W. S. Anderson, G. F. Friend, R. S. Yarrow, etc., and scores for various categories.

portion of the book refers mainly to cutters, having been of English origin, duly acknowledged by the author. It may be safely said that any man who is well up in cutter sailing can handle anything of a similar kind...

HULL REGATTA.

DECIDEDLY THE MOST successful match sailed this season. We always have words of praise in store for regatta authorities who comprehend their own entry to all corners, class prizes, perfect order...

The racing at Hull has now obtained such deserved popularity that nothing so exciting has been witnessed here for some time...

Prizes: First Class—For sloops and schooners measuring 50t. and under 60t. on the water-line: First prize for sloops, \$50; second, \$30; third, \$20...

Second Class—For centerboards and keel yachts measuring 20t. and under 30t. on the water-line: First prize for centerboards, \$25; second, \$15; third, \$10...

Third Class—For centerboards and keel yachts measuring 10t. and under 20t. on the water-line: First prize for centerboards, \$15; second, \$10; third, \$7; fourth, \$5...

Fourth Class—For centerboards and keel yachts measuring less than 10t. on the water-line: First prize for centerboards, \$10; second, \$7; third, \$5; fourth, \$3...

Fifth Class—For centerboards and keel yachts measuring less than 10t. on the water-line: First prize for centerboards, \$10; second, \$7; third, \$5; fourth, \$3...

Sixth Class—For sloops and schooners measuring 50t. and under 60t. on the water-line: First prize for sloops, \$50; second, \$30; third, \$20...

Seventh Class—For sloops and schooners measuring 30t. and under 50t. on the water-line: First prize for sloops, \$30; second, \$20; third, \$15...

Eighth Class—For sloops and schooners measuring 20t. and under 30t. on the water-line: First prize for sloops, \$20; second, \$15; third, \$10...

Ninth Class—For sloops and schooners measuring 10t. and under 20t. on the water-line: First prize for sloops, \$15; second, \$10; third, \$7; fourth, \$5...

Tenth Class—For sloops and schooners measuring less than 10t. on the water-line: First prize for sloops, \$10; second, \$7; third, \$5; fourth, \$3...

T. F. Patterson, J. H. Conant, C. B. Churchill and C. B. Southard. All trustees crowd assembled to witness the regatta. The town was given up to festivity, the Hotel Pemberton and many private residences were decorated, music on all sides, fireworks and illuminations...

Table with 4 columns: Name and owner, Length, Ft. In., H. M. S., H. M. S., and Corrected Time. Includes names like Falcon, W. Frost, etc.

Table with 4 columns: Name and owner, Length, Ft. In., H. M. S., H. M. S., and Corrected Time. Includes names like Ashley, Dr. John Bryant, etc.

Table with 4 columns: Name and owner, Length, Ft. In., H. M. S., H. M. S., and Corrected Time. Includes names like Transit, A. D. Snow, etc.

Table with 4 columns: Name and owner, Length, Ft. In., H. M. S., H. M. S., and Corrected Time. Includes names like Gem, Frank Lincoln, etc.

Table with 4 columns: Name and owner, Length, Ft. In., H. M. S., H. M. S., and Corrected Time. Includes names like Rocket, B. F. Bass, etc.

Table with 4 columns: Name and owner, Length, Ft. In., H. M. S., H. M. S., and Corrected Time. Includes names like Plowden, H. N. Curtis, etc.

Table with 4 columns: Name and owner, Length, Ft. In., H. M. S., H. M. S., and Corrected Time. Includes names like Virginia, B. W. Hatch, etc.

Table with 4 columns: Name and owner, Length, Ft. In., H. M. S., H. M. S., and Corrected Time. Includes names like Julia, W. E. Merritt, etc.

Table with 4 columns: Name and owner, Length, Ft. In., H. M. S., H. M. S., and Corrected Time. Includes names like Nonpareil, J. W. Mansfield, etc.

The winners had not been officially announced at time of writing, but there is little doubt but that they will be in accord with the table given.

BEVERLY YACHT CLUB.

Editor Forest and Stream: The sixty-fourth regatta of the club, being the second championship race of the season, took place Saturday, Aug. 13, at Nahant. The course for the first class was from Judges' yacht, leaving it by the light of E. W. Conant and a buoy of Graves, on port hand and back, 10 1/2 miles.

Table with 4 columns: Name and owner, Measurement, Ft. In., H. M. S., H. M. S., and Corrected Time. Includes names like Moya, cutter, Edward Burgess, etc.

Table with 4 columns: Name and owner, Measurement, Ft. In., H. M. S., H. M. S., and Corrected Time. Includes names like Psyche, cat, Vice-Com. Burgess, etc.

Table with 4 columns: Name and owner, Measurement, Ft. In., H. M. S., H. M. S., and Corrected Time. Includes names like Psyche, cat, R. D. Sears, etc.

First prizes taken by Moya, Psyche, Hayden and Psyche; second prizes by Mosquito and Jolla; penonants by Moya and Psyche, who held them, and Hayden being held first.

LARCHMONT YACHT CLUB.—Pennant regatta is fixed for August 30, open to cabin yachts of the club—10th and 12th and 14th and 16th classes. The regatta will be held during the forenoon, with the following conditions:

Dachting and Canoeing.

Table with 2 columns: Name and Score. Includes names like W. Damon, G. A. Dean, J. W. Condit, etc., and scores for various categories.

THE SAILOR'S HANDY BOOK.

To publish anything relating to nautical interest nowadays requires considerable courage in view of the almost total decay of American shipping and its allied interests. To make a nautical work a commercial success, a sufficiently broad field has to be sought in order that the authors' labor may appear as to many as possible.

The club table for allowances will be used.

Protests.—Any protest must be made in writing within half an hour after the race.

There must be three or more yachts sail in a class to insure two prizes being given.

The result of the regatta will be given through the daily papers and the yachtsmen will be notified by mail where to obtain their prizes.

Our rods are considered superior to all others by those who have seen or used them. Send stamp for catalogue, with Mass. Fish and Game Law.

GORDON SETTERS.

In order to reduce the price of the best blood in the world, I have spent no pains or expense to bring this strain of dogs up to the very highest standard. They combine the blood Gordon's, Farrar's imported Rupert, Stoddard's imported Duke, Farris' familiar with Gordons which they are the blood of, and the best of the best. Several bitches are now in whelp to Duke of Louisa Valley, by my Moore's Gordon out of Dream. For field qualification refer to Col. Albert J. Snow, Vincennes, Ind., Mr. H. Malouin, Baltimore; Col. Jas. Gordon ("Plous Jeems") Pontotoc, Miss. Address for full pedigree and cobs., GORDON KENNEL, Locust Valley, I. I. Aug 15, 11

RARE OPPORTUNITY—Pointer bitch, ten months old, dark liver and white, by the Plunkett dog club. Just at the field; having no time to work her, will sell at a sacrifice. Address FRED, Box 96 New York P. O. Aug 15, 11

LEONARD'S Split Bamboo Rods, WITH PATENT WATERPROOF AND PATENT SPLIT FERRULES.

No. 1 SHOWS WATERPROOF CUP IN FERRULE (PATENTED OCTOBER 26, 1875). This prevents any moisture from reaching the wood, and the ferrule from becoming loose. The constant wetting and drying of the bamboo must rot the wood, and make other makes of rods less durable than Leonard's.

No. 2 SHOWS SPLIT FERRULE (PATENTED SEPTEMBER 8, 1875). This split thoroughly strengthens where the ferrule is joined to the wood, which is the weakest part of a rod, and where so many of other makes of rods (bamboo especially) break. Mr. Leonard has yet to hear of a single instance of breakage at this point since the PATENT SPLIT FERRULE has been applied. We consider this the GREATEST IMPROVEMENT that has been introduced in rod making since rods have been made.

No. 3 SHOWS SPLIT FERRULE WHIPPED WITH SILK AS IT APPEARS ON THE ROD.

EVERY ROD WARRANTED.

ENOS JAMES & CO.'S BREECH-LOADERS.

We now offer a complete line of these beautiful breech-loaders, all bearing their name, ranging from their plain but found and substantial guns of the lowest grade up to their superb Trap and Triumph Complete Guns, intended for Glass Ball and Pigeon Trap shooting, where closeness and great penetration are required. What is the use of buying a worthless gun, which the maker is ashamed to put his name upon when you can get an Enos James & Co. gun with their name and guaranty for the same price? Or what is the use of paying an absurd price for a gun made by some old miser when you can buy a gun made by Enos James & Co. which is just as good or better for about half the price.

We are sole agents at New York for the celebrated Colt Club Guns, which are now the standard with all the leading clubs. We also have a small job Lot of Webl-y Guns, of many styles, which we offer at great bargains, and a few of the improved Parker Guns at special rates. Address: P. O. Box 492. H. & D. Hotels and Routes for Sportsmen

"THE FISHING LINE."

TAKE THE Grand Rapids & Indiana R. R. THE ONLY ROUTE TO THE Trout, Grayling & Black Bass Fisheries, AND THE FAMOUS SUMMER, HEALTH AND GAME RESORTS AND LAKES OF NORTHERN MICHIGAN.

The waters of the Grand Traverse Region, and the Michigan North Woods are unsurpassed, if equalled, in the abundance and great variety of fish contained.

BROOK TROUT abound in the streams, and the famous AMERICAN GRAYLING is found only in these waters.

BLACK BASS, PIKE, PICKEREL and MUSCALONGE, also abound in large numbers in the many lakes and lakelets of this territory. The sportsman can readily send trophies of his skill to his friends or "club" at home, as ice for packing fish can be had at nearly all points.

Take your family with you. The scenery of the North Woods and Lakes is very beautiful. The air is pure and bracing. The climate is peculiarly beneficial to those suffering with Hay Fever and Asthma Affections.

The hotel accommodations are excellent, and will be largely increased in time for the sea on of 1881 by new buildings and additions.

During the season of 1881 TRIP EXCURSION TICKETS WILL BE SOLD AT LOW RATES, and attractive train facilities offered to Tourists and Sportsmen.

Dogs, Guns and Fishing Tackle Carried Free at owner's risk. It is our aim to make sportsmen feel "at home" on this route. For tourists' Guide a handsomely illustrated book of 150 pages sent free. Time cards, folders and further information, address

A. B. LEEB, Gen'l Pass'r Agent, Grand Rapids, Mich.

Fishing Season at Rangely Lakes Again Open.

YACHTING AND CANOEING.—
Madagascar; The Lake George Meet; For Inland Waters; New Publications; Oconomococ Yacht Club..... 76

ANSWERS TO CORRESPONDENTS...... 77

COL. JAMES G. BENTON.

COL. JAMES G. BENTON, the well-known ordnance officer and author of several works on gunnery, died at his home in Springfield, Mass., last Tuesday morning, from heart disease.

Born in New Hampshire, in 1820, he entered West Point in 1838, acquitted himself with credit at the United States Military Academy, and was graduated in 1842, receiving a commission as Second Lieutenant of Ordnance in the United States army and served for six years as Assistant Ordnance Officer at Watervliet Arsenal, New York. In 1847 he was promoted to the rank of a Second Lieutenant, and in 1848 to that of a First Lieutenant. During the two following years he was engaged in important work at the Ordnance Bureau at Washington, preparing a system of artillery for the army and writing the Ordnance Manual. From 1849 to 1852 Lieut. Benton was in charge of the United States Ordnance Depot at San Antonio, Texas, and in 1853 served as Assistant Inspector of Arsenals and Armories. Going to Washington in the latter part of that year he was engaged for several years in making experiments to determine the model of a new rifle, and during this time he was also a member of the Ordnance Board and the Instructor of Ordnance and Gunnery in the Military Academy. In 1856, after fourteen years service, he was commissioned a Captain. Serving with honor in the civil war, being for three years in command of the Washington Arsenal, he was brevetted a Colonel in March, 1865, in recognition of his work in the Ordnance Department. In June, 1866, Col. Benton was placed in command of the United States Armory at Springfield, Mass., where he remained until his death.

DEFENDING FISHCULTURE.

WHERE fishculture is a new thing it may be well for those interested to reply to its ignorant assailants; or for a local paper to print laudatory reports of visits to hatcheries. But for the FOREST AND STREAM this sort of thing is entirely out of place. Our readers are too well informed of the merits of fishculture to appreciate an argument in its favor, at this late day. They would regard it much as an intelligent community would an article approving of the steam engine as motive power, and recommending its use.

In Canada there are a few men who have arrayed themselves against the fishculturists, and ventilate their narrow views in the newspapers. Our attention has been called to their articles several times, but their talk was abusive, and we have not thought fit to notice it, and have wondered that respectable Canadian newspapers would print such stuff. The *Telegraph*, of St. John, N. B., recently had an editorial article on the subject, wherein a correspondent was quoted who asserted that "the people were of the opinion that on rivers where hatcheries are established there had been a steady falling off in the catch of salmon, and that they looked at results in the light of cause and effect."

To this Mr. Everett Smith, a former fish commissioner of Maine and an enthusiastic fishculturist, makes a reply from which we extract the following:

"The planting of seed cannot render fertile waters barren, and for practical results accomplished by fishculture as applied to salmon fisheries, I would call attention to the work of the Department of Fisheries in Maine.

"When the work of restocking the Penobscot River with salmon was begun by the Commissioners of Fisheries for Maine, the eggs were purchased of Canadian officials. But the salmon have greatly increased in numbers, owing to continuous and systematic protection and artificial propagation, so that now the Maine Commissioners are enabled to procure from fish caught in Maine rivers all the eggs desired for stocking purposes, and at a cost of less than one-tenth formerly paid for eggs purchased in Canada for the same purpose."

That Mr. Smith is correct there is no room for doubt, but it appears to us like using heavy artillery to kill mosquitoes. The facts are too self-evident to need repeating.

TO CORRESPONDENTS.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen.

Communications upon the subjects to which its pages are devoted are invited from every part of the country.

Anonymous communications will not be regarded. No correspondent's name will be published except with his consent.

The Editors cannot be held responsible for the views of correspondents.

Subscriptions.

Subscriptions may begin at any time. The subscription price is \$4 per year; \$2 for six months. Remittances should be sent by registered letter, money order, or draft payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada; and is on sale in Europe by The American Exchange, 49 Strand, W. C., London, Eng.; and by Em. Verquien, 15 Boulevard, St. Martin, Paris, France.

Advertisements.

Inside pages, nonpareil type, 25 cents per line. Spectral rates for three, six and twelve months. Reading notices 50 cents per line—eight words to the line, and twelve lines to one inch. Advertisements should be sent in by the Saturday of each week previous to the issue in which they are to be inserted.

Address: Forest and Stream Publishing Co., Nos. 39 and 40 Park Row, New York City.

FOREST AND STREAM.

USE FOR THE DOG FISH.

AN old saying has it that if a thing is kept seven years a use will be found for it. The dogfish of the Atlantic coast has been "kep" for centuries and only now has it been utilized by man. This fish is of the shark family and it has been the pest of the fisherman, devouring the menhaden, the cod, haddock, mackerel and other valuable fishes, and tearing nets. It has increased until it was a nuisance of the first magnitude. The day of retribution has come.

The menhaden fishers of Maine have found but little use for their nets this year and have been compelled to look to other things for a living. The dogfish was one of the other things. His liver contained oil and his body could be made into fertilizing material. They tried it and the idle menhaden steamers are now using trawl lines and taking dogfish. The trawls have hooks with long iron shanks and the dogfish gnashes his teeth upon them in vain. The steamers and sail vessels instead of menhaden take from 30,000 to 50,000 of the dogfish per day and obtain one cent each for them. The factories at Boothbay are turning this old enemy of the fisherman to use. His liver will help to grease their way of life, or light them on the road, while his vile carcass will enrich their potato patches. Success to the movement to thin out the dogfish.

Early manifesting a taste for ordnance study and applying himself with enthusiasm to that branch of study, Col. Benton had acquired an extensive, thorough and practical knowledge of all matters pertaining to that department, and his services were constantly in requisition on military boards and commissions. In 1867 he was a member of the board on sea-coast rifle cannon, projectiles, carriages, equipments, etc., and in 1869 served as a member of a commission to consider the protocol of the International Military Commission relative to the use of certain projectiles in war, and also upon the results of the Perrine shell. He superintended the arming of sea-coast fortifications from Charleston, S. C., to Mobile, Ala., in 1873, and a few months after completing that important work he gave his attention to the subject of determining the proper calibre of small arms. During a portion of the year 1873 he was assigned to examine the manufacture and construction of ordnance and ordnance stores in the various countries of Europe. On the 23d of June, 1874, he was made a full Lieutenant-Colonel, and in the first part of the year 1877 he was appointed to adjust royalties to be paid by the United States on ordnance inventions. After finishing this task he was directed, in compliance with an act of Congress, to select a magazine gun for the United States service. The commission of Colonel was bestowed upon him in May, 1879. Col. Benton was an enthusiastic devotee of his chosen calling, and aside from the every-day duties of his busy career he found time to publish several valuable articles on the subject of ordnance. He was the author of "A Course of Instruction in Ordnance and Gunnery for the Use of the Cadets in the United States Military Academy."

LONDON DOG SHOW.—Mr. Charles Lincoln, Superintendent of the London Dog Show, which is to be held at London, Ont., September 27, 28, 29 and 30, writes that exhibitors from the States will be extended all possible courtesies by the Committee of Management, and their stay will be made as pleasant as possible. We have no doubt of this, for our Canadian cousins are noted for their kindnesses to all those who, for the love of sport, cross the line and stop in the Dominion. We trust that the show will be a complete success, and would suggest to all intending exhibitors that they do not delay in filling up their entry blanks, and then sending them in as soon as possible. This will enable the management to complete all their arrangements at an early day, and will secure for the show its smooth running.

SPORTSMEN TOURISTS are invited to record their field and stream experiences in the columns of the FOREST AND STREAM.

THE CREEDMOOR MEETING.

IT does not at present look as though we were to have a very extensive meeting at Creedmoor during the coming month. Delays of various sorts will contribute to keeping away competitors and the paucity of the prize list may have some effect. The problem which the National Rifle Association must solve, if it expects to receive the lasting support of the community, is that of getting all the members of our National Guard up to a fair level of shooting ability. The all-comers' matches will take care of themselves. They will be participated in by a certain number of lovers of out-door sport, who find in rifle shooting one of the most exciting and healthful of recreations. To encourage military rifle shooting requires a certain amount of organized effort, and the National Rifle Association can best make a plea for the support it so seriously lacks when it can point to a record of work done in the ranks of the military. The State authorities of New York have for some mysterious reason seen fit to frown upon rifle practice, thereby displaying their ignorance of the uses and management of the civilian-soldier element. But the National Guard remains not only in this State but throughout the Union where it is just taking form, as it is in many of the States, it is important that a careful system of practice at the butts should form a part of the school of the soldier.

We have little fear now that rifle practice will be abandoned. Within ten years past the Regulars have discovered what they did not know about rifle shooting, and have become convinced that there is plenty of room for improvement. Enough knowledge of shooting and marksmanship has been scattered here and there among the militia forces to act as a leaven for the whole mass. We are putting together a mass of record. We are formulating what may be called the "expectancy" of a volunteer. We are getting a basis upon which we may stand, and call upon officers and men to reach a certain standard, and falling below that we may point to the statistics and declare them derelict. The func-

tions of the N. R. A. is to keep in advance of all these movements, and to appoint committees of experts to determine many points. There is a warning against some pitfalls in the story of the N. R. A. of Great Britain, and in this connection it is proper to quote what the London *Times* found it necessary to say in a recent issue at the close of the July meeting at Wimbledon:

It may be impossible to banish the element of lucre from Wimbledon: but the committee of the National Rifle Association might probably do something to prevent the abuse of a system. Well-known prize-winners might be handicapped, it is fully clear that no more competitions of the ordinary sort are wanted. A large prize list is little more than a distribution of presents among a few crack shots, already gorged with this kind of booty. Perhaps the best system of the reform is to be discovered in the character of the prizes most recently instituted, and exciting a large share of public interest. * * * * * Such competitions must exclude the money-making element, while they advance the efficiency of the volunteer force in a direction not hitherto attempted. In fact, what the public would wish the National Rifle Association to aim at is the improvement of the general shooting among the rank and file of the volunteers, as distinguished from the few hundreds of first-class marksmen. In spite of the reputation which Wimbledon, more than ought else, has secured for the shooting of volunteers, there is reason to suspect that a large and worthless residuum of bad shots remains behind the choice specimens who come to the surface at Wimbledon. The National Rifle Association, will, no doubt, disclaim any educational mission of the sort suggested. But they have already fulfilled what we may suppose to have been their primary object—that of discovering and rewarding the best shots. That is one method of improving the general shooting of the volunteer force, but it does not exclude resort to the methods which may be more practically useful and not open to the objection that, like the teaching of some of our public schools, they neglect the mass while they single out and reward the handful of the most proficient."

THE MARKED DIFFERENCE in the number of entries in yacht races in the East and in New York waters has probably not escaped any one. Half a dozen coming to the line, especially among the smaller boats, is to be considered quite a respectable turn out in metropolitan waters, yet when compared to the doings among our Eastern friends, New York suffers severely, and can take little credit to herself if we remember that our "near-by" population is several times greater than that of Boston and vicinity. There they also sail a half dozen matches to our one, but in spite of the rapidity with which regatta announcements follow each other, the entries are always well filled, and spirited rivalry, lively racing, and well-established records are the rule. One cause, and the principal one, of the greater prosperity of the sport among small craft in the East is to be found in their rule prohibiting shuffling ballast. In New York, on the contrary, this pernicious custom is still in full swing, and as a direct consequence small yachts have been driven out of existence; the legitimate craft have been displaced by sailing machines, which are so costly to build, to own and especially to race, that even with these very craft, ostensibly built for racing and acknowledged totally unfit for anything else, we are unable to fill a single match to the extent of arousing public interest. We virtually rule out of existence the cheap, handy little boat with fixed ballast within the reach of thousands, and then fail to accomplish anything but occasional duckings and drownings with the expensive, dangerous and unsatisfactory sand-bag caricatures which cost a small mint to run, and give next to nothing in return. So we will continue to play second fiddle to Boston, until some junior club shows itself possessed of intelligence and enterprise enough to take the honest little boat under its wings, and give her through numbers the power and standing her virtues entitle her to claim in the yachting community here just as well as in the East. The club that takes our hint will become the most prosperous among those devoted to the cause of small "open boats," as they are termed, and will find itself on the high road to popularity and public esteem much sooner than may now seem likely. In place of the score of shabby, sonneted, local family affairs called yacht clubs by courtesy, we should have an organization which, except in point of tonnage, might be made the peer of any in the country.

THE FIRST GORAMI IN AMERICA.—The first fish of this species, which it is proposed to introduce as a food fish into Southern waters, arrived in New York last week. It is a male of three inches in length and was sent by Mr. Carbonnier, of Paris, to Mr. E. G. Blackford, of the New York Fish Commission. The female which accompanied it died just outside Sandy Hook. The fish is lively and is beautiful in its dress of green and black. It is now in Mr. Blackford's office in Fulton Market. For a description of this fish and its breeding habits we would refer our readers to the article, with illustrations, by Col. Nicolas Pike, in our issue of June 16, of this year.

AN ESTEEMED GERMAN CONTEMPORARY sandwiches the card of an undertaker in between the advertisements of a wholesale lip-rod dealer and a powder mill. A most "fortuitous combination."

OLD MEN AS SCIENTISTS.—Recently Professor Huxley said that ninety-nine men out of every hundred became simply obstructive after sixty years old and were not flexible enough to yield to the advance of new ideas. The world, he thought, would be benefited by any man who had taken part in science being strangled after reaching the age of sixty. Will the Professor please remember that, and act accordingly in a few years when he reaches that age?

THE ENCAMPMENT HOTEL at the Warwick Woodlands has been entered at the International Cotton Exposition at Atlanta, Ga., as a cotton hotel, and will be open for guests under the care of L. Y. Jenness from October 5 to January 1, after which it will be removed to an orange grove in Florida for the rest of the season.

MR. CHARLES H. GILBERT, the ichthyologist and collaborator with Prof. Jordan, has been severely injured in the Alps. A telegram from London, on the 18th, says:

A correspondent writes from Zermatt, in the cañon of Valais, Switzerland, as follows: "Five American tourists ascended the Matterhorn on Saturday last. On their return a rock was accidentally dislodged, and it struck the head of Mr. Gilbert, a tutor of the Indiana University, at Bloomington, Ind., rendering him partially insensible. He was just able to move mechanically along. Nearly four hours was spent in bringing him to the first hut, which was reached at about 5 o'clock in the afternoon. Some of the party proceeded and brought doctors. Mr. Gilbert arrived at Zermatt at 5 o'clock Sunday evening. He suffers principally from the loss of blood, and will be able to leave before noon. The guides were apprehensive that if he collapsed before he arrived at the hut the party would be frozen to death before succor could be obtained."

FIELD SPORTS AND LIFE.—I never saw the man who loved the woods and the chase but who was brave in war and manly in his civic life; and many is the time in forensic tilts that a knowledge of woodcraft is essential; and as I see the Englishman and American, growing day by day more expert in the manly sport on land and water, I feel that he is growing wiser in head, stronger in body, braver in battle and gentler at home.—G.

The Sportsman Tourist.

CROSSING THE RANGE.

LULLED by the "magic of the time," we had lingered in our cabin on the Larriweev, until, one day, Ignotus, casting his weather-eye up to the heavens, sagely prognosticated that, "first thing we knew, we'd get snowed in, if we didn't hurry up, and light out." The Indian-summer day no which this announcement was made, seemed to laugh at any such absurd prediction; but we knew from past experience that Ignotus was on confidential terms with the Bureau of Storms and the Department of the Weather, and that his allurances on any such point were to be viewed in a semi-official light.

John and the Rhymer had joined us before this, and we had concluded to spend the winter in the lower country, rather than endure the monotony of a six months' imprisonment by snow in Argentina. Two routes were open to us—the one, straight down the Larriweev, to its junction with the Grand; the other, over the range, between El Conquistador and Waluta, down the Rio Dolores to the Big Bend, and then easterly. The first had the disadvantages of unfamiliar country and of Pocomari-Guinep's band of rocadee Pi-Utes, so we chose the latter.

Though there seemed no particular hurry, it was deemed advisable to start early next morning, that we might fairly pass the summit of the range before nightfall, but we merely succeeded in adding another block to that proverbial pavement as it was after noon before we fairly started. Quick as our departure was, however, the change which Ignotus had predicted, was quicker.

When we rose in the morning, the sky was overcast, and by the middle of the forenoon, a fine rain was falling, which we knew would be an icy sheet at the summit of the pass. As long as our way led up the valley, our progress was only moderately uncomfortable, but when we turned aside, and began to ascend the mountain, trouble opened before us.

The trail up the pass was one of the steepest in the country, and was now, of course, rendered tenfold more difficult by the falling sleet which had covered it with a glaze of ice. Riding was out of the question—walking, nearly as impossible. A great part of the way, we were forced to employ primitive means. Tying a rope to the halter of the leading horse, three of us, scrambling upward as far as we could, would haul him up after us by main strength, while the fourth, with "quirt" or "black-snake," reinforced energy below. Slipping, sliding, stumbling, falling—on his feet, on his knees, on his side, the poor animal would at last gain a resting place, and, panting with fatigue, and shivering with cold, wait while the process was repeated with its companions in misery. The many falls, and the violent struggle necessary to rise again, so disorganized the packs, that constant halts were necessary to rearrange them. Owing to these delays, night overtook us, before we gained the summit. To attempt to cross after nightfall would have been madness, and so, just before we came to timber-line, we went into camp. The horses were turned out to find what nourishment they could in spruce twigs, some dry wood collected, a fire made, coffee prepared, and supper eaten. Everything was coated with ice—our clothes were stiff, and arms and legs felt as though inclosed in joints of stove-pipe. For while the fire seemed to be in league with the spirits of the storm, and refused to do more than to burn feebly, with a dull yellow flame, and a sullen discouraged air. Finally, however, finding that we were too old campaigners to lose temper at its misadventure, it shook off its sullenness, and blazed up royally. The crowding imps of darkness and cold were driven further and further back—our stiffened garments began to soften and then to steam—our chilled blood to circulate—our numb extremities to regain feeling, until under the combined influence of the fire, hot coffee, and pipes, we began to feel more comfortable, and to pity those poor fellows who had never experienced the pleasure of a good thorough storm of hail and sleet upon the summit of the Rockies. One does not know what fire is, until he has

seen it in the woods at night, when Nov and Erebus, and Ennis and Notus hold the world in their talons. This night, how our fire did roar and laugh! How it clapped its hands, and threw up its arms! How it stood a tiptoe upon its pedestal of spruce logs, a winged Mercury, ready to take flight and soar into the unknown regions of darkness above! How the shadows skulk away, and retreat, pell-mell, into the forest behind! As we lie watching it, the Rhymer quotes softly,

"The broad flame pennons droop and flap
And heave and tug as a flag in the wind;
Like a hoarse shout, the wind-whistles say,
Hunted to death in its galleries blind:
And swift little flocks of silent sparks
Now jumping, now plunging away in fear,
Go threading the forests' tangled darks,
Like herds of frightened deer."

The sound of his voice arouses Ignotus, who declares it is time to turn in. John, the Ambidextrous, had, ere this, cut four logs, about eight inches in diameter, and as many feet in length. These were placed in a square upon the ground, our rubber blankets spread between, then the robes and outer blankets, and over all the wagon sheet, a huge square of waterproof canvas, which, drawn over, and tucked in, amply protected us from the wet. We seldom went to the trouble of pitching our tent, unless our stay was to be a protracted one.

It was a veritable Walpurgis Night. All the spirits of the storm were abroad. The hail rattled on the wagon sheet like musketry, or smote the logs between which we lay crouched, like whiffs of grape-shot. From every point of the compass, the winds met above us, and wrestled with each other as to which should have us for their prey. They swooped down upon us like snarling wolves, caught the wagon sheet in their fangs, and tugged and tived to pull it off. They caught up huge brands from the fire, and sent them whirling into the woods, lighting up for a moment the black recesses with a train of glowing sparks. When the blasts passed a moment to take breath, we could hear the sullen plunge of rocks, loosed from the peak of El Conquistador, crashing through the spruces till they came to rest in the valley three thousand feet below. As I snuggled down by the side of Ignotus, I felt disposed to be thankful that I wasn't a country physician, or an court lover, or of any other profession that might have to do with the elements when in such a snarl as they seemed to be that night.

Before morning, the wind died down, the sleet changed to snow, and when we awoke, and endeavored to throw off our blankets, the superincumbent weight of snow was such that John declared he felt as if the Day of Resurrection had come, and he were the first to appear above the ground. The snow came down—not in flakes nor in sheets—but by the square acre, by the quarter section. At ten feet away, objects were then—at so many yards, invisible. The whole atmosphere seemed to be crystallizing and settling down on us in layers. Our fire, of course, had gone out—buried under a foot of snow. Ignotus, with a woodman's foresight, had tucked away some dry spruce splinters under the blankets at the head of his bed, the night before, making them serve as a pillow, and with these, and a due modicum of patience, we finally succeeded in starting a fire.

In the *dolce far niente* of the preceding evening, the Rhymer, who was also our *chef de cuisine*, had neglected to bake any bread for breakfast, and to do so now, in such a deluge of falling snow, was no easy task. Heap the lid of the Dutch oven with coals, and kindle a burning coal, in three minutes they were quenched, and the lid was white with snow. However, the bread was served at last; as John remarked, "Very well baked on an average—burnt on the bottom, and raw on the top." The fried bacon was a success, though Ignotus complained that Dame Nature had botched the job, by putting too much water in the gravy.

When John suggested that the coffee seemed weaker than usual, the Rhymer accounted for it by calling to our minds, the well known physical law in the boiling point of liquids varies in inverse ratio to the height above the sea level, and as, in our case, this was about 15,000 ft., a slight mathematical calculation would prove that coffee made here would only be about one-half as strong as the normal infusion; and, if we would taste carefully, we would find that the present brew had almost exactly that ratio of strength. Ignotus mildly observed that he accounted for it, by the fact that he had noticed that the Rhymer had forgotten to put in any fresh coffee when he filled the pot with water, and we had been drinking a stale brew ever since the night's disaster. The Rhymer contented himself by remarking confidentially to the bottom of his cup, as he inverted it to let the last drop run down his throat, that there was no use in trying to explain natural phenomena to a man who would indulge in a *provisi* reasoning.

Breakfast over, we met in Committee of the Whole to discuss future movements. It was manifestly "extra hazardous" to continue our journey till the storm should abate, and yet, if it continued, the trail would soon be impassable. Either horn of the dilemma had its own particularly sharp point, upon which we were liable to be impaled. If we started, the odds were great that we should lose our way, and be precipitated over some precipice, or becoming involved in the labyrinth of gulches, wander around till hopelessly lost; if we remained, twelve hours more of such a snow would so hockade the trail, that movement would be impossible. The snow was already knee-deep—by night, at the rate at which it was falling, it would be six feet, and that meant a repetition in a smaller scale, of the terrible Donner Disaster.

Our indecision was brought to an end by our horses, who came up to the fire, and seemed to ask in their patient way, if we proposed to remain there till they were starved or frozen to death. As Rob's head loomed up out of the falling snow, Ignotus rose silently, took down his bridle from the branch on which it hung, and, after warming the bit a moment at the fire, slipped it into his mouth. Without a word, we rose and followed his example. Saddling and packing finished, the horses were then led to the head of one trail to the tail of another—so that, if the last footing upon the treacherous trail, he might be supported by the others. Ignotus, uncoiling a thirty foot lariat, fastened one end securely around his waist, and passed the other end to John, who did the same. So started the silent procession; Ignotus first, carefully feeling for the hidden trail with his long alpenstock, linked to and followed by John, leading the train with sure-footed and sagacious Rob at the head, and at the rear, the Rhymer and myself, riding. All trace of trail or path was obliterated.

As we were climbing diagonally up a white mountain side, trying to follow, under two feet of snow, a narrow crooked trail, which had to be felt for, step by step, and which sometimes seemed to be lost entirely, while Ignotus prodded painfully for it with his staff. The snow fell so heavily that the

rear and van-guard were invisible to each other, and could only communicate by means of shouts. Such by inch we crept along, the only variation in the drear monotony being when the Rhymer and I would relieve the weary "path-finders" in front, or *vice versa*.

At last, when it began to snow to our dazed minds and tired legs as though we had been a year at this dismal work, the ascent became less steep, then, for a few rods, almost level, and then—I saw Doe's legs to hope downward. Some light notes told us, what I had failed to notice, but which had not escaped their keen woodman's instincts, that the wind had changed, and that he thought the storm would soon be over. As if to confirm our faith in his infallibility, in less than an hour a manifest slackening was visible, and by the time we had reached "timber-line," the last lake had fallen. Thoroughly exhausted, we halted for the night. The storm had evidently been localized, and we had nearly reached the edge of it, for though it had lasted nearly twelve hours, the snow was not so deep here, as where we started.

Next morning, the sun rose upon a much less forlorn and despoiled company than had travelled over the range the day before. Every mile of travel now dropped us a thousand feet lower and nearer to regions where the grass was green, and the birds were singing. The worst was past. Discomfort there might be before us, but danger was past. The snow grew thinner and thinner, until by the time we struck the Rio Dolores, it lay only a white whiff upon the ground.

"Rio Dolores"—old Coronado named it, and it proved a "river of grief" to us as we were to find. Headed in by the "canyon walls," it is not content to flow straight down, leaving room for a trail on either side, but frets impatiently from one cliff to the other, like a caged leopard dashing itself against its prison bars. After descending this stream, one is tempted to believe the reason assigned for the absence of fish in the upper part—that in attempting to ascend, the numerous twists and turns so confuse them, that they soon lose their reason, and die raving maniacs. The trail was as straight as the river was crooked, and, as a consequence, the water was ice-cold, and, on an average, it was up to our horses' withers, were dripping continually. Brimstone—as he was called, either from his color, or his temper, or, perhaps, both—had, on account of his superior height, been chosen to carry the most of our bedding, so that in fording, there should be less danger of its becoming wet. He had been uncommonly neck and doleful all day, and a grim foreboding was gradually creeping over me, that he was meditating some diabolical deed, which should clipse all his former doings. His eyes, I observed, however, for the depth of his depravity, he finally displayed. Either from "pure enviousness," or from a calculating diabolism that possessed him, at about the twenty-fourth crossing, he quietly lay down in the middle of the torrent, till only his ugly yellow neck and head projected above the rushing water. A stream of vigorous Anglo-Saxon from Ignoots, and a lusty "black-snake," plied vehemently by myself, failed to move him. While the icy water saturated our blankets, there he sat, but, *not* like the fabled steed, "pawing to get his former dignity." The wit of the Rhymer, cut the Gordian knot. Slipping the loop of his lariat over the pendulous lower lip of the saddle beast, attaching the other end to the pommel of his saddle, and starting up his own horse, the pressure thus brought to bear was too great to be resisted, and Brimstone, making a virtue of necessity, floundered to his feet, and waded ashore. It behooved us to go into camp as soon as possible, that we might dry our blankets before night. Pitch-pine was plenty, and the usual night-fire was soon roaring and crackling, while the blankets, stretched on lariat stumps from tree to tree, formed a drawing-room, whose walls steamed to heaven, and which also screened us from the wind which drew down the canyon, and bore with it the chill of the snow drifts we had left behind.

As we lay around after supper, in that happy half-hour devoted to pipes and laziness, the Rhymer was observed to take a paper from his breast pocket, and make, here and there, a careful correction.

"'Qu' est-ce?' queried John.
 "Only some verses," wrote the other day, while lying on top of El Conquistador."
 "Then I suppose the verses lie, too," breathed John softly, under his breath.

Taking no notice of this ungenerous skit, the Rhymer, at our solicitation, read us what he called

"ON THE HOLIDAYS."

"Outstretched on Nature's lap I lie
 And feel her great heart beat;
 Or catch the soft breeze in my eye,
 The rhythm of her feet.
 Each rustle of the wind-swept pine,
 Each murmur of the fir,
 Slugs in my ear a song too fine
 To lose to these blue skies.
 For me, the splintered torrents leap
 Adown their porphyry walls;
 And from the thunder-shattered steep
 The plunging snow-slide falls.
 For me, the cinnamon's rocky path,
 The wild trail of the bear,
 For me the tenapest's aftermath,
 The glacier, blue and clear.
 And softer sights and sounds I know;
 The white-winded ptarmigan,
 An autumn's misty vapor,
 Courser of winter's van.
 The rosbark's scarlet gontanon
 In windy cedar-trees,
 The lark's strong form, facing the sun,
 Asleep upon the breeze.
 For me the onsel clips his wing
 Beneath the beaded foam;
 For me the shy crane-warblers sing
 Their earlier songs.
 And sometimes, where the sunlight sifts
 Through leafy colonnades,
 The veil of ice-shakes and firs,
 And, ere the trees have died,
 I catch the secret of the hills
 All virgin and bare,
 The meaning of the voice that thrills
 The hollows of the air.
 Hence do I lean's proud ls mine,
 And note the silencing dew;
 For me the misting Pleiads shine
 Above my wind-swept thine.
 The cryptogram of Nature's lore
 Its secrets yields to me,
 All doucesly open with before
 My "open sesame."

H. P. U.

THE QUANT VALES OF DARE COUNTY.

I AM now stopping at the Nag's Head Hotel, on the beach opposite Roanoke Island, and near where Walter Raleigh founded his first colony over three hundred years ago. The hotel is a plain but comfortable building, and has some half-mile of piazza. It is frequented by the people from up the country. The prices are reasonable and the fare is good; beds clean, and air pure and bracing, and no mosquito bugs needed. As I sit writing in front of my room on the third story I can overlook the ocean and sound for many miles. What little I have in view is sandy, but produces wonderful crops of vegetables, and a great many fruits, and the waters are full of fish and oysters, crabs, clams, terrapin; and millions of ducks, geese, brant, swan and other wild fowl frequent the waters in the cold weather. I am getting Spanish mackerel every meal, and the landlord tells me they only cost two cents each. They are very large, some of them weighing about eight pounds. All kinds of beach birds are plenty, and bluefish, drum and sheephead fishing is first class.

The country is thinly populated, having about 8,000 people. They are mostly seafaring men, and some of them are old sailors who have been all over the world. They live in low-pitched houses built of juniper and cypress, which last for generations, and I have spent many a pleasant hour visiting them in their homes and listening to their yarns of life on the deep, dark sea. Some of them live to an advanced age and retain their activity and strength in a wonderful manner. They usually have large families. Their wealth is in boats, beach cattle, ponies and sheep, and many have considerable sums of hard money saved down. One old sea-dog, about 80 years of age, told me he had been investing his savings in feather beds for several years, and had several dozen hired out and loaned. He said: "Banks busted, Bonds got burnt or stolen. Hid money gets sandered over. A man pays his notes with a bankrupt's notice, but feather beds were safe, and, as the Yankees killed all the game, they would be scarce and high, and so he invested in beds."

Large herds of ponies, cattle and sheep range up and down the beach, and, as they do not cost anything to raise, they are quite profitable.

The ponies are small, but tough and wiry, and very intelligent. One owned by Captain John Ethredge, who lived on the Banks, near Oregon Inlet, used to follow him like a dog, and would get into his sailboat and move from side to side of the boat, crossing over the centre-board at the command, "To starboard, Billy!" and would lean on the rail at the order, "Lean to the windward, Billy!" Some of them are used to stalk wild fowl in the beach ponds between sound and sea, and yoked cattle are used for the same purpose, the hunter keeping them between the fox and him. The cattle feed in the summer time on the grass that grows in the sound, wading out into the water miles from shore, where the water is so deep that only their horns and noses can be seen. In the winter, when the swan and geese are in the waters, they have battles for possession of the shoals with the cattle, who venture out when the weather is warm, but the sharp bills of the wild fowl usually drive the cattle to shore. Most of the people have wild decoy geese and breed them; there are also a few decoy swan.

Every man who is "any account" has a canoe or sailing craft of some kind, and they take great pride in them; and the "boat must be painted whether the old woman has a bosom pin or not." I have yet to meet a "captain" who will not claim superior excellence for his craft or some point of sailing. If you ask one of them who has the fast boat of the county, he will probably say: "I don't like to brag on my own boat, but give me a stiff breeze and plenty of sandbags to pile to windward and I will go against any of them." Some sail best before the wind, some with a light wind; others sail best in a gale, or can beat to windward best, or sail closer to the wind, or carry more cattle or poles, or theirs is the driest boat, or the tightest boat. Each and all of them have some claim of superiority over the others for their boats.

I hired an old rheumatic fellow, with his crazy, old, patched-up boat and tattered sails, to take me over to the Croatian Lighthouse a few days ago. I asked him what his boat could do in the sailing way. He said: "I can't brag so much on fastness, as you 'niggers' do, but you can't hear before the wind-wind it, but he is the best one-man boat in Dare. She can near about sail herself." I gave him my lask on the way, as it was wet; and the old chap emptied it and got a little funny. After I left him he tried some fancy jibing and went overboard, and his boat sur enough went off sailing away on her own hook. We fished the old man out of the water and caught his canoe.

I like to sit on the piazza of Captain Sam Bowser—a veteran sailor of close upon twenty years, bronzed face, hairy, broad-chested, deep-chested, vigorous, strong and active—and, looking out on the ocean in front of his house, listen to his yarns, while the deep boom of the sea beats time to the low growl of the old tar as he tells of his experience on distant seas and in foreign lands. Like Brainerd's sea captain, "He has hunted the leviathan of the deep in Arctic seas, harpoun in hand; and he has seen the great sea serpent dash across his bows in the gray dawn of the morning. He has moored his bark to the towering ice-berg, and floated against the Gulf Stream; and has been hunted by the Flying Dutchman off Cape Horn. He has scraped his keel over coral reefs in Madagascars seas, and seen the whale and swordfish fight beneath his bows. He has sailed in the dark night along the wave-washed coast of Labrador, and through pitiless fields of ice in acres. He lay becalmed for weeks on the African gulf coast, and saw his shipmates die one by one with the deadly fever. He has fought, cutlass in hand, against Malacca pirates on the bloody deck; and floated for days on a broken spar off Cape Hatteras. He has been wrecked on the wild waves of Mississippi, dashed in on the sower, and has struggled with the clinging anchorage of the Gulf; and he has met such dangers with a sailor's skill and brav'd them with a sailor's courage."

This is the dull season, and the crews of the life-saving stations and the fishermen have a furlough, which most of them spend in Elizabeth City or "Town," as they call it, to spend their savings.

They usually return after a day or two's absence with a new suit and some new wares, or a cleaner jacket, indicating that the Jews have taken "Town." Dyed moustaches, oiled hair, tin-tucked and biled shirt are now in vogue, and the men who succeed away contentedly all winter on an old fig-stemmed powhattan will smoke nothing but "ceogars."

But they are all brave, manly fellows, and have patrolled the beach night after night in all kinds of weather and saved many a life that would have otherwise been lost; so let them have their fling. Dum vivimus vivamus.

Next winter Uncle Sam will have a rival and lose many of his best men who have been employed in the stations, for a club of New York gentlemen have bought up all the best shooting grounds in the county, and the young men are looking forward to a more congenial life in attending on the sportsman as boatmen and gunners. And, as it is said to be a strong club with shooting for a large number of men, no doubt they will give employment to a large number of them. I fear I shall have to move further down for a quiet place, and shall prospect in Currituck county during the summer.

There is some talk of a narrow gauge railroad on the beach from Norfolk to Oregon Inlet. The road would be built near the ocean, so as to avoid the sand hills, and steamers would connect from New Bern, Wilmington and other points south of Oregon Inlet.

The brant, between a canvas back and a goose in size and preferred by some to the canvas back, are very little known in the Northern markets. But no doubt large numbers of them will find their way to market next winter and, if the beach railroad is built, there is hardly a limit to the quantity that could be shipped. The waters from Oregon Inlet to New Inlet, and below as far west as Roper's Tract on Pamlico Sound, a distance of fifteen miles, are often black with them. Black brant are the most abundant; white brant in immense rafts frequent the waters further south. There are a great many swan and geese, also, in their season, on the shoals near Oregon Inlet and above.

Fresh fish would also be shipped in immense quantities by the railroad and reach market in good condition. Oysters, clams, soft crabs, fruits, truck, stock, poultry, etc., that now come through the canals, taking two days for the trip, would reach Norfolk in a very short time. Telegraph operators on Bodie's Island Light and White's Head Light could see schools of bluefish and menhaden thirty miles out at sea and send the word along the beach to the fishermen. They could also send the word in case of ships in trouble out at sea, and the crews of the life-saving stations could be concentrated at any one point on short notice, thus enabling them to save many valuable lives and much property. The life-saving stations could be reduced in number, and the life-cars, bombs, and all the apparatus might be loaded on a car and stand ready under shelter, with switch to connect with the railroad. The patrollers could be dispensed with and the present heavy expense of keeping up the life-saving stations, standing as they do five miles apart along the beach, would be reduced to a trifle. Sportsmen would patronize the road, and in the summer excursionists would frequent the many pleasant places along the coast, such as Back Bay, Kitty Hawk Bay and Roanoke Island. They might have a ride in a motor car along the wave-washed coast with the green billows rolling almost to the car-wheels! No dust, no heat. Think of a lunch on sea bress, Spanish mackerel, soft crabs or wild fowl at Oregon Inlet; a dip in the ocean, and return to Norfolk in time for dinner! Soft crabs are five cents per dozen in Kitty Hawk Bay and \$1 per dozen in Norfolk, and Spanish mackerel thirty inches long ten cents each at Oregon Inlet and \$3 in New York; black brant, fifteen cents each at Duck Island and \$3 per pair in Baltimore; spring chickens ten cents each, and swine year potatoes nine cents per bushel on Roanoke Island. What a margin for profit! Think of leaving the Navy Yard after breakfast, riding down to Gallop's Woods, killing a deer, and return in time to broil a steak for dinner.

There are no obstacles to be encountered. Right of way, a trifle, and a dead level from Norfolk to the Inlet. The Inlet has twelve feet of water from the ocean to the inner bar, where there is five and a half feet of water. A dredge could run out into a channel into the deep waters of Pamlico Sound through the narrow bar, and there would be plenty at different points, for it is not all a barren sand beach. By no means. Heavy forstis grow at different points; for instance, the Gallop Woods are ten miles long and from two to four miles wide, and the timber is very large and good heart pine. Collington Island, on Kitty Hawk Bay, is covered with a heavy growth of first-class timber. In Princess Anne there are many fine tracts of pine and cypress convenient to the projected line of this railroad. Government aid would probably be secured for the amount saved in life-saving stations and the expense of supplying them and of paying superintendents, inspectors, paymasters, etc., would save Government \$150,000 a year from Cape Henry to Oregon Inlet. It would not be practicable to continue the road any lower down than that inlet, on account of the strong tides. Wire fences would have to be made on the north side of the road to keep the bank stock from the track. But the wires could be fastened to the telegraph and telephone poles and would probably be well cared for.

I believe that within a short time sportsmen will be able to leave New York City after breakfast and travel by rail and boat, via Crisfield, Md., and Norfolk, Va., and reach the shooting and fishing grounds in Dare in ten hours. Marshall Parks and other capitalists have already bought large tracts of land on the beach in anticipation of an investment. In the meantime it is to be hoped clubs and good laws will protect the game and fish from extermination.

JOHN BRONSON.

RANDOM NOTES IN THE ADIRONDACKS.

MY way led me through the western portion of the Adirondacks, and then easterly to Blue Mountain Lake. Of course, you will say, the number of men who go who would come in contact would not be very large. Well, let us see. First of all we meet the guides—men, every inch of them, and many of them are nature's noblemen, honest, faithful, reliable and capable. What more would you ask? The guide with whom I have traveled the woods for several years past I would place alongside of any piece of humanity that I ever knew, for all the sterling qualities that make a man. As a guide he knows his business thoroughly; the whole track of his wilderness family he knows and he will lose him there. On the water he is fearless and at the same time careful. I have many a time been with him when a single wrong stroke of the oar would have swamped his frail boat and drowned its occupants, but never yet have I seen an uneasy glance or a sign of doubt or hesitation. His nerves were equal to any emergency, true as steel. The haunts of fish and game he knows like his A B C. If a fine mess of trout was wanted, or some special occasion, just tell him the night before, and on the morning will tell you where the fish will be waiting for you; and if you want to see a deer he can do equally well with you. The other day, when about forty miles from camp, he pointed out a spring-hole. "There," said he, "is a place where, a few years ago, you could pick out a big lot of trout, now you can't find one."

In my wanderings I have met many whole-souled, genial sportsmen—as a general thing they are such—some excep-

Specimen copies of the FOREST AND STREAM sent free upon application.

"THE RECREATIONS OF A COUNTRY PARSON."

Editor Forest and Stream:

"Though I'm a clergyman, of the orthodox stamp, I have no patience with the class of priests who repute all literature which is not distinctly religious. Secular books and papers, no matter how refined and instructive they may be, they have to banish these views to regard with feelings of horror; willfully ignorant of the fact that much that they enjoy of art and science, civilization and even religion, they owe largely to these very publications. They remind one of those fastidious folk who are afraid to pluck a robin lest there be enclosed in it the sting of a wasp. For the most part, they are of a cold, narrow-minded, warped specimen of humanity. Nor can I have any sympathy with that other class of extremists who turn in disgust from everything religious and who are wholly absorbed in secular reading, much of which may be of questionable refinement."

"In this age, when of making books and papers there is no end, there is need, as everybody knows, of wise discrimination in selection. These myriad publications are spread before the people, who have the liberty of choice; and between the two extremes referred to there is a middle ground which all may occupy, and which never fails to fulfill its promise of pleasure and profit to the reader."

"Now, a parson's occupation goes far to determine the character of the reading which he makes a specialty. It will be in a line with his business. The artisan takes naturally to treatises on mechanics; the merchant to commerce; the farmer to agriculture; the attorney to law; the clergyman to theology and the physician to medicine. But then it is not wise to keep the mind on a constant strain over these special subjects. All have need of mental relaxation, and general information, and this two fold necessity is met by our daiy papers and weekly and monthly magazines, which are largely miscellaneous in their make-up. They who do not avail themselves of one, two or more of these accessible avenues of current news and intelligence live behind the privileges of their age. They are not abreast with the times; and recent happenings, when they chance to be told of them, sound to their ears as much like fiction as old-time fables."

"If mental rest is the immediate need gave the mind something as to ally different as possible from that which it has been steadily occupied with. My parish numbers one hundred families. After a tour of a formal visitation, or after I have been engaged for several hours in study pertaining directly to my profession, I feel the need of rest, mental recreation; and one of my favorite resorts is the FOREST AND STREAM, which comes new and fresh every week by its sanatorium from the Times Building of the great metropolis. Though sitting at home, reading graphic descriptions of forest, lake and river scenery, and of the various adventures with the rod and gun, and of rifle and bow, and bird contests, yet it does not require a great stretch of the imagination to transport out one's self to the heart of the wild woods and grassy lands, and among the happy groups of pleasure-seekers on the land and on the sea. These scenes at home are permitted to enter into their sports, participate in their pleasures and partake of their joys. From their repose beneath the hemlocks our weary heads gain rest. From their exploits our high-spirited nerves snatch snatches of relaxation, and so our lives, as well as theirs, are sweetened and prolonged."

"As to my own thoughts and suggestions here which help me in my work, I whip illustrations out of fly rods, shake them out of yachting canoes and shoot them out of gun. I find them in the bent bow and flying arrow, and in the cataract in the leaping cataract and the music of the woods. I am reminded of the happy hit which the sainted Dr. Bethune once made. A neighboring minister said to him one day: "Brother, how has it happened that while I have labored so diligently as you have, and preached better sermons, and more of them, my parish has been scattered to the winds, and yours remains strong and unbroken?" Dr. Bethune then facetiously replied: "O, tell you, brother. When you go fishing, you first set a great high pole at a head wind, which you attach a large cod line, and a great hook and line as much as the fish can swallow. With these accoutrements you dash up to the brook and throw in your hook with, "There, bite, you dogs." Thus you scare away all the fish. When I go fishing I get a little switchy-gone, a small line and just such a hook and bait as the fish can swallow. Then I creep up to the brook, and gently slip them in, and I twitch 'em out, twitch 'em out, till my basket is full."

"To all of which the FOREST AND STREAM says amen; and to this will be joined the endorsement of the many clergymen who are appended to many letters. It will be recognized in this way of court building his share of the good things to the general fund he follows out the custom of his profession. And just here let us reprint from the Independent this rhyme of

A FISHING PARSON.

In a quiet village, far away,
The pulpit was vacant many a day.
Cassidore came from far and near,
Every Sabbath morning there.
Some were too awkward; some preached with ease;
But no one was able them all to please.
At length there came from a distant place
A man of unusual power and grace.
His frame was strong and his eye was clear,
And all were pleased who came to hear.
"This is our man!" said the elders all,
And old and young united to call.
The clerk then read, and early in May
The new parson came to his new abode to stay;
But after the toll of the settling down,
In his pleasant home in the little town,
The parson was one day seen to stroll
Across the street with his basket and pole,
And take his way o'er field and brake,
To a rippling stream that entered the lake
Just below the town. "What does it mean?"
Asked the good-people, and all who had seen.
"A fishing parson!" exclaimed the men,
"How could we so deride him?"
The spinsters said: "'Twas a shame and sin—
A parson to be engaged in
Such worldly sports!" "'Twas late in the day
When the parson took his homeward way,
With well-filled basket, and letter still,
A glowing check and a healthful thrill,
Caus'd by the blood that flows through his veins
To torrents flow after summer rains.
Some said, with boldness: "They nevertmore
Could respect and love him as before."

"A fishing parson! Who ever heard
Of a fishing man who preach'd the Word?"
Thus spoke the elders and deacons and all,
And before them at once the parson they call.
"A painful duty," the eldest said,
Devolves upon the man who sits his head
In a serious way. "Never before,
For eight and seventy years or more,
"Have we as a church been called upon
To reprove our pastor for what he has done."
"You went a-fishing the other day,
We think it unseemly in every way,
"Twill injure the cause with the young and the gay,
"Tis scandalous! What have you to say?"
A smile came o'er the parson's face,
As he rose to respond with a pleasing grace.
He spoke of Peter and brethren three,
Who to once went fishing on Galilee.
"These were the men that the Master chose
To carry His gospel to friends and foes."
He spake of Bethune and he spake of Todd—
"Fishing parsons!" but woe to God.
"Fishing parsons!" yet better men
To preach the Word and wield the pen
The church has not known for many a day,
They loved to preach, they loved to pray;
Not their Lord the less because as well
They loved the rod and the line and dell.
"And as for myself, I can boldly say,
I preach the better, from day to day,
"For the strength I gain in my walks about,
While casting my fly for the speckled trout.
"And when in the forest, alone, oppressed,
God speaks to me and I am blest."
No more was said, but as time rolled on
The pews in the church filled, one by one.
And as never before, from far and near,
The people thronged to the church to hear
"The fishing parson!" a name unknown
By boys and girls and men full-grown.
And at length the meeting-house, which before
Had held them all, with room for more,
Became so crowded that ere the fall
An effort was set on foot to
To build a new house, with an acre room
For all the people who wished to come.
And though the years rolled swiftly by
The fire still glowed in the parson's eye;
And he often said in his pleasant way,
As he labored on from day to day,
That his power to work with a steady plod
Was due to his love of the creed and rod.
The parson lived long, and rejoiced to think
Of the souls that were saved from ruin's brink.
True fisher of men! he had tried to be—
As faithful as those of Galilee.
"As at eighty and three, and preaching still,
And serving his Master with heart and will,
That he wrote sermon after last was sent
To call him home from this position.
And it is my duty on his tombstone to engr,
When his last end "fallen to sleep."
"Here lie the fishing parson" and ten,
"His master made him a fisher of men."
JAMES H. HOADLEY.

"THE FORESTER SCHOOL OF BATHOS."

The following editorial is by request reprinted from our issue of Dec. 18, 1879:

"We have already spoken of the fashion set by Forester, and followed by his disciples, of making the potatoes of the sportsman a prominent feature of field stories; and we have sometimes thought that the author has had a very appreciable influence upon the literary style of amateur writers upon sporting topics. There is a class of young haphazard sportsmen who, in the levity of sentiment and style exhibited by no other English author; and who, contentedly, model their own efforts after his style. Now, without detracting in the least from Forester's deserved greatness, we may suggest that in common with many writers of his time, he is somewhat out of fashion so far as modes of expression are concerned. The adjective does not play so important a part now as it did then. We have nowadays less of vague, expansive soaring, and more of common sense, straightforward, plain English prose. One reason of this is, that one hundred authors are now writing where ten were writing then. To find an audience for one hundred must be much more terse and explicit than it was necessary for the ten to be. Washington Irving's Sketch Book is not read as much as formerly; not alone because it is crowded out by the thousand and one new hooks of like character, but because its style is too rambling and diffuse for the day. The incoherence and compactness which mark the American character in other fields, has its influence also in literature. In the literary world it is true this new order of things may be a mistake, but at all events the tendency becomes well defined to any one who will take the pains to compare the old and the new books in his library.

"We have, in the writings of some of the self-constituted sporting literature oracle of the day, a survival of the crudities and faults of the American literature of the past. This is not difficult to explain. It is always easier to imitate faults than excellencies; to catch the hollow form of a writer's style without at all entering into the spirit of his writings. And again, the influence of a writer who is the only author, or one of a very few authors, read by the amateur reader of the pen, is so unmistakable that he falls unconsciously into the same set phrases and turns of expression. When a young man reads of Frank Forester's writings, that "All bear the indelible impress of a master mind, and have the qualities of imperishable works," and that "the bright thoughts of his surpassing genius, as embodied in his writings, will ever remain a grand and indelible monument to his memory, more durable than bronze or granite material, as these shall remain fresh and beautiful when the more perishable material will have crumbled or been consumed by rust," and still further, that "the spirit of Forester is still with us," and that "we feel his presence; we are cheered by his inspired teachings, and under the consolation thus afforded, are better able to bear the loss of his mortal form and awe-inspiring presence;" and when we read such stuff as this, written by a person of the masculine gender, and published in the Year of Grace, One thousand, eight hundred and seventy-nine, we may safely conclude that something more than the literary taste of the writer is affected by

the devotion to "the lamented master of the craft;" a devotion so intense, indeed, that we are threatened with its outgrowth at a future date, in the shape of a "work," illustration of the literary achievements of the spirit aforesaid.

"It is a relief to turn from this balloon style of adjective to the numberless common sense and valuable papers which are written by sportsmen, for sportsmen, and published in the sportsmen's journals of the day. The Forester school is only a little orbit within itself, growing gradually smaller from year to year. The majority of those who employ their pens in writing to FOREST AND STREAM, even though they are non-professional writers, put their ideas into plain, intelligible prose. Were it not the case we should long since have been forced to suspend publication; for, however much the Forester school may enjoy composing their effusions, it is certain that people will not pay four dollars per year for the privilege of reading them.

"While the writings of Forester hold a deservedly high place in the library of the sportsman, and we rely to maintain that place for a long time to come, we are gratified to see the influence of their style gradually decreasing among writers.

"Some have been found to argue that composition is a direct means of culture; that if a person has appeared in print—even though it be only sandwiched in among the advertising columns of a tall paper's monthly—it is a step in intellectual growth. The mere publication of the article does not, in itself, argue that the author has advanced his subject matter may possibly, too, even in the latter case, it would have been better worth the literary aspirant's time and trouble to have absorbed the writings of some standard thinker, than to have allowed off his own crudities upon the world.

"The best writing is that of him who has something to say. The plain statement of an observation in natural history, practical science, or mechanics, a practical description of a shooting or fishing trip, and kindred communications, are more acceptable to the sportsman than all the effusions of spring writers of blank verse. Fusing on the miniature of a church's people may make the populace open wide its mouth in wonder, but it is, on the whole, neither a useful nor a lucrative performance."

It may be added that the sixteen goodly volumes of the FOREST AND STREAM, with its current numbers of its Seventeenth Volume, afford a bright and shining example of what is wanted by the American sportsman of to-day.

Natural History.

AN EXHAUSTIVE REVIEW of Gantner's "Introduction to the Study of Fishes" and "Ichthyology," from the pen of Prof. Theodore Gill, is now in type and will be published in our next issue.

THE MOCKING BIRD'S SONG.

SPRINGFIELD, N. Y., Aug. 22.

NOTICE in the last issue of the FOREST AND STREAM an article from "Robert West," in the *Adventurer*, on the mocking bird, in which he claims that this pestless singer is imitated, that he is not a mocking bird at all, but merely a wonderful bird, who sings an original song, but which somehow singularly happens to be composed of the identical notes of other songsters or animals, and attempts to prove his assertion by the fact that a young bird raised apart from other birds acquired, or originated, according to Mr. West, the same notes as birds grown under the tutelage of old singers. It seems strange that any one should assume such a position. Bird "Bob White" is the innumerable company of other birds get their notes as if the mocking bird? Will a blue bird or robin, raised in confinement, fail to pipe the note of his parents? It is hereditary as much as his shape, and so to a great degree is the incomparable pointer of the mackinac bird, yet not altogether. Centuries of practice have bred in this bird his wonderful powers as surely as his individual plumage, and raised in confinement he will naturally reproduce a note, if not all, the selections of his ancestors. Yet, nevertheless, he is a mocker as much as wine is. To say he is not to assume that he originated the note of other birds. Birds of different species do not have the same song. He either origin led these songs or he belongs to several dozens of different species, or he is a mocker.

And Mr. West says "a first-class singer invariably excels that which he is popularly supposed to be imitating, and other birds recognize and acquiesce in this without any exception." Can perfection be exceeded? When a mocking bird reproduces the note of a warbler or kingfisher to a "great-bird," how is he going to exceed it? He may play a few variations on it, by supplementing or prefacing it to some other imitation, but on imitation pure and simple he cannot excel, in the sense Mr. West uses the word.

As to the statement that other birds recognize and acquiesce in the mocking bird's superiority, it is one of the pretty things that cannot be proven. I don't deny that they will fight to do so, but that they do so "without any exception" is assuming a position which no circumstances was real. Many birds exist in Florida which have heard quite a number of mocking birds and, being a lover of the bird, I have paid considerable attention to the wonderful powers of this strange creature. The comb of my rufous is the stage whereon a couple or more exhibit their requirements to the public daily. The orange trees are alive with them, and many have the same succession of notes, liquid drops of sweetest, wonderful melody which they trail after them as they fly from tree to tree. He runs over with song. Even when sitting he can't keep quiet, but spreads out and folds his wings close to ally, while he utters the song of his form, of which I have heard many peculiarities in the chimney-top and behind his venture with the loveliest little plants or on rind, and when once the bird is opened he must sing or die. He warbles, he trills, he shakes, he whistles, he gives you note of quail, yellowhammer, night-bawk, whippoorwill and a number of others, while interwoven intricately are his own inimitable comments on the scene. At intervals during this enterprising he lifts himself by an impassioned wing beat or two into the air, and with a sort of explosive of his sentiments, and settles singing a note on his perch to continue with accents, and distinctive notes, legs and staccato, repeat and da capo. The imprisoned melody presses up a bar, and when the surging, quivering notes escape him they soar above through all the delighted air in wondrous harmony, at ebbing the love and omnipotence of the Creator. In the stillest hush of night, when the stars look forth from the lake, and moon and the foot of the owl in the distant swamp mars the quiet, the

sleeping mocking bird in the orange tree near my window breathes of music, partially wakes and warbles a few soft, sleepy, delicious notes, a beautiful musical soliloquy, stopping as abruptly as it began; and he dreams again to awaken the sleeper, near him with a royal salute to the coming morn, when the east flushes and the stars grow dim.

DO OPOSSUMS FEIGN DEATH?

THAT the opossum will feign death that he may live is known by all acquainted with their habits. Hence the saying "play 'possum" whence the opossum lives.

When collecting botanical specimens, many years ago, in Wilcox County, Alabama, I saw an opossum up a small tree of only about three inches in diameter. To see if he would pretend to be dead I armed myself with a green stick of the size of a large cane and began shaking the tree. He was about ten feet high next the body of the tree, on a small limb. The shaking caused him to run out on the limb and also to lose his foothold, but he caught the limb by the tail and remained suspended until repeated shaking caused him to fall.

Several blows on the head stretched him on the ground, seemingly dead. I held him up by the tail and threw him down, and he showed no signs of life. I then stood and watched him until I saw him breathe slowly and at distant intervals. I went several rods distant, where he could not see me. Finally he opened his eyes, raised his head, looked around, got up, and ran into his hole a short distance off, beneath the ruptured roots of a large fallen tree. I did not know that his home was so near, if I had I should have closed the entrance and killed him.

Opossums are common in this portion of Texas. I have killed many of them when they came after my chickens at night. One I thought I had killed and threw him down with a bloody head. Next morning he was gone, since which I make sure work in killing them.

According to Prof. Baird in the Mexican Boundary Survey, and also in Vol. 3 of the Pacific Railroad Reports, the Virginia 'possum is not known to live in Texas, but the Texas 'possum is the *Didelphys californica*, a similar animal with a larger tail.

The 'possum of this region seems to be identical with the one east of the Mississippi in size and appearance, nor have I ever heard any one speak of the Texas 'possum as being different. I believe a full investigation of the matter will prove them to be the same species.

The 'possum cannot run faster than a man, hence, in a fair field by moonlight, he is easily overtaken. I have killed two females, each of which had nine young ones in pouch attached to dugs.

A few years ago a 'possum was killed near Naples, Ontario Co., N. Y., where it is so rare that many people do not know its name. S. B. BRUCKLEY.

Austin, Texas, August, 1881.

HOW A SNAKE CLIMBS.

NEW ORLEANS, August 17.

HAVING noticed in your issue of 11th inst. the remark that none of your correspondents upon the subject of snakes climbing trees had described the manner of ascent I would state that I happened once to witness the act.

Returning from a trout-fishing excursion in the Alleghenies, traveling by the turnpike that runs along the north fork of the south branch of the Potomac in Pendleton County, West Virginia, my attention was attracted by a black snake, about four feet in length, flattened against the trunk of an oak of about three feet diameter. It had got some four or five feet from the ground and was making its way slowly upward in an almost perpendicular direction. Every muscle appeared to be at its greatest tension; the body was rigid and drawn in irregular serpentine folds much more marked than those made in progression on the ground, taking hold by the abdominal plates upon the corners or projections of the corrugated bark and so drawing its length upward as from a step in the manner suggested by you. The surface of the bark, broken by irregular upright channels and ridges, with transverse breaks in the latter, afforded so many points d'appui, that one of which the snake would lift a section of its length to another and so on upward, slowly but surely.

I was so struck by this acrobatic feat of a legless reptile that I have retained a lively recollection of it to this day.—G. A. W.

A CURIOUS OLD SQUIRREL.—PLATTSBURGH, N. Y., May 9.—Editor Forest and Stream.—On the 7th of May, a friend and myself took a ramble in search of some hawk's eggs, as I have not yet quite lost my old spirit of a "nest-robbing robin," but confine my collection to the eggs of the hawk, owl, crow, etc., against which I waged a ceaseless war. On our return we found in a large maple tree. We had a boy to do the climbing and adjusting the climbers to his legs he was soon up to the nest. He cried out that it was an old hawk's nest, and threw it down. Where it struck the ground a great chattering was set up, and on examining the nest, we found in the interior of the bunch of sticks and dead leaves three young gray squirrels whose eyes were not yet opened. We arranged the nest as best as we could, and covering the young squirrels up with leaves, left them at the foot of the tree, in hopes that the old gray might find them. On our return we thought we would look for the squirrels, but on watching the tree we found squirrels and nest gone, and in a tree near by was a new nest. On looking closer we saw the old gray squirrel sitting in a crotch about a yard from the nest. On seeing us the squirrel jumped into the next tree and sat up again. We drew nearer, to get a better view of her, when she jumped into the next tree, and so gradually led us away from the nest. Now it certainly looked as if the old squirrel had, during the day, made a new nest, transferred her young to it, and upon seeing us return, had led us into one hundred yards from the nest, while the thinking her young were safe, she ran up an elm and was out of sight in a twinkling. P. B. JOHNSON.

CLIMBING WOODHOOPS AGAIN.—New Castle, Pa., July 7.—Two instances of the kind came under my own observation. One day last fall I was hunting squirrels in the eastern part of this county. Seating myself on a log to rest, I noticed some large, dark animal climbing, or, it seemed to me, sliding up a tree until it was eight inches in diameter. I quickly slipping a couple of heavy shells into my gage, I made my way to the tree. The woodchuck—for such I found it to be—went on up the tree where it forked, and sticking his head through the forks, proceeded to "take in" the surrounding country. But he "took in" more than he had

bargained for—a charge of No. 4 shot—and then took a tumble. It was the largest one I ever saw. This spring, while hunting ducks on one of our streams, I saw a woodchuck jump out of a small willow tree where he had been sitting about four feet from the ground. Before I could throw my gun to fly shoulder and pull he was in a hole at the foot of the tree. It is very common for them to tree when hotly pursued by dogs. I have a friend living in the country who has shot at least a dozen in that way.—WOODCHUCK.

THE ORPHAN ROBIN'S FOSTER-FATHER.—In Rocky Hill a tame male robin is kept by Mrs. Ryer in a cage. He would come back to the cage, when liberated, after flying about out-doors. Near by, in a dwarf pear tree, a pair of robins had a nest. The house cat, just about the time the young robins were hatched, succeeded in climbing and killing the male bird of the pair, and they or two blue jays also cat also killed the mother bird, thus leaving the young birds unprotected. Mrs. Ryer took the nest out of the tree, and placed it, with its gaping and hungry little inmates, in the cage of her tame cock-robin, together with a dish of boiled eggs, as an experiment. The old bird looked at them, and apparently thought the matter over in a reflecting mood. Then he proceeded to feed them a little—giving to each little wide-open to a morsel of the egg-yolk. Having disposed of that, he flew off on a search for worms, but his solitary old huncher bird continued very industriously to forego the gardens thereabout for the benefit of those nestlings. These latter grew apace, and in the time were big enough to be encouraged to get out-doors themselves and try their wings. Whether the old cock-robin after that taught them by example how to find and secure worms for themselves in the sward of the lawn and in the garden has not been reported, but that in the case of robins the parent birds do teach their young is shown this very summer. In the Rocky Hill case the young robins became able to take care of themselves; and then their benevolent self-appointed guardian went back to his cage.—Hartford (Conn.) Times.

LARGE DEER HORNS.—Moirs, near the Adirondacks, July 29, 1881.—The deer are, for some reason or other, more plenty in the St. Regis district than they have been before in several years past, although they have been hunted ever since the middle of May. Parties have been up to the sixteen-mile level during the past two weeks have found them plenty as ever. A very large buck was killed there last week. They have the horns at the Blue Mount House, and all who see them say they are the largest they ever saw. They are in the velvet yet, and I have sixteen prongs started, eight on each horn. They measure eight inches in circumference near the head, and are eight inches broad at the widest part near their ends. The points which killed the deer had no means of weighing it, but think it would weigh over 200 lbs. It was very fat and they got a large quantity of tallow when they dressed it. Another buck was killed there last week, near the same place, nearly as large as that one, but it had not such large horns; and two deer were shot there Wednesday night last, and both got away wounded out to death. This is the curse of night hunting. As many get away wounded and are left to die a lingering death as there are of those killed on the spot and got by the hunters.—A. C.

Game Bag and Gun.

A CAMP HUNT IN ISAQUENA COUNTY.

IN my earlier days of hunting in the swamps of Mississippi I was considered entirely hors de convenance while following a pack of bear dogs, to shoot at any other game however the temptation. Many times it occurred to pass a fine great buck or a drove of turkeys, but daring to break through the prescribed rules of the country. On one occasion, however, in company with my father and several English gentlemen, on a grand camp hunt, I broke the proscribed rules, and so little bad effect upon the dogs, that since then to be referred to the old rule has been placed on file, not even to be recalled.

Before telling the circumstance under which I laid myself liable to at least severe censure, I will try and give the readers of the FOREST AND STREAM an account of that, my first experience of camping in the wilderness. It was in the fall of 1850. The weather had been remarkably fine, and the mast more abundant than ever known before. The country were very sparsely settled, and the wood full of game, panthers and bears being so plentiful that it was the constant talk of the inhabitants as to their holdness, and the great depredations they had made upon the few heads of stock which was in the country. Our camp equipage was not only complete but luxurious; negroes to wait upon us, and any number of mules to pack our baggage. We even carried along a couple of canvas canoes to facilitate crossing bayous, and to do duck, goose and swan shooting from. After leaving the cleared land some few miles, we were dependent upon the compass for our guide, as though we had special objects, so we did not attempt to hunt or unsnap a bound until we had gone several miles and come to the bank of a beautiful, clear-running bayou, where we determined to pitch our tents, and from there start upon our first hunt.

Our negroes, under the direction of my father's old body servant Rupert, were left to attend to the camp details, and after taking observations as to our exact position, the dogs were uncoiled. We had seen a good deal of deer sign, and the old hunter, "Liz," who was our bear track or two, he was but a few minutes before old "Spot" opened (we lit was in eight of him at the time), and I was particularly struck at his manner. He was standing perfectly still; every few seconds he would put his nose to the ground, and then suddenly raising his head, he would give one of those peculiar, long, musical howls, as only the thoroughbred hound can. This state of things lasted several seconds; the other dogs showed impatience, yet they seemed to know as it was not proper to start until the leader was ready. At last he broke away as though he had sighted the game, then followed the others, opening their musical throats with such intensity of purpose that their confidence seemed perfect in having business ahead. It was rather difficult to keep very close up to them, on account of the briars, undergrowth and fallen timber, but such absolute silence prevailed in this virgin forest, outside of the beautiful notes of the pack, that we could hear them

distinctly; the chase at times was most exciting; as the dog would find a place where the trail was freshest, their yelping and barking would have made one unaccustomed to this kind of hunting think that they had found the quarry; then would come a pause, caused by the bear crossing a creek, or else when closely pursued (they are cunning as foxes); they will run through water on top of logs and sometimes go in a hollow tree to throw the dogs off the trail. That was not the case, however, with this one; the pack was fresh and thirsting for blood, and Bruin was allowed no time for his pranks. He turned first one way and then another, and must have gone at a tremendous speed for at least an hour and a half; when overcome he took to a cane-brake, and in a few minutes went up on his game, and after the sharp crack of his heels, and when we got up to them, which we did by dismounting at the edge of the brake, and with cane knives cutting our way to them, they were at its base, barking and yelping with such fury that it is no wonder that the poor beast had not the courage to turn and meet them in combat. As I had killed my bear already, one of the Englishmen, Hon. M. B. P. was allowed the shot. He had a Lancaster double barrelled and double grooved rifle, carrying an ounce ball, which drew on his game, and after the sharp crack of the report down tumbled Bruin as dead as a mackerel.

As none of our party were any too clever at "loking the compass" had it not been for the sagacity of a mule I was riding we would have had some trouble in finding our camp. Here we found everything in splendid order. The tents pitched, a splendid fire burning, camp stools set out in front, and a table improvised from a few poles, and a bit of stray canvas stretched tight across them, upon which was laid a white table cloth ornamented with silver spoons and forks, plates, tumblers and napkins. Such a dinner and such appetites can only be had under such circumstances. We had a capital soup. "Rupert" had put one of the men to fishing (black bass in quantities) and he took a gun (when we were out of hearing) and bagged a few fine mallards which, added to the supplies brought along, made us a sumptuous repast.

The day's work had not been heavy so a fox hunt was proposed. That night all joined except myself, and I not, simply because being near-sighted I had no chance to have a shot, but because I knew that my father wished his dogs to go as much hunting as possible. Before going to sleep in the deadly stillness which reigned I heard three or four reports of guns, which in the morning proved to be fruitful of a fine fat doe weighing some ninety odd pounds.

We remained at this camp until the varmints began to know of our whereabouts, and kept clear of us, requiring too long ranges to find game, so we up traps and made for the banks of Little Sunflower. Here we had royal sport killing several bears, two panthers, and any number of deer and turkeys, and it was when the dogs were in hot pursuit of a bear that I made my terrible innovation upon the former stereotyped rules of the bear chase. I was left behind on the banks of the bayou at a place where bear tracks were plenty and fresh. Supposing that he might attempt to cross there the hounds could be distinctly heard, and they seemed to be running in the direction of my stand so much so that I had both barrels of my gun cooked ready for any emergency. The dogs were apparently closing closer and closer, until I caught the sound of a tremendous rattling and cracking of the cane on the opposite bank from where I stood, and made sure I would soon see the bear; the noise continued, as though whatever was making it was undecided as to which way to go. I was, I must confess, getting quite nervous, the dogs in the meantime, judging from the sound, had passed the point opposite where I was, and from their weak cry I fancied they had lost the trail. The rattling noise in my front continued, and I took my rifle behind a large cypress tree close by, where I was standing. In about two minutes still looking opposite me, there came at a rattling pace down the bank a magnificent buck with a pair of splendid antlers, into the bayou he dashed and was making toward my side. I remembered the rule of not shooting at any game when the hounds were on a bear track, but the temptation was too great, I raised my gun to fire, but then thought if I shot and did kill the buck in the water he would sink, so I kept cool until he began clambering up the bank, and when within arms reach, I fired at once, and the magnificent animal fell to the ground, but such a kick my gun gave me that it incapacitated me for shooting the rest of the time we were out. I got on my mule and he kindly took me to camp about two miles away. I described as well as I could where my buck was, and having blazed several trees on my way back with my cane knife, the men had but little difficulty in finding him.

When the others came in at night they said they had heard my gun, but it was my silence, the naming of the dogs. Since then, then no matter how the hounds were of their outside game were allowed to pass, and the bear dogs did their duty, just as well. We were out about ten days when the beautiful weather changed to rain, and we broke camp and went home, not having been more than twenty-five miles distant all the while, and having broken camp but twice. As the FOREST AND STREAM goes to England I hope some of the gentlemen who were of our party could see this little narrative. Many wonderful changes have taken place in that county. My father is since dead, so is Liz, and of course, not a vestige of the origin of our dogs is in the county. There was seen the most beautiful cotton plantations in the South with their hundreds of darkeys to cultivate them, now there is nothing but ruin and desolation. J. D. H.

MAINE GAME NOTES.

MONSON, Maine, Aug. 16.

This morning, at about six o'clock, Mr. James O. Bishop, of this place, started a fox about three miles distant with his English foxhound Spot. He started him in the Thompson woods, and, after a chase of twenty minutes, the dog succeeded in driving him into his hole, when Mr. Bishop captured him alive. It was the first fox of the season, and was a common American red fox, *Vulpes fulvus*. This gentleman is the owner of several other valuable dogs, among which are an English bull-baiter, a Thru, and a native foxhound bitch named "Bell." He informs me that the prospect for fox hunting in this vicinity is excellent.

Sportsmen who desire this kind of sport would find this a rich field for operations.

When the season for ruffed grouse and woodcock opens sportsmen here are looking for lively times.

In the old Elliottsville township, at the north of us, and in the neighboring towns of Howard, Bangor and Ashby are many miles of solitary and almost forsaken highways running through dense forests where these birds abound in great numbers.

From September 1 to October 1 the cocker spaniel is the best dog to bring here. Later in the season setters and pointers are more successful. PROSATOR.

FOREST AND STREAM GAME TABLE.

The seasons, in which it is lawful to shoot game in the several States and Territories, open as designated in the following table.

Table with columns: States, Deer, Woodcock, Quail, Pinnacled Grouse, Wild-Geese, Wild-Turkey. Rows list various states and their hunting seasons.

Ala. Sept. 1 to Oct. 31. Ark. Sept. 1 to Oct. 31. Cal. Sept. 1 to Oct. 31. Conn. Sept. 1 to Oct. 31. D. C. Sept. 1 to Oct. 31. Ga. Sept. 1 to Oct. 31. Idaho Sept. 1 to Oct. 31. Ill. Sept. 1 to Oct. 31. Ind. Sept. 1 to Oct. 31. Iowa Sept. 1 to Oct. 31. Kan. Sept. 1 to Oct. 31. Ky. Sept. 1 to Oct. 31. La. Sept. 1 to Oct. 31. Me. Sept. 1 to Oct. 31. Mass. Sept. 1 to Oct. 31. Mich. Sept. 1 to Oct. 31. Minn. Sept. 1 to Oct. 31. Miss. Sept. 1 to Oct. 31. Mo. Sept. 1 to Oct. 31. Mont. Sept. 1 to Oct. 31. N. H. Sept. 1 to Oct. 31. N. J. Sept. 1 to Oct. 31. N. C. Sept. 1 to Oct. 31. N. D. Sept. 1 to Oct. 31. N. Mex. Sept. 1 to Oct. 31. N. Y. Sept. 1 to Oct. 31. Ohio Sept. 1 to Oct. 31. Pa. Sept. 1 to Oct. 31. R. I. Sept. 1 to Oct. 31. S. C. Sept. 1 to Oct. 31. Tenn. Sept. 1 to Oct. 31. Tex. Sept. 1 to Oct. 31. Utah Sept. 1 to Oct. 31. Vt. Sept. 1 to Oct. 31. Va. Sept. 1 to Oct. 31. Wash. Sept. 1 to Oct. 31. W. Va. Sept. 1 to Oct. 31. Wis. Sept. 1 to Oct. 31. Wyo. Sept. 1 to Oct. 31.

On the fifth day of January next (1789) no person whatsoever (Masters or Slaves excepted) not having a freehold of one hundred acres of land within this Province, or tending ten thousand corn hills at least five feet distance each, shall hunt or kill Deer; under penalty of ten pounds proclamation money, for every offence; and moreover shall forfeit his gun, or the value thereof.

"V. Provided, also, that nothing herein contained shall extend to har or hinder an overseer of a slave or slave from hunting and killing Deer with a gun in his employer's lands, or the waste lands of the King, or Lord Granville, within five miles of the residence of a rich overseer."

The reasons recited for the necessity of this act were that many disorderly and dissolute persons, having no habitation of their own, still continue to hunt on the King's Waste, and the lands of other persons, and kill deer and leave the carcasses in the woods, by which means the wolves, bears and other vermin are fed and raised, to the great damage of many of the inhabitants of the Province; and the fines being difficult of recovery, by means of persons having no property of their own assembling in great numbers and camping in the woods and kill Deer, burn and destroy the range, burn fences and commit many other injuries to the inhabitants of this Province and associate for the mutual protection and defence of each other against any person or persons who shall attempt to execute any precept on any of them; For Remedy whereof, etc., etc.

In 1770 was passed an act to prevent hunting for and killing Deer by fire-light, because under such pretence they "kill and destroy horses and cattle, to the great prejudice of the owners," under penalty of five pounds, * * * and the Justice may order such offender to have and receive "Thirty-nine Lashes on his bare Back, well laid on."

The act also provides a fine of five pounds for any person who shall see another fire-hunting and who does not report the same. But then comes the "searcher," viz.: "IV. And in order to discourage all persons from this pernicious Practice, or the more easily to detect them in the commission thereof, Be it further enacted, etc., That in case any person shall, upon oath, before some Magistrate of the county, declare that he suspects any person or persons to be guilty of hunting with a Gun in the Night Time by Fire Light, it shall and it is the duty of such Magistrate to issue his warrant to apprehend the person or persons so suspected and to bring him or them before him, or some other Magistrate of the county where the offence is supposed to be committed; And in case the person or persons so apprehended will not, upon Oath, declare that he or they have not been guilty since the passing of this Act of hunting in the manner aforesaid, such person or persons shall, in such case, be deemed guilty of the Offence and be liable to be punished as in this Act is before directed."

This act is a model for the "game protection law." It is true that the act was to be in force during the term of two years only, but it must certainly have tended to "discourage," at least, that particularly pernicious method of hunting. In 1773 this act was modified, limiting the fine to five pounds and a month's confinement, and in case of a slave, the forfeiture of his gun and fifty lashes.

THE MINNESOTA CHICKEN SEASON.

ALBERT LEA, Minn., Aug. 15, 1881. Editor Forest and Stream: In your issue of Aug. 11 I saw an article by Geo. E. Cole on "Prairie Chicken Shooting in Minnesota," and in which he gives his idea in regard to the new game law of our State, which prohibits the killing of prairie chickens before September 1.

Now, in our locality that law has proved to be one of the worst things that could have happened in the way of preventing the killing of the prairie chicken. It has completely "broken the cannon's bark." All those who indulge in this kind of sport say: "We can't comply with the law and get our share of the game, so we will go in with the rest," and the consequence is that about all went out long before the birds were large enough, and as early as in July. Last year, and before, we all stuck together, formed a club for the protection of game, and very few chickens were killed before August 15. We have never this season than we have had for many years, and they are being slaughtered by the thousands throughout the State.

The persons who take an interest in these matters and are the ones to enforce the laws are our home sportsmen, composed mostly of the business men and clerks of our towns, who, after September 1, are too busy to go hunting, and, therefore, rather than protect they encourage the shooting of chickens before that time, and then take a hand in the matter too. I, for one, think it would be a better protection to our game to have the law of last winter repealed. August 15 is plenty late. F. W. BARLOW.

AN ANCIENT GUN.

THE "breach-loader scare" has been got over, I think, all most everywhere. It is three years since I was asked by a venerable agriculturist not to "shoot off then at guns on his plantation as he was 'feared they'd burn it up.'" Talking of the long barrels reminds me of an amusing episode connected with them that occurred to me the other day. I had called on a friend at a country store where a worthy old farmer of my acquaintance presides over a few boots and a shoe, a valued assortment of dead-looking candy and a barrel or two of tin-house power apple brandy, home manufactured. The immense length of an antebellum gun, which was resting in a corner, led for any emergency, attracted my attention, and prompted a certain amount of hilarity at our aged friend's expense. "Ife could 'a-d that," he said, and, diving into the earth somewhere he speedily reappeared, or rather a tube went on appearing for some time till, just as the plaster of the ceiling was descending, its owner arrived holding on to one end of it. Talk about a scurppent or a mile of gas piping! Bent the other gun? I should rather think it did. Beside this new apparition the first one shrank into a pocket pistol. This gun had been his father's favorite arm. A rapid calculation took us back to the war of 1812, and the thought occurred that if there were many such guns as this in those days the result of that war was not surprising.

But how did his paternal relative and he himself in childhood's hour load such a gun? "Easy enough," said our de-lighted informant, and, having the hint end carefully on the ground, (for to my horror I saw the thing was loaded—the e relics always rare) he ran nimbly along, slipping his hand

up the barrel, till he arrived at the further extremity at which distant point he demonstrated by pantomimic gestures how his worthy sire, I suppose, charged this veritable "Mons Meg."

Even in the son's days, and he was seventy-two, it had been a great gun by all accounts. It was not so good he said for "shutting on the wing." As I felt bound to say something, I suggested that it would be a trifle unwholly for cutting down a woodcock in an alder swamp or for single bird shooting in second growth pines.

"Yes, sir; but you put her plum on the mark and pull aud author's got to go." I pondered for a few seconds on which of the three parties concerned were most likely to go in the event of such a discharge, the squirrel, the gun or the shooter, but not wishing to hurt the feelings of my aged friend I did not communicate to him the result of my calculations, which was that there would be a general disappearance of all concerned. IRINGWOOD.

A LETTER FROM MISSOURI.

OUR country here in Southwest Missouri is called a prairie country, is thickly set in farms with hedge fences. Kansas on the west is about the same. We have numerous streams with timber along the banks and groves interspersed over the prairie, all of which make a complete cover for the breeding and rearing of quail. The hedges also afford fine protection for them in the shooting season by reason of their being so thick and thorny that the hunter cannot get through, even his faithful dog will sometimes scent a covey and make the attempt to get through but fails, and will run a quarter of a mile to find an entrance and come back disgusted. I was in Kansas last fall on a quail hunt and found them very plenty, but nearly always along a thick hedge. I have probably seventy-five quail on my farm now that have been hatched under my hedge. I very often see them with their little broods picking bugs and seeds in my door yard, and I live within a quarter of a mile of the city limits, with 10,000 inhabitants and many good sporting men. But we are law-abiding.

I have never tried to prohibit shooting on my farm, but shall this fall on account of the boys from town, who destroy my fences rabbit hunting. I do not object to men hunting, who will regard the rights of the man whose land they are hunting on. I have been a hunter all my days and claim it as my privilege to capture wild game, no matter whose soil it is mowing or flying over. We all in common feed it, and of right it is ours. I found some localities last fall where the farmers objected to shooting quail even on the broad prairie for the reason of their destruction to chintz bugs; but the same farmers would like us to shoot the chickens on the ground that they destroy the corn. The chickens were quite plenty here, but being wild they would not breed here, but came in during the cold weather to feed on the grain fields. I think the greatest violation of our game law here is in fishing. Men will steal the timber and draw a seine, and to bring him or them before him, or some other Magistrate of the county where the offence is supposed to be committed; And in case the person or persons so apprehended will not, upon Oath, declare that he or they have not been guilty since the passing of this Act of hunting in the manner aforesaid, such person or persons shall, in such case, be deemed guilty of the Offence and be liable to be punished as in this Act is before directed." It is not my purpose to write you anything but facts, but I do say that our sporting community are men who regard the protection of game and fish as a subject that needs their attention, and they are determined to attend to it. N. M. S.

OHIO GAME NOTES.

CLEVELAND, Ohio. The weather has been extremely hot, too much so for shooting. Woodcock are rather scarce this year; my biggest bag was twenty-two snipe, other days averaging about one dozen. I have, however, two young eight-month puppies in training and, of course, cannot wait about as draw a seine, but they do exceedingly well for hot weather and average together a large share of birds. Our old birds did not breed well on account of late snow and bad weather. I found one nest of four eggs that was three feet under the snow and eggs spoiled, of course. I know of more found here also. I don't know, but really am inclined to believe, that they only breed one trip. I always thought so, but feel more disposed than ever this season to think so, as so many more old ones are killed in Ohio this season than ever before than I remember in forty years' shooting in the State.

Quail are in very fair quantities and the weather has been extremely favorable for them to breed. Dogs pointed a brood of young grouse, half-grown, July 4. Our snipe season was not good; largest bag for two of us in one day's shooting was forty-five. On another day, alone, I brought home twenty-one, other days about twelve, making about 150 in all. I generally shoot 300 or more in March and April till May 13, but there were very few snipe this season here. We have had some excellent dove shooting, and they are extremely good eating. Have shot as many as forty or five of an evening to three guns. They require quick work, fly sharp and are tenacious of life, but make excellent sport when plenty. I think them quite equal to woodcock for eating. We prefer them to old woodcock any time. They breed here, and are ready to shoot in May, say the 20th. We find them now in wheat stubble. JAMES CHUBB.

A "STILL" HUNTING CLUB—1843.

St. Louis, Mo., Aug. 18. Editor Forest and Stream: You often publish the constitutions of game protective societies, and I have no doubt that such forms give very substantial aid in the formation of new societies. Now here are the rules of an old deer hunting club, drawn up in the year 1843 by a party from St. Louis, assembled at the Dent farm—the same Dent family which has become known because of its alliance by marriage with ex-President Grant. In fact Grant's father-in-law, you will see, was one of the designers of the document. Do not think that these rules are sent to you to be used, or that they are of any value for a model. I am of opinion that, while the Gray's Rock Club, after one of their "meets," may have been awful examples of warbling to the rising generation, their regulations are hardly up to the present standard of hunting clubs. They belong to the cate-

DEER, SLAVES AND VAGABONDS.

SOME LAWS OF NORTH CAROLINA, A. D. 1788.

AMONG the colonial laws of North Carolina were the following:

"I. Be it enacted, by his Excellency Gabriel Johnston, Esq., Governor, by and with the advice and consent of his Majesty's Council, etc., that it shall not be lawful to kill or destroy any Deer running wild in the woods or unfenced ground in this Government by day or any other ways or means whatsoever between the Fifteenth Day of February in each year, and the Fifteenth Day of July succeeding after the ratification of this Act; And if any person, not being a servant or slave, shall kill any Deer contrary to this Act, and be thereof lawfully convicted, the said person for every Deer so killed or destroyed shall forfeit, and pay the sum of Five Pounds current Money.

"III. And be it further enacted, by the Authority aforesaid, That if any Servant or Slave, by order or command of his or her Master or Overseer, shall kill or destroy any Deer, contrary to this Act, the Master, Mistress, or Overseer giving such order or command, and being thereof lawfully convicted, for every Deer so killed or destroyed, as aforesaid, shall forfeit and pay the aforesaid Penalty of Five Pounds, as if the said Master, Mistress, or Overseer had actually committed the Offence.

"III. And be it further enacted, by the authority aforesaid, That if any Servant or Slave of his own accord, without any order or command from his or her Master, Mistress, or Overseer, shall kill or destroy any Deer, contrary to this Act, and be thereof convicted, by the Oath of one credible Witness, before a Justice of the Peace of the county, wherein the offence is committed, for every Deer so killed or destroyed, as aforesaid, the said Servant or Slave shall receive and receive, on his or her bare Back, Thirty Lashes, well laid on, to be inflicted by the order of the said Justice before whom the said conviction shall be; unless some sufficient Person will become bound to pay, for the said servant or slave, the sum of Five Pounds current Money, within six months after the date of the said conviction aforesaid, to the church wardens of the Parish where the offence is committed, for the uses directed by this act."

In 1758 an act was passed providing that no slave should go armed with gun, sword, or any other weapon, or should keep such weapons, or hunt in the woods with one, unless the Master should give a sufficient bond, etc., or hunt or range in the woods with a dog or dogs, except such as have a certificate for hunting, as was in the act of 1758, and which violated the act any person might kill his dogs and the offender should receive not to exceed thirty lashes upon conviction.

gory of the Sheridan fishing rules, recently published in your columns. The original document is now in possession of Mr. Chartrand, of the Recorder's office, of this city, and has about it a sort of horse-laugh humor which gives us a hint of what was thought to be fun in those days. The rules are as follows:

1. The society to be known as the Gravois Hunting Club.
2. The company shall consist of such commissioned and non-commissioned officers as prescribed by other hunting societies, unless a majority deem it necessary to alter them.
3. It shall be the duty of the president to appoint the necessary number of officers, who shall hold their offices until December 31, 1844, when there shall be a general election.
4. Persons failing to attend either a meeting of the club or a drive, after being notified, shall pay for the benefit of the company one quart of whiskey.
5. Any member who shall shoot at a deer at the distance of sixty yards or less, without killing, shall pay half a gallon. If he fails to draw blood he shall pay one gallon, and if he neglects to shoot when within sixty yards he shall pay more than two gallons, at the discretion of the company.
6. No person shall read a newspaper on his stand under a penalty of one quart, and in case of such fine it shall be placed to the credit of the driver.
7. Any person going to sleep on or near a stand shall forfeit one quart, and if he shall snore so loud as to be heard 100 yards he shall pay one gallon to the driver.
8. Any member who shall fail to feed a dog belonging to the club when it is in his power to do so, shall forfeit half a gallon for each dog, to be credited to the dog's master.
9. Any member who shall hit by the fire for more than half an hour without telling a deer story or calling for a horn shall forfeit a quart.
10. No member is allowed to get so drunk after a drive as to require four persons to carry him to bed, under a penalty of one gallon.
11. The members who go to bed with their boots on shall pay for the benefit of the landlord one-quarter of venison.
12. Any members who shall refuse to take a slice of good venison when invited shall forfeit one gallon for the benefit of the club.
13. Any member getting so drunk as to shoot at a horse, cow or sheep by mistake for a deer shall foot the bill at the first dram shop and have his grog stopped for six months.
14. Any member who is guilty of contributing for distant charitable purposes when his charity is needed at home shall forfeit two gallons.
15. Any member who shall discover an individual of our opponents or enemies driving or keeping a loaded hid in his barn, or still-hunting under a pretense of amusement or necessity, shall receive a premium of five gallons and two plugs of tobacco, to be paid by the treasurer out of any liquor or tobacco not otherwise appropriated.
16. Any member who shall play a game of cards without a stake of tobacco shall pay for the benefit of the club not more than one plug nor less than one chew, at the option of the president.

By the above rules and regulations we pledge ourselves, our lives, our fortunes and our skill in shooting.

The signers were: Thos. M. Richey, President; James Bailey, Vice President; Harrison L. Long, Comdant; Abner E. Bailey, Captain; Andrew J. Cronwell, Gamekeeper; John J. Bailey, Treasurer; Oliver Cromwell, Sergeant; Lewis D. Dent, Clerk; John C. Dent, Secretary; John F. Long, Recorder.

I wonder if some of the older readers of the **FOREST AND STREAM** cannot give us a glimpse of other old-time hunting clubs.

WAGONWHEEL.

A COLORADO BEAR HUNT.—Denver, Col.—You see it all happened in this way. Doc drove up one morning with his bronchos and light wagon outfitted for hunting. Said he was going up Bruh Creek, where he 'lowed there was bear. Frank said if he'd wait a few minutes he'd go along. I said I was crazy to go too. Off we started, Doc entertaining us with rife's of the bear scraps he'd been in. "Hold on," said Frank, as we went around a rough bend, and we jumped before we could check the team. As we stopped we could see him behind peering along the ground as an Indian would hunt for a trail. "What is it," we cried. "Fresh bear tracks," he answered. Out I jumped and, sure enough, there in the dust was the fresh track which, I imagine, resembled Cruso's man Friday's as much as anything.

Well, where there was tracks we knew there had been bear; and so we hurried on, more eager than ever. Soon we reached Bruh Creek, and then waded our way up into the canyon over a rough wash as rough as the wagon and were a ride. We safely made camp about noon, luckily finding a comfortable log cabin at our disposal, which had been used formerly by the choppers. After a hasty lunch we loaded our rifles and started out. I did not get back until 9 o'clock at night, having seen neither deer nor bear; but before night I had come across a covey of black grouse and had bagged four or five. The others were more fortunate. Doc and Frank, having joined forces, took a fresh deer trail, jumping up two fine bucks and killed them.

For two days we hunted for bears without avail, and as Doc was anxious to get home we decided at noon to pull out. So we packed up, Doc going ahead with the team, Frank and myself following foot. As we neared the mouth of the gulch the canyon widened, and off to our left another wide gulch came into the main one. As we neared it all at once we saw in the road the freshest kind of bear tracks, which proved to be those of an old one and two cubs. We lost no time in halting Doc; and quicker than it takes to tell it we had our team hauled and tied to the wagon and were on our way after our snare. It was an exciting experience following through brush and over rocks the trail, which every moment seemed fresher and which every moment led us deeper into the gulch and away from the hill on our right. After we had traveled for a mile and the brush seemed thicker, Doc remarked that we had better be getting out as we were liable to be caught at a great disadvantage. No sooner had he spoken than I, who was in the rear, saw our bear rise up on her haunches some 100 yards to our left. "There she is," I said. "Hold on," said Doc. "Let me have the first shot." So Doc, up with his rifle and pulls at her shoulders, overshooting and only causing her to rise on her haunches. "Now is my time," I said, and held for her head. Doc, all the time crying not to shoot as we'd surely get tangled up in the brush. I told him he had hit her shot and now I was going to have mine and I pulled, hitting her in the breast, but making only a flesh wound. The way she jumped over the bushes and ran for us was a caution. It started Doc on a run in the opposite direction, with Frank and I bringing up in the rear. But that didn't last long, Doc getting out of breath and out higher ground. There we reconnoitered and saw our bear

going back to the mountains and endeavoring to entice her cubs to follow. But we had a short work of these proceedings by pouring into them a shower of lead from our repeating rifles that caused them all to hit the dust—or rather snow, as a heavy snow squall had set in ten minutes before.

We marketed our bear and deer heads and realized handsomely besides the exciting sport which we had.—J. A. B.

A NEW YORK BOY'S ADVENTURE.—Conway, N. H., Aug. 12.—We have had quite a sensation here this week. Four young men (city boys) went from here to Swift River intervale, in the town of Albany and among the mountains, some fifteen miles from this village, to camp out a few nights and hunt and fish. On the second afternoon one of them started off by himself to see if he could shoot something; and in a short time he discovered that he was lost, and that he did not know which way to go to reach his camp. He wandered around till it began to grow dark, and then went up into a large tree and passed the night in it, not sleeping a wink all night. The next day he traveled all day, and not having any food with him he shot a partridge and kindled a fire and roasted part of it and ate it (without salt). About 5 p. m., feeling tired, he sat down under a tree to rest. Being very weary, he soon fell asleep, and when he woke up he found it 7 the next morning. Seeing a large hill (it is called Greene's Cliff) he thought he would go up and look off, when he discovered houses, and having a small compass with him he took his course for the nearest one and struck a bee line for it. He found it very bad walking as it was through swamp and over windfalls, but coming up to the river at last he heard a cow bell on the opposite side; he crossed over, found the cow, followed her home and arrived at the house at 7 p. m., having been out two and a half days and two nights. He asked for something to eat, although he said he was not in a starving condition, and also asked if that was Swift River intervale, and being informed it was, told his story. The house was about four miles south of where he went in. His father resides in New York city. He says he is going back in about a week to try it again, and thinks he won't get lost the second time.

THE BRADFORD BANQUET.—The recent publication of the bill of fare at the banquet of the Washington Woodmont Rod and Gun Club prompts a Bradford friend to send us the bill of fare of a supper-given to the Audubon Shooting Club of Buffalo, New York, by the Bradford Shooting Club, of Bradford, Pa., June 9, 1881. The "spread" was given at the St. James Hotel, Humphrey and Pierce proprietors, and the members of the visiting club—but, why say what every one understands—of course the occasion was one long to be cherished in memory. The menu was as follows:

Terrapin Soup.

| | |
|--|-------------------------------------|
| Brook Trout, Fried, Mountain style. | Chicken Salad. |
| Restigouche Salmon, Boiled, Lobster Sauce. | New Potatoes. |
| Leg of Southdown Mutton, Capers Sauce. | Green Peas. |
| Turkey with Cranberry Jelly. | Sweet Corn. |
| Spring Lamb with Green Mint. | English Plum Pudding, Brandy Sauce. |
| | Pine Apples. |
| | Lemon Meringue Pie. |
| | Assorted Cakes. |
| | Neapolitan Ice Cream. |
| Shrimp Salad. | Vienna Coffee. |
| Assparagus. | Assorted Nuts. |
| | HAZEL. |

NEW ENGLAND SHOOTING WANTED.—Editor *Forest and Stream*.—I wish to find some place either in the State of Maine, Vermont or New Hampshire where good duck and snipe shooting or ruffed grouse and woodcock shooting could be obtained from the 10th to the 25th of September; also the person's name who will take boarders in locality.

D. D. D.

Read last and present issues.

You might go to Grafton, Vt. Of that locality a letter just at hand says: "Grafton, Vt., Aug. 23.—Agreeable to your request for information as to good grounds for sportsmen to visit with reasonable chances of success, I take the liberty to suggest that we have some of the finest woodcock grounds in New England in our immediate vicinity, which appear to be well stocked with cock. We have no local hunters with us and very few birds have been killed here at any time. I have no doubt but with good dogs and hunters who are up to the business fine sport could be had. We have a fine hotel and lively stable here, which make very low charges. Just now the hotel is full, but after the first of September they will have ample accommodations for sportsmen. Woodcock are seen constantly in the gardens of the village citizens and I hear of them in many localities.—S. W. G."

SOME SNIPER SCORES.—Louisville, August 5.—The neighborhood of Vincennes, Ind., is said to be the best snipe ground in the State. In an old memorandum book of my dear friend Capt. Goble, now dead, one of the best sportsmen and lovehest men Kentucky ever produced, I find the following memoranda: "Near Carlisle, Illinois, April 4, 1868.—Four of us killed 242 snipe; April 5 we killed 230 snipe, April 7 we killed 330 snipe, April 8 three of us killed 259 snipe." The best snipe shooting I ever had was on the riparian plantations near Clarksville. The fields are square and separated by ditches, the ditch banks being five or six feet above the fields. Four of us hunted in different fields, the snipe flying from one to the other. The snipe were in clouds, like grasshoppers in the fall, and would often alight right at our feet. I am sure that I sometimes saw more than a hundred on the wing at once.—L. P. Y.

ELEVATION IN SHOOTING SHOT.—Recently I bought a new breech-loader, the best in market of course. I ordered a 9-lb., 12-gauge, choke-bore, expressly for long-range shooting, chiefly to use shore shot. Upon testing at target with No. 4s, sixty and seventy shot, I found that by sighting direct at the centre in a high-line target the greater portion of the charge was found below the centre, but well distributed. Adhering to my old notion that when shot are driven with

such force they could not drop at that distance (sixty yards), I continued the trial, with the same result. By good luck I had found in a book store a pamphlet called "Game Birds," by Thos. Alexander, in which I find many valuable suggestions. Among others he said that shot will drop four inches in forty yards. I concluded to act upon the suggestion, elevating to six inches above the centre spot at sixty yards, and to my satisfaction found the charge every time where I wanted it. At other trials since have had no difficulty in planting from ten to fifteen No. 2s near the centre at 100 yards every time, elevating in the latter case about two feet. Of course in shooting in trees this rule does not apply. Perhaps there are others of your readers, like myself, who have not considered that the law of gravitation acts upon a charge of shot as well as upon a ball.—

ADIRONDACK GUIDES AGAIN.—New York, Aug. 20.—I spent over two months last summer on the Fulton Chain of Lakes, and during that time came in contact with a great many of the guides, both from the upper and lower lakes, and found them to be perfect gentlemen in every respect. I did not meet one that I would not trust any lady with at any time and under any circumstances. I believe them to be as a class finer men than you will find in almost any work, in other words, men that are square to the letter. The article in the New York *Mad* is unjust in the extreme, and it is evident that the writer has never been in the company of an Adirondack guide or he would have known that he was entirely wrong and unjust in saying that "the Adirondack guides are a class to be let severely alone."—Vex.

AN UNUSUAL ACCIDENT.—I would ask you the cause for a rifle's holding fire in this manner: A young man out shooting woodchuck had snapped his rifle at one and for some reason it did not discharge. He lowered the gun, drew the ramrod and was driving the charge home, thinking the powder had not entered the tube. The gun discharged while in that position, driving the rod and charge through his hand, which, it is thought, will cause him to lose the use of it. Is it right to suppose a piece of lint in the tube had caused the gun to hold fire, acting as a train to the powder?—Mrg.

[The supposition of our correspondent is as plausible as any we can suggest. The action of the gun was very curious, although not without parallel in our experience. The powder may have been damp and caked, especially if the charge had been in the gun some time.]

BEAR DOGS.—Many years ago when bears were more plenty than pumpkins in the Empire State, it used to be common for hunters to find where they made nocturnal visits to corn-fields and then to take a little whiffed dog, that was trained for the business, and hunt them in the same way that coons are hunted now. The little dog would generally scare the bear and put him to flight and then nip his heels as he ran, which would cause him to take to a tree the first chance he had to get, where he would remain long enough, before getting over his fright, for the hunter to come up and give him a dose of lead by the light of a torch or large fire. One old hunter, Elijah Dibble, who lived in Delaware Co., was the owner of a well trained dog, and was noted as a great bear slayer.

J. H. A.

NEBRASKA CHICKENS.—LINCOLN, Neb., August 18.—It turns out that chickens are not so abundant as was anticipated. The hunters were out in force on the 15th and very few of them made the bags they counted upon. Mr. Hallett and I stayed in the country Sunday night and began work at early dawn the next day. During the day, after a tramp of nearly twenty miles, over a good dog, we got thirty-seven chickens, all of them pretty nearly grown except three. So far as we can learn it was the best bag made that day; but it was arduous work. It may be, cooler weather will show more chickens.—Burr H. POLK.

ILLINOIS DUCK SHOOTING.—Chicago, August 15.—Duck shooting commenced in this State to-day. Ducks are numerous and we are anticipating fine sport this fall. Chickens and quail are also plenty. A great deal of illegal shooting is going on here and just over the "line" in Indiana, by alleged sportsmen's clubs. Several parties have been fined for shooting ducks out of season, but this does not seem to stop the shooting. Black bass fishing in the small lakes in this vicinity is unusually good.—Jim.

DUCKING ON CHAMPLAIN.—Troy, N. Y., July 30.—I see by your last that some one wants to go duck shooting. I am making arrangements to go to the north end of Lake Champlain on the 10th of September next. Another party is going with me, but we would not object to a third. Am myself acquainted with the ground, and can show him some fine sport. If he wishes he can correspond with me on the subject.—H. W. BROWN.

PAPABOTTES.—Indianola, Tex., Aug. 16.—Have at last had a fine rain, and the shooting around this place is splendid. "Papabottes" are very plenty and fat. I should say that there are at least a hundred birds a day killed in a radius of three miles of this town, a single gun in an afternoon getting as many as forty and fifty. A few miles up the railroad chickens are very plenty, and there will be plenty of quail this season.—G. A.

NEW JERSEY.—Coster, Aug. 20.—Woodcock shooting has been very poor during July. We may have a full flight, but that is uncertain. I am afraid Bob White has for-been-us, as I do not hear from him as I did last year. I think they will be scarce. Partridges none.—J. I.

KORTREIJT, N. Y.—I have often seen woodchucks climb trees. Partridges have been bred in vast numbers here this summer and promise good shooting in the fall. Woodcock shooting will also be good. Squirrels and rabbits are plenty.—CHAT OWL.

ALBANY, N. Y., Aug. 17.—Woodcock are very scarce here this season. I was out with a friend yesterday and day before and bagged six birds only.—J. W. P.

WISCONSIN CHICKENS.—MENOMONEE, Wis.—Chickens are large in size, and larger still in number in this section.

M. A. O.

We learn from Messrs. Uphoff and McCallan, of Valparaiso, Ind., that the demand for their Hotbird shooting suits this season is unprecedented. Using only the very best material, and engaged exclusive contracts of these suits, enables them to give a perfect outfit.—J. A. V.

Sea and River Fishing.

FRESH WATER.

- Salmon, *Salmo salar*.
Rainbow Trout, *Salmo irideatus*.
Dolly Varden Trout, *Salvelinus malma*.
Grayling, *Thymallus tricolor* and *T. arcticus*.
Black Bass, *Micropterus salmoides* and *M. dolomieu*.
Muscongus, *Esox nubilosus*.
Perch, *Percius perca*.
Pike or Pickerel, *Esox lucius*.
Pike-perca (wall-eyed pike)

- Sea Bass, *Centropristis atrarum*.
Striped Bass or Rockfish, *Roccus tenebrosus*.
White Perch, *Morone americana*.
Bluefish or Tailor, *Morone saxatilis*.
Scup or Forgie, *Stenotomus argenteus*.
Pomok, *Polydora carbonaria*.
Tautog or Blackfish, *Tautoga onitis*.
Spanish Mackerel, *Cybilium maculatum*.

BALT WATER.

- Weakfish or Spicetogee, *Cynoscion regalis*.
La Fayette or Spot, *Listonotus ocellatus*.
Channel Bass, Spot or Redfish, *Sciaenops ocellatus*.
Sheepshead, *Archosargus probatopterus*.
Kingfisher or Barb, *Merluccius nebulosus*.

Patience, certainly, is a necessary qualification in an angler. Indeed, I remember... Thence fishermen who, on my enticing some displeasure...

ON KING'S LAKE.

OUR club, the "Troy King's Lake Fishing and Hunting Club," has not so long a name, nor so large a membership as some...

We are all business men residing at Troy, Lincoln County, Mo., a village of a thousand, more or less, situated in the center of a splendid farming and grazing country...

King's Lake lies in the eastern part of Lincoln County, Mo., and is formed by the widening of Bryan's Creek. It is eight miles long, 300 yards wide at its widest...

We own two tents, one of twelve ounce duck, fourteen by sixteen feet, the other eight by ten. In the commissary department for our two weeks' supply we have fifty pounds of home-made bread, fifteen pounds of coffee, roasted and ground...

Two days morning finds us all gone from camp, some hunting, some fishing. The fish we have are the black bass from eight pounds down, striped bass from two pounds, and croppie from eighteen inches down.

Catching bass is a different kind of business, and much slower than the fact that a brush heap will only afford two or three, and you may be sampling round for an hour before you find them.

The striped bass of King's Lake is the handsomest fish in these waters, and the gamiest. One of a pound weight will fight equal to a black bass of a pound and a half...

joy fishing unless I can wind up short, or throw out long, as fancy strikes me, and sometimes I want to put a hook way under a brush heap where a long line couldn't go...

Getting back to our camp as the shadows fade, we find the hunters all in, sitting around the blazing fire, toasting their feet and recounting the adventures of the day.

As goes one day, so goes the next—unless it rains; and then how cross every fellow gets, and how he wishes he was at home with the old woman...

The question of one of your correspondents prompts me to write a description of one of our boats. What we wanted was a boat large enough to carry two with their plunder...

When knoeked down for transportation the seats, ribs and rods are put in a two-husel bag; the canvas is rolled up, and gunwales and false bottom lie loose in the bottom of the wagon-bed.

WORMS IN BLACK BASS.

ABOUT seven years ago our river, the west branch of the Susquehanna, was stocked with black bass. We have been fishing for them for the past three years.

myself, but a friend of mine and also my son describes them as resembling the worms found in chestnuts, but smaller. It has disgusted people with the bait. Will you please tell me what you know of the matter?

Ans.—This question is coming in from all quarters. See correspondence in this and last issue. Read article entitled "Worms in Fishes," in issue of June 16, 1881, page 600.

Every year these reports come in. It is natural for the fish to have these parasites, and we eat bass, worms and all. If you want the worms worked up, put a piece of the flesh containing plenty of them in alcohol for a week...

MY FIRST FISHING TRIP TO THE AU SAUBLE.

MY first fishing trip to this river was made in 1874, during the month of June. There were four of us in the party: Geo. MacF., T. B. M., W. J., more often known by the name of "Silas," and myself.

The river opposite our camp was about 150 yards wide, and ran parallel to Lake Huron for about five miles, nothing but a range of low sand hills separating them...

The rest of the day was spent in preparing the fish to take home with us in rifle practice. I had brought my twenty-two calibre rifle with me and a plentiful supply of cartridges...

We went daily to the lake and had a bath in its cool waters, which helped to cool down the inflammation of the eyes and clear the sand from the eyes.

The first day, and some of the party became very good marksmen in consequence, besides learning the art of catching a black bass with credit to themselves...

These first days, and some of the party became very good marksmen in consequence, besides learning the art of catching a black bass with credit to themselves...

One incident of the trip and I am done, as it relates to our mosquitoie friends. On the fourth night in camp Y. B. had been elected to keep the snudge in good order during the night...

FISH BUTCHERY IN INDIANA.

A new sort of fish butchery is being practiced in this State. They are, from a reliable report, being killed by thousands by use of dynamite cartridges. The "meditative man" will find little recreation in this State if this thing is not stopped soon.

Inclosed are a sample of newspaper clippings which may be of interest to readers of FOREST AND STREAM: "The destruction of fish in the Whitewater by dynamite fish torpedoes is not confined to the locality of Richmond alone, but extends for thirty miles along the stream and its tributaries. It is estimated that ten thousand fish have been destroyed by them...

BASS AND TARPON FISHING.

In your last issue I noticed an error which needs correction. In publishing an extract from my letter to you, you made me state: "From this time until the middle of December the fishing will improve."

Now, I have been tarpon fishing and failed to capture one of these specimens of "greased lightning." My main object was to capture a tarpon and do a little bass fishing. I left my city on Thursday, August 4, m. and arrived at Mayport at 6.30, and soon after getting on shore in the pleasant occupation of depositing bass chowder, shrimp, fried sheephead and devilled crabs at Burroughs's hospitable board.

LARGE TROUT FROM CHATEAUGAY LAKE.

LYON MOUNTAIN, N. Y., Aug. 18. Editor Forest and Stream: Inclosed find stereoscopic view of a large speckled brook trout taken here this week by Mr. O. M. Bogart, Jr., of your city, which weighed three pounds six ounces. I only regret that I could not have shown you the fish instead of the picture.

Though the medium of the FOREST AND STREAM and a few such gentlemen as Mr. Charles Dennis, Jr., Mr. E. G. Arthur and Mr. Charles Stokes, all of New York, and of the Stock Exchange, I believe, I have had a house full of very excellent people, all of whom I think are pleased with the house and lake.

CAUGHT ON THE FLY.—Plattsburgh, N. Y., August 10.—A singular event occurred to the Dominie yesterday, which he is constrained to tell to the fraternity of him who said "I go a-fishing," the "apostolic succession" of the writer writing for its truth.

While casting flies on Mead's Pond, a private trout preserve, the birds were numerous over the water, skimming it, as is their wont, with rapid flight, catching the bugs that live upon the surface. An unusually long cast had been thrown, perhaps fifty feet, with two flies upon the leader—one a colesh-man and the other a Montreal—when, just as the line struck the water, a swallow "struck" the fly, hooked himself and fluttered in the air with hook and line pendant from his bill for the space of ten or twelve seconds. How's that for a flying fish?

GREENWOOD LAKE.—Having passed two weeks in a very comfortable manor at the Encampment Hotel, at Warwick Woodlands, on the shores of Greenwood Lake, it is but just to say that the accommodations provided were all that could be desired by any one who can enjoy a tent for a bed-room and parlor, instead of being housed up in a hotel building. The tents will be left standing a few weeks longer, so that any one who desires camping out with the comforts of a good hotel table and attendance, can improve the opportunity.

DEFIANCE OF LAW IN NEW YORK.—A special correspondent of the Syracuse Standard pictures an organized gang of poachers on Skaneateles Lake. "It is a shame," he says, "that these robbers cannot be brought into subjection, but the fact is, and we can't disguise it, the lake is literally ruled by the New Hope rangers. They act as they please, knowing that the warnings they have already given of their power and daring will hold in check all the efforts to get the upper hand. They have no regard at all for the law, being utterly reckless in what they do. They have burned barns, sunk boats, stolen horses and done many other things equally as lawless, simply out of revenge for attacks on what they consider their rights. Our Sportsman's Club which had slumbered for years, was reorganized last year for the purpose of attempting to break up the illegal fishing, but the thing flattened out. The truth is most of us were frightened off. Unless some measure is taken soon to quell these desperadoes there will be no safety in navigating the lake unarméd."

The fact that a reign of terror exists upon the shores of Skaneateles Lake has not been of recent discovery, nor is its positive knowledge of it confined to the more frequent visitors to that beautiful sheet of water. It is infested by organized hands of moonshiners, who laugh to scorn the best legislative efforts to protect the fish of the State, and hold at bay those whose duty or desire it is to see the law enforced. The so-called "New Hope rangers" are a body of reckless fellows bailing from New Hope, Cayuga County, on the west shore of the lake. They swarm to the shores after nightfall, cast their seines into the water and draw them full of fish, without so much as giving a thought to such a person as a game constable.

LARGE TROUT IN SARANAC LAKE.—Saturday, Aug. 20.—In your issue of Aug. 14 I see a note from Al. Burr relating to the landing of a 24 pound trout, nothing being said as to the variety of trout or the manner in which was caught "the largest of the season." During the past month Dr. M. H. Williams, of your city, has been in camp with me at Big Trout Pond, and on Aug. 18 caught, among eleven of lesser weight and size, a speckled brook trout weighing 3 pounds, and measuring 19 1/2 inches in length, with a 9 oz. red with a brown backle. Mr. Hathaway, in camp with my father-in-law Calvin Brown—almost equalled this the next day, and we think a 20 pound mess of this size fish "no great shakes," for it can be done every day during the season. A five-pounder has risen to the fly several times, and his capture is but a question of time, of which you will be duly notified.

A STEP BACKWARD.—The New Hampshire Legislature has passed a bill or resolution exempting the Contoocook River, one of the principal rivers of the State, from the law in force for several years requiring all owners of dams to provide suitable fishways. This river was stocked with salmon some years ago, and this is needed to make them plenty once more in an open way.

All dams on the river, with the exception of one or two, have been so provided at great expense. It seems strange that such an act of injustice should be allowed to pass when the principal part in getting it through was one of the company who have been violating the law for nearly two years. It was put through in the rush of business at the close of the session, and not understood, or it would not have been approved by so intelligent a body of men.

Where is the New Hampshire Game Law? JUSTICE.

LARGE MASCOLOGE—Camp of the "Kingfishers," Intermediate Lake, Mich., Aug. 12.—Two weeks ago to-day I took in Bower's Lake, fifth lake above this, a mascologe four feet four inches long, twenty inches girth at pectorals; weight, don't know, but as much as we weighed in on a steel yard that pulled thirty-two pounds. He flipped the hall up vehemently at thirty-two pounds, so we felt safe at calling him a thirty-five pound fish. A Canadian that has speared numbers of them called him a forty pound fish. I took him on a seven and one-half ounce rod, speckled frog; time, an hour and a half.—KINGFISHER.

SULLIVAN COUNTY FISHING.—Eldred, Sullivan county, N. Y., Aug. 22.—There is a lake near my house where perch averaging from a quarter of a pound up to one and a quarter pounds actual weight have been caught by the hundreds; and pickerel from one to four pounds. New York references can be given.—I. M. BRADLEY.

STURGEON VEGETS HALLIBUT.—Albany, N. Y.—In a late copy of your paper I saw that the fishermen on the Lakes were smoking the sturgeon and fraudulently selling it for hallibut. To an Albanian that sounds like smoking good beef and fraudulently vending it for milk meat. Why the sturgeon, which is so common here, in its native habitat should be the subject of so much absurd prejudice I don't see. It is not only a good fish, but a most excellent one, if properly cooked and eaten without prejudice.—ABRANTAN.

LARGE SHEEPSHEAD.—Jersey City, Aug. 23.—John Peen, of this city, while fishing in New York Bay (off the Spunker Island), on Monday last, caught a sheephead weighing 6 1/2 lbs. Haven't sheephead been strangers to New York Bay for sometime?—RUSTIC.

BLUEFISH AT CAPE MAY.—Aug. 19.—Just now bluefish fishing is fine at Cape May, N. J., and all along the Jersey coast. Anglers are doing good work. At Bitterton the big perch are biting freely and in our Delaware and Schuylkill black bass are being caught in fair numbers. It seems that eight out of ten of the fish are taken after 6 o'clock p. m.—HOMO.

FISHING AT LOON LAKE.—Hornellsville, N. Y., Aug. 14.—In reply to your invitation to tell of my fishing, for hunting and fishing I would say there is good black bass and pickerel fishing at Loon Lake. Loon Lake is in Steuben Co., N. Y., ninety five miles from Hornellsville and five miles from Wayland or Liberty on the Rochester division of the Erie R. R. The lake is formed entirely by springs, and is one of the biggest bodies of water in the State, being over 400 feet above the Cohocton Valley, which is only four miles distant. The altitude of the lake is a strong argument in its favor as a summer fishing place, being healthy, cool and pleasant. No mosquitos or black flies. There is a good hotel at the lake, Lindenwood Cottage, kept by G. E. and C. Cotton, whose address is Cohocton, Steuben Co., N. Y., Linden, \$1 per day, which includes use of boats. It is at Boardwalk that once a month through the season eludes from Rochester, Hornellsville, Geneseo, Naples, Dansville, Wayland, Cohocton, Corning and other places meet for a grand glass ball shooting match. No liquors are sold on the premises. Fishing is much better than usual, as there was no fishing through the ice last winter, the being of laws prohibiting the same during the winter months.—J. ORIS FELLOWS.

Fishculture.

REBUILDING THE MCCLLOUD HATCHERY.

