MATERNAL SOLICITUDE.—*Drawn and Engraved for the American Agriculturist.*

A frisky young pig is not more unlike a staid old porker than is a baby elephant unlike the mature animal. A young elephant is a playful, odd-looking thing, appearing more like an animated mass of India-rubber than like an animal. It is tamed with the greatest ease, and those who have lived in the East inform us that, as it increases in size, its familiarity becomes oppressive. Petting a young elephant is all very well, until the animal gets large enough to pet

its owner, and strength of trunk accompanies strength of affection. When this occurs, the favorite must be sent away. Those who have described the habits of the elephant speak of the great care of the mother for her young; she will brave any danger in order to protect her offspring. The artist in the above striking picture shows the mother interposing her body between the javelins of the hunters and her child. It seems a pity that so noble a beast should be

slaughtered for its tusks, and it is still more to be regretted that large numbers should be killed for sport. The tusks, which are much larger in the male than in the female, weigh from 50 to 150 pounds; the largest recorded weight is 350 pounds. To supply the demand of the American market for ivory, about 4,000 elephants must be killed each year, and about twice that number are required to furnish the amount of ivory annually imported into England.

AMERICAN AGRICULTURIST.

NEW-YORK, JANUARY, 1869.

We have hosts of new readers, who join the ranks of old and well-tried ones, for whom we have the most friendly regard. To old friends, and to all who may join us, we begin the season and this new volume with the heartiest wishes of a HAPPY NEW YEAR.

One year of work is done and another begins. Merchants and mechanics get rich and retire; professional men generally, like old soldiers, repose on their laurels when the hardest part of their life's warfare is over; but the farmers, as a class, work on, and die in the harness. We might learn many a lesson from commercial men, who, to be sure, labor too exclusively for wealth, and think too little of health, intellectual enjoyment, and the comforts of life, and our lives would be much more comfortable if we were more thorough as business men. Not one farmer in five hundred knows how he makes his profits, or what they are. We know that we gain a fair living, that we get money from the sale of beef, or sheep, or corn; but what pays the best? On what do we expend labor to the greatest advantage? How is money invested in the farm or its appointments made to pay the best interest? We ought to have records of cash and labor expended, of materials and time consumed, that we can refer to for a satisfactory solution of such problems. How many of us can do so? Few have even an accurate record of the days' work hired, and the work done, and we believe that in a majority of cases where a good account is kept, the wife has a hand in it. All honor to such wives!

We stand at the beginning of a new year, and look forward and backward, like Janus with two faces, from whom this month is named. Our account-books, journals, and memorandum-books should be for us the retrospective face, and our course for the future should, as far as possible, be guided by experience; not that vague experience which is like a half-forgotten dream, and is well remembered only when a blunder twice made wakes us up to the knowledge that it is too familiar; but an experience aided by a well-quickened memory, made clear and definite by memorandums, jotted down upon the spot. Such is a safe guide, and we may all have it for next year if we have it not now.

Hints about Work.

Building.—Build, or make such alterations as may be necessary in old buildings. Trees may be felled, saw-mill logs be carted, and the lumber be piled up to season, if one is not yet ready to build.

Fuel.—If there is not a year's stock on hand, prepare it now without delay. Labor is cheaper, and many swampy places in the woods are accessible now, that cannot be reached in summer. If the wood is to be marketed, it is much easier to cart when well seasoned. If to be used at home, it makes a much hotter fire, and makes the good wife "mistress of the situation" when she has to prepare an early breakfast or an extra meal. Dry wood is an excellent means of grace in a household, promoting good temper and cheerfulness. Pack the wood-shed full, or if that institution has not yet been established, pile the wood in regular tiers, and put a few boards or slabs on top, to shed rain.

Clearing Land.—In open winters, forests and brush pastures can be cleared. But in attempting to clear wood-land, a man should consider if wood is not the best crop the land is capable of producing. Rocky land is sometimes cleared of trees to the great detriment of the farm. Pastures should always be kept clear of brush. It is directly in the way of grass—the great source of profit on all grazing farms.

Frost and Snow.—Keep a sharp look-out for damage from these sources. If the frost penetrate the cellar pipes may be burst and vegetables be injured. Bank the cellar walls well with earth or with snow, which is a good defence against extreme cold. Clear all snow from low, flat roofs, which a

great weight might crush, or where water banked up by drifts might come through. Break out the roads immediately after every snow fall with ox teams and inverted sleds. They are much more easily broken while the snow is fresh.

Ice Paths.—Severe falls may be prevented by sprinkling the slippery places about the house and yard with coal ashes, sand, or sawdust. The last is the most cleanly, and is easily obtained at saw-mills in the country, as well as in large towns.

Ice-houses.—We wonder that ice-houses are so rarely found upon the farmer's premises. They can be built of materials found upon the farm in a very cheap, substantial way, and would save many times the interest of the money invested every year. Buy a few nails, get boards and joists from your wood lot, and try your hand at an ice-house, filling the sides with sawdust or planing-mill shavings. See plans in back numbers of the *Agriculturist*. If the ice-house is ready, fill it as soon as you have ice six inches thick. The first ice formed is quite sure to be clear and solid, and is often the best of the season.

Fencing Materials.—Splitting rails and making posts is legitimate business for winter, and on most farms a few more are always wanted. Chestnut splits readily and endures exposure to the weather remarkably well. White cedar is still more durable, and the swamps are often accessible only in winter.

Draining can sometimes be attended to, if the winter is open. Springy land seldom freezes so deep that drains may not easily be dug. No work is more satisfactory in its results.

The Digging of Muck and Peat can sometimes be best done when the surface is frozen—making a solid bridge for carting it off. One can never have too large a stock of this on hand. Make piles of it near the barns, stables, and sties.

Manures.—Keep all the sources of supply, the yards, sties, and privies, well supplied with absorbents. The great error in all our farming is the neglect of the manure heap. Study constantly to increase this as the grand secret of success in farming. Keep your animals all stabled, or in close sheds, that all the manure may be daily thrown into heaps, and mingled with muck and other absorbents. Keep the manure under cover, if possible, and if not, compost it in heaps. From the manure of fowls, and night soil, an excellent fertilizer may be prepared for hills and drills. Almost all crops are benefited by these applications.

Fowls should have special attention. They can shift for themselves in summer if they have range enough, but now they are dependent upon man for the supply of all their wants. They should be regularly fed with a variety of food, and their roosts be kept scrupulously clean. If they have warm quarters or the run of a cold grapey, a few may be set the last of the month to bring early chickens. Animal food should be provided, if you wish fresh eggs. The breeding birds should now be selected for all kinds of poultry. Old geese should be chosen, and turkeys of two years old are much better than young ones. Old hens, as a rule, make better mothers than pullets.

Swine should have dry, warm sties, with well-littered yards. Breeding sows should be kept in good flesh, and as they approach the time of farrowing, each sow should have a pen by herself, with a plenty of clean straw. Store swine and pigs should be fed generously, and be kept growing. There is no profit in half feeding animals.

Sheep want good-sized yards, with deep sheds, opening to the south, to which they can have access during the day, and in which they can be confined at night. The ewes should not be suffered to lose flesh at all. Some farmers do a good business in fattening sheep for the spring markets. The pens should be kept constantly dry with absorbents. In feeding fattening sheep, see that each one gets a due allowance. The strong may be as much injured by over-feeding as the weaker ones by too little.

Horses.—Examine the shoes frequently and see that they are kept sharp. The best smooth-shod

animal is almost helpless on the ice. Horses do better without blankets, unless immediately after exercise. Break colts to the halter, and accustom them to the saddle and to gentle handling.

Cows.—It is poor policy to stint the feed of dry cows. Good keeping will tell upon the calf, and in the milk-pail next summer. Keep them in warm stables, and water four times a day. The use of the brush and card occasionally will pay. Roots come to a good market in their mangers.

Milk Cows should have succulent food, and meal, if you wish them to show all their good qualities. Feed generously, and keep the flesh increasing, as well as the milk.

Beves.—Most of our beef is made in summer pastures, but in the districts where corn and oil-cake are cheap, stall feeding will pay. They should have a variety of food, and roots are valuable. The fattening animals should be kept quiet, and in warm, well-ventilated stables. It is better that they should have but one attendant, and that they should be fed at regular hours.

Young Cattle should have as good treatment and quarters as the cows and oxen. The rapid growth they are making when they come in from grass should be kept up by good hay and roots. The bog hay and frozen butts, on which they are so often starved, are better used for bedding and the manure heap. Give them full, generous feed, and they will astonish you by their rapid growth.

Work in the Horticultural Departments.

As many new readers will look to these columns for hints, we will say a word about them. They are intended to point out the things necessary to be done, and give suggestions as to the way of doing them. Even the most experienced need a reminder of this kind, especially when there are many details to be looked after. One of our largest gardeners has a record made of each day's doings at his establishment, and with all his extensive experience he finds it necessary to refer frequently to this diary as a guide. "But your notes are the same thing, year after year," some may say. They are, in part, just as the seasons are the same, year after year. They derive their chief value from speaking of certain things at a certain time, and so far one year is like another. The warp remains the same, but the woof is constantly changing. The whole is always re-written, and such improvements as larger experience suggests are worked in, and often new processes are given here instead of devoting special articles to them. While all vegetation is in repose and our favorites are sleeping beneath the snow, we can study what will be best to do for them when the time of awaking comes. Every intelligent gardener will have some standard work upon the subjects in which he is specially interested. A glance at our book list will show that there are a plenty of such works. He is a poor gardener who does not do better this year than he did last, whether his operations extend over acres or are confined to the narrow limits of his door yard.

Orchard and Nursery.

The first thing to be considered is the care of young trees already planted.

Domestic Animals, if allowed access to a young orchard, will do much damage. Have fences and gates in good repair, to keep out all intruders.

Mice.—A mound of earth a foot high should have been formed at the base of each young tree; if this was not done, see that there is no litter near the tree to afford them shelter. After a snow fall, tramp the snow down solid around each tree, whether it has a mound of earth or not. This is some trouble, but if you plant a tree, it implies a contract to take care of it. Those having little trouble with their trees are seldom bothered with fruit.

Rabbits are often worse than mice. The old notion that rabbits would not touch a tree that had been rubbed with the flesh of one of their fellows has

its foundation in the fact that the animals have an aversion to blood. The blood of pigs or any other animal, sprinkled on the lower part of the tree, will answer as well as rabbit's blood. Cloth or stiff packing paper wrapped around near the ground and as high up as a rabbit will reach will keep them off; this is slow work where there are many trees.

What to Plant, if a new orchard is to be set in spring, is worthy of serious consideration. Many think that they have only to determine what are the best varieties and order them. The real question is, What are the best varieties you can grow? Get the experience of neighbors who grow fruit, or of the nearest intelligent and reliable nurseryman. If about to plant for market, recollect that productiveness, regularity in bearing, showiness of fruit, and an ability to bear transportation, are all of as much or more importance than quality. Do not be taken with the highly-colored pictures shown by travelling salesmen.

Cions should have been cut before severe weather, but may be cut now during a thaw. See note on their preservation in "Basket."

Insects.—Look over the trees, and if there appears to be a swelling just below the end of a twig, there will probably be found a cluster of the eggs of the tent caterpillar securely glued around it. Cut off and burn every one of these that can be found and there will be few nests to destroy next spring.

Pruning.—Winter pruning, except on young trees and nursery stock to bring them into shape, is not generally approved. Still it is better to remove the useless and crowded limbs of an old tree at this season than to neglect it altogether. Make a clean cut and cover it with melted grafting wax.

Root Grafting is done at any time during the winter, the stock and cions having been stored in an accessible place. Do grafting at the "collar" of the stock. Bits of roots should not be used.

Manure.—Cart out and spread upon the orchard.

Fruit Garden.

Every one who has land enough should have a separate enclosure for fruit. In a mixed garden, where vegetables and fruit are grown together, neither can be grown to the best advantage. The land should be drained, if at all disposed to be wet, and the soil deep, well worked, and of moderate richness. The care to protect the trees, etc., from injury is the same as noted under Orchard.

A **Succession of fruit** is to be planned for. By a proper selection a supply may be had every day through the fruiting season. Strawberries, raspberries, currants, blackberries, grapes, etc., are rarities with farmers, rather than an essential part of their every-day food. With a climate that allows all of these to be produced with the greatest ease, how many thousands fail to enjoy them! Let us have less meat and more fruit.

Kitchen Garden.

In the Southern States, whenever the condition of the soil will allow it, the hardy, early vegetables are sown in succession from January to April. The hardy vegetables include beet, carrot, parsnip, parsley, radish, turnip, onion, leek, lettuce, cress, cauliflower, cabbage, spinach, etc. Tender vegetables, such as cucumbers, melons, beans, tomatoes, etc., can only be sown with safety in the open ground, at corn planting time, or when the peach is in full bloom. These rules answer for any latitude.

Seeds.—Their quality and integrity are of the greatest importance. It is better to be at any trouble and expense to get good seed, true to its kind, than to take that which is doubtful for nothing. Purchase early of reliable dealers only. Seeds go by mail at the rate of two cents for four oz.; if in doubt about the quality offered by home dealers, send to those of known reputation.

The Vitality of Seeds can only be positively ascertained by sowing a counted quantity in a box of earth in a warm room. If three-fourths come up, the seeds may be considered of average good qual-

ity. Some seeds must be renewed every year, such as onions, parsnips, and leeks. The following should not be over two years old: beans, peas, peppers, carrot, egg-plant, okra, salsify, sage, and other sweet herbs. Those considered safe for three years are, asparagus, endive, lettuce, spinach, radish and parsley. Those which are good at the end of four years are, cabbage and its relatives, such as cauliflower, etc., turnips, and celery. Those good from five to ten years are melons, cucumbers, and all of the squash family, beet, and tomato.

Hot-beds for raising seedlings are to be started about six weeks before the time at which it will be safe to set out the plants. Sashes should be got ready; paint, if need be, and replace broken lights. Make new sashes; the usual size is 6x3 feet.

Straw Mats are of great use in covering hot-beds and frames at night. There are several ways of making them, and one of the simplest is to stretch five cords—strong twine or "marine," lay on the straw evenly, with the but ends towards the edges of the mat; then put above the straw five other cords directly over the lower ones, and sew through the straw with a coarse needle and twine, catching both cords. The cords may be stretched on a frame made for the purpose; the mats should be a foot longer than the sash and of its width or a half wider, so that two mats may cover three sashes.

Cold Frames.—Air in clear weather whenever the temperature is not below 20° in the shade. If snow covers the glass after a mild spell, remove it, but if the plants are already frozen, let it remain.

Manure is a thing of which the gardener cannot have too much. Carting is better done now than later. Place the manure in good-sized heaps, and when it begins to "smoke" turn it over. The heaps should be large enough to prevent freezing.

Flower Garden and Lawn.

But little can be done out of doors. Where improvements are contemplated, a plan should be drawn to a scale, and sufficiently large to serve as a guide in working. It will be found when the time comes to execute it that operations will be wonderfully facilitated by its use. Not only should walks, beds, etc., be properly laid down upon the plan, but the places for trees, shrubs, etc., should be indicated. Do all the thinking now and there will be no time lost in deciding where to place things at planting season. Where much money is to be expended on a place it will be cheaper in the end to employ a landscape gardener to make a plan.

Cold Frames, or cellars in which plants are stored for the winter, must be aired when the weather is not too cold. Keep the temperature uniformly low and just above freezing.

Trellises, Stakes, and all the little appliances that will be needed in spring, should be made and repaired while there is leisure.

Snow is apt to injure evergreens and dense shrubbery; shake out the accumulations before they become icy. Drifts around low-branching evergreens are apt to break off the lower branches as they settle, and should be shovelled away.

Green-house and Window Plants.

This division was formerly headed Green and Hot-houses. As very few amateurs grow hot-house plants proper, they generally falling to the care of professional gardeners, we shall leave them out and give more space to hints about window plants.

Temperature with house plants is less readily adapted to their wants than in the green-house. Very few plants will bloom below 60°, though they will keep healthy at a much lower degree.

Air is to be given in the green-house whenever the ventilators can be opened with safety. Window plants need a change of air and should have it whenever it can be given without chilling them.

Insects are easily kept under by fumigating.

Dust.—Arrange some kind of a shield of cloth or paper to put over the plants while sweeping.

Water is to be given only as the plants need it.

AMERICAN AGRICULTURIST.

ORANGE JUDN & CO., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies: Four to nine copies, \$1.25 each: Ten to nineteen copies, \$1.20 each: Twenty copies and upwards, \$1 each. Papers are addressed to each name.

FOR

Large Pay

Little Work.

"Large Pay for Little Work" is what everybody is looking after, and this is just what we offer to one or more persons at every post-office, or in every neighborhood in the United States and Territories, in British America, and in other countries.

Can People Get It? Yes, easily. A great many thousands have done so during the past half dozen years, and what has been done by these can just as easily be done by at least eighty thousand people this very year.

How?—Answer.—Here is a good paper, full of carefully prepared, practical information, and containing at least \$12,000 worth of fine engravings during the year. It is useful to everybody. Everybody who takes it, besides the pleasure derived, will be pretty sure to get from the thousand columns of reading matter some hints, some suggestions, or some trains of thought started, that will in the end repay him tenfold, very often a thousand fold, for the small subscription price.

Well, it only needs one or more persons in the vicinity of every post-office to take a copy of the paper and show it, and explain its value, in order to get a large number of people to subscribe for and receive it regularly.—To every person who does so, and forwards to us a dozen or more subscriptions, we present a first-rate article from our premium list, (see table in 3rd column) just such an article as he or she may desire, either for personal use or for sale. (Many persons canvass as a business, receive the premiums, sell them for cash, and thus secure a large salary.) By large cash purchases, at wholesale prices and less, and by advertising arrangements with manufacturers, etc., we are able to pay much larger commissions to canvassers in the form of premiums, than we could possibly give in cash, while the premium articles are fully worth the prices named for each. Indeed, they are often worth more, for we carefully select them, guarantee their quality, and those getting them through us as premiums, avoid all risks of dealing with unreliable parties, or of getting poor articles. To understand how we can afford such large premiums, and why we give them, read the "EXPLANATION" in the next column.

Who Get the Premiums?—Answer.—Men, women, and children, in every station. Our books show that many Ladies have secured sewing machines etc., for their own use, while others support their families by the sale of articles they receive as premiums from us for clubs of subscribers. In this way, by two or three months' work they have realized from \$250 to \$700 each. One lady canvassed in Western New York and Ohio last year, and made about \$1,500 in six or seven months; and she has secured about that amount for subscribers already sent in for 1869. These are large sums, easily attainable by those having tact, energy, and perseverance; but smaller sums of \$20 to \$500 are very easily secured by a large multitude of people. There is hardly a Post-office where there are not people enough to furnish a club of a dozen or more, while, in a large majority of neighborhoods and towns, there is abundant room for two, three, four, or five premium clubs of twenty to fifty or more names. We have received from 500 to 1,100 subscribers from single post-offices in larger towns and cities, and 50 to 500 from single county offices.

ing machines etc., for their own use, while others support their families by the sale of articles they receive as premiums from us for clubs of subscribers. In this way, by two or three months' work they have realized from \$250 to \$700 each. One lady canvassed in Western New York and Ohio last year, and made about \$1,500 in six or seven months; and she has secured about that amount for subscribers already sent in for 1869. These are large sums, easily attainable by those having tact, energy, and perseverance; but smaller sums of \$20 to \$500 are very easily secured by a large multitude of people. There is hardly a Post-office where there are not people enough to furnish a club of a dozen or more, while, in a large majority of neighborhoods and towns, there is abundant room for two, three, four, or five premium clubs of twenty to fifty or more names. We have received from 500 to 1,100 subscribers from single post-offices in larger towns and cities, and 50 to 500 from single county offices.

Farmers, Mechanics, Clergymen, Teachers, Clerks, Post - Masters, Boys and Girls, all have special facilities for gathering Premium Clubs of subscribers, and securing our Premiums. Schools and Churches often unite and get the Melodeons for the Church, Sunday or Week-day School Rooms, or the Cyclopaedia, or Sewing Machines, or Watches, etc., for their Pastor or a Teacher. Many Boys and Girls get the Dictionaries, and other articles for themselves. LOOK all through the Table, and you will see there is something provided for everybody. There is enough of all these articles (except the animals) to supply everybody.

It is Easier than one would suppose, to get up a premium list! Hundreds have written thus, after a little experience. Take a copy of the paper, show what it is, how much it gives in a year for less than half a cent a day, or less than three cents a week, and few will fail to make so good an investment. They will thus be benefited, and you will soon have names enough to secure the premium for your trouble.—TRY IT!.....To-day.

See Premium Regulations on next Page.

EXPLANATION.—Our immense circulation enables us to do things on an extensive scale, and doing this, adds again to our circulation. We spend large sums for engravings, for collecting information, etc., and it costs no more for all these to supply half a million subscribers than it would half a thousand. There is but one office, one set of editors, engravers, etc., to be supported, and we can thus furnish a superior paper at an exceedingly low price.... We expend all the subscription money, and tens of thousands of dollars more, in simply getting up and furnishing the paper itself, and yet make a satisfactory profit, besides paying all the premiums. Our unprecedented circulation makes every line very valuable to advertisers, who gladly pay a large price to reach so many people—especially as they know we shut out humbugs and unreliable parties from our advertising columns. So our advertisements furnish money to pay premiums; the premiums get more subscribers; more subscribers add to the value of the advertisements, and that brings us more money for more premiums. The whole thing is simple, and only requires courage and enterprise to carry it out. Everybody gets a very good and very cheap paper; and thousands of people get good premium articles—just

such as they want for themselves or for sale—simply by making up clubs of subscribers. It is easily done by those who take hold of the work with courage and determination to succeed. Some have had poor success at the first trial, and afterwards became very successful and realized large sums. Your opportunity to do this, Reader, is just as good as that of any other person.

[In this table are given the regular cash prices of each article, and the number of subscribers required at \$1.50 a year, to get it free, also at the lowest club rate of \$1 a year. For full descriptions of the articles see extra sheets, sent free.]

Table of Premiums and Terms, For Volume 28—(1869).

Table with columns: No., Names of Premium Articles, Price of Premiums at \$1.50, and Number of Subscribers required at \$1.50. Includes items like Short-horn Bull, Sheep Machine, and various tools.

See Premium 106 on page 32.

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The thirty-two Premiums, Nos. 29, 30, 31, 61, 62, 63, 64, and 76 to 100 inclusive, will each be delivered FREE of all charges,

by mail or express, (at the Post-office or express office nearest recipient), to any place in the United States or Territories. —The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance specified.

PREMIUM REGULATIONS.

Read and carefully Note the following: (a) Get subscribers anywhere; all sent by one person count together, though from one or a dozen different Post-offices. But....(b) Say with each name or list of names sent, that it is for a premium list, and we will so record it....(c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. Any time, from one to four months, will be allowed, to fill up your list as large as you may desire. The premium will be paid whenever you call for it....(d) Send the exact money with each list of names, so that there may be no confusion of money accounts....(e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer the premiums....(f) Specimen Numbers, Cards, and Show-bills, will be supplied free as needed by canvassers, but they should be used carefully and economically, for every extra copy of the paper costs, with the 2c. prepaid postage, about 12 cents....(g) Remit money in Checks on New York Banks or Bankers payable to order of Orange Judd & Co., or send Post-Office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk.

If from any Cause one fails to get the larger premium desired, the names can be used for a smaller one.

Description of the Premiums.

A FULL DESCRIPTION of all the premiums is given on an extra sheet, a copy of which will be sent free to every one desiring it. For New Premium 106, see page 32. We have only room here for the following:

No. 42—Clothes-Wringing Machine.

—A very useful, time-saving, strength-saving, clothes-saving implement, that should be in every family. The wringing of clothes by hand is hard upon the hands, arms, and chest, and the twisting stretches and breaks the fibres with lever power. With the Wringing Machine, the garments are passed rapidly between elastic rollers, which press the water out better than hand wringing, and as fast as one can pick up the garments.

Nos. 76 to 81—Volumes of the American Agriculturist (Unbound).—These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. We have stereotype plates from the Sixteenth to the Twenty-seventh Volume complete, from which we print numbers as needed. The price of the volumes is \$1.50 each, at the Office, or \$1.75 if sent by mail, as they must be post-paid. They are put up in clean numbers, with full index to each volume.—They are profusely Illustrated, the Engravings used in them having alone cost about \$30,000. Those obtaining premiums for less than twelve volumes can select any volumes desired, from 16 to 27.

Nos. 82 to 87—Bound Volumes of Agriculturist.—These are the same as Nos. 76 to 81 above, but are neatly bound in uniform style, and cost us more for the binding and postage. Sent post-paid.

Nos. 88 to 99—GOOD LIBRARIES.

—In these premiums, we offer a choice of Books for the Farm, Garden, and Household. The person entitled to any one of the premiums 88 to 99 may select any books desired from the list on page 33, to the amount of the premiums, and the books will be forwarded, paid through to the nearest Post-Office, or Express office, as we may find it most convenient to send them.

No. 100—General Book Premium.—Any one not desiring the specific Book premiums, 88 to 99, may select Books from list on page 33, to the amount of 10 cents' worth for each subscriber sent at \$1: or 30 cents for each name sent at the (ten) club price of \$1.20 each: or 60 cents' worth for each name at \$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through by us.

See Premium 106 on page 32.

New York Live Stock Markets.—

Table with columns: WEEK ENDING, Beesves, Cows, Calves, Sheep, Swine, Tot'l. Rows include Nov. 30th, Dec. 7th, 14th, and totals for four weeks and previous 5 weeks.

The above table gives the weekly receipts for the four weeks ending Dec. 14th, the total number of all kinds for each week, also the number of each kind for the four weeks, as well as the sum of all kinds for the month.

The cattle trade has been gradually improving since our last report. The stock has averaged at least two per cent better in quality, and prices have advanced a little. Most of the cattle for "Thanksgiving trade" were good, and some of the best brought as high as 17c. per pound. The steadily increasing cold weather since has kept the market fully up to the prices paid in Thanksgiving week, and good, fat stock were selling for 16 1/2 @ 17 1/2 c. per lb. at the close of our report. The large run for the week ending Nov. 30th and the very low prices are no guide. Most of the stock for that week was very poor, and not 200 decent bullocks were to be seen in the whole 7,000. This great rush of stock to market was caused by the reported advance of 1c. per pound in price, and a little storm of snow West, obliging farmers to house their stock or sell, and they chose the latter course; consequently "State Hoppers" were plenty and the yards full of two-year-old steers, dry cows, oxen and bulls. Drivers expected a little decline in price after a holiday week, for the extra quantity of poultry in market at these times must be sold, but no one looked for such a rush of thin stock on a perfectly flat market. Prices are much improved for the week ending Dec. 14th, and quality enough better to place the advance at least 2c. per pound. The following list gives the range of prices, average prices and figures at which the largest lots were sold.

Table with columns: Nov. 23d ranged 10@17c, Av. 14c, Largest sales 13 1/2 @ 16, do. 30th do. 8@15c, do. 13c, do. do. 12 @ 14 1/2, Dec. 7th do. 9 1/2 @ 17 1/2 c, do. 14 1/2 c, do. do. 13 @ 16, do. 14th do. 8 @ 15c, do. 14 1/2 c, do. do. 10 @ 16

Extending the week ending Nov. 30 from our estimate, it is safe to say that prices have advanced at least 1c. per pound and that the quality of the beef is much better than last month. Milch Cows are scarce and prices high. Indeed there is very little change since our last report. Good milkers are constantly called for and go off quickly at \$80@\$110 each. Some have sold as high \$115@\$125, but these were extra milkers or "fancy cows." Veal Calves have not been so plenty this month, but quite enough so to sell well in a market full of other stock. Prices remain about the same as last reported, ranging 9@11 1/2 c. for common and 12@13 1/2 c. for good. Sheep and Lambs are still plenty; some weeks they exceed the demand and trade drags heavily. Prices have varied a little from day to day, and many sheep have been sold by the head as low as \$2.50@2.75 each. The majority of the stock is poor, and not fit for market. Those that had any fat on them and sold by the pound ranged 4@5 1/2 c. for sheep; lambs 6@7 1/2 c. per pound. Swine are coming in thick and fast and trade has been dull all the month. Prices are a little better at the close of our report. For the week ending Nov. 30th the large run of over 40,000 put prices down as low as 7c. per pound, live weight, for good, fair goods. The cool weather, however, and a little falling off in arrivals soon advanced the price somewhat and now, Dec. 14, prices range from 8@8 1/2 c. per pound, and trade is more lively. A few dressed hogs are coming in and sell for 10 1/2 @ 10 3/4 c. per pound.

Commercial Matters—Market Prices

Gold has advanced since our last, under a more active demand, chiefly from speculative sources; it closes firmly at 135 1/2. There has been a livelier inquiry for most kinds of Breadstuffs since our last, for home use, shipment, and on speculative account; and prices have been generally quoted higher. Flour, Winter Wheat, and Western Oats, close buoyantly, while Spring Wheat, Corn, Rye, and Barley, leave off in favor of buyers. The receipts have fallen off materially since the closing of the canals, early in the current month, and are now quite limited in amount, daily. There has been more activity in the Provision line, especially since Dec. 1st, but at variable prices, most articles closing strong and buoyant at our quotations.... Cotton has been more sought after,

closing a fraction higher.... Wool has been in moderate request at steady rates.... Tobacco, Hops, and Seeds have been lightly dealt in.... Hay closes briskly at an advance.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for the month ending Dec. 15, 1868, and for the corresponding month last year:

TRANSACTIONS AT THE NEW-YORK MARKETS. RECEIPTS, Flour, Wheat, Corn, Rye, Barley, Oats. SALES, Flour, Wheat, Corn, Rye, Barley, Oats. Comparison with same period at this time last year. RECEIPTS, Flour, Wheat, Corn, Rye, Barley, Oats. SALES, Flour, Wheat, Corn, Rye, Barley, Oats. Exports from New York, Jan. 1 to Dec. 14: Flour, Wheat, Corn, Rye, Barley, Oats. Stock of grain in store at New York: Wheat, Corn, Rye, Barley, Oats, Mill. Receipts at tide water at Albany to Dec. 7th: Flour, Wheat, Corn, Rye, Barley, Oats.

COBBENT WHOLESALE PRICES.

Table with columns: Nov. 14, Dec. 15. Rows include PRICE OF GOLD, FLOUR—Super to Extra State, Super to Extra Southern, Extra Western, Extra Genesee, Superior Western, RYE FLOUR, CORN MEAL, WHEAT—All kinds of White, All kinds of Red and Amber, CORN—Yellow, Mixed, OATS—Western, State, RYE, BARLEY, HAY—Bale #100 lb., LOOSE, STRAW, #100 lb., COTTON—Middle, HOPS—Crop of 1868, FEATHERS—Live Geese, SEED—Clover, Timothy, Flax, # bushel, STARCH—Brown, MOLASSES, Cuba, COFFEE—Rio, (Gold, in bond), TOBACCO, Kentucky, &c., Seed Leaf, WOOL—Domestic Fleece, Domestic, pulled, California, washed, TALLOW, OIL—Coke, # ton, PORK—Mess, # barrel, Prime, # barrel, BEEF—Plain mess, LARD, in tins, & barrels, BUTTER—Western, State, CHEESE, BEANS—# bushel, PEAS—Canada, in bond, Eggs—Fresh, # dozen, POULTRY—Fowls, Turkeys, POTATOES, new—# bbl., APPLES—# barrel, SWEET POTATOES, # bbl., CRANBERRIES, # barrel, TURNIPS—# bbl., CABBAGES—# 100, ONIONS—# bbl., SQUASHES—# bbl., GRAPES—# pound, QUINCES—# bbl., VENISON—by the carcass.

Advertisers who have used our columns for years past are unanimous in the statement that nowhere else do they receive so good a return for their money. This is owing, not only to the great circulation, but also to the fact that we are careful to admit none but those believed to be entirely reliable, so that subscribers are not afraid to send their orders. The same rule will be observed in future, and as our circulation is rapidly increasing, while at present the advertising rates remain the same, those about announcing their business to the public can do so in these columns to great advantage.

containing a great variety of items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Mark All Subscriptions sent in, as *New or Old*.

How to Remit:—Checks on New-York Banks or Bankers are best for large sums; made payable to the order of **Orange Judd & Co.**

Post-Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us *without any loss*.

Registered Letters, under the new system, which went into effect June 1st, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. *Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. Buy and affix the stamps both for postage and registry, put in the money and seal the letter in the presence of the postmaster, and take his receipt for it.* Letters sent in this way to us are at our risk.

Postage.—To our published terms for the *American Agriculturist*, postage must in all cases be added when ordered to go out of the United States. For Canada, send twelve cents besides the subscription money with each subscriber. Everywhere in the United States, *three cents*, each quarter, or *twelve cents*, yearly, must be pre-paid at the Post-office where the paper is received.

Bound Copies of Volume XXVII (1868) are now ready. Price, \$2, at our office, or \$2.50 each, if sent by mail. Any of the previous eleven volumes (16 to 26) will be forwarded at the same price. Sets of numbers sent to our office will be neatly bound in our regular style for 75 cents per volume, (50 cents extra if returned by mail.) Missing numbers supplied at 12c. each.

CLUBS can at any time be increased by sending for each addition the price paid by the original members, if the subscriptions all date at the same starting point. The back numbers will, of course, be sent to added names.

Editorial.—Col. Geo. E. Waring, author of *Draining for Profit and Health, Elements of Agriculture*, and well known as a successful Agricultural Engineer, has become a member of the Editorial Staff of the *Agriculturist*. Col. W. will contribute articles, not only upon certain subjects which he has made specialties, but upon improved agriculture in general. He has a farm, where, with ample means to test the matter, he proposes to show that high farming will pay as a profitable investment of capital, and his experience will be given to the readers of the *Agriculturist*. We make this announcement with no little pleasure, and our readers will take it as an indication of the desire of the publishers to give them the best paper that can be made.—[Eds.]

To Correspondents.—This month we address a large number of readers for the first time, and we wish to give a few hints that may serve to make our future intercourse most profitable. We are always glad to hear from our readers, if they have anything to communicate that will interest or instruct others. Questions on subjects of general interest are always welcome. It is not always practicable to answer each correspondent personally, so we often reply in a general article. Queries are useful, as serving as an index to the wants of our readers. Where an answer is desired, enclose a stamp—and no more—for return postage. We answer such letters of this kind as we are able. Some are unanswerable. Do not ask us to do things quite out of our line, such as finding places for boys, looking up inheritance of property, selling consignments of produce, and the like. We cannot attend to such matters. Do not ask our opinion of any of the many advertising doctors—we don't know any of them, and don't mean to, if we can help it. Please write upon one side of the paper only, and do not mix up several subjects. If there is more than one subject, leave a space between them, so that they can be cut apart, and each referred to the proper editor. We cannot be expected to write treatises for the asking. A young man about engaging in gardening wrote us, not long ago, asking us to "tell him all we knew about raising vegetables." Volumes already printed are to be had much cheaper than they can be written. In describing

any implement or contrivance, do not be afraid of trying to make a sketch, no matter how rough it may be. A few scratches with a pen or pencil will often tell more than a page of explanation. Don't apologize for writing, and oblige us to read a half a page before the point is reached. Always give name and address; the name will not be used when a desire that it should not be is indicated. Let our friends give, as well as ask. Long essays are not desirable; concise, compact notes of personal experience in rural matters, new expedients for facilitating work, better methods of doing things, even in the minor things of country life, are always welcome.

The Cover will be welcomed by our subscribers as a protection to the first page of the paper. This page usually contains a valuable engraving, and as each paper is read by many persons, it is usually badly soiled. The cover not only prevents this, but allows our art department to present a pleasing design, which speaks for itself. The implements and products of agriculture and horticulture are tastefully arranged to form a setting for pictures which will be changed from time to time.

Death in the House.—It is a terrible thing that a large number of happy homes are liable to become at any moment scenes of desolation, that the lamp which lights the faces of the family circle should often be an impending danger. We read of kerosene accidents so often that they cause no feeling of alarm, and are looked upon as a part of the news of the day. Were as many killed in battle as are killed during a year by kerosene, the whole country would be deeply stirred. Let any one read the account of a recent case at Sing-Sing, N. Y., and say if it is not time that this matter was agitated. A father left his wife with three children at home; all that remained on his return was one poor, burned, little thing. The mother and two children were dead. A kerosene lamp had exploded, and that was all. "Do you not approve of kerosene?" Certainly we do, and often use it in preference to gas. There is no trouble with the good article. The explosions and deaths lie at the door of the villains who mix naphtha and the like cheaper and dangerous oils with the proper burning oil. The retailers are not so much to blame, as they are generally ignorant of the nature of the substance with which they deal, but the manufacturers are wickedly criminal, as they do know just what they are making, and exactly how dangerous the material is. We gave in November last the method of distinguishing the safe from the unsafe oils. Congress has passed a law in relation to the matter, but it does not seem to meet the case. Is it not time for the people to move? Or must there be a few more "accidents," which are properly murders. Now that the Legislatures are generally in session is the time for the people to demand a State law. Rhode Island has set the example, and with most beneficial results. Stop this wanton waste of human life.

We Accept the Amendment.—"J. J." writes: "You say in the *Agriculturist*, Dec. 1868—'Sell an acre of land, if necessary, and stock your house with \$10 to \$50 worth of good books.' Would it not have been better to have said, set aside one acre of land; let your sons cultivate it at every odd moment; put on the crop that will leave the land in *best condition*, and bring the *best returns* when sold. Encourage them by word or assistance. Let this crop be sold each year, and invested in all new agricultural works—histories—standard works, not agricultural—and papers, not forgetting that standard agricultural paper, the *Agriculturist*. Would not the pleasure in reading be far more when each book was earned by their own efforts? In how few years a large library would be formed, and the acre can then be devoted to other similar purposes."

Our Show-bill for 1869 is, we think, the most brilliant and attractive of any yet sent out. It is sent free to those making up clubs; they will find it useful, and will have a collection of handsome engravings besides.

The American Agricultural Annual for 1869 is issued the present month. The plan of this volume, following that of former numbers, is to furnish the farmer with a complete *Almanac* and record of the more important Sideral Phenomena, Eclipses, etc., together with a carefully prepared *Calendar of Operations*, or Hints about Work for each month; a variety of information, interesting and important to farmers, as indicated by the following list of articles; and concluding with a *Farmers' Directory*, containing a list of the principal dealers in implements, fertilizers, seeds, horses, cattle, sheep, swine, and poultry. Aside from the matters specified, the Annual contains numerous valuable and convenient practical tables, a Retrospective View of the past year, a record of Progress in Agricultural Education, with a list of Agricultural Colleges, with

the advantages offered students, and a Notice of Agricultural Inventions. There is also an article on Recent Progress in Agricultural Science, by Prof. S. W. Johnson; one upon Hoes and Hand-weeders; one upon Clearing Rocky Land; "A Few Words on Pigs, Breeding and Management," by Joseph Harris; Gas Tur, its Products and Uses, Roofing, Walks, Floors, etc., by H. W. Johns; Veterinary Matters, by Dr. John Busted; Prevalent Diseases of the Cattle of the United States, by Prof. John Gamgee, of London; Trout Culture, by William Clift; Fine Wool Sheep; Agricultural and kindred literature of the past year; together with other articles and minor items. The whole comprises a work of about 152 1/2mo pages, illustrated in the best style, and bound in paper or cloth; price 50 cents or 75 cents, according to style of binding.

Some Too Late.—Several parties whose advertisements we would gladly have inserted sent their favors too late for this number, and similar cases occur almost every month. Please bear in mind that to be sure of publication, advertisements must reach us by the fifth of the preceding month. Our immense edition requires a long time for printing in the careful manner it is done, and mailing, etc., can hardly be accomplished before the end of the month, even when commenced so early.

Our Horticultural Annual.—The American Horticultural Annual for 1869 is now ready. It follows the same general plan as in former years. It is the only work in which an attempt is made to present in a compact form the horticultural progress of the year. Reference is made to all the new fruits, flowers, vegetables, etc., described and figured in the several horticultural journals, each department being made up by one who has made a specialty of his subject. Aside from the *résumé* of the year's doings, we aim to present in each issue several essays on horticultural matters which shall be of permanent value. Of this kind are the excellent article on the Clematis, by Josiah Hoopes; on the Gladiolus, by George Such; and on the Cultivation of Asparagus, by Francis Brill. Besides the gentlemen just mentioned, there will be found among the contributors the eminent names of Warder, Barry, Elliott, Fuller, Henderson, Parsons, Gregory, and others identified with American horticulture. Besides contributions, there is much editorial matter, a concise Calendar of Operations, a list of dealers and nurserymen, the books of the year, etc. The illustrations are of the same superior character as those of former years. The whole forms a useful, beautiful, and remarkably cheap year-book of 152 pages. Price, by mail, 50 cents, in illuminated paper covers; 75 cents, in cloth binding.

Sundry Humbugs.—Please don't send any more letters asking about this or that doctor, who advertises in this or that paper. We have frequently stated that we regard *all* advertising "doctors" as quacks. There may be a difference in them, but we are unable to draw the line; they differ only in degree. Some merely publish a list of their wonderful cures; some warrant to cure or no pay; while others use more striking expedients to attract public attention. There used to be a chap with a stand in the street near our old office, where for a long time he peddled a toothache remedy and such stuff. Lately he has been extensively advertised as "Doctor," and the papers are filled with his doggerels. Lord advertising being his way of gulling people, he carried it to the extent of a procession. A few days ago this passed by our office. First came an omnibus with a brass band; then an open barouche, the four horses of which were decked with ribbons, and within the "Doctor" sat in solitary grandeur. After the Great Mogul's chariot came several other barouches filled with boys carrying banners and placards to advertise the quack's nostrums. This is one style of advertising "doctors" and more rare than another style which may be called the hotel doctor. These birds of prey suddenly arrive at the village or town hotel, issue stunning hand-bills, stating that the celebrated "Doctor" so and so may be consulted for a few days, etc. Forthwith the weak-minded men and women give the fellow their dollars, and the community is well off if the only loss that it sustains is that of money. We recently gave an account in a paper of the doings of two of these chaps in an Eastern State. One of them, calling himself an "Indian Doctor," so ingratiated himself with the daughter of wealthy parents that she married him. The father, anxious for the welfare of the young couple, generously contributed means to start his son-in-law in business. This was just what the "Doctor" wanted, and with the confiding father's money in his pocket, he decamped to parts unknown, leaving his bride worse than a widow. Before leaving the town he boasted of having, during his short stay there, invaded the home circle of no less than eighty families, and destroyed the virtue of as many women. This fiend is still at large, and, no doubt,

planning like operations in other parts. Look out for travelling advertising doctors. . . . A few old offenders in the "gift enterprise business" are evidently trying to sell out. We give them the benefit of a notice, viz: W. J. Wheeler & Co., alias L. S. Todd, alias Hayward & Co., alias C. H. Garland & Co.; Hunt, Anthony & Co., who may be the same as Gains W. Hubbard, Jun.; that old offender Westbrook, and Harper, Wilson & Co., are the most prominent among the operators just now. They offer for sale at greatly reduced prices "large importations of watches, jewelry, &c." Beware of them. Cheap jewelry is dear at any price. The old "ticket dodge," which some still try, is well known by our readers. Unless the "Rural American" can look a little more closely to the character of advertisements admitted to its columns, it had better stop business. Advertising "patent medicines" is had enough, but licentiousness is little less than criminal. . . . "One dollar" stores are on the increase; we repeat, we see no advantage in them. In our November No., p. 370, 1853, we called attention to the "Patent Butter Association." They claim that by dissolving a certain powder in the milk before churning they are able to get a pound of butter from a pint of milk. We mention the subject again to class it with the humbugs. The stuff obtained from churning together one pint of milk, a teaspoonful of this powder, and half a pound of butter, (the added butter said to be essential "to coax the milk") and which they call "butter," is a whitish, odorless, almost tasteless mass of grease and water. That the fresh wet mass will weigh a pound and a half we do not know. To get a pound of solid matter of any sort from a pint of liquid weighing a little over 17 oz., 70 per cent of which is water, is impossible. . . . The Royal Havana Lottery makes an enormous spread just now. There are no less than half a dozen "special agents" for this grand humbug in this city. Some are old and well-known names; a few are new. Of course, our readers will not trust money in any lottery whatever, even if it be a "Royal" one. D. A. Smythe, C. A. Taylor & Co., W. O. Smith & Co., Lloyd, Semmes & Co., are the more prominent "special agents." Any person sending money to these parties subjects his letters to confiscation by the P. O. Department, and must not complain if he loses his money. . . . Mr. D. R. Jun., you will get that "grand piano" "in a horn." We know of no such institution as the "New York City Charity Mission," and no such "grand distribution of premiums" ever came off at Cooper Institute or any where else, except in the fertile brains of H. Clay Horn and his "Rev." friend, J. E. Woolver. Charity missions do not operate in the way this H. Clay Horn would have people suppose.

A Remarkable Little Gun is offered as Premium No. 106. It has shown some excellent performances in the hands of our senior Publisher and his friends, and is worth looking after. A full description with illustrations will be found in the advertising columns in the latter part of the paper. We hope some hundreds or thousands of our readers will be the happy recipients of one of these weapons as a premium.

Report on the Utica Plow Trial.—We have received the report of this famous trial. It is a volume of 288 octavo pages, full of illustrations. It is prefaced by a History of the Plow and several other important chapters. Though, on the whole, a most valuable contribution to agricultural literature, on some points it is criticisable. Lack of space prevents our insertion of an extended notice prepared for this number. It is issued by the New York State Agricultural Society, under whose auspices the trials were made.

Early Rose Potato Premium.—We shall send no more of this premium until April, unless by special request and at the risk of the party ordering, as there is danger from frost. All orders will be received and the potatoes forwarded in the spring.

Massachusetts Agricultural College is located at Amherst, Mass. Previous to 1867, but little had been done except to purchase four hundred acres of land about a mile from the village. Since then, seven large buildings have been erected—a Botanic Museum and Lecture room, a Chemical Laboratory, two Dormitories and Boarding-houses, and the Durfee Plant-house, covering 10,000 square feet, with all the best appliances for growing tropical and other plants of our own climate. There are ninety or more young men who are now in the institution. The average age is eighteen years, and about three-fourths of them are from the farm. Over a third of them have declared their purpose to become farmers, while the rest have not decided upon their calling in life. Six hours of labor each week is the maximum required. Some of the students, whose necessities require it, labor more, and are paid 12½ cents an hour for it. A few who are skilled

in special labors are paid more, and nearly defray their college expenses by their work. Funds are wanted to furnish good stock of all the improved breeds. Ten acres of land have been underdrained and seeded with the best grasses. This is designed for the Botanic garden, and will be planted as it is needed. The Institution is so prosperous that the new Dormitories are filled as fast as they are built, and they are now in as much need of a third Dormitory, as they were of a second a year ago. The faculty are doing their work well, and have the confidence of the students, and of the farmers of the State. Beside the studies appropriate to such an Institution, the classes go through a course of military tactics, and are so thoroughly drilled, that the State will have good soldiers as well as farmers for its future defenders. We congratulate the gentlemen who have labored so long and faithfully for this institution, upon their great success.

Pigs in Russia.—Our correspondent at Moscow is informed that his queries are referred to the editor who is best qualified to answer, and he will reply by letter. Within a few days we have had queries from Japan, New South Wales, and Russia. Africa sends us quite a number of subscribers, and there are but few countries not on our mail books. We shall be obliged to address our correspondents as Webster (we think it was), called an immense mass meeting to order—"Attention, the Universe!—Advance by Nations."

Knox's Seed Store.—If Mr. J. Knox had not acquired so wide a reputation as a successful grower of grapes, strawberries, etc., he would probably have been celebrated as a seedsman. While carrying on his fruit farm, he has been building up the most extensive seed and implement business in Pittsburgh. This branch of his business now passes into the hands of his son, Mr. W. W. Knox, who has heretofore had the chief management of it. Mr. Knox the younger has abundant energy and enterprise to make his establishment the leading one upon the western side of the Alleghenies. He will keep all the novelties in the way of seeds and implements, as well as the standard articles, in large or small quantities.

Post-office Directory.—A new edition, containing a list of all post-offices, etc., useful to all who have much correspondence, is advertised in this paper.

Please Speak of It.—The **Agriculturist in German** contains the same illustrations and mainly the same reading matter as the English edition. It has a large circulation among the German population of the West and elsewhere, and it is made more acceptable to them by having each month contributions from the Hon. F. Muench, one of the most experienced agriculturists in Missouri, in addition to what is given in our English edition. Many who take the English edition find that a copy of the translation for the use of their German workmen is a good investment. This German edition is of great value to the large number of German cultivators living in our country, and especially to those constantly arriving. Will our readers please speak of it to their German friends?

A Few Dollars' worth of books pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to *make their heads help their hands*. Any good book will, in the end, be of far more value to a youth than to have an extra acre of land on coming to manhood. The thinking, reasoning, observing man, will certainly make more off from 49 acres than he would off from 50 acres without the mental ability which reading will give him. Far better to sell the acre of land than do without the books. Several good books are announced in the Advertising columns, and in the list on page 5. The Publishers' premium offers, on the same page, open a way to get books without expense. The farmers of any neighborhood may put their heads together and raise a club of subscribers, receive the books, and hold them for general use by all.

Report of the Commissioner of Agriculture.—General Capron's report of the seventh year's doings of the Department of Agriculture is one calculated to secure for him and his associates the confidence and co-operation of the agriculturists of the whole country. His deprecation of a renewal of the Canadian reciprocity treaty or any thing like it, and his appeal to Congress for means to prosecute further investigations into the diseases threatening or attacking our farm stock, and to publish the report made by Professor Gamgee on the Texas fever, come directly home to our farmers. We are so thoroughly with General Capron in his desire to spread reliable information on the subject of the diseases of farm stock before the public, that we

earnestly appeal to Congress, assuring our Representatives that, so far as we can judge, they can hardly make more useful or more popular appropriations.

Florida Fruits.—"A subscriber" sends us specimens of oranges, lemons, etc., grown at San Augustine, Fla. We do not know "Subscriber's" name, but the fruit was very fine, and we thank him all the same.

Massachusetts Board of Agriculture.—This body met at Amherst the second week in December, and devoted three days to lectures, and discussions on agricultural and horticultural topics. Lectures were delivered by J. F. C. Hyde on "Fruit Culture," by Prof. John Gamgee, by Prof. Louis Agassiz, by Mr. X. A. Willard on Dairy Farming, and by Dr. G. E. Loring on Agricultural Progress. Discussions were held upon "Commercial Fertilizers," "How to Make Farming Profitable," "The Art of Agriculture," "The Hay Crop," and other subjects. There was a large attendance of the Board and of the friends of improved husbandry, from all parts of the State, and some from abroad. Farmers from the neighborhood flocked to the meetings, and the large hall devoted to them was well filled. We have rarely attended a more enthusiastic agricultural meeting. A large class of the farmers of Massachusetts are wide awake to the interests of their calling. The arrangements for the meetings were good, and the hospitalities of the citizens were liberally bestowed. Full reports of these meetings are given, not only in the papers, but in the Annual Report of Secretary Flint. The example of the Board in holding their sessions in the midst of a fine farming district, and thus commanding a full house, is worthy of imitation. These discussions and lectures cannot fail to quicken the minds and improve the farm practice of all who had the privilege of attending them.

The Cornell University.—The opening of this institution occurring just at the time of the numerous fairs, we were unable to be present. We are glad to learn from those capable of judging, that, for so large and new an organization, it is working satisfactorily. The faculty, so far as we know them, are eminently qualified for their work, and the students are said to be a remarkably intelligent and enthusiastic body of young men. Minutely endowed by Mr. Cornell and the State, this University ought to realize all that its founder intends it should, and all that its friends hope.

Insect Extinguisher is the quaint title of a lecture given by Joseph Treat before the people of Vineland, and which he has printed for distribution. It brings together the various modes that are in use for destroying insects. Whether we should be the gainers by the indiscriminate slaughter of useful and injurious insects is a matter upon which all are not agreed.

"Earth Closets; and how to make and use them," is a little 12mo volume, by Col. Geo. E. Waring, Jr., published by the Tribune Association. Very good, very useful, well worth its cost—25 cents—but unsatisfactorily brief. Our own faith in dry earth is increasing month by month. It is a wonderful and inexpensive article, the best disinfectant, deodorizer, and purifier known wherever it can be applied. Col. Waring gives accurate drawings of earth closets, chamber commodes, etc., from which others may be constructed. Sent by mail from the office of the *Agriculturist*.

An Experimental Farm.—Some one writes to us to offer, for a consideration, his farm for experimental purposes to "carry out the views given in the *Agriculturist*, and report the results." We allude to this matter, as there may be others who think our teachings are merely abstract views, which yet need to be verified by practice. We believe there is no paper that "smells of the soil" more distinctly than the *Agriculturist*, while as to farms, there are three managed by different editors of the paper, and instead of our needing a place to carry out the views given in the paper, our "views" are the result of actual experience.

Basket Full and running over, and many items intended for this month are left out until the next.

New York State Poultry Society.—The Poultry breeders and fanciers who met at the last Fair of the New York State Agricultural Society then and there associated themselves under the title above given. The "Annual meeting" has just been held, officers elected, and an exhibition of poultry provided for, which is to take place late in the winter or early in the spring, in New York City. G. H. Warner, New York Mills, Oneida County, N. Y., is President, and Daniel E. Gavit, New York City, is Corres. Secretary.

The European Larch.—At the Kane Co., Ill., Fair, a European Larch tree was exhibited from the Larch forest of D. C. Scofield, Elgin, Ill., of thirty feet in height and twelve inches in diameter at the base or collar, which tree was imported from Scotland eleven years before, a plant the size of a goose quill. This tree was by no means the largest of the thousands growing in the above-mentioned forest, but is a demonstrative evidence of the rapid growth of the larch, which is one of the most valuable of all varieties of timber.

Tree Named.—"C. W. II.," Bacon Hill, N. Y. The leaf is that of the Tulip Tree, also called Whitewood, and in some parts of the West, Poplar. It is one of our most beautiful ornamental trees. The leaf sent is much larger than the usual size, being a foot across, and is probably from a young plant.

The Diseases of the Wine, how to prevent and how to cure them." By J. A. Schmidt, New York. The researches of Pasteur upon the various ailments of wines have attracted much attention abroad. For the benefit of American wine makers these have been embodied by Mr. Schmidt in a small volume of 47 pages, illustrated by numerous engravings of the microscopic characters of diseased wines. A small edition was issued to supply subscribers, and the few remaining copies are offered at \$2 each.

Cancer Nonsense.—Under the head of "Agricultural," the N. Y. Weekly Tribune publishes the following: "*Cancer Cured.*—J. W. James, Deerfield Centre, N. H. 'My wife had a cancer three inches in diameter drawn out by the use of a plaster made of wood sorrel. There is no mistake about it, for we did it ourselves, and several other cases have succeeded in the same way.'" What there is "agricultural" about that we fail to see. We wonder what became of that "cancer" when it was drawn out. Did it crawl off, crab-fashion? What an awful hole it must have left! Why cannot the Tribune confine its quackery to its advertising columns, and not give an editorial endorsement to such stuff.

Moon-Signs.—Unbeliever, Burgettstown, Pa., asks: "Do you believe, as many do, in the 'signs of the moon,' in regard to sowing, planting, etc.?"—Of course we do, in our way. We believe if carrots are sown in the full of the moon, that they must be hoed and weeded very thoroughly in order to get a full crop. If pork killed in the wane of the moon "shrinks in the pot," it is a sure sign that the pig wasn't properly fed. We have known many a crop to fail when the signs of the moon were not observed. There is a great deal in signs—if you don't believe it, ask Barnum.

Pears Do not Bear.—"A. L. B.," Munroe, Mich., wishes to know why young pear trees, which blossom abundantly in spring, bear only four or five years. Merely blossoming, that is, the opening of the flower, is not all that is necessary to produce fruit. The pistil must be fertilized by the pollen, and if a cold, wet spell occurs at the time when the pollen is ready to do its office, fertilization is apt to fail. Then, again, many flowers are incapable of self fertilization, but must receive pollen from another blossom of the same tree, or from one of a different tree. How far this is the case with the pear is not established, but there is no doubt that with this and other fruit trees, bees and other insects materially assist in the important work of fertilization, by carrying pollen from one flower to another.

The Stark Apple.—A. H. Gaston, Henry, Ill., sends us specimens of this apple, which he considers of great value. Mr. G. says if he were to plant 1,000 trees, 700 of them would be of the Stark. The fruit is large, and has every appearance of being a good market variety. While Mr. G. sets forth the good qualities of the fruit at length, he frankly admits that "in point of flavor it is not first-rate, but it is as good as we can expect." We learn from other sources that it is regarded as a reliable and profitable market variety, and our Eastern orchardists would do well to look after it.

Horticultural Journals.—The new year brings some changes among our horticultural contemporaries. Years ago, Hovey's Magazine was the only journal of the kind, and in its earlier days showed more of vigor than latterly. Mr. Hovey has been absorbed in too many other enterprises to give it that attention it needed, and quotations from foreign journals filled a large share of its pages. The Horticulturist appeared some years later, and was most charmingly edited by the late A. J. Downing. It has passed through many hands since. The Gardener's Monthly came next in order, edited by Thomas Meehan, one of the most original

thinkers and careful observers of our day. Last on the list came the American Journal of Horticulture, which does not appear to have been edited at all. We learn by a "Notice Extraordinary!" of a "Grand Horticultural Consolidation." Hovey's Magazine and the American Journal of Horticulture are to expire in each other's arms, to reappear as Tilton's Journal of Horticulture and Floral Magazine, which is a very sensible thing to do. There ought to be talent enough at and around the "Hub" to give us something better in the way of a journal than we have yet had from there. The Horticulturist changes hands. Mr. Woodward has probably found that he could not attend to his profession and manage a journal too, and has disposed of the Horticulturist to H. T. Williams, who will, no doubt, infuse fresh life into it. We wish these new enterprises much success, which they can only attain by giving the horticultural public better journals than either Hovey's, the Horticulturist, or the American Journal of Horticulture has been of late. As to the Gardener's Monthly, we hope it will continue to be as good as it has been.

Putnam on Illustrations.—Putnam's Magazine for October has an appreciative notice of Hoopes' Book of Evergreens, in which it speaks of the illustrations as "exceptionally good," and supposes that they must be the work of Mr. Isaac Sprague, an artist who lives near Boston. It says: "If they prove to be by another than Mr. Sprague, we shall then be gratified with the information that we have two first-rate botanical draughtsmen, when we thought ourselves happy in only one." We think it a high compliment to the illustrations to have them taken for Mr. Sprague's work, but the reviewer has much to learn about draughtsmen and engravers. The illustrations which he thinks are so good that the name of draughtsman and engraver should be published, were drawn by four different artists, and engraved by six different engravers. All the work was done in our own establishment. Boston is a clever place but it does not contain all the talent in that line.

Pine Leaves.—These, called "pine straw" and "pine needles," are used at the South as a mulch and for bedding animals. Who can tell about their value as a manure, and how to make them available?

Cut Cions Early, for when properly kept through the winter they are more likely to succeed in spring than those cut just before the time to set them. Vigorous shoots, which are the best for cions, often do not become so thoroughly ripened that their vitality is not more or less impaired by long-continued cold weather. Small quantities of cions are best kept in sawdust. J. J. Thomas gives a very good method of preserving large quantities. They are placed in a box, which should be about two-thirds filled; slats are then nailed across the box on the inside, to hold the cions down when it is inverted. The box is then buried upside down below the reach of frost in a place where water will not stand.

Sheep and Plantain.—"Contributor," Franklin, Tenn., writes in reference to an item in the October *Agriculturist*: "If your northern Plantain is anything like our narrow-leaved Tennessee Plantain, and if your sheep have the same preferences as our Southern sheep, your correspondent will find that a small flock of sheep will do more in one day in eradicating the pest than a dozen hand weeders could do in a week. With us it is the favorite food of the sheep, and as they crop very close, two years of occasional grazing will get rid of it effectually. Indeed, in our State, where our meadows and lawns are infested with numberless varieties of weeds, we find that sheep and goats are worth their keep for no other purpose than as scavengers. Aside from their value as mutton and the product of their wool, we can well afford to feed a large flock for two months in the winter, (which is all that is ever required in our climate,) in order to have their services as scavengers. There is no weed or 'noxious plant' grown in our latitude which the sheep and goat will not eradicate, except the 'wild sage,' and the 'old field broom sedge.'"—The trouble complained of was the Broad-leaved Plantain, *Plantago major*; the one to which "Contributor" refers is the Rib-wort Plantain, or Rib-grass, *Plantago lanceolata*, which has been cultivated in Europe as pasturage. We quite agree with him as to the utility of sheep, but their services are not always available in ornamental grounds.

The Scuppernon Grape; its History and mode of cultivation, with a short treatise on the manufacture of wine from it. By J. Van Baren, of Clarks-ville, Ga. The above is the title of a neat pamphlet of 52 pages devoted to the Scuppernon, which was described in our pages in Nov. last. Of course it can be of use only to our Southern readers, and such will find full

directions for the planting, treatment, etc., of this peculiarly Southern grape, and have some political reflections of the author besides. Price of the work not given.

Tree Peddlers.—"T. M.," Goshen, N. Y., writes: "It would be an excellent plan if you would call the attention of your readers to the importance of not patronizing the men who are going about canvassing for fruit trees. I have bought several times, and the trees are now beginning to bear, but out of fifty different varieties that I purchased, not one is true to name. In fact, they are all of one kind of apple, small and sour. I hear this complaint all over this section. It is necessary that we who want trees should go to some reliable nurseryman, and state to him what we want. One of my neighbors bought 300 apple trees and 150 pear trees; they were to be of the best varieties of fruit, and the apples turned out to be crab apples, and the pears at present it is hard to name for there is scarcely any taste to the fruit, and it is very small. You can do a great amount of good by writing an article, and urging upon your readers the importance of avoiding such scams as these tree agents are." If friend "T. M." had read the *Agriculturist* for many years he would have seen frequent warnings against tree peddlers, and the advice to order directly of the nurseries. As a class, the tree peddlers are a bad lot. They get orders and fill them with what they can pick up. In condemning all who travel and solicit orders for trees, some very worthy people will be included. Some of the best nurseries have travelling agents, who will fill orders faithfully; but these are not of the class to which our correspondent alludes. It is always the safest to order direct, and never safe to order of a stranger unless he can give satisfactory proof that he is a duly authorized agent of some nursery of good reputation.

Price of Farming Lands.—"J. K. S.," "I notice that farms are sold in the Carolinas for five dollars an acre, and in Lancaster County, Pa., for two hundred and upwards. What makes the difference, and how can we make the cheap lands in this vicinity worth two hundred?"—Lands are worth, for cultivation, any sum that they will pay the interest on. The Carolina lands do not now pay the interest on five dollars, and the Lancaster County farms do pay the interest on \$200 per acre. The difference is not altogether owing to quality of soil. Good neighborhood, security for property, healthful climate, facility for getting manures and for marketing farm products, all affect the price of land. In the South, land is plenty, and the workers with capital few. In Pennsylvania, the workers are many, and they all want land. Of course, the price goes up. Bring in more workers who have capital, and improve your cultivation, and the price of land will increase. A very interesting problem for the farmer to solve is—how to make an acre of average land pay the interest on \$200.

Field Peas.—"A Subscriber" inquires for "the name of the field peas raised in Canada for fattening hogs."—The varieties for field culture are not so numerous as those grown in gardens. We presume you can get them of any wholesale seedsmen by ordering Canada field peas. The principal sorts are the gray and the white, and the best kinds for splitting are the "Pearl" and the "Suffolk."

Pumpkin Seeds.—"J. R. S.," of Perryville, Pa., wishes to know if pumpkin seeds are good for beef cattle. What effects might be expected from an exclusive diet of these seeds we do not know, but fed with the pumpkins they would certainly do little harm. The seeds of pumpkins and similar plants, when eaten, produce an increased secretion of urine, and check the secretion of milk in cows, and it may also be better not to feed the seeds to fattening animals for the same reason.

White Labor at the South.—"N. D.," Shelburne, Vt.—"I have been thinking of purchasing a farm in the Carolinas. Can you tell me if a white man can endure labor in that climate?"—Many parts of the Carolinas are as favorable to the health of white men as the North. The river bottoms and rice swamps are unhealthy, even for negroes. On the uplands, in cleared districts, the Northern man endures the sun very well. A Southern planter, forced to work by the exigencies of the times, says: "I worked hard, took the weather as it came, plowed, and hoed corn and cotton beneath the hot suns of June and July, pulled fodder, and yet my health has been unusually good, better than for many years that were passed in sedentary occupations. Many persons told me I could not stand the hot suns. I have stood them very well, and I believe a great many others could do the same, if they had the will." Many more white men are killed in the South, as well as elsewhere, by their vices than by the climate. Germans and Irishmen are found as laborers in all the Gulf States, doing quite well.

Hen Guano.—"E. C. L.," Williamsville, (where?), gives the following method of preparing and using hen manure: "During the fall and winter, every few days, a few shovelfuls of dry manure were spread over the droppings beneath the roosts, which were made with floors for the purpose. It had the effect of keeping the house sweet and odorless. In the spring I had a good pile of home-made guano. By shovelling it over several times it was finely pulverized, and no more unpleasant to handle than dry earth. I used it upon a late piece of corn, dropping a handful in each hill. It soon caught up with corn planted ten days earlier, ripened full as early, and yielded better. It seemed to grow so fast that the outworm could make no impression upon it."—The manure of fowls is the most valuable made upon the farm, and the example of our correspondent is worthy of general imitation. If the fowls are left to roost upon the trees, or on the carts and wagons, this valuable fertilizer is wasted. Nothing pays better than a good roosting place. Five minutes spent every day in it, with muck, shovel and broom, will be repaid in several dollars' worth of excellent manure at the close of the winter.

How to Use Sea-weeds.—"L. P.," Westport, Ct., writes: "I have a beach within a mile of my barn-yard. Will it pay to cart sea-weed that distance, and what is the best method of making manure from it?"—There are several varieties of these weeds thrown upon our shores, some much more valuable for manure than others. The rock-weed, kelp, and others, which are algae or sea-weeds proper, are much more highly esteemed than the cel-grass, which is not a true sea-weed, though this is very largely used. Farmers not infrequently cart them five or six miles back from the shore, and find it to pay, especially if taken as return loads. A man who has access to a beach where this material comes ashore in unlimited quantities can make his farm as rich as he pleases. It is good carted into the yards and sties as an absorbent. The dried cel-grass makes very good bedding for cattle. The other varieties are used to a considerable extent for top-dressing meadows, and with excellent results, and are worth about as much as yard manure. They are, besides, much used in making compost heaps, with surface soil, or peat. The winter is a very favorable time for gathering sea-weeds, as the heavy storms always tear up large quantities, and wash them ashore. The heaps need watching, as thousands of loads are frequently within reach to-day, and are gone to-morrow. This marine vegetation is especially valuable for potatoes and turnips.

Carrots for Horses.—"L. D.," Boston Corners. "I see these roots often recommended for horses. How should they be fed?"—They are one of the best kinds of feed for horses, and should be fed about two to four quarts a day, in connection with other feed; more will do no harm, as hay, oats, or corn meal. Wash the roots, and run them through a root cutter, or in the absence of a machine, slice or mash them in some other way.

Feeding Mangel Wurzel.—"M. O.," Orange County.—"I fed this article to milk cows last winter, and it caused the scours. Is there any way to avoid this?"—These roots undergo a curing process after they are stored, and we have found it best to use them in the latter part of winter and spring. If they loosen the bowels, feed in smaller quantities. They should always be used in connection with some dry food.

Buckwheat for Milk Cows.—"M. W. P.," Canada. "What do you think of buckwheat for cows, and would you feed it dry, or wet it up with cut hay or straw?"—Buckwheat is excellent provender for all cattle and swine. It is more commonly ground up with corn and oats, and the meal fed in connection with cut hay or straw.

Value of Straw for Feed.—"F. W.," "What is the relative value of the straw of the several kinds of grain?"—Rye is generally considered of the least value for feed, but best for bedding. If cut a little green, all the different kinds of straw have nourishment, and are advantageously used, together with meal.

Scrap-Cake.—"A. G. F.," Milton, Pa. "Can you tell the price of scrap-cake, which is recommended as a good feed for hens in winter?"—Pork-scrap can be had at the agricultural warehouses at about 3½ cents a pound, in small quantities; of the packers and tallow chandlers, at 2½ to 3 cents per pound, in large quantities. Beef-scrap is about ½ cent per pound less.

Poultry Items.—How to Make Hens Lay.—"S. R. W.," asks for the best way of making hens lay that wish to set. Our way is to confine

them in a light coop in the yard among other fowls; give water, but very little food, for three days or more, as may be necessary, and after this feed abundantly, giving pork-scraps or other rich food with grain.

How Many Chicks for One Hen.—In winter, set nine eggs; in spring, thirteen; in summer, fifteen, under the same hoo. She will give, if well cooped, two-thirds the number, with good protection, and after the first of June, if the coops are brought under a dry shed during cold storms, the chicks of most varieties of fowls will not suffer if a hen hatches as many eggs as she can cover.

Stray Grains for Chickens.—Under this title the Gardener's Magazine (English), gives the following sensible hints: "Feed your poultry on raw onions chopped fine, mixed with other food, about twice a week. It is better than a dozen cures for chicken cholera. Fowls exposed to dampness are apt to be troubled with catarrh, which will run to roup, if not attended to. Red pepper mixed with soft feed, fed several times a week, will remove the cold. Pulverized charcoal, given occasionally, is a preventive of putrid affections, to which fowls are very subject. Setting-hens can be cured by putting water in a vessel to the depth of one inch, putting the hen into it, and covering the top of the vessel for about twenty-four hours. The vessel should be deep enough to allow the fowl to stand up. This is the best remedy I have ever tried. Pulverized chalk administered with soft feed will cure diarrhoea. This disorder is caused by want of variety in the food, or by too much green food. Garlic feed once or twice a week is excellent for colds."

Raising Poultry for Market.—"E. F. V.," Arch St., asks: "Where can I find some one who is engaged in raising poultry for the market? I intend going into the business."—Poultry raising is a branch of business usually followed on the farm, and you can hardly go amiss of good poultry men in any farming district. It is seldom pursued as a distinct business, and when attempted has generally failed, mainly, we think, through too close crowding. A thousand hens, turkeys, ducks, and geese, ought to have at least twenty acres of land, partly covered with wood and brush. Ducks, geese, and turkeys, are very extensively raised about Narragansett Bay, in R. I., and it would pay a man who wishes to raise water fowl to visit Tiverton and Little Compton, in that State, to learn how it is done.

Mixed Stock in Pastures.—"E. D. S.," Putnam Co. "Is it a good plan to keep different kinds of stock in the same pasture?"—John Johnston says: "Sheep do well among cattle, but cattle do badly among sheep." Unless pastures are very large, and the feed very abundant, it is better to keep them separate. Sheep gnaw the grass very closely, and their fresh droppings are so offensive to cattle that they will not feed near them. Besides, sheep are very liable to get injured by horned cattle. If the high grounds at a distance from the house are selected for the sheep, they will keep the pasture constantly improving without other manure. The pastures nearer the barn are much more convenient for the cows. Sheep and horses do better together. Both are close feeders, and there is much less danger of the sheep getting harm. It is well to have a rotation of stock as well as of crops. The pastures fed one season by cattle may, with advantage, be fed the next by sheep.

How to Start a Farmers' Club.—"G. L. C.," Dennis, Mass.—"Can you tell us how to start and manage a Farmers' Club?"—This is one of the things that ought to go of itself in any farming community. Call a meeting without delay. It is not necessary to have a constitution or any officers but a chairman, who may be provided for in alphabetical order of the names. Propose a subject, invite in the neighbors, and let each man have his five or ten minutes' talk upon it. It will be found very profitable to compare notes. If men from other callings will come in and give their outside views of farming operations, it will be all the better.

Small vs. Large Farms.—"R. D.," Hackettstown, N. J., asks: "What is your objection to farming on a large scale, say 400 to 500 acres?"—None whatever, if the man has capital, and skill enough to work that number of acres thoroughly. The probabilities are that the man who has much land will not spend money enough upon it to make it pay as well as the small farmer would. There are some advantages in the large farm. It requires less capital per acre for buildings, stock, tools, and oversight. The system of small farms is probably the best for society. It brings families closer together, distributes wealth more equally, and favors social intercourse. With farms occupying a mile square, public schools are almost impracticable, and it is difficult to sustain churches, lyceums, and libraries. The highest state of social cultivation does not harmonize with the plantation system, or with enormously large farms.

A Small Farm in California.—In a recent conversation with a farmer from California, he spoke of his 1,200 acres as a small farm, and his 200 acres of wheat as a small affair. Some of his neighbors had 5,000 acres of wheat, and the yield was from 20 to 40 bushels to the acre. The highest yield he had known was 83 bushels to the acre. The fencing of land was getting so common that cattle could not be kept as profitably as formerly, and he had come East to invest in Cotswold sheep. To an Eastern man, the terms small and great have a very indefinite application in that country.

Potato Balls.—"W. H. S.," Wilmington, Mo. Potatoes from the balls or seed proper may or may not be better than the potato producing the balls. The seeds are washed out of the balls and saved just like tomato and similar seed, and carefully sown in good soil in the spring. It takes several years' cultivation of the product to ascertain whether the seedling is valuable or not. The process is resorted to only by those who wish to experiment in raising new varieties.

Asphalt or Concrete Flooring.—The Gardener's Magazine, (English, Shirley Hibbert's), has the following: "Three parts coal-ashes (those from the blacksmith's forge to be preferred) and two parts gas-lime from gas-works, to be thoroughly mixed, and then made into a mortar with gas-tar. If the gas-tar come from gas-works where the ammoniacal liquor is not separated, it will be sufficiently mixed for the purpose; but if the latter be separated, and the tar be thick, it will set quicker if about one-fourth part of water be mixed thoroughly with the tar when used. For the floors of cow-sheds, this should be laid about three inches thick in one layer, on an even surface of gravel, or stone broken very small with a sprinkling of gravel over, and rolled down. The mortar may be laid on with a common shovel, and merely patted down flat. In dry, warm weather, if the mortar has been carefully made, the floor will set firm in a few days. For any ordinary outhouse, half the thickness will make a permanent floor."

How to Make Rails Durable.—Almost every one notices a difference in the rails used for fencing material. Timber left with the bark on rots very much quicker than that which is split and seasoned. Some rails last but three or four years, and others are good for fifteen or twenty. There is a difference, of course, in the woods used for this purpose. Birch poles are sometimes worthless after a year's use, and chestnut is very durable. Experiments show that rails cut and split soon after midsummer last much longer than those prepared in winter. But summer is usually fully occupied with tillage and harvest, and of necessity fencing material must be prepared at a time of more leisure. If cut early in the winter, (and none should be cut late) have the logs split immediately, and the rails piled where the sun and wind can have free access to them. It is a good plan to draw them to where they are to be used, as the ground is now frozen. Peel poles too small for splitting.

Cutting Hoop Poles.—"T. R. M.," Hopkinton, R. I.—"I have a large tract of thrifty woods, principally oak and hickory, and wish to know if it will be damaged by thinning, and if there is any market for hoop poles."—A large part of the young trees that start in a piece of cleared land die, and only the fittest survive. If a portion are cut for poles, the remainder will grow more rapidly, and the timber will be of better quality. The poles are in demand in all our large cities for hooping casks, strapping boxes, and similar uses, and they will sometimes sell for enough to pay for an acre of land.

Compressing the Soil.

All facts in regard to soils should be familiar to the farmer, even if they have no apparent bearing on practical agriculture. We may not fully understand why a soil that has been stirred will settle into a smaller space than it occupied before it was moved, but such seems to be a fact. The soil thrown from an under-drain, when put back, will form a slight ridge on top, but in the course of a year or so will settle down enough to form quite a hollow. In other words, stirring the soil at first expands it, but afterwards compresses it. In engineering, this *shrinkage*, as it is called, which is the result of excavating, transporting, and compacting in embankments, is allowed for. Mr. Elwood Morris, C. E., in experiments on a large scale, found this shrinkage of light sandy earth to be 1/8 of its volume in excavation; of yellow

clayey earth $\frac{1}{10}$; and of gravelly earth $\frac{1}{12}$, (Gillespie on Road Making, page 119). In other words, sandy soils are compressed more than clayey soils by working. It is often very desirable to compress sandy soils so as to give a firmer foothold for the plants, especially of wheat. An English turnip fallow, which makes the land as mellow and loose as an ash heap, when the turnips are afterwards fed off on the land by sheep, converts a "blowing sand" into firm, fertile land. But our object at present is merely to call attention to the shrinkage of soils by working them, and to the fact that clayey soils are compressed less than sandy soils. Our readers can draw their own conclusions.

Deep Plowing Should be Done Gradually.

A correspondent, who has one of the finest and most productive farms in Western New York, which he keeps in a high state of fertility by thorough cultivation and the growth of red clover, makes the following sensible remarks in regard to deep plowing: "A sudden bringing up to the surface of many inches of heavy clay, that has never been punctured by the roots of plants, and this too in the spring of the year, would probably injure the first crop. Clay subsoils are best brought to the surface two or three inches at a time, and that in the fall, so that the frosts of winter may mellow them down. The next spring plow, say twice as many inches deep as the clay subsoil is thick. This will mix things up so that even a crop of corn would be much improved by the deep fall plowing. If we had the power and tools necessary to go on with this process of bringing up the subsoil to, and mixing it with, the surface soil, until we had one foot or more of mellow soil that had been enriched by turning under repeated clover crops, and then under this foot or more of soil, we could run a subsoil plow two feet deep, and so break the clay to a depth of three feet, the clover roots would have a chance to bring to the surface the fertility that now lies dormant under the surface of our lands. This is the theory that I have constructed on the experience of a lifetime as a farmer; and I have no doubt of its applicability on our lands here. I do not think it would do on all lands, but it is practicable here, or at least will be when we get the Steam Plow that can do the subsoiling for us. In the meantime we are doing the best we can in the direction I have indicated."

The Clover and Lime Theory in Practice.

We have had much to say upon the benefits of using lime and clover upon worn-out soils, to give them a start. And yet we are apprehensive that many of our readers have regarded the matter as mainly theoretical, and will not be induced to try it. Although agriculture is admitted to be a tentative art, some things are settled as well as they ever can be by any amount of experiment. Among them is the utility of applying lime to soils that have not already enough of it, and cropping with clover to add vegetable matter and ammonia to thin, light soils, or those that do not give remunerative crops. In a recent trip over the line of the New Jersey Central Railroad, we saw abundant evidence of the renovation of worn-out farms. Thirty years ago these farms were unproductive, and many of their owners were anxious to sell out at thirty dollars an acre and emigrate. It was difficult to sell at any price. Now one will have to go far to find a more

beautiful farming region than stretches from Plainfield, N. J., to Easton, Pa. Farms are worth from \$125 to \$200 per acre, and are constantly increasing in value. It is true some of this rise is due to the railroad, which affords better facilities for marketing, but the most of it is owing to the better management of the land. They make more of clover than in the regular Pennsylvania rotation, as it comes in oftener. The rotation is: 1, corn upon a clover sod, limed; 2, oats; 3, wheat, with the manure of the farm; 4, clover, to be cut or pastured. The farmers in all this region attribute the great change in the value of their lands to this rotation. The crops are luxuriant, and the wheat fields as promising as in any part of the West. In all the better farming districts of Pennsylvania, similar results are manifest. Clover and lime, in connection with the manure made upon the place, keep the farms in good heart, and constantly improving. The average production of wheat and of corn in these districts is much higher than in the Western States, which had a richer virgin soil. Wherever this treatment of the soil has been introduced, it secures the most satisfactory results. We do not see how this management of the soil can be considered as pertaining merely to the theory of agriculture. Yet the mass of our farmers in the Eastern States continue to raise clover in small patches, as a forage crop, without reference to its value as a renovator of the soil. If they would travel more and see what is accomplished in the line of their art, they would form better views, both of the theory and practice of agriculture.

(For the American Agriculturist.)

The Diseases of Animals

BY PROFESSOR JOHN GAMGEE, OF LONDON, ENGLAND.

A movement is on foot, both in the Old World and the New, which promises great and beneficial results. A century since and more, the French inaugurated a system of supervision in relation to the manifestation of fatal cattle diseases, which led to the foundation of veterinary colleges. The steppe murrain, or rinderpest, which mowed down the herds at every movement of contending armies or enterprising stock drovers, stirred up the energies of the Germans, from the Russian frontier to the Rhine provinces, and even the Italians at a somewhat later date picked out four intelligent lads to be educated in the Veterinary College of Alfort, in order afterwards to diffuse the knowledge they acquired amongst the people of their native land. England had been engaged in numerous continental wars, and the flood of people crossing the German Ocean and British Channel attached at various times fatal links between the infected herds of Central Europe and those of the British farmer. Early last century England suffered severely, and continued to suffer, more or less, at intervals, until by the advice of intelligent physicians, amongst whom may be numbered Cullen, the importation of foreign cattle was strictly prohibited.

Thus freed from contagious cattle disease, the breeds of England improved, and how much this immunity from fatal maladies has tended to the development of that excellence for which British stock is proverbial is a question which has never been discussed. I, for one, believe that the protection offered to British herds by strict isolation from the plague-stricken animals of Eastern Europe was for three-quarters of a century one of the silent but most active agencies favoring the development of our match-

less bovine breeds. Since the introduction of pleuro-pneumonia and the foot and mouth disease we have in many points gone back, and our town dairymen fail to obtain in large quantities the excellent half-bred Short-horn cows which filled their milk-pails to repletion. They have had to import Dutch cattle, and with these much disease. The rinderpest in 1865-'66-'67 effectually accomplished the reduction of our breeding stock, but at the same time the restrictions on trade which had to be enforced cleared off the other contagious diseases. Had the Liberal party in the House of Commons not been misled by its leaders, who construed preventive measures into measures for the rich to the detriment of the poor, cattle-disease legislation would have prospered, and another term of peace and prosperity would have ruled the destinies of our enterprising breeders. As it is, little is being done for the protection of British herds, beyond the discussions and resolutions at Farmers' Clubs and Chambers of Agriculture. The lessons learned, however, cannot be forgotten, and at a recent meeting in Edinburgh of the first active and important Chamber of this description, it was proposed that a Consolidated Cattle Diseases, Traffic, and Transit Act of Parliament would, by providing increased security and protection from disease, and thereby decreasing the cost of producing meat, be of the greatest advantage, not only to the agricultural interest, but to the whole community; and further, that the recent ravages of cattle plague prove the necessity for a comprehensive measure, whilst the experience gained indicates the most effective means for the extermination and prevention of contagious diseases.

We need not enter further into the details of the Scottish recommendations, beyond remarking that it is proposed to legislate for contagious diseases only, which comprise both the fatal and non-fatal. Considering that America has repeatedly imported the lung disease from England and Holland, all that is done there for the prevention of cattle disease interests the people of the New World. But, strange to say, an indigenous disease, one springing, in physicians' language, as an endemic or local disease, from the rank pastures of the Gulf States, has stirred the cattle breeders of the whole continent. A meeting of the American Convention of Cattle Commissioners has just been held at Springfield, Ill. We congratulate all engaged in that important *réunion* on the earnestness and business-like skill brought to bear on the subjects discussed. The Black Water or Fever of Texas has been an excuse, and a good one, for attempting more than checking the movement of Southern steers in the summer. Specific recommendations are made in this respect, but State authorities are no longer to overlook the ravages by fatal diseases of any kind affecting the lower animals, and Congress is to be memorialized with a view to the obtaining of reliable and exhaustive reports concerning what almost deserves the appellation of the Cattle Plague of America. There is one point which the Springfield convention should not have overlooked. That is the establishment of veterinary colleges. The States or the general Government must take this matter in hand, for without pecuniary aid such efforts as those to which Dr. John Busted, of New York, has devoted his life and means must prove abortive. Veterinary colleges are needed, and the example of France and Prussia, of Austria, and even Russia, must be followed, or this country will experience the lamentable disasters which have crippled and ruined many a farmer and stock breeder in the Old Country.

In the Lumber Regions.

The great and increasing demand for lumber each year sends the lumbermen further into the

will allow of only a brief outline of the operations. The land is first explored, or "prospected," as the miners say. Good timber must be not only abundant, but accessible, and

which consists of a large log house for the men and hovels for the cattle. These logging camps are more or less carefully prepared, and our artist has shown one of the better sort. As we

wilderness, and whoever would visit a logging camp, and enjoy the hospitality and novel life of its inmates, must now go a long distance from the sea-board. One of our artists, who passed a

sufficiently near a stream to allow of its being taken out after it has been cut. Many a noble pine yet standing owes its existence to the fact that it is located where its fallen trunk could

have seen them, the door and a hole in the roof were the only openings, that in the roof serving to let in light, and for the exit of smoke. Within, the camp fire occupies the center of the

building, and on each side are beds made of hemlock boughs, with the feet towards the fire. If the party is to be a large one, rude bunks are made, one above another. The advance party

Fig. 5.—A JAM.

Fig. 6.—THE LUMBER SHIP.

occupation which requires capital and organized labor; and while the general features are everywhere the same, its details are modified by the laws and customs of different States. Space

They make the journey sometimes by boat, but often on foot after they get beyond the reach of roads, packing their provisions and "traps" upon their backs. This party prepare a camp,

also make roads on which to haul the timber to the river, by cutting down undergrowth, bridging over swampy places with logs, and in other ways constructing such roads that a

covering of snow will make them easily passable for the teams. When frost and snow render it practicable, the main party come with ox-teams and abundant supplies for man and beast, and work commences in earnest. The crews consist of twenty or thirty men, who have their assigned duties, and a cook. A skilled chopper will fell a tree with an ease and neatness that are wonderful to witness. No hunter is more fastidious about the points of a rifle than the chopper about those of his axe. The felled trunks are deprived of their limbs and bark, sawed into proper lengths, marked with the owner's brand, and are hauled upon sleds to the banks of the stream, and placed where they can be readily launched. With the breaking up of the ice in the streams, the work of the choppers ends, and a portion of the party return home with the teams, while others remain to "drive" the logs. Driving is the most exciting and hazardous, as well as the most laborious, portion of the work. The logs, committed to the swollen stream, go down with a rush, and it is the business of the drivers to follow them in a boat, and to be at hand to help them out of all difficulties. What with getting off those which run aground, and extricating those which become "jammed," the driver has a lively time. Sometimes on the slippery logs, sometimes in the ice-cold water, and with but little rest, it is a task that can be performed only by the most robust. Where the stream suddenly narrows, a "jam" of the accumulated logs frequently takes place, and to break it up is often a very risky matter, as the starting of a single log may allow the whole mass to move, to the sure destruction of the drivers. Sometimes where the jam takes place between the high banks of a stream, the men who are at work upon it have ropes attached to them by which they can be drawn out of harm's way as soon as the logs start. The writer once saw upon one of the branches of the Penobscot a jam so firmly fixed that it resisted the attempts to blow it up by powder. In driving, the logs of various parties become mixed, and they are only separated when they arrive at the end of the drive, which is at the boom. The boom is made of trunks of trees chained together end to end. These stretch across the river, or from one massive pier to another. All the logs are caught by the boom, and those of each owner, as indicated by the marks, are collected together. In Maine this is done by State officers, who receive a compensation regulated by law. From the boom to the saw-mill is the next step. Here the logs are converted into lumber, which, by various modes of conveyance, reaches the points at which it is consumed. As the great lumbering rivers of Maine flow directly to the sea, most of the lumber is rafted down to tide-water, and placed on slipboard. The engravings show the various steps here described, and need no other explanation than those given.

CARD THE COWS.—One would think that any kind-hearted man, when he sees how grateful this operation is to a cow, would be willing to spend a few moments daily in carding her. It pays as well to clean a cow as a horse. All who have fairly tried it find great benefit from the operation. And yet not one farmer in a hundred makes it a practice to use the card or curry-comb in the cow-stable. We know stupid men who laugh at the idea as a mere notion of some fancy farmer. But, in point of fact, no cow can give the best results at the pail unless this matter is attended to, especially in winter.

Walks and Talks on the Farm—No. 61.

We have had very disagreeable weather for finishing up fall work. Much time was lost, and labor was very scarce and high. In this neighborhood one farmer paid men \$1.75 per day for digging potatoes, women \$1.50, and boys \$1. Potatoes have brought a high price, but such wages take off the profits, especially with a poor crop. There are many fields this year that produced not more than 75 bushels per acre, and 15 bushels of these were too small to sell. Now it costs nearly as much to dig such a crop as one which yields 175 bushels per acre. In point of fact, it costs *more*, for this reason: the good crop is clean and the land mellow; the poor crop is full of weeds, and it takes about as much labor to dig the weeds as to dig the potatoes. I have made up my mind never again to plant an acre of potatoes, unless there is a reasonable prospect of getting a good crop. It is impossible to pay such high wages unless we raise large crops. This is the great truth which we should fully understand and realize. There is no other way of making money by farming. Theoretically we all acknowledge this truth, but it is not so inwrought in our convictions as to enable us to withstand all temptations to plant on land not in good condition. If farmers would raise as much as they now do on *half the land*—in other words, double their crops per acre—they would quadruple their profits. There would be no more to sell than now, and consequently no danger of glutting the markets and bringing down prices below the cost of production. We should spend far less for labor; should need fewer horses; there would be less wear and tear of implements; blacksmith and wheelwright bills would not count up so frightfully as they now do; we should not have to toil and toil from morning to night in getting in our scanty crops; we should have just as much produce to sell, and could keep double the amount of stock; and our farms would become cleaner, richer, and more productive, year after year, instead of becoming poorer and more weedy.

Were I about to hire out to a farmer, I would look for one who raises large crops. Such a man would pay cheerfully and promptly; but a farmer who has to pay high wages for getting in a poor crop could hardly fail to be as cross as a bear. I often think of this matter in connection with the *American Agriculturist*. The expenses for editing, engraving, etc., would frighten the publisher of any ordinary journal.

High salaries are paid, and paid with such cheerful promptness that it is a pleasure to work for its liberal-minded proprietors. The secret of the whole matter is: *they raise enormous crops*. If I raised three hundred bushels of potatoes per acre, I could pay two dollars a day for digging them more cheerfully than I now pay twelve shillings. It would not cost me over two or three cents a bushel to dig them, and now it costs me ten cents or a shilling. And though the *Agriculturist* pays me twice as much as any one else could afford to pay for the work done, yet it amounts to but a very little for each subscriber.

Yes, I do want a new barn. I had a big crop of hay and was obliged to put more than half of it in stacks, and during this wet weather it gives me dyspepsia to look at them. Some farmers have more capital than faith; I have more faith than capital. I have faith in good farming, faith in good stock, and faith in substantial, but not expensive, barns. But those of

us who are short of capital must get along the best way we can. It will not do to fold our hands and bemoan our lot. Energy will overcome great difficulties, and little troubles disappear when looked full in the face by an earnest man. I have two farming friends who are equally short of capital, and yet one gets along very well, and the other is running behind. His fences are all out of repair, the barn leaks, the doors are off the hinges, implements are scattered around, and the stock are allowed to run in the fields all winter, and eat at the straw stack, without as much as a board fence to shelter the shivering and half-starved animals from the pitiless storm. The other keeps things snug and in repair, and, not having money to build a barn for his cattle, he has constructed a shed with rough boards and covered it with corn-stalks, and his cattle and sheep, being regularly fed and carefully attended to, look as comfortable and thrive as well as some that are kept in an expensive barn. It is downright cruelty to let our animals be exposed to the wind in winter. There is none of us so poor that he cannot put up something that shall afford a shelter from the wind, if not from rain.

Prof. Miles, of the Michigan Agricultural College, has sent me a pair of wild turkeys. The eggs were found in the woods this spring, and hatched under a hen. There were no domestic turkeys within miles, and they are undoubtedly genuine. The most striking difference between them and the domestic turkey is in the length and fineness of their legs. They look exactly like those figured in the *American Agriculturist* for October, except that they have not yet got a tuft of hair on the breast. It is curious that, while the object of breeders is to reduce the weight of bones, these wild turkeys should have finer bones than the domestic turkey. The latter arrives at maturity earlier than the wild turkey, but with this exception, it would seem that very little improvement has taken place.

Dr. Miles has also favored me with a diagram showing the results of his experiments on pigs. The general results are similar to those obtained in the first series of experiments, (see *American Agriculturist* for December 1867, page 440); that is to say, there is a remarkable decrease in the amount of food consumed in proportion to live weight as the animal grows old. Thus the average amount of milk, reckoned in pounds, consumed for each pound of live weight was:

	1st week.	2d week.	3d week.	4th week.
Experiment of 1866.	3.96	3.32	2.92	2.49
" " 1868.	3.90	4.42	2.95	2.57

The gain for each 100 lbs. of live weight was:

	1st week.	2d week.	3d week.	4th week.
Experiment of 1866.	75.86 lbs.	53.92 lbs.	23.20 lbs.	23.00 lbs.
" 1868.	56.00 "	59.64 "	26.73 "	27.69 lbs.

In other words, the pigs gained 86 per cent the first week, and only about 28 per cent the fourth week. The amount of milk consumed to produce one pound of increase was:

	1st week.	2d week.	3d week.	4th week.
Experiment 1866.	7.20 lbs.	7.92 lbs.	11.81 lbs.	10.13 lbs.
1868.	6.53 "	7.50 "	12.52 "	10.56 "

These experiments were in progress when I visited the college, and it was very evident that no pains were spared to insure accuracy. There is no new point brought out by the second experiment, but it confirms the results obtained in 1866, and we may accept as established facts, 1st, That, up to a certain age at least, a young animal eats much more in proportion to live weight than an older one. Thus, for each pound of live weight, the pigs eat nearly 4 lbs. of milk the first week, and only about 2½ lbs. the fourth week. 2d, That for the food consumed, the

younger the animal the more rapidly it gains. Thus, taking the mean of the two experiments, it required the first fortnight only 7½ lbs. of milk to produce one pound of increase of animal, and more than 11 lbs. of milk the second fortnight, or over 65 per cent more.

I hope the experiments will be continued until the pigs are fat enough for the butcher. Four weeks is not long enough to give us all the facts required. These are the only experiments I know of directly bearing on the point, but it seems clear to my mind that there is an immense advantage in getting animals to eat, digest, and assimilate a *large amount* of food, for the simple reason that it takes a very large proportion of the food to sustain the vital functions, and all the growth of the animal is derived from the food eaten in excess of this amount. I believe this is now the most important point to which breeders can direct their attention. The amount of offal in well-bred animals has been reduced by skillful breeding to a minimum. Now let them aim to increase the digestive powers. Said an experienced dairyman, "I never knew a cow that was a great milker that was not a great eater." This is my idea exactly. And what we want is a breed that will eat 25 or 50 per cent more in proportion to live weight than any animals we now have. They would, *in proportion to the food consumed*, grow twice as fast as they now do. I have very little doubt as to the truth of this proposition; and if it is true, the sooner it is acknowledged and acted on by our breeders the better.

I got a letter this morning from the managing editor of the *Agriculturist* calling for "more copy," and earlier. "You country folks," he says, "ought to pass a few months in New York in winter to get a little *go* in you." New York is a very pleasant place to visit for a few days, but a whole winter! Not if I know it. It is a fact, however, that these New Yorkers accomplish an immense amount of work in a given time. People in the country think they have enough to do, but we do not work half as hard as they do in a large city. They earn all that they get, and sometimes do not get all that they earn. It is the "pace that kills." We are all inclined to go fast enough. Steady work is what counts, and you will find that the men who have accomplished the most in life are generally "country folks."

Last spring I intended to get 4 tons of Peruvian guano to put on 20 acres of potatoes, but the freight from New York to Rochester was \$22 per ton, and I gave up the idea. A few weeks after, when it was too late to sow the guano, the freight was reduced to \$3 00 per ton. Our potatoes are sent to New York, mostly by railroad. My crop did not average, for want of manure, over 75 bushels per acre. The freight on this to New York would be about \$20, or \$400 on the 20 acres. Now I have no sort of doubt that 400 lbs. of guano per acre would have given a crop of 200 bushels per acre, and the freight on this would be about \$53 per acre, or \$1,060 on the 20 acres. In other words, if Vanderbilt would have brought me 4 tons of guano for \$32 instead of charging \$88, he would have received \$1,060 for carrying back the potatoes, instead of \$400. If railroad companies understood this matter they would transport manures at the lowest possible rates. I have known the application of one ton of superphosphate on 5 acres of turnips to *increase* the yield 10 tons per acre, or 50 tons, and one ton of guano

will sometimes give an *increase* of 18 tons of potatoes. They can afford to carry a ton of superphosphate or guano at a cheap rate in the spring, for the purpose of getting 50 tons of turnips, or 18 tons of potatoes to carry back in the fall.

The trustees of one of our agricultural colleges told me that they could get ten literary and scientific professors easier than they could get one for the department of agriculture. And I notice that "one of the foremost colleges of the country" is advertising in the newspapers for a "Professor of Agriculture." This is rather hard on the trustees. I am very sorry for them.

I do not know what college it is that is advertising for a Professor of Agriculture, but I presume they will get scores of applicants! It will not be an easy matter to make a selection, and the better way would be to put the names in a hat and draw out one, and let this be the successful candidate! The chances are that he will be as good as any! Some years ago a city man who had dabbled a little in chemistry asked me to recommend him as Professor of Agricultural Chemistry to a newly started Agricultural College. I forget whether I complied or not. He knew nothing or next to nothing about agricultural chemistry, but as there are few people that know any more, I told him I thought he would probably do as well as the next man. He applied for the place. The trustees met, and it appeared that there were two candidates for the Professorship of Agricultural Chemistry, and none for the Professorship of Practical Agriculture. They made the appointments, and my friend came to me laughing and excited. "Here's a joke," he said; "those people have appointed me Professor of Agriculture, and I don't know what to do about it." "Accept, of course," I said. "You are out of a situation, and if you go down there something will turn up. Perhaps the other man will resign, and then you will probably be appointed to the chemical chair and will get along well enough." "I'll do it," he said, "but it's a great joke." And so it was. He was a good fellow, but did not know a Short-horn from a Devon, or a Southdown from a Merino, and it may well be questioned if he knew wheat from barley. His whole life had been spent in the city, and he was not to blame for knowing nothing about farming. But the fun of the joke is that he is to this day, or was the last time I heard of him, Professor of Agriculture in one of our prominent agricultural colleges, and a writer for one of our agricultural papers. And, truth to tell, he writes as well and knows as much about farming as the editor himself.

These matters will right themselves by and by. Agricultural Colleges will endure much tribulation, but there is a necessity for them, and they will ultimately prove eminently useful and be established on a permanent basis. At present, too much is expected from them by one class of people, and too little by others. The Professor of Agriculture should be a practical man and a man of good common sense. The more he knows of science and the less he says about it the better. It is not his province to tell the class how crops grow, but to show how to grow them. Let the chemist teach chemistry, and the farmer, farming. There are not ten men in the world who can teach both. Let the Agricultural Professor teach the young men how to clean a horse, how to bed him, when to water and feed him, how much he will eat, and what is the best food. And so with cows, sheep, and pigs. Fancy my old city friend a Professor of Agriculture, talking about such things to his class, and going on the high side of a cow to

milk her, and suddenly finding himself, milk-pail and gold spectacles, upset by a protesting kick. But a really practical, intelligent man could teach any young farmer a good deal about such matters that would prove very useful to him in after life. So in regard to plowing, harrowing, and cultivating. There is great need for the exercise of a little common sense about these ordinary operations. There is a chance for great improvement in the common methods of doing them. Why should a man plow when the same effect can be obtained at half the cost by the use of a cultivator? And why need a man waste half his time driving two horses on a harrow or cultivator when he can just as easily drive four and do double the work, or do it a great deal deeper and better? Let whatever is done on the farm or in the garden be done in the best manner. Let not a weed grow. Sow no crop unless the ground is in good order. If a field intended for winter wheat cannot be got into good condition, give up sowing the wheat, and plow and cultivate the land two or three times in the fall, and sow it to barley the next spring. Better have a good crop of barley than a poor crop of wheat—better far for the land, and a good example for the boys. Nothing is more important than to teach them not to expect good crops without good preparation. Let them know that there is no royal road to farming, and that there is more hope of improving old processes than of discovering new ones that shall revolutionize our system of agriculture. Let them know, however, and what is more important, let them see, that it is just as easy to raise 30 bushels of wheat per acre as 15, just as easy to raise 150 bushels of potatoes as 75, and *ten times* more profitable. A little figuring would convince any one of the fact, and yet few farmers understand it, because they think about gross receipts and not about the profits left after deducting the expenses.

I am always glad to answer inquiries about farming. I believe this is true of all the other editors of the *Agriculturist*. But they have the advantage of me. They get their letters promptly, while letters intended for me, sent to New York, are sometimes delayed. I received a batch to-day. One gentleman wants to know what tedder it was I saw at the Michigan Agricultural College,—an inquiry which is now rather out of date. Another wants to know "if the field that yielded 50 bushels of barley per acre was the same field I wanted to raise a good crop of corn off, alluded to in the *May Agriculturist*, 1867." It was the same field. Owing to the drouth the corn was not as heavy as I expected, but the clean culture and the previous manuring told on the barley. And the wheat sown after it this fall looked well when the winter set in. He wants to sow superphosphate on his barley next spring, on a corn stubble plowed this fall, and wishes to know how to apply it. Sow it broadcast before drilling in the seed. Better sow half superphosphate and half Peruvian guano, say 300 or 400 lbs. of the mixture per acre. At the present price of barley it will pay well to use a mixture of guano and superphosphate for this crop. Another gentleman, whose letter is dated Cleveland, Tennessee, wants to know all about underdraining, and also about liming land for wheat. This is too much of a good thing, and if I commenced to talk about underdraining I should never stop. Old John Johnston used to tell his correspondents to *commence* draining in the best way they could, and then if they could not find out all they wanted to know, he would help

them. Cut a narrow ditch through the land 2½ to 4 feet deep. Make it level at the bottom and so that the water will run. Lay the tiles, or stones, carefully commencing at the upper end. If the water follows you, you may be sure you are all right. Then throw in the soil on the top of the tiles, and the work is done. Better get Waring's book, "Draining for Profit and for Health." In regard to liming, I do not think it makes much matter when you apply the lime, so that you get enough on per acre. One of my neighbors applied 100 bushels on an acre of heavy clay land fifteen years ago, and he sees the effect in every crop to this day. It has entirely changed the character of the soil. My father used to put on 150 bushels per acre, and always contended that a small dose of lime did little good. It is not a popular doctrine nowadays, but I believe he was more than half right. There is no question in my mind in regard to the benefits of liming. Drain first, summer-fallow next, and then lime. The land will not forget it in 30 years. There are several other inquiries which I have not now time to notice. I take a brotherly interest in every one engaged in farming, and am always glad to hear from such.

Can the United States Raise its Own Barley?

Large quantities of barley are annually imported into the United States from Canada, and in addition to this it is said that orders have recently been sent to England for many thousand bushels. The fact is a significant one. Barley requires good land and good culture. We have abundance of good land, but what shall we say of its culture? Let the price of barley answer.

There was a time when it seemed doubtful whether we could afford to improve our farms in the older settled parts of the country as long as we had to compete with the cheap and fertile land of the West. To spend \$30 in draining an acre of land in Western New York, while this sum would buy 20 acres of choice land in Iowa, required more faith in good farming than most of us possessed. But the truth seems to be that land, in itself considered, has comparatively little value. What is it worth in parts of Texas or South America? It is the labor, skill, and capital, expended upon it directly and indirectly that gives it value. We build roads, canals, railways, towns, cities, churches, and school-houses, and every dollar so spent adds to the value of the land. In this view, the land in the West is not so much cheaper than at the East as is generally supposed; and at all events we need not hesitate to expend capital for needed improvements on our farms, for fear that the fertile lands of the West will so flood our markets with cheap produce that we cannot make a living. At any rate, if we cultivate our land at all we must cultivate it well. The only farmers who have been greatly benefited by the high prices of the last six years are those whose land is in good condition; and this will always be the case. We think there can be no doubt that our general system of farming is improving, but there is still great need of more thorough culture and manuring. The high price of barley, and the fact that we obtain such large quantities from Canada, where the soil and climate are no better than with us, and that the freight, duty, and premium on gold, give us at least 25 cents a bushel advantage in price, is a sure indication that we are not farming as well as it is for our interest to do. Barley, as we have said, requires high culture, and at present

prices we can certainly afford to put our land in proper condition to produce a large yield.

