**Roentgen rays, Röntgen rays** (pron. rōnt'-gēn), *X-rays, s. pl.* [See definition.] Certain invisible non-refractable rays emanating from the surface of an electrically excited vacuum tube opposite the cathode electrode, having power (1) of permeating objects impervious to light or heat rays, (2) of discharging electrified bodies or surfaces exposed to them, (3) of exciting fluorescence in fluorescent salts, and (4) of affecting sensitized photographic plates in a manner similar to light rays. They were discovered by William Konrad Röntgen, professor of physics at the Royal University of Würzburg, in Germany, towards the close of the year 1895. Not being certain as to the nature of the rays, Professor Röntgen provisionally termed them the X-rays, and they are still commonly known by that name, though the name Roentgen rays is also common. At the beginning of the year 1894, Professor Paul Lenard, at Bonn, announced the discovery that by using a Crookes tube in which the cathode rays were made to impinge on a thin sheet of aluminum a screen covered with a phosphorescent substance outside the tube could be made to phosphoresce by their action. That, further, it was possible by means of these cathode rays, as he supposed, to obtain "shadows" of objects through optically opaque substances and to produce an impress of these "shadows" on photographic plates, which could afterwards be developed and fixed by ordinary photographic processes. Working upon this line of investigation Professor Röntgen inclosed an excited vacuum tube in blackened cardboard treated with barium platino-cyanide, and discovered that the cathode beam is accompanied by certain rays not before known, which, although of phosphorescent and photographic quality, differ from any known form of light in not being susceptible of refraction. These were the wonderful X-rays, which have opened up to the world a new region of scientific exploration. Besides obtaining radiographs of the bones in the living human hand Professor Röntgen radiographed a compass card completely inclosed in a metallic box. From these and similar experiments he inferred that these newly discovered rays generated in the neighborhood of the Crookes tube by the electric disturbance set up by the passage of an electric current possessed the property of passing through all bodies in their path, and that some bodies, being less permeable than others, cast a shadow. Subsequent experiments have established the fact that the transparency of a body to the X-rays is proportional to its density. As to the real nature of the X-rays eminent physicists differ, but all agree that they must be regarded as of a nature essentially different from ordinary light. They cast an invisible life-size shadow of the objects that obstruct their passage, which invisible shadow if received on a surface which phosphoresces or glows under their action becomes a visible shadow, which makes the wonderful revelations of the fluoroscope possible. If this invisible shadow is received on a sensitive plate, the plate is impressed, and upon subsequent development the representation of the obstructing object is perpetuated on the photographic plate. The Roentgen rays pass very freely through the various tissues and fluids of the body, but are obstructed by the bones; hence it is possible to take a perfect shadow-picture, or radiograph, as it is now generally called, of the bones of a living person or animal. By far the most important result of the discovery has been the application of the new rays to surgery. Radiographs of bones fractured, splintered or diseased, have been of much practical use in aiding diagnosis and treatment. Attempts more or less successful have also been made to radiograph internal organs and tissues other than bones. Needles, bullets and other foreign objects in various parts of the body have been successfully located, and the invention of the fluoroscope (*q. v.*) has made it possible to use the Roentgen rays, not only in surgical cases, in searching for fractures, etc., but to undertake anatomical studies and make the diagnosis of internal diseases. The full physiological effects of the X-rays are not yet clearly understood. Experiments show that long exposure to the rays causes acute maladies of the skin and also baldness, and in some instances legal proceedings have been brought for damages thus occasioned to patients while undergoing X-ray treatment. A very interesting and practical application of the rays was made at Pittsburg, Pa., early in March, 1897. By means of a very powerful X-ray apparatus, designed by Professor Reginald A. Fessenden of the Western University of Pittsburg, tests were made that prove that blow holes in heavy armor can be detected by the aid of radiography. It is reported that with the aid of the fluoroscope a slab of steel four inches thick was pierced by the eye, and that perfect radiographs were produced through sheets

and articles of steel. Ever since Röntgen made his discovery scientific investigators throughout the world have been actively at work on the nature and character of the rays generated by the electrically excited vacuum tube, and Professor E. Friedrich, of the Vienna Academy of Sciences, claims to have discovered certain "black rays" which he terms Kritic rays, or critical rays, that reveal with absolute reliability the entrance of death into the body. In his letter addressed to the Imperial Academy of Science, in January, 1897, he says: "The Kritic rays are directed out of a vacuum tube and are so piercing that they immediately penetrate the body upon which, for the purposes of experiment, the investigator has turned them. The rays produce on the photographic plate images which are of a different character according as they are taken of a living or of a dead body. The photographing of a hand is the easiest experiment in test work of this kind. If, when it is laid on the photographic plate and subjected to the Kritic rays, it appears as the living hand does under the Roentgen rays, viz., with all the bones distinguished, then beyond question the person is alive. If, however, the hand does not yield its characteristic form under this process the person to whom it belongs is undoubtedly dead." As to the value of Professor Friedrich's representations time and experience must determine.

The grooves in the rolls are so made as to be coactive in giving the required form to the heated iron passing between them. The face of each roller has a series of grooves gradually decreasing in size toward one end. The iron is passed through each in succession, being thus gradually reduced in size and increased in length. By this operation two objects are effected: (1) The scoriae and other impurities are expelled, and (2) the required form, whether of plate, bolt, or bar, is given to the metal.

¶ *The Epistle of Paul the Apostle to the Romans:* *New Test. Canon:* The first in arrangement (not in date) of St. Paul's Epistles. It was written from Corinth (cf. xvi. 23 with 1 Cor. i. 14; 2 Tim. iv. 20) on his third missionary journey, apparently in the

spring of A. D. 58, a year after the First, and half a year after the Second Epistle to the Corinthians, and a few months after the Epistle to the Galatians (cf. Rom. xv. 25, 26 with Acts xix. 21, xx. 1-3, xxi. 15). In writing it he employed an amanuensis, Tertius (Rom. xvi. 22), and sent it by the hand of Phebe, a servant to the church at Cenchrea, the port of Corinth (verse 1). When Paul penned it he had never been to Rome (Acts xix. 21; Rom. i. 10-13, &c.), and had not, therefore, directly founded its church. Among those present on the day of Pentecost, there were "strangers of Rome, Jews, and proselytes" (Acts ii. 10). If, as is possible, some of them returned home after seeing the miracle, and listening to the impassioned preaching of St. Peter, they may have been the first to sow the seeds of Christianity in the metropolis, and Peter have been the indirect founder of the Roman Church. The tradition that he founded it more directly, A. D. 41, originated with Jerome, who died A. D. 420, and is difficult to reconcile with Acts xv. 7-11, and Gal. ii. 1-9. It is remarkable that St. Paul makes no allusion in his epistle to any pastor of the Roman Church, as if it had not been organized under ecclesiastical officers. The Church seems to have been partly Jewish (ii. 14-17, vii. 1), and partly Gentile (i. 6, 13, xi. 13). The epistle opens with an introduction in which Paul declares his apostleship (i. 1-7), commends the faith of the Roman Christians, whom he earnestly desires to visit (8-13), proclaims that he is not ashamed of the gospel of Christ (14-17), and then glides almost insensibly into the most systematic treatment of Christian doctrine and practice to be found in the New Testament. Trying the Roman and other parts of the Gentile world by the light of nature (19-20), he shows how fearfully corrupt the heathens then were, and how destitute of excuse for their conduct (18-32). The Jew is next shown to have flagrantly violated the Divine law revealed to him, and it is proclaimed that all the world stands guilty before God (ii., iii. 1-19). Justification is in no case to be obtained by the "deeds of the law" (20), but is granted freely by God's grace to those who have faith in the propitiatory sacrifice of Christ (23-31). After showing that the same principle was in force in the times of Abraham and of David (iv.), he enumerates some of the blessings which faith brings in its train; as, peace (v. 1), patience, experience, hope, and eternal life (2-21). Nor does the doctrine of free grace encourage its recipients to carelessness of moral practice. Paul and other believers are dead to sin, and arespiritual men continually in conflict with it (vi., vii., viii. 1-15). Led by the Spirit of God, admitted to the privileges of sonship, aided in prayer by the Spirit of God, they shall never be separated from the love of Christ, and through Him shall be more than conquerors (16-39). The doctrine of the Divine sovereignty is next treated of with respect to nations and individuals, passionate desire being expressed for the salvation, ultimately to take place, of the Jewish people (ix.-xi.). Then follow practical exhortations with respect to Christian conduct in the several relations of life—as to friends, to enemies and persecutors, to the Roman civil authorities, to the church in general, and to weaker brethren in particular (xii.-xv. 13). After intimating more minutely than before his own intended movements (14-33), and sending many salutations from himself and his companions (xvi. 1-23) he closes with a benediction (24-27). No eminent critic has disputed the genuineness of the epistle which is acknowledged even by Baur. It is first alluded to by Clement of Rome, A. D. 95, by Ignatius, by Polycarp, by various Gnostics, by Justin Martyr, by the writer of the epistle to Diognetus, &c., till finally Irenæus, about 185, refers to it by name. [PAULINE THEOLOGY.]

**Roman-alum, s.** An alum extracted from the volcanic rocks of the solfaterra near Naples, and containing more alumina than the common alum.

**Roman-architecture, s.**

*Arch.:* The Composite order. During the first centuries of the Roman state the buildings erected are to be ascribed to the Etruscans, Etruscan art forming the basis of Roman architecture; subsequently, in the time of the Scipios, the taste for Grecian art was mingled with it. Greek architects were soon introduced into Italy; and thus Roman architecture, like Roman art in general, conformed as nearly to the Grecian as the Roman genius permitted it to do. The reticulated masonry [OPUS-RETICULATUM] is peculiar to Roman architecture. It consists of square cuneiform stones or tiles, with the broad ends facing outward, and arranged in lines, which do not run horizontally, but intersect each other like network. The base and the corners of these walls consist of horizontal layers of square-stone, and there are sometimes intersecting belts of the same kind of material in the middle of the network itself. Among all the forms which the Romans borrowed from foreign sources, the art of vaulting, which they learned from the Etruscans, was that which they most skillfully adapted and

developed, and rendered the most distinctive expression of the peculiarity of their own style. Two modes of construction consequently appear side by side in Roman architecture, viz., the Italian arch and the Grecian column.

**Roman Catholic, a. & s.**

**A. As adj.:** Of or belonging to the Roman Catholics. [B.]

**B. As substantive:**

1. *Church History (pl.):* The adherents of the Church which is Roman in its center and catholic in its circumference. The word Catholic, meaning Universal, was used in early Christian and mediæval times for the great ecclesiastical organization with which the vast mass of Christians were connected. When the Reformation took place, the Protestants refused to admit that the Church which they had left was entitled to call itself Catholic, and prefixed the adjective Roman, while its adherents claimed the designation Catholic without any limiting adjective. All admit it to be catholic in the sense of being the largest Church in Christendom, and all other episcopal Churches acknowledge the validity of the orders of its clergy. The number of Roman Catholics in the world has been estimated at 152,000,000, which is far too low; at 213,518,063, at 214,370,000, and at 218,000,000. Taking the second of these estimates, the distribution of Roman Catholics over the world is believed to be: In Europe, 150,684,050; Asia, 8,311,800; Africa, 2,656,205; America, 51,422,566; Australia and the adjacent islands, 443,442, making a total of 213,518,063.

The radical difference between Protestants and Roman Catholics lies in their conception of the Church. The latter hold that the Roman Church is the Church of the New Testament, with authority to define articles of faith, and that all bodies not in communion with her are either heretical or schismatic. Protestants' views differ widely—from that of the High Churchman who, while denying the universal jurisdiction of the Pope, admits that as Bishop of Rome he is *primus inter pares*, to that which considers him the Man of Sin and the Antichrist of Scripture. From this fundamental difference all others necessarily follow. Roman Catholics hold the Apostles', the Nicene, and the Athanasian Creeds, Transubstantiation and the sacrifice of the Mass (q. v.), Seven Sacraments [SACRAMENT, s., II. 2.], the necessity of Confession [PENANCE], the existence of a Purgatory (q. v.), the Immaculate Conception of the Virgin Mary, and the Infallibility of the Pope.

It is of quite modern date, and was originally only the shirt-collar turned down over the stock.

**Roman-law, subst.** The civil law; the system of jurisprudence of the ancient Roman Empire.

¶ Roman law, like every other law, originated in custom. Its first great stage of development was reached in the publication by the Decemviri of the Twelve Tables, B. C. 451. These were supplemented rather than superseded under the republic and the empire. Under the former, enactments made in the *Comitia Centuriata* and the *Comitia Tributa*, the *Senatus Consulta*, and the Magisterial Edicts, and, under the latter, the *Imperial Constitutiones* had the force of law. Finally the Justinian Code, A. D. 529, gave symmetry to the whole. The Roman law has more or less affected the legislation of all European countries.

**Roman-literature, s.**

*Literature:* For nearly 500 years from the accepted date of the foundation of Rome its people had no literature, and when at length they attempted to supply the great want, they wrote in Greek, and in a servile manner followed Greek models. Ennius, who was born B. C. 249, laid the foundation of a genuine Latin literature. It gradually developed, culminating in the Augustan age.

Cicero flourished B. C. 60; Cæsar, 54; Cornelius Nepos, 44; Virgil and Horace, 28; Livy and Ovid, 14. About A. D. 180 the Roman literature began to decline, and by 539 it was in the last stage of decay.

**Roman-nose, s.** A nose somewhat aquiline, like that of an ancient Roman.

**Roman-numerals, s. pl.**

*Math.:* The Roman system of numerals has been deduced by Latin scholars from inscriptions and references in books rather than from any known Latin arithmetic. The Romans had seven prime figures: I for 1, V for 5, X for 10, L for 50, C for 100, D for 500, and M for 1,000. D was I∩ and M was originally CI∩. When ∩ was affixed to any number, it indicated that that number was multiplied by 10. Thus I∩∩ stood for 5,000; I∩∩∩ for 50,000. C had to be prefixed to a number as many times as ∩ was affixed. When present in such quantities it doubled the number indicated by the reversed Cs. Thus I∩∩ was 5,000, CC∩∩∩ was 10,000, and so on.

†2. *Astron.:* The moment from which one begins to calculate the time of revolution of a planet.

3. *Bot.:* The radix or descending axis of a plant. The tendency downward is very powerful. Unlike the symmetrically placed branches of the stem, the ramifications of the roots look irregular as if they arose from any part of the surface. There is in them, however, a certain Rhizotaxis (q. v.). The roots of Dicotyledons are exorhizal, those of Monocotyledons endorhizal, and those of Acotyledons heterorhizal. A root has no perfect bark, true pith, medullary sheath, or true leaves, and only a thin epidermis, a few stomata, and very rarely leaf-buds. Its growth is chiefly at the lower extremity. The body of a root is called the caudex, its minute subdivisions the fibrils or radicles, and their ends the spongioles. A primary root is one formed by the downward elongation of the axis of the embryo, and is, therefore, in a line with the stem; secondary or lateral roots, like those of ivy, spring laterally from the stem and from the primary root. When the primary root is thicker than the branches which proceed from it, it is called a tap root, when it is no thicker than its ramifications, which conceal it from view, the root is said to be fibrous. Other forms of roots are conical, fusiform, napiform, rotund, nodose or coralline, moniliform, tuberose, or (finally) pre-morse. Most roots are terrestrial, a few are aerial, and a few aquatic. The chief functions of the root are to anchor the plant firmly in the ground, and to transmit upward to the stem and leaves absorbed nutriment from the soil. Roots require air, and in some cases in gardens obtain it by pushing their way into old drains.

*Bot.*: Roseworts; an order of plants placed by Lindley under his Rosal Alliance. Calyx four or five-lobed, free or adhering to the ovary; petals five, perigynous, equal; stamens indefinite, rising from the calyx just within the petals, curving inward in aestivation; ovaries several or only one; ovules two or more, generally suspended; fruit either one-seeded nuts or acini, or several-seeded follicles; the leaves are simple or compound, generally with two stipules. Herbaceous plants or shrubs. The Rosaceæ are closely akin to the Pomaceæ, the Drupaceæ, the Sanguisorbææ, and some other orders. They are divided by Lindley into five families or tribes, Rosidæ, Potentillidæ, Spiræidæ, Quillaidæ, and Neuradææ. The Rosaceæ occur chiefly in the temperate and cold parts of the northern hemisphere; when they occur in the tropics it is generally on high land. There is no unwholesome plant in the order. They are in general astringent, and have been regarded as febrifuges. [For details, see Agrimonia, Brayera, Fragaria, Geum, Gillenia, Potentilla, Rosa, Rubus, Spiræa, and Tormentilla.] In 1846 Lindley enumerated thirty-eight genera and estimated the known species at 500. Sir Joseph Hooker, in 1870, considered the genera to be seventy-one and the species 1,000, but he includes Lindley's Pomaceæ and Drupaceæ.

A red dye, occurring in commerce under the names aniline red, azaline, fuchsine, magenta, roseine, &c. It is prepared by heating a mixture of dry arsenic acid and aniline to 140°, for six or eight hours. It forms colorless crystalline plates, which are colored red on exposure to the air, insoluble in water, but soluble in alcohol. The aniline reds used in dyeing are generally monoacid salts of rosaniline more or less pure. Rosaniline acetate,  $C_{20}H_{19}N_3 \cdot C_2H_3O_2$ , forms beautiful large crystals, which are more soluble in water than the other salts. Rosaniline hydrochloride,  $C_{20}H_{19}N_3 \cdot HCl$ , prepared in France and Germany, crystallizes in golden-green rhombic octahedra, and is very soluble in alcohol, with a fine red color.

II. Technically:

1. *Compar. Relig.*: A string of beads by means of which account is kept of the number of prayers uttered. Tylor (*loc. inf. cit.*) thinks that its invention or adoption was due to the fact that, with advancing civilization, prayers, from being at first utterances as free and flexible as requests to a living patriarch or chief, stiffened into traditional formulas, whose repetition required verbal accuracy, and whose nature practically assimilated more or less to that of charms.

"This devotional calculating-machine is of Asiatic invention; it had, if not its origin, at least its special development among the ancient Buddhists, and its 108 balls still slide through the modern Buddhist's hands as of old, measuring out the sacred formulas whose reiteration occupies so large a fraction of a pious life. It was not till toward the middle ages that the rosary passed into Mohammedan and Christian lands, and finding there conceptions of prayer which it was suited to accompany, has flourished ever since."—*Tylor: Prim. Cult.* (ed. 1873), ii. 372.

