1. *Chem.*: Symbol, Ni; atomic weight, 58.7. A tetrad-metallic element, discovered by Cronstedt in 1751, in combination with arsenic, in the copper-colored mineral arsenide of nickel; called by the miners *kupfernīckel*. Its preparation is effected in various ways, the methods involving first the separation of the arsenic, copper, &c., with hydric sulphide, and that of cobalt by chloride of lime or nitrite of potash. The solution of pure nickel is precipitated by potash, and the dry oxide mixed with oil or charcoal and exposed in a crucible to the heat of a blast-furnace, whereby the metal is obtained as a fused mass. Nickel is silver-white, malleable and ductile, and as infusible as iron. Specific gravity, 8.28-8.66. It is magnetic at ordinary temperatures and dissolves in dilute sulphuric, nitric, and hydrochloric acids. Nickel forms several alloys, the most important being known as German-silver. It forms two oxides: Nickel protoxide, NiO, formed by exposing nitrate of nickel to continued ignition; it is a grayish-green non-magnetic powder, which does not absorb oxygen from the air; Nickel sesquioxide, Ni<sub>2</sub>O<sub>3</sub>, formed by exposing nitrate of nickel to a moderate heat; it is a black powder, which dissolves in acids with evolution of oxygen and formation of nickel salts. These are mostly emerald-green in the hydrated state, turning yellow when heated.

*Chem.*: Nico-tannic acid; a substance observed in tobacco leaves. It is obtained as a friable mass, slightly soluble in ether, easily soluble in alcohol and water, strikes a green color with ferric salts, and yields canary-yellow precipitates with oxide of lead, lime, and baryta. It instantly reduces oxide of silver and permanganates like ordinary tannin, but does not precipitate gelatin or the alkaloids.

**Nicol's prism, s.**

**Optics:** An instrument for polarizing light. It is formed from a rhombohedron of Iceland spar, thrice as long as its diameter, which is bisected in the plane which passes through the obtuse angle. The new faces being polished, the two halves are again united by Canada balsam. When a luminous ray enters the prism the ordinary ray undergoes total reflection at the layer of balsam, and is reflected out of the crystal, while the extraordinary one is alone polarized. It is thus a most valuable polarizer. Modifications of this prism have been made by Foucault, who substitutes for the balsam a layer of air; by Prazmowski, who cuts the spar differently, and cements the two halves together with linseed-oil; by Dr. Steeg, Mr. Glazebrook, Professor Thompson, Dr. Feussner, and others.

**Nic-ō-lā'-ī-tāne, Nic-ō-lā'-ī-tan, a. & s.** [Gr. *Nikolaítai*; Lat. *Nicolaitæ*; remote etym. doubtful. (See def. B.)]

"It may be concluded that the Nicolaitane doctrine was a doctrine of general libertinism in religious rites, passing quickly into a doctrine of general libertinism, defending itself under a show of fanaticism, and attaching itself to other heresies."—*Blunt: Dict. Sects and Heresies*, p. 373.

**B. As substantive:**

**Church Hist. (pl.):** An heretical sect mentioned in the Revelation (ii. 6, 14), and there charged with disregarding the injunction laid by Peter, James, and Paul upon the Gentile converts (Acts xv. 20). In all probability the impurity forbidden was looked upon as an act of religious worship, such as in early Jewish times had been borrowed from pagan nations (2 Kings xxiii., 6, 7; 2 Chron. xxi. 11; cf. Baruch iv. 43), notably from the Babylonians, whose worship of Mylitta is described by Herodotus (i. 199). Hosea (iv. 12-14) trenchantly denounces such practices. The Nicolaitanes are said to have been founded by Nicolas the Deacon, but the evidence is not convincing.

**Chem.:** C<sub>10</sub>H<sub>14</sub>N<sub>2</sub>. An acrid poisonous alkaloid found in tobacco leaves to the extent of from 1 to 5 per cent. It may be prepared by passing a current of steam through a mixture of lime and powdered tobacco, neutralizing the liquid which comes over with sulphuric acid, adding ammonia to liberate the nicotine, and dissolving the latter in ether. The ethereal solution yields almost pure nicotine. It is a colorless transparent oil, which boils at 250°, and does not freeze at -10°. Specific gravity, 1.027 at 15°. It has a strongly alkaline re-action, and turns the plane of polarization to the left. Soluble in water, alcohol, ether, and the fat oils, and its characteristic re-action is the formation of a kermes-brown precipitate with tincture of iodine. Nicotine forms

numerous salts. The sulphate (C<sub>10</sub>H<sub>14</sub>N<sub>2</sub>)<sub>2</sub>H<sub>2</sub>SO<sub>4</sub> is uncrystallizable, but the chloride, C<sub>10</sub>H<sub>14</sub>N<sub>2</sub>HCl, may be obtained in crystals by passing hydrochloric acid gas into nicotine under vacuo.

The lines of a design are cut in a piece of gold or silver; it is then covered with a black composition consisting of copper, silver, lead, and sulphur, and a little borax is sprinkled over it by subjecting it to heat over a fire, the composition becomes liquid and runs into the lines of the design; the whole is then allowed to cool, when the surface of the metal is scraped and burnished, leaving the drawing in black upon the metal. The art is still practiced as a mode of ornamenting ware, but its principal use is for door-plates, plates for shop fronts, &c., in which the brass or zinc plates are engraved and the depressions filled with wax. The term is also applied to impressions in a viscid water-ink on paper from metal-plate engravings taken by the early fathers of copperplate printing for testing the state of their work.

**II. Technically:**

1. *Hist. & Polit.*: A term used in Western Europe to designate the Russian Socialist movement, which began about 1870, and may be divided into two distinct periods: (1) "The going among the peasants." A number of young men and young women of the upper classes voluntarily went to work in the fields and the factories so as personally to carry on a Socialist propaganda and distribute Socialist literature. Their organs were the *Yperiod* (*Forward!*) of London and the *Workman* of Geneva. This lasted about six years, during which time there were twenty-three political trials of 417 persons, half of whom were condemned to exile in Siberia or to hard labor in the mines. (2) In 1878 the struggle with the government commenced. At a congress held at Lipetz, shortly after Solovieff's attempt on the life of Alexander II, the acquisition of political freedom was declared to be the first necessity. It was hoped to gain this by the formation of a legislative body, elected by the people, with guarantees for electoral independence, and liberty to agitate for reforms. This was demanded from Alexander III, shortly after the assassination of his predecessor as the price of cessation from violence. The Nihilist programme is an agrarian socialism based on communal property. The discoveries of the police show that Nihilism is widely spread in Russia, not only among the working, but among the well-to-do, classes, and even in the army, especially in St. Petersburg, and in many of the principal cities and towns.

It was condemned at the Council of Lateran in 1179.

2. *Hist. & Polit.* (*pl.*): A name given in western Europe to the adherents of the Russian Socialist movement. In this sense the name is unknown in Russia. It was first applied by Ivan Tourgeneff to the hero of his novel *Fathers and Sons*, who was intended to be the personification of a movement in Russia, about 1860, for the emancipation of women, the independence of children, and the spread of natural religion.

1. *Art*: A term applied, especially in sacred art, to a halo or glory surrounding the head in representations of divine or sacred personages. The nimbus is of pagan origin, and was probably derived from the Romans, who ornamented the statues of their divinities and emperors with radiated crowns. The aureola, with which the nimbus is frequently confounded, envelops the whole body, while the nimbus is limited to the head. Nimbi are properly depicted in gold, but sometimes in stained windows they appear of various colors. The nimbus of God the Father is generally represented of a triangular shape, with rays diverging from it in all directions; that of Christ contains a cross, more or less enriched; that of the Virgin Mary a circlet of small stars; those of angels, a circle of small rays, surrounded by another circle of quatrefoils, like roses, interspersed with pearls. When the nimbus is depicted of a square form, it indicates that the person was living when delineated, and is affixed as a mark of honor and respect. As an attribute of power, the nimbus is often seen attached to the heads of evil spirits. In many illuminated books of the ninth and following centuries, Satan wears a crown.

\*I. *Ordinary Language*:

1. A name, a title, a designation.

"There wanteth a term or *nomenclature* for it."—*Bacon: Natural History*.

2. A vocabulary, a dictionary, a glossary.

II. *Science*: The names taken collectively of the objects of study in any branch of science. Sometimes it includes, but far more generally it is distinguished from, terminology. In botany, for example, the names assigned to the several classes, orders, tribes, genera, species, &c., are its nomenclature; the definition of the various words, whether substantives or adjectives, used in describing a plant, belong to terminology. The designation, *Rosa canina* (Dog-rose), falls under the department of nomenclature; nectary, diœcious, &c., under that of terminology. In 1842 the subject of scientific nomenclature was investigated and reported on by a Committee of the British Association.

1. *Biol.*: The practice of using two names—one generic, the other specific; it originated with Linnæus. [2, 6.]

2. *Bot.*: Linnæus laid down thirty-one rules for the guidance of botanists in nomenclature; some of these have fallen into disuse. [¶ 1.] Orders generally end in *-aceæ*, tribes in *-eæ*, and their subdivisions in *-idæ*. Botanical assemblages with the last-named ending are called, in this work, families; though family in botany is sometimes made synonymous with order. This brings them into harmony with zoological families in *-idæ*, to which they are apparently equivalent.

3. *Chem.*: The spoken language of chemistry, which at every period of its history reflects the stage of its development. The early belief that the heavenly bodies determined the character of terrestrial matter led to the use of such names as *sol*=gold, *luna*=silver, and mercury, the name by which the metal is still known. Later, the physical character of the substance gave rise to the name of the compound, as in milk of lime, sugar of lead. But the present system is, with some minor variations, the work of Lavoisier, Berthollet, and Morveau, and appeared in 1787. The leading principle is that the names of compound bodies should express the simple substances they contain, and their relative proportions. Generally the root-word is employed, together with certain terminations and prefixes to indicate the degree of oxidation and the number of atoms of the elements contained in it—*e. g.*,  $\text{KNO}_3$ =potassic nitrate,  $\text{KNO}_2$ =potassic nitrite,  $\text{HNO}_3$ =nitric acid,  $\text{HNO}_2$ =nitrous acid. The following compound shows the manner in which the numeral

prefixes are employed:  $\text{Hg}_4 \begin{matrix} \text{Cl}_2 \\ \text{O}_2 \\ \text{N}_2 \end{matrix}$  = tetra-mercurio-tetra-hydric-dioxi-dichloro-dinitride. The above rule does not apply strictly to organic substances, where regard is had to the history of the groups forming the compound.

4. *Geol.*: For the names given to the geological formations, as Silurian, Devonian, Oolite, &c. (see Geology). The system adopted has many merits, but in one direction it tends to generate error. When a stratum is called chalk, one naturally expects it to be white and calcareous; it may be neither the one nor the other. When another is called greensand, the mind expects it to be characterized by grains of sand of green color; it may be quite different. Such words, used of the spots where the several strata were first identified, are appropriate; but, being founded on local peculiarities, become quite inaccurate when applied to other, and specially to distant regions. Used of the world at large, they are simply chronological, and have no reference to the appearance of particular rocks.

5. *Min., Petrol., & Palæont.*: Linnæus carried his system of two Latin names through the mineral no less than the animal kingdom. Thus, he had his *Schistus tabularis*, *S. atratus*, &c. These are now exchanged for the vernacular terms. Minerals are now generally made to end in *-ite*, which Dana alters for rocks to *-yte*. Genera of fossils often end in *-ites*, as Belemnites, anglicized Belemnite.

6. *Zool.*: In the days of Swainson and the other adherents of the quinary system, conformity of system in the nomenclature was greatly insisted upon. Every tribe ended in *-es*, every family in *-idæ*, and every sub-family in *-inæ*. Of late, the system has been departed from, and the great aid which it rendered to the memory in consequence sacrificed. With regard to vernacular names, they vary in different parts of the country, and often

bōll, bōy; pōut, jōwī; cat, çell, chorus, çhin, bench; go, gem; thin, ðis; sin, aç; expect, Xenophon, exist. ph = f. -clan, -tian = shan. -tion, -sion = shün; -ñion, -ñion = zhün. -tious, -cious, -sious = shüs. -ble, -dle, &c. = bēl, dēl.

suggest error. Thus the goat-sucker does not suck goats, and the timouse is not one of the Muridæ, but a bird. They are regarded as unscientific, and used only for popular convenience in scientific works. [1.]

He was charged with holding heretical opinions concerning the Trinity, for which he was cited before the Council of Soissons, and condemned A. D. 1092. ## II. Technically:

1. **Eng. Hist. (pl.):** Those who declined to conform their worship to that by law established. They were of two kinds: First, those who, being religious, worshiped nowhere; second, those who attended the services of some other religious denomination than the established church. It was more frequently used of the latter class. The name was first applied to those who declined to conform to the enactments of the Act of Uniformity, 2 & 3 Edward VI., c. 1, passed in 1549. It was revived and applied to the two thousand clergymen, who had to surrender their livings on account of their inability to conform to the more celebrated Act of Uniformity, 14 Charles II., c. 4, first enforced on Aug. 24, 1662. Etymologically viewed, a Dissenter and a Conformist somewhat differ. The former word denotes that he feels differently from Churchmen, that his sympathies go in a different direction; the latter word refers, not to his feelings, but to his action with respect to public worship. The laws formerly existing required him to conform to that of the Established Church by attending the services and partaking of the Communion. The two words, Dissenter and Nonconformist, as generally referring to the same individual, became interchangeable. (For the history of Nonconformist, see therefore Dissenter.)

**Eng. Church Hist. (pl.):** A term applied to those of the clergy and laity of the Establishment, who, holding that James II. was sovereign *de jure* after the throne had been declared vacant, refused to take the oath of allegiance to William III. and his successors. Among these were Sancroft, Archbishop of Canterbury, and six bishops—Turner (Ely), Lloyd (Norwich), Frampton (Gloucester), Lake (Chichester), White (Peterborough), and Ken (Bath and Wells). Sancroft sanctioned the consecration of a bishop, and thus a schism arose. The Nonjurors themselves divided on the question of Nonjurors' usages (q. v.), and each party consecrated bishops. Gordon, the last prelate of the regular body, died in 1799, and so the Nonjurors proper came to an end. **Law:** The stoppage of a suit during trial. This is done by the judge when, in his opinion, the plaintiff fails to make out a legal cause of action, or to support his pleadings by any evidence.

