¶ The ancient Hindu Vedas consists in large measures of rhythmical hymns. Hindu poetry reached its highest development in the epics of the Ramayan and the Mahabharat. Specimens of that of the Hebrews, made conspicuous to the English reader by being printed in separate lines in the R. V., are found in Gen. iv. 23-24, ix. 25-27, xxvii. 39, 40, xlix. 2-27, and Exodus xv. 1-18, 21. It reached its highest development in the books of Job and of Psalms. The poetry of the Greeks began with Homer and Hesiod, and continued till about B. C. 500. The chief poets of Rome came late upon the scene, Virgil being born B. C. 70, and Horace B. C. 65. Geoffrey Chaucer, the father of English poetry, died A. D. Oct. 25, 1400; John Barbour, author of the "Bruce" (1373), was the first Scottish poet. Of the English poets of high genius were Chaucer in the fourteenth, Shakespeare and Spenser in the sixteenth century, Milton and Dryden in the seventeenth, Pope and Cowper in the eighteenth, Byron, &c., in the nineteenth. Of Scottish poets, Burns in the eighteenth century. Of American poets, Longfellow, Poe, Bryant, and many others, all living in the nineteenth century.

II. *Technically*:

*Pharm.*: Professor Christison divides poisons into three great classes: Irritants, narcotics, and narcotico-acrids or narcotico-irritants. A fourth class is sometimes added, septic, consisting of animal poisons, such as the bites of rabid animals and venomous snakes, the stings of insects, and the poison generated by pestilential carbuncle, &c. An irritant poison produces violent pain and cramp in the stomach, nausea, vomiting, convulsions, &c. A narcotico poison produces stupor, numbness, drowsiness, coldness, and stiffness of the extremities, cold fetid greasy perspiration, vertigo, weakened eyesight, delirium, paralysis of the lower extremities, &c.; a narcotico-acrid poison produces a certain combination of the symptoms attendant on both the former classes. The chief irritants are the acids and their bases, some alkalies and their salts, the metallic compounds, as arsenic, mercury; the vegetable acrids or irritants, as some Cucurbitacæ, Euphorbiacæ, Ranunculacæ, &c.; animal irritants, as cantharides; mechanical irritants, as glass, &c.; irritant gases, as chlorine, the vapor of nitrous acid, &c.; narcotic poisons, like opium, nightshade, prussic acid, &c.; narcotico-acrids, such as strychnine, *Cocculus indicus*, and poisonous mushrooms. Savages poison their arrows by the milky juice of various Euphorbias or of the manchineel, or by the juice of two species of Strychnos. Both in man and in the inferior animals there is often a curious correlation between the color of the skin and hair and immunity from the action of certain vegetable poisons. Metallic poisons act upon vegetables nearly as they do upon animals, that is, they are absorbed into the different parts of a plant, destroying the structure. Vegetable poisons, especially those which destroy animals by action upon their nervous system, also cause the death of plants.

"When the animal strikes its prey, the *poison-fangs* are erected by the elevation of the movable maxillæ (to which they are ankylosed), and the poison is forced through the tube which perforates each, partly by the contractions of the muscular walls of the gland, and partly by the muscles of the jaws."—*Nicholson: Zoölogy* (edit. 1878), p. 579.

In the typical spider the poison-gland is an elongate oval vesicle, having the fibers of the contractile tissue arranged in spiral folds. (*Owen*.)

¶ (1) *Polarization of light*:

*Optics*: A state into which the ethereal undulations which cause the sensation of light are brought under certain conditions. These undulations are perpendicular to the line of transmission of the wave, as in a stretched cord, but, in a ray of common light, appear to take place successively in all directions in the manner shown in the diagram A (but with the transitions far more gradual), the vibrations successively passing through rectilinear,

elliptical, and circular phases with inconceivable rapidity. If, now, the vibrations become, or are rendered, stable in any one form of orbit, the light is in the condition known as polarized, and the state is one of plane, elliptical, or circular polarization, according as the orbit resembles B, C, or D. The most familiar and simple form is that of plane polarization. This may be produced in various ways, the piece of apparatus producing such modifications being called a Polarizer. When produced, however, the effects can only be perceived by examining them through another piece of apparatus which, used alone, would polarize the light, but when used to examine light already polarized, is called the Analyser. The two in combination, with the necessary adjustments, form a Polaroscope, of which there are many forms.

(a) *Plane polarization*: When a ray of common light passes through a crystal (not of the cubic system), the atoms being so arranged that the elasticity (or other properties affecting motions of the ether within the crystal) are different in different directions, the ether motions are at once resolved into that of the greatest and the least elasticity at right angles to the path of the ray, so dividing the ray of common light into two "plane polarized" rays, polarized in planes at right angles to each other. One of these rays being easily eliminated by total reflection in the Nicol prism (q. v.), two such prisms form a convenient polariscope. The ray, after passing through the first prism, appears just like common light, only of half the original brilliancy; but on looking at it through the second Nicol, on turning the latter round, we find two positions in which the light from the first Nicol gets through the second unaltered; and two positions at right angles to the former in which it is absolutely stopped, and the second prism, though clear as glass, is absolutely opaque to it. The beam of light appears thus to have acquired sides, and to behave differently according to the relation these sides bear to the position of the prism. Such is the fundamental nature and phenomenon of Polarized Light. Light is also polarized by reflection from polished transparent surfaces, when incident at such an angle that the reflected and refracted rays make a right angle. In glass, this angle is about 56°. An exactly equal quantity of the incident light which is transmitted through the glass, is polarized in a plane at right angles to the former. At other angles the effect is partial. The scattered light of the sky is always more or less polarized, as is all light reflected from small particles in air or water, if the particles are small enough; the polarizing angle for such particles is, as might be expected, 45°.

(b) *Chromatic polarization*: Let the perpendicular vibrations from a Nicol prism encounter in their path a crystalline film of selenite or mica, whose planes of greatest and least elasticity are arranged diagonally. The perpendicular vibrations are again "resolved" into two sets, one of which is retarded behind the other owing to the difference in the two elasticities. The analyzer "resolves" each of these again, bringing half of each set back into one plane. The two sets of waves are then in a position to exercise interference, and the consequence is that, if the plate or film is of suitable thickness, the most gorgeous colors are presented. It is the same with every substance having different elasticities in different directions, and as all "structure" presents such differences, polarized light becomes the most powerful weapon of the biologist, revealing structure where ordinary light will not do so.

(c) *Circular polarization*: If two rectangular, equal impulses are given to a pendulum, or to a stretched cord, one of them a quarter-vibration later than the other, the two are compounded into a single circular orbit. Therefore, if a beam of plane-polarized light passes, as in the last paragraph, through a film, of mica of such a thickness that one of the two diagonally vibrating sets of waves shall be retarded, while in the film one quarter-vibration behind the other, the two are compounded on emergence into one beam of circularly-polarized light.

At approximate thicknesses, the light is elliptically polarized. Circularly polarized light is never stopped by the analyzer, but differs from common light in producing polarized effects. The most important of these is—

(d) *Rotatory polarization*: Vary the former experiment by passing the light from the polarizing Nicol, with its vibrations in a vertical plane, through a plate of selenite or mica which gives fine color; the vibrations are then in the two diagonals. Let this light now traverse a "quarter-wave" mica film, with its polarizing planes perpendicular and horizontal. Each set of rays from the first plate becomes circularly polarized, but the two in opposite directions, the circular movements thus opposing each other. Whenever two circular motions thus meet, as in two circular pendulums clashing, the tangential motion is destroyed, and the pendulums would both fall back together through the center of the former orbit. It is so in this case; but as one set of rays has been retarded in the plates

more than the other, the swing of the ether atoms is no longer in the original plane of vibration. Let that plane be A, B; instead of the two circular waves meeting at A again, as they would if both circular motions were equally rapid, the meeting-point will be somewhere on one side or other of it, as at M. There the right-handed ray will meet the left-handed ray, the tangential motions RM, LM, will be destroyed, and the radial forces unite in the plane-polarized swing-orbit MP passing through the center C. If, therefore, light of one wave-length or color be employed, instead of the analyzer having to be turned across A B to extinguish it, it must now be turned across M P—in other words, the original plane of polarization has been rotated. If white light be employed, the many various wave-lengths will obviously meet at different points, and hence rotation of the analyzer will give in succession more or less of the colors of the spectrum. If the quarter-wave film is cut in half, and its position reversed in one half, the transition of colors will occur in opposite orders in the two halves. Rotatory polarization is of the greatest practical importance. There are many crystals, plates of which, when cut in proper directions, produce naturally all the phenomena of the double-plate described above. Many fluids, such as oil of lemons, turpentine, and solution of cane-sugar, also show the same phenomena very strongly, and in their case it is remarkably connected with the presence in the molecule of what chemists call "asymmetrical atoms." In solutions, as of sugar, the amount of rotation is proportionate to the quantity of sugar in solution in a given column of fluid; hence the "estimation" of crystallizable sugar, whenever accuracy is required, is now always made by the polariscope. Faraday discovered, in 1845, that the property of rotatory polarization was conferred upon any transparent body when the axis of the ray employed was made the axis of a galvanic solenoid or strong magnetic field. [POLARIZED-RINGS.]

**pō-lar-ized**, *pa. par. or a.* [POLARIZE.] Having polarity; affected or acted upon by polarization.

**polarized-rings**, *s. pl.*

*Optics*: Imagine a crystal symmetrical around a single axis, like a section of the trunk of a tree, with the elasticity greatest or least in the direction of the axis, and symmetrically alike all round the circumference. If we cut a plate in the way of a plank, it will behave like the films already spoken of. But if a slice be cut across the trunk at right angles it must be different, when a ray of light passes through in the direction of the axis. The ether vibrations are at right angles to the path of the ray (now the same as the axis), but in all these directions the elasticity is equal, consequently a beam of common light will not be doubly-refracted, nor a beam of plane-polarized light further resolved, in passing along the axis. This is borne out by cutting a plate of calcite at right angles to its axis. But if the ray passes through such a plate obliquely, double refractions and interference will come into action, and we shall perceive color. Imagine now a conical, or strongly convergent pencil of plane-polarized light traversing the plate, and the analyzer turned so as to extinguish the light passing the polarizing Nicol. The center of the plate, where the beam is truly

fāte, fāt, fāre, amidst, whāt, fāll, father; wē, wēt, hēre, camēl, hēr, thēre; pīne, pīt, sīre, sīr, marīne; gō, pōt, or, wōre, wōlf, wōrk, whō, sōn; mūte, cūb, cūre, unite, cūr, rāle, fūll; trÿ, Sÿrian. æ, œ = ē; ey = ā. qu = kw.

axial, will still appear dark. But, as the light becomes more and more oblique, the vibrations will be resolved into some plane passing through the axis, and planes at right angles to these, or tangential planes. In perpendicular and horizontal planes, these will cause no further resolution of the vibrations, and there will therefore be a black cross when the analyzer is crossed; but in all other planes, the more and more oblique light must cause successive rings of light and darkness, or, when white light is employed, of color. In crystals which are not perfectly symmetrical about one axis, the ideal structure may be compared to that of a tree-trunk of an oval section. Here, a plank would still give two polarizing planes, as in a film of selenite; but a transverse section would also show two rectangular elasticities. In such a case, analysis proves that there must be two lines or axes inclined to each other, in which there can be no double refraction, and that the fringes of color must take the general shape of lemniscates. In many crystals the properties are quite different for light of different wave-lengths, and in some the plane of the axes is at right angles for one end of the spectrum to what it is for the other. The relation of the elasticities may also be profoundly changed by heating the crystal, so that the intermediate one becomes greatest or least; in such cases, as in heating selenite, the double rings gradually merge into one, and then the two rings spread out again in a direction at right angles to the former. Generally, it may be said that cubic crystals possess no double refraction; that crystals symmetrical round one axis are uniaxial, doubly-refracting, and exhibit circular rings; and that other crystals are bi-axial, and exhibit double rings. All these phenomena are of the greatest importance in the study of rocks, and the fragments of crystals imbedded in them.

