*Nat. Science*: A system of classification published by Macleay in his *Horæ Entomologicæ* (1819-21), applied by Vigors to ornithology in 1823 (*Trans. Linn. Soc.*, xiv. 395-517), and modified by Swainson (*Geog. & Class. Anim.* (1835), 224, 225.):

1. Every natural series of beings, in its progress from a given point, either actually returns, or evinces a tendency to return, again to that point, thereby forming a circle.

2. The primary circular divisions of every group are three actually, or five apparently.

3. The contents of such a group are symbolically (or analogically) represented by the contents of all other circles in the animal kingdom.

4. These primary divisions of every group are characterized by definite peculiarities of form, structure, and economy which, under diversified modifications, are uniform throughout the animal kingdom, and are therefore to be regarded as the primary types of nature.

5. The different ranks or degrees of circular groups exhibited in the animal kingdom are nine in number, each being involved within the other.

Fleming (*Quart. Rev.*, xli. 302-27) pointed out the fallacies of the system, and Rennie (*Montagu's Ornithol. Dict.*) attacked it, more especially in its application to ornithology. It is now deservedly exploded.

**quīnic-acid, s.**

*Chem.*:  $C_6H_7(OH)_4COOH$ . Kinic acid. A monobasic acid found in cinchona bark, bilberry plant, coffee beans, and the leaves of several plants. It is obtained from cinchona by adding milk of lime to an acid decoction of the bark, evaporating the liquid portion to a syrup, submitting the calcium quinate which separates to recrystallization, and exactly decomposing a solution of the salt with oxalic acid. The acid crystallizes in colorless monoclinic prisms, which melt at 161°, and have a specific gravity=1.63. It exerts a left-handed action on polarized light, dissolves in 2½ parts of cold water, is slightly soluble in strong alcohol, nearly insoluble in ether. Distilled with sulphuric acid and peroxide of manganese, it yields crystals of quinone. This reaction is very delicate. The salts of quinic acid are neutral, and for the most part crystallizable; soluble in water, insoluble in strong alcohol. *Quinate of calcium*  $C_6H_7(OH)_4COO Ca'' + 10H_2O$ , found in cinchona bark, and is formed by adding calcium chloride to an alkaline quinate. It crystallizes in rhomboidal plates, easily splitting into laminae, dissolves in six parts of water at 16°, and is nearly insoluble in alcohol.

**quīn-ī-dine, s.** [CONCHININE.]

**quī-nine, s.** [Fr., from Sp. *quinina*, from Peruv. *quina*=Peruvian-bark.]

*Chem.*:  $C_{20}H_{24}N_2O_2$ . Chinin. Quinia. The most important alkaloid of the true cinchona barks, first obtained, but in an impure state, by Gomez, of Lisbon, in 1811. [CINCHONA-BARK, CINCHONABASES.] It is permanent in the air, inodorous, and very bitter; almost insoluble in water, but soluble in absolute alcohol, ether, and chloroform. From its alcoholic solution it crystallizes in prisms, having the composition  $C_{20}H_{24}N_2O_2 + 3H_2O$ , and fusing at 75°. It exerts a strong levorotary action on polarized light, and is a powerful base, neutralizing acids completely, and forming easily crystallizable salts, which are very bitter and less soluble in water than the salts of the other cinchona alkaloids. Solutions of quinine in dilute sulphuric acid exhibit a blue fluorescence, and this is observable in solutions containing much less than one part in 200,000 parts of water.

**quīn-ine-sulphates, s. pl.**

*Chem.*: The neutral or common medicinal sulphate,  $2C_{20}H_{24}N_2O_2 \cdot H_2SO_4 + 8H_2O$ , is prepared by neutralizing quinine with dilute sulphuric acid. It crystallizes in long flexible monoclinic needles, having a nacreous aspect, almost insoluble in cold water, but soluble in boiling water, in alcohol, and in dilute sulphuric acid; insoluble in ether, chloroform, and petroleum spirit. The solution of quinine sulphate in water, acidulated with sulphuric acid, exhibits a powerful blue fluorescence, and turns the plane of polarization of a ray of light strongly

to the left, (a)j=255°6. In commerce it is frequently found mixed with cinchonidine or cinchonine. This may be due either to actual adulteration, or to an imperfect mode of preparation. The acid salt or soluble sulphate,  $C_{20}H_{24}N_2O_2 \cdot H_2SO_4 + 7H_2O$ , separates from a solution of quinine in excess of sulphuric acid. It crystallizes in rectangular prisms, soluble in water and in alcohol. Quinine sulphate is largely employed as a febrifuge and tonic, and it possesses powerful antiseptic properties.

(See extract.)

"The *quipu* is a near relation of the rosary and the wampum-string. It consists of a cord with knots tied in it for the purpose of recalling or suggesting something to the mind. When a farmer's daughter ties a knot in her handkerchief to remember a commission at market by, she makes a rudimentary *quipu*. . . . Von Tschudi describes them as consisting of a thick main cord, with thinner cords tied on to it at certain distances, in which the knots are tied. The length of the *quipus* varies much, the main trunk being often many ells long, sometimes only a single foot, the branches seldom more than two feet, and usually much less. . . . The cords are often of various colors, each with its own proper meaning: red for soldiers, yellow for gold, white for silver, green for corn, and so on. This knot-writing was especially suited for reckonings and statistical tables; a single knot meant ten, a double one a hundred, a triple one a thousand, two singles side by side twenty, two doubles two hundred. The distances from the main cord were of great importance, as was the sequence of the branches, for the principal objects were placed on the first branches and near the trunk, and so in decreasing order. This art of reckoning . . . is still in use among the herdsmen of the Puna."—*Taylor: Early Hist. Mankind* (ed. 1878), pp. 154-156.

**Jewish Hist. & Lit.:** Rabbi (Heb. *rabbi*, Greek *rabbi*) is the noun *Rab* with the pronominal suffix, and in Biblical Hebrew=a great man, distinguished for age, rank, office, or skill (Job xxxii. 9; Dan. i. 3; Prov. xxvi. 10), where, however, it only occurs without the suffix. In post-Biblical Hebrew it is used as a title indicating sundry degrees by its several terminations. Thus, the simple term *Rab*=teacher, master, and was the title which Babylonian Jews gave to a doctor of the law. *Rabbi* (=my master), which is the same with the pronominal suffix first person singular, is the Palestinian title, and is the one so frequently given to Christ (cf. Matt. xxiii. 7, 8; xxvi. 25, 49, &c.). *Rabbon*, which is the same term with the pronominal suffix

first person plural (=our teacher, our master), is the Aramaic form of it, and is the highest degree. This form, however, is also used as a noun absolute, the plural of which is *Rabbonin* and *Rabbonim*. *Rabboni*=our master, the title given to Christ in Mark, which is spelled *Rabbouni* in John xx. 16, is the form of the title with the suffix first person plural. This title was conferred when three authorized Rabbins called a student Rabbi, which invested him with the right to administer the penal law.

It probably had its home in the western portion of the Mediterranean basin, but has spread over western Europe, Britain, Ireland, Australia, New Zealand and America. The rabbit is smaller than the hare (q. v.); its muzzle is slenderer, and the palate larger and narrower. The ears and feet are shorter, the former with a smaller black tip (in some cases it is entirely absent), and the general color is grayer. They begin to breed at six months old, and have several litters in each year. The young—usually from five to eight in number—are born blind and naked, and are produced in a separate burrow. Domesticated rabbits have been greatly modified by the skill of the breeder; they have increased in size and vary in color, albinos being very common, and forming a separate race. Rabbits form an important article of food.

THE eighteenth letter and the fourteenth consonant of the English language, is classed as a semi-vowel and a liquid. It is also called a trill. It is generally considered to have two sounds: The first, when it begins a word or syllable, and when it is preceded by a consonant, being then produced by an expulsion of vocalized breath, the tongue almost

touching the palate or gum near the front teeth, with a greater or less tremulous motion, as in *ran*, *tree*, *morose*, &c.; the second, less decidedly consonantal, heard at the end of words and syllables, and when it is followed by a consonant, being formed by a vibration of the lower part of the tongue, near the root, against the soft palate, as in *her*, *star*, *beard*, &c. With many English speakers *r* when followed by a consonant at the end of a syllable is scarcely heard as a separate, distinct sound, but has merely the effect of lengthening the preceding vowel, becoming in such cases a vowel, rather than a consonant. In Scotch and some dialects, *r* has always the same sound, being uttered with a strong vibration of the tongue, but less guttural than in French or German. By the Romans *r* was called the "dogs' letter" (*litera canina*), from its sound resembling the snarling of dogs. In words derived from the Greek we follow the custom of the Romans, who represented the aspirated sound with which *r* was pronounced by the Greeks, by *rh*, as in *rhapsody*, *rhetoric*, &c. In such words, however, the *h* has no influence on the pronunciation of the English word, and is, therefore, entirely superfluous. *R* and *l* are frequently interchanged (see remarks under *L*). They also sometimes change places. *R* sometimes represents a more original *s*, as in *ear*=Goth. *auso*; *iron*=O. Eng. *isen*, *iren*=Goth. *eisarn*. It has disappeared from some words, as *speak*=A. S. *spræcan*; *pin*=A. S. *preon*; *palsy*=Mid. Eng. *parlesie*, Fr. *paralysie*, Greek *paralysis*; *cockade*=O. Fr. *cocart*, &c. *R* has intruded itself into several words to which it does not properly belong, as *groom* (bridgroom)=A. S. *guma*; *hoarse*=A. S. *hōs*; *partridge*=Fr. *perdriz*, Latin *perdix*; *cartridge*=Fr. *cartouche*; *culprit*, from Lat. *culpa*; *corporal*=Fr. *caporal*. In *celery* it represents an original *n*, Gr. *selinon*.

*râil-wây*, *s.* [Eng. *rail* (3), *s.*, and *way*.]

1. A way or road provided with rails of iron or steel, upon which the wheels of the cars run in order to lessen the friction. The "rails" were originally of timber, laid straight and parallel upon transverse sleepers, and secured with pegs of wood, the sleepers being imbedded in the material of the roadway; the wheels had flanges on one side of the periphery, to confine them to the track. The roadway was scantling, five by seven, pegged down to oak sleepers, four by eight, six feet long, and laid two and a half feet apart. The track for the horses was filled in with ashes above the sleepers. Such roads were first laid near Newcastle in 1602. About 1716, the wooden ways were capped with thin plates of malleable iron, having flanges along one side. Cast-iron bars were substituted in 1767. The modern railway consists of one or more series of iron or steel rails [*RAIL* (3), *s.*, II. 3.], laid parallel and continuously at a certain distance or width from each other, called the gauge. [*GAUGE*, *s.*, II. 7.] One pair of parallel rails constitutes a single track of railway, two pairs a double track, and so on. The first railway opened in England was that from Stockton to Darlington (Sept. 25, 1825), the second that from Liverpool to Manchester (Sept. 15, 1830). Railway development in the United States has had to adapt itself to the needs of a new and rapidly growing country, a large part of which was first made available for settlement by railways. Three locomotives were imported from England in 1829, and the first trial in America took place on August 8, 1829, at Honesdale, Penn. The first railway constructed to be worked by locomotives was the South Carolina Railroad (1826-30), though trials of an experimental locomotive had been made before on the Baltimore and Ohio Railroad, which continued to be worked by horse-power until 1832. The mileage of railway construction about kept pace with that of Great Britain until 1850; at the beginning of 1885 it amounted to 125,379 miles. The mileage completed amounted to 40 miles at the end of 1830, to 3,361 miles in 1841, and to 5,206 miles in 1847, of which 1,350 miles had been opened within six years. Then there was a sudden and great increase, the yearly additions for seven years being 1,056 miles in 1848, 1,048 in 1849, 1,261 in 1850, 1,274 in 1851, 2,288 in 1852, 2,170 in 1853, 3,442 miles in 1854. The civil war checked railway construction, only 3,257 miles being opened during the five years ending with 1865, when the aggregate amounted to 32,996 miles. Between 1865 and 1873, the mileage increased more than 100 per cent. including one road in operation and a second line in progress of construction to the Pacific coast. The greatest increase of this period was in the western and southwestern States, in which fully 25,000 miles of trackage were made ready for traffic. At the close of 1873 the total capital invested in railroads of the United States aggregated \$3,784,543,034 of which \$1,836,904,450 represented the bonded indebtedness. The depression which followed the panic of that year continued until 1879. In the latter year the construction again increased 100 per cent., and between 1874 and 1888, there were built 85,814 miles of new railroad. Since the revival of railroad construction in 1879

there have been completed sufficient miles of road to give a total length of 221,629 miles. This does not include the elevated steam and electric railroads in the various large cities or the country. A railway, as a general rule, is carried in as straight a line from point to point as the nature of the country and the necessities of local and intermediate traffic will allow. It is carried over valleys by embankments or viaducts, over rivers and roads by bridges, and through hills or elevated ground by deep trenches, technically called cuttings, or by tunnels. When the material excavated is insufficient for the embankments, recourse is had to side cuttings, that is, to widening the cuttings, so as to obtain extra material to supply the deficiency. A perfect railway would be one laid on a level line, but as this is not always possible owing to the inequalities in the country traversed, or the difference of levels of the places to be connected, the line follows the level of the country traversed, rising and falling according to circumstances. These slopes or inclines of the line are called its gradients, and the whole arrangement of inclines is called the grading of the line. The way or track of the railway is laid with clean gravel or broken stones, called ballast, and in this the sleepers are laid transversely. [*SLEEPER*.] The rails on English railways are, in most instances, supported at short intervals by cast-iron frames, called chairs, which are fastened firmly by spikes to the sleepers, and in which the rails are firmly secured by wooden blocks, called keys. [*CHAIR*, *s.*, A. II. 4; *KEY* (3), *s.*, II. 6.] Where flange-rails are used there are no chairs, the rails being attached direct to the sleepers. Transverse sleepers are laid at a distance of from two feet six inches to three feet from center to center. The rails are joined at their extremities generally by fish-joints (q. v.). In order to allow trains to pass each other, or to pass from one line to another, sidings and junctions are constructed. Sidings are generally used for freight cars or trains to remain in temporarily while being loaded or unloaded, or while another train is allowed to pass on the line of rails on which the first train is proceeding. The change from one line of rails to another at a junction is effected by means of points or switches (q. v.), and the process of turning a train into a siding or from one line to another is termed shunting (q. v.), or switching. When a railway is thus completed, the work is called the permanent way (q. v.). The extremities of a railway are called its termini [*TERMINUS*], and the various places, provided with offices, &c., along the line where trains stop for passengers or freight are termed stations or depots. The motive power usually employed on railways in drawing the trains is steam. [*MOTIVE*.] Attempts have also been made, but not very successfully, to utilize atmospheric pressure as a motive power. [*ATMOSPHERIC-RAILWAY*.] In a few other cases a fixed engine is employed to draw the carriages, &c., along by means of an endless rope running over pulleys, or of one which winds and unwinds on a cylinder. Such engines are known as stationary engines, and the system, which is in very successful operation, is known as the "cable system." Electricity is also employed as a motive power on many short lines. [*ELECTRIC-RAILWAY*.]