We do not, at this time, propose discussing the best methods of growing barley. Our object is to call attention to a fact that affords encouragement to those who are expending capital in the improvement of their land. Poor farmers can raise good barley. Let those who are underdraining and otherwise improving their land, and are sometimes frightened at the expense, take courage. There is an absolute necessity for an improved system of agriculture, and those who are getting their land in good condition will assuredly have their reward.

Ladders for General Use.

We all have need of good ladders. There is not a farmer in the land who has not occasion now and then to use one, and, perhaps, often trusts or risks his life upon one. It is a criminal thing to have weak, shaky ladders about, especially tall ones; for while the risk to life and limb is next to nothing upon a good ladder, he who uses an unsafe one is in great danger. In making a ladder, we prefer to use red cedar for the poles, and oak for the rounds. White cedar will answer well, and so will white pine or spruce for poles, and the rounds may be made of many different woods. Dogwood is good, cutting stems of the right size, and the bark may be left on. Hickory does well, if the ladder be kept painted, and not exposed to the weather—otherwise it rots at the ends where inserted in the poles. Cut a straight cedar pole of at least six or eight inches in diameter at the but, and of

CRANE'S LADDER SUPPORT.

the desired length, if such an one can be found. Lay it up to season six months or a year, and take care that in drying it does not get a bend. With a little painstaking it may be improved in straightness while seasoning, if not straight. Then shave off the bark and branches with a drawing knife; cut it of the right length; plane down a strip of three inches wide on opposite sides, and mark it and saw it in two in the middle, lengthways. If well done, we shall have two long, straight, sound, tough, stiff poles. Mark off the points for holes for the rounds alike in each; 14 inches is a good distance to have the rounds apart. If the ladder is to be a wide one, the lower rounds should be

an inch and a quarter in diameter, and the holes an inch, while the upper rounds need not be more than an inch in diameter. For a ladder 14 inches between the poles, inch rounds are large enough for the bottom ones, and five-eighths inch for the top. Split and shaved rounds are as good as turned ones, unless one is making a very nice job, when the rounds may be split out and then turned. It is well to make the rounds with a slight shoulder, so that the poles cannot be driven together at all by a fall. This is apt to split them, and if the rounds are simply shaved down to enter the holes, it is imperatively necessary to insert several flat rounds two or two and a half inches wide and three quarters of an inch thick, having tenons at the end, with strong shoulders, and fitting into mortises. When the ladder is put together, dip the ends of the rounds in paint; set all the rounds in one pole first; then put on the other, and finally, after sawing off the ends of the rounds, drive hard wood wedges in each alternate round, so as to spread the ends and prevent their drawing out. Wedge the flat ones particularly. With a plane, a drawing knife, and a little sand paper, the ladder is easily finished, and a good coat of varnish will make it last a long time as good as new.

The engraving represents a ladder with a support, for use in the orchard or elsewhere, applicable to medium-sized ladders, and far better, to our notion, than most such contrivances. The peculiarity is in the support, which consists of two stiff poles, very nearly as long as the ladder, fastened together by a bolt near the top, so that the bottoms may be moved apart or nearer together. There are two strong hooks inserted in these poles below where they are bolted together, and upon these one of the upper rounds is made to rest, as shown in the engraving. This is the invention of Mr. J. C. Crane, of Newark, N. J., and combines efficiency and safety. The supports are readily removed, when the ladder is needed for uses in which they are not required.

A Rotation for the West.

The agriculture of the West is, if possible, in a still ruder condition than that of the East. The course pursued by the great majority of farmers has been well calculated to destroy the fertility of the land. The aim has almost always been to get the greatest amount of present profit, with the least labor. The improvement of the land has not been thought of, or cared for. The emigrant has pitched his tent in the forest, or upon the edge of the prairie, and, with very little capital, has begun the struggle for life. Corn has been the essential crop, for it furnished food for his family and for his animals, and prepared the way for wheat, which was the main reliance for money. Corn was planted among the girdled trees, and sometimes for several years in succession, until the limbs and many of the trunks of the trees had fallen. In some of the states there are large tracts that have been planted with corn for thirty years or more, and are said to still produce forty bushels to the acre, which is a reduction of one-half from its primitive fertility. In many places corn and wheat, both exhausting crops, have been grown in alternate succession until both have ceased to be remunerative. In all the older Western States, the average yield of wheat has been reduced one-half or more, so that on many farms it is given up as an uncertain crop. Troublesome weeds have come in so abundantly that it is no

longer possible to get clean grass seed or wheat. The remedy for this unprofitable husbandry is a careful saving of manures, and a rotation adapted to the circumstances of the farmer and the character of his soil. We suggest a few that may be of service. I. 1, Corn on limed sod; 2, Oats; 3, Wheat with manure; 4, Clover; 5, Timothy, cut; 6, Timothy, pastured. II. 1, Corn on sod; 2, Oats; 3, Clover; 4, Wheat; 5, Clover; 6, Timothy. III. 1, Corn; 2, Spring Wheat; 3, Clover; 4, Wheat; 5, Clover; 6, Blue Grass and other grasses; 7, and 8, Pasture. IV. 1, Corn; 2, Barley; 3, Clover; 4, Rye; 5, Clover; 6, Timothy, and other grasses. In some places, where the land is very foul, these rotations might be changed by planting corn two years in succession, with thorough cultivation four or five times in the season. Near cities or river ports, where there is cheap transportation to market, potatoes might come into the rotation advantageously. In some localities root crops, especially turnips and beets, can be grown to good advantage. In all cases particular attention should be paid to making manure, and it is applied with excellent effect either to corn the second year, or to wheat. The idea that the new soils of the West will never need manure is already exploded among intelligent farmers. Lands that now produce but 40 bushels of corn and 15 of wheat to the acre, may be made to double their yield by the aid of manure. The increased profit of such crops needs no showing. With a good system of cropping, and the use of manure, the fertile soils of the West may be kept up to their early productiveness.

Management of Cows in Winter.

A correspondent of the *Agriculturist* inquires: "When cows are stabled nights in winter, how long should they be allowed to remain in the yard during the day?" This depends a good deal on the weather, and also on the food and whether the cows are expected to give milk or not. When the object is to obtain milk in winter, if water is supplied in the stable we would seldom turn them out at all. And if necessary to turn them out to water, we would let them out twice a day, say for ten or fifteen minutes. Cows like to be humored a little in regard to watering. They will not drink as readily as a horse. They should be allowed plenty of time. When cows are not giving milk and it is desirable to have them eat coarse fodder, they should be turned out for several hours during the day. They will eat this class of fodder much better in the yard than in the stable. Judgment, however, should be exercised. If the weather is stormy, they will be better in the stable, and at all times, if they seem cold and are not eating or enjoying themselves, let them be immediately tied up. Let the stable be well ventilated and cleaned out twice a day, and made as dry and comfortable as possible. The great defect in most stables is in not having sufficient ventilation. The ventilators should be so arranged that they can easily be adjusted to suit the weather. Make it a rule to visit the stable before retiring for the night, and see that everything is right.

FIG NATURE.—"Walks and Talks" writes: "I was amused with the picture of the jealous hog in the *Agriculturist* for August. It illustrates one of my pet ideas—that the more you can get an animal to eat, provided he will digest and assimilate it, the better. I would select the "biggest eaters" I could find to breed

from. I would not care how coarse they were. Cross them with fine-boned, thoroughbred males, and aim to combine the digestive powers of the mother with the refinement and early maturity of the sire. The main object of breeders has been to lessen the demand on the stomach by reducing the quantity of hair, horn, bone, and offal, and stimulating the growth of the most desirable points by an abundance of highly nutritious food. I do not think they have given proper attention to the digestive powers.

Conversion of Wagons into Sleighs.

We can recommend to nobody, unless it be to the village store-keeper or butcher, to attempt to use a wagon with runners placed upon the axles, or of the same width of track as the wheels, if he consults his pleasure and not his necessities. Such vehicles do very well to run

Fig. 1.—RUNNER FOR WAGON AXLE.

about in the streets of a town, but on country roads they are a nuisance. Still, many a man is caught fifty or a hundred miles away from home on wheels, when a fall of a foot or two of snow makes it next to impossible for him to proceed or return. The wagon body may be set upon runners, but this is an awkward fashion. If there is a half a day's time, and a carpenter shop is at hand, it is no very great job to fit out a wagon with four independent runners to go on in place of

Fig. 2.—OUTER SIDE PIECE.

wheels. These may be made to fit upon almost any wagon, by the aid of a few wooden washers, and are easily stored so as to be used at any time. Each runner is made of three pieces of inch board. Two pieces form the sides of each runner, and meet at the bottom, while they are six or eight inches apart at the top. The outer side piece is sawed full of kerfs at the front end, so that it will bend around snug to the other. The two side pieces are nailed upon the edge with clinch nails, and stiffened with battens, if necessary, and these battens

Fig. 3.—SECTION.

enter mortises in the top piece, or the top piece is simply nailed down upon the others. Two round holes are cut a little back of the middle for the axle. These should be level and exactly opposite; they need not be exactly of a size to fit the axle, but the snugger they fit the better on rough roads. A spring wagon thus arranged upon runners is the easiest running vehicle imaginable, (next to a boat or a balloon). Each runner moves independently, like a wagon wheel, and this motion, very easy of itself, is made still more gentle by the springs. The runners, if used much, may be shod with iron or steel, though if it be well to incur this expense, it is worth while to inquire if it would not be best to have the runners made with care, light and handsome, upon

regular hubs by a wheelwright or carriage maker. Figure 1 shows a single runner; fig. 2, the inside of the outer side piece; while fig. 3 shows the inclination of the sides, the top board, and the axle passing through the side pieces.

Scrub and Grade Bulls Public Nuisances.

We drive about through dairy regions and through those sections which supply our larger cities with milk, and, baring now and then a Jersey or an Ayrshire as rare exceptions, we see almost every herd of a dozen or more cows accompanied by a little yearling bull—coarse-horned, big-headed, slab-sided, long-legged, and rough-haired. In the summer, after the time of year has passed when the bulls are especially useful, we often meet on the road droves of these bulls one and two years old—the sires of the next generation of calves. These, having reached an age when they require more care and are more expensive to keep than calves, are sold for a small price and slaughtered. The calf which is selected to be raised is usually the one that the butcher will not buy, or that is dropped in some "out pasture" or in the woods, and hidden by the cow until ten days old or more, when, as it seems a pity to "deacon" so old a calf, it is kept. This is not always the case, but we believe that it is very rare that a bull is raised because his mother was a famous milker, or for any real or fancied superiority of his breeding.

This state of things prevails extensively. Farmers argue that they only need a bull in order to get fresh cows; that the calves are of no value to them; that they rarely raise their own heifer calves; hence it makes no difference to them what sort of a bull they have. They argue very foolishly. The stock of every dairy region is, to a considerable extent, supplied from its own herds. There are now comparatively few sections (and these are decreasing in number,) where it does not pay to raise veal, at least until it is four weeks old. The use of a thoroughbred bull, not even excepting the Jersey, will greatly increase the size and value of the veal. Besides, however strange it may seem, it is true that thoroughbred bulls, even of breeds not famous as milkers, as the Short-horns, for instance, get heifer calves which are very likely to become great milkers. The use of such immature sires has, according to all observation and analogical reasoning, a bad effect upon the system and functions of their get. We therefore have small cows, better calculated to eat and drink than to give milk, or lay on flesh and fat. There is not the least reason why any good animal should come of such sires, any more than a vine should bear figs. This state of things will continue as long as our milk raisers persist in using scrub bulls.

The loss to the State in the item of taxable property is very great, not only as the live stock are of much less value, but the products of the herd,—milk, butter, cheese, veal, and beef,—are vastly less. But the loss to the State is as nothing compared with that to the farmers themselves.

The use of thoroughbred sires for beef is pretty well appreciated, and in the great beef-raising districts Short-horns predominate, and the great mass of beef which comes from the West has the marks of this blood to a greater or less extent. The advantage to dairy and milk farmers is quite as real as to beef raisers, and ought to be believed in. The farmer who buys an Ayrshire or Devon bull, and before his own heifer calves mature exchanges him with a

neighbor for one of the same breed, and thus every second year makes a change, breeding always from bulls not less than three and if possible four or five years old, will have the satisfaction of seeing great changes take place in his herd and in the profits of his dairy. No intelligent farmer should use a scrub or grade bull if he can help it. The temptation to raise grade bull calves is often too great to be resisted. They are very large and handsome, they may have come of a favorite cow, and the farmer feels sure that if size and beauty are worth any thing in a bull, he will do well to raise such an one. The bull comes to maturity, handsomer than his thoroughbred sire, perhaps; nevertheless the probabilities are very likely ten to one, that the stock of his gerting will be little, if any, better than that of an out-and-out scrub.

The Canada Thistle as a Subsoiler.

An intelligent and observing farmer writes us: "Many years since I cut a ditch into a well that was seven feet deep, and laid a pipe from that well to convey the water to a barn-yard. After 16 years the pipe required repairing. To make the repairs it was necessary to dig up the pipe. I found the earth that had been cast back into the ditch was full of the roots of plants. Canada thistles seemed to enjoy this subsoiled earth very much. The difference was so marked between the undisturbed earth on each side of the ditch and that within it, in regard to the presence of the roots of plants, that I venture the assertion that the most inveterate unbeliever in deep plowing, if he could have seen this ditch dug the second time, would have admitted that there was one piece of land that deep plowing would greatly improve * * *. I spoke of Canada thistles in this ditch. This much dreaded weed is a great subsoiler, sending its roots down to water, if the water is within any reasonable distance. Take a rank patch of Canada thistles, plow it and cultivate as often as the thistles show a bit of top, for one year; then put on a crop, and mark the rank growth on the ground in which these thistles' roots have been subsoiling for years. Put on this land red clover, and let the clover roots take the place of the thistle roots, and this old thistle patch will pay about as good dividends as any land you have."—We have no doubt that deep tap-roots that descend into the subsoil bring up considerable quantities of plant-food, which, if the plants decay on the surface or in the surface soil, must add to its fertility. This is one reason why clover is such an admirable renovator of land "worn out" by superficial cultivation. But it is also true that in the case mentioned by our correspondent, "plowing the land and cultivating it as often as the thistles show a bit of top" would in itself enrich such soil as he is the fortunate possessor of.

Don't Keep too Much Stock.

Said a farmer who does not take the *American Agriculturist* to a neighbor who does: "You want more stock to make manure." It was an innocent remark, but our friend is as fond of an argument as was Dr. Johnson, and replied: "That remark indicates a lack of just ideas on the subject. It is as absurd to say I want more stock to make manure as it would be to say I want more stoves to make ashes. If I burn fifty cords of wood the amount of ashes will be the same, whether I use three stoves or a dozen, and if I use up all the fodder I have it will make

little difference, so far as the quantity and quality of the manure is concerned, whether I keep a large number of cattle, sheep, and pigs, or a small number. The value of the manure heap will depend on the grain, hay, straw, and stalks used on the farm, and not on the stock." There is considerable truth in what our friend says, and we are glad he has so far profited by the teachings of the *Agriculturist* that he realizes that the value of the manure depends on the food, and not on the kind of stock it is fed to. It is a great mistake to be overstocked. There is no possible advantage—not even in the manure heap—and not unfrequently the loss is very great. Better sell a part of the stock and feed what is retained all they can eat—enough, at all events, to keep them in a thrifty, healthy condition. If an animal is not gaining, we are losing all the food it consumes. By providing warm, sheltered, dry, and comfortable quarters we can save a considerable amount of food, but after all is done, the animal still requires about 2½ lbs. of hay per day, or its equivalent in straw, for each 100 lbs. of live weight, to sustain the vital functions and keep it from losing in flesh. What we gain in milk, flesh, or wool, is derived from the food consumed in excess of this amount.

Fix Up the Implements.

During the winter every implement and machine that will be required next spring and summer should be overhauled and repaired. Examine the plows, and if they have been neglected and are rusty, wash off all the dirt, and then apply with a swab fastened on the end of a stick, a mixture of one part sulphuric acid and two parts water. Rub the mould-board and other parts that are rusty with this liquid until the rust is all removed; then wash it off and rub it dry. Then smear it over with crude petroleum or some other cheap oil, and next spring you will be saved from the loss and annoyance of clogging. Every farmer should buy a barrel of petroleum, and use it freely on all his wagons, machines, implements, etc. It will keep the iron from rusting and the wood from decay, and in cold weather it is a useful lubricating oil. We find it absolutely essential to keep on hand several sizes of carriage bolts. With these and a brace, and a set of bits, nearly all ordinary fractures can be easily repaired. It is a great convenience, also, to have a vise, and to keep on hand an assortment of uncut nuts, with the tools for making the thread in them and also on the bolts. All these things can be obtained at a hardware store, and a farmer who buys them will never regret it. But if it is necessary to take anything to the blacksmith's shop, now is the time to do it, and when it is repaired, clean off the rust, paint it with linseed oil, and put it away for use in the spring. If the farmer or his son would go over all the implements, machinery, wagons, hay racks, tools, etc., paint them, oil and tighten the bolts, and see that everything is strong and in good order, it would not only greatly lessen the blacksmith's bill, but would save much precious time and no little annoyance next spring and summer. The winter is also the time to make whiffletrees, and three-horse eveners. It is a great advantage to have an extra set of these on hand.

LUMBER.—It is very convenient to have a supply of seasoned boards, planks, and scantling, and now is the time to secure them. Get a good hard maple log sawed up into two-inch planks for store boards, and elm into two-

inch planks for purposes too numerous to mention. A few oak and soft maple inch boards are also very useful, and oak and white ash scantling 3x3 will be very convenient to repair cultivators, harrows, etc. Scarcely anything of this kind will come amiss on the farm.

The Old Well-Sweep.

Without discussing the respective merits of pumps and open wells, we have a word to say in favor of the old well-sweep and the oaken bucket. It may be that a love for what is old, and good, and picturesque in the landscape, first inclined the writer to regard the well-sweep with favor, especially when it was associated with the mossy bucket coming, with a bound almost, sparkling and dripping, from the dark depths below; but after a pretty careful inspection and use of various kinds of windlasses, patent well-curbs, and other efforts of inventive genius to supplant it, we come back to the well-sweep as the simplest, most durable, easiest, and by far the best method of drawing water by the bucket from wells not over 20 or 25 feet deep, and perhaps it is equally useful for deeper wells. The height of the crotch, in which the sweep is hung, should be such that the sweep will be horizontal when the bucket is half way to the bottom of the well, and the sweep should be long enough and so hung that it will swing the bucket clear of the curb. The occasional binding of the bucket bail in the hook of the pole may be remedied perfectly by interposing a small round link between the eye in the bail and the closed hook on the end of the sweep-pole. We rarely see a new well-sweep nowadays, while the clattering, squeaking boxes of machinery called patent well-curbs, always getting out of repair, and rarely bringing up two-thirds of a pail of water, are seen on every hand.

Will You Ever Get Your Money Back?

Of all the sneers which beset the path of an improving farmer the commonest and the meanest is: "Will you ever get your money back?"

Let him build a large and commodious barn, large enough to accommodate not only all the stock and store that he has now, but all that he hopes to have in years to come, and with shelter for all the manure that he will make during the season, replete, too, with every convenience for economizing labor, and with such general arrangements as he feels sure cannot fail to make his work lighter and more profitable;—some carping neighbor will throw cold water on his hopes by suggesting that he probably "doesn't expect ever to get his money back."

Let him deeply plow and subsoil one of his fields at an obvious cost of \$25 an acre,—this same comment will greet his improvement.

Let him thoroughly underdrain ten acres of his heavy, cold land, at an outside cost of \$1,000, and fancy that he sees his account, in doing the work,—the same question will jar upon his ears.

For the moment, this view of the case may shake his hopes, but it is not at all a fair view to take of any permanent agricultural improvement. We do not build barns for the purpose of getting back the money that they cost, nor can we always count on an extra \$25 an acre from the crop that we raise after expensive cultivation. It would be too much to expect that \$1,000 invested in draining would come back with the first harvest after the work was done.

Who cares that it should come back at all? We can't have our cake and eat it too. A man

does not buy a farm to get his money back; he buys it to get the farm, and having it he tries to make it worth more to him than the money was.

If a barn cost \$5,000, it ought to add \$500 a year to the income of the farm in lighter work, better manure, better kept fodder, and more thriving stock.

The money spent in deep and thorough cultivation ought to let the roots of our crops so far into the ground, and give them a so much wider feeding surface, that their yield will be worth permanently two or three more dollars per acre. Generally the result will be much better.

The thousand dollars expended in draining brings easier cultivation; the ability to do work when work ought to be done; a more complete mastery over weeds; a greater independence of wet and dry seasons; and, partly because of these things, and partly from the increased productiveness of the land, the crops ought to be very much better than before the work was done. If they are \$10 an acre better, our investment has been a good one; agriculturally considered, remarkably good.

Any man whose investments on his farm will, one year with another, bring him a return of ten per cent may rest satisfied. This allows six per cent for the use of the money, and four per cent for his skill in placing it judiciously.

Let no one, then, be deterred from improving his farm to the highest point of which it is capable, and which his means can compass. To be a successful farmer, he must give his time and his chief attention to his business.

The more capital he can prudently invest in real improvements, the better scope he will have for the exercise of his talents, and the better chance for being amply repaid.

A Question Worth Considering.

The real question in regard to enriching the land by deep plowing is whether we can furnish a better "pasture for plants" at a less cost by developing on the one hand the latent plant-food in the subsoil, or, on the other hand, by thorough working and manuring the surface soil, six or eight inches deep. There can be no doubt that many of our subsoils contain large quantities of latent plant food. But we think that it is not often that they contain any more than the surface soil. The reason that our soils are not as productive as we could wish is generally not from a lack of plant-food in the soil, but because it is not in an available condition. It is inert and insoluble. And the question is how to make it available. On Mr. Lawes' experimental wheat-field, the soil of which is in no way remarkable for its fertility, he has got, by plowing the land twice, to the best of our recollection not over five or six inches deep, and by hoeing two or three times in the spring, an average yield of 15 bushels of wheat per acre every year, for a quarter of a century, without a particle of manure. By adding on adjoining plots, otherwise similarly treated, 200 lbs. or so of ammonia, phosphoric acid, potash, etc., he gets 30, 40, and sometimes 50 bushels of wheat per acre. Now the real question is how to get this 200 lbs. of extra plant-food. Can we get it cheaper by deep and thorough tillage, or by making and applying more manure? That there is abundance of plant-food in our ordinary clay loams cannot be doubted. An acre of soil a foot deep weighs about 3,000,000 lbs. Is it better to break up, work over, pulverize, and expose to the atmosphere this amount of soil, or to work over say

2,000,000 lbs. more thoroughly and frequently, and at much less cost, and expend the money thus saved in making or buying an extra quantity of manure? When we are enabled, as we soon shall be, to work our land a foot deep by steam, and to do it at the right season, we have no doubt that it will be cheaper to work over the 3,000,000 lbs. of soil until it is as fine as a garden, but to do it with horses is too expensive. We can break it up once, but that is not enough. It must be worked thoroughly afterwards, and the whole mass brought in contact with the atmosphere. This is where we usually fail. Many plow deep enough, but very few cultivate sufficiently afterwards. On ordinary good, loamy soils our rule at present should be, to plow as deep as three horses can draw the plow steadily along. The cost of an extra horse is not much. Then our cultivators should run as deep as four horses abreast can work them rapidly. A cultivator going through the soil at the rate of three miles an hour will break up the soil more effectually than one going at the rate of two miles. Three-horse plows and four-horse cultivators should be our favorite implements until we are ready for the Steam Plow.

Draining.

Now is the time to commence one of the most important parts of the work of draining.

The digging of ditches and the laying of tiles must be postponed until spring, and probably the press of other work will put it off still longer, until after harvest. But the digging and tile-laying are, after all, not the only essential items of the work. To do this is, of course, most necessary, but to do it *rightly* is the main thing. It costs no more to drain in the right way than to drain in the wrong way,—usually not so much,—and the difference in effectiveness and in durability of the work is incomparable.

Therefore, the operation should be commenced now, and quite as much attention should be given to the *plan* in the house, as will eventually be given to the *work* in the field.

Tile-draining is expensive work,—very expensive,—and it should never be undertaken without a determination to make it so complete and substantial that it may be regarded as an absolutely permanent improvement. Properly done, the work should last forever. A well-burned tile is indestructible by any action to which it is subjected in the soil, and it will withstand the slow trickling of pure water through it as long as water continues to run. There is much more danger that the action of the elements will wash away the surface of the farm than that the water flowing through the drains will wear them out. The only chances for destruction lie in imperfect construction. With such a knowledge of the subject as any farmer can acquire, with great care, and with a judicious outlay of money, it is possible,—it is easy,—to drain land in such a way that we need never again give a thought to it, further than to see that the outlets remain unobstructed. With a little less knowledge, a little less care, or a little less cost, we may easily introduce an element of weakness, which will fix a very early day for the choking up and bursting out of an important drain; and then commences the costly and annoying work of repairing.

When drains are so well laid that they need never again cost a dollar, nor occupy a day, and when it is as certain as any thing in this world can be that they will last as long as the land lasts, all that we need to do is to charge the

land, as a part of its annual expense, like rent or taxes, a sum which will cover the *interest* on the cost of the work, and there is an end of it.

But when, in addition to the annual interest money, there comes every year a charge for cost of repairs, and for damage to crops because of defective drainage,—then the work becomes a serious tax on the farmer.

When it is so meanly, so ignorantly, or so carelessly done that, in addition to interest and repairs, there comes the certainty that in ten years the whole thing will have ceased to act, bringing the whole cost of the work on the first few years of the improvement, draining becomes so expensive that no system of agriculture,—unless it be the cultivation of vegetables for market,—can bear the charge.

For the foregoing reasons, the first steps in draining land should be the following:—

1. To decide what land shall be drained.
2. To learn how the work should be done.
3. To make a plan by which it is to be done.

And these steps should be taken now, while freedom from other work allows due time to be given them.

In future numbers it is proposed to discuss these points. Those who wish to study the subject in detail are in the meantime referred to "Waring's Draining for Profit," in which the whole subject is carefully and plainly treated.

The question of *means* should never deter a farmer from draining at least a portion of his wetter land—enough to make a beginning. It is not pleasant to have to borrow money, and a mortgage on one's farm is a cloud over one's life. Still, and we say it after full deliberation, we would never hesitate a moment to mortgage land of our own to raise money for underdraining, if we could get money in no more convenient way. It is demonstrated by the experience of thousands of farmers, in this and other countries, that the yearly benefit from the draining of wet or *too moist* land is much more than any usual rate of interest, and the advantages resulting from the operation are so various and so important (aside from the mere increase of crops) that we would accept the annoyance of a mortgage rather than not to reap them.

The mortgage would be a serious annoyance, it is true, but it would sink into insignificance when compared with the feeling of being (as every farmer of wet land is) a slave to *chance*, and of running the risk of seeing the fruits of a whole year's hard work snatched from our hands by an unusual season.

POINTS OF A GOOD FOWL.—For general use a hen should be a good layer, sitter, and mother. She must be a good feeder, too, bright, clear-eyed, quick in her motions, but not scary, and with these points, she will pay to keep. Besides, she should be large, well-feathered, with small, short legs, with a small head, broad shoulders, and deep body. The cock should be thicker in the leg, broader across the shoulders, fully a third heavier. He should have a gallant strut, be first out in the morning, first to go to roost, inclined to take on flesh easily, generous in picking out titbits for the hens, and not quarrelsome. We do not associate large eyes with great hardiness. They are a great beauty, and indicate high breeding; hence, with perfection in feather and other points, they are desirable in fancy fowls. In very large breeds quick growth is desirable, while early maturity is not. Each of the different breeds has its characteristic points, and the fowl should, in addition to the above general marks, show them distinctly.

[COPYRIGHT SECURED.]

A MEXICAN CATTLE DRIVER.—FROM A SKETCH BY MR. JUMP.—Drawn and Engraved for the American Agriculturist.

The Use of the Lasso.

There is but little in the customs of the Mexicans worthy of imitation, yet there are a few things in which they excel, and one of them is the use of the lasso. One who sees the ease with which a Mexican can capture a half wild horse or mule, and remembers the time he has spent in endeavoring to catch a gentle but frisky horse in a pasture, wonders why throwing the lasso has never become a Yankee accomplishment. The best lasso, also called "lariat" and "riate," is made of braided rawhide, and so prepared (probably oiled) as to be perfectly flexible. This is thirty feet or more long, and has an eye in one end, through which the other end is run, to form a slip-noose, which, spread out, would form a circle six or eight feet in diameter. To throw the lasso, the noose is grasped in the right hand about a foot from the eye, both parts, the running portion and that to which the eye is attached, being held; the rest is coiled loosely and held by the left hand. The noose is then whirled round the head, slowly at first but with increasing rapidity; by a revolving motion of the wrist, which cannot well be described, the noose is always kept in the same plane and

spreads out in an elliptical form. When sufficient velocity has been attained and at just the right instant the noose is let go and at the same time the coil in the left hand is allowed to play out. One skilled in the use of the lasso will take such unerring aim as to throw the noose over the head of an animal, whether it be running or standing still. A novice in his first attempts will hit anything but the object he aims at. Nothing but practice will teach its use. The Mexicans begin when children, and it is very common to see the "muchachitos" with a lasso made of a bit of cord, essaying their skill on pigs and chickens. Not only is lassoing done on foot but on horseback. One end of the lasso is attached to the horn, which Mexican saddles always have in front. The saddles are very strong, and are furnished with wide and strong girths, for when a wild animal is caught there is often a trial of strength between the captor and the captured. The Mexican horses, used to the business, brace themselves as soon as the lasso is thrown, to resist a pull, and the horseman takes an additional precaution against being unseated by clasping his enormous spurs under the horse's belly. Nowhere is the lasso used with more skill than among the Califor-

nian Mexicans. The writer has seen two, father and son, chase a wild bullock; one would catch the animal by the horns and the other by one of the hind legs and bring it to the ground quicker than it takes to describe it, and this while all were on the full gallop. The above scene, furnished by a Californian artist, represents a Mexican driving cattle. It not only shows the use of the lasso in bringing refractory animals to terms, but gives a good idea of the picturesque costume of a Mexican "vaquero," or cattle driver, and the equipments of his horse. The Mexican bit, which cannot be distinctly shown on so small a scale, is so constructed that the rider has the most restive animal quite under control. The spurs, which may seem like an exaggeration in the picture, were drawn from a well-worn pair in the possession of the writer. So far from being cruel, as most persons suppose, they are so blunt as to be incapable of inflicting a wound, and they can at most serve to give a blow. The reason for making them so large is to aid the rider in holding his seat, as alluded to above. The Mexican saddles are remarkable for their strength and the easy seat they give the rider; they are usually covered with embossed and embroidered leather,

The Akebia in Fruit.

In September last there appeared in the *Agriculturist* an engraving of a beautiful climber, the Akebia. Since then Mr. Geo. H. Hite, of Westchester Co., N. Y., brought us specimens of the fruit of this plant, which was quite new to us. Upon inquiry of those who have known the vine from its first introduction, we find that they never heard of its fruiting, and if this is not the first instance of its doing so in this country, it is at least the first in the vicinity of New York, and as such deserves recording. The engraving gives the closed fruit of the average size, and the open one reduced about one-third. It is a sort of berry-like pod, which is of a purplish-drab color, with a slight bloom. At full maturity it splits open, exposing the seeds, which are enveloped in a pulp and form a gelatinous mass. The pod is rather spongy in texture, and when freshly opened its inner surface has a roughish appearance that reminds one of a half of a cracker. We notice that the latest authorities place this plant in the Barberry family, for reasons which would not interest the general reader. The plant is one of the earliest to put out its leaves in spring, and it holds them until late in autumn. They are of a fine brilliant green, and as the vine is a rapid grower, it is very suitable for covering trellises. The delightful odor of its blossoms makes it very desirable near the house. We hope to see this interesting climber more generally cultivated, and we warn the nurserymen to provide a stock, as it is well known that when the *Agriculturist* popularizes a plant, a demand is quite sure to be made for it. It is propagated from cuttings of the old wood.

From the manner of growth of the plant and the pink-like appearance of the flowers, the popular name Moss Pink was naturally enough applied to it, though it is far removed in its

is in April and May. One of the great merits of this plant is its early flowering, and to those who love these old-fashioned plants the masses of the Moss Pink are always associated with their thoughts of spring work in the garden.—A French writer recommends the Moss Pink for edgings to beds and borders, and says it is “perfectly ravishing.”

FRUIT OF THE AKEBIA.

The Adulteration of Seeds.

A committee of the Royal Agricultural Society (Eng.), has recently reported its investigations upon the subject of seed adulteration. As a large share of the seeds sold in this country are imported, it is a matter of no little interest to our cultivators, especially as we are informed by the committee that “It was represented to the council that as the business of seedsmen is at present conducted, the purchaser of seeds frequently receives neither the kind nor the quality of the seeds he pays for.”—The causes of inferior seeds are: 1, Keeping seeds so long that their vitality is lost. 2, The addition of bad seed to good, and mixing old and new. 3, By the addition of seed whose vitality has been killed. This is done with rare and valuable seed, killed seed of similar appearance being added to increase the quantity. What seed comes up is true to kind. 4, Manipulating and doctoring bad seed to make it look like good, as by dyeing bad clover seed, sulphur-smoking bad grass seed, oil-dressing bad turnip seed, etc. The committee found that there was no sure way to test the value of seeds except by sowing. They purchased samples of Cauliflower, Broccoli, Carrot, and White and Yellow Turnip

seeds, from eighteen different wholesale houses, and trials were made both at the Society's grounds at Chiswick, and by one of the members of the committee separately. One hundred each of the above-named seeds were sown, and the numbers which came up are reported. We will only give the highest and lowest figures.

Of Cauliflower, the range was from 86 to 24; Broccoli, 86 to 35; Carrot, 61 to 14; White Turnip, 98 to 57; Yellow Turnip, 95 to 28. The subject is one that has caused no little excitement among English seed dealers and growers, and an act which shall reform the abuse is to be presented to Parliament. We are far from assuming that failure with seeds is always due to the bad quality of the seeds themselves. A want of knowledge in the sower

Phloxes—The Moss Pink.

Among the Phloxes are found some of our most charming plants. The Drummond's Phlox is not exceeded in variety and brilliancy by any other annual, while some of the tall perennial ones are late-blooming, and some of them truly magnificent. There is an humble perennial, one which is different from others of that class. Its prostrate stems are furnished with small, prickly leaves, and form dense tufts or mats, and these, in spring, are covered with flowers so profusely as to hide the foliage. The engraving shows the form of the flowers, the leaves,

relationships from the pinks proper. It is a Phlox, and the species is *P. subulata*, a name referring to its awl-shaped leaves. As it varies somewhat in the form of its leaves, as well as the color of its flowers, several names have been given, such as *P. setacea*, *P. nivalis*, etc., but they are now regarded as only varieties. The Moss Pink is

MOSS PINK.—(*P. subulata*.)

and the general habit of the plant, but the effect of a broad mat of it cannot be given in an illustration. The color of the flowers varies from purple to white, the latter being quite rare.

found growing wild in Southern New York, New Jersey, and southward. It does best in a light, sandy soil, and is readily multiplied by dividing the clumps after flowering time, which

often leads to a failure which is ascribed to the seeds. The synopsis of the report given above shows that the purchaser of seeds, as well as of other commodities, should have

some regard to the quality of the article. One of his best safeguards is to purchase of seedsmen of known good reputation. As far as our acquaintance with American seedsmen extends, we believe that they would not knowingly sell a bad article. The report confirms our often repeated advice to test the vitality of seeds by sowing a counted number and noting how many come up before risking a loss by sowing largely.

Property in Plants.

A question is now being discussed which is of no little importance to both raisers and growers of plants. In brief, it is this: Should not one who, by years of careful labor and patient experiment, produces a new and valuable fruit, or other plant, derive some pecuniary benefit from it? Books, the result of a few weeks' labor, are copyrighted, and cannot be reproduced without the consent of the author. A particular arrangement of sticks and strings for growing hops, or a combination of the posts and wires for a grape-trellis may be patented, and no one can use them without paying for the privilege of doing so. But if one, after many trials and years of failure, produces a new variety of hop, or a new grape of more value to the country than all the trellises that were ever invented, the moment the first bit of either goes out of his possession he loses all control over it, and whoever possesses the most ample means for propagating realizes the greatest benefit from it. That the originator of a valuable plant should be remunerated no one will deny. How protection can be assured by law is not so easy to see. Several earnest horticulturists, who think something should be done, are moving in the matter, and it will, probably before long, be presented to our law-makers.

Crab Apples.

Fruit growers are just now paying considerable attention to Crab Apples. It we were asked to define a Crab Apple we should be much puzzled, as the subject, both in pomological books and in nurseries, is "rather mixed." The term is applied to the wild state of our cultivated apple (*Pyrus Malus*), to two Siberian species or varieties (*P. prunifolia* and *P. baccata*), and to two native species of apple (*P. coronaria* and *P. angustifolia*). More than this, some small apples of doubtful origin, which may possibly be hybrids, are also called crabs. Years ago when we had only the kind that bore small, waxen looking fruit from which the calyx dropped, there was no trouble in distinguishing a Crab Apple. This was the Small Siberian Crab (*P. baccata*.) Then came the Large Siberian, both red and yellow, which was like the other in most respects, except that the fruit was larger and the calyx remained. This is the Siberian Plum-leaved Apple Tree (*P. prunifolia*.) Of the sorts more lately introduced, the origin is doubtful. Leaving pomologists to settle knotty points, we may say that those apples which have, so to speak, Siberian blood in them are hardy and productive, and though the fruit is not always of the first quality it is generally good for cooking, and the trees by their hardness are especially suited to cold climates.

From the great beauty and profusion of the fruit the Crabs are worthy of cultivation as ornamental trees, while at the same time, the apples will be found excellent for preserves and jellies. We enumerate the most prominent varieties: *Currant Crab*, cultivated for ornament,

it being showy both in fruit and flower. *Small Red* and *Small Yellow Crab*. These are the kinds referred to above as dropping the calyx; very showy in fruit. *Large Red* and *Large Yellow Crab*. These bear fruit about twice the size of the foregoing, do not drop the calyx, and the trees also have differently shaped leaves.

Transcendent Crab. Said to have been discovered on Long Island. A great bearer, with most beautiful fruit, and withstands the severest cold of our northernmost localities. The foregoing are ripe in September and October. We have now a winter crab, which is said to keep until spring, called the *Marengo Winter Crab*. This is very strongly advocated by the proprietor, who brings good testimony in favor of its quality. We have not seen the fruit.

The Soulard Crab is another new variety, which has been supposed to be of Russian origin, but Mr. Soulard, in the Gardener's Monthly for July last, gives its history. A thicket of native Crab Apple trees near St. Louis, Mo., was cut down, and another crop of trees afterwards sprang up, in which was found the variety now known as the Soulard. He supposes it to be a hybrid between the Wild Crab (*Pyrus coronaria*) and the cultivated apple. Said to be very fine for cooking and with care to keep for two years.

Our Wild Crab, so beautiful in flower and foliage, bears a fruit of marked fragrance, but of little value. We learn that an improved seedling of it has been exhibited in Canada, but no particulars are given concerning its qualities.

Fresh Figs.

There are many places in which fresh figs might be enjoyed at the expense of a little trouble. We read in our exchanges of their success in Southern Ohio, but it is not stated if any protection is given. Good crops are obtained around New York City if the trees are laid down and covered with earth in winter. Those of our readers who live in the South and Southwest should have them in abundance, and those who live in still colder climates would, no doubt, succeed if they gave their trees some slight protection during winter, such as branches of evergreens. White's Gardening for the South enumerates twelve varieties known to be good; the Brown Turkey, Small Brown Ischia, and Celestial, are considered the hardiest. Mr. Van Buren, who wrote the article on the fig, recommends that growth be stopped after the middle of September, by breaking off the ends of the shoots and removing all fruit that forms after that time. Rivers, in his Miniature Fruit Garden, gives a plan successfully followed in England, and worthy of trial here.

"The trees should be low or half standards, or dwarfs with a clear stem (not bushes branching from the ground). The former should have a stem three feet high, and the latter, one from one foot to eighteen inches; in each case the tree should have a nice rounded head.

Trees thus selected should be planted in a sunny situation, and require only the following simple mode of treatment. They, we will assume, were planted in March or April. They will make a tolerably vigorous growth, and must be pruned by pinching off the top of every shoot as soon as it has made six leaves, leaving five. The stem must be kept quite clear from young shoots. By the autumn, nice round-headed trees will be formed, and about the end of October they should be taken up (their leaves cut off, if they have not fallen) and placed

in a cellar—no matter if dark, but a light, dry cellar would be preferable—some earth should be placed over their roots, and there they may remain till the first week in May, when they should be planted out, and the same routine of culture followed. They will bear one good crop of fruit in a season, and ripen it in September. This annual removal brings on great sturdiness of growth in the tree, and the roots become so fibrous as to hold a large quantity of earth, which should not be shaken from them when they go into their annual winter abode. In the year 1857 I saw fine trees thus treated in the garden of the Duke of Altenburg, in Central Germany; their stems were as stout as a man's leg and their heads full of fruit; and this season, 1865, my fig-trees, taken up last October, and placed in the orchard-house during the winter—their roots in the soil—have given me a crop of very rich, well-ripened fruit. The roots that have borne best are the Brown Ischia, Brown Turkey, and Brunswick."

BROWNED LEAVES occur upon house plants, especially if the temperature of the room be high, much to the annoyance of the cultivator. In the majority of cases, the trouble is caused by the insect popularly known as the "Red Spider." It is so small that it requires sharp eyes to see it, and one would hardly think such a mite of a thing capable of producing so much damage, yet it is one of the worst pests, not only of the green-house but of many open air plants. The red spider will not flourish in a moist atmosphere, and frequent drenchings are fatal to it. The remedy is to shower the plants frequently, especially the under sides of the leaves. If you have no syringe, lay the plants down and shower them from a watering pot with a fine rose.

GROWING STAKES.—Gardeners and nurserymen who live upon the prairies can, with a little trouble, raise stakes and poles for vines and other plants. One of the best of the quick-growing things is the Ailanthus, which is in some places grown for vineyard purposes. The Deciduous Cypress of the South, perfectly hardy in the climate of New York, in a few years from the seed, makes fine and durable stakes. Osiers answer an excellent purpose for small grape and other vines requiring support.

An Edging of Apple Trees.

Last autumn we saw one of our best known nurserymen preparing to plant dwarf apple trees along the borders of his fruit garden. This plan is very popular in Europe, where it is called the "cordon horizontal." The trees must be purely dwarfs and on Paradise stocks, and are set at five or six feet apart. A wire is stretched upon stakes at a foot or eighteen inches from

FIG. 1.—CORDON OF APPLE TREES.

the ground, and the trees cut back to the height of the wire. Two of the upper shoots are trained along the wire and all the rest removed. Another way, and one we have seen successfully practiced, though the result is not so neat in appearance, is to bend the trees down and fasten them to the wire without cutting them back, as shown in figure 1. Where a tree treated in this way is long enough to reach the next one, the

two are inarched. The form of cut for inarching is shown in figure 2. The parts are interlocked as in whip grafting, and bound with waxed cloth. The operation is done in the spring, and in the spring following the extremities of the inarched trees are removed. The

Fig. 2.—INARCHING.

trees are kept in a very dwarf state by pinching, and while they are very ornamental in appearance, they bear a considerable amount of fruit. This plan of growing trees is of course commendable only to those who are sufficiently enthusiastic to take the proper pains with it. The apples must be on the French Paradise stocks, and not upon the Doucin, which dwarfs but little.

The Scuppernong Grape Again.

The following communication is from "E. M. W.," Craven Co., N. C., and we are glad to hear about the Scuppernong from one who apparently knows something about it. The statement made in our article published in November, that "the fruit is said to be produced on spurs two or more years old," was made with great misgivings. We could not understand it, but as the point was made by several Southern writers we put it guardedly—"is said." Mr. Van Buren, in his pamphlet upon this grape, repeats the statement in almost the same words. Mr. E. M. W. says:

"My knowledge of that vine and its seedlings is derived from an intimate acquaintance with my vineyard of 56 acres, planted exclusively with the Scuppernong (white) and the Thomas, Flowers, and Mish seedlings (black or purple).

"It is true that 'the fruit of these vines drops from the cluster when ripe,' that is, *thoroughly* ripe, at which period the berry is very tender and juicy, with thin, soft skin, while its stem has become quite brown and slightly shrunken.

"The fruit is said to be produced on spurs two or more years old, and not, as is the case with other varieties, upon shoots of the current season.' It is hard to conceive how any one at all acquainted with the fruiting habit of the vine could have committed such a mistake. The fruit is invariably borne upon *shoots*, though these shoots are frequently quite short and grown from short canes—due, I think, to the immense amount of wood carried by an unpruned vine six, eight, or more years old. I practice both summer and winter pruning on my vines with entire success, and 'that the vine is not shortened in by pruning' generally, 'but allowed to spread over a large space,' is due firstly to the fact that the health of the vine does not seem to suffer thereby, and secondly to the prevailing notion that summer pruning will kill the vine. This opinion had its rise in the days when men thought an empty whiskey, vinegar, or molasses barrel a good enough vessel for the must; their smoke-house or corn-crib an excellent place to keep wine; and when sugar in large quantities, whiskey or brandy, was necessary, to prevent acetic fermentation.

"So far north as Hammondsport, N. Y., I doubt not that the must was deficient in sugar. Indeed, I think with you that the Potomac River is the northern boundary of its successful,

certainly its profitable, culture. But here, in Eastern Carolina, the must of *ripe* grapes needs no sugar, to make a fine table or medicinal wine.

"I have had the fresh must of the Scuppernong grape, strained through linen, to register 96° on Oechsle's scale, at 60° (Fahr.) temperature.—[The must tested at Hammondsport was from grapes raised in North Carolina.—Ed.]

"The most sanguine friend of the Scuppernong has never supposed that in it he had a grape equal to the Riesling or Pineau; but what in simplest justice we may all claim is, that in the Scuppernong we have a vine hardy and prolific, entirely free from mildew, rot, and the depredations of insects, giving us a never-failing crop of grapes capable of a dry or sweet wine, either white or red, of fine body and bouquet."

APPLES FOR CANADA.—D. W. Beadle, Esq., an eminent pomologist of St. Catharines, Canada, in an essay which received the prize at the Ontario Fruit Growers' Association, gives the following selection for the colder parts of the Province: Red Astrachan, Duchess of Oldenburgh, St. Lawrence, Snow Apple (Fameuse), Borassa, Pomme Grise, and Golden Russet. "If there be any spot so chill and inhospitable that these varieties will not thrive, recourse must be had to the still more hardy Crabs, of which the Yellow Siberian, Golden Beauty, Montreal Beauty, Transcendent, and Hyslop are the best."

Progressive Horticulture.

Only those who are familiar with the English and Continental works on Horticulture are aware how different are not only our own practices but our own horticultural literature.

Until a comparatively recent date, our few works copied closely after European models, and processes quite unsuited to our climate and our social conditions were taught and followed. Our peculiarities of climate, and the necessity of supplying a wide extent of country with trees and plants both rapidly and cheaply, have made it necessary to depart from the old ways, and to adopt processes suited to our needs. The propagation of trees by root grafting enables their multiplication to be carried on with marvellous facility. Propagating by root cuttings, so clearly set forth in Fuller's Small Fruit Culturist, has revolutionized the manner of increasing some of our small fruits. Henderson, in his Gardening for Profit, showed what must be done to make gardening pay. Warder, in American Pomology, gave us some of the Western labor-saving expedients, and now comes Peter Henderson with a "Practical Floriculture," in which is shown that our methods of raising ornamental plants are as widely different from those of Europe as are our processes in other departments of horticulture. Cutting adrift from old formulas, Mr. H. presents us his way of doing things, and to those who do not believe that his methods are practicable he says: "Come and see our plants." We can only refer to a few of the many points in which Mr. H. departs from the rules. Instead of having, as do some authors, nineteen different composts, he has but one for all species and varieties of plants. Two-thirds decayed sods and one-third rotted waste hops from the breweries, or well-decomposed manure, serves to grow everything. Other writers are great upon drainage; the pot must be filled to such a depth with broken crocks, then moss or fibrous peat, and great stress laid upon the right doing of this. Mr. H. is equally eloquent upon drain-

ing, but he makes the point that it is not necessary to do it at all. We were always told that to insure success in making a cutting the stem must be divided at a joint, and then to root it, it must be put in silver sand. Mr. H. tells us to cut anywhere, and that one kind of sand is just as good as another, and that coal dust, or anything else that will serve as a proper medium to hold moisture, will do just as well as sand. These are a few of the radical departures from the stereotyped way of doing things. Mr. H. places great stress upon doing everything at the proper time, and not the least valuable portion of the work is a calendar of the operations at his establishment for each day in the year. Mr. Henderson's reputation as a successful florist is so well established that the best commendation we can give the work is to say that it gives the processes upon which his success has depended, and it will be useful alike to the amateur, private gardener, and professional florist. The work adds another valuable contribution to the literature of progressive horticulture.

POKE-WEED "HARDY."—A few months ago some one wrote to the English Cottage Gardener that he had seen the Poke-weed or Pigeon-berry growing in the open air in Belgium. This brought out statements that in several gardens in England it was hardy, and grew as finely in the open air as it did under glass. This reads strangely to those in this country who are troubled to get rid of the plant, and who know that our winters never get cold enough to kill it. It is probably because the summers are not hot enough in England that the plant is a rare one. When loaded with its ripe clusters of almost black fruit it is a fine plant, only with us it lacks one important quality—rarity.

Osage Orange—Seed and Plants.

The Osage Orange will doubtless continue to be the popular hedge-plant in those portions of the country where it will endure the winter. Formerly the supply of seed came from Texas and Arkansas, but at present so many old hedges have come into bearing that the amount of northern seed is quite large. The difficulty of extracting the seed from the balls or "oranges" has with some been an obstacle to the use of home-grown seed. A correspondent, "A. W.," gives his method of treating the seed, with some useful hints on the management of the plants: "Let the balls remain outdoors all winter, but out of the way of cattle, as some will eat them as soon as they would turnips, while others will not touch them. Gather up the balls and place them where they will freeze and thaw all winter, and in the spring, when the frost comes out of the ground, they will be soft and mushy. Place a *portion* of them in a tub, and with a hoe or pounder mash and work them up thoroughly; then fill up the tub with water, stir, let it settle for a few minutes, and then pour off the water. Continue to wash until the seeds are left clean. It would be well to do the washing near a brook or spring, as it takes more water to clean them than one would suppose. To prepare the seed for sowing, soak them in water, (warm, not hot,) for 6 or 8 days, changing the water every day, and keep in a warm place, such as near a chimney or under a stove. At the end of a week or 8 days, turn off the water, cover the seed with some thick woolen cloths, to prevent them from becoming dry, and keep in a warm place until they sprout. If convenient, drill in the seed in rows as early as possible, for the earlier in the

spring the seed is planted, the larger will be the plants in the fall; but if other work is pressing at the time, the seed will not spoil, for I have left a portion of mine that I washed out last spring for three weeks after they had sprouted, and then sowed them. To all appearances every one grew, but the plants are not as large as those that were sown first. I sowed but a small patch, as I was afraid they would not grow, but from my little spot I have just plowed up 7,568 No. 1 plants. In setting out hedge-plants I never use a dibbler, or dibble, as some advocate, but plow a land and make a dead furrow where I want the hedge-row, then plow in the bottom, or, in other words, subsoil the dead furrow; in this I set my plants 18 inches apart. Some set only 8 inches apart, but I think the fence made in my way is the cheaper in the end, and equally good. By so doing the roots can be placed somewhat as nature placed them, but this cannot be done when they are poked into a small hole made by a dibble. Turn on the soil with the plow or shovel, and pack it with the foot; keep the ground clear from weeds by the use of tools, or by a mulch; let the plants grow without trimming until large enough to slash (that is, cut partly off, and bend over). I have plants that I cut nearly off near the ground last spring and lapped, that have borne hedge apples of full size the past summer."

The Swiss Chard, or Leaf Beet.

Mention has been made of the Swiss Chard several times, and now that those who take an interest in their gardens are deciding on what to plant next spring, we wish to describe it more particularly, and press its claims more forcibly. The Swiss Chard, also called Leaf Beet, White Beet, and Sea-kale Beet, is so different in appearance from the common beet, cultivated for its root, that some have considered it a distinct species, but it is now regarded as only a marked variety, in which the leaves are remarkably developed at the expense of the root. The root of the Swiss Chard is small, badly shaped, tough, and worthless. The leaves have remarkably large stalks, and the leaf proper is very fleshy and succulent. The engraving gives a leaf much reduced in size. There are white, yellow, and red varieties, the white being the best. The red kind is sometimes used in Europe, for its fine color, in planting ornamental beds. The sowing and culture are the same as with the common beet, and to get a rapid growth of leaves the soil should be pretty rich. The great value of this plant is that it produces a supply of the finest greens during the hot summer months, when spinach cannot be had. The outer leaves are pulled off for use, leaving the central ones to develop. In cooking, the entire leaf may be boiled, or the green portion cut away from the stalk, and each part cooked separately. The green portion or blade

of the leaf, cooked and dressed precisely as spinach, forms a most acceptable substitute for that vegetable. The stalks, tied in bundles, boiled and dressed the same as asparagus, are

SWISS CHARD, OR LEAF BEET.

liked by most persons. These stalks are called in France the "Poor Man's Asparagus." We believe that the seed of the Swiss Chard is kept at all the seed stores, and we recommend all lovers of good vegetables to make a trial of it.

ishes as we come northward, and in the Northern States we have only three species, all of them being low-growing *Opuntias*. The commonest one is the well-known Prickly-Pear, (*Opuntia vulgaris*), which is not rare in the vicinity of New York, and is hardy considerably north of that. Another is Rafinesque's Prickly-Pear, (*Opuntia Rafinesquii*), found in Wisconsin and westward, and the third, the Missouri Prickly-Pear, (*Opuntia Missouriensis*), found also at the far West. These have a close resemblance in general appearance, but differ in their spines and other particulars. The engraving shows the common and Rafinesque's species. Their flattened, jointed stems are very striking. These stems, being flat and green, are popularly considered as leaves. The proper leaves are very small, being only about a quarter of an inch long. They are only to be noticed on the young growths, as they soon fall off, and usually leave a tuft of bristles or a few stiff spines to show where they stood. The common species is less spiny than the other two. The flowers of all three of our species are yellow, Rafinesque's sometimes having a red center; they open several days in succession. The berry is of the shape shown in the drawing, and when ripe, is edible in the two species there given. It has, however, no very marked flavor, but the fruit of some of the natives of warm countries is really delicious. In eating the fruit, care is requisite to avoid the spines with which it is beset. The *Revue Horticole*, a journal usually very accurate in its statements, had an article some months ago on Rafinesque's Prickly-Pear, in which it stated that it is abundant around New York, and that the fruit is to be found in the markets, where it is regarded as a delicacy for children. This is as far from true as can be. These Prickly-Pears form dense, spreading tufts, and, being perfectly hardy, they are

PRICKLY-PEARS—COMMON.

RAFINESQUE'S.

Our Native Cactuses—Prickly-Pears.

Northern Mexico and parts of Arizona are the "head centres" of the Cactus family, where it often makes up a large share of the vegetation. These singularly shaped and often terribly spiny plants present a great variety in form and size, some being only an inch or two high, while others tower up to forty feet or more, and by their often brilliant and showy flowers at seasons, make gay the otherwise dreary wastes they inhabit. The number of species rapidly dimin-

of easy cultivation. Their odd forms, and the fact that they will live in the most unpromising places, make them well suited to plant upon rock-work. These plants should be handled with care, as their minute bristles easily penetrate the skin and cause troublesome irritation. The Mexicans plant a large species with formidable spines upon the top of their mud fences, where it forms an effectual barrier to fruit-stealing boys. Many of the Cactus family are cultivated for the beauty of their flowers, and belong to different genera from these native species. The Epiphyllums, popularly known as "Crab's-claw Cactuses," on account of the shape of their jointed stems, are desirable winter-blooming plants. Several species of *Cereus* produce flowers of great size and of gorgeous coloring. These are summer blooming, and during the winter should be kept nearly dry and at rest. In summer they produce a fine effect set upon the piazza, or they may be placed in the border with the pots plunged in the soil up to the rim. The rare Night-blooming *Cereus* requires a hot-house,

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

A Rustic Flower Stand.

Ladies, with the assistance of some of the male members of the family in the rough portions of the work, can make "rustic work" equal to that sold in cities at high prices. A good stock of crooked

RUSTIC FLOWER STAND.

limbs, large and small, is required. Cedar, Locust, Wild Grape and others, come in play. Much skill can be displayed in taking advantage of natural distortions, an instance of which we give in illustration of a stand for flowers. This is not a fancy sketch, but was drawn from one constructed by a regular maker of such work, and is one of the most beautiful we have seen. It will be noticed that instead of the shallow bowl usually furnished for the reception of the plants it has a small tub of sufficient depth. A powder keg or other small keg, sawed in two, serves excellently for such purposes. Nail all the staves securely to the hoops.

Household Talks.

BY AUNT HATTIE.

ECONOMY IN SOAP.—Soap lasts much longer when cut into squares and dried, than when left in the bars and cut up as wanted. Leaving economy out of consideration, how much more convenient it is to have the soap in proper shape for using, than to be obliged to get a knife or find a string every time a fresh piece is needed! I have often seen washerwomen and careless girls break a bar of soap in two with their hands, thus leaving long ends to each half. Of course where this is done, there must necessarily be a good deal of waste. I find that by buying a box at a time, I can get it a few cents cheaper in the pound, and I store it away and deal it out as it is required. I know that many providers consider that where stores are bought by the wholesale, much is wasted and sometimes a good deal is stolen. Of course this will probably be the case where the housekeeper neglects the obvious duties of keeping articles under lock and key, and dealing them out as required. After cutting into proper shape, the rough edges must be trimmed, and the pieces or scrapings may

be melted and made into a ball or square. By following this method all waste soap is avoided.

CHRISTMAS OR PLUM PUDDING.—This pudding, which I make for Christmas, is equally good on any other occasion. I usually make it many weeks before the time at which it will be eaten, but you know that these rich compounds improve very much by keeping. I have known them kept a year with manifest improvement. I think my receipt a good one; it is as follows: Reduce to crumbs a pound of bread, freed from crust, add to it one pound of brown sugar, chop, and add three-quarters of a pound of beef suet, and a pound each of dried, well-washed, foreign currants and raisins. Add half a pound of citron or candied orange peel, chopped fine, and grate a nutmeg over it. The juice of a lemon will be an improvement. Mix well together with six or eight eggs, well beaten. Pack firmly in bowls. Let them be heaped full and the pudding made smooth and round. Then a white cloth should be tied down with a string, and the whole boiled for four hours. When it is made some months before using, it should occasionally be put into a kettle of boiling water and boiled for an hour.

BREAD MAKING.—My bread, or rather dough, was sour this morning, and I found it necessary to work in a teaspoonful of soda before baking it. The soda was first dissolved in a little water. This misfortune of having sour dough to deal with is one which seldom occurs with me. It was at this time owing to an experiment. A neighbor of mine recommended me to try her way, which was to set the sponge in the afternoon, to work it over with the flour before going to bed, and bake the first thing before breakfast in the morning. I know many persons follow this plan, but I think inexperienced housekeepers, and especially late risers, should adopt my method. It is this: Set the sponge just before going to bed, then in the morning, the first thing, work in the flour; when well risen, mould into loaves, set to rise for half an hour, and bake.

ABOUT TEA.—For some time past we have had miserable tea, or rather an apology for tea. Mary had become so careless in the making of it that it was really undrinkable. Sometimes it would be almost as black as ink, and at others of a decided pink shade after the cream was added, and occasionally as weak as water. I considered the case desperate enough to make a decided stand in favor of good tea; so not long ago, just about tea time, I went into the kitchen and said: "Mary, I want you to put away the tea steeper, as I do not wish it used any more, and you will make the tea after a different plan." "Well! and indeed, mam!" "Never mind, Mary," I said, "I know that you desire to please me in everything, and it is my wish to have the tea made in another way. Take the teapot and rinse it out with a little hot water." Mary did so. "Now put in three teaspoonfuls of tea and fill the teapot with boiling water." It was done without any more demur. "Now, Mary, put it on the top of the water boiler; never put it on the stove, as I do not wish it boiled. Always make it in this way, and only just before tea is ready to be served." Mary has followed these directions ever since, and the result has invariably been tea of delightful flavor. The fact is, the Chinese never stew their tea, and the French never boil their coffee, and we can learn something of these nations as to the best method of preparing their great national beverages.

Dyeing Tan Color.—Our housekeeping friends have sent numerous responses to our

request for directions for coloring cotton, especially carpet warp, of a tan color. Several recipes use hemlock bark or its extract. The fullest of these was given in the November "Basket." Mrs. N. J. Fairn, Jefferson Co., Tenn., says: "Boil the outside hull of the black walnut until a strong liquor is obtained, remove the hulls, and put in either cotton or woolen yarn; boil ten minutes; take out and dip in a pail of strong lime-water. Continue the process until the color suits. A decoction of chestnut or walnut bark will answer instead of the above, using lime-water after boiling the yarn." Mrs. S. J. P. sends a recipe, but as we do not quite understand it, we do not give it.

Cochineal and its Uses.

The question "What is Cochineal?" at one time was the subject of much discussion, some holding that it was a seed, and others that it was an insect. To such an extent was this controversy carried, that early in the last century a Spaniard lost his whole fortune upon a wager that it was of vegetable origin. It is an insect, a species of *Coccus*, of which we have some troublesome relations in the form of the scale insect which attacks our fruit trees, and the Mealy bug, sometimes so troublesome in plant houses. The Cochineal insect is found upon the Nopal, a species of *Opuntia* or Prickly-Pear. The Nopals are cultivated for the purpose of raising the insect, and have the general appearance of the Prickly-Pears figured on page 22, except that they have a more upright habit, and grow from ten to twenty feet high. The Cochineal insects are in many respects like our plant lice; the females are wingless, and after they have once fixed themselves by their proboscis to the plant from which they draw their sustenance, they never move. The males, being winged, present an altogether different appearance. Fig. 1 shows a number of females feeding upon a portion of Nopal. At figure 2, an enlarged female is given, and at figure 3, a male, also enlarged. The female lays "several thousand eggs" which, as in our scale insect, are concealed under the dead body of the mother until they are hatched, when the young insects fix themselves to the plant, to complete their growth. The insects are brushed from the plant and killed, either by plunging in boiling water or by a dry heat, and when thoroughly dried are thrown into commerce. Cochineal, as it is found in the shops, consists of numerous grains about the size of a kernel of barley, and in appearance so unlike an insect that it is not

COCHINEAL INSECTS—MALE AND FEMALE.

strange that its nature was so long in doubt. The best has a purplish-gray color, the blackish varieties being less valuable. It takes about 70,000 of the dried insects to make a pound. When broken open, the grains present a dull purplish color, and this is imparted to water in which cochineal is soaked. By the use of mordants, cochineal yields some of the most brilliant colors. The fine scarlets are produced by cochineal, with the tin mordant (chloride or muriate of tin). The use of alum gives a crimson. The brilliant and costly paint carmine is obtained by adding alum to an infusion of cochineal.

neal; the carmine is deposited and afterwards dried. The principal use of cochineal for domestic purposes is in coloring jellies, icces, etc. For these purposes it is prepared as follows: take an ounce of cochineal, an ounce of cream of tartar, one-fourth of an ounce of alum, and half a pint of water, put into a tin or glazed saucepan, and place over the fire until it boils; let it stand until cold, and pour off the clear liquid. If the coloring is to be kept for a long time, dissolve enough white sugar in it to form a syrup, and preserve in bottles. This is the coloring generally used by confectioners and pastry cooks, and is perfectly harmless. Carmine is used in the preparation of the finer kinds of red ink. It is very soluble in ammonia, and a much more brilliant red ink than is usually sold may be made by dissolving a few grains of carmine in a small quantity of water of ammonia (hart-horn of the shops), and adding a little gum Arabic to prevent it from spreading on the paper.

The Table—Order and Ornament.

That the appearance of the table affects our enjoyment of the food, no one will deny. Were this not the case, table-cloths might be dispensed with, and it would be a matter of indifference whether our plates were of tin or of china. How far we should regard the appearance of the table will depend in part upon one's tastes, and in part upon one's means. Ornamentation to a certain extent is pleasing, but this generally takes time—just the thing which housekeepers in general can least afford. Such things, except in the most simple form, are better left for the wealthy, who can pay for the necessary service. Still there are many things pertaining to order and neatness that take scarcely any time in their execution, and which even the housekeeper who is her own cook and waiter can observe, if her attention is called to them. At present we will refer only to "dishing up." So simple an article as mashed potatoes is capable of looking at its best. A shapeless, pudding mass, such as is often dumped into a dish, is far from being attractive in appearance. Smooth this down with a knife to a neatly rounded surface, and the whole look of the dish is changed. Set the dish in a quick oven, to brown the surface, and you have a work of art. Nothing is more distressing than to see a roasted fowl come to the table "flying" with outspread wings, and legs looking as if the bird had kicked before the fire. A turning of the wings and a bit of string around the legs would have converted the ridiculous object into a respectably dressed fowl. Even so simple a thing as mutton chops may be neatly served or otherwise. Let one compare a dish of chops thrown into the plate "higgledy pig-gledy," with one in which the small ends are all laid one way, with the broad portion slightly overlapping, and the difference will be manifest at once. Other illustrations might be given, but these will indicate what we mean by neatness in dishing up. Such matters may seem trivial to some, but much of our comfort is due to the observance of trifles.

Treatment of Hams.

Mr. Stephen Bowman, Rensselaer Co., N. Y., having in early life become dissatisfied with ordinary ham and bacon, tried to improve upon them, and at last concluded he could accomplish his purpose by smoking the tub instead of the meat. He is satisfied with his plan, which he has practiced for fifty-two years, and communicates it substantially as follows: Place the tub over a small fire made of corn cobs, green walnut, or rock maple, and smoke for about four hours. For one hundred pounds of meat, use four quarts of salt, two ounces of saltpetre, and two pounds of sugar. Before the meat is put into the tub, rub a little salt in near the bones, and place a part of the salt in the smoked tub; then put in the meat rather loosely, cover with cold water, and put in the sugar, saltpetre, and the remainder of the salt. The hams will be ready for use in three weeks. The above is for cold weather; as warm

weather comes on more salt is to be added, and if a stronger flavor of smoke is required, remove the meat and brine, and smoke the tub again. Beef may be put in the tub with the hams and in about six weeks taken out to dry. Mr. B. claims that this method is easier, cheaper, and better than the usual way, and that the hams are completely kept from the attacks of insects. Any portion of a cut ham may be returned to the brine. He states that he has kept hams in this way until October.

An Irish Stew.

On a cold winter's day an Irish stew is a very toothsome thing. Many compounds called by the name are not the real thing, and we have seen heterogeneous mixtures of beef and various vegetables served as Irish stew. You can no more make Irish stew out of beef than you can make pea soup of pebbles. Mutton is the basis; beef makes a good stew, but it isn't "raale Irish." Then this stew is not only good but economical, as the neck piece of mutton is the part generally preferred. Cut the neck into chops, and wash if bloody. Two and a half pounds of mutton require eight good-sized potatoes, four small onions, and a quart of water. Now in the cooking judgment is required; the meat must be thoroughly done, so as to leave the bone readily, (for picking is a part of the pleasure in eating the stew) and the potatoes must be cooked to that point at which they are just ready to go to pieces and have absorbed a good part of the gravy. So if the meat appears at all tough, it had better be stewed awhile by itself; then add the potatoes cut in thick slices, the onions, and pepper and salt. It is to be served very hot, as it is apt to be very rich with fat, and mutton fat hardens readily. This is, of course, not a dish for those who cannot tolerate fat; but most persons who take much exercise in cold weather actually need a good share of fatty food.

Household Economy.

Mrs. H. M. R. writes: "I have commenced fixing an old calico dress to-day. It was worn off at the edge on the bottom, and on the edge of the wrists. I ripped it off the waist, took off the facing, unbemmed the pocket-hole, and ran a seam the entire length of the skirt where it was; then made a new one in another breadth, in the end that was at the bottom before, and mended such little "nieks" as happened to be in the skirt. I ripped out the sleeves from the waist and put the right sleeve into the left armhole, and vice versa. This brings the worn side on the top of the arm, where it will get but little more wear. Then I put new bands on the wrists, and the dress is ready for the wash-tub, which will take out all the wrinkles at the top of the skirt, and it will be ready for the facing, which should be turned bottom upward also. What I did to-day took about three hours, and it will take three or four more to finish by attaching the skirt, bottom upwards, to the waist, and make it ready to wear after it is ironed; then I shall have a dress that will wear more than half as long as a new one, in place of one that would have lasted only a few weeks at most, if it had not been fixed. The dress should not be worn too long before the change is made. When the edge of the wrists is worn off is the right time, if the cloth is good, and do not buy any other.

I always make my afternoon aprons for house wear of two widths of calico a yard long, and when they are a little over half worn, rip the seam in the middle and sew the edges together, which can be done in a half hour, and it will increase the wear of the apron at least one-third. I serve my sheets in the same way; of course the hems must be ripped a little way to admit of sewing it nicely at the ends, and then sewed down again the last thing. I usually cut the bindings of the aprons in two, and fix them as nicely as possible by ripping it a little way, moving the gathers so as to make the apron a little narrower, and turn the binding in and sew it firmly."

About Soups.

It is not easy to understand why soups are held in so little favor with Americans generally, while with most other people they form an important article of food. It is an economical disposition to make of pieces of meat not otherwise easily made useful, and even very cheap meat may be converted into palatable and wholesome food.

The French, from the richest to the poorest, have their *Pot au feu*, which literally would be "pot on the fire," but it is the name used to designate the universal soup. The directions for this vary; we give one of the most economical: Put in a pot, which is kept for this purpose alone, four and a half quarts of cold water and three pounds of rump beef, with whatever remains of poultry or cooked meat may be at hand. Put upon the fire until it boils, and then place where it will simmer gently, removing the scum as it rises; add two carrots, two turnips, two leeks or small onions, a head of celery, and three or four cloves. Let it simmer for six hours, adding water to supply the loss by evaporation. The whole story is meat and vegetables simmered slowly together, and it may be varied in many ways by using different vegetables, etc. The meat and vegetables are removed and the clear soup served, after which the meat and vegetables are served plain, or the meat is dressed with tomato or other sauce. Sometimes a tough fowl is put into the soup pot and cooked until tender, and then put into the oven and browned. The broth thus made serves for a variety of soups; with vermicelli, macaroni, rice or barley, it gives soups of those names. By using a variety of vegetables cut fine it makes vegetable soup. Roast an onion until it is thoroughly brown and boil it in the broth, and you have brown soup, or use a little of the following

Browning for Soups.—Many of the rich-looking soups owe their attractive appearance to burnt sugar, which is prepared as follows: Put three tablespoonfuls of brown sugar and an ounce of butter into a small frying pan and set over the fire; stir continually until it is of a bright brown color; add half a pint of water, boil and skim, and when cold bottle for use. Add to soups at discretion.

Ox-tail Soup is an exceedingly rich preparation, highly relished by most persons, especially in cold weather. Two ox-tails are cut in pieces at the joints, and with carrots, onions, turnips, pepper and salt, are slowly stewed in three quarts of water for three or four hours, or until the meat parts readily from the bone. A little thickening of flour is usually added. The flavoring is also varied by the use of cloves, catsup, etc.

Cold Cream or Rose Water Ointment is a most useful application, especially in winter, when chapped hands and cracked lips are prevalent. The best way is to buy it in small quantities of the apothecary, but in country towns it is seldom found fresh, and when rancid it is useless. It may be readily made in the family. The ingredients are one ounce of rose water, two ounces of oil of almonds (sweet), half an ounce of spermaceti, and a drachm of white wax. Of course a less quantity, but in the same proportion, may be used. Put the oil, spermaceti, and wax, in a bowl; set this in a vessel of water, and heat until the ingredients are all melted. Remove from the fire, and add the rose water in small quantities at a time, constantly stirring with a wooden knife whittled out for the purpose, until cool. It needs a great deal of stirring, and when properly made will be pure white and perfectly smooth. The addition of a small quantity of glycerine will make what is called "glycerine ointment,"—a very soothing application to burns and excoriated or inflamed surfaces.

Apple Sago Pudding.—By M. E. Elliott.—Core as many sour apples as can be placed in the bottom of a quart pan; fill the center of each apple full of sugar, add a little salt and one cup of sago; fill up the pan with water. To be eaten with sugar and cream (or milk) for sauce. Bake until the apples are done. An excellent pudding.

BOYS & GIRLS' COLUMNS.

A Happy New Year.

Many thousand kindly greetings have already reached us from the readers of these columns, while renewing their subscriptions for 1869. We here return them with compound interest, and tender to all the boys and girls, old and young, heartfelt wishes for their prosperity and happiness during the new year now commenced. It warms the hearts of the editors to look out in imagination upon the tens of thousands of faces that meet them with a smile as their monthly visits are made. Some of them are long-tried friends, who write that they have taken the *Agriculturist* the whole *twenty-seven* years during which it has been published, and that they have liked it all the time. Such testimony as this encourages us to continue to work faithfully in trying to interest and instruct. We do not make promises to excite your hopes and please our vanity, but address ourselves at once to performing what we can find to do for our mutual improvement. We cordially share the pleasure of the fortunate ones who are rejoicing in their holiday gifts, which speak of the affection and prosperity of their friends. But it will please us most to bring a smile to the face of some *poor* boy or girl, left to neglect, and perhaps suffering by the indifference, thoughtlessness, or avarice of others. Cheer up, little one. This is God's world, made for you, as much as for the richest and proudest man you know. Sunlight, air, health, strong muscles, opportunities to work, to grow stronger and better, and to make the world better, are all yours. *Work and Wait!* Take that for your motto, and your good time will come. All last summer, the bees worked through the sweltering heat, and now they are enjoying their feast; trees and plants worked to store up nourishment for future use; now they are stripped bare and stand desolate in the wintry storms, but they are only waiting; spring buds, summer blossoms, and autumn fruits, will remind you that winter cannot last forever. And you who need no such comforting assurances, who have never known the hardships of friendlessness and poverty, do your part to lighten the load and brighten the life of the less favored. Let your motto be *Help and Enjoy!* Thus all may realize a **HAPPY NEW YEAR!**

Premium Boys at the Fair.

The Ohio State Fair was a great exhibition. More useful and curious articles were gathered there than one could examine in several days. There were throngs of visitors, old and young, and it was as entertaining to watch them, as to look at the things brought on purpose to be shown. There were premium men and women, girls and boys there, although no prizes had been offered for such. Two of this class interested us more than any thing else we saw at the fair. They were boys about twelve years old, and were busy examining a long line of fodder cutters. Most of those present merely looked at these implements, and could have told that such things were on exhibition. But these boys went from one to another, and carefully looked into the working of each. One had too much machinery to suit them; another worked too slow; another was too hard to turn; each was criticised, commended, or condemned, as it seemed to them to have good or weak points. The sparkle of their knowing looking eyes, the healthy glow of their cheeks, and more than all, their intelligent conversation, marked them as 1st premium boys. We have little doubt that they are active members of the great *Agriculturist* family, and feel sure they will become thriving farmers.

The Lobster at Home.

A writer in a foreign paper thus pleasantly refers to the habits of this peculiar shell-fish:

"A lobster is a particular fellow in his food. I have been watching one in my marine aquarium. If a portion of food be thrown to him, he immediately sets his long horns at work to ascertain the whereabouts of his dinner. If he does not like it, he at once pushes it away from him with the attitude of an epicure, who bids the waiter take away a plate of meat he does not fancy. If the food is agreeable to him, he manches it up, moving his jaws in a peculiar way, like a weaver making a blanket. He tears his food into large pieces, leaving the actual grinding to be done by the very peculiar internal teeth which are found in the lining of the stomach. When the lobster goes out for a walk, and is not in a particular hurry, he carries his great claws in front of him, well away from the ground. He walks upon the little legs which are underneath his body, while he keeps his horns moving in front of his nose, like the blind man tapping the ground with his stick as he plods along, led by his dog; hence I conclude the lobster is short-sighted. If the least thing alarms him, he scuttles backward on his little legs, which move with the rapidity of a centipede. If he does not go fast enough in this way, he sud-

denly soaps his tail toward him, like a man suddenly closing his hand, and flies backward with a jerk, like an india-rubber band soaped in half. He always goes into his cave tail foremost, and he takes the most wonderfully good shots at the entrance. I really think the lobster must have an eye in his tail somewhere. Our pet lobster is not willing that the secret of his toilet should be exposed to vulgar gaze, so the first night he was in the tank he artfully collected cockle and oyster-shells, and made a trench around himself, after the fashion of the Romans who they took possession of a bill-top. A branch of sea-weed forms a canopy over his head, and there he is at this minute, in a house of his own making."

Agricultural Advice.—Punch advises farmers to sow their P's, keep their U's warm, hive their B's, shoot their J's, feed their N's, look after the potos I's, and we might add, they should C's every opportunity to improve, and then take their E's after work is over.

A Powerful Whistle.

Horace Mann used to tell a story of a conversation he once had with an inmate of the lunatic asylum at Worcester, Mass., whose peculiar mania resulted from an inordinate development of the hump of self-esteem. "What's the news? Has anything unusual happened of late, sir?" inquired he, with a consequential air. Mr. M. happening to recollect that a furious storm had occurred a few days previous, gave him some account of it, mentioning that on the sea-coast it was very severe, several vessels having been driven ashore and wrecked, with the loss of many lives. "Can you remember, sir, what night in the week all that happened?" eagerly inquired the listener. Mr. Mann said he believed it was the night of Tuesday. "Ah!" said the idiotic, with an air of solemnity, mingled with triumph, and lowering his voice to a whisper, "I can account for it, sir! That is the night I whistled so. I must be more careful in the future!"

A man living in the activities of the nineteenth century may properly be called a condensed Methusalem.

Young Punster.—A friend recently heard two boys wishing aloud for what they saw over the fence in a neighboring yard. "I'd like to have that hen," said one little fellow. "I'd take that dog," said the other. "That would be first-rate," replied the first speaker. "My hen could lay eggs, and your dog could lay down!"

New Puzzles to be Answered.

No. 335. *Illustrated Rebus.*—A desirable accomplishment.

No. 336. *Mathematical Problem.*—A certain number divided by 10 leaves 9 for a remainder; divide by 9 and 8 remains; divide by 8 and 7 is left, and so on; dividing by each of the nine digits, the remainder in each case will be one less than the divisor; if the number be divided by 11 there will be no remainder. What is it?

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the December number, page 459. . . . No. 332. *Illustrated Rebus.*—Aching teeth are ill tenants. (*A king t hare rill X ants.*) . . . No. 333. *Illustrated Rebus.*—No one too wise to learn. (*No 1 2 yj's stool urn.*) The following have sent in correct answers to puzzles previously published. Salina E. Sanborn, Frank L. Whitecomb, O. O. Brown, Isaac T. McLain, John Milton Snyder, James Polk Harmony, Wetunka, Mosheim Weills, John Lehdes, E. Leonard, Marius Heighton, Emma Waterman, Jackson Brown, A. E. Lewis, Nellie C., O. R. Goodale, "Crescent and Star," W. Wettit, John E. Holmes, Mrs. Rebecca Rickel, Robert Simpson, Eva Gray, Frank L. Smith, Hattie E. Hawley, S. F. Higley, Mira A. Lick, Thomas Wellhogs.

No. 334. *A Puzzle for Fishermen.*—The first picture shows the bait, which is to be cut into pieces, as shown by the lines. Then by fishing with them in the pond shown in the second engraving, you may catch a fine

pickarel. It will require skillful angling to accomplish it. Instead of cutting the pieces out of the paper, which would spoil a number, lay a thin piece of white paper upon the engraving, trace the outlines, and cut them up for bait.

[COPYRIGHT SECURED.]

A TREACHEROUS FRIEND.—*Drawn and Engraved for the American Agriculturist.*

Few pets are more attractive at first sight than a cat and kittens, so tame, playful, and affectionate. But the picture shows the other side of cat nature, sly, murderous, and cruel. The poor squirrel, lately so full of life and frolic, has fallen a victim to the ferocity of the cat, and the whole family are in high glee over the poor mutilated body. This can scarcely be wondered at when we know that the cat is first consin to the lion, tiger, and leopard, and when wild is itself a most ferocious creature. Its habits are much changed by domestication, but the cat nature remains, ready to show itself on every favorable occasion. The lesson of the picture is very plain: do not keep cats and squirrels together, and be as wise in keeping innocent children away from smooth, purring, cat-like, vicious companions, who will kill with a smile.

Eight Acres of Music.

Not long since a musical gentleman of our acquaintance purchased a small piano of the kind offered in our premium list. His house is situated in about the middle of an enclosure of eight acres, and by listening in different parts of the field he found that he could distinctly hear the notes of the instrument when played on, from every part of the premises. Our young philosophers know that sound is caused by vibrations communicated to the air from a sonorous body, and conveyed to the ear, passing thence through the auditory nerve to the brain. Here, then, was the air over eight acres in extent, all tremulous when a single note was struck, the whole caused by the vibration of a wire less than three feet long. It is a pleasant thought that one can thus make acres of music. Without doubt all the fine notes of dust floating in the air felt the influence, and were set to dancing after their own fashion, to the music of the piano. We have wit-

nessed something even more wonderful than this. A pleasant thought given out by some warm-hearted writer and sent vibrating through the land by the press has brought music to tens of thousands of hearts. Play on the pleasant strings, boys and girls, and let there be a continued and happy chorus ringing through the land.

Good Places for Boys.

Dear Sir:—I would like very much to get a place as clerk in New York. I am sixteen years old, and have always lived on a farm. I understand arithmetic pretty well, and think I could give good satisfaction in a store. If you can help me get a place, it will be doing me a great favor.

Yours respectfully,

Many such letters are received here every year. We have not time to answer each one personally, and as the matter is an important one to many young readers, we give the following general answer. First, to follow the Yankee way of answering one question by asking another. Why do you wish to leave the farm and come to New York? The answer in most cases is, "It's easier than working on a farm." Perhaps so. It is easier in one sense to be good for nothing than to be valuable to yourself and others; it takes much less work—simply do nothing, and be nobody, is the rule. But the question to be looked at is, Will it pay to have an easy time and get little in return? Those who succeed in the city must do it by hard work. Many a rich merchant in New York performs more real labor in a day and is more exhausted than the hardest worked laborer on a farm. He does not exert his muscles as much, but his brain, which is the seat of power, is intensely active, and he wears out fast. Those who "take things easy" in the city get the same small return as the loungers in the country; so nothing will be gained in that respect. "But," say, or rather

think, many boys, "they have such nice things in New York; shows, museums, circuses, and something going on all the time." Yes, there are thousands of ways for spending money for amusement here, all of which bring no profit, and what is worse, too many of them are surrounded with danger. Thousands of the young are every year amused by the shows and ruined by their corrupt surroundings, for the drinking saloon and the gambling rooms are close by the principal places of amusement, and every temptation to enter them is held out. But furthermore, there are thousands of boys and young men born here, accustomed to city life, who stand ready to fill all the desirable places. They usually have the best opportunities, having acquaintances and friends to help them, so that a boy from the country applies for a place under great disadvantages. A single advertisement for a boy by a friend of ours was recently answered by more than two hundred applicants. It is true that a few, perhaps one out of a hundred, who come to this city, succeed by long self-denial and hard work in gaining an independence, but it is not certain that even these are better off than they would have been to have used the same energy and worked their way up in the country. Work, patience, perseverance, honesty, brains, and energy, will win anywhere, and the farm where you have already made a beginning is equal to any other place for working out the problem of life.

A Spendthrift was advised by a friend to buy a neglected farm. "Why," replied the former, "there's not a passable road through the whole of it." "That is the very reason you should get it," replied his friend; "it will take you longer to run through it."

Some do first, think afterwards, and repent forever.

OUR YOUNG FOLKS FOR 1869.

The Conductors of "OUR YOUNG FOLKS" intend to preserve the high literary character of the Magazine, and at the same time to give it a more *comprehensive and practical* cast than heretofore. They feel confident that the arrangements they have made for the coming year will answer all reasonable demands of parents for a Magazine at once entertaining and useful.

The following are some of the principal features of the coming volume.

The Story of a Bad Boy. By T. B. ALDRICH. One of the brightest and most entertaining stories ever written for youthful readers.

Gardening for Girls. By the Author of "Six Hundred Dollars a Year."

How to Do It. By EDWARD EVERETT HALE. A series of articles for young folks,—suggesting How to Talk; How to Read; How to Write; How to Travel; How to Act in Society, and How to Work.

The World we Live On. A valuable series of articles, by Mrs. PROF. AGASSIZ, telling about Coral Islands, Coal Deposits, Earthquakes, &c.

Biographical Sketches of the Great Navigators, Voyagers, and Discoverers. By JAMES PARTON.

American History. Articles of great interest and value. By J. H. A. BOXE.

Glass-Making, Coal-Mining, Ship-Building, Watch-Making, and other attractive branches of Industry. By J. T. TROWBRIDGE.

Nature and Out-Door Life. By the Author of "The Seven Little Sisters," also by W. F. G. SHANKS and CHARLES J. FOSTER.

Declamations; Dialogues; Numerous Full-page Illustrations; Regular or Occasional Contributions from Mrs. STOWE, Mrs. DIAZ, Miss MULLOCK, Mrs. WHITNEY, Mrs. ATSTIN, Miss PHELPS, "SOPHIE MAY," Mrs. WELLS, Mrs. THAXTER, "AUNT FANNY," Mrs. WEEKS, Miss PRESCOTT, and other popular writers.

THE PICTURE'S STORY.

[SPECIMEN OF THE ILLUSTRATIONS IN "OUR YOUNG FOLKS."]

WHAT THE READERS OF "OUR YOUNG FOLKS" THINK OF IT.

TOLEDO, Ohio, Nov. 18, 1868.
"My little brother is perfectly delighted with 'Our Young Folks,' and his delight is shared by the whole family."

COLD WATER, Mich., Oct. 12, 1868.
"I wanted so many new books and tools this year. I thought I would try and get along without 'Our Young Folks'—\$2.00 a year. In advance; 3 copies, \$5.00; 5 copies, \$8.00; 10 copies, \$15.00. ATLANTIC MONTHLY and OUR YOUNG FOLKS together, \$5.00.

FOLKS, but I can't do it. I am lame and cannot go off and play with the other boys, so I must have my old friend again."

UTICA, N. Y., Dec. 7, 1868.
"My little son has taken your excellent Magazine since the first number; and he would as soon think of going to bed without his supper as of being deprived of the pleasure the Magazine affords him."

BLOOMINGTON, Ill., Dec. 1, 1868.
" * * * We enjoy 'Our Young Folks' so much we feel as though we could not get along nicely without it. Many a lonely and sick hour has been passed, pleasantly by its help, and I think it improves all the time."

HORACE GREELEY ON POLITICAL ECONOMY.

Greeley's History of the War.

Mr. GREELEY purposes to write, during the year 1869, an elementary work on Political Economy, wherein the policy of Protection to Home Industry will be explained and vindicated. This work will first be given to the public through successive issues of THE NEW-YORK TRIBUNE, and will appear in all its editions—DAILY, SEMI-WEEKLY, and WEEKLY. The work will contain the best results of the observations and study of a lifetime, and, as the question of Protection to American Industry concerns our entire people, it will be looked for with great interest. In addition to this work by Mr. Greeley, THE TRIBUNE has engaged George Geddes, one of the best and most successful farmers in the country, and other able writers on Agricultural subjects, to write regularly for its columns. The American Institute Farmers Club will continue to be reported in THE SEMI-WEEKLY and WEEKLY TRIBUNE. No farmer who desires to till the soil with profit, and to know the progress constantly made in the science of his calling, can afford to neglect the advantages of a newspaper like THE WEEKLY TRIBUNE, especially when it unites with agriculture other features of interest and profit. THE WEEKLY TRIBUNE contains a summary of all that appears in THE DAILY and SEMI-WEEKLY editions, while in addition it is made to address itself to the wants of the great farming class. Reviews of new publications, and of what is new in music and the fine arts; letters from different parts of the world—some of them of rare interest to the farmer, as showing the progress of agriculture in other countries; editorial essays on all topics of home and foreign interest, together with full and carefully printed reports of the markets, will be furnished from week to week, and at a lower price than that of any other newspaper in America. By pursuing this policy THE WEEKLY TRIBUNE has attained its present commanding influence and circulation, and we enter upon the new year with an assurance to our readers that no pains and no expense will be spared to give it still greater usefulness and power, and to make it a yet more welcome visitor to every fireside in the land.

GREELEY'S HISTORY OF THE WAR.

THE TRIBUNE also proposes to send "The American Conflict," by Horace Greeley, in 2 Vols. of 648 and 732 pages respectively, to clubs on terms stated below. This history has received from all quarters the highest commendations for accuracy of statement and fullness of detail. It is substantially bound, and must be deemed a valuable addition to any library. These volumes should be placed in every School District library to the land, and each school contains scholars who can, with a few hours of attention, raise a Tribune Club and secure the history. Almost any one who wishes can now obtain it by giving a few hours to procuring subscriptions for THE TRIBUNE among his friends and neighbors, and we hope many will be incited to do so. The work will be promptly forwarded, prepaid, by express or by mail, on receipt of the required subscriptions.

TERMS OF THE TRIBUNE.

DAILY TRIBUNE, Mail Subscribers, \$10 per annum.

SEMI-WEEKLY TRIBUNE.

Mail Subscribers, \$1 per annum. Five copies or over, \$3 each; 16 copies, \$15. For \$36, 10 copies and Greeley's History; for \$63, 20 copies and Greeley's History; for \$116, 40 copies and Greeley's History.

WEEKLY TRIBUNE.

Mail Subscribers, \$2 per annum; 5 copies, \$9; 11 copies, to one address, \$15; 10 copies and Greeley's History, to one address, \$20; 21 copies, to one address, \$25; 20 copies and the History, to one address, \$31; 59 copies, to one address, \$50; 50 copies and the History, to one address, \$56; 11 copies, to names of subscribers, \$16; 10 copies, to names, with one copy of the History, \$21; 21 copies, to names, \$27; 20 copies, to names, with one copy of History, \$33; 50 copies, to names, \$35; 50 copies, to names, with one copy of History, \$61.

The money must, in all cases, be received at one time, and the papers be sent to one Post-Office.

Friends wishing to secure the History on these terms must send the Clubs precisely as we have stated them. SEMI-WEEKLY and WEEKLY subscriptions must not be mixed in one Club.

Terms, cash in advance. Address

Farmers' Club Sweet Corn.

Early, Productive, Tender, Creamy and Delicious.

Testimony.—Solon Robinson says: "After years of trial, I still express the same opinion I did at first: that is, that your sweet corn is the best variety, all things considered, that I have ever grown."

Hon. Levi Bartlett, Warner, N. H., says: "The Sweet Corn you forwarded me was far superior to three other varieties I grew. * * * I can cheerfully recommend it as worthy of a wide dissemination."

Thos. Meek, Editor of Gardener's Monthly, says: "I was very much pleased with your corn. After it came to table, inquiries were numerous as to where that excellent corn came from. I do not think you need hesitate about bringing it out as a first-class variety."

Col. M. C. Weld, Associate Editor of American Agriculturist, writes: "Your most excellent corn has afforded us a great deal of enjoyment. It is decidedly the sweetest and best corn I have ever eaten. The yield is, besides, large. That dried for winter use is as 'sweet as honey,' and it is with repeated assertions only that we convince our guests that it is not sweetened."

This corn is the result of eight years' search and trial of more than forty varieties. I propose to make seed corn a specialty, and will gladly pay \$50 for a single ear of a better kind. Package of seed by mail sufficient for fifty hills, 50 cents. JAS. B. OLCOTT, Buckland, Conn.

No Sixty-pound Cabbage,

But a Cabbage such as every gardener likes to grow, and every housekeeper to use. Sold, of fine texture, small-ribbed, short-stemmed, and good size; such are the varieties we offer of our own growth. Warranted fresh and genuine.

Dreer's Philadelphia Drumhead Cabbage 50 cts. per oz., \$5 per lb. Dreer's Philadelphia Flat Dutch Cabbage 50 cts. per oz., \$5 per lb. The Flat Dutch is about one week earlier than the Drumhead.

No charge for mailing. For a full list of genuine Seeds, see Dreer's Garden Calendar for 1869.

HENRY A. DREER,
714 Chestnut-st., Philadelphia, Pa.

THE AMERICAN HOUSEWIFE.—Agent wanted.—Just the paper for the family. It contains hints for housekeepers, choice literature, fashion, etiquette, and fancy work. Illustrated floral and children's departments. Terms, one copy, one year, \$1.50. Specimens free. Address Mrs. M. M. B. GOODWIN, Monitor Office, Indianapolis, Ind.

THE COMSTOCK & GLIDDEN SPADER.—Awarded a Silver Medal at the Paris Exposition. Greatly improved and reduced to nearly half its original weight and price. We are prepared to fill orders for spring work. Farmers, send for Circular. EDWARD P. ALLIS & CO., Milwaukee, Wisconsin.

C. O. D.—READER, if you want to buy a WALTHAM WATCH, in solid Gold and Silver cases only, procure circular (sent free) of M. E. CHAPMAN & CO., No. 47 Liberty-st., New York. They sell the genuine cheaper than any other dealers.

Tomatoes. Tomatoes.

KING OF THE TOMATOES.—A new and superior variety of this valuable esculent, combining more good qualities than any other variety in cultivation. Plant, strong and vigorous; fruit above medium size; grows in clusters; form round, somewhat flattened at the ends, seldom creased or wrinkled; color a deep, rich red, very showy and attractive in appearance; flesh very solid, with but few seeds, of fine flavor; very productive, ripens with the Tilden. Its great beauty and remarkable keeping properties make it a most desirable market variety, while its solidity and agreeable flavor make it equally desirable for canning. Price 25 cts. per packet; 5 packets for \$1.

BOSTON MARKET.—An improved variety of the "Large Smooth Red"; very productive, slow, and of superior quality. It is extensively grown by the market gardeners in the vicinity of Boston, who esteem it above all others as a market variety. Our Seed was selected from the stock of one of the most successful growers in New England. Per packet 15 cts.; per ounce 75 cts.

ORANGEFIELD PROLIFIC.—An English variety of great merit. The experience of the past season fully confirms what we stated of this variety when we first offered it last spring, and we have no hesitation in pronouncing it the earliest and one of the most productive varieties in cultivation. In our trial-grounds it proved a week earlier than any other variety on our Catalogue. The dwarf and compact growth of the plant makes it particularly desirable for forcing. Per packet 25 cts.; five packets for \$1.

One packet of each of the above varieties 60 cts. Also the following well-known varieties at 10 cts. per packet: Keyes' Early Cedar Hill, Tilden, Maupay's Sim's Early Cluster, Extra Early York, Cook's Favorite, Mammoth Chihuahua, Large Red Smooth, Fejee, Perfected, Fear, Cherry, Strawberry, etc., etc. Address

Pittsburgh, Pa.

FARMERS, THEIR WIVES, SONS AND

DAUGHTERS, should read the pictorial PHRENOLOGICAL JOURNAL, 1869. Self-Culture, Memory, Good Behavior Love, Courtship, Whom and When to Marry, Likes and Dislikes, Choice of Pursuits, or What Each Can Do Best; with rules for Reading Character, by Physiognomy, Phrenology, etc., only \$3 a year. Address S. R. WELLS, 389 Broadway, New York.

THE Subscriber desires to make an arrangement with a young farmer with family, for the prosecution of the business of farming. A. B. HUMPHREY, Albany, N. Y.

WEEKLY EVENING POST.

A HANDSOME EIGHT-DAY BRONZE CLOCK FOR THE PARLOR MANTEL OF EVERY HOUSEHOLD.

The Proprietors of the **EVENING POST** offer an **EIGHT-DAY BRONZE CLOCK**, which the above cut illustrates, to every person who will obtain

ONLY FIFTEEN SUBSCRIBERS FOR THE WEEKLY EVENING POST,

At Two Dollars each, or for EIGHT SUBSCRIBERS to the SEMI-WEEKLY EVENING POST, At Four Dollars each.

The Clocks which we thus offer as a premium were first placed in the market some years since, by the **AMERICAN CLOCK COMPANY** of this City and have won general approval for their accuracy as time-keepers, as well as their elegance of form, which makes such a clock an ornament fit for any parlor mantel-piece, and in beauty of design and fineness of finish they are equal to the French Clocks. The movements are made upon the French plan, have steel plinions, are finely polished, and dealers admit that they will run more surely and correctly than the French; while they have the qualities which have always made the French clocks desirable, of noiseless ticking, and a pleasant, clear-toned bell, striking the hours and half-hours. Many thousands of these clocks have been manufactured, and the demand keeps pace with the supply. The liberality of our offer will be appreciated when it is considered that these clocks cannot be bought at the stores throughout the country for less than **TWENTY-FIVE DOLLARS**; so that, as the regular subscription price for 15 copies of the **WEEKLY POST** is \$30, or \$32 for eight copies of the **SEMI-WEEKLY**, the clock or the paper is nearly an

ABSOLUTE GIFT

In order that all may be encouraged to make the attempt to procure this desirable Household Article, we shall allow, in the event of persons not being able to procure the requisite number of names, a commission of *Twenty-five Cents* for each subscription to our **WEEKLY**, or *Fifty Cents* for each subscription to our **SEMI-WEEKLY**, so that all may be rewarded for their effort, "it being understood that in every case the money must accompany the names." The clocks will be carefully packed and sent by Express to any address; and we have made arrangements with the Express Companies, which will cause their being forwarded at a much less cost to the receiver than their ordinary charges.

The appropriateness of our premium as a

HOLIDAY GIFT,

will be apparent, and doubtless we shall be the medium of many pleasant surprises.

The proprietors of the **EVENING POST** desire to add largely to the circulation of the **WEEKLY** and **SEMI-WEEKLY** editions of their journals; believing that the care with which these papers are made up, the unusual variety of their contents, their high literary character, fullness of news, both foreign and domestic, and interesting special features, contribute to make either the **WEEKLY** or **SEMI-WEEKLY EVENING POST** the best family journal in America.

The Best Family Journal in America.

F. M. CHURCHMAN, Indianapolis, Indiana.

Either of the books mentioned below will be sent, post-paid, on receipt of the price, by the Publishers, ORANGE JUDD & CO., 245 Broadway, New York City.

Gardening for Profit.....\$1.50

A new work on **MARKET AND FAMILY GARDENING**. It is finely illustrated, and is the first book of the kind prepared by a Market Gardener, in this country. The author is well known, and his successful experience of eighteen years, enables him to give a most valuable record. It is an *original and purely American work*, and not made up, as books on gardening too often are, by quotations from foreign authors. Everything is made perfectly plain, and the subject treated in all its details, from the selection of the soil to preparing the products for market. By PETER HENDERSON. Cloth, 12mo 252 pp.

Fuller's Grape Culturist.....\$1.50

This is the latest and most practical work issued on the Culture of the Hardy Grapes, with full directions for all departments of Propagation, culture, etc., with one hundred and five excellent engravings, illustrating the various operations of Planting, Training, Grafting, etc. New edition, revised and enlarged. By ANDREW S. FULLER, Practical Horticulturist. Cloth, 12mo, 262 pp.

Tim Bunker Papers.....\$1.50

Although "Timothy Bunker, Esquire," writes in the Connecticut vernacular, there is more sound common sense, and real information upon agricultural matters, in this work than is to be found in many more pretentious volumes. His old friends will gladly welcome the collected writings of Mr. Bunker, and those who are not familiar with them will derive not only instruction but amusement from their perusal. The distinguished artist Hoppin has tried his pencil on some of the inhabitants of Hookertown, and given a series of characteristic illustrations. Cloth, 12mo. 312 pp.

B. K. BLISS & SON,

Nos. 21 Park Row & 151 Nassau Sts., New York,

(Formerly of Springfield, Mass.)

Importers, Growers and Dealers in Garden, Field, and Flower Seeds.

Horticultural Implements and Garden Requisites.

Would invite the attention of all who are interested in the culture of Flowers and Vegetables, to their large and well-selected assortment of the above, comprising the newest and most approved varieties, both of European and home production, the quality and utility of which cannot be surpassed. For a list of these see their

NEW ILLUSTRATED SEED CATALOGUE,

AND

GUIDE TO THE FLOWER AND KITCHEN GARDEN.

The Fifteenth Annual Edition, enlarged and improved, contains 132 pages of closely printed matter, beautifully illustrated with 100 Engravings, and a descriptive list of 2,500 varieties of Flower, Vegetable and Agricultural Seeds, including all the novelties of the past season, with explicit directions for their culture; also, a list of 125 varieties of French Hybrid Gladiolus, embracing many new sorts now offered for the first time in this country—with many other Summer Flowering Bulbs, consisting of Anemones, Tuberoses, Tigridius, Lilies, etc.; with much other useful information upon the subject of gardening generally, will be published early in January. A copy will be mailed to all applicants upon receipt of 25 Cents. Our regular customers supplied without charge.

Bliss' Gardeners' Almanac for 1869

Contains 68 pages of closely printed matter, embracing a Monthly Calendar of operations, and a priced list of the leading varieties of Garden, Field and Flower Seeds, with brief directions for their cultivation. A copy will be mailed to all applicants enclosing a three cent stamp.

B. K. BLISS & SON, Box 512 P. O. 41 Park Row, and 151 Nassau-st., New York.

One Hundred Dollar Prize

For an Essay on the Potato and its Cultivation, to be called

"THE GOODRICH PRIZE."

I offer \$100 as a prize for the best essay on the cultivation of the potato. The manuscript must be sent in to B. K. Bliss & Son, 41 Park Row, N. Y. City, by or before July 1st, 1869. Each writer must enclose his name and address in a separate sealed envelope, placing a mark upon the envelope like one on the manuscript.

Authors should save copies of their essays and have them plainly written. The successful competitor will be announced and the essay published by J. Ferguson & Co., New Castle, Pa. and B. K. Bliss & Son.

The decision will be made by a committee consisting of Col. M. C. Weld, of the American Agriculturist, A. S. Fuller, of Ridgewood, N. J., and Editor of the New York Sun, and Dr. F. M. Hexamer. For other information, address (Rev.) W. T. WYLIE, New Castle, Pa.

FRESH GARDEN SEEDS.

We offer at following low rates by express; when wanted by mail, post-paid, add 20c. per quart. Early Mohawk, Early China, Early Valentine, Early Yellow, Six Weeks and Heinze Beans, and Dan O'Rourke Early, Blue Imperial and Champion of England Peas, at 25c. per quart. Black Wax (Bush) and Indian Chief (Wax), and Horticultural, Pole Beans, at 40c. per quart. Large Lima and Concord, pole beans, Carter's First Crop, Advance, Little Gem and Tom Thumb Peas, at 60 cts. per quart. Giant Wax Pole Bean, \$1.50 per quart. Very fine named French and Belgian Hybrid Gladiolus, \$1.50 per doz. For other Seeds and Plants, see our new Catalogue, ready about the 15th. In addition to premiums offered in Dec. No. 6, American Agriculturist, we also offer handsome premiums for largest yield of Early Rose Potato and Norway Oats, from packages ordered before March 1st.

Beans, Peas and Potatoes, the best varieties, warranted genuine, by peck, half bushel and barrel, at lower rates than generally offered. Purchasers of seeds in large or small quantities will save their money by inclosing one stamp for our Catalogue.

For three dollars we will send three dollars' worth of seed in packets and 1 lb. of Early Rose Potato free. WARDWELL & CO., West Dreston, Yates Co., N. Y.

NORWAY OATS.

Send orders to headquarters. Every acre sown in this seed will pay a profit of several hundred dollars next year. Farmers should consider this before it is too late. Price \$10 per bushel; \$6 half bushel; \$4 per peck; or by mail, \$2 two quarts; \$1.25 one quart, post-paid.