One points to the north and is called the North Pole, the other to the south and is called the South Pole. Similar poles repel, dissimilar poles attract each other. Sometimes there are intermediate poles, called "consequent poles." When the earth is viewed as a magnet, the spots where the magnetic needle stands vertical are called the "magnetic poles." In 1830 Sir James Ross found that the magnetic north pole was in 76° N. and 96° 43' W. At the same time the position of the magnetic south pole was calculated to be in 75½° S. and 154° E. But it does not always retain the same place. This is shown by what is called the declination or variation of the magnetic needle, *i. e.*, the angle which it makes with the geographical meridian. At London, in 1580, this was 11° 36' E., and in 1834, 18° 8' W.

¶ The unit magnetic pole or the pole of unit strength, is that which repels an equal pole at unit distance with unit force. In the C. G. [PRECEDENCE.] Even now the circle it describes is too small to be discernible by the ordinary eye. The pole-star is really a double star of yellow hue, but while the larger or visible one is between the second and third magnitude, its companion is only of the ninth, and therefore a telescopic star. In a more limited sense, the administration of the laws, by-laws, and regulations of a city. The primary objects of the police system are the prevention and detection of crime, and the preservation of peace and order, but various other duties have been from time to time added, as the prevention and removal of public nuisances and obstructions, the suppression of mendicancy, and the carrying into effect of the numerous laws and regulations made from time to time for the maintenance of public health, order, and safety.

1. *Comm.*: A document containing a promise to pay a certain sum of money on the occurrence of some event. In return for this promise a sum of money is paid down, called the premium (q. v.). By far the largest part of insurance business is applied to disasters at sea; to destruction of property by fire; to making provision for heirs and successors in case of death, and to loss of time and expense through accident. The practice of insurance has also been extended to making provision against loss of crops from bad weather, against destruction of glass from storms and accidents, &c. In every case a form is filled up containing a promise to pay a certain sum in the event of the happening of the specified contingency, and this document is always called the policy. Although an insurance policy is a contract, it is only signed by one party, the insurer, who for that reason is called the underwriter, and forms, therefore, what is called in law an unilateral contract. Marine policies are of two kinds: (1) Valued policy, one in which the goods or property insured are at a specified value; (2) Open policy, one in which the value of the goods or property is not mentioned. **political-economy, s.** The science which investigates the nature of wealth and the laws of its production and distribution, including, directly or remotely, the operation of all the causes by which the condition of mankind, or of any society of human beings, in respect to this universal object

of human desire, is made prosperous or the reverse. Inquiries on these points must have existed from the earliest times in every nation, but political economy as a science is very modern. Crude views on the subject arose in the middle ages in the free Italian cities and the Hanseatic towns. Sir Walter Raleigh (1595), Sir William Petty (1667), and Sir Dudley North (1691) wrote on the subject with enlightenment for their age. François Quesnay, in France (1768), founded the school of the economists which held that the soil is the source of all wealth. [PHYSIOCRAT.] Adam Smith (1723-1790) had made political economy a portion of his lectures while professor in Glasgow University from 1751 to 1764. Visiting Paris in that year, he became acquainted with Quesnay and the leading economists, but the principles of his great work, the *Wealth of Nations* published after ten years' retirement, in 1776, were in the main, thought out independently. Since Adam Smith's time, no work on the subject has appeared more original or influential than the *Principles of Political Economy*, by John Stuart Mill. In this and his other productions advocating liberty, he yet considers that public opinion and, if need be, even law should be directed against the increase of population when there is no hope of comfortable, or at least of decent, maintenance, and that the unearned increment of land should be appropriated by the state. This latter view the late Prof. Fawcett, another eminent political economist, strongly controverted. Probably the most notable political economist of the latter part of the century is Henry George, of New York City, whose views, to some extent, coincide with those of J. S. Mill, especially as regards the unearned increment of the land. Mr. George's theory has been popularly denominated the single-tax idea, and is best set forth in his work, *Progress and Poverty*. The most important corollary of the single tax is unlimited free trade,—these two principles forming, in fact, all of Mr. George's theory.

*Anthrop.*: The marriage of one woman to several men at once. Spencer (*Sociology* (ed. 1885), i. 645) traces several forms of it. The custom is still widely spread in the East. Cæsar (*de Bell. Gall.*, v. xiv.) found it in Britain on his arrival. Tacitus (*Germ.*, xx.) has been cited as an authority that the ancient Germans practiced polyandry, but Lubbock (*Orig. Civil.*, 1882, p. 139) does not consider the passage conclusive. M'Lennan (*Prim. Mar.*, p. 180) gives a long list of tribes which he regards as polyandrous.

**Compar. Relig.:** The worship of many gods. It is not necessarily the same as idolatry, for gods may be adored without any image of them being made. In Sir John Lubbock's classification of religious

beliefs, Fetishism and Totemism are polytheistic; the next stage in the ascending order, Anthropomorphism, may or may not be so. No mention is made in Scripture of Polytheism before the flood. It existed among the ancestors of Abraham in Ur of the Chaldees (Joshua xxiv. 2). The first commandment is leveled against it (Exod. xx. 3, Deut. v. 7). It was common at the time among the Canaanites (Deut. vi. 14, vii. 4, &c.). At many periods the Jews, high and low, lapsed into it (1 Kings xix. 2; 2 Kings xvii. 16, 17; Ezek. viii. 3-18). Though some of the Greek and Roman philosophers may have risen above polytheism to conceive the unity of God, the masses of the people were polytheistic, as is the case with the ethnic nations to-day, though in some cases, as in that of India, pantheism underlies polytheism, and some apparent polytheists really believe all nature to be one God.

The pool-table is constructed exactly the same as a billiard-table, excepting the fact that it has four or six apertures in the rails, through one of which it is necessary to drive a ball to make a count, the ball so driven being propelled from the force imparted by being struck by the cue-ball. A pyramid of fifteen balls is placed at a given spot on the table and the game is ended, if there are but two players, when eight balls

are pocketed, as that is a majority of the fifteen object balls. When three or more players participate the game is ended when it is impossible for the player who has the least number of balls to get enough to equal his next highest competitor.

5. The Bullfinch (q. v.).

¶ The term Papa, or Papas (father), has always been given by the Greek Church to presbyters, like the term Father now applied to a Roman priest. In the early centuries the bishops received the same title till, in a council held at Rome in 1076, at the instance of Gregory VII. (Hildebrand), it was limited to the Bishop of Rome. Holding that office, being also Metropolitan of Rome and primate, and claiming to be the earthly head of the Church universal, it is in the last-named capacity that the term Pope is held to be specially applicable. [CONCLAVE.] It has been a matter of controversy among Roman Catholics whether the authority of the Pope was above or below that of the General Council. That of Pisa (1409), claiming to be a General Council, deposed two rival popes, and appointed a third; but the two former repudiated the authority of the Council, and exercised their functions as before. The Council of Constance (1414-1418) also deposed two rival popes and elected one. In 751 Pope Zachary being consulted as to the right of the warlike French to depose their incompetent king, Childeric, and raise Pepin, the able Mayor of the Palace, to the sovereignty, sanctioned the proceeding. Pepin, in return, became his friend, and handed over to the Church the Exarchate and the Pentapolis. Charlemagne, in 774, confirmed and enlarged the gift. In 1076 or 1077 the Princess Matilda, daughter of Boniface, Duke of Tuscany, made the Holy See heir to her extensive possessions. Thus arose "the States of the Church" which figured on the map of Europe as an independent sovereignty till Sept. 20, 1870, when the troops of Victor Emmanuel, King of Italy, entered Rome, nominally in the interests of order, and took possession of the palace for the Italian Kingdom. On July 2 and 3, 1871, the seat of government was removed thither. It still continues the metropolis. No interference took place with the Pope's purely spiritual authority, but much with his temporal possessions and revenues. [INFALLIBILITY.]

From the mother-liquor carbonate of potassium throws down the populin, which must be recrystallized from boiling water. It forms white silky needles containing two molecules of water; dissolves in 76 parts of boiling water, in 100 parts of cold alcohol, and easily in acids. 1. *Bot.*: Poplar; a genus of Salicaceæ. Catkins drooping, their scales usually jagged; disc cup-shaped, oblique, entire. Males, stamens four to thirty; females, stigmas, two to four-cleft; capsule two-celled, loculicidal. Known species eighteen; from the north temperate zone. Two, *Populus alba*, the Great White Poplar or Abele, and *P. tremula*, the Trembling Poplar or Aspen, are indigenous. *P. nigra*, the Black Poplar, is only naturalized. The first is a large tree with downy, but not viscid buds, roundish, cordate, lobed-toothed leaves, glabrous above, downy and very white beneath, ultimately becoming glabrous on both sides. It grows in moist places and mountain woods. The timber is white, soft, and used only for coarse work. The bark is said to be useful in stranguary. Sir Joseph Hooker considers *P. canescens*, the Gray Poplar, to be only a sub-species of it. For the second species, see Aspen. *P. nigra* has viscid buds, leaves rhombic deltoid, or suborbicular, finely crenato-serrate; at length becoming glabrous. It grows in moist places, on river banks, &c. The wood is light, and not very valuable. It is used for carving, or burnt for charcoal, and the bark employed for tannin. *P. monilifera* is the Black Italian Poplar, *P. fastigiata*,

the Lombardy Poplar, and *P. canadensis*, the Canadian Poplar. The buds of *P. nigra*, the Himalayan *P. balsamifera*, *P. candicans*, &c., are besmeared in winter with a resinous, balsamic, bitter, aromatic exudation, called Tacamahac, considered to be diuretic, and antiscorbutic. The bark of *P. euphratica* is given in India as a vermifuge.