\*2. *Fig.*: A shower or pouring down of anything.

II. *Technically*:

1. *Meteor.*: The fall of water in drops from the clouds, or the drops which fall. A cloud consists of aqueous vapor, the individual vesicles of which are very small. When by the constant condensation of fresh aqueous vapor these vesicles become large and heavy, and several of them unite, they are unable to resist the action of gravity and fall as rain.

2. *Geology*: The direct action of rain, as distinguished from its indirect one in creating streams, rivers, &c., is a potent aqueous cause. In many places, however, its effect is much diminished by the protective influence over the soil exerted by the vegetation (*Lyell: Princ.*, ch. xlv.) Penetrating into crevices of rocks, it is frozen and splits them. [*ICE*.] Moreover, in passing through the atmosphere, it absorbs a considerable amount of carbon dioxide, which enables it to transform the carbonate of lime in limestone rocks into the soluble bicarbonate, and ultimately waste them away; it acts also on feldspar, &c.

It feeds on animal substances. Gosse says (*Birds of Jamaica*, p. 275), "I have found in various individuals, locusts, Phasmata, spiders, Phryni, a whole mouse, caterpillars, &c." It is sometimes also called Tom Fool, from its silly habit of gratifying its curiosity instead of securing its safety. The rain collected in the bottle is measured in a glass jar having one-tenth the area of the funnel, and graduated so that a rainfall of one-tenth of an inch collected by the funnel is measured by one inch on the side of the vessel. The stand should be placed at a sufficient distance from any buildings, &c., to prevent their affecting the amount falling into the funnel.

**A. As substantive:**

1. *Meteor.*: A luminous bow or arch appearing in the clouds opposite to the sun when they are resolved into rain. Theoretically several bows may co-exist; generally, however, there is but one. Sometimes there are two, very rarely three or even four—the largest number authentically on record. Every rainbow exhibits the prismatic colors. When there are two bows, the lower, or primary, is very bright, and has the red highest; the outer, or secondary, is more faint, and has the violet the highest color. They are produced chiefly by the refraction and dispersion of the light in passing through the raindrops, partly also by its reflection from the back of the drops, without which the appearances would not reach the eye. The secondary bow ceases to be visible when the sun is 54° above the horizon.

2. *Ornith.*: The genus *Diphlogena*, containing two of the most brilliantly plumaged Humming-birds. The bill is straight and very long, the tail deeply forked. The sexes are so different that for a long while the female of *Diphlogena iris* was considered to be a distinct species. Two species are known, *D. iris* from Bolivia, and *D. hesperus* from Ecuador.

The former is a small, lightly-built animal, about seven inches long, with a slender head, large ears, and a thin scaly tail, longer than the body. In temperate climates the color is a bluish-black lighter on the belly. This species is represented in warmer climates by the Alexandrian Rat (*M. alexandrinus*, Geoff., better known as *M. rattus rufescens*, see *Proc. Zoöl. Soc.*, 1886, p. 57), with a gray or reddish back, and white under-surface. By later naturalists it is considered as only a variety. The albino and pied rats, kept as pets, also belong to this species, which had its home in India, and penetrated thence to almost every part of the world, driving out the native rats, and to be, in its turn, exterminated by the Brown Rat (probably a native of China, where a similar species, *M. humilatus*, is still found). The Brown Rat is much more heavily built than the Black Rat, grayish-brown above and white beneath; ears, feet, and tail flesh-colored. Melanism often occurs, but such animals may be readily distinguished by ordinary specific differences from the true Black Rat. Length of head and body eight or nine inches long, tail shorter. Both the species are omnivorous, predaceous, and extremely fecund, breeding four or five times in the year, the female producing from four to ten blind, naked young, which breed in their turn at about six months old. *M. fuscipes* is the Brown-footed Rat of Australia; *Nesokia bandicota*, the Bandicoot, or Pig-rat; and *N. bengalensis* the Indian Field Rat. **II. Technically:**

1. *Horol.*: The daily gain or loss of a chronometer or other timepiece in seconds and fractions of a second.

2. *Navy*: The order, rank, or class of a ship according to its magnitude or fighting power. Formerly ships of war were rated according to the number of guns carried by them. The first rate was from 100 guns upward, the second from 90 to 100 guns, the third from 80 to 84 guns, the fourth from 60 to 74 guns, and the fifth rate 32 to 40 guns; the sixth rate included the smallest armaments.

This has been altered since the introduction of iron-clads, which are rated according to construction and strength of armament and armor. Formerly United States naval vessels were rated according to their tonnage. Thus, ships of 3,000 tons and upward were first rates, 2,000 to 3,000 tons second rates, 800 to 2,000, or ironclads from 1,200 to 2000, third rates, under 800 tons, or ironclads under 1,200, fourth rates; latterly they are rated according to displacement.

Two species are usually distinguished, *Mellivora indica*, the Indian, and *M. ratel*, the Cape Ratel; some authors give specific distinction to the West African race, as *M. leuconota*. The body is stout and heavily built, legs short and strong, with long curved fossorial claws, tail short, ear-conches rudimentary. General coloration iron-gray on the upper, and black on the lower surface, reversing the general plan of coloration, which is generally lighter on the under surface. A marked white stripe divides the gray of the upper parts from the black in the Cape Ratel, which is said to live principally on honey. Jerdon (*Mammals of India*, p. 79) says that *M. indica*, which he calls the Indian badger, is found throughout India, living usually in pairs, and eating rats, birds, frogs, white ants, and various insects; and in the north of India, where it is accused of digging out dead bodies, it is popularly known as the Grave-digger. It doubtless also, like its Cape congener, occasionally partakes of honey, and is often very destructive to poultry. In confinement it is quiet, and will eat fruits, rice, &c.

\*I. *Ord. Lang.*: Reason, cause.

II. *Technically*:

1. *Law*: An account; a cause, or the giving judgment therein.

2. *Mathematics*:

(1) The measure of the relation which one quantity bears to another of the same kind; that is, it is the number of times that one quantity contains another regarded as a standard. This is found by dividing the one by the other. The quotient or ratio thus obtained is the proper measure of the relation of the two quantities. Some writers define the ratio of one quantity to another as the quotient of the first quantity divided by the second, while others define it as the quotient of the second divided by the first. Thus, the ratio of 2 to 4, or of *a* to *b*, may be taken either as 2+4 or 4+2, and *a*+*b* or *b*+*a*. In every ratio there are two quantities compared, one of which is supposed known, and is assumed as a standard; the other is to be determined in terms of this standard. These quantities are called terms of the ratio; the first one, or that which is antecedently known, is called the antecedent, and that whose value is to be measured by the antecedent, is called the consequent. Ratios are compared by comparing the fractions; thus, the ratio of 8:5 is compared with the ratio of 9:6, by comparing the fractions  $\frac{8}{5}$  and  $\frac{9}{6}$ ; these fractions are respectively equal to  $\frac{16}{10}$  and  $\frac{15}{10}$ , and since  $\frac{16}{10}$  is greater than  $\frac{15}{10}$ , the ratio of 8:5 is greater than that of 9:6. Ratios are compounded together by multiplying their antecedents together for a new antecedent, and their consequents together for a new consequent; thus, the ratio of *a*:*b*, compounded with that of *c*:*d*, is *ac*:*bd*. Proportion is the relation of equality subsisting between two ratios. [PROPORTION, *s.*]

(2) A name sometimes given to the Rule of Three in Arithmetic.

¶ (1) *Compound ratio*:

(a) [COMPOUND, *a.*]

(b) When one quantity is connected with two others in such a manner that if the first is increased or diminished, the product of the other two is increased or diminished in the same proportion, then the first quantity is said to be in the compound ratio of the other two.

(2) *Direct ratio*: Two quantities are said to be in direct ratio when they both increase or decrease together, and in such a manner that their ratio is constant.

(3) *Duplicate ratio*: When three quantities are in continued proportion, the first is said to have to the third the duplicate ratio of that which it has to the second, or the first is to the third as the square of the first to the square of the second.

(4) *Inverse ratio*: Two quantities or magnitudes are said to be in inverse ratio, when if the one increases the other necessarily decreases, and, *vice versa*, when the one decreases the other increases.

(5) *Mixed ratio*: [MIXED.]

(6) *Prime and ultimate ratios*: A method of analysis, devised and first successfully employed by Newton in his *Principia*. It is an extension and simplification of the method known among the ancients as the method of exhaustions. To conceive the idea of this method, let us suppose two variable quantities constantly approaching each other

in value, so that their ratio continually approaches 1, and at last differs from 1 by less than any assignable quantity; then is the ultimate ratio of the two quantities equal to 1. In general when two variable quantities simultaneously approach two other quantities, which, under the same circumstances, remain fixed in value, the ultimate ratio of the variable quantities is the same as the ratio of the quantities whose values remain fixed. They are called prime or ultimate ratios, according as the ratio of the variable quantities is receding from or approaching to the ratio of the limits. This method of analysis is generally called the method of limits.

(7) *Extreme and mean ratio*: [EXTREME.]

(8) *Composition of ratios*: The act of compounding ratios. [COMPOUND-RATIO.]

(9) *Ratio of a geometrical progression*: The constant quantity by which each term is multiplied to produce the succeeding one. To find the ratio of a given progression, divide any term by the preceding one.

(10) *Ratio of exchange*: A phrase used in Political Economy to denote the proportion in which a quantity of one commodity exchanges for a given quantity of another. The expression can never be used with any degree of accuracy, except in those cases where the commodities are homogeneous in quality, and susceptible of weight or measurement, as in the exchange of gold for silver, copper, iron, &c., or that of wheat for barley, oats, &c. (*Bithell.*)

**rā-tion-al-izm, s.** [Fr. *rationalisme*.]

*Theol.*: A system which makes reason the supreme arbiter in all matters connected with the Bible and the Christian religion, and which refuses to accept any doctrine or professedly historical statement to which reason believes that it has grounds for taking exception. Isolated cases of rationalism, or an approach to it, have frequently appeared in the Church; as, for instance, in the case of Theodore, Bishop of Mopsuestia, 329-428; but as a system it first became prominent in Germany in the latter half of the eighteenth century. In 1754 Hermann Reimarus of Hamburg privately circulated among his friends some rationalistic writings of his. Lessing pretended that he had found them in the Wolfenbüttel library, of which he was librarian, and between 1773 and 1777 published them under the name of the Wolfenbüttel Fragments. They produced a great sensation. John David Michaelis (1717-1791), Johann Semler (1728-1794), and others established a middle path between the extreme views of the Fragmentists and the accepted Protestant orthodoxy, and it was to this intermediate school that the term rationalistic was chiefly applied. The earlier rationalists in large measure confined their new methods of interpretation to the Old Testament; Johann Eichorn (1752-1827) and Heinrich Paulus (1761-1850) extended them to the New. As time advanced, rationalism became more extreme. Its earlier professors generally, accepting the views as to the authorship of the several sacred books traditionally held, considered that they, when rightly understood, narrated true history, but their oriental or poetic language required to be translated into that of ordinary life. For instance, the angel and the flaming sword which prevented our first parents from re-entering paradise really meant the thunder-storms prevalent in the region. The later rationalists mostly deny the accepted authorship of the sacred books, and more sweepingly than their predecessors set their teaching aside. In 1835-6 Dr. David Strauss, in his *Leben Jesu*, resolved the whole evangelical narrative into myth and legend. Rationalism subsequently spread from Germany into other countries. In 1860 appeared the *Essays and Reviews*, by seven clergymen of the English Church, and in 1862 the first part of a *Critical Commentary* on the Pentateuch and the Book of Joshua by Dr. William Colenso, Bishop of Natal, five other parts subsequently appearing. Both these productions led to ecclesiastical prosecutions. In 1863 Ernest Renan published in Paris his *Vie de Jésus*. Though combating the claims of the sacred writers, as a rule, rationalists of all schools speak with respect of them.