JONES & CLARK, 39 Liberty-st., New York.

P. O. Box. 5669.

New and Choice Potatoes.

CLIMAX.

The CLIMAX is a seedling of the Early Goodrich, and originated with Mr. D. S. Hoffman, in 1861, and is thus described by him:

"It has a stout, erect stalk, large leaves, a tuber about medium size, smooth, cylindrical form, swelled out at center, eyes, shallow, but strongly defined; skin considerably netted or russet, tough, white; flesh entirely white, solid, heavy, brittle, and never hollow; boils through quickly, with no hard core at center, is mealy, of floury whiteness, and of superior table quality. It is equally productive with the Early Rose, but a few days later, earlier than the Early Goodrich, while its keeping qualities are as good as the Peachblows."

We have made arrangements with Mr. Hoffman for a portion of his stock, which we offer to our patrons, fully confident of its good quality. Price \$3.00 per pound, by mail, post-paid.

BREEZE'S PROLIFIC (or No. 2).

This remarkable variety originated with Albert Breeze, Esq., of Hubbardton, Vermont, who was also the originator of the justly celebrated Early Rose, both varieties being produced from the same Seed-ball of the Garnet Chili.

The vines of Breeze's Prolific are of medium height, quite bushy, somewhat spreading, large leaves, have produced no seed-balls. Tubers large, regular in shape, and very smooth, slightly oblong, somewhat flattened. Skin dull white, inclined to be russeted; eyes but little depressed and slightly pinkish, flesh white; cooks quickly, is very mealy, and of excellent quality, yield very large, often exceeding One Hundred fold, matures about three weeks later than the Early Rose, and will prove a most valuable variety for field culture. A silver medal was awarded to this variety at the annual exhibition of the Mass. Hort. Society, last September. Price \$3.00 per pound by mail, post-paid.

EARLY ROSE.

Among the many thousands of our patrons to whom we furnished this valuable Potato last spring, we have yet to hear from the first one who is not fully satisfied with his purchase. The only regret expressed is that they had not purchased more. We are daily in receipt of the most flattering testimonials, not only of its earliness and good quality, but of its astonishing productiveness, some of which seem almost fabulous. Several reports of having grown a barrel from a single pound; a yield of one hundred fold is an every-day occurrence. The following well-known gentlemen have given their unqualified approval, and endorse it as the best, most productive, and earliest variety in cultivation: Hon. Marshall P. Wilder, Chas. Downing, Esq., Rev. Henry Ward Beecher, Fearful Barr, Esq., Dr. J. G. Holland, (Timothy Hitchcock), and many other prominent agriculturists, horticulturists, and market gardeners. We shall continue to execute cash orders through the month of January at the following prices:

One pound, \$1.00; Three pounds, \$2.00, by mail, postpaid. One peck, (15 lbs.), \$5.00; 1/2 bushel, \$8.00; 1 bushel, (60 lbs.), \$15.00; 1 hbl., (165 lbs.) \$30.00. Prices to the trade, in larger quantities, will be given upon application. The freight on all packages by express, boat, or railroad, to be paid by the purchaser. No charge for packages or cartage.

Upon receipt of \$5.00 we will mail, post-paid, to any address in the United States or British Provinces, ONE POUND each of the CLIMAX, BREEZE'S PROLIFIC, and the EARLY ROSE. Orders will be booked in the order in which they are received, and the potatoes forwarded on and after April first, when they will be free from danger of frost. They can be forwarded earlier if desired, at the risk of the purchaser. No orders will be accepted unless accompanied with the cash.

In addition to the above, we have a large stock of EARLY SEED, EARLY GOODRICH, YANDEBERG'S SEEDLING, JACKSON WHITE, HARRISON, &c., &c., which we offer at the lowest market prices.

Our descriptive priced list of potatoes mailed to all applicants.

A new and valuable work on the Potato and its Culture, with illustrations of several new varieties, by Rev. W. T. Wylie, of New York, Pa., just published, and mailed to all applicants upon receipt of 20 cts.

B. K. BLISS & SON,

41 Park Row and 151 Nassau-st., New York. (P. O. Box 5712.) Formerly of Springfield, Mass.

OLM BROTHERS, Successors to B. K. Bliss, Springfield, Mass.

AMATEUR CULTIVATOR'S GUIDE

TO THE

KITCHEN AND FLOWER GARDEN.

THE TWENTY-THIRD EDITION of this popular and useful work, which has met with so great favor in the past, will be ready Jan. 15, much enlarged and improved, containing descriptive lists of all Flower and Garden Seeds worthy of cultivation, embracing over twenty-five hundred varieties; to which is added all the novelties in Flowers and Vegetables for 1869, also two hundred varieties of the choicest French Hybrid Gladiolus.

The following testimonials are unsolicited by us, and can be multiplied by hundreds:—

From Edward S. Rand, Jun., Dedham, Mass., author of "Flowers for the Parlor and Garden."

"Accept many thanks for the beautiful copy of your Annual Catalogue which you so kindly send me. I find much that is new and rare therein. The arrangement, the concisely cultural instructions, copious illustrations, and clear typographical execution, all combine to make it a model catalogue. I shall often have occasion to refer to it. It cannot fail to be of great use and interest to all horticulturists."

From Joseph Hobbins, M.D., Madison, Wis., President Wisconsin State Horticultural Society, and Corresponding Member of the Royal Horticultural Society of England.

"Please accept my thanks for your 'Guide.' I think you ought to call it 'The Garden Companion.' It is at once very usefully and conveniently arranged; a sort of ready-reference book, very ornamentally got up; one of those few books I find fitted for any table; often wanted, and always at hand."

From Andrew S. Fuller, Horticultural Editor of the "New York Sun."

"There is no use in denying the fact that Washburn's Catalogue is the handsomest thing of the kind ever got up in this country."

From the "Banner of Light," March 7, 1868.

"It is a perfect repository of suggestions of very great value to those who are addicted to gardening and its numerous delightful associations. The profuseness of the illustrations greatly increases its value as a guide to the amateur."

The above work comprises 150 pages. Tastefully bound in cloth, with two beautiful Colored Plates,—one steel,—besides one hundred other Engravings. Price 50 cents, post-paid. Paper Cover, one Colored Plate, one hundred Engravings, post-paid, 25 cents. Address

WASHBURN & CO., Horticultural Hall, Boston, Mass.

CURTIS & COBB'S

Illustrated Annual Catalogue FOR THE SEASON OF 1869.

We shall be early prepared to offer, as usual, very choice Seeds of every description. As the crops abroad, owing to the dry weather last summer, were very short, some varieties will be scarce. We hope, however, to be well supplied, but still would impress upon our patrons the importance of ordering early.

Our New Catalogue will contain a list of those very fine French and German Flower Seeds, which, as sold by us, as imported, in the original packages, have given such great satisfaction.

We shall offer in due season, many New Varieties of Vegetable and Flower Seeds, of undoubted excellence, as well as a very large lot of New French Hybrid Gladiolus, many of which were the admiration of the public as exhibited by us at the annual exhibition of the Massachusetts Horticultural Society last autumn. To amateurs and others ordering in quantity, special inducements will be offered.

Novelties and Specialties of the season will be found in our New Kitchen and Flower Garden Directory, of 150 pages, beautifully illustrated, with price of each article, and explicit directions for cultivation, which will be forwarded early in January to our patrons, free, and to all others on receipt of ten cents. Do not forget to address, early, CURTIS & COBB, Seedsmen, &c., 318 Washington-st., Boston, Mass.

Pear Seeds and all Fruit and Tree, FLOWER AND GARDEN SEEDS, by the paper, oz., lb., or cwt. Seeds on Commission. Trade List and General Catalogue to any address gratis, ready. B. M. WATSON, Plymouth, Mass.

(Published in January.) Every lover of flowers wishing this new work, free of charge, should address immediately M. O'KEEFE, SON & CO, Ellwanger & Barry's Block, Rochester, N. Y.

The Unrivalled Prize Tomato.
GENERAL GRANT.

We take great pleasure in announcing to the public that we have secured the entire stock of this justly celebrated Tomato. It originated in the garden of an Amateur, who, after growing it for a number of years in connection with all the leading sorts, became convinced that it was far superior to any other, and that it should be widely disseminated, and for this purpose it was put into our hands. In consideration of the many disappointments experienced in the introduction of new varieties, we have given it a thorough trial of two years, and it has far exceeded our expectations, ever attracting great attention wherever exhibited, taking the first prize above all others at the Mass. Horticultural Society Exhibitions the past two years. We feel the fullest confidence that too much cannot be said in its praise. We believe it the nearest approach to perfection of anything of the kind yet offered, combining more superior qualities. Size above the medium, three to four inches in diameter, growing in clusters, form round, slightly flattened, very regular, symmetrical, and rarely ribbed or wrinkled, color brilliant, glossy crimson, flesh unusually firm, solid, and free from water, weighing from ten to twenty pounds more per bushel than any other variety, skin remarkably fine, smooth, and shining, coloring well up to the stem, a quality very desirable to those preparing them for the table, very productive, and of the finest flavor, bears carriage well, and keeps in good condition a long time after being gathered, retaining its goodness, and free from wilting; it will be found to ripen uniformly, and as early, if not earlier than the other varieties. Our whole stock of seed has been grown for us by Mr. C. N. Brackett, Chairman of the Vegetable Committee of the Mass. Hort. Society, and saved only from the most perfect fruit, and we are warranted in saying that it cannot fail to give satisfaction in every instance.

We offer the following testimonials from practical parties, gentlemen whose judgment in such matters is fully reliable; for further testimonials and description see Amateur Cultivators' Guide.

From Andrew S. Fuller, Author of Small Fruit Culturist. "We have had an opportunity of testing this tomato the past season, and believe it will prove to be one of the very best varieties in cultivation."

From J. F. C. Hyde, Pres't. of Mass. Hort. Society. "I have known the General Grant Tomato for two years, and last season raised a few tomatoes of this variety. I think it is the smoothest, and every way the handsomest variety I have ever seen. It is quite solid, equal in this respect to any other variety. I have regarded it as a great acquisition to our list of tomatoes."

From C. Bates, of Kingston, originator of Bates' Early Tomato. "The General Grant Tomato I have tried with several other varieties, viz.: Cedar Hill, Ford, Tilden, Keyes', Bates' Early. The General Grant beat all in earliness except Bates' Early; with that it was about "neck and neck." But for beauty of form, color, and compact flesh, it stands head and shoulders above all the rest. Planted the 15th of May, fruit ripe 6th of August."

CAUTION.

On account of the immense popularity of this variety we find that parties are offering for sale a spurious seed, desiring to obtain large prices for the common sorts. We would therefore recommend parties purchasing to take only those sealed in paper packets bearing our name, as none other can be genuine.

Price per packet, 25 cts.; 5 packets, \$1.00.

Prices to the trade on application.

a Trial, will please send for a Pamphlet.
Double Refined Poudrette,
Bone-dust, Bone-flour, and
Nitro-phosphate of Lime.

Address

The Lodi Manufacturing Company,
Office, 66 Courtlandt Street,
Box 3133, New York P. O.

NEW JERSEY STATE AGRICULTURAL COLLEGE,
New Brunswick, Oct. 31st, 1868.

James R. Dey, Esq., Pres't of the Lodi Man'g Co.,

Dear Sir: The Double Refined Poudrette and Nitro-phosphate of Lime prepared at your works have been tried upon our farm crops the past season; viz: Upon Potatoes, Corn, Beets, Carrots, Cabbages, and Turnips, which have been already gathered, and upon wheat, which we hope to report next year. The experiments are entirely satisfactory, proving that these fertilizers have paid us full 100 per cent above their market price in the increase of crops this year, and enable us to recommend them to the public.

Respectfully yours,
GEO. H. COOK, Prof. of Agriculture.

DOVER, DEL., Oct. 12th, 1868.

Lodi Manufacturing Co.,

Gent.: We used the Double Refined Poudrette we purchased of you, on Tomatoes and Rhubarb. Land, sandy loam. The result proved more favorable than we expected. Both made a good growth, and the Tomatoes matured Ten Weeks earlier than others not manured.

We are, Yours respectfully,
WILLIAMS BROS.

KENANSVILLE, N. C., Oct. 26th, 1868.

Dear Sir: Your "Nitro-phosphate of Lime," and the Double Refined Poudrette sold by us last season, were used on Corn, Potatoes, Sweet Potatoes, and Garden Vegetables, with satisfactory results, and our Farmers express a desire to try them again.

HINSON & BROWN.

NEAR CHEROKEE CORNER, OGLETHORPE CO., GA.,
Oct. 21th, 1868.

Dear Sir: The ton of Double Refined Poudrette I purchased of your agent, Dr. H. M. Smith, at Athens, I used on about six acres of Cotton in the hill, turning with the foot a light covering of earth over the Poudrette before dropping the seed. The Cotton came up well and grew off finely, and I think it has very nearly, if not quite, Doubled the crop. As evidence of the estimation which I place on it as a fertilizer, I intend to order two tons for my next crop.

Yours truly,
P. W. HUTCHISON, Sen'r.

EUFULA, ALA., Oct. 9th, 1868.

Dear Sir: My Cotton grew off very handsomely under the influence of the Double Refined Poudrette, and was fully equal to other fields joining my plantation which had been manured with the best Superphosphate.

But the entire crop of Cotton in this section was ruined by the Worm, and therefore our investments in Fertilizers this year have been in a measure lost.

In haste, Yours respectfully,
ELI S. SHORTER.

MOSCOW, LUZERNE CO., PA., Oct. 9th, 1868.

Dear Sir: About one-half of the two tons of Double Refined Poudrette I purchased last spring I distributed among my neighbors, and I believe all that used it are well satisfied. I applied it to cabbage, melons, flowers, etc., to great advantage, but its greatest value to me is the almost certain realization of a heavy crop of corn. To satisfy myself and others I planted one row of corn in the middle of the field without applying any Poudrette, and did not mark it, feeling assured it would easily be found: I was not mistaken, as it was far inferior to the rest of the field. The cost to me per acre (including freight) was \$7.50, (using about 450 pounds.) I cannot give the actual advantage I received, but at the present value of corn I estimate it at from \$15 to \$25 per acre.

Very respectfully yours,
CHAS. A. HAVENSTRITE.

GREENWICH, N. J., Oct. 21st, 1868.

Dear Sir: I can speak in the highest terms of my Nitro-phosphate of Lime. It did admirably. I used it on stalk ground spread broadcast 300 lbs. per acre, plowed in. It was equal to Peruvian guano, with a saving in cost of \$2.50 per acre in favor of the Phosphate. I also applied 1000 yard manure, 10 loads per acre on part of the same field; also 300 lbs. fine bone per acre, which also did well, but I can safely say the Phosphate was second to none of the other applications, making 60 bushels of corn per acre where 40 bushels would have been as much as I could have looked for without the Phosphate. It was used by my neighbor, Capt. Charles Miller, did equally as well.

Yours with respect,
B. F. MAUL.

KINGSTON, N. J., Oct. 8th, 1868.

President Lodi Manufacturing Co.—Dear Sir: The Double Refined Poudrette I purchased of you last spring, I used on part of my corn as a dressing in the hill. I have never used anything equal to it, and I feel quite certain I shall have a third more corn where it was used than where it was not, all other things being equal. In fact, I have been rather enthusiastic over this fertilizer, and also over your Bone-dust, which I have used for three years, the effect of both being so visible on my farm. I remain yours truly,

H. L. R. VAN DYCK.

For several hundred more certificates of like nature see Pamphlet, which will be mailed FREE on application to us, Address as above.

Premium No. 106.

A remarkable little Fire-arm—A "Breech-loading Pocket Rifle"—weight only eleven ounces, yet shoots with great accuracy and power from 30 to 100 yards or more.—Can be loaded and fired five times a minute.—Can be carried in a side pocket while working in the fields, ready to bring down game at short notice. Exceedingly convenient in new countries as a defensive weapon, or for picking off game, and useful generally upon the farm where wild animals, large or small, are common.—A beautiful little piece for amusement in target practice.

Fig. 1. Mahogany Box containing the Pocket Rifle, Extension Breech, Cleaning Rod, and 250 rounds of ammunition.—Fig. 2. The Rifle.—Fig. 3. The Breech opened for loading.—Fig. 4. Copper cartridge, containing powder, ball, and percussion complete.—Fig. 5. Extension Breech.—Fig. 6. The extension Breech piece applied.—Fig. 7. (at the head) Mode of holding when the Breech is used.

While in Ulster County last October, we fell in with a little arm in the hands of a farmer who was out plowing, and its performances were so striking that, on our return, we immediately called on Messrs. Cooper, Harris & Hodgkins (No. 177 Broadway) who retail them, and procured one for testing. After firing it over 300 times, at targets, etc., varying in distance from 25 to 110 yards, and in several cases farther, we are prepared to recommend it, in strong terms, as a most useful weapon, especially for farmers who wish to have an effective weapon with them when out at work near groves, or wherever game is likely to be seen. It is convenient, also, for carrying on a journey, where a serviceable "shooting iron" may sometimes be desirable. We present pictures of four targets, reduced to one-fourth the actual diameter. The balls were loaded and fired as fast as the marker standing near the target could plug the holes successively made. Ordinarily it is only necessary to carry the weapon in a side pocket under the vest, with the ammunition in a small box in the pocket.

Fig. 8.—Distance 30 yards.—Thirty-six successive shots fired off-hand (without a rest) in 11 minutes, by Orange Judd, Nov. 28.

Fig. 9.—Distance 40 yards.—Thirty-six successive shots fired in 21 minutes, by Orange Judd, Nov. 28, 1868. Targets 4 1/2 inches diameter.

Fig. 10.—Distance 66 yds.—Twenty-five successive shots fired Dec. 5, 1868, by Orange Judd. The balls all entered the 2nd inch-board.

Fig. 11.—Distance 66 yds.—Twenty-five successive shots fired Dec. 5, 1868, by David W. Judd. (Editor N. Y. Commercial Advertiser.)

Any one needing the extension breech, to steady the piece while firing, can put it in the pocket along with the weapon. The bore is 22-100ths of an inch, and the ball would kill a deer or other large animal at a moderate range, if aimed at a vital part. The copper case confines the strength of the powder so as to give great force. At 40 yards the balls go through two inch-thick boards, and penetrate a third. At a distance of 110 yards, we put 22 balls, out of 25 fired, inside a 10-inch ring, and they pierced to the center of the second inch-board and beyond.

The copper cartridges are coated with paraffine, which renders them water-proof, and also lubricates the barrel. We wiped out the barrel once, in firing 300 shots, and that was hardly necessary. To load, it is only necessary to half-cock, touch a spring which releases the barrel, thrust in the cartridge, press the barrel in place again, take aim and fire. But two cartridges in 300 missed fire, and one of these fired on turning it round to present another part of the percussion ring to the hammer.

Impressed with the utility of this little weapon, we sought out the manufacturers (Messrs. J. Stevens & Co., Chicopee Falls, Mass.), and we are happy to announce that we have made arrangements with them by which we can offer 100 or more as Premiums for clubs of subscribers. The price of the weapon, plated extension Breech, cleaner, and 100 rounds of ammunition, all complete in a neat mahogany case, with lock and key, is \$15. For the convenience of those who may live in remote Western localities, we put 250 Rounds or Cartridges in the Premium cases, making the whole \$16.

We will present one of these Premium Cases complete, (with the gun, 250 rounds of ammunition, etc.), to any person sending us 24 subscribers to the American Agriculturist for 1869, at the regular price of \$1.50 each—or 80 subscribers at \$1 each.

THE AMERICAN AGRICULTURAL ANNUAL

For 1869.

A YEAR-BOOK

WANTED BY EVERYBODY.

This volume contains a variety of information of interest and importance to farmers, concluding with a Farmer's Directory in which a list is given of the principal dealers in implements, fertilizers, seeds, horses, cattle, sheep, swine, and poultry.

The following are some of the valuable articles contributed:

Recent Progress in Agricultural Science, BY PROF. S. W. JOHNSON.

"A Few Words on Pigs," BY JOSEPH HARRIS.

Gas Tar; Products and Uses; Roofing etc., BY H. W. JOHNS.

Veterinary Matters, BY DR. JOHN EUSTED.

Diseases of the Cattle of the United States, BY PROF. JOHN GAMGEE, OF LONDON.

Trout Culture, BY WILLIAM CLIFT.

The volume is

FINELY ILLUSTRATED,

and in its general features is like the Agricultural Annuals for 1867 and 1868, which may be had of the publishers. Sent post-paid. Price, fancy paper covers, 50 cts.; cloth, 75 cts.

ORANGE JUDD & CO., 245 Broadway, New-York.

THE AMERICAN HORTICULTURAL ANNUAL

For 1869.

A YEAR-BOOK

FOR EVERY HOME.

The third number of this beautiful serial is now ready. It contains a popular record of horticultural progress during the past year. Among the contributors will be found the names of

WARDER, HENDERSON, BARRY, HOOPES, ELLIOTT, SUCH, FULLER, PARSONS, BRILL, GREGORY,

and others identified with American horticulture.

It contains a number of

BEAUTIFUL ILLUSTRATIONS.

In addition to articles contributed there is much editorial matter, Tables, Lists of Nurserymen, Seedsmen, and Florists, the Books of the year, etc. Sent post-paid. Price, fancy paper covers, 50 cts.; cloth, 75 cts.

ORANGE JUDD & CO., 245 Broadway, New York.

NEW BOOK FOR HUNTERS.

THE HUNTER AND TRAPPER.

BY

HALSEY THRASHER,

AN EXPERIENCED HUNTER.

ILLUSTRATED.

This little book will be read with interest by all who would find instruction and entertainment in the narrative of an old hunter's experience. The following, from the author's Preface, will give an idea of the character and design of the work:

"I am a blacksmith by trade, but when I was a boy I became fond of a gun and a trap, and my first success in my shop was to make a steel trap. It was my aim to become an expert trapper, and I tried my hand at catching foxes.

"Many a dollar have I paid to cunning old men to learn the art, and I have succeeded pretty well, too; but why has not some man of experience written a book explaining the art of successfully trapping the different kinds of fur animals? I propose to tell the boys how to do it.

"I have studied the nature and habits of animals of different species, and a plan that was good to capture the otter, the mink, and the beaver, forty years ago, is just as good now as then. The nature of animals doesn't change like the nature of men; we have grown wiser, while they have remained the same. The mode of capturing them when I was a boy, and the way used now, may be put together, and succeed better than either one alone.

"Men are traveling through the country selling recipes at a high price to teach how to dress skins. I propose in this work to teach all these things, so that a man may have them in a neat little volume for reference at any time. I shall also treat upon angling for the trout, the bass, and the pickerel, which I think I understand. I hope to make it all so plain that even the inexperienced will, in some measure, succeed."

CONTENTS.

CHAPTER I.—Deer Hunting. CHAPTER II.—How to Catch the Fox. CHAPTER III.—How to Hunt and Catch the Beaver. CHAPTER IV.—How to Catch the Otter. CHAPTER V.—How to Catch the Mink. CHAPTER VI.—How to Hunt and Catch the Muskrat. CHAPTER VII.—How to Catch the Marten. CHAPTER VIII.—How to Catch the Fisher. CHAPTER IX.—How to Catch the Raccoon. CHAPTER X.—How to Hunt and Trap the Bear. CHAPTER XI.—How to Hunt and Trap the Wolf. CHAPTER XII.—How to Trap the Pocket Gopher. CHAPTER XIII.—Fishing for Trout, Pickerel, and Bass. CHAPTER XIV.—How to Hunt the Honey Bee. CHAPTER XV.—Hints About Shot-Guns and Rifles. CHAPTER XVI.—Traps. CHAPTER XVII.—Dressing and Tanning Skins and Furs.

DRAINING FOR PROFIT AND DRAINING FOR HEALTH.

By GEO. E. WARING, Jr.,
Engineer of the Drainage of Central Park, New York.

CONTENTS.

LAND TO BE DRAINED; HOW DRAINS ACT; HOW TO MAKE DRAINS; HOW TO TAKE CARE OF DRAINS; WHAT DRAINING COSTS; WILL IT PAY? HOW TO MAKE TILES; RECLAIMING SALT MARSHES; HOUSE AND TOWN DRAINAGE.

EXTRACTS FROM NOTICES BY THE PRESS.

He (the author) describes the action of draining upon the soil, the construction of single drains and systems of drains, the cost and the profit of thorough drainage, the making of dikes, and the reclaiming of salt marshes, treats sensibly of malarial diseases, and closes with a chapter which should be widely read, on house drainage and town sewerage in their relations to the public health.

[Portland (Me.) Press.

Nowhere does this book merit a wider circulation than in the West. Every year adds to the thousands of dollars lost to this State from want of proper surface drainage, to say nothing of the added gain to result from a complete system of under-drainage. This book will prove an aid to any farmer who may consult it.

[Chicago (Ill.) Republican.

ELEMENTS OF AGRICULTURE.

A BOOK FOR YOUNG FARMERS,

By GEO. E. WARING, Jr.,

Formerly Agricultural Engineer of the Central Park, in New York.

CAREFULLY REVISED.

CONTENTS.

THE PLANT; THE SOIL; MANURES; MECHANICAL CULTIVATION; ANALYSIS.

The foregoing subjects are all discussed in plain and simple language, that any farmer's boy may understand. The book is written by a successful practical farmer, and is full of information, good advice, and sound doctrine.

HORACE GREELEY says of it: "Though dealing with facts unfamiliar to many, there is no obscure sentence, and scarcely a hard word in the book; its 254 fair, open pages may be read in the course of two evenings and thoroughly studied in the leisure hours of a week; and we pity the man or boy, however old or young, who can find it dull reading. Hardly any one is so wise that he will not learn something of value from its perusal; no one is so ignorant or undeveloped that he cannot generally understand it; and no farmer or farmer's son can study it thoughtfully without being a better and more successful cultivator than before."

SENT POST-PAID, PRICE, \$1.00.

EARTH CLOSETS:

How to Make them and how to Use them.

By GEO. E. WARING, Jr.

It is sufficiently understood, by all who have given the least thought to the subject, that the waste of the most vital elements of the soil's fertility, through our present practice of treating human excrement as a thing that is to be hurried into the sea, or buried in underground vaults, or in some other way put out of sight and out of reach, is full of danger to our future prosperity. Supported as the arguments in this little work are by the most imperative agricultural and sanitary considerations, it is believed that they will commend themselves to the approval of all, in both town and country, who have the well-being of society at heart.

SENT POST-PAID, PAPER COVERS, PRICE 25cts.

Address **ORANGE JUDD & CO.,**
245 Broadway, New York.

Hall's Journal of Health for 1869.

Land Wanted in South-west Missouri.

Will buy for Cash, or trade Nursery Stock. Prefer land within 100 miles of south-west corner of State.
Address JOHN WAMPLER, Trotwood, Ohio.

Farm for Sale.

A splendid farm of 560 acres situated within 3 miles of Greenville, the county seat of Wood Co., Ill. Greenville is 47 miles from St. Louis, on the St. Louis, Vandalia, and Terre Haute R. R., which is finished up to this place. The farm is well improved, and the land of very good quality; there are on the place about 500 fruit trees, mostly young, beginning to bear. It is particularly well adapted for stock raising, as there is a creek running through the middle of it, where the water is 6 feet deep all the year round. Will sell part or the whole of it. For price and further particulars,
Address GUSTAVE GROSS,
Greenville, Bond Co., Ill.

FOR SALE.—A rare opportunity is offered to those wishing a Florist Business, 3 Green-houses, well stocked. For particulars address J. H. FRY, New Brighton, Richmond Co., Staten Island, N. Y.

Fotler's Improved Brunswick.

There is no hard-heading Drumhead Cabbage as Fotler's, none more reliable for heading, or that heads up with greater uniformity. In size it is the very largest, the Marblehead Mammoth only excepted. Seed of my own raising from Mr. Fotler's stock, per package, 25 cts.; per oz., \$1.00. My garden seed Catalogue, containing besides standard varieties, many new and rare kinds, sent gratis to all. All seed insured to reach the purchaser.
JAMES J. H. GREGORY, Marblehead, Mass.

WOLF CREEK NURSERY.—60,000 Cherry, (50,000 E. May), 20,000 Peach, Apple and Pear, Standard and Dwarf, 500,000 Apple Stocks, extra Pear and Quince Stocks. A variety of Trees and Plants. Our E. May Cherry is (we think) the finest in the world. Come and see, or get Catalogue free. JOHN WAMPLER, Trotwood, Ohio.

HONEY LOCUST SEED from Honey Locust Farm, Long Island. \$1.00 per pound, post-paid.
Address R. CRISWELL, Brooklyn, L. I.

New and Rare Vegetables.

Having been the original introducer of the Hubbard Squash, Marblehead Mammoth Cabbage, and many other new things, I still continue to make the raising of the seed of new and rare vegetables a specialty, in addition to the standard kinds. Catalogues gratis to all.

JAMES J. H. GREGORY, Marblehead, Mass.

The Ives, or Great American Grape.

Its roots and slips for sale by FINCH & NORCROSS, Plainville, Hamilton County, Ohio. The Great Longworth Premium "For the best Wine Grape for our whole Country" was awarded to this Grape, and to our Mr. Finch, by a Committee from remote States, at the Great Horticultural Fair in Cincinnati, 1858. Mr. Finch made the first wine from it; and from a life-long vine-grower, was entitled to the prize. The 27 years this vine has been bearing, without mildew, rot, or failure of a heavy yield, proved its great value. Those wishing the Genuine vines, propagated in open air, will do well to forward us their orders. Other vines and Small Fruit for sale.

1,000,000 of Choice Grape Vines

of all leading varieties, 3,000,000 of Grape Vine Cuttings, and a great supply of Currants, Gooseberry, Raspberry, and Strawberry plants, cheaper than anywhere else, for sale. Send for Price List and Essays, with stamp.

DR. H. SCHRODER,
Bloomington, Illinois.

RASPBERRIES AND BLACKBERRIES.—Large quantities. Best quality and varieties for field culture. Wild Goose Plums. Other fruit and ornamental trees. Send stamp for Catalogues and Club-rates.
WM. PARRY, Cinnamon, N. J.

JOHN S. COLLINS, of Moorestown, N. J., has 175 acres planted in Berries; has a good stock of plants of his own raising. All who have not should send now for his List of low prices, and get some of the plants next spring.

13,000 Ives Seedling grape roots, 2-year old.
25,000 one-year old, all raised from Cuttings of from 4 to 6 buds of strong growth, and
40,000 Cuttings No. 1, all of which I will sell low. Address GOTTLIEB MYERS, care of Mr. Wm. Baker, 165 Sycamore Street, Cincinnati, Ohio.

Potatoes for Spring Delivery.

I will now contract to deliver in the spring, Early Rose, Early Goodrich, Philbrick's Early White, Shaker's Fancy, Colebrook's Seedling, Gleason, Orvino, and Harrison potatoes, by the lb., peck, bushel, or barrel. All but one of the above varieties are of my own raising, and are warranted true. Circulars of prices gratis to all.

JAMES J. H. GREGORY, Marblehead, Mass.

THE GREAT NAOMI RASPBERRY a specialty.

NASBY'S PAPER, THE TOLEDO BLADE.

ANNOUNCEMENT FOR 1869.

GREAT ENLARGEMENT!
GREAT IMPROVEMENT!!

To the People of the United States:

The proprietors of the TOLEDO BLADE, encouraged by the unparalleled success which has attended their efforts to establish a

First-Class National Newspaper,

announce that they have just enlarged the BLADE to a Mammoth Sheet, of Eight Pages, containing fifty-six broad columns.

Our motto is "EXCELSTOR," and we shall spare no effort to furnish our readers the best and cheapest paper in the world.

THE NASBY LETTERS.

The rich, racy, rollicking humor of the Letters of "Rev. PETERLEIN W. NASBY, P. M., which is Postmaster,"—their quaint irony, keen sarcasm, and cutting satire,—their merciless exposure of the heresies of political demagogues of ALL PARTIES, and, withal, their profound philosophy and unanswerable arguments, have rendered them the most popular political literature ever published, in this or any other country. These Letters are written expressly for the BLADE, and will be continued regularly in its columns.

NEW FEATURES!!

GREAT ATTRACTIONS!

For the year 1869 we have already engaged a large number of new attractions, which cannot fail to render the BLADE even more popular with all classes of readers than ever before. Among these is an original story, by the brilliant and popular authoress, Miss OLIVE LOGAN, entitled,

"NO WEDDING RING."

This is a story of thrilling interest and high moral tone, entrancing the reader's attention from the first chapter and holding it unabated to the end.

We shall also shortly commence the publication of

A NEW STORY BY NASBY!

ENTITLED

The White Slave's Story!

Competent critics pronounce this one of the best stories that has ever appeared in the periodical press of the country. We intend to continue during the year the publication of original stories from the pens of the best writers, and will also have regular contributions on topics of general interest from writers of national reputation; and in addition to these rare attractions, we shall keep up faithfully

A PERFECT NEWS DEPARTMENT,

giving, in a condensed and readable form, the latest news by telegraph and mail, from all parts of the world.

A COMMERCIAL DEPARTMENT,

embracing the latest telegraphic market reports, and a weekly review, perfectly reliable, and invaluable to every farmer and business man. We shall also have regularly

A RELIGIOUS DEPARTMENT,

A CHILDREN'S DEPARTMENT,

AN AGRICULTURAL DEPARTMENT,

POETRY, WIT, HUMOR, TALES,

SKETCHES, &c., &c., &c.

In short, it is our constant aim to make the TOLEDO BLADE

A Perfect Family Newspaper.

RATES OF SUBSCRIPTION.

Single Copies, per year, - - - \$2.00

And at same rate for shorter time.

Clubs of Five, - - - \$1.75 each

Clubs of Ten and over, - - \$1.50 each

With an extra copy to every person getting up a Club.

PAY! PAY!! PAY!!! PAY!!!!

We propose to pay liberally IN CASH every person who will assist us in extending the circulation of the BLADE. Postmasters, Clergymen, Students, Teachers, and all others having leisure time are invited to send for our circular to agents.

The names for a club need not all be sent in at one time, and the papers need not all be sent to one Post-office.

SPECIMEN COPIES

Will be sent free to any address. Send for a copy, and at the same time give us the address of a dozen or so of your friends to whom we will send copies free and postage paid.

TRY THE BLADE A YEAR,

and we are sure you will never consent to do without it. Address

MILLER, LOCKE & CO.,
Toledo, Ohio.

TWELVE SHORT, TRUE STORIES, BY TWELVE DISTINGUISHED CLERGYMEN.

We are now publishing in the NEW YORK LEDGER, a series of *Twelve Short, True Stories*, by Twelve of the most distinguished Clergymen of the United States, all written expressly for the *Ledger*. The first is entitled—

The End of a Life of Fashion.

By REV. STEPHEN H. TYNG, D. D.

The Second:

Forbidding the Banns.

By REV. FRANCIS VINTON, D. D.

The Third:

A Life Saved and a Life Won.

By REV. HOWARD CROSBY, D. D.

The Fourth:

A Morning with Gamblers.

By REV. JOHN MCCLINTOCK, D. D.

The Fifth:

The Bashful Bridegroom.

By REV. THOMAS ARMITAGE, D. D.

The Sixth:

Good Society.

By REV. EDWARD EVERETT HALE.

The Seventh:

The Rose Window.

By REV. SAMUEL OSGOOD, D. D.

The Eighth:

Incidents of My Pastorate.

By REV. THOS. H. SKINNER, D. D.

The Ninth:

A Common Story.

By J. WILLIAMS, D. D., LL. D., BISHOP OF CONNECTICUT.

The Tenth:

The Two Marriages.

By REV. LEONARO BACON, D. D.

The Eleventh:

A Storm at Sea.

By BISHOP SIMPSON, OF THE METHODIST EPISCOPAL CHURCH.

The Twelfth:

Covering the Tracks.

By THOS. M. CLARKE, D. D., LL. D., BISHOP OF RHODE ISLAND.

It is our aim not only to make the *Ledger* instructive and entertaining, but to make such a paper that our subscribers will say that the sum paid for it is the most satisfactory expenditure of the year.

REV. DR. TYNG is now engaged upon an Original Story, for the new year, which will be continued through twelve numbers of the *Ledger*.

HENRY WARD BEECHER, JOHN G. Saxe, FANNY Fern, and a host of other popular authors, write for no paper but the *Ledger*.

The *Ledger* is for sale at all the bookstores and news-depots, at six cents a copy, and mailed to subscribers at three dollars a year. Address:

ROBERT BONNER, Publisher,

Corner of William and Spruce sts., New York.

(Advertisements on this page, \$2.50 per A gate Line of Space.)

ESTABLISHED 1861.

THE GREAT AMERICAN TEA COMPANY

RECEIVE THEIR TEAS BY THE CARGO FROM THE BEST TEA DISTRICTS of CHINA and JAPAN, and sell them in quantities to suit customers AT CARGO PRICES.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st.—The American house in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in the country have made their immense fortunes through their houses in China.

2d.—The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d.—The Importer makes a profit of 30 to 50 per cent in many cases.

4th.—On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1,000 to 2,000 packages, at an average profit of about 10 per cent.

5th.—The Speculator sells it to the Wholesale Tea Dealer in lines at a profit of 10 to 15 per cent.

6th.—The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th.—The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th.—The Retailer sells it to the Consumer for ALL THE PROFIT HE CAN GET.

When you have added to these EIGHT profits as many brokerages, cartages, storages, cooperages and wastes, and add the original cost of the Tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than other dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages and wastes, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Teas at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

For manner of getting up Clubs, see former advertisement in this paper.

Parties sending Club or other orders for less than thirty dollars had better send a Post-office draft or money with their orders, to save the expense of collections by Express, but larger orders we will forward by express, "to collect on delivery."

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary packages for Clubs less than \$20.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House stores to our Warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend to meet the wants of clubs. They are sold at cargo prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST OF TEAS:

- OOLONG (Black), 70c., 80c., 90c., best \$1 7/8 lb.
- MIXED, (Green and Black), 70c., 80c., 90c., best \$1 per lb.
- ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.20 per pound.
- IMPERIAL, (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
- YOUNG HYSON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
- UNCOLORED JAPAN, 90c., \$1, \$1.10, best \$1.25 per pound.
- GUNPOWDER, (Green), \$1.25, best \$1.50 per pound.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of this Company.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound. Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction. ROASTED (Unground), 30c., 35c., best 40c. per lb. GREEN (Unroasted), 25c., 30c., 35c., best 35c. per lb.

NOTICE OF THE PRESS.

From the American Agriculturist.

THE GREAT AMERICAN TEA COMPANY.—To Queries.—Before admitting their advertisement, we learned that a large number of our clerks and others had for several months been buying their Tea and Coffee from this Company, without its being known who they were, and that they had been highly pleased with their purchases, both as to quality and price, and were all recommending their friends to the same course. As we have published the advertisement for many months, and received no complaints, we conclude "there is no humbug about the establishment."

N. B.—INHABITANTS OF VILLAGES AND TOWNS WHERE A LARGE NUMBER RESIDE, BY CLUBBING TOGETHER, CAN REDUCE THE COST OF THEIR TEAS AND COFFEES ABOUT ONE-THIRD, (BESIDES THE EXPRESS CHARGES), BY SENDING DIRECTLY TO "THE GREAT AMERICAN TEA COMPANY."

CLUB ORDER.

Gents—Above I send my fourth order. Your Teas have given good satisfaction, and those who have used them will have no other, but induce their friends to send also. To prove this; I had made up my order and got a Post-Office Money Order, when others came in and nearly doubled the amount, as you will see by second money order, both of which I enclose.

The last order came safely to hand by Merchants' Union Express. Accept thanks for complimentary package.

Very respectfully,

S. LANPHEAR.

Caution.—As some concerns, in this city and other places, imitate our name and style of advertising and doing business, it is important that our friends should be very careful to write our address in full, and also to put on the number of our Post-Office Box, as appears in this advertisement. This will prevent their orders from getting into the hands of these bogus imitators.

POST-OFFICE orders and Drafts, make payable to the order of "The Great American Tea Company." Direct letters and orders (as below, no more, no less).

Great American Tea Company,

Nos. 31 and 33 VESEY-ST.,
Post-Office Box, 5,643, New York City.

HORSFORD'S SELF-RAISING BREAD PREPARATION makes the most wholesome and best of bread, biscuit, cakes, &c. Unlike some other yeast, it contains no POISON to create DYSPEPSIA, and the bread may therefore be eaten hot without detriment. Resolving itself into Phosphate of Lime and soda, it prevents RICKETS, CHOLERA, and decay of TEETH, and promotes the growth of Muscle and Bone. In "raising" the dough it does not, like other yeast, decompose flour, but adds nutriment to the bread, and otherwise improves it in quality and quantity. Each package contains full directions for use. Send to H. T. Love, No. 5 James Slip, New York, for "The Good Cook's Hand Book," for particular directions, to be sent you gratis, and ask your Grocer for "Horsford's Bread Preparation." JOHN DWIGHT & CO., Wholesale Agents, No. 11 Old Slip, New York.

PORTABLE STEAM ENGINES.

FOR FARM, MINING or MECHANICAL PURPOSES. These machines require no brick work; mounted on legs they are especially adapted for use in MILLS, SHOPS, FOUNDRIES or PRINTING ROOMS,—or mounted on wheels they are adapted for out-door work, TRIMMING, WOOD SAWING, &c. See Rural New-Yorker of August 15th, 1868, first page.

Red Jacket Axe.

FREDERICKTOWN, KNOX Co., O.
November 2, 1868.

LIPPINCOTT & BAKWELL—

Dear Sirs:—I received your second Red Jacket Axe per express, and now acknowledge the same. For the benefit of all whose desires or necessities make it their business to chop with an axe, I would say: Take the Red Jacket; and, as the Supreme Court have held that a Doctor's opinion without his reasons is of little value, I will give my reasons: *First*—The Red Jacket cuts deeper than the common bit. *Second*—It being round on the cut, it does not stick in the wood. *Third*—Every chopper with the common axe must discover that there is as much labor and strength expended in taking the axe out of the cut as in making the blow. *Fourth*—This with the Red Jacket is all avoided, and from one-third to one-half the labor is saved in getting the same quantity. *Fifth*—By putting in the same labor that is necessary with a common axe, you can easily make at least thirty-three per cent more wood in the same time. You are safe in letting any honest man try your Red Jacket on these tests, and if it fails, refund him his money. Respectfully, yours,

HARRY BALDWIN,

For sale by all responsible Hardware Dealers, and the manufacturers, LIPPINCOTT & BAKWELL, PITTSBURGH, PA., Sole owners of Colburn's and Red Jacket Patents.

"A D V E R S I T Y."—AFTER A PAINTING BY VERLAT.—Drawn and Engraved for the American Agriculturist.

There are several ways in which deer are killed. Some are simple butchery, and where deer are plenty may be practiced by honorable men for the sake of food; but no true sportsman ever kills wantonly or for the mere sake of killing. Men may get venison when the animal has no chance for its life, or next to none, and when they display no more skill than if they shot calves in a barn-yard; but they have no sport. The pleasure in hunting lies not in killing, but in the exercise of the art, the care, the precaution, a quick wit, a steady eye, and a close aim, while the result of a shot may be

painful to a sensitive man, as he sees the stricken victim sobbing out the last gasps of its wild life.

In deer-stalking or still-hunting the sportsman prefers a rifle throwing a heavy ball, for a deer shot even through the heart, with a light ball, will often run many rods, and perhaps get away or hide itself, only to die a lingering death. The shock produced by a large ball usually gives the hunter time to reload and come up before the animal revives. Still-hunting is not lying in wait at a spring or salt-lick where deer are known to come daily, which approaches the barn-yard style of sportsmanship. Silently fol-

lowing up the trail in the dew or light snow, and attacking the deer on its own feeding grounds, the hunter keeps himself to the leeward, for hearing and scent are very acute in the deer, approaches with extreme caution, and is usually obliged to fire at long range. The application of the title given by the distinguished artist is almost as inappropriate to the fallen buck as to the lucky hunter, whose appetite is no doubt sharpened to appreciate a juicy steak for his late supper; but the bullet brings "adversity" indeed to the forlorn young doe, left alone, perhaps, even before the end of the honeymoon.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from electrotype plates as wanted, all the numbers and volumes for ten years past, beginning with 1857—that is, Vol. 16 to Vol. 27, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes, neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past ten years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW-YORK, FEBRUARY, 1869.

If we ask our readers this first of February a few questions which, though perhaps none of our business, yet interest us much, we hope it will not be thought an impertinence. Are you going to try peas this year? or shall you sow oats or barley, as usual? Have you bought your seed-wheat? or do you raise your own seed? If not, why don't you raise it? It is worth more than the market price, as you will find if you have to buy. Why is it that your land is so weedy that you have to buy all your seed? You might have a good deal of clover-seed, which it is easy to get tolerably clean. Why don't you plan to save enough for your own use? Clover is the cheapest manure you can use. Did you ever plow under a crop? Are you going to buy a mower and reaper this year? or will you hire, as you did last? You probably pay, if you hire, ten per cent interest on two or three machines. Is it not so? How about horse-rakes? Don't you know that it takes the best man to work the old revolver, and a smart boy can work many of the new ones perfectly well? You never put in any grain with a drill; why not? Don't you think it would be a great saving,—taking less seed, making the crop ripen earlier, giving you better straw and a surer and larger crop? What plans have you made for the spring and summer? How many hands will you employ? What permanent improvements are you going to make? Do you know any man who would take your farm and make more money on it than you, without taxing the land more than you do, if so much? If so, how do you think he would do it? Will it not pay you to do the same?

February is just the month to discuss a great many such questions, and some of them will keep until warm weather. But while they are mooted, the work must go on just the same.

Hints about Work.

Over a good part of the Union, it is neither winter nor spring; the frost may be out of the ground so that we can begin setting fences and doing some kinds of spring work, and it may come on and freeze again, and a second edition of winter in all its severity be upon us.

Winter Work.—Make the best use of the snow to haul home the timber, fencing stuff, and boards, from the saw-mill or from the wood lot. Employ every hour of daylight, when other important work is not pressing, in cutting

Fire-wood, and thus making provision against a more hurried season, when every hour will be worth two or three hours of this time of the year. There is nothing that pleases the good wife better than a nice lot of clean, dry chips and light stuff, to make a quick blaze; and if she or her maid has to run to the wood-pile, tear off splinters, pick up damp chips, and so spend five minutes out of the kitchen just at the critical time when the dinner needs attention, the farmer must not complain if the potatoes burn in the pot, and things go wrong.

Ice, nice ice, will keep splendidly on a floor of rails, under a heap of straw. Lay a floor of slabs on three old rails as sleepers, the floor being 12x12 feet square; cover it a foot thick with straw; lay up a square pile of ice eight or ten feet high, of solid square pieces, having the spaces between the cakes well chinked in with pounded ice; set posts, as for a high fence, two feet outside, all around; board up with close-fitting 16-foot inch or inch-and-a-quarter boards, and stuff the whole, outside the ice, with straw; put on a single-pitch roof of boards, inclined to the north, and fill the whole interior above the ice with straw. The ice will keep well, and should be used from the top only. It is well, before piling up the ice, to set two light posts, two feet from each corner, against which the ice may rest, so that the corners of the pile will remain firm.

Laborers.—Look out early for good farm hands. The best men are the first to make engagements;

common hands may be picked up more easily. On every large farm the farmer should have a man he can make a foreman, to allow himself a little freedom from the constant attention to minor details. Such a man may often be obtained for five dollars a month more than a mere clodhopper, who can only be trusted to work under the eye of a "boss." With a good, active, intelligent German, who has been in this country a few years, one can employ, at low wages, a class of his countrymen which would otherwise only be a nuisance on the farm.

Manure.—The time for economizing in the use of bedding is late in the season, if ever. Early in the winter, use as much as you can in order to increase the manure pile. This month often offers a first-rate opportunity to work over all the accumulations of manure in the yards and cellars, to throw them in compact heaps, well laid up, mingling with them as much muck and litter as can be spared from the stores of bedding for use later in the season, and all the uneaten cornstalks, which are too apt, at this time in the winter, to disfigure the yards. Composts may be greatly enriched and their fermentation quickened by a mixture of hog and hen manure; but it is important that these should be pretty thoroughly disseminated through the whole mass in order to give it uniformity.

Plows and Harrows.—Farmers living at a considerable distance from mechanics should have, not only good plows, but plenty of duplicate parts, that they can themselves attach in case of breakage; several new shares, at least one new beam for each breaking-up plow, and several plow handles that may be adapted to the plows most used. Have wood ready to mend harrows, if they are to be subjected to any trying work among stumps or on rough, rooty ground. Give a coat of paint to all tools of this class, being particular to work it well into the joints, and it is well to give these spots several coats, so that water cannot get in. Paint tools only when thoroughly dry.

Wagons.—When the sleighing is good, don't forget to put the wagons in good order.

Good Roads, whether good for wheels or runners, should be made use of, so that there shall be no need to deliver sold goods when the roads are breaking up in the spring, nor to do heavy teaming, like hauling home lumber, coal, and provisions. What a good thing it would be if we had in this country such grand highways as connect almost every farming community in Europe with the market town, and market towns with one another all over the country! On these roads a pair of horses will trundle off, at a trot, on level ground, four tons on a wagon that weighs a ton. The roads are, the year round, equal to ours in midwinter.

Working Cattle.—Save the strength of the ox for the plow and for the heavy work; feed him a little grain; keep him in first-rate working order, and give just work enough to prevent his neck getting soft; then when the time for hard labor arrives, give good feed and all the work he can do. **Work the Bulls!** They are healthier for it; they are easier and safer to handle; they are surer and better stock-getters; they are more intelligent than oxen, and easier taught, if they do not learn that dangerous lesson, that they need not mind unless it suits their own convenience.

Cows.—Feed dry cows well; give them a daily feed of meal of some kind, corn-meal and wheat-bran, or corn-meal and oil-cake, or some other milk-producing or fattening diet. You will get it all back when you begin to milk. Keep neat stock of all kinds sheltered and warm. Do not expose them to the spring storms, which are more trying than those of the autumn and early winter.

Young Cattle should never stop growing until they come to full maturity. They will surely stop, and thenceforth have that stunted, weakly look so common among "scrubs," unless they are sheltered and so well fed that they do not lose flesh.

Horses and Colts.—The same remarks are applicable to these animals as to neat stock, except that the horse will thrive under much surer exposure than cattle, if he has enough to eat and a shed to go under. It is, however, the worst policy to put

the toughness of any animal to severe tests. Horses must be fed up for the hard work of spring. Great care should be taken that colds are not caught from exposure during sleighing excursions, or after other sweating work; they are very apt to run into confirmed coughs and the heaves, especially at this season. Blanket only and always when warm, rub off dry, withhold food and drink, and litter freely. A horse-stable should not be exposed to interior draughts.

Sheep.—Have an eye to evidences of parasites, and apply a strong solution of carbolic soap, thrown into the parted wool, on the parts most affected, from a bottle having a quill through the cork.

Selling Stock of all kinds must not be neglected; irregularity is nearly as bad as entire neglect.

Poultry require close attention, especially if they are laying freely. Hens that are repeatedly checked in their laying by exposure to cold are liable to become diseased. If hens are sitting, they must be well protected, and must not be interfered with, lest they remain in cold weather too long off their nests, and the eggs get chilled. We know of no better feed for laying hens or young chicks than good wheat screenings.

Spring Work.—As soon as the frost is out of the ground, and the weather is favorable,

Re-set Fences, and renew rails and posts, wherever they are failing. Staking and binding with withes answers a tolerable purpose, but is a very bad-looking way of mending a fence.

Repair the Roads by filling soft spots with stones, and covering them with good, sharp gravel, leaving the cart-paths and farm roads rounded up, free from water, and as even as you can with the time and labor you have to put upon them.

Ditching and Draining may be at once undertaken, and pushed at odd times, when the ground is too wet to plow.

Work in the Horticultural Departments.

In arranging plans for spring work, do not lay out more than can be done thoroughly. Amateurs especially are apt to grasp at too much and take up a heavier load than they can carry. Laying out and planting are not all, but only the beginning; the labor and cost of cultivation and maintenance are to be taken into the account. "Walks and Talks" discusses the size of farms, and his remarks apply to the garden, whether it be one for ornament or for use. Orders for trees and seeds sent the present month are more likely to be satisfactorily filled than if delayed until planting time.

Orchard and Nursery.

Plant Trees in those States where the season is sufficiently advanced to admit of it. At the North it is much better to wait until spring is well opened. Young, recently planted trees are often much injured by exposure to cold, dry winds, as they are unable to take up moisture to supply the waste by evaporation.

Grafting, for the same reason, should not be done too early. If the cions are put in just as the tree is starting into growth the chances of success are much greater.

Nursery Trees, if frozen in transportation, as they are apt to be, are not likely to be injured if allowed to thaw very gradually. Cover the package with hay or straw, that the thawing may go on slowly.

Injured Trees are to be attended to as soon as the trouble is discovered. If any limbs have been broken by storms, secure a smooth wound, as directed in the article on pruning on page 57.

Girdling by rabbits and mice may now be discovered. Most trees injured in this way may be saved by proper care. Draw up a mound of earth to completely cover the wound, or if the place be too high for this, bind on a generous plaster of clayey loam; if this be mixed with cow-dung it will retain its moisture better. If the injury is very severe, grafts must be inserted to establish a connection between the bark below the wound and that above it. Cut incisions with a chisel downwards,

below the wound, and upwards, above it; then take twigs of the same kind of tree of the proper length, sharpen them to a wedge at each end, and insert the ends in the incisions; put grafting wax over the insertions, as in ordinary grafting.

Cions.—Cut, if not already done, and preserved, as mentioned last month on page 8.

Pruning has sufficient said upon it in a special article on page 57. We omitted to mention there that thick white-lead paint is found to answer excellently as a covering for the wounds made in pruning. It may be colored with lamp-black, to make it less conspicuous, or it may be made more like the color of the tree by using amber.

Washing with some alkaline wash is of great benefit to trees, as it removes parasitic growths, loosens old bark scales, and dislodges insects. Home-made soft soap, thinned with water, and put on with a brush, is one of the best applications, or a moderately strong lye of potash or soda-ash may be used. The effect is more satisfactory if the wash is used during a damp spell.

Insects.—Remove all eggs of the tent-caterpillar before they hatch. Canker-worms, or rather the insects of which they are the larva, come out of the ground as soon as it thaws. The females are wingless, and must crawl up the trees, and upon this fact all the preventives depend. We have given some of these. Whatever places an impassable barrier to the ascent of the insect, without injury to the tree, will answer. See several articles upon the canker-worm in last volume.

Fruit Garden.

Do all preparatory work that the weather will allow; see under Orchard for sundry hints.

Blackberries and Raspberries should be planted as soon as the ground can be worked, as they start very early; the shoots will be much broken in handling them if delayed until they have pushed.

Dwarf Trees—and none others should be in the fruit garden—may have the general care given to trees in the orchard; being small, they are more accessible, and it is inexcusable to neglect them.

Strawberries.—Some good cultivators prefer to set them as soon as the frost is out of the ground, while others prefer to wait until later.

Grape-vines which were neglected may be pruned in mild weather. Cuttings made from wood that has been exposed all winter do not usually succeed so well as from that cut in the fall and properly cared for during the winter.

Kitchen Garden.

The main consideration just now is manure, which will soon be needed, not only for enriching the land but for hot-beds. In our brief space we must confine ourselves to the family garden; those who propose growing vegetables for market should have Mr. Henderson's "Gardening for Profit."

Manure.—The heaps should not be so small as to freeze, and when the heat increases so as to cause an issue of steam from the heap it should be forked over, and watered, if dry enough to need it.

Cold Frames are treated of on page 59.

Hot-beds are best left until next month, unless in the Southern States, when they may be started, and Egg Plant, Tomato, etc., sown in them.

Straw Mats are almost indispensable when glass is used over hot-beds or cold frames, and come in play in various ways, in protecting plants from the effects of frost and sun. Brief directions for making them were given last month.

Brush and Poles.—Whatever supports of these kinds will be needed should be gathered before the leaves start, and made ready for use. When material is scarce it will pay to char the ends of the poles; treated in this way, and housed as soon as out of use, poles will last several years.

Peas.—If the soil is in a condition to allow of planting, a row may be risked in a sheltered place; keep the ground warm by laying boards over the row at night. When the plants come up they may be protected by placing the boards upon bricks or other supports. This, of course, will only pay for those who wish to be a little earlier than others.

Potatoes may be forwarded by a similar treatment.

Plant some early sort as soon as the frost will allow, and have some litter at hand to draw over them when there are frosty nights.

Parsnips, Salsify and Horseradish.—Dig for use or for market as soon as the ground is thawed.

Rhubarb.—Those who have a green-house can readily force a few plants by taking up the roots during a thaw, and setting them in boxes of earth under the stage of a green-house. The same thing can be done by placing the roots in a barrel in a warm room; or cover a few roots with boxes or barrels, and place over them a heap of fermenting manure.

Seeds.—Order long before they are wanted for sowing, as the supply will be better, and there is time for testing the vitality of doubtful ones, as directed in last month's notes.

Flower Garden and Lawn.

Last month we advised making a plan for all improvements, and it cannot be delayed much longer. The plan given on page 60 will afford some excellent hints as to the management of a small place. There will be many who, with a small piece of ground, would prefer to have more in vegetable and fruit garden than is there given. In the border and beds in the lawn, plan to have the planting different this year from what it was last.

Cannas are among the most pleasing plants for beds upon the lawn, and we fully agree with what is said by M. Jean Sisley on page 57. Roots are sold by the florists, or the plants may be raised from seed, which had better be started in a hot-bed.

Deciduous Trees.—Those used for ornament should have the same care in giving needed pruning and manuring as those grown for fruit. Do not prune such trees out of their natural shape.

Planting of Trees and Shrubs is to be done under the conditions given for trees in the orchard.

Shrubs.—The pruning of these should not be done indiscriminately. An observer will notice that some shrubs have their flower-buds ready formed; to remove these by shortening the branches would destroy the bloom for the coming season. Others produce flowers from the new wood which will grow next spring; shrubs like these will flower more strongly if well cut back.

Pits or Cold Frames.—The increasing heat of the sun will start plants in these into growth unless they are freely aired. They need to be kept quiet until the season is more advanced.

Lawns.—Wherever the frost is out of the ground roll the grass, and dress with compost or bone-dust, provided it was not manured in autumn.

Repairs to wood-work of all kinds, and painting, are best done now. Paint trellises, and other work needing it, using drab or some other subdued color in preference to glaring white or green. Rustic work should have one or more coats of oil.

Green-house and Window Plants.

Plants coming into flower need more water and a place nearer the glass. Prolong the bloom by shading from the hot sun in the middle of the day.

Annuals may be sown in the green-house, but it is a month too early where it is done in the window. In either case boxes are better than pots.

Bulbs in pots, as they go out of flower, should have the flower-stalk cut away and the leaves kept growing until they naturally decay. Bulbs grown in glasses of water are not worth anything afterwards; those forced in pots will do to turn out into the garden as soon as the frost is out.

Air is to be given whenever the weather will allow.

Dust.—Mild days will allow window plants to be taken outside for a thorough showering; where this cannot be done with safety a bath-tub or sink will serve a good turn. Lay the plants on the side, when it can be done without injury, and shower from a watering-pot with a fine rose; in this way both sides of the leaves will be washed.

Propagating of bedding plants will now occupy attention. The secret of success is to have the temperature of the house lower than that of the cutting bench. Every one who wishes to propagate plants to any extent should consult Henderson's new work, called Practical Floriculture.

AMERICAN AGRICULTURIST.

ORANGE JUDG & Co., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies: Four to nine copies, \$1.25 each; Ten to nineteen copies, \$1.20 each; Twenty copies and upwards, \$1 each. Papers are addressed to each name.

TWO HARVESTS IN WINTER.

Nearly all the Editors and Publishers, and many of the clerks and employees in this Office, know by experience a good deal about the hurry and drive of the haying and harvest season on the farm. They are now experiencing, as never before, what a real Winter Harvest in the city means—that is, on the plot of ground at 245 Broadway. Take, for example, ten days past: The Record Book shows that in these ten days they have gathered, assorted, bound in sheaves (P. O. clubs), and arranged the names, post-office address, date of beginning and ending, etc., of 23,480 different subscribers! This is over three a minute for twelve hours each day, or two-and-a-half a minute for sixteen hours a day—about the time all have had to work. One day the mails brought in 3,365 names, or nearly five a minute for twelve hours! Other days for many weeks have been proportionately brisk. Every name has been entered on the day of its arrival, and, within two days after, copies of our beautiful January number for each have been entrusted to our good "Uncle Sam," properly directed for delivery—all over the country. ... This unprecedented expansion of the circulation of the Agriculturist is exceedingly pleasant to both Publishers and Editors—in a triple sense. It tells them their efforts are appreciated by their friends, viz. the whole people of America and beyond (for example: 100 subscribers in a club from the Sandwich Islands, 72 in a club from Bermuda, and large lists from many foreign lands); it supplies funds, and confidence, for increased effort and expense upon the paper for the future; and it is a pleasure to think that there are so many new homes where the paper will carry pleasure and instruction during all this year. We firmly believe that every reader will be directly or indirectly benefited in heart and mind, and we hope in the end pecuniarily benefited. So, with all its hurry and work, our harvest season is a very pleasant one indeed, aside from any profit. But a very large number of

our READERS have

a rich harvest also. The splendid Premiums that go out daily from our Office cannot fail to please the recipients. The table in the third column gives the names of the good things we are sending out as presents to those who gather and forward lists of subscribers; and everything there named is good and desirable.—Our letter files give many almost wonderful accounts of the speedy manner in which our subscribers have secured coveted premiums. Many and the people all ready and waiting to give in their names. Probably a thousand persons have taken premiums, worth, on an average, \$12 each, which have not cost over six or seven hours' time—giving them \$2 an hour. Others have even made \$5 an hour in canvassing. Others have done poorly at first, but, by perseverance, have come out splendidly in the end. One lady has alone earned over \$2,000 since the middle of September. Others have made large sums, and are adding daily. ... But aside from the many cases of large success, there is abundant

OPPORTUNITY

for smaller clubs, bringing premiums of \$10, \$20, or \$50 in value. The book and other premiums range even smaller. Many keep the matter in hand from day to day and week to week, adding names as opportunity occurs, without devoting any time specially to the business, and thus gradually accumulate names enough to get an article of considerable value. The fact is, there are persons enough at every post-office who need this journal, who would be greatly benefited by it, and who would take it if properly presented to them and its value and usefulness impressed upon them. We desire by the offer of these fine premiums to have this done by some one; and one or more persons at every post-office in America, and many beyond our shores, may now go to work and secure a very desirable premium

IN FEBRUARY

by a very little effort. It is the reading month of the year. The past year's work is finished, and people are looking ahead, laying out plans for the next active season. They want every help possible. A single hint will very often lead one's thoughts into a channel that will terminate in success, when without this hint his mind would have run in an entirely different direction. Successful labor is only the carrying out of well-conceived plans and modes of operations. In the aggregate, untold millions of dollars have been secured by our readers alone, simply from hints and suggestions they have derived from the pages of the Agriculturist during the past twenty-seven years. We know many persons can themselves readily tell what particular hint gave their minds the direction they took,

FOR A VERY

great number have written us, tracing their success with a crop, or in a business enterprise, to some idea thrown out in these pages. The more any man reads and thinks—and the more he reads the more he will think—the more will his head help his hands and his muscles. So we say to every kind-hearted person, who desires the prosperity of his neighbors, get them all to reading, as much as possible—not trashy novels or fictitious stories that merely lull the mind, or instill false and visionary notions—but reading matter that will awaken thought, that will stir up the reasoning faculties, lead to investigation, and afford practical information.... Such reading matter abounds in the Agriculturist, and NOW, in this month of February, is a good time to do something toward getting people to read. To stimulate efforts in this direction, we offer good articles as tokens or prizes. Many are getting them, and they are thus enjoying A

RICH HARVEST,

and we invite YOU, Reader, to go into the field and gather a sheaf. There is abundant room. There are a million families yet to be supplied with the Agriculturist, many of them residing near you, and we give plenty of time to fill up lists already under way, and to start and fill up new premium clubs. Read the list in the next column; also the Descriptive List, which we will send to all applicants not having it already. Choose the article most desired, and a few odd hours will secure it. Try it—to-day,

[In this table are given the regular cash prices of each article, and the number of subscribers required at \$1.50 a year, to get it free, also at the lowest club rate of \$1 a year. For full descriptions of the articles see extra sheets, sent free.]

Table of Premiums and Terms, For Volume 28—(1869).

Table with 4 columns: No., Names of Premium Articles, Price of Premiums, and Number of Subscribers required. Lists items like 'Short-horn Bull', 'Sewing Machine', 'Piano', etc., with their respective prices and subscriber requirements.

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The thirty-two Premiums, Nos. 29, 30, 31, 61, 62, 63, 64, and 76 to 100 inclusive, will each be delivered FREE of all charges, by mail or express, (at the Post-office or express office nearest recipient), to any place in the United States or Territories. —The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance specified.

Read and carefully Note the following: (a) Get subscribers anywhere; all sent by one person count together, though from one or a dozen different Post-offices. Bat....(b) Say with each name or list of names sent, that it is for a premium list, and we will so record it....(c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at

once. Any time, from one to three months, will be allowed to fill up your list as large as you may desire. The premium will be paid whenever you call for it....(d) Send the exact money with each list of names, so that there may be no confusion of money accounts....(e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer the premiums....(f) Specimen Numbers, Cards, and Show-bills, will be supplied free as needed by canvassers, but they should be used carefully and economically, for every extra copy of the paper costs, with the 2c. prepaid postage, about 12 cents....(g) Remit money in Checks on New York Banks or Bankers payable to order of Orange Judd & Co., or send Post-Office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk.

If from any Cause one fails to get the larger premium desired, the names can be used for a smaller one.

A Full Description of the Premiums is given on an extra sheet; a copy will be sent free to every one desiring it. For New Premium 106, see page 32, last month. We have only room here for the following:

No. 42—Clothes-Wringing Machine. A very useful, time-saving, strength-saving, clothes-wringing implement, that should be in every family. The wringing of clothes by hand is hard upon the hands, arms, and chest, and the twisting stretches and breaks the fibres with lever power. With the Wringing Machine, the garments are passed rapidly between elastic rollers, which press the water out better than hand wringing, and as fast as one can pick up the garments.

Nos. 76 to 81—Volumes of the American Agriculturist (Unbound).—These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. We have stereotype plates from the Sixteenth to the Twenty-seventh Volume complete, from which we print numbers as needed. The price of the volumes is \$1.50 each, at the Office, or \$1.75 if sent by mail, as they must be post-paid. They are put up in clean numbers, with full Index to each volume.—They are profusely illustrated, the Engravings used in them having alone cost about \$40,000. Those obtaining premiums for less than twelve volumes can select any volumes desired, from 16 to 27.

Nos. 82 to 87—Bound Volumes of Agriculturist.—These are the same as Nos. 76 to 81 above, but are neatly bound in uniform style, and cost us more for the binding and postage. Sent post-paid.

Nos. 88 to 99—GOOD LIBRARIES.—In these premiums, we offer a choice of Books for the Farm, Garden, and Household. The person entitled to any one of the premiums 88 to 99 may select any books desired from the list on page 73, to the amount of the premiums, and the books will be forwarded, paid through to the nearest Post-Office, or Express office, as we may find it most convenient to send them.

No. 100—General Book Premium.—Any one not desiring the specific Book premiums, 88 to 99, may select Books from list on page 73, to the amount of 10 cents' worth for each subscriber sent at \$1; or 30 cents for each name sent at the (ten) club price of \$1.30 each; or 60 cents' worth for each name at \$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through by us.

A Few Dollars' worth of books pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to make their heads help their hands. Any good book will, in the end, be of far more value to a youth than to have an extra acre of land on coming to manhood. The thinking, reasoning, observing man, will certainly make more off from 49 acres than he would off from 50 acres without the mental ability which reading will give him. Far better to sell the acre of land, than do without the books. Several good books are announced in the Advertising columns, and in the list on page 73.

No. 106—Pocket Rifle.—(Breach Loading).—A full description of this beautiful implement, with illustrations, was given on page 32, last number. No one who enjoys shooting, or who has occasion to carry a light but effective weapon in traveling or while at work, will regret the trouble required to gather the 24 (or 18) subscribers required to secure this weapon free. If any one does not care for the mahogany case, we will present the weapon all complete, with 100 cartridges, on receipt of 18 subscribers for 1869 at \$1.50 each. In this case, it will be packed in a strong pasteboard box, neatly papered,

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for the month ending Jan. 14, 1869, and for the corresponding month last year; also for the year ending Dec. 31.

1. TRANSACTIONS AT THE NEW-YORK MARKETS. RECEIPTS. Flour, Wheat, Corn, Rye, Barley, Oats. 20 days this m'th. 179,000 324,000 378,500 3,900 27,000 36,000 26 days last m'th. 438,000 3,297,000 988,500 241,000 731,000 2,366,000

SALES. Flour, Wheat, Corn, Rye, Barley, Oats. 20 days this m'th. 241,000 1,052,500 1,497,000 163,000 185,000 910,000 26 days last m'th. 359,000 1,736,000 1,639,000 201,000 268,000 2,710,000

2. Comparison with same period at this time last year. RECEIPTS. Flour, Wheat, Corn, Rye, Barley, Oats. 20 days 1868. 179,000 324,000 378,500 3,900 27,000 36,000 24 days 1867. 372,500 811,000 708,000 48,000 333,000 498,000

SALES. Flour, Wheat, Corn, Rye, Barley, Oats. 20 days 1868. 241,000 1,052,500 1,497,000 163,000 185,000 910,000 24 days 1867. 315,000 1,013,000 1,426,000 91,000 724,000 1,617,000

3. Exports from New York, Jan. 1 to Jan. 14: Flour, Wheat, Corn, Rye, Barley, Oats. 1869. 36,914 131,992 214,250 7,800 1868. 29,860 59,670 300,987 1,074

4. Stock of grain in store at New York: Wheat, Corn, Rye, Barley, Oats, Malt. 1869. Jan. 13. 3,534,172 1,509,233 263,360 54,710 2,864,354 236,001 1868. Dec. 11. 3,175,544 2,005,819 287,101 342,921 8,044,591 90,526 Nov. 10. 1,831,057 2,773,309 123,248 371,055 2,082,793 23,691 Oct. 12. 483,006 2,508,744 31,825 22,026 1,393,936 50,631 Sept. 9. 245,349 2,143,500 16,990 256,427 97,094 Aug. 11. 585,370 1,611,468 675 489,100 12,995 July 13. 392,919 1,404,412 28,897 575 780,835 57,138 June 10. 1,576,797 1,326,711 51,460 575 527,364 11,265 May 12. 579,842 1,039,621 33,341 493,494 8,705 Apr. 13. 686,630 1,238,259 8,276 13,235 894,190 Mar. 10. 1,175,152 1,719,822 43,542 46,614 1,794,242 34,102 Feb. 11. 1,501,679 1,705,380 182,111 93,032 1,234,191 65,237 Jan. 13. 1,644,418 1,434,553 189,330 161,313 2,379,826 69,339

5. Receipts of Breadstuffs in New York in each of the last six years: Flour, Wheat, Corn, Rye, Barley, Oats. 1868. 2,800,736 12,988,147 19,053,615 773,351 2,853,043 10,231,590 1867. 2,602,392 9,540,131 14,972,277 765,576 2,669,724 8,008,807 1866. 2,720,835 9,729,912 22,189,532 1,814,943 5,695,485 8,111,064 1865. 3,628,526 8,768,929 15,935,277 899,679 8,239,054 9,851,955 1864. 3,967,717 13,453,136 7,164,895 491,915 2,544,891 19,222,238 1863. 4,574,059 19,937,356 14,334,899 439,567 2,145,485 11,016,035

6. Exports from New York during each of 10 years past: Flour, Wheat, Corn, Rye, Barley, Oats, bush. 1868. 1,020,522 5,775,109 6,002,285 153,093 1867. 867,122 4,450,963 7,081,748 454,006 886,863 120,195 1866. 900,084 522,669 11,079,394 248,643 1,329,842 1,100,583 1865. 1,402,144 3,327,929 4,439,610 198,348 1864. 1,915,392 9,340,433 946,821 588 150 42,435 1863. 2,720,835 12,924,859 7,523,431 416,399 52,439 126,556 1862. 2,961,518 25,264,755 12,039,848 1,041,549 42,061 210,669 1861. 3,110,340 28,896,314 12,889,550 1,000,405 3,927 160,825 1860. 1,626,202 13,538,039 4,087,082 450 8,160 103,076 1859. 1,038,516 297,587 497,886 450 6,550 2,568

9. Receipts of Breadstuffs at Albany, by the New York Canals, in each of the last nine years: Flour, Wheat, Corn, Rye, Barley, Oats, bush. 1860. 1,149,100 11,176,000 14,155,500 322,100 2,867,600 6,490,000 1861. 1,493,338 30,886,687 22,342,354 832,792 2,235,850 5,948,358 1862. 1,836,669 32,667,866 23,809,882 748,897 2,262,639 5,990,038 1863. 1,560,800 22,306,900 20,608,600 470,509 3,100,500 12,438,500 1864. 1,483,300 15,465,600 10,832,400 620,300 2,465,900 12,177,500 1865. 1,014,000 10,579,200 16,639,900 1,251,900 4,551,600 10,841,500 1866. 570,700 7,684,200 26,516,500 1,749,500 7,440,800 11,220,900 1867. 410,100 9,166,100 15,495,800 890,300 3,866,100 8,841,600 1868. 467,900 14,085,300 16,900,400 869,500 6,328,300 12,184,900

Gold has been quite firm, closing at 137 3/4. Breadstuffs have been in much less request, both for home use and export, at reduced prices. The activity and stringency in the money market have operated very severely against sellers of both Produce and Merchandise, and particularly of Flour and Grain. The available supplies have been liberal, and holders have been more willing to meet the demand, at the ruling figures. The tendency at the close is downward, in most instances.... A brisk speculation has been in progress in Provisions, chiefly in Hog products, prices of which have been advanced sharply, to the detriment of regular trade. This speculation has been based on short crop estimates.... In Cotton, also, the transactions have been very extensive, largely on speculative account, at advanced rates,.... Wool has been in fair demand and held with increas-

ing confidence. The stock of domestic here on the 1st inst. was 7,330,000 lbs., and of foreign, 14,902,500 lbs.... Hay, Seeds, and Tobacco, have been more sought after, closing buoyantly.... Hops and Rice have been inactive.

The above table gives the weekly receipts for the four weeks ending Jan. 11th, the total number of all kinds for each week, also the number of each kind for the four weeks, as well as the sum of all kinds for the month.

A steady advance is shown in the total number of animals received in each department for each of the past five years. As compared with other years, 1868 shows the largest numbers. This is to be expected in a market like New York, where the population is steadily increasing, not only in the city proper, but where every year new suburban towns are being built, which depend almost entirely on New York for their supply of food. Very much of the stock now sold in our market finds its way to the country again in the shape of "dressed meats," and it is not unusual to meet purchasers from twenty and thirty miles distant getting their weekly supply.

Beef Cattle.—The market has been unsettled for the past month, an advance in prices one day being marked by a corresponding decline the next. There has been the usual supply of extra beef for Christmas week, some of it selling as high as 20c. @ 21c. per pound. Heavy, very fat steers are not desirable, except in small numbers, and then only to "dress off the stall," as the butchers say. The finest lot in market for Christmas week was eleven head of grade Durhams, fed by Henry Kirk, Ohio. They averaged 2,330 pounds each, live weight, and sold in divided lots to several butchers at 21c. per pound. David Selsor had a drove of thirty-one head, very nearly as fat, which were thought by many to be better bargains at 20c. per pound. Where there are a few lots of very fat stock one is sure to find some very poor; this has been too much the case all the past month, and ordinarily good steers, such as butchers like, were scarce, and sold at an advance of 1/2c. per pound over prices paid

for the same grades last month. The following list gives the range of prices, average price, and figures at which the largest lots were sold:

Dec. 1st ranged 9	@ 30 c. Av. 15c.	Largest sales 14	@ 16
do. 28th do. 11	@ 18½c. do. 15½c.	do. do. 14½	@ 16½
Jan. 1st do. 11	@ 18½c. do. 16½c.	do. do. 15	@ 17
do. 11th do. 10½	@ 18 c. do. 15½c.	do. do. 14½	@ 16½

The light supply for the weeks ending December 28th and January 4th caused an advance in price of 2c. per pound on all grades, and butchers bought sparingly, hoping that a few days would give them more stock and better selections. Stock men, as soon as their droves were sold, hurried to the country for cattle, and fresh arrivals every day up to January 11th crowded the markets, and caused a decline which more than offset the gain of previous weeks, and our report closes with a dull market.

Milk Cows.—The supply previous to the week ending January 11th was small, and good milkers were in fair demand, prices ranging from \$90 to \$100 each, and \$70 to \$80 for ordinary. An increase in the supply made a total of one hundred head in market January 11th, the majority of which were good milkers. This caused a decline in price, and many good cows sold as low as \$80, while ordinary ones remained unsold, or brought only \$50 to \$65.

Calves.—Sales are steady, and the supply too small to make much change in prices. This is the season of small numbers in this department, and such as are fresh, just from the cow, young and fat, bring 12½c. @ 13c. per pound, live weight. **Sheep and Lambs.**—There is but little change to notice here. With the exception of extra Christmas mutton, prices keep about the same. The demand may be said to be only fair for good stock, while poor things sell slowly, at from \$2 to \$5 a head. Prices range at 5c. @ 7c. per pound for good sheep.

Swine.—Very little can be said for Hogs. The arrivals are light, and sell quickly. Prices range from 10c. to 12½c. per pound; fresh dressed, 11½c. @ 12½c.; and Western dressed, fat, 13c. @ 13½c. per pound.

containing a great variety of items, including many good hints and suggestions which are thrown into smaller type and condensed form, for want of space elsewhere.

Mark All Subscriptions sent in, as New or Old.

How to Remit:—Checks on New-York Banks or Bankers are best for large sums; made payable to the order of **Orange Judd & Co.**

Post-Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect June 1st, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. Buy and affix the stamps both for postage and registry, put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Letters sent in this way to us are at our risk.

MANY THOUSANDS of people have received the Premiums offered by the Publishers, and a large number of these have written expressing their great gratification, while not one in five hundred has indicated the least dissatisfaction or disappointment. We hope to send out many thousands more of these good articles yet this winter. Human nature and human wants are about the same everywhere, and it will be just as easy for others to get these premiums as for those who have done so. A few get discouraged because not as successful at the first attempt as they hoped to be. Hundreds have written us that it took several trials to "get their hands in," but that by perseverance they were in the end unexpectedly successful. One of our present most successful canvassers, who gets a large salary every year from the sale of premium articles received from this office, failed almost entirely the first week of trial.—Please look through what is said on page 40, and then see what can be done in your neighborhood.

About the Advertisements.—These are doubly advantageous to the reader. Of the income they yield, tens of thousands of dollars are every year expended in getting up and supplying the paper, in addition to all the receipts for subscriptions. We should have to charge about double the present subscription rates, but for the advertising income. Then these pages are very useful as a kind of reliable "Business Directory." They tell what is for sale, by whom, and usually at what

price, and the more there are of them, the better is the opportunity to choose. It is like going to make purchases in a great city. We shut out a much larger class of advertisements than we receive. Humbugs, patent medicines, and those generally who "give little for much," pay publishers the highest prices. Our aim is to live up to one rule, viz: "An advertiser, in order to be advertised here, if unknown to the editors personally or by good repute, must furnish them satisfactory evidence that he has both the ABILITY and INTENTION to do what he promises to do in his advertisement."—By adhering to this rule, we hope to make our business pages doubly valuable to both readers and advertisers. In order that the latter may know how large a class of intelligent, wide-awake people they reach through this paper, we request those sending orders to them, or writing for circulars, etc., to mention where any advertisement was seen.

Postage.—To our published terms for the *American Agriculturist*, postage must in all cases be added when ordered to go out of the United States. For Canada, send twelve cents besides the subscription money with each subscriber. Everywhere in the United States, three cents, each quarter, or twelve cents, yearly, must be prepaid at the Post-office where the paper is received.

Bound Copies of Volume XXVII (1888) are now ready. Price, \$3, at our office, or \$2.50 each, if sent by mail. Any of the previous eleven volumes (15 to 26) will be forwarded at the same price. Sets of numbers sent to our office will be neatly bound in our regular style for 75 cents per volume, (50 cents extra if returned by mail.) Missing numbers supplied at 12c. each.

Kerosene Murders.—So many have died victims to the frauds in kerosene, that at last one man has been aroused to do something. Coroner Keenan, in holding an inquest upon a death from "accident" by kerosene, had samples of the oil tested. Finding that the oil was nearly pure benzine and would explode at 66 degrees, instead of requiring to be heated to 110 degrees, he had both the vender and manufacturer of the oil arrested and held to await the action of the grand jury. The coroners can take cognizance of the matter only after death has occurred. . . . Since the foregoing was in type, we find that the Board of Health has waked up, after allowing the matter to go unnoticed for several years. It needed a chemist to tell them what every one of the inspectors should have known "of his own knowledge," that almost all the kerosene sold in New York is unsafe, and some of it eminently so. The report of Professor Chandler is very long and interesting; from seventy-eight samples, procured in different parts of the city, not one could be called really safe. One sample contained 90 per cent of benzine, naphtha, etc. A large number of the oils formed an explosive vapor, at considerably below the ordinary temperature of a sitting-room. The wonder is, that so few "accidents" should happen, rather than that there should be so many. Let everybody agitate this matter in his own neighborhood. Good kerosene is to be had, that will not burn below 110 degrees; demand this of the dealers, and it will be supplied.

Sundry Humbugs.—The man who offers "Music Boxes" for a dollar, William Scott, Franklin street, New York, has found one person foolish enough to trust his promises, and who, for one dollar forwarded by mail, received a child's toy known as Harmonicon, a 4 in. by 1 in. tin and wooden instrument, which makes a noise by blowing through holes in the edge of the wood, across the ends of reeds fixed in a plate of zinc—wholesaled at 50c. to 1.50 per doz. . . . Stewart & Smith "offer the public greater inducements than ever before." We should say so. "Elegant gold watch chains" with patent swivel, and all the fixings, for \$3.00 each, not to speak of other things, including brooch and ear-rings with no fewer than twenty-three diamonds, each one of them as big as fat-peas, at \$1.00. Oh! Messrs. Stewart & Smith, how can you! Of course you are the manufacturers, as none others could offer such inducements to purchasers, and you must have learned the art of advertising and of doing business from that "unexplained mystery," Planchette, which you advertise for sale at the low price of \$2.00 each. . . . The "Rev.," J. T. Inman is out with his "noble remedy" for troubles which we will not mention here. Being a "Rev.," J. T. I. has his address at Station D., Bible House. It is well for those out of the city to know that the Bible House rents stores for various purposes, and the P. O., Station D., occupies one of them, but has no connection whatever with the Bible House. . . . Try again, Mr. I., that trick is musty. . . . Chas. J. C. Kline & Co. have been long known as venders of vile things, and we wonder that people will ask if they are honest or honorable. . . . The "American Butter Powder Co." have an agency in Boston. Look out for them. We consider their powders worthless. They now propose to sell them in packages at 50c. @ \$1 each. . . . Parker, Moore & Co.

seem to be managers for the "Metropolitan Gift Co.," at present. This is the only change from the old plan so loudly advertised a few months ago. The whole thing is a swindle. . . . Hunt, Anthony & Co., still hang out at the old number. Let them keep their watches. . . . We are tired of showing up these old concerns. Do try some new dodge. . . . Reed & Co., Bankers, well known to our readers as successors to Geo. A. Cook & Co., of "Soldier's Orphan's Lottery" notoriety (see July No., p. 245, 1868), are now acting as managers and bankers for Wells, James & Co. Strange, so many men need managing, and all by Reed & Co. A few weeks ago Reed & Co. notified one of our readers, Mr. D., that his number had drawn a prize, in this case a watch, and that by forwarding to them the sum of \$9.00, by mail, they would send him the watch, or, if preferred, they would send the same by express, marked C. O. D. The stranger preferred the latter course and left the amount with a friend to pay express charges, should the package ever come. In due time it came and was paid for. Upon opening it no watch at all was found, but a nice parcel of broken brick, whereupon Mr. D. asks us to seek some redress for him. Pretty well done, Mr. Reed; we should say that you are making a good thing of this manager's business. Mr. D. will see no more of his \$9.00 or of Reed & Co., in all probability. We are unable to say where they hold forth at present.

Among the lotteries proper which still flourish are L. D. Sine's Gift Lottery, Cincinnati, and the New York Jeweler's Co-operative Union, Servies & Co.,—both grand humbugs. Derby Athenaeum is a bookstore with a lottery attachment. A person buying a certain amount of books receives a ticket in a drawing of pictures. The selling of tickets is got around in this way, but nevertheless it is a game of chance, and as such is illegal. The tickets are many and the prizes few. Those who do not believe in lotteries at all will have nothing to do with one masked in the manner that this is. . . . Oroide Watches are watches in composition cases, like a nice brass, when well made; and we suppose the works will run just as well as if cased in gold and precious stones, provided the works themselves are good. But there's the rub. A subscriber in Indiana writes that he worked hard to get up a club of 50 subscribers for a journal, with the promise of an Oroide watch as good "for all practical uses as watches worth \$100." But when it came it was "a worthless, cylinder escapement, brass-cased watch, not worth \$5.00." Giving premiums is a good and proper thing, if the premiums are themselves good, and most newspapers, even the old staid religious papers that need to be so dignified, give premiums now; but any publisher who does this ought to be careful not to humbug those who work for him—not even by letting himself be humbugged into the belief that a brass watch is as desirable as a gold one.

Wide-awake Nurserymen.—A list of these will be found in the Horticultural Annual.

The American Pomological Society.—The President, Hon. Marshall P. Wilder, has addressed the following circular to the members of the various committees of the Society:—It having, upon consultation with some of the Fruit Committees, been deemed advisable to hold a special meeting of the officers and committee men of the American Pomological Society, for the purpose of a careful revision of the Catalogue, the undersigned hereby give notice that such meeting will be held on the 10th day of February, 1869, at ten o'clock, A.M., at the rooms of the *Agriculturist*, in the city of New York. It is hoped that every one will recognize the importance of our Fruit Catalogue, and also see the necessity of a special meeting for its revision, and be present thereat, to aid and assist, preparatory to the next session of the Society, to be held in Philadelphia, Sept. 15, 1869. Should it be impossible for any one to attend in person, he is urgently requested to write out his views and opinions, and forward the same to F. R. Elliott, care of Charles Downing, Newburgh, N. Y. Contributions of fruits are also specially invited in aid of the work to be performed. These may be directed to "American Pomological Society, care of ORANGE JUDD & Co., Broadway, New York."

Clubs can at any time be increased, by remitting for each addition the price paid by the original members, if the subscriptions all date at the same starting point. The back numbers will, of course, be sent to added names.

What Evergreens are Hardy?—The experience of Messrs. Samuel B. Parsons and Josiah Hoopes with evergreens in the winter of 1867 and '68 is of great value to tree planters. See Horticultural Annual.

Death of Mr. Affleck.—Mr. Thomas Affleck, formerly of Mississippi and more recently of Bronham, Texas, died early in January last at his residence at the last named place. Mr. Affleck was well known as a writer to various agricultural journals, and in his death Texas loses one of her leading agriculturists.

Good Stock Needs Good Land.

The *Agriculturist* has always advocated the introduction of improved breeds of cattle, sheep, and swine. We know that a well-bred animal is vastly more profitable than common stock. It is just as absurd for a farmer to keep stock that shows no breeding as it is to use a poor scythe instead of a mowing machine. We avail ourselves of skill and thought in the one case. Why not in the other? We have cattle, and sheep, and pigs, that are as superior to common stock as the modern steel plow is superior to a wooden stick, and for the same reason—the thought that has been bestowed upon them. But while this is true, it should never be forgotten that improved stock necessitates an improved system of farming,—the two must go together. We have prepared our friends for the mowing machine. Let us get our farms ready for improved breeds of stock. We shall not attain the best results until this is done.

Does Plaster Lose its Properties by Keeping?

—There is an opinion among farmers that this is the case. We do not see that any change can take place that will lessen the value of the plaster gypsum as manure, and we should have no hesitation in drawing the plaster during good sleighing in the winter, rather than wait until spring, when the roads are bad. We know farmers who draw all their plaster in the winter, and find great advantage in so doing. Keep it dry, and it will be just as good as if obtained fresh from the mill.

Duck Raising.—"H. C. P.," Litchfield Co., Conn.

Less is known about the diseases of ducks than of fowls. They are, in our experience, best hatched by hens and kept in a dry pen for several weeks. Give plenty of grass, frequently renewed, keep water always before them in shallow vessels, and feed often. A pen of boards a foot high, covered with laths nailed across the top, with one corner or one end covered, to exclude rain, is all-sufficient. This pen should be frequently shifted upon dry, grassy ground. If one is noticed moping, swelled up, or out of sorts in any way, give soaked bread and milk, red with Cayenne pepper. The best are Rouens, Aylesburys, and Cayuga Blacks. Points of excellence for common purposes are size and number of eggs.

Destruction of Turkeys by a Fox.

—A fox in Meriden, Ct., has destroyed 80 turkeys the present season, at three farm-houses. This is a loss of at least \$150 from a single worthless animal. In some of the States there is a bounty of one dollar a head upon foxes. Is it not quite time that the bounty was raised, to correspond somewhat with the injury they inflict upon farmers? Five dollars a head would start the hounds after them, and they would soon be exterminated.

Sell when You Can Get a Good Price.

—This should be the farmer's rule. To hold produce in hope of getting extravagant prices may occasionally succeed, but it generally fails. Farmers, by holding back their produce, may help speculators to "form a corner," but the speculators never divide the profits. If you can get a fair price, sell as soon as you are ready. But if an article that you can hold does not bring a fair price—if it is below the cost of production—do not dispose of it. It will certainly rise. We know that there are few things that make a farmer "feel so bad" as to find that if he had held his produce a few weeks he could have got a much higher price. We know farmers who sold their barley last fall at \$1.50, and their wheat at \$2.25; while some of their neighbors held both, and sold the barley for \$2.10, and have their wheat still on hand. Now it is not pleasant to think that you could have got 60 cents a bushel more for the barley, but then there is some consolation in thinking that you got 50 cents a bushel more for the wheat than you could get now. We once crossed the Atlantic with a well-known captain in a sailing vessel. Another equally celebrated captain left Liverpool on the same day. When we took in the pilot, the first question the captain asked was: "Any news of the New World?" "She reached New York three days ago." We all "felt as bad" at being beaten as the farmer who sold his barley at \$1.50. But our captain remarked: "He must have taken the southern course. He has hit it for once. But it is wrong, nevertheless." So we say to the farmer who got \$2.10 for his barley. He hit it for once. But the principle is wrong. Better to sell when you are offered a fair price. This same farmer had some capital hogs. They were very fat, and he was offered 13½ cents for them. He kept them three weeks longer, and then sold them for 10½ cents.

Potatoes on Spring-turned Sod.

—A correspondent residing in Washington County, Ohio, writes as follows: "After many years' experience I prefer sod for potatoes, avoiding heavy clays. Plow as early in

April as the ground is in order, harrow thoroughly and plant in hills, cultivate thoroughly both ways and often until they bloom, then quit. I mature with coarse manure before plowing or with fine after, and never fail."—We have no doubt the practice is good, although to secure thorough rotting of the sod and destruction of weeds, we advise plowing in August; yet it depends very much upon the kinds of grass and weeds in the soil, and upon the mode of plowing and strength of the soil.

The American Jersey Cattle Club.

—The prominent breeders of Jersey (or Alderney) cattle in this country have associated themselves together under the above title, for the purpose of fostering the interests of the breed, and for the preparation and publication of a careful Herd-book, or record of pedigrees. The type of this breed is so strongly fixed, and the bulls usually mark their progeny so strongly, that seven-eighths, or even three quarters bred grade animals have often been palmed off upon unsuspecting purchasers as pure bred, and sold at correspondingly high prices. It is one of the chief purposes of the Club to render such jockeying impossible in future. The Club itself is a close corporation—none but breeders of established reliability being admitted to membership—but its Herd-book is open to the general public, and all pedigrees can be entered which meet the unanimous approval of the Executive Committee, which is composed of the following persons:—President, Samuel J. Sharpless, St. Road Station, Chester Co., Penn.; Treasurer, Thos. J. Hand, Sing Sing, N. Y.; Secretary, Geo. E. Waring, Jr., Newport, R. I. Additional members—Thos. Motley, Jamaica Plain, Mass.; S. W. Robbins, Wethersfield, Conn., and John Glenn, Baltimore, Md. Information concerning the Club can be obtained from the Secretary or Treasurer.

"A Cow Gives Richer Milk when Fat than when Poor."

—Such is one of the conclusions arrived at by Mr. Clarke from his experiments. (See *Agriculturist* for Dec. 1868, p. 441). There are fat cows that give poor milk, and not much of it. In fact, this is one reason why they get fat. The food goes to form flesh and fat, instead of cheese and butter. The trouble is in the cow and not in her condition. If she was poor in flesh she would give no more or richer milk, and yet there are farmers who think otherwise. If a cow is fat, they conclude that she must be a poor milker—and there is some truth in the idea. If a cow keeps fat all through the summer, while she is giving milk, on ordinary food, she is a poor milker, or else she gives poor milk. So far the popular notion is correct. But it is very absurd to condemn a new milch cow because she is fat. If she is to give large quantities of rich milk she must be fat. It is a monstrous perversion of an acknowledged truth, that because a "deep milker" is seldom very fat we must therefore try to keep our cows thin, in order to make them good milkers. There are thousands of farmers who fall into this error. They mistake the effect for the cause.

Is our Wheat Land Running Out?

—We think not. There are farmers who raise as much wheat per acre as they ever did. They have no better land than their neighbors. There is no difference, except that they farm better. We may not be able to raise wheat as easily as when the land was new and full of organic matter from the decay of leaves. But if more labor is required, we get a more than corresponding increase in price. So that, in point of fact, farmers are better off than formerly. Our mistake is in trying to raise wheat with as little preparation as when the land was new. The farmer who underdrains his land, works it thoroughly, and keeps it clean, who makes rich manure and does not crop his land too frequently, can raise as much wheat per acre as he ever could. There can be no doubt on this point. We are confident that such farming will pay—and at all events, if it will not pay, poor farming certainly will not. We never heard of a case where good farming failed to afford handsome profits.

"All the Fat Goes into the Pail."

—This truth cannot be too often repeated. A cow that is a good milker should be fed liberally, not only while she is giving milk, but while she is dry. All the fat she accumulates before she calves will find its way to the pail during the summer. There is no period at which a cow lays on fat so rapidly as before she calves, provided she has food enough. It is a wise provision of nature. And yet many farmers feed nothing but straw and cornstalks at this period. Because the cow is not giving milk they think it will not pay to supply more food than is necessary to sustain life. Frequently the poor cows are not even provided with shelter from the storm. And it is a mystery how they manage to digest straw enough to keep up their animal heat. No wonder that many of them have to be "lifted" in the spring. There is nothing that pays so well as good shelter and good feed for cows dur-

ing winter, whether they are giving milk or not. Every pound of fat stored up before calving will, if the cow is a good milker, find its way to the pail during the summer. And a pound of tallow will make more than a pound of butter, because the former contains little or no water, while butter contains from 15 to 20 per cent.

Milk Fever.—Cows that are well fed and get fat sometimes die of milk fever. Alas! that it should be so, for it is used as an argument against providing the most useful of all our domestic animals with the necessary care and food during the most interesting and important period of her history. The truth of the matter seems to be this: cows that are poorly fed get accustomed to this condition. They eat little, and give little milk. Cows accustomed to an abundance of food adapt themselves to this condition. They will eat a good deal, and give a good deal of rich milk; or, if bred for the purpose, will gain rapidly in flesh. Such a cow will suffer more from poor feeding than the other, while the latter may be injured from high feeding. It is a matter of fact that dairies of such cows, when fed on rich food, have many cases of milk fever, while dairies of grade Short-horns, in similar circumstances, are generally exempt. We should adapt the feeding to the breeding, and the breeding to the feeding. We lose half the advantage of high feeding unless we have the right kind of animals, and we lose all the advantage of good animals unless we give them good food and good treatment.

Subsoiling.—"N. D.," Lyon, Ct.

"I see a great deal in the papers about subsoiling. Is it beneficial for all lands? I have tried it on one piece, and could not see any difference."—The object of subsoiling is to loosen the soil beyond the reach of the plow, and thus subject it to the action of the air, allow the roots to go down, and the moisture to come up. If the subsoil is a loose gravel, allowing a free circulating air, there is no use for the subsoil plow. If it contains substances injurious to plants, the first crop would probably be injured by the loosening. If it is so wet that the roots of plants cannot go down into it, it would not be worth while to subsoil it. Well-drained lands are most benefited by the operation, and it is rare to find soils of this character that will not pay well for subsoiling. It is easy to subsoil in a few furrows, and by comparing the crop with that of land not thus treated, you can determine if this operation will pay.

The Department of Agriculture.

—The N. Y. Times has a growl at Commissioner Capron, and the N. Y. Sun follows it up with a proposition to abolish the Department altogether. It may be that one of the Times people did not have a job on the annual report this year, which would account for the course of that paper. But we are at a loss to account for the course of the progressive Sun. We would suggest to these sheets that the Agricultural Press feels quite competent to take charge of this matter, and removal in another manner only prevented its influence from displacing the former Commissioner. The agriculturists, through their own papers, will speak when they are dissatisfied with the present Commissioner, and then he will have to go, and all the *Suns* and *Timeses* will not hasten or retard it. This is a matter in which farmers have a word to say, and politicians very little. We have no other interest in the matter than that Col. Capron shall have a fair trial. It is not fair to expect that one coming into the control of a thoroughly disorganized department should immediately make the change felt. We think that the plans of the Commissioner are such as will meet the approval of intelligent agriculturists, and they are the only ones individually concerned. The Times thinks the monthly reports of no value; others think differently. The Sun would abolish the Department on the score of economy; we go for ample appropriations. If the Sun wishes to economize, we can show it a place to begin. There is a concern called the Botanical Garden, which is a very high sounding name; some \$50,000 are being expended for a new glass structure, and round sums are yearly paid for keeping up the establishment. We last fall went among the plants which are to go into this costly house. There were a few rare specimens, but the principal stock was just such as a regular florist would keep for cut flowers—*Heliotropes*, *Bonvardias*, and all such stuff in great quantities. Now this Botanical Garden is just a contrivance for furnishing the wives of Senators and Members flowers at public expense. The wife of one Senator had last winter thirty-nine bouquets from this establishment for one party. This concern is in no manner connected with the Agricultural Department, nor do the Agricultural Press recognize it, and if outsiders wish to pitch into something, here is a chance. We intend that the Department shall be sustained, and that liberally, and if Col. Capron is not the man to run it, we shall keep trying until the right one is found.

New Coluses.—A few days ago we saw at Peter Henderson's small specimens of some of the new varieties of Coluses, about which so much talk has been made abroad. The leaves are beautifully and curiously variegated, while the colors are of different shades from anything we have had before. They are pretty as pot plants, but it will require an open air exposure during one of our hot summers to determine their real value.

The New Vegetables.—Mr. Gregory, Mr. Henderson, and others, give their experience with the new vegetables in our Horticultural Annual.

Where Shall I Go?—We have a number of letters asking advice as to whether the writers had better move to this place or that. A little reflection will show that it is quite impracticable to give advice in such cases. Some men will flourish where others would starve, and it is difficult to put such under circumstances where they will not make a living. Others would be "ne'er do wells" if they had a farm given to them in the most fertile region, ready stocked with all that is needed for its best cultivation. Unless one has made up his mind to be a "mover," as they say out West, *i. e.*, put all his worldly goods and family into a wagon, and travel until he finds a place to suit him, he had better make a visit to the place first. It will be money and time well invested. Many inquiries are made about Vineland, N. J., and similar land speculations. We can only say about these, that we know some who have settled in such places and are quite content with their lot, and others who have left in disgust. Success anywhere depends quite as much upon the man as upon the place.

Glanders in the Human Subject.—The medical journals report the case of Mr. Eli Townsend, Montgomery, Ala., who treated a horse having the glanders. Mr. Townsend had, at the time, a scratch upon one of his hands, through which his system became inoculated with the poison, and after great suffering, he died in fifteen days from the beginning of the attack. A similar case has recently occurred in the City of New York, where the disease is very prevalent among horses.

Seeding Grass Land.—"C. J. H." of Rock Dell, Minnesota, writes: "I have a piece of land which I wish to seed down next spring to clover for pasture. The land is plowed, and I want to put on oats. Will oats and clover grow together, or shall I put on red top and timothy?"—It is a common practice to seed land to grass and clover with oats in the spring. The clover has the ground the second year, and the grasses the third and subsequent years. A pound of white clover seed to the acre would be a good addition to the red clover and the grass seed. It is best to substitute blue grass for timothy, if the object is to make a permanent pasture.

Mule Market.—"E. H. F. S." Gorham, Me.—You will generally find mules at the horse markets in the large cities, at prices from \$300 to \$600 a pair, according to size and quality.

California Plants.—W. S. Jacks, of Napa Valley, will please accept our thanks. We went through the beautiful Napa Valley when the settlers were few and far between; while there we discovered a Dutchman's Pipe which was undescribed. We alluded to it in an article upon the Dutchman's Pipe of the East, and Mr. J. took the pains to send us plants by a friend who was coming East. The plants on the passage made an unnatural growth, and arriving here at a cold season the shock was too much for them. Upon learning this Mr. J. sends us cuttings by mail. These, though rather dry when they reached us, we hope to start.

Tile Factories.—"G. C." Staunton, Va., writes: "If the tile makers can't afford to advertise in this section, will you be so charitable as to recommend some of them to us? The farmers of my neighborhood wish to combine to get a supply of tiles, but so far have found no advertisement."—There are large tile factories at Albany, N. Y., and at Woodbridge, N. J., both points from which tiles could be easily shipped to the seaports of Virginia. Probably it will be cheaper for you to import a tile maker and machinery than tiles. Most of the tiles laid in England are made upon the estates where used. A very large item in the expense of draining is the transportation of tiles, and this would be quite heavy from the seaboard to your place. C. W. Boynton, Woodbridge, N. J., would probably give you the needed information about tiles, and the way to make them.

Devon Herd-books.—The first Devon Herd-book was published in England in 1851, by John Tanner Davy, of England, and contained only the animals of British breeders. The second volume appeared in

1854, and was edited by Mr. Davy and by Mr. Sanford Howard, then of Boston. It contained the names of eighteen American breeders. The third volume appeared in 1859, as an exclusively American Herd-book, being edited by Mr. Howard, while Mr. Davy issued a third English volume on his side of the Atlantic. The Association of Breeders of Thoroughbred Neat Stock published a Herd-book in 1863, edited by Mr. H. M. Sessions, of South Wilbraham, Mass., and a second volume has recently been issued under the auspices of this Association, by the same editor. These two volumes, bound in one, contain a History of the Devons, Points of excellence in Bulls and in Cows, the pedigrees of 1,171 animals, and (not the least valuable portion of the work), a Directory in the second volume to the names and addresses of one hundred and fifty breeders residing in twenty-one States. The editor, one of the most successful breeders of the country, assumed the pecuniary responsibility, we believe, of the publication of this volume, and it may be obtained by addressing him. The Devons are one of our most useful breeds, and pre-eminently combine most of the desirable and valuable qualities—beef, labor, milk, hardiness, and ease of keeping.

Early Field Corn.—"Charles Mallory," of Embarrass, Wis., sends us a well-matured ear of variegated flint corn, planted June 21st, and cut September 5th, a period of eleven weeks. This variety will be of great value in the regions of early frosts.

Importation of 25,000 Bushels of German Barley!—The January number of the *Amerikanische Bierbrauer*, the German Brewer's journal of this city, notices the importation of 25,000 bushels of German barley. It weighed eleven pounds to the bushel more than other barley in market, and was eagerly bought up by the best brewers. It was of the two-rowed sort, and we infer its reception was such as to encourage further importations. We raise barley enough to ship a good deal to England, where it brings a poor price compared with their own, and is used for horse-feed. Our brewers are forced to use it because they can get no other, and some (we believe ignorantly) even prefer the four or six-rowed barley to the two-rowed sort. Our barley-raisers may be assured that a much better quality of grain will bring a proportionably higher price, and they will do well to look out early for superior seed.

