Shadows are three-fold: the first is a single shadow, and the least of all; and is proper to the plain surface, where it is not wholly possessed of the light. The second is the double shadow, and

it is used when the surface begins once to forsake your eye, as in columns. The third shadow is made by crossing over your double shadow again, which darkeneth by a third part. It is used for the inmost shadow, and farthest from the light, as in gulfs, wells, and caves."—Peacham: *On Drawing*.

Shadow.

proceeding from the point, and grazing the intervening object. But as every luminous body is possessed of some magnitude, and, therefore, emits light from many points, the shadow is not precisely defined, but consists of a portion in perfect shadow, or to which no luminous rays have access, and penumbra, to which some rays have access. In the former case the theoretical shadow is a geometric one, in the latter physical, i. e., such as actually occurs in nature.

(1) A name given to an American sect of celibates of both sexes, founded by Ann Lee, an English emigrant, about 1776, from their using a kind of dance in their religious exercises, but who call themselves the United Society of Believers in Christ's Second Appearing. Their chief settlement is at Mount Lebanon, in the State of New York. Their founders was called the Elect Lady, and Mother of all the Elect, and claimed to be the woman mentioned in Rev. xii. The Shakers profess to have passed through death and the resurrection into a state of grace—the Resurrection order, in which the love which leads to marriage is not allowed, and are known as brothers and sisters. They abstain from wine and pork, live on the land and shun towns. They cultivate the virtues of sobriety, prudence, and meekness, take no oaths, deprecate law, avoid contention, and repudiate war. They affect to hold communion with the dead, and believe in angels and spirits, not as a theological dogma, but as a practical fact.

"In many of their ideas the Shakers would appear to be followers of the Essenes . . . Their church is based on these grand ideas: The kingdom of heaven has come, Christ has actually appeared on earth; the personal rule of God has been restored; the old law is abolished; the command to multiply has ceased; Adam's sin has been atoned; the intercourse of heaven and earth has been restored; the curse is taken away from labor; the earth, and all that is on it, will be redeemed; angels and spirits have become, as of old, the familiars and ministers of men."—W. (1) Forming the first persons singular and plural of the future tense, *shall* is used to denote simple futurity, and simply foretelling or declaring something which is to take place, and thus equivalent to *am to*, *are to*; as, *I shall go to town to-morrow, i. e.*, I am to, or I intend to go to town. *Shall* in this case expresses mere futurity, without any idea of determination or decision, to denote which in the first persons singular and plural *will* is used [WILL (1), *v.*]; that is, the simple future in full is, *I shall, thou wilt, he will; we shall, you will, they will*. In indirect narration, however, *shall* is used in the second and third persons to denote simple futurity; as, *He thinks he shall go*.

(2) In the second and third persons *shall* is used: (a) To denote control or authority on the part of the speaker, as when a promise, command, or determination is applied; as, *You shall go, i. e.*, *You must go, Thou shalt not kill, &c.*

(b) To denote necessity or inevitability in the mind of the speaker; futurity thought inevitable and answered for by the speaker.

"Beasts shall tremble at thy din."  
*Shakesp.*: *Tempest*, i. 2.

(3) When used interrogatively, in the first and third persons, *shall* asks for direction or refers the question to the decision of the person asked; as, *Shall I go? Shall they go?* But in the second person *shall*, used interrogatively, merely asks for information as to the future; as, *Shall you come?*

(4) After conditionals, as *if* or *whether*, and in dependent clauses generally, *shall*, in all the persons, denotes simple futurity.

"If we shall shake off our slavish yoke."  
*Shakesp.*: *Richard II.*, ii. 2.

\*2. *Shall* and *should* are used elliptically with adverbs, for *shall* (or *should*) *go*, as:

3. *Should*, though in form the past of *shall*, is not used to express simple past futurity, except in indirect speech; as, *I said I should go*. It is used:

(1) To express present duty or obligation; as, *We (they, &c.) should practice virtue*; or

(2) Past duty or obligation; as, *I (thou, he, &c.) should have gone, i. e.*, *I (thou, he, &c.) ought to have gone, It was the duty of me (you, him, &c.) to have gone*.

(3) To express a simple hypothetical case or a contingent future event, standing in the same relation to *would* that *shall* does to *will*; as, *I shall be pleased if you will come, and I should be pleased if you would come*. So also in conditional and dependent clauses *should* is, like *shall*, used to denote simple futurity; as, *If it should rain to-morrow, he will not come*.

"He had expected that he *should* be able to push forward without a moment's pause, that he *should* find the French army in a state of wild disorder, and that his victory *would* be easy and complete."—*Macaulay*: *Hist. Eng.*, ch. xix.

(4) It is used to soften or modify a statement; as, *I should not like to say so*.

(5) *It should seem* was formerly used for "it seems," where we now say, *It would seem*.

4. *Shall* was sometimes colloquially or provincially abbreviated into 's; as,

"Thou's hear our counsel."  
*Shakesp.*: *Romeo and Juliet*, i. 3.

**II. Technically:**

1. *Ichthy.:* The English popular name for any individual of the group Selachoides (q. v.). The body is generally elongated; the muzzle, on the under side of which the nostrils are placed, projects over the mouth, and the males have claspers (with the function of intromittent organs) attached to the ventral fins. The ova are large and few in number, impregnated, and in some genera developed, within an uterine cavity; in others deposited in a tough, horny case, from which the young fish, carrying a yolk bag, for its nourishment till it is able to seek food, is discharged; in this stage the gill-laminae are prolonged into filaments projecting beyond the gill-cavities, but these are soon absorbed. The teeth are generally large, sharp, and formed for cutting, often with serrated edges, but in some genera they form a solid pavement-like mass. Sharks are scaleless, and the skin is usually very rough. [SHAGREEN.] They are most numerous in tropical seas, becoming scarcer as they recede from the warmer regions, a few only reaching the Arctic circle. They are rapid swimmers, with great power of endurance; the larger sharks are exclusively carnivorous, and some of them extremely dangerous to man. They scent their food from a distance, and are readily attracted by the smell of blood or decomposing bodies. The smaller sharks are popularly known as Dog-fishes or Hounds, and, though not dangerous to man, do great damage to fishermen's lines and nets. The flesh of sharks is coarse, but it is sometimes eaten; the Chinese use sharks' fins for making thick gelatinous soups, and the liver yields an oil, for the sake of which a shark-fishery is prosecuted on the coast of Ceylon. Their rough skin is employed by joiners to polish fine-grained wood, and by cutlers to cover the hilts of swords to make them firmer in the grasp. The most important species are described in this Dictionary under their popular names. [BASKING-SHARK, DOGFISH, HAMMER-HEADED SHARK, TIGER-SHARK, WHITE SHARK, &c.]

In the Falkland Islands it is called the Kelp-pigeon. **II. Zool.**: The genus *Ovis* (q. v.), or any individual of that genus, particularly *Ovis aries*, the Common Sheep, or any of its numerous breeds. Sheep form a small group of Cavicorn Ruminants, characterized by their thick, heavy, transversely-ridged horns, curved spirally outward, and by their peculiar physiognomy, quite distinct from that of their nearest allies. They have been known and domesticated from remote antiquity, and it is now almost impossible to ascertain the ancestral stock from which they are descended; probably they have a mixed origin from several wild species, and were introduced into Britain in prehistoric times. Wild sheep are essentially mountainous; they have their head-quarters in Asia, with species in Africa and North America. They are gregarious, and this character is retained in the domesticated state. The male of the sheep is called a ram, and the female a ewe; the former often exhibits great pugnacity, rushing straight at a foe, and butting with its strongly-ridged forehead. The sheep is one of the most profitable domestic animals, nearly every part serving some useful purpose; the fleece yields wool, the flesh is used for food, the skin is made into leather for bookbinding and gloves, or into parchment, and

the intestines into strings for musical instruments. [CATGUT.] The milk was formerly much used, as it is still in some countries; and cheese is made of it in continental Europe. The disposition of the sheep is patient and peaceable, its constitution is sufficiently hardy to endure extremes of temperature, it thrives on a variety of pastures, and sheep-farming, both for the production of wool and mutton, is an important industry in all agricultural countries. The ewe generally brings forth one lamb, frequently twins, sometimes three, at a birth. The lambing season is generally in early spring, but sometimes late in the winter, in order to furnish young lambs to the market. The breeds of sheep are numerous; the Dishley, or Improved Leicesters, are in high repute for weight of carcass and fattening qualities. The Lincoln, the Cotswold, the Teeswater, and Romney Marsh are heavy breeds, exceeding the Leicester in quantity of wool and hardness of constitution; the Short-wooled Southdowns have a close-set fleece of fine wool, and their mutton is of superior quality. They were first bred on the chalky downs in the south of England, and have since spread all over the world. The Black-faced, the Cheviot, and the Welsh sheep are mountain breeds; the Cheviot are the least hardy of the three, but they all yield excellent mutton. The Iceland sheep have three, four, and sometimes five horns; the Broad-tailed sheep of Asia have the tail so loaded with fat on each side as to weigh seventy or eighty pounds. As the tail is considered a great delicacy, the shepherd sometimes protects it from being injured by dragging on the ground by attaching to it a small board on rough wheels. The Fat-rumped sheep of Southern Tartary has a similar development of fat on the rump. The Wallachian sheep is noted for the size of its horns; and the Astracan and Circassian sheep yield the fur known as Astracan (q. v.). Among the wool-producing breeds one of the most important is the Merino (q. v.).

"With domesticated *sheep* the presence or absence of horns is not a firmly-fixed character: for a certain proportion of the Merino ewes bear small horns, and some of the rams are hornless; and in most breeds hornless ewes are occasionally produced."—*Darwin: Descent of Man* (ed. 1885), p. 235.

Some make *skjöldr*=a shield, and refer it to the shield-like patch on the breast of the bird, thus accounting for the English form *shieldrake*.]

*Ornith.*: *Tadorna cornuta* (or *vulpanser*) of modern ornithologists; *Anas tadorna* (Linn.). It is somewhat larger than an ordinary duck, with a fleshy protuberance at the base of the bill, whence its specific name. It is a very handsome bird; head and upper neck dark, glossy green, broad white collar, below which a broader band of bright bay extends from the back across the breast; outer scapulars, primaries, a median abdominal stripe, and a bar on tip of middle tail-quills black; inner secondaries and lower tail-coverts gray; speculum

rich bronze-green; rest of plumage white. The female is smaller, and less brilliantly colored. It frequents sandy coasts in Europe, North Africa, ranging across Asia to Japan; nesting under cover, usually in a rabbit-hole. The ruddy Sheldrake, *Tadorna casarca*, is a native of Barbary, south-eastern Europe, and central Asia. Its color is an almost uniform bay, the male with a black ring round the neck. The Common Sheldrake breeds freely in captivity, crossing readily with other species, and the offspring show a remarkable tendency to reversion.

4. *Optics*: A concave-faced tool of cast-iron, in which convex lenses are ground. The glasses are attached to the face of a runner, which is worked around with a circular swinging stroke, so as not to wear either the glasses or the shell into ridges.

5. *Ordn.*: A hollow projectile containing a bursting-charge, which is exploded by a time or percussion fuse. Invented at Venlo, 1495; used by the Turks at the siege of Rhodes, 1522. Shells are usually made of cast-iron, and for mortars and smooth-bore cannon are spherical; but for rifled guns they are, with the exception of Whitworth's and a few others, cylindrical and have a conoidal point. Palliser shells are made of "chilled" cast-iron, and are much harder. Shells are caused to take the grooves in a rifled gun; to receive a rotary motion, by means of studs, as in the French and early Woolwich and Armstrong systems; by a leaden casing, as in many of Armstrong's first guns, and, more recently, by means of a disc or ring, the sabot, which is expanded in the act of firing. Those on the Whitworth principle are polygonal in section, corresponding to the bore of the gun, which they accurately fit.

6. *Ornith.*: [EGG-SHELL.]

7. *Weaving*: The bars of the lay, which are grooved to receive the reed.

8. *Zoöl.*: A calcareous defense for the soft and vulnerable bodies of the various animals, specif., of the Mollusca. The relation of the shell to the breathing-organ is so close that Mr. S. P. Woodward regarded the former as a pneumoskeleton, essentially a calcified portion of the mantle, with the breathing organ as the most specialized part. So many mollusks have shells that the whole subkingdom has been called Testacea, or popularly "shell-fish;" but some are without shells, while the great Crustacean sub-class of the Entomostraca possess them, and the fossil bivalve, hingeless shell of the Crustacean genus *Estheria* was long mistaken for the binged shell of *Posidonomya*, a true mollusk. Shells are said to be external when the animal is contained in them, and internal when they are concealed in the mantle. In form, the shells of mollusks may be univalves or bivalves. Formerly there was a category also of multivalves, including the cirripedes; but these are now classed with the crustacea. Shells are composed of carbonate of lime with a little animal matter. The former is derived from the food. In structure they may be fibrous, laminated, horny, or glossy and translucent; in luster they may be dull, porcellanous, or nacreous. The shell is formed by the mantle. The more it is exposed to light the brighter it is. [For their geological value see Fossil.] The distribution of sea-shells in the ocean is easily accounted for; freshwater shells, in Darwin's view, are transferred to new regions by adhering, as young ones often do, to the feet of water-birds. The means for dispersing land-shells are less effective, and in fact they are often confined to single islands or similar limited areas. [CARAPACE, ECHINODERMATA, FORAMINIFERA, TEST, TORTOISE-SHELL, &c.]

*Law*: The chief officer of a shire or a county, to whom is entrusted the execution of the laws, the serving of judicial writs and processes, and the preservation of the peace.

¶ (1) In the United States the sheriff is either elected by the legislature or the citizens, or appointed and commissioned by the executive of the state. The office is almost exclusively ministerial. The sheriff in person or by deputy executes civil and criminal process throughout the county, has charge of the jail and prisoners, attends courts, and keeps the peace. His judicial authority is generally confined to ascertaining damages on writs of inquiry, &c.

(2) In England the sheriff is the chief officer of the Crown in every county or shire, to whom the charge of the county is committed by letters patent. He is appointed (except in the case of London and the county of Middlesex) by the Crown out of three names submitted for each county by the judge who goes on circuit. [PRICKING, ¶.] Unless specially exempted, or in case of legal disability, the person nominated is bound under penalty to serve the office. As keeper of the peace, the sheriff is the first man in the county, and during his year of office is superior in rank to any nobleman in the county. He is specially intrusted with the execution of the law and the preservation of the peace in his county, for which purposes he has at his disposal the whole civil force of the county. [POSSE COMITATUS.] Personally the sheriff performs only such duties as are purely honorary, as attendance upon the judges on

circuit, or duties of dignity or public importance, as presiding over elections and the holding of county meetings. The ordinary functions, such as execution of writs, &c., are discharged through an under-sheriff, so called to distinguish him from the sheriff, who is often popularly known as the High-sheriff.

(3) In Scotland the sheriff is a law officer whose functions seem to have been originally, like those of the sheriffs in England, mainly executive, but who now is judge in a county court. At one time the office was hereditary; but this arrangement was abolished by 20 Geo. II., c. 43, s. 20, and it is now in the appointment of the Crown. While the heritable jurisdiction lasted, the sheriff was allowed to appoint one or more substitutes, and the privilege still continues. Nearly all the sheriffs are now practicing lawyers resident in Edinburgh, sheriff-substitutes acting for them as local judges in the several counties. In civil matters the latter can deal with actions regarding damage done by undue exercise of the rights of property, actions on debt or obligations, small debts under £12, &c.; an appealing from the sheriff-substitute to the sheriff himself without new pleadings; and from the latter, with fresh pleadings, to the court of session. The sheriff-substitute can also try criminal cases when a conviction will not involve more than two years' imprisonment. The lord-lieutenant of a Scotch county sometimes receives the honorary title of sheriff-principal.

1. *Comm.*: A favorite Spanish white wine, prepared from small white grapes grown in the province of Andalusia, those which furnish the better qualities being cultivated in the vineyards of Xeres. In the manufacture of sherry the grapes are not gathered until they are quite ripe, and the fermentation is continued until nearly all the sugar has been converted into alcohol. At first it is of a pale straw color, but it darkens with age. Sherries may be divided into natural, containing from 20 to 26 per cent. of proof spirit, and fortified, containing from 30 to 40 per cent.; the reason given for the addition of so much spirit is that the wine will not otherwise stand the voyage. Sherry is not adulterated to any great extent, but many of the cheap sherries are mixtures of low-classed sherries with ordinary white wine, the strength being increased by the addition of alcohol.

shîll'-ing, \*shill-yng, \*shyll-ing, subst. [A. S. scilling, scylling; cogn. with Dut. schelling; Icel. skillingr; Dan. & Sw. skilling; Goth. skillinggs; Ger. schilling, from the same root as Icel. skilja = to divide; Dan. skille; cf. Sw. skiljemynt; Dan. skillemynt (from skilja, skille = to divide, and mynt = coin); and Ger. scheidemünze (from scheiden = to divide, and münze = coin), all meaning small change.]

*Numis.*: A British coin of currency and account, now equal in value to twelve pennies, or to  $\frac{1}{20}$  of the pound sterling = 24.3 $\frac{1}{4}$  cents American currency. It has varied considerably in value at different times, from four pennies to twenty pence. In 1560 the pound troy was coined into sixty shillings, in 1600 into sixty-two shillings, and by the Act, 56 George III., it was ordered to be coined into sixty-six shillings, which is the rate at which shillings are now struck. The term shilling was also applied to a weight equivalent to the twentieth part of a pound; thus, the statute of Henry II., A. D. 1266, decreed that "if the corn be at twopenne a quarter, the farthing loaf shall weigh six pounds sixteen shillings," i. e., six pounds and  $\frac{1}{16}$  of a pound. The shilling is a monetary term yet current in this country; although no coin of that denomination is now issued. Owing to the fluctuation of monetary values during the organized existence of the colonial governments, the shilling as a constituent part of a pound acquired in different sections a varying value. Thus in some of the colonies the pound depreciated to a value = \$3.33; hence the shilling was  $\frac{1}{3}$  of a dollar, or 16 $\frac{2}{3}$ ¢; in others it was still less, being valued at 12 $\frac{1}{2}$ ¢; in still others = 13 $\frac{1}{2}$ ¢, and in some others it equaled 21 $\frac{1}{2}$ ¢.