They may be divided into two groups: (1) Those in which the wing has a rudimentary or very short humerus, and not more than one unguis phalanx (the Casuariidæ, the fast-vanishing Apterygidæ, and the extinct Dinornithidæ, often treated as one family (Apterygidæ); and (2) those having a long humerus and two unguis phalanges (Rheidæ and Struthionidæ, often combined under the latter name). 2. Zool.: An organ developed in the genus *Crotalus*. The tail terminates in a series of horny rings, varying in number with the age of the individual, as one is added at each sloughing, which occurs more than once in the year. The last (3-8) vertebrae coalesce to form a compressed conical bone, covered by muscle, and thick spongy skin, which secretes the rings in succession, each one being larger than the one secreted before it, as the secreting surface becomes larger. The pieces hang loosely, but securely, together, the basal ring of one joint grasping the projecting second ring of the preceding joint, and so on. The first joint alone has vital connection with the skin of the animal, and, being vibrated by the muscles of the skin, communicates a quivering motion, accompanied by a slight rattling sound, to the dry horny pieces behind it.

"The habit of violently agitating the tail is by no means peculiar to the rattlesnake, but has been observed in other venomous as well as innocuous snakes, with the ordinary termination of the tail, when under the influence of fear or anger. The special object for which the rattle has been developed in these snakes is unknown."—*Encyc. Brit.* (ed. 9th), xx. 293.

răt'-tle-snāke, s. [Eng. rattle, s., and snake.]

Zool.: The English name for any species of the American genus *Crotalus* (q. v.), the tail of which is furnished with a rattle [RATTLE, s., II. 2]. Garman (*Reptiles and Batrachians of North America*) enumerates twelve species and thirteen varieties, falling into two groups: (1) Having the upper side of the head covered with nine dermal shields; (2) having the shields behind the eyes broken up or replaced by small scales. The second group comprises the more formidable kinds, generally described as *Crotalus horridus* and *C. durissus*. The first name was formerly applied to the reptile extending from Paraguay and Chili, through Brazil, into Mexico, and the latter to the North American rattlesnake. In recent American works this nomenclature is reversed. The poison of the Rattlesnake is usually fatal to man, though fortunately they are sluggish, and never attempt to strike unless they are molested. They are widely distributed on the American continent; but advancing cultivation is rapidly thinning their numbers, and the half-wild hogs of the settlers, peccaries, and deer contribute materially to this result. They are far from uniform in coloration: often the ground-color is brownish, sometimes yellow or blackish, with dark spots, frequently bordered with yellow, on the back and sides; head and neck ornamented with dark or black longitudinal bands, or of almost uniform coloration.

*Ornith.*: The genus *Corvus*, and especially *Corvus corax*, one of the largest of the Passerines. It is about twenty-six inches long, plumage black, glossed with steel-blue and purple; very widely distributed in the northern hemisphere. The Raven has played an important part in mythology and folk-lore. It is the first bird mentioned by name in the Old Testament (Gen. viii. 7); by the ministry of ravens Elijah was fed (1 Kings xvii. 6), and they were to be the ministers of vengeance on unruly children (Prov. xxx. 17). The raven was the bird of Odin, and in classic mythology was of ill-omen, a character often attributed to it by the early English dramatists. Marlowe (*Jew of Malta*, ii. 1) calls it the 'sad presageful raven,' and Shakespeare repeatedly refers to the belief that its appearance foreboded misfortune. This belief, which is widespread, probably arose from the preternaturally grave manner of the bird, its sable plumage, and the readiness with which it learns to imitate human speech.

In 1786, Pott, an Englishman, made a machine which had a revolving cylinder, with rows of combs or ripples, which tore off the ears and discharged them into a box (as had been done in Gaul A. D. 70). Six or seven other machines followed in England within the next thirty-six years.

In 1822 a self-sharpening mowing machine was patented in this country. Between 1852 and 1874 nearly three thousand patents for reaping machines were taken out in the United States. Two of the most celebrated are McCormick's, invented about 1831, and improved in 1846, and Wood's reaping and automatic binding machine, first used in 1874. At a competition between three reaping machines, held near Paris, in 1855, the American machine cut an acre in twenty-two minutes, the English in sixty-six minutes, and the Algerian in seventy-two minutes.

1. In the same sense as II. 3.

"The word reason itself is far from being precise in its meaning. In common and popular discourse it denotes that power by which we distinguish truth from falsehood, and right from wrong, and by which we are enabled to combine means for the attainment of particular ends."  
Stewart: *Of the Human Mind*.

2. Due exercise of the reasoning faculty; reasoning; ratiocination; the deduction of consequences from premises; right judgment.

"When she [the soul] rates things, and moves from ground to ground,  
The name of Reason she obtains by this."  
Davies: *Immortality of the Soul*.

3. That which is in accordance with or conformable to right judgment or the principles of the reasoning faculty.

"Thou speakest reason."  
Shakesp.: *Much Ado about Nothing*, v. 1.

4. Hence, specifically:

(1) That which is reasonable, right, just, or fair; that which reason dictates or suggests.

"I shall do that that is reason."  
Shakesp.: *Merry Wives of Windsor*, i. 1.

**II. Technically:**

1. *History:* On November 10, 1793, the French National Convention ordered the worship of the Goddess of Reason. Madame Maillard, selected as such a goddess, was drawn on a splendid car to the cathedral of Notre Dame to receive homage from the multitude. For some time afterward that cathedral was designated the Temple of Reason.

2. *Logic:* The premise or premises of an argument, and especially the minor premise.

3. *Metaph.:* The power of thinking consecutively; the power of passing in mental review all the facts and principles bearing on a subject, and, after a careful consideration of their bearings, drawing conclusions in many cases conformable with truth. Reason, weighing facts, discovers the law of gravitation, calculates eclipses, weighs the planets, ascertains the constituent elements of the sun, and even of more distant worlds. It can exercise itself on the most abstract and spiritual theories, as well as on those of a simpler character. Reid (*Essay* vi, ch. iii.) distinguished between reason and judgment, considering the sphere of the former to be propositions capable of demonstration. Stewart (*Philosophy Human Mind*, pt. ii., Prelim. Observ.) considered the word reason as ambiguous. In common discourse it denotes the power of discriminating truth from falsehood, and right from wrong. To these he adds the power of devising means to accomplish ends; or reason may be limited to the power of distinguishing truth from falsehood; or it may be used of our rational power in general, or of the discursive faculty alone. Brown (*Phil. Hum. Mind*, lect. li.) thinks that there is no faculty of reason, which is nothing more than a series of relative suggestions. Immanuel Kant's *Critique of Pure Reason* appeared 1781. [KANTIAN PHILOSOPHY.] Mill (*Logic*, bk. i., ch. i.) considers reasoning in its extended sense to be synonymous with inference, and divides it into induction, *i. e.*, reasoning from particulars to generals, and ratiocination, reasoning from generals to particulars. Formerly it was believed that of the whole visible creation man alone was capable of reasoning; but Darwin (*Descent of Man*, pt. i., ch. iii.) considers that only a few persons now dispute that animals possess some power of reason. Their actions may be due to instinct or to the association of ideas, the last-named principle being connected with reason.

\* (2) *To do reason* (Fr. *faire raison*): To do satisfaction.

Foot: *The Commissary*, iii. 1.

The sound has nothing of the nature of a cheer. It is a wild, unearthly cross between a screech and a yell that is calculated not only to strike terror to the enemy, but to enthuse and encourage our own soldiers, who, when they have charged within thirty yards of their foe, dash forward from a double-quick to a mad rush, wildly yelling, "Y-Yō-Yō-Wō-Wō," for the triple purpose of encouraging each other and confusing and terrorizing the enemy.

*Naut.*: To take a reef or reefs in; to reduce or contract the extent of a sail by rolling or folding a certain portion of it and making it fast to the yard. Fore-and-aft sails are reefed from the foot, the first reef being the lowest. In the ordinary process of reefing square sails, the seamen ascend the rigging and lie out on the yard, standing on the horses or foot-ropes while they gather in and secure the hauled-up portion of the sail. To obviate the necessity for this dangerous operation, which is a fruitful source of accident, many ships are now furnished with apparatus by which the sails can be reefed from the deck.

"'Reef top-sails, reef!' the master calls again."

reēm, *s.* [Heb. *rēm*, *rēym*, *rēm*; Sept. Gr. *monokerōs*=a unicorn.]

*Scrip. Zool.*: *Bos primigenius*. In the A. V. the influence of the Septuagint has prevailed, and the word is translated unicorn, but erroneously, as the mention of two horns on one reem (Deut. xxxiii. 17) proves. The word unicorn has disappeared from the R. V., wild ox being substituted for it; but in Numb. xxiii. 22, the alternative rendering ox-antelope (*Oryx leucorox*) is given in the margin. Young (*Paraphrase of Job*, 241) transliterates the Hebrew word. [AUROCHS.]

"The identification of the Hebrew *reēm* with the wild ox (*Bos primigenius*) is one of the most certain of all Bible animal names. It rests on philological evidence, for the Assyrian *rimu* clearly denotes this same wild bovine; on pictorial evidence, for the Assyrian monuments depict it admirably; on palæontological evidence, for the bone breccia of the Lebanon has revealed the teeth of this once common wild ox of Palestine and the adjacent countries; on historical evidence as a definite inhabitant of Palestine, for a hunting record of Tiglath-Pileser I. informs us that this monarch slew some of these wild *rimu* 'in the country of the Hittites and at the foot of Lebanon,' the exact spot where its teeth have been discovered; on ideographic evidence, for the Accadian character is a pictorial or hieroglyphic figure of an ox's head, while all the references in the Bible are exactly suited to this large and fierce wild ox."—*W. Houghton*, in *Academy*, April 24, 1886, p. 292.

II. Optics:

1. A device by which the rays proceeding from a luminous or heated object are thrown back or diverted in a given direction. The reflecting surface may be either plane or curved. In practice it is often made spherical or parabolic. The former does not bring the rays to a true focus, but is easily formed, and is consequently generally employed where extreme accuracy is not sought for. A mirror is a familiar example of a plane reflector. The material should be as smooth and highly polished as possible. Sheet-tin is frequently used for common purposes, as for door or hall lamps, or those carried by vehicles, while for other purposes a more perfectly reflecting surface is employed, such as speculum metal or silver protected by glass. Silver is the most perfectly reflecting substance known, absorbing but 9 per cent. of the incident rays, while speculum metal absorbs 37 per cent. Glass itself, owing to its property of totally reflecting incident rays at a low angle, is used in certain cases. Reflectors with parabolic surfaces are employed for throwing the light emanating from objects placed in their foci in parallel straight lines to a great distance, and for converging the heat rays from a distant object, as the sun, to a focus, and also, in connection with eye-glasses, in the reflecting-telescope, which is itself often simply denominated a reflector.

¶ The term mirror is less comprehensive than that of reflector, being usually only applied to such surfaces as afford definite images and colors, while a reflector may not merely be used for throwing back the rays of light and heat, or of heat only, but also the waves of sound.

2. The same as REFLECTING-TELESCOPE (q. v.).

[REFORM (1), v.] The amendment or reformation of that which is corrupt, vicious, defective, or the like; a change from worse to better; a return from a bad to a former good state; amendment, corruption; specifically, a change or amendment in the regulations of parliamentary representation.

"A variety of schemes, founded in visionary and impracticable ideas of *reform*, were suddenly produced."  
*Pitt: Parliamentary Reform, May, 7, 1783.*

**Reform Acts, s. pl.** A term applied to certain acts of the British parliament by which the regulations as to the parliamentary representation of the people were altered, and especially to those of 1832, 1867, and 1884-85. The first two Acts provided both for an extension of the franchise [FRANCHISE] and for a redistribution of seats. The Reform Act of 1832 disfranchised fifty-six rotten boroughs with less than 2,000 inhabitants each, and returning 111 members; thirty boroughs with less than 4,000 inhabitants, and two above that number, lost each a member, and thus 143 seats were obtained for distribution. Forty-three new boroughs were created, twenty-two of which received two members each, and twenty-one one member each. The county members for England and Wales were increased from ninety-five to 159, twenty-six of the large counties being divided, and a third member given to seven important county constituencies. Scotch and Irish Acts followed; the Scotch representation, fixed by the Act of Union at forty-five, was raised to fifty-three (thirty of them given to counties and twenty-three to cities and boroughs), and the Irish members, fixed by the Act of Union at 100, were increased to 105. The Reform Act of 1867 disfranchised eleven small English boroughs, took a member from thirty-five more, and two from Scotch counties, which, with four seats obtained from boroughs disfranchised for corruption, gave fifty-two seats for redistribution. Five of these were given to as many large English and Scotch boroughs on

the three-cornered system (q. v.), and three to Universities, the others to old or new county or borough divisions. Seven members were added to Scotland. There was no redistribution in Ireland. In the third successful effort for Parliamentary Reform, that of 1884-85, the franchise and redistribution of seats constituted two distinct Acts. The Franchise Bill received the royal assent on December 6, 1884, and came into operation on January 1, 1885. It established household and lodger franchise in the counties, introduced a service-franchise (q. v.), diminished, though it did not destroy, *fagot* voting, and made a uniform occupation franchise of £10 rent both in counties and in boroughs in place of the three formerly existing. It left untouched the forty-shilling freeholders of inheritance, and conferred votes on copyholders possessing land of greater value than £5 annually. By the Redistribution Act of 1885, eighty-one English, two Scotch, and twenty-two Irish boroughs were totally disfranchised; thirty-six English and three Irish boroughs each lost a member, as did two English counties; the City of London was reduced from four to two; six seats were obtained from places disfranchised for corruption, and the members of the House of Commons were increased by twelve. The seats thus obtained for redistribution were 180. The great feature of the scheme which followed (agreed to after a conference between the two great political parties) was the separation of populous boroughs and counties into divisions, each returning a single member. Only a few places hitherto with two members were left with the old arrangement. England has now (1894) 461 members, Wales 34, Scotland 72, and Ireland 103, the reduction from 105 occurring through the disfranchisement of Sligo and Cashel some years ago for corruption. (W. A. Holdsworth: *The New Reform Act*.)