2. *Roman Church*:

(1) A form of prayer in which the *Hail Mary* (q. v.) is recited 150 times in honor of the Virgin Mary. It is divided into fifteen decades, each of which begins with the *Our Father* [LORD'S PRAYER], is accompanied by meditation on one of the Mysteries in the life of Our Lord, and ends with the Doxology. This is properly called the Dominican, or Great Rosary, but the name is often popularly given to the Chaplet, which contains but fifty aves. The fifteen Mysteries which should be meditated on during the recitation of the Rosary are divided into three series, each corresponding to a chaplet:

1. JOYFUL.—The Annunciation, the Visitation, the Birth of Jesus, the Presentation in the Temple, the Finding in the Temple.

2. SORROWFUL.—The Agony in the Garden, the Scourging at the Pillar, the Crowning with Thorns, the Carrying of the Cross, the Crucifixion.

3. GLORIOUS.—The resurrection, the Ascension, the Descent of the Holy Ghost, the Assumption, and the Coronation of the B. V. M.

There are also the Rosaries of St. Bridget, of the Seven Dolors, of the Immaculate Conception, of the Five Wounds, and the Crown of Our Savior.

Found intimately associated with native gold in California.

C., 136 during the reign of Ptolemy Epiphanes. The inscription is in hieroglyphic, in demotic, and in Greek. It was deciphered by Dr. Young, and formed the key to the reading of the hieroglyphic characters. It was captured by the English on the defeat of the French forces in Egypt, and is now in the British Museum.

Brazilian rosewood is imported in large slabs. Its colors are from light hazel to deep purple, or nearly black. It is very heavy, and is used for cabinet work, especially as veneers. **A. As adj.**: Of or belonging to Rosenkreuz or the society which he is said to have founded.

**B. As subst. (pl.)**: A mystic secret society which became known to the public early in the seventeenth century, and was alleged to have been founded by a German noble called Christian Rosenkreuz, A. D. 1388. He was said to have died at the age of 106. The society consisted of adepts, who perpetuated it by initiating other adepts. It did not interfere with religion or politics, but sought after true philosophy. The Rosicrucians pretended to be able to transmute metals, to prolong life, and to know what was passing in distant places. Many contradictory hypotheses have been brought forward regarding the Rosicrucians, and as it is admitted that their secret was never revealed, it is open to doubt if there was one to reveal. They are said to have died out in the eighteenth century. The writer of the article "Rosicrucians" in the *Encyclopædia Britannica* (ed. 9th) believes that the Rosicrucian Society never existed, and that the persons making it known did so simply for a jest. As, however, the public believed in its existence, individuals from time to time declared that they belonged to it. Called also Brothers of the Rosy Cross.

1. Resin with a little water remaining after nearly all the oil has been distilled off.

2. Resin with all the water distilled away. The solid residuum is then black, and is a compound of several hydrocarbons. It is called colophane or fiddler's rosin, and is applied to the hair of violin,

viola, and violoncello bows to give them the necessary bite upon the strings. Rosin for the double bass is made of equal proportions of ordinary rosin and white pitch.

**\*rōs'-ma-rine** (2), *subst.* [Norwegian *rosmar*=a walrus (*ros*=a horse, and *mar* (Lat. *mare*)=the sea), from which is formed Modern Latin *rosmarus*, now the specific name of the Walrus. There is no connection with the Latin *ros marinus* [ROSEMARY]. The confusion seems to have arisen from a passage in Olaus Magnus (ed. 1558, Antv.) "ut rorulento dulcis aquæ gramine vescantur." This appears in a German edition of 1567 (where the animal is called Rossmar) as "dem süssen grasz." Gesner has simply "gramine pascitur." He notes that Germans living on the seaboard call it *ros-tinger*, that in Moscovy or Scythian Hungary, not far from the source of the Tanais, it is called *morsz*; and that some believe the Modern Lat. *rosmarus* to be formed from a (M. H.) Ger. *rusósz*, "which seems to have been coined to express the impetus and rushing sound with which the animal moves through the water."

Rosmarine.

(From Olaus Magnus, *loc. cit.*)

*Zööl.*: The Walrus (q. v.). At the time Spenser wrote little was known of this animal, but Gesner

(*Hist. Anima.*, iv. 249), to whom Spenser is indebted, was sufficiently well informed to point out that the picture given of it in Magnus' book was incorrect, both as to the feet and the tusks, though he quotes Magnus' statement that the animal was as big as an elephant, that it climbed up the rocks on the seashore by the aid of its teeth, and that when it fell asleep after grazing, the fishermen attacked and killed it for the sake of its teeth, which were in high estimation for the handles of swords, daggers, and knives.

The novitiate lasts two years, and the members take the three vows of poverty, chastity, and obedience, but wear no distinctive habit. Each retains a sort of title to his own property, but it is really at the disposal of the general. The Order owns no property.

"Its members are better known by the shorter name, Rosminians."—T. Davidson: *Phil. Syst. of A. Rosmini-Serbatī*, p. xlv.

His starting point and central principle was the dictum of St. Thomas Aquinas, that Being (*ens* or *ens commune*) was the object of intelligence and the ground of the principle of contradiction. (1740-58), and to it were referred those spiritual causes from foreign countries, now settled on the spot by judges delegated by the See of Rome. It consists of twelve members, called Auditors, presided over by a Dean, and is divided into two colleges or senates. Prior to 1870 one of these was a court of appeal for civil suits tried in different cities of the Papal States; the other was a court of final appeal from (1) the appeal courts of the Papal States; (2) all spiritual courts, in the secular affairs belonging to their competence; and (3) the lower senate. And children that ne'er shall be born complain—  
I mean such as dy'd before they did live,  
Like Harrington's Rota, or th' engine of Vane."

. II. *Technically*:1. *Agric.*: [¶ (4).]2. *Astron.*: The turning of a planet round on its imaginary axis, like that of a wheel on its axle. In the infancy of astronomy it was assumed that the earth was at rest, and that the sun and stars moved round it from east to west. After note had been taken of the fact that when a boat is gently gliding along a canal or tranquil lake, the sensation to one on board is as if the boat were stationary, and objects on the bank moved past in the opposite direction, a second hypothesis became worthy consideration, viz., that the apparently stationary earth might be like the moving boat, and the heavens resemble the really stationary banks. It gathered strength when it was considered that the earth was not a sphere but an oblate spheroid, as if rapid whirling had bulged it out at the equator, that Jupiter was yet more flattened at the poles than the earth, and that the direction of the trade-winds, cyclones, &c., seemed the result of rotation. In 1851 Foucault completed the proof by making visible to the eye that a pendulum with a very long string alters its direction in a way which cannot be accounted for except by rotation. [GYROSCOPE.] The rotation of the earth is performed with a uniform motion from west to east, and occupies the interval in time which would elapse between the departure of a star from a certain point in the sky and its return to the same point again. The only motions which interfere with its regularity are the Precession of the Equinoxes and Nutation (q. v.). The time taken for the rotation of the earth measures the length of its day (q. v.). So with the other planets. The sun also rotates as is shown by the movement of spots across its disc. [SUN.] The earth's rotation slightly increases the force of gravity in moving from the equator to the poles. Sir Wm. Thomson, reasoning from some small anomalies in the moon's motion, inferred that ten millions of years ago the earth rotated one-seventh faster than it does now, and that the centrifugal force then was to that now as 64 to 49.3. *Bot.*: A rotary movement of a layer of protoplasm, investing the whole internal surface of a cell, as well seen in Chara, &c. It was first investigated by Corti in 1774. Called more fully Intercellular rotation.4. *Physiology*:(1) The movement of a bone round its axis, without any great change of situation. (*Quain*.)(2) The moving of the yolk in an ovum at a certain stage of development on its axis in the surrounding fluid. This was first observed by Leuwenhoeck in 1695. (*Owen*.)¶ (1) *Angular velocity of rotation*: [ANGULAR-VELOCITY.](2) *Axis of rotation*: [AXIS.](3) *Center of spontaneous rotation*: [CENTER, ¶ (35).](4) *Rotation of crops*:*Agric.*: The cultivation of a different kind of crop each year, for a certain period, to prevent the exhaustion of the soil. If a plant requiring specially alkaline nutriment be planted year after year in the same field or bed, it will ultimately exhaust all the alkalies in the soil and then languish. But if a plant be substituted in large measure requiring siliceous elements for its growth, it can flourish where its alkaline predecessor is starved. Meanwhile the action of the atmosphere is continually reducing to a soluble condition small quantities of soil, thus restoring the lost alkalies. Manure will replace lost elements more quickly. The period of rotation is often made four years. [FOURCOURSE.] By the neglect of rotation soils in parts of Sicily, Asia Minor, Campania, and Spain, which were once highly productive, are now barren.rō-tā'-tion-ā, a. They are microscopic animals, contractile, crowned with vibratile cilia at the anterior part of the body, which, by their motion, often resemble a wheel revolving rapidly. Intestine distinct, terminated at one extremity by a mouth, at the other by an anus; generation oviparous, sometimes viviparous. [SUMMER-EGGS.] The nervous system is represented by a relatively large single ganglion, with one or two eye-spots, on one side of the body, near the mouth, and there are organs which appear to be sensory. They are free or adherent, but never absolutely fixed animals.

**Royal Society, subst.** A society for prosecuting research in general and physico-mathematical science in particular, founded in London in 1660. In 1645, a few friends, including Drs. Wilkins and Wallis, established a scientific club in the metropolis, which maintained a checkered and intermittent existence sometimes in London, at others in Oxford, till at length being revived at the Restoration it became the parent of the Royal Society. At a meeting of the club, held Nov. 28, 1660, the formation of a new society was resolved on, and its scope and constitution defined. Its first public action took place on Dec. 5, 1660, and the members, in 1662, obtained a charter, and were incorporated as the Royal Society. Charles II. flattered himself that he was its founder, and among the names of its fellows was that of the Duke of York, afterward James II. Sir Isaac Newton was elected a fellow in Jan., 1672, admitted in Feb., 1672, and in 1703 became president. The first number of the *Philosophical Transactions*, recording the work of the society, appeared on March 6, 1665. After 1800 the annual volume took the place of occasional numbers. In 1709, a bequest from Sir Godfrey Copley led to the establishment of the Copley gold medal, and a donation from Count Rumford, in 1796, resulted in the foundation of the Rumford gold and silver medals. Two more medals were established by George IV. in 1825. The Linnæan Society branched off from it in 1788, the Geological Society in 1807, and the Royal Astronomical Society in 1820. For a considerable time the number of the members stood at 600; latterly, however, only fifteen members have been annually elected, so that the number of fellows will in a few years be reduced below 500. With the exception of a small Roman Academy, the Royal Society of London was the first of the kind established, the Royal Academy of Science at Paris not having arisen till 1666.

It crystallizes in light yellow plates or needles having a strong reddish green luster, slightly soluble in boiling water, but very soluble in boiling alcohol. It dissolves in sulphuric acid, forming a yellow liquid, and in alkalies forming purple solutions. It is of little use as a dye, a piece of mordanted calico being scarcely colored by it.

**rû-bĭ-â-dĭn, s.** [*Eng. rubiad (ip)in.*]

*Chem.*:  $C_{16}H_{14}O_5$ . A substance produced, together with glucose, by the action of alkalies on rubiacin. It crystallizes in yellow needles or rectangular plates, which are slightly soluble in alcohol. With strong sulphuric acid it forms a yellow solution, and aqueous ammonia dissolves it, at the boiling-heat, with blood-red color.

**rû-bĭ-âd'-ĭ-pin, s.** [*Mod. Lat. rubia; English (a)dip(ose), and -in (Chem.).*]

*Chemistry.*:  $C_{30}H_{24}O_5$  (?). One of the compounds formed by the fermentation of madder with erythrozym. After the removal of alizarin, rubiretin, rubiafin, &c., it is obtained, along with rubiagin, from which it is separated by solution in cold alcohol. It is a yellowish-brown fatty substance, soluble in alcohol and alkalies, the latter forming a blood-red soapy liquid.

**rû-bĭ-â-fin, s.** [*Mod. Lat. rubia; f connect., and -in (Chem.).*]

*Chem.*:  $C_{32}H_{26}O_9$  (?). A substance isomeric with rubiadin, and produced by the fermentation of rubian. It is separated, along with verantin, from alizarin, &c., by the action of acetate of copper, and from verantin by boiling with stannous oxide. It crystallizes from the stannous solution in yellow shining plates and needles which behave in all respects like rubiacin.

**rû-bĭ-â-gĭn, s.** [*Mod. Latin rubia; g connect., and -in (Chem.).*]

*Chem.*: Produced by the fermentation of rubian, and separated from rubiadipin by cold alcohol. It is obtained as yellow granules or grouped needles,

insoluble in boiling water, soluble in boiling alcohol. Alkalies dissolve it with blood-red color, and neutral acetate of lead throws down orange-colored grains from its alcoholic solution. Formula uncertain.

**rû'-bĭ-ân, s.** [*Mod. Latin rubi(a); English suff. -an.*]

*Chemist.*:  $C_{28}H_{34}O_{15}$ . A glucoside, discovered by Schunck in madder root, in 1847. It yields, under the influence of acids, alkalies, or madder ferment, alizarin, with other coloring matters, and glucose. It is a dry, brittle, amorphous mass, resembling dried varnish, and of a deep yellow color in thin layers, very soluble in water, less soluble in alcohol, and insoluble in ether. Its solutions are very bitter. Heated above  $130^\circ$ , it gives off orange-red vapors of alizarin. Oil of vitriol dissolves it with blood-red color.

**rû-bĭ-ân'-ĭc, a.** [*Eng. rubian; -ic.*] Contained or derived from rubian (q. v.).

**rubianic-acid, s.**

*Chem.*:  $C_{20}H_{30}O_{14}$  (?). Produced by the oxidation of rubian in contact with alkalies, and obtained by treating rubian with baryta water, collecting the barium compound formed, decomposing the latter with sulphuric acid, and recrystallizing from boiling water. It forms lemon-yellow silky needles, tastes bitter, reddens litmus, dissolves easily in boiling water and in alcohol, but not in ether.

**rû-bĭ-ân'-ĭn, s.** [*Eng. rubian; -in.*]

*Chem.*:  $C_{32}H_{38}O_{15}$ . Obtained by boiling aqueous rubian with dilute sulphuric acid, dissolving out alizarin, &c., with boiling alcohol from the coloring matters produced, and continuing the treatment of the solid residue with boiling alcohol, from whence rubianin crystallizes into lemon-yellow colored needles with silky luster, moderately soluble in boiling water, very slightly in alcohol.

*Chem.*:  $C_{14}H_{16}O_9$  (?). An acid found in the root and leaves of *Rubia tinctorum*, and separated from an aqueous solution by basic acetate of lead in presence of ammonia. It forms a colorless or slightly yellow mass, having a faint nauseous taste, easily soluble in water and alcohol, and is converted by heating with hydrochloric acid into dark green flocks of chlorarubin.

**Rû-bĭ-côn, s.** [*Lat.*] A small stream of Italy, falling into the Adriatic to the north of Ariminum. It formed in part the northern boundary of *Italia Propria*, and on this account the Roman generals were forbidden to pass the Rubicon with an armed force, under dreadful imprecations, and to do so was considered equivalent to a declaration of war. According to the story, Cæsar crossed the Rubicon with his army at the breaking out of the civil war with Pompey, exclaiming, "The die is cast!" Hence the phrase, *To cross (or pass) the Rubicon=to take a decisive step in any enterprise.* The position of the Rubicon has not been clearly ascertained; some identify it with Fiumesimo, some with Lusa, and others with Pisatello.

**rû'-bĭ-cünd, a.** [*Lat. rubicundus, from rubeo=to be red; Fr. rubiconde.*]

**rū-bīd'-ī-ūm**, s. [Lat. *rubidus*=dark red.]

*Chem.*: A monad metallic element belonging to the potassium group, discovered by Kirchhoff and Bunsen in 1860. Symbol Rb; atomic weight, 85.4; specific gravity, 1.52. It has been detected in mineral waters, in several lepidolites, and in the ash of many plants, as tobacco, tea, and coffee. It may be obtained from the saline residue in the preparation of lithia from lepidolites, by adding platinic chloride, and dissolving out the potassium compound by repeated boiling with water. The chloro-platinate of rubidium is reduced with hydrogen, and the purified chloride of rubidium, mixed with calcium tartrate and soot, is heated in a furnace, the volatilized metal being collected in a receiver containing mineral naphtha. It is a white metal with silvery luster, soft to the touch, and melting at 38.5°. Exposed to the air, it becomes covered with a gray film, and soon takes fire. When thrown on water it takes fire even more readily than potassium, and burns with a flame like the latter.

1. *Lit. & Animal Physiol.*: The act of chewing the cud. The food of the ruminants is grass, which requires a longer series of chemical changes to convert a portion of it into blood than does the flesh of other animals eaten by the Carnivora. To produce these changes there is a complex stomach divided into four parts, the Rumex or Paunch, the Reticulum or Honeycomb Bag, the Psalterium or Manyplies, and the Abomasum or Reed. A ruminant does not chew the fodder which it eats, but simply swallows it. When it has had enough it retires to a quiet spot, forces up again to the mouth a portion of the food in its paunch, thoroughly chews it and then swallows it again. Another and another bolus is thus disposed of. Each of these, started from the paunch, was forced next into the honeycomb bag where it received its form and then went up the gullet. On returning it passed direct from the paunch into the manyplies or third stomach, and then to the abomasum.

1. Any letter of the Futhork (q. v.). They are formed almost entirely of straight lines, and may have been derived, as Schlegel supposes, from the Phœnicians, for several of the Runic characters bear close resemblance to the letters of the Phœnician alphabet. Schloezzer holds that they are corruptions of the Roman alphabet, while another theory is that they are the original characters of the Indo-Germanic tribes brought from the East, and preserved among the races of that stock. The name Rune was first mentioned by Venantius Fortunatus in the sixth century as the name of a German letter. The knowledge of the Runes was confined to a small class, and they were used for purposes of augury, and for magical symbols. They have been grouped into three systems—the Anglo-Saxon, the German, and the Norse or Scandinavian; but no great difference exists between them. Traces of Runes in inscriptions occur in England in the old kingdoms of Northumbria, Mercia, and East Anglia; in Denmark, Norway, Sweden, Germany and Iceland.