1. Strictly, a three-masted vessel with square sails on each mast, but applied in ordinary language to vessels of whatever kind, excepting boats, adapted for navigation. Ships are of various sizes, and fitted for various purposes, and are called by various names, according to their rig and the purposes to which they are applied; as, men-of-war, merchantmen, brigs, sloops, schooners, galleys, &c. A ship, strictly so called, has a bowsprit and three masts—main-mast, fore-mast, and mizzen-mast—each square-rigged, and composed of a lower-mast, a top-mast, and a top-gallant mast. A ship is distinguished from a barque by the square sails on the mizzen, where a barque has only fore-and-aft sails. In order to meet the increase in size, and especially in length, some ships are now built with four masts. Ships were, until comparatively recent times, constructed of wood, such as oak, pine, &c., but this material has to a

Full-rigged Ship.

very great extent been superseded by iron and steel, by the adoption of which lightness and strength are combined. Vessels of war are often constructed on the composite system, that is, of wood with a skin or coating of iron or steel.

"The proper definition of a ship is a vessel with three masts, each mast being square-rigged. She would be a ship, even if she did not carry anything above her cross-trees, for she is made so by her cross-jack and mizzen topsail yard and mizzen top; yet, if you add a fourth mast to a ship she is still a ship, even if it be what is termed a spanker mast—that is, a mast rigged like the mizzen-mast of a barque."—*London Daily Telegraph*.

The art was practiced by the Romans, was lost in the Dark Ages, from the third to the sixteenth centuries, and was revived in England in the reign of Elizabeth. Some 300 different systems have since been published. The most important of these are: Rich (1654), Mason (1672), Gurney (1740), Byrom (1767), Mavor (1780), Taylor (1786), Lewis (1812), Harding (1823), Moat (1833). The most popular system of shorthand is Isaac Pitman's Phonography, invented in 1837, based on the sounds of the English language. The alphabet contains six long and six short vowels, five diphthongs, and twenty-four consonants, or forty-one letters in all. Hooks and circles at the beginning and end of the consonant strokes make double and treble consonants for abbreviating the writing.

2. Small spherical pellets of lead or shot metal, used for shooting birds and other small game. This was superseded by the method now employed of dropping the molten metal, in a finely divided state, from a height into water, invented by Watts, of England, about 1782. To obviate the necessity for the high tower, the metal is sometimes dropped through a tube, up which a strong current of cold air is driven, and in another process the lead is dropped through a column of glycerine or oil instead of air.

adoption of the elongated shot, round shot being retained only for use with mortars or smooth-bore arms. In the case of the Palliser shot, the same projectile may be used with or without a bursting charge, it being cast hollow so as to serve as a shell or an ordinary shot. Various forms of shot are manufactured, which will be found described under their respective heads.

"The first *shot* struck one of the holsters of Prince George of Hesse, and brought his horse to the ground."—*Macaulay*: *Hist. Eng.*, ch. xvi.

It was to be set on a table of shittim wood (q. v.), overlaid with gold (Exod. xxv. 23-29; 1 Kings vii. 48), and having a blue covering (Num. iv. 7). The shew-bread consisted of twelve cakes baked with fine flour, two tenths deals being in each cake (Lev. xxiv. 5). It was to stand in the Holy Place, and, being sprinkled with frankincense, was there to be eaten each Sabbath by Aaron and his priestly descendants (Lev. xxiv. 9). When the old shew-bread was removed, new and hot bread was to take its place (1 Sam. xxi. 6). When David was in want

of food, he ate the shew-bread, though he was not a priest (1 Sam. xxi. 3-6), and Jesus approved the deed (Matt. xii. 4; Mark ii. 26; Luke vi. 4). The twelve cakes of shew-bread were apparently one for each tribe; the deeper spiritual significance of the bread has been variously interpreted.

The improved shrapnel has its bursting charge in a cylinder in the middle of the elongated projectile used with rifled guns. (1) A popular name for any individual of the genus *Crangon* (q. v.), allied to Lobster, Crayfish, and Prawn. The form is elongated, tapering, and arched. The rostrum is very short, claws small, the fixed finger being merely a small tooth, the movable finger unciniform. The whole structure is delicate and sub-translucent, and of such hues that the species may readily escape observation, whether resting on a sandy bottom or moving through the water. When alarmed they bury themselves in the sand by a peculiar motion of the telson. The Common Shrimp (*Crangon vulgaris*), about two inches long, greenish-gray dotted with brown, is esteemed as an article of food; other species, from warmer latitudes, are equally prized. They are usually taken by means of a shrimp-net. (See extract.)

"The common *shrimp* is an exception to the general rule that the cuticle of the Crustaceans is either red in the living animal or becomes so on boiling. The cuticle of *C. vulgaris* in the living state is light-brown or almost white, and the animal is somewhat translucent. . . . After boiling, the cuticle assumes its well-known brown color."

There is one of these pins on each side of the loom, and they are connected by a cord to which a handle is attached. Holding the handle in his right hand, the weaver moves the two pins together in each direction alternately by a sudden jerk. The fly-shuttle was invented by John Kay, of Bury, England, in 1733. The shuttle for haircloth weaving has no pins, but a spring-catch to hold the ends of the hair forming the weft, and carry them through the shed, when the shuttle is thrown.

1. **Class. Mythology:** One of a number of certain women supposed to be inspired by heaven, who flourished in different parts of the ancient world. According to Varro, the Sibyls were ten in number: Persica, Delphica, Cumæa (of Cumæ, in Italy), Erythræa, Samia, Cumana (of Cymæ, in Æolis, called Amalthæa, Herophile, and Demophile), Hellepontica, Phrygia, who prophesied at Ancyra, Libyssa, and Tiburs, called Albunea, worshiped at Tibur. Besides these there were a Hebrew, a Chaldean, a Babylonian, an Egyptian, a Sardinian Sibyl, and some others. It is considered, however, most probable that the first eight of these were in reality identical. The most celebrated of the whole number was the Cymæan (Amalthæa), who is said to have offered the Sibylline Books, originally nine in number, and which were supposed to contain the fate of the Roman Empire, to Tarquin the Proud. Tarquin refusing to give the price she asked, she went away and burnt three of them. Returning with the remainder, she again offered these to the king at the same price, and on his second refusal departed again, and returned with three, which she still offered at the same price as the original nine. The king, struck with her conduct, at last acceded to her offer, and entrusted the care of the books to

certain priests (the quindecimviri). They were preserved in a stone chest beneath the temple of Jupiter Capitolinus, and were consulted in times of public danger or calamity. They were destroyed by the fire that consumed the Capitol in the Marsic war. After this calamity, ambassadors were sent to collect fragments of Sibylline prophecies in various countries; from these Augustus formed two new books, which were deposited in the temple of the Palatine Apollo. Sibylline verses are often quoted by Christian writers, as containing prophecies of Christianity; but these are forgeries of the second century. (*Ramsay.*)

He therefore proposed that, to avoid a European war when the demise-took place, Russia and Great Britain should come at once to a private arrangement as to the disposal of the Sick Man's effects. As France was ignored in the arrangement, there was some doubt as to the good faith of the Czar. The British Government rejected the proposal, intimated its belief in the recovery of the Sick Man, and soon after fought by his side in the Crimean war.

*Palæobot.*: The type-genus of *Sigillariæ* (q. v.), or any individual of the genus. The trunk is arborescent, cylindrical, unjointed, and unbranched, except toward the apex, where in some species it parts dichotomously. The height is from thirty to sixty or seventy feet; the diameter of the stem from one to five. Its interior being largely cellular, speedily decayed, for most of the prostrate stems are flattened, the outer parts being now generally coal without vegetable structure, and the inner portion is replaced by the inorganic rock. The stem is deeply fluted with oblong, discoid, or nearly rounded leaf scars, with three vascular marks in their center. The arrangement is not distinctly spiral. The long, narrow, rigid, two or three-nerved leaves, at first called from their sedge-like appearance *Cyperites*, are their leaves. *Stigmaria* (q. v.) has been proved to constitute the roots, the two having been seen actually united. Principal Dawson believes that *Sigillaria* had medullary rays, Mr. Carruthers is of a contrary opinion. The former palæobotanist believes *Trigonocarpum* to have been their fruit, the latter regards the fruit as having been a cone or strobilus. Brongniart ultimately classified them with arborescent ferns; Corda thought them akin to Euphorbiaceæ; Principal Dawson places them among Gymnosperms near the Cycads, or intermediate between these and the higher Acrogens; Sir Joseph Hooker deems them Cryptogams; Mr. Carruthers, concurring in this view, ranks them among the Lycopods. A species is recorded from the Upper Silurian, they occur in the Devonian, reach their maximum in the Carboniferous.

Thus the Euphrasia, or Eye-bright, was, and is, supposed to be good for the eyes, on the strength of a blackupil-like spot in its corolla, the yellow turmeric was thought good for jaundice, and the blood-stone is probably used to this day for stopping

blood. By virtue of a similar association of ideas, the ginseng, which is still largely used in China, was also employed by the Indians of North America, and in both countries its virtues were deduced from the shape of the root, which is supposed to resemble the human body."—*Tylor: Early Hist. *Religious History, &c.*: A Hindu reforming sect and nationality, the former of which commenced with Nánuk Shah, (A. D. 1469-1539). He was an enthusiast who, retaining the whole body of poetical and mythological fiction of Hinduism, still preached the unity of the Godhead, the essential identity of all castes, universal toleration, and the emancipation of the spirit from the tenets of Maya (illusion), by acts of benevolence and self-denial. Persecuted by the Mohammedans, the Sikh enthusiasm became fanaticism; and about the close of the seventeenth century, their leader, the Guru Govind, the tenth teacher from Nánuk, devoted his followers to steel and the worship of the sword, which he encouraged them to use in defense of the faith. He also ordered his adherents to allow their hair and beards to grow, to wear blue garments, and eat all flesh but that of the cow. Caste was abolished among his followers, and the *Das Padishah ka granth* was compiled by him, that, with the *Adi Granth*, containing the sayings of Nánuk and his immediate successors, it might supersede the Vedas and the Puranas. The struggle against the Mohammedan government was sanguinary, but it ended by the Sikhs achieving their independence. Runjeet Singh (1780-1839), the Lion of the Punjab, their chief seat, obtained for them the benefit of European discipline, and laid the foundation of a Sikh empire, which, coming into collision with the Anglo-Indian government, went down in the

pitched battles of Moodkee, Ferozeshah, Aliwal, and Soobraon, in 1845-6. Rebellion occurring in 1848, further losses were inflicted, in 1849, at Chillianwallah and Guzerat. When the mutinies broke out in 1857, the Sikhs, who had been well governed during the few years they had been under British rule, fought with exceeding loyalty on the side of their conquerors, to prevent the restoration of a Mohammedan empire like that from which, two centuries before, they had suffered such persecution.

*Chem.*: Silicon. A tetratomic element, symbol, Si; atomic weight, 28.2; specific gravity (crystallized) 2.49, first isolated by Berzelius in 1810; occurs in combination with oxygen as quartz or silica, and enters largely into the composition of many of the rocks of which the earth is composed. With the exception of oxygen it is the most abundant and widely distributed of the elements. It may be obtained nearly pure by heating the double fluoride of silicon and potassium in a glass vessel with its own weight of potassium or sodium, and treating the fused mass when cold with water, silicium remaining behind as a dark-brown amorphous powder. It may also be obtained in a crystalline form by heating in a crucible a mixture of aluminum, glass, and cryolite. Amorphous silicium is devoid of luster, inflames when heated in the air, and is insoluble in water and all acids, except hydrofluoric, in which it dissolves readily. Crystallized silicium forms dark lustrous octahedra, hard enough to scratch glass, and is almost infusible.

**A. As substantive:**

1. A fine, glossy, and tenacious fiber spun by *Bombyx mori* and allied species. [SILK-WORM.] The Chinese seem to have led the way in rearing the silk-worm, a native of their country, and using the silk for textile purposes. The first Greek writer who mentions it is Aristotle (B. C. 384-322). Some think that Virgil alludes to silk in *Georg.* ii. 121, but it may be cotton that is referred to. Pliny describes the formation of silk by the *Bombyx* (*Hist. Nat.*, xi. 17). In the reign of Tiberius a law was passed at Rome that no man should disgrace himself by wearing a silken garment (*Tacit.*: *An.*, ii. 33). The Emperor Heliogabalus broke through the regulation and came forth all in silk. His example was followed, and the use of silk spread among all classes. Hitherto the fiber had been imported from China, but in A. D. 551 two Persian monks, resident in China, were encouraged by Justinian to carry off the eggs of the moth to Constantinople. They were successful, and the new industry took root in Europe. It was introduced into Sicily in 1146, whence it passed to the mainland of Italy, to Spain in 1253, and to Lyons, now its great seat in France, in 1521, and to England by refugees from Antwerp in 1585. Its production in this country has been attempted, but the attempt was a failure. The insects feed in continental Europe on mulberry leaves, their appropriate nutriment, though they will also consume lettuces. The cocoons are boiled for a considerable time in an alkaline solution, to which some glycerine may be added. They are then placed in a basin, where a semi-rotating brush is so adjusted as to remove the outer waste shell, and pick out the continuous threads. Then the cocoons are placed in the hot-water basin of a reeling machine, cleansed, and a fixed number of threads are wound into a single of uniform thickness. Two or more singles are then thrown together and spun or twisted into a yarn. Two or more threads twisted together are called a tram. When silk is employed in this state in weaving it is called the shoot, or weft. Thrown silk is formed of two, three, or more singles twisted together in a contrary direction to that in which the singles of which it is composed are twisted. This process is termed organzining, and the product organzine. [SILK-TROWER.] The silk reaches the spinner twisted into the form of knots, and in batches called books or hard yarn. (For the manufacture of silk in India see *Tusser*.)

A thread of silk will support a weight standing to that borne by a flax thread of the same diameter in the ratio of 136 to 47, and to one of hemp in the ratio of 102 to 49.

#### Silurian-system, *s.*

*Geol.*: A term made public by Sir Roderick Murchison, in 1839, though he had begun to use it as early as 1835. It implied that, speaking broadly, the rocks so described were well developed in the country of the old Silures. The term has been universally adopted. Murchison divided his Silurian system into Upper and Lower Silurian, contending that the Cambrian system of Sedgwick was not independent, but simply Lower Silurian. What-ever be the case with the Cambrian, the Laurentian system, since established, is unequivocally older than the Silurian. Under the Upper Silurian were ranged in descending order: (1) the Tilestone of Brecon and Caermarthen; (2) the Ludlow Ironstone and Shale, and (3) the Wenlock or Dudley Lime-stone. Under the Lower Silurian: (1) the Caradoc Sandstone; (2) the Llandeilo flags and schists. Now the Table of Strata stands thus:

I. *Upper Silurian*: 1. Ludlow formation (q. v.); 2. Wenlock formation (q. v.); 3. Llandovery formation or Group (q. v.).

II. *Lower Silurian*: 1. Bala and Caradoc beds. [CARADOC.]; 2. Llandeilo flags (q. v.); 3. Arenig or Stiper Stone Group.

There is a great break between the Upper and Lower Silurian, which are unconformable, and a greater break between the Upper Silurian and the Devonian. During the early part of the Silurian the land was sinking; during the deposition of the Llandeilo the sea was moderately deep. Algæ, corals, brachiopods, trilobites, and other crustacea, and, in the upper strata, fishes, are the characteristic fossils. The higher vertebrates had not yet appeared. Vast areas in Russia, &c., are covered by Silurian rocks. In America, the Canadian and the Trenton formations are believed to be Lower Silurian; the Niagara formation to be Upper Llandovery and Wenlock, and the Salina, the Lower Helderberg, and the Oriskany to be formations of Ludlow age. [GREYWACKE, TRANSITION.]

The anal and dorsal fins are variable in their development, and the family have been subdivided as under:

2. *Coinage, Comm., &c.*: As early as the times of Abraham silver (not coined, but weighed) was given as a medium of exchange (Gen. xxiii. 16). For many ages it has been coined into money, bearing a certain fluctuating relation to the value of gold. Murchison (*Siluria*, ch. xvii.) stated that gold was so restricted in range and abundance, and silver or argentiferous lead so plentiful, that there was no danger of the depreciation of gold. Depreciation of silver, with the corresponding appreciation of gold, has been in progress since 1876, caused partly by increased produce of silver in the South American mines, with the introduction by Germany of a gold coinage. Hence the controversy between the mono-metalists and the bi-metalists. [BIMETALLISM.]

3. *Min.*: Crystallization isometric, only occasionally found in distinct crystals, more often filiform, reticulated and arborescent in calcite and quartz in veins traversing metamorphic rocks. Dana distinguishes the following varieties: (1) Ordinary, (a) crystallized, (b) filiform or arborescent, (c) massive; (2), Auriferous = Küstelite; (3) Cupriferous; (4) Antimonial. Much of the silver from Kongsberg,

Norway, contains mercury in variable amounts, which, it is suggested, may account for the fine crystallizations which occur there. In the copper mines of the Lake Superior mining region it is frequently found in a pure state, intimately associated with native copper.

**I. Ordinary Language:**

1. Any voluntary transgression of the law of God; disobedience to the divine command; any violation of the divine command; moral depravity, wickedness, iniquity. Sin includes not only actions, but neglect of known duty, all evil thoughts, words, purposes, and all that is contrary to the law of God. It may consist in commission, when a known divine law is violated, or in omission, when a positive divine command or a rule of duty is voluntarily and willfully neglected.

2. An offense in general; a transgression, a breach; as, a *sin* against good taste.

\*3. A sin-offering; an offering made to atone for sin.

