2. Script.: In the A. V. the word Paradise does not occur in the Old Testament. The Hebrew word pardes is found in Neh. ii. 8., where in the A. V. it is rendered "forest," and in Eccles. ii. 5, and Song of Solomon iv. 13, where it is rendered "orchard." The R. V. translates the first and second "park" and the third "garden," or, on the margin, "paradise." The word, which was of Aryan origin, specially referred to the tree-studded parks around Persian palaces, and the LXX. applied the word paradi(e)isos to the Garden of Eden. [EDEN.] The word paradise occurs three times in the A. V. of the New Testament. It was the place to which Jesus and the penitent thief went the day that they died (Luke xxiii. 43). St. Paul was caught up into it, and identified it with the third heaven (cf. 2 Cor. xii. 2, 4). With analogies still preserved to the earthly Eden, the tree of life is in its midst (cf. Rev. ii. 7 with Gen. ii. 9.)

¶ (1) *Angle of parallax*:

*Optics*: The angle formed by two lines drawn from an object, one to the center of each eye.

(2) *Annual parallax*:

(a) The term sometimes applied to a parallax, if any is visible, of a star when viewed from two opposite points of the earth's orbit. The annual parallax of the stars is not in any case certainly  $2''$ , and in every case but one, unquestionably less than a single second.

(b) Sometimes the difference in the position of a star as viewed from the sun and from the earth at the extremity of her orbit; in other words, with a base-line of half her orbit.

(3) *Binocular parallax*:

*Optics*: The difference between the position of an object as seen with the one eye and with the other, the head remaining unmoved.

(4) *Concentric parallax*: The same as Diurnal parallax.

(5) *Diurnal parallax*: The same as *Geocentric parallax* (q. v.).

(6) *Geocentric parallax*:

*Astron.*: The parallax of a heavenly body when in the horizon. The term is specially used of the

moon. When in the horizon the parallax is greater than when the moon is in any other position.

(7) *Horizontal equatorial parallax*:

*Astron.*: As the radii of the earth are not all equal, it is needful to decide which to use in calculating the moon's horizontal parallax. The insertion of the term equatorial means that the equator is the particular radius which has been employed, as it actually is by most astronomers. The moon's horizontal equatorial parallax varies from  $54'$  to  $1^\circ 1' 15''$ , the difference arising from the elliptic orbit in which the luminary moves. (*Airy: Pop. Astron.*, p. 165.) The distance of the moon is computed by means of her equatorial horizontal parallax. Theoretically speaking, that of the sun can be ascertained in a similar way; but, the figures being small, a minute error in them would make a great difference in the results of computations founded on them. Hence other methods are adopted. [SUN, TRANSIT.]

(8) *Parallax in altitude*:

*Astron.*: The parallax of a heavenly body when it has risen to a certain altitude above the horizon.

In the parabola the parameter of any diameter is a third proportional to the abscissa and ordinate of any point of the curve, the abscissa and ordinate being referred to that diameter and the tangent at its vertex. In all cases the parameter of any diameter is equal to four times the distance from the focus to the vertex of the diameter. The parameter of the axis is the least possible, and is called the parameter of the curve. In the ellipse and hyperbola, the parameter of any diameter is a third proportional to the diameter and its conjugate. The parameter of the transverse axis is the least possible, and is called the parameter of the curve. In all of the conic sections, the parameter of the curve is equal to the chord of the curve drawn through the focus, perpendicular to the axis. The parameter of a conic section and the foci are sufficient data for constructing the curve.

*Shakesp.: Timon of Athens*, iii. 6.

2. An animal or plant subsisting at the expense of another organism.

*II. Technically*:

1. *Bot.*: The parasites on plants are either animals or vegetables. Some of the latter are of high organization, as *Loranthus* and *Orobanche* among *Exogens*, and *Epiphytal Orchids* among *Endogens*. Many cryptogams in certain ferns, mosses, lichens, and fungals are parasites. The roots of the more highly organized parasites penetrate the substance of the herb at whose expense they feed, and take up from it nutrient substances already in large measure assimilated. The lower parasites, by means of their cells, penetrate other cells to live in and on them. The former are more destructive to the plant.

2. *Min.*: A plumose variety of boracite (q. v.) occurring in the interior of crystals of the same, and resulting from their partial alteration.

3. *Zoöl.*: An animal which lives in, on, or at the expense of the actual substance of another. There is scarcely an animal which does not play the part of host to numerous parasites, and a very large number of the lower *Invertebrata* are parasitic at some stage of their existence. Parasites may enter the system in the following ways:

(1) Through the medium of food or drink.

(2) Eggs are transferred from one animal to another by actual bodily contact, e. g., the eggs of *Pentastomum* by the licking of dogs.

(3) Eggs are deposited in or on the host, as is the case with those of the *Estridæ*.

Van Beneden divided Parasites into three classes: (1) Parasites proper, living at the expense of the organic substance of the hosts, as the tapeworm; (2) Commensals, who live with, or on, but not at the expense of their hosts, as sea anemones often live on shells of hermit-crabs, and come in for a share of their prey; and (3) Mutualists, a class not clearly defined, and now generally abandoned.

Leuckhart divided Parasites into *Ecto-* and *Endo-*parasites, according as they lived on, or within, their hosts. Of the latter, by far the larger number belong to the type *Vermes*. Vertebrate parasites are rare, but exist among the *Pisces*. Myxine (the Hagfish or Borer) penetrates the abdominal cavity of Gadoids, and feeds on their flesh; the species of *Fierasfer*, *Encheliophis*, and *Echeneis*, and some *Siluroids*, are commensals rather than true parasites.

"The special parasites of man are estimated by Cobbold as many as 121 species (13 Trematodes, 16 Cestodes, 21 Nematoids, 10 Leeches, 17 Arachnids, 44 Insects); many of these, especially among insects . . . have occurred only very rarely, and should not be reckoned; while a considerable number of the truly parasitic forms have been only once or twice described—the above estimate thus becoming reduced well-nigh to half."—*Encyc. Brit.* (ed. 9th), xviii. 260.

II. Law: The pardoning power is a prerogative of the sovereign power in a state, whether representative or monarchical. In this country the pardoning power for offenses against the general government is vested in the President of the United States, the authority being delegated by the people through the medium of the constitution of the country. For offenses against the states the pardoning power is vested in the several governors, or as in a few cases, the governor and state legislature conjointly. The signification of *pardon* is to be differentiated from that of *amnesty*, which latter is the obliteration of a peculiar line of offenses arising on a special occasion, and does not bar prosecution for offenses other than those specified, while *pardon* includes all offenses of which a person may have, up to date, been guilty and absolves the offender entirely. In England a pardon must, until recently, have been issued under the great seal; but is now simply granted by warrant under the royal sign manual, countersigned by one of the principal secretaries of state. It may be absolute or conditional; that is, the sovereign may extend his mercy upon what terms he pleases; and may annex to his bounty a condition either precedent or subsequent, on the performance whereof the validity of the pardon will depend; and this by the common law.

**par-dōn-ā-ble**, *a.* [Fr. *pardonnable*; Sp. *perdonable*; Ital. *perdonabile*.] That may or can be pardoned; capable of being pardoned, forgiven, or overlooked; excusable, venial.

Parheliion.

"The two outer or mock-suns gradually assumed the prismatic colors, and lengthening out, joined above, thus forming the 'ordinary halo,' in which the red color was nearest to the real sun. Concentric and exterior to it was another prismatic halo, the 'extraordinary halo,' which was rather fainter, in which also the red color was innermost. Touching this latter externally was the 'circumzenithal halo,' which was by far the most brilliant of the three, lying as if horizontally overhead. In this, likewise, the red color was next the sun, this forming the outer periphery of the halo. The phenomenon began a

little after 2 P. M., and lasted only for about half an hour, attaining its greatest splendor at 2.20 P. M."—*Brit. Assoc. Rep.*, 1871, ii. 56.

"Shaw has demonstrated, in the most conclusive manner, that those small salmonoids, which are generally called *Parr*, are the offspring of the salmon, and that many males, from seven to eight inches long, have their sexual organs fully developed, and that their milt has all the impregnating properties of the seminal fluid of a much older and larger fish. That this *Parr* is not a distinct species—as has been again maintained by Couch—is further proved by the circumstance that these sexually mature *Parr* are absolutely identical in their zoological characters with the immature *Parr*, which are undoubtedly young salmon, and that no *Parr* has ever been found with mature ova."—*Günther: Study of Fishes*, p. 639.

The Crested Parakeet, or Parakeet Cockatoo, is *Nymphicus nove-hollandice*; the genus *Platyercus* contains the Wide-tailed Parakeets, and *Platyercus caledonicus* and *P. eximius* are known respectively as the Yellow-bellied, and the Rose or Nonpareil Parakeet, sometimes called the Rosella Parrot. *Pezoporus formosus* is the Ground Parakeet, and Grass Parakeet is a popular name for the Australian genus *Melopsittacus*. *Palaornis torquatus*, the Rose-ringed Parakeet, is a familiar cage-bird, as is the Alexandrine Parakeet (*Palaornis alexandri*), so named from the supposition that it was brought to Europe by Alexander the Great. "Parakeet (spelled in various ways in English), is usually applied to the smaller kinds of Parrots, especially those which have long tails, not as *perroquet* in French, which is used as a general term for all Parrots."—*Encyc. Brit.* (ed. 9th), xviii. 321.

Thus, in *I have written a letter*, *written* is a participle denoting a specific act done at a certain time; but in *a written letter*, *written* is an adjective. There are two simple participles in English, the present (or imperfect active) and the past (or passive). The former now ends in *-ing*, the latter in *-ed*, *-d*, or *-t*, in the case of weak verbs; in the case of strong verbs the past participles all once ended in *-en* or *-n*, as in *know*, *known*, *sow*, *sown*, but in very many cases this suffix has been dropped, in many other instances verbs originally strong have adopted a weak form for the past tense and past participle, as in *sweep*, *swept* (orig. *swâpen*, *swepen*), *crow*, *crowed* (orig. *crâwen*, *crown*), &c. In such sentences as *seeing is believing*, the termination *-ing* is not that of the present participle, but represents the A. S. verbal termination *-ung*, as in *showing*=A. S. *sceaung*.

**Passion-music**, *s.* Music set to the narrative of our Lord's Passion in the Gospels. Dramatic representations of the subject date from a very early period, there being still extant a play ascribed, though somewhat doubtfully, to Gregory Nazianzen, Bishop of Antioch. The dramatic performance of the Passion arose in imitation of the ancient custom, still observed in the Roman Church, of dividing the recital of the Gospel of the Passion in Holy Week between two, three, or more readers, assigning those parts which reproduce the words of the people (*turba*) to the congregation or choir. To one priest was assigned the part of Jesus; to others those of Pilate, Judas, &c. All these parts were recited according to the rules of the *accentus ecclesiasticus*, while the people's part was delivered in monotone. Some of the best known settings are by Bach.

1. *Judaism:*

(1) A festival instituted to commemorate Jehovah's "passing over" the Israelite houses while "passing through" those of the Egyptians, to destroy in the latter all the first-born (Exod. xii. 11, 12, 23, 27). The first passover (that in Egypt), those subsequently occurring in Old Testament times, and those of the New Testament and later Judaism, were all somewhat different. In the first of these a lamb without blemish was taken on the tenth, and killed on the fourteenth, of the month Abib, thenceforward in consequence to be reckoned the first month of the ecclesiastical year. The blood of the lamb was to be sprinkled on the two side-posts and the single upper door-post, and the flesh eaten "with unleavened bread and bitter herbs" before morning (Exodus xii. 1-13). That night Jehovah, passing over the blood-stained doors, slew the first-born in the Egyptian houses not similarly protected; and, as the emancipated Jews that night departed from Egypt, that first passover could have continued only one day. But the festival was to be an annual one. Connected with it was to be a feast of unleavened bread, continuing seven additional days, viz., from the fifteenth to the twenty-first of Abib, during which no leaven was to be eaten, or even allowed to be in the house (Exod. xii. 14-20; Num. xxviii. 16). [UNLEAVENED.] Sometimes the term passover is limited to the festival of the fourteenth of Abib; sometimes it includes that and the feast of unleavened bread also, the two being viewed as parts of one whole (Ezek. xlv. 21). When the Jews reached Canaan, every male was required to present himself before God thrice a year, viz., at the passover, or feast of unleavened bread, at that of "harvest," and that of "ingathering" (Exod. xxiii. 16). The designations of the second and third suggest that the first also marked a stage in the agricultural year. It was, in fact, the spring-festival (Deut. xvi. 9), held about the time when the first barley was ripe. In the Old Testament six passovers are mentioned as having been actually kept: That in Egypt (Exod. xii. 21-28), that in the wilderness (Num. ix. 1-14), that under Joshua at Gilgal (Joshua v. 10), that under Hezekiah (2 Chron. xxx.), that under Josiah (2 Chron. xxxv.), and that under Ezra (Ezra vi.). After the exile wine was introduced, and is still used (cf. Matt. xxvi. 17, 27, &c.) In modern Judaism no lamb

*Church Hist.:* The name given to those persons who took part in certain risings in France in the thirteenth and fourteenth centuries. It is probable that these outbreaks, of what Blunt calls "religious Jacquerie," were due in a large degree to the sufferings of the peasantry from the exactions of the nobility, and that the hostility displayed to the clergy was a consequence of their connection with the aristocracy. These outbreaks took place—

1. In Berry in 1214. The peasantry pillaged chateaux and religious houses, and proclaimed universal equality and the coming of the Holy Ghost. (*Larousse*.)