¶ *The Book of Ruth*:

*Old Test. Canon*: A short book now placed in the Hebrew Bible in the Hagiographa, between the Song of Solomon and the Lamentations. The English Bible, following the Septuagint and the Vulgate, arranges it between the Books of Judges and Samuel. During the times of the Judges, a certain Elimelech, of Bethlehem-Judah, i. e., of Bethlehem in Judah, as distinguished from Beth-le-hem in Zebulun (Josh. xix. 15), to escape a famine then raging, went to Moab with his wife, Naomi, and his two sons, Mahlon and Chilion, who married two Moabitesses, Orpah and Ruth. There all the male members of the family died, and the widowed Naomi, hearing that the famine was over, thought of returning home. Orpah, after starting with her, was prevailed on to return; Ruth, the heroine of the narrative, could not be persuaded to go back, and having, after reaching Bethlehem, gone into the fields as a gleaner, she attracted the notice of Boaz, an aged kinsman, with whom she made a romantic marriage, ultimately becoming the great-grandmother of King David, and an ancestress of Jesus Christ (Matt. i. 5). The Book of Ruth is a beautiful idyllic composition. It was penned not earlier than the time of David (ch. iv. 22), and probably much later, for there had been time for customs existent in the days of Boaz and Ruth to change (7). The narrative is in pure Hebrew, but there are Aramæanisms in the dialogues. Most critics place its composition before, but Ewald during, the Exile. Its canonicity has never been doubted.

"In 1828 Osann stated that he had discovered three new metals in the platinum ores from the Ural. To one of these he gave the name of *ruthenium*, from the name of Russia."—H. E. Roscoe: *Treat. on Chemistry*, ii. (pt. ii.), 449.

*Chem.*: A tetrad metallic element discovered by Osann in 1828, and first isolated by Claus in 1846. Symbol, Ru. Atomic weight 104. It occurs in platinum ores, chiefly in osmiridium, and is separated from the latter by heating to redness a mixture of this ore and common salt in a current of moist chlorine. By digestion in cold water an extract is obtained from which ammonia throws down the oxides of ruthenium and osmium. The latter is expelled by heat, and the former converted into ruthenate of potassium by fusion with potash, which yields oxide of ruthenium on addition of nitric acid. On ignition in a stream of hydrogen the oxide is reduced to the metallic state in the form of porous fragments. With the exception of osmium it is the most refractory of all metals, but can be fused in the hottest part of the oxyhydrogen blow-pipe. It then has a density of 11 to 11.4, and is scarcely attacked by nitro-muriatic acid.

## ruthenium-chlorides, s. pl.

*Chemistry*: Ruthenium forms three chlorides: (1) Dichloride, RuCl<sub>2</sub>; produced when powdered ruthenium is ignited in a stream of chlorine. It remains as a black crystalline powder, insoluble in water and in all acids. (2) Trichloride, RuCl<sub>3</sub>; prepared by dissolving in hydrochloric acid the black precipitate obtained from ruthenate of potassium by addition of an acid. It is a yellow-brown crystalline mass, easily soluble in water and alcohol. With sulphocyanide of the alkalies it yields a red coloration, changing to deep violet on heating. (3) Tetrachloride, RuCl<sub>4</sub>; known only in combination in its double salts, e. g., K<sub>2</sub>RuCl<sub>6</sub>, which crystallizes in regular transparent octahedrons.

## ruthenium-oxides, s. pl.

*Chem.*: Ruthenium forms five oxides: (1) Protoxide, RuO, obtained by calcination of the dichloride, has a dark-gray color, and is not acted on by acids. (2) Sesquioxide, or ruthenous oxide, Ru<sub>2</sub>O<sub>3</sub>, produced when pulverized ruthenium is heated in contact with the air, has a deep blue color, and is insoluble in acids. (3) Dioxide, or ruthenic oxide, RuO<sub>2</sub>, formed by roasting the disulphide. It is a black-blue powder with a tinge of green. (4) Trioxide, RuO<sub>3</sub>, commonly called ruthenic acid, is known in combination with potash, and is produced when ruthenium is fused with potash and nitrate of potassium. (5) Tetroxide, RuO<sub>4</sub>, produced by passing chlorine into a solution of the fused mass obtained by heating ruthenium with potash and niter. This volatile oxide passes over and condenses on the neck of the retort. It is golden-yellow and crystalline, volatilizes at ordinary temperatures, melts at 58°, boils at 100°, and is heavier than sulphuric acid. Is sparingly soluble in water.

THE nineteenth letter and the fifteenth consonant of the English alphabet, represents a hissing sound, and is classed as a sibilant. "In pronouncing s, we touch the gum with a part of the tongue just above that part which is used in pronouncing the palatals; but we touch the gum so lightly, and with the tongue so broadened out that we do not stop the outward flow of the breath completely; it oozes forth with that hissing sound which, whether in the human organ or in any other machine, invariably results from the rapid flow of air through a

contracted passage." (*Beames: Comp. Gram. Aryan Lang.* (ed. 1872), i. 217.) There are two sounds attached to this letter in English; the one surd, or uttered with breath merely, the other sonant or voiced. The first is a mere hissing sound, as in *sin, so, &c.*; the other is exactly the same as that of z, as in *music, muse, &c.* S in some words, as *isle, island, viscount*, is silent. It is closely allied to r, and even in the oldest English we have traces of the interchange, as in *fröre=frören=frosen (frozen), gecoren=chosen, &c.* S has become st in *hoist=hoise, whilst=whiles, &c.* It has been changed into c, as in *mice=O. Eng. mys, once=O. Eng. ones, hence=O. Eng. hennes, &c.* With a following h it forms a digraph, a weakening of an older and stronger sound sc, as *shall=O. Eng. sceal, fish=O. Eng. fisc, &c.* It has been changed into ge, as in *cabbage=Fr. cabus; Lat. cabusia; sausage=Fr. saucisse; Lat. salsisia*. In *pick-ax*, owing to a mistaken etymology, it has become x. In Romance words s has passed into sh, as *radish=Lat. radix; cash=Fr. casse, chasse=Lat. capsa*. From some words it has disappeared as in *pea=O. Eng. pise=Latin pisum; hautboy=Fr. hautbois; puny=Fr. puisne, &c.* In a few words we find an intruded s, as in *island=O. Eng. ealand, igland, aisle=Fr. aile; squeeze, sneeze, scratch, smelt, &c.* It is represented by z in *dizzy=O. Eng. dysig; freeze=O. Eng. freosan*. In O. Eng. sc and sp were frequently transposed to cs and ps, as in *ask=O. Eng. axian, clasped=clapsed*. S is an exceedingly common letter in English. It is the characteristic sign of the genitive case and plurals of nouns.

S as an initial is used for South, as in S.W.=Southwest; for Society, as F. R. S.=Fellow of the Royal Society; for Saint, or double (SS.) for Saints.

S as a symbol is used:

1. As a numeral for 7, and with a dash over it,  $\bar{S}$ , for 7,000.

2. In chemistry for the element Sulphur.

\*1. In the sixteenth century, one who considered that the Christian Sabbath should be kept on the seventh day (Saturday). [SEVENTH-DAY BAPTISTS.]

"This term designates a very small sect in the 17th and 18th centuries, who insisted strictly on keeping the seventh day as their Sabbath, according to the letter of the divine injunction. It is only by a modern misuse of the word that a Sabbatarian is understood to be one who abjures all work on Sunday."—*London Daily Telegraph.*

2. One who holds that the Lord's day is to be observed among Christians in exactly the same manner as the Jews were enjoined to keep the Sabbath; one who holds rigid views of Sabbath observance.

**Sabbatarian Controversy, s.**

*Church Hist.:* A controversy regarding the manner in which Sunday should be kept, arising out of the publication of King James' *Book of Sports* [SPORT, *s.*], published in 1618, between the High Churchmen, who were generally in favor of the king's views, and the Puritans, who very strongly opposed them. Though the controversy has altered its form, and access to museums, libraries, and picture-galleries is now contended for, it has not yet reached its end.

**Săb-ba-tă'-tî, s. pl.** [INSABBATATI.]

**Săb'-ba-th, s. & a.** [Hebrew *shabbath*=Sabbath, from *shabath*=to rest.]

**A. As substantive:**

1. *Old Test.:* A sacred day of rest, the institution of which is first mentioned in Gen. ii. 2-3:

"And on the seventh day God finished his work which he had made; and he rested on the seventh day from all his work which he had made. And God blessed the seventh day and hallowed it; because that on it he rested from all his work which God had created and made."—*R. V.*

The prevailing interpretation of these verses is that the Sabbath was instituted at the Creation for mankind in general, and that septenary institutions (*q. v.*) may therefore be expected in all nations. Prior to the giving of the law from Mount Sinai, the Sabbath is mentioned in connection with the descent of manna (Exod. xvi. 5, 22-30). The keeping holy of the Sabbath is enjoined in the fourth commandment in Exodus, because of God's having rested after the Creation (Exod. xx. 8-11); in Deut. because of the deliverance of the Hebrew bondsmen from Egypt (Deut. v. 12-15). Two lambs instead of one were offered when it came (cf. Num. xxviii. 3-4 with ver. 9). Isaiah (lvi. 2, lviii. 13) strongly advocated its observance. [SABBATH-BREAKING.]

2. *New Test.:* Always in the gospels, and as a rule in the other books, Sabbath means the seventh day of the week. By this time its observance had become very rigid and punctilious, and Jesus himself was constantly denounced by the Pharisees and others as a Sabbath-breaker (Matt. xii. 1-2; Mark ii. 2-3, &c.). In self-defense he laid down this principle: "The Sabbath was made for man, and not man for the Sabbath; therefore the Son of Man is Lord also of the Sabbath," (cf. Matt. xii. 8 with Mark ii. 28). In the epistles the keeping of the Jewish Sabbath is left optional with Christians (Col. ii. 16-17); the day for them is the Lord's day (*q. v.*) (Rev. i. 10).

3. *Theol. & Church Hist.:* For the first three centuries the Christian fathers in general drew a distinction between the Sabbath and the Sunday or Lord's day, regarding the former as Jewish and obsolete, and the latter as a divinely instituted day, joyous in its character as commemorating Christ's resurrection. But from the days of the first and ambiguous edict of Constantine on the subject:

"Let all judges, inhabitants of the cities, and artificers, rest on the venerable Sunday [dies solis]. But husbandmen may freely and at their pleasure apply to the business of agriculture,"

there was an increasing tendency to transfer to the Sunday and, in a less degree, to saints' days and

minor festivals the restrictions of the Jewish Sabbath. The third Council of Orleans (A. D. 538) strove to check this tendency, but in the same century we find legends of miraculous judgments on those who worked on the Sunday (*Migne: Patrol.*, lxxii. 61). The idea of the "Christian Sabbath" seems to be enunciated for the first time in Alcuin (*Homil. xviii. post Pent.*). Smith (*Christ. Antiq.*, ii. 1,052) says "that the general teaching of the schoolmen follows the express declaration of Aquinas, 'that the observance of the Lord's Day in the New Law supersedes the observance of the Sabbath, not by obligation of the (divine) law, but by the ordinance of the Church and the custom of the Christian people.'" The Reformers generally were opposed to Sabbatarian views, which, however, more or less modified, have found a place in Protestant churches generally, and reached their height in the Puritan period. [SABBATARIAN CONTROVERSY.]

¶ In the middle ages Sabbath meant only Saturday. According to the elder Disraeli, it was first used in England for Sunday in 1554.

4. *Law:* [SABBATH-BREAKING.]

5. The Sabbatical year among the Israelites.

"In the seventh year shall be a sabbath of rest unto the land, a sabbath for the Lord."—*Leviticus xxv. 4.*

\*6. A time of rest; intermission of pain or sorrow.

"Never any sabbath of release  
Could free his travels and afflictions deep."  
*Daniel: Civil Wars.*

**B. As adj.:** Of or belonging to the Sabbath, or to sacred text.

**Sabbath-breaker, s.** One who breaks, violates, or profanes the Sabbath by neglecting the religious observance of that day.

**Sabbath-breaking, s. & a.**

**A. As subst.:** The act of breaking, profaning, or violating the Sabbath—

1. *Jewish times:* Moses, by the divine command, punished with death a man who gathered sticks on the Sabbath (Num. xv. 32-36). Nehemiah put an end to secular work among the Jews and the heathen Tyrians who came to traffic at Jerusalem (Neh. xiii. 15-22).

2. *Christian times:* The edict of Constantine [SABBATH] of course carried with it penalties on those who disregarded it. Legislation in favor of the Sabbath naturally followed in most Christian countries. In the United States legislation concerning the observance of Sunday varies according to the views prevailing in the different states. In one feature, however, all are agreed, viz.: that no religious act in honor of the day shall be enforced by law. In all matters under its control it is the practice of the Federal Government to require the keeping of the Sunday as a day of rest from unnecessary labor and business. In England, statutes on the subject were passed under Athelstan, Henry VI., Charles I., &c. By the statute 29 Chas. II., c. 7., still in force:

"No person is allowed to work on the Lord's day, or use any boat or barge, or expose any goods to sale, except meat in public houses, milk at certain hours, and works of necessity or charity, on forfeiture of 5s. Nor shall any drover, carrier, or the like travel upon that day, under pain of 20s."

The Act 21 Geo. III., c. 49, passed in 1781, chiefly at the instance of Beilby Porteus, Bishop first of Chester, then of London, was primarily directed against Sunday promenades for which money was taken, and meetings for discussing points of Scripture. It is put in force when Sunday evening meetings of a kind objected to by Sabbatarians are attempted.

"Profanation of the Lord's day, vulgarly (but improperly) called *sabbath-breaking*."—*Blackstone: Comment.*, bk. i. ch. 4.

**Sabbath day's journey, s.**

*Judaism:* A very short journey, so as not to interfere with the rest of the Sabbath. The Mosaic law does not precisely define it. Practically it was fixed at 2,000 yards, because the fields of the suburbs for the pasture of the Levites' flocks and herds measured 2,000 yards across. (Acts i. 12.)

*Church Hist.:* The name given to any form of doctrine which denies a real distinction between the Persons of the Trinity.

1. *Patrisianism* (*q. v.*).

2. The doctrine of the adherents of Sabellius (an African presbyter of the third century), if not of Sabellius himself. It resolved the doctrine of the Trinity into three manifestations of God to man, and taught that the same Person was the Holy Ghost when manifesting himself to the Christian Church, and, by parity of reasoning, the Son, when he appeared in Christ. Thus *Patrisianism* was avoided, but the Incarnation, as well as the Trinity, was denied, for the manifestation of God in Christ could differ only in degree, not in kind, from his union with other holy men. Akin to this teaching was that of Marcellus (bishop of Ancyra in the early part of the fourth century), who made the Logos a mere attribute of God, manifesting itself in the Creation, the Incarnation, and the sanctification of Christians.

1. *Protestant Theol.*: The Church of England and the Protestant Episcopal Church in the United States define a sacrament as "an outward and visible sign of an inward and spiritual grace given unto us, ordained by Christ Himself, as a means whereby we receive the same, and a pledge to assure us thereof." They recognize two only as generally necessary to salvation, Baptism, and the Supper of the Lord. Article xxv. says that they were ordained by Christ not only to be badges or tokens of Christian men's profession, but also, or rather, to be sure signs of grace and God's good will toward us, by which He strengthens our faith in Him. They have a wholesome effect or operation only to those who worthily receive them; unworthy recipients purchase to themselves damnation [Cf. 1 Cor. xi. 29. The R. V. has "judgment"]. The Westminster Confession of Faith teaches essentially the same doctrine. It considers sacraments to be "holy signs and seals of the covenant of grace" (ch. xxvii.). Other Protestant formulas are substantially the same.

2. *Roman Theol.*: A visible sign, instituted by Christ, which confers *ex opere operato* sanctifying grace on man. [OPUS OPERATUM.] Matter, form, and a minister acting with the intention of doing what the Church does are necessary to the valid administration of a sacrament. Besides sanctifying grace, sacraments confer sacramental grace—that is, they aid the suscipient in a special manner to attain the end for which each sacrament was instituted. (*Gury: Tract. de Sac. in Genere.*) The Council of Trent (sess. vii., can. 1) defines that the Sacraments of the New Law were instituted by Our Lord, and are neither more nor fewer than seven in number: Baptism, Confirmation, Eucharist, Penance, Extreme Unction, Holy Orders, and Matrimony. The first five are necessary for all Christians, the last two are necessary only for the community. Baptism, Confirmation, and Order imprint a character on their subject, and cannot be repeated without sacrilege. The term Sacraments of the Old Law has been adopted to signify circumcision, the paschal lamb, the ordination of priests and Levites, &c., of the Mosaic economy. St. Augustine (*adv. Julian.*, v. 11) was of opinion that some remedy for original sin must have existed prior to the institution of circumcision, and to this the name of Sacrament of Nature is often given.

When Russia fights, she uniformly gives out that it is a holy war; and after the destruction of the Turkish fleet at Sinope (Nov. 30, 1853), it was officially or semi-officially intimated that "the most pious Czar thanks the Lord of Lords for the success of the victorious Russian arms which triumphed in the sacred combat for the orthodox faith."

(2) That which is so devoted, surrendered, or abandoned.

(3) The selling or disposing of goods at a value under cost price; as, to sell one's stock at a sacrifice.

**II. Technically:**

**1. Compar. Relig.:** Sacrifices form an important part of all early forms of religion. Tylor (*Prim. Cult.*, ch. xviii.) traces three stages in the development of the rite. (1) The gift-theory, in which the deity takes and values the offering for himself; (2) the homage-theory, in which the submission or gratitude of the offerer is expressed by a gift; and (3) the abnegation-theory, in which the worshiper deprives himself of something prized. With regard to their nature, sacrifices are divided into (1) Bloody [(a) human; (b) of the lower animals], and (2) Unbloody. The terrible custom of offering human sacrifices was very widely spread [See extracts]. It was known among the Greeks (*Il. iv. 35, xviii. 336, xxi. 28; Eurip., Iphig.*) and the Romans (*Dio Cas., Hist. Rom.*, xliii. 24); and is frequently mentioned in Scripture (cf. Gen. xxii. 1-4, Judges xi. 29-40, 2 Kings iii. 27, xvii. 31, xxi. 6, xxiii. 10, 2 Chron. xxviii. 3, xxxiii. 6, Jer. vii. 31, 32, xix. 5, 6, Ezek. xvi. 21, xx. 31, Mic. vi. 7. See also *Kalisch: Levit.*, pt. i., pp. 331 sqq). Stanley (*Jewish Church*, i. 40) says:

"On the altars of Moab, and of Phœnicia, and of the distant Canaanite settlements in Carthage and in Spain, nay even, at times, within the confines of the Chosen People itself, in the wild vow of Jephthah, in the sacrifices of Saul's sons at Gibeah, in the dark sacrifices of Hinnom, under the very walls of Jerusalem—this almost irrepressible tendency of the burning zeal of a primitive race found its terrible expression."