"He hath made him to be *sin* for us, who knew no sin, that we might be made the righteousness of God in him."—*2 Corinthians* v. 21.

\*4. A man enormously wicked; the incarnation of sin.

"Thy ambition,  
Thou scarlet *sin*, robb'd this bewailing land  
Of noble Buckingham."  
*Shakesp.: Henry VIII.*, iii. 2.

**II. Technically:**

1. **Script. & Protest. Theol.:** Sin is used generically (1 Kings viii. 34; Rom. vi. 1) and specifically (Exod. xxxiv. 7). It is defined as the transgression of the law (1 John iii. 4). All sins are not equally great (Exod. xxxii. 31; 1 Sam. ii. 17). Distinction is recognized between a "sin unto death" and a sin "not unto death" (1 John v. 16). There are sins against one's self (Num. xvi. 38; Acts xvi. 28) and against one's fellow-man (Gen. xlii. 22; Matt. xviii. 21), but every sin is also a sin against God (Deut. xx. 18), which is so important, that compared with it the others may almost be left unmentioned (cf. Psalm li. 4, 14). Unlike crime, or transgression of human law, sin may be committed without any overt act; there may be sins of thought as well as sins of word or deed (Matt. v. 22-23). Theologians divide sins into sins of omission and of commission; the former characterized by the omission of some commanded duty, and the latter by the commission of some deed positively forbidden. Another division is into Original and Actual Sin. [ORIGINAL-SIN.]

2. **Roman Theol.:** Sin was defined by St. Augustine as "any thought, word, or deed against the law of God," and his definition is generally followed by theologians. The Council of Trent (sess. vi., can. 23) defined that "no one can avoid sin altogether, except by a special privilege of God, as the Church holds of the Blessed Virgin." Hence follows the division into mortal and venial. [MORTAL-SIN, VENIAL-SIN.]

\***sin-born**, *a.* Born of sin; originally sprung or derived from sin. (*Milton: P. L.*, x. 596.)

\***sin-bred**, *a.* Produced or bred from sin. (*Milton: P. L.*, iv. 315.)

\***sin-eater**, *s.*

**Folklore:** A man who, for a small consideration, professed to take upon himself the sins of a person recently deceased. [SIN-EATING.]

"The manner was, that when the corpse was brought out of the house, and laid on the bier, a loaf of bread was brought out and delivered to the *sin-eater*, over the corpse, as also a mazard-bowl, of maple, full of beer (which he was to drink up), and sixpence in money: in consideration whereof he took upon himself, *ipso facto*, all the sins of the defunct, and freed him or her from walking after they were dead."—*Aubrey, in Hone: Year Book*, July 19.

\***sin-eating**, *s.*

**Folklore:** A practice formerly common, by which a man [SIN-EATER], in consideration of a small quantity of food and drink and a trifling money gratuity, professed to take upon himself the sins of a person deceased. The practice is said by Laurence Howel (*Hist. Pontificate*) to have originated from a mistaken interpretation of Hosea iv. 8: "They eat up the sins of my people."

"An usage called *sin-eating* undoubtedly arose in Catholic times, and, however it may have been limited to the clergy in early ages, was afterward continued and practiced as a profession by certain persons called *sin-eaters*."—*Hone: Year Book*, July 19.

**sin-offering**, *s.*

**Judaism:** Hebrew *chhattath*, a sacrifice for the removal of sin, first instituted in Lev. iv. When a sin had been committed by an anointed priest, a young bullock without blemish was brought to the door of the tabernacle of the congregation before the Lord. The priest laid his hand upon the bullock's head (as if to transfer his sins to the animal), and then killed it before the Lord. [SCAPEGOAT.] He next sprinkled its blood seven times before the veil of the sanctuary, put some of it on the horns of the altar of incense, burnt the fat, &c., and then the bullock itself outside the camp (Lev. iv. 1-12). There were similar ceremonies in the case of the people at large (13-21), or of a ruler (22-26), or one of the common people (27-35). Sometimes a ram or a kid of the goats was substituted for a bullock, or, in case of poverty, a turtle-dove (v. 7); or, if the indigence was still greater, the tenth part of an ephah of fine flour (11). There were stated times or occasions on which sin-offerings were sacrificed (Num. xxviii. 15; xxix. 38). The Christian sees in the sin-offering a vivid type of the propitiatory sacrifice of Christ. (Cf. Heb. vii. 27; ix. 13, 14; x. 26, &c.)

"The flesh of the bullock shalt thou burn without the camp; it is a *sin-offering*."—*Exodus* xxix. 14.

**Chem.:**  $C_4H_6N_2 = \left. \begin{matrix} CN \\ C_2H_5 \\ H \end{matrix} \right\} N$ . A basic compound,

discovered in 1839 by Robiquet and Bussy, prepared by rubbing together a mixture of one part thiosinamine and five parts mercuric oxide, exhausting with ether, evaporating, dissolving the viscid mass in boiling water, and allowing it to crystallize. It forms white, shining, triclinic prisms, which melt at 100°, is very bitter to the taste, inodorous, and dissolves in water, alcohol, and ether. Its aqueous solution has an alkaline reaction, and is precipitated by tannic acid. With nitrate of silver it forms a resinous precipitate.

It crystallizes in prisms, which melt between 150° and 200°, is sparingly soluble in water and alcohol at the ordinary temperature, very soluble in boiling alcohol, but insoluble in ether. It forms easily soluble salts with the alkalies, sparingly soluble with the earths and metallic oxides, but all the salts decompose with great facility.

**sinapine-sulphocyanate**, *s.*

*Chemistry*:  $C_{17}H_{24}N_2SO_5 = C_{16}H_{23}NO_5 \cdot HSCN$ . Dry mustard freed from fixed oil by pressure, and washed with cold alcohol as long as the alcohol acquires a yellow color, is boiled with alcohol of 85 per cent., and filtered. On evaporating the filtrate, and removing the layer of fat from the solution, sinapine-sulphocyanate crystallizes out in loose tufts of white pearly needles, which melt at 130°. It is inodorous, tastes bitter, and dissolves with a yellow color in water, alcohol, and ether. When strongly heated, it decomposes, giving off empyreumatic oils, which burn with luminous flame, leaving charcoal.

**si-phōn**, \***sŷ-phōn**, *s.* [Fr. *siphon*, from Latin *siphonem*, accus. of *siphon*=a siphon; Gr. *siphōn*=a small pipe or reed.]

1. A curved tube having one branch longer than the other; used for transferring liquids from higher to lower levels. It acts by atmospheric pressure, and consequently cannot be depended on for overcoming heights greater than about thirty feet near the level of the sea, and a less height at great elevations. It is used in transferring liquids in the following manner: The siphon is filled with some liquid, and the two ends being closed, the shorter leg is dipped in the liquid, or the shorter leg having been dipped in the liquid, the air is exhausted by applying the mouth at the extremity of the longer leg. A vacuum is thus produced, the liquid in the vessel rises and fills the tube in consequence of the atmospheric pressure. It will then run out through the siphon as long as the shorter end dips in the liquid. In the illustration, C is the surface of the liquid; C D A the siphon. The pressure acting on the right and left hand sides of the bend equals the pressure of the atmosphere, less the pressure of the column of liquid A B, D C respectively. Since A B is greater than D C, the pressure tending to keep the liquid in the tube is less on the right-hand side; the liquid consequently flows, and will continue to flow from the lower end of the siphon so long as the shorter end remains in the liquid, and the end B is lower than the surface C. [INTERMITTENT-SIPHON.]

A. As substantive:

1. Ordinary Language:

1. In the same sense as II. 2.

"Next, where the sirens dwell, you plow the seas."

Pope: *Homer's Odyssey*, vii. 51.

\*2. A mermaid.

"Over-against the creeke Pæstanum, there is Leucasia, called so of a mermaid or *sirene* there buried."—P. *Holland*: *Pliny*, bk. iii., ch. vii.

3. A charming, alluring, or seductive woman; a woman dangerous from her powers of alluring or enticing.

"Oh, train me not, sweet mermaid, with thy note,

To drown me in thy sister's flood of tears:

Sing, *siren*, to thyself, and I will dote."

Shakesp.: *Comedy of Errors*, iii. 2.

\*4. Something alluring, seductive, or insidious.

II. Technically:

1. *Acoustics*: An instrument for determining the number of vibrations corresponding to a note of any given pitch. In its most elementary form the siren is simply a perforated rotating disk, against which a current of air is directed, producing sounds of higher or lower pitch, according to the velocity of rotation. The improved siren of Helmholtz consists of two equal disks, one forming the top of a hollow fixed cylinder into which air can be driven, the other capable of revolving concentrically upon it with the smallest possible amount of friction. A circle of small holes, equidistant from each other, is bored upon each disk, and concentric with it, those in the upper disk being inclined slantwise to its plane, those in the lower being slantwise also, but in the opposite direction. There are arrangements for registering the number of revolutions the upper disk performs in a minute. Thus, when air is forced into the cylinder, it will pass through the perforations, and, by reason of their obliquity, will cause the movable disk to revolve with a rapidity corresponding to the pressure, and each time that the holes coincide, a number of little puffs of air get through simultaneously, and, if the pressure of the air in the cylinder is sufficient, the series of impulses thus given will link themselves together, forming a continuous note. From the deep, piercing nature of the sound which the siren emits, it is well adapted for fog-signals or alarms. In this case two disks rotating with great rapidity in opposite directions are employed. They are driven by a steam-engine, which also forces a blast of steam through their apertures when those in the two disks come in apposition. The device is placed at the smaller extremity of a large trumpet, which intensifies the sound.

Siren, used as Fog-signal.

2. *Class. Mythol.*: Certain melodious divinities, who dwelt on the shores of Sicily, and so charmed passing mariners by the sweetness of their song, that they forgot their homes, and remained there till they perished of hunger. According to one legend, they threw themselves into the sea, from rage and despair, on hearing the more melodious song of Orpheus. Originally there were only two sirens; but their number was afterward increased to three, and their names are given with great variety.

3. *Zoöl.*: Mud-eels: a genus of Urodela or of Perennibranchiate Ichthyoidea, constituting the family Sirenidae. They are eel-like Amphibians, with two anterior feet and permanent branchiæ, and range from Texas to Carolina. There are three species. *Siren lacertina* is the Mud-eel (q. v.).

B. As *adj.*: Pertaining to a siren; like or befitting a siren; bewitching, alluring, fascinating.

sī-rēn'-ī-a, *s. pl.* [Mod. Lat., from *siren*.] Named from the pectoral position of the mammæ.]

1. *Zoöl.*: An order of aquatic Mammalia, allied to the Cetacea, with which they were formerly and are still occasionally classed. The body is long, compact, and cylindrical, narrowing toward the tail, which is set horizontally and terminates either in forked flukes or a flat fibrous expansion. Hind limbs and sacrum absent; anterior limbs converted into paddles. Snout fleshy and well-developed; nostrils on upper surface; lips fleshy, the upper lip usually with a moustache. The skin is rough and sparsely hairy, or smooth like that of the Whale. The two mammæ are on the breast, close to the armpits, and there is little doubt that from the habit of the Dugong (q. v.) raising the upper part of its body perpendicularly out of the water and clasping its young to its breast, the stories of Sirens and Mermaids took their rise. There are two recent genera, Halicore and Manatus. The former is monophyodont, the latter diphyodont, the permanent teeth consisting of molars with flattened crowns adapted for bruising vegetable food. The recently extinct genus *Rhytina* (q. v.) had no true teeth. The Sirenia pass their life in the water, living chiefly in shallow bays, estuaries, lagoons, and rivers, never straying far from shore, and feeding solely on aquatic vegetation.

2. *Palæont.*: From the Eocene onward. [EOTHERIUM, RHYTINA.]

It is, however, an aberrant saw-fly, the apparent sting being a projecting ovipositor. It is black, the antennæ, the hinder part of the head on each side, the tibiæ and tarsi, and the base and apex of the abdomen yellow; abdomen of the male reddish, spotted with black at the sides and apex. It is not uncommon in pine and fir woods. The eggs are deposited about an inch from the surface, and the hatched grubs bore deeper. The male is banded with orange, while the female is dark purple.

Sīr'-ī-ūs, *s.* [Lat., from Gr. *Seirios*.]

*Astron.*: The Dog-star, by far the brightest fixed star in the sky. It is *alpha Canis Major*, situated a little below Orion, and is mythologically regarded as one of the hounds held in leash by Orion, Procyon in *Canis Minor* being the other. A line drawn from the Pleiades through the three stars of Orion's belt will pass it closely; straight lines connecting it with Procyon and Betelgeuse will constitute a nearly equilateral triangle; and Aldebaran, Betelgeuse, Sirius, and Regel, all of the first magnitude, form a lozenge-shaped figure, with Orion's belt in the center. Ptolemy, in the second century, ranked Sirius among red stars; now it is white, and is a very brilliant object, its light being 324 times as great as that of a star of the sixth magnitude. It is about a million times as far from us as the sun, and its mass is about twenty times as great. Viewed by the spectroscope, its chief lines are those of incandescent hydrogen, with feebler ones of sodium and magnesium; the metal mercury seems also to be present. Some irregular movements of Sirius led to the belief that a heavenly body existed near enough to produce a perturbation, and a son of Mr. Alvin Clark, of Boston (Mass.), discovered, on Jan. 31, 1862, what appears to be a planet revolving around Sirius as its sun, it is thought in about forty-nine years. The heliacal rising of Sirius varies in different latitudes, and the precession of the equinoxes makes it do so also in successive ages. When the heliacal rising of Sirius (called by the old Egyptians Sothis) took place, it indicated to them that the overflow of the Nile was at hand. Some consider the Dog-star to have been Procyon; but that hound rises, like the other dogs, far behind the "dog-days," in place of ushering them in.

They nest usually in the fork of a bough, and lay from three to five eggs, bluish-white, spotted at the larger end with brown or gray. Breeders often pair the Siskin with the Canary to obtain a songbird whose note is less shrill than that of the pure Canary.

"The members of a religious *sisterhood* were trained to habits of order and obedience."—*Victoria Magazine*.

¶ In the early ages of the Church the object of religious women living in community was their own sanctification by means of retirement from the world, prayer, and meditation. In course of time they extended their sphere of work, and founded hospitals, refuges for penitents, and schools, and for the last four centuries among Roman Catholics the education of girls of all classes has been largely connected with sisterhoods. The first Anglican sisterhood was founded by Miss Sellon in 1848. Since then several others have arisen, such as the Sisters of the Poor and the Good Samaritans. The Anglican sisters generally wear a distinguishing dress, but this is not a universal rule; and vows are not obligatory, though it is understood that they mean to devote themselves heart and soul to the work. The following are some of the most important Roman sisterhoods. (The statistics given are taken from *Addis & Arnold's Catholic Dictionary*, ed. 1884.)

(1) *Little Sisters of the Poor*: Founded in 1840 by M. le Pailleur, the Curé of St. Servan, for the support, relief, and nursing of the aged or infirm poor. Their only resources are the alms of the charitable, in many cases gathered from door to door.

(2) *School Sisters of Notre Dame*: Founded at Amiens in 1797. The sisters devote themselves to teaching, especially among the poor.

(3) *Sisters of Charity*: Founded by St. Vincent de Paul at Paris in 1634, for the work of nursing the sick in hospitals, to which are sometimes added the charge of orphanages and the management of poor schools. Called also Gray Sisters, Daughters of Charity, and Sisters of St. Vincent de Paul.

Sī'-va, †Sī'-wa, s. [Sans., &c., from Sans. *civa* =happy, happiness.]

1. *Brahmanism*: The Destroyer and Reproducer; the third person of the Hindu triad. Modern views of Siva seem to have been evolved from two distinct germs, one Aryan, the other Turanian. The Aryans of Vedic times, deeply impressed on hearing the noise and viewing the devastation produced by a cyclone, framed the conception of Rudra, the Roarer, or Storm-god, afterward developed into Siva, the destroyer. Reflecting next that the death of living organisms cleared the way for younger and more fruitful life, they added the conception of Siva, the Reproducer as well as the Destroyer. The Turanian aborigines were in that state of religious barbarism when every god is an object of terror. When converted to Brahmanism, they had to choose between Vishnu, the Preserver, and Siva, the Destroyer (Brahma having become nearly obsolete), and instinctively preferred Siva as their patron divinity. The image of Siva, on the Brahminical conception, is a man of fair color, in profound thought, with the symbol of the Ganges above his head, and the Brahman-bull (q. v.) at his side. The Turanians added a necklace of skulls, a collar of twining serpents, a tiger skin and a club with a human head at the end, five faces and four arms; his wife is Durga, or Kali; the Linga (q. v.) is his symbol, and the chief form in which he is now worshiped in India. 2. *Geol. (pl.)*: The Sivalik strata.

Sivalik-strata, s. pl.

*Geology*: Certain freshwater strata found in the Sivalik Hills in Sirmoor, &c. They were originally regarded as Miocene, but Mr. Blanford believes that, while the Lower Sivalik or Nahun beds are not older than Upper Miocene, the mass of the strata is Pliocene. They have been investigated by Dr. Hugh Falconer, Sir Proby T. Cautley, Lieuts. Baker and Durand (Sir Henry Durand), and by the Geological Survey of India—leading to a series of publications beginning in Calcutta in 1836. They yielded mollusca belonging chiefly to living species. Forty-eight genera and ninety-three species of mammalia, some recent, others extinct, have been described; they include *Macacus*, *Semnopithecus*, *Felis*, *Machairodus*, *Elephas*, *Mastodon*, *Rhinoceros*, *Equus*, *Hipparion*, *Hippopotamus*, *Cervus*, *Sivatherium*, *Antilope*, *Capra*, *Ovis*, *Camelus*, *Mus*, and *Hystrix*. sī'-va-thēr'-i-ūm, s. [Eng., &c., *Siva*, 1, and Gr. *therion*=a wild beast.]