A. *As substantive*:

*Art*: A fictile material intermediate between glass and pottery, being formed of two substances, fusible and infusible, the latter enabling it to withstand the heat necessary to vitrify the former, thus producing its peculiar semi-translucency. The infusible material is alumina, called kaolin; the fusible substance is felspar, and is called pe-tun-tse, both Chinese terms. There are two kinds, hard and soft (*pâte dure* and *pâte tendre*); the hard body has more alumina and less silic and lime. Oriental porcelain is of two kinds, ancient and modern; the latter class includes imitations and reproductions. The manufacture began in China between 185 B. C. and 87 A. D., and reached its perfection during the Ming dynasty (1368-1644). The rarest Chinese wares are of the Tsin dynasty (265-419 A. D.), the Soui (581-618), and the Thang (618-907)—forms virtually extinct except as copies. The Tcheou porcelain (954-959) is so valued that fragments are worn as personal ornaments. Ware of the Song dynasty (960-1279) is also highly prized. Porcelain came by trade into Persia and Egypt, and was known in Syria in the twelfth century. Marco Polo in the thirteenth century described the Chinese method of manufacture from personal observation. First imported into Europe by the Portuguese in 1520. In Japan the porcelain manufacture began before 27 B. C., with a whiter body and more brilliant glaze than that of the Chinese. It is doubtful if it was ever made in Persia. In Europe, Boettcher, a Saxon chemist, found kaolin while seeking the philosopher's stone; and Augustus II., elector of Saxony and king of Poland, established and placed under his control the famous Meissen factory at the castle of Albrechtsburg in 1710; forty years later 700 men were employed. In Vienna, Stölzel, who escaped from Meissen in 1720, began the Austrian factory, which in 1785 employed 500 men; another was established in Berlin by Frederick the Great. During the eighteenth century, works were begun in Russia, Holland, Denmark, Spain, Portugal, Switzerland, and Italy. In France, soft porcelain was made at St. Cloud in 1695. Comte de Brancas-Lauraguan, in 1758, found kaolin, near Alençon, and porcelain was made at St. Yrieux, near Limoges. The Sèvres manufactory was first established at Vincennes in 1740, and moved to Sèvres in 1756. In France, the manufacture of soft porcelain extends from 1695 to 1770, after which date the hard body of Sèvres takes its place. In England, William Cookworthy, a chemist of Plymouth, found kaolin at Tregonning, near Helstone, in Cornwall, and his patent of 1768 was worked at Plymouth for two or three years, when the works were removed to Bristol. At Chelsea and Bow soft porcelain had been made. These two were transferred to Derby in 1770 and 1776. Bristol had a soft body works in 1753; its best period was from 1774 to 1778. Worcester porcelain dates from 1751; its best period ended with 1783. Large quantities of porcelain are produced in the United States. About Trenton, N. J., is the seat of the industry.

The Common Porcupine (*Hystrix cristata*) may be taken as a type of the True Porcupine. It is found in the south of Europe, and the north and west of Africa, is about twenty-eight inches long, exclusive of the tail, about four inches. It is somewhat heavily built, with obtuse head and short limbs. The head, fore quarters, and under surface are clothed with short spines intermixed with hairs, crest on head and neck, hind quarters covered with long sharp spines, ringed with black and white, and erectile at will. They are but loosely attached to the skin and readily fall out, a circumstance which probably gave rise to the belief that the animal was able to project them at an enemy. It is a purely vegetable feeder, and lives in holes in the rock, and burrows in the ground. The Hairy-nosed Porcupine is *H. leucura* (or *hirsutirostris*) from Syria, Asia Minor, and India; and the Brush-tailed Porcupines belong to the genus *Atherura*. It is still used by some petrologists as a generic name for all rocks consisting of a felsitic base, with felspar crystals. Rocks of varied mineralogical composition, origin, and of various colors, having however been included under this name, most petrologists use it in its adjectival form only. Thus, any rock in which crystals of felspar are individually developed, irrespective of the mineralogical composition of the whole, is said to be porphyritic.

The head is rounded in front, and the snout is not produced into a beak. The external surface is shining and hairless, dark gray or black on the upper parts, under pure white. It is gregarious in habit, and is often seen in small herds, frequenting the coasts rather than the open seas. It often ascends rivers. It is found on the coasts of Scandinavia, and ranges as far north as Baffin's Bay and as far west as the coast of the United States. Southward its range is limited, and it is unknown in the Mediterranean. It feeds on fish, and was formerly esteemed as an article of food. Its only commercial value now is derived from the oil obtained from its blubber, and its skin, which is used for leather and shoe-laces; but "porpoise-hides" are ordinarily obtained from *Delphinapterus leucas*, the Beluga, or White Whale.

*Comm.*: A species of red wine, produced chiefly in the mountainous districts of Portugal, and shipped from Oporto. After the juice has been pressed from the grape, and fermentation fairly started, a certain quantity of spirit is added to impede the process, so as to retain in the liquid some of the saccharine matter, as well as the flavor of the grape. A good port-wine should possess body and aroma, a full and rich color, moderate fruitiness, and be neither too sweet nor too rough. The proportion of proof-spirit varies from 26 to 36 per cent. It is frequently adulterated, both before it reaches this country and after its arrival here, sometimes by the addition of inferior wines or elderberry juice, at other times by diluting with water, adding a cheap spirit, and restoring the color by means of logwood or some other dye. A little powdered catechu is also occasionally added to produce a rough and astringent flavor and to insure a fine crust.

Mentally, the possession by an unclean spirit produced symptoms almost undistinguishable from those of madness (Mark v. 2-20). Jesus, when on earth, cast out demons (Matt. iv. 24, &c.).

"That the intruding or invading spirit may be either a human soul, or may belong to some other class in the spiritual hierarchy, countenances the opinion that the *possession-theory* is . . . modeled on the ordinary theory of the soul acting on the body. In illustrating the doctrine from typical examples from the enormous mass of available details, it will be hardly possible to discriminate among the operating spirits, between those which are souls and those which are demons, nor to draw an exact line between obsession by a demon outside, and possession by a demon inside."—*Tylor: Prim. ¶ In 1776 a continental postal system was inaugurated in this country, and Benjamin Franklin proceeded to organize the service. Up to 1829, however, the Postmasters-General were not regarded as belonging to the Presidential Cabinet. The first postmaster after the formation of a stable form of government was Samuel Osgood, of Massachusetts, who served under Washington for over two years, and was succeeded by Timothy Pickering. During the administration of President Jackson the office was made a cabinet position and William T. Barry, of Kentucky, was appointed. For a time the rates of carriage of letters varied, the matter of distance being the criterion of cost. After the civil war the system was thoroughly overhauled, and under the guidance of men like Buchanan and his associates, brought to its present state of high efficiency. The rates of postage have been rendered about uniform with those of other civilized countries, which have to a great extent taken our system as a model. As at present regulated the postmasters of the larger towns are nominated by the President and confirmed by the Senate, while those of the less important places are appointed by the President. All the other appointees are given position in accordance with the civil service reform laws.

**pō-tās'-sī-ūm**, s. [Latinized from *potash* (q. v.).]

**Chem.:** Symbol, K; atomic weight, 39. A monad metallic element, discovered by Davy in 1807, and very widely diffused through the vegetable, mineral and animal kingdoms. It usually exists in combination with inorganic and organic acids, and, when its organic salts are burned, they are resolved into carbonate, from which all the other salts of potassium can be prepared. It may be obtained by electrolysis, but is now produced in large quantity by distilling in an iron retort an intimate mixture of charcoal and carbonate of potassium, a condition readily obtained by igniting crude tartar in a covered crucible. It is a bluish-white metal; specific gravity, '865, being the lightest of all the metals except lithium. At 0° it is brittle and crystalline; soft at 15°, and may be easily cut with a knife; fluid at 62.5°, and at a red heat distills, yielding a beautiful green vapor. Thrown upon water, the metal decomposes it with great violence, forming hydrate of potassium, while the escaping hydrogen takes fire, burning with a rose-red color. It can only be preserved in the metallic state by immersing it in rock oil.

It crystallizes in brilliant cubes, having a sharp taste; specific gravity, '269; is more readily soluble in hot than in cold water, and is slightly soluble in alcohol. By oxidizing agents it is converted into bromate.

**potassium-carboxide**, s.

**Chem.:**  $K_2C_2O_2$ . A highly explosive compound formed sometimes in the manufacture of potassium, and when potassium is heated to 80° in presence of carbonic oxide. It is first of a gray color, and then becomes dark red. The gray compound has the composition  $K_2CO$ ; the red body can be preserved under mineral naphtha. In contact with water it explodes with great violence.

**potassium-chloride**, s.

**Chem.:** KCl. Occurs native as sylvite, and is formed when potassium is burned in chlorine, and when potash or carbonate of potash is neutralized with aqueous hydrochloric acid. It crystallizes mostly in cubes, rarely in octahedrons; specific gravity 1.95; tastes like common salt, melts at a low red heat, and at a higher temperature volatilizes unchanged. It is very soluble in water, one part of

the salt dissolving in 2.85 parts of water at 15.5°; is slightly soluble in strong alcohol, but wood spirit dissolves it more readily. It forms crystallizable double salts with most of the metallic chlorides.

**potassium-ethyl, s.**

*Chem.*: C<sub>2</sub>H<sub>5</sub>K. Not known in the separate state, but in combination with zinc-ethyl by treating that compound with potassium.

**potassium-hydrate, s.**

*Chem.*: KHO. Potash. Potassa. Caustic potash. Produced by dissolving protoxide of potassium in water, but generally prepared by adding two parts of quicklime, slaked with water, to a solution of one part of carbonate of potassium in twelve parts of water, and boiling the mixture for some time. After standing, the clear liquid is siphoned off and evaporated in iron or silver basins. To remove several of the impurities it is subsequently treated with alcohol. After fusion it is a white, hard, brittle substance, specific gravity 2.1, melts below redness to a clear liquid, volatilizes at a red heat, dissolves in half its weight of water, and in nearly the same quantity of alcohol. It has an acrid taste, is a powerful caustic, decomposes most metallic salts, and at a high temperature acts with great energy on nearly all substances.