2. In 1250; the ostensible objects were the rescue of Louis VII. and the recovery of the Holy Sepulcher. The rising originated in Flanders, under the leadership of a person of unknown name called the Master of Hungary, who, when he reached Paris, was at the head of 100,000 men. Here "they not only usurped priestly functions, performed marriages, distributed crosses, offered absolution to those who joined the crusade, but they inveighed against the vices of the priesthood." (*Blunt*.) They separated into three divisions, and marched southward, where they were attacked and cut to pieces.

3. In 1320, in the reign of Philip V. This outbreak took place under the pretense of a crusade. The insurgents were excommunicated by Pope John XXII.; and being hemmed in in Carcassonne, numbers perished of disease and famine, and the survivors were put to death.

#### Pâu-liç-ĩ-ãn, *a. & s.* [See def.]

**A. *As adj.***: Belonging to or connected with the sect, or holding the tenets, described under B.

**B. *As substantive***:

*Church Hist. (pl.)*: A Manichæan sect of Asiatic origin, who appeared in Armenia in the seventh century. They owed their name to a mythical

founder, or to their claim to "a monopoly of the pure doctrine of the Apostle of the Gentiles." (*Blunt*.) From the close of the seventh to the middle of the ninth century, they suffered severe persecution, notably under the regency of Theodora (841-857), who did her best to extirpate them; no less than 100,000 are said to have perished from her attempts to carry out her design. *Blunt (Dict. Sects)* thus summarizes their doctrines:

"They taught the essential evil of matter, the eternal hostility of the two principles; they denied the inspiration of the Old Testament and the Deity of Jehovah; they despised the Cross; and, holding the Valentinian doctrine that the spiritual Christ passed through the body of the Virgin like water through a pipe, were naturally accused of insulting her memory; they taught a purely illusory baptism, and had no Eucharist; they excluded their ministers or scribes from all government in their community; above all they were iconoclasts, and placed the Scriptures in the hands of the laity."

#### Pauline-epistles, *s. pl.*

*New Test. Canon*: Fourteen epistles of the New Testament, thirteen of which commence with St. Paul's name, the fourteenth opening abruptly without any intimation as to the writer, though the detached title, "The Epistle of Paul," has been prefixed to it. Its author was more probably Apollos than Paul. [HEBREW.] Of the other thirteen, five (Romans, Ephesians, 1 and 2 Timothy, and Titus) have only St. Paul's name attached; four (2 Corinthians, Philippians, Colossians, and Philemon) are from Paul and Timothy; two (1 and 2 Thess.) are from Paul, Silvanus, and Timothy (Timothy); one (1 Cor.) from Paul and Sosthenes, and one (Galatians) from Paul and "all the brethren that are with me." Their order of publication may have been: 1 and 2 Thessalonians on Paul's second missionary journey; Galatians, Romans, and 1 and 2 Corinthians, on his third; Philemon, Colossians, Ephesians, and Philippians during his imprisonment at Rome. The dates of the first epistle to Timothy and of that to Titus are somewhat doubtful; the second to Timothy was just before the Apostle's martyrdom. For details see the several epistles. Baur only admits the genuineness of four, viz., Romans, 1 Corinthians, 2 Corinthians, and Galatians; but most critics believe the others also to have been the work of the great Apostle.

#### Pauline-theology, *s.*

*Script. & Theol.*: The teaching of St. Paul as gathered from his sermons and addresses briefly reported in the Acts of the Apostles, and his Epistles. [PAULINE-EPISTLES.] He gives prominence to the doctrine of justification by faith without the deeds of the law (Acts xiii. 39; Rom. iii. 19-31; iv. 1-25; v. 1; Gal. ii. 16; iii. 8, 24, &c.). But he states the doctrine as not to encourage sin (Rom. vi. 1-23), and of the three Christian graces he assigns the preëminence to love, rendered in the A. V. charity (1 Cor. xiii. 13). The Apostle of the Gentiles, he contends against numerous gainsayers that the middle wall of partition between the Jews and Gentiles is broken down, both now standing on the same footing as brethren in Christ (Rom. iii. 29; Ephes. ii. 11-22; iii. 1-11; Col. i. 21, 22; iii. 11). But he speaks of his countrymen with the tenderest affection (Rom. ix. 1-5). The ceremonies of the older economy he regarded as but temporary, and as standing to Christ and the newer one in the relation of a shadow to substance (Col. ii. 16, 17). These broad views rendered the Apostle an object of suspicion to the Hebrew converts (Acts xxi. 20-21), and excited the most deadly animosity against him on the part of the unbelieving Jews (Acts xxii. 21, 22). Baur and others of the Tübingen school consider that St. Paul, in emancipating himself from the Judaic prejudices in which the other apostles were entangled, became the real founder of Christianity as a universal religion; but Prof. Otto Pfeiderer, of Berlin, in the Hibbert Lectures for 1885, rejects this extreme view, and considers Pauline Christianity as a genuine development of the teaching of Jesus.

To obviate possible danger from this custom, the Apostolic Constitutions strictly decreed the separation of the sexes at public worship. The pax was given at mass in the Western Churches till the thirteenth century, when Arch-bishop Walter in 1250 introduced the metal pax [2], and its use spread to the Continent. The pax is now only given at high masses, and the formal embrace [¶] substituted for the kiss is confined to those in the sanctuary.

2. An osculatorium; at first probably a crucifix, then a plate of metal adorned with a figure of Christ crucified, or some other pious picture or emblem, passed among the congregation to be kissed as a substitute for the actual kiss of peace. Its use is almost entirely confined to religious houses and seminaries. Called also *Instrumentum*, *Tabella Pacis*, *Pacificale*, and *Freda* (from Ger. *Friede*=peace).

"And eke he awaiteth to sit, or to go above him in the way, or kiss the pax, or ben incensed . . . before his neighbour."—*Chaucer: Persones Tale.*

The hands of the giver and receiver of the pax are placed lightly on each other's shoulders, they bow, and the giver says "Pax tecum" (Peace be with thee).

(1) *Sing.*: Any individual of the genus *Pavo* (q. v.), specif., the common peacock (*Pavo cristatus*), a native of India, domesticated in Britain. The plumage is extremely gorgeous. Head, neck, and breast rich purple, with gold and green reflections; back green, feathers scale-like, with coppery edges; wings, inner coverts, and shoulders, white, striated with black; middle coverts deep blue, primaries and tail chestnut, abdomen black; train chiefly green, beautifully ocellated. Crest of about twenty-four feathers, webbed only at tip; green, with blue and gold reflections. Bill and legs horny brown. Length to end of tail about four feet, and the train measures about as much more. The peahen is chestnut-brown about the head and nape; breast and neck greenish, edged with pale whitish-brown; upper plumage light hair-brown, with faint wavings, increased on upper tail coverts; tail deep brown with whitish tips; abdomen white; lower parts and under tail-coverts brown. Length thirty-eight to forty inches; crest shorter and duller than in the male. (*Jerdon*.) Among the Greeks and Romans the peacock was sacred to Hēra or Juno. By the epicures of the Italian peninsula its flesh was esteemed a dainty. "Quintus Hortensius (born 119 B. C.) was the first to serve up peacocks at table, at the supper which he gave on entering on the office of augur." (*Macrob.*: *Satur.*, iii. 13.) The proverbial reproach, "as vain as a peacock," is scarcely well-founded, for the bird is no vainer than other birds in the love-season, and the display of his train is intended to attract the attention of the hen-bird, or to outline some rival.

"The peacock during the courting season raises his tail vertically, and with it, of course, the lengthened train, spreading it out, and strutting about to captivate the hen-birds; and he has the power of clattering the feathers in a most curious manner."—*Jerdon: Birds of India* ii. By some old travelers this gland was mistaken for a second navel, a circumstance which influenced Cuvier in selecting the generic name.

Church History and Ecclesiology:

A. As adj.: Of or belonging to Pelagius [B.].

B. As subst. (pl.): The followers of Pelagius, a monk, probably of Welsh origin, first in high repute for genius, learning, and piety, who, going to Rome about A. D. 400, proceeded, some five years later, to promulgate new views regarding original sin (q. v.) and free grace (q. v.). He was the great opponent of St. Augustine, but there are two reasons why the teaching of Pelagius cannot be exactly ascertained: (1) It is gathered chiefly from the writings of his adversaries; (2) he was willing to adopt orthodox language, provided he might interpret it in his own fashion. Blunt enumerates the following as his chief errors:

1. The denial of original sin, and, as a necessary consequence, its remission in baptism.
2. The denial of the necessity of grace.
3. The assertion of complete free will.
4. The possibility of a perfectly sinless man.
5. The existence of a middle state for infants dying unbaptized.
6. That Adam's fall injured himself only, and not his posterity.
7. That neither death nor sin passed upon all men by the fall of Adam.

His views were shared by an associate of his, another monk, Celestius, apparently an Irishman. Celestius was condemned for heresy in 412 by the Council of Carthage, and in 415 by a synod at Rome, and was banished by the emperor. He was again condemned by a synod at Rome in 430, and by the Council of Ephesus in 431. The controversy went on in a languishing manner till the seventh century. [SEMIPELAGIAN.]

 dependent from the flexible branches of the lower  
 mandible, but capable of being contracted when  
 not in use as a depository for food. The species are  
 widely distributed, and frequent the shores of the  
 sea, rivers, and lakes, feeding chiefly on fish, which  
 they hunt in shallow water, the Pelican of this  
 country (*P. fuscus*) being the only species which  
 dives for its prey. The Common Pelican is about  
 the size of a swan, though its enormous bill and  
 loose plumage make it look considerably larger;  
 it is white, slightly tinged with flesh-color, and  
 the breast feathers become yellow in old birds. It  
 usually nests on the ground, in some retired spot  
 near the water, and lays two or three white eggs.  
 The pelican sits during the night with its bill rest-  
 ing on its breast; and, as the hook at the extremity  
 of the bill is red, this may have given rise to the  
 legend that the bird feeds its young with blood  
 from its own breast [6], though it is possible that  
 the story has some foundation in fact. It is well  
 known that the males of many species assiduously  
 feed the hen-birds during incubation; and in 1869  
 the flamingoes in London Zoological Gardens were  
 observed to eject into the mouth of the Cariamias,  
 apparently in the belief that the latter were in want  
 of food, a glutinous red fluid, which, on microscop-  
 ical examination, was found to consist almost  
 entirely of blood-corpuscles.

2. *Script.*: Heb. *qaath*, from a verb in the cognate  
 languages=to vomit, seems to be the pelican (Lev.  
 xi. 18, Deut. xiv. 17, Psalm cii. 6). In the A. V. it is  
 mistranslated cormorant, in Isa. xxxiv. 11 and Zeph.  
 ii. 14, the R. V. restoring uniformity by rendering it  
 pelican.

6. *Art*: The pelican is the symbol of charity. It  
 is generally represented wounding its breast to feed

its young with its own blood—a tale told in the fab-  
 ulous natural history of the middle ages, and which  
 made the bird the adopted symbol of the Redeemer.  
 When so represented the pelican is said to be "in her  
 piety." In crucifixes the lamb is at the foot and  
 the pelican at the top of the cross.

2. The outward acts by which sorrow for sin is evinced.

3. The satisfaction which a priest imposes on the penitent before giving absolution, often called sacramental penance. [PENITENTIAL-DISCIPLINE.]