THE tenth session of the U. S. Salmon Hatchery, established upon the McCloud River bids fair to be a successful one. When Mr. Stone arrived in May, nothing had been done toward rebuilding the hatchery and dwelling houses carried away by the high water last winter, except to get about forty thousand feet of lumber on the ground. Since then, Mr. Stone's personal superintendence and the harmonious working of the several forces of men, much has been accomplished toward the reconstruction of the establishment. A comfortable two-story dwelling house for the men and a good sized addition to the large dwelling house, 40 x 40 ft., is rapidly progressing toward completion. This latter building is to contain all the hatching apparatus which is to replace that carried away last winter.

A water wheel of great power, thirty-two feet in diameter, for furnishing the water supply for the hatching house is also being constructed. It is supposed that this wheel will lift a hundred thousand gallons an hour into the hatching house. Mr. Stone expects to have everything in readiness to take the first eggs about the last of August. If possible, he intends to take ten millions. There seems to be an unusually large number of salmon in the river this year.

The bridge across the river is closed, so that no more salmon go up to the headwaters of the river after this. Due provision has been taken for keeping the new buildings to guard against losses by high water in the future.

The total cost of the reconstruction of the fishery buildings, including the replacing of the lost material which had been collected during the last eight or nine years, will amount to not less than fifteen thousand dollars. GEO. B. WILLIAMS, JR.

FISHCULTURE AT THE PARIS EXPOSITION.

WE have just received the report of Mr. T. B. Ferguson, Commissioner for the United States to the Universal Exposition in Paris, 1878, on fishculture.

The author says that it was a matter of surprise, as well as of regret, that an exhibition so replete with objects of art, and illustrating so fully most of the sciences, should have made no mention of the department of which he reports treats. It was natural to expect that France, having taken the initiative in the artificial propagation of fish, under the lead of M. Quatrefages, M. Coste, M. Abne-Edwards and others, and having set an example to the world by taking hold of the discovery, should have been present in the fullest detail the advance of this important industry in Europe. But, as the report shows, the illustration of the modes and appliances of fishculture, and of the implements and means employed in the fisheries, was exceedingly poor.

They are attributed to the absence of the Germans, now the foremost nation of Europe in fishculture, on account of the bitter feelings consequent upon the Franco-German war. France made comparatively no exhibition of fishculture processes, except in the horticultural department, which she has since been doing in fishculture. M. Carboneau, being the only exhibitor from France, and he only showed a few implements and devices employed by him about his aquaria. The United States did not attempt a fishculture exhibit, because no provision was made for co-operation in the exposition until very near the opening. Too late to make a creditable showing. The apparatus in the Troadero Aquarium consisted merely of a model of an apparatus designed by M. Traok, Director of the Establishment at Hueningen, for retarding the hatching of the eggs of the Salmonidae by use of water from running streams. The idea was suggested by M. Williams's Californian hatchery and a modification of a cog wheel, alleged to be an invention of Mr. Wilmot's. These and a transporting can of M. Carboneau's comprise the apparatus.

With such poor material Mr. Ferguson makes out to fill his remarkable pages with interesting matter relating to French laws regarding the capture of fishes and for their protection, directions for restocking streams and transporting fish, maritime fishing statistics, the relation of the plankton to crop culture, the feeding of young fishes, list of exhibitors in the fishery department, sea and fresh water, food products, implements of capture, etc. Much space is given to the fresh water aquarium, which was a grand feature of the Exposition.

This aquarium covered a surface of about 3,000 square meters and was most subterranean. It was not covered by a building, but erected in the open air, and rocky columns supported a roof, which gave the whole an appearance of a cavern. The report is a very creditable one considering the paucity of material.

"An octavo of 836 pages and 24 plates of fishing vessels and nets, besides several figures of fishculture apparatus. Unbound, bearing on the cover the title 'Universal Exposition of Fish Culture' and the names of United States commissioners. Fishculture. Thomas B. Ferguson." No imprint of publication office, date, nor index.

[New York Spirit of the Times.]
EQUINE INQUIRIES.

A WORD FOR THE HORSE, — THE "CRACKS" OF THE QUEEN CITY.

[Cincinnati Correspondence.]

Our sporting fraternity throughout the whole country, as all know, hate their sentimentality on the trot. Whether they meet along the rock-bound coast of New England, and tread a track so close beside the snowy beach that the music of the hoof tread commingles with the music of the surf, or whether they transport themselves to Kentucky's pleasant hills and valleys, "the cracks" and the horse will be at all times and places a fitting subject for discussion. The man who loves his horse loves the crack, in the words.

Whenever we meet with a man who will bestow proper kindness, food and care upon his horse, there we have found a man who, in time of need, will be true to his fellow-man, and consequently a true man. The laws of association, strong in man, are likewise strong in the horse. And the latter full well knows the hand that smites it harshly or the one that strokes it lightly, and tends to its sores and bruises. A cautious intemperance in the horse occurred recently in the stables of Mr. A. Toungman, situated on North Elm street. Mr. T., has for a long time been in the habit of using St. Jacobs Oil, the Great German Remedy, in his extensive stables. Among Mr. T.'s many horses is a great, powerful Canadian draught horse. This animal in course of time got so that he knew the St. Jacobs Oil bottle very well. So well, in fact, that one day recently on Mr. T.'s return from business, upon entering his stable he caught him licking the sores on either side of his forehead with his mouth, giving a wise survey to his licking work, turned his head, caught up in his teeth from the box used as its receptacle a bottle of St. Jacobs Oil. He then the bottle on the floor with violence enough to break it, and then deliberately licked up the St. Jacobs Oil and applied it to the end of leaders. We have seen the laws of association belied by things with less reason than in the horse. The word has passed among us, and when we see a man who won't try the Oil we say, "He is worse than Toungman's horse."

Now many thousands there are beside Mr. T. and his horse who do use St. Jacobs Oil. There is, for instance, B. Meertz, in Cincinnati, on Plum street; just opposite the City buildings, who always keeps a supply of the best horses, and St. Jacobs Oil in case of necessity. That gentleman says it is the best remedy ever used in a stable. He told us this in a conversational way recently, and the gentleman's word is away above doubt.

In Cincinnati, living at No. 15 Woodward street, may be found Mr. Michael Kelly, boss drayman. This gentleman, in reply to our inquiry as to whether he used St. Jacobs Oil, said: "I would not try to do without St. Jacobs Oil. There is no other. I could not do it. Draught-horses, like livey horses, receive so many bruises, cuts, sprains, &c., that, in my opinion, no sensible man will try to do without St. Jacobs Oil. It is the best remedy ever used in a stable, and has always found it the very best remedy in use for horses. By the way, I have used the Oil in my family on several occasions,

and had I the time to-day I would like to tell you of its effects. You know my train-time is up; but he sure and call on me again some day."

"Being that courteous gentleman that in future we would be pleased to call on him, we bade him good-day and turned our own horses — who were in the way of the day — toward St. Jacobs Oil, toward the Reading road, thence to Montgomery place, to the palatial home and stables of Capt. George K. Hoel. After a friendly chat, a sumptuous dinner and a fine drive, the captain laid himself out for horse-talk. Said the captain:

"Little Elic, the four-year-old mare which you saw in my stall, is my favorite. I regard her as a wonderful resurrection. About a year ago, and just after my mare had made her six months, she took a very aggravated case of rheumatism, either coming down the Sound or going up the Hudson River. She had more red flannel around her legs than would make shirts for all the colored boys handling her. I had given up all hopes. I never expected to see her on the trot again. One day a celebrated Irish trainer and driver looked at my mare. He said, 'Can you cure her?' I asked, 'I will cure her in a week if you will let me have my way,' he replied. I told him to take her in hand. I knew she could not be worse; I never expected to see her better." The captain patted a long while, and the changed expression of his countenance would make St. Jacobs Oil, as being to his foot the captain said: "Why, hang me, I had never seen a horse driven in three days, and all through St. Jacobs Oil, the Great German Remedy. St. Jacobs Oil, my friend, brought about a resurrection!"

"Then, Captain," said I, "truthfully and fairly, St. Jacobs Oil is the wonder, is it not?" "You are right," said the captain. "Being in the neighborhood of Chester Park, Cincinnati's beautiful driving grounds, upon which have appeared most, if not all, of the great horses of the day, it occurred to me, knowing that preparations were being made for the coming spring trot, to enter. We did so and were soon in conversation with the justly-celebrated William W. Bair, the best-known sportsman in the United States, a gentleman who brought out "Maud S.," owned by William H. Vanderbilt; "Katie Middleton," owned by R. C. Bates; "St. Julien" and several more of the very best horses in the country. Said we to Mr. Bair: "In the management of horses, Mr. Bair, must not a trainer possess veterinary knowledge and know what to prescribe for their ailments?" Mr. Bair replied: "The horse has had in the past as varied forms of treatment as man. Now, when the horse is afflicted with such ailments as stiffness, bruises, cuts, &c., there is but one article that should be used, and that is St. Jacobs Oil, the Great German Remedy. I know all about horses, I have applied several remedies and can say without fear of contradiction, that St. Jacobs Oil is the only remedy to be relied on." Mr. Bair being very busy, the scribe bade that courteous gentleman adieu and drove away.

Having regained the city we drove up Court street, and reined up at the well-known store of Mr. William Carroll, a gentleman who handles great quantities of domestic and imported fruits of all kinds, and of the best quality. Stopping to make some purchases from Mr. Carroll's tempting stock, that gentleman, throwing the eye of a connoisseur on the horses, immediately fell to "talking horse." After praising our team, which we flatter ourselves is a pretty good

one, thanks to St. Jacob, he, with the honest pride of proprietorship, invited us back to inspect his stables. Of course we could not refuse, and, indeed, had a great and hearty dinner and consumed a bottle of *Hotel de Cheval*. Mr. Carroll, in a manner which showed in a gentleman's familiarity with the subject, showed us "the politics" of his stock. "Mr. Carroll, are you a horse doctor or had occasion to doctor horses?" said that gentleman. "My dear sir, although you now see before you some fine horses, from the horse which is driven in my delivery wagon to the stud driven by my son, and which, by the way, is a 2300 roaster, yet I have had an immense amount of trouble with them. What from rheumatism to the simplest form of cut-bone, there is not an ailment which I believe they have not had — flog-bone, spavin, — why, in fact, really believe everything they could have. I spent hundreds of dollars in veterinary surgeons' bills, which were money thrown away. There is a remedy, though, upon which I rely by all means, and upon which I will wager forever. It is St. Jacobs Oil, the Great German Remedy, the greatest remedy in the world. I cured my horses every time it was applied. Here," said the gentleman, "is where I keep St. Jacobs Oil; you see I guard him jealously." Mr. Carroll hereupon opened for my inspection a chest, and arranged along the shaft the writer saw several bottles of St. Jacobs Oil. Said we, examining one of the bottles: "Do you find it an expensive remedy, Mr. Carroll?" "Expensive!" exclaimed he: "Why, had I known of it two years ago, it would have saved me hundreds of dollars. It costs a mere nothing — fifty cents per bottle — and each bottle will do more good than \$50 worth of the so-called surgery." With this we left the stable, and, bidding Mr. Carroll good evening, we departed. Driving up Court street to John, we turned southward to John to our own stables. Just as we reached the corner of John and Eighth streets we perceived our amiable and learned friend, Dr. F. P. Alsey, about to start himself behind his magnificent gray to take an evening drive. After exchanging the usual compliments with this distinguished physician, politician and scholar, we said: "Oh, yes," replied that gentleman, "he is indeed fine. But he is just out of a severe attack of rheumatism now, and I must curb him for a while." "Is a physician, ought scarcely to praise a proprietary medicine, and would not probably recommend their use among his patients; but I must say for that best known of all medicines, St. Jacobs Oil, the Great German Remedy, that it cured my horse, and consequently I must praise it." Here the Doctor laughed heartily and, with a pleasant "good evening," we parted.

We wish to say to those of our readers who do not know the Doctor — should there be any such, a fact which we very much doubt — that he is the ex-Coroner of Hamilton County, when every Cincinnati citizen, and that he is a solitary physician, which fact every body should know. Fully aware of the Doctor's reputation extends, we believe, as far as St. Jacobs Oil is known, and that is from Maine to California, from the Lakes to the Gulf.

After leaving the Doctor we had not far to go to reach our own stables, and, putting away our horses, we asked ourselves, as we watched the groom handle them, whether we had derived the more pleasure from the ride or from the information. We anxiously answered in favor of the information and good news we heard concerning St. Jacobs Oil.

MacIntosh Waterproof Goods.

In Ordering Stock or Pants please state the Size—you can easily obtain it from your Shoemaker — of the Boot or Shoe you are accustomed to wear.

The quality of these goods is so well and widely known as to require no comment. It is not only unequalled, but also unapproached by that of any similar manufacture in the world. By a special arrangement with the Messrs. Macintosh, we are enabled to place their goods in the hands of Sportsmen at prices which will certainly drive all inferior makes out of the market.

Stockings, full length, any sized foot, per pair, - - - - - \$8 00
Pants, reaching nearly to armpit, - - - - - 14 00
Heavy Flax ground sheets, weight 6-12 lbs., size 7-1 1/2 x 4-1 1/2 ft., each, - - - - - 8 00

DISCOUNT TO THE TRADE ONLY. Orders received from persons residing in cities in which the dealers keep a full line of our goods will not be filled at any price.

ABBEY & IMBRIE, 48 Maiden Lane, New York.

HOLABIRD Shooting Suits.

BENEDICT.

FIRST AND SPECIAL NEW YORK, 1881.

Imported black field spaniel at the Stud, Fee, \$25. Broods bred to Squires and Lissa O' Devon; brother in blood to Kafir and Zulu. Negro, litter brother to Benedict, was second to Kafir and Zulu's last month.

Black, and liver-colored puppies by Benedict for sale. LACHINE KENNEL CLUB, Whitestone, L. I. June 14, 11

LEONARD'S Split Bamboo Rods, WITH PATENT WATERPROOF AND PATENT SPLIT FERRULES.

No. 1 SHOWS WATERPROOF CUP IN FERRULE (PATENTED OCTOBER 26, 1875). This prevents any moisture from reaching the wood, and the ferrule from becoming loose. The constant wetting and drying of the bamboo must rot the wood, and make other makes of rods less durable than Leonard's.

No. 2 SHOWS SPLIT FERRULE (PATENTED SEPTEMBER 3, 1875). This split thoroughly strengthens where the ferrule is joined to the wood, which is the weakest part of a rod, and where so many of other makes of rods (bamboo especially) break. Mr. Leonard has yet to hear of a single instance of breakage at this point since the PATENT SPLIT FERRULE has been applied. We consider this the GREATEST IMPROVEMENT that has been introduced in rod making since rods have been made.

No. 3 SHOWS SPLIT FERRULE WHIPPED WITH SILK AS IT APPEARS ON THE ROD.

EVERY ROD WARRANTED.

SOLE AGENTS, WILLIAM MILLS & SON, 7 WARREN STREET, NEW YORK.

The Kennel.

GORDON SETTERS.—In order to reduce the Kennel will sell any of the brood bitches and young dogs belonging to the estate of the late Jas. R. Tully, who, during his lifetime, had spared no pains or expense to bring this strain of dogs up to the very highest standard. They combine the blood of Copelan's imported Stur. Moore's imported Cross, Farrar's imported Rupert, Stoddard's imported Duke. Parties familiar with Gordons will at once see that this blood can't be had. Several bitches are now in whelp to Duke of Louisa Valley, by Moore's Cross out of Dream. For field qualities refer to Col. Albert J. Sloc, Vincennes, Ind.; Mr. H. Malcolm, Baltimore; Col. Jas. Gordon (of Fous Jerny's) Whitlock, Miss. Address for full pedigree, etc., GORDON KENNEL, Louisa Valley, L. I. Aug 14, 11

TO COCKER BUYERS AND BREEDERS.—A. W. Langdale, of 5 Newmarket Terrace, Victoria Road, Lynton, England, late owner of Champions, Lavray, Bachelier, Ladybird, Ladyfay, Lizzie, Louisa, Leicester, Limerick, Libba, Laurence, Lena, Lyndy, Behn, Young Beth, Besse H., Barones, and many more important winners at our best shows; also, contributor to Vero Shaw's new work on spaniels, will buy on commission spaniels of any breed, and has on his books a number of grand specimens; deposit system. Mar 11, 11

COCKERS FOR SALE.—3 solid liver colored dogs whelped July 5, 31, out of Gro. Green ex-black Charlie, 415 each. Also a solid liver field spaniel bitch ten months old, imp. But ex-Henry (Hanns). Three ex-champ. Brash, \$25. Address BURT ILLIUS, Birchell Kennel Prop., Hornellsville, N. Y. Aug 15, 11

FOX TERRIER PUPPIES (smooth) for sale. A litter whelped July 6 by Ruthersford's Royal (see Forest and Stream, July 21) out of owner's Waspen by Raganan out of Vicky Trap. Dog puppies \$15 each. WM. R. HILLS, Albany, N. Y. Aug 15, 11

The Kennel.

DINE LODGE KENNELS.—I am prepared to take a limited number of dogs, either setters or pointers, and train them thoroughly. Dupont's Rifle, Sporting and Blasting Powder.

THE MOST POPULAR POWDER IN USE! DUPONT'S GUNPOWDER MILLS, established in 1802, have maintained their great reputation for seventy-eight years. Manufacture the following celebrated brands of powder:

Dupont's Diamond Grain.—Nos. 1 (coarse) to 5 (fine); used in strength, quickness and cleanliness; adapted for glass-ball and pigeon shooting. Packed in 1 lb. canisters.
Dupont's Eagle Bucking.—Nos. 1 (coarse) to 5 (fine); burns slowly, strong and very clean; great penetration, with a close pattern; adapted for glass-ball, pigeon, duck and other shooting, with either muzzle or breech loaders. Packed in 1 lb. and 5 lb. canisters etc.; and 12 1/2 lb. kegs.
Dupont's Choice Bore.—Specially adapted for "Choice Bore" guns, and particularly for prairie and upland shooting. Burns slowly, strong and moist; does not cake or burn on the barrels, gives both a good penetration and a close pattern; will be found well adapted for glass-ball and pigeon shooting. Made of two sizes, only No. 7 and No. 5. No. 7 being the coarsest. Packed in 1/2 lb. kegs and 1 lb. canisters.
Dupont's Eagle Rifle.—A quick, strong and clean powder, of very fine grain, for pistol shooting. Packed in 1 lb. canisters and 1/2 lb. kegs.
Dupont's Rifle No. 1.—"Sea-Shooting."—Fg. and Ffg. The Fg. for long-range rifle shooting, the Ffg. and 1 Ffg. for general use, burning strong and moist. Packed in 1/2 lb., 1 lb., and 5 lb. canisters, 1/2, 1, 2, and 5 lb. kegs. Fg. Coarse, Ffg. Fine.

Dupont's Sporting, Mining, Snapping and Blasting powders of all sizes and descriptions. **Special Grades for Export.** Also Rifle, Cartridge, Musket, Cannon, Mortar, Mammoth, Hexagonal, Cubical and Pellet Powders, U. S. Government Standard. Powder manufactured to order of any required grain or size.
Agencies in all the cities and principal towns throughout the United States. Represented by **F. L. KNEELAND, 57 Beaver St., N. Y.** N. B.—Use none but DUPONT'S Fg. or Ffg. for long-range rifle shooting.

ANSWERS TO CORRESPONDENTS..... 95

TO CORRESPONDENTS.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are invited from every part of the country. Anonymous communications will not be regarded. No correspondent's name will be published except with his consent. The Editors cannot be held responsible for the views of correspondents.

Subscriptions.

Subscriptions may begin at any time. The subscription price is \$4 per year; \$3 for six months. Remittances should be sent by registered letter, money order, or draft payable to the Forest and Stream Publishing Company. The paper may be obtained of newsvendors throughout the United States and Canada; and is on sale in Europe by The American Exchange, 48 Strand, W. C., London, Eng.; and by Em. Terquem, 16 Boulevard, St. Martin, Paris, France.

Advertisements.

Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices 50 cents per line—eight words to the line, and twelve lines to one inch. Advertisements should be sent in by the Saturday of each week previous to the issue in which they are to be inserted.

Address: Forest and Stream Publishing Co., Nos. 39 and 40 Park Row, New York City.

FOREST AND STREAM.

Thursday, September 1.

Specimen copies of the FOREST AND STREAM sent free upon application.

COURSING.—A correspondent suggests in another column that the Eastern owners of greyhounds hold a meeting during the coming autumn and test the qualities of their dogs. There is no reason why such a meeting should not be inaugurated as the sport of coursing is one of the most beautiful and interesting known in the long list of sports that have been transplanted from England to this country. A meeting of this kind under proper management could be made especially attractive, not only to sportsmen but to ladies. In England the meets are always largely attended by the fair ones, and as we write we can see the hills of Shinnecock and Montauk (admirable places for conducting the course) crowned by the gaily dressed charmers watching the speeding and turning of the fleet ones. Greyhounds have for many centuries back been the favorites of the women of England. They have appeared in many old family portraits by the side of the beauties of the house, and only a few years ago the Queen ordered that Master McGrath should be brought up to Windsor for her inspection. We should like to see the suggestion of our correspondent put into shape, and if the large hare of New York State should not be found game enough it would be an easy matter to import some of his English cousins to test the metal of our dogs.

ESTO PERPETUA.

IN Westminster Abbey is a stone on which is inscribed: "Sacred to the Eternal Memory of —." The rest is obliterated by time's effacing fingers, and the stone stands in mockery of the puny efforts of transient man to fix his name indelibly as a record that he has lived. What a sermon on the perishable things of this earth is on this stone!

The Egyptians embalmed their dead that they might be preserved "to all eternity." A stranger has invaded their land. Some of their remains so carefully embalmed and affectionately laid away in spices are now in dime museums, others have been taken to England and ground for fertilizers, literally returning to dust, while now artists have discovered that "mummies" make the finest pigment!

The London *Truth* says: "A gentleman, passing through Long Acre the other day, peeped into a little shop and started suddenly at the sight of several dead bodies. They had been dead for over 2,000 years—they were mummies. Where did they come from? From Thebes. Are more coming? Yes; plenty. There appears to be a regular business going on in mummies between Thebes and Long Acre. The mummies are brought over enveloped in their rich bituminous covering, and—*horresco referens*—ground up, bones, cases, coverings, bitumen, and all! What for? Why, for paint. There seems to be no burnt sienna like ground mummy. The artists are willing to pay high prices for this mummy paint. Our Academy walls may be limned with the dust of the Ptolemies."

We are not going to preach a sermon on this, it is a little out of our line, but it will afford thought for those who think, and might suggest that "a precession of the equinoxes" could sweep from the earth all traces that the human race had ever inhabited it. *Sic transit* would be rapid transit, and *gloria mundi* would need regenerating. Verily, Macauley's New Zealander may yet stand upon London bridge and muse on the ancient race who built it, or New York become a polar sea which explorers will perish in reaching, if the earth should be re-inhabited.

YE OYSTER ARRIVETH.

BY the time that this is before our readers the oyster will be in its glory. Its four months' holiday is past and its partner, the clam, which has filled its place during the interval, is now relieved from the burden of furnishing "raws" and falls back to its position in the soup and in the roast.

The fact that transplanted oysters are good all summer is taken advantage of by wicked oystermen to advocate their use in the months whose names do not contain the necessary R. They have even suborned New York editors to keep stating the fact and urging the people to eat them in the tabooed season, that their trade may continue the year round. There is no denying that there are certain facts which are obnoxious and which should be suppressed when they come in contact with a prejudice which is better than the fact, and the prejudice against oysters in the R-less months is one that should be encouraged for two reasons. The first is, that after abstaining for four months the oyster-eater enters upon the season with a fresh appetite and makes up for lost time, and so the wicked oysterman really sells as many of the mollusks in eight months as he would in twelve. The second reason is, that during the forbidden time the delicious "Little Neck clam" opens the banquet and furnishes the daily or evening lunch, and so really has a season of its own, without which its excellencies might never be known to many; and there are those who prefer the young and tender clam to the oyster.

To show that we practice our faith in this matter we will relate an incident which happened yesterday, the last day of August. We entered our favorite restaurant and, stopping up so the oyster counter, ordered a "Little Neck raw." There were piles of oysters on the counter and we asked the conchologist who opens the bivalves if many oysters had been called for during the past month. "Oh, yes, sir," replied the oyster surgeon, "the people eat 'em just the same; that's all humber about their not being good in months wot ain't got no R." It was evident that this bivalve shucker was in league with the wicked dealers and oystermen, and was trying to break down the wholesome prejudice, so, remember-

ing how Col. John Hay tells "The Pledge at Spunky Point," we expressed to the student of molluscus science our abiding faith that no oyster was good until after the hands of the clock had marked one minute past midnight on the last of August, and that, like the hero of Hay's poem, we should sit up and watch for it that night. "Jes' like watchin' the old year out and the new year in," remarked the malacostracologist, with a smile at our credulous simplicity, as we handed him a "quarter" and bade him good morning.

INTERVIEWING A SENSIBLE TROUT.

THERE is a prize within the boundaries of that quiet pool, for, "quivering with almost the tremor of life," the leader with his flies had scarcely touched its surface when, quicker than lubricated lightning, one of those golden-tinted princes took hold and sped away, turning the red fast as the indicator on a gas-meter goes round. The prophet Baalam was not more surprised when his ass spoke to him than was this trout, when in the simplicity of his innocence he rose so greedily only to discover that the Montreal fly was "a mockery, a delusion and a snare."

His madness that he had become the victim of trickery rendered him desperate. A bundle of nerves under galvanic action could not have been more restless. Physical pain had nothing to do with his erratic movements after the hook had been fastened in his jaws. He was angry at the unprovoked trick that had been played upon him. It was anger unjustifiable, for no fish that can augment the sum total of human happiness and help replenish human larders by being caught can reasonably expect any sympathy in his self-imposed insanity. If he is so unreasonable as to consider himself a martyr, very well; but let him emulate the examples of John Huss and Konarski and other models and suffer his martyrdom in silence.

Hold on! hold on!—that would not afford the angler so much sport; so plunge ahead, old fellow, and welcome to your freedom, if you can gain it—even at the loss of my line and leader. If we had the faintest suspicion that we were causing you needless pain we would whip out our knife instantly, cut the line, and promise never to repeat the trick that enticed you into your present predicament, for it were downright cruelty to punish you for your thinking you could make a good square meal off a few feathers and a fish-hook. But honestly, old fellow, don't you enjoy it?

"Not a bit of it. I know the afterclap. This is glorious fun slashing around in this pool, but it is the toasting you will give meat your shanty that I do not like. You had better believe we know what comes of our being landed."

"Then why don't you leave my flies alone?"

"You put them on the water in so artistic a manner that I thought they were only such food as Nature provided for us, and was deceived into taking what I thought was mine by right."

"You would talk and flatter us into letting you go."

"It's the truth I'm telling you. I would scorn to earn my exemption from your broiler at the sacrifice of truth."

"Does the hook hurt?"

"Not a particle. There is nothing jollier in our watery kingdom than being yanked about on the end of a good, springy rod, if the man at the butt end of it understands the correct manner of manipulating it. It is just the kind of circus we enjoy."

"Why, then, are you fighting so desperately?"

"It's your deuced frying-pan."

"Never mind the frying-pan. Don't borrow trouble. Just as soon as you have finished your frolic and we have landed you we promise on honor to put you out of misery by severing your vertebrate column."

"All right! Proceed with the exhibition. I see you understand our case exactly and it is a real pleasure to be caught by you, and yet you would little blame me if I managed to give you the slip."

"None whatever. A good gamy fellow like you, who earns his freedom after a desperate fight, is heartily welcome to it."

It is a real pleasure to talk with so sensible a trout. He honestly admits that, properly hooked, he suffers no pain, and if on being landed he receives a quieting and soothing crack of the neck that sends him in a twinkling to trout's heaven

it makes him better for the table than if allowed to flounder in the basket until he contracts a fever and dies a miserable and lingering death.

There are no nerves in the cartilaginous part of a trout's mouth, and his being hooked there, as is most frequently the case, causes no more pain than a man's experiences in the chair of a skillful barber.

Try it MILLARD.

THE ENGLISH SPARROW'S OBITUARY.

A POEM OF THE FUTURE.

WHEN we published the other day Bryant's English sparrow poem, we intimated the pleasure it would afford us to print also an obituary of the last bird of that race in America. Our long-time friend, Mr. Isaac McLellan, responding to our note, has thoughtfully furnished us a poem fitted for such a purpose. Unfortunately, however, the English sparrow is still with us, and to publish a triumphal song over his extinction were premature. In fact it was not so much the song that we wanted as it was the occasion for the song. We look out now from the desk where we are writing, and in the dusty City Hall Park we see the squabbling hordes of these chattering birds twittering about, fearless of the tramps on the benches, and noisily assuring us that the English sparrow is here—and proposes to stay. We shall not dispute it. We shall not attempt to deceive ourselves nor our readers in this matter. The English sparrow brood has a long life before it in America. Publishing its obituary will not intimidate it. No words will intimidate it. Fine shot might. But we publish the poem. We put it on record in the files of this paper. The hope inspires us that in the future of promise, when the chair in this sanctum shall have been filled by another, and by yet another, some one of the editors of the FOREST AND STREAM may at length herald the going of the sparrow, and republish from this, then old and forgotten Volume Seventeen, the poem which we print here this day, September 1, 1881, descriptive of what shall then be the native song birds' panegyric of joy.

THE DEATH OF THE LAST SPARROW.

The song-birds rejoice in valley and wood,
For the sparrows have gone, that pestilent brood!
The meadow lark warbles his penons of praise,
Robin red-breast is sweet with his jubilant lays.

The blue-birds that perch on the old garden gate
And the little brown wrens now with joy are elate,
The black-birds with musical chatter declare,
As their hovering phantoms circle in air,

That the fierce, fighting sparrows no longer molest,
To sting with their bills or harrow the nest,
And no longer in orchard or green forest glade
Will the haunts of the innocent warblers invade.

The cat-birds that lurk where the thickets are dim,
The martins that round the barn gables now skim;
The swallows that feed on the insects of air,
The humming-birds brilliant as emeralds rare;

The oriole splendid with purple and gold,
The bright little yellow-birds, fair to behold;
The gay bob-o-link, whose minstrelsy flows
Like the bubbling brook thro' the meadow that goes;

The own thrush, that hermit of deep solitudes,
The lone cuckoo that chirps in the woods;—
All these native harpists, a musical band,
Rejoice that the sparrow is dead in the land!

These foreign invaders all seem'd of a fat slug,
Scor'd army worms, festsilent fly, forest mite and bug;
Woe'd not feast on the succets that poison the fruit,
That staid the green leaves which garland the shoot.

But staid are their bills with the blood of the grape
Whose clusters of nectar the trellises drape;
They feed on the strawberries, luscious and red,
And on all the sweets of the garden are fed.

On the round, ruddy globes of the peach tree, that fills
With fragrance the air as the honey distills;
On the brown, juicy pears that burst as they fall;
On the sweet purple plums that drop o'er the wall;

On the cherries ambrosial, whose clustering gems
Clasp and crown the light twigs with rare diamonds;
But now since the sparrows have met with their doom,
The harvest may flourish, the gardens may bloom.

Yes! now the broad acres of ripening grain
May brighten in sunshine and freshen in rain;
The fruits of the orchard their treasures may store,
The song-birds may warble as ever of yore,
For the sparrows will rob and molest never more.

Shelter Island, Aug. 22. ISAAC McLELLAN.

DEATH-TRAPS AGAIN.—We have a list of some fifty "accidents" to yachts this season, one and all traceable to a lack of depth and low weights. The list is unfortunately not yet complete. The Herald of Sunday adds two more of these so-called accidents. A "yacht" turns turtle on the St. Lawrence, off Murray Bay, Aug. 23, and her crew of three are drowned; and, nearer home, another yacht, the Mabel Emma, rolls over near Long Beach, the same day, spills her contents, and Colonel William Chalmers, of this city, expires with his life the blunders of the heavy light-draft school. Next week we will print a letter from General Frazer to the Boston Advertiser, which shows we are no longer alone in the crusade against the man-traps a perverted taste confounds with craft entitled to the appellation "yacht."

MANY ENGLISH SPORTSMEN are visiting America this season and seeking sport at the West.

BLOOD POISONING FROM FISH.

WE know of several persons who cannot eat fish, lobsters, oysters, etc., either one or all, without experiencing a most intolerable itching and often an eruption upon the skin. We also know a lady who is afflicted in the same manner after eating strawberries. One person can eat fish which have been out of water some days, but a visit to the sea shore and an indulgence in fish fresh from the water produces the poisoning described.

A doctor who was applied to in one instance recommended the heroic treatment of eating fish and scratching, until the system became reconciled to the diet, as in the case of the use of other poisons. This would require the devotion which the small boy brings to the mastery of tobacco, and would require his enthusiasm, which is not usually found in adults. This deprivation of fish food is, to those who love it, a serious matter, and we have written this at the request of a sufferer, in order to see if some of our medical readers cannot suggest a remedy.

A ROMANCE IN REAL LIFE.

IT gives us much pleasure to chronicle an incident which took place at Whitestone, Long Island, Tuesday evening of last week, and more particularly so as the circumstances reflect great credit upon a gentleman well known to many of the readers of the FOREST AND STREAM Mr. George Macdougall who upon the occasion referred to took a header into Long Island Sound, and pluckily rescued from drowning a young lady, who had inadvertently tumbled into the same. Like the brave young oysterman, who in the ballad said

"To save his dear
Leander swam the Hellespont,
And I can swim this here,"

he gallantly bore her to the shore. One of those ever-present Arrys, whom Punch delights to picture, was of course on hand, in the shape of a newspaper man, to claim the glory. The young miss was pleasant, pretty and picturesque, and, if newspaper reports are to be relied upon, instead of saying to a rather pertinent question, "No, George; oh, no, George! not just yet," she looked up or down, we know not which, into the large blue eyes of her hero and said "Yes." We wish them joy. It was a brave act, and nothing could be more fitting than that the sequel should be the approved happy one of the Oliver Optic story-books.

JOHN P. MOORE, whose name has been prominent in the gun trade for more than half a century, died at his residence in this city, last Saturday, August 27, at the advanced age of eighty-one years, having been born in this city in 1799. When eighteen years old he entered the employ of Benjamin Cooper as an apprentice in the trade of gunsmithing, and began business on his own account four years later at No. 206 Broadway. His building erected not long after on the site of the present Evening Post building was the largest on Broadway at that time. In 1860 he retired, leaving the business to his sons. Mr. Moore had an enviable reputation for sterling integrity, and held in the course of his business career many positions of trust, having been for some time a Director in the Mechanic's Bank. At the time of his death he was a Director of the Jefferson Fire Insurance Company, an office he had held for twenty-five years. He was one of the earliest members of the General Society of Mechanics and Tradesmen, and took much pride in the success of its Apprentices' Library. For many years he was President of the society. The school in charge of the society became one of the best in the city during the time Mr. Moore was Chairman of the Committee on Education.

ICHTHYOLOGICAL STUDENTS will do well to read Dr. Gill's criticism on Dr. Gunther's "Introduction to the Study of Ichthyology," in another column. The need of such a work as Dr. Gunther proposed to furnish has long been felt, but those who are competent to furnish it are so engaged with advanced work that they have neglected it. We had hoped that the book of Dr. Gunther would prove a boon to the beginner, but Dr. Gill thinks otherwise. A book of this character hearing the name of any recognized American ichthyologist would no doubt be in demand. Hardly a day passes without application being made to us for such a work. We realize the difficulties which beset a beginner who has no teacher and knows not where to commence, for we were ourselves led into all sorts of bye-paths in trying to find a road to ichthyic knowledge.

AN ARCHERY TOURNAMENT will be held at the Fair Grounds, Waverly, New Jersey, on Friday, Sept. 20, in which all the clubs of this vicinity are expected to take part. The Corresponding Secretary is Mr. W. Holberton, of No. 65 Fulton street, this city. Lawn tennis and lacrosse are also on the programme.

A NEW MAINE MAP.—Mr. Thos. Sedgwick Steele is preparing a map of the Maine canoeing region to accompany his forthcoming book, "Puddle and Portage." The map, we understand, is prepared from original sources of information and will doubtless prove indispensable to the Maine canoeist.

WILD CLEURY.—Mr. D. W. Cross writes that he has had several letters about transplanting the wild celery, and in all probability the experiment will be so thoroughly tested that the question of its success will be definitely settled.

The Sportsman Tourist.

"OLE WHEELER."

IT was nearly noon when our party emerged from the forest into a little clearing. Struck by its appearance, they rested upon its edge and gazed around. Very beautiful was this little opening in the vast forest—this oasis in the desert of tree trunks. It disclosed a broad, blue belt of sky, of which only a speck here and there had been visible in the woods. The sun, too, which sent but few pale rays into the forest depths, here shone full brightly, carelessly the tree-tops with its sparkling light, warming the grass and bushes and bringing a deeper blush to the raspberries, whose clustering vines filled the greater part of the clearing and ran riot over the mouldering tree-trunks. The stillness of mid-day rested upon the scene. The breeze scarcely swayed the graceful foliage of the elms, above whose tops two hawks were lazily soaring. The rippling of the little brook, hurrying over its bed, as if impatient to gain the cool of the forest beyond, was the only sound.

"This is the place, Jeds, and a pleasant one don't lie in the whole South woods," said Wren. "If there were only a little lake by I'd like to camp here for the rest of my mortal days. These elms show good soil."

"Where's his hut?" asked Sigourney. "Some might call it a hut, but if he hasn't put a French roof on it since I was here last I should denominated it a novel. Over here." And he led the way to the centre of the clearing.

A large elm tree shaded the brook, which here widened a little, and from its grassy banks sloped away. On one side was an irregular pile of logs and bark, covered with leaves. Wren went to one end of it and, stooping down, pushed away some boards.

"There is nobody at home. The mansion is vacant. Look!" and he stepped aside.

"Merciful God, is it one of thy creatures that exists here! Through a single pane of glass, fastened in its place by a few pegs, the interior was dimly lighted. The damp earth was covered with mould and a pool of stagnant water stood in the middle. On the farther side, where the hole had not been dug so deeply, lay a ragged sheepskin—the man's bed. A shelf held a few bottles, traps and cooking utensils and in front was a stone fire-place, in which the ashes of fifteen years were standing. Wren knew they had been there fifteen years, for the man had lived there that time and such a heap couldn't have been collected in any less. The party were still curiously gazing into the den when Wren whispered, "Here comes 'Ole Wheeler' hisself."

With long swinging steps, and gun at a trail, a figure was swiftly approaching from the woods—a tall, gaunt figure, bent and awkward. A face—a face that will never be forgotten by those who then met his gaze—looked out from a matted beard and long tangled hair. Surely fancy would have named this creature some old river god, some mighty genius of the woods, had it not been for his ragged pants, torn off at the knees, and the quaint old swallow-tailed coat, fastened by its brass buttons tightly around him. The Professor recognized the same figure which he had seen crossing Gress River. His eyes, black and restless, moved from one to another—eyes that glowed with a wavering light that told plainly the loss of reason.

"Have ye come to steal me taters or me sugar, Mr. Wren?"

"Neither one nor t'other. We're four honest men as wants to take dinner and be sociable-like with yer."

"Ole Wheeler" appeared assured and laid aside his rusty gun. He winked, then, and the party had a tapping meal of jerked venison and bread spread out on the ground.

"Berries!" exclaimed Wheeler, emerging from his burrow.

"Yes, that's so," said Wren. There were about six quarts of rich, ripe raspberries.

"Sugar!" said Wheeler coming up out of the tomb again.

"Right agin," said Wren.

The Professor, however, declared it was syrup; maple syrup in that delicious half way in which you find it only in the woods. With it the berries were delicious. But the purpose of the parties' visit was to hear "Ole Wheeler" talk, and accordingly Wren soon put him on the trail.

"Do I like to be alone here? Yes, I love to; I love to sit here nights an' watch the stars an' the moon sir. I've watched 'em these fifteen years, and I know 'em every one; as well as I know the lakes an' the hills. I know how they move an' I can tell ye. Have I read the books about 'em? Yes, an' they lie sir, they all lie; they're made to sell—'ole."

What the Professor knew was true an' no book learnin' can make me believe otherwise. Why don't I write a book? Well, I'm poor an' folks think I'm ignorant, an' they wouldn't believe me; but maybe I shall write some day. I've got papers and drawings made. No, the books deceive ye. I know the sun isn't fur off as they say it is. I've measured it here an' I know it's near me. I can feel it warm me, an' the moon and the stars, they ain't fur off; an' sometimes in bright clear nights they talk to me, an' they tell me about the good God. I like to sir, I like to talk with 'em an' with the trees an' the animals, they're better'n men. Have I a family? Well, my wife is livin' sir, but she's dead to me. My son, he went to California where the rivers run gold, but the Indians killed him. My nephew said seven year ago he'd come an' visit me, and I expects him. We shall live on taters. My taters are the best in the county."

After making the old man a few presents the party started for camp. As they struck off into the trail they heard him say,

"If ye meet my nephew, tell him to hurry. Say he shall have 'taters an' sugar."

They promised and walked on in silence. "What is that which we call the love of nature, that power which draws man to her, which has its influence over the coarse and the cultivated mind, and often endows him who passes his life with her with those refined traits of character which make him in the truest sense of the word 'Nature's nobleman?' All classes of men are drawn to her. The rude backwoodsman loves her solitude, he knows not why. The cultivated man delights in her company. The careworn merchant, the student with weary brain, seek her music and are refreshed. The tempted commune with her and are strengthened. The upright man finds with her peace and security. The criminal trembles when she alone is by. The soul embittered by some wrong flees to her. The heart stung by some great sorrow seeks consolation with her. In that society where none intrudes" she speaks with man; she calls to him from the vastness of the mountains, the mad dashing of the rapids, and the awful gloom of night; from

the calm lakes, the leaping brooks, the trees, the birds, the flowers. She tells him that there in that vast wilderness he is alone in the presence of his Maker.

On the sand beach of head of Massachusetts is a lonely grave. The birches bend tenderly over it and the waters of the inlet ripple by in an unending dirge. Tradition says that years ago a maniac, who had escaped from his keeper, wandered off into the woods and made his bed here. When too weak to walk he had crawled back and forth to the little brook for water and some hunters found him long after, lying dead upon his couch of leaves. No one knows what led that being to flee from his fellow men to the solitude of the wilderness, but it seems certain that to those bereft of reason, to find a companion in their intercourse with their fellows is nature speaks a powerful language. As a father is more tender to a weak and helpless child, so the kind Father of all looks mercifully down upon these most helpless of his children and reveals hidden beauties to their eyes. For love of nature is love of God.

AN INVALID IN THE FIELD.

It is a clear, cold October morning of which I write. The woods are in the "sere and yellow." The prairie grass has died of grief, perhaps, for the bright flowers that have wilted earlier, or more likely, has had the emerald tint knocked out of it by Sir John Frost, the destroyer.

I have been confined to my room for ten days playing a game of patience ("a game, I do not understand") with a severe fit of rheumatic gout; but on this morning, after fearful groaning, I have dressed and, mounting my crutches, hobbled to the window to look out.

My dogs, Don, an English setter, and Stella, a pointer bitch—both "naives"—are sleeping on the gallery in a patch of sunlight. A tap upon the window and both heads "come to attention;" another tap and their bright eyes turn toward the window and, catching sight of my face, they bolt through the door. My chamber door and whinnying beg in the most piteous manner to be admitted.

"Open the door, mother, and let them in!"

"Nonsense, bob; they'll be sure to hurt you."

"I'll risk it; here, give me that low chair. Right; now turn that high chair—no, not that, the one with the cane back—down in front of my feet and knees; all right. Now let them come."

The door is opened and in they rush! It is well that I have entrenched myself or their affectionate onslaught might have been serious. They eagerly leap upon me and with low whines of "I'm sure you're well," and their honest eyes beam with an expression of love more plain than any spoken words can express. Ah! me! How pleasant it is to be the object of such unselfish devotion, dumb brutes though they be! And yet they tell us that these loving and intelligent, though dumb, companions have no "heresafter"; that after serving us for years, learning to know our thoughts and share our feelings, they die and there is no more of them forever! Believe it who will, I do not. The preachers tell us of material joys and pains in the world to come, of golden streets and jasper walls; but who wants to walk on golden streets unless sure of leaving their ill behind them, or rather, who would walk at all if there be angelic wings with which to fly. As for jasper walls, they are doubtless beautiful, but to my mind more ornamental than useful. For myself, I could never endure "city life" in this world and I am sure I should not enjoy being cramped in the next. No, sir, God is good, and I truly believe that all of the many dogs and hunting ponies I have owned and loved here, and who have shared with me some of the best of my life on that other shore; and to be once more with them on those eternal hunting grounds, with a hammerless gun, smokeless powder and undying youth in which to follow the chase—ah, me, but that will be heaven!

I look out at the window again, then glance at my dogs, now quietly sleeping upon the hearth rug, then at my gun-case, and the longing to be afield once more becomes irresistible. Turning to my wife I say: "Mother, will you take me on the prairie this morning in the buggy?"

"Why, Bob, are you crazy? How could you get into the buggy?"

"Not crazy, mother, but a sudden attack of 'Cacoethes'—what the deuce is the Greek for hunting?"

"I'm sure I don't know," she says; "but you certainly don't mean to take your gun!"

"I most certainly do. You shall drive me—I'll shoot from the buggy."

"And come back half dead with the gout!"

"Not so, my wife, it will cure me! So, good now, please have my Dandy harnessed at once. My souls in arms and out for the prairie!"

"But you've got the gout and can't get away!"

"Confound it, madam, will you—oh! ah! Whew?"

"What's the matter with you now?"

"I struck my lame foot against that infernal chair-rocker. Ah me! but hurry, mother, and let's be off."

And now, while she goes to order the buggy, let me explain that our only living son has attained to his majority and gone out into the world to carve out his destiny, for weal or woe; and our only living daughter, having married years ago, has a home and children of her own. So that with the exception of an occasional visit from our children and grandchildren and the necessary dependents, are left alone in the old home. That is why Mrs. C. is nearly always my companion in bird hunting and fishing, and though she cannot herself shoot, a gun, she takes great pride in my shooting, and "chaffs" me unmercifully when I shoot badly. But here she comes to tell me that she is ready.

With much pain and the aid of kindly hands I am helped into the buggy. Mrs. C. takes the reins, and away we go.

Ah, ha! How deliciously exhilarating it is to one who has been for days confined to a close room to drink in the fresh draught of pure prairie air. How pleasant to a hunter to inhale the peculiar aroma of dead grass and weeds that in the fall pervades the prairie atmosphere.

But Don and Stella are eagerly quartering the ground from right to left, meeting and passing each other in front of the buggy, so we have no time to poetize. Suddenly Don checks his pace and cautiously moves to the right, while Stella, catching sight of him, backs for a second and then moves as he does. There is no need to caution them, but in my heart I think, "Ah, my beauties, how I love you!" Now Don halts and becomes rigid, his lips "going in an out" with suppressed breathing until his head turns slightly, and his bright eyes say to me, "Old man, they are here; I've done my work, now do yours." Meantime Stella is backing like the darling little thing she is, in the most beautiful manner.

"What is it?" whispers wife,

"Quail, I reckon; too close to timber for chickens. Turn Dandy a little and drive slowly to Don's right—a little nearer, I wish the horses to flush them." (N. B.—I always walk up my birds. A dog trained to flush is, in my judgment, undesirable.) "Now, Mollie, watch the old man take 'em in." Whirr-whirr-rang! bang! "Eh, what—a miss with both barrels. Oh, confound it!"

"Not a feather," says Mrs. C. "Ahem, is that the way you take 'em in, old man?"

"Well, you see, mother, I'm weak and nervous. But see, Don has another point. Drive to the right of him again—there." Whirr-r—An old cock quail, and straightaway I throw up my gun, and, resisting the impulse to pull trigger until he is fairly before the hammers, and then my finger catches. A few floating feathers in the air, but I feel the bird is mine.

"A long shot, Bob."

"Well, yes, so so; the fact is I had to kill him or go home. When I find myself nervous at the start I must, by a powerful exercise of the will, overcome it at once or I grow worse and make a bad day of it. Dead bird, Don, fetch. Come in, Stella, it's Don's bird." When hunting two dogs I let the dog that points the bird retrieve it, if killed; it is his right and he expects it.

"Did you mark them down, Mollie?"

"Yes; three or four dropped near you last vesin wed."

"Good; drive that way—lie 'way Don, lie 'way, Stella!"

The dogs quarter the ground, and when near the designated weed they point at the same instant, but at different objects.

"To which shall I drive first?"

"To Don; he's the uccrest."

"Yes, but Stella is young and may break point at gun fire, while old Don will stand all day."

"Yes, and all night, too, the dear old fellow; but we will trust Stella, and if she breaks—I point to the dog whip at her feet. The dogs are not over twenty yards apart. Wife drives slowly to Don, and up jump a brace of quails. I am ready, and remembering the result of firing too quickly at my first birds I hold hard, and with slow haste score a clean kill of both birds.

"Dead; Don, fetch." He's off at the word (and never before) retrieving both birds, of course, singly.

"Well, Mollie, how did Stella stand the racket?"

"Beautifully," she answers, enthusiastically. "At the first report of the gun she dropped to snout, but only for a second, when she resumed her point."

We turn the horse toward Stella, and Don, getting sight of her, backs her like a gentleman. We get close to the bitch but flush nothing.

"It must be so close to her nose as to be paralyzed with—" when out bounces a rabbit, and away goes Stella in full chase. I whistle and call frantically, but she heeds me never a bit. After a chase of a hundred yards or so the rabbit is lost in the high grass, and then Miss Stella hears my whistle and sees the buggy heading down upon her. Instantly realizing the enormity of her offense she absolutely wails and under a sense of fear and shame. I stop the buggy, and order her to "come in." She starts to us dragging her feet as though they were weighted with lead.

"Here, wife, take the whip, jump out and punish her."

"Now, Mrs. C., whose *embonpoint* is one of those self-evident facts about which there is no discussion, is not much of a jumper at any time, and in this instance her kind heart makes her rather slow in getting out. I look to see if the bitch is coming, and lo! she is making a splendid point.

"Get back, Mollie, Stella is pointing."

"Perhaps she's found her rabbit again."

"No, I think not; besides, look at Don!" who was now cautiously working his way toward the bitch and on arriving within fifteen or twenty steps he points in her direction. Evidently the birds are between them.

"Bet thinks they've found chickens!"

"Thanks; no. I neither eat nor drink," says Mrs. C.

"Pardon me. Of course I didn't mean to be with you. A man and his wife being one cannot bet with each other."

"Except as to drinks they may be one, but I'm sure that your drinks never gave me the gout."

"Don't make personal remarks, mother; bad taste—very. Drive around so as to come between the dogs."

The horse makes one or two steps, when—"whirr-r"—up jumps four or five "chickens." Although unready and a little startled, I let drive with both barrels and down once, while another goes away with both legs dangling.

"Mark the cripple," Mollie."

"I slip a shell in each barrel. 'Now drive between the dogs.' They have kept their points, and as we get close in, up get the chickens in a bunch. I swing my gun round and out away right and left to two that have separated from the others, miss one, and drop the other. Stella holds her point still.

"Drive close in front of her." An old cocks gets up with a tremendous clatter, but drops at the crack of the gun.

"Dead, Don! Dead, Stella! Fetch!"

"No, mother, for the cripple."

"Wait a moment," and she picks up the dog-whip and makes a move to get out.

"What are you going to do?"

"Whip Stella for chasing that rabbit?"

"Whip your granny! Give me that whip. Don't you see that she has repeated and 'brought forth meat for repentance.' Job—'When found make a note.'"

"All right; but if your scriptural quotation is correct, there's a typo in the Holy Bible."

"Well, I quote from memory only, but let's go for that wounded chicken and then home, for my feet begin to pain me fearfully."

"Just as I feared."

The dogs soon find and retrieve the chickens, and we turn our horse's head homeward. I am assisted out of the buggy and into the house. I lie down upon the lounge, while the Governor takes the reins and drives to the door.

"Yes, ma'am; give me a dose of cod-liver, please."

She pours out a spoonful, which I no sooner swallow than I cry out: "Mercy, mother! What is it you are giving me?" She snatches up the bottle and gives one look.

"Oh, Bob, I'm so sorry! I've made a mistake in the bottle and given you—"

"What? poison?"

"No. It's—'it's—"

"My God! What?"

"Vernifuge!"

"Verni—!—la!—!—! Why, confound it! I don't you know I'm past—" But she had left the room. Well, the Lord's will be done; but fancy giving a fellow "wurrum" medicine for the gout!

Crockett's Bluff, Ark.

"PODGERS" DISCOURSETH,

AND PROMISES TO TALK SOME MORE.

DUNK EAST, Aug. 31, 1891.

Editor Forest and Stream:

Have just been reading the last two numbers of FOREST AND STREAM from beginning to end, lying flat on my back on a lounge, with coat off, a good cigar, and feet at the usual orthodox angle, the mantel of No. 86, Young's Hotel, doing duty as a foot-stool.

This time it is not stories of big fish and wonderful catches, but the burden runs more to 'possum and climbing snakes. It is wonderful what a deal of experience and modern instances the mere suggestion of a case or a query brings forth. The 'possum question has certainly been well ventilated, and snakes have now had a good run. Strikes me the friends of FOREST AND STREAM have had an undue experience with snakes; had some myself, but not the sort I fear many of those gentlemen know most of. I acknowledge a total absence of 'possum experience; really don't believe I ever saw one, much less ate one, hot or cold. Do remember going out once from Virginia Springs for an evening 'coon hunt, with a dozen niggers and dogs, but beyond the dreadful hubbub, yells, barking, and noise and flashes of torches and final death of something said to be a 'possum, I know nothing.

But when you talk about snakes I am with you, remember that. I mean the veritable, not the imaginary, and I can write a snake story for every number of the FOREST AND STREAM for the next five years. But the question mainly rises, I believe, to climbing snakes or snakes that do or don't climb. The climes certainly have much to do with it. In tropical countries we know the great boa or python climbs trees; and will he may, for it is easy for such a monster to do it. As for our common snakes, I am with the *pros*, for I have seen them doing it, and especially in spring time when the birds were nesting and the young ones about hatching, although for that matter their snakeships are not over-particular; they will take the eggs before hatching. But all the snakes I have seen climbing did so with the spiral motion. In the descent they are not so particular, being generally considerably hurried by us boys.

I think old Otsego County, in my native State of New York, could at that period claim precedence over any other locality for snakes, big or little, especially the black and the dreaded rattlesnake. There was a ledge of rocks back of my native village and a cave under it which was designated "Rattlesnake Den." In the spring of the year, when the sun began to warm things up, the snakes would crawl out and lie on the shelf rocks, while we boys, from our secure perch overhead, waiting until a good lot of them had gathered, would launch at a concerted signal a ton or two of collared boulders, and then gathering up the slain, drag them into town with a string and sell them to a weird old woman—generally considered a witch by us boys. What she did with them we never knew, but surmised that she used them in her incantations. She probably extracted the oil, which by popular belief contained wonderful healing properties. These snakes included all sorts—the garter, black and venomous ones—being in harmony, or at least had apparently spent the winter together.

That black snakes do climb is a fact forcibly impressed on my memory by the following circumstance. My governor was a man who would have made a splendid and staunch supporter of Bergh's Berghers, and a thorough sportsman of the old pattern, *i. e.*, great on deer and fox hunting with hounds, and would visit on us boys the most severe punishment for disturbing a bird's nest. The old em bell of the house was a safe and reliable lodgment for nests of family raising, and especially laid a pair of robins come year after year to repair and make use of the old nest, in a smaller offshoot of the main tree. One spring, in accordance with their usual custom, a nestful of young robins were hatched, and one of my daily duties was to go into the garden with a spade, turn up the soil, and expose worms for the benefit of the youngsters, which the old birds accepted, and hopped down from the tree to pick up. From the window where the Governor usually sat in the soft spring days, making time for the approaching trout season and rigging up last year's tackle, he could look down into the nest; and so tame were the old birds that they would hop on the sill of the open window. One day the Governor, on looking down into the nest, noticed that two of the four young robins were gone. At once the subscriber was suspected; and whether from a previous bad reputation or strong suspicions, his protestations of innocence were unheeded, and the sudden change of temperature from a cool spring day to a most fearful one, the climate of the day was wonderful. Such a warming, ending with imprisonment, was wonderful.

The next morning, while listlessly lolling out of the window, looking down at a smaller brother, who was out this early with a huge piece of bread spread with brown sugar, as a special concession for being so much better than his elder brother, I heard a great chattering and to-do in the tree, and on looking, discovered a large black snake approaching the nest. At once I flashed on my mind that here was a key to the mystery. Disregarding the injunction to stay where I was until released, I flew down stairs to the old gentleman's room and called on him to look out and see the snake rubbing the robin's nest, which peculiar evidence was now to be gained. Tableaux—a dead snake with a young robin in its mouth; and another slice of bread and butter, with sugar on it, in mine. The Governor was a man of few words, and on this occasion, seeing the injustice of my punishment, might have had his own views, but did not express them, and in answer to sundry regretful and pitying expressions from the mother, merely remarked: "Very true, he was not guilty this once, but we will credit the brushing on general account, and then there will be quite a balance in your account for."

The Governor, however, made the *amende* in a way that was much more acceptable than apologies; he took me along trout fishing a few days later, and I had the privilege of following with my primitive alder rod and worm, while he proceeded with the fly; and precious little chance did I usually have to fish, as one of my duties consisted in picking up the fish as he used them to me with a peculiar motion of the rod, saving himself the trouble of hooking by filling off the barb of the hook. Those were the days though when every stream in old Delaware County swarmed with trout, and we usually returned from a two days fish with a champagne basketful, supplying all the village for several days. What a hand the Governor was with the fly; and his celebrity as a fisherman earned for him the name of The Fisherman Lawyer that no man could hold a candle to. And, by the way, I never could understand why that particular virtue there could be, or wherein lay the evidence of great skill in being able to hold that candle. We hear of many of that can't; there must be some that can; and then what?

Natural History

GUNTHER'S LITERATURE AND MORPHOLOGY OF FISHES.

A REVIEW BY PROF. THOMAS GILL OF GUNTHER'S "INTRODUCTION TO THE STUDY OF FISHES."

SMITHSONIAN INSTITUTION, WASHINGTON, Aug 17, 1891.

Editor Forest and Stream:

In response to your favor I herewith send the review of (Günther's recent work published in the Nation of August 11, but have intercalated the much new matter, so that the present gives a complement to the first chapter (the Literature), and a tolerably thorough analysis of the second chapter of the "Introduction," i. e., the "Topographical Description of the External Parts of Fishes." I have been especially led to complete the review of the second chapter since I have read the notice of Günther's work in the January number of the "Westminster Review." The Westminster reviewer thinks "The second chapter, called a topographical description of the external parts of fishes, gives, in a manner altogether masterly, not merely an account of the structures of which it treats, in their immense variety, but some idea of their functions, with sufficient reference to individual fishes to invest a technical subject with interest and precision." (Am. Ed., p. 142.) You will thus perceive that I have said what I have not without knowledge of what can be alleged on the other side, and in order that you may be able to refer without trouble to what has been said about Dr. Günther's work I append a brief list of notices of it.

The following are all favorable reviews, but deal in generalities:

- "Saturday Review," v. 60, pp. 769-771, Dec. 18, 1880.
"Westminster Review," v. 115, Am. ed., pp. 142-144, Jan. 1881.
"Annals and Magazine of Natural History" (3), v. 7, pp. 63-64, Jan. 1881.
"The Academy," 1881, pp. 11-13, Jan. 1, 1881.
"Nature," v. 23, pp. 215-215, Jan. 1881.
"The Athenaeum," 1881, pp. 97-98, Jan. 15, 1881.
"The Spectator," v. 54, pp. 479-481, April 9, 1881.
"The Zoologist," (3), v. 5, pp. 221-226, May, 1881.

The succeeding (the first by Prof. Cope, the balance by myself) take an unfavorable view of the work and give specific details:

- "American Naturalist," v. 15, pp. 222-223, March, 1881.
"The Critic," v. 11, pp. 123-125, 27, 1881.
"The New York Times," May 29, 1881, (3 columns).
"Forest and Stream," v. 16, p. 428, June 30, 1881. (Reprinted with additions from the "Critic.")
"Science," v. 7, pp. 323-326, July 9, 1881.
"The Sea World," etc., v. 45, p. 7, July 13, 1881. (Reprinted from "Science" in part, i. e., the last 8 paragraphs.)
"The Nation," v. 23, pp. 120-122, August 11, 1881.

As you will attribute the accompanying review to my own name I have been more explicit in my criticisms—more "personal" if you will—than I would feel authorized to be in an anonymous notice.

You ask, "How do you like Henshall on the nomenclature of the Microperca?" Much as I dislike the change, I am loath to admit that he is right—unquestionably so. In this new disturbance we have another example of the results of the neglect at Washington to procure the essentials for the student. I had long endeavored to have the original edition of Lacepede purchased here, but it has only been lately bought, and we were obliged till then to use what now proves to be a bad and misleading edition. As soon as I examined the first edition I saw at once that the figure of Microperca dolomieu was not a very poor one (for the time) of the small-mouthed black bass and that the illustration of Labrus salmou was a very good one. The illustration of Labrus salmou, Cuvier and Valenciennes, as we now know, confounded both species, although their description of Gryllus salmouides was apparently based only on the small-mouthed species, while, as you are aware, they failed to recognize in the Haro nigricans a relation. The error of Cuvier was corrected as long back as 1843, by Agassiz, and yet Günther, in his late work, still clings to it, notwithstanding that (1) the known nomenclature of the fish records the former and (2) the description, (4) the anomalous morphological deviation the admission of the type would involve, as well as (5) the unanimous testimony of American ichthyologists would have prevented a careful man from such a blunder. This illustration of Günther's negligence and slovenliness must confirm you in the belief that his work is a very, very poor one.

Yours truly, THOS. GILL.

An Introduction to the Study of Fishes. By Albert C. G. Günther, M.A., M.D., Ph. D., F.R.S., Keeper of the Zoological Department in the British Museum. Edinburgh: Adam & Charles Black, 1860. 8vo., xvi., 720 pp.

Ichthyology. (Article signed "A. C. G.") in the Encyclopaedia Britannica, ninth edition, vol. xii. Edinburgh: Adam & Charles Black, 1881. Pp. 630-695.

When the announcement was made several years ago that Dr. Günther was engaged on a manual of ichthyology, many looked forward with eager expectancy for its appearance; but a few who knew Dr. Günther well from his previous works, entertained considerable misgivings lest he should be unable to divest himself of prejudices and opinions once assumed. The "Introduction to the Study of Fishes" is destined to equally disappoint the former and justify the good service to ichthyology. Dr. Günther has in the past done complete "Species Piscium," in the form of a "Catalogue of the Fishes in the British Museum." This work was issued in eight volumes, from 1859 to 1870, and is deemed moderately well the state of science at that period. The author, however, has been unable to any considerable degree to discard what he has once accepted and to bring himself into relations with the science of the present, but adheres tenaciously to beliefs formed in a much less advanced state of knowledge, and in spite of conclusive evidence against their tenability. This mental attitude is prominently manifested in his new work as well as in his article in the "Encyclopaedia Britannica." The "Introduction" is really a complement to the "Catalogue" divided into two parts—viz., (1) a treatise on the principles of ichthyology, and (2) a nomenclature of the genera, with definitions of all the including groups admitted by him. The article, "Ichthyology," in the Encyclopaedia Britannica is in great part essentially the same, and is either General Part of the introduction, being reproduced in full; the second part is condensed, and only the definitions and remarks on

the families and higher groups are incorporated therein, the genera being simply enumerated by name. The criticisms herein are therefore equally applicable to both.

The curiosity with which the experienced ichthyologist will take up the treatise must be soon subordinated to astonishment as he proceeds in the examination of it, for it is scarcely possible that any one should be prepared for the numerous errors of one kind or another that are constantly cropping out on almost every page. It is difficult to believe that one who has written so much on fishes as the author has should make so many lapses. The errors commence on the first page and flow in an almost uninterrupted, but varying stream to the end of the work. Those chapters to which fault might seem to be the least incident are the ones devoted to the history of the subject and the external modifications of the animals under investigation. We can only afford passing glance at the former, but the latter will be of sufficient interest and importance to deserve a detailed examination.

The first chapter has the caption of "History and Literature." In the opening paragraph it is alleged that "Aristotle had a perfect knowledge of the general structure of fishes," and in illustration of the thesis Aristotle is quoted as stating, among other things, that "all scaly fishes are viviparous, but the cartilaginous fishes (with the exception of the sea-devil [Lophius piscatorius], which Aristotle places along with them) are viviparous," and that "kidneys and urinary bladder are absent" (p. 2). An unopinionated reader would naturally suppose that inasmuch as Aristotle's knowledge was said to be "perfect," his statements particularized were thereby vouched for as being true. Nevertheless, in subsequent chapters we find statements contradicting them in the most explicit manner.

Thus, as to the generation of fishes we are told, further on, that certain "scaly fishes" are "viviparous" (p. 159), and that of the cartilaginous "the majority of the Rays are oviparous" (p. 336).

(The contradicting statement itself is quite erroneous, for of the 150 Rays, in round numbers, about three-fourths are viviparous and very little more than a fourth a small minority are oviparous.)

Again, as to the kidneys, they are not only admitted to be present but a special chapter ("Chapter XI, Urinary Organs") is devoted to the description of those organs and their appendages.

The remainder of the chapter in continuation of the History of Ichthyology is as unsatisfactory and irrelevant as could well be. There are almost no indications as to the progress of the progress of the science nor as to the relations of special discoveries to the perfection of the system. The discovery of *Centrodus* is indicated particularized connection with the classification (pp. 25-28), but with irreducible effrontery that which belonged to another (Kreffel) has been claimed by the author of the work as original with himself. In fact the element of judicial exposition is entirely wanting. It would take too much time and space to traverse the chapter in detail.

We need not inquire here that although the majority of the best naturalists of the world, and all the recognized ichthyological authorities of the United States, consider "fishes" to be divisible among several classes, there is no hint in the chapter that there has ever been a difference of opinion as to the limits of the class of Pisces except in the statement that "according to the views generally adopted at present all those vertebrate animals are referred to the class of fishes which, living in water, breathe air dissolved in water by means of gills or branchia" (p. 1).

The titles of some works more important than some specified by Mr. Günther descriptive of the "Fauna" of special countries may supplement his bibliography of "Recent Works," and indicate how defective even this is. In the mode of quotation the titles conform to the Güntherian style and are incomplete.

A. Great Britain.—Add to (1) Parnell, (2) Yarrell and (3) Couch, the following of which the latter is more important than any of them, viz:

- A. W. Sclater.—"British Fresh-water Fishes." (London, 1879-80), xxvi., 204 pp., about 40 pl.
F. Day.—"The Fishes of Great Britain and Ireland," etc. (London, 1880, et seq., 8vo.)—The first part appeared in 1880, the second in 1881, and the remainder, in the words of Günther apropos of the "Fishes of H. B. Challenger, Fishes by A. Günther," is "in course of publication.")

B. Denmark and Scandinavia.—Add to (1) Kroyer, (2) Nilsson and (3) Friese och Ekström, the following more recent and important works:

- A. H. Wilogen.—"De svenska fiskarternas naturliga historia." (Stockholm, 1870, 8vo.), 2.
B. Bollett.—"Norges Fiske, med Bemærkninger om deres Udbredelse." (Christiania, 1875, 8vo., title, 240 pp., 2 pl., 1 map.) See also Supplement, 1870.

C. Russia.—Add to (1) Nordmann the following equally or more indispensable works:

- 2. K. Kessler.—"The Fishes of the Government of St. Petersburg." (Leninga, (St. Petersburg), 1870.)
3. K. Kessler.—"Zur Ichthyologie des Südwestlichen Russlands." (In Bull. Soc. Imp. Nat. Moscou, 1859-57.)
4. K. Kessler.—"Ichthyologische Fauna of Turkestan." (Russian. (In N. Mém. Soc. Imp. Nat. Moscou, v. 10, 1872.)
5. K. Kessler.—"Fishes of the Black and Caspian Seas." (St. Petersburg, 1874.)
6. K. Kessler.—"Beitrage zur Ichthyologie von Central Asien." (In Bull. Acad. St. Petersburg, v. 25, pp. 292-310, 1879.)

G. Seiditz.—"Fauna Baltica, Die Fische (Pisces) der Ostsee-provinzen Russlands." (Dorpat, 1877, 8vo.)

D. Germany.—[Including the Netherlands, Belgium and Switzerland.] Add to (1) Heckel and Kner, and (2) Steindachner, which are confined to the fresh water fishes, the following, of which two also include the salt water fishes:

- H. Schlegel.—"Die Fische von Niederland."—Gewerbelve Dierm.—Visschen? (Haarlem, 1862, 8vo.)
P. J. Van Beneden.—"Les Poissons des Côtes de Belgique, leurs parasites et leurs commensaux." (In Mém. Acad. Belg. par. 38, 1870, 100 pp., 8 pl.)
G. Linné.—"Histoire Naturelle des Poissons du Bassin du Léman." (Genève, Bâle, Lyon, 1874, fol., iv., 209 pp., 30 pl.)

E. Italy and Mediterranean.—Add to the "incomplete" works of (1) Bonaparte and (2) Costa the following complete one:
G. Cuvier.—"Prospetto critica del Pesci d'acqua dolce

I wander from snakes to fish, which reminds me to ask if it is not almost time for the summer lies to begin to come in? There's a lot of sanguine young men and tough "old sports" up at the Adirondacks and in Maine, scattered around the lakes there. Isn't it almost time for them to be heard from? Won't somebody with nothing better to do about your establishment collect, codify, and have the FOREST AND STREAM get out an official seaside or railroad edition of "Summer Lies by Angling Sportsmen?"

I would suggest also that a reward of a brass reel be offered to the man who can write an account of his trout or salmon fishing without alluding to the former as "speckled beauties," or the latter as *Salmo salar*. It makes one unwell to see those terms so everlastingly quoted. Let us call things by their right names, and not seek to air our science by scientific terms! Call a catfish a catfish, and not *Piscata felina*, and a big bass a big bass, not a *Basso profundo*. Let's have no D. B. nonsense, but settle squarely to "biz."

Thanks to your Michigan friend, who says he is glad to hear from me again, and is acquainted with that enterprising firm of George & Swindle. If he is a sportsman he must necessarily know that ubiquitous concern. As for hearing from me again, if that makes him happy, he is welcome, for I know no more agreeable way of passing idle time when stranded at a hotel over Sunday (while present instance) than in scribbling of the pastimes of fishing, shooting or yachting. And yet there are people who make hard work of writing; and worse still, men there are, and they manage to get through their lives, that have set for either. For such let us pray, and sympathize with them.

Speaking of yachting, the Eastern clubs, Boston and along shore, have had a foggy time of it for their Eastern cruising. I overheard a conversation at lunch the other day:

"Hello, Jim; thought you were down East on a cruise?"

"Well, I was; but out of thirteen days we only had three clear ones, and gave it up."

"Where's the yacht?"

"Oh, she's eating along."

"Where did you leave her?"

"At Gloucester."

"Why didn't you come back in her? Such a lovely breeze to-day. Come along a-flukin'."

"Oh, well, I was in a hurry. Wanted to get to town. I had to come up by rail."

I watched that fellow. I saw at once what was the matter; looked streaked about the gills, and went in for pickles and acids for his lunch. Got seasick and came ashore.

Speaking of yachting, I wish to express my personal obligations to your correspondent who has given us such a graphic and interesting account of his trip from Moosehead Lake to the St. John's. I have enjoyed his papers greatly, as doubtless have your many readers. I would rather have made the trip with him than the tour of Europe.

Well, as it is not fair to monopolize all the space of FOREST AND STREAM with my "remarks," I will put aside my stychographic and subside. Give you another dose when you have worked this off.

DICKERS.

It is herewith declared "off."—Ed. More.—O. T. WIST.

A PARROT ON ITS TRAVELS.

I.

From the Forest and Stream, Nov. 11, 1890.

The following story comes to us well authenticated: At a certain club house in Boston there was kept in the billiard room a parrot which was so tame and such a favorite that it was not confined to its cage, but was allowed the liberty of the room, and was often seen perching on the shoulders of the players. One day, when on one occasion, when the bird was seated in one corner of the room, a gentleman, a Mr. B., entered, followed by his dog, whether a pointer or a setter we do not know. The dog after a few moments wended the parrot, drew on it, and finally stood fast. The bird, which had been up to this time apparently oblivious of the presence of the canine, now turned its head slowly and in tones expressive of the utmost contempt said, "Go home, you darned fool." The dog started, looked, and then, turning tail, slunk out of the room. It is said that, although up to this time the animal had been a splendid hunter, he would thenceforth never point a bird.

II.

From the English Land and Water, July 30, 1881.

If a story we read the other day is to be relied on—and our authority is an unimpeachable daily journal published in a rare old city of the West country, famous for its sportsmen and port wine—sighting-men who still use pointers and setters had better beware of parrots. A gentleman living near the south coast had a fine pointer, of which he was very fond, the dog being staunch, with a good nose, reliable, and well trained. One day, however, the family received an addition to this fine pointer, brought over by the sailor son of the housekeeper. When first the dog came into the housekeeper's room he stopped at the doorway and pointed at the gay bird perched on the outside of its cage at the other end of the room. The parrot, not at all daunted by the dog's professional attitude, but with a look of scorn, brought over the room, "with many a flirt and flutter," and squared itself in front of the setter. The two confronted each other for a second, and then the bird remarked impressively "You're a rascal!" The dog was for a second transfixed, with horror at the unprecedented phenomenon of his "game" so rudely abusing him in the human tongue. It was too much for him; he had never "blinked" his game before, but now his tail sunk between his legs, and he slunk away. From that day a valuable dog was spoiled, for the pointer would never point a bird again.

III.

From the Sacramento, Cal., Bee, Aug. 20, 1881.

A gentleman living near Port Jarvis, N. Y., says an exchange, has a parrot which knows a good deal more than the law allows. Last summer a friend of his, whose name we withhold for obvious reasons, called at his place one day. A valuable young dog, a pointer, was with him. The two gentlemen sat on the porch smoking, and the parrot, which is very tame, was seated in an instance in the trellis about the porch. The dog was lying on the floor at his master's feet; and, finally, his attention was called to the bird, which "game" so rudely abusing him in the human tongue. It was too much for him; he had never "blinked" his game before, but now his tail sunk between his legs, and he slunk away. From that day a valuable dog was spoiled, for the pointer would never point a bird again.

BWELPS AWAYS THE COCKLES.—FOREST AND STREAM comes to us like the visit of an old friend, cheering me, and sweeping the cockle burrs out of my soul. More power to your elbow.—ST. CLAIR.

THE FRIENDS of Mr. G. L. Gidderaleve of Brooklyn, will be pained to hear of the serious accident which befel that gentleman one afternoon last week. While attempting to board a Brighton Beach train, he fell and broke his leg. At last report the unfortunate member was doing well.

d'Italia." (In Arch. per la Zool., Anat., etc., iv, 1866, pp. 47-187, with pl.)

F. France.—Add to (1) *Melanochia*, which includes only the fresh water fishes, the following (a work like Couch's), which includes also the marine species.

2. *H. Gerardi* et *R. Boulard.*—"Les Poissons; Synonymie, Description, Mœurs, Frai, Pêche, Iconographie des espèces comprises plus particulièrement la Faune Française." (Paris, 1876, 3 vols, 8vo.)

G. Pyrenean Peninsula.—Insert.
1. *P. de Brito Capello.*—"Catálogo dos Peixes de Portugal que existam no Museu de Lisboa." (In Journ. Sc. Math., Phys. e Nat. Lisboa, 1864, etc.)
2. *F. Steindachner.*—"Ichthyologischer Bericht über eine nach Spanien und Portugal unternommene Reise." (In Sitzb. K. Akad. Wiss. Wien, v. 52, 1855, et seq.)

H. North America.—Add to (1) *Richardson* and (2) *Dekay* the following more recent and important illustrated works, viz.:
1. *J. Kirtland.*—"Descriptions of the Fishes of the Ohio River and its Tributaries." (In Journ. Boston Soc. Nat. Hist., v. 3-5.)

2. *C. Girard.*—"Fishes." (Washington, 1858, 4to. In "Explorations and Surveys for a Railroad Route from the Mississippi River to the Pacific Ocean," v. 10.)
3. *J. E. Holbrook.*—"Ichthyology of South Carolina." Charleston, 1860, 4to.)
4. *F. Steiner.*—"A History of the Fishes of Massachusetts." (Boston, 1867, 4to.)

1. *Japan.*—Add to (1) *Schlegel*.
2. *P. Bleeker.*—"Nieuwe Nolezingen op de Ichthyologie von Japan." (Batavia, 1854, 4to, 132 pp., 8 pl. In Ver. band Batavia. Genovis Kurst. in Wet., v. 35.)
3. *P. Bleeker.*—"Description des espèces de Poissons actuellement connues du Japon," [etc.] (In Verh. Akad. Wet., Amsterdam, v. 18, 1876.)

J. East Indies.—Add to Hamilton, Buchanan, McClelland, Day, etc., the following, containing descriptions of all the species and including groups:
1. *F. Day.*—"Report on the Fresh Water Fish and Fisheries of Java and Borneo." (Calcutta, 1873, 8vo., 2 pl., x., 118, cecivii pp)

K. Africa.—Add to (1) Günther and (2) Peters the following, all of which are to be much more noteworthy than the unimportant chapter of Günther in Petherick's work, viz.:
1. *Sir A. Smith.*—"Illustrations of the Zoology of South Africa." (London, 1801, 4to.)
2. *R. T. Lowe.*—"The Fishes of Madeira." (London, 1843, 8vo.)

3. *A. Duméril.*—"Reptiles et Poissons de l'Afrique Occidentale." (In N. Arch. Mus. d'Hist. Nat., v., 10.)
4. *P. Bleeker.*—"Poissons de la cote de Guinée." (In Mem. Soc. Holl., Harlem, 1862-63.)
5. *F. Steindachner.*—"Zur Fisch Fauna des Senegal." (In Sitzb. K. Akad. Wiss. (Wien) 1. abth., v. 60 et seq., 1839, etc.)
6. *P. Bleeker* et *F. Pollen.*—"Poissons de Péches." (Leyden, 1875, 4to. In F. Pollen and Van Dam's "Recherches sur la Faune de Madagascar.")
7. *C. Darnbeck.*—"Die Verbreitung der Süss- und Brackwasser-Fische in Africa." (In Jen. Zeitsch. Naturw., v., 18, pp. 404-458, 1879.)
8. *P. Bleeker.*—"Contribution à la faune ichthyologique de l'île Maurice." (In Verh. K. Akad. Wet., Amsterdam, v. 18, 1879.)
9. *H. B. Sauxoye.*—"Etude sur la faune ichthyologique du Congo." (In N. Arch. Mus. d'Hist. Nat. (2), v. 3, 1880, pp. 5-58, pl. 1-3.)

1. *West Indies and South America.*—Add to (1) *Agassiz*, (2) *Castelnau*, (3) *Günther* and (4) *Vaillant* et *Bocour* the following:
5. *J. Guichenot.*—"Poissons." (In R. de la Sagra's *Histoire de Cuba*, 1843, Paris, 1855 8vo. and 4to.)
6. *F. de Tschudi.*—"Fauna Peruviana Ichthyologica." (St. Gallen, 1845, fol.)
7. *C. Gay.*—"Historia Fisica y Política de Chile, Zool., t. 2." (Paris, 1847, text, 8vo., Atlas, fol.)
8. *F. Steindachner.*—"Die Süsswasser-fische des sudöstlichen Braziliens." (In Sitzb. K. Akad. Wiss. Wien [pt. 1], v. 70, pp. 449-638, pl. 1-6, 1875 [pt. 3], v. 74, pp. 559-664, pl. 1-13, 1876.)
9. *Prey.*—"Enumeratio Piscium Cubensium." (Madrid, 1875-76, 8vo., 1 p. l., 224 pp., 9 pl.)
10. *G. D. Good.*—"Catalogue of the Fishes of the Bermudas." (Washington, 1876, 8vo. Additional in 1877.)
5. Almost equally noteworthy with Steindachner's articles are *Lutken's* and *Cope's* contributions.

M. New Zealand (and Australia).—Add to (1) *Hutton* and *Macleay's* Fishes of New Zealand the following:
2. *F. Steindachner.*—"Zur Fischfauna von Port Jackson, in Australien." (In Sitzb. K. Akad. Wiss. [Wien], Math. Nat. Cl., v. 53, 1. abth., pp. 424-440, 866; v. 56, 1. abth., pp. 320-335, 1867.)
3. *G. Kreyll.*—"Australian Vercbrata Fossil and Recent." (Melbourne, 1871, 8vo. Enumerates 439 species of fishes.)
4. *P. de Coste.*—"Contribution to the Ichthyology of Australia." (In Prov. Zool. and Acclim. Soc., Victoria, v. 1 and 2, 1873-75.)
5. *E. A. Macleay.*—"Essay on the Ichthyology of Port Jackson." (In Proc. Linn. Soc., N. S. Wales, v. 3, 1879, pp. 347-401.)
6. *C. B. Kunzinger.*—"Die v. Müllersche Sammlung Australischer Fische in Stuttgart." (In Sitzb. K. Akad. Wiss. [Wien], Math. Nat. Cl., v. 80, 1. abth., pp. 325-430, pl. 1-9.)

The second chapter is devoted to a "Topographical Description of the External Parts of Fishes," and in almost every paragraph there is some ambiguous or misleading statement. The graver errors which exist may be enumerated and commented on in the order in which they occur:

"In the body of a fish four parts are distinguished—the head, trunk, tail, and the fins. [1] the boundary between the first and second being generally indicated by the gill-opening, and [2] the boundary between the second and third by the vent. (p. 55.)" (1) Now, the boundary between the head and trunk may, in a certain sense, be said to be generally indicated by the gill-opening, but when we consider that all the representatives of the sub-classes of Leptocephalians, Cyclostomes, and Selachians fall to have the parts so distinguished, and that even among the Teleosts the Pediculates and others form exceptions,

the statement is too broad even with the word "generally" introduced. (2) The statement that the boundary between the trunk and tail is marked by the vent is unequalled; nevertheless there are a number of forms which furnish exceptions—e. g., the North American Aphrodoterids (the Amphimedonidae), the latter comprising the stickleback (and fishes) and the South American electrical eel, and all the family of Sternopygids. In the last two the vent is just behind the chin.

"In fishes which are endowed with the power of steady and more or less rapid motion, a deviation from that form of body which we observe in the perch, carp, or mackerel is never excessive. The body forms a simple, equally-formed wedge, compressed or slightly rounded, well fitted for cleaving the water" (p. 35). The form most eminently adapted for rapid progress in the water is exemplified in the tunnies and bonito; their body is fusiform, little compressed, and boldly rounded. The form of the carp is not well adapted for rapid progress, the fish being rather a slow swimmer, and is also not what is generally known as wedge-shaped.

"In fishes which are in the habit of moving on the bottom, the whole body, or at least the head, is vertically depressed and flattened" (p. 35). In Anmomydids or Sand Lances and the Ophidiids, which are in the habit of moving on the bottom and burrowing in the sand, the body and head are much compressed, and there are many other exceptions to the generalization in question—e. g., the Weevers or Trachinids and the "so-called eel-fishes," as Günther designates them. Indeed only a page further on (p. 36) Günther says that the last, as well as the eel, are "bottom-fish [the idea of the bottom being thus especially connected by a lyphean with the fish], capable of insinuating themselves into narrow crevices and holes. The form of the body is strongly compressed, as in the Band-fishes (*Trichurus*, *eglebus*, &c.)," which is also, to be sure, in length, but frequently the head and trunk participate more or less in this form and are "strongly compressed."

"The mouth is formed by the intermaxillary and maxillary bones, or by the intermaxillary only in the upper jaw, and by the mandibular bone in the lower" (p. 37). This statement is remarkable one to emanate from a professional ichthyologist and anatomist. Every tyro knows that the Leptocephalians and the Lampreys are entirely destitute of anything like true jaw bones, and all the Selachians lack developed intermaxillary and maxillary bones, and have the upper border of the mouth constituted by the palatine bones (p. 69).

"The jaws of some fishes are modified into a special weapon of attack (sword-fish, saw-fish); in fact, throughout the whole class of fishes the jaws are the only organs specialized for the purpose of attacking; weapons on other parts of the body are purely defensive" (p. 37). This paragraph caps the climax of false statements and unscientific generalizations. It implicates that the "weapons" of a sword-fish and a saw-fish are both modifications of the jaws in tantamount to the assertion that the jaws and nose are the same thing. Dr. Günther himself has known this (see pp. 336, 337 of the "Introduction"). There is possibility for difference of opinion as to what are "organs specialized for the purpose of attacking" but there is none that the saw of the saw-fish is a prolongation of the snout, and has nothing to do with the jaws, and none that "weapons on other parts of the body are" not "purely defensive." It is conceded that any part of the body which is efficient for the capture of prey, active pursuit, or for active assault on another animal, is pro tanto specialized, and there are several parts besides the jaws which are subservient to those ends. None of the sub-classes of Leptocephalians or Cyclostomes have jaws, and yet all preying, the parts concerned therein are organs for attacking. (1) In the Leptocephalians the fringed margins of the mouth are concerned. (2) In the Cyclostomes the suctorial and denigerous oral disc and the tongue-like organ are the agents. (3) In the sharks the palatines bear the formidable armature. (4) In the saw-fishes of the shark order (*Pristiophorus*), as well as of the *l. order (Pristis)*, the saw, admitted by Dr. Günther to be a special weapon of attack, is not formed at all by the jaws, but by the rostral cartilage, and thus we have an exception to the generalization specified in the same line in which it is formulated. (5) Dr. Günther himself, in his "Introduction" (p. 322), informs us, under *Alpocetas*, that "when feeding it uses the long tail in splashing the surface of the water, while it swims in generally decreasing circles round a shoal of fishes, which it thus sweeps round in an assault on its prey to their enemy." And thus, even if we discredit the use by *Alpocetas* of its tail against the whale, etc., we must consider it as to some extent a special weapon of attack. (6) The Sting-Rays (Trygonids) scarcely confine the use of their spines to defense, and these are at least offensive-defensive. (7) The Devil-fishes (Cephalopterids) ascend to use the cephalic fins for seizing and grasping (see Elliott's "Carolina Sports" p. 58.) (8) The Sticklebacks are well known to use the dorsal spines as weapons of attack, and to swim under and rip the belly of their antagonists. (9) The Surgeons, or *Acanthuri*, are credited with using their lancet-bearing tails by actively slashing therewith their antagonists, and it is difficult to surmise what would be the function of their characteristic armature save as weapons of offense as well as defense. (10) The Weevers (*Trachini*) use their opercular spines at least for offensive-defensive purposes, and Col. Montagu called them "offensive weapons."—It therefore follows, that so far from the jaws "being the only organs specialized for the purpose of attacking," modification thereof exist in (1) the mouth as a whole; (2) a peculiar tongue-like organ; (3) palatine bones; (4) snout; (5) caudal fin; (6) supraorbital spines; (7) cephalic fins; (8) dorsal spines; (9) lateral caudal spines, and (10) opercular spines.

"In Dipnoi and other Ganoids one [nostril] at least is within the labial boundary of the mouth" (p. 38). One unfamiliar with ichthyology would infer from this paragraph that one or more of several dilemmas existed, viz.: (1) that none "Dipnoi and other Ganoids" *might have more than one nostril* "within the labial boundary of the mouth." (2) that other existing ganoids had one at least, or (3) that the characteristic was of too little importance to diagnose. It is necessary, therefore, to be specific. (1) Dr. Günther at one time contended that in the Dipnoi both nostrils were intranasal, and even in the "Introduction" (p. 355) asserts that they are "more or less within the mouth." It is quite safe to say that never has a fish been found in which there were two (pairs of) nostrils within the mouth, and the existence of both nostrils within the mouth as here intended is anomalous. (2) No other existing Ganoid has been found to have two "within the labial boundary of the mouth." (3) The development of the nostrils in the Dipnoi is one of the most weighty and suggestive characteristics of the group, and one by which they contrast with all other living fishes.

"In the post-orbital part of the head there are distinguished, at least in most Teleosteous fishes and many Ganoids, the *proopercular* (p. 38). Inasmuch as none of the Leptocephalians, Cyclostomes, or Selachians are a prooperculum and no normal Teleosteous fishes fail to have a prooperculum, this statement is at least misleading, even after following full latitude to the vagueness of its phrasingology.

"The gill-opening is a foramen or a slit behind or below the head" (p. 38). This statement is absolute, although we have a number of exceptions—notably all Pediculates and, as the author himself afterwards admits (p. 39) the genus *Myxine*. These, of course, have the gills behind the head (not in front), but not immediately behind, as is evidently meant.

"Sometimes (*Symbranchius*) the two [gill] openings coalesce and form what externally appears as a single opening only" (p. 38). *Symbranchius* is by no means the only form in which the two openings coalesce into a single one. *Amphiphonus*, *Monopterus* and *Choloitraxalus* (each the type of a peculiar family) all possessing the same characteristic. "The margin of the gill-cover is provided with a cutaneous fringe in order to more effectually close the gill-opening; and this fringe is supported by one or several or many bony rays, the *branchiostegals*" (p. 38). The statement is absolute, and is not true as to the representatives of the sub-classes Leptocephalians, Cyclostomes, or Selachians, and, among living typical fishes, the Polypteroids and Dipnoans are also destitute of true developed branchiostegals.

"The space on the chest between the two ram of the lower jaw and between the gill openings is called the *isthmus*" (p. 39). The isthmus is defined as the interspace between the branchial apertures below, and consequently has no determinate relation to the ram of the lower jaw.

"*Myxine* in which the gill opening is at a great distance from the head" (p. 39). It is also at a great distance from the head among true fishes in the Pediculates, and some eels.

"The trunk gradually passes in all fishes into the tail" (p. 39). To this there are many exceptions, as in most rays, and especially in the representatives of the families Trygonids, Myliobatids and Cephalopterids, in which the tail is very attenuated, whip like, and abruptly differentiated from the trunk.

"The vent may be either close to the extremity of the tail or to the foremost part of the trunk" (p. 39). From this statement we would scarcely be prepared to learn that the vent may also be situated below the head and as far forward as the chin, near which position it is found in the Gymnoids and Sternopygids.

"In fishes in which they [the vertical fins] are least developed or most embryonic, the vertical fin appears as a simple fold of the skin surrounding the extremity of the tail" (p. 40). In *Epiplatysichthys* "the dorsal fringe is distinctly higher and rayed, and the caudal fringe is absent" (p. 696). In certain *Ophidiids* (*Ophidiopsis*, etc.) in which the dorsal and anal fins are developed, "the extremity of the tail is free" (p. 674), and in a number of other forms (*Trichurus*, *Haloauridia*, *Gymnarchid*, *Sternopygina*, etc.) in which the dorsal or anal fins, or both, are developed the caudal fin is likewise atrophied. (See pp. 436, 626, 665, 666.)

"Many and systematically important differences are observed in the dorsal fin, which is either spiny-rayed (spinous) (*Acanthopterygian*), or soft-rayed (*Malaopterygian*)," p. 41. These differences have been, however, exaggerated as to value, and, in a number of forms regarded as *Acanthopterygian*, as Günther here, the dorsal fin less "spiny-rayed" than many forms called *Malaopterygian* by him.

"In the *Malaopterygian* type, all the rays remain joined; indeed, sometimes the foremost ray, with its preceding short supports, is likewise ossified, and a hard spine, but the articulations can nearly always be distinctly traced" (p. 41). In the majority of the *Malaopterygian* type all the rays do not remain joined, for the foremost of both the dorsal and anal are innarticulate. In these foremost rays the articulation can almost never be distinctly traced. "The pectoral fins are always inserted immediately behind the gill opening" (p. 42). The pectoral fins are inserted below the gill opening in many sharks, and in all the Rays they extend far forward beyond them. Among the true fishes, in the Pediculates, their bases are in advance of the gill openings which are in their axils (p. 466).

"The pectoral fins are either symmetrical, with a rounded posterior margin, or asymmetrical, with the upper rays longest and strongest" (p. 42). In also of the fishes with pectorals having rounded posterior margins and the pectorals are said to be truly symmetrical; those in which they are most nearly symmetrical—Gastrosteids—the posterior margin is nearly vertical or emarginate. The pectoral fins are perhaps the most asymmetrical, in the sense used by Günther, in the Lepidopodinae, in which they are "inserted almost horizontally with the lowest rays longest, and with the posterior border emarginate" (p. 435).

"The ventral fins are either behind the pectorals or below them, or in advance of them" (p. 42). They would thus apparently be reduced to three categories or gradations between those, but in one family (Ophidiids) the ventral fins are at the chin and, therefore, although they are certainly in advance of the pectorals, one would scarcely be prepared to expect such a position from the phrasingology used.

"The ventral fins are generally narrow" (p. 42). This is correct, although when we consider that all the representatives of the sub-class of Selachians fail to possess the characteristic a better expression would have been desirable.

"For the definition of the pectoral and anal groups, and the determination of species, the numbers of the spines and rays are generally of the greatest importance. This holds good, especially for the ventral rays, by the number of which the *Acanthopterygian* affinities of the fish can nearly always be determined" (p. 43). Dr. Günther placed the Gadoids fishes *Epicopus* (*Merluccius*), *Hapsisiptera* (young Gadoid), etc., among the *Acanthopterygians*, and consequently has shown by his own example the caution with which this character must be viewed.

"The numbers of the pectoral and caudal rays are rarely of any account" (p. 44). They are generally of quite as much account as the dorsal and anal rays, and in the case of the fully developed rays of the caudal, of more account—in almost all cases of the highest systematic importance.

"In some Gobioidei (*Perrinitidinus*), Trigloids, Scorpenoids and Pediculate the pectoral fins are perfect organs of walking" (p. 45). It is certainly by the utmost stretch of language that the pectoral fins in any of the Trigloids or Scorpenoids can be said to be organs of walking, and it cannot in any logical sense of the word be said to have that function at all.

"Scales of fishes are very different from those of reptiles, the latter being merely folds of the cutis, whilst the scales of fishes are distinct, having elements developed and grooves

or pockets of the skin, like hairs, nails or feathers" (p. 46). There are no such differences and relationships. It is possible that Mr. Günther may have been deceived by superficial appearances and confused and reversed what he had read of or been told by others. The facts in the cases are thus formulated by Dr. Baillet in his "Treatise on Comparative Embryology," just published (p. 2, 1936): "The type of embryology developed on the inner side of the general epidermis is confined to the Pisces, where it appears as scales. * * * The type developed on the outer side of the epidermis is almost entirely confined to the Amphibia and Amniota [Reptiles, Birds and Mammals], where it appears as scutes, feathers, hairs, claws, nails, etc."

"Both kinds of scales (the cycloid and ctenoid) may occur not only in the same genus (fishes, but in the same fish" (p. 47). The two kinds may not occur, but do actually exist together in very many fishes, like the Acanthopterygian type, and especially in some of the Gobies, in which all gradations are found.

"All scales are continually growing or wasting away on the surface, and it seems that some fish at least—for instance Salmonoids—shed them periodically" (p. 60). This conceals the most misleading and erroneous ideas as to the genesis, development and mode of growth of scales. The periodicity and therefore regular shedding of scales, if it occurred, would come within the cognitions of numerous practical men—fishermen, fish-dealers, pisciculturists, anglers, etc.—and who of them has observed the pretended phenomenon? Periodical shedding would imply periodical renewal of scales. What can Mr. Günther's ideas respecting the formation of scales lead him to believe that such things occur? It is not worth while, however, to pursue the vagaries of our author.

The contradictions of the generalizations just indicated are in almost all cases furnished by the same work, and when such has been the case, the author has not only suggested where the correct information is given. Unquestionably, Mr. Günther has known better than might be inferred from the above enumeration of errors. The paragraphs in question are indeed due not to positive ignorance but to temporary forgetfulness (not momentary, for it has lasted from the time of composition to final correction of the proofs) and crude generalization. They are really the expressions of a peculiar mental habit, and interesting from a psychological point of view. Nevertheless the statements have been made, and it will be well to be explicit and to let the reader know what the author may have almost become part of his being to ascertain that his teacher knew better. What is wanted is that he should teach better, for the work will not be generally purchased as a psychological curiosity, but for the information which it is believed to embody and which the author's reputation will be considered to guarantee. To those who know how to correct all the misstatements the volume is of no use.

It will certainly appear probable that if the author has failed grievously in the treatment of a branch of his subject of which the data are most readily attainable, which is most within the general purview, and which has been the special object of his study, the chances are that he has failed at least equally in his consideration of the more remote and less known branches. Such anticipation will be found to be fully realized. Every chapter, every section, will be found to be impregnated with errors. The mental idiosyncrasies already indicated may crop out in the most unexpected places, and there is no telling where fallacy of some kind or other will be concealed. The most apparent and radical defects are the disproportion and incongruity manifested in the systematic portion of the work. The author seems indeed to be destitute to an unusual degree of a sense of proportion and of taxonomic tact. To enter on a consideration of such questions would, however, transcend the limits of a review. Suffice it to state that he is in discord with all the best systematic zoologists and original investigators. He commences with the Sharks, and thence proceeds successively to the exposition of the Rays, Holocephalids and Gobioids; and then considers the Pisces, whence thence jumps to the Physostomes and thus places farthest away from the Ganoids the types most like them, skips again to the Lophobranchiata, and ends the Teleost series with the Trunk fishes, after which follow the Cyclostomes, the most generalized and specialized of fishes, and which in a natural arrangement would be near the opposite extreme, being consequently most approximated.

In these strictures it has never been forgotten that work should be considered with reference to the circumstances under which it was done. Let it be again recalled then, that Dr. Günther published his truly great work on Fishes between the years 1859 and 1870, and that there was a comparative degree of harmony between its execution and the times and conditions then prevailing. As has been indicated, however the author's conceptions when once expressed became fixed and crystallized in the type in which they were cast. The "Introduction" is, therefore, not an exhibit of the present state of Ichthyology, but of (1) Dr. Günther's ideas of the families, etc., defined in 1859 to 1870, in which (2) the families of "Acanthopterygians" are arranged according to his scheme of 1801, and (3) the "orders" retained with the limits, and ranked with the sequence postulated in 1871; (4) genera described since by Dr. Günther (and a few others) are intercalated. The systematic part of the work might therefore have been prepared by any copyist or cut out of the pages of the "Catalogue of the Fishes in the British Museum" and arranged as indicated.

Never has a score of years been so fruitful in researches and results as the period between the inception of Dr. Günther's "Catalogue" and the present. In that interval Darwin has given to the world his immortal work and revolutionized the methods and objects of biological investigation, while laborers almost innumerable have elucidated the various branches of Ichthyology—the anatomy, embryology, the past history, the systematic relations, the species, the geographical distribution of forms, the faunas of the world. All these have been in view for Dr. Günther. One of the principal discoveries—that of *Osteoichthyes*—has been recognized by him simply to become a stumbling-block and involve him in one of the most astonishing misuses of error of modern times. Unquestionably the most prominent characteristic of the present time is the acceptance of evolution and its ramifications into all the details of biological investigation and classification. But in the "Introduction to the Study of Fishes" no allusion has been made to this principle and the author's treatment of his subject indicates that it has been practically ignored. There is, however, no group of animals to which its application is more fruitful in suggestive

and profitable results than the branchiferous vertebrates. Still scattered in the waters of the globe live here and there as solitary survivors, representatives of types once abounding in species, that enable us to trace the lineage of our brusch from the humblest beginnings to the specialized Acanthopterygian and grotesque Plectognath and Lophobranchiatic fishes in one glissade and to man in another. And in no branch have there been so many the genesis and development of different structures more in hand than do the fishes afford in the case of the vertebrates. Morphology and taxonomy march hand in hand; the successive stages of development of the skeleton, the nervous system, the respiratory system, the viscera, etc., are instructively indicated by the conditions of those structures in the Pharyngobranchiata (*Aplousia*), Cyclostomes (Lampreys, etc.), Plagiostomes (*Sharks*), Holocephali (*Cyprintra*), Dipnoi (*Ceratodus*, etc.), Polypteroidei, Lophoselachii, Amioidei, the allied Physostomi (*Elopids*, *Albionids*, etc.), the Haplomi (*Pikes*, etc.), the Percosoids (*Atherinids*, etc.), the typical Acanthopterygians (*Perches*, etc.), and the Anacanthinos (*Cod*, etc.); the grades of organization in their turn proclaim the natural sequence of the types enumerated. It is strange that evidence so striking as that furnished by the forms in question should have been so entirely overlooked by Dr. Günther. The failure to appreciate the facts doubtless results from the method pursued. A certain type has been assumed as "higher" on account of vague psychological conceptions, and with this as an initial form, others are successively taken up, till the author has lost his bearings and recklessly dealt with the remainder. A moral seems to be pointed by the result. Scientific taxonomists have been for some time wont to start their phyla with the lowest and most generalized known type and by successive approximations complete the series, and if they will, in deference to ancient custom, have the highest first, reverse the series if they have obtained. Dr. Günther's arbitrary scheme of least to others somewhat like it, teaches us that after all the right way is the only one to be followed. Had our author been compelled to begin his subject with the generalized and then proceed with the more and more specialized types the faults that now pervade his work would doubtless have been fewer.

The existing genera recognized by Dr. Günther number fully 1,136, of which 638 are only noticed by name, while the remaining 478 are more or less satisfactorily diagnosed. If the same system of classification adopted for the other groups of vertebrates should be applied to the fishes, the number indicated would be nearly doubled.

THE RATTLESNAKE AND THE COPPERHEAD.

CASHIER'S VALLEY, N. C.

FOR the past two years I have had a good opportunity for studying the habits of the rattlesnake; and for the benefit of your readers will give what I know to be facts. In the mountain counties of Western North Carolina the line has been where this family of snakes were quite numerous, but of late years since the mountaineers have begun to raise so many hogs that range *ad libitum* all over the country the rattlesnake has suffered in consequence therefrom. This snake crawls out from its winter home from among the cliffs and hollow logs in the month of June, and begins its search at once in quest of food. Their favorite subjects for food are squirrels, mice, birds, rabbits and not frogs.

There seems to be a wide difference of opinion in regard to how the sex of this snake may be determined. It is the general impression that the black color is the male, and the yellow or buff the female; but on close inspection it has been found that this will not do to settle on in every instance in regard to sex. There are instances where the male has been known to be of a darkest yellow hue and the female of a deep black, but such is of rare occurrence. They move about in a slow manner and sometimes charm their food; at others they attack it or lie in wait for it to come within range of their power. If their food is very large, like the rabbit, it takes them more than a day to swallow it. As soon as they catch any little animal it is held firmly in the coils of the snake about the middle of its length, while the head and mouth is engaged in depositing a thin, slimy fluid all over the animal and then the process of swallowing begins. After it has lodged its food into its body the snake remains in a torpid state from two to nine hours—according to the size of food swallowed. While in this state their food is undergoing digestion.

In the month of August, when the weather is the hottest and the small streams begin to dry up, the "rattlers" begin to come down from off the mountains in search of running water in great numbers. Then their mating season begins. While en route to hunt water at this season is the most dangerous time to meet this snake, for they are nearly or quite blind, mad, and of a nervous nature. They come about in a gait at this season at a head of a spring of some size, and then they pair and remain near the spring head until the season is passed, which lasts from one to two weeks, or until a heavy rain has fallen. Their young are born about the 15th of September, and number from six to twelve, according to the age of the mother. They do not lay eggs as other species of snakes do. This is a settled fact, although it has been often disputed. All harmless snakes have been laid and lay eggs; all poisonous ones have been found to lay no eggs. The former matter is not a matter of dispute, but the latter inclined to run and hide while attending to the wants of her young than the male. They have regular periods of the day in which they move about; they never move from their coiled position while the dew is on the grass and weeds or bushes. When the sun goes down and the air is chilled they seek some dry spot and coil up, and there remain until ten o'clock next day before they begin to move about again. This statement explodes the idea that has gained much ground among the ignorant class of mountaineers, who are afraid to stir out at night for fear of being bitten by the rattlers. With few exceptions all the living things upon the face of the earth rest themselves at night. We make a positive assertion that no reliable person has ever seen a rattlesnake after night crawling about in this mountain section.

The reason for their quietude is because the air is chilled, and the grass and weeds are full of dew, and they are either asleep or prefer to remain coiled up until the sun shines out to warm them up. The rattlesnake is a very honest snake. If it does not have a mouse, it kills the mouse itself into a coil, and gives an immediate fire, loud alarm with the rattles from which it takes its name from. This alarm is made with a number of little rattles on the end of their tails, which are from three to twenty in number—according to the age of the snake—when they are about six weeks old three rattles appear, and from one to two appear each year alternately.

On the end of the rattles is situated what is called a button, which is nothing more than an undeveloped rattle. When they give this alarm then is the time that they are mad and will strike or bite. If very mad when in this position they will bite at once; if only a little angry they will make a motion with the head, which amounts to nothing. They do not open their mouths with both jaws to bite, but only with their upper jaw in which is located two, and only two, fangs in the shape of a fish hook with a groove on the end next to the inside. These fangs cut the prey into the object they observe. The snake wishes to bite, and these fangs are surrounded with a fleshy sack which contains a poisonous fluid, which is injected into the cavity made with the fangs while the snake is in rage. This is the dangerous element that does the harm when bitten by a rattler. This fluid is of a ran color, and in bulk about the size of a grain of wheat—it immediately ascends the veins of the system when brought in contact with them, and throws the subject into spasms. The rattlesnake does not poison its food when struggling to master it, nor do they bite while forcing their food into their coils. They never bite or attack an object without giving an alarm, this entitles them to be classed as honorable creatures.

There is a snake which is considerably smaller than the rattlesnake, with no rattles, but resembles the rattler in many respects in regard to color and habits, that is called the "pilot snake." This snake gets its name from being a guide to the rattlesnake and second to be a guide for them. They are the forerunners of the rattlers in the spring, and take the lead in going to their winter quarters in the fall. The pilot is regarded to be more poisonous than the rattler, and it is said that if a person is once bitten by them they never recover from the attack; but if death is not immediate the poison never leaves the system. J. I. LOMBARD.

There are some points in our correspondent's article on which we hold a different opinion. We doubt the story of American serpents covering their food with saliva before swallowing it. We have fed snakes and have not observed this, which has been a standard "fact" of writers on popular natural history. We wish that the three men most qualified to speak on the feeding of snakes, Mr. Conklin, of the Central Park Menagerie, Mr. Frank Thompson, of Cincinnati, and Mr. Brown, of the Philadelphia Zoological Garden, would give their experience, which has been very great. Our correspondent has evidently studied his subject some, and is correct in saying that the rattlesnake and "pilot," which is really the copperhead, form the greater part of the diet of these ore-viviparous—that is, they have eggs, but retain them in the body until hatched; but all harmless snakes are not oviparous. The ancient story of the copperhead "piloting" the rattler early needs proof. "The question, why should he? naturally comes up. On the subject of charming we do not care to express an opinion at present. We will be glad to hear from him again.

METALLIC CASTINGS OF DELICATE NATURAL OBJECTS.—The following process is recommended by Ablass for producing metallic castings of flowers, leaves, insects, etc. The object to be cast is placed in a shallow tin or box, and the lead in a dead beetle for example, is first arranged in a natural position, and the feet are connected with an oval rim of wax. It is then fixed in the centre of a paper or wooden box by means of pieces of fine wire, so that it is perfectly free, and thicker wires are run from the sides of the box to the object, which subsequently serve to form air channels in the mold by their removal. A wooden stick, tapering toward the bottom, is placed upon the back of the insect to produce a runner for pouring the metal into the mold. The stick is covered with plaster of Paris, and one of brick-dust, mixed up with a solution of alum and sal ammoniac. It is also well first to brush the object with this paste to prevent the formation of air bubbles. After the mold thus formed has set, the object is removed from the interior by first reducing it to ashes. It is therefore dried slowly, and finally heated gradually to a red heat, and then allowed to cool slowly to prevent the formation of flaws or cracks. The ashes are removed by pouring mercury into the coils, and shaking it thoroughly before pouring it out, and repeating this operation several times. The thicker wires are then drawn out, and the mold needs simply to be thoroughly heated before it is filled with metal in order that the latter may flow into all portions of it. After it has become cold it is softened and carefully broken away from the casting.

SNAKES AFTER SWALLOW'S EGGS.—FOISE BARTRICKS, Idaho.—I saw, in 1878, two chicken snakes (Box's black snake) or racers killed at Camp Supply, Indian Territory, while they were in the act of swallowing eggs and young ones, which were sent me by the Quartermaster's store at Fort Smith. The snakes were fifteen to twenty feet from the ground.—T. E. WILCOX.

THE CANADA PORCUPINE IN MARYLAND.—Referring to the paper on the occurrence of the Canada porcupine in West Virginia by Mr. Goode, in Vol. I, Proceedings U. S. National Museum, page 284, I wish to mention that this porcupine, *Erethizon americanum*, is still, though rarely, found in Maryland, in the museum of the Maryland Academy of Sciences is a specimen from Allegany County, Maryland. Another specimen I saw living in confinement in the Blue Ridge Mountains, where it was caught two years ago. One was killed quite recently near Elk City, Maryland.—OTTO LUIGER, Maryland Academy of Sciences.

RANGE OF THE BEAVER.—NEWBURGH, N. Y.—I spent last winter in Texas, principally in the counties of Concho, San Saba and McCullough, and saw many indications of beavers through that section. All the large streams and many of the smaller ones are inhabited by them. These counties are situated between 30 and 32 degs. north latitude. They seem to be quite numerous, but their fur is of little value. I think that they are found much further south in Texas than these counties.—L. M. H.

"THE OWN AND HOW TO USE IT" is the title of a book written by Mr. Gwynne Price, a well-known pigeon shot of St. Louis. The book deals mostly with trap-shooting, being largely an account of Mr. Price's experience at the traps. There are many hints about loading, etc., which may be useful to amateur pigeon shooters. The author, it appears, had, previous to writing his book, been presented with some of Dittmer's detouring powder, and evidently felt it duty bound to puff it. Here Mr. Price is behind the times. The FOREST AND STREAM exposed the dangerous nature of that compound so thoroughly a year ago that advice to use it now can hardly help the powder or redound to the credit of the man who gives it.

* * * The horny teeth of the Cyclostomata (Lampreys, etc.) are structures belonging to this group.

Game Bag and Gun.

FOREST AND STREAM GAME TABLE.

OPEN SEASONS.

The seasons, in which it is lawful to shoot game in the several States and Territories, open as designated in the following table:

Table with columns: States, Deer, Woodcock, Quail, Stuffed Game, Pinnated Grouse (Chick-ch), Wild-fowl, Wild Turkey. Lists months and dates for various states including Ala., Calif., Conn., Dak., Del., D. C., Ga., Idaho, Ill., Ind., Iowa, Ky., La., Me., Mass., Mich., Minn., Miss., Mo., N. C., N. H., N. Mex., N. Y., Pa., R. I., S. C., Tenn., Tex., Utah, Va., Wash., W. Va., Wyo.

Autopole—Col, Sept. 1; Idaho, Aug. 1; Neb, Oct. 1; Nev., Aug. 1; N. Mex, Sept. 1; Utah, Aug. 1; Wyo, Aug. 1. Buffalo—Colo, Sept. 1; Neb, Oct. 1; N. Mex, Sept. 1. Deer—Ala., Aug. 1; Cal, July 1; Ga, Oct. 1; Kan, Aug. 1; Miss, Sept. 1; Mo, Aug. 1; N. C, Oct. 1; S. C, Oct. 15. Elk—Colo, Sept. 1; Idaho, Sept. 1; Mont, Nov. 1; Neb, Oct. 1; Nev, Aug. 1; N. Mex, Sept. 1; Or, July 1; Utah, Aug. 1; Wyo, Aug. 15. Mountain Sheep—Col, Sept. 1; Neb, Oct. 1; Nev, Aug. 1; N. Mex, Sept. 1; Utah, Aug. 1; Wyo, Aug. 15. Otter—Cal, Aug. 1; Del, Sept. 1; D. C, Sept. 1; Pa, Sept. 1. Rattlesnake—Del, Sept. 1; D. C, Sept. 1; N. J, Aug. 25; Pa, Sept. 1. Snake—Dakota, Aug. 15; D. C, Sept. 1; S. C, Sept. 1; N. C, Sept. 1.

was entered upon and participated in by most of the party. The prize, a silver cup with crossed rifles on the face, was won by a Livestock Wildlife with a score of thirteen. Other sports were engaged in until 7 o'clock in the evening, at which hour the company made a start homeward, arriving to the city about 9 o'clock.

ARE THEY MONOPOLIES?

SANDUSKY, O., Aug., 1881.

Dear X: I have just received a copy of the FOREST AND STREAM of Aug. 18, and I presume I am indebted to you for it. If so, accept my thanks, and I thank you also for the article entitled "Are They Monopolies?" which I feel sure is from your ready pen. I approve of every word of it. But it seems strange that any such defense should be needed. Why should not a man or a corporation have as good a right to own wet land as dry-land covered with water as land above water? Why should not be permitted to own what be owned if he the water belonging to him as well as on the land? If he cannot let an abolish all right of property (I suppose this is what "Didymus" and all arrarian, communistic sharks want) let everything be in common and thus return at once to the worst state of barbarism and confusion. I advised the Colonel of the unusual number of ducks in the marshes for this time of the year, have sent my guns and ammunition forward, and hope to meet you and the Colonel on the 1st prox. E. B. S.

[The above letter was sent to us by its recipient for publication.—Ed.]

INDIANA GAME LAW.

FORT WAYNE, Indiana, Aug. 25.

Editor Forest and Stream: Herewith find statement of the Indiana game law, as approved April 14, 1881. Open seasons, penalties, etc.—Deer, October 1 to January 1; penalty \$10. Quail and pheasant, Oct. 15 to Dec. 20; penalty \$3 for each bird shot out of season. Turkey, Nov. 1 to Feb. 1; penalty \$2. Prairie chicken, Sept. 1 to Feb. 1; penalty \$10. Woodcock, July 1 to Jan. 1; penalty \$2. Duck, Sept. 1 to April 15, penalty \$2. Penalty of one dollar for each and every quail, pheasant, prairie chicken, woodcock or duck exposed to sale, possessed or pursued with intent to kill during close season, and same penalty selling or attempting to sell any of said birds that have not been shot. Each bird creates a separate and distinct offense. Unlawful to take any fish with a net, seine, gill or trap of any kind (minnows excepted) or set net, weir or pot at any time, penalty not less than ten nor more than twenty dollars for each fish so taken. The use of gill and spear permitted in March, April, May, November and December. Same penalty attaches for killing or attempting to kill fish by use of poison, drugs, grant powder, dynamite, etc. Penalty not less than ten nor more than two hundred dollars and imprisonment for any determinate period added, for using or placing in the water any dip net, gill net, set net, or seine, except for minnows for bait or aquaculture. WILLIS D. MAIER.

NOTES FROM HOLLIDAYSBERG.

HOLLIDAYSBERG, Pa., Aug. 22.

SINCE the opening of the woodcock season, July 4, the weather has continued very dry and warm, but several bags of nearly a score have been made. On the Fourth of July our party of four guns bagged forty-three cocks, all nice plum birds, as sweet when plucked as when shot. We have been out several times since then and succeeded in making good bags, although none so large as the first. On Tuesday, Aug. 19, our party of three—P. B., P. W. and self—shot six brace of cock, among many doves, one rail (a scarce bird among our mountains) and a huge gray crane over four feet high, with a spread of nearly six feet. P. B.'s ten brace "barker" brought down this gentleman at over seventy yards, with No. 8 shot. Our shooting nearly all in the tall weeds and willow scrub of the creek and river bottoms and it requires good dogs and snip shooting to bag the birds. With a few exceptions along the spring runs the woodcock leave us at the latter part of this month and we see them no more till another season.

Quail have been almost exterminated since the repeal of the bounty on hawks, owls and "other vermin," and quail shooting is a thing of the past. Ruffed grouse and rabbits are, as usual, abundant and promise good sport this fall. Gray and black squirrels are reported numerous on the mountains and wild turkeys and a few deer remain for those who can get them.

Although the old canal reservoir near this place, which is over a mile and a half long, by three-quarters wide, and in some places fifty feet deep, and which was stocked with black and grass bass by the Fishery Commissioners has been drawn off, yet good catches are made in the "Junjata" after dark. Quite a number of fishermen use the fly in catching bass but the majority still stick to their old love, the minnow.

One of our sportsmen recently shot and killed a large crane, snowy white with a pinkish bill, and the bird was sent to your city to be mounted. T. D.

THE WILD TURKEY CALL.

Editor Forest and Stream: I have read interesting articles on wild turkey hunting in your paper, but do not remember to have seen any on the call notes of the wild turkey. On several occasions I have flushed flocks of wild turkeys and all my calling would not bring them back. Once I was sitting with a friend on a log in a dense woods. My friend leaned down me his "caller," made the small sound of an ox-bow. I made frequent calls of seven notes, commencing slowly and rising fast and high. After calling a long while and submitting to the upbraiding of my friend that "no sane man ever used such notes to call turkeys," etc., etc., I discovered that we were surrounded by wild turkeys. I killed an eleven-pound young cock and the flock scattered. All the calling I did failed to bring one of them back or even get a response. Some hunters say four calls are proper, and others say five, with a rising inflection. I have often tried this and as often failed. Which are the proper notes to call a wild turkey? Will any of your readers explain?—KROOK.

We trust that some of our experienced turkey hunter, will compare notes and give us the result of their use of the various calls. We have used the common lone call which is made from the common bone of the bird. The ends are cut off and the call-note is made by slowly sucking through the tube. With a narrow chisel hollow out a piece of dry cedar, two inches long and one and one-half inches wide and one-quarter inches thick, so that the sides are about as thick as a piece of tin; but do not let them be too delicate. It should be hollowed out within a quarter of an inch of the bottom and ends. Taking this simple call between your thumb and fingers, rub it crosswise against the butt of your gun or on the barrels. No ro-in is required; the simple wood can be manipulated with a little practice to perfectly imitate the turkey call.

AN IOWA GAME CENTRE.

LOCATION, Humboldt County, Iowa. Can be reached via Illinois Central Railroad to Fort Dodge, thence by Ft. Ridgely Railroad to Humboldt, or by Iowa Division Chicago, Millwaukee and St. Paul Railroad to Agona and thence by stage to Humboldt. Good hotel accommodations at Humboldt, Dakota or Rutland at \$1 per day. Guides not needed. Teams, \$3 per day. The fish are pickerel, wall-eyed pike, black bass and rock bass in great abundance. Game birds are ducks (mallards, teal, wood, spring-tail, spoon-bill, red-heads, hooded mergansers and buffle heads), Hutchins's geese, Canada geese, snow geese, white-fronted geese (brant), sand-hill and whooping or white cranes, pinnated grouse, quail, golden plover, Wilson's snipe, rail, long-billed curlew, Hudsonian curlew and rabbits or hares.

Of course not all of this game can be taken at any one time of the year, but in their season may be taken. The west fork of the Des Moines, above Rutland, is the best fishing grounds in Iowa from Sept. 1 to Nov. 1. Black bass and wall-eyed pike may be taken beyond desire. Bass and pike of six and eight pounds are very common. During September plumed grouse may be killed by the hundreds, but October and November are the months for ducks, geese and cranes. Hunters will find it easier to reach the shooting and fishing grounds by can ping out.

Address Chas. Sherman, Ira E. Weleb, or the writer, at Rutland, Humboldt County, Iowa. N. A. Proc.

FAMOUS FOX-HUNTERS.

FOME EXTRAORDINARY RIDERS.

IT is astonishing with what enthusiasm a man—or woman—enters upon the sport when once a taste for it has been acquired. A regular fox-hunter dies in harness; the older he grows the stronger becomes his love for the pastime. Such, at least, may be inferred from the lives of men and women who have gained renown in the field. Men who were as blind as bats have followed the hounds with the best riders of their day, and, in one instance, the want of both hands and feet has not deprived a hunter from being in at the death. This seems hardly possible, but of it there is ample evidence. Of blind fox-hunters a dozen or more instances might be given.

The Reverend Edward Stokes, of Blaby, county Leicester, England, may be cited as one such instance. He lived to be ninety-three years of age and died in 1797. At the time that he last his sight, then forty-two years old, he had acquired a taste for fox hunting from his father, whom he had succeeded as rector of the little church at Blasley. During his boy life he never lost an opportunity to mount and follow the hounds, accompanied by an attendant, who rang a bell as they approached a fence or hedge, and both went over together.

But the reverend gentleman was outdone by an officer of the British army, who equally blind, was noted as one of the boldest riders in the M-rquiss of Granby's hunts. He had no attendant, but went with the crowd and relied, on some one to take for fox hunting from his father, whom he had succeeded as rector of the little church at Blasley. During his boy life he never lost an opportunity to mount and follow the hounds, accompanied by an attendant, who rang a bell as they approached a fence or hedge, and both went over together.

But the reverend gentleman was outdone by an officer of the British army, who equally blind, was noted as one of the boldest riders in the M-rquiss of Granby's hunts. He had no attendant, but went with the crowd and relied, on some one to take for fox hunting from his father, whom he had succeeded as rector of the little church at Blasley. During his boy life he never lost an opportunity to mount and follow the hounds, accompanied by an attendant, who rang a bell as they approached a fence or hedge, and both went over together.

John Metcalf was a still more remarkable lover of the chase. He was long known about Knareborough as "Blind Jack" and was the first person who set up a wheel carriage in Harrowgate for the conveyance of passengers to and from places of resort. At one time he was a musician in Colonel Thornton's volunteers (1745) and was taken prisoner at Falkirk. Singularly enough, his man established himself as a common carrier between Knareborough and York, and, blind as he was, served as guide through the intricate paths of the forest, when covered with snow as well as at other times. Fox-hunting was to him a delight, and he entered upon it heart and soul, following the hounds both on foot and in the saddle, with the greatest precision and without meeting with any serious accident. More than this, he explored the neighboring country, projected and laid out roads and built houses and bridges by contract.

THE LAKE HOPATCONG EXCURSION.

THE beautiful New Jersey lake lies among the Schooley Mountains, 1,800 feet above the level of the sea. We visited last week by invitation of the Washington Gun Club, of Brooklyn, on the occasion of their first annual excursion. The lake is famous for its pike (N. Y. pickerel) fishing and also contains black bass, perch and other fish. The invitation set forth that a dinner, a boat race, a rifle match and a sail on the lake were to be enjoyed, as well as the music of Frank's brass band. So on Thursday, Aug. 25, we boarded the train at Hoboken and, after a two hours ride to Hopatcong station found a little steamer, which took us three miles up the canal and one of its feeders and then up the lake to the Lake View House, where the sports were to be held.

First came the boat racing, in working boats, for a handsome cup, given by the host, Mr. A. J. Zueck. There were to be four preliminary races and the winners were to then row for the prize. The first one had four entries, the names being given in the order of their arrival at the finish: Dr. Hughes, Mr. Bernheimer, A. Altenbrund and Jost Miller. The second heat was between Rubensan, Fieldman, C. O'brig and Cotter. The third between Mr. Griffith, of the Dela wares, Lackawanna and Western Railroad; O. Prety, Wit wick and Rogers. The fourth between Messrs. Trot, Condit, Hopps and Bulger. Then came the final race for the cup between the winners. They came in in the following order: Dr. Hughes, Trot, Griffith, Mr. Rubensan declining to toss for boats was not permitted to compete. The course was one-fourth of a mile; no time taken. Judge, Mr. Fred Mather, of FOREST AND STREAM. A shell race, with single shells, over a half-mile course, followed between Messrs. Ravens and Ross, won by the former.

Dinner was then in order and the following menu was served:

- SOUF. Green Turtle, à la Reine. FISH. Boiled Lake Hopatcong Pike, with butter sauce. ROAST. Fillet de Boeuf, à la Champignon, with Asparagus. Green Corn and Duck and Chicken. Spring Lamb Chop, with French Peas, Green Corn and Lettuce salad. COMPOTE. Vanilla Ice Cream, with cake. DESSERT. Washington Gun Club Pudding, Cheese.

After dinner Mr. Henry Altenbrand, the President of the club, in a neatly worded speech welcomed the guests in attendance and expatiated upon the grand and attractive of outdoor sports in general. Remarks were also made by Dr. S. J. Brady, Mr. Mather, Captain Miller and Mr. W. Leslie Wade. Following dinner, the shooting match, open to all

good send-off." Thomas Moody was of this number. For thirty years he was whipper in for George Forrester and when he died he was carried to his grave by a number of old earth-stoppers, who mourned his involuntary departure. His favorite horse, carrying Moody's last brush in front of his bridle, was led behind the corpse and the cap, whip, boots and spurs of the whipper-in were hung across the saddle. After the service, as requested before his death "three clear, rattling viv halloes" were given over his grave, and when they had done this his followers felt that they had paid the highest mark of respect to his memory.

But Miss Mary Breese, who lived to see seventy-eight years (fox hunters are usually long-lived), went Moody one better. She regularly took out a license, kept good horses and hounds, and as a shot was not surpassed by any sportsman in Norfolk County. Daily leaving the chase, and expecting and hoping to keep it up in the world to come, she gave orders at her death that her favorite mare and dogs should be killed and buried with her.