**potassium-iodide, s.**

*Chem.*: KI. Obtained by direct union of iodine and potassium, and by neutralizing hydriodic acid with potash. It crystallizes in cubes, which are sometimes transparent, often opaque; specific gravity 2.90. It has a sharp taste, melts below a red heat, and at a moderate red heat volatilizes without change; is soluble in 7 part of water at 16°, and in 5.5 parts alcohol at 12.5°. A solution of this salt dissolves free iodine, forming a dark-brown solution. It is much-used in medicine.

**potassium-oxides, s. pl.**

*Chem.*: Potassium forms three oxides: (1) Protoxide, K<sub>2</sub>O, formed when potassium is exposed to dry air at ordinary temperatures, is white, very deliquescent and caustic, and unites with water so energetically as to produce incandescence; (2) Dioxide, K<sub>2</sub>O<sub>2</sub>, is formed at a certain stage in the preparation of the tetroxide, and when the latter substance is decomposed with water; (3) Tetroxide, K<sub>2</sub>O<sub>4</sub>, is produced when potassium is burnt in dry air or oxygen. It is a chrome yellow powder which is reduced to protoxide when heated in an atmosphere of nitrogen, and to the dioxide when dissolved in water, oxygen in each case being evolved.

**potassium-sulphides, s. pl.**

*Chem.*: Potassium unites with sulphur in five different proportions: K<sub>2</sub>S, protosulphide, obtained, but in a state of doubtful purity, by igniting sulphate of potassium in a covered crucible with finely divided carbon. It has a reddish-yellow color, is deliquescent and caustic. K<sub>2</sub>S<sub>2</sub>, disulphide, formed by exposing the sulphhydrate to the air, is obtained as an orange-colored fusible substance. K<sub>2</sub>S<sub>3</sub>, trisulphide, obtained by passing the vapor of carbonic disulphide over ignited potassium carbonate. K<sub>2</sub>S<sub>4</sub>, tetrasulphide, formed by reducing sulphate of potassium by means of the vapor of carbonic disulphide. K<sub>2</sub>S<sub>5</sub>, pentasulphide, obtained from any of the above sulphides by boiling them with excess of sulphur until fully saturated. All the sulphides have an alkaline reaction and smell of sulphydric acid.

*Bot., Hort., Agric., &c.*: *Solanum tuberosum*, a well-known plant, the tubers (dilated branches) of which are eaten. It is a native of Chili and Peru. Some think that it was first brought to Spain from the mountains near Quito early in the sixteenth century. Thence it spread to Italy and Austria. Sir Walter Raleigh is supposed to have taken it to England in July, 1586, having obtained it from the Virginian colonists who had left England in 1584. Gerarde, in his *Herbale*, figured it in 1597 as "the potatoe of Virginia," where he said he had obtained its roots. Sir Walter Raleigh cultivated potatoes

on his estate of Youghal, near Cork. For the next century and a half they were regarded as garden plants only. They gradually made way to the important position which they now occupy in agriculture. Many varieties are grown, differing in earliness, form, size, color, &c.

**potato-disease, s.**

*Veg. Pathol.*: A disease or murrain produced by a fungus, *Peronospora infestans*. It generally first attacks the leaves and stems of the plant, forming brown spots upon them in July and August. By this time, the fungus which first penetrated the tissue of the leaf, has thrust forth through the stomates its conidia-bearing filaments. The leaves soon afterward die. Next the tubers are attacked and decay, either in a moist manner, attended by a disagreeable odor, or by a drying up of the tissue. Sometimes the term potato-disease is limited to the first of these kinds of decay, but they are closely akin, the one form passing into the other. Possibly an excess of rain in particular seasons created a predisposition to the attacks of the fungus. Too strong manuring, and the cutting up of seed potatoes have also been suggested as predisposing causes. The potato-disease first appeared in this country. In 1845-1847 it caused the failure of the potato crop in Ireland, producing famine. [FAMINE.] It has never since completely disappeared, and in 1860 was nearly as formidable in some places as on its first appearance. When it is prevalent, the potatoes should be powdered with flowers of sulphur before being planted. They should be put early in the ground, and the haulm removed when the disease manifests itself.

When the patricians were compelled to acquiesce in the consulship being thrown open to the plebeians, they stipulated that a new Curule magistrate should be appointed from the patricians exclusively, to act as supreme judge in the civil courts. On this magistrate the title of Prætor was bestowed. In B. C. 337, the Prætorship was thrown open to the plebeians. About B. C. 240, the number of aliens residing in Rome had increased to such an extent that it was found necessary to appoint a second Prætor, who should decide suits between aliens or between aliens and citizens. He was known as the *Prætor peregrinus*, the other Prætor, *Prætor urbanus*, having cognizance of suits between citizens only. In B. C. 227, the number was increased to four, the two additional prætors to act as governors of provinces. † *Precession of the equinoxes:*

(1) *Astron.:* The going forward of the equinoxes. The arrival of the sun at the point Aries a little earlier than he might be expected to reach it was first observed by Hipparchus about B. C. 150. Depending, as the phenomenon does, for its explanation, on the law of gravity, Hipparchus could not account for it. Sir Isaac Newton was the first who did so, and that his newly discovered law of gravitation explained the precession of the equinoxes was a confirmation of the accuracy with which he had read the law itself. Excepting only at the two equinoxes, the plane in which the sun moves in his orbit and that in which the earth rotates do not coincide. By the law of gravitation one body does not attract another in mass, but acts on its separate particles. The sun then does not attract the earth as a whole, but tends to pull the parts nearest it away from those in proximity to the center, and the center again away from those on the other side. The bulged-out equatorial zone is specially liable to be thus acted upon, and, but for the rotation of the earth, would be so drawn down toward the ecliptic that it and the equator would ultimately be in one plane. The earth's rotation, however, modifies this action, and simply causes the points at which the earth's equator intersects the plane of the ecliptic to move slowly in a direction opposite

to that in which the earth rotates. This is what is denominated the precession of the equinoxes. It is generally associated with the sun, but the moon is twice as potent in producing it; owing to her comparative nearness to the earth she is able to produce a greater differential effect on the nearer and more remote portions of our planet. The annual motion of the first point of Aries is about 50", and about 25,867 years will be required for the entire revolution. [*ARIES.*]

1. A governor, a commander, a chief magistrate; specif.:

(1) A title given to several officers, military, naval, and civil, in ancient Rome. Thus, in the times of the kings the officer appointed by the king to act as his deputy when he was compelled to leave the city was called the *Præfectus urbi*, or Prefect of the City. Later, during the earlier ages of the republic, when both consuls were required for military service, a *Præfectus urbi* was named by the Senate to act during their absence. He must have held the office of consul, and he enjoyed during the period of his office the same powers and privileges within the walls as the consuls themselves. In times of dearth or famine a commissioner was appointed to procure supplies, his official title being *Præfectus annonæ*, or Prefect of Corn. In war the whole body of the cavalry was under the command of an officer, also styled a Prefect. The captain of a ship of war was called *Præfectus navis*, and the admiral of a fleet *Præfectus classis*. Under Constantine the Prefects became governors of provinces.

**B. As substantive:**

*Church Hist. & Ecclesiol. (pl.)*: Those who believe that the government of the church by means of presbyters is founded on and agreeable to the word of God. They hold that presbyter (elder) and bishop are different names for the same ecclesiastical functionary (cf. Acts xx. 17, 28, R. V., Phil. i. 1, &c.); that, consequently, every presbyter is a bishop, and on a footing of equality with his other brethren in the eldership. Presbyters are divided into two classes—teaching and ruling elders (1 Tim. v. 17). The former are popularly called "ministers," the latter "elders," or "lay-elders;" but, theoretically, both hold spiritual office. The government is by means of four courts of judicature, rising consecutively in dignity and authority. The lowest, called the "Session" [KIRKSESSION], rules over the congregation in all spiritual matters; while finance, being deemed more secular, is relegated to deacons or managers. Above the Session is the Presbytery (q. v.). Above this again is a Synod for a certain district. Highest of all is the General Assembly. The minister of a congregation presides *ex officio* in the Session, and non-ministerial elders are ineligible for the Moderatorship of the Presbytery, Synod, and Assembly. A Presbyterian denomination stands to an Episcopal one nearly in the same relation as a republic to a monarchy. The Waldensian church was constituted on an essentially presbyterian model. The system was partially introduced into Switzerland in 1541, and its discipline was subsequently carried out by Calvin with iron firmness at Geneva. The first French Synod met in Paris in 1559, the first Dutch Synod at Dort in 1574. The Hungarian and various other continental Protestant churches are also Presbyterian. The system thoroughly rooted itself in Scotland, the first General Assembly being held there in 1560. [CHURCH OF SCOTLAND.] The same year a presbytery was formed in Ireland, at Carrickfergus [SYNOD OF ULSTER],

and in 1572 one in England, at Wandsworth. In 1646-7 the Church of England was reconstituted on a presbyterian basis, but in 1660 was again made episcopal. [CHURCH OF ENGLAND.] The clergymen who had to leave the English Church, in 1662, owing to the Act of Uniformity, were mainly Presbyterians. A number of the congregations which they founded ultimately lapsed first into Arianism, and then into Socinianism, retaining the name Presbyterian after they had abandoned the form of government. But the great mass of the American and British Presbyterians are strongly Trinitarian. They hold the Bible to be the sole rule of belief, and the Confession of Faith their chief, or their only, human standard. The first presbytery in the United States met at Philadelphia in 1705. There are now powerful Presbyterian churches in various parts of the world, the number of communicants in this country reaching to over a million and a half.

The Moderator opens and closes each meeting with prayer. The functions of the court are executive, not legislative. The Presbytery supervises all the congregations within its bounds, hears appeals from the decisions of sessions, examines candidates for the ministry, licenses probationers, and ordains ministers by laying on of hands (1 Tim. iv. 14) [ORDINATION], &c. Appeal lies from it to the Synod (q. v.).

¶ *The President of the United States* is the chief executive of the government, and is, in power, literally an elected, uncrowned king. He is commander-in-chief of the army and navy of the country, and has the nomination of most of the executive officers of the government, besides a large number of judicial and administrative functionaries. He is elected for a term of four years, and is eligible for any number of reelections, although, in conformity with the precedent set by Gen. George Washington, no president has yet been elected more than twice. President Cleveland, up to date, is the only president who has ever been reelected after an interregnum. The president has a veto power and unlimited pardoning prerogative as to offenders against national laws. His salary is \$50,000 a year, and his residence, during his presidency, is the "White House" in Washington. He is elected by an electoral college, which in some contingencies makes the choice by states, and he may receive a minority of the popular vote and yet be legally chosen to the office. In case of his death or total disability the functions of the office devolve upon the vice-president, who is elected coincidentally with the president, and is the presiding officer of the Senate. The following is the list of presidents up to the present: George Washington, 1789 and 1793; John Adams, 1797; Thomas Jefferson, 1801 and 1805; James Madison, 1809 and 1813; James Monroe, 1817 and 1821; John Quincy Adams, 1825; Andrew Jackson, 1829 and 1833; Martin Van Buren, 1837; William Henry Harrison (died April 4, 1841), 1841; John Tyler (elected as vice-president), 1841; James Knox Polk, 1845; Zachary Taylor (died July 9, 1850), 1849; Millard Fillmore (elected as vice-president), 1850; Franklin Pierce, 1853; James Buchanan, 1857; Abraham Lincoln (assassinated April 14, 1865), 1861 and 1865; Andrew Johnson (elected as vice-president), 1865; Ulysses S. Grant, 1869 and 1873; Rutherford B. Hayes, 1877; James A. Garfield (died by assassination September 19, 1881), 1881; Chester A. #### II. Technically:

1. *Ethnicism*: In the same sense as I. 1. (*Gen. xlvii. 22*, *Acts* xiv. 13.)