¶ **The Reformation:**

**Hist.:** The great revolt against the tenets and the domination of the mediæval church which took place in Western Europe in the sixteenth century. The Church of the Middle Ages had possessed an amount of power never before or since reached by any other ecclesiastical organization. It attained the height of its glory in the thirteenth century, and by the fourteenth had begun to decline. In that century arose Wycliffe (1324(?)–1384), "the Morning Star of the Reformation." [LOLLARD, LOLLARDISM.] There is an historical connection between his labors and the Hussite movement. [HUSSITE.] Meanwhile, the revival of letters, the invention of printing, the discovery of America (1492), and the Cape route to India (1497), enlarged men's conceptions, and prepared them for novelties in religion. In the sixteenth century, the decisive struggle began, independently; in France in 1512, under James Lefevre of Etaples; in Switzerland in 1516, under Ulrich Zwingli, and in Germany in 1517. The French movement in large measure

failed [HUGUENOT], and of the other two, that in Germany was so much the more potent that from its commencement (October 31, 1517) dates the period of the Reformation and of modern times. [LUTHERAN, PROTESTANT.] (For the Swiss Reformation see Reformed Church; for that of England, Church of England; for that of Scotland, Church of Scotland.) Though the most potent influence in the Reformation was a strong spiritual impulse, yet other elements had a large place. The ethnologist observes that, speaking broadly, the Teutonic race in England, Scotland, Germany, Switzerland, Holland, Sweden, Norway, and Denmark, embraced the Reformation, while the Latin and Celtic races rejected it, the chief exception being that Teutonic Austria remained Catholic, while the Celtic Scottish Highlanders became Protestant. The intellectual impulse which the Reformation communicated is still in full force, and will never fade away.

**Church Hist.:** The name given first to the Helvetic Church, which rejected both transubstantiation and consubstantiation, regarding the communion as simply a commemorative ordinance. [LORD'S SUPPER.] Afterward, the name Reformed Churches was extended to all other religious bodies who held similar sacramental views. The founder of the Helvetic Church was Ulrich Zwingli, who began to preach reformed doctrines in 1516, and in 1519 engaged in a contest with Samson, a seller of indulgences. D'Aubigné (*Hist. Ref.*, bk. xv.), himself a Swiss, shows that from 1519 to 1526 Zurich was the center of the Swiss Reformation, which was then entirely German, and was propagated in the eastern and northern parts of the Helvetic Confederation. Between 1526 and 1532 the movement was communicated from Berne; it was at once German and French, and extended to the center of Switzerland from the gorges of the Jura to the deepest valleys of the Alps. In 1532 Geneva took the lead. Here the Reformation was essentially French. The first or German part of the movement was conducted by Zwingli, till his death at the battle of Cappel (Oct. 11, 1531), the second by various reformers, the third part by William Farel, and then by John Calvin. [CALVINIST.] During the last and the present century rationalism has extensively pervaded the Swiss Church.

**rē-frāc'-tion**, *s.* [Fr., from Lat. *refractus*, pa. par. of *refringo*=to break up; Sp. *refraccion*; Ital. *rifrazione*.] [REFRACT.]

1. **Ord. Lang.:** The act of bending back; the state of being refracted or bent back.

2. **Physics:** The bending or deflection of a ray of light (including heat and all other forms of radiant energy) which takes place whenever the ray passes at any other angle than a right angle from the surface of one medium into another medium of different density. This optical density by no means coincides with comparative specific gravity, *e. g.*, turpentine is optically denser than water, but floats on the top of it. It is a retarding influence; and accordingly when the ray enters the denser medium at right angles, though not refracted, it is retarded in a certain proportion, traversing a less distance in a given time. Rays at other angles, it can be shown by analysis, must be bent aside according to a law discovered by Snell about A. D. 1620. Let *w w* represent the refracting surface of the denser medium, for example of water; and draw *A B* perpendicular to that surface. Describe a circle round the point *C*, where the perpendicular cuts the surface. Now let a ray *D C* enter the surface at *C*, at some angle *A C D* with the perpendicular, and suppose it found by experiment that the refracted ray takes the direction *C d*. In the first place, the refracted ray will be found to be in the same plane as the incident ray. In the second place, if the medium below *w w* be the denser, the refracted ray will be bent toward the perpendicular, and the reverse in the contrary case, so that a ray *d C* incident in water would be refracted as *C D*, further away from the perpendicular, on emergence into air. But thirdly, the refracted course of every other ray can now be calculated, according to the following (Snell's)

bōil, bōy; pōut, jōwl; cat, ççil, chorus, çhin, bench; go, gem; thin, çhis; sin, aç; expect, Xenophon, exist. ph = f. -cian, -tian = çhan. -tion, -sion = çhün; -çion, -çion = çhün. -tious, -cious, -sious = çhüs. -ble, -dle, &c. = beç, deç.

law. Draw  $Ds$  and  $ds$  normal to the perpendicular, then the lines  $Ds$  and  $ds$  will represent geometrically the sines of the arcs  $AD$  and  $dB$ , and if the radius  $CA$  be unity, the numbers expressing  $sD$  and  $sB$  will be the sines of the angles. The sine  $sD$  will have a certain ratio to the sine  $sB$ . And now if any other incident ray,  $EC$ , be taken, its sine found in the same way will be found to bear the same ratio to the sine of the refracted ray. This ratio of the sines is therefore invariable for all incidences for the same homogeneous substance. Such ratio is called its refractive index. And it will be readily seen how, the index of any substance—as some kind of optical glass—being once found by some simple experiment, the course of every refracted ray incident at any angle on the curved surface of a lens can be foreseen, and thus its focus and other properties calculated, or the curves calculated for a given focus, which is simply the point to which refracted rays converge.

¶ (1) *Astronomical, atmospheric, or celestial refraction:*

*Astron., &c.:* The alteration of the direction of a luminous ray proceeding from a heavenly body to the eye of a spectator on the earth. It is caused by the passage of the ray from space or the rarer air high in the atmosphere to the denser medium near the surface of the earth. It produces the greatest effect when the heavenly body is on the horizon, and is non-existent when it is in the zenith. It makes a heavenly body appear higher than it is, or even visible before it has really risen. Allowance must be made for refraction in all observations of altitude. The amount of refraction at a certain elevation above the horizon, for a certain temperature of the air, and a certain height of the barometer, may be approximately determined, but minute variations in it make the corrected places of the stars occasionally wrong by a second or more. (*Ball.*)

(2) *Axis of double refraction:* [AXIS.]

(3) *Axis of refraction:* [AXIS.]

(4) *Conical refraction:*

*Optics:* The refraction of a ray of light into a number of other rays forming a hollow cone. It arises when a ray of light passes through biaxial crystals [*Polarization of Light*] in a particular direction, nearly coinciding with the optic axis. When the ray, leaving the crystal, forms a cone with the apex at the point of emergence, it is called external conical refraction; when the cone is formed by the ray on entering the crystal, and it emerges in a hollow cylinder, it is called internal conical refraction. It was first reasoned out by Sir William R. Hamilton, and subsequently demonstrated experimentally by Lloyd.

(5) *Double refraction:*

*Optics:* Many crystals are not homogeneous, but have different properties of elasticity, &c., in different directions. The effect of such a constitution is, that unless a ray of light enters the crystal in some particular directions, it is not merely refracted in the manner described under Refraction, but divided into two rays. In this case the refracted ray or rays are not always in the same plane as the incident ray. [*Polarization of Light.*]

(6) *Index of refraction:* [INDEX, s., ¶ (4).]

¶ *Chemical refrigeration* is effected by solutions which cause the absorption of the latent heat of liquefaction from the sensible heat, thus lowering the temperature. These solutions are called freezing mixtures, refrigerating mixtures, etc. *Dynamic or mechanical refrigeration* is produced by the conversion of heat into work. (See extract.)

"All dynamic or mechanical refrigeration by use of compressed air or other gases depends upon the following fundamental principles, which have been both mathematically and experimentally demonstrated:

(a) The performance of work by the molecules of any substance or material, as by air or steam in expanding, is done at the expense of heat in such substance or material; heat is thus converted into work.

(b) The performance of work upon the molecules of any substance or material, as in compressing air or steam, results in an increase of heat in the material; work is thus converted into heat.

(c) If air, or other gas, be first compressed, and the heat produced by the work of compression be then taken out of it (cooling by water is the usual way of doing this), and if it then be expanded, *expanding the work of expansion upon some other exterior body or substance*, it gets very cold, and in this state may be used to extract heat from, or cool, other substances or bodies. The italicized words express a condition absolutely essential to a successful refrigerating process."—*Leicester Allen: American Machinist* for June, 1898.

I. *Ord. Lang.*: The act of *regenerating* or producing anew; the state of being reproduced.

II. *Technically*:

1. *Biol.*: The genesis or production of new tissue to supply the place of an old texture lost or removed. In some of the inferior animals an organ or a limb can thus be supplied; in man *regeneration* is much more limited in its operation. Thus, when a breach of continuity takes place in a muscle, it is repaired by a new growth of connective tissue, but muscular substance like that lost is not restored. Nerve, fibrous, areolar, and epithelial tissues are more easily repaired.

2. *Script. & Theol.*: The state of being born again, *i. e.*, in a spiritual manner. The word *regeneration*, Gr. *palinnesia*, occurs twice in the A. V. and R. V. of the New Testament. In Matt. xix. 28, if connected, as seems natural, with the words which follow, not with those which precede it, it refers to the renovation or restoration of all things which shall take place at the second advent of Christ. The other passage is:

"Not by works done in righteousness which we did ourselves, but according to his mercy he saved us through the washing [margin, laver] of *regeneration* and renewing of the Holy Ghost."—*Titus* iii. 5 (R. V.).

The doctrine of *regeneration* was formally expounded by Jesus in his interview with Nicodemus (*John* iii. 1-10). All theologians consider the Holy Spirit the author of *regeneration*. Two views exist as to the relation between baptism and the new birth. One considers the water in *John* iii. 5, and the washing or laver of *Titus* iii. 5, to be that of baptism, and that the administration of the rite of baptism is immediately followed or accompanied by what is called in consequence "baptismal *regeneration*." The other view is that the water, washing, and laver, in these passages, are but figurative allusions to the power of the Holy Spirit in removing the corruption of the heart, and that *regeneration* is effected quite independently of baptism by the Holy Spirit alone.

**rĕ-gĕn'-ĕr-ā-tive**, *a.* [Eng. *regenerat*(e); *-ive*.]

B. *As substantive*:

\*1. A ruler, a governor.

2. *Specif.*: One invested with vicarious authority, one who governs a kingdom during the minority, absence, or disability of the sovereign. In hereditary governments the regent is usually, but not necessarily or always, the nearest relative of the sovereign who is capable of undertaking the office.

3. A member of a governing board; a trustee.

4. A member of one of the English Universities, having certain duties of instruction or government. At Cambridge the regents are all resident masters of less than four years' standing, and all doctors of less than two years' standing. At Oxford the period of regency is shorter. Masters and doctors of a longer standing, who keep their names on the college books, are termed Non-regents. At Oxford the regents compose the congregation, by whom degrees are conferred, and the ordinary business of the University transacted. Together with the non-regents they compose convocation (q. v.). At Cambridge the regents compose the upper, and the non-regents the lower house of the senate or governing body.

5. In the State of New York, a member of a corporate body, consisting of twenty-one members, which is invested with the superintendence of all the colleges, academies, and schools in the state which are supported in whole or in part by public funds.

*Ornith.*: *Sericulus chrysocephalus*, a Bower-bird of extremely beautiful plumage. In the adult male it is golden-yellow and rich velvet-black; the female is of more sober hue, all the upper surface being deep olive-brown. The normal number of eggs apparently two, that number of young birds having been repeatedly found. The bower of the Regent-bird (which derives its popular name from the fact that it was discovered during the regency of the Prince of Wales, afterward George IV.) is smaller and less dome-shaped than that of the Satin-bird, and the decorations are uniform, consisting only of the shells of a small species of Helix. It is sometimes, but erroneously, called the Regent-oriole.

Regent-bird.

S. *hrāndeōr*; Icel. *hreinn*, *hreindyr*; Dau. *rensdyr*; Sw. *ren*, *rendjur*; Dut. *rendier*; Ger. *rennthier*, from Lapp. *reino*, according to Skeat=pasture, but mistaken by the Swedes for the name of the animal.] *Zoöl.*: *Rangifer tarandus*, the only domesticated species of the family. It extends over the boreal regions of both hemispheres, and runs into several well-marked varieties. Many authors consider the American reindeer, which has never been domesticated, as a distinct species. The reindeer formerly had a much wider geographical range, and is probably the *bos cervi figura* described by Cæsar as inhabiting Hercynian forest (*de Bell. Gall.* vi. 26). That the European winters were much severer than now may be gathered from Juvenal (vi. 521-3), Horace (*Od.* i. 9, 1-4), and Ovid (*Trist.*, iii. 10). Both the male and female have antlers, and these are not alike on both sides, the great palmated brow-antler being, as a rule, developed on one side only. In the winter the fur is long, grayish-brown on the body; neck, hind-quarters, and belly white. In summer the gray hair darkens into a sooty brown, and the white parts become gray. To the Laplander the reindeer is the only representative of wealth, and it serves him as a substitute for the horse, the cow, the sheep, and the goat. It is extensively employed as a beast of draught and carriage, being broken to draw sledges, or to carry men or packages on its

back. A full-grown animal can draw a weight of 300 lbs., and travel at the rate of 100 miles a day, its broad deeply cleft hoofs fitting it admirably for traveling over the broken snow. In winter the herds feed in the woods on the lichens which hang from the trees; in summer they seek the mountains in order to escape the mosquitoes and gad-flies.