Seedsmen and Florists.—The Horticultural Annual has a very full list of them.

A Potato Testing.—By a happy conjunction, as the astrologers would say, quite a number of persons interested in potato culture happened to be in New York early in January, and Messrs. B. K. Bliss & Son, the well-known seedsmen, availed themselves of the opportunity to give a potato feast to a party, which included those above referred to and several of the agricultural press. Mr. Bresee was present, and with his new potatoes. Mr. B. is the originator of the Early Rose, and has some new varieties of great promise. Single potatoes of one of his varieties have sold at enormous prices. Of one of these he sold one tuber for \$60. At the feast alluded to, sundry valuable specimens were served, boiled and roasted, but we noticed that calls for a "few raw" were passed unheeded. We cannot give a full report of the discussion, which elicited a great many valuable facts, but briefly give the results. Of the specimens tested, the Early Rose was unanimously declared the best; Bresee's Prolific stood No. 2, by a small majority; Bresee's King of the Earlies, No. 3; and Climax, No. 4. This vote was solely on the merits of the potatoes as they appeared upon the table, and had no reference to productiveness, earliness, or any other quality. Bresee's King of the Earlies is said to have been dug before it was fully matured, to save it from being stolen. Climax had evidently been badly kept, as it had the flavor of a potato that had been exposed to the air and light. The Early Rose was of the highest quality, and all the testimony was in favor of its great productiveness and earliness.

The Farmers' Club.—What should we do for fun if this advertising medium should become extinct? The Tribune claims to have "exclusive reports" (whatever that may mean) of the doings of this branch of its business. The New York Sun has reports that are not exclusive, and we quote from it the way in which a woman disposed of the gabble about deep plowing:—"Mrs. Hallock—'I am delighted to hear these gentlemen all repeat the same story, with slight variations. When I remarked here, a few weeks since, that this Club was not celebrated for scientific attainments, some of the reporters opened their eyes so wide that I feared they would never get them together again. But suppose a company of women should spend their time in discussing the subject of long or short stitches, what would you think of them? Gentlemen, it seems to me you are just

about as sensible in your talk, for you have not told us what you call deep or shallow culture.'"

Bids for the State Fair.—The officers of the New York State Agricultural Society are desirous of having the "bids" for the State Fair ready to be presented at the annual meeting, which occurs on the 10th and 11th of this month. The requirements are, good ground of about 30 acres in extent, well-fenced, the needed stalls, pens, buildings and offices, forage for stock, water, etc., and about \$1,200 in money. A schedule giving the details will be furnished to all sending for it to the Secretary, Col. B. P. Johnson, Albany.

A Great Poultry Show in Prospect.—At the last fair of the New York State Agricultural Society the Poultry-breeders present inaugurated a Society called the New York State Poultry Society, which has ever since been growing in influence, respectability, and the confidence of the public. Dealers whose reputation for dishonesty and trickery was or would have been a reproach to the Society have been both virtually expelled and excluded, and the energy of its members, the increasing ranks of its life-members, and the funds now on hand or pledged to the treasury, give the fairest promise that the proposed show, which is advertised to take place March 23d to 26th, will be well managed and worthy the fair beginning of the young Society. The officers have secured the 3d Avenue Skating Rink, a building 250 feet long, 150 feet wide, covered with an arched roof 70 feet high, and furnished with parlors, retiring rooms, committee rooms, etc., a restaurant, band of music, and everything needed for a grand poultry fancier's festival, except the fowls themselves. A lecture will be delivered by some distinguished speaker on some subject connected with the objects of the Society, and a very liberal premium list will shortly be circulated. Besides farm-yard and ornamental poultry, dressed poultry, Singing Birds, Rabbits, and all animal pets, are included in the prize list. An advertisement in this number of the *Agriculturist* furnishes further information.

Show of Pigeons and Poultry.—The American Columbarian Society held its first exhibition in New York about the middle of December. The show of fancy pigeons was highly creditable, and was especially rich in Pouters, Carriers, and Tumblers, of which breeds very beautiful specimens were shown by several exhibitors. The largest number of first premiums was taken by Mr. William A. Wood, of New York, who received on this account the Society's Gold Medal. The show of poultry was small, but contained some of the finest fowls we ever saw. Mr. Benj. Haines, Jr., of Elizabeth, was winner of the Gold Medal in this department, for having the most first prizes. Exceedingly fine Crevecoeurs and Cochins were shown by Mr. Leavitt, of Flushing.

Gardening for the South has met with an unexpectedly rapid sale. A work adapted to the peculiar wants of the warmer States has long been wanted, and Mr. White's book is just the one that was needed. Those at the North who have friends at the South can send no more acceptable present. Sent by mail for \$2.00.

Country Life.—A great many people annually leave the city and town for the country. We do not know any work better suited to such than "Copenhagen's Country Life," which gives the general management, not only of farm matters, but of ornamental grounds, flower gardens, green-houses, etc. A handsome volume of over 900 pages. \$5.00.

Great Show of the Pennsylvania Poultry Society.—Christmas week was devoted by the Pennsylvania Poultry Society to a show of poultry, open to national competition. The fine hall of the Horticultural Society was used as an exhibition room, and we believe all the appointments and regulations were gratifying to both exhibitors and visitors. There were 302 distinct entries, chiefly of fowls in trios. Brahmas were the prominent feature, there having been more than thirty coops entered, containing an aggregate of upwards of 100 fowls, and among them many of extraordinary size and beauty. A very interesting bird in this class was a 12-year-old hen weighing 14 lb. 6 oz. The show of Coeliffus was good also, the first prize being won by the Secretary of the Society, Mr. J. M. Wade, for a trio, the progeny of those of which we gave engravings last September, and winners of the first prize of their class at the show of the Columbarian Society in this city. Silver-spangled Hamburgs were quite a feature of the exhibition, and were very fine. Leghorns also were shown in good numbers. Our artist secured excellent portraits of those winning the silver cup, which we shall show our readers in due time. The French fowls seem hardly to be so great favorites among Pennsylvania breeders as with those in the vicinity of New York; but though the show in this class was not

large, it was very fine. A silver medal was offered for the best practical exhibition coop, which was taken by Mr. J. Salisbury, Jr., of Nyaek, New York. A very pleasant feature of the exhibition was that there were no money prizes,—silver cups, bronze medals, diplomas, and books being the prizes offered. We congratulate the Society on so satisfactory a show, taken all in all.

Evergreens are the most charming of trees, for they are beautiful in winter as well as in summer. They generally do best if planted later than other trees. The number of the hardy ones is greater than is generally supposed. Hoopes' Book of Evergreens is acknowledged, both in this country and in Europe, to be the best in the language. Beautifully illustrated. Price by mail, \$3.00.

Pears.—The Horticultural Annual contains a valuable article by P. Barry on new pears and his experience with the old ones.

Canadian Peas.—An inquiry in the *Janu-ary Agriculturist* in regard to the kind of pea raised most in Canada brings a prompt response from the editor of the "Farmer's Advocate," of London, Ontario. He writes as follows: "We have many varieties—some adapted to different soils and different purposes. We have the Golden Vine, the Crown Pea, and the Strawberry Vine, that are extensively raised for exportation or for milling purposes. Each has its advantages. The Crown Pea is the largest yielder, but requires good soil and good cultivation, and can be cut with the mowing-machine. The Golden Vine is more productive in straw, and is extensively cultivated here. It will smother weeds much better than the former variety, and may be more successfully raised by the careless or slovenly farmer. The third variety is a small and fine pea, but not so extensively raised as the others. We also cultivate the White Marrowfat, Black-eyed Marrowfat, and Imperial Blue Peas, for stock. The California Peas have also been cultivated here, but are longer in maturing and yield too much straw."

Our Native Birds.—It has been long in contemplation to publish a series of articles on our native birds, which should be not only popular but accurate. The illness of the gentleman who promised these articles prevented the execution of this plan. We have now made arrangements with others to carry out our original intention.

Oyster Shells Around Trees.—"T. E." asks:—"Are oyster shells around fruit trees a protection against borers? What would be the effect if they were burned and the animal matter expelled? Would they then do the trees any harm? Would they do any good in any way?"—Oyster shells around fruit trees would be just as valuable as stones or any other mechanical obstacle to the parent of the borer; they would prevent her from depositing her eggs. Shells when burned are converted into an entirely different substance—shell lime—which differs somewhat from common lime. We should not advise to heap this around a tree, as caustic lime of any kind would injure it; but shell lime would generally be a valuable manure spread around the tree. The cases of shell in its natural state and burned are widely different.

Unsafe Advice.—There is a great deal of advice going about with respect to the medication of animals, which it is unsafe to follow. The following is sent to us:—"For a preventive of hog cholera, dissolve blue stone in swill, and give it to the hogs while in health. If the solution is strong, put shelled oats or meal on the top and they will drink it all up. I salt my hogs as regularly as my other stock."—"Blue stone" is Blue Vitriol (sulphate of copper). It is a violent emetic, and in doses of two drachms a fatal poison to man. Six grains have been known to kill a dog. That in moderate doses it might act as a useful astringent in hog cholera we do not doubt, but the direction to make the solution "strong," without saying what is meant by "strong," is likely to lead to unpleasant results.

Practical Floriculture.—We have in the announcements of this work already given an idea of its scope. The press of business at the beginning of the year prevented its issue earlier, though it has been some time in type. The book is now ready, and we regard it as one of the most valuable among the many valuable works we have published. Price \$1.50 by mail.

The American Entomologist.—This journal improves in value with each number, and its mechanical appearance is excellent. We do not know either editors or publishers but by their works, and from these

we wish their enterprise all success. Very cheap; \$1 a year. Published by R. P. Studley & Co., St. Louis, Mo.

Mushrooms.—Mrs. E. Earl, Fountain Co., Indiana.—Mushroom spawn is not the seed, as mushrooms have no seed, in the proper sense of the term. To express the matter popularly, the mushroom plant consists of numerous whitish threads, which grow in manure, or in a highly manured soil. The part which we value may be regarded as the flowering portion of the plant, though it does not bear flowers, but produces in its "gills" a reproductive dust. The threads, of which the underground portion of the plant consists (*mycelium* of the botanists), are capable of laying dormant for a long time, but revive and grow when placed in proper material and supplied with the necessary heat and moisture. Spawn consists of blocks of earth and manure, through which these threads have spread themselves; the blocks are dried, and the thread-like plant remains in a state of suspended animation. Pieces of spawn are put into a bed, and, if the conditions are right, the plant will spread rapidly, or, as the gardeners say, "the spawn will run." When the underground portion acquires sufficient strength, it throws up its reproductive organs, which are the mushrooms. The raising of mushrooms is rarely successful, except under a shed or in a cellar, and even under the best circumstances experienced gardeners often fail. Henderson's "Gardening for Profit" gives an account of his process, but it is too long to transfer to our columns.

Cherries.—F. R. Elliott, the authority on cherries, has an excellent article on their culture in the Horticultural Annual.

Hen Manure.—A subscriber writes: "I have about twenty barrels of pure hen manure; will it do to let it lay in bulk? If not, what is best to mix with it, and in what proportion for general use?"—If you have dry muck, mix it with that, and let it lie in a heap until it heats. Then work it over and mix with more, doing so three times, perhaps, and finally having the hen dung mixed with fully four times its weight of muck, and that will probably be eight times its bulk. Soil will do instead of muck, and common barn-yard manure will answer very well, and the compost will be very rich.

Currant Worm.—"Inquirer."—What is commonly called the currant worm attacks the leaves only. The one you found in the pith of the stem is the larva of another insect, a currant borer, of which we have two kinds. The larvae, or rather the chrysalis, is still in the stem, and the perfect insect will eat out in May or June. As your "new wood is all killed," cut it off and burn it, and so far prevent the increase of the insects.

Grapes.—An account of the new varieties, and valuable notes on the old ones for 1869, will be found in the American Horticultural Annual.

A Bushel of Lime or of Corn.—"Cordova," of Westfield, N. J., writes: "I would like to know if, when you speak of a 'bushel of lime' in the *Agriculturist*, you mean unslaked or slaked lime? and speaking of corn, whether you mean shelled or not?"—The common agricultural lime of this part of the country is shell lime, and this is always, so far as we know, sold slaked. Other lime is slaked before it is applied; hence, we always mean slaked lime when we refer to an application to the land, or of lime as an ingredient of a compost, unless the contrary is specified. "A bushel of corn" always means a bushel of shelled corn, or its equivalent, 14 pounds being allowed for the weight of the cobs. Thus 56 pounds is the legal weight of a bushel of corn, except in a few States, and 70 pounds that of corn in the ear.

Cheese Making vs. Butter Making.—A correspondent in Eastern Pennsylvania asks the following questions, which doubtless will interest thousands of our readers: "1st. Does *cheese making* pay better than producing butter? 2d. Is the eastern part of Pennsylvania as well adapted to the production of cheese as New York, Ohio, or other parts of the country where it is successfully carried on?"—In cheese making, all the milk and all the cream may be used; or most of the cream may be removed, and the skimmed milk made into cheese, or only half the milk may be skimmed, and the rest made cheese of. In making butter, the greater part of the cream rises in two or three hours, and it is a common custom to skim this off and send the skimmed milk to the city, where it will always bring a good price. Much of this half-skimmed milk is condensed in some parts of the State of New York, and thus a home market made for sweet skimmed milk at the factory, and probably two-thirds as much butter made as if all the milk were set as usual. Where there is an extra good market for butter, and the herds of cows have long been bred as

butter makers, we doubt if it will pay to make cheese. "Skimmed-milk cheese" (made from *sweet* milk, of course) is said to pay well. The condensed milk alluded to is sold in the cities at a little less price than the condensed whole milk. Cheese making on the large scale, and where the aim is to produce the best possible article from the whole milk, will not pay usually within the range of the milk trains running into our large cities. The "eastern part of Pennsylvania" is well adapted to producing cheese, but still it may be a question if some other disposition of the milk will not bring in more money.

Spotted Quinces.—"N. C. T.," Staten Island, is troubled with black spots on his quinces. His statement that the trees stand on rather poor soil probably explains the matter. Prune the trees, if, as is usually the case, they are a mass of suckers, and give a good dressing of manure. Salt is considered beneficial to the quince, but your trees are too near the sea to be likely to need it, though a sprinkling would do no harm.

Boiled Potatoes for Milk Cows.—"J. K. H.," of Norwood, N. J., writes: "Are boiled potatoes good for milk cows? I was going to feed them to my cows, and several of my neighbors told me that they would dry them up."—We have been often remonstrated with for recommending and feeding Indian meal to milk cows, for the same reason. People who feed nothing but cornstalks and dry hay are apt to console themselves with some such notion, as the fox did who believed all the grapes were sour which he could not reach. We do not feed boiled potatoes—not for the reason that they will dry the cows up, but because corn fodder, and oil-meal and corn-meal mixed is a cheaper and better diet. If any of our readers can prove that boiled potatoes dry up cows, we are open to conviction.

Small Fruits.—Every year brings many new varieties, and Mr. A. S. Fuller gives his experience with them in the Horticultural Annual.

"Our Young Folks."—Fields, Osgood & Co., Boston, publish such a charming Juvenile Magazine for boys and girls, that one involuntarily wishes he were young again, that he might experience the pleasure that only children can feel over such a beautiful periodical, prepared expressly for them. Beautiful stories are illustrated by beautiful pictures, and all in just as grand a style as if it were intended for Old Folks instead of Young Folks. 20 cents a number is very cheap for so good a thing.

Death of Caleb N. Bement.—Few, if any, of our readers, who are fanciers of poultry, are not familiar with the name and writings of Mr. Bement, who was widely known, both as a poultry fancier, and as the author of the fullest and most elaborate American work on domestic poultry—"The American Poultryer's Companion." He learned the trade of a printer in a newspaper office, and followed it in Poughkeepsie and Albany. At the latter place, he was for many years a popular hotel landlord, a contributor to the agricultural press, and we believe managed a farm in connection with his establishment. He subsequently had a farm on Staten Island, and for some fifteen years, until quite recently, had charge of the farm and gardens of the late Matthew Vassar, of Poughkeepsie. He had much experience, wrote easily and acceptably on a variety of subjects, was a good observer, a man of discriminating judgment, and much respected. He died December 22d, at Poughkeepsie, aged 77.

Report on the Trial of Plows, held at Utica, by the New York State Agricultural Society, etc. This is an octavo volume, of 288 pages, illustrated with 8 plates and 129 wood engravings. The first six chapters (134 pages) are a *History of the Plow*, from the earliest time to the present. Then follow chapters on the "Objects to be Accomplished by Plowing," on "Practical Questions in Plows and Plowing," on the "Line of Draught," and on the "Mechanical Conditions of the Plow;" then the report of the trial, and of the supplementary trial held at Brattleboro, Vt., in June, 1868. We did not publish the awards, as announced, preferring to wait for the report. They are as follows: Class i. *Sod Plows for Stiff Soil.*—Gold medal to F. F. Holbrook, Boston, "Lap-furrow plow." (No competition). Class ii. *Stiff Soil Stubble Plows.*—Gold medal to same party for "Holbrook's 66." Class iii. *Sandy Soil Sod Plows.*—No fit soil; no awards. Class iv. *Stubble Plow for 3 Horses,* to turn a furrow at least 5 inches wide and 12 inches deep.—Gold medal to F. F. Holbrook, Boston, for "Holbrook's 69." Class v. *Sod and Subsoil (Double or Michigan) Plows.*—Gold medal to same party for "No. 69," with stubble mouldboard and skim plow. (No competition.)

Class vi. *Subsoil Attachment* to ordinary plow.—Award withheld.

Class vii. *Ditching Plow* for opening drains.—Gold medal to N. Hawkes, Appleton, Maine, for Hawkes' Ditching Plow and Cultivator.

Class viii. *Ditching Machine for Underdraining*.—Gold medal to E. Heath, Fowlerville, N. Y.

Class ix. *Steel Plow* for alluvial and unctuous lands.—Gold Medal to Collins & Co., New York, for "C No. 3." (No competition).

Class x. *Swing or Side-hill Plows*.—No award made, as the Committee were divided between F. F. Holbrook's plow and that of Lyman D. Burch, of Shelburn, N. Y.

Harrows.—Gold medal to J. E. Morgan, Deerfield, N. Y. Special gold medal to F. Nishwitz, (no address given) for scarifier and clod-crusher.

Cultivators. Class i, Sec. 1.—(One-horse). Alden & Co., Auburn, N. Y. Gold medal. Class i, Sec. 2. A. L. Brearley, Trenton, N. J., for Pfifer's 2-horse Cultivator and Cotton Plow. Gold Medal. (No competition).

Cultivators. Class ii, Sec. 1.—(Two-horse). Ford & Howe, Oneonta, N. Y. Gold medal. Class ii, Sec. 2. W. H. Bartis & Co., Maltaville, N. Y. McQueston's Improved Cultivator. Gold medal.

This report has evidently been prepared with the careful diligence characteristic of the Chairman of the Committee, but for the lack of that editing it should have had, hours of labor are imposed upon any one who wishes to learn anything from it. Careful reading of the entire report, which is necessary in order to make out the list of awards, brings to light many points which render the work fairly liable to rather severe criticism, and not less the hook than the whole work of the Committee. The above was prepared for the previous number of the *Agriculturist*, but was crowded out. Fuller comments upon the work, which is really a valuable addition to our agricultural literature, are rendered unnecessary by the notice it receives from the writer of "Walks and Talks."

Forwarding Cabbage, Cauliflower, and Lettuce.

BY PETER HENDERSON, BERGEN CITY, N. J.

During the past month, I have had scores of applications from beginners in Market Gardening, enquiring whether there is any way in which the above-named vegetables may be forwarded by hot-bed or otherwise, so as to be in the condition that our cold-frame plants are for planting out in spring. It being impossible for me to make suitable replies to such queries separately, I avail myself of the medium of the *Agriculturist*, to briefly detail a method we now practice, by which as early a crop can be obtained as by wintering over in cold-frames, and where the necessary forcing-pits are in use, at less expense than by the cold-frame process. In all districts having a latitude nearly that of New York, the seed for Cabbage, Cauliflower, or Lettuce, should be sown from the 1st to the 15th of February in forcing-pits, or in hot-beds, such as we describe in "Gardening for Profit." But instead of sowing the seed on the benches of the forcing-pits or in the bed of the hot-bed, as there described, we advise it to be sown in shallow boxes. We use the ordinary soap box, cut in three parts, giving a depth of two or three inches of soil, and a surface of about two square feet. Care must be taken that the bottom boards are not matched too close, so that the surplus moisture may pass off freely. The best soil is sandy loam and leaf mould, in about equal parts, or if leaf mould cannot be got, stable manure, decomposed to the condition of leaf mould, will answer equally well. The seed should be sown somewhat thickly—say an ounce to every ten square feet. If sown on the 1st of February, and kept at an average temperature of sixty degrees, the plants will be two or three inches high in three or four weeks, when they should be planted out in the same kind of boxes and soil, at such a distance apart as will give about two hundred plants to each box. If the weather is warm and sunny at the time the seedling plants are put into the boxes, it will be necessary to shade them for two or three days, until they begin to form new roots, giving a moderate watering whenever the surface of the soil appears dry. For the first week the same temperature may be maintained as for the seed boxes, but gradually more air must be admitted, so as to harden the plants, and fit them to be placed under the protection of sashes only, without further artificial heat—simply cold-frames. This treatment, by exposing them to the air, (by removing the sashes entirely) whenever the weather will admit, will harden the plants sufficiently to be planted out in the open field by the first of April. During the latter part of March, the sashes would rarely require to be kept on during the day, but it will strengthen the plants to be protected from the cold at night until the end of the month.

One of the advantages of growing these plants in shallow boxes is that, being thus portable, they are readily

changed from one hot-bed or forcing-pit to another, and they grow quite as well for the short time necessary in two or three inches of soil as in a greater depth. Another advantage is, that the transplanting process has the effect of making the plants form the necessary fibrous roots, besides giving them greater strength, from standing more thinly in the transplanting box than in the seed-bed.

Last season I tested a few thousand in this way by the side of those wintered over in cold-frames, and found that there was no perceptible difference, those sown in our forcing-pits in February being marketable quite as soon as those sown in September and kept through the winter.

This method may be practiced even by such as have not the conveniences of either forcing house or hot-bed sashes of any kind, for seeds sown in boxes and placed in the window of any dwelling room in which a comfortable heat is maintained can be treated just as we do those in our hot-houses or hot-beds, only that by the time the plants have been transplanted, it will be necessary to harden them off, which, in the absence of sashes, may be done simply by taking the boxes out of doors during warm March days, and placing them in the house at night.

Forwarding Tomatoes, Pepper, or Egg Plants, we do exactly in the same manner, except that as they are plants requiring at all times a high temperature, instead of sowing the seed in February, as we do Cabbage and Lettuce, we sow in April, and the transplanting in the boxes is not done until May.

Curing Bacon for the English Market.— Letter from Moscow, Russia.

"E. H." writes from Moscow, Nov. 2, 1868: "I want to raise a thousand or more pigs, and go into the lard business, as well as ham and bacon, here in Russia. The average price of corn-fed pigs of 350 lbs. is, with us, 5@5½ cents per lb., currency, live weight. Just now, it is 7 cents. Salt is worth \$2 per cwt. Do these prices promise a paying export business to England and Germany? The freight from here to either London or Hamburg is about \$1.50 per cwt. The quality of the corn-fed meat is good. But, so far, the few experiments which have been made in ham and bacon curing for exportation have failed. I account for it because ham and bacon are cured here during very cold weather, out of frozen ment, which is unfrozen in the most sudden way. They put the carcass in a Russian bath-room, where the temperature is exceedingly high, and after leaving it for only six or eight hours, they cut it up, and salt the hams in tubs and the bacon dry. Ham and bacon are badly cut; that is, in a way that is not known or liked in England. And all is done in the most slovenly way imaginable.

In regard to pig raising, I know a place on the banks of the Volga, where about twenty starch-mills are at work. The refuse from them is sold there on the spot at 10 cents per cwt.; and as the mills are worked in the most primitive way, I reckon that the refuse must contain more nutritious matter than the refuse of your mills. The starch is made out of wheat. Some geese, but no pigs, are raised there. The price of rye there is about 70 cents per bushel; barley, 60 cents; oats, 40 cents just now, but these are uncommonly high prices. At how much per lb. could I raise bacon pigs at these prices? And what kind of breed would best answer my purpose? I want, I believe, pigs attaining great weight; more so than those which produce delicate meat, especially as I want to produce lard and bacon principally. The animals ought to be hardy and able to stand our severe winter. Lard has gone up here in the course of a year from 11c. to 14c. per lb. The rise is owing principally to the demand from Germany and England. The exports this year were about 1,000 tons. Though a very small quantity for so large a country, it has not failed to produce a marked effect, inasmuch as, in former years, none was exported."

REMARKS.—It gives us great pleasure to attempt to reply to these questions, but we fear we can throw very little light on the matter. On a farm, pigs can seldom be raised with much profit, except in connection with other stock. Their true office is to eat food that would otherwise be wasted. Without knowing how much water it contains, we can make no accurate estimate of the value of the refuse from the starch mills. A good deal depends on the demand for, and value of, manure in the neighborhood. Pigs fed on this refuse would afford rich manure, but for fattening hogs it would be well to give, in connection with it, some grain containing more starch, such as barley or rye, or Indian corn. With ordinary pigs, shut up to fatten, it would take about eight bushels of rye or barley to make 100 lbs. live weight of pig. If kept in large numbers, and in pens not well littered and otherwise comfortable, it would take considerable more. At 7 cents per lb., live weight, after deducting expenses, there is not much margin for profit. A good deal would depend on the price paid for the pigs when shut up to fatten. If they could be bought for 5 cents per lb. and sold

when fat for 7 cents per lb., the account would stand thus:

1 pig, 250 lbs., at 5 cents,.....	\$12.50
16 bushels rye and barley, at 65 cents,.....	10.40
	\$22.90
1 fat pig, 450 lbs., at 7 cents,.....	\$31.50
Profit,.....	\$8.60

The manure, if carefully saved, ought to more than pay for attendance, interest, etc. In this country, we can usually buy lean hogs two or three cents per pound less than fat ones. If this is the case in Russia, hogs might be fattened at considerable profit.

In regard to raising a thousand pigs, we doubt if it can be done profitably, except in connection with other kinds of farming. The sows should have a good range of clover or grass in summer; otherwise they can seldom be kept economically. With good pasture, and a feed twice a day of the refuse from the starch factory, the sows and store pigs might be cheaply kept through the summer and autumn. Those intended for fattening in the autumn and early winter might be kept in the same way, except that they should have a more liberal allowance of the starch refuse. Success will depend very much upon keeping them growing rapidly while at grass, so that when shut up to fatten, little grain will be required to finish them off. The quality of the bacon and also the quantity of lard depends a good deal on keeping the growing pigs rapidly advancing. The nearer fat they can be kept at all times, the better will be the bacon, and the more and better lard will they yield.

For the English market, the quality of the bacon is of prime importance. The dealers and consumers are excellent judges of the article. They will pay full prices for good bacon, while that which is inferior or badly cured is difficult to dispose of, even at a low figure. The breed or kind of hog has something to do with the superiority of English bacon, and the fattening not less so. Get a good kind of hog, and never let it be starved at any time. This is the great secret of success. We are not sufficiently acquainted with the breeds of pigs in Russia to say which is the best. We have seen "Russia hogs" imported to this country that had many good qualities. They were strong, hardy, pretty well formed, of good size, but decidedly coarse, and the quality of the meat was not satisfactory. But a cross with some of the English breeds, such as the Yorkshire or Essex, would greatly improve their quality and fattening properties. And such a cross, if well fed, would come to maturity earlier and afford a great deal more lard. For bacon, it is not only important to have hogs of good size, but they must be fat. This is more important for bacon than for pork, because in drying, any lean that is left on the flitches or sides withers up and becomes rusty, imparting a disagreeable flavor to the meat.

Bacon is sent from Canada and from the United States to England, and when proper care is exercised, it gives good satisfaction. We often experience as low a temperature here as in Moscow, and much of our pork is made from carcasses frozen solid, and in this condition transported hundreds and even thousands of miles. But it is essential to thaw them out before salting. And it is, doubtless, very important that this should be done gradually—say in a room not over 40° Far. So far as climate is concerned, we think there is no reason why bacon and hams cannot be cured in Russia as well as in Canada and the United States. Before embarking largely in this business, however, it would be well to visit the pork packing establishments in this country. Our impression is, that it would be found that pigs can be raised and fattened and cured in the Western States cheaper than in Russia. Certain it is, that in past years, our Western farmers often sold corn-fed hogs for less than 5 cents per lb., live weight. But here, as in Russia, and in fact throughout the world, pork is much higher than the average of former years before the war. We should be pleased to hear from our correspondent again.

Bee Items.—By M. Quinby.

Artificial Queens.—In the improved management of bees, a resort to artificial queens will be necessary. But before bee-keepers will have full confidence in such queens, they must be satisfied that they are, in every respect, equal to others. By artificial queens is meant such as are reared from eggs or larvae that are deposited in worker cells, and would have produced workers but for the changes made by the bees.

Much has been said about the imperfect development of such queens, and especially that they are cramped for room in worker cells in the early stages of their existence. Being satisfied myself that this objection is not well founded, I shall try to satisfy others. All admit that eggs laid in worker cells and queen cells are precisely alike. That in the worker cell produces a worker, the other, a queen. It is contended that the queen reared in a worker cell must be dwarfed in size, as a larger bee

than a worker cannot expand there. But it is demonstrated that queens are *not* reared in worker cells after all. The egg that produces the queen may be laid there, it may hatch there, and the larva be fed as a worker for two or three days; but then, if a queen is required, the bees immediately enlarge the cell, and lengthen it. If there is room directly under it, it is turned downward; if not, it is made more nearly horizontal. The cell, as prepared for a worker, is *filled* to the very brim with royal jelly, on the surface of which swims the larva of the future queen. By examining such a cell, it will be seen that the larva does not occupy any part of the original cell, but has ample room in the part specially prepared. Another proof that the queen is not dwarfed by the size of the cell is, you cannot predict the size of queens with any certainty from the size of cells. A great many queens reared in large-sized cells are very little larger than workers. Any one at all familiar with the manner of raising brood is aware that *full-sized* workers can be reared in cells that have been used for the same purpose from twelve to twenty years, and must be diminished in size nearly one-third. It is thus quite clear that they were larger than required at first. Whoever will examine a sheet of new comb with brood in the chrysalis state will find the cell much larger than the bee, and ample room for a large moth-worm to spin its gallery between the head of the bee and the capping. I have seen many queens from large cells that would have had ample room for their development in one of these, showing conclusively that their size did not depend on that of the cell.

It is also said, that when a very few bees are set to rearing queens, the quantity of food is likely to be less than it should be, and that an inferior size is the consequence. But whoever has looked into a queen cell immediately after its occupant has left, has invariably found some of the food yet remaining. This is certainly not an evidence of a scanty supply. Until something more conclusive shows that artificial queens are indeed inferior to others, I shall continue to recommend in future numbers of the *Agriculturist* the rearing of just such artificial queens as my experience has proved to be most profitable.

Bad Luck with Bees.—M. C. Hester, Clark Co., Md., says: "We are having terribly bad luck with our bees. I think I am within the bounds of truth when I say that fully half the stands of bees in this and the adjoining county of Scott have died since the honey-raising season closed. They have not died for want of stores, for all that I have examined or heard of have left an abundance of honey in their combs. Nor are they troubled with worms, or 'foul brood,' or dysentery, or other disease mentioned in the books. I suspect the cause of the trouble is the loss of the queens. We cannot discover anything ailing the workers. There has been very little brood in any of the hives since the middle of October. Can you give us any light on this matter? No one can account for it. Some think it in some way caused by the locusts that swarmed upon us in the spring. They have not done well during any part of the season, made very little surplus honey, and not one stand in twenty sent off a swarm."—Although the foregoing was private, it seems advisable to print it, as very many bee-keepers in Mr. Hester's locality have suffered in a similar way, and one case, somewhat like it, was reported from Ohio, in the *Bee Journal*. No one seems sufficiently acquainted with the difficulty to be able to explain the cause, or give a remedy. Mr. Hester suspects the "cause of the trouble is the loss of queens," but this is secondary only; we wish to know the cause of the loss of queens, and of workers as well. There being but little brood after the middle of October does not prove the hives queenless. It is quite common for the most thrifty stocks in many sections to cease raising brood by the middle of September. The cause of other maladies has been found in the quality of the honey, and if we could ascertain from what sources these bees obtained their stores, it might afford the desired light.

Mr. Wagner, editor of the *Bee Journal*, gave me, a few years ago, a description of a malady, in the form of foul brood, that was observed in Germany. In a peculiar season, (I forget whether very wet or very dry) there appeared upon the leaves and twigs of the trees myriads of plant-lice (*Aphides*). These secreted and discharged a clear saccharine fluid, much sought after by the bees. The result was that in a few months foul brood prevailed to an unprecedented extent. A few years since, in one of the Western States, (Illinois, I think) this aphid was found on standing grain, particularly oats, injuring the grain materially. The next winter, bees seemed unhealthy, leaving the hives in cold weather with swollen bodies, and perishing by hundreds. Those describing this attributed it to the aphid, and were probably correct, as there has been no further complaint of unusual maladies until now in Indiana. The present season is reported as rather poor in Illinois, Indiana, and Ohio. It is possible that in some places the bees have availed themselves of some unusual product, and are affected as described in consequence. The probability is, that the

trouble will pass away as suddenly as it appeared, without giving us any further clue as to its cause.

Bees Do not Swarm.—J. Scholl, Lyons Station, Ind., writes: "I have practiced artificial swarming, with very good success, though I have had no instructions except through the *Agriculturist*. But the past season, the bees in this section of the country, and as far as heard from, have refused to swarm, with hives full of honey, brood, and young bees. Waiting full two weeks after the time for early swarms, I took a swarm from each hive, all of which soon filled their boxes, as the honey season was splendid for a few weeks. But young bees did not appear again in the old hives until late in July. Of forty stands of which I have knowledge, and which were allowed their own time to swarm, only six did so the past season. The experience of the last ten years convinces me that, with black bees, it will not do to depend on natural swarming; for, as a general thing, four-fifths of all strong *early* swarms go off. Late, weak ones stay, and are not worth bothering with. Would the Italians do any better here, where there are such inviting places in the woods for them?"—This shows the advantage, as well as the necessity, of taking this swarming matter into our own hands. Thousands who keep bees have had similar experience. It is a difficulty that attends all swarming hives; hence, much better things cannot be expected of the Italians, under the old system, and working with that system only I cannot give a satisfactory reply. Continued and valuable experience, however, suggests new forms of management, by which the evil can be remedied. By taking advantage of a knowledge of certain facts and laws in respect to bees, we expect to have such entire control of them, as to direct their energies either to increasing their colonies or to the storing of surplus honey, as we may choose. In the course of the season, I expect to give the results of my later experience, and at the proper time, to speak particularly of the difficulty above mentioned.

On Colic in Horses.

BY PROFESSOR JOHN GAMGEE, OF LONDON, ENG.

The diseases of animals are materially modified in different species by the structural and functional peculiarities of their various organs and parts. A comprehensive knowledge of the anatomy and physiology of all domestic animals is therefore essential to the full understanding of their maladies, and no better illustrations of this can be afforded than by referring to the digestive organs. The ox gathers food rapidly, accumulates it in his paunch, then ruminates; and by the peculiar action of the third stomach the solid parts of the food are retarded for effectual digestion in the true or fourth stomach, while the liquid portions pass on, are promptly subjected to the action of secretions in the intestines, and are thus absorbed. The great mass of imperfectly digested food, therefore, lies in the large pouches described as the first three stomachs. Hence it is that cattle are subject to hoove, or disengagement and accumulations of gases, in the first two stomachs, and then to impaction of the third, which constitutes either an independent disease of a dangerous character or a frequent complication in febrile and other maladies that are associated with costiveness. The horse, on the other hand, has a small single stomach, and some idea of the difference in the amount of food retained in the gastric cavities of the horse and ox may be formed from the fact that a horse dying of repletion of the stomach has been found to have not more than thirty pounds weight of food impacted in it, whereas an ox that has been fasting for twenty-four hours has been found with one hundred and fifty, and as high as two hundred pounds of fodder in its first two stomachs. The horse feeds fast, but the food is not retained long in the stomach, and passes on for more complete digestion in the intestine. Ruminants have a long intestine. In sheep it is twenty-seven times the length of the body; in the ox, twenty times; and in the horse, twelve. But in the horse the large intestine is very capacious, and occupies the greater portion of the cavity of the belly. It is sacculated and puckered up by muscular bands so as to retain the food for a long time, and it is owing to the bagging of the intestinal tube that the excrement becomes dry and ball-shaped, as it is in the horse. In ruminants, therefore, the food is kept long in the stomach and passes quickly through the intestine, whereas the reverse holds in the horse.

It is evident from these remarks that when horses suffer from an accumulation of undigested or indigestible matter in their alimentary canal the tendency is to impaction of the large intestine. The great weight of material held in the pouches of the intestine demands a constant rolling and forcing movement, due to what physiologists call the peristaltic action of the intestine, and if anything interferes with the mobility of the included mass the muscular cord of the intestine is liable to irregular, spasmodic, and painful efforts. This is the theory of spasmodic colic in the horse, and although there are many causes assigned

for this common disease, such as drinking cold water, exposure to draughts, etc., it is necessary to impress on all horsemen that in the great majority of cases where a horse shows signs of pain in the belly by pawing, crouching, lying, groaning, rising and lying down alternately, rolling, etc., the intestine requires to be relieved of an obstructing mass. It is the want of this simple item of knowledge that renders colic the most fatal of all equine diseases, and in the British Isles about fifty per cent of the deaths by disease amongst horses occur from simple indigestion, or what is commonly known by the names of colic, spasmodic colic, flatulent colic, etc.

It is not my intention here to enter into minute details concerning the symptoms, results, and varieties of this disease. The facts I wish to impress on American farmers relate more to prevention and treatment. Regularity in feeding, and the use of sound corn, oats, and well-cured hay, constitute the great injunctions regarding prevention. The cure of the disease is as simple as it is effectual, and it is most effectual when practiced early. As usually treated, colic is a very fatal disease, whereas with proper treatment not one case in five hundred should be fatal.

A farmer should never be without a funnel to be used in giving injections to sick animals. The funnel may be made six inches wide at top, five inches deep, leading to an inch tube two inches long; from the end of this tube a horizontal pipe extends about nine inches in length, tapering to a half-inch hole, properly rounded off on its edges. Any tinsmith can make this invaluable instrument, and it will be found that having oiled the tube and passed it into the intestine, tepid water can be readily poured in without the aid of any pumping force. A syringe stimulates the intestine to repel the liquid, whereas if water be permitted to gravitate by the funnel two or three quarts will gravitate slowly and be held. It is a mistake to use too much water at once. The injections should be repeated every ten, twenty, or thirty minutes, and given with care. Medicated injections are, as a rule, not desirable.

Not infrequently one or two injections suffice to cure a horse, but as a rule it is necessary to administer a purgative according to the age and size of the animal. Five or six drachms of good aloes, made up in a ball, is the most certain agent, and no faith must be had in the frequent recommendation to give the physic in solution. Aloes acts promptly as a nauseant, sedative, and last, but not least, as an evacuant. If farmers will learn this lesson by heart I vouch for they will rarely, if ever, lose a horse with colic. They should try no nostrums, stimulants, anti-spasmodics, or poisonous sedatives. Let them use aloes and injections early, and trust to them. Above all things they must not bleed a horse when attacked by colic.

The Sefton Breed of Swine.

The Earl of Sefton, whose estates are near the city of Liverpool, has devoted much attention to the improvement of swine, and has established a breed in some respects remarkable, which is here known by his name. The animals are distinguished by great size, strength of constitution, and the excellent quality of their flesh. They are quite different from the Berkshire, Essex, and other fine-boned and very fat breeds, inasmuch as while they are not coarse in bone, they are longer, deeper flanked, and not so excessively fleshy, although quite as much so as is compatible with the production of the finest pork.

It is reported—we are not able to say with what truth—that this breed in England is confined exclusively to the Earl of Sefton's own estate, and that he never allows any animals of the breed to leave his place alive for use in England, although he has, in several instances, allowed them to be brought to this country. General Tyler, of Red Bank, N. J., imported a pair some years since, and their progeny have been considerably distributed throughout the country. They are more nearly like the best specimens of the Chester White than any of our other breeds, and are claimed to be even superior to them. We are inclined to think that a cross of the two breeds would be better than either.

A pair of pure Seftons, slaughtered a year ago in Hartford, weighed eight hundred pounds, and their flesh was very firm and attractive in appearance. We are not disposed to recommend that these animals be adopted by any farmer

with the idea that they are vastly superior to anything else, but we think enough has been shown in regard to them, during the few years of their breeding in this country, to make them worthy of the attention of those who are seeking to improve their stock of swine.

Cutting Food by Power.

Much has been written concerning the advantages of cutting food for stock, and notwithstanding the stupid discussion that was held a short time ago by the remarkable Farmers' Club, in New York, where the quidnuncs of that association were so emphatically snubbed by Patrick Quinn, much more will be written, and an increasing confidence is sure to be placed in the beneficial results of the practice.

The great objection to the more rapid introduction of fodder cutting among our farmers is to be found in the fact, that, even with the best hand-power cutting machines, the work is very laborious, and the result is but slowly accomplished. Many have attempted to adopt the system with the aid of hand-machines, and have found it impossible to carry it out owing to the immense amount of time and labor required.

By the aid of the horse-power attached to a larger machine, this work may be done so rapidly and so easily, that the chief objection passes away. On all farms on which the number of animals to be fed is considerable, and where the proprietor is satisfied of the decided advantages of cutting, it will pay to purchase a horse-power, and a horse-power cutting machine. But those who desire to try the experiment in a somewhat extensive way, without the outlay of the two or three hundred dollars that the horse-power and the larger cutting machine would require, may attach any good cutter to the horse-power belonging to parties who, during the summer and autumn, thrash grain for others. It is a very simple matter to take one of these movable horse-powers, set it up in the barn, and connect its belt with the pulley on the cutting box; and one good horse or ox may be made to perform the work at this season without much interfering with the other uses of the farm team.

We confidently predict that any one who will give this system a thorough trial during a single season will find that the value of the food saved in feeding from ten to twenty animals will be sufficient to make a permanent investment in a horse-power a very profitable one.

Tim Bunker on Carding Cattle.

"Things look considerable grand round here," said Jake Frink, one morning, as he walked into my new barn, where I was cleaning off my Black Hawk span, getting ready to take Mrs. Bunker down to Shadown, to spend Thanksgiving. You see, Sally and her husband have generally come home to spend this day, but just then there was a responsibility so young that the mother could not venture out.

"The Squire is gittin' so pertikelar with his cattle that he'll be movin' em all into the parlor pretty soon, I guess," responded George Washington Tucker.

"Many a poor fellow don't have sich blankets as them hosses," said Seth Twiggs, as he scratched a match and lighted his pipe.

"Nor sich bedding," added Benjamin Franklin Jones, looking at the clean, bright straw.

"Plauks, I see, are a little too hard for your animals to stand on," said Deacon Smith, in-

quiringly, as he poked away the straw and examined the bottom of the stall.

"There is three feet of dry muck in there," I replied, "and the pit is all cemented, so that I sba'n't lose any of the liquid manure. I calculate a horse will half pay for his keeping in the manure he makes, if you give him a chance."

"Iled chestnut for siding the stalls!" exclaimed Jotham Sparrowgrass, as he rubbed his hand over the surface. "I declare it looks about equal to the pews in the meetin' house."

"The Squire 'll be havin' a parson in here preachin' to his cattle, yet; see if he don't," added Jake Frink, maliciously.

"Mr. Spooner would get some bearers here that he don't have on Sunday, I guess," said Seth Twiggs, meekly, with a puff of smoke, that made Jake look blue.

"What new-fangled consarn is this you're cleanin' your crifters with?" asked Uncle Jotham, as he eyed a new India-rubber card that I was passing over the legs of the horses.

"What do you give your cows, that makes their coats shine so?" asked Deacon Smith, as he looked at a row of Jerseys on the other side of the barn floor.

"Oil-meal and carrots inside, and India-rubber card outside," I replied.

"You don't mean to say that you keerd 'em every day?" asked Jake Frink, whose tangled locks evidently had not been astonished by card or comb for many a day.

"Somebody attends to just this business every day, and I think it pays."

"Wall, Squire, you're a bigger fool than I thought you was. I've sometimes cleaned up a hoss when I had a trade ahead, but I never touched a keerd to a cow in all my life. 'Tain't naturel, sartain."

"Then," I asked, "what are the spines upon a cow's tongue made for, and why do they use them upon one another's hides so much?"

"They haint much else to do," said Jake, hesitatingly.

Now, I hold, Mr. Editor, that all our bovine animals carry a clean bill of rights to carding in their tongues, and the best card is the one that comes nearest to the original, which is moderately sharp, fine, and flexible. Women's rights, about which folks are making such a fuss, don't begin to be so clear as this matter. I wish you would get up a revolution, and put on a strong editorial team to advocate the divine right of our domestic animals to be kept tolerably clean and comfortable. It would not pay, perhaps, to put them all into a warm bath every day, as Deacon Smith's Eliza serves her lapdog, but it will pay to use the card and brush every day. They have an organization very like our own, and the skin is all the time throwing off dead matter, which lodges under the hair, unless some pains be taken to get rid of it. If left free, you will see them using their tongues upon every part of their body that is accessible, and getting help from their neighbors for those parts they cannot reach. They will rub their necks and backs against posts, and fences, and trees, to start this dead matter and clean their skins. In the summer they will wade into the streams, and stand for hours in the running water, to keep themselves clean as well as cool. There is no mistaking these acts. They show the instinct of cleanliness just as clearly as the comb, and brush, and wash-basin show it in man. Now, when we take these creatures into our care, and confine them in stalls and stables, we come under some obligation to treat them according to their natures. We have no right to torment them by withholding what they so

strongly crave. They want food and drink, and the means of cleanliness and comfort, and they are generally profitable to us just as we provide liberally for their wants. To keep them in the filth in which many farmers compel them to wallow is as shocking and cruel as it is unprofitable. Just look at Jake Frink's stables. There is not a curry-comb or brush in them, and has not been for a dozen years. He says he "never touched a keerd to his cows," but there is a card upon the buttocks of his oxen an inch thick, that certifies to Jake's nastiness, as if it were written in letters of ink. Is it any wonder that his neglected oxen get so weak that he has to hire his plowing done in the spring, and that his cows have the "slink fever," and his horse dreads the sight of crows? I wish we had your Mr. Bergh out here in the country. There is a great deal more need for a society to prevent cruelty to brutes than in the city. There are many more of the brutes, and the men who torment them with slow torture do not have all their neighbors looking at them, nor a policeman to step in and regulate their abuse. I hold that a man is demoralized by the abuse or neglect of his cattle. The farmer that will let his oxen lie in their own filth, from the beginning to the end of winter, without any effort to bed them or clean them, makes himself brutish, no matter how he stands in church or State. He can't fail to grow hard toward his fellows, as well as toward his cattle. But there is a right as well as a wrong way of keeping your cattle clean, as there is in doing other things. Some of the cards and curry-combs are fit only to scrape the hide of a rhinoceros. I have tried pretty much everything in the market, and have come to the conclusion that there is as much difference in cards and curry-combs as in other things. Here is a card with the teeth set into the wood, as stiff as so many shingle nails. Put this into Patrick's hand, and upon the back of a thin-skinned and nervous horse, and it is a terrible instrument of torture. No wonder he shrinks from Pat's approach, and learns to kick and bite. He is in a proper school to become vicious. Here is a curry-comb, cut out of a brass plate, with sharp saw teeth, and as unyielding as a saw. Think of such a tool going over bones not too thickly covered with flesh, and ripping up old sores! Is it at all strange that there is a chronic state of bad feeling between Pat and the poor brute, that is literally harrowed every day under the mistaken notion of cleaning? The old-fashioned wool card, with small brass teeth, inserted in leather, had some flexibility when carefully handled, answered a good purpose, but was rather too stiff. The card with an India-rubber back, fitted to the hand by a strap, is the latest and best invention in this line. It adapts itself perfectly under the hand, to all the little inequalities of the skin, and gives gentle friction without tearing. With a good brush, nothing better is needed. If the horses and cows could have a convention, I have no doubt they would pass a vote of thanks, or make the inventor a Justice of the Peace. It certainly promotes peace between man and beast, and makes the daily cleaning a luxury, instead of a torment. My animals come around me for their regular cleaning, with as much interest as they come for their fodder. They certainly understand the difference between hatchels and cards, between harrowing and cleaning. They thrive well under this treatment, and though it takes considerable time, I doubt if it could be spent more to their profit or mine.

Hookertown, Dec. 15, 1868.

Yours to Command,
TIMOTHY BUNKER, ESQ.

Silver-spangled Hamburg Fowls.

The groups of distinct breeds called Hamburg have many points in common, and breed with great uniformity of marking. They are recognized as Silver-spangled, Golden-spangled, Silver-penciled, Golden-penciled, and Black Hamburgs. There are, besides, quite a large number of tolerably distinct varieties referred to the Hamburgs, but not recognized by fanciers, such as Bolton Grays, Chittaprats, Dominiques, Creoles, etc., all distinguished by close, double combs, full neck and saddle hackle, a full tail in the cocks, blue legs, proud carriage, and excellence as layers—usually, also, by having a disinclination to sit, which, in the well-bred fowls, is confirmed. The difference in the color and markings upon the feathers of the four breeds first named is very noticeable, and owing to their great distinctness, the different breeds of Hamburgs are among the most showy and beautiful of fancy fowls. Their great value is as layers, and as such they are esteemed among the most profitable varieties; but as their useful qualities are held secondary to their points of beauty, it would not be surprising to find the most beautiful specimens lacking somewhat in that particular. We give a picture of a pair of Silver-spangled fowls belonging to Mr. J. C. Sidell, of Englewood, N. J., exhibiting well the peculiarities of the variety. It will be observed that every feather is white, tipped with black. In the spangled varieties, this peculiarity is constant, and only one spot occurs. There are subvarieties of both Golden-spangled and Silver-spangled fowls, marked by a difference in the shape of the spots, as well as in the character of the birds. In the penciled breeds, each feather has several markings or pencilings. The more perfect these are marked, and the more even the color of the fowl, the more highly is it esteemed by fanciers.

During the winter and early spring, there are days and weeks when married laboring men, living in the neighborhood of farmers, can get nothing to do. In the summer, they will ask \$2.00 a day, and in harvest, \$3.00. If they could get \$26 a month, the year round, they would receive more money than they do now, and the farmers would get double the work done.

The fame of the sparrows and the good they have done in and around New York has spread abroad, and individuals elsewhere, desirous of introducing the birds in their own localities, have written us concerning them. We have been at some trouble to get portraits of the male and female bird, which are from life, one-half of the natural size. They are so exceedingly lively that

SILVER-SPANGLED HAMBURGH FOWLS.

The European or House Sparrow.
(*Passer domesticus.*)

A few years ago, the trees in the public grounds and streets of New York and its suburbs were so overrun by the span-worm that they were more of a nuisance than an ornament. "Worm-time" was dreaded by all, and many were the devices proposed for exter-

minating the span-worm. At last, some one introduced the European sparrow, which made itself completely at home, and soon proved too much for the insects. For the deliverance from insects the people have been duly grateful; whole villages of bird houses have been built for them, food is provided in winter, and their lives are especially watched over by the police. The sparrow is very prolific, several broods being raised in a year. They are remarkably domestic, preferring to remain about dwellings, and building their nests wherever a suitable cavity can be found. The young are raised mainly upon grubs and caterpillars, and it is estimated that a single pair consume 4,000 caterpillars in a week. The mature birds consume grain and other vegetable food, which, in cities, they find in the droppings of animals and elsewhere. It is a matter of doubt whether the general introduction of sparrows would be beneficial or otherwise. In England, where they are numerous, it is contended that they are the enemies, rather than the friends, of the cultivator, though the birds have their advocates. There is no doubt about their utility in cities, but in the country they are charged with consuming large quantities of grain, scratching up seeds in the garden, picking off buds of fruit trees in winter, and other mischievous acts. We have briefly stated the case in favor of and against the sparrow. The present price with the dealers is \$4.00 per pair, for birds said to be imported. Those who have them upon their premises are unwilling to part with them at any price. They readily make themselves at home in a small box for a house. In winter, food should be freely scattered where they can have access to it.

EUROPEAN SPARROWS.

LABOR ON FARMS.—That farmers must employ more labor is an undoubted fact. That there are men enough is equally true. The trouble is, that they are not steadily employed.

Walks and Talks on the Farm—No. 62.

"Why don't you come West," writes an eminent lawyer and farmer of Ohio, "and not wear yourself out among those stones? Suppose the stones *have* been placed in the ground on purpose to be taken out, does it follow that a good fellow who has brains and intelligence enough to do something better should be the man to take them out?" I will tell my friend why I do not go West. First.—Because I am here. Second.—Because there is a very general disposition to change, and, as a rule, it is better not to do what everybody else is doing; and consequently those who stay where they are will be likely to do better than those who are anxious to sell their farms and go West. Third.—Because I do not believe all the good things of this life are confined to one particular place. Fourth.—Because, so far as I have seen, taking everything into consideration, farms are cheaper here than in the West. Fifth.—Because there is abundant opportunity here to improve our farms, and there is great pleasure and profit in increasing the productiveness of land. Sixth.—Because I have stood in a two-hundred-acre field of corn in the vicinity where my friend lives,—land, rich, mellow, clean, no stones, and few weeds; nothing to do but plow, harrow, plant, cultivate, and harvest; and repeat the same thing year after year,—and I did not think I should like that kind of farming. It is too monotonous. To tell the truth I would much rather strike a stone occasionally and have the pleasure of getting it out. "But all the land in Ohio is not of this character." Very true; but if you take high, rolling upland, you meet with just the same difficulties we have here, and there is no use in selling one farm and buying another merely for the love of change. Here, in Western New York, we have just as good land, all things considered, as there is in Ohio. We may have to pay more attention to making manure; we may have to underdrain more; we may have to work the land more thoroughly, in order to kill weeds and develop the latent plant-food in the soil; we may have more stones to get out; but what of all this? There is great pleasure in underdraining; it is real fun to get out stones; and the good crops which result from killing weeds and manuring the land afford a kind and degree of satisfaction that can be obtained in no other way.

It is a mistake, however, to suppose that the West raises large crops without cultivation or manuring. The recently published prize essay on the Farming of Delaware Co., Ohio, by Judge Jones, shows that even the farmers in this celebrated district need to exert themselves in order to raise large crops. He says: "The crop of wheat in 1866 was a failure, being killed outright by hard freezing and high winds while the ground was bare. In 1867 the crop was very superior in quality and fair in quantity." He tells us, however, that owing to these occasional failures and the high price of labor, farmers have "greatly reduced the quantity of land devoted to this important crop." He further states: "The idea that wheat can no longer be grown with profit prevails to some extent all over the State." And let me say, the idea *will* prevail so long as it is thought that men, with "brains and intelligence," should be engaged with something better than getting out stones and improving the land.

"The average yield of wheat in Delaware Co. from 1850 to 1864 was a little over 11 bushels per acre." This county averages 33 bushels of corn

per acre, which is about equal to the average in the Scioto Valley. I do not think I will go West, and "wear out" my life in growing such crops.

We *can* do better here, though it must be confessed that our average yield of corn is no higher. But our land can be made to produce 80 bushels. All it needs is "brains and intelligence." The crop of oats in this county in 1865 did not average 27 bushels per acre, and barley only 11 bushels; potatoes not 80 bushels per acre; rye not 13 bushels per acre. These are small crops for one of the finest counties in Ohio. And the pastures are no better. Judge Jones thinks it requires "about two acres to graze a full-grown cow or ox, which," he adds, "is but little more than half the grass our lands ought to produce." No doubt about that. One of my fields the past summer supported stock equal to at least two cows per acre until after hay harvest, when I plowed it up, and summer-fallowed it for spring barley. And it was out of a knoll in this very field that we got the stones which seem to have excited the pity of my Ohio friend. Now if I can make such land carry double the stock it does in the Scioto Valley, and have the pleasure of getting out the stones besides, why should I go West?

Mr. Lawes used to say that in England the best farmers were found on the poorest land, and the poorest farmers on the best land. Thus Norfolk has the poorest land and the worst climate in England, while nowhere in the world can be found larger crops, cleaner land, or more intelligent, enterprising, and wealthy farmers. Devonshire has the best climate and the best soil in England, and, with some exceptions, the poorest farmers. Hitherto this rule did not prove good with us. We have the best farmers on the best and richest land. It will not always be so. I am mistaken if New England will not produce some of the most enterprising, intelligent, and successful farmers on the continent.

It seems I have been criticised in some of your papers for advocating large farms. I did nothing of the kind. All I said was that there was a manifest tendency towards larger farms, and that, argue against it and deplore it as we may, we could not stop it. The Deacon and I talked this matter over, and we came to the conclusion that the small farmers could spare but little produce for the support of the rapidly increasing population in our cities and villages. They may have neater farms and better gardens, but they raise little more wheat, and pork, and beef, than is necessary for home consumption. A good share of their income is derived from the orchard, and from the sale of small fruits and vegetables. We find as much intelligence, refinement, and real comfort and enjoyment, among this class as in any other. But, strictly speaking, this is not farming. A farmer is a manufacturer. He differs from other manufacturers merely in this, that while they generally buy a great many articles that they use, the farmer makes nearly all of his himself. Thus a farmer manufactures and sells wheat, barley, clover seed, beef, wool, mutton, pork, and butter; but in order to turn out these articles it is necessary to manufacture grass, hay, corn, oats, peas, and other articles needed for supplying the factory. It is a great establishment, and it cannot be profitably conducted on a small scale. To talk of ten acres being enough for a *farm* is simply an absurdity. It is difficult to manage even a fifty-acre farm in such a manner that there shall not be a great waste of hours, implements, fences, &c. It takes as long to get one cow from the field as a dozen. In a little country like England there is some

excuse for small farms, but here we have so much land that the Government gives it away to any one who will agree to cultivate it. The fact is, however, that in England the farms are much larger, as a general rule, than with us, and they are becoming larger rather than smaller. But enough of this. The rule should be to have as large a farm as one has capital, energy, and experience, to manage to the best advantage, and no larger. A young farmer should begin on a small scale, and enlarge his farm as he acquires capital and experience. It is easier to buy more land than to sell a part of a large farm.

The report of the trial of plows, &c., by the N. Y. State Agricultural Society, at Utica, in 1867, has just been published. It is a remarkable document. The report is longer than the trial, and smells more of the closet than the field. The trial consisted essentially in testing several plows constructed on a new principle, invented by Gov. Holbrook, of Vt. It is claimed for these plows that they break the furrow slice in turning it over more completely than anything we have had before. Judging from the report it is doubtful how far this elaborate and costly trial throws much light on the subject. The trial was to have been made in May, but owing to excessive rains, "which made the land like a mortar-bed," it was postponed until September, when, in the language of the committee, the soil, saturated with water in the spring, "had been baked by the fierce summer sun, until it was almost as hard as a brickbat." No farmer would attempt to plow such land during a severe drouth, and it is not easy to see how such a trial affords any satisfactory tests of the merits of a plow to be used in ordinary plowing. Then, again, there was scarcely any competition. Five gold medals were awarded in five different classes of plowing. In three of these there was but one entry, and in one of them a prize was awarded *without any trial*, there being no land suitable for the purpose.

The report, which occupies nearly 300 pages, gives us an account of Way's experiments on the absorptive powers of soils and the formation of double silicates, and tells us that "the success of the practical farmer depends almost entirely upon a knowledge of their principles." I published these experiments a dozen years ago, and studied them thoroughly, and consequently ought to be a very successful farmer; but I have been so busy of late years, trying to kill weeds and get the land dry and mellow, that I have thought very little about double silicates, except that I believed that if I could get manure into the soil it would not be apt to run away, especially if the land was underdrained.

The report further tells us that "soil in a finely divided state radiates heat much more rapidly than when its surface is hard and baked." One of my men, who knows more about digging drains than about chemistry, after the idea was explained to him, said he did not know about the heat, but he knew the *cold* could not get into loose soil as easily as into hard; and in digging ditches in winter he is careful to leave the "crumbs" of loose dirt on the bottom of the ditch, to keep the frost out. And I find that in the field which we summer-fallowed for barley, and a part of which was cultivated six or eight inches deep in December, the land is scarcely frozen at all, while unplowed soil near it is as hard as a rock. On land thoroughly cultivated in this way, a man could dig ditches nearly all winter.

There is one fact brought out by this trial that interests me very much, and that is, that

the speed of the team does not materially affect the draft. Thus a plow, cutting a furrow fourteen inches wide and seven inches deep and going at the rate of $1\frac{1}{2}$ miles an hour, required a draft of $484\frac{1}{2}$ lbs., while the same plow, cutting the same furrow at the rate of nearly 2½ miles an hour, required only 500 lbs. One plowed an acre in 4 hours and 25 minutes, and the other in 2 hours and 39 minutes. If I was a horse I would rather pull 500 lbs. for 2 hours and 39 minutes than $484\frac{1}{2}$ lbs. for 4 hours and 25 minutes. As much work would be done in the one case as in the other, and done better, for the extra speed would stir the soil more thoroughly. The practical conclusion is to put on three horses, if necessary, and never let a team walk slower than its natural gait. Horses on the road frequently walk three miles an hour with a load. If they walked at the same rate in plowing, allowing a reasonable time for turning, etc., they would plow an acre in $2\frac{1}{2}$ hours, with a furrow 14 inches wide. On my farm we do not plow an acre and a half a day, and yet men and horses seem to work hard enough. Why this discrepancy between facts and figures? I think the main reason is owing to the stones. Not that I have such an unusually stony farm, but that man and horses are never certain when the plow will strike, and consequently they have to go cautiously all the time. This, too, is the reason for the habit of putting the lines back of the shoulders in plowing—a practice which I most cordially detest.

It is more important for a farmer to know how to get out stones, and to have energy and determination enough to do it, than it is to know all about the absorptive power of soils.

Old horses that plow among stones are so afraid of being jarred that they will scarcely move. The wear and tear of harness, plows, cultivators, harrows, drills, &c., is certainly doubled on account of stones, and one would think that when a man gets a good rap on the ribs in striking a stone, he would be inclined to get it out. A sensible man will do so, a fool will swear at it and pass on. The one is just as angry as the other, but the one controls his anger and learns patience until he can remove the cause of his trouble; the other boils over and his anger escapes in jerks and blows on unoffending horses.

One of my neighbors, who formerly did nearly all his work with oxen, but who gave them up and bought a span of heavy Canadian horses, is about to return to the oxen. He says if you get the right kind and *know how to manage them*, they will do nearly or quite as much work as horses; they cost less; do not require so much care; there is no expense for harness; and they can be turned off to the butcher, generally with a profit.

On a rough farm, where there are stumps and stones, and more or less logging to be done in winter, especially on swampy land, a yoke of cattle is indispensable. But when the farm is cleared of stones and stumps, horses, it seems to me, are more profitable. Our seasons are so short, and wages so high, that it is very desirable to push forward the work rapidly. There is a great difference in cattle, just as there is in horses, but, as a rule, horses will get over the ground faster than oxen. If two horses cannot walk along with a plow or harrow at a fair rate, put on three.

The more I read of them, the more I am convinced that the Percheron horses, say half or three quarters blood, will prove to be just what American farmers need. When I read Mr. Du

Hüys's charmingly written and interesting work, "The Percheron Horse," I feared, from his remarks in regard to the climate of Perche (page 89), that when bred here they might lose some of their energy. But I have just read an article in the Journal of the Royal Agricultural Society of England, which indicates that we need have no fear on this point. Our climate is vastly more stimulating than that of England, and if this breed does not degenerate there it certainly will not here. Mr. W. Dickenson, the writer of the article, than whose there is no higher authority, says if he had not gone to the Paris Exposition in 1855, he "should have continued thinking there was no better class of farm horses in the world than the English." But in the streets of Paris he saw a class of horses that "astonished" him. "These horses, walking so nimbly with great loads of stone, were not so fat as our own favorites, but they seemed to me to be doing twice the work. Although leaner, they bore the strictest scrutiny; the more I saw of them, the more I admired them. Meeting Mr. Jonas Webb I called his attention to them. He said he had never seen such before; he had observed a horse taking into the show yard an immense load of provender, that astonished him beyond measure; he had resolved to try to buy him, but he lost sight of him that day and never saw him afterwards." Mr. D. obtained a stallion which he called "Napoléon," and says: "He has been at work on my farm ever since, almost always with mares. I have never had so good, quiet, active, and powerful a horse before. He is unlike our English cart-horses, for with great size ($16\frac{1}{2}$ hands high) and immense substance, he shows a dash of blood. He has an Arabian head, not small, but of fine character, well proportioned to his size. The neck is very muscular and well turned, the shoulders large, very deep, without lumps on the sides, and oblique,—such a shape as would not be objected to for a riding horse; the bosom open, the fore legs magnificent and very short, with great bone, hard sinews, and little hair upon them. His feet are perfect in shape, and perfectly sound in work, his back short, rather dipped, round-shaped ribs, large loins, rather plain, drooping hind-quarters, very large thighs, low down, and tightly joined together with prodigiously powerful, clean hocks, and very short hind legs, well under him. We never have had a difficulty with the engine or thrasher or with anything in the mill, that Nap could not extricate us from. His stock are as good and kind as possible. It is a saying with the men, that Nap's colts need no breaking. My mares are small and active; the stock are considerably larger than the dams, but so cleanly, that as foals they look more like carriage horses."

It is very evident that the Percheron stallion is what we want, to improve our race of farm horses. When grain and hay was cheap it did not make so much difference what kind of horses we kept, and how many of them. We could, perhaps, afford to let them lie idle half the time. But all this is now changed. Horse feed is expensive, and wages of the teamsters high, and it is very important to keep none but the best horses and to study economy in using them. I have seen a farmer draw a load of only 22 bushels of potatoes to the city, while another farmer, by having a large, double box, drew ever 50 bushels. And even this is a small load—only 2,800 lbs. for two horses. M. Du Hüys, in "The Percheron Horse" (page 69), says: "In London a traction of only 2,000 lbs. is required of a draft horse. In Paris the horses harnessed to the heavy stone carts are required to drag as much

as 5,000 lbs. each, and often more." And the testimony of Jonas Webb and W. Dickenson is to the same effect. In other words, a pair of Percheron horses draw a load of 5 tons, or more than 175 bushels of potatoes, or 166 bushels of wheat. It would take a farmer who goes down ten miles to the city with 22 bushels of potatoes *a whole week* to draw as many potatoes as a good span of horses would draw at one load. And as he pays 25 cents toll, and a man and team are worth \$4 a day, the cost will be:

6 days at \$4	\$24 00
Toll	1 50
	\$25 50
1 day and toll	4 25
Saving in delivering 132 bushels potatoes ..	20 25

It is a well-known fact that dogs wag their tails, and a philosopher once computed the amount of power in the aggregate, lost to the world by this useless habit, and found that it was sufficient to turn half the grist-mills in Europe. If he should figure up all the power we lose on the farm in the year for want of a little thought, he would probably tell us it would be sufficient to dig in a week or two all the gold there is in California, and make us all rich. But, joking apart, if other manufacturers lost as much time and power as some farmers do they would soon be ruined. We lose time in every way. We take a load to the city and come back empty, and then go empty to the city to bring back a load. We lose time in scraping dirt on to a road, to raise it a few inches above the water, while half the labor in ditching would take the water three feet below the road. We lose a great deal of time by being in a hurry. We have not time to oil the harness; to keep carriages clean and the nuts tight; to drive a hoop on a barrel or a pail when it gets loose; to put up tools and implements; to plant fruit trees, or take care of them. We have never time to attend to the many little things of the farm, and we lose more by neglecting them than we can possibly earn at steady work. I have known a farmer to go, all alone, into the woods to chop, and leave a stout hired man at home to attend to the stock and do chores!

Why Keep Up Interior Fences?

It is a common statement among farmers, especially in the Eastern States, and it is probably not a very exaggerated one, that it would cost more to-day to fence the farms in most counties than the land itself would sell for. This enormous amount of labor has been done gradually, and at seasons when there was little other work, and its great cost has not been felt. The annual cost of keeping fences in repair, and the labor required, all reduced to dollars and cents, as it ought to be, would constitute a more serious tax than most farmers would be willing to meet. And the question naturally arises, What is the use of all this? Why do we need so many fences? Pasture lands, of course, must be fenced, but in our opinion no others should be, or at least no others need be, except for the purpose of separating our meadows and cultivated fields from our own pastures, from the public highway, and from a neighbor's land. In expressing this opinion we base it, of course, on a conviction that mowing land should never be trodden by the hoof of an animal, except for purposes of fertilizing and harvesting the crop.

The cost of making and repairing fences, after all, is only a small part of the argument against their excessive use. They are disadvantageous in many ways: 1. They shorten the furrow and require much time to be lost in turning plow-teams, etc. 2. They cut up the

fair face of the farm into unsightly patches. 3. They prevent the adoption of the best systems of agriculture. 4. They harbor vermin. 5. The headlands beside them not only occasion a great waste of land, but they foster the growth of troublesome weeds, which spread yearly from them into the cultivated land adjoining.

Therefore, we say, do away with fences wherever possible; spend a part of the time, at least, that is now occupied by repairs, in removing them altogether; make the fields larger, and lessen the growth of troublesome weeds.

These remarks will naturally lead to the inquiry, How shall we get rid of the stones? and to the second one, Shall we use them in making underdrains? Stones may be advantageously disposed of in two ways: 1. Build them up into slightly, cylindrical piles in corners of the fields, and cover them with Virginia Creeper or some other vine. This is the easiest way to manage the question, and adds to the beauty of the farm. 2. Bury them in the ground. In this we do not recommend generally that they be used in making underdrains. The cheapest way is to dig holes and trenches, dump the stones in, and cover them up. Whenever tiles can be delivered on the farm for three cents a foot it will be much cheaper to drain the land with tiles than with stones, although these be dumped, ready for use, at the banks of the ditches, —cheaper in first cost, because the amount of excavation required for tiles is very much less than the cost of laying the stones; cheaper in the long run, because a well-laid tile drain is an absolutely permanent improvement, while the best laid stone drain is constantly subject to lasting and annoying obstructions.

Farm Bridges—How to Make Them.

A permanent stream is a fine thing on a farm; in fact, it is so anywhere. The longer we live, the more we love water—running water, springs, rills, brooks, rivulets. If the rivulets cross the farm, we are obliged often to cross them, and have our choice of doing so by a bridge or by a ford, which is deep in the spring, liable to be washed out or piled full of stones and gravel banks by summer and autumn rains, and icy and often impassable in winter. With a

Fig. 1.—FRAME BRIDGE.

ford for wagons, we almost always need a foot-bridge of some kind in addition. Good bridges are, therefore, next to a necessity on a well-managed, well-watered farm. These are easily made when the streams are small and stones are plenty; for walls being laid on each side so as to give a sufficient channel for the water at its greatest rush, flat stones, rough, stone arches or timber, to be covered with planks, are laid across. When, however, the stream is wide or the channel deep, the bridge becomes an important structure, and, both for safety and durability, should be constructed with care. We show in figure 1 a substantial bridge-frame, made as follows: Two hewn or sawed chestnut, oak, or pine sills are laid upon the walls; in these, near each end, a post is set, mortised in, and braced

from the end of the sill. The two posts on the same side of the bridge are connected by a stout hand-rail, into which the posts are let two-thirds through, and pinned. Neither the mortises in the rails, nor the tenons in the posts should be cut before the sills are laid and the posts set, especially in the case of diagonal cross-

Fig. 2.—BRIDGE TRUSS.

ings, for a very little twist makes either the post or rail liable to split. When the hand-rails are on, lay the string-pieces and spike them to the sills and to the posts. They may be of chestnut, pine, spruce, or hemlock, and upon them lay the flooring of oak, chestnut, pine, or spruce plank, the thickness being governed by the amount and character of the travel which will pass. White oak is, no doubt, the best flooring, if we regard simply durability, but it is objec-

Fig. 3.—STRENGTHENED STRING-PIECE.

tionable when heavy loads have to be hauled up by teams standing upon the bridge, as is often the case. Oak, unless subjected to constant wear, becomes so hard and smooth that horses slip badly upon it. This plan for a bridge is susceptible of any degree of rustic or other ornamentation; it is simple, durable, and good enough for streams not so wide that the string-pieces will vibrate perceptibly under the passage of heavy loads. For wider streams heavier stringers stiffened in some way are employed. Figure 2 represents a good form for an end string-piece of a bridge sixteen to thirty feet long. The truss-beams are about half the size of the main timber, and are scarfed or notched to bear against its ends, while their upper ends, bearing against each other, are connected by a long bolt or rod having a screw and nut at one end, and a broad head and washer at the other, to a cross-beam placed athwart the bridge and under all the string-pieces. The rod is of three-quarter-inch to inch iron, and passes through the main-timber and cross-pieces. Bridges may be made with three of these trusses for string-pieces, but they are always awkward in the middle of a bridge, and a better way is to stiffen a timber by a long iron rod passing diagonally through its ends and under the cross-timber, in the manner shown in figure 3. Such timber may be used in any desired number under the floor of the bridge, the planks being spiked directly upon them. Such bridges are usually made of sawed timber, and are not easily ornamented in a simple rustic way. They are, however, adapted to any desirable "architectural" ornamentation.

Rich Grass.

There is one point in our December chapter of "Walks and Talks on the Farm" to which we desire to call especial attention, since it is a point that farmers are apt to overlook, and one which their best interests require that they should always bear in mind. It is, that one ton

of very rich hay is more economical to feed than two tons of coarse and over-ripe strawy hay.

In feeding the latter it is necessary, in order to have a sufficient amount of nutriment, to add grain to the fodder; while in the other case the hay itself is so rich that in consuming the same weight even more extra nutriment than is contained in the added grain may be assimilated. This the article itself tells, and tells very clearly. We only desire to carry the argument to its legitimate conclusion, which is, that in all cultivation of the farm, year after year, it should be constantly

borne in mind that the cultivation by which we rid the land of weeds and foul grasses, for the benefit of the growing crop, and the manure which we add for the increase of the yield, tells with great effect not only on the crop which we are raising, but on the future capacity of the soil to produce more nutritious grasses when it is permanently laid down.

Furthermore, it indicates very strongly an additional reason for avoiding excessive grain growing and the too common practice of laying down land to grass after a series of exhausting crops, trusting to get the little manure that remains in the form of poor hay, and then to have the very last drop of life-blood sucked out of the impoverished land by poor and stunted pasture grasses.

Faith in Farming.

The sight of a new barn eighty feet long by fifty in width, built in the most substantial manner, and with all the appliances for handling and storing crops easily, and for making manure on a large scale, is an indication of that faith which is so often wanting upon the farm. There is a man who believes in improved husbandry, and is willing to invest ten thousand dollars, or full half of his capital, in a good barn. He has no doubt that he can so manage his farm and barn as to get back the interest on all the money invested in it. In his view the barn is worth more to him than the same amount of money invested in bank stock or in Government bonds. This kind of faith is still the exception among farmers. Very few live up to the light they have, and are willing to invest their money when they have every reason to believe it will pay well. They know very well the efficiency of well-made yard manures, and feel the need of more of them every year. Yet they hesitate about putting a cellar under the barn, or building sheds and hovels around the yard, for the purpose of sheltering the manure, and the men while they are at work upon the compost heaps in stormy weather. They have muck and peat enough to learn its great value, and yet they hesitate about using labor enough to keep a large stock always on hand. Few intelligent men doubt the great waste of feeding cattle at the stack in the winter, and yet they do not provide the necessary barn room or sheds to protect the animals and save the soiling of the fodder. They follow the old wasteful methods mainly, because custom has made them easy. It is conceded by all who have tried them, that we have new varieties of potatoes more prolific than the old, much less liable to rot, and of fair quality for the table. And yet the mass of farmers cling to the old, in spite of the rot, because they have a well-established reputation in the markets, and sell well when

they can be raised. They hesitate to buy seedlings that have been thoroughly tested and are fully indorsed by our best horticulturists. This want of faith is the reason, mainly, why agriculture does not improve more rapidly, and why other callings are crowded with adventurers at the expense of the farm. The merchant makes ventures, whenever he sees a good opportunity, not only investing all his spare capital, but often all that he is worth, in a single enterprise. The ventures of the farmer would never be so largely and suddenly lucrative as those of the merchant sometimes prove to be, but then he runs no such risks. It is safe to make ventures in barn cellars, and in the very great enlargement of the manure heap, in underdraining, in lime and clover, in improved tools and stock, and in new varieties of fruits and vegetables. We should show by our investments that we have faith in our business, and that we expect to make a living by it, and get handsome returns for our capital. This done, our young men will quit measuring ribbons and tape, and go to measuring land and working it. Let us have faith.

A Very Good Milk-rack.

A note came to us, signed A. W., without date or other signature, containing an excellent idea for a milk-rack, which we have not met with elsewhere. The writer describes it as a 6x6 pine stick, placed upright, having slats of half-inch material nailed up on each side of the post. Two pans of milk are supported by two such slats on opposite sides. We have had an engraving made which scarcely needs any description, and in it suggest a slight improvement upon the plan of our correspondent—namely, putting the post upon a pivot, so that it will revolve. If

MILK-RACK.

arranged in this way, the cream pot need not be moved in skimming a whole rack full of pans. One advantage of such a rack over shelves is, that the air has free play under as well as over and around the milk.

SUMMER-FALLOWS FOR WHEAT.—J. B. E., of Monticello, Ind., writes: "Neighbor Keener had a piece of wheat sowed on summer-fallowed land, one-half of which was plowed the second time. The six acres plowed but once yielded 23 bushels per acre. The six acres plowed twice yielded 38 bushels per acre. He sold the wheat for \$2 per bushel, and thus received \$180 for about three days' work with a man and team." Farmers differ as to whether it is better to plow a so-called summer-fallow for wheat more than once. Some, who have had considerable experience, contend that if the land is broken up with care in June, and the cultivator and harrow are used freely afterward to kill weeds and mellow the surface three or four inches deep,

this method is better than a second plowing. This may or may not be the case. It depends a good deal on the nature of the soil. One thing is sure, it is vain to expect the full profit of a summer-fallow unless the soil is thoroughly worked and the weeds destroyed. If this can be best done by a second plowing, well; if by cultivating and harrowing, that is well, too. The method which will develop the most plant-food and clear the land most thoroughly is the best.

Improving our Stock of Common Fowls.

While we advocate the introduction of new and improved breeds of poultry, we would still more earnestly urge our readers to improve their stocks of common fowls. It often happens that when a pair of chickens or ducks are wanted for dinner the best of the lot are selected—which is very nice for the present time, but ruinous for the future. A better plan is to select *the worst*, and if not fat enough—as they probably will not be—shut them up by themselves for ten days or two weeks, and feed them all they will eat. Or select the best and keep them separate for breeding stock.

A selection of cockerels for stock birds may be made by the time they weigh one and a half or two pounds, and are fit to market as broilers. Large, full-breasted, broad-backed, flat-iron-shaped, strong-limbed, small-headed birds should be chosen. They will, of course, be taken, if possible, from the earliest broods, and thus come from the best early-laying hens. It makes a great difference in the stock what eggs are set; those of many hens never ought to be hatched.

It rarely pays to winter more than twice any but very superior hens, of choice breeds, and throwing well-marked chickens. Keep only very good common hens over winter, but thin out the ranks and fill them with early pullets. There is always some member of the family who knows more about the fowls than all the rest. Summon that one and any others interested. A good word may be said for some old hens that might otherwise be condemned, and bad traits or shortcomings recollected in others that a superficial "scale of points" would induce us to retain. A hen that deserted her nest, or is a special nuisance in the garden, or is a poor layer, or a bad mother, or that kills the chickens of other hens, should have little time wasted on her care. Away with her! Those that are known to be good layers will be entitled to much consideration, and this point being established, good size, good shape, and a tendency to fatten, must be looked for. The latter quality is very desirable, provided the hen is also a good layer. But hens that lay a great many eggs are seldom inclined to fatten rapidly, though the two qualities may be combined.

In selecting pullets, one should be guided by the character of the hen that laid the egg in each particular case, if possible; by their early maturity, large size, perfection of general characteristics, and by their health and vivacity. Especial points are a full breast, straight breast-bone, a flat back, broad between the shoulders, deep body, small, short, and delicate legs and feet, small head, full, clear eye, and smooth, unruffled plumage. Such will probably be gentle, quiet, and familiar; if not, these points must be sought, for a quiet disposition is a great point in

favor of any hen. Our object will be attained if we induce our readers to attend to this matter. Let one select the best according to his own notions, and he will be astonished at the quick time in which he will have a superior lot of fowls.

Although great and rapid improvement may be made by careful selection and the occasional interchange of eggs with neighbors, or an exchange of cockerels, (which is, perhaps, a better way of getting fresh blood,) yet no way is nearly so rapid as breeding from cocks of some pure breed, well adapted to our wants, for the improvement of our dunghill fowls in all useful qualities,—hardiness, earliness, size and eggs combined. The Brahmas and Cochins undoubtedly are the best with which to cross. The Gray Dorking cross of the first season is less hardy, but superior as a table fowl. The principles applicable to breeding cattle, sheep, and swine, are perfectly applicable to poultry also.

Wagons Upon Runners.

In the January number, page 15, is an article upon the conversion of wagons into sleighs. Another method, occasionally resorted to, is worthy of notice, as being sometimes convenient under circumstances similar to those specified in the former article; that is, when accidentally caught away from home upon wheels, by the fall of a great depth of snow. There is seldom real necessity for putting a wagon upon runners, but if an occasion occurs, as when the snow is soft and deep, the labor is not much, and the relief to the team may be very great. Two stout hickory or ash saplings are taken, smooth-

WAGON ON RUNNERS.

ed upon two sides, and the points marked where the wheels will rest when placed upon them, as in the accompanying engraving, the butts being to the front. If the butts are not placed to the front the sticks must be squared throughout the whole length. When the places for the wheels are marked, grooves may be cut for them to stand in, and the poles may be shaved down in front so as to bend. The runners are fastened to the wheels by boring holes through them and winding stout iron wire many times around the felloes and through the holes in the runners, the bent ends being fastened in the same way. Runners which are narrower in front than behind are often very hard on the team, especially so when running in frozen sled tracks.

The Best Way to Store Manure.

Farmers are often perplexed as to the best means for storing their winter-made manure. As an almost universal rule they seem to have fixed upon the side of the barn where there is the greatest drip from the eaves. This practice is so evidently a wasteful one that more careful men adopt various devices to avoid the excessive leaching of more than an ordinary rain fall. They pile their manure in large heaps in the field, put it under sheds, deposit it in cellars,

and distribute it in small heaps on the land where it is to be used during the next season.

The practice of earing manure directly to the field where it is to be used is becoming more and more common and spreading it broadcast, to be plowed under or harrowed in in the spring.

The efforts of agricultural chemists and agricultural writers during the first fifteen or twenty years of the existence of the science of agricultural chemistry, were devoted chiefly to an endeavor to discourage this latter practice. They insisted that the loss by evaporation was so great that the farmer could hope for only a tithing of the benefit to be derived from a more careful use of his fertilizers. During the past ten years, however, agricultural writers have had their eyes opened to the fact that this opinion with regard to loss by evaporation was probably wrong.

The very careful experiments made by Dr. Voelcker at the Royal Agricultural College at Cirencester in England, prove clearly that the very best place in which manure can be put, both to prevent loss and to insure the even distribution of its soluble and fertilizing parts among the particles of the soil, is on the surface of the field where it is to be used, spread as evenly as possible, and without regard to loss by evaporation, it being a fact that there are very few volatile substances developed in the decomposition of manure, except when it is thrown together in such masses that its decay is attended with the evolution of sensible heat. Of course, it would be folly to apply manure in this way on lands which slope so rapidly as to suffer seriously from surface washings, or on fields so situated that they receive surface wash from other lands lying above and adjacent to them. The best receptacle for manure, until it can be hauled out and spread as recommended, is a cellar directly under the animals; the next best, a well-covered shed behind them; the next, a well-built heap so situated as to receive no water except the actual rain fall upon it. Almost the worst of all is a barn-yard where the manure is being constantly turned over and disturbed by the tread of cattle, exposing freshly decomposed parts to loss by evaporation; and the very worst of all is under the drip of a barn roof, especially where there is a conveniently arranged gutter to carry into the highway, or on to a neighbor's field, or even upon one place on our own fields, the brown liquor which contains the most valuable constituents of the heap.

Wisconsin Cattle Stables.

A correspondent of the *American Agriculturist*, Mr. G. B. Gray, of Green Lake County, Wisconsin, sends us a drawing and de-

Fig. 1.—WISCONSIN COW STABLE.

scription of the mangers in his cow stable, showing also his method of tying. The peculiar advantage of the plan is that no divisions between the stalls are needed, and it is impossible for cattle to throw the fodder out of the manger. He writes as follows: "I send you a plan of mangers, such as we are using here. They are made of common inch

boards. The dimensions, or essential points, are given on the sketch; there need be no division between them, the cross board nailed on the top to support the front being sufficient. A feed box for bran or meal is shown by the dotted lines in the front view, figure 1. I claim the method of tying as peculiar, and not patented that I know of. This I have found not only convenient,

Fig. 2.—MANGER SEEN FROM ABOVE.

cheap and secure, but comfortable for the cattle. It requires about eight feet of five-eighths inch rope. The bight of the rope makes a noose by having a hard knot on one side and a loose knot on the other; the hard knot is pulled through the loose one, so as to enlarge the noose, which is put over the cow's horns, the hard knot drawn back outside, the loose one pulled tight, and the cow is fast. No matter how much one cow may be disposed to hook her neighbor, she cannot do it; at the same time her head is free, and she can feed and lie down comfortably. Instead of the noose, a leather strap or a chain with a strap to fasten to a neck-strap would be better, but a little more expensive.

"Figure 1 exhibits a view of the manger from the rear of the stable. Figure 2 is a view drawn to the same scale representing the mangers as seen from the floor above looking directly down."

High Farming.

American agricultural writers have, perhaps, been too chary of their discussions on the subject of High-farming. While it is well to present to country readers chiefly such matters as are of the most vital daily interest to them, we think that it is time that a decided reform in this direction were instituted, and we propose to make good our opinion by laying before the readers of the *Agriculturist* some of the facts about what is known as "High-farming," and some of the reasons why it should be the goal toward which all farmers should aim.

High-farming is always good farming, but good farming may exist without being high-farming. The idea on which high-farming is based is, that every dollar a farmer has invested in his business, whether it is in land, implements, soil-improvements, live stock, or facilities for some special cultivation, should be made to produce the largest possible yearly income, both in the form of money received and in the increased value of all stock in trade. As an element of its success it must include a comprehensive and carefully detailed system, which allows no single dollar's worth of produce or of opportunities to fail to produce the largest result. This is all that the expression "high-farming" really comprises; and truly there is no item in the specification which can be objected to

by any farmer in the land. The extent to which any individual may apply this criterion to his own business must depend almost entirely on his location, his capital, and his circumstances. A farmer in North-western Missouri lacks many of the advantages which only a large and near market can give, and which are necessary, to enable him to reap the largest re-

turns from his business. The tenant of a hired farm, or the occupant of a new one, will undoubtedly find himself deprived of a majority of those conveniences for the management of his operations, which would be necessary to enable him to adopt the system of high-farming in its completeness. And almost all of us, in this country, lack the capital which is the motive-power of all high-farming.

Having suggested what we believe high-farming to be, let us now state what we are quite sure that it is not. It is not the sort of cultivation and management that is usually adopted by gentlemen of wealth, who retire

from business in the city and go to the country to take up farming as an amusement. These men, too frequently with little knowledge of farming, but with a superabundant capital, commence their improvements by the construction of very expensive and needlessly elegant farm buildings, by the laying out of a good part of their grounds in an ornamental manner, by the purchase of very expensive but not very judiciously selected live stock, by the employment of managers and laborers who are either not sufficiently skillful, or not sufficiently industrious to be well suited for their work, and by the purchase of a general assortment of improved implements, while they lack either the knowledge or the firmness to compel their managers to keep them in constant and profitable use.

Such men generally flatter themselves that they are "high-farmers," and that they are conferring a great benefit upon the country, or at least upon their own neighborhood, by setting an example of improvement. In our opinion, they are doing nothing of the kind; and while we have no sympathy with the sneers that old-fashioned people are disposed to bestow upon real improvements, we heartily concur with them in their opinion concerning this class of men. If a man has a large fortune, it is, of course, nobody's business but his own how much of it he spends in agricultural experiments, foolishly or otherwise; but he goes a little too far when he expects sensible, practical men to accept his conduct as an example for themselves.

High-farming requires, at least, three things: 1st. A perfect soil. 2d. Buildings and implements exactly adapted to their uses. 3d. Good means for disposing of the soil's products.

The soil should be, first of all, well drained, either naturally or artificially, it matters not which. No crop should find its roots checked in their downward passage in search of moisture or nutriment by a subsoil which too much water makes impenetrable by them. Nor should the rapidity of their growth during the growing season be lessened by the chilling influence of the evaporation of water from the surface of the land. Furthermore, when the time comes to plow, to plant, to harrow, to cultivate, to hoe, or to harvest, the farmer should never be prevented for more than one or two days after the heaviest storm from performing the work because the land is too wet for it. If he is so prevented, the whole plan of his season's work is thrown out of gear; and he not only fails to make a profitable use of the days immediately succeeding the storm, but work which should then be done interferes with other work which should be done on subsequent days, and it requires more time in the doing of it. For instance; take the case of the first hoeing of corn. As soon as it is in condition for this treatment, it should receive it; if the land is undrained, it not unfrequently happens that a heavy fall of

rain puts it into such a condition that it is impossible, or at least injudicious, to work it for a week after the appointed day. During this week, weeds grow and the evaporation of water from the surface causes it to become baked and hardened, so that when the work can be done it requires greater force and more time for the eradication of weeds, which, a few days earlier, might have been killed in their germination.

The soil must be rich, that is, it must contain, within the reach of the roots of the plants, all that they require to enable them to assimilate in the most rapid manner possible that larger part of their nutriment which they gain from the atmosphere. Not only should it be rich, loose, and friable near the surface, but the sub-soil itself should be so loosened, by either natural or artificial means, that the deeper reaching roots will have no difficulty in descending to a point where they may, during the driest season, find the moisture needed for the largest growth. By the richness of the soil we do not mean simply such an accumulation of stimulating manures as will force the growth of luxuriant stems, but an ample store of those mineral matters which are needed for the strengthening of the stem, and for the large and perfect development of the seed, or, in the case of root crops, for the storing up of a large quantity of nutriment in them. This bountiful supply of mineral matter is necessary to success in high-farming, and, indeed, no *good* farming, whether it be high-farming or not, is possible without it.

The buildings of the farm should comprise everything that is necessary for the safe storing of all crops which require shelter; for the economical handling of the supply in the feeding of animals, or in the preparing of grain, etc., for market; for the comfortable and well-ventilated shelter of animals; and for the perfect protection and preparation of manure. About the house and dairy, also, everything should be so arranged that the largest amount of work may be accomplished with the least possible waste of time and energy. The implements with which the soil is to be cultivated and the crops harvested and prepared for market or for use should all be such as to save labor, and to enable every thing to be done in the best manner and at the right moment of time.

The disposition of the crops should be well considered. If it will pay better to sell everything that the soil produces, and to buy back a sufficient quantity of foreign manure to keep its fertility constantly increasing, rather than to feed the crops out on the farm, and to sell them indirectly in the form of butter, cheese, beef or wool, this should be done. There is no sensible foundation for the idea that every farm that is devoted to the production of hay, grain, tobacco, or other crops for sale, is on the sure road to exhaustion. The soil is, in a measure, exhausted by the simple raising and removal of the crop. After the crop has been taken into the barn it really makes no difference, so far as the soil is concerned, whether it is consumed there by animals, and the residuum returned to the land, or whether it is carted away and fertilizers equivalent to that residuum brought back and applied to the land. Whatever pays the best is the best, a part of the pay always being taken in the form of an improved condition of the land.

The moment we step beyond these three leading requirements, and put fancy gilded weather-cocks on our barns, expensive hard wood finishing in our stables, too much ornament on our implements, too expensive or unprofitable animals in our stalls, or do any of the things which

constitute what is properly designated as "fancy farming," we recede from the position of high-farmers, and in so doing not only lessen the value of our example for others, but make for ourselves a plaything of that which we profess to call a business occupation.

Above and beyond all this, high-farming requires a high-farmer; a man whose best energies are devoted to his business; who allows no single improvement in the agriculture of the world to escape his careful attention; and if it promise an improvement in his own practice, who does not, after cautious experiments, adopt it into his system. There is an old and good maxim that "there is no manure like the master's foot." And every day's hard work which the proprietor himself performs in the field with his men will profit him very much more than the simple amount of work accomplished. It will give him a greater familiarity with the daily operations of his farm, and a far better influence over his assistants, than he can get in any other way. At the same time he cannot afford to devote so much of his time or of his energy to field labor as to lessen in the slightest degree his capacity for an intelligent management of every detail of his operations, and for a keen foresight which shall constantly compass, not only the operations of the day and of the season, but the execution of a well-laid and well considered plan whose great results lie in the distant future.

Winter Work.

We fancy that our readers are well-nigh tired by this time of the rules that we have felt it our duty to din into their patient ears, about painting tools, oiling gudgeons, tacking fast loose shingles and clapboards, and mending up wife's wash bench, and all that; and about the turning, hauling out, and spreading of manure heaps, gathering leaves, cutting fodder, sorting apples, and the whole of the long list of things which it is necessary for farmers to do, and which it has been, and always will be, (more is the pity), our duty to remind them of.

Just now we are going to say never a word about all that, but only to suggest that there is other work, which the farmer can only attend to when somewhat at leisure, and which is more important to his "getting on" than any of the out-of-door or indoor patching and mending.

Now that winter has fairly closed in, and winter arrangements are comfortably settled, every farmer,—at least every farmer who cares enough about good farming to read the *Agriculturist*,—should set vigorously about the cultivation, planting, and enriching of that other farm from which his greatest satisfaction,—aye, and his most *paying* crops, too,—must come.

Dickens says: "The part of the holding of a farmer or landowner which pays best for cultivation is the small estate within the ring fence of his skull." It is mainly this small estate to which our winter work should be devoted. Of course, our other duties must not be neglected, and among other duties we include the very important ones of visiting and of entertaining friends, and of making life generally pleasant and cheerful for ourself and for the family.

But, after all this is done, there are hours passed in twirling the thumbs over the fire, in unprofitable twaddle at the store or post-office, and in idleness about the house, which ought to be devoted to better things.

We are often told that farming is the noblest, as it is the freest, of all occupations. That depends. There is nothing especially noble in

the life of a farmer who drives his business at the pace at which he drives his oxen, and who gives about as much thought to the one as to the other; who wastes one-half of his labor in raising crops under unfavorable circumstances, which he does not know or care how to improve; who wastes one-half of his crops in ill-managed feeding; and whose years, from one end to the other, are spent in a struggle to make both ends meet, and to scrape together a few dollars, to lend out on bond and mortgage.

On the other hand, no life is more noble than that of an intelligent farmer who commences as a young man with straitened means and a poor farm with a mortgage on it, and who, by activity of mind and body, makes every year a marked improvement in the productiveness of his land, in the character and thrift of his stock, and in his knowledge of his business; who sees where he can make an improvement, and is judicious in procuring the means for making it.

Such a man as this will get more satisfaction and happiness out of his life as a farmer than he could get in any other avocation, and he will count far more in the general advance of civilization. The other will get no satisfaction, and only an animal sort of happiness, and when he dies the cause of the world's improvement will not have sustained a loss.

The best index to the difference between these two classes of men is to be found in the manner in which they pass their leisure winter hours.

The one will simply doze them away, coming out in the spring as nearly like what he was the spring before, as it is possible for him to do. The other will turn his spring furrow in pursuance of well-laid plans for the season's work, and with a mind eager for their execution.

Let the loose clapboards be not neglected, and give the stock a full meed of intelligent care, but above all let the farmer keep his own mind in the most perfect trim, and bestow a good share of cultivation on the only part of his possessions to which his title is indefeasible.

Clover—How it Benefits the Land.

The reason generally given for the beneficial effect of clover is that it receives most of its nutriment from the atmosphere, and that, consequently, when either the whole crop or the heavy roots and stubble left after mowing are plowed under and allowed to decompose in the soil, this matter, taken from the atmosphere, adds to the resulting fertilizing elements.

This is perfectly true, but it is also true, and true in almost equal degree, of every plant that grows. In "How Crops Grow," p. 381, table ii, the number of pounds of *earthly* matter in 1,000 pounds of different crops, coming under the head of "green fodder," is given as follows:

Meadow Grass.....	23	Wheat.....	22
Rye Grass.....	21	Clover.....	13
Timothy.....	21	Peas.....	31
Oats.....	17	Rye Fodder.....	15
Barley.....	22		

All of the rest comes either directly or indirectly from the air, and the difference in the amount of atmospheric matter assimilated by meadow-grass and by clover is the difference between 977 and 987. Obviously, then, the argument in favor of clover, that it derives most of its nutriment from the atmosphere, applies with equal force to every other crop.

The beneficial effect of clover must be sought in some other circumstance attending its growth, and, so far as science has been able to discover the difference between it and many of our other

[COPYRIGHT SECURED.]

THE QUEEN OF JERSEY COWS, "DUCHESS."—FROM A PHOTOGRAPH.—Engraved for the American Agriculturist.

crops, its advantage lies, first, in the fact that it has exceedingly strong tap-roots, which strike deeply into the subsoil and extract from it mineral food, which is either out of the reach of the roots of many other crops, or exists in the soil in a condition not easily available by them; and second, in the supposed, perhaps in the demonstrated, power of clover to absorb nitrogen directly from the atmosphere. Whether clover does really absorb the pure nitrogen of the air or not, it is a well-established fact that from some source, even when not manured with nitrogenous manures, it very readily takes up large quantities of nitrogen and stores a considerable proportion of it in its roots.

Therefore, when clover or clover stubble is plowed under, the roots and what is left of the plant itself, being mixed with the soil on its decomposition, yield ammonia and mineral matter in a form and in a situation best suited to the needs of succeeding crops grown.

In addition to this, the long, stout roots have a very great effect in ameliorating the tenacity of heavy soils, and the decomposition of the lower ends of the roots, below where they are cut off by the plow, opens inviting channels and new fields of exploration to the more delicate roots of those plants which succeed them.

Perfection in a Milch Cow.

We seek in a milch cow, above all other qualities, rich milk in abundance; everything else is secondary. The more milk, if it be rich, the better; and the richer, the better, if there be enough of it. Such a cow is a machine formed for converting fodder into milk and butter, chiefly "by art and man's device." The original cow was very different; she fed, and laid on flesh and fat, and bore calves, and produced milk, and roughed it in all weathers, and was half-starved half the time. Man's necessities and the art of breeding have produced the change. Where shall we stop? What is the limit of milk production and butter yielding? There is a limit in the nature of things; and if that be reached in one case, we shall still strive to breed so as to bring the average given by all cows of the breed as near as possible to it.

Several months since Charles L. Sharpless, of Philadelphia, an enthusiastic admirer of Jersey cattle, sent us a magnificent "imperial photograph" of his beautiful cow "Duchess," the finest picture of a milch cow we ever saw. The engraving which we have had made, though lacking in the softness and mellow beauty of the photograph, nearly satisfies us, and reflects

great credit upon both draughtsman and engraver. The cow is eight years old and was imported last spring with eight others. She calved on shipboard two weeks before landing, and two weeks after landing, gave 21 quarts of milk per day, on grass alone, and in two separate trials of a week each, on the same feed, made 13 pounds of butter. Many a cow may be fed up to give more milk, and a few may make more butter, with all the oil-meal, roots, and grass, they can eat, but we have never known it done on grass alone. She is therefore a good cow, and her picture shows her to be no less beautiful than good. We give Mr. Sharpless' enthusiastic, and we believe, truthful description: "Size, below medium—would be called small; color was dark, but has been growing lighter, and is now fawn; skin, yellow and mellow; hair, soft, with satiny coat; inside of ears, bag, and teats, deep orange; horns, semi-transparent, not amber, but butter-colored; hoofs, yellow; eyes, full and soft; neck, very thin; crops, thin and sharp; capacity of the barrel enormous, in contrast with her fine head, neck, tail and legs; and she has a docile, fine, nervous organization." Such an animal must come very near the standard of perfection in Jersey cows. Some good breeders have marked her fully up to it.

Cannas as Ornamental Plants.

BY M. JEAN SISLEY, LYONS, FRANCE.

[The following plea for the cultivation of the Cannas, from our correspondent, a distinguished French horticulturist, we can heartily endorse.

They are, however, more cultivated now than at the time to which he alludes, but not nearly as much so as they should be, and we hope to see them take a place among our most popular plants.—Ed.]

The Canna was first introduced into Europe about three centuries ago, under the name of *Cinna Indica*, and although nothing positive is known about its introduction, it is generally admitted that it was brought by Spanish missionaries from Brazil, where it grows abundantly in marshy and rather shaded places. This species is still known and cultivated in botanic gardens and is considered as the original type, although some others are described as distinct species, like *C. flaccida*, *iridiflora*, *discolor*, and *glauca*, which, in the present state of botanical science, can be admitted (under reserve) on account of the great difference existing between them. They are all natives of South America, except *flaccida*, which grows in Florida and South Carolina. A great many others, although described by some botanists, who are fond of creating species, as distinct ones, must, I think, be considered as varieties from the original type, influenced by climate, culture, and other unknown causes. But a discussion on this subject would carry me far away from my main object, which is to call the serious attention of horticulturists and lovers of beautiful plants to the Canna. When I visited the United States, eight years ago, I was surprised not to see them in gardens, knowing that they grow wild in the country. The reason of their omission in American gardens, and even in your splendid Central Park (in 1860), is very likely the same which deferred their cultivation in European gardens.

Cannas had been cultivated in hot-houses until 1846, it being the general opinion that plants from tropical climates could not grow in the open air in colder countries, when Th. Année, who had been for several years French Consular Agent at Valparaiso, brought with him to Paris a numerous collection, of which he planted a portion in the open air. This trial succeeding, he successively planted them all out, and in

1848 he tried to cross them by artificial impregnation, and obtained the beautiful *Annéei* from *Indica*, fecundated by *Nepalensis*. But it was not before the creation of the fine public squares of Paris, in 1855, that the Cannas were cultivated in the open air to any extent. Baréillet Deschamps, the

Fig. 1.—BAD PRUNING.

able principal gardener of Paris, not minding the violent opposition he met with, continued *Année's* experiments, and was soon followed by several amateurs and horticulturists.

This induced *Année* to continue his artificial fecundations in 1857, at which time he obtained *Warsewiczoides Annéei*, which he crossed again with the other original sorts, and obtained several very fine hybrids. Since that time several horticulturists have continued the same prac-

THE GIGANTIC CANNA—(*Canna gigantea*.)

tice, and have produced a great number of fine varieties, far superior to the old type, and which are now cultivated throughout Europe.

The most remarkable and distinct of the varieties now cultivated in Europe are:

- | | |
|---------------------------------|-------------------------------|
| <i>Annéei</i> , | <i>Gnayaquilla</i> , |
| <i>Aurantiaca splendida</i> , | <i>Insignis</i> , |
| <i>Annéei rubra</i> , | <i>Iridiflora rubra</i> , |
| <i>Anguste Ferrier</i> , | <i>Jean Vandeal</i> , |
| <i>Bihorell</i> , | <i>Liliflora</i> , |
| <i>Barilleti</i> , | <i>Maréchal Vaillant</i> , |
| <i>Daniel Hooibrenk</i> , | <i>Nigricans</i> , |
| <i>Deputé Henon</i> , | <i>Picturata nana</i> , |
| <i>Edouard Morren</i> , | <i>Picturata fastuosa</i> , |
| <i>Flaccida</i> , | <i>Premices de Nice</i> , |
| <i>Grandiflora floribunda</i> , | <i>Purpurea spectabilis</i> . |

They have the advantage over a great many ornamental plants, that although issued from the same type, they differ very much in height, as well as in size, form and color of the foliage, color, size, and character of the flowers.