2. *Patriarchism*: Under this dispensation the patriarchs themselves exercised priestly functions, e. g., sacrifice (*Gen. xxii. 1-13*) and blessing (*xxvii. 28, 29*). The case of Melchisedek belongs to an older ritual, by no means confined to Palestine (cf. *Virg., Æn. iii. 80*, and *Serv. in loc.*)

3. *Judaism*: Heb. *kohen* (*Lev. xxi. 10*, &c.), Sept. and New Testament Gr. *hiericus* (*Matt. viii. 4*, *xii. 4, 15*, &c.). A descendant of Aaron, and therefore one of the sacred caste. The Jewish priests filled all the important offices in connection, first with the tabernacle and then with the temple worship, less important ones being handed over to the Levites, and those still more menial to the Nethinims (q. v.). They constituted a sacred hierarchy, of which the high priest was the head. Their chief duties were to offer sacrifices for themselves and the people, and intercede for them with God. The priests were divided into twenty-four courses for the service of the temple (*1 Chron. xxiv. 1-19*; *Luke i. 5*). Probably the "chief priests" were the heads of these courses, with any high priest out of the office (*Matt. xxvi. 3*).

4. *New Test.*: A rendering of the Greek *hiericus*. [*3.*] In this sense applied largely to Christ (*Heb. v. 6*, *vii. 11, 15*), the Great High Priest of our profession, and, in an inferior sense, to Christians in general, inasmuch as they offer spiritual sacrifices (*1 Pet. ii. 5*; *Rev. i. 6*, *v. 10, xx. 6*), but never used of any order in the Christian ministry.

**C. As substantive:**

1. The act, process, or practice of impressing letters, characters, or figures on paper, cloth, or other material; the business of a printer; typography. There are several branches of the art, as, the printing of books, &c., by means of movable types; the printing of engraved steel or copper plates [ENGRAVING]; the taking impressions from stone [LITHOGRAPHY], and the printing of figured patterns on fabrics [CALICO-PRINTING]. Letterpress-printing, or the method of taking impressions from type or letters, and other characters cut or cast in relief upon separate pieces of metal, is the most important branch of printing. Printing in its earliest form consisted in taking impressions from engraved blocks. [BLOCK-BOOKS, BLOCK-PRINTING.] The use of separate types was invented by Guttenberg, of Mentz, about the year A. D. 1450. In company with Faust and others he printed several works with wooden types and wooden blocks. These were the *Alexandri Galli Doctrinale* and *Petri Hispani Tractatus* in 1442, and subsequently the *Tabula Alphabeticæ, Catholicon, Donati Grammatica*, and the *Confessionalia*, between the years 1444 and 1450. In the years 1450-55, the Bible of 637 leaves was printed by Guttenberg and Faust with cut metal types. Guttenberg died in 1468, in high honor for his genius and perseverance. Faust, after dissolving partnership (1455) with Guttenberg, became allied with Schoeffer; and they published in 1457 the *Codex Psalmorum* with metallic types—the most ancient book with a date and inscription. Cast metallic types were invented by Schoeffer in 1459. As first practiced in Europe the sheets were printed on one side only, and the backs of the pages pasted together. The art of printing was introduced into France in 1469; Italy, 1465; Spain, 1477, and England (by Caxton) in 1474. In letterpress printing the impressions are taken directly from the surface of the types, or from stereotyped plates [STEREOTYPE] by superficial pressure, as in the hand printing-press, or by cylindrical pressure, as in the steam printing-machine, or by the action of a roller, as in the copper-plate press. The ink or pigment employed is laid upon the surface of the type with a printer's roller. Printing is divided into two departments, composition and press-work. (See these words.) In printing for the blind the letters or characters are impressed in relief on stout paper or cardboard without the use of ink.

2. *Photog.*: The process of obtaining proofs from negatives. - [AUTOTYPE, PHOTOCOLLO-TYPE, PLATINOTYPE, POWDER-PROCESS, SILVER-PRINTING, STANNOTYPE, WOODBURYTYPE.]

**printing-ink, s.** The ink used by printers. Generally it is a compound of linseed-oil and lamp or ivory black.

**printing-machine, s.** A name in England for a machine for taking impressions on paper from type, electrotype, or stereotype forms, steel or copper plates, lithographic stones, &c., and which in this country is termed a printing press (q. v.). It is moved by hand, or by steam, or other power. The impression from the forms is generally effected by cylindrical pressure. Letterpress printing machines are of three kinds: (1) Single cylinder, by which the sheet of paper is printed on one side only; (2) Perfecting, which prints both sides of the sheet at one operation; and (3) Platen, which prints one side of the sheet by flat, instead of cylindrical, pressure. There are also various kinds of Rotary machines used for printing newspapers, into which the paper is drawn from reels, instead of being fed by single sheets. The first cylinder printing machine was patented by W. Nicholson in 1790. The invention of steam printing presses rendered books and periodicals so cheap that the progress of knowledge was amazingly accelerated; and soon the capacity of the cylinder press proved unequal to the work of printing the enormous editions of some of the leading newspapers of the world; and the first successful invention to meet the exigency was made by Col. Richard M. Hoe, of New York, in the Type Revolving Printing Machine. It is, as its name indicates, on the rotary principle. The Hoe Perfecting Press with folding machine combined soon followed. In this machine the first pair of cylinders over which hangs the roll of paper consists of one stereotype and one impression cylinder, and by it the first side of the paper is printed. The second pair, printing the second side, consists likewise of one stereotype and one impression cylinder, but the latter is below the former and is of much greater size, so that the "set off" from the fresh ink shall not fall continuously on the same surface of blanket. There is a third pair of cylinders which cuts off the sheet, and a fourth (in which, however, one cylinder is replaced by a brace of rollers), gives the first fold and shoots the doubled sheet in the circular cutter, which slits it into two papers, sending them on to be folded again separately and delivered in their respective places in piles at the side of the press; or the papers are rolled up exactly on the top of each other, six in number, and flown perfectly on the fly-board. For detailed account of modern perfecting printing machines see *Sup. Cyc.*

A contrivance for running the form in and out was afterward added. In the printing-press the matter to be printed is laid on an even horizontal surface, usually of iron, and the pressure is produced by a parallel surface, also usually of iron, called a platen, by means of a screw or lever, or both combined. [PRINTING-MACHINE.]

*Church Hist.*: A title loosely applied before the thirteenth century to any monk, who, by reason of age, experience, or acquirements, ranked above his fellows. It was thus a mark of superiority due to personal qualities, rather than an official title of dignity. Priors are now of two kinds: Conventual and Claustal. A conventual prior is the head of a religious house, either independently, as among the Regular Canons, the Carthusians, and the Dominicans, or as superior of a cell or offshoot from some larger monastery.   2. A necessary-house.
- II. Law:** A partaker; a person having an interest in any action or thing; one having an interest in an estate created by another; one having an interest derived from a contract or conveyance to which he is not a party.

**privy-chamber, s.** A private apartment in a royal residence or mansion.

¶ *Gentlemen of the Privy Chamber:* Officers of the royal household of Great Britain, who attend on the sovereign at court, state processions and ceremonies, &c.

**\*privy-coat, s.** A light coat or defense of mail worn concealed under the ordinary dress.

**privy-council, s.**

*Eng. Law:* The principal council of the sovereign, consisting of members chosen at his or her pleasure. Its dissolution depends upon the royal pleasure; by common law it was dissolved *ipso facto* by the demise of the sovereign, but to prevent the inconvenience of having no council in being at the accession of a new prince, the privy council is enabled by statute to continue for six months after

the demise of the crown, unless sooner dissolved by the successor. It is presided over by the Lord President of the Council, who has precedence next after the Lord Chancellor. Members of the privy council are addressed as Right Honorable. The duty of a privy councilor appears from the oath, which consists of seven articles:

1. To advise the king according to the best of his cunning and discretion; 2. To advise for the king's honor and good of the public, without partiality through affection, love, meed, doubt, or dread; 3. To keep the king's counsel secret; 4. To avoid corruption; 5. To help and strengthen the execution of what shall be there resolved; 6. To withstand all persons who would attempt the contrary; and lastly, in general, 7. To observe, keep, and do all that a good and true councilor ought to do to his sovereign lord.

The office of a privy councilor is now confined to advising the sovereign in the discharge of executive, legislative, and judicial duties. The former have, since the accession of Queen Anne, been intrusted to responsible ministers; and it has consequently become the settled practice to summon to the meetings of the council those members of it only who are the ministers of the crown. The power of the privy council is to inquire into all offenses against the government, and to commit the offenders for trial; but their jurisdiction is only to inquire and not to punish, except in the case of the judicial committee, which has full power to punish for contempt and to award costs. The duties of the privy council are, to a great extent, performed by committees, as the judicial committee, who hear allegations and proofs, and report to the sovereign, by whom judgment is finally given, and the committee of council on education, presided over by the Vice-president of the Council, who is a member of the government.

St. Alphonsus Liguori (1732-87) in his *Homo Apostolicus* and *Theologia Moralis* revived Probabilism, which is now the ordinary rule of confessors in the Roman Church.

† *Procession of the Holy Ghost:*

1. *Theol.*: The noun procession is not found in Scripture, it was, however, legitimately framed by theologians from the verb occurring in John xv. 26, "The Spirit of truth, which proceedeth from the Father." There is no similar passage categorically stating procession from the Son, and the question arises, can equivalent language be found? If the words in John xiv. 26, "The Comforter, which is the Holy Ghost, whom the Father will send in my name," imply the procession of the Holy Ghost, so do those in xv. 26, "But when the Comforter is come, whom I will send unto you from the Father," and there is a Procession of the Holy Ghost from the Son as well as from the Father, if they are not equivalent there is no procession from the Son. (Cf. Gal. iv. 6.)