The foregoing reference to a license calls to mind a disquisition that once took place in England, growing out of the subject, and how happily an astute magistrate bridged over the difficulty. The question was raised whether a sportsman who followed a pack of hounds kept by subscription, he being known as a subscriber, made himself liable to a penalty by sporting without a license, and, as the members of the club could not decide it, it was referred to a man of law, who gave the opinion that "the Game Certificate Act, George III., requiring that "every person who shall use any dog, gun or other engine to destroy game" did not apply in such case, "for the members of a club do not use dogs to destroy game, it being the object of the association to hunt or course by which game will be destroyed." The above opinion was accompanied by the suggestion that if a member of the club kept the pack and took out a certificate, there was no reason in the world why he should not include the other members to hunt with him—a step that would not make them liable under the Certificate Act or any other existing game law.

Every hunter holds that there should be game laws and that they should be obeyed, if not too stringent, and with them it is a matter of faith that the fox was made to be hunted.

"Nature's instinctive laws the beasts obey,
Imprinted in their breasts by Nature's God,
And say, vain man, did not the same great cause
Which gave the fox to taint the ground with scent,
Give to the dog sagacity and speed?"

The poet evidently knew nothing of an artificial scent, and if he had lived in Germany he would have known that the scent in fox-hunting could be dispensed with altogether. When the Emperor of Germany sent an embassy to Constantinople (1664) to settle terms of peace, marked attention was shown the ambassador and his suite on their arrival at Vienna. Among other things a fox-hunt was got up for their benefit. After dinner the Emperor, accompanied by the Empress and Princesses, led the way to a park about a mile from Vienna, where four or five acres of ground were inclosed with canvas as high as a man's head, which was kept in place by means of poles. Within the inclosure was another line of canvas, which made a lane breast high. At the proper time and at a given signal eight or ten foxes were let loose by the master of the hunt, and were chased by beagles, while the hunters, each with a net, did their best to bag the game. What with the aid of the nets and dogs, and a free use of sticks, seventy foxes were killed, which the Emperor said was enough for one day.—CHAMPLIN in the Evening Post.

TRAJECTORY CURVES OF SPORTING RIFLES.

DURING the spring I continued some experiments made last spring in regard to the trajectory curves of the standard sporting rifles of American make. Having better facilities, the experiments were more extended and consequently more satisfactory.

Seven screens were used, instead of four, at one time, one at each twenty-five yard point and one at the highest point of the curve. Walter Cooper, of Bozeman, the most extensive gun dealer in Montana, placed at my disposal all of the standard sporting rifles of his establishment, as also the standard fixed ammunition.

Where the same standard of rifles were used the trajectories agreed very closely with those obtained a year ago, making allowance for difference of barometric pressure and difference in direction of wind.

Experiments were first made to locate the highest of each curve. Screens were accordingly placed at 100 yards, plus 25 feet (325 feet), and 100 yards, plus 40 feet (340 feet). For balls as light as the 1873 Winchester (200 grs.) the highest point appeared to be at or near the latter point, or .566 of the total range. For the heavier balls it appeared to be at or near the former screen, or .643 of the range. This was to be expected, as the lighter ball falls much more rapidly in its descending branch of the curve. I inferred from experiments made last spring that this point was about .55 of total range and so stated in article in FOREST AND STREAM. Prof. Bashforth, in his work on "The Motion of Projectiles," gives examples from the curves made by rifle balls of from three to six inch calibre; that for Ogival-headed balls, this point was .53, and for spherical balls .55 of range, initial velocity being from 1,300 to 1,500 feet per second.

A great deal depends upon the weight and velocity of each ball in determining this point, but from .53 to .57 will cover every case, I think.

It appeared desirable to test whether the tissue paper of the seven screens had any effect in decreasing the velocity of the balls. Shots were accordingly fired from same rifle, under like conditions, first through two screens near the centre and then through the whole set, seven screens, the highest point of curve in each case being carefully measured. No appreciable difference could be discovered in the curves and it was inferred that the tissue paper due to the paper screens might be practically disregarded.

Subjoined is a table, a careful study of which will give all the information desired as to atmospheric conditions, features of rifle used, weight of powder and ball and resulting trajectory curves. This table contains a few of the many shots fired from the several rifles.

The rifles reported here were either new or, if used, were in first-class condition and were mostly furnished from Walter Cooper's establishment.

In a series of experiments from same rifle they rarely differed more than one-half inch at highest point. Of course great care was required in getting the centre of bore of rifle at firing point—the (0) zero line of each screen and the centre of bulls-eye in the same sight line. It is confidently believed these points are correct to (.10 in.) one-tenth of one inch and that the curves given are substantially correct. As was to be expected, little irregularities occurred in the

curves made by the same rifle under the same conditions and that, too, irrespective of any error there might have been in the zero line of screens. These irregularities might have been corrected by *differentiating*. All the curves were plotted to an enlarged scale and those reported above were such as appeared the most regular. The curves as they existed, from standard rifles, using standard ammunition, were what was desired and not what they should have been theoretically.

The experiments showed that the flight of the ball, between the firing point and the target was frequently very erratic, and this entirely independent of any error possibly existing in the zero line of screens. This was the more observable in

The same irregularity was observed in regard to the expense or hollow-pointed ball, when the core-peg, forming the orifice, was suspected of being slightly eccentric to the centre line of ball. The effect of weight of balls on the trajectory is very noticeable. Take the two extremes in this regard, No. 1 and No. 4.

The latter, with a lead-powder proportion of 5/24, has nearly (4) four inches flatter trajectory than the former, with a lead-powder proportion of 5/00. This is probably due to the 3-inch longer barrel of No. 4, for it is well established that with the same conditions of powder charge the longer barrel will give the higher velocity. The experiments of Major Farley, of the Ordnance Department, are exhaustive on this subject.

No. 3 and No. 13 have very near the same curve, the smaller bore of the latter compensating with a possibly higher initial velocity for its lighter ball, No. 5, with its very sharp twist, has by approximate calculation an initial velocity of 1850 or 1900 feet per second, showing that its very quick twist does not interfere with its power to impart a very high velocity. No. 12 is said to be the "Corona rifle" among the buffalo hunters on the Yellowstone. That has surprised me, but my surprise is lessened on comparing its flatter curve (nearly two inches) with that of No. 4, its competitor among those hunters.

The beginning of each curve is at the centre of bore of rifle at the muzzle. In practice this is corrected according to the height of the foresight of each rifle. Take, for example, No. 5, whose highest point is 7.06 inch. The height of foresight above centre of bore is 7.44 inch. The highest point (7.06) is to be corrected by reducing it by .38 inch, leaving as the practical height of curve 6.72 inch. Reduced to a point blank of 150 yards, the curve at 75 yards would be 3.25 inch above, and at 175 yards it would be (-2.70) 2.70 inch below line of sight.

I failed to state in proper place that the firing point was (8) eight feet below the target, which will make the curves slightly flatter than were the range horizontal. P. Camp or Stillwater, Montana, June 1.

A GENTLEMAN FROM KENTUCKY.—Josiah Quincy in his Reminiscences tells a story of his college days at Harvard in the following style: Oxford street, in Cambridge, is at present a very decorous thoroughfare, not at all adapted to the wild sport of turkey-shooting, for which purpose the ground it occupies was used when I was in college. We stood with our backs to the site of Memorial Hall, and discharged rifles at long range at a turkey which was dimly discernible in the distance. A small fee was granted for the privilege of shooting, and the turkey was to be given to any one who could hit it. But, except for some chance shot, like that made by Mr. Tupman when out rook-shooting, it was safe to predict that nobody would hit it. The usual end of a Harvard turkey-shooting was the departure of the proprietor of the turkeys with all his birds and all our sixpences. Still, there was the excitement of a lottery about it, if nothing else. The ball, if discharged, must strike somewhere, and if so why might it not happen to be the turkey? The logic was simply irresistible. A fowl of that magnitude would be a most desirable addition to the meagre fare furnished by the college commons; and so the rifles cracked, with small results to the students and splendid profits to the turkey man. One day a little tow-headed fellow appeared on the field and desired to take part in the sport. Though he seemed almost too young to be trusted with a rifle, the master of the fowls, foreseeing future gains, was quite willing he should try. He must first receive proper instructions about the holding and pointing of his piece, and then there would really be no danger. Young Larz received the directions with great good nature, raised the rifle, and down went the turkey. The man stared with amazement, and then broke into a smile. "Try it again, young one," said he; "most any one can throw sixes once, you know." Another bird was procured, and the ball flew to the mark with the same result. The law of chances was now so overwhelmingly in favor of the turkey man that a third bird was set up with some confidence. Again the boy raised his rifle, and that third turkey was added to the banquet upon which his friends would feign. "Well, where in (in the United States let us call it) did you come from?" exclaimed the master of the fowls, who began to realize that his occupation was gone.

"I came from the State of Kentucky, sir," answered Larz Anderson, proudly; "and next time you meet a gentleman from that State, just remember there's not much you can tell him about a rifle. That's all."

WORCESTER GUN CLUB AT SPRINGFIELD.—WORCESTER, MASS., Aug. 29. A number of members of the Worcester Gun Club were invited to the Rod and Gun Club, of Springfield, Mass., for a friendly shoot on their grounds the 34th inst. The visitors were met at the depot by the Rod and Gun Club, and after many friendly greetings, conducted to the rooms of the latter, which are fitted up in most artistic style, the walls being hung with elegant paintings, representing every kind of native game. From the club rooms the party adjourned to the Massachusetts House, where a hospitable repast was served to their guests by the Rod and Gun Club. A noticeable feature of the day was the honor paid to the generosity of the Worcester Gun Club, who were not a legal target. After a hard contest at the shooting grounds, the special prize was won by the Springfields. One of the most interesting places visited was the large and attractive store of L. H. Mayott, dealer in sporting goods, 445 Main street. Mr. Mayott, who is a thorough sportsman and perfect gentleman, showed them every attention in his power, and will be remembered by them for many a day. The Worcester Gun Club wish to express their heartfelt thanks to the Rod and Gun Club for their hospitality and hope at an early day to be honored by a visit from them in Worcester, when an earnest endeavor will be made to give them a day of enjoyment in return. RAYNARD.

RABBIT TAKING TO WATER.—Bainbridge, Ga., Aug. 19.—I see in your issue of Aug. 4 inquiry if any one ever saw a rabbit take to water? In the spring of 1874 the Chattahoochee River at Euftaula, Ala., was very high, in fact a regular flood. All the lowlands around were covered and a great many islands formed. Several of us went up the river rabbit hunting in a bateau. We did not carry any guns, for we were sure to find these islands and use the rabbit, and after a jolly time we would have catching him. Right in the water he would go, and one of the boys after him until it got too deep, then we would chase him with the boat, and a right lively one too it was; for just as you thought you had him he would turn his course, and on would go the boat twenty-five or fifty yards before we could change it. We succeeded

the naked or cannellured balls, and more especially with the lightest (200-grain) kind. As an example, three balls were fired from same rifle, under like conditions. One would be highest at the 25-yard screen, then cross below the other two to be the lowest about the centre of range, cross back and be highest at the 175-yard screen. The other two would be lower at 25-yard screen, highest at the half-way point and then lower at the 175-yard screen; sometimes crossing each other's flight. With other balls, of three consecutive shots, two would be regular, having the highest point at the proper place, whilst the third shot would be highest at the 100-yard screen. I feel sure this does not occur from any irregularity of the screens, but results from irregularities in the shape of the balls or for want of homogeneity in density of the lead. This irregularity was to be expected from the cannellured ball, when it is recollected the circular grooves in these balls are at right angles to their flight, and must (being often jagged after coming from the rifle) affect the trueness of their flight. This will sufficiently account for their want of accuracy when compared to the smooth patched ball. Experiments had before led me to suspect that a rifle ball might fly with reasonable accuracy to the bulls-eye and still have a gyratory motion, corkscrew fashion, around the line of true curves. That suspicion is more than confirmed by these experiments, and is sufficient to account for many of the slight irregularities above alluded to.

in catching forty five that day. But one old fellow was the smartest of them all. Some negroes were chasing him with dogs and he gave them the dodge; turned back, ran for a good distance; took to the water and went out and squatted. I saw only his head out. We saw all of this from the boat. We went over and I shot and killed him. As for rabbits taking to water, that is nothing strange down South.—L. F. P.

WILD RICE—Asbland, Wis., Aug. 25.—I see in your issue of Aug. 13, Mr. Charles Gilchrist alludes to an article of mine on the depth of water that wild rice grows with. I have spent the summer at this place, and, to my surprise, find no wild rice here (not a stalk) except the small kind, which amounts to little compared with species I intended in my article. I did not suppose anybody attempted to introduce the small kind, as it bears but little seed and in two feet to penetrate the depth Mr. G. says. He says: "A stalk nine and a half feet long grew in seven and a half feet of water," showing only two feet out of water. The variety I described grows from six to ten and twelve feet, and not in water over two to three feet, and in a dry time out of water. It grows so large and thick you can hardly push a boat through it. This kind has an immense seed pod, while the small variety grows little seed on a small straight stalk along the edge of rivers and sand bars in deeper water, where none but diving ducks can feed on it. The large kind spreads the top like broom corn, not broken down. I consider the large kind the only desirable one.—LUTROX.

MAINE GAME NOTES—Lincoln, Maine, August.—Woodcock are fairly plenty in this vicinity. In an hour's stroll from the office the other day my dog pointed and flushed five. They are not in prime condition here before the middle of September. Ruffed grouse are plentiful. Deer are reported very numerous about the lakes in our immediate vicinity. I wish many others here have a decided inclination toward the view that we should be allowed to hunt deer; not that we do hunt them—that would be in violation of our laws for game—but we regard the prohibition of hunting wrong and an evil to be corrected. The sketch I sent you, "Sysoledosis and Passadumkeag," some time ago was the cause of a visit from the "Deputy Warden." In my desire to present a truthful and accurate account of our trip, I forgot the law for the time and introduced a hound which aided us in securing a deer. Well, that Deputy read the account and at once locked me up.—So you see our game overseers attend strictly to business.—F. C. P.

"PARKER" NOT A GUIDE.—Montez, Aug. 24.—"Nes-muk" is quite right. "Charles Parker" was no guide, his real name is Frank Cook. He was born in Sheldon, Vt., in 1846, or thereabout, and always bore a bad reputation. In 1879 he was arrested in Highgate, Vt., for adultery and taken to St. Albans jail, where he overpowered the Sheriff and locked him into a cell and escaped, but was soon after recaptured and sentenced to a year in the State prison. After that term was out he returned to Highgate, where he was often engaged in drunken brawls and fights. In 1878 he was sent to jail for intoxication, but was pardoned out by the Governor and soon after left the State. His Adirondack escapade was fully in keeping with his reputation, where he was well known in his native and adjoining towns, and the feeling there is that at the hands of Constable Cole he has received his just punishment.—FRANSTEAD.

WISCONSIN DUCKING GROUNDS—Rosen, France, Aug. 11. *Editor Forest and Stream:* Your issue of July 28 reached me here this morning. I would like your correspondence. J. W. B. wants to go duck shooting, and I can tell him of a good place. Let him go to Green Bay, Wisconsin. There are several professionals whom he can employ. I had a man named Welsh whom I can recommend. I paid him two dollars per day and gave him the birds, which he sold. He furnished boat. Three years ago a friend and myself in five days' shooting killed over three hundred ducks, many of them canvas-backs and redheads. I got the information which led to my going to Green Bay from FOREST AND STREAM, and think I cannot do better than "pass it along."—DUCK.

WOODCOCK ON MAIN STREET—Lockport, N. Y., Aug. 26.—Last evening as I was driving from Niagara street on the bridge that crosses the canal to Main street, near the centre of the business part of the city, a woodcock flew by and came near flying against the rear of the buildings on Main street, but turned to the right and passed over Main street up Cottage street. Some three years ago a ruffed grouse flew against a house on Park place and was killed. A few days after another woodcock was shot in the same place. I was directly on the opposite side of the same street, and after flying about and frightening the occupant of the room, passed out through the window seemingly unhurt; and yet if you wish to shoot grouse or woodcock you will have to go far beyond the city limits to find them.—J. L. DAYTON.

MISSISSIPPI GAME—Philadelphia, Miss., Aug. 19.—At the last meeting of our Legislature the game law was put into the hands of the boards of supervisors of the various counties and a provision made allowing parties to kill game for depre-dating upon crops. Some of the counties are trying to abolish the game law, and every "pot-hunter" claims that his farm is entirely over-run with the deer and turkey, and his crops are being destroyed, and their sporting friends are called in to help him kill. I see quantities of young quail and turkey sufficiently large to afford good sport now.—S. P. NASH.

PULASKI GUN CLUB—Pulaski, N. Y., Aug. 26.—A sporting club was organized at Pulaski, N. Y., August 13, under the name of the Pulaski Gun Club, its purpose being the better protection of game and fish. The following gentlemen were elected officers for the ensuing year: A. F. Betts, President; A. W. Dunn, Vice-President; M. D. Bumpus, Secretary; W. E. Pierce, Treasurer. This club has leased the water, land and marsh known as Deers Creek marsh, comprising over one thousand acres, for the term of five years, for their private hunting and fishing.

PENNSYLVANIA—Wyalusing, Pa., Aug. 26.—Woodcock were scarce, the drought of about four weeks' duration raising havoc with them on our sandy flats. Quail are plenty—thanks to those who fed them during the heavy snows last winter. Ruffed grouse are about the same in abundance. Rabbits are plenty; squirrels in large numbers in the oak ridges. By the way, there are two associations in this coun-

ty, Bradford, for the protection of game and fish, yet the slaughter goes on out of season. I heard of one party killing fifteen gray and black squirrels two or three days ago.—ON THE WING.

QUAIL IN ALABAMA—Hayueville, Ala., Aug. 26.—Quail shooting in this country promises to be better than usual, as the dry spring and summer has been propitious for their propagation; and numbers of half fledged little ones are seen along the roadside and in the stubble. The almost unprecedented cold weather last winter destroyed thousands of doves, and in consequence the annual wheat field sport of this section has been considerably abridged. The sluggish waters of August and the industrious mosquito deter the most inveterate angler at this season.—A. E. C.

NEW JERSEY RAIL LAW—New York, Aug. 29.—I would like to call your attention to one of the great evils of our game laws. In New Jersey the law allows rail to be shot after Sept. 1st and reed birds after Aug. 20. The result is, that our marshes are infested with poachers, who are after reed birds, but by mistake kill rail. It is impossible, even with men on the river to watch to prevent it. Reed birds and rail should be allowed to be shot Sept. 1 and then there would be no excuse.—W. HOLBERTSON.

HERBERT'S IMPRESSION ON A BOY—I knew Herbert well, he having spent nearly a year in Kentucky with my grandfather. My impression of him, for I was a mere youth, was chiefly—1st, that he was a crack shot; 2d, that he knew more Greek and Latin than I did; 3d, that he knew fine old whisky. Pence to hisashes. A gentleman, a scholar, a deep thinker. *Requiescat in pace.*—ST. CLAIR.

NEBRASKA PRAIRIE CHICKENS—For pinnated grouse shooting in Nebraska go to Lincoln; and find some of the Sportsmen's Association members and get from them a tip as to the exact spot to go to. The birds are reported plenty all along the line of the Burlington and Missouri Railroad west of Lincoln.

AN AUGUST WOODCOCK IN MISSISSIPPI—Natchez, Miss., Aug. 23.—A young woodcock was captured here yesterday in the residence of one of our citizens, where it had flown through mistake. This is rather early for them down here.—S. W. M.

TO TOLEDO FOR DUCKS—A correspondent, who has moved from Cincinnati to Toledo, O., says: "Game is getting scarce around Cincinnati and hard to get at; cannot very well get along without it, so moved up here and expect to take it out of the ducks this fall."—E. M.

ONE YEAR AFTER—Woodford, Me., Aug. 24.—*Editor Forest and Stream:*—It is a little late, but allow me to thank you for the good work in the cause of humanity that you have done in exposing so thoroughly the Dittmar powder.—M. S.

The Chicago and Northwestern Railway has the most appetizing bill of fare for its palace dining cars between Chicago and Council Bluffs.

REED BIRDS are reported plenty on the marshes about Philadelphia now, and the season promises to be a fair one.

Sea and River Fishing.

FISH IN SEASON IN SEPTEMBER.

FRESH WATER.
 Grayling, *Thymallus triolor* and *T. montanus*.
 Black Bass, *Nicropterus salmoides* and *M. palidus*.
 Muskellonge, *Esox nobilior*.
 Pickerel, *Esox reichertii*.
 Pike or Pickerel, *Esox lucius*.
 Pike-perch (wall-eyed pike) *Stizostedion americanum*, *S. gregarium*, etc.

SALT WATER.
 Sea Bass, *Centropristis atrarufa*.
 Striped Bass or Rockfish, *Rockfish*.
 Flounder, *Paralichthys americanus*.
 White Perch, *Morone americana*.
 Bluefish or Taylor, *Pomatomus saltatrix*.
 Scup or Porgie, *Stenotomus argyropus*.
 Pollock, *Palaetogaster carbonarius*.
 Tautog or Blackfish, *Tautoga onitis*.
 Spanish Mackerel, *Cybitum maculatum*.

YELLOW.
 Yellow Perch, *Percus flavescitlis*.
 Rock Bass, *Roccus lineatus*.
 White Bass, *Roccus chrysopterus*.
 Rock Bass, *Ambloplites*. (Two species).
 Wal-mouth, *Channorynus guano*.
 Crappie, *Pomoxys nigromaculatus*.
 Bachelor, *Pomoxys annularis*.
 Chub, *Semotilus corporalis*.

The bend of the rod, the gentle feeling with the finger as I checked the run of the line, told his weight almost as accurately as a spring scale. Don't imagine always that anglers have no authority for their figures when they tell of large fish that they have struck and lost. I know men who are accustomed to tell the weight of their fish before they have seen them above water, and who will hit it correctly within an ounce or two nine times out of ten; yet the angler knows his rod and it grows to his hand like a part of it, so that he feels the fish on as if he were in his very grasp.—WILLIAM C. PRIME.

"THE KING FISHER OF THE NORTHWEST."

BY REV. E. B. RAFFENSPERGER, PHILADELPHIA, PA.

SOME months ago I paid a visit to Toledo, Ohio, "the great city of the future," as it is fondly termed by its enterprising people. I found there a number of strange things that were unknown in those parts when I first made the acquaintance of the "raging Maumee," a score of years ago. Then the city at its mouth had only 12,000 inhabitants, now it boasts of a population four times as large. The improvements for the past decade are of the most substantial character. Massive stone blocks of buildings have been erected that are seldom excelled in any city. It really begins to look now as if the predictions of one of its ancient prophets were about to be fulfilled, and the proud designation quoted above may yet be accorded to Toledo by those living outside the city limits who have no real estate for sale! Among the attractions of Toledo may be ranked the Ohio Fish Hatchery. This is situated in the southern part of the

city, only a few rods from the huge water stack. My old time friend, the Hon. Emory D. Potter, a former representative in Congress from the Toledo district, and now a judge in the Circuit Court, and subsequently a Custom House officer, occupies to it the relation of founder and superintendent. He is a salaried officer of the State, but, unlike many another man who receives large pay and does little, the judge receives little and does much. I have ventured to term him the King Fisher, or *Alosa alosyn*, of the Northwest. For a whole generation he has been the referee in matters pertaining to the finny brood by all the dwellers in that region.

Shortly after my settlement in Toledo I became acquainted with the "Weakfish" and have enjoyed his wonderful stories concerning them. Having had some experience in New England trout fishing, I was greatly interested in the accounts he had to give of the speckled beauties of the mountain streams. Little did I then think that these could live in the waters of Ohio. The Judge was a member of our Board of Trustees of the First Presbyterian Church, and we held our meetings in his office in the Custom House. While he took a deep interest in matters ecclesiastical, it must be confessed that he was just as much concerned apparently about the fish than he was about the church. He was to catch the "finny brood" about to make an annual visit to a favorite summer resort in his native Pennsylvania, and he spent all his leisure moments for several weeks in scraping and tempering his elegant trout rod. A man might learn more about the peculiarities of this splendid fish by conversing with the Judge for an hour than by attempting to fish for trout in the best stream in America for a day. While he was a member of Congress it is related of Daniel Webster that he frequently induced the Judge to leave the Capitol and accompany him on fishing excursions along the Potomac. An old Toledo tradition says that one time, while the Judge was absent in Washington, several fine specimens of the *Esox nobilior*, or muskellonge, were captured in Swan Creek above Toledo. This was regarded by the Judge as a most singular occurrence, and he reproved a part of his constituents for not sending for him to come home directly from Washington, because, he said, "the thing needed looking into at once!"

The State of Ohio could not have selected from its millions of men who so well posted to fish matters or so well qualified to take charge of the call of beneficent institutions under his care. No wonder that other States, appreciating his worth in promoting this great industry, have offered the Judge five times as much as the Buckeye State pays him for superintending the hatchery of Toledo.

The attention of the people of this land is now directed to fish in a manner that portends good in the near future. Within the past fourteen years about twenty-five fish commissions have been organized. These belong to nearly as many States of the Union. Wonderful results have been attained, and we are just beginning to enjoy the benefits of these hatcheries. Seventeen years ago Judge Potter predicted that if no efforts were made to arrest the destruction of fish food the waters of Ohio would be destitute of fish in a few years. The State finally waked up and looked at the subject through his spectacles. The few thousand dollars expended on the hatchery are already coming back into the coffers of the fish dealers. One firm in the vicinity of Toledo said that in the year 1877 its catch was 43,797 lbs., while in 1878 it reached 104,913 lbs., and it attributes its increase to the hatchery under the care of the Judge. His Honor called for me one day and invited me to go out and see the "infant department" as he termed it. A ride of several miles brought us to the establishment and the process of hatching was fully explained to me.

In the spawning season the fish are captured and brought to the place prepared for them. Here the dog eggs are carefully separated from the bad ones and tenderly watched and protected until the little wrigglers, that look not unlike incipient mosquitoes, emerge from their shells. Their eyes are very large and in this respect alone do they differ from baby mosquitoes in appearance. In a less enlightened community if a man, whose reputation for veracity is not well established, would exhibit the millions of wrigglers that I saw in the tanks of Judge Potter he would be looked upon as a disturber of the peace. The people of Toledo regard the superintendent as a man of truth and fully believe that in three or four years these big-eyed wrigglers will be whitefish weighing two or three pounds each. The hatchery is capable of producing annually twenty million of whitefish of baby state. At the proper time these are consigned to the water and left in the care of Him who provideth food for all the inhabitants of earth.

None but an adept in fishculture could carry on successfully such an establishment. A slight mistake would result in the destruction of myriads of fish soon to be distributed in the waters of the State. I have seen human mothers who seemed to be less careful of their infants than is the good whitefish wrigglers. Long ago I had the honor to have my generation in the work entrusted to him. He has now attained his "three score and ten," but was able recently, while celebrating his birthday, to go out into Maumee Bay and kill fifteen ducks. He loves to recount his experiences on the water, and all who hear him are astonished at the wonderful facts that have come under his observation in respect to fishculture.

Those who have enjoyed the privilege of accompanying him on fishing and hunting excursions tell marvelous stories about the adaptation of his life to all the exigencies of the case. He is accomplished in the mysteries of the cuisine and can provide for the bodily sustenance of the party in ways that are absolutely incomprehensible. A friend, who is a great epicure and well acquainted with the best hotels of our land, told me that some years ago he formed one of a party who spent some days in the "wilderness of sin" near Toledo. The commissariat was under the direction of the Judge, but, like Moses of old, he also encountered difficulty in providing for the hungry. They were obliged to start out with an ample supply of store goods, but had eaten up almost everything and, having killed and caught nothing, they were in distress and actually clamored for something to eat. The Judge coolly told them that if they could put up with a puddling he could keep them from starving! They advised him to go ahead. He gathered up the fragments and, with the aid of a lot of corn-meal and several damp newspapers, instead of a puddling, he managed to produce a pudding that his hungry companions pronounced equal to any ever prepared at Delmonico's.

The Judge informed me that his friend Dr. Theodas Garlick, of Cleveland, was the first man in the United States who experimented successfully in artificial fish hatching. He prepared a hatchery in Cleveland in the year 1853 and raised a large number of brook trout, *Salmo fontinalis*. Twenty years later John Hoyt, Esq., of Castalia, Ohio, hatched out 3,000 Eastern salmon (*Salmo solar*) and set them free. He

also introduced the brook trout into the stream at Castalia and, according to the estimate of Judge Potter, that is to-day the best-stocked trout stream in America. If this be so, then the Buckeye State will take the first premium for producing trout as well as Presidents. The stream at Castalia, with its precious contents, is owned by a party of wealthy and intelligent gentlemen in Cleveland. It will give the writer great pleasure some day to accompany one of them to Castalia just for the purpose of testing the truthfulness of the statement made by Judge Potter.

Experiments are now in progress at the Toledo hatchery for producing shad, California salmon, cels, black and white bass and other species. Who can estimate the blessings yet in store for fishermen and the lovers of fish that had their origin in the brain and heart of the "King Fisher of the Northwest?"

FISHING IN LAKE CHAMPLAIN.

SWANTON, Vt., Aug. 22.

I DO not recollect having seen any report of the fishing in this locality in your journal, and as your readers should be apprised of the excellent sport to be found here, a few lines may be welcome. Saturday last, a party of three took seventy pounds of black bass and rock bass in one day's fishing. To-day the same party took fifty pounds. The fish run about two pounds each, although Mr. George Snyder, one of your neighbors, caught one to-day weighing four pounds. Mr. Fred Newman also captured a large sized bass, so you see that your part of the city contains some good fishermen. Many larger fish were lost by the vigor of the game. Double-gut snells were snapped five times, and as the fish were nearly landed each time, it is no fisherman's exaggeration to say that these lost monsters (pickled) weighed from five to seven pounds. One big fellow carried off a large-sized salmon in his snout, and twice afterwards broke the water within a hundred feet of the boat, tossing his head with frantic efforts to get rid of his artificial ornament.

Large-sized perch, weighing from one to two pounds, are contentiously tossed back into the lake, while very fine sunfish and rock bass are in like manner consigned to perdition. I have seen half a bushel of excellent panfish, which in Fulton Market I would gladly buy for a treat—no mean dish your golden "pupkin seed" makes—fed to the boys. The bait now used is worms and grasshoppers, but minnows will insure your catching monsters from the "vasty deep." Trolling takes a few with the spoon. Strong tackle is required, large-sized hooks with four-ply gut snells and leaders, or perhaps a gimp snell and strong leaders. Of course, if you prefer a light outfit and wish to play your fish for a day or two, come rigged out with a cobweb; but, after having your tackle smashed in pieces a few times, you will have a change come over the spirit of your dream.

A new hotel has just been opened here, the "Champlain," Mr. Boynton proprietor, and guests will be surprised with finding gas, electric bells, etc., fine beds of fare and good beds at eight dollars per week. The Central Vermont Railroad leaves you at the door of the house, or you can come via Albany, Lake George and Lake Champlain to Plattsburg and across by boat.

INDIANA AWAKENS!

THE lawlessness of Indiana poachers is a matter well known outside the State. Last spring a prominent gentleman of that State wrote us as follows:

"That you can comprehend the situation in Indiana, I will state that we have some feeble laws unexecuted for the protection and preservation of fish. We have for our population the children of the pioneers, whose ideas of freedom were limited by 'the right to fish when, where and how they please, and cut a 'coon or bee free on any man's land.' To these add the heterogeneous mass of emigrants from every land with communistic thoughts fairly developed, and the whole mass thoroughly denaturalized by entering politicians in a pivotal state."

Recently a Spartan band has arisen in Indianapolis, who declare that the use of dynamite must be stopped. They have formed an association, and the following has been circulated on postal cards:

INDIANAPOLIS, Aug. 20, 1881.

"Dear Sir: You have probably seen by the newspapers that a society has been lately formed for the protection of fish. This is not an 'Angling Club,' but has for its object, 'enforcing the law prohibiting the use of dynamite, etc., in the destruction of fish.' At the present rate of this warfare, but a few weeks will see the creeks and streams of Indiana entirely stripped of fish. We want the names of prominent men who will assist us in this fight, and therefore ask you to join this society. The initiation fee is only \$1. Please give or send in your name to any of the following persons: Alex. C. Jameson, President; Geo. F. McWilliams, Vice-President; W. C. Phillips, Secretary; F. T. Holliday, Treasurer; John A. French, Jos. A. Moore, W. H. Ross, Bryant Elliot, Ignatius Brown."

The new Association can count on FOREST AND STREAM as being on their side first, last and all the time. Success to them.

"ALBANY BEEF"

THE sturgeon was a favorite with the Dutch settlers of the State of New York, especially with those who made their homes on the upper Hudson. So common was it that it was known as "Albany beef." We have recently printed some notes on its being smoked and sold as halibut on the great lakes, and also a communication from an Albatian claiming the sturgeon to be superior to the latter fish. In this connection we reproduce the following from the Hudson Register:

"The smoked flesh of the sturgeon is a favorite article of food in the towns along the Hudson River, and when it is well prepared and has not become stale, it is a very nutritious and palatable edible. In former years the catch of sturgeon in the Hudson River was amply sufficient to supply all demands for the beef at low prices. Within the past few years, however, the fish have become scarce and shy and have to be brought to Albany, where the principal smoking establishments are, from the Kennebec River, in Maine; from the St. John's in Friburg, and from the great lakes. At Albany the fish cost from five to eight cents a pound. It shrinks considerably before it is smoked and, therefore, the beef is wholesaled at fifteen cents per pound, at which price there is only a moderate profit made. The stores retail it at

about eighteen cents. The sales of one firm in Albany average over 1,000 pounds per week and have reached as high as 4,500 pounds one week this season. In this city Phillip Kavanaugh has an establishment for dressing and curing sturgeon. He is unable to meet the demand for the beef. Large numbers of sturgeon are received daily, coming principally from Hyde Park. The quantity of fish sold in this city alone is immense, the price being the same as at Albany. The trade is reported to be constantly on the increase in this city and along the upper Hudson, even at the prices named."

GRUBS IN BLACK BASS.—While camping (a year ago) on Brooklyn Point, Crooked Lake, near Petoskey, Michigan, I had the pleasure of taking a great many large black bass during my stay of two months in that delightful retreat. It was not until I had assisted largely in eating that excellent fish that I discovered I had not had a horsed foot for, as it afterwards proved that a bass entirely free from grubs was a notable exception. Of course the inhabitants of that wild region, acting as guides for a living, have to furnish so many transient amateurs with fish for their friends at home that they never eat them themselves, and consequently "don't know nothin' 'bout grubs in bass" around there, whatever they may tell you about grubs in bass of other lakes.

By skimming the fish instead of scaling it the grubs are exposed in the black seal-transparent flies, like so many grains of boiled rice stuck into the fish jelly. The process of skinning is very easy, by cutting down the back of the fish on each side of the dorsal fin. This harmless grub should not be confounded with the wriggling, wiry worm found in knots and large colonies in the intestines of other fish, such as for instance the sunfish, late in the summer in muddy lakes.

New York, August 27, 1881.

NOTES FROM MOOSEHEAD.—From a private letter from Mr. T. Sedgwick Steele we extract the following notes about Moosehead Lake and its surroundings:

"I have been much interested in Fay's article, 'Moosehead Lake to the Main St. John's River,' and an accompanying experience with Mr. Fay. The fishing here has been very fine indeed, even up to the 15th of July, fifteen days beyond its usual time, and is in its usual poor state to-day and will not amount to much until Sept. 1. However, trout can be had with hard work and going off alone quietly with your guide to some inland lake or stream. I have handed some two and two-and-a-half pounders since I came, but in addition to my family there are six others to entertain, and these 'quiet nooks' can not accommodate so large a party."

"The 'boiled shirts,' I regret to say, are more numerous at this hotel, the Mr. Kineo Hou-e, this season than ever before, which makes us patrons of the lannel feel a little out of place, and before long we old sportsmen will have (like the 'darkey' to 'take to the woods.'"

"That trip of Mr. Fay's is very easy and accessible to even ladies. My brother-in-law, wife and two children went through it three years ago, and now that there is a 'juniper' or alced on the Umbazookus and Mud Pond carries it requires little exertion."

A HUNGRY TURTLE.—Vicksburg, Miss.—Speaking of turtles, my brother said he was fishing in a small creek in an adjoining county. They had stuck their poles into the bank, and were discussing a lunch a short distance off, when perceiving a bite on one of the lines F. approached and drew it up. A good-sized turtle came to the surface on the hook, and then letting go sank to the bottom. He soon took hold again, and was again drawn up. This time F. had a pistol in his hand, and sent a bullet through the turtles back, whereupon it let go the hook and sank, leaving stains of blood on the water. An hour or two later they were fishing near each other some two hundred yards further up the stream, when F. having a "bite" again drew a turtle to the surface, which, however, also let go, but in making off it caught one of its feet on the other hook some yards away, and was safely landed. To F's astonishment he found it to be the same turtle he had shot some two hours before and a couple of hundred yards down stream, the bullet having gone through its body, and its entrails were protruding through the hole in the lower shell. Yet it came back for more bait. That lends Douglass Jerold, who cracked a joke on his death bed.—"MANOONER."

A MENHADEN WAR THREATENED.—Barrelet, N. J., Aug. 28.—For the past two years our people, in Monmouth county, have complained that the menhaden fishers, with their purse nets, are ruining our fisheries by taking the menhaden in such quantities that few are left for our valuable food fishes to feed upon. When they sight a school of fish they follow it until they have caught the last one and our food fishes are decreasing, either starved or driven to seek food on some coast where the pestilent and persistent menhaden fish-ers, with his all-compassing pound net is unknown. Men who claim to know all the lower to our people in food fish amounts to one million of dollars annually and petitions are now being circulated asking the State Legislature to pass a law prohibiting the wholesale catching of menhaden along our coast. Thousands of signatures have been obtained and the question will enter into politics in our fall campaign.—X.

UNWHOLESOME FISH AT BILLINGSBATE.—We learn from Land and Water that during the month of July the fishermen appointed by the Fishmongers' Company seized at Billingsgate market, and on board boats bringing off that place, 93 tons 15 cwt. of fish as unfit for human food. Of these 54 tons 18 cwt. came by land, and 35 tons 7 cwt. by water. Nineteen tons were shellfish. The single fish numbered 99,937, and include 8 catfish, 10 cod, 18 crayfish, 500 cels, 120 conger-eels, 500 dhais, 81,560 haddock, 2,500 lobsters, 760 mackerel, 4,322 plaice, 630 skate, 73 pairs of soles, 1 sturgeon, 245 turbot and 8,450 whiting. There were also 10 barrels of erabs, and 12 of pickled herrings, 3 boxes of herrings, 108 bags of mussels, 4 of oysters, 99 of lobsters and 106 of whelks, 2 kidneys, 150 kidneys and 1 of prawns, 1,643 gallons of shrimps and 55 quarts of whitt-bait.

THE STARFISH AS A COMESTIBLE.—Editor Forest and Stream: I found the starfish under the above heading on my receipt for a bispic of starfish in your issue of Aug. 18. No one has lethystrophist should condemn the starfish until he has tasted a bispic made of it. In my opinion the starfish, properly cooked, far surpasses the crab or lobster in delicacy of flavor and should be called the king of shellfish. They may "smell to heaven" while being dissected,

but there is nothing disagreeable about them after hatching in hot water a few minutes.—THOS. J. MURRAY, Steward of Glen Island.

BASS LAKE, VT.—Montreal, Quebec, Aug. 24.—Mr. W. L. Mattice, of this city; Mr. H. Cascan, of Shelton, Vt., the writer and his son, spent several days last week camping at Bass Lake, Franklin, Vt. We made a fair catch of bass, the largest weighed 5 lbs. Master Barnly used a Toz. greenheart rod, and killed several bass that weighed over four pounds each. I gave us old fellows more pleasure to see him hatched to a large bass than to take it ourselves.—SPANSTRAD.

BLACK BASS IN THE SUSQUEHANNA.—Wyalusing, Pa., Aug. 26.—In this part of Pennsylvania, living, as we do, on the banks of the Susquehanna, we have ample fishing grounds. The water being low on account of the drought, the size of the "catch" of black bass has increased and the quantity diminished. Some are caught weighing four pounds. Once in a while fishermen will catch well-eyed pike weighing from four to ten pounds.—ON THE WING.

HICKORY FOR RONS.—Flemington, N. J., Aug. 23.—I would like to know the proper time to cut hickory to make fish rods from—spring, summer or fall of the year? Do you want small saplings or from large timber, and what kind of hickory? There are several kinds, I believe. I have noticed in some book, speaking of browu hickory—what is meant by that? By answering the above questions you will greatly oblige—L. F.

My wife and daughter were made healthy by the use of Hop Bitters and I recommend them to my people.—Methodist Clergyman.

Fishculture.

THE McCLLOUD RIVER HATCHERY.

U. S. FISHERY, BAIND, Shasta Co., Cal., Aug. 18.

Editor Forest and Stream: I enclose herewith an extract from my next report on the McCloud River hatchery stations, concerning the destruction of the buildings and the rebuilding of the hatchery. The work is now nearly completed, and we expect to begin to take salmon eggs next week.—LIVINGSTON STONE.

Up to the 31st of December, 1880, the rain fell on the McCloud River and its tributaries. Indeed there had been more than the customary number of fair days until the 18th of December when it began to rain, and rained eleven days in succession, the river rising on the 25th eight feet and two inches above its summer level. This was nothing extraordinary, however, and no fears or even misgivings were entertained of any disaster from rain to the fishery buildings, they being built from eighteen to nineteen feet above the river.

There was a dense fog over the McCloud River the last two days of December, but no rain, and when the New Year opened the river had fallen back to within a foot and a half of its usual level.

The month of January, however, was attended by a rain fall wholly unprecedented in Northern California since its settlement by white men. Forty-seven inches of water fell at Shasta City during this month, and the hatchery, which is situated on a body of water much greater, On the 27th of July the McCloud rose twelve and one-half feet, but the water had not higher than that in previous years, and still no one supposed that the buildings were in danger. Again the river fell, but this time the rise of water here was greater, the rise of water ever known on this river before, either by white men or Indians now living.

During the first days of February the rain poured down in torrents. It is said by those who saw it that it did not fall as rain generally falls, but it fell as if the winds of four or five were directed in a body from the sky at once. Mr. J. B. Campbell, who lives on the McCloud, relates that near his house in a canyon, which is dry in summer, the water in not many minutes became thirty feet deep, and the violence of the current was so great that trees a hundred feet long were swept down, rock, trunk and branches, into the river. On the 2d of February the McCloud River began to rise at the rate of a foot an hour. By nine o'clock in the evening it was sixteen feet and eight inches above its ordinary level. This was within four inches of the danger mark, and two young men went to the Fishery, Richard D. Hubbard and Oscar Fritz, made an attempt, at the risk of their lives, to save some of the most valuable movable property in the buildings. They waded through the fierce current in the blinding rain and pitchy darkness until they were nearly exhausted, but the water was so deep that it was then up to their shoulders, and the unequal struggle could not be long maintained. These young men are entitled to great credit for succeeding in rescuing what they did from the flood on that frightful night.

The water has now a foot above the danger mark, and the buildings began to rock and totter as if nearly ready to fall. There was now no hope of saving them or anything in them. At half past two in the morning of the 3d of February they toppled over with a great crash, and were seized by the resistless current and hurried down the river.

When the day dawned nothing whatever was to be seen of the main structures which composed the United States Salmon Breeding Station on the McCloud River. The mess-house, where the workmen had eaten and slept for nine successive seasons and which contained the original cabin, twelve feet by fourteen feet, where the pioneers of the U. S. Fish Commission on this coast lived during the first season of 1872; the hatching house, which, with the addition of a second, had cost \$70,000, and the salmon eggs, the tent that previously was reached from New Zealand to St. Petersburg; the large dwelling-house, to which improvements and conveniences had been added each year for five years—these were all gone, every vestige of them, and nothing was to be seen in the direction where they stood except the wreck of a mill race, a wooden wheel, which through summer snow and winter rains has poured a hundred million gallons of water over the salmon eggs in the hatchery and which now lies dismantled and ruined upon the flat-tops which had supported it and which were kept from escaping by two wire cables fast to the river bank.

The river continued to rise the next forenoon until it reached a maximum height of twenty-six feet and eight inches above its summer level. This, of course, is not a very extraordinary rise for a slow-moving river, and it is reasonable to suppose that it will be at low water a succession of cascades and rapids, having an average fall of forty feet to the mile, it will be seen at once what a vast volume of water must have been poured into this very rapid river in a very short time and with what velocity it must have come to have raised it twenty-six feet when its natural fall was sweeping it out of the canyon so swiftly.

Those who saw this mighty volume of water at its highest point rushing through its mountain canyon with such speed say that it was appalling, with the roar of the torrent was so deafening that it drove a steady stinging side by side on the bank could not bear to stay when talking in an ordinary tone of voice.

It must be over two centuries since the McCloud River rose, if ever, as high as it did last winter. There is a very good evidence of this on the very spot where the fishery was located, for just behind the mess-house, and exactly under where the fishery flag floats with a good south breeze, is an Indian gravestone where the venerable chiefs of the McCloud tribe have been taken for burial for at least two hundred years, and there is no knowing how much

longer. One-third of this graveyard was swept away by the high water last winter and the ground below strewn with dead men's bones. Now that the spring has been the habit of burying their dead in this spot, for two centuries proves that the river has never risen to the height of last winter's rise within that year, for nothing could induce Indians to bury their fathers where they thought there was the least danger of the sacred bones being trampled by flood.

When the water subsided it became apparent what a clean sweep the river had made. Here and there the stumps of a few posts, broken off and worn down nearly to the ground by the driftwood grinding over them, formed the only vestiges whatever to indicate that anything had ever existed there but the rocky bar that the falling waters had left.

The inventory showed that over \$1,000 worth of hatching apparatus, house furniture, tools and other articles were lost or destroyed by the flood, besides the buildings themselves. The whole loss could not have been less than \$15,000. LIVINGSTON STONE.

A QUINNAT SALMON IN GREENWOOD LAKE.

WARWICK WOODLANDS, Greenwood Lake, N. Y.

Elller Forest and Stream.
In November, 1876, a large number of California salmon, 9,000, I believe, were put in Greenwood Lake, lying partly in Orange County, N. Y., and Passaic County, N. J. They were obtained from Mr. Fred. Mather, through the Fishery Aquarium, on an order from Prof. S. F. Baird, through the instrumentality of Mr. W. O. McDowell, assisted by myself, and were placed at the mouth of the different streams. Mr. McDowell also procured from the New York Fish Commission a large lot of lake or salmon trout, which were also placed in the lake.

Since that time we have received no intelligence of any salmon having been caught, and it has been supposed that they had become extinct, but such is not the case for on the afternoon of Aug. 25 Messrs. E. J. Peck and Irving Brown, of Haverstraw, N. York, for a week have been the guests of the country Mr. Tenness, at the Encampment Hotel, Warwick Woodlands, were engaged in still fishing for black bass, when the former took a very nice salmon with beamrains for bait.

The behavior of this fish after being hooked was most peculiar and unique in its nature, the most peculiar I have seen in any fish. On being struck he darted with a good deal of vim about six feet and then remained almost stationary for four or five minutes, notwithstanding Mr. Peck with all the power he dared exert with his eight rods, failed to knock down the fish in any position, when at last he came up to the extended end of the net with ease. It was taken in the camp, where it was much admired for its beautiful markings and was the subject of much surprise and interest.

Most unfortunately the fish was taken to the hotel and cooked, and therefore all chance of positively identifying it is lost. Mr. Boyd said in an interview that the fishermen are familiar with lake trout, and that this fish differed in shape and color from them. It was only about twelve to fifteen ounces in weight and, if it was really a quinnat salmon, it must have been a young one. We hope that if more should be caught in this lake, or any other, they will be kept in alcohol, or sent in ice to this office, when we will see that they are placed in alcohol and forwarded to Prof. Baird. This course will place the matter on record beyond all chance of a doubt as to the species caught.

NEW YORK LAW ON FISHWAYS.

CHAP. 620.—An Act to amend section one of chapter two hundred and fifty-two of the laws of eighteen hundred and eighty, entitled "An Act to provide for the construction of fishways in the State dams across the Oswego, Oneida and Seneca rivers." Passed July 8, 1881; three-fifths by consent.

The People of the State of New York, represented in Senate and Assembly, do enact as follows:

§ 1. Section two hundred and fifty-two of the laws of eighteen hundred and eighty, entitled "An Act to provide for the construction of fishways in the State dams across the Oswego, Oneida and Seneca rivers," is hereby amended so as to read as follows:

§ 2. It shall be the duty of the superintendent of public works of this State to cause fishways to be constructed and maintained in all the State dams across the Oswego, Oneida and Seneca rivers, to permit the passage of all fish endeavoring to migrate to the waters above said dams. The said superintendent of public works shall construct and maintain said fishways in such manner and according to such plans and specifications as the commissioners of fisheries may prescribe, provided the superintendent of public works shall determine that the construction and maintenance of said fishways in such manner and according to such plans and specifications will in no way interfere with the due and proper management and navigation of the canals or materially injure the said dams.

§ 3. This Act shall take effect immediately.

FISHCULTURAL NOTES.—Iowa has an additional hatchery in charge of assistant commissioner, A. A. Mosher, at Spirit Lake. From this house 2,000,000 lake trout, *S. novaeboracensis* will be taken for the northwestern portion of the State. Commissioners Shreve and Locke have been ordered to purchase salmon, rainbow trout and other species at the old hatchery in as large numbers as they can procure.

Some of the friends of Commissioner Sisty, of Colorado, advertise in his name for a dog, when he arrived at his office he thought by the number and quality of the canine assemblage that his next neighbor was about to start a sausage factory.

BLACK BASS WANTED.—A correspondent writes as follows: "Can you inform me as to the proper means of stocking the waters of this lake with black bass, or any other desirable fish, and whether in your judgment that is a good species for these waters. I will like to buy the best of you, and have the fish, when I apply to, and about what it would cost, if you have the means of furnishing me with the information I ask for."

This is a sample of many letters that we receive, and to all we reply that we do not know. "There is no demand for live stock for stocking waters of any kind, one should supply. If we wanted a hundred of them next week, we know of no other way to get them than to go fishing for them. Persons who can furnish them would do well to advertise in our columns."

LAND LOCKED SALMON IN LONG POND—Lincoln, Me., Aug. 25.—I am glad to report the success of our Fish Commissioners in catching a large number of salmon in Long Pond here five years ago. Several fine fish have been taken this season weighing from one and one-quarter to two pounds. One of the latter weight I succeeded in capturing with a fly yesterday. Verily, it was royal sport. We shall have well-fledged lake salmon fishing here in another year or two.—C.

THE COLORADO HATCHERY.—Fish Commissioner Sisty, of Colorado, has been looking for a site for a hatchery for some time and, having found a suitable location, it was generously presented to the State for the purpose mentioned by the owner, Mr. Wilson Waddingham. It is about six acres in extent, and is located eight or nine miles from Denver. A large spring rises on the property, and is abundantly supplied with water. The fish, says Mr. Waddingham, a generous donation deserves hearty commendation.

TWO KINDS OF PARADISE-FISH.—Cincinnati, O.—In your editorial remarks on the Paradise-fish in your issue of August 11, you mention the *Macropodus chinensis varians*. This is a different kind from *M. varians*. I have both kinds, the manners in which they take the same, the only difference is in the coloring. In *varians*

varians the dark green takes the place of the blue and the deep yellow or gold the place of the crimson in *variatus*.—H. M. McFARRE.

AQUARIUM NOTE.—Dr. Sedlitzky, of Salzburg, recommends the addition of four drops of a solution of one gram of salicylic acid in 900 grams of water to every 100 grams of water in the aquarium, and says this will keep the fish healthy without changing the water.

Malarial fever, Ague and Biliousness will leave every neighborhood as soon as HOP BITTERS arrive.

MEASUREMENTS OF PRIZE WINNERS AT NEW YORK SHOW.

WE published in issues of May 19 and June 2 of FOREST AND STREAM the measurements of the pointers Bush, Rhe, Rhonor, Princess, Water Lily and Rapp, and of the setters Spark, Petrel II, Chief, Dash, Lady Gordon and Spot. At that time we were unable to obtain from the owners measurement of the other prize winners, but since they have secured the following, which we present to our readers:

LE GUY.

Mr. A. H. Moore's small pointer dog Guy, by Champion Bang out of Juno. Color, dark liver and white. Winner in champion Irish setter dog class of seven entries. Weight, 52 lbs.; height at shoulder, 21 inches; length from nose to set on of tail, 33 inches; length of tail, 14 inches; girth of chest, 24 inches; girth of loin, 21 inches; girth of head, 17 1/2 inches; girth of forearm, 14 inches; length of head from occiput to tip of nose, 9 inches; girth of neck midway between head and shoulders, 17 1/2 inches; girth of muzzle midway between eyes and tip of nose, 8 1/2 inches; length from corner of eye to end of nose, 4 1/2 inches; length from elbow to top of shoulder, 13 inches; ears, when extended (measurement taken across the head), 19 inches.

LOO II.

Mr. A. H. Moore's champion Irish setter bitch Loo II, by Gordon out of Mayhe. Color, black and white. Whelped February, 1878. Winner in champion Irish setter bitch class of six entries. Weight, 52 lbs.; height at shoulder, 21 inches; length from nose to set on of tail, 33 inches; length of tail, 16 inches; girth of chest, 22 inches; girth of loin, 16 inches; girth of head, 16 inches; girth of forearm, 9 inches; length of head from occiput to tip of nose, 15 inches; girth of neck midway between head and shoulders, 13 inches; girth of muzzle midway between eyes and tip of nose, 4 1/2 inches; length from corner of eye to end of nose, 4 1/2 inches; length from elbow to top of shoulder, 13 inches; ears, when extended (measurement taken across the head), 17 1/2 inches.

BERLEY.

Mr. A. H. Moore's champion Irish setter dog Berkeley, by Echo out of Leo II. Color, black and white. Whelped January, 1878. Winner in champion Irish setter dog class of seven entries. Weight, 58 lbs.; height at shoulder, 24 inches; length from nose to set on of tail, 35 inches; length of tail, 16 inches; girth of chest, 24 inches; girth of loin, 27 inches; girth of head, 17 inches; girth of forearm, 14 inches; length of head from occiput to tip of nose, 9 inches; girth of neck midway between head and shoulders, 23 inches; girth of muzzle midway between eyes and tip of nose, 9 inches; length from corner of eye to end of nose, 4 1/2 inches; length from elbow to top of shoulder, 14 inches; ears, when extended (measurement taken across the head), 19 inches.

LEICESTER.

Mr. A. H. Moore's champion English setter dog Leicester, by Dan out of Lill II. Color, black and white. Whelped July, 1872. Winner in champion English setter dog class of six entries. Weight, 61 pounds. Height at shoulder, 26 inches; length of nose to set on of tail, 39 inches; length of tail, 20 inches; girth of chest, 25 inches; girth of loin, 19 inches; girth of head, 17 1/2 inches; girth of forearm, 13 inches; length of head from occiput to tip of nose, 10 inches; girth of neck midway between head and shoulders, 16 inches; girth of muzzle midway between eyes and tip of nose, 10 1/2 inches; length from corner of eye to end of nose, 5 inches; length from elbow to top of shoulder, 14 inches; ears, when extended, (measurement taken across the head) 19 1/2 inches.

BOB.

Mr. A. H. Moore's champion Gordon setter dog Bob, by Lang out of Floss. Whelped May, 1877. Winner in champion black and tan setter dog class of four entries. Weight, 70 pounds. Height at shoulders, 26 inches; length from nose to set on of tail, 41 inches; length of tail, 17 inches; girth of chest, 17 inches; girth of loin, 26 inches; girth of head, 19 inches; girth of forearm, 13 inches; length of head from occiput to tip of nose, 12 inches; girth of neck midway between head and shoulders, 19 inches; girth of muzzle midway between eyes and tip of nose, 10 inches; length from corner of eye to end of nose, 5 inches; length of elbows to top of shoulders, 14 inches; ears when extended, (measurement taken across the head) 21 inches. August, 1881.

TRAMP.

Mr. E. Langdon Will's champion pointer dog Tramp, by Sensation out of Felba. Color, cream and white. Age, 3 1/2 years. Winner in champion pointer class for dogs over 55 pounds. Two entries present. Height at shoulder, 27 1/2 inches; length from nose to set on of tail, 42 inches; length of tail, 17 inches; girth of chest, 21 1/2 inches; girth of loin, 17 inches; girth of head, 20 inches; girth of forearm, 9 1/2 inches; girth of neck, 17 1/2 inches; length of head from occiput to tip of nose, 11 1/2 inches; girth of muzzle midway between eyes and tip of nose, 11 1/2 inches; girth of neck midway between head and shoulders, 18 inches; length from corner of eye to end of nose 6 inches; length from elbow to

top of shoulders, 14 1/2 inches; length of ear from top to set on at skull, 8 inches. May 31, 1881.

Mr. Charles Moran Jr.'s, Irish English setter bitch Donna, by Charm out of Mandy. Color, orange and white; age, 3 1/2 years; weight, 50 pounds; height at shoulder, 23 1/2 inches; length from nose to set on of tail, 43 inches; length of tail, 18 inches; girth of chest, 25 1/2 inches; girth of loin, 21 inches; girth of head, 15 1/2 inches; girth of forearm above joint, 9 inches; below joint, 6 1/2 inches; length of head from occiput to tip of nose, 8 1/2 inches; girth of neck midway between head and shoulders, 15 1/2 inches; length from corner of eye to end of nose, 4 inches; length from elbow to top of shoulders, 12 1/2 inches; ears when extended (measurement taken across the head), 17 1/2 inches. August 23, 1881.

A typographical error occurred in the publishing of the girth of muzzle midway between eyes and tip of nose, of Mr. J. C. Higgins' Petrel II. It should have read 9, not 4 inches. We are now unable to obtain the measurements of the bitch. We are now unable to obtain the measurements of the bitch. We are now unable to obtain the measurements of the bitch. We are now unable to obtain the measurements of the bitch.

THE CARE OF PUPPIES.

[From Vera Shaw's "Book of the Dog," Cassell, Patten, & Co., Broadway, New York. Courtesy of Author and Publishers.]

AT five weeks old the whelps may usually begin to be removed from their mother, and it is well to do this gradually, as they suffer less from the separation if this course is pursued; and by extending the intervals of the bitch's absence they can be almost entirely weaned without any ill effects. This may be done at an hour or two in the warmest part of the day, so that the chance of the puppies catching cold is diminished. The periods of her absence can then be prolonged until she is only returned to them at a night, and finally be made a day, should it be found impossible to wean them in this manner. It is not an ordinary mistake to feed the pups with the teeth of the bitch when they suckle her; and inflammation from the influx of milk, often arises when they are removed. Considerable relief can be obtained by rubbing some camphorated oil over the stomach, and this can be repeated three or four times a day, or once a day, a mild dose of physic being administered when the puppies are fully weaned. In the event, however, of the milk that she has secreted still bothering her, and her teats being so tender that drawing some off by ordinary milking is impossible recourse may be had to an ordinary soda-water bottle, heated with hot water, the mouth of which can be pressed over the inflamed teat. This has the effect of drawing some of the milk out, and thereby relieving the bitch of a great deal of pain. Or an ordinary brass-pump may be employed.

When a pup is taken from their mother, a very considerable change for the worse immediately takes place in the appearance, which is due mainly to the alteration in their diet and general mode of life. Instead of drawing a certain amount of sustenance from their mother, and thus being able to depend on her until their own resources for a means of subsistence. The necessity of having to get up and hunt about for the fish which contains its food is a fact which it takes a puppy's mind a long time to master. Consequently the entire litter often passes through a course of sickness, during the time that they are thus kept from their mothers' teats, and it is not until a happy thought strikes one of them that it might be a good plan if he got up and looked for something that they all follow his example, and fall to eat as only hungry puppies can. Alarming, however, as this is, it is not a fatal ailment, and should be removed from their mothers' teats should be taken to rid themselves of such ailments. The presence of worms is certain when the stomachs of puppies swell and harden, but they frequently exist without developing such symptoms. It is therefore better to administer a course of their delicate mouths and throats are not injured in administering the remedy. The two best vermifuges are areca-nut and santoin. The latter, in its crystallized form, is an excellent remedy for worms in dogs, and it is well to give a course of it as a vermifuge for puppies of seven or eight weeks old, whose parents weigh from forty to sixty pounds weight. If too strong a dose is given, santoin has a tendency to affect the brain and cause fits, so caution must be exercised in its use, and it is best to give it in small quantities. The use of areca-nut lies in getting it frobly grated, as if allowed to become stale it loses its virtue as an anthelmintic. To avoid this the nut should be grated on an ordinary nutmeg-grater, and given immediately in butter or lard. The ordinary dose is two grains for every pound of weight, and it is better to give five grains than two, and should never be given. Pratt's worm powders are also excellent remedies, if an owner has to clear his pets of these pests, and are easily procured of any chemist.

It is useless to resort to any remedy for worms in dogs unless the medicine is administered on an empty stomach. Small dogs should fast for at least twelve hours, and large powerful animals for twenty-four, before the medicine is administered. It is also desirable to prevent their drinking too much water during the time they are thus kept from their mothers' teats, and of worms of all sorts of food, so that the anthelmintic may have a greater chance of success. Many persons give a dose of castor-oil the night before the vermifuge is given, and a second one two or three hours after if it has had no effect. As long as the puppies are weakly assist the operation of the medicine; but judgment and caution must, of course, be exercised, and it would be foolish to adopt such vigorous treatment with a weakly puppy.

Crusted biscuits, oatmeal-porridge, and bread and gravy, with the addition of a little chopped meat and vegetables, are the best diet for puppies when first away from their mother, and the amount they can get through in the course of twenty-four hours is considerable. The greatest care must be taken to guard against any change of diet, in any respect, until they are fully weaned, especially being given food which is *sour* or *decomposed*. A very fruitful and common cause of this has only lately come to our knowledge. We are indebted for the following information to Mr. E. Grasham, whose country dog is a pup, and who is a very experienced breeder. The gentleman has proved by experience that food cooked in a copper or other boiler is very apt to turn sour as soon as cooked, if allowed to stand and cool in the vessel in which it has been prepared. Care should therefore be taken to remove it as soon as the cooking is over, and to put it in a cool or clean receptacle, where it can remain until it is required for the dogs, or is returned to the boiler, to be added to other meals in course of preparation.

All draughts should be kept away from their kennel, which must be kept dry, and the puppies will not spread and grow as they should do; and a run in a dry yard is imperative, if the weather is not too cold or damp. By keeping his puppies clean and dry, an owner considerably lessens the risk of distemper ravaging his kennel, for this fearful disease is apt to be contracted in a cool or damp place, and except on very rare occasions, when its origin can usually be traced, is scarcely ever present in well-constructed establishments. In our own kennels we have never experienced a single case of distemper among puppies of our own breeding, and it has been under circumstances of great difficulty, where for over three years an average of nearly fifty dogs have been kept in confined spaces. A strict attention to cleanliness, fresh air, fresh water, sound food, combined with proper grooming and exercise, renders the presence of distemper well-nigh impossible, and a breeder should be especially on his guard against the mistake to have it communicated to his stock (for distemper is contagious), he will find them the better able to resist its attacks if they have been previously well looked after.

As soon as the entire litter can be separated, it is in cases of puppies we had bought (one or two of which sickened within the week)

SOUTH BOSTON YACHT CLUB.—An open match is contemplated for the middle of September with some \$300 for prizes.

TREE-PLANTING PAYS in California. Four years ago an agriculturist, having thirty-two acres of rugged hill-top land unfit for cultivation, planted eucalyptus trees (680 to the acre) upon it. This tree grows nearly as fast as the willow and furnishes excellent wood for cabinet working. To-day the land is valued at \$200 per acre. This example has set other

agriculturists to thinking and they are now paying more attention to tree-planting than heretofore.

[St. Louis Post-Dispatch.]
WEATHER WISDOM.

Under the title of Old Probabilities, one of the most useful and valuable officers of the U. S. Government, is most widely known. But quite as well known is Prof. J. H. Tice, the meteorologist of the Mississippi valley, whose contributions to his favorite study have given him an almost national reputation. On a recent lecture tour through the Northwest, the Professor had a narrow escape from the serious consequences of a sudden and very dangerous illness, the particulars

of which he thus refers to:
 The day after concluding my course of lectures at Burlington, Iowa, on 21st December last, I was seized with a sudden attack of neuralgia in the chest, giving me excruciating pain and almost preventing breathing. My pulse, usually 80, fell to 35; intense nausea of the stomach succeeded, and a cold, clammy sweat covered my entire body. The attending physician could do nothing to relieve me; after suffering for three hours, I thought, as I had been using St. Jacobs Oil with good effect for rheumatic pains, I would try it. I saturated a piece of flannel large enough to cover my chest, with the Oil, and applied it. The relief was almost instantaneous. In one hour I was entirely free from pain, and would have taken the train to fill an appointment that night in a neighboring town had my friends not dissuaded me. As it was, I took the night train for my home, St. Louis, and have not been troubled since.

Any one can take

It is most agreeable to the taste. Some medicines are really offensive, and the stomach rejects them. This can be taken by children. It will purge gently; cure constitutional costiveness; expel acute affections of the liver; remove healthily the cause of rheumatism; brace up the nervous system without creating nausea or vomiting—in a word, this aperient is Nature's remedy, prepared in the alembic of the earth for the cure of man.

CREATLY IMPROVED.
NOT OVER 1 PER CENT. OF BREAKAGE AT THE TRAP GUARANTEED.
THREE ANNUAL PRIZES TO CLUBS: 1st, \$100; 2d, \$25; 3d, one trap and 1,000 pigeons. For particulars, rules, score cards, etc., address the manufacturers.
 [Extract from FOREST AND STREAM, July 7, 1881, p. 445.]
 This flight so nearly resembles the actual motions of birds that the Clay Pigeons afford excellent practice for wing shooting. We commend all sportsmen to test its merits."

Hotels and Routes for Sportsmen

"**THE FISHING LINE.**"
 TAKE THE
Grand Rapids & Indiana R. R.
 THE ONLY ROUTE TO THE
Trout, Grayling & Black Bass Fisheries,
 AND THE
**FAMOUS SUMMER, HEALTH AND GAME RE-
 SORTS AND LAKES OF**

NORTHERN MICHIGAN.

The waters of the
Grand Traverse Region
 and the Michigan North Woods are unsurpassed, if
 equaled, in the abundance and great variety of fish
 contained.
BROOK TROUT abound in the streams, and the
 famous AMERICAN GRAYLING is found only in
 these waters.
THE TROUT season begins May 1 and ends Sept. 1.
THE GRAYLING season opens June 1 and ends
 Nov. 1.
BLACK BASS, PIKE, PICKEREL and **MUSCA-
 LONUE,** also abound in large numbers in the many
 lakes and streams of this territory. The sports-
 man can readily send trophies of his skill to his
 friends or "club" at home, as well for packing fish
 can be had in nearly every part of the State.
TAKE YOUR FAMILY with you. The
 scenery of the North Woods and Lakes is very
 beautiful. The air is pure, dry and bracing. The
 climate is peculiarly beneficial to those suffering
 with
Hay Fever and Asthma Affections.
 The hotel accommodations are excellent, and will
 be largely increased in time for the sea-on of 1891
 by new buildings and additions.
 During the season **ROUND TRIP EXCURSION**
TICKETS WILL BE SOLD AT LOW RATES, and
 attractive train facilities offered to Tourists and
 Sportsmen.
Dogs, Guns and Fishing Tackle Carried Free of
owner's risk.
 It is our aim to make sportsmen feel "at home"
 on this route. For Tourists Guide a handsomely
 illustrated book of 160 pages sent free. Time Cards,
 Folders and further information, address

GUNPOWDER!
Dupont's Rifle, Sporting and Blasting Powder.

THE MOST POPULAR POWDER IN USE!
 DUPONT'S GUNPOWDER MILLS, established in 1802,
 have maintained their great reputation for seventy-
 eight years. Manufacture the following celebrated
 brands of powder:
Dupont's Blinoud Grain.—Nos. 1 (coarse)
 to 4 (fine) unequalled in strength, quickness and
 cleanliness; adapted for glass-ball and pigeon
 shooting. Packed in 1 lb. canisters.
Dupont's Eagle Ducking.—Nos. 1 (coarse)
 to 3 (fine); burns slowly, strong and very clean;
 great penetration, with a close pattern; adapted
 for glass-ball, pigeon, duck and other shooting,
 with either muzzle or breech loaders. Packed in 1
 lb. and 5 lb. cans, 700 grains and 12 1/2 lb. kegs.
Dupont's Choke Bore.—Specially adapted
 for "choke bore" guns, and particularly for prairie
 and upland shooting. Burns slowly, strong and
 moist; does not coke or burn on the barrels, gives
 both a good penetration and a close pattern; will
 be found well adapted for glass-ball and pigeon
 shooting. Made of two sizes, only No. 1 and No. 5,
 No. 1 being the coarsest. Packed in 6 1/2 lb. kegs and
 1 lb. canisters.
Dupont's Eagle Rifle.—A quick, strong and
 clean powder, of very fine grain, for pistol shooting.
 Packed in 1 lb. canisters and 6 1/2 lb. kegs.
Dupont's Rifle P.G.—"Sea Shooting."—
 P.G. and P.F.G. 4 lb. P.G. for long-range rifle shoot-
 ing, the P.F.G. and P.F.F.G. for general use, air-trip
 firing and noise. Packed in 3, 10, 1 lb. and 5 lb.
 canisters, 6 1/2, 12 1/2 and 20 lb. kegs. P.G. coarse, P.F.G.
 fine.
Dupont's Sporting, Mining, Surriero and Blasting
Powders of all sizes and descriptions. Special
Grades for Export. Also Rifle, Cartridge, Musket,
 Cannon, Mortar, Mammot, Hexagonal, Cubical
 and Pellet Powder, U. S. Government Standard.
 Powder manufactured to order of any required
 grain or proof.
 Agencies in all the cities and principal towns
 throughout the United States. Represented by
 F. L. KEELAND, 87 Beaver St., N. Y.
 N. B.—Use none but DUPONT'S P.G. or P.F.G. for
 long-range rifle shooting.

ANSWERS TO CORRESPONDENTS..... 117

TO CORRESPONDENTS.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are invited from every part of the country. Anonymous communications will not be regarded. No correspondent's name will be published except with his consent. The Editors cannot be held responsible for the views of correspondents.

Subscriptions.

Subscriptions may begin at any time. The subscription price is \$4 per year; \$2 for six months. Remittances should be sent by registered letter, money order, or draft payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada; and is on sale in Europe by The American Express, 40 Strand, W. C., London, Eng.; and by Ed. Verquert, 15 Boulevard, St. Martin, Paris, France.

Advertisements.

Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices 50 cents per line—eight words to the line, and twelve lines to one inch. Advertisements should be sent in by the Saturday of each week previous to the issue in which they are to be inserted.

Address: Forest and Stream Publishing Co., Nos. 39 and 40 Park Row, New York City.

FOREST AND STREAM.

Thursday, September 8.

The Index of Volume XVI. is published with this issue.

LAST WINTER it was the cold, and now it is the drought. Between the two the game birds are having a hard time. Sportsmen naturally think of the effect of the drought and the forest fires upon the birds, but the prolonged dry season has a much more serious aspect than this; the crops in many parts of the country have suffered severely, and the area of crops thus damaged is an unusually extended one.

THE DAILY PRESS devotes a large share of space to reporting the sport of the day. "Sport" means horse racing, all the games, base ball, lawn tennis, polo, yachting, target shooting, cock fighting, dog fights, rowing contests, boxing, pedestrianism, and the various kinds of diversions of the time. The daily papers can give more space to these different events than is afforded by some of the special weeklies. Thus the Brooklyn Eagle devotes a column of small type to a description of a pigeon shooting match, while the FOREST AND STREAM, in order to find room for all its matter, is compelled to condense its report of the same match into ten lines. There can be no question, either, but that the ten-line report is enough. Our daily press has a way of spinning things out which is of profit only to the reporter, who is paid by the column. Our aim, on the contrary, is to give as much as possible in the space at our command.

RAIL SHOOTING.

THE first of this month was the opening day for rail shooting on the Delaware, but as the tides did not suit, the bags were not large. The morning high tides are always considered poor except when it is cloudy and hazy, but the afternoon tides are those when the large bags are made. Should the wind blow from the eastward, either north or south, the water is driven in the mouth of the Capes and large tides are the results. Northwest winds are bad, as the low water prevents the boats from being pushed over the flats. As yet, the reeds have not been broken down, and the mysterious little fowls have too many hiding-places to be easily flushed. Should a northeast storm prevail, one that will last a day or two, we advise our friends to leave in the storm, and they will be sure of splendid sport when it clears, as birds this season are exceedingly numerous. The 15th of this month is considered to be generally the height of the season, but we have had fine sport on Oldman's Island, below Chester, Pa., during the last of the month.

The shooting is conducted out of boats, which enter the marshes about an hour and a half before high water. The gun stands on the bow, and the skiff is propelled by a pusher who uses a long pole of about fifteen feet in length, with a pronged foot, which prevents the pole from being driven deep in the mud. Light charges of powder are used. One hundred and fifty cartridges should be always taken out, and number twelve-shot is the thing. For a number ten-gauge gun, the charge is three and one-half drachms of powder, one ounce of shot, and for a twelve-gauge, three drachms of powder, and the same quantity of shot. To keep one's perpendicular is not an easy matter at first, but by putting the left foot forward, if a right hand man, the motion of the boat is soon acquired. All the sportsman need wear is an old pair of trousers, a flannel shirt and broad-brimmed hat. A couple of thick pairs of worsted stockings on the feet will be less difficult to stand in than shoes, the soles of which are apt to become slippery. When muzzle-loaders were in vogue, the exploded caps which were dropped in the boat prevented the use of stockings. The changing of the clothes can be done in one of the private rooms of the hotel along the river edge.

Once fairly in the reeds, the rail spring before the bow of the skiff, and are easily dropped. The sportsman need not heed their whereabouts, as it is the pusher's business to mark the birds and retrieve them. This he does with wonderful accuracy and rapidity, considering the sameness of the reedy growth and its matted nature. Often a large flock of reed-birds will swoop down, and cluster within easy reach, on the tops of the wild rice.

Occasionally a passing flock of yellow legs will be called down in shot, by an imitation of their shrill, tremulous whistle. At times an English snipe will spring from off a raft of floating reeds; and during the top of the tide, large flocks of teal disturbed by the incessant popping of the guns skim over the flats, darting here and there with their whistling wings, running the gauntlet of innumerable guns, and leaving brothers and sisters behind as trophies of the correctness of the sportsman's aim, and as dead as a duck (et) dead.

Two of the best places on the Delaware to make a start from are Miller's Hotel at Lazaretto, one mile distant from Moore's Station, on the P. W. and B. R. R. and Goff's Steamboat Hotel at Chester, Delaware County, Pa. Both places are equally famous as headquarters for rail-shooters. In olden times the boats made from each place were immense, and that in the days before the muzzle-loader, loading rod and rail box had to give way to the breech-loader and its trimly-turned cartridge. The rail box, by the way, was an ingeniously-contrived magazine, which was constructed of tin and divided up into different parts, one to hold wads and caps at either end, while the powder and shot were contained in the two centre divisions, between which a lid was hinged, so that when the powder was being dipped out by the two little tin chargers, which were soldered together, the shot was covered, and when the shot was being handled the lid covered the powder and prevented to some extent the burning wadding from igniting it.

Miller's Hotel can be reached by the following trains, which leave Broad street and Washington avenues, Philadelphia, daily (except Sundays) for Moore's Station, at 6:45

and 10:35 A. M.; 1:30, 12:30, 2:30, 3:15, 4:45, 5:30, 6:20, 6:40, 8:00, 10:00, 11:00 and 11:30 P. M.

Although there are generally a large number of pushers and their boats it is always well to telegraph to the hotel proprietors several days in advance and engage one of the first-class men. At Lazaretto John McCollum has the reputation of being one of the best men on the river, but any of the Wood boys, Dick, Bill or Milt, George Morr's, John Brown, Lem Gilbert, Ben Badger are good ones, and the e is hardly any choice among them. We print elsewhere the high-water table at Lazaretto during the season that our friends may from afar calculate their trips and save much time.

Mr. John Goff is proprietor of Goff's Hotel at Chester, a grand stamping ground. It is really historic in its way and many redoubtable shots have enjoyed its hospitality and pushed out from it to have a day's sport in the reeds. It was here that Herbert, Col. De Pyster, Porter, Andrew Staley and many other gentlemen sportsmen used to rendezvous and spend a week or more every season in shooting and fish.

There are no better pushers on the river than those which hail from Goff's place, the principal being Isaac Rothwell, Dick Brown, Sam Brown, Perry Allen, Ben Harris, Sam Preston, Bill Rump, Charles Goff, Ben D. Isckett, Jacob Miller and a great many others, but not considered first class. Those named can be relied upon and are hard to beat.

GREAT SOUTH BAY.

THE sea fisheries of Long Island bring in a great amount of money to the inhabitants, especially of the South side, both directly and indirectly. A great number of people go there for pleasure fishing who spend five times as much money as the fish are worth commercially. To this class of people the Long Islanders, if they are wise, will cater. They come, hire boats, buy bait, pay hotel bills and other expenses, which brings in a revenue to the South Siders, the loss of which would be seriously felt. And yet they permit a few men to fill the Great South Bay with nets, to the detriment of the line fishing, when even the owners of the nets would be benefited in the end by keeping them out of the water, in the increase of visitors, some of whom say all summer.

Instead of general assertions on this subject let us look at the figures. At Fire Island there are from fifteen to twenty boats sent out each day for ninety days, containing three to five persons each, who pay for boats and hotel. There are twenty-one places on the Great South Bay which send out from three to twenty boats each day. From information received we can calculate twelve places sending out from three to twenty boats a day for 100 days, or about 4,500 boats, which, with three persons to a boat, would be 13,500 people during the season. The boats are mostly "cat boats" of two to five tons and, with a man to sail them, cost \$4 per day, making \$18 00 per season, for the boats.

Board averages a dollar and a half a day, by the week; refreshments and extras, 50 cents; railroad fares, \$3; making \$7 for a three-days' trip for each individual of the 13,000 people estimated to visit the Great South Bay in a season; equalling \$94,500 for the season, which, added to the boat hire amounts to \$112,500. This amount might easily be doubled if the dozen nets which do not bring in \$600 each to their owners, and are a nuisance to all others who must sail around them, were kept out.

For the \$7 which the visitor pays for his three-days' trip he is perfectly satisfied if he catches what would be worth \$2 or \$3 in market, and these he usually gives to his boatman. Looking at the fisheries of the South Bay as a common property of the citizens living on it, they cannot do better with it, in a pecuniary sense, than to prohibit all netting within its waters.

If the bay were free from nets the fish would spawn there more freely, for the angler seldom takes the spawning fish, and in a few years the fame of the fishing on the South Side would be so great that the summer rush of anglers, who now straggle all over our coast from Maine to Florida, would be increased ten fold, and the hotel men and the Bay men would be busy and wax fat, figuratively speaking. At present it is financial suicide for them to allow a few men to fill the bay with nets.

We take an active interest in this question because the South Bay is a convenient fishing-ground for New Yorkers, and we have advised many people to go there. Every day FOREST AND STREAM is asked many times, either personally or by letter, how the fishing is there, and if it is better to go there or to Barnegat Bay, or elsewhere. If this state of things continue, we will be under the necessity of advising our readers to go anywhere for good fishing, rather than to the Great South Bay.

W. C. COUP.—Our old friend Coup, formerly of the New York Aquarium, has been lost to the sight of New Yorkers for the past two years, but he has not been idle. Mr. Coup is a restless man, who is never satisfied with playing second fiddle in anything he undertakes, and is always planning, regardless of the cost, to astonish the world with something which it has not seen. He first appeared in New York as the business manager of P. T. Barnum and built the Hippodrome, where his "Congress of Nations" is remembered by New Yorkers as the most dazzling pageant ever beheld here. He soon after left this concern and built the Aquarium. Now, after two years' search of the old and new worlds, he turns up at the old place with an exhibition which eclipses everything in the way of circus, menagerie or museum that has ever appeared here.

It is the custom of circus owners to advertise "The Greatest Show on Earth," but Coup's undoubtedly is the largest, handsomest and costliest. It contains three rings and a hippodrome track forty feet wide around them all, beside the menagerie and museum, with simultaneous performances in all. The trained broncho horses are indeed wonderful, one of them distinguishing colors and bringing a flag of any color ordered from among several different ones, walking on stilts, etc.

Who does not love the glory of the circus!—its glimpses of fairyland to the youngsters and its exciting "hoop-la." And how necessary it is for all of Johnny's uncles to attend it, "just to see him enjoy it." We hope never to get too old for the circus and its feats of daring, and intend to study Coup's animals often before he starts again for the road. Perhaps after he leaves town we will give our readers a hint to how menageries are made. He only came in for a two weeks' season, beginning on the 5th, and, knowing him to be an honest, large-hearted and enterprising man, we wish him full measure of success.

THE GREENWOOD LAKE SALMON.—In our last issue we published a letter from Mr. James R. Boyd, of the Eocompment Hotel, at Greenwood Lake, N. Y., in which he reported the capture of a strange fish, which was supposed to be one of the California salmon pined in the lake some years ago. As the fish was cooked all hope of identifying it was lost, but Mr. Boyd promised to take good care of any other specimens which might be found. Yesterday we received a letter from him dated September 5, saying that another one was caught and was held there alive. We immediately telegraphed to have it rolled in muslin, to keep it from bruising, and packed in fine ice and sent to our office for identification. It came, and alas! proved to be a fine twelve inch specimen of *Smoltus bullaris*, called in different localities "fall fish," "diace," "ehub," "roch," etc. It grows to eighteen inches in length, and is a game fish, rising to the fly. We are under obligations to Mr. Boyd in enabling us to identify this fish, and are exceedingly sorry that it did not turn out to be a salmon.

THE AMATORY CLAM.—The "loves of an oyster," and "an oyster crossed in love" have been so often mentioned as to be familiar phrases. It has, however, devolved upon Mr. Langman, of the New York World, to show how clams can love. We publish his poem, "Molluscus and Bivalvula," in another place wherein he tells in tuneful verse how the loves of elam-klund do not always run smooth. The argument is that Molluscus, a noble young clam togs to see the world and perhaps conquer it, and declines to be detained at home by the tears of fond Mollusca, whose siphons overflow at the thought of the dangers her hero may encounter. We have been permitted to publish this entire, for the first time, by favor of the fair Secretary of the "Pot-Luck Club," and henceforth we will eat our "Little Necks" with circumspection, lest our molars may crush a tearful "Bivalvula" just parted from her "Molluscus."

"But Give Me," said the Postman to us the other day, "a young woodchuck. Fellers talk about game birds, but I take a woodchuck every time." The Postman is not alone in his taste. A correspondent of Mrs. Lewis's *Food and Health* says that since the woodchuck lives on clover and other "clean" food, it ought to be good eating. He has actually tested its edible qualities by having some woodchuck dishes served at a New York restaurant, and he, together with his friends, who were not aware that they were eating, pronounced it a delicious dish. Clearly there is yet a line of food experiments which are out of the scope of the Ichthyophagous Club. Can we not, following the example of those gentlemen, extend the list of the edible inhabitants of the earth and air? We might take a hint or two from the Digger Indians.

HAWK DESTRUCTION.—The new Ohio hawk law is working well. One county in the State has already paid \$84 in bounties on 183 hawks. Let the good work go on.

WHO DESERVES THE CREDIT?—A correspondent asks who first imported English sparrows into America. If we are not mistaken several claimants for the honor have appeared. In the year 1846 Thomas Woodcock, President of the Natural History Society of Brooklyn, N. Y., brought over from England several specimens of the field birds of that country. Among them were some English sparrows, although it is not on record that they bred. Eight years later, in 1854, Col. W. Rhodes, now of Quebec, Canada, imported some sparrows into Portland, Maine, and subsequently into Quebec. In the year 1858 the Messrs. Chas. Reich & Bro., bird dealers, of this city, imported a number of the birds into this city, and from these and subsequent importations the present birds are descended. We have no precise data to give our correspondent.

We are deeply pained to chronicle the death of Alexander Moseley, for many years senior editor of the *Richmond, Va., Whip*, at his residence in New Kent County, Virginia, August 30. A more fitting notice of the life and character of our friend will be given next week.

It is said that large numbers of orioles are being killed in Maryland to be used in advertising the coming oriole festival in Baltimore. This is a very foolish piece of business, and the bird-killers should be punished according to the law.

POT-LUCK POETRY.

WE have before recorded how Mrs. Marion T. Fortescue, the Secretary of the Pot-Luck Club, gave a piazza picnic and banquet on August 7, at her villa at Rockville Centre, Long Island, in honor of the fifty-second birthday of Hon. Robert B. Roosevelt, the president of the club. In our brief mention of the jolly occasion where the water flowed, rippled and bubbled over among the assembled *Uterai*, we only hinted at the poetry, two specimens of which we have been fortunate enough to secure for publication. First comes one on the president's family or familiar nickname:

BY JOHN HARRINGTON.
When man was boy in days long past
And comitment seemed fame,
How swelled his heart when first he heard
"Mister" before his name.
But when the years with cruel hand
Had scrawled his features o'er,
Frown changed to smile if some one spoke
His boyish name once more.

Lucky the man we greet to-day,
Though time may meanly rob
His store of years, it cannot steal
His youthful nickname, "Bob."

Long be his days among us all,
And, knowing him, may you
Search out the way to be addressed
As boys at fifty-two.

A clever journalist who could not be present to help slaughter the clams sent the following account of their loves:

MOLLUSCUS AND BIVALVULA.
BY G. T. LANGMAN.
In a far beach, remote from human view,
From youth to clamhood bold Molluscus grew;
Of all the clams were in its sandy space
None so valued him in beauty, vigor, grace;
Was none more swiftly burrowed in the mud,
Was none whose siphon sucked an ampler food,
Was none that sought to thwart him in his suit
For fair Bivalvula's hand—I should say foot.
Fair was Bivalvula, a fay might well
Envy the foot thrust coolly from her shell,
Plump and plumpish, old Ocean ne'er a more
Bewitching creature had seen upon his shore.
Since lovely Venus in the shell of the
Tridacna gigas rose from out the sea,
Suitsors had sue by scores, from all apart
She kept, with vigorous reserve, her heart.
The clam you in the restaurant found
Upon the ice-block could not be more cold!
Valv'ly their love the suitsors strove to tell;
In to the mud she dyed and closed her shell;
Contentmentously silent as—I am
At loss for simile—as—a clam!

But when his tale of love Molluscus told
Through all her tubes a throbbing current rolled,
And bustling to her shell, the maiden coy
Confessed her passion and revealed her joy,
And in the sand they nestled side by side
Happy as—clams at a propitious tide.
Blest was their wooing, yet Bivalvula
From time to time with silent anguish saw
Within Molluscus' beseeching siphons swell
That fairly seemed to corrugate his shell.
The wild desire for a wider life,
The tumult, the mastery and the strife.

Once as they sat, nor feared the fisher's toe,
(The moon had risen and the tide was low)
Unto Bivalvula, whose siphons peeped
Her pensive shells betrayed, Molluscus spoke:
"Valv'ly, adored!—belays, you'll regret to see,
Have such diminutives as well as we—
"Valv'ly, adored, there is a world without
This flutte beach, we nothing know and know;
I long to quit this narrow life and tomb,
And make myself a fortune and a name—
I will return and consp'it thee to my shell,
And cheer our happy life until the last
With laces of all the stigres I have passed."
Then she, "Molluscus, mine's a timid heart,
And from my tube the unbidden tear will start,
I know thee good and brave, but oh! I fear

Perils that await thee in another sphere.
Peruse the annals of our house and race,
What clam has risen or to power or place?
Stay, my Molluscus, stay at home and rest,
Homekeeping hearts are ever happier;
Health, for me, love already hast thou got,
The paths of glory lead but to the pot?"

But he replied: "Bivalvula, my dear,
Trust thy Molluscus, true and have no fear;
The fact of men we love have to risk and toiled
Have been, I fancy, much calamitated;
They recognize our virtues in their speech,
Our qualities for imitation teach;
In gladdens hours a man exults, 'I am
As happy as a—man? no; 'as a clam!"
To claim they come when they would mark their sense
Of the surprising worth of reticence.

Did not ANNE BOLLYN at the fatal block
Of "LITTLE NECKS" into the head-man take?
"Mong Austin poets none hold their heads so high
As our friends the Clam-Gallies family.
In our own land important parts we've played
In politics, society and trade.
Lo, the poor Indian, whose untutored mind
Our cast-off shells for currency designed;
Behold the Pilgrim Father in despair,
As Mother Hubbard's is the cupboard bare,
Shall not their work in famine die, and tears?"
No! Liberty is saved—the clam appears.
Seize Grant's cabinet—my love, be calm!
As well as Fish, we too have to risk and toiled
Is there one board, the poorest to the least,
At which the clam is not a welcome guest?
Nay, when our hardy fishers go abroad
Pursuing or the haddock or the cod,
The clam goes with them as an honored freight
In the unexplained capacity of bait.
I do not know what 'bait' is, but across
My mind comes a suspicion it means "boss."

Still shed Bivalvula the peary tear:
"Uch! can not thy Molluscus, Valv'ly, dear,
"Myself shall with him fare, thou too shall see;
To-morrow, darling, thou shalt come with me.
"You have not been invited?" True, but still come!
I know that any friend of mine is welcome.
The feast is in our honor—claims to eat
("Eat" means to worship) do the convives meet,
And we our choice shall take of the menu—
Kao, foast, soup, chowder, 't, fry, broil or stew.
For us the cook collects, and proud surveys
The tasselled t-casques of the golden maize;
For us the oyster, white and red, they tear,
With it rans of rapture from its earthly jail;
For us a host of dishes rare they frame,
Made of Port-culcants I cannot name;
All things await us. Valv'ly, shall we not
Take pot-luck too? Forbid this unclingly thought
That treachery is meant! In that case, hem!
We'd be compelled to disagree with them,
And in the silent watches of the night
Let indignation wait on appetite.

No! Let the virtues of our bests flourish
Be our strong suit—"we'll to the least repair."
He spoke; Bivalvula wiped her tearful eyes.
Where ignorance is bliss 'tis folly to be wise!
They came! The young, the beautiful, of where
Our brave Molluscus and Bivalvula the fair?
O, may the god that on our lovers waits
Ordain they were not served on different plates;
And may the guests who met them here to-day
Enjoy a pleasanter Pot-luck than they.

L'ENVOI.

Unhess, accept these verses, written down
On a hot morning in the dusty town.
And when you read them may it pleaseant be
By the cool waters of the sounding sea,
May you not find them stupid, harsh and hard;
And eat a clam unto your absent bard!

Mrs. Fortescue then read a poem of greeting, of which we only possess as the following verses:

From mountains green and mountains white,
From gray old hills' rugged heights
From a remote sea where the anorous breeze
Lays down its life in golden ease,
From brimstone springs that flow by night,
Where dawdling the day out hour by hour,
Fair maiden, harken! the broad land is
In straggling cluster of broad lustro,
On the tuskly aesthetic kitchen duster,
With shaded woods in a stony tower;

From Spanish hill and Alpine rock
Our scattered deer, and faint red flock,
Send word of good home to the fold,
"God bless our Prince of Pot-luck bold,
For whom e'en Time turns back his clock."

From "Savage's Ride," by Mrs. Sprague, descriptive of the adventures of Dr. John Savage in search of "Marion's Rest" on a former occasion, we take this:
"My heart," said the bard, "is blithe and gay;
Queen Marion holds her court to-day;
A court marine beside the sea,
(Its lady chief-justice, not shea, but she)
And the clerk of that court I'll surely be;
And oh! the rock lying time to-day
At Marion's, twenty miles away."

THE TRAJECTORY studies of our correspondent, "P.," which were published in our last issue, are supplemented to-day by a paper on the subject from the able pen of Major H. W. Merrill. Both gentlemen have a thoroughly practical as well as theoretical knowledge of rifle-shooting, and both are sportsmen of long experience. The two articles are valuable contributions to the literature of the subject of projectiles. Major Merrill explodes the "dead on" fallacy in which many shooters still persist,

The Sportsman Courier.

MARK COCK:

BY PAUL PASINOR.

AUGUST'S fifty nights and sultry days, like opposite levers trying away incessantly at old earth, have loosened on the intense summery vigor of her frame, her glossy locks begin to fade, her limbs droop with the burden of the harvest, her matted cloak of green grows scant and rusty in the sun, and the bird, as if she were passing another season's prime, and is hasting toward her annual decay.

But what curbs the ardent sportsman for the sentiment of the seas? 'All summer long, while nature was in her bloom, while all things were fresh and rapt in field and wood, and birds cheerily voted the holiday of the year, he has been languishing, whether at toil or play, whether chained to the urban desk or stretched at length beneath the shade of some pine or grove, languishing and pining for the sound of his beloved brook—languishing, and the indelible arm of a cloud of gauzy mist, and the water, which he still so solace himself with the little conciliatory pastimes and diversions allotted to the summer months. He has cast and trailed the various seductive baits of the fisherman with passable success and occasional zest, but, when, as he very sensibly remarks, fishing would be a somewhat better apology for sport if the two ends of the pole could be a little more equitably balanced. He has fished, and read, and slept, and eaten. But his principal enjoyment has been to dream—dream of the good time coming, when the heat and the law would fall off together like the seamless garment, and he would be free to enter the forbidden land—

"The realm of sweet desire."

And now at last the first of September has come; the catlike, sneaking sportsman that infest the covert in hopes of "bagging" an unwary and impatient sportsman, have folded their tents like the Arabs, and as silently stolen away. Nothing prevents; it is a charming crisp-aired day—shall we not put our respects to that prince of the covert, the woodcock? Yes; yes, by all means! Our breech-loader is in the hole of trim, and fairly seething for a duel at dialogue with dame Echo: our shells are freshly loaded with keen little No. 3, our luncheon of pickled snails, lemons nervously at his side. "Charge!" like a bronze statue she is frozen to the earth. My friend mounts up and takes his seat beside me. We commence to move away. There lies Quaid pitifully stanch, but with bright, pathetic eyes pleading as no tongue can plead. See how the beautiful creature trembles in every limb! A moment more of trial, and then the word is given. "Come!" And she comes!—like a cross-bolt out of a bow; like an arrow drawn to the head. A few minutes' ecstatic scamper, and then we take it into the team, for Charlie and I are not awfully tender of the human sportsman, and his hearts suffer then to take on a blow, panting and dust-choked dog into a sultry cover.

We agree, as we ride along, to make the very most of the day. We must visit all our favorite coverts and keep the upper hand of our nerves—no potting shots to-day. First in order is the river-bottom. We must take that in the cool of the day, for it is so hemmed in with hills that by noon the pools will fairly steam. We leave our team in a cool glade above the interval and plunge down the bank as excitedly as two school boys, down we are, right in the thick of it. We must go carefully now and Quaid must be encouraged to work close, for it will be like shooting stars between two flying clouds to hit the brown whistlers here. We move on, about two rods apart, and Quaid quarters back and forth in front of us. Steady, now! That bog looks fairly profitable. Quaid is gingerly working around the edge. See! the spell is upon her—the witching spell of the scent. She's all alert; her little dicked tail vibrates excitedly; she bubbles up and goes into the cover. There your sportsman—your eyes are shot in an emergency and note his lightning-like decision, his quick, clean action, his splendid self-possession. Here is where he learned it, and here he needs it all, and needs it now. A third of a second to will, a third of a second to do—two-thirds of a second and it is all over. Time is never quite so valuable and so significant as just after the whistle of a flashing cock.

We are comparatively in the open and that saves our credit. The two reports are almost instantaneous. The cock turns in the air and darts sideways, as if deluged by the force of the shot. "Down he bird, Quaid! bring it!" Quaid, who has been charging faithfully since the cock flushed, now follows the finger of her master and her own sharp nose, and soon emerges from the thick ferns bearing her prize as tenderly as if it were a lady's glove. The bird is pretty badly torn with shot, so we anxiously conclude that we both hit it and thus enjoy the luxury of being generous and selfish at the same time.

Fun now has fairly commenced. Quaid has small-dred blood, and now she smells powder. The thicket opens a little and we drift farther apart, whistling occasionally when the leaves hide us from each other's sight. Pretty soon I catch sight of Quaid on a dead point! Her little body is stiff and motionless, her tail stands out straight, one of her forefeet is slightly raised, and she is drinking in the electric aroma of the game. At first I am inclined to call Charlie, that he too may wonder at the beautiful and unusual phenomenon; but slight signs—perhaps I should rather call them premonitions—of a break on Quaid's part causes me to change my intention. I throw myself and gun into an attitude of readiness, none too soon. Quaid makes a lightning-like dash, and scarce three feet in front of her, flashes a magnificent cock, Bang! bang! Nothing but leaves, I declare! Not even a feather floats down. Just then Charlie's gun cracks, out to the left and a little in advance, and presently I hear him calling, "Here, Quaid! dead bird! dead bird!" Quaid is "up and away" in an instant and I know that her mouth is watering over my lost bird. Charlie and I exchange hallooos and then move on again. But the thrill of the thrill is broken by my friend's quick, clear cry: "Mark cock!" I know he has flushed a bird, but for some reason or other been unable to get a shot at it. I keep my eyes and ears open, and an rewarded by hearing a bird whistle through the top of the undergrowth

and dive down a few rods in advance of me. Quaid comes dashing after, but a cautionary signal puts her on her guard, and she charges to await further instructions. As soon as I can come abreast of the intelligent little creature, I indicate by a wave of my hand, and source I wish her to pursue. She makes it all in a twinkling, and when I give the word sails in I am standing in a sort of glade comparatively open, but bounded on both sides by thick cover. On the side opposite from me the cock appears to have dropped. Somewhere in that thick brush he must be hiding. Quaid goes through it like a mosquito through a window netting. She glides through thorny apertures, which would hardly admit the nose of a pointer or a setter. She works as if she were made of rubber and steel. No plunging or errand, no changing of her course to avoid disagreeable situations. Silently, swiftly, faithfully canvasses that cover, and puts me up the right where I want him. Her blood is up now, and as with the previous bird, she flies after him through the air in a succession of glorious leaps—herself a veritable witch of the wood, her feathered carlsing, her bright eyes glistening like stars. For a moment I watch her. The sight is too lovely to disregard; it is fully fascinating. Then, fearing to shoot lest I may down the wrong bird, I cry out sharply: "Charge!" She drops as if I had shot her! Ah, here is a creature that is fearfully and wonderfully trained! I lose the cock, but I gain a spectacle that is worth a bird.

But time and space fly. I cannot stop to tell you in detail how we finished the river bottom, and how I retrieved my reputation by bagging half a dozen birds in six straight shots, for I have no more right to trespass on the choice preserves of the FOREST AND STREAM outlying the proper bounds of this article than I have to smother the first shooting in my neighbor's "posted" ground. But I must tell you in conclusion how we crowned our day's sport.

It was drawing toward sunset, and hot and tired, Charlie and I and Quaid were making our way back to the team across a wide meadow. We had just been all the way round Half-Moon Cove, and were discouraged at not having flushed a single bird in that remarkably promising cover. A large patch of corn lay right in our path, and at one corner of the corn was a small 6x9 birch covert—as you might describe it. Into this we sent Quaid as a last resort, and before she came out we wished we had resorted there earlier. Cock after cock came whistling out over the corn so fast that we could not possibly get a shot at all of them. The westerner's stone hit the faces; it was some-what faded and nervous with the day's work, and, all in all, I suppose we could have done better. As it was, however, we bagged nine cock out of that little birch covert! Although they were all shots in the open, the birds flew with compensating swiftness. We have never seen cocks so active on the wing. Imagine yourself facing a blaze of western glory, your eyes still further blinded with boiling perspiration, and somebody of strong arm flinging good-sized potatoes across the sunlight with all his strength, and you will have some idea how those woodcocks flew, and the difficulty of cutting them down in good shape. I saw six or seven, I do not know how many flushed out of the covert—I should judge about fifteen. All the feathered population of Half-Moon Cove seemed to have adjourned to that little grove for a caucus or a picnic, or something else of equal interest.

When we reached home our combined bag yielded up twenty-three of the brown beauties, so I do not think we disgraced ourselves.

My parting advice to the amateur woodcock shooter (and such is not myself) is this: Go buy the first-class cocker spaniel, and that right quickly.

"PODGER'S" PUTS A MOTION.

DOWN EAST, August 25.

SINCE writing you last, wherein I gave my "experience" on the snake question, I have carefully perused the last number of your issue, and have been struck by the additional evidence on snake gymnastics, and I see that the general weight of testimony is that snakes do climb, and that they go straight up. I stated that those I had seen climbing had ascended with a spiral movement. I should have qualified the statement by saying that I had only seen them ascending small trees, and before some one sails into me and proves firstly, that I never saw a boy; secondly, never "got hooked," and thirdly, never saw a snake, I want to commend the snakes that go straight up, and also to prefer the old method it is their business not mine, and I hasten to admit that they go straight up head foremost or tail foremost, or any other way that suits them best—they can take their choice. This concession to the general verdict I trust will save me from being "set upon" by some hypercritical correspondent disposed to prove that I don't know anything about snakes. You evidently have a large number of readers who have snake on the brain, in their boots and everywhere else. Can't we pass the snake dispute, and take up crows and their peculiarity to feed on fish? We have exhausted 'possum, skunk bites, and woodchucks and snakes; now crows have the floor. I move that crows have a chance, or let us go back to dog stories, a much more interesting subject. I bar the previous question on the above subjects including that of whether trout flip the fly into their mouths with their tails. Strikes me you will have to limit the latitude of discussion on any subject, for the varied experiences of your numerous readers on every known topic or query that arises is wonderful, and shows how extensively the FOREST AND STREAM is read.

I see by your last number that has seen us so troubled with worms. It must necessarily be the angle worms. I want to suggest that your correspondents give their statistical experience as to how many squirms and contortions to the square inch can be got out of a stale Boston lobster. After all have handed in their evidence I want a show, and when I have given my experience if I can be out-squirmed I am ready to go to jail.

I may not be quite as sound as some of your correspondents on snakes, but oh, Jerusalem! what an experience I have got in my mind—the result of misplaced confidence in a Boston restaurant's bill of fare. Give me a show when the time comes.

Speaking of the readers of the FOREST AND STREAM I must tell you what a time I had in Boston to get a copy of your last issue. I went to every news-stand I could hear of, to every place where papers were sold (this was on Monday, and blazing hot at that), and in every instance the answer was "Not one left." I could not find a copy in the town. At last I espied a familiar face projecting from under a pile of papers at a hotel stand kept by a Frenchman. I was raked it out to his view after he had denied having a copy, he remarked, "By George! I did not know nubbings about dot one. I could have sold him six times ago." All of

which goes to show the popularity of and great demand for the paper. But don't get conceited or put on any airs; it is your correspondence that is doing it, and it is not a head idea to have an interchange of views and ideas even on stinks and woodchucks. We fellows will write up your paper for you every week if we are let loose, and the observations of a sportsman are often instructive as well as interesting, bringing to light as it does many peculiarities of game animals and birds, and a copy of the FOREST AND STREAM is about as interesting reading as you can find in a day's journey.

I observe that your nautical editor has got to have his comb out a little. He has been let alone so long that he fancies he has things all his own way, and the way he is sailing in on deep water models reminds it very necessary that we fish-toting fellows should come to the rescue; and now that this English cutter "Madge" has come over, there's no living with him. I won't admit that he has got us under, and we must stand up on our models do, and take a little of the conceit out of him, I, for one, am not going to be "sat on," on this question either. Eight tons of lead on the keel of a little craft of thirty-eight feet, forsooth! He can't prove that we want any such craft in our shallow bays by me. Not being amphibious, I prefer staying on top of the water. If I have time I will go on for his next week, and give you a little more of a little more. I had down East recently in a deep boat, by jingo! It is all very well to call our craft "tubs," but a tub possesses the merit of being able to stand on its bottom when the tide goes out. Fun is fun, but I don't see any in a mud bath. There is a "pint" beyond which, etc. Lastly, as the long-winded preachers say, and should say everlastingly, I want to make a suggestion to my brother sportsmen, and that is to show up in all communications the impositions by "Gouge and Swindle" (don't print George and Swindle this time, or you'll be over a first-rate). Whenever a sportsman is caught by swindle and strangled by gouge, show him up. When railroad officials are impudent and unaccommodating, give examples. I propose that we, the great body of sportsmen, do form ourselves into a society for the general reformation of all people whom we, the sportsmen, are, by virtue of our pursuits, thrown in contact with. We will go for the man that kicks our dog (pretty likely to do that on the spot) and the baggage snatcher that slams our guns and things around, and the fellows that put up rates on our boats and tents. It will end in making foreman is caught by swindle, what else of things. Let us not forget either to give credit and praise where due. Who seconds this motion? PONDERS.

A REMINISCENCE OF THE WAR.

READING, some time since, a reminiscence of the late war put me in the notion of giving to your readers some recollections of my adventures and escapades. I am quite sure a great portion of unwarmed sportsmen first-rate. When a man is taken to a pretty camp, almost as much as standing behind a tree of thoroughly broken dogs ready for the flush. The troubles and pleasures I am about to speak of came to me through my love for a regular old-fashioned Virginia pointer and his mistress. It was a clear case of love at first sight and "if you love me, love my dog." It was a truism in this case. I was young then, so young and yet felt so old. She stood framed in the doorway of her father's house as I rode up, and when I had dismounted she came with hesitating steps and inquiring gaze to know what I wished. I would not take forage away, and she caught the light of her blue eyes, the deed was done and I was a prisoner.

The Harris Light Cavalry, of which I was a member, was encamped near Catlett Station, and at the opening of my story we were about to break camp and march with other forces on Fredericksburg, some twenty-five miles south. I had not been around the country much during our stay at Catlett's, and it was only some three or four days before the departure of the regiment that I made the acquaintance of this blue-eyed and brown-haired girl. So on this beautiful April morning, 1862, riding some three miles from camp, I came across the comfortable residence of Mr. Joslin; met his youngest daughter, fell in love with her, was introduced to the family, Mrs. Joslin and three daughters—Mary, Lney, and the youngest (she of the blue eyes), Mabel or "Mab." I overstepped the bounds of propriety, I fear, for I stayed fully two hours, and left with many regrets and a most cordial invitation to come again. As I was mounting I saw coming through the gate Miss J., followed by a fine pointer—bringing me back for me to bring home a dog, what I wanted that he was and that his name was Rob. "Did I shoot?" Was I a sportsman? If so I should shoot over her dog and she would go with me, only we could not go until October. "Oh, my, what a beastly game law not to allow shooting in April."

I rode back to camp in a meditative mood—that is, meditating how I should arrange to make another visit to this hospitable roof. I arranged it a couple of days after, and had a charming visit; and how I did pet Rob, and how he and his mistress appreciated it. Arriving in camp late in the afternoon, I found we were under marching orders for Friday, the next day but one.

I stayed in camp until after dinner Thursday, then rode out to bid my good friends adieu, possibly never to see them again, for were we not going to Richmond, and so on south? The future was full of possibilities—one was promotion, the other death; and it was possible that death might destroy us. And so it fell out that as the twilight was coming on I stood in the midst of that family group and bade them farewell. I had mentioned again about to turn away, when Miss Lney handed me a piece of paper. It proved that she was the face of a handsome young man in full uniform of gray. Said she, "Mr. Stuart, that is James Davis; he is serving with Gen. J. E. B. Dick. Should he ever fall into your hands, be kind to him. Should you ever fall into his hands, he will do all he can for you." I at once drew my own conclusions as to the relation James Davis sustained to the speaker. I took a good look at the piece, then returned it, and, putting myself to my horse, I galloped away with a heavy heart in one respect and a light one in another.

"Books and saddles" sounded at five o'clock next morning. Twenty minutes later the Harris Light Cavalry were well on the march, the objective points being Falmouth and Fredericksburg. That day was to see the first engagement with the enemy, The battle of Falmouth Heights, the first battle of Fredericksburg, and the occupation of Fredericksburg followed.

During the summer the cavalry was kept busy doing picket duty and raiding in the enemy's country. I had managed, however, to make two trips into the rear, and when on one occasion I ran great danger of capture, but with my usual good fortune escaped by showing a clean pair of heels. In July Gen. McDowell was ordered to join Gen. Banks in the Val

ley of Virginia and while the army was marching North and in proximity to Cattle's Station, I embraced the apparently good opportunity of making a third visit. Striking off from the main column, I rode for an hour, when I sighted the blue and soon thereafter was riding through the gateway. I went out at the door by Mr. Joslin's. The family was about to sit down to dinner and I entered the dining-room. I did not notice anything unusual in the bearing or behavior of my host, hostess or the young ladies, but it all came to me afterwards—their rather strained conversation, Miss Lucy's pale face and agitated manner, and I remembered so well afterwards of Miss Mabel sitting so close to me at table. I sat facing a haircase, the mount of which was quite cheap. I noticed then that Miss Lucy excused herself twice and ascended these stairs, quickly returning each time. Dinner being over, Miss Mabel, "Roh" and I went to the front of the house and there, in the shade, sat for nearly an hour. Mabel remained close to me the whole time. I afterwards remembered her agitated manner and how careful she was to keep the dog near and that she would not let me go to the barn to get hay for my horse, but called a negro, who fed the animal. At 3 o'clock I prepared to go, bidding good-bye to the family. I was soon on my way. Taking the road back of the house, I followed it to the woods, then taking bearings, I struck through the forest the nearest way known to myself, by which I could probably reach the main column. I had ridden possibly two hundred yards when from the side of the path the negro Tim appeared, out of breath and the perspiration streaming down his black face.

"Mars Dick, don't take de ole road to de creek; take de road what you knows to Keiley Ford; an' go, for de Lor' sakes, as fast as yer hoss kin make it; ders danger in de air. Miss Mabel say dis, and may de Lor' stan' by yars da'ner."

"But, Tom, what on earth is wrong? What have you seen?"

"Mars Dick, I's seen lots o' heard lots. Go, go, go!"

Now thoroughly aware that a great danger hovered near and somehow feeling Miss Mabel knew it, I instantly followed Tom's advice and direction. Changing my course from nor west to a little north of west I urged my horse forward at a rapid rate, keeping my pistol ready and a sharp lookout. A few minutes past four I left the woods and found myself on the track leading to the ford and probably four hundred yards from it. At this moment I heard hoof strikes behind me. Turning in to see what was two horns approaching at an easy trot. I did not wait for further investigation; I felt a near danger. Striking my horse sharply with the spurs I fled to the road. At the same instant "zip, zip," came two rifle balls in close proximity. Glancing back I saw a little cloud of blue smoke over the horse and they were flying in pursuit. It was now a question of horse flesh. The fine animal I rode had never yet failed me. Could I reach the ford and get safely over all night yet he well. The river is in sight. Faster and faster flies the horse that carries my life and my liberty. A minute more and I am in the swift current of the Rappahannock, the horse making tremendous plunges under the spurs. "Halt!" Three horsemen in blue appear on the way up creek. I point back. Instantly three carbines are raised and three balls speed over my head. I look back—the pursuing Confederates are wheeling about; they lie up the hill and are soon "lost to sight—to memory dear."

Lieutenant P. said that night in camp: "Dick, that's another one of your close calls. You'll be picked up yet. You can't combine love-making with war in the enemy's country. Some of these girls will betray you."

Lieutenant P. did not know the hiding faith in my heart for at least one of those girls. She had saved me that day.

Fall, winter and spring passed away and, although I had been a regular scout all that time, I had never been able to visit the Joslins. It was three days after the battle of Chancellorsville. I was alone on the road from Fredericksburg leading to Beaton. I had left Palמות the evening previous and, encountering Federal pickets ten miles north of town, started with the officer of the picket all night. Four A. M. found me in the saddle. I knew that the road was dangerous, being well patrolled by Confederate cavalry, but, trusting to my knowledge of the county and ability to keep from beaten paths, I pushed on.

By 9 A. M. I reached Morrisville, some miles from Beaton. Here I met as prearranged another scout. He struck for the river, going west; I passed on north. After getting away from Morrisville a mile and a quarter I was walking my horse through a hollow in the road musing and thinking of things far away, when out of the thick overhanging pine trees sprang three men in pant gray, covering me with their carbines. "Stop!" they called. "Get off that horse!"

"Third, 'Down with that pistol or your a dead man!' My bridle was quickly seized. I dismounted, and was hurried into the woods, and in a thrice was quickly disarmed.

"The man who took my belt was James Davis. 'Mr. Swiveller this is the third time I spotted you, and followed you, and now I've got you.' The big, handsome fellow smiled grimly, and shook me warmly by the hand. I was completely crestfallen and beat, and felt about as mean as a man ever got over anything in his world.

Davis then recounted the following: He said that the day I took dinner at Mr. Joslin's he was in the house, and while we were at dinner he was in the room immediately over the dining-room, and through a small knot hole in the floor (there being no plaster) he watched me. He was then anxious to effect the capture, but he was deterred partly by the position I occupied facing the stairs which would give me a chance of seeing him about as quick as he could get his pistol on me, and partly by my having a gun in my hand. I had a horse in common with the rest of their family but for serious results that might attend the attempt. He pursued me as soon as I left, being joined by a companion. Miss Mabel divining their intentions sent Tom to warn me not to go the way I came. They missed me at the creek crossing, so must have crossed my trail a couple of miles back in trying to intercept me at the upper ford. Had they changed their course five minutes earlier there would have been trouble for me; as it was I saved myself by superior speed.

Going back in the woods to a place well screened from the rough capture, I prepared to have my result, man, fried eggs and biscuits. We dined, and the rest of the day was spent in talks of the war, and telling sportsmen's yarns for all were fond of dog and gun. Davis and his companions had not learned of the death of Stonewall Jackson until so informed by me. They had been inside the Federal lines almost a week previous to my capture. I will not here describe how I was conducted beyond the lines at night, and of the magnificent ride across the Blue Ridge, and the splendid trout I caught from mountain streams. Four days after my capture I was

delivered at Gen. Fitzhugh Lee's headquarters, was introduced to that officer, and most agreeably entertained. My parole and exchange occurred six weeks later.

October found my brigade fighting Gen. Stuart at different places along the Rappahannock. At the close of a day's skirmishing we bivouacked in the woods. My horse was through feeding, I was preparing to wrap up in my blanket, when suddenly occurred to me that I was but ten or twelve miles from Joslin's house. Could I make a visit? But then a portion of the enemy must be nearer to Cadlets than our forces. However we wanted information as to the enemies whereabouts, and particularly if they were amassing near Cattle's Station, and I had already been ordered to ascertain this fact if possible. I therefore determined to combine pleasure with duty, get what information I could of the enemy, and visit my friends in the bargain. I at once communicated my plans to Geo. Kenner, one of the best scouts on our staff; he fell in with them at once. My idea was to visit Joslin's that night, leave there before day, and scout the country back.

Eight o'clock found us in the saddle and away. After a ride of a short distance Kenner stopped as if struck. "It will be strange if James Davis is not at this moment making himself comfortable in the very house we propose visiting," since Gen. Stuart's command must be nearer there than we, said he. The whole thing flashed on me in a moment, of course we would have to be careful not to capture him, if such was the case? We would try. So it was arranged to approach the house with caution, and find out if his horse was in the barn, if so that would tell of his presence.

We pushed on as rapidly as the course we were taking would admit. Ten o'clock found us in the woods two hundred yards back of the Joslin House. We stayed there until midnight. Leaving Kenner, I made my way to the barn, being careful to keep out of sight of the house, not being willing to take any chances in the twilight. The latch string was out and I opened the small door in the rear of the barn and entered. Taking a match from my case I struck it and slowly made my way along the stalls. There were three cows and two mules. The light went out. The second match blazed up. The family horse. Ha! With hands trembling with excitement I cautiously struck the third match, and, looking right at me, was David's bay mare. Two more matches and I found his saddle. There would be no mistake now.

I quitted and stealthily made my way out of the barn and joined Kenner. It was arranged for one of us to go to the rear and the other to the front of the barn and rouse the folks. Kenner was to do the talking, his voice being strange. We hoped by this that Davis would think it some of his own men.

We started for the house, and when within fifty yards of the barn, 'halt! what's that?' We distinctly hear a horse walking quickly through the barn yard. A moment of intense suspense and there breaks on the stillness of the night the clatter of a horse's hoofs on the road.

"Telling Kenner to wait, I go into the barn; as quickly as possible I made my way by sense of touch to near the stall that contained the bay mare and struck a match.

The bay mare had vanished!

Danger was in the air. We left the place, mounted and rode away. It was some days before we joined the command, but I made that visit before returning and had the mystery solved.

CONSULDED IN OUR NEXT.

THE PREVIOUS 'POSSUM QUESTION.

TUCSON, Arizona, August 20.

The courtesy which you have extended to the 'possum question, so innocently raised last spring, emboldens me to ask the usual parliamentary favor of closing the debate.

The mass literature, which has been so cheerfully given to the public through your columns has perhaps refreshed the lagging senses of many a gony planter and revived memories harmless and pleasing.

The 'possum is hard to eat in the summer, and only matures with the falling of persimmons in the autumn, when the frost crisps the ground.

Americans are fond of imagining that no other country produces the opossum, but in Northern China I have seen a vermillion orchard set in rows expressly for the purpose of feeding opossums, which are esteemed a great luxury among the Chinese, who are exceedingly fond of fat things such as pig and 'possum, and invariably eat them hot.

One of your correspondents suggests hunting 'possums with a gun. I have known one shot in a man who would shoot a fox is banished from polite society forever, and a man who is so lost to sportsmanship as to hunt a 'possum with a gun in the night should be condemned to eat him cold and afterward to undergo a nightmare.

Any negro in the Southern States can catch a 'possum. He may climb onto the limb of a papaw tree ever so far and twist his tail around a limb; but a bickery pole in the hands of an expert darkey or ten year old boy will fetch him to the ground; and then you place the pole across his neck with your feet on each side and give a jerk with the hind legs and his neck is broken.

The controversy did not originate about catching 'possums, but cooking them, and the preponderance of evidence is in favor of baking with sweet potatoes in an oven or skillet, or in the ground surrounded by stones, "tatama" fashion, and seasoning with sage and red pepper.

In the coming autumn no doubt the voluminous intelligence you have spread abroad will revive a taste for 'possum sport and 'possum cooking.

The time may come when the American people will plant persimmon orchards like the Chinese and give the 'possum his due as an epicurean gratification. The question is settled by the majority in favor of baking with sweet potatoes and eating while hot.

With many thanks for the polite consideration the subject has received I call the "previous question."

CHARLEY D. POSTON.

TOADS FOR GARDENS.—According to a French paper a market for the sale of toads to gardeners is held regularly every week in Paris. Dealers bring their "goods" in well-ventilated casks, in which the toads are packed in lots of a hundred, in damp moss. A lot of a hundred good individuals will bring fifteen to seventeen dollars. The gardeners use them to keep down the destructive insects that annoy them. A Dutch gardener, M. Krelage, of Haarlem, recommends the use of the toad in greenhouses, as furnishing an excellent means for destroying the millepedes that infest the plants.

Why be stork and stork when Hop Bitters will surely cure you?

Natural History.

HABITS OF SNAKES.

AS OBSERVED AT THE PHILADELPHIA ZOOLOGICAL GARDENS.

Editor Forest and Stream:

In your number of September 1 you ask for further information on the habits of the rattlesnake; as stated in an interesting letter on that subject from a writer in North Carolina. While considerable observation has evidently been made by your correspondent, some of his conclusions are not altogether so correct as he will perhaps be apt to state a few facts, which are reasonably well ascertained to be such.

1. No serpent covers its food with slime before swallowing it. There is no organ provided for such a purpose, and it would be as easy to paint in water colors with a sharp-ended slate pencil as to smear a "slimy fluid" over the hair or feather of an animal with the slender point of tongue of a snake. Deglutition usually begins at once without any preliminary; when the prey is secured, and the secretion of the salivary gland serves merely to facilitate its passage down the oesophagus and into the stomach.

2. As to the supposed powers of fascination in snakes. In general, animals placed in a cave to serve as food are perfectly indifferent to the presence of the snake until the latter becomes aggressive when they naturally show much fear, but under no circumstance have I ever been able to find any trace of a power to charm on the part of the snake. It is reasonably safe to strike out the intention element implied by the common belief, and to attribute the behavior of the victim to trance or nervous exhaustion. It is well ascertained that this curious mental state often known as "Braidism" or "Hypnotism" can be induced by fear, and also by having the attention strongly attracted on one object in a fixed manner, for even a short space of time. Without going into a long discussion it will be apparent to all who are at all familiar with the experiments which have been made on this subject that the slow approach, and the fixed, glittering eye of the snake might be a frequent cause of this condition in the prey which it was about to seize, under such circumstances so long as the object is not moving, as is the case, as a rule, when a snake gives a shock to the nervous system of the animal affected, there would appear to be a complete paralysis of the motor nerves and an incapacity to effect any voluntary motion to escape from the spot. It is almost needless to say that these conditions not infrequently exist with human beings in the face of sudden danger, which may often be of such a nature that the most firm believer in the supernatural could hardly suppose it to be gifted with a voluntary power of fascination.

3. When a snake is quiet for several hours after feeding, it can hardly be supposed that it desires so to allow digestion to take place, as this process in most if not in all snakes requires several weeks instead of from two to nine hours.

The muscular force exerted by the snake in drawing down its throat is considerable and long continued. Furthermore, the arrangement of the two bones composing the lower jaw and of some of those entering into the base of the skull is such that they are movable on each other, and can be dislocated at will, much along the front to give passage to the food. After this is swallowed they are drawn back into position by contraction of the elastic ligaments which hold them together. When the operation is completed a greater or less time must be allowed for these overstrained muscles and ligaments to recover their tone and contract. During this time it is reasonable to suppose that the snake would—just as in ordinary cases of fatigue—he be disposed to be still, and to some extent, probably be incapable of exertion.

4. The usual number of young produced at a birth by the rattlesnake is very small, from six to twelve, as stated; but it has been known to be as high as fifteen on one occasion in the Philadelphia Zoological Garden.

5. The generalization that all harmless snakes lay eggs, and all poisonous ones do not is unsound. The young of the rattlesnake, as stated by your correspondent, and probably all of the North American venomous serpents are produced alive, but so also are the young of many of our harmless species, as in the familiar cases of the water snakes and common water snakes. The bringing forth of the world of young in oviparous or viviparous principles really does not seem to be a matter of vital importance in the economy of the animal, as it can frequently be influenced to some extent by artificial conditions.

6. The reason given for the quietude of snakes at night in this latitude is probably correct—viz., the chill of the night air and the dew on the ground, but in this quietude reptiles—if indeed it be general among them—differ from most animals instead of agreeing with them in the world of food. If it were an animal such as the mammal in habit not but all those, both birds and animals, of a carnivorous and therefore predacious nature.

7. The development of the rattles differs somewhat from the manner stated. The snake is born with a small knob at the end of the tail, which becomes the hutton of the forthcoming rattle. At the end of about six weeks—depending much upon the time when the first toad is taken—the young snake sheds its skin and one rattle is then added, and subsequently, as a general rule, the bringing forth of the world of young whenever the skin is shed, but this is exceedingly irregular; the snake some times sheds three or four times in the course of a year; sometimes two or three rattles are produced at once, and occasionally none at all, also rattles are frequently lost by accident from the end of the tail—i. e., the end of the rattle—which are never reproduced, as the growth is lost. It is thus readily seen, that while under normal conditions there is a general relation between the number of rattles and the age of the serpent, it is much too uncertain to afford any correct indication of the latter.

What a nest of strange notions is that part of the human brain which may be supposed to be devoted to snakes. All men are prone to misrepresentation and superstition in their regard. Everywhere their graceful, gliding motions and their colors—often as striking and brilliant as Nature can paint—are looked on with aversion and fear. Hardly a religion of ancient or modern times be it classed as mythology or theology, in which the serpent is not recognized either as an object to be feared and therefore to be propitiated by worship, or to be feared and therefore to be hated as the incarnation of evil. Probably few readers of FOREST AND STREAM has ever had their attention drawn to the fact that in all theistic creation, the monkey alone—"that rough sketch of man"—shows his sentiments in this respect, and that universally in the animals of that order, so far as articulate sounds and the language of gesture can make plain, horror, aversion and fear mingled with an invincible curiosity are found, just as the same feelings are displayed under the highest development of all Nature's forms.

Space is wanting just now, but some day it will not be uninteresting to give the mass of facts and draw the conclusions as to the evolution of the moral relations of man toward the serpent.

ARTHUR ERWIN BROWN.
Zoological Garden, Philadelphia, Sept. 2, 1881.

LAND AND HERMIT CRABS.

YOUR editorial note appended to a correspondent's remarks on the "Blacks of the Hermit crab," and the allusion made in it to the land crab of Bermuda, makes me venture to offer a few remarks upon the subject. You say that a land species of hermit crab exists in Bermuda. May not some of your readers infer from this that there is a hermit crab there which is also a true land crab? The large hermit crab of that island, which does certainly go as far as twenty or thirty feet from the water to hide itself in the little rock caverns, which occur so commonly on the southern shore, does not belong to the Geucocentrus, but is a true Pagurus, generally inhabiting the shells of Turbo shells.

THE BEAVER.