No plant can be compared to the Cannas for ornamental qualities, in a small garden as well as in a park. In a small garden a single plant will, on a grass plot, produce a beautiful effect, the flowers succeeding without interruption.

In a large garden, or a park, twenty, fifty, or a hundred Cannas, disposed in a semicircle, having in the background a plantation of tall evergreens, pines, etc., when well grouped, with the higher ones from 9 to 10 feet at the further end, and the smaller ones of 3 to 4 feet in front, will produce a really splendid sight.

The leaves vary in color, from pale green to

dark purplish brown, and in form from those narrow and pointed, to large and broad ones, some being erect, others gracefully inclined.

The flowers vary from pale yellow to dark crimson; some are striped and spotted, and in point of form equal to the finest *Gladiolus*.

The culture is most easy. Treated as Dahlias, they will flourish everywhere, and offer this advantage, that they will succeed as well in the most sunny position as in a shaded one, and are not affected by the neighborhood of trees, provided they are supplied with plenty of water and liquid manure. They can be planted out as soon as danger of frost is over, and when in autumn frost has killed the foliage, the roots must be taken up and put in a dry cellar or some other sheltered place. The propagation of the Canna is also very easy, it being simply to divide the roots at the time of planting.

Pruning—The Why and How.

So many letters have been received, the purport of which is, "How shall I prune my trees?" that we propose to devote a few articles to pruning. These queries come from those who find themselves in charge of trees for the first time, and our articles will be written for such, rather than for the experienced orchardist. Many think that trees must have an annual pruning, just as in old times people used to consider it necessary to have an annual bleeding. Scarcely any subject connected with horticulture has been more discussed than that of pruning, and the novice is bewildered when he reads that he must prune to make a tree grow, and prune to check luxuriant growth; prune a tree if it bears too little, and if it bears too much—prune it. All these are correct, but one had better not prune at all unless he has some idea of what he is to do it for. It will be seen that we cannot answer in general terms the question, "How shall I prune my trees?"

as each case, did we know its condition, would require a different answer. For the present we will confine our remarks to the most frequently occurring cases, in which old trees have become crowded with limbs through neglect. Here the most careless observer must see that light and air must be let

into the head, and that crowded and crossed branches must be removed. This never need have occurred had the tree been properly treated when young, but it is now in this condition, and the only help is surgery. Pruning is not only needed, but judicious pruning; the tree must be studied, to see what the effect will be of removing certain limbs. The head must not merely be made more open, but the tree at the same time left shapely and well-balanced. Again, trees, where there is much passing near them,

Fig. 2.—GOOD PRUNING.

often need to have their lower limbs removed. This is especially the case with shade trees; and it may be remarked, that all our deciduous trees are pruned in the same way, and mainly for the same reasons, as those of the orchard. The removal of certain limbs having been decided on, the next thing is to remove them. The time for pruning has been the subject of much controversy. The best time is after the trees have completed their season's growth; the worst time is when they are growing in spring. There are no serious objections to doing it late in the winter, provided it is done properly. The work with us is usually done with a saw; a rather narrow-bladed saw, with the teeth set rather wide, is best. When the limb is nearly severed

Fig. 3.

its weight will break it off, and tearing the bark make a bad wound. This must be guarded against by first cutting through the bark below, and by having the limb supported until the cutting is completed. It may be held up by means of a pitchfork in the hands of an assistant, or in any other way that suggests itself. It is to be borne in mind that every wound made upon a tree, unless it heals over properly, sooner or later leads to decay; hence too much care cannot be taken to avoid accidents like those referred to, as well as to put the wound in such a condition that the exposed wood will remain sound until covered by a new growth of bark. The rough surface left by the saw will hold moisture and prepare the way for decay, and it should be neatly smoothed by the use of a drawing-knife. The use of the saw is considered so objectionable in continental Europe that it is discarded altogether. The pruning there is done with a *serpette*, which is a heavy knife, much like a butcher's cleaver; the clean surface left by this in the hands of an expert operator needs very little trimming. The cutting is begun first below the limb, and then continued above, as shown in figure 3. A chisel, about three inches broad, and heavy in proportion, is also used in France, and by some good operators in this country. Stout handles of various length are provided for the chisel, and by driving it up from below with a mallet, limbs of considerable size are easily and neatly removed. In whatever way the limb is taken off, the wound should be covered, to protect the wood from the weather. Melted grafting wax is a good application, and may be put on with a brush. In France coal tar is used, but with this we have had no experience. It is important to cut so as to leave the smallest possible wound. When the branch is at nearly right angles with the trunk, cut straight across, and as near to the trunk as possible. If the branch is an ascending one, making an acute angle with the trunk, a cut close to the trunk would leave a large, oval wound; in this case the cut is to be a little oblique. We frequently see stubs six inches or more in length, which never should be the case. The wood of these projections after a few years decays, and the decay is communicated to the tree. Figure 1 shows the steps in this disaster. A stub is shown in the upper part of the figure; in the centre, an attempt of nature to repair the damage, and in the lower part, the too common result. A wound properly made and covered, heals in a few years, with the wood beneath it perfectly

sound. At the end of the first year a ring of new wood and bark is formed, as seen in the lower part of figure 2. This ring increases, year after year, gradually closing over the wound, until it appears as shown in the upper part of the same figure, and leaves the wood sound.

How Lilies are Propagated.

The Japanese Lilies are so hardy, as well as beautiful, that they should become as common as the Turk's Cap and Tiger Lilies. They are now all moderately cheap, and if one only has a bulb or two to start with, the stock may be readily increased. If left to themselves, the bulbs become large clumps by natural subdivision, but this is a slow way of multiplying them. If a lily be taken up in autumn, after the leaves have withered, there will be found upon the stem, just above the old bulb, a mass of small bulbs intermingled with roots. The engraving (fig. 1) shows one of our bulbs of the Golden-banded Lily (*L. auratum*) as it appeared when taken up last fall. The small bulbs are not as numerous here as they often are on stronger plants. A dozen, and even more, are frequently found. The little bulbs may be removed and planted out separately, or the stem to which they are attached may be cut off just above the old bulb, and set out with the cluster of bulbs and roots attached. They should be covered the first winter with a few inches of litter. The next season they will make strong bulbs. Another method of propagation is from the scales, of which the lily bulb is mostly made up, as seen in figure 1. These scales are attached to a solid portion at the base of the bulb, and they are broken off close to this, it being important to get the very base of the scale. The

Fig. 1.

outer scales of a bulb may be removed without injury to it; indeed the majority of those offered for sale by florists have first been deprived of their outer scales, which makes the bulb look better and at the same time gives them material for propagating. The scales are set out in an upright position in boxes of sandy compost, pressing them down into it until the point is about level with the surface. The boxes are to be placed in a room where they will be at about the temperature of 50° or 60°, and kept just moist enough to prevent shriveling. In about two months a small bulb—sometimes two—will

be found at the base of each scale, as in figure 2. In spring the boxes are plunged in the open ground, and the bulbs allowed to grow all summer; in the following fall cover them with litter, and the next spring, if too thick, they are to be planted out separately. This manner of treatment of the scales is that given by Mr. Henderson in his *Practical Floriculture*. Another plan is to mix the scales with moss, (*Sphagnum*), such as is used for packing plants, and place them in a box in a warm room. They should not be so dry as to shrivel nor so moist as to be in danger of rotting. Tilton's *Journal of Horticulture* for January says, in speaking of *Lilium auratum*, "Thanks are due to our noble line of steamers plying between San Francisco and Japan, that this magnificent floral production can now be had at prices low enough to place it within the reach of all." That will do very well for Boston, but thanks to the noble line of ferry-boats plying between New York and Long Island and New Jersey, our wide-awake cultivators do not leave us to depend upon far-off Japan, with its shriveled bulbs. Thousands of the most perfect bulbs are grown around New York by the processes given above, and we commend them to the attention of our cotemporary.

Fig. 2.

Apple and Pear Seeds.

The seeds of the apple and pear will seldom germinate satisfactorily if sown when dry. They may be mixed with two or three times their bulk of sand and allowed to absorb moisture gradually. They should be placed in a box where they can be shoveled over to prevent heating. Mr. L. Kauffmann, of Johnson Co., Iowa, prepares his seed by freezing. In February, he just covers the seed with water, which, at the end of 24 or 36 hours, will all be absorbed; twice the bulk of sand is added, and the mixture of sand and seed placed where it will freeze, the boxes containing it being covered with boards, to keep out rain. The seeds should be sown as early as possible in the spring.

The Flower Trade.

Very few people are aware of the extent of the trade in flowers, especially in New York. A number of stores at a high rent are occupied by those whose whole business is the sale of flowers in bouquets, baskets, and other forms. A gentleman who is largely engaged in the trade himself recently informed us that he had no doubt that, during the holiday week, \$200,000 were expended for flowers in New York City alone; one florist's sales were \$10,000. To supply this demand requires many glass structures, which, in some cases, are extensive ranges devoted to the purpose, growing a large number of kinds; but mainly the flowers come from small establishments, where but few varieties are grown. In one of the suburbs of New York, the production of flowers forms a large item in the industry of the place. Camellias are most in demand, and the flowers sell from 15c. to 50 cents each, according to the season. In the week preceding the last New Year's Day, there was a great scarcity of these flowers, and parties came from Albany and other places in the

vain search for them in New York. Rose-buds sell at 4c. to 8c.; Tuberoses, at 5c. to 8c. the single flower; Double White Primroses, 50c. per hundred flowers; Heliotropes and Bouvardias, about \$1.50 per hundred trusses; Carnations, 2c. to 4c. each. Aside from the flowers, large quantities of bouquet green (*Lycopodium dendroideum*) and other greens are used. We have named above only the principal flowers used in bouquets. In making up baskets and ornamental designs, other flowers are worked in.

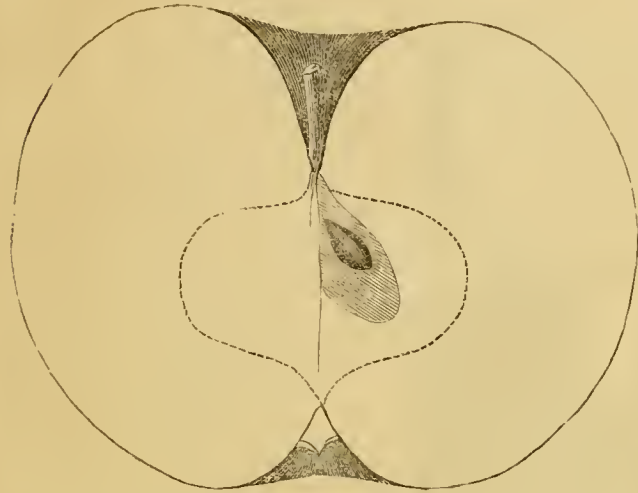

Fig. 1.—LAWVER.

New Western Apples.

BY JOHN A. WARDER.

[After Doct. Warder's Report on New Apples for the Horticultural Annual was in type, he sent drawings and descriptions of some fruits that had been lately brought to his notice, two of which are given here. The Lawver is briefly described in the Annual; we give here a figure and a more extended account of it.—Ed.]

LAWVER.—This beautiful fruit was raised by Mr. George S. Park, of Parkville, Mo., who named it in honor of Mr. A. M. Lawver, who has devoted many years to the development of pomology. Mr. L. has planted near South Pass, Illinois, probably the largest experimental

Fig. 2.—ZIMMERMAN.

orchard in the country, embracing some thousand varieties. The apple is a very handsome tribute, since it is considered "to excel all

others in color, size, and quality." It has been supposed that the Lawver would become for the West what the Baldwin is in the East—the favorite winter sort of apple, for all purposes.

Fruit, large, very handsome, regular, oblate; surface, smooth, deep red; dots, numerous, fawn-colored. Basin, medium, regular, or slightly ribbed; eye, small, closed. Cavity, acute, regular, brown; stem, short. Core, wide, regular, closed, not meeting the eye; seeds, plump, dark brown; flesh, yellow, breaking, fine-grained, juicy; flavor, acid, aromatic; use, table, market, and kitchen; quality, best; season, December and all winter. It is an early and constant bearer and escapes injury by the spring frosts.

ZIMMERMAN.—This beautiful fruit has been sent by Mr. Lawver, who received it from Western Missouri. It is not recognized as any known variety, and is therefore described.

Fruit, large and beautiful, oblong, truncated, regular; surface, smooth, light red on yellow, splashed bright red; dots, numerous, gray and fawn-colored. Basin, deep, regular; eye, small but long, closed. Cavity, deep, acute, clean; stem, medium, brown. Core, medium, closed, clasping; seeds, few, short, plump, wide. The flesh

is of a light yellowish color, breaking, and fine-grained; the flavor is subacid, mild, rich, but not highly flavored; use, table and market; quality, good to very good; season, December.

More About Quinces.

In December last we alluded to the scarcity of quinces, and mentioned that Angers Quince stocks upon which pear buds had failed had been used to fill orders. We did not do this with the intention of speaking against the Angers, but to illustrate the scarcity of those sorts usually grown for their fruit. We know of some who regard the fruit of the Angers as highly as they do that of any other variety.

Mr. J. L. Galloway, Milford, Ohio, writes as follows: "Until within the last year quince trees could not be sold in large quantities at any price. To illustrate. A tree planter called the other day for 200 trees; I asked him \$20 per 100, when he exclaimed, 'Why, quince trees must have raised. Four years ago, I bought them at \$5 per 100.' Now, the fact is, the present call for this stock is one of those spasmodic cases so common to our trade. "You also speak of filling orders with Angers in rather a disparaging connection. Now, it is a fact, that here in Southern Ohio the Angers, Fontenay, and Portugal, are all becoming quite popular, and we often have orders for all of them. On my sandy and gravelly soil, I find the Fontenay better than all other varieties, both for fruit and stocks, for dwarfing the pear. Its fruit is now (Dec. 8th.) keeping in my cellar as perfectly as it was the day it was taken from the

tree. This variety this season was fully as large and much more handsome with me than the Orange variety; and trees 6 years old had more fruit upon them than trees of the Orange variety 13 years planted had. The fruit of the Fontenay quince is much firmer and heavier than other kinds, cooks quicker, and is less astringent. I have long been advising those who plant the Peach for profit, to substitute the Quince."

Cold Frames.

Cold frames in gardens, if they have been carefully attended to during the early part of the season, and the cabbage and other plants in them properly hardened off, may now be more exposed than heretofore. By this time the plants should be so tough that hardly any amount of freezing will injure them. The most that is necessary is to prevent their being covered with snow. On this account, and chiefly on this account, it is not safe to leave the sashes up or off, even during the mildest nights, lest a sudden change of weather should do damage; but during all sunny days, no matter how cold, unless the wind is blowing violently, it will be of advantage to the plants to strip the sashes off entirely. Even yet, and until the first of March, they should be kept covered in the morning, until after the frost is thawed off from the under side of the glass.

Plants which have been treated as we direct may be set out in place in the field as early in March as it is possible to prepare the ground for them; and although, as during last spring, the whole of April and a part of May may be so cold and so wet that they will not grow at all, they will be in no way injured, and so much of the heavy work of the spring will be done and out of the way. To use the sashes with the greatest economy, there should be another set of frames ready to receive them as soon as they are removed from over the cabbages. The earth in these frames should have been prepared the autumn before, and well covered with litter, to prevent hard freezing. Lettuce plants taken from the cold frames may be rapidly forwarded in these as soon as the sashes can be used to cover them; and after the lettuce is out, they may be used for the early crop of cucumbers.

The Barberry for Hedges.

Some two years ago we published about all that was known regarding the use of the Barberry for hedges. Our correspondence shows a continued interest in the matter, and we will briefly answer the queries proposed. The Barberry makes a beautiful hedge, grows quite rapidly, is not disposed to sucker far away from the stems, and bears the shears well, though it requires but little cutting. Whether it would be proof against breachy cattle, we are not yet satisfied. We have seen no hedge of it equally "bull proof" with the Osage Orange or Honey Locust. This is a point on which we would like reports. The plant is best raised from seed; it will grow from cuttings or layers, but not so readily as other plants. Seeds are now sold by our large dealers. It would be better to procure the seeds in the fall, and keep them mixed with sand during winter. Those that have been dried are slow in germinating. We never had occasion to sow the seed but once, and then it was mixed with damp sand and exposed to the weather. The plants came up in great abundance. The young seedlings should be carefully thinned, weeded, and watered.

Evergreens in Pots.

BY JOSIAH HOOPES—AUTHOR OF BOOK OF EVERGREENS.

For many years past, the pot-culture of Evergreens has been a feature in the nurseries and arboretums of Europe, while Americans have nearly overlooked this practice, with all its consequent advantages and profits. The main advantages to be derived from growing Evergreens in pots are—their early removal, comparative safety during transportation, the ease in handling, successful transplanting, promotion of fibrous roots, etc. The rarer species only are grown in pots, as the common and cheaper kinds will not remunerate for the extra expense. The seedlings or cuttings should be early potted off, to induce an abundance of fibrous roots at the commencement, as well as for the purpose of hardening the stem, and making the plant stocky. A proper compost is two parts of good turfy loam, one of muck or well-rotted leaf mould, and one of coarse, sharp sand; to which may be added a small proportion of old hot-bed manure, thoroughly decomposed. Never, under any circumstances, use fresh manure, sand from a bank, nor muck or leaf mould that has not been exposed to the action of frost. A sandy mould is preferable to a clayey one. The young plants should never be shifted into larger pots, unless the roots become very plentiful on the surface of the ball of earth. We have known instances where valuable plants were killed by using too large pots, and thus causing the young rootlets to rot. Evergreens never require a great abundance of water, but they should never suffer from its being withheld too long. A thorough drainage should always be used. Rough pebbles, broken pots, charcoal, etc., are excellent, with a slight covering of moss. During the summer, the pots should be sunk in the ground up to their rims, and they will consequently need but little attention, except an occasional watering and weeding—little, if any more in fact, than when growing in the soil of the border. We have seen in some places very pretty effects produced with these young Evergreens in pots, by placing them in certain positions, to form neat-looking beds of various shapes—the taller ones in the centre, gradually sloping down to the little specimens in the outer circles. Our nurserymen in the Northern States are often desirous of growing some of the half-hardy species, but are deterred by the losses sustained during winter. Pot-culture offers a remedy. The plants may be taken up in the autumn and sunk in cold-frames. They are then easily protected by a good thick covering of rough manure around the sides of the frame, whilst the top should have tight shutters, to cover it securely. A cool, dry cellar is an excellent place in which to winter young Conifers in pots, and will pay for itself in a short time. Whoever has visited the beautiful collections at Wodenethe on the Hudson, or Wellesley near Boston, must have been pleased with the oriental appearance produced by the large Araucarias, etc., grown in tubs. There is something indescribable in the novel effect of these tender strangers, intermingled with the well-known Spruces and Pines, so familiar to us all. To have these in perfection requires a large glass-house during winter, and consequently their

culture must, to a certain extent, be limited; but there are very many plants with evergreen leaves, that can be grown in large pots for several years, and which will prove very valuable for decorative purposes; as, for instance, *Pinus patula*, *P. longifolia*, *P. Canariensis*, *P. Devoniana*, *P. filifolia*, *P. Gordoniana*, several species of *Cupressus*, *Dacrydium*, *Frenela*, *Juniperus*, *Podocarpus*, &c., &c. As the plants become unmanageable, they should be supplanted by younger ones, which will last for several years. By sinking the pots their whole length

By simply locating steps on the left or right hand side of the piazza, the drive could be carried on the side of the house, leaving the front lawn entirely free for ornamenting, and thus avoiding a large graveled space where a lawn would appear much better, and be less trouble.

To economize space, instead of establishing a turn on the right of the house, the drive is carried up to the stable yard at C, which is made a few feet larger than usual, to allow vehicles to turn and drive back to the front steps. This arrangement greatly simplifies the

PLAN FOR LAYING OUT A SMALL PLACE.

in the ground, the tender occupants have the appearance of growing in the position where they are placed, although the larger plants in tubs are attractive when simply set on the grass in suitable positions, either singly or in groups.

Plan for Laying Out a Small Place.

BY EUGENE A. BAUMANN, RAHWAY, N. J.

[The following plan, by one of our most eminent landscape gardeners, will meet the wants of many owners of town or village lots.—Ed.]

This plan shows a town or suburban lot about 350 by 400 feet, having about one-half the area in walks, yard, and vegetable garden.

The laying out is in the simple style generally preferred for such places; the vegetable garden is in the rear, and being near the stable yard, manure is readily carried to the ground.

The carriage approach, 12 feet wide, strikes the dwelling A, just in front. This is an arrangement to which I am generally opposed, preferring to have the main front free, and the entrance somewhere on the side; but as in most small suburban houses, in consequence of the interior arrangements, the main entrance is the front, the drive is made to conform to it.

whole, but I am afraid that many persons will object to turning in front of the coach house, though that place can be kept as clean as any other. At D, in a triangle left between the stable yard and one of the walks, there will be room for a drying ground. At B, in the rear yard, there is the well, near the kitchen door; at E, a grape arbor, subdividing the rear of the house and the yard from the pleasure ground, leading in a straight line to the central walk in the vegetable garden. At F, is suggested a small flower garden on the sunny side of the building; more flower beds could be made on the soddings surrounding the dwelling, near the grape arbor, or in single groups on the lawn, but the smallness of the scale hardly allows them to be represented. The vegetable garden at the rear is divided into two main parts; one, G, for the ordinary annual crops on the right; the one on the left is in the three divisions, H, I, K, for Asparagus, Strawberry, and Rhubarb beds, or perhaps for Gooseberries, Blackberries, and Raspberries. Borders of eight feet in width, all along the fences, are intended for standard and dwarf fruit trees, placed alternately, while the two borders along the central path are for small fruits. The upper border, at M, most exposed to the sun, may best answer for a trellis of Grape vines, with Currants and Gooseberries in front. At O, O, O, a hedge is indicated, dividing the vegetable garden from the pleasure ground. This hedge ought to be of some kind which answers well in a shady place, as the belt of shrubbery suggested between the pleasure ground and the hedge will partly shade it. The Barberry will be the best.

The part of the lawn N is mainly surrounded by deciduous shade trees, like the Sycamore, Norway Maple, and American Linden, and could be advantageously used either as a croquet ground, or a play-ground for children.

The trees in the rear of the house, as well as those in front of the stable yard and north of the grape arbor, are mostly Evergreens.

Other evergreen trees, principally Hemlocks and White Pines, and some Junipers, may be employed to advantage right and left of the two gates, but mixed with deciduous kinds.

The balance of the plants, especially along the south-west fence, is to be mostly of deciduous trees and shrubs, with single evergreen trees of various sizes and sorts in front of them. Groups of flowering shrubs, such as Weigelia, Spiraea, Deutzias, and Hydrangeas, ought to be detached from the densely crowded belts, to show better.

PLANTS IN THE CELLAR need air on mild days. They are more apt to suffer from dampness than from dryness, yet they should be looked to occasionally, and not be allowed to become what Mr. Henderson calls "killing dry."

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

The Table—Order and Ornament.

Some remarks under the above head have called out a request that we should be more explicit and tell those who have a desire to appear at the best their circumstances will allow, something more on the

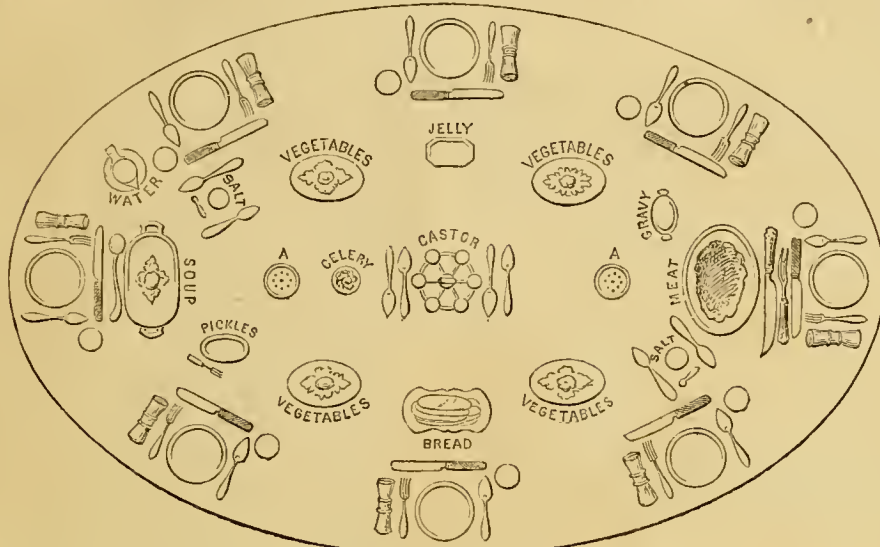

DIAGRAM FOR SETTING A TABLE.

subject. We designedly put "order" before "ornament," as being more desirable and more readily attained. In no one thing in the household is order more desirable than in the arrangements of the table, and we propose to say a word about setting a table. Many will think this too simple a matter to write about, but it must be recollected that there are hundreds living in isolated places who desire to know how such simple things as this are done elsewhere, and who wish to conform to the best usages. Who would not rather partake of a simple meal at a well-ordered table than an elaborate dinner at a slovenly one? There are two things necessary to the proper enjoyment of a meal, whatever or wherever it may be: these are order and scrupulous neatness. The writer once had a "help" who had been for a long time on a steamboat. She was a good cook, but oh! what a mess she made of the table! The plates and knives and forks were chucked on, steamboat fashion, and the castor, salt-cellars, and other articles, never in the same place twice in succession. But we did not start with the intention of telling how not to do it. In the great majority of families no domestics are kept, and all the table arrangements, where this is the case, should be with a view to avoid, as far as possible, the necessity of any one's rising to get a missing article, or for the change of plates. A diagram is here given of a table set for a family of eight; the oval form of a table is the pleasantest, as there are no corners, but the same order may be observed in a square one. Each plate has knife, fork, spoon, napkin, and glass for water. The meat is placed before the "man of the house," with carving knife and fork; also the steel, which we forgot to put in the diagram. Soup is served by the lady. We are well aware that soup is not frequently served at farmers' tables, but that is no reason it should not be, and we put it in the diagram as a reminder that a cheap and nutritious food is much neglected. The castor occupies the center; butter, when used at dinner, stands at A, A. Four dishes of vegetables are indicated, which are more than are generally used. Where there are fewer, let them be placed near the older members of the family. A spoon should be put upon the table for each dish to be served, with one or two to spare. Salt, if in large salt-cellars, needs salt spoons. Small salt-cellars, one to each plate, are much in use; with these no spoons are needed. Where there is no help, the dessert should be arranged on a side table, close at hand, and there should also be

a place for dishes to be removed. When plates are to be changed it should be the business of some particular member of the family to do it quietly. The table should be set as nearly as possible in the same way, so that those who sit at it will always know where to look for whatever they may require. In the way of neatness, clean table-linen is of the first importance. If an accidental spot is made upon the cloth before it is generally soiled enough to change, lay a napkin over it. Have

the glasses carefully wiped, the knives perfectly clean, and the silver bright. A table thus arranged will always look cheerful and homelike. We leave the family seated at it, and postpone the serving of the eatables thereon until another time.

Household Talks.

BY AUNT HATTIE.

TRIMMING LAMPS.—Some always use a pair of shears to trim their lamp wicks. I never do. A better way, and one which I invariably practice, is to pinch or wipe off the black crust with a piece of paper; you may keep a cloth for the purpose, if you wish.

You will find that the flame will be perfect in shape, and exactly in the center of the lamp chimney, and also that the wick will last twice or three times as long,—quite a desideratum in the country, where I have known it to be necessary to harness the horse and drive to town for lamp wicks.

CUTTING UP AND SALTING PORK.—Farmer Johnson brought me my two-hundred-pounder the week before Christmas. I was anxious that he should kill two or three weeks before that time, but he insisted upon it that the hogs were not fat enough, and as I knew that he must be better acquainted with his own business than I could possibly be, I allowed myself to be persuaded. I have long since ceased to depend upon Edward for assistance in culinary matters, and I have been the more willing to excuse him, because of his promptness in providing funds wherewith to procure other and better help.

Farmer Johnson also has become fully acquainted with this deficiency, and annually brings his butcher knife with the hog. I quite enjoy the cutting up process, both because I have the satisfaction of knowing that it will be done exactly as I wish, and because I enjoy an hour's social intercourse with a genial, practical, and intelligent farmer.

"Now, Mr. Johnson, I want you to cut the hams as large as possible; cut right into the side as far up as my finger." "Why! marm, that'll leave full three inches of fat on the lean, and will make the fitch mighty small."

"I do not care for that; whatever fat you leave upon the ham will be ham, and if you leave it on the side it will be bacon. The one is worth 25 cents a pound, and the other only 15 cents."

"You don't calculate to sell your hams?" "Oh no! that is not my idea at all, but a slice of fat ham

for breakfast will taste better than a slice of fat pork; besides, the lean of the ham will be far juicier, sweeter, and better, and the fly will be better resisted, if it should be exposed. The jagged side ends will do for lard, or will make a small roast."

The head is divided, and the cheeks or jowls cut off in good shape. They will, of course, be cured with the rest of the pork, and will, after being boiled and skinned, make excellent side dishes with roast or boiled chicken or veal.

Mr. Johnson is an Englishman, and cures his pork in the English way. As it has been always more convenient for me, and as I like it too, I have followed his directions, which are as follows:

Lay the sides upon a board suitable for the purpose, which should be raised from the ground. Rub in on both sides a quantity of salt and a little pounded saltpeter: after rubbing, allow about half an inch depth of salt on the side; place the other side over the first and salt in the same way, then the shoulders or hams, heaping over these as much salt as you can; then the cheeks or jowls. Allow more saltpeter to the hams and shoulders than to the rest. The color of the lean will be much improved, and I think the flavor will be better. The cellar should be occasionally visited and the pork examined, and any exposed places rubbed with a little more salt. In five or six weeks I take them from the salt, of which there will be but little left, wipe dry, fold in newspapers and cloth bags, and hang in a dry, warm room until they are ready to store in the attic. If the sides are too large to handle conveniently, they may be cut into any size required. I am very well aware that this method is entirely contrary to the practice of most American housekeepers, yet I am convinced that should they become used to the plan they would be willing to acknowledge that they like it far better. Of course the hams may be smoked, if that distinctive flavor is preferred.

KEEPING EGGS.—The eggs are coming in quite plentifully now, and I prepare them for keeping any length of time, fresh and good, as follows: Place ten or a dozen in a small basket and immerse them in boiling water, taking out almost instantly. I then pack them, small end down, in dry salt or sawdust, as convenient. If they were rubbed over with a little warm lard it might be an advantage. To dip them in boiling lard would not do, as fat boils at a much higher temperature, and the shells would immediately crack. The principle of this method is obvious. The entire portion of the surface of the white of the egg immediately under the skin-like membrane which exists in every egg is congealed, thus forming an impervious coating, which prevents the evaporation of the contents and consequently the admission of the atmosphere.

ROASTING PORK.—The roast pork we had for dinner was excellent, served as it was to-day. I call it mock goose. A small incision was made in the meat and stuffed with a little chopped onion, seasoned with sage, pepper, and salt. Pork should always be thoroughly cooked. The fat should be removed from the brown gravy, a little water added, but no flour, boiled, and sent to table in a gravy dish. Apple sauce made in a crock in the oven, onion sauce, and fresh boiled potatoes, are the necessary accompaniments.

VEGETABLES.—I never serve carrots, cabbage, or turnips, with cold meats. They are always acceptable and wholesome when brought to the table with hot roast beef, or a leg of mutton, and some like them with chicken; mashed turnip, of course, is excellent with a freshly roasted turkey. Turnips should be well pressed before they are mashed. Carrots are much nicer chopped almost fine, say as large as dice. A trifle of butter, mind only a trifle, stirred in, will improve their appearance and flavor.

TO ROAST A GOOSE.—Procure a young and tender one, if possible. The giblets, which consist of the middle joint of the wings, the neck, with the heart, liver, and gizzard, should be separated, seasoned with salt and pepper, and stewed until tender; when done they should be taken from the water, which should be reserved to add to the brown gravy from the goose when roasted. Remove all the loose fat from the inside of the goose, and stuff

It with a mixture of chopped onions and sage, seasoned with pepper and salt. Two good-sized onions, a tablespoonful of powdered sage, a teaspoonful of salt, and a half-teaspoonful of pepper, is about the proportion. The openings in the skin should be stitched together firmly, so that no grease may enter. Allow no water in the pan, and baste often with the fat from the pan. When the goose is of a fine brown, especially around the wings and legs, it having been in the oven over an hour, you may, I think, if the goose is young, depend upon its being done. The fat should all be poured from the pan, keeping back the brown part, which is the gravy. Set the pan on top of the fire and add the water in which the giblets were cooked, and pepper and salt, in sufficient quantity; boil up and serve in a gravy dish. Hot apple sauce and onion sauce should be served with goose. The onion sauce is made as follows: Boil a dozen onions until tender, chop fine, make a sauce of milk well thickened with flour, and a little butter and salt. When boiling, add the chopped onions, and send to the table hot. The grease from goose should never be sent to table at all. Ducks are excellent roasted and served like any goose. If green peas can be had, all the better; "duck and green peas" are familiar to all epicures.

BRAWN, or HEAD CHEESE.—After the pig's head has been cleaned, soak in water. I use warm water, for twenty-four hours, changing it occasionally. If properly done the rinds will be as white as paper, and will look very nice and delicate. All hairs which resist the knife should be singed with burning paper.

Rub into the pork a little powdered saltpeter, then plenty of salt, and let it stand for two weeks. Take from the salt and soak for half a day, boil tender, remove all the bones, chop pretty fine, place in basins or molds, cover and press. When cold it is ready to serve. Some season with pepper, some add sage; I make mine without either, and eat with mustard and vinegar. The thinner the slices can be cut, the nicer they will be to eat.

Tin-ware to Mend.

One of the street cries of large cities is that of the traveling tinkers, who cry out, "Tin-ware to Mend." From the number of letters asking us to give directions for soldering, one would suppose that a share of our readers had an idea of turning tinkers—and for that matter, why shouldn't they? Tin-ware will wear out, and it is very convenient to be enough of a tinker to be able to stop a leak upon an emergency. The ability to do ordinary soldering is easily acquired by a little practice, though in this, as in other mechanical operations, some will be more apt than others. Those who are disposed to undertake it will learn more from watching a good workman for a few minutes than they can from any instructions, however minutely written. We can only set forth the chief points to be observed. Domestic soldering operations are mainly confined to articles of tin-ware, with occasionally one of copper. Soldering is a sort of pasting together of two pieces of metal by the use of another metal, called solder, that melts at a comparatively low temperature. The solder must readily unite with, or adhere to, the metal to be soldered. That it may the more readily do this, a flux, usually of rosin, is used to protect the surfaces from the action of the air, and secure a more perfect union. Common tin-ware—and some of it is very common—is not made, as is often supposed, of pure tin, but of thin plates of iron, the surfaces of which are merely coated with tin. This is called tin-plate, while vessels made of pure tin, which they very rarely are, are called block-tin. The Britannia ware, white metal, and pewter, of which teapots, etc., are often made, are alloys of lead, tin, copper, and other metals. Ordinary tin-ware is soldered with comparative ease; Britannia, pewter, and the like, require skillful management, as they melt at nearly the same temperature as the solder. Copper is soldered quite readily by the aid of a zinc solution, to be mentioned below. The materials required are a soldering iron, solder, rosin, zinc solution, and a scraper. The soldering iron, so-called, is really a

soldering copper; its shape is shown in the engraving. It may be purchased ready-made, or it may be made by a blacksmith. The copper portion is a cylinder with a four-sided point; it is about an inch and a half in diameter, and weighs about a pound and a quarter. It is fastened to an iron shank, which may be screwed in, or attached by rivets, and this shank fits into a wooden handle. The pointed portion is to be "tinned," as the workmen say, which means that it is to be coated with solder. To tin the point, file it smooth, heat the tool hot enough to melt solder, then quickly file the surface bright, and rub it on a small lump of solder that has been placed on a board for the purpose, using rosin, or a few drops of the zinc solution. If not successful in coating the end with solder at the first attempt, try again. The point being once well covered it will keep so unless the tool is heated so hot as to burn it off. Solder may be had at the hardware stores, or tin shops. Get what is called

SOLDERING IRON.

fine solder, which is better than that used for coarse work. Solder is an alloy of lead and tin. Common rosin, coarsely powdered, should be kept in a little box. The zinc solution is made by putting some muriatic acid, say two ounces, in a wide-mouthed bottle, with twice as much water; add to this some strips of sheet zinc, and when the acid has dissolved all the zinc it will, which will be known by the stopping of the effervescence, it is ready for use. This is best done in the open air, as the gas given off during the operation smells unpleasantly. A scraper is made by grinding down an old file to a smooth edge. The soldering iron is best heated in charcoal, or the coals of a wood fire; if a hard-coal fire is used, more care is required. The copper should never get red-hot, as in that case the coating of the point will be burned off, and it must be re-tinned. Scrape the surface of the portion to be soldered, clean and bright, and sprinkle on a little rosin. When the iron is at the proper heat, wipe its point on a wet cloth and apply it to the end of a bar of solder; a small portion of the solder will be melted and stick to it like a drop. Draw the point of the iron along the place where the solder is needed, recollecting that the metal to be soldered must be heated by the contact before the solder will unite with it and flow. It is well to practice first on some bits of tin, as an unskilled hand may heat the utensil too much, and thus unsolder parts already joined. If any of the iron surface of the tin-ware is exposed, a drop or two of zinc solution must be applied by means of a stick, the surface being previously well scraped. Small holes are most readily stopped by placing a bit of solder on them, and then melting this by means of the iron, so that it forms an adhering drop.

Dissolving—Solution.

The directions to dissolve this or that, and the term solution, are often used not only with indefiniteness, but with great inaccuracy. When we are told to "dissolve starch in cold water" and to "take a solution of lime as thick as cream," we are directed to do that which is impossible. Starch is completely insoluble in cold water, and water mixed with lime to the thickness of cream is no solution at all. For a substance to be in solution in water or other liquid it must be so intimately combined with it that the liquid shall be perfectly transparent, and no separation or deposit shall take place except with a change of temperature. Starch stirred with water will all finally settle when left at rest. Lime stirred with water, in sufficient quantity to make it milky, will nearly all settle, but a very little will be held in solution; all that a pint of water can dissolve is about eight grains. When a liquid has taken up all of a solid it can dissolve at a given temperature it is said to be saturated. We say at a given temperature, because most soluble solids are dissolved more readily by hot liquids than by cold. A notable exception to this is one

that we often have occasion to dissolve—common salt. Boiling water dissolves but a very little more salt than cold water, while in the case of sugar, the amount dissolved is enormously increased as the water is heated. When a substance is very soluble at a high temperature, and less so at a lower one, a portion of the substance is deposited as the liquid cools. A pint of boiling water will dissolve over a pound of alum, but when the solution cools, more than nine-tenths of the alum will appear again in the solid form. To make a solution as rapidly as possible, the solid should be finely divided or powdered, and the liquid should be stirred until solution is complete. If we throw a peck of salt into a barrel of water and allow it to remain there, the lower portion of the water will become saturated long before all the salt is dissolved, and the water above will contain comparatively little. If, on the contrary, the same amount of salt be tied in a cloth and hung at the top of a barrel of water, it will dissolve rapidly; as soon as a portion of water is impregnated with salt, it becomes heavier and sinks, and a circulation is kept up until the whole is dissolved. Here we see the philosophy of the practice of the good housekeeper, who always keeps some undissolved salt upon the top of her meat; as long as this remains undissolved, she knows that her brine is thoroughly saturated—i. e., it contains all the salt that can be usefully put into it.

How to Make Good Bread.

Prof. Horsford recently gave a public lecture in New York upon "The Philosophy of the Oven," in which the whole history of bread-making was discussed. We extract from the report of the lecture the following directions for making bread: "Select good, plump, fully ripened, hard-grained wheat. Have it freshly ground and not too finely bolted. Prepare the yeast as follows: Boil thoroughly with the skins on, in one quart of water, enough potatoes to make a quart of mashed potatoes. Peel the boiled potatoes and mash them to fineness; mix intimately with them one pint of flour, and stir the whole to an emulsion with the water in which the potatoes were boiled. Cool the product to about 80° (lukewarmness), and add half a pint of the best fresh baker's yeast, and a tablespoonful of brown sugar. Set aside the mixture at an even temperature of about 80°, till it works well, or is in active fermentation. Of this yeast take half a pint to a gallon (7 lb.) of flour, mixed with three pints of water, or two of water and one of milk, all at the temperature of about 80°; add a little salt, knead thoroughly, and set aside to rise at the temperature mentioned. When it has risen to nearly the full volume for the dough, divide it into loaves, knead again, set it aside at the temperature already named until it attains the full size of the loaf, and place it in an oven heated to not less than 450°. Let the loaves of dough be smaller than the tins. Keep them covered with flat tin plates or stiff paper until the dough is fully raised and the heat carried up to, and sometimes maintained throughout the loaf at 212°, to convert all the starch to the mucilaginous or emulsion form and destroy the ferment. Then remove the cover, and permit the browning to take place. If the loaves are large, a higher temperature will be required. Seven pounds of flour will make eight loaves of 1½ lb. each when baked, or four of 2½ lbs. each. Such yeast, as is above described, will keep a week in winter and from two to four days in summer. Bread made with it, in faithful obedience to these instructions, will be good.

Potatoes should always be kept in the dark. Rural housekeepers do not need to be told this, but many others who live in towns and cities should know that potatoes exposed to the light, for a day only, have their flavor injured, and the longer exposed the worse they are. Never use a greenish potato.

Breakfast Indian Fried Cakes.—1 quart of meal, 2 eggs, 1 cup of sour milk, 1 teaspoonful of saleratus. Mix them with new milk hard enough to make them round with your hand.

[COPYRIGHT SECURED.]

"ASKING THE BLESSING."—DRAWN BY F. BEARD.—Engraved for the American Agriculturist.

A clergyman recently related the following: Two young friends of his were boarding in Germany with a very devout Catholic lady, who always asked a blessing before each meal. One day she asked the young men how the Americans asked a blessing. One of them, remembering the haste with which so many of his countrymen attack their food, said, "The American blessing is, 'Pitch in.'" A few days after, the good lady, thinking to please her boarders, reverently folded her hands before breakfast and uttered the words, "Pitch in," which they, of course, did. But such a custom, we are happy to know, is far from being universal. Thousands lovingly remember the source from which all good things are sent, and never partake of food without first lifting up thoughts of thankfulness to the great Giver. The picture above shows such a scene. The settler on the far western frontier, who is about to take his noonday meal from the hands of his little daughter, pauses, and reverently lifting his hat, asks God's blessing, while she stands silent and thoughtful, learning a lesson for life. The man who is thus mindful of dependence upon the Father of all will be likely to live continually in His smile and be prospered.

Curious Philosophy.

The former sexton of the John St. Methodist Church in New York was an odd character. On one occasion he had taken a heavy cold, and was hoarsely croaking about, when a friend asked him how he was so unfortunate. "I know just how I got it," replied he. "I was shoveling snow, and my back was very cold. When I went into the house, I stood with my back to the fire for some time, and that gave me the cold. For, you see, I ought to have stood my face to the fire, then the cold would have been driven out; but instead of that it was driven right in through

me, and settled on my lungs." This was equaled by a member of the Board of Agriculture of a certain State. The plan of a new barn was under discussion, and there was a difference of opinion among the members, whether it should be boarded up tight, or left with openings between the siding. One of the members said that he was opposed to the open siding, because the cold coming in from all parts would drive the heat of the hay to the center, and it would therefore burn! One of our editors was present at the discussion and knows this to be a fact.

"All a Settin'."

An exchange gives the following: "Old Farmer Gruff was one morning tugging away with all his might and main at a barrel of apples, which he was endeavoring to get up the cellar stair, and calling at the top of his voice for one of his boys to lend a helping hand, but in vain. When he had, after an infinite amount of sweating, accomplished the task, and just when they were not needed, of course, the boys made their appearance. "Where have you been and what have you been about, I'd like to know; couldn't you hear me call?" inquired the farmer in an angry tone, addressing the eldest. "Out in the shop, settin' the saw," replied the youth. "And you, Dick?" "Out in the barn, settin' the hen." "And you, sir?" "Up in Granny's room, settin' the clock." "And you, young man?" "Up garret, settin' the trap." "And now, Master Fred, where were you settin'?" asked the old farmer of his youngest progeny, the asperity of his temper somewhat softened by this amusing catalogue of answers. "Come, let's hear." "On the doorstep, settin' still," replied the young hopeful, seriously. "A remarkable set, I must confess," added the amused sire, dispersing the grinning group with a wave of the hand.

Superstitions of Miners.

Miners in most countries are very superstitious, as might be expected from their general ignorance, and their gloomy occupation. This is especially true in England, where the miners will tell you of the "knoockers" whom they declare they often hear in the solid rock before them, boring, blasting, and getting out ore. They are not dreaded however, for the miners expect to find good workings when they can hear these mysterious noises. One singular feature in their operations is that they are only heard when the miners themselves are at work; the moment they stop to listen, the knoockers are silent also. From this circumstance, unbelievers conclude that echoes make all the mystery. In Staffordshire a story is current of a miner named Jack, who worked there many years ago. He would never descend the mine in the daytime, when others were at work, but always went down alone at night, and did more than three ordinary workmen could do in the same time. Finally a fellow workman resolved to find out Jack's secret, and quietly descended into the mine after Jack had been there for some time. To his astonishment he saw Jack seated at his ease smoking his pipe, while hundreds of little men were busy at work getting out coals for him. Alarmed at the curious sight, he immediately hastened out of the mine, but had only got fairly away from its opening, when a tremendous explosion was heard, and sulphurous smoke and a quantity of coals were blown out of the mouth of the pit with tremendous force. The next morning Jack was found dead at the bottom of the mine. The miners believe the pigmies were angry at the intrusion of a stranger, and revenged themselves on Jack. No trace of them was ever again seen. It is very easy to see how such a story could have been started from the singular habits of some unusually active workman.

"OUR YOUNG FOLKS."

AN ILLUSTRATED JUVENILE MAGAZINE.

This Magazine has won golden opinions from its many thousands of readers, who have awaited with eager interest each successive number since the first made its appearance, four years ago. Its Stories, Sketches of Travel and Adventure, Poems, and Articles on Historical, Biographical, or Scientific Subjects, have been furnished by the ablest and most popular writers in America and England; and its Illustrations have come from the most skillful artists in the country. The efforts made by the Conductors of "OUR YOUNG FOLKS" to produce for youthful readers a Magazine at once instructive and entertaining, by a wide variety of excellent reading from writers whose names are a passport to the affections of all boys and girls, and to the confidence of older and more cautious readers, have been successful in a remarkable degree. The Press has praised the Magazine in the highest terms as "the Best Juvenile Magazine ever produced in any Land or Language." The wisest Educators of the country have commended it as a most valuable auxiliary to the teacher and parent in the instruction of youth. The most distinguished Clergymen, of all denominations, have spoken of it as an excellent Magazine for the family, and some have commended it as eminently suited to add to the interest and practical benefit of Sunday-schools.

But the strongest and the best testimony to its attractiveness comes FROM THE READERS OF "OUR YOUNG FOLKS."

MADISON, December 2d, 1868.

I have taken "Our Young Folks" ever since the first number made its appearance, and I would sooner go without my dinner every day than lose a single number: it is meat, drink, and lodging for me.

FOND DU LAC, WIS., May 13th, 1868.

To the Editor of "Our Young Folks":

I am a member of a class in school which uses your Magazine for a reading book, and we have taken much pleasure in our reading exercise that we determined to write and tell you how much we enjoy it. You cannot think how tired we used to be of the political speeches and all sorts of dry reading in our old readers. We dragged along in them for the first two or three terms of our school, until our teacher asked us how we would like to have "Our Young Folks" to read in. We all thought we would like it very much, and I meant to have it; and now, after a term's trial, we are prepared to say that we are much pleased and really thank you. We look forward with real pleasure to the time of our reading class now, and we can hardly wait for the new numbers to reach us. Yours, gratefully, for the whole class,

COLDWATER, MICH., Oct. 12, 1868.

I wanted so many new books and tools this year, I thought I would try and get along without "Our Young Folks"; but I can't do it. I am lame, and cannot go off and play with the other boys; so I must have my old friend again.

FAIRBANKS, MINN., Sept. 21, 1868.

My little boy took your incomparable Magazine for two years. But this year I was not able to get it for him at the beginning of the year; at this late day I can get it. I think your Magazine the best that I have seen, and hope to send for it earlier another year.

BERMANN, MO., Nov. 29, 1868.

*** My brother has given me the first and second volumes of "Our Young Folks." I like these so well that I want to own them all, and have tried to earn money enough to pay for them. I have found it a hard job, as money is not as plenty as work; but I have succeeded now, and I mean to keep on taking "Our Young Folks" as long as it is published, which I hope will be for a long time.

PAINTED POST, N. Y., Nov. 24, 1868.

We find your excellent Magazine indispensable in our family.

TOLEDO, OHIO, Nov. 18, 1868.

DEAR SIR:—I wish to renew my subscription for "Our Young Folks" for 1869. My little brother is perfectly delighted with it, and his delight is shared by the whole family. *** Yours, most respectfully,

UTICA, N. Y., Dec. 7, 1868.

MESSRS. FIELDS, OSGOOD & Co.:

My little son has been a subscriber to your excellent Magazine ever since the first number was issued; and he would as soon think of going to bed without his supper as of being deprived of the pleasure the Magazine affords him. ***

BLOOMINGTON, ILL., Dec. 1, 1868.

*** We enjoy "Our Young Folks" so much we feel as though we could not get along nicely without it. Many a lonely and sick hour has been passed pleasantly by its help, and I think it improves all the time.

ALBANY, Dec. 23, 1868.

MESSRS. FIELDS & OSGOOD.—I send \$3, the price for five copies of "Our Young Folks" for 1869. I use your Magazine first rate and I have got four of my chums to take it with me this year. I think I shall like "The Story of a Bad Boy," because I think it is going to be the story of a *real* boy, and that is what I want. I suppose I am a sort of bad boy; somehow I can't help getting into mischief sometimes, but I don't mean to be a *very* bad boy. I hope we shall have more of William Henry's letters. I know a boy just like him. Commence with the January number. Yours truly,

The following extract from a letter of the Chicago Tribune includes additional testimony to the popularity of the magazine among its readers:

"It is very interesting to step in, of a morning, to the publishing house of Fields, Osgood & Co., to see what the mail has brought them from the patrons of a single one of their periodicals—'Our Young Folks.' This juvenile magazine has achieved a most substantial success. Its present circulation is fifty thousand copies, and the rate of increase was never more rapid than now. The prospectus for the new year, with its promise of papers of juvenile science by Mrs. Agassiz, practical instruction by Edward E. Hale, adventurous biography by Mr. Parton, and so forth, and the specimen number issued for January, with the beginning of Mr. T. B. Aldrich's wonderfully taking 'Story of a Bad Boy,' have given the present impetus to subscriptions. But I began to speak of the examination of papers of the morning mail. This brings, at this time of year, an average of 500 letters daily to this department of the store—a pile very formidable on the desk, and requiring several hours of steady labor to attend to. The children themselves write most of the letters: and it is exceedingly curious to see the quaint epistolary methods, and the odd phraseology, which these young folks pick up in their early essays at business correspondence. A remarkably large portion of them come from the Northwest; almost every town in Illinois, Minnesota, Wisconsin, Iowa, Ohio, Indiana, and Michigan is represented in one morning's mail. One enthusiastic youngster in Madison, who has had every number from the beginning, says he would rather go to every number than to his dinner. He has a little magazine, 'Real Folks,' the little boy has written all the kind things said of it by his friends, old and young; and its growing popularity, while it steadily adheres to its plan of developing a taste for the very best literature, is one of the most gratifying signs of the time, so far as the rising generation is concerned."

TERMS.—\$2.00, in advance; 3 copies, \$5.00; 5 copies, \$8.00; 10 copies, \$15.00, and \$1.50 for each additional copy.

N. B.—A copy of "OUR YOUNG FOLKS" for 1869 will be sent GRATIS to any person who will act as agent and raise a club for the Magazine.

Specimen Copy, Premium List, Circulars, etc., sent upon application. The "ATLANTIC" and "OUR YOUNG FOLKS" sent to one address for \$5.00 per annum.

FIELDS, OSGOOD & CO., Publishers, (Successors to Ticknor & Fields,) 124 Tremont Street, Boston.

The leading Serial Story for "OUR YOUNG FOLKS" for 1869 is

"THE STORY OF A BAD BOY."

BY T. B. ALDRICH.

To indicate its general character, and its great superiority to ordinary stories for youthful readers, the Introductory Chapter is given:

This is the story of a bad boy. Well, not such a very bad, but a pretty bad boy; and I ought to know, for I am, or rather I was, that boy myself.

Lest the title should mislead the reader, I hasten to assure him here that I have no dark confessions to make. I call my story the story of a bad boy, partly to distinguish myself from those faultless young gentlemen who generally figure in narratives of this kind, and partly because I really was not a cherub. I may truthfully say I was an amiable, impulsive lad, blessed with fine digestive powers, and no hypocrite. I didn't want to be an angel and with the angels stand; I didn't think the missionary tracts presented to me by the Rev. Wilbur Hawkins were half so nice as Robinson Crusoe; and I didn't send my little pocket money to the natives of the Fejee Islands, but spent it royally in peppermint-drops and taffy candy. In short, I was a real human boy, such as you may meet anywhere in New England, and no more like the impossible boy in a story-book than a sound orange is like one that has been sucked dry. But let us begin at the beginning.

Whenever a new scholar came to our school I used to confront him at recess with the following words: "My name's Tom Bailey; what's your name?" If the name struck me favorably, I shook hands with the new pupil cordially; but if it didn't I would turn on my heel, for I was particular on this point. Such names as Higgins, Wiggins, and Spriggins, were deadly affronts to my ear; while Langdon, Wallace, Blake, and the like, were passwords to my confidence and esteem.

Ah me! some of those dear fellows are rather elderly boys by this time,—lawyers, merchants, sea-captains, soldiers, authors, what not? Phil Adams (a special good name that Adams) is consul at Shanghai, where I picture him to myself with his head closely shaved,—he never had too much hair,—and a long pigtail hanging behind. He is married, I hear, and I hope he and she that was Miss Wang Wang are very happy together, sitting cross-legged over their diminutive cups of tea in a sky-blue towel hung with bells. It is so I think of him; to me he is henceforth a jeweled mandarin, talking nothing but broken China. Whitcomb is a judge, sedate and wise, with spectacles balanced on the bridge of that remarkable nose which, in former days, was so plentifully sprinkled with freckles that the boys christened him Pepper Whitcomb. Just to think of little Pepper Whitcomb being a judge! What would he do to me now, I wonder, if I were to sing out "Pepper!" some day in court? Fred Langdon is in California, in the native-wine business,—he used to make the best licorice-water I ever tasted! Binny Wallace sleeps in the Old South Burying-ground; and Jack Harris, too, is dead,—Harris, who commanded us boys, of old, in the famous snow-ball battles of Slater's Hill. Was it yesterday I saw him at the head of his regiment on its way to join the shattered Army of the Potomac? Not yesterday, but five years ago. It was at the battle of the Seven Pines. Gallant Jack Harris, that never drew rein until he had dashed into the Rebel battery! So they found him—lying across the enemy's guns.

How we have parted, and wandered, and married, and died! I wonder what has become of all the boys who went to the Temple Grammar School at Rivermouth when I was a youngster?

"All, all are gone, the old familiar faces!"

It is with no ungentle hand I summon them back, for a moment, from that Past which has closed upon them and upon me. How pleasantly they live again in my memory! Happy, magical Past, in whose fairy atmosphere even Conway, mine ancient foe, stands forth transfigured, with a sort of dreamy glory encircling his bright red hair!

With the old-school formula I commence these sketches of my boyhood. My name is Tom Bailey; what is yours, gentle reader? I take for granted it is neither Wiggins nor Spriggins, and that we shall get on amicably together in the pages of this magazine, and be capital friends forever.

LYNN, MASS., Jan. 6, 1869.

MESSRS. FIELDS & OSGOOD.—DEAR SIR:—I take for granted it is "The Story of a Bad Boy" a real, true story, or only made up? It begins bully, anyhow. I want to know where is Rivermouth? I can't find it on the map anywhere. My brother says Mr. Trowbridge's "Glass Making" is good. He says Mr. Trowbridge is a regular blower. He's only joking. Yours,

WORCESTER, Jan. 4, 1869.

GENTLEMEN:—Our teacher proposes to use "Our Young Folks" as a reading book during this year. We think it will be quite nice to have something fresh and interesting to read, instead of the same old selections which we know by heart. How much will it cost to have twelve copies of "Our Young Folks" sent? Will they be any cheaper than if each boy should subscribe by himself? Please answer soon.

I remain yours,

Good as "OUR YOUNG FOLKS" has heretofore been, its value for the present year will be greatly increased by the prominence given to *practical* and *instructive* features; to Biography, History, Industrial Subjects, Scientific Articles of a popular yet thoroughly reliable character, Gardening, Declamations and Dialogues. Special attention is invited to the following outline of the leading features of

"OUR YOUNG FOLKS" for 1869.

THE STORY OF A BAD BOY.

BY T. B. ALDRICH.

will be the leading Serial Story in "OUR YOUNG FOLKS" for the year 1869, and promises to be one of the brightest and most entertaining stories ever written for youthful readers.

GARDENING FOR GIRLS.

A highly interesting and important story, written by the Author of "Six Hundred Dollars a Year," and intended to convey hints to young girls as to a useful disposal of their time, and to give valuable assistance in the Study of Botany, serving the purpose for them which was answered for boys in the admirable serial, "Farming for Boys."

HOW TO DO IT.

EDWARD EVERETT HALE will contribute various papers, written for the practical instruction of grown-up boys and girls, and of our young men and women, in the methods of life. They will include suggestions as to the way—How to Talk; How to Read; How to Write; How to Travel; How to Act in Society; and How to Work.

THE WORLD WE LIVE ON.

MRS. AGASSIZ will give a series of papers, explaining in a familiar way many of the phenomena observed in the world about us. She will give an account of the coal deposits, and explain the way in which the coral insects construct islands in the ocean. She will also explain how and why earthquakes occur, and describe some of the more noted ones.

THE GREAT NAVIGATORS, VOYAGERS, AND DISCOVERERS.

MR. JAMES PARTON will contribute a number of Biographical Sketches, taking as his subjects the lives of some of the most eminent navigators and discoverers. These will include Prince Henry of Portugal, Diaz, Vasco da Gama, Magellan, Columbus, John and Sebastian Cabot, Champlain, Hudson, and others.

DIALOGUES.

MR. EPES SARGENT will furnish a number of new Dialogues, adapted to School Exhibitions and Private Representations.

AMERICAN HISTORY

will be presented in articles by MR. J. H. A. DONE.

HUMAN BEES.

MR. TROWBRIDGE will describe some of the more important and interesting branches of human industry, such as GLASS-MAKING, COAL-MINING, SHIP-BUILDING.

NATURE AND OUT-DOOR LIFE

will be the subject of articles by the author of "The Seven Little Sisters," to which others will be added by MR. CHARLES J. FOSTER, and by MR. W. F. G. SHANKS, who will furnish papers upon the FIRE-DAMP, WRECKS and WRECKING, etc.

DECLAMATIONS.

DECLAMATIONS of an entirely fresh character will be furnished by REV. ELIJAH KELLOGG, author of "Spartacus," and "Icilius."

B. K. BLISS & SON,

Nos. 41 Park Row & 151 Nassau Sts., New York,

(Formerly of Springfield, Mass.)

Importers, Growers and Dealers in
Garden, Field, and Flower Seeds,

Horticultural Implements and Garden
Requisites,

World invite the attention of all who are interested in the culture of **Flowers and Vegetables**, to their large and well-selected assortment of the above, comprising the newest and most approved varieties, both of European and home production, the quality and utility of which cannot be surpassed. For a list of these see their

**NEW ILLUSTRATED SEED CATALOGUE,
AND
GUIDE TO THE FLOWER AND KITCHEN GARDEN.**

The *Fifteenth Annual Edition*, enlarged and improved, contains 132 pages of closely printed matter, beautifully illustrated with 100 Engravings, and a descriptive list of 2,500 varieties of *Flower, Vegetable and Agricultural Seeds*, including all the novelties of the past season, with explicit directions for their culture; also, a list of 125 varieties of *French Hybrid Gladioli*, embracing many new sorts now offered for the first time in this country—with many other *Summer Flowering Bulbs*, consisting of *Amaryllis, Tuberoses, Tigridius, Lilies*, etc.; with much other useful information upon the subject of gardening generally. A copy will be mailed to all applicants upon receipt of 25 Cents. Our regular customers supplied without charge.

**Bliss' Gardeners' Almanac
for 1869**

Contains 63 pages of closely printed matter, embracing a *Monthly Calendar of operations*, and a priced list of the leading varieties of *Grains, Fodder and Flower Seeds*, with brief directions for their cultivation. A copy will be mailed to all applicants enclosing a three cent stamp.

Address B. K. BLISS & SON, Box 5,712 P. O.,
41 Park Row, and 151 Nassau-st., New York.

Tomatoes, Tomatoes.

KING OF THE TOMATOES.—A new and superior variety of this valuable esculent, combining more good qualities than any other variety in cultivation. Plant strong and vigorous; fruit, above medium size, grows in clusters; firm, round, somewhat flattened at the ends, seldom creased or wrinkled; color, a deep, rich red, very slow and attractive in appearance; flesh, very solid, with but few seeds, of fine flavor; very productive, ripens with the Tilden. Its great beauty and remarkable keeping properties make it a most desirable market variety, while its solidity and agreeable flavor make it equally desirable for canning. Price 25 cts. per packet; 5 packets for \$1.

GENERAL CRANT.—Size, above the medium, three to four inches in diameter, growing in clusters, firm, round, slightly flattened, very regular, symmetrical, and rarely ribbed or wrinkled; color, brilliant, glossy crimson; flesh, unusually firm, solid, and free from water; weighing from ten to twenty pounds more per bush than any other variety; skin, remarkably fine, smooth and shining, coloring well up to the stem; very productive, and of the finest flavor, bears carriage well, and keeps in good condition a long time after being gathered. 25 cts. per packet; 3 packets for \$1.

CRIMSON CLUSTER TOMATO.—This variety grows in clusters of from 15 to 20, each cluster weighing from 4 to 6 pounds. Fruit, of first quality and very early, perfectly smooth, of average size, and of a scarlet crimson color, delicately tinted with specks of pure golden yellow. It ripens if whole cluster at once. 25 cts. per packet; 5 packets for \$1.

BOSTON MARKET.—An improved variety of the "Large Smooth Red"; very productive, showy, and of superior quality. It is extensively grown by the market gardeners in the vicinity of Boston, who esteem it above all others as a market variety. Our seed was selected from the stock of one of the most successful growers in New England. Per packet 15 cts.; per ounce 7 cts.

ORANGE-FIELD PROLIFIC.—An English variety of great merit. The experience of the past season fully confirms what we stated of this variety when we first offered it last spring, and we have no hesitation in pronouncing it the earliest and one of the most productive varieties in cultivation. In our trial-grounds it proved a week earlier than any other variety on our Catalogue. The dwarf and compact growth of the plant makes it particularly desirable for forcing. Per packet 25 cts.; five packets for \$1.

One packet of each of the above varieties \$1.00. Also the following well-known varieties at 10 cts. per packet: *Keen's Early, Cedar Hill, Tilden, Maunpoy's, Sim's, Earl's Cluster, Extra Early York, Cook's Favorite, Mammoth Chihuahua, Larue's, Best Smooth, Nice, Perfected, Pear, Cherry, Strawberry, etc., etc.*

NEW CROP ONION SEED.

Red Wethersfield, Yellow Dauvers and White Portugal, grown for us in Connecticut the past season. One ounce 50 cts.; 4 ounces \$1.75; 1 pound \$6.00, mailed postpaid to any address upon receipt of price.

Address B. K. BLISS & SON, P. O. Box 5,712,
Nos. 41 Park Row and 151 Nassau-st., New York.

New and Choice Potatoes.

CLIMAX.

This CLIMAX is a seedling of the Early Goodrich, and is thus described by the savor:

"It has a stout, erect stalk, large leaves; tuber, about medium size, smooth, cylindrical, one, two, or three; eyes, shallow, but strongly defined; skin, considerably netted or russet, tough, white; flesh, entirely white, solid, heavy, brittle, and never hollow; boils through quickly, with no hard core at center, is mealy, of floury whiteness, and of superior table quality. It is equally productive with the Early Rose, but a few days later, earlier than the Early Goodrich, while its keeping qualities are as good as the Peachblows." Price \$3.00 per pound, by mail, post-paid.

BRESEE'S PROLIFIC (or No. 2).

This remarkable variety originated with Albert Bresee, Esq., of Hubbardton, Vermont, who was also the originator of the justly celebrated *Early Rose*, both varieties being produced from the same seed-bait of the Garnet Chili.

The vines of *Bresee's Prolific* are of medium height, quite bushy, somewhat spreading, large leaves, have produced no seed-balls. Tubers, large, regular in shape, and very smooth, slightly oblong, somewhat flattened. Skin, dull white, inclining to be russeted; eyes, but little depressed and slightly pinkish; flesh, white, cooks quickly, is very mealy, and of excellent quality, yield very large, often exceeding *One Hundred fold*, matures about three weeks later than the *Early Rose*, and will prove a most valuable variety for field culture. A silver medal was awarded to this variety at the annual exhibition of the Mass. Hort. Society, last September. Price \$3.00 per pound by mail, post-paid.

EARLY ROSE.

Among the many thousands of our patrons to whom we furnished this valuable Potato last spring, we have yet to hear from the first one who is not fully satisfied with his purchase. The only regret expressed is that they had not procured more. We are daily in receipt of the most flattering testimonials, not only of its earliness and good quality, but of its astonishing productiveness, some of which seem almost fabulous. Several reports of having grown a barrel from a single pound; a yield of one hundred fold is an every-day occurrence. The following well-known gentlemen have given it their unqualified approval, and endorse it as the best, most productive, and earliest variety in cultivation: Hon. Marshall P. Wilder, Chas. Downing, Esq., Rev. Henry Ward Beecher, Fearing Burr, Esq., Dr. J. G. Holland, (Timothy Titcomb), and many other prominent agriculturists, horticulturists, and market gardeners. We shall continue to execute cash orders through the month of February at the following prices:

One pound, \$1.00; Three pounds, \$2.00, by mail, post-paid. One peck, (15 lbs.), \$5.00; 1/2 bush, \$8.00; 1 bush, (60 lbs.), \$15.00; 1 hbl., (165 lbs.) \$40.00. Prices to the trade, in larger quantities, will be given upon application. The freight on all packages by express, boat, or railroad, to be paid by the purchaser. No charge for packages or cartage.

Upon receipt of \$5.00 we will mail, post-paid, to any address in the United States or British Provinces, ONE POUND EACH OF THE CLIMAX, BRESEE'S PROLIFIC, and the EARLY ROSE. Orders will be booked in the order in which they are received, and the potatoes forwarded on and after April first, when they will be free from danger of frost. They can be forwarded earlier if desired, at the risk of the purchaser. No orders will be accepted unless accompanied with the cash.

In addition to the above, we have a large stock of EARLY SEEDS, EARLY GOODRICH, VANDEVER'S SEEDLING, JACKSON WHITE, HARRISON, &c., which we offer at the lowest market prices.

Our descriptive priced list of potatoes mailed to all applicants.

B. K. BLISS & SON.

41 Park Row and 151 Nassau-st., New York.
(P. O. Box 5,712.) Formerly of Springfield, Mass.

GREGORY'S ANNUAL LIST

OF

Choice Garden Seeds.

Having in former years introduced to the public the Hubbard Squash, American Turban Squash, Marblehead Mammoth Cabbage, Cannon Ball Cabbage, Mexican Sweet Corn, Brown's New Dwarf Marrowfat Pea, Boston Curled Lettuce, and other new and valuable vegetables, with the return of another season, I am again prepared to supply the public with seed of the purest quality of any of the above, and also many other new and rare kinds. My Annual Seed Catalogue, containing a list not only of all novelties, but also of the standard vegetables of the garden, (over one hundred of which are of my own growing), will be forwarded gratis to all who write for it.

A package of any of the varieties in the following list (of which a full description will be found in my Catalogue) will be forwarded to any address for 25 Cents, and warranted to reach each purchaser.

Alger Tomato, Gen. Grant Tomato, Marblehead Mammoth Cabbage, Cannon Ball Cabbage, Fattler's Improved Brunswick Cabbage, Carter's Dwarf Mammoth Cauliflower, Carter's Champion Broccoli, Ornamental Kale, Mammoth French Squash, Norrithon Giant Cucumber, Sugar Trough Gourds, Vegetable Caterpillars, etc.

Also, the following kinds at 15 Cents per package: White Japan Cucumber, Columbia Sweet Corn, Alton Nutmeg Melon, New White Tomato, Boston Market Tomato, Orange-field Tomato, Mammoth Tomato, Cedar Hill Tomato, Maunpoy's Tomato, Early York Tomato, Alsike Clover, Berberry Seed, New York Farmers' Club Sweet Corn, Giant Wax Bean, Early Fejee Bean, Concord Bean, Herring's New Turnip Beet, White Japan Mustard, Phoenix's New Watermelon, Boston Market Celery, Reed's Latticess Celery, Ornamental Gourds, Mammoth Millet, Mammoth Russian Sunflower, Striped-leaved Japanese Maize, Improved American Savoy Cabbage, Early Umi Savoy Cabbage, Jersey Cow Kale, Bates' Extra Early Sweet Corn, Mammoth Plant Corn, Mexican Sweet Corn, Dwarf Broom-corn, Hubbard Squash, American Turban Squash, and Improved Long Green Cucumber.

All seed ordered warranted to reach my customers. For full details, describing each of the above and many other new varieties, see my Catalogue, which I shall be happy to forward gratis to all.

JAMES J. H. GREGORY,
Marblehead, Mass.

VALUABLE CATALOGUE.—See last page of cover.

CUCUMBER, GEN. GRANT.

A superior variety, either for forcing or for culture in the open ground. It is perfect in form, solid and crisp, and of a most agreeable flavor. Many specimens were grown the past season averaging thirty inches in length. After a five years' trial, we unhesitatingly pronounce it better than any other variety for forcing.

Packets, containing 10 seeds, 25 cents. Five Packets for \$1.00.

**Conover's
COLOSSAL
ASPARAGUS.**

A European variety, introduced several years since, which, by a careful selection of seeds from the most vigorous shoots, has been wonderfully improved, both in size and quality, in point of which it surpasses all other varieties in cultivation. Specimens were exhibited the past season, by Mr. Conover, which were grown along side the best "Oyster Bay" varieties, and received the same care and treatment, which attained four times the size of that popular variety. Though but two years from the seed, many of the plants produced from twenty to thirty sprouts, averaging from two to four inches in circumference, and were ready for cutting one year in advance of the ordinary varieties. Packets, containing 1/2 ounce, 50 cents. B. K. BLISS & SON, 41 Park Row, and 151 Nassau St., New York, (P. O. Box, 5,712), formerly of Springfield, Mass.

FLOWER AND VEGETABLE SEEDS.

Owing to the large and increasing trade, the subscriber has made a business connection with E. S. Buchelder and I. M. Dagg, the firm name being changed to *Ferre, Buchelder & Co.* HENRY FERRE.

Our *Illustrated Catalogue and Vegetable and Flower Garden Manual*, containing a list of all the valuable varieties of *Flower and Vegetable Seeds of American growth*, together with many varieties and novelties obtained from the most reliable *English and Continental Dealers and Growers*, with special directions for their cultivation; also, a list of many *Summer Flowering Bulbs, Small Fruits, etc.*, with many other valuable hints for cultivators, is now ready, and will be forwarded to all applicants upon receipt of 10 cents, which is not one-half the cost. Address

FERRE, BACHELDER & CO.,
231 Main St.,
Springfield, Mass.

ALL who have Children to Educate, or School Taxes to pay, should see *American Educational Monthly* for January, 48 pages of interesting matter. Price, 15 cts. J. W. SCHERMERHORN & Co., 14 Bond-st., N. Y.

CHEAP LANDS IN INDIANA.

The Indiana and Illinois Central Railway Co. offer for sale 40,000 acres unimproved land, in the Central and Northern counties of Indiana; on and near Railroads; in well-improved neighborhoods; in not less than forty-acre tracts; at low prices, and on easy terms. Tracts, part prairie and part timber can be selected. Here is a rare chance to get cheap land, in one of the best agricultural States in the Union. Address JOHN R. ELDEB, Agent, Indianapolis, Indiana.

My Three Warrants!

1st.—I insure all the seed I send out to be as represented. 2d.—I insure all seed ordered shall reach my customers. 3d.—I insure all moneys sent to my address (sums of \$5 and upwards taken in P. O. Orders, or Cashiers' Checks), will reach me. No fair man can ask more than this. *Catalogues gratis to all.* JAMES J. H. GREGORY, Marblehead, Mass.

Diplomas for Prizes.

Plain and in colors. Samples sent on application. Address THE MAJOR & KNAPP ENGRAVING, ME'G & LITH. CO. 71 Broadway, New York.

FRUIT FARMS FOR SALE.—A number of desirable farms, planted with selected fruits for market. Prices from \$800 to \$10,000. The climate, health, and location unsurpassed. Also Farm and Fruit lands at \$30 per acre. Terms easy. For full information address R. J. BYRNES, Hammonont, New Jersey.

Bloomington Nursery.

18th Year; 400 Acres; 10 Green-houses. Fruit and Ornamental Trees, Nursery Stocks, Small Evergreens, Forest Trees, Hedge Plants, Roses, Grapes, Evergreens, Green-house and Bedding Plants, all of best sorts and shipping sizes. Send 10c. for three spring Catalogues. Bloomington Nursery, F. K. PIGENIX, McLean Co., Ill.

THE BEST BLACKBERRY.—See last page of cover.

WONDERFUL RAPIDITY.

Perfectly Regular and EVEN DISTRIBUTION OF THE SEED. **CAHOON'S PATENT BROADCAST SEED SOWER,** FOR SOWING ALL KINDS OF GRAIN AND GRASS SEED.

This machine has been in use in a few localities for the past ten years, and has proved itself by long trial to be an invaluable implement. The proprietor of the Patent, having been largely engaged in another branch of business, neglected to bring it into public notice.

The subscribers having long known it to be an efficient and very much needed machine by agriculturists everywhere, have recently bought, at large expense, the entire right of manufacture and sale of it, throughout the United States, and are now prepared to supply the trade.

The greatest value of this implement consists in the fact that it distributes the grain evenly in the most perfect manner, thus insuring a larger crop than can be obtained from any other mode of seeding.

Its operation is so simple that anybody can readily use it. The Hand Machine sows from 6 to 8 acres of wheat per hour, and the Power Machines from 15 to 20. It sows

WHEAT, RYE, BARLEY, HEMP, OATS, CLOVER, and HERDS GRASS or TIMOTHY SEED perfectly, and is invaluable for sowing Guano, Superphosphate, or any dry Fertilizer.

We want every farmer in this country to buy one of these machines. Buy them of the nearest dealer in Agricultural Implements, if you can, but if you cannot, we will box and forward by express a Hand Machine on receipt of Ten Dollars, and a Power Machine on receipt of Sixty Dollars. We make a liberal discount to the trade.

We could furnish hundreds of testimonials, but have room only for the following:

PORTLAND, MAINE, October 29th, 1868.

MESSRS. D. H. GOODELL & Co., of ANTRIM, N. H., have this day purchased of me the SOLE Right to manufacture and sell "CAHOON BROADCAST SEED SOWERS," in the United States. They will soon be able to supply the largely increasing demand, and all orders should be addressed as above.

The validity of this patent has been fully established after one of the most exhaustive suits known to Patent Law, and fully believing any practical Seed Sower operating by centrifugal force to be an infringement, I caution the Public against buying or selling any other than the "CAHOON MACHINE," as all infringements will be Promptly Prosecuted.

HENRY H. FURBISH.

Assignee of all Cahoon Seed Sower Patents. SAN FRANCISCO, CAL., 14th May, 1868.

GENTLEMEN:—The "CAHOON BROADCAST SEED SOWER," Hand and Power, are universally used in California, and give entire satisfaction. We sell no other, and no other could sell along side of them. They are the very embodiment of utility. Yours Respectfully,

TREADWELL & CO.

NORA, JO. DAVISS COUNTY, ILLINOIS, May 2nd, 1868.

GENTLEMEN:—I have been using your Power Machine for the last nine years, and I can safely say, it is the best and most durable BROADCAST SOWER that was ever brought before the farming community. I would not be obliged to do without it for three times its cost. I have averaged sowing three hundred acres a year for the past nine years, and therefore think I am competent to judge of the Machine. I could not buy a Machine that would suit me as well, or do the amount of sowing that I have every year. To accommodate my friends, I often go three or four miles away from home to sow grass seed, and I can sow it to perfection, no matter which way the wind blows. I am confident I can beat any one sowing by hand. The agent told me when I bought the Machine if I could sow more evenly by hand he would make me a present of the machine, but I never tried and do not care to. Very Truly Yours,

B. H. KESSNER.

D. H. GOODELL & CO., Sole Manufacturers, Antrim, N. H.

FRANK LESLIE'S Illustrated Newspaper.

The aim of this paper is to furnish a pictorial history of current events. Between thirty and forty illustrations appear in every weekly number, including eight engravings of the pictorial spirit of the foreign press, events of national or local interest, railroad or steamboat accidents, amusing and thrilling incidents, comics, &c. The literary matter comprises, besides well written editorials on the leading questions of the day, and descriptions of the engravings, a serial story of thrilling interest, entertaining narratives and tales, humorous anecdotes, choice poems, &c.
Subscription price, \$4 per year.

FRANK LESLIE'S Chimney Corner.

A purely literary pictorial. Excluding events of the day, its aim, as its title indicates, is to furnish amusement for the leisure hour. Its contents consist principally of original stories by able writers,—including a serial, accounts of remarkable adventures, biographical sketches of self-made men—with portraits,—descriptions of manners and customs in remote countries, short poems, fairy stories, enigmas, conundrums, charades, &c. Illustrated with large and spirited engravings, of which there are from fifteen to twenty in each weekly number.
Subscription price, \$4 per year.

FRANK LESLIE'S Boys' and Girls' Weekly.

One of the cheapest pictorial papers ever published. Intended for the amusement of youth of both sexes. The illustrations and literary matter are such as especially recommend themselves to the young. It contains, besides a continued story and well-written tales, accounts of wonderful adventures, descriptions and illustrations of foreign manners and customs, anecdotes and pictures of animals, familiar and funny fables, parlor magic, &c. From twenty to twenty-five engravings appear in each weekly issue.
Subscription price, \$2.50 per year.

FRANK LESLIE'S Lady's Magazine.

The leading fashion periodical in America. Each monthly number contains a large colored plate of the latest fashions, from designs sent from Paris as soon as invented, which are thus published simultaneously in New York and Paris; also a four-page uncolored fashion plate, embracing the various leading styles. These are accompanied with full descriptions and explanations, with numerous other illustrations. Every number contains an original letter from Paris describing the very latest modes, by a lady whose position gives her access to fashionable society. The literary portion of this Magazine comprises a continued story, numerous interesting tales, poetry, anecdotes, &c. The whole profusely illustrated with fine engravings.
Subscription price, \$3.50 per year.
Specimen copies forwarded on application.
Subscriptions should be sent to

FRANK LESLIE,
537 Pearl Street, New York City.

The most economical Crate and Basket in use. Neat, strong, compact, and well ventilated. Agents wanted in all the fruit-growing districts. Orders for Western New-York direct to S. D. REDMAN, Box and Basket Co., Newfane, N. Y. CIRCULARS SENT FREE.

Is the fastest, cheapest, and best for cutting Turnips, Carrots, Beets or Potatoes, fine or coarse. Need not be paid for till tried and found satisfactory. Send for Illustrated Circular. Agents wanted. PEEKSKILL FLOW WORKS, Peekskill, N. Y., or Cleveland, O.

THE BEST CURRANT.—See last page of cover,

THE AMERICAN AGRICULTURAL ANNUAL

For 1869.

A YEAR-BOOK WANTED BY EVERYBODY.

This volume contains a variety of information of interest and importance to farmers, concluding with a *Farm-er's Directory* in which a list is given of the principal dealers in implements, fertilizers, seeds, horses, cattle, sheep, swine, and poultry.

The following are some of the valuable articles contributed :

- Recent Progress in Agricultural Science,** BY PROF. S. W. JOHNSON.
- "A Few Words on Pigs,"** BY JOSEPH HARRIS.
- Gas Tar; Products and Uses; Roofing etc.,** BY H. W. JOHNS.
- Veterinary Matters,** BY DR. JOHN BUSTEED.
- Diseases of the Cattle of the United States,** BY PROF. JOHN GANGE, OF LONDON.
- Trout Culture,** BY WILLIAM CLIFT.

The volume is

FINELY ILLUSTRATED,

and in its general features is like the Agricultural Annuals for 1867 and 1868, which may be had of the publishers. Sent post-paid. Price, fancy paper covers, 50 cts.; cloth, 75 cts.

ORANGE JUDD & CO.,
245 Broadway, New-York.

THE AMERICAN HORTICULTURAL ANNUAL

For 1869.

A YEAR-BOOK FOR EVERY HOME.

The third number of this beautiful serial is now ready. It contains a popular record of horticultural progress during the past year. Among the contributors will be found the names of

- WARDER, HENDERSON,
- BARRY, HOOPES,
- ELLIOTT, SUCH,
- FULLER, PARSONS,
- BRILL, GREGORY,

and others identified with American horticulture.

It contains a number of

BEAUTIFUL ILLUSTRATIONS.

In addition to articles contributed there is much editorial matter, Tables, Lists of Nurserymen, Seedsmen, and Florists, the Books of the year, etc. Sent post-paid. Price, fancy paper covers, 50 cts.; cloth, 75 cts.

ORANGE JUDD & CO.,
245 Broadway, New York.

HOW CROPS GROW.

A TREATISE

ON THE

Chemical Composition, Structure, and Life of the Plant,

FOR ALL STUDENTS OF AGRICULTURE.

WITH NUMEROUS ILLUSTRATIONS AND TABLES
OF ANALYSES,

BY

SAMUEL W. JOHNSON, M. A.

PROFESSOR OF ANALYTICAL AND AGRICULTURAL CHEMISTRY IN YALE COLLEGE; CHEMIST TO THE CONN. STATE AGRICULTURAL SOCIETY; MEMBER OF THE NATIONAL ACADEMY OF SCIENCES.

This is a volume of nearly 400 pages, in which Agricultural Plants, or "Crops," are considered from three distinct, yet closely related, stand-points, as indicated by the descriptive title.

The Chemical Composition of the Plant

Is discussed in three Chapters.

- 1st.—*The Volatile Part.*
- 2d.—*The Ash*—its Ingredients, their Distribution, Variation and Quantities. The Composition of the Ash of various Farm Crops, with full Tables; and the Functions of the Ash.
- 3d.—*Composition of the Plant in various Stages of Growth,* and the Relations subsisting among the Ingredients.

The Structure of the Plant and the Offices of its Organs

Is the subject of the Second Division, in which are discussed

- The Primary Elements of Organic Structure.*
- The Vegetative Organs*—Root, Stem, and Leaf, and their Functions; and
- The Reproductive Organs, viz.,* Flowers and Fruit, and the Vitality of Seeds with their Influence on the Plants they produce.

The Life of the Plant

Forms the Third Division, under which are discussed the Phenomena of

- Germination,* and the conditions most favorable and unfavorable to it.
- The Food of the Plant* when independent of the Seed.
- Sap and its Motions,* etc., etc.

THE APPENDIX, which consists of 12 Tables exhibiting the Composition of a great number of Plants viewed from many different stand-points, will be found of inestimable value to practical agriculturists, students, and theorists.

SENT POST-PAID.....PRICE \$2.00.

ORANGE JUDD & CO.,
245 Broadway, New York,

GRAPE VINES.

Iona, Isabella, Delaware, Diana, Concord, Ives, for garden and vineyard. A large stock of Concord, 1 and 2 years old, from \$35 to \$50 per 1,000. Very fine Iona vines, 1 year old, especially adapted for Clusters, and for gardens and small vineyards. Iona, 1 and 2 years old, for general vineyard planting. All the above at extremely low prices, by dozen or quantity. Terms to Clubs especially favorable.

THE EUMELAN

Is offered to the public as a grape far above all others in its adaptation to meet the wants of the present time.

It is a black grape (dark blue), entirely exempt from all native defects, and equal to the best European kinds for the table and for wine.

It is very vigorous, hardy, and productive. Though ripening earliest of all, (earlier than Hartford), its fruit hangs to the end of the season without shriveling, and is among the best for late-keeping.

It has no near competitor for making red wine, and is the only one of this country that can bear any comparison with the fine European kinds for that purpose. To all who desire to take an active part in the advancement of American grape culture, the present affords an advantageous opportunity that cannot be expected to recur. By extensive trial it has shown itself particularly hardy, and adapted for general cultivation in gardens; and sufficient trial has been made to leave no doubt that it is well adapted for vineyard culture in all measurably favorable localities. For full account send for Pamphlet, General and Special Price Lists, and Club propositions.

The Advantages to Clubs are greater than ever before offered.

AGENTS WANTED for every village where there are not any at present engaged.

Vines 1 and 2 years old, of very fine quality; a few of extra quality.

C. W. GRANT,
Iona, (near Peckskill) N. Y.

SMALL FRUIT INSTRUCTOR.

32 PAGES of plain directions for planting and cultivating, for family as well as market garden, and marketing all Small Fruits. Written from 20 years' experience, and gives all the information of the larger and more costly works, so as to put new beginners on equal footing with old fruit growers. We have hundreds of testimonials, of which the following from Rev. H. W. Beecher is a sample: "Your directions for growing Strawberries and Raspberries are the best I have ever seen." Price 10 cents. Ready in January. Wholesale and retail lists of our plants sent by mail free on application. Address PURDY & JOHNSON, Palmyra, N. Y., or PURDY & HANCE, South Bend, Ind.

The Ives, or Great American Grape.

Its roots and slips for sale by FINCH & NORCROSS, Plainville, Hamilton County, Ohio. The Great Longworth Premium "For the best Wine Grape for our whole Country" was awarded to this Grape, and to our Mr. Finch, by a Committee from remote States, at the Great Horticultural Fair in Cincinnati, 1858. Mr. Finch made the first wine from it; and from a life-long vine-grower, was entitled to the prize. The 27 years this vine has been bearing, without mildew, rot, or failure of a heavy yield, proved its great value.

Those wishing the Genuine vines, propagated in open air, will do well to forward us their orders.

Other vines and Small Fruit for sale.

New and Rare Vegetables.

Having been the original introducer of the Hubbard Squash, Marblehead Mammoth Cabbage, and many other new things, I still continue to make the raising of the seed of new and rare vegetables a specialty, in addition to the standard kinds. Catalogues gratis to all.

JAMES J. H. GREGORY, Marblehead, Mass.

REMARKABLE APPLES.—In 1862, Leroy of France sent to me apples, and clones of the following new kinds: Roy Monstrous, Amelia, Belle, Garibaldi, Citron, Rival, Marigold, Incomparable, Rosa, Rosa Red, Leroy, and Yaloula. These were exhibited by the American Institute and awarded a gold medal. They have fruited with me, and are very fine, all large, ripening in fall and winter. 2 kinds, 2 cents each; 6 kinds, \$2; the 12 kinds, \$3. These new seedlings are from Russia, all ripening in July. Grand Sultan, Transparent Yellow, Scarlet Venus, Transparent Red, Cardinal. 1 variety, 2 cents; \$1; 3 varieties \$2; 5 varieties \$3. Address W. S. CARPENTER, Rye, Westchester Co., New York.

FLAX BRAKES,

That break 2,000 to 3,000 lbs. Flax Straw in ten hours, and take out 65 per cent of woody matter. A man and boy, with one to two horses, can work them. Will break both tangled and straight straw, and save 120 lbs. to the ton more than any other machine, while it does the work better. No danger to life or limb. They weigh about 1,600 lbs., occupy about five feet square, and as now made are strong and durable. Sold all ready to put the belt on pulley and start them. Hundreds are in use, and are admitted to be the best machine to break flax. Flax and tow now bring high prices, with increasing consumption. Send for circular to **JOHN W. QUINCY**, 98 William St., New York City, Treasurer and Agent of the Mallory & Sandford Flax Machine Co.

The best instructions for raising flax are contained in a "Manual of Flax Culture," published by Orange Judd & Co., 235 Broadway, New York.

GREAT TRIUMPH OF AMERICAN INDUSTRY.

SHEEP SHEARS

Patented November 22, 1861; September 30, 1866; and July 21, 1868.

MANUFACTURED BY

Henry Seymour & Co.,

52 Beekman Street, N. Y.

AWARDED

TWELVE First Premiums at

Twelve Different State Fairs, October and November, 1868. Only

Medal and Diploma at American

Institute Fair, October 26, 1867.

"Valuable & Well-made Implements."

HORACE GREELEY, Pres't.

HON. H. S. RANDALL,

President New York Wool Growers' Association, and Author of Sheep Husbandry, says in Rural New Yorker:

"We much like the Sheep Shears made by **HENRY SEYMOUR & CO.** They possess the superior advantage of being made from one piece of metal, which gives them solid springs. The stops are tempered so they cannot wear away and let the blades lap. Among their varieties we entirely prefer for fine wool sheep, Strong's Patent Thumb-piece Shears. The Thumb-piece gives better facilities for clipping the legs, heads, etc., of any kind of sheep. I also use their Toe Nippers. No. 3 is most used. I have tested the articles, and such is my verdict."

\$10 a Day for All.—Stencil Tool Samples free. Address **A. J. FULLAM**, Springfield, Vt.

Compare Prices.

Four Octave Organ, \$50. The same with two sets of reeds, \$75. Five Octave Metropolitan Organ, \$100. The same, with two sets of reeds, five stops, and tremulant, \$125. The same, with two sets of reeds and sub bass, six stops and tremulant, \$150. The same, with seven stops, having Octave completer and Sub Bass, \$175. Cabinet Organ, with two sets of reeds and five stops, having the new and exquisite IMPROVED VOX HUMANA, the best organ of its size which can be made, \$170.

These are specimens of the reduced prices of the **MASON & HAMLIN ORGAN COMPANY**, whose organs are acknowledged the best in the world. They were awarded the Medal at the Paris Exposition, and have received seventy-five highest premiums in this country. This Company have adopted, and adhere rigidly to the policy of selling at the very lowest prices to every one. They therefore print their very lowest prices, which will be found to be very much less than the prices usually demanded, even for greatly inferior work.

Circulars with full descriptions and illustrations sent free to any address.

TO FARMERS.

THE LODI MANUFACTURING CO. invite Farmers and others using manures, to send for a pamphlet descriptive of their Fertilizers. They offer their

Double Refined Poudrette.

equal to the best superphosphate, at the low price of \$25.00 per ton on board, in New York. They also make superior articles of **NITRO-PHOSPHATE AND PURE BONE-DUST.**

WE ASK ATTENTION TO THE FOLLOWING TESTIMONIALS.

Prof. Geo. H. Cook, of the New Jersey Agricultural College of New Brunswick, says: "The Double Refined Poudrette and Nitro-phosphate of Lime, paid us full 100 per cent above their market value, in the increase of crops this year."

Michael Moore, Trenton Falls, Oneida Co., N. Y., says: "With the Poudrette, I have always had a fine crop of Onions; without it a miserable failure. For all root crops and green-house plants I consider it invaluable."

C. G. Starkweather & Sons, Rochester, N. Y., (seed growers) say of the Double Refined Poudrette: "For growing Onions it can't be beat. On Corn, used one and a half blbl. to the acre without any other manure; you would be surprised to see the difference where we skipped a row or two. It added one-fourth to the crop, and matured much earlier, also the same on Potatoes. It is worth its cost as a preventive of the wire-worm."

Horace Valentine, Cambridge, Washington Co., N. Y., says: "Where used, it gave one-half more Corn and Potatoes."

C. O. Brundage, South Sodus, says: "I think it added nearly one-half more to the yield of my corn crop."

Wilson N. Page, Chapequa, Westchester Co., says: "I used the different kinds of superphosphates along side of your Double Refined Poudrette. The crop where the Poudrette was used was fully equal to the other at half the cost."

Address, **THE LODI MANUFACTURING CO.**
 Office 66 Cortlandt-st. Box 3,139, New York P. O.

Cloth, beveled boards, Svo., 926 pp.

Downing's Landscape Gardening and Rural Architecture.....\$6.50

The most complete and valuable work ever issued on Landscape Gardening in North-America, for the Improvement of Country Residences; containing full Directions for everything connected with the Laying out and adorning the Rural Home, the Grounds, the Gardens, the Buildings, the Trees and Plants, etc., with principles of taste so stated as to adapt the work to all classes. Splendidly illustrated with many Steel and fine Wood Engravings. By the late A. J. DOWNING. New Edition, Enlarged, Newly Illustrated and Revised, with Supplement, by HENRY WINTHROP SARGENT. Octavo, 534 pp. Extra cloth, gilt, beveled hds.

Darwin's Variation of Animals and Plants under Domestication. 2 Vols. Finely Illustrated.....\$6.00

This is one of the most remarkable books of the day, presenting an array of facts that show the most extraordinary amount of observation and research. All the domestic animals, from horses and cattle to canary-birds and honey-bees, are discussed, as well as our leading culinary and other plants, making it a work of the greatest interest.

Its importance to agriculturists, breeders, scientific men, and the general reader, will be seen by its scope as indicated in the following partial enumeration of its contents: PIGS, CATTLE, SHEEP, GOATS; DOGS AND CATS, HORSES AND ASSES; DOMESTIC RABBITS; DOMESTIC PIGEONS; FOWLS, DUCKS, GESE, PEACOCK, TURKEY, GUINEA FOWL, CANARY-BIRD, GOLD-FISH; HIVE-BEES; SILK-MOTHS. CULTIVATED PLANTS; CEREAL AND CULINARY PLANTS; FRUITS, ORNAMENTAL TREES, FLOWERS, BUD VARIATION. INHERITANCE, REVERSION OR ATAVISM, CROSSING. ON THE GOOD EFFECTS OF CROSSING, AND ON THE EVIL EFFECTS OF CLOSE INTERBREEDING. SELECTION. CAUSES OF VARIABILITY, LAWS OF VARIATION, ETC., ETC.

"The immense collection of facts which it presents in illustration of the scientific views of the writer are of singular interest and value, irrespective of the peculiar theory of which he is the most able and earnest advocate, and in its present form, the original exponent."

By CHARLES DARWIN, M. A., F. R. S., &c., with a preface to the American Edition by the author, and also one by PROFESSOR ASA GRAY. 2 vols. 12mo, containing nearly 1,100 pages.

GARDENING FOR THE SOUTH;

OR, HOW TO GROW

VEGETABLES AND FRUITS.

BY THE LATE

WILLIAM N. WHITE,

OF ATHENS, GA.

WITH ADDITIONS BY MR. J. VAN BUREN, AND

DR. JAS. CAMAK.

REVISED AND NEWLY STEROTYPED.

ILLUSTRATED.

Though entitled "Gardening for the South," the work is one of the utility of which is not restricted to the South. It is an admirable treatise on gardening in general, and will rank among the most useful horticultural works of the present day.

CONTENTS.

CHAPTER I.—Formation and Management of Gardens in General. CHAPTER II.—Soils—Their Characteristics. CHAPTER III.—The Improvement of the Soil. CHAPTER IV.—Manures. CHAPTER V.—Manures—Their Sources and Preparation. CHAPTER VI.—Rotation of Crops. CHAPTER VII.—Hot-beds, Cold Frames, and Pits. CHAPTER VIII.—Garden Implements. CHAPTER IX.—Propagation of Plants. CHAPTER X.—Budding and Grafting. CHAPTER XI.—Pruning and Training. CHAPTER XII.—Transplanting. CHAPTER XIII.—Mulching, Shading, and Watering. CHAPTER XIV.—Protection from Frost. CHAPTER XV.—Insects and Vermin. CHAPTER XVI.—Vegetables—Description and Culture. CHAPTER XVII.—Fruits—Varieties and Culture.

SENT POST-PAID.....PRICE \$2.00.

ORANGE JUDD & CO., 245 Broadway, New York.

THE BOOK OF EVERGREENS.

BY

JOSIAH HOOPES, WESTCHESTER, PA.

Including Propagation, Cultivation, Description of Varieties and their Adaptability to Different Situations.

NOTICES BY THE PRESS:

A very complete and every way admirable treatise on the Coniferae, or cone-bearing plants, is The Book of Evergreens. Mr. Hoopes has devoted many years of labor and attention to the beautiful class of trees treated of, and his work, which is copiously illustrated, must at once become an authority. We shall be glad also, if it induces any to a closer study of trees, and to a further ornamentation of their houses with them.

[Springfield Republican.]

The value of this volume consists in its being both a labor of love and of duty. The author, having devoted a life to the study of trees and plants as a practical horticulturist, records here his views and experiences. Mr. Hoopes has studied all the treatises which bear on his subject, and availed himself of the assistance of many scientific friends, as well as recorded his own experience. The illustrations are numerous and excellent, and altogether the work has all the characteristics of an authority on the subject it so minutely and comprehensively treats.—[Boston Transcript.]

It is a practical treatise on the Coniferae, or cone-bearing plants, describing them in all their families, and their best culture, management, and so forth, and is well illustrated. It fills a vacant niche, and every intelligent cultivator of trees should have and use it.

[Congregationalist & Recorder, (Boston).]

The work was evidently prepared with great care and pains, and embodies the results of years of close observation and study. It is one of great value to the agriculturist and landscape gardener, and of special interest to all who care to know anything of the flora of the globe. To those who wish to raise trees, it is an indispensable hand-book.—[Liberal Christian.]

It is undoubtedly the most complete American work of the kind in print. It is well illustrated and handsomely printed.—[Boston Journal.]

We have examined this handsome book with a great deal of pleasure and satisfaction. The author has pursued a very desirable plan in his work, giving sufficient scientific information to meet the wants of the botanical student, and yet the work is sufficiently elementary in explaining terms and points about plant structure, and systems of classification,—in short, plain enough to meet the wants of every reader. It is printed in neat style, with thick covers and beveled edges, and a large number of very superior illustrations.—[Journal of Agriculture.]

The work is now ready. 435 p., 12mo, on fine paper.

SENT POST-PAID, - - - PRICE \$3.00.

Books for Winter Evenings.

A few of the **Good Books for the Farm, Garden, and Household**, published by Orange Judd & Co., 245 Broadway, New York, are mentioned in the following list, and some of the notices of the same by the Press are given. In these long winter evenings there is much spare time, which may well be improved in reading interesting and instructive books. Just such books are here offered. Any one of them will be sent post-paid on receipt of the price by the publishers.

Gardening for Profit.—A Guide to the successful cultivation of the Market and Family Garden. By Peter Henderson. Finely illustrated. Cloth, 12 mo. 252 pp. Price \$1.50.

There are marvels of transformation and rapid reproduction recorded therein which might well shame the dull fancy of the author of Aladdin or of Koolah. There is no theory about it; a man who has made himself rich by market-gardening plainly tells our young men how they can get rich as easily as he did, and without wandering to California or Montana for it either.

[*Horace Greeley in the N. Y. Tribune.*]

This is no stilted, impractical work. It is from the pen of a practical and successful gardener. It contains plain, unaffected talk, and facts such as every man going into gardening as a business will be glad to obtain. We can recommend it to every owner of a garden.

[*Cincinnati Weekly Gazette.*]

The author has made himself rich during the eighteen years he has devoted to the business of market gardening, and his book is a plain record of his successful experience.—[*Providence Journal.*]

It is unquestionably the most thorough and the best work of its kind we have yet had from the pen of an American author.—[*Bangor Evening Times.*]

Though designed for a special class, it cannot fail to be valuable to the amateur and private gardener, and un-lucky experience has taught us that the information contained in a single chapter would have been worth to us the price of the book.—[*New Bedford Mercury.*]

The Small Fruit Culturist.—By A. S. Fuller. Illustrated. Cloth, 12mo, 276 pp. Price \$1.50.

Mr. Fuller's work is full of information concerning all the small fruits, and is a complete manual for the practical gardener.—[*Salem (Mass.) Observer.*]

The facts and conclusions at which the author arrives are not based upon hearsay evidence. They are derived from personal tests of the multitudinous varieties of plants put forth by nurserymen and propagators from time to time.—[*Jersey City Times.*]

This volume is the only one within our knowledge that is devoted exclusively to the cultivation of the small fruits. It is illustrated by more than a hundred beautiful engravings.—[*Worcester (Mass.) Palladium.*]

It is written clearly and concisely, with apparent ease, and a perfect understanding of the subject, without digressions or interpolation, and so simply as to be within the comprehension of the most ordinary mind.

[*Washington National Republican.*]

The chapter on gathering and packing fruit is a valuable one, and in it are figured all the baskets and boxes now in common use.—[*Dorer (N. H.) Gazette.*]

New Book of Flowers.—By Joseph Breck. Illustrated. Cloth, 12mo, beveled boards. 450 pp. Price \$1.75.

To the lovers and cultivators of flowers, this will be a most welcome work, as it contains in a convenient space just what they wish to know.—[*Boston Journal.*]

It is precisely the book that one needs in beautifying the grounds of a rural home.—[*Christian Advocate (N. Y.)*]

All of the plants described in this volume are such as can be cultivated without difficulty in the open ground in this climate; the present work has been greatly enlarged and improved.—[*Boston Sat. Evening Express.*]

The alphabetical descriptive list is full, embracing both botanical and common names, and the instructions for laying out, plotting, cultivating, etc., are satisfactory.

[*Montpelier (Vt.) Watchman.*]

The book is a beautiful parlor ornament.—[*Pittsburgh Chronicle.*]

Hints to Horsekeepers.—By the late Henry William Herbert (Frank Forrester). Finely illustrated. Cloth, 12mo. 425 pp. Price \$1.75.

The Society for the Prevention of Cruelty to Animals ought to buy the copyright of this book to gratuitously circulate it among the people, who would thus learn how to care for our noblest domestic animals, at present subjected to so much abusive treatment by thousands of ignorant human brutes placed in charge of horses.

[*New York Sun.*]

Every person who has to do with a horse may derive useful hints and information from this work.

[*Providence Journal.*]

The work possesses more value than can be touched in a mere cursory review, and we would recommend it to all our horse-loving readers. Directions for riding, driving, for ladies' riding, for carriages and harness, are fully and thoroughly given, and probably no person having a horse could purchase and read the book without feeling that a paying investment had been made, in the amount of practical knowledge thus placed at their command.

[*The Pioneer (N. J.)*]

American Pomology.—Apples. By Dr. John A. Warder. 290 illustrations. Cloth, 12mo, beveled boards. 744 pp. Price \$3.00.

It is undoubtedly the latest and best book on apples.

[*Cleveland Evangelical Messenger.*]

The illustrations are admirable, and give one a faithful and accurate idea of the fruit described. The publishers have performed their part of the work quite as well as the author did his. With most excellent paper, and clear, bold print, we have an American book on apples which cannot be surpassed.—[*Detroit Free Press.*]

This is a superb volume, and contains a world of information in regard to fruit and fruit-growing, especially the apple of all kinds.—[*Christian Press (New York).*]

It is a book which no one who owns an orchard, or even hopes to plant one, can afford to do without.

[*Jersey City Times.*]

The Grape Culturist.—A Treatise on the Cultivation of the native Grape. By Andrew S. Fuller. Cloth, 12mo, 286 pp. Price \$1.50.

Mr. Fuller gives the knowledge necessary for the successful cultivation of the grape most clearly, and illustrates it so plainly that no one can fail to understand it, and for this reason his book has become remarkably popular, and has not been, nor is it likely to be, superseded by any other work on the same subject.