2. *Church Hist.*: The clause "filioque" [NICENE CREED], implying procession from the Father and the Son, being accepted in the West while rejected in the East, was one potent cause of the ultimate separation between the Greek and Latin Churches. ¶ (1) *Promise and offer:*

**Scots Law:** An offer is a proposal made by the offerer to the person to whom the offer is addressed, to give or to do something either gratuitously or on an onerous consideration. A promise is an offer with this addition, that the promiser, from the nature of his proposal, thinks it unnecessary to wait for the other party's assent, which he takes for granted. An offerer is not bound until his offer is accepted. A promiser is bound as soon as the promise reaches the party to whom it is made. A promise may be absolute or conditional, lawful or unlawful, express or implied. An absolute promise must be fulfilled in all events. The obligation to fulfill a conditional promise depends on the performance of the condition. An unlawful promise is not binding, being void by the nature of it, as being incompatible with a prior paramount obligation of obedience to the laws. An express promise is one expressed in words or writing. An implied promise is one which reason and justice dictate. A promise without deed is said to be parol, and the term is usually applied to engagement by parol only, a promise by deed being technically called a covenant (q. v.).

¶ 1. *The Prophets*:

(1) Men divinely inspired, and who often uttered predictions of future events. Three Hebraic words are applied to the Old Testament prophets; the most common is *nabhi*, from the verb *nabha*=primarily, to bubble forth, to send forth copious floods of speech, hence in Niphal=to speak under a divine impulse, to prophesy (1 Sam. ix. 9; 1 Kings xx. 13); the second *roeh*=a seer, from *raah*=to see (1 Sam. ix. 9), and the third *chhozeh*=a seer, from *chhazah*=to see, to look (1 Chron. xxi. 9; xxv. 5, &c.). It is connected with *chhazon*=a vision. The second term was the oldest (1 Sam. ix. 9). Both it and *chhozeh* suggest that the subjects of the prophecies passed before the eyes of the seer in panoramic vision (cf. Isaiah i. 1; Ezek. i. 4; Rev. i. 12), he simply recording what he saw. In many cases, however, words were communicated (Jer. i. 4, 9, 11, 12). The first word, *nabhi*, suggested that when inspired communications had to be made, the prophet, like a frenzied person raving, uttered words in a copious flood, flowing forth with some considerable impulse. Abraham is called a prophet (Gen. xx. 7); it is implied that Moses was one (Deut. xviii. 15; Acts vii. 37), but the more typical prophets began with Samuel (Acts xiii. 20), who was a civil ruler as well. Yet the full development of the prophetic order was not till the separation between the two kingdoms. In Judah the general faithfulness to Jehovah left them less scope. In the kingdom of Israel, on the other hand, where the worship, even when nominally that of Jehovah, was idolatrous, and where that of Baal often prevailed, the prophets were very prominent and influential, denouncing apostasy and moral depravity. The first, like Elijah, Elisha, &c., have left no writings; the later prophets have. [(2.)] The last of the Old Testament prophets passed away with Malachi, and scribes took their place. In the early church there were prophets (Rom. xii. 6; 1 Cor. xii. 28; Ephes. iv. 11, &c.). Their chief function seems to have been preaching in the church (1 Cor. xiv. 2-5).

(2) The prophetic books of the Old Testament, or the Old Testament except the books of Moses (Matt. xxii. 40; Luke xxiv. 27).

2. *School of the Prophets*: An association of the prophets in which the elder lovingly trained the younger, who were called their sons (1 Kings xx. 35). First Elijah, and then Elisha, presided over such a society.

2. **Arith.**: A rule by which from three given quantities a fourth may be found bearing the same ratio to the third as the second bears to the first. Also called the Rule of Three.

3. **Math.**: The relation which one quantity bears to another of the same kind, with respect to magnitude or numerical value. This relation may be expressed in two ways: (1) By the difference of the quantities, and (2) by their quotient. When the relation is expressed by their difference, it is called an Arithmetical Proportion; when by their quotient, Geometrical Proportion, or simply Proportion. Four quantities are in proportion when the ratio of the first to the second is equal to the ratio of the third to the fourth; this relation is expressed algebraically thus:  $a:b::c:d$ . This expression is called a proportion; it is read,  $a$  is to  $b$  as  $c$  is to  $d$ , and is equivalent to the expression  $b+a=d+c$ . Hence a proportion may be defined to be the algebraic expression of equality of ratios.

2. That which protects, shelters, or preserves from danger, injury, or evil; a shelter, a defense; as, Clothes are a *protection* against the cold.

†3. A writing which assured safety or protection; a passport, a safe-conduct.

*II. Polit. Economy*: Protection in this sense is said to have been derived from the name of the Society for the Protection of Agriculture (England, 1844-53). But the idea is old, and has been known to a greater or less extent in all ages and in all lands. Taxes levied solely for the raising of revenue operate in restraint of free trade, and are therefore a form of protection, but the term is generally limited to cases in which these taxes are imposed for other than fiscal purposes. Their most common aim is to shield some languishing trade, occupation, or profession from open competition. As to the practical effect of protection the opinions of politicians and political economists are much divided. On the one hand it is claimed that in this country protection is absolutely necessary to protect home industry and enable the producers of a protected article to receive in return for their services a fair remuneration. On the other hand it is asserted that the uniform effect of the policy is to render the article produced both dear and bad. Protection to the farmer, free-traders say, makes every loaf smaller, thus taxing for the benefit of a class the very poorest person in the country, and aggravating the effects of any famine that may arise. [CORN-LAWS.] Navigation laws, they say, make it more expensive to work a ship, and diminish the probability of its being largely employed in the carrying trade of the world. [NAVIGATION-LAWS.] A bounty on exportation it is claimed is a present made to foreign countries, and *vice versa*.

[BOUNTY.] It is believed that the protectionist system on a large scale was first proposed by the Chancellor de Birague, an Italian, in the suite of Catherine de Medici. It was developed by Colbert in 1664, and has not since passed away. In 1692 England retaliated on France, according to Adam Smith, taxing goods imported from that country in 1696 75 per cent. or more. Bounties were abolished in Britain between 1818 and 1824, and this, with the repeal of the Corn and Navigation Laws, gave the protectionist system in that country its death-blow. In this country protection still carries with it the mass of the people and the government, though a large minority are in favor of free-trade.

*Biol., &c.*: "The living matter from which all kinds of living beings are formed and developed, and to the properties of which all their functions are ultimately referred." It was first noticed and described by Roesel v. Rosenhof, in his account of the Proteus-animalcule, and was named sarcode by Dujardin in 1835. In 1846 v. Mohl gave the name protoplasm to the "tough, slimy, granular semifluid" portion of the contents of the vegetable cell. Cohn suggested the identity of vegetable protoplasm and animal sarcode, which was established by Schultze (*Arch. f. Anat. u. Phys.* (Leipzig), 1861, pp. 1-27), whose conclusions were probably aided by the researches of De Bary and Koelliker. Protoplasm is a transparent homogeneous, or granular-looking substance. Under high microscopic power, in many instances, it shows a more or less definite structure, composed of fibrils more or less regular, and in some instances grouped into a honeycombed or fibrillar reticulum, in the meshes of which is a homogeneous interstitial substance. The closer the meshes of the reticulum, the less there is of this interstitial substance, and the more regularly granular does it appear. Water, dilute acids, and alkalis cause protoplasm to swell up, and ultimately become disintegrated, and it is coagulated by those substances that coagulate proteids. Its composition is a problem with which science is still to deal.

1. An old and common saying; a short or pithy sentence often repeated, and containing or expressing some well-known truth or common fact ascertained by experience or observation; a sentence which briefly and forcibly expresses some practical truth; a maxim, a saw, an adage, an aphorism, an apophthegm.

"A *proverb* is usually defined, an instructive sentence, or common and pithy saying, in which more is generally designed than expressed, famous for its peculiarity and elegance, and therefore adapted by the learned as well as the vulgar, by which 'tis distinguished from counterfeits which want such authority."—*Ray: Proverbs*. (Pref.)

2. A by-word; an expression or name of contempt, hatred, or reproach. (1 *Kings* ix. 7.)

3. A short dramatic composition, chiefly French, in which some well-known proverb or popular saying is taken as the foundation of the plot.

**II. Scripture:**

1. A moral saying or maxim, enigmatical or allegorical in its nature. (*Proverbs* i. 6.)

2. (*Pl.*) *Old Test. Canon*: Heb. *Mishlei*, pl. of *mashal*=(1) a similitude, a parable (*Ezek.* xvii. 2, xxiv. 3); (2) a pithy saying, generally involving latent comparison; (3) a proverb properly so called; (4) a song or poem, prophetic (*Num.* xxiii. 7, 18), didactic (*Job* xxvii. 1), or derisive (*Isaiah* xiv. 4), &c. The noun *mashal* is from the verb *mashal*=to

make like, to assimilate. (*Gesenius*.) It was therefore to be expected that the book of Proverbs would not consist exclusively of proverbs properly so called; nor does it. For instance, ch. ii. is not a series of detached sayings, but a didactic treatise. Dr. Otto Zöckler (*Prov. Solomon* (ed. Aiken), pp. 35-37) divides the Book into five leading portions: (1) Introductory (i. 7-ix. 18); (2) original nucleus of the collection, genuine Proverbs of Solomon (x. 1-xxii. 16); (3) additions made before Hezekiah's day (xxii. 17-xxiv. 34); (4) gleanings by the men of Hezekiah (xxv.-xxix.); (5) the Supplements (xxx.-xxxii.), the first being the words of Agur (xxx.), and the second the words of Lemuel, with the poem in praise of the matron (xxxi.). Chapter xxxi. 10-31 constitutes an alphabetical acrostic. Chapters i.-xxix. are generally attributed to Solomon, who was "wiser than all men," and "spake 3,000 proverbs" (1 *Kings* iv. 31, 32), which do not seem to have been founded solely on his own experience, but on the shrewd observation of the nation at large (i. 6). The collection made under Hezekiah repeats many proverbs which appeared in the earlier one. The lives of Agur and of King Lemuel's mother, and the dates of the two appendices ascribed to them, are unknown. The New Testament directly quotes from this book in very many instances.

Cf. *Prov.* iii. 11, 12 with *Heb.* xii. 5, 6, *Rev.* iii. 19; *Prov.* iii. 34 with *James* iv. 6; *Prov.* xi. 31 with 1 *Pet.* iv. 18; *Prov.* xxv. 21, 22 with *Rom.* xii. 20; *Prov.* xxvi. 11 with 2 *Pet.* ii. 22. Allusion is made to *Prov.* i. 16 in *Rom.* iii. 15; to *Prov.* iii. 7 in *Rom.* xii. 16, and to *Prov.* x. 12 in 1 *Pet.* iv. 8.