As civilization advanced, human victims were replaced by symbols (*Ovid: Fasti*, v. 665-660), or oxen or sheep were offered in their stead. Unbloody sacrifices consisted of libations, incense, fruit, and cakes (often in the form of, and as substitutes for, real animals). It is noteworthy that though the

first sacrifice mentioned in the Old Testament (Gen. iv. 3) belonged to this category, the first sacrifice accepted (Gen. iv. 4) was a bloody one.

"The custom of sacrificing human life to the gods arose undoubtedly from the belief, which under different forms has manifested itself at all times and in all nations, that the nobler the sacrifice and the dearer to its possessor, the more pleasing it would be to the gods."—*Smith: Dict. Antiq.*, p. 999.

**2. Old Test.:** Sacrifices were of two kinds, bloody and unbloody. Those designed to atone for sin were of the former kind (Lev. i.-vii.; cf. Heb. ix. 22). The idea of sacrifice first appears in Gen. iv. 3-5, and viii. 20, but the English word sacrifice does not occur in the A. V. till xxxi. 54. The paschal lamb is called a sacrifice (Exod. xxxiv. 25; Deut. xvi. 2). Even from patriarchal times sacrifices were limited to clean beasts and birds, and were offered on an altar (Gen. viii. 20). Many of these sacrifices were made by fire. [BURNT-OFFERING.] A certain portion of the slain animal was reserved for the priest (Deut. xviii. 3). Under the law there were morning and evening sacrifices (1 Kings xviii. 29; Ezra ix. 4, 5, Dan. viii. 11, 12, 13; xii. 11), besides weekly sacrifices on the Sabbath, sacrifices at new moons, annual ones, &c. Not merely were there stated sacrifices for the people at large, arrangements were at times made that private families also should possess the boon (1 Sam. xx. 6, 20). Under the Monarchy sacrifices were confined to the temple at Jerusalem (2 Chron. vii. 12). Thanksgiving was called a sacrifice (Lev. vii. 12, 13; Psalm cvii. 22; cxvi. 17; Jonah ii. 9), so was praise (Jer. xxxiii. 11). Ultimately sacrifice, having hardened into a ceremony with little influence on moral conduct, is itself disparaged (Psalm xl. 6; Hosea vi. 6), and preference is accorded to obedience (1 Sam. xv. 22), justice or righteousness (Prov. xxi. 3) and mercy (Hosea vi. 6).

**3. New Test.:** Abel's offering is now called a sacrifice, and its excellence is made to arise from the faith with which it was offered (Heb. xi. 4). The frequent repetition of the sacrifices under the law is adduced as evidence of their failure to remove sin (Heb. vii. 27; x. 1-9). Jesus is at once the sacrificing high priest (Heb. vii. 12) and the victim sacrificed (ix. 26). To love the Lord is declared by Jesus to be more than all sacrifice (Mark xii. 33), and thanksgiving and praise (Heb. xiii. 15) are again ranked as sacrifices.

**4. Theol.:** The evangelical doctrine is that the sacrifices of the older economy were types and shadows of the atoning sacrifice made by Christ. For instance the lamb offered by Abel typified the Lamb of God (John i. 29) the devotion of the lamb to death implied a confession on the part of Abel that he was sinful, and deserved to die, coupled with a hope that the substitution of the innocent lamb for the guilty offerer would be permitted. It is held that when Jesus died his sacrifice once for all satisfied Divine justice, and no other was requisite, or would, if offered, be accepted (Heb. ix. 12, 25-28, x. 10, 12, 14).

*Byron: Child Harold, ii. 8.*

**II. Judaism (pl.)**: One of the three Jewish sects. The current tradition, which was first published by Rabbi Nathan in the second century, is that the Sadducees derived their name from a certain *Zadok*, a disciple of Antigonos of Soko (B. C. 200-170). In the opinion of Geiger and others, the *Zadok* from whom they derive their name was the priest who declared in favor of Solomon when the High Priest Abiathar adhered to Adonijah (1 Kings i. 32-45). His descendants had a subsequent preëminence (Ezek. xl. 46, xliii. 19, xlv. 15, xlvi. 11). Not that the Sadducees became a party so early, or that *Zadok* was their founder; but that some of them may have been his descendants, and all admired his fidelity to the theocratic government, even when the head of the priesthood had gone astray. It was their desire to be equally faithful. All the Jews admitted that the Mosaic law was given at Sinai by Jehovah himself. Most of the people, with the concurrence and support of the Pharisees, believed that an oral law of Moses had similarly come from God. The Sadducees rejected this view, and would accept nothing beyond the written word. They were the Protestants of the older economy. Certain consequences followed. In the Mosaic law there is no reference to a state

of rewards and punishments in a future world. When Jesus proves the resurrection from the Pentateuch, He does so by an inference, there being no direct passage which He can quote (Matt. xxii. 31, 32). The Sadducees therefore denied the resurrection from the dead (verse 23). The doctrine of a future world is taught in some passages of the Old Testament, specially in Dan. xiv. 2, 3, &c., which should have modified their belief. That it did not do so can be explained only by supposing that they attributed a higher inspiration to the Mosaic law than to other parts of the Old Testament. Epiphanius (*Hæres.*, xiv.) and some other of the fathers assert that the Sadducees rejected all the Old Testament but the Pentateuch. Probably, however, these writers confounded the Sadducees with the Samaritans. In Acts xxiii. 8, it is stated that they say that "there is neither angel nor spirit." How they could ignore all the angelic appearances in the Pentateuch (Gen. xvi. 7, 11, xix. 1, &c.), is hard to understand. Perhaps they may have believed that, though angelic appearances once took place, they had now ceased. It is surprising that a sect with these views should, at least at one time, have almost monopolized the highest places in the priesthood; yet such was the case, at least temporarily (Acts iv. 1-6). But, with all their sacred office and worldly rank, they could have had no hold on the common people. It is probable that, when Christianity spread—even among its Jewish opponents—a belief in the resurrection, the Sadducees must have still further lost ground; but they ultimately revived, and still exist, under the name of Karaites (q. v.).

**safety-lamp**, *s.* A lamp for the purpose of giving light in mines where fire-damp prevails. The commonest form is that invented by Sir H. Davy, in 1816. The principle of his lamp lies in the fact that flame will not pass through a fine network of wire or gauze. The flame of the lamp is enveloped by a cylinder of wire-gauze, the apertures in which must not exceed  $\frac{1}{2}$  of an inch square, through which the air passes freely, even if charged with fire-damp. When the lamp is lighted and introduced into an atmosphere mixed with fire-damp, the size and length of the flame are first increased. When the inflammable gas becomes as much as one-twelfth of the volume of air, the cylinder becomes filled with a feeble blue flame, within which the flame of the wick burns brightly; its light continues till the fire-damp increases to one-sixth, or one-fifth, when it is lost in the flame of the fire-damp which fills the cylinder with a pretty strong light; but when the foul air constitutes one-third of the atmosphere, it is no longer fit for respiration. In some forms of the lamp a glass cylinder is placed inside the wire gauze; this resists air-currents, and

insures a steadier light. Experience, however, has shown that Davy's lamp is not an absolute protection against the danger of explosion from fire-damp, and a perfect safety-lamp is still a desideratum.

**safety-valve**, *s.*

*Steam Eng.*: A valve which automatically opens to permit steam to escape or air to enter the boiler in order to prevent its explosion or collapse. Of these there are two kinds, the one internal, opening to the inner side when the pressure of steam is less than a given weight; the other opening to the outside when the pressure of steam exceeds a given weight. The latter is the more important, and consists commonly of a lever of the third class pivoted at one end; the valve, which is on a stem projecting from the lower side of the lever, is conical, and fits into a corresponding seat. The lever has notches for receiving the hook or loop of a weight which is suspended therefrom, and may be moved from one notch to another, like the weight of a steelyard, so that a greater or less amount of steam pressure may be required to lift the valve from its seat. In locomotive engines, it is fixed at one end to a stud, and rests on the valve at a short distance from this stud. Its length is proportioned to the area of the valve, and a spring-balance indicates the pressure in pounds per square inch on the boiler above atmospheric pressure. Safety-valves are also used with boilers of various kinds, air and gas engines, proving-pumps, and hydraulic-presses. Locomotive-engines have two valves placed on the boiler for the escape of steam when it exceeds certain limits. One of them is placed beyond the control of the driver, and is called the lock-up valve. The other is regulated by a lever and spring-balance at a little lower pressure than the lock-up valve.

A less amount is obtainable from *Caryota urens*, the Bastard Sago-tree, from *Phoenix farinifera*, and, in Java, from the pith of the gebang-palm, *Corypha gebanga*, and some of the Cycads.

**sago-palm, s.**

The hilum, which is situated at one end of the granule, is in some a minute circle, in others a slit or cross. Sago is largely used in the manufacture of the so-called soluble cocoas, and is also frequently added to the cheaper varieties of arrow-root.

**Bot.:** A genus of Arceæ. *Saguerus saccharifer* (*Arenga saccharifera*) is from twenty to twenty-five feet high, and is very common in the islands of the Indian Archipelago, the Moluccas, and Philippines. The spadices are wounded and then pounded without detaching them from the tree. This causes them to yield a quantity of saccharine matter, which may be boiled into sugar or be converted by fermentation into an intoxicating liquor. When the trees are exhausted by this drain on their energies, sago is obtained from the trunk, as much sometimes as 150 or 200 pounds from a single tree. The cabbage-like bunch of young leaves at the summit of the stem is eaten, the leaf-stalks yield strong and useful fibers, and the mid-rib of the leaves is used for pens and for tubes through which to blow arrows. 2. *Zoöl.*: A popular name for any individual of the Salamandrinæ (q. v.), the Tritons or Newts being distinguished as Aquatic or Water Salamanders, and the other genera as Terrestrial or Land Salamanders. They are timid, sluggish, lacertiform creatures, feeding on worms, slugs, snails, and insects. When alarmed they exude from the pores of the back and sides a milky humor, injurious to small animals but innocuous to man. From this circumstance, Salamanders have probably derived their popular reputation of being venomous, which, however, is totally without foundation. Strange tales have been told of them from very early times, particularly that the icy coldness of their bodies enabled them to endure fire without being injured, and even to extinguish the flames in which they were placed. Pliny records that he tried the experiment, with the natural result that the Salamander was burnt to powder, but the fable received credence among the uneducated until quite modern times.

There are two species: *Salamandra maculosa*, the Spotted Salamander, from Central Europe and the mountainous districts on both sides of the Mediterranean, and *S. atra*, the Black Salamander, from the high mountains of Central Germany, France, and Switzerland. The young of this species undergo their metamorphoses in the body of the mother. A young tadpole prematurely extracted, and placed in water and watched by Mlle. Marie de Chauvin, lost its gills, which were replaced by others. It lived for fifteen weeks at the bottom of its tank, when the gills atrophied, and, after molting, the animal quitted the water. The gill-clefts then closed, and it became an adult land-salamander.

The lower extremities of the net are guided by a cord, which, being drawn toward the raft at the same time that the long bamboos are elevated by the crane and counterpoise, only a small portion of the net remains in the water, and is easily cleared of its contents by means of a landing-net. One grain added to each ounce of a fermenting liquid will at once arrest fermentation. It has the power of preserving for a time milk, fresh meat, albumen, &c., and is used in the surgery, either alone or mixed with starch, to destroy the fetid odor of cancerous surfaces or uncleaned wounds.

(2) (*Pl.*): Applied in a general sense to compounds of a metal and a halogen, as sodium chloride, NaCl; and to compounds formed by the union of an acid and a base, nitrate of silver, AgNO<sub>3</sub>. In its fuller signification the term suggests a compound which can suffer rapid double decomposition with another soluble substance, as when solutions of chloride of sodium and nitrate of silver are mixed together they at once decompose each other and form chloride of silver and nitrate of sodium. By an extension of meaning the name is sometimes applied to compounds, as chloride of ethyl, acetate of ethyl, and even to fats, as stearin, tristearate of glycerin. Popularly and medicinally the term salts refers to Epsom salts (q. v.).

2. *Comm., &c.:* Salt production is a very important industry in the United States. As early as 1620 the Jamestown colonists of Virginia established salt works at Cape Charles. Rock salt is abundant in West Virginia and Louisiana, and salt "licks" and springs are found in nearly all the States and Territories. The springs of Southern Illinois were worked by the French and Indians in 1720. The Kentucky salt springs were known and used before 1790. Valuable salt works have been established in Western Virginia, Ohio, Missouri, Michigan, New Mexico, Nebraska, New York, California, and Arkansas. The more important sources of supply are New York, West Virginia, and Ohio. New York alone producing more than one-half of the entire domestic supply. Besides seasoning food and preserving it for domestic use, for long voyages, &c., salt is used in the manufacture of muriatic acid and soda, to glaze pottery, to give hardness to soap, to preserve the surface of metals from being calcined when they are being melted, also as a mordant, &c.

*Ecclesiol. & Church Hist.*: A religious organization virtually constituting a distinct religious sect, its founder and general being Mr. William Booth, born at Nottingham, England, in 1829. In 1843 he entered the ministry of the Methodist New Connection, which stationed him in London. Soon afterward he obtained great spiritual success at Guernsey, and in 1844 was set apart as an evangelist. In 1856-7 he returned to the regular pastorate, but felt himself out of his sphere; and when, in 1861, the Conference refused to allow him again to become an evangelist, he resigned connection with it, and commenced an independent career. A year before this, Mrs. Booth had begun to preach. In 1862-3 he labored in Cornwall, Newcastle, &c., and in June, 1865, in Whitechapel, London, where he obtained many converts, whom he united into the East London Christian Revival Society, afterward the East London Christian Mission. Visits to other cities and towns commenced the work also there. In 1865-6 Mr. Booth hired a large theater, and, in 1870, the People's Market at Whitechapel. By the commencement of 1878 thirty stations had been occupied; at its close there were eighty, and the evangelists had increased from thirty to 127. The first appearance of the title *Salvation Army* in the Registrar-general's returns was in 1880. With the name army came military phraseology. Prayer became knee-drill, the leader became a general, one of his sons chief of the staff, evangelists took the name of officers, candidates were cadets, and not merely converts were sought, but recruits. A semi-military attire was assumed, barracks built instead of separate residences, and when the army marched forth to take some place by storm, it was with banners displayed and bands of music leading the march. Its possession of the streets was not undisputed, especially in the earlier part of its career. [*SKELETON-ARMY*.] Religious soldier-life was open to women, and many female officers conducted evangelistic operations. [*HALLELUJAH-LASSES*.] The progress of the army was very rapid. The amount of property owned by this organization now exceeds four million dollars, and the annual income is over \$3,600,000. The Division of the Army in this country in 1905 had 2,361 officers, 696 corps and 25,000 members. Miss Eva Booth is commander of the army in the United States, with headquarters at 120 West Fourteenth Street, New York city, where information may be obtained regarding the organization and its work.

Originally made of leather they became in time articles of great luxury, being made of gold, silver, &c., and ornamented.

The flowers are at first yellowish, but afterward of a deep ferruginous hue. Though they are inodorous, the wood when cut, especially near the root, is highly fragrant. It grows in the dry region of Southern India, and in the islands of the Indian Archipelago. When felled the trunk is about nine inches or a foot in diameter. It is then barked, cut into billets, and buried in a dry place for about two months. It is largely exported from India to China and Arabia, and, to a certain extent, to Europe. The heart-wood is used in the East for carving, for incense, and for perfume. The seeds yield by expression a thick viscid oil, burnt by the poorer classes in India. An essential oil is also distilled from the wood. Hindu doctors consider

sandal-wood sedative and cooling, and use it in gonorrhœa. The sandal-wood of the Sandwich Islands is derived from *Santalum freycinetianum* and *S. paniculatum*. Red sandal-wood is the wood of *Pterocarpus santalinus*, growing in Coromandel and Ceylon. In occidental pharmacy it is used only to color the compound tincture of lavender. In India the name is also given to *Adenanthera pavonina*.

When very fine in grain, they are called freestones; when coarse and composed of angular or subangular grains of sand, they become grits; when pebbly, pudding-stones. Loose and friable sandstones do not as a rule preserve fossils well. They are often deeply ripple-marked, and occasionally preserve footprints or the indentations made by old rain-drops. **Jewish Antiq.**: The superior court or council of the Jewish nation. Tradition says that it was instituted in the time of Moses, and consisted of seventy-one members, viz., the seventy elders appointed by God (Num. xi. 17-25), with the lawgiver himself as president; but the fact of its Greek derivation (see etym.) renders it highly probable that it did not arise till after the Græco-Macedonian period. It is never alluded to in the Old Testament, unless it be in 2 Chron. xix. 8. That work, however, may not have taken its final form till the period in question. The Sanhedrim may have developed from and succeeded the Great Synagogue. The tradition is that it had seventy-one members. If so, the number was probably fixed to put it in harmony with the court of Moses and the seventy, and, if the number of the seventy disciples sent out by Jesus was fixed to constitute with him seventy-one in imitation of the Sanhedrim, this would confirm the tradition. But, if Jesus followed Moses, and not the Sanhedrim, the apparent confirmation would fall to the ground. The Sanhedrim consisted of three classes: First, the heads of the twenty-four courses into which the priests were divided (1 Chron. xxiv. 4-6), with those who had been high priests (?)—the elders or heads of the people (Matt. xvi. 21, xxvii. 1-3), and the scribes, or lawyers (Matt. xxvi. 3). They sat in a crescent, the president, on a higher seat than the rest, in the middle, supported on the right by the vice-president, and on the left by a learned referee. Herod was summoned before the Sanhedrim for putting people to death, B. C. 47 (*Josephus: Antiq.*, xiv. 9, § 4), and Jesus was condemned by it for claiming to be the Messiah (Matt. xxvi. 57-66). Shortly before this it had lost the power of life and death (John xviii. 31), which is generally held to

have fulfilled the Messianic prophecy in Gen. xlix. 10. It ended when Theodosius put the last president to death, A. D. 425.

**San José (hō-să) scăle**, s. **Entom.**: *Aspidiotus perniciosus*, a minute tree-louse that is particularly destructive to orchards. "Never in the history of economic entomology in the United States," says Prof. L. O. Howard, entomologist of the U. S. Department of Agriculture, "has a single species of insect excited so much interest as has the San José scale." It is no larger than a fly-speck, and is often mistaken for such when appearing on fruit, but when examined with a microscope it is a most formidable six-legged insect. The male is distinguished by wings, the female being wingless. Although named from an American city, the San José scale is a native of Mexico. It has found its way into the United States and many parts of Europe, having been carried from country to country in shipments of fruit. In 1897 Austria legislated against American fruit on the alleged ground of its being infested with this destructive insect. Where it once finds a lodgment it is extremely hard to get rid of, for, besides being very prolific, it is tenacious of life. It drains the juices from the trees, destroying the bark by sapping its life away. Hydrocyanic acid gas as a fumigator is said to kill them, and kerosene oil, used as a wash, is recommended as being equally fatal. But if any escape they will soon infest a large orchard. [SCALE-INSECT.]