A CONTRIBUTOR to a recent number of FOREST AND STREAM gives the beaver credit for a trifle more intelligence than I have observed it to possess, although it is a very knowing and cautious animal. He said, in substance, that it understands the direction a tree will naturally fall, and cuts down only those which will serve its purpose by falling where wanted for the construction of a dam or house. This is a mistake. A family of beavers will attack a grove of cottonwood trees on the bank of a stream, and if not interrupted, or otherwise diverted from their purpose, will cut them all down, regardless of the direction in which they may fall. But a few days ago, while fishing in the Adams River, Middle Park, I was attracted by "beaver work" in clumps of cottonwoods too far from the stream for any of them to reach it in falling. There were ten or fifteen trees altogether, ranging from one foot to two feet in diameter. All were girdled; some were cut half through, but yet standing, while several had fallen. One of the largest in the group had fallen directly away from the stream, its top breaking to pieces against the foot of the mountain. Another of the large ones, after falling a few feet, had lodged against another tree—an inevitable result to man's intelligence. Furthermore, most of the branches of this tree were either dead or being carried away by the wind, so there was very little object to cut it down for. At another tree, standing within six feet of the above, the curious miscalculation had been made of cutting one side about two feet higher than the other, occasioned by the fact that a log lay against it on the up-hill side, from which they worked, while on the other side the work was from the ground. In this instance, a dry, seasoned branch, several inches in diameter, had been cut away in order to make room to work. The tops and branches of all the fallen trees had been cut off and taken away, but there was no dam near, the stream being too large and rapid for them to manage in that way.

Going from the cottonwoods toward the river, across the low bottom dotted with clumps of tall willows and black alders, the open spaces thickly covered with rank grass, I soon came to a beaver canal leading across the bend of the stream from one point to the other. It was straight as though laid by hand about two feet deep, and containing four or five inches of water that constantly showed the pulsations of the river current. There had been recent work upon the canal in the way of deepening the channel and smoothing the banks, probably suggested by the falling water in the river. Here and there were "slides" where the animals entered and left the canal and carried in their stores of wood. Elsewhere the banks were overhung by the grass. Everywhere I found a large portion of the masses, way to be tunnels; that as such it passed under bunches of willows and clumps of alder trees; that it had many branches turning off right and left, and I finally dropped into an "air shaft" of one of them that was hidden by the rank grass. It became readily apparent that this underground town, with its liquid streets, was the home of the beaver colony, and that they were laying in their winter store of "cord-wood" for food.

While the beaver may not judge correctly by the direction a tree will naturally fall, or estimate the amount of proponder it is to contain, he readily adapts himself to circumstances that best govern his new home. If he cannot dam and control the stream he seeks for a small tributary, or a spring that he can command, and thereby secure a site for his house that suits him. Failing that, he burrows in the alluvial banks, nicely adjusting his rooms and his walks in the water level, and extending his underground works for hundreds of feet.

So far from the above mentioned works I found, a few years ago, a cottonwood tree three and a half feet in diameter that had been cut down by beavers. Although I cannot present a photograph of the patriarch who bossed the business, I can exhibit the stump and the log to any "doubting Thomas" who questions the story.

Rocky mountain streams are nearly all occupied by beavers. In many small creeks their dams are so frequent as to create continuous "sloaks" or dead water for miles. At the higher altitudes are reached the timber growth becomes more and more limited and dwarfed. The cottonwood disappears about eight thousand feet. For the next two thousand feet the quaking aspen becomes his favorite food, but in this range there are many streams that have no aspens near them—that are fringed only by low willows or flow through meadows without any shrubs at all. So long as the beaver can find willows as thick as the finger and twenty inches long he can build an efficient dam, and then these fall the dam is broken, and the water banks. Thus beavers are two agencies that make him a burrower for the time being; first, a stream too large and impetuous for him to dam, and second, lack of material for a dam. I have seen in sluggish, meadow bordered streams, at high altitudes, obstructions placed by

beavers that appeared to be composed entirely of grass, grass roots, and bits of sod, but they could not be called dams. The animals lived in the banks, and there was no very apparent use for the mock dams. Perhaps their construction was from instinct, or mere force of habit. To illustrate this trait I will relate an instance. A friend who followed trapping some years ago caught a young beaver very soon after its birth, carried it to his cabin, and it soon became a great pet. As it approached maturity it got to building dams, and each morning he found his cabin floor divided by a dam that reached from wall to wall, and was composed of firewood, boots, articles of clothing, and all other movable articles in the house that it could reach and transport. It could not have known from observation what a stream of water was like or what a dam was for.

The beaver will go several hundred feet from a stream to cut down small aspen trees; will then divide them into convenient lengths, and transport every portion to the water. He will carry out steep mountain side for such purpose. One noticed a pitch pine, fifteen inches through, that they had cut down. It was on an mountain slope, some distance from the stream, but they had not removed the branches, and I supposed it was cut as an experiment to see what kind of "fuel" it bore. W. N. B.

Denver, Col.

SNAKES AND SQUIRRELS.

VIKSBURG, Miss., Aug. 29. THERE is a good deal in some of your late issues about snakes and squirrels. I once saw a grayish-colored bird snake climb straight up the trunk of a perpendicular oak tree, which had not a branch for forty feet above the ground. He went up as much faculty, apparently, as if crawling on the ground, only descending from a straight line a little to avail himself of the sutures in the bark of the tree.

In the fall of 1878, being driven to the woods by the yellow fever epidemic, I spent much time in shooting squirrels for convalescent patients, killing sometimes as many as six ten in a day, as well as numerous partridges (quail?). On one occasion, while pursuing a squirrel which was barking on a bush a short distance ahead, I was creeping along a hog path, when I came upon a chicken snake, about one foot long, lying in the path. Not wishing to walk around him in the leaves, I endeavored to make him move on by kicking small sticks on to him, but he declined to move, so I stepped around him. After killing the squirrel I returned in a minute or two and found his snake-hip in the same place. Upon being teased a while he crawled up a small sapling, not larger than his own body, and when he had gotten as high as it would sustain his weight—about eight feet high, he reached up to the extent of about half his length in order to get hold of a buck twig which hung over him. Thus he got hold of the yielding twig, his head swung downward to the horizontal, when he would retract it and try again. After several unsuccessful efforts he gave it up and turned up a me with such a fierce attitude that I thought he intended to spring upon me, so, not wishing to kill him, I left him in possession.

The swamp country above here, in the Yazoo, Snuflower and Steeles bayou bottoms, abounds in game for winter shooting, such as deer, bears, turkeys, ducks and squirrels innumerable. The latter are of the black variety exclusively, while the turkeys inhabit the contiguous bill country.

My friend W. L. P. killed twenty-two black squirrels one day last winter on Steels bayou, though not on a squirrel hunt that day. He was hunting turkeys, but, having despaired of killing one, he turned to the squirrels, bagging twenty-two.

When camped with the "Marooner Club" several years ago, on the Sund wcr, we estimated our supply of squirrels by the yard, having them string on grape vines stretched from one tree to another. We sometimes had half a dozen yards of squirrels in our larder at a time, besides ducks and fish in abundance.

These squirrels were feeding on hackberries, and a notable feature was their remarkable fatness. Some of them, upon being opened, would contain perhaps a teaspoonful of yellow fat. When broiling them on the camp fire, in a patent grid-iron, butter was entirely superfluous.

I think if some of our Northern brothers of the rod and gun would make an occasional trip down into these regions in the winter they would find themselves amply repaid.

MARONER.

DO CHIPMUNKS SWIM?—Two years ago, while enjoying a delightful "float" in company with two friends down the beautiful Kalamazoo, from the City of Battle Creek to the village of Augusta, it was reported to me that the water in a pool of our boat was chipped making his way across the stream from bank to bank so easily, apparently, as a muskrat would make a similar trip. Although quite familiar with the ways of this cunning little squirrel, I have never seen anything of the kind before, and I was struck with the novelty of the situation. D. B.

(New York, Aug. 29.)

KILLING THE BREEDING QUAIL—Springfield, Mass., Aug. 20.—There is not much going on hereabouts in the way of water sports at this season, so I am afraid that the woodcock hunters are killing the young grouse, which, of course, we must expect so long as summer shooting is allowed. Our sister State of Connecticut does not allow any shooting until Oct. 1, which is the proper time; but here sportsmen have already slaughtered many woodcock and grouse, and in one instance, at least, there is strong presumptive evidence that a pair of quail were shot, the female on near her nest, and her mate, while his little throat was pouring forth a note, was reported to have been suddenly smothered with fond hopes of happiness in anticipation of the blessed joy in store for him when the wee bird of downy beauties should rather around him and with winsome ways and low, sweet prattle sanctify the golden hours.

I have no words to voice my indignation at the vandalism. I am in despair of the future to know that such things can be, and can only pray for the hastening of the good time coming when the teachings and precepts of the FOREST AND STREAM shall have formed a public opinion that will see to it that our laws are obeyed and the dastardly "murderers of the innocents" reformed and brought to condign punishment. —SHADOW

The Solid South, to a woman, are for Hop Bitters, using them as their only family medicine.

Game Bag and Gun.

FOREST AND STREAM GAME TABLE.

THE seasons, in which it is lawful to shoot game in the several States and Territories, open as designated in the following table:

Table with columns for State/Territory, Deer, Woodcock, Quail, Ruffed Grouse, Pinnated Grouse (Prairie Chick-en), Wild-foat, and Wild Turkey. Rows list various states and territories with their respective seasons.

Antelope—Col., Sept. 1; Idaho, Aug. 1; Neb., Aug. 1; Nev., Aug. 1; N. Mex., Sept. 1; Utah, Aug. 15.
Buffalo—Colo., Sept. 1; Neb., Oct. 1; N. Mex., Sept. 1.
Caribou—Me., Oct. 1; N. H., Sept. 1.
Doves—Ala., Aug. 1; Cal., July 1; Ga., Oct. 1; Kan., Aug. 1; Miss., Sept. 1; Mo., Aug. 1; N. C., Oct. 1; S. C., Oct. 15.
Hk.—Colo., Sept. 1; Idaho, Aug. 1; Mich., Nov. 1; Neb., Oct. 1; Nev., Aug. 1; Mex., Sept. 1; O., July 1; Utah, Aug. 1; Wyo., Aug. 15.
Moose—Me., Oct. 1; N. H., Sept. 1; Ore., July 1.
Mountain Sheep—Col., Sept. 1; Neb., Oct. 1; Nev., Aug. 1; N. Mex., Sept. 1; Utah, Aug. 1; Wyo., Aug. 15.
Plover—D. C., Sept. 1; Me., Aug. 1; Mo., Aug. 1; Nev., Sept. 1; N. H., Aug. 1.
Rail—Del., Sept. 5; N. C., Sept. 1; Pa., Sept. 1.
Redbreast—Del., Sept. 5; D. C., Sept. 1; N. C., Sept. 1; N. H., Sept. 1; N. C., Oct. 15.
Sage—Idaho, Aug. 15; D. C., Sept. 1; Nev., Sept. 1; N. C., Oct. 15.

In these States there are special county laws. A deer law applying to the possession of a license, and a license on the coast. In Upper Peninsula deer season opens Aug. 15, a California quail protected to 1882. In Cons County deer season opens Aug. 1, moose Aug. 1, caribou Sept. 1, E. Fox and Moose Sept. 1, H. G. Quail July 1. Wild game Aug. 1. Quail shooting prohibited to Nov. 1, 1882, in counties of Montgomery, Schoenady, Saratoga and Albany. Wildfowl season in Long Island prohibited during August. A deer law relates to female deer only.

TRAJECTORY.

POINT-BLANK.—AMERICAN, FRENCH AND ENGLISH AUTHORITIES ABBRE.—STRAIGHT SHOOTING ABSTRACT.—LAW OF FALLING BODIES.—MINIMUM ERROR OF RIFLE.—THE TEN-YARD TRAJECTORY PROVEN TO BE A CURVE.

BY MAJ. H. W. MERRILL.

NOTICE in the English sporting journal, Land and Water, of April 23, 1881, a reprint of my article, "The Flight of a Rifle Ball," which first appeared in FOREST AND STREAM, Feb. 3, 1881.

My main object in writing this article was to illustrate and clearly define the true meaning of the terms point-blank and point-blank range, as now recognized in the United States and France. By way of illustration it embraced some practical results of rifle shooting. To the soundness of this article I have seen no valid objection raised anywhere, though it has now passed under the scrutinizing ordeal of two continents, and I believe, done much good for the cause of rifle shooting. This is belief is more than a reward for the contribution, and I here desire to thank the several editors for their favorable mention of it.

But the end is not yet, nor is this very important subject exhausted. On the contrary I feel called upon to reply to some introductory remarks made by the editor of Land and Water. I am pleased that he made them, for I hope to add something which may prove of interest to the general reader.

He says, "Authorities differ on the question as to what actually constitutes 'point-blank' as applied to rifles, that is, the exact distance from the muzzle to the piece at which the bullet ceases to travel in a straight line." Now, persons who are not familiar with this subject differ as to what constitutes point-blank. I here refer to the American and French point-blank, for both are identical. Therefore it was that I explained this subject and gave my definitions in accordance with the recognized authorities. No one has controverted my premises (3) or denied the truth of my definition. It cannot be done. But I do not find but standard "authorities" ever differ on this point, nor do they call the trajectory. Thus I wish to assert that the path of the bullet is not a curve, line from the muzzle of the gun to the end of the range. I here quote from Captain Hans Busk's book, entitled "The Rifle and How to Use It." He correctly says, "The force of gravity commences to act upon the bullet as soon as it quits the muzzle, drawing it toward the ground with greater velocity the longer it is exposed to its influence. These two distinct motions, the one increasing as the other diminishes, cause the bullet to move in a curved line, called the trajectory." Thus writes this intelligent English officer, and so all authors write who understand this subject. None of them (that I have ever seen) place point-blank on the line of fire. If any do so they place it improperly. Any definition which places point-blank along the line of fire conflicts with the law of gravity. The fact that the bullet travels in a curve throughout its course created a

necessity for the term point-blank, as I have defined it in my article. Then you speak of "the exact distance from the muzzle of the piece at which the bullet ceases to travel in a straight line." There is no such distance in rifle shooting. He further says: "The scientific point-blank adopted by the British artillery means the exact spot where a ball fired with out elevation, *i. e.*, with the axis of the barrel set quite horizontally, will first graze the equally horizontal earth."

Just so! and all British artillerymen and authorities will say, that the ball, as Hans Bask states it, falls in a curved path from beginning to end. In this assertion I but vindicate the intelligence of the British officers and nation. This definition, like the American and French, recognizes in practice and theory that the axis of the bore points *above* the object when the piece is discharged, and both alike make a point-blank with a falling ball—the American by falling to the line of sight, the British by falling to the ground. Both point-blanks are made separate and distinct from the line of fire—that is, point-blank shots can never be made along this line or the axis of the bore continued, and why? Let Hans Bask truly answer; he says, "If the axis of the piece be directed upon an object, the bullet will never hit it, but will always pass below it." This is just what my article taught. Then you present the delusive idea of straight shooting? It cannot be done, strictly speaking, for the length of one barley-corn. I admit that some persons, but not authorities disagree, as to what constitutes true point-blank. He further says: "The time occupied in reaching this exact spot (on the ground) is exactly the same as that during which the same ball would have fallen to the ground from the muzzle of the fire-arm."

Exactly so. The horizontal velocity imparted to a rifle-ball, however great it be, does not prevent the bullet from falling, just as if it had no velocity. Philosophical experiments and ordinary rifle practice, as well as theory, all establish this fact, which we will call Fact No. 1.

Fact No. 2 is that we know the law governing the fall of a bullet as well as we know the alphabet. Fact No. 3 is the law itself, *viz.*, "The spaces passed over by a falling body are proportional to the squares of the times occupied in falling."

Fact No. 4 under this law is that if the rifle-ball falls through a space, which we will represent by 1, in one time, it will fall through a space represented by 4 (the square of 2) in two times, and by 9 in three times, and by 16 in four times, and so on, the times being regarded as equal and the fall in a vacuum (no air).

Fact No. 5 is that these falls, 1, 4, 9, 16 and so on, correctly indicate the effects of gravity on the ball after it leaves the muzzle and when considered as lines of fall, they locate the bullet and thus establish four points in the curve or trajectory.

up. He goes on: "The point-blank of our artillerists is not accepted by those of other countries, as with them it is the extreme horizontal distance reached by the bullet before it falls under (or cuts the second time) the line of sight."

The parentheses are ours. He here evidently refers to the French and American point-blank, though not quite clearly. I will now insert this definition as I gave it in my article, which he copied. For a full explanation of it see the article itself.

"By POINT-BLANK is meant the SECOND point, where the trajectory or curved path of the ball cuts the line of sight."

"This second intersection of the line of sight by the ball is made in its descending flight, after having first cut it near the piece in ascending." (Figure 1.)

With the present article I further contribute a very important drawing, clearly illustrating this definition and the principles of rifle shooting.

He continues: "This principle (the French and American system) Dougall in his treatise on the art of shooting, considers a better definition than the British, although it is open to the grave objection that it misleads by not admitting that there may have been a curve in the flight of the ball before cutting the level of the sight (or line of sight)."

Now, I have never seen the treatise of Mr. Dougall, a prominent gunmaker in England, and, I believe, of Express rifles, but I will assume that his meaning is correctly represented above, if not quoted exactly, and will reply accordingly.

I am unable to see that the definition is open to any "grave objection" whatever. It is simply the announcement of one plain fact, which every point-blank shot verifies. It does not profess to define the nature of the path of the ball in any part of its flight. This evidently was not its original object, but only to fix a mathematical point from which, as an element, in combination with others, the trajectory could be mathematically determined and plotted. This fixed point and the one at the centre of the bore determine the length or base of the curve. From these points and the base we can reason, and so solve the problem, but without them we are helpless. Point-blank is also made a very useful term of reference in works on gunnery as well as in ordinary practice. Whether any part of the trajectory is straight or not is left for scientists and practical men to say, but certainly the definition, in the general application of which Mr. Dougall sees "grave objections," repudiates the idea of the trajectory being anything but a curved line throughout its course.

As we have before illustrated, the law of gravity settles the nature of the trajectory, and this fact sets aside the complication made by Mr. Dougall. It has no bottom to it.

A New Definition.—The editor continues: "The true and

point-blank. I regret this, for I do not understand whether he completely ignores such a fixed point or not. Be this as it may, his definition does not allow of any change of elevation or variation in the mode of sighting for his ideal range, and this will hold him to.

To my mind, however, it appears as if he wishes to have it understood by the public that certain rifles (his express, perhaps) shoot so nearly straight at long hunting distances that no elevation is required, nor judging of distances necessary, nor varying the aim, but that the shooter has only to draw sight up and "to aim dead on the exact point he wishes to hit" in order to hit it.

For Mr. Dougall to claim the right (he may not) of any elevation for his ideal range I think is inconsistent with his loose definition, but I will allow him a point-blank elevation for each range and so treat the subject.

As he failed to commit himself in regard to the length of his range, or of any range, we are obliged to hunt for it, as best we can. This may be done by asking questions in regard to the range and then applying the approximate results of rifle shooting to answer them. In the future we hope to learn from Mr. Dougall himself his approximate results in rifle shooting—I mean genuine results, not guess work. The public wants facts.

"Sensible curve or trajectory," as will be seen, appears to be the ruling fact in determining the length of Mr. Dougall's undefined range—hence I put these questions to him:

First—What amount of curvature in the trajectory constitutes "sensible curve or trajectory"?

Second—At about what distance from the muzzle will this amount be found?

Third—Under his definition for "point-blank range" is a point-blank recognized?

Fourth—If so, what determines it, and where is it found?

Fifth—is the definition for "point-blank range" in his ideal range general in its application, or only applicable to this or that rifle?

Sixth—Can his definition or definitions be used in science to calculate the trajectory and to plot it?

Several of the advantages have they over the British and American definitions that he should prefer them?

Explicit answers to these questions, especially to the first and second, will throw much light on this subject. Facts only must settle the doubtful questions.

To proceed in the inquiry for the ideal range, I will first assume the rifle or rifles to have a point-blank elevation for 200 yards and 100 grains of ".45" American powder for loads.

Q. 1. Can the range be 200 yards?

No, unless we wish to shoot about 7 to 10 inches over a turkey's head at 110 yards, when "aiming dead on the exact spot" we wish "to hit."

Most surely such wild shooting as this will never bag the turkeys in the United States or Canada, nor will it in hunting kill any but large deer, though it may frighten the smaller ones away from their white flags a-flying.

This 7 to 10 inches gradually diminishes to nothing at first and second intersections of the line of sight by the bullet, as fully explained in my previous article.

In the next case I assume the rifle's point-blank to be 150 yards.

Q. 2. Can the range be 150 yards?

No, unless we wish to shoot about 23 to 53 inches over at 75 and 80 yards, "aiming dead on the exact point we wish to hit." Such shooting would be very apt to miss a deer's head or a turkey, while all small game along mid-range "aimed dead on" would escape. This will never do.

This 23 to 53 inches gradually diminishes to nothing, as remarked above.

Thus "aiming dead on" is again a failure, especially in the case of all small game shot at the ideal range, between about 30 and 135 yards.

I next assume the point-blank to be 100 yards.

Q. 3. Can the range be 100 yards?

No, unless we wish to shoot about 13 to 24 inches, "aiming dead on the exact point we wish to hit," at 40, 50, 60 and 70 yards.

This "sensible curve or trajectory" will never answer to give us the best results, as, for instance, where the object is to knock off a squirrel's head along mid-range. No! you will shoot right over for times in five by aiming "dead on" the centre. Every person who has used the rifle must know this to be so; then why set forth absurdities or isms lessons pointing to them? But in hunting large game—deer, antelope, bear, wolves, geese, turkey, etc.—aiming "dead on" will usually answer. Thus "aiming dead on" the exact point we wish to hit is a failure in shooting along the 100 yard range, for the rifle will certainly shoot over all small game along mid-range. To this rule there is no exception, no matter who makes the rifle or what is its name. This error of 13 to 24 inches (too high) at or near mid-range, diminishes gradually both ways to nothing, as before described.

I next suppose the rifle to have a point-blank for 50 yards.

Q. 4. Can the range be 50 yards?

Yes, for all hunting purposes, though the rifle will shoot "aiming dead on" will not win the prize in Conliu's gallery, unless the rifle has the proper point-blank or the aim is a little changed on the face of the target. Strictly speaking, aiming "dead on" can never win, for the ball falls below the object aimed at.

NO ELEVATION.

I have now presented the sad results of aiming "dead on" (in accordance with Mr. Dougall's theory) under the most favorable circumstances, by allowing the rifle to have four different elevations. I will next regard the case of no elevation, or point-blank, which I think tallies with his definition or views.

First.—If the rifle has no elevation of sight, then it will allow about too low and can never make a point-blank, or centre shot, at any distance. The instant the bullet leaves the muzzle it is nearer the centre of the target, considered vertically, than it will ever be again throughout the range.

Second.—If "aimed dead on" the centre, the exact point we wish to hit, is a failure in shooting along the 100 yard range, and the largest elk or a 48 inch circle at 200 yards. Here I stop, for the animals are becoming too small in proportion to the distance to be hit in the "dead level sights," "aiming right on the centre."

We therefore see that aiming "dead on" with "dead level sights" and making good shooting is preposterous. I am ready to prove that point-blank shooting, which is always made under an elevation of the rear sight, is at least 500 yds. represented to be always made without any elevation of the rear sight, the aim being "aimed dead on" the exact

FIGURE 1.

AB is the line of sight. B is the target. CD is the line of fire, or axis of the bore prolonged; the barrel always points above the target. K is the first and B the second intersection of the line of sight by the trajectory. B is the true point-blank. K is the near point-blank. The same shot will centre both at K and B and nowhere else.

Construction.—Now draw a horizontal line, A, B, from left to right to represent the axis of piece and the "line of fire," which is but the centre of the axis of the gun. Draw it, I say 10 inches long, then divide it into 10 equal parts, each part to represent one yard and one equal time—the whole line thus representing 10 yards and 10 equal times. From "A," considered as the muzzle, the path of the trajectory commences and you wish to represent it further. To do so from the divisions 1, 2, 3, 4, and numbered from the muzzle, let fall four vertical lines, whose lengths shall be to each other as 1, 4, 9, 16, etc.—1-0, 4-10, 9-10, 16-10 in. will be found satisfactory and easy to plot.

Now draw a curved line from the muzzle through the lower ends of these lines, and you will have a curved trajectory for the first ten yards of the range, though greatly distorted, and the values of the falls are unknown. It is the principle that I am illustrating. The point of all this is that,

honest point-blank range he [Dougall] holds, and we [the editor] agree with him, is the extreme range attained without sensible curve or trajectory, so that up to that range the shooter has to make no calculations or allowance in firing, but to aim "dead on" to the exact point he wishes to hit."

The above is very easily said. Now, let us see if it can be done, and notice the sad results of such shooting.

But first in order. Why use the words "true and honest" before point-blank range? This "side-hit" calls for the definition of point-blank range, and is taken from my article.

"By Point-BLANK RANGE is meant the straight line or shortest distance from the piece to the point-blank, or in practice, to the target whose centre is struck at this point."—CB Diagram No. 1.

Now, in both the English and American point-blank

FIGURE 2.

AD, horizontal axis of the bore. BC, line of sight. The aim is at C for two shots. First, the horizontal shot, or which the curve shows the height run above AD (.624"). A represents the oblique line of fire under 10° in elevation. OB and OC are each equal to .0073 in., the drop for 10 yds. AD and BC are parallel. 75 is the distance from the centre of the bore to the line of sight.

with these facts before him, no one can deny that the first ten yards of the trajectory is a curved line (as will be proven hereafter), or assert that it is a straight one for an inch. Then either that rifle and time both begin at the instant of discharge. We specially invite the attention of Mr. Van Dyke, "The Still Hunter," to this point. The difference of the fall of the bullet *in vacuo* or in air is inappreciable for ten yards, also any change in the velocity of the ball, and thus the times are virtually equal for each ten yards of the range. The same law of gravity governs a trajectory for one yard and for one inch as it does for ten yards.

Then why, with the law of gravity staring them in the face and demanding a curved trajectory throughout, do some persons argue or rather write to the contrary? I do not mean the editor of the *Forest and Stream*, but rather those who have an axe to grind, or some particular rifle to crack

ranges the distances are measured in practice. There is, then, no want of "truth and honesty" in this. So also are the two given points defined as point-blank. There is, then, no want of "truth or honesty" in either of these. Thus, both definitions define only plain, positive facts, and facts necessary to be known, in order to nail the trajectory just where the facts in the case place it.

Query—May it not be possible that these stern facts serve to nail it too exactly in its true place? I confess I sometimes think so, and that some persons, having a hobby, would like to escape the true awards of the definitions, that is, measure for measure, without regard to this or that kind of rifle. Thus the definitions, both American and British, are "truthful and honest." One might infer from Mr. Dougall's remarks that they are not.

Mr. Dougall is silent, as it appears, on the subject of a

centre of the target. Hence, by using elevated sights we gain this immense advantage in any range.

Now, it is my level, and I claim it, to ask this one simple question of all who read my articles:

Q. What are the "long-range" curves?

A. It is considered from the centre of the bull-hole and not from the cut of the ball. All my errors mentioned above are so regarded, and are measured from the line of sight and are not cut, and not from the base of the trajectory. I have given the four circles a little less diameter than I am accustomed to do when considering the actual results of the strongest shooting rifles when heavily loaded, as is the custom for "long-range," "mid-range," and hunting purposes, and with fixed ammunition, or its equivalent in lead (the express balls included), and with "00" powder, the same which is used generally used for long ranges. The greater of the errors mentioned while treating the four ranges (to find the ideal one) embraces the "long-range" trajectories for the short distances. In all cases I have sought to put the minimum errors down to about the very lowest point in practice. Possibly by some extreme trials they may be reduced a trifle, but such extremes I reject as being worthless in common practice—they beg the true question. The weaker shooting rifles, or where the charge of powder is reduced for the same distance, will show more error than the present—perhaps double. I am satisfied that the average hunting curve for different rifles, as generally used in hunting, with light loads of powder, will not differ much from the long-range curve or errors given.

I invite all fair and honest criticism, but must insist on the appropriate facts being given. General comment and "glittering generalities" will not suffice; the public is surfeited with these already and calls for facts—mere facts—every line.

For plain rules in "aiming the hunting rifle with open sights," and the reason for it, see FOREST AND STREAM AND ROY AND GUN OF MARCH 3, 1881.

THE TEN-YARDS TRAJECTORY A CURVE.—Fearing that this article may prove dry, I will now offer something entirely new, at least it was to me until I worked it out. It has a direct bearing on the subject of rifle curves and I have no doubt will be read with deep interest by many.

I present the FALL of the rifle ball for each yard when fired horizontally at ten yards (only), commencing at the muzzle, for sharp long-range Creedmoor rifle, model of '76, 100 grains powder, 550 grains lead, .01 inches elevation, velocity of bullet about 1,400 feet per second.

The fall at ten yards I find to be nearly 1-10 of an inch (or .0973). Mr. W. E. Metford, of England, a student of this subject and a maker of good Express rifles, states the fall to be 1/8 of an inch for twelve yards; that the "average" long-range rifle, thus showing but .006 in difference in our work. The fall or drop, therefore, for ten yards is here set out. Below I give the fall or drops of the bullet in decimals of inches at each yard of the range, also the height of the trajectory at five yards, or mid-range. I omit the regular "curve," as the curve is unimportant; they are regular (see curve 3, diagram).

Table with 3 columns: Yards, Fall of Ball, Height of Curve. Rows 1-10.

Here we can see what the fall of the bullet is from the muzzle at each yard for the 10 yards, and each space or fall is strictly in accordance with the law of gravity previously given.

Proof.—Squaring the numbers representing the yards, and regarding these squares as the squares of the drops or falls, any one of the drops or falls is to any other of the drops or falls, as the squares of the corresponding times.

Example.—.00922² : .00875² :: 4 : 9.

Where the product of the extremes equals the product of the means, and so for all the others, according to the law of gravity.

At 1 yard the fall is over (.009) nine-tenths thousandths of an inch (or .00922), when reduced (1-40) one-fourth of an inch, which is also the height of the curve above its base at 5 yards, when the rifle is fired under the proper elevation of .01 of an inch. At 10 yards it is .0973 (when reduced nearly the (1-10) one-tenth of an inch (and 1-9, 1-10, 1-11, 1-12, 1-13, may be regarded as the limits of fall generally for rifles). These stubborn facts, as I hold them approximately to be, serve to throw an electric light right into the very recesses of this dark retreat, which has been so long the chief hiding place of the tens of thousands who have written me as talked so much, and yet so erroneously, upon this subject.

The drawing here presented is full size in vertical projection. This we can readily see (curve 1) the opening caused by the fall of the ball from the line of fire, A D, when the rifle is fired horizontally, also the opening between A D and the curve 2 when the rifle is fired under the proper elevation, .01 inch. Both trajectories lie far below (.72675 in.) the line of sight, hence there is no point-blank under the definition, and the rifle shoots too low, as fully explained in my previous article on point-blank or zero.

Now, where does "dead level," "aiming right on" or "straight shooting" along the line of fire or pointing of the barrel come in? Look upon the figures in the table, and the drawing also, and place your finger upon this point if you can. It cannot be done.

Then, I pray you, let us hear no more of "straight shooting," either along the line of fire or the line of sight, for there can be no such thing, a law of nature forbids it. And let us hear no more in our sporting journals of "dead level sights" and "dead level shooting," and "aiming dead on" as a rule, for these delusive ideas are but "twin sisters" to straight shooting, and are generally used to convey that idea when moral coercion is wanting to plainly assert it. Hence you see one great object of this article—it is to try and blot out these pernicious phrases which tend so strongly to lead the beginner in rifle shooting into the seductive paths of error.

In conclusion I would specially invite the attention of your readers to the invaluable experiments on trajectories made by "P." of Montana Territory, (distinguished hunter, reported in the FOREST AND STREAM OF SEPT. 1). I have examined this model report with much interest, and compared it with some of my own work on this subject, and I am ready to endorse his report. See also his experiments on the same subject, to be found in FOREST AND STREAM OF SEP.

AND GUN OF JULY 8, 1880. I desire to most heartily thank him for his trouble and the useful information he has imparted and I hope he will next send us the fall of the ball for the different ranges. I endorse his recommendation on the trial of rifles.

It is very rare indeed that we find such accurate and important experiments. He seems to be a master of his subject, and if he handles his rifle only half as well among the mountains and grizzlies as he does across a stump woe unto them when he pulls the trigger.

New Rochelle, New York.

(From a Special Correspondent.)

OVER THE SEA.

THE ELEVEN INTERNATIONAL SPORTING EXHIBITION.

LONDON, England, Aug. 17.

Editor Forest and Stream:

Well, here I am back in old London again, just in from Cleve. Have you ever been to Cleve? I rather looked to see you there this year, for, as a representative of the great body of American sportsmen, you would have been greatly interested in an exhibition they have been holding there. Cleve, you must know, is a representative Prussian city, having that its castle is now used as a house of correction. The surroundings of the town are most picturesque. If you are ever in the vicinity take my advice and visit Cleve.

My trip was made especially to inspect the Jagd-Ausstellung, an international display of sporting implements and accessories, given under the direction of the Deutschen Jagdschütz Vereins, the President of which society is Prince Hohenlohe-Langenburg.

I cannot detail the many objects of interest which I saw here, and shall content myself with briefly referring to the most important features. The display is arranged in two buildings of appropriate design, erected in a large grove, and comprises ten classes, the principal one, of course, consisting of firearms, ancient and modern. The curious old arms present a strange contrast to the weapons of to-day, but there is a fineness of engraving and finish about some of them which our modern makers do not attempt to surpass. The difference is also notable between the German and our English guns, the former being uniformly heavier, and vastly more cumbersome. Our "Pompa" friends appear to put more stress on elaborate ornamentation than upon lightness and ease of manipulation. Perhaps this exhibition may be productive of improvement among the German gunmakers. Among foreign representations I noticed guns from Belgium, Holland, England and America.

One very interesting class of exhibits is that of deer and other horns. Here are some magnificent specimens of the antlers of the red deer, some of fourteen and sixteen points, and others of strangely abnormal and fantastic growth. There are nearly 1,000 specimens of roe deer horns, one separate collection of them having been in process of accumulation since 1803, and comprising many strangely formed ones. There are also sambar, fallow deer, caribou, moose, elk, buffalo, chamois, antelope, the Bos arvensis, axis deer and rhinoceros horns, and—one of the two horns of a dilemma.

I must not forget the furniture made from horns, some of which is exceptionally fine. The chairs, tables and other articles in this class are composed wholly or in part of the horns and hoofs of various members of the bovine race, and a many hands-on-set could be procured for the sanctum of the FOREST AND STREAM.

Furs, skins and rugs made from them constitute another class, the wolf, fox, tiger, lion, bear, buffalo, and in fact every beast that man has ever slain being well represented. In my opinion Scandinavia is ahead in this class; perhaps because they use fur so extensively up there.

The Norwegian sledges and karöö too are well worth studying. In the wagon class are also several examples of game wagens, the German and Dutch exhibits being less novel. In the making of glass ball traps, Germany has much to learn yet, and I should imagine that some of your enterprising American makers could find an extensive market for the very admirably constructed traps you have.

The Cleve exhibition contains many fine specimens of oil paintings picturing the various phases of the chase; some magnificently carved furniture depicting wild life, and numerous articles of sportsman's bric-a-brac. On the whole the display is a creditable and entertaining one.

Who is M. Bombonnel? He is the question which he groined my ears the other day. I don't know who he is, but Bombonnel is an enterprising fellow, and if his magnificent scheme, of which he publishes the prospectus in the Daily News, which "pans out" well—to use an Americanism—he may yet be known to all Europe. This grand scheme is nothing more nor less than a huge game preserve in Algeria. A large forest district has been leased, in which our friend agrees to keep a good stock of all the game which he can get. He is to keep a good stock of all the game which he can get, such as gazes, hares, mules and all broken down animals, but his for lions and tigers and panthers, which will serve to take up their permanent abode and increase and multiply in the fastnesses of the leased forest. Here M. Bombonnel proposes to erect shooting boxes for his patrons; the amateurs and ladies to have shelter and ambuscades, and open stands for "sturdy sportsmen" for whom the caws of lions and panthers have no terror. As M. Bombonnel will keep his preserves well stocked with the wild horses, etc., and as he will give to any number of hunters and sportsmen shall all arms with the accessories of a good culture and a first-class dog, it will cost but a fraction of what some of our mighty English hunters annually expend in their quest of blood. The terms are \$100 in advance for two months per annum for five years. Do you want a pres-ticket to the "Algerian Lion and Panther Hunting Preserve"?

THE GROUSE MOORS.

All England is now grouse shooting. That is to say, all sporting England, which of old after all, is not qualifying, for all England enters the field of the "two hit," and hangs away at the birds. It is expensive business, too, that is if you must have the best sport. And that costs money. Grouse shooting, like most forms of sport, is chiefly for rich men. Drovers that range in from £2,000 to £300 are not within the reach of every one, and sportsmen accustomed to large bags naturally despise small ones. As indulgence becomes popular and grouse become wild, the passion of driving becomes popular, and drives are given. Instead of large moors with a small army of beaters, preceded by setters or pointers, the grouse are comfortably settled in affluence behind stone walls. The beaters go round in advance, and then cross the moor shouting and making as much noise as possible. The grouse, which perhaps could have been approached in no other way, then fly with astonishing rapidity over the heads of the men lying in ambush, and a good deal of experience and skill are needed to bring them down. When should one shoot? Before the grouse reach you? and how much before? and how far in advance by way of calculating for pace? are questions the novice asks, but only practice can answer them. As this sort of shooting demands no exertion, no walking, except from one ambush to another, it is deservedly popular with the lazy amateur. But even poor men, though they cannot aspire to large bags and to driving may get a little bag and plenty of walking for their money on farms in the Scotch border countries, especially, perhaps, in the neighborhood of the Cheviots. A stock farmer may have taken the shooting on his farm, and may sublet it, or a farmer who owns a little estate of his own at a distance from the place where he lives may be ready to let the shooting. There is generally a fifteen to about getting accommodation, but young and earnest men do not disdain a shepherd's hut, and are even ready to ride over twenty or thirty miles on horseback for the sake of a gun and excessive mixed bags—three brace of grouse, a couple of snipe, two or three hares and the like—but then they pay very little for their pleasure, and they lay in a large stock of health, and find themselves in picturesque scenes and places famous in border history, which otherwise they would have missed. With youth and eagerness on their side perhaps these humble gunners enjoy themselves as much as tenants who pay thousands for moors and forests."

A SMART GROUSE TRICK.

But the men who pay for the best shooting grounds do not always send to the best birds to their guns. I have seen many a slip. Let me illustrate by recalling a curious incident which was not long ago exposed. A father and three brothers were serving as guards on one of the northern lines of railway. The men bought from keepers, through the agency of a confederate, who shared in the profits of the swindle, all the poor grouse which could be obtained, "cheepers," "piners," and "cripples" especially. These birds, by arrangement, were carefully packed and consigned to the railway to the South, where they were to be sold. The birds were filled with these contents of the confederate, and sent to the station, were repacked upon a train which was started by two of the brothers who regularly traveled by the train as guards; these men opened all the other hampers of grouse sent by the same train, and selecting the largest and fattest birds, replaced them with "piners" or "cheepers." Boxes consigned to private individuals were first repacked upon, he cause persons who receive presents of grouse do not usually look their gift-horse in the mouth, and, therefore, in acknowledging receipts of such presents, are not so particular of the quality of the birds. Dealers, of course, are not so reckless, and credit the account of the senders with the price only which the bird are worth. The trick was, however, worked in this way. The grouse sent presents to private persons were first selected; and, if there were not enough of these, the birds were changed and changed all round, till even the dealers could hardly make a complaint. The fine, heavy half dozen brace of plump birds consigned to Lady A. were at once seized upon by the two guards; but they could not put in their very "sturdy" bags, as Lady A. was a judge of grouse. So they operated on all the other hampers till they worked 'em out, until in the end of the thousands of birds sent forth by that particular train, the cream de la creme of the lot were found to be consigned to Messrs. O., P. and Q., the consignees being X., Y. and Z., of, say, Inverdeen. The price paid for "cheepers" was at the rate of about 6d. per bird, the price credited was nearly 8s. per brace—a most excellent rate of profit certainly, and the rascals kept it up until they played it once too often.

A VETERAN GROUSE SHOOTER.

It is wonderful how some of our veteran grouse killers do stick to the moor every year. I notice that my old friend, Mr. Horatio Ross, of Wyvis Lodge, Ewanton, Inverness, is out again this year, for his sixty-seventh sea-son. In a recent letter he says:

"Once more (probably the last time) I have the satisfaction of ordering the ammunition for the dear old Twelfth. Sixty-seven years have passed since I first made similar arrangements! I was out all day Monday and Tuesday, trying to get a stag, as my son told me in their letter, but I shot a quantity of deer, but failed in getting a shot. To-morrow I shall be out there, as there is a good sea. I find I can still go up a hill with perfect ease and comfort (thank God for such health).

There is a British constitution for you. Can you match it America? I doubt it.

AN ANTIMOTAL CAT WAIL.

Our Royal Society for the Prevention of Cruelty to Animals is now, as usual at this season of the year, appealing to London cat-lovers to see to it that the animals are not left to starve in town. Now, doubtless the Society is right, but as one of our weeklies pertinently puts the case, it is impossible to keep a cat within bounds like a dog; and, except in rare cases, nobody takes the same amount of trouble about it as the second. It could scarcely happen that anybody would leave a dog ownerless to wander about the streets while he was away from home, or that a dog should be shut up in an empty house without food. But this is a common fate for London cats in the autumn; and although they have a stronger instinct of finding an under precarious conditions of life, they must needs suffer a great amount of suffering, and I see no remedy for the trouble. In my next letter I shall have something to say about the year's work of the Society.

A REFRIGERATOR SHIP.

We have in Queenstown Harbor a novel ship, the owners being a French firm, M. M. Cabillot et Cie, of Marseilles. She is a fishing schooner of the carrying capacity of 1,000 tons and is loaded with fish from Labrador. She carries two steam launches for fish, and the peculiarity of her construction is that her holds are refrigerated and hermetically sealed. One of her officers writes to the Times:

"I have eaten at déjeuner a breakfast quite fresh and palatable after being on board four months, although not particularly tender, and I have brought ashore a beautiful salmon, frozen stiff, which is warranted to be fit for dinner to-day, and for the chief officer. I wish to bring under your notice is, that this vessel can come here for orders and work as easily as if she carried grain. She has a crew of 150 men, Liverpool, Rouen (for Paris), or even Bombay, and I sell her cargo in large or small quantities without any fear of spoiling the market. She can bring a-hoard of one or two tons of goods like the like has never been seen fresh before, and, indeed, I need not expatiate upon what such a vessel can do in the way of bringing a fresh supply of food, she could deliver

her present cargo in London and go to the Nor'h Sea fishing grounds (if the prospects were good), and run a cargo thence to Billingsgate safely in the hottest weather." Bow-Bells.

REMINISCENCES OF FORTY YEARS.

I.—LOON LAKE IN 1856.

IN your issue of to-day one of your correspondents recommends Loon Lake, Franklin county, N. Y., for fishing, etc. I can fully endorse his recommendation, having been one of a party who visited this delightful country, made delight out of his sports of flood and field, or rather, I may say, forest and lake. This magnificent sheet of water, if I remember correctly, is about one or one-and-half miles wide and three or four miles long. Picked to an enormous size are there in any quantity, together with trout of great weight. A party of half-a-dozen from Saratoga in September, 1856, visited this wilderness. After steaming up Lake Champlain we hired a team, and have not forgotten the thumps and bumps experienced in climbing the rocky hills. From noon until about midnight we journeyed, inquiring from persons we met, "How far is it to Smith's Hotel?" "Oh, about six miles." After jerking an hour or two the next inquiry, "How far to Smith's place?" "Up this place and down there, then straight on about two miles." We kept on thumping and lumping along for another hour, when we expected to see the hotel in the short distance. However we struck a cabin by the roadside, and lo! long out to the denizens, asked, "How far to Smith's Hotel?" "Oh, I guess about six or seven miles." We still went on, inquiring as we went, and found all our answers varied in distance from fifty to one hundred per cent. one with another. At last we reached the much-desired spot, were ushered into a nice comfortable tavern or hotel, and nine host Smith seemed (as Le Prov'd) a good fellow, fond of his mountain sports and a good hotel man in every respect, providing all comforts necessary for man or beast.

Our first morning, after an early breakfast, we start'd for a deer hunt. According to the custom there the dogs drive the deer to or from pools or lakes, and a boat was in readiness to put out after the deer. The dogs give tongue some two miles across the lake, but the deer took over the hills to another point, where he made good his escape, and the dogs could not get together that day in time for another drive.

As I was standing there, my brains working at nothing, my attention was suddenly attracted by the lake, some two miles probably, to a flight of birds skimming and hugging the shore in flocks and gradually approaching me. In a few moments I discovered them to be ducks, as they came within 200 yards of the mound on which I was stationed, when they settled down in a cove which was probably 100 yards in circumference, edged all round with tall rushes from four to five feet high.

"Hello, my boy!" says I to myself, "here's a chance," and luckily I had carried with me about half-a-dozen charges of No. 7 shot from Saratoga, having shot a fifty double pigeon match the week before, killing 95 wild birds out of 100, traps 5 feet apart, 21 yards rise, 100 yards fall. Lots of old residents of Saratoga at the present season greeted me and gave me a hearty shake of the hand, especially the wry host of the Adelphi Hotel—at that time Mac kept the American.

But to the flights of ducks. I accordingly drew out of each barrel the wads, then the twenty buck shot and put in place one and one-half ounces of No. 7s. I went on hands and knees, some times flat, crawling around through the tall rushes in order to get within shot at the edge of this curve where the ducks were. This took me probably half an hour, the distance around to avoid sight of my game in quest being several hundred yards. At length I made my journey, and, peering up, beheld a wonderful sight. A dead log, a tree without limbs, was hanging across this cove, some twenty yards in length, on which the ducks were sitting, some jumping off, uttering and splashing the water, the next moment on the ice shaking their feathers.

I never saw such a shot for a raker, and as I had waited some hours for the deer and got nothing I made up my mind this once for a broadside. I accordingly crept in a line with the log. The ducks had no apparent danger for some were feathering themselves, others with their beaks under the wing. I took a level sweep and, being ready in the bushes, the gun in position, I gave a whistle; they all raised their heads for a 10k—twenty-one duck—the first, a right barrel, heched forth fire and smoke, and the roar reverberated all around.

Two ducks arose; one of these fell to my left barrel. And the splashing and fluttering on each side of the log I will not easily forget; the water red with blood, all being shot through the head.

Nineteen shell-drakes at one shot out of twenty-one, of the other two, shooting off, one fell to the left barrel, bagging twenty out of twenty-one. I did not then know the shell-drake, never having shot any, but from the head knew it was a fish duck. The boat came now for me and my bag, and the wonder was great at the prodigious sweep, but you could not miss them if you held right for the first duck, lowering sufficiently to take in the lot.

The next day I shot my deer, being driven two miles to my stand as before described, but let her bound (a large doe) and gave her a round for her life, showing myself and bolting just as she jumped on land. It seemed more like murder in the first degree, or shooting down a calf, the poor thing being only some twelve or fifteen years from me, but she gave a tremendous frightened leap on hearing and seeing me, that a second or third leap would have carried her from barn of the gun, behind a bluff. Therefore I had to do or not to do, a dozen buckshot going through neck and shoulder. Our friend Smith at the hotel had three ducks or shell-drakes cooked for dinner on our arrival. The next day's deer hunt, and as you have lately had much discussion on cooking roasts, I will tell you how these ducks were served up, and the process used for taking away any fishy taste. I gave Smith the idea. All seemed young, large birds, legs like a mallard's, and fully as heavy as a plump mallard.

Just skin the ducks, as the skin generally contains the oily, fishy taste. Clean them, wrap them in wet cloths; dig a hole in ground, and bury them over night; take them up in morning and wash them well, and soak an hour in salt and water. As some home hungry enough from our hunt, and with appetites sharp, but I never sat down to a stew with onions, that surpassed these tender, juicy, sweet, deliciously, served-up shell-drakes.

Our worthy host, then of the hotel Loon Lake, has since left that locality. If this should meet his eye will please address me in care of the FOREST AND STREAM? I will be very happy to find his whereabouts, and probably pay him a visit.

We saw the day we left Loon Lake an immense wolf caught in a trap there. Deer in those days in that mighty wild wilderness was as plenty as sheep on the plains. How they are now I do not know, but the lake, for the best fishing in the world of its kind, I think cannot be surpassed.

Now, as I have made a commencement with you I will continue giving you only some remarkable and strange shots made during forty years' handling the double-barrel. I will give my experiences of shots I made myself at different times and different parts of the United States. WM. KING.

JORNELLSVILLE.—There was a slight mistake in the letter about Loon Lake in your issue of Aug. 23. It should read (15) fifteen miles from J. Hornellsville no 95 as printed. The lake was stocked some years ago with trout, but none were ever caught, until last week when Seth Green went there, and caught a fine lot greatly to the surprise of the local fishermen. —J. O. F.

THE WHITE PANTHER.

BY XLX YORRIS.

THE days passed pleasantly away with boating on the river and angling in the mountain streams for trout. The evening was spent in the library with Mr. St. Clair, who was actively engaged in collecting and describing the ferns and mosses in which the Alleghenies are so rich. One evening he remarked that Mandolph, a young hunter living in the wild recesses of the mountains, had paid him a visit that day and that he had noticed in his cap a very rare and beautiful fern, but the fronds were so withered and broken that he was unable to identify it. The hunter could not remember positively where he had gathered it; he was in the habit of placing beautiful plants and flowers in his cap and thinking no more about them. He was under the impression, however, that he had found it growing near the Panther Pond, a small lake situated near a wild gorge among the mountains.

"Let us hunt the fern to-morrow, Vivian," said Karl, as they retired that night. "I was just going to propose it," replied his friend; "so let us get up early and away."

At dawn they took the boat and rowed across the river. Vivian carried a repeating rifle and wore a long hunting-knife in his belt. Karl was armed with a well-tried gun.

"To the lover of nature," said Vivian, "the wild mountains have peculiar and unalloyed charms. In summer, deep carpeted with moss and glorious with the bloom of rhododendron and azalea, there is about them a mysterious beauty found nowhere else. In winter cedar and pine are columns of silver and the pillared rocks are turned to marble monuments—a auditing, perhaps, beside the graves of the red hunters who have long ago. Hunting the wild deer all through the autumn evenings—

"Till many a night I saw the pleads, rising through the mellow shade, glitter like a swarm of fireflies tangled in a silver braid.

"I could understand why the Swiss in love with the Alps and the Gael with the Highlands. Returning, after a long day's hunt on the mountains, to his lonely camp by the lake, the hunter may hear the scream of the cougar in the laurel and the moeking laugh of the owl in the pine. Yet, wrapped in his blanket before his blazing camp-fire, his slumers are none the less sweet, though he knows that the king of the mountains is abroad in the storm.

"Your hunter is a naturalist, too, in his way; knowing little of books, he studies living nature in the wild wood—familiar with the habits of the animals around him his labors would bring him no returns. He knows that during the month of September the bucks will be found quiet and alone on the highest mountain peaks, drying their antlers in the sunbeams and rubbing off the velvet against rock and pine."

"Yes," replied Karl, "the hunter, though surrounded by danger, learns to forget fear. His mind is filled with the love of the forest and he can find his way anywhere by the moss on the trees—don't you see that it is no abundant on the side toward the north? Then one feels so different here from what he does in the crowded city; there he is lost in the maze of the busy multitude, and here the water is when mingled with the ocean; here he walks the earth like a god—

"In the olden, golden plories
Of the golden, olden times."

"Those were happy days, Vivian, in the morning of the world, when forest and stream, lake and river, vale and mountain were peopled with strange, wild forms. But the beautiful fairy no longer dances to the sound of elfin music among the golden flowers of summer, when the moonbeams are painting ghostly pictures everywhere. The treasure caves of the dwarfs are all closed and the gold and gems are hidden away from the eyes of men and the earth is the Basileisk are harmless now and the Hippogriff no longer bears away knight or paladin on rapid wings to deeds of arms or fields of chivalry."

"True," replied his companion; "when the sun of civilization shone brighter and clearer over the earth these creatures of the world of fairy faded and paled in the light of its splendor. They retired to lonely caves in lonely lands and are now seen only by the dwellers in mist-wrapped mountains, far away from the eyes of men and the search of the eagle. In these forests, as you said, there roams a phantom creature, fierce and terrible—a snow-white cougar, but I suppose that it is only a hunter's dream, though many claim to have seen it.

"But here is a beautiful spring, clear as crystal and cold as ice, bubbling up from among the rocks and perfumed by the bloom of the red rhododendron. Let us sit down on this mossy stone and rest. You must be hungry," he continued, drawing from his pockets great lumps of cheese, butter, rolls and a roasted venison and spreading them out before him on the moss. "The rapid walk and mountain air gives one an appetite. Yes, the Alleghenies are grand and picturesque, but the mountains of the torrid zone are more beautiful by far. They are like wonderful gardens, rising terrace above

terrace, until their snowy summits are lost among the clouds. Tempera ure, you know, is the principal agent governing the geographical distribution of plants, hence we find growing at their base in a sunny Eden the palm, the arborescent fern, the aloe, the pineapple and the banana. Higher up in its slopes the orange, the olive tree and the laurel; above these again the magnolia, the live oak, the cypress and the cedar. Ascending yet higher we find the forest of fir and spruce, the birch, the beech, the elm and the willow. Among the eternal snows on their summits we find the plants of Spitzbergen and Lapland—the mosses and lichens of the far North growing under the equator!"

"Botany has always been my favorite study," replied the other, "and plants are quite as wonderful as animals. Indeed, so closely are they blended in their lowest forms, that we are quite unable to distinguish the one from the other. Like animals, they move, eat, drink, sleep, breathe, perspire, have circulation due to vital causes, are male and female. They have sensibility, too, similar to animals. Poison will destroy some as quickly as it would a bird, and opium throws others into a profound sleep. Many are carnivorous, feeding upon the blood and flesh of animals, like the lynx and the cougar."

"Yes, and the vegetable, like the animal edifice, is built up from the cell. Every seed contains an embryonic plant—the trunk, the branches, the roots, the leaves, all are there, like the bird in the egg, only waiting to be buried in the soil and washed forth by the sun to kiss them into flower and fruit. The roots and the branches of trees are identically the same, and the one may be made to become the other; the flowers are only transformed leaves. But I think the Panther Pond is there between those mountains. Let us hurry on."

A rapid walk of half an hour up the slopes brought them to the summit, where a wide and beautiful prospect was spread out before them. Far as eye could reach were piled up around the peaks the pine and fir pinacles of the Alleghenies, clothed everywhere, except in the castellated rocks in the green of rhododendron and pine and here and there between the peaks they caught a glimpse of the crystal river gleaming in the sunbeams far away.

"There's the pond," said Karl; "don't you see it there shut up in the hollow of the mountains and surrounded by the dark fir trees?"

"Yes, and I was looking long and dark, as though a sunbeam had never kissed his bosom, but let us hurry on," he said, and started forward, as if by magic, swift as the bird of the desert, but Karl saw only a metallic glimmer of gold and emerald flashing under the pines. A frightened deer dashed through the laurel and behind it over the fern waving his white plume proudly as ever did Henry of Navarre.

"Was that a cougar?" asked Karl. "No, only a buck," replied Vivian, as the two friends hurried on down the mountain toward the pond. As they approached the waters Karl drew back pale and trembling. "Look!" he said in a whisper, "there is the Panther Cougar, white as snow, and it is gazing at you!"

The cougar leaped behind a rock, and peering around it, saw the mountain king at his meal. His head was turned from them toward the pond, and they could hear him crushing the bones of his victim, growing all the while like a cat. "This is no phantom," said young St. Clair, in a whisper; "ghosts do not eat." "What shall we do?" said Karl, with a white, scared face. "You are pale," said his companion; "keep quiet, we must kill him." "I may be pale," returned Karl, "but I am no coward, as you will see when he comes upon us. But if we only wound him he will spring upon us." "Be steady," whispered his companion; "aim at his head with your gun, and I will send a ball from the rifle through his heart. If we miss or only wound him, he will again as soon as possible. But I shall not miss him," he said, cocking his rifle as he spoke and resting the barrel again at the rock. The cougar heard the sharp click of the springs and turned his head toward them, dropping from his mouth the heart of the fawn. "Now!" said Vivian, and a loud report rang over the waters and led away into the echo among the mountains. The cougar bounded into the air, but sank quivering to the ground. "He is killed," cried Karl; "let us run to him." "Stop!" said the other, "he may be only stunned; we will give him another volley. Aim at his head. Now!" and again the reports of their rifles resounded through the forest, setting the squirrels to chattering in the pines and the owls to haw haw in the fir trees.

"He is besting the ground with his tail," said Karl; "he will never rise again—see how he quivers and shudders. Now walk up to the pond, and be sure and shoot him between his head and here is a large one through his ear," he continued; "and see! here is yours in his shoulder. Look at his cruel eyes—how bloody red; his claws how long and sharp and his fangs were mad for murder."

Just then they heard a rustling in the leaves behind them, and turning quickly, there stood Randolph, the hunter, leaning on his rifle.

"So, Mr. St. Clair, you and your young friend have killed the King—really I never would have thought it. This is the largest cougar I have ever seen," he continued, holding it up with his bow, "and the only albino ever seen in the Alleghenies. I saw him five years ago for the first time, and several times since then, but could never get a shot at him. I have killed several white deer, and they are not uncommon in the mountains, but this cougar though seen by many hunters has always been regarded by them with superstitious awe. They believed him to be a phantom, a spirit of the mountain storm, fierce and terrible, and when a hunter lost in the night and frozen in the snow was found it was said that he had fallen a victim to this fiend of the Alleghenies. I was hunting the fern for your father on the other side of the pond, when I heard your commotion, and thought I would come around and see what was the trouble. It is fortunate that you killed him at the first fire; had you only wounded him he would certainly have torn you to pieces; but let us skin him, and carry his pelt to the villa as a trophy."

The work was rapidly and skillfully done, and Randolph, throwing the skin across his shoulder, went down to the pond to wash the blood from his hands and hunting knife.

"Did you find the fern?" asked young Mr. Clair.

"No," replied the hunter, "but will you now resume the search."

It was a beautiful pond, deep and dark. Cedar and pine reached down their arms, and played lovingly with its waters; it is islands of reed looked out from its bosom, and the belted kingfisher dipped his wings in its waves.

"Here in the sand are footprints of a deer, and here are the tracks of a wild bear," said Karl.

"No," said Randolph, "the cougar has been here. Don't you see that his foot is round like a cat's?"

Resting a moment by the water they started down the shore of the lake, but had not proceeded far when the hunter stooped to examine a beautiful plant growing among the

moss-covered rocks, and immediately cried, "It is the walking fern. I thought it must be. We have surely plucked far enough to find it. This is certainly the very plant that Mr. St. Clair is so anxious to obtain, and it is quite different from all the others on the mountain." Vivian collected some of the mossy ferns for the use of his father's conservatory, wrapping them carefully in moss, and sprinkling them with water from the pond.

"It is time that we were off," said the hunter, "the mountain paths are rough, and we have far to go. It will be nightfall before you can reach your home. I will accompany you to the river, and guide you the nearest way through the forest."

"Do you never lose your way in the dark pine woods?" asked Karl.

"No," replied Randolph, "I have always lived among the mountains, and I know each path."

"Why is it, Randolph, that your language is so different from that used by the other hunters?" asked Vivian with a smile.

"Were you a deer at school?"

"I am a graduate," replied the hunter, "of the Normal Institute at St. George. The otters and fishers were formerly very abundant among the All gables, and I was a very successful trapper. I sold my furs and purchased books, studying late every night by the light of the blazing pine knots. I was in the study in the mountain cabin. I had progressed so far in my studies that I was able to graduate a year after entering the institute. When I have money enough I will go to the university and finish my education there. The Randolphs have not always been hunters," he added, sadly, "but it is hard to break the iron web that destiny weaves around us."

He stopped suddenly in the narrow pathway, gave a shrill whistle through his clenched teeth, the cougar's skin slipped from his shoulder to the ground, and a moment after the animal seemed to climb from cliff to crag up the rocky wall of the mountain. "Ha! ha! ho! ho! ho!" laughed the owl in the fir tree, and the gray wolf answered with a howl from the laurel. The hunter, without speaking or moving from where he stood, commenced reloading his rifle.

"What was it, Mr. Randolph?" asked Karl.

"You will see," replied the hunter capping his gun. "It was a long shot, but I think a true one."

After walking a hundred yards or more through the tangled forest he came upon a large buck lying dead by a mountain spring. "Shooting through the heart," said Vivian, thrusting his finger into the wound. "Yes," replied the hunter. "I can shoot." Bending down a young birch tree they tied the antlers to its top with a cord and then releasing the tree it immediately regained an upright position lifting the deer far above the reach of the prowling wolf. "It will be safe there," said Randolph, "until I come for it in the morning."

"The laws of inheritance," he continued, "apply to all the lower animals as well as to us. They are gaining knowledge, and among wild species these individuals possess the most perfect faculties—keenness of scent, of sight and of hearing, the greatest courage, strength and fleetness, the longest teeth and sharpest claws, combined with the highest development of the reasoning powers, survive and perpetuate their race—the others perish. Thus the cougar succeeds in capturing only those deer that are deficient in these characteristics, as hearing for example. The wise old buck with perfect faculties leaves the forest until age impairs them; the weak and foolish die in youth. There are deer on these mountains that have never been in reach of cougar's claws or hunter's rifle. Others have great curiosity and little caution. They must stop to investigate any unknown object and listen to every unusual sound; it was this peculiarity that caused the buck I killed a few moments ago to lose his life. Those having the most caution and the least curiosity live to the greatest age."

"Yes," replied the student, "the laws of heredity have been in force upon the earth since the first appearance of life upon its surface, and apply to the vegetable kingdom as well as to the animal. Man, by taking advantage of these laws of nature, improves everything that comes under his dominion. Among domestic animals it seems as though an artist had taken the rough sketch and covered all the rude outlines with beauty. He waxes his magic wand over a poor and bitter fruit and changes its juices into the sweetness of the orange and its color into the glory of the lilies."

"Here is the river and there is the light in the windows of your house," said Randolph, emerging from the laurel and pointing out to the mountains the moonbeams were gleaming over the mountain summits and throwing their lines of silver across the crystal waters. "Good night, young gentlemen; I have far to go," he said, throwing the snowy cougar skin into the boat and disappearing under the arches of the pines. The two young friends roved rapidly over the stream and were met on the opposite shore by Prof. St. Clair, who, becoming alarmed at their prolonged absence, was eagerly awaiting their return.

"What is this?" he exclaimed, as Vivian tossed the cougar car lessly over his shoulder and started up the gravel walk toward the villa.

"The robe of the White Cougar, the mountain king," replied Karl with a laugh. "Yes, Randolph, the hunter told me that he had often seen this remarkable creature near the Panther Pond, but I thought he must be mistaken. So he has killed it at last and sent me the pelt." "Randolph did not kill him," said Vivian, stopping to pluck a rose; "I spent myself to his banquet at St. George, and he was embarrassed with his wine as he would have should he have owned a 'gunpowder plot' for the purpose of detroning him." "You do not mean to say that you killed him?" exclaimed the Professor excitedly, turning to Karl. "Certainly," replied the latter; "after we had defied his power which else could we do but imitate the example of Cromwell, and put the king to death."

"I," said Vivian, "you draw your sword against your prince, you must throw away the scabbard."

"What I must do," said the Professor, "is that you have exhibited wonderful courage I still think that you were reckless and foolish, and your conduct merits the severest censure."

"But I was the fiercer, tatter," said Vivian, drawing it from under his coat as they entered the library.

"So it is, my son!" cried the delighted Professor, forgetful of everything else in his admiration of the beautiful fronds of the walking fern!

When Vivian and Karl returned to college at the close of the summer vacation Randolph, who had been with them and remained until he graduated with the honors of his class. He is now the most distinguished physician in the city where his father failed, and comes every summer to the mountain villa.

RAIL SHOOTING SCORES.

Following are some of the scores made this season: From Goff's Hotel, Sept. 1—Isaac Rothwell pushed James Kboards, of Spring Hill, and boated 44 rail; 10 rood birds; Benj. Haddock pushed Erle A. New York, and boated 35 rail; Dick Brown pushed John Goff, of Chester, and boated 27 rail; P. rry Allen pushed Frank Weaver, and boated 36 rail; Chas. Goff pushed Thos. Butler, of West Chester, and boated 39 rail; Sam. Preston pushed E. Johnson, of Philadelphia, and boated 22 rail; B. n. Driskett pushed T. S. Dands, of Philadelphia, and boated 23 rail; Jacob Miller pushed Harry Black, of Chester, and boated 19.

Sept. 2—Isaac Rothwell shot 21; Bill Rump, 18; J. Miller, 23; Sept. 3—J. Brown, 30; J. Kehlwald, 23; Bill Rump, 18; Henj. Harris, 20. We will be pleased to furnish to all inquiring friends information concerning the cost of the shooting.

On the Hackensack meadows there was a large representation of gunners last Thursday, so many, in fact, that some of the men took the shot intended for the birds. Seven men were "shot marked," Constable Earle receiving eleven shot as his share. Among the gentlemen whose records are considered good, John Ryan leads the list with 48 birds one side and 30 another; Lawyer Griggs, of Paterson, had a string of 47; Julian Wood, of this city, 61; two tides; G. C. Van Houten, of Paterson, 35; F. B. Spencer, Brooklyn, 38; Shepherd Knapp, this city, 31; G. C. Trwlliger, 32; Ed. Ackerman, Hackensack, 35; George Ricardo, 31; Chris. Huber, Paterson, 29; Charles Knapp, 28; S. F. Spencer, Elizabeth, 24. A New York correspondent writes, under date of Sept. 3: On the opening day I again went to Hackensack to try my hand at rail birds. We started out on Thursday about noon, but soon found that the tide was not yet high enough to get in the meadows. So we pulled up and in the creek, putting up a bird now and then. At one o'clock the tide was high enough, and then the fun began. There was a continual popping on all sides for about two hours. There were not so many birds as last year, but still enough to keep us at it quite lively. There was in all about fifteen boats, out of which I came in "high boat," with a score of 44 birds; other boats came in with the scores of 40 and 39. I can safely say I had one of the best pushes out that day, and I would advise any one going there to inquire for Henry Penning, who can always be found at Franklyn Hotel, and he can give them as good a day's sport as any one could wish.—G. E. J.

Boats' score from Riverside Hotel, Lazzaretto, Delaware Co., Pa., Thursday, Sept. 1, 1881. Gilert Griffin, 87; E. McCready, 76; J. W. Thorn, 121; Arthur Godson, 44; Jos. M. Liu, 58; Mr. Purves, 5; E. C. Pece, 16; F. B. Rogers, 40; C. L. Wormley, 39; Wm. Stroud, 52; Frank Sartori, 67; W. Audr-rion, 21; Geo. Martin, 10; A. J. Morion, 17; Mr. Grant, 55; Mr. Paterson, 60; H. S. Townsend, 21; Ed. Maher, 45; Al. Baley, 3; Samuel Adams, 11; Mr. Henry, 4; Jacob Altherr, 30; John P. Pole, 24; Mr. Gayer, 15; Mr. Clew, 20; Mr. Shook, 23; Tot-1, 955

Friday, September 2. Elwood James, 35; E. C. Peace, 7; T. B. Rogers, 23; Frank Sartori, 18; Geo. Martin, 16; C. L. Wormley, 61; Ge. McC-nnell, 20; Louis Good, 20; B. Ogden, 22; Chas. Johnson, Jr. G. Jas. Thorn, 38; E. Harrison, 39; Thos. Waddington, 16; Arthur Godson, 26; W. Crawford, 17; Geo. Smith, 51. Total, 43.

Saturday, Sept. 3. Dr. Gardner, 30; John E. Pole, 43; H. Andrews, 25; C. M. Armley, 28; Louis Good, 18; Chas. Richter, 11; H. Mingle, 12; Jas. Kirk, 29; Geo. Smith, 62; Thos. Thompson, 40; Isaac Worrel, 13; W. H. Harris, 8; Stacy Springer, 16; Mr. Mansfield, 6; Henry Shultz, 26; H. Houblt, 12; W. Anderson, 10; John Richardson, 14. Total, 403.

Mr. William Miller is the proprietor of the Riverside Hotel. If advised by mail to Ridleyville, Pa., or by Telegraph (Philadelphia and Reading Railroad telegraph lines) to Lazzaretto, Pa., conveyances will be furnished to meet any train from Philadelphia on its arrival at Moore's Station, P. W. & B. R. H.

HIGH WATER AT LAZARETTO AND OHESTER.

Table with 4 columns: Date, Time, Score, and another column. Rows include Sept. 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20.

*Marked thus shot one tide only, the others both morning and evening tides.

THE SCARCITY OF BAY SNIFE.

Editor Forest and Stream: I would like to hear from your readers as to their observations on the growing scarcity of bay snipe and plover. My own experience, confined to Long Island, is that they had fair at the present rate, in a few years to afford no remuneration to the market gunner and no sport to the sportsman. I spent four days on the Rockaway marshes last spring and have been there once a week since July 13, making a *de jour fair sport*; and some of the days have been in every way favorable. The season, in fact, has been a failure there—so it has been at Shinnecock Bay—as I learn from gentlemen, who have been there two weeks at a time (not the hotel keepers).

One theory is that the birds have changed their course and now fly down the Mississippi Valley. The following from a recent letter from Cobb's Island, Va., indicates that they have not merely skipped Long Island in flying down the Atlantic Coast. The line between the island and the mainland surrounds hundreds of acres of salt marshes. From May until October these marshes are the home of thousands of bay birds—snipe, curlew, willet and plover. May is the great shooting month on the island. The birds stop on their way to the breeding grounds and they are killed by thousands. In fact so many of them are killed at this season that there has been a marked diminution in the fall flight during the past two or three years. It is estimated that an average of one thousand birds were killed each day during the month of May last.

Is not this the solution of the matter? Are not breeder-loaders and spring shooting, especially the latter, the cause of the decrease of bay birds?—L. New York Sept. 5.

SEVERAL POSSIBLE EXPLANATIONS—Indianapolis, Ind., Aug. 31.—Editor Forest and Stream: Inclosed I send this clipping from the Indianapolis Journal of Aug. 31: "Nimrod Reunited.—Rev. Myron Reed and Prof. Ora Pearson, who have been re-locating in the Brule River region, Michigan, returned to the city yesterday to manage a few days' absence. The report was joyfully received as a del. dful time, the fish and game were plentiful, five deer having been bagged a short time previous to their return." I would like to know what right the parties mentioned therein have to kill deer in Michigan before the expiration of the close season? If I understood the game laws, I believe deer shooting opens in the above State on Oct. 1.—BOOK.

[Several possible explanations suggest themselves. Newspaper items like the above are not always reliable; but granting that the report is correct: (1) It is not stated that the Indianapolis gentlemen bagged the deer, but simply the fact of the deer having been bagged. Some one else may have done it. Again, the report may have misunderstood and (2) instead of "bagged" the tourists may have said "seen" or, (3) the deer may have been simply an invention of the reporter, who did not know anything about game laws and who is thus guilty of a base libel on the Indianapolis sportsmen. Any one of these three suppositions, or of a dozen others which might be named, is more plausible than the story that Messrs. Reed and Pearson killed five deer in Michigan in the month of August, 1881.]

CALIFORNIA QUAIL IN MISSOURI.—Of the importation of California quail into Missouri, a Jefferson City, Mo., correspondent writes: "I have never yet seen any of the birds myself since they were liberated, but have had repeated information that I consider reliable, that they were seen last summer as well as this spring. I am satisfied they were several hundreds last summer, and I have heard of their being seen this summer but have not yet heard of any young ones. Some were seen last winter in Pulaski county, at least seventy-five miles from here; and last summer they were seen repeatedly on my farm six miles below this city. Then this spring Dr. Glover reported seeing some in his neighborhood, and Judge Clarenbach saw them in two different places near here. I believe their acclimation and increase here will be a success. As to the results of their liberation in places in Callaway, eight miles west, eight miles southeast at Mr. Wards, and six miles east on my farm. I have not this summer received definite information, except from two places. In Callaway none have been seen this summer. On my farm I have information that two or three have been seen this summer, but my informant may have been mistaken in the bird, yet I believe they were seen. From the other two places I have no information. I hope we will succeed in stocking the country with each kind.—H. E.

WHY THERE ARE NO WILD PIGEONS—GOSHEN, N. Y., Aug. 15.—Editor Forest and Stream:—A friend and myself desire to take a little hunt, and would especially like to have a wild pigeon hunt for a few days. Only a very few years since pigeons would be about this region in September, about the time acorns began to shell, upon wheat fields recently sown. No great birds could be got, but enough to satisfy a reasonable man. Do you know of any local fly, not too far from New York City, where we might go and have a few days of such hunting as I have tried to describe? For some unexplained reason pigeons do not come about us as formerly, but I cannot but believe that there are sections they still visit for a few weeks in early fall. W. H. N.

[The only sure plan for getting some shots at wild pigeons is to join an "association for the protection of fish and game." Then you will be sure of an opportunity to shoot ten or fifteen, or fifty half-fledged squabs fired out of a trap and unable to fly. No reasonable man could ask for pigeons in the field and pigeons in the trap too; and if our correspondent is a "true sportsman," he will doubtless be willing to forego his favorite sport for the sake of the cause of "game protection."]

GAME BIRDS WANTED—Rushville, Ill., Aug. 29.—Editor Forest and Stream: Can you refer me to any party in the East who has live black ducks, seaons brant or other kinds of water-fowl which are not common in the West who would be likely to exchange some of them for woodcock? We are trying to get a collection of our native game water-fowl, and have several pairs of woodcocks that we could spare, which we would like to exchange for good specimens of the above mentioned birds, which are very rare and difficult to obtain in the West. Any information you can give me that will put me in communication with persons likely to exchange will be thankfully received. J. P. LEAON.

Several years ago, 1870 to 1875, we had a collection of live fowl, including mallards, wood ducks, black ducks, Canada geese, blue geese, white-fronted geese and brant. A change of business necessitated their sale. During this time we bought, so do or exchanged with the following persons: Lewis Homan, Patchogue, L. I.; W. A. Conklin, Central Park, New York city; Zoological Gardens, Philadelphia; John Boetcher, Oakwood Cemetery, Troy, N. Y.; G. H. Boardman, Weston, Vt.; Gree e Smith, Peterboro, N. Y. (now dead); Dr. J. N. Bates, Worcester, Mass.; N. Guilbert, Goodwood, Pa.; Geo. Ivin, Mysville, Catawago Co., N. Y.; J. Y. Bicknell, Westmoreland, N. Y.

Explosions of various kinds have been numerous within a fortnight past. The list is headed by the explosion of a great quantity of fulminate gun caps, which imbedded themselves in the body of a workman with fatal effects. (2.) This was followed by an explosion of fifteen pounds of powder in a Connecticut armory, nine persons being injured. (3.) The premature explosion of a torpedo, at the Newport torpedo station, killed two persons. (4.) An explosion of naphtha in Front Street, New York City, wrecked a building and killed two men. (5.) A bomb-shell, thought to be unloaded, was thrown into a Brooklyn foundry furnace, but did not stay there very long; it went out through the windows. No one was hurt. (6.) And there was the usual accident whereby the "thought-it-wasn't-loaded" victim was killed by the discharge of a gun. (7.) The seventh did not explode. Some workmen in a foundry were about to pour the molten iron into the molds, when a slight disturbance of the molten metal caused an explosion, which was heard. The cavity was full of gunpowder. One drop of the molten metal would have caused an awful explosion, probably killing everybody in the building. That the strikers were guilty of the plot was shown by the fact that, instead of crowding about the doors and windows to jeer at the new men, as they

had done on previous days, they remained at a considerable distance. A detective claims to have discovered that the powder was deposited by a committee of three men, to whom the task of wreaking vengeance had been given by their comrades."

"LEFT-EYED SHOOTING."—Editor Forest and Stream: I am an abominably bad shot; and have lately seen what appears to be a plausible explanation of my trouble. It is this, that I am "left-eyed." Forming a ring with my thumb and first finger, and holding my hand a short distance before my face, I "focus" the ring, so that I can see a small object, such as a dove's knob, through it with both eyes open. Now, holding my hand perfectly still and shutting my left eye, I am unable to see the object through the ring with my right eye, but shutting my right eye, I can see it with my left. Hence, I am told, I am "left-eyed," and in order to shoot accurately I must learn to shoot from the left shoulder. Do you think that this is so? And will it pay me to try to learn to shoot left-handed? I should like your opinion.—LIVIDUIS.

[Our opinion is that the philosopher who was being prating to you about left-eyed shooting, if you have no gun, shoot from your right shoulder you certainly cannot from your left. What the experient you mention has to do with sighting along a gun barrel is more than we can understand, or you either.]

MAINE LARGE GAME.—I have been on a jaunt lately in the neighborhood of Bangor, Me., and met many tourists on their way to the Rangeley and Moosehead Lakes. At Portland I learned from undoubted authority that a yearling bull moose had been killed this summer at either Rangeley or Moosehead, I forgot which of the lakes. This was contrary to law, and the rare animal was shot from behind a jack. My informant tells me the slayer was a native of Portland and one that should have known better. I could have been taken to the skin and seen it drying. What is more shameful, I heard of a caribou having been shot at Moosehead this summer a few days, by a tourist, before I left Bangor, Me. I trust these lines may meet the eye of both the worthy gentlemen who participated in this rare illegal sport. The names of both are only well known on account of the promise I made to my informants. You may rely on it. Moose and caribou are too rare now-days in Maine to be slaughtered out of season as soon as they put their noses into the State. Deer are becoming very plenty in Maine. More have been seen this summer than for twenty years past, notwithstanding "tailing and jack hunting"—HOMO.

ANOTHER ANCIENT FIREARM.—Richmond, Va., Aug. 31.—Editor Forest and Stream: Your correspondent's story of the long gun he found in a Virginia country store reminds me of a famous old rifle I once saw up in Highland County, of this same State. It is a mistake to suppose that we can shoot any better with our "new-fangled" rifles than our fathers shot before us. The arms may be better, but we certainly do not use them to better purpose. The rifle to which I refer is the property of Mr. William Lockridge, a man well advanced in life. His home is on the Bull Pasture River, in Highland County. The rifle is a flint-lock muzzle-loader and must be over 100 years old. Its present owner has had it more than fifty years. The game which he has killed with it counts up 3,000 deer, besides numbers of wolves, bears, foxes, wild cats and squirrels ad infinitum. The old gun's aim was still bright and his aim steady.—ALBEX.

SEMPER, South Carolina, August 24.—Quails, or partridges as they are universally called, are quite plentiful about here. I knew of about fifteen or twenty coveys within two or three miles of our house last season. Some of them, however, were "swamp birds" and would be lost after the first flush. Numbers of them are annually destroyed by the darkies and poor whites with their traps and pens, by one of which a whole covey is sometimes taken at a time. Coons, opossums, squirrels and foxes abound in the swamps and woods. Wild turkeys are sometimes seen, but are very plentiful. The nearest good fishing place is the Wateree swamp, about ten miles off. This swamp is about four or five miles wide and is interspersed with bayous or lakes, as they are called. The red water of these lakes abounds in fish of a lighter color and better flavor than those caught in the black water streams.—R. B. F.

AN INDIANA GAME CENTER.—Clovevale, Putnam Co., Ind., is reached from Indianapolis, via the Vandavia Railroad, to Greensville, thence south ten miles, via the L. N. & C. R. R., time four hours from Indianapolis. Hotel Central House, J. J. Lewis, proprietor; rates \$3.50 per week, open the year round. Ducks are hunted in the fall and spring, most plentiful in spring, mostly of the small kind. A few English snipe in the spring; quail very plentiful in season from Oct. 1 Jan 1. Permits to shoot will have to be obtained in some localities. Rabbits are very numerous, and are killed during the whole of the winter season. Bass are plentiful in Red River and Deer Creek. Fishing with the fly is entirely unknown. Squirrels are also plenty. In this region of country modern breech-loaders are entirely unknown.—J. B. V.

VIRGINIA SHOOTING GROUNDS.—BOSTON, Mass.—Editor Forest and Stream: I have heard from various sources of the good shooting to be had in Virginia and, as I shall spend a week or so in that State the last of September, I would be obliged if any of your correspondents or subscribers who are acquainted with the country would give me any information concerning it.—HOWARD.

[Our correspondent will find excellent quail shooting, we presume, in the vicinity of Bellefonte, Northway county, where game there is deer, quail and turkeys. By riding out from Norfolk in almost any direction good quail shooting may be had. Excellent shooting is to be had along the Rappahannock River bottoms. Warrenton Springs, Fauquier county, is recommended, as is also Littleton, in Sussex county.]

THE DROOPY DUCK FRAMES, made by Mr. F. A. Allen, of Mount Vernon, Ill., are by all odds the most effective decoys yet invented. They are ingeniously constructed to support in a life-like position upon the water the dead bird, and every one knows that nothing looks more like a duck alive than a duck dead. The ducks themselves think so, for with the Allen decoys the few can be brought within gunshot when all other lures have failed. Mr. Davis, a local duck shooter and known the ways of the ducks, has made and sold \$5,000 of the frames since last fall and 2,000 of his duck-collars.

CAZENOVIA, N. Y., Sept. 2.—Dr. E. C. Bass won the Wendell golf badge, the regular weekly shoot of the Cazenovia Gun Club, held at their grounds Sept. 2, 1891. He is in favor of a third term, and says it is never too late to win. Will Thomas went grouse shooting Sept. 1, and remarks that it is his first and last appearance in the woods. Grouse season opened here yesterday, and the following bags were made: Morse and Dwyer, three grouse; Carl and Cook, nine grouse and one woodcock; Brown, Atwell and Webber, eight grouse and one woodcock; Smith and Crutenden, seven grouse and five woodcock. Never saw it as dry as now and birds are scarce.—HAMMILLERS.

THAT STEAM LAUNCH.—Vicksburg, Miss.—You published some time ago a story of "A Duck Hunt in a Steam Launch." The launch was put in first-rate order and we made several very successful hunts in her. On one occasion I bagged with my own gun alone twenty-one mallards and four geese, besides other species which escaped with broken wings.—ONE OF THE MARCONERS.

TWO NEW HAMPSHIRE QUERRIES.—Boston, Sept. 5.—Will some of your New Hampshire correspondents please inform me through the columns of your excellent paper in what part of New Hampshire good white rabbit shooting can be had, also if the law in that State in regard to sheep compels the owner of a dog to pay damages (if the dog should kill any sheep) provided that the dog is licensed?—H. P. U.

THE ANNUAL MEETING OF THE Long Island Forester Club was held at Brooklyn, Thursday evening, September 6. The following officers were elected: Henry Thorpe, President; Chas. M. Edwards, Vice-President; C. W. Field, Secretary, and R. T. Sabin, Treasurer. Messrs. Thorpe, Field and Sabin were appointed as a committee to investigate the credentials of proposed members.

A LARGE WOODCOCK.—Georgetown, Del., Sept. 2.—On Thursday morning Mr. P. B. Hillen was called into the yard of Judge Layton to shoot a woodcock, which was feeding there. Mr. H., it is said, at first thought it was a spring chicken, but his quick eye soon detected the mistake and he "pulled" bringing down the bird, which, when plucked upon the scales, was found to weigh twenty-four ounces.—M. A. M.

Sea and River Fishing.

FISH IN SEASON IN SEPTEMBER.

| FRESH WATER. | |
|---|---|
| Grayling, <i>Thymallus triobolus</i> and <i>T. montanus</i> . | Yellow Perch, <i>Perca flavescens</i> . |
| Black Bass, <i>Micropterus salmoides</i> and <i>M. pallidus</i> . | Striped Bass, <i>Roccus lincolns</i> . |
| Masacutong, <i>Esox nubilus</i> . | White Bass, <i>Roccus chrysops</i> . |
| Brook Trout, <i>Salvelinus fontinalis</i> . | Crappie, <i>Chromis nigriventris</i> . |
| Pike or Pickerel, <i>Esox lucius</i> . | Crappie, <i>Pomoxis nigromaculatus</i> . |
| Pike-perch (wall-eyed pike) <i>Stizostedion americanum</i> , <i>S. gulosum</i> , etc. | Chub, <i>Scomellus corporalis</i> . |
| SALT WATER. | |
| Sea Bass, <i>Centropristis atrariva</i> . | Weakfish or scoutague, <i>Cynoscion regalis</i> . |

| Pollock, <i>Polachius carbonatus</i> . | |
| Turbot or Blackfish, <i>Pentage onitis</i> . | |
| Skipjack Mackerel, <i>Scombrus maculatus</i> . | |

ALL fish should be killed the moment they are taken out of the water, not only on account of the inhumanity of allowing them to linger in an element ungenial to their nature, but also to prevent them to die by slow degrees rendering them less valuable, nourishing and conducive to health as food. E. Jesse, Esq., in his work, "Anglers' troubles," says he always has a large knife with a hammer at the end to kill fish as soon as they are taken. He was so polite, at my request, as to refer me to the cutter who made it; but the knife was large, consequently heavy, and the price high. I had one made very neat and lighter, at less than a quarter the price, and the blow of the hammer on the skull of the fish kills it instantly.—W. WRIGHT.

ANGLING IN THE BAY OF QUINTE.

SEEING that you oftentimes request communications from your readers, I write to describe this part of the country where I have been enjoying the fresh air and sport for a few days, and trust if any of your numerous readers should come this way that they will enjoy themselves as much as I have.

This place is generally known as Mill Point, is situated at the head of the long reach on the Bay of Quinte (an inlet of Lake Ontario) and about thirty miles from Kingston. The place has two large saw-mills, machine-shop, sash and blind factory, flour-mill, ship-yard and other industries all in active operation. It is easy of access as boats run from Kingston, Belleville, Napanee, etc., and in the near neighborhood are Hay Bay, Carnahans Bay and the Lake on the Mountain. The two former are well-known as good shooting and fishing resorts in this season; while the latter is a natural wonder, being a lake of about 200 acres in extent situated on the top of a hill some 400 feet above the level of the bay, and without any visible inlet. From the top of the mountain hill, a magnificent view may be had, Lake Ontario, Hay Bay, Carnahans Bay, a large portion of the Bay of Quinte, and the surrounding country being at once in view.

There are numerous good places for camping both up and down the Bay from this place, within easy reach of which may be had excellent fishing at this season. Black bass, pickerel, muskellunge and perch are caught. Last evening your correspondent went out and acquitted sport from six till dark, catching ten fish, weighing twenty and a half pounds, the largest four and a half pounds. The evening before two young men caught eighteen weighing fifty-four pounds. Just now the fly, or trolling with either fly or spoon, takes well.

As a simple easy of access where good shooting, fishing and camping may be had, the Bay of Quinte takes the lead.

GARHEART'S LAKE, LOUISIANA.

WOODLAND PLANTATION, WE T BELUCH RA PALHUR, LA. LIVING in New Orleans as I do, I hardly realized there could be within a distance of one hundred and sixty miles a region so rolling as in this parish. Really it is astonishing, the skill that is required by driver and autoists to ensnare a vehicle up and down the hills in safety. To look up, it seems impossible to make it, and to look back it seems a great achievement. The most interesting of all the rides is to "the Bluff" to see the sunset. One rises so gradually in the course of the ride that it is hard to realize the height one has attained. Suddenly you find your elf on the brink of what might have been an inland sea, the margin reaching as far as the eye can range. It is filled with a forest of immense cedar trees covered with moss. In fact, it is what is called, "The Cedar Forest." Below is the swamp land and famous for fishing. Imagine the sensation of overlooking these immense trees, and then a distance above them as great as their height. The view of a sunset at this spot beggars description and we could hardly realize there was any access to the lake and the woods.

Our host, a most sensible and thoughtful bachelor, arranged a fishing party and "fish fry" for us. The morning arrived, and at the darkest hour we were aroused, to be in complete readiness to move, by the early light. It was clear and lovely, and the morning star shone brilliantly and was a stranger to most of us. Now the idea was to provide all the breakfast to be made complete by the cutting and frying of the fish. "The gentleman of color," who officiated as cook, combined the art of fiddling to while away the time before the morning meal. After alighting from the wagon, we descended to the lake by a winding path down the edge of the hill, and it seemed to be the very bottom of a bowl, as we could only see up through the dense foliage to the sky above us. Overhung with trees, quiet, except the noises of birds and insects, the morning hour before the rays of the sun were perceptible, it seemed an enchanted spot indeed. The party scattered to different points. Some went out in dug-outs, others took a stand on an old raft in the middle of the lake, and in the first morning of the season the first fish were caught—trout, goggled-eyed, speckled and brim perch, cat, and other varieties usual in Southern lakes.

Having had only black coffee since morning, we had caught an appetite as well. We remained a few hours, and had a second fry and repaired up the hill to the wagon to be jolted home over the hills and dales and roots of trees, and shall long remember the novelty, pleasure and benefit of a good "fish-fry" at Garheart's Lake. RITA.

TURNER'S ANGLING.—Of Turner, the painter, an English writer gives this reminiscence: "Lord Egremont once invited Turner to stay a week at Potworth and paint two pictures for him of some favorite hills of scenery on the estate. On the first morning of his visit Lord Egremont asked Turner what he should like to see, and the painter replied he would go fishing. The next morning at breakfast Lord E. inquired again what it would please Mr. Turner to do and he replied that, having enjoyed himself so much yesterday, he would go fishing again. On the third morning Lord Egremont thought he would wait for Turner to announce his own plans and was greatly amused when he quietly said he was again going fishing. On the fourth morning Lord E., unable to conceal his anxiety, said: 'Well, Mr. Turner, I am only too glad for you to go to enjoy yourself, but you are talking of going away to-morrow and I felt anxious about the pictures.' 'Come upstairs to my room,' said Turner, 'and set your mind at rest.' Nothing could exceed the surprise and delight of Lord Egremont when Turner introduced him to two exquisite pictures, painted as he had desired. The great man had risen each morning with the sun, and before breakfast had, by a good day's work, earned his pleasure in fishing."

A FISH TRUTHS.—The Sunday Call, of Newark, N. J., has a sermon upon its staff who is an o'servant man, a ye, and a philosopher. He formulates certain angling truths which have the merit of containing much that is beyond argument. He says: "All observing anglers will admit that among the most prominent of the natural laws governing fishing the following are incontrovertible: That the biggest fish always bites on the hook of the biggest duffer. That you have arrived just when the fish have'sopped eating for the season. That there is a good place for fishing all the time, but that the best place is the one you will hear of a better place five miles further. That you could cross the continent on just such information if your money held out. That the guides will convince you that you have neglected to provide appropriate tackle, and that they have got just what you need, to sell at a fabulous price. That it will ain and blow, and be too dry, and too warm, and that the water will be too high, and too low, and too muddy, and too clear, everywhere you go. That the largest fish will be the one you lose just at the top of the water. That the fishing ain't what it used to be. That you won't go ag'in. That in spite of your resolutions you will be at it again within a week."

CONNECTICUT NOTES.—PUTNAM, Aug. 27.—Up here in Windham county, we have our sport just now with the black bass, one fisherman taking 214 in three days' fishing, ranging in weight from one-half to four and a half pounds. They were taken at Webster Pond, a few miles east of this place, by Mr. Jesse Herecude. Others have taken large strings of bass recently. Messrs. Eric Johnson, Hiram Penn and John Sharp, of this place further up the pond from a number of trips to the Rangeley Lakes. They report a catch of ten trout, ten fat fish, and a couple of about ten pounds each in good solid flesh. A few of the old campers expect to go up to the lakes the last of next month. If so, look out for some of those six-pound trout, for they always bring some home with them, and of which FOREST AND STREAM readers will know more about in due time.—E. T. W.

FISHWAYS FOR NEW YORK.—OSWEGO, N. Y., Aug. 20.—Leuth-erstocking Club, of this city, had their annual meeting this afternoon to petition the Commissioners of Fisheries to make the specifications for the construction of fishways in the Oswego, Oneida and Hancock rivers, and also to petition the State Board of Fish Works, according to the provisions of an Act passed in July last, appropriating \$5,000 for the purpose. The following officers were elected: Dr. G. D. McManus, President; O. L. Osterhout, Vice-President; G. P. Maltzen, Secretary; Hon. N. W. Nutting, Treasurer; H. C. Turner, Attorney; Hon. W. Tamm, G. W. Lyman, W. H. Fallis, Oswego; A. Emerick Fulton and A. F. Betts, Pulaski; Board of Managers, Hon. F. W. Cullinan was elected an honorary member.—YETTER.

a credential for winning in a class for special color will have a stamp upon him for pronouncing that color spurious, as, for instance, a liver and white pointer takes a first prize, and is a very fine animal to an extent that a choice is made of him by a breeder of liver and whites for these prizes, and it turns out that he was from a mixed blood. The president has gained for me merely a stamp and delusion, but he is likely to red-lemmon or whites as a lemon and white brother. It may be said that a right and proper knowledge of the *Stud Book* should prevent this, but still it does not appear quite to one's notion of breeding that animals belonging to different breeds should be mixed together. I have thought it a great slur on show exhibitors that a spaniel called a black spaniel, a Sussex spaniel and a cocker spaniel could all three be bred in the same litter, and each win in separate classes, arranged for the encouragement of three different breeds. Why can such a system mean? I am free to acknowledge that there is a difference as regards pointers, and if breeders could by a classification of color be induced to breed hard and fast to a chosen color, be it lemon and white, liver and white, or black and white, I should believe that ultimately we should gain a greater uniformity in pointers. I have no faith, however, that hard and fast rules will be laid down, and I have fears that it will lead to experimental sort of breeding that invariably does more harm than good to a general cause.

All modern scientific classification in color as regards setters than I am to pointers, as there appears to me to be no reason for it, and certainly encouragement to breed black, white and tan setters is fraught with the danger that I have laid down in the above remarks. There have no doubt been some very good black, white, and tan setters, but I am not certain to any one who has bred that they bred their own colors in anything like the same degree as liver and white pointers are bred. I have myself bred a great many large fillers of pointers, and I never bred anything but liver and whites in my life, and I am certain to any one who has bred the backs of pointers at all, that black, white and tan whites can be produced, that a hundred to one can be laid after the choice of parents that there will not be a single variation in the color. I have bred a few small dogs, and I have bred a few pointers, and I have bred one entirely of black, white and tan, and I do not believe any one else has. As a rule setter litter will uniformity in color. The Laveracks are by far the most uniform, both in size and color, but these vary, and they are not to be classified by color only. Black, white and tan, however, might include Laveracks, and I have bred every species of setter but a red Irish. A bad Gordon, i. e., with a good deal too much white about him—would, of course, be qualified; and there are, no doubt, black, white and tan Gordons; while it would throw out strong temptations to those fond of maintaining sort of pointers, to breed black, white and tan with a Gordon would be nearly certain to throw black, white and tan. It should also be considered that there is no proved original breed of this color, and the inference to be gathered from the *Stud Book* is that the English dog, bred with a South East Gordon, and at an average date than about 1820 years ago. I think, as a rule, taking the breeds dog right through, that it is much safer to leave color to the discretion and judgment of breeders themselves, and to consider it as merely a point in the element of uniformity. At the same time I should like to see the day when kennels adhered closely to their own particular color—that is, in some breeds, such as pointers and setters. To get into a right shade of lemon and white pointers, and to be able to maintain it from its own source, might be a result that any one might try for, and success would be a sufficient reward for a good deal of trouble. In the same way black, white and tan setters are very handsome, particularly with the black and tan marked heads only, and flecked bodies, such as, for instance, Mr. Barclay Field's was. Then, under the name of black, white and tan, even mixed heads and flecked bodies, all look alike. I have observed, again, lemon and white setters are beautiful dogs, and a team of them look magnificent, as many people will think, on grassy moors to-day. As a rule, the colors in setter kennels are too varied. I think, perhaps, the best color is black, white and tan, and white and black, black and white, liver and white, and black white and tan, but it would be a bold step to take to pick out one of the colors as the best, and to force one into publicity at the expense of the others would be to no public good.

It is said that the Americans can already equal or beat us in setters, and that at both the winter shows at Birmingham and the Alexandra Palace there will be teams from America of pure Laverack setters and others bred by themselves. I sincerely hope they will do so, as I believe the Americans have been very observant in their adherence to pedigrees than we have, and they have believed in and found out for themselves that the oldest known blood on record is always the best to follow as the foundation for the best results. They have bred the best dogs, I think, of the most recent importation being Emperor Fred for three years tall figure, I saw, told, and when they have got a good one in their own market they keep it at any price, as lately intimated by a pure Laverack dog called Blunder, advertised for sale at 120 sovs., and he was picked up long before my time. I have seen a fine dog of the other side of the Atlantic to my mind. Now, the American prize list at their dog shows is very much in conformity with the policy pursued by them in breeding, as they have prizes for the highest strains of blood, prizes for teams and prizes for teams. This is a class of prize list that I have never seen in any other country coming into vogue in England of classification by color, as if a breeder attends to the matter of color, he obtains one of the elements of uniformity, and hence he is able to produce a team or a brace. I should like to see a pure blooded setter as purchased in this country, than we usually find at our big shows, and prizes for sires and dams to be shown with specimens of their produce. Also, such prizes given at the Crystal Palace a few years ago for pointer and setter sires that had won field trials, and were the service of the public at large. It is the chief point of all competition that serves to bring out merit. A deal has been done to develop dog shows, and the authorities in power are always doing their best to further improvements and useful innovations. But it is not to be forgotten that the dog shows are springing up from all quarters abroad, and that, therefore, individual suggestion, however well meant and disinterested, must be weighed over by hard thinking committees before they are accepted as benefits for the public. —*Belt's Life.*

THE MOODUS DOG SWINDLER.

INTENDING purchasers of dogs are warned against sending money or making any other valuable consideration to the editor of *Moodus*, Conn., styling himself "B. H. Hammond, Attorney and Counselor at Law." He is the same fellow who formerly advertised as F. A. Chester, and he is a most arrant fraud and swindler. Below we publish two letters from him, one written Dec. 16, 1880, and the other Dec. 18, 1880, and which are now in our possession, and both are in the same handwriting:

"Dear Sir
"Your asking if I would trade my dog for your gun received. I would have rather sold the dog right out but as the gun may come handy at some future time I will trade with you as the dog must be sold. The dog is a pure blooded setter as purchased of Mr. F. Hollis of Westfield Conn and is by champion Elton and out of Nell Plunkett—Stella—He is three years old weight fifty pounds, color red with a little white in a splendid retriever from land or water kind and quiet and staunch as a rock. Good nose in field and stylish in the ring. He is used to being shot at and will fetch wild woodcock and English snipe. If there are any birds to be found he will find them for you and when he points you need not hunt with all your might for fear that he will flush them you may sit down and eat your lunch if you wish he will stand there. My reasons for selling him are that I am going into business in New York City the first of next month and shall have no time to hunt or place to keep him in. Should you conclude to trade

you enter express the gun to me, and I will box and express the dog to you. Or if you would like to see the dog work before trading send me money enough to guarantee express charges both ways and I will send him to you and give you one day to try him in the field when I will return (which I know he will) you can send me the gun and I will return your money. If he does not suit you can return him to me hoping to hear from you at once. I am yours &c.
"F. A. CHESTER.

"P. S. I would prefer to trade at once if agreeable as it will save me a great deal of trouble as I am full of business but I cannot blame you if you wish to give him a trial before trading."

"OFFICE OF B. H. HAMMOND, ATTORNEY AND COUNSELLOR AT LAW, MOODUS, CONN., AUG. 8, 1881."

"Dear Sir
"Your read should have answered before but have been from home. The dog is an Eng. Setter and is by Ranger liver and out of Moll. Was purchased of A. E. Godfrey owner of the Nevinsville Lodge Kennels, Guyard N. Y. Color liver and white weight about fifty pounds. Age three years. Is a splendid retriever from land or water and does not bite or maul his birds but will fetch promptly and put them in your hand. He was broken by John H. Gibbs of this place a professional breaker. Does not drop to shot or work but stands perfectly still until told to fetch or lie on. Works by motion of the hand or whistle. Is fast and stylish and staunch as a rock. There are any birds to be found he will hunt for you when he points you need not hurry with all your might for fear that he will flush them. You may sit down and eat your lunch if you wish he will stand there. The birds which he is used to hunting are Partridge Woodcock snipe and English snipe. He is used to being shot at and will stand \$25 for him when eight weeks old. I am obliged to part with him as I have entered into partnership with a law firm in the City of Hartford where it will be impossible for me to keep him and I offer him thus low so as to sell him at once. If you will come here I shall be pleased to take him out and show you what he can do, or, if you wish you can send me check or registered letter for the amount and I will securely box him and send him to you by express. Hoping to hear from you I yours &c.

"B. H. HAMMOND, OFFICE OF ASSISTANT INSPECTOR LIFE-SAVING STATIONS, MILWAUKEE, WIS., AUGUST 29, 1881."

"Reference as responsibility character of Judge W. A. Howard Moodus, The J. E. Tyler, Mantr. Co Moodus Hon B. M. Davis Hartford, The Pratt St Savings Bank of Hartford, Ct. Should you come here notify me before by letter as if you do not I may be away from home.
"Since putting the above into type, we have received from this Moodus individual, whose latest name is "W. A. Howard," a request to insert another advertisement for him. Certainly, Mr. Frank Fowler, alias "F. C. Fowler," alias "F. A. Chester," alias "B. H. Hammond," alias "Howard," alias "H. H. Hammond," alias "you all this fine noise to do not begrudge you a free ad. too. He is it. "For sale—a thoroughly broken Laverack setter dog, retriever. Is staunch. Is sold for no fault, and will be sold low. Address W. A. Howard, Box 227, Moodus, Conn." And, by the way, Mr. Fowler—Charles Hammond, when you have sold your dog, just let us know, will you not?"

NEWFOUNDLAND DOGS FOR LIFE-SAVING STATIONS.

OFFICE OF ASSISTANT INSPECTOR LIFE-SAVING STATIONS, MILWAUKEE, WIS., AUGUST 29, 1881.

Editor *Forest and Stream*:
"Several weeks ago I was made the recipient of a copy of your valuable paper containing a very interesting article under the caption of "Newfoundland Dogs for Life-Saving Stations."

Thereby avail myself of the occasion to say that in the light of eight years' experience on the beach in connection with the U. S. Life-Saving Service, I have no objection to the views therein expressed. I trust that some of our wealthy citizens—ladies and gentlemen of enterprise, and who take as much interest in the noble animal who has proved that he can die as well as live for his too often ungrateful and exacting master—will take this matter to heart.

I think the scheme is entirely practical, and would result in much good to the service—no man would care to be outdone by a dog in his efforts to rescue the shipwrecked. The inspiring example set by the noble "Newfoundland" would, it seems to me, give the heart of most men a while, as has been proved, he might be an invaluable aid to the surfman, whose own personal self-sacrifice has been manifested on a thousand different occasions. As keepers of life-saving stations are required to receipt and account for all property in their charge, the dogs could each be furnished with a stout collar with his own name and that of the donor engraved thereon, and accounted for to the inspecting officer, a record of his services being also kept and daily published.

The dog alluded to in the article above mentioned I know well, "Smut" was purchased of me by the U. S. Life-Saving Service (or water guard), and as his name implies, was jet black. His owner, a native gunner of Stratford, N. C., put a load of heavy shot into his shoulder as a reward for his zeal in springing me early to the front in a partying flood, and in doing so he so injured his master to lose him that he was informed. After that the dog could not be kept at home during the active season of the life-saving service, but would kennel at the adjacent stations (Nos. 1 and 5). It was there I made his acquaintance. The men made a great deal of him, and such was the admiration of the men that they would join the patrol from the next station to return to No. 4 the following night.

When the steamship "Metropolis" was lost on the desolate coast above referred to in February, 1875, "Smut" showed what kind of stuff he was made of, and endeared himself to the boys by stronger ties than ever. His wound caused him to limp slightly, and he was getting along in years. I can now see the faithful animal on his back, and I can remember his jumping me and his master to meet the minute objects afloat in the water, and then to look back with his honest, intelligent eye to see if I was taking notes. Poor old "Smut" if there is a dog heaven you will certainly go to it and have your reward.

With many thanks for the article, which, for "Smut" sake, has already come into my scrap-book, I am truly yours,
WALTER WALTON.

"DRAGGED BEFORE THE WORLD AS A BULL DOG."

Editor *Forest and Stream*:
I trust that you will give a poor abused dog space to draw attention to the way in which we poor bull dogs are labelled nearly every day by the newspaper reporters and others. If any person is so unfortunate as to be bitten—generally, too, through their own fault—by some of our four-legged dogs, the newspaper man hears of it, he is sure to describe the offender as a "ferocious bull dog," and calls him always "a huge beast," and writes about him all day generally as though they were about the size and disposition of a kangaroo. No wonder people residing in one of our prejudiced towns against all our family. I should like to meet one of those reporting gentlemen alongside my wife some quiet night. I would give him materials for a paragraph, although he could not with truth describe me as a "huge beast." For only one such forty or more words would be needed to describe me as a bull dog are much the same as other dogs, although our family claims to be one of the most ancient. We are better than most breeds; we are quiet, not given to barking at the moon; we are clean, very affectionate, brave and patient, and stand up for ourselves and are not to be friendly. It is about the time the reporters and the public generally learned to know what a bull dog really is. I don't see why we should be saddled with the crimes of every half-bred mastiff and bull terrier in the coun-

try. People should know that we number so few in America that we cannot hurt many if we would, and we are too valuable to be allowed to run at large in the streets. We are not dangerous. At the last show I attended in England sixty-nine of our breed were exhibited, and only one was disgraced by the label "Dangerous," and only one dog was so ill bred as to bark at the spectators. It is the ignorant reporters and others look up your Shaw's "Book of the Dog" or "Stoicheage," and see what they say about us, or let them pay a visit to some highly connected members of our race at present in Boston or New York and see the real thing for themselves, and they will find that we are not the dangerous animals they imagine.
HENRIK'S HERO.
St. Leonard, Quebec.

MEASUREMENT OF PRIZE WINNER NOREEN.

DR. WILLIAM JARVIS' Irish setter bitch Noreen, by Garry Owen out of Cora. Color, red. Weighed June 18, 1878. Winner in Irish setter bitch open class of 20 entries. Weight, 8 lbs.; height at shoulder, 22 inches; length from nose to set on tail, 36 inches; length of tail, 15 inches; girth of chest, 28 inches; girth of loin, 19 inches; girth of head, 15 inches; girth of forearm, 1 1/2 inches; length of ear, 1 1/2 inches; length of ear to tip of nose, 8 inches; length from corner of eye to end of nose, 4 1/2 inches; length of elbow to top of shoulder, 11 inches; ears, when extended (measurement taken across the head), 10 1/2 inches.

COCKERS IN THE FIELD.—Editor *Forest and Stream*: I notice your inquiry as to a brace of cockers that will work the gun and behave as good proper cockers should do. Now I have several brace that myself and others call good workers, and have a few brace that I call perfect workers. These last I can work any and all day upon ruffed grouse, and keep them working exactly when I want them without any other preparation on my part, by only the whistles for attention or halt, and to come together with motions for their guidance. Woodcock shooting requires the use of the words of command more, and does not prove disadvantageous, as it would with ruffed grouse. I also have a few and reliable crews of ruffed grouse among them as any sportsman would ask for, and if I am to believe the reports of other breeders and sportsmen—and I have no earthly reason for disbelieving them—they have as well broken cockers as any one; and scores, yes, thousands of sportsmen in America have known my ruffed grouse sportsmen, and not been show men, they are only taken to local sportsmen and as who breed them for them. You are welcome to come and see any of my dogs work, and, if seeing is convincing, I can convince you. My invitation of course will be in person, but you may decline my sought-for invites to work with and over my dogs, and that, too, against my inclination, or else I would get no rest, and the kennel affairs suffer accordingly. I dare say that you may get a few ruffed grouse, but I have a few ruffed grouse, and I am willing to show dies, and I wish you lots of sport.—M. P. McKoske.

THE QUEENS COUNTY HUNT SUPPER.—Although the thermometer has been ranging in the nineties, the gentleness of this hunt has had a number of meets this summer at Newport, R. I. They certainly must be enthusiastic sportsmen to hold such a hunt in the month of August, but as they are only to be held, we work must necessarily be severe on men, horses and dogs. We have heard the custom of hunting in the summer season strongly condemned by several of our contemporaries, and those who indulged in the hunts roundly abused and laughed at, but it is not nearly as severe on man and beast, as the absurd infatuation for shooting woodcock from daylight to dark in close covers, where the tail never clears.

Most of the activities of the season, and to show the farmers and the families that they appreciated the courtesies shown them during their visits for the past three years, the members of the hunt gave a grand moonlight elmlambake at Southwick's Grove in the adjoining town of Middletown on Tuesday evening last. It was a most magnificent elaborate affair, and was held in the grove of Aquidneck. The grove was lighted with reflectors and Chinese lanterns, the latter being tastefully arranged among the stately trees. The harvest moon never shone upon a more animated scene. The festivities were kept up until a late hour.

PENNSYLVANIA FIELD TRIALS.—The second annual trials of the Pennsylvania State Field Association will be held at the Hotel Marlborough, on Oct. 25, 26, 27, 28, 1881, for Setters and pointers. Open to members of the Association only.

All-aged Stakes, open to setters and pointers only.—First prize, one dog and his bitch, to be killed by the order of the winner (value, \$100); second prize, one of Parker Bros' double guns (value, \$30); third prize, solid silver cup, donated by Caldwell & Co., Jewelers, Philadelphia (value, \$50). Entrance fee, \$10; forfeit, \$10, to account for entrance.

Derry Stakes, open to puppies whelped on or after January 1, 1881.—First prize, silver cup (value, \$100); second prize, double barrel breech loading shot gun (value, \$75); third prize, silver set (value, \$50). Nominal one for Derry, \$5; admission for each dog for a few days. Judges will be announced later on. All entries close Oct. 15, 1881.

A MASSACHUSETTS DECISION.—In the course of a review of the present State laws respecting Sunday trade and travel, the *Christian Union* mentions this case: "And even Massachusetts has been no exception. Her laws have been so strict and so strict, that it has happened lately, lately, both in Massachusetts and in Iowa, that when a man has been driving for pleasure along a public road, on the Sabbath, a savage dog kept at some house by the roadside has rushed out, barking at or biting his horse, the horse has run away, and the driver has been thrown out and hurt. In both cases the owner of the dog, longed for damages has pleaded the law against pleasure driving, and said that if the sufferer had remained at home, as he should have done, he would not have been injured. But the courts said that the Sunday law was not intended for such a purpose, and that the driver was not at fault. Whatever the wrong may be in driving contrary to law, it has no tendency for which the driver can be blamed to provoke attacks of wild beasts such as ought to be confined."

ANOTHER DOG SHOW OFF.—We are in receipt of information that there will be no show at St. Leonard, Quebec, in connection with the managers of the announced Montreal, Canada, show to secure a suitable building at a reasonable rental, the idea of having a dog show this autumn has been given up. The edge of disappointment has been felt here, but it is to be hoped that the exhibition of fowls and dogs next winter. This is very much in the style of poor Malzel's announcement with which he was always wont to wind up his evening entertainment of the Automaton Chess Player; "The morning, my ladies and gentlemen, more like an old-fashioned, my evening."

SLEEPS.—Mr. D. C. Sanborn is chucking it at Fairmont, Minn., and getting his dogs in running order for the coming trials. "Bobby's Best" is not a bad name for a black spaniel whelp. It will be more applicable, his owners say, when they begin to show him. The show will be held at Fairmont, Minn., on the 15th and 16th of next week. Very admirable arrangements for boarding dogs. We spent last Saturday at his kennels, and can recommend him to those who wish to have their stock well cared for. Of the eighteen occupants every one was in fine condition.

LONDON DOG SHOW.—The new building is now in progress, and it is expected that the opening of the show on the 27th. All dogs can be shipped to arrive on the 26th, as preparatory will be made to receive them. A catalogue will be issued during the show, and the entries are advertised to close on the 12th inst.

himself of a very severe attack of the gout in New York just before his 40th year by the use of the same remedy. I at once left my young friend and went below to find the steward. I not only found him off duty, but discovered that he had a bottle of the Oil in his locker, which he had carried across the ocean in case of another attack. He readily parted with it on my representation, and, hurrying up again, I soon persuaded the young man to allow me to take him to his berth and apply the remedy. After noting so I covered him up snugly in bed and requested him not to get up until I should see him again. That evening I returned to his stateroom and found him sleeping peacefully and breathing gently. I roused him and inquired how he felt. "Like a new man," he answered, with a grateful smile. "I feel no pain and am able to stretch my limbs without difficulty. I think I'll get up." "No, don't get up to-night," I said, "but let me rub you again with the Oil, and in the morning you will be much better able to go afloat." "All right," he said, laughing. I then applied the

Oil again, rubbing his knees, ankles and arms thoroughly, until he said he felt as if he had a mustard poultice all over his body. I then left him. The next morning when I went up on deck for a breezy promenade, according to my custom, I found my patient waiting for me with a smiling face, and without his crutches, although he limped in his movements, but without a pain. I don't think I ever felt so happy in my life. To make a long story short, I attended him closely during the rest of our voyage—some four days—applying the Oil every night, and guarding him against too much exposure to the fresh and damp spring breeze, and on landing at New York he was able, without assistance, to mount the hotel omnibus and go to the Astor House. I called on him two days later, and found him actually engaged in packing his trunk, preparatory to starting West for his home, that evening. With a bright and grateful smile he welcomed me, and pointing to a little box, carefully done up in thick brown paper, which stood upon the table, he said: "My good friend, can you

guess what that is?" "A present for your sweetheart," I answered. "No," he laughed—"that is a dozen bottles of St. Jacobs Oil, which I have just purchased from Hudnut, the druggist across the way, and I am taking them home to show my good mother what has saved her son's life and restored him to her in health. And with it, I would like to carry you along also, to show her the face of him, without whom, I should probably never have tried it. If you should ever visit the little village of Sedalia, in Missouri, Charlie Townsend and his mother will welcome you to their little home, with hearts full of gratitude, and they will show you a bottle of St. Jacobs Oil, unshaken in a silver and gold case, which we shall send as a part of our present as well as a memento of our meeting on the Cunard steamer."

"We parted, after an hour's pleasant chat, with mutual good-will and esteem, and a few weeks afterwards I received a letter from him, telling me he was in perfect health and containing many grateful expressions of his affectionate regards."

STONEHEUNG ON THE DOG. Price \$3 50. For sale by Forest and Stream Publishing Co.

LEONARD'S Split Bamboo Rods, WITH PATENT WATERPROOF AND PATENT SPLIT FERRULES.

No. 1 SHOWS WATERPROOF CUP IN FERRULE (PATENTED OCTOBER 26, 1875). This prevents any moisture from reaching the wood, and the ferrule from becoming loose. The constant wetting and drying of the bamboo must rot the wood, and make other makes of rods less durable than Leonard's. No. 2 SHOWS SPLIT FERRULE (PATENTED SEPTEMBER 3, 1875). This split thoroughly strengthens where the ferrule is joined to the wood, which is the weakest part of a rod, and where so many of other makes of rods (bamboo especially) break. Mr. Leonard has yet to hear of a single instance of breakage at this point since the PATENT SPLIT FERRULE has been applied. We consider this the GREATEST IMPROVEMENT that has been introduced in rod making since rods have been made. No. 3 SHOWS SPLIT FERRULE WHIPPED WITH SILK AS IT APPEARS ON THE ROD.

EVERY ROD WARRANTED.

SOLE AGENTS, WILLIAM MILLS & SON, 7 WARREN STREET, NEW YORK.

THE COLT CLUB GUN.

It should be remembered that while we are the chief distributors of the regular Colt Guns, we are sole agents in New York for the Colt Club Guns. The complete supremacy of these guns in pipe and glass ball trap shooting is so well known that no word of commendation is necessary. Every genuine Colt Club Gun has the rubber heel plate, with the words, THE CLUB GUN around a circle, with which appears the rampant Colt beautifully embossed. We are also agents for the celebrated guns of Enos James & Co. Birmingham, and Forehand & Wadsworth's Great Single Breach-Loader. Besides these we offer a small Job Lot of Webley Guns and some choice Parker Guns on special terms. Address H. & D. FOLSOM, 30 Warren Street, New York. P. O. BOX 4,309.

The Kennel.

TO COCKER BUYERS AND BREEDERS.—A W Langdale, of 5 N. 8th March Terrace, Victoria Road, Leytonstone, England, late owner of Champions Lawyer, Batcher, Ladybird, Ladylove, Lizzie, Louie, Leicester, Limerick, Liba, Lancelot, Lona, Lydney, Bob, Young Bob, Bessie II, Bessie, and many more important winners at our best shows; also, contributor to Vero Shaws' new work on spaniels; will buy on commission panels of any breed, and has on his books a number of grand specimens; deposit system. The Kennel.

GORDON SETTERS.—In order to reduce the Kennel will sell any of the brood bitches and young dogs belonging to the estate of the late Jas. R. Tiley, who, during his lifetime, had spared no pains or expense to bring this strain of dogs up to the very highest standard. They combine the blood of Copeian's imported shot, Moore's imported Gordon, Parra's imported Ruppert, Stoddard's imported Duke. Parties familiar with Gordons will at once see that this blood can't be beat. Several bitches are now in whelp to Duke of Locust Valley, by Moore's cross out of Urean. For full particulars refer to Col. Albert J. Sloc, Vincennes, Ind.; Mr. H. Malcolm, Baltimore; Col. Jas. Gordon (6 Hous Goods) Pontotoc, Miss. Address for full pedigree, etc., GORDON KENNEL, Locust Valley, L. I. Aug 1, 4 t

"THE FISHING LINE."

TAKE THE
Grand Rapids & Indiana R. R.
THE ONLY ROUTE TO THE
Trout, Grayling & Black Bass Fisheries,
AND THE
FAMOUS SUMMER, HEALTH AND GAME RE-
SORTS OF
NORTHERN MICHIGAN.

The waters of the
Grand Traverse Region
and the Michigan North Woods are unsurpassed. If
equalled, in the abundance and great variety of fish
contained.

The FISHING season begins May 1 and ends Sept 1.
The GRAYLING season opens June 1 and ends
Nov. 1.
BLACK BASS, PIKE, PICKEREL and MUSCAL-
LONGE, also abound in large numbers in the many
lakes and lakelets of this territory. The Sports-
man can readily secure trophies of his skill to his
friends or "club" at home, as ice for packing fish
can be had at nearly all points.

TAKE YOUR FAMILY WITH YOU. The scenery
of the North Woods and Lakes is very
beautiful. The air is pure, dry and bracing. The
climate is peculiarly beneficial to those suffering with
Hay Fever and Asthma Affections.
The hotel accommodations are excellent, and will
be largely increased in time for the season of 1883
by new buildings and additions.
During the season ROUND TRIP EXCURSION
TICKETS WILL BE SOLD AT LOW RATES, and
attractive rates facilities offered to Tourists and
Sportsmen.
Dogs, Guns and Fishing Tackle Carried Free at
owners risk.
It is our aim to make sportsmen feel "at home"
on this route. For Tourists' Guide a handsomely
illustrated book of 160 pages sent free. Also Cards,
Folders and farther information, address

TO CORRESPONDENTS.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are invited from every part of the country. Anonymous communications will not be regarded. No correspondents names will be published except with his consent. The Editors cannot be held responsible for the views or correspondents.

Subscriptions.

Subscriptions may begin at any time. The subscription price is \$4 per year; \$2 for six months. Remittances should be sent by registered letter, money order, or draft payable to the Forest and Stream Publishing Company. The paper may be obtained of newsmen throughout the United States and Canada; and is on sale in Europe by The American Exchange, 44 Strand, W. C., London, Eng; and by Em. Terquem, 15 Boulevard, St. Martin, Paris, France.

Advertisements.

Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices 50 cents per line—eight words to the line, and twelve lines to one inch. Advertisements should be sent in by the Saturday of each week previous to the issue in which they are to be inserted.

Address: Forest and Stream Publishing Co., Nos. 39 and 40 Park Row, New York City.

FOREST AND STREAM.

Thursday, September 15.

Specimen copies of the FOREST AND STREAM sent free upon application.

SUPERSTITION LINGERS.—A man in Massachusetts the other day was bitten by a dog and dressed the wound with the hair of the brute that bit him. It did not cure him. A week's argument would not convince some people that the flesh of the snake applied to the wound is not a sure antidote for rattlesnake bite.

THE CREEDMOOR MEETING.—The prospects are that, despite the nigardly driving aloof on the part of the State authorities, the fall meeting now in progress at Creedmoor will record a fair success. Walnut Hill has sent her best shots to make matters lively for the small bore home guard, while the "woodchuck hunters" from the edge of the Adirondack wilderness have come down to see if they can pick up a prize or so from their metropolitan fellows in arms, and if not, at any rate get a point or two on rifle practice. Pennsylvania sends a team for that State prize, and this only makes the absence of New Jersey and Connecticut the more conspicuous. With a promise of fine weather, there is every indication of top scores, and next week the facts of the meeting will be fully set forth in cold type and figures that cannot lie in our columns.

ALEXANDER MOSELEY.

CHIEF among the employments congenial to old age, Cicero cites the tilling of the soil and the pruning of the vine. The peaceful pursuit of agriculture and the quiet of rural surroundings have ever been counted a saloace of declining years. Many a man who has striven amid the tolling some sceues of life has, Sir Lancelot-like, found contentment at last in his garden.

Our cities, the bone and sinew of them, are replenished from the country; and deep in the heart of the country-born man ever flows the fond love for the scenes of his boyhood. Its current may seem to lie buried and dormant, but when some mighty convulsion comes it is revealed strong and full. King David, sorely wounded, cried out for a drink from the springs of Bethlehem, his childhood's home; and one of the most pathetic incidents in the long and weary struggle in that darkened room at the White House was when the other day the President begged to be taken back to Mentor, and forgetting the concerns of office and political life, talked of caring for the old farm.

Fortunate are they whose life is so ordered that they may retire to rural life; and thrice happy they who having realized their dream of peaceful years are content!

The telegraph brought to us the other day tidings of the death of a friend whose life of busy toil and commanding influence had been thus rounded with a period of retirement in a Virginia country home where, with the light cares of his estate, the visits of old friends, and the pursuit of his favorite pastime of angling, the days passed into weeks and the weeks into months and years, until the years were merged at length into that which is beyond. Here then was a man who, retired from the world, had gratified his longing for a quiet country life, and whose best eulogy is, that unlike an anchorite, he had wrought well, had done his part, and in his retirement from active duties neither forgot the world nor was forgotten by it.

Alexander Moseley was born in 1809, and had therefore at the time of his death, August 30, 1881, more than filled the three score years and ten allotted to man. For many years the senior editor of the *Richmond Whig*, he had been for more than half a century a leader of public thought and a moulder of public opinion. Withdrawing at two separate intervals from the active duties of his chosen profession, he was led in each instance by the vicissitudes of fortune to resume his work, until some eight years ago, health and strength beginning to fail, he again yielded to his longing for quiet and seclusion and removed to a country farm, with humorous conceit dubbing his abode "The Shanty." One reason which influenced to the selection of this farm in Kent County, was his nearness to fishing ponds and angling streams. Mr. Moseley was much devoted to the pursuit of angling, and made many excursions among the streams in the vicinity. He was deeply and intelligently interested in fishculture, having served with success as one of the first Fish Commissioners of his State; and his fondness for angling increased with his years and with the opportunities for gratifying the taste. His last years were spent in this quiet way at "The Shanty," caring for his farm, writing letters and carving curious pipes for his many friends. Last winter there came from him to the FOREST AND STREAM office, with an article which was published at the time, a box of these fantastic creations of his leisure hours, and one of them lies before us on our table as we write. We shall cherish it with his letters as reminder of the kindly heart and friendship of Alexander Moseley.

GENERAL BURNSIDE.—The death of General Ambrose E. Burnside on Tuesday morning last at his residence in Bristol, R. I., recalls the fact that he was the first President of the National Rifle Association. He held the post but a short time, other duties so engrossing his attention that he could not devote the care to the subject of rifle shooting which he considered should be paid to it. He appreciated earlier perhaps than any other officer of the army the general lack of efficiency in the art of marksmanship among the rank and file of the regular army, and took every occasion to urge a more thorough system of drill and practice in that direction.

MANUFACTURERS AND DEALERS will oblige us by sending their descriptive catalogues and price lists to this office.

TENNESSEE IS BEHIND THE AGE.

THE State of Tennessee has a fish commission composed of good men who have the interests of the State at heart and have done some work at their own personal expense. But they are now powerless because of the lack of funds at their disposal. Why the Legislature ever created a board of commissioners and then gave them nothing to work with is a conundrum which we cannot answer. The fact of their giving the Governor power to appoint the board shows that they realized that something of the kind was needed, but perhaps they thought that somehow their mere appointment would cause the fish food of the State to increase in some manner, without further action.