"It is usual for a plaintiff, when he or his counsel perceives that he has not given evidence sufficient to maintain his issue, to be voluntarily nonsuited, or withdraw himself; whereupon the crier is ordered to call the plaintiff; and if neither he, nor anybody for him, appears, he is nonsuited, the jurors are discharged, the action is at an end, and the defendant shall recover his costs. The reason of this practice is, that a nonsuit is more eligible for the plaintiff, than a verdict against him; for after a nonsuit, which is only a default, he may commence the same suit again for the same cause of action; but after a verdict had, and judgment consequent thereupon, he is forever barred from attacking the defendant upon the same ground of complaint. But in case the plaintiff appears, the jury by their foreman deliver in their verdict."—*Blackstone: Comment.*, bk. iii., ch. 13.

**Norman architecture**, s.

*Architecture*:

1. *In France*: The Normans brought the Romanesque style to a high state of perfection in this country. While the simplicity of the entire structure and the general effect bear witness to the Roman origin of the style, yet there is displayed a rich treatment of details. Both piers and arches are molded, and the ornamentation, especially that which serves as a rich setting to the arches, consists of the most simple line patterns; as, for instance, the meander, or the zigzag, or of bands or fillets occurring in regular succession; frequently, also, it is composed of various enrichments resembling the squares of a chess-board, lozenges, or nail-heads. Norman workmanship was, at first, remarkable only for its solidity. The walls were of great thickness, and often built of rubble, faced with small squared stones—a manner of building which had been copied from the works which the Romans had left behind them in France.

2. *In England*: English Romanesque (more commonly called Norman) architecture is to be considered as a branch and offshoot of that of Normandy; for, while many peculiarities of detail crop up, the main features of the original style are distinctly observed. The earliest work of the Normans which exists in England was conducted by Gundulph, who, after rebuilding his cathedral at Rochester, was employed by William to superintend the construction of the White Tower, in the Tower of London, which contains within its walls perhaps the only ecclesiastical remnant of the Conqueror's time at present in existence. Simplicity of design and detail is not met with in the same degree as in Normandy itself. Very richly molded features are introduced into heavy masses of building, and more ornamentation is employed, which is introduced in an arbitrary manner. The plan of the churches was the same as in Normandy. All were built with the semicircular chancel, but the arches of the nave usually rested on heavy cylindrical piers, hardly ever to be found in French churches, except in crypts. The windows and the doors were the same as in Normandy, and the Norman moldings were introduced with little alteration. The walls were remarkably thick, and without prominent buttresses. Specimens of the time of Rufus are to be seen in the west end and nave of Rochester cathedral; the choir, side aisles, and middle transept at Durham; in the walls of the lower part of the western façade of Lincoln; the tower and transept of St. Alban's; and the oldest remaining parts of Winchester. A strongly-marked mode of enrichment, resembling scales or diamonds in its design, was generally employed on the surface of the walls; the arches were ornamented for the most part with the usual zigzag. The character of the exterior of buildings in the Norman style may be described as heavy and massive. The windows were generally small. Blind, narrow arcades often occur in the façades and towers, sometimes interlacing, and sometimes not so, in several ranges, one above the other. The Norman style is of frequent occurrence in the case of the castles of the feudal lords of the epoch. The nucleus of these buildings, which were in reality fortresses, consisted of a high and massive tower, which served at the same time for the residence of the lord and for purposes of defense. This tower was only accessible by a flight of steps leading along the wall to an upper story of the building, and was only lighted by very small windows. In the last quarter of the twelfth century the transition from the Norman to the Pointed style began. The earliest examples of this transition are the round part of the Temple Church, London, consecrated in 1185; the choir of Canterbury Cathedral, rebuilt in 1175; and the great tower at the west end of Ely Cathedral, built by Bishop Ridel, who died in 1189. (*Rosengarten, &c.*)

It consists of a square wooden box lined with a soft, non-conducting substance; cow's hair is the substance actually employed. The lid is similarly lined. The interior is arranged for one or more saucepans, which, when inserted in the stove, are completely surrounded by the material. The meat or other substance in the saucepan being brought to the boiling-point in the ordinary manner, the pan is inserted in place in the stove, where, the radiation of heat being prevented by the lining, the contents remain at a boiling heat a sufficient time to insure their being thoroughly cooked. When used as a refrigerator, the lining prevents the access of warm air to the cooler object within. No heat is ever applied to the apparatus, which is designed merely to maintain the temperature of an object already heated. It is only adapted for articles cooked by water or steam.

I. Ordinary Language:

\*1. Originally, among the ancient Romans, a person employed to take notes of trials, proceedings in courts, contracts, &c.; a shorthand writer. This kind of work was at first usually performed by slaves, but the notarii, as they increased in ability and raised themselves above the servile ranks, gradually assumed the duties and functions of the tabelliones, writers who, under the Roman law, were employed in drawing up contracts, wills and commercial documents, and the work which fell to them in this capacity corresponded very closely to some of the business now undertaken by the modern notary public, the solicitor, attorney and conveyancer.

2. A public official authorized to attest signatures in deeds, contracts, affidavits, and declarations. They protest bills of exchange and notes, draw up protests after receiving affidavits of mariners and masters of ships, and administer oaths. Also called a Notary Public.

"Go with me to a *notary*, seal me there  
Your bond."

*Shakesp.*: *Merchant of Venice*, i. 3.

¶ From a document dated 1574, it appears that the Company of Notaries in London at that time numbered sixteen, and that they got their living by the "Making of Policies, Intimations, and Renunciations, and other writings," for the doing of which a monopoly had just been granted to one Richard Candler. nō-tā-tion, s. [Lat. *notatio*=a marking, a noting, from *notatus*=pa. par. of *noto*=to mark, to note; *nota*=a mark.]

1. The act of marking or noting; the act or practice of recording anything by means of marks, characters, or figures.

2. A system of marks, notes, signs, or characters employed in any art or science, to express in a brief and compendious form certain facts connected with that art or science. [¶.]

\*3. Etymology; etymological signification.

"The *notation* of a word is, when the original thereof is sought out; and consisteth in two things, the kind and the figure."—*Ben Jonson* *English Grammar*, ch. viii.

¶ (1) *Architectural Notation*: A system of signs, marks, or characters, appended to figures, when used to denote dimensions on drawings, as ' for feet, '' for inches, '' for parts; as, 10' 6''=ten feet six inches.

(2) *Arithmetical Notation*: A system of figures or characters used to represent numbers. Two methods of expressing numbers are at present in use, the Roman and the Arabic.

In the Roman method seven characters are employed, called numeral letters. These, standing separately, represent the following numbers, viz.,

fāte, fāt, fāre, amidst, whāt, fāl, father; wē, wēt, hēre, camel, hēr, thēre; pine, pīt, sire, sīr, marine; gō, pōt, or, wōre, wōlf, wōrk, whō, sōn; mūte, cūb, cūre, unite, cūr, rāle, fūll; trŷ, Sŷrian. æ. œ = ē; ey = ā. qu = kw.

I. for one, V. for five, X. for ten, L. for fifty, C. for a hundred, D. for five hundred, and M. for one thousand. By combinations of these characters, in accordance with the following principles, every number may be expressed: (a) When a letter stands alone, it represents the number given above, as V. for five; (b) when a letter is repeated, the combination stands for the product of the number denoted by the letter by the number of times which it is taken: thus, III. stands for three; XXX. for thirty, &c.; (c) when a letter precedes another, taken in the order given above, the combination stands for the number denoted by the greater diminished by that denoted by the less: thus, IV. stands for five less one, *i. e.*, four; XC. for one hundred less ten, *i. e.*, ninety, &c.; (d) when a letter, taken in the order given above, follows another, the combination stands for the sum of the numbers denoted by the letters taken separately: thus, XI. stands for ten plus one, *i. e.*, eleven; LV. for fifty plus five, *i. e.*, fifty-five; CIV. for one hundred plus four [IV = five less one, *i. e.*, four as in (c)], *i. e.*, one hundred and four; MDCCCLXXXV. for eighteen hundred and eighty-five. This method of notation is now little used except for dates, headings of chapters, &c.

In the Arabic, or rather the Hindu, method, introduced by the Arabs into Europe at the close of the tenth century, numbers are represented by the symbols, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, and their combinations, according to conventional rules. The characters are called figures or digits, and, taken in their order, stand for naught, one, two, three, four, five, six, seven, eight, nine; the value of the unit depends upon the place which the figure occupies in the scale adopted. The value of each figure or digit increases in a tenfold ratio from the right to the left; the number of places of the digit from the right to the left indicating the power of 10, and the digit itself the number of such powers intended to be expressed: thus, 10 = ten taken once = ten; 200 = ten squared taken twice =  $2 \times 10^2$ ;  $7656 = 7 + 10^3 + (6 \times 10^2) + (5 \times 10) + 6 =$  seven thousand six hundred and fifty-six, the values of the places being thus: 7 (thousands), 6 (hundreds), 5 (tens), 6 (units).

(3) *Chemical notation*: The written language of chemistry. The system now in use belongs exclusively to modern times, but in all ages signs of some kind or other seem to have been employed to represent the various kinds of matter. In 1815 Berzelius proposed the use of the initial letter of the element, and the employment of coefficients to express the number of the same atoms in the compound, bringing chemical notation almost into its present state. Thus, sulphate of soda =  $\text{Na}_2\text{SO}_4$ , indicating that the compound is formed of two atoms of sodium (natrium), one of sulphur, and four of oxygen. In organic compounds, the constitution of which is known, the symbols are so arranged as to show the various groups of radicals.  $\text{CH}_3\text{CO}(\text{C}_2\text{H}_5)\text{O} =$  ethylic acetate, but butyric acid, with the same number of atoms, is expressed by  $\text{CH}_3(\text{CH}_2)_2\text{COHO}$ .

The first division of notes was, as might be expected, into long and short (breve or brief). The long was a four-sided note with a tail; the breve a four-sided note without a tail; the semibreve a diamond note. There are now six notes in ordinary use, viz., the semibreve, the minim, the crotchet, the quaver, the semiquaver, and the demisemiquaver. The half-demisemiquaver is also occasionally used. One semibreve is equal to two minims, or four crotchets, or eight quavers, or sixteen semiquavers, or thirty-two demisemiquavers, or sixty-four half-demisemiquavers.

¶ *Notwithstanding* answers exactly to the Latin *non obstante*, used with a noun as an ablative absolute. Thus, in the extract given above, we might

also read "His prohibitions *notwithstanding*," that is, his prohibitions not causing any obstacle or hindrance; and so we sometimes find *notwithstanding* placed at the end of the sentence or clause.

His murderous taxations *notwithstanding*."  
*Shakesp.: Richard II., ii. 1.*

**nōū'-mē-nal**, a. [NOUMENON.] Of or pertaining to the noumenon; real, as opposed to phenomenal.

**nōū'-mē-nōn**, s. [Gr.=a thing perceived; neut. sing. of *noumenos*, perf. pass. par. of *noeō*=to perceive.]

*Philos.:* (See extracts.)

"*Noumenon* is the antithesis to phenomenon. . . . *Noumenon* means the substratum, or, to use the Scholastic word, the Substance. Thus, as matter is recognized by us only in its manifestations (phenomena), we may logically distinguish those manifestations from the thing manifested; and the former will be the *materia circa quam*, the latter the *materia in qua*. *Noumenon* is, therefore, equivalent to the Essence; phenomenon to the manifestation."—*G. H. Lewis: Hist. Philos.* (1880), i. 76. (Note.)

"The notion of a *noumenon* is therefore no concept of an object, but the problem unavoidably connected with the limitation of our sensibility, viz., whether there may not exist objects quite independent of its intuition—a question which can only be vaguely answered by saying that as our sensuous intuition does not apply to all things indiscriminately, there is room for more and for other objects, so that they cannot be absolutely denied, but neither, in the absence of any definite notion, can they be affirmed as objects for our understanding."—*Kant: Critick* (ed. Mahaffy), p. 206.

and this being in conflict with the interests of the South Carolinian planters, who found their best market in Europe, the legislature of that state at once passed resolutions declaring the right of a state to nullify any act of Congress which was not in accordance with the constitution of the country. After this a convention was held, and the tariff act was resolved by the convention to be null and void. President Andrew Jackson at once issued a proclamation intimating his intention to use force if necessary to enforce the laws of Congress, but meantime the tariff was modified, and the clash of state and federal authority was cut short, although the President is said to have expressed an ardent desire to hang John C. In Greek, Sanscrit, and a few other languages, a third number was used, called the dual, when only two individuals were spoken of. In the oldest English a dual number existed in the case of pronouns.

† The Fourth Book of Moses, called Numbers:

*Old Test. Canon*: The fourth book of the Pentateuch. In the Hebrew Bible it is called *Be-midbar*=in the desert, the fifth word of the first chapter. It has been sometimes quoted also as *Vatedabber*=And he spake—this being the first word of the book. The Septuagint translators named it *Arithmoi*=Numbers. The reference is to two numberings of the Israelites. Chaps. i.-iv. give the details of the first census, and prescribe the order in which the tribes were to encamp, and the arrangement and duties of the Levites; v. and vi. contain laws, including those relating to the Nazarites; vii. contains the offerings at the dedication of the tabernacle; viii.-x. 28, other laws and arrangements; x. 29-xiv., the historic narrative, including the sending out of the spies; xv., other laws; xvi. and xvii., the rebellion of Korah, Dathan, and Abiram, with the budding of Aaron's rod; xviii. and xix. Levitical laws; xx. and xxi., the striking of the rock, followed by a miraculous flow of water, the making of the brazen serpent [NEHUSHTAN]; xxii.-xxiv., Balaam's prophecies; xxv., sin with the Midianites; xxvi., the second census; xxvii.-xxxi., other laws and incidents, including the conquest of the Midianites; xxxii.-xxxv., the distribution of the land east of the Jordan; an itinerary of the journey out of Egypt; the establishment of Levitical cities, and provision in cases of homicide by misadventure. The last chapter (xxxvi.) contains some provisions for the marriage of heiresses, so as to retain their inheritance in their own tribes.