4. A sacrament of the New Law, whereby sins, whether mortal or venial, committed after baptism, are forgiven. The Council of Trent (sess. xiv., c. iii.) defines that the form of the sacrament consists in the words, "Ego te absolvo," &c., the "quasi materia" in the acts of the penitent—contrition, confession, and satisfaction. The minister of the sacrament is a priest with ordinary or delegated power to absolve, and the subjects those who have received baptism. It is not of obligation to confess venial sins, but mortal sins committed after baptism must be confessed. Roman theologians rely on the words of Jesus (John xx. 23) as proving the divine institution of the sacrament of penance. The dispositions and acts necessary on the part of the penitent are a hearty sorrow for sin, because it is an offense against God, joined with a firm purpose of amendment, the confession of sins to a priest approved by the bishop, and the performance of the penance imposed by him.

**pě-nā'-tēs, s. pl.** [Lat. *penus*=store or provision of food; the innermost part of a temple; from *pa-*, root of *pascor*=to feed, *pabulum*=food, nourishment, *panis*=bread.]

*Compar. Religions*: The Roman gods of the store-room and kitchen. The family hearth, which formerly stood in the atrium, was their altar, and on it their images, two in number, were placed, with the image of the Lar between them. These Penates were represented dancing and elevating a drinking-horn in token of joy and plenty. The Calends, Nones, and Ides of each month were set apart for their worship, as were the Caristia (Feb. 22) and the Saturnalia (q. v.). Each family had its own Penates, and the state had its public Penates. The worship of these gods was closely connected with that of Vesta (*Cicero: de Nat. Deor.*, ii. 27), in whose temple the public Penates were at one time worshipped, though they had a temple of their own near the Forum. It is possible that the former may have been the Penates of Latin, while the latter may have been the Penates of the city. The origin

of these gods is extremely doubtful. According to ancient tradition they were first worshiped in Samothrace, thence brought to Troy, and Virgil (*Æn.* i. 88) makes Æneas the means of their introduction into Italy. As was the case with the Lares, their name was a synonym for home (*Horace: Carm.* iii. 27, 49; cf. *Carm. Sec.*, 39).

"Thus the Penates, as simple gods of food, are probably much more ancient than deities like Jupiter, Neptune, Apollo, and Minerva, whose wide and varied attributes represent a power of abstraction and generalization in the minds of their worshippers such as is not possessed by very primitive men."—*Encyc. Brit.* (ed. 9th), xviii. 489.

**II. Technically:**

1. *Mech.:* A simple pendulum is a heavy particle suspended by a fine thread from a fixed point, about which it oscillates without friction. The time of its vibration is directly as the square root of the length, and inversely as the square root of the accelerating force of gravity. The length of the arc through which it vibrates does not affect the result. No simple pendulum can exist; all constructed by man are compound pendulums in which there gravitates, not a particle, but a heavy body called the bob, the law of friction of course operating.

2. *Horology:*

(1) The ordinary pendulum is believed to have been the invention of Ebn Junis of the university of Cordova about A. D. 1100, his companion, Gerbert (poisoned in 1102), making the first escapement. Henry de Wyck (1364), Harris (1641), and Huyghens (about 1657), applied it to clocks, Galileo, in 1581, having recommended a pendulous weight as a true measurer, and Sanctorius, in 1612, the combination of a pendulum with wheel-work. Pendulums generally move in arcs of circles. In the cycloidal pendulum the rod of suspension describes the arc of a cycloid, and in the conical a cone. Heat lengthens, and cold contracts the rod of a pendulum, if it be of a single metal, as steel or iron. To neutralize these effects compensation pendulums are made; the gridiron pendulum having bars of iron and brass to work against each other, and the mercurial pendulum making the center of the oscillation of the bob uniform by the expansion and contraction of mercury inside. The curved line along which the bob of a pendulum moves is called the arc of vibration, the horizontal chord of that are the axis of oscillation, and the point around which the pendulum moves the point of suspension, or the center of motion. The length of a pendulum vibrating seconds is directly proportionate to the force of gravity at the place. One constructed to beat seconds at London (lat. of Greenwich Observatory, 51° 28' N.) at the sea-level must measure 39.13983 inches; at the Equator, 39.02074 inches; and at Spitzbergen, 39.21469 inches. To regulate a clock by means of a pendulum, the rod of the latter is made to pass between the prongs of a fork, and thus communicate its motion to a rod oscillating on a horizontal axis. To this axis is fixed a piece called an escapement, or crutch, terminated by two projections named pallets, which work alternately with the teeth of the escapement wheel. As the pendulum moves, the one crutch is raised, allowing the wheel to escape from the control of the pallet, the weight then descends, till arrested and made to re-ascend by the action of the other pallet. The motion of the escapement is communicated by additional mechanism to the hands of the clock, which are thus regulated by the pendulum.

In support of the last hypothesis, Mr. Reeks wrote (*Zoologist*, ser. 2, p. 1854) that the people in Newfoundland who used to meet with this bird always pronounced its name "pin-wing." The French *pingouin*=the Great Auk.]

1. *Ornithology*:

(1) *Sing.*: A name first given to the Great Auk (*Alca impennis*), but now applied to any member of the family Sphænicidae (q. v.). Penguins are aquatic birds confined to the high southern latitudes of both hemispheres, where they congregate in large flocks. The body is generally elliptical; neck of moderate length; head small; bill moderately long, straight, compressed; tail short. They have no quills in their wings, which are as rigid as the flippers of a cetacean, and utterly useless for flight, though they move freely at the shoulder-joint, forming most efficient paddles, and are usually worked alternately with a rotatory motion. In standing, the penguin preserves an upright position, generally resting on the tarsus, which is widened like the foot of a quadruped; but in progression this is kept nearly vertical, and the weight supported on the toes alone. They make no nest, and lay a single egg, which is tended by both birds, and the female takes charge of the young for nearly

twelve months. The Emperor Penguin is *Aptenodytes patagonica*, and the King Penguin *A. longirostris*. Their molting is very peculiar. The flipper-like wings cast off short scale-like feathers; they flake off like the shedding of the skin of a serpent. (2) (*Pl.*): The family Sphænicidae, or the modern order Impennes, as distinguished from Illiger's group.

2. *Bot.*: The broad-leaved Pine-apple, *Bromelia pinguin*, of which Penguin is a corruption. It is very common in Jamaica, where it is planted as a fence around pasture lands, on account of its prickly leaves. When stripped of their pulp, soaked in water, and beaten with a wooden mallet, they yield a fiber whence thread is made. The juice of the fruit in water makes a good cooling drink in fevers. It is anthelmintic and diuretic, and can also be made into good vinegar.

¶ *Peninsular War*:

*Hist.*: The war carried on in the beginning of the present century in Spain and Portugal by the British forces, aided by the native troops, against the French. Sir Arthur Wellesley, afterward the Duke of Wellington, landed, with 10,000 British troops, at Figueras, in Portugal, August 1-3, 1808, and on the 21st defeated the French at Vimiera. On August 30 the Convention of Cintra was signed, by which Junot agreed to evacuate the country. Wellesley returning home, the command of the army, now increased to 20,000 men, was given over to Sir John Moore, who was forced by Soult to fall back on Corunna, where a battle was fought on January 16, 1809, in which the former lost his life. Wellesley again received command of the army, and, after a series of sanguinary but generally successful combats, drove the French across the Pyrenees, entering France on October 7, 1813.

According to Lucian, it served the Pythagoreans for a salutation and symbol of health. In German mythology it was regarded as the footprint of swan-footed Nornen, till, as Christianity gained ground, these beings were looked on as witches and evil Pentageron spirits. Henceforward, this sign was, with the sign of the cross, placed at the door to prevent the entrance of Druden and witches, but any break in the figure caused it to lose its virtue. **pěn-tā-teuch**, s. [Lat. *pentateuchus*, from Gr. *pente*=five, and *teuchos*=a tool, a book; French *pentateuque*; Ital. & Sp. *pentateuco*.]

**Script. Canon.**: A term applied exclusively to the first five books of the Old Testament collectively, termed in Hebrew *torah*=the Law. The first mention of the fivefold division is by Josephus. It seems to have been made by the Septuagint translators, who then bestowed on the volume a Greek name expressive of what they had done. [Etyim.] In its undivided state it is called in Ezra vii. 6, "the Law of Moses;" in Neh. viii. 1, "the Book of the Law of Moses;" and, more simply, in 2 Chron. xxv. 4, xxxv. 12, Ezra vi. 18, Neh. xiii. 1, "the Book of Moses." It is the "Book of the Law of the Lord" (Jehovah) in 2 Chron. xvii. 9. Either the Pentateuch or the book of Deuteronomy is the "Book of the Covenant" in 2 Kings xxiii. 2, 21, and "the Book of the Law" in xxii. 8. The titles in both of the A. V. and R. V. of the Bible, following the Septuagint, attribute the five books to Moses. The Hebrew text prefixes his name only to Deuteronomy (Deut. i. 1),

Head of *Pentastoma Tænioides*.

and to portions of the others (Exod. xvii. 14, xxiv. 3, 4, xxxiv. 27). No critic attributes Deut. xxxiv. 5 to Moses. Some other passages seem of later date, Gen. xii. 6, xiv. 14 (cf. with Judges xviii. 29), Gen. xxxvi. 31, Lev. xviii. 28, Deut. iii. 11, &c.; others, such as modesty would have prevented Moses from writing (Exod. xi. 3, Num. xii. 3). These are often attributed to Ezra. Except the author of the Clementine Homilies, who disbelieved, and Jerome, who doubted it, the Mosaic authorship of the Pentateuch seems to have been universally accepted by the early Christians.

† *Samaritan Pentateuch*:

**Script.**: The Pentateuch in use among the Samaritans. Words which have in them *d* and *r*, and again *i* and *v*, letters unlike in the Samaritan, but very similar in Hebrew [(*d*) and (*r*), also (*i*) and (*v*)], are sometimes interchanged, showing that the work was derived from a Hebrew original. The passages attributed to Ezra are in it. It substitutes Mount Gerizim for Mount Ebal in Deut. xxvii. 4. The text in various places differs from the Hebrew, generally, however, agreeing with the Septuagint. The chronology also is in places at variance with that of the Hebrew Bible. If Josephus is correct as to the date of the building of the Temple on Mount Gerizim, the Samaritan Pentateuch was made probably about 330 B. C., though the popular belief is that it is much older.

**pěn-tā-teuch'-al**, *adj.* [Eng. *pentateuch*; -al.] Pertaining or relating to the pentateuch; contained in the pentateuch.

Its Greek name was given because it was held on the fiftieth day [Etyim.], counting from the second of the Passover (Lev. xxiii. 15, 16), whence it was called in Hebrew the Feast of Weeks (Deut. xvi. 9, 10). By this account the enumeration of the weeks was to be from "such time as thou beginnest to put the sickle to the corn." It was called also the Feast of Harvest, or Firstfruits of Wheat Harvest (Exod. xxiii. 16; xxxiv. 22). When it came every Jewish male had to present himself before Jehovah (Exod. xxiii. 17; xxxiv. 23). Meat or wave offerings, especially two wave loaves, and sacrifices

II. *Metaph.*: The reception of knowledge through the senses, and the faculty by which knowledge is so received and communication maintained between the subject and the external world. Perception differs from conception, in dealing with things that have an actual, not merely a possible existence; and from consciousness, in that it is concerned with objects external to the mind of the percipient. It is, in brief, the taking cognizance of impressions received by the senses.

"The word *Perception* is, in the language of philosophers previous to Reid, used in a very extensive signification. By Descartes, Malebranche, Locke, Leibnitz, and others, it is employed in a sense almost as unexclusive as consciousness in its widest signification. By Reid this word was limited to our faculty acquisitive of knowledge, and to that branch of this faculty whereby, through the

senses, we obtain a knowledge of the external world. But his limitation did not stop here. In the act of external perception, he distinguished two elements, to which he gave the name of *Perception* and *Sensation*. He ought, perhaps, to have called these *Perception* proper and *Sensation* proper, when employed in his special meaning; for, in the language of other philosophers, *Sensation* was a term which included his *Perception*, and *Perception* a term which included his *Sensation*."—*Hamilton: Metaphysics* (ed. Mansel), ii. 93.