Writing at this distance, we are not certain that it is the Legislature which is to blame for this state of affairs; but that the blame rests somewhere is apparent. It cannot be possible that the law-makers of this State want the benefits of fishculture argued before them at this late day, a course which appears as unnecessary to us as it would be to circulate tracts among the farmers on the benefits of cultivating their lands. Certainly the State has public waters which at one time supplied the people with a portion of their food and which can be made to do so again, if properly stocked and protected from destructive modes of fishing and during spawning seasons. But we need not enter into argument on this question—the day for that has passed. The battle has been fought and won, and those who ridiculed fishculture a dozen years ago are silent now in sight of its triumphs.

We have been moved to write this on account of the destruction of the carp in some parts of Tennessee by drought, when a small outlay could have saved them, if the Fish Commissioners had possessed the means. These carp were reared in the National carp ponds and sent to Tennessee at the expense of the Government. The Tennessee Commissioners were at some personal expense—not to speak of their time—in distributing the fish, which have since grown rapidly. In one pond in Sumner County there are several thousand of these imported fish dying from the extreme drought, which is drying the pond. There are certain notions, such as "saving at the spigot and wasting at the bung," and the one relating to pence and pounds, which might profitably be placed before the eyes of the law-makers of Tennessee.

THE OLD RED ROOSTER.

BEFORE the days when the rage for Asiatic fowls filled the laud with great coarse specimens of domestic fowls which do not mature under two years old and then are stringy and tasteless, there existed the old-fashioned red rooster. A cheerful fowl was he, combining the qualities of gallantry, domesticity, beauty and excellence for the table. He is gone! Not a specimen is extant in any of our museums. He has disappeared before a desire for improvement, which, so far from being a real benefit, has displaced a good fowl by Mongolian hybrids until not a barnyard has been spared the pollution.

In place of the gallant fellow whose not distant kinship to the sprightly and toothsome game fowl gave him a brightness of eye and feather and a hardness of wing, we have awkward, fluffy mongrels whose hoarse attempt to crow is a burlesque on the clarion challenge of the old red. These big-footed interlopers are fibrous when brought to pot and stringy on the platter, and as for fat, you might as well try to fatten a threshing machine by running cats through it. The young generation of Americans do not even know the bird of which we write, but those of our readers who have left forty or more milestones on the road of life behind them can call him up well.

The old red rooster never was guilty of the gross ill manners of the Asiatic fowl. He never found a worm and ate it himself after calling his harem to first look at it; but he ever summoned the nearest pullet to the feast and duckled to see her enjoy it. When a strange dog entered the yard he never died ignominiously to save his carcass, leaving the females of his family to their fate, as the Cochins and Brahmas do, but presented a bold front to the enemy and fought for them.

Alas! poor fellow, you have gone before the imported hordes of chauticeers, as our song birds are destined to disappear before the European sparrow, and your place is filled

by an ignoble bird. It has been long since your red hawk and graceful falcon, with its curled green feathers, has greeted our optics, but, as we journey through unfrequented routes, we hope to come upon some settler's cabin where we may yet behold one of your unpolluted descendants mount the rail fence and announce his challenge to the world.

Adieu! The only place we find your picture is where it heads a column in a country newspaper announcing a political victory. There you will be handed down to posterity to be wondered at as a *vera avis*, for your clumsy follower will surely never appeal to an artist's eye as the symbol of victory.

EASTERN FIELD TRIALS CLUB.—This organization will hold a special meeting to-day for the purpose of selecting the judges for the trials. It is full time that the names of those who are to judge were made known, and, as the entries close on October 1, the public will receive the information through the sporting press only eight days before that date. This is not time enough. No one should court a dog either at a bench show or for a field trial without first knowing the names of all the judges.

DOG ASYLUMS.—Paris is to have a dog shelter, and Boston will follow suit. Some time ago we published the details of the Philadelphia institution of this character, and the Boston asylum will be conducted on the same plan. The Massachusetts Society for the Prevention of Cruelty to Animals has recently been empowered by the State Legislature to establish such a home. We understand that Mr. Nathan Appleton is the promoter of the enterprise. He will receive subscriptions at No. 96 Tremont street, Boston.

"HOPELESS CASES."—A note from the Adirondacks, referring to the many deaths of tourists in the Saranac region this year, says that in almost every instance these were hopeless cases. The invalids had deferred seeking the Adirondack air until it was too late for them to receive any benefit from it. This sad story is repeated in scores and scores of melancholy instances.

THE PORTABLE BOAT AND CANOE INDUSTRY is assuming important proportions. Our advertising pages show that the manufacturers are wide-awake to the increasing demands for the craft. Great perfection of construction has been attained and the advance of the small-boat trade is a notable one. It is in a large measure also an instructive example of the wisdom of advertising a good thing in the **FOREST AND STREAM**.

INDIAN JOURNALISM is yet in its infancy. The specimens which find their way to our table are edited and published by the Indian pupils at Carlisle. The editorials and communications have a healthy tone, despite their mixed English, and are a pleasing evidence that the Carlisle school is doing a good work so far as its goes.

FOREST FIRES have devastated the counties of Huron and Sanilac, in Michigan, nearly ten thousand acres of land having been burned over. Three hundred lives have been lost and fifteen thousand people are left homeless. The country, with ready sympathy and prompt liberality, is responding with funds to aid the sufferers.

SARATOGA HOTEL PROPRIETORS have been interviewed by one of the game protectors of the State, and we understand that one man settled up, as the law provides, to the tune of \$500. Expensive birds out of season.

MR. GEORGE LIGOWSKY, of clay-pigeon fame, was on the staff of Carl Schmetz in the war. Mr. Ligowsky is a Pole. The name is one which seems destined to become familiar to sportsmen, as the clay-pigeon is being well received.

A WORD TO EXCHANGES.—The **FOREST AND STREAM** always gives credit to its exchanges when copying from their columns. Is it too much to ask that a similar courtesy be shown to us by our friends?

EVERY DOG HAS HIS DAY; and every dog wags his tail, too. The Moodus rascal has come to the end of his rope.

MOHETTA, Georgia, Sept. 4, 1881.

Editor *Forest and Stream*:

I was glad to see the republication of your article on "The Forester School of Bohos."

To Herbert, as one of the earliest writers on American field sports, we are indebted, no doubt.

His writings, particularly those on fishing, contained many errors, however; and his style was not the "straight-forward English" of later times.

Is the much-worn phrase, "speckled beauties," to be traced to Herbert? He was too well-read a man to be responsible for that vice one, so often seen of late, "*Sir Isaac Walton*."

I have a constant delight and surprise at the variety and excellence of your correspondence, and it seems to improve regularly till **FOREST AND STREAM** now is a treasury of sporting literature, natural history and scientific research.

The capture of a thirty-five pound muskellunge in Intermediary Lake on a seven and a half ounce rod, reported in your paper of August 25, seems to me a great angling feat, nearly equal to that of a tarpon weighing 140 pounds on a bass rod in the Indian River, Florida, by Mr. Jenon, of Philadelphia, in 1859. This I had from an eye witness of the performance, or, knowing well the immense strength and activity of the fish, I could hardly have credited the story. Very truly yours,
S. C. CLARK.

The Sportsman Tourist.

NOTES FROM LAKE GEORGE.

WHAT do you think of hunting a bear with a steamboat? And yet that was the way one hunter proceeded here a few days ago. It happened in this way. The little beauty "Horicon" was near Anthony's Nose when the pilot saw something which, on closer examination, proved to be a bear swimming directly across the lake. As the boat neared the object all doubt was dissipated. There, sure enough, was a big black bear making "quick time." A couple of adventurous fellows had already started out from the steamboat in a small boat armed with an axe only, intending to intercept the animal. But wares off the shouts of the boat not to tackle bruin with such a slight weapon they turned back. The boat was then headed directly for the brute with the intention of running him down. As this became manifest to the sagacious animal he turned and put back. The two men who had returned to the steamboat again started out to attack him despite the advice not to do so, and were soon up with bruin. Bear now adopted different measures. Facing his enemies he swam directly for the boat, and tried to climb in. But as no more passengers were aboard, the over-crowding statute was rigidly enforced, and the boat was saluted with the axe, only a scarp wound being inflicted, however. It was enough to infuriate him, and again he renewed his attack with flashing eyes and foam-frothing mouth. As he seized the side of the boat with his powerful paws another blow of the axe disabled one of them, and now unable to climb in with one paw he turned his efforts to capsize the boat! The hunters now became the hunted. It was deemed prudent to heat a retreat, and with some difficulty the thoroughly frightened pair got back to the steamboat. The bear pursued them, and was "in sight" now. Now he gained, and then the rowers. At last when they climbed back into the steamboat the bear tried to follow. But one of the boat hands, prepared for this, had a rope arranged with a running noose all ready, and with the first throw he cleverly slipped it over the brute's head, and quickly drew it tight. The game was up, and bruin was drawn to the stern of the boat, lashing and tearing the water. Full speed was put on and he was drowned. But to prevent any lumber on the bear's part he was prudently kept in the water until the boat reached the dock. An angry voyage to land bears in this fashion I refer him to Mr. F. A. Johnson, of Glen's Falls, who witnessed the hunt, and who can supply particulars as to outfit, etc.

So, you see there is a spice of adventure left here notwithstanding the conventionalities of society. A party of us ascended Black Mountain one afternoon, taking hammocks, water and provisions for an all-night stay. After a four-mile walk in the ascent of the 2,600 feet, we gained the summit, lighted a camp-fire, snipped off *la levra*, sandwich *a la maitre*, hot coffee *sans hot de sucre*, and imagined ourselves at Delmonico's with real French names for our hill fare. Night passed joyously, Mentor savagely insisting on sleep for all hands in order to be fresh for the sunrise and the descent in the morning. But, given a girl in a hammock, sleeping out doors in the night on a mountain top, clouds scudding over the moon, stars glowing almost in her face, so near did they seem, and you get but little sleep. *Q. E. D.*

Mentor burnt up fifteen good-sized trees keeping the fire going, furnished coffee at his hot intervals, and rounded us all—for sleep claimed its victims at last—in time for the first gleams of sunrise. The glory of the scene, of course, repaid all the labor.

A few nights after two of the gentlemen essayed another peak. But the results were not as satisfactory. The summit was reached at dusk, no time was left to gather wood for a fire, and the shelter of a ravine was sought from the furious winds. The resort proved to be the shelter also of something else, for while the twins were making earnest efforts to light a fire, another crowd of men, followed by another, before one's wits could be well gathered. The wriggling by of a large snake completed the discomfiture and the rocky top of the mountain became the only safe spot. Morning enabled the chilled pair to find a path down, and mountain climbing suddenly fell below par. One of our best pianists took his hands so badly in this venture that for a while Orpheus politely declined all invitations to play. But he is all right again, and the noble fellow is none the worse for the trip. This adventure very agreeably breaks into the monotonous "cake walks," "*germans*," "*con merce parties*," "*o hops*" and the inevitable rut of young sportsmen, and while these last are kept under by the rugged nature yet left around the lake there is more variety to be found here in the way of holiday amusement than in any place in the State. Of course the fishing cannot amount to much where there is a man for every minnow, but nevertheless from fifteen to thirty pounds of black bass, pickered, yellow perch, etc., can be taken by a good angler in half a day, and this is enough for anybody.

September is the most charming month in the year for a visit to this place, and the summer boards leave so rapidly that landlords reduce their prices to seven dollars per week. There is nothing to complain of in regard to the price of board at any season. Good fare and comfortable rooms can be had at from eight to twelve dollars per week, and at these rates all are well satisfied; the guests are merry and the landlords make a nice profit. But, where you are charged more than this, you get less in proportion, and are unfairly dealt with. And the fare at the resorts here is worse than at the cheapest places, and is charged at three times the price. The day is rapidly coming when the lake will be one vast boarding house—more is the pity! Now, you can go to the table with an ordinary flannel shirt, but with your snobby New Yorker begins to look here, with or without his snobbier wife, the old set fide away. The men and women make a brave stand at some of the houses for the old-fashioned plain style, but shoddy will have her full dress votaries, and the "lah-dah-dah" class generally triumph. Thus, prices go up and comfort goes down, the flannel shirt succumbs to the "german," and Mr. and Mrs. Platonoff give way to Mr. and Mrs. Flasher. There is one remedy; get the State to sell the islands which, at present, are occupied mainly by squatters in utter disregard of the people's rights, and settle upon them in your own way of living. Run a railroad from Glen's Falls to the lake, supplanting the present stage monopoly, which is a fantastic burlesque on comfort and convenience and about one hundred years behind the age, and the lake will hold its own, otherwise newer and less conventional resorts will be sought year after year, and after the day of fishing is got tired of at this place, Lake George will have had its day. I want your items as to fishing.

grounds, etc., up here, let me know and I will give you ranges and "points," so that you might fish in the dark.
Lake George, Sept. 1. ONE HUNDRED ISLANDS.

ADIRONDACK NOTES.

Editor *Forest and Stream*:

Allow me a word from the Adirondacks. I am pleased to know that the Adirondack guides have received a good word through your columns within the past three weeks, and justly thns. In connection with Parker as a guide, they may have suffered somewhat from outside influences, but no further, for all, who are conversant with and know the Adirondack guides, cannot recognize him as a liar. Parker was never recognized as a guide, speaking in a professional manner, and was only required under urgent circumstances. A mycologist embroidered the entire trouble, and there all it rest.

The Saranac guides suffer the opprobrium as Adirondack guides in connection with the transaction, and in their behalf one word. I have known them intimately for many, very many years. Their character for honesty and faithfulness, in every respect, is without reproach. I would trust them anywhere, and with any amount. And I add for reference, Dr. J. R. Roney, of Keeseville, N. Y., who has employed them for thirty years; Col. T. J. Hoyt, of New York, for twenty years; Mr. J. M. Wiant, of Bergen Point, N. J., for nine years, and many others, but to the above gentlemen, well known, I take the liberty to refer to.

The Adirondacks for the past season have been overcrowded. No such rush was anticipated, or preparation would have been made. Another year and every house will be prepared to meet every emergency and every demand made for satisfaction, in every respect.

In regard to the great number of deaths in the Saranac region, I would add that in nearly every case they were hopeless ones, and it was a last resort, and proved that, and, as it was anticipated in every case before they left home, therefore no blame can be attached to Doctors Trudo, Romyen, Loomis and o'hers to whom advice was applied for.
S. S. N.

SEYMOUR'S ISLAND.

I SAW in your columns inquiries as to the best way to reach the fishing and hunting in this part of the world. From Saatonoga go to North Creek, thence to Blue Mt. Lake, where you will put up at John Holland's. A more genial, kind and accommodating landlord is not known in the Adirondack Mountains. Mr. Frost, his head clerk, is composed of kindness, and that in no small quantity, for he weighs 250 avoirdupois, and many a tourist, tired and hungry after a ride of thirty miles over a rough road from North Creek, has been comforted by his cheerful smile and hearty welcome, and afterwards by the ozee of the mountain, and the refreshing sleep one enjoys in the mountains is well prepared to enjoy a ride on the lake, and comment on its surroundings.

About half a mile from Holland's is Thatcher's Island occupied by Mr. Boyd and family. A little further down to the right is Col. Seymour's Island, occupied this season by Mr. Hawk (proprietor of the Windsor Hotel, New York,) and his family, and there let us stop and look around us. The island is one of nature's choicest productions, with its bold front to the south and sloping gradually down to the water's edge on the north, it is heavily timbered with balsam, spruce, hemlock, pine and cedar, also white maple, birch and mountain ash in abundance, with foliage so dense you are protected from the rays of the sun at mid-day. Down the centre of this island is a row of tentified with every convenience for comfort and health, even to windows of rope cordage opposite every sleeping apartment, through which steal the zephyrs of morning, that freighted with the perfume of the *Nympha odorata*, mingled with the odor of the balsam, and aided by the ozone of the mountains, lends a glow of health on the cheeks of the unconscious sleepers. At the landing is a natural flower garden, where the cardinal flower and the wild rose grow in profusion on the shore, while the arrowhead grows at the margin of the water, and the white water lily pillows its snowy head on the heaving waters of the lake, whence they are daintily plucked by the ladies of the island and transferred to vases, and bloom for days in all their loveliness owing to the gentleness with which they were handled.

But those tents are not closed nearly as the lily, neither do the inmates rise with the lark, but are sure to be singing while the nightingale in the evening. An amusing event occurred on the last evening in July, when all were gathered around the camp and song was at its best. Miss Davis was just finishing one of her choicest selections, with bell-like clearness, or as when a tiny silver cord is touched by the hand of some unseen fairy, the sweet melody dying away into far-off dream-land. The spell was broken by noise in the lake and, looking through the trees, we saw three boats from the new Crop House. This house is filled with guests, some of whom were out with their guides for an evening boat ride, and were attracted to Seymour's Island by the full, rich strains of music floating from it on the evening air. When they neared the island and saw so many tents and heard so many voices they concluded they had come upon an island camp-meeting. One old gentleman, who sat with solemn face and uncovered head, not knowing whether the music was human or divine, was soon undeceived by Wm. Proctor, who never came here still, or any length of time, striking in and singing, in his clear, full voice, "the party was not, I care not what the world may say." The transformation was sudden in the old man's countenance, which quickly changed from devotion to disappointment, and the last we saw or heard of that party they were turning the point of Thatcher's Island and singing at the top of their voices—

"Pull for the shore, sailor,
Pull for the shore."

The choir broke up for the night, but not before they had planned to ascend old Blue Mountain in the morning.

The morning was cold and rainy, but the ladies and ladies of decision and the gentlemen could not say no, so taking an early breakfast, they started at half-past six in the morning, prepared for the ascent, having for guides James McClelland, Jr., and Bert Proctor.

No accident occurred and all "went merry as a marriage bell," but, as they neared the top of the mountain, they were met by parties who were on their way back to Holland's, and by a disaster which was about to occur. The party was not less was clouds and rain. The gentleman who the party was so long in telling his story, as the rain was dripping from his

HABITS OF THE ALLIGATOR.

To the student of natural history, or those of inquiring turn of mind, it is interesting to note the character and habits of the American crocodile.

Perchance the reader will question whether the huge and ugly reptile really has a character.

We will not debate that question now while the weather is so warm. Perhaps he has no morals even; but having been among them rather more than less for five months, I venture the assertion that he at least has habits of a most positive nature, and think my position on that point is invulnerable. I propose to defend it, at least, and if vanquished, will gracefully retire.

The brain or nerve center of a twelve foot alligator, is hardly as large as a man's thumb; still he does sharp things sometimes and the hunter may steal a march on the timid, watchful deer or wild turkey as easily as he can approach this scaly monstrous-looking reptile without being observed. It does not follow, though, that he is as difficult to capture, for often they are on the bank your boat may glide up within a few feet before he makes the plunge for deep water, or they may remain quiet while you pass near enough to touch them with an oar. The expression of his eye, however, and a very slight motion of his head, reveals to a close observer that he is not quite *sang froid*, and my sudden demonstration about the boat is liable to start him; and then, having decided to go, nothing less than a well directed bullet will check the impetuous charge, though he may come in contact with and nearly capsize the craft in his headlong rush for the bottom of the river. Where they are often disturbed by fishing boats, they become very wild and one must be crick shot with the rifle to have much success with them. They are confirmed cannibals, and as a measure of self-preservation, the young are compelled to avoid the company of those that are grown.

The alligator is fond of fresh fish, and the black bass, (called trout in the South) seems to be his favorite. In dark water he is really skillful if not artistic in taking them. One method is to swim slowly and a few feet from the bank, in a favorable location, to open his jaws along the water and bring his tail around slowly toward his head on the side nearest shore. The frequent repeat of this maneuver is that the fish, when it feels the commotion in the water caused by the moving tail, takes alarm, and leaps from its native element to escape the unseen foe, but sometimes only to become a victim of the terrible jaws which close on it like a steel trap.

People who have noticed the habits of the black bass in Florida are aware that when feeding they often operate in large numbers together and make short work of any unfortunate school of minnows or small fish that come in their way. Alligators, where numerous, often adopt a similar plan of operation, and then the bass must suffer in his turn: the jaguars swimming about among them and each individual taking what he can get as the fish leap from the water to escape the supposed danger from the long moving tails of the reptiles. This jumping habit of the bass, by the way, often puts the canoeist in possession of fresh fish, *adans volens*, or being alarmed by the dip of the oar, they, in making the leap, fall plump into the boat. In that way, we have secured as fine fish as I ever caught with the fly or spoon.

When collected in large numbers the alligators are very bold, and show more curiosity at the presence of a boat. On one occasion I rolled seventeen very large ones as fast as I could shoot, and left nearly twice that number that were of no use to me.

To suppose that "a large alligator is never killed at the first shot" is a mistake. One ball, if properly directed, will answer as well as a dozen. If a party of hunters boast that they required nine balls to quiet their game it indicates a lack of marksmanship, or else that their arms were inferior.

Of all the appetites that of the alligator is probably the most indiscriminate. They will catch turtles, and the immense strength in their jaws enable them to crush the shells before swallowing them. They are excessively fond of dogs, but the average Florida canine seems well aware of that fact, and is constantly on the alert when his duties require him to swim or pass through low grounds, where the most dreaded species are lurking, yet many of them are caught, and the old Floridian is frequently heard lamenting the loss of "the best hog-dog in Florida." Many hogs are also destroyed in newly settled regions, and young cattle are sometimes victimized; even grown cows have been attacked by the largest of these vicious reptiles, and severely injured if not killed outright. I found in the stomach of one alligator the hoofs of a nearly half-grown bovine, a number of the indigestible bones or shells from the heads of black bass, and bones and complete set of ten rattles of the diamond rattlesnake, several abraded pieces of wood, sections of cypress limbs, etc. But why do they swallow chunks of wood? Is it for the same purpose that the hen takes gravel? I never knew them to indulge in any other kind of vegetable diet. Iterative in their habits they explore lagoons, make long journeys, sometimes overland from one river or lake to another. The walk of a muscovy duck is graceful when compared with the pedestrian efforts of an alligator.

His travels by land are slow, and his gait is awkward, but we cannot say the same of his evolutions when in the water.

The way he snatches a boat through the water when harpooned or snared suggests the idea of a mule race at the other end of the line. Probably before he is overpowered or dispatched he will make things lively on board by reeling the line upon his body, and unless well handled may pile himself aboard or turn the craft over. A light, frail boat will be in danger, too, from his powerful jaws. Repeatedly they have splinters as large as my fingers from the hull of my yellow pine skiff. Good nerves and promptness on the part of the harpooned man will usually avert disaster, though taking them by this method is somewhat dangerous, and the boat employed ought to be a good strong one. Other requisites are a half-inch line, ten to fifteen yards long. One end fastened to bow of the boat, and the other to a fifteen-inch spar, which is used by means of a staff similar to the ordinary spear or gig pole, said staff to be detached the instant after the alligator is stuck or, of course, it would be broken in the *moules* that follows. The skeleton may be of the harpoon or the pole.

An assortment of destructive weapons, as guns, pistols, axes and hatchets completes the outfit.

In the spring of the year fierce battles often occur between the males, in which they get severely punished. "Catch a catch can" embodies the rules of the fight, and, having hitled, a lively flourishing whirling and twisting, with savage howls from the powerful tails, makes things interesting for all concerned, and the water is lashed to a foam,

garments and his teeth chattering while he talked, and he had much the appearance of a chicken just rescued from a pail of water, with drooping plumage and downcast air.

After passing the descending pedestrians the Hawk party were soon on the summit of the mountain. Though somewhat fatigued, they were well repaid for all their trouble, for at that moment the rain ceased, the clouds cleared away and a more beautiful view was never seen from the top of old Blue Mountain.

Standing on its lofty summit they could overlook a terrific storm in all its majestic grandeur, and hear the crashing sound of the heaven and earth with the lightning which, in its zigzag course, seemed like some fiery monster writhing in the last agonies of death. But as the storm passed off to the east the party were aroused from their reverby by the irrepressible William Preatis singing in a well-modulated tone:

"Now up, now down, now high, now low,
We plodded through the rain,
A brightler or a happier time
May never come again."

The party said they could count fifteen bodies of water from the top of the mountain besides all that had soaked into their garments. After a lanch and two hours' sunshine they started for camp, which they reached in high spirits.

With daily excursions said many adventures to relate in the evening, time passed pleasantly until the 15th of July, when other duties claimed the attention of some of the party so they were forced to leave the scenes where they had passed so many pleasant hours. The "vacuum" has since been filled by Mr. Samuel Hawk, who presides at the head of his bountiful table, and it appears that all that will come may come and partake of his hospitality. He remains in camp until the last of August, when he leaves for the city, when Wm. S. Hawk will do the honors of the camp. He expects to be joined by other friends. Late in September the party will break camp and start for Saranac Lake by the way of Little Tupper Lake. I will by and by give you an account of their trip.

SARANAC GUIDE.

Blue Mountain Lake, Aug. 20.

(Continued from Page 104.)

A REMINISCENCE OF THE WAR.

NOT waiting for further examination of Mr. Joslin's barn for seeking to penetrate the corners of the missing Kenuer, and I had ridden rapidly southeast for five miles, hardly exchanging a word; I did not feel at all like talking. I was deeply chagrined at our failure to make the capture and busy with my own thoughts as to how it all came about. James Davis' mare was certainly in the barn and so was his saddle, but was it he who took her away? Was it possible that we had been discovered? Had he, while in the house, even at that late hour, received an intimation of the close proximity of an enemy and in desperate haste fled? Had it all happened so? Had he escaped to that that hour and done unconscious of his danger? And so, the more I thought of it the more determined I became to fathom the whole thing at an early day.

We found a place to camp away back in the deep woods, being unsaddled and tied our horses, we talked freely of the night's work and matured plans for the morrow. In the silence of the black woods we talked, ate our hard tack and pork, not daring to build a fire, for we did not know just some scouting parties might be lurking near. However, we were content to tuck ourselves in among our blankets, with a saddle for a pillow, we were soon lost to all sound and sense.

The sun was an hour high when we awoke. It was arranged we should part company there, Kenner to go south and west and work north to Catlett's, but to keep out of that place, gain all the information possible, then return to the command and report; I to strike the vicinity of Bristo Station and thence work toward the Rappahannock, cross as best I could and find the command, that is if it had again crossed to the south side, which was hardly possible. I kept steadily northward, keeping sheltered by the woods, traveling, as I had often done before, by compass.

That night I discovered the enemy in considerable force at Bristo Station, showing he had fallen back from near Catlett's and was possibly alarmed that he might be surrounded and captured. Rostering my horse and self until about 2 o'clock a. m., I started to find our command; rode cautiously until daybreak, then pushed rapidly on to cross the railroad a couple of miles north of Catlett's. The position of the enemy's cavalry at Bristo caused me to take, to a certain degree, my back trail. I felt sure the Confederates had left the vicinity of Catlett's, and if so Kenner would know this and then if such were the case, which was highly probable, why could I not make a visit, if even a short one, and thus combine pleasure with duty and at the same time know what I was burning to know—why I had not captured the man who rode James Davis' mare?

Riding along the edge of the woods back of Mr. Joslin's house, I met the black man, Tom. I questioned him closely, knowing I would get the truth. He had not seen James Davis; "fo' de Lawd Mars James hadn't done bin' den sene de battle at Bristo." It was enough.

I went directly to the house; I entered and was greeted warmly by all. The clock struck two; I felt safe. I determined to spend the remainder of the afternoon and travel that night toward the command. Yes, James had been there, so Miss Lucy said; had told them all about capturing me, etc. "and," said Lucey, "he left here suddenly at about 10 o'clock night before last. He and I were sitting here by this window talking. Suddenly he went to the door, quietly opened it and looked over toward the barn. Telling me to wait a moment, he disappeared in the direction of the barn. I could not imagine why he went to the barn unless it was to look after his mare. I sat looking out toward the barn for possibly ten minutes, when I heard the barn-yard gate open and James crossed the road, leading "Cora" and saying he must go at once. He rode away at a lively pace up the road." I held my peace. I did not tell them anything I knew, still it was only a partial explanation. He came in the night quietly and left in the night suddenly. Tom had seen him at all.

And now I come to that part of these adventures, if so I may call them, wherein the ending was as near as it could have been without being a bloody tragedy.

It had struck three. Mrs. Joslin and Lucey were in the spring house, Mabel and I sat in the parlor. I was on a chair facing the rear door (the door in the dining-room) and at the end of the piano; Mabel sat on the piano-stool, facing me almost, and slightly between me and the door. Suddenly a man's step sounded on the dining-room floor, and—James

Davis stood in the doorway. The recognition was instantaneous, mutual. Revolvers leaped in the air, accompanied by an ominous elieking, and we covered each other almost at the same time.

"You are my prisoner," I cried.

Mabel gave one frightened look and jumped between the leveled pistols, crying, "Don't shoot; for God's sake don't kill each other. Are you real men?—are you gentlemen?—that you would dishonor with blood the house that has welcomed you and sheltered you?" It was all done in so few seconds—pistols were slowly lowered; shame came upon us.

"Have you friends with you?" I asked of him.

"No, sir."

"Quits. I am alone also."

Mabel seized my arm and Lucey, mshing in, seized Davis.

"Well, Mr. Dick," said he, "I reckon we are both captured."

We shook hands. Like myself, Davis could not resist the temptation of making a call at the Joslins'. Conversation became general; Davis and I declared a truce for twelve hours and sat amicably at tea. And then he explained the mystery. He saw the uncertain light in the barn, thought that that the bars was on fire and went to examine. He opened the small door almost in the rear of his horse, when he distinctly heard some one leave the barn, or else come in. He waited and listened a long time and, hearing nothing, determined to go in and get his horse; said he did not feel right about the situation and concluded to leave any way. So mutual explanations occurred on both sides. We parted that night with mutual good wishes and a warm grasp of the hand. He took his way, I mine.

Although I scouted through that country much after these events, I never met him again. We both, by mutual consent—a tacit agreement—did not visit Joslin's, indeed, the forces of either were near in goodly numbers. But I never forgot those good people and I lived to see the day when I shot quail over "Rish" and enjoyed the hospitalities of the house untrammelled by a war cloud. After the surrender and when gentle peace had come, I spent many happy days at their guest.

James Davis lived to marry Miss Lucy. The last I knew of them they were in West Virginia, doing well. But as for myself—well, that tale cannot be told. "All's well that ends well." It ended well and therefore must be well.

DIK SWIVELLE.

FLORIDA AS A SUMMER RESORT—San Mateo, Fla., Sept. 9.—Editor Forest and Stream: Our weather in Florida since September came is very beautiful—mercury rarely above 90 degs. and seldom up to that point; pleasant, bright days, with plenty of air stirring, splendid moonlight nights, cool and delightful. Never think of Florida as "proportionately hot" when you are "roasting." A letter received in early summer from Central New York said, "Mercury nearly at 100 degs. What must it be with you?" That same day it was about 85 degs. with us. O. R. T.

Sportsmen's Wives should not fail to purchase their Scissors from C. L. Ritzmann, 914 Broadway, New York.—A do

Natural History.

CLOGGED FEET OF YOUNG PARTRIDGE.

THE annexed weird and uncanny-looking engraving is an exact representation, natural size, of the remains of a young partridge found a short time since by a correspondent. The bird was obviously destroyed by its inability to drag about the mass of clay which had adhered to the left foot. It is difficult to imagine the manner in which so immature a bird could have existed so long as it did with such an incumbrance attached to it and impeding its progress. These hulls on the feet commence on the claws, which become separately incrustated, and they increase by what a botanist would term an exogenous mode of growth, layer after layer being deposited until the mass attains a considerable size. In the present instance the weight of the clay in the dry state is almost exactly an ounce. This weight would have been considerably increased by the amount of moisture present when the bird was alive.

Were such a weight attached suddenly to so small a bird it would be quite incapacitated from active locomotion; but the gradual and slow increase day by day enabled the

animal to become habituated to the incumbrance, and to survive, though obviously with great discomfort, until it had attained the size depicted.

The right wing conceals the skeleton of the animal, which was intact, the flesh having been removed by the maggots of the blow-fly—these universal and useful scavengers of exposed animal remains.

In poultry-yards and pigeon-houses similar instances to the one represented above, not unfrequently occur; but the case is so interesting an illustration of the struggle for life under unfavorable conditions that I have thought it worthy of being illustrated by an engraving; and I beg to return my thanks to the gentleman who kindly forwarded it.—W. B. TRIGHTMERE, in London Field.

made a good start for a full hog. About a mile from camp we came to a high hill, with open woods on every side. Concealing ourselves in a fallen tree-top, at a point from which we could see two hundred yards in every direction, I felt sure we would bring up a gobbler before sundown, especially since I knew this hill to be a favorite range in the spring time.

I yelped a while without any response. Then I tried gobbler. (I am one of the few men in this State who can gobble successfully.) My first effort was successful, for some three hundred yards off two turkeys gobbled their loudest. In a few moments we saw them coming toward us in a full trot, the front one holding his wings down in a sort of half strut. I whispered to F. to cock both barrels and wait until I fired, then to try them both on the remaining turkey, if necessary. F. was a good wing shot, and I felt sure he would bag his game. On they came, one of them fully thirty feet in advance of the other. Waiting until the front one was within twenty-five yards of us, I whistled and brought both to a full stop. I fired at the one furthest off, and dropped him in his tracks. F. let drive the first barrel at the other one. He staggered and fluttered, I think, with a fatal shot; but he didn't die fast enough for F., so he fired into him again and settled him forever. I don't think I ever saw a finer turkey but once, and I am sure I never saw a prouder man than my friend.

Concluding that we had had enough glory for one day, and it now being quite late, we return to camp. My friend's supper, garnished with a mile away, came down to chat with us a while. During his stay he told us that he had heard turkeys gobbling that evening back of his field, and that whenever he heard them there of evenings he always heard them near the mornings following; so he felt sure the ones he heard in the evening roosted near his field. He was quite certain that they usually roosted in some large oak trees which grew on a steep hill side, a place very easily found, as a path ran near by.

Waking up about two hours before day the next morning F. and I started for the place in the hope of finding the turkeys by moonlight. Arriving at the place designated by the farmer we got down and commenced hitching our horses; during which the owls in the creek bottom half a mile off began one of their pandemoniac concerts, and to our amazement a turkey gobbled near them. Once before I had heard a turkey gobble on a moonlight night, but that was where they were very plentiful and but seldom hunted. This did not cause us to change our programme, but we went right on and hunted through the timber on the hill side. It was a fine place for turkeys, but they were not there. Meanwhile the owls kept hooting and the turkey in the bottom kept gobbling. At my suggestion we concluded to "go for bin." Leaving our horses at the edge of the bottom we walked in. When about a hundred yards from the turkey we came to the creek, which was too wide to jump across, but a small log was near by. On proposing to cross on this I was astonished to hear F. say that he could not walk a log in day time much less in the night. The only thing then was for me to take the shot gun and go after the turkey. This I did in a few minutes, and with "many a flutter" we came to the ground.

We concluded to separate, F. going back to the place which he had hunted to wait until day, feeling assured that the turkeys could not be far off, and he was not disappointed. I went down the creek a mile, then struck out into the hills. Before I had gone as far as I wished I heard the red birds begin to whistle, and I knew day was breaking. Going a little further I happened to scare out of a tree, and almost immediately I heard my turkey copping quickly. I listened for him to light. Soon I heard him strike in a tree a good distance off. Riding in that direction as far as I deemed it prudent I dismounted and hunted for him. He was soon discovered perched in the very top of a small oak tree. It was quite dark yet, but I didn't want to wait, and I knew I had killed many a turkey with my rifle when I had no more light than now, so I fired. A way he flew, but he made an awful fuss. I knew he was badly shot, so I listened, and in a moment heard him strike the ground. It was no trouble to him, as he did not fly more than a hundred and fifty yards.

By this time I heard turkeys gobbling in several directions, but none seemed nearer than a mile. On arriving near two I saw it was too light to get a shot on the roost, so I resorted to the best plan any man ever tried for killing a turkey in gobbling time. I went out on the very crest of the hill in which the turkeys roosted. Concealing myself, I gave a low, soft yelp or two. The gobblers both rattled loudly. I knew they were in the neighborhood. In a moment I heard one fly, and then I saw him light within thirty yards of me. On comes the other one, but he dropped down further off. It was too dark yet to shoot at heads, so I fired at the body of the one near me, and down he came.

Loading quickly, I slipped around and headed off the other gobbler four hundred yards from where I shot. I yelped; he strutted but would not gobble. After waiting some time he came in sight but would not come close. He was promptly killed at one hundred and twenty-seven yards. I stepped it. From here I returned to camp to find that F. had killed a young gobbler and had fired at a large one, but didn't hurt him. We concluded to go home, feeling well satisfied with our trip, having killed a deer and nine turkeys, two of which were the first F. had ever bagged.

I am very fond of a "breach-loader" for all small game; but when I go after turkeys or deer, I prefer the old rifle, a muzzle-loader, with which I have killed hundreds of deer and turkeys.

TEXAS.

ROASTED WOODCHUCK.—The Postman, in your issue of Sept. 8, is not the only one who knows the flavor of woodchuck when well roasted. The first one I ever cooked was about eight years ago, during a trip with team and camping outfit through the State of New Hampshire. We had stopped at one or two a few miles west of Deerfield. One morning I had breakfasted at a roadside inn, and the cook had cooked him, using an open tin baker set before a fire of hard wood coals (by the way we could bake biscuit in that same baker in ten minutes.) We baked well with salt pork cut in three slices, and did wait till our game was done brown; but with the savory roast-pig-like odor, it was a big strain on the patience. One fall before that while camped near the head waters of Passadunkook Stream in Maine, we had dined a rabbit boiled ten minutes with onions and had a lesson. In a moment the woodchuck was well roasted. Was it good? I only wish that the Postman could have been there. The meat was rich, juicy and delicious. It was just like every other woodchuck we have roasted since, and we always eat them while in camp; and we go on our regular fall hunt every year.—H. L. M.

WILD TURKEY CALLS.

MILLENBERG, Pa., Sept. 6.

"Kookk" in the last number of the FOREST AND STREAM asks about turkey calls. Having had some experience in the matter, we may perhaps impart some information, but it is doubtful if "Kookk" or any one else will ever learn a certain method to call up a wild turkey. The instrument adopted by us is the little horn with a stem three or four inches in length. We have used the turkey bone to good advantage, but found it too severe on the lips; and the band should be used to cover each end of the bone in order to give the note that far-off sound so necessary when the birds are wary. We have used scrapers of many patterns, but have found them wanting in one or more particulars, and have discarded them. A common clay pipe scraped on a piece of slate makes as good a sound as any scraper, if properly handled. The best caller we ever met called with his mouth only; he somehow twisted his head to the right and downward, twisted his mouth to one side of his face, and, placing one end and gave the side of his nose, pushed it over to the other side and finger to the side of his face. As the occasion might require, he could do the old hen or the old gobbler up to nature, or imitate the young birds to perfection. That boy would be worth five dollars a day to any one wanting a day among the turkeys.

We use the horn; all things considered, it is the best when an instrument must be used. As to the style, tone and number of yelps, we invariably leave that for the birds to decide. We do as they do; if they make three or four yelps we do the same; if they make one yelp, we come down to that figure. If they call cautiously and softly, we do likewise; in fact, we imitate their call. In case that we suspect that turkeys are about and are too shy to call, which often occurs late in the season, we come the old hen on them, and most likely the bird will come, unless it be the old hen herself; as to that we cannot say. The mother turkey's call will generally bring the answer, and is the best to start a stray youngster to yelping, or will even make the father of the flock come to bag. We would advise "Kookk," or any one else so inclined, to visit the turkey hen and learn. She may now and then utter a note, which is a bold, metallic ring, that family yell and listen to her plaintive note. If a wild bird is not at hand, or to be tame sisters and cousins and aunts, and have your farmer friend scare the flock badly, and you will hear the mother's note. She knows how to do it as well as her timid relative of the woods. It is made up of two or three long, fine, plaintive whistles, finished up with two or more coarser notes. Turkeys do not, however, always call alike, and there is as great a difference in their voices as in the voices of men. Sometimes the sound is cracked and grating, sometimes it is a bold, metallic ring, and sometimes it is quite subdued. We have heard them give from one to a great many yelps. Times, circumstances, flocks and individuals differ widely, and the hunter must, if he wants to bag the bird, come down to his wits.

Sometimes a flock can be walked into and the birds do not seem surprised very much—they even appear in no hurry to get away, but they do get away pretty quick, anyhow. A flock of turkeys, knowing that they are pursued by either dog or man, will generally run some distance, and not fly, unless forced to do so, and if they do fly they will nearly all take the same or nearly the same course, and no calling, however good, will bring them back. If one bird should get astray, that one may be called in; if a flock is surprised and quickly scattered in all directions, they may be called back; in fact, some of the birds will come back without being called at all. It is next to impossible to call up a turkey after he has seen the hunter; therefore the hunter should be well hidden and not move until he is sure he has the bird near enough to make his shot. We hunt turkeys with a "valley dog." Our dog gives no tongue until she gets into the midst of the flock. She leaves none upon the ground, and usually, when she is done with them, they are well scattered, and some of them can be called in and bagged. Sometimes a number of birds will take to the trees; we would prefer that they would not, as they are hard to approach, and will certainly see us, which lessens our chance of making a good bag. Sometimes one or more of the treed birds will see the hunter make his blind, and then the call made this bird will sing out, "Pee, pee, pee," very low and somewhat long drawn, and as long as that bird is there none of the rest will move or utter a sound in reply to the hunter's call; and even after the fellow has been driven off or shot the chances for bagging a turkey out of that flock, for the time being, are slim. When a flock is scattered we secure the dog and hide ourselves and dog where the dog struck the birds as near as we can tell. When everything is quieted down we try the old hen's call very cautiously; by and bye she may, until we either get a reply or convince us that no game is coming. In the latter case we get the dog to stir them up again, if possible. If not found we try the next best new ground and new flocks.

We have failed many a time, and always promised to do better next time; we have, however, brought to bag four or five at one sitting and out of one flock, and we think that glory enough for one day—and turkey enough, too. Noise does not seem to affect turkeys, but the sight of men or dog makes them uneasy. Tobacco smoke arouses their suspicion, and they can see a black coat or hat quicker than any other garment worn by man. They can carry off more shot than most men would imagine possible, and unless the head or neck is riddled they will get away with a handful of shot. We use No. 4 shot, and find it to answer the purpose well. We hunt turkeys on high ground, not on the tops of the mountains, but just below the tops. We sometimes meet them upon flat or low ground. They do sometimes come down to the fields to feed, but they come with their eyes open, and seldom lose any of their number. They are a wary bird.

We think turkey hunting fine sport, and have never seen any one who was not well pleased after a day among the turkeys, when things were done according to instructions and no blunders made. We have never baited turkeys with the purpose of killing them. We have never hunted them in spring, when all good turkeys should be hunting a mate and housekeeping, and all good sportsmen should let them alone. No game should be hunted between January 1 and September 1. C. X.

SARDIS, Miss., Sept. 4.—I notice "Kookk" in this week's issue asks how to call turkeys. From his letter it is my opinion that he gets a little excited and calls too fast and loud, which was for a long time my fault. I have often been squirrel hunting in the creek-bottoms of Carroll and Benton counties, Tennessee, where I would flush a fine dove of turkeys. After waiting a reasonable length of time I would

build me a blind of old chunks of logs and brush, and with caller I began to fool the poor creatures, but the fooling would not last long because at about the second or third answer my excitement would be at such a pitch that I would strain myself to bring them just a little faster, and consequently would "yelp" too long and frequently, and scare the turkeys off. But I have found that a turkey is not at all easily deceived—at least such has been my experience.

My way now is when I scatter or flush a dove, I first get there and separate, then call, my blind not far from where I flushed them, to wait about forty-five minutes or an hour, and then call slow and low, and with not more than three or four "yelps." When I get an "answer" I keep perfectly composed, and am fully ready for an emergency. The next time I call I am careful not to make the note too loud or frequent. A turkey has a splendid ear.

When the turkey gets within 200 or 300 yards he gradually stops calling, and reconnoiters for danger, especially if he is an old gobbler, and he is just as apt to put in an appearance on the opposite side from that expected as otherwise. This is the time to hold your piece of horn or some away from your mouth, and not try to call, for if you do, nine times in ten you lose your chance for a better turkey. Now is the critical moment, but if you are bound to call or die from impatience, call just twice and loud enough to be heard about forty yards, but it is much the most sure to keep silent. If the turkey is not assured that it is one of his companions he will come up through curiosity to see what you are. I have had old gobblers in the spring come within 100 yards of me, and get behind a log or large tree, and then wait and gobble for half or three-quarters of an hour, but I had "been there before," and it was only a question of time as to who could hold out the longest, I or he, and every time the turkey comes to roost. In the winter and fall you don't have to be near so cautious, as most of the turkeys are young and do not understand the "traps" as their long-bearded forefathers do.

I think if "Kookk" will try my plan he will have better success. I will, if he wishes, explain how to make a "caller" that will be person with a little practice can fool the smartest old gobbler in the woods with.

W. H. C.

A BADLY SCARED MAN.

CAPTAINS—now of Canada, late of H. M. Service, who is the most orthodox and conventional of British sportsmen, is in the habit of coming South every year for the quail shooting and is fond of relating his first day's experience in Virginia.

The Captain's host, being particularly anxious to insure him sport of the best, with warning that he was going to take him into a back country where some of the social amenities would have to be sacrificed for the sake of unusually excellent shooting, landed him on a bright November morning in a back country, and had a goodly number of local sportsmen well, if somewhat rudely, armed assembled to do the sporting honors of the neighborhood.

The Captain, though an excellent sportsman, was of that strictly conventional order so often found in the mother-country that like to follow the sports of the field under certain conditions fixed in his own mind, or not at all. His boots must be of a certain description, or they hurt him to wear in, and consequently put him off his shooting. His party must be the very best—no number is absurd. He must be on a particular side of the line, or he cannot shoot. If a companion, who does not know any better or from a spirit of mischief, cuts down a bird in front of him, he is deeply shocked and scandalized—a heinous crime that can never be forgiven. So, when he found himself bestriding a Mexican saddle on top of a mule and going along at a shuffling canter, with six other sportsmen kicking up the dust with all sorts of gait and upon all sorts of quadrupeds, did he not rustle and nod (to him) suspiciously, like-looking garments, with powder-horns and shot flasks tucked in his belt, he never recollected to have seen before of old armories and curiosity shops, he felt and looked a miserable man, and could not for the life of him reconcile such crude surroundings with "true sport." Everybody did his best to make him feel at home, as Virginians of all classes always do; but the Captain, having been in a quiet infantry regiment and a non-hunting man, was in agonies upon such a saddle and such a beast.

Some of the sportsmen, who had met together to do honor to the stranger's visit, had not handled their rusty old muzzler-loaders for two or three years. Others were not professed sportsmen at all, or, at best, turkey and squirrel men, and brought, in all good faith and in the highest spirits, the most awful blunderbusses to the fray, with a vague intention of having a frolic and a good time generally. The dogs, too, though each individually excellent—far more excellent, in fact, than they looked to the orthodox Captain—were apt, in consequence of their long idleness, to be so nervous and so prone to transform themselves at a moment's notice into bounds or "possum dogs, when they thought that the occasion demanded independence of action.

This was nothing, however, according to the Captain, to the shooting. He declares that at no time during the day at Inkerman and the Alma, in both of which engagements he conducted himself gallantly, was he in one-half the danger that he was upon this memorable occasion. He says his horse, or rather his mule, was so nervous that he could not get on his feet until he had been perhaps the correct term—for the noble charger left the Captain upon the ground, as I used for home with the deliberation and accuracy that only a mule, charged with a load of "pure cussedness" and half an ounce of No. 6 shot, can do.

The roar of musketry that followed the closing up of the column on a devoted covey resounded in his ears for three weeks after the day was over.

By two o'clock two dogs had fallen, one badly and the other slightly wounded; and a negro boy had been shot twice—both times, fortunately, in the head. The Captain so far had not fired off his gun, as there was no such thing as outside and inside the line, and he had been so engrossingly occupied with ducking and dodging the leaden hail, which he declares fairly filled the air, that so far out of the forty birds (for there were some really good shots out) that had found their way into the bag he could claim none.

He thought he was getting used to it, and would soon be able, with luck, to get on a bird when a stray quail got behind him, was fired at by his next neighbor, who wheeled around for the purpose in utter disregard of sportsman's rule six who, with his back to the gun but in a straight line with the bird, was tying his shoe against a fence about fifty yards off. A violent rubbing of the back of the head and a torrent of unparliamentary language from the said number six, was the only result of the shot. The shooter in the meantime, with his hand over his eyes, still marking the

sounding bird, quietly observed: "All right, old fellow; I saw you had your back turned toward me when I fired!" The complete absence of natural custom appeared to the Captain to be here distinctly indicated, and put a finishing touch to his already agitated nerves. The rest of the day he devoted to keeping as near out of shot as common decency would allow, and in the morning was seized with a sudden indisposition that compelled a return to his host's house. "The Capt'n's a right good fellah," observed one of that famous party to a friend of mine, who was himself hunting in the neighborhood the following year; "but, dorgoned, if you can get him within a hundred yards of the dogs to save your life."

FOREST AND STREAM GAME TABLE.

OPEN SEASONS.

The seasons in which it is lawful to shoot game in the several States and Territories, open as designated in the following table:

| State. | Deer. | Woodcock. | Quail. | Partridge (Prairie or Ch.) | Wild Turkey. |
|---------|-----------|-----------|-----------|----------------------------|--------------|
| Ala. | Oct. 20. | Sept. 15. | Sept. 15. | Oct. 1. | Oct. 20. |
| Cal. | July 1. | Sept. 15. | Sept. 15. | Sept. 15. | Sept. 15. |
| Col. | Sept. 1. | Prohd. | Oct. 1. | Oct. 1. | Prohd. |
| Conn. | Oct. 1. | Oct. 1. | Oct. 1. | Sept. 1. | Prohd. |
| Del. | July 1. | Nov. 1. | Nov. 1. | Sept. 1. | Sept. 1. |
| D. C. | Aug. 15. | Nov. 1. | Nov. 1. | Sept. 1. | Sept. 1. |
| Fla. | Oct. 1. | Oct. 15. | Sept. 1. | Oct. 1. | Oct. 1. |
| Idaho. | Aug. 1. | Sept. 1. | Sept. 1. | Aug. 1. | Sept. 1. |
| Ill. | Sept. 1. | July 4. | Oct. 1. | Oct. 1. | Aug. 15. |
| Ind. | Oct. 1. | July 1. | Oct. 15. | Sept. 1. | Nov. 1. |
| Iowa. | Sept. 1. | July 20. | Oct. 1. | Oct. 1. | Aug. 15. |
| Kan. | Sept. 1. | July 1. | Sept. 1. | Sept. 1. | Sept. 1. |
| La. | Aug. 1. | Sept. 1. | Sept. 15. | Sept. 1. | Sept. 1. |
| Mass. | Nov. 1. | Sept. 1. | 1883 | Sept. 1. | Sept. 1. |
| Mich. | Oct. 1. | Aug. 1. | Nov. 1. | Sept. 1. | 1882 |
| Minn. | Nov. 1. | July 4. | Nov. 1. | Sept. 1. | Sept. 1. |
| Miss. | Oct. 1. | Sept. 1. | Sept. 1. | Sept. 1. | Sept. 15. |
| Mo. | Sept. 1. | July 1. | Oct. 15. | Oct. 1. | Sept. 15. |
| Mont. | Oct. 1. | Sept. 1. | Aug. 15. | Aug. 15. | Oct. 1. |
| Nebr. | Oct. 1. | Sept. 1. | Sept. 1. | Sept. 1. | Sept. 1. |
| Nev. | Aug. 1. | Sept. 1. | Sept. 1. | Aug. 1. | Sept. 1. |
| N. H. | Sept. 1. | Aug. 1. | Sept. 1. | Sept. 1. | Sept. 1. |
| N. J. | Sept. 1. | Aug. 1. | Sept. 1. | Sept. 1. | Sept. 1. |
| N. Mex. | Sept. 1. | Aug. 1. | Sept. 1. | Sept. 1. | Sept. 1. |
| N. Y. | Aug. 1. | Sept. 1. | Sept. 1. | Sept. 1. | Sept. 1. |
| N. C. | Aug. 15. | Oct. 1. | Oct. 1. | Oct. 1. | Oct. 1. |
| Ohio. | Oct. 15. | July 4. | Nov. 1. | Sept. 1. | Nov. 1. |
| Pa. | Oct. 1. | July 4. | Oct. 15. | Oct. 1. | Sept. 1. |
| R. I. | Sept. 1. | Sept. 1. | Sept. 1. | Sept. 1. | Sept. 1. |
| S. C. | Aug. 1. | Sept. 15. | Sept. 15. | Sept. 15. | Sept. 15. |
| Texas. | Aug. 1. | Sept. 1. | Sept. 1. | July 1. | July 1. |
| Vt. | Sept. 1. | Sept. 1. | Sept. 1. | Sept. 1. | Sept. 1. |
| Wa. | Sept. 1. | July 1. | Nov. 1. | Aug. 1. | Oct. 15. |
| W. Va. | Aug. 1. | Sept. 1. | Sept. 1. | Sept. 1. | Sept. 1. |
| Wis. | Sept. 15. | July 10. | Aug. 1. | Aug. 15. | Aug. 15. |
| Wyo. | Aug. 15. | Sept. 1. | Sept. 1. | Sept. 1. | Sept. 1. |

Antelope.—Col., Sept. 1; Idaho, Aug. 1; Neb., Oct. 1; Nev., Aug. 1; N. Mex., Sept. 1; Utah, Aug. 1; Wyo., Aug. 15.
Cariboo.—Col., Oct. 1; N. H., Sept. 1.
Quail.—Ala., Aug. 1; Cal., July 1; Ga., Oct. 1; Kan., Aug. 1; Miss., Sept. 1; Mo., Aug. 1; N. C., Oct. 1; N. H., Sept. 1; N. J., Oct. 1; N. Mex., Sept. 1; Ohio, Aug. 1; Pa., Sept. 1; S. C., Sept. 1; Va., Sept. 1; W. Va., July 1; Wis., Sept. 15; Wyo., Aug. 15.
Partridge.—Col., Sept. 1; Idaho, Aug. 1; Minn., Nov. 1; Neb., Oct. 1; Nev., Aug. 1; N. Mex., Sept. 1; Ore., July 1; Utah, Aug. 1; Wyo., Aug. 15.
Woodcock.—Col., Oct. 1; N. H., Sept. 1; Ore., July 1.
Wild Turkey.—Cal., Sept. 1; Mich., Sept. 1; Mo., Aug. 1; Nev., Sept. 1; N. H., Aug. 1; Pa., July 1; R. I., Aug. 1.
Wildcat.—Del., Sept. 1; N. C., Sept. 1; N. J., Aug. 25; Pa., Sept. 1; S. C., Sept. 1; Va., Sept. 1; W. Va., Sept. 1; Wis., Sept. 1; N. C., Oct. 15.

* In these States there are special county laws. a The deer law applies to sale or possession. b Wildcat not protected on the coast. c In Upper Peninsula deer season opens Aug. 15. d California quail prohibited to hunt. e Deer season opens Aug. 1. f Moose and Cariboo, Sept. 1. g First open woodcock season began July 1; will close Aug. 1. h Quail shooting prohibited to Nov. 1, 1882. In counties of Montgomery, Schoharie, Saratoga and Albany. Wildcat season in Long Island waters opens Oct. 1. h Deer law relates to female deer only.

ARE THEY MONOPOLIES?

BRIDGEPORT, Conn., Sept. 10.

Editor Forest and Stream:

The question at issue seems to be conveniently pushed aside by the sportsmen of the opposition, and they have raved about railroads, potatoes, etc., etc., as if they had something or other to do with shooting ducks. I simply mentioned railroads in connection with the general tendency of mankind toward monopoly and oppression, but they have no part nor lot in this discussion.

So far, not a solid argument has been used by them; but that modest little organization, the seventy-mile club, has not been heard from yet. Perhaps they will think of something that will utterly convert your humble servant into a "smut-thrasher." I alluded at the opening of this "confutation" that they had the legal right to deprive their brother sportsmen of any share in the pleasures of the field—if they had money enough to accomplish their purpose; but I also have the right to oppose them, and I will, but I mean to do it decently, and not get mad and throw potatoes and ugly epithets, for that would only prove that I had no arguments.

One wicked man calls me a communistic case, or words to that effect, and says: "Let everything be in common, and thus ruin it all." The worst state of barbarism and confusion." Now, that's good! But I'm afraid it was "wrote sarcastic," for that state of barbarism to which he wishes to return is just what we had till the monopolists began their work (though I never saw any "confusion"), and its just what we ought to return to with some modifications. "X" of Cleveland, says: "There are hundreds of such clubs established all over the United States and Canada by the best of men and for the best of purposes—the protection and preservation of game, etc."

"If these humane sportsmen preserve it after it is dead; and if they protect it, all they protect it from others so that they may have the exclusive privilege of killing it. All endeavors to suppress illegal shooting will meet a hearty response from every one, but not one of these men would raise a finger in that direction except in their own interests. Their motto is: "Protection and preservation of game for our exclusive benefit."

They have a game law in Connecticut, and it permits woodcock shooting from October 1, to any time in my travels through the State this summer, I was told that lawless

loaders had been shooting them all over the State since the 1st of July, and not a person cares or dares to stop them. It is much worse than no law, but it's the very thing these rascals advocate for it gives them all the birds. It is pretty well settled that no one but a paid game constable will arrest a man for illegal shooting, and these game clubs are no exception to this rule, except on their own domains.

My antipathy to game clubs is based on their selfishness. They are not content to buy up enough for their purposes, but they want to prevent all other sportsmen from ever having a day's shooting. There are never many members of any club on the grounds at a time, yet they claim jurisdiction over miles upon miles of shooting-ground. My hostility to market-shooters is as great as theirs, and if I had it in my power I would prevent any one from making a business of what ought to be an occasional pleasure. A market-shooter is usually too lazy to work, and is next thing to a vagrant. There is where the destruction of game comes in; and in looking after them, these clubs could find ample scope for their anxiety to preserve and protect game without owning the country for miles around them.

It is generally conceded that to be a Christian or a gentleman, it is necessary to believe in the "Golden Rule." Are the advocates of monopoly ready to say the Golden Rule is all both? Some of the "best of men" are sportsmen, outside the clubs as well as in them, but the clubs have the money and can snap their fingers at them and ask, "What are you going to do about it?" I furnished them at the start with their only available argument: "We have the right to buy what we please and to do what we please with it."

WILD RICE.

Pont IOWA, Ont., Sept. 10.

Editor Forest and Stream:

I see in your issue of September 1st an article by "Lutron" in which he speaks of my rice as being of the small kind. The rice of which I wrote in my letter of the 18th had not fully matured when I pulled it; it had but a very faint sign of a head, and would have grown two or more feet in length. Although the bed from which I pulled the stalk was growing in water six feet or more in depth, yet in the bays and some of the lake beds it grows in less than the same number of inches of water. All the rice in this lake grows from two to six feet above the surface. Right here allow me to state a fact: I never yet saw rice bear seed where the water had gone down to such an extent as to leave the roots dry; it would have a large and apparently well filled head, but upon feeling it you would find the seed vessel had never filled up, and that there was in fact no seed. I have seen places where the mud to the depth of three or more inches had from some cause risen to the surface, bringing the rice bodily and erect with it. In a case of this kind the seed would be good and the stalks large and strong.

Mr. W. F. Whiteley, Commissioner of Fisheries, wrote to me Sept. 5th of some seed—about fifty bushels—he got from me last fall. The following is an extract: "It (the rice) has since appeared very thick and high. I expect a fine crop if the water does not fall too low." The sample of rice I sent you last fall was very plump and large. I have had some samples of Wisconsin, Minnesota and Michigan seed, yet none were to be compared to Rice Lake seed.

Most of those desiring rice wait until it is too late in the field to sow it, and have to wait for spring. It will grow even if planted then, yet Mr. Whiteley and others besides myself have proved by experiments that it is not so sure a crop as it would be if fall planted. To give it a fair chance, at least several bushels should be planted in the fall, and where it comes to the surface and heads up, game geese and blackbirds will feed upon it, and if only a small quantity has been planted they are almost sure to clean it out. If a larger amount has been sown it gets a chance to sow itself, and once it does that success is assured.

By to-day's mail I send you a sample of rice stalk pulled before it was matured, yet it is very large and has several stalks growing from one root. I also send you sample of new seed, some of which is full one inch in length and very plump. CHAS. GILCHRIST, Fishery Inspector.

A WILD BUCK IN THE CITY OF VICKSBURG.

IN 1874 I was residing in the city of Vicksburg, Miss., not far from the business centre of the town. The rear of my premises looked out upon the shops of the V. & M. R. R., a couple of hundred yards distant, with an intervening common and a pond.

One morning before breakfast, when in my back yard, I heard a hue and cry over toward the Wild duck pond. I heard workmen, with banners, axes and other tools, in pursuit of something, which I supposed to be a fugitive thief or malefactor of some kind. I saw at the same moment a splash in the pond and then the antlers of a buck above the water. The deer swam through the pond and climbed the steep bank on my side, the men running around. I ran into the house and seized my gun, a muzzle-loader, which had been standing some time, loaded with No. 8 shot. When I came out the deer had gone over a spur, down into a small hollow and was making his way over a few bushes in the direction of a Rectory, on Cherry street, one of the principal thoroughfares of the town. The rector, Dr. Lord, was in his gallery, in his slippers, reading the morning paper, and was very much astonished at the spectacle. The deer, being very much exhausted, was cornered by his pursuers and I, taking up a close position, snapped both barrels behind his ear. I then took a pistol out of the hand of a negro and shot the buck in the forehead, but his nose being elevated the bullet glanced over without entering the skull. He was then struck on the head with an axe and tumbled on the ground. The man who had shot me then claimed the carcass, as he had run through their shop, and they had found him. I claimed the horns, which I have yet—a very pretty pair.

It seems the deer had been run by hunters out of Big Black Swamp, some twelve miles distant, and got bewildered in the suburbs of the town in an exhausted condition, having been pursued all night by hounds.

MARQUERRE.

MANITOBA GAME NOTES.—TORONTO, Sept. 10.—Seeing your recent note on game in Manitoba I send you this letter from Winnipeg, written to the *Globe* of this city under date of Aug. 24: "We saw occasional covys of prairie chicken over the whole route, and from information received from settlers have no doubt they are very plentiful; but at this

season the old birds are very careful to keep their young hidden in the long grass. A dog is necessary to insure successful sport, but the sportsman will need to be careful to look to the condition of the animal every night, as the wild turkey" sticks to the coat and, unless removed, draws lice into the flesh and eventually leads to death. Ducks are plentiful wherever there is water. Every pond and little lake we passed swarmed with them, principally mallards and gray ducks. There were, too, black ducks and blue-winged teal of all ages and sizes, from the full-grown ones down to the flappers and the little fellows in their "yellow fluff" but a day or two out of the shell. We could quite understand what a settler would have thought if he could not look a duck in the face. Plover of all kinds and snipe also about in places, and in the autumn this must be the sportsman's paradise. A few moose are found in the Pembina Mountains, some of very large size. Elk are more plentiful. At Mountain City we saw the heads of two which were shot last winter within a mile of that place, the horns of one being nearly five feet long. At Pembina Crossing we were told of eighteen having been shot there last winter, and of three having crossed in sight of the stopping place on the morning of the day of our arrival. There were no deer, but we saw both wolves and foxes, one of the former on the banks of the Pembina, not three miles from Brandon. Geese, sand-hill cranes (of which we saw a couple of dozen), and pelicans make up the list of the game which came under our notice."

THE SATURDAY CLUB EATS VENISON.—LAST December, Dr. Theophilus Parvin, of Indianapolis, who is an intimate friend of Dr. Oliver Wendell Holmes, sent to the latter a saddle of venison. The characteristic reply from the poet was as follows:

BOSTON, Dec. 28.

My Dear Dr. Parvin:

The venison arrived in perfect order. I suppose that Mrs. Holmes and myself could have feasted on it for a month and found ourselves in good condition at the end of it. But I felt a solemn responsibility in the disposition of such a momentous piece of game, and I thought the best thing I could do was to have it served up at the meeting of our "Saturday Club," which took place yesterday. The club, which included members for more than twenty years, was included, and still includes, many whose names you know. In fact, it has counted so many distinguished persons that I am perhaps a little proud in mentioning the names of those whom we have met or still meet in the large club room at "Parke's"—Agassiz, Longfellow, Hawthorne, Emerson, Lowell, Sumner, Gov. Andrew, Motley, Chief Justice Gray, Judge Hoar (formerly 4 Torrey-General of the United States), Prof. Fiske (Dean of the Coast Survey, etc.), President Eliot, Alexander Agassiz, Francis Parkman (historian), Howells, William Hunt (painter), Asa Gray. Is not that a remarkable list? Some, as you know, are dead. Emerson is too old and forgetful to come; Lowell is Minister to England, and so on, but we had President Eliot, Francis Parkman, Judge Hoar, Alexander Agassiz, Prof. Norton, Gibbs and Gurnay, and other persons of name and note less widely known than some of these. I introduced the venison in a very brief speech, telling you sent it and where it came from. Very soon the blazers (or blazes—I can't find the word in my dictionary) were all around the table. Then came a remarkable silence, each diner being occupied with his volcano for a while, and then with the product of his culinary art. Well, the venison was voted more than excellent. I should say it was the best I ever tasted. The company drank your health with great enthusiasm and loud applause, and I felt that I could not have done better in the disposition of your most acceptable gift. For my own part, I beg you to accept my very sincere thanks, and to assure you of the great pleasure you have afforded me by your kindness which enabled me to extend to others. Believe me, my dear sir, very truly yours, O. W. HOLMES.

WISCONSIN DEER SLAUGHTERED THE YEAR AROUND.—CHICAGO.—I HAVE JUST RETURNED from a two-months' trip through Wisconsin and Michigan, and I was greatly surprised to find that in some parts of the former State the game laws were entirely ignored and openly violated. The open season for deer commences Sept. 15 in Wisconsin, and I can not claim knowledge of deer being slaughtered by the hundreds during, say, the months of July and August of this year. Deer meat is set on hand the year around at the butcher's shop in Poshigo, Wis., and the citizens of the latter place are never happy except when they are butchering fawns and does out of season. Their plan of shooting is to go out in large parties, accompanied with a score of hounds, and set the dogs on a fresh deer trail. If they are lucky, and they generally are, they run the deer to the river, where pickets are established, and when the deer attempt to swim, they are shot, a volley from his rifle, and you have afforded me by your kindness which enabled me to extend to others. Believe me, my dear sir, very truly yours, O. W. HOLMES.

ILLINOIS GAME NOTES.—QUINEY, Illinois, Sept. 4.—A few days ago, my friend H. S. and I went to Bay Island, a few miles above here, after woodcock; had only about three hours' shooting, and bagged seventeen woodcock, besides three blue wings. We had very high water the morning of the 4th, and the ducks were washed up high on the shores of the rivers, lakes, etc., and were covered with a fine growth of grass which last summer we had yards upon yards of pasty mud to go before we came to the water's edge. This made fine woodcock ground. The birds are plenty, but most of the shots are snap shots, as the birds have but a few yards to go before entering the tall weeds from ten to twelve feet high, resembling a real old-fashioned canebrake. The fall shooting near here will be unusually fine, consisting of quail, prairie chickens, ducks, geese, etc. We also look for good spring snipe shooting, but the swim across the marsh will be better. The outlook is even better, especially for fall shooting, including turkey. We are going over there chicken shooting as soon as business permits.—J. A. B.

HIGH SCORES.—CHESTER, Pa., September 11.—Inclosed you will find the score of birds killed for the week ending September 11, 1891, which I think is good:—Sept. 4, B. Harris, 52; C. Goff, 45; Ike Rothwell, 43. Sept. 5, P. Allen, 45; C. Goff, 47; Harris, 34; Drisket, 23; D. Brown, 23; Sept. 6, B. Rump, 23; C. Goff, 47; B. Harris, 41; Rothwell, 33. Sept. 7, Allen, 33; Harris, 48; Rump, 55; S. Preston, 23; C. Goff, 36; D. Brown, 31. Sept. 8, B. Rump, 59; S. Preston, 63; P. Allen, 30; J. Rothwell, 51; B. Harris,

39; D. Brown, 27; J. Miller, 33; B. E. Brickett, 95; E. Rump, 31. Sept. 9. D. Brown, 35; S. Preston, 45; B. Rump, 31; S. Brown, 53; J. Rothwell, 58; C. Goff, 31; N. Rump, 52; J. Miller, 40; B. Harris, 41; J. Hawks, 107. Sept. 10. J. Rothwell, 31; B. Harris, 44; Barlestone, 57; P. Brown, 35; S. Preston, 35; B. Rump, 40; C. Goff, 49; J. Preston, 35; N. Rump, 43; S. Brown, 49; J. Miller, 31.

JOHN GORF.

AUDUBON GUN CLUB.—The annual meeting of the Audubon Gun Club, for the election of officers for the ensuing year, was held last Monday evening at their club rooms, 31 Moffat street, Brooklyn. The following officers were elected: President, Robert T. Smith; Vice-President, J. Scharf; Secretary, Henry Pier; Treasurer, Frank A. Gehring. The club also held their twelfth monthly and final competitive contest for the club medal last Thursday, at Newtown, L. I. Twelve members participated in the match, which, toward the finish, grew quite exciting, from the fact that a tie shot took place between three members, of whom two, Messrs. P. Post and R. T. Sabiu, had each won the medal three times during the year. Finally, after four ties had been shot off, Mr. Post won the medal.—*LA GAZ.*

THE SCARCITY OF BAY SNIPES.—Your correspondent "L," in issue, Sept. 8, wishes observations on the growing scarcity of bay snipe and plover. Each succeeding year for the past twenty-five years has shown a decrease, and the past ten years the decrease has been very rapid. Spring shooting and breech loaders are especially to blame, but egging at Cobb's Island, "writing up" shooting resorts by hotel keepers and enthusiastic amateurs, who "give away" the places dear to sportsmen, establishing wintering places along the coast and shooting by the coast. Life-saving crews are the principal causes of the diminished number of bay birds. Men and boys tramping about the meadows and sand-bars instead of shooting from ambush, also tend to frighten the birds from our shores.—*CREWEL.*

GENERAL SHERIDAN'S PARTY.—CHICAGO, Sept. 10.—General Phil Sheridan and party, consisting of General Strong, Colonel M. V. Sheridan, Colonel Gregory, Edwin B. Sheldon, and Inspector-General Sackett, of this city, returned last Tuesday from a big hunt and exploring expedition, which extended through Wyoming, Montana, and Idaho. The party's line of travel was through the Black Hills, then over the Snow Mountains, and then down to the Yellowstone National Park. The country traveled through was full of game, and all the elk, antelope, bear and small game were abundant, and they could make use of General Sheridan reports the streams well stocked with trout. Ducks and chickens are very numerous here at present.—*"TEN DORZ."*

IN THE DAYS OF MUZZLE-LOADERS many ludicrous mistakes in loading were made when the abundance of game prompted to haste. Our correspondent "Dell" tells of such an experience: "In my frantic haste I got both loads of powder in one barrel and both loads of shot in the other. An old gander would come directly over my head, about ten feet above, and I took careful aim, and the result was a singed goose, but he got away, minus nearly all his feathers. The next shot was a double, and, as it was imagined, I stood drawing the shot from my left barrel with a look of mortification on my face, for the larger one of the pair raised a short, startled "honk," and winked one eye at me as he soared but a few feet above my crazy head.

THE HACKENSACK RAIL SEASON.—New York, Sept. 8.—I notice in your correspondent's account of rail shooting on the Hackensack that he states that rail are not so plenty as last season. Have been out every first day for the last ten years and never saw rail so plenty as on the opening day of this season. We only pushed over a little bit of the ground and most of it had been shot over. I brought in forty-five birds that day and since then larger bags have been made.—*W. HOLBERTON.*

"LEFT-EYED SHOOTING."—Will you be kind enough to "invidious" to inform him that, if he will try the experiment he has mentioned with his left hand, he will find himself "right-eyed" according to his theory. Evidently he used his right hand last time, which made him "left-eyed." As he can thus prove himself to be both "right-eyed" and "left-eyed," he must blame the gun or the game for his bad shooting. I believe it is always safest to blame the gun or the charge.—*D. (Girardville, Pa.)*

DUCKS IN SULLIVAN COUNTY.—Wild ducks, such as wood ducks and black ducks, are here in great numbers. I have never known them so plenty before. Some good shooting can now be had, and here is the place—via Erie Railroad to Shohola Station. My house is six miles from Shohola, and I will meet all parties on appointment. Address J. M. Bradley, Eldred, Sullivan County, N. Y. I have boats, dogs and guides.

VERMONT WOODCOCK.—East Townshend, Vt.—A part of our grounds are well stocked with the woodcock, and I think I am the only one that knows what they are. Ruffed grouse are thick, and up to the present time are not wild and the flocks are not broken up any. Ducks are not plenty, but there is a flock now right in front of my window of fourteen head, and full grown.—*H. T. E.*

KENTUCKY GAME NOTES.—Mt. Sterling, Ky., Sept. 9.—Parties are plenty. The best hunting full-grown and strong, the second hatching still gray, but doing finely. There is a numerous second crop, it having been dry and nothing to prevent full broods. The hawk bounty has been a blessed success, so this fall let every club offer a bounty, and we can have many more birds to put in bag.—*VAN A.*

WOODCOCK IN PENNSYLVANIA.—A Philadelphia correspondent reports that the spriny swarms of Lehigh County, Pa., were taken possession of this year for honskeeping purposes by a greater number of woodcock than ever was known before. Just before cold weather will be the time to catch these fellows in that section of the country. Ruffed grouse may be come across on nearly the same grounds at the same time.

AMERICAN QUAIL IN ENGLAND.—Several attempts have been made to introduce "Bob White" into England, several thousands of the birds having been at different times imported into that country. All of these importations were unsuccessful.

We have received from Mr. J. Page Fisher, 112 N. 12th street, Philadelphia, a copy of his "Pocket Edition of the Game Laws of New York, New Jersey, Pennsylvania, Delaware and Maryland."

NEWPORT NOTES.—Newport, R. I., Sept. 5.—Plover, rail and some snipe are shot on the marsh every morning. Black-fish, bass and bluefish are the principal fish sought for, and good catches are made every day from the piers, rocks and boats.

Ice water is rendered harmless and more refreshing with Hop Bitters in each drop.

For Dog Collars and Dog supplies of every description go to C. L. Kitzmann, 918 Broadway, New York.—*Ad.*

Sea and River Fishing.

FISH IN SEASON IN SEPTEMBER.

FRESH WATER.
 Grayling, *Thymallus tricolor* and *T. maculatus*.
 Black Bass, *Morone americana* and *M. chrysops*.
 Muskellunge, *Esox sabulosus*.
 Pickerel, *Esox reticulatus*.
 Pike or Pickerel, *Esox lucius*.
 Pike-perch (Whitefish) (pike) *Stizostedion americanum*, *S. griseum*, etc.

SALT WATER.
 Striped Bass, *Centropomus virgatus*.
 Sea Bass or Rockfish, *Urophycis regia*.
 Yellow Perch, *Perca americana*.
 Bluefish or Taylor, *Pomatomus saltatrix*.
 Scup or Porpie, *Stenotomus argyrops*.
 Pollack, *Pelachius carbonarius*.
 Tautog or Blackfish, *Tautoga onitis*.
 Spanish Mackerel, *Cybinus maculatus*.

FRESH WATER.
 Yellow Perch, *Perca flavescens*.
 Striped Bass, *Morone chrysops*.
 White Bass, *Morone americana*.
 Rock Bass, *Ambloplites*. (Two species).
 Warmouth, *Chromobrytus gulosus*.
 Crappie, *Pomoxys nigromaculatus*.
 Bluegill, *Lepomis macrochirus*.
 Chub, *Semotilus corporalis*.

AN ANGLING DAY.
 A LONG by the banks of a rushing river;
 Alone, alone, with the birds and daisies;
 The birds that sing,
 And the daisies that smile,
 From the mountain's side,
 Bring the soul to beguile,
 That such things may be forever.

Alone by the banks of a rushing river;
 Alone, alone, with the past and nature;
 The sunbeams that dance
 From the mountain's wall,
 And the shades that fall
 In the day's advance,
 Tell that such joys can't last forever.

W. H. HASBROCK.

AN ICTHYOPHAGIST COMES TO GRIEF.

ONE of the most daring of the Ichthyophagis Mr. Thomas J. Murray, Steward of Glen Island. He dives into the water (this is a figure of speech, as A. Ward would say) and, if he does not pluck up drowned honor by the locks, he at least brings up things most strange to himself; for he it known, and not at all to his disgrace, that the accomplished caterer of this famous summer resort, with his great interest in the fish-eating club with the hard name, is no zoologist. We have enbathed in our columns how he has dared to experiment with the despised starfish, and pronounces them excellent in a lisque of his own making. And now we record what we are glad has not turned out a tragedy, although every morning we are prepared to read in the daily papers that the Coroner's jury have decided that Mr. Murray came to his death by eating of some fiendish and diabolical marine monster, whose name and habits are unknown to the said jury. The facts are these. Last week we received a letter as follows:

"STAIR'S GLEN ISLAND, Sept. 10.
 "To the Scientist of the Ichthyophagists Club:
 "I am in trouble at last through my propensity to experiment with the unknown inhabitants of the vasy deep. I inclosed you a shell or outer habiliment of the individual which made this trouble. I don't know the name of it, but presume that it is familiar to you. I made a stew of the mollusk who wore this silyony overcoat, and I ate the stew. Then began the trouble alluded to. Shell-bearing mollusks, I need not tell you, are not known for the swiftness of their movements in life; but the way that stew 'traveled' was marvelous. What in thunder is it?
 T. J. MURRAY."

The shell in question is one commonly found on the outside of oysters, scallops and other shells. It is a nivalve and is known to science as *Crepidula fornicata*, and the children who pick up the empty shells along shore call them "boat shells" or "lady slippers," on account of the transverse partition in the middle. We are greatly pleased to know that the daring experimenter has met with nothing worse than what might be called "dissolving views" in his researches after the eatable among the neglected mollusks of our coast.

FISHING NEAR NEW ORLEANS.

A WRITER in the New Orleans Democrat says that the fish-are coming in now. That salt water fish come into Lake Pontchartrain freely because of the absence of Mississippi river water to freshen it. He says: "Since the low water in the river and the cessation of the flow of water through Bonnet Carre Creek, the increase in the number of fish in Lake Pontchartrain has been tenfold. The water in the lake is once more assuming its transparency, and again the needle fish and mullet play around the wharf. Sheepshead have been caught off the old breaker-water outside Milneburg, and flounders on the flats near West End. This return of salt water fish is hailed with delight by all those living along the shore, and they are all united in hoping for the closure of the crevasse.

"One fisherman in speaking to a reporter said: 'You don't know, sir, how much the people of New Orleans would be benefited by having that crevasse closed up so that no river water could pass through. As it once was the fishing smacks could bring their red fish, red snappers, and other fish caught outside in deep water, alive and kicking right up to the city. Since river water has been running into the lake all the fish supply must come either by rail on ice or from Terre-aux-Bouffis in wagons, or from Barataria. Fish transported in that manner cannot be good. With the crevasse closed up we can bring fish alive in the wells of our smacks right up to West End, and they will be alive on reaching market.'

"We have the best fish country (?) in the world, and it is a pity that on account of a little break in the river a whole city has to have its fish supply brought to it on ice. I don't believe it's healthy. Why, I can remember the time that sheepshead, croakers, red fish, flounders, sea trout and numerous other good eating fishes were most plentiful in the lake. Look what it is now, or what it was a month ago. Nothing but sea. You'd bait your hooks out on the croaker banks, get a bite, and haul in a nasty little catfish. You just go around and ask the people living on the lakeshore about that crevasse. Ask the captains of schooners. They will tell you fish are driven away, the lake is shoaling, the oyster beds outside are being ruined, and all for the lack of a little money to shut that plaguey thing up. There ain't any use in looking to the government to do it. They don't care for Lake Pontchartrain, but we fishermen do, and the people of New Orleans ought to. You just tell some of them chaps with plenty of money, who like good eating, to help close that crevasse up and they will have fish what is fish. The Democrat can close it up if it pleases it, for the people will when they see it in the right light, back up the paper with the stuff."

"The fisherman who on much in the same strain for some time as he tarried his seinc."

GULF FISH AND HOW TO COOK THEM.

[From a Tract issued by the Pensacola Ice Company.]
RED SNAPPER.
 This fish, varying in weight from three pounds to thirty, should be either broiled or dressed with drawn butter and egg or oyster sauce; baked, stuffed with oyster dressing or plain; broiled after slicing lengthwise, removing the back bone; fried, dip the slices in corn meal and cook in hot pork fat, Cape Cod style.

BLAOK GROUPER.
 This fish, with flesh similar to halibut, should be skinned, then cook same as snapper.

RED GROUPER.
 This fish has a distinct lobster flavor. Skin and cook same as snapper; requires more cooking, as the flesh is harder; when well done, will suit the palate of any lover of good eating.

BLUE FISH.
 Eat this fish broiled, fried or baked. Prepare for baking by stuffing, and score with a sharp knife to backbone, and insert thin slices of fat pickled pork. For broiling, split open down the back; clear fire and only one turn.

POMPANNO.
 Split down the back, clear through the head; dry with a cloth; broil over a clear fire; be careful not to burn; salt only after the side is cooked and turned up; dress with a little good butter and the fourth of a good lemon dropped on the flanks and centre; when hot it will permeate and develop its unsurpassed nutty flavor. Lives there a man with soul so dear, as this.

JUAREL (PROSOONOED "WARELL").
 This fine fish is best adapted to the pan. Clean and score to the backbone with four cross cuts, fry in sweet pork fat or olive oil, and you will be able to emulate the secretary of certain corporation, who ate five at one sitting on board one of our smacks and then quit only in consideration of the feelings of the fish. Baked similar to the bluefish it is rich and highly flavored.

SILVER WHITING.
 This fish, equal to the speckled brook trout, treat in a similar manner. Sheepshead, spadefish, salt-water trout, bass and blackfish, ditto.

SPANISH MACKEREL.
 Cook same as the pompanno.
MEM.—In all cases a hot fire and clean dish. Of the forty varieties in use "from the depths of the sea," we commend all for varied qualities of nutri ion and flavor.
 Some of our friends in the interior who submit them to the trying ordeal of "trying in warm lard" over a slow fire, never will discover that they are other than "almost as good as cat" until they treat them with good cooking and common sense. By order of
NEPTUNE'S "CHIEF COOK."

THE GREAT LAKES FISHERIES.—The fisheries of the great lakes lying within the United States are confined to eight States, and form an important industry. A forthcoming report from the U. S. Census Office shows that in 1879 the business employed 4,657 vessels, of which 40 were steam tugs, and 5,050 fisherman. The annexed table gives the number of men and the amount of capital contributed by each State engaged in the fisheries and the value of the product which accrued to each:

| State | Fishermen | Capital | Product |
|--------------|-----------|-------------|-------------|
| Minnesota | 45 | \$10,160 | \$5,200 |
| Wisconsin | 80 | 92,240 | 253,100 |
| Michigan | 1,881 | 447,605 | 1,761,750 |
| Illino | 590 | 1,000,000 | 6,051,400 |
| Indiana | 52 | 29,300 | 39,200 |
| Ohio | 1,016 | 478,500 | 518,200 |
| Pennsylvania | 10 | 10,000 | 34,600 |
| New York | 922 | 60,250 | 134,500 |
| Total | 5,691 | \$1,845,915 | \$1,751,900 |

The heaviest fisheries are on Lake Michigan and Lake Erie. The value of the products for the several lakes during the year are set down as follows: Lake Superior, \$105,535; Lake Michigan, \$312,410; Lakes Huron and St. Clair, \$349,865; Lake Erie, \$578,690; Lake Ontario, \$138,050; total, \$1,784,050. The products were marketed in the following conditions: Fresh fish, \$1,102,950; salt fish, \$402,670; frozen fish, \$128,100; smoked fish, \$109,070; caviare, \$34,315; singlans, \$5,705; oil, \$2,280; total, \$1,784,050. The foregoing shows the value of the products, being in excess of 100 per cent. on capital invested.

A PENNSYLVANIA RESORT.

STRETLTON, Dauphin Co., Pa. I desire to add my mite for the benefit of the disciples of the rod and gun. White House Station, on main line of Pennsylvania Railroad, seven miles east of Harrisburg, in this county, is an excellent place for bass and salmon fishing from June 1 until winter. The river is also full of the more common varieties of fish, such as carp, chub, cat fish, mullet, a few rock fish, and plenty of shad in season. There is also excellent duck shooting in the spring and fall. Hotel on river bank. Accommodations plain, but good and substantial. For particulars address, with stamp, E. M. Stoner, High Spire, Pa.; R. M. Neiman (prop'r hotel), High Spire, or the writer at Stetton, Pa. Boats plenty at low rates. Mr. Neiman was for a number of years a resident of the lumber regions of this State, and to persons wishing it could give all the necessary information in regard to the trout and bass streams of Northern and Central Pennsylvania. The hotel is a popular stopping place for lumbermen and raftsmen on their down river trips, and from them the sportsman could gain much valuable information in regard to choice trout streams and game regions known to scarcely any one else; but these hardy backwoodsfolk of the mountains and forests of Pennsylvania. All way passenger trains stop at White House. JOHN H. LOTHROP.

FISHING AT BEAUFORT.

NEW BERNE, N. C. FISHING at Beaufort and vicinity is now at its height, and all the species usually taken here are plenty, especially Spanish mackerel and bluefish. The harbor is alive with boats in charge of capable men and occupied by amateur fishermen who, with hook and line, catch in a short time such quantities of fish as are rarely seen under ordinary circumstances the result of seine fishing. Postmaster Hubbs of this city, Internal Revenue Collector White and his chief clerk, Tinker, constituted a party in the Ives Sharpie Lucia, in charge of Captain Ben Piegott, and had admirable success in taking the members of the finny tribe. Although these gentlemen, leading as they do comparatively sedentary lives and lacking the experience that makes good fishermen, hauled in on this occasion seventy handsome Spanish mackerel and seventy-nine bluefish. One of the former, caught by Mr. White, measured thirty-seven inches in length and weighed nineteen pounds—the finest catch this season. In this connection one of this party assures us that whole schools of fish are dispersing themselves, the big ones eating the little ones, and the whole hovered over by gulls, who dive down for their prey. G. N. L.

SALMON FISHERIES OF SCOTLAND.—From the Scotsman, of August 26, we learn that the net salmon fishings on the Doe and Don terminated on the 25th. The season has been a very successful one. At the outset the returns were comparatively poor, but as the season advanced the catches of fish largely increased, and at the close the yield from both rivers is considerably ahead of the last two years. In the latter end of July, and during the present month the netter Don has yielded between 300 and 400 fish per day. The fishing on the Doe all round was over an average, the greater portion of the fish having been got at the Pot and Fords. From the middle of June onward big hauls have daily been got, and it is estimated that not for twenty years have so many fish been got at these stations as there have been got this season. The returns at the Millchingle were also good. The beginning of the earlier season the fishing has been interrupted by disagreeable weather. The best catch of the season was about the middle of July, when some 600 fish were landed in one day from the Pot and the Fords on the Doe. All through the season the quality of the fish has been good. Price for salmon in Aberdeen has varied during the season from 2s. 8d. to 10d. per pound, and grise from 1s. 6d. to 9d. per pound. Quantities of fish were retailed for the Aberdeen market at London prices, but the greater part of the fish were sent by train and steamer to the London Market.

STREP DRESSING AT NEWPORT.—Wm. Rotch Wister, Esq., of Philadelphia, has recently returned from Newport, R. I., and is reported in the Germantown Telegraph as saying that striped bass fishing was very successful there just before his departure. One angler succeeded in taking nine fish in one day, aggregating 450 pounds in weight. Angling there for this fish is quite as expensive as angling for salmon in Canada. It bites best when the ocean is rough. The angler rents one of the small rocks with about in the vicinity, and his prevention can be washed off it into the sea by an iron railing. He engages a man to bait the ground for days in advance of the time he intends to fish. He may remain there every day for a week without getting a single specimen. The tackle used by these anglers is the best which is made, a rod and reel not unfrequently costing \$200. Much skill is required in landing large fish, an hour or longer not unfrequently being spent in this exciting amusement.

UNWHOLESALE FISH AT BILLINGSGATE.—We learn from Land and Water that during the month of July the fish-lands appointed by the Fishmongers' Company seized at Billingsgate Market, and on board boats lying off that place, 25 tons 15 cwt. of fish as unfit for human food. Of these 54 tons 18 cwt. came by land, and 38 tons 17 cwt. by water. Nineteen tons were shellfish. The single fish numbered 99,937, and include 8 catfish, 10 cod, 18 crayfish, 500 eels, 250 conger eels, 500 dabs, 81,500 haddock, 2,300 lobsters, 720 mackerel, 4,822 plaice, 620 skate, 73 pairs of soles, 1 sturgeon, 245 turbot and 8 4/10 whiting. There were also 10 barrels of crabs and 12 of pickled herrings, 168 bags of mussels, 4 of oysters, 30 of periwinkle and 106 of whelks, 8 kits of pilchards and 1 of eels, 1,648 gallons of shrimps and 55 quarts of whitebait.

When an arm of the sea encircles a neck of land look out for fishing smacks.—Yonkers Statesman.

BASS IN SWARTSWOOD LAKE—Newton, N. J., Sept. 8.—A party of three gentlemen from Newton caught forty-eight pounds of black bass in Swartswood Lake last Monday morning. The largest bass weighed four and one-half pounds, and the others weighed four pounds. The fish were brought to Newton to-day, and attracted much attention. Nearly all the lovers of the sport in the town have gone, or are about to go, to try their luck. The lake was stocked with bass a few years ago by the State Fishery Commission. Previous to this time few had been caught. Since Monday's excitement, however, the yield has been large and constant, affording the greatest gratification to the successful anglers. The bass are caught with the little black crickets as bait.

THE STREAMS DRY.—Pittsburg, Pa., Sept. 6.—We are having a severe drought in this part of the State, and in consequence the rivulets and mountain streams are dry and our rivers are lower than ever known but once before. The fish are reported all dying. A gentleman just in my office, who came down Monongahela River this morning, reports seeing large numbers of dead bass and other fish along the river, on the rocks, and along the river bank. A few more days of such weather will certainly kill all the fish in our streams, except possibly those in deep holes.—I. R. S.

TROUT IN THE THAMES.—Mr. J. Harrington Keene, in the London Fishing Gazette, favors the extermination of pike in the Thames and the establishment of a large trout hatchery thereon. He thinks that a seven years close time for Thames trout, a yearly introduction of the true trout of the river, coupled with a persevering decimation of the eels and pike, would render the river the finest trout stream in the world. We know little of the local peculiarities of the river, but on general principles we agree with Mr. Keene.

HOW DOES A BLACK BASS TAKE A CRAWFISH?—Paris, Ky. One thing has been agitating our fishermen—viz., How does a black bass swallow a crawfish? Which end of crawfish ahead? The outest waxed warm, and they agreed to leave it to FOREST AND STREAM for decision.—CARPIO.

We have the impression that the black bass takes the crawfish by the tail, but as our observations have been limited we would like to hear from others on this subject.

TO A CLAM.

I OVEPLY TANTO of the sea, Shell-bound doughnut dear to me, Dear to you where ripples play, On the beach at Rockaway, Dear to me as porgie ball, Dear still upon a plate, Dear to you to the fish, You eclipse all other fish.

Far beneath the sizzling wave, Lolling 'toud some coral cave, How you watch in happy glee, Mornalds rake their golden bags, How you close one eye and grin At the chummy terrapin— While you watch the blue fish grab At the nervous soldier crab.

Little salted demigod, Prisoned in a peary pod, Lying on the ocean bar, Winking at the lappy star; Hums a-below the water, Cousin of the cod fish ball, How you set my soul a-dream With your aquatic steam.

Ever you lead a quiet life, For you haven't got a wife; Ever your earthly pain aside, In your soddy solitude, I would I were the blue fish grab At the nervous soldier crab, With a seaweed ordonnance In mid ocean's deepest divide; Far from dishing oyster knives;

Far from Hockaway hotels, Hid among mussel-nauted shells; Far from Summerville and Mott's Patent lever chowder pots. Then I'd sit and chatter my chin With a diabolic grin, Vowing my soul should never swoon In Coney Island soup.

R. K. FITZPATRICK, in South's Sunday Times.

Fishculture.

FOCUS IN THE HISTORY OF FISHCULTURE.—The conclusion of Prof. Good's "Epochs in the History of Fishculture" is in type and will be given in our next issue, its publication being deferred to that time that the proofs may have the author's supervision.

FISHCULTURE NOTES.

North Carolina has a shad hatchery at Avoos and a trout hatchery at Morgantown, both under a charge of Mr. S. G. Worth, the Acting Commissioner of Fisheries. The Wisconsin Commission has at their hatchery at Red Wing, in charge of Mr. S. S. Watkins, brook trout, California salmon, rainbow trout, Atlantic salmon, lake trout, wall-eyed pike, yellow perch, and hybrids between the brook trout and quinnat salmon. Mr. T. T. Bailey has been appointed Superintendent of the hatchery at Madison, Wis., in place of H. H. Welcher, resigned. Mr. William H. Firman, the veteran trout culturist of Mississippi, near Brooklyn, N. Y., has bought a place on the Nissequogue River, Long Island, and is making trout ponds there. He has a fine place near Smithton.

The Maine Commissioners are stocking lakes with black bass. They have also stocked the Rangeley Lakes with whitefish.

CARP IN KENTUCKY.

PARIS, Ky., Sept. 10. Fish Commissioner Dr. W. Van Antwerp, of the Ninth District, has been turning his attention to the carp which have been placed in the hands of private parties and can therefore be protected, for our public waters are depleted by the cursed giant powder and senes, so the only fish that can be protected are those in private ponds. Our country is plentifully covered with artificial ponds for stock water, they average from three to ten feet deep, with muddy bottoms, and aquatic grasses furnish plenty of food with an occasional bunch of cabbage and lettuce from the garden, and they are hatched and grow finely. From four ponds I have measured and weighed fourteen inches, one and one-half feet. The leather carp being larger than the sealed variety, the farmers who have them are very enthusiastic concerning their culture, and I know if Prof. S.

F. Baird could hear the words of praise he gets for their introduction he would feel happy. I learn from a friend that Dr. Van Antwerp has promised to get some pamphlets on the growth and culture of carp from Prof. Baird, and distribute them to those having ponds, the knowledge of the requisite of this valuable fish may be more widely known. A discussion as to the table merits of the carp resulted in a practical test. A company of epicures dined off black bass and carp recently in Clark Co., Ky., and they say no difference exists as to flavor that they could discover. CARPIO.

For the Holidays: A Present which will be kept and remembered for years is a Bio Graphoscope or stereoscope with some handsome Photographs of celebrities. NEBRASKA FIELD TRIALS.

AT CAMP, TEN MILES N. W. OF NORFOLK.

THE second annual Field Trials of pointers and setters under the auspices of the State Sportsman's Association, of Nebraska, was held at this place some ten miles northwesterly of the thriving little town of Norfolk on the east side of the north fork of the Elkhorn River. In the company of the sportsmen, being situated on a high point on the left bank of the river, a beautiful stream of clear, wholesome water, skirted by one of the handsomest and richest valleys in the State, and at this point about five miles wide, and studded with fine fields of corn and groves of forest-trees—planted and nurtured by the deft hands of the pioneers.

Here upon this big plateau of "smooth-shaven grass" stands four canvas tents. The largest one, a hospital tent, is assigned to the owners. The three smaller ones for the use of the attendants, competitors and their dogs. The scenery is of the most beautiful and such as when the last peg had been driven in to hold the sturdy tent cords in place we felt ourselves at home.

I must not omit to mention that this delightful location was suitably wet down with copious libations of cool, clear ice-water. In this regard score one for the Nebraska Sportsmen. Another fact may be mentioned of the large number of young and middle-aged men, who neither smoke nor chew tobacco at all, or moderately, so; we saw no whisky on the ground during the whole time, except a "single pint flask in the hands of one of the innumerable medical gentlemen present who had come simply as a precaution against "snake bites." It was wonderful how many titled gentlemen congregated at such an encampment. Boys instantly become captains, colonels, generals, doctors, lawyers and judges, and seem to bear these heavy titles as if they were scarcely expected of their ages. And yet there were many really titled men present and several distinguished ladies with their children a portion of the time, which especially made the encampment more pleasant, and may sufficiently account for the orderly demeanor of the sportsmen, and the absence of whisky and profane language. The dinner being settled we were summoned to dinner by our congenial restaurateur, Capt. Bigelow, whose rotund and stalwart form and genial good nature (except when some needless dog invaded his apartment) made all feel at home.

The dinner being over, and there being no entries in the stakes for puppies under twelve months old, and as other parties were expected to arrive with dogs to run in the second stakes—for Nebraska dogs—it was arranged to hold the entries open until the following morning, and thus give all who desired a fair opportunity to take part in the trials. A sufficient number of teams being at hand nearly the entire number of sportsmen rode out into the broad prairie outside the limits of the ground assigned for the trials to take place, with dogs and gun to pick up a few chickens for the use of the camp, and in which a very pleasant afternoon was spent, and about eighty birds were brought in as well as about the same number of wonderful things, and incidents of this dog and that dog, of this shot and that shot, from which one might easily conclude that every dog was not only a clipper in his way, but at all times.

Blue bloods, Natives, English, Irish and Gordons, setters and pointers of high and low degree, pedigreed and unpedigreed, and all of them imported, or would have been able to lay claim to that distinction but for the fact that, like the majority of our sportsmen, who labored under the misfortune of not being born in his native country, they were all begotten, whelped and reared in this side of the "Big Pond."

A pleasant evening was spent in recounting the afternoon's experiences, and at ten o'clock all turned in for the night anticipating the events and misadventure that awaited the scenes of the next day. Here it may be well to note who and whose dogs are here. In the list is Mr. C. B. Whitman, with note-book and House of Representatives of Nebraska, an ardent sportsman with his Irish setter dog Mack, by Livingston's Brian out of his Mous; Captain J. D. Brown, of Missouri Valley, Iowa, with his black and white Belton setter and his Irish setters whose names are those who failed to obtain; Dr. J. B. Leas, of Norfolk, late several years ago he labored under the misfortune of not being born in his native country, they were all begotten, whelped and reared in this side of the "Big Pond."

LIVADIA AGAIN.

HAD FOREST AND STREAM been gifted with prophetic vision no clearer verdict upon the Livadia could have been rendered than appeared in the se columns. While that nondescript yet untried, and while contemporaries were going into fantastic ecstasies about the great revolution the Livadia would create, FOREST AND STREAM stood alone in its warning and hesitated to believe that modern naval science could be driven from its throne by the blarney hobby of a prince sailing an old sea dog or two. We declined to follow the wild craze for beam which set in for a while and condemned the principles, or rather want of principles, upon which Livadia was being built. We pronounced her slow, wasteful, unmanageable, a wicked boat in a sea, weak in structure and generally impracticable. That the mark was hit as surely as when we condemned the Antiracite quackery can be gathered from the official report of experts who recently examined the Livadia in the interests of the Russian government. The report concludes that the Livadia "does not satisfactorily answer the requirements of a seagoing vessel, either in a nautical or mechanical sense, as she rolls too much, is too slow, too weakly built and the materials used in her construction are of inferior quality. It is, therefore, suggested to take the yacht to pieces and build a gun boat and three cruisers out of the materials and use the fittings and furniture for a new yacht to be built on the lines of the original Livadia." Almost the identical words used many months ago in FOREST AND STREAM! Exit the latest revolution. A little more naval science and a little less clumsy, primitive stumbing will hereafter be the rule in the Russian service. The world has not built ships in vain during the last half century and naval science, resting upon the experience and deductions of such a term, cannot be denied by snobbish ignorance without the risk of serious consequences. The Captain, the Livadia and the fleet prominently in this case, are the quality of the quality or trusting to the overweening confidence and conceit of self-sufficient men bent upon creating sensations and disdaining the consideration due to well established fundamental maxims and to the diligent and persevering investigations of their betters.

THE OLD WANDERER.

FOREST AND STREAM goes everywhere. Not long ago a correspondent inquired about the old-time Wanderer built way back in the "fifties." The next week brought an answer from the far West with information about her model. This week, from another quarter, comes a full description of the famous schooner. It is safe to say that the knowledge sought could have been procured through no other sporting paper. Its prompt publication is more evidence of the unqualified character of these columns enjoy:

Concerning the yacht Wanderer, I send you the following: She was launched in 1851 at Setauket from the shipyard of Joseph Rowland and was the largest yacht ever built on this side of the Atlantic at the time. She was modeled and built by Mr. Rowland under the immediate superintendence and direction of Capt. Thomas B. Hawkins, of Port Jefferson, for Mr. John B. Johnson, of the New York Yacht Club, and from her model, which appeared to be a happy combination of all the late improvements, gave promise of great speed combined with strength and beauty. Her length of keel was 45 ft.; breadth of beam, 32 ft.; depth of hold, 10 ft.; length over all, 114 ft.; tonnage, 250. Her sails were made by R. H. Wilson, of Port Jefferson, the maker of the sails of the yacht America on the occasion of her

visit to England. She was rigged by Messrs. Barker & Cochran, of Port Jefferson, and her cabin fitted by Messrs. Youngs and Cutler. The following were the dimensions of her spars taken from her sail plan now in my possession: Mastmast, 84 ft.; fore mast, 83 ft.; main boom, 81 ft.; main gaff, 33 ft.; fore gaff, 30 ft.; 11 ft. foremast, topmast, 26 ft.; bowsprit outboard, 41 ft.; flying jibboom, 25 ft. The Wanderer fully met the expectations of her builders. Being very staunch and a good sea boat she made many voyages at sea, making the best time between New Orleans and New York ever made by a sailing vessel. The Wanderer was wrecked on the coast of Cuba in 1875 or 1876. Any one wishing to see the model or sail plan can do so by applying to T. B. Hawkins, or Wilson's sail loft, Port Jefferson, L. I. A. Wilson.

CATS ABROAD.—The Providence Daily Journal publishes an account written by an eye-witness of a race between Mr. Gowor's boat Gleam, sent out from Providence, and two English built Unas, off Cowes, Aug. 13. One of these was sailed by the Prince of Wales, the other by Lord Bessford. Gleam did not enter, but went over the course, we should say, about two or three times to the other's once. In view of the failure of the George and Annie to do anything of the kind with the Clyde yacht, we are compelled to believe the story of the eye-witness a little fishy, or else the Prince of Wales and his compatriot mighty poor sailers of small boats. In logging the race in question the English sporting prints fail to record anything wonderful on the part of the Gleam. To suppose they refrained from mentioning the striking performance an "eye-witness" sends home, merely from prejudice as asserted, is proof enough that "eye-witness" himself has not yet shed his provincial shell. If Mr. Gowor is honestly seeking races for his boat, he can be accommodated with plenty of private matches if open to fair terms. There is no necessity for relying upon the brag of a giddy head for his boat's reputation.

TORONTO CANOE CLUB.—Races, Sept. 10, included a combined paddling and sailing race, which was won by Hugh Nelson's Racine Shadow Telephone, beating S. Hicks in the Lipton Whisker; F. M. Nicholson's Racine Shadow Sudio N.; W. B. Burrage's open race Lake Scagull, and Wm. Black in the Fairy. The last two capsized. In the 100 yards capsizing race S. Hick won in his Rob Roy, with M. F. Johnston second in a Racine Rob Roy; W. Arnold third in the Fairy; H. W. Kent fourth in the Scagull. Johnston was the first to board his canoe after the tyeed, but he was passed under paddle by Hicks. The remaining races will probably take place Saturday.

IOLA.—Mr. Oswald Jackson's new sloop Iola has arrived here from the builders at Mystic, and will soon go on an Eastern cruise. She is 48 ft. over all, 42 ft. w. l., 15 ft. beam and 5 ft. 6 in. deep. W. H. Decker has been appointed skipper.

TORONTO YACHT CLUB.—The following gentlemen have been elected officers: Thos. McGaw, Commodore; Wm. Kyle, Vice-Commodore; G. H. Duggan, Captain, and H. F. Wyatt, Secretary and Treasurer.

SAILORS' HANDBOOK.—Attention is directed to the advertisement of Ohas, Scribner's Sons, in another column. The Sailors' Handbook is invaluable to all seamen and yachtsmen.

IRON KEEL.—Lawley & Son, City Point, So. Boston, are to build a keel sloop, 33 ft. long, for Mr. C. Armstrong. Iron keel, hard wood finish.

NAUTILUS YACHT CLUB.—Wave Crest, E. B. Rogers, won the sixth race for the Challenge Cup, beating Peri and Comus in 37m. 9s.

FOR SALE.—In the "For Sale" column floating property is offered this week which may suit the wants of some readers.

Answers to Correspondents.

NO NOTICE TAKEN OF ANONYMOUS COMMUNICATIONS.

C. C., Pittsburg, Pa.—Rabbit season in your State opens Oct. 15. No provision in the law respecting doves.

A. B.—Get Mayhew's book, Management of Dogs; it will give the information you wish. We can furnish it.

F. R. N., West Garfield, Mass.—A misprint in our reply to you last week. Have applied for the desired information.

ELMIRA.—Do not know whether the sectional iron boats are still manufactured. Have not seen them in use of late.

H. W. K., New York City, need not try to find any shooting "just in the woods near by the city." There is none to be had.

B. R., Buffalo.—Would there be any difference between the recoil of a 30 cal. 85 grains, 30 grains lead and a 30 cal. 70 grains, 400 grains lead cartridge? Ans. The latter would have the greater recoil.

F. L., Boston, Mass.—A canvas shooting coat from continued exposure has become very stiff. Can you give me any information by which I can make it soft and pliable? Ans. Some coats have this peculiarity, and we know of no way of making them pliable except beating and "mouthing" them.

B. B., Ellenville, N. Y.—The subject you refer to was fully discussed in this paper last winter. Turn to your files and you will find what you want. Any dog that has a nose, and will bark when the grouse flush will cause the birds to tree. The best dog we ever saw was a foxey-looking "yellow dog." We do not consider the popping off of string grouse very high art, and you would find more sport in the hunting of these birds with either a setter or pointer.

I. E. F., Huntsville, Ala.—1. Ducks, geese, sand-hill cranes, plover, blue grouse, sage hens and pintails and ruffed grouse are found in Wagoning. 2. The dusky grouse is found in the open and also in wooded country. They nest on the ground in tufts. 3. The importation of migratory (they should not, be called Miggins) quail into this country has been a success in some localities. It is too early at

Hotels and Routes for Sportsmen.

"THE FISHING LINE."

TAKE THE Grand Rapids & Indiana R. R.

THE ONLY ROUTE TO THE Trout, Grayling & Black Bass Fisheries, FAMOUS SUMMER, HEALTH AND GAME RESORTS AND LAKES OF

NORTHERN MICHIGAN.

The waters of the Grand Traverse Region and the Michigan North Woods are unsurpassed, if equaled, in the abundance and great variety of fish contained.

BROOK TROUT abound in the streams, and the famous AMERICAN GRAYLING is found only in these waters. THE TROUT season begins May 1 and ends Sept. 1. THE GRAYLING Season opens June 1 and ends Nov. 1.

BLACK BASS, PIKE, PICKEREL and MUSCALONGE, also abound in large numbers in the many lakes and lakesets of the territory. The Sportsman can readily send trophies of his skill to his friends or "club" at home, as loe for packing fish can be had at nearly all points.

TAKE YOUR FAMILY WITH YOU. The scenery of the North Woods and Lakes is very beautiful. The air is pure, dry and bracing. The climate is peculiarly beneficial to those suffering with

Hay Fever and Asthma Affections. The hotel accommodations are excellent, and will be largely increased in time for the season of 1881 by new buildings and additions.

During the season ROUND TRIP EXCURSION TICKETS WILL BE SOLD AT LOW RATES, and attractive train facilities offered to Tourists and Sportsmen.

Dogs, Guns and Fishing Tackle Carried Free at owner's risk. It is our aim to make sportsmen feel "at home" on this route. For Tourists' Guide a handsomely illustrated book of 160 pages sent free. Time Cards, Folders and further information, address

A. B. LEET, Gen'l Pass Agent, Grand Rapids, Mich.

Fishing Season at Rangeley Lakes Again Open.

EXCURSION TICKETS VIA BOSTON AND MAINE RAILROAD.

Table with 2 columns: Destination and Price. Includes Boston to Andover, South Arm (Richmond Lakes), Middle Dam, Upton, Mountain View House, Indian Rock, Indian River, Rangeley Lake, Phillips, Indian Rock, and Moschehead.

Also tourists' tickets to all Sporting and Pleasure resorts in Maine and the Provinces. The Tickets for sale at all principal ticket offices and 250 WASHINGTON STREET, DEPOT, HAYMARKET SQ., BOSTON. Send for list of excursions.

D. J. FLANDERS, Gen. Pass. and Ticket Agent.

UPLAND SHOOTING.

Deer, Partridge, Woodcock, Ducks and Rabbits. In the numbers. Good fishing, boats, dogs and guides. Six miles from Shoshoni, Erie R. R. Good accommodations and retences. Come or address

I. M. BRADLEY, Eldred, Sullivan Co., N. Y.

GARDEN AND FARM SEEDS.

ANSWERS TO CORRESPONDENTS..... 157

TO CORRESPONDENTS.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen.
(Communications upon the subjects to which its pages are devoted are invited from every part of the country.)
Anonymous communications will not be regarded. No correspondents' name will be published except with his consent.
The Editors cannot be held responsible for the views of correspondents.

Subscriptions.

Subscriptions may begin at any time. The subscription price is \$4 per year; \$2 for six months. Remittances should be sent by registered letter, money order, or draft payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada; and is on sale in Europe by The American Exchange, 49 Strand, W. C., London, Eng.; and by Em. Terquem, 15 Boulevard, St. Martin, Paris, France.

Advertisements.

Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices 50 cents per line—eight words to the line, and twelve lines to one inch. Advertisements should be sent in by the Saturday of each week previous to the issue to which they are to be inserted.

Address: Forest and Stream Publishing Co.,
Nos. 39 and 40 Park Row, New York City.

Specimen copies of the FOREST AND STREAM sent free upon application.

FOREST AND STREAM.

Thursday, September 22.

LAST Monday night the news was flashed forth to the world that James A. Garfield was dead. The ball of the assassin had done its work. The long agony was over. The well-spent life had ended. The Nation mourned.

A strong man, in the prime of life, having attained the height of political preferment, surrounded by his friends and just starting with bright anticipations to rejoin his family for a summer holiday, is suddenly and without warning struck down by the bullet of a contemptible assassin. Eighty days follow of intense physical suffering and dire distress, the victim, with her-ic, determined, marvelous endurance, battling for life; eleven weeks of a death-bed struggle whose pathetic surroundings are without a parallel, while without the chamber, in mute and anxious suspense, the Nation watches the mortal anguish of the sufferer and marks the fluctuations of life and death—and then the pitiable ending! Such is the dismal tragedy which began in Washington on the morning of that eventful second of July and ended at Elberon, New Jersey, at thirty-five minutes past ten o'clock last Monday night.

It were needless now to dwell upon the painful details of these memorable months. The anger and indignation awakened ere the report of the wretched murderer's pistol had died away, the spontaneous outburst of grief and sympathy for the President, the resolute, undaunted determination of the wounded men to improve "the one chance," the tender, self-forgetful solicitude with which he thought and spoke of the absent wife, the succeeding scenes at the White House, the letter written by the President to his mother, his pathetic appeals to be taken back to his Mentor home, the historic journey to Long Branch; all the daily incidents of this protracted and hopeless struggle, as week was added to week; and then, after it all, the final yielding of the poor, wasted, pain-racked body, and the quenching at once of Garfield's life, and the Nation's anxious hope—all these have engaged the concern of the people and formed a part of their daily thought and life.

The circumstances attending the sick chamber at Washington were such as to arouse the sympathy of all classes, of men and women, of old and young. When that fatal shot was fired last July, it was not Garfield, the President and public man, alone, who fell; it was Garfield, a husband, a father, and a son. The connection of the political and domestic phases of his life had been so strong, and their association in his sickness and death were so intimately blended, as to appeal with a peculiar directness and tenderness to every family circle. And so in turn, when the telegraph sent its melancholy message over the land last Monday night, the intelligence was received by all with the pang which comes with the announcement of the death of a near and dear friend. The grief, which is symbolized to-day by the funeral drappings of black, is not the conventional mourning for the demise of a public functionary; it is the sorrow of the Nation and of the households which compose the Nation, a sorrow genuine and universal, akin to that of a family for one of its own.

If in this long watching at the bedside of James A. Garfield, and in this common grief at his untimely death, the Nation has forgotten and put away forever the harboring of sectional distrust, and the uselessly feuds of partisanship; if now, when the country is one in its grief, the threads of its union be knit into a closer and stronger woof, this will have been the one bright side of these eleven long weeks of national distress. If, because of his sufferings, the Union is to-day more a Union than it was before, then indeed not in vain nor without glorious reward has been the slow martyrdom of James A. Garfield.

A second name has been added to the list of the martyr Presidents of the United States. God grant that it may be the last!

IT IS A MISTAKE to infer from what has appeared in these columns respecting the would-be imitators of "Frank Forester," that we are lacking in appreciation of the eminent services which Herbert rendered to American sportsmanship. The influence of his writing has been much greater than can readily be estimated; and we would not attempt to detract from his merits and fame. We admire "Frank Forester's" writings; what we do not admire is the prating about "Our Frank," and the attempt to make demigods of Herbert and his sporting friends. To Herbert let due credit be given, but in giving it let us preserve our masculinity and talk and write as men.

It has been suggested that the President of the United States ought to be in future provided with a body-guard. No. Such a provision would be in vain, if the excretion and loathing, which the nation has heaped upon the guilty wretch now awaiting the gallows for his terrible crime, shall not suffice to deter another from winning by a like deed a like reward of infamy.

"IN THE MASH."

"A H! Twenty years ago, them was the times. Then they was birds." So the old pushers have said to us many a time as we have been quietly rowing to or from the flats. And it is likely enough that with the rail, as with the other game birds, the olden days were days of plenty. Whether this be true or not, it is safe to say that in the time of muzzle-loaders the birds seemed more numerous than they now are. When one's gun was empty, and the birds were getting up by twos and threes about his boat, they seemed to multiply themselves wonderfully, and the impression left on a man's mind was that of tens where really there were only units. Rail shooting to our mind is capital sport, and the practice, coming as it does just at the opening of the season, is just what one needs to put him in shape for the later shooting, where the birds are harder to hit, and the work, from all points of view, more difficult. The chief objection to the sport is that there is not enough work about it. We have seen gentlemen, faultlessly attired and wearing diamond studs and kid gloves, shovled over the grounds killing their birds in excellent shape, and at last stepping out of the boat at the landing without a speck or a stain upon their clothing, looking as fresh and neat as though they had just emerged from their dressing rooms. One of our friends even had an arm chair placed in the bow of his skiff, and used to shoot most of the time from that, only rising to his feet when the grass was too high for him to see over from his seat. Now, while the charms of keeping dry and clean are certainly very great, it is no small advantage for one to be so clad that if necessary he can jump overboard and help shove the boat off a bog, or over some little strip of dry land which may separate one good piece of shoving ground from another. One can often save fifteen or twenty minutes by such a manœuvre as the last named, and if the birds are plenty the tide will seem all too short without any such loss of time.

The methods employed in rail shooting have already been alluded to and are well known. The birds are easily killed and furnish most delicate morsels for the table. They fly straight and slow, and are excellent birds for the beginner to practice on, although a too long extended course of rail shooting has, to our mind, a tendency to develop a pottering shot. Therefore let the tyro begin on rail September 1, and, after practicing at them for two or three weeks, look up the few English snipe that will by that time have made their appearance. The woodcock and ruffed grouse he can essay as soon as the law is off, and the quail will be about right in November. By commencing with the rail and snipe he has the advantage of shooting at first in the open, and thus learns, much more readily than he otherwise would, where to hold on his birds. An autumn's practice, thus begun, ought to enable him to get a pretty good idea of how to shoot in the proper way.

It is astonishing, when we consider how many of them are killed each season, how little is known of the habits of our rail. The old idea that they spent the winter lying torpid in the mud at the bottom of lakes and streams is no longer held, it is true, but still, very few people know much about the way in which they pass their lives. This results naturally enough from the places which they inhabit, which are never visited by the sportsman, excepting during the shooting season. Then, too, the rail do not like to fly if they can escape by running. They are swift of foot, and, where the grass is very thick, can run through it faster than a boat can be shoved. Often they will not fly until the boat is almost on them, and we have seen uninjured birds, too tame to fly, killed by a blow from the pusher's pole. All old rail shooters know how difficult it is to retrieve cripples. They will dive, swim under water, and cling to the bottom, but above all they will hide. When the grass is thick, the task of finding a wounded bird is almost a hopeless one. This fact often gives the pusher who has not carefully marked down his bird an excuse; and if, after searching for it for a while he cannot find it, he is likely to say, "You didn't kill that one—he was only wingbroke."

We have all of us been witnesses of the ambition which the pusher exhibits to have his man show the biggest count when the boats come in after the shooting is over. It is curious to see how soon the propelling power of the boat becomes weakened, if the man in the bow cannot hit his birds. The boat goes along slowly and listlessly, and the shover has

to be constantly urged to do his duty. The unfortunate shooter incurs the contempt of the pusher, who is now only anxious to have the tide over and to get ashore again.

Ten species of the family *Rallidae* are known inhabitants of North America; and of these, the so-called sora or Carolina rail (*Porzana carolina*), is by far the most abundant. It is this species which furnishes ninety-nine out hundredths of the birds killed during the season. The salt water marsh hen, *Rallus longirostris*, is perhaps next in order of numbers, and is followed by the Virginia rail, *R. virginianus*. This species is much more abundant than is ordinarily supposed to be the case, but as it never flies when it can possibly escape by running, it is not often seen. The coot (*Fulica americana*) is not very abundant along our Middle Atlantic coast, but is very numerous inland, and on the Pacific coast. The gallinules (*Gallinula galeata* and *martinica*) are southern birds, but the former is frequently taken in the Middle States and even in Massachusetts. The yellow rail, and the heisk rail (*Porzana noveboracensis* and *P. jamaicensis*) are not often seen, but the former is common on some marshes in October. The latter is rare everywhere, we believe.

From the 15th to the 25th of September the rail shooting is at its height, and the next easterly storm that we have will, we think, bring a flight of birds, which should be in fine order. By the first of October the greater part of the birds have passed on, although the few that remain are fat and delicious. We have killed rail in November, but only as stragglers, for, as a rule, they disappear with the first sharp frosts.

In another column will be found a brief description of some of our North American *Rallidae*.

THE CREEDMOOR FALL MEETING.

THE full report which we present of the work at Creedmoor during the past week tells the story of a successful rifle gathering. The flock of outsiders was indeed wanting, but this was not a loss, for it must be some such extraneous inducements as the glamour of a foreign team or the presence of a pool box that will bring the ordinary idler to study the progress of a rifle contest.

In many other ways the recent meeting differed from previous assemblies of the sort on the Creedmoor range. The regular army was represented only by such entries as were made up among the Willett's Point Engineers. These men were among the earliest of the firm friends of the National Rifle Association. Not a meeting or a match of consequence has passed without the presence of competitors of the blue-coated rank and file of the Willett's Point garrison. They come as individuals, and not as representing the Army of the United States. The War Department took no steps to secure a showing of the progress which the regulars may have made during the past year. It is true that more attention is now paid to ball practice in the ranks of Uecla Sam's military force than at any previous period in the history of the army, but while reports of progress may be ever so flattering on paper, there will always be a margin of uncertainty and doubt unless the people are allowed to see the picked teams of the Army brought out in direct competition with other marksmen not of the Army cloth. Hence it should be looked upon as an expressed want of faith in their own powers or of a waning interest in rifle shooting, when the names of the several Army divisions do not figure on the list of entries at this, the representative rifle gathering of the country. To be sure the regulars have made what may be termed a "ten strike" at Creedmoor. A year ago they made for themselves a record of which they may well be proud, but they will soon be placed in the ranks of the "have-beens" if they do not steadily maintain the fight for first place.

The meeting has had its local character somewhat relieved by the presence of the Pennsylvania and the New Jersey teams, but, though they did not figure as leaders in any of the matches, these teams did sufficiently well to encourage further visits. They are handicapped by the fact of shooting on a strange range, while the city teams are thoroughly at home. The "woodchuck hunters" of Watertown, N. Y., perhaps did not find warrant in their success to repeat their former triumphant entry into their native town, and the stuffed woodchuck will hibernate yet another year, but they did well considering that the assisting arm of the State was withdrawn from them. Too many good things have come out of this pleasant Northern city in the past not to lead us to look for desirable visitors in the future.

The Massachusetts representatives from Walnut Hill proved that they could do good and fine work away from their favorite all-year shooting ground; and deserve all the credit given them for their skill as close-hitting marksmen. The management of the meeting was very far from the best. When it takes the "juvenile asylum" in charge of the score tickets several days to arrange the figures of a single match, it is not strange that there are complaints from those whose duty it is to place on record the doings at the range, and that the newspapers present so many departures from a strict accuracy of report. Of course there are many points in the management which the contestants would criticize, and the fact that there are several protests to be considered does not speak well for the thoroughness of the management on the ground. However, fair weather enabled the meeting, with its comparatively few contestants and many days of shooting, to be carried out without, at times, such a seeming necessity as an executive officer; but the directors must not be surprised if sharp things are said of them when

they shuffle over their assumed duties in such a perfunctory style.

To the State authorities at Albany, with their beggarly neglect of the question of rifle-shooting, the meeting teaches the lesson that as obstructionists they can do very little, while as advocates of, and supporters of, a well-considered, and economically carried out, plan of practice, they can do much. In such a work, whatever scheme of drill may be adopted, it is necessary to excite the best endeavors of the men by emulation, and the fall meeting at Creedmoor is the goal to which the efforts of those who are confident of their ability naturally tend. To reduce the rifle practice of the State to the mere making up of so many schedules of figures to be pigeon-holed into the oblivion of the Adjutant General's office at Albany, is to kill the interest of the National Guard in the subject. We would hazard nothing in saying that the interest awakened by the making up of a regimental team for the Creedmoor competitions of the past week would be of more service in an organization than all the ordered drill at the butts which the sapient Attorney-General is likely to force upon men who don uniforms and shoulder rifles under the conditions which govern our militia.

BYE-WAYS OF THE NORTHWEST.

THIRD PAPER.

VICTORIA is a charming town of six or seven thousand inhabitants, situated on the extreme southeastern point of Van Couver Island. Previous to the gold excitement of 1858 it consisted merely of a Hudson's Bay fort, with the few dwellings occupied by the servants of that powerful company. The discovery of gold in small quantities on the Fraser River in 1857, and later on the Queenella and at Cariboo, wrought a great change in the prospects of the place. The story of the new "diggings" soon reached California, and caused a wild excitement among the mining population of that State, then ripe for a fresh move. The usual rush took place, and the drowsy old Hudson's Bay post, to which heretofore the only event of the year had been the arrival of the ship from England with the mail, was startled from its slumbers by the advent of twenty thousand miners, who pitched their tents about it and formed what is now Victoria. Buildings soon sprang up and trade flourished. Everything going to or coming from the mines passed through the town and paid it tribute. High hopes were entertained of its future greatness and, in 1862, one writer said: "Already it has become the emporium of commerce, the metropolis of the northwest coast of America." But, unfortunately for Victoria, the mines, which caused its existence as a town, ceased to pay, and its commerce fell off. It has not fulfilled the promise of its early youth and, until it can have some more speedy means of communication with the outer world than it at present possesses, its growth will be very slow. The completion of the Canadian Pacific Railroad, now in process of construction, will unquestionably be of the greatest benefit to the place as well as to the other towns in British Columbia, for it will give them a market for their products, and at present they have none. The duty which goods sent to the United States have to pay leaves little margin for profit, and the very heavy tariff on imports bears severely on the inhabitants of the Province. Although the work of constructing the railroad is going on, it is not progressing as rapidly as might be expected, and there is no immediate prospect of its completion. Labor is hard to obtain in British Columbia, much of it coming from the United States, and great dissatisfaction seems to exist among the launds employed by the railway contractors. To so great an extent is this the case that the men are continually leaving the work and fresh hands have to be obtained. Of the real merits of this case I, of course, have no knowledge. The fact seems well established, however, that the men employed on the road are leaving constantly and, as they say, on account of bad treatment.

The country about Victoria is extremely picturesque and attractive, and the roads are good. There are few places about which one can find so many pleasant drives, and several days devoted to an examination of the environs of the town will not be wasted. The George is within easy walking distance—about four miles—and at low-tide is a boiling torrent, flowing between high rocky banks. Cedar Hill is about six miles distant, and from its summit one may obtain a fine *coup d'oeil* of the city, the Straits of Fuca, the Gulf of Georgia, with its hundreds of islands, and the main land rough with mountain peaks, among which, and rising far above them all, stands Mt. Baker, calm and white, a snow-robed monarch.

I should feel myself decidedly blameworthy were I to fail to mention that at Victoria there is one of the very best hotels that I know of. An experience of many years of travel in America and Europe gives me the confidence to believe that I am qualified to judge in a matter of this kind, and I have no hesitation in saying that I know of no place on this continent where one will fare more comfortably than at the Driard House. The rooms, it is true, are not furnished in a particularly luxurious style, but they are neat and comfortable. The table is perfection; the food of the very best quality and far more carefully and better cooked than is the case in many of the leading hotels of our largest cities. One of the proprietors does all the marketing and is the *chef de cuisine*, and he is certainly a jewel among cooks, a veritable artist. So long as the Driard remains under its present man-

agement, and maintains the reputation which it now has, no one need hesitate about which hotel to go to while in Victoria.