The book spans a period of nearly thirty-nine years, commencing with the second year of the wanderings, the second month, and the first day,

and terminating in the fortieth year. The Jews and the Christians of early and mediæval times implicitly believed in the Mosaic authorship of Numbers. Modern rationalists resolve the book into different portions, assigning each to a separate writer. One eminent critic of this school considered that 274 verses of Numbers constituted the original narrative; that six verses, appearing to belong to writings of some older time, were inserted by the Deuteronomist (q. v.), and the remaining 1,008 verses—more than three-fourths of the book—belonged to the Later Legislation. The 274 verses of the original narrative are thus given:

"Ch. x. 29-36; xi., xii., xiii. 1-3, 17-20, 22-24, 26 (except to Kadesh), 27-31, 33; xiv. 11-25, 39-45; xvi. 1, 2, 12-15, 23-34 (except Korah, &c., in vers. 1, 24, 27, 32); xx. 1, 14-22; xxi. 1, 13, 16-26, 31-35; xxii. 2-41; xxiii., xxiv., xxv. 1-5; xxxii. 1, 16-24, 33-42."

The six verses from old sources assigned to the Deuteronomist are xxi. 14, 15, 27-30. (*Colenso: On the Pentateuch*, vi. 88.) These views created some excitement when first published, but they have failed to make any considerable impression on the Christian public.

The first wheel of the series containing the units is moved one figure between each impact, and when the units are exhausted the tens come into action, and act in coincidence with the units, which continue their action.

**II. Alg. & Arith.:** A term which stands opposed to literal, and implies that the numbers composing a given expression are denoted by figures, and not by letters. A numerical equation is an equation in which all the quantities, except the unknown or variable quantities, are numbers. Numerical, as opposed to algebraical, is applied to the values of quantities; thus we say, that -5 is numerically greater than -3, although its algebraical value is less. The numerical value of an expression, in algebra, is the number obtained by attributing numerical values to all the quantities which enter the expression, and performing all the operations indicated. Thus, the numerical value of  $a^2b - c^2d$ , where  $a=2$ ,  $b=3$ ,  $c=1$ , and  $d=2$ , is 10.

"The *numerical* value of a concrete quantity is its ratio to a selected magnitude of the same kind, called the unit. It varies directly as the concrete quantity itself, and inversely as the unit, in terms of which it is expressed."—Everett: *C. G. S. Syst. of Units* (1875), p. 1.

**numerical-aperture**, s.

**Optics:** The formula by which the illuminating and resolving power of high-power microscopic objectives is now calculated. Since it became customary to interpose water, oil, or other fluid between the object and the lens, it is found that a water-immersion lens of  $97\frac{1}{2}^\circ$ , and an oil-immersion of  $82^\circ$ , give equal results to a dry or air lens of  $180^\circ$ . This obviously depends on the diameter of the back lens of the objective, and this upon the refractive index of the medium between lens and object. It is expressed by the formula,  $n \sin u$ , where *n* is the refractive index of the medium—air or fluid—and *u* the semi-angle of aperture. It is thus found that an oil-lens of  $180^\circ$  (oil of ref. index 1.52) has an N. A. of 1.52 against 1.00 for  $180^\circ$  in air. This only represents the comparative diameters of the effective pencils, and the relative *illumination* is, of course, obtained by squaring the N. A.'s to get the comparative areas of the pencils. We thus find that an oil-lens of  $180^\circ$  gives 2.310 the illumination of a dry objective of  $180^\circ$ .

Properly the term coin is applied to such pieces of metal as were struck for circulation as money, and the term medal to such as were struck in commemoration of some person or event, but ancient coins are frequently called medals. The parts of a coin or medal are the obverse or front, on which is usually stamped the head, bust, or figure of the sovereign by whom it is issued, or of the person in whose honor it has been struck, or some emblematical figure referring to him; and the reverse, or back, on which is stamped various figures or words. The words in the middle of the field form the inscription, those round the edge the legend. There are distinct species of nummulites in the several portions of the formation, *Nummulites variolarius* being found in its upper, *N. lævigatus* in its middle, and *N. planulatus* in its lower part. As nummulites, whose remains were originally deposited at the bottom of the beds of the ocean, are now 10,000 feet high in the Alps, and 16,500 in Western Tibet, it is evident that these regions must have been upheaved to their present elevation since the deposition of the nummulites in Eocene times.

Ger. *nunnā*; M. H. Ger. *nunne*.]

1. A virgin or widow who has consecrated herself to the service of God by the three vows of poverty, chastity, and obedience, and bound herself to live in a religious house under a certain rule. The first authentic notice of nuns is that by St. Antony, who, when retiring from the world, placed his sister in a house of virgins. St. Augustin, of Hippo, and St. Scholastica, sister of St. Benedict, both founded nunneries, and all the great orders of men have orders of women affiliated to them or following their rule as closely as difference of sex will permit. Communities founded since the Council of Trent mostly follow the rule of St. Augustin, with certain modifications. Nearly all nuns are bound to the recitation of the divine office in choir, and take their meals in common, but each has a separate cell. Their occupations vary. Some devote themselves to the work of education, to nursing the sick, or the care of the poor. Others are contemplative. Excommunication is pronounced against any one

attempting to force a woman to become a nun against her will, or to prevent her from becoming a nun without just cause. [DEACONESS, PROFESSION, VEIL.]

This jurisdiction, however, holds good only in those countries which are themselves subject to the decretals and discipline of the Council of Trent.

**II. Technically:**

1. *Astron.*: As the attraction of the sun, tending to drag the equator down to the ecliptic which causes the precession of equinoxes [PRECESSION], is greatest at the solstices and ceases at the equinoxes, the precession of the equinoxes cannot be uniform, but varies from time to time. Similarly the moon produces a slight variation in different parts of her monthly revolution. But besides this, the moon, which does not move in the ecliptic but in an orbit inclined to the plane of the ecliptic, has a movement like that of the precession of the earth's equinoxes, which causes the place of the intersection of her orbit with that of the sun to revolve every nineteen years. During half of this time the moon's path is little inclined to the earth's equator, while during the remaining portion of the time it is much inclined. Hence her influence over the time of the earth's equinoxes is unequal. The irregularities in the movement of the earth's equinoxes and her axis caused in the three ways are called nutation.

**nūy'-a-ya, s.** [Sansc., from *ni*=into, and *aya*=going.]

*Philos.*: One of the six schools of Brahmanic philosophy, and regarded as eminently orthodox. It was founded by Gotama, who must not be confounded with the Gotama or Gautama generally looked on as the founder of Buddhism, though the tenets of both were much akin. The Nyaya philosophy begins with the assertion that supreme felicity is derivable from true knowledge. Ignorance, by producing faults and activity, became the cause of birth. The world is a compound of good and evil, pleasure and pain; but it must be renounced, effort and activity abandoned, and the soul separated from body and mind. The world is held to be in a state of suffering, the doctrine of the transmigration of souls accepted, and men are urged to look forward to final emancipation from pain, birth, activity, fault, and false notions, in which case they shall attain supreme felicity. (*Banerjea: Dialogues on the Hindu Philosophy.*)

THE fifteenth letter, and the fourth vowel of the English alphabet. The shape of the written letter was probably suggested by the circular formation of the lips in uttering the sound. *O* is called the labial vowel, *i* being the palatal vowel, and *a* the guttural. In English *o* has six distinct sounds or shades of sound: (1) The sound of *o* in

*not*, as in *pot* (marked in this book  $\hat{o}$ ). (2) The same sound lengthened by a following *r*, as in *or*; and in the digraph *ou*, as in *fought*, *sought* (unmarked,  $\hat{o}$ ). (3) The sound of *o* in *go*; and in the digraphs *oe*, as in *foe*, *toe*; *oa*, as in *groan*, *moan*, *boat*; and *ou* in *though* (marked  $\hat{o}$ ). This sound is modified by *r* following the vowel, as in *more* (marked  $\hat{o}$ ). (4) The sound of *o* in *who*, *move*, *tomb*; and in the digraphs *oo*, as in *room*, *soon*; and *ou*, as in *through*, *wound* (marked  $\hat{o}$ ). (5) The sound of *u* in *bull* or *full*, as in *wolf*, *woman* (marked  $\hat{u}$ ). (6) The sound of *u* in *tub*, as in *son*, *love*, *come*; and in the digraphs *oe*, as in *does*; *oo*, as in *blood*; *ou*, as in *enough*, *tough* (marked  $\hat{u}$ ). B. **As interj.:** An exclamation used in earnest or solemn address, entreaty, appeal, or invocation, and prefixed to the noun of address. Attempts have been made to distinguish between *O* and *Oh* by some writers; namely, that *O* should be used only in direct address to a person or personified object, and should never be followed by the exclamation point, while *Oh* should be used in mere exclamations, where no direct address or appeal is made to the object, and may be followed by the exclamation point or not, according to the nature or construction of the sentence. This distinction is, however, merely arbitrary, and is not regarded by most writers, even the best, the two forms being generally used indiscriminately.

1. A solemn affirmation or declaration made with an appeal to God for the truth of what is affirmed. By the appeal to the Supreme Being, the person making oath is understood to invoke His vengeance if that which is affirmed or declared is false; or, in case of a promissory oath, if the promise or obligation is willfully broken. Oaths are of two kinds: (1) Assertory oaths, or those oaths by which the truth of a statement is affirmed; as an oath sworn to the truth of an affidavit; (2) promissory oaths, or those oaths by which something is promised, or an obligation is assumed: as, the oaths of witnesses; the oath of allegiance, by which the person taking the oath promises allegiance (q. v.) to the government. Modern legislation has also provided particular forms of oaths, having permitted affirmations to be made by persons who have conscientious objections to take an oath. Witnesses are allowed to swear to the truth of their evidence in any way which is binding upon their consciences.

"But whatever be the form of an oath, the signification is the same."—*Paley: Moral Philosophy, bk. iii., ch. xvi.*

2. *Chem.:* The meal of the oat deprived of its husk. An analysis of a sample of oatmeal gave 13 per cent. of nitrogenous material, 60-70 per cent. of heat givers, and 3 per cent. of mineral matter. It is a strong food, and requires much cooking in order to burst its starch cells; the longer it is cooked the more digestible it becomes.

2. *Old Test. Canon:* The fourth of the minor prophetic books. It contains only one chapter of twenty-one verses, denouncing vengeance against the Edomites for their unbrotherly conduct, when, on the occasion of the capture of Jerusalem by a heathen foe, they helped to plunder that capital, besides cutting off fugitive Jews and surrendering refugees (10-14). Prophecy is then made of the future glory in store for the Jews (17-21). If, as is probable, the capture of Jerusalem referred to was that by Nebuchadnezzar, then the book was written after the year B. C. 588. It is related to Jeremiah xlix. 7-22. (Cf. specially Obadiah 1-6, 8, 16, with Jer. xlix. 14, 15, 16, 9, 10, 7, 12. Which is the original has not been decided: Obadiah 1, 19, 21, is the same in theme as Amos ix 11, which may possibly explain why Obadiah immediately follows Amos in the Bible.)

2. *Arch.*: A quadrangular, slender stone shaft, with a pyramidal apex. The width of the base is usually about one-tenth of the height, and the pyramidal apex has about one-tenth of the whole length. Obelisks were commonly formed from a single stone, mostly of granite. Obelisks were erected in pairs, and many still exist on the ancient sites, while others have been removed and set up elsewhere.

¶ The obelisk was the Egyptian symbol of the supreme God. The Arabians called them Pharaoh's needles, and the Egyptian priests the fingers of the sun. The first obelisk is said to have been erected by Rameses, King of Egypt, in the time of the Trojan war; it was 40 cubits high, and employed 20,000 men in building. There are about a dozen Egyptian obelisks erected in Rome. One was erected by the emperor Augustus in the Campus Martius, on the pavement of which was a horizontal dial that marked the hour, about 14 B. C. Of the obelisks brought to Rome by the emperors, several have been restored and set up by various popes. The largest is that from Heliopolis. It is of granite, and now stands before the north portico of the Church of St. John Lateran, where it was erected in 1588. Its whole height is about 149 feet; without the base, 105 feet. It was removed to Alexandria by Constantine, and to Rome by his son Constantianus, and placed in the Circus Maximus. The obelisk at Luxor was presented to the French nation, in 1820, by Mehemet Ali, and was reerected in Paris in 1833. Its height is 73 feet. The obelisk presented to the English nation was removed to England and

set up on the Thames Embankment in London. It is 68 feet 5½ inches in height, with a width at the base of 7 feet 10½ inches by 7 feet 5 inches. Of Egyptian obelisks 42 are known, some broken; 12 at Rome; 1, from Luxor, set up in the Place de la Concorde, Paris, October, 1833; 5 in England; 1 in Central Park, New York. The obelisks improperly named *Cleopatra's Needles* were erected by Thothmes III. at On (Heliopolis), about 1600 B. C. One was removed to Alexandria by Augustus, about 23 B. C. After being long embedded in the shore, it was acquired for Great Britain by Sir Ralph Abercromby, in 1801; but not removed until 1878, when it was erected on the Thames Embankment in the City of London. The other was presented to the United States and now stands in Central Park, New York. The work of moving this obelisk from Alexandria to New York was managed by Commander H. H. Goringe, of the United States Navy. The officer reached Alexandria October 16, 1879, and at once began to work with one hundred Arabs, who completed the excavation of the obelisk's pedestal by removing 1,730 cubic yards of earth in about twenty days. The machinery for lowering the monolith was then attached, and the block was laid in a horizontal position. Within the foundation and steps of the pedestal were found stones and implements engraved with emblematic designs, and some delay was caused in order that these might be taken up very carefully to be placed in exactly the same position in the pedestal when reerected in New York. The obelisk was removed to the wharf and upon the steamer waiting for it by means of cannon balls rolling in metal grooves. The shaft, pedestal, and steps of the obelisk were removed separately, the entire mass weighing 1,470 tons. The steamer bearing this freight left Alexandria June 12, 1880, and arrived at New York July 20. The iron tracks and cannon balls were adjusted after some delay, and on these the monolith was disembarked September 16. Next the rise and fall of the tide was utilized to float it up the North River and land it at the foot of Ninety-sixth street, where it was moved by steam power on tracks with rollers to Central Park. The track was two miles long, and was inclined, the upper part of it being laid on trestle-work, in order to bring the shaft, when it was to be raised, at a proper height above the pedestal. Pulleys, chains, and ropes were then attached, and the signal being given, the great mass was rapidly and gently raised, and in a short time stood firmly upon the base which had been previously securely put in place. The Washington obelisk at Washington is 555 feet high, and was dedicated Feb. 22, 1885. The Bunker Hill Monument may also be properly called an obelisk, and that with the Washington (above noted) are the two most famous of American construction. The battle to commemorate which the monument was erected took place June 17, 1775. Just fifty years later the Marquis de La Fayette laid its corner stone. It is 30 feet square at base and 231 feet high. It was dedicated in 1843.