**Philol.**: The ancient language of the Hindus, and the oldest and most primitive of the Indo-European tongues. It has long ceased to be a living language, but in it most of the literature of the Hindus is written, from the oldest portion of the Vedas onward. [VEDA.] To the scores of tribes and nations of discordant speech in India Sanscrit has long been the sacred and literary dialect, and all the cultivated tongues of modern India are as full of Sanscrit words as the European tongues are of Latin. It is a highly inflected language, and to philologists is the most valuable of tongues, owing to its freedom from the corruptions and disguises of phonetic changes and from obliteration of the original meaning of its vocables.

"The classical Sanskrit is a dialect which, at a later period, after the full possession of Hindustan and the development of Brahmanism out of the simpler and more primitive religion and polity of Vedic times, became established as the literary language of the whole country, and has ever since maintained that character, being still learned for writing and speaking in the native schools of the Brahmanic priesthood. From the fact that inscriptions in a later form of Indian language are found dating from the third century B. C., it is inferred that the Sanskrit must at least as early as that have ceased to be a vernacular tongue."—*Whitney: Life and Growth of Language*, ch. x.

The sap ascends with great rapidity in a zigzag course, sending off lateral currents to the leaves. The most copious ascent is in spring; in winter the operation intermits. *Ichthy.*: *Clupea sardina*, a fish resembling the pilchard, but smaller, specially abundant in the Mediterranean; found also in the Atlantic. They are cured with oil in tin boxes and form a wholesome article of food. The annual value of the exports from French and Mediterranean ports is about \$730,000. Sometimes the French cure them in red wine, when they are called anchovy sardines, and are exported to the Levant.

¶ The United States Fish Commission calls attention to the food value of the anchovy of the waters of the Northwest, which, it is predicted, will displace the Sardinian sardine as a small fish canned in oil. It is said to far surpass the sardine in flavor and richness. The anchovy of the Sound is seldom more than six inches long, and it is much better adapted for canning than the Eastport (Me.) variety of "sardine," which is either young herring or the small fry of other fish. A test of the flavors of the Pacific coast anchovy as a fish canned in oil was recently made, and experts pronounced them delicious. They were put up in California olive oil.

*Ornith.*: *Ptilonorhynchus violaceus*. The adult male is conspicuous for the satin texture of its glossy black plumage. The younger bird is at first entirely of a dull green color, which gradually becomes mottled with black, and eventually changes entirely into that hue. Long before the construction of their nest, and quite independently of it, they, with consummate skill, weave an arbor-like gallery of uncertain length, in which they amuse themselves with the most active glee, the male displaying himself therein to attract the hen bird. The architecture of the bower is excessively tasteful, and scarcely a day passes without some fresh arrangement of the shells, feathers, bones, and other decorative materials, which they bring from long distances in the bush to ornament the bower and the platform on which it stands. They immediately appropriate every fragment placed within their reach when in confinement for the same purpose.

1. **Class. Mythology:** The youngest son of Cœlus (Uranus) and Gaia, the goddess of the earth. Being banished by Jupiter from heaven, he fled to Latium, and was received by Janus, king of Italy, who made him his partner on the throne. Saturn occupied himself in softening the barbarous manners of the people of Italy, and in teaching them agriculture, and the useful and liberal arts. His reign there was so mild and beneficent that mankind have called it the Golden Age, to intimate the happiness and tranquillity which the earth then enjoyed. He is generally identified with the Greek Kronos, and the festival in his honor, called Saturnalia, corresponded with the Greek Kronia. He is generally represented as an old man bent through age and infirmity, holding a scythe in his right hand. His temple was the state treasury.

2. **Astron.:** The sixth of the major planets in distance from the sun. This averages 884,000,000 miles, and at certain times is nearly 1,000,000,000. It is the second planet in point of magnitude, having a mean diameter of 71,000 miles. To the eye it is as large as a fixed star of the first magnitude, and was known to the ancients. The equatorial diameter is about 76,000 miles, the polar 70,000. The large discrepancy indicates rapid rotation. This is performed in 10 hours, 14 minutes, and 23.8 seconds. Saturn's day is consequently not half the length of ours. But its year, fixed by the time of its revolution round the sun, is twenty-nine and a half earthly years. It moves through about twelve degrees of the sky in a year, enough to be noted by any ordinarily careful observer. The density of Saturn is one-eighth that of the earth. Were water enough supplied for the purpose, Saturn would float with one-fifth of its bulk dry. It is supposed that the materials of which it is composed are too greatly heated to condense into a compact body, but its weight is about eighty times that of the earth. Prior to 1610, Galileo, with his telescope, which magnified thirty

The Planet Saturn.

times, discovered three bodies projecting from the planet's disc, which in that year began to diminish in size. Huyghens, in 1655, proved these to be a

ring. In 1675, J. D. Cassini showed that a black line divided the ring into two parts. These Maraldi, in 1715, and Sir Wm. Herschel, in 1790 (?), showed to be all probably separate rings. In 1850, Professor Bond, of Cambridge, Massachusetts, discovered a third ring, a dusky, semi-transparent structure, which has been called a crape ring. Sir Wm. Herschel had proved in 1789 that the rings rotated in 10 hours, 32 minutes, 15 seconds. Astronomers have shown that, were the rings either solid or fluid, they must undergo disruption by unequal stress; and that they therefore probably consist of minute bodies like the meteorites surrounding the sun. On March 25, 1655, Huyghens discovered the first satellite of Saturn. Between 1671 and 1684 Cassini found five more. On August 28, 1789, Sir Wm. Herschel added a seventh, and on Sept. 19, 1848, Professor Bond, of Cambridge, Massachusetts, and Mr. Lassell, of Liverpool, an eighth. The discovery of a ninth satellite was announced March 18, 1899, by Prof. Pickering, of Cambridge, Mass. The names of the nine are: Mimas, Enceladus, Tethys, Dione, Rhea, Titan, Hyperion, Iapetus, Phœbe.

sāw, pret. of v. [SEE, v.]

sāw (1), sawe (1), s. [A. S. *saga*; cogn. with Dut. *zaag*; Icel. *sög*; Dan. *sav*; Sw. *såg*; Ger. *säge*. From the same root as Lat. *seco*=to cut.]

1. *Anthrop.*: The Greeks claim the invention of the saw, but it occurs on the Egyptian monuments. Saws of the bronze age have been found in Germany and Denmark; and in the stone age rude saws of flint were affixed to wooden handles by bitumen. The Caribs formerly employed saws of notched shells, and the Tahitians of sharks' teeth.

2. *Carp.*: An instrument with a serrated or dented blade, the teeth of which rasp or cut away wood or other material, making a groove known as a kerf. The best saws are of tempered steel, ground bright and smooth; those of iron are hammer-hardened; hence the first, besides being stiffer, are likewise found smoother than the last. The edge in which are the teeth is usually thinner than the back, because the back is to follow the edge. The teeth are cut and sharpened with a triangular file, the blade of the saw being first fixed in a whetting-block. Saws are used to cut wood, stone, ivory, and other materials, and are either reciprocating or circular, and of various sizes and forms, according to the purpose for which each is intended. They may be divided into hand-saws and machine-saws, of which the first are the more numerous. Of hand-saws the most commonly used are the band-saw, the cross-cut saw, the frame-saw, the hand-saw, the panel-saw, the key-hole saw, the bow-saw, the ripping-saw, the sash-saw, the tenon-saw, &c., which will be found described in this work under their several heads. Machine-saws are divided into circular, reciprocating, and band-saws. The circular-saw is a disc of steel with teeth on its periphery; it is made to revolve at great speed, while the material to be cut is pushed forward against it by means of a traveling platform. The reciprocating-saw works like a two-handled hand-saw, but it is fixed and the material pushed forward against its teeth. The ribbon-saw consists of a thin endless saw placed over two wheels, and strained on them. It passes down through a flat sawing table, upon which the material to be cut is laid.

(5) In music, the sounds in consecutive order used by various nations in different forms as the material of music. In a proper succession such sounds form Melody. In proper combinations they constitute Harmony. The modern scale, universally used among the more civilized nations, consists of twelve divisions, called semitones, included in one octave. The ancient Greeks and Asiatics ancient and modern exhibit the use of less intervals. Such scales are called Enharmonic. Other nations have intervals of a third between some of the steps. This is exhibited in the Chinese and ancient Scotch scales, and in the scales of some savage nations. A scale containing only five unequal divisions of the octave has been called Pentaphonic or, less correctly, Pentatonic. All scales are purely arbitrary, consisting of a selection of sounds produced by the aliquot divisions of a monochord. When the divisions of a monochord are slightly altered to suit the required steps in an octave, as is the case in the modern scale, the scale is said to be tempered; when the harmonic divisions of the monochord are strictly followed, the scale is said to be in just intonation. The modern scale when used as a succession of twelve semitones is called Chromatic, when used in the ordinary mixture of tones and semitones it is called Diatonic, when the third and the sixth are flattened it is called the Modern minor diatonic scale, when the third and sixth remain major, the scale is said to be a Major diatonic scale. The scale is also called the gamut (French *gamme*) from the words *gamma* and *ut*, the names of sol and do, found in the Guidonian system of overlapping hexachords. The Italian names for the degrees of the scale, *ut, re, mi, fa, sol, la*, are derived from the initial syllables of a Latin hymn quoted in all musical histories. *Ut* was afterward called *do* by many nations, and the name *si* was given to the seventh degree of the scale, when the ancient system of hexachords was converted into the modern system of octaves. When the scales, whatever the pitch, start from *do*, the system is said to be that of the movable *do*; when the first note of the scale is called *do, re, mi, &c.*, according to a stated pitch called *do*, the system is called that of the fixed *do*.

Viewed in thin fragments, it appears translucent and of a golden-brown color. Genuine scammony should contain from 75 to 82 per cent. of resinous matter, soluble in alcohol, the remainder being wax, gum, starch, &c. It is, however, frequently adulterated, the adulterants being starch, gum, and inorganic salts. Samples have been found to contain not more than 10 per cent. of scammony, and over 60 per cent. of gypsum and chalk. Pure scammony is a powerful drastic purgative and anthelmintic.

scape-goat, s.

1. *Lit. & Jewish ritual*: A goat designed to 'scape, i. e., escape, as opposed to one killed and offered in sacrifice. Once a year, on the great day of atonement, after Aaron had offered a bullock in sacrifice for the sins of himself and his house (Lev. xvi. 1-6), he was to take two goats "for a sin offering" (5). Lots were to be cast, one lot for the Lord, and one (8, A. V.) for Azazel (R. V., on the margin "for dismissal"). The goat on which Jehovah's lot fell was to be offered for a sin offering (9).

"But the goat on which the lot fell for Azazel shall be set alive before the Lord, to make atonement for him to send him away for Azazel into the wilderness." (10.) Cf. Matt. xii. 43; Luke xi. 24.

Before the dismissal, Aaron was to lay both his hands on the goat's head, and confess his sins and those of the people, putting them on the head of the goat, and send him by the hand of a trusty man into the wilderness, "and the goat shall bear upon him all their iniquities into a solitary land" (21, R. V.). If Azazel is an evil spirit [AZAZEL, 1], then after the sacrifice of the one goat had atoned for

and removed the sins of the worshipers, the other scape-goat might return those sins in mockery to Azazel, the evil spirit regarded as their author. This is Hengstenburg's view. Rationalism, on the contrary, sees in the narrative a certain remnant of devil-worship flourishing perhaps in pre-Mosaic times. Under the later Judaism the goat was thrown over a precipice about twelve miles from Jerusalem. The scape-goat is generally considered the clearest type of the substitution of Christ for sinners, and His eternal removal of their transgressions (cf. Isaiah liii. 11-12; John i. 29; Heb. ix. 28; 1 Peter ii. 24).

*Pathol.*: Scarlet fever, a disease of childhood but occurring at any age, consisting of an inflammation affecting the entire integument, both cutaneous and mucous, accompanied by an infectious or contagious fever. There are three varieties, *S. simplex*, *S. anginosa*, where the throat is chiefly implicated, and *S. maligna*, where the poison is so rapidly fatal as frequently to kill the patient before the chief usual symptoms develop. The eruption appears on the second or third day in the form of closely aggregated points about the size of a pin's head, with normal skin between, rounded and tending to become confluent. The period of desquamation, owing to excessive production of new epidermis, follows in two or three days. The eruption may be on the face only, the most frequent change being in the throat, the tonsils becoming swollen with catarrhal pharyngitis, tenacious mucous secretion, and œdema, with great difficulty in swallowing. Inflammation of the parotids and other glands often occurs, with suppuration and abscess, destroying the cell-tissues, with sloughing, and occasionally fatal hæmorrhage. The middle ear is frequently affected in the eruptive stage, often resulting in permanent deafness, and diphtheria is a not unusual complication, leading some observers to treat it as a symptom of scarlatina or eruptive maladies affecting the throat instead of a distinct disease. The kidneys are more affected in this disease than any other organ, nephritis being a common accompaniment, and dropsy a very frequent sequela. It is very contagious, the infection persisting for a long time, and tending to attack every member of a family not protected by a previous attack. Its regular course is from two to three weeks, the period of infection being strongest during the process of desquamation, and lasting for about three

weeks from the commencement of that process. It is most fatal in the very young, during pregnancy, or in adults suffering from organic diseases, or when complications exist. Death may ensue from pyæmia, septicæmia, pneumonia, or anasarca, being ushered in by convulsions and coma; should the temperature reach 105°, with a pulse over 120, livid eruption, nervousness with typhoid symptoms, hæmorrhage of the skin, or vomiting, diarrhœa, or dropsy set in, the prognosis is very unfavorable. There is no known specific for this formidable malady.

1. One who doubts the truth or reality of any principle or system of principles or doctrines; one who hesitates to believe; (more loosely) a disbeliever.

(2) *Philosophy*: One who pursues the sceptical system in philosophy. [SCEPTICISM, 2. (2).]

"Scepticism, meaning doubt, and being frequently used to signify religious doubt, has alarming associations attached to it. To call a man a *sceptic* is to call a man a heretic. And, unfortunately for Hume's philosophical reputation, he was a *sceptic* in Theology as well as in Philosophy, and mankind have consequently identified the former with the latter."—*G. H. 2. *Specifically:*

(2) *Philos.*: The principle of universal doubt, or at least doubt with regard to the validity of all judgments respecting that which lies beyond the range of experience. (*Kant*, in *Ueberweg: Hist. Philos.* (Eng. ed.), ii. 32.) There were three schools of Scepticism in Greek Philosophy: (1) That of Pyrrho of Elis, in the time of Alexander the Great.

(2) the Middle Academy, beginning with Arcesilaus, who flourished toward the close of the third century B. C.; and (3) the Later Sceptics, beginning with Ænesidemus of Cnossus, who appears to have taught at Alexandria in the first century after Christ; they founded their teaching upon that of Pyrrho, and are often called Pyrrhonists. Scepticism found an active and able opponent in St. Augustine of Hippo (354-430), but revived somewhat in the Middle Ages, though at that period, as in later times, it dealt rather with the arguments by which theological teachings were sustained than with the teachings themselves and the philosophical doctrines corresponding thereto. The spirit of inquiry awakened by the Reformation and the Renaissance, and the decadence of the Scholastic Philosophy, led men to

recur to the ancient Greek systems, and Scepticism was revived and supported by Montaigne (1553-92), Pierre Charron (1541-1603), and Bayle (1647-1706) in France, and in England by Hobbes (1588-1679), Glanvill (1636-80, author of *Scepsis Scientifica*, and chaplain to Charles II.), and Joseph Hume (1711-76), whose philosophical scepticism incited Kant to the construction of his Critical Philosophy.

"Such is the battle-field, where *skepticism* and dogmatism contend. The controversy between them reduces itself to this question—Is human knowledge, or is it not, a faithful image of real being?"—*Jouffroy: Introd. to Ethics* (ed. Channing), i. 203.

**†scēp'-tī-çize, v. i.** [Eng. *sceptic*; -ize.] To act the sceptic; to doubt or to pretend to doubt of everything; to be or to pretend to be sceptical.

*Mech.*: An apparatus for detecting internal flaws in metal fabrications. It is the invention of Capt. De Place, of Paris, and consists of a small pneumatic tapper worked by the hand, and with which the piece of steel or iron to be tested is tapped all over. Connected with the tapper is a telephone with a microphone interposed in the circuit. Two operators are required, one to apply the tapper and the other to listen through the telephone to the sounds produced. These operators, who are in electrical communication, are in separate apartments, so that the direct sounds of the taps may not disturb the listener, whose province it is to detect flaws. In applying the system one operator places the telephone to his ear, and so long as the sounds produced by the taps are normal he does nothing. Directly a false sound—which is very distinct from the normal sound—is heard, he instantly signals for the spot to be marked. By this means he is able not only to detect a flaw, but to locate it.

**schîsm** (*ch* silent), \***schîsme**, \***scîsme**, *s.* [Fr. *schîsme*, *scîsme*=a division in or from the church, from Lat. *schisma*; Gr. *schisma*=a rent, a split, a schism, from Gr. *shizo*=to cleave; Sp. *cisma*; Port. *schisma*; Ital. *scisma*, *cisma*.]

1. *Ordinary Language*: A split or division in a community.

2. *Theol.*: The Greek word *schisma* is used in three senses in the New Testament: (1) a rent or tear (Matt. ix. 16, Mark ii. 21, Vulg. *scissura*); (2) a difference of opinion, dissension (John vii. 43, x. 19, Vulg. *dissensio*, ix. 16, Vulg. *schisma*); (3) party spirit or division in the Church (1 Cor. i. 10, xii. 25, Vulg. *schisma*, xi. 18, Vulg. *scissura*). The word was afterward employed by the fathers and theological writers to denote formal separation from the unity of the Church.

"He [St. Thomas Aquinas] thus explains the difference between heresy and *schism*. Heresy is opposed to faith, *schism* to charity, so that, although all heretics are schismatics, because loss of faith includes separation from the Church, all schismatics are not heretics, since a man may, from anger, pride, ambition, or the like, sever himself from the communion of the Church, and yet believe all that which the Church proposes for our belief. Still, a state of pure *schism*, *i. e.*, of *schism* without heresy, cannot continue long, at least, in the case of a large number of men."—*Addis & Arnold: Cath. Dict.*, p. 745.