If I were to attempt to describe all the beautiful scenery that is passed in approaching Victoria, from whatever point, my letters would spin themselves out to an unconscionable length; whether one comes by way of the ocean, through the Straits of Fuca, or direct from the United States over the blue waters, and by the pine-clad hills of Puget Sound, or from the mainland of British Columbia, threading his way through any of the narrow passages that separate the many islands of the Gulf, now breasting the tideway of one channel, and again being hurried forward by the current of another—from whichever side he comes—the scene is one of great beauty. Few places have greater natural advantages than Victoria. Her harbor is, it is true, small and needs a good deal of improvement before it will be at all what is needed, but in that of Esquimalt, only three miles distant, she has one which will accommodate the largest vessels. The sportsmen of Victoria are fortunate in having shooting and fishing-grounds close at hand. During the months of July and August, the salt waters of the straits and gulf abound with salmon, which are readily taken by trolling, and when thus taken on a light rod afford fine sport. Most of the brooks of the island afford excellent trout-fishing, the Comox River being especially renowned for the size and the numbers of the fish in it.

About Victoria there are found two species of grouse, the dusky or blue, (*Canace obscurus*) and the ruffed (*Donax umbellus* var. *sabinei*). The California quail (*Lophortyx californica*) has been introduced here, and seems from all reports to have done well, but is not in particularly high favor, owing to its habit of taking to the thick brush as soon as flushed, and its failure thereafter to lie satisfactorily to the dog. Whether these faults can be overcome by education is a question that time alone can answer. In the autumn, ducks and geese are found in favorable localities in great numbers, and judging from all the reports, the shooting must be very good.

Of large game there is considerable variety. The black-tail deer (*Cervus columbianus*) is extremely abundant within a few miles of Victoria, and it is not an uncommon thing for parties to start out with a wagon in the evening and return the next night with several deer. Among the scrub oaks which grow here in certain localities still-hunting may be successfully practiced, but in most sections recourse must be had to hounds in order to obtain the game, as the timber is so thick, and the underbrush and ferns so dense and tangled, that it is impossible for one to travel through the brush without making a great deal of noise.

On the northern end of Vancouver Island, and in the interior as far south as the Comox River, elk are to be found, but I fancy, from the accounts which reached me, that they are by no means numerous. Bears and panthers are said to be abundant everywhere on the island. Sooke, distant from Victoria about twenty miles, is a great place for bears. By far the greater number of those killed are black or cinnamon, but I was shown the remains of a grizzly, said to have been killed at Sooke. The panthers are hunted and killed chiefly by those farmers who have flocks or herds to protect, and are not often seen by deer hunters. There are a few wolves, but they are not often seen except in winter.

My stay in Victoria on this occasion was not very long, and I hastened to the town of New Westminster, on the mainland, by the first steamer. Here I had the very great pleasure of meeting "Mowich," whose graceful and instructive letters to *FOREST AND STREAM* have given to its readers so much information relative to the fauna of this far distant country, and to the methods employed in the capture of its game. Through his kindness I was enabled to see much that was new and interesting to me, and from the stores of his knowledge of British Columbia I drew many facts which afterward proved extremely useful.

While enjoying the kind hospitality of Mr. H. on the evening of my arrival at New Westminster, he proposed that we should make a little hunt together next morning, as he thought it likely that we might get a deer before breakfast. Accordingly the next day about four o'clock we started on foot for a little lake about four miles from town.

The day promised to be a perfect one; the sky was cloudless, and no fog obscured the view. The sun had not yet risen, but in the east, above the jagged and broken summits of the Pitt River Mountains, stars were beginning to disappear, and the sky to flush and glow, each instant becoming more and more bright. We were soon passing through the woods. The air was cool, fresh and exhilarating. A gentle breeze just moved the higher branches of the enormous trees, and brought from the recesses of the tangled forest the balsamic breath of the Douglas firs and the terebinthine fragrance of the cedars, mingled with the faint cad odor of decaying vegetation so characteristic of the timber in all climates. The vegetation was all new to me, and I admired the dark green of the firs, the paler foliage of the cedar, the maples with their large leaves, the tangle of underbrush, and, hence, all the ferns from four to seven feet high. We were passing between high walls of foliage extending far before us on either side. Above was a narrow strip of sky, and before us the yellow road. Little bits of bright color were not wanting along the roadside. The *Epidendrum*, so universally distributed through the mountains, shone like a tongue of flame against its background of green; here and there, from the wet springy places, the foxglove nodded its

tall spike of red or white flowers; the feathery plumes of the *Spiraea* waved a greeting, the white blossoms of the *Canadica cornel* looked up from their nests of leaves, and the delicate pink caducous buds of the *Linnæa* fell in showers from their stems as we passed by. Then there were the berries in infinite variety and great profusion. The salmon berries, red or yellow; blackberries, green and red; blueberries of several kinds, the purple sallal, the velvetberry, the scarlet, and as yet unripe, paeules of the elder, and the brilliant fruit of the umbrella plant were all here, and seemed to invite our inspection.

We had with us three hounds, Captain, Dinah and Wallace, and better dogs it would be hard, I think, to find. The two first named, so far as form and color went, exactly filled my eye. They were types of the hound, their points perfect throughout, black and tan in color, and with voices both musical and powerful. Old Captain especially had a tongue like that of a trumpeter, and I have never heard sweeter or more harmonious cry from any pack than from these three splendid dogs. Wallace did not present to the eye so complete a picture as did the others. His points were not nearly so good, but as a workman in the field he could scarcely be excelled and in the estimation of his owner he stands perhaps first favorite on the list of his hounds. Even to one who does not know him he conveys the impression of being a cunning old fellow and a worker. He has a knowing look on his face, and has so much more flesh on his bones than his kennel mates, that it is easy to see he understands running and in general takes good care of himself. This must not be interpreted as meaning that he saves himself at the expense of the other dogs, for that is not the case. On the contrary, Wallace, though not so fleet as Dinah, often leads the pack, and has in many cases caught a deer without any assistance. He is a terrible fighter, and the deer that he once puts his teeth into is lost. Mr. H. told me a very exciting story of a combat between Wallace and a deer, which took place on the face of a precipice on a narrow ledge of rock sixty feet above the water. From this shelf the two combatants fell into the stream below and the hunter, coming up in his canoe, put an end to the battle.

Our party consisted of Mr. H., a Douglas River Indian named Squawitch (the Sturgeon) and the writer. An hour's brisk walk brought us to the lake, and here the dogs were slipped, and sent off into the woods with Squawitch while the two white men seated themselves on a log, and, lighting their pipes, awaited the Indian's return. As we sat there admiring the beauty of the sheet of water spread out before us, my companion told me something about the lake. It appears that it is believed by the Indians of the surrounding country to be inhabited by a Scellium; Scellium being the Chinook word for anything supernatural. In this case the belief is that some terrible monster, who is aided and abetted by the evil spirit, lives at the bottom of the lake, and that when any one is rash enough to venture upon it this dreadful creature rises to the surface, overturns the canoe and gobbles up the unfortunate occupants. This belief is so firmly held by the Indians that they will by no means venture on the lake, nor will they approach its margin when gathering berries. They hold up their hands in horror at the daring which "Mowitch" shows in venturing so frequently on its placid waters, and prophesy for him some dreadful fate as a reward for his audacity. Once, when he was overturned near the middle of the lake and lost a valuable gun, the Indians told him that the Scellium was giving him a warning now to escape and that he had better not neglect it. Squawitch is perhaps the only Indian in the region that ventures to enter a canoe on the lake, and he only does so when in company with my friend. Whether he regards "Cholley's" medicine as stronger than that of the Scellium, or thinks that if "Cholley" can afford to risk being devoured, he can also, I do not know, but he was certainly here with us now, and had gone off to start the dogs in a most unbecoming manner, although he has just told Mr. H. that an Indian had seen the Scellium here on the lake within the past two or three weeks.

We had been seated there but a few moments, when we heard the faint cry of a hound—the deep voice of Captain. A little later the shriller cry of Dinah made itself heard, and then both becoming fainter and fainter, passed out of our hearing. A moment later Squawitch parted the bushes near us and, walking down a log toward the water, drew from the low brush a canoe and two paddles. Signing to us to step into the canoe, he took his seat in the stern while Mr. H. took the bow paddle, and I seated myself amidships. Then with a stroke or two of the paddles we shot out of the little cove and on to the unruflled surface of Mirror Lake. Yo.

New Westminster, B. C.

ISAAC McLELLAN'S POEMS.—We understand that those poems of Mr. Isaac McLellan, which relate to field sports, are to be collected and published in book form. Such a volume would be welcomed by the sporting fraternity. Mr. McLellan is one of our oldest American poets, he and Longfellow having begun to write and publish at the same time in Bryant's *United States Literary Gazette*, at that time printed in Boston, and subsequently in New York. Longfellow was at the time in his junior year at college, and McLellan in his sophomore year, both at Bowdoin College, Brunswick, Me. That was more than fifty years ago, a period longer than has been covered by the life of nine men out of ten who read these lines; a span of years, which in these progressive times,

veritably bridges over the old and the new. How rich in personal recollections of literary men must such a life be! Mr. McLellan's pen has not yet lost its grace. The first column on the first page of the initial number of the *FOREST AND STREAM* contained a poetical salutory from him, and our columns have since that time been frequently enriched by his verses. We have now in type a poem in which he tenderly alludes to his college days and his companionship with Longfellow at Brunswick.

POWDER MILLS ought to be, and usually are built, on sites remote from other buildings, so that in the event of an explosion the property of others need not be damaged, nor lives needlessly destroyed. This is certainly a wise rule and one which most powder manufacturers observe. It appears, however, that Mr. Carl Dittmar fails to recognize the necessity of "seeking some sequestered spot" for a blasting powder factory. After our discussion of this gentleman's so-called sporting powder, just one year ago to-day, he engaged in the manufacture of blasting powder at Binghamton, where his mill was blown up last April, as noticed in our columns at the time. If we may believe the newspaper reports, several deaths were immediately or indirectly the result of that explosion, and property in the neighborhood was damaged to the extent of \$20,000. Mr. Dittmar was perfectly willing to blast again, and doubtless would have been equally willing to start a nitro-glycerine mill "in the heart of London town;" but the Binghamton residents righteously protested, and the Grand Jury of Broome county have indicted the powder company, and it is sought to suppress the mill as a nuisance. Elsewhere will be found a letter on the subject from a Binghamton correspondent.

THE KITTY HAWK BAY CLUB.—The proposed organization of this club, which was referred to some three months ago in the columns of *FOREST AND STREAM*, has proceeded so far that there now seems every prospect that this will be one of the leading organizations of the kind in this country.

The charter memberships were sold at \$500 each, and the applications received by the committee were ten or twelve times in excess of the number of shares to be issued. The last two shares sold brought \$2,000 each. It is understood that their par value is to be fixed at \$2,500.

A committee of gentlemen belonging to the club are now in the South examining the property, and their report will be awaited with interest. It is thought that the club will not put up a house before next summer, as there are at present ample accommodations for the members convenient to the best shooting grounds.

YO'S LETTERS.—We print this week another letter from our correspondent Yo, who writes from British Columbia. He has for a long time been beyond the reach of the mail service, seeing strange sights and strange people. The letter now printed was sent in by an Indian, and traveled many miles in a northern canoe before reaching the post office whose stamp it bears.

THE CLAY PIGEON.—Mr. Harry M. Hills, of Cincinnati, Ohio, a prominent shot of the Wyoming Gun Club, is about to take the field in the interests of the Ligowsky Clay Pigeon Co. If any Club, which has not yet seen the invention used a notice to the Company, 33 Vine street, Cincinnati, O., Mr. Hills will endeavor to arrange a match with the clay pigeon for that club in the course of his travels.

THE WORST OF IT ALL.—To smash one's leg is bad enough, but for a sportsman to be retired with a broken limb just at the height of the game season is an added woe. So thinks and writes an Ontario friend, whose plans for fall sport have been frustrated by an untimely accident.

VENNOR KNOWS, or professes to know, a great deal about the weather; but he confesses himself unable to cope with the Washington musquito. He says that in the Canadian wilderness he can manage the pest with smudge fires, but in a Washington hotel recourses to such an expedient is out of the question.

(For Forest and Stream.)
BEFORE AND AFTER.

YO! must wake and call me early; call me early, Jane, my dear! To-morrow 'll be the happiest day of all the sporting year, Of all the sporting year, my Jane, the maddest, merriest day, For we're going to shoot the canvas-backs, the canvas-backs, I say!

There are several small sneak boats, Jane, but none so small as mine; So small it is and narrow I—do you think the day 'll be fine?— And such a lot I'll shoot, Jane, I'm sure to have such luck, And for weeks we'll dine on nothing, Jane, but daily canvas duck!

I sleep so sound all night, Jane, that I shall never wake, if you do not call me early, when the day begins to break; For I must fix my tackle and must set out my decoys: To-morrow crowns the total of all my cartily joys.

When you're rising, let me sleep, Jane, don't you wake me—do you hear?
"Where's my bag of ducks for dinner?" You're a precious fool, I fear! Wish you'd had the "ducks" that I did! Clothing dry is what I lack; Evil water limp—and demons! Don't you name a canvas-back!

Can't you leave a man in quiet? How much sport? you want to know!
If this day's work you call sport, your perception's pretty slow! If you want to give a rumpus, don't you go and fire my gun, (And upon his side he turns), with a simulated snore.—A. L. F. L. A.

The Sportsman Tourist.

FROM VERA CRUZ TO MANZANILLA.

THE distance from the City of Vera Cruz, on the Gulf of Mexico, to the nearest opposite point on the shores of the Pacific Ocean is but little more than 600 miles. While there are already two lines of railroad between the Atlantic and Pacific shores within the territory of the United States, although the distance is more than five times as great, the distracted condition of our sister republic has thus prevented the construction of one of its much-needed lines of internal communication. It is very easy to see by a glance at the map what advantages must accrue from the completion of such a work.

By the extension of a line of railroad to the Pacific sea-port of Manzanilla, and thence northward, a final junction with the Southern Pacific Railroad might easily be effected; while, on the other hand, even before its completion, the harbor of Manzanilla affords a convenient half-way freight depot for the steamers from Panama for San Francisco, whence merchandise of all descriptions could be shipped with less cost to New York than by the primitive transportation on mule's back from the interior of Mexico to the shore of the Gulf of Mexico.

It appears that at last the Mexican Government has been awakened to the importance of opening a new channel for its valuable products, and that as a commencement in earnest a survey from the City of Mexico to Manzanilla has been ordered, with a view of extending the line of railroad which now already connects Vera Cruz with the capital. This difficult pioneer work of a survey through a comparatively unknown and unsafe portion of the Mexican territory has been intrusted to a small party of American engineers, under direction of W. C. Wetherill, Esq., with headquarters in the City of Mexico. It does not require a great stretch of imagination to comprehend the opposing difficulties of this stupendous task. Not only is it necessary to make an accurate topographical survey of the elevations and river courses in a country, which is up to the present time lamentably backward in all knowledge concerning its own territories, but the explorations have to be conducted under great disadvantages, including considerations of personal safety, as the population is still bitterly hostile to all strangers from this side of the line and averse in general to all innovations. Besides this it is impossible to obtain intelligent assistance, and the work has thus to be undertaken by the labor and energetic perseverance of a handful of devoted men.

Mr. Louis von Niendorff, formerly residing at Hornellsville, N. Y., has been appointed as one of the assistants of this survey, and, as Mr. Niendorff is an indefatigable laborer as well in the field of natural history and an expert and practical anatomist and taxidermist, he will be able by means of his well-trained powers of observation to add much valuable knowledge of a part of our continent concerning which, by reason of perpetual civil wars, there is really less substantial information in existence than about the interior of Africa. As Mr. Niendorff has promised to condense an account of his experiences in the form of a few rough notes, detailing what he sees and the experiences he goes through, they may be of some value to the readers of *FOREST AND STREAM*, in reason of their being a plain and unvarnished account of the country and the condition of its inhabitants. His notes date as far back as the departure of the steamer British Empire for Vera Cruz, and commend themselves by their interesting treatment. He writes:

MARAVATIO, MICHOACAN, Mexican Republic, July 25, 1881.]

I will try to introduce my notes by a brief account. We arrived at the City of Mexico on the 12th of July. The mail cart from Maravatio does not leave until Friday, and I will be able to send along by it, as well, a few of the insects I have collected here. We left New York in the steamer British Empire, of Alexander's Havana and Mexican S. S. Line. She is a large four-masted craft of great speed, and furnished with all possible appliances to insure safety and comfort for her passengers. The table is most excellent, and the large state rooms enhance the pleasant surroundings.

On Monday, July 4, we were abreast of the southern point of Florida, with a pleasant and strong breeze, which increased materially our comfort under the ship's awnings which were spread over the deck. On Tuesday, the 5th of July, we celebrated the same by firing a salute with the ship's cannon and hoisting our glorious stars and stripes to the gaff. It was a pleasing spectacle to see all of our passengers, irrespective of their nationality, joining in these festivities in honor of Uncle Sam, and attest to their appreciation of this great individual by roaring volleys from their breech-loading carbines, revolvers, etc., in place of the usual terra firma Chinese substitutes. A grand supper in the evening closed fittingly the festivities on shipboard.

On Tuesday, at 5 A. M., we sighted Havana, steamed past the famous fortress of Moro Castle, and went without delay ashore, but only to return early, rather disgusted with our visit on a hot summer day to the capital of the Queen of the Antilles. The streets of this city are too narrow and dusty; the sea-breeze failed to make its appearance and an intolerable heat was produced, which only the traveler to the tropics in summer can fully realize. After discharging some of our cargo we proceeded from Havana to Progresso, on the coast of Yucatan, favored during day by the most beautiful weather, tempered by the strong northeast trade winds, while the firmament at night became more brilliant by the resplendent constellation of the Southern Cross, along with the interesting sight of the erratic comet.

We anchored, on account of the yellow fever, about three miles from shore, off Progresso, and discharged our cargo in lighters. While there the steamer was literally surrounded by countless sharks, which, however, knew too much and would not condescend to favor our carefully baited hooks with a call.

July 10 we arrived, after a short and fine run, at Vera Cruz, and bade good-bye to our comfortable quarters on board of the British Empire, with three rousing cheers for her captain and crew. On landing at that port we had to pass through the usual routine of custom-house inspection of luggage, which, by reason of the perfectly useless and unnecessary close scrutiny of purely personal effects, was doubly annoying, particularly when the fact is taken into consideration that our party was in some measure officially recognized as acting under orders and in the assistance of the very government to which Vera Cruz belongs. Every possible restriction in conformity with established prohibitory rules was duly enforced including the small allowance of only 233

Porzana carolina (Linn.) Baird. Sora rail, Carolina rail, Or. In.

Length 8-9 inches. Above olive brown, varied with black, and streaked and spotted d with white. Flanks black, white barred. In adult birds the face and throat is black, and the sides of head and the breast slate blue; belly and under tail coverts fulvous. The young lack the black face and have the throat white, the breast being whitish or fulvous. This is the common rail on all our Atlantic coast, to which, however, it is by no means confined. It is distributed everywhere over the continent, and we have killed them on the alkaline lakes of the high central plateau of the Rocky Mountains, as well as on the low river bottoms of the Western States.

Porzana noveboracensis (Gmel.) Baird. Little yellow rail.

Smaller than the last, about 6 inches in length; above varied with black and tawny; young birds marked with white dots, which, however, the adults lack; below yellowish brown, paler on throat and whitening on the belly; flanks dark brown, white barred. Not an uncommon bird, but rarely killed save by chance. When flying it may be recognized by the white tips of the secondary quills, which are then conspicuous.

Porzana javanensis (Gmel.) Baird. Little black rail. Smaller; length about 5 inches; blackish; head and under parts dark slaty, paler or whitening on the throat; above speckled with white, the cervix and upper back varied with dark chestnut; lower belly, c-issus, flanks and axillars white barred; quills with white spots. (Coies). A tropical species rarely seen in the United States. Sportsmen should be on the watch for this, and should see that any specimens killed are preserved and their occurrence reported.

The Gallinule are much like the genus *Porzana* in their general configuration, but the forehead bears a conspicuous horny plate, extending up from the bill, and the toes have a margin at membrane.

Totanus Martinica (Linn.) Reich. Purple Gallinule.

Head, neck and underparts beautiful purplish blue, blackening on the belly, the crissum white; above, olivaceous green, the cervix and wing coverts tinted with blue; frontal shield blue; bill red, tipped d with yellow, legs yellowish. Young, with head, neck and lower back brownish, the under parts mostly white, mixed with ochrey. (Coies).—Length 10½ inches; a southern species; but stragglers have been taken as far north as New England.

Gallinula galeata (Licht) Bp. Florida gallinule.

General color slate, darkest on head, and paler on belly, back olive, flanks and under tail coverts white-striped, legs and toes greenish; bill, frontal plate and a ring around tibia, red; length 12 to 15 inches. Rather southern in its distribution, but occurs regularly as far north as Massachusetts. A few are taken every year in the marshes of the Middle States.

Pelecanus americana—Gmel. Coot, Mud-hen—This sub-family differs from the preceding mainly in the character of its plumage, which is thick and duck like; and in the feet, which are much better adapted for swimming than in any other members of the group. The feet are lobate, that is, they are furnished with semi-circular flaps for swimming, something like the feet of the grebes, but still more like those of the phalaropes. The cois spend much of their time upon the water, and are excellent swimmers. In color the male is dark slate, changing to black on the head and neck, and becoming paler on the belly. The under tail-coverts and tips of secondaries are white. Bill white, with a chocolate-colored spot near the end; frontal-plate chocolate-brown; length about 14 inches. The coot is exceedingly abundant in the interior as well as in the South and on the Pacific coast. In the New England and Middle States they are not particularly abundant, but they are seen in small numbers throughout the fall.

RABBITS AND FOXES AS SWIMMERS.—Sept. 14, 1881.—I have seen rabbits and foxes both take to water, in winter as well as summer. But the longest swim I ever knew a rabbit to make was at the end of a swimming pool, where he was standing on the shores of a creek, listening to hounds on the opposite side, when, much to our surprise, a rabbit ran out from the brush on the other side, plunging into the water and swam over to us; he landed safely, and made his way in peace. The place where he crossed was two hundred feet wide, and the hounds did not follow. I have several times known of a fox swimming creeks to escape when hunted, and once knew one to get a cold bath while on a hunt himself. This happened in the winter. There had been a light fall of snow on the evening previous, so several of us started in the morning to hunt white hares. On getting into the swampy bottom near Ma-le Springs, we ran where some hungry fox had taken a hare's track. His hairship made a bee-line for the brook and foxy followed. They reached the brook where it was sixteen or eighteen feet wide. The evidence on the other side showed that the hare must have cleared it at a bound; but not with the fox. As he neared the brink it looked too wide, or else, as the banks were icy, he dared not try. His speed was such, however, that all efforts to stop him were vain. The ice, which covered the water at the margin of the brook only made matters worse, and although he sat down, 'twas no use; in he went, and his aid for he was suddenly cooled. A few yards down stream we could plainly see the prints which a wet fox left as he crawled out of an ice-cold trout brook.

EAST MILTON, MASS.—Speaking of rattlesnakes, there is one killed here ten years ago on a limb as high as a man's head, and one last week on the lower limbs of a pine tree about two feet from the ground. J. G. S.

The very great variety of rubber goods, useful and ornamental, now manufactured for the use of sportsmen, is well shown by the catalogue of Messrs. Hodgman & Co., which we have just received. Most of the things that one needs in the field seem to be provided, and are for sale at their two houses in this city. They are among the oldest of our advertisers.

"GONGE AND SWINDLE"—Kingston, Sept. 12.—As a unit of the hearty and gentlemanly fraternity of sportsmen, I allow me, with all sincerity, to second the motion put by our good friend "Podgers" in regard to the firm of "Gonge and Swindle." Sportsmen seem to be the legitimate prey of all sorts of vultures. If a man be seen carrying a gun or rod the universal partners of the "Gonge and Swindle" firm are ever on the alert to take him in. Let us Boycott them. Why not reorganize our army and give dear old "Podgers" the command?—A.

Game Bag and Gun.

*For table of game seasons see last issue.

DEER HUNTING IN NORTHERN ONTARIO.

REV. Myron W. Reed says: "There are people who, failing to catch the whooping cough in childhood, are caught by it late in life. These have it 'harr.' So it is with shooting. A man may lead a blameless existence until the very end of his life, and then his hobby, and then fall." Just so it was with the present writer. I had led the "blameless existence" for over half a century and the "white dust" had settled thickly, and then not until then did I "fall."

Allured by the word "sport" I, who had never in my life fired a shot at a deer, was tempted to join a deer-hunting party. Probably the party itself had a share in the temptation, for a better lot one need not wish to fall in with than were the Judge, the Sheriff, the Lawyer and the Doctor.

The spot selected was among the lakes of Northern Ontario. Meeting at points on the road we reached together at the rendezvous at the extreme limit of public conveyance. Here, after partaking of a supper of fried venison that whetted the appetite for more, we met and arranged with our guides, cook and teamsters, laid aside some of the garments of civilization, retaining only the necessary or useful, and prepared for a plunge into the woods.

That was indeed a beautiful October morning on which we ended our way toward camp. Delays appeared to be the order of the day, and the sun hung "high in his path" before we were fairly started. The Judge, Lawyer and Sheriff started ahead on foot with some of the dogs. Some time after the baggage wagon got under way, the Doctor and I occupying prominence, if not comfortable, positions upon it. Anon followed another wagon, bearing five large canoes, and the men, leading the rest of the dogs, brought up the rear. It was understood that on catching up with the leading pedestrians the Doctor and I were to give up our places in the wagon, to go on foot, and to take the wrong path, and we did not see them again until some time after reaching the end of our land journey. The road was simply shocking, and our driver was so very considerate (of his horse) that he made us get out and walk up every hill, little or big, on the road; but after all it did not appear that we had so much the advantage over those who walked all the way. It was not until late in the afternoon that all parties arrived. Wagons unpacked, dinner cooked and eaten, and canoes launched and loaded, we set out for a four-mile paddle to our ultimate destination—the east side of Long Lake. And by the time the trip was accomplished, the food and drink furnished, supper attended to, and everything made snug and comfortable, all were quite ready and willing to retire for the night.

Our men were George Green, the leader of the hunt, his brother John, son William, and brother-in-law Story, all first-class bushmen and canoeists. John fell to my lot. A better paddler need not be wanted, but a temporary affliction of the eyes made him useless as to those organs for us while in camp. Will was supposed to go with the Doctor and Story with the Judge, while the Sheriff and Lawyer were to go together, "padding their own canoe." But these arrangements were by no means constant. I must not omit to mention the cook, who rejoiced in the name "Jim," and whose chief characteristics were a beautiful ignorance of everything pertaining to the art of cooking and enormous (that is the word) vocal powers, which he would persistently display just as I wanted to go to sleep. My piteous appeals to the others to choke or drown him were of no avail. The Doctor and the Judge did succeed in driving some ideas about cooking into his head, but nothing could quench his sonorous voice or the inclination to exercise it.

I tented with the Judge. The Sheriff and Lawyer were together in another tent. The Doctor had one to himself, and the men a larger one a short distance away. I was fortunate in my companion, for anything he does not know in the way of making himself comfortable on such occasions is hardly worth learning, and I had the benefit of his experience and knowledge. On a small stove in the tent added very materially to our comfort in the evening. Our three tents were placed in a circle, with the openings to the east, where a fire was kept burning. We first camped, for convenience, on the bank of the lake, but after a very windy night I missed the Judge early in the morning. He had not been able to sleep on account of the storm, and went out to prospect for better quarters. The result was a transfer of the whole camp to a spot cleared for the purpose in the shelter of a grove of balsams. The bright fires, white tents and dark green surroundings made indeed a very pleasant picture.

Our hunting grounds were Long Lake, a very irregular body of water about six miles long; Round Lake, west of Long Lake, on the outlet, about three fourths of a mile in length; Spruce Lake, another irregular one about two miles long, east of Long Lake, with a half mile portage between, and an unnamed lake north of Long Lake, reached by a portage of about a mile. Except for the work of lumbermen, the whole of the surroundings were as nature had left them. To the south there was a settlement five or six miles away. In all other directions many miles would have to be traversed before a farm or clearing could be found. We had a hunt almost daily, Sunday excepted. At first we tried it twice a day, but found it was too much for the drivers, the dogs and ourselves. Other hunting parties were in the neighborhood; and it was arranged all around that the deer should "follow the dogs." That is, if a dog started a deer, that deer, no matter who might shoot it, should go to the party owning the dog that started it. An honest old trapper proposed this to the Judge the night of our arrival, and he was so taken with the idea and the merit of the law, that he was with us only a few hours, as we shall see, to show him that the trapper was decidedly ahead in that arrangement.

Our first hunt was on Long and Spruce Lakes. The Judge and Sheriff had their canoes carried across to the latter lake. My watch was at an island nearly opposite the camp. The Lawyer, alone in a "bark," was more to the north, and still farther on, near the head of the lake, the Doctor had his position. Green went out with the dogs northward between the two lakes, and we all got into our positions. I watched long and faithfully, watered in the lake, and, very walking, gazed across the water in all directions until the eyes grew dim and weary, and fancy conjured up all kinds of visions in the mist that at first obscured and the dazzling sunshine that afterwards lighted up the water, watched until I was tired of watching, and still watched on and on and saw nothing, at least nothing that would pass for a deer. Tried to convince

myself that this was exhilarating sport, but could not succeed. Watched until I was tired down the lake, and then went in to the camp and found the Doctor in possession of a fine doe. It had taken the water on the Lawyer's watch and got a good start across the lake before he saw it.

The wind was dead ahead blowing hard, and he could not get within shot. Finding it getting away from him he fired twice ineffectually and gave it up. The Doctor in the mean time had foreseen the result and, his canoe being double manned, he hastened to intercept the deer and succeeded in doing so before it reached the other shore.

Soon after we landed the Judge, made his appearance, looking anything but happy. He had bargled a noble buck, the best of the whole hunt, and was congratulating himself on his success when the honest old trapper aforesaid, put in and established his claim to the deer, on the ground of his dogs having run it in. The Judge wanted to know where his, the trapper's, watchers were, and found that he had none. He had made a splendid one-sided arrangement, by which we were to spend our time in hunting deer for his benefit, without any possibility of return. It is needless to say that that agreement was cancelled in quick time, and it took the whole of the day to restore the Judge to his wonted good humor.

The next day we hunted the west side of Long Lake. This time the watch was not so tedious. I soon had an opportunity to distinguish myself, and succeeded admirably in doing so. We could, from our canoe, hear the dogs working up the lake, and paddled up slowly after them; finally, pausing a few hundred yards from the shore. Although John's eyes were of little use, his quick ear detected a deer taking to the water. We went toward it, but owing to the reflection of the trees, and not knowing what a deer in the water was like, I could not see it for some little time. At last I observed it swimming from point to point of a shallow bay. We tried, without avail, to cut it off from the shore, and then, by hard paddling, to get within shot. By this I made my shot, for we got quite near enough; for any one else to hit it. Seeing it about to land, I blazed away with one barrel (buck-shot) and missed, of course. John began me to hold the other barrel until the deer struck the bank, when I would have a larger animal to advise. Besides had I not my rifle ready as a final resort. So I fired again with the same result. The deer was then close to land, and as it sprang up the bank I took hurried aim with the rifle, but the thing would not go off. I had forgotten to cock it; and before that trifling preliminary could be attended to, the deer was out of sight. To say that I was crestfallen and disgusted, is putting it very mildly. The boys behaved very well over it though. Krypt down their laughing as well as they could, and good naturedly circulated all sorts of excuses for that they were kind enough to term my "bad luck." The Sheriff secured a fine buck and the Judge a doe, on this hunt, so the game began to count up, notwithstanding my blundering.

The Lawyer shot one at Spruce Lake soon after, and even I was not altogether "white-washed." I was watching the upper end of Long Lake, had the canoe drawn up on the beach under some trees, and was sitting very comfortably on its bow, when I saw the head and then the ears of a deer pass a projecting point not a hundred yards away, and start across the lake. It was cool enough now, in the case of "bad luck" to term my "bad luck." The Sheriff secured a fine buck and the Judge a doe, on this hunt, so the game began to count up, notwithstanding my blundering.

The Lawyer shot one at Spruce Lake soon after, and even I was not altogether "white-washed." I was watching the upper end of Long Lake, had the canoe drawn up on the beach under some trees, and was sitting very comfortably on its bow, when I saw the head and then the ears of a deer pass a projecting point not a hundred yards away, and start across the lake. It was cool enough now, in the case of "bad luck" to term my "bad luck." The Sheriff secured a fine buck and the Judge a doe, on this hunt, so the game began to count up, notwithstanding my blundering.

The next (and last) day we tried the same ground. It was proposed, as everybody was now in an agreeable humor, that I should take a watch that would give me a better chance of getting an herd deer. But I declined. I had got one and that was all I wanted. Besides, John had to go and hunt up another team to take out the deer that had so suddenly increased on our hands. So I went again to the landing at South Bay, sent John out to the settlement, and remained on water alone, for the first time. This bay is nearly square, about half a mile across each way. Green determined to go north. Around this point a short narrow leading to a second bay but not so wide, and after crossing it a channel nearly half a mile long leads into the lake. I had no thought of seeing a deer, and paid but little attention to the watch, but habit of observation and quickness of perception had grown up in me even in one short week, and I was watching without knowing it. An unexplained ripple at the extreme northeast corner of the bay after a while developed a swimming deer making for the west side. I waited until it had got so far that I could see its head to the point, and then set out to intercept it. But I was too hasty, and had hardly started when it turned and made for the point. I strained every nerve and muscle to reach it or head it off, but without avail, and in desperation fired a parting shot, unsuccessful, of course. I was dead a moment to see if it would again take the water on that side, and then paddled through the narrows. On emerging I saw it in the next bay, again making for the west side, and headed it off to the next point on the east, not getting within shot. I then paddled through the channel as fast as I could, hoping to get a glimpse of the deer as it again entered the outlet. On my reaching the lake the deer had again taken the water, but instead of making directly for the west, was turning a point to the east about a quarter of a mile away. I waited until it was out of sight and then followed in the eye of the point. Reaching it I saw the deer off the next point, but farther out. I paddled close in to the shore, and the deer observing me, made for the open water. A long peninsula stretches into the lake from the west, for which I made no account, but I succeeded in heading it off, getting within shot and securing it after over two miles of by far the hardest paddling I ever did.

Leaving my deer I went back to pick up my man. On his arrival we started for the camp. I making myself as comfortable as I could and declaring I would not touch a paddle that trip. Going through the first narrows I saw

among the brushwood something that was not brush, and soon distinguished the antlers of a buck which was crossing the second bay. Forgetting my resolution of a few minutes previous, we both did our best in making the old canoe spin through the water, and by a very narrow majority got within shot of the deer and added it to our stock of venison. On reaching camp we found the party in from the other lake with another deer.

This was our last day in camp. We had thirteen deer of various ages, but all in splendid condition, and a nice lot of venison it would be difficult to find. All had enough and to spare for numerous friends. Besides these our party killed three deer for other parties. One of these is said to have given an exciting chase. One of the other party was on watch near where the deer took the water. It nearly succeeded in getting across the bay, but he managed to head it off, and fired a couple of shots and missed. Loading again he followed the deer, fired both barrels and again missed. The deer in the meantime was rapidly nearing the shore where it had entered. Two of our men in a canoe at some distance hastened up, but did not get within fair shot, although firing twice. Story, who was in another direction, also hurried to the scene, but before he got near the deer was out of the water, and making for the woods. Two or three jumps more and he was safe. Story, at the last moment, stopped paddling, seized his rifle and dropped the deer. The distance was estimated at 120 yards, and the shot is spoken of by those who saw it as something almost marvellous under the circumstances.

Our sport was not confined to deer hunting. Partridges were plenty, and some of the party made considerable havoc among them. Ducks also there were, but not numerous or generally of good quality, being mostly of what are called the "fishy" kinds. Whitefish and mountain trout, both delicious, were taken with the troll, as many as we could use. A night's fishing by jack-light was very enjoyable, but did not add much to our larder. And the mere strolling on the fine autumn afternoons through the boundless woods, untouched by the march of man, or paddling by the bright inlets among the islands and bays, was quite enough for one of the party.

Our evenings were spent very quietly. We rose, and were glad to retire, early. It was, in some respects, a model camp. There was no Sunday hunting, no guzzling of liquor, no rihaldry or profanity, and no bickering or jealousies. All went on smoothly and pleasantly, and the only regret was that a longer stay had not been arranged, and even this was removed before our departure was made.

The morning of our return was the finest of all. So fine was it that we had not time been engaged to meet us, that day, we would have been tempted to remain a while longer. Fortunate it was that we had not done so, for that afternoon the snow fell heavily, and the next morning was thirteen inches and the following night two feet deep.

We were astir early. To breakfast, get everything packed up, carried down to the beach and loaded in canoes and punts, paddle to the landing and wait for and load up the wagons, took up considerably more than half the day, and then followed the march of thirty miles, a part of it through a piece of snow storm. To me, entirely unused to such work, and not very sound of foot, it was a serious affair. By the time Story passed me, a couple of miles from the end of the walk, fresh as if just started, and relieved me of my gun, it had so increased in weight that seventy-five pounds would have been a moderate estimate. An excellent supper, a solid roof and a "real bed" were never more enjoyable.

So began and ended my first deer hunt. Shall it be the last? The Great Disposer of events only knows. I fear I have "fallen" irretrievably, and the temptation to go and again come in my way, there would not be much resistance, health and business permitting. I would, however, like to make some stipulations—one, that less time be given to solid hunting and more to enjoyment of the scene and season; another, that the deer so conduct themselves as to make some considerable exertion necessary to get them, and not come right in the way, as my first one did. I should also like to be secured against very long watchings, and more particularly against any more disagreeable "muffs." And above all would I like as agreeable company to share in the sport.

NEMO.

DITTMAR INDICTED.

BINGHAMTON, N. Y., Sept. 19.

Editor Forest and Stream:

Your readers will remember the facts of the terrific explosion of Dittmar's blasting powder mill, which started this city on the 21st day of last April. Despite Dittmar's endeavor to make it appear that it was somebody else's powder that caused all the damage, the residents of the city were aroused by the explosion to a sense of the peril to life and property ever imminent so long as the Dittmar blasting powder factory should be tolerated here. The powder mill is right in a position to do immense damage should it "go off" again, a little harder than it did the last time, and the people are alive to the importance of taking precautions before the arrival of the impending earthquake.

We are a law-abiding folk, however, and are proceeding to remove this nuisance according to legal forms. The feeling of the populace was shown at a recent meeting held to show this corporation that, there were rights which even they may be compelled to respect. All masses of us in a state of protest against the further continuance in our midst of an institution having its only purpose in destruction. The meeting was largely attended and the unanimous vote of those present in favor of the following resolutions was but an expression of a popular determination to be rid of this nuisance and that too in a short space of time. The resolutions read:

"Whereas, An explosion at the Dittmar Powder Company's works, situated adjoining the city of Binghamton, in the town of Binghamton, in the State of New York, on the 21st day of April last, was the direct cause of bad mining death and the permanent loss of health in many cases, besides the damage done property to the extent of probably \$20,000; also causing the depreciation of the value of real estate in the vicinity of said powder works to an alarming extent; and,

"Whereas, The said Dittmar Powder Company have rebuilt and are from time to time making not only powder, but more dangerous explosives known as nitro-sugar, or dynamite, and various other high explosives; therefore, be it

Resolved, That a committee, consisting of the chairman of this meeting and Messrs. William Wildey, Roswell Bump, Nevall W. Ackerman and Hiram Barnum, be appointed with full power to procure subscriptions for a fund to be applied to the purpose of preventing, by all proper means, the manufacture or storage of dangerous explosives, or the erection of buildings therefor within the vicinity of Binghamton, and to apply the moneys so obtained to the prosecution of the object of this meeting; the repression of the manufacture of explosives within limits dangerous to the safety of the lives and property of the citizens in this vicinity; and that such committee be and it is invested with full power to employ a collector to receive the funds on such subscription and pay him a reasonable compensation, also to employ such attorneys and counsel as it shall be advised.

Resolved, That a copy of these resolutions be addressed to the Dittmar Powder Company, or their representatives, immediately.

The committee set to work at once and indictments have been found by the Grand Jury here against Carl Dittmar, Wm. Haldame and A. J. Parker. The matter is now progressing well in the courts under able counsel.

This united and public effort to rid Binghamton of this incubus is not the only one in progress. Many private suits have been opened, and after a test case has been made it is expected that they will be rapidly disposed of.

We mean business and that business just at present is to get Mr. Carl Dittmar to seek another site for his manufactory. We will not be taken by such a proffer of pamphlets to show that the stuff may, can, must and should not explode. We are willing to grant every one of the many good qualities he used to claim for his other deceptive-looking product; we will swallow his hounded tale that the front of his shop in New York city was blown out by the slamming to of the back door; we will share his belief that the guns which burst here and there over the country with his white powder charges were rotten old blunderbusses in the hands of pot-hunters; we will sign his application to have the powder he makes given freely to the untrodden Loos on our Western frontier; we will do a great many things—but we ask in return only one favor, that Mr. Carl Dittmar will give us his room rather than his Company. BING.

SPOTS IN GUN BARRELS.

Editor Forest and Stream: Boston, Sept. 15.

There is a vexed question that is worrying the souls of a number of sportsmen, and the subject remains unanswered. We wish you would air it in your column.

What is the true cause of the spots that form in gun barrels? I have had three breech-loaders in succession afflicted with the "gun measles," all under such circumstances that I am puzzled to account for it. Dampness, of course, suggests itself at once, but this solution seems incorrect in face of facts. My guns and those of my friends, when in use, are always cleaned, dried and oiled every night and morning with great care, and therefore could not get into them and stay long enough to apply to the interior of the barrel and freckle them. Further, on damp days the above cleaning process is performed half a dozen times and sometimes more.

Now for erosion, caused by chemicals in powder, or especially cheap moist powder. This assumption causes disagreement; some say it is possible and probable, and others say the reverse; the writer does not know.

When a man comes down to the marsh with a new gun, cleans it, etc., and takes extra pains with it, and is rewarded in two days by seeing the interior of his gun speckled and freckled, consequently he wishes to know what it did and what should be done to avoid it. It has been advanced that cheap powder is the trouble, but the writer has used the most expensive powder, and the old story has been repeated.

Let the vast talent at the command of the FOREST AND STREAM be exercised and commanded to explain these fearful mysteries, but do not, for heaven's sake, or rather men's sake, mention anything in the rust preventive line. All, all have been tried, and alas!

We can give you the trouble referred to by the suggestion that the cleaning was not thorough, although we presume that this will be resented by our correspondent. We have seen scores of guns marred by rust spots, and have always explained it satisfactorily to ourselves by the fact that without the most thorough care after the gun is cleaned fine particles of the residuum may still be left in the barrels, and it is from these that the rust spots start.]

ONTARIO SHOOTING NOTES.

BOWMANVILLE, Ont., Sept. 12.

OUR summer has come and gone again, and once more the season for using our guns has arrived, but so far the prospect is not very inviting. There are a few—a very few—grouse left, a stray pigeon or two, a frightened rabbit or so and plenty of rails. These constitute our hill of game at present. The ducks have not begun to come in yet, and we scarcely expect them before the heavy winds and rains stop and the grounds of the North. Our sole shooting now, that can be called shooting, is the sore rail. These little beggars are in all the marshes and rice beds here in innumerable numbers. A good shot would have no difficulty in getting 200 of them in a day. They are counted small game here, and no one seems to think them worth shooting. I and Will Piggett went to the marsh after them last week, and in two hours' shooting we secured three dozen, punting for each other in turn. It is not out of the way to say that there were thousands of them. Every shore of the canoe put them up in all directions, and I loaded and fired the muzzle-loader I was using faster, I think, than I ever did before in my life. Very few ever shoot them, and fewer eat them, as they do not count them worth the trouble of cleaning, but they give good sport for an hour or two, after that it is unnecessary cruelty and waste of life to shoot them, as enough can be secured in that time to feed a dozen sportsmen, and I never believe in fishing or shooting to make a count.

All sport for trout ends here on the 15th of this month. I and W. Piggett went out after them a month ago, driving about sixteen miles to a small creek. We fished for four hours, and succeeded in gathering in between six and seven dozen of as fine trout as any one would want to catch, my largest one measuring sixteen and one-half inches in length, and weighing eighteen ounces the morning after being caught. I had four more nearly the same size, while the rest ran from one-fourth to one-half pound. Both of us took our wives

with us, and my wife gained the honor of landing the second largest trout taken to the day's fishing.

By the way, I saw in the paper two or three numbers back some one asking what shooting can be had about Lindsay and the country about there. Lindsay is only about twenty-seven miles from us here, so I can speak with certainty of its sporting facilities. There are a few grouse in the fall, and only a few. There are plenty of ducks in the fall, but Rice Lake and Scugog lakes are too near, and the birds keep to the open water, not coming into the rice until after night. From the first day the season opens they are unceasingly persecuted by gunners night and day, and the consequence is that in a week's shooting you can scarcely get a dozen ducks, and these are mostly blue-winged teal. There are no deer without going a long and toilsome journey north of Lindsay; then they are not plenty. There are no quail in any part of Ontario east of Toronto, and only very few between that place and the city of London. The fishing about Lindsay or any place on Lake Scugog is only fair, but in Rice Lake the bass fishing is splendid, and the muskellonge fishing first-class in some seasons of the year. AF SAUBLE.

MISSISSIPPI GAME NOTES.—Sardis, Miss.—Editor Forest and Stream: Quail shooting was tolerably good here last winter, considering the poor opportunities the birds have in this part of Mississippi to "scratch" a subsistence out of the cotton and seidge fields. I have been living here nearly two years, and have never yet seen but one or two wheat or stubble fields of any consequence, and very few corn fields—only those that are so near the farmer's residence that the birds do not come into them for fear of being "pop-hunted." Even some of our best sportsmen (? take advantage of every opportunity to shoot them on the ground. I don't think a person is worthy the name of sportsman who will shoot birds on the ground, catch them in nets or traps, seine or trap fish. All such sport (as some call it) is not only a shame and disgrace to the perpetrator, but is really, in my opinion, cruel and barbarous, to say nothing of the disgust and contempt a true sportsman should feel for them. I learned, recently, that the deer, pouther, bear and smaller game was hunted very little in the bottoms around Bevan and South lakes last season, on account of the frequent high waters, which prevented hunters from going into the cane around the lakes. Immidately surrounding these lakes the land is so high the water has to rise unusually high to overflow it, and all kinds of game collect there for safety, and the hunter must take the chances of filling a "watery grave" in swimming his horse to them, which is the only way to get there, as a canoe cannot get through the cane where the water would not swim a horse. Some few, in past years, have ridden through the low bottoms between the hills and high land around the lakes, but one trip thoroughly satisfies all who attempt it. But we be unto the game (all kinds) that resort to the hills for safety from high water, for it is death from hounds to nearly all the game.—Davy.

REVOLVERS AND MUZZLE LOADERS.—Philadelphia, Pa., Sept. 15, '91.—An Arkansas correspondent, writing the other day in a sportsman's paper, denies that "revolvers" are older than (about) 1826. He says: "I guess those have been made (moulded) in recent years, like the spurious relics you sold on the field of Waterloo." He writes from Becker, Ark., and is referring to specimens in the Tower of London. He is very much in error; the revolver, in principle, is old. A revolving-muzzled gun, made in 1500, is now in a museum in Nuremberg; and scores of specimens on this principle, made in the sixteenth and seventeenth centuries, are to-day in Continental museums. In like manner, in 1498, Leipzig had the germ of the rifle, and in 1520 Koster (or Kutter) of Nuremberg, was celebrated for his "star-grooved barrels," in which the grooves had a spiral form. I regret to see that the genial Major Merrill, earnestly and at length, sings the praises of the "m. l. rifle." But, *est bono!* I grant that it is a noble weapon, but not easy to give up. But, *est bono!* "no shot" loading weapon, for war or chase, has now "no shot" at all for "coming to the front," it is at the rear, just where it deserves to be. The "breech" loading arm, all things considered, is abundantly the better weapon. W. MICK, II.

THE SCARCITY OF BAY SNARE.—Editor Forest and Stream: I notice in the last number of your paper a complaint by L. of the scarcity of bay snare on Long Island, and asking if it is not so all along our coast. I can say that my experience, from the middle of August up to last Monday, confirms this undoubtedly on Barnegat Bay. Many of the small sandpipers were seen and a few yellow legs; but the larger birds, like willetts, curlew, talltales, plover, calico-backs, robin snipe and dowitchers, are extremely scarce. This can better be attributed to the long-continued drought, which has lasted for three weeks, than anything else, as it is well known they never come until after a good storm. On the 10th and 11th of this month a heavy rain brought a few, and there will be more in two or three days later. The rail that has not been spotted very much by the hot weather around Philadelphia, but the reed birds are scarce and not in good condition.—COLMAN.

PENNSYLVANIA NOTES.—Media, Sept. 15.—Squirrels have been shot in large numbers since I wrote you. Black bass fishing has been good. One gentleman, who takes your paper, went out with another person, and caught six black bass weighing eighteen pounds and three quarters. Another, a physician of Wyalusing, caught one of four pounds and fourteen ounces weight. As I was passing up the street this evening I saw a woodcock right by my house, as though he was looking for the first person coming living in this county, have a pack of hounds, also horses for riding, and they hunt on the English style. OS THE WING.

The editor of the Greensburg, Pa., Press is a good shot. He writes that grouse and quail are plenty there this year.

THE KING'S LAKE CLUB.—Of the King's Lake Club, whose camp was described in our issue of Aug. 26, the author of that article writes: Last fall cold weather was so early, and the night went up snowed, four inches deep, and next morning colder'n blue blazes. "Alice same" though, we went the regular rounds, two day's spoils being some 550 fish, and sundry dozen mallards, etc. The club are now preparing for this fall's campaign, and will be on time; to my regret, business will prevent my being with them but a few days, but those few I'll put in for all they're worth, and in so doing will remember the many ideas gathered from your columns. NEW YORK SCHUTZEN CORPS.

THE annual excursion of the New York Schutzen Corps to the Highlands of Navesink was held Wednesday and Thursday, Sept. 14 and 15.

Shooting match was under the following conditions: Three shots at fifty yards, string measurement. Every man that hit the target won a prize.

Table with 2 columns: Name and Score. Includes names like P. H. Klein, A. W. Williams, etc.

Major Aery also won the FOREST and STREAM cup for the best bul-lyt. In the Judges' March the first prize, a handsome gold-headed cane...

For first-class Carvers and Table Knives go to C. L. Ritzmann, 318 Broadway—147.

Sea and River Fishing.

I recommend no sour, ascetic life. I believe not only in the thrush on the rosebud, but in the roses which the thrush defend.

FISH GAME IN THE NORTHWEST.

I have just returned from my usual summer's expedition in the interest of the National Museum at Washington, D. C.

those fish that pass the mouth of the river unobstructed between Saturday night and Monday morning run into the nets...

Livinston Stone estimates that a salmon travels only two miles a day, twenty-four hours, in the Sacramento River...

There are more canneries established every year, and now they have some between the Dalles and Celilo, Oregon...

I think it is safe to estimate that not one fish in a 1,000 that starts up the river reaches its spawning grounds.

If a fishway was constructed at Oregon City at the Falls of the Willamette it would open a number of fine and eminently suitable streams to these fish...

Our sharp tail grouse are rather scarce in the vicinity of Walla Walla, and it is a hard matter to get at the true cause of the scarcity.

I see that the snake-climbing controversy is being revived again, but I consider it pretty well settled. I supposed nearly every one knew that the constrictor family could and did climb...

THE GAMY CATFISH.

REMINISCENCES.—I. BY OLD HICKORY.

IN my younger days, say fifteen or twenty years ago, I used to fish for catfish, and thought there wasn't much better sport than to have a light rod, a multiplying reel, and a sea grass line...

Well, as I said, I thought it was fine sport, but in an evil hour I read in some Eastern book, descriptive of Western fishes, that the catfish was a slow, sluggish fish...

cats, I won't say anything. Yet these grow to much larger size. The heaviest I ever had weighed only weighed twenty-one pounds, and I took it with bass tackle.

Many of my acquaintances I've had with these forked-tail fellows and many times I've had to give up whipped, but we won't count them.

Another time I was about thirty feet out on a leaning willow six inches through, fishing in the eddy of a mill-race on Salt River in north Missouri...

Of course this one didn't kick and make high jumps like the bass and pickerel that I've caught down among the Thons and Islands...

One time I went into business on a heavy scale. Down on Main River, as we called it, the boys had been telling awful tales of how, when they had set out hooks, they had caught fish of five to ten pounds weight...

I took this hook, applied it to a coil of twelve-thread manilla rope that I had and for bait took a soft-finned catfish weighing three pounds, which I had day caught specially for the purpose.

ANGLING IN NORTHERN SCOTLAND.

THE fact that the name of Mr. Archibald Young appears in the title page of the angling guide to Sutherland is a guarantee of its reliability.

The book will prove a handy pocket companion to any one wishing to try the salmon or the trout in the waters of northern Scotland.

In the first chapter the reader is treated to a comparison between the county of Sutherland in the seventeenth and eighteenth centuries and in the present day...

Now, Mr. Young informs us, these authors would be sure to be in that condition, is a surprise to those of us who are not familiar with the local history of the remote counties of Great Britain.

prised at the change wrought in the county thus unfavorably characterized;—I may have five hundred miles of good roads and railroad are within its borders and it is well fitted to charm the tourist, the sportsman and the artist, to whom it presents attractions not to be found elsewhere in Great Britain. The angler, especially one who is not rich enough to rent a salmon river, will find quite a fisherman's paradise.

A chapter on flies and fishing tackle precedes a detailed description of the county and the island of Hlanda. There are some fiscal notes in the book to which we will refer at another time.

CAN A FISHERMAN BE A CHRISTIAN?

THE above query runs through my mind as I sit and listen to the wonderful fish stories interchanged between two friends of mine—ardent lovers of spots (plecutoria) and who have just returned from the Michigan fishing grounds. The tendency with a fisherman is to exaggerate—the comparative minnow becomes a huge fish; the average bass swells into something less than a whale. Even those most scrupulous in the ordinary walks of life, when they capture a fish weighing ten pounds and seven ounces, are apt to let their credence stretch enough to cover the odd nine ounces and call the fish a ten-pounder. Let a fisherman meet with an ordinary run of "luck" and he forthwith relates marvelous tales of catches such as even that snake, which some one tells of last week's FOREST AND STREAM, as having been caught with five young rabbits in its interior arrangements, would not be able to swallow.

Now, what is the reason of this almost universal prevalence of magnification—to call it by a polite name—in the stories of fishermen, when he seldom to be met with in the other branches of recreation affected by sportsmen? Who ever heard of a follower of Nimrod, on his return from a hunt, relating to his friends that he had killed three squirrels, each as large as the size of a church, or bagged a quail measuring eight feet from tip of wing to tip of its wings? or who ever heard of a canoeist standing in the midst of an admiring and open-mouthed throng of neighbors swearing that he had paddled eighteen miles an hour up-stream and against a head-peddled wind in a boat of the Nautilus pattern? And yet this is just what we find in the way of gullible and gullible tales from our fishermen, young and old. It is the same undisciplined principle in books and lines and rods and reels and flies that leads their owner's tongue into ways that are dark? or does some peculiar or invest the fony tribe, which, being absorbed by the fisherman, renders him for the time being oblivious to all considerations of truthfulness, so far as the number and weight of his fish are concerned? Scientists should examine into this matter and report for the benefit of a suffering people.

Just here one of my two friends fires across the desk at the other: "Say, don't you remember that 14 1/2 lbs. bass which I caught that day at the upper end of Buzzard's Lake?" Then comes the answer: "Yes, that was a beauty; but I beat you with the 15-lb. pickerel which I hauled out of Jimpson Weed River the day it rained so hard."

Which is why I hold my head and groan and inquire—Can a fisherman be a Christian?

[We answer that there is no reason why he cannot. Would you tie the soaring spirit of the angler, who sit upon a stump all day and never gets a bite, by the rules which govern Nimrod, whose active body heated by the chase depresses his imagination? Would you bring the fisherman's poetic soul down to the level of steel yards and tape measures?

The angler reckons such materialistic things, as he does the mechanical measuring of his mountains and the estimating of the quantity of water which falls over his favorite cascade. What plain practical people prefer to consider prevarication, is to the angler merely a recognized poetical license; and his enthusiasm is too great to coldly calculate by tables of weights and measures, like groveling scientists and groppers after facts. He believes his stories thoroughly, and they do not harm his fellow man, who is not thoroughly induced with his spirit, smiles at his enthusiasm. Angling is the only sport which does not pull upon a man as he grows older. It is one of which he never tires. The aged angler is more enthusiastic than the younger man, and its quiet soothing influences, interrupted by the sudden excitement of hooking a large fish, make him keenly alive to impressions which may, like a poetic vision, be magnified in its relating. The poet's eye, in a fine frenzy rolling, magnifies hills to mountains and a water-fall to a cataract, yet none complain of him. This is the only manner we can make of our correspondent.

We have enlarged stories; and always allow for the personality of the catcher of great fishes. He is so entirely harmless and derives so much consolation from the narration of his exploits that it were a sin to compel him to carry weights and measures and then ask him to step up to a notary and certify to his statements.]

THE SALMON RIVER COUNTRY.

BOISE BARROWS, Idaho Territory, Sept. 7.

I AM the only one at the Post who makes any pretension to fishing with flies, and the people in town usually take the cheaper and less amusing method of hooking with grasshoppers. In the fishing line I had magnificent sport in July and August. In July I was up north in what is called "Little Salmon Meadows." The Little Salmon abounds with fine mountain trout, averaging about 2 1/2 pounds. It was no uncommon thing for me to have two and sometimes three on my line at a time. You can imagine my light six-jointed rod under such a strain. Fifty of those fellows was a fair day's fishing.

In August I went south from here and in a stream called Big Spring Creek I caught 150 in a day, but smaller than those in the north. About fifteen of the men were fishing with grasshoppers. About the afternoon returned with 1,100, more than enough for the command for two or three days. The shooting was also good. Ducks, geese, plover, antelope, deer, etc., in abundance. If some of your Eastern people could take a trip into the Salmon River country and Payette Lakes during July, August and September they would have fine hunting and fishing. W. R. P.

ADMIRAL COFFIN'S LOBSTERS. But—Amongst the diminishing size of lobsters, which is now engaging the attention of our New-England pisciculturists, is the story which General James Grant Wilson writes to the Cape Ann Advertiser: "Sir Isaac Coffin, a British Admiral, and a member of the

family which held a famous reunion at Nantucket, August 16, was born at Boston, and when a child, lived for some years on Cape Cod. Sir Isaac came to this country soon after the war of 1812 and, during the voyage, he stated to the officers of his flagship that when they reached Cape Cod he would show them lobsters that weighed ninety pounds. The rules of a quarterdeck do not permit you to falsify contradict an Admiral, but still some doubt and distrust was visible on the countenances of the Captain and Lieutenants who stood around. "Well," said Sir Isaac, "if you doubt it, I will make you a wager that when we reach Cape Cod, I will produce a lobster that weighs ninety pounds." The wager was made, and the gracious permission of the Admiral, and when they arrived there Sir Isaac took to the Cape, but he could not find any lobster that weighed ninety pounds. So he said: "Well, they don't happen to be here just now, but I will obtain the affidavits of the old fishermen to prove that there are such lobsters." And he produced a pile of affidavits showing that, when they were fishermen in early times, lobsters that weighed ninety pounds were as common as huckleberries on the Cape. Then it was left to an empire to decide which had lost and which had won, and by him so completely under the gracious permission of the Admiral, would entitle him to the vacant Judgeship in the Massachusetts Supreme Court if all his decisions were equally good. His decision was "affidavits are not lobsters."

HABITS OF LAKE TROUT.—Rochester, Sept. 16.—I am occasionally in receipt of letters from parties residing in the vicinity of lakes having been stocked with salmon trout, complaining that none or very few have ever been taken, and inquiring the reason why.

Salmon trout require the purest water of any fish that I have ever had any experience with, and they will not do well in waters having a much less depth than one hundred feet, for the reason that they require a very uniform temperature of water, and as the surface warms up during the hot summer months, they must have access to the cool depths beyond the penetrating heat of the sun. If not sufficient sets in and they are killed.

Another reason why they are not heard from more arises from the fact that they are in portions of the lake almost uninhabited by other fish, and there is not one chance in a hundred of coming within fishing for other species. Even in waters where they are quite numerous they are difficult to catch, and it requires considerable experience and skill to induce them to take the bait and bring them to the landing net successfully. SETH GREEN.

FISH IN MARKET.—Smelts, from Bathurst, Me., have appeared in limited quantities in Fulton Market this week, an extremely early date for them. Mr. Blackford also received a lot of grise, of 2 1/2 to 6 pounds, and some salmon, from the same place. They were not a good lot, however, and some of them were said to be haddock salmon. The mousie-fish, *Perchippus ferox*, from Chesapeake Bay, are plenty and of large size and fine. Scallops are also coming in.

THE ONLY GOUDAMI IS DEAD.—A few weeks ago we noticed the arrival in New York of a live male goudami, consigned to Mr. C. G. Blackford by Mr. Caubonier of Paris. This was the first one of these fishes which ever reached our shores alive, its mate, which was shipped with it, having died just outside Sandy Hook. Mr. Blackford took excellent care of the stranger, but it was exceedingly poor and would not eat. He offered it cabbage, lettuce and other succulent vegetation, which it is said to eat in its native waters in India, but it declined them all and died.

WE ARE TOASTED.—Here is a neat toast from "Old Hickory." The old reliable, "FOREST AND STREAM"—May its shade never grow less nor its stream run dry.

* No hospital needed for patients that use Hop Bitters, as they cure so speedily at home.

For a good Razor go to C. L. Ritzmann, 444 Broadway, New York—Ad.

Fishculture.

[Continued from page 353, Vol. XVI.]

EPOCHS IN THE HISTORY OF FISH CULTURE.*

BY PROF. G. BROWN GOODE.

LIX. 1871.—Establishment of the United States Fish Commission.—On the 9th of February, 1871, Congress passed a joint resolution which authorized the appointment of a Commission of Fish and Fisheries. The duties of the Commissioner were thus defined: "To prosecute investigations on the subject of the diminution of valuable fishes; with the view of ascertaining whether any and what diminution in the number of the food-fishes of the coast and the lakes of the United States has taken place; and, if so, to what causes the same is due; and also whether any and what protective, prohibitory or precautionary measures should be adopted in the premises, and to report upon the same to Congress."

The resolution establishing the office of Commissioner of Fisheries required that the person to be appointed should be a civil officer of the Government, of proved scientific and practical acquaintance with the duties of the coast, to serve without additional salary. The choice was thus practically limited to a single man for whom, in fact, the office had been created. Prof. Spencer F. Baird, at that time Assistant Secretary of the Smithsonian Institution, was appointed and entered at once upon his duties. Up to 1880, 1876, and 1877, he was reported for the use of the Commission. (See G. BROWN GOODE, The First Decade of the U. S. Fish Commission; its plan of work and accomplished results, scientific and technical. *Proceedings of the American Association for the Advancement of Science*, XXIX, 1880, pp. 56-574. *Forest and Stream*, N. Y., pp. 597-9. *Circular Deutscher Fischerer Verein*, 1880, pp. 190-7. Report Smithsonian Institution, 1880, pp. 140-9.)

LX. 1871.—Introduction of Shad into the Great Lakes.—The introduction of shad into the Great Lakes was accomplished in 1871 by the New York Fish Commission, a quantity being placed in the Genesee River, a tributary to Lake Ontario. [Report U. S. F. C., II., p. xvii.]

LXI. 1871.—Introduction of Shad into the Mississippi.—In 1871 shad were introduced into the Ohio and Mississippi Rivers by the U. S. Fish Commission, by the hands of Mr. Seth Green and Mr. William Child. [Report U. S. F. C., II., p. xvii.]

LXII. 1871.—Establishment of the Salmon Breeding Establishment at Orland, Me.—This was created at the joint expense of the U. S. Fish Commission, Massachusetts and Connecticut. [Report U. S. F. C., II., p. lxxi.]

* A paper read before the American Piscicultural Association, and here reprinted from advanced sheets of the U. S. Fish Commission, Part VII.

LXIII. 1872.—Importation of White Salmon.—A gift from the Central Government of 300,000 to 400,000 ova of this fish, purchased, brought to this country under the charge of Dr. Hessel, arriving late in the fall. The 4,000 or 5,000 which were sound were planted in a tributary of the Delaware. [Report U. S. F. C., part II., xlii.]

LXIV. 1872.—Beginning of the Propagation of California Salmon.—This work, begun at the suggestion of Mr. R. B. Hoeswell, was accomplished in October, 1872, for the U. S. Fish Commission by Mr. Livingston Stone. [Report U. S. F. C., II., xxiii.]

LXV. 1872.—Invention of the Green Trough.—This device, which was an improvement upon the former used by C. O. Atkins, was perfected in 1872, in the progress of experiments on whitefish. [MILNER: Report U. S. F. C., II., p. 546-556.]

LXVI. 1872.—The Invention of the Yellow Fish-Spinner Hatchery.

This was an improvement upon the former used by C. O. Atkins, was patented March 18, 1873, is of much importance in the hatching of whitefish eggs. [MILNER: Report U. S. F. C., II., p. 546, plate liv.]

LXVII. 1872.—The Work of Propagating Fish Undertaken by the U. S. Fish Commission.—At the suggestion and through the influence of the American Fish Culturist's Association. [Report U. S. F. C., II., xvi.]

LXVIII. 1872.—Invention of N. W. Clark's Fish-Hatching Trough.—This important piece of apparatus was devised in 1873 and patented March 3, 1874. [MILNER: Report U. S. F. C., II., p. 546, pl. xv.]

LXIX. 1872.—Invention of the Clark Transporting Case.—This device was successfully used in transporting whitefish eggs to California. [MILNER: Report U. S. F. C., II., p. 547.]

LXX. 1872.—Invention of the Williamson or California Hatching Trough.—This apparatus, similar to the Clark trough except that the water flows from below instead of from the top, was invented about 1872. [MILNER: Report U. S. F. C., II., p. 547.]

LXXI. 1872.—Establishment of the Salmon Breeding Establishment at Backsport, Me.—In 1872 the extensive salmon breeding establishment at Backsport, Me., was erected under the direction of Mr. C. G. Atkins, and at the joint expense of the Fish Commission of Maine, Massachusetts and Connecticut, and of the State of California. [MILNER: Report U. S. F. C., II., p. 546, pl. xv.]

LXXII. 1872.—First Propagation of the Striped Bass.—In May, 1872, this species was successfully propagated in this country artificially at Welden C. Pier. [Report U. S. F. C., Part II., pp. 558-559.]

LXXIII. 1873.—The California Aquarium Car.—In 1873 Mr. Livingston Stone, under the auspices of the U. S. Fish Commission and that of California, fitted up a special car for the purpose of transporting fish from California to California. The car was capsize, June 8, in the Fikhor river, Nebraska. In 1874 the experiment was repeated in behalf of the California Commission. [Report U. S. F. C., II., xxvii.]

LXXIV. 1873.—Establishment of the Ohio Fish Commission.—The Ohio Fish Commission was established in June, 1873, by the appointment as commissioners of John H. Klieber, John Hussey and Dr. E. Sterling. By act of April 26, 1876, the commission in its present form was organized. Up to 1880 \$28,000 had been voted for fishculture. [Reports of Ohio State Fish Commission: I, (1874); II, (1875); III, (1876); IV, (1877); V, (1878); VI, (1879); VII, (1880); VIII, (1881).]

LXXV. 1873.—Establishment of the Wisconsin Fish Commission.—In 1873 an appropriation was made by the Wisconsin Legislature to establish a Commission of Fish and Fisheries. In 1874 William Welsh, A. Palmer and P. B. Hoy were elected commissioners. Up to 1880 \$38,560 had been voted for fishculture. [Reports: I, (1874); II, (1875); III, (1876); IV, (1877); V, (1878); VI, (1879); VII, (1880).]

LXXVI. 1873.—Establishment of the Maine Fish Commission.—In 1873 an appropriation was made by the Maine Legislature to establish a Commission of Fish and Fisheries. In 1874 William Welsh, A. Palmer and P. B. Hoy were elected commissioners. Up to 1880 \$22,750 had been appropriated for fishculture. [Reports: I, (1874); II, (1875); III, (1876); IV, (1877); V, (1878); VI, (1879); VII, (1880).]

LXXVII. 1873.—Establishment of the Land-Locked Salmon.—Establishment of the Hatching Station of Grand Lake Stream.—Experiments were begun at Sebce Lake, in 1873, under the auspices of the Massachusetts, Connecticut and United States Fish Commission, by the appointment of Mr. C. G. Atkins, Mr. Leonard. In 1874 this was transferred under the same auspices to Grand Lake Stream, and placed in charge of Mr. C. G. Atkins. [Report U. S. F. C., IV., p. 265.]

LXXVIII. 1874.—Attempts to Transport Living Shad across the Atlantic.—The first trip was made with young fish by Messrs Fred Mather and A. Anderson, in August, 1874, who lost the fish ten days after getting to sea; the second by Messrs. H. W. Welcher and Monroe A. Green, who attempted to carry the eggs, which were destroyed before they reached the steamer. [Report U. S. F. C., III., pp. 322, 330, 339-40.]

LXXIX. 1874.—Successful Propagation of the Opayusa Trout.—In October, 1874, the Maine Fish Commission obtained 30,000 eggs, 5,000 of which were sent to New York. [Maine registers: 1874-1875: Fish and Fisheries, pp. 156-157.]

LXXX. 1874.—First Attempts to Propagate Grayling.—In April, 1874, Mr. Fred Mather visited the Au Sable River, Mich., to experiment on the propagation of the grayling. From the last to the 30th of April, fish were sent to the ponds of the fish club at Leonard. In 1874 this was transferred under the same auspices to Grand Lake Stream, and placed in charge of Mr. C. G. Atkins. [Report U. S. F. C., IV., p. 265.]

LXXXI. 1874.—Attempts to Transport Living Shad across the Atlantic.—The first trip was made with young fish by Messrs Fred Mather and A. Anderson, in August, 1874, who lost the fish ten days after getting to sea; the second by Messrs. H. W. Welcher and Monroe A. Green, who attempted to carry the eggs, which were destroyed before they reached the steamer. [Report U. S. F. C., III., pp. 322, 330, 339-40.]

LXXXII. 1874.—Successful Propagation of the Opayusa Trout.—In October, 1874, the Maine Fish Commission obtained 30,000 eggs, 5,000 of which were sent to New York. [Maine registers: 1874-1875: Fish and Fisheries, pp. 156-157.]

LXXXIII. 1874.—First Attempts to Propagate Grayling.—In April, 1874, Mr. Fred Mather visited the Au Sable River, Mich., to experiment on the propagation of the grayling. From the last to the 30th of April, fish were sent to the ponds of the fish club at Leonard. In 1874 this was transferred under the same auspices to Grand Lake Stream, and placed in charge of Mr. C. G. Atkins. [Report U. S. F. C., IV., p. 265.]

LXXXIV. 1874.—Propagation of the Sea Bass, *Centropristis striatatus*, were successfully fertilized at the U. S. Fish Commission Station at Neauk, Conn. [Report U. S. F. C., IV., p. 265.]

LXXXV. 1874.—Establishment of the Iowa Fish Commission.—The Iowa Fish Commission was established by the act of the legislature, March 19, 1874. S. B. Evans, B. F. Shaw and C. A. Harris were appointed commissioners. Up to 1880 \$22,750 had been appropriated for fishculture. [Reports (biennial): I, (1874-5); II, (1875-6); III, (1876-7); IV, (1877-8); V, (1878-9); VI, (1879-80).]

LXXXVI. 1875.—First Artificial Impregnation of Grayling Eggs.—In April, 1875, Mr. Fred Mather made a second attempt to transport living shad across the Atlantic. He found them ripe from the 6th to the 10th, and 10,000 were impregnated and afterward hatched, by F. N. Clark at Northville, Mich., and himself at Hancock Falls, N. Y. [FOREST AND STREAM, Vol. IV., p. 214.]

LXXXVII. 1875.—Invention of the Mather Hatching Cone.—The principle of suspending eggs in water by a stream, admitted at the bottom of a cone, and thereby hatching them in bulk instead of in layers, was discovered in 1875 by Fred Mather and his assistant, Charles Bell. [FOREST AND STREAM, Vol. IV., p. 19; Report U. S. F. C., II., p. 547, 548, 549.]

LXXXVIII. 1875.—Hatching of Sturgeon.—In 1874 efforts were made by Seth Green in behalf of the New York Commission to hatch sturgeon. In 1875 these efforts were renewed by Dr. Hoeswell. [FOREST AND STREAM, Vol. IV., p. 164.]

LXXXIX. 1875.—Invention of Chase's Self-Striking Apparatus.—This ingenious device for the removal of dead eggs from hatching jars was invented by Oren M. Chase of Detroit, Mich. [Report U. S. F. C., IV., p. 192.]

LXXXX. 1875.—Establishment of the Minnesota Fish Commission.—This Commission was created in 1875, David Dav, M. D., Horace Austin and A. W. Latham being appointed commissioners. Up to 1880 \$22,500 had been appropriated for fishculture. [Reports: I, (1875); II, (1876); III, (1877); IV, (1878); V, (1879); VI, (1880).]

LXXXXI. 1875.—Establishment of the Virginia Fish Commission.—The Virginia Commission was organized in 1875, Hon. Alex. Mooney, Dr. W. B. Robertson and Dr. M. E. Elmy being appointed commissioners. [Reports: I, (1875); II, (1876); III, (1877); IV, (1878); V, (1879); VI, (1880).]

LXXXXII. 1876-77.—Restoration of Salmon to the Connecticut River.—In 1876 a single salmon was taken in the Connecticut

In 1877 several; in 1878 more than 600 individuals. These were the first seen in the river since the exclusion of the species from the river by the building of the Millers' River Dam in 1798.

LXXXIX. 1876.—Introduction of Whitefish into New Zealand.—At the request of the Government of New Zealand the U. S. Fish Commission set a lot of whitefish eggs to that country, a portion of which arrived in good condition.

XC. 1876.—Establishment of the Arkansas Fish Commission.—The Arkansas Commission was organized in 1876, N. H. Fish, J. R. Stoddard and M. B. Pearce being appointed commissioners.

XCI. 1876.—Establishment of the Kentucky Fish Commission.—By fish law of Kentucky, approved March 20, 1876, the Kentucky Commission was organized by the appointment of ten commissioners, one from each Congressional district.

XCII. 1877.—Introduction of the Madue Maracina into the United States.—By the courtesy of Mr. R. Eckhardt, of Lullabach, Germany, who presented 1,000 eggs of the Madue Maracina (Coregonus maracina) to the U. S. Fish Commission, this species was introduced into Gardner's Lake, Michigan.

XCIII. 1877.—Artificial Hatching of the Herring and Discovery of the Cause of the Sterility of Eggs.—Experiments were successfully carried out by Dr. H. A. Meyer, of Kiel, Germany, in hatching and retarding the development of the eggs by cold, and in hatching them, by Vinel N. Edwards, of the U. S. Fish Commission.

XCIV. 1877.—Establishment of the Clackamas Hatchery.—A hatchery was established by the salmon canners of the Columbia River, and carried on under the supervision of Mr. Livingston Stone.

XCV. 1877.—Introduction of Carp into the United States.—On the 22d of May, 1877, John W. Mathers, acting for the U. S. Fish Commission, deposited 227 leather and mirror carp and 115 scale carp in the ponds of the Maryland State Hatchery at Baltimore.

XCVI. 1877.—Establishment of the Government Carp Ponds.—The Government carp ponds on the Monument Lot, Washington, were established by the passage of an appropriation by Congress.

XCVII. 1877.—Discovery of Planted Salmon in the Delaware River and in the Susquehanna.—In November, 1877, a mature female salmon was taken in the Delaware, at Trenton, supposed to have been planted in 1872 or 1873.

XCVIII. 1877.—Introduction of the Ferguson Plunging Buckets for Hatching Fish.—In 1877, the system of plunging buckets, worked by steam, for hatching ehad in tidal waters, then newly devised by Major T. B. Ferguson, was first tested at Havre de Grace by the joint efforts of the U. S. Fish Commission and the Maryland Fish Commission.

XCIX. 1877.—Establishment of the Colorado Fish Commission.—In 1877 Mr. Wilson E. Sletty was chosen Commissioner for Colorado, up to 1880 \$2,400 had been appropriated for fish culture.

C. 1877.—Establishment of the Nevada Fish Commission.—A fish commission for Nevada was created in 1877, and Hon. H. G. Peckham was appointed Commissioner. Up to 1880 \$3,900 had been appropriated for the use of the commissioner.

CII. 1877.—Establishment of the West Virginia Fish Commission.—In 1877, the West Virginia commission was established by the appointment of John W. Mathers, Henry D. Miller and C. S. White as commissioners. Up to 1880 \$3,900 had been appropriated for the purposes of fish culture.

CIII. 1878.—Invention of the Wrotten Buckets.—This ingenious contrivance, a modification of the Chase jars, was invented in 1878 by W. T. Wrotten.

CIV. 1878.—Introduction of Soles into the United States.—On the 6th of January, 1878, Mr. Mather, who had been sent to England by the U. S. Fish Commission for the purpose of procuring a supply of soles, deposited 250 soles in Washington Bank in Cape Cod Bay.

C. 1878.—Introduction of Soles into the United States.—On the 6th of January, 1878, Mr. Mather, who had been sent to England by the U. S. Fish Commission for the purpose of procuring a supply of soles, deposited 250 soles in Washington Bank in Cape Cod Bay.

C. 1878.—Introduction of Soles into the United States.—On the 6th of January, 1878, Mr. Mather, who had been sent to England by the U. S. Fish Commission for the purpose of procuring a supply of soles, deposited 250 soles in Washington Bank in Cape Cod Bay.

C. 1878.—Introduction of Soles into the United States.—On the 6th of January, 1878, Mr. Mather, who had been sent to England by the U. S. Fish Commission for the purpose of procuring a supply of soles, deposited 250 soles in Washington Bank in Cape Cod Bay.

C. 1878.—Introduction of Soles into the United States.—On the 6th of January, 1878, Mr. Mather, who had been sent to England by the U. S. Fish Commission for the purpose of procuring a supply of soles, deposited 250 soles in Washington Bank in Cape Cod Bay.

C. 1878.—Introduction of Soles into the United States.—On the 6th of January, 1878, Mr. Mather, who had been sent to England by the U. S. Fish Commission for the purpose of procuring a supply of soles, deposited 250 soles in Washington Bank in Cape Cod Bay.

FIXTURES.

BENCH SLEWS.

September 21, 22 and 23, at Franklin, Pa., Franklin Sportsmen's Club and Game Protective Society Bench Show. Entries closed September 15. Thos. D. Adams, Superintendent, P. O. Box 61, Franklin, Pa.

FIELD TRIALS.

September 13 and 14, at Pittsburgh, Pa. Collie Trials, held under the auspices of the Pennsylvania State Agricultural Society. Entries closed September 9. Elbridge McConkey, Secretary, Harrisburg, Pa.

THE PENNSYLVANIA STATE COLLIE TRIALS.

THE annual sheep dog trials held under the management of the Pennsylvania State Agricultural Society, took place at the Pittsburgh show-grounds during the recent State Fair. The trials were advertised to commence on Tuesday, Sept. 13, but owing to the non-arrival of some of the competitors, they were postponed until the next day.

ALLIANCE NAMES.

Dr. J. W. Downey, New Market, Md., Tweed. Dr. J. W. Downey, New Market, Md., Scottish Maid. Mr. T. A. Ralston, Elderton, Pa., Jim. Mr. T. A. Ralston, Elderton, Pa., Waddie.

The order of the running was fixed by drawing lots. The start fell to Dr. Downey's Tweed, and he was the first dog called. Five sheep were placed in the starting pen, and at the sound of the bell in the judge's stand the dog entered and drove them out on the track.

Dr. J. W. Downey, New Market, Md., Tweed, 1st prize, \$50; time, 14m, 3s. Same owner's Scottish Maid, 2nd prize, \$20; time, 14m, 26s. Mr. T. A. Ralston's Elderton, Pa., Jim, 3rd prize, \$10; time, 29m, 30s. Same owner's Waddie, 4th prize, \$10; time, 29m, 30s.

the crowd on the grand stands greeted the interesting performance. Time, fourteen minutes and three seconds.

Mr. Ralston's Jim, a black and tan dog of the smooth type, was the next dog called. He was worked by his owner, and if judiciously handled would be a good performer in any trial.

The next called was Mr. Streen's fawn-colored, rough-coated collie dog Rover. From the fact that he had been broken under the training of a very good hand, the dog was very obedient, and the drive was slow and tedious.

Dr. Downey's Scottish Maid, a medium-sized, rough-coated black-and-white-and-tan bitch, was the next called. By the signal she failed to get on the track in the morning.

Dr. Downey's Scottish Maid, a medium-sized, rough-coated black-and-white-and-tan bitch, was the next called. By the signal she failed to get on the track in the morning.

Dr. Downey's Scottish Maid, a medium-sized, rough-coated black-and-white-and-tan bitch, was the next called. By the signal she failed to get on the track in the morning.

Dr. Downey's Scottish Maid, a medium-sized, rough-coated black-and-white-and-tan bitch, was the next called. By the signal she failed to get on the track in the morning.

GUNNER II.—Brooklyne, Sept. 14—I have a retriever in my kennel named FRUITER II. (No. 130.) It was bred by the late Gunner of Long Branch (of whom I saw a notice recently in the FOREST AND STREAM, giving his obituary). He is out of Warden's Flora, and was bred by me and owned by Mrs. D. T. Gordon, of New York City.

FOR SALE, a number of well bred and well broken pointers and setters, also dogs boarded and broken, satisfaction guaranteed. Address H. B. RICHMOND, Lakeville, Mass. Sept 22, 81.

—See Kennel Advertisements next page.

LEONARD'S Split Bamboo Rods, WITH PATENT WATERPROOF AND PATENT SPLIT FERRULES.

No. 1 SHOWS WATERPROOF CUP IN FERRULE (PATENTED OCTOBER 26, 1875).

This prevents any moisture from reaching the wood, and the ferrule from becoming loose. The constant wetting and drying of the bamboo must rot the wood, and make other makes of rods less durable than Leonard's.

No. 2 SHOWS SPLIT FERRULE (PATENTED SEPTEMBER 8, 1875).

This split thoroughly strengthens where the ferrule is joined to the wood, which is the weakest part of a rod, and where so many of other makes of rods (bamboo especially) break. Mr. Leonard has yet to hear of a single instance of breakage at this point since the PATENT SPLIT-FERRULE has been applied. We consider this the GREATEST IMPROVEMENT that has been introduced in rod making since rods have been made.

No. 3 SHOWS SPLIT FERRULE WHIPPED WITH SILK AS IT APPEARS ON THE ROD.

EVERY ROD WARRANTED.

SOLE AGENTS, WILLIAM MILLS & SON, 7 WARREN STREET, NEW YORK.

ALLEN'S NICKEL-PLATED DUCK CALLER.

ENOS JAMES & CO.'S HARD-HITTING GUNS.

This cut exactly represents JAMES & CO.'S GREAT GUN, called THE TRIUMPH. Every Triumph or Trap Gun is choke-bored and targeted.

We now offer a full line of ENOS JAMES & CO.'S Superb Break-Loaders. What is the use of paying an absurd price for a gun made by some old maker when you can get a JAMES' GUN as good or better for half the money? Or what is the use of buying a gun bearing either a fictitious name or no name at all, when you can get one of ENOS JAMES & CO.'S guns with their name and guaranty for the same price?

We are sole agents at New York for the Colt Club Gun.

We offer a small JOB LOT of the famous Webley Guns of all sorts at about half price.

Also a few choice Parker guns of latest style at special rates. Address

H. & D. FOLSOM,

P. O. Box 4,309, 80 WARREN ST., NEW YORK.

It has come to our knowledge that common guns are being sold in the States bearing our name. As we make only fine guns, genuine TOLLEY guns have engraved on the rib, "J. & W. TOLLEY, Makers, St. Mary's Sq., Birmingham."

GUN POWDER!

Dupont's Rifle, Sporting and
Blasting Powder.

THE MOST POPULAR POWDER IN USE!
DUPONT'S GUNPOWDER MILLS, established in 1809,
have maintained their great reputation for seventy-
eight years. Manufacture the following celebrated
brands of powder:

Dupont's Diamond Grain.—Nos. 1 (coarse)
to 4 (fine) unequalled in strength, quickness and
cleanliness; adapted for glass-ball and pigeon
shooting. Packed in 1 lb. canisters.

Dupont's Eagle Ducking.—Nos. 1 (coarse)
to 5 (fine); burns slowly, strong and very clean;
great penetration, with a close pattern; adapted
for glass-ball, pigeon, duck and other shooting,
with either muzzle or breech loaders. Packed in 1
lb. and 5 lb. canisters and 6½ and 12½ lb. kegs.

Dupont's Choke Bore.—Specially adapted for
"Choke Bore" guns, and particularly for prairie
and upland shooting. Burns slowly, strong and
moist; does not cake or burn on the barrels, gives
both a good penetration and a close pattern; will
be found well adapted for glass-ball and pigeon
shooting. Made of two sizes, only No. 7 and No. 6,
No. 7 being the coarsest. Packed in 6½ lb. kegs and
1 lb. canisters.

Dupont's Eagle Rifle.—A quick, strong and
clean powder, of very fine grain, for pistol shooting.
Packed in 1 lb. canisters and 6½ lb. kegs.

Dupont's Rifle E. G.—"Sea-Shooting."—
F.F.G. and P.F.G. The E. G. for long-range rifle shoot-
ing, the F.F.G. and P.F.G. for general use, burning
strong and moist. Packed in ½ lb., 1 lb. and 5 lb.
canisters, 6½, 12½ and 25 lb. kegs. E. G. coarse, F.F.G.
fine.

Dupont's Sporting, Mining, Sappers and Blasting
Powders of all sizes and descriptions. Special
Grades for Export. Also Rifle, Cartridge, Musket,
Cannon, Mortar, Mammoth, Hexagonal, Cubical
and Pellet Powder, U. S. Government Standard.
Powder manufactured to order of any required
grain or proof.

Agencies in all the cities and principal towns
throughout the United States. Represented by

The Parker Gun.

Again Victorious at the Late Exposition at
MELBOURNE, AUSTRALIA.

THE PHILADELPHIA JOURNAL OF COMMERCE says: "At Melbourne they had an excellent opportunity of testing their powers beside those of every exhibitor in the world, and they came off conquerors over every other maker. Their highest award comes to them from a country whose reputation for this class of goods has for many years been above all others."
They have been in the hands of shooters for the past sixteen years and stood the severest test, and have won more laurels than any other gun when brought in competition in the field or at the trap. At Coney Island this year, at the New York State Convention, the PARKER won the Pierce Diamond Badge and the "Forest and Stream" Badge for the best average over nearly 200 competitors. Send for Catalogue.

The Hazard Powder Co., MANUFACTURERS OF Gunpowder

Hazard's "Electric Powder."
Nos. 1 (fine) to 4 (coarse). Unsurpassed in point
of strength and cleanliness. Packed in square
canisters of one pound only.

Hazard's "American Sporting."
Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and
6½ lb. kegs. A fine grain, quick and clean for up-
land prairie shooting. Well adapted to shot-guns.

Hazard's "Duck Shooting."
Nos. 1 (fine) to 6 (coarse). In 1 and 5 lb. canisters
and 6½ and 12½ lb. kegs. Burns slowly and very
clean, shooting remarkably close and with great
penetration. For field, forest or water shooting it
ranks any other powder and it is equally serviceable
for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."
FFFG, FFG and "Sea Shooting" FG in kegs of
25, 12½ and 6½ lbs. and cans of 1 lbs. FFGs also
packed in 1 and 5 lb. canisters. Burns strong and
moist. The FFGs and FFG are favorite brands for
ordinary sporting and the "Sea Shooting" FG is the
standard Rifle Powder of the country.

RIFLE AND TRAP SHOOTING..... 177

ANSWERS TO CORRESPONDENTS..... 175

ONE OF THE RESULTS OF FISH-CULTURE.

IN connection with the "Reply to a Benighted Man," on another page we would refer to the following from the Report of the Fish Commissioners, of California, for the year 1880:

Two millions of the quinnat salmon have been annually hatched and deposited in the tributaries of the Sacramento River and have produced their legitimate results. Salmon are now plenty in the river, although how many could be taken at present if pisciculture had not been adopted cannot of course be known, but as the spawning beds have been destroyed by sediment brought down by mining operations the number would probably have been small, if the fish existed at all. It is the testimony of all the pioneers, at the beginning of the mining operations, that every tributary of the Sacramento was filled with this salmon at the spawning season, struggling to reach the sources. A few continued to enter the Feather, Yuba, Bear and American rivers until the floods of 1860-1 covered the gravel bottoms of those streams with mining sediment. In 1872 and 1873 the fish were nearly extinct in them and the minimum of production was reached. Previous to those years artificial culture was begun and the yield has increased.

The Commissioners have wisely kept a record of the catch of salmon in the Sacramento and therefore the effect of the yearly introduction of these 2,000,000 fry can be exhibited. Since 1874 they have obtained both the number and the weight of the salmon caught in the Sacramento and San Joaquin that have been sent to San Francisco, Sacramento and Stockton, and also of those put up in tins by the canning companies. The record is:

| | |
|-------------------------------------|--------------------|
| For season ending Aug. 1, 1875..... | 5,098,781 pounds. |
| For season ending Aug. 1, 1876..... | 5,311,423 pounds. |
| For season ending Aug. 1, 1877..... | 6,493,563 pounds. |
| For season ending Aug. 1, 1878..... | 6,520,768 pounds. |
| For season ending Aug. 1, 1879..... | 4,432,250 pounds. |
| For season ending Aug. 1, 1880..... | 10,537,400 pounds. |

The apparent falling off in the season ending Aug. 1, 1879, was due to a disagreement between the fishermen and proprietors of the canneries, during which time no salmon were sent to market. Comment on this is unnecessary.

MIDGE.—The brilliant victory scored by the deep and narrow Scotch cutter Midge over the fastest light-draft centre-board sloop we have in America will be discussed in all its bearings in our next issue. In the meantime we think unprejudiced readers will bear us out in the claim that our course in favor of yachts built upon the principles so successfully followed in the Midge has been as persistent and conscientious as our endeavors to lead yachtsmen into the higher realms of the sport—in short, to make ships out of machines and sailors out of dawdlers. The issue now terminating in our favor will, we hope, justify in their eyes our enjoying to the full the sweets of a victory earned after much hard work and ceaseless, as well as disinterested, advocacy of what we conceive to be the worthiest and healthiest aims of the grand art of sailing.

WHY "COMIC PRELUDE?"—Noting the arrival of Alfred Shaw's cricket team of English professionals at New York this week, one of the daily papers announces that they will play "a game of base-ball by way of comic prelude." And why "comic prelude," pray? A hundred thousand American base-ball players in this country will agree with us that base-ball is ten times the game that cricket is. There is nothing "comic" about it in comparison with cricket.

THE KANSAS TOURNAMENT.—The tournament of the Kansas State Sportsmen's Association, which had been appointed for October, has been postponed until next Spring, because the managers could not procure birds for the trap-shooting. The Secretary writes that this is a great disappointment as a large attendance had been anticipated.

PROF. JORDAN AT HOME.—We are pleased to record the arrival of Prof. D. S. Jordan from his annual summer trip to Europe. He returns fresh and hearty and promises to issue a Synopsis of our fishes soon. This will have an index of popular names and will prove a valuable addition to our ichthyology.

BY-WAYS OF THE NORTHWEST.

FOURTH PAPER.

MIRROR LAKE, as I first saw it, well deserves its name. A lovely sheet of water, only a few hundred yards in width and less than a mile long, it is surrounded on all sides by a superb forest of gigantic oaks. All along its margin is a narrow border of grass or low willows, separating the water from the dark forest, and beyond this border is a fringe of lily pads, which float motionless upon the unruffled surface of the lake. The little strip of grass, the tall green trees and the blue sky above are so perfectly reflected in the clear waters that it is difficult to determine where the reflection ends and the vegetation begins. Shut in on all sides by the primeval forest, the lake lies there like a great eye, which gazes steadfastly and unwinkingly at the sky which it so perfectly mirrors.

The light breeze had fallen as the sun rose, and there was now not the slightest motion on the water. The branches of the trees had ceased to wave, and the stillness of the morning was at first unbroken. As we sat there listening for the cry of the hounds, there was time for us to admire to the full the quiet beauty of the scene, which, however, little by little became more animated. The various inhabitants of lake and forest began, one by one, to resume their wonted occupations, and unconsciously to reveal to us little glimpses into their life history. An old mother gold-eye led her brood of half a dozen young out from among some low willows, whose drooping branches touched the water, and began to teach them how they could most easily procure food, calling to them occasionally in low lisping tones, to which the little ones responded with soft peepings. High up above us on the dead limb of an enormous Douglas fir a huge gray eagle (*Haliaeetus leucophthalmus*) sat sleepily, apparently not yet quite awake, although the sun was now well up in the heavens. On the other side of the lake a little pine squirrel was making his breakfast from the green cones, which he cut from the tree as fast as he could eat them, making more noise with the dropping husks than a band of elk would have done had they been feeding there. Occasionally the cry of the hounds "from farther distance borne" would be faintly heard, only to die away again and leave but the voices of the forest to break the morning's stillness. A pair of superb white-headed eagles flew silently across the lake, the hindmost strenuously endeavoring to overtake the one in front. This he succeeded in doing, when the foremost bird, without closing his wings, swung over on his back, thrust out his talons menacingly toward his pursuer, and then resuming his normal position, passed onward and out of sight. It was almost with a shock that I heard the loud mournful cry of a loon, two of which settled down on the water not far from the canoe. And now for a little while there was no more silence. The birds swam backward and forward over the lake, screaming every five minutes, until Mr. H. in despair, said: "I wish that loon was dead." It was useless now to listen for the dogs; we could only watch. After half an hour of impatient waiting, the loons ceased their doleful screaming, took wing, and disappeared in the direction of Burnaby Lake. Now once more we gave all our attention to the cry of the hounds which was now heard again, though very faintly. Before long, however, it came nearer and nearer, passed the west end of the lake and again grew fainter, and then out of hearing. Mr. H. has just remarked, with an air of disappointment, that he feared the deer would take water in Burnaby Lake, when I heard the Indian speak in very emphatic, but suppressed, tones to my companion, and, following the direction of their eyes, saw something moving slowly through the water at the other end of the lake. The object, whatever it was, moved very slowly, and looked as much like a box two feet square floating on top of the water as anything else. I took it for granted that it was the deer, because I could not think of any other unrecognisable living thing that would be in that place at that time. It appeared, however, that there was one man in the canoe who by no means believed it to be a deer. I was much surprised to see the Indian so much excited at the appearance of the game. It seemed altogether out of character, and in all my experience of Indians, on the Plains, in the mountains and by the sea shore, I had never seen any

TO CORRESPONDENTS.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are invited from every part of the country. Anonymous communications will not be regarded. No correspondents' names will be published except with his consent. The Editors cannot be held responsible for the views of correspondents.

Subscriptions.

Subscriptions may begin at any time. The subscription price is \$4 per year; \$2 for six months. Remittances should be sent by registered letter, money order, or draft payable to the Forest and Stream Publishing Company. The paper may be obtained of newdealers throughout the United States and Canada; and is on sale in Europe by The American Exchange, 49 Strand, W. C., London, Eng.; and by G. Terquem, 15 Boulevard, St. Martin, Paris, France.

Advertisements.

Inside pages, nonpareil type, 25 cents per line. Special rates for large, six and twelve months. Reading notices 50 cents per line—eight words to the line, and twelve lines to one inch. Advertisements must be sent in by the Saturday of each week previous to the issue in which they are to be inserted.

Address: Forest and Stream Publishing Co., Nos. 39 and 40 Park Row, New York City.

FOREST AND STREAM.

Thursday, September 29.

BLACK BASS FOR PONDS.—In a recent article we said that if we wanted black bass for stocking purposes we would not know how to get them by other means than to go and catch them. We were aware that Mr. Livingston Stoue formerly advertised them, but had not heard of his doing so for some years past. We now take pleasure in calling attention to his advertisement, which will be found in this issue of our paper. Mr. Stoue has just finished his season's work in the Pacific Coast Department of the United States Fish Commission, and is now on his way East to attend to his private business.

CLAY PIGEONS VS. GLASS BALLS.—It has been claimed by one that the new clay pigeons are hard to break. The fact they are far more easily broken than glass balls, as can be testified by any one who will repeat the following experiment, made by Mr. H. M. Hills, of the Wyoming City Gun Club, at Cincinnati, Sept. 19. He first placed a clay pigeon and a Bogardus glass ball side by side, and fired ten shots at a range of sixty-five yards. Nine clay pigeons out of ten were broken, while the one glass ball was not broken at all. He then fired at it, though there were seven distinct red marks upon it. A second experiment was made by using ten glass balls side by side, and firing at them at forty-five yards range. Five only of them were thus broken. Ten clay pigeons were then similarly fired at, a same range, eight of which were broken. The clay pigeons used were taken at random from a barrel of same. The glass balls were all sound.

thing like this emotion at the sight of game. The dialogue which took place between Squawitch and Mr. H., as afterward detailed to me, was both earnest and excited.

Squawitch said: "What's that there in the water, Choley?" "Mowitch" (the deer), was the reply. "Wake mowitch, sellakium, delate sellakium" ('tis no deer, it is the monster; yes, it's a true monster). "We had better go to the shore on account we'll all be killed," said Squawitch and he made a motion with his paddle as if to turn the canoe to shore. "Keep still," rejoined Mr. H., "I tell you it's the deer." And a moment later, the object having by this time turned well out into the lake, he added, "Manook" (pull), and the canoe shot toward the mysterious thing. The first few strokes pulled by Squawitch did very little toward helping the canoe forward, but, at least, if they were not strong, they were noiseless ones. No doubt he wished to avoid attracting the attention of the Sellakium by making any sound, and so we advanced silently toward it. Before we had gone very far, however, the mystery explained itself in a very simple way, and the Indian's fears were quieted. We saw swimming slowly along a fine buck, about whose horns were twisted two or three long sprays of fern, which overshadowed his head, and falling down behind trailed in the water. The reflection cast by this mass of green in the water, which rippled behind and on each side of the swimming animal, was rendered vague, and blurred that of the trees near the margin of the lake, so that the whole thing had a misty and indistinct appearance, which might well cause doubt as to what it was to arise in the mind of one who was prepared to see something supernatural. Squawitch believed as thoroughly in the existence of the Sellakium as he did in his own, and seeing something in the water unlike anything that he had ever previously beheld, at once concluded that the monster had appeared. I have no doubt that he felt perfectly sure during the first hundred yards of our progress that we were all hastening into the jaws of death. He was probably ashamed to draw back when his two companions insisted on advancing, and indeed there was no way for him to reach the shore except by swimming.

As soon as we were near enough to the huck to make out what he was, and thus to soothe the fears of the Indian, the latter put more vigor into his strokes, and we rapidly neared the object of our pursuit, which had not yet observed us, but was swimming quietly along, evidently very tired with his long run. We ran up to within twenty yards of him before he noticed us. When he did so, he at once turned toward the shore and put on a burst of speed. He swam almost as fast as the canoe went, but before reaching the land slowed down somewhat. Just before his feet touched the bottom, Mr. H. warned me to be ready, and I rose to my feet, and, as the deer made his first bound to shore, shot him through the neck. The crimson fluid tinted the clear water, the animal turned back toward the deep water, and Mr. H., fearing lest it should die and sink there, gave it the coup de grace.

This was the first time that I had ever seen a deer killed before dogs, and I confess that, to my notion, this method of hunting suffers by comparison with still-hunting. The hunter, after he has the deer in the water, and has pulled up to it, is too sure of his quarry. He has too much time to think about it. The struggles which the animal makes to reach the shore excite his sympathies, and after he has killed his game he is likely to wish that he had allowed it to escape. There are, however, some localities in which, during the summer and early autumn, this is the only way in which game can be obtained, and this is true of most of the sea coast of British Columbia. The forests are utterly unlike anything that I have seen elsewhere on this continent, and progress through them is slow, difficult and noisy. Under such conditions still-hunting is an impossibility, a mere waste of time and productive only of loss of temper. The forests are very thick and full of down timber, and the underbrush dense and tangled. One strives to force one's way through it quietly, but at every step makes as much noise as a six-mule team. Fallen trees, from two to seven feet in diameter, have to be climbed over, or crawled under. In the open spots, ferns as high as one's head obstruct the view, and rocks, concealed by the luxuriant vegetation, bark your shins. You slip upon the thick, wet moss. The luckleclery and sallow vines twine lovingly about your legs and throw you to the ground. You grasp the stem of a sapling to ease your fall, and find that you have chosen the thorny umbrella plant, or "devil's walking stick," as a support. Then you sit down and, taking out your knife, pick the spines out of your hand and think pleasant thoughts, while the Douglas squirrel and the Stellers jay chatter derisively in the branches above your head. One feels at such a time that all is indeed vanity. I do not by any means wish to imply that all the country through which I passed is like what I have described, but through a very large portion of it it is impossible to hunt.

Our deer having been secured, we left to Squawitch the task of transporting it to town, while we hastened thither ahead of him. At two o'clock, with a charming party of friends, we took the stage for Burrard Inlet, distant nine miles from New Westminster, which we reached about 4.30. We were met here by Mr. John Fannin, a gentleman who has long resided in this northern country, and whose graceful pen has contributed to the columns of FOREST AND STREAM more than one most graphic and realistic pen picture of life in the Far North. Both Mr. H. and Mr. Fannin are interested in zoology, and through their observations not a few interesting points in regard to the habits of

certain Northwest coast birds, mammals and fishes have been brought to light. Many a pleasant hour did I spend with these two gentlemen, examining their specimens, talking over the fauna of the region, discussing knotty points as to the relationships of closely allied forms, and listening to the relation of the experiences through which, in their wanderings, they had passed. Tales of Cariboo and Cassiar, of Alaska and Dease Lake, of Athabaska, Peace River and the Arctic slope, gave a reality to those districts, heretofore only vaguely heard of, which to me they had never had, and made me promise myself that, in the years to come, I too would visit these scenes.

By eight o'clock the next morning our party had embarked on the little steamer Senator, and were swiftly steaming up Burrard Inlet, which, opposite the town of Hastings, is a mile or more in width. The staunch and comfortable little craft here us swiftly up the Inlet, past the Indian ranche on the north bank, past wooded hills and low grassy points, past the rough granite mountain faces, where the few scattering trees can scarcely find earth enough to support them, and with difficulty maintain their foothold upon the bare rock, until, six miles from Hastings, we turned sharply to the left, and up the North Arm of the Inlet. Here the hills on either side drew nearer together, and thus appeared higher and more rugged, their summits being capped with snow, which in many of the gorges and ravines extended far down toward the water's edge. The almost vertical rock faces were covered with a harsh brown moss, which, except when it is wet, gives an excellent foothold. Where the soil is not utterly wanting, or the precipices are not too nearly vertical, the mountains are densely wooded with Douglas fir and cedar, some of the timber being of great size. The varying shades of green displayed by the different species of trees gave a variety to the aspect of the forests as a whole, which had almost the effect of cloud shadows, and added greatly to the beauty of the scene. Down almost every slope in sight, and constantly changing as our position and point of view changed, poured most lovely cascades, some of which even deserved the title of waterfalls. Though at present carrying but little water, their wide beds of naked rock showed that in spring, after the rains, and in the early summer, when the snows were melting, they were mighty torrents which would sweep everything before them by their resistless power. Even now they were extremely beautiful, stretching as they did like delicate white threads far up the mountain side, often scarcely separable in the distance from the lines of snow in the ravines. Only by the aid of a good glass could we discern the leaping, wavering motion of the torrent, which served to distinguish the white, hurrying flood from the unmoving snowdrift. The presence of animal life added still further charms to the scene. The pigeon guillemot, in its somber liverly of black, relieved only by its white shoulder knots and coral-red feet, was present on the water in great numbers—an active, busy little bird, constantly employed in its search for food. A species of crayfish seems to be a favorite article of diet with this bird, and many of those which we saw flying by the vessel were carrying this crustacean to their young. They are said by the Indians to breed on the islands in the Inlet, rearing their young in the holes in the rocks. On these islands, too, the barquin duck is said to breed, though not in such numbers as on the river, which flows into the Inlet at the head of the Arm. Eagles, fishawks, kingfishers and crows fairly swarmed along the shores, for these waters abound in fish, good, bad and indifferent, the hideous dogfish standing at the foot of the list and the salmon at the head. Each species contributes something toward the support of the birds, and, besides these, the shellfish afford excellent feeding for the crows and ravens.

Here I first saw that very common incident in the history of the two species, the robbing of the fishhawk by the white-headed eagle—a beautiful sight and one long to be remembered. The eagle passed us, flying low and swiftly, while the osprey had risen to a considerable height with his fish, and apparently was about to make off with it over the woods. As soon, however, as he caught sight of his pursuer he began to rise in a spiral higher and higher, but it was easy to perceive that the eagle was gaining rapidly. At last he had risen above the fishhawk and made one or two darts at the latter, which it seemed easily to avoid, but evidently despairing of getting away with its prey, it dropped it. Shining like a hair of silver, the fish fell and was carried off by the wind diagonally on one side, but the eagle, half closing his wings, stooped for it, secured it before it had fallen half way to the water, and bore it off to a tall tree on the mountain side.

On the islands in the North Arm, as well as on the mainland, deer are abundant, and it is a delightful place for a hunt, as in many places the timber is so sparse that both deer and hounds can be seen from the canoe for a good part of the run.

Burrard Inlet, B. C.

THE MONROE MARSHES.—The famous ducking grounds of the Monroe Marshes, Michigan, at the mouth of the Racine River, in Lake Erie, have been purchased by a club, and are now rigidly protected. The club property comprises between eight hundred and one thousand acres. Mr. George Dawson, of Albany, N. Y., is the President of the club, and Mr. J. Bevans Giles, St. Catharines, Ont., the Secretary. The full organization of the club will be effected next month.

FISH COMMISSIONERS OF NORTH AMERICA.

WE herewith present to the Fish Commissioners of North America a list, revised and corrected to September 21. This list has been obtained by correspondence and is correct. It will be found to contain some new names as well as new commissions. We take this labor upon ourselves annually, that the Commissioners may be able to change reports and other information with certainty. It is a gratifying fact that the fishericulturists of America recognize the FOREST AND STREAM as their organ of communication with each other, and choose it to publish such news as they may wish to make public, instead of scattering it in other papers where it is not seen by those interested.

We take this occasion to return thanks to the Fish Commissions of the different Provinces, States and Territories for their uniform courtesy in crediting to us such articles from our columns as they have seen fit to make use of in their reports, as well as for crediting us with the labor of compiling the official list of Commissioners. A prominent commissioner writes us: "My colleague, Mr. —, thinks it is too poor to subscribe for your paper. Send it to him on my expense. No intelligent fishericulturist can afford to go without FOREST AND STREAM if the price were increased tenfold. He would soon find himself behind in the race, and is not to the strong, but to the best posted."

OFFICIAL LIST OF FISH COMMISSIONERS.

The expirations of the terms of office are indicated by the dates in *italics*. Where no date is given the term is indefinite.

- CANADA—
W. F. Whiteaker, Ottawa, Ontario.
NEW BRUNSWICK—W. H. Venning, Inspector of Fisheries, St. John.
NOVA SCOTIA—W. H. Rogers, Insp't. of Fisheries, Amherst.
PRINCE EDWARD ISLAND—J. H. Duvar, Inspector of Fisheries, Alberton.
BRITISH COLUMBIA—Alex. C. Anderson, Inspector of Fisheries, Victoria.
THE UNITED STATES—
Prof. Spencer F. Baird, Washington, D. C.
ALABAMA—G. S. Foster, Prattville.
D. B. Hildreth, Sea Beach, Camden, Ga.
ARIZONA—John J. Gosper, Prescott (1884).
Richard Rule, Tombstone (1884).
Dr. J. H. Taggart, Yuma (1884).
ARKANSAS—N. B. Pearce, Osage Mills.
James Hornbrook, Little Rock.
John B. Beardon, Little Rock.
CALIFORNIA—S. R. Throckmorton, San Francisco (1893).
E. B. Reddy, San Francisco (1893).
J. D. Farwell, Niles, Alameda Co. (1893).
COLORADO—W. E. Sisty, Brookvale (1893).
CONNECTICUT—Dr. W. M. Hudson, Hartford (1892).
Robert G. Pike, Middletown (1892).
G. N. Woodruff, Sherman (1894).
GEORGIA—J. T. Henderson, Com'r of Agriculture and Com'r of Fisheries, Atlanta (1892).
Dr. H. H. Carey, Supt. of Fisheries, La Grange (1892).
ILLINOIS—N. K. Fairbank, President, Chicago (1892).
S. P. Bartlett, Quincy (1894).
S. P. McDoel, Aurora (1894).
INDIANA—Calvin Fletcher, Spencer, Owen County.
IOWA—B. F. Shaw, Anamosa (1892).
A. A. Mosher (Ass't for N. W. portion), Spirit Lake (1893).
D. B. Long, Ellsworth (March, 1893).
KENTUCKY—Wm. Griffith, President, Louisville.
Dr. S. W. Coombs, Secretary, Bowling Green.
P. H. Darby, Princeton.
John B. Walker, Madisonville.
Hon. C. J. Walton, Manfordsville.
Hon. J. A. Steele, Versailles.
Dr. C. Price, Danville.
Dr. W. Van Antwerp, Mt. Sterling.
Hon. J. M. Chambers, Independence, Kenton Co.
A. H. Gobie, Cadetsburg.
MAINE—Henry O. Stanley, Dixfield (1893).
E. M. Stillwell (Assistant Commissioner), Bangor (1893).
MARYLAND—T. B. Ferguson (of Baltimore), Massachusetts (1892).
Washington, D. C. (1892).
Thomas Hughtell, Easton (April, 1892).
MASSACHUSETTS—Theodore Lyman, Brookline (1894).
E. A. Brackett, Winchester (1884).
Asa French, South Braintree (1881).
MICHIGAN—Eli R. Miller, Richland (1893).
A. J. Kollig, Detroit (1895).
Dr. J. C. Parker, Grand Rapids (1897).
MINNESOTA—1st District—Daniel Cameron, La Crosse (1892).
2d District—Wm. W. Sweney, M. D., Red Wing (1892).
3d District—Robert Ormsby Sweney, President, Paul (1893).
MISSOURI—Hon. Silas Woodson, St. Joseph (1892).
John Reid, Lexington (1892).
J. G. W. Stockard, 2,909 Pine st., St. Louis (1892).
NEBRASKA—R. Livingston, Plattsmouth.
H. S. Kaley, Red Cloud.
W. L. May, Fremont.
NEVADA—H. C. Parker, Carson City (1892).
NEW HAMPSHIRE—Albina H. Powers, Plymouth (1896).
Luther Hayes, Milford (1886).
Dr. Edw'd Spaulding, Nashua (1886).
NEW JERSEY—Dr. B. P. Howell, Woodbury, Gloucester Co. (1892).
Maj. E. J. Anderson, Trenton (1893).
Theo. Morton, Newton, Sussex Co. (1892).
NEW YORK—Hon. R. Barnwell Roosevelt, 76 Chambers st., York.
Edward M. Smith, Rochester.
Richard U. Sherman, New Hartford, Oneida Co.
Eugene G. Blackford (Fulton Market, New York Co. 809 Bedford ave., Brooklyn).
NORTH CAROLINA—G. F. Worth, Morgantown.
(Mr. Worth is acting as Commissioner and Superintendent, but being no special Fish Commissioner recognized in the State, his department is under the general supervision of the Commissioner of Agriculture, Hon. Montford Moore, Raleigh.)
OHIO—L. A. Harris, Cincinnati (1894).
C. W. Bond, Toledo (1894).
H. C. Post, Sandusky (1894).
PENNSYLVANIA—Hon. H. J. Reeder, Easton, Northampton (1891).
Hon. Ben L. Hewitt, Hollidaysburg, Blair Co. (1892).
James Duffy, Marietta, Lancaster Co. (1892).

The Sportsman Tourist.

THE STURGEON.

WHERE the broad Hudson gracefully sweeps Along its fair, romantic shores; Where past its western, wooded banks Androwning Palisades it pours; And upward where the narrowing stream Is girdled by the embracing bank; Far upward where the timbered woods Umbrageous gather, rank on rank, And downward where its outlet yields Its generous tribute to the deep, The white-scaled sturgeons glide or leap; A hard-sought prize to net or spear, Wherever they urge their free career.

Up the wide Sound, and far as tread The rocks that hem New England's coast; Up the Maine rivers, broad and deep, Where boiling tides are ever tost, The silver spangled sturgeon roam In the fresh tides or salty foam. And often gazing o'er the main Where the Atlantic billows break; O'er that limitless plain I see them their mad gambols make; Now swiftly shooting o'er the surge, Now leaping upward, each its length, In course eccentric on their urge. With matchless speed, surpassing strength, The billows brighten where they leap, The spray tides upward, white and high, Then sudden to abysses deep They settle, lost to human eye. Far, far along thy dangerous edge, O, Malle, with reefs and rocks beset, Lined with the seaweed and the sedge, Where ceaseless the salt surges fret, I've seen the gleaming sturgeons play, Along old Ocean's endless way, And where thy rivers pour their tide, Penobscot, Androscoggin wide, I've seen far up the drooping woods The sturgeon flashing in the floods. Ah, me! how pleasant to recall Those college days, so distant wide, When you and I, dear Longfellow, Wandered in converse, side by side; Wandered 'neath a Frisco-steeple's play woods, Or by the Androscoggin's floods; Now pausing by the way to note The pikeon rocks above us float, Or catch the sudden flash and leap Of the great sturgeons o'er the deep. Though time has long inscribed thy name High on the scroll of poet's fame, Yet well I know thy memory strays Far back to scenes of vanished days, To Brunswick woods and waters blue, When we were young and life was new. Though time has sprinkled on our brows His white, inevitable snows, Still in our hearts the fire-drops pour As warm, as loving as of yore.

Shelter Island, Sept. 16.

ISAAC McLELLAN.

A FEARLESS DOE.

YOU see, Hank had promised me a farewell hunt on one of the finest sheets of water that a deer ever plunged in. Where that is, my friends, and how we got there must forever remain a mystery, for I have promised Hank never to reveal his secret lake. It is sufficient for you to know that about five hours after we left camp yesterday we were passing through a grand piece of woods, a regular old "forest primeval." We were following a trail marked by blazes on the trees. It led us up the side of a steep ridge, and on its top we stopped to rest. All was still. There is a silence which never comes to the city even in the hush of midnight, nor to the fields of the country though the peace of the Sabbath rest upon them. It is that peculiar silence which is felt only in the deep forest.

I remember days in the woods when the whole air resounded with the notes of animal life; the quick chatter of squirrels, the sharp notes of the chickadee, the dull drumming of the woodpecker and the hum of insects. I remember days, too, when no sound broke the almost painful stillness, when even the falling of a leaf would have been a relief to the ear. It was on such a still day that Hank and I rested there, the only human beings in that vast unbroken wilderness. The scene around was grand. Huge pines and hemlocks towered above us, some to the height of a hundred and fifty feet, some even more.

On both sides of us the ridge sloped abruptly away, and we could look down into the valleys below. They were covered by many fallen trunks slowly crumbling away. Moss everywhere covered the ground with its soft carpet; it hung in masses on the mouldering tree trunks and had already taken up its abode on those newly fallen. Though it was a bright day, all was dark and gloomy in the forest. Here and there a few rays fell from an opening in the foliage above, glancing and glittering on the leaves and gilding the green ferns and mosses.

We followed the ridge along, Hank carrying the canoe on his yoke, I loaded with "duffe." It was a long carry, but the beauty of the country interested me and kept me from tiring.

At last we caught a glimpse of water through the tree trunks. Then it grew lighter, and we stepped from a clump of pines upon the shore of the lake at last. O! what a lake was there, my would-be deer slayers! Hank says that ours is the first cedar that in waters floated, and you would believe it if you could see the water. Only a moment we admired it, for Hank suddenly touched me and pointed to the opposite shore. The canoe was quickly in the water, and I, crouched in the bow, was intently watching the red form that was browsing along just under the alders. Long before we reached him the deer walked out. We turned back. "Well paddle round and inspect a little," said Hank, "get a daylight shot if we can, and if it be otherwise, go in and camp before dark."

The lake was the wildest and loveliest I had ever seen. The shores were densely wooded and high ridges rose from all sides. I found it hard to believe that human beings had ever looked on this wild water, for wherever man goes he leaves the mark of his destroying hand.

But there was no dead timber here, no peeled spruces, no fire slashes where careless campers had let their fires run, no mark or trace of man. Even the wild creatures seemed scarcely to heed our approach. Upon the left, where the shore was bold and high, two gulls were scanning themselves on a rock. Near by a woodcock was hurrying along with her brood behind her, while just across at the head of a marsh which stretched out from a tamarack swamp, where the inlet seemed to be, a crane stood, silently watching for his favorite frog. I was admiring the patience of the bird, wondering how he could stand there for hours with one leg curled up under his breast, when a quiver ran along the boat. I grasped the rifle and looked along the shore, but could see nothing.

"Right over there in that cove among the lily pads," whispered Hank. Sure enough, it was another deer.

"It's a little doe," said Hank. "Don't fire, it might spoil our chances for better game by and by."

"Let's see how near we eat get to her." At four rods she raised her head. The canoe was motionless, and the figures in it sat as if carved out of rock. She began to feed again. Three rods. I held my breath. Two rods. The canoe scarcely moved now. One rod.

"Look here, sissy," you'll doubtless be ignorant of this world's eussedness. The yearling raised her head and lowered into our faces as if to ask the meaning of that sentence. One quick, strong stroke and the canoe flew toward her. She jumped now. We were right upon her. I grabbed an oar and, reaching out, attempted to administer a parting chastisement for her temerity.

She was a little too far. We started back toward the outlet and made for the point where we had left our "duffe."

It was sunset now. Sun on one of the most beautiful lakes of the Adirondack Mountains. What words can paint the scene! Could we see it upon the canvas, glowing beneath the skillful artist's brush, we should call it unnatural and overdrawn. Would you try to imagine it? Read all the descriptions of glorious sunsets that have ever been written, among the Alps, the Scottish Highlands, our own White Hills; combine the beauties of all in one fair picture. That is an Adirondack sunset.

The breeze almost always dies away at evening. It was all gone now; not a breath left. The lake surface was a perfect mirror. As we looked over the boat side we grew dizzy and seemed to long to leap over and fall down, down away off there among those fleecy clouds, away into that vast abyss of space, and drift off amid the gold and crimson hues of that other sunset. Yes, there was another sunset, even more beautiful than the one above; another forest too. What was of more interest I perceived for the first time how very dirty my face was. But no; it couldn't be. That fat, dirty, tar-colored fellow who grinned and nodded at me from the boat below was not myself, or at least it was an illusion. I was clean, and fair too, so my wife says; but how two mouths in two hoods do metamorphose one!

[Continued from page 146.]

FROM VERA CRUZ TO MANZANILLA.

MARAVATO, MICHOACAN, Mexico Republic, July 25, 1881.

After only two days in the City of Mexico we were transferred by a short line railway to the Mexican stage, which extends as far as the town of Maravato, 250 miles north-west of Mexico, and midway between that city and the Port of Manzanilla, on the Pacific Ocean, the proposed terminus of our contemplated railroad survey.

I am now almost worn out after a terribly fatiguing journey of three days in the Mexican stage coach. Within the few days that I have been here I have seen a great many species of our most common northern birds in great abundance. Insects are equally plentiful, and as the birds are out of plume, being in the molting season, I shall devote my spare time to the collecting of beetles, which I will forward from time to time. Transportation by mail is high, the postage to the City of Mexico is twenty-five cents, while the transport of twenty-five pounds of merchandise of any kind to Vera Cruz costs three dollars. There are a number of old ruins about here, but the transportation of these great tablets or images would cost more than their value amounts to. Today I saw near my house some crow hawkbirds, mocking birds, meadow larks, quail, red-winged starlings, crows, blue jays, and many other birds, and also some warblers, some of which latter are new to me. There is also a plenty of water fowl on the near-by lake, and they appear to be in good plume.

This town of Maravato, where I am now stationed, is a rather pleasant-looking place of about four thousand inhabitants. The River Lerma traverses it; in summer this water-course is an almost dry gorge, while it assumes respectable depth and width in the rainy season. A few small fishes seem just now to be inhabitants. Near by and in one full sight is the volcano of Nevado de Toluca, which is an altitude of 17,800 feet, and is, of course, snow-covered at its summit. We came here by far the larger part of our journey by stage. This is a truly horrible affair to travel in, and is driven by mules which are frequently changed. We carried in our own conveyance seventeen passengers, and the conductor or postillion, whose chief and sole duty consists in driving his mules, which feat he accomplishes by the most dexterous use of a whip of about twenty feet in length. This instrument he wields around his head, and in any case, whenever needed, apply it specially to any particular one of his long team of nine mules, whether it be the foremost or in the rear. Whenever he exercises thus his dexterous skill he never fails to draw blood. The scenery about Maravato, after we arrived there, recompensed me for many privations we suffered on the way. High rocky mountainous walls arise almost perpendicularly everywhere, and through vast gorges the little river Lerma winds its way. Every mile or so a hacienda, strongly enough walled for any siege, embellishes the picture. The stations on the way to Maravato are equally substantial-looking structures, all surrounded by high and massive walls. I shall never forget the night our party spent at one of them near Haroban, a little town on the way from Yxamalaca to Maravato. We arrived there tired and hungry. After supper, which was served on a table so high that we could barely reach up to its edge with our hands from our low seats, were accommodated with a few rough mat-

CATALOGUES RECEIVED.

Winchester Repeating Arms Company, New York.

WREAKFISH ABOUT NEW YORK.—For the past two weeks weakfish about New York.—For the past two weeks weakfish have been plenty in the vicinity of New York City. Many have been taken with the hook off Staten Island. For the past few days the catch has been light, but they may come in the bay in considerable numbers yet. This fish is the "squeteague" of Massachusetts and the "salt water trout" of the Southern coast. It has been a fair season for it, as far as we have heard, and does not seem to be decreasing as fast as some other fish.

trusses and blankets. As the night was very cold, we found good use for our own of heavy texture, or else we would have nearly sufficed for the natives in this latitude 20 deg. 40 min., and fairly within the tropics.

There were about a dozen or more sinister-looking individuals of dark, forbidding aspect, sauntering around the tavern, and their looks were not at all calculated to put us at ease. As we hardly fancied our situation, being all alone and thus far without any government escort, in an out-of-the-way place among an ever turbulent, lawless population, we took some precautionary measures to impress the natives that we were at least not absolutely helpless. All of us were well armed with Sharps rifles. I carried an excellent snipe-barrelled breech-loading shot-gun for collecting purposes. We took, then, good care in making an impressive display of our defensive and offensive material by a proper exhibition of the same before the crowd, who viewed this demonstration with feelings not at all harmonious with the calculations they had originally made, and disappeared one by one disappointed into the darkness of the night. We deemed it advisable, however, to keep, after we had indulged in a strict watch all through the night, to guard against any sudden surprise on their part against the Gringos, who ever since the American-Mexican war have been regarded by these people with bitter hatred. Nothing, however, happened to disturb our repose, and with dawn morning we were enabled to again resume our tedious journey for Maravatio, which we reached next day.

There are no mosquitoes here, but legions of flies fill the bill of annoyances. They find good pasture on dogs of all kinds—many, lean, hungry curs, of which every man about town owns at least a couple. The climate itself is otherwise unobjectionable, and we have at this time of the year refreshing showers, which occur late in the afternoon most every day. The air, owing to the high elevation, is so rarified that even such a trifling exertion as going up stairs is frequently attended with copious bleeding from the nose, and we soon get entirely out of breath whenever we attempt to walk fast. Otherwise the atmosphere is remarkably pure. Large pieces of fresh beef may hang in the open air without any danger of decomposition; they dry up gradually. Such climatic advantages naturally induce in their aid in the preparation of all taxidermical preparations which I shall make shortly, when the mature plumage of the birds will pay for the trouble and time expended in this tedious labor. Maravatio, where I am now temporarily stationed, is built like any other Mexican town, and consists chiefly of one-story houses with brick walls, which surround an open courtyard, whereby every house is almost a sort of enclosed fortress-like square. The streets are rather narrow, with sidewalks of about two feet in width, with a gutter in their center, which keeps the rain-water clear. Well-to-do people live in rather comfortable quarters, but the poorer persons are housed in dirty cells of about fifteen feet in height and sixteen feet square, with a single room without any floor or windows. The men wear only cotton shirts and pants of like material, while the women are attired in a single loose sort of a chemise or petticoat, without either bonnets or foot gear. Their children are half-saundered and very dirty.