The publishers have not spared expense upon this book, which will be found a valuable addition to the library of every farmer and fruit culturist. City people should send the "Grape Culturist" to their country friends.—[*New York Sun.*]

This is a standard work on the cultivation of the vine, very popular, for the good reason that Mr. Fuller gives his knowledge of the vine and its habits, and illustrates so plainly that no one can fail to understand it.

[*Rochester Democrat.*]

The Percheron Horse.—Translated from the French of Charles Du Rny. Illustrated. Cloth, 12 mo. 100 pp. Price \$1.00.

This work is a report made to the French Government upon the breeding and rearing of this admirable breed of draft horses. It is written with the view of indicating how to defend the race against degenerating, to improve it in all its estimable qualities, and at the same time to enable the breeders of Perche, the region of France from which these horses come, to supply the ever-hungry market. Interest in the Percheron has greatly increased in the United States as the breed has become better known, and every new importation adds to it and to the firm friends of the breed.

A horse like the Percheron, or the Normandy, makes a team with which the farmer can pull through anything; they are not slow on the road either. This book contains a full history of the Percherons, and many hints on the breeding of draft horses.—[*Ohio Farmer.*]

The Percheron Horse derives its name from the Department of Perche, in France, and has long possessed the highest reputation in France as a draft horse, and especially for rapid draft. The publishers have issued this work in a neat little volume, and have illustrated it with portraits of several specimens of the breed recently imported into this country by Mr. Walters, of Baltimore, Md.—[*Western Rural.*]

Cotton Culture.—By Joseph B. Lyman, late of Louisiana, with an additional chapter on Cotton Seed and its Uses, by J. R. Sypher. Illustrated. Cloth, 12mo. 190 pp. Price \$1.50.

There is a store of useful information contained in this little work.—[*Hannibal (Mo.) Courier.*]

A map is prefixed, showing by colors the different limits of the soil for various qualities of cotton. The author claims that his work is not a compilation, but the result of direct personal observation.—[*Boston Post.*]

The writer's own experience of twelve years in cotton culture in Louisiana would give weight to his own statements and opinions. The last chapter, upon cotton seed and its uses, is especially interesting, and supplies information upon a subject of much importance to cotton planters, that can be obtained nowhere else in so comprehensive a form, so far as we know.

[*Wilmington Daily Journal.*]

Squashes.—How to grow them. By James J. H. Gregory. Paper, 12mo. 69 pp. Price 80 cents.

This treatise is worth five times its price to any man who grows squashes, either for family use or market.

[*Chicago Republican.*]

We venture to say no person in the United States is better qualified to give instruction in the garden and field culture of the squash than Mr. Gregory.—[*Machias Union.*]

A practical treatise on squash culture, giving full details on every point, including keeping and marketing the crop.—[*Commonwealth (Boston).*]

Mr. Gregory has tested the theories of writers by his own experience, and briefly stated all which is desirable to be known about the soil, seed, cultivation, and general management of the squash.

[*Philadelphia North American*]

The Miniature Fruit Garden; or, the Culture of Pyramidal and Bush Fruit Trees. By Thomas Rivers. Illustrated. Cloth, 12mo. 133 pp. Price \$1.00.

It is written in a clear and common-sense style, and cannot fail to be acceptable to that increasing class who cultivate a suburban garden plot.

[*N. Y. Christian Advocate.*]

Mr. Rivers' book gives the directions that are needed in a concise and lucid form, as to the planting, pruning and culture of dwarf pear, apple, cherry, plum and peach trees, as pyramids and as bushes, under glass and in espallers; of nuts, figs, apricots, currants, etc.

[*Brooklyn Union.*]

The work is full of practical suggestions, particularly to those who have small gardens, and who give their personal attention to their cultivation.—[*Boston Journal*.]

The remarks upon dwarf pear trees alone are worth the price of the book.—[*Brattleboro (Vt.) Farmer*.]

The book has passed through thirteen editions in England, which is a testimonial of its value, which every one will appreciate.—[*Hartford Courant*.]

My Vineyard at Lakeview.—By a Western Grape Grower. Cloth, 12mo, beveled boards. Illustrated. 143 pp. Price \$1.25.

This dainty little volume contains a narrative of the experience of a Western grape grower, and a truly interesting narrative it is. Doubtless it will lead many others to follow the example of the author, and exchange the confinement and exhaustion of city labor for life in the open country; and in doing this it will do a good work.—[*S. S. Times*.]

This little work on grape culture is pleasant reading, even to those who never intend to cultivate the luscious fruit.—[*Phila. Inquirer*.]

The author has given the volume the interesting character and the pleasant flavor of a narrative, thus making it decidedly attractive.—[*Montpelier (Vt.) Freeman*.]

Hard-working mechanics, who can barely secure a living, should read this little volume, and they will see how they can make themselves independent with small capital, needing only industry and common sense.

[*New Bedford Standard*.]

DRAINING FOR PROFIT AND DRAINING FOR HEALTH.

By GEO. E. WARING, Jr.,
Engineer of the Drainage of Central Park, New York.

CONTENTS.

LAND TO BE DRAINED; HOW DRAINS ACT; HOW TO MAKE DRAINS; HOW TO TAKE CARE OF DRAINS; WHAT DRAINING COSTS; WILL IT PAY? HOW TO MAKE TILES; RECLAIMING SALT MARSHES; HOUSE AND TOWN DRAINAGE.

EXTRACTS FROM NOTICES BY THE PRESS.

He (the author) describes the action of draining upon the soil, the construction of single drains and systems of drains, the cost and the profit on thorough drainage, the making of tiles, and the reclaiming of salt marshes, treats sensibly of malarial diseases, and closes with a chapter which should be widely read, on house drainage and town sewerage in their relations to the public health.
[*Portland (Me.) Press*.]

Nowhere does this book merit a wider circulation than in the West. Every year adds to the thousands of dollars lost to this State from want of proper surface drainage, to say nothing of the added gain to result from a complete system of under-drainage. This book will prove an aid to any farmer who may consult it.
[*Chicago (Ill.) Republican*.]

This is a capital book. It is fully illustrated, and detailed instructions are given how to lay out the land, how to set out the drains, how to make them, also how to manufacture the tiles. And there is a chapter on house and town sewerage. . . . The book will be read with interest by English as well as American readers.
[*Gardener's Chronicle & Agricultural Gazette (England)*.]

A Book that ought to be in the hands of every Farmer.
SENT POST-PAID, PRICE, \$1.50.

ELEMENTS OF AGRICULTURE.

A BOOK FOR YOUNG FARMERS,

By GEO. E. WARING, Jr.,
Formerly Agricultural Engineer of the Central Park, in New York.

CAREFULLY REVISED.

CONTENTS.

THE PLANT;
THE SOIL;
MANURES;
MECHANICAL CULTIVATION:
ANALYSIS.

The foregoing subjects are all discussed in plain and simple language, that any farmer's boy may understand. The book is written by a successful *practical farmer*, and is full of information, good advice, and sound doctrine.

HORACE GREELEY says of it: "Though dealing with facts unfamiliar to many, there is no obscure sentence, and scarcely a hard word in the book; its 254 fair, open pages may be read in the course of two evenings and thoroughly studied in the leisure hours of a week; and we pity the man or boy, however old or young, who can find it dull reading. Hardly any one is so wise that he will not learn something of value from its perusal; no one is so ignorant or undeveloped that he cannot generally understand it; and no farmer or farmer's son can study it thoughtfully without being a better and more successful cultivator than before."
SENT POST-PAID, PRICE, \$1.00.

EARTH CLOSETS:

How to Make them and how to Use them.

By GEO. E. WARING, Jr.

It is sufficiently understood, by all who have given the least thought to the subject, that the waste of the most vital elements of the soil's fertility, through our present practice of treating human excrement as a thing that is to be hurried into the sea, or buried in underground vaults, or in some other way put out of sight and out of reach, is full of danger to our future prosperity. Supported as the arguments in this little work are by the most imperative agricultural and sanitary considerations, it is believed that they will commend themselves to the approval of all, in both town and country, who have the well-being of society at heart.
SENT POST-PAID, . . . PAPER COVERS. PRICE 25cts.

ENDLESS AMUSEMENT FOR BOYS AND GIRLS.

Crandall's Improved Building Blocks furnish a most attractive amusement for children. They are very simple in construction, will stand years of children's handling without breaking, and give renewed pleasure daily.

CHURCHES, DWELLINGS,
BARNs, MILLS,
FENCES, FURNITURE, etc.,

in almost endless variety, can be built with them, and when finished, the structure remains firm so that it can be carried about without falling to pieces.

The Blocks are put up in neat boxes, each box containing a set, and a card giving various designs of buildings. Price per Set: Plain, No. 1, \$2.00; No. 2, \$1.50; No. 3, \$1.00. Extra, Maple Finish, No. 1, \$3.00; No. 2, \$2.00; No. 3, \$1.50. A liberal discount will be made to dealers. Address

ORANGE JUDD & CO.,
245 Broadway and 41 Park Row, N. Y.

ESTABLISHED 1861.

THE GREAT AMERICAN TEA COMPANY

RECEIVE THEIR TEAS BY THE CARGO

FROM THE BEST TEA DISTRICTS

of CHINA and JAPAN,

and sell them in quantities to suit customers

AT CARGO PRICES.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st.—The American house in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in the country have made their immense fortunes through their houses in China.

2d.—The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d.—The Importer makes a profit of 30 to 50 per cent in many cases.

4th.—On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1,000 to 2,000 packages, at an average profit of about 10 per cent.

5th.—The Speculator sells it to the Wholesale Tea Dealer in lines at a profit of 10 to 15 per cent.

6th.—The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th.—The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th.—The Retailer sells it to the Consumer for ALL THE PROFIT HE CAN GET.

When you have added to these eight profits as many brokerages, cartages, storages, cooperages and wastes, and add the original cost of the Tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than other dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages and wastes, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Teas at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

For manner of getting up Clubs, see former advertisement in this paper.

Parties sending Club or other orders for less than thirty dollars had better send a Post-office draft or money with their orders, to save the expense of collections by Express, but larger orders we will forward by express, "to collect on delivery."

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary packages for Clubs less than \$30.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House stores to our Warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend to meet the wants of clubs. They are sold at cargo prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST OF TEAS:

- OOLONG (Black), 70c., 80c., 90c., best \$1.10 lb.
- MIXED (Green and Black), 70c., 80c., 90c., best \$1 per lb.
- ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.20 per pound.
- IMPERIAL (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
- YOUNG HYSON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
- UNCOLORED JAPAN, 90c., \$1, \$1.10, best \$1.25 per pound.
- GUNPOWDER (Green), \$1.25, best \$1.50 per pound.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of this Company.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound. Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction. ROASTED (Unground), 30c., 35c., best 40c. per lb. GREEN (Unroasted), 25c., 30c., 35c., best 35c. per lb.

NOTICE OF THE PRESS.

From the American Agriculturist.

THE GREAT AMERICAN TEA COMPANY.—To Queries.—Before admitting their advertisement, we learned that a large number of our clerks and others had for several months been buying their Tea and Coffee from this Company, without its being known who they were, and that they had been highly pleased with their purchases, both as to quality and price, and were all recommending their friends to the same course. As we have published the advertisement for many months, and received no complaints, we conclude "there is no bumbag about the establishment."

N. B.—INHABITANTS OF VILLAGES AND TOWNS WHERE A LARGE NUMBER RESIDE, BY CLUBBING TOGETHER, CAN REDUCE THE COST OF THEIR TEAS AND COFFEES ABOUT ONE-THIRD. (BESIDES THE EXPRESS CHARGES), BY SENDING DIRECTLY TO "THE GREAT AMERICAN TEA COMPANY."

CLUB ORDER.

SPRINGFIELD, Ill., Sept. 16, 1867.

TO THE GREAT AMERICAN TEA COMPANY, 31 and 33 Vesey Street, New York.

Please send me by Merchants' Union Express the following bill of Tea, &c.

Gents:—Above I send my fourth order. Your Teas have given good satisfaction, and those who have used them will have no other, but induce their friends to send also. To prove this; I had made up my order and got a Post-Office Money Order, when others came in and nearly doubled the amount, as you will see by second money order, both of which I enclose.

The 1st order came safely to hand by Merchants' Union Express. Accept thanks for complimentary package.

Very respectfully,

S. LANPHEAR.

Caution.—As some concerns, in this city and other places, imitate our name and style of advertising and doing business, it is important that our friends should be very careful to write our address in full, and also to put on the number of our Post-Office Box, as appears in this advertisement. This will prevent their orders from getting into the hands of these bogus imitators.

POST-OFFICE orders and Drafts, make payable to the order of "The Great American Tea Company." Direct letters and orders (as below, no more, no less).

Great American Tea Company,

Nos. 31 and 33 VESEY-ST.,

Post-Office Box, 5,613, New York City.

HORSFORD'S SELF-RAISING BREAD PREP-

ARATION makes the most wholesome and best of bread, BISCUIT, CAKES, &c. Unlike some other yeast, it contains no POISON to create DYSPEPSIA, and the bread may therefore be eaten hot without detriment. Resolving itself into Phosphate of Lime and soda, it prevents RICKETS, CHOLERA, and decay of TEETH, and promotes the growth of Muscle and Bone. In "raising" the dough it does not, like other yeast, decompose flour, but adds nutriment to the bread, and otherwise improves it in quality and quantity. Each package contains full directions for use. Send to H. T. Love, No. 5 James Slip, New York, for "The Good Cook's Hand Book," for particular directions, to be sent you gratis, and ask your Grocer for "Horsford's Bread Preparation." JOHN DWIGHT & CO., Wholesale Agents, No. 11 Old Slip, New York.

PORTABLE STEAM ENGINES.

FOR FARM, MINING, OR MECHANICAL PURPOSES. These machines require no brick work; mounted on legs they are especially adapted for use in MILLS, STOPS, FOUNDRIES, OR PRINTING ROOMS.—or mounted on wheels they are adapted for out-door work, THRESHING, WOOD SAWING, &c. See Rural New-Yorker of August 15th, 1868, first page.

Circulars with description and prices furnished on application to A. N. WOOD & CO., Eaton, Madison Co., N. Y.

CHICKERING & SONS

HIGHEST AWARD.

FIRST GRAND PRIZE.

Paris, 1867.

MANUFACTURERS OF

GRAND, SQUARE, AND UPRIGHT

PIANO FORTES

RECEIVED THE FIRST GRAND GOLD MEDAL, and the still higher recompense, THE CROSS OF THE LEGION OF HONOR, AT THE UNIVERSAL EXPOSITION, PARIS, 1867.

These were the highest awards of the Exposition, and the house of CHICKERING & SONS was the ONLY ONE so honored.

In the United States we have been Awarded SIXTY-NINE FIRST PREMIUMS in direct competition with the leading manufacturers of the country, and at the Great Exhibition in London we received the highest award given to any manufacturer in the United States.

Total, Seventy-one First Premiums, and the most flattering testimonials from the leading artists of the world.

WAREHOUSES,

SHAD FISHING.—DRAWN BY EDWIN FORBES.—Engraved for the American Agriculturist

Every farmer has, or should have, an interest in a body of water adjoining or upon his farm, whether it be a pond, lake, or river. Fish culture and protection are subjects which are just now attracting the attention not only of individuals but of legislatures. We have long enough given to the sea, and now it is well to look for a return. Among the fishes of prime importance, wherever there is a stream connecting with the sea, is the shad. The shad is an ocean fish, which spawns in fresh water, and is caught in the rivers from March until July, in New England, or earlier in the southern waters.

On account of dams and other obstructions which have been placed in our rivers, the abundance of this admirable fish yearly diminishes, and it is well that legal measures have been taken for its protection. Shad are caught in various ways. The fishermen along the coast capture large numbers in pound-nets and fykes. When they enter the rivers they are taken in different kinds of nets. One of the most common of these is the gill-net, which has a length proportioned to the width of the river, and is usually about sixteen feet deep, with meshes five and a half inches wide. The fish on their passage up

stream are arrested by the net, and upon attempting to back out are caught by the gills and held until the net is lifted. The net is held in place by long poles, as shown in the illustration; these are driven into the bed of the river, often, as is the case on the Hudson, to the annoyance of navigators. To fish in this way requires a large capital for boats, nets, poles, and labor. It is estimated that at least \$5,000,000 are invested in this branch of industry. The artist has chosen low tide at night for his sketch. One disposed to be facetious might say that this most effectively showed shadows and shadders,

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from electrolyte plates as wanted, all the numbers and volumes for ten years past, beginning with 1857—that is, Vol. 16 to Vol. 27, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes, neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past ten years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW-YORK, MARCH, 1869.

Up to the time of writing, the winter has been unusually mild and pleasant along the Atlantic coast. There have been comparatively few snow storms reported, and the cold has been by no means so great as that of last year. The anticipations of an early spring were blasted then, and the fickleness of the season may give us early bland airs, freedom from frost in the soil, and good weather to push forward spring work this year; but, in the natural order of things, this can hardly be expected. A warm winter is often followed by a rough, harsh, cold, wet spring. Winter may linger, and we may thus have full time to get ready to make the very most of the good weather when it comes. Make full memorandums at once of those kinds of work which ought to be done—work for rainy weather, work for freezing weather, work for fair weather when the soil is too wet to plow, and proper field work. Know beforehand how much labor can be profitably employed at each job, and calculate, if possible, to leave yourself free for extra work, not included beforehand in your calculations, or to take hold and finish up any job that drags, and requires more time than planned for. We have often compared well-considered plans to axle grease on the farm wagon.

Thousands of farmers are thinking anxiously about the seed they shall sow and plant. A more worthy subject for serious thought and investigation can hardly have their attention. The papers are full of advertisements and notices of new articles, from Norway oats to the most thoroughly established varieties of spring wheat. The effort to get something new that has merit enough to base great stories upon, and lead to sanguine expectations, leads to the introduction of many worthless things. Dealers generally care less for what is really good, than to know and to have what will sell. If seeds are scarce and high, as is onion seed this year, the temptation is very great to mix it with old seed. In England, it is very common to use the seeds of charlock, or some other cruciferous plants which have been heated, and the vitality destroyed, to mix with turnip seed. It is precisely on the principle of watering milk, and over-issuing railway stock. If possible, get samples, and see how many of the seeds will germinate, as directed for clover seed, on page 95. We are far from condemning the novelties, whatever price they bear; but this we are free to say, the price bears no direct ratio to their value. The fact that \$2 a quart is charged for oats, or \$50 apiece for potatoes, shows that there has been a good deal of interest excited by advertising, or otherwise, and that either the owners mean to put a nearly prohibitory price upon the articles, or believe they will make more this year and next by selling now at high rates. It often pays to buy at rather high prices, in order to raise one's own seed for another year, but it surely does not pay unless the article is of established excellence, and one knows he gets it genuine. Do not buy simply because very improbable and wonderful stories are told in print, or anywhere, about oats, Egyptian wheat, or any similar thing. The best way is, for several neighbors to club together, and thus get and examine samples. Do not expect to raise heavier grain than the seed you sow.

Hints About Work.

Breeding Animals must be well fed. A quart or two of oil meal daily, or an equivalent of rye bran, or coarse corn meal and wheat bran mixed, is good. If roots are plenty, eat up and feed four to eight quarts a day with the meal; if not, save them until just before calving, and after that, to be used until grass comes, or the rye for soiling is fit to eat.

Cows.—Prepare roomy, loose boxes for cows to calve in, and litter them well. The cows may be kept tied until the time actually comes, when it is best to give them the freedom of the box.

Mares should be treated in very much the same

way; a few carrots are an excellent addition to their diet, and roots and oil cake may be fed freely if care be taken that they do not induce too great laxness of the bowels; constipation is to be always guarded against in animals approaching parturition.

Sows should be especially guarded against it; and this is easily effected by feeding raw roots, mashed, and sprinkled with bran, to give them a relish, and to add to their nutritious value. The sow must have her quiet, warm nest, with plenty of straw, and be let alone. A big, blundering brute will not infrequently overlie her young, and kill many in this way. To prevent this in a measure, it has been advised to arrange slanting rails at the back of the pen, so that the sow can not crowd herself against the rear partition, and that the young may have a place of safety at all times. This is especially desirable if sows are cross, and inclined to eat their young ones. Such an unnatural appetite is usually accompanied by constipation and feverishness, which are relieved in most cases by the diet advised.

Sheep.—As the weather grows warmer, look out for ticks, scab, and lice. We have great faith in carbolic soap, and this may be applied without fear of injury to the animals. The wool should be parted, and the solution squirted in from a bottle with a quill in the cork, or poured from an oil can with a small nozzle. If ewes yearn early, have a care that the lambs do not get chilled; visit the pens frequently. Chilled lambs, apparently past sneer, may often be revived by bringing to the fire, giving warm baths, followed by friction with dry cloths, and a little mild milk punch.

Horses are often injured by their exertions to draw heavy wagons out of miry spots in the road. Spavins are frequently caused in this way. After such exertion, the horses' legs ought to be hand rubbed for an hour a day, for several days. This is a gentle friction by the hand up and down the legs. Coarse horses seldom require it, but high-bred ones are much benefited by the operation.

The Workshops.—Every farmer should at least have a good work-bench, tolerably supplied with carpenters' tools, and to these many may profitably add soldering irons, awls, and needles for mending harness, a rivet set and rivets, paint pots and brushes, and a variety of other tools. There is a great deal of work for rainy and cold days that may be done—like mending and painting farm implements, making bee-hives and honey-boxes, hens' nests, chicken coops, etc.

Surface Irrigation.—As the snows melt, the trickling streams carry fertility wherever they go. If they can be conducted from the roads upon the meadows, a marked increase will be noticed in

The Grass Crops, which may also be considerably increased by top-dressing with plaster, ashes, superphosphate of lime, Peruvian guano, and other soluble manures. It rarely pays to apply stable manure or composts at this season.

Liquid Manure on grass and grain fields, and on rye and wheat sown for soiling, is more advantageous in spring than at any other time. It should be applied as soon as the frost is out of the ground.

Clover.—See short article on page 95.

Field Work.—Animals must be gradually accustomed to hard labor, or their necks and shoulders may gall badly. Where galls or tender spots occur, they should be washed with castile soap and cold water, and covered over night with compresses of wet cloths. As more labor is demanded, increase the feed. Never plow when the ground packs hard from the moisture it contains. Some sandy soils never pack thus, and never bake into clods, but loamy and peaty soils do, and a field is often greatly injured if plowed a day or two too soon, or if worked in any way while wet.

Fences.—Before the ground settles after the coming out of the frost, and while it is yet too wet to plow, embrace the opportunity to reset old fences, and put up new ones. Try the posts, and strengthen weak ones by stakes driven along side; replace rotten rails with strong ones.

Poultry.—The present is a critical season with all kinds of poultry. If well fed and watched, a great

stock of eggs may usually be secured. Hens that steal their nests will usually become broody as soon as they have a dozen or fifteen eggs. So, if half a dozen hens lay in one nest, the nest full of eggs tends to stop the laying, and promote a desire to sit. The same is true of turkeys and ducks; perhaps also of geese, but in a less degree. Ducks ought to be shut up every night, and not let out before eight or nine o'clock in the morning, or not until each duck has laid an egg; thus they will keep on laying until July. Fowls must not be allowed to sit in exposed places; and if broods come off, they will die of cold and exposure, or fall victims to vermin, unless very carefully protected, and kept in warm, dry places. Old empty hay bays are very favorable for this purpose.

Getting out Manure.—This is work for frosty mornings, as the wheels and teams would cut up the land badly at other times; or it should be delayed until the ground is somewhat dry.

Composts made now will heat and be in good order for the corn crop. Muck got out in the winter will be in condition to be thus used, mixed with $\frac{1}{4}$, or $\frac{1}{3}$ its bulk of barn-yard manure.

Work in the Horticultural Departments.

Orchard and Nursery.

Planting, in some localities, can now be done, but at the North, generally, it is better to wait until next month. A young tree, put into cold soil, and exposed to drying March winds, has a hard struggle.

Shriveled Trees, that have become dried during transportation, are to be placed in a trench, and covered, root and branch, with fine, mellow earth. In about a week they will be found to have regained their original plumpness, when they may be taken out, properly pruned, and planted.

Heeling in should be done with trees as soon as they arrive, if there is to be the least delay in planting. The importance of keeping the roots of trees from drying cannot be overestimated.

Grafting may be done first on the cherry, and later on the plum. Apples and pears do better if left until the buds commence to start.

Cherry Stones, for stocks, start very early; plant as soon as the frost is out of the ground.

Stocks budded last year are to be headed back.

Evergreen Seeds.—Many inquire about raising evergreens from seed, and some complain of failure. It is useless to look for success unless some provision is made for shading the young plants. On a small scale, the following plan, suggested by Meehan, is said to work well. "A common board frame is placed over a carefully-prepared bed of light mould, and covered with shaded, hot-bed sash. Under each corner of the frame is placed a prop, raising the bottom about three inches above the surface of the ground. The advantages of this contrivance will at once be appreciated when we consider that the most essential conditions in raising evergreen seedlings are a moist atmosphere, protection from the direct rays of the sun, and, at the same time, a free circulation of air through the plants."

Fruit Garden.

Strawberries may be set as soon as the ground can be worked. Take the country through, and the Wilson will be found to be the favorite; there are many better varieties, but this is the most generally reliable. Set the plants eighteen inches apart, in rows two feet apart; keep the ground clean, remove all runners and blossom buds, and next spring there will be a good crop.

Blackberries and Raspberries are best set in autumn. Spring planting should be done as early as the season will admit. Cut the canes down to the surface of the soil. Blackberries are usually put in rows eight feet apart, and raspberries from four to six feet, according to the variety.

Grape Vines.—Prune those that were not attended to last autumn as soon as the frost is out of them. Keep young vines to a single cane, or two

canes, until good strong ones, half an inch in diameter, are secured as the basis of the vine.

Current Cuttings should have been put out last fall, but they will do fairly if set now. Pack the earth well about their lower ends.

Current and Gooseberry bushes start early, and should be transplanted as soon as practicable. Prune those that need it. See article on page 96.

Kitchen Garden.

Preparation and forwarding are the order here. Every one likes to be just a little ahead of his neighbors with early crops, and if one markets his produce, it is well known that a few days in earliness makes a great difference in the receipts.

Hot-beds are of great use in getting early seedlings, and there is scarcely any subject concerning which we have more letters of inquiry. The requisites for making a hot-bed are boards, glazed sashes, manure in a state of active fermentation, and a supply of light, rich soil. The old way of making a manure stack on top of the ground, and putting a frame over it, is well-nigh abandoned. It is more economical of manure and other materials to make an excavation. All the operations depend upon the size of the sashes. Six feet by three is the regular size, but any other will do. Select a well-drained place, facing to the south; and sheltered by a fence, building, or hedge, from prevailing cold winds; make an excavation two feet deep, of a width and length to accommodate the sash. Drive down stakes, and board up the pit, having the boards at the rear 18 inches, and those at the front 12 inches above the surface. The manure to be used should be in a state of active fermentation—a condition which may be secured by turning over stable manure two or three times, at intervals of a few days, according to the temperature, watering it if it becomes dry. A good rule is to form the manure in a compact, conical heap, and when it "smokes," turn it over. Fill the trench with fermenting manure, pack or tread it rather firmly, cover it with six inches of light, rich soil, and put the sashes in place. Put a thermometer in the soil, and when the heat declines from 100°, the sowing may be done. Sow Tomatoes, Egg Plant, Peppers, Early Cabbages, etc., in rows four inches apart. The soil covering the seeds must be both rich and light. Where plants are forwarded to the best advantage, a milder bed is in readiness, to which the plants are transplanted, when large enough to handle. For the management of the hot-bed, after the plants are up, see article on page 99.

Cold Frames, properly arranged, are nearly as quick as hot-beds. Place a frame covered with sash over well-prepared soil. Let it be well exposed to the sun during the day, but before its heat declines in the afternoon, cover the sash with mats. In this way, a patch of warm soil will be secured, in which seeds will germinate rapidly. Airing and other care must be observed, as for hot beds.

Preparation of the soil must be pushed as fast as its condition will allow. Use an abundance of manure, and spade or plow deeply.

Sods are most admirable for hot-bed work. Lay a good bit of pasture sod, grass side down, and cut it into pieces three inches square. Plant in the soil of these pieces seeds of such plants as do not bear transplanting kindly—cucumbers, squashes, and the whole of that family, corn, and even early potatoes. Put these sods in the hot bed, or cold frame; the young plants will fairly revel in the fresh earth, and at transplanting time the sod can be placed out without disturbance of the roots.

Window Boxes are to be commended to those who operate on a small scale. A box four inches deep, filled with light, rich soil, and placed in a sunny kitchen window, will afford early plants for the family garden. Have a similar box in reserve for the young plants, when they need transplanting.

Cabbages and Cauliflowers that have been wintered over in cold frames may now be fully exposed.

Roots.—Dig parsnips and salsify before any growth commences.

Asparagus and Rhubarb Beds, that have been covered during the winter, may have the coarse manure removed, and the finer portions forked in.

Peas.—Sow for early crop, putting the seed at least three or four inches deep. Try the dwarfs.

Potatoes.—Plant early sorts; it is best to have some litter at hand, to draw over in case of frost.

Onions.—Potato and top onions, as well as sets, are to be put in as soon as the soil can be worked. Plant 4 or 5 inches apart, in rows a foot distant.

Seed Raising.—All roots saved to produce seed should be set out early. In warm and dry soils, this may be done this month. Soil may be drawn towards them, to protect them from frosts, which is to be removed after danger is over.

Hardy Vegetables include carrots, beets, spinach, salsify, onions, leeks, early turnips, etc.; these may be sown for the first crop whenever the soil and season will allow. Sow in rows fifteen inches apart. Cress and lettuce may be put twelve inches apart. Radishes may be sown broadcast with beets, etc., or have a bed by themselves.

Flower Garden and Lawn.

Roads and Walks need thorough work. Drainage is essential, and solidity should be secured by making a good bed of stones to receive the gravel.

Lawns are mostly failures in this country for want of good work beneath the surface. The drainage being secured, the soil should be sufficiently fertile to sustain a verdure for years. If one kind of seed only is sown, use June Grass, or Red Top. Henderson recommends the following mixture: 12 quarts Rhode Island Bent Grass, 4 quarts Creeping Bent Grass, 10 quarts Red Top, 3 quarts sweet-scented Vernal Grass, 2 quarts Kentucky Blue (June) Grass, 1 quart White Clover=1 Bushel; and from 2 to 5 bushels to the acre, according to the soil, using more for a poor than for a rich one.

Trees.—The deciduous ones may be planted whenever it will do to plant fruit trees; give the same care as indicated for fruit trees under Orchard.

Shrubs.—Transplant the hardy kinds. Let those which were covered for the winter retain their protection until the weather becomes established.

Perennials that have been in place for three or four years will need to be lifted, and after being properly divided, reset. If there is a surplus, do not throw them away, but give to the neighbors. If nobody at hand wishes the plants, heel them in in a spare corner until some needy one comes along.

Annuals may be sown—the hardy ones—in the open ground, but the tender kinds should be put in hot-beds, frames, or boxes, as directed under Kitchen Garden. Seed-men's catalogues usually designate the hardy and the tender varieties.

Green-house and Window Plants.

Propagation for a supply of plants to use for bedding purposes can now go on rapidly. Where there is a green-house and a gardener, no instructions are needed, but in the absence of these,

Saucer Propagation is the great resource of the amateur. A shallow dish of sand, always kept wet—in the condition of thin mud—allows of the rapid multiplication of most plants. We published this some years ago, and several have complained of failure. We have tried it with things of the most diverse nature, and know that it will succeed if the cuttings are sufficiently succulent, the sand is kept thoroughly wet, and the whole exposed to full light. As soon as the plants make root, they must be potted in light and rich soil.

Camellias bear all needed pruning. The only time the camellia can be forced is when it is making its growth. Rapid growth and early formed buds will give early flowers next autumn.

Plants in Cellars are to be brought forward according to the season. Exposure to light, water, and heat, will soon start them into growth.

Insects will increase with the season. Prevention by fumigation is better than cure. Make a smoke of tobacco in the houses at least twice a week.

AMERICAN AGRICULTURIST.

ORANGE JUDD & Co., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies: Four to nine copies, \$1.25 each: Ten to nineteen copies, \$1.20 each: Twenty copies and upwards, \$1 each. Papers are addressed to each name.

MARCH ON!

MARCH is an excellent month for going forward with the premium lists. Many thousands of these clubs are in progress all over the continent, and beyond, and one or more instalments of names have already come in. These may all be filled during MARCH, and the premiums obtained. So also may thousands of new clubs be started and quickly filled. Our premiums named in the next column are splendid articles, worth working hard for, yet many get them with very little work or trouble. Very many have earned from one to five dollars an hour for all their time actually spent in canvassing. A clergyman brought us on Thursday a list of ninety-six subscribers, gathered in his country village parish since Monday morning, and took home the \$80 Cyclopaedia, which was just what his library needed. . . . A little country school-boy obtained a \$12 Worcester Dictionary in two days of Holiday Week, by obtaining nineteen subscribers. He will make his way in the world, and so will a good many others of these active boys who exercise their business tact and cultivate their talents for persuading, while gathering up these premium lists. It would be a good business exercise and a development of tact, even were there no pecuniary reward for it. One of the most successful newspaper Publishers in New York, once a farmer boy, says he learned the secret of his success and acquired the mental and business training that has made him successful, by canvassing for subscribers to a newspaper as a means of paying his way at school. It would be a useful exercise for every boy in the country to take a little practice in the kind of business exercise required to tell the good qualities of a newspaper, magazine, or book, and show how much one subscribing for and reading it would be benefited. . . . And it would do the Girls good to cultivate a little of the same business talent. Many girls, some of them quite young, are the happy possessors of a pair of fowls, a lot of flower seeds, a set of spoons for mother's table, a dictionary, etc., etc., received from this office for lists of subscribers they have themselves gathered. . . . Hundreds of acres of grass will be cut next season with mowers secured by a few days' time spent in getting up subscription lists. Had we space, we could go through the whole table in the next column, and tell interesting incidents concerning the various articles—how they have been obtained by those who desired them, without money and with no real loss of time. Those ladies who are earning from \$300 to \$2,500 each, in canvassing for premiums and selling them this year, don't permit us to publish their names. They are doing a good work for themselves, and for the sluggish people they are getting to read and think. . . . Well, we would like to stir up a few thousand more to go and do likewise. There ought to be one in every neighborhood, at every Post-office, who will raise a larger or smaller premium list. We know it can be done at every Post-office. Suppose, Reader, that you attend to the work in your neighborhood. No matter if some one has made up a list, there are plenty more people who need the paper, and would take it if it were properly shown. Pick out some article in the table, a small one first, perhaps, and by the time you get names enough for that, you will be likely to choose a larger article instead, and get it. So it has worked in hundreds of instances. This month, people are waking up from the sleep of winter, and casting about for the summer work. The Agriculturist will give them many hints and suggestions that will put them on the road to better field crops, better garden plots, finer flowers, and better house-keeping. Get them to try it this year; you will receive their future thanks, and your present reward from the Publishers in the premium article you may be able to call for. Try it this first week in March. MARCH ON!

[In this table are given the regular cash prices of each article, and the number of subscribers required at \$1.50 a year, to get it free, also at the lowest club rate of \$1 a year. For full descriptions of the articles see extra sheets, sent free.]

Table of Premiums and Terms, For Volume 28—(1869). Open to all—No Competition.

Table with columns: No., Names of Premium Articles, Price of Premiums, and Number of Subscribers required at \$1.50 and \$1. Items include various agricultural tools, seeds, and books.

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The thirty-two Premiums, Nos. 29, 30, 31, 61, 62, 63, 61, and 76 to 100 inclusive, will each be delivered FREE of all charges, by mail or express, (at the Post-office or express office nearest recipient), to any place in the United States or Territories. —The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance specified.

Read and carefully Note the following: (a) Get subscribers anywhere; all sent by one person count together, though from one or a dozen different Post-offices. But. . . (b) Say with each name or list of names sent, that it is for a premium list, and we will so record it. . . (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. Any time, from one to three months, will be allowed to fill up your list as large as you may desire. The premium will be paid whenever you call for it. . . (d) Send the exact money with each list of names, so that there

may be no confusion of money accounts. . . (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer the premiums. . . (f) Specimen Numbers, Cards, and Show-bills, will be supplied free as needed by canvassers, but they should be used carefully and economically, for every extra copy of the paper costs, with the 2c. prepaid postage, about 12 cents. . . (g) Remit money in Checks on New York Banks or Bankers payable to order of Orange Judd & Co., or send Post-Office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk.

If from any Cause one fails to get the larger premium desired, the names can be used for a smaller one.

A Full Description of the Premiums is given on an extra sheet; a copy will be sent free to every one desiring it. For New Premium 106, see page 32, January No. We have only room here for the following:

No. 42—Clothes-Wringing Machine. —A very useful, time-saving, strength-saving, clothes-saving implement, that should be in every family. The wringing of clothes by hand is hard upon the hands, arms, and chest, and the twisting stretches and breaks the fibres with lever power. With the Wringing Machine, the garments are passed rapidly between elastic rollers, which press the water out better than hand wringing, and as fast as one can pick up the garments.

Nos. 76 to 81—Volumes of the American Agriculturist (Unbound). —These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. We have stereotype plates from the Sixteenth to the Twenty-seventh Volume complete, from which we print numbers as needed. The price of the volumes is \$1.50 each, at the Office, or \$1.75 if sent by mail, as they must be post-paid. They are put up in clean numbers, with full Index to each volume. —They are profusely illustrated, the Engravings used in them having alone cost about \$40,000. Those obtaining premiums for less than twelve volumes can select any volumes desired, from 16 to 27.

Nos. 82 to 87—Bound Volumes of Agriculturist. —These are the same as Nos. 76 to 81 above, but are neatly bound in uniform style, and cost us more for the binding and postage. Sent post-paid.

Nos. 88 to 99—GOOD LIBRARIES. —In these premiums, we offer a choice of Books for the Farm, Garden, and Household. The person entitled to any of the premiums 88 to 99 may select any books desired from the list on 3d cover page, to the amount of the premiums, and the books will be forwarded, paid through to the nearest Post-Office, or Express office, as we may find it most convenient to send them.

No. 100—General Book Premium: Any one not desiring the specific Book premiums, 88 to 99, may select Books from list on cover, to the amount of 10 cents' worth for each subscriber sent at \$1; or 20 cents for each name sent at the (ten) club price of \$1.30 each; or 60 cents' worth for each name at \$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through by us.

A Few Dollars' worth of books pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to make their hearts help their hands. Any good book will, in the end, be of far more value to a youth than to have an extra acre of land on coming to manhood. The thinking, reasoning, observing man, will certainly make more off from 49 acres than he would off from 50 acres without the mental ability which reading will give him. Far better to sell the acre of land, than do without the books. Several good books are announced in the Advertising columns, and in the list on the 3d cover page.

No. 106—Pocket Rifle.—(Breech Loading).—A full description of this beautiful implement, with illustrations, was given on page 32, of Jan. No. No one who enjoys shooting, or who has occasion to carry a light but effective weapon in traveling or while at work, will regret the trouble required to gather the 24 (or 18) subscribers required to secure this weapon free. If any one does not care for the mahogany case, we will present the weapon all complete, with extension breech and 100 cartridges, on receipt of 18 subscribers for 1869 at \$1.50 each, all packed in a strong pasteboard box, neatly papered,

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for the month ending Feb. 15, 1869, and for the corresponding month last year.

1. TRANSACTIONS AT THE NEW-YORK MARKETS.

Table with columns: RECEIPTS, Flour, Wheat, Corn, Rye, Barley, Oats. Rows for 26 days this month and 26 days last month.

Table with columns: SALES, Flour, Wheat, Corn, Rye, Barley, Oats. Rows for 26 days this month and 26 days last month.

2. Comparison with same period of this time last year.

Table with columns: RECEIPTS, Flour, Wheat, Corn, Rye, Barley, Oats. Rows for 26 days 1868 and 26 days 1869.

Table with columns: SALES, Flour, Wheat, Corn, Rye, Barley, Oats. Rows for 26 days 1868 and 26 days 1869.

3. Exports from New York, Jan. 1 to Feb. 15:

Table with columns: Flour, Wheat, Corn, Rye, Barley, Oats. Rows for 1868 and 1869.

4. Stock of grain in store at New York:

Table with columns: Wheat, Corn, Rye, Barley, Oats, Mill. Rows for months from Feb. 10 to Dec. 14.

CURRENT WHOLESALE PRICES.

Table with columns: PRICE OF GOLD, FLOUR, WHEAT, CORN, RYE, BARLEY, OATS, etc. Rows for various commodities and their prices.

Gold has been as high as 136 1/2, but closes tamely at 135 1/2. There has been more inquiry for the leading kinds of Breadstuffs for home use, shipment, and on speculative account—in several instances at advanced prices, though the market closes dull, and slightly in favor of purchasers.

regular business. All sellers agreed unhesitatingly to the conditions, and the sale was positive and unexceptionable in every particular. The terms were "cash within 30 days, for all sums less than \$3,000; for all larger amounts, cash in 30 days, or approved indorsed paper at not over 90 days, with interest added from date of sale. Interest at 10 per cent per annum allowed on all amounts paid before the expiration of 90 days."

New York Live Stock Markets.

Table with columns: WEEK ENDING, Beaves, Cows, Calves, Sheep, Swine, Total. Rows for Jan 15th, Feb 1st, Feb 8th, Feb 15th.

Table with columns: Total in 5 Weeks, do. for prev. 4 Weeks. Rows for 27,724 and 26,790.

Table with columns: Average per Week, do. do. last Month, do. do. prev's Month, Average per Week, do. do. 1867, do. do. 1868, do. do. 1864, Total in 1868, Total in 1867, Total in 1866, Total in 1865, Total in 1864.

There has been very little improvement in the cattle for sale this month over those of last month. But few really desirable lots were in market on any one day, and few droves run even enough in quality to sell in a "bunch" at one price.

The weather has been extremely mild for midwinter, and butchers bought in small lots, just to suit immediate demand. There have been a few pair of choice steers on sale each week, fully equal in fatness to the "Christmas stock," and were sold by private sale, a little above the highest prices given in our list.

The following list gives the range of prices, average price, and figures at which the largest lots were sold: Jan. 15th ranged 8 @ 17 1/2c. Av. 15c. Largest sales 14 @ 16 do. 25th do. 10 @ 17 1/2c. do. 13c. do. 14 @ 16 do. Feb. 1st do. 10 @ 17 1/2c. do. 13 1/2c. do. 13 1/2 @ 16 do. 8th do. 10 @ 17 1/2c. do. 15c. do. do. 14 @ 16 do. 15th do. 10 @ 17 c. do. 14 1/2c. do. do. 14 @ 16

The season of Lent brings a dull trade for meats of all kinds. For the past month, prices have been quite even, and the market steady. With the poorer grades, sales were dull, but good steers have quite held their own. The extreme low price during the week ending January 18th was for a few lots of inferior stock. The highest price on our list, 17 1/2c., may be considered the very top of the market, only the very best of each drove reaching that figure on the scales at 60 lbs. net to the cwt.

Milk Cows have been a little more in demand, and really good cows sell quickly. The prices paid have been about the same as last month. The highest paid this month for a "fancy" cow was \$110; the lowest for a poor one, \$60. Stock-men are asking \$80 @ \$90 for good cows, and find steady sales. Half-dry cows of milkmen drag slowly on the market; still there is a demand for good milkers at prices given.

Veal Calves have been quite plenty, and the market rather dull. The continued warm weather made dealers in Western "hog-dressed" calves anxious to get rid of their lots, and prices declined 1c. or more per pound for this sort. A comparative decline ran through the live calf market, and trade was dull. Western "hog-dressed" sell at 14c. @ 18c. per pound. A few extra fat, and very nice, brought 20c. Live calves, of fair quality, bring 12c. @ 12 1/2c., live weight. Sheep and Lambs have been plenty, and a little improved in quality. Sales have been a little more steady, and rates have advanced about 1/2c. @ 1c. per pound over the prices paid last month.

Prices range for good from 7c. @ 7 1/2c. per pound, and extra as high as 9c., while common to poor sell for 5c. @ 6c. per pound. Swine.—There has been a marked falling off in arrivals. The market has been steady, but not strong, and prices a little advanced. But few sales are made on foot, packers preferring to buy the dressed carcasses. On foot, prices run 11 1/2c. @ 11 3/4c. per pound, live weight. City dressed, 14 1/2c. @ 14 3/4c., and Western dressed, 14c. @ 14 1/2c. Stock-men formerly engaged in selling cattle at Hudson City now have their offices at Communipaw. A difference between the managers of the Erie R. R. and cattle men is the cause of the change, and hereafter such stock from the west as formerly reached here by the Erie R. R. will be shipped from Pittsburgh, via the Pennsylvania and New Jersey Central Railroads to Communipaw.

The Great White Ox.—The readers of the Agriculturist will remember the great ox, "Pride of Livingston," of which we gave a portrait at the time of

his exhibition at the Sanitary Fair, in New York, in 1864. At that time he weighed 3,602 pounds, as certified by respectable persons under oath. He was sold for \$1,000, and became the property of a gentleman in the State of Vermont, who named him "General Grant," and presented him to Mr. Lincoln, on his re-election in November. Mr. Lincoln gave him to the Sanitary Fair at Boston. Here he earned \$2,000, and sold for \$2,000 in a raffle—the winner selling him to his late owner for \$850. He was also shown at the Sanitary Fairs of Chicago and Philadelphia, in 1865, and in all his exhibitions and sales, earned more than \$12,000 for the sick and wounded soldiers. He has, besides, visited numerous State and County Fairs, and been carried about in torchlight processions, and exhibited in other ways. The ox has been given to be roasted for the Invalid Soldiers, on the 4th of March. As beef, he is not worth so much as he was in 1864, but he is still a very handsome, fat ox, in excellent health, active, clear eyed, and fresh skinned as possible. He measures from base of horns to root of tail, 8 feet, 9 inches; in girth, 11 feet, 2 inches; in height, 5 feet, 10 inches; in width, through the hips, 3 feet, 11 inches; perpendicularly, through shoulder and brisket, 4 feet, 8 inches; and the brisket is 11 inches thick. The meat will be cut from the bones, and the skeleton given to Professor Agassiz, for the Zoological Museum at Cambridge.

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Mark All Subscriptions sent in, as New or Old. How to Remit:—Checks on New-York Banks or Bankers are best for large sums; made payable to the order of Orange Judd & Co.

Post-Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect June 1st, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. Buy and affix the stamps both for postage and registry, put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Letters sent in this way to us are at our risk.

Postage.—To our published terms for the American Agriculturist, postage must in all cases be added when ordered to go out of the United States. For Canada, send twelve cents besides the subscription money with each subscriber. Everywhere in the United States, three cents, each quarter, or twelve cents, yearly, must be prepaid at the Post-office where the paper is received.

Bound Copies of Volume XXVII (1868) are now ready. Price, \$2, at our office, or \$2.50 each, if sent by mail. Any of the previous eleven volumes (16 to 26) will be forwarded at the same price. Sets of numbers sent to our office will be neatly bound in our regular style for 75 cents per volume, (50 cents extra if returned by mail.) Missing numbers supplied at 12c. each.

Canada Postage Stamps cannot be used or sold here. Please remit in United States or Canada money.

Our Premium Fowls.—The La Fleche and Houdans have recently arrived from Paris. The Crevecoeurs are bred direct from the imported Paris Exposition prize stock, and are all very fine. Light Brahmas are from pure stock, and only a few left. Dark Brahmas and Scbright Bantams none left. Those canvassing for these premiums should send in their orders as soon as possible.

Change of Address.—Subscribers wishing the American Agriculturist changed to a different post-office should give us a month's notice, as the wrappers are written and arranged long before the date of the paper. Get the postmaster at the place you are leaving to forward one number, and the rest will go all right from our office.

No More Anonymous Letters.—If a person is ashamed to put his name to a letter, he had

better not write. We are tired of "Subscriber" and "Constant Reader," as signed to letters. It is not considered gentlemanly to write an anonymous letter to a private individual; why should it be otherwise to an editor? We do not wish to publish names, but it is right that we should have names as a guarantee that a statement is made in good faith. Sign initials or any fancied signature to the article intended for publication, but give us the real name, as a clue to the author.

The Death of Mr. Pardee.—Mr. R. G. Pardee, well known in the horticultural world, died in New York City on February 4th, in his 57th year. Mr. P. was an enthusiastic lover of horticulture and the author of a work on the strawberry; besides he was widely known as a devoted worker in the Sunday-school cause.

Veterinary Education.—The New York Legislature could not do a better thing with the people's money than to extend such aid to the New York College of Veterinary Surgeons as it gives to other educational institutions. If they were to liberally endow it, it would be money well appropriated.

The Grape Culturist is the title of a new monthly by George Husmann, St. Louis, Mo., at \$2 a year. Mr. H. informs us by letter that copies have been sent, but they have failed to reach us. The starting of a periodical devoted exclusively to grapes and wine is an indication of the importance attached to this branch of industry. Mr. Husmann is not only an experienced grape grower and vintner, but a remarkably vigorous writer, and we look for not only an instructive journal, but one with a great deal of "snap" to it.

The Cincinnati Horticultural Society shows remarkable vitality. It will hold spring and summer exhibitions every Saturday from June 5th to July 31st, and offers most liberal premiums for such fruits, vegetables, and flowers as may be in season. The merchants of Cincinnati have taken hold of the matter, and offer liberal special premiums. The prospectus is a capital specimen of tasteful printing. The President of the Society is Capt. W. P. Anderson, and the Corresponding Secretary, C. H. Wardlow.

Palmer's "Heaven Manure."—In our December number, we published an item in respect to this. It was written by one of our editors wholly from what appeared in the Circular itself, which was sent to us from a subscriber for an opinion. That Circular, taken by itself, without any explanations, would warrant the general inferences drawn. But Mr. Palmer has called upon us and made some explanations, which put rather a different face upon the matter. He says he did not intend that Circular to go beyond the bounds of his annual route (though printed in general terms); that the \$25 (or \$15) he asks applies to those only so far aside as to require extra labor, and includes recipes, a book of 200 pages, and all necessary attention in preserving and preparing mixtures and manures of all kinds. We have no doubt that in such a work he may be of practical service, however much we may call in question his science of manures. Any man devoting his whole time to making or working manures will be able to afford aid to those who give no observation to the subject, but work haphazard. Mr. Palmer also brings us certificates from many of his neighbors and patrons for his good character as an honest Christian man, with good intentions. With these explanations and certificates, and after hearing from himself his desires and mode of operation, we very cheerfully withdraw any reflections upon his personal character, or his intention to humbug people, for we judge that he means to do right. In saying this as to his personal character and intentions, we do not necessarily endorse his manures or "science." We are perfectly willing that he should demonstrate his faith by his works.

A Grand Bazaar for Our Readers is provided in the Advertising Pages, where they can find what is for sale and by whom, and consult a great variety of establishments. We are sorry to be compelled to leave out nearly three full pages of advertisements that arrived too late. Please be on time. Probably nowhere else can one find so many reliable business announcements brought together, for our rules exclude those not known personally, unless they furnish evidence that they have the ability and intention to do what they promise. We repeat the request that those sending to our advertisers for cards or circulars, or ordering, should mention the fact of seeing the advertisement in this journal. It gives special pleasure to advertisers to know where their business notices are seen; and we like to have them learn something of the vast number of wide-awake people that see this journal, not only in every part of this continent, but also in remote lands.

The Horticulturist.—The first number of this journal under its new management has a pleasant look, as it has returned nearly to its original form of page. The contents show signs of vigor, though bearing the marks of having been hastily made up. An eminent writer said to us a few days ago that "no one ever should publish a first number, but destroy it after it was made up and begin with the second." While we do not intend to say that the first number of the Horticulturist deserves this fate, we are sure that the second will be better, when the new editor becomes used to the harness, where we hope he will have a heavy load (of subscribers) to pull.

The Currant Borer.—H. T. Prindle. The only way to "prevent" the ravages of the currant borer is to destroy the parent insect which lays the eggs. Traps of sweetened water might help. There are two borers, one the larva of a small beetle, and the other that of a small moth. Cut off and burn the infested twigs.

The American Pomological Society.—A special meeting of the Executive and Fruit Committees was held in New York on February 10th, the Hon. Marshall P. Wilder presiding. The main object of the meeting was to give the fruit catalogues a more careful revision than could be done at the annual meeting. Though we missed many whom we hoped to see present, there was an assemblage fitly representing the pomologists of the country. The gentlemen went into the work with earnestness and prosecuted it with perseverance, and their labors will relieve the annual gathering of much time-consuming work. The prompt and well-matured decisions given by those present indicated a great amount of careful observation. As the work of revision was going on, it occurred to us that people in general know but little of their indebtedness to these workers in pomology, who give years of experiment to enable them to say whether a variety is worthy or unworthy of cultivation. Fruit growers all over the country reap the benefits of these observations, which for the most part are carried on through a love for the cause rather than from any prospect of gain. Among those who took an active part in the proceedings were Wilder, Hovey, Hyde, and Manning, of Massachusetts. New York was represented by Downing, Barry, Ellwanger, Messrs. Parsons, and others; New Jersey by Perry, Fuller, and Quinn; Eastern Pennsylvania by Mitchell, Hoopes, and Mehan, and the western part of the State by Knox and Bockstoeck. Ohio found an able representative in Elliott. Saunders and Saul were present for the District of Columbia. Other names escape us at the moment, but enough have been given to show the character of the meeting.

Asparagus.—The Horticultural Annual contains an excellent article on the market and garden culture, by F. Brill, a New Jersey market gardener.

Excelsior Potatoes, from Mr. Jas. J. II. Gregory, Marblehead, Mass., were of really first quality.

Practical Floriculture.—The immediate sale of the first issue of this work rendered it necessary to print a second edition at once. In doing so some typographical errors—which any one familiar with the subject must have seen were merely mistakes of the types, and not of the author—have been corrected. It is the only work which gives a full account of the management of a commercial florist's establishment. The wants of the amateur are also kept in mind. Price by mail, \$1.50.

The New York Tribune deserves thanks for the persistence with which it advertises the *Agriculturist*, in addition to what we pay for. Some one thought the tail of a cat in a picture in our children's department too large, and accordingly wrote to the Farmers' Club (as the body most competent to judge of such subjects) upon this and other minor details of our pictures. This letter the Tribune kindly published, as it often does letters in which the *Agriculturist* is mentioned. The February number, containing the pictures alluded to, has had a remarkable sale, showing the influence of the Tribune's advertising. We return the favor by saying that the Weekly Tribune is a most admirable paper. If it would devote the columns which it facetiously heads "Agricultural" to some useful matter, well understood, it would be even a still greater marvel of excellence combined with cheapness than it now is.

The Stark Apple.—A variety under this name has recently been attracting attention at the West. We give an outline of it, with Dr. Warder's description, on another page. Since that page was printed a meeting of the Fruit Committees of the American Pomological Society was held in New York, at which specimens of

the "Stark" were presented. The pomologists pronounced them to be the Pennock, or Pennock's Red Winter, an old and but little valued sort, under a new name.

Bommer's Method.—We are rather taken to task for having said in a recent issue that we did not endorse the little book called "Bommer's Method." The writer sent for the pamphlet, made the tank, and followed the directions with great satisfaction,—no doubt greatly increasing the quantity and the quality of his manure, and he does not see why we do not endorse it all. We do heartily approve the general process, and follow the same as nearly as we conveniently can; but there are some claims and statements in the book a little extravagant, or at variance with views at present received.

Green-Houses Upon House-Tops.—A correspondent of the *Country Gentleman* suggests that the modern style of building houses allows of the ready conversion of the attic into a conservatory or greenhouse. The idea is not a new one, it having been advocated as long ago as 1861 by Mr. Samuel B. Parsons. An article on the subject, with illustrations, will be found in the *Agriculturist* for April, 1861. It is not surprising that a plan so feasible should have suggested itself to others.

The New York Fruit Growers' Club are to have a committee who are to call on all the powers that be and are to be, to enlarge the "Bureau of Agriculture" into a full Department, so as to insure greater attention to horticulture. Now we do not know what the "Bureau" of Agriculture is. There is a Department of Agriculture in Washington, and had the Club desired to know what that has in contemplation for horticulture and about its plans, the execution of which is only deferred until spring, it could easily have obtained the knowledge. Mr. Saunders, of the Department, was present when the resolution was offered, and had he been called upon, he might have shown the Club that quite all they propose is already on its way toward accomplishment.

Sundry Humbugs.—The "Gift Enterprise" business, which for some months past seemed to be on the decline, has in a measure revived again, and several of the more prominent companies are flooding the country with their circulars of "great promise," regardless of the law in the matter. Those who have seen the notices of these various firms in our Humbug articles for the past year will not, of course, trust any of them. To all persons we say, invest in no "gift lottery" or cheap jewelry enterprise whatsoever. An instance showing how successful these leeches of society sometimes are in their operations was given in the Brooklyn police reports. On January 29th, one Jonah Andrews, of Fulton Street, Brooklyn, was arrested, and, although proof was strong against him, he was let go on his promise to quit the business. He admitted to the authorities that he had made over \$100,000 at the business, most of which was invested in real estate. Young men of the country, when you feel tempted to trust the promises of such persons, remember that every cent you send them is so much encouragement to villany, and that, as a rule, you will never see the prize you send for or hear of the money again. . . . Half a dozen parties in Boston, in Williamsburg, N. Y., and elsewhere, are operating in the "dry goods" line. On the receipt of a specified sum they propose to send a certain number of yards of cloth of various kinds and patterns. And to those who are willing to act as agents for them, they will, besides allowing 15 per cent on their sales, give them twelve yards of cloth as a premium on their first sales amounting to \$6. The wise will risk no money on these schemes. The cat is well mealed over, but we see the ears, toes, tail, and the teeth sticking out. Some of them have no "cat," but are like the "Eureka Print Works"—well known to our readers as a thing not to be found except on paper. . . . E. A. Saunders is impressed with the belief that people will think him honest and that he will do as he agrees. His plan is this: To make it appear to the managers of the "Delaware State Lottery" that they owe you a prize, you are to send him \$10 in a letter dated one day previous to its being mailed. This letter he will put into the hands of the "Managers," and by a judicious system of lying obtain from them a prize-ticket which will entitle the holder to \$400 in "greenbacks." This "prize-ticket" he agrees to return to you with instructions how to get the prize! Of course none of our readers are verdant enough to be caught in such a trap. The game is altogether too ancient, Mr. S., and you will have to try something new, or go among those the *Agriculturist* does not reach. . . . "Music boxes" (a three-penny reed whistle), sold for one or more dollars each, are just now a favorite swindle adopted by swindling parties, new and old. . . . Rev. Edward H. Wilson! This swindling wolf in sheep's clothing continues to advertise. We are glad to see in the Methodist Home Journal of Philadelphia a letter from a correspondent

protesting against the admission of Wilson's advertisement in that excellent paper. Every publisher who advertises for Wilson helps to cheat his readers, unwillingly, we hope, but hardly blamelessly. We have exposed Wilson several times in the last dozen years. He purported to be a Methodist minister, and claimed to belong to the "New Haven Methodist Conference," until we published the fact that there was no such Conference known to Methodists. He then changed his tactics, studied up the "minutes," and located himself in an actual Conference, where, strange to say, none of his "brethren" knew him. He professes to be actuated solely by benevolent motives, but fails to let the press publish his recipe gratuitously, albeit we did publish it (see *Agriculturist* for July, 1859, April, 1862, and December, 1865). Like several others of his class, he is an un-hung villain, who, under an assumed name, steals the livery of Heaven to serve the devil (his own pocket) in. ... There are several others of the Wilson class before the public just now. One of the more prominent ones claims to be a woman by the name of Mrs. M. C. Leggett. She has remedies for catarrh, scrofula, and deafness, any or all of which she will send free of charge to any address. Of course, the several ingredients from which these "remedies" are compounded can only be obtained from her; and in a private letter on the back of the circular sent with the receipt, she tells you that for \$5 she will send you every article named therein, fresh and good, etc.!! That is the dodge they all have; "free of charge" means \$5, or some other sum of money, for a worthless or dangerous article, or a temporary stimulant, costing a few cents. ... Look out for "Real Estate Lotteries" of all kinds, for they are humbugs. ... The Implement Humbug every now and then turns up. "Shakes" (an appropriate name for some parts of the State he writes from) says: "There is one going the rounds this winter—a patent right cultivator and seed-sower. Town rights are sold to unsuspecting farmers for \$200 or more, they giving their notes, expecting that large profits will soon repay them. One man made twelve hundred dollars by shoving these notes in one county. I do not know of an instance where the dupe has been able to dupe enough of his neighbors to enable him to get his money back." The less a farmer has to do with these traveling patent right chaps the better. He should never buy an implement of any kind that has not been thoroughly tested.

Parsons on the Rose.—The publishers of the *Agriculturist* will shortly issue a new and mainly re-written edition of this standard work on rose culture. So great has been the progress in this branch of horticulture that, as far as varieties are concerned, a thorough revision was necessary. Much new material has been added and at the same time such matter as has become superfluous has been omitted. New illustrations have been prepared, and the whole is essentially a new work. Ready in April. Price, \$1.50.

The New York State Poultry Society premium list is now ready, and will be sent free on application. Office, 229 Broadway, New York.

New Work on Architecture.—Woodward's National Architect.—We have long sought in the various excellent works on house building for more of detail both of construction and ornamentation. The work before us supplies this want in an unusual degree. Besides giving a great number of attractive house designs, to cost, as estimated, from \$2,000 to \$30,000, with perspective views of most, front elevations, side elevations, and plans of all, the details are given with great minuteness, including the framing, mouldings, casings, newels, stair balusters, etc., etc., to the iron ornaments, vases, and crestings for the roof. Accompanying each design is a "complete set of specifications and an estimate of cost," at New York prices, to enable any one to compare and make his own estimates. The work will be valued by any one intending to build, and be very useful for country builders. It contains 20 designs of buildings, 109 plates, and 1,000 original engravings, including designs, plans, and details. It is sold by subscription, but the proprietors of the *American Agriculturist* have made arrangements with the publishers to supply the work at the subscription price—\$12.

The Department of Agriculture and the N. Y. Times.—The N. Y. Times has the following: "The *American Agriculturist* snarls at the Times for suggesting any improvement in the management of the Agricultural Department at Washington. It states, with a great deal of arrogance, that any improvements in that Department are directed by the 'Agricultural Press,' and all the 'Timeses' in the country will not hasten or retard any proposed movement, as farmers have the business in hand, and politicians have very little to say about the matter. We doubt

whether that is so. But if it be the case, it is the bounden duty of every man and woman to sign a petition praying Congress to abolish the Agricultural Department at once. We did hope that something worthy of record and advantageous to the country would be accomplished in that Department. But if the parties alluded to have got the power, the miserable inefficiency of the past will bear a small comparison to the distressed management that we may look for."—We print the above merely to put the Times on record, and let the farmers see what a paper which has an "agricultural" column really thinks of them. The Times railed at the monthly reports of the Department as being of no value. Shortly after it had quite a long article on the crops, based on the report of the Department, and largely made up with quotations from it. Either that paper was insincere in denouncing the reports, or it chooses to furnish its readers with matter of no value. If report speaks truly, one of the subordinates of the Times wishes to become Commissioner of Agriculture. The course of the paper in trying to destroy confidence in the present Commissioner looks like an effort to prepare the way for a change. It won't work.

Soft-shelled Eggs.—"J. H. L.," of Cincinnati, says his hens' eggs are nearly all soft-shelled, though the fowls have both sand and lime to run to. The lime is doubtless in a form which is distasteful, or not recognized by the hens. Give the hens powdered oyster or clam shells, finely pounded bones, or marble dust, mixed with their feed.

Gray's School and Field-Book of Botany.—"How shall I study botany?" is a question often put to us. We now have a ready answer—buy the above book, and study it faithfully. Dr. Gray has done the public good service in the preparation of this work, and Ivison, Phinney, Blakeman & Co. have presented it in a handsome style. The book consists of two portions: First, the "Lessons," which have been before the public for several years. No work, however elaborate, has so clearly and charmingly presented the structure of plants as these unpretending "Lessons." The writer, upon their first appearance, had occasion to say that "the work contained more botany than any he knew of." They are written in a spirit only possible to a mind thoroughly imbued with the subject, and in a style so plain that a child may comprehend it. A knowledge of the structure of plants and of the plan of vegetation is the groundwork of all botanical knowledge, and can nowhere be better acquired than from these lessons. Then comes the study of the classification of plants, the identification of species, their grouping into genera, families, etc. These are treated of in the second part of the volume. Gray's Manual of Botany contains descriptions of all the native plants of the Northern United States, and much of the matter in that is of but little use to the general student. The present work includes such wild plants as are most commonly met with, and, what will prove generally acceptable—the plants of the garden and green-house. Means for studying cultivated plants have heretofore been only within the reach of those having libraries, but here is a whole library of description condensed into less than 400 pages, with that clearness and conciseness which are so characteristic of its author. The work under notice will do much to popularize the study of botany, and we commend it not only to the general public but to gardeners and florists, who have now no excuse for following an incorrect nomenclature. Sent from the office of the *Agriculturist*, by mail, for the publishers' price, \$2.50.

Salt Marsh Mud.—Benjamin White, Mass.—Get out the mud, and let it dry on the shore. If it becomes easily pulverized, it may be spread at once on grass land, and will probably have a good effect,—better if put on after mowing. Whether easily crushed or not, it may be composted either with lime or yard manure with good results upon all farm crops.

Norway Oats.—Several inquirers.—As a finality we would say that we have grown an oat called Norway, and found it a good and productive grain. The position of this journal in regard to such matters is this: If we believe that those who advertise "novelties" are acting in good faith, we admit their advertisements. We do not endorse the representations made concerning the articles; nor do we admit the advertisement if we have reason to suppose that there is any "humbug" about it. Moreover, we advise no one to invest in new and untried things, unless he can afford to lose his money in case of failure. Please remember that all new plants, seeds, and the like, are on probation. If one in twenty proves better than any thing of its kind already in cultivation it is a great gain. If we were to exclude all seeds and plants until they had been generally tested and proved valuable all over the country, it would be depriving our readers of opportunities for experiment which they ought to have; indeed, few things would ever get generally tested. That

spurious "Norway oats" are in the market we do not doubt. That the "Norway" or any other oat will prove a success everywhere we do not believe. That the "Norway" has been found valuable in Vermont, Nebraska and other States, we are as well assured as we can be of any thing depending upon testimony. Touch all new things gently, and if a failure is likely to be at all embarrassing let them alone until those who can afford to do so have tried them.

New Roses.—John Saul, an acknowledged authority, describes them in the Horticultural Annual.

Climax Potato.—In December last, we gave the Early Rose as the parent of the Climax. We intended to say Early Goodrich, and thank Mr. Breece for calling our attention to the error.

George Hussmann has sold his celebrated vineyard at Hermann, Mo., and will remove to Bluffton.

There will be a Grande Exposition Universelle at Lyons, France, in 1870, which is some years too soon.

Will it freeze? is the question in France, the early spring flowers being all in bloom in January.

Hovey looks many years younger now he is no longer an editor.

Two of Arnold's new grapes have been tested. The Comocopia stood 79 and Antuchon 86 on the must scale.

A machine has been invented in England for killing cheap seeds to mix with new and dear varieties.

Camellias are having a great time this year in England. One man reports 49 blooms on a plant out of doors Jan. 11.

In England, small green-houses are heated by petroleum stoves. Here is a chance for some Yankee inventor.

English florists make a great palaver about a new Bolivian annual called *Palaver*.

The Lancaster Farmer is a new monthly, published at Lancaster, Pa., at \$1 a year.

The Chautauqua Farmer began its existence with the present year, at Dunkirk, N. Y. It is a weekly at \$1.50.

Edward Jones wonders why those who have choice grain seeds—wheat, corn, oats, etc.—do not advertise them. So do we.

The boys at Cornell University publish a paper, the Cornell Era. It looks as if some old boys had a hand in it.

The winter has been very mild in England. In January, Roses were in bloom, Horse Chestnut buds expanded, and Rhubarb fit for use in the open ground.

What's in a name? A great deal we should say when we read of *Primula Sinensis imbricata punctata elegantissima*. The poor thing lived, notwithstanding its name.

The Toronto (Canada) Weekly Globe has a horticultural department excellently conducted by D. W. Beadle, a well-known pomologist.

A man who went to Florida to buy land for a company reports that the soil might possibly be made productive if manured every twenty-four hours.

A. M. is informed that we do not treat with parties who do not give their names; also that we never decide to publish or reject articles without first seeing them.

Deitz's "Experimental Farm Journal" is a new agricultural monthly of 32 pages, octavo, in covers, issued by Geo. A. Deitz, of wheat fame, at Chambersburgh, Pa., at \$1.50 per annum.

The International Horticultural Exhibition to be held at St. Petersburg on May 14th offers a large silver medal for the best collection of North American Oaks suitable for cultivation in Russia.

In Russia a water-melon is *arboor* and melon patch a *bagshta*; moreover a cucumber is a *goortsee*. Those who wish more of the nomenclature can attend the International Horticultural Congress at St. Petersburg next May.

Some half dozen Secretaries of Horticultural Societies sent notices of their winter meetings in February, about the time half our edition was mailed. How could they have been published?

A convention of American Philologists will be held at Poughkeepsie, N. Y., on the 27th of next July. Professors of Language in Universities, Colleges, Theological Seminaries, and other high schools of learning, Presidents of Colleges and other schools where Languages are taught, and amateurs and patrons of Philological studies and investigation, are invited to be present.

A prolific writer is Mr. "Ex." whose articles appear in so many agricultural journals. If a man can take our articles and satisfy his conscience by accrediting them to "Ex." he must have his conscience under good subjection. We have more respect for an open thief, like one New England paper which took an article from the *Agriculturist* and printed it double leaded, word for word, as its own. A highwayman is more respectable than a speak-thief.

A Very Complete Country House.

As one enjoys planting a tree, watching its development, and by training and pruning compelling it to grow to suit his fancy, so does another having a mechanical taste take great delight in seeing a house of his own planning "grow up" under his direction and oversight. This is especially the case when it is built by "day's work" instead of by "contract," so that he can add here, change there, and make all desired improvements upon the original plans and specifications. Such source of enjoyment and recreation has been indulged in by one of our Publishers. Having some spare land near his own residence in Flushing, he has from time to time erected one or more dwellings, which have been sold to desirable neighbors as fast as completed. The example has stimulated others, and there are now fifty-two dwellings in the neighborhood, where eight years ago there were but five. We present herewith the plans and description of one of the last two houses completed, which will probably furnish useful hints to many who are contemplating building for themselves or others, as the aim has been to introduce into these every improvement and convenience to be found in city as well as in country dwellings.

The Elevation.—A view, from the southwest corner, is shown in the engraving. As will be seen from the ground plans, the house appears nearly as well when seen from the opposite or northeast corner, where there is a glass enclosed piazza. The windows, etc., on the rear, are finished in the same style as the rest. (The too common custom is, to expend all the taste on the front, where others

Fig. 2.—BASEMENT.—Height 8½ feet in clear. *Aa*, Kitchen, with large range not shown; *u*, Sink; *n*, Pump, with tin-lined pipe to Cistern; *w*, Dumb-waiter, with speaking-tube (*s*) to Dining-room; *s, s*, Speaking-tubes, one to Dining-room, and one to Family Bedroom (*J*); *c*, pot-closet; *Cc*, Kitchen Pantry; *Bb*, Laundry; *t, t, t*, Stationary Wash-tubs, with hot and cold water; *u*, large copper Force-pump, to bring cold water to tubs, and to force water if needed in a drouth, into the upper tank (*X*); *Z*, 45-gallon Copper Boiler, with pipes to water-back of range, in *Aa*. *Dd*, Vegetable and general cellar; *Ee*, Milk or food cellar, plastered; *Ff*, Coal cellar; *Hh*, Hall, 8 feet wide, with brick walls; *Oo*, Heater for whole house; *c*, Closet. Gas in every basement room and hall.

see it, and leave the rear very plain, if not unsightly, because seen only by the occupants. This hardly tends to beget self-respect and culture in one's self or family.)... These houses are on brick cellar walls, 5 feet above the ground, frame, filled in with brick to the roof. The siding is of 10-inch boards, 1 inch thick, grooved at the deep half-lap joints, and in the middle of each board (fig. 6.) This gives the appearance of narrow siding, with stone-joint joints, instead of clapboard lap, and there are fewer joints, and less opportunity for entrance of air and water, while the expense is little, if any, greater. The roof is Mansard or French, the top of tin, and the slant portion of blue slate, over double layers of asphaltic felt, so that the sifting in of snow, or leakage, is im-

possible. The common error of making the top portion too flat is avoided. Bay windows are provided in three rooms. These are not sufficiently appreciated generally. They add much to the size and convenience of a room; they are ornamental to the exterior, in breaking up the blank, barn-like look of the side of a house; while they are pleasant for an out-look, up and down a street, or upon the garden or pleasure grounds. The addition of a Tower does not add greatly to the expense, for, as will be seen by the plans, all the room is used, while the room at the top makes a good observatory. [From the tower of these houses there is a fine out-look over the village and bay of Flushing, upon a section of Long Island Sound where all shipping passes, and over a portion of Westchester County, with a clear view of the Palisades on the west bank of the Hudson.] Except where high winds prevail, people generally build too low. A few square feet of framing timber, siding, and plastering, \$1 or \$2 on the \$100 of total cost, is all the difference between the expense of a house with rooms 9 to 11½ feet high, and one with rooms 7 or 8 feet high. All the expenses for floors, ceiling, roof, cellar, casings, doors, etc., etc., are the same, while the higher rooms are far more healthful, and every way desirable. A wide, spacious Hall is desirable. The appearance of this to one first entering a house gives an impression of the whole building, that is not overcome. If wide, there is a feeling of size and substantial comfort, no matter how small the individual rooms may be. One does not get over the idea that there is plenty of room somewhere in the house. The several floor plans, with the descriptions underneath, sufficiently explain the general division of the rooms, etc., and we need only to speak of some special items.

The Basement (fig. 2).—The Furnace (*Oo*), the "Oriental," is a "base-burner." A large supply of coal is put into a central cylinder, whence it drops as fast as burned out below, so that a constant fire is kept up. After a long examination, this new style was selected on account of its great amount of heating surface. It is so located that all ashes and dust are confined to the coal room (*Ff*) by a tight partition. It is placed near the north side of the dwelling, because the prevailing cold winds come from that direction, and the air from all heating furnaces tends to the leeward rooms. For this reason, also, an extra pipe is taken to the north side of Room *N*. The warm air pipes for the second story are carried up in the partition walls in elliptical tin pipes, and against these are placed iron lath, made by cutting strips of sheet iron about 2¼ inches wide, and bending the edges round, to form lips for holding the mortar. ... *Ee* is a very convenient "clean cellar" or milk-room, for food, finished off with plastered walls and ceilings. ... In the Kitchen, *Aa*, the sink, *u*, is supplied with hot water cock from the boiler, *z*, and the pump, *p*, draws filtered water from a large cistern outside, through a tin-lined pipe. The Pantry, *Cc*, gives ample room. In the chimney is a "Challenge Range," from the National Stove Works, N. Y., with water-back. A "pot-closet," *c*, is placed between the range and dumb-waiter, *w*. *Bb* is finished off for a Laundry; the Boiler, *z*, is placed in this room, to heat it. The large copper force-pump, *u*, draws cold water from the cistern for the tubs, and, when needed, it forces water to the reservoir, *X*, in the Attic. A valve prevents any descent of water, so that indolent servants can not exhaust the reservoir,

but must pump from the cistern, which holds an inexhaustible supply. The stationary wash-tubs, *t, t, t*, are supplied with hot and cold water cocks, and discharge pipes. These are of inestimable value in any house; no housekeeper having once used them would do without them if possible to secure them.

First Story (fig. 3).—This is mainly described under the engraving. The Vestibule, *G*, is desirable in any house, to stop drafts of air. The doors are surmounted by half circle plates of glass, and the inner doors are glass in upper panels. The outer doors open round against the closets on either side. These closets are very convenient, instead of the Hall bat-stands. ... The wide Hall *H* appears still larger, or the house does, on account of the large double doors into the rooms on either side. The stairs turn before reaching their full height, to break the long, continuous ascent. ... The Parlor *A* is ample for all ordinary purposes, but the Library, *B*, may be a part of it when used for a large gathering, or party. ... The Butler's Pantry, *E*, has a large copper basin with plated cocks for hot and cold water, for washing Silver and China, etc., not to be sent to the kitchen, or entrusted to servants. A register in the floor, *r*, can be used when needed. It may be desirable to have the dumb-waiter come up into this room, though this would throw it further from the Range and Sink; the study has been to save steps in every possible way. As the dish closets, *c, c*, are near, it would have been as well to place the dumb-waiter in the right hand one of these, with the door of it opening into *E*. This would leave a larger closet in *C*. All these items should be arranged to save steps. Fifty times a day across a 17-foot room amounts to nearly 600 miles in the course of ten years. ... Under the rear stairs in the back Hall is a closet, *c*. Every spare nook and corner

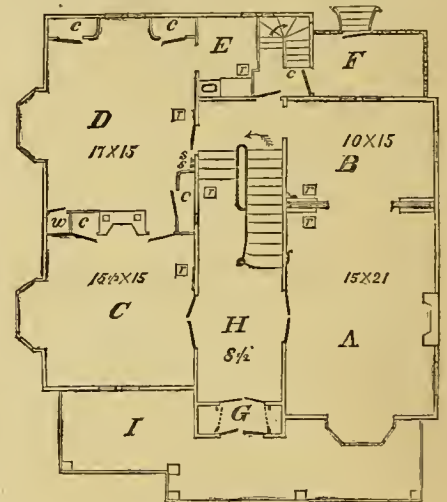

Fig. 3.—FIRST STORY.—Height 11½ feet in clear. *A*, Main Parlor, connected with smaller Parlor, or Library *B*, by ornamental ground glass sliding doors. ... *C*, Family Parlor, or Reception Room, or Sitting-room. ... *D*, Dining-room, with spacious pantries, *c, c, c*, and Dumb-waiter, *w*. ... *E*, large Butler's Pantry, having wash sink, with hot and cold water, drawers, shelf-closets, etc. ... *F*, Rear Piazza, enclosed in glass. ... *G*, Vestibule, with locked closets on each side for clothes, hats, etc., and glass inner doors into the Main Hall, *H*. Both vestibule doors have glass circle-heads. *I*, Front Piazza, 9 feet wide; *c, c, c, c, c, c, c, c*, Closets; *r, r, r, r, r, r*, Warm-air Registers; *s, s, s*, Speaking-Tubes, two to Kitchen, one to *M*. Small black markings on the walls of *A, B, C, D*, fig. 3, and *X, L, M, N, O*, fig. 4, indicate bell-pulls.

in the whole house is occupied with a closet, so that there is no waste room anywhere, while there are in all twenty-one different closets and pantries. *F* is a convenient cool piazza, which is neatly inclosed in sash.

Second Story, or CHAMBERS (fig. 4).—The engraving mainly describes this. The four wash-basins, *d, d, d, d*, are placed in the division walls in arched niches, but separated by lath and plastered walls, and rounded out in front with casings. This arrangement is convenient for the position of the basins, and one set of pipes answers for each pair. They are each supplied with hot and cold water cocks. Special care is taken to have all plumbing work above ground kept at a distance from the outside walls of the house, so that there is no danger from frost. The pipes pass up through closets along side of the chimneys, and nearly all pipes are accessible. When lead pipes pass through beams or floors, they should go tightly, or be cased round with tin, or cement containing broken glass, or else have abundant room around them for rats to pass; otherwise these pests will gnaw into the soft lead in attempting to enlarge a runway. A flooded house from this cause taught us a lesson some years ago. ... The Bath-room, *O*, is accessible to all of the cham-

Fig. 2.—SECOND STORY.—Height 9 1/4 feet in clear. *K* and *L*, Chamber Parlors, or Bedrooms. *M*, Family Bedroom, with Speaking-Tubes to Kitchen, Dining-Room, and to bell-pull outside front Door; and bells to basement Hall, and Attic Hall for summoning and waking servants. . . . *Q*, for Dressing Room, or Bedroom, or Sewing Room, or Nurse's Room, as required. . . . *N*, Large Bedroom with closets, *c*, *c*, *c*. . . . *O*, Bath-room, with bathing-tub, marbleized iron wash-stand, water-closet, closet, register, gas, obscured ornamental glass doors, etc. *P*, Main Chamber Hall, 8 1/2 feet wide; *R*, rear stairs Hall. All chamber rooms have wash-basins (*b*, *b*, *b*, *b*) in alcoves, with Italian marble tops and wall-protectors, plated hot and cold water self-acting cocks, registers, (*r*, *r*, *r*, *r*, *r*), closets, (*c*, *c*, *c*, *c*, *c*, *c*), double wall ventilators, bells, and *T*, *M*, and *N*, have Italian Marble Mantels, with Summer pieces, having German-silver guards, etc.

bers by the ball *P*. The water-closet at the end of the bath-tub has a lead box standing under it upon the floor, so as to catch any possible drip from the pipes or valves. The seat under the close-fitting cover is hung upon hinges, and under this lead pipe is put on dishing, which serves as a broad-topped urinal, by raising the seat.

Attic, or THIRD STORY (Fig. 5).—The water tank, *X*, which holds forty-eight barrels, is supported by extra heavy timbers from the cellar up. It is surrounded with double plastered walls, but can not well freeze, as the stair-way opening all the way up supplies an abundance of warm air. This tank is neatly cased in, with trap door in the cover. The water from all the upper roof comes into it until full, when the surplus runs down into a filtering cistern, and thence into the main cistern. It will be noticed that the chimney between *S* and *T* is carried over to the outer wall, to bring the top out where it is desired in the roof for architectural effect. The warm-air registers in *S* and *T* are under control of the mistress by means of dampers in the rooms below, so that either of these rooms can be warmed only when she desires.

General Remarks—Conveniences.—It will be seen that there is no carrying water to and from the rooms. A house anywhere in the country can have an abundant supply of the best "distilled" water—the purest possible. Nature carries it up; we have only to provide for interrupting it as it comes down. Forty to fifty barrels will furnish ample supply from one rain storm to another. In case of a long drouth, the force-pump will

Fig. 5.—ATTIC OR THIRD STORY.—Height of ceiling, 8 feet. *S* and *T*, large Bedrooms, with closets, warm-air register from the Furnace, opened or shut off by damper in the family room below. *U*, a Play-room for children, or for drying clothes, or other purposes. Two doors are provided, so that it can be divided into two rooms with separate entrances, if ever so wanted. *S*, *T*, and *U*, have ample dormer windows, (3 in *T*, and 2 each in *S* and *T*). *Y*, upper hall, with railing and banisters. *X*, Water Tank, holding 48 barrels, filled from upper roof. *W*, Small Bedroom, or general Store-room, with closet, *c*, and stairs to a fine Tower room or Observatory.

readily fill the tank. Such a supply will often aid to put out a fire that would otherwise be destructive. The entire plumbing work of these houses, including pumps, sinks, copper boilers, tank, drains, marble wash-basin, first-class plated cocks, bath-room, etc., can be put in for not to exceed \$700 in most places, the annual interest of which is only \$50 a year. It will save twice that sum in female help and board, to say nothing of comfort, convenience, utility, and fire risk. The cost can be reduced by using brass cocks, cheaper wash-basins, etc. But low-priced plumbing, such as, poor work, thin lead, etc., is not cheap, but very dear in the long run. (These houses were plumbed by Thos. Elliot, of Flushing, which is saying enough for the character of the work. We may say the same of the mason work, by J. & P. Carroll, of College Point, the gas fitting, by Henry Lewis, and the painting by Thos. Gosling. The whole work has been under the general superintendence of Mr. John Donald, as architect and builder, who has worked on salary, and therefore had no inducement to slight a single item, were he so disposed,—which he is not. We give credit to each of these men, for they have worked for it and deserved it, as the houses will abundantly show.

BELL-PULLS in each room in the first and second stories ring below in the kitchen or basement hall. One in the bath-tub calls a servant up to bring a towel, etc., and bells extend from the family sleeping room, *M*, to the upper hall, to awaken servants, and also from the first story rooms to call them down when needed.

SPEAKING-TUBES from *M* enable the housekeeper to give directions to the Dining-room and Kitchen, without going into the hall or calling servants up. A speaking-tube also extends from the same room, *M*, opening over the bell-pull at the front door, so that any one calling at night can be conversed with, without getting up and dressing, or risking meeting a robber at the door. Fifty or sixty dollars will fit out a house like these, with neat porcelain and plated knobs, pulls, month-pieces, etc., if put into the walls while constructing them; and how many times they will repay the interest every year! Houses thus fitted up command good "help," and less of it, and save the housewife immense labor and worry.

VENTILATORS.—Two of these are placed in all rooms, one near the baseboard, the other near the ceiling, with openings up through the walls. By closing the upper one and opening the lower one when the room is cold, the warm air from the grate or register, rising to the top, forces the cold air out. *Vis versa*: when the air is hot and impure, open the top register and close the lower one, and the rarefied impure air will pass off from the upper part of the room. A dozen pairs of these registers cost less than \$40, all put in, and they will pay in health a hundred per cent per annum. Gas PIPES are carried to every room, from cellar to attic, and to two places in some rooms. Mr. Judd believes in heating houses with pure air, brought directly from outdoors through large pipes, passed over a large, warm furnace surface, not a red-hot one, and thence into the rooms, provided always that ample watery vapor be supplied to the air while passing through the furnace chambers. Hence he has put warm air registers in every principal room, including bath-room, with grates in the two principal rooms for those who specially desire them. Marble mantels, and summer fronts, with German-silver guards, are placed in *A*, *C*, *M*, *N*, *K*. The *Painting Materials* were all purchased of Mr. C. T. Reynolds in New York, that there might be no chance for poor quality, or inducement to the workmen to slight the coatings. The outer color is drab, or light gray, with darker shadings for trimmings and blinds. Inside, the Halls and *C* are walnut stipple grained; *A* is a shaded white, with bluish gray tint on portions of mouldings. *D* and *E* are oak grained, and the chambers dead white; the two sides of the doors correspond in color with the several rooms and halls.

Any suggestions in regard to the interior arrangement of these houses or otherwise will be thankfully received, and published, if of general utility, our aim being to afford every hint we can that will aid in increasing the convenience and comfort of our American homes. The cost here of a house like the above, exclusive of ground, is not far from \$12,000, all complete, with fences, drains, lattice-enclosed Privy, Grape Arbor, etc. The items of cost are about as follows: Lumber, \$1,900; Carpenter work, \$2,000; Mason work and materials, \$2,200; Roofing, \$350; Furnaces, put in, \$350; Range, \$60; Ventilators, \$30; Gas Pipes, \$120; Sashes, \$230; Ground glass for Parlors, \$60; Mantels, \$200; Grates and summer pieces, \$100; Doors, \$200; Paints and Painting, \$600; Hardware, Nails, Bells, etc., \$450; Plumbing, \$700; Blinds, \$110; Stairs, steps, banisters, \$200; Mouldings, sawing, planing, etc., \$400; Locusts for fence, basement sleepers, etc., \$50; Labor—draining, grading, digging cellar, cess-pools, etc., \$450; Cartage and freights, \$250; Insurance, Interest, and many sundries, \$750.

These houses stand on high ground on Sandford Avenue, one of the finest streets running from the village, on a deep lot, 125 feet front, about three-eighths of a

mile from the R. R. depot, whence twelve trains a day run to the city. One of them is sold to and now occupied by Robt. McKim, Esq., of the firm of McKim Brothers, Bankers, Wall St., N. Y.; and the other, just finished, will be sold on very easy terms to the first comer—at the net cost of the house and a fair price for the land. The price named in a previous item was below the cost, as many additions were subsequently made.—Prior to its sale, permission to examine the above house can be obtained by calling on John Donald, residing near by. Cars run both ways nearly every hour in the day and evening, over the Railroad to Haoter's Point, in connection with the ferry-boats from James Slip, down town, and 34th Street, up town, in New York.—By the way, the recent great improvements in the railroads, bring Flushing and vicinity practically nearer in time and comfort of travel, and more convenient to the business portions of New York, than many parts of the city itself, day or night.

Fig. 6.—As still further suggestive to those building, we append in Fig. 7 a sketch of the casings or trimmings in the rooms of the different stories, drawn a little larger than 1 inch to the foot—those of the first story being 8 1/2 inches wide. . . . Fig. 6 shows the mode of cutting the siding, referred to in the second column of page 84.

Cure for Sheep-killing Dogs.—“L. B.,” Washington Hollow, writes: “I have a valuable dog, and more valuable sheep, for which the dog has an illicit liking. Is there any cure short of bullet?”—In one instance, the following remedy was effectual. The culprit was muzzled and strapped by the neck to the necks of two stout wethers. The sheep took fright at their unusual companion, and dragged him around the pasture in all directions. When tired out, the sheep were released, and the dog sneaked home, thoroughly cured of his appetite for live mutton, and he was never known to chase sheep afterward. If this remedy fails, try the bullet.

Barley.—“W. H. W.,” Allegan Co., Mich.—The piece of land you describe—a clay loam, plowed last fall after corn—is well suited for barley, provided it is not wet. If it needs draining, better sow it to oats. You may get a fair crop of oats, but you certainly will not get a good crop of barley. The first requisite for barley is a naturally dry or drained soil. Then a rich clay loam, well cultivated for corn, fall plowed and again plowed in the spring, and sown as early as the ground is in good condition, ought to give a good crop of barley. Drill in the seed at the rate of 2 to 2 1/2 bushels per acre.

Sawdust and Ashes for Clay Land.—“M. J.,” Marion Co., Ind. The rapidity with which sawdust will decay depends somewhat upon the kind. In time, any kind makes good mould; and as an ingredient in composts, as an absorbent in stables, and as a loosener of stiff clay soils, sawdust is almost always of value. As to wood ashes, leached or not, you can not get too many, though too much may be used at once on a limited surface.

Wax Candles.—“C. B. C.,” Bloomfield, Iowa. Of course wax candles are made of wax only, but a large proportion of those sold as wax are mixtures. A white vegetable wax from China, and paraffine, together make a candle hardly to be told from one of pure wax.

Unusual Regularity on a Railroad.—During the six months past that the N. Y. & Flushing Railroad has been owned by the present proprietors, twenty-three trains have been daily run over the road, and with two unimportant exceptions, all the trains, nearly FOUR THOUSAND in number, have made regular time and due connections with the East River Ferry-boats to and from the city. May not the fact that the President of the road is an Editor have something to do with this remarkable, if not unprecedented, regularity? Editors are accustomed to being “on time.” Would it not be well for the public to place one of them at the head of each of our railroad corporations? The arrangements required to collect information from all parts of the world, to get this systematically condensed, classified, printed, and issued, often within a few minutes after its reception, and fifty to a hundred and fifty thousand copies appropriately distributed to all parts of the city and country, are quite as extensive and complicated as the machinery of our largest railroads. Yet who thinks of missing his paper at the precise moment, unless, indeed, it has been delayed by some railroad irregularity? Is it not practicable to bring the same talent for system and punctuality into railway management generally?

Renovating a Poor Field.—"J.," a Michigan farmer, writes: "I have a seventeen-acre field that is considerably run down, and I have undertaken to bring it back to its original state of fertility. I seeded it down with a large kind of red clover in 1867. Last year took off a crop of seed, 2½ bushels per acre. This spring I propose to sow on some lime and pasture the field until some time in June, and then let the clover go to seed and plow it under, and sow wheat and again seed to clover. Is my plan a good one?"—Clover sometimes does not take well immediately after clover. A better plan would have been to pasture it the first year, instead of taking off a crop of seed. Then this spring either let the clover grow until June, or pasture it and then plow it up and summer-fallow. If it is a heavy soil, plow it three times and reduce it as fine as possible. You might then expect fair wheat and a good catch of clover. If a lighter loam, once plowing with repeated harrowing and "cultivating," to keep down the weeds, will be sufficient. Apply the lime on the fallow, rather than on the grass.

Corn, Oats, Wheat, seeded with Timothy and Clover. Such is the rotation adopted by one of our correspondents in Virginia, and he adds, "Our system of farming in this section is very defective and barely self-sustaining." We supposed that corn was off in time to sow wheat. If so, it would, we think, be better to give up the oat crop and sow the corn stubble to wheat and seed down with clover. Less oats and more clover would make the land richer and give better wheat.

New Land for Settlers is every year opened up by the network of railroads which is so rapidly spreading itself over Missouri, Wisconsin, Iowa, and other comparatively new States. The settlers who rush in upon them are generally those from other Western States, who are dissatisfied with their homes, so they often leave good houses and "improvements," that is, fences, sheds, and perhaps barns, roads, and, very likely, churches and school-houses ready built. These deserted houses, if in healthy localities, are much cheaper for Eastern farmers than the wild land further west.

Raising the Price of Farms.—"J. G. S.," Worcester, Mass.—The best thing that can be done is, to apply more capital and skill to the soil. Improved husbandry, in any district, raises the price of lands quite rapidly. In Germany, since the introduction of a new system of agriculture, the population has increased, and the land risen in value 150 per cent. Germany has instituted schools for instruction in farming, in which all the specialties of agriculture, the cultivation of the vineyard, and all other branches, are taught by professors devoted to the subjects. This great painstaking to teach both the science and art of husbandry in schools has resulted in an extraordinary increase in the production, and in the wealth of the country. Better farmers will inevitably make more valuable farms.

Top-dressing Fall Wheat in the Spring.—A New Jersey subscriber of the *Agriculturist* asks if it will pay to apply bone-dust or superphosphate to winter wheat in the spring. The increase of the wheat crop alone would probably not pay for the manure, but bone-dust would benefit the land so much that in the end he would much more than get the money back. For immediate effect on the wheat, sow a mixture of Peruvian guano and superphosphate, 150 lbs. each, per acre. Sow it as early in the spring as possible. Sift the guano, to get out all the lumps; then break them up and pass them through the sifter. There should no lumps be sown larger than a marrowfat pea. If wheat brings \$2.50 per bushel, the money expended, and probably more, will be returned from the increase in the first crop, and the clover will show a great improvement; while the extra straw and clover will enable him to go on enriching the land.

What's the Price of Wool?—Wool growers will admit by and by that the persistent advocacy of the long and middle-wool breeds of sheep by the *Agriculturist* was wise. This has never been exclusive. There is great use for the fine-wool breeds, if they produce wool in those sections where sheep cannot receive much care and shelter, winter or summer, and where the distance from market is such that mutton bears a low price. Over a great part of the Union now the long-wools, especially Cotswolds and Leicesters, and middle-wools, particularly Southdowns, may be profitably raised, both for wool and mutton. The amount of combing wool used in this country is vastly in excess of the supply. The growing demand for lustrous wools, of the character of Leicester and Cotswold wool, is for the manufacture of worsted goods, lastings, delaines, beroges, Italian cloths, bunting, furniture damask and reps, cords, and

tassels, etc., etc. It is stated that 12,000,000 pounds were consumed by twenty-five manufacturing firms last year, which is an increase of 9,000,000 pounds since 1861. The short supply seriously checks the manufacture, and though fashions may change, and the demand for fine wools increase, as we hope it will, yet the great advantage which the raiser of combing wool has over the fine-wool producer, viz., that his mutton will always be in demand, will remain; and for many years we presume whatever he gets for his wool may be counted as clear gain. Common long combing wool sells at 67 cts. to 72 cts. per pound, while choice Saxony brings but 65 cts., and common to fine grades of Merino 45 cts. to 50 cts.

Potato Rot Again.—Dr. Moody G. Freeman, Marshall Co., Ill., writes: "In the fall of 1864, and at different times since, I have preserved my potatoes from the rot by applying two quarts of common salt to three bushels of potatoes, sprinkling the heap, containing the number of bushels which I wished to preserve, with a little water, and covering them with dry straw and sufficient earth to keep from freezing. My success induces me to believe that it will always preserve them when rightly applied, and even stop the progress of decay after it has commenced. Let the farmers try it."

Cheap Lands in Florida.—The reason why the land is offered so very cheap to settlers, as it appears from the experience of a friend, who says he was "Yankee enough not to be caught," is, that the railroad company mean to get their money back in transportation charges. The land cost \$2.50 per acre for wood land, and \$5 for cleared land. The charge for one barrel of produce from Cedar Keys to Fernandina, about 150 miles, was \$5.

Irrigation in Winter.—"J. M.," Groton, Ct., asks: "Have you any experience with irrigating grass lands in winter? Does it kill the grass?"—We have noticed but one instance in which the grass was injured by winter flowing, and that was near Brattleboro, Vt., and we presume this was owing to very severe freezing, and to the smothering of the grass. In most cases where the water is allowed to flow freely all winter, the ground is protected by the covering of ice, and does not freeze at all. This we judge to be safer than to have the water upon soil already frozen solid. The best results follow from abundant irrigation of all naturally dry or well-drained soils, both in summer and winter. Not only is the grass crop increased, but the subsequent hoed crops, when the sod is broken, show that the land has been permanently enriched.

Preparing Manure for Wheat.—A young Virginia farmer asks how to make a compost to put on his wheat next fall. Material on hand, manure from the stable and cow yard, some long straw, and leaves from the woods.—Make the heap ten feet wide, put a layer of the straw at the bottom, then a layer of horse manure, then a layer of leaves, and then a layer of cow manure. Then another layer of straw, horse manure, and so on as before, until the heap is of the desired height, say five or six feet. Then cover the whole with some old decomposed sods or soil. The work should be done early in the spring, when the manure is wet. And if any liquid runs from the heap, throw up the soil around the heap to absorb it. Then as soon as the heap has fermented, turn it all over and mix with it the soil that has absorbed the liquid. When done, cover with a few inches of soil as before. On some wet day during the summer turn the heap again and cover as before. In this way you will have a pile of well-rotted manure ready to spread on the soil and harrowed in after the land is plowed for wheat. If there is much straw, the manure will not be as rich as is desirable, neither will the heap ferment readily. If you could put in half a bushel of bone-dust to each ton of manure, it would be a great improvement. Scatter it on each layer of the material as you are making the heap. It will promote fermentation of the manure, and the fermentation will react on the bone-dust and decompose it, so that it will act more immediately than when sown alone. Any animal matter, such as hair, hide, wool, blood, bone sawings, etc., will be a very valuable addition to the heap. The value of a compost depends on the materials of which it is composed. The object of piling, turning, etc., is to decompose them and render them more available as food for plants.

Greasing Wagon Wheels.—"A. N.," Fort Wayne.—"What is the best article for greasing axles, and how often should it be applied?"—Mutton or beef tallow is a good article for wooden axles, and castor oil is, perhaps, the best cheap oil for iron or steel. "Little and often" is the rule for greasing. Hubs are often injured by too much oil, as it tends to loosen the spokes and boxes. Rancid castor oil can frequently be had very cheap, and it is quite as good as the best for a

lubricator. A teaspoonful of oil applied to an axle is just as efficacious as a quart, and would be much cheaper.

Bees Items.—By M. Quinby.

Loss of Bees.—B. W. Cox, Willow Gate, Ind., writes: "Within the last three weeks 75 stoads of bees have died in this county. There was plenty of honey in the gums. Would like something on the subject."—This shows that the malady spoken of last month still continues. Flowers have not yielded honey since October last, which is about the time previous reports were made. The trouble is doubtless in the honey, and as the bees could not have collected it from flowers, within the last two months, the probability is, they have robbed some hive or hives that have died earlier in the season, in consequence of a disease or poison, caused by the unusual product referred to in a former article. Nothing is more common with careless bee keepers, than robbing on some fine day in November or December. Should this be correct, it would be important that every hive without bees be immediately removed and the contents put out of the way, otherwise I fear we shall hear further disastrous reports. Yet should there be a tree in the woods, in reach of healthy bees, where poisoned honey has been left, I see no escape from the malady until such honey is used up. It would be interesting to know how far this has already spread from the starting-point; and also if some one at that place had not been experimenting with some noxious compound as a cheap food for his bees. All the facts would be thankfully received, if faithfully reported. . . . Since writing the foregoing I see in the N. Y. Tribune, further complaints of this malady, and a reply from Mrs. Ellen S. Tupper, a distinguished apiarian, who also attributes these sad effects to poisons honey; and suggests further, that the cause might be too much honey, and too few bees, for cold weather. Had she

Fig. 1.

known that this malady commenced in October, while the weather was yet comparatively warm, the last suggestion would probably not have been offered. A friend, with much alarm, says: "I see they have the bee malady, also, in Maryland." This is an error in printing on page 47, *American Agriculturist*—"Clark Co., Md.," instead of Clark Co., Ind., which it should have been.

Artificial Queens.—In addition to what was said last month, relative to the dwarfing of the queen on account of size of cell, I will here introduce two cells, to illustrate the surplus room of the royal apartments. Figure 1 shows the royal larva in a cell just built, with the original worker cell, or that part entirely filled with royal jelly. The other, figure 2, shows a finished cell, with the side cut off, to exhibit the full-sized queen in a state of repose, just at maturity; showing that such queen would find ample room in a cell half the size. This figure is taken from Mr. Langstroth's work.

Fig. 2.

Bee Plants.—"M.," Clayton, N. Y., says: "Can you inform me which is the best plant for honey? I have tried Buckwheat, which is not as good as clover, but we cannot always obtain that. I want something that will be the most profitable. Is borage as good or better? What kind of soil is required?"—The question most frequently asked is, "Will it pay to sow any thing especially for bees?" This one asks what is best. Motherwort, Borage, and Catnip yield abundantly. The first named will last but a short time, while the other two will sometimes produce honey continuously for three months. If I should cultivate any plant exclusively for honey, it would be the catnip. When we come to the question, Will it pay? I should answer no, when land is more than \$10 per acre. To talk about cultivating plants for the honey they produce is simply a waste of breath. When we contemplate the thousands of tons of honey grown annually, even in this State, only to be "wasted on the desert air" for want of bees and skill in aiding them to collect it, it would seem like better pay to cultivate bees. In the 90,000 lbs. of honey sent to market in 1863 from a small part of the Mohawk Valley, less than one-sixth was obtained from Buckwheat. Rather than raise more honey, we can more profitably take care of what already grows spontaneously. When one field is occupied with the bees necessary to collect its sweets, take 50 or 100 stocks to another, three or four miles away; and still another, and another, until all the country is filled, and all the honey gathered. Then will be time to talk about raising more. In the new system of management, one man will take the necessary care of hundreds, with very much better chances of profit and success than ever before.

How to Raise a First-rate Crop of Potatoes.—“J. M.,” Chester Co., Pa. There are many ways of doing this. But as you only enter on the farm this spring, you will work to disadvantage. To obtain the best results, it is necessary to prepare for the crop two or three years beforehand. All that you can do this year is to select the best land on the farm, put on 400 lbs. of Peruvian guano, cultivate thoroughly, and suffer not a weed to grow. A two or three-year-old clover sod, on warm, rich, sandy loam, gives a good chance for potatoes. Do not plow until you are ready to plant. Sow the guano broadcast after plowing, and harrow it in or apply a tablespoonful in each bill, and mix it with the soil. Mark out the rows, both ways, three feet apart, and drop a fair sized potato in each hill. Start the cultivator as soon as the rows can be distinguished, and repeat every week or ten days until there is danger of disturbing the roots. We usually hill up a little, making a broad, flat hill. A tablespoonful of plaster dusted on the young plants soon after they come up will usually do good. We recommend guano because in our experience it does not increase the rot. But it is only fair to add, that we have not found even barn-yard manure, if thoroughly rotted and well mixed with the soil the fall previous, half so injurious as some people would have us suppose. If any one will put 25 loads per acre on our potato land, we will agree to plant and run the risk of the rot. But we would use some guano as well. The truth is, that it is useless to expect a large crop of potatoes, say 350 bushels per acre, without plenty of manure.

Compression of Soils by Stirring.

—“A. S. C.,” of Ohio, says: “I notice your article on the compression of soils in the January No. of the *Agriculturist*, page 9, and write to ask what such a fact teaches on subsoiling. If stirring the ground leaves it in condition to pack more closely, why is subsoiling not injurious?”—Yankee-like, we will answer the question by asking another. If stirring the soil leaves it in condition to pack more closely, why is plowing or spading not injurious? An isolated fact teaches nothing. If soils are compressed by stirring, it is absurd to say, in the face of all experience, that stirring the soil must be injurious. And so the fact we mentioned does not prove that subsoiling is either beneficial or injurious. In underdraining a clay soil, as the water is carried off by the tiles, the clay dries and contracts, and the whole soil by degrees becomes full of little fissures, that permit the water to percolate through it. Shall we say that because the soil contracts by draining, therefore draining is injurious?