He thus made experience the basis of all science. In the middle ages, Albertus Magnus (1193-1280) did much to spread the Peripatetic philosophy, as well as the ethical and physical writings of Aristotle, and his pupil, St. Thomas Aquinas (1227-1274), the greatest of the Scholastics, was much influenced by them. *Arch.*: The third period of Pointed Architecture. It originated at the end of the fourteenth century, and continued until the close of the sixteenth,

when it was succeeded by the Revivod, or Debased Classic, known as the Elizabethan. It is also known as the Florid, from the multiplicity, profusion, and minuteness of ornamental detail, and its more general name, Perpendicular, is derived from the mullions of the windows and the divisions of ornamental panel-work running in straight or perpendicular lines, which was not the case in any earlier style. The pointed arches are constructed from almost every radius. The most common doorway is the depressed four-centered arch (almost peculiar to this style) within a square head, having generally a hood-molding over, the spandrels being filled with quatrefoils, paneling, roses, foliage, small shields, or other sculptured ornaments. Fan-shaped roofs, ornamented with dependent pendants resembling stalactites, are also peculiar to the Perpendicular style. Richly decorated roof-trusses, which are left clearly visible, are also of frequent occurrence. In these roofs the spaces between the highly ornamented and molded beam

are filled with rich tracery, while the intersections and junctions of the woodwork are enriched with dependent carving and representations of foliage and figures. Westminster Hall is an instance of this description of roof. The roofs, when they are plain, are sometimes overlaid with boarding, and divided by ribs and panels.

**perpetual-motion**, *s.*

1. A motion which, once generated by mechanical means, should have the power of perpetuating itself.

"As the result of the vain search after the *perpetual motion* there grew up the greatest of all the generalizations of physical science, the principle of the conservation of energy."—*Encyc. Brit.* (ed. 9th), xviii. 533.

2. A machine, which, according to the hopes of its inventors, after it has been once set in motion, will keep in motion without drawing on any external source of energy. Such a machine would entirely controvert the established principle of the conservation of energy, and since the establishment of that principle the search for a perpetual motion has been judged visionary. So early as 1775 the Académie des Sciences of Paris placed the problem in the same category with the duplication of the cube and the quadrature of the circle, and refused to receive schemes claiming to have overcome the difficulty—in reality, to have performed the impossible. The overbalancing wheel was a favorite contrivance with the seekers after a perpetual motion. It appears as early as the thirteenth century. Perpetual motions have been founded on the hydrostatic paradox, on capillary attraction, on electricity and magnetism, but in every case the result has been a failure.

"Briefly, a *perpetual motion* usually means a machine which will create energy."—*Encyc. Brit.* (ed. 9th), xviii. 553.

\*3. A carrying on; prosecution. (*Hales*.)

¶ The word first became current in Christian circles in connection with "ten" persecutions of Christians under the Roman emperors. The first was the persecution under Nero, A. D. 64; the second, under Domitian, A. D. 95; the third, under Trajan, A. D. 106; the fourth, under Marcus Aurelius, A. D. 166; the fifth, under Septimius Severus, A. D. 198; the sixth, under Maximin I., A. D. 235; the seventh, under Decius, A. D. 250; the eighth, under Valerian, A. D. 258; the ninth, under Aurelian, A. D. 275; and the tenth, under Diocletian, A. D. 303. The arrangement is not perfect. If only persecutions general through the empire are counted, the number is fewer than ten; if local ones are taken into account, they are more numerous. When Christianity became dominant in portions of the Roman empire, it used the civil power for the overthrow of heathenism. The mediæval church persecuted all whom it considered heretics, and the Reformation in England everywhere had to struggle against persecution. When it became powerful enough, it also became intolerant to those who differed from it, passing and carrying out penal laws against Roman Catholics, dissenters, and unbelievers.

**II. Art:**

1. The science of representing appearances, and as such is opposed to geometry, which is the science of representing facts. It is founded upon such rules as can be deduced from the facts which are discovered by looking at objects through a sheet of glass or other transparent medium placed upright between the object and the observer. This is indicated in the etymology of the word. It is found when objects are so looked at that their apparent form is very different from their real one, both as regards shape and distinctness. The portion of the subject which deals with the changes in form is absolutely scientific; it is called Linear Perspective. The changes in distinctness are effected by distance and atmosphere, and differ constantly with different conditions of light and atmosphere. It is the purely artistic side of the science which is called Aerial Perspective, and success in its application depends upon the individual ability of the artist. The chief point with which Linear Perspective has to deal is the apparent diminution in size of objects as they recede from the spectator, a fact which any one can test by observing a long straight stretch of railway. The cross sleepers and the telegraph poles diminish in apparent size to the point of invisibility when they are far off on the horizon. It is the rules which govern such changes as these which are dealt with by Linear Perspective; while the fact that the same telegraph poles, black and brown and yellow when seen close, gradually put on a blue hazy color as they become more distant is one of the facts

dealt with by Aerial Perspective. A practical knowledge of the science is absolutely a necessity for a successful artist.

2. A kind of painting designed expressly to deceive the sight by representing the continuation of an alley, a building, a landscape, or the like.

¶ (1) *Isometric perspective*: [ISOMETRIC.]

(4) *Perspective plane*: The surface upon which the objects are delineated, or the picture drawn. It is supposed to be placed vertically between the eye of the spectator and the object. Also termed the plane of projection, or the plane of the picture.

3. That which is *perspired* or emitted by the pores of the skin.

II. *Physiology*:

1. *Human*: Watery matter "breathed out," or made to expire from the system by means of the pores in the skin. It is more copious than the matter sent forth from the lungs by respiration, averaging eleven grains per minute against seven from the lungs. The quantity varies greatly, and is affected by the amount of heat or dryness in the atmosphere, by the fluid drunk, by the exercise taken, by the relative activity of the kidneys, by medicine, &c. The relative proportions of sensible and insensible perspiration also vary; and sometimes, when, seeing drops on our skin, we believe that we are *perspiring* copiously, the increase is chiefly in the sensible kind, not in the total amount. Less than two per cent. of solid matter is contained in the watery vapor. The chief ingredients are: Sodium chloride, formic, acetic, butyric, and perhaps propionic, caproic, and caprylic acids; neutral fats, cholesterine, nitrogen, &c. Besides keeping the skin in a healthy, moist condition, and acting as a refrigerator, perspiration takes its share in carrying off superfluous or noxious matter from the system. If stopped, morbid consequences are sure, sooner or later, to ensue.

2. *Compar.*: The horse *perspires* freely all over the body; the pig does so on the snout; the cat chiefly on the soles of the feet; the dog from the same part, but not to the same extent. Rabbits, and the Rodentia generally, appear not to sweat at all. (*Foster: Physiol.*)

3. *Vegetable*: Used also of the transudation of water through pores of plants. According to Hales, the perspiration of plants is proportionately seventeen times as copious as that of animals.

I. *Ord. Language*: That mental attitude which induces one to give preponderating importance to the evils and sorrows of existence; the habit of taking a gloomy and desponding view of things.

II. *Hist. & Philos.*: The name given to the system of philosophy enounced by Schopenhauer (1788-1860) in *Die Welt als Wille und Vorstellung* (of which the first volume was published in 1819, and the second some five-and-twenty years after), and by Von Hartmann in his *Philosophie des Unbewussten* (1860), though the feelings to which these writers gave utterance had previously a wide range both in time and space. The belief that "the times are very evil" has found expression in almost every philosophic and religious system at one period or other of its existence. But it was at the beginning of this century that Pessimism began to create a literature of its own, and to impart a somber hue to the writings of men not avowedly its disciples. As examples may be cited Byron's *Euthanasia* and Heine's *Fragen*. The adherents of this philosophy have for the most part belonged to the German races, Leopardi (1798-1837) being the sole Latin writer of note who has advocated pessimist theories.

"In their special and technical employment, optimism and pessimism denote specific theories elaborated by philosophers . . . the latter [to show] that existence, when summed up, has an enormous surplus of pain over pleasure, and that man in particular, recognizing this fact, can find real good only in abnegation and self-sacrifice."—*Encyc. Pĕs-tă-lōz'-zī-ăn-ĭsm (zz astz), s. [Eng. *Pestalozzian*; -ism.]

*Hist. & Education*: The system of education introduced by Pestalozzi. It brought no new principle

to bear upon the subject, but put in practice one already established, that education is rather a developing of the faculties than an imparting of knowledge. In his book, *How Gertrude Teaches her Children*, Pestalozzi lays down the following dicta:

1. Demonstration is the foundation of teaching.
2. Instruction should begin with the simplest elements, advancing step by step to the more difficult.
3. The first lesson should be mastered before attempting a second.
4. The true end of education to be kept in view.
5. The relation between teacher and scholar should be that of love.

It is the rendering of the East Aramæan *kepha*, a corruption or derivation from Heb. *keph*=a rock (Job xxx. 6; Jer. iv. 29), and was given by Jesus (John i. 40-42). Transliterated into Greek, with a termination, it became *Képhas* (Gal. ii. 9). Peter's real name was Simon (Matt. xvii. 25; Luke iv. 38, v. 3, 5, &c.), his father's Jonas (John xxi. 15), his brother's Andrew (Matt. iv. 18). Peter was born at Bethsaida (John i. 44), but had removed to Capernaum, where he had a house, being a married man (Matt. xviii. 14; Mark i. 30; Luke iv. 38; 1 Cor. ix. 5). For his call to be an apostle, see Matt. iv. 18; Mark i. 16-18; Luke v. 1-11; John i. 35-42. Three of the twelve were selected on three occasions by Jesus for special honor (Mark v. 37; Matt. xvii. 1, xxvi. 37), Peter's name standing first, though John was the disciple whom Jesus loved (John xix. 26, xx. 2, xxi. 20, 24). [PILLAR-APOSTLES.] The Power of the Keys was first bestowed on him (Matt. xvi. 13-20), though afterward also on the other apostles (cf. xviii. 1 with 18). Peter was of an impulsive temperament, generous, but too forward in speech (xvi. 22, 23), and rash in action (John xviii. 10). It was not natural cowardice, but because through his rashness he had committed himself, and was in danger of arrest, that made him deny his Lord (Matt. xxvi. 51-75). After the Ascension, he was for a time the most prominent of the apostles (Acts i. 15, ii. 14, &c., iii. 1-26, iv. 8, 9, v. 1-16), and though specially sent to the Jews (Gal. ii. 8), yet had the privilege of being the first to admit Gentiles into the church (Acts x. 1-48). Afterward he was somewhat cast into the shade by the eminence of St. Paul, and on one occasion dissembling his liberal views when in narrow Judaic company, was withstood by St. Paul to the face "because he was to be blamed" (Gal. ii. 11). Tradition makes him die as a martyr at Rome, about A. D. 64, crucified with his head downward. Roman Catholics claim him as the first Bishop of Rome, and consider that the authority delegated him by Jesus appertains also to his successors, the Popes of Rome.

¶(1) **The First Epistle General of Peter**:

**New Test. Canon**: An epistle which claims to have been written by the Apostle Peter (i. 1), apparently from Babylon (v. 13), "to the strangers scattered throughout Pontus, Galatia, Cappadocia, Asia, and Bithynia" (i. 1), all places in Asia Minor. These strangers were obviously Christian converts, the majority apparently Gentiles (i. 14, ii. 10, iv. 3). Their churches were in charge of elders (v. 4). They were in suffering (i. 6), which the apostle foresaw

would deepen into severe persecution (iv. 12-18). He exhorts them to steadfastness, to careful avoidance of crime and scandal (ii. 12, iv. 15), to humility (v. 5-6), and the proper observance of their duties of subjects, servants, husbands or wives, brethren in a natural or spiritual sense (ii. 13-iii. 8), office-bearers, or members in Christian churches (v. 1-5). The epistle was probably carried by Silvanus (v. 12). St. Mark seems to have been with Peter when it was written (v. 13). Its date is uncertain, probably between A. D. 60 and A. D. 64. There is strong evidence for its authenticity, which has rarely been doubted.

(2) **The Second Epistle of Peter**:

**New Test. Canon**: Another epistle claiming to have been penned by the Apostle (i. 1), the author also referring to the transfiguration scene as one which he personally witnessed (i. 17, 18), and to a previous epistle (iii. 1). In this second letter he seeks to establish Christians in the faith, warns them against false teachers, and predicts the general conflagration of the world. Its style is different from that of the first. The language and sentiments of ch. ii. and part of iii. resemble Jude. When it was published, the epistles of St. Paul had been collected, and formed part of New Testament Scripture (iii. 15-16). The evidence for its authenticity is much less strong than that for the first epistle. Clement of Alexandria seems to have known it. It is not in the Peschito (q. v.); Cyprian ignored it; Origen and Eusebius placed it among the controverted writings, but it gradually obtained acceptance before the close of the fourth century.