This is practically the sense in which the word is used by Anglican High Churchmen. Protestant Dissenters apply the term to divisions or parties in a religious body (cf. 1 Cor. xii. 24-6), or rending a church into two portions without adequate cause.

**schō-lās'-tī-çīsm**, s. [Eng. *scholastic*; *-ism*.]

*Philosophy & Church Hist.*: The name given to a movement which began with the opening of cloister schools by Charlemagne (742-814), attained its greatest development in the early part of the thirteenth century under Aquinas and Scotus, and, after receiving a check from the labors of Roger Bacon (1214-92) and the criticism of Occam (died 1347), gradually subsided at the Renaissance. Scholasticism was the reproduction of ancient philosophy under the control of ecclesiastical discipline, the former being accommodated to the latter, in case of any discrepancy between them. It had two chief periods: (1) That from Scotus Erigena (died circ. 886) to the beginning of the thirteenth century, in which Aristotelian logic and Neoplatonic philosophemes were pressed into the service of the Church; and (2) from this time till the Renaissance and the Reformation, marked by the adaptation of the whole Aristotelian philosophy to theology. Alexander of Hales (died 1245) seems to have been the first scholastic who was acquainted with the whole of Aristotle's works and the Arabian Commentaries thereon. In the first period arose the Nominalists and the Realists; in the second the Scotists and the Thomists. [See these words; SCHOOLMEN.]

"But when the belief of the Church had been unfolded into a complex of dogmas, and when these dogmas had become firmly established, it remained for the school to verify and systematize them by the aid of a corresponding reconstruction of ancient Philosophy; in this lay the mission of *Scholasticism*."—*Ueberweg: Hist. 2. Pertaining or relating to the Schoolmen; as *school* divinity.

¶ Education in the earliest periods seems to have been mainly domestic; the parents imparted it, and its character was religious (cf. Gen. xviii. 19; Exodus xiii. 14). Scholars are mentioned in 1 Chron. xxv. 8 and Mal. 11, 12, but nowhere in the Old Testament is there a word for school, though, according to Dr. Ginsburg, eleven words having that meaning were introduced into Hebrew between the return from Babylon and the close of the Talmudic period. The words for school in most European languages being from the same root, and the Mahratta *sal*=school, being apparently so, schools among the Aryans must be carried back to a remote period. Among the ancient Greeks, both boys and girls were taught at public schools (cf. Acts xix. 9; Gal. iii. 24, 25), as was the case with the Romans. The view that India has for centuries possessed a system of village schools, attended by all the boys, is much beyond the truth, and even now only a fraction of the Indian population can read. The missionaries instituted vernacular schools, the government founded some of its own with the Bible excluded, and one or two Indian administrators aided the native schools. In 1854 Sir Charles Wood, afterward Lord Halifax, sent out from London a dispatch on the subject, which led to the subsidizing of every efficient school, and ultimately gave a great impulse to education. The number of schools in China has been greatly exaggerated. In England the procedure of the law courts called "benefit of clergy" (q. v.) shows that for centuries there

was scarcely a layman even of rank who could read. Schools therefore were designed chiefly for the education of ecclesiastics. Some were founded in the seats of bishoprics or archbishoprics; thus, Canterbury school existed at least as early as 1321, and Winchester school and college in 1387. There were various endowed schools in connection with religious foundations, and schools for teaching "grammar" and singing in connection with the chantries. The dissolution of the monasteries under Henry VIII. and of the chantries under Edward VI. led to the establishment of several endowed public and grammar schools. Those founded under the latter ruler are called King Edward's Schools. They still remain and are wealthy. Eton College was founded in 1541, Christ's Hospital or the Blue-coat School in 1552, Winchester refounded in 1560, Rugby founded in 1567, and Harrow in 1585. These "grammar" schools, *i. e.*, schools for teaching Latin and Greek, were, as a rule, for poor orphans, but the education given was one suitable to the upper and middle classes, and in practice they have scarcely affected the lower classes. During mediæval times the view that ignorance is the mother of devotion had helped to keep the masses ignorant. To this succeeded the middle and upper class prejudice, not now often avowed, but secretly held by many, that to teach the poor would render them discontented with their lot. The first great improvement arose from the establishment in 1783 in England of Sunday-schools (q. v.). Very early in the settlement of this country the cause of education received a great share of the public attention, and schools of almost every grade were established for the education of the young and for fitting older students for various professions. The first noted foundation in this connection was Harvard College, which began its existence in 1636, under patronage of the Rev. John Harvard. For fifty-seven years this institution was without a rival, but in 1693 at Williamsburg, Virginia, the College of William and Mary was founded, having for its patrons the King and Queen of England (William of Orange and Mary, daughter of James II.). Eight years later Yale was established, and at once took rank amidst the foremost schools of the world. Pennsylvania University was the next of the noted schools now in existence, being founded in 1740. It was followed by the College of New Jersey at Princeton in 1746. In 1749 Washington College (now Washington and Lee University) was founded at Lexington, Va. New York City was the next on the list, Columbia College in that city being founded in 1754. Rutgers College, New Brunswick, N. J., was established in 1766, and New Hampshire followed with Dartmouth College in 1769. From this time onward, despite the troublous times of the Revolution, the increase in the number of higher schools was rapid and steady, and to-day there is not a state in the Union which is not liberally supplied with facilities for its people acquiring higher education. The colleges and universities of the United States now in operation on a successful foundation number over 450. The idea of public schools maintained by the states was also of early date, and in the northern and anti-slavery states was put into practice. In the southern, slave-holding states, the proposition did not meet with favor, the richer classes of the population refusing to allow their children to attend "free" schools, as they were contemptuously called, at the same time being opposed to the education of the "poor white" element, and absolutely forbidding the instruction of negroes, the theory being that education would tend to make these two classes of population restive under the yoke which the laws imposed upon them. After the civil war, however, the slaves having been freed from servitude, the people of the South found themselves face to face with the problem of what to do with several millions of ignorant citizens who could not read or write, and were steeped in grossest superstition and almost barbarous. The education of these classes became a paramount necessity, and a system of public free schools was inaugurated in the states which had theretofore had none, and now every state and territory in the Union has its school system. The number of scholars enrolled in the entire country in 1900 was as follows: University and college students, 110,912; normal school pupils, 69,593; pupils in professional schools, 58,070; in business schools, 91,549; common school pupils enrolled, 15,341,220, with an average daily attendance of 10,513,518. The total number of teachers in the common schools was 421,288.

**1.** Knowledge. (Byron: *Cain*, i. 1.)

**2.** Knowledge amassed, severely tested, coördinated, and systematized, specially regarding those wide generalizations called the laws of nature. Herbert Spencer thus classifies the sciences: (1) Abstract sciences: Logic and mathematics; (2) Abstract concrete sciences: Mechanics, chemistry, physics, &c.; (3) Concrete sciences: Astronomy, geology, biology, sociology, &c. No science rests on a firmer base than mathematics, which, being founded on demonstrative evidence, may be accepted as absolutely true. The results in logic, which, like mathematics, is a deductive science, are much less certain; for error may creep into the premises, with the result of vitiating the conclusion. All other sciences are to a large extent inductive. These, resting only on probable evidence, are not really science, or knowledge, in the strict sense of the word, but continually approach nearer and nearer to it, as scientific methods improve. The sciences vary in the distances they have moved toward perfection, astronomy having gone far forward and therapeutics lagged behind. The inductive sciences may be divided into the mental and the physical. The former are largely to be studied by reflection on our own mental operations; the latter require observation, experiment, comparison of the facts obtained, inductive and deductive reasoning, the whole ending in as wide generalization as the ascertained facts will permit. No one can be a truly scientific student unless he considers truth of priceless importance, and is prepared to sacrifice all preconceived notions and carefully elaborated opinions, whenever he discovers them to be erroneous. No expenditure of money, time, or even life, is considered extravagant if the sacrifice be made for the discovery of fresh truth. The initial stages in the evolution of the several sciences are to be sought in a remote period of antiquity. Moral science, a department of mental science, reached some degree of maturity first, early man desiring to ascertain what his conduct should be to his fellows and to his god or gods. Mental science, or the investigation of the thinking and feeling mind, came next; but, to this day, has made but slow progress, and is still far from certainty. Physical science had really commenced, though it was in its infancy, when ancient myths of observation were framed, many of which were hypotheses to account for natural phenomena. Its progress, slow till the eighteenth century, has since then been increasingly rapid. Prior to this, the greatest advances were made in astronomy and in physics, then in chemistry, botany, &c. Geology did not attract much notice till the beginning of the nineteenth century, and anthropology, comparative religions, &c., not till its second half. Though science has been prosecuted by its most earnest cultivators for its own sake, and not for the beneficial effects which the discoveries will have on mankind, yet those discoveries have already helped man incalculably. Railways, ocean steamers, telegraphy, gas, &c., all resulted from scientific inquiry turned to practical account.

**3.** Knowledge regarding any one department of mind or matter, coördinated, arranged, and systematized; as the *science* of botany, of geology, &c.

**4.** Art or skill derived or resulting from precepts, principles, or training; exceptional or preëminent skill.

**5.** One of the seven liberal arts: Grammar, rhetoric, logic, arithmetic, music, geometry, astronomy.

And though no *science*, fairly worth the seven."—Pope: *Moral Essays*, iv. 43.

**6.** An object of study; a branch of knowledge.

Whereof I know she is not ignorant."—Shakesp.: *Taming of the Shrew*, ii.

Head large, slightly compressed, armed with spines, and generally with tentacles; mouth large, oblique, villiform teeth; no air-bladder. They are small sedentary fishes, none probably exceeding a length of eighteen inches, usually lying hidden in sands or beneath seaweed, watching for their prey—fishes smaller than themselves. Their strong pectoral rays assist them in burrowing or in moving along the bottom. Coloration an irregular mottling of red, brown, yellow, and black, varying greatly in its distribution. The flesh is well-flavored. Their fin-spines inflict exceedingly painful wounds, but these are not followed by any serious consequences.

**scor'-pī-ō**, *s.* [Lat.=a scorpion.]

1. *Astrology*: The "accursed constellation," the "false sign," ominous of war, discord, and woe. It is of "watery triplicity," and is attended at its setting by tempests and by autumnal diseases. Gadbury dissented from these views, having been born when Scorpio was in the ascendant. So did the alchemists, for they believed that iron could not be transmuted into gold except when the Sun was in the sign of Scorpio.

2. *Astronomy*:

(1) The eighth zodiacal constellation. It is bounded on the north by Ophiuchus and Serpens, on the south by Lupus, Norma, and Ara, on the east by Sagittarius, and on the west by Libra. It is a small but very brilliant constellation, especially when seen from places south of the equator. It contains Antares (q. v.) or Cor Scorpæ (Alpha Scorpæ), of the first magnitude, and Iklil, or Beta Scorpæ, of the second magnitude.

4. *Zoölogy*: Any individual of the family Scorpionides (q. v.). The European species are three or four inches long, and confined to the southern parts of the Continent, but Scorpions have a wide geographical range in tropical and sub-tropical regions, and in Equatorial Africa and South America they grow to a length of nine or ten inches. The sting in the tropical species is much more formidable than that of the European Scorpion, though it may be doubted if it ever proves fatal to a healthy adult human being. They are nocturnal in habit, concealing themselves under stones, the loose bark of trees, and in crevices in walls, coming forth at dusk. They prey on other spiders and insects; and, seizing their prey in their palpi, which are practically useless as weapons of offense, sting it to death. The eggs are hatched in the enlarged oviducts, and the young, usually from forty to sixty, are carried about for some time on the back of the mother. Scorpions are very pugnacious, and the victor usually devours his conquered foe.

Scotism was a more pronounced form of Realism than Thomism (q. v.), and taught that the species is numerically one, assigning to each individual a *haecitas*—something which gives individuality apart from matter; that the created will is the total and immediate cause of its own volition; that the creation of the world and immortality of the human soul are not demonstrable by human reason; that the opinion that the Virgin Mary never contracted original sin is the "more probable" (which led to the Franciscans being recognized as the champions of the Immaculate Conception); and that an action is not necessarily good or bad, but may be indifferent. In opposition to St. Thomas Aquinas, Scotus held that the secular power may be lawfully employed to compel Jews to enter the church.

1. *Mach. & Mech.*: A cylinder surrounded by a spiral ridge or groove, every part of which forms an equal angle with the axis of the cylinder, so that if developed on a plane surface it would be an inclined plane. The screw is considered as one of the six mechanical powers, but is really only a modification of the inclined plane. A convex screw is known as the external or male screw, a concave or hollow screw (generally termed a nut) is an internal or female screw. The mechanical effect of a screw is increased by lessening the distance between the threads, or by making them finer, or by lengthening the lever to which the power is applied; this law is, however, greatly modified by the friction, which is very great. The parts of a screw are the head, barrel or stem, thread, and point. The head has a slit, nick, or square. In number screws vary, as single, double, triple; the numbers representing the individual threads, and those above single being known as multiplex-threaded.

In 1802, Shorter, an English mechanic, produced motion through the water by means of a screw, but his discovery had no practical value, and it was not till 1837 that its practicability was demonstrated by the American inventor, Captain Ericsson, since which time the screw has steadily gained in favor as a means of propulsion for vessels all over the world. In 1860, Messrs. Dudgeon, of London, England, constructed a steamer with twin screws, one under each quarter, having independent action, and imparting additional steering power. The motion of a screw-steamer is more uncomfortable to passengers than that of a paddle-boat, for the rapid revolution of the shaft produces a continuous vibration. In many cases, however, this is obviated in some measure by placing the saloon in the fore-part of the ship. [**TWIN-SCREW**.]

"A Stock Exchange term contracted from 'subscription.' When a foreign loan is issued, or a new company is about to borrow capital, the public are invited to 'subscribe' to it, that is, in plain language, they are asked to say how much money they are willing to lend for either of those purposes. This invitation is presented in the form of a 'prospectus.' The lender or subscriber 'applies' for a share in the loan, or for the privilege of contributing to a company's capital, and in answer receives a 'letter of allotment.' This letter of allotment is afterward exchanged for 'scrip,' that is a kind of provisional document entitling him to claim definite bonds or share certificates, indicating how many bonds or shares he has subscribed."—*Bithell: Counting House Dictionary.*

1. The art of cutting, carving, or hewing wood, stone, or similar material into the figures of men, beasts, or other things. It also includes the modeling of figures in clay, wax, or other material, to be afterward cast in bronze, or other metal.

2. A piece of sculpture; carved work; a figure cut or carved in wood, stone, or similar material, representing some real or imaginary object.

† The origin of sculpture is lost in antiquity. An admirable material for early effort was found in clay, so widely diffused in many lands [TERRACOTTA], to which, as knowledge advanced, were added wax, gesso, marble, bronze, &c. Hence the rudiments of sculpture are found among all races of mankind. The idolatry of the Old World gave it a great impulse, from the necessity which it produced of representing gods. [IDOL.] Innumerable highly antique sculptures remain belonging to the Egyptians; they are not confined to gods, but represent men engaged in their several occupations. To a certain extent it is the same with the Assyrian sculptures. Those of India are known chiefly in connection with Buddhism and the Later Brahmanism; they are more exclusively connected with religion. All these are mediocre specimens of art. It was reserved to the Greeks, and specially to the Athenians, to carry sculpture to the highest perfection, which Phidias did, about B. C. 442, and Praxiteles, about B. C. 363. The works of the former were characterized by sublimity, those of the latter by beauty. Praxiteles was the first who ventured to produce a wholly nude figure. The conquest and spoliation of Greece by the Romans, B. C. 146, led to the removal of Greek masterpieces to Rome. This ultimately created a certain taste for sculpture among the Romans, especially under the Emperor Augustus, but, as sculptors, the Romans never equaled the Greeks. Under the later emperors the art declined; under the barbarian invaders who next succeeded to power it all but expired. It was revived in Italy in the thirteenth century by Pisano, and gradually spread to other European countries. Among Italian sculptors were Donatello (1383-1460), Michael Angelo (1474-1564), and Canova (1757-1822). Among English sculptors are Thomas Banks (1735-1805), Joseph Nollekens (1737-1823), John Bacon (1740-99), John Flaxman (1755-1826), John Gibson (1781-1866), John Henry Foley (1818-74), Alfred Stevens (1817-75), &c. Prominent among American sculptors are Hiram Powers (1805-1873), Benjamin Paul Akers (1825-1861), Harriet G. Hosmer (1830—), Martin Gilmore (1845-1883), and William Wetmore Story (1819—).

**sea-serpent, s.**

1. A sea-snake (q. v.).

2. An animal of immense size, and of serpentine form, said to inhabit the ocean, but concerning which nothing definite is known. The first detailed accounts come from Norway. Pontoppidan (*Nat. Hist.*, ed. (1755), ii. 195) figures the Sea-serpent raising itself from the water and spouting, but the *Encyclopædia Britannica* (edit. 9th), xxi. 609, matches the figure with that of a squid. In more recent times several appearances of the "Sea-serpent" have been recorded; notably by Captain M'Quhæ, of H. M. S. *Dædalus* (*Lond. Times*, Oct. 9, 1848, figured in *Illus. Lond. News*, Oct. 28, 1848), by Capt. A. Hassel (*Graphic*, Aug. 17, 1872), by the master and crew of the *Pauline*, of London (*Illus. Lond. News*, Nov. 20, 1875), by Lieut. Haynes, of the Royal yacht *Osborne* (see illustration, and *Graphic*, June 30, 1877), by Major Senior, from the *City of Baltimore* (*Graphic*, April 19, 1879), and by a clergyman at Busselton, West Australia (*Nature*, June 24, 1879). In these cases the observers testify to

Sea-serpent.

having seen a monstrous serpentiform animal, and their good faith is beyond question. Prof. Owen, in a letter to the *Lond. Times* (see *Illus. Lond. News*, Nov. 25 1848, where Capt. M'Quhæ's reply is also printed), maintained that the animal seen by Capt. M'Quhæ was a gigantic seal, *Macrorhinus elephantinus*; but whilst many Sea-serpent stories may be, and some certainly have been, satisfactorily explained away by deceptive appearance of well-known natural objects at a distance, and "Sea-serpent" remains cast on British

and American shores have been proved to belong to well-known species, there is a growing tendency at least to suspend judgment in the matter. Agassiz says that if the Sea-serpent exist it must be closely allied to the Plesiosaur (*Geological Sketches*, i. 16), and P. H. Gosse (*Romance of Nat. Hist.* (1st ser.), p. 358) claims that it is a surviving Enaliosaur.