Self-sown Clover.

—C. A. Winders, of Alleghany Co., N. Y., writes: “A farmer who recently moved here from Pennsylvania, says: ‘If you sow wheat in the fall, sow clover seed on the last light snow in the spring, and if the growth is large you may pasture it a little in the fall without injury. The next summer, when the clover is nicely in blossom, pasture until it is time to plow for wheat. Plow and sow wheat, and the next year you will have a good crop of clover without sowing any seed.’ He says that under this treatment the land will grow richer and richer until you will be obliged to kill the clover. We have timothy and pasture alternately, the land constantly growing better with only one expense for clover seed. Have you ever known this tried? Will not the clover seed be covered too deep to grow, and if it grows will the land improve under this severe wheat cropping?”—We think a farmer had better raise his clover seed in the ordinary way and sow it in the spring on the wheat. No sensible farmer would think of sowing clover seed in July or August, and plowing it under. Should he sow a bushel or two per acre there would probably be three or four quarts not covered so deep, but it would not germinate and from this the land would be seeded. So in plowing under a crop of clover, which had partly gone to seed, we might get a crop of clover the next year, but it is a slovenly system. To plow under clover seed worth \$3 or \$10 per bushel, or say \$300 per ton, is rather expensive manuring!

Raising Beans on a Large Scale.

—A Virginia gentleman wants to know how to raise beans on a large scale.—Take a good piece of clover or grass sod, plow it carefully, harrow, and roll. Get a drill that plants two rows at a time. The one we use makes the rows 2½ feet apart. It is better to mark the land first, as in this way the drill can be kept in the marks, and the rows will be straighter. We set the slides of the drill to drop five or six beans in hills about fifteen inches apart. If a common grain drill is used, set it so as to drop a bean about every three inches, the rows, of course, to be 2½ or 3 feet apart, as before. Drilling, we think, gives a larger yield, but dropping in hills 15 inches apart is more convenient in hoeing and in pulling the crop. We generally sow beans as soon as we are through planting corn. We drill in about three inches

deep. If the ground is mellow, the seed will all be covered. If not, it is necessary for a couple of men to follow the drill with hoes, and cover any beans that are on the surface. This completes the operation of planting. As soon as the rows can be distinguished, go through them with a light cultivator, and continue to do so as often as is necessary, which is about as often again as is generally supposed. Destroy with the hoe all weeds that cannot be reached with the cultivator. They must not be suffered to get the start. This is the great secret of success. We would advise no one to plant beans on a large scale who cannot command the necessary labor to hoe them at the right moment. Last year we turned over a heavy crop of clover in June, and planted beans immediately after the plow. They soon came up, and, except on the sandy parts of the field, there were few weeds, and no hoeing was necessary. But when there are weeds, they must be killed. We insist the more on this point from the fact that the bean crop of the United States is diminished every year more than one-half, simply from the growth of weeds. And nothing is gained by it, for the extra labor of pulling the beans is more than would have sufficed to hoe the crop, if done in season. Pulling costs about \$2.00 an acre. Curing we will treat on in a future article. For ordinary cultivation the white medium is probably the most profitable variety.

Are Potatoes Injured by Wire Worms good for Seed?

—Mr. L. I. Jackson says that last spring he plowed up a piece of old sod and planted it to potatoes. At hoeing time he was greatly elated at the prospect of a large yield; but when he came to dig them he found half the crop destroyed by wire worms. Some of the worms had gone their whole length into the potatoes. He asks: “Will it answer to plant such worm-eaten potatoes, or will it be better economy to buy new seed?” The potatoes are probably just as good for seed as if they had not been injured by the worms. It is generally best to change seed frequently.

Wheat and Clover Alternately

is the old-fashioned plan practiced when the country was new. On some of the “oak openings” of Western New York, which had been annually burnt over by the Indians, and when the land was consequently destitute of organic matter, the plan of growing clover and plowing it in every other year for wheat greatly increased the fertility of the land. The clover obtained organic matter from the atmosphere, and the soil contained abundance of mineral matter, which was developed by cultivation. In process of time, however, the land got surcharged with organic matter. This, as is well known, has a tendency to retard the ripening of the crop. Large crops of straw were grown, but the grain was light. Rust, too, often injured the wheat, and finally the midge came and the system had to be abandoned. As long as we can continue to grow large crops of clover, we may be sure that there is no lack of plant-food in the soil for wheat. And if growing clover and wheat every other year will keep the land clean, and is more profitable than a mixed system of cropping, we can see no objection to it.

Grinding Corn on the Cobs.

—J. W. Bliss, of Nebraska, wishes to know if corn and cob meal is injurious to stock. We have heard of cases, where it has been fed in very large quantities, in which it has injured the stock, but in our experience we have had no trouble with it. It is certainly better to grind cob and grain together than to feed it whole on the cob. But so far as the nutriment contained in the cob goes, it will not pay for the cost of grinding. Better shell the corn and grind it, and then feed the meal with cut hay, or bran.

Our Indian Farmer.

—We published nearly a year ago a description of the corn crib of Mr. J. T. Jones (“Ottawa Jones”), a successful farmer of Kansas. In a letter recently received he writes: “I have lived in Kansas for thirty-two years, being an Indian at first. I knew very little about farming, and in fact I know very little about it now. Having no one to teach me I did the best I could for those times, beginning with a single hoe in a hazel thicket, planting a few hills of potatoes, enlarging the area of my garden and farm with more suitable farming implements and increased power; in a few years, I made out to open a farm of more than 100 acres. All that time I knew nothing about sowing small grain, such as wheat and oats, but Mother Necessity had to be my forcible teacher. Now I can teach many white farmers who come from the East how to farm in Kansas. In addition to this knowledge, I have learned more of the art of farming in many particulars in reading your valuable paper than in any other way; yes, than from all the farmers in this country put together. I wish every farmer, every housekeeper, every gardener in our entire country had it; we might then, in a very few years, have a far better system of farming than now. Farmers

at the East come to the West and open extensive farms, and in so doing, they go to a good deal of expense; but unfortunately they go to skimming over the land for three or four years, and then some of them will begin to cry, ‘Kansas is too dry;’ some, ‘too wet;’ some give the alarm of ‘grasshoppers’ or the ‘chinchies,’ or some other lamentable cry against Kansas, and give up farming for some speculative or more lucrative business. There are, however, a few honorable exceptions to this condition of things. But as a farming community in the West, we are making poor work at farming.”

Stabling Cows and Horses together.

—“J. S.,” Chippewa, Canada. “Will the breath of cows be detrimental to horses kept in the same stable?”—It is usual to keep these animals in separate stables on large farms, more as a matter of convenience than for any other cause. But the multitude of people in villages, who keep but one or two horses, and as many cows, quite as generally keep them in adjoining stalls. If the stables are well ventilated and the urine is absorbed by muck or other deodorizers, so that there is no bad odor, the health of neither will suffer from the companionship. There is, perhaps, no foundation for the popular opinion that the breath of cows is wholesome for consumptives. Any pure air like that of a well-ventilated stable is much better for them than the close, hot, dry rooms invalids usually occupy.

Clover.

—Mrs. P., of Sand Prairie.—The best time to sow clover is probably in August. It should then be sown on well-mellowed ground, with a dressing of plaster, say 10 bushels to the acre. The kind of seed we prefer is the median, or common red. The pea-vine makes very coarse hay, but is the best for plowing under green. Sown in the spring it is best to take a quiet morning in March, when a light snow has fallen on ground that has been bare and has thawed. Clover does very well sown upon winter grain, or with spring grain, but better by itself. Suitable top-dressings for light land plowed in the spring to be sown with clover, are plaster, ashes, any fine compost, Peruvian guano, made fine and mixed with plaster and soil, or superphosphate of lime. It is worth while to roll the land after sowing. It may be done any time before the first of May, or even later.

Light vs. Heavy Soils.

—A young farmer in Ohio writes: “Would it pay better to buy 50 acres of sandy loam at \$100 per acre, or 100 acres of good clay soil at \$50 per acre?”—It depends a good deal on the crops to be raised. As a general rule, a warm, sandy loam gives the largest immediate profit; but a good clay is the more enduring. It contains a large amount of latent plant-food, which can be developed by cultivation. If you bought 50 acres of the clay land and spent \$50 an acre in underdraining, cultivating, manuring, etc., you would probably have a much more productive farm, especially for grass and wheat, than the sandy loam. But before buying, ascertain whether there is fall enough to drain it three or four feet deep; and furthermore, do not buy the 100 acres unless you have capital enough to make all needed improvements. As a rule, the high-priced farms are the cheapest, and especially so at the present time, when improvements of all kinds are very costly.

How Crops Grow.

—The knowledge of the principal facts which underlie the science and art of agriculture is much more general than it was a few years ago, but after all, it is vague and indefinite in the minds of most of even the best informed farmers. This valuable work of Prof. Johnson is intended to give exactly that important definiteness to general knowledge of agricultural principles which we need for accurate reasoning. It is impossible in such articles as we prepare for the *Agriculturist*, to go largely into the details of science, and were we to do so they would not be read except by the few. Such works, by authors of the most thorough scientific attainments, having a practical knowledge of the details of farm practice, and of the conditions of successful culture, are exactly adapted to amplify, explain, and prove these general principles which we are obliged to assert dogmatically.

What is the best Variety of Spring Wheat?

—We cannot answer this question. The China or Black Tea is a very handsome spring wheat, and yields well on good soil. The Fife is a favorite Canadian wheat, especially for rather low soils, and we believe it gives good satisfaction in the Western States, although it is not so extensively sown as the Canada Club variety. The latter ripens earlier, but does not yield as much per acre. Where the midge injures the crop, the Fife is a useful variety to sow late. Sown the first week in June, it has produced a good crop, when early sown wheat was nearly all destroyed by the midge.

Tim Bunker on Getting the Best.

"I can't afford it," said Jake Frink, as he looked into my flock of sheep, and declined to take a Cotswold ram that I offered him for \$100.

"That's a smashin' price for a sheep, Squire," said Uncle Jotham Sparrowgrass. "Never heard the like on't on the Island. A hundred dollars would buy a decent horse."

"Can you afford to keep the sheep you've got now?" I asked.

"Well, I never thought much about that," said Jake. "I keep 'em, and I guess it pays about as well as any thing."

"Your scrub sheep," said I, "probably pay you a dollar a head above the cost of keeping. Mutton and wool are all you get out of them for market, and not much of either. The Cotswolds will give you these, and a prime article of stock to sell, which will give you more profit than the flesh and wool. With this breed you get a carcass two or three times as large, and the meat will bring a higher price in market. By using a thoroughbred ram, if you do not want to raise them for stock, you will get larger lambs, and they will be ready for market in June, when the butchers will give you big prices. It pays much better to get six dollars for a lamb than three, especially if you don't have to keep him so long. That hundred dollar ram would serve your forty ewes, and if you only got a dollar a head more for the lambs, it would make a difference of forty dollars in the year's receipts from your flock. If you raised the ewe lambs and got a bigger stock to breed from, it would pay you still better. Here, in New England, where almost every farm is within an hour's ride of a good market, and where the butchers come to your door to purchase every animal you can raise, size in a calf or lamb is a very desirable quality. Lamb, as meat, retails for 35 cents a pound, and they can afford to pay well for lambs that will dress thirty or forty pounds. There is no more trouble in getting large lambs than small ones, if you only have the right stock to start with."

"That's so, Squire," said Seth Twiggs, "but them big sheep are hard on feed. The quantity of hay and turnips they'll make way with is astonishing to hay-mows and root cellars."

"Well," I replied, "what is fodder good for but to be eaten? And if you get more for feeding a hundred pounds of hay to one animal than to three, better feed one, and save the care and risk of two of them. A sheep is a machine to turn fodder into wool and mutton, and that is the best breed that will give me the most for my fodder, sold in this form. As a rule, the more a sheep eats, the more mutton and wool it makes, and the better it pays."

Jake Frink could not exactly see this, though it must be clear enough to people that have brains. The "Saleratus man" has got hold of the true doctrine in farming. "Get the best" should be hung up as a motto over every farmer's door. Here lies, mainly, the secret of success. This makes the difference between thrifty and unthrifty farmers. A man down in Shadtown last year bought a wild gander to put with one of his common geese. He started for some mongrel geese, which he knew brought the highest price in market. He fed them well, and got the goose to laying early. The first laying of eggs he set under hens, and the second the goose hatched herself, twenty-one goslings in all, which all grew up, and were sold in the fall for \$80. The feathers were sold for \$11, making \$91 as the proceeds of a single pair of

geese for the season. The high price of the mongrel geese, as well as skill in rearing, effected the result. It paid to "get the best" in this case, although he had to pay a high price for the gander. Good Rouen ducks will dress eight pounds. The common ducks of our yards will not average four. These birds get the most of their living from the ponds and brooks near the farm-house, and very little is fed out to them until they are put up for fattening. The Rouens will bring for poultry four or five dollars a pair, the others less than half that sum. If a man has to pay fifteen or twenty dollars for a trio of Rouens, he makes a better investment than to buy the common ducks at cheap prices. "Get the best" in any kind of poultry or farm stock.

There is one very good reason for doing this, which most farmers overlook. They will always have the best to sell. It is surprising to notice what a difference there is in the price of farm products, even in the small market of Hookertown. The good name of some farmers will sell any thing they have to put off. They can get their own prices, always a little above the market, because everybody knows they sell nothing but the best. If Deacon Smith drives down to Shadtown with a load of hay, he don't have to wait long on the street, before it is sold. In fact, it is generally spoke for beforehand, for the livery stable men all know the Deacon's brand. He cuts his hay early, cures it just enough, and stores it in the barn. It comes out in the best condition, and every pound is available for fodder. I don't suppose he would sell a load of mouldy hay any sooner than he would go into his neighbor's hen-roost to steal chickens. It is just so with the Deacon's butter. He keeps grade Alderneys for the most of his herd, though he has some pure-bred animals that he raises for stock. Every thing about the milk-room is kept in the neatest order, and the butter is thoroughly worked. He supplies the same families year after year, though they have to pay him about ten cents a pound above the market price. Some of the Deacon's neighbors, I am sorry to say, don't believe in his doctrine, and they find it rather hard to sell any thing except upon its own merits. Squire Bentham lives up a piece beyond the White Oaks, has a large farm, a fine white house with green blinds, good barn, and good fences, and you would think the farm always turned off the best products. But it don't. The Squire is *streaked*. He comes to our meeting and pays his pew rent, but somehow Mr. Spooner's preaching never took the meanness out of him. About a dozen years ago, he sold the parson a skin-cheese, as an offset to a part of his pew rent. He sold it for the best, and it came so near being the worst, that Mr. Spooner has never found the like of it. He never said any thing about it, but it leaked out through the servant girl that the White Oak cheese went into the swill pail. Squire Bentham will never hear the last of it. The boys got hold of it, and he rarely got out of Hookertown without being asked the price of skim-cheese. I suppose that little meanness has cost him hundreds of dollars in the way of trade. He can't sell any thing by sample where he is known. He has smelt of skim-cheese for a dozen years, and the odor will never get out of him. Josh Butler lives out on the Shadtown road a couple of miles, and used to make quite a business of bringing in lamb, mutton, and poultry, to sell around to our families. In an evil day, some disease got among Josh's sheep, that he was fattening, and one of them died.

It was too much for him to think of losing,

and the diseased meat was dressed, and sold on Hookertown street. It got out through the hired man, and Josh was in trouble every time he came to market. Mysterious "bals" were heard about the houses when he knocked at the doors, and his trade tapered down to nothing. Josh has probably repented of that a great many times, but he never will get over it. It spoiled him for Hookertown. Now it may not be always possible for a farmer to have the best articles to sell, but he can refuse to sell any thing that is bad. His reputation he should never put in the market. If he goes upon the principle of getting only the best seed and stock upon his farm, he will be quite sure, with ordinary care, to have the best to sell. The thoroughbred article costs a good deal, and it requires more capital to do business with, but it pays much better in the end. I think this kind of investment begets habits of carefulness, that tell upon all his business. He puts more money into a thoroughbred Devon or Durham, than into a scrub, and it very naturally gets carded oftener, and has better fare. Our hearts go with our treasures in farming, as in other things. One first-rate animal prepares the way for others, and the business grows in this direction, until the motto of the farm becomes, "Get the best."

Hookertown, Conn.
Jan. 13, 1893.

Yours to Command,
TIMOTHY BUNKER, Esq.

Want of Success with Wheat.

Mr. Shaw, of Indiana, who has a farm about two miles from the Ohio River, says he has not for the last five years been able to raise a paying crop of wheat. Fifteen bushels per acre was formerly considered a fair average, but now as soon as the head comes out, the Rust strikes the blade, and by the time the grain ought to be ripening, there is none in the head. It is only in a section of four or five hundred acres that the rust is so bad. These are situated on the ridges which lead to the branch of the creek. In the valley of the creek, and even on the ridges and hillsides nearer the mouth of the branch, the wheat is not affected so badly, and often escapes altogether, though the soil is neither so good nor so well tilled.

There is no known cure for rust. The great point is to get early wheat, so that it shall be so far advanced when the rust strikes it that little damage will be done. A barrel of salt per acre, sown in the fall with the wheat, has frequently a good effect on wheat liable to rust from over-luxuriance. It is curious that the wheat on the ridges should rust, while that in the valley escapes. The probability is that these ridges are full of springs and need underdraining. This can be easily ascertained by digging a few holes three feet deep. If water comes in and remains there for a week or two, the land needs draining, and no other cure for rust need be looked for until this is accomplished. The main preventives of rust are underdraining, good, clean culture, thorough pulverization of the soil, the liberal application of lime as a manure, and, in case the soil abounds in organic matter, the use of a barrel of salt per acre sown broadcast before putting in the crop. Then select an early variety for sowing and trust to Providence.

Mr. S. adds that "wheat rusts just as badly on land recently cleared as on land that has been in cultivation twenty-five years," so that it is not caused by exhaustion of the soil. But the fact that 15 bushels per acre was formerly considered a fair yield indicates that the land was never very productive. All the facts here given would seem to indicate a want of draining.

Leghorn Fowls.

The credit belongs, we believe, to American breeders for having discovered among the fowls of many colors and styles, imported direct, and through England from China, the characteristics of a pure breed, early named Brahma Pootra, now known as Light Brahmas, (the Dark Brahmas having been developed and "brought out" in England.) We claim also for our discriminating countrymen the honor of developing from heterogeneous materials an elegant and useful breed, with strong, well-marked characteristics; namely, the Leghorns. Our own earliest knowledge of this breed of fowls does not antedate ten years. One of the first flocks to which our attention was drawn belonged to Mr. J. C. Thompson, of Staten Island. They were chiefly of his own importation,

and generally had yellow legs, single combs, and white ear-lobes, but were not alike in many other particulars. As we remember them, some were white, others of various colors, like common dunghills. We remember also some flocks of all white, and which seldom threw chicks with colored plumage or double combs. Yet birds were often sold and bred as Leghorns, both white and colored, with broad rose combs, pink legs, and with bodies like Dorkings. These, in our opinion, were cross-bred birds, having Dorking or some other blood; and although rose or double combs occur in yards where careful breeding is exercised, we are inclined to pronounce against them *in toto*. Pink or white legs are of quite frequent occurrence in the yards of the very best breeders, so far as we are aware, and to throw out either class of birds would clearly be doing injustice to their other good points, for in all desirable qualities of style and beauty, as well as in usefulness, we venture to say no difference can be determined. Except for the fact that flesh-colored legs are almost regarded as the peculiar property of Dorkings, we know no reason why the yellow-legged Leghorns should be preferred.

We have gone on breeding Leghorns. Every year they have shown more style, more marks of high breeding, and their useful qualities have kept pace with their improvement in other re-

spects. Importations have been made, and are almost every year being made, but without finding any birds approaching our home-bred stock, which are now raised by perhaps one hundred fanciers. They are bred of several classes, Slaters, Dominiques, etc., but in no color do we find the *thoroughbred* characteristics of the single-combed

the throwing of white chickens is reported, but these are exceptional cases, and no true breed has been established from them, so far as we know. The rose-combed Leghorns might very appropriately be called White Hamburgs, for the whole style of the two breeds is similar. We see no reason for excluding from the Hamburg class those with double combs and white legs, provided they breed true. However, the style which we figure has our decided preference, and we hope to see it recognized as the type.

Ayrshire Cattle.

In the November number of the *Agriculturist*, we showed portraits of two cows, and discussed briefly the merits of the Ayrshire breed as milkers. One of the cows engraved was Dolly 3d, of the herd of S. M. & D. Wells, of Wethersfield, dam of the fine bull, a portrait of

which, copied from a photograph, is now exhibited. This animal was past three years old when the photograph was taken. He represents well the characteristics of his race—being fine in head, bone, and horn, having a deep body, and short, powerful legs, which are fine and flat. In color, he is deep red, and white; his skin is soft and pliable, the hair abundant, and the color of the nude spots—the interior of the ears, about the eyes, etc.—of that orange brown, which indicates a tendency in the progeny to give rich milk. Stock of his get have proved remarkably good animals, and on the whole, he seems the worthy son of an illustrious dam. The drawings we frequently see of Ayrshire bulls exhibit few, if any, points of difference between them and Short-horns. We venture to say, no breeder will mistake this for the likeness of a Durham bull. Nevertheless, the beef-points of the animal are very good, and we do not doubt that he, or steers of

AMERICAN-BRED WHITE LEGHORNS.

White. We give an engraving of a remarkably fine pair of these, the property of Mr. John Salisbury, Jr., of Nyack, N. Y. These are pure white in plumage, with yellow legs and white ear-lobes. The cock's comb is thin and very erect, his wattles delicate, but large, while the hen's comb droops. The hens are non-sitters, or at least are rarely broody, and are easily broken of the desire to sit. The eggs are above the medium size, and very white; the chickens hardy;

AYRSHIRE BULL "ALECK CRISTIE."

the flesh tolerably good. They are naturally classified with the Black Spanish, Polands, and Hamburgs, and their many good qualities lead them to be highly esteemed in comparison with the best of these justly favored breeds of fowls.

Leghorns resemble the Spanish so much that they have been called "White Spanish." We know of no proper White Spanish. Black Spanish fowls occasionally moult white, and

his get would fatten easily and profitably, where Short-horns would not. "Aleck Christie" is owned by his breeder, above named, and is the sire of several of the young bulls offered by the Publishers of the *Agriculturist* as premiums.

There is, probably, no breed of cattle, the good qualities of which are more readily engrafted upon our "native"—that is, mongrel stock,—than the Ayrshire, the best qualities of

Edwin Forbes del.

the natives being retained. Thus, Ayrshire grade cows are almost surely deep milkers. They are active grazers, and will do as well as, and probably better than, common cows, on hill pastures, and on salt hay and dry cornstalks; and they will make much better use of rich and abundant forage, giving more and richer milk, and making more cheese. Every year of careful breeding confirms the Ayrshires in desirable characteristics of their own. Though particular styles are bred for by different breeders to some extent, all aim at early maturity, quantity and quality of milk, (quantity first) and vigorous constitutions. Economy in milk production is worthy the more general attention of breeders, and should be considered and bred for.

Blanketing Horses.

It is not unusual for over-kind and very careful people, in very cold weather, to put on a heavy blanket under the harness of their horses when about to drive to town or to church. This practice, although intended as a humane one, is by no means to be recommended. While the horse is performing his work, there is no danger that he will suffer from the severest cold, or that his natural clothing will not be enough. Indeed, unless his work is very slow, perspiration will be excited, and the moisture thus arising would be retained by the blanket, instead of being immediately dissipated into the air. The consequence is, that, the moment we stop, our horse stands in the cold winds, with a wet blanket over his whole body, the effect of the evaporation of the water being to make him much colder than he would be if the blanket were then taken off. The true plan is, in cold weather, never to blanket a horse while he is taking his exercise; and never to allow him to stand a moment without blanketing with a *dry* blanket, when his exercise has ceased. So true is this, that the most careful and experienced owners and drivers of fine horses find it advantageous to remove even the heavy coating of hair that nature supplies for the winter season, so that there may be no accumulation of moisture about the skin in consequence of heating work; and to supply its place, at all times, when the animal is at rest, by ample clothing.

PIG DISPOSITION.—"Walks and Talks" writes: It is curious how qualities and even disposition are transmitted in animals. You know a thoroughbred pig is quiet and gentle. I can do anything with mine. The sow will let you take all the little pigs away from her, and let you take hold of her and turn her over in the bed. The common sow that I crossed with the Essex was a coarse, savage sort of brute. When I bought her, she was half starved, and the first thing she did when turned into the yard was to rush at a young rooster and gobble him up. And she has killed several lambs for me. I have had several litters of half Essex pigs from her, and from some cause or other she is getting to be a gentle, well-behaved sort of hog. She has now a litter of little grade Essex, and one of my neighbors was here to-day to look at them. She was lying in the yard, and I stooped down to catch one of them. As soon as he saw what I was doing, my neighbor, who is an old farmer, looked round for a stick, expecting an attack from the sow. But the little one did not start or squeal, and in fact all of them rather liked to be taken hold of and petted—though this is the first time any one has touched them. They inherit the disposition from the Essex.

Walks and Talks on the Farm—No. 63.

There seems to be a determination among farmers not to pay such high wages. The results of the past year have not been satisfactory. Farmers feel poor. We have got in the habit of spending more freely, while we now find that a dollar does not go as far as it used to. Money seems to disappear like dew. For several weeks after last harvest, wheat brought a higher price than we expected; but farmers were busy and did not thrash. When they got ready to sell, the price had declined. Then they were unwilling to sell more than was absolutely necessary to pay hired help, and to meet pressing necessities. Prices did not advance, and taxes had to be paid. Enough was sold to pay them. And thus the weeks and months went past. Farmers who had calculated upon receiving such and such an amount for their produce saw their granaries gradually get empty and the money gone, they hardly knew where. To sell 500 bushels of wheat for \$1,000 or \$1,200, and get a check for the whole at once, makes a farmer's heart glad; but to sell 50 bushels at a time, and for half a dollar a bushel less than could have been obtained months before, and then to pay the money out before it has time to get warm in one's pocket, is anything but pleasant. No wonder farmers feel poor. And yet we have no just reasons to complain. We are getting as high prices as we had a right to expect. Butter, cheese, pork, beef, beans, and barley, are as much above their normal value as wheat and wool are below. We have no cause to feel discouraged. Wages are undoubtedly too high, especially for unmarried men who get their board and washing, and have nothing to buy except clothes. Farm men with families are no better off than before the war. And it is wrong to attribute all our troubles to high wages. The principal reason why farmers are not doing as well as the advance in prices would lead us to expect, is this: the yield per acre is too small. We raise from 10 to 15 bushels of wheat per acre, instead of 25 to 30 bushels; 15 to 20 bushels of barley, instead of 35 to 40; 30 bushels of corn, instead of 60; 75 bushels of potatoes, instead of 150 or 200. Our cows, instead of yielding 150 or 200 lbs. of butter a year, do not yield over 100 lbs. Our steers, which at three years old should weigh 1,500 lbs., do not average over 1,000 lbs. at four years old.

But will the kind of farming necessary to produce such crops pay? That depends a good deal on the means employed to accomplish the result. A farmer in Iowa might send to New York for guano enough to double all his crops, but it would not pay. We must call to our aid all the knowledge that can be obtained, and then exercise a little common sense. John Johnston used Peruvian guano on his wheat last year, and says it paid. And I think all the artificial manures I have used have paid me well. But leaving these things out of the question it may safely be asserted that it does *not* pay to raise weeds; it does not pay to half-plow and half-work our land; and it certainly will not pay to plow and plant land that is a mud puddle in the spring and a brick-yard in summer.

"But if we drain our land and cultivate it more thoroughly, we shall have to employ more labor, and wages, instead of being lower, will be higher." This sounds plausible, but it is not necessarily true. Men who would not work for me last summer and autumn for \$2.50 per day, are working for me now at 75c. to \$1.00 a day, and board themselves. Underdraining can be done

at a season when other work is not pressing, and when men have little else to do. And this is also true of other kinds of work that would add greatly to the productiveness of our farms. There are very few days in the year when something cannot be found to do that ought to be done, and that it will pay to do, provided men can be found willing to work at reasonable wages. We must employ more labor on our farms, but it should be done judiciously, and so as not to increase the demand during the busy season. That this can be done, I have no sort of doubt. From the middle of March to the middle of May, men who hire out by the day have little to do. And this is the time to drain, to pile manure, to make and mend fences, to get out stones, and to prepare wood for next winter. And yet during this season men not hired by the month are idle half the time. I am well aware that many of them will not work unless they can get high wages. I have heard them talk among themselves: "Not much doing now, but as soon as planting commences there'll be work enough, and we can get two dollars a day." And they are generally right. We do little until it is time to plant potatoes; we then try to do too much: a heavy rain delays operations; we get behind, are in a hurry, and offer to pay high wages to the very ones who foresaw the result and made calculations for it. And this is not all; they feel very independent and do not perform more than half a good day's work. The remedy for this state of things is to give employment during the early spring months to all who will work at reasonable wages. Then plant only about half the usual area, and so be able to dispense with half the usual labor during the busy season. If the proper means have been used to *prepare and enrich the land*, we shall get as much produce as formerly, and our *profits* will be a great deal larger. We shall get a great deal of extra work done without spending more money; and the men will receive as much money, and be just as well off as when they received double wages half of the time and were idle the other half.

Farming will never be as profitable as it ought to be until we are able and willing to furnish men work during the whole year. By making preparations for it, as much labor may be employed in winter as in summer. In fact, I have more men at work now in the dead of winter on my farm than I sometimes have in harvest. One man is trimming the apple orchard, two are drawing stones, another has gone for a load of draining tiles, and four are digging underdrains. And I could find work for two or three more. When it is too stormy to work outdoors, the day hands stay at home, and if they are industrious men they can find something to do for themselves. The others can thrash beans, cut fodder, sort over potatoes, shell corn, and grind it; repair implements, oil harness, clean out the pig-pens, card all the cows in the stable, and give each horse an extra half hour's cleaning. Of course, work of this kind needs constant supervision. The men are not used to it, and the farmer must direct every operation, and see that it is done properly. On my farm this is the weak point. When I am writing in the house, the men are loitering in the barn. But this is no objection to the system. It only proves that a man who, for his sins, is obliged to edit a paper, cannot be as good a farmer as one of those thrice happy individuals who can devote all their time and thoughts to managing the farm.

A New Jersey farmer thinks that in advocating hoeing wheat in the spring, I have over-

looked the fact that we generally sow clover with the wheat. Not at all; I distinctly stated that we should have to give up sowing clover with winter wheat. The plan is open to that objection. "You say," he writes, "that we must have a rotation of crops to keep up the fertility of our farms, and generally speak of the course pursued in this State and others, of grass after wheat as being the best. Now, by hoeing the wheat, what becomes of the timothy seed we are so careful to sow in the fall, and the clover seed we are advised to sow so early in the spring? I don't see that hoeing wheat can ever become general, for even at the West they will yet have to come to rotation in order to keep up the land."

I do not think I ever said that a rotation of crops is necessary to *keep up the fertility* of the land. If I did, I said what is not true; give me plenty of manure and I can raise potatoes, onions, corn, grass, barley, and wheat, without rotation. There is a great advantage in a judicious rotation of crops, but there is no absolute necessity for it so far as the fertility of the soil is concerned. In fact, I could impoverish a farm sooner with a rotation of crops than without it. A few years ago, chemists had a good deal to say about the requirements of different plants, and could tell us what crops ought to follow each other. Since then, they have studied the matter more thoroughly, and I hazard little in saying that if you should go to the best agricultural chemist in this country and tell him that a certain rotation was not convenient, he would say, "Change it for one that is convenient." A chemist can give excellent reasons why barley does well after a crop of turnips that have been eaten by sheep on the land, but this is not the reason why the English farmer adopts the system. He sows barley after turnips for the same reason that we sow barley after corn, because it is more convenient than it is to sow winter wheat. That rotation of crops which will enable us to clean the land at the least expense, which gives us the most work to do during the leisure season, and the least during a busy one—in other words, the system which is most convenient,—will, as a general rule, be the best. So then, if it is desirable to hoe wheat we need not hesitate to change our rotation. Fifty years ago it was the common practice in England to sow grass and clover seed with wheat; now it is very uncommon to do so. The wheat is hoed once or twice in the spring, and as soon as it is harvested, the land is scarified and worked thoroughly in the fall, and prepared for the turnip crop the following spring. And this system has helped to make English agriculture the admiration of the world. Clover is sown with the barley crop, and wheat follows the clover.

Farmers must think for themselves, and adopt a rotation of crops suited to their soil, location, and circumstances. One thing is certain; we shall be compelled to make a more determined effort to clean our land. The weeds cheat us out of half our profits. The system best adapted to get rid of them is what we are in search of. Our climate is much more favorable for their destruction than that of England, and it may well be that we shall discover some better and cheaper method than hoeing the wheat. I am not sure that the plan I am now trying of fallowing for barley will prove to be what we want. It will certainly destroy that pest of the wheat-grower—red-root.

A gentleman in Massachusetts wants to know why I prefer Peruvian guano to other manures for potatoes. I do not think it is any better

than thoroughly rotted manure from well-fed animals. But for immediate effect it is much cheaper. The better plan is to use both. Apply the manure to the previous crop, (say of corn,) and then sow 300 lbs. of guano broadcast on the land after it is plowed in the spring for potatoes, and harrow it in. If the land is suitable and the crop is kept clean, I should expect a large yield. But if I had no manured land I should not hesitate to sow guano alone. I have seen good crops raised on very poor land, with guano only. And, in fact, I have never known Peruvian guano to fail to produce a good crop when properly applied, and the land well plowed and cultivated. If the crop is planted in hills, the guano will have a better effect if applied in the hill. But care is necessary to prevent the guano from coming in contact with the seed, or it will burn it up. If the hills are 3 feet apart, 1 oz. of guano, or about a tablespoonful, will give 300 lbs. per acre. I would mark out the rows both ways with a broad-toothed marker, and then drop a tablespoonful of guano on the spot where the seed is to be planted. Then with a hoe thoroughly incorporate it with the soil, and at the same time make the hole for the set two or three inches deep. I think we are apt to plant too shallow. Drop the set and cover with loose earth. In this way the guano will not hurt the seed, and will act more rapidly than when sown broadcast.

A young farmer in Ohio asks my advice in regard to the improvement of a stiff clay farm that formerly produced good wheat, but now fails to yield remunerative crops. He says it undoubtedly needs underdraining; that he has cut one drain through his garden, and "the effect is wonderful." But he is considerably in debt, and to spend \$50 an acre in draining is out of the question. He does not wish to sell the farm, and cannot sell a part, as there is much land in the neighborhood that can be bought for \$10 per acre. The soil, he says, seems best adapted to grass and clover, and he has thought of going into the dairy business, but lacks money to buy cows. "Now," he writes in conclusion, "the problem I wish you to solve is, how to make the farm get itself out of debt, stock itself, and pay for underdraining." Better sell and buy a cheaper farm; or work for some other farmer until money enough is saved to farm properly. It is now almost impossible to obtain an intelligent, experienced man to take charge of a farm. Such a man can command a good salary. But if, in such a case as this, the owner is an "independent American," who would rather suffer the greatest privations on his own land than work for others, and if he cannot sell, he must stay where he is and do the best he can. Pluck is to a certain extent equivalent to capital. If good land in the neighborhood sells for \$10 an acre, it will not pay to spend \$50 an acre in draining. But, in point of fact, on the majority of our farms, no such sum is required. I believe \$20 an acre would drain my farm perfectly. Some fields require more, some less. Drain those fields first that are going to be plowed. Let the others lie in grass. Take pains to get off all the surface water. Never let a drop lie on the land a day, if possible. Much can be done in this respect with the plow. The furrows should be opened at the bottom with a spade, and then a few minutes' work with a hoe will often let off more water in an hour than the sun can evaporate in a week. Where sufficient capital is at command, it is undoubtedly better to underdrain systematically and thoroughly at once, but it is nevertheless true, that a few

drains judiciously laid through the springy portions of the farm, in conjunction with surface drains, will prove very useful. In this country, as compared with England, although we have a greater rain-fall, we have fewer rainy days. When it rains here, it rains. For several months in the year, too, the rain is held as snow, and when the thaw comes, the ground being frozen, the water runs over the surface to the lowest level. I believe we can get rid of more than half the water which falls on the land by means of surface drains. The trouble generally is that we do not provide ditches deep enough into which the surface drains can be conducted.

Comparatively few people in the world do more than get a living. And it is asking a good deal of a farm to "get itself out of debt," stock itself, and furnish the money for improvements that would double or treble its value, and support a family in the meantime. It is true that thousands of farmers have accomplished such a result in this country, and what has been done can be done, but it is usually the labor of a life. To a mind rightly constituted, the improvement of land is the most pleasurable of all occupations, and we can afford to live economically for the time being, and wait patiently for the profits.

Mr. Boardman, of Ontario County, N. Y., wants to know the value for manure of a ton of clover seed straw as compared with a ton of clover hay. He says he has been reading Prof. Johnson's new book, "How Crops Grow," but cannot find the information. This is true, but as he has given us the most valuable work of the kind in the English language, we must excuse him. He gives the composition of the *ash* of clover seed, but not the percentage of nitrogen. We are pretty sure in concluding, however, that clover seed is very similar in composition to peas and beans. Furthermore it is probable that there is but little loss of nitrogen during the ripening of the seed, and consequently if a ton of clover seed hay yields 300 lbs. of seed, we may conclude that 1,700 lbs. of straw and 300 lbs. of peas, beans, or oil-cake, would make manure as valuable as a ton of ordinary clover hay. Clover seed, or peas and beans, is worth for manure about as much again per lb. as ordinary clover hay. It may be safely asserted that the straw of peas, beans, or clover, is worth three times as much for manure as wheat straw.

Mr. B. has a good wheat farm of 120 acres, and his wheat crop last year brought him \$2,400; besides this he had 800 bushels of potatoes and expects 50 bushels of clover seed. He does not raise any oats, barley, or buckwheat, and feeds out the corn from 10 acres on his farm. He has 12 acres of orchard, keeps 180 sheep, 6 head of cattle, and 4 horses. His practice is to spread manure on clover sod in winter or spring, pasture the field with sheep until the 1st of July, then plow it about 10 inches deep, cultivate thoroughly, and sow wheat Sept. 1st. As soon as the wheat is harvested, the field is plowed with a double plow a little deeper than before. Then it is rolled with a four-horse iron roller, cultivated thoroughly, and sown with *wheat again*, seeding with clover in the spring. That this plan gives good wheat on his farm, the crop of last season abundantly proves. But I fear that the system would not keep the land clean, unless the first crop was hoed. A once-plowed summer fallow, with only two months of cultivation, is not sufficient to germinate seeds of weeds. I see no other objection to the plan. It will not exhaust the soil any sooner than raising wheat after barley or oats.

Fodder Cutting at Ogden Farm.

One of the items of improved agriculture on which the operations of this establishment were originally based was the cutting of all hay, cornstalks, and other fodder, to be consumed by the stock; and the barn was purposely so constructed as to make it inconvenient to feed long fodder to animals. For some time, however, it seemed quite impossible to secure the regular cutting of the feed; for, even when a sufficient force was furnished, the labor of turning the machine for so large an amount of work was so irksome that it was impossible to get it properly performed; and the question of mechanical power became an important one. It was first contemplated to erect a large wind-mill on the barn for this purpose; but, in the absence of practical evidence that it would succeed, the attempt has not thus far been made. It was found, also, that the use of a steam engine would possibly vitiate the insurance policy on the barn and live-stock; and so recourse was finally had to the railway horse-power. A double power, used during the summer by an itinerant thrasher, has been hired for the winter and set up on the main floor of the barn. Its belt being connected with a Daniels' power hay-cutter, it is found that one heavy mule will drive even the double horse-power without undue exertion; and the amount of hay or cornstalks required for the entire foddering of about 30 head of stock is cut daily in 30 minutes. There is no difficulty whatever in securing the regular performance of the work, since the hay requires no more handling than would be necessary to deliver it in front of the stalls; and the subsequent handling of the chaff with the facilities provided is so easy that there is no excuse, and, indeed, no temptation, for its neglect. As a consequence, whatever advantage may be gained by the cutting of hay,—and so far as can now be estimated in this experiment, it is fully ten per cent of the whole,—is attained without additional labor by the use of a horse-power, hired for the winter for \$10, and the daily use of one mule for half an hour. Arrangements having been perfected for steaming the hay, after being cut, is all subjected to this process before being fed.

The Distribution of Liquid Manure.

All plant-food enters the roots of crops in solution in water. When ordinary kinds of manure are applied to the land in a solid form, considerable time is usually required for the ac-

Fig. 1.—MANURE CART ON LEVEL GROUND.

tion of the natural forces of the earth and rains, air and warmth, before it is all so far part and parcel of the soil as to be assimilable by the

plant. A portion is almost immediately available, but other portions gradually become so. The contrary is true with liquid manure. When it enters the soil, a great portion of it is in a state of immediate availability, and the rest rapidly becomes so. When applied to crops whose roots already fill the soil, as to grass or grain, a portion is at once seized upon by the plants, while the rest, being absorbed by the soil, is furnished as occasion requires. This takes place on well-drained soils, most rapidly in moist seasons. The application on such land is best made just before a moderate rain, or just after one, while the soil is still full of water. The reason for this is that the large quantity of water causes a more general diffusion of the manure than would otherwise occur. The idea that manure in the liquid form is likely to be lost by leaching is erroneous. Any tolerably good soil possesses properties which arrest and render solid almost

Fig. 2.—MANURE CART ON HILLSIDE.

all substances in solution, having a high manurial value, like the alkalis, phosphates, and ammonia. This takes place most rapidly in that portion of the top-soil least exposed to the action of the elements. Hence it is, that rains, while they dissolve plant-food in the top soil, cannot carry it far below the surface. If, however, instead of sinking into the earth, water flows over it, great damage may be the result.

There are many ways of distributing liquid manure. It is extensively done by hand, and this is the best way for manuring cabbages, beans, and all plants growing in hills or distinct rows. On grass and grain a very even distribution may be effected from a skillfully handled bucket. A French or German farmer accustomed to it will fling his bucketful in fine spray over a half circle of 15 feet radius, and no one can tell if one part gets more than another.

For ordinary purposes, and for common people, however, a cart made for the purpose is most satisfactory. We give figures like one which we know worked very well and which is almost identically like the one engraved, except that it has a tin distributor instead of a wooden one. Tin ones are light, but hard to clean, and they often need cleaning, and soon rust out.

This cart is a pipe or hoghead set upon an axle. There is a hole in the top as it lies; and it is set so that nearly all the water will run out of a hole in the rear head. A 3-inch hole is made at this point, and a plug with a 2-inch bore inserted; or no plug need be used. In either case a canvas or leathern hose is attached over the hole or to the plug, and a valve is placed to close the opening inside of the hoghead, which is shown in both fig. 3 and fig. 4. This valve is opened by a wire passing out at the top where the driver can reach it. The hose is attached to the distributor, and is long enough to

allow its swinging from side to side, at least a foot. This part of the apparatus is easily made by taking a piece of pump tube 3 inches square, having a 2-inch bore, cutting it of the right length, plugging up the ends, and boring holes at the proper distances, more frequent towards the ends than in the middle, if of large size. Holes $\frac{1}{2}$ -inch

in diameter are about right. The distributor may be attached directly and immovably to the cart, or it may swing as shown in the engravings. When this plan is followed, a $\frac{3}{4}$ -inch bolt should be used, driven from the inside through a $\frac{3}{8}$ -inch hole. The distributor should swing very loose. It will then accommodate itself to inequalities of the surfaces, but more especially to uniform inclines, like side-hills, which it is desirable to travel across, and not up and down. Figure 1 exhibits the liquid manure cart upon level ground, giving a top-dressing to a field of beets or ruta-bagas. A few plugs might be inserted, so that only the two jets nearest over the rows of roots should flow. Figure 2 represents the same cart on a side-hill, the distributor retaining its horizontal position, whatever be the inclination. Figure 4 shows the side view and section at once, the dotted lines indicating the internal structure. There is a screen or strainer, to free the liquid from particles of straw, etc., before it enters the distributor, seen in fig. 3. As a safeguard it is also best to strain all the water through a piece of sacking placed in the opening in the top of the hoghead. Should the distributor become clogged or dirty, it is easily cleaned by knocking out the plugs and swabbing it out, clearing the

Fig. 4.—SECTION AND SIDE VIEW.

holes at the same time. In case pump tubing cannot be obtained, substitutes are easily constructed, as indicated in figure 4, a, b, and c.

Great Milkers for Butter Dairies.

It is fast coming to be understood that for the manufacture of butter simply, great milkers are not always the best cows. To say nothing of the superior butter-making qualities of Jersey cattle, the difference in butter-making capacity between different cows of any breed depends very slightly on the quantity of milk that they give and almost entirely on its quality. A cow giving ten quarts of milk per day will often make more butter than another of the same breed giving sixteen quarts; and where this is the case, if the business is exclusively, or chiefly, the manufacture of butter, the smaller

milker is much the more profitable, for the reason that the skimmed milk is usually of little value, except for the manufacture of pork, and this will not compensate for the greater amount of food that the larger milker consumes.

For butter dairies, then, it should be our aim, setting aside all other considerations, to select such animals as ample experience has shown will make the largest quantity of butter from a given amount of food. Whether the food be fed to one animal or to two is a matter of little consequence. What we want is to get the most money as the result of its consumption; and this is often attained by feeding it to a larger number of smaller milkers. In the case of thoroughbred animals, the advantage of the larger number of cows is still greater, for the reason that they give us more valuable calves.

Salt as an Article of Diet for Stock.

It would seem absurd to argue that salt is an essential ingredient in, or in connection with, the feed of live-stock. The problem is one which has its demonstration daily in the fondness of the animals for it, in their rough coats, and nibbling and sniffing appetites when deprived of it, and in the sleek condition and sharp appetites which soon come from its moderate use. The deer and the buffalo are as fond

Fig. 1.—SALT-TROUGH WITH ROOF.

of salt as our domestic ruminants, and in a condition of captivity, it is as essential to their health. Cattle near the sea-board do not need salt, and though they like it, the use of it is often given up, because its benefits are not apparent, and the very knowledge of its utility may be lost in a few generations.

"How quickly your butter comes!" said an acquaintance who had stepped in to have a morning chat with the good wife of a farmer living near one of our seaside watering-places. "You must salt your cows well."—"Oh, no! we never salt them; do you salt your cows?"—"Certainly, every week."—"How do you do it?" "rub it into their backs?" was the innocent, and, from her standpoint, natural rejoinder.

When cattle and sheep are salted once a week and flat rocks with basins in them are not abundant, the next best things are little oak "dug-outs," like the one shown in fig. 2, three feet long, ten inches wide, four high, and about two deep. They will last out in the weather a long time if they are only housed in the winter, or turned bottom upwards on a rock. We give also a sketch of a salt-trough (fig. 1) for the constant supply of dry salt. A swinging roof hung in a frame, which supports the trough a little above the ground, protects the salt from the weather, and animals will quickly learn to push the roof to one side and get at the salt, and

when they leave, the roof swings back again.

Rock-salt in lumps of several pounds' weight is the best article for placing in troughs or mangers. This costs a good deal more than the

Fig. 2.—"DUG-OUT" FOR SALT.

salt from the same mines, dissolved, evaporated, purified, and furnished in sacks, as "Ashton's Factory-filled," simply because there is not demand enough for it to make it an article of extensive commerce. It is so hard that animals cannot gnaw it easily, and in simply licking it they do not get too much, but quite enough.

Cheap Shelter for Cattle.

A common excuse for the barbarous practice of wintering cattle at the stack-yard is the want of capital to build a good barn. For the prosperous farmer a convenient barn, as near the center of his premises as possible, is doubtless the most economical arrangement. But almost every farm furnishes the material for "hovels," with very little expenditure of money, and a temporary hovel may be made quite as comfortable as a barn. Our Irish fellow-citizens have a genius for this kind of structure, and one often sees by their rude houses, shelters for the poor man's cow, that are models of comfort, if not of beauty. He has but one to provide for, and its walls and roof are thrown up in a day; but if it pays the poor man to provide shelter for his cow, it certainly

will pay the large farmer to shelter his herd. Select dry ground for your hovel, and, if possible, the southern slope of a hill or the south side of a grove. Plant a row of posts ten or twelve feet apart, and eight feet high, for the rear of the hovel, and a second row, twelve feet high, about twelve feet in front. These rows of posts should be extended according to the number of cattle to be accommodated, allowing three feet for the smaller animals, and four for the larger. Boards or slabs may be used for the siding and for the roof, if these are available. Doors should open to the south, at convenient distances. A long feeding rack is constructed at the back side of the hovel, and the cattle are tied up, fed, and attended as if in a barn. The stacks of fodder are made immediately around the hovel, with reference to convenience in feeding. This is not so easy as to feed from the barn floor, but it involves very little more labor than foddering from the stack-yard, where the hay has not only to be thrown over the fence, but scattered

widely, to give every animal a fair chance. Not nearly as much hay would be wasted by trampling, and about as much would be saved by shelter as in the best constructed barn. If lumber is scarce, the siding and roof may be made of straw, bog hay, sedges, sea-weed, or even of the hay that is to serve for fodder. Thatch, well put on, will last nearly as long as shingles. Siding of straw, a foot thick, packed between poles, will last several years with slight repairs. But the stacks of hay may be so arranged as to form the most of the siding, and if the hay knife be used, the part next to the hovel may be left to the last, and be fed out in spring, after the extreme cold has passed. This style of hovel is much used upon the prairies, and in the new settlements, where timber is scarce, by the more careful farmers. It might often be used to advantage by all farmers in the North, who have not sufficient barn room for their cattle. It is as valuable for manure making as for shelter. If the floor of the hovel be covered a foot or more thick with muck, peat, or surface soil, well dried, it will absorb all the valuable parts of the urine, leaving only the water to leach away into the earth. The whole floor may be treated as in box stalls, adding loam and straw, as they are needed to keep the cattle clean and comfortable. All the manure of the cattle would be saved in this way, and it would add greatly to the riches of the farm. One great advantage of these cheap shelters would be a great saving in the carting of manures. If the hovel were located as it should be, upon the field to be broken up for corn, the manure would be already upon the ground for spring use. The only labor would be to compost the manure, and spread it for plowing in. This would give relief to the teams at a time when all their strength is wanted for the pressing labors of seed-time, and by adopting this plan the remote fields of the farm might be kept in good heart.

A Farmer's Skiff.

Many whose farms border on a stream or lake find it very convenient to have a boat of some kind. A correspondent in West Virginia sends us drawings and a description of a boat that can be made at a small cost. He states that he has had one in use for two years, and finds it very serviceable. It will carry six persons, and a large man can stand on one side of it without dipping water. He says:

Fig. 1.—SKIFF AS COMPLETED.

"For sides, take two 1-inch planks, 16 inches wide, and 14 feet long; for ends, 2-inch plank, the same width. Cut the stern-piece 30 inches long at bottom, and 40 at top; cut the bow-piece 12 inches long at bottom, and 20 inches at top; then cut a center-piece 12 inches wide, 40

inches long at bottom, and 50 inches long at top; put these pieces in position, and *securely* nail the sides to them; this can be readily done by boring holes very near the ends of the side planks, bringing them into place by means of a rope, twisted by a short lever. After the sides

Fig. 2.—STERN PIECE.

Fig. 3.—BOW.

are thus secured, true up the bottom edges, and plank *crosswise* with $\frac{1}{4}$ -inch plank, $\frac{1}{2}$ of an inch apart; caulk these seams with oakum or cotton, and tar the *whole bottom*, and two or three inches up the sides. A keel 1, 2 or 3 inches

Fig. 2.—MIDDLE PIECE.

deep can then be nailed on, depending on the shallowness of the water where the boat is to be used. For seats, nail

a plank across each end, and one for the rower, over the middle-piece; two row-locks, about six inches above the sides of the boat, complete the job. These can be made of plank, set up on end, and fastened to the inside of the boat. A common carpenter can make such a boat in

about two days; and if planed and painted, it looks well. The ends ought to incline outwards about three inches to the foot. I have boated as much ice at one time in such a boat as four horses could haul in a wagon; yet it is

so light, that a little girl rowed it three-quarters of a mile against a slight current without fatigue. Fig. 1, on the preceding page, shows the skiff completed; fig. 2 is a diagram of the stern piece; fig. 3, the bow piece; fig. 4, the middle piece, and fig. 5, the row-lock.

Ogden Farm.—Past, Present, and Future.

Near Newport, R. I., there is a farm of sixty acres which promises to be of some consequence to the agriculture of America. Its improvement is the joint operation of Mr. Geo. F. Tyler, of Philadelphia, and Col. Geo. E. Waring, Jr., of Newport. The farm in question has not been undertaken for any fancy purpose. A desire to show what can be done and an attempt to teach others how to farm formed no part of the motive for the enterprise, which was, on the contrary, founded on the very sensible basis of a desire to make money by farming. The soil is a friable loam from five to ten inches deep, lying upon a very compact, bluish subsoil, such as is usually considered impervious to water.

The land lies over the crown of a gently sloping hill. The difference in elevation between the highest and lowest points, distant from each other rather more than half a mile, is about fifty feet. The summit of the hill is nearly flat, and all of the water that fell upon it, unable to descend through the hard pan for want of an outlet beneath, has always traveled by slow and easy stages, from one particle of the soil to another, down the slope of the land, save as evaporated from the surface, preventing all possibility of a fertile condition, despite repeated coaxings with manure, and good cultivation. During its previous history, the farm has been repeatedly sold at low prices, and rented at low rates; its owners and tenants having usually retired lame from its possession, it had earned the name of "Poverty Farm." When it came into the present possession, it seemed to many

Rhode Island farmers to be but a stepping-stone to the poor-house or the mad-house, and the well-worn compliment concerning fools and their money has not yet gone out of use in the neighborhood. The purchase was made a little more than a year ago. Since that time every acre of the land has been thoroughly drained in the best manner with tiles placed four feet deep in parallel lines 40 feet apart. Much of the land has been subsoiled and nearly the whole of it broken up. The interior fences have been, or are being entirely removed, the whole farm being thrown into a single field, with the exception of about four acres enclosing the buildings and yards. A three-story barn, 40 feet by 100 feet, has been built, and a stock of over twenty head of pure Jersey Cattle has been purchased, or bred on the place. This barn is designed to be a model of simplicity and convenience.

It is, of course, too early in the history of the improvement to do much more than to call attention to it, but the effect of the drainage has been so marked that it will already bear more than a passing notice. On the eastern side the drains of about twenty acres discharge through a four-inch outlet. We visited the farm the day after Thanksgiving, and found teams plowing what had been the wettest land of the whole farm—land which, without draining, surely could not have been plowed before June next; and the record of the flow at the outlet showed how prompt the action of the drains had been. On Wednesday, the outlet had been flowing about half an inch deep; on Thursday, Thanksgiving Day, it commenced to rain at noon, and stormed furiously until about nightfall, at which time the 4-inch pipe was running entirely full. The next day when we saw it, and when the land was in good condition for plowing, the flow of the outlet had receded to a depth of less than one inch, showing a much more rapid descent of the water through a compact subsoil than was looked for, so soon after the completion of the draining.

The fact that Ogden Farm is not intended to be in any sense a "model" farm makes it all the more valuable as a model. When a rich man, with "agricultural tastes," moves into the country, builds a \$25,000 barn, a \$1,000 poultry-house, and stone walls at \$10 a rod, and thinks that he is advancing the cause of scientific agriculture, we are disposed to sympathize very heartily with those who think that he is doing it a real injury. His investments will never bring a respectable return, and he does not care that they should, and his example must often have the effect of deterring men of smaller means from undertaking real improvements.

The farm in question, on the other hand, has had hardly a dollar expended upon it for the purpose of show or ornament. The whole investment is purely a business one, with capital sufficient to insure its success, if its plans have been judiciously laid out. We shall watch its course with interest, and shall endeavor to keep our readers informed of its successes and failures as they occur.

Steaming Food for Horses.

Mr. Stewart, of North Evans, New York, who, in an article furnished for the Annual Report of the Department of Agriculture, has stated very clearly the general arguments in favor of steaming food for farm stock, and the results of his own experience therein, mentions, incidentally, the fact that the steaming of hay is a sure preventive of heaves, and a sure cure of coughs and colds, instancing the case of an animal of

his own, which came in from pasture with a severe cough, and was entirely cured within two weeks by an exclusive steamed diet. This result is in accordance with the idea, that the irritation of the throat by dusty hay is a fertile source of heaves and coughs, and it suggests an important argument in favor of steaming.

On general principles, it being admitted that steaming food for neat cattle produces the most economical results, it is fair to assume that the steaming of horse food will be even more beneficial; for the reason that the digestive organs of the horse are much less elaborate than those of the ox, and that in all cases a much larger proportion of the food passes the bowels in an undigested condition. Therefore, whatever may tend, as unquestionably steaming does, to increase the digestibility of food, must have the effect of economizing, in a very marked degree, that which is given to our horses; and the application of steaming in the feeding of all of the animals on our farms would considerably lessen the incidental expenses of the process, in proportion to the number of animals fed.

The Management of Colts.

Probably American farmers are as successful as any other farmers in the raising of young horses;—that is to say, considering the character of the sires and dams, they bring about as good final results as attend horse breeding in any other country where breeding is only incidental to farm work. But there is one item of management which is either disregarded or imperfectly understood, and that is, the early *education* of the colt. Mr. Rarey has done much to upset the old-fashioned notion of *breaking* horses, and has shown that, by judicious bending, the necessity for breaking may be entirely obviated; but even Mr. Rarey's system confined itself chiefly to horses which had arrived at an age when their services could be made immediately useful. The reason why it is necessary to apply any strenuous system of training in bringing colts to their first work is, that they have to be taught to do that for which their previous life has in no manner prepared their minds. The first three or four years of a colt's life are passed at pasture, or in the stable, and the most that he learns is, to obey the restraints of the halter, and occasionally, though, unfortunately, too seldom, to allow himself to be cleaned. When the day of his usefulness arrives, he is to be taught his trade in a few days or a few weeks; and the bit, the bridle, the girth, the saddle, the hard-pressing collar,—all perfectly new revelations to him,—are to be crammed down his young throat in the most remorseless manner, and he is a fortunate colt if the cramming be done with a gentle hand. Too often his simple wonder excites his master's temper, and a contest ensues, from the effect of which he never recovers. If every colt could be treated as are, for example, those of Mr. Charles Sharpless, of Pennsylvania, the result upon the average temper of our harness and saddle horses would be remarkable, and at least one-half of the dangers of horsemanship would be obviated. It is Mr. Sharpless' universal custom, while the colt is still running with its dam, even at the age of six weeks or two months, to follow the handling and caressing to which it has been accustomed almost from the hour of its birth, by a gradual harnessing and playing with straps, and generally on the third or fourth day of trial, by hitching to a pair of light wheels, with which the little shaver fol-

lows its dam about the field. The colt learns these things at this early day as easily as it would learn anything else, and the lesson is never forgotten; so that when the time for actual harnessing comes, it creates no surprise, makes no trouble, and gives rise to no contests.

Improvements in Draining Tiles.

BY COL. GEORGE E. WARING, JR.

In view of the fact that in my article on "Tile Draining," published in the *Agricultural*

Fig. 1 and 2.—TILE AND COLLAR.

Annual for 1867, and in my "Draining for Profit and Draining for Health," published by your house, I have very strenuously insisted upon the necessity for using silt basins in the laying of underdrains, I have thought it advisable to state explicitly the reasons which have led me in my own practice, and in advice to others, to dispense almost entirely with their use. They were at best a rather imperfect and quite

Fig. 3.—TILE AS LAID.

expensive means for preventing the obstruction of drains by accumulations of silt; but, with the draining materials procurable at the time when the book and article above alluded to were written, they were indispensable. During

Fig. 4. Fig. 5.

the last year I have used largely the tiles manufactured by Messrs. C. W. Boynton & Co., of Woodbridge, N. J., which are made with certain modifications and improvements that very greatly lessen the necessity for silt basins. Indeed, in draining my own farm of 60 acres, I have not made a single one of these. The tiles referred to are made from the tenacious clay of the

Fig. 6.

Amboy region, which is so much richer in quality and so much more uniform than the brick clay ordinarily employed for the purpose, that it is found easy to make even the smallest tiles two feet long, which, of itself, is a great advantage, inasmuch as it reduces by one-half the number of joints, which must always form a greater or less obstacle to the smooth flow of water, while there are still openings enough remaining for the complete admission of soil water. Only round tiles are made at this establish-

Fig. 7.

Fig. 8.—CONNECTION OF LATERAL WITH MAIN.

ment, the smaller ones being provided with well-fitting collars for connecting their ends.

The tile and collar respectively are shown in figs. 1 and 2. The continuous line is laid as shown in fig. 3. The curved tiles, such as those shown in figs. 4 and 5, bent to various degrees, in order to suit the requirements of different circumstances, I have found of great assistance, especially in abruptly changing the direction of main drains. Figure 6 represents an enlarging tile, by which, in increasing the size of a drain, as from two to three inches, the abrupt rough edge, formed by inserting the smaller tile into the larger one, may be avoided. This gradual enlargement will effectually prevent the checking of the flow that is unavoidable in all cases where a confined stream breaks abruptly into a larger conduit. The most important improvement that Boynton has made, and the one which does more than any other to obviate the need for silt basins, is the junction

Fig. 9.

piece, shown in fig. 7, which is used for connecting lateral drains with mains, or one main with another. These junction pieces are made complete, as shown in the figure, for all the different sizes of mains and laterals; and, by their use, the water from the lateral is introduced into the main at an angle of 45°. As it enters near the bottom of the main it materially accelerates the flow in the latter by its force of entry, while, with the best joint that it was formerly possible for us to make by the aid of the tile pick, there was an interruption of the flow and frequently a tendency to deposit silt at the junctions. By the use of these junction pieces, the points of intersection are made the safest of the whole drain, instead of being, as they were under the old system, the most insecure. The manner in which the collared small lateral is connected with the lower part of the larger tile of the main drain is shown in fig. 8. When the

Fig. 10.—VIEW OF OUTLET.

lateral approaches the main at a right angle, or at a very obtuse angle, the curved tile shown in fig. 5 should be used, in order that the flow may strike in the direction of the oblique junction.

Messrs. Boynton & Co. have also made an earthen-ware grating for covering outlets, which is very much cheaper than the wire grating recommended in my book; and, as the last pipe of the drain is glazed or vitrified ware, the outer end may project a little beyond the mason work without fear that it will be injured by frost. This grated outlet is shown in fig. 9. The grating is movable, and can be easily detached for cleaning when necessary. The appearance of an outlet, so arranged in connection with masonry, is shown in fig. 10, and it is difficult to conceive of any plan more simple or more effective.

SOWING CLOVER SEED.—Test the seed, unless it is known to be good. To do this, take a saucer half full of sand, pat it level, sprinkle on a known number of seeds, lay a piece of muslin over them, and put a light layer of sand upon it; keep all moist, and after a few days,

see how many seeds germinate. Before sowing clover, practice taking a pinch for a cast between the thumb and two fingers, doing it many times, until the same quantity is taken each time. The chief advantage of sowing upon a light fall of snow is, that the evenness and regularity of the casts may be seen. To sow well requires practice. The field should be paced, the amount of seed estimated, then measured out, and divided, for a beginner, into as many equal parcels as he will need to test the accuracy of his sowing. It is best for a very raw hand to sow half the entire lot of seed, making it cover the whole field, and then, going at right angles, to sow the other half. A good way is, to wait until the seed starts and shows spots which have too little and then scatter on some additional seed, so as to remedy the defect.

The Award of Prizes at Fairs.

Some very absurd awards, recently made in the name of one of the prominent poultry societies of the country, have caused the general subject of awards at fairs to be discussed by persons especially interested in agricultural and kindred societies. Two questions will at once set in a clear light the delicacy of this subject, viz: 1st. What shall the officers of a society do when their judges make and ask them to promulgate unjust and absurd awards? 2d. What kind of judges and judgments will be obtained if the judges know that their reports of awards are subject to be overruled by the executive committee of the society? Men who are placed upon committees of award ought to know more than the executive committee of the society about their own specialties, and if any society could secure the services of such men, we are sure, that while they would not submit to have their awards revised by anybody, they would be happy to conform to the most stringent rules for the guidance of committees, which might be laid down by the society. Judges who would tamely submit to a revision of their work are just the men not wanted as judges. True, an ignoramus might be just as sensitive in regard to his judgment as a wise man; but, nevertheless, it is most important that all judges should feel that their decisions, if made within the just rules of the society, are irrevocable. Without this, there can be no generally good decisions secured. The question then arises—What rules ought the society to lay down, and how instruct its judges? It is almost universal, that certain rules upon points of honor are considered established by usage; for instance, no man should pass judgment upon his own articles, or upon those in which he may be considered to have a personal interest, as upon those of a son or other friend. Neither may a person accept a position where his bias in favor of some unimportant peculiarity will interfere with his fair judgment. The society should, however, cause to be printed and placed in the hand of committees of judges, a set of rules, somewhat like the following:

Awards will be made impartially, having reference solely to the excellence of the articles under consideration, and entirely without reference to the number of prizes the exhibitor may take, or to any remuneration of deserving exhibitors, even though every prize be taken by one person.—Any attempt of an exhibitor to deceive, in regard to anything, and especially in reference to ownership, breeding, age, or characteristics of any of his live-stock, shall disqualify both the exhibitor and all his stock.

[COPYRIGHT SECURED.]

GOING TO MARKET.—DRAWN BY E. FORBES.—Engraved for the American Agriculturist.

—No awards may be made to unworthy articles. When there is no competition, an article unworthy of the first prize in such a case is also unworthy of the second or third, for the society commits itself for the excellence of anything to which a prize is awarded.—In judging of live-stock of all kinds, awards must be made in accordance with recognized standards of excellence, and scales of points; and in cases of doubt, the judges must consult the counselling committee through the superintendent, or superintendent of the department.

Decisions and awards made in accordance with these rules are *final*. No appeal from the decisions of judges will be entertained, except on the plea that the rules are departed from, and such appeals will be heard by the executive committee of the society at any time before or after the promulgation of the awards. Every society should furnish for the information of judges, full scales of points, descriptions of breeds, and specifications of disqualifying and undesirable characteristics. It should, moreover, provide convenient scales for weighing poultry, and, if possible, books containing engravings of famous prize birds, and information of value to judges, in enabling them to “post up” upon points which few men retain in their memories.

Going to Market.

The author of Walks and Talks mentioned last month the waste of time in going to town with a poor team. When we have been in Southern cities, the slow and cumbrous way of getting to market has struck us as a great waste of time and power. In those cities it is the custom to have regular market days, usually two in each week. Early in the afternoon preceding market day, the country wagons begin to arrive, and take places along the streets. The vehicles are usually large, heavy, out of all proportion to their contents, and are covered with a canvas top, stretched over bows. The wagons are backed up to the side walk, and the horses or mules unhitched, tied to the sides of the wagon, and fed with provender which has been brought along. The wagon itself serves as a hotel for the driver and those who may accompany him. By nightfall, the streets present a grotesque and lively appearance to a stranger, with the many odd-looking wagons, and numerous animals bivouacked in two long rows. Our artist gives a picturesque view of one of these heavy wagons on its way to market; the driver is apparently belated. The market wagon in use around New York is a comparatively light

affair, upon springs, and without a top. The “truck” is packed in, and covered with a large canvas, which is drawn closely over the load. In New York, the raiser rarely retails his produce; it is taken off his hands at once by the grocers, and retailers, and the streets are cleared of wagons by seven o'clock in the morning.

OLD CURRANT BUSHES are among the most unpromising things with which one has to deal; their tangled and misshapen stalks present a puzzle to the novice. Whatever is done should be undertaken during the first mild spell, as the currant pushes very early. The bush will probably have numerous shoots starting from below ground, or near the surface; cut out all but four or six of these, according to the size of the plant, leaving only the most healthy looking ones, and taking care to have these as equally distant as possible. The fruit is borne on wood two or more years old. One-year-old wood is distinguished by its different color and small buds. Cut out all weak shoots of this kind, and shorten the stronger ones two-thirds or one-half. Manure around the bushes, and when dry weather approaches, mulch. Make the old bushes do their best, and start a new plantation which will come into bearing in two years.

In the Flower Garden.

What should we put in the flower garden? It is quite time this was settled, as these March winds are drying up the ground, and the days when we can work will soon be here. Annuals,

Fig. 1.—BLEEDING HEART.

bedding plants, and perennials, all have their uses, and we do not sympathize with those who decry either. Among annuals are some plants that we cannot well do without, and it is the same with bedding plants—by which we mean those soft-wooded green-house plants that are used for one season only—but of both of these we will speak another time; at present, we wish to say a word about our favorites, the perennials. These are plants which die down every year, while the faithful old root lives, and when the sun calls warmly enough, sends up its shoots to gladden us. With our liking for plants of all kinds, we must own to a partiality for these; when frost comes, or before, they go to their winter's rest, and all through the winter we enjoy thinking of them as they lie under their covering of snow, and we long for the day when we shall welcome their return. At last, a tender shoot breaks the ground, and looks about to see if it is safe to venture out; if all is right, the rest of the shoots soon follow. How vigorously they push, nourished as they are by the bountiful mother root! and how soon they develop into things of beauty! We wish people would take more to these perennial plants, which, once obtained, remain as a part of the place, the only trouble they give being that of

Fig. 2.—NOBLE FUMITORY.

reducing their size. Once in three or four years the roots get too large to do well, and they need to be taken up, divided, and reset. At present, we give an account of a few that are our especial favorites; the list might be extended indefi-

nately, but these are all good, and may all be had of the florists and nurserymen. Most perennials may be raised from the seed, in which case the young plants must be carefully cultivated the first year, and they will flower in the second. All the plants here mentioned do best in a light, rich soil, but we have grown them satisfactorily in a very poor and sandy one.

BLEEDING HEART—*Dicentra spectabilis*.—We put this at the very head of the list of perennials for its hardiness, grace, and beauty. It was known to Linnæus, who called it *Corydalis formosa*, but it is less than twenty years ago that Mr. Fortune placed it in the hands of cultivators. Since that time, the poor thing has had a hard time of it as to names. It has been called *Dielytra*, *Diclytra*, *Dylithra*, etc., by the florists and nurserymen, who, as a general thing, if there is a wrong name for a plant, will be sure to hold on to it. Figure 1 gives an idea of a clump of this plant, which grows to the height of two or three feet. The foliage is much like that of a *Pæony*, but of a more delicate and tender green. The grace of the bending racemes, and the beauty of the individual heart-shaped, rose-colored flowers, make it surpassingly attractive. It seeds sparingly, but multiplies freely by the root. Blooms through spring and early summer. There is a whitish variety.

NOBLE FUMITORY—*Corydalis nobilis*.—This is not a true Fumitory, as the genus has been separated; but it is not easy to change common names when they are once well established.

Fig. 5.—MISSOURI EVENING PRIMROSE.

Figure 2 gives the general appearance of the plant, the resemblance of which to the *Dicentra* will be at once recognized; they both belong to the same botanical family. This blooms in April, pushing up its clusters of light yellow flowers to about the height of a foot. It is a plant that soon does up its work; as the foliage dies down very early, and as all vestiges of it are soon gone, its place should be marked, for fear that it may be forgotten and that its subterranean life may be accidentally disturbed.

JAPAN ASTILBE—*Astilbe Japonica*.—The foliage of this plant (fig. 3) would give it a place in the garden, as it is of so rich a green, and so handsome in form; but in addition to its fine leaves, it produces a pyramidal cluster of pure white, delicate flowers, upon a stem one or two feet high. A most charming, hardy plant for the border, and one that is often used for forcing. Some two years ago, we figured the flowers of the natural size; the engraving now presented shows the habit of the plant. There is a variety with beautifully variegated foliage, which holds its golden markings until our hot days come on, when it is green for the rest of the season. Florists will persist in calling this *Spiræa Japonica*, but it is not a *Spiræa*, nor does it belong to the same botanical family.

MISSOURI EVENING PRIMROSE—*Oenothera Missouriensis*, also called *O. macrocarpa*.—A

low growing plant, with prostrate stems, a foot or more in length. The leaves are of a dull, hoary green. The flowers, which are of a fine, golden yellow, are from four to six inches across; they open towards evening, and remain until the next day's sun becomes too hot for

Fig. 3.—JAPAN ASTILBE.

them. The plant (fig. 4) blooms all summer, and is a very effective one to use in masses.

PERENNIAL FLAX—*Linum perenne*.—This, a native of the country beyond the Mississippi, is shown in figure 5, as far as its form and habit go, but we cannot give an idea of the beautiful blue of its flowers, which the French aptly call "celestial." The plant throws up numerous slender stems, about a foot and a half high, which bear great numbers of flowers, and has a remarkably airy appearance. The individual flowers soon wither, but they are each day replaced by new ones, and the plant continues to produce its cloud of blue bloom all summer

Packing and Shipping Vegetables to a Distant Market.

BY S. B. CONOVER, WEST WASHINGTON MARKET, N. Y.

[A good share of the many persons who have gone to the warmer States for the purpose of raising fruits and vegetables for the markets of northern cities are destined to disappointment. They may be entirely successful in raising good crops, but they will be disappointed in the returns they receive, for the reason that their articles did not reach the purchaser in good order. In cities the appearance of a package has much

Fig. 4.—PERENNIAL FLAX.

to do with the price it brings. To help those who need instruction in the matter, we have requested of Mr. Conover, one of our most experienced commission-merchants, some articles on

the packing and shipping of fruits and vegetables for the New York market. His directions will, of course, serve for other markets.—Eds.]

The condition in which vegetables and fruits should be packed for shipment requires the exercise of some judgment. Some, such as Tomatoes and Peaches, are picked in a partially green state, and ripen up during transportation, so as to be in a salable condition when they reach the market. The grower who lives within a day or two of a market can pack such things in a much riper condition than one whose produce must be four or five days in transportation. Other articles, such as Cucumbers, Beans, and Peas, commence to deteriorate from the moment they are picked, and, especially if heated in the hold of the steamer, often arrive in a perfectly worthless condition. Packages receive much rough handling; injury from this cause is in a measure prevented by packing as firmly as the nature of the article will allow. Never send poor, small, or worthless articles to market; they will not pay the cost of transportation.

CRATES, to hold one and one half bushel, are made of two ends and one middle piece, of inch stuff, 18×8 inches square; to these, slats sawed of half-inch stuff, 27 inches long, are nailed, leaving spaces of one-half to one inch between the slats for ventilation. Crates of this kind are easy to handle, and their contents are not so liable to be injured by rolling, as those of barrels. Potatoes, Sweet Potatoes, Onions, Cucumbers, Beans, Peas, and Apples, are shipped in the size above given. For Tomatoes, Peaches, and Pears, a smaller sized crate is used, which holds two $\frac{5}{8}$ peach baskets, equal to one and a quarter bushel. The middle and ends are 18×8, but the slats forming the sides are but 24 inches long, of $\frac{3}{4}$ or $\frac{3}{8}$ stuff, allowing the spaces between the slats for ventilation.

POTATOES.—These should not be dug until the "skin is set," i. e., so ripe that the skin will not readily rub off. When dug, they must not be left exposed to the sun, else the sap next the skin will scald, which soon causes fermentation and decay. From this cause, all in the crate or barrel are frequently rotten by the time they reach the market, or if only a portion decay, these injure the sale of the sound ones. Pack in barrels for a near market. If sent from the South, potatoes should be packed in crates holding one and a half bushel. In filling, leave out all cullings and wormy or decayed potatoes, and shake down before mailing up. Potatoes should be thoroughly dry, i. e., free from all outside moisture, and be cooled as much as possible before they are packed.

ONIONS.—Pull when the tops fall over, and cure in the shade. The sun soon scalds them, when the outer skin becomes slippery, and they soon rot. Cut the roots close, but leave the tops an inch or an inch and a half long. Onions should be perfectly dry and shelly when packed, and none that are soft or rotten put in.

CUCUMBERS.—Pack only those of medium size and perfectly green. The White-spined is the best variety for shipping. Yellow cucumbers are perfectly worthless in the market.

BEANS AND PEAS.—Let them be perfectly dry and sound when packed, and keep out all bruised or decayed ones. Do not ship Beans that are too old, or that will not snap when broken. See that the crates are well filled.

TOMATOES.—At the far South, Florida and Georgia, these should be picked just as they begin to turn red at the stem side. Put in none that are ripe, wormy, or cracked. A few ripe ones packed with the rest will rot and spoil the

whole crate. Shake down and have the crate so full that a moderate pressure will be required to allow the top to be nailed on. If picked at the right time and properly packed they will ripen up so as to be salable by the time they reach New York. For Virginia and places further north they may be a little riper when picked.

BEETS AND CARROTS.—Cut off the tops, leaving about one-half an inch. Keep dry and pack in crates, having them well filled.

Timber Culture—The Larch.

BY D. C. SCOFIELD, ELOIN, ILL.

[The writer of the following article is not a nurseryman, but a tree cultivator, who is very enthusiastic in the matter of the cultivation of forest trees. He puts the culture of the European Larch in a striking light. It will be noticed that Mr. S. expresses a preference for the Tyrolean variety, and gives his reasons for it. We do not find the seed of this variety in the catalogues of our dealers, but probably a demand for it would bring a supply. The common European Larch is sufficiently valuable to induce those who wish to grow timber to take that. We wish that Mr. S. had given us the cost of planting, as well as the returns for an acre. Seed of the European Larch is offered by our dealers at \$2.50 per pound. We have had no experience in sowing it, and as in works devoted to tree culture we find no special directions, it is assumed that the seed is to be treated like other seeds. We should advise to sow in a good soil as early as possible. It is useless for any one to sow tree seeds unless he will take care of the young plants, and the young seedlings of the hardiest forest trees need as much care as those of the cabbage or tomato. They need weeding, watering, and frequently, shading.—Eds.]

At the Annual Fair of the Kane County, Illinois, Agricultural Society, held in Sept. last, two European, or Tyrolean, Larch trees were placed on the grounds for exhibition—one two years old and ten inches in height, (and a fine plant, indeed, the usual size being only about an average of six inches), grown from the seed on American soil; and the other eleven years older than the former, standing thirty feet in height, twelve inches in diameter at the base, which was a plant imported by the writer from Scotland, in 1857, when only six inches long. At the close of the exhibition the larger tree was cut into fence posts, each seven feet in length, making four posts, the but end making two posts. This tree was cut from a grove of Larch, set three feet apart in the row. Now suppose there had been one acre of ground set eleven years ago with these Larch; there would have been 4,820 trees. Allowing that each tree makes four posts, we have the round number of 19,280 posts which at twenty cents each would amount to \$3,856, equal to more than \$350 annually for the crop of eleven years. But instead of cutting off the entire crop we take only one-half, and leave the residue to grow on at a distance of 3 to 6 feet apart, and a crop may be gathered worth \$1,882, or equal to an annual crop of more than \$150 per acre. Now there are standing on the ground more than 2,400 trees, which, left to grow for twenty years, will be 60 feet, or more, in height, and will each make thirty fence posts, or ten railroad ties, which at 20 cents per post will amount to \$14,400. But when we take into consideration the increased value of these posts over all other kinds of wood, from their imperishable character, the estimate would be double. Allowing that the price of timber remain what

it is now, the profits of timber culture would far exceed all other productions of the soil.

Another important item in this estimate is the very small outlay to produce this crop. It costs less money to plant an acre of European Larch than an acre of hops, it requires cultivation only two years from the planting, and the next labor is the gathering the harvest. If the good of the country and of future generations will not induce the farmer to plant forests, then let his love of gain prompt him to the work. (In a letter received since the above came to hand, Mr. S. says:—) In regard to the *Tyrolean* and *Common* Larch of Europe I learn from late replies to my queries proposed to some of the leading nurserymen and foresters of Europe, and those who have made the distinction in their catalogues between the two, and uniformly rank the "Tyrolean" variety at a higher price than "Common," that they call seedlings grown from seed collected in Switzerland, "Tyrolean," and from seed grown in Scotland, "Common do." Several years ago the late Peter Lawson, of the firm of Peter Lawson & Son, in answer to my inquiry about the durable qualities of the two varieties, said: "Either is more durable than Red Cedar, but of the two the Tyrolean had the preference. But the European Larch when brought into competition with American is as English oak to the Basswood for durability."

Low-headed versus High-headed Trees.

BY DR. E. S. HULL, ALTON, ILL.

[A course of lectures by various distinguished agriculturists and pomologists was given in January last at the Illinois State Industrial University. In a lecture on Orchard Fruits, Dr. E. S. Hull, a most successful Illinois orchardist, made the following remarks, which were reported for the *Agriculturist* by Mr. O. L. Barler, of Upper Alton, Ill.—Eds.]

Shall we grow our trees with branches starting from the ground, or shall we prune? and to what height? These and similar questions are often asked. It would be superfluous to give any illustration of growing fruit trees to low heads, since for the past sixteen or eighteen years all our journals, both horticultural and agricultural, have vied with each other in descriptions how best to accomplish, as they supposed, so desirable a result. Indeed, so much has been written on this point, that we have gone from trunks six to eight feet high down to those of as many inches. These low-headed orchards on coming into bearing—have disappointed, or must soon disappoint, their owners. The conditions attending the growing of fruits are now so changed from what they were but a few years since, that trees with *low heads* are in the main no longer a success! They increase the labor of cultivation many fold. The low branches cut off the under circulation, inducing disease in the foliage and rot in the fruit. They invite insect enemies, and make it difficult, if not impracticable, to arrest their ravages. In short, *low heads* are a failure, and the sooner we can induce people to start the heads of their trees at a proper height, the sooner will it be possible to successfully destroy insects, to ward off diseases, to insure color to the fruit, and make it practicable to cultivate quite up to the trees by means of horse-power. In planting an orchard, we select trees as to age, according to their kind, Apricot, Peach, Plum, Cherry, one year old from the bud or graft; Apple and Pear, two and three years old. The four first named, if well grown, will be not less than five or six feet

high, and will have many side or lateral shoots branching out horizontally from the main stem. In addition to the side branches there will also be found numerous buds extending from the ground to the top of the tree. Cut away all the branches and buds to the height of twelve or fifteen inches. Next cut away all buds below the point at which it is intended the tree shall form its head, except six or eight, which are to be left at regular intervals and on different sides of the stem. These last-mentioned buds will push into as many branches as there are buds. It will be necessary to keep these side branches pinched back to ten or twelve inches during the summer, to prevent them from running off with the growth, and robbing those buds and branches selected for the future head of the tree. Some time after the fall of the leaves, and before growth commences in the spring, reduce the side branches to one bud each, and when the branches from these buds shall extend to ten or twelve inches, pinch them, as directed in the first year. The treatment will be the same in the third year as we have directed for the second, except at the end of the season cut away all the side branches, except those intended to form the head of the tree. The object of the side branches, of which mention has been made, was to strengthen the stem or trunk of the tree. Without them the tree would have become top heavy and bent the trunk. Trees that have been grown as we have directed will have straight and tapering stems, which will be of sufficient strength in their fourth year to stand erect.

Digging Holes for Trees.

A Connecticut friend, who is full of common sense, has his own way of sending us occasionally a fragment just as it occurs to him, of which the following is a specimen. If he would take the pains to write out his horticultural and agricultural views and experiences, he would rank among our most popular writers.—Eds.

There is a deal of good horticultural sweat wasted in digging holes for trees, when we dig so deep and wide as the fathers in horticulture have taught. There are unfinished portions of creation, of course, where, in planting an apple-tree, it may be necessary to remove a load of gravel, and bring a load and a half of soil—growing trees, as it were, in pots. But would it not save transportation to pack one's baggage and decamp from such places? In a fair soil, if the transplanted tree but have the earth about it to itself, and be not robbed by some nimble-rooted green-crop, under the guise of "cultivation," or by grass, or foul weeds, of just that ready nutriment which the dismembered tree so sorely needs, fifteen or eighteen inches is deep enough for the holes. When the tree-top (I am thinking of apples) is twenty, thirty, forty feet in diameter, even the deepest holes the most enthusiastic cultivator ever perspired in, are insignificant. Manure, too—why put in under the young tree a Golgotha of bones, old boots, stones, tin pots, and what-not? One shovelful of old barn-yard manure will feed a young tree for a year, perhaps more. Can't we save some of this ardor for the time when the tree needs a little pruning—a twig here and there—and instead of such extreme generosity with the sub-soil at the start, show a continuous disposition to let the tree have the surface-soil, which it so delights in? Can't we keep up the enthusiasm long enough (having secured thrift, which is half the battle against insects), to keep vigilant watch for the insidious borer? But that matter

of insects must be taken hold of in great earnest. The negligence of cultivators in this respect is costing the nation many millions.

STARK APPLE.

Western Apples—The Stark.

The Stark Apple is a variety now attracting attention in the West, and great claims to superiority are made for it. We have already given our opinion of the samples as they came to us, which was to the effect that, while it appears to be a valuable market variety, it cannot be classed as first for quality. The Stark is described in the Horticultural Annual for 1869; the drawing reaching us too late to appear there, we give it here, with Dr. Warder's description.

"STARK.—Tree, vigorous, healthy, and strong, with open head; productive. Fruit, globular, regular, large; surface, smooth, yellow, covered generally, mixed red, splashed crimson; dots, numerous, medium, dark. Basin, regular, rather wide, sometimes folded; eye, medium, closed. Cavity, deep, regular; stem, medium to long. Core, medium, closed, meeting or clasping the eye; seeds, few, imperfect; flesh, yellow, breaking, juicy; flavor, subacid, rather agreeable; quality, good; use, market and kitchen; season, December and all winter. 'As good a keeper as the Gilpin and Willow Twig.' Bears heavily on alternate years. The size and showy appearance of this apple, its firmness in transportation, and its color, which hides the effects of bruises, all make it a good market fruit, while the vigor and productiveness of the tree cannot fail to make it profitable in the orchard. Specimens received from H. McMaster, Leonaardsburgh, Ohio, who has cultivated the variety with profit, and esteems it very highly. Mr. A. H. Gaston, of Henry, Marshall Co., Ill., thinks it 'the very best apple in America,' with this I cannot agree, at least as the variety is produced in Ohio, where those who cultivate it value it as a good and profitable winter apple."

Hedge Planting on the Prairies.

G. N. M. gives the following as his experience:—Hedge plants set in the raw (or wild) sod, turned over, will do well. We take a narrow spade, and grind the corners round and sharp. Then get a ball of strong twine, four or five rods long, and begin at one end and tie knots as far apart as the sets are to be; take coarse, red yarn, cut it short, and insert a piece of yarn in each knot before it is drawn up

tight. When this is done, you have a line with which the plants can be set. Take a spade, set it along the side of the line at the knots, drive it in a little slanting, give it a shove forward, take a set, and put it in while the spade is forward, then draw back the spade to where it was driven in, hold on to the top of the set, pull out the spade, and you are ready to repeat the same operation. Two men and a smart boy can set a half mile in a day. When one line is done, let a man tramp along each side, and between the sets, being careful to close all of the opening that the spade makes. I have three quarters of a mile set in that way one year ago last June, which has done well. I prefer to throw up the ground where I wish to grow a hedge-row, as it is one-half better, or the sets will be one-half better, in the same time, than on ground that is not thrown up. [We have no doubt

that very rapid work may be done in this way. The tramping of the soil, after the plants have been set, is an important part of the operation. It is essential to the success in setting shrubs and trees of any kind, that the soil be brought in close contact with the roots.—ED.]

GRAFTING STONE-FRUITS.—To be successful, the grafting of stone-fruits must be done very early. The cherry needs to be grafted earlier than the plum, and the operation must be performed on both before the buds commence to swell. The peach is said to succeed by root grafting, if done early enough in the spring, but in this we have had no experience.

The Management of Hot-beds.

Those who have requested us to tell them how to make a hot-bed will find sufficient directions in "Notes upon Work." The making of a hot-bed is a very easy matter; when it is done, it has to be properly cared for, and here is where many fail. The plants in the bed, naturally tender from the manner in which they have been raised, are in a confined space, with a heating medium below them which gives the air in which they are enclosed as high a temperature as they can well endure. If now this already heated space be made still hotter by the direct rays of the sun, the tender and succulent plants at once perish. As soon as the plants are up, the bed must have not only daily attention, but at least twice daily—morning and afternoon. In the morning, about nine o'clock, the upper edge of the sash must be raised by means of a wedge-shaped block, the opening being more or less, according to the interior temperature and the heat of the sun. This operation is termed "airing," and by proper attention to it, injury from overheating may be avoided. In guarding against danger from heat, that from the opposite extreme should not be incurred. The sashes are to be closed in the afternoon when the force of the sun has abated, and on cold days opened very slightly, or not at all. Watering, when required, is to be done from a watering-pot with a very fine rose, so as to compact the earth as little as possible. Weeds are sometimes troublesome in hot-beds, and they should never be allowed to get a start.

Hospitality to Our Friends the Birds.

While the horticultural societies are discussing the question whether birds are not more plague than profit, we assume that certain small birds are useful to the cultivator. The wrens have long been accepted as friends, and now the European sparrow comes to us, to help in the war against insects. The last named have been on their good behavior thus far, and no one has been able to bring any serious charges against them. These little birds seem to prefer to be near dwellings, and to court our protection.

Wrens, sparrows, and the like, will avail themselves of any cavity that seems convenient as a nesting place, and will occupy houses with great readiness. Bird-houses have become a kind of institution in New York City since the sparrows have come, and some structures have been put up that are more elaborate than tasteful.

One of the public squares has so many of these ornamented bird-houses that it looks much like a

Fig. 1.—FLOWER-POT HOUSE.

Fig. 7.—DIAGRAM OF FIG. 6.

confectioner's shop. When we consider that all that the bird needs is a secure cavity in which to place its nest, it will be seen that all this painting and gilding is as useless as it is in bad taste. The rudest box will be occupied as readily as the most costly and highly ornamented bird-house. Some years ago we gave an account of a curious bird-house. Some one had hung an old oil-feeder upon the picket of a fence; this was taken possession of by a pair of wrens, who

habited. Even so rude a thing as a common flower-pot was converted into a bird-house by Mr. Edwin Roberts, of Brooklyn. Figure 1 shows how the flower-pot was suspended. The

Fig. 2.—THATCHED HOUSE UPON POLE.

hole at the bottom of the pot was of course enlarged, as may readily be done by nipping out small bits with a pair of pincers, or by careful punching with an iron rod, the bottom of the pot being placed upon the ground. Leaving these simple devices, we give some more elaborate, yet tasteful ones, devised by our artist. Where the bird-house stands out by itself, it should not be a piece of "gingerbread-work," but in keeping with its surroundings. Figure 2 shows a very pretty rustic one, intended to be placed upon a pole. It is made of a portion of a nail-keg, or similar receptacle—in fact, it is a small tub well secured by hoops. The interior may be divided into as many compartments as is desirable, each one with a small opening outwards. The interior being arranged as a tenement-house, the exterior is covered with pieces of bark neatly nailed on. The pole passes through far enough to allow of the attachment of the straw which is to serve for the thatched roof. A house of this kind placed upon a rough pole, with a Trumpet Creeper or other vine

six or eight-sided, and has a rustic appearance given to it by the use of bark, and the burs of the Sweet Gum tree (*Liquidambar*). Figure 4 gives a pretty design, in which an old oyster or paint keg is made to serve as the basis of the structure. Its exterior is covered with bark; it has a roof of the same material, and is placed on a rustic shelf. In figure 5, a keg may be used, or a cut of solid timber may be taken, a portion of the bark being removed to allow of the cutting out of the cavity, and the bark carefully tacked on afterwards. Hollow sticks can often be found which with a little ingenuity may be converted into bird-houses, and where these are wanting a sound stick may be made to serve, as shown in figure 6. A portion of the bark is to be removed, and a cavity made, as seen in the diagram, fig. 7; a hole for an entrance is bored, and the bark is replaced. A sufficient number of illustrations are here given to show that it requires no great amount of skill to afford accommodations for our feathered friends, that will be unobtrusive and tasteful without taxing the ingenuity of the carpenter or painter. If paint must be used in any such structures, let it be of an inconspicuous color.

Fig. 3.—HEXAGON HOUSE.

PEACH STONES for planting should have been kept mixed with sand or sandy loam, and exposed to the frost. Freezing is necessary to insure their germination. If the stones have been kept dry, mix with earth, and freeze them at once. If they show no signs of germinating at planting time, they must be cracked, and the

Fig. 4.—RUSTIC HOUSE.

built their nest and raised a brood in these odd quarters. A simple box with a hole in it, fastened against a tree, will be very sure to be in-

Fig. 6.—A HOUSE MADE IN A LIMB.

running over it, is exceedingly picturesque. In figure 3, we give one of the least objectionable of the New York houses; it is made either

seeds mixed with earth, and kept warm until they begin to start, taking care to keep them moist. Plant as soon as they begin to start.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

A Family Festival.

BY MRS. L. LAMB.

It being John's birthday, and having nothing prepared for a present or a remembrancer, I was obliged to set mother wit to work to improvise a celebration of some description in honor of the day.

John went to his office after breakfast, and there was no time for me to lose after he had gone. I decided to make a cake, a New Year's pudding, and cook my nice turkey, which we had been fattening for a couple of weeks, and which was dressed and hung up in the carriage-house a week ago. There was no school, and the two older children could assist me, while the younger two would be useful in amusing the baby, a busy, active, two-year-old boy.

As soon as the breakfast things were cleared away and the beds made, I went again to the kitchen and left the children to put the sitting-room in order. I have taught them to sweep, by first wetting the broom and shaking or striking off the surplus water. In this way no dust rises, and the carpet looks bright and clean. If the room is large, the broom should be dampened several times.

Charlie pared and sliced six medium-sized Baldwin apples, one-third of which I placed on the bottom of a pudding pan, then scattered over a few slices of canned quince, some raisins, cut in two, a tablespoonful of raw rice, and two tablespoonfuls of sugar; this was one layer. Two more layers were made in the same manner, and at last a pinch of salt and a very little nutmeg were added. The pan was filled up with new, rich milk, and the whole baked slowly from two to three hours. It is a dish fit for a prince and perfectly healthful.

My cake was a medium-sized sponge cake, made from a tried recipe of my own. This is the recipe: Take one-third of a half pound ball of butter, two cups of light brown sugar, rolled fine and beaten with the butter. While I am doing this, Charlie beats the yolks of six eggs, which I add to the sugar and butter, and beat with a fork, while he beats the six whites to a stiff froth with the beater. It takes but a minute. Mix one spoonful of baking powder with two cups of flour, add half a cup of sweet milk, a little mace or lemon extract, and stir all lightly and quickly together. Pour into a baking pan that has a tube in the center, and bake as quickly as possible without burning.

One of the children chopped the bread for the dressing, and I seasoned and stuffed the turkey while the cake was baking. As soon as the cake came out of the oven the turkey went in. Then I took the whites of two eggs and made an icing for the cake, allowing nine teaspoonfuls of powdered sugar and one of corn starch to each egg, flavoring with extract of lemon. Two coats of the icing covered the cake nicely; I saved about a spoonful and colored it with a bit of cochineal the size of a pea, and wrote with a knife blade my husband's initials, and the date, with a dotted vine around the edge. The children gathered a few sprays of pine and some scarlet berries from the wild rose bushes, to put in the center, and it looked very pretty.

My good little Charlie dressed the potatoes and turnips, and Carrie set the table, placing Papa's cake in the center upon a tall, glass cake-plate, and a bouquet of evergreen and scarlet berries at either end. As soon as the potatoes were done I poured off the water, set them over the fire with the cover off a minute, then putting the turnips into a basin for Charlie to mash, I mashed the potatoes fine and quickly, seasoned with salt, butter, and cream, and then with a knife and spoon made them into oval shapes, dipped each one into batter made of egg-yolks and flour, with a bit of salt, and set them in the oven for ten minutes, when they came out a golden brown, delightful to look at and delicious to taste.

The children kept watch for Papa, so that I could have every thing in order at the right time. I changed my dress as soon as the turkey was put in, and wore an apron until just as the little waiters saw Papa coming up the steps. When he came in,

every thing was as it should be. The bird was a most perfect success; the potatoes looked almost too nice to eat; and the cake, with its crimson direction, "J. L., Jan. 1, 1869," could not be intended for anybody else. Papa was surprised and delighted. The children looked at each other across the table, radiant with the consciousness of having contributed to the general success of the festival, and I was more than repaid for my labor.

Fig. 1.—FRAME COVERED WITH IVY.

A Living Ornament—Ivy.

In the columns devoted to horticultural matters, the cultivation of Ivy, both in and out of doors, has been advocated more than once. It is one of the best plants to have in the house, as it bears a large amount of neglect and abuse, and gratefully repays good treatment. It is not rare to see a pot of Ivy placed where it can be trained around picture frames and thus border the picture with living green. One of our associates has hit upon a way of dispensing with the pot, or rather he has a substitute for it which is kept out of sight. Figure 1 shows a picture frame wreathed with Ivy after his method. Only a good-sized picture can be treated in this way, and as such pictures are usually hung so that the top of the frame leans forward, the

Fig. 2.

space between the frame and the wall is available for the receptacle for the plant. A pot or pan of zinc, of a wedge shape, and of a size to suit the space between the frame and the wall, as shown in figure 2, can be readily made by any tinsmith. This is to be hung against the wall so as to be quite concealed by the picture, and the Ivy tastefully trained over the frame. A rustic frame is better suited to this purpose, as it not only affords better facilities for attaching the stems of the plant, but its style seems better adapted to this kind of decoration than more pretentious ones. Still, a gilt frame may be beautified in the same way. Don't forget the water; the pan holding the plant is out of sight and therefore should be kept in mind. In summer the pan containing the plants may be hung up on the shady side of the house, or the plants may be turned out in the open ground. Ivy when planted out in the garden, if it is intended to repot it in autumn, should be kept tied up to a stake; if the branches are allowed to lie upon the ground they will take root at nearly

every joint. There is no plant easier to start from cuttings than Ivy, and none grows more readily if it has a good soil and does not suffer from dryness.

Household Talks.

BY AUNT HATTIE.

ROASTING MEAT.—Many persons seem to suppose that it is an indifferent matter whether meat is cooked for a short or a long time, provided only that it is cooked enough. I have often seen them place the meat for dinner in the oven as early as nine o'clock, making no distinction between beef, mutton, lamb, pork, chicken, goose, or duck, or three pounds, seven, or fifteen. They rightly consider that it is not necessary to watch it, for a generous supply of water in the pan effectually prevents its burning. Now, there is as much difference between a piece of well-cooked or badly cooked meat, as between a loaf of good bread or bad bread, and perhaps more. Meat of mature (and by mature I do not mean old) animals, such as beef and mutton, requires less time to cook than meat from immature animals, such as lamb and veal, which needs thorough cooking. The reverse is the case with poultry; all young poultry, such as spring chickens, young ducks, and green geese, take far less time than tough old fellows that can stand any amount of fire. Pork should always be well done. These few hints I throw out as a sort of key to the methods of roasting that I am about to give you. Another thing, mature meat should never be put into the oven until the latter is very hot, in order that the intense heat may quickly sear or shrivel the surface of the meat, which will prevent the juice from escaping. Never stick a fork or skewer into a joint of meat while it is cooking, as the gravy will ooze out. It is obvious that where water is put into the pan, this quick searing of the surface cannot be effected. I think if advocates for water as an element in roasting would consider that it cannot be raised above a certain temperature, (its boiling point,) and that fat is susceptible of a much greater degree of heat, their scruples against grease as a basting agent would be removed.

ROAST BEEF.—A piece of beef to roast for my table must come from the sirloin or first or second cut. The third cut is near the shoulder, and is not as good as the others. A small portion of the shoulder-blade is taken with the third cut, which the butcher removes, and in its place neatly inserts a piece of fat, thereby deceiving the initiated; but it makes a poor roast. Epicures require that beef and mutton should be cooked rare. There is a great difference between raw and rare meat; raw meat inside of a roast will have a dark purplish color, while rare meat is of a delicate crimson. The plates should be very warm when rare meat is served. Allow no flour or fat in the gravy. Carrots chopped fine, turnips mashed, and whole potatoes and cabbage, are excellent with roast beef. I never mash potatoes for hot roast beef or mutton.

ROAST VEAL.—A loin of veal should be thoroughly cooked; a large piece will require three hours in a moderate oven. I should not put water in the pan for veal; a few slices of salt pork placed upon the top will improve the flavor, and will also serve to moisten or baste it.

FILLET OF VEAL.—This is cut from the thick part of the leg. Insert into the opening a stuffing made of crumbs of bread seasoned with summer savory, pepper, and salt, and a little lemon juice, if convenient; tie around with a string, making the piece the shape of a small cheese. Never use sage or onions with delicate meat like veal. Roast thoroughly; make a brown gravy by adding flour and water to the exuded juice in the pan; serve with slices of lemon, and fried or boiled pork. The loin should be served also with pork and lemon, and flour should always be added to the gravy.

LAMB should be thoroughly cooked, but will require less time than veal or pork; when of a fine brown on all sides, you may conclude that it is done. Serve with mint sauce, made as follows: To one dozen leaves of spearmint chopped to a pulp, add two tablespoonfuls of sugar and a half teacup

of sharp vinegar. Lamb and green peas is the rule, but any vegetable nicely served will be acceptable.

MEAT FOR CHILDREN.—Many persons consider meat injurious to children, but I allow my children a little beef or mutton whenever we have it for dinner, which is about four times a week; even the baby must have a piece as large as a finger, from which he pretty effectually extracts the juice. While I consider that meat in moderate quantities gives tone and vigor to the constitution, its indiscriminate use by children should be forbidden. My mother always gave her children milk and bread for breakfast, and bread and butter for tea. I reverse that order, giving them a few warmed-up potatoes, and bread and butter for breakfast, with a bowl of milk and bread for supper. They are at table at breakfast and dinner, but not at tea.

VEAL PIE.—Take a deep baking-dish, and place some small pieces of veal in it, allowing any little bones to remain. The neck pieces may be used if desired. Nearly cover with water, and sprinkle with salt and pepper, adding little bits of butter. Cover with a paste, and bake. When the crust is done, open the oven door and let the pie remain an hour or more, to cook the meat. Is delicious eaten cold.

MINCED VEAL OR HASH.—Take any cold veal which may be left from the roast, and cut up into very small pieces, but do not chop; cover with water, adding a little pepper, salt, and butter; bring to a boil, and thicken with a teaspoonful of flour. Toast a few slices of bread freed from crust, butter and place them around the dish, and pour the mince nicely in the center. It is a most acceptable dish.

RAISED DUMPLINGS.—Edward is very fond of dumplings made of dough, and we often have them. I reserve a small quantity of dough from the bread pan and place in the pantry until about an hour before dinner, when I make them of a round shape, and about as large as an orange, and set to rise. When light, I drop them into a pot of boiling water, cook until done, and serve with drawn butter sauce and syrup, or sugar. I consider this an agreeable and wholesome dessert.

APPLE DUMPLINGS.—Take one apple pared and cored, surround it with a very thin paste; tie separately in a clean cloth and boil for 40 minutes.