"Remains of the reindeer are found in caves and other Post-pliocene deposits as far south as the south of France, this boreal species having been enabled to spread over Southern Europe, owing to the access of cold during the Glacial period. It appears to have continued to exist in Scotland down even to the twelfth century."—*Encyc. Brit.* (ed. 9th), vii. 25.

#### reindeer-moss, *s.*

*Bot., &c.*: A lichen, *Cenomyce rangiferina*, which forms the winter food of the reindeer. It has erect, elongated, roughish, very much branched podetia, the alternate branches drooping; the apothecia sub-globose, brown, on small erect branchlets. It is abundant in the pine forests of Lapland, and flourishes even when they have been burnt. Reindeer feed upon it and dig for it when it is covered by snow. It tastes like wheat bran, but leaves a slightly burning sensation on the palate. It is not eaten by the Laplanders. It is the badge of the clan Mackenzie. [CLADONIA.]

#### reindeer-period, *s.*

*Anthrop.*: The English equivalent of Lartet's *âge du renne*.

"But now comes the great question: When was the Reindeer-period in Southern France? and what is its antiquity? It is far easier to indicate its place in the series of observed facts in relation to ancient man, than to assign to it any definite antiquity of years. Geologically, a wide gulf separates it from the Drift-period . . . but, on the other hand, it will seem, both from the palæontological and archæological bearings, to be of higher antiquity than the Kjøkkenmøddings of Denmark and the Lacustrine Dwellings of Switzerland, and very certainly than the whole group of so called Celtic and Cromlech remains."—*Lartet & Christy: Reliquiæ Aquitanicæ* (ed. T. R. Jones), p. 25.

### I. Ordinary Language:

1. That which remains or is left after the loss, decay, or destruction of the rest; remains.

"The relics of mankind, secure of rest,  
Oped every window to receive the guest."  
Dryden: *Palamon and Arcite*. (Ded.)

2. The body of a deceased person; a corpse. So called from the notion of its being left behind by the soul. (Usually in the plural.)

"The bleeding relics of men who had been the captains of armies, the leaders of parties, the oracles of senates, and the ornaments of courts."—*Macaulay: Hist. Eng.*, ch. v.

3. That which is kept in memory of another; a souvenir, a memento.

**II. Compar. Religions:** The respect and veneration paid to relics of the departed are founded on association of ideas—that the dead person keeps up a connection with his remains—and are present in nearly every form of religion. The Spartans were enjoined by the oracle at Delphi to find and carry with them the bones of Orestes as a condition of success against the men of Tegea (*Herod.*, i. 67, 68). Tylor (*Prim. Cult.*, ed. 1873, ii. 150, 151) gives many instances of the preservation and honoring of relics among tribes of low culture in the present day. In Jewish history we read how when the corpse of a man "was let down, and touched the bones of Elisha, he revived, and stood on his feet" (2 Kings xiii. 21; cf. Acts xix. 12). The cultus of relics also obtains in Eastern religions; the mythical tooth of Buddha is venerated at Kandy. The Caaba is now as great an object of devotion to Mohammedans as was the shrine of a saint to mediæval Christian pilgrims. But it is in the Roman Church that the veneration of relics has attained its maximum. Addis and Arnold (*Cath. Dict.*) define relics to be "bodies, or fragments of the bodies, of departed saints, articles, or portion of articles, which they have used, the holy nails, lance, spear or fragments of the True Cross, and the girdle, veil, &c., of the Blessed Virgin." Devotion to relics, which dates from very early times, rests on two grounds: (1) Honoring the bodies of the dead who sleep in Christ; and (2) the belief that God is sometimes pleased to honor the relics of His saints, by making them the instruments of miracles. All Roman altars contain some relic or relics, placed in a special repository called the sepulcher. Relics are usually venerated in public by being exposed in their reliquaries on the altar, with burning lights. A special mass and office may be said in churches possessing an important relic (*insignis reliquia*) of a saint named in the Martyrology. In the Roman Breviary there are special offices for the Most Holy Relics (to be said on the fourth or last Sunday in October), for the Crown of Thorns, the Lance and Nails, &c.

"Abuses have, no doubt, occurred in all ages with regard to relics. In 1215, canon 62 of the Fourth Lateran Council forbade relics to be sold or to be exposed outside of their cases or shrines, and prohibited the public veneration of new relics till their authenticity had been approved by the Pope."—*Addis & Arnold: Cath. Dict.*, p. 714.

### relic-worship, s.

**Compar. Religions:** The worship of relics, especially of the actual remains of the dead.

"The conception of such human relics becoming fetishes, inhabited or at least acted through by the souls which formerly belonged to them, would give a rational explanation of much relic-worship otherwise obscure."—*Tylor: Prim. Cult.* (ed. 1873), ii. 151.

It was freer than the antique.

**renaissance-architecture**, *s.*

*Arch.*: A style which first sprang into existence in Italy in the beginning of the fifteenth century. It reached its zenith in that country in the course of the same century, and at the beginning of the following became a model for all other countries. At the early epoch of its existence the new style of architecture displays not so much an alteration in

the arrangement of the spaces and of the main features of the buildings, as in the system of ornamentation and in the aspect of the profiles. During the early period there was an endeavor to adapt classical forms with more or less freedom to modern buildings, while later, that is in the sixteenth century, a scheme based on ancient architecture was universally prescriptive. Two distinct styles belong to this first period, each possessing its especial peculiarities. These are: The Early Florentine and Early Venetian Renaissance styles. The style may be said to have originated with Brunelleschi of Florence (died 1446), and Ambrogio Borgognone of Pavia in 1473.

The Venetian Renaissance style first sprang into existence toward the end of the fifteenth century and flourished till the close of the sixteenth. It is chiefly remarkable in connection with the architecture of palaces. The decoration appears to have been borrowed from Byzantine models. Palladio, the special champion of this style (born 1518, died 1580), introduced the style known after him as Palladian (q. v.). The first and most important school of the Roman Renaissance was originated by Donato Lazzari, known under the name of Bramante (1444-1514); this was joined by Balthazar Peruzzi and Antonio di Sangallo; another school was represented by Giacomo Barozio, known as Vignola (1507-1573), while a third was directed by Michelangelo Buonarroti (1474-1564), and by its arbitrary character formed a stepping-stone to the Rococo style which succeeded it. The finest example of these schools are the Cancelleria Palace, the Court of the Vatican, the Farnese Palace, and St. Peter's at Rome. The Renaissance style was introduced into France by Fra Giocondo, under Louis XII., about 1502, and by Serlio and other Italian architects under Francis I. (1515-1547) and Henry II. These architects modified their ideas to suit the French taste, the general arrangement of the Gothic churches being retained, and only the Renaissance system of decoration substituted for the Gothic; the ground-plan, the proportions, and the whole structure with its flying buttresses, pinnacles, clustered columns, deeply-recessed portals, &c., were borrowed from the Pointed style, and it was only in the details and in the ornamentation that the Renaissance was followed. The Louvre and the earlier portions of the Tuileries are examples of this style. The Renaissance style was not employed in Germany before the middle of the sixteenth century, and the most noteworthy instances of it are the Belvedere of Ferdinand I., on the Hradschin at Prague, and the so-called Otto Henry additions to the Heidelberg Castle (1556-1559). In Spain an Early Renaissance style appears—a kind of transitional Renaissance belonging to the first half of the sixteenth century. It consisted of the application of Moorish and pointed arch forms in conjunction with those of classical antiquity; in this way a conformation was produced which was peculiar to Spain, and the style is characterized by bold lightness, by luxuriance in decoration, and by a spirit of romance. The Italian Renaissance style was introduced into England about the middle of the sixteenth century by John of Padua, the architect of Henry VIII. The most noteworthy examples of it are Whitehall Palace, by Inigo Jones, and St. Paul's and other churches, by Sir Christopher Wren.

Sp. & Port. *randa*; Spanish *renta*; Dut., Dan. & Ger. *rente*; Sw. *renta, ränta*; Icel. *rentà*.] A sum of money, or other valuable consideration, payable periodically for the use of lands or tenements; the return made to the owner by the occupier or user of any corporeal inheritance. It does not necessarily consist in money. *Bithell (Counting House Dictionary)* says:

"The word has three different meanings, which it is important to distinguish:

1. In common speech, it signifies the payment periodically made for the use of lands, houses, or property of any kind.

2. In legal phraseology, it signifies the right to demand payment for the same, not the payment itself.

3. In political economy the meaning is more restricted, and is applied to the payment annually made for the use of . . . lands employed simply for the production of such wealth as is yielded by tilling it."

Rents, as defined by the English common law, are of three kinds, *rent-service*, *rent-charge*, and *rent-seck*. *Rent-service* is when some corporeal service is incident to it, as by fealty, and a sum of money; *rent-charge* is when the owner of the rent has no future interest or reversion expectant in the land, but the rent is reserved in the deed by a clause of distress for rent in arrear; *rent-seck* (dry rent) is rent reserved by deed, but without any clause of distress.

"Rent is an incorporeal hereditament, and signifies a compensation or acknowledgment given for the possession of some corporeal inheritance, being defined as certain profit issuing yearly out of lands and tenements corporeal. It must be a profit; yet there is no occasion for it to be money; for capons, corn, and other matters may be rendered by way of rent. It must issue out of lands and tenements corporeal; that is, from some inheritance whereunto the owner or grantee of the rent may have recourse to distrain. Therefore a rent cannot be reserved out of an advowson, a common, an office, a franchise, or the like. Rent is regularly due and payable upon the land from whence it issues, if no particular place is mentioned in the reservation. And strictly it is demandable

and payable before the time of sunset of the day whereon it is reserved, though perhaps not absolutely due till midnight."—*Blackstone: Comment.*, bk. ii., ch. 3.

¶ Adam Smith considers rent as the price paid for the use of land. Ricardo and his followers considered that the rent of superior soils is equal to the difference between their produce and that of the worst soils cultivated. There is great doubt as to the accuracy of this view. Land let by a landlord to a tenant for purpose of cultivation is analogous to money lent to a borrower. The rent of the land is virtually the interest on the land viewed as a loan.

The second kind of repentance mourns that sin is attended by a penalty rather than hates sin. ¶ The methods of newspaper reporting in this country have been developed to a degree of the greatest efficiency. It is usual for the reporter to be a proficient in the art of stenography as well as in that of mere literary composition. Further than this, in some of the large cities of this country the reporter must also be an operator upon a type-writing-machine, in order that his "copy" may go to the compositor in its most legible shape. The rapidity with which reports of speeches, meetings, notable incidents, &c., are furnished to the press is something almost incredible to the uninitiated. The various press associations of the country are the principal factors in the work of disseminating the results of reportorial work, and greatly facilitate the interchange of intelligence between distant points.

Or, secondly, *ex mandato regis*, from the mere pleasure of the crown, expressed in any way to the court by whom the execution is to be awarded. This is the mode in which *reprieves* are generally granted, through the intervention of one of the secretaries of state. *Reprieves* may also be *ex necessitate legis*: as, where a woman is capitally convicted, and pleads her pregnancy; though this is no cause to stay the judgment, yet it is to respite the execution till she be delivered. Reprobate occurs both as an adjective (Jer. vi. 30; Rom. i. 28; 2 Tim. iii. 8; Titus i. 16) and as a substantive (2 Cor. xiii. 5, 6, 7). *Reprobatio* was used by Tertullian (*Apol.* xiii.), adopted by the Swiss theologians, and Anglicized as reprobation. The doctrine is thus stated in the *Westminster Confession of Faith*, iii. 7, the name reprobation, however, not being used:

"The rest of mankind [*i. e.*, all but the elect] God was pleased, according to the unsearchable counsel of his own will, whereby he extendeth or withholdeth mercy as he pleaseth, for the glory of his sovereign power over his creatures to pass by, and to ordain them to dishonor and wrath for their sin, to the praise of his glorious grace."

Calvinists adduce in support of the doctrine Rom. ix. 11-22; 1 Thess. v. 9; 1 Pet. ii. 8; Jude 4, &c. The 17th Article teaches the predestination of life of "those whom he [God] hath chosen in Christ out of mankind," and is silent as to the fate of others.

"Though some words may be accommodated to God's predestination, yet it is the scope of that text to treat of the *reprobation* of any man to hell fire."

¶ Reproduction of animals is of two kinds, sexual [GAMOGENESIS, HOMOGENESIS] and non-sexual [XENOGENESIS]. The former is effected by the contact of a germ cell or ovum and a sperm cell or spermatozoid. When the former is present in a female and the latter in a male, the species is said to be diocious; when there is only one individual, the terms used are hermaphrodite, androgynous, or monocious. Non-sexual, agamic, or asexual reproduction is by gemmation and fission, by internal gemmation, by alternation of generations, or by parthenogenesis (q. v.). In plants also there is a sexual and an asexual reproduction. The former is by germ cells or oospheres, the latter by spores, gemmæ, bulbils, conidia, buds, gonidia, &c.

"In some of the most important characters . . . reptiles agree with birds, as in the presence of a single occipital condyle, a complex lower jaw articulated to the skull by a quadrate bone, and nucleated blood-corpuscles . . . At the present epoch, indeed, birds are strikingly differentiated from reptiles, but the discoveries within recent years of a number of extinct birds with Reptilian character offer ample evidence that birds are the descend-ants of some branch or branches of the Reptilian type in which the power of flight was developed, and with it other anatomical peculiarities by which birds are now distinguished from living reptiles."—*St. G. Mivart*, in *Encyc. Brit.* (ed. 9th), xx. 442.