II. *Law*: The taking possession of those things which before belonged to nobody, and the right acquired by so taking possession. This, the original and only primitive method of acquiring any property, has been restrained and abridged by the laws of society, in order to maintain peace and harmony among mankind. For this purpose, gifts, contracts, wills, legacies, &c., have been introduced, in order to transfer and continue that property and possession in things personal which has once been acquired by the owner. In some few instances this original right of occupancy is still permitted and recognized. Thus the benefits of the elements, the light, the air, and water can only be appropriated by occupancy.

*ō'-cean* (ce as sh), \**o-ceane*, *s. & a.* [French *océan*, from Lat. *oceanum*, *accus.* of *oceanus*=the ocean, the main sea, from Gr. *ōkeanos*=the great stream supposed to surround the earth; Sp. & Ital. *ocean*.]

## A. As substantive:

1. *Lit. & Science*: The sea, using that term in its widest sense. Properly speaking, there is but one ocean or sea, all the salt water on the globe, with a few trifling exceptions, like the Caspian, the Sea of Aral, and the Dead Sea, being more or less in complete communication with each other. Different portions of the ocean have received distinctive names: The Arctic, the Atlantic, the Indian, the Pacific, and the Antarctic oceans, five in all; or if the Atlantic and Pacific be separated into a northern and a southern portion by the Equator, then there are seven in all. The unequal heating of portions of the vast expanse of water on the globe, the rotation of the earth, and other causes tend to keep the water in constant circulation and preserve it from being stagnant and impure. [CURRENT.] The

winds also agitate the surface, producing waves. [WAVE.] The attractions of the moon and sun cause tides. [TIDE.] The area of the ocean is about 155,000,000 square miles, or nearly three-fourths of the whole surface of the earth. This space is distributed (in square miles) among the principal seas as follows: Arctic, 5,000,000; Southern, 10,000,000; Indian, 20,000,000; Atlantic, 40,000,000; Pacific, 80,000,000. This great volume of water largely modifies the temperature of the adjacent lands, tempering the heat of summer and the cold of winter. As far as observation has yet extended, the average depth of the ocean is not more than 2,000 fathoms, *s. e.*, somewhat above two miles. Ordinarily, the portion of the ocean fringing the shores is but a few hundred feet deep, but a little further from the land the depth suddenly becomes 2,000 fathoms or more. At 62° Fahr. the relative density of salt and freshwater is as 1.0275 to 1. The ocean has been salt through all known geological periods. The origin of this saltiness is a difficult geological problem. While on land the temperature rises as mines or borings become deeper, the opposite occurs with the ocean. As a rule, the surface water is the warmest. The old views as to the absence of animal life in ocean depths have been proved erroneous by comparatively recent expeditions. Abundant life has been brought up from the ocean depth. The level of the ocean remains permanent from age to age. It is the land that is upheaved or subsides, not the ocean which has risen to a higher or sunk to a lower level. The color of the ocean varies in different places, being as a rule greenish near the shore and blue in the deeper parts. The saltiness of the ocean, the nature of the bottom where it is shallow, and the color of the clouds overhead, all modify the color.

Two wheels of the same diameter, and turning freely on the same axis, are placed face to face; the edge of one is cut into 100 teeth, and that of the other into 99 teeth, and an endless screw works into the notches in each wheel. When the screw has turned 100 times around, the wheel having 99 teeth will have gained one notch on the other, which gain is shown by an index attached to one wheel, which passes over a graduated arc on the other. Every hundred turns are thus registered on the second wheel, and all turns less than a hundred are shown by a separate index. Now, instead of the screw turning on its axis, it is found more convenient to have the screw fast, and to allow the weight of the machine to be suspended freely, so that as the carriage-wheel turns, the effect is the same as turning the screw on its axis.

I. *Literally*:

1. *Art*:

(1) The fixed oils used in painting on canvas, &c., are linseed, walnut, and poppy, expressed from the seeds and purified in various ways, and rendered drying by the addition of the oxides of lead or zinc. Cold-drawn linseed oil is the best for use, especially after being boiled upon charcoal to separate the mucilage and other impurities. These oils are the vehicles or media in which the pigments are ground and diluted for use; they should be pale in color, limpid, and transparent, and should dry quickly. The essential oils used in painting are those of turpentine for diluting the pigments ground in oil, and of spike or lavender for wax and enamel painting.

*Tickell: To Sir Godfrey Kneller*.

Fixed oils are found chiefly in the cells of tissues, and have a relation to, or, at times, seem to occur as substitutes for starch. Some fruits contain oil in their perisperms; spores of cryptogamic plants and pollen grains have it in abundance.

3. *Chem.*: A term generally applied to all neutral fatty substances which are liquid at ordinary temperatures. The mineral oils, and many of the volatile oils of vegetable origin, are simply compounds

of carbon and hydrogen, but the larger proportion of vegetable and animal oils contain oxygen in addition, while a few also contain nitrogen and sulphur, as in oil of mustard. The vegetable and animal oils containing oxygen are mostly glycerides of fatty acids, and are characterized by being insoluble in water, slightly soluble in alcohol, but readily soluble in ether.

**Old Catholics**, *s. pl.*

*Church Hist.*: The name assumed by a body of German priests and laymen who refused to accept the dogma of Papal Infallibility, and, in consequence of its definition, formed themselves into a separate body. It was essentially a University movement, for the German bishops who had left Rome to avoid voting—Hefeles among the number—afterward submitted. Van Schulte, a professor at Prague, published a formal protest; then came the Nuremberg protest of "Catholic professors" (Aug., 1870). Father Hyacinthe's "Appel aux Evêques" followed in *La Liberté* early in 1871, and (March 28) Dr. Dollinger set forth his reasons for withholding his assent "as a Christian, a theologian, an historical student, and a citizen." Dollinger and Friedrich were immediately excommunicated. In September following, a congress was held at Munich, when it was resolved to seek re-union with the Greeks. In 1872 a second congress was held at Cologne, at which Dean Stanley was present, and sent an account to the *London Times*, which aroused much interest all over the world. On Aug. 11, 1873, Dr. Reinkens was consecrated at Rotterdam by Dr. Hey de Kamp, Jansenist Bishop of Deventer, and, in 1876, Dr. Reinkens consecrated Dr. Herzog. The first synod (1874) made confession and fasting voluntary; the second (1875) reduced the number of feasts, and admitted only such impediments to marriage as were recognized by the State; the third (1876) permitted priests to marry, but forbade them to officiate after marriage. This prohibition was annulled by the fifth synod (1878), and, in consequence, Friedrich, Reusch, and some others withdrew. Congregations of Old Catholics exist in Austria, Italy, Spain, Switzerland, France, and Mexico, but their numbers are small. In Germany they seem to be dwindling away, but the protest of Dollinger and his fellows will remain an important landmark in religious history.

**Old Glory**, *s.* The American flag. This name was first applied to the stars and stripes in 1831 by a Salem, Mass., skipper named William Driver, who was at that time captain of the brig Charles Doggett. Captain Driver was a successful deep sea-sailor, and at the time of bestowing the name "Old Glory" on the flag he was preparing to shape the brig's course to the southern Pacific. Just before the brig left Salem, a young man at the head of a party of friends saluted Captain Driver on the deck of his vessel and presented him with a large and beautifully made American flag. It was sent aloft, and when flung to the breeze Captain Driver christened it "Old Glory." He took it to the south Pacific, and years after, when old age forced him to relinquish the sea, he treasured the flag as an old friend. In 1837 Captain Driver removed to Nashville, Tenn., and he died there in 1886. Previous to the outbreak of hostilities between the North and South "Old Glory" was flung to the breeze every day from the window of Captain Driver's Nashville house, but when the conflict began the old flag had to be secreted. It was kept out of sight until General Nelson's wing of the Union army appeared in Nashville, Feb. 27, 1862, when Captain Driver presented it to the general to be hoisted on the capitol. It was run up, and Captain Driver himself did the hoisting. Its name and history soon became familiar to all the soldiers in General Nelson's command, and from Captain Driver's cherished flag the name "Old Glory" was extended by the boys in blue to every flag of the Union.

The former is spiny, and has worthless fruit; the many sub-varieties of the latter are unarmed and have large, oily fruits. The specific name *europæa* implies that Europe was its native continent, which is doubtful. Its original seat was probably western Asia, and perhaps Europe as well. It was very abundant in Palestine, and even yet there are fine olive plantations near Jerusalem, Nabulus (formerly Shechem), &c. C. 884, were held at the beginning of every fifth year, on the banks of the Alpheus, near Olympia, in the Peloponnesus, now the Morea, to exercise the youth in five kinds of combats, the conquerors being highly honored. The prize contended for was a crown made of a kind of wild olive, appropriated to this use. The festival was abolished by Theodosius, A. D. 394.

In 1896, after a lapse of more than 1500 years, these games were revived at Athens. They began on April 6th and continued for five consecutive days. The number of spectators was enormous. Athletes from various countries of the world competed for prizes, and some of the principal contests were won by Americans. It is held by some philologists that all language had its origin in onomatopœia, words formed by this principle being the most natural, and readily suggesting the actions or objects producing the sounds which the words are intended to represent.

"The office of *onomatopœia* was the provision, by the easiest attainable method, of the means of mutual intelligence; in proportion, then, as it became easier to make the same provision by another method, the differentiation and new application of signs already existing, the primitive method went into comparative disuse—as it has ever since continued, though never absolutely unused."—*Whitney: Life and Growth of Language*, ch. xiv.

"We have regarded the reproduction, with intent to signify something of the natural tones and cries, as the positively earliest speech; but this would so immediately and certainly come to be combined with imitative or *onomatopœic* utterances, that the distinction in time between the two is rather theoretical than actual. Indeed, the reproduction itself is in a certain way *onomatopœic.*"—*Whitney: Life and Growth of Language*, ch. xiv.

ontological-argument, ontological-proof, s.

*Philos.*: An argument for, or proof of the existence of God, derived from the very idea which man has of God—the greatest object or being that can be conceived. This conception exists in the intellect of all such as have the idea of God, and in the intellect of the atheist as well, for he understands what is expressed by "the absolutely greatest." But the greatest cannot be in the intellect alone, for then it would be possible to conceive something still greater, which should exist not only in the intellect, but in external reality. Hence the greatest must exist at the same time in the intellect and in the sphere of objective reality. God, therefore, is not simply conceived by man; he also really exists. The ontological argument was thus formulated by Anselm (1033-1109), and was revived in the seventeenth century by Descartes. (*Ueberweg.*)

The writings of Prof. Ubaghs of Louvain, a prominent Ontologist, were censured by the Inquisition in 1866, and since then ontologism has ceased to have any practical influence on Roman metaphysical teaching. Geol. & Palæont.: The term is not now generally petrological, but is chiefly chronological, being applied to a certain considerable portion of the Secondary period and to the strata then deposited. During the Oölitic period Europe was largely covered by the sea, hot enough to be studded in places with coral reefs and contain certain cephalopods like Ammonites and Belemnites. At intervals muddy sediment so clouded the water as to kill the coral animals. This series of events was repeated more than once. Islands in the sea had a vegetation of Cycads, Ferns, Coniferæ, &c. Reptiles abounded, birds had apparently come into being [ARCHÆOPTERYX], and mammals of the Marsupial type. Some trap rocks in the Morea, in the Apennines, &c., seem to have proceeded from volcanoes active at this time, and some granites in the Alps appear contemporaneous. [JURASSIC.]

*ōp-ēr-a*, subst. [Ital.=work, performance, from Lat. *opera*=work, from *opus* (genit. *operis*)=work; Fr. *opéra*; Sp. *opera*.]

1. A dramatic entertainment, in which music forms an essential and not merely an accessory part. The opera is composed of solos, recitatives, duets, trios, quartets, or other pieces for single voices; choruses and finales; accompanied throughout with instruments variously combined to produce certain desired effects. Overtures or introductions precede the whole work or its several acts in nearly every case. The dramatic effect is heightened by the accessories of costumes and scenery, but they are not absolutely indispensable. The libretto or book of words rarely possesses any claim to literary merit, but serves as a mere framework for the composer. In many of the German and French operas of a lighter character spoken dialogue is introduced in the place of recitative, and the same practice is often observed in English opera, so called. There are many varieties of opera, but the chief are: The grand opera or *opera seria*, the romantic opera or *opera drammatica*, and the comic opera or *opera bouffa*, for which the French term *opera bouffe* has been adopted in America and also in England. The opera is of Italian origin, and of comparatively modern date, and is the immediate successor of the miracle-plays with music.

It consists of a wide conical tube, terminating in a bell like that of a horn, having ten ventages with keys, and a mouthpiece like that of the serpent. There are two sorts of ophicleides, alto and bass. The bass ophicleide is written on the F-clef, and its compass is three octaves and one note, from B on the third space below the bass staff to C on the third space of the treble staff. They are in two keys, C and B $\flat$ . The alto ophicleide has a compass similar in extent to that of the bass instrument, but starting from a note one octave higher. This instrument is not so satisfactory as its bass fellow, and is therefore but rarely heard. The double-bass ophicleides are in F and E $\flat$ , a fifth below the bass ophicleides in C and B $\flat$ . The amount of breath required to play the double-bass ophicleide will probably prevent its general adoption.

They have no sternum, pectoral arch, forelimbs, or sacrum; nor, as a rule, are traces of hinder limbs present, though they occasionally occur *e. g.*, in Python (q. v.). Hooked conical teeth are always present, ankylosed with the jaw. [POISON-FANG.] The order is preëminently tropical, the species rapidly diminishing as the distance from the Equator increases, and wholly ceasing before the Arctic or Antarctic Circle is reached. The classification is not fixed. According to Wallace, the order contains twenty-five families. There is another and natural division into three sub-orders: (1) Thanatophidia (Venomous Snakes), with two groups, Proteroglyphia and Solenoglyphia; (2) Colubri-formes (Innocuous Colubri-form Snakes); and (3) Typhlopida (Blind Snakes).