We expect soon to leave for Guadalajara, which we shall make for some time our headquarters. Birds are plenty, but not in good plumage. I made a good snipe out of a lot of nice fat golden-winged. I see a lot of Indigo birds, yellow birds and a sort of very small pigeon quite frequently. A contractor, who is here at work grading the roads near Texaco, a village on the banks of the Texaco Lake, stumbled in his excavations upon a large lot of ancient pottery, coins and tools, but will not part with nor sell a single fraction of his collection. The postmaster of the village, however, to whom I have been of incidental assist, has promised me a set of duplicates from his own store of ancient curiosities. When I am in the field at this time I shall be able to furnish a more interesting and exhaustive account of what comes under my own observation. **LOUIS VON NIKENBORFF.**

BUILDING A BIRCH CANOE.

In the following account of his trip across the River St. John, our friend Mr. Edward Jack, has told more than many another could find to report so entertainingly in a voyage around the Horn:

"It was Le Maître, I believe, who wrote an account of a journey around his room, and on this subject produced a vast amount of world-wide attention. The journey which I am about to describe was a little more extensive and embraces a distance of three-quarters of a mile.

"On the 27th of August, 1880, on a bright, clear and calm day, Mr. Robert Orr and the writer took their seats in the bark canoe of Gabe, who is so well known to sportsmen frequenting Fredericton.

"When about midway of the river we noticed a canoe with two Indians in it, apparently searching for something on the bottom. On hearing them our captain and pilot addressed them in the Abenaki language, asking them what they were doing. The reply was, fishing for a piece of wood attached to the sunken French vessel about which we have heard so much. Going up to where they were we could distinctly see in four feet of water the keel and what remained of the ribs of a sunken vessel. Gabe said that he had never seen the River St. John so low before, that the tide now rose 12 inches, while in ordinary years at the lowest time of water the rise here was only from 6 to 7 inches. Drawing near to the shore, the writer said that as he had good boats on he would step on to the water first in order to save the canoe. It was in vain, but Gabe replied to this suggestion by saying that he would like to know who was master of this ship. Obedience to the captain being therefore a duty, Gabe was allowed to step out first and haul the canoe ashore. After disembarking, we ascended the shore to the Indian village, which stands opposite to Fredericton. Here we found two Indians at work building two canoes, a remarkably interesting operation, and concluded that we would chronicle for the information of the public all the details relating to the construction of the light and fairy crafts which glide so smoothly over our lakes and rivers. We proceed, accordingly, to give Gabe's description of it.

"The bark is obtained from the white birch; there are two kinds, the summer and the winter. The latter is much the better, and is obtained in the month of May; the tree being selected, which is one of good size, is cut down; its limbs are made and with these the outer bark of the tree is warmed to facilitate peeling, a cut is made in it the desired length and the bark is skinned off by inserting a sharp-pointed piece of bark, which is then used as a plane, and, as the harder material is scratched or otherwise injured the harder substance. After it is peeled it must be again warmed and flattened on

the snow or ground; it is then rolled up like a sheet of paper, warming it as this is done. The inside of the winter bark is a smooth brown; of the summer, a whitish yellow. Winter bark is more compact and firm, from its being peeled before the sap ascends; that which is peeled later in the year is inferior.

"In building the canoe, the ground is first made smooth and level and is beaten down to make it firm. The bark is then spread upon it. The gunwales are framed, fitted together and laid flat upon it. A large quantity of stones, say half a ton, are then placed upon the bark, which is thereby rendered perfectly smooth. It is then cut so as to give the canoe the proper swell and shear. Strakes are then driven into the ground to preserve the shape of the widest part of the canoe and keep it firm all around. Side pieces of bark are sewn on to make the sides sufficiently high. For this purpose the small, fibrous roots of the black spruce are used, these having been previously split in two and being, consequently, half round. If the bark be big enough, side pieces are not required.

"The bark is kept in position by long, narrow strips of ash or other flexible wood, which are placed longitudinally inside of the sides.

"The gunwale is then raised from the ground and placed in its proper position; the bark is turned over and tacked to the top of it.

"The canoe is then taken up and placed bottom up on elevated cross poles and the bow and stern fitted to their proper shape and the seams are painted with a mixture of resin and oil.

"It is then placed again upon the ground; long, thin strips of cedar are laid in the bottom for planishing.

"Ribs of cedar, which have been prepared by drying for a length of time, then steamed and bent into the proper form, which they are made to retain by means of a bandage of cedar bark, are brought out.

"Grooves having been left in the side of the gunwale for the top of the ribs, each rib is placed on the bottom and driven into its proper position by means of a peculiarly shaped semi-elliptical mallet, the head and body of which are made of one piece of wood. This mallet is named by the Indians a teek-a-hoh-ah.

"Shafts are stuffed into the cavities in the bow and stern; against these are driven a thin piece of cedar to keep in place, and the work is done.

"Gabe said that the canoe was always christened. I asked him how, but he appealed to Big Louis, who he said, was the canoe builder. Louis admitted that it was so, but to my inquiries as to how this was done merely shook his head and laughed, nor would he vouch me a single word on this important subject.

"On our return to our canoe we noticed the Indians and squaws at work. One of the latter was squatted on the ground, making fancy baskets of sweet hay, which seem to be in demand at the present time.

"Before leaving, Gabe made me a present of a beautiful arrow head of white translucent quartz, having parallel bands of smoky quartz through it. He said that he had lately found it at the mouth of the Clearwater, a branch of the Southwest Miramichi, where he says found some old Indian relics every time that he passed. It was only last summer that he discovered there an Indian mortar, which they used in preparing their corn for cooking. This he had unfortunately left behind.

"Embarking in our frail vessel, we were soon across the river to Fredericton, and thus ended a journey of an hour. The recital of its events may, I hope, prove as interesting to the reader as they were to the writer."

CHAT BY AN OLD TYPO.

All who are not acquainted with the inside workings of a large office the typographical errors that sometimes creep in are matters of wonderment, but to the initiated the wonder is that so few appear; that out of such a chaos of villainous manuscript perplexities and errors as fair a whole is sent forth as any marbling paper presents to its readers.

In an article treating on the literary attachés, et al., of a defunct daily the writer pathetically referred to "Mr. D., the old bookkeeper of the *Intelligencer*," which the compositor rendered "Mr. D., the old bull pup of the *Intelligencer*." To say that an author who greeted the presentation of his proof does scant justice to the occasion. The unhappy author of the bull, like the wife of Weller, kept on, not "cutting bread and butter," but setting type.

The next in order is the "Old Pil," thus named by an honest Teuton who found it difficult to enunciate the second letter of the English alphabet, who was and is a local celebrity and many times has distinguished himself in twisting the types. Having occasion to set a display head during the war between France and Germany, read as "The Franco-Prussian War," he rendered it "The Francoisen-Prussian War." "The Prince de Joinville Turned Pirate" appeared "The Prince de Joinville Turned Pirate." Being a candidate for delegate to the Printers' Union when it met in Montreal, the old gentleman, who has always enjoyed a fair degree of popularity among the boys, felt quite confident of his election. But he was not as close a reader as many of his craftsmen are known to be. Hearing the expression "shooting the rapids," in connection with a trip to Canada, he but imperfectly caught it. On the morning of the preceding the hallooer himself: "Well, boys, I suppose that by this time next week (it was the first week in June) I shall be up in Montreal shooting rabbits." The shout that greeted the announcement told the old man that again had he gotten his foot into it.

A man who had been reading a paper in *Jarper's* on the "Rise and Fall of the Turkish Janissaries" had the name "Julias Icarotto" set up in an editorial and gave it "Julias Janissary." The hilarity which these mistakes occasion in an office constitutes the spice island of a compositor's life on a morning paper.

I observe that the *FOREST AND STREAM* treats considerably of dogs; indeed, I have observed that peculiarity in most sporting papers. Well, without further premise, I proceed to the black-and-tan incident. Mr. Aman, on Ninth street, near the avenue, keeps a restaurant and a lively little dog, Jerry. When the dog law took effect poor Jerry had to submit to the cruel strain like other respectable dogs. A new friend of the dog. One day he got Jerry on his lap and thrust a stout wedge through his mouth-strap, but at an acute angle, and let him go. The dog resumed the endless hunt for the unhappy King of Ireland, who was changed into a dog by the fairies. The first dog that came round the corner

was an immense mastiff, who, with sedate and dignified tread, was passing by without stopping; but Jerry, eyeing the stranger, and hurrying out of the bar-room to interview him. The interview ended as soon as it began with the big dog going up the street with remarkable celerity and no dignity at all. The expression of surprise on Jerry's face at his mysterious power was only equalled by that of the dogs whom he interviewed. The affair made so much fun and confusion that Jerry's needle was performed broken off.

QUAIL IN CONFINEMENT.

I HAVE been informed of the successful raising of young quail. Last spring a year a boy caught six young quail in the Park (they were apparently not more than a day or two old), and brought them to Mr. Geo. K. Miller, of No. 246 North 2d street, Philadelphia. He thought it a shame to take such young birds, and desired the boy to return them to the place where they were found. The boy refused to do so. Mr. Miller then took them into his garret, where he had an old hen quail. Placing them on the floor, he waited to see what the old quail would do. She immediately commenced to call them. The little things ran to her and got under her wings, and appeared to think they were with their mother. She raised five out of the six, and to-day they are as fine, hearty, large quail as one ever saw. Mr. Miller will keep them until spring, when he will give them to me to set free on my place in Montgomery county, Pa. I shall watch them closely, and from time to time inform you as to their habits and prosperity. I think this a remarkable case, and one worth bringing to the notice of the readers of *FOREST AND STREAM*. The quail can be seen any time by calling upon Mr. Miller at his residence, 246 North 2d street, Philadelphia, and he can furnish the testimony of many gentlemen who saw the quail when only a few days old. **LEWIS W. SHARPE.**

Maple Grove, Montgomery Co., Pa.

MY WOODPECKERS.

HAVING issued my annual bulletin about the nesting and hatching out their broods of a family of "woodpeckers" which have come regularly to perform the same duties of procreation, and in the identical spot prepared by them, in a tree close by my bed room door four years ago, I feel it a duty to myself and the reader's of the *FOREST AND STREAM* to announce the annual return of my noisy friends, and the fact that according to my belief on this last visit they raised two broods. If not, they certainly lingered much longer than in previous years.

As one of the young ones of what I will call the first brood was being taught the means of loc motion, and while too sparsely ledged to more than skip from branch to branch in its native aerial birthplace, an accidental gust of wind blew it from its perch and the poor little fellow fell to the ground, making a hideous cry for assistance and which, though intended for its parents, attracted first the attention of a huge crow. This cruel fellow unhesitatingly dashed for the dainty morsel which he no doubt thought had been prepared for him by the "gods of cats" but not until the mournful wailings of the young bird had reached the ears of its natural defenders. Here they came, helter skelter, plumage erect, and by their dual cries denoted the passion in their hearts as to the rescue they dashed. "Thomas" was taken shack, but in turn resolved to fight rather than run, so he instantly assured the most approved hellfegant attitude known to his race, and he no doubt said in his own language, "Come on, woodpeckers," etc., could we have only understood his vernacular. Certainly he did defy them with tones as full of anger as those with which his assailants made the charge. The birds were too quick in their movements for "Tom," and though they did not save their dear one's life, or kill the murderer, they did withdraw from the conflict the conquerors leaving, as they did, "Thomas" minus both eyes. I regretted losing the cat because he had done me more service than my casual visitors, yet I could not but feel a certain emotion of satisfaction in witnessing severe justice dealt to a ferociously monster by two little weak creatures like my woodpeckers, in return for the heartless outrage perpetrated upon them, particularly as "Thomas" had no rage ungratified.

Neville, Sept. 19, 1881.

J. D. H.

TWO PUZZLING QUESTIONS.

Editor Forest and Stream:
Do yellow-billed and black-billed cuckoos mate together? About the 20th of July I was passing through an old apple orchard in the suburbs of our city, when a cuckoo flew from a tree over my head into an adjoining tree, and I noticed that it had something in its bill. On examining it more closely I saw it was a black-billed cuckoo and had a grub. I came to the conclusion that it must have a nest near by and on returning to the tree from which it flew, I found a nest, and what surprised me more, there was a yellow-billed cuckoo on it. On further examination I found there were two nearly full fledged young birds in the nest, and the question occurred to me, Do the two species mate with each other? I visited the nest a day or two after and tried to see if the bills of the young birds were alike, but the nest was so far out on the limb that I could not reach it. At this time I saw only one yellow-billed cuckoo. Some two or three days after I made another visit, but the birds had flown, and I could find neither old nor young birds in the orchard. On my next visit, which was not for the cuckoos alone. On the 22d of June, while passing under the very next tree to the one containing the cuckoo's nest, I found a humming-bird's nest, containing two eggs, and as it was the first we had ever found I took a part of the branch, nest and eggs to add to our collection. On July 17, twenty-five days after, while passing near the same tree, I noticed a humming-bird fly past me and the thought came to me that perhaps I am in the very building another nest. A few moments after, in the next tree in the next row, I found the nest containing two young humming-birds just out of the shell. As the nest was only eight and a half feet from the ground, I could easily pull it down and examine them, which I did a number of times within the next two weeks. I was surprised to notice that the bills of the young birds did not grow in proportion to the body, as they did not seem to be much longer than the bills of other young birds. On my last visit I found the nest

empty and, as in the case of the first nest, took a part of the branch and nest. And now I would like to ask the FOREST AND STREAM if it thinks both nests were made by the same birds. J. L. D.

[It is difficult to give a positive answer to such questions as are asked by our correspondent, and we can only give an opinion. We think it possible that a yellow and black-billed cuckoo might breed together, but very improbable. We should think it much more likely that there may have been some mistake in the identification of either the male or the female bird. We think it very likely that the second humming-bird's nest was built by the original pair of birds.]

LONGEVITY OF TURTLES.

WARRENTON, Va., Sept. 17, 1881.

Editor Forest and Stream:—The following express a "dry land terrapin" picked up by a friend between this point and the Fauquier Wild Sulphur Springs, where the "Yankees" camped on the land of Mr. Kemper, in 1862.

Examine the under side of this creeper, and you will find the inscription—

1802.

YANKEE.

Which fixes the age at nineteen at least. How old the "terrapin" was when the aforesaid "Yankee" put his bottom mark upon him is a matter of doubt. Evidently he was a full grown. After inspection will you transmit the terrapin to the Smithsonian Institution at Washington, where he can be cared for and fill the full term of a respected old age.

R. H. D.

[The question as to the age to which the animals of this group attain is an interesting one, and deserves more attention than has yet been given to it. That turtles are unusually well protected from the attacks of enemies is certain. We have been told, however, that raccoons eat the freshwater turtles, and have ourselves found the shells under circumstances which seemed to confirm this statement. A note on this subject which has recently appeared in the American Naturalist from the pen of Dr. A. S. Packard, Jr., bears directly on this subject. He says:

"So far as we are aware, no attempt has been made to explain the unusual longevity of turtles, whose lives, as is well known, span over a century. There appears to be no longer lived animals than these beings of slow gait and slow manner of life. The following facts may throw light on the cause of their great age. In the first place, they are protected by their solid shell from the attacks of snakes, fishes and birds; young turtles, we are informed by Professor J. W. P. Jenks, are sometimes carried off by herons, but in adult life they are probably rarely eaten by other animals. Has any one ever found any empty turtle shells? As some turtles lay but two or three eggs a year, nature seems to have counted upon an immunity from the ordinary evils of childhood in these animals. It is probable that the larger portion of—indeed most—young turtles when hatched survive, and when two or three years old, are fitted to resist successfully ordinary fish and avian enemies. They are not exposed to vicissitudes of weather; the fact that the period of egg-laying (in New England from June 20-25) is so constant, and varies so little at different seasons, shows that they are hardy and tough. Finally, the persistence of the type of gigantic tortoises on the Galapagos Islands indicate the wonderful vitality of this type of life in resisting prolonged climatic and geological changes."

The shells of the common box tortoise are not uncommonly found in dry woods, and we have twice found in the wet meadows near the salt marshes of the Atlantic coast shells of *Wanemys guttata*, which had apparently died a natural death.

We do not remember that any extended observations have been made on this subject, although the general belief that turtles live to a great age seems to be justified by what we do know.

The specimen referred to by our correspondent has been received and thought to be a lively and apparently in good condition. Beyond the inscription above noticed, there appears very faintly on the back part of the shell the initials R. N. or R. M.

Can any one claim the specimen as an old acquaintance?

SPECIAL INSTANCES OF ANT INTELLIGENCE.

It is always difficult to draw the line between instinct and reason, between adjective action due to hereditary or purposive habit and adjective action due to individual and purposive adaptation. But we may be least diffident in accepting, as evidence of the latter, cases where animals exhibit a power of adapting their actions to meet the requirements of novel circumstances—or circumstances which cannot be supposed to have been of sufficiently frequent occurrence in the life-history of the species to have developed instincts of mechanical response in the individual. It is in view of this consideration that the following instances are selected:

Ebrard records in his "Etudes de Meurs" an observation of his own on *F. fusca*. The ants were engaged in building walls and when the work was nearly completed there still remained an interspace of twelve or fifteen millimetres to be covered in. For a moment the ants were thrown into confusion, inclined to leave their work, but soon turned instead to a grass plant growing near, the long, narrow leaves of which ran close together. They chose the nearest and weighted its distal end with damp earth until its apex just bent down to the space to be covered. Unfortunately, the bend was too close to the extremity and it threatened to break. To prevent this misfortune the ants gnawed at the base of the leaf until it bent along its whole length and covered the space required. But, as this did not seem to be quite enough, they heaped damp earth between the base of the plant and the end of the roof, and another gnawing at the base. After they had attained their object they heaped on the buttressing leaf the materials required for building the arched roof.

This observation naturally leads to two others by two different observers. Thus, Moggridge says: "It was able to watch the operation of removing roots which had pierced through their galleries, belonging to seedling plants growing on the surface, and which was performed by two ants, one pulling at the root, and the other gnawing at its fibres where the strain was greatest, until at length it gave way." Again, as previously quoted in another connection, he says that two ants sometimes combine their efforts, one stationing itself near the base of a footstalk and gnawing at the point of greatest tension, while the other hauls upon and twists it.

The other observer to whom I have referred is McCook, who says of the harvesting ants of America that he has seen "the workers, in several cases, leave the point at which they had begun a cutting, ascend the blade, and pass as far toward the point as possible. The blade was thus borne downward, and, as the ant swayed up and down, it really seemed that she was taking advantage of the leverage thus gained, and was bringing the augmented force to bear upon the fracture. In two or three cases there appeared to be a division of labor; that is to say, while the center of the roots kept on with his work, another ant climbed the grass-blade and applied the power at the opposite end of the lever. This position may have been quite accidental, but it certainly had the appearance of voluntary co-operation."—G. J. ROMANS, in Popular Science Monthly for October.

NOTE ON SNAKES.—Medis, Delaware Co., Sept. 19.—I have read in your paper of September 13, the interesting communication of H. J. Lombard, of Castle Valley, N. C., in reference to snakes. In it he states that "all harmless snakes have been tails and lay eggs." I can now recall to mind at least two exceptions to this rule. I have seen, among the mountains of North Carolina, not far from Castle Valley, a snake of stout body and thick, short tail, viz., the hog-nosed snake, sometimes called the spreading-eater, *Heterodon platyrhinos*. This snake is harmless, though the sight of it is quite suggestive of venom.

I do not think that the common water snakes of Pennsylvania lay eggs, as I have frequently killed them with young snakes in their bodies. They are ovo-viviparous.

In reply to a former question in your paper, "Do black and garter snakes eat fish?" I have seen garter snakes eat fish, both fresh and in a putrid condition. In the former case, the head is swallowed first. In the latter case, the tail was swallowed first, the flesh being then soft, the dorsal spines were easily reversed, and offered no impediment to the process of deglutition. I had never seen any record of snakes eating putrid fish.

When a garter snake swallows a frog, the hind feet and legs go down the throat first. The frog is not previously killed, as I have heard one cry pitifully after it was swallowed. A hungry snake will sometimes make an absurd attempt to swallow a large fish. I once observed, for a long time, the efforts of a garter snake to swallow a fish so large that it could get but little more than the snout and fins. It was finally abandoned.

In illustration of the Southern distribution of the beaver, I will state that I have seen the stumps of small trees freshly cut by beavers in Cherokee County, North Carolina, near the Georgia State line.

J. WILLOOX.

[It is curious to note how almost universal is the belief that the hog-nosed snake, sometimes in New England called puff-adder, is venomous. Probably the only dangerous snake in that portion of the country east of the Hudson River is the rattlesnake, which is almost everywhere extremely rare.]

ARRIVAL OF A YOUNG GORILLA IN ENGLAND.—The last issue of *Land and Water* contains the following account of the recent arrival in England of a young gorilla: "We are informed that Mr. Cross, the animal dealer, of Liverpool, has received a fine young gorilla. It arrived on the steamer *Senegal*. During the voyage from Africa to the Mersey, the gorilla appears from an account which is published in the *Liverpool Daily Express*, to have given some trouble on board. After the vessel had been a number of days at sea, the animal, availing it of the liberty which had been incautiously given to it, made an attack upon several of the crew. It ran sinuic, in fact, at the captain, biting him savagely in the leg, and two men who came forward to his assistance were also attacked, and to some extent injured. By dint of some well-applied chastisement, however, the gorilla was induced to confine his ebullitions of temper to mere displays of his teeth, and later it was found possible to treat him without severity—a change of tactics which he repaid by becoming quite tame, and allowing himself to be handled with tolerable impunity. The gorilla was taken on board the *Senegal* at Settecama, a small port on the southwest coast of Africa, and on its arrival in Liverpool it came into the possession of Mr. Cross. The animal is not, as might be implied from the foregoing account, at all fierce, but is a fully grown specimen, but its physique and appearance, as well as its height of four feet four inches, give it what might be called rank even among the finest of African gorillas. The new arrival has already accommodated itself in the most condescending manner to its new quarters, where it is fed on Valencia raisins—of which it eats a pound daily—eggs, and other dainty food, which it devours voraciously. He has at present a cat for a companion, and the pair play some amusing antic."

FANGS OF THE RATTLESNAKE.—Vicksburg, Miss., September 7, 1881.—The fangs of the rattlesnake are perforated from base to point, through the centre, the hollow being about the size of a canalic needle. The specimen which I examined was three and a-half feet long. I boiled the head and found on each side of the upper jaw three fangs: one matured, one about half grown, and the third in embryo. The matured fangs were three quarters of an inch long, hollow from base to point, the base being much enlarged and containing a cavity as large as a pea. The fangs are curved like a blackberry briar. The orifice at the point is in the form of a slit, in the upper side, as though a diagonal slice had been shaved off with a penknife. I ran a fine straw entirely through the fang. The upper jaw is immovable, as in the case of most vertebrates. The lower jaw works on a hinge, and is susceptible of being opened wide enough to lie back against the throat, giving unobstructed play to the fangs.

"MAROONER."

A GENEROUS OFFER.—Fort Madison, Iowa, September 10, 1881.—I to-day caught a two-third grown cock pheasant. He tried to cross the river here and when he landed he was nearly played out that I walked up and picked him up. I will try to keep him and will send him to any one that has a hen, and would like to domesticate them.—W. H. ARTEE.

[We hope that some of our readers are in a position to accept our correspondent's generous offer.]

A HINT TO "HOWARD"—Warrenton, Va., Sept. 21.—I see that "Howard" asks you for some place in Virginia to hunt as large as B. September. There is absolutely no game at that time if I except a few squirrels. The song and wood birds have left, the partridge season does not open until Oct. 15, the wild turkeys are in the mountains, the ducking grounds are bare and woodcock in the depths of the swamp. If "Howard" don't intend to stay he may as well leave his breech-loader at home as to bring it here this season of the year.—CHASSURS.

Game Bag and Gun.

FOREST AND STREAM GAME TABLE.

OPEN SEASONS.

The seasons, in which it is lawful to shoot game in the several States and Territories, open as designated in the following table:

Table with columns: States, Deer, Woodcock, Quail, Ringed Grouse, Pinnated Grouse (Chickens), Wild-Fowl, Wild Turkey. Rows list various states and their corresponding seasons for each game type.

Antelope.—Cal., Sept. 1; Idaho, Aug. 1; Neb., Oct. 1; Nev., Aug. 1; N. Mex., Sept. 1; Utah, Aug. 1; Wyo., Aug. 1.
Buffalo.—Cal., Sept. 1; Neb., Oct. 1; N. Mex., Sept. 1.
Caribou.—Me., Oct. 1; N. H., Sept. 1.
Doves.—Ala., Aug. 1; Cal., July 1; Ga., Oct. 1; Kan., Aug. 1; Miss., Sept. 15; Mo., Aug. 1; N. C., Oct. 1; S. C., Oct. 15.
Hk.—Cal., Sept. 1; Idaho, Aug. 1; Mich., Oct. 1; Neb., Oct. 1; N. Mex., Sept. 1; Or., July 1; Utah, Aug. 1; Wyo., Aug. 15.
Hoose.—Me., Oct. 1; N. H., Sept. 1; Ore., July 1.
Mountain Sheep.—Cal., Sept. 1; Neb., Oct. 1; Nev., Aug. 1; N. Mex., Sept. 1; Utah, Aug. 1; Wyo., Aug. 15.
Plover.—Del., Sept. 1; Mich., Aug. 1; Mo., Aug. 1; Nev., Sept. 1; N. H., Aug. 1; Pa., July 15; N. J., Aug. 1; N. Y., Aug. 1; Ohio, Aug. 1; S. C., Aug. 1; Va., July 15; W. Va., Aug. 1; Wis., Aug. 1.
Redwing.—Del., Sept. 1; D. C., Sept. 1; N. J., Aug. 25; Pa., Sept. 1.
Sage.—Dakota, Aug. 15; D. C., Sept. 1; Nev., Sept. 1; N. C., Oct. 15.

*In these states there are special county laws. A deer law applies to all counties. In Upper Peninsula deer season opens Aug. 15. D California quail protected to 1882. E in Cass County deer season opens Aug. 1; moose and caribou season, Sept. 1. F in Cook County deer season opens Aug. 1; moose and caribou, Sept. 1. G quail shooting prohibited to Nov. 1, 1882, in counties of Montgomery, Schenectady, Saratoga and Albany. Wildfowl season in Long Island waters opens Oct. 1. A Deer law relates to game only.

SOME OLD GUNS THAT I HAVE SHOT.

I SPRUNG from a race of sportsmen. Well do I remember the picture of an ancestor engaged in a hand-to-hand encounter with a large stag. Cruelly wounded and disfigured by the sharp hoofs of the infuriated deer, whom he had "creased," his turtled dyed in blood, he stood in the picture, giving blow for blow with his stout hunting knife, which, as the story goes, he at last plunged into the heart of his maddened enemy. How I cheered the large deer bound in the picture, slowly trailing the stag; how I could stand with bated breath that the stag too was covered with wounds, and how I read the story of the picture and resolved that I too would some day kill my stag and, if need be, would kill him with my knife. I did, but that was foreign to this paper.

I never had the child's love of gunpowder simply because it made a noise. The first attempt that I remember—I think I was about seven, and my faithful friend and my *Fidus Achatas*, Dick, cock black, about nine years old, was converted into "ole man" John's fishing cane into an *essex* gun. This cane, which had grown in Mississippi, was about the size of my arm and about twenty feet long. To cut off two joints at the bottom would not hurt, the cane and would make us a good gun with which to shoot "dat ole rooster," a very pugnacious bird and Sandy's and my special enemy. When we had cut off the joints we bored a touch-hole at the bottom of the first joint, and thus we had a gun about three feet long, calibre No. 8. I did the aiming, while Sandy would apply a lighted pipe, hold the gun and tremble, to the primer. With light rifle charge, and shot carefully counted, fifteen in number, we brought to grief, in the orchard, divers sapsuckers and other sandy and ill-conditioned birds.

Growing bolder, we resolved to test the efficacy of our improvised fowling-piece upon the nefarious rooster who had so often put us both to shame and ignominy by driving us out of his domain with sharp spur and peck, delivered *en treille*. Putting in our blunderbuss two rifle charges and five rifle bullets, we slipped up to the fence and saw our enemy strutting in all his glory, not more than ten feet distant. To aim, to apply the coal was but the work of a moment, and the next we were asking each other what had happened. The gun—our fondly cherished gun—was gone, and with the exception of a few splinters, none could tell where it had gone. Sandy was minus all the wool on one side of his head from too eagerly watching the effect of the shot and sighting as he applied the coal. I, too, was minus eyebrows, eyelashes and most of my hair. Fortunately for the peace of mind of those who had me in charge, I was set off to board my school in a short time afterwards, and Sandy was made "game minter." He detested me in a feeling manner how "ole Mas" had licked him for eating "dat rooster." He had taken that tough fowl to his mother's cabin and some wretch had told on him. I was affected, but told him to keep quiet, gave him a silver half-dollar to insure it, and parted from the staunchest friend that I ever had. Brave Sandy! How

many would have kept their counsel and never told on me? He had his reward in way of cents, and he now lives in a comfortable manner "way down South" in Alabama. Good luck attend him, and may his round, black face never grow discolored!

It was at the boarding-school that I first fired my first "sure enough" gun. I had been sent to a cobbler of that vicinity to get my shoes half-soled—needed badly from too much sliding on the ice—and there I remember that the disciple of St. Crispin let me have in my two hands an old musket that had seen service in all the wars in all America. Proudly did the owner point to a dent in the barrel made by an Indian tomahawk. How I fawned upon that cobbler! How anxiously I waited breathless upon his lightest word! And yet he ate raw onions and drank bad whiskey—two things that which there could be nothing more disgraceful to my infant mind. (The judgment of my ripper years has but confirmed that youthful opinion.) On the next Saturday but one I was to meet the crafty cobbler (who had gobbled my whole supply of pocket money) in the woods, near his cabin. At length the happy day dawned, and I ate little or no breakfast on that morning. I found him seated on a stump, with two bottles containing powder and shot, and a third—something that he had frequent recourse throughout the whole day, necessitating, finally, his assumption of a recumbent position, where I left him alone in his glory. The gun was handed to me to carry, and proudly did I assume that heavy weight. We had not gone far when a large blackbird, who had been fishing in the creek, upon the top of all systems and commenced his usual farcical dance upon seeing me. At least, that was the rule with his tribe, and I had sworn vengeance whenever and wherever I could get a chance at one of his fun-making companions. Laying my gun up by the side of a small tree, with my heart beating triple time, I took deliberate aim and pulled trigger. No one but those who have shot a flint-lock gun can have any idea of the intolerably long time intervening between the pulling of the trigger, the fizzle fizzle! fizzle! of the priming, and finally the loud report, followed, as in my case, by your falling in no light manner, either flat upon your back. I arose, and, feeling for my bruises, I went to look for my old enemy, the blackbird. I found him doubled up among some briars, looking a very forlorn bird indeed. Where he all your fun-making now of innocent, large-eyed boys? We gather him and go forward on the hunt. The tales at the end of that day sum up: Two blackbirds, two larks, one yellow hammer, one jay, and one glorious rabbit, shot from a nest across an old log.

I had a schoolmate, Peter Holmes, who loved to shoot as well as I. Many a time that we took the cobbler's gun and killed of birds a great number, finally aspiring to the dignity of killing squirrels, for which his gun was not well fitted. And right here let me say that I have found many old smooth-bore muskets that shoot remarkably well. On what principle they do so I am unable to say; but in the hands of our Southern negroes they have killed all the squirrels. They are certainly not choke-bored, they are not made of fine materials, and yet, for No. 8, No. 4 or No. 2 bullets, they will kill like a snipe, and are coming in falling in no light manner, either flat upon your back. In the hands of pot-hunters they are formidable weapons. I wish there was not one in Georgia—I should be happy.

I went home with Peter Holmes, my affinity, to spend the vacation, my uncle remarking in his letter giving me that permission, "that it did not much matter where I was, because gunpowder was plentiful, and I would be sure to bring my inventive genius to bear upon the construction of some to burn it."

Throughout the South at that time all old rifles that had become smooth from long use were bored by gunsmiths and converted into shot guns. As the bore was originally very small, the gunsmith merely cut all the "rifles" out, and left the gun about .25 caliber. Indeed, I have seen some as small as .50 calibre. Bored on no scientific principle, admitting but a very light charge, they were utterly worthless at any but a very short range. My friend was the fortunate possessor of one of these unique shot-guns, and, above all, it was fired with percussion caps; and, furthermore, if you had a right, it would kill a man if a shot from the muzzle of the tall shell-bark hickory that could be found on our place. As to doves, why, that gun could kill one ever so much further than brother Jim's rifle, which tore 'em to pieces; and my gun would do it too, but you shoot shot out of it, instead of a single bullet. As to yellow-hammers, why, I never shot at one in my life, far or near, that he did not fall stone dead. Our first exploit, two or three days after our arrival at Peter's home, was to expend our whole stock of powder and shot at three discolored gray squirrels in a game country. It would have well been a snipe if the wheat field, not more than a hundred yards from the house. The nuts of the shell-bark hickory afford a rich and favorite food for squirrels in the early autumn. At each discharge of our gun there was at first a great scampering and clattering among the squirrels; but as they soon found out that we could not harm them, they would rather a nut, run out on a limb, curl their tails over their backs, wink at us in the most confident manner and proceed leisurely to dispose of the spoil. How we shook our fists at this! How I disparaged the noise, which was as killing things, at any range!

Now, O shame! Brother Jim, hearing the continual firing and suspecting something of the truth, came down with his rifle and, at three shots, killed every one of those squirrels! And shot their heads off, too! So, in doubt and darkness, in a supreme contempt for all smooth bore, ended our first experience of old guns in squirrel shooting.

Some two years after this episode in my sporting life I went to visit a cousin who lived in a fine game country. He had a single-barrelled gun of about 12 calibre, and I found sold every year in which style of guns there were thousands sold every year in the country stores of the South. They shot well, too; some of them extraordinarily well. As well as I recollect they must have been English guns, for most of them had on their barrels, "London fine twist," a legend, as I now have reason to believe, like many other legends, having no solid basis of truth. However, they were good enough for boys, and we could kill with them.

Among the negroes owned by my uncle was a practical old fellow named Joe. A privileged and favorite servant he would attend to take the rifle and kill the squirrels and turkeys with which the woods abounded. But Joe had been reared with my uncle, and had learned to shoot under his tuition. If there was anything on earth for which Joe had a supreme contempt it was a shotgun. It was his honest conviction that no shotgun had a range exceeding thirty yards. Any distance above that a shotgun, in his opinion, was utterly worthless. As we would return from hunting

he would meet us and, with sneer and gibe, taunting us with the inability "oh dat ole shotgun." So far did he carry it that he offered to let us shoot at him, or rather his back, at seventy-five yards. Exasperated at his jers at our favorite gun we dared him to a trial. Behold us, then, with seventy-five long yards stepped off by Joe himself! It was fully ninety, but we did not care, for we intended taking the conceit out of Joe forever. Turning his back to us, our living target, with a derisive gesture, told us to "fire away!" At the crack of the gun Joe leaped about three feet perpendicularly into the air and immediately fell upon his back, while visions of murder seized upon us boys. "Fire! Water! Murder! Fire!" mingled with horrible oaths came from the prostrate negro in rapid succession. We found on examination that four shot had buried themselves low down in his back, while one had gone through his nose and another through his ear. This had been caused by his looking at me, the marksmen, between his legs. Joe never to his dying day could believe that that some supernatural or diabolical agency was concerned in carrying the shot so far into his corpse. We boys were soundly thrashed for being such fools as to shoot at old Joe, even when he was willing. We convinced him.

Sr. CLAIR.

A GRAND HUNT.

READING the accounts of those royally-appointed hunting expeditions to the Far West, got up by Mr. Marble, has brought to me recollections of a grand hunt, in which I participated, down the Mississippi River. The party consisted of three gentlemen besides myself. We had built in New York a small propeller, which was shipped to New Orleans by steamer and thence to Cairo by boat, at which point she was launched and there we joined her. Our crew consisted of one engineer, a negro who acted in the dual capacity of stoker and deck hand, and two servants, one as cook, the other as stevedore. Our vessel measured 43 feet over all, 31 feet beam and drew when loaded about 3 feet 6 inches. The boiler and engine were placed as far as possible, leaving the midships for the accommodation of ourselves, and the forecabin for the men. A standing awning with roll-up curtains on either side served as a protection against the weather. The side lockers were made wide enough for their tops to serve as berths; in the center was a fold-up table, and above it a rack for glassware and crockery.

On board this diminutive ship we embarked late one afternoon on October 1 and, in less than an hour, landed some twenty miles down the river, where we understood geese and ducks to be very abundant. What with the current and the aid of steam, we have in sight of our first stopping place in about two hours. Charley Fore, the most practical hunter of our party, suggested stopping the engine for a few minutes so he could listen for any sign of game that might have congregated on the island for the night. He leaned over the vessel's side, putting his ear close to the water, and in a few minutes reported birds in quantities. This determined us to tie up for the night, to be ready for business in the morning. After supper the guns were taken from their cases, cartridges dealt around to each, a signal light hung upon the smoke-stack, one of the men stationed as lookout, and the remainder of us turned in for a dose of "nature's sweet restorer." As the lookout struck "six bells" we arose, but to find ourselves enveloped in a dense fog, accompanied by a misty rain.

"Just the weather we want," said Charley.

"Excellent for rheumatism," muttered George D—.

These were the first words spoken, and certainly I agreed with the majority, as a more dismal, dreary outlook it would be difficult to imagine.

Mr. Kurlfman, the engineer, asked if he should get up steam, or "jess hold it 'twixt and 'tween till further orders."

"Hold it," replied "George," rather sharply, "or else you'll blow us up to make matters even worse."

Soon, however, the fog began to blow away, and such a queaking of ducks and squaking of geese I never heard.

"Now," said Charley, "Mr. Kurlfman, if you have your boats in boiling water, we will kick on into the stream, but go along as slowly as you can to keep steerageway on the craft, and the sooner we get under way the better."

With the first signs of Aurora, we were off. The fog had nearly disappeared, and in a few minutes the fusillade began; shooting at the game first in the water, and then as they rose to fly. It was as exciting as a genuine skirmish for the first two or three rounds; a number of birds fell to our guns and lay on the island and in the water.

"Let two of us get ashore up to the island," said Charley, "and then crack steam, and make for the lower end of the island, and come back for us through the chute. In this way we will have some good shooting this morning."

We pointed the boat's head to the land, going slowly, as the water around these islands is very shallow, and as soon as we touched bottom Charley and Jack jumped overboard and waded ashore. Down the main stream we then went, at full speed, rounding as directed at the foot of the island. Our engine made so little noise that we ran unawares on a large flock of geese, out of which George and I bagged six each at the first shot and three at the second. Steaming up the chute we scared the birds back toward our friends, whom we could hear firing in rapid succession. We then checked our speed, and had a couple more shots before the birds left us for good. Picking up the game was tedious work, and no doubt we lost some; but, as it was, we counted twenty-five ducks and nineteen geese.

We now started down the river, intending to stop at New Madrid, and take a day's shooting in the lakes back of that place, and to purchase a few furs, if possible. It was nearly midnight when we reached the boat at this earthquake-destroyed town. Our arrival created, even at that late hour, a stir, as the natives had never seen a craft like ours before; they all wanted to come on board, even to the women folks. Of course we gratified them, and it was through one of these visits that a name was given to our unnamed yacht. The morning after our arrival we were seated at breakfast, when an old lady and a young girl came alongside and asked who we were, where from, and the name of the vessel. The little steamer boat "Liza Jane" after her "gal." As I was the owner I agreed, and the christening ceremony was performed there and then by the girl herself, who came on board, pronounced in a clear voice "Liza Jane," and broke a bottle of Charles Heidsieck over her bow. We then, in a glass each of the sparkling wine, drank long life to the young girl and her namesake.

The shooting back of New Madrid surpassed any I ever had; ducks and geese being the only game, but in such numbers as to soon satisfy and other than a pot-hunter's thirst for blood. The morning we slipped our moorings the whole

tow was turned out to see us off. "Liza Jane" was there decked in her gayest, although the poor child's face wore an air of sadness as she saw her namesake steam away.

Every day was a succession of good shooting, as we made it a rule to tie up every night near some island, to have the morning's sport. At the towns we would, of course, stop, give our game away, or else Joe would sell it, and buy instead, as he called it, "town grub."

On reaching Helena we decided to make a short run up the Arkansas River, as we found an old, reliable pilot there, who offered to steer us safely, taking his pay out in fun. We saw but very few birds, but George, who was sitting in the how with his gun in hand, suddenly, as we turned a sharp point of the river, discharged both barrels, at what proved to be a magnificent buck with superb antlers. This circumstance aroused a great desire for a land hunt, but, as we had no dogs, the plan was not practicable, and we returned to the mouth of the river, there to resume our journey downward. Here I bought the skill we so much needed, and which proved invaluable to us in our future mastiff shoots. The grandest day we had was at Island Ninety-five. This isolated piece of land is nearly two miles long, and heavily timbered, forming an excellent cover for game. Before daylight, Charley, Jack, Joe and the cook, took to the shift, and pulled off to the inside chute of the island, while the "Liza Jane," with George Kurlfman and myself, steamed down to the lower end. Each of us had a gun, leaving the management of the vessel to the stoker. We began firing as soon as the point was turned, and as we steamed slowly up stream, the skill and its crew were floating down, so that the birds were kept constantly on the wing, going first one way, then the other, until at last we shot out all of our shells, and were rather glad of it. We picked up over two hundred ducks and geese.

We tied up at the plantation of Colonel Dick Christmas, a few miles below this point, to rest awhile; and gave the "Liza Jane" a thorough cleaning before making Vicksburg, at which point we had decided to leave the boat, and to go by rail to New Orleans. After a day or two's sojourn with the amiable Colonel, we again started on our voyage, reaching the "City of Hills" after six hours' run. The "Liza Jane" was ordered to Deer Creek, and thus ended the most charming hunt of my life.

Nashville, Tenn.

"LEFT-EYED SHOOTING."

ROCKINGHAM, N. C., September 12.

Editor Forest and Stream:

Very much amused on reading your opinion in reply to "Invidius" on "Left-eyed Shooting," I will not express the same opinion in regard to yourself that you did of the Philosopher; yet I will say, and I think prove it, too, that the Philosopher was right and that you are wrong.

I will premise by saying that a majority of persons are right-eyed; some few, however, are left-eyed; while others are either-eyed or both-eyed.

Now for the demonstration or proof. Point with your finger, or with a stick, at any object in the distance, keeping both eyes open, with the hand held in both perfectly straight; then close your left eye, and if the finger is still in line with the object, you are certainly right-eyed. Try again, both eyes open; now close your right eye, and if your finger is in line with the left eye, you are certainly left-eyed. Again, both eyes open; now close alternately one eye and then the other. A little practice in this will determine which eye you are. Sometimes in closing the eye the finger seems to point to the left, and in closing the other eye with first open, of course, points to the right at the same distance from the object. In this case you are both-eyed, or either-eyed.

In answer to Invidius, I will say that the only thing necessary to enable him to shoot accurately is that he should close that obstreperous left eye of his when the gun is brought to the right shoulder. If he can accustom himself to bring the gun to the left shoulder, he can shoot equally well with both eyes open; yet there is no necessity for it, if he will close his left eye when he shoots.

To sum up then, to shoot with a right-eyed man, with both eyes open, the shooter should close the right shoulder, and a left-eyed man from the left shoulder, while each can shoot equally well from either shoulder by closing the opposite eye. If a right-eyed man shoots from the left shoulder, and a left-eyed man from the right, both eyes being open, neither would hit a barn door at forty yards. All this I learned years ago in shooting deer from horseback, and ducks from boats. Now, sir, just pick up your gun, I guess, of course, you always keep one handy. I take it, also, that you are right-eyed—bring gun quickly to the left shoulder—both eyes open, remember—kick aim, or (try to, at least,) at an object indirectly. What is the matter? Why don't you shoot? Can't get your aim satisfactory, ah! No you can't! Why? Because, sir, you are right-eyed, and your left eye won't serve you in sighting the object along the ribs of the barrels, but that right eye of yours tries mighty hard to get over on the left, and if you will not let it, the very best you can do will be to close it, then you are freed from the dilemma.

Parson me for saying so much, "I rest to explain," and couldn't get down any sicker. I have never yet met one who knew of this "eyed" business, and have never failed to convince them. So, if you have a great deal of company, I won't call you "a fool."

TROBRILL.

RUST SPOTS IN GUN BARRELS.

CAMDEN, N. J., Sept. 26.

Editor Forest and Stream:

In your last issue a Boston correspondent, F. S., asks for information on the cause of gun barrels rusting in spots. If the interior surface of a pair of barrels is scratched with a microscope it will be seen that they are covered with an immense number of such holes, which serve excellently to let in the moisture. Now, when the oxygen, which exists more or less in the air, comes in contact with the steel, it collects in and around these minute holes, forming Ferric oxide, or common rust. This makes the surface still rougher, and if not cared for properly, goes on taking up oxygen and consuming the steel, until the holes become large enough to be seen by the naked eye.

When in this condition, emery paste, made from three parts cosoline, or oil, and one part emery, should be used on a carefully prepared swab, which will smooth the barrels out to a certain extent; then apply the wire scratch brush and wash out clean. If this is not attended to frequently, at the sea-shore or in damp situations, nothing but rebaring will bring out spots or holes. So long as the barrels are kept smooth but little trouble need be expended, but when specks appear

unmitigated care will keep them from getting worse. Gunpowder has often been blamed as the cause of rust; but, if of good quality, it contains nothing that will oxidize. However, the cleaner grade, especially when of fine grain, has a good deal of moisture in consequence of the grains not being so hard as the more expensive kinds. The various ingredients of cheap powder—such as sulphur, carbon and saltpetre—are often of inferior quality, and the residue they leave in gun barrels should be removed as soon as possible.

What really does more damage to the barrels than the worst kind of powder, is the fulminate of mercury which is left after the discharge of the copper cap in the shell. It, together with the other compounds, mixed with acids to make primers, is a possible form of oxidation in six or eight inches from the breech, and it will often be noticed that most rusting occurs there.

Perhaps the best way to avoid this, is when the gun is not in use, to push tight-fitting wooden rods covered with blazer flannel into the barrels, first having smeared them well with ordinary lube oil.

Editor Forest and Stream: Some one wants to know what takes to sports come on inside of gun barrels; and says that it is not always clean. I have a gun which has been used for five years, and is today as bright and smooth as the day when it came from the maker, but I have kept it by "eternal vigilance" and elbow grease, using the emery polish with. I have had a good many guns brought to me, which the owners claimed were clean, but upon examining them I have found them otherwise. Gun barrels are sprung to make them shoot centrally (so they will not cross), and looking through them, unless you make a close inspection, you may be quite a number of places overlooked; and I try any one to get them off especially if the day is hot and bright, unless they work hard and use something besides a magnet, and then, to keep the barrels clean and bright, is to find a thing to do as anything that I have ever tried, may be worse jobs, but I have yet to see them. It is best to leave too much oil on them after cleaning them.

HAMMERLESS.

SPORT IN FRANCE.

SHOOTING began on Sunday in most of the departments of France, as it begins with you to-morrow. This, as usual, there has been a wait over the growing ardency of game, and suggestions have been made that shooting should be prohibited for one year out of four in everyondissement of a department, turn about. It is not unlikely that some legislation will be attempted in this direction, for shooting has here long become a national amusement, in which all orders of men join. From M. Greyer, who has a well-preserved estate at Mont Sous-Vandrey in the east, down to bank-clerks who have friends in the country I have Paris on Sunday mornings attired in costume de chasse, everybody who can afford to pay twenty-eight francs a permit to carry arms must needs have a few days' sport the course of the year. People still talk about the *over-the-hill* in France as if the country teemed with game, indeed, many hurry away from the pensile for this important country; châteaux overflow with guests, and gunmakers, to be a more numerous body in France than in any other country, do a capital business. Any stranger who happened to be at one of the Paris railway stations on Sunday morning might have thought that this was *par excellence* a land of venison. Men in shooting dress were to be seen, not by tens but by hundreds; and most of them were accompanied by dogs, who yelped, tugged at their leashes, and dragged their owners hither and thither. A card with the word "Hunt" was pinned to the breast of the railway earriage, as an intimation that to those compartments dogs and master could travel together; and in some carriages you might see eight dogs, eight double barrels and eight *chasseurs* plinkily accoutred. A great deal of the pleasure which a man of a drives from sport must consist in the habiliments which he dons for the occasion. He wears gaiters, a coat with a leather shoulder patch, a game bag of netting slung on a broad strap, a belt with a cartridge-pouch, a flask, a knife and his dog, and the hunter's hunting-knife two blades to dispose of wild beasts if any should turn up. Late Alexandre Dumas, when asked why he carried a dirk in he went out to shoot rabbits, answered: "*C'est pour les le dire; il faut que tout le monde s'amuse.*" It is to be noted, however, that most of these sportsmen who are rigged apparently more for show than for work, do manage to run in the evenings with their game-bags full. So there is to be a fair amount of game after all; and if it be scarce in some parts, the game, they deserve the more credit for getting down so much. I have myself seen there some first-rate shots among Frenchmen; and the Americans which squirrels and citizens brag of their adventures in covers at this season of the year shows that the love of hunting is no mere affectation. This being so, it is probable the Legislature will soon deal with the game question in a frank manner. It is not desirable that all the game in the thousands should be deprived of a sport which is to some extent an amusement, but in others a great source of profit. It is not only the *archibusters*, shot-makers and other men, who earn much by selling the implements and outfit of sport; villagers also make a good deal out of selling parties. Boys are hired as beaters; the village innkeeper prepares dinners for the sportsmen, and has the pleasure to see them drink a great deal of his wine and "old ale," while the vagabonds and old women pick up many dollars by begging of the sportsmen when they have finished their day's work. Indeed, so generally recognized as a thing for country folks that the poacher is no longer regarded with a friendly eye in villages. His depredateion is not blamed when he thinned off the over-stocked forest of rich seigneurs; but he is now looked upon as a fellow who appropriates to himself game which might really have brought money to a good many poor people's commune.—*St. James' Gazette*, Sept. 3.

HOT WEATHER CAMP—Van Buren, Ark., Sept. 1—I see a short article from one of our town papers. "Old" the writer, is known to you, and is a venerable old man and true. The remainder of the party mentioned young, and lacked much of his experience, but were by as enthusiastic and hoped by persistent practice to be eventually perfect. Although we killed one deer, this was not the way we were in pursuit of, as we only wanted turkeys and squirrels, and the only way in which we were able to supply our table. This is not, of course, the best season with us to hunt, but there were some of us

where only chance it was until the noble gobbler raises his "racker" in the spring—except for an occasional evening with the ducks, at which we expect to have rare sport when the proper time and ducks arrive.—**DICK.** The extracts are as follows: "It is useless to call every excursion to the woods, especially in dog days, a camp hunt; yet we camped at it in the spring and hunted just as well. On or about the 16th of August I met some enthusiastic sportsmen, having grown weary of hot weather and dusty streets, left Van Buren and lited to the woods near Jackson Kings in the Cherokee Nation, some twenty miles from the starting point. Arrived at three o'clock, found all things lovely, plenty of game, and without half trying bagged in half an hour nine squirrels, one turkey and two quail. The next morning at early dawn the guns were soon at hand and shooting became rapid and repeated for half an hour, and the parties returned to camp with eighteen squirrels and three turkeys. After scolding them for the lavish slaughter, we all consented not to shoot another gun that day. On the 18th we killed ten squirrels in the morning and rested in the shade all day. "On the 19th the sun rose as usual in a red, hazy sky, threatening another torrid day. The boys went out early to bag a sufficient amount of game for the day, which was done in a half hour. After breakfasting on broiled squirrels and fried turkey I left for home, via Fort Smith, taking with me two of the company, leaving but three and the cook to remain until the wagon returned for them and the camp. The game killed on the 19th (the first of our season) by their memoranda was three turkeys. On the 20th John Fritz left for home, leaving only Bourland and O'Kane. Amount of game that day was one turkey, by O'Kane. On the 21st four squirrels and one turkey. Morning's hunt (22) resulted in the killing of a fine fat deer by O'Kane, only a few hundred yards from camp. It was apparent that such large game could only be saved by the Indian process of "jerking," which consists in cutting up in small pieces and placing on a scaffold over a brisk fire, making a kind of semibarbecue. This having been completed and the wagon having returned, all came home. I said in the beginning that the hunt was not all a hunt, but rather an excursion to the woods. The weather was so intensely hot that no game could be kept over six hours, and to kill more than could be consumed was not only cruel but lavish waste.—**OLD NIM**"

GAME IN SULLIVAN COUNTY.

New York, Sept. 19.

IN perusing the interesting articles contained in your issue of 16th instants, I notice an advertisement of J. M. Bradley in reference to the good duck shooting to be found in the vicinity of Eldred, Sullivan county, N. Y.

If among your numerous readers there are any who would like such sport, I should advise them to pay Mr. B. a visit. I think I can guarantee them enough sport to satisfy a sportsman, having just arrived home from a two weeks' vacation spent there, principally fishing for pickerel and perch. These fish afford much sport, but I was caught in large quantities and of good size, within a short distance of the house. The day before I left Eldred, Sept. 9th, Mr. B. and I drove about six miles (stopping on the way in the best of an old pond, where Mr. B. bagged three fine wood ducks, over two splendid eiders lately broken by him for Boston parties) to a large pond bordered by marsh land, called Giles's Lake, where we succeeded in shooting nine ducks, five only of which were retrieved by the dogs. They were one black and four wood ducks. The rest falling at long distances in the dense wood and long marsh grass, were lost.

Had I been any kind of a shot, and in possession of a muzzle-loading instead of muzzle-loading gun, I think I could myself very easily have killed fifteen birds.

When we left the lake, at dusk, the birds were just beginning to fly in from the neighboring lakes in streams, but our ammunition having given out we were obliged to depart.

Beside ducks, there is very good deer, partridge and woodcock shooting, and a few quail are to be had.

There is also good trout fishing during the early summer months in several streams in the vicinity.

On the thirtieth day of August, Mr. B. and I fished the Beaver Brook, about a mile from the house, but only caught twenty-six fish. The reason for this was the low water and the bright, hot day, the thermometer that day showing 100 deg. in the shade. We, however, did not feel the heat, wading in the cold spring water under the shade of the laurel bushes and the spreading branches of the tall pine trees. Mr. B. caught one trout last spring that weighed two and a quarter pounds.

Mr. J. M. Bradley's address is Eldred, Sullivan county, N. Y. By writing in advance he will meet you with his wagon at Shohola, Pa., Erie Road.

ENGLISH SPORTSMEN IN WYOMING.—The Big Horn range of mountains in Wyoming will become as well known in England in the course of a few years as the jungles of India. Every summer increases the number of the English gentry visiting this famous hunting-ground. We felt a little sorry for the last one of these noble sportsmen who passed through Pottersman for the Powder River country—Lord Manners. He is quite a young man and very ingenious, and being unfamiliar with the country he was easily taken advantage of by every cow-boy he met. Some one—"I don't know who—induced him to buy a broncho at Roek Creek, and instead of driving comfortably in a stage to Fort Pottersman, persuaded him that it was the correct thing to ride the pony, which he did, making forty-three miles in one day and forty miles the next on "bucking" ponies of an English saddle and short stirrups. The pony led round, quaked up when he reached Pottersman; but notwithstanding, he started off the next day, all alone, for a fifty-mile ride toward the Big Horn, and the last seen of him was about ten miles north of Pottersman, his roll of blankets suspended from the crupper of his saddle and nearly reaching the ground on one side, while his overcoat was thrown across the pommel and dragging in the road on the other side; and my lord, utterly oblivious to his surroundings, was bobbing up and down on his bucking pony, with his neck outstretched, peering across the sand-hills eagerly looking for the next stopping place. Lord Manners is an officer of the Grenadier Guards, now stationed at Windsor Castle, and his leave of absence expires on the 25th of October; hence his hurry. Captain Gaskell, formerly of the English army (9th Hussars), and his wife, are at present hunting in northwest Wyoming. The Captain has made quite a number of friends among the army officers, he having several years ago made a tour through Montana and the whole of the north of the country, visiting the National Park of the Yellowstone, and the various military posts on the way. The Captain is a genial, clever, and well informed

gentleman, and Mrs. Gaskell is a charming, petite, demure, vivacious and lively as one of our own American women. The following are the names of some of the distinguished English people now hunting in northwest Wyoming: Sir Samuel and Lady Baker, Lord Granville Gordon and Mr. H. W. Flowers, Captain and Mrs. Gaskell, Lord Mayo, Lord Manners, the Hon. Mr. Leigh, and Mr. Richard John Power.—*Correspondence Army and Navy Journal.*

RAIL SHOOTING IN MARYLAND.—The rail-shooting season has just begun on the Choptank, but owing to the tides not making high enough, which prevents the boats from getting on many of the marshes, comparatively few have been bagged as yet. There are thought to be more rails this year than usual, but not knowing anything of their previous life before they appeared on our marshes two months ago, we are unable to account for the unusual number. One of our sportsmen, though not having the advantage of an average high tide, succeeded in getting ninety-seven birds in about two hours and a half this morning. The unbroken wild oat stalks were also an inconvenience, and until the weeds are mashed down, it is difficult to push over the marsh. A fine season is anticipated, and a number of gentlemen from neighboring towns and cities have arrived, and more are expected, to participate in the sport, and ere long our marshes will be the scene of almost incessant reports of breech-loaders. There will be an effort made at the assembling of the State Legislature to pass a law regulating the time to commence killing these delicious birds, which has been so badly needed, as which has never been kept, other game of large size being plentiful and rails not so much sought for.—*N. Y. Denton, Curlews Co., Md., Sept. 15, 1881.*

[There should of course be a law in all the States regulating the rail, and in New Jersey, Pennsylvania, Delaware and some counties (Ceel and Harford) there is such a law. In Ceel county the season for these birds opens Sept. 15, and in Harford Sept. 10.]

CAYUGA COUNTY SPECIAL LAW.—A special "Act for the preservation of quail and partridge within the County of Cayuga," N. Y., passed Dec. 21, 1881, provides as follows:

Sec. 1. From and after the passage of this ordinance or regulation it shall be unlawful for any person to catch, kill or drive in this or her possession any quail or partridge taken within the County of Cayuga, for the period of three years.

Sec. 2. Any person violating this act shall forfeit a penalty of twenty-five dollars, to be sued for by any person before any Justice of the Peace, or the City Court of the city of Auburn, where such Justice of the Peace or City Court has territorial jurisdiction. The recovery, if any be had, to be paid, one-half to the complainant, and the balance to the County Treasurer for the support of the poor of the county. The process, pleadings, proceedings, judgments and costs in such actions shall be the same as are provided by law in civil actions before such Justice of the Peace or City Court of the city of Auburn. And the process for the collection of any judgment rendered under this act shall be the same as is now allowed by law in actions of tort.

QUAIL NEAR NEW ORLEANS.—New Orleans, Sept. 23.—The morning of the 15th, at seven o'clock, found me in the saddle with my old friend, John G. Watson, at Arcola, La., in search of that game little bird, Bob White. Notwithstanding the increasing weather, we had capital sport. About the middle of the day we were joined by Messrs. Arch and Pierce Watson, who, by the way, are two of the shots as Louisiana claims. The day was agreeably spent; birds were numerous, and my late purchase of Munson's quail, in spite of the fact that for two seasons past she had inhaled the delightful aroma of quail, did excellent work and fully her share of the coverts and single birds; and the two dog companions she competed with were good ones, and only a dog of extra use could get in a point. In the three days' hunt over 150 quail were bagged, quite a fair percentage being shot so close a range as to be unfit for the table—or bag. For the benefit of some of my Northern friends let me state that we found each day not less than twelve coverts, and one day eighteen. The very dry season has been of advantage to the young, and most of the birds were from two-thirds to full grown. While ours were the first guns that had been fired this season, we found the birds all in a "hurry" when flushed. With plenty of fresh milk, butter, the best of corn bread and quail coverts, as is the case when we visit the Watsons, we had a most delightful trip, and many other promises of a speedy return were allowed to remain to our city home.

TENNESSEE NOTES—Montvale Springs, Tenn., Sept. 15.—This place is situated about nine miles from Maryville, the terminus of a small railroad which runs between that place and Knoxville. The hotel at the Springs (which is also the post-office) is a large, plain, frame building which will accommodate several hundred, and is well kept by a gentleman named Maritain. The springs on the grounds are said to be very beneficial to invalids. I have been hunting some and killed considerable small game. The country is very hilly and there are some considerable mountains near here; the air is very strong and clear. The larger mountains southeast of this place contain some large game, and as soon as the snakes go into winter quarters I am going with a party to have a good hunt.—*W. R. B.*

Nashville, Sept. 19.—Last Thursday commenced our open season, though under the most unfavorable circumstances. Rain fell in torrents the night previous and continued to do so all day. Birds are reported as very abundant, and from the quantities brought into town Saturday, I should say that the reports are true. Our gentleman sportsmen, as a rule, have excellent dogs, the best of guns, and being crack shots they soon kill out the game in the immediate vicinity of the city, though within a radius of twenty miles there are plenty birds for all. Since the rain hunting has commenced in earnest. The number of the moon shines brightly, and when there is a wind the delicious melody of the hounds can often be heard even in the city. Col. W. H. Johnson and David McGee, living each within a few miles of Nashville, have voted packs of foxhounds, and when they give voice the whole country is aroused. Dan Adams, Esq., has gone on a shooting expedition; he uses a single barrel breech-loader, with which he says he can bag as many birds as any of the crack shots with a double-barrel.—*J. D. H.*

THE LOBB AND DESAL COUNTRY.—Columbus, Neb., Sept. 14.—John B. Clark of Boston, William Nye, Jr., New Bedford, W. H. Hutchinson of Lynn, and T. G. Hart, Hartsvant and F. H. Ellis, of Framingham, Mass., left here to-

IN NORTHERN MICHIGAN.

Trotting in the bay is fair for that class of sport, though a few bass are thus taken, and still fewer of the well-cryd pike, called *ava* here, yet the principal catch is pickerel, which have firm and well-flavored flesh in these cold waters. They are in weight from three to ten pounds, though some are taken of twenty pounds and over. My best day was twenty fish from ten o'clock in the morning till six in the evening, stopping two hours for lunch. To insure success your boatman must row you in the deep water within a few feet of the shoulder of the bank beyond which is the shallow water, say eight or ten feet deep. If two lines are out the one on the side near the bank will take more than twice as many as the other, no matter which is the longest. The lines should be from 100 to 150 feet long, at least so results have taught me.

There is no very inviting trout fishing in the vicinity of Escanaba. Probably the finest that has ever been found in this country was Trout Lake. It is situated in an uninhabited forest, mostly surrounded with high banks, three miles long and three-quarters of a mile wide. It is fed by springs mainly from the north. From it issues Whitefish River which empties into the head of the Little Bay De Noquette from which the lake is thirty miles due north. Last year a party visited this lake and caught in a legitimate way, on the first afternoon, 250 pounds of trout, but a severe illness of one of the party compelled them to leave the next morning. They were all taken from a raft which they anchored near a large bed of white material which looked like marl and was literally covered with trout which, when alarmed, they insist, would disappear beneath the white surface. If in this they were not mistaken I do not doubt, a large spring full of white sand held in suspension.

Like other fish, the speckled trout have their good days and bad days for biting, for which there is no apparent cause. Soon after the same locality was visited by a party which found the trout just as abundant as on the former occasion, and as same, but they could not be persuaded to take the hook. Not to be balked they attached three large hooks together with heavy sinkers, threw them beyond the trout bed and drew them in quickly. In this way they hooked several hundred pounds before the fish became thoroughly alarmed and they completely flew. I have often this discreditable affair was repeated. I do not know, nor to what extent other illegitimate means, such as netting, in this charming lake we may never know, but it is certain that trout have frequently appeared in the markets, and that legitimate fishing in Trout Lake has been entirely destroyed. I cannot learn that a pound has been legitimately taken from that lonely lake this year. A party lately visited the lake for legitimate fishing, but found the usual haunts of the trout entirely deserted, and only caught a few small ones in the outlet. It is indeed a pity that the despoilers cannot be subjected to the penalties of the law which in its letter is ample; but the letter is dead in that secluded place.

I was more interested in a fact, which was new to me at least, and that is that the lake whitefish are sometimes taken with the hook. More than twenty years ago I examined the stomachs of a number of whitefish at Eagle River, on Lake Superior. The principal contents found undigested consisted of crustacea and bivalves about the size of the head of a pin. There are no doubts found at the bottom of the deep waters of the lake, as I could hear of none which had ever been seen in the more shallow waters subject to ordinary inspection. No doubt there is a rich harvest in reserve for those who shall dredge the deep waters of these lakes.

Since that time many others have examined the stomachs of the whitefish, but all go to show that they gather their food from the bottom of deep waters, rather by the process of suction than by an active pursuit of their prey and biting it. Nor do I think this was contradicted by the fact that they are sometimes taken with the hook where the conditions were proper investigated.

William Hart, a young boatman and fisherman at Escanaba, when rowing me for trotting, told me that he had frequently taken hooked whitefish around the iron docks. While I was skeptical, I carefully questioned as to the mode in which it was done. He said he had only taken them with the hook late in the fall, and nowhere except about the docks. He baited a small hook with a translucent minnow, which does not appear in these waters before the last of October. He never took them with any other bait, though he had tried many kinds. The bait was sunk to the bottom where it was permitted to rest till picked up rather sluggishly by the white fish. When hooked it was very active, and quite as gamy as the black bass. He had thus taken the whitefish for several years in succession, but at no other time of the year and with no other bait. He says the whitefish do not now enter Little Bay De Noquette till late in the fall, and only then can the proper bait be procured. No satisfactory reasons why they do not appear in these waters before the last of October. He never took them with any other bait, though he had tried many kinds. The bait was sunk to the bottom where it was permitted to rest till picked up rather sluggishly by the white fish. When hooked it was very active, and quite as gamy as the black bass. He had thus taken the whitefish for several years in succession, but at no other time of the year and with no other bait. He says the whitefish do not now enter Little Bay De Noquette till late in the fall, and only then can the proper bait be procured. No satisfactory reasons why they do not appear in these waters before the last of October.

Upon inquiry I found a number of reputable citizens who had seen Hart catch whitefish at various times, as he claims. Mr. Winger saw him take five large ones near his docks in one afternoon.

Escanaba Sept. 1, 1881.

[That whitefish take the fly is new to us. We should like to know further of it.]

A LARGE BROOK TROUT.

New York, Sept. 21.

IN the Oswegatchie River Inlet to Cranberry Lake, St. Lawrence Co., N. Y., at the mouth of a spring brook, upon the 17th of July, a gentleman from this city caught a brook trout weighing four pounds and six ounces. It was twenty-one inches long, and every one in that vicinity united in calling it the biggest trout caught there within the memory of the "oldest inhabitant." There were plenty of witnesses to the weighing of it, so that this fish story must be considered as one which can be well substantiated in every particular.

A few worms were used as bait, and the number one Sprock hook was attached to a double snood.

The rod was of medium weight, and its first two joints were badly sprung in the protracted struggle with the heavy fish. The moment it felt the touch of the landing net it flopped off the hook, and as the reel proved too small to hold it, it had to be killed and thrown into the bottom of the boat.

We are aware that larger trout have been caught in the lakes of Maine and at the West, but have any of your readers ever caught a larger speckled brook trout in the Adirondacks? SEVEN.

THE writer has the love of humanity ingrafted in his constitution, and it is to aid his suffering fellow-creatures that he sends the following narrative of a trip that he made last summer into Northern Michigan. Those employed in a great many classes of confining business are given an annual vacation, but do not know how to pass it to the best advantage. Lying around the old home, smoking, reading and sleeping, while it may be enjoyable, is not particularly healthful, and it grows monotonous. It costs considerable money and does not restore the lost vitality to "spruce" around fashionable watering-places or loaf in the cities. Those who are confined by their business most of the year should get out in the open air, where they can live, for a few weeks at least, in a pure atmosphere, hunt, fish and swim, and have no greater cares to tax their brains than cooking and avoiding mosquitoes. If they will do this the exhausted forces of the body will be restored to new strength and the wanderer will return with his body and brain in good condition to meet the duties of the long and confining winter and provokingly lazy spring.

Purely through a lucky accident I was last year given an opportunity to join a party on a trip to Higgins' Lake, one of the innumerable little bodies of water found in the pineries of Michigan. The entire country is so completely explored through the East, including a stay at Washington, the view of the earthly eyalium up in the pine forests completely shut out thoughts of the conquests I might have made had I squandered my time and cash at Long Branch and Saratoga. We took the train at Jackson for Bay City, and had a delightful ride up through fertile Southern Michigan—but then, when there are six lively people in a crowd, rides generally are delightful, no matter where taken. We reached Bay City about ten o'clock, and the sight as we entered the town was one of the prettiest I have ever witnessed. Scores of sawmills were in full blast, and aside from the fact that it looked as if the city was on fire, the reflection of the light on the water made a beautiful picture. Here, through necessity—there being no other train—we remained that night. In the morning about eight o'clock we again took the train, and settled ourselves for the last long pull of ninety-eight miles. The common bond of sympathy, which unites all those working in the same cause, attracted us to other gentlemen, who were so bound for Higgins' Lake. They were all glad to find they would have a good time, and I am free to confess they did not. All of the four weeks they were out it was grumble, grumble, and I was led to believe that they lived on eel-fish and crackers at home, and were mad because they didn't get something better away from there. These gentlemen made themselves objects of commiseration and contempt among all the people around the lake; they live in Chicago, and if this meets their eyes, they will see what the writer longed to tell them to their faces. And let him say right here that those who go to camp out with the expectation of finding anything comfortable, and everything to suit them, will be woefully disappointed. If you cannot stand coarse food and rough weather you had better "camp" in some hotel on the seashore at \$4 a day.

Our ride that day was not through a cheerful country. Michigan, above Bay City, is the most God-forsaken piece of land on the American continent. Sand, sand, sand, and occasionally a huckleberry bush to break for an instant the monotony of the pine forests. Frequently we would enter a stretch of burned country and a ten-mile-long, nothing making the eye, but the black, carbon-trunks and broken sand. Then we would crawl painfully up a grade at a pace which the proverbially slow turtle could almost shame; and finally down an incline at a speed which sent the loose sand up in whirling clouds, which penetrated the cars and got into our ears, our eyes, and our sandwiches. The view on the side was always the same—blackened trees or green forests, and sand—that never failed. It was a long and tiresome ride, and I was glad when we reached Roscommon, got out and stretched our limbs, secured our dinner, and learned that the railroad could take us but eight miles farther. We were a tired set when we reached Pereberey, the station nearest the lake, but our woes were not yet ended.

We had written on ahead to Mr. G. M. Cheney, who owns property near the lake, to keep for us one of the little pine board cabins he has built for the use of those who do not care to carry tents. Mr. C. was at the "depot," a board platform, and smilingly informed us that he would immediately cart us to our future residence. So, after leaving our names at the alternative post-office, and making it seem our mail to the lake, we packed our traps upon the lumber wagon, mounted the same, and began a ride through the forest through sand and foot deep. The distance was seven miles. I know not what the schedule time is, but it took our conveyance just three hours to make the trip. To add to the misery of lame backs—owing to no backing—dark clouds began to rise in the sky and huge clouds of mosquitoes began to rise from the bushes. By the time we reached our destination both of these children of nature were well along in their tasks—the execrable insects had raised numerous hotches on our faces which the rain tried to cool. However, the lake finally came into view. Everything was hastily unloaded and carried into the cabin, and by the time we had our things well housed the rain came down in torrents. Two rough beds were speedily nailed up, upon which we spread our blankets and, stretching our tired bodies, fell asleep, soothed by the patter of the rain upon the roof and the mournful sighing of the pine trees.

Morning found the air yet misty; discouraging clouds hung above and threatened rain; the lake looked dismal enough with the haze rising from it; the pine trees dripped water from the night's rain, and our ardor was as much dampened as everything else. Notwithstanding these discouragements, we worked hard all day and got everything in good shape. Rice straw was obtained from a plain about three miles distant, which we broke and made into mattresses. A very primitive-style cook stove—not remarkable for its beauty, but just as useful as a more handsome article would have been, and not occupying half so much space—was planted back of the cabin. Shelves were put up, fishing tackle and guns put in good order, and when night arrived we were well tired out. More rain and more discouragement.

When I awoke the next morning the sun was shining brightly, and for the first time I felt buoyant enough in spirit to look around and see where we were. Never having seen Como or Mark Twain's much-praised Tahoe, I am inclined to think that even if that little body of water in Michigan has not a very common name, it is the prettiest lake I can remember to have seen. The water was so blue, which rose in terraces up the banks until they seemed to touch the sky, and with its various colors it looked like a picture in a dark frame. The crystal waters flung back the sun's fresh rays with ten-

fold force; the water on the tall pines sparkled like thousands of diamonds; the blue-jays filled the woods and the air resounded with their loud "caws;" the atmosphere was pure and invigorating, and a cool breeze blew from the lake with sufficient force to drive the festive mosquito back among the trees. As I lay there on a bench, puffing my old wooden pipe, I thought I had at last set foot in the promised land.

From that day our stay was one continued round of fun, pleasure and healthful exercise. Our cabin was one of a row of about ten, built in the shade of the pine trees upon the gently sloping bank, and we soon had companions to participate in our pleasures. Before we left, as many as two hundred people, mostly from Saginaw, Saginaw City and Bay City, were scattered along the lake within a stretch of two miles. The nearest postoffice was Pereberey, and our mail was brought us daily. We suffered some inconvenience at first for want of a boat, but everybody is your friend up there, and was perfectly willing to lend until we secured one of our own. We were somewhat disappointed in the hunting, but the fishing was splendid. The lake is fairly alive with perch, bass, pike and whitefish. One afternoon two of us rowed over an eighth of a mile and back, and during the time intervening between the journeys, caught seventy-eight perch and bass, and the whole operation was performed in an hour. We fished altogether with minnows, never using flies; the fish do not take them readily. We rose at daylight, went to bed at dark, fished and hunted, swam and basted, joked and laughed, and when the days of July drew to a close and we pulled up stakes to move homeward, a broker, hotelier, butler, satisfied party could not have been found "in thirteen States."

Higgins' Lake lies in the southern part of Crawford county, Michigan; it is 9 miles long, and 4½ miles wide, and is probably as pure a body of water as exists; in a depth of thirty feet every pebble on the bottom can be clearly seen; the bottom slopes from the shore very gradually for a quarter of a mile, when it suddenly falls, and in the centre the lake cannot be sounded. About the middle there is an island nearly half a mile long, around which ducks can be found in great abundance. The lake was first conceived of as a summer resort by Lorenzo Burrows, Esq., a wealthy banker of Saginaw, Mich., who found it while hunting deer one winter in that region. He went there alone with his family four or five summers, when he prevailed upon some of his friends to accompany him. Last year there were fully two hundred people scattered around the lake when we left. They were divided into two camps, "Burrows' Camp," and the "New Camp," and in the latter were many spacious cottages being built. The two camps are separated by about a mile, and to those who wish to "rough it," Burrows is infinitely to be preferred. We obtained our cabin for \$1 a month, and it was much more satisfactory than a tent would have been, being cooler and dryer.

The lake is reached by way of Jackson, on the Saginaw extension of the Michigan Central Railroad. Tickets are sold at excursion rates and the road checked everything for us without extra charge. We took everything with us necessary for camping out, as nothing can be purchased at the lake, or could not be taken. We believe a small eating house is to be erected this year in the New Camp, but it is more fun to cook one's own grub. All the wearing apparel I took with me was a stout pair of pants and boots, two blue flannel shirts, a broad-brim hat and a close-fitting cap and several pairs of cheap hose. I never spent a more enjoyable month in my life, and the fresh air, regular sleep and exercise, put me in a healthy condition, which a year's rest at home would not have done. I left Ohio we weigh 115 pounds, and returned to my regular weight, and in the same time, as in the party as there were in ours, the trip can be made very cheap. My share of the expenses, including railroad fare above Jackson, was but \$25.00, and I was gone a month.

ARTHUR JAY.

HOW TO KILL A MUSKALLONGE.

I was much interested in reading Mr. Bissell's account of his muskallonge fishing in Sparrow Lake, as it vividly recalled my experience thirty years ago, when I used to fish for "lung" in the Scoug water, and take them in numbers which would now be thought fabulous. I then learned the method described by your correspondent of taking them out of the water by the fingers pressed into the orbits, and have since often instructed my fellow sportsmen how to do it, and have seen them do it in various places.

My object in writing is to supplement from my long experience in handling hundreds of these splendid fish, what is wanting in his instructions. Your correspondent says: "As with one hand leveling the line you draw the fish close to the side of the boat, pass the other along his back to see that he will remain quiet, and so up to his head, until the thumb and fore-finger are over his eyes, where the projecting bones give you firm hold, if you grasp him tightly, and thus with both hands you neatly and quickly draw him over the side and up to safe quarters before he has time and consciousness to struggle. For his struggles when in the boat you must be prepared, though it is not advisable to do as one Doctor recently did on this lake with his first twelve pounder—got one hand into his gills and the other into his mouth, to be cut and sliced by the sharp teeth, and require two weeks' surgery."

The "hopping and floundering" which I can easily imagine was "as astonishing to behold when the fish was lifted into the canoe, would have been entirely prevented if it had been before relinquishing his hold in the orbits, and the narrow-bladed knife down into the spinal marrow just behind the head. The orbits communicate so freely with the cranial cavity that pressure through them completely paralyzes the fish, and if the spinal cord is severed while the pressure is kept up, the fish will lie in the canoe incapable of moving even a fin, and all clubbing or gaffing or floundering is certainly prevented.

In the same number of your journal I am pleased to see a letter from my dear old friend, Dr. Garlick, whose claims to have first practiced pisciculture on this continent have at last been fully recognized. It was my privilege to have made his acquaintance over twenty-five years ago, and to have heard then from himself of his success in breeding trout at Cleveland. At a very large expense of time, money and trouble, he demonstrated in 1853 the practicability of fish-culture, and the recognition of his labors, though tardy, will cheer his generous heart and help him to bear with more fortitude the suffering he has been compelled to endure through so many weary years.

During one of my visits to Dr. Garlick he showed me a plaster cast of a "lung" which weighed between fifty and sixty pounds. As far as I know, he was the first to practice

the method of taking plaster casts of fish and coloring them to life. The copy of his cast of a six-and-a-quarter pound brook trout, taken at the Salt Ste. Marie by that other veteran of the rod, Judge Potter, of Toledo, has graced my library for many years and is a most lovely ornament.

The sad death of that noble man, President Garfield, which has filled this community with grief, recalls to my mind that it was the morning of that visit to Dr. Garfield when, on arriving at Cleveland, the news was received of the assassination of that other noble man, President Lincoln.

JAMES H. RICHMOND.

ONEIDA LAKE.

NEW YORK State Game Agent Dodge is again at work on Oneida Lake. Anticipating that the "trap net" fishermen would try the fall fishing again this season in some parts of the lake, he has had Special Deputy Lindley quietly looking after them. The result is that last week they took out seven trap nets. While taking up some nets in Toad Harbor, on Wednesday morning, a party came out in a boat to investigate the matter. It was finally arranged that a delegation from Toad Harbor would come across the lake in the afternoon and meet the officers at the Ocean House, claim the nets that were being taken up, and see what could be done about it.

According to agreement, about two o'clock in the afternoon, they came over, a good strong delegation. The matter of net fishing and the laws against it were thoroughly discussed; and, although the fishermen were considerably wrought up on the question of having their property taken from them in this manner, they made no ugly demonstration, but on the whole appeared pleased to meet State Agent Dodge in the line of duty, and to learn that it was of spirit of malice that prompted him in opposing them in this determined manner, but that he was simply performing the duties of his office like a man. When they returned to their boat to make the voyage home, the best of feeling prevailed among all parties, and the fishermen were well satisfied that if they continued to put their nets into the lake they would stand good chances of losing them.

The desire of the majority of the fishing class around Oneida Lake appears to be now to secure, by legislation, an open season in the fall of two or three months. They all pledge themselves to use every effort to stop the spring fishing if they can have this open season. If they would live up to such a promise to the very letter, they present many arguments in favor of such a plan. But, on the other hand, the manner in which they disregard the present law gives good grounds for the anti-net men to argue that there would be just as much trouble during the closed season as there is now. I believe if a middle line could be drawn in some manner it would be a good plan.

Mr. Geo. Crowbart, of the Ocean House, has been one of the men that has had the backbone to stand up for the law, and has rendered valuable assistance to the State Agent and his assistants. He has been threatened in all manner of ways—has had four of his best boats destroyed by the exasperated fishermen; but it makes no difference—George is running his house for the benefit of sportsmen and people who want a pleasant place to stay through the summer season, as well as for his neighbors and friends around the lake. He believes that the trap nets set in Oneida Lake do not improve the hook fishing. The Ocean House is one of the finest locations on the entire lake for beauty of scenery and fishing, and sportsmen going to Oneida Lake will do well to make their headquarters with George and his pleasant wife at the Ocean House.

Although the delegation did not claim their nets as were talked in the morning before they came over, it would seem that the meeting between them and the State Agent may yet produce good results; at any rate, it appeared to take away much of the ill feeling they had entertained before they got acquainted with him, and believe that many of them are honest (I wish I could say so) and do not intend to fish until they have a legal right to do so.

HOOK AND LINE.

PICKEREL FISHING AT BROWN'S MILLS.

AMONG the game and health resorts which you have published this summer, I think Brown's Mills will not stand least. Situated on a beautiful lake of the same name, in the pine woods of Burlington Co., New Jersey, the hotel there offers a pleasant place for all those who like boating and pickerel fishing in summer, as well as the gunners who come for black ducks, quail, rabbits and grouse in the fall. The number of anglers from spring to the use of invalids, as well as for those who have no bodily ailments, and further on the trout fishermen may find some return for his trouble in the waters of Rauceous Creek, which rise from the lake here and flow thirty miles or more to the Delaware River.

The fishing in the lake is usually for pickerel, although catfish and eels are sometimes caught. The latter can be pulled in more expeditiously by bobbing for them at night in the dam of the old mills, from which this place took its name. Pickerel usually bite better at a live minnow, but many are caught trolling and using the Caledonian minnow and India-rubber frog. The largest fish are caught in the latter way.

Taking a boat from the number belonging to the Newell House, the fisherman first goes to the best place for live minnows to bait with, and while he holds a string with a lump of dough in the water with one hand, manages with the other a small net to scoop in as many of the slimmers as possible. After the kettle, tin can or receptacle is full and a suitable spot is found, the fun begins. Pickerel from six to eighteen inches in length bite with a ferocity peculiar to themselves, and are landed in the boat as soon as their strength is exhausted by the rod and reel.

The number of the catch depends on whether the day is favorable or not, but a few can be caught at any time with a little skill.

Every year two or three camping parties come down and stay on the islands or shores of the lake to enjoy the fishing, and being so near the best spots enables them to get quite a large number.

The anglers are not thick around the hotel, where there is no underbrush and a good many large oaks and hickories, but on the road to the station, extending a mile and one-half through scrubby pines, they are found in countless numbers.

This place is only thirty miles from Philadelphia, on the P. R. R., and for a camping party is about as good as can be found in the State.

COLIN.

PRESERVING LIVE FISH IN RUSSIA.

ONE of the most pleasing things about the fish supply at St Petersburg, and elsewhere in Russia, is that you are always sure of getting your fish fresh. The arrangements for the sale of fresh-water fish are admirable. On the principal canals and tributary rivers flowing through the town you will find what are called sadoks, or floating fish stores. They consist of a barge, built very much after the style of the Toy Noah's Ark, with a dwelling-house constructed on the deck for the accommodation of the fishmonger and his family. Around this are moored several walled barges, containing all kinds of fish from smelts to salmon, which are brought in walled fishing-boats direct from the fisheries at the estuary of the Neva and in the Gulf of Finland, and also from the lakes of the northeast of Russia. Even the itinerant fishmonger carries the fish he sells alive in a wide, rather shallow tub filled with water, which he dexterously balances on his head. At the restaurant establishments humanity and gastronomy seem to unite to prolong the lives of the fish to the latest possible moment. In the entrance hall or ante-room there is usually a large glass aquarium, in which the fish swim until they are wanted. This custom of preserving live fish in Russia has existed for live hundred years.

In the household economy of the great boyars of ancient Muscovy, among the necessities of the table, live and (generally speaking) fresh fish formed a very important item. The prolonged fasts, the holiday feasts—which were conducted on a grand scale as regards the number of dishes—consumed such fish in incredible quantities. The Russians are distinctly good lovers; they keep no meagre nor inhospitable tables. These banquets impressed Archdeacon Coxé favorably in the eighteenth century, and a traveler of the sixteenth century says he saw a fish brook, to table which it required three men to carry. The fish was probably a gigantic sturgeon. Every large household of those days, in their solicitude for having a constant supply of every kind of provision at home, took great care that the live fish they required was not purchased from the fishmonger's sadoks or wells at high prices, but that it should be stored in their own ponds and caught in the rivers on their own estates, by their own serfs, so that in this manner it could be obtained as it was wanted for the table, at any time, and almost for nothing.

With this view, on every estate, however small, wherever the locality was suitable, were formed ponds and wells, and on the estates of the great and rich boyars, besides these, were established the fish rivers regular fisheries. We are told that the great boyar Morozov, who was a kind of Prime Minister in the reign of the Czar Alexey Mikhailovich in the beginning of the seventeenth century, and who resided at the court, Moscow, had a number of fish wells and ponds on his estate near Moscow, which were supplied with live fish from his estates in Russia in the interior of the country, where he owned a village, the inhabitants of which, instead of the payment of *obrok*, the usual tax, were compelled to furnish for the boyar's use as much fish as they could catch. It is remarkable how conveniently situated were Morozov's estates. From the River Oka, in the Province of Riazan, and occasionally from the Volga, there was not the least difficulty in conveying live fish to his estates near Moscow, where the boyar had established what one might term his chief piscicultural establishments. These fish were carried in specially constructed walled boats up the river Oka into the Moscow River, thence by the Istra to the village of Pavlovsk on the latter river. The fish were usually sturgeon, sterlet, bream, tench, pike, crucian carp, perch, etc. At the present day the firm of Frolov—large wholesale fishmongers of Kazan and Moscow, who have owned extensive fisheries on the Caspian Sea and the Volga for the past century—owing to their direct and constant communication with their various fishing stations, can supply any quantity of live fish to any part of Russia where there exists river communication.

The Grizistzian Railway Company have gone even further; they have constructed special wagons with wells for conveying live fish from the Volga to Moscow, each conveying holding about thirteen hundred weight of fish.—*The London Field*

KILBOURNE'S FISH AND GAME PICTURES.

A RARE opportunity is now offered some of our wealthy angling clubs or individuals of purchasing from the collection of the late S. A. Kilbourne. To those who have seen the work of his pencil no word of comment is necessary; but to others not so fortunate we may say that he stood at the head of painters of fishes, and that he wrote a book on the fish and bird revival, the approval of such scientists as Baird and Goode. At the time of Mr. Kilbourne's death he was about to be called to Washington to do similar work for the Smithsonian Institution, or the National Museum. The collection left comprises thirty-one oil paintings and two crayons of different fishes, and six paintings of birds.

The following are the finished fish pictures: California Salmon, Atlantic Salmon (2), Common Mackerel, Spanish Mackerel, Grayling (2), Trout (7), Weakfish and Sheepshead, a Trout, a Striped Bass, a Bluefish, a Charr, a Herring, as sent us by Prof. Baird, who has taken great interest in Mr. Kilbourne's work, with a request that it be published. The following pictures have the fish finished, but lack the background: Red Snapper, Spanish Mackerel, Black Bass, Trout, Atlantic Salmon, California Salmon, Striped Bass (2), Bluefish, Pompano, Lake Trout, Kingfish, Bonito, Black Seabass and Redfish.

The birds are: Young Quail, Dead Game, Quail (2), Dead Meadow Lark (2).

None of Mr. Kilbourne's paintings are held by dealers, and we would much like to see the whole collection kept together as a collection, if possible, but if not so held they will be disposed of separately. Particulars may be had of Mrs. W. C. Kilbourne, Morissiana Station, New York City.

INDIA-RUBBER RING ON A MACKEREL.—A rather singular incident in connection with the life of a mackerel came to hand here yesterday. While one of our small-mackerel boats was fishing for mackerel with hook and line in our bay a mackerel was caught with an India-rubber band around it, and which had been there for a long time, as the skin under the band showed considerable abrasion, with here and there occasional wounds. The probabilities are that about a year ago a fishing pleasure party were out somewhere along our coasts who had been drinking ginger beer, when small mackerel of six or seven inches were probably plentiful, and one of the young, restless imps who are always to be found among such a party, must have drawn out the elastic ring or

band from the bottle and slipped it over the head of a live mackerel, and just below the pectoral fins, and then have thrown the fish back again into the sea; and as a consequence, the poor mackerel must have had a weary and miserable year of it. And here, I am sure, some of our lady social reformers may learn a lesson on tight-lacing with a vengeance, for, as the fish fed and increased in size, the band kept its firm grip around him, and only allowed him to grow to the extent of the elasticity of the band; and so touchacious was the hold, that whereas the mackerel lived grown to eleven inches in length and four inches in circumference above above and below the band, under it the girth was only three inches. In fact, the poor mackerel had really a wasp waist. Moreover, from this ligature being so constantly and firmly around the fish, I estimate that it lost from its natural growth two inches in length and one inch in girth in the year.—*Cornwall (Eng.) Correspondence in Land and Water.*

CANNED BROOK TROUT.

SOME time ago we received for inspection from our friend L. and correspondent, Captain L. A. Beardsley, U. S. N., a fish preserved after the manner of sardines, and with a large showy label, on one side of which was the legend, "Spiced Brook Trout," and on the other a double-headed eagle, with the words "Maurice Buch Forellen." This was evidently intended to convey the idea that the trout was prepared in Germany for the American market. A glance at the fish, with its serrated abdomen, at once proclaimed it a Chipmunk—either a herring or a mackerel, without a head.

We kept it some time without finding opportunity to look into the matter, and last night, as of Mrs. Lewis, editor of *Food and Health*, part of whose good work it is to show up food imitations, combinations and adulterations. We sent Capt. Beardsley's fish to her. After looking in vain in several places, she found a dealer who owned the brand, and in the last issue of her journal she thus relates the interview:

"You sell canned brook trout, do you not? Do you know this label?"

"Decidedly. It is our brand, but we do not, can it."

"Can you guarantee this to be brook trout?"

"By no means. It may be anything else, so far as we know. It is put up as brook trout in Maine, and we sell it. It is nice; people like it, and buy it at a reasonable price. We do not ask any more questions."

"But is this not a fraudulent label, sir?" said *Food and Health*.

"My dear sir, how can the people expect brook trout, which sells for \$1.00 per lb. in the season. The public like it to be called brook trout, and eat it for brook trout, and that is all."

"Will you guarantee it?"

"How can we? Why don't you go to the big houses—people who put on wrong labels every day. This brook trout is like all brook trout; no better, no worse."

"If an inquiry is made about it, what will you do?"

"Stop selling it; but the public has been pleased with our brook trout, and like it. It has been always put up and sold as brook trout."

Here the interview ended, and the reporter was unable to get the customer's name.

EFFORTS OF SUBMERSIBLE LIGHT ON FISH.—A very interesting exposition of submarine lighting was opened in the West-minster several of weeks since. The apparatus employed was that of M. Faure, whose name has been brought prominently before the public recently in connection with what has been termed the storage of forces. The electricity employed was generated at Woolwich and carried in M. Faure's accumulators to the aquarium. The current was of sufficient intensity to heat to redness and dissipate into vapor a cord of copper wire the thickness of a penholder.

M. Faure's lights are contained in small closed glass vessels several of which were placed in the tank, brilliantly illuminating the fish and plants contained within it.

The most remarkable fact to be noticed was that the whole of the fish, of several species, appeared perfectly indifferent to the electric lights. They swam close to them without apparently noticing their presence. The minnows, of which there was a large shoal, pursued their graceful motions in precisely the same manner as in ordinary daylight, rising and falling and gliding through the tank, apparently without even recognizing the position of the lights by which they were so brilliantly illuminated. A small tank riveted a couple of his leisure without considering that the exhibition was a scientific experiment, and that he was therefore rendering himself liable to prosecution, from which he would have been exempt had he merely gratified his natural appetite.

The total indifference of fish to the submerged light goes far to explain the failure of the numerous schemes for attracting fish toward nets by means of submerged lights which have been proposed and in some cases carried into operation.—*London Field.*

PIKE-PRECH IN THE SUSQUEHANNA.—The Harrisburg Patriot thus records the fishing for pike perch, or wall-eyed pike, *Stizostedion*, sp. which it pleases Pennsylvania, in common with people in Ohio and the upper Mississippi, to miscall a salmon. It says: "About the finest string of the best varieties of fish known in the waters of Central Pennsylvania was brought to the city last evening by Messrs. D. Davidson and Samuel Livingston, consisting of twenty odd minnow and six very fine bass, the result of a day's fishing at Hawk Rock, a well known locality in the Susquehanna River, a few miles below this city. One of the salmon, caught on a No. 2 'Sproat' hook, by Mr. Livingston, weighed eight and a quarter pounds strong, and was voted a beauty by an admiring group of Wallonians who had congregated in front of the Harris House, North Third street, last evening. Mr. Livingston, who is a keen disciple of old Izard Walton, said the 'lubber' gave him plenty of trouble, and it was only by a determined effort that he succeeded in playing *salmo* 'out' and landing him in the boat. It is the largest salmon caught with hook and line in this vicinity for years."

CRAB AND CATFISH TAKE THE FLY.—Willis, Texas, Sept. 18. One day last week Captain Ashie, of our town, while taking some perch and catfish from his pond with artificial flies, also took a carp. He was very much surprised to find the fly, and too small to have any name, but still very killing on the sun perch and bull-head as that infest his pond. These same cats take the fly as well as the perch. He only took one carp, and that surprised him so that he did not fish any more that day. The carp that was caught was placed in the pond

last January, 1881, with some fifty others. They were then... This one was a mirror carp, and was 114 inches in length, and a most beautiful fellow too.

A MISTAKE IN ELLIOTT'S BIBLE.—Putnam County, Sept. 1881.—The Rev. John Elliott, who translated the Bible into the Indian tongue in 1663 (while engaged in this wonderful work) came to the passage, "The mother of Sisera looked out at the window and cried through the lattice," etc.

A BLACK BASS RESORT.—For fine black bass and pickerel fishing go to Narragansett, Sullivan Co., N. Y., four hours riding Erie Railway; fare \$3.75; excursions good for three weeks \$5.00; board, \$1 per day; boats, 50 cents per day.

SEASON RIVER.—The number of visitors at Red Rock, Virginia, as registered in the books of the Commissioners of Fisheries at that point, up to August 20, this season, is sixty-four. Of these seventeen made no report of fish, and I presume did not go up the river at all.

AN UPRID OIL ARM.—The Sacramento Bee says that a gun recently purchased by a Yuma (A. T.) gunsmith is of his own work. One of the barrels is a smooth-bore and the other is rifled by forcing a ring and a byonit is run out.

Fishculture.

A REPLY TO A BENTHIGED MAN.

The British Provinces there are a few persons who are either totally unenlightened or are hopelessly ignorant. They write all sorts of articles in the columns of the Fishery Commission, and a few newspapers are so short of other matters that they print their stuff.

Not having seen Mr. Spurr's letters, to which a settler refers, I am not in a position to offer any opinion on the matter in dispute. I have carefully studied and written on the Fishery Commission, and I would remind the writer that "Justice is done in doing men no injury, decency in giving them no more."

It is a pity that traps, pound nets, and all other nets, are so much used in the fisheries. How is this? I thought that the law was passed through the Dominion, and I saw no contrary. I think I may satisfy you on answering a Settler's assertion, and remind him that in all important questions "sound sense should weigh more than popular opinion."

I can also state as a fact, that a gentleman who leases one of the Gaspe Rivers, expected no less than \$1,000 a few years since, all of which went into the pockets of the settlers. The next assertion is that, "Worse than all the rest, he that Commissioner, has built breeding houses which have totally destroyed the salmon fisheries." An assertion is easily made, but not so easily proved.

Most respectable parties have endeavored to prove they killed the salmon caught, barreled them up, and no doubt the Commissioner shared the blame. What next? Salmon after spawning are not fit to eat. Were the Indians a body of settlers to prove the fish into the river. For I suppose these are the fish spoken of, at Gaspe Basin the fish when deprived of their spawn are marked and restored to their native element, and it is a well-established fact that numbers of the fish so marked have been caught by the salmon fishers, in their nets, the years following.

The next striking assertion is that "hundreds of thousands of dollars are to be made out of the repeal of the old Fishery Act, which are swallowed up by useless Commissioners, Inspectors and Fishery Officers." I have fortunately before me the Fishery Statements for 1880, giving a detailed statement of expenditure, by which it will be seen that the total only amounts to \$86,162.55. Collectors \$423.16, thus making the total cost to the country only \$67,439.34.

Let not a Settler suppose that the writer is one of those who would wield his pen to the prejudice or injury of the poor settler, or any other poor man. On the contrary, the Mercator has ever supported the rights of the settler, and fearlessly combated prejudice and wrong doing, thereby subjecting to the benighted majority of men in high places—acting on a high and right-minded mother's oft repeated charge, "Remember that right never comes wrong, and wrong will never come right."

PHILIP VIERT. Perce, August 23, 1881.

FISHCULTURAL NOTES.

The Ohio Fish Commission has placed a large number of black trout in the streams and made arrangements to hatch twenty million whitefish at the Toledo hatchery under the management of Sandusky if they can obtain the eggs, which they have proposed to take. The veteran fish culturist, Judge Potter, has retired from superintending the hatchery at Toledo and Mr. D. Y. Howell has been appointed in his stead.

The annual report of the American Fishcultural Association has just been issued. The Secretary, Mr. Barrett Phillips, has it well in hand and most of it in type, but has been waiting for the completion of Prof. Goode's "Epochs in the History of Fishculture," which will appear in the next issue of the journal. The delay has been caused by the great pressure of extra work put upon Prof. Goode this year by the fishery census and the completion of the new National Museum, of which he is Curator.

Prof. Baird reports this year's crop of carp as extremely large for their age. The carp has evidently had its growth stimulated by introduction into the warm waters of America, which are of higher temperature in summer than those of Germany. We would not be surprised to learn that some have spanned at a year old. A little evidence points that way.

CARP PONDS IN WINTER.—Mr. W. Dmker, editor of the Fisheries Zeitung, of Stettin, Germany, says in his Fishery Calendar, a yearly publication for anglers and fish culturists, that the inflow and outflow channels of fish ponds must be constantly kept clear of ice and the snow partially removed to afford a necessary amount of high water. The ponds, however, should not be left undisturbed, since snow helps to keep off the extreme cold. When the ice bears, air-holes should be provided, and these should be sawn, not chopped. To protect these from further action of the frost thin poles should be laid athwart them, covered with a thin layer of brush, and the air-holes should be kept open. The air-holes be made above the spot where the fish have congregated for the winter, and the most suitable position for them is at opposite ends of the pond, close to the in and out flow, so as to secure a maximum current of water.

as that caused by cutting ice for storage, skating or sledging, is to be avoided; otherwise the fish will be roused and tempted to rise to the surface, where, in all probability, they will freeze fast to the ice and die in consequence.

THE EDINBURGH FISHERIES EXHIBITION.

The following circular has been reproduced and circulated by the United States Fish Commission, dated Washington, D. C., Aug. 18, 1881.

INTERNATIONAL FISHERIES EXHIBITION, EDINBURGH, 1881. 22 Royal Circus, July 7, 1881.

Sir: We have the honor to inform you that an international fisheries exhibition will be held in Edinburgh in the month of April next. The exhibition will be open to exhibitors from all countries, and is intended to include, as far as possible, objects illustrative of or connected with the fisheries of the world. Such, for example, as models, drawings and photographs of boats used in fishing, and of steam engines adapted for fishing boats; models of fishing-boats and nets; and of fishermen's honors; nets, lines and fishing tackle of all kinds, both for the sea and inland waters; piscicultural apparatus; live fish in tanks; collections of stuffed fish and aquatic birds; life-saving apparatus; fog signals and lights for fishing boats; fresh fish, cured and tinned fish, and preparations for preserving fish; models of fish passes and ladders and other similar objects.

We shall esteem it a favor if you will bring under the notice of those engaged in, or connected with, the fisheries in your country, the fact that such an exhibition will be held here in April next, and if you will also kindly inform us whether you are likely to send any valuable contributions.

An answer to the above may be sent to Archibald Young, Esq., Commissioner of Scotch Salmon Fisheries, 22 Royal Circus, Edinburgh. We have the honor to be, your obedient servants, Sir J. R. S. Maitland, Bart., Wm. Skene, City Clerk, Edinburgh, F. N. Menzies, Secretary to Highland Society, Archibald Young, Advocate, Commissioner of Scotch Salmon Fisheries, Secretary to International Fisheries Exhibition, Edinburgh.

FISHCULTURE IN SCOTLAND.

FROM the book entitled "The Angler's and Sketcher's Guide to Scotland," by Archibald Young, noticed in our last issue, we extract the following: "On the south shore of Loch Broa, near Perth, Scotland, there is an establishment belonging to the Duke of Sutherland for the artificial hatching of salmon. When I saw it I contained about 30,000 salmon eggs from the Broa, Helmsdale, Thurso and Rhine. There can be no doubt of the great advantages to be derived from the system of artificial hatching, though its benefits have not yet been so thoroughly appreciated in this country as in Canada and the United States. In Canada the Colonial Government maintains seven hatchingeries, at an annual expense of 25,000, which have turned out sixty millions of eggs and young fry of different kinds of fish into the lakes and rivers within the last ten years. There are similar establishments in the United States and the Commissioner of Fisheries there has lately drawn up a volume of nearly a thousand pages on the subject of the propagation of fishes. By the artificial method, we can do away, in a great measure, with the terrible risks to which the young fry bred in our rivers in the natural way are exposed, as we can succeed in raising smolts from at least three-fourths of the vitalized eggs placed in the breeding troughs, whereas, if these eggs had been exposed to the dangers of the river, more than three-fourths of the fry produced from them would never have reached the smolt stage.

"The breeding troughs used in the establishment on Loch Broa, at the time I visited it, were the ordinary old wooden trough, much more bulky and cumbersome than they need be. It would be a great improvement if troughs similar to those used by Sir J. R. S. Maitland in his great piscicultural establishment at Craigend, near Stirling, were substituted for them. These troughs are made of carbonized wood, perforated zinc and glass rods. They take up little room, are light, neat, and afford excellent protection against fungus, that great enemy of the pisciculturist.

THE KENNEL.

SOME FISH COMMISSION REPORTS WANTED.—On looking over our collection of reports, with a view of having them bound, we miss the following: New York—1st report, 1868; Massachusetts—1st, 9th, 11th, 12th, 13th, 14th. Pennsylvania—1870 and all before; also 1872, 75, 76, 77 and 78. New Jersey—1st, 2d, 3d, 4th, 1878-1880. Virginia—1st, 2d, 3d, 4th, 5th, 6th, 7th, 8th, 9th, 10th, 11th, 12th, 13th, 14th, 15th, 16th, 17th, 18th, 19th, 20th, 21st, 22nd, 23rd, 24th, 25th, 26th, 27th, 28th, 29th, 30th, 31st, 32nd, 33rd, 34th, 35th, 36th, 37th, 38th, 39th, 40th, 41st, 42nd, 43rd, 44th, 45th, 46th, 47th, 48th, 49th, 50th, 51st, 52nd, 53rd, 54th, 55th, 56th, 57th, 58th, 59th, 60th, 61st, 62nd, 63rd, 64th, 65th, 66th, 67th, 68th, 69th, 70th, 71st, 72nd, 73rd, 74th, 75th, 76th, 77th, 78th, 79th, 80th, 81st, 82nd, 83rd, 84th, 85th, 86th, 87th, 88th, 89th, 90th, 91st, 92nd, 93rd, 94th, 95th, 96th, 97th, 98th, 99th, 100th.

FIELD TRIALS. October 1, at New York City. Close entries Eastern Field Trials. Trials commence on Thanksgiving Day. Jacob Pentz, Secretary, P. O. Box 314, New York City. October 5, 26, 27 and 28 at Masonville, Fayette Co., Pa., via boat from Erie. Entries close at Pittsburgh, Pa., October 1. R. B. Young, Secretary. November 7, at Citrus, Cal. Field Trials of the Citrus Rod and Gun Club. Entries close November 1. L. Lewyette, Secretary. November 23, Louisiana State Field Trials. Entries close November 1. Edward Odell, Secretary, New Orleans, La. December 5, at Grand Junction, Tenn., National American Kennel Club's Field Trials. J. H. Dew, Secretary, Columbia, Tenn.

EVERETT SMITH'S KENNEL.

Editor Forest and Stream: While at Portland a week or ten days since I had the pleasure of meeting Mr. Everett Smith and inspecting his kennel. I have never seen dogs under such perfect command or so thoroughly yard-broken. We have all heard of dogs drooping to shot, at the first bark of a hare, etc. Mr. Smith's wonderful performance in this respect, and I was given an exhibition of his wabbit and signal training. I must confess I have never witnessed such extraordinary obedience on the part of setter or pointer in my life. Call, a good deep set dog, Mr. Smith's, I admired most of all his dogs, but I am not mistaken, his best performance is fully equal to his looks. Cora II., a mate to Cale, gave evidence by her obedience of being a very tractable bitch in the field, notwithstanding the reputation the Irish setters have gained of being "setters."

Ninth Regiment score list including Capt. W. J. Griffith, Lieut. H. H. Haddenhorst, etc.

Seventh Regiment score list including Capt. W. H. Bilbee, Capt. C. J. Bamford, etc.

Four competitors retired.

Headquarters National Guard Match: 200 and 500 yards; 5 shots each distance.

Table of scores for National Guard Match, listing names and scores for 200 and 500 yard ranges.

Champion badge, First Brigade N. G. N. J., 200 and 500 yards, 5 shots each distance.

Table of scores for Champion badge match, listing names and scores.

Thursday, Sept. 22. Chumpton Match. Col Howard, P. Honner, B. F. Goodspeed, etc.

Table of scores for Thursday match, listing names and scores.

BOSTON, Sept. 21.—On the Walnut Hill range to day but few marksmen were out.

Table of scores for Boston match, listing names and scores.

Sept. 21.—The attendance to-day at Walnut Hill was large.

Table of scores for Sept. 21 match, listing names and scores.

Table of scores for Sept. 21 match, listing names and scores.

Handicap Match score list including E. P. Richardson, F. E. Foster, J. N. Frye, etc.

NEW ORLEANS, Sept. 18.—There was a large attendance of riflemen at the grounds of the New Orleans Shooting Club to-day to participate in the contest for the diamond badge presented for competition by Mr. Dunlap Seyler, as well as that for positions on the state team and for the New Orleans and Denver pictures.

Table of scores for New Orleans match, listing names and scores.

SEVENTH INDIVIDUAL SHOT FOR NEW ORLEANS AND DENVER PICTURES. 200 yds., 300 yds., 400 yds., 500 yds.

MR. FERDINAND, Mass., Sept. 21.—At Bellevue range, this afternoon, there was the largest attendance since spring, there being some 250 riflemen and a score of spectators to witness the sport.

THE TRAP.

Table of scores for The Trap match, listing names and scores.

DES MOINES.—Match shot by the Hawkeye Gun Club of Des Moines, Ia., for badge.

Table of scores for Des Moines match, listing names and scores.

WELLINGTON, Mass., Sept. 23.—To-day proved a gala one for the members of the Raynolds Sportsmen's Club at Wellington.

WASHINGTON GUN CLUB—Ridgewood Park, Brooklyn, E. D., Sept. 22.—21 yards. 100.010-4 Moller, Jr.; 21 yards, 101.015-5 Dierkins, etc.

WILKINSVILLE, Ill., Sept. 25.—The following scores were made at the tournament held by the Central (Ill.) Sportsmen's Association.

Table of scores for Wilkesville match, listing names and scores.

H. D. Moore, 14; W. B. Witherill, 14; W. C. Mayhew, 13; E. Kennedy, 12; W. G. Vaughn, 11; F. Estrill, 10.

Table of scores for Boston match, listing names and scores.

THOMAS FISHER, Sept. 21.—The following scores were made on second day (21st list.) at tournament held by the Central Ill. Sportsmen's Association.

Table of scores for Thomas Fisher match, listing names and scores.

CLAY PIGEONS.—Cincinnati, O., Sept. 23.—The following scores were made on second day (21st list.) at tournament held by the Central Ill. Sportsmen's Association.

Table of scores for Clay Pigeons match, listing names and scores.

DR. HENRY, Sept. 21.—The following scores were made on second day (21st list.) at tournament held by the Central Ill. Sportsmen's Association.

Table of scores for Dr. Henry match, listing names and scores.

WHITESIDE, L. I., Sept. 18.—The third regular monthly contest of the Whiteside Gun Club at glass ball game held September 13.

Table of scores for Whiteside match, listing names and scores.

WASHINGTON GUN CLUB—Ridgewood Park, Brooklyn, E. D., Sept. 22.—21 yards. 100.010-4 Moller, Jr.; 21 yards, 101.015-5 Dierkins, etc.

WELLS, Sept. 21.—The following scores were made on second day (21st list.) at tournament held by the Central Ill. Sportsmen's Association.

Table of scores for Wells match, listing names and scores.

WELLS, Sept. 21.—The following scores were made on second day (21st list.) at tournament held by the Central Ill. Sportsmen's Association.

Table of scores for Wells match, listing names and scores.

TO CORRESPONDENTS.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are invited from every part of the country. Anonymous communications will not be regarded. No correspondent's name will be published except with his consent. The Editors cannot be held responsible for the views of correspondents.

Subscriptions.

Subscriptions may begin at any time. The subscription price is \$4 per year; \$2 for six months. Remittances should be sent by registered letter, money order, or draft payable to the Forest and Stream Publishing Company. The paper may be obtained of newsvendors throughout the United States and Canada; and is on sale in Europe by the American Exchange, 49 Strand, W. C., London, Eng.; and by Em. Terquem, 15 Boulevard, St. Martin, Paris, France.

Advertisements.

Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices 50 cents per line—eight words to the line, and twelve lines to one inch. Advertisements should be sent in by the Saturday of each week previous to the issue in which they are to be inserted.

Address: Forest and Stream Publishing Co., Nos. 39 and 40 Park Row, New York City.

FOREST AND STREAM.

Thursday, September 6.

MR. CHARLES H. GILBERT, the ichthyologist, whose injuries by a fall on the Matterhorn we recorded in our issue of August 25, has recovered and has returned to his home in Indiana. It may be remembered that he was struck on the head by a rock in climbing that mountain which has been so fruitful of accidents. His companion, Prof. Jordan, writes that the injury was severe at the time but that he is well now, "with only a sabre cut to show for the Matterhorn."

MOOSE IN MAINE.—We printed last week a communication in which was reported the killing of a moose at King and Bartlett Lake, Maine, in September. As the law on moose in Maine was not off until the first day in October, the case reported in our columns might profitably engage the attention of the Maine Game Commissioners, and we hope that the publicity which we have given to the affair may be of some use.

THE GROSS INJUSTICE of the pound-nets in the Great South Bay of Long Island is only alluded to by Mr. Roosevelt this week. He has not told the whole story. This wholesale destruction of fish is a matter claiming attention at Albany. We know one man whom we could wish were appointed with full license to exterminate the nets. A year or two ago he ran a steam launch through an army of illegal nets, and their owners did not think that there was enough left of them to pay for gathering the remnants.

HINTS FOR THE EARLY SHOOTING.

THE first of October in a number of States is the opening of the shooting season, and from that time until January 1 almost all game is in season. This date is, however, much too early for most of the birds that we kill. The quail, on which most people are apt to depend, are, many of them, too small to shoot, and have not yet settled down to their regular fall feeding grounds. The woodcock have not begun to move in any numbers, and what few snipe are to be found are very "scattering." The ruffed grouse are, it is true, in good order, but in our thickly settled East these birds are scarcely to be found in numbers sufficient to make it worth while to go out for them alone. Moreover, the weather is usually at this time hot and dry, and the foliage and weeds still thick. The work is hard both for men and dogs, but especially so for the latter. In fact, shooting in the early part of October too often bears a strong family resemblance to shooting in July.

This year the weather has been especially unfavorable for early fall shooting. The heat and drought are something almost without parallel, and no dog, however good he may be, can be expected to do himself justice under such conditions as are now prevailing along our Atlantic seaboard. The snipe have as yet scarcely made their appearance, and the rail have about gone, though an easterly storm may be likely to bring along one more flight of good heavy birds. Until, however, we have some rain and a few frosts we shall probably not hear of any satisfactory bags. Later, when November's breath has turned brown, and wrenched from the trees, the leaves now so green, each of us will seek some favorite spot not known to the multitude which will yield to us a couple of dozen cock, half as many ruffed grouse and a few quail. Thinner, with one or two in most two friends, we shall repair, and have a day or two in the field. Old Rex and True will be given an opportunity to work off their superfluous flesh, and to get so tired that they will groan all night, and be so stiff in the morning that they can hardly move. We shall make a few lucky difficult shots, and no doubt miss a lot of easy ones, which we will try to excuse—to ourselves. At last we shall drive to the depot and take the train for home, carrying with us our birds—not a great many to be sure, but enough to excite the envy of some of the friends that we left behind in the city.

Before that time, however, it will be possible to find a few snipe on the meadows, and as the blue wing teal, widgeons, shovellers and black ducks are coming in in fair numbers, and are to be found on all the rivers and creeks where the wild rice abounds, there will be many opportunities for getting occasional shots at them.

It is high time now for those who have not already attended to the matter to prepare to get their dogs into condition for the fall shooting. Most dogs accumulate during the summer a good deal of fat which should be got rid of before their regular work begins. Animals kept in the city are especially apt to be in a state which makes them utterly unfit for any hard and regular work. It is absurd to suppose that a dog which has been kept on chain or confined in a small yard for months should be able to undergo the enormous amount of work which, even in a single day's shooting, is expected of him. The animal should be put through a course of training to fit him for the very severe labor which he is obliged to perform. We have always considered that the easiest and best way to give our dogs the necessary running was to have them follow us when we rode on horseback. Roads should be chosen where the dogs can always be kept in sight, and they should be allowed to range in the fields but should always be kept within call of the rider. The dogs having all their spare flesh taken off them by exercise, and having become hard and able to stand work, should have a little medicine given them two or three days before taking the field. Let each of them have at night a teaspoonful of sulphur, and the next morning from a teaspoonful to a dessert spoonful of sulphate of magnesia, which may be dissolved in water and poured down the animal's throat. We have never believed that it was well to feed dogs meat except during the season when they are at work, although we know that others differ with us on this point, and up to the opening of the shooting we feed them almost wholly on vegetable matter. When their work begins, however, let them have

some cooked meat, and if they are hunted regularly they should have plenty of it. The very severe drain on the system must be supplied by generous nourishment.

The reports which we have received from various quarters would seem to indicate that quail will be rather abundant this season. Certainly the spring and summer were very favorable for them, and it is possible that in this way the destruction of last winter may have been in part repaired. Ruffed grouse or partridges are said to be very scarce, and about other game it is as yet too early to say much.

We shall be glad to receive from our correspondents in all sections of the country reports as to the abundance or scarcity of game, and hope that all our readers will let us hear from them.

THE INTERNATIONAL GALLERY MATCH.

THE final preliminaries for the coming International Gallery Rifle Match are now arranged. Mr. Rigby, the famous long-range marksman, will select four gentlemen of Dublin; and Mr. J. S. Conlin four New York gentlemen. The respective fours to compose the team. The Irish team will shoot at a range in Dublin, and the Americans at Conlin's Gallery, 1,223 Broadway, New York. As the match is in progress the scores will be cable.

Each member of the team is to shoot twenty consecutive shots, with a .22 calibre rifle, three pounds pull, off-hand, at the Rigby target (one inch bullseye) distance twenty-five yards. Highest possible score for team, 400 points. Mr. J. K. Milner, the noted "crack" long-range marksman of Ireland will act as referee for the American team in Dublin, and Col. L. C. Bruce will act in a similar capacity in New York for the Irish team.

The names of the gentlemen who will compose the teams will be announced in due season. There is every indication that the contest will bring out some wonderful scores. Both sides are confident of their ability to win. This will be the first match of its kind ever shot. The riflemen on both sides of the Atlantic are taking great interest in the affair, and not a few think that such matches will become as popular with the general public as the famous international long-range matches of a few year ago.

THE INDIANA FISH COMMISSION.

IN our last issue we published a list of the Fish Commissioners of North America. It had stood in type for several days before the day of publication and after Indiana were the words "no appointment as we go to press." We had learned that the Governor was soon to make an appointment in accordance with the law passed last spring and a correspondent at Indianapolis had promised to telegraph us when announced. We received his telegram at 6 p. m. on Wednesday, the 28th, just as the forms were about to be locked and the change was made announcing Mr. Calvin Fletcher, of Spencer, Owen county, as the Commissioner.

The appointment we judge to be a good one, for, while we never had the pleasure of meeting Mr. Fletcher, we know him to be an ardent pisciculturist, who has been engaged in breeding carp—a fish, by the way, that is peculiarly adapted to the warm and sluggish waters which abound in parts of this State. We know that he has the question of fish food for the people at heart by correspondence which has come from different parts of Indiana, showing also that he has been publicly mentioned as being so interested.

Indiana has long needed such an officer, for her streams have been depleted by all sorts of illegal fishing, and now there is a chance of their being stocked again. This work takes time. It has taken thirty years or more to impoverish them and they cannot be restored to their fruitfulness in five years, nor in ten. The restoration will be gradual in the streams, because it is the food fishes which have disappeared and left their aquatic enemies. The bony gar still flourishes in the streams of Indiana, because its worthlessness has protected it, and it is capable of destroying thousands of the fry of good fish before the latter become numerous enough to compete with it in the struggle for food. The streams swarm with other animals, which, if they do not devour the adult or half grown fish, as the gar does, still enter into this competition for food. The science of pisciculture, for it is a science,

takes cognizance of all the influences which bear upon fish life and finds that many animals, apparently harmless, do much injury simply by devouring food which should go to sustaining valuable species.

It has been a matter of surprise that Indiana has not attended to this source of food production before this, as the States immediately surrounding her have been engaged in it for some years, with valuable results.

SALMON REPORTED ON THE VIRGINIA COAST.

WE have received the following letter, the original of which we have sent to Professor Baird, U. S. Fish Commissioner. If the fish were indeed salmon it was most important news, and goes to prove that the California species, which have been placed in the waters of Virginia and Maryland, are long in reaching maturity. We hope that specimens have been saved in alcohol, or packed in ice, and sent to the Smithsonian Institution, Washington, D. C., for identification. This is the only proper course to be pursued in such cases, for we have recently chronicled cases of mistaken identity in this same fish. Undoubtedly strange fish were caught off Cape Charles, but the fishermen there are not likely to be familiar with fresh salmon and may have made a mistake. The letter is as follows:

NORFOLK, Va., Sept. 30, 1881.

Editor Forest and Stream:

We were informed yesterday by Mr. John Henry, a merchant of this city, that one of his friends, Captain James Johnson, a famous fisherman, also of this place, had been fishing near Cape Charles for thirteen days without much success. On the fourteenth day his labor and patience were rewarded by taking three hundred and fifty (350) fine large salmon. We take this as something unusual, as there was never known to be caught more than two or three in one day before. We would be very glad to hear your opinion in regard to this matter, as we never know that salmon come in at Cape Charles and Henry. Will you please give us your opinion as to the cause of their sudden appearance?

J. B. WHITE.

THE CUTTER MADGE.

HAVING given proofs of her extraordinary sailing qualities this ten-ton cutter will probably soon store up for the voyage to the East in the hopes of finding fresh victims to add to her string of wins in American waters; that is if any one can still be found believing that the slovenly rigged, round waisted sloop can point, reach, turn or hook a sea with the flying cutter. Sundry additional challenges have been sent to the press; among them one from the sloop Wild Duck, of Pampero, Mr. Lutz, owner. The Duck if we are not mistaken, is a McGiehn built feather weight, and reputed a fast one in smooth water. To put her through a sea off the Hook with Madge would be such a one sided exhibition in the light of recent experience that, unless Mr. Lutz can hit a smooth day, his money is much safer in bank. A race was also to be sailed with Poloma, but we believe this has fallen through for the obvious reason that, though a big sloop, she would not have the ghost of a chance with the Scotchman. Mr. Prague has likewise issued a challenge in behalf of the Fanita. This sloop is 44 ft. water line, 17 ft. beam and 6 1/2 ft. de. p. Madge is 38 ft. w. l. waterline, 7 ft. 9 1/2 in. beam and 6 ft. 2 in. deep. Multiplying the three principal dimensions in each case to obtain an approximate relation of the sizes of the two we find Fanita to be more than two and one-half times as large as Madge. The bolt of the sloop is something like 4 f., that of the cutter but 27 ft. To race these two on nearly equal terms became their men lengths happen to be nearly alike—Madge's long, light overhang being made to count as half its length of additional water line with the concomitant increase of beam and depth—is so palpably ridiculous that we are inclined to think Mr. Prague issued his challenge simply as a good joke. Of course it will not be entertained. The fairest trial of merits Madge enjoyed was with Mistral, for these two boats are practically alike in size. In that match the long, narrow form proved itself so very much superior on every point of sailing that the question of type may be deemed definitely settled in favor of the cutter. The Schemer was fairly beaten on her merits. The Wave would have made much the best showing, but for bad seamanship, and had some slight chance of scoring. But the disparity in size—the sloop being a third larger than the cutter—would have robbed a result favorable to the Wave of all its import, and no conclusions of value could have been drawn from such a termination of the race. Lest we be deemed prejudiced in the matter we have collected the opinions of the press of all shades, showing a universal acknowledgment of the superior qualities of the cutter. These were so marked that even the strong natural predilection of all for the home production and our style of build and rig could not overcome the testimony of facts as witnessed by the representatives of the press following over the course in the Judges' steamer on successive days. Perhaps the most noticeable feature of these races is the fact that the cutter never once "met her weather" in the real sense of that term. It was almost wholly in our favor, only calling for a temporary single reef up on one occasion when sailing the Mistral. This occasion plainly showed that in a shorter, the idea of matching a sloop against a cutter borders upon the ridiculous. Let us now go to work, apply the lessons learned, and try to regain that prestige for our pleasure navy so unexpectedly lost.

OUR KENNEL DEPARTMENT.

IT is with sincere regret that we announce that Mr. Franklin Satterthwaite has felt obliged to sever his connection with this journal.

Mr. Satterthwaite has long been known to our readers as a sportsman of great experience—an excellent shot, and a capital hand with a dog. Under his management the Kennel Department of FOREST AND STREAM, by its fearless and independent course, won the respect and admiration of all men. It attacked abuses unsparingly, and was never influenced by fear or favor.

Mr. Satterthwaite's whole energies have been bent toward the elevation and improvement of the sport he loves so well and has practiced for so many years.

His association with us has always been of the pleasantest character, and we shall miss his genial laugh, his good story and his shrewd advice. It is with deep regret that we part with him, and our best wishes for his future follow him wherever he goes.

We have made arrangements to have the position thus made vacant filled by a sportsman of thirty-five years experience, who is known to a very large majority of our readers, and is acknowledged to be an authority on all matters connected with dog and gun. The department will be conducted, as in the past, in the interest of the dog alone, and not of any clique of dog owners. As of old, our readers may rely on it.

ESSEX COUNTY HUNT.—The Essex County Hunt (whose kennels are near Llewellyn Park, N. J.) have just purchased of Sir Hugh Allen, of Montreal, a very handsome pack of thirteen couples of imported foxhounds. They are all of uniform height, ad marked black, tan and white. Including the old pack, the kennel of the hunt now numbers fifty-six hounds, young and old. As this is more than they require they advertise to sell a few puppies and young hounds. The season opened last Saturday, with a large attendance, no less than forty being in the saddle, nearly all of whom rode through the hunt. There were over a dozen in at the death, including one lady rider.

A BAD PRECEDENT.—The decision of the Executive Committee in the case of the protest made by W. G. L. Morse against the long-range score of Dr. S. I. Scott in the champion's match, seems to be a very strange one. If the schedule system of placing time of day and target for each contestant in a match is of any use, it should be rigorously carried out, so far as circumstances would permit. To permit one competitor in a match the use of the pool targets, after the hour set for his match shooting, means the virtual abrogation of the whole schedule system.

SPRINGFIELD ROD AND GUN CLUB.—The Springfield Rod and Gun Club will hold its third annual rifle tournament at the club range, Oct. 11 and 12. There will be a champion match at 200 yards, and a four-team match open to any organized rifle association. The Secretary is Mr. L. H. Maycut. The Springfield boys know how to make it pleasant for visitors, and we look for a large attendance from outside that city.

A POSTAL CARD MARK.—A novelty is proposed at Creedmore in a postal card match in which the ordinary "postal" will be placed over the central part of the bullseye at 200 yards and shot at with any rifle. This curious cartoon will test the best eyesight of the marksmen and ought to get a great many hits from the close holders. The details of the postal card, which will probably be set for some time this month, will be given in our next issue.