*Palæont.*: A genus of Antilopidæ or Sivatheridæ, with one species, *Sivatherium giganteum*, discovered by Falconer and Cautley in the Sivalik Hills. [SIVALIK-STRATA.] It must have been far larger than any living Ruminant, for the skull was nearly as long as that of an elephant. Dr. Falconer (*Palæont. Notes*, ed. Murchison), considered that it connected the Ruminantia with the Pachydermata. It had two pairs of horns; the anterior pair simple, the posterior possessing two snags or branches. [BRAMATHERIUM.] (See extract.)

Skull of Sivatherium.

"That the *Sivatherium* had a huge long proboscis, tactile and prehensile, as in the Elephant, or, to a lessened extent, as in the Tapir, does not seem to be established. Falconer and Cautley, from the structure of the facial bones, infer as much. The bones of the face of *Sivatherium* and Saiga assimilate closely in pattern, and individually correspond; and, as in the latter we have a soft, flabby, enlarged, patulous nostril of moderate dimension, it follows, as a matter of probability, that the same existed in the former, as in the Elk and others. For it is to be borne in mind, when we attribute a pachyderm's trunk to the *Sivatherium*, that the animal had large, heavy horns occipital and pre-frontal, a circumstance vastly different from the Elephant and Tapir."—Dr. Murie, in *Geol. Mag.*, 1871, p. 442.

II. *Anat.*: The support or framework of an animal body, in life protecting the central parts of the nervous system, and forming a fulcrum for the limbs. It is made up of different parts—in the human adult of 193 separate bones. The skeleton proper consists of the skull and bones of the trunk, the pectoral and pelvic limbs forming the appendicular skeleton, the whole constituting the interior or endoskeleton. This, when removed from the body for purposes of examination and study, is termed a natural skeleton, if connected by the dried ligaments; an artificial skeleton, if the various bones are joined together by wire; and a disarticulated skeleton, if the bones are separated from each other. In the majority of vertebrates the skeleton is osseous; in some fishes it is cartilaginous, and in the Lancelet (*Branchiostoma lanceolatum*) the vertebral column is reduced to a notochord. [CHORDA-DORSALIS.] Owen looks upon the endoskeleton as a whole made up of three parts: The neuroskeleton, the scleroskeleton, and the splanchnoskeleton. (See these words.) In the typical skeleton the axial or chief portion comprises the skull, the vertebral column, the sternum, and the ribs. The anterior or pectoral portion of the appendicular skeleton consists of the humerus, the radius, and ulna, and the carpals metacarpals, and phalanges. The posterior or pelvic portion consists of the femur, the tibia and fibula, the tarsals, metatarsals, and phalanges. In the Pinnipedia, Cetacea, and Fishes all four limbs are modified; in Bats and Birds the pectoral limbs evolve as organs of flight; in the Pythons the pelvic, and in some lizards—*e. g.*, the Slow-worm—both pelvic and pectoral limbs are rudimentary. [VESTIGE.] There is no endoskeleton in the Invertebrata, though the internal bone of some of the Cephalopoda may foreshadow the neuroskeleton, as the phragmacone foreshadows the splanchnoskeleton. The armadillo, crocodile, and the sturgeon among Vertebrates, and

the crab and lobster among Invertebrates, are familiar examples of animals furnished with an exoskeleton or dermoskeleton (q. v.).

The hyoid bone, one of the bones of the head, is suspended from the under surface of the cranium. Goethe, in 1791, adopted the view that the skull was formed by four modified vertebrae. Oken independently published the same view in 1807. In the hands of subsequent anatomists, the hypothesis has undergone some change, and has by some been abandoned altogether. (*Quain.*) The skull varies in form according to age, sex, race, &c. [BRACHYCEPHALIC, DOLICHOCEPHALIC, ORTHOGNATHOUS, PROGATHOUS.] Broadly speaking, the capacity of the skull measures the intellect. is black, or very dark brown, with a white streak on the forehead, and a white patch on the neck, from which two broad bands of the same color proceed backward on the upper surface of the body. In general appearance the Skunk resembles the Badger, and, like it, burrows in the earth, and feeds on mice, fruits, insects, &c. Its means of defense consist in its power of ejecting a fetid, acrid secretion from the anal glands, and its bite produces symptoms not distinguishable from hydrophobia. Clothes defiled with the secretion are rendered useless on account of its unbearable odor, and it is said that persons have been rendered blind by having it squirted into their eyes by the animal. A method of purifying Skunk-skins has been discovered, and large numbers are used by furriers.

1. *Naut.:* A triangular sky-sail.

2. *Arch.:* The name given to the very tall buildings to be seen in our larger American cities, particularly in New York and Chicago.

steel frames resting on a great cantilever sunk down to bed-rock, some seventy feet below the street level. By this arrangement the tallest structure is invincible to the strongest gales. Each portion is dependent on the rest and cannot give way unless the very foundations are riven. The iron framework system presents another advantage, too, that it renders the building practically invulnerable. The danger of fire in a *sky-scraper* is practically nil; and even should one occur, such are the precautionary arrangements that but little damage could be done either to life or property. Finally, so simple is the process of construction that a fully equipped thirty-story building can be raised from its foundation to its roof in less than six months."—*Metropolitan Magazine* for Nov. 1898.

slāv-ĕr-ŷ, *s.* [Eng. *slave*; *-ry.*]

1. The state or condition of a slave; bondage; the state or condition of being entirely subject to the will of another. Slavery is the obligation of the slave to work for the benefit of his master, without the consent or contract of the former; or it is the establishment of a right which gives one person such a power over another as to make him absolute master of the other's life and property.

¶ In barbarous times the man who overcame an adversary in battle never thought his victory completed till he had killed him. In the next stage of development it was discovered that by sparing him he could be put to some use, and slavery arose as a reform. Though tending to stop slaughter in the battlefield, it caused fresh wars of its own, the object being to overcome the men of feebler tribes, and reduce them, with their wives and families, to servitude.

The subjection of some, at least, of Ham's race to slavery is prophesied in Gen. ix. 25, and slavery very early existed in the world. The 318 trained servants (A. V.), men (R. V.) born in Abraham's house seem to have been slaves, and the patriarch must have habitually treated them well, or he would not have ventured to arm them (Gen. xiv. 14). The Mosaic law found slavery previously existing among the Jews, and regulated it, making it milder (Exod. xxi. 16), especially in the case of the poor of their own race temporarily in bondage (Lev. xxv. 39), for whom it had a year of release (Exod. xxi. 2) and a jubilee (Lev. xxv. 39-54).

The Egyptians (Gen. xxxix. 1, Exod. i.-xii.), the Carthaginians, the Greeks, and the Romans, even when their civilization was at its highest, all had slaves. The New Testament did not directly attack slavery (Philemon 10-19), but the principles of Jesus were quite inconsistent with its maintenance (Matt. vii. 12), and, as Christianity gained the power of molding European faith and practice, the severe slavery of the ancient times was transformed into the milder serfage of the Middle Ages. With regard to Mohammedan slavery, Hughes (*Dict. Islam, p. 596*) says:

"From the teaching of the Qur'an . . . it will be seen that all male and female slaves taken as plunder in war are the lawful property of their master; that the master has power to take to himself any female slave either married or single; that the position of a slave is as helpless as that of the stone idols of Arabia; but they should be treated with kindness, and granted their freedom when they are able to ask for and pay for it."

On the conquest of Hispaniola (Hayti), Peru, and Mexico by the Spaniards, the American Indian natives, reduced to bondage, were compelled to labor long hours in mining and other occupations, Las Casas (1474-1566), a Spanish Dominican, "the Father and Protector of the Indians," in vain urging their emancipation. The mortality among them was so great that negroes from Africa were introduced to take their place. It was found that a negro did four times as much work as an Indian, and lived when the Indian died. The first slaves were brought to Hispaniola in 1503, and a larger number in 1511. American slavery once begun gradually reached large proportions, and sullied the fair fame of all European nations which possessed colonies abroad. In 1713, Great Britain was no better than the rest. [ASSIENTO.] The worst feature of slavery was the slave trade. As early as A. D. 1688, William Penn, the Quaker, had denounced it. The London Society of Friends did so also in 1727, and resolved in 1760 to expel any member who engaged in the traffic. On June 22, 1772, the English Court of King's Bench, in the case of Somerset, decided that a slave reaching England was free, and the Scotch Court of Session, about the same time, came to the same decision. In 1785, the Vice-Chancellor of the University of Cambridge offered a prize for the best essay on the question whether slavery was right, and the successful candidate was Mr. Thomas Clarkson (1760-1846), who commenced an agitation for the abolition of the slave trade. Many of his warmest supporters belonged to the Society of Friends. In 1786 William Wilberforce (1759-1833) brought the subject before Parliament, but the Act abolishing it did not become law till March 25, 1807. Agitation was now directed against slavery itself, and in 1833 an Emancipation Act was passed, which, on August 1, 1834, set free 770,280 slaves in the British West Indies, with a compensation of £20,000,000 to their owners. On August 1, 1838, slavery was abolished in British India.

As time went forward, the struggle between the advocates of slavery and the abolitionists in the United States became more determined, the former being generally Democrats and the latter Republicans, and when on Nov. 6, 1860, Abraham Lincoln, the Republican candidate, was elected President, great excitement arose among the Southern or slave-holding States, one after another of which seceded from the Union. [CONFEDERATE.] Lincoln, at the head of the Northern States, declared war against the revolted South. The war was undertaken for the preservation of the Union, yet events compelled Lincoln (Jan. 2, 1863) to proclaim the emancipation of the slaves in the unsubdued portions of the South, and the ultimate success of the North led to the abolition of slavery throughout the Union.

"Whether it be natural to the Indians to be thus melancholy, or the effect of their slavery, I am not certain."—*Dampier: Voyages (an. 1684).*

II. *Physiol.*: The periodical lethargy and repose of the organs of sense and locomotion and some of the intellectual powers. The salient feature of sleep is the cessation of the automatic activity of the brain. When sleep is approaching, the mind becomes less active, the power of attention being among the first to give way; finally greater or less loss of consciousness takes place. [DREAM.] All the higher animals sleep, and some hibernate. [HIBERNATION.] The functions of organic life are not much affected by sleep. The pulse and breathing are slower, the latter more thoracic than diaphragmatic; the intestines and other muscular mechanisms and the secreting organs less active, or even some of them quiescent, and the pupil of the eye is contracted proportionally to the depth of the sleep. The temperature of the body is lower, and from two to five in the morning vitality is low, and this period is marked by a high rate of mortality among the old and weak. The cause of sleep is not yet fully understood. The very young require much sleep; in adult life about eight hours' sleep are required; in old age there should be more, for the repair of waste, but generally there is less. A morbid tendency to sleep denotes imperfect nutrition and degeneracy of the nervous tissue, and is often the precursor of apoplexy. It may be caused also by undue heat or cold, by dyspepsia, passion, mental excitement, overwork, anxiety, or drunkenness. [SLEEPLESSNESS.]

¶ *Sleep* denotes an entire relaxation of the physical frame; *drowse* is a short, light sleep. *Sleep* is the general term; to slumber is to sleep lightly and softly; to doze is to incline to sleep, or to begin sleeping; to nap is to sleep for a time.

II. *Zoöl.*: The popular name for any individual of the Edentate group Tardigrada (q. v.), from their slow and awkward movements on the ground, owing to the peculiar structure of the wrist and ankle-joints. The feet are armed with long claws, and turned toward the body, so that the animal is compelled to rest on the side of the hind foot, while the disproportionate length of the fore-limbs causes it to rest also on the elbows. It shuffles forward, alternately stretching the fore-legs and hooking the claws into the ground, or grasping some object to draw itself along. Sloths are natives of South America, nocturnal in habit, and are found in the forests of that region, passing their lives among the branches of trees, on the leaves and young shoots of which they feed. In moving from one limb of a tree to another, they hang back downward, embracing the limb with their hind, and drawing themselves forward with their fore feet. They are covered with coarse, shaggy hair, not unlike withered grass, which protects them from insects and shields them from observation when at rest in the daytime. The stomach is complicated, but there is no rumination. The female produces but one at a birth, which clings to its mother till able to provide for itself. Their chief enemies are snakes and the Carnivora; their arboreal habits are a partial protection against the latter, and against the former they defend themselves by their powerful fore-limbs and claws. There are several species, the most important of which are described in this Dictionary under their popular names. [AI, TWO-TOED SLOTH, THREE-TOED SLOTH.]

\*B. As *adj.*: Slow, slothful.

serous infiltrations, called vesicles, with their characteristic central depression, changing to pustules, which invade the deeper tissue under the skin and leave cicatrices in the form of pitting. After the pustules have formed, a crust is produced, contracting in the center, and ultimately falling off, when in favorable cases, recovery takes place; but often sloughing, pyæmia, pneumonia, laryngitis, &c., supervene, and increase the danger to life. The sight also is liable to be destroyed by the formation of pustules on the cornea, and the eruption is also found in severe cases in the nostrils, mouth and other mucous passages. The period of incubation is usually about twelve days, in which fever, headache, backache, and restlessness and anxiety are prominent symptoms. Three days after the invasion of the initial fever, the eruption appears, going on to suppuration, with secondary fever about the eighth day, and terminating from the eleventh to the fourteenth day, with desiccation, which lasts for three to six weeks or more, according to the severity of the attack. There are three chief forms of the disease, *variola discreta* (simple small-pox), usually terminating in recovery; *variola confluens* (confluent small-pox, where the spots run into one another), in which almost half the cases end fatally; and *variola hæmorrhagica* (the spots being of a purplish-black from hæmorrhagic effusions), usually fatal in forty-eight hours. Vaccination (q. v.) is ordinarily a preventive, and where it does not prevent, greatly modifies the disease, although fatal cases sometimes occur among vaccinated persons. The mortality from small-pox unmodified by vaccination is about 50 per cent. [REVACCINATION.] From the very contagious nature of the disease, isolation of the patient, and vaccination or revaccination of all who have been in contact with him, are absolutely indicated to prevent it becoming, as it too frequently does through neglect of these precautions, epidemic.

A. & B. *As pr. par. & particip. adj.*: (See the verb.)

C. *As subst.*: The act or process of obtaining metal from ore by the combined action of heat, air, and fluxes. The operation varies according to the different metallic ores to be operated on. In smelting iron, the ore is first roasted in a kiln, in order to drive off the water, sulphur, and arsenic with which it is more or less combined in its native state, and is then subjected to the heat of a blast-furnace, along with certain proportions of coke or coal and limestone, varying according to the quality and composition of the ore to be heated. [BLAST-FURNACE.] The smelting of copper consists in alternate roastings and fusions. The first of these operations is calcining the ore in furnaces in which the heat is applied, and increased gradually, till the temperature be as high as the ore can support without melting or agglutinating, when the ore is thrown into an arch formed under the sole of the furnace. The second operation, or fusion of the calcined ore, is performed in a luted furnace, the ore having been spread uniformly over the hearth, and fluxes, such as lime, sand, or fluor-spar, being added when required, although the necessity for this addition is sought to be obviated by a careful admixture of ores of different qualities, the several earthy components of which shall serve as fluxes in the fusion of the mass. These two processes of calcination and fusion are repeated alternately until the ore is completely freed from all the earthy materials, and pure metal is obtained. In smelting lead, the ores, after being sorted, cleansed, ground, and washed, are roasted in furnaces, which are without any blast or blowing apparatus, the ores being separable from the metal by its great fusibility. The smelting of tin consists of the calcining or roasting of the ores after they had been cleaned, sorted, stamped, and washed.

**smelting-furnace, s.** A furnace for disengaging the metal from its gangue or the non-metalliferous portions of the ore. The furnaces differ much, according to the metals to be treated. [BLAST-FURNACE, REVERBERATORY-FURNACE.]

**smokeless powder, s.** (See ¶.)

¶ Owing to the tremendous increase in the power of field guns in recent years, a necessity has arisen for a parallel increase in the efficiency of small arms, and thus the attention of the principal nations was directed to the magazine gun as a weapon for arming their troops. This at once made a change in ammunition (both as to weight of projectile and power of projection) a paramount necessity. The increase of range demanded that the weapon should have an exceedingly flat trajectory, and to this end the best authorities at first were in favor of the employment of a strong, quick-burning powder, but this was at once met by the objection that the use of such an agent demanded an increase in the weight of the gun in order to enable it to withstand the explosive force of the charge. Another difficulty had to be obviated in the fact that, even under the old conditions, the smoke arising from the combustion of the charge was sufficiently dense to obscure the vision of the combatants, while under the new order, with rapid-fire guns, the pall of smoke would be so dense as to render it impossible for anything at all to be seen beyond a distance of a few feet. Hence experiments were all directed to the manufacture of an explosive which should have a slow-starting but accelerating combustion, giving its greatest power as the bullet leaves the muzzle of the weapon, thus disposing of its bursting tendency in a manner most advantageous to the gun; at the same time such material as would produce the least amount of vapor on combustion was a desideratum. As a result many agents have been proposed—none of them absolutely smokeless, but all of them reducing the generation of vapor to a minimum. Comparative statements of the relative strengths of various explosives have recently been published, but as reference is had chiefly to their blasting effects they convey but little information as to the value of the explosives for military purposes. A number of very powerful explosives have recently been invented in various parts of the world, the most important of which, probably, is pyrocollodion (q. v.), invented in 1896, by Prof. Mendelejeff, of Russia.

"Some time ago Russia ordered of the Krupps several ten-inch plates hardened by the American or Harvey system, for the turrets of the Petropavloosk and the Sevastopol, now in process of construction. A round was fired at the plates with a velocity of 2,800 feet from an 8 inch gun 45 calibers long, and the plate was completely perforated. This remarkable velocity was achieved by a Russian smokeless powder, which has been perfected after several years of experiment. This powder is called *pyrocollodion*."—*London Times*, Jan. 9, 1897.

(acc.) *nipha*, from a nom. *niph*, not found; *niphos*=a snow-flake; Ir. & Gael. *sneachd*; Wel. *nyf*.]