*Hist., &c.*: In China, India, Turkey, and other parts of the East, and, to a small extent, in the West, opium is used as a narcotic drug. The great source whence China has always derived its opium has been India, where, since 1793, the drug has been

a government monopoly, the cultivators in Behar, Benares, and Malwa being paid at a fixed rate for their crops for exportation to China. The trade, which was conducted in clippers, was contraband, the Chinese government having in 1796 prohibited the importation of opium, and issued various subsequent proclamations on the subject, of the same tenor as the first. Nevertheless, by the connivance of the Chinese local officers, the importation about trebled in the twenty years between 1816-17 and 1836-37, in the two latter years being 20,049 chests, valued at more than £2,000,000. In March, 1839, the Chinese authorities, without warning given, enforced the law, forbade all foreigners to quit Canton, and ordered them to deliver up the opium in their possession, which was burnt. War with Britain resulted, which ended in the defeat of the Chinese, who were obliged to pay an indemnity for the opium. They have since been compelled to admit it, and the Indian revenue derivable from its growth has risen to about £9,000,000 annually. The religious community in general dislikes the opium traffic, and sections of it at times take active steps for its abolition.

**ōp'-tīcs**, *s.* [OPTIC.]

*Physics*: Optics was defined by Sir David Brewster as that branch of knowledge which treats of the properties of light and of vision as performed by the human eye. He divided his treatise on the subject into four parts: 1. On the Reflection and Refraction of light: (1) Catoptrics (q. v.), (2) Dioptrics (q. v.). 2. Physical Optics. 3. On the application of optical principles to the explanation of Natural Phenomena. 4. Of Optical Instruments. The more modern division of the science is into: 1. Sources of Light; 2. Transmission, Velocity, and Intensity of Light; 3. Reflection of Light—Mirrors; 4. Single Refraction—Lenses; 5. Dispersion and Achromatism; 6. Optical Instruments; 7. The eye considered as an Optical Instrument; 8. Phosphorescence and Fluorescence; and 9. Double Refraction, Interference, and Polarization.

The rays from the object to be drawn are reflected from a plane-mirror through the object-glass of the instrument to a speculum, and thence through an eye-glass to the eye. Between the eye and the speculum is a piece of parallel faced glass with a small dot in its center, exactly in the focus of the eye-glass. By moving the pencil, the dot seen in the field of the telescope is passed over the outlines of the object, which are at the same time traced on the paper by the pencil.

1. *Philos.*: The name given to the view propounded in the *Theodicee* of Leibnitz that this world, as the work of God, must be the best among all possible worlds; for, were a better world possible than that which actually exists, God's wisdom must have known, His goodness must have willed, and His omnipotence must have created it. Leibnitz maintained that, if there was to be a world, it must consist of finite beings; this is the justification of finiteness and liability to suffering, or metaphysical evil; that physical evil, or pain, is salutary as punishment, or means of tuition; and that God could not remove moral evil, or wrong, without removing the power of self-determination, and, therewith, the possibility of morality itself. J. S. Mill points out that Leibnitz did not maintain that this is the best of all conceivable, but of all possible, worlds, so that his doctrine might be held by a "limited" Theist.

*Roman Theol.*: Usually employed adverbially (*ex opere operantis*). The phrase (=the work of the worker) is used to signify that the effect of a particular rite or act of devotion is directly due, not to the rite (*opus*) itself, but to the dispositions of the person who is the subject of the rite or who practices the devotion. This is the Protestant view of the efficacy of the sacraments, as opposed to the Roman and High Anglican view. [OPUS OPERATUM.]

**opus operatum**, *phr.*

*Roman Theol.*: Usually employed adverbially (*ex opere operato*). The expression *opus operatum* (=the work done) was used by mediæval theologians to signify that grace was conferred by the sacrament itself, and adopted by the Council of Trent, which, in the eighth canon (*De Sacramentis in genere*) of the seventh session, anathematizes any one who shall say that the sacraments do not confer grace *ex opere operato*. The necessary dispositions on the part of the recipient are *conditiones sine qua non*; and, according to the Roman view, the grace conferred is due, not to these necessary dispositions, but to the sacrament as received with these necessary dispositions.

"When we say the sacrament confers grace *ex opere operato*, our meaning is that grace is conferred by virtue of the sacramental act itself instituted by God for this end, not by the merit of the minister or the recipient."—*Bellarmin: De Sacramentis*, lib. ii. 1.

\*10. A cant name for a watch.

II. *Anthrop.*: Oracles are of high antiquity. They existed among the Egyptians (*Herod. v. 89, viii. 82*), and the poetry of the Greeks and the Romans is full of allusion to them. The Hebrews might lawfully, by the high priest, consult the Urim and Thummim (*Num. xxvii. 21*), but they also illicitly sought responses from teraphim (*Judges xvii. 5*), and from the gods of surrounding nations (*2 Kings i. 2, 3, 6, 16*). The responses were supposed to be given by a supernatural afflatus, either through a person, as at Delphi and Cumæ, or through some object, as in the rustling of the sacred grove at Dodona. But in every case there is present the idea of a power more than human taking possession of a person or thing, and making that person or thing the vehicle of the response. (*Of. Num. xxiii., xxiv., Acts xvi. 16; Homer, Odys. v. 396; Virgil, Æn. vi. 45-51.*) Tylor holds that the belief in oracles was a consequence of animism, and, after giving instances of the survival of the belief among races of low culture, says (*Prim. Cult., ed. 1873, ii. 135*), "Could a South Sea Islander have gone to Delphi to watch the convulsive struggles of the Pythia, and listen to her raving, shrieking utterances, he would have needed no explanation whatever of a rite so absolutely in conformity with his own savage philosophy."

*ō-räng', s.* [ORANG-OUTANG.]

*orang-outang, orang-utan, orang-utang, ourang-utang, s.*

*Zoöl.*: *Simia satyrus*, the Mias of the Dyaks. The name by which it is known in this country is Malay, and signifies, "the wild man of the wood." It is a dull, slothful animal, but possessed of great strength. These animals are now confined to the swampy forests of Sumatra and Borneo. Their height has been variously stated, but we have not the least reliable evidence of the existence of Orangs in Borneo more than four feet two inches high. The legs are very short, the arms as disproportionately long, reaching to the ankle when the animal is placed in an erect position. The hair is long, ruddy-brown, with a decidedly red tinge, face dark, eyes and nose small, jaws prognathous, the hair falling over the forehead and backward over the neck; it is long on the limbs, with a downward direction on the upper, and an upward on the lower arm. There are neither cheek pouches nor natesal callosities, nor a tail, and the hips are covered with hair. The males have a longish beard, and they sometimes develop warty protuberances on each side of the face. The resemblance to man in appearance is greatest in the females and in young animals. The head of a baby Orang is not very different from that of an average child; but in the adult the muzzle is as well-marked a feature as in the Carnivora. The Orang is aboreal, and forms a sort of nest or shelter among the trees. It never walks erect, unless when using its hands to support itself by branches overhead, or when attacked.

*ör-ange (a as i), \*or-enge, \*or-onge, s. & a.* [O. Fr. *orange* (Fr. *orange*). The word should properly be *nareng*, from Pers. *nārang*, *nārinj*, *nārang*=an orange. II. *Botany, &c.*: Properly *Citrus aurantium*, the sweet orange. The leaves are ovate, oblong, acute, slightly serrulated; petiole more or less winged; the pulp is sweet. It is a native of India, and by some botanists is believed to be only a variety of the citron (*Citrus medica*). It was introduced into the south of Europe about the twelfth century, having been brought into Arabia about three centuries earlier. It lives about six hundred years. Among the many varieties are the China orange, which is the common orange of the markets; the Blood, or Malta orange; the St. Michael's orange; the Noble, or Mandarin orange, &c. A single tree in St. Michael's has yielded 20,000 oranges fit for packing. The orange contains malic acid; the rind is bitter and aromatic; the fruit itself is said to be disinfectant. Orange leaves are sometimes prescribed for hysterical females, instead of tea. Orange poultice has been recommended in India in skin diseases. Sometimes there is a monstrous separation of the carpels, producing what is popularly called a horned orange. There are various allied species, specially the Bitter, or Seville orange, *C. bigaradia*, largely imported for the manufacture of candied orange-peel, &c. It, too, has run into several varieties. Another species is the Bergamot (q. v.). Sir Joseph Hooker makes all these varieties of *C. aurantium*. Of late years much attention has been paid to orange culture in this country. In Florida and Southern California vast orange plantations are providing immense crops of many varieties of the orange.

A. As substantive:

1. *Lit. & Anthrop.*: The *judicium Dei* of mediæval writers; the practice of referring disputed questions (especially those touching the criminality of a suspected person) to supernatural decision, in the belief that the Deity would work a miracle rather than the innocent should suffer or the guilty escape punishment. Dr. E. B. Tylor (*Encyc. Brit.*, ed. 9th, xvii. 818) says of the practice, that "in principle, and often in the very forms used, it belongs to ancient culture, thence flourishing up to the mediæval European and modern Asiatic levels, but dying out before modern civilization." It existed among the Jews. A wife accused of adultery was required to drink "the bitter water that causeth a curse" (Numbers v. 12-31), and a strangely similar institution exists at the present day among the negroes of the Gold Coast of Africa; and ordeal in some form or other is still practiced by races of low culture, and by individuals of low culture among races standing in the forefront of civilization. In the Middle Ages in Europe ordeal was sanctioned both by the civil and the ecclesiastical authorities, and was chiefly of three kinds: (1) By fire—a survival from the early classic times (cf. Sophocles, *Antigone*, 264; Æschylus, *Frag.* 284), in which the accused had to walk barefoot and blindfolded over red-hot plowshares, or to take up and carry a piece of red-hot iron a certain distance. This method was allowed only to persons of high rank; (2) By water,

Orchis Mascula.

for persons of the middle and lower classes. This was of two kinds. The accused had to take a stone out of boiling water, and if, after a certain time, his arm presented no marks of injury, he was adjudged innocent. In the second case—a common method when witchcraft was alleged—the accused, bound hand and foot, was thrown into a river or pond, and it was believed that a guilty person would float without effort, and that an innocent person would infallibly sink; (3) Wager of battle. [BATTLE, s., B. 1.] Besides these three principal methods there were three others in less general use: A supposed murderer was required to touch the body of the murdered man, and was pronounced guilty if blood flowed from the wounds (*Shakesp.: Richard III.*, i. 2); the Ordeal of the Eucharist, in which divine judgment was supposed to follow unworthy reception of the sacrament; and the Corsned (q. v.).

2. *Fig.*: A severe or strict trial through which one has to pass; trying circumstances.

The former recovered, the latter died. Certain women, subjected to the same ordeal in April, all recovered.

**or-dêr, \*or-dre, s.** [Fr. *ordre* (O. Fr. *ordene, ordine*), from Lat. *ordinem*, accus. of *ordo*=order; Sp. *orden*; Ital. *ordine*.]

3. Established process; customary mode of procedure; established usage; specif., the established or customary mode of procedure in public debates or discussions.

4. Absence of confusion or disturbance; tranquillity; freedom from disorder or tumult; regular government; as, to keep *order* at a meeting.

¶ *Order* is used alone as an exclamation to call the attention of a speaker or member of an assembly or meeting to the fact that he is transgressing the rules of debate or otherwise out of order.

"Then there was a cry of *order*; and he was threatened with the serjeant and the Tower."—*Macaulay: Hist. Eng.*, ch. xxiv.

5. A rule, a regulation; as, a standing *order*. [¶ (11).]

6. A precept, a mandate; a direction, whether verbal or written.

This night to play before him."

A body of persons associated together by the possession of a common honorary distinction conferred upon by a prince or other authority; hence, the dignity, rank, or distinction itself; as, The *Order* of the Garter, the *Order* of St. Michael and St. George. The various orders have distinctive insignia, consisting generally of a collar, star, badge or jewel, and ribbon. [BATH, GARTER, KNIGHTHOOD, STAR, THISTLE, &c.]

**II. Technically:**

1. *Arch.*: The different modes of architectural treatment adopted by the ancients in constructing their public edifices and buildings of the higher class. They are usually separated into five, principally distinguished from each other by the proportions of their columns and the kind of capitals employed, but also by the relative proportions and decorative parts of their entablatures, as well as other minor features. They are known as the Doric, Ionic, Corinthian, Tuscan, and Composite. (See these words.)

2. *Ecclesiastical*:

(1) In the Roman Church, "a Sacrament of the New Law by which spiritual power is given, and grace conferred for the performance of sacred duties." The Council of Trent (sess. xxiii.) asserted, and anathematized those who denied (1) That there was a real priesthood in the New Law; (2) that, besides the priesthood, there were grades of orders; (3) that Order was a Sacrament instituted by Christ; (4) that the Holy Ghost was given and a character conferred at ordination; (5) that unction was properly used in ordination; (6) that there was a divinely appointed hierarchy in the Roman Church; (7) that bishops were superior in power to priests, and were the ministers of Confirmation and Order; and (8) that bishops appointed by the Roman Pontiffs were true and legitimate bishops. The doctrine of Apostolical Succession is a necessary deduction from the view that Order is a Sacrament.

(2) (*Pl.*): In the Roman Church Orders are divided into two classes: Sacred, or Major, and Minor Orders (see these words). Some theologians regard the episcopate as the completion and extension of the priesthood, while others consider it a separate order. In the East the number of orders has varied at different times, but in the Greek, Coptic, and Nestorian Churches the orders recognized are those of bishop, priest, deacon, subdeacon, and reader. Anglicans acknowledge three: bishops, priests, and deacons. The validity of Anglican Orders is denied by the Roman Church. English clerics entering that church, and wishing to become priests, must be ordained by a Roman Bishop.

3. *Geom.*: Rank or class. In analysis, magnitudes are classed into orders, depending upon the degree of their equations. All algebraic magnitudes whose equations are of the first degree are of the first order; those whose equations are of the second, third, &c., degrees, are respectively of the second, third, &c., orders.

4. *Nat. Science*: The designation given to the division immediately below a class or sub-class and next above a tribe or a family. [NATURAL-ORDER.]

(b) *Mil.*: Specific commands or notices issued by a superior officer to the troops under his command.