From being sent to Rome it was called by the Saxons *Rome-feoh*, *Rome-scot*, and *Rome-pennyng*. The name *Peter-pence* arose from its being collected on St. Peter's Day. From being levied on every private and every religious house, the Abbey of St. Albans only excepted, it was called also *Hearth-money*. At first it was used chiefly for the support of an English college at Rome, then the Pope shared the gift with the college, and finally appropriated the whole. Edward III. forbade its being paid; but it was soon restored. The Act 21 Henry VIII. c. 21, passed in 1534, swept it away.

**A. Transitive:**

**I. Lit.:** To convert or change into stone or stony substance.

"Moss *petrified* with branching corallines."—*Mason: English Garden*, iv.

† A "*petrification*" is not, strictly speaking, a transformation of the original animal or plant into stone. It is merely a replacement of the organic tissue by mineral substance. As each particle of the plant or animal decays and disappears its place is taken, usually in water or mud, by a particle of mineral matter deposited from the water which has held it in suspension. Thus the perishable original is changed into imperishable stone, preserving its form and even its structural appearance when cut into. By such means have the skeletons of animals millions of years old been preserved in the rocks of the everlasting hills, so that they may be reconstructed to-day as they were ages before man appeared on the earth. But it is only the bones that are in this way kept; never the flesh, because water can not percolate through it. In the same way whole forests of trees in the Yellowstone region and elsewhere are changed into agate and other forms of stone, the hollow logs of the forest primeval being often found filled with beautiful crystals of quartz and amethyst.

The tenets attributed to him by Peter, Abbot of Cluny, who in 1141 wrote to confute him, were that persons should not be baptized till they reached years of discretion; that there should be no churches built, and that those already erected should be pulled down; that crosses should be abolished; that the sacred elements in the communion are only signs of the body and blood of Christ, and that the oblations, prayers, and good offices of the living do not profit the dead. Peter is regarded with much respect by some Protestants, who claim him as a reformer before the Reformation. His followers continued till the sixteenth century.

Chem.: Earth oil, naphtha, mineral oil, paraffin oil. A term applied to a variety of inflammable liquids found naturally in many parts of the earth, and formed by the gradual decomposition of vegetable matter beneath the surface. These liquids vary in color from a faint yellow to a brownish-black, and in consistence from a thin transparent oil to a fluid as thick as treacle, and their specific gravities range from .7-1.1. They are met with in most countries of Europe, but occur in abundance in Pennsylvania and other parts of the United States, and in Canada. Pelouze and Cohours have shown that these oils consist mainly of homologues of marsh-gas, and they were able to isolate by fractional distillation twelve members of the series [PARAFFIN, 1 (2)], gaseous, liquid, and semi-solid. A light petroleum oil is used all over the world for illuminating purposes, and a heavy oil for lubricating machinery.

Nat. Science: The study of the mineralogical and chemical composition of rocks; including the various changes they have undergone through physical and chemical agencies, either combined or separate. Macroscopic and microscopic examination, together with chemical analysis, are the methods pursued. If the rock is of sufficiently coarse texture, an examination by an ordinary lens suffices, but in rocks of fine grain a thin section is prepared, and, under the microscope, the individual mineral constituents are recognized by their specific structural and optical characters. The chemical analysis is performed either on the rock as a whole, or the mass is pulverized, and the mineral species of which it consists separated by certain fluid chemical compounds of known density, and the products of this separation separately analyzed.

The Gray Phalarope (*P. fulicarius*) is so called from the prevailing hue of its winter plumage; in summer the upper parts exhibit a mixture of black, white, and yellow; breast and under parts reddish chestnut. The idea that natural productions were engendered in a manner akin to the propagation of man and the lower animals is poetically expressed by Virgil (*Georg.* ii. 325-327) and Lucretius (i. 257, 599). Phallism appears to have been at first an independent cult, but was afterward adopted into other forms of worship, or it may have been the germ whence other forms sprang. Its origin is unknown. The Phoenicians ascribed its introduction into their worship to Adonis; the Egyptians to Osiris, the Phrygians to Atys, and the Greeks to Dionysos, but such a belief may well have arisen in many places in the infancy of the human race. According to Westropp (*loc. inf. cit.*, p. 31), three phases in its representation should be noted: (1) when it was the object of reverence and religious worship; (2) when it was used as a protection against malign influences, and especially against the evil eye; and (3) when it became the emblem of mere licentiousness (*Juvenal*, ii. 95).

I. Ordinary Language:

1. Lit.: In the same sense as II.

2. Fig.: A conceited and self-righteous religionist like the Pharisee described by Jesus, in Luke xviii. 10-14.

II. Judaism (pl.): The most numerous of the three divisions or orders of Judaism in the time of Christ, the other two being the Essenes and the Sadducees. They were so called because they kept aloof from Levitically impure food, separated themselves from the lawless people of the land, and united to keep the Mosaic law in accordance with Ezra vi. 21, ix. 1, x. 11; Neh. ix. 2, x. 28. They arose immediately after the return from the Babylonish captivity. As all the students of the law naturally joined this association, the appellation Member, Associate, *chaber*, or Pharisee, *parush*, became synonymous with student, disciple, lawyer, scribe. Accordingly, they represented the national faith of orthodox Judaism. Having to expound, to adapt to the vicissitudes of the commonwealth, and to administer such an extensive and gorgeous ritual as that of the Mosaic law, some of the Pharisees fell into extravagances, and laid more stress on trifling and petty formulæ than on the spirit of the law. Hence, the Talmud itself divides the Pharisees into seven kinds: (1) The *shoulder* Pharisee, who carries, as it were, his good works on his shoulders to boast of them openly, and is weighed down by his innumerable virtues; (2) the *time-gaining* Pharisee, who, when you ask for anything, always says, 'Let me go first to do a godly work;' (3) the *deducting* Pharisee, who says, 'Deduct from my many virtues the few vices I commit;' (4) the *saving* Pharisee, who says, 'I save from my small means to be able to spend it on good works;' (5) the Pharisee who says, 'Would that I knew what sin I committed that I might atone for it by doing a good work;' (6) the *God-fearing* Pharisee, and (7) the *God-loving* Pharisee (*Jerusalem Berachoth*, ix. 14; *Babylon Sota*, 22 b), the last two of which alone are to be commended." It is the first five kinds to whom the rebukes of Christ refer, and who have given rise to the term Pharisee being used as synonymous with a strict observer of external forms of religion without the spirit of it. Onesimus was most useful to his spiritual father (13), who, however, would not retain him, unless with his master's permission (14). He, therefore, sent him back, carrying the epistle with him, and counseling Philemon to receive him back, not now in a servile capacity, but as a brother beloved (16). Anticipating his speedy release, he also requested Philemon to prepare him a lodging (22). The epistle seems to have been written in A. D. 63 or 64, and to have been sent with the Epistle to the Colossians. Its genuineness is generally admitted.

[¶ *The Epistle of Paul the Apostle to the Philippians*.]

*New Test. Canon*: An epistle addressed by St. Paul, in conjunction with Timothy, "to all the saints in Christ Jesus which are at Philippi, with the bishops and deacons." Shortly after Paul had passed for the first time from Asia to Europe, he reached Philippi, then a Roman provincial capital and colony (Acts xvi. 12). It lay about nine miles inland. His first convert, Lydia, was from Thyatira, in Asia Minor (Acts xvi. 14; cf. Rev. i. 4, 11); his next was a certain damsel possessed with a spirit of divination (16-18) in connection with whom rioting occurred, followed by Paul's imprisonment, and the conversion of his jailer (19-40). Thus Paul was the founder of the Philippian church. Timothy was subsequently sent into Macedonia, and doubtless to Philippi (xix. 22), Paul himself following (xx. 1-6). (Compare with the facts regarding Timothy, Philippians i. 1, ii. 19-23.) The Philippians had oftener than once sent the Apostle pecuniary contributions (iv. 10-18), long being the only church which had done so. Epaphroditus had brought these gifts (ii. 25, iv. 18), and afterward, falling very dangerously sick (ii. 26, 27), Paul had sent him back that the Philippians might be assured of his recovery, apparently requesting him to carry with him the epistle (ii. 28). The Apostle when he sent the epistle was a prisoner in Rome (i. 7, 13; iv. 22). He expected release (i. 25; ii. 24), though martyrdom was by no means impossible. He expresses intense affection for the Philippians (i. 8), and thankfulness for their Christian character (i. 4). He counsels them to avoid strife, vain-glory, murmurings, controversies (ii. 3, 14), points to the Son of God as the exemplar of humility and self-sacrifice (ii. 5-11), and warns his readers against Judaizing teachers (iii. 2-11), and immoral and self-seeking men (18, 19). The Christians sending salutations to the church at Philippi were chiefly of Cæsar's household (iv. 22). The genuineness of this epistle is generally admitted, though Baur (1845), and Schwegler (1846), held the contrary view. Its date was probably early in A. D. 63.

1. The term is said by *Diogenes Laertius* (Proem) to have been suggested by *Pythagoras* [B. C. 570-504 (?)], who, on being complimented on his wisdom, said that he was not wise but a lover of wisdom, the Deity alone being wise. The salts formed by the alkalies and metals are highly crystalline.

*Chem.*: C<sub>6</sub>H<sub>6</sub>O<sub>3</sub>. Phloroglucol. Formed from phloretin by the action of potashlye. The phloretate of potash produced is removed by alcohol, and the residue, after neutralizing with sulphuric acid and evaporation, deposits crystals of phloroglucin, which may be purified by re-crystallization. The hydrated crystals belong to the trimetric system, are sweeter than cane-sugar, neutral, permanent at common temperatures, and melt at 220°. They dissolve in water, alcohol, and ether, strike a violet-red color with ferric chloride, and reduce copper salts like dextrose. 2. *Bot.*: The typical genus of the family Phœnicidæ (q. v.). Dioecious trees with pinnate leaves; calyx three toothed; petals three, stamens six, rarely three or nine; filaments very short, ovaries three, only one coming to perfection. Habitat, Northern Africa and Southern Asia. Known species about twelve. *Phœnix dactylifera* is the Date Palm (q. v.). *P. sylvestris* is the Wild Date, a tree thirty or forty feet high, very common, both wild and cultivated, in India. The fibrous leaflets and the fibers from the petioles are manufactured into mats, ropes, and baskets; sugar is made from the sap of the tree, which, moreover, yields gum. The juice of *P. farinifera*, a small species in sandy parts of India, yields sago; its leaves are used in mat-making, and those of *P. paludosa*, which grows in the Sunderbunds, for rough ropes and thatching. The fruit of *P. acaulis*, a stemless species from the Sub-Himalayas and Central India, is eaten by the natives, and the pith is made into sago.

3. *Entom.*: *Cidaria ribesaria*, a geometer moth, the larva of which feeds on currant and gooseberry bushes.

4. *Mythol.*: A fabulous female bird of Arabia, which was feigned to live for five or six hundred years in the desert, when she built for herself a funeral pyre of wood and aromatic gums, to which she set fire by the fanning of her wings, and so consumed herself; but from the ashes she sprang up again in youth and freshness. Hence the Phœnix is frequently found depicted as an emblem of immortality. In heraldry the bird is represented in coat-armor in flames.

2. An instrument for recording and reproducing sounds, invented by Mr. T. A. Edison. It consists of a cylinder of brass, mounted axially upon a steel screw, the pitch of which corresponds with that of a spiral groove on the outside of the cylinder. Attached to the baseboard by a movable arm is a mouthpiece with a diaphragm, from the center of the under surface of which projects a steel point. To use the instrument, the cylinder is covered with tinfoil or wax, paraffine, or other inelastic, easily indented substance, and the arm so adjusted that when the axle is revolved, the whole of the groove on the cylinder will pass in succession under the point. On speaking into the mouthpiece, at the same time turning the cylinder, every vibration of the diaphragm causes the point to make a corresponding mark upon the tinfoil. The arm being temporarily turned back, the cylinder can now be set back to its original position, and on turning it with the mouthpiece in position as at first, the stylus, traveling over the indentations in the type-laden tinfoil, causes the diaphragm to vibrate as before, thus producing the original sounds.