**rěp-tíl'-i-a, s. pl.** [Latin, neut. pl. of *reptilis*.] [REPTILE.]

1. *Zoöl.*: A class of Huxley's vertebrate section Sauropsida (q. v.). They are cold-blooded, oviparous, or ovoviviparous. Vertebrate animals having the skin covered with scales or scutes. Heart with two auricles, ventricular chamber incompletely divided. Respiration takes place by lungs; respira-tory movements slow and irregular. Intestinal tract and urogenital organs open into a common cloaca. When the appendicular parts of the skeleton are present, the sternum is never replaced by membrane bone, and the posterior sternal ribs are attached to a median prolongation of the sternum. The meta-tarsal bones are not ankylosed among themselves or with the distal tarsal bone. The foetus is inclosed in an amnion and allantois, and nourished from the vitellus. Its literature dates from Aristotle (B. C. 384-322). Some progress in classification was made by Ray (1628-1705) and Linnæus (1707-78). [AMPHIBIA.] Brongniart, in 1799, first recognized the characters by which the Batrachia (q. v.) differ from other reptiles, and form a natural passage to the fishes. In the beginning of this century Opper, Duméril and Cuvier worked assiduously on the material accumulated in the Paris Museum, and were followed by Blainville, Merrem, Latreille, Gray, and Wagler. In 1854 appeared the ninth and last volume of the *Erpétologie Générale* of Duméril and Bibron, having been twenty years in progress. In 1863, in his Hunterian Lectures, Huxley adopted the term Sauroids for that division of the Verte-brates which he afterward called Sauropsida. He divides the Reptilia (*Anat. Vert.*, p. 196) into the following orders: Chelonia, Plesiosauria, Lacertilia, Ophidia, Ichthyosauria, Crocodilia, Dicyno-dontia, Ornithoscelida, and Pterosauria. Owen makes reptiles proper the highest of the five sub-classes into which he finally divided his Hæma-tocrya with nine orders.

*Ichthyopterygia* (extinct), *Sauropterygia* (extinct), *Anomodontia* (extinct), *Chelonia*, *Lacertilia* (with the extinct *Mosasaurus*), *Ophidia*, *Crocodilia* (with the extinct *Teleosaurus* and *Strepsospondylus*), *Dinosauria* (extinct), and *Pterosauria* (extinct).

Prof. Mivart (*Encyc. Brit.* (ed. 9th), xx. 442-45) divides the Reptilia into the following ten orders:

*Ichthyopterygia* (extinct), *Anomodontia* (extinct), *Dinosauria* (extinct), *Ornithosauria* (extinct), *Croco-dilia*, *Rhynchocephalia*, *Sauropterygia*, *Lacertilia*, *Ophi-dia*, and *Chelonia*.

2. *Palæont.*: The first appearance of reptiles is believed to be indicated by remains of a marine Saurian (*Eosaurus acadianus*) of Carboniferous age. Proterosaurus is found in the Permian. In Mesozoic times the Reptilian type appears in such variety and in such a high state of development that this era has been distinguished as the Reptilian age. In the Trias large marine Saurians and Dinosaurs are met with; the more gigantic forms were developed in the Jurassic period; and the class attained its highest culmination in the Chalk. Sir R. Owen's *British Fossil Reptiles* is the best authority on the subject with which it deals.

Promise themselves a name from building churches,  
Or anything that tends to the republic."  
*Randolph: Muses' Looking Glass*, iii. 1.

2. A commonwealth; a form of political consti-tution in which the supreme power is vested, not in an hereditary ruler, but in the hands either of certain privileged members of the community or of the whole community. Theoretically, the purest and most perfect form of a republic is a state in which all the members of the community meet in public assembly to enact laws, and transact all other national business. Such a system is, how-ever, practicable only in very small states, and has, therefore, given way in all modern republics to the representative system—that is, one in which the supreme power is vested in rulers chosen periodi-cally by and from the whole body of the people, or by their representatives assembled in a congress or national assembly, as in the present French republic. The republics of Venice and Genoa were exclusive oligarchies, the supreme power being vested in the nobles or a few privileged persons. The republics of the United States and Switzerland are federal republics—that is, composed of a num-ber of separate states bound together by compact, subject to a central government for all national purposes, but having powers of self-government in matters affecting individual states.

\*3. One's country at large; the state, the public.

1. A name formerly applied to the political party in the United States now known as the Democratic party. Thomas Jefferson was its founder. It was opposed by the party called federalists (q. v.), whose greatest leader was Alexander Hamilton.

2. One of the two existing great political parties in the United States. It was organized during the administration of President Pierce, 1853-57, by members from other parties who were opposed to the further extension of slavery. In 1856 it nomi-nated John C. Fremont for President. He was de-feated by James Buchanan, the nominee of the Democratic party. In 1860 its nominee for Presi-dent was Abraham Lincoln. He was elected and civil war followed. Mr. Lincoln was reflected in 1864, and was assassinated by John Wilkes Booth April 14, 1865, five days after the close of the war by

the surrender of General Lee at Appomattox. Andrew Johnson, the vice-president, succeeded him and served out his term. At the close of the war slavery in the United States was abolished by an amendment of the constitution, and the Republican party adjusted itself to other issues, its leading principles being: The supremacy of the national government; equal civil rights to all citizens; the integrity of the national credit; a sound national currency, based on gold and silver of equal and interchangeable value; individual personal liberty; a tariff for the protection and encouragement of American industries.

No repulsion exists between bodies at sensible distances, unless when they are in certain electric or magnetic states, in which case the repulsions between them are in the inverse ratio of the square of the distance. At insensible distances some influence keeps the particles of a body from being in absolute contact, whence results the phenomenon of elasticity. The motions produced by heat are also a cause of strong molecular repulsion.

\*1. The act of breathing again, or of returning to life.

"Ev'ry breath, by *respiration* strong  
Fore'd downward." *Cowper: Task*, iv. 348.

\*3. An interval.

II. *Technically:*

1. *Physiol.*: The process of breathing, in which oxygen is taken into the lungs by inspiration, and carbonic acid expelled by expiration, the carbonic acid being given out by the blood, and oxygen taking its place. When respiration is interfered with, asphyxia takes place, except in hibernation (q. v.). The action of respiration exposes the blood to the air, and, by mutual diffusion, the two actions of oxygenating the blood and freeing it of carbonic acid are accomplished by the same act, thus resembling the endosmose and exosmose of liquids. In the higher animals, the capillaries are connected with the arteries immediately issuing from the heart, effecting a constant renewal in the blood, and, by a series of muscular movements, fresh air is supplied, and vitiated air removed alternately, owing to nervous reflex action, not dependent on the will, as the same process goes on in sleep and in other unconscious states. The lungs themselves are almost passive in the process. In the lowest and simplest forms of animals, the aquatic, no special apparatus is provided for the aëration of the fluids of the body, this being effected by the general movements of the body, or by cilia (q. v.), producing the necessary currents. In bivalve mollusks, the internal surface of the mantle or skinlining of the valves is in some cases the special organ of respiration; in others, the mantle is convoluted into four folds, fringed at the edges, with the same action as gills in fishes. The transition from gill-like tufts in animals which can either breathe air or water, as the leech and the earthworm, is seen in the formation in them of small sacs at regular intervals on each side of the body, opening by a row of pores termed spiracles or stigmata. In insects, the spiracles open into tubes, which communicate with each other through the body, and are prevented from closing by an elastic spiral fiber winding round them, serving the purpose of the cartilaginous rings in the trachea and bronchi of the air-breathing vertebrata; in spiders, the respiratory apparatus becomes more concentrated, and through the different classes of animals there is a gradual leading-up to the delicate and highly organized apparatus seen in the higher vertebrata. [LUNGS.] The number of the respiratory movements in health are from fourteen to eighteen per minute. Besides carbonic acid, watery vapor and a minute quantity of organic matter are exhaled in respiration, the latter varying in accordance with the state of the digestive apparatus.

2. *Bot.*: A term occasionally used for the process in plants somewhat analogous to that of respiration in animals. A plant takes carbon dioxide from the atmosphere, decomposing it under the action of chlorophyll and light, emitting the oxygen, and retaining the carbon to build up the vegetable structure. During darkness, oxygen is absorbed and carbon dioxide given off, but not in quantities so great as to vitiate the atmosphere of the room in which flowers in pots are kept.

3. *Pathol.*: In effusion of pus into the pleura the respiration is bronchial; in one stage of phthisis it may be cavernous, in another puerile.

*Artificial respiration:*

Respirators are used by cutlers and other grinders to exclude the dust from the lungs. Such respirators may have magnetic gauze to attract the passing particles of steel. Respirators for persons having weak lungs have several folds of fine gauze, which warm the air as it passes through.

**rěs'-pi-rā-tōr-ŭ, rě-spír-řa-tōr-ŭ, a.** [RESPIRATOR.] Pertaining to or serving for respiration.

**retribution-theory**, *s.*

*Anthrop.*: The term used to signify the belief in different grades of future happiness, especially in different regions of the other world, allotted to men according to their lives in this. It is very far from being universal. Tylor (*Prim. Cult.*, ch. xiii.) considers that at first the doctrine of a future life was that such life was a mere continuance of the present, and this he calls the Continuance-theory; that the belief passed through an intermediate stage, in which it was held that excellence, valor, social rank, and religious observance modified circumstances and surroundings in the next life, and was finally developed into a doctrine of future reward and punishment.

"On the whole, however, in the religions of the lower range of culture, unless where they may have been affected by contact with higher religions, the destiny of the soul

after death seems comparatively seldom to turn on a judicial system of reward and punishment. Such difference as they make between the future conditions of different classes of souls seems often to belong to a remarkable intermediate doctrine, standing between the earlier continuance-theory and the retribution-theory."—*Tylor: Prim. Cult.*, ch. xiii.

It was acted on in the early legislation of all countries. Its principle was, "An eye for an eye, and a tooth for a tooth" (Exod. xxi. 24). It has been displaced by the view that no more punishment should be inflicted by human law than is sufficient to deter others from committing the offense. Even capital punishment is not defended on the principle that "Life shall go for life" (cf. Deut. xix. 21), but because it is believed that with abandoned criminals of a certain type it has a more deterrent effect than penal servitude for life would possess.

¶ *The Revelation of St. John the Divine*:

*New Test. Canon*: The last book of the New Testament, and the only distinctively prophetic one given to fling back the veil [Etym.] which hides futurity from the view. Its writer was John (i. 4, xxii. 8), the servant of God (i. 1), the "brother" and "companion in tribulation" of the then persecuted Christians, himself an exile in Patmos, "for the word of God and for the testimony of Jesus Christ" (i. 9). It was there he saw the prophetic visions, narrating them after he left the island. The majority of the Fathers and the Church of the Middle Ages considered, as do most modern Christians, that the author was John the Apostle; though Dionysius of Alexandria, and some others among the ancients, believed him to have been a certain John the Presbyter (mentioned by Papias, Dionysius, Eusebius, and Jerome), whose tomb, like that of the apostle, was said to be at Ephesus. Finally, Beza hinted, and Hitzig more confidently asserted, that the work emanated from John Mark, author of the second gospel, with whose style that of the Revelation was said partly to agree. Many modern critics have rejected the hypothesis that John the Apostle was the author of the Revelation, stating that the Greek of the latter book is deeply tinged with Hebraisms, while that of the gospel is much more classic. Among those who accept the apostolic authorship of the work, two views are current as to its date. The prevailing one is, that the visions in Patmos were seen in A. D. 96, and the work penned in that year or in 97, the reigning emperor being Domitian. The other view is, that it was penned about A. D. 68 or 69. Ch. xvii. 10 is interpreted to mean that five Roman emperors had reigned and died, viz., Augustus, Tiberius, Caligula, Claudius, Nero, "one is," i. e., Galba, or if Julius Cæsar be considered the first emperor, then the "one" is Nero. Respecting the canonicity of this book, it was alluded to or quoted in Hermas, Papias, Melito, Justin Martyr, the fragment published by Muratori, Theophilus of Antioch, Apollonius of Ephesus, Irenæus, Hippolytus, Tertullian, Clement of Alexandria, Origen, Jerome, &c. It was not in the Old Syrian version, though some Greeks accepted it. The Cerinthians, Caius of Rome, and others rejected it. Luther, Carlstadt, and Zwingli spoke of it disparagingly, but it is accepted by the Churches of the Reformation, as well as by the Roman Church. The "Son of Man (i. 13), who died and lives again forevermore, and has the keys of hell and death" (i. 18), appears in the first vision, and commissions the apostle to write to the seven churches of Asia (ii. iii.). A manifestation of the divine glory is seen (iv.), and the "Lamb who was slain," "the Lion of the tribe of Judah," having opened a book with seven seals, seven

visions corresponding to the seven seals are witnessed (vi.). To the seals succeed seven trumpets (viii., ix.), afterward a woman persecuted by a dragon (xii.), and two beasts, which rise, one from the sea the other from the earth, are exhibited (xiii.). Those sealed by the Lamb appear in blessedness (xiv.), seven vials of wrath are poured out (xv., xvi.), the mystic Babylon is destroyed (xvii.-xix.), millennial glory follows (xx. 1-6), and after a brief apostasy (7-10), the last judgment takes place (11-15), the New Jerusalem descends (xxi.), and unalloyed felicity arises to those who have been faithful to the end (xxii.). Three schemes of interpretation exist: The Preterist, which makes the events predicted now wholly passed, the Futurist, which regards them as future, and that of a third and numerous school, who regard the visions as a historical or continuous prediction of the whole history of the Church from apostolic times to the consummation of all things.

In Scotland the principals of universities, if clergymen, and the moderator of the General Assembly for the time being, are styled *very reverend*, and each of the ministers *reverend*.) All ministers of religion in the United States, Britain, and the British colonies are given this title. ## Revised Version, s.