(8) *Religious Orders*:

*Eccles. & Church Hist.*: The name Order is popularly given to all associations of a monastic character. Strictly speaking, it is of far less extended application, and is confined to associations which have received the formal approbation of the Roman Pontiff and the members of which are bound by solemn vows. Thus Orders are sharply marked off from Congregations, in which the vows are

simple, and for the erection of which the consent of the Ordinary alone is necessary. The term Order did not come into use till the tenth century, when offshoots from the Benedictines first appeared, and grew into such communities as those of Cîteaux, Cluny, and La Chartreuse, where modifications of the Benedictine rule were practiced. Next in importance come the Mendicant Orders and the Jesuits, the Hieronymites, the Minims, Theatines, Capuchins, and Barnabites. (See these words.)

**II. Ritual:**

1. *Roman:* The act of conferring the sacrament of order. Women are incapable of being validly ordained (1 Cor. xiv. 34; 1 Tim. ii. 11, 12). Ordination is, in the normal course of things, conferred by bishops, but abbots may confer minor orders on their subjects. Dimissory letters are necessary if a man is to be ordained for a diocese other than that in which he was born, and he must have legitimate and sufficient title (q. v.). Ordination to sacred orders, according to the general law of the Church, can only take place on the Saturdays in the four Ember weeks, on the fifth Saturday in Lent, or on Holy Saturday, and always during mass. Minor orders (q. v.) can be conferred at general ordinations, and also on any Sunday or holiday, not necessarily during mass. The Council of Trent (sess. xxiii., can. 8, *de Ref.*) enjoins that sacred orders should be publicly conferred in the cathedral or in one of the principal churches of the diocese, in the presence of the canons, but custom has sanctioned a departure from the practice when a reasonable cause exists. Regulars are usually ordained in their monasteries. [ORDER, *s.* II.]

2. In this country Protestant churches have each their own method of ordination, which is rather a service of consecration than a sacrament imparting special power. The ordination in the Episcopal church is patterned largely after that of the English Episcopal church.

3. *Anglican*: Strictly speaking, the term ordination is used only of priests, deacons being "made," and no lower order being recognized. Order is not a sacrament in the Anglican Church, though there is more than a tendency on the part of High Churchmen to recognize it as such, and the Rev. Orby Shipley (*Gloss. Eccles. Terms*, s. v. *Ordination*) says, "The ordination of priests has generally been counted among the five lesser Sacraments of the Church." [ORDER, s. II. (2).] Ordinations are held on the Sundays following the four Ember seasons, and the canonical interstices are observed. [INTERSTICE, s. ¶.]

4. *Presbyterian*: Ordination by laying on the hands of the Presbytery is required before a probationer obtains the full status of a minister. It is not conferred unless he has received a call as pastor or an appointment as a missionary. Elders are ordained by the Session.

Ore consists of metals mineralized by chemical combination with one or more of the non-metallic elements. The principal ores are combinations of metals with sulphur, forming sulphides; with chlorine, forming chlorides; with oxygen, forming oxides; and with carbonic, silicic, sulphuric, arsenic, and phosphoric acids, forming carbonates, silicates, sulphates, arsenates, and phosphates. Generally speaking, however, all mineral substances containing metals, combined or free, are called ores. They are found in veins or lodes, in bedded masses, and also disseminated in rocks of all ages, both igneous and stratified sedimentary. In the latter, the ores of iron and manganese are the most abundant, and often found in beds of large extent. Some ores, as well as native metals, are also found in alluvial deposits; gold, platinum, &c., in those known as placers. Placer products, sometimes called placer ores, have been derived from the degradation and

wearing away of older rocks, the minerals having been washed out and re-deposited by the agency of water. Were it not for the fact that much of the gold and silver-bearing ores found in the Rocky Mountains is of too low a grade to work profitably, the product of those metals would have been much greater from many of the Western States, as millions of tons of low grade ores now encumber the dumps of the mines. Improved methods of treating the ore or some cheaper plan of transportation to the smelters from the mines is certain to transform much of this now valueless product into one of great value. Edison has experimented with some degree of success in treating low grade ore by the electrical process.

I. Ordinary Language:

1. An instrument; the means by which any office, duty, or function is performed; that by which some important action is performed or object attained; espec., one of those parts of an animal or vegetable body by which some particular action, duty, operation, or function is performed; a natural instrument; as, The eye is the *organ* of sight; the lungs are the *organs* of respiration; animals and plants have reproductive *organs*, &c.

2. A medium, means, or instrument of communication between persons; a medium or channel of conveying or expressing one's opinions. (*Cowper: Task*, ii. 355.)

3. Hence, a newspaper, as the medium of expressing public opinion.

\*4. A musical instrument of any kind.

\*5. The vocal organs collectively; the voice.

\*6. Palate, taste. (*Gentleman Instructed*, p. 367.)

II. Technically:

1. *Anat. (pl.)*: Members of an organized being through which its functions are executed. Thus the root, stem, and leaves of a plant, the heart, &c., the brain and stomach of an animal are organs. They are composed of tissues.

2. *Music*: The most comprehensive and important of all wind instruments. Its history can be traced back to the earliest antiquity. Starting from a small collection of pipes, perhaps even from a syrinx, it has gradually grown in size and complexity until, at the present day, one performer has complete control over many thousands of pipes. The *ugab*, translated "organ," in Genesis (iv. 21) and Job (xxi. 12), was probably one of the earliest and simplest forms of a collection of pipes placed over a wind-box or sound-board. In this rudimentary state, the wind was admitted to each pipe at the will of the player by means of a sliding strip of wood, which could be pulled in and out; this mechanism was the ancestor of our modern key-board. The next step was to have more than one series of pipes; strips of wood passing lengthwise under the mouths of each set enabled the player, by pulling a stop, to exercise a choice as to which he used. Afterward, as larger organs were constructed, the smaller were called "portative," because they could be carried about in processions, &c., and the large were called "positive" [*Posit*], because they were fixtures. The essential principles of the construction of an organ were thus discovered, and it only remained to expand the instruments (1) by the placing of several organs under the control of one player, with a separate manual or clavier for each; (2) by the use of keys to be played by the feet, or pedals; (3) by the increase of the compass; (4) by the introduction of great variety of tone; (5) by perfecting the bellows and wind-supply, and placing the registers under the organist's control by means of mechanical appliances. It is probable that the use of water in ancient organs (hence called hydraulic organs) was merely for the purpose of graduating the exit of air from a chamber into the pipes. In modern instruments, four, or sometimes even five, rows of keys are found, each representing a distinct instrument; these are named after their use or characteristics; as, Great organ, that used for grand effects, the principal manual; Choir organ, that used for the accompaniment of voices; Solo organ, that containing stops for solo use; Swell organ, pipes placed in a distant box, with shutters opening and closing like Venetian blinds, by means of which a *crescendo* can be made; Pedal organ, the pipes controlled by the pedals. Pipes range from 32 feet to ¼ inch in length; they are divided into two great classes, Flue and Reed, names which need no explanation. The title of stops generally intimates their quality of tone, e. g., Flute, Violin, Oboe, Clarinet, Trumpet, &c. The touch of a large organ is made "light" by levers filled with highly compressed air, hence called Pneumatic levers; the long array of stops is controlled by composition-pedals, combination-pistons, or by vents; and, lastly, mechanical means have superseded manual labor for blowing.

¶ By the old writers the instrument was called the *organs*, or a pair of organs.

¶ *Organ of Bojanus*:

*Comp. Anat. & Physiol.*: A double organ with two bilaterally symmetrical halves, one on each side of the body, just below the pericardium, communicating with it and with the mantle cavity, in the Lamellibranchiata. Most of these acids are formed by the oxidation of alcohols, by replacing H<sub>2</sub> in the oxatylic portion by O, e. g.,  

$$\begin{matrix} \text{CH}_3 \\ \text{CH}_2^3\text{HO} + \text{O}_2 = \begin{cases} \text{CH}_3 \\ \text{COOH} \end{cases} \text{ (acetic acid)} + \text{H}_2\text{O}; \text{ but} \end{matrix}$$

*Chem.*: The chemistry of the carbon compounds in which the hydrogen or nitrogen of the substance is directly united with carbon. **Palaeont.**: The English name for any of the fossil footprints, supposed to be those of birds, found abundantly on the sandstone slabs of the Trias, especially in the sandstones of the Connecticut valley. It is, however, doubtful if the first element of the name is justified. Prof. Newton says that "the best American palaeontologists are now inclined to attribute them rather to Dinosaurian reptiles than to birds."

"Dr. Hitchcock, President of Amherst College, United States, first submitted these impressions to scientific comparison, and published the interpretation of their having been produced by the feet of living birds, and gave them the name of ornithichnites."—*Owen: Palaeont.* (ed. 2d), p. 325.

He divided it into two groups: (1) Pachydactyli, with three species, and (2) Leptodactyli, with five species and three varieties; but remarks, "When I speak of species here I mean species in oryctology, not in ornithology."

"Since this is a department of oryctology hitherto unexplored, I suppose I shall be justified in proposing some new terms. I include all the varieties of tracks under the term *Ornithichnites*; and if it be convenient to speak of the subject as a distinct branch of knowledge, I should call it Ornithichnology."—*Prof. Hitchcock, in Amer. Jour. Sci. and Art*, xxix. 315.

inferior portion, to form a common uterine cavity, but open separately, as in the Birds and the Reptiles. In Huxley's newer classification, they form his group Prototheria (q. v.). They are the Oöto-coidea of Dana.

**or-nīth-ō-dēl'-phīc, a.** [Mod. Latin *ornithodelph(ia)*; Eng. adj. suff. -ic.] Of or pertaining to the Ornithodelphia (q. v.).

**or-nī-thōl'-ō-gý, s.** [Pref. *ornitho-*, and Gr. *logos*=a word, a discourse; Fr. *ornithologie*; Sp. & Ital. *ornitologia*.]

**Nat. Science.**: "The methodical study, and consequent knowledge of birds, with all that relates to them." (*Prof. Newton, in Encyc. Brit.*, xviii. 2.) It embraces Caliology (which treats of nests), Oölogy, Pterylogy, and Ornithotomy. Its earliest literature dates from Aristotle (B. C. 385-322), and every succeeding age has added its quota. That part of the science which deals with the classification of birds is in an unsettled state; but the fact that old classifications based on external characteristics are of little or no scientific value is now recognized. In the early part of this century Nitzsch made an attempt to introduce a better method. Sundevall followed, in the memoir he presented to the Academy of Sciences, Stockholm, in 1835; and Prof. Huxley, in a paper read before the Zoölogical Society (*Proc.*, 1867, 415-72), in which he made his celebrated announcement that "Birds are greatly modified Reptiles," proposed a morphological classification.

The species are parasitic on birds. *Ornithomyia avicularia* infests many birds; *O. hirundinis*, which resembles a small spider, is usually peculiar to the martin, though Van Beneden relates a case in which these insects left their feathered hosts to attack the patients in the military hospital at Louvain.

The wings, measuring fully seven inches in expanse, are velvety black, contrasted in *Ornithoptera brookeana* with spots of brilliant metallic green, replaced in *O. croesus* by fiery orange, while the body of the latter is golden and its breast a vivid crimson. The species, which are numerous, are distributed over the islands of the Malay archipelago, reaching their maximum of size and beauty in the Moluccas. (*Wallace: Malay Archipelago*.)

**Zoöl.**: The sole genus of the family Ornithorhynchidae, founded by Blumenbach (1800), the name Platypus, given by Shaw (1799), being previously taken for a genus of Coleoptera. Premaxilla and mandible expanded anteriorly, and supporting a horny beak; teeth supplied functionally by horny structures; legs short, fitted for swimming; feet webbed, each with five well-developed toes, armed with large claws, and beyond which, in the fore-foot, the interdigital membrane is extended. Tongue not extensile; tail rather short, broad, and depressed; eyes very small; fur close and soft. A single species, *Ornithorhynchus paradoxus* (Blum.) *O. anatinus* (Shaw), inhabits Australia and Tasmania. It is aquatic, and feeds on water-insects, small mollusca, and worms. The Ornithorhynchus, though mammalian in its general structure, is oviparous, laying two eggs at a time. These are about  $\frac{3}{4}$  in. in the longer, and  $\frac{1}{2}$  in. in the shorter diameter. The shell is white, strong, and flexible.

*Egypt. Mythol.*: One of the chief Egyptian divinities, the brother and husband of Isis, and, together with her, the greatest benefactor of Egypt, into which he introduced a knowledge of religion, laws and the arts and sciences. His principal office, as an Egyptian deity, was to judge the dead, and to rule over that kingdom into which the souls of the good were admitted to eternal felicity. He was that attribute of the deity which signified the divine goodness; and as an *avatar*, or manifestation of the divinity on earth, he was superior to any even of the Egyptian gods. He was styled Manifester of Good, President of the West, Lord of the East, Lord of Lords, Eternal Ruler, King of the Gods, &c. These, with many others, are commonly found in the hieroglyphic legends accompanying his figure; and the Papyri frequently present a list of forty-nine names of Osiris in the funeral rituals. Osiris has been identified with many of the Grecian divinities; but more especially with Jupiter, Pluto, and with Bacchus, on account of his reputed conquest of India. He was venerated under the form of the sacred bulls Apis and Mnevis; or as a human figure with a bull's head, distinguished by the name Apis-Osiris, and is usually represented as clad in pure white. His general attributes are the high cap of Upper Egypt, a flagellum, and sometimes a spotted skin. Under the form of the sacred bull Apis he was supposed to be always present among men. [APIS (1).]

ōs'-mī-ūm, *s.* [Gr. *osmē*=an odor.]