1. *Lit. & Meteor.:* Aqueous particles frozen in their descent through the atmosphere into separate crystals, afterward uniting into assemblages of crystals called snow-flakes. To view the crystals to advantage under the microscope they should be allowed to fall on a black surface. The finest are observed in the polar regions, where Captain Scoresby keenly examined them, arranging them in five classes. They belong to the rhombohedral or hexagonal system, and so vary that about a thousand forms of them have been observed. Some appear as hexagonal or dodecahedral plates, others as hexagonal prisms, either single or stellate, or terminated by rectangularly placed plates or secondary groups of needles. The angles of these crystals often form secondary centers, around which others of more skeleton form aggregate. Snow does not fall at all on low tropical plains, though it does on high mountains. [SNOW-LINE.] It is absent from Malta; it falls at Palermo on an average one day each year, at Rome two days, at Venice five, at Paris twelve, at Copenhagen thirty, and at St. Petersburg 170. Where it falls it protects the ground from sinking to a temperature which would injure the seeds in the superficial mold. The snow and ice of the polar regions are among the great elements affecting the winds, and through them the climates, of the several regions of the globe. The cold of the snow on the lofty mountain chains is carried down to the tropical places in which they are principally situated, and tempers their heat. [RED-SNOW.]

**snow-bunting, s.**

*Ornith.:* *Plectrophanes nivalis*, an Arctic passerine bird, visiting more southerly latitudes in the winter. It is about seven inches in length, and its plumage varies considerably at different seasons. (See extract.) In winter the upper part of the head, cheeks, and a band on the lower neck are light reddish-brown; lower parts white, upper parts black, edged with yellowish-brown, but varying much in individuals. In summer the head, neck, lower parts, and a patch on the wings are pure white, the rest of the plumage black. They feed on seeds and insects, and soon after their arrival in temperate regions become very fat, and are then esteemed a delicacy. The Greenlanders kill them in great numbers, and dry them for winter use. Their song is not unlike that of the lark, and when singing they perch near a mate; their call is a shrill piping note, generally uttered on the wing.

"There arrive every year in this country, from the north, flocks of pretty little birds called snow-buntings. They come from within the Arctic Circle, and are so variable in their plumage that naturalists almost despaired of ever getting a characteristic description. Indeed, so much a puzzle did these little strangers offer, that for long they were described by the older naturalists as three different birds. Of course, we now know that the mountain, tawny, and snow-bunting are one; and this because we get them in almost every possible stage of transition. They breed upon the summits of the highest hills with the partridge, and, like that bird, they regulate their plumage according to the prevailing aspect of their haunts. In this they succeed admirably, and flourish accordingly."—*St. James's Gazette*, Jan. 6, 1887.

It is of two kinds: one is adapted to be hauled by horses or oxen on a common highway, and the other to be placed in front of a locomotive. A variety of the latter is adapted for street railways. The simplest form for common highways consists of boards framed together so as to form a sharp angle, like the letter A, in front, and spreading out behind to a greater or less width. Being drawn along with the apex in front, the snow is thrown off by the boards to the side of the road or path, and thus a free passage is opened for traffic. For railway purposes the forms are various, according to the character of the country, the amount of snow-fall, tendency to drift, &c.

The tread of the shoe is formed of strips of raw hide, hard-twisted twine, or, among the Indians, of deer-sinews. In use, the toe is placed beneath the strap and the foot rests on the thongs; as the heel rises in walking, the snow-shoe is not raised, but as the foot is lifted, the toe elevates the forward end of the snow-shoe, which is then dragged along on the snow as the leg is advanced. They are usually from three to four feet in length, and a foot to eighteen inches broad in the middle.

Commercially, it is a detergent substance, consisting of the potassium and sodium salts of the fatty acids derived from animal or vegetable oils and fats, and prepared by boiling the neutral fat, such as tallow, palm oil, or olive oil, with caustic soda or potash, until saponification (q. v.) is complete. To separate the soap from the excess of alkali and glycerin, a weak solution of common salt is added, and the boiling continued for a certain time. The soap being thereby rendered insoluble in the lye, rises to the top in the form of a granular mass or curd, and is ladled out or run off into frames, where it cools and solidifies. Hard soaps are compounds of the fatty acids and soda, the best known being curd and yellow soaps, the latter containing a small percentage of rosin. A good hard soap should contain not more than 26 per cent. water, 7 per cent. soda, and 66 per cent. of fatty acids. Soft soap is a combination of potash, or potash and soda, with the fatty acids derived from the drying oils, such as whale-oil, seal-oil, linseed-oil, &c. **\*sōc'-age, \*sōc'-cage (age as íg), s.** [Low Lat. *sociagium*, from A. S. *sōc*.]

**Old Law:** A tenure by any certain and determinate service; being in this sense put in opposition to knight-service, where the render was precarious and uncertain, and to villenage, where the service was of the meanest kind. These tenures are generally considered to be relics of Saxon liberty; retained by such persons as had neither forfeited their estates to the crown nor been obliged to exchange their tenure for the more honorable but, at the same time, more burdensome tenure of knight-service. As, therefore, the distinguishing

mark of socage is the having its renders or services ascertained, it includes all other methods of holding free lands by certain and invariable rents and duties; and, in particular, petit serjeanty, tenure in burgage, and gavelkind. Socage is distinguished as free and villein: Free socage (also called common or simple socage), where the service was not only certain but honorable, as by fealty and the payment of a small sum, in name of annual rent; villein socage, when the service, though certain, was of a baser nature. From this last tenure have sprung our present copyhold tenures.

**social-contract, or original-contract, subst.** That imaginary bond of union which keeps mankind together, and which consists in a sense of mutual weakness and dependence.

¶ Jean Jacques Rousseau (1712-1778) maintained that the natural and proper state of man is the savage state, when he possesses complete liberty, and that every social organization is an infraction of natural right. All men he believed are born equal, and society is founded on a "Contract social," a social contract. His views on the subject prepared the way for the first French Revolution. David Hume (1711-1776) says:

"It cannot be denied that all government is at first founded on a contract, and that the most ancient rude combinations of mankind were formed chiefly by that principle. In vain are we asked in what record this charter of our liberties is registered. It was not written on parchment, nor yet on leaves or barks of trees. It preceded the use of writing and all the other arts of civilized life."—*Essays* (ed. 2d), pt. ii., p. 473.

1. The systematic investigation of questions relating to public and domestic hygiene, education, labor, the punishment and reformation of criminals, the prevention of pauperism, and the like. The *Sociétés de Bienfaisance*, established in France in the eighteenth century, were founded for the purpose of discussing similar matters, and the National Association for the Promotion of Social Science originated in a meeting, in 1857, at the house of Lord Brougham (1778-1868), when he was appointed the first President. The association held annual meetings, and published its proceedings, classed under the heads of Jurisprudence, Education, Punishment and Reformation, Public Health, Social Economy, and Trade and International Law, but its action was temporarily suspended in 1886. Since its establishment, social science has made great advances in most civilized countries, notably in precautions against disease, the reconstitution of hospital charities, the regulation of prisons and workhouses, the establishment of reformatories for young criminals and penitentiaries for fallen women, and the extension of middle-class and industrial education.

sō'-ciāl-īsm (c as sh), *s.* [Eng. *social*; -ism.]

*History and Sociology:* The word Socialism is employed in several different senses. Loosely, it includes all schemes for abolishing social inequality, and in this sense it is generally distinguished as Utopian Socialism, under which designation communities like those of the Essenes, the early Christians, and the Shakers in America at the present day, and the ideal commonwealths of Plato, More, and Harington, are to be classed. St. Simon (1760-1825), Owen (1771-1858), and Fourier (1768-1830) were the leading modern Utopians. Scientific Socialism is an economic theory which affirms that

the materials from which labor produces wealth—*i. e.*, the land—should be the property of the community, not of individuals forming a separate class. Socialists also demand that the existing capital, having (as they contend) been unjustly appropriated by the landholding class or its assignees, be restored, with the land, to the community. It vests all authority in the hands of delegates elected by the community, and seeks to substitute public coöperation for private enterprise in supplying all social needs. Modern Socialism is of European origin. In the first half of the nineteenth century, F. D. Maurice (1805-72), and Charles Kingsley (1819-75), two English clergymen, advocated a large extension of the system of coöperation. The work begun by them is carried on on more extended lines by Christian Socialism, which "claims to be the result of applying Christ's teaching to national, social, and commercial life, and not merely to personal conduct. Those who hold this view maintain that Christ said little as to a future state, but much of bettering the conditions of life in this world. They point out that he consistently placed the community before the individual, and taught that the foundation of society is brotherhood, not competition for profit, as now with us. Christian Socialists adopt that name because they believe that a really Christian society must be what is called socialistic." (*Rev. H. C. Shuttleworth.*)

Scientific Socialism embraces:

(1) *Collectivism:* An ideal Socialistic state of society, in which the functions of the government will include the organization of all the industries of the country. In a Collectivist State every person would be a State official, and the State would be coextensive with the whole people. Safeguards would be provided against the formation of an oligarchy by the controlling officials.

(2) *Anarchism* (meaning mistrust of government, and not abandonment of social order) would secure individual liberty against encroachment on the part of the State in the Socialistic Commonwealth. Anarchists deny that the legislation of yesterday is enlightened enough for the affairs of to-day, and seek to make laws and other institutions as fluid as possible. They admit no authority except that which carries conviction, and would treat an incorrigible criminal as a dangerous lunatic. They are divided into Mutualists, who hope to attain their ends by banks of exchange and free currency, and Communists, whose motto is "From every man according to his capacity, to every man according to his needs."

Sō'-cĭn'-i-an-īsm, *s.* [Eng. *Socinian*; -ism.]

*Church Hist.:* A form of Unitarianism which is identified with Lælius and Faustus Socinus. The former, born in 1525, early adopted anti-Trinitarian views, and diligently propagated them among his friends, but making no public avowal of them, he escaped persecution, and died a natural death at Zurich, in 1562. His papers came into the hands of his nephew, Faustus (1539-1604), who in the main adopted his convictions, and zealously promulgated them, both in Transylvania and in Poland. He denied the existence of Jesus Christ previous to his birth of the Virgin Mary, and to this extent was opposed to Arianism (q. v.) as well as to Trinitarianism (q. v.). He, however, accepted the doctrine of the Miraculous Conception, and allowed to the teachings of Christ peculiar authority, on the ground that during his life he was translated to heaven, where revelations were made to him. He also taught that after Christ's final ascension, power was delegated to him to assist men in working out their salvation, and that he was invested with attributes by which he was virtually deified, so that he may be spoken of as God, and is entitled to our worship and obedience. Socinianism is sometimes used loosely as synonymous with Unitarianism (q. v.), but it differs in important particulars, not only from Arianism, but from the more modern and rationalistic phase of Unitarianism which represents Christ as simply a man in whose birth and life there was no element of the supernatural.

Sō'-cĭn'-ī-an-ize, *v. t.* [Eng. *Socinian*; -ize.] To cause to conform to Socinianism; to regulate by the principles of Socinianism.

sō'-ci-ōl'-ō-gĭy (c as sh), *s.* [Fr. *sociologie*, a hybrid word coined by Auguste Comte, from Fr. *société*=society, and Gr. *logos*=a discourse.]

*Philos.:* The science of the evolution and constitution of human society, and, therefore, one aspect of

the wider question of evolution in general. It is claimed for Comte that he created the science of Sociology, but according to Mill, he only rendered such a science possible. Lewes (*Hist. Philos.*, ii, 721) points out that Macchiavelli, Montesquieu, Adam Smith, and Bentham had had a full conviction that social phenomena conform to invariable laws, but that it was reserved for Comte to bring them under his Law of the Three Stages [STAGE, s., ¶] and to show that all societies pass through a theological, a metaphysical, and a positive stage. The subject of Sociology embraces all social phenomena under their statical and dynamical aspects. Social statics is the study of the conditions of existence and permanence of the social state; social dynamics studies the laws which govern the evolution of society. Herbert Spencer, in the Plan of his *Principles of Sociology* (prefixed to his *First Principles*) proposes to begin with the data of Sociology (the several sets of factors entering into social phenomena), and to give the empirical generalizations arrived at by comparing different societies and successive phases of the same society; next to deal with political, ecclesiastical, ceremonial, and industrial organizations; then to treat of the evolution of languages, knowledge, æsthetics, and morals, and lastly, the necessary interdependence of structures and of functions in each type of society, and in the successive phases of social development. The completion of his great systematic work was accomplished in 1890, by the publication of his third volume of "Principles of Sociology." Separate schools or departments of sociology have recently been organized by several of the American Universities.

**Socratic-method**, s.

*Philosophy*: The method of exact definition and induction introduced by Socrates (B. C. 469-399) (*Arist.: Metaph.*, xiii. 4). It was his custom to carry on his investigations from propositions generally received as true, and to place the particular statement to be examined in a variety of combinations, thus implying that each thought must, if true, maintain its validity under every possible combination. From the fact that this method was employed by its author in the form of dialogue, the term Socratic method is often loosely applied to any inquiry carried on in the form of question and answer, without reference to the fulfillment of the conditions which Socrates regarded as being all-important.

"With respect to the *Socratic-method*, in its employment of induction, I cannot agree with those who consider it an anticipation of Bacon."—*G. H. Lewes: Hist. Philos.* (ed. 1880), i. 162.

**Socratic-philosophy**, s.

*Philosophy*:

1. A term sometimes used to include the development of Greek philosophy from the time of Socrates to the rise of the Neoplatonists, because, with the exception of the Epicureans, the chief philosophical schools up to that period professed to ground their teachings on the authority of Socrates.

2. The ethics of Socrates, as gathered from the writings of Xenophon, Plato, and Aristotle. It is not known when Socrates commenced his career as a public teacher, but he first attracted notice as an opponent of the Sophists (q. v.), and was about forty-six years of age when Aristophanes introduced him on the stage in *The Clouds*, strange to say, in the character of a Sophist. All previous philosophers had been occupied with the Universe as a whole; the chief business of Socrates was with man as a moral being. His reforming tendencies made many enemies. In B. C. 399 Meletus, a leather-seller, seconded by Anytus, a poet, and Lycon, a rhetor, preferred this indictment against him: "Socrates is guilty of reviling the gods acknowledged by the State, and of preaching new gods; moreover he is guilty of corrupting the youth." He was tried and condemned to death, and, refusing the means of escape provided by his friends, drank the fatal hemlock in the seventieth year of his age. Bishop Blomfield (*Ency. Metropol.*, s. v. *Socrates*) says: "Socrates taught that the divine attributes might be inferred from the works of creation. He maintained the omniscience, ubiquity, and providence of the Deity; and, from the existence of conscience in the human breast he inferred that man is a moral agent, the object of reward and punishment; and that the great distinction of virtue and vice was ordained by the Deity."

**sō-dī-ūm**, *s.* [SODA.]

*Chem.*: Sodium. A monad metallic element recognized as a distinct substance by Duhamel in 1736, and obtained in the metallic state by Davy in 1807. Symbol Na. Atomic weight=23. It is very widely diffused and abundant, occurring as chloride in sea water and salt springs, and as nitrate in South America, and is prepared by introducing an intimate mixture of thirty parts dry sodic carbonate, thirteen parts coal, and three parts chalk into an iron cylinder, heated in a reverberatory furnace, the pure metal distilling over. It has a high luster and silver-white color, specific gravity, .972, is hard at  $-20^\circ$ , soft at ordinary temperatures, semifluid at  $50^\circ$ , and melts at  $97^\circ$ . It rapidly oxidizes in the air, and when dropped upon water decomposes it, liberating hydrogen, which takes fire if the water be previously heated. Sodium and its salts impart a beautiful yellow color to the flame of the blow-pipe. It forms a monoxide and a dioxide, and a hydrate corresponding to the former.

**sodium-bicarbonate**, *s.*

*Chem.*:  $NaHCO_3$ . Bicarbonate of soda. Prepared by passing carbonic acid gas into a cold solution of the carbonate, or by placing the crystals in an atmosphere of the gas. It is a crystalline white powder, soluble in ten parts of water at  $15.5^\circ$ , but which cannot be dissolved in warm water without partial decomposition, feebly alkaline, and more pleasant to the taste than the carbonate. It is employed in the preparation of effervescing powders and draughts, and is an ingredient in baking-powders.

**sodium-bromide**, *s.*

*Chem.*:  $NaBr$ . Obtained by saturating hydrobromic acid with soda. It crystallizes in anhydrous cubes or oblique rhombic prisms according to the temperature of evaporation. Specific gravity at  $17.5^\circ = 3.079$ . Dissolves easily in water and alcohol.

**sodium-carbonate**, *s.*

*Chem.*:  $Na_2CO_3 \cdot 10H_2O$ . Washing-soda. Prepared by decomposing common salt with sulphuric acid, heating the resulting sulphate of sodium with chalk and small coal in a reverberatory furnace, lixiviating the mass with cold or tepid water, evaporating the solution to dryness, and calcining the product with sawdust in a suitable furnace. By dissolving the soda-ash (*q. v.*) formed in hot water, filtering, and allowing to cool slowly, the carbonate is deposited in large transparent crystals, which effloresce in dry air, and crumble to a white powder. When this is redissolved in water, filtered, and the solution carefully crystallized, it constitutes the pure carbonate of soda used in pharmacy.

**sodium-chloride**, *s.*

*Chem.*:  $NaCl$ . Common salt. Sea salt. Formed by direct union of its elements, and obtained in a state of considerable purity by recrystallization from brine springs. The rock-salt of Poland is nearly pure chloride of sodium, that of Cheshire, England, contains 98.5 per cent. of the pure salt. It has an agreeable taste, crystallizes in colorless, anhydrous cubes, specific gravity, 2.1-2.57, melts at a red heat, dissolves in about three parts of cold water, and is only a little more soluble in boiling water; insoluble in absolute alcohol.