1. The property which many substances and organic beings possess of emitting light under certain conditions.

2. A phosphoric light.

"A large number of substances . . . emit in darkness a phosphorescence."—*Ganot: Physics*, § 626.

¶ Becquerel traces five causes of phosphorescence: (1) Spontaneous action; (2) Elevation of temperature; (3) Mechanical action, as friction, percussion, or cleavage; (4) Electricity, and (5) Insolation. Examples of No. (1) may be seen among plants in certain fungals, also at times in decaying wood. Among animals, some of Cuvier's sub-kingdom Radiata have the power of emitting

light in the dark, especially if they are disturbed, and the phosphorescence of the sea in tropical, and even at times in temperate climates, is attributed to a small infusorial animalcule, *Noctiluca miliaris* [NOCTILUCA], aided by *Physalia utriculus*, and other Medusæ, Tunicata, Annelids, &c. On land, of insects, some millipedes, the female glow-worm, and the fireflies, emit light. In the glow-worm the light is from the under side of the final segments of the abdomen. In the case of various Elateridæ the phosphorescence is from a small, white, oval spot on each side of the thorax. The phosphorescence of fish in a cupboard is well known; also of decaying animals in marshes.

The gas evolved is passed through a tube surrounded with a freezing mixture, which condenses this compound as a colorless and highly refractive liquid. In contact with air it inflames instantly. Solid phosphide,  $\text{HP}_2$ , formed by the action of light on the liquid phosphide,  $5\text{H}_2\text{P} = 3\text{H}_3\text{P} + \text{HP}_2$  (solid phosphide).

**phōs'-phōr-ūs**, \***phōs'-phōr**, *s.* [Latin, from Gr. *phōsphoros*=bringing or giving light: *phōs*=light, and *phoros*=bringing; *phero*=to bring; Fr. *phosphore*; Sp. & Ital. *fosforo*.]

1. *Ordin. Lang.*: The morning-star; Phosphor (q. v.).

2. *Chem.*: Symbol P; atomic weight=31. A non-metallic pentad element. Found in a state of combination in the unstratified rocks, the soil, the organism of plants, and the bodies of animals. Discovered by Brandt in 1669. It is prepared from powdered calcined bones by treating them with two-thirds of their weight of sulphuric acid diluted with water, evaporating the liquid portion, and, after mixing with charcoal, desiccating by heating in an iron vessel. The dry mass is then introduced into a stone retort, heated, and the phosphorus evolved collected under water. It resembles imperfectly bleached wax, is soft and flexible at common temperatures; specific gravity, 1.77; vapor density, 4.35; melts at  $42.2^\circ$ , and boils at  $287^\circ$ . On cooling, it sometimes forms dodecahedral crystals. It is insoluble in water, and is kept in that liquid, but dissolves in native naphtha and bisulphide of carbon; is very inflammable, and sometimes takes fire from the heat of the hand. A remarkable modification exists under the name of amorphous phosphorus, prepared by exposing common phosphorus to  $250^\circ$  for fifty hours. It is a reddish-brown infusible substance, insoluble in bisulphide of carbon; specific gravity, 2.089-2.106. It is not luminous in the dark, and can be reconverted into ordinary phosphorus when heated to  $260^\circ$ . Used on a very large scale in the preparation of safety matches. [BOLOGNA-PHOSPHORUS.]

3. *Pharm.*: It has been given in small doses in intercostal and trigeminal neuralgia, psoriasis, eczema, and goiter; but even in minute doses it is dangerous. In larger ones it produces jaundice, vomiting, hæmorrhage, and death.

Phosphoric anhydride,  $P_2O_5$ , formed when dry atmospheric air is passed over burning phosphorus contained in a suitable apparatus. It is obtained as a snow-like powder, having a great attraction for water. When thrown into the latter it combines with explosive violence. It is readily volatilized.

**phosphorus-poisoning**, *s.*

*Chemistry*: Phosphorus, especially when finely divided, is highly poisonous. Fatal effects are sometimes produced by very small doses, the use of 11 grain having ended fatally. Some hours often elapse before the worst symptoms appear, consisting generally of a burning pain, vomiting, and, after two or three days, jaundice, and large effusion of blood. It is not very amenable to antidotes unless they are applied at an early stage, but an emetic should at once be administered, in the form of 10 grains sulphate of zinc or 30 grains of powdered ipecacuanha; or, if these are not at hand, some mustard in hot water. One dram of French oil of turpentine should then be given floating on water, and repeated in half-dram doses every half-hour for some time.

A photographic negative of the subject required is printed on a film of gelatine which has been treated with bichromate of potash, to render it sensitive to the action of light. Those parts on which the light has not acted are soluble in water, and are washed away, leaving the printed parts that are insoluble in relief. From this relief a mold in wax is taken, and an electrotype made in the usual way. Unless special means are taken to translate the half-tones of the photograph into line or stipple, this process is only available for reproducing drawings, etc., in black and white.

**phō-tō-ēn-grāv'-īng**, *s.* [Pref. *photo-*, and Eng. *engraving* (q. v.).]

1. A term applied to processes for producing printing blocks or plates by photography. The most commonly employed process is to coat a metal plate with a thin film of asphaltum, and expose it to light under a reversed positive. The picture is next developed by dissolving away the parts of the asphaltum not acted upon by the light, and the plate is subsequently etched in the usual way. This process is sometimes called Photo-aquatint. The second method is more elaborate. A film of bichromatized gelatine, on a sheet of glass or a copper plate, is exposed under a photographic negative, and the unprinted portions which are soluble in water washed away, leaving the printed parts in relief. The plate with the relief is next coated with a film of silver by electro-deposition, and placed in an ordinary electrotyping bath, in which it is allowed to remain until a shell of copper from one-sixteenth to one-eighth of an inch thick (according to size of plate) is formed. This, after the rough excrescences have been removed by filing, becomes the printing plate. It can be worked upon by an engraver, if necessary, to remove photographic defects, and is printed on a copper-plate press. When a relief block is required, a reversed negative is used to print from, and the etching is carried to a much greater extent. These processes answer for subjects in black and white, as well as in colors. By printing from the half-tone block twice or more and having the impression slightly off register, beautiful results have been obtained. This is also the system by which conversion of the half-tones of a photograph into an ordinary printing block or plate has become so eminently successful. [PHOTOGRAVURE, PHOTOELECTROTYPE.]

2. The process of making photoelectrotypes. [PHOTOGRAVURE.]

**phō-tōg'-ra-phỹ**, *s.* [Pref. *photo-*, and Greek *graphō*=to write; Fr. *photographie*.] The art of producing pictures by the action of certain sensitive substances, under the influence of light. It may be said to have sprung from the discovery, some three hundred years ago, that the luna cornea of the alchemists—i. e., fused silver chloride—would darken on exposure to light. Nothing more was known until in 1777 Scheele, the Swedish chemist, noticed that the power which produced this darkening resided chiefly in the violet end of the solar spectrum. In 1802 Thomas Wedgwood published his method of taking profiles, upon paper or white leather treated with nitrate of silver, and exposed to the light of the sun under the object to be represented. For many years no method was known of fixing the picture, i. e., of dissolving away the unaltered sensitive salt; but the difficulty was eventually overcome by Sir John Herschel, when he suggested the use of hyposulphite (thiosulphate) of soda, a salt now used for the same purpose. M. Niepce was the first worker with bitumen of Judæa, which loses its solubility in certain media when exposed to the light, and his method has since been enormously developed as the basis of photoetching, and many other processes. The year 1839 was one of paramount importance in the history of photography, for then Henry Fox Talbot published his calotype process, in which paper, having on its surface chloride of silver, was exposed in a camera obscura (q. v.), and the image developed by a solution of gallic acid. The discovery of this kind of development, which marks an epoch in the history of photography, is due to the Rev. J. B. Reade. The pictures so produced were negatives (q. v.), and from them positives were obtained by exposing to light, under them, another sensitive sheet. The substitution, in the next year, of silver iodide for chloride, greatly improved the process, which was now thoroughly workable, and by its means many beautiful results have been obtained. In the same year, Mungo Ponton observed the sensitiveness to light of paper containing bichromate of potash. This phenomenon, the true nature of which was explained by Becquerel in 1840, has given birth to the carbon process, the Woodburytype (q. v.), and many others. The world-famous Daguerreotype process was also published in 1839, a film of silver iodide on a plate of silvered copper being the sensitive material, the pictures on which were developed by the vapor of mercury. This process is still used for making photographs from which accurate measurements are to be taken. In 1850 the art of photography was greatly advanced by the introduction of Mr. Scott Archer's process, in which the sensitive iodide and bromide of silver are held in a film of collodion, on glass, the image being developed with pyrogallic acid, or a ferrous salt. The next great step forward was the adoption of alkaline development for dry plates. The collodion process (q. v.) still holds its own for many purposes, and was generally employed until a few years ago, when the art was once more completely revolutionized by the introduction of gelatine, which may be

spread either upon glass or paper, as a medium for holding the sensitive salts. The sensitiveness of these gelatine plates is so great that photographs of express trains in motion, leaping horses, and birds on the wing are of everyday occurrence. [KINETOGRAPH, MUTOSCOPE, VITASCOPE.] The so-called "New Photography," by means of which it is possible to obtain a shadow picture of the bones in a living body, or of a foreign metallic object, such as a bullet, imbedded in the flesh, is treated of herein under its more appropriate title RADIOGRAPHY (q. v.). The application of photography to astronomy has been attended, of late years, with truly remarkable results, for we have now pictures of every object in the heavens, from the nebula in Orion to the spots upon the face of the sun himself. Photographs in color, upon silver chloride, and even photographs of sound waves have been exhibited. [CALOTYPE, CAMERA-OBSCURA, CARBON-PRINTING, COLLODION-PROCESS, HELIOTYPE, PLATINOTYPE, POSITIVE, SILVER-PRINTING, STANNOTYPE, WOODBURYTYPE.]

**phō-tō-gra-vüre**, *s.* [Fr.] A term applied to methods of producing, by photography, plates for printing in a copper-plate press. The processes are kept secret; but, in one of them, the translation of photographic half-tones into the corresponding grain required for printing, is said to be effected by the aid of a substance which crystallizes when exposed to light, the size of the crystals depending upon the amount of light they receive. Such a substance, exposed under a negative, will give a surface, the grain of which will exactly correspond with the lights and shades of the picture, and from which an electrotype can be made for printing purposes.

A sheet of suitable paper is coated with gelatine containing bichromate of potash, and exposed under a negative. The surface is then inked with lithographic transfer ink. The paper is next floated, face upward, in hot water, until the unaltered gelatine swells; then the superfluous ink and soluble gelatine are removed by gentle sponging with hot water. The resultant image is transferred to stone and printed by lithography (q. v.). There are other methods: In some the stone itself is coated with sensitive gelatine; or an exposed sheet of paper coated with gum arabic and bichromate of potash may be damped and transferred to the stone at once. The gum not rendered insoluble by the action of light adheres to the stone. The ink subsequently applied only adheres where there is no gum. Proofs are taken by lithography.

A parallel beam of powerful light is reflected from a silvered diaphragm, and received in a paraboloidal mirror, in the focus of which is a selenium "cell," connected with a battery and Bell telephone. Any sounds which cause the diaphragm to vibrate produce a corresponding variation in the reflected light, which in its turn alters the resistance of the selenium cell to the current from the battery, and so reproduces in the telephone the original sounds.

The model stands in a studio of special construction, in the center of a circle of twenty-four cameras, by all of which he is photographed at the same moment. The twenty-four negatives are then projected in succession upon a screen by means of an optical lantern, and the artist goes over the outline of each with the tracer of a pantagraph, a cutting tool acting upon a lump of modeling clay, mounted upon a turntable, being substituted for the usual pencil. After each photograph is gone over, the clay is turned through fifteen degrees, and when a complete revolution has been effected, it is removed and finished by hand.