*Chem.*: A tetrad metallic element, discovered by Tennant in 1804. Symbol Os, atomic weight 199.2. Occurs combined with iridium, forming the native alloy osmiridium, in platinum ore. To obtain the metal, osmium tetroxide is digested with hydrochloric acid and metallic mercury, in a well-closed vessel, at 140°, the osmium being reduced and an amalgam formed. On distilling the amalgam in an atmosphere of hydrogen gas, the mercury and calomel pass over, leaving metallic osmium as a black powder. Its properties vary according to the mode of preparation. In the pulverulent state it is black, destitute of metallic luster, and has a density of 7. By passing the vapor of the tetroxide, mixed with hydrogen, through a glass tube heated to redness, the metal is deposited as a compact metallic ring, density 10. When heated to the melting-point of rhodium, it acquires a density of 21.4. It is the most infusible of all metals. In the finely divided state it is highly combustible, continuing to burn, when set on fire, till it is all volatilized. Osmium forms three chlorides: Osmious chloride, OsCl<sub>2</sub>; osmioso-osmic chloride, OsCl<sub>3</sub>; and osmic chloride, OsCl<sub>4</sub>; all produced by the action of chlorine gas on osmium. Five oxides are known: Osmious oxide, OsO; sesquioxide of osmium, Os<sub>2</sub>O<sub>3</sub>; osmic oxide, OsO<sub>2</sub>; osmious anhydride, OsO<sub>3</sub>; and osmic acid, OsO<sub>4</sub>. The first three form salts with acids, the fourth is a weak acid, and the fifth is usually regarded as an acid, but its salts are very unstable.

1. *Chem.*: Osmosis. The mixing of dissimilar substances through a porous diaphragm—a phenomenon due to the attraction which the liquids have for each other. When liquids or gases are separated by a membrane, such as a bladder, it is generally found that the quantities passing in opposite directions are unequal. In the case of water and alcohol the water passes into the alcohol, but only a small quantity of alcohol is found in the water. When a colloidal substance is on one side of the diaphragm and water on the other, the latter only passes through.

1. Ornithology:

(1) *Struthio camelus*, from the deserts of Africa and Arabia. It is the largest of all living birds, standing from six to eight feet in height, and has been known from remote antiquity [2]; Xenophon mentions it in the *Anabasis* (i. 5), as found in the plains of Artemisia, and there are frequent references to it in later Roman literature. Heliogabalus is said to have had a dish served up composed of the brains of six hundred ostriches. Hunters report that the flesh is palatable. The ostrich is hunted and bred for the sake of the quill feathers of the wings and tail, now used by ladies, though formerly ostrich plumes decked the helmets of knights, still later, the hats of the Cavaliers, and the fashion came in again for a time at the Restoration. The ostrich is a vegetable feeder, but swallows stones, bits of iron, and other hard substances to aid the gizzard in its functions. On ostrich-farms newly-hatched birds have been observed to pick up little stones before taking any food. The head and neck are nearly naked, body black, quill feathers of wings and tail white. The wings are useless for flight, but of so much assistance in running that the bird can outstrip the fleetest horse. Ostriches are polygamous, the hens lay their eggs in a common nest—a hole scratched in the sand, and the cock-bird relieves the hens in the task of incubation, which is aided by the heat of the sun. [STRUTHIO.]

(2) The name Ostrich is often given loosely to individuals of the genera *Rhea* (q. v.) and *Dromaius* (q. v.).

2. Scrip.: The *renanim*, of Job xxxix. 13, were obviously ostriches, as were the *yeenim*, of Lam. iv. 3. The *bathhayaananah*, of Lev. xi. 16, Deut. xiv. 15, Job xxx. 29, and Isa. xxxiv. 13, xliii. 20, rendered owl in the A. V., seems also to have been the ostrich, and is so translated in the R. V.

**ōut-lāw**, *v. t.* [OUTLAW, *s.*]

2. To deprive of legal force; to remove from legal jurisdiction.

**ōut-lāw-rŷ**, **\*out-law-rie**, *s.* [Eng. *outlaw*; *-ry*.] The act of outlawing; the state of being outlawed; the putting a man out of the protection of the law, or the process by which a man is deprived of that protection, as a punishment for contempt in refusing to appear when called into court.

Formerly any one might kill an outlawed person without incurring any penalty, but now the wanton killing of an outlaw is considered as murder. In this country, in the case of notorious felons, a proclamation of outlawry sometimes issues from either the governor of a state or the President of the United States, and the proclamation is usually accompanied by a promise of pecuniary reward for the delivery of the criminal to the authorities either dead or alive, the captor being thus left to exercise his own discretion as to the taking of life.

"After the several writs of *venire facias*, *distringas*, and *capias* have issued without any effect, the offender shall be put in the exigent in order to his *outlawry*; that is, he shall be exacted, proclaimed, or required to surrender, at five county courts; and if he be returned *quinto exactus*, and does not appear at the fifth exaction or requisition, then he is adjudged to be *outlawed*, or put out of the protection of the law; so that he is incapable of taking the benefit of it in any respect, either by bringing actions or otherwise. The punishment for *outlawries* upon indictments for misdemeanors is the same as for *outlawries* upon civil actions, viz., forfeiture of goods and chattels. But an *outlawry* in treason or felony amounts to a conviction and attainder of the offense, as if the offender had been found guilty. But such *outlawry* may be reversed by writ of error; the proceedings therein being, as it is fit they should be, exceedingly nice and circumstantial; and, if any single minute point be omitted or misconducted, the whole *outlawry* is illegal, and may be reversed; upon which reversal the party accused is admitted to plead to, and defend himself against the indictment."—*Blackstone: Comment.*, bk. iv., ch. 24.

1. **Ornith.:** A popular name for any nocturnal

raptorial bird, of which about 200 species are known. Their classification is in a very unsettled state. Willughby's division into two sections—one having "ears" or "horns," as the tufts of feathers on their heads were called, the other destitute of such appendages—was shown to be unnatural by Geoffroy St. Hilaire. They were formerly made a family of Accipitres, or Raptores, but are now more generally raised to an order (or at least a sub-order), Striges. Following Alphonse Milne-Edwards, a classification has been proposed, based on pterylogical and osteological characters, broadly dividing the Owls into two sections: (1) The Screech-owl, and (2) the Tawny-owl section, with (the Linnæan) *Strix flammea* and *S. stridula* as the respective types. The former is known as the Alucine (from Fleming's name for the genus, Aluco), and the latter as the Strigine section. The prevailing color of the plumage is brown, with a tinge of rusty-red, and it is exceedingly loose and soft, so that their flight (even in the larger species) is almost noiseless, enabling them to swoop upon their prey, which they hunt in the twilight. All owls cast up in the form of pellets the indigestible parts of the food swallowed. These castings may be seen under any owl-roost, and show plainly the great service these birds render to man in destroying rats and mice. They range over the whole globe.

*Chem.*: Symbol, O; at. wt., 16. A dyad element existing in the free state in the atmosphere, and in combination in the ocean. It forms about one-fifth of the former and eight-ninths of the latter. It is also present in the great majority of substances forming the earth's crust, and is the most abundant of all the elements. It was discovered in 1774 by Scheele in Sweden and Priestley in England independently, but the name was given by Lavoisier some time after. It can be obtained pure by heating black oxide of manganese, or a mixture of this oxide with potassic chlorate in a retort, and collecting the gas over water. When pure it is without color, taste, or smell. It is the sustaining principle of animal life and of the ordinary phenomena of combustion. Phosphorus and ignited charcoal burn in it with great brilliancy, and a piece of watch-spring, having at the end some lighted sulphur, exhibits in oxygen a beautiful phenomenon of combustion. It is a little heavier than atmospheric air, specific gravity=1.1. One hundred cubic inches of oxygen at mean temperature and pressure weigh 34.29 grains. Under the influence of cold and high pressure it has been reduced to the liquid state. It enters into combination in various ways, taking the place of hydrogen in the radicals of compounds formed on any of the types, HCl, H<sub>2</sub>O, H<sub>3</sub>N, &c., giving rise to oxychlorides, oxyiodides, oxynitrides, &c.

**ōŷs'-tēr**, *subst.* [A. S. *ostre*; Mid. Eng. & O. Fr. *oistre*; Fr. *huître*, all from Lat. *ostrea*; Gr. *ostreon*=an oyster, named from its shell, *ostreon*=a bone, a shell.]

1. *Zoöl.*: The genus *Ostrea* (q. v.), and especially *Ostrea virginiana*, of which there are two kinds—Sea or Rock Oysters, which arrive at maturity in about four years, and those which are artificially cultivated, and do not reach their full growth for five, and sometimes seven years. The latter are the more highly esteemed. Oysters form a very important commercial product in and about Baltimore and other points along the Atlantic coast. The Pacific coast oyster is very small, with much poorer flavor than that of the Atlantic. The American species (*Ostrea virginiana*) and the European (*Ostrea edulis*) are the most valuable known. A sandy bottom is fatal to oyster culture; for the grains get into the hinge and prevent the opening and shutting of the valves of the shell. Their food consists of minute organisms. Oysters spawn in May or June, the "spat" resembling fine slate-pencil dust. The number of ova from one female has been variously estimated from 100,000 to 10,000,000, but the most general estimate is about three-quarters of a million. The Starfish and Dog-whelk are deadly enemies to the oyster, and cause great loss to the proprietors of oyster fisheries. Oysters were known to and esteemed by the Romans. Juvenal (iv. 140-42) tells how Montanus could distinguish by the taste whether an oyster came from Circeii, the Lucrine Lake, or Rutupia (the modern Richborough). It was then a common belief that oysters and other shellfish grew fat or lost flesh as the moon waxed or waned (Cic., *de Div.*, ii. 33). They were also known to less cultured nations, as is proved by the existence of oyster shells in the kitchen-middens of Europe and America. The name is also given to some other mollusks, as Hammer-oyster, Pearl-oyster, &c. These will be found under their proper entries. [OSTREA.]

"Whoever steals oysters or oyster-brood from an oyster-bed which is private property, is guilty of felony."—*Chambers' Encyc.*

**oyster-catcher**, *s.*

*Ornithology*:  
1. *Hæmatopus ostralegus*; a handsome European bird, about sixteen inches long, common on flat, sandy coasts. The head, neck, throat, scapularies, quill-feathers, and latter half of the tail-feathers are deep glossy black, the rest of the plumage pure white. The bill, about three inches

long, is a rich ruddy color, deepest at the base; very much compressed, with a wedge-like termination. Oyster-catcher is a misnomer, for the bird feeds mostly on mussels and limpets, though it frequently takes to the water in search of food. The bird seems to lay its head sideways on the ground, and then, grasping the limpet's shell close to the rock between the mandibles, use them as scissor-blades to cut off the mollusk from its sticking place.

THE sixteenth letter and the twelfth consonant of the English alphabet is a labial sound, formed by a compression of the anterior part of the lips, as in *pull*, *papa*, *ap*. As a sharp labial it is classed with *f*, and corresponds to the flat labial *b*. *P* has but one sound in English, except when in combination with *h* it forms the digraph *ph*, which is

sounded as *f*, and occurs in words derived from the Greek. In the case of many words derived from the Greek, initial *p* is not sounded, as in *pneumatics*, *psalm*, *psalter*, *pterodactyl*. It is sometimes, but rarely, silent in the middle of a word, as in *receipt*. *P* represents an original *b* in *gossip* (Mid. Eng. *godsib*), *purse* (O. Fr. *borse*, Lat. *bursa*), *apricot* (Fr. *abricot*). An original *p* is represented by *b* in *lobster* (Mid. Eng. *loppestre*), *cobweb* (Mid. Eng. *copweb*), and by *v* in *knave* (Mid. Eng. *cnapa*). *P* is often found inserted between *m* and *t*, as in *empty* (Mid. Eng. *emtig*), *tempt* (O. Fr. *tenter*, Lat. *tento*).

military man, (3) a heathen or pagan; from *pagus* = a village. The last use of the word dates from the fourth century. Trench says that the first use of the word in this sense is in an edict of the Emperor Valentinian, A. D. 368. Christianity was first preached in the large towns, and partly on this account and partly from the greater proneness of the people of cities to adopt new opinions, it rooted itself at the great centers of population before greatly affecting the country parts; the cities were then Christian, while the country people were heathen, and the word *paganus* = a villager, consequently became synonymous with heathen (q. v.).]

"The ruin of paganism, in the age of Theodosius, is, perhaps, the only example of the total extirpation of any ancient and popular superstition."—*Gibbon: Roman Empire, ch. xxviii.*

¶ Used specially of that of ancient Rome. Licinius having made war against Constantine, A. D. 314, and again in 324, after the conversion of the latter to Christianity, was supported by the good wishes and the power of the pagan priests. Constantine believed that paganism was a danger to the throne, and began to discourage it. In 331 he ordered the destruction of the pagan temples throughout the Roman empire. Julian, in 361, began to rebuild them, but the work ceased with his death. In 385 Theodosius I. issued an edict against pagan sacrifices, and soon afterward closed the temples and the shrines. In 388 the Roman Senate renounced paganism, and in 391 it was legally abolished through the whole Roman empire, and afterward gradually died away.

1. The temple of an idol in India. They belong both to antiquity and modern times. Some are wonderfully large and magnificent. They consist of one or more quadrangular courts with towers at the corners, surrounded by a wall. Large pyramids rising in stages cover the entrance, behind which extend colonnades. Inside the courts are lustral pools, colonnades, and large halls, called *Tschultris*, which are used to lodge pilgrims in. Small side-temples appear with cupolas surmounting the accessory buildings. Behind the first court is often a second and a third, in which, finally, the chief temple stands. Although the architecture of all these constructive designs has no pretensions to artistic or stylistic importance, still a wonderfully fantastic effect is produced by a tasteless excess in peculiar ornamentation and architectural features. The most important pagodas are those of Madura, Tanjore, and Chillumbaram. The most celebrated is that of Juggernaut, in the island of Ramisseram, completed toward the end of the twelfth century. All these buildings are of a pyramidal shape, with vertical stages, which are separated by curved roofs and terminate above in the form of a cupola. Rows of small cupolas stand out from the roofs of the stages.

"Wild crests as pagod ever decked."  
*Scott: Lady of the Lake*, i. 41.

After some discussion, Captain Nares [Dec. 1875] decided upon calling the frozen sea, on the southern border of which we were wintering, the '*Palæocrustic Sea*,' the name being derived from the two Greek words *palaios* ancient, and *krystallos* ice. Through Anchitherium (q. v.), the Palæotheridæ approach the Equidæ so closely, that it is probable both families are descended from a common form.

pāl-æ-ð-zō'-īc, pā-lē-ð-zō'-īc, a. [Pref. palæo-, and Gr. zōē=life, existence.]