**sodium-hydrate**, *s.*

*Chemistry*:  $NaHO$ . Caustic soda. Formed when protoxide of sodium ( $Na_2O$ ) is brought into contact with water, and prepared by decomposing the carbonate of soda with milk of lime, concentrating the clear filtrate and afterward purifying by alcohol. The final product, when concentration is complete, is poured into molds or on to plates to solidify. It is a white, opaque, brittle substance having a fibrous texture, melts below redness, is highly soluble in water, less easily in alcohol; specific gravity = 2.0, and is extensively used for making soap

**sodium-iodide**, *s.*

*Chem.*:  $NaI$ . This salt is contained in the mother liquor of kelp, and is prepared by dissolving iodine in soda and slightly calcining the residue to decompose the iodate. It crystallizes from water in anhydrous cubes, which are very soluble in water and alcohol.

**sodium-oxide**, *s.*

*Chem.*: (1) Monoxide or Protoxide,  $Na_2O$ . Produced together with dioxide when sodium is burned in the air, and obtained pure when the dioxide is strongly heated or when equivalent quantities of sodic hydrate and sodium are heated. It is a gray mass, specific gravity 2.805, and melts at a red heat. (2) Dioxide or peroxide of sodium,  $Na_2O_2$ . Formed when sodium is burnt in oxygen gas until the weight is constant. It has a pure white color, but turns yellow when heated, and white again on cooling. Added, in the state of powder, very cautiously to water, it dissolves without decomposition, forming a solution of the dioxide.

They consider that God alone exists; that He is in all nature, and that all nature is in Him, the visible universe being an emanation from His essence. God is the real author of the deeds of men, and there is therefore no valid distinction between good and evil. The passages in the Koran which speak of a paradise and a hell are only allegorical. Man's soul existed before his body, and will transmigrate when he dies into other bodies till sufficiently purified to be absorbed into the Deity.

**sōft**, \***softe**, *adj., adv., s. & interj.* [A. S. *sōfte*=softly; O. Sax. *sāfto*; Ger. *sanft*; O. H. Ger. *samfto*.]

**A.** *As adjective*:

**I. Ordinary Language**:

1. Easily yielding to pressure; yielding, impressible, easily penetrated; not hard or compact.

"Hard and soft are names we give things, only in relation to the constitutions of our own bodies; that being called hard, which will put us to pain sooner than change figure, by the pressure of any part of our bodies; and that soft, which changes the situation of its parts upon an easy touch."—*Locke: Human Understanding*, bk. ii., ch. iv.

—*Macaulay: Hist. Eng.*, ch. xvi.

12. Affecting the senses in a gentle, mild, or delicate manner; as—

(1) Smooth, flowing; not rough or harsh; gentle or melodious to the ear.

"Soft! no haste!"

*Shakesp.: Merchant of Venice, iv. 1.*

¶ *To have a soft thing*: To have a prospect of certain success in an undertaking.

¶ *To tread softly* is an art which is acquired from the dancing-master; to go *gently* is a voluntary act; we may go a *gentle* or a quick pace at pleasure. Words are either *soft* or *gentle*; a *soft* word falls lightly upon the person to whom it is addressed; it does not excite any angry sentiment. A censure, an admonition, or a hint is *gentle* which bears indirectly on the offender, and does not expose the whole of his infirmity to view; a prudent friend will always try to correct our errors by *gentle* remonstrances. Persons, or their manners, are termed *soft* and *gentle*, but still with a similar distinction; a *soft* address, a *soft* air, and the like are becoming or not, according to the sex; in that which is denominated the *softer* sex, these qualities of *softness* are characteristic excellencies; but even in this sex they may degenerate, by their excess, into insipidity; and in the male sex they are compatible only in a small degree with manly firmness of carriage. *Gentle* manners are becoming in all persons who take a part in social life; *gentleness* is, in fact, that due medium of *softness* which is alike suitable to both sexes, and which it is the object of polite education to produce. (*Crabbe.*)

¶ *Soft* is largely used in compounds, the meanings being in most cases sufficiently obvious; as, *soft-breathing*.

*Mohammedanism*: The pupils who study Mussulman law and theology in the medrissas or secondary schools attached to the mosques. They are boarded in the imarets or free hotels kept up with the revenues of the vakouf property or pious legacies. Their clothing and bedding are furnished by their families, if these are in a position to do so, if not by charity. The number of softas is very great, because they are exempt from military service. After long study of the Arabic language, the Koran, and its commentaries, they pass an examination, which is almost always successful, and which authorizes them to assume the title of khodjas (q. v.) The name is also applied to all the classes connected with the mosques: Ulemas, Imams, Khodjas, and students of theology or of the jurisprudence of the Koran. Most of them are distinguishable by wearing a white turban around their fez. The Sultan Abdul Medjid (1839-1861) endeavored to induce his subjects to wear a European dress, and succeeded so far that almost every one, except the very lowest in the public service, adopted it. But the softas, to a man, retain the old-fashioned baggy, slouching dress which Abdul Medjid wished to get rid of. This is an indication of the conservatism of the class. In May, 1876, the softas were the authors of a revolution at Constantinople, their chief seat; they dictated the dismissal of the grand vizier, and were obeyed. Afterward they made a movement against the sultan himself.

**Compar. Mythol.**: A nature myth embodying, or supposed to embody a description of the sun's course in heroic legend, and used, notably by Max Müller and Cox, to explain the mythology of Aryan nations. (See extract.)

"Of this vast mass of solar-myths, some have merged into independent legends, others have furnished the groundwork of whole epics. . . . The legends of Kephales and Prokris, of Daphne, Narkissos, and Endymion, have come down to us in a less artificial form than that of Heraklēs, while the myth of Heraklēs has been arrested at a less advanced stage than those of Zeus and Apollōn. But all alike can be translated back into mythical expressions, and most of these expressions are found in the Vedas with their strict mythological meaning."—Cox: *Myth. Aryan Nations*, i. 53.

Vega belongs to the class of which Sirius is the most illustrious representative—stars which are supposed to be in an earlier stage of world-life and to be intensely hot as well as intensely brilliant."—Chicago Tribune, Aug. 5, 1894.

**solar-system**, s.

**Astron.**: The sun and the various bodies which revolve around him, deriving from him their light and heat. The enumeration of these bodies, deemed by the ancients complete, was: The Earth (in the center), then the Moon, Mercury, Venus, the Sun, Mars, Jupiter, and Saturn, seven in all. [WEEK.] Now planets, primary and secondary, are regarded as only one, though certainly a very important, part of the solar system. Of the major planets, called simply the planets, eight are recognized—Mercury, Venus, the Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. Of the secondary planets or satellites, including the moon, twenty-one.

Among other bodies revolving around the sun in more or less eccentric orbits are many comets, and a number of meteoric rings, some of which have been found to have a close relation to certain comets.

The orderly movements of the several bodies in the solar system is effected mainly by gravitation. Loosely stated, the planets revolve around the Sun. What really takes place is that they revolve around the center of gravity common to him and them, but his mass so much outweighs the aggregate of their masses that the point around which the revolution takes place, though not the sun's center, is still within his mass. Their revolution also somewhat alters his position. When several of the large planets are together on the same side they draw the sun a certain small distance from his place; then, as they go round to the other side, they gradually attract him back again; so that the stability of the solar system is not disturbed. [PERTURBATION.] That system constitutes part of the Galaxy (q. v.) and is moving to a point in the constellation Hercules.

The Nebular Hypothesis (q. v.), as to the origin of the solar system, after being quiescent for a time, revived with the discoveries made by the spectroscopist (q. v.), and in 1877 Dr. T. H. Gladstone, F. R. S. (*British Assoc. Report*, 1877, ii. 41. *Phil. Mag.*, 1877), said:

"Supposing the solar system to have been originally a great revolving nebula of this description condensing to a central sun, and forming from its outer portions smaller masses, such as the planets and their satellites, or the comets and meteorites, we may expect them to consist principally of the more volatile or the lightest elements, with smaller portions of the less volatile or heavier ones. On arranging the elements of which the earth is composed according to the known or presumed density of the vapors it is found that such is actually the case."

Regarding the age of the earth and of the solar system generally, physicists, as represented by Sir Wm. Thomson, Prof. Tait, &c., and geologists, led by Prof. Huxley, are at variance. [GEOLOGY, 1. (3).] Nor is there any agreement as to its probable future duration. [COPERNICAN, KEPLER, PTOLEMAIC, &c.]

**sōl-dēr-ēr**, *s.* [Eng. *solder*, *v.*; *-er*.] One who or a machine which solders.

**sōl-dēr-īng**, *s.* [SOLDER, *v.*] The process of uniting two pieces of the same or of different metals by the interposition of a metal or alloy, which, by fusion, combines with each. In autogenous soldering, the two pieces are directly united by the partial fusion of their contiguous surfaces. In the ordinary process of soldering small articles, the workman places the two metallic surfaces together, and then, with his soldering-iron, which has been previously heated in a furnace, melts off sufficient solder from the stick or cake, allowing it to flow on and between the parts to be joined; the hot iron is then applied to the joint, so as to cause the solder to become uniformly fluid, equalize its distribution, and smooth its exposed surface. The surfaces to be joined must be perfectly cleaned by filing or scraping, and the flow of the melted solder is also assisted by the employment of certain substances as either deoxidizers or fluxes; among these, resin, sal-ammoniac, or muriatic acid are chiefly used. Instead of a soldering-iron, some form of blow-pipe is often employed to heat the solder. Another method sometimes employed to solder small brass articles is to face and clean the two surfaces, rub them with sal-ammoniac or dilute acid, and then squeeze them into contact with a piece of tinfoil between them. When the whole is heated, the two are soldered together by the melted tinfoil.

**soldering-blowpipe**, *s.* A portable gas blow-pipe, which can be attached by a flexible tube to any gas supply. Another flexible tube allows a blast from the mouth to be blown through the center of the gas flame, which can be directed to any part of a water-pipe or other article. **sōl-mī-zā-tion, sol-mī-ŝā-tion, subst.** [Fr. *solmiser*=to sol-fa. (See def.)]

*Music*: The art of singing certain syllables to the notes of the musical scale, as opposed to the use of a vowel sound, such as *a* (*ah*), *e* (*ā*), *i* (*ē*), &c. The earliest known form in use among the Greeks was pronounced probably *ta, tē, tē, tō*. The basis of our present system is to be found in that of Guido d'Arezzo, in the eleventh century, who named his six notes *ut, re, mi, fa, sol, la*, after the initial notes of a Latin hymn. [SCALE.] This system was gradually superseded in this country by the repetition of *fa, sol, la*, for the six notes of the scale, from any starting point, the syllable *mi* being reserved for the leading note only; thus, *fa, sol, la, fa, sol, la, mi, fa*. But where this system was not adopted the name *ut* was gradually rejected in favor of *do* in this country, and *si* was the name given to the seventh degree. We now reach the seven recurring syllables, *do, re, mi, fa, sol, la, si*; but about the middle of the eighteenth century, Boisgelou, a Frenchman, suggested the following chromatic series, *do* (or *ut*), *de, re, ma, mi, fa, fi, sol, fe, la, sa, si*. This idea has been improved and expanded in the Tonic sol-fa system as now used. The use of sol-fa syllables gives to the singer merely a rough notion of tones and semitones; it gives no clue to the mathematical ratios, or "proportion," of notes.

fāte, fāt, fāre, amidst, whāt, fāll, father; wē, wēt, hēre camel, hēr, thēre; pīne, pīt, sīre, sīr, marīne; gō, pōt, or, wōre, wōlf, wōrk, whō, sōn; mūte, cūb, cūre, unite, cūr, rāle, fūll; trŷ, Sŷrian. æ, œ = ē; ey = ā. qu = kw.

**Script. Biography:** The younger son of David and Bathsheba (2 Sam. xii. 24; 1 Chron. iii. 5). He was proclaimed king in opposition to Adonijah by David's orders just before his death (1 Kings i. 5-53). Asking from God "an understanding heart" to qualify him for judging the people, he was made the wisest of men (iii. 5-28, iv. 31, &c.). "He spake three thousand proverbs, and his songs were a thousand and five" (iv. 32); he "spake also of plants and animals" (33), and built the first Temple (vi.). He lived in great magnificence (iv. 22-28, vii. 1-12, x.), and Israel, though too heavily taxed (xii. 10), enjoyed great prosperity under his rule (iv. 20, 21). In his old age he had an extensive harem of Gentile women, by whom he was led into idolatry, and the way was prepared for the disruption of the kingdom, the limits of which were wider than at any previous or subsequent period (iv. 21, xi.) By the received Hebrew chronology, Solomon was born about B. C. 1033. His reign of forty years (xi. 42) extended from B. C. 1015 to 975.

¶ (1) *The Song of Solomon:*

**Old Test. Canon:** Heb. *Shir hashshirim*, Sept. *Asma asmatōn*, Vulg. *Canticum Canticorum*, all = the Song of Songs [CANTICLES], *i. e.*, the song more beautiful or more excellent than all others. It stands in the A. V. and Septuagint between Ecclesiastes and Isaiah, and in the Hebrew Bible between Job and Ruth. The external evidence that it formed part of the Jewish canon is unimpeachable, almost the only point connected with the book about which there has been no controversy. The chief disputes have turned on the method of interpretation. Three views have been entertained: (1) That it should be taken literally as a poetic description of actual occurrences, or, perhaps, of conceptions like those of a modern novel; (2) that it is a spiritual allegory; and (3) (a combination of both views) that it has a literal meaning typifying spiritual truth. The second hypothesis arose in the Jewish Church prior to A. D. 90, for in that year the Sanhedrim decided in its favor. The Talmudists strongly held it, and it has ever since been the prevalent view among the Jews. They believe that the Beloved (ii. 8, 9, 16, &c.) is God, his loved one (ii. 10-13, &c.) the Jewish nation and Church, and the theme of the book his dealings with his people from the time of the Exodus, or even from the call of Abraham, to the coming of the Messiah and the building of the third temple. This explanation soon found its way into the Christian Church, and prevailed till Origen substituted for it the view, now generally received, that the Beloved is Christ and his love the Christian Church. (See the headings in the A. V. to the several chapters.) Theodore of Mopsuestia introduced the typical explanation that the Song primarily celebrated the marriage of Solomon with Pharaoh's daughter (1 Kings iii. 1, ix. 24). This view is still held by many.

The literal view and the uncanonicity of the Song were maintained about the time of our Lord by the School of Shammai, in opposition to that of Hillel, who adopted the allegorical interpretation. It arose again among the Jews about A. D. 1100, and still has supporters. Sebastian Castellio (1515-1563) timidly suggested it in the Reformed Church, and wished the work removed from the Canon. Jacobi (1771), Herder (1778), Ewald (1826), Dr. Pye Smith (1818-21), Dr. Davidson (1856), and many others also took the literal view. Some held that if the work had no spiritual reference it should be deemed uncanonical; others maintained that the

sanctity of virtuous courtship and marriage, as opposed to polygamy and seduction, was a theme worthy of a place in Scripture. Dr. Ginsburg, who holds this opinion, considers that the book, which he divides into five sections, celebrates the fidelity to her lover of a humble village maid betrothed to a shepherd, and her successful resistance to the arts with which King Solomon tried to induce her to enter his harem. He does not believe that it was written by Solomon, but that it was composed just after his age. It is not directly quoted in the New Testament.

¶ *Brahmā Somāj, Brahma Samāj*:

*Compar. Religions*: A Hindu theistic sect, existing chiefly in Bengal. It was founded by a Brahman of high descent, Rammohun Roy. Born about 1774, at the age of sixteen he began to attack the idolatry of modern Hinduism, and continued to do so throughout his life, on the ground that it was not countenanced by the Vedas (q. v.), and translated the Vedant (an old summary of the Vedas) into Hindustanee and Bengalee, publishing in 1861 an extract of it into English. He opposed the burning of widows. [SUTTEE.] In 1820 he sent forth in English, Sanskrit, and Bengalee, a series of extracts from the New Testament, entitled *The Precepts of Jesus, the Guide to Peace and Happiness*. He believed in the divine mission of Christ, but held at the same time the Vedas to be a revelation from God. In 1828 he established the Brahma Somāj, which called into existence as an antagonist to it the Dharma Sabha, to defend Hindu orthodoxy. Sent in 1830 by the Emperor of Delhi to London with the title of Rajah, to prefer a complaint about a financial matter, he arrived in April, 1831, gained what he had come to seek, fraternized with the English Unitarians, and, dying on Sept. 27, 1833, near Bristol, was interred, according to instructions which he had left, without Christian rites, lest the report that he had been converted and lost caste might, by a law then existing in Bengal, deprive his children of their inheritance. Rammohun predicted that after his death Christians, Hindus, and Mohammedans would all claim him. They did; but in his final stage of religious evolution he seems to have held only the doctrines of philosophic theism or natural religion. (*Calcutta Review*, iv. 355-393.) The Brahma Somāj, when deprived of its founder, languished for a time, but in 1841 it received a fresh impulse from Babu Debendra Nath Tagore, and again made way, drawing to it many of the youths educated in the Hindu College and the Missionary Institutions. As numbers increased, it became evident that there were in the Somaj a conservative and a progressive party, and about 1863 the latter broke off from the association on the question of the divine authority of the Vedas, and, under the leadership of Babu Keshub Chunder Sen, founded what they considered churches rather than societies throughout Bengal, the northwestern provinces, the Punjab, Bombay, and Madras. In 1870 Keshub visited England, finding his nearest allies in the Unitarians. Both sections have singing, prayer, and addresses or sermons in their assemblies. The seceding brethren consider themselves to be founding the Indian Church of the future, adopting the essence of the gospel without the distinctive doctrines of Christianity.

sōm-nām'-bu-līsm, subst. [Lat. somnus=sleep; ambulo=to walk, and Eng. suff. -ism.]

Pathol.: Strictly speaking, the act of walking in one's sleep, but used in a wider sense for all the phenomena which take place when a person, apparently insensible to the external objects, acts as if he were in a state of consciousness. The somnambulist not merely dreams like others, but he carries his dream into action. Talking or crying in sleep is a mild form of somnambulism. In the typical cases of somnambulism a person rises from bed, and sets about the duties of the day, or leaving the house by a window, climbs upon the roof unconscious of danger, or, quitting it by the door, proceeds to walk forth along the street or road. Sometimes one intellectually disposed tries a difficult problem which has baffled his efforts during the day, or notes down a fact which he is anxious not to forget. Somnambulism arises from derangement of the nervous system, and may be idiopathic or symptomatic, and is said to be produced by animal magnetism. It sometimes appears to exist along with good health; in most cases there is a tendency to catalepsy, ecstasy, and possibly insanity.