"It would thus appear that, while, with very few exceptions, all the so-called 'sea-serpents' can be explained by reference to some well known animal or other natural object, there is still a residuum sufficient to prevent modern zoölogists from denying the possibility that some such creature may after all exist."—*Encyc. Brit.* (ed. 9th), xxi. 610.

"Innumerable preventatives and remedies have been proposed, but most of them fall short of the success claimed for them. No means have yet been discovered which can altogether prevent the occurrence of *sea-sickness*, nor is it likely that any will be found, since it is largely due to the pitching movements of the vessel, which cannot be averted."—*Encyc. *Zoöl.*: The English name for any individual of a group of Marine Carnivora, with resemblances in cranial characters to the True Bears on the one hand and the Otters on the other (*Proc. Zoöl. Soc.*, 1869, p. 34). They fall naturally into two families: The Phocidæ, or True Seals, and the Otariidæ, or Eared Seals. The body in the former is elongated and somewhat pisciform, covered with a short, thick fur, or harsh hairs, and terminated behind by a short, conical tail. The limbs are developed into flippers, and adapted for swimming organs, while they are practically useless on land (a modification foreshadowed in the hind-limbs of the Sea Otter), so that, when they leave the water, the True Seals can only drag themselves laboriously along, chiefly by contractions of the abdominal muscles. They especially abound in the Arctic and Antarctic regions, passing the greater part of the year in the sea, not far from the shore, to which, however, they invariably resort in the breeding season and to bring forth their young. The Eared Seals, almost exclusively confined to the southern hemisphere, are more closely allied to Land Carnivora than the True Seals, as they possess small external ears, and are able to use the hind limbs for progression on shore. The male Eared Seal is much larger than the female, which looks ridiculously small beside her lord. It is from one of this group that most of

the seal-skins of commerce are obtained. [NORTHERN FUR-SEAL.] Seals are largely hunted for the sake of their blubber, which yields a transparent, inodorous oil; and the skins of those species which have no close under-fur [SEAL-SKIN], when tanned, are employed in making boots, and, when dressed with the hair on, serve to cover trunks, &c. The species of True and Eared Seals are numerous, and the most important are described in this Dictionary under their popular names.

**seal-fishery, subst.** The most important fishing-ground for hair-seals is off the coasts of Newfoundland and Labrador, about 250,000 seals having been captured there in one year (chiefly *Phoca groenlandica* and *Cystophora cristata*). There are others in the Gulf of St. Lawrence, off Nova Zembla, in the White and Caspian Seas, and the Arctic and North and South Pacific Oceans. Originally it meant the time of sowing crops, as the most important *season*; Sp. *sazon*; Port. *sezão*, *sezão*.]

I. *Lit. & Astron.*: The alternations in the relative length of day and night, heat and cold, &c., which take place each year. In America there are four seasons, spring, summer, autumn, and winter. The Anglo-Saxons reckoned only three, spring, summer, and winter, the words for which are all from Anglo-Saxon; autumn (q. v.) was borrowed from the Romans. In India there are but three well-marked seasons of four months each, the hot (February-May), the rainy (June-September), and the cold (October-January). The essential astronomical fact on which the recurrence of the successive seasons depends is that the axis of the earth always points in the same direction, whatever portion of the orbit the earth may at the time be traversing. The inclination of the equator to the ecliptic is 23° 27'. On June 21, when the sun is at the highest point of the ecliptic the north pole necessarily inclines toward the sun, and is as much irradiated as it ever can be by his beams, while the south pole, on the contrary, is as little. It is therefore mid-summer in the northern and midwinter in the southern hemisphere. Six months later, Dec. 21, the southern pole points toward the sun. It is therefore now midwinter in the northern and midsummer in the southern hemisphere. At the intermediate periods (March 21 and September 21), the axis of the earth is at right angles to the direction of the sun; hence, in both hemispheres it is the equinox, the vernal at the former date in the northern and at the latter in the southern hemisphere.

**II. Scotch Eccles. Hist.:** A religious body which broke off from the Established Church of Scotland in 1733. In 1730 the General Assembly had put an end to the practice of recording the protests occasionally taken by individual members against the decision of the church courts. In 1731 the operation of patronage having led to the settlement of an unpopular presentee in the church of Kinross, the presbytery of Dunfermline hesitated to induct him, and his settlement had to be carried out by what was stigmatized as a Riding Committee. Next year the Rev. Ebenezer Erskine, one of the twelve ministers who had taken the evangelical side in the Marrow Controversy (q. v.), preached strongly against the action of the Assembly, in which the Moderates were then dominant. The Synod rebuking him, he appealed to the Assembly, which decided that he should be admonished. He and three other ministers protested, for which they were first suspended and then loosed from their charges. They at once gave in their "secession" from the prevailing party in the Church, whence arose the name, "the Secession." On Dec. 6, 1733, they constituted themselves into an Associated Presbytery. Four more joined in 1737, and a first "Act and Testimony" was published. In 1747 an ensnaring burgess oath divided them into Burghers and Anti-burghers. In 1806 the voluntary question [VOLUNTARISM] led to another schism. In 1820 they were reunited as the Associated Synod, and in 1847, joining with the Relief (q. v.), constituted the United Presbyterian Church (q. v.).

*Geology:*

\*1. All sedimentary and fossiliferous rocks, as distinguished from the primary rocks below [PRIMARY] and the Tertiary alluviums and diluviums above.

2. An extensive series of stratified rocks, having certain characters in common distinguishing them from the primary rocks beneath and the Tertiary above them. Lyell divides the Secondary rocks into the Trias, the Lias, the Oolite, and the Cretaceous; Seeley into the Trias, the Lias, the Pelolithic, the Psammolithic, and the Cretaceous; and Etheridge into the Triassic, the Jurassic, and the Cretaceous. In many places the palæozoic strata had been fractured, contorted, and even thrown into a vertical position before the Secondary rocks began to be deposited. There is a break between the end of the Primary [PALÆOZOIC] rocks and the commencement of the Secondary strata. Though most of the latter seem conformable to each other, yet the considerable alterations ever and anon occurring in the character of the fossil remains suggest the existence of breaks not stratigraphically visible. Thus there is no visible unconformability in the Lias, yet only five per cent. of the fossils pass from the Middle to the Upper Lias. During the deposition of the Secondary rocks the geographical features of the northern hemisphere were again and again modified. From the Lias to the Chalk there seems to have been a series of large tropical islands, drained by considerable rivers, with a vegetation of Cycads, Reeds, and Conifers. Gigantic reptiles were the dominant vertebrates. A great break occurs between the Secondary and the Tertiary. Murchison says that gold is generally absent from Secondary rocks. [MESOZOIC.]

**sěd'-ī-mēnt**, *s.* [Fr., from Lat. *sedimentum*=a settling, subsidence, from *sedeo*=to sit, to settle; Sp. & Ital. *sedimento*.]

**1. Ord. Lang.**: The matter which subsides or settles to the bottom of water or any other liquor; lees, dregs, settlings.

"A sort of water . . . with a yellow *sediment* at the bottom."—Cook: *Third Voyage*, bk. iii., ch. viii.

**2. Geol.**: Earthy or other matter which, after having for a time been suspended or held in solution in water, is deposited at the bottom. It is produced wherever there is water in motion, and the strata which it calls into existence may consequently be lacustrine, fluviatile, or marine. It often alters its area of deposition; thus, if a lake which intercepted it be filled up, it may pass along a river traversing that lake, and be deposited many miles away in the sea. Volcanic movements altering the levels of a country affect it greatly. It is of the same color as the materials from which it was derived, if these are homogeneous. It is perpetually deposited through the globe on a colossal scale, and has in process of ages created the sedimentary rocks. The International Geological Congress (1881) recommended the following terms for describing sedimentary strata: A group requiring an era, a system requiring a period, a series requiring an epoch, and a stage requiring an age for its deposition. A stage is divided into beds, for which a corresponding chronological term has not yet been fixed. On this plan one would speak of the Secondary or Mesozoic group and era, the Oölitic system and period, the Upper Oölitic series and epoch, and the Middle Purbeck stage and age.

II. *Bot. & Veg. Physiol.*: A mature ovule. As a rule, it remains modeled on the same plan, though minor changes may be produced by the suppression, addition, or modification of certain parts. The side of a seed most nearly parallel with the axis of a compound fruit, or with the ventral suture or sutural line of a simple fruit, is called its face; the opposite side, its back. point is its apex (q. v.). The integuments of a seed are called its testa; the rudiments of the future plant, its embryo, and a substance often interposed between them, albumen (q. v.). [CHALAZA, RAPHE, ARIL COTYLEDON.] Except in the Gymnosperms, the seeds are inclosed in a pericarp, often strong, which defends them from cold or from injury. Within a country, a balloon-like pappus, hooks, &c., can disperse seeds. Most of them, however, even when defended by their pericarps, cannot be long in salt water without being injured; still, Darwin calculated that one-tenth the plants of a flora might be floated across 900 miles of sea, and after all germinate. They could be taken yet farther in the gizzards of birds, in particles of earth adhering to their feet, or among soil floated on icebergs. On shore, melon seeds have been known to grow when forty-one years old, maize when thirty, rye when forty, the sensitive plant when sixty, and the kidney bean when 100. The old story about seeds taken from a mummy-case germinating is not now believed. [MUMMY-WHEAT.]

**seigniorage**, **seignorage** (as *sĕn'-yēr-ĭg*), *s.* [French.]

1. Something claimed by virtue of sovereign prerogative; specif., a percentage upon bullion brought to the mint to be coined, or to be exchanged for coin; the profit derived from issuing coins at a rate above their intrinsic value.

¶ In the United States the present ratio of silver to gold is "sixteen to one" (q. v.), and the face value of the silver dollar is therefore greater than its bullion value, so when silver bullion is purchased and coined into dollars there is a profit from such coinage the amount of which depends upon the price paid for the bullion. For example, there are 371¼ grains of pure silver in a dollar, and there are 480 grains of silver in a fine ounce. The coinage value of a fine ounce is therefore 1.2929—. If the fine ounce can be purchased for 70 cents, the profit of its coinage (the *seigniorage*) is 0.5929—, and the profit on the 371¼ grains of pure silver in the single dollar is \$0.4586—, which is the difference between the actual cost of the bullion in the dollar and the nominal value of the dollar. The seigniorage is an addition to the volume of money in the country, while the silver dollars representing the cost of the bullion are not, since they are only paid out in redemption of the Treasury notes of 1890, whereupon the latter are cancelled and retired, as prescribed by the Act of July 14, 1890. There is no profit from the coinage of gold bullion, the face value of gold coins being the same as their bullion value. [BULLION.]

"The coincidence of eruptions from neighboring volcanoes with extraordinary seismic convulsions."—*Sorope: Volcanoes* (ed. 1872), p. 7.

**seismic-center**, **seismic-focus**, *subst.* (See extract.)

"Whatever may be the real origin of the earthquake shock, it is convenient to regard its effects as proceeding from a concussion or sudden blow delivered underground at some definite center. This center of impulse is called the *seismic-focus*. It must be borne in mind, however, that such a center . . . is in nature a subterranean region, which in many cases is no doubt of very large dimensions, measuring, perhaps, some miles in diameter."—*Encyc. Brit.* (ed. 9th), vii. 609.

## seismic-vertical, s.

*Physics.*: An imaginary vertical line, joining the earth's surface and the seismic center.

"Just as the seismic force is in nature, not a single point, but a considerable space, so the *seismic-vertical* is not a single line, but rather a succession of parallel lines drawn vertically from every point of the focal area to the surface."—*Encyc. Brit.* (ed. 9th), vii. 610.

**sĕis'-mō-grāph**, *s.* [Gr. *seismos* = an earthquake, and *graphō* = to write.]

*Physics.*: A seismometer; an instrument for recording the period, extent, and direction of each of the vibrations which constitute an earthquake. For a complete seismograph, three distinct sets of apparatus are required: (1) To record horizontal motion; (2) to record vertical motion; and (3) to record time. The horizontal and vertical motions must be written on the same receiver, and if possible side by side, while at the instant at which the time is recorded a mark must be made on the diagram which is being drawn by the seismograph. The first instruments were merely modifications of the seismoscope (q. v.), but successive improvements have been introduced, and the seismograph has been brought to a high pitch of perfection. Some of the best, if not the best forms known are in use in the Imperial Observatory at Tokio, Japan.

"The only approximations to true *seismographs* which have yet been invented, are without doubt those which during the past few years have been used in Japan."—*J. Milne: Earthquakes*, p. 13.

**sĕis-mōl'-ō-gĭst**, **†sĕis'-mō-lōgue**, *s.* [English *seismology* (q. v.); -ist.] A student of seismology; one versed in seismology.

"He can only pretend to be a very modest *seismologist*."—*Cornhill Magazine*, Jan., 1884, p. 50.

**sĕis-mōl'-ō-gŭ**, *s.* [Gr. *seismos* = an earthquake; suff. -ology.]

*Physics.*: The study of earthquakes. Prof. Milne (*Earthquakes*, Introd.) suggests that in addition to what are generally known as earthquakes, seismology should investigate: (1) Earth-tremors, or minute movements which escape attention by the smallness of their amplitude; (2) Earth-pulsations, or movements which are overlooked on account of the length of their period; and (3) Earth-oscillations, or slow and quiet changes in the relative level of the sea and land, which geologists speak of as elevations or subsidences. Although seismology can scarcely be said to have existed before the early part of the nineteenth century, it has a rapidly-growing bibliography, is accumulating a store of facts and observations on which generalizations may be based, and Prof. Milne is sanguine that earthquake-warnings in countries subject to seismic disturbances will be as common and as trustworthy as the storm-warnings at our seaports. (See also *Brit. Assoc. Report*, 1858.)

"Another great impetus which observational seismology received was Mr. Mallet's report upon the Neapolitan earthquake of 1857."—*J. Milne: Earthquakes*, p. 8.

**seiš-mōm'-ē-trī**, *s.* [English *seismometer*; *-y*.] The act or art of measuring the force and duration of earthquakes by a seismometer.

**seiš'-mō-scōpe**, *s.* [Gr. *seismos*=an earthquake, and *skopeō*=to see, to observe.]

*Physics*: The earliest and simplest form of earthquake-recorder. The first known was invented by a Chinaman named Choko, in A. D. 136, and shows the occurrence and direction of an earthquake by the fall of a column, a principle which was afterward independently adopted in the West. Vessels filled with viscid liquids have been used; the height to which the liquid is washed up the side of the vessel being taken to indicate the intensity, and a line joining the points of maximum motion to denote the direction of an earthquake. Palmieri's seismoscope (probably suggested by Mallett) consists of horizontal tubes turned up at the end, partly filled with mercury. To intensify the motion of the mercury, small floats of iron are placed on the surface, attached by threads to a pulley provided with indices moving in front of a scale of degrees, whence the intensity may be read off. The direction is determined by the azimuth of the tube giving the maximum indication, several tubes being placed in different azimuths. Pendulum seismoscopes, both swinging and fixed, have also been employed.

"The clock is started into motion by means of a Palmieri seismoscope."—*Nature*, Aug. 12, 1886, p. 344.

Head and upper surface shining bluish-black; wings dark; lores deep velvety black, under surface silky white, except sides of the chest, which are dull black. It frequently sallies forth into the open glades of the forest, and procures its prey by poisoning itself in the air by a remarkably quick motion of the wings, precisely after the manner of the English kestrel, every now and then making sudden perpendicular descents to capture any insect that may attract its notice (*Gould*).

1. Of or pertaining to selenite; resembling selenite, or partaking of its nature or properties. [SELENITE (3).]

\*2. Pertaining to the moon.

**sě-lē-nī-ūm**, *s.* [Gr. *selēnē*=the moon. Named by Berzelius, because it was associated with tellurium (*q. v.*).]

*Chem.*: A non-metallic hexad element occupying an intermediate place between sulphur and tellurium. Symbol Se. Atomic weight 79.5. Discovered by Berzelius in 1817. Though not very abundant in nature, it enters into the composition of many minerals, and has been found in the free state in certain parts of Mexico. It is prepared from cyanoplastic selenide by heating the pulverized ore with hydrochloric acid, igniting the insoluble residue with an equal weight of black flux and dissolving out the selenide of potassium with boiling water. By exposing this solution to the air Selenium is deposited as a gray powder. Like sulphur, it occurs in the amorphous and crystalline states. In the former it may be drawn out into ruby-colored threads, and when melted and quickly cooled becomes vitreous with a specific gravity of 4.3, and nearly insoluble in bisulphide of carbon. In the crystalline condition it forms monoclinic prisms of specific gravity=4.5-4.7. It boils below a red heat and gives off a deep yellow vapor which condenses in scarlet flowers, and when thoroughly heated burns with a blue flame forming selenious anhydride. It is oxidized and dissolved by nitric acid, yielding selenious acid. It is used in certain electric contrivances on account of the changes its electric resistance undergoes when it is subjected to light.

**selenium-chlorides**, *s. pl.*

*Chem.*: The dichloride,  $SeCl_2$ , is obtained by passing a slow stream of chlorine over fused selenium. It condenses as a dark-yellow oily liquid with very pungent odor, and is quickly decomposed with hot water into selenious and hydrochloric acids. The tetrachloride is formed by freely passing chlorine over fused selenium. It forms a white crystalline mass, which on further heating yields a yellow vapor. It dissolves in water, forming selenious and hydrochloric acids.

selenium-oxides, *s. pl.*

*Chem.*: Selenious oxide,  $\text{SeO}_2$ , is the only oxide of which the composition is exactly known. It is formed when selenium is burnt in a stream of oxygen. At a heat below redness it volatilizes in the form of a yellow vapor which condenses in white four-sided needles. It readily takes up water, forming selenious acid. The trioxide,  $\text{SeO}_3$ , the anhydride of selenic acid, is not known.