Geol.: The term generally applied to the series of strata commencing with the first rocks which have traces of life, and ending with the upper part of the Permian. As the uppermost strata of all are called by some Quaternary, those immediately beneath these Tertiary, and those a stage further down Secondary, one would expect the basal rocks of the series to be called Primary. But unhappily that term was misused in the infancy of geology, being applied to granite, gneiss, &c., in consequence of which, to avoid confusion, it was allowed to become, for a time at least, extinct—the word palæozoic being substituted in its room. Sir Charles Lyell, however, in his Student's Elements of Geology, retained its use, dividing the "Primary or Palæozoic," from beneath upward into Laurentian or Archæan, Cambrian, Silurian, Devonian, Carboniferous, and Permian (q. v.). Judged by the thickness of the beds, the Palæozoic strata took a vastly longer time to deposit than all the strata which succeeded, from the close of the Permian to the present time. The palæontological break between the Palæozoic and the Secondary rocks is very considerable. (For details see the various divisions of the period.) [GEOLOGY, FOSSIL.]

*Palladian-architecture*, s. A style of architecture introduced by Palladio, and conforming closely to the precepts of Vitruvius. As regards style, it falls under the category of Roman Renaissance, but of rather a confused kind, for he adorned buildings of every kind, and of most varied purposes and arrangement, with classical temple-portals, without taking into consideration their object or the requirements of the building as a whole, so that the order was frequently carried up through several stories without any reference to its arrangement. The lower story of palaces built by Palladio, the greater part of which are at Vicenza, is generally of rustic work, while the upper stories have

pilasters or a colonnade; occasionally, however, pilasters or arcades are introduced on the ground-floor. The works of Palladio remained for a long period the model for an entire style.

2. *Fig.*: That which affords defense, protection, or safety; a safeguard.

**II. Technically:**

1. *Class. Antiq.*: A celebrated statue of Pallas or Minerva, on the preservation of which depended the safety of the city of Troy. (*Virgil: Æneid*, ii. 166-183.) This circumstance being known to the Greeks during the Trojan war, Ulysses and Diomedes, by the advice and aid of Helenus, son of Priam, climbed secretly by night over the ramparts of Troy and carried it off. Some writers assert another statue was taken, and that the real *Palladium* was conveyed from Troy to Italy by Æneas, 1183 B. C., and preserved by the Romans with the greatest secrecy in the temple of Vesta.

2. *Chem.*: A tetrad metallic element discovered by Wollaston in 1803. Symbol, Pd; at. wt. 106.6; specific gravity 12.1. It is found, associated with platinum and gold, in South America, and is extracted from the gold in which it is found, by fusing with silver, dissolving out the palladium, &c., with nitric acid, removing silver with common salt, and then adding ammonia and hydrochloric acid, which throws down ammonia-chloride of palladium as a yellow powder. This, on ignition, yields the pure metal. It resembles platinum in its malleability and ductility, but is more fusible, less dense, and has a more silvery appearance. It is slightly soluble in concentrated hydrochloric and sulphuric acids, more so in nitric acid, but dissolves freely in nitrohydrochloric acid. Its surface is blackened by tincture of iodine, which has no effect on platinum. Like platinum, it forms two classes of compounds, viz., palladious compounds, in which it is bivalent, and palladic compounds, in which it is quadrivalent.

3. *Min.*: An isometric native metal, not found pure, but mostly alloyed with a little platinum and iridium. Sometimes found in minute octahedrons, but mostly as grains, with native platinum, in Brazil. Hardness, 4.5-5; specific gravity, 11.3-11.8; luster, metallic; color, steel-gray.

*palladium-alloys*, s. pl.

*Chem.*: Palladium unites with most metals, but few of its alloys are of practical importance. An alloy of one part palladium with 100 parts steel is well adapted for cutting instruments requiring a smooth edge. An alloy of one part silver and nine parts palladium is used by dentists. Its alloys with gold are of a gray or almost white color.

*palladium-bases*, s. pl.

*Chem.*: Compounds of palladium with ammonia and ammonio-organic radicals, not known in the free state, but in combination as chlorides and oxides. Chloride of palladamine,  $N_2H_6PdCl_2$ , is formed by adding ammonia to a solution of palladious chloride. The oxide forms a strong base. The ethyl compound, pallad-ethylamine chloride,  $(C_2H_5)_2(NH_2)_2PdCl_2$ , is formed by the action of ethylamine on palladious chloride. It becomes dark yellow and crystalline.

*palladium-chloride*, s.

*Chem.*: Palladium forms two chlorides: Palladious chloride,  $PdCl_2$ , obtained by dissolving the metal in hydrochloric acid containing a little nitric acid; and palladic chloride,  $PdCl_4$ , obtained by slightly heating palladious chloride in strong nitrohydrochloric acid. Both compounds are very dark in color.

*palladium-gold*, s. [PORPEZITE.]

*palladium-oxide*, s.

*Chem.*: The protoxide,  $PdO$ , is obtained by decomposing the nitrate at a moderate heat. It is a dark gray or black powder, slightly soluble in acids. The dioxide,  $PdO_2$ , is not known in the free state. Alkalies throw down from palladic chloride the hydrated dioxide mixed with the alkali.

*pāl-lā'-dī-ūm-īze*, v. t. [Eng. *palladium*; -ize.] To cover or coat with palladium in lieu of zinc, as in galvanizing.

*Ecclesiology*: The Sunday immediately preceding Easter. It commemorates the triumphal entry of Jesus into Jerusalem, when the multitude strewed palm "branches," or rather leaves, for the typical palms, like those of Palestine, have no branches (John xii. 13). In some Roman and High Anglican churches genuine palms are used for decorations on that day, but they are too rare and expensive for ordinary use. A substitute has therefore been found in an early flowering willow (*Salix caprea*), which is popularly called a palm [I. 2 (2)].

It is obtained by saponifying palm oil with potassic hydrate, decomposing the resulting soap, and purifying the separated fatty acid by crystallization from alcohol. It is a colorless, solid body, without taste or smell, insoluble in water, very soluble in alcohol and ether, melts at 62°, and resolidifies on cooling in a mass of leafy crystals. The first two are prepared by heating palmitic acid with glycerin in sealed tubes, and the third by heating a mixture of monopalmitin and palmitic acid to 250° for thirty hours. They are all crystalline fats. Tripalmitin is identical with the natural palmitin of fats, such as palm-oil, from which it may be obtained by repeated crystallization from alcohol and ether.

**Pathol.:** Loss of the power of motion. It is a symptom of disease, usually of apoplexy. The two causes on which it depends are an affection of a nerve or nerves, or a morbid state of the nervous centers, the brain or spinal cord. Under the former head poisoning of nervous matter or any morbid process impairing the nerves or solution of continuity, or pressure may cause it; under the latter, it is due to a morbid state of the centers of the nervous system. The commonest form is hemiplegia, a paralytic stroke on one side or half, which may be complete, profound, or incomplete. The upper and lower extremities, the muscles of mastication, and, when complete, those of the face, on one side of the body, are all affected. Consciousness may not be lost, but the patient cannot stand. No voluntary movements can be performed; sometimes no reflex, involuntary muscular movements, or only those of the lower extremity, are performed, and only partially and painfully. In some cases the eye can be shut, but not opened [Ptosis], owing to paralysis of the third nerve. The brain lesion and the palsy are on opposite sides owing to the decussation of the pyramidal columns of the *medulla oblongata*. Brown-Sequard has found exceptions to this rule, and also to the body and face being paralyzed on the same side. It is rare in the spinal cord, paraplegia or palsy of both extremities being the usual form of lesion there. There are six forms:

Cerebral, spinal, epileptic, choreic, hysterical, and peripheral, their frequency being in the order named. Palsy is uncommon but serious in the young, and most common in advanced life. There are four modes of termination: (1) Death; (2) complete recovery with wasting muscles; (3) partial recovery with rigid muscles; (4) complete recovery. Recovery begins with the speech, tongue, and face, the lower limb next, and, if at all, a good while after, the use of the upper limb returns. In hysterical hemiplegia the lower limb, instead of being dragged by a rotatory movement, is usually dragged straight forward.

"The *palsy*, and not fear provokes me."

Of late years, the verisimilitude of panoramas has been greatly increased. The spectators stand on a central platform, and the painting forms the boundary of a circular building, while the space from the platform to the painting is realistically treated. This has been done with great effect in panoramas of battle-scenes, the foreground being strewn with shattered arms, lay-figures of men and horses, and the juncture of the mass and the painting so skillfully effected that it is difficult to tell where one ends and the other begins.

*Philos.*: The view that God and the universe are identical. It was taught in India in the Vedantic system of philosophy, one of the six leading schools of thought, and to this day it is widely accepted, both by the instructed Brahmins and by the common people. Pantheism is believed to have been the creed of various Greek philosophers, as of Anaximander of Miletus (B. C. 610-547), Pythagoras (B. C. 610-547), and Xenophanes (B. C. 540-500). It was held by John Scotus Erigena, A. D. 874. In the latter part of the twelfth century it was taught by Amalric of Chartres, a dialectician and theologian. Pope Innocent III. forced him to recant his views, notwithstanding which his bones were dug up and burnt in 1209. John, Bishop of Strasburg, in a rescript against the Brethren of the Free Spirit, published in 1317, attributed to them this, among other tenets. "God is formally whatever exists." By many Spinoza is considered to have revived Pantheism, but his teaching in this respect has been misunderstood. [SPINOZISM.] In the Pantheism of Schelling God is considered as the Absolute Being, revealing Himself in external nature and in human intelligence and freedom, thus closely approaching the dictum of St. Paul, "In Him we live, and move, and have our being" (Acts xvii. 28; cf. Col. i. 17). It is noteworthy that the Greek poet Aratus, quoted by St. Paul, is distinctly pantheistic, and his lines might have served for the germ of the better known, but not less beautiful passage in Virgil (*Georg.* iv. 219-227). [See example under Pantheist.]

**pān'-thē-ist**, s. [Eng. *panthe(ism)*; *-ist*.] One who believes that God and the universe are identical.

height, exclusive of the flat dome surmounting the upper cornice, 102 feet, the dome being 36 feet high. The porch is octastyle, and is 103 feet wide. The two square towers on the summit of the building, called in Rome "Asses' Ears," have been recently removed.

The pantograph is principally useful to the draughtsman in enabling him to mark off the principal points in a reduced copy, through which the lines may afterward be drawn by the usual methods of construction. **II. Manuf.:** A material made in thin sheets from a pulp of rags, esparto grass, straw, wood, and other fibers, and used for writing or printing upon, or for wrapping. The name is derived from papyrus, an Egyptian reed, whose stalk furnished the principal material for writing upon to the nations bordering upon the Mediterranean for so many centuries. [PAPYRUS.] Paper is manufactured principally from vegetable fiber, reduced to a pulp by boiling and mechanical means. Over 400 different materials have been suggested or actually used for paper manufacture, but rags and esparto form the best materials. Old written or printed paper is also extensively used for remanufacture. The oldest manuscript written on cotton paper in England is in the Bodleian collection of the British Museum, and bears date 1049. The most ancient manuscript on the same material in the Library of Paris is dated 1050. Up to the beginning of the nineteenth century, all paper was manufactured by hand, in molds of various sizes. The different kinds of paper manufactured for printing, drawing, correspondence, &c., will be found under their proper names. Machine-made paper is manufactured in a continuous sheet, and newspapers of large circulation are printed on webs several miles in length, the paper not being cut until after the printing. **paper-money, s.**

*Comm.*: Paper-money may be either with or without forced currency enacted by law in the country of its issue and circulation. In the former case, the holder has no right to claim coin in exchange, as the paper supersedes the coinage and common use of metallic money. In the latter case, it is simply a promise to pay coin, voluntarily accepted at the calculated current estimate of its financial value. Of forced currency, otherwise called inconvertible paper-money, there have been abundant examples in the past century. France issued its *assignats* between 1789 and 1796, during which years they fluctuated between par, or an equal value with silver coin, and a depreciation of 99-100 per cent., thus utterly canceling their value in exchange. England restricted its specie payments, wholly or partially, from 1797 to 1821, with a resulting fluctuation between an equal or par value of paper-money and gold coin and a depreciation of 25½ per cent. at the lowest point. The financial history of all other countries of Europe and America presents exactly similar examples down to the present time. In the case of paper-money without forced currency, such as bank-notes promising to pay, on demand, a given sum in coin, the chance of loss to holders is guarded against by the necessity, enforced by law or prudence, of keeping up such a reserve of coin as experience proves to be generally sufficient.

The pulp is rolled into thick sheets, and a sufficient quantity is taken to form the article of ornament desired; this is subjected to heavy pressure between cameo and intaglio dies and afterward dried. Its surface may now be gilded, painted with oil or size colors, or varnished. The toughness and lightness of this material peculiarly adapt it for table-ware, table and desk furniture, interior architectural and other ornaments.

pa-rāb'-ō-la, s. [Latin, from Gr. parabolē, so called from its axis being parallel to the side of the cone; Ger. parabel; Fr. parabole; Ital. parabola.] [PARABLE, s.]

Math.: In conic sections, a plane curve of such a form that if from any point in the curve one straight line be drawn to a given fixed point, the other perpendicular to a straight line given in position, these two straight lines will always be equal to one another. The given fixed point is called the focus of the parabola. The straight line given in position is called the directrix (q. v.). A straight line drawn perpendicular to the directrix, and cutting the curve, is called a diameter, and the point in which it cuts the curve is called the vertex of the diameter. The diameter which passes through the focus is the axis, and the point in which it cuts the curve is the principal vertex. A straight line which meets the curve in any point, but which when produced both ways does not cut it, is called a tangent to the curve at that point. A straight line drawn from any point in the curve, parallel to the tangent at the vertex of any diameter, and terminated both ways by the curve, is called an ordinate to that diameter. The ordinate which passes through the focus is called the parameter of that diameter. The part of a diameter intercepted between its vertex and the point in which it is intersected by one of its own ordinates, is called the abscissa of the diameter. A straight line drawn from any point in the curve, perpendicular to the axis, and terminated both ways by the curve, is called an ordinate to the axis. The ordinate to the axis which passes through the focus is called the principal parameter, or latus rectum, of the parabola. The part of the axis intercepted between its vertex and the point in which it is intersected by one of its own ordinates is called the sub-tangent of the axis. If a tangent be drawn at any point, and a straight line be drawn from the point of contact perpendicular to the axis, it and terminated by the axis, that straight line is called a normal. The part of the axis intercepted between the intersections of the normal and the ordinate is called a sub-normal. [DIRECTRIX, TANGENT.]