**sō-na'-tā, s.** [Ital., from *sonare* (Lat. *sono*)=to sound.]

*Music*: A term originally applied to any kind of musical composition for instruments, as distinguished from vocal compositions, which were called Cantatas. It is now, however, confined to compositions for solo instruments, generally the piano-forte. The term Sonata or Suonata, as applied to a musical composition, was first used about the beginning of the seventeenth century. Those of that time so called had but one movement; they were in fact simply airs arranged in parts for an instrument or instruments. A modern sonata is generally constructed upon the following plan: The first movement is an allegro, sometimes with an introduction, but more frequently without one; the second, "the slow movement," is set in any time, between adagio and andante; and the final movement is an allegro. [CONCERTO.]

**sōng, s.** [A. S. *sang*, *song*, from *sang*, pa. t. of *singan*=to sing; eogn. with Dut. *zang*; Icel. *sōngr*; Sw. *sång*; Dut. & Ger. *sang*; Goth. *saggws*.]

**I. Literally:**

1. That which is sung or uttered with musical modulations of the voice, whether of a human being or of a bird; a singing.

"The night-warbling bird, that now awake  
Tunes sweetest his love-labor'd song."  
*Milton: P. L.*, v. 41.

2. A short poem to be sung or uttered with musical modulations. A musical setting of a short poem or portion of prose. The word is generally applied to solos, but sometimes also to compositions for two or more voices. The second subject of a sonata is sometimes called the "song."

"This curious piece [a song or catch in praise of the cuckoo], which is thought to be 'the most ancient English song, with (or without) the musical notes, anywhere extant,' is preserved in a manuscript of the Harleian Library."—*Ritson: Ancient Songs*, i. 1.

¶ (1) *An old song*: A mere trifle; an insignificant sum.

(2) *Song of Solomon*: [SOLOMON'S SONG.]

(3) *Song of the Three Holy Children: Apocrypha*: One of the three pieces formerly incorporated with the narrative of Daniel. It constitutes a single chapter, with sixty-eight verses. According to Westcott, "the abruptness of the narrative in Daniel, furnished an occasion for the introduction of the prayer and the hymn" immediately after iii. 23, but the fragment is now placed in

most copies of the Apocrypha between Baruch and the History of Susanna. It opens with a prayer of Azarias from the midst of the fire (1-22), describes the fierceness of the flame (23-27), and concludes with a call from the three confessors to the heavens, the angels, the earth, the winds, the animals, man, the servants of God, and specially themselves, to worship and bless the Lord. The prayer of Azarias seems to have had a different author from the rest of the book. It makes no allusion to the fiery furnace, and while verse 15 tells that the temple with its worship had ceased to exist, verses 31, 32, 62 imply that it had not passed away. Neither the authorship nor the date is known. The *Codex Alexandrinus* places the book as two psalms at the end of the Psalter, calling them "The Prayer of Azarias" and the "Hymn of our Fathers." Other Greek and Latin psalters adopt the same arrangement, and verses 35-66, under the name of the Benedictite, have been used liturgically in the Christian Church from the fourth century till now.

"He [Arion] had a wonderful desire to chaunt a *sonnet* or hymn unto Apollo Pythius."—*P. Holland: Plutarch's Morals*, p. 343.

2. The sonnet proper is a form of verse of Italian origin, and consists of fourteen lines, each of five accents, the whole being divided into two unequal parts—(1) the first of eight lines, (2) the second of six. (1) In the first part there are two four-line stanzas. In each stanza the two middle lines rhyme together, and the two outside lines rhyme together, and the second stanza repeats the same rhymes as the first. (2) The second part consists of two three-line stanzas. The first, second, and third lines in the first stanza rhyme severally with the first, second, and third lines of the second stanza. In the second part of the sonnet great variety prevails. The six lines all rhyme in some way together; but sometimes there are only two rhymes instead of three. Shakespeare's sonnets consist of fourteen lines, each of five accents. The first twelve rhyme alternately; the last two rhyme together.

1. Literally and Greek History: A word used at first as an honorable title, but afterward as a term of reproach.

(1) A master of one's craft; a person distinguished for learning or ability.

"A *Sophist*, in the genuine sense of the word, was a wise man, a clever man, one who stood prominently before the public as distinguished for intellect or talent of some kind. Thus Solon and Pythagoras are both called *Sophists*."—*Grote: Hist. Greece, viii. 480.*

(2) One who demanded payment for philosophical instruction.

"Zeller (*Phil. d. Griech.*, erst. Theil, 1856, p. 750) says that the specific name of *sophist* at first merely designated one who taught philosophy for pay. The philosophy might be good or bad; the characteristic designated by the epithet *sophistical* was its demand of money fees."—*G. H. Lewes: Hist. Philos. (ed. 1880), ii. 109.*

(3) One of a class of men at Athens in the fifth century before Christ, who were the chief public teachers, especially of the art of disputation, which had a special charm for the Greeks. Chief among the Sophists were Protagoras of Abdera, with his scholars Gorgias and Prodicus, and Hippias of Elia. Blomfield (*Encyc. Metrop.*, s. v. *Socrates*) says of them "that the principal merit to which they laid claim was that of communicating to their disciples a ready, off-hand kind of knowledge, which might enable them to talk speciously and fluently upon all subjects whatever, and to impart to them that pernicious skill in dialectics by which they might baffle their adversary, whether right or wrong, and 'make the worse appear the better cause.'" It should be borne in mind that the Sophists are known only from the writings of their antagonists; Grote points out that the hostility supposed to have been entertained by Socrates to the Sophists is Platonic rather than Socratic, and Jowett (*Introd. to Sophist*) and Lewes take a similar view.

"That the Athenians did not consider the *Sophists* as corruptors of youth is unequivocally shown in two facts: they did not impeach the *Sophists*, and they did impeach Socrates. When Anaxagoras the philosopher and Protagoras the *sophist* 'sapped the foundations of morality' by expressing opinions contrary to the religion of Athens, they were banished; but who impeached Gorgias, or Hippias, or Prodicus?"—*G. H. Lewes: Hist. Philos. (ed. 1880), ii. 117.*

A sorites has as many middle terms as there are intermediate propositions between the first and the last; and, consequently, it may be drawn out into as many separate and independent syllogisms. There are two forms, the Aristotelian and the Goclenian.

"In the Goclenian *Sorites* extension is made more prominent by starting with the premise which has the two widest terms; in the common form intension predominates, as the narrower terms precede. The former descends in extension from the predicate of the conclusion; the latter ascends in intension, from the subject. The Goclenian form suits deduction best; the common, or Aristotelian form, induction. The Goclenian descends from law to fact; the common ascends from fact to law.

**II. Technically:**

1. *Philos.*: The Scholastics, following Aristotle, by soul meant the primary principle of life, and held that a plant was endowed with a vegetable soul, that brutes and man had in addition a sensitive soul, while man alone had a rational and immaterial soul. They based their proof of the immateriality of the distinctively human soul on the power of the mind to form abstract ideas.

2. *Script. & Theol.*: The word soul is used chiefly for "that spiritual, reasonable, and immortal substance in man which is the origin of our thoughts,

of our desires, of our reasonings, which distinguishes us from the brute creation, and which bears some resemblance to its Divine Master." (*Cruden.*) All Christians admit the responsibility of the soul to God for the deeds done in the body; and the orthodox view—that of the Anglican, Roman, and Greek Churches, and of the great dissenting bodies—is that at the final judgment the lot of every soul will be irrevocably fixed, and that it will either eternally enjoy the Beatific Vision in heaven or share the endless torments prepared for the devil and his angels. Two other views—both of which have found supporters in the Church from early ages—are coming increasingly to the front: (1) That of the Restorationists, of whom there are two schools: (a) the Dogmatic, who assert, and (b) those, represented by Archdeacon Farrar, who express a hope that all men will be finally saved [**RESTORATIONIST**, **UNIVERSALIST**]; and (2) the Annihilationists or Destructionists, who hold that while the righteous will be forever in a state of bliss, the wicked, after receiving the punishment of their sins, will be blotted out of existence. Origen, with Plato, held the doctrine of the preexistence of souls, which was condemned by a synod at Constantinople in 543. [**TRANSMIGRATION**.] Two distinct views have at different times found supporters in the Christian Church: (1) That the soul is produced by natural generation [**TRADUCIANISM**]; (2) that each soul is separately created by God. [**CREATIONISM**.]

¶ *Soul* is largely used in composition, forming compounds, the meanings of which are in general self-explanatory: as, *soul*-betraying, *soul*-calming, *soul*-cheering, *soul*-deadening, *soul*-destroying, *soul*-entrancing, *soul*-refreshing, *soul*-stirring, *soul*-vexed, &c.

**II. Physics & Physiol.:** Sound is properly considered under a twofold aspect—(1) the effect produced when the brain takes cognizance of sensations excited in the auditory nerve, and (2) a phenomenon actually produced in nature by a sounding body when the particles of that body are in such a state of vibration as to make an impression on normal auditory nerves. This would exist, even if no living being were possessed of a sense of hearing, and some of the effects of sound-waves would still be observable; for instance, the shattering of windows by the impact of sound-waves. When a sonorous body is struck, or an explosion takes place, or a person speaks, a sound wave is propagated by molecular motion, the particles of the air moving forward, each impinging on that immediately before it, and then rebounding, till those which fill the cavity of the ear are finally driven against the tympanic membrane, the vibration of which is transmitted to the auditory nerve, and thence to the brain, which takes cognizance of the sensation. By this alternate movement of advance and rebound the air is alternately condensed and

rarefied, and the length of a sound-wave is measured from condensation to condensation, just as in water the length of a wave is measured from crest to crest. Solids, when they possess elasticity, are better conductors of sounds than gases or liquids. This fact is known experimentally to savages, who place their ears to the ground to detect the approach of an enemy, and has been utilized in medicine in the construction of the stethoscope (q. v.). [For the rate of sound, see ACOUSTICS.] Sound radiates from a sounding body in all directions in straight lines, and diminishes in intensity in inverse proportion to the square of the distance. Sound-waves may be reflected, refracted, and inflected. By reflection they produce echoes [ECHO], by refraction they may be converged on any given spot, and by inflection they bend round solid obstacles. Tyndall (*On Sound*, p. 23) notes a striking instance of their inflection when a powder magazine exploded in 1864. The building was some miles distant from the magazine, yet every window in the church, back and front, was bent inward, the building being, so to speak, clasped by a girdle of intensely compressed air. Sounds are classified as musical sounds and noises, a musical sound depending upon a succession of impulses at a regular rate, the pitch of the note rising with the rapidity; it will also be readily understood how greater rapidity must shorten the sound-wave, the air when rebounding from one compression being more quickly again compressed by the succeeding impulse. The human ear is limited in its range of hearing musical sounds. If the vibrations are less than sixteen per second the separate shocks are perceived, if they exceed 3,800 per second consciousness of sound ceases. [ACOUSTICS.]

*Church Hist. (pl.)*: The followers of Joanna Southcott (1750-1814), who claimed to be descended from an old Hertfordshire family, but whose own circumstances were so poor that she had to become a domestic servant. She had strong religious feelings, and, till about the age of forty, was a member of the Methodist body. In 1792 she professed to receive revelations, which she published in 1801-3. These were partly in prose, but chiefly in doggerel. From that time to her death the number of believers in her pretensions largely increased. These were by no means confined to the uneducated classes, and they made such provision for her as enabled her to live in considerable style. In return for their offerings her followers received "seals"—papers which purported to number them with the mystical "hundred and forty and four thousand" of the Apocalypse (vii. 4). In 1813 Joanna announced that she was about to become a mother, that the child would be miraculously conceived, and would be the Shiloh (Gen. xlix. 10) in whom the Millennium was to be established. She died Dec. 27, 1814, and on her tombstone, in Marylebone Churchyard, is an inscription foretelling her re-appearance. Shortly before her death, the Rev. J. T. Foley, Rector of Old Swinford, on her behalf, announced to her followers that she had received a heavenly command that they were not to assemble for worship till after the birth of Shiloh, but to attend Protestant churches. In 1825, Charles William Twort pretended to be the Shiloh, and another impostor, George Turner (whose followers were called Turnerites), arose about the same time. The last leader of the Southcottians was John Wroe, of Bowling, near Bradford. He claimed prophetic gifts, and taught that the Second Advent was at hand. His adherents, who are called Christian Israelites, are much stronger in Australia (where Wroe died in 1863) than elsewhere.

I. *Ordinary Language*:

1. Extension, considered independently of anything which it may contain; extension considered in its own nature without regard to anything external; room.

2. Any quantity or portion of extension; the interval between any two or more objects.

"Apart, some little *space*, was made

The grave where Francis must be laid."

*Wordsworth*: *White Doe*, vi.

3. Quantity of time; duration; the interval between two points of time.

\*4. A short time; a while. (*Spenser*.)

II. *Technically*:

1. *Geom.*: The room in which an object, actual or imaginary, exists. All material objects possess length, breadth, and thickness; in other words, they exist in space of three dimensions. Plane surfaces have only two dimensions—length and breadth, and straight lines but one dimension—length. Hence we have notions of space of one dimension and of two dimensions, as distinguished from the three-dimensional space in which we live. The question has arisen, and has been warmly discussed, as to whether space of four, and perhaps of higher dimensions exists. *Zöllner* (*Transcendental Physics*) believes that it does, and that some persons have some of the powers of beings living in space of four dimensions, and thus accounts for many of the phenomena of Spiritualism. For example, while a being living in space of two dimensions could only get in or out of a square by passing through one of its sides, a human being could enter the square from above; so, he argues, a person having the properties of a four-dimensional being could enter or leave a closed box or room on its fourth-dimensional side. (See *Abbott*: *Flat Land*, and *Hinton*: *What is the Fourth Dimension?*)

2. *Metaphysics*: A conjugate of material existence. Empirical philosophers maintain that notions of space are derived from our knowledge of existence; transcendentalists that these notions are innate. [TIME.]

3. *Music*: One of the four intervals between the five lines of a staff. They take their names from the notes which occupy them; thus, the spaces of the treble staff, counting upward, are F, A, C, and E, and of the bass, A, C, E, and G.

4. *Physics*: The room in which the Cosmos or universe exists.

"As to the infinity of physical *space*, or the infinity of actual material existence, all that we can say is, that however far we advance (and we have advanced a great deal) in the power of discerning distant objects, we have uniformly found new objects to discern, and we have, therefore, good analogical reason for supposing that no limit can be assigned to their still further existence. This view of what is commonly called the infinity of *space* is further supported by the fact that metaphysical *space* as a conjugate of material existence in no way precludes the possibility of its infinite extension."—*Brande & Cox*.

5. *Printing*:

(1) The interval between words in printed matter.

(2) A thin piece of type-metal, shorter than a type, and used to separate the letters in a word or words in a line, so as to justify the line.

The coat should be wavy and thick, and the color black and white, pure black, liver and white, or red and white. The Springer is heavier, slower, and more easily kept within range than the Cocker. The Clumber, the Sussex, and the Norfolk Spaniel are breeds of Springers. The Clumber is a low, strong-limbed dog, never giving tongue, highly valued for battue-shooting. Color, lemon and white, or yellow and white; coat thick, legs well feathered, feet round; head square and heavy, muzzle broad, ears long. The Sussex Spaniel is lighter in shape and richer in color than the Clumber, and gives tongue freely.

They are excellent water-dogs and extremely faithful and affectionate. They run into several strains.

They were the special pets of Charles II. The Blenheim is white, with patches of red or yellow. Both should have a short muzzle, round head, full prominent eyes, ears close to the head and fringed with long silky hair, and hairs growing from the toes and reaching beyond the claws.

*Ornith.*: *Passer domesticus* (*Pyrgita domestica*, Cuvier), the House Sparrow, a well-known bird, the constant follower of civilized man. It ranges over Europe, into the north of Africa and Asia, and has been introduced into America and Australia. Sparrows are found even in crowded cities and in manufacturing towns, these differing only from country birds in being dirtier, and, if possible, more daring. Mantle of male brown striped with black; head bluish-gray; two narrow bands, one white and the other rusty-yellow, on wings; cheeks grayish-white, front of neck black, under-parts light-gray. From a high antiquity, their great fecundity, their attachment to their young, their extreme pugnacity, and the large tolls they levy on the farmer and market-gardener have been commented on by writers on ornithology, but opinions have long been divided on the subject of their alleged service to man in destroying insect pests. Farmers have, however, settled the question to their own satisfaction, and in many places a small sum is paid for the destruction of these birds, the legislatures of some of the states having made appropriations for this fund. Mr. J. H. Gurney in *The House Sparrow* (published 1885) conclusively shows, from a number of dissections, that the sparrow's food, to the amount of seventy-five per cent., consists of grain, and only ten per cent. of insects. Dr. Coues (*The English Sparrow in America*, 1885), says that these birds, introduced to keep down insect life, "have proved a failure, and are now generally regarded as a distinct curse." The name sparrow is also loosely applied to several of the Fringillidæ. [HEDGE-SPARROW, REED-SPARROW, TREE-SPARROW.]

sparrow-bill, s. [SPARABLE.]

sparrow-hawk, s.

*Ornithology*: *Accipiter nisus*, extending across Europe, through Asia to Japan. The adult male is about twelve inches long, dark-brown on the upper surface, softening into gray as the bird grows old; the entire under-surface is rusty-brown, with bands of a darker shade. The female is about fifteen inches long, the upper surface nearly resembling that of male bird in ground-color, but having many of the feathers white at the base; under surface grayish-white, with dark transverse bars. The Sparrow-hawk is very destructive to small quadrupeds and young birds. The hen lays four or five eggs irregularly blotched with brownish-crimson on a bluish-white ground. The name is also applied to the American falcon, the Australian collared sparrow-hawk, the European kestrel, and the New Zealand quail-hawk.