¶ *The Book of Psalms*:

*Old Test. Canon.*: Heb. *tehillim* or *tehillim*, an abnormal pl. of masc. form to the fem. *tehillah* or *tehillah*=(1) praise; (2) a hymn of praise; (3) glory. In one codex the Septuagint calls the book *Psalmoi*=Psalms; in another *psaltērion*=a stringed instrument. It was the praise-book or psalter of the Hebrew temple or synagogues. In the present Hebrew Bibles it is placed just after the Prophets at the head of the Hagiographa (q. v.), and in Luke xxiv. 44, is generally supposed to stand for that division of the Old Testament books. The hundred and fifty psalms are arranged in Hebrew in five books, each terminating with a doxology, in some cases closing with "Amen and amen." The R. V. prints them separately. Book 1 contains i.-xli.; book 2, lxii.-lxxii.; book 3, lxxiii.-lxxxix.; book 4, xc-cvii., and book 5, cviii.-cl. All but thirty-four psalms have titles in the Hebrew Bible; the latter were called by the Rabbins orphan psalms. In the Septuagint all but two have titles. Though not as a rule accepted as part of Scripture, they are ancient, and worthy of high respect. They attribute all Book 1 to David, except Ps. i., ii., x., and xxxiii. The name of the Supreme Being used in this book is chiefly Jehovah. Book 2 assigns Psalms to David, to Korah, to Asaph, and to Solomon, and leaves others anonymous. The name for the Supreme Being in this book is Elohim (q. v.). Book 3 ascribes Psalms to David, to Korah, to Asaph, to Ethan, and to Heman the Ezrahite. Elohim and Jehovah are about equally common in the book, the former, however, being apparently preferred. Book 4 ascribes Psalm xc. to Moses, the others not anonymous to David. Book 5 leaves many psalms anonymous, attributing others to David. The Hebrew Bible, but not the Septuagint, assigns Psalm cxvii. to Solomon. This volume contains the Songs of Degrees. The book was evidently brought together from many sources. It was commenced, rather than entirely composed, by David. Its composition and compilation extended over centuries. Psalm cxxxvii. speaks of the Babylonish captivity as an event recently gone by. Psalm xliv. and lxxix. seem very suitable to the time of the persecution under Antiochus Epiphanes (B. C. 168-165). If the Talmudic statement, discovered by Gratz, that the night service alluded to in Psalm cxxxiv. did not become part of the Jewish ritual till the time of Queen Alexandra (B. C. 79-70), it and perhaps others of the Songs of Degrees may be slightly more recent than that date. The book of Psalms is quoted or alluded to as an inspired composition by Our Savior and his Apostles at least seventy times; no Old Testament book is more frequently quoted. Its canonical authority has never been seriously doubted. It has become the psalter of the Christian Church. Its rhythmical form and careful parallelism (q. v.) (now rendered obvious by the R. V.) adapt it for the musical part of public worship. [MESSIANIC.]

Biol.: (See extract.)

"The young [of viviparous Aphides] are developed within organs which resemble the ovarioles of the true females in their disposition, and may be termed *pseudovaries*. The . . . anterior chamber of each pseudovarian tube is lined by an epithelium, which incloses a number of nucleated cells. One of the hindermost of these cells enlarges, and becomes detached from the rest as a pseudovum. It then divides and gives rise to a cellular mass . . . which gradually becomes fashioned into the body of a larval Aphid. A portion of the cells of which it is composed become converted into a *pseudovarium*, and the development of new pseudova commences before the young leaves the body of its parent. It is obvious that this operation is comparable to a kind of budding. If the pseudovum remained adherent to the parental body the analogy would be complete."—Huxley: *Anat. Invert.*, pp. 447, 448.

**Ptolemaic-system**, *s.*

**Astron.**: The hypothesis maintained by Ptolemy in his *Almagest* that the earth was a fixed body, remaining constantly at rest in the center of the universe, with the sun and moon revolving round it as attendant satellites. To account for the more complicated movements of the planets, a contrivance was devised by which each planet revolved in a circle, while the center of that circle described another circle round the earth, for the ancient physicists refused to admit that any movement except in a circle could be perfect. The Ptolemaic system prevailed till Copernicus propounded what is now accepted as the true system of the universe, and Prof. Ball (*Story of the Heavens*, p. 6) says of the old theory that "though so widely divergent from what is now known to be the truth, it did really present a fairly accurate account of the movement of the planets." **Organic Chem.**: A putrescent product of animal origin and of a basic or alkaloidal nature, closely allied to the vegetable alkaloids; a cadaveric poison. About 50 varieties of ptomaines are known, some being harmless, others very poisonous. Ordinary foods frequently undergo changes that render them harmful, and especially is this so with muscles, clams, oysters, fish, meat, sausage, milk, ice-cream, cheese and canned goods. These changes are due to the presence of ptomaines. Heat will destroy the ptomaine bacteria, but their poison is not eliminated by cooking. Treatment of ptomaine poisoning is by emetics in connection with hypodermic injections of strychnine, aromatic ammonia, whisky, or very small doses of atropine, to stimulate the heart's action. In no case should opiates or coal-tar preparations be employed. [BACTERIUM.]

For the transference of sense cf. *horse*=a kind of frame; Fr. *poutre*=a filly . . . a beam; *chèvre*=a goat . . . a crane; Eng. *crane*=in its double meaning; Gr. *onos*=an ass, a crane, a pulley, &c.]

1. *Mech.*: One of the six simple machines or mechanical powers. It consists of a small circular plate or wheel which can turn round an axis passing through the centers of its faces, and having its ends supported by a framework which is called the block. The circular plate has a groove cut in its edge to prevent a string from slipping off when it is put round the pulley. With a single fixed pulley (that is one in which the block in which the pulley turns is fixed), there is neither gain nor loss of power; for, as the tension in every part of the cord is the same, if a weight be suspended at one extremity, an equal weight must be applied at the other to maintain equilibrium. Hence, the effect of a fixed pulley is simply to change the direction of a force. By means of movable pulleys one can gain mechanical advantage, greater or less, according to the number and mode of combination of the pulleys. This advantage may be computed by comparing the velocity of the weight raised with that of the moving power, according to the principle of virtual velocities. Thus:

In a single movable pulley with the strings parallel when there is equilibrium the weight is twice the power.

It may, therefore, be considered a lever of the second class, in which the distance of the power from the fulcrum is double that of the weight from the fulcrum.

In a system of pulleys in which each pulley hangs by a separate string and all the pulleys are parallel, when there is equilibrium the weight is equal to the power multiplied by 2<sup>n</sup>, where *n* is the number of pulleys.

In a system of pulleys in which the same string passes round all the pulleys, and the parts of it between the pulleys are parallel, when there is equilibrium the weight is equal to the power multiplied by the number of strings at the lower block.

In a system of pulleys in which each string is attached to the weight, and all the strings are parallel, when there is equilibrium the weight is equal to the power multiplied by 2 raised to a power whose exponent is one less than the number of pulleys.

allusion being to the plunging action of the piston or plunger; Sw. *pump*; Dan. *pompe*; Russ. *pompa*=a pump.]

1. Lit.: A machine, engine, or device, consisting of an arrangement of a piston, cylinder, and valves, for raising water or other liquid to a higher level, or for compressing or exhausting air and other gases. There are numerous varieties of pumps differing more or less in construction, according to the purposes for which each is intended, but the most important are the suction-pump, the lifting- or lift-pump, the force-pump, and the centrifugal- or rotary-pump. The simplest form of pump is that of the common lift-pump, which consists of a straight tube with two valves, one of which is fitted to the lower end of the tube, and the other is made to slide air-tight in the cavity of the tube or barrel. Both of these valves are adapted to open upward only, and thus the water is admitted and lifted from the lower part of the tube to the discharge aperture above. The pump acts by the pressure of the atmosphere upon the external body of water from which the supply is raised, but by the forcing-pump water may be raised above the level to which it is driven by the pressure of the atmosphere. The forcing-pump consists of a barrel fitted with a solid piston or forcer, the barrel being also provided with a branch forcing-pipe. The lower part of the barrel and the branch-pipe are each fitted with a valve opening upward, and by repeated strokes of the piston, the pressure of the air from above being removed, the fluid is brought up to fill the space between the two valves, and being prevented from returning by the lower valve, it passes through the upper valve of the branch-pipe into a capacious upper vessel, and there accumulating, may be ejected in a constant instead of an intermittent stream.

None of them is dated. Some quote from others, and the period of their redaction embraces perhaps a dozen centuries. In their present form none of them appears older than the ninth century A. D. The most celebrated are the Vishnu and the Bhāgavat Purānas. They are full of legends relating to holy places and ceremonial rites, with minute fragments of history. Modern Hinduism is largely founded on these compositions, some of which are sectarian productions, advocating the claims of particular divinities to the disparagement of others. In addition to the eighteen principal Purānas, there are eighteen Upapurānas or secondary Purānas, enumerated by H. H. Wilson (*Vishnu Purāna*, Intro.), and these do not complete the list of Puranic literature.

In Brahmanism and Buddhism, the working out of good and evil actions into their necessary consequence of happiness and misery is the very key to the philosophy of life, whether life's successive transmigrations be in animal or human, or demon births on earth, or in luxurious heaven-palaces of gold and jewels, or in the agonizing hells where Oriental fancy riots in the hideous inventory of torture."

(*Addis & Arnold.*) The existence of a purgatory was defined by the Councils of Florence (1438-9) and Trent. At the latter council (sess. xxv., Dec. 3, 4, 1563) it was declared that the "souls in Purgatory are assisted by the suffrages of the faithful, and especially by the Sacrifice of the altar." Beyond this nothing is defined, and the same decree enjoins bishops "to abstain from difficult and subtle questions" in their discourses on the subject, and prohibits curious inquiries, superstitious practices, and the making of purgatory a source of gain as "scandals and stumbling-blocks to the faithful."

3. *Anglican:* Art. xxii. treats of Purgatory, and most Protestants consider that it denies Scriptural evidence for the existence of such a place. High Churchmen, on the contrary, hold that the Anglican Church has no authoritative teaching on the point, and that the article is rather directed against an erroneous view of the Roman doctrine than that doctrine itself. Prayers for the dead—the natural outcome of the doctrine of purgatory—are in many instances offered privately by her members, and in some few instances publicly requested in her churches.

1. **Ord. Lang. & Chem.**: The apparently spontaneous decomposition of organic substances, especially those rich in nitrogen. It differs from fermentation (q. v.) in being accompanied by the evolution of fetid and noxious gases. In the process of putrefaction, organic bodies of a higher order are changed, sometimes into lower organic compounds, sometimes into inorganic compounds, as ammonia, sulphuretted hydrogen, &c., and sometimes into simple substances, as hydrogen and nitrogen. Putrefaction may be prevented, or its further progress arrested, by various means:

(1) By keeping the substance in a vacuum, or in a vessel containing air which has been deprived of all organic germs.