*Science*: The science or doctrine which teaches that a relation exists between the several faculties of the human mind and particular portions of the brain, the latter being the organs through which the former act. That the brain, taken as a whole, is the part of the human body through which the mind operates, had been from ancient times the general belief; but the localization of the several faculties was first attempted by Dr. Franz Joseph Gall, who was born at Tiefenbrunn in Suabia, March 9, 1757; first promulgated his views in a course of lectures in his house at Vienna in 1796; gained, in 1804, a valuable coadjutor in Dr. Spurzheim; journeyed with him in 1807 to Paris, where a commission appointed by the Institute reported very unfavorably of his system; and died Aug. 22, 1828. When Spurzheim visited Edinburgh, he met Mr. George Combe, who adopted his views, and in 1819 published *Essays on Phrenology*, ultimately developed into his *System of Phrenology*, which became very popular. Gall enumerated nearly thirty, Spurzheim thirty-five, mental faculties which he considered as primitive. These Spurzheim divides into moral, or affective, and intellectual. The affective faculties are subdivided into propensities producing desires or inclination, and sentiments, which along with this excite some higher emotion. The intellectual faculties are similarly divided into perceptive and reflective. They were then localized on the brain, or rather on the skull, for phrenology during life can observe only the skull of an individual, and even that with flesh, skin, and hair intervening; and there is not always a correspondence between the form of the skull and that of the brain. The phrenological charts will show the localities of the various organs.

I. Affective propensities:

1. Amativeness; 2. Philoprogenitiveness; 3. Inhabitiveness; 4. Adhesiveness; 5. Combativeness; 6. Destructiveness; 7. Secretiveness; 8. Acquisitiveness; 9. Constructiveness.

II. Sentiments:

10. Self-esteem; 11. Love of approbation; 12. Cautiousness; 13. Benevolence; 14. Veneration (situated on the crown, between 13 and 15); 15. Firmness; 16. Conscientiousness; 17. Hope; 18. Marvelousness; 19. Ideality; 20. Mirthfulness (Wit); 21. Imitation; 22. Individuality; 23. Configuration; 24. Size; 25. Weight and Resistance; 26. Color; 27. Locality; 28. Calculation; 29. Order; 30. Eventuality; 31. Time; 32. Melody; 33. Language; 34. Comparison; 35. Casuality.

Phrenological Charts.

In constructing these terms Spurzheim says:

"I have employed the term *-ive* as indicating the quality of producing, and *-ness* as indicating the abstract state: I have therefore joined *-iveness* to different roots or fundamental words."—*Physiognomical System* (1815), p. ix.

Spurzheim seems to have considered the most unassailable point in phrenology to be the connection between amativeness and the cerebellum. He says:

"Indeed, it is impossible to unite a greater number of proofs to demonstrate any natural truth, than may be presented to determine the function of this organ."—*Ibid.*, pp. 277, 278.

body produced by the action of ammonia on phthalic anhydride. It forms a mass of silky, flexible needles, soluble in water, melts at 130°, and sublimes at a higher temperature.

**phthāl'-ā-mīne, s.** [Eng. *phthal(ic)*, and *amine*.]

*Chem.*:  $C_8H_9NO_2$ . An oily body heavier than water, produced by the action of ferrous acetate on nitronaphthalene, treating the crude product with sulphuric acid, and precipitating by ammonia.

It crystallizes in small rhombic plates which melt at 65°, is slightly soluble in cold, more so in hot water, and is readily oxidized to phthalic acid, by an alkaline solution of potassic permanganate.

**phthāl'-īc, adj.** [English (*na*)*phthal(ene)*; -ic.] Derived from or contained in naphthalene.

*Music*: A musical instrument, the sounds of which are produced by blows from hammers, acted upon by levers called keys. This is probably the most widely-known and generally-used musical instrument in the world. Although slight improvements are from time to time made in its mechanism, it may be described as the perfected form of all the ancient instruments which consisted of strings struck by hammers. Originally the strings were placed in a small and portable box, and struck by hammers held in the hands. In this early shape, known as the "Dulcimer," the instrument can be traced in nearly every part of the globe, and it now survives, almost in its original form, both in Europe and Asia. The dulcimer was also called psalter, sautrie, or sawtry. The name given to the first instrument with keys acting on hammers was clavicytherium, or keyed-cithara, which was introduced in the fifteenth, or early in the sixteenth, century; next came the clavichord, or clarichord, sometimes called monochord, in which quills plucked the

strings; the virginal soon followed, which was an oblong instrument with an improved form of jack containing the quill; this was soon followed by the spinet, of similar construction but generally triangular in shape; then came the harpsichord, a vast improvement on its predecessors, having a more extended compass and often two manuals. The earliest form of pianoforte, early in the eighteenth century, was perhaps, in some respects, inferior to a fine harpsichord, but it possessed the elements of expansion, as now exhibited in a modern grand trichord pianoforte of more than seven octaves compass, with every gradation of sound, from pianissimo to a splendid fortissimo, and the most sensitive and delicate mechanism between the finger and the hammer.

It is the *pompilus* of the ancients; and Ovid (*Hal.* 101) calls it *comes ratium*. The connection between this fish and the shark has been accounted for in various ways; but it is probably a purely selfish one on the part of the pilot-fish, which obtains a great part of its food from the parasitic crustaceans with which sharks and other large fish are infested, and from the small pieces of flesh left unnoticed when the shark tears its prey. The pilot-fish is never, so far as is known, attacked by the shark; but that is probably because the smaller fish is too nimble for the larger one. Pilot-fish often accompany ships into harbor.

"Bedlam beggars with roaring voices,  
Stick in their numb'd but fortified bare arms  
*Pins*."

*Shakesp.: Lear*, ii. 8.

"Pins were made by hand of metal in the sixteenth century. Before that time small skewers of ivory or wood were used, just as the negroes in the country districts of the South use the long thorns of the haw-tree to-day. Many packages of pins may be bought now for the amount asked for a single pin in those days; yet each one of these little articles—so cheap that the least coin in any civilized country is large enough to buy many of them—requires very expensive machinery and the attention of several men and women to make it. The process of making the wire from which the pins are manufactured is of itself slow and complex, but it is not considered in pin-making, because the wire is made by one manufacturer and sold by him to another, who makes the pins. This wire comes in coils of great length, and is just the size of the body of the pin. It is first drawn between six or eight little rollers, to press all the bends and kinks out of it. The machine which does this also winds the wire carefully on a large reel; and this reel is placed on a spindle attached to the machine which makes the pins.

When a reel is put on the spindle a workman inserts the free end of the wire between two steel rollers, which draw it in and feed it properly to the cutters. After this it continues to feed itself. As the wire leaves the rollers it passes between two matched dies until it touches a gauge. Just as it does this the dies come together and clamp it firmly in a groove in their face. At the same time the machine cuts it off the proper length. The gauge then moves away, and a little punch forms the head, by striking the end which rested against the gauge. When this is finished the dies separate and deliver the pin into one of a great many grooves in the face of a wheel about a foot in diameter, and just as wide across its faces as the pin is long.

"As soon as the first pin leaves the dies, the feed rollers send the wire between them again, and the whole operation is repeated. When the pin is taken by the wheel it has no point; but as the wheel turns it rubs the pins against an outside band, which causes each one to roll in its groove, and at the same time carries them past a set of rapidly moving files, which rub against the blunt ends and sharpen them roughly. They next pass against the faces of two grinding wheels, which smooth the points, and then to a rapidly moving leather band having fine emery glued on its face. This gives them the final polish; and as they leave the band they are dropped into a box underneath the machine. This machine works so rapidly

that it makes seven thousand five hundred pins an hour. After this the pins are plated with tin to give them a bright, silvery appearance. They are prepared for plating by being first immersed in weak sulphuric acid, to

remove all grease, and then dried by being placed—a bushel or so at a time, with about the same quantity of sawdust—in a machine called a tumbling barrel. This is simply a cask suspended on a shaft, which passes through it lengthwise. The shaft is made to turn by means of a belt, and in doing this it revolves the barrel. Two or three hours' rolling in this sawdust cleans the pins and wears away any little roughness which the machine may have caused. Pins and sawdust are taken together from the barrel and allowed to fall in a steady stream through a blast of air. The sawdust being the lightest, it is blown over into a large, room-like box, while the pins, being heavier, fall into a bin below. After this they are spread out in trays, having sheets of zinc in their bottoms, which have been previously connected with one of the wires of an electric battery. The trays are then placed in a tank containing a solution of tin in muriatic acid, and the other wire of the battery is inserted in the solution. Electrical action immediately begins, and deposits metallic tin on the entire surface of each pin. They are then washed in a tank of water and put into other tumbling barrels with hot sawdust. When they have been dried and cleaned of the sawdust, as in the former instance, they are put into a large, slowly-revolving copper-lined tub,

which is tilted at an angle of about 45°. As this revolves the pins keep sliding down the smooth copper to the lower side. This constant rubbing against the tub and against each other polishes them.

“It was the practice formerly to allow pins of all lengths to become mixed in the different operations, and after polishing to separate them by a very ingenious machine; but it has been found more economical to keep each size to itself. From the polishing tub the pins are carried to the ‘sticker,’ where they fall from a hopper on an inclined plane in which are a number of slits. The pins catch in these slits, and, hanging by their heads, slide down the incline to the apparatus which inserts them in the paper. As the number of pins in a row on the paper and the number of slits are the same, an entire row is stuck at once by an ingenious device, which takes one pin from each slit and inserts them all at once in the two ridges which have been crimped in the paper by a wheel that holds it in place to receive the pins. At the same time this wheel crimps the paper it spaces the rows, so that when filled with pins the paper will fold up properly. This whole machine is so delicate in its action that a single bent, or otherwise imperfect pin, will cause the machine to stop feeding until the attendant removes it; yet its operation is so rapid that one machine will stick ninety thousand pins an hour. As the long strip of paper on which the pins are stuck comes from the machine, it is cut into proper lengths by girls, who then fold and pack the papers in bundles ready for shipment.”—*Harry Platt, in The Youth's Companion.*

*Mach.*: A device so fitted as to occupy the sectional area of a tube and be capable of reciprocation by pressure on either of its sides. It may be of any shape corresponding accurately to the bore of the tube; but the cylindrical form is almost exclusively employed for both, as in the common pump and the steam-engine. One of its sides is fitted to a rod, to which it either imparts reciprocatory motion, as in the steam-engine, or by which it is itself reciprocated, as in the pump. In the former case, it has no opening leading from one side to the other, and is termed solid, though generally not really so; but in the latter, an aperture controlled by a valve permits the passage of the fluid from one side to the other during its downward movement. A distinction is, however, made in pumps; the solid piston being known as a plunger, the hollow piston as a bucket. The piston usually requires packing to cause it to fit closely within its cylinder and at the same time allow its free backward and forward movement.

5. *Mining*: A lode or portion of a lode let out to men to work by the piece or by a percentage of the output.

6. *Music*: Musical sounds give to the mind a feeling of acuteness or gravity according to the rapidity or slowness of the vibrations producing them; hence, the former are called acute or high, the latter grave or low. The absolute pitch of sounds is measured by giving the number of vibrations per second which produce a given sound, e. g., C=528; the relative pitch of sounds is described by giving the ratio of vibrations of the interval, e. g., a fifth is 2:3—that is, the higher sound of any interval of a fifth gives three vibrations, while the lower sound in the same time gives two. The determination of fixed pitch is purely arbitrary, and it has from time to time undergone great variations. In England we have high concert-pitch C = about 540, more or less, and medium-pitch C = about 528; on the Continent the French "diapason normal," C = 518, is being largely adopted. The official standard adopted in this country during the world's fair was what is known as international or "French" pitch, which gives as a standard middle A with 435 vibrations, although the majority of American upright pianos are tuned to high-concert pitch.

II. *Pathol.*: A peculiarly malignant fever of the continued and contagious type, now believed to be almost identical with the worst kinds of typhus fever. It is produced by the absorption of a poison generated by decaying animal matter combined with heat, moisture, and bad ventilation. The famines produced by the ravages of locusts, and the subsequent decay of their bodies, often generate it. The period of incubation varies from a few hours to three weeks. It chiefly attacks the cervical, axillary, inguinal, and mesenteric glands, producing buboes, carbuncles, &c. The "boil" from which Hezekiah suffered seems to have been the carbuncle of plague (2 Kings xx. 7, Isaiah xxxviii. 21). At first there is great restlessness, followed ultimately by corresponding exhaustion, and death supervenes in two or three days. Grand Cairo is the chief known focus of the plague, the spread of which, in different directions, is at least attempted to be checked by quarantine. The plague seems to have been the Black Death of the fourteenth century. It was known by the name of plague when, in 1665, it slew in London 68,596 people, about one-third of the population. The great fire of London (1666) obtains the credit of having banished the plague from the metropolis by destroying the fever nests which it had infested.