*Bible*: A revised edition of the Authorized Version of the Bible. The resolution to undertake it was come to by the Convocation of Canterbury in February and May, 1870, and various members were

nominated to carry out the work. Cooperation was sought from scholars in other churches and from an American committee. A better text was constructed, manuscripts being used which had been discovered since the Authorized Version had been made. Revision, not retranslation, was aimed at, as few alterations as possible being introduced, and these only if adopted by the votes of two-thirds of the translators. It follows that a new rendering might commend itself to the majority of them, and yet be relegated to the margin, while that which had only a minority of votes was left in the text. The headings of chapters and pages, paragraphs, italics, and punctuation were to be revised, and finally the headings were omitted. Poetry was printed in lines, showing the rhythm. The New Testament was published in May, 1881, the Old in May, 1885. Each had an immediate and large sale, but the Authorized Version still holds its place in most churches.

7. The reproduction, as of a play at a theater, after a lapse of time.

**II. Comparative Religions**:

1. *Gen.*: Revivals occur in all religions. When one takes place a large number of persons who have been comparatively dead or indifferent to spiritual considerations, simultaneously or in quick succession become alive to their importance, alter spiritually and morally, and act with exceeding zeal in converting others to their views. A Mohammedan revival takes the form of a return to the strict doctrines of the Koran, and a desire to propagate them by the sword. A Christian minority living in the place is in danger of being massacred by the revivalists.

2. *Christian Revivals*: Pentecostal effusion of the Holy Spirit (Acts ii.) produced a revival within the infant church, followed by numerous conversions

from outside. Revivals, though not called by that name, occurred at intervals from apostolic times till the Reformation, the revivalists being sometimes so unsympathetically treated that they left the Church and formed sects, while in other cases, and notably in those of the founders of the monastic orders, they were retained and acted on the Church as a whole. The spiritual impulse which led to the Reformation, and the antagonistic one which produced or attended the rise of the Society of Jesus, were both revivalist. It is, however, to sudden increase of spiritual activity within the Protestant churches of the English-speaking peoples that the term revival is chiefly confined. The enterprise of the Wesleys and of Whitefield in this country and England from 1738 onward was thoroughly revivalist. There were revivals at Northampton, in Massachusetts, in 1734, and throughout New England in 1740-1, the Rev. Jonathan Edwards being the chief instrument in their production. A great one arose in America in 1857, after the financial crisis of that year. It spread in 1859 to Ireland, and in 1864 to Scotland and to parts of England. Since then various revivals have from time to time occurred, and nearly all denominations aim at their production. The means adopted are prayer for the Holy Spirit, meetings continued night after night, often to a late hour, stirring addresses, chiefly from revivalist laymen, and after-meetings to deal with those impressed. Ultimately, it is found that some of those apparently converted have been steadfast, others have fallen back, while deadness proportioned to the previous excitement temporarily prevails. Sometimes excitable persons at revival meetings utter piercing cries, or even fall prostrate. These morbid manifestations are now discouraged, and have in consequence become more rare. One of the most remarkable movements of modern times, properly coming under the head of a revival, is that of the Salvation Army (*q. v.*), founded in the early sixties by the Rev. William Booth, a Methodist minister of Nottingham, England. This movement has been recognized since 1880 as a distinct sect, and with its essential military organization has become an immense power among the poorer classes both in this country and in Europe. The commander (or chief pastor) in this country is General Ballington Booth, who together with his wife administers with signal ability the affairs of the connection.

Some forms of the weapon are breech-loading. The system has been applied to rifles and other guns, as the *Mitrailleuse* (q. v.). 1. Originally, the art of speaking effectively in public, but afterward the meaning was so extended as to comprehend the theory of eloquence, whether spoken or written. The first treatise on rhetoric, that of Aristotle (B. C. 384-322), is marked by great acuteness and is still valuable. He considered Rhetoric as a branch of Logic. The chief elements of an oration may be comprised under (1) Invention, or the character of the ideas to be employed; (2) Disposition, or their arrangement; and (3) Elocution and (4) Delivery, both of which have respect to words, style, utterance, action, &c. The rhetorical points and accents are said to have been introduced by Aristophanes of Byzantium, about 200 B. C. The art was taught at Rome by Potitius Gallus about 87 B. C. Quintilian, after teaching rhetoric for twenty years, published, in the reign of Domitian, his Institutio oratoris, the education of an orator. In 1776 Principal Campbell published a work on the Philosophy of Rhetoric, and, in the year 1826, Archbishop Whately issued his Elements of Rhetoric. Probably the best known American writer on the subject is George P. Quackenbos, who is the author of several text-books. Campbell (Phil. of Rhetoric, bk. i., ch. i.) considers the art the same as eloquence, and defines it as "That art or talent by which the discourse is adapted to its end," and states that the ends of speaking (or writing) are reducible to four, to enlighten the understanding, to please the imagination, to move the passions, or to influence the will. Broadly speaking, the aim of rhetoric is to expound the rules governing prose composition, or speech designed to influence the judgment or the feelings. It includes, therefore, within its province, accuracy of expression, the structure of periods, and figures of speech.

2. The art which teaches oratory; the rules which govern the art of speaking with propriety, elegance, and force.

3. Rhetoric exhibited in language; artificial eloquence, as opposed to natural or real eloquence; declamation; showy oratory.

4. The power of persuading or influencing; as, the rhetoric of the eyes.

¶ **The Rheumatics:** Rheumatic pains; rheumatism. (*Vulgar.*)

**rheû-mā-tiŝm**, *s.* [Lat. *rheumatismus*; Greek *rheumatismos*, from *rheuma*.] [RHEUMA (1).]

**Pathol.:** Acute articular rheumatism or rheumatic fever is produced by the presence in the blood of a poisonous material (probably lactic acid in excess), generated within the system by some derangement of the nutritive and elementary processes. The ordinary causes of an onset are exposure to cold and damp, sudden chill, remaining in wet clothes or in a cold draught, or the absorption into the blood of waste product either of the body itself, induced by too severe labor and insufficient nutrition, or the waste induced by too great a consumption of stimulating food, without exercise enough to eliminate the waste products of such food from the system, and scarlatina also sometimes produces it in children. Predisposition to this disease is distinctly hereditary. It chiefly attacks persons from fifteen to thirty-five years of age, but no time of life is exempt. Affections of the heart are present in most acute cases, particularly pericarditis, with the blowing, bellows-like murmur so characteristic of this complication, and this is apt to be permanent. It is usual for many attacks to follow through life, and in the young chorea, or St. Vitus' dance, is a common sequent. The joints become swollen, red, hot, and painful even to agony. Relief of pain and alkalinity of the blood are the most necessary indications for the successful treatment of rheumatism. It frequently becomes chronic, and assumes other forms as well as the articular, or rheumatism of the joints, such as myalgia, or muscular rheumatism, wry-neck, lumbago, gonorrhœal rheumatism, and *Arthritis deformans*, in which deformity and twisting of the joints is the most prominent characteristic.

**1. Zoology:**

(1) The sole recent genus of the family Rhinocerotidae (q. v.). It falls naturally into three sections, which some zoologists raise to the rank of genera.

(a) *Rhinoceros*: Adults with a single large compressed incisor above on each side, occasionally a small lateral one, below a very small median, and a very large procumbent, pointed, lateral incisor; nasal bone pointed in front; single nasal horn; skin very thick, and raised into strong, definitely arranged folds. There are two well-marked species: (1) *Rhinoceros unicornis* (Linnaeus; *indicus*, Cuvier), now found wild only in the terai regions of Nepal and Bhotan and in Assam, though it had formerly a much wider geographical range; (2) *R. sondaicus* (or *javanus*, Cuvier), the Javan Rhinoceros, is smaller and distinguished by the different arrangement of the folds of the skin, and by the small size or absence of the horn in the female. Found near Calcutta, in Burmah, Malay Peninsula, Java, Sumatra, and probably Borneo. *R. unicornis* was known to the ancients, and was seen probably for the first time by modern Europeans when one was sent to the king of Portugal from India in 1513.

(b) *Ceratorhinus*: The folds are not so strongly marked as in the first section. There is a well-developed nasal, and a small frontal horn, separated by an interval. The name, *R. sumatrensis*, has possibly been applied to more than one species, and two animals in the Zoological Gardens, Regent's Park, London, presented considerable differences of form and color. Dr. Sclater named one of them *R. lasiotis*, the Hairy-eared Rhinoceros. Geographical range nearly the same as that of the Javan Rhinoceros, but it does extend into Bengal.

(c) *Atelodus*, with two well-marked species, peculiar to Africa. Incisors rudimentary or wanting, well-developed anterior and posterior horns in close contact; skin without definite permanent folds. *R. bicornis*, the Common Two-horned Rhinoceros, is the smaller, and has a pointed prehensile lip. It ranges from Abyssinia to Cape Colony, but the progress of civilization and the attacks of sportsmen are rapidly reducing its numbers. Two varieties are said to exist, *R. bicornis major* and *R. bicornis minor*. Specimens in which the posterior horn has attained a length as great as or greater than the anterior have also been separated under the specific name of *R. keitloa* [KEITLOA], but with scarcely sufficient reason. *R. simus*, Burchell's, the Square-mouthed, or White Rhinoceros, has a square truncated lip, browses on grasses and frequents open country. It is the largest of the family, an adult male standing over six feet at the shoulder. The epithet White is a misnomer, for the animal is a dingy slate-color. A local variety in which the horn has a forward rake is sometimes described as *R. oswellii*.

(2) Any individual of the genus Rhinoceros [(1)]. The rhinoceros is the largest and most powerful terrestrial mammal, except the elephant, to which, as well as to the hippopotamus and tapir, it is allied. They are of low intelligence, and usually harmless, but when provoked they display considerable ferocity, and, though apparently so clumsily formed, can run with great speed. Only one is produced at a birth. The flesh is sometimes used for food; in the East Indies, the skin, which is said to be bullet-proof at short distances, is used for shields, and in South Africa it is made into whips.

**2. Palaeont.:** *R. pachygnathus*, from the Miocene of Greece, was apparently intermediate between *R. bicornis* and *R. simus*. Four species, all bicorn, formerly inhabited Britain: *R. tichorhinus*, the Woolly Rhinoceros (q. v.), from the Brick-earths of the Thames Valley; *R. hemitechus* (Falc., *leptorhinus*, Owen), *R. megarhinus* (*leptorhinus*, Cuvier & Falc.), and *R. etruscus*, of Pliocene age. The one-horned Indian type was well represented (*R. sivalensis*, *R. palaeindicus*) in the Pleistocene of the sub-Himalayan region. *R. schleirmacheri*, of the late European Miocenes, possessed incisors and was bicorn.

**Chem.:** A tetratomic metallic element belonging to the platinum group, symbol Rh; atomic weight, 104.4; specific gravity, 10.6-12; discovered by Wollaston in 1804 in crude platinum. To obtain it, the solution from which platinum, palladium, and iridium have been separated is mixed with hydrochloric acid, evaporated to dryness, and the residue treated with alcohol of specific gravity 0.837, which dissolves everything except the double chlorides of rhodium and sodium. On filtering, heating the residue to dryness, and boiling with water, metallic rhodium remains. It is a whitish-gray metal, very hard, less fusible and less ductile than platinum, unalterable in the air at ordinary temperatures, but oxidizing at a red heat. When pure it is unacted upon by the strongest acids, but when alloyed it dissolves in nitro-hydrochloric acid. Rhodium forms but one chloride,  $RhCl_3$ , a brownish-red

deliquescent mass, soluble in water. It forms four oxides: Monoxide,  $RhO$ , a dark-gray substance, unattacked by acids; sesquioxide or rhodic oxide,  $Rh_2O_3$ , a gray porous mass, with a metallic iridescence; dioxide,  $RhO_2$ , a dark-brown substance; and trioxide,  $RhO_3$ , a blue flocculent powder, all insoluble in acids. The salts of rhodium are for the most part rose-colored.

**rhodizonic-acid, s.**

**Chemistry:** A name applied to two distinct compounds, produced under different circumstances from potassium carboxide. Alpha-rhodizonic acid,  $C_5H_4O_6=(C_5HO_3)''''\} O_3$ , discovered by Heller in

1837, is formed from carboxylic acid by the assumption of water,  $C_{10}H_4O_{10}+2H_2O=2C_5H_4O_6$ . It crystallizes in colorless rhombic prisms, easily soluble in water and alcohol. On exposure to the air the crystals turn brownish-red, heated to 100° they turn black, at a higher temperature they decompose, leaving a carbonaceous residue. The alpha-rhodizonates, produced from the hydro-carboxylates, are all red, and very insoluble. Beta-rhodizonic acid,  $C_{10}H_6O_8$ . This acid is unknown in the free state, but its potassium salt,  $C_{10}K_6O_8$ , discovered by Brodie in 1859, remains undissolved when potassium carboxide is treated with absolute alcohol. It is distinguished from alpha-rhodizonate by the rapidity with which it absorbs oxygen on exposure to air and moisture, being converted into potassium croconate.

 2. Hort., &c.: The common Garden Rhubarb is *Rheum rhabarbaricum*, though some of the red-stalked rhubarb is from *R. undulatum*. The former plant has broadly cordate leaves, strongly veined beneath. The footstalks are long, thick, and fleshy, with a channel above. Its growth is exceedingly rapid. rhūs, subst. [Latin, from Greek *rhous* = *Rhus cotinus* (?).]