Animals of low organization are less specialized than those higher in the scale of being, and are older in geological date. Many causes have contributed to this end, one of the most potent being natural selection.

**spĕ'-ciĕ** (c as sh), s. [A pseudo sing. from *species* = money paid by tale, by confusion with Latin *specie*, abl. sing. of *species*, as, paid in *specie* = in visible coin.] Gold, silver, &c., coined and circulated as a medium of commerce and exchange; hard money, coin; in contradistinction to paper-money, as bank-notes, bills, &c.

**spĕ'-ciĕs** (c as sh), s. [Lat. = a look, appearance, kind, sort, from *specio* = to look, to see; Sp. & Port. *especie*; Ital. *specie*, *specie*.]

**I. Ordinary Language:**

"Rome possessed a much greater proportion of the circulating *species* of its time than any European city."—*Arbuthnot: On Coins*.

**II. Technically:**

1. *Biology:* A somewhat ambiguous term used to denote a limited group of organisms, resembling each other, and capable of reproducing similar organisms, animal or vegetable, as the case may be. A species is defined by Haeckel (*Gen. Morphologie*, ii. 359) as "the sum of all cycles of reproduction which, under similar conditions of existence, exhibit similar forms." Linnaeus held that all species were the direct descendants from and had the characters of primevally created forms (*Totidem numeramus species quot in principio formæ sunt creatæ*), and in this he was followed by those who accepted the first chapter of Genesis in a strictly literal sense. Buffon and Cuvier, leaving the question of origin on one side, held the distinguishing marks of a species to be similarity and capability of reproduction. But besides varieties and races in various species of animals and plants, dimorphism, and in others trimorphism, exists, so that close similarity cannot be taken as a criterion, and the value attached to external resemblances varies in the case of different observers. At a later date was added the physiological definition that all the individuals of every species were capable of producing fertile offspring, by intercrossing, whereas sexual intercourse between different species produced only sterile offspring or was actually infertile; and, although subject to exceptions, this

definition is generally true. The descent of any given series of individuals from a single pair, or from pairs exactly similar to each other, is in no case capable of proof. Darwin, in his *Origin of Species*, says: "I look at the term species as one arbitrarily given for the sake of convenience to a set of individuals closely resembling each other, and that it does not essentially differ from the term variety, which is given to less distinct and more fluctuating forms" (ch. ii.). [DARWINISM.] That book popularized in England the idea of the mutability of species, the chief factor in which Darwin believed to be Natural Selection, though he afterward modified his views to some extent as to its importance. The latest theory of the origin of species is that of Physiological Selection, propounded by Mr. W. G. J. Romanes, F. R. S., who holds that many species have arisen on account of variations in the reproductive system, leading to some infertility with parent forms—mutual sterility being thus regarded as one of the conditions, and not as one of the consequences of specific differentiation. (*Journal Linn. Soc., Zool.*, July, 1886; see also Oscar Schmidt: *Doctrine of Descent*, ch. v.)

2. *Civil Law:* The form or shape given to materials; form, figure.

3. *Logic:* A predicable that expresses the whole essence of its subject in so far as any common term can express it. The names *species* and *genus* are merely relative, and the same common term may, in one case, be the species which is predicated of an individual, and in another case the individual of which a species is predicated. Thus, the individual, George, belongs to the logical species man, while man is an individual of the logical species animal. [SPECIFIC-DIFFERENCE.]

"The name of a *species* is a more extensive [*i. e.* comprehensive] but less full and complete term than that of an individual . . . since the *species* may be predicated of each of these."—*Whately: Logic*, bk. ii., ch. v., § 3.

"*Specific difference* is that primary attribute which distinguishes each *species* from one another, while they stand ranked under the same general nature or genus. **specific-legacy, s.**

*Law:* A bequest of a particular thing, as of a particular piece of furniture, specified and distinguished from all others.

**specific-name, s.**

*Nat. Science:* The scientific name by which one species is distinguished from another. Linnæus introduced the binomial system of nomenclature, in which the first word is the generic, and the second the specific name. Thus the lion and the wild cat both belong to the genus *Felis*, but the specific name of the first is *leo*, and of the second *catus*; the potato and the egg-plant both belong to the genus *Solanum*, but the specific name of the first is *tuberosum*, and of the second *esculentum*. In the trinomial system, sometimes adopted owing to the difficulty of distinguishing between varieties and species, the second name is specific and the third varietal; as, *Sciurus* (indicating the genus) *caniceps* (the species) *pygerythrus* (the variety).

4. (*Pl.*): A familiar and invaluable optical instrument used to assist or correct defects of vision. They are frequently also called *eye-glasses*, though properly this term is applied to spectacles which are merely fixed on the nose. *Spectacles* consist of two oval or circular lenses mounted in a light metal frame, composed of the bows, bridge, and sides or temples. The frame is so constructed as to rest on and adhere to the nose and temples, and keep the lenses in their proper position. *Short sight* is the habitual accommodation of the eyes for a distance less than that of ordinary vision, so that persons affected in this way only see very near objects distinctly. Its usual cause is a too great convexity of the cornea or of the crystalline lens; the eye being too convergent, the focus, in place of forming on the retina, is formed in front, so that the image is indistinct. It may be remedied by means of diverging glasses, which, in making the rays deviate from their common axis, throw the focus farther back, and cause the image to be formed on the retina. *Long sight* is the contrary of short sight; the eye can see distant objects very well, but cannot distinguish those which are very near. The eye is not sufficiently convergent, and hence the image of objects is formed beyond the retina; but if the objects are removed farther off, the image approaches the retina, and when they are at a suitable distance is exactly formed upon it, so that the objects are clearly seen. Long sight is corrected by means of converging lenses. These glasses bring the rays together before their entrance into the eye, and therefore, if the converging power is properly chosen, the image will be formed exactly on the retina. Generally speaking, numbers are engraved on these glasses, which express their focal length in inches. The spectacles must be so chosen that they are close to the eye, and that they make the distance of distinct vision ten or twelve inches. (*Ganot*.)

*Astigmatic* vision is a defect of the eyes in which the focus of the crystalline lens is different in different azimuths. Thus, if vision is directed to a figure, as in the margin, in strong black lines and on a larger scale, some of the lines may be seen sharply defined, while others are blurred. These defects can be remedied by spectacles in which the focus differs in different azimuths, and extreme cases have been known in which cylindrical lenses (*i. e.*, lenses with no focus at all in one direction, but a strong focus in some other—a segment of a cylinder instead of a sphere) have been required. Astigmatism more than any other defect requires thorough study by an oculist, as the focus of the eyes is apt to be normal in some directions, and this masks it, while yet the vain effort to define the object in all parts causes constant distress and pain. There are also tinted, gray, or smoke-gray spectacles to protect sensitive eyes from too much light. Mere weakness of the eyes is not benefited by spectacles, unless by the protective kind. Wire-gauze spectacles are used to exclude dust and

It has been applied to a micrometer or other apparatus applied to the eyepiece of a spectroscope for measuring the position of the lines. But it is now very generally used as a substitute for spectroscopy, the word being applied to that better class of instruments which are fitted up for measuring and determining with great exactness the position of the lines in the spectra examined, and the qualities of prisms as regards refractive and dispersive power.

spěc'-trō-scōpe, subst. [Lat. *spectrum*, and Gr. *skopeō* = to see.]

*Optics*: An instrument for observing spectra, or for spectrum analysis. With a single glass prism, the few most prominent lines in a solar spectrum may be seen, by using a narrow slit to admit the light, which was the first great improvement made upon Newton's experiment, since a hole or wide slit gives confusion of effect. The second great improvement was to place a collimating lens behind the slit at its focal distance, whereby all the rays from the slit become a parallel bundle before passing through the prism. Finally, a small telescope was mounted behind the prism, to magnify and define the image thus obtained. The whole arranged on a table, with means of adjusting the collimating and eye-tubes at the proper angles with the prism, forms the ordinary single-prism Spectroscope. Further prisms may be added to increase the dispersion, and as many as eleven have been used, but it is more usual to employ half the total number, and having sent the rays once through their lower portion, to reflect them back again through the upper ends, thus using each prism twice. Arrangements are often added for throwing the image of a micrometer scale upon the spectrum [SPECTROMETER], or a reflecting prism may be placed over half of the slit to reflect the solar spectrum into the instrument for comparison with the one under observation. It is in this way that spectra are compared with the solar lines, which are carefully mapped,

and form the standard of reference. By combining prisms of different refractive and dispersive powers, a strong spectrum may be obtained without deflection. Such prisms may be contained in quite a small tube with slit and lens, and are called Direct-vision Spectroscopes, which are much used for microscopic observation. Instruments specially fitted for the purpose are called Star Spectroscopes, and there are also special Sun Spectroscopes, such being necessarily different in practical details from ordinary or Chemical Spectroscopes. Of late years, it has become very usual to employ the spectra from diffraction-gratings instead of prisms. The higher-order spectra thus produced are very pure, and have the advantage of giving the lines in the true position due to their relative wave-lengths alone, while prisms compress some groups of lines, and extend others, according to the peculiar dispersion of the glass. Spectroscopes thus constructed are called Grating Spectroscopes.

\*1. *Ord. Lang.*: A specter.

2. *Optics*: The colored image or images produced when the rays from any source of light are decomposed or dispersed by refraction through a prism. It has been proved that whiteness is simply a totality of effect produced by the simultaneous effects of many colors falling at once upon the retina. It has been shown [REFRACTION] how a beam of light is deflected on meeting at any inclination the surface of a denser medium, and it is obvious that by using a prism with two inclined surfaces, the beam may be permanently deflected. It is found that each different color, representing a different length of wave, is differently refracted by the prism, or has its own special index of refraction; hence, the prism separates or spreads out, in order, according to their refrangibility, all the different colors of which the beam is composed. This appearance is the Spectrum of that particular light. Solids or liquids heated to incandescence—as the particles of soot in a candle-flame—always yield an unbroken band of colors shading into one another; this is called a continuous spectrum. Incandescent gases generally yield lines or bands only, and this is a line or banded spectrum. When portions of what would have been a continuous spectrum are intercepted or cut out by an intervening medium, this is called an absorption spectrum. Besides the waves of such a length as cause visual effects, there are many more beyond the red at one end of the spectrum and the violet at the other, which produce powerful chemical and heating effects. This portion is sometimes called the Invisible Spectrum, sometimes described as the Ultra-red or Ultra-violet spectrum. Its length greatly exceeds that of the visible spectrum, and it is found to comprise lines and bands precisely analogous to those occurring in the luminous portion. [SPECTRUM-ANALYSIS.]

spectrum-analysis, s.

*Physics and Chemistry*: The determination of the chemical composition, the physical condition, or both, of any body by the Spectrum (q. v.) of the light which it emits or suffers to pass through it, under certain conditions. For such determinations an instrument is used called the Spectroscope (q. v.), which employs the light passing through a very narrow slit, and, by using more prisms than one, disperses or separates the colors a great deal more than one prism alone can do. The human eye is totally unable to judge of the real component colors of any light presented to it; not only does a mixture of all colors appear white, but so do many simple pairs of colors; and, similarly, two apparently similar shades of color, may be quite differently constituted, the one being perhaps a pure color, while the other is really a compound. The prism never errs, but rigidly sorts out any light presented to it under all the separate wave-lengths

of which it is composed, each one having its own invariable place in the spectrum of a beam of ideal white light.

A vast mass of commercial spectrum analysis consists of the study of simple absorption spectra. Most of the color we see around us is really of the nature of a shadow; the colored body absorbs among its molecules many of the constituent rays of the white light which falls upon it, and the color we see consists of the remainder. It is the same with colored transparent bodies; a red glass does not turn all the light into red, but simply stops or absorbs all the rays except those which make up the red. This is shown by spectrum analysis of the light which has passed through any such body, or been reflected from it; various dark bands are cut out of the white-light spectrum. If glass cells are filled with various colored fluids, and interposed between the slit of the spectroscopy and some source of light which gives a complete continuous spectrum, the various bands cut out are observed. These bands are invariable for the same substance, in the same state—i. e., of dilution or otherwise—and hence we have an analysis which is very powerful as regards adulteration. Thus, an alcoholic solution with a decoction of logwood, &c., can be made up so as to precisely imitate to the eye the color of port wine. But the spectroscopy cannot be so cheated; the spectrum of port wine cannot be imitated by anything else; though the visual total may appear the same, the prism will sort out the imitation with different constituents. It has been found that up to a certain age even the year of the vintage can be thus determined. So, again, healthy blood gives a quite different absorption spectrum from blood poisoned by carbonic oxide. The prism is thus used daily to test the validity of many commercial products. It should be observed that numerous apparently clear and colorless substances show very strong absorption bands, e. g., solutions of didymium.

Analysis of the rays emitted by luminous bodies throws light upon both their chemical constitution and physical condition. A solid or liquid substance heated to a high temperature gives a continuous spectrum. [SPECTRUM.] It first becomes red, representing the slowest vibrations as taken up by its molecules. Gradually the yellow, green, and, finally, blue rays are added as quicker and more energetic vibrations are imparted, till it becomes a white or even bluish color, but the spectrum is always continuous so far as it goes. Therefore a continuous spectrum is presumptive proof of the body being in a solid or liquid state. On the other hand, every substance heated sufficiently to become luminous, as gas or vapor, when at a low pressure, gives a spectrum of bright lines or bands only. It is this localization which causes the color of the flame; and the spectrum of each of the known elements is so well recognized, that new lines are proofs of the presence of some unknown chemical element, several of which have been discovered in this manner. Thus the spectrum of the vapor of a substance, when ignited in the electric arc or in a vacuum tube, is another searching method of chemical analysis. It is found, however, that as the density is increased the lines in the spectrum of a luminous gas are widened or thickened. Gradually these widened bands approach each other, until, at a great pressure, the spectrum becomes continuous. This is intelligible on the hypothesis that in rarified gases the molecules are free to give their own peculiar periods of vibration, but that as they are crowded together they are hampered, and the vibrations and encounters modified into other periods, until at last the complex vibrations of a solid are produced, and give the complete or continuous spectrum. Thus the nature of the spectrum—say of a gaseous nebula—gives us information not only of the composition, but of the physical condition of the gas.

Another wide department of research was opened by the study of the spectrum of the sun. To Newton this appeared continuous; but when it was made pure by more dispersion and the use of a slit, it was found to be crossed by countless dark lines, thousands of which have been mapped. On the face of it, these appeared to show absorption of some kind; while the foundation or continuous spectrum must be due to either incandescent solid, liquid, or at least very dense gaseous matter. It was soon discovered that two of the most distinct dark lines (called D lines) across the yellow portion were exactly coincident with the two bright yellow lines given by incandescent sodium vapor; and Prof. Stokes, in 1852, pointed out the probable cause of this, in the molecules taking up or absorbing all vibrations of their own peculiar period which reach them, just as a tuning-fork will respond to its own note sung to it. Kirchhoff verified this, proving experimentally that sodium flame interposed before the slit of a bright solar spectrum, darkened the D lines. Most of the other dark lines of the solar spectrum were afterward identified with the bright lines of the vapors of various

elements; and thus was proved the fact that the incandescent photosphere of the sun is surrounded by a highly-heated, but still by comparison cooler, atmosphere containing hydrogen, sodium, iron, and many other substances. Subsequently, by suitable arrangements, the bright lines of this external atmosphere were obtained at the edge of the sun's disc. The chemistry and condition of the stars were rapidly studied in the same way, with the result of discovering very interesting resemblances, and in many cases still more interesting and marked differences between their condition and that of the sun. In this way, for instance, when a great increase in the brilliancy of the variable star Tau Coronæ was observed in May, 1886, the spectroscopy showed its usual absorption spectrum to be crossed by a few bright lines, and thus the phenomenon was clearly traced to some almost inconceivable outburst of glowing hydrogen, as was also the "new star" which appeared in Cygnus in 1876. In another star there is an abundant quantity of the metal tellurium, which cannot be traced in our sun, and is only present in exceedingly small quantities in our earth.

Still further; the apparent color or wave-length of any given ray apparently depends simply upon the rate at which the ethereal waves beat upon the retina. If the source of light be approaching rapidly enough, this rate will obviously be increased, the effect of which will be to make that ray of apparently higher refrangibility, or nearer a blue color. In sound we get exactly the same effect, if a whistle sounds while two trains are approaching; the pitch rises till the whistle is opposite a hearer in the other train, and then as rapidly falls as it recedes. Now it is found that well-known groups of lines are thus shifted in the case of certain stars; and thus it is absolutely determined that they are approaching or receding from the solar system at the rate of so many miles per second. In exactly the same way the speed of up-rushes and down-rushes of the glowing hydrogen during solar storms has been determined.

Spectrum analysis has finally led to a theory or speculation of capital importance, concerning the so-called "elements." The spectra of compounds are as characteristic as those of what are called elements; but as the temperature of the luminous vapor is increased, this spectrum breaks up, as it were, into the lines of the elements themselves. Where the vapor is known to be "dissociated," as it is termed, at a certain temperature, there is simultaneously a marked and sudden change in its spectrum. Now it is found that even at temperatures produced in our laboratories the spectra of the so-called elements themselves go through analogous changes as the temperature is raised, giving apparently similar reason to believe that they then break up into still simpler elements. In the far greater heat of the sun's chromosphere there is much more evidence of this process going on, and there is one strong line in particular which has never been identified with any element known on earth. It further appears, that unless we are to suppose an amount of impurity hardly possible, different elements are capable at certain high temperatures of giving rise to certain coincident lines; and from these and other collated facts, such as an ascertained relation between the atomic weight of an element and the position of its lines in the spectrum, it is now held to be probable that the so-called elements are themselves compounds, which at a certain temperature are broken up into much fewer elements, or possibly into one. This conclusion is one of the latest results of spectrum analysis.