In the summer of 1896 a very malignant form of disease, known as the "bubonic" plague, made its appearance in Bombay, India, and spread with great rapidity. The number of cases and deaths finally became so large that a panic ensued, and more than 450,000 people—one-half of the population; fled from the city. The bubonic plague receives its name from the fact that it attacks the lymphatic glands in the neck, arm-pits, groin and other parts of the body. In general, the disease is spread in the same manner as cholera, except that the cholera germ must enter the intestinal tract, while the germ of the plague may attack any part of the mucous membrane, or be attended by even the minutest abrasion of the skin. But while this germ is so virile and so easily taken into the system it is one of the most easily killed by disinfection. One per cent. of quicklime will destroy it.

*Astron.*: A heavenly body which, to old-world observers, seemed to wander about aimlessly in the sky, thus markedly contrasting with the orderly movements of the fixed stars. Subsequently it was discovered that the seemingly erratic bodies were as regular in their movements as the others, revolving, like the earth, around the sun, the aberrations arising from the fact that both the planets and the observers were in motion. When they are comparatively near the earth and move thence to go round

the sun, they seem to go in one direction; when they return on the other side of their orbit, they appear to retrograde in the sky. Shining only with reflected light, they shine with a steady radiance in place of twinkling like the fixed stars. Planets are primary or secondary, the former revolving around the sun, the latter around the primaries. The primary planets known to the ancients were five: Mercury, Venus, Mars, Jupiter, and Saturn. Omitting asteroids, comets, and meteoric rings, eight are now known: Mercury, Venus, the Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. Twenty-one secondary planets are known, the Moon, two satellites of Mars, five of Jupiter, eight of Saturn, four of Uranus, and one of Neptune. The existence of an intermercurial primary planet has been suspected but not proved. The planets Mercury and Venus, being nearer than the Earth to the Sun, are called inferior planets; the others, being more distant, are termed superior. Another classification is sometimes adopted, that into intra- and extra-asteroidal planets; that is, those nearer and those more remote from the sun than the asteroids. Under the first are included, Mercury, Venus, the Earth, and Mars, all of which are comparatively small, while the others, Jupiter, Saturn, Uranus, and Neptune are the giants of the system. For instance, the Earth is 7,918 miles in diameter, and Mars 4,200, but Jupiter is 85,000. The intra-asteroidal planets complete the annual revolution in short periods, the Earth, for example, in 365<sup>2</sup>/<sub>26</sub> days, while Neptune takes to do so 60,127 days, or about 165 years. The minor planets, planetoids, or asteroids are between Mars and Jupiter.

¶ In this sense A. S. Palmer considers the word to be the O. Fr. *plant* = a plan.

#### II. Technically:

1. *Nat. Science*: Linnæus defined a plant as an organized body (being) possessed of life, but not of feeling. In his contrasted definition of an animal, he assigned the latter life, feeling, and voluntary motion, implying that if a plant moved it did not do so voluntarily. His definition is essentially accurate. With regard to all the higher members of the Vegetable and Animal Kingdoms, there is no difficulty in saying which is a plant and which is an animal. Some Mimosas, &c., have a certain sensitiveness when touched, but notwithstanding this they are clearly plants. But "Natura non facit saltus" (Nature does not make leaps, that is, abrupt transitions); and the humbler members of the two kingdoms are so closely akin, that whether sponges were animal or vegetable was once a debatable question, though now they are considered compound animals, while again many of Ehrenberg's Infusoria, once ranked as animals, now figure as humble Algae. Plants derive their nourishment directly from the mineral kingdom, animals do so only through the intervention of plants. The latter are, as a rule, composed chiefly of carbon, hydrogen, and oxygen; animals have nitrogen as well. Plants generally absorb carbon dioxide, and give forth oxygen; animals reverse the process. With slight exceptions cellulose and chlorophyll are distinctively vegetable productions. A plant consists of a root, of organs of vegetation, and organs of reproduction. It may be annual, biennial, or perennial (q. v.). It may be a herb, an undershrub, a shrub, or a tree. It may be evergreen, or have deciduous leaves. In winter there is a suspension of assimilative power and growth, like the hibernation of animals. The close of petals and the folding of leaves at night in some plants suggest their sleep. Like animals, sooner or later they die. DeCandolle conjectured that the known plants were from 110,000 to 120,000.

Much uncertainty exists as to the place in the system of many species of fossil plants, and scientific names frequently indicate that doubt. Though there is much doubt as to fruit, there is more as to leaves, for they often have the same form and venation in orders remotely apart from each other. Hence at present the vegetable unit is much less valuable than the animal in investigating fossils. The first appearance of plants seems to have been in the Silurian rocks; they were probably Algae. In the Upper Silurian, Acrogens and Conifers first

appear. The Acrogens greatly predominated during the Carboniferous period; the Cycads attained their maximum during the Jurassic and Lower Cretaceous. Dicotyledons began apparently before the close of the Cretaceous, and became dominant in the Tertiary.

A suitable paper is prepared by floating it upon a solution containing 60 grains of ferric oxalate and 60 grains of potassic chloro-platinate to the ounce. When exposed to light under the negative, the ferric oxalate becomes converted into ferrous oxalate in exact proportion to the amount of light it has received. The picture is developed by floating the exposed paper upon a solution of potassic oxalate, 130 grains to the ounce, at a temperature of from 170-180°. The ferrous salt formed by the action of the light reduces the platinum to a metallic state in the presence of the potassic oxalate solution, thus forming the image. A wash in dilute hydrochloric acid, 1 in 80, completes the process.

**plät-in-ōūs, a.** [*Eng. platin(um); -ous.*] Containing or consisting of platinum; of the nature of platinum.

**plät-ī-nūm, s.** [*PLATINA.*]

*Chem.*: Symbol, Pt. Atomic weight, 194.3; specific gravity=21.6. A tetrad metallic element discovered first in America, and still largely produced in this country; also found in the Ural chain, and in copper ore from the Alps. [*PLATINUM-ORE.*] The ore is treated with nitromuriatic acid, which dissolves platinum and palladium, the solution is then treated with potassic chloride, yielding the double salt of platinum and potassium—the palladium being left in solution. By igniting with carbonate of potash, the platinum is reduced to the metallic state. It still contains traces of iridium, which gives it greater hardness and tenacity. Pure-forged platinum takes a high luster, is nearly as white as silver, and very ductile and malleable. It resists the strongest heat of the forge-fire, but can be fused by the electric current; is the heaviest known substance excepting osmium and iridium, is unalterable in the air, dissolves slowly in nitromuriatic acid, but is not attacked by any single acid. Its properties render it extremely useful to the chemist for the construction of crucibles, evaporating dishes, and stills used in the concentration of oil of vitriol.

**platinum-antimonide, s.**

*Chem.*: An alloy formed by acting on spongy platinum with two parts of pulverized antimony. It unites with vivid incandescence, and when further heated fuses into a steel-gray fine-grained alloy.

*Chem.*: The chlorides, sulphates, &c., of platinum are capable of taking up ammonia and forming amines, e. g., the diammonio-platinous chloride = (H<sub>3</sub>N)<sub>2</sub>PtCl<sub>2</sub>, is obtained by neutralizing a solution of platinous chloride in hydrochloric acid with carbonate of ammonia, heating to the boiling point, adding to it ammonia, and allowing to cool. It deposits as a yellow crystalline salt. Methylamine combines with platinous chloride in a similar way, forming the compound, PtCl<sub>2</sub>(CH<sub>3</sub>N)<sub>4</sub>PtCl<sub>4</sub> a chrome-green powder.

**platinum-black, s.**

*Chem.*: Platinum in a finely-divided state. Obtained when alcohol is carefully added to a solution of platinous chloride in hot concentrated potash. When purified and dried it resembles lamp-black, condenses gas in its pores like charcoal, and converts alcohol into acetic acid.

*Chem.*: Pt'B. Obtained as a silver-white fusible compound, when boron is heated with platinum foil before the blowpipe.

**platinum-carbide, s.**

*Chem.*: PtC (?). A compound obtained by calcining organic platinum salts at a moderate heat. Is slowly attacked by nitromuriatic acid.

**platinum-chlorides, s. pl.**

*Chem.*: Platinum forms two chlorides: (1) Platinous chloride, PtCl<sub>2</sub>. Prepared by heating platinic chloride, by the aid of an oil bath, to 200°, until it becomes insoluble in water. It is a greenish-brown solid body, soluble in hydrochloric acid as dichloride, if protected from the air. It dissolves in caustic potash, and all the platinum is thrown down as platinum-black on the addition of alcohol. With metallic chlorides it forms double salts, most of which are highly crystalline. (2) Platinic chloride, PtCl<sub>4</sub>. Obtained by dissolving platinum in nitromuriatic acid and evaporating over the water-bath. It forms a brown-red mass, easily soluble in water, and combines with potassium chloride to form one of the most important double salts of platinum, K<sub>2</sub>PtCl<sub>6</sub>, insoluble in alcohol.

**platinum-iodides, s. pl.**

*Chem.*: Platinum forms two iodides: (1) Platinous iodide, PtI<sub>2</sub>, and (2) Platinic iodide, PtI<sub>4</sub>. They are obtained as black amorphous compounds on treating the corresponding chlorides with iodide of potassium.

**platinum-ore, s.**

*Chem.*: Usually found in thin scales or irregular grains, containing on the average 80 parts platinum, 2 iridium, 1 osmium, 2½ rhodium, 1 palladium, 1½ gold, 1 copper, 6 iron, and 5 of sand.

**platinum-oxides, s. pl.**

*Chem.*: Platinum forms two oxides. (1) Platinous oxide, Pt'O, obtained as a hydrate, Pt'OH<sub>2</sub>O, by digesting platinous chloride in warm potash. At a gentle heat it becomes anhydrous, and dissolves slowly in acids, forming unstable salts. (2) Platinic oxide, Pt''O<sub>2</sub>, obtained with difficulty by decomposing a solution of platinic sulphate with carbonate of calcium, and dissolving out the calcium sulphate and carbonate with weak acetic acid. It is a black powder, which dissolves in acids, forming uncrystallizable salts.

*Hist. & Philos.*: The philosophy of Plato, or rather that attributed to Plato, for though his writings exerted a marvelous influence over the minds of his successors, and, in a certain degree, over the early Christian Church, yet in those writings there is nothing like a connected system to be found. G. H. Lewes (*Hist. of Philos.* (ed. 1880), i. 220) says: "I come to the conclusion that he never systematized his thoughts, but allowed free play to scepticism, taking opposite sides in every debate, because he had no steady conviction to guide him; unsaying to-day what he had said yesterday, satisfied to show the weakness of an opponent." Nevertheless, he is of opinion that certain theoretical views, which frequently recur in the writings of Plato, in more or less modified form, may be loosely styled Platonic theories, though "they are sometimes disregarded, at others contradicted." These are (1) The theory of Ideas [IDEA]; (2) The doctrine of the Preexistence and Immortality of the Soul; and (3) The subjection of the popular divinities to one Supreme God.

¶ Niebuhr was of opinion that the Roman population consisted originally of patricians and their clients, and that a free plebs arose gradually, its organization being due to the elder Tarquin and Servius Tullius. In B. C. 494 the plebeians, smarting under the severe law of debt, seceded to the Mons Sacer, three miles from Rome, but were persuaded to return. They obtained, however, the institution of the Tribuneship, to which two of their number were appointed year by year. In B. C. 445 a law of Canuleius removed the prohibition of marriage between patricians and plebeians. The Licinian rogations, carried after a nine years' controversy (B. C. 375-366), threw open the consulate, to which Lucius Sextus, a plebeian, was soon afterward elected. The plebeians were admitted to the censorship B. C. 351, and to the priesthood B. C. 300.

*Dental Surgery*: A dental device that throws the sunken cheek outward, giving it an attractive plumpness. It is a plate with an artificial gum which fills the hollow cheek. The sinking of the cheeks is usually due to the recession of the natural gum caused by the loss of teeth, but sometimes the cheek is naturally sunken even when the teeth are intact. The insertion of a plumper into the mouth will instantly remove this facial defect. Plumbers are made of rubber, celluloid, or gold. The method of manufacture is simple. An impression of the roof of the mouth and the gums is taken in wax. A mold is made from the impression, and the mold used in making the plumper-plate. Where the natural gum is sunken the plate is simply filled out, so that when it is inserted in the mouth it will throw the cheek outward. The plate is held in place by suction. As a rule plumbers are made with artificial teeth also, although if the patient desires the plate alone is made. Where the jaw has been broken or is misshapen as the result of an accident the plumper proves very effective in removing the defect.