1. Bot.: A genus of Anacardiaceæ. Leaves simple or compound. Flowers in axillary or terminal panicles, bisexual or polygamous. Calyx small, persistent, five-partite; petals five; stamens five; ovary one-celled, sessile; fruit a dry drupe, with one exalbuminous seed. Nearly a hundred species are known. Most are shrubs, from six to ten feet high. They exist in all the continents. The leaves of *Rhus coriaria*, the Hide or Elm-leaved Sumach of the south of Europe, are used for tanning morocco leather. In the Himalayas those of *R. cotinus* are similarly employed. The fruit of the former was given in dysentery. In India, *R. parviflora*, *R. semialata*, *R. succedanea*, are used medicinally. Exudations from incisions in the bark of *R. succedanea* and *R. varnicifera* yield the varnish used in Japanese and Chinese wickerwork. The former produces astringent galls, and its seeds yield a kind of wax; as do also those of *R. wallichii* and the Japanese *R. varnix*. The juice of the latter species blisters the skin. The Turks use the acid fruits of *R. coriaria* to sharpen their vinegar. The plant yields sumach (q. v.). The bark of *R. glabrum* is a febrifuge, and is employed as a mordant for red colors. *R. metopium*, a Jamaica plant, yields a medicinal gum. *R. toxicodendron* (used in pharmacy as a topical irritant) and *R. venenata*, American species, are poisonous, nor is any of the genus very safe. These two species are called indifferently POISON OAK, POISON IVY, POISON SUMAC, and more rarely mercury. The wood of *R. cotinus* is employed for inlaid and cabinet work. [FUSTIC.]

1. The measure of time or movement by regularly recurring motions, impulses, sounds, &c., as in poetry, prose, and music, and, by analogy, in dancing; periodical emphasis; numerical proportion or harmony. In poetry rhythm is the regular succession of arses and theses, or of long and short (heavy and light) syllables in a verse. In prose it is an arrangement of words in an expressive and pleasing succession; but its regularity is not so great that it can be reduced to a law. When it can be reduced to a law, it loses the name of *rhythm* and becomes *meter*. In music rhythm is the disposition of the notes of a composition in respect of time and measure; the measured beat which marks the character and expression of the music. In dancing, the rhythm is recognized in the sound of the feet.

"When we talk or write continuously about any subject that appeals to the passions, we gratify a natural instinct by falling into a certain regularity. Both the voice and the arrangement of the words fall under this regular influence: the voice is modulated, and the words are regulated in a kind of flow called *rhythm*. Without *rhythm*, the expression of passion becomes spasmodic and painful, like the sobbing of a child. *Rhythm* averts this pain by giving a sense of order controlling and directing passion. Hence *rhythm* is in place wherever speech is impassioned, and intended at the same time to be pleasurable: and impassioned speech without *rhythm* is, when long continued, unpleasing."—*Abbott & Seeley: English Lessons for Eng. People*, § 91.

3. **Physiol.**: The proportion as to time between the action of an organ, an intermittent or remittent disease, &c., at successive periods. The last was supposed to have been killed in 1768, but "Nordenskiöld obtained information from the natives of Behring's Island which led him to believe that a few individuals may have survived to a much later date, even to 1854" (*Encyc. Brit.* (ed. 9th), xv. 391. Note). The habits of the Rhytina were similar to those of the Manatee, which it greatly exceeded in size, attaining a length of about twenty-five feet. A rib consists of a head or capitulum, a neck, a tubercle, a body, an angle, and a sub-costal groove. 'Fixity of tenure,' which has lately been so boldly demanded by the advocates of tenant-right, was then only secretly proclaimed in the lodges of the Ribbon Society, and 'fixity of tenure' it was determined to carry out to the death. riçe, \*rize, \*ryce, s. [Fr. *riz*; Sp. & Port. *arroz*; Ital. *riso*; Lat. *oryza*; Gr. *oryza*; Pers. *orz*; Arab. *rozz*, or with the article *ar-roz*.] The grain produced by *Oryza sativa*, believed to be a native of southern Asia, though it grows apparently wild along some rivers in South America. It is a marsh plant, and the land on which it is cultivated requires to be artificially irrigated. Sometimes small fields are surrounded by an earthen rampart descending from which one will sink ankle deep in mud. Rice is very extensively cultivated in India, especially in Bengal, in the Eastern Peninsula and Islands, and in China. It constitutes half the cereal crop of Africa. In 1700 it was accidentally introduced into the Southern States, and is now largely grown here. To a less extent it is grown in southern Europe. It probably supports a larger number of the human race than any other cereal, or indeed than any other plant. It contains 85 per cent. of starch, and is considered less nutritious than wheat. Professor Watt says that the husked seeds and the flour are demulcent and diuretic. In India they are sometimes used in diseases of the urinary organs and in catarrh, also as an external application to burns and scalds.

¶ Canada, Water, or Wild Rice is *Zizania aquatica*. [ZIZANIA.] Hungry Rice is *Paspalum exile*. Mountain Rice, a variety of *Oryza sativa*, growing in dry places on Indian mountains. [PADDY.]

It is largely cultivated all over the warmer countries. In Europe it becomes an annual. Fifteen or sixteen varieties of the plant have arisen. Prof. Watt (*Calcutta Exhib. Rep.*, iv. 60) reduces them to three sections: (1) Small-seeded, (2) large-seeded, (3) a form grown, on account of its leaves, as food for the Eria silkworm. The small-seeded form is grown as a crop, the large-seeded one as a hedge. The seeds furnish castor oil, and are also used by dyers to render colors permanent. Persons camping near a field of the plant are apt to be attacked with diarrhoea. The fresh juice is used as an emetic; made into a poultice with barley-meal it is used in inflammation of the eye. The leaves as a decoction, or as a poultice, are lactagogues and emmenagogues.

1. The term applied to any musket or gun-barrel which is grooved so that the projectile may have a rotatory motion on its own axis. The rifling may be polygroove as in the Armstrong and other guns, with only two grooves as in some of the early weapons, with the two grooves with the angles rounded away so as to produce an oval and yet twisted bore as in the Lancaster guns, or with three or more grooves as in most modern weapons. The grooves are of varying size, form, and width, and of different degrees of twist in the length of the barrel itself, that of the Henry rifling being one turn in twenty-two calibers or widths of the bore. The bullet is made to fit the bore either by expansion of the base of the lead bullet, or, as in the early pattern, by having the ball "belted," so that the belt should take the groove and so emerge from the muzzle with a rotatory motion.

*Sansk. Literature:* The oldest and most original of the four Vedas, and probably the oldest literary composition in the world. In all likelihood it was in course of composition about 1,400 years B. C., but was not committed to writing at that time. It contains no allusion to writing or writing materials, and Max Müller believes that for a long period it was transmitted orally from generation to generation. It consists of 1,017 short lyrical poems, with 10,580 verses. The religion was nature worship, Indra, the Cloud-compeller, being the chief object of adoration, and, after him, Agni (cf. Lat. *ignis*) the God of fire. The Hindu Triad had not yet arisen. [VEDA.] The Rig Veda does not recognize the institution of caste. Beef was eaten. Women held a high position, and some of the hymns were composed by them. 1. A correspondence of sound in the final syllable or syllables of two or more words; especially the correspondence in sound of the final syllable or word of one line of poetry with the final syllable or word of another. Three things are essential to a perfect rime—

(1) Identity in the vowel sound, and, if the words end in a consonant, in the consonants also, as in *try* and *cry*, *sight* and *light*. Identity of letters is not enough, the identity must be one of sound; thus, *close* and *lose*, *heath* and *death* are not rimes.

(2) Difference in the consonants preceding the vowel, as *way* and *lay*, *find* and *mind*.

(3) Similarity of accent, as *sing* and *fling*; *sing-ing* and *fling* would not be good rimes.

¶ Words like *oar* and *o'er*, *eye* and *I*, are assonances [ASSONANCE]. Rimes in which the final syllables alone correspond are called single or masculine (male) rimes, as *band*, *hand*; those in which the two final syllables correspond, the first being accented, are called double or feminine (female) rimes, as *crying*, *trying*. Triple rimes extend over three syllables, as *scrutiny*, *mutiny*; *dutiful*, *beautiful*.

In the United States each state has its own Riot Act. It is usual, in a time of riot, for the peace officer to command the peace in the name of the people of the state, and sometimes to read the Riot Act to the rioters in order that they may have an opportunity to desist from unlawful demonstrations before an order is given to military or civic force to fire upon them.

Its magazine has room for six twelve-caliber cartridges. Each cartridge contains three and a half drams of powder and twelve buckshot. Between the shot and the powder are two one-eighth-inch compressed paper wads. The shell of the cartridge is of paper, backed by a rim of brass. Its outward appearance is very much like that of the ordinary shotgun shell, but its surface is thicker and much stronger. The six cartridges may be fired in half as many seconds, thus throwing seventy-two scattering bullets, any of which would inflict a serious wound at eighty yards' distance. The magazine may be reloaded easily within half a minute. It is calculated that with the shot of each cartridge scattering as it is discharged, the gun, in the hands of a fairly accurate shot, is capable of disabling 150 men to the minute."—*New York World*, July 6, 1894.

**II. Technically:**

1. *Geog.*: A large stream of water flowing over a certain portion of the earth's surface, and discharging itself into the sea, a lake, a marsh, or another river. A river is generally a stream of considerable size formed by the union of several brooks, streams, or rivulets. When several streams join, so as to produce a river of considerable size, this last is called the principal river and the minor rivers of which it is composed are called its tributaries, affluents, branches, or feeders. The district drained by such a system of streams or rivers is termed a river-basin (q. v.). Rivers generally have their sources in springs, or from the gradual melting of the snow and ice which perpetually cover the summits of the most elevated ranges of mountains. The channel or cavity in which a river flows is called its bed, and the solid land which borders the bed is its banks. The termination of the course of a river, or where it discharges itself into the sea, another river, &c., is called its mouth.

The following table shows the length and area of some of the principal rivers:

	Length in miles.	Area of Basin. Sq. miles.
Mississippi, with Missouri.....	4,200.....	1,244,000
Nile.....	4,100.....	750,000
Amazon.....	3,750.....	2,275,000
Yang-tse-Kiang.....	3,600.....	700,000
Yenesei.....	3,400.....	1,020,000
Volga.....	2,400.....	600,000
La Plata.....	2,300.....	1,242,000
Obi.....	2,000.....	1,357,000
Danube.....	1,725.....	300,000

Darwin (*Descent of Man*, pt. i., ch. vi.) considered rivers as harbors of refuge for certain fishes, and as standing to the ocean in the same relation as islands do to continents.

2. *Geol.*: Rivers may in some cases be aided in hollowing out their beds by existing ravines and fissures, in others their whole channel is scooped out by themselves. The most rapid movement of the water is at the surface, friction retarding the lower and lateral currents. A velocity of three inches per second at the bottom is sufficient to tear up fine clay, six inches per second fine sand, twelve inches per second fine gravel, and three feet per second stones as large as an egg. Hence the transporting power of a river is enormous, especially when in flood. The material carried forward is deposited in the estuary at the mouth of the stream, and tends to form a delta (q. v.). Rivers have existed in all geological periods.

3. *Law*: Rivers are divided into navigable and non-navigable, the former being held to be public property, the latter the property of those through whose lands they flow.

*Compar. Religions*: An expression frequently met with in anthropological writings, and derived from the fact that, in very many forms of religion, the passage from the present to another state of existence is thought to be effected by the actual crossing of a river. The belief existed in classical times (cf. *Virg. Æn.* vi. 134, 145, with *Od.* xii. 22), and is

widely spread among races of low culture in the present day (*Taylor: Prim. Cult.*, ch. xii., xiii.). Allusions in Christian allegory and hymnology, which seem to embody this notion, probably refer to the passage of the Jordan by the Jews before entering the Land of Promise.

The stub end is swaged to prevent its withdrawal. When used for joining pieces of leather, as in making belting, an annular disc, termed a burr, is placed over this end previous to swaging, in order to give a greater bearing. Rivets are cut from round metal rods, and formed by special machinery. In riveting iron plates together, as in boilers, tanks, &c., the rivet is made red-hot, and while a sledge is held against the head, the end is swaged down by striking directly with a riveting-hammer, or a species of die called a snap-head is interposed. In riveting together wooden surfaces, they may be lined with metallic plate, or washers may be placed under the head and the swaged burr, to prevent the indentation of the wood.

**II. Geol.:** Any portion of the earth's crust, coherent or incoherent, any sedimentary stratum or any dyke or overlying mass of volcanic or plutonic mineral matter. The older writers drew a distinction between rocks and soils. Both are now regarded as rocks. So are blown sand, silt, mold, and peat; though the last is soft, spongy, and of vegetable origin. Were the vegetable character to exclude it, coal would have to be omitted too. Most rocks, originally soft, have become hard and compact by losing their moisture, and being subjected to pressure. As a rule a rock is not a bed of some simple mineral. In most cases there are crystals cemented together by imperfectly crystalline or amorphous matter, or there is a mixture of angular and rounded grains, also bound together by mineral matter. [MINERAL.] Viewed as to composition, there are three leading classes of rock: Siliceous or Arenaceous, some formed of loose sand, others of hard sandstone, with all intermediate grades; Argillaceous rocks, *i. e.* rocks of clay, or more specifically having one-fourth alumina to three-fourths silica; and Calcareous rocks composed chiefly of carbonate of lime, some of them proved, and most of the others suspected, to be originally composed of various organisms. Viewed as to their origin, Lyell long recognized four kinds of rocks: Aqueous or Sedimentary, Volcanic, Metamorphic, and Plutonic (all which see). A fifth category has now been superadded, *viz.*, Aërial or Æolian, formed by the action of wind. Aqueous, Æolian, and Metamorphic rocks are, as a rule, stratified; Volcanic and Plutonic rocks generally unstratified; the last two are called igneous. Some stratified rocks are unfossiliferous, others fossiliferous. For the stratigraphical or chronological order of the latter, see Fossiliferous. Much light has recently been thrown on the composition and origin of rocks, by subjecting thin sections of them to microscopic examination. [GEOLOGY.]