*sēlf*, \**selfe*, \**silf*, *a. & s.* [A. S. *self*, *seolf*, *syf*; cogn. with Dut. *zelf*; Icel. *sjálf*; Dan. *selv*; Sw. *sjelf*; Goth. *silba*; Ger. *selbe*, *selbst*. According to Skeat, from a Teutonic base, *selba* for *seliba*, where *se* is the same as the Lat. *se*; Skt. *sva*=one's own self, and *lib* is the same as the base of Goth. *laiba*=a remnant; *vilaiþjan*=to be left; hence, the original meaning of self is "left to one's self." *Self* was originally used as an adjective=same, as "That self mold" (*Shakesp.*: *Richard II.*, i. 2), and was declined as a definite or indefinite adjective, as *Ic self*, *Ic selfa*=I (my)self, and agreed with the pronoun to which it was added: as nom. *Ic selfa*; genit. *min selfes*; dat. *me silfum*; accus. *mec silfne*; *thu selfa*=thou (thy)self, *he selfa*=he (him)self, *we silfe*=we (our)selves, *hi silfe*=they (them)selves, &c. In Old Eng. the dative of the personal pronoun was sometimes prefixed to the nominative of self, as *Ic me silf*=I myself, *thu the silf*=thou thyself, *ke him silf*=he himself, *we us silfe*, *ge eow silfe*, *hi him silfe*. In the thirteenth century the genitive was substituted for the dative of the prefixed pronouns in the first and second persons, as *mi self*, *thi self*, for *me self*, *the self*, and *our self*, *your self*, for

*us self*, *you self*. From this the transition to *myself*, *thyself* was easy. *Self* then began to be regarded as a substantive, and the plural, *selves*, was formed on the analogy of nouns ending in *f*. In *himself*, *themselves*, *itself*, the old dative remains unchanged; *his self*, *their selves*, are provincialisms. With *own*, the possessive pronouns *his*, *our*, *your*, and *their* may be used; as, "Who his own self bare our sins in his own body on the tree" (1 Peter ii. 24), and so in Scriptural language *mine*; as, "I judge not mine own self" (1 Cor. iv. 3).]

## A. As adjective:

In one self place." *Marlowe: Faustus*, ii. 1.

\*2. Of or pertaining to one's self; own.

"Who by self and violent hands took off her life."—*Shakesp.*: *Macbeth*, v. 8.

3. As a pronominal affix or adjective, *self* is affixed to personal pronouns (1) to express emphasis or distinction, and (2) when the pronouns are used reflexively. Thus, for emphasis, *I myself* will go, denotes not only my intention of going, but also my determination of going in person. Reflexively, *he killed himself*, *we keep ourselves*, &c. *Himself*, *herself*, and *themselves* are used in the nominative as well as in the objective case; as, "Jesus himself baptised not, but his disciples" (John iv. 2). *Self* (or *selves*) is sometimes found separated from the pronoun; as, "to thy sweet self too cruel" (*Shakesp.*: *Sonnet* 1), though in such cases, *self* may be regarded as a noun. Such phrases as *Cæsar's self*, *Tarquin's self*, are not, philologically speaking, so correct as *Cæsar self*, *Tarquin self*.

**II. Technically**:

1. *Metaph.*: The word *Sensation*, like *Perception* [See extract under *PERCEPTION*, II.], is employed in different senses:

(1) Mental consciousness of the processes of physiological sensation. [2.]

"Our Senses, conversant about particular sensible objects, do convey into the Mind several distinct perceptions of things, according to those various ways wherein those objects do affect them; and thus we come by those ideas we have, of Yellow, White, Heat, Cold, Soft, Hard, Bitter, Sweet, and all those which we call sensible qualities, which when I say the senses convey into the Mind, I mean, they from external objects convey into the Mind what produces there those perceptions. This great source of most of the ideas we have, depending wholly upon our Senses, and derived by them to the Understanding, I call *Sensation*."—*Locke: Human Understanding*, bk. ii., ch. i.

(2) Subjective experience, as of pleasure or pain, arising from objective experience, *e. g.*, from the sight of a beautiful landscape.

"There is all the difference in the world between the permanence or independence of tangible extension and that of the mere feeling of contact, the sensation of taste, of pleasure or pain. In the latter cases we know that the actual *sensation* ceases to be the moment it passes out of consciousness."—*Veitch: Hamilton*, p. 190.

(3) For the use of the word in Positive Philosophy, see extract. [SENSATIONAL-CENTERS.]

"By *Sensation*, therefore, must be understood that form of sensibility which belongs to the organs of Sense—including, of course, those important, but generally neglected sensibilities which arise from the viscera and from muscular actions."—*G. H. Lewes: Hist. Philos.* (ed. 1880), ii. 357.

2. *Physiol.*: The peculiar property of the nervous system in a state of activity, by which impressions are conveyed to the brain or sensorium. When an impression is made on any portion of the bodily surface by contact, heat, electricity, or any other agent, the mind is rendered conscious of this by sensation. In this process there are three stages—reception of the impression at the end of the sensory nerve, the conduction of it along the nerve trunk to the sensorium, and the change it excites in the sensorium itself, through which is produced sensation.

† The word is frequently used adjectivally, in the sense of causing great interest or feeling; sensational; as, *sensation* dramas.

**sensation-novels**, *s. pl.* Novels which produce their effect by highly-exciting and often improbable situations, having, as their ground work,

H. Lewes: Hist. Philos.* (ed. 1880), ii. 359.

2. *Philos.*: The doctrine that knowledge is the outcome of sensation, that Psychology is a branch of the wider science of Biology, and Mind but one aspect of Life. This teaching flourished, chiefly in France, in the eighteenth century, whence *Sensationalism* is sometimes called *Eighteenth-century Philosophy*. Its precursor was Hobbes [*HOBBISM*], whom Condillac (1715-80) followed and amplified, attributing a sensuous origin to faculties as well as to ideas. Hartley (1705-57) and Erasmus Darwin (1731-1802) in England and de Tracy (1754-1836) and Cabanis (1757-1808) in France, also endeavored to establish a physiological basis for mental phenomena.

"Here is stated, in the broadest manner, the principle of *sensationalism*. It is in direct antagonism to the doctrine of Descartes, that there are innate ideas; in direct antagonism to the old doctrine of the spirituality of Mind."—*G. H. Lewes: Hist. Philos.* (ed. 1880), ii. 231.

*Shakesp.: Measure for Measure*, ii. 2.

II. *Anat., Physiol., Metaph., &c.*: Perception by means of certain bodily organs. Five senses are universally recognized: Sight, hearing, smell, taste, and touch. Each has its appropriate organ; seeing has the eye, hearing the ear, smell the nostrils, taste the tongue, and touch the fingers and the body generally. To this some add a sixth or muscular sense, by which we become aware of the position and direction of the limbs and other parts moved by means of the voluntary muscles. But the sensation is really in the nerves distributed through the muscles. If the nerves be cut sensation in the muscles ceases. Some believe that the muscular sense is not essentially distinct from the touch; it is, however, recognized by Foster. Each sense has a nerve conveying the appropriate impressions to the brain. (For the metaphysics of the senses, see *SENSATION*.)

*Hist.*: A slight alteration of the ordinary word used for centuries by the natives of India for a soldier in general, but confined by Anglo-Indians to the Hindu and Mohammedan troops, especially to those in British pay. The French, under Labourdonnais, set the example of employing sepoy at the siege of Madras in 1746. Next year, sepoy, probably undisciplined peons or policemen, fought on the British side; and in 1748 a small corps of sepoy was raised. As the three Presidencies were established and developed, each trained sepoy, till at length there arose three great armies, which largely aided Britain in establishing its Indian empire. The battle of Inkerman (Nov. 5, 1854) having shown the superiority of the Minie rifle to the old musket, the British desired to place the Enfield, an improvement on the Minie, in the hands of the native soldiery. Unhappily for the British the cartridges manufactured in England were made up with cows' grease, which, by the Hindu ceremonial law, was fatal to the caste of any one putting them to his lips. The cry arose that this was done intentionally, all explanations to the contrary were rejected, and on Sunday, May 10, 1857, the troops stationed at Meerut broke into open mutiny, attended by a massacre of Europeans. The mutineers escaped to Delhi, where a fresh massacre took place. The restoration of the Mogul empire was proclaimed, and the Bengal sepoy mutiny became strengthened by a Mohammedan rebellion. Regiment after regiment of the Bengal army mutinied, till nearly all had deserted their colors, and a death struggle took place during the next two years between the handful of Europeans in Upper India and Bengal and those who sought their lives. Delhi was retaken, after desperate fighting, between the 14th and 20th of Sept., 1857; Lucknow reinforced on Nov. 16, 1857, and relieved in March, 1858. [EAST INDIA COMPANY.] The disproportion between sepoy and European soldiers, which had been very great at the outbreak of the mutiny, was reduced at once by a large diminution of the former and a great increase of the latter. Immediately before the Mutiny the number of European officers was 6,170, of soldiers 39,352, and of natives 232,224—total 277,746. Mr. W. W. Hunter states that in 1882-3 the Bengal army numbered 105,270 officers and men, of whom 66,081 were native troops; the Madras army 46,309, of whom 34,283 were natives; and the Bombay army 33,897, of whom 27,041 were natives. The total British army in India consisted of 190,416 officers and men, of whom 63,071 were Europeans and 102,183 natives.

**A. As substantive**:

*Scripture*: A Greek version of the Hebrew or Old Testament Scriptures; the oldest one made into any language. A still extant letter referred to by Josephus, Jerome, and Eusebius, purports to be from a certain Aristeas, officer at the court of Ptolemy Philadelphus. It states that after the king had founded the great Alexandrian library, he wished to have in it a copy of the Jewish sacred books. By the advice of his chief librarian, Demetrius Phalareus, he sent to the high priest at Jerusalem, requesting him to send six translators from each tribe, seventy-two in all. The request was complied with; the translators came and completed their work in seventy-two days. From their number, and perhaps the time they occupied, the name Septuagint arose. But the letter of Aristeas is not now believed to be genuine, and Coptic words in the work show that the translators were from Egypt, and not from Jerusalem. The version was apparently made at Alexandria, and was commenced about B. C. 280 the Pentateuch being the only part translated at first. It is well done. Next in value is the book of Proverbs. Job was translated from the Hebrew text, differing both by excess and defect from that now recognized. Esther, the Psalms, and the Prophets followed, seemingly between B. C. 180 and 170. Jeremiah is the best translated, and Daniel is executed so badly that Theodotion, in the second century A. D., had to do the work again. Jesus and His Apostles frequently quoted the Septuagint in place

of the Hebrew. The Jews had a high opinion of the Septuagint, but on finding the Messianic passages used effectively by the Christians in controversy with them, they established a fast to mourn that the Septuagint had ever been issued, and had a new translation by Aquila brought out for the use of the synagogues. Three Christian recensions took place late in the third or early in the fourth century. The first modern edition was the Complutensian in 1514-1517; since then several others have appeared.

The title was abolished in 1880. The number of *serjeants-at-law* was limited to fifteen. The most valuable privilege enjoyed by them was the monopoly of pleading in the Court of Common Pleas. This was taken away from them by the Act 9 & 10 Vict., c. 54 (1846), when the privilege was extended to barristers of any degree practicing in the superior courts at Westminster. They wore scarlet robes, and in former times a coif or hood, of lawn, upon the head. This latter was afterward represented by a small circlet of black silk, of about three inches in diameter, upon the top of the wig. They were addressed as "Brothers" by the judges.

**A. As substantive:**

**I. Ordinary Language:**

1. *Lit.*: In the same sense as II. 4.

2. *Fig.*: A subtle, treacherous, and malicious person.

**II. Technically:**

1. *Astron.*: One of the forty-eight ancient constellations extending serpent-like through a wide expanse of sky. The head is under *Corona borealis*, the body winds through *Ophiuchus*, and the tail reaches the Milky Way near the constellation *Aquila*. Its stars are generally very small, the largest, *Cor serpentis*, being intermediate between the second and the third magnitude.

2. *Music*: An almost obsolete bass instrument of a powerful character. It is a wooden tube, about eight feet long, increasing conically from 5 inch diameter at the mouth-piece to four inches at the open end, twisted into V-shaped turns, followed by a large circular convolution. This is covered with leather, and has a mouth-piece like a horn or trombone, and keys for the several notes to be produced. It was invented by a French priest at Auxerre in 1590, and is frequently used in the orchestra to strengthen the bass part; but it requires to be very skillfully blown. The serpent is a transposing instrument, being in B flat, and the part it is to take is therefore written a note higher than its real sound. Its compass is three octaves and one note.

3. *Pyrotechny*: A small paper tube, filled with mealed powder or rocket composition, not very compactly driven. Serpents are used for filling

paper shells or the pots of rockets, and pursue a wavering serpentine course through the air when ignited.

4. *Zoöl. (pl.)*: Ophidia, an order of Reptiles particularly distinguished from the rest of the class by having a very elongated body and no external limbs. They are very widely distributed, abounding in the tropics, where they attain their greatest size, absent only from the Arctic and Antarctic regions, and they are mentioned in the earliest records of the human race. The body and tail are covered with scales, and the head often with plates or shields. Locomotion is effected either entirely by means of the ribs, the free extremities of which are attached by muscular connections to the abdominal scales—the animals walking, so to speak, on the ends of their ribs, or aided by rudimentary hind limbs, the only external trace of which is a horny claw or spur, as in the case of the Boas and Pythons (to which the name serpent is often popularly confined). They are divided into three groups: Innocuous, Venomous Colubrine, and Viperine, the last two groups possessing poison-fangs, the Boas, which kill their prey by constriction, belonging to the first. Broadly speaking, the innocuous serpents are oviparous, the venomous are ovoviparous. Most of the former deposit the eggs in a long string in some heap of decaying vegetable matter, and leave them; while some of the larger serpents coil round their eggs, and hatch them by the heat of their bodies. The senses of smell and taste are probably not acute; the ear has no external opening, but they are sensible of sound, and especially of sharp, shrill notes [SERPENT-CHARMING]; the eyes are small, and protected from injury by a transparent integument, which comes away with the slough when the animal casts its skin, which happens at least once a year. [TROPIDONOTUS.] Serpents are very variously colored; some are extremely beautiful; but, as a rule, the venomous kinds are of darker and more uniform coloration than those which are not poisonous. Some of the innocuous kinds are capable of being tamed; the Rat-snake (*Ptyas mucosus*) is often kept in houses in India for the purpose of destroying rats and mice, but by the generality of mankind serpents are regarded with aversion and horror; and Brehm and Darwin both note the terror which they excite in monkeys—zoölogically so near akin to man.

serpent-charming, s. A fascination exercised over a serpent by simple music. Many itinerant showmen make a living in the East by exhibiting their powers over venomous snakes. The practice has come down from remote antiquity, and is alluded to in Psalm lviii. 4, 5, and Jer. viii. 17. In most cases the cobra (*Naja tripudians*) is the serpent charmed, and the poison-fangs are generally extracted; if this is not done, the performer holds a cloth in one hand which he allows the serpent to strike, and so exhaust the supply of venom.

serpent-withe, s.

Bot.: A plant, *Aristolochia odoratissima*.

serpent-wood, s. [OPHIOTYXON.]

serpent-worship, s.

Compar. Relig.: Ophiolatry; the worship of serpents as symbols or avatars of a deity, a branch of animal-worship [ZOÖLATRY], with a wide range in time and space. Fergusson connects it with Tree-worship (q. v.). He considers that the curse pronounced on the Serpent (Gen. iii. 14, 15) had reference to serpent-worship, and was put in by the writers of the Pentateuch, who "set themselves to introduce the purer and loftier worship of the Elohim, or of Jehovah," in order to discountenance an older faith, to which from time to time some of the Jews seem to have reverted (2 Kings xviii. 4; Wisdom xi. 15, Story of Bel). In Greece the center of serpent-worship was the grove of Epidaurus, whence the Romans, on the occasion of a plague, A. U. C. 462, sent for a serpent, and brought it to Rome with great ceremony (*Liv.* x. 47; *Ov. Met.* xv. 626-744); at the siege of Troy a serpent appears as an omen of victory to the Greeks (*Il.* ii. 304; cf. *Ov. Met.* xii. 1-23), and from Plutarch we know that Alexander was reputed to have been of a serpent-race. In Roman history many traces of serpent-worship appear. In addition to the embassy to Epidaurus, may be cited the fate of Laocoon (*Æn.* ii. 201-33), the snake which glided from the tomb of Anchises (*ib.* v. 84-99), and which Æneas considered to be either the *genius loci*, or the spirit of his father; and the sacred serpent of Lanuvium (*Prop.* iv. 8); while from Persia (i. 113), and from discoveries at Pompeii and Herculaneum, it is clear that the serpent was a sacred emblem. In modern times serpent-worship is prevalent among some of the Indians of North America, on the west coast of Africa, and, to a great extent, in India.

"When we first meet serpent-worship either in the wilderness of Sinai, the groves of Epidaurus, in Sarmatian huts, or Indian temples, the serpent is always the Agathodæmon, the bringer of health and good fortune. He is the teacher of wisdom, the oracle of future events. His worship may have originated in fear, but long before we become practically acquainted with it, it had passed to the opposite extreme among its votaries."—Fergusson: *Tree and Serpent Worship*, p. 3.

serpent-worshiper, s.

Compar. Relig.: One who pays divine honors to serpents. [SERPENT-WORSHIP.]

**Seventh-day, s.** Saturday, the Seventh day of the week or the Sabbath of the Jews. [SABBATH.]

**Seventh-day Baptists:**

**Church Hist. & Eccles.:** Baptists who, holding that the Fourth Commandment expressly named the seventh as the sacred day, and that there is no express command in the New Testament to alter that day to the first of the week, observe Saturday as their Sabbath. This view arose in the sixteenth century among a minority of the continental Anabaptists. Erasmus (*De Amab. Concord.*, col. 506), in an obscure passage, perhaps alludes to a sect of this nature among the Bohemians. In 1620 John Traske, Trasque, or Thraske, published a work advocating a seventh-day Sabbath. Even before this, he had made known his opinions, and in 1618 had been censured by the Star Chamber, set in the pillory at Westminster, and thence whipped to the Fleet, where he was imprisoned till he nominally retracted his views. In 1628 Theophilus Brabourne, a Puritan minister in Norfolk, published a sermon, followed shortly after by another publication, in favor of Seventh-day Sabbatarianism. He was induced by the High Commission Court to abandon his views, which, however, continued to be maintained by his followers. Mr. Edward Stennet, writing from Abingdon, in Berkshire, in 1668, said that there were about nine or ten churches (congregations) in England holding that the seventh day is the Sabbath. In 1851 there were only three congregations in England. In New England and other parts of America they are more numerous, and issue tracts and republish works bearing on their opinions.

water by which such matter is carried off, the waste water of baths, wash-houses, and other domestic operations, the liquid waste product of various manufacturing operations, and, in most cases, of the greater part of the surface drainage of the area drained. In most cases the sewage of towns, &c., is allowed to run to waste into some river, the sea, &c.; but the value of its fertilizing constituents being now recognized, many towns and districts and large establishments have adopted systems of sewage utilization. Of these, the chief is irrigation of land especially prepared for the purpose. Attempts have also been made to produce a dry, portable manure from the sewage by treatment with chemicals, deposition, &c. The quantity of sewage passing from a town, &c., is estimated, according to circumstances, at about thirty gallons per head per day.