BAY SNIPER SHOOTERS will appreciate the description of that sport contained in Mr. Roosevelt's sketch, "The Great South Bay."

IS IT GAMBLING?

JAMESTOWN, N. Y., Sept. 24.

Editor Forest and Stream:

I am sorry to trouble you the second time on the same subject, but I do not think that your answer to my question covers our case, or my question should have been asked differently.

One section in our constitution reads: "There shall be no betting, or gambling of any description, at any of the meetings, under the auspices of this association."

The above has been strictly lived up to for two years, but some members are now claiming that we have a mistaken notion of the definition of "gambling."

1. Now, if we, at the regular meetings on the rifle range, put up money individually and divide it in prizes, are we violating the above section of our constitution or not?

2. If the association should purchase a rifle and put it up to be shot off in one or more shootings, would that be in violation of the above article?

3. If an individual member donates a gun and we shoot for it, do we violate the above section?

The original inquiry of our correspondent included only the first case cited, and our reply to him was that the law did not recognize this as gambling. This reply did not satisfy him. The question, however, is one that cannot be answered dogmatically. Much fair argument may be adduced to support either side of it, and we think it of sufficient interest and importance to elicit general discussion. The question may be broadened to include also trap-shooting.

In the second and third cases given, provided there be no betting, there is no gambling.

The Sportsman Tourist.

For Forest and Stream.

OCTOBER.

The mists are rising on the river,
Rising slow.
The birch leaves gleam with rustling quiver,
Soft and low.
Nymphs of the woodwail gather lightly
Copes, and sublimas scatter brightly,—
Scarlet leaves are blazing in the gold.

Draped with haze are the giant mountains,—
Draped in blue.
Their rugged lineaments and fountains
Vell from view.

Breath of the woodlands' hushed, and slighting,
Whisper soft of the Summer's dylog,—
Scarlet leaves are blazing in the gold!

JOHN PRESTON TRACY.

THE GREAT SOUTH BAY.

IN TWO PARTS.—PART FIRST.

THE Fishery Commission of the State of New York had under advisement for some time the practicability of establishing a hatchery for sea fishes and had been studying Long Island as the most promising place to locate it. For this there was a double reason; first, that here was most of our sea frontage, and secondly, it offered an opportunity for cultivating trout for the southeastern portion of the State, which had heretofore been somewhat neglected, in consequence of its distance from the fresh water hatchery at Caledonia. On the northerly side of Long Island, a 4 extending its entire length of some hundred and forty miles, lies the Sound, but into this the sea breeze of the greatest value never penetrated. Bass fish, for instance, the most rising and predatory of their tribe, are rarely seen west of the "Race," except in their bay-whood, when they are popularly known as "snapping mackerel." The rare Spanish mackerel, of which there was indeed an excellent fishery at Orient Point, never were regularly taken in the Sound and have not even abandoned the former feeding grounds. The strip-bass are rather more numerous, but we-fish, kingfish and sheepshead are seldom caught in any of the waters to the north of Long Island.

On the south of the Island stretches a long, narrow lagoon of salt water, fed from the land by innumerable trout brooks pouring their sparkling rivulets, scarcely more than a mile apart, and connected with the sea by several inlets, cut by the waves through the narrow beach of low sand that separates the bay from the ocean. This lagoon, called the Great South Bay, is in reality sixty miles long, although it passes under several local names, but a boat starting from Rockaway on salt sixty miles eastward without passing through any but natural water communications.

The bay formerly abounded with fish. Here weakfish, king fish, blue-fish, sheepshead, sea bass and other species lived and bred, while Spanish mackerel, bonito and various migratory kinds visited it in their season, if they did not deposit their eggs there. This seemed a favorable location for the hatchery, although the fishing had been much reduced by the use of pound nets in and near the inlets, which not only captured fish in immense numbers but of immature size. So Mr. Seth Green, the State Superintendent of Fisheries, and one of the Commissioners, took a yacht and set out on an exploring expedition determined to investigate the possibilities of the entire bay. I went along to see that they made no mistakes.

On the 8th day of August, 1881, the good yacht Au Revoir started from the neighborhood of Islip, well provisioned for a two weeks' trip, and carrying its load of piscatorial science safely housed in its comfortable cabin of some ten feet square and five feet high. Extensive accommodations are not a feature of the yachts of athern Long Island, for the reason that while the bay is sixty miles long and four wide it is for the most part less than two feet deep. The true yachtman, however, can "stow" himself, and a prodigious deal besides, in a very small space, and "our voyagers" were naturally good yachtmen as well as great pisciculturists. Unfortunately the Commissioner is fond of gambling, and has long held the theory, which no amount of experience has removed, that the wind will come from either a great light or snipe along the beach on the south of the bay. So he insisted on bringing guns, cartridges, snipe decoys and all that along; and, more unfortunately still, he made up his mind from the signs in the heavens, the direction of the wind, or the motion of the tides, that the ninth day of August was the day on which this flight would take place. With this idea in his heart he headed the Au Revoir to the east, intending first to investigate that part of the water which was contiguous to the best sniping grounds.

No one who has not enjoyed the comforts of a cabin ten feet square, with just height of ceiling enough to enable one when sitting on the berth—which answers the double purpose of settee by day and bed by night—to take a drink of water without hitting one's head against the timbers of the roof, can imagine how snug it is. And when their first destination had been reached, anchor let go and sails furled, the explorers found the night settling down upon them and were glad to take refuge in their cosy home, get out their table luxuries and superintend the cooking of their meal. Appetite is a permanent passenger on every yacht, it lends a spice to food, assists in the cookery, helps along digestion and aids in many pleasant ways. Weariness smooths the small pillows, softens and widens the hard and narrow beds and brings balmy sleep. Supper over and even the bright rays of the kerosene lamp which lighted up the cabin like a private sun could not keep the party awake, nor persuade them to attend to the piles of literature they had brought to while away what never comes—the unoccupied and waste time of yachting.

Four o'clock a. m., and Mr. Green remarked that if they had come to snipe snipe it would not do to lose the best part of the day. In ordinary life there may be a question which is the best part of the day. The business man may consider that from ten to three covers the case; the belle may select the same hours, but from a different portion of the twenty-four; to the gourmand the dinner hour is all in all; to the speculator, the time of meeting of the Stock Board; to the lover, the hour when his mistress is visible;—but to the duck or snipe shooter, no time equals that, from dawn to full sunlight. There was no need here of Mr. Green's sage remark, though Sloth begged for a little more "folding of the hands to sleep," and the Commissioner was fain to set out sleepy

and breakfast toward the shore in the dingy, accompanied by guns, ammunition, false birds and the paraphernalia of the full art.

... "a term that includes all the sandpipers, plovers, sanders, waders and all that follow the coast in their annual migrations from their summer nesting places in the neighborhood of Hudson's Bay to their winter feeding places "away down South"—nobody knows exactly where or how far—are exceedingly gregarious in their nature. Therein lies a weakness that has proved most fatal to them and thinned their numbers from countless myriads that once fairly swarmed along the shore of the Atlantic Ocean during the summer and early autumn to a few desultory birds that survive over winter what is in sporting technique known as "a light," which means a continuous movement of flocks sufficient to give the gunner remunerative and satisfactory sport for one or more days at a time. These birds are of all sizes, from the sickle-bill curlew, that stands as high as a Shanghai chicken and weighs one-half as much, down to the "ox-eye," or "hawk's eye"—the name and its derivation both being in doubt—which is about as big as a wren and furnishes as much food as though one bit one's thumb. But, large and small, they are all possessed of eyes so brilliant and sharp and powers of sight so strong, that they would rarely be shot were they not so gregarious as they are stung and beautiful. Their social qualities and individual attributes are too largely developed for their good. A "solitary track," or a flock making its way safely up in the blue empyrean, far beyond the reach of even a "wire cartridge," on perceiving another flock, real or imitated, calls aloud with pleasure in soft, musical whistling notes, and on receiving an answer—a poor simulation often of its own call—descends confidently to death and destruction. There are few more exciting experiences in the sportsman's life than in chasing a "whiting rig" a flock of bay ships to the decoys. The man conceals himself in an artificial "blind," in a piling seaweed up around him, while he lies on his back in a water-proof coat. Our Fishery Commissioner was a sporting sportsman, and sat in a camp chair and had an artist's umbrella to shield him from an excess of sun, so he had to build a tall blind of bushes. The Superintendent, always discovering new ways of doing things, while he approved the camp chair, repudiated the tall bushes and built up a huge rampart of seaweed, sloughy because seaweed was abundant along the shore, and so seaweed being not so easily blown away, had been the best thing as a cover. But the Commissioner argued that such a mountain of seaweed would scare all the birds out of the bay.

The decoys, or "stools" as they are usually called, are made of wood in a rough way and painted not more like the natural bird than the law allows. A long stick is thrust into their body for the double purpose of legs and to set them up with on a shallow, sandy point, which is always chosen. The roughly manufactured, spurious snipe are, however, wonderfully delusive, and at a short distance cannot be distinguished from a flock of living birds. As soon as the preliminary preparations are made, the stools set out and the sportsman hidden, the latter expects the former to "open the ball"—that is, a single bird fly, already perhaps having seen all his sisters, his cousins and his aunts killed by similar ambush and trickery, is wending his solitary way to the fair sandbanks of the South. He catches sight of the false presentations, joy fills his heart—which has learned nothing by this time, and in a moment possibly his lost kindred. He calls aloud; the false friends or relations seem to answer, though their voices are hoarse—from wet feet and cold, doubtless.

Unobsciously he drops from the clouds; and with outstretched neck and expanded wings he sails gracefully and confidently up to the blind. There is a flash of lightning and a roar of thunder, and his body lies dead upon the sand, while his soul has gone to the "Happy Hunting Grounds of all eternities" to be murdered over and over again through all the centuries; for if there are happy Hunting Grounds, there must inevitably be hapless came to hunt, and, likewise, comes in the same way, only crowding and justifying another and hurrying to be first in at the death; and then the sportsman's happiness is supreme, and his art tested to its utmost, for then he can only be said to have justified himself if he shall have killed two or more with the first barrel, as they are crowding and crossing one another; and at least one with his second barrel.

... the sportsman's skill in whistling a correct and loud imitation, as in his accuracy and rapidity of aim. The variety of species is very great, and the ordinary ones will be found the following, some still retaining their quaint, Indian names: The Sickle-bill curlew, a large, brown bird, with a curved bill, which is occasionally eleven inches long; the Marlin, another brown bird, with a bill nearly straight, in fact bent slightly upward toward the point; the Jack curlew, like the sickle bill, but smaller; the Willet, about the same size as the last, with a light gray body and black and white wings; the Bull-head, or Black-breast Plover; the Golden or Greenback Plover, two fine birds for the table, and latter the better of the two; the Yelper, or large Yellowlegs; the Small Yellowlegs; the DOWITCHER, or DOWITCHER, an excellent table morsel, and the only true snipe, ornithologically considered, in the entire list; Robin snipe, somewhat similar in appearance to the Dowitcher; Brant bird, or Turnstone, a beautiful but rather tough variety; the Kricker, or Shortneck; the Peep, or Longshanked snipe; the Kinglet; the Sand snipe; the Surf snipe; and the Ouzel, and others which are scarce and infrequent. Every one of these has its own individual and characteristic whistle, which must be imitated by the gunner as nearly as possible. Each variety must be distinguished and recognized as soon as seen, for they often fly in perfect silence, and will not notice the decoys unless called. They are recognized by their size, color and manner of flight; and an experienced gunner, with perfect eyesight, can tell them apart at a prodigious distance. Then all the "Jacks" are the most wary, and as a consequence, to maintain their numbers less diminished than of the others. Some varieties, like the Golden Plover, have been almost exterminated, and in olden times a day's sport has not been determined by count, but, like the Biblical fowler, by bushel—basketfuls. As they come to the stand, they hover and set their wings, and drop their legs as if to alight; and will often do so if undisturbed; but the true sportsman never waits for that, but picks out a crossing pair or more and shoots at those. At the report the frightened flock flies, and the second shot is directed as it is technically called, making the second shot as direct as the first is easy. In a moment they will have so entirely regained their courage that those which escaped will wheel and return for a second or third shot, until sometimes they are all killed.

The sport, if it is good and the birds plenty, is exciting,

The variety of species, the difference of call and flight, the uncertainty of bringing the game within range, when it is hesitating whether to come or not, and the difficulty in selecting the best part of the flock to kill the greatest number, and a charm never to be found in no other kind of sport. Alas! however, this particular season there was error in the calculations. The Commissioner's pouch, like Venor's, was simply the contrary of what it ought to have been. In spite of winds and waves, the movements of the planets and the conjunctions of the constellations, there was no flight on the ninth day of August, 1881. Seth Green having armed himself with the ship's glass, not the customary glass of yachting parties, and surveyed the horizon from the moment it was visible till the sun appeared, announced that there was not a bird anywhere, and utterly refused to wait for them to come from some "discovered" country, while there was possible fishing to be had anywhere to be lost if the living. As he knew nothing of this kind of shooting, it was only natural that he should make up his mind promptly and the Commissioner surrendered to his views, with the saving clause, grumblingly uttered, "that if there had been thousands of birds they never would have come near a blind made of seaweed and high as a hill." So the "white wings" were spread and the Au Revoir leaped away on her course toward the west.

Now they meant business and their destination was Fire Island Inlet, the largest feeder of salt water to the Great South Bay, a channel through which a considerable amount of commerce passes and a spot that was once famous for the excellence of its fishing, but which is now so bogged in with pound-nets that the sport has greatly deteriorated, while fish that spawn in the bay are almost entirely excluded from it. It is one of the marvels of American character that in spite of its energy and enterprise it will allow the few to utterly override and trample under foot the rights and interests of the many. The Great South Bay, from time immemorial furnished a living to thousands of dwellers on its shores. Its waters are whitened with the sails of the working-boats of its hardy and laborious toilers; its oysters are famous as far as England, where "Blue Points are received fresh daily," as a restaurant sign informs the world. Its bottom is literally covered with clams and mussels and a few years ago hundreds of visitors came daily in the summer months for the sport of trolling for bluchfish off Fire Island. A sportsman could at any one cast haul the weakfish, kingfish or sea bass he wanted; or the poor man could, in a few hours, get food enough with hook and line to keep a family for a week. No man suffered for food who could work and who lived near the bay; and no more happy and independent race of men was to be found than those of the south side of Long Island. Now some twenty, certainly not over thirty, owners of pound-nets have changed all this; they have destroyed the fish, captured young and old, interrupted access to the spawning grounds, driven the boatmen to clamming and oystering exclusively, until these industries are overworked, and have brought poverty and suffering upon an entire community. And yet the people submit. Ten thousand men are ruled by thirty self-created despots, who tax the others beyond what would be dared by the greatest autocrat the world ever saw. I have not space to explain the structure or working of a pound net, but can only give the invariable experience of the New York Fishery Commission, that where the pound-net, with unrestricted length and mesh is introduced in any waters, the fishing is in a few years exhausted.

While the pound-net ruined the fishing in the bay by excluding the spawning fish, it ruined the fishing in the bay by some, especially of the smaller kinds, and could not prevent the way up the channel. The "Cinderbeds," so called from a peculiar coral formation which grows on them, are the favorite resort of porgies, sea bass and robins or gurnards, while small blue fish are taken in the channel by what is called "chumming." To the Cinderbeds an Au Revoir flew as fast as the wind and our impatience would carry her. We bought a hundred clams on the way from one of the working boats, with which the bay is dotted every working day in the year, and as soon as we reached our destination we anchored and went to fishing. Seth Green and the Commissioner each rigged up his line, and no doubt the amount of skill, erudition, research and experience involved in that operation would be hard to describe. Catching a surreptitious view of Mr. Green's rig-out, I found he had a silk worm gut leader armed with seven hooks, while the Commissioner had fastened his hooks by short lengths to his line above the sinker, half way to the tip of his rod. It is needless to say that against such skill the fish have no chance. There was a pound net within a stone's throw, and I commiserated its incapacity beside these formidable engines. Not satisfied, however, the Superintendent arranged a wire bag filled it with bait that the fish could not get at, and hung it over the side to attract them. Up came the fish by ones, by twos, by threes at every cast, of all kinds, large and small. The yacht's deck was covered with fish. Fish flopped and sparkled in the sun; fish bounced about the cockpit; fish got under your feet; fish hid away in the cabin. Baskets and boxes were filled with fish, and had it not been for an interruption the Au Revoir would have been loaded down with fish. While these two enthusiastic piscatorial artists were bent at it, with no signs of giving up, a stylish-looking craft sailed by. It had a signal on which was the suggestive figure of a fish, and beneath that the word "Bait," and the Commissioner recognizing it at once as the "chum boat," shouted out that he wanted a hundred mossbunkers. Chum bait is usual mossbunker, bony-fish or menhaden, three names for the same thing, and the chum boat immediately put larger and more alluring pieces on his hook. The chum gives out an oil which floats on the water and attracts the bluefish, while the bait catches them. As the menhaden is oily and nasty to handle it is not a pleasant nor clean style of fishing, but it is the only mode of taking bluefish which the pound nets have left possible. Fortunately on this occasion the bluefish were not plentiful, and even high art cannot catch what does not exist. So when a few had been taken and the afternoon was spent, fish powder was cooked in Mr. Green's finest style, and eaten appreciatingly. The yacht was got under way, and headed for the outmost verge of the extreme beach.

On the western point of Fire Island inlet—with the ocean in front, the bay behind, the inlet to one side, and a vast meadow to the other—Mr. Henry Haveneyer had erected a castle and watch tower, like the knights of old with their strongholds on the Rhine. Mr. Havenyer, like the knights, is a man of olden and noble lineage, and he draws his levy toll on his hard-working followers, and he draws his excise from the water and the air. From his beautiful and comfortable "coign of vantage" he can issue forth upon the

ravenous bluefish, which are busy preying upon their smaller brethren, or he can meditate as he fishes hour after hour in the hope of a hit from a sheepshead; or he can mark the flight of the bay snipe in the sky, or the motions of the ducks upon the bay. For health and pleasure, for the delights of a free and independent life, for the benefits of abundant exercise and pure air, for the comforts of a cool breeze and sleepless nights there is nothing to be compared to a home on our sea beaches; and the men and women who go to the Adirondacks and other wildernesses travel far and endure much to obtain what they might find with far fewer drawbacks at their very doors. In this most sensible movement Mr. Haveneyer is the pioneer, whose ocean home will be quickly followed by others, till every foot of available sand will be occupied. Unfortunately he was not at home, and only the solitary lamp that hangs over the portals, a guiding star to delayed mariners, and the deep baying of his hounds, whose voices are enough to frighten away interlopers, gave us a sad and sombre welcome, and pressingly suggested that we had better extend our journey a half mile further to Jesse Conkling's famous hostelry and the hospitable halls of the Waywanda Club on Cap Tree Island, upon the shores of Whig Inlet.

We did so, and I am sorry to say that we found the Waywanda very hospitable and the guests at Jesse Conkling's very friendly and musical and all. Seth Green and the Commissioner of Fisheries exceedingly sociable after their trip upon the thirsty sea. They went to bed, though, after a while, having received the promise that "Ge rre" would wake them at five next morning and take them snipe shooting once more.

The last words of Mr. Green to his new friends were: "I have to-day fixed a rig to catch salt water fish here, which I have explained to the Commissioner, who will explain it to you, and which, as they told him will catch more fish twice over than any other arrangement"—his words were a rebuke of the fact that the Commissioner had with his big hounds Mr. Green by two fish on a count of the day's catch—and if any of you would like to catch salmon-trout and will come to me, I will give you a rig for them that will take more of them than any plan you are acquainted with."

ROBERT E. ROOSEVELT.

SPORT IN NORTHWESTERN IOWA.

BY S. R. HARRIS.

The sportsman and tourist there can be no more attractive region than northwestern Iowa. The remote corner appears to have been overlooked until recently by knights of the rod and gun, as well as by the rush of emigrants from the Eastern States and Europe, who have been seeking homes in the fertile prairies of the West.

I propose to condense, in as brief a manner as possible, in a single article, a description of the country and its attractions to sportsman, tourist and farmer.

By reference to the map it will be observed that northwestern Iowa is bounded on the west by Dakota Territory, and on the north by Minnesota. Until recently it was an wholly unsettled. The tide of immigration rushed here, leaving an eddy here unvisited and undisturbed. The locality was remote from railroads, and the wonderful beauty of the country and the fertility of its soil was unknown, except to the venturesome hunter, who chased the deer and the elk over its rolling prairie; and to the disciple of Walton, who sought the most beautiful of fish in the clear waters of its romantic lakes and running streams.

The first railroad to break the solitude of this far-off land was constructed from Sioux City on the Missouri River, in a northeasterly direction to St. Paul, on the Mississippi. The next access to the country has been opened within the past two years by the Black Hills extension of the Chicago, Milwaukee and St. Paul Railroad, which is now completed through the heart of this region far into Dakota, with a prospect of reaching Deadwood, within a few months, thanks to that prince of Western railroad proprietors, Hon. Alexander Mitchell, the ventureur from Bonnie Scotland, who found a welcome among the pioneers of the West, where he rapidly rose to wealth and distinction, and whose master hand is seen in the magic with which the solitudes of the West sprung into life, culture and commerce. The crossing of these two roads is near the west side of O'Brien county, at the thriving young town of Sheldon, and near the corners of Sioux, Lyon, Osceola and O'Brien counties, which meet at one common point. The two former counties border on Dakota, and the latter on the State of Minnesota.

For the past few years I have, when August came, laid a series of traps and snares, at a distance of one hundred and twenty feet in less than half a mile, affording great water power. Two large mills are completed, the lower one having been in operation for several years. The central fall has been purchased by some New York capitalists, who have recently erected an immense mill, constructed of the igneous rock, which they blasted from the face. The water is conveyed to a turbine wheel through a seven foot iron pipe, and has a head of seventy feet. This mill is just completed and is one of the wonders of this kind of wonders. It will only be surpassed by the celebrated falls of Coy Washburn, at Minneapolis, which grinds fifteen hundred barrels of flour daily, and when completed and run to its full capacity, is expected to increase the daily product to two thousand barrels.

Another point of interest is Spirit Lake in Dickinson county, Iowa, some thirty miles northeast of Sheldon. The popular name would indicate but one body of water, yet, in reality, it is a cluster of very interesting lakes. The upper one is Spirit Lake. The next is East Okoboji, and the lower one West Okoboji, all being connected by channels. Near the upper lake, and only separated from it by a narrow tangle of willows, on the west, is Sunk Lake. By the appearance of the willow-like bank, it is evident that the earth once covered it, and it was with its large timber and only sunk at some remote period, of which even the Indians had no tradition. Deep down in clear waters can be distinctly seen large trees with their leafless limbs and broken stumps standing uninjured. Interspersed with these are broken stumps and fallen timber, and in some places the water is so shallow that the roots of the pure water of the lake for many ages.

The outlet of this cluster of lakes constitutes the Little

Sioux River, which affords water-power and mill-sites throughout its course, until it debouches into the Missouri, midway between Sioux City and Omaha City.

These lakes abound in fish such as bass and pickerel. The fish appear to have brighter colors than the same species in other waters. On the occasion of my first visit I stopped with "Old Crandall," a pioneer, and one of the few who escaped the Indian massacre. He keeps a cozy tavern of the chateau style. A party of us camped near the lake with Crandall as our guide; fished in the lake, and shot pinted grouse chickens on the neighboring prairies. We had the most signal success in both sports. When night came on our host cooked us one of his famous fish chowders of which I had heard and read, but to which all descriptions had failed to do justice.

Pierre LeRond, of New York city, many years ago discovered by some means this paradise for sportsmen. He also discovered that West Okoboji, from its elevation, depth and size, was a natural place for yacht sailing, and so purchased a considerable body of land on the west side of the lake, where he has a large boat house and all conveniences for shooting, fishing and sailing. Mr. LeRond and a few friends have had the sport, and comparatively to themselves for years, but lately their solitude has been invaded, and a rush of tourists have made this their favorite summer resort for the past two years.

The railroads are in course of construction having these lakes for their objective point. One of them, the Burlington, Cedar Rapids and Northern, has purchased a tract of land, and will erect in time for next season's business an immense hotel for the accommodation of sport-men, fishermen and pleasure-seekers. Measures are also being taken to preserve the fish of the lakes from wholesale slaughter by sieves in summer and fishing through the ice in winter. For hook and line fishing the supply is inexhaustible. In less than an hour our party caught all we wanted, and spent the afternoon on the prairie, where each shooter bagged some twenty birds. During the fall commencing late in October, the waterfowl on these lakes are innumerable. A skillful sportsman can stand on the crossing places between the lakes, and in a favorable day shoot a car-load of ducks and geese.

When I left Spirit Lake on the occasion of my first visit I took passage in a hack. The proprietor carried the mail. He was a man of fifty and a pioneer. The nearest railroad station on my way to headquarters at Sheldon was Sibley. The route was an interesting one. We passed a succession of small lakes. On this route I was the only passenger, and the driver was quite communicative, being well acquainted with every lake and stream; he had for each some traditional romance to relate. Kish Lake attracted my attention. It derives its name from the abundance of bulrushes of unusual size that grow in water from six to ten feet deep, and cover the greater part of the surface of the lake with their green spike-like stocks, extending from three to six feet above the surface. A shooter can conceal his boat in the rushes late in the fall, and kill an unlimited number of geese and ducks.

The next lake we reached was known as Silver Lake. It derives its name from the color of its water, which is not transparent, as its name would indicate, but is much the color of silver sand as if filed by sieves and bottom of chalk. The poet just crosses a low rustic bridge over the inlet of this lake road where it empties its current of clear water into the ocean-colored lake. The stream, for many rods beyond its mouth, maintains its identity as if running between light-colored walls.

At the suggestion of my guide, the loquacious hack driver, I went with him to the outlet on the bridge looking into the current. Soon we saw the heads of fish, and busily peeping from the sides of the lake into the clear water of the stream, and when undisturbed they ventured out, but at the slightest movement by us they would dart back out of sight. Mr. Jehu made a loop and a noise of his whip lash and lunged into the water, leaving it motionless for a short time, and then with a sudden jerk landed a venenous fish which he called a bull-head. (It is customary in this region to give the scientific name of the fish, but being an ignorant fisher, I am uncertain to which class it belongs, but on the authority of the captor I suppose it was a *Tetraodon caput*.)

In due time I arrived at Sheldon, and found friends ready to join me with dogs and guns. We usually did our shooting in the evenings, and it was not uncommon for each sportsman to bag two dozen birds on these excursions.

The Floyd River runs near Sheldon. Its source is in Minnesota, a few miles north, and the stream is but small. It receives tributaries and enlarges and flows south. At Leona it turns to the east, and empties into the Missouri at Sioux City.

The beaver and otter still make their abode on this stream. On one occasion I was shooting prairie chickens with a party of friends near the railroad station at Sheldon. I stood on the bank of the stream. A bevy of birds had been flushed by my friends on the prairie, and one flew toward me, high in the air. I shot it directly over my head. Its velocity carried it behind me, where it fell into the water. Instantaneously there was a splash and innisk, and before I could turn around one of the next time as had captured my bird and disappeared, with it under the water, leaving only bubbles and circling waves to mark the spot.

In addition to the attraction of the country about Sheldon for sportsmen it possesses great advantages to the agriculturist. The cheapness of lands and their fertility are already attracting emigration. The settlers thus far have been from Wisconsin, Central New York and Northern Ohio, with an occasional Old German and Scandinavian.

Mr. W. B. Close, a graduate of Cambridge University in England and an aviator, a new species which he discovered in the course of that year, came to America in 1876 to row in the Centennial regatta. He chanced to fall into conversation with a gentleman from this region, who told him of the grasshopper panic, which had devastated one of the finest and most fertile portions of the continent, and of the fine opportunity for cheap lands. Close accordingly went by the Illinois Central Railroad to Le Mars, the nearest railroad point, and effected himself that the visits of the grasshoppers were accidental, that they bred far away and were as likely to strike New England the next time as the Northwest, and he instead largely improved lands. He established cable communications with his brothers in London, and received orders from them to invest in their behalf. He at once secured 30,000 acres, all of which, under the name of Close Brothers, they still retain and are also farming as their individual property. By reason of their reputation and extensive connections in England they were flooded with inquiries, and Mr. W. B. Close, to satisfy the sudden and growing interest in his native land, wrote articles for the *Times*, the *Field* and other leading English papers; and finally a conference was

had with the celebrated John Bright, whose support was given to an enterprise which had already been suggested by the Close Brothers, three of whom promptly engaged in the work. They decided to engage farm property for a fixed compensation, and to systematically encourage colonization. The enterprise culminated in the purchase of all the lands of the Sioux City and St. Paul Railroad Company.

Mr. W. B. Close, in the meantime, married an accomplished American lady, and returned to London in furtherance of his scheme, while his brothers James B. and Fred B. Close remained to receive their newly arriving recruits. Soon the tide of emigration began, and the few scattered pioneer settlers were gladdened by the new life which was infused into the country about them. The new comers were men of character and large resources. Among the number may be named Capt. Rynolds Moreton, R. N., who is a brother of the Earl of Ducie; Lord Hobert, the future Earl of Buckinghamshire; the son of Admiral Sir Sidney Dacres, K. C. B.; the two sons of Admiral Parguhar, of the Royal Navy; a son of Sir John Lubbock, the member of Parliament for the City of London; the son of Lord Alfred Paget; R. Potter, the son of the president of the Cobden Club, and others of equal note. The Duke of Buckingham with a party of English gentlemen and capitalists visited this region during the present summer, and were driven over the prairies west and northwest of Sheldon. The party were so pleased with what they saw that on their return to England they were influential in the formation of the "Iowa Land Company, Limited," with a capital of £500,000. Among its trustees are several of the Duke's party. The capital was promptly paid in, and the Close brothers were made managers of the company. Breaking teams were at once set to work and over twenty-six square miles of prairie were broken the present year, and 100 houses were erected. These lands are mostly sold to English settlers, and the balance are rented on easy terms. Several hundred houses had been previously erected within the last two years in Sioux, Lyon and Plymouth counties, under the supervision of the Close brothers, and many additional tenement houses were erected on their own lands.

It might be supposed that the purchase of lands on such a gigantic scale would be viewed with dislike by the American farmers of the vicinity; but such does not appear to be the fact. On the contrary they appear to be pleased with the rapid settlement and cultivation of the soil.

All of the lands embraced in the Englishmen's purchase are populated with the sons, sons of whom they bought their farms, while others are tenants. The settlement and population of the country is what all parties desired. The English gentlemen, true to their love of British sports, have their race tracks and cricket grounds. Hurdle races were a novelty in that region until introduced by these colonists. They have as yet made no purchases in the neighboring counties of O'Brien, Clay and Dickinson, which are equally fertile, and where unimproved lands may be had at prices varying from \$5 to \$10 per acre.

Some parties last spring purchased for \$5 per acre a tract of 3,000 acres in Onaga Township, O'Brien County, ten miles south of the station of Hartley on the Chicago, Milwaukee & St. Paul Railroad. They broke two thousand acres, sowed flax on the sod and harvested twelve bushels per acre from it, all in one season. The product of this year will more than pay for the land. It seems strange that farmers with small means will struggle along for a scanty living in the sterile hills of the Eastern States, where lands sell from \$50 to \$100 per acre, instead of making in the Northwest, where broad rolling prairies may be purchased so cheaply in the immediate vicinity of good markets.

The pioneers of the East had to spend the best years of their lives felling trees and clearing forests before they had any surplus produce for markets. On the matchless prairies of the Northwest they may break their prairies and have grain in market without vexatious delays. With the use of improved agricultural machinery the vocation of a farmer comes to be one of toil; but, on the contrary, his life on the prairie becomes one of luxury and independence.

The farmer, the sportsman, the angler and tourist, there can be no more inviting fields than the prairies, the lakes and the streams of this Northwest.

SPORT AND GAME IN NEWFOUNDLAND.

HAVING in a previous paper treated of the caribou, which is the king of game animals in Newfoundland, I now venture an article upon the chief of our game birds, the noble *Bonasa canadensis* or Canada goose.

When I term it a game bird, I may state that, owing to the peculiarity of its haunts and the physical character of the country, rendering access to those haunts laborious and uncertain, few wild geese fall to the gun of our sportsmen proper, who devote themselves chiefly to the more certain enjoyment of grouse shooting, and shooting of smaller game.

The Canada goose is a regular annual visitor to Newfoundland, coming along from southern regions in early spring (April), remaining during the breeding season, and taking its return to large flocks in September. They breed abundantly on this island, laying their eggs upon islets in the bog-holes or lakelets which dot the large savannas or marshes, so numerous in the interior wilds of Newfoundland. They thus isolate their nests as far as possible from the designs of enemies, and as the young brood approach maturity they are conducted by the parent birds to the brooks which course through the interior parts of the island to the bays and seashore.

On this point I must correct a mistake made in a very interesting and instructive work, entitled "Game Birds in the United States," by Thomas Alexander, author of "Fish and Fishing," and other works on sport, and published in New York in 1879.

Writing of the Canada goose Mr. Alexander says: "He comes up from the south in the earliest spring, bravely making the long-studied migration in search of a breeding place. How far to the north he goes before his particular taste in this matter is satisfied is unknown, for no mortal eye has yet gazed upon the Arctic Circle having met them, with long necks outstretched toward the pole, still pursuing their journey."

"Possibly they find the long sought open Polar Sea and rest securely on its desolate bosom until their young are grown to sufficient maturity to undertake the mighty journey to the far south, where they spend the winter."

Writing in ignorance of the subject, as these statements show him to have been, it would have been wiser not to have so positively asserted such an egregious error as is contained in them, and which any one in this country having the remotest knowledge concerning wild fowl could refute.

Wild geese may have been seen heading for the North Pole; this is not questioned; and they may have solved the problem that has baffled the efforts of generations of the most daring navigators; but I opine the season of summer within the confines of the Arctic Circle is of scarcely sufficient duration for the breeding and rearing purposes of birds which require nearly six months from the time of nesting until the period of annual migration to Southern climes. No matter how much farther North they may have been seen it is a matter of fact that the Canada goose breeds in Newfoundland. Every year fishermen in some of the outlying settlements are accustomed to go off "into the country" in search of the broods of wild geese while they are still young, and frequently bring out the birds when about two-thirds grown and before their wings are sufficiently developed to enable them to escape. This is quite a common occurrence, and the birds so captured are, in the fall, sold to amateur poultry fanciers in the Capital and elsewhere at a good price. Those domesticated wild geese, may, at any time, be seen in dozens of poultry yards about St. Johns, and they breed in their captivity, both *inter se* and with the common domestic goose, producing a hybrid bird much esteemed for the table.

The fishermen also sometimes manage by means of rafts to get at the nests of the birds, and bring out and hatch the eggs under the common goose. The writer has himself seen a number of these rafts.

If further proof were necessary in support of this correction, I may state that while the Game Act of Newfoundland establishes a close time under heavy penalties for infraction, in respect to all other game birds, wild geese and the eggs of wild geese are specially excepted from the operation of the law, so as not to interfere with the small source of emolument the fishermen and poor settlers may derive therefrom. It is thought also that as those birds breed in such generally inaccessible places, no extensive injury will thus result to them, still the wisdom of molesting any animal valuable to man in its season of procreation is very questionable.

Toward the end of September large flocks of geese are seen on the "barrens," which they frequent for the purpose, preparatory to migration, of feeding up on the partridge berries and marsh berries which, in some localities and seasons, are very abundant. These so-called "barrens" are extensive strips of high barren land, interspersed with vast peat marshes, generally undulating, with clumps of stunted fir trees here and there, but chiefly on the slopes of the hollows or water courses. It is a most interesting sight to see, and there is little chance of a near approach to them.

"While grouse shooting on one occasion upon a "barrens" in St. Mary's Bay, about seventy miles from St. Johns, my setter dog, a thoroughly staunch and reliable one, stood firm at the leeward end of a long stretch of gently ascending dry ground. It was the very spot for grouse, so dismounting from the pony I rode, and handling the bridle to my attendant, I said: "In great straits of a shot here." After advancing a bit, with the dog still setting, every moment expecting a little to rise in front of me, I happened to cast my eyes a little further on, and there, at about one hundred yards off, were nine geese standing erect watching our proceedings. At the same instant that I saw them they took flight. Those were what the dog stuck to, though they were the first he had ever seen or scented. I had no chance of firing at them as they were out of shot, and even had they not been, I was only charged with No. 5.

Along the shores of many of our larger bays are natural inlets or creeks, barred by beaches along the coast line, having an opening or gut, through which the ou or waters ebb and flow. These ruinor stretches of water are generally called ponds, and frequently barrieways, from the French term, *barrachois*. They sometimes contain islets or peninsulas, upon which grows goose grass, a favorite food of the birds. At the periods when flocks of geese are expected to frequent those haunts, the fishermen of the neighborhood sometimes erect a kind of blind, or as they call it, "gaze," within a certain range of those spots where geese are in the habit of landing. The "gaze" is rough, close framework of fir trees and boughs, having room inside for a couple of men to lie and watch for the birds and to fire from when the proper opportunity arrives, and often considerable execution is thus done among them. The "gaze" must be constructed before the time when the birds are expected, so that they may see it when they come, for so cunning is their instinct that if built after they have arrived at a pond they regard it as a suspicious innovation, whose neighborhood it is best for them to avoid.

I have not thought it necessary to go into a description of the *Bonasa canadensis*, as it is well known to all who take an interest in sporting matters. TERRA NOVA.

NEW JERSEY ARCHERY.—The second annual N. J. State archery meeting took place Wednesday at Waverly. The attendance was good and the scores, notwithstanding the very high wind, were an improvement on the scores of the previous meeting. In the morning were shot the champion matches. Mrs. Gibbs, of the "Newark Toxophilites," carried off the champion's gold medal; Miss Brandegee, of the same club, secured, winning a silver medal, and Mrs. Holberton, of the Orifanti Archers, third, a yew bow.

In the Gentlemen's Champion Match, W. Holberton, President of the Orifanti Archers of Hackensack, won the State Champion Gold Medal, and Mr. C. R. Moore, of the same club, won the gold medal for highest score. Mr. Frazer, of the N. Y. Club, won the first prize, a yew bow, in the long range match.

The Team Match in the afternoon was very interesting and closely contested—48 arrows at 60 yards. The Orifanti team won by two points only, the Brooklyn team coming in second, and the N. Y. Club team third. The Newark Toxophilites was the only club to send a ladies' team and, having only scratch teams to compete with, won an easy first.—ARONER.

The third annual tournament of the Eastern Archery Association will be held in Boston on the Base Ball Grounds, October 13, 14 and 14. Those desirous of participating are requested to send their names as early as possible to George D. Underwood, City Hall, Boston, Mass.

EXPORTS OF WILD ANIMALS.—Messrs. Chas. Reich & Bro., of this city, made quite a large shipment of small American animals to Bremen, Germany, on Saturday last. Among them were a South American ocelot, Rocky Mountain wild cats, prairie wolves and dogs, a large raccoon, Mexican pigeons, etc. On the same day they received from their New York friends a giraffe, several swans and a quantity of fancy birds.

DETROIT, MICH., SEPT. 28.

Natural History.

HABITS OF PET SNAKES.

New York, Sept. 23.

HAVING seen in your publication several very interesting accounts of snakes' doings, I will tell you something of a few that I have had.

I have now a small garter snake that I captured while it was crossing a lake, at least sixty yards from one shore and about thirty yards from the shore from which it was swimming; so he must have undertaken a swim of about ninety yards. I once saw one cross a small brook, but never knew them to take such long swims. I saw an account in Forest and Stream of a garter snake that climbed a tree by going straight up, instead of the usual spiral motion. I also saw, not long ago, the snake that I now have climb a varnished walking-stick in that manner. The stick stood in a corner of the room at an angle of eighty-five degrees. The snake, by the by, is only eleven inches in length. He curved himself so that parts of his body were on each side of the cane, reaching three-quarters of the distance around it and covering about five inches of the length of it. He then pressed the lower third of his body firmly against the sides of the cane and stretched upward the other two-thirds as far as possible. Then holding fast in the manner just described, by the upper third pulled up the remainder, and so on to the top. On finding that he could go no farther in that direction, he crawled back over himself slowly and carefully until he was straightened out head downward and then slid down, pressing his body against the sides of the stick to serve as a brake.

I had five snakes at one time. I used to keep them in a large box with a wire gauze cover. Out of the five only one ever ate anything—my knowledge that the one only ate was possible. Then holding fast in the manner just described, by the upper third pulled up the remainder, and so on to the top. On finding that he could go no farther in that direction, he crawled back over himself slowly and carefully until he was straightened out head downward and then slid down, pressing his body against the sides of the stick to serve as a brake.

B. F. JOHNSON.

ECHOES OF SOME OLD DISCUSSIONS.

LEFT-EYED SHOOTING—EDIBLE WOODCHUCKS—DEER FEEDING BY THE MOON—MOONLIGHT AND FISH.

FROM time to time topics have been touched upon in your paper, to which my attention has been called, and questions discussed upon which I have myself heard evidence. I have delayed contributing to the discussions until now the list includes quite a number, and I will unburden myself upon some of them.

1. First, I will take the last question. In a recent number you were asked if a person could not be "left-eyed," and the fact was mentioned that when a circle, formed by the thumb and finger was brought in line with an object, both eyes being open, it remained in line when the left eye was closed, but, upon closing the right eye and opening the left, the fingers appeared to the right of the object. Several weeks ago some newspaper (I have forgotten what one) mentioned this fact, and accounted for it by saying that it proved that distance was judged by both eyes, and direction by only one. This seemed plausible to me, until I found by experiment that, in shooting a pistol, I could sight with either right or left eye, or with both open, with the same results. So I am at a loss to know what hearing this fact may have, if any. However, your answer, that a man who cannot shoot with the right eye probably could not shoot with the left either, is wrong. My brother, though a right-handed man, shoots from the left shoulder, and sights with the left eye (closing the right), because the right one is a little dim, owing to an accident to it in youth. The clerk of the County Court of this place, also, has lately commenced shooting from the left shoulder, sighting with the left eye, because he could not shoot satisfactorily in the ordinary way, and he finds his new method just suits him. So there are two cases existing of "left-eyed" persons, and it is reasonable to suppose there may be more.

2. A recent number also spoke of woodchuck-eating, as being a new thing. I well remember that the first "game" (if so it be), I ever ate was a woodchuck, which our farm dog in New Hampshire dug out, and, with the help of us boys, killed. Recollection tells me that it was good, and I thought it was the sweetest morsel I had ever tasted, and straightway the spirit of Esau took possession of me, and I have been killing and eating the beasts of the woods and the birds of the air ever since, when opportunity offered, woodchuck among the rest.

3. Whether deer feed by the moon is a question that may be considered laid at rest; still, the testimony I will present is different from the bulk of that you have published; and I submit to you that if it can be established that certain deer have been observed, and seen to do it, it will be of more weight than the opinions of those who simply can say they never seen such a thing, and so don't believe it. All the hunters on the Florida Keys, and on the mainland of Florida, with whom I have talked, are firm in their belief that deer come out to feed at "moon-rise," "moon-set" and "moon-south, below and above," and they are firm enough in their belief to hunt according to it—and they kill deer, too.

But to come to more conclusive evidence. Jo. Biva, or Viva, living at Fort Myer, in the Chesapeake, told me that he had seen a rabbit among deer for years, and that he had seen which he had caught and raised in his yard, invariably got up in the night and fed according to the times of the

moon as mentioned. This he had noticed himself. Also Mr. John Pent, of this place, has now a fawn which was caught some months since, when so small that a boy ran it down. He keeps it in his yard, and he tells me that it comes out from its pen and feeds "by the moon," that is at its rising, setting and meridian height, "above and below."

Have any persons who dispute this ever watched deer to see how they eat? Perhaps it is a Florida habit only!

4. Some people do not believe that the moon shining on fish spoils it. We have a large population of fishermen here; and all to whom I have ever spoken about it say the moonlight does spoil fish exposed to it; makes it soft, taints it, and unfits it for eating to such an extent that it will make one sick, the same as had meat or fruit will do. I suppose I could furnish innumerable affidavits to this, and if any one is curious on the subject I will refer them to my informants. Key West, Fla., Sept., 1881.

[Our original remarks to "Invadins" about his eyes must be taken with the limitations supplied by his letter. Of course, if a man be near-sighted in one eye he can see better, and so shoot better, by using the other eye. So, too, if the right eye be a glass eye, and there are such cases, a man may shoot from the left shoulder. Again, we know a man who shoots from the left shoulder because he cannot squint with his left eye.

The effect of moonlight on fish has been argued at length and has amounted to nothing—assertions on one side and denials on the other. If an entirely disinterested person would experiment with fish of the same weight, kept side by side and subjected to exactly the same influences, with the exception that one was exposed to the rays of the moon, while the other was protected from them, then the case could be proved one way or the other. The experimenter should be perfectly indifferent which theory was sustained, in order to try the question fairly. We have no opinion to express.]

"VIS MEDICATRIX NATURÆ."

THAT "Dame Nature" is abundantly able to care for her lowliest creatures when they are the subjects of injury, is strikingly proven by the specimen which I hand you herewith, and which, will, I doubt not, possess an interest for many who call at your rooms.

Every sportsman experiences a feeling of sadness when he is unable to recover a wounded bird—not so much from the fact that it will not swell the bag, as because he knows the poor creature must suffer for hours, or it may be, days, before death kindly comes to its release. It is cheering, therefore, to know by actual demonstration, that nature, not unfrequently, heals the wounds we make, and restores her crippled children to complete health.

On a beautiful November afternoon, two years ago, I strayed out into the woods with my dog and gun, and after a pleasant ramble of an hour or two, during which I had been only fairly successful, I was turning my steps homeward, when I saw that my dog was "making game" very decidedly, and from his action I surmised that he was trailing a partridge. Suddenly, to my left, up through a thicket of underbrush, with a royal old rush and whirr-r-r, jumped the bird—a large and strong one.

I gave him a barrel as he plunged into the tree tops, but away he went without so much as dropping a feather; and taking his line of flight as best I could, we pursued, the dog being kept well in. After tramping some time we again struck his track. This time I was looking out for him, and as when he flushed with a strong bound, a well directed shot brought him to bag.

This bird, whose rapid motions put my marksmanship to the test, had at some time or other had the misfortune to get its wing broken, most probably by a shot at the hands of some gunner—but which had been so thoroughly mended as to enable him to fly as swiftly and steadily as before the accident befell it.

The fracture had occurred in the bird's right humerus—the bone which joins with the body—about an inch from its upper articular surface, at the junction of the upper with the middle third of the shaft of the bone. The fractured ends of the bone had slipped past each other, shortening the wing

A, proximal end of humerus, or upper arm bone, of the wing of *Merula americana*; B, distal end, which articulates with the radius and ulna; B and C, fractured ends of humerus, which have slipped by one another and are now overlapping; D, "callus" or bony substance, thrown out from nature and now firmly binding the overlapping positions together.

a full half inch. But nature had poured out the provisional callus so abundantly from the attached fragment as to firmly and completely unite it with its fellow, restoring to the bird a most useful wing, so useful, in fact, that he whirred away from my first shot like a lumbeluck; with only a slight peeping and I had to flush him a second time before bringing him to bag.

The deformity was not discovered until the bird was picked, when my attention was called to it, and I at once decided to prepare and preserve the bone. I send it to you at the suggestion of some of my sportsmen friends.

The specimen is a very perfect and beautiful one, and as I before said it shows how kindly nature cares for her creatures, and how successfully she accomplishes her purposes. Lagrangeville, N. Y., Sept. 17. GEO. HUNTINGTON, M. D.

[The specimen is certainly a curious one, and so interesting that we have thought it worthy of an illustration. The bone is now at this office, and we shall be pleased to exhibit it to our friends. Mr. John G. Bell, the taxidermist of this city, has in the course of his long experience come across several instances of this healing power of Mother Nature. Among other specimens was that of a woodcock, in one of the bones of which were found, cutted by the callus, some interlaced feathers, showing that the bird had been previously wounded and the wound had healed. How quiet the bird must be while the wonderful process is going on.]

Editor Forest and Stream:

In a recent number of your excellent journal appeared an article by Albert West, quoted from the Advance, in which he takes the ground that the mocking bird is not an imitative bird, but inherits the talent of singing all his varied notes. It seems that he draws conclusions from his observation of one bird taken from the nest at an early day and kept entirely away from other birds.

He states that the bird developed notes similar to the blue bird, etc. Had he compared the real notes of the other varieties mentioned he would have seen that there was a similarity only; while he would have heard a perfect imitation, if the mocker had heard the notes of other birds.

It is a fact that the mocking birds have a great variety of notes in their song; but that they are not imitative I will attempt to disprove. Our conclusions are drawn from a number of years' observation, not only of this variety, but a number of other wild varieties, as the robin, catbird, thrush, etc. We have studied carefully their habits and peculiarities both in the woods and in the cage. The canary has also come in for a large share of attention. This little warbler can be taught to whistle anything within the range of his delicate throat. I have known them to learn the ticking and striking of a clock, a tune from a hand organ, and one learned the tune of "Yankee Doodle," whistled by its mistress. It seems almost impossible for them to do otherwise than to imitate the sounds that they hear repeated for a number of weeks.

The mocking bird will do the same, only they learn in a shorter time and include a greater variety in their programme. We have one in mind now, not a half dozen weeks away, that has been kept near a yard where fowls are confined, and it has learned the crowing of the cock and the cackle of the hens to perfection. Another one that came under our observation would imitate the filing of a saw. He was owned next door to a man who made it his business to file saws. We have in mind another which hung near an old-fashioned clock. In a short time he acquired the faculty of ticking and striking with perfect regularity. A lady friend of the writer left her mocker in his cage for a time, and in about five days he would imitate the song of the rose-breasted grosbeak. I also taught him some peculiar strains by dwelling on the same notes for a number of days.

We think this is sufficient to convince the most skeptical that they are a mocking bird in the true sense of the word. If left to themselves they will no doubt develop a very fine song, but unless they hear other birds they will not show near the sweetness and variety that they would to hear different varieties for sufficient time to acquire a perfect imitation. Hor.

IS THE TURTLE FISH OR GAME?

WARRENTON, VA., OCT. 1.

Editor Forest and Stream:

Seeing an account of the turtle found near this place, and reading the remarks, reminds me of a circumstance that happened in the Virginia Legislature that sat in Richmond three winters ago. It seems that there were two separate committees, called respectively the "Committee on Chesapeake and its Tributaries," which had the sole jurisdiction over fish, and the "Committee on Game," which attended to the protection of the birds, or rather the feather and the fur of the commonwealth.

Now, these two committees were very jealous of each other's functions, and watched one another like hawks. At last a circumstance occurred which made the smothered fire break out into an angry flame, and open hostility was the result.

It appears that the chairman of the game committee brought in a bill for the better protection of "terrapins." The chairman of the fish committee indignantly denied the right of the other to claim jurisdiction over the fish, because he said it was a fish. The game committee claimed the terrapin as game, and appealed to the House, and all that night the General Assembly of Virginia were debating that knotty question—Is the turtle a fish? They haven't decided it to this day. Cannot some readers of the FOREST AND STREAM cut that Gordian knot of conundrums? CAUTION THE FAMOUS "Pot Luck Club" throw light on this subject, which added the brains and stamped the judgment of the wisest of the Old Dominion statesmen? Or brother sportsmen, I rise for information. Is the turtle fish or game? [Let the Pot Luck Club speak.] CHASSIEUX.

SKUNK VS. WOODCHUCK.

IN your issue of the 8th inst. the paragraph relative to the edible qualities of the woodchuck brings to mind an incident that goes to show that even the skunk is considered quite a delicacy by some people.

In the autumn of 1873 I accompanied a surveying expedition to the northwestern frontier of this State. We had employed in the party about twenty Mexicans. On going into camp one evening on the San Gabriel the Mexicans discovered the skunk making their way into a hollow log and the men immediately set about to capture the varmints.

Having located the animals, they proceeded to cut into the hollow of the log a hole of sufficient size, when one of the men thrust his hand in and drew out one of the skunks, holding it by the tail close to the roots, taking the precaution to catch it also by the back of the neck. Held in this position, and at arm's length, it was killed by a blow on the head. The other was secured in the same manner and, strange to say, none of the timid odor peculiar to the animal could be detected. The Mexicans were so that he dug it by the root of the tail rendered it powerless to discharge any of its offensive fluid.

Both animals being dispatched, a roaring fire of brushwood was built and they were thrown in the flame and allowed to remain for the space of thirty seconds. On being taken out they were scraped, the hair slipping off easily. Next the gland containing the defensive fluid was carefully and skillfully removed, the animals were dressed and placed upon a spit and roasted before the fire. The skunk being pronounced cooked, I was invited to partake of the feast, but very respectfully declined. The Mexicans, however, seemed to enjoy the feast immensely and pronounced the flesh not inferior to that of opossum. P.

Fort Clark, Texas, Sept. 19.

Game Bag and Gun.

FOREST AND STREAM GAME TABLE

OPEN SEASONS.

The seasons, in which it is lawful to shoot game in the several States and Territories, open as designated in the following table:

Table with columns: States, Deer, Woodcock, Quail, Ruffed Grouse, Pinnated Grouse (Prairie Chick-en), Wild-foal, Wild Turkey. Rows list various states and their respective hunting seasons for each game type.

Ala., Oct. 20, Sept. 15, Oct. 1, Oct. 20.
Ariz., July 1, Sept. 15, Oct. 1, Oct. 20.
Cal., Sept. 1, Prohib. Oct. 1, Oct. 1.

In these States there are special county laws. a The deer law applies to sale or possession. b Wildnot not protected on the coast. c Upper Peninsula deer season opens Aug. 15. d California quail protected to 1882. e Arizona quail season opens July 1. f Moose and cariboo, Sept. 1. g First open woodcock season begins July 1; will close Aug. 1. h Quail shooting prohibited to Nov. 1, 1882, in counties of Montgomery, Schuylker, Saratoga and Albany. i Whitetail season in Long Island waters opens Oct. 1. A deer law relates to female deer only.

A DAY WITH THE HOUNDS.

TWENTY years ago the forests along Pine Creek were well stocked with game, and during the hunting season the baying of hounds could be heard almost every day telling the story of a chase, and suggesting a venison supper. A deer was no unusual sight then, and the traveler along the river road would frequently be startled by a splash, and looking round would see the victim of the chase cooling himself with a swim or by jumping on a log. Sometimes he might see a more exciting sight when the hounds came before the deer left the stream, and might find ample field for sympathy, whether sportsman or not, in the struggle for life between the tired animals.

Those days, with their rich harvest of sport, will never be seen again. The pioneer's axe has extended the line of clearing, and the crash of falling trees have frightened away the timid deer that have taken refuge in the mountains too far back to be cultivated. The runways* of that time are now the sites of cities, and the fields that have succeeded the corn. The idols of the sportsman are broken, and the march of civilization has trodden down his choicest treasure leaving him only the despised portions of his old-time territory on which to found a new empire suitable for his patron saint, Diana.

If sportsmen were easily discouraged there would be little hunting done now, but faith and persistence are the leading traits of character developed by the true sportsman, and the interest and hopefulness that he would exhibit under the most dismal circumstances are the proper place for such an account of the hounds as they follow a track, old enough perhaps to be an ancient landmark, exhilarates him nearly as much as the sight of game, and the transparent lies that he will tell to account for the return of the hounds without a deer are simply inexhaustible. He will not lose faith in final success, no matter how unfortunate his first few days' experience may be, and with serene boldness prepares every day for a venison steak for supper. A whole volume might be written on the discipline a man must undergo before he can become a professional hunter, but as this is not the proper place for such an account it is omitted, and our story is resumed.

On one of the pleasant days of last November a party of four, embracing one professional hunter and three amateurs, started for a week's hunting, taking with them all necessary equipments and five of the best hounds that could be found in the village—long, silky-eared animals, whose clean limbs and thoroughbred coloring distinguished them from the ordinary dog and told their aristocratic lineage. Nothing that a professional hunter could think of was omitted and the fertility of such an individual's mind is really confusing; so confusing, indeed, that at this time none of the amateurs can say what benefit was derived from some of the articles he considered necessary, nor can they explain why the inventory of the property was so remarkably short when they returned. Professional hunters are expensive and mysterious, but aside from these annoying qualities they are a beneficent institution and deserve to be patronized.

The first few days were not successful, so far as results

were concerned, but the practices were beyond reproach. Everything was conducted on purely professional principles. The hounds were fed just so much and at just such times; the guns were cleaned, oiled and primed, and the hunting knives were sharpened with as much care as would have been used had a hundred elk been killed every day. The amateurs were getting discouraged, but the professional was as unimpaired and sanguine as he could have been if he had believed his own lies. No matter what was said, the same calm prophecy of final good fortune was made, and at last it came.

The hounds were taken, as usual, far up among the mountains, several miles from the river, to be started. The usual examination for fresh tracks was made, and this time it was successful. In the head of one of the large basins that are found between the mountains, a number of deer had spent the night and the hounds immediately started with such a chorus of baying as would delight any sportsman. They went slowly at first, following the tracks where the deer had been feeding, the pairs frequently crossing each other and troubling the hounds to follow them; but at last they got started and started off through dense forest with "starters" heard their music, now in short, hurried barks when they were near the game, and again in long, deep, but infrequent bays as the scent was less fresh. They were going in the right direction and the "starters" work was done. He could only hope for success and wonder whether the amateurs or the professional would get the first shot.

Several miles below the men were stationed on the runways near the river awaiting developments. They had been on the same runways several previous days waiting for game and none had come, which had discouraged all but one so much that considerable persuasion was required to get them out. But on this day they were more than repaid for the ill-luck of the preceding watches and the one who had been steadfast in his faith was looked to as a prophet.

At first they heard only an occasional sound from old Colonel, the strongest hound in the pack, but in a few moments the earnest barking of all was heard coming steadily toward the watchers. The bark was the "game bark" too, not the discouraged howl of a man-of-scent, and the men on the runways prepared for the expected game. Loads and triggers were examined and the priming in every tube carefully replaced with new powder. Everything was done to prevent accident when the time for action came, and the men, fully prepared, but a little nervous, sat down and waited for the hounds to come in.

The waiting is one of the trying points of a sportsman's life, and one in which his coolness and patience are manifested, if he have any. The hounds come slowly, and as their deep and strong bark is heard for miles, it is sometimes over an hour before they are first heard, but the game is driven in, and all this time the hunter must wait, feeling that honor is to be lost or won when the distant barking that he is listening to reaches him. Sometimes the deer leave the runways, that with strange instinct they follow as men do the public streets, and come into the river at unexpected places; but this is unusual, and if all the runways are guarded, some one is usually sure to get a shot at any game that may be started. Each mountain and valley has its deer paths, many of them grown like the cattle paths, and whenever the hounds find the timid animals are started they lose all these paths into danger, instead of away from it, as instinct might be supposed to teach them.

After waiting for half an hour and listening to the barking of the hounds growing louder and less musical as it came nearer, the watchers were startled by a couple of shots in what seemed to be the locality of the hounds. They were somewhat surprised and very much annoyed by the occurrence, and even the professional was afraid some one had killed the game and left the hounds to bark. The music was resumed, and it was decided that a mistake had been made in thinking the shots were fired near the hounds.

The music of the chase came nearer and nearer, and every man was at his post, with gun ready, waiting for the expected deer. Nothing was unnoticed, and the flying of a bird or the rustling of a twig was a signal for the hearer to raise his gun to his face; and the flight of a disturbed squirrel threw even the professional into panic and a shot. Everything that stirred excited them, and he could have sworn it was possible for a rabbit to move without being detected, so watchful were they.

At last the deer came in sight, three of them dashing over the brow of a hill nearly half a mile away and coming down the hill in great leaps that only deer can make. It was scarcely more than a minute before they passed the watching places, but there was time to admire their beauty and the unimpeded grace of their movement. Writers sometimes speak of the goodly motion, but the word is meaningless until a deer is seen running wild in his native forest. Such perfect grace combined with strength, such agility and such infinite ease of movement, are worth a journey across the continent to see. Every moment seems a courtesy, and a sentimental sportsman almost loses his desire for spoils as he watches the graceful movements of the tender eye game coming to slaughter.

In this case the sportsmen were not sentimental, and after a moment's admiration every man prepared for the coming deer. They got back to their guns and waited for the first shot on which the amateurs were stationed, and the hounds so far behind that they could not be seen. As they went by the hunters the rifles were discharged, and then the deer fairly flew in their mad dash toward the river. Whether they had hit any of the deer or not the hunters could not tell, and they hurried toward the river, which they reached just in time to see the professional discharge both barrels of his gun at the deer as they were dashing. There were only two in the water and both were killed in less than a minute by the expert professional, with all his faults, was an unusually skillful woodsman and hunter. A search discovered the third deer lying dead a few rods from the runway, having, as is usual, left the path after being hit, and in a few moments three dead deer were hung up side by side to be gazed on by the happiest and most excited sportsmen that Pine Creek ever saw. The amateurs had killed one deer and they were happy. Those shot had killed him they did not know; they had done it between them, and that was enough. They could go back to their homes and tell every one of their successful, wondering friends; and what more was there to content reasonable sportsmen? It was a lucky day for them, and they would have gone home satisfied if some unknown "still-hunter" had not shot one of their hounds.

After the deer were dressed they looked around for their hounds and soon found all but Colonel, who was missing. They called him and searched everywhere, but were at last obliged to give him up as lost. The mystery of the two shots was explained, and they knew that the brave old hound that

always led the pack was a victim to the hate of men who hunt without dogs. The loss was a sad one and marred the otherwise complete day, but the grand success of their hunt made them practically forget the misfortune, and they all look back upon the Pine Creek trip as the most successful one they have ever taken. Hounds die every day, but such a pair of antlers as were won in that hunt are found but once in a century.

REMINISCENCES OF FORTY YEARS.

SECOND PAPER.

VISITING a planter in the valley of Alabama, in 1842, near the mouth of the Alabama River, from Decatur, Ala., my host and myself made up our minds for a deer hunt. We started early in the morning, mounted on horses and mules. Heavy rains had prevailed for some days and the river was greatly swollen. We soon came to a bit of river bottom where the country road was overflowed for a distance of some three or four hundred yards. All the old hunters mournfully shook their heads at the prospect of fording it, knowing from many former overflows the length and depth were to go through.

My friend, a spare built, wiry gentleman, not more than 130 pounds or so in weight, and mounted on his regular hunting pony, was ready enough on his part, and asked if any one or more would go with him. I said I would follow, but the rest turned back. I was mounted on a mule, Billy, a sure-footed animal, and frequently used for breaking deer on these soil hunts. My friend on his pony went on very well for 100 yards, getting deeper, until half up the pony's sides. All at once the pony struck out swimming, but so high and far out of water that my friend kept dry enough by tucking up his legs. Not so Billy, the mule. When he came to this hole, a descent of some six to eight feet of water, he too, struck out with his head and neck out of water, but his body and mine submerged. Still on we went and pulled through. We then dismounted, shook our wet clothes and galloped off to an old squire's house, some two miles, where we were shown to a room with a blazing log fire, dried our things, dined with the old squire and his three good looking daughters, lit our pipes and mounted again at 3 p. m. for the mountains. We reached our destination at nightfall, a comfortable log cabin, that held in its fireplace a cord of hickory if required.

Next day came our breaking for deer on horseback. Some half dozen were mounted, myself on Billy the mule. We agreed not to shoot at anything but large game, meaning deer, bear, wolf, &c. We rode on a line with each other, about 100 yards apart, through timber with little or no underbrush, making a path of 600 yards at all. Each had a horn (cow horn) to blow when they saw a successful shot was fired. We had gone probably a mile and had seen nothing, when Billy began to snort, pricked forward his ears and stood still, trying to call my attention to his object, which I saw, a remarkable looking thing, at a stump of a tree, which I could not make head nor tail of. However, I considered it large game, and surely wild, let drive my little 14-gauge and rolled over the creature, took the cow horn and blew my blast.

Down came two of the Luntsmen. "What have you got? What have you got?" I said, "The devil of a run looking thing, just walking the middle up to it. It was a ram, a horned ram, but a tremendous large one. We strapped him behind on Billy, and that evening at the log cabin he was well cleaned and laid on the shingles over the fire's night. Now comes the cooking. First—Well cleaned and wiped out after the frost had dissolved; stuffed with bread crumbs—sweet potatoes and something else—some herbs, lemon, thyme, I think—sweved up and a grave was made in the deep ash of this monster fireplace. The 'possum was then submerged in cold water and allowed to cool, and roasted in a pot. Well covered up and two or three shovel-fuls of hickory coals around and on top the ash heap—coals renewed as fast as required until some two hours or more, when the 'possum was laid on the table, and with a cloth the hair removed as easily as scraping a carrot—the skin and flesh as white as milk—smoking hot, done through and through—put on the table hot—hot—hot and no cold 'possum was left after a half-dozen hungry hunters had got through. Well, nothing of the kind could be finer than what I saw was in the 'possum! Potatoes and fixings—remaining steaming through when a bushel of live coals and ashes. This was my first 'possum I had ever seen cooked and ate, and the first and last I ever shot. In the early spring of 1853 we started before day-light to catch the old gobblers, calling them before they flew off their roosting-place. My first old gobbler—shot from a very high tree, he fell—ran like a race-horse—myself after him, until he gave up the ghost. This tree was sixty-ton yards from where I was and high timber—one shot only did the work, and fixings—remaining steaming through when a bushel of live coals and ashes. This was my first 'possum I had ever seen cooked and ate, and the first and last I ever shot. In the early spring of 1853 we started before day-light to catch the old gobblers, calling them before they flew off their roosting-place. My first old gobbler—shot from a very high tree, he fell—ran like a race-horse—myself after him, until he gave up the ghost. This tree was sixty-ton yards from where I was and high timber—one shot only did the work, and fixings—remaining steaming through when a bushel of live coals and ashes. This was my first 'possum I had ever seen cooked and ate, and the first and last I ever shot.

My second shot was at a fine hen-turkey roosting on a very high tree in a swamp, which I could not creep nearer than one hundred yards without being up to my middle while viewing the situation. She took flight, coming straight for me, for fifty or sixty yards, when she turned to the right and at the time of passing me (so that I would be shooting "behind the feathers") she must have been from ninety to one hundred yards off. I was using a 28-gauge bought in St. Louis. The right barrel shot through the middle of the wing, the right trigger and down came the bird. On examining her I found that the charge had bunched, entered above the rump, gone through the body, coming out the crop. The space—a hole at the entrance—was as large as a turkey's egg. One might shoot a hundred years, and not have such an occurrence again. My next was a double shot from the saddle by the Cumberland River. Ten large gobblers rose on wing some forty yards before me. I pulled my pony round to the right, shot well forward for their heads and necks, and at each right and left crack they tumbled—shot through the head—kept bounding up in their dying flitter. They weighed forty-eight pounds together, and when their heads were tied together and swung across the pony at the horn of the saddle their feet touched the ground.

In Crawford Co., Missouri, in 1867, near where I was stopping was a cornfield at the back. On two or three occasions the folks came running in the night to me—"The turkeys are in the cornfield!" I at once hurried with my gun the first and second time, only to find some of them had gone through the way near the fence, and entered them off—they are so easily set off on the least alarm. The third time, however, I caught them there, and creeping through some hazel bushes near the fence, got a range of two heads pretty well in a line so that I pulled the right barrel. Then came the prising of the brood of full-grown fellows fattened on mast and corn, being in October full-moulted. The first barrel killed the two I saw, and one further down the furrow some forty yards, which I

did not see. The left barrel invited the old gobbler down, not making four in the double shot. I could scarcely lift, much less carry in my arms, a turkey shot. It was in the meadows in September, '80, in a field adjoining the cornfield mentioned above. The turkeys were in a meadow feeding on crasshopper. I went r and the field in the tim of out of sibs, creeping up to the fence, where they were some forty yards out, struggling. I waited, thinking two might get together, when I would try them with my right and left as they flew to the timber. Watching and waiting, at last a grasshopper started flying (butterfly grasshopper) from the turkey in the middle of the row. The first shot I fired was a snap at the fifty bird. As the grasshopper grounded, the three heads arived together to grab him, but my right barrel sent a dose of number six among them killing them all three, and as a fine young gobbler rose the left barrel brought him down. Ditto the last double shot—three turkeys with the right, one with the left (four)—viz., eight turkeys in the two double shots. The last four were young and very tender, three-pairs grown—weighing from ten to twelve pounds each.

Near the Mineral Mountain lead mines, in Crawford county, was a corn field some ten acres. As I had miners at work prospecting I generally rode my horse Dick every morning to the shafts, and always carried my gun with me. I generally pass d this corn field about 9 A. M., and had frequently shot the squirrels coming from the corn and in a large elm tree. One morning I was there at day-break and seeing several scampering from the field with large ears of corn in their mouths, I shot one. In a minute they were scampering from all parts of the field to this one lonely elm. I dismounted and shot and loaded as fast as I could. The tree was full of large fox squirrels, and the only hole half way up was stuffed full of corn ears and squirrels, until not another could get in, but, like the ostrich, could get their heads out of sight, with their bodies a target for No. 6. I blazed away, dropping them at every shot. When the last was shot from outside the hole, I found them in various parts of the elm, hanging along the large limbs. I picked off all I could find, killing twenty with only walking round and round this tree—all large fox squirrels.

One day I was surprised by squirrels I have often thought of. Passing through the timber near the above locality I saw a fox squirrel running as hard as he could. I followed him and pressed him so hard that he could not reach the tree where his hole was, and had to take another—which I was sure he must have gone up. Still I look'd around here and there. At last I saw something in a fork, which crossed the fork of the two points of the tree high up, and above this crossing peeped up two little pointed somethings, very like squirrel's ears. I concluded the way my fox squirrel had taken in his mouth, crossing from the hole in the fork just above the cut; these two little points must be the ears, so I let drive. I knocked the cork eighteen yards from the tree (down hill) and the squirrel's tail half the distance, with his throat cut with shot.

In the fall of 1850 I spent three months on the Gunpowder River, near Baltimore, having a fine cove on the Harewood farm, where the river's water was still, and a dock-house with two or three hundred decoys. I shot from October until the frost fell the river over, which was not until I had succeeded in some of my fine shooting over decoys for blinds. My acc-out of ducks killed amounted to 1,472 head, including canvas backs, red heads, bald pat, pin tails, etc. Here I had a tolling shot, bringing the immense field of ducks, all canvas backs and red heads, to stare at a red head-crook, a club at the end of a pole from my blind, moving backward and forward; had heard of this tolling but could scarcely believe it until I tried it. Only fancy 1,000 fine canvas backs, as thick on the water, apparently, as they can be swimming up with arched necks like a snake, and when thirty-five or forty yards I let go my first barrel, expecting to see the water black with the dead and fluttering ones, instead of which I overshot them, through a small piece of cedar brush being near the sight of my gun I afterward observed; the second barrel stopped two or three hundred yards out. Two or three weeks after I made up, again getting the fellows to look at the red flag with so much curiosity, there was this time 200 to 300, I presume, in a bunch. My right and left counted eleven and two, thirteen canvas back. I could not get them to toll, and their curiosity must have been fully gratified. WILLIAM KING.

ANOTHER ANCIENT GUN.

AMHERST, N. H., Sept. 26.

AS stories of ancient fire-arms seem to be in order, I fixed up an old gun that I have now standing in my shop and old gun that prompts many curious remarks from my sporting brethren. I will give you a description of it and let better by your readers than "Kingwood" or "Abern."

The gun has been in the possession of the Prince family, and was brought over by one of their ancestors from England fully two hundred years ago. The barrel measures six feet in length and is an inch and three quarters in diameter at breech, and a ten-gauge shell will just enter the muzzle. The whole length of the gun is seven feet four inches; its weight seventeen pounds.

I remember the old gun when it had its old-fashioned hook-back hammer, flint lock; but about thirty years ago its former owner, "Old Uncle Jimmy" Prince had the lock changed to percussion. It has been fired but a few times since the lock was changed. The traditional mule's kick is a love pat compared with the way it will kick. No one cares to fire it a second time.

A story is told: A short time after the old man had fixed up his gun on a tree about forty rods from the house, so he got the old gun and loaded it about right for the distance, as he judged; went up stairs and knelt on the floor and fired from the chamber window. As it happened, there was a chimney about eight feet back that stopped him. The old man came down stairs, rubbing himself and remarked, "The old gun'll kill both ends." He killed the crow.

H. H. P.

BAY SNIP SHOOTING—Good Ground, Long Island, Shinnecock Bay.—We are having the best bay snip shooting of the season. The young fall birds are coming on and are making good shooting. We have also the best feed for ducks we have had in years. There has been for two years a scarcity of feed for the waterfowl, but this year the feed has come in more plentiful than I ever saw before, and we expect plenty of ducks this fall.—WM. N. LANE.

"LEFT-EYED SHOOTING."

BOSTON, October 3, 1881.

Editor Forest and Stream:

As "Teecel" was so kindly a moderator of your feelings in his article on "Left-eyed Shooting," I will endeavor to be the same of his; nevertheless, I enjoyed a hearty laugh when I read his opinion, and now hope I shall be able to convince him of his error.

It is evident that in looking at any object, a figure in the wall-paper for example, there must be two visual rays, one proceeding from each eye, which are focused upon the article so that they form a sort of V. Now, suppose a finger to be held up a short distance directly in front of the nose, it is evident in this case the two visual rays will be much shorter, and that the object, as projected, would strike one on each side of the figure on the wall; or, in other words, the person would be "both-eyed," as the view of the object with either eye would not be obstructed by the finger.

But suppose instead of holding his finger directly in front of his nose, or in other words between his eyes, a person holds it a little at the right; now with both eyes open he can still see the figure on the wall, but he does not see it with both eyes, as the finger is between it and his right eye which would make him according to "Teecel" "left-eyed"; in the same manner, if his finger should be held a little at the left he would become "right-eyed," with which eye he can see the figure when the other is closed, depending solely upon the position of the finger.

As for a "left-eyed" man not being able to shoot from his right shoulder, with both eyes open, that is something new to me. Shooting at a bird flying I never aim along the barrel; if I should do that I should lose him; I somehow look at him with both eyes, point the gun where I think he is and pull; I don't have time to bring him in line with the gun.

If "Teecel" is not convinced by this, I hope he will give us the benefit of some more arguments and experience to strengthen his position. PENTAGON.

ENGLEWOOD, N. J., Oct. 1, 1881.

Editor Forest and Stream:

In your issue of 29th ult., a correspondent, "Teecel," writes of "Left-eyed Shooting," promulgating a theory and explaining a simple method for testing the same. I have many times, and long, and for many years, by the same method and arrived practically at the same results. I did not dream of claiming originality either for theory or method, as the theory is, I understand, generally admitted by oculists, and the method (or a very similar one) constantly employed by them in their examinations. I am led to believe that I am, for one, decidedly "left-eyed." I am forced also to the conclusion that a decided change has taken place in this respect within a few years. It has resulted in bad shooting—shooting unaccountable on any theory of "want of practice" or "loss of nerve"—and I have met with measurable success in correcting the difficulty by learning to shoot with "both eyes." As I am not left-handed I am prevented from using my left eye alone, by the lack of proper muscular facility in bringing the gun to the left shoulder readily and quickly; but by using both eyes I arrive at tolerably satisfactory results.

In conversation the other day with a gentleman recently returned from England, who is a well-known and enthusiastic lover of sports, some allusion was made to the hammerless guns; and he mentioned the fact that they were decidedly the best guns for persons who used both eyes in shooting. Though I do not think he said so in so many words, he certainly gave me the impression that this method of shooting with "both eyes" was the prevailing one with the best English sportsmen whom he had met. I am quite of opinion that "crooked eyes" are almost as common as "crooked whiskey," though I am not prepared to say that they fairly account for anything like as much bad shooting.

THE MAJOR.

[How about cross-eyed shooters? We have known two such, and they were both bad marksmen. Was this because they were cross-eyed.]

RUST SPOTS IN GUN BARRELS.

MAOON, Mo., Sept. 25.

Editor Forest and Stream:

The "crooked" specimen spoken of by "F. S." in Forest and Stream, September 18, is fully answered in your editorial note at bottom of article, "the cleaning has not been thorough." I have owned several guns and have had a great deal of experience in cleaning them, and have been troubled with rust spots, but not of late years. A gun properly cleaned will not rust nor speak inside; and it is no killing task to clean a gun properly, if done at the end of each day's shooting, as it always should be. The finest gun ever made would soon be covered with rust specks on the inside if left over night without cleaning a few times. Let your correspondent try this way of cleaning, and report. It answers the purpose as well as any way I have ever tried; and can be done without any great amount of labor, and does not require over five minutes of time.

Take the gun apart; that is, take off the front stock and barrels and action apart, push the extractor back to its proper place, attach bristle-brush to cleaning rod; dampen the brush in a pan of water, and draw it backward and forward through each barrel several times, which will take out all the burnt powder. Remove bristle-brush; wipe out the barrels with a dry cloth to remove dampness; then run an oiled rag through each barrel several times. Now attach a three-rod wire-brush to the cleaning rod, one that will fit the barrels tightly. Push the same through the barrels up to the choke (if a choke-bore) several times, which will remove all the lead that may have adhered to the inside during the day's shooting. Clean out the muzzle with a muzzle brush. Go thoroughly inside with best refined sperm oil. Rub off outside of barrels and stock with a rag slightly saturated with boiled linseed oil—and the task is done.

If you have a gun that water into the action during the day's shooting you had better take the stock and action apart and thoroughly dry and oil the action, and lay the stock near the stove to dry, but not near enough to burn.

Any one who will try the above will find that rust spots are not such an annoyance as they are thought to be.

BORDER RUFFIAN.

Sodalia, Mo.—Editor Forest and Stream: It is said that "distances lend enchantment to the view," and on this account I am inclined to hope that many of your correspondents escape the editorial frown when asking hard questions

or when writing such long dry articles with the thermometer 109 deg. in the shade. Out West, in the basin of the Missouri, yachting news is all a fore-lan tongue, as nine-tenths of the people here are never on the water, or trolling or punting, or any other of the many sources of pleasure to sportsmen of Eastern cities. Notwithstanding all this, you have some subscribers here who derive a great deal of comfort from the weekly visits of FOREST AND STREAM. We don't fish here simply because we have not any waters to fish in; but when you talk about dog and gun we feel at home. Some correspondent, in last week's issue, asks about rust in guns. Every one handling guns will at once recognize this "measle," and some may have a remedy. I do not wish to speak disparagingly of the various articles advertised as rust preventives, for I do not believe that the fault lies in them altogether. Gun barrels not only become fouled with the residuum of powder, but by new products set free by combustion. For instance, a gun carelessly wiped and then oiled is sure to rust, which would not be the case if no oil was used. The sulphurous acid set free by the powder explosion contains two parts of oxygen, but is, in this state, innocuous, unless combined with something that will strictly change its force. When gun barrels become hot, or even warm, from rapid firing, the lead adheres in small particles to the metallic fibre. It does not matter in any difference whether you have a soft shot, or even tinned shot. In cleaning the gun, if all the particles of lead are not removed when you oil and put the gun away, you will start a chemical action that will result in the formation of oleic acid, which will rust like drops of vinegar. Now, to prevent this, you must use boiling water to clean the gun barrels with in which has been dissolved a small amount of clean Castile soap; then thoroughly dry and oil, while hot, with pure coal oil, and never use any other grease about your gun except for the purpose of a lubricator. —OODENT.

Cleveland, O.—Editor Forest and Stream:—I see some of your correspondents are complaining of rust spots in their guns. I can tell them how to prevent them; but once there they come to stay. I used to have much trouble in keeping spots out of gun barrels, and finally hit upon the following as a sure preventive: Make a wooden rack, taking three pieces of 3/4 in. thick board, 8 in. wide, and long enough to hold all the barrels you have. Cut holes in two of the pieces large enough to let the breech end of the barrels pass easily through; then take four strips, say 3/8 in. long, of 2x1 in. st. fl. and make an upright rack by putting the piece of board without holes at bottom, say 2 in. from bottom. At 6 in. above this, put one of the other pieces with holes, and 20 inches above put the third piece. Now set a tin pan made 2 1/2 in. deep, 4 or 5 in. wide, and just long enough to slip on to the lower shelf. Procure some good dry corks to fit the chambers (shell end of barrels), and set the barrels upright in the rack, the barrels resting inside the pan. Now fill up the barrels with refined sperm or porpoise oil, and they may remain as long as you choose, and be absolutely safe from rust or spots. When wanted for use have your oil cut and funnel ready and turn the oil back into your can for future use. You can use the same oil for any length of time. Be sure and oil the corks the first time they are used.

By fairly cleaning a gun before putting away in this manner, you can never rust, and it is only in five minutes for use by simply turning out the oil, removing the corks and wiping out the oil remaining in the barrels. A liberal dose on the outside will keep that off a rust, too.

I made a rack on same principle as above, but somewhat more expensive and still better, as follows: I had some round tin tubes made, 2 inches longer than my barrels, and set them up in a rack similar to the other, then put my barrels in the tubes muzzle-down, with no corks, but with a string cord from the breech hanging out-side of tube, by which to lift the barrels out of the tubes. When barrels are in place, fill up the tubes with one oil inch over the barrels, and you have them safe for any length of time. This takes more oil and more money; but much less time, as you leave the oil in the tubes all the time. By removing the barrels with the cord, and after letting run off what oil will at once drain in the tube, and then setting the barrels upright in a tin pan to drain, while one is busy getting other traps ready very little time need be wasted. CANVAS BACK.

Goshen, O.—Editor Forest and Stream: Your Boston correspondent, "F. S.," can give the "fearful mystery" explained and the remedy provided to prevent "gun meas" hereafter. I also, have had three breech-loaders, two of which contracted the disease by loosing; the third, having failed to desert its master, retains the careful polish without spot or blemish, although having suffered hard usage and exposure in all kinds of weather since February, 1876. I would state also that it is never loosed after out of gunning season.

The cause of erosion is an element left by the burnt powder, all qualities, that rust preventive, coal oil, "yellow grease" and patent cleaners cannot entirely remove. Simply wash or swab the barrels with hot water until clean; wipe dry and, if possible, absorb all moisture by a gentle heat. Apply Eaton's Rust Preventive inside and out, place inside and stow away in a dry place and the following season finds all rust gone. Use no oil until the water has been applied. If hot water cannot be had cold will answer, and if you cannot clean, I have no "axe to grind" in advertising either rust preventive or water, but simply desire to favor my sportsman friends not having discovered the remedy.

AQCA.

Belleville, Ill., Sept. 26.—Editor Forest and Stream: "F. S." does not say what kind of oil he used to oil the inside of his gun barrels with; perhaps he used coal oil. I have very often seen it recommended as being good to remove rust. If he did use it, and especially if he put his gun away after applying it, he will have just such spots as he speaks of. Why it produces them I cannot tell. I have no doubt that it is good to apply when kinds of machinery to remove gun, but it never should be used on guns, and is not to any other part of a gun. I think pure sperm oil is very good to use in the barrels; then dry them with pure whiting or finely pulverized chalk by running the rod through the barrels with a soft cotton rag for a swab.—O. H. A.

GRANITEVILLE, S. C.—Editor Forest and Stream:—Your correspondent "F. S.," can keep his gun free from rust spots and specks, the result of rust caused by the small amount of oxidation from the hand that is left on the leaden rag put through the barrels at the conclusion of cleaning. The last rag should be perfectly dry from all saline matter; the salt in

preparation causing all the trouble; this at least has been my experience. I am not troubled now. Dry the last rag by fire or in the sun; wipe the hands dry; handle the rag little as possible, and examine barrels for a day or so afterward.

DICK SWIVELLER.

THE BARNEGAT SNEAK BOX.

Apron. *f*—Shows where it is nailed to deck. *b*—Cockpit. *c*—Trunk. *d*—Stool rack. *e*—Rowlocks.

Length, 12 feet. Width midships, 4 feet; width of stern, 2 feet 9 in. D. pih of stern, 7 in. Sprung timbers all of one pattern, 9-16x15-16 in. distance apart; 8 in. deck timbers, natural bend, 1 in. x 1/2 in. Cockpit, inside measurement, length 3 feet 4 in.; width at bow and stern, 1 1/2 in.; mid-hips, 19 in. Coaming, height of inside at low tide stern, 2 1/2 in.; midships, 3 in. From bottom of coaming to top ceiling, 15 in. Trunk on port side, set slanting to take a 15 in. board trunk placed alongside and abaft of forward corner of coaming. Rowlocks, height 6 in. from coaming 9 in. middle of stern, 4 feet 7 in., made to fold down inboard and to fasten up with a hook. Stool rack runs from rowlocks to stern, notched at ends into fastenings of rowlocks, also notched at corners and hooked together, rest against a cleat on deck outside, and are hooked to the deck inside. In a heavy sea the apron is used. It is held up by a stek from two thirds its length. The wings are fastened to the top and bottom of the rowlocks. Mast hole 2 1/2 in., 2 in. from coaming. Drop of sides from top of deck, 5/8 in., dead rise, 8 in. Over cockpit a hatch is placed. Everything connected with the boat is placed inside, gunners often leaving their guns, &c., looking the hatch fast. The boats sail well, and covered with sedge, are used to shoot from. With the hatch on a person can be protected from rain, and with blankets, can be accommodated with a night's lodging. B. ards for boats, white cedar, 3/4 in. thick; deck, narrow strips tongued and grooved.

LET THE TURKEYS BE CALLED.

Editor Forest and Stream: I have read with pleasure the letters of "C. X." and "W. H. C." on the subject of turkey calling, and now comes "C. L. J." who promises some instructions on calling turkeys. This is what is wanted, as well as a description of the instruments used in making the yelps. The FOREST AND STREAM has given its design for a caller, and "W. H. C." says he will explain how to make a caller if desired. I have no doubt or information on these subjects. I am well satisfied that the old turkey hunters could tell us all about it. "C. X." doubts whether turkeys have certain methods of calling. I cannot understand why they should not. What have the old turkey hunters to say about this? Can it be mere curiosity in the turkey to visit the spot where his imitators are yelping, to find out what it means, or are the notes made so much like his own that he is deceived by them? Have not turkeys regular methodical calls and these notes known to and used by turkey hunters to successfully call them? KNOW.

- RAIL SOCIETY—Ridleyville, Lezette, et al.—Below please find a continuation of the scores for rail shooting:
Total shot up to and including Sept. 18, 6866.
Tuesday, Sept. 20.—Richard Wood 13, Wm. Miller 6, John Brown 3, A. Jackson 13, Jos. Douglas 3, Geo. Morris 24, J. Hendry 21, Jno. Kleckner 20, Wm. Cummings 15—118.
Wednesday, Sept. 21.—B. F. Miller 20, Richard Wood 17, Jno. Brown 12, Wm. Dando 30, Geo. Morris 21—100.
Thursday, Sept. 22.—G. Griffin 24, Jno. P. Pole 31, Jacob Albruger 63, Ed. McCready 30, Dr. Sinclair 19, Char. Haines 27, Jas. Malin 11, A. Lodge 19, Wm. Miller 13, C. K. Dolby 5, Wash. James 19, Tim Reilly 36, Jno. Kleckner 10, Saml. Hart 35, Jno. C. le 47—420.
Friday, Sept. 23.—W. Greenwood 24, Dr. Karsner 35, Jos. Douglas 16, Chas. Haines 25, Jas. Malin 33, Wm. Luptine 22, E. Wood James 15, Wash. James 6, Jno. Brown 16, H. Mingle 2, B. F. Miller 11, Dave Shelzline 37—242.
Saturday, Sept. 24.—Wm. Miller 12, Dr. Piffard 18—32; Dr. Printer 31, Mr. Rutter 15, Wash. James 9, Jno. Kleckner 18, Thos. Waddington 5, Tim Reilly 29, Jno. Thorne 9, Chas. Murphy 8, F. Fitzer 12—179.
Total to date, 7,925.—W. M. MILLER.

THE FIRM OF KNAPP & VAN NOSTRAND are the successors of an old and honorable name in the poultry and game business of New York city. Mr. Eldridge Packer, formerly of Mystic, Conn., in 1833 established himself in the poultry, game and egg business in the old Fly Market of this city. After the great fire Mr. Packer located himself in the Franklin Market, then the center of trade for shipping and families. In 1840 Mr. Packer established a branch in Washington Market, at Nos. 289 and 290, and shortly after removed his whole business there. In 1849 Mr. Packer took as partners his son, Saml. R. Packer, and his son-in-law, Halsey W. Knapp, under the firm name of Packer & Knapp. In 1852 the junior partners purchased the interest of Mr. E. Packer and continued under the above firm until 1866, when Mr. S. R. Packer retired from business. Mr. Daniel Van Nostrand succeeded Mr. Packer as a partner, under the firm name of W. Knapp & Co. In 1876 Mr. Danl. K. Van Nostrand purchased his father's interest and continued the business under the name of Knapp & Van Nostrand. Mr. Knapp has been associated as partner and bookkeeper for thirty-five years.

The firm has never failed to meet its obligations promptly during any of the panicky or depressing times of business from the days of B. Packer to the present time. The business has been conducted on principles of integrity and fair dealing to both buyer and seller. It has always kept up with the times, and in addition to old established place in Washington Market has a large wholesale department at No. 208 Washington street. They have immense freezers there and every facility for preserving poultry and game.

NEW YORK GAME LAW—Wading River, Suffolk Co., N. Y.—Editor Forest and Stream.—I have followed the dog for the last forty-five years, and can realize the change in the number of our birds on Long Island. I do not write this thinking it may benefit me, whose snuds are nearly run, although I take some pleasure at the old pastime yet. I think the State should pass a general law, protecting snipe, particularly in the spring. Small birds the same as now. For quail and partridge, season should be open from October 25, to December 25. Also authorize the Supervisors of each county, to pass laws adapted to the wants of their respective Counties. The State or Supervisors to appoint game protectors enough to enforce or punish violations, and to be paid by the State. We can see the game on the increase, if proper laws are enacted. I have come to the conclusion that the "Game Clubs" can at any time have all the sport they desire or deserve near the cities at cooped pigeons, etc. Why don't some enterprising gun-maker get up an air gun that will shoot fine shot cartridges for sparrows, etc., at short distances?—C.

CHICAGO NOTES.—Chicago, Ill., Sept. 26.—Duck and snipe shooting has been poor here lately owing to the hot weather. Several good bags of duck have been made, however, on the Calumet and at Lake George. Jerome Marbleland party passed through Chicago last week in their hunting gear, bound for the far West. A great many "flickers" or yellow hammer by every city very morning and evening, flying to and from their feeding grounds. They fly in large flocks, sometimes as many as a hundred in a flock. I shot twice into a flock yesterday and got nine birds. Plover are scarce at present. I have been out several mornings plover shooting, but have had no success. The ducks that are here at present are blue wing teal, with an occasional green wing or wildgeon.—TEX BOYZ.

October 1.—The weather here has been very hot lately, making bad duck weather. The best bag I have heard of so far was made by Alex. Sample at Toleston, Indiana. Mr. Sample shot 64 ducks Wednesday morning. Some very good woodcock shooting has been had lately just south of the city limits. The men of the Fire Insurance Patrol have a very lively young bear for a pot. He was captured in northern Wisconsin.—TEX BOYZ.

PHILADELPHIA NOTES.—September 27.—We have had a few good tides in the Delaware River lately, and at some points good rail shooting. I hear of one being shot. It is most too early in the season to look for them to the morning; and only those that are near and those jumped before the boat while rail shooting are killed, and these chances, let me tell you, in our river, are few and far between now days. There was a time when it was a common occurrence to bring in six or eight teal ducks with our rail, after being in the flax with a favorite pusher; but alas! the time has passed, never, I fear, to return. The continued dry weather has made our meadows a poor place for snipe. When it does rain the water is sucked up by the parched earth, and its fall has hardly been discernible.—HOMO.

SOUTH CAROLINA NOTES.—Granville, S. C., Sept. 26.—The drought has been simply awful; factories on this water-course have been shut down from time to time for want of water power. Our first rain of any amount since last April fell ten days ago, and now the factory folks are happy; the stoppage of 40,000 spindles is a serious matter of bread and bacon to these people. I was out last Saturday to look after the quail. Found ten large coveys of one-quarter grown birds. The past summer has been superb for the birds; the number is simply immense. Duck shooting on the Savannah will be good; the mast and acorn crop is plentiful.

DICK SWIVELLER.

POWOW SHOOTING CLUB—Amesbury, Mass.—At the semi-annual meeting of the Powow Shooting Club, held Wednesday evening, Sept. 28, the following officers were elected: A. N. Barry, President; G. G. Osborn, Vice-President; F. T. Morrill, Secretary and Treasurer.

THE MICHIGAN GAME LAW.

C. W. C., Bowling Green, O.—The Michigan game law provides that "no person or persons shall pursue, or hunt, or kill any deer, save only in the Upper Peninsula, from the 1st day of August to the 15th day of November, and in the Lower Peninsula from the 1st day of October to the 1st day of December, inclusive in each year, or kill at any time any deer when it is in its red coat, or any fawn when it is in its spotted coat. No person shall at any time kill or capture any deer in the water of any of the streams, ponds or lakes within the jurisdiction of this State, or in any other water, by any means whatever, or attempt to take or destroy, any wild turkey any time except in the months of October, November and December of each year, or kill or capture, or attempt to take or destroy, any wild quail, or any wild duck, or any wild mallard duck or gray duck, save only from the first day of September in each year, to the first day of January next following, or any wild mallard or snipe between the first day of May and the first day of October, or any other wild duck, or any wild snipe, by any means whatever, in or through any county of this State, any of the game or animals which have been killed or captured on or before the 1st day of September, or the first day of August, shall be illegal. No person shall kill or destroy, or attempt to kill or destroy, any wild quail, or any wild turkey, save only in the months of September and October of each year, or attempt to kill any wild quail, or any wild turkey, with or by means of a snipe or punt gun, or rob or destroy the nests of any wild duck, or wild goose, or wild turkey, or wild quail, or any of the birds here named, nor at any time on their nesting places. Section 1 prohibits the killing or robbing nests of robin, night-hawk, whippoorwill, huck, brown thrasher, weebill, martin, oriole, woodpecker, bobolink, or any song bird. The transportation law provides that no person or corporation or company shall buy, sell, or transport, or attempt to buy, sell, or transport, any wild turkey, or any part of the carcass of the same, after the same has been killed, for any purpose, or for sale, or for use as food, or for any other purpose. No person, corporation or company shall kill or expose for sale, or have in possession except as a wild or tame deer, rabbit, grouse, coon or quail, or any of the animals here named, or any part of the carcass of the same, or transported beyond the limits of this State. The full text of the law may be had by sending money to the order of Messrs. Gilman & Co., corner Woodward and Jefferson avenues, Detroit.

Sea and River Fishing.

FISH IN SEASON IN OCTOBER.

FRESH WATER.

Black Bass, Microperca salmoides and M. paludosa. White Perch, Perca flavescens. Striped Bass, Roccus castratus. Malescoale, Esox nobilior. White Bass, Roccus chrysopterus. Pickerel, Esox tetrazinatus. Rock Bass, Ambloplites. (Two Pike-perch (wall-eyed pike) Stizostedion americanum, gresium, etc.

SALT WATER.

Weakfish or Squeteague, Cynoscion regalis. La Fayette or Spot, Liatomus obleucus. Clamper Bass, Spot or Redfish, Sciaenops ocellatus. Sheepshead, Archæogaster probatocephalus. Kingfish, Scomber or Barb, Menidia menidia. Spanish Mackerel, Cybium maculatum.

I know a party who come up here every summer from Boston and bring a "snuer-kraut runner" to pack their trout in, and sail down the coast with one man only until they get home. They catch all they can and keep all they catch, good and bad. Bath a poor little salted trout—it tastes more like a piece of "runner soap" than a fish. Such fishermen are but one remove from the back parlors I found snaring and netting trout in the still water below here, last August. I can just see their shanty from here. "Instruments of cruelty are in their habitations." O my soul, come not thou into their secret; unto their assembly, mine honor, be thou not united!—TRAD, NORRIS.

THE MARINE CATFISH.

SOME of the correspondents of FOREST AND STREAM have been telling of the game qualities of the blue cat of Western waters, and certainly that species is not to be despised when found in swift streams or clear lakes.

On the Southern coast occurs a salt-water catfish rejoicing in the name "Etheurichthys marinus" (Baird) Girard, its name being comparatively longer than its own, which seldom weighs more than six pounds, except in the Indian river of Florida, where it sometimes reaches ten. Only that the head is rather large, E. m. is a handsomely formed fish, forked tail, high dorsal, well-developed pectorals, each armed with a long and sharp bone, serrated on the edges and barbed after the manner of the weapon of the sting ray, capable of inflicting painful wounds. This fish is very long eel-like or barbed depending from the mouth. Its color is a bluish slate upon the back and sides, white beneath.

It comes into the rivers and bays in March and April for spawning purposes. The eggs are of the size of a runcel ball, golden yellow in color, and a cluster of them exactly resembles a bunch of California grapes, though the cluster of eggs is only about half the size of that fruit. It is said by the fishermen that the young of this fish are, when hatched, carried about in the gills of the parent for some time. The young are very care taken in taking them, any bait either on the bottom, in mid-water, or on the surface. It will take a trolling spoon or fly, and is a strong and persistent fighter when hooked. It combines the strong surging and boring down of the sheepshead with some of the long runs of the redfish or bass. When these catfish are abundant it is difficult to catch anything else. The fish is firm and well flavored, and elsewhere would be prized; but there are so many better fish on this coast that the forked-tail cat is despised.

Besides the dangerous spine, the fish is covered with a glutinous slime, which adheres to the hands, the line and the hook very disagreeably. There is another sea cat, taken in the same waters, which much resembles the black catfish of fresh water. This is seldom over two pounds in weight.

S. C. C.

REMOVAL OF WALTON'S HOUSE AND THE COCK TAVERN.

THESE two historic buildings are doomed by the proposed widening of Fleet street from Chancery lane to Bell yard. Many Americans, while in London, have visited these historic places, which are soon to make way for the march of improvement. The London Times recently said: "Among the buildings which have to be removed appear to be the Cock tavern and the dwelling of Isaac Walton the Cock, since it was first established as an ale-house, can reckon an existence of two centuries and a half, or more. Pepsy ate lobsters and drank in it. It was a resort of Addison and Johnson and Goldsmith. The Poet Laureate has sung its praises and conferred on its head water an immortality at which tradition reports that dignitary to have taken umbrage. For innumerable generations of Templars and Lincoln-inn's barristers it fulfilled the practical functions of a club before club had become the fashion. The things they are its sundial floor has been trodden by every learned lawyer of the reigns of the Stuarts and Georges and probably by as many of the wis. Social fashions have changed as well as literary since its career opened. The solemn hush amid which the law students and practitioners of the present eat their chops and steaks, of which it wants a liberal education to master the price nomenclature, would have amazed and amused the riotous revellers of the past in their convivial pews. The ancient tavern survived all the vicissitudes of altered habits. It keeps its hold on the custom and affection of the neighboring legal world, to which, as much as a special de-murrer or writ of Qui Tam, it belonged, so long as legal appetites grew keen for food at 5 o'clock. When, under some mysterious influence, whether from aberrations in the Gulf Stream or the ice fields of the North Pole, hudding chancellors and chief justices could no longer dine at the close of their day's work, the sand of the Cock's well-worn floor was virtually run. It has lived since then with a sword brand suspended over its garden. Its emblem has been preparing to flutter away into the region of legend. The old might come as opportunely now as a year or ten years hence. Not the less, however, will its former votaries and subjects cherish a feeling of indignation that it should have been dislodged from its perch to make up for space ill-occupied by Guildhall art."

"The house of the author of 'The Complete Angler' is another and more direct victim of this unfortunate manu-

ment of civic expenditure. Happily, literature is independent of localities, whatever the memories of eaten dinners may be. The site of Isaac Walton's home derives its interest chiefly from the curious contrast it presents to the spirit of the writings by which his name is perpetuated. Fleet street was as tumultuous when Walton moved thither from Cornhill 257 years ago as it is now. His was its busiest corner; it is likely that his was not its least busy shop. Yet there, and down, he sat in the idyllic seclusion, calmly as when he stood ankle-deep in meadow grass on the bank of the quiet Lea. Though he had retired from business ten years before his classical work appeared, a volume like that was no effort of a season; it was the fruit of a lifetime of patient self-communings and luminous reveries. From his draper's or milliner's counter he had set off one May after another "Up Totham hill" to snip at Bleak hall on trout, as good as they were great, of his own catching. Back to Fleet street at the end of one May after another had he returned when his holiday was over, to put in order the thoughts his sport had suggested on the current and eddies of human existence and to concoct new retorts to those 'faceries,' men of sour complexion, money-getting men, poor-rich men, that are condemn'd to be rich, and always discontented, or busie, who mocked at a love of angling as a proof of folly. The charm of the hook comes from within more than from without. It mattered little to his writer, it mattered little to his readers, whether he was sitting down 'under this honey-suckle hedge' by Ware or Walton, or encircled by the roar of the school of English humorsists, utterly distinct from vanity, fences round an oasis of innocent pleasure, and happy chances for himself and readers to have their pastimes and work in. He bids them in his preface 'take notice that in writing he has made a recreation of a recreation.' He desires to be perused by none who are not willing to share his company in all his quaint turns of fancy, from joining in a madrigal to learning how most artistically to slit a black snail for bait. Contemporaries and posterity alike have been ready to dance to his low but sweet-tuned pipe. Though not by the many the easiest of the school of English humorists, he is the first who has kept his place in popular esteem.

"When Fleet street is widened it will be as possible as it is now to be at home with Isaac Walton, though his bouse be leveled with the ground. An emotion of regret is felt whenever a local landmark of a gracious intelligence is effaced. But the use and beauty of a vast and toiling town cannot be sacrificed to a memory of which the true shrine is the library. The fault of Londoners has too often been that they have sometimes sacrificed permanent use and beauty to the transient and ephemeral improvements. Specimens of antique architecture have been demolished with a recklessness that has furnished the perennial source of a delight money cannot buy. Vacant ground has been heaped with buildings which would have been inestimable as breathing space for increasing millions. Only at last does a sense begin to have arisen that London is a whole, and that what it may be convenient for one part to subvert it may be for the advantage of the rest to retain.

FISHERIES, BRITISH AND FOREIGN.

ALTHOUGH it is some time since the International Fishery Exhibition was held at Berlin, it may be doubted whether the public in this country have read any such clear account of it as is contained in the report recently presented to the Home Department. This report contains a memorandum by Mr. Walpole of a special visit paid by him to the exhibition on behalf of the New South Wales Government, and sets forth in a concise form many of the peculiarities which distinguish the art of fishing as practiced in different parts of the world. It suggests, therefore, as may readily be supposed, several points in which our own fishermen might well take a hint; and on this ground it possesses a special interest independent of other considerations.

Mr. Walpole expresses some surprise that the devices used for catching fish should be so nearly the same among all races, however widely separated from one another. But there is, perhaps, no great reason for astonishment in this, when it is remembered how few and how obvious are the devices in question. If we except the use of freemans and dynamite for purposes of destroying fish, we shall not find that there are more than about four methods of taking them from their native element. The net, the hook and line, and the trap are the modes best known to our own coasts; and to these must be added the method of trapping in the various beasts to the chase, which is still in vogue in China and some other countries. In the first of these different kinds of fishing—in the use of nets—it would seem that we still hold our own. The specimens of English nets sent to the Berlin Exhibition are pronounced by Mr. Walpole to have been equal at least to those of any other exhibitors, if not superior. Still more practical testimony is to be found in the fact that the best of these herring-nets formed a "magnificent collection" at Berlin, rarely made there at home, but almost always imported from Scotland. The only country which seems to compete with us at all on equal terms is, curiously enough, Germany—the country which in other respects is almost behindhand in fishing. At Itzehoe some admirable nets are made; and the manufacturers there say they can undersell the Scotch makers. The net which must be considered as most efficacious at the present time is the trawl, which is used by some 1,000 boats in England, and finds employment for some 400 men and 400 mules and capital of about a million and a half sterling. The trawl makes a clean sweep of all sorts of fish, the immature and the mature; and only on the assumption that the supply is inexhaustible can its use be justified. That the trawl is, practically speaking, unknown in America, may be gathered from the fact that in that country the name of trawl-fisheries is applied to set lines baited with fish. The "drift nets," also, or long walls of netting which float along with the tide, and which are used almost exclusively for the herring-fishery, seem to be neglected on the other side of the Atlantic, where it is more common to use "gill-nets," which are similar in form, but kept stationary in position by means of an anchor attached to them. One of the other principal American industries—that of mackerel-fishing with seine nets—seems to have been introduced on a large scale well within the last twenty years. The seines are often worth \$1,000 or even \$1,500 apiece, and are worked by "dories," or flat-bottomed boats, carried in large swift-sailing schooners. The net is shot round the head of mackerel, and then the lower edge of it is drawn together by a purse-line, after which the fish inclosed are dipped out with a hoop net.

The other fisheries of the United States are chiefly conducted by means of line and hook; and in this branch of the art the Americans have made a striking improvement, which it would be easy for our fishermen to adopt. They use an

apparatus known as "nippers," and consisting of double rings of flannel, each about the size of a small quoit, bound round with knitted wool and sewn together. The nipper is used for grasping the wet and slippery line, and enables the operator to do his work with infinitely greater ease and comfort, while it increases his strength fourfold. Another invention worthy of notice is the glass bait, silvered and gilt, which is used with considerable success by the Norwegians in their cod-fisheries, and by the help of which they effect a great saving in live bait. The most economical of all methods of ensuring fish is of course that which has been mentioned under the name of traps, including weirs, stake nets, and fixed engines of various kinds. In Sweden these fixed engines are the usual means for catching salmon, and in Denmark they are used more than anything else for the capture of herring. The foreshores in these two countries, as well as in Norway, are let out and farmed or owned for the purpose of entrapping fish; whereas in England the use of such machines is for the most part prohibited, except in cases where the owners claim a prescriptive right lasting for six centuries. In the northern countries, as well as in Holland, weirs made of brushwood are in common use; and the same thing may be said of China, Japan and Brazil. The spearing of fish is generally prohibited by most Governments; but Mr. Walpole mentions the exhibition of a "leister," or fish-spear, by the Norwegians as an engine still in use, and concludes that there is consequently much destruction of salmon by means of it in the fjords. There is a picturesque fishery in the Bay of Oporto, in which a small fish called "saigalle" is killed in the shallow waters by means of a four-pronged spear.

In other matters connected with the fishing industry foreigners offer us a salutary lesson. In the first place, the art of transporting fish when caught seems to be in some respects better understood in the United States. The schooner-rigged vessels used in their mackerel-fisheries are described as handsome, fast, yacht-like boats of from fifty to ninety tons. They are built especially for speed, so as to be able to run the fish quickly to the Boston or other markets. The vessels used in the menhaden fishery are frequently worked by steam; the dories which take part in it being transported in steamers along the coast. A still newer and more ingenious use of steamers is in vogue in Denmark, where they seem to be employed for beam-trawling on the west coast of Jutland. As to the methods of preserving fish, the Americans understand them to perfection. The preparation of "boneless" cod, salted mackerel, sardines in half a dozen different forms—which are the most successful of the cod and menhaden fisheries—has advanced to a high degree of perfection, which brings home to the people a vast supply of food more palatable and wholesome than our salt herring, without being much dearer. About 18,000,000 pounds of boneless cod were prepared in one American town in 1879; while 12,000,000 pounds of halibut were brought into the same place and sold fresh. The art of utilizing the waste portions of fish is likewise well understood in the United States, and in Norway too, where "fish-flour" is ground out of stockfish, and the roe of the cod is separated and sold to be used for sardine bait in Spain and France.

The last and most important difference between Great Britain and the United States is to be found in the efforts made in the two countries for artificially adding to the annual supply of fish. In each country a good deal is done for this purpose, but in a totally different manner. Our Government does nothing in a systematic way toward breeding either sea fish or fresh-water fish; neither does it protect the former after any effective method; but it affords very valuable protection to all the inland fish-breeding places, which use the rivers merely as breeding-places. The United States Government, on the other hand, takes no trouble whatever to protect fish of any sort or kind, but expends large sums and infinite ingenuity in artificially propagating them. Besides their recent great achievement of hatching young cod the United States Commission has been for years past hatching eggs of numerous other varieties. In six years alone they propagated, and distributed to various parts of the country, 24,000,000 shad, 5,000,000 California salmon, 3,300,000 salmon and trout, and 4,000,000 brook trout. The apparatus used for hatching these different species are ingenious beyond description, and were probably the most interesting feature in the whole exhibition. The Commissioners, it should be added, have a steamer of their own—the Fish-hawk—fitted with tubes, cones and grates and all the approved apparatus both for hatching and keeping the young fish as they are carried to the various stations. The other nation which does the most in this way is Germany, where, though sea-fishing is neglected, the inland fisheries are cultivated with great perseverance. About ten millions of fishery are artificially bred in Germany every year, mostly by means of "California trays." Besides salmon and trout and the noller sort of fish, carp and roach and others of the baser sort are largely propagated; and the German Government devotes a small grant every year to the support of the Fischerei Verein, by whose exertions the fry are distributed to the various lakes and rivers.

The whole report goes to show that pisciculture in its several branches is very imperfectly practiced throughout the civilized world. There are but two in one branch of it often fall in another; and there is no example of a nation which both breeds and protects its fish successfully. Few, however, would deny that both these systems have their merits; and it is difficult to believe that they cannot, or should not, both be employed. In the way of fish-breeding, as well as of improving the means of transport and of preserving fish, there is much to be learned (and easily to be learned) in England before the wealth of the surrounding seas can become as available as it should be to the population.—*St. James' (London) Gazette.*

ANOTHER LARGE POMFANO.—The common pomfano, *Trachynotus carolinus*, has been quite plenty in New York markets for the past two or three years, being formerly unknown here. It is seldom over two pounds in weight, but within the past two years an odd specimen or two of an allied species common to the African coast has been taken. This is the *T. gorenensis*, and one is now in the Smithsonian Institution which weighed twenty pounds. This week Mr. Blackford received one of the latter which weighed twelve pounds, and with his usual generosity forwarded it to the National Museum.

WATERPROOF FOR HOOKS.—If your correspondent, who is inquiring for something better than shellac for hooks, will use common red sealing wax (best quality), dissolved in spirits of wine, I think he will find it satisfactory. I have used it for the past four or five years, and think it is the best article I ever tried.—ALEX (Grand Rapids, Mich.).

THE SILVER SALMON.

(*Noorhynchus kisutch*).

We publish the following from the Field Assistant of the Fishery Census of 1880 for the Northwest Coast, by permission:

PORT TOWNSEND, W. T., Sept. 10.

Prof. S. F. Baird, U. S. Fish Commissioner.
DEAR SIR—Mr. J. S. Wykoff, of this place, a gentleman who is an enthusiast in fishing and a very successful angler, told me today that a few days since he was at Snow Bay, opposite Port Townsend, taking salmon with rod and line. He was using the "sand lance" (*Xyphias*) for bait. He had taken fourteen silver salmon, and as his bait was becoming scarce he opened one of them to see what it had been feeding upon. To his surprise he found its stomach filled with prawns, or large shrimp, in a partially digested state. From a portion of one of the most perfect specimens thus found he baited his hook and caught a silver salmon weighing about six pounds.

Mr. Wykoff says that this is the first instance in his experience of many years as a salmon fisher that he has obtained shrimp in the stomach of a salmon, and as he found them in every salmon which he examined, he thinks it proves that the silver salmon of Puget Sound is a bottom feeder. This is a fact which I do not remember to have seen recorded before, and as it is new to me and very interesting, I think it important and my duty to inform you at once.

JAMES G. SWAN.

A NEW REEL—Indianapolis, Ind., Sept. 25.—*Editor Forest and Stream:* I have recently been shown by the inventor, Mr. Louis A. Klefer, a watchmaker of this city, an improvement in fishing reels that will certainly commend itself to anglers, particularly those sportsmen who delight in taking the black bass. The improvement is an attachment by which the parts can be quickly thrown out of gear, the handle disconnected from the spool, and again as quickly thrown into gear. The object in separating the spool from the handle by throwing out of gear is to permit the line (unencumbered with the handle) to play out without resistance, and the object is so well accomplished by this improvement that the commonest reel, when provided with this attachment, will allow the line to run off as easily as does the finest Frankfort reel. It will readily be seen that when out of gear the annoyance of a revolving handle or crank is dispensed with, and in making a cast the angler can take hold of the whole reel and have a firmer hold, having his hand and finger in the best possible position for controlling the overrunning of the line. The gearing is managed entirely by a small lever protruding from the side in a convenient position, which, at a touch, throws the machinery into place ready for winding in the line. This simple attachment does the thing to a nicety. The great points are the increased speed given to the reel by prying out the line and preventing the handle from coming in contact with surrounding objects when the line is paying out.—C. D.

AN IMPROVED REEL FITTING has appeared in England. The *Redditch Indicator* says: "Messrs Alcock & Co., of the Standard Works, Redditch, have just purchased the exclusive patent right of a new mode of attachment of the reel to the rod, which is alike so simple, so convenient, so easy of application, and so certain in its arrangement, that the only wonder is it was not brought into use years ago, for like many other really practical inventions it simply lies waiting for a glance. Every old angler has at some time or other found himself in difficulties from the setting fast by the rain or otherwise of the brass ferrule which attaches the reel to the rod, and sometimes he has had to trudge homeward without being able to free the reel. The new patent which fitting is simply this: A brass plate, grooved at the sides, is let into the hub of the rod where the reel is attached, into which the winch plate of the reel is made to slide with absolute accuracy. When the reel is pushed into its place a spring at the base rises and holds it in security. Depression of the spring by the thumb or finger releases it. Nothing could be simpler, nothing more secure. The new fitting can be adapted to any rod, but the plate on the reel must fit the groove with absolute nicety."

SMITHSONIAN PUBLICATIONS.—Among the publications of the Smithsonian during the present year are Prof. S. H. Souders' index of names used for genera in zoology; a quarto edition of new tables to the rain-fall, with charts of the precipitation of moisture from the air during the four seasons, by Charles A. Schott; an octavo "Nomenclature of American Birds," by Robert Ridgway; a synopsis of the fishes of North America, by Prof. D. S. Jordan, and an octavo giving directions for collecting specimens of natural history, with special reference to deep sea dredging, by Richard Rathbun. It is not generally known that, according to a law on the statute-books, any citizen may subscribe to a Government publication by notifying the Government Printer at an early date. If any person desiring extra copies of any document printed at the Government Printing-office by authority of law shall, previous to its being put to press, notify the Congressional Printer of the number of copies wanted, and shall pay to him, in advance, the estimated cost thereof, and ten per centum thereon, the Congressional Printer may, under the direction of the Joint Committee on Public Printing, furnish the same.—*See 3,500 Revised Statutes.*

LARGE COD AND HALIBUT.—Mr. James G. Swan, Field Assistant to procure statistics of Fish and Fisheries of Washington Territory and the Northwest Coast for the census of 1880, writes to Prof. Baird from Port Townsend, W. T., as follows: "For more than four months past the water between Point Hudson and Point Wilson has swarmed with young cod—trudcod—and they are taken in great numbers by hook and line. They are from a foot to twenty inches in length, I have specimens in alcohol. None of the old residents here remember to have heard of the truch being taken in the vicinity of Port Townsend for the past twenty years, and this visit of a school of young cod lasting for such a long time and in such great numbers is worthy of special note. While at Victoria last week I saw a halibut, that had been taken at the entrance of the harbor, which weighed 225 lbs., and at the thickest part measured seven and a half inches through. I am told by the fishermen that recently a truch cod weighing sixty pounds was taken in Victoria harbor. This was mentioned in the *Colonist* of that date."

VOLUMES OF THE FOREST AND STREAM.—Mr. W. L. Colville, Forester, S. C., has three and a half years' numbers of the FOREST AND STREAM for sale, 1876 to 1881. Also a dozen numbers of the London Field.

Fishculture.

THE NEBRASKA FISH COMMISSION.—Owing to the death of Hon H. S. Kelsey, a new appointment was necessary to fill the board of the fish commission of this State.

NEBRASKA FISH COMMISSION, Fremont, October 1, 1891.

Editor Forest and Stream:

Have allowed replying to your request for official names of our State Commission until now, owing to non-appointment by the Governor of the State in vacating his own office.

Wm T. May, Fremont; term expiring June, 1893. R. R. La Grange, Plattsmouth, term expiring June, 1894. B. E. B. Kennedy, Omaha, term expiring June, 1895.

FISH CULTURE IN GEORGIA.—The Atlanta Constitution says:—"The Legislature never carried its fine idea of economy to further lengths than when it killed the Fish Bill providing for the propagation of fish.

"If anything has been demonstrated, it is that money can be spent nowhere so profitably as in providing for fish hatcheries in this State. Without any money, paying his own expenses in many cases, Dr. Cary, the Commissioner, has stocked nearly a thousand ponds in Georgia with carp, and the country press is filled with accounts of the wonderful growth and fecundity of this fish.

"It will not do to say that if this much has been done without any appropriation, no appropriation need be made. What has been done through the enthusiasm of Dr. Cary, without money, is but a hint of what he might have done had he been provided with funds.

GREEN SCUM ON PONDS.—Professor C. E. Bessey, of the Iowa Agricultural College, writes to the New York Tribune in answer to one who asks, "How to prevent the growing, and coming to the top of a fish pond, of the green scum commonly called frog-spittle?"

He says: "It is an alga or fresh water seaweed, composed of threads of cylindrical cells containing a green pigment—chlorophyll. There are several genera of these plants. This fresh water alga is no special indication of great impurity of water. Fish will do well where it grows abundantly, and even feed upon it to a considerable extent.

FISHWAY FOR THE RAPPAHANNOCK.—The Fredricksburg Water Power Works is about creating a McDonald fishway over their dam on the Rappahannock River about two miles above the ancient Borough of Fredricksburg.

FISHCULTURAL NOTES.—Mr. J. J. Stranahan, editor of the Chicago Fish Culture, writes to the Forest and Stream in regard to propagating the small-mouthed black bass. It will cover half an acre, and has a supply of good brook water, gravelly bottom, with rocks and a raised flat stone for hiding places.

Carp will be distributed by the United States Fish Commission this month. Those who have not made application for them had better do so now. Blanks can be had by applying at this office.

The Kennel.

EASTERN FIELD TRIALS CLUB.

New York, Sept. 28.

Editor Forest and Stream:

Please find with this programme, running rules and entry blanks for our coming meeting, and for which some of your friends may apply.

At a meeting held this a. m. the following gentlemen were selected to act as the judges of the trials: Messrs. E. H. Lathrop, Springfield, Ill.; J. Von Lengenke, New York; T. F. Taylor, of Richmond, Mass.; J. M. Kinroy, of Stanton, Va.—Jesse Penz, Sec.

The third annual meeting will be held under the auspices of the Eastern Field Trials Club, at Robin's Island, Peconic Bay, Long Island, N. Y., commencing Thanksgiving Day, 1891. Open to the world.

Robin's Island Stakes, or Eastern Field Trials Derby.—Open for all puppies whelped on or after April 1, 1891. First prize, \$150. Second, \$100. Third, \$50. Forfeit, \$5. \$10 additional to fill.

Peconic, or All-Aged Stakes.—Open to all setters or pointers. First prize, \$250. Second, \$150. Third, \$50. Forfeit, \$5 with \$20 additional to fill. Nominations to close positively on October 1, 1891.

Members' Stake.—Open to members of the club only. Each entry to be owned and handled by the member making the nomination. The prize to be a piece of equal value of \$100. This prize to be known as the Eastern Field Trials Cup of 1891.

EASTERN FIELD TRIALS CLUB.

FULL LIST OF ENTRIES OF THE THIRD ANNUAL MEETING.

Robin's Island Stakes, or Eastern Field Trials Derby. Open for all puppies whelped on or after April 1, 1891. First prize, \$150. Second, \$100. Third, \$50. Forfeit, \$5. \$10 additional to fill.

St Elmo II, English setter, 9mos St Elmo-Prairie Rose, S Fleet Spaulding, N. Y. City.

St Elmo III, English setter, 15mos St Elmo-Diana, same owner. St. Mrs, English setter, 11mos St Elmo-Diana, same owner. Don, English setter, 15mos Ranger II-White's Daisy, F R Aten, Brooklyn, N. Y. City.

Foxhall, pointer puppy, 14mos Dash Monarch-Petrol, J C Higgins, Delaware City, Del. Guyard, Irish setter, 15mos Rover II-Rose Bradwardine, A E Godfrey, Ghyward, N. Y. City.

Times, Gordon setter, 9mos Bob-Benny, same owner. Sensation, Jr., pointer setter, 15mos Sensation-Owner's Graco, Lake White, Bridgeport, Conn.

Tom, English setter, 3 yrs Royal Duke-Bessie, Geo W Watkins, Brooklyn, N. Y.

THE LONDON DOG SHOW.

London, Oct. 5, 1891. On arriving here your correspondent found the town and its hotels crowded with dog-lovers, including the owners of the animal cattle, agricultural and horticultural exhibition to which was also added the bench show of dogs.

The weather, though extremely warm for the season, was favorable during the meeting, and the visits to see and exhibit were highly pleased with the arrangements made for the accommodation and care of the canines, which were under the able supervision of Mr. Charles Lincoln, whose ability to carry out successfully such an undertaking in too well known to need any further comment.

Among the gentlemen present who take great interest in these matters we noticed the following: Messrs. John B. Long and E. Williams, of Detroit; Edmund Orgill, of Brooklyn, N. Y.; Wm. B. Gill, of Chatham; H. B. Harrison and Fred. Tilson, of Tilsenburgh; J. S. Niven, M. D., and L. H. Smallman, of London, and many others not forgetting Mr. T. H. Smith, of Stratford, whose arrangements were a source of pleasure to the many visitors who are favored with his acquaintance.

The judge appointed for the sporting classes was Major J. M. Taylor, of Lexington, Ky., whose ability to fill this position cannot be questioned. The non-sporting class was judged by Mr. G. B. Alsop, of York, and the society of England, whose experience in "dogology" is said to be second to none.

The entries, which numbered nearly four hundred, most of which were on hand, represented some of the finest stock in the country.

Brought out the splendid brace of English setters, Paris and Pearl, belonging to Mr. Smith, of Stratford, which were entered for exhibition only. Paris bears his seven years nicely, and is still a grand dog. Here I would like to remark that I consider the Standard as done once for all for the improvement of our sporting dogs by any other individual.

I started the ball in motion by importing that king of sires, Leicester and the remarkable bitch Dart, whose progeny and descendants can be readily distinguished at all exhibitions.

Brought out but one entry, Mr. Wm. R. Well's Star, a good specimen of the Llewellyn setter.

English Setter Dogs.—Contained fifteen entries, and was a magnificent class, but the Major sown tapered down the number to the choice ones, and the best was secured by the Glen Bolton, Dick Lavereck, Thunder-Pierces. Dick is one of the grandest dogs of the day, and bids fair at no distant time to run a tight race for supremacy with his sire Thunder. Mr. Long's Coon II was justly entitled to second honors. He is a dog of splendid, large frame, bushy hair, and some of the best bred of the breed.

London came for v. h. e. but we should have selected Mr. Wells' Mark, who had to be content with a c. as to our eye he is a very compact dog, full of quality. Mr. Weighell's Trump, who obtained h. c. also pleased us.

English Setter Bitches.—Brought out another nice lot. First prize was awarded to Mr. Harrison's Belle. This bitch was catalogued at \$200, and immediately picked up by Mr. Long, of Detroit, who always has an eye open for a choice specimen, Kalo, who secured second place, and was secured by Mr. Harrison, was also from L. The remainder were far above the average.

English Setter Dog Puppies.—Were a superior and very promising class. Mr. Wells secured first position with his Druid-Strad black and white pup Mingo, ten months old. He also secured second with a litter brother Giger. These are certainly a grand set of litter.

Mr. G. D. Davey's Pride of the Dominion and Mr. Cazen's Duke of Brunswick well merited the h. c. which was awarded them.

English Setter Bitch Puppies.—Comprised eight entries. For first honor it was indeed a close up between the Moltak Foundry's Belle's Pride and Mr. Wells' Dido II. The judge after the most careful scrutiny awarded the premium to Belle's Pride. Had we considered Dido II. as equally good points and manner points had it not been having had his pup more, which prevented her showing in the ring to advantage. She was in the pink of condition, and is a gem. Mr. Davey's Norah D. is quite promising, and fully earned the position given to her.

Champion Gordon Setter Dogs.—Dr. Niven's Blossom met with no competitors; he is a dog of good points, but age is now beginning to tell against him.

Champion Gordon Setter Bitches.—Mr. T. H. Smallman's Maiden was the winner.

Gordon Setter Dogs.—For which there were ten entries, and among them some extra good ones. Mr. Puddicombe scored the blue ribbon with his Grisco-Moll dog Jack, a good specimen of his class. He was secured by Dr. Niven's Blossom, who is a very young dog and we think in some points had the advantage over Jack. The Gordon Kennel Club, of Locest Valley, L. L. have a very compact dog in Gordon; he shows fine quality, true markings and for an all-day dog he would be our choice. However, we were not allowed to see him.

Champion Gordon Setter Dogs.—Dr. Niven's Blossom met with no competitors; he is a dog of good points, but age is now beginning to tell against him. Champion Gordon Setter Bitches.—Mr. T. H. Smallman's Maiden was the winner.