(2) By freeing from moisture and keeping perfectly dry.

(3) By keeping the substance in an atmosphere a few degrees above 0°.

(4) By heating to the boiling point, and hermetically sealing.

(5) By the use of antiseptics, as salicylic acid, &c.

From experiments made by Pasteur and others, it appears that putrefaction only takes place when a body comes in contact with living germs. (Used also figuratively.)

1. **Egyptian Antiquities**: A solid structure substantially invariable in form, viz., a simple mass resting on a square or sometimes approximately square base, with the sides facing with slight deviations toward the four principal winds, and tapering off gradually toward the top to a point or to a flat surface, as a substitute for an apex. The proportion of the base to the height is not always the same, nor is the angle of inclination uniform. The pyramids were constructed in platforms, and then revêted or coated with blocks or slabs of granite, as may still be observed in incomplete pyramids. Recently the theory has been maintained that in the case of the largest pyramids, a smaller one was erected as a nucleus, and subsequently enveloped by another layer. The interior of these massive structures contains narrow passages, and some totally dark halls or chambers, and probably served as the burial-places of the kings who had caused them to be constructed. The entrance to these buildings is raised considerably above the level of the base, and was blocked up by a portcullis of granite, so as to be on ordinary occasions inaccessible. In the pyramid of Cheops, the entrance is raised about 47 ft. 6 in. above the base. The pyramids of Egypt begin immediately south of Cairo, and continue southward at varying intervals for nearly seventy miles. The largest is that of Cheops, at Ghizeh, standing on a base each side of which was originally 764 feet long, but owing to the removal of the coating is now only 746 feet. Its perpendicular height, according to Wilkinson, was originally 480 ft. 9 in., present height, 460 ft. The principal chamber, the so-called Crowning Hall or King's Chamber, is 34 ft. 3 in. long, and 17 ft. 1 in. wide. Its roof is formed of massive blocks of granite, over which, with a view to support the weight, other blocks are laid, with clear intervals between. According to Herodotus, the erection of this pyramid employed 100,000 men for twenty years.

2. **Mexican**: The Teocallis, or Houses of the gods, which have come down from Aztec times, are four-sided pyramids rising by terraces to a considerable height. A group of such erections still exists at Teotihuacan, about twenty miles northeast of

the city of Mexico. There are two large pyramids, with some hundred smaller ones. The base of the largest is 900 feet long, its height 160 feet; the height of the second is 130 feet. One is dedicated to the sun, the other to the moon. A yet larger one is at Cholula; its base is 1,488 feet long, its height 178 feet. All the Mexican pyramids face the cardinal points.

3. Hence, applied to any mass or heap more or less resembling a pyramid in form.

Heap with a rising pyramid the plain."  
*Pope: Homer's Iliad*, xxiii.

4. **Anat.**: A conical bony eminence in the anterior wall of the tympanum of the ear. Also that portion of the *medulla oblongata* forming the floor of the fourth ventricle of the brain; two conical eminences known as the posterior pyramids, the *corpora pyramidalia*, leading to the *pons Varolii*, being the anterior pyramids.

5. **Geom.**: A polyhedron bounded by a polygon, having any number of sides, called the base, and by triangles meeting in a common point, called the vertex. Pyramids take different names according to the natures of their bases. They may be triangular, quadrangular, &c., according as their bases are triangles, quadrilaterals, pentagons, &c. The base and lateral triangles are called faces; the lines in which the faces meet are called edges; the points in which the edges meet are called vertices of the pyramid. A right pyramid is one whose base is a regular polygon, and in which a perpendicular let fall from the vertex upon the base, passes through its center. The regular pyramid is a pyramid bounded by four equilateral triangles. It is called the tetrahedron.

The most improved form of this apparatus consists of a tube six inches in length and about half an inch in diameter, provided at its lower extremity with a screw-cap and a small support. At the other end there is a bent rod, to which the drawing point is fixed by means of a screw. For the formation of the combustible gas and the heating of the rod, sulphuric ether is employed. This liquid, like benzine, is quite inflammable, and care must be taken not to pour it out near a flame. In a closed receptacle it is safe enough. After the flame has been regulated it is possible to work for two consecutive hours at an expense of a cent for ether. The vapors disengage themselves constantly and feed the small flame, which is barely perceptible. The heat is always uniform, and even on leather a sure and sharp execution of the design is possible. The finest and most delicate lines can be drawn, and there is no danger of burning holes in the material. As the left hand is free, the object to be ornamented can be turned in any position while the work is in progress.

**p̄r-ōm-ēt-ēr, s.** [Pref. *pyro-*, and Eng. *meter* (q. v.).] A term originally applied to an instrument in the form of a single metallic bar, employed by Muschenbroek about 1730, to indicate temperatures above the boiling point of mercury, 660° Fahr. It is now applied to any instrument used for such purpose. The first which came into extensive use was that of Wedgwood, about 1780; it was devised and used by him for testing the heat of his pottery and porcelain kilns. No fewer than eleven different modes have been proposed or actually employed for measuring high temperatures: (1) By contraction of clay on exposure to heat, as in Wedgwood's; (2) by expansion of bars of different metals; (3) by change of pressure in confined gases; (4) by the amount of heat imparted to a cold mass; (5) by the fusing-point of solids; (6) by conduction and radiation of heat, depending upon observations with thermometers of moderate range at relative distances [PYROSCOPE]; (7) by color, as red and white heat; (8) by change in velocity of sounds depending on the change of pitch in musical notes; (9) by resolution of chemical compounds; (10) by generation of electricity, as in Becquerel's thermo-electric pyrometer; (11) by change in resistance to electricity, as in Siemens' pyrometer, which depends on the increased resistance offered by an iron or platinum wire to the passage of electricity. Of all these, the third (M. Lamy's), depending on the measurement of the tension of carbonic-acid gas developed from marble when heated, and the last, are considered the best.

¶ Tremeschini's pyrometer is founded on the expansion of a thin plate of platinum, heated by a mass of metal previously raised to the temperature of the medium. The Trampler pyrometer is based upon the difference in the coefficients of dilatation for iron and graphite; the Gauntlet pyrometer on the difference of those of iron and fire-clay. The Ducomet pyrometer consists of a series of rings made of alloys which have slightly different melting points. [THALPOTASIMETER.] In pyrometers on the Watertype principle, the temperature is determined by noting the amount of heat communicated to a current of water of known temperature which is kept circulating in the medium to be observed.

*Philos., Astron., &c.*: The system of belief attributed to Pythagoras, born in Samos about 540 B. C., his mother being a Samian and his father, it is believed, a Phœnician. After traveling in Egypt, Persia, &c., in quest of knowledge, he settled in Croton, in the south of Italy, ultimately founding a society constituting at once a philosophical school, a religious brotherhood, and a political association of aristocratic sympathies. He died about 504. He never committed his system to writing. This was first done by Philolaus, one of his disciples. Pythagoras is said to have regarded numbers as the essence or principle of things, the elements out of which the universe was made, and attributed to them a true and independent existence. The principles of numbers were contrasted, as a straight line and a curve, an even and an odd, all traceable back to a monad in which both an even and an odd were included. The world was a breathing being. There were five elements, fire, air, water, earth, and one unnamed. In the central part of the

universe was a fire, around which the sun, moon, and planets, with the celestial sphere itself, revolved. These were either themselves gods, or had their movements directed by gods. There existed a music of the spheres, the celestial bodies dancing a choral dance around the central fire. The soul of man was an emanation from the universal soul of the world. There was a transmigration of souls. Flesh and beans were not to be eaten. Nature was in uniformity with the will of the Deity, and human life should make an approach to the harmony of Nature. The Pythagorean system declined about B. C. 300, but revived two centuries later, and in the Augustan age the views of its advocates as to the past changes which the earth had undergone through the operation of fire, water, &c. (*Ovid: Metamorph.*, bk. xv.), were essentially so sound as to excite the commendation of Sir Charles Lyell. (*Princip. of Geol.*, bk. i., ch. i.)

THE seventeenth letter and the thirteenth consonant of the English alphabet, a consonant having only one sound, that of *k* or *c*. It is always followed by *u*, and since this combination can be represented by *kw* (or *k* when the *u* is silent), *q* is a superfluous letter. In Latin, as in English, *q* was always followed by *u*. *Q* did not occur in the Anglo-Saxon alphabet, its sound being represented by *cw* or *cu*, as *cwic*=Eng. *quick*, *cwén*=Eng. *queen*, *cweian*=Eng. *quau*, &c. For *qu* in English the Dutch use *kw*, the Germans *qu*, the Swedes and Danes *qv*. *Q* is most commonly found as an initial letter; it never ends a word. The name of the letter is said to be from Fr. *queue*=a tail, the form being that of an *O* with a tail to it.

I. *As an initial*: *Q* represents the Latin *Quintus* in inscriptions or literature; in geometry, &c., it represents the Latin *quod* (=which), as *Q. E. D.*=*quod erat demonstrandum*=which was to be shown or proved; *Q. E. F.*=*quod erat faciendum*=which was to be done, abbreviations frequently written at the end of a theorem or problem respectively.

"The *quadrature* of the circle is a famous problem, which has probably been the subject of more discussion and research than any other problem within the whole range of mathematical science. The area of the circle being equal to a rectangle described upon the radius and half of the circumference, it follows that the *quadrature* would be possible if an algebraic expression, with a finite number of terms, could be found for the length of the circumference. Hence, the problem is reduced to finding such an expression, or to finding an exact expression in algebraic terms for the ratio of the diameter to the circumference. No such expression has yet been found, and it is by no means probable that such an expression will ever be found. The problem may safely be classed with the problems for the geometrical trisection of an angle, the duplication of the cube, &c., all of which are now regarded as beyond the power of exact geometrical construction."—*Davies & Peck: Math. Dictionary*.

"If we accept, with Prof. Owen [*Anat. Vert.*, ii. 553], as the definition of the word 'foot,' 'an extremity in which the hallux forms the fulcrum in standing or walking,' then man alone has a pair of feet. But, anatomically, the foot of apes agrees far more with the foot of man than with his hand, and similarly the ape's hand resembles man's hand, and differs from his foot. Even estimated physiologically, or according to use, the hand throughout the whole order [Primates] remains the prehensile organ *par excellence*, while the predominant function of the foot, however prehensile it be, is constantly locomotive. No miser is rich, are Universal propositions, and their subjects are therefore said to be distributed, being understood to stand, each, for the whole of its Significates; but, Some islands are fertile.