AUNT HATTIE ON THE BREAD QUESTION.—I hardly know whether I was amused or annoyed the most at Miss —, on Tuesday evening. She called with a young gentleman to whom rumor says she is engaged to be married. The truth of this report, for his sake, I hope is unfounded. As they had had a long walk—nearly a mile and a half—I thought an evening luncheon would be just the thing. Edward had gone to a trustee meeting, and Bridget also was out, so I went myself to the pantry to prepare a lunch. I covered a large tray with a napkin, and placed on it some cold meat, knives and forks, plates, etc., some little patty-pan mince pies, and a loaf of bread uncut, and carried it into the sitting-room, because they seemed to enjoy so much the cheerful, open fireplace. Mr. B. cut a little of the meat for each, and before he was quite through doing so, the young lady asked him if he would also cut some of the bread. "You know," she added, "I never cut bread." I felt surprised, as I knew that she was the oldest of several children, and that they were often without a girl, and while I cut some of the bread, for I had risen to do so, I expressed aloud my astonishment and incredulity. "Why," she said, laughing, "I never cut a slice of bread in my life.".... "Is it possible?" I said.... "Not only possible, but a fact; I never cut a slice of bread nor part of a slice in my life.".... "Who cuts bread for the children and for the family?".... "Oh, the girl, always.".... "But she is away sometimes, and at times you have none.".... "Well, mother is always at home, and then she does it; she does not care how her hands look.".... "Then you cannot make bread?" I said, hesitatingly. A little light, rippling laugh, and an amused and significant glance passing between the two was all the answer I received, but I read plainly that she considered bread-making and bread-cutting as arts belonging to old women, mothers, and mortals less refined than she. Ah, well! she may laugh now, and he

may laugh with her and admire her delicate hands, but by and by, when they are older, when mother is gone, and the strain of life comes on, and perhaps adversity sets in, when servants are scarce, and impudent, and ignorant,—what think you? will he laugh then when sour, heavy, clammy, half-baked bread is presented? Will he cut the loaf then for her and the children? Speaking not from experience but from observation, I can but say no, but I can assure them that dark looks, angry frowns, and unpleasant words, often arise from nothing more serious than sour, bad bread.

The Table—Order and Ornament.

Last month a neat way of setting a family table was given, and we proposed to follow it with some hints upon serving the food. Soup was provided for with the hope that this excellent form of food might become more popular than it now is. Soup ought not to be too hot when served; it should be just at that temperature at which it can be eaten without inconvenience. In eating soup, the side of the spoon should be used; it will sometimes be necessary to use the end of the spoon if the soup contains bits of meat or vegetables, but it is better to avoid it as far as may be. The waiter should remove the soup plates when all are done, and if there is no waiter it should be the business of some member of the family to rise and take them away quietly, and bring the meat and place it before the head of the family. The vegetables, if in covered dishes, may be placed on with the soup; otherwise they must be brought in with the meat. A good carver will know the tastes of all who sit regularly at the table, and serve them accordingly as far as may be; he will ask the preferences of a guest, as to rare or well done, fat or lean, etc. He will not serve gravy without first learning if it is acceptable. Where no waiter is at hand to pass the dishes, each one should contribute to the general comfort by promptly passing plates, helping those vegetables that may be nearest, etc. Where the table is waited upon, the vegetables, in some families, are passed for each person to help himself, and in others the waiter takes the plate and procures those which are desired. Individual deportment has much to do with the general enjoyment of a meal, and a word on this may not be out of place. Some time ago we read in a Western paper an injunction not to pick the teeth with the fork. We wondered what kind of readers the writer could be addressing, but since then we have actually seen it done. We do not think it necessary to repeat this injunction, but there is a use of the knife which we may allude to. It is not considered the proper thing to carry food to the mouth with the knife. The knife is for cutting, and the fork is the proper implement to use in taking the food. We have heard it said that no one who eats with his knife can be a gentleman, which is all nonsense, it being moral qualities which make a *gentle* man, and not forms, which are matters of early education. Still we say to those who wish to conform to the best usages, eat with the fork instead of the knife. One's own knife should not be put into the butter or salt, unless in cases where butter-knives and salt-spoons are not provided. At table where it is necessary to help one another, one should not be so absorbed in his own eating as not to observe what is going on and be ready at the right moment to supply such things near him as may be needed. When through eating lay the knife and fork side by side upon the plate; do not cross them, nor push the plate from you.

Boxes for Boots and Shoes.—"Genesee" says: "Will some kind reader who is not fortunate enough to live in a 'mansion,' tell me how to put away boots and shoes to make them look orderly and in place? Having two or three children with their 'Sunday,' 'Monday,' and over-shoes, besides my own and husband's, it becomes quite an item, at least to me."—Lack of sufficient and proper closet room is as much felt by those who live in "mansions" as by dwellers in humbler houses; it is a striking fault of the great majority

of house plans. A friend of ours proposed to his wife to make the apple pies in a pitcher, so that he could get plenty of apple with his crust. With something the same feeling we sometimes wish for a house in which the closets bear about the same proportion to the other rooms as would the apple have borne to the crust in our friend's pie. The best remedy we can suggest to "Genesee" is to make some shoe boxes. Get packing boxes of convenient size and of a light suitable for a low seat; hinge the cover so that it will open readily—leather hinges will do—then cover the sides with chintz or other material tacked on. Make a thin cushion and fasten it to the lid, and put around the edges of the lid a narrow flounce or fringe; this will quite conceal the box and with a little taste the whole may be made a very pretty ottoman. A box of this kind is a neat and most useful piece of bed-room furniture, for besides keeping boots and shoes in order and out of sight, it serves as a convenient place on which to sit while dressing the feet.

Indefiniteness in Recipes.

Ability to teach others what one perfectly understands himself or herself is a rare accomplishment. If you doubt it, ask your boy or girl, who knows every inch of the road, the way to Neighbor B's. Many hundreds of recipes come to us in the course of a year, some of which we use, some are omitted because an important article is quite forgotten, and others are not used, for the reason that though everything may be enumerated we are not told what to do with the mixture when we have all the ingredients together. As an example of indefiniteness, and not by any means a bad one, we give the following. We trust the lady who sent it will forgive the use we make of her recipe, as we can assure her that the selection was entirely accidental.

Apple Tea-cake.—Four apples pared and cut in quarters, 1 egg, 1 cup of sugar, 1 cup of milk, 4 cups of flour. Stir the apples in the batter the last thing; 1 teaspoonful cream of tartar, $\frac{1}{2}$ of soda."

Now this is commendable, inasmuch as it enumerates at the outset all the things required, except the cream of tartar and soda, but is faulty in its directions. We suppose that a batter is to be made with the flour, sugar, egg, and milk; we are directed to stir in the apples the last thing, and then comes soda and cream of tartar, which are probably intended to be the very last things. What is to be done with the mixture we are not told. "Any body would know it was to be baked." The probabilities are that it should be, but as we have recipes for bread that is to be boiled several hours in a kettle, and other things where the compound is to be steamed, it is just as well to say so. In writing a recipe or giving a direction of any kind it is the best way to assume that the person to whom it is addressed has no knowledge whatever on the subject. It is seldom that directions are too explicit, and it is much easier for us to cut out such as may be superfluous than it is to supply omissions.

Tin and Britannia Ware.—A correspondent says: "No dishes fare harder at the hands of the inexperienced housekeeper, or careless help, than tin dishes. Though sooner tarnished than china by cold, greasy, dish-water, they are usually left the last on the list to be washed, are but partially dried, and, as a consequence, soon become dull and rusty. Then when the "clearing-up time" comes, they are scoured with ashes or sand, taking off in the process the outer coat of tin, and very soon look worse than before. Let me give a better way. Rub the dish thoroughly with soft soap, wash in hot, clean suds, and rinse with boiling water, dry with a clean towel, and there will be no occasion for scouring. This is equally good treatment for articles of white metal or Britannia Ware."

Eye Drop Cakes.—By M. E. E.—1 pint of milk, 3 eggs, one tablespoonful of sugar, a little salt. Stir in sifted rye until of about the consistency of pancakes. Bake in buttered cups one half hour.

BOYS & GIRLS' COLUMNS.

The Improvement Circle.

It is hard, dry work for most boys and girls to get knowledge from books. This is not surprising. Young people are too full of life to sit still long at a time, and besides this most books impart instruction in a very uninteresting way. Facts, packed away in leaves, are like dried fruit - it is much pleasanter to gather either fruit or knowledge fresh from nature. For example, you may read how each seed contains a young plant in itself, which grows larger and multiplies its different parts, when properly placed in the soil; but how much more interesting to take a seed, carefully cut it open, and find the plant! Then to take others and examine them day after day in their different stages of growth! Every day would show a fresh wonder, to brighten the eyes of the young student. So of any other facts in every branch of knowledge. The careful observer will also soon become so interested that he will be pleased with books which tell him more than he has been able to discover himself. Now suppose a dozen, more or less, boys and girls of any neighborhood should unite into a circle to gain knowledge. They should first agree to be governed by the wishes of the majority and then select some one subject for their studies. We will suppose they agree first to learn what they can about the plants growing in their neighborhood, which would be a very pleasant and profitable topic. The special question first taken up might be, How many different kinds of plants can be found within a certain district? A week might be taken to gain information on this point. Then you may be sure there would be twelve pairs of eyes looking more sharply at plants than ever before. Every hedge-row would be searched and every nook and corner closely examined, for with commendable rivalry each would try to secure the largest number of specimens. When they met to compare notes, all duplicates would be thrown out, the remainder counted, and examined by all. Thus each member of the circle would have the benefit of twelve pairs of eyes and hands instead of one, and might be able to learn almost twelve times as much as though working alone, besides having the added pleasure which agreeable union brings. The next week new specimens might be looked for, and when no more could be found, each member might be requested to find out all the facts possible about some one plant, for instance the potato. Then one would perhaps be led to study the leaf, another the stem, another the root, etc., and all would be surprised to see how many new things would be learned, and learned in such a way as not to be forgotten. This is but an example of what might be accomplished. The insects, the birds, stones, clouds, weather, sun, moon, and stars, history, geography, philosophy, - in short, the whole round of knowledge - will furnish an inexhaustible fund for most pleasurable and profitable study. Who will have the honor of forming Circle No. 1, and send an account of its first and second meetings? Perhaps they would be interesting enough to publish for the emulation of others. Many parents and teachers to whom this plan is mentioned will be able to give valuable suggestions to the young students, but they should be left mostly to themselves, carefully guided, but not discouraged by offering too much advice and help.

The World Not Finished.

The first inhabitants of the earth would hardly know their old home, should they now revisit it. Changes have been going on in every part; mountains have been lowered in some places, and lifted up in others; great lakes and rivers have disappeared; the plants of different sections are not the same as formerly; old breeds of animals are gone and new ones have appeared, and everywhere the great work of improving and finishing the world is going on. Every summer's sun and winter's frost does something to change the face of nature; rocks crumble little by little, are washed down the hill-sides, and help to fill the valleys. The streams are wearing away their banks and carrying earth, to deposit it in new places. The ocean slowly advances on some coasts and retires from others. Now and then a volcano or an earthquake in a few hours sweeps away all old landmarks, and a large district is thus at once made over. Equally great changes are going on among men, in their appearance, habits, customs, laws, and character. Whole races have passed away and left only here and there a mark to show that they existed, and new nations are coming forward to rule the progress of the world. It is remarkable that in all these particulars there is, on the whole, manifest improvement. Nature and men are less fierce than formerly. The ages of fearful monsters and ferocious nations have nearly passed. Peace, order, beauty, and happiness, are gradually advancing: the world is being finished by its Great Creator. The six days' work in the beginning, described in the Bible, was merely the bring-

ing together of the materials and putting them together roughly. The adjusting and polishing have yet to be completed. All have a part to do in the great work. The sunbeam that enlivens a little plant by the wayside helps make the world better; the boy or girl who lives right is like a whole sun scattering light on every hand, and will as surely do his or her work in society, as the rays of the natural sun perform their appointed part. Let's all take hold and try to finish up the world by making somebody better.

A Pleasing Home Game.

Our young folks, including the writer, have passed many a pleasant evening hour playing a new game called "Squalls." It is for sale at toy and stationary stores, but almost any one can make the necessary parts. A small block of lead, say half an inch in diameter and of the same height, is placed on the center of a smooth table; this is the target. The squalls, sixteen or more round, flat, and smooth pieces of hard wood about two inches in diameter, are distributed among the players. These pieces should be differently colored or numbered, so as to distinguish those belonging to each player, there being four of each color or number. In case these can not be easily procured, large, flat overcoat buttons of wood or metal will answer very well. The players are seated, and each in turn places a squall on the edge of the table, projecting a little over the edge, and with the hand gives it a slight blow or snaps it with his finger, to drive it as near as possible to the target. When all the squalls are played, the one remaining nearest the target counts one for its player; if he have been skillful or fortunate enough to leave two or more squalls nearer the target than those of any other player, each squall counts one, in the same way as in pitching quoits. He who thus counts seven, nine, or any other number decided upon, wins the game. The first play is made in rotation from right to left. A good part of the fun is the uncertainty until the last squall is played. A skillful shot by the last player may drive away one or more well-placed squalls, and gain the victory. If the target is driven out of place, it is to be played at where it lies. Any squall driven more than three inches upon the table can not be taken back until the end of the game.

Whiskey vs. Brains.

The "Southern Son" relates that a temperance lecturer gave the following hard hit at "moderate drinkers": - "All who in youth acquire a habit of drinking whiskey, at forty years of age will be total abstainers or drunkards. No one can use whiskey for years with moderation. If there is a person in this audience whose experience disputes this, let him make it known and I will account for it, or acknowledge that I am mistaken." A tall, large man arose, and folding his arms across his breast, said: "I offer myself as one whose own experience contradicts your statement." "Are you a moderate drinker?" asked the Judge. "I am." "How long have you drank in moderation?" "Forty years." "And were you never intoxicated?" "Never." "Well," remarked the Judge, scanning his subject closely from head to foot, "yours is a singular case, yet I think it easily accounted for. I am reminded by it of a little story: A colored man, with a loaf of bread and a bottle of whiskey, sat down on the bank of a clear stream to dine. In breaking the bread he dropped some of the crumbs into the water. These were eagerly seized and eaten by the fish. That circumstance suggested to the negro the idea of dipping the bread into the whiskey and feeding it to them. He tried it. It worked well. Some of the fish ate of it, became drunk, and floated helplessly on the surface. In this way he easily caught a large number. But in the stream was a large fish, very unlike the rest. It partook freely of the bread and whiskey, with no perceptible effect. It was shy of every effort of the negro to take it. He resolved to have it at all hazards, that he might learn its name and nature. He procured a net, and after much effort caught it, carried it to a colored neighbor, and asked his opinion in the matter. The other surveyed the wonder a moment, and then said: 'Sambo, I understand dis case. Dis fish is a mullet head; it ain't got any brains!' 'In other words,' added the judge, "alcohol affects only the brains, and of course those having none may drink without injury." The storm of laughter which followed drove the "moderate drinker" suddenly from the house.

Spacious Cottage.-A real estate agent informs the public "that he has a beautiful cottage for sale, containing ten rooms and an acre of land."

Stunning Farewell.-A Connecticut editor gives an account of a man who blew out his brains after bidding his wife good-by with a shot gun.

Conundrum.-When does a man have a vegetable time-piece? *Answer.*-When he gets a potato clock, (gets up at eight o'clock).

A Picture Story.-Write it out yourself.

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the February number, page 63... No. 337. *Arithmetical Problem.*-A pays 43 16, and B, 311-16 cents per pound... No. 338. *Illustrated Rebus.*-A circle of pictures appears, in which are exhibited five pairs of ewes. Though their tenor you can not entirely foresee, perseverance, I fancy, will give you the key. In justice to our young readers we state that through an error of the draughtsman, the ewe in the first circle should be an ewer... The following have sent in correct answers to some of the puzzles recently published: Frank L. Whitcomb, "N. N. M.," Fidelity R. Lord, Sallie Work, N. Jennie Fain, Julia M. Rowley, Robert Simpson, John M. Cotton, M. Rutter, H. Ague, "Charlie P.," Wesley T. Jolly, A. Berdan, George A. Fuller, James Vandemark, Carrie Nell Smith, John H. Halleck, Aaron H. Manderbach, T. T. Kerr, Edwin C. Brady, Frank Lockwood, "Carrie, Jr."

[COPYRIGHT SECURED.]
UNSEEN DANGERS.—DRAWN BY JAMES BAIRD.—Engraved for the American Agriculturist.

"I'm tired enough of this humdrum life!" sighed Mrs. Drake as she waddled disconsolately about the yard, followed by her young brood. "Here I've been shut up these six weeks in the company of vulgar chickens, with nothing but a puddle to swim in, and I can see that my darlings are getting the hateful ways of the low young ones they have to associate with. Oh, that I could escape to the lake where we used to have such glorious parties, and where I first became acquainted with Mr. Drake!" "It is awful!" echoed Mr. Drake, who stood mooping near by. "Here I have my new spring snit all finished, but it's no use, there's no society here." Just then a crash was heard, and part of the poultry-yard fence came tumbling down, where two oxen fighting had crowded against it. "Quack! quack!" shouted Mr. Drake in triumph, as he hastened away through the opening, quickly followed by his whole family. Straight they steered for the well-known lake, which they soon reached, joyous in the prospect of enjoying the world again, as they had done before family cares and the prudence of their owner had kept them in narrower bounds. "I wonder what we shall have for breakfast this morning," said a hungry young pike who was darting restlessly about among the lily stems. "I'm hungry enough to swallow a catfish if I could catch him." "Catfish be hooked!" growled out a snapping turtle that was burrowing in the mud below, hunting for worms. "It's 'most time for young ducks. What a feast I had last year! ah, it makes my mouth water to think of it!" Proudly Mrs. Drake sailed upon the water, followed by her brood, while Mr. Drake proudly stood upon the bank admiring his prodigies. "How well they dive!" thought he. "How long they stay under! They're just like their father for all the world! They'll surely make a sensation in society when they are educated." Now you can finish the story

by looking at the picture, and see how restlessness and vanity brought ruin to a family. This will be a much pleasanter way to learn the lesson, than to be dragged out into society as some children are by their vain parents and exposed to the hungry fish, always on the lookout for prey, that frequent its treacherous depths.

A Costly Table.

A traveler in Italy relates that he saw a table valued at two hundred thousand dollars. It was less than six feet in diameter, but had required the work of a large number of men for fifteen years. It was ornamented with mosaic work, that is, stones of different colors and shades matched together so as to form various pictures. The traveler says: "Upon entering the hall where this kind of work is done, I could not doubt these enormous figures. Suppose, for instance, a thousand of the hardest and most expensive stones which will take on a high polish, to be cut into pieces three-eighths of an inch thick. These pieces are cut the other way into small pieces like shoe pegs, and where the shading from one color to another is sudden, these pegs must not be larger than a needle. Now the artist cuts and puts in these, selected according to their color, so as to give the coloring wanted as distinct as though painted. These pieces or pegs must be fitted so closely that lines of separation will not show, and set upon end, side by side, like types. They claim that ten thousand different shades of color are necessary; and in order to do this kind of work a man must be skilled in colors and shades as a painter, in order to place the colors properly, and then be the most careful and accurate of mechanics, in order to fit the pieces; and he must have patience enough to work on cheap pictures one year, and on a fine one, from ten to twenty years."

Curious Dreams.

A writer in the "Argos" says: "I remember, when a boy, sleeping in a strange house, in an old-fashioned room, with an oaken store cupboard over the bed. I dreamed that I was being murdered; the assassin struck me on the head, and I awoke with a sense of pain in that region. Putting my hand to my forehead, I found it sticky—with blood! I felt almost too ill to cry for help; but at length I alarmed the household, and, on procuring a light, it was discovered that some jam had leaked through the bottom of the cupboard, and fallen upon my head in a small sluggish stream. A few months ago, shortly before going to bed, a friend had been discussing with me the peculiar instincts of animals, and more particularly their sense of the coming on of storms. After this he dreamed he was a Worcestershire Short-horn, grazing in a pleasant meadow on the Herefordshire side of the Malvern Hills. He had a number of companions. Signs of a storm appeared in the sky; a misty vapor hung on the well-known beacon. He remembered distinctly, although he was a cow, watching, with a sense of great delight, the heauty of the preliminary tokens of the storm. With the other cows he quietly strolled toward the shelter of an adjacent tree, and waited until the storm should break. He distinctly remembered wagging his tail." One of the editors of this paper, while traveling some time since, dreamed that he was an advertisement, for which there was no room in the paper, and was made very uncomfortable by the effort to crowd him into a column. On awaking he found himself inconveniently crowded in the berth which he was sharing with his son.

Many troubles, like waves of the ocean, will, if we wait calmly, only break at our feet and disappear.

"OUR YOUNG FOLKS."

AN ILLUSTRATED MONTHLY MAGAZINE
FOR
BOYS AND GIRLS.

The January and February numbers of "OUR YOUNG FOLKS" have been commended by the Press in the most enthusiastic terms. Its Stories, by MR. ALDRICH, MRS. STOWE, MRS. DIAZ, SOPHIE MAY, "AUNT FANNY;" its Poems, by LUCY LARCOM, HARRIET PRESCOTT SPOFFORD, MISS MULLOCK, and C. A. BARRY; MR. TROWBRIDGE'S graphic and instructive description of Glass-Making; MR. PARTON'S interesting account of the Invention of the Compass; and MRS. AGASSIZ'S attractive opening paper of her series about "The World we Live on"—all these are recognized as giving to the Magazine in due proportion the two essential qualities of healthful entertainment and practical value; and as having such variety of character, such literary excellence, and so high a moral tone, as to make the Magazine all that can reasonably be demanded.

"The Story of a Bad Boy," by T. B. ALDRICH, has excited general attention, by its genuineness, its graphic delineations of boy character, and the sustained interest of the incidents. In the February number of the Agriculturist, the opening chapter was given.

As illustrating the great interest that has been manifested by the readers of this Story, and MR. TROWBRIDGE'S excellent articles, we copy from Our Letter Box in the March number of "OUR YOUNG FOLKS" the following extract.

We print this little note just as it came to us, because it is a specimen of many which testify to the growing interest in our Magazine, and because it contains a question about one of our most valuable contributors.

"DEAR YOUNG FOLKS:

"Papa made Jamie and me a Christmas present of 'Our Young Folks' for 1869; and as we have the January and February numbers, we want to tell you how delighted we are with our Magazine.

"I like to read Mr. Trowbridge's pieces on Glass-Making, because I have often wondered how glass was made, and I never could understand how they could use potash and sand in making it, as I have been told they did.

"Jamie thinks Tom Bailey is going to be the right sort of a boy after all, and I like to read about such a boy, too. Jamie is 12 and I am 14.

"Jamie wants me to ask who Mr. Aldrich is, and if he is Tom Bailey; and where Ilvermouth is. We can't find it at all, and we have looked on our map all along the coast of Massachusetts."

We thank our little friend for her kind words, and we are gratified to know that she is pleased with the stories she mentions.

When Mr. Trowbridge comes to speak of Coal-Mining and Ship-Building, we have no doubt that she and many

besides will be as much interested as they have been in Glass-Making. Before preparing his papers on Coal-Mining, which are soon to appear, he visited the coal regions of Pennsylvania, and saw the miners at their work. In describing the manner of carrying on this great business he will have much to tell about these miners, and the little "slate pickers," and the cats and rats in the mines, and other curious and interesting things.

But about Mr. Aldrich and his story,—Well, Mr. Aldrich is widely known as a poet. Those who do not own the dainty blue-and-gold volume of his poems may yet remember the graceful sweetness of his "Bible Bell," which so delighted children and grown-up people a few years since. He writes prose sketches, as well as poems, for the "Atlantic." "A Young Desperado," published in that Magazine for December, 1857, is probably not unknown to some of our readers. Mr. Aldrich is also the Editor of "Every Saturday."

In proposing to write a story for "Our Young Folks," he said he wanted to give the history of a real, natural boy, such as all wide-awake, hearty boys are, everywhere, and asked if he could have the liberty of doing so. He was assured that he could.

"Well," said Mr. Aldrich, "such a story as I have in mind will be an honest one, but do you think it will do to publish?" "Why not?" he was asked. "Because the boy

I am thinking of is not what is called a good boy. He is full of mischief and fond of fun; and, what is worse, perhaps he will fight, if it is necessary for him to fight. On the other hand, he is generous and honest, and won't do a mean thing. And" said he, "I don't think such boys are fully appreciated."

The Editors, bearing in mind the thousands of brave, generous boys who constantly read this Magazine,—boys not impossibly faultless, but who hate meanness as thoroughly as they love fun,—replied, "It is just the story we want."

"Very well," said Mr. Aldrich, "you shall have it on this condition, that you call it 'The Story of a Bad Boy'; for I don't wish any one to read it under false impressions."

So you see, dear young folks, why Tom Bailey is called a bad boy.

We don't wonder that many of our friends have hunted over their maps in vain for Ilvermouth. It would be hardly fair play on our part to tell the reader what town is really meant by Ilvermouth. It may be Lynn, or Portsmouth, or Newburyport,—our correspondent "Edgar" positively declares it is Salem,—but we are not going to settle the question. Every boy or girl who knows anything of our New England coast will see at a glance that Ilvermouth is a faithful picture of a real seaport town, and that must suffice for the present.

The March number of "OUR YOUNG FOLKS," in addition to the "Story of a Bad Boy," has a very interesting article by MR. TROWBRIDGE on Glass-Cutting and Ornamenting; The Physical History of Florida, by MRS. PROFESSOR AGASSIZ, showing how Florida was built by Coral Insects; MR. PARTON'S account of Who First Used the Mariner's Compass; an exceedingly valuable article, How to Talk, by EDWARD EVERETT HALE, pointing out the errors of conversation into which young persons are most likely to fall, and telling in his fascinating way how all may learn to talk well; the ninth packet of the charming William Henry Letters, by MRS. A. M. DIAZ; a spirited declamation, Hannibal at the Altar, by ELIJAH KELLOGG; and other attractive and valuable articles, all copiously illustrated by the best artists.

TERMS: \$2.00 a year, in advance; 3 copies, \$5; 5 copies \$8; 10 copies, \$15; and \$1.50 for each additional copy.

A copy of "OUR YOUNG FOLKS" for the first four months of 1869 will be sent free to any one who wishes to examine the Magazine, on application to the Publishers,

FIELDS, OSGOOD & CO.,

(Successors to Ticknor & Fields,)

124 Tremont Street, Boston.

B. K. BLISS & SON,

Nos. 41 Park Row & 151 Nassau Sts., New York, (Formerly of Springfield, Mass.)

Importers, Growers and Dealers in Garden, Field, and Flower Seeds, Horticultural Implements and Garden Requisites.

World invite the attention of all who are interested in the culture of Flowers and Vegetables, to their large and well-selected assortment of the above, comprising the newest and most approved varieties, both of European and home production, the quality and utility of which cannot be surpassed. For a list of these see their

NEW ILLUSTRATED SEED CATALOGUE, AND GUIDE TO THE FLOWER AND KITCHEN GARDEN.

The Fifteenth Annual Edition, enlarged and improved, contains 132 pages of closely printed matter, beautifully illustrated with 100 Engravings, and a descriptive list of 2,500 varieties of Flowers, Vegetables, and Agricultural Seeds, including all the novelties of the past season, with explicit directions for their culture; also, a list of 125 varieties of French Hybrid Gladioli, embracing many new sorts now offered for the first time in this country—with many other Summer Flowering Bulbs, consisting of *Amaryllis*, *Tuberose*, *Turkey*, *Lily*, etc.; with much other useful information upon the subject of gardening generally. A copy will be mailed to all applicants upon receipt of 25 Cents. Our regular customers supplied without charge.

Bliss' Gardeners' Almanac for 1869

Contains 68 pages of closely printed matter, embracing a Monthly Calendar of operations, and a priced list of the best varieties of Garden, Field, and Flower Seeds, with brief directions for their cultivation. A copy will be mailed to all applicants enclosing a three cent stamp.

Seeds for the Farm & Garden.

Table listing various seeds and plants with prices. Includes items like Beans, Cattle Flower, Celery, Corn, Egg Plant, Lettuce, Parsnip, Peas, Peppers, Radish, Squash, Turnip, etc.

New and Choice Potatoes.

CLIMAX.

The CLIMAX is a seedling of the Early Goodrich, and is thus described by the raiser:

"It has a stout, erect stalk, large leaves; tuber, about medium size, smooth, cylindrical form, swelled out at center; eyes, shallow, but strongly defined; skin, considerably netted or russet, tough, white; flesh, entirely white, solid heavy, brittle, and never hollow; boils through quickly, with no hard core at center, is mealy, of floury whiteness, and of superior table quality. It is equally productive with the Early Rose, but a few days later, earlier than the Early Goodrich, while its keeping qualities are as good as the Peachblows." Price \$3.00 per pound, by mail, post-paid.

BRESEE'S PROLIFIC (or No. 2).

This remarkable variety originated with Albert Breesee, who was also the originator of the justly celebrated Early Rose, both varieties being produced from the same Seed ball of the Garnet Chili.

The vines of Breesee's Prolific are of medium height, quite bushy, somewhat spreading, large leaves. Tubers, large, round in shape, and very smooth, slightly oblong, somewhat flattened. Skin, dull white, inclined to be russeted; eyes, but little depressed and slightly pinkish; flesh, white; cooks quickly, is very mealy, and of excellent quality, yield very large, often exceeding One Hundred fold, matures about three weeks later than the Early Rose, and will prove a most valuable variety for field culture. A silver medal was awarded to this variety at the annual exhibition of the Mass. Hort. Society, last September. Price \$3.00 per pound by mail, post-paid.

EARLY ROSE.

Among the many thousands of our patrons to whom we furnished this valuable Potato last spring, we have yet to hear from the first one who is not fully satisfied with his purchase. The only regret expressed is that they had not procured more. We are daily in receipt of the most flattering testimonials, not only of its earliness and good quality, but of its astonishing productiveness, some of which seem almost fabulous. Several reports of having grown a barrel from a single pound; a yield of one hundred fold is an every-day occurrence. The following well-known gentlemen have given their unqualified approval, and endorse it as the best, most productive, and earliest variety in cultivation: Hon. Marshall P. Wilder, Chas. Downing, Esq., Rev. Henry Ward Beecher, Fearful Burr, Esq., Dr. J. G. Holland, (Timothy Titcomb), and many other prominent agriculturists, horticulturists, and market gardeners. We shall continue to execute cash orders through the month of February at the following prices:

One pound, \$1.00; Three pounds, \$3.00, by mail, post-paid. One peck, (15 lbs.), \$5.00; 1/2 bush, \$8.00; 1 bush, (60 lbs.), \$15.00; 1 bbl., (65 lbs.) \$10.00. Prices to the trade, in larger quantities, will be given upon application. The freight on all packages by express, boat, or railroad, to be paid by the purchaser. No charge for packages or cartage.

Upon receipt of \$5.00 we will mail, post-paid, to any address in the United States or British Provinces, by Express, each of the CLIMAX, BRESEE'S PROLIFIC, and the EARLY ROSE. Orders will be booked in the order in which they are received, and the potatoes forwarded on and after April first, when they will be free from danger of frost. No orders will be accepted unless accompanied with the cash.

In addition to the above, we have a large stock of EARLY SEED, EARLY GARDEN, and EARLY MARKET, such as EARLY WHITE, EARLY HARRISON, &c., &c., which we offer at the lowest market prices.

Our descriptive and illustrated priced list of potatoes mailed to all applicants.

B. K. BLISS & SON, 41 Park Row and 151 Nassau-st., New York. (P. O. Box 5,712.) Formerly of Springfield, Mass.

Collections of Flower Seeds by Mail.

The following collections have been sent out from our establishment for the past 15 years, and are now favorably known in every section of the country. They contain the most showy varieties in our large assortment, with full directions for culture. Each packet contains a mixture of the different colors and varieties of its species, so that a greater display can be made at a much less price than when ordered in separate packets. Those unacquainted with Flowers, as well as the experienced cultivator, may order without fear of disappointment.

- No. 1—contains twenty choice varieties of Annuals, \$1.00
- No. 2—contains twenty choice varieties of Biennials and Perennials, \$1.00
- No. 3—contains ten extra varieties of Annuals and Perennials, embracing many of the new and choicest in cultivation, \$1.00
- No. 4—contains five very choice varieties, selected from Prize Flowers, of English Pansies, German Carnation and Picotee Pinks, Verbeas, Truffant's French Asters, Double Hollyhocks, \$1.00
- Any one remitting \$3.00 will receive the four assortments, postage free.
- No. 5—contains fifteen very select varieties of Green-house Seeds, \$3.00
- No. 6—contains one hundred varieties of Annuals, Biennials and Perennials, including many new and choice varieties, \$5.00
- No. 7—contains fifty varieties of Annuals, Biennials and Perennials, \$2.50
- No. 8—contains twenty varieties of hardy Annuals, Biennials and Perennials, for sowing in Autumn, \$1.00

The seeds contained in the above assortments are of our own selection. Purchasers who prefer to make their selection from the Catalogue will be entitled to a discount proportionate to the quantity ordered.

B. K. BLISS & SON, Box 5,712, 41 Park Row & 151 Nassau-st., New York.

Cabbages Worth Growing.

The following embraces the very best varieties in cultivation for a succession. Mailed to any address upon receipt of price.

	per doz.	4oz.	pound.
Early Wakefield	\$0.75	\$2.50	\$ 8.00
Early York and Large York, each	0.25	0.75	2.50
Early Winningstadt	0.40	1.50	5.00
Large Early Selzwinfurt	0.50	1.50	6.00
Large or Flat Brunswick, (True)	0.75	2.50	8.00
Premium Flat Dutch	0.50	1.50	5.00
Stone Mason	0.40	1.50	5.00
Marched Mammoth	1.00	3.50	12.00
Improved Ann Drumhead	0.50	1.50	5.00
Large Bergen late	0.50	1.50	5.00
Red Dutch for Pickling	0.35	1.25	4.00

A 1-ounce packet of each of the above varieties \$5.50. A common sized packet of the 12 varieties \$1.50.

B. K. BLISS & SON, Box 5,712, New York.

CUCUMBER, GEN. GRANT.

A superior variety, either for forcing or for culture in the open ground. It is perfect in form, solid and crisp, and of a most agreeable flavor. Many specimens were grown the past season averaging thirty inches in length. After a five years' trial, we unhesitatingly pronounce it better than any other variety for forcing.

Packets, containing 10 seeds, 25 cents. Five Packets for \$1.00.

Conover's COLOSSAL ASPARAGUS.

A European variety, introduced several years since, which, by a careful selection of seeds from the most vigorous shoots, has been wonderfully improved, both in size and quality, in point of which it surpasses all other varieties in cultivation. Specimens were exhibited the past season by Mr. Conover, which were grown along side the best "Oyster Bay" varieties, and received the same care and treatment, which attained four times the size of that popular variety. Though but two years from the seed, many of the plants produced from twenty to thirty sprouts, averaging from two to four inches in circumference, and were ready for cutting one year in advance of the ordinary varieties. Packets, containing 1/2 ounce, 50 cents. B. K. BLISS & SON, 41 Park Row, and 151 Nassau St., New York, (P. O. Box, 5,712).

New Tomatoes.

For a complete description of each variety, see February No. of *Agriculturist*.

- KING OF THE TOMATOES**—Remarkable for its great beauty, solidity, and fine flavor; per packet 25 cts.
- GENERAL GRANT**—Brilliant glossy crimson, productive, and of excellent quality; per packet 25 cts.
- CRIMSON CLUSTER**—Grows in clusters of from fifteen to thirty, each cluster weighing from 4 to 6 lbs.; per packet 25 cts.
- ORANGEFIELD PROLIFIC**—An English variety; the earliest of any in the country; immensely productive, of good quality, fine for forcing or pot culture; per packet 25 cts.
- BOSTON MARKET**—An improved variety of the "Large Smooth Red," extensively grown in the vicinity of Boston, where it is esteemed above all others as a market variety; per oz. 75 cts.; per packet 15 cts.

One packet of each of the above varieties \$1.00. Also the following well-known varieties at 10 cts. per packet: *Keyes' Early*, *Cedar Hill*, *Tilden*, *Maupay's*, *Sim's Early Cluster*, *Extra Early York*, *Cooks' Fairrite*, *Mammoth Chihuahua*, *Large Red Smooth*, *Feije*, *Perfected*, *Pear*, *Cherry*, *Strawberry*, etc., etc.

B. K. BLISS & SON, P. O. Box 5,712, New York.

 Third size, do. do. .75 do. 6.00 do. do.

The trade supplied upon the most liberal terms.
 Address **B. K. BLISS & SON, P. O. Box 5,712, New York.**

THE UNRIVALLED PRIZE TOMATO "GENERAL GRANT."

We take great pleasure in announcing to the public that we have secured the entire stock of this justly celebrated Tomato. We believe it the nearest approach to perfection of anything of the kind yet offered, combining more superior qualities. Size above the medium, three to four inches in diameter, growing in clusters; form round, slightly flattened, very regular, symmetrical, and rarely ribbed or wrinkled; color brilliant glossy crimson; flesh unusually firm, solid, and free from water, weighing from ten to twenty pounds more per bushel than other varieties; skin remarkably fine, smooth, and shining, coloring well up to the stem, a quality very desirable to those preparing them for the table; very productive, and of the finest flavor; bears carriage well, and keeps in good condition a long time after being gathered, retaining its goodness, and free from wilting.

We offer the following testimonials from practical parties, - gentlemen whose judgment in such matters is fully reliable. For further testimonials and description, see

Amateur Cultivator's Guide.

From Andrew S. Fuller, Author of Small Fruit Culturist.

We have had an opportunity of testing this tomato the past season, and believe it will prove to be one of the very best varieties in cultivation.

From J. F. C. Hyde, President of Massachusetts Horticultural Society.

I have known the General Grant Tomato now for two years, and last season raised a few tomatoes of this variety. I think it is the smoothest and every way the handsomest sort I have ever seen; it is quite solid, equal in this respect to any other out. I have regarded it as a great acquisition to our list of tomatoes.

From C. M. Brackett, Chairman of the Vegetable Committee, Mass. Horticultural Society.

Gents.—I have given the new tomato General Grant a fair trial of two seasons, in connection with a dozen or more of the new varieties recently introduced, such as the Cook's Favorite, Tilden, Valencia Cluster, Keyes', Eureka, Manray, Foard, Cedar Hill, etc., and find it surpasses them all in earliness, productiveness, and all the qualities which I consider requisite in a first-class market variety; and can heartily recommend it. No person, I think, who makes any of the above-named varieties his standard of excellence, will, after giving this variety one season's trial, grow any other. Its extraordinary beauty and singular richness of color command the attention of the most careless observer. Price per packet 25 cts.; 5 packets, \$1.00, by mail, post-paid. Prices to the trade on application.

AMATEUR CULTIVATOR'S GUIDE TO THE KITCHEN AND FLOWER GARDEN.

The twenty-third edition of this popular and useful work, which has met with so great favor in the past, will be ready Jan. 15, much enlarged and improved, containing descriptive lists of all Flower and Garden Seeds, worthy of cultivation, embracing over twenty-five hundred varieties; to which is added all the novelties in Flowers and Vegetables for 1869; also two hundred varieties of the choicest French Hybrid Gladioli.

The following testimonials are unsolicited by us, and can be multiplied by hundreds:

From Edward S. Rand, Jun., Dalton, Mass., author of "Flowers for the Parlor and Garden."

"Accept many thanks for the beautiful copy of your Annual Catalogue which you so kindly sent me. I find much that is new and rare therein. The arrangement, the concise cultural instructions, copious illustrations, and clear typographical execution, all combine to make it a model catalogue. I shall often have occasion to refer to it. It cannot fail to be of great use and interest to all horticulturists."

From Joseph Hobbins, M. D., Madison, Wis., President Wisconsin State Horticultural Society, and Corresponding Member of the Royal Horticultural Society of England.

"Please accept my thanks for your 'Guide.' I think you ought to call it 'The Garden Companion.' It is at once very useful and conveniently arranged; a sort of ready-reference book, very ornamentally got up; one of these few books I find fitted for any table; often wanted, and always at hand."

From Andrew S. Fuller, Horticultural Editor of "The New York Sun."

"There is no use in denying the fact that Washburn's Catalogue is the handsomest thing of the kind ever got up in this country."

The above work comprises 150 pages. Tastefully bound in cloth, with two beautiful Colored Plates,—one steel,—besides one hundred other Engravings. Price 50 cents, post-paid. Paper Cover, one Colored Plate, one hundred Engravings, post-paid, 25 cents. Address WASHBURN & CO., Horticultural Hall, Boston, Mass.

Worcester or Rielly Potato.

This valuable variety has not been well known until the past season, when Mr. B. HARRINGTON, of Lexington, (who had grown it for a number of years), induced by his high opinion of its value, and the united testimony of all who had ever grown or eaten it, challenged a trial in quality with any seedling, old or new, from any State in the Union. Last September, at the Annual Dinner of the Committee of the Massachusetts Horticultural Society, a trial took place at the Parker House, Boston. There were present many distinguished horticulturists. Among those offered for trial was the Early Rose and several other varieties, considered by their respective friends the best. But it was the unanimous decision that the Worcester was the best table potato offered. It proved to be very mealy, dry, and of the most delicate flavor; free from any earthy taste; fair size; form inclined to roundish; color light pink; flesh very white; skin thin; eyes deep; and of superior baking quality. Another characteristic of this variety is that it will be found dry and mealy when but two-thirds grown.

From Hon. Marshall P. Wilder.

BOSTON, Nov. 20, 1868. DEAR SIR,—Please receive my thanks for the Worcester Seedling Potatoes. As a table-potato, it is certainly of first quality.

From the Editor of the Hartford Times, November, 1868. "We have received the Worcester Seedling Potatoes from you. We found them to be superior to any we have tried for several years; and we have tested about all of the best sorts."

From L. S. Goodale, Editor of the Berkshire Courier, Nov. 12, 1868.

"We tried the quality of the Worcester Seedling with the Rose and many other famous seedlings, and found it so decidedly the best, that nearly all others seemed coarse and earthy, and inferior in delicacy of flavor and fineness of grain,—a little to my disappointment, as I have quite a little stock of Rose in store. A gentleman from New York visiting with me claimed he could tell the Worcester from any other variety by smell. He was blindfolded; and, to my surprise, I found that he invariably could; also others, without confusion."

Four Pounds by mail, post-paid, \$1; One Peck, \$3; One Bushel, \$10; One Barrel, \$30; express to be paid by purchaser. WASHBURN & CO., Horticultural Hall, Boston, Mass.

CROSBY'S EARLY SWEET CORN.

This new variety of Corn is early, sweet, and large. Unlike most early varieties, it averages twelve rows, and well filled. It is taking the place of all others, giving great satisfaction. Our stock grown from the original. Price, per packet, 15 cents. Address WASHBURN & CO., Horticultural Hall, Boston, Mass.

BEAN.

Giant Wax.—Recently introduced, and differing essentially from the old German Wax Bean, being of a more robust growth and more productive. The pods are one and a half to two inches in length, and from three-fourths to one inch in breadth; the beans, when ripe, are of a reddish color. Mr. A. L. FELTON, a highly successful vegetable-grower near Philadelphia, who has grown them for several seasons, estimates the yield at about one-half peck of pods to the pole, of three plants. The pods, when fit for use, are of a clear, waxy color, perfectly stringless, and when cooked are as tender as marrow, and truly delicious. Price per packet, post-paid, 25 cents.

PEAS.

LAXTON'S PROLIFIC EARLY LONG POD. This valuable variety was raised by T. Laxton, of Stamford, Eng. Some pods (in a green state) were exhibited at Mark Lane, last June, averaging eleven and twelve peas in a pod; and they were pronounced by several eminent members of the London seed trade to be an exceedingly fine variety. For a second early pea, there is no pea of a similar class in cultivation to equal it; and we feel very confident that it will be in general cultivation in a very few years. The pea has the same habit and character as Dickson's Favorite, excepting that the pods are nearly double the size. Price, post-paid, per pkt. containing 1/2 pint, 50 cts.; per qt., \$1.50. WASHBURN & CO., Horticultural Hall, Boston, Mass.

Bates's Early Bronze Field Corn.

Mr. C. BATES of Kingston, Mass., has spent twenty years of labor and care in producing this valuable variety of corn, obtaining the following results: It is a cross between the Whitman or Smutt's White and Early Canada. A rapid-growing and early-maturing corn, of low growth, small stalk, throwing its strength into the ears; ears growing very near the ground; cob small; corn large and well filled; color bronze, or a blending of yellow and white with a slight trace of red; very productive, yielding large crops even on poor soil; harvest averaging, from root to top, six spines from four to five feet long. This corn is highly recommended for all latitudes, particularly Northern, on account of the above-mentioned qualities,—early maturity, large yield of grain, and small amount of stalk. The favorable reports, together with the good impressions received on visiting Mr. Bates's corn-crib, have induced us to secure the entire stock, and we now offer it, in large or small quantities, at the following prices:

One Quart, by mail, post-paid \$1.

One Bushel, \$12; Five Bushels, \$50.

WASHBURN & CO., Horticultural Hall, Boston, Mass.

Vines and Plants free of charge for packing or carrying. See last page of Cover.

FRESH AND GENUINE GARDEN AND FLOWER SEEDS.

FERRE, BATCHELDER & Co.,

231 Main St., Springfield, Mass.

Importers and Growers of Garden, Field and Flower Seeds, and Dealers in Agricultural and Horticultural Implements, Fertilizers, etc., etc.

The attention of the public is invited to our large and superior assortment of the above, a list of which see our ILLUSTRATED CATALOGUE AND VEGETABLE AND FLOWER GARDEN MANUAL, which contains about 100 pages with numerous illustrations, and a descriptive list of all the valuable varieties of FLOWER AND VEGETABLE SEEDS OF AMERICAN GROWTH, together with many varieties and novelties obtained from the most reliable ENGLISH and CONTINENTAL DEALERS and GROWERS, with special directions for their cultivation,—also a list of many SUMMER FLOWERING BULBS, SMALL FRUITS, ETC., with many other valuable hints for cultivators. A copy will be mailed to all applicants enclosing 10 cents, which is not one-half the cost. Our ILLUSTRATED PLANT CATALOGUE will be published March 1st, and will be mailed upon receipt of 5 cents.

Address FERRE, BATCHELDER & CO., 231 Main-st., Springfield, Massachusetts.

NEW CROP ONION SEED.

Table listing onion seed varieties: LARGE RED WETHERSFIELD, YELLOW DANVERS, EARLY RED, WHITE PORTUGAL. Prices per oz. and per lb. are listed.

Collections of Garden Seeds for a Large or Small Garden.

In order to introduce our vegetable seeds as extensively as possible, and make it an object for every person who cultivates a vegetable garden to test their merits, we shall continue our very liberal inducements to purchasers. The following collections are put up in the most liberal manner, and contain choice seeds of the most and most useful sorts. Collection No. 1 contains 20 varieties, No. 2 " " " 40 " " " 200

The above are prepared for sending by mail, and will be sent post-paid. The following large collections can be sent by express—which we will deliver free of express charges. No. 3, \$5. No. 4, \$8. No. 5, \$15. No. 6, \$30. No. 7, \$37. For a list of the varieties, etc., in the above, see our Catalogue. Address FERRE, BATCHELDER & CO., 231 Main St., Springfield, Mass.

Flower Seeds in Collections.

These collections are all our own selection, and we take especial pains that they shall be highly valuable, and every way worthy of perfect confidence. Persons desiring to make their own selections from the general list will be entitled to a discount proportionate to the quantity ordered.

- List of flower seed collections: No. 1.—Contains Twenty varieties of choice Annuals... \$1.00 No. 2.—Twenty varieties of choice Biennials and Perennials... 1.00 No. 3.—Ten extra fine varieties of rare Annuals and Perennials... 1.00 No. 4.—Five choice varieties from PRIZE FLOWERS, of Truffaut's French Aspers, German, Carnation, and Prussian Pinks, English Pinks, Verbenas, and Hollyhocks... 1.00 No. 5.—Fifty varieties (including collection No. 4) Annuals, Biennials and Perennials... \$2.50 No. 6.—One hundred varieties Annuals, Biennials, and Perennials, including many of the best in cultivation... 5.00 No. 7.—Contains fifteen choice varieties of Green-house seeds... 5.00 Address FERRE, BATCHELDER & CO., 231 Main St., Springfield, Mass.

THE PREMIUM SANFORD CORN,

Early Rose, Harison, Early Goodrich Potatoes, and the Norway Oats.

This is a good opportunity for those who prefer to procure their seed direct from the grower and at low rates. I warrant my stock to be the TRUE and GENUINE.

EVERY FARMER

should send for my Descriptive Circular, giving History of the SANFORD CORN, with testimonials from those who have tested it the past season. Wherever grown it has met with universal favor, and

The East and West, the North and South endorse it as being the best field corn. It ripens early and yields more with same culture, than any other variety. Testimonials can be furnished from different States, where it is reported to have yielded at the rate of 150 to 200 bushels per acre with ordinary cultivation.

My prices for the EARLY ROSE and other choice seed potatoes, by bushel or barrel, are low and within reach of all. THE THREE NORWAY OATS seed obtained from H. C. Pease, agent for Mr. Randsell, \$3 per bushel, five bushels and upwards, \$7 per bushel.

Upon receipt of \$1 I will forward to any address one pound Early Rose and choice of one pint Norway Oats or Sanford Corn.

Circulars with Price List sent FREE. Address S. B. FANNING, Jamesport, Long Island, N. Y.

600 Barrels Harison Potatoes, for sale at \$4.50 per barrel. Early Rose, Early Goodrich, Vandever and other choice Seed Potatoes at low rates. Descriptive Circulars with price lists sent FREE. Address S. B. FANNING, Jamesport, Long Island, N. Y.

GLADIOLUS.

We would call the attention of all cultivators of this beautiful Flower to our fine collection, which includes all the new varieties. See "AMATEUR CULTIVATOR'S GUIDE." Mailed free for 25 cts. WASHBURN & CO., Horticultural Hall, Boston, Mass.

"GUANO" No. 1 PERUVIAN.

Sardy's "Soluble Phospho-Peruvian." Do. "Ammoniated Soluble Pacific." Also, Ground Carolina Phosphate and Land Plaster. The use of the above Soluble Phospho-Peruvian and Ammoniated Soluble Pacific Guanos, is particularly recommended, they being compounds of the richest Pacific Phosphate Guanos, rendered soluble; the former containing 20 per cent of Peruvian Guano, and the latter highly ammoniated with animal matter—making the most concentrated and profitable fertilizers in use for Cotton, Corn, Wheat, Tobacco, and all other crops. For prices and full particulars send for pamphlet. For sale in Bags and Barrels, in quantities to suit, by JOHN B. SARDY, 88 Wall-st., New York. P. O. Box 5,883. "Feed your Land and it will Feed You."

Missouri Lands for Sale.

Missouri Lands are very fertile, and situated in the heart of the Union; they furnish an extraordinary opportunity for the people of the Northern States to acquire cheap, healthful, and productive farms. This can never occur again so near the centre of population.

North Missouri contains about 25,000 square miles, or sixteen million acres, as desirable as any in the valley of the Mississippi. Through this garden of Missouri the Hannibal and St. Joseph Railroad extends, and all its lands lie near its track and numerous depots. The climate, so temperate and healthful, and a virgin soil so capable of producing almost every kind of vegetation, invite emigrants from the cold and bleak North to settle on our rich prairies.

All are invited! Let the industrious and enterprising, rich and poor, come and prosper. They should come at once and preoccupy this splendid country.

Circulars, giving full and valuable particulars in English and German, are supplied gratis to all wishing to come themselves, or to circulate to induce others to come also.

A Sectional Map, showing the exact location of all our Railroad Lands, is sold at thirty cents. Address GEO. S. HARRIS, Land Commissioner Hannibal & St. Joseph R. R. Co., HANNIBAL, Mo.

HEXAMER'S PRONG-HOE.

The best Hand-cultivator ever invented. It saves half the labor of hoeing, and does the work better than any other tool. Every Farmer and Gardener should have it. Circulars sent on application. Price \$1.50, cash with the order. Address REISIG & HEXAMER, New Castle, Westchester Co., N. Y.

Knox's Nursery at Your Door. See last page of Cover.

THE MASON & HAMLIN ORGANS,

THE ACKNOWLEDGED STANDARD OF EXCELLENCE

Among Instruments of the class,

At Prices of Inferior Work.

New Inventions, New Styles, Greatly Reduced Prices; Lowest Prices printed and alike to all; New Illustrated Catalogue.

The MASON & HAMLIN ORGAN CO., winners of the Paris Exposition Medal, and seventy-five other highest premiums for superiority, respectfully announce:

1. The introduction in several styles of their organs of a new invention which is likely to prove the most popular improvement ever introduced in instruments of this class.

2. The introduction of new styles of organs, with important improvements, including new and elegant designs in cases.

3. A Material Reduction in Prices, and rigid adherence to the policy of printing their lowest prices, which are therefore alike to all, and subject to no discount.

The Company's perfected machinery and accumulated facilities enable them to offer their well-known organs at prices as low or even less than those demanded for inferior work.

The Percheron Stallion Imported from France, NAPOLEON BONAPARTE,

Will make the ensuing season, from April 1st to July 1st, at the Six-Mile House, Natural Bridge Road, 3 miles west of Fair Grounds, St. Louis Co., Mo., at \$25 the season, payable at time of service.

This horse is a beautiful dappled grey, 6 years old, 17 hands high, weighs 1,670 lbs., is of remarkably fine action, and trots very fast. This breed of horses is peculiarly adapted to the uses of the farmer, possessing extreme docility, great strength, fine action, beautiful carriage, durable color, and remarkable speed, combined with wonderful endurance, as shown from the following extracts of Mons. du Hays, of France.

A grey mare, 7 years old, attached to a tilbury or gig, and over a mountainous and difficult road, trotted 58 miles in 4 hours, 1m, and 35 seconds, returning following day, same route, in 4 hours, 1m, 30 seconds; doing the last 3 1/2 miles in one hour. Vailhante trotted 15-6lbs miles in 43m, or his mile in 23:14. The average time of 31 horses at 1 mile was 3:38. Good pasturage provided at \$1.00 per week. Grain \$4.00 per week. Accidents and escapes at owner's risk. For further particulars, apply to FITZ KRAUT, 6-Mile House.

T. C. MAXWELL & BROTHERS, Geneva, Ontario Co., N. Y., offer a large assortment of

Standard and Dwarf Fruit Trees, of the best quality. Small Fruits.—Grape Vines, Currants, Gooseberries, Blackberries, Raspberries, Strawberries, &c. Ornamental Trees and Shrubs.—Evergreen and Deciduous. Roses.—Hybrid Perpetual, Climbing, &c., a large stock of the best sorts on their own roots, and budded. Gladiolus, named and unnamed, very cheap. Stocks for Nurserymen, Small Evergreens, Green-House and Bedding Plants. Send for Catalogues.

HOVEY & CO'S ILLUSTRATED GUIDE

B. M. WATSON, Old Colony Nurseries and Seed Establishment.
Plymouth, Mass.
Established 1842.

GIANT WAX BEAN.

We offer a fine supply of this excellent Bean of recent introduction. The Editor of the *American Agriculturist* speaks of it as follows:

"Pods 6 to 9 inches long, thick and fleshy, of a pale, yellow color and waxy appearance; the seeds are red. The peculiarity about this variety is, that its pods, even when full-grown, are perfectly tender, and may be used as Snap Beans. We have tried them, both separately and in succotash, and consider them really delicious. The variety is a pole or running Bean; its origin is unknown, but wherever it comes from, we welcome it as a valuable addition to our list of varieties."

Fearing Burr, Esq., author of the "Vegetables of America" also speaks in the highest praise of it. For his opinion we refer to our **Illustrated, Descriptive Seed Catalogue for 1869**, containing full descriptions of all the choicest novelties, which we mail to any address on receipt of ten cents. Price of Giant Wax Bean, by mail, postage paid, 35 cents per packet, 85 cents per pint.

EDWARD J. EVANS & CO.,
Nurserymen and Seedsmen, York, Pa.

Pear Seeds and all Fruit and Tree, FLOWER AND GARDEN SEEDS, by the paper, oz., lb., or cwt. Seeds on Commission. Trade List and General Catalogue to any address gratis, ready. **B. M. WATSON,** Plymouth, Mass.

CONOVER'S COLOSSAL ASPARAGUS.

An entirely new variety of Asparagus. Imported and fully tested the past six years. Sending up from 15 to 40 sprouts from each root, from 1/2 to 1 1/4 inches in diameter, at two years from the seed; about four times the size of the best known varieties now in use. The sprout is solid, tender, and of a deep green color, with a small, close, compact flower, one-half oz., fifty cents; one oz., \$1.00, and \$10.00 per pound. Also, Seed Potatoes of all the well-known varieties for sale.

S. B. CONOVER,
260 & 261 West Washington Market,
Foot Fulton-st., New York.

DAMSDELL'S NORWAY OATS.

A. S. Fuller, Esq., in a late letter to the editor of the *Rochester Farmer*, states that he never pronounced the Norway Oats a bungus, as was reported in the *New York papers*. On the contrary he says: "If they will produce five bushels to the acre more than our other kinds, they are worth more than \$10 per bushel." Mr. S. A. Joslyn, of Miller Co., Mo., writes, Jan. 2, 1870: "I raised last season 5 1/2 bushels from one pint, and 60 bushels from half a bushel of seed, both inferior crops on account of the drought."

G. F. Smith, a Vermont farmer, stated before the *New York Farmers' Club*, Jan. 19, 1869, that he raised 120 bushels from one peck of seed on 100 square rods of ground. We have evidence now before us which proves that many hundred bushels of inferior seed have already been sold for Norway Oats. We again caution farmers against these imposters, and will not hold ourselves responsible for any seed which has not passed through our hands. Our full illustrated circular is furnished free to all who desire it. Our seed is fully warranted and furnished at \$10 per bushel, \$6 per half bushel, \$4 per peck, or \$1.35 per quart, by mail, post-paid. Sold by the standard of 32 pounds to the bushel.

Address **JONES & CLARK,**

MELONS.

The melon grows to perfection in the sandy soil about Terre Haute, thousands being shipped north every year. I have good seed of the following kinds, grown and saved for me. Sent post-paid:

Thiney's Early Watermelon, very early and good; per oz. 5c.; per pkt. 15c.; *Persian* (Bayard Taylor's) large, good to ship, lb. \$3; oz. 30c.; pkt. 15c.; *Russian American*, cross between Persian and M. Sweet, oz. 50c.; pkt. 15c.; *Mountain Sweet*, the standard variety, lb. \$1.25; oz. 15c.; pkt. 10c., and a dozen other varieties of Water and Muskmelons. See Catalogue, *Field Corn and Table Corn*. Kentucky White, Tennessee (Flint) white, Houny (Flint) Corn, all perfectly matured and carefully selected seed. Also Crosby's Early Sweet, Evergreen, Forty Days, and other kinds. Manpay's Superior Tomato, the best variety in cultivation. Superior seed of Early Cabbage, Lettuce, and Long Green Cucumber. All the standard seeds, potatoes, bulbs, &c., new and old kinds. Catalogue sent free of charge.

J. A. FOOTE, Seedsmen, 65 Main St., Terre Haute, Ind.

Bouquet Dahlia Little Herman.

Without exception the finest Bouquet Dahlia in cultivation; its color is a beautiful cerise pink tipped with white, often darkening toward the white, small, close, compact flower, of the most perfect form, never showing a centre, and often producing three or four different colored flowers upon the same plant. It is a vigorous grower, very profuse of flower, commencing early in the season, and will flower finely in a large vase or tub, and will be found very useful in forming bouquets, baskets, and vases of cut flowers. No gardener should be without this little gem. Strong plants, by mail, 50 cts. each. Also, *LYGOMIA PALMATUM*, a beautiful, hardy, climbing Fern, superb, if cut when green and pressed, for decorating picture frames, mantle ornaments, and the like. Plants 50 cts. each, 3 plants 75 cts., per doz. \$3. *FUCHSIA-VAINOTER DE PUEBLA*, the best double White Fuchsia, very free and fine, plants 30 cts. each. The above plants by mail, post-paid, \$1.50.

Descriptive Catalogue of Verbenas, Dahlias, Geraniums, etc., now ready, and provided to all applicants enclosing one red stamp. Address **DEXTER SNOW,** Chicopee, Mass.

Flower Seeds. Flower Seeds.

BY MAIL, POST-PAID OR OTHERWISE.

The subscriber has for many years past spared no pains or expense in procuring, both in Europe and this country, every variety of *Annual Flower Seed* that could be obtained, and after cultivating over one thousand varieties, has selected one hundred kinds with a view of including all the most desirable for hardy garden cultivation, a list of which will be sent to any one. And for \$1 Thirty-three kinds of any on the list will be sent by mail, postage paid.

G. R. GARRETTSON, Flushing, Long Island, N. Y.

Gregory's Seed Catalogue.

On my three seed Farms in Marblehead, Mass., where I have over fifty acres in seed, I have raised this season nine varieties of Cabbage seed; six of Beet seed; four of Carrot; ten of Turnip; twenty of Tomatoes; seven of Corn; five of Onions; eleven of Beans; six of Manzel Wurzel; and seven of Squashes.—Besides seed of numerous other vegetables,—all of which were grown perfectly.—I offer the opportunity to Market Gardeners and others who desire to procure as large a proportion of these seed as possible directly from the grower. Catalogues gratis to all.

JAMES J. H. GREGORY, Marblehead, Mass.

My Three Warrants!

1st.—I insure all the seed I send out to be as represented.
2d.—I insure all seed ordered shall reach my customers.
3d.—I insure all moneys sent to my address (sums of \$5 and upwards taken in P. O. Orders, or Cashiers' Checks), will reach me. No fair man can ask more than this. Catalogues gratis to all.

JAMES J. H. GREGORY, Marblehead, Mass.

The "BOSTON PRIZE TOMATO"

is a very decided improvement on the "Boston Market." The fruit is large, firm and solid, as early as the earliest, and for productiveness it cannot be surpassed. One gardener says: "I grew every variety of Tomato last season, but none excelled the Boston Prize." Another: "It is the most productive Tomato I have ever grown, will always command a high price and ready sale." Per paper, 15 cts.; per oz., 75 cts., postage paid.

CUTTIS & COBE,
348 Washington St., Boston.

Farmers' Club Sweet Corn.

Highly recommended by Solon Robinson, Thos. Meehan, Levi Bartlett, Mr. C. Weld, Donald G. Mitchell, and Chas. L. Flint. (Send stamp for Circular.) Sold in my own envelopes only. Seed for 50 hills, 50 cts.; 4 packages \$2. Free by mail.

JAS. B. OLCOTT, Buckland, Conn.

Fotler's Improved Branswick.

There is no hard-heading Drumhead Cabbage as early as Fotler's, none more reliable for heading, or that heads up with greater uniformity. In size it is the very largest, the Marblehead Mammoth only excepted. Seed of my own raising from Mr. Fotler's stock, per package, 25 cts.; per oz., \$1.00. My garden seed Catalogue, containing the best standard varieties, many new and rare kinds, sent gratis to all. All seed insured to reach the purchaser.

JAMES J. H. GREGORY, Marblehead, Mass.

Garden Seeds, Asparagus Roots, etc.

A new Retail Catalogue with reduced prices will be sent to all who apply for it. Asparagus roots of good quality, two years old, at 75 cents per 100, or \$4 per 1,000.

G. R. GARRETTSON,
Flushing, Long Island, N. Y.

New and Rare Vegetables.

Having been the original introducer of the Hubbard Squash, Marblehead Mammoth Cabbage, and many other new things, I still continue to make the raising of the seed of new and rare vegetables a specialty, in addition to the standard kinds. Catalogues gratis to all.

JAMES J. H. GREGORY, Marblehead, Mass.

L. D. SCOTT & CO., Huron, O.

Look out for HUMBLED ROSE.

As there are potatoes selling that are not genuine you would better buy from GEO. A. DEITZ, Chambersburgh, Pa., who has the largest list of genuine Early Rose in the country, furnished by Messrs. Elms, Conover, and D. S. Jefferson.

Four Acres of Early Rose!

I raised last season between four and five acres of this new potato, obtaining my seed directly from the original growers in Vermont. I found that it grew to a large size, was remarkably productive, and of excellent quality.

Excelsior, per lb. by mail, \$1.00. Philbrick's Early White, " do, by mail, \$2.00. Western Chief, " do, " per bush. per bbl. \$5.50

Goodrich's Seedling Potatoes, Early Goodrich & Gleason, per peck 75 cts.; per bush. \$1.75; per bbl. \$1.50.

Goodrich's Seedling Potatoes, Early Goodrich & Gleason, per peck 75 cts.; per bush. \$1.75; per bbl. \$1.50. Harison, per peck, 85 cts.; per bush, \$2; per bbl. \$3.

POTATOES. POTATOES.

Early Rose, Early Goodrich, Early White Sprout, Early White Mountain, Harison, Shaker's Fancy, Flemish Beauty, &c. &c.

We offer our Stock at Low Market Rates, and invite all Dealers, Planters, and the Trade, to call and examine, or write for Catalogue and particulars.

Harison Potatoes, Cotswold Sheep, Chester Pigs, Bronze Turkeys, Pea Fowl, Siberian Bantams, Muscovy and Rouen Ducks, Guinea, Brahma, Java and other Fowls, cheap.

WHITE CHILI POTATO,

The best for main crop at the South, is large, nearly round, white flesh and skin, cooks very neatly. It yields enormous and grows most admirably; the top stands perfectly erect all summer and is very lushy.

Seed Potatoes for Sale.

Harison, Gleason, Cuzco, Early Goodrich, and Early Sebce. By the peck, bushel, or barrel. A limited supply of Early Rose by the pound only. Prices made known on application.

Instructions for Planting and Management of Small Fruits. See last page of Cover.

EARLY ROSE POTATO.

Our stock of Early Rose is without a superior in the country. It is grown in Vermont, is of uniform size, and is first-class in every respect.

The merits of this celebrated variety are now so well known, and the profits of its culture so great, that we confidently affirm that no other agricultural investment will give such liberal and quick returns.

How shall we Paint our Houses?

READY MADE COLORS FOR PAINTING EXTERIORS OF COUNTRY AND CITY HOUSES.

These Paints require only to be thinned with Raw Linseed Oil to make them ready for use. The list includes forty shades and tints, comprising all the colors suitable for exterior painting. In durability and permanency of color they will be found superior in every respect to pure White Lead, while they cost (considering the quantity required) only about half as much.

Sample Cards, with a descriptive pamphlet, sent free by mail. Be sure you get the genuine "RAILROAD" Colors, every package of which bears our full name, in addition to our copy-righted title, "Railroad Paints and Railroad Colors." None are reliable which do not bear these marks.

We would call attention also to our Warranted Perfectly Pure Combination White Lead, which for economy and durability is the best in market. For sale by all Paint Dealers throughout the country, or MASURY & WHITON, 111 Fulton Street, New York.

Proprietors of the Globe White Lead and Color Works, Manufacturers of White Lead, Zinc and Painters' Fine Colors.

N. B.—"How Shall we Paint?" A popular treatise on the art of House Painting, &c., by John W. Masury. Cloth, 215 pages. \$1.50. Also, Hints on House Painting. Cloth, 84 pages. 10 cts. Either of the above sent free by mail on receipt of price.

KNIFE GRINDER for Mowing Machines.—Sanford's Patent. It is light, and can be taken to the field for use. A boy can grind the knives accurately in 15 minutes, without injury to the knife, and with safety. It is a labor-saver. Price \$10.50. Send for Circular. Address JOHN W. QUINCY, 93 William-st., New York City. Rights for sale.

THE FARMERS' FAVORITE!

GREATLY IMPROVED.

BICKFORD & HUFFMAN'S

WORLD-RENOUNDED PREMIUM

GRAIN DRILL,

With the Improved Guano Attachment & Grass Seed Sower.

A CONTINUOUS GRAIN DISTRIBUTOR!

The Desideratum of Seeders! Perfect in Mechanical Construction! Perfect in its Performance of Work!

Sowing all grains, from the coarsest Marrowfat Peas to the finest keraled, with accuracy. Thistle balls and dirt do not clog it. Sending an even continuous stream through each tube, performing equally well up hill or down side hill or level. No Bunching of Grain! No Liability to Get Out of Order or Broken! Built as a plain Grain Drill or with Compost or Seed Attachment. For one of these incomparable Machines, address

W. L. BUCKINGHAM, General Agent, 50 1/2 South Charles-st., Baltimore, Md.

THE HARPER & PARTRIDGE CORN PLANTER.

Saves one hand in planting; a boy can use it; fits any hoe handle; counts and drops the grains exactly where wanted; weighs seven ounces; an extra metallic wheel, Harper's Improvement, with each planter. Sold at retail prices as follows: No. 1, \$1. No. 2, \$1.25, by the dozen, \$7 and \$8. Extra wheels \$1.50 per dozen. County licenses on reasonable terms. Address

F. W. STRICKLAND, No. 206 Pearl St., New York.

PAINTS for FARMERS and others.

The Grafton Mineral Paint Co. are now manufacturing the Best, Cheapest and most Durable Paint in use; two coats well put on, mixed with pure Linseed Oil, will last 10 or 15 years; it is of a light brown or beautiful chocolate color, and can be changed to green, lead, stone, drab, olive or cream, to suit the taste of the consumer. It is valuable for Houses, Barns, Fences, Carriage and Car-makers' Pails and Wooden ware, Agricultural Implements, Canal Boats, Vessels and Ships' Bottoms, Canvas, Metal and Shingle Roofs, (it being Fire and Water-proof) Floor Oil Cloths, (one Manufacturer having used 5,000 blis. the past year) and as a paint for any purpose is unsurpassed for body, durability, elasticity, and adhesiveness. Price \$6 per hbl. of 300 lbs., which will supply a farmer for years to come. Warranted in all cases as above. Send for a circular which gives full particulars. None genuine unless branded in a trade mark, Grafton Mineral Paint. Persons can order the Paint and remit the money on receipt of the goods. Address DANIEL BIDWELL, 251 Pearl Street, New York.

CHEAP LAWN MOWER.

Cutting 14 inches. Weighing only 60 pounds. PRICE \$30. R. H. ALLEN & CO., P. O. Box, 316, New York.

ANY MAN, young or old, in City, Town, or Country, can have genteel, profitable, and pleasant employment (New Blind Fixture). Send stamp for illustrated Circular. Box 450, New Haven, Conn.

The Phifer "SKELETON" Wheel Gang Plow and Cultivator

for Corn, Cotton, and Potatoes, for the season of 1869 is constructed under an entirely new patent. (June 16, 1868). The 4 cast-iron Hangers (of the former patents) are substituted by a single wrought-iron Rock-shaft. The draught is directly from the beams of the plows, and consequently no neck draught on the horses. It is much more simple and efficient than our previous manufacture.

The "Phifer Plow" was awarded:
The Gold Medal, at the Utica International Plow Trial, September, 1867.
Silver Medal, (Highest award) at the Maryland Institute, October, 1867.

First Premium, at the Mechanics and Agricultural Association, New Orleans, La., January, 1868, after the severest tests and most determined opposition. For Agencies and single machines address the proprietors and manufacturers.

A. L. BREARLEY & CO.,
Eureka Agricultural Works. Office No. 115 Perry St.,
Trenton, N. J.

Coates Lock Lever Hay Rake

has no equal for ease of discharge, holds itself to the ground, can be worked by a boy. TRY IT.

Seed Drills—Threshing Machines, Feed Cutters, all approved kinds and warranted.

Morton's Hay Press is portable; three men will bale one ton an hour. Can be worked by one man.

Blake's Endless Plank Horse-Power will do more work than any other power in use.

Wood Splitters, DRAG and CIRCULAR SAWING ATTACHMENTS. For Circular and Agency apply to **SHAW & WELLS, Buffalo, N. Y.**

Winchester Repeating Rifles.

FIRING TWO SHOTS A SECOND AS A REPEATER, AND TWENTY SHOTS A MINUTE AS A SINGLE BREACH LOADER.

These powerful, accurate, and wonderfully effective weapons, carrying eighteen charges, which can be fired in nine seconds, are now ready for the market, and are for sale by all the responsible Gun Dealers throughout the country. For full information send for Circulars and Pamphlets to the **WINCHESTER REPEATING ARMS CO., New Haven, Conn.**

BETT'S DOUBLE MOLD BRANCH BEAM BILLING PLOW cultivates corn and potatoes, without hand hoeing. The only Double Mold Plow that runs steady and doesn't clog.

Send for Illustrated Circular to **PEEKSKILL PLOW WORKS, Peekskill, N. Y., or Cleveland, O.**
Also, *Shaw's Counter Harrow, Hutchinson's Pat. Cider Mill, Deep Working Plows, Copper Strip Feed Cutter, Gale's Vegetable Cutter.*

FLAX BRAKES,

That break 2,000 to 3,000 lbs. Flax Straw in ten hours, and take out 65 per cent of woody matter. A man and boy, with one to two horses, can work them. Will break both tangled and straight straw, and save 120 lbs. to the ton more than any other machine, while it does the work better. No danger to life or limb. They weigh about 1,400 lbs., occupy about five feet square, and as now made are strong and durable. Sold all ready to put the belt on pulley and start them. Hundreds are in use, and are admitted to be the best machine to break flax. Flax and tow now bring high prices, with increasing consumption. Send for circular to **JOHN W. ORIN & CO., 98 William St., New York City,** Treasurer and Agent of the Malloy & Sandford Flax Machine Co.
The best instructions for raising flax are contained in a "Manual of Flax Culture," published by Orange Judd & Co., 24 Broadway, New York.

GARDEN TOOLS, RAKES, HOES, CHILDREN'S SETS, and House Furnishing Goods.—Great Labor-saving Machine for the Million.

LYMAN'S NEW PATENT WEED ANNIHILATOR.—By actual test the most practical, cheap and reliable Weed Destroyer known, combining strength, durability, great ease in working, doing the work of two or more tools of the ordinary old styles now in use, with much greater ease and rapidity, cutting from 3 to 10 inches in width, with steel tempered adjustable blades.

Depot, 30 Barclay St., N. Y. Manufactured only by **A. E. LYMAN & SON, Northampton, Mass.**

GOLD SEAL Flavoring Extracts, Maple Baking Powders and I. X. L. Liquid Blueing. **W. E. JOHNSON,** Office and Manufactory, 176 Centre St., New York.

The Most Perfect and Successful Harvester in the World.

In eleven years the sale of the BUCKEYE has increased from 75 Machines to 20,000, in a single season, and over 100,000 are now in use in the United States.

It has received the Highest Premiums at the most important Field Trials ever held in any country.

Its Great Durability has been thoroughly Established, and it is everywhere known and recognized as the

Standard of Excellence in Material and Workmanship, as well as Perfection of Principle.

Valuable improvements added for 1869.

Manufactured by **ADRIANCE, PLATT & CO.,**
N.Y.—Poughkeepsie, N. Y. 165 Greenwich-st., N. Y.

STEPHEN W. SMITH,
90 William-street, New York.

GREAT TRIUMPH OF AMERICAN INDUSTRY.

SHEEP SHEARS

Patented November 22, 1864; September 30, 1866; and July 21, 1868.

MANUFACTURED BY **Henry Seymour & Co.,**

52 Beekman Street, N. Y.,

AWARDED

TWELVE First Premiums at

Twelve Different State Fairs, October and November, 1868. Only

Medal and Diploma at American

Institute Fair, October 26, 1867.

"Valuable & Well-made Implements."

HORACE GREELEY, Pres't.

HON. H. S. RANDALL,

President New York Wool Growers' Association, and Author of Sheep Husbandry, says in Rural New Yorker:

"We much like the Sheep Shears made by **HENRY SEYMOUR & CO.** They possess the superior advantage of being made from one piece of metal, which gives them solid springs. The stops are tempered so they cannot wear away and let the blades slip. Among their varieties we entirely prefer for fine wool sheep, Strong's Patent Thumb-piece Shears. The Thumb-piece gives better facilities for clipping the legs, heads, etc., of any kind of sheep. I also use their Toe Nippers. No. 3 is most used. I have tested the articles, and such is my verdict."

Woolen Remnants AT FACTORY PRICES.

Send Samples and prices sent free. Address **PAUL,** the Remnant man, Providence, R. I.

Knox's Nursery at Your Door. See last page of Cover.

PATENT COMBINED Bag Holder and TRUCK.

This implement is used to hold and convey bags. The Holder, B, is attached to the truck frame A; slides on the frame, and can be moved to any position to suit any length of bag. The Holder, B, Locks itself to the truck frame at any desired point, and can be instantly moved to any part of the frame. Simple, cheap, not liable to get out of order, does the work perfectly, saves one hand, and does not prevent the truck being used to wheel barrels or boxes as the bag-holder can be instantly removed from the truck. A very desirable article for millers and farmers.

Price of Bag-Holder & Truck combined, only \$3.

Also for sale, at whole sale and retail, *Doty's Clothes Washer, Universal Wringer, Hand or Power Corn Shellers* (best in market), *The Universal Iron Hand, all sizes Trucks, Richardson's Six-Shovel Sulky Corn Cultivator, Hand and Power Punching and Shearing Machinery.*

EVERYBODY send for our free Circular. DEALERS send for our Wholesale Terms.

equal to the best superphosphate, at the low price of \$35.00 per ton on board, in New York. They also make superior articles of NITRO-PHOSPHATE and PURE BONE-UST.

WE ASK ATTENTION TO THE FOLLOWING TESTIMONIALS.

Prof. Geo. H. Cook, of the New Jersey Agricultural College of New Brunswick, says: "The Double Refined Poudrette and Nitro-phosphate of Lime, paid us full 100 per cent above their market value, in the increase of crops this year."

Michael Moore, Trenton Falls, Oneida Co., N. Y., says: "With the Poudrette, I have always had a fine crop of Onions; without it a miserable failure."

For all root crops and green-house plants I consider it invaluable."
 C. G. Starkweather & Sons, Rochester, N. Y., (seed growers) say of the Double Refined Poudrette: "For growing Onions it can't be beat. On Corn, used one and a half bush, to the acre without any other manure; you would be surprised to see the difference where we skipped a row or two; it added one-fourth to the crop, and matured much earlier; also the same on Potatoes. It is worth its cost as a preventive of the wire-worm."

Horace Valentine, Cambridge, Washington Co., N. Y., says: "Where used, it gave one-half more Corn and Potatoes."

C. O. Brundage, South Sodus, says: "I think it added nearly one-half more to the yield of my corn crop."

Wilson N. Pace, Chateaugua, Westchester Co., says: "I used the different kinds of superphosphates along side of your Double Refined Poudrette. The crop where the Poudrette was used was fully equal to the other at half the cost."

IMPORTANT ANNOUNCEMENT.
 VALUABLE ADDITION TO
Gray's Botanical Text-Books.
 By ASA GRAY, M. D.,
 Fisher Prof. of Natural Science in Harvard University.

The *Teacher*, the *Student*, and the *Botanist*, will hail with delight the appearance of this new and valuable CLASS-BOOK, just added to this popular Series, namely:

SCHOOL & FIELD BOOK OF BOTANY.

—This consists of the "LESSONS IN BOTANY" and the "FIELD, FOREST AND GARDEN BOTANY," bound together in one compact volume, forming a comprehensive *School Botany*. This will be the most generally used class-book of the whole Series, adapted to beginners and advanced classes, to Agricultural Colleges and Schools, as well as to all other grades in which the science is taught.

This work supplies a great desideratum to the Botanist and Botanical Teacher, there being no similar class-book published in this country. Cloth. 8vo. 623 pages. Price \$2.50.

GRAY'S FIELD, FOREST and GARDEN BOTANY—is an easy introduction to a knowledge of all the common Plants of the United States (east of the Mississippi), both wild and cultivated. It is designed to be a companion of the "LESSONS IN BOTANY." 256 pages. Price, \$2.00.

Single copies sent by mail on receipt of price. Address the Publishers,
IVISON, PHINNEY, BLAKEMAN & CO.,
 47 & 49 Greene St., New York.

TO THE SUBSCRIBERS OF MAPLE LEAVES.

The undersigned regrets to state that during the last few weeks he has received numerous complaints from persons who have sent to him for MAPLE LEAVES. Some of these complaints are the result of neglect in his office, others are not. During the last half of December and the first part of January, he was compelled to be absent from his business on account of a terrible affliction, and during that absence the parties in charge of his business did not attend to it as they should have done, one in particular, having sent papers in every direction but the right one, judging from the number of papers that have been returned by the P. O. Department. On his return to business he discovered at once how things stood, and long before this notice appears all errors, as far as in his power, will have been rectified. He has on hand a large pile of letters ordering Maple Leaves, some as specimen copies, some as subscribers, with which he can do nothing, as the writers have neglected to give their addresses; and in nine cases out of ten these parties do not write to find out what is, and to be able, but consider that they have been swindled. He desires all who have written for Maple Leaves and had no reply or paper, to write again, at once, and give their full name and address, and they will receive immediate attention, and he trusts be convinced that this is not a swindling concern, as many evidently believe it is.
 O. A. ROORBACH, 102 Nassau-st., New York.

Agents Wanted
 FOR THE AMERICAN YEAR BOOK AND NATIONAL REGISTER for 1869. Astronomical, Historical, Political, Financial, Commercial, Agricultural, Educational, Religious. This work contains a vast fund of late and valuable information respecting the United States and Foreign countries, including every department of the General and State Governments, which all classes will find invaluable for daily reference. Address O. D. CASE & CO., Publishers, Hartford, Conn.

WANTED.—Agents to canvass for "NAPOLEON III." By JOHN S. C. ABBOTT. A new work of great beauty and rare merit. It is the best book for agents in the market, because the subject is continually before the people. Napoleon is the most conspicuous person in the world. Abbott is the most fascinating writer in America. It is a new book, with no competition. Address B. B. RUSSELL, 35 Cornhill, Boston.

AGENTS WANTED.—For the only steel engraving of Gen. Grant and his family published with their approval. Engraved by Sartain. Size 15 by 19. \$2.50. 100 per cent to agents. Address GOODSPEED & CO., Chicago, or No. 37 Park Row, N. Y.

(Advertisements on this page, \$2.50 per Agate Line of Space.)

ESTABLISHED 1861.

THE GREAT AMERICAN TEA COMPANY

RECEIVE THEIR

TEAS BY THE CARGO

FROM THE

BEST TEA DISTRICTS

of

CHINA and JAPAN,

and sell them in quantities to suit customers

AT CARGO PRICES.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st.—The American house in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in the country have made their immense fortunes through their houses in China.

2d.—The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d.—The Importer makes a profit of 30 to 50 per cent in many cases.

4th.—On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1,000 to 2,000 packages, at an average profit of about 10 per cent.

5th.—The Speculator sells it to the Wholesale Tea Dealer in lines at a profit of 10 to 15 per cent.

6th.—The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th.—The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th.—The Retailer sells it to the Consumer for ALL THE PROFIT HE CAN GET.

When you have added to these EIGHT profits as many brokerages, cartages, storages, cooperages and wastes, and add the original cost of the Tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than other dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages and wastes, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Teas at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

For manner of getting up Clubs, see former advertisement in this paper.

Parties sending Club or other orders for less than thirty dollars had better send a Post-office draft or money with their orders, to save the expense of collections by Express, but larger orders we will forward by express, "to collect on delivery."

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary packages for Clubs less than \$30.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House stores to our Warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend to meet the wants of clubs. They are sold at cargo prices, the same as the Company sell them in New York, at the list of prices will show.

PRICE LIST OF TEAS:

- OOLONG (Black), 70c., 80c., 90c., best \$1.10 lb.
- MIXED (Green and Black), 70c., 80c., 90c., best \$1 per lb.
- ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.30 per pound.
- IMPERIAL (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
- YOUNG HYSON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
- UNCOLORED JAPAN, 90c., \$1, \$1.10, best \$1.25 per pound.
- UNPOWDERED (Green), \$1.25, best \$1.50 per pound.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of this Company.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound. Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction. ROASTED (Unground), 30c., 35c., best 40c. per lb. GREEN (Unroasted), 25c., 30c., 35c., best 35c. per lb.

NOTICE OF THE PRESS.

From the American Agriculturist.

THE GREAT AMERICAN TEA COMPANY.—To Querles.—Before admitting their advertisement, we learned that a large number of our clerks and others had for several months been buying their Tea and Coffee from this Company, without its being known who they were, and that they had been highly pleased with their purchases, both as to quality and price, and were all recommending their friends to the same course. As we have published the advertisement for many months, and received no complaints, we conclude "there is no humbug about the establishment."

N. B.—INHABITANTS OF VILLAGES AND TOWNS WHERE A LARGE NUMBER RESIDE, BY CLUBBING TOGETHER, CAN REDUCE THE COST OF THEIR TEAS AND COFFEES ABOUT ONE-THIRD, (BESIDES THE EXPRESS CHARGES), BY SENDING DIRECTLY TO "THE GREAT AMERICAN TEA COMPANY."

Gents.—Above I send my fourth order. Your Teas have given good satisfaction, and those who have used them will have no other, but induce their friends to send also. To prove this, I had made up my order and got a Post-Office Money Order, when others came in and nearly doubled the amount, as you will see by second money order, both of which I enclose.

The last order came safely to hand by Merchants' Union Express. Accept thanks for complimentary package.

Very respectfully,

S. LANPHEAR.

Caution.—As some concerns, in this city and other places, imitate our name and style of advertising and doing business, it is important that our friends should be very careful to write our address in full, and also to put on the number of our Post-Office Box, as appears in this advertisement. This will prevent their orders from getting into the hands of these bogus imitators.

POST-OFFICE orders and Drafts, make payable to the order of "The Great American Tea Company." Direct letters and orders (as below, no more, no less)

Great American Tea Company,

Nos. 31 and 33 VESEY-ST.,

Post-Office Box, 5,613, New York City.

HORSTON'S SELF-RAISING BREAD PREPARATION makes the most wholesome and best of bread, BISCUIT, CAKES, &c. Unlike some other yeast, it contains no POISON to create DYSPEPSIA, and the bread may therefore be eaten hot without detriment. Resolving itself into Phosphate of Lime and soda, it prevents RICKETS, CHOLERA, and decay of TEETH, and promotes the growth of Muscle and Bone. In "raising" the dough it does not, like other yeast, decompose flour, but adds nutriment to the bread, and otherwise improves it in quality and quantity. Each package contains full directions for use. Send to H. T. Love, No. 5 James Slip, New York, for "The Good Cook's Hand Book," for particular directions, to be sent you gratis, and ask your Grocer for "Horston's Bread Preparation." JOHN DWIGHT & CO., Wholesale Agents, No. 11 Old Slip, New York.

PORTABLE STEAM ENGINES.

For FARM, MIXING, or MECHANICAL purposes. These machines require no brick work; mounted on legs they are especially adapted for use in MILLS, SHOPS, FORDRIES, or PRINTING ROOMS,—or mounted on wheels they are adapted for out-door work, THRESHING, WOOD SAWING, &c. See Rural New-Yorker of August 15th, 1868, first page.

CHANGE OF PASTURE.—DRAWN BY EDWIN FORBES.—Engraved for the American Agriculturist.

It is an interesting question, regarding the care of sheep at the West, how far the Spanish-American negligent practice, British carefulness, or the native American "easy-go-lucky" mixture of care and neglect, will prevail. In the scene before us we have a shepherd with his flock and doubtless well-trained dog in an American landscape. In this our artist truthfully represents not only the facts on hundreds of farms, but the spirit of the times. A change of pasture, even though the grass may be thick and abundant, is of great benefit to all kinds of grazing animals; and when land is carrying anywhere

near a full stock, the benefit to the pasturage is quite as great as to the animals. A great portion of the herbage of a pasture becomes distasteful to the stock from being trodden and lain upon, or otherwise defiled, and it requires a week or more of time in connection with the action of dews and rains to purify it. Young grass shoots up among the old spears, and a fragrance and flavor is added to it which leads cattle to eat it with much greater relish, even though it has had but a few days' respite. Every farmer, of a moderate range of experience, has observed the advantages coming from a change

of fodder in the winter, and, if possible, he varies the feed of his sheep by giving, occasionally, oats in the sheaf, corn fodder, and hemlock boughs, as a change from wheat straw and hay. The herbage of different pastures does not consist of precisely the same species of plants; the soil varies, and hence the same kinds of plant exhibit slight differences in their chemical constitution; besides, the waters vary, and for these reasons a change of pasture is also a change of diet. So the needs of the system are better supplied, and, besides, the mere variation produces favorable effects upon the digestion of the animals.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from electrolyte plates as wanted, all the numbers and volumes for ten years past, beginning with 1857—that is, Vol. 16 to Vol. 27, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes, neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past ten years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW-YORK, APRIL, 1869.

Writing our hints about work in April early in March, as we must, with the thermometer at twelve degrees above zero, and sinking, so that we doubt not that it will record six degrees lower by sunrise, it seems as if a yielding sward and green fields were too far in the future to be objects of immediate care. Nevertheless the sun every day rises higher, and the warm noons and lengthening days are welcome assurance of a change of season.

April, in our climate rarely a very rainy month, is seed-time throughout the most of the United States; at the extreme north winter may still hold sway, and throughout the cotton belt a good part of this work has been anticipated. The heavy and constant labors of the spring give farmers little leisure, as these must be pushed forward with all vigor as rapidly as possible while fair weather and tolerably dry soil make field labor possible. Storms are always threatening, and we must be ever careful to have the work so planned that it may be dropped for a week without serious consequences. We may sow the spring grains, wheat, (rye), barley, oats, and peas; the grasses and clovers, carrots and onions, beets and flax, as well as other crops, the seeds of which are not likely to rot in the ground; and seedlings not liable to injury from moderate freezing. This month our flocks and herds usually receive their greatest natural increase. The weather is favorable, being rarely too cold for the young, and yet so cool and moist that puerperal and milk-fevers are less liable to attack the dams than later in the season.

Hints About Work.

Let us begin the season with the resolution that we will not raise weeds, come what will. Last year the whole country seemed full of them; they carpeted the corn and cotton fields; grass grew everywhere; weeds stood as high as the grain in thousands of fields. In our trips about the country, potato fields were rarely recognizable after August, except by the ragweed, and this state of things existed from Maine to Minnesota, and southward.

Grass and Clover may be sown on any land which is suitably prepared for them, upon winter or spring grain, on old sod harrowed well, or by themselves. It is better to brush or bush in grass and clover seed than to roll the land. The plan of sowing a little white clover with grass-seed is advisable wherever an application of plaster will not bring it in abundantly, as it generally will on old land.

Spring Grains.—The land should never be wrought when wet or tenacious. Wait for it to dry, but get the seed in as early as possible. On good strong soil it is best to drill all kinds of grain. We have no doubts either that it will usually pay to cultivate wheat, barley, and oats. Spring grains have a short time to grow. They ought not to be obliged to dispute their ground with weeds, and while the land must support all the plants it can carry it should not be burdened, nor should the best be crowded with many penny ones. Trust no light grain; get heavy seed, even if it cost \$10 per bushel. Soak the seed in strong brine, to kill the smut spores, and dry it in lime slaked to a powder, to make it fit for sowing. See Basket items for an effective scarecrow.

Winter Grain, if harmed by frost, is much benefited by rolling and by a top-dressing of dry soil, all the more if one or two hundred-weight of guano and plaster per acre be mixed with the soil. Grass and clover may be sown upon it any time this month. Liquid manure applied by a sprinkling cart will bring forward with a rush that intended for soiling. It will pay to send the men and boys through grain fields, especially if drilled, with hoes to cut up the weeds large and small. Those which get an early start will live; others will be smothered by the grain. If this weeding can be thorough, it will undoubtedly pay to put off sowing grass and clover until the first of May.

Potatoes.—Plant only in good soil; if it be rich, fresh manure will cause the crop to rot more or less. If the soil be poor, a lack of vigor in the plants to resist disease. It is best to plant as soon as the soil is warm—cutting the seed into pieces of two or three eyes, and letting them dry a little before planting. Plant deep under light ridges, so that the field may be harrowed. The sets may be cut smaller later in the season.

Onions, if sufficient labor can be given, are a very paying field crop. The ground must be in perfect order, rich and mellow. Do not sow too extensively, make sure of good seed, and plant early.

Carrots.—Sow the Long Orange, on rich soil deeply worked, any time this month or next,—the earlier the better if the soil is not too weedy. Put the rows twenty inches apart, so as to cultivate by horse power conveniently.

Flax requires land in the very best state of preparation. Whether grown for seed or for fibre it should be sown as soon as the ground is warm and light. No coarse manure should be employed, and the greatest pains should be taken to have the land free from weeds, water, and stones, and the seed evenly sown, and covered. We have not space for particular instructions, but they are given fully and clearly in a pamphlet on flax-culture. See book list.

Tobacco.—The seed bed is prepared this month, and the seed sown. The best and the warmest spot in the garden or elsewhere is selected, well enriched and mellowed. A bed four feet wide and twelve to sixteen feet long is abundantly sufficient for an acre of ground. It is well to burn brush, evenly spread over the soil, to kill weed seeds, and to sow the seed while the soil is still warm after thorough raking. A pamphlet of seed suffices. See Tobacco Culture pamphlet in book list.

Hemp needs good rich corn land; it follows corn in rotation very well. When many acres are put in it is well to sow one or two acres at a time, at intervals, for a month, to take advantage of variable seasons, and so that the culture and harvesting shall not come too much at once.

Farm Hands.—Make early engagements for the season or for the year. Most hands engaged for the year in the spring and paid by the month will remain through the winter. Engaged in the autumn they are often tempted to leave in the spring. Make it a rule to pay a man all that he is worth. Never bind yourself so that you cannot discharge a man for impudence, dishonesty, and filthiness, moral or physical. An employer need not keep a servant guilty of a criminal offence, even though he have a contract or witnessed engagement.

Manure.—We have little faith in top-dressings of barn-yard manure applied in the spring. Manure ought to be got under ground, or well harrowed in at this season. The temptation is strong to scatter the manure too much. Concentrate is the rule. We manure too much ground, we work over too much, and thoroughness is out of the question in too many cases. The hauling out of manure is attended with a great deal of labor, especially if the roads are poor and the ground is soft. Field compost heaps made in the fall, and manure piles laid up in the fields when needed during the winter, are a great saving.

Commercial Fertilizers.—It pays to use them discreetly. Peruvian Guano obtained pure is the safest and cheapest fertilizer a farmer can buy, if he will only mix it thoroughly with some divisor, and distribute it evenly in proper quantities. Pure bone-dust is safe, but rarely cheap; superphosphate of lime, still less cheap, but if pure, excellent, if used with care; fish manure of various kinds, both good and cheap. Samples vary greatly. Pondrette rarely pays to cart far; its real value is but little greater than good barn-yard manure, and often it is not worth so much. It requires discretion and considerable experience to make a profitable use of concentrated manures, but they are a valuable resource to the intelligent farmer.

Farm Stock.—The directions in regard to farm animals given in the Hints about Work last month are equally applicable to this, and it is not worth

while to repeat them. Be especially solicitous that breeding stock of all kinds have good feed and care. Working animals must be well fed. They ought to be thoroughly and frequently groomed,—both oxen and horses. Milch cows will give more throughout the season if supplied during the period between the time they "come in" and "grass," with succulent feed—roots, grain sown for soiling, etc.

Tools.—We are apt to neglect to get hand tools until we want to use them. It is a poor plan, but it is not followed by such risks and inconveniences as when we delay getting mowing machines and other heavy implements in the same way. The latter ought to be ordered at once. In buying hand tools, get such as are adapted to the soil and the work; men ought to accustom themselves to use the tools fittest for their labor. The tendency to employ steel instead of iron, and to make tools light, springy, tough, and sharp, rather than heavy, is to be encouraged. There is a great saving of labor in it. Keep all tools sharp, clean, and free from rust. Have a box at the tool-house door with a peck of corn cobs in it, and half a dozen bunches of husks tied like little brooms, and a less number of little birch brushes as large around as one's wrist, so that there may be no excuse for dirty tools. Lard melted with a tenth part of its weight of rosin is the best application for keeping rust from hoe blades, plows, mowing machine knives and fingers, and all edge tools.

Work in the Horticultural Departments.

To the inexperienced in such matters our advice to prepare soil for trees, etc., in October and November, and to order trees and seeds in February, may have seemed of but little weight; but now that the busy, working time has come, it will be found that every day that has been saved by heeding these hints is of great help. Now is the time when well-considered plans tell, and when the winter "head-work" shows its value. Most beginners in any branch of horticulture undertake too much at first. An acre well planted and thoroughly cared for will bring more in satisfaction or in money, than several acres done "with a lick and a promise." No one has a moral right to set out a tree or plant that is likely to be neglected. A slovenly acre is an injury to all the property in the neighborhood. While work must be pressed at all points, do not try to "hurry the season." Land must settle and dry before it can be worked, and should never be stirred unless it will crumble.

Orchard and Nursery.

Preparation for planting and setting the trees will, in most localities, be done this month.

Injured Trees.—See last month's notes. If trees have become heated and the buds have started in the packages, prune them very severely.

Pruning at Planting.—Much nonsense has of late been written on the disastrous effects of pruning young trees. If a tenth of the recorded bad results have been obtained, the cultivator had better go into some other business, and let trees alone. See Dr. Hull's remarks on page 98, last month.

Planting.—Holes should be made wide enough to receive all the roots of the tree properly spread out. Set the tree no deeper than it stood in the nursery, allowing for the settling of the recently disturbed soil. Fill in with fine top-soil, using no manure. Be careful to leave no holes among the roots un-filled; work the earth in with the fingers, separating all matted fibres, and use water from a watering-pot to carry it into the crevices. Make the soil firm over the roots by pressure with the foot.

Nursery Rows.—If trees cannot be planted in the best manner, it will be better to set them in nursery rows until autumn. The distance apart is to be governed by their size. Give room enough to grow without crowding, and enough for thorough cultivation. Trees thus treated may be transplanted in autumn without difficulty.

Grafting the plum and cherry may be done whenever the buds have not swelled. Other varieties may be worked much later.

Pruning on nursery trees and small stock should be done before the buds open. Cut back the weakest branches the most severely.

Budded Stocks are to be headed back, *i. e.*, have the stock cut off above the bud which was put in last summer. This is done two or three inches above the insertion. When the buds have failed, the stock, if large enough, may be grafted; remove the soil and graft below the surface in the collar.

Root-Grafts, as well as cuttings, are to be set as soon as the soil can be worked. Put the root-grafts in rows four feet apart, or wide enough for the cultivator, and ten or twelve inches apart in the rows. Careful planting, to secure close contact between the soil and roots, is essential to success.

Seeds.—Plant tree seeds of all kinds as soon as possible. An early growth, before hot weather comes on, is necessary to make good stems.

Fruit Garden.

Early planting, as soon as the ground can be put in order, is desirable. Those who grow fruit for a family supply should plant the well-tried and reliable varieties for their main crop. At the same time it is well to test such "novelties" as appear to promise well. These, if found desirable, can be readily propagated in any required quantity. We enumerate some varieties here; descriptions of others are found in catalogues and advertisements. Directions for planting were given last month.

Blackberries.—The Kittatinny has, on the whole, proved itself the best variety. Wilson's Early is a little earlier. New Rochelle is too tender.

Raspberries.—The list is large. The Clarke is perhaps the hardiest of the red sorts. The Black-caps are becoming popular. The Improved or Doolittle is good, but exceeded in productiveness by the Mammoth Cluster, which is somewhat later.

Currants.—Versailles is the best red; the White Grape, the best white. Have plenty of currants.

Gooseberries.—The native varieties are the only ones to be relied upon. The Houghton, or American Seedling, is one of the best.

Grapes.—Plant good one-year or two-year-old vines. Concord is the generally reliable variety. There are many better sorts, some of which are local in their success. Creveling, Iona, Delaware, Salem, Eumelan, and Diana, are all good. The Ives is very hardy, and in quality not superior to Concord.

Strawberries.—The Wilson is the most generally reliable. Beyond this it is difficult to select. For heavy soils, we should try Jucunda, Triomphe de Gand, McAvoy's Superior, Charles Downing, etc., and on light soils the Agriculturist. The number of varieties is so large, and success so variable in different localities, that it is not practicable to make a list that would suit everywhere. Plants are cheap, and it costs but little to experiment with a few sorts.

Kitchen Garden.

Manure and thorough cultivation are the requisites to success, after good seed or good plants have been obtained. Notes on some of the newer vegetables will be found on page 138. We can here enumerate only some of the leading sorts. Some sub-tropical things omitted in the present enumeration will be given next month. While we have given here only a few standard varieties, we advise the trial of novelties by those whose tastes and means allow them to do so. To us one of the great charms of gardening is the trial of varieties we have not before grown. Send to some reliable seedsman for a catalogue, and make a selection of things for trial. See last month's, and previous numbers, for articles on hot-beds and cold frames. In January notes, the distinction between hardy and tender vegetables is given.

Plant in Rows as much as possible, if horse implements are to be used in cultivating.

Seed-beds will be needed for such plants as are started in the open air, and then transplanted. The soil of these should be rich and light.

Asparagus.—Remove the litter from old beds,

and fork in the manure. Salt, at the rate of five bushels to the acre, is beneficial. Sow seed in fifteen-inch rows, to get young plants. Conover's Colossal is said to be large and prolific. Make beds of year-old plants, setting them in well-manured soil, in two-foot rows, fifteen inches apart.

Beans.—Plant as soon as danger of frost is over. Early Valentine is a standard sort. Fejee is highly commended. Plant in drills two feet apart. Leave Limas until the ground is well warmed.

Beets.—Sow in drills a foot apart, Bassano, Simon's Early Turnip, or other early sort.

Carrots.—Shorthorn is best early. Sow as beets.

Cabbage.—Transplant from cold frame or hot-beds; make the rows two feet apart, and set the plants sixteen inches apart. Sow seeds in seed-bed. Wakefield and Little Pixie are good early; Winnigstadt, medium; Marblehead Drumhead, and others, late, not forgetting the Savoys. Next month is soon enough for the late sorts.

Cauliflower.—Treatment the same as cabbage. Erfurt for early, and Lenormand for late, are best.

Celery.—Sow in seed-bed, Dwarf White, Solid, Boston Market, etc. The Turnip-rooted variety is sown the same.

Corn.—Early Dwarf Sugar, Farmers' Club, and Stowell, are all good. Mexican is the sweetest of all the varieties we have tested, though, being black, its appearance may be objected to.

Cress or Peppergrass.—Sow the curled every week or two, in drills six or eight inches apart.

Cucumbers.—Start on sods, as directed last month. White Spined is the best for table use; Early Russian, the earliest.

Egg Plant.—Always started under glass. See last month. New York Improved is the standard. Black Pekin and Large White are both fine varieties.

Horse-radish.—Putting the sets in manured trenches, and filling in as the plant grows is a good way.

Kohlrabi.—Sow in May and June, in 18-inch rows.

Leek.—Sow in seed-bed; the Flag is best.

Lettuce.—Transplant from cold frame, a foot apart each way. Sow in seed-bed. Curled Silesia and Simpson are the earliest. See catalogues for numerous sorts.

Onions.—See article on page 126. Put out sets of Top and Potato Onions, in fifteen-inch rows.

Parsley.—Sow in cold frames; Curled is best.

Parsnip.—The Hollow-crowned, the best. Sow in fifteen-inch drills. Use last year's seed only.

Peas.—See page 138. By all means try dwarf sorts for family gardens. Among these the Little Gem is the best. Sow in drills a foot apart. For late sorts, choose from the catalogues. We have yet to see a better pea than the Champion of England.

Peppers.—Sow in hot-bed, Squash for pickles, Sweet Mountain for stuffing, and other varieties.

Potatoes.—The Early Rose is the best of all the early potatoes generally obtainable. Those who feel they can afford the high price at which the seed is now sold should experiment with it. Early Goodrich was generally bad last year, but good heretofore. Dykeman is popular around New York. There are other early sorts offered. Early varieties only should go in the garden.

Rhubarb.—Fork plenty of manure into the bed, which can hardly be made too rich. Divide old roots, so as to have a bed to each piece, putting them four to six inches apart each way, according to the size of the variety.

Subsify.—Sow fresh seed and treat like carrots.

Spinach.—Sow the Round-leaved in eighteen-inch drills. Try the New Zealand later.

Sweet Potatoes.—Start the tubers in hot-beds, for sprouting about the middle of the month. Lay them nearly touching on two inches of good compost, splitting the large ones lengthwise. When the buds begin to start, cover with an inch of compost. Nansmond is the best variety.

Tomatoes.—Read all that has been said about the varieties of Tomato, and then plant Early Smooth Red for general crop, and try some of the newer

sorts. We have tried in vain to get at the bottom of the Tomato question. Sow in hot-bed, if not already done. Prick out those early sown into another hot-bed, when large enough to handle.

Turnips.—Sow early sorts in fifteen-inch drills. The Early Red and White Top are among the best.

Flower Garden and Lawn.

See last month's notes about lawns. Push all heavy work, such as making of paths and roads, and the laying out of borders, and get it out of the way.

Trees.—Set out deciduous ones as soon as possible, and do it with all the care given to fruit trees.

Edgings.—Box should be set early. Make neat work. Old plants, stripped up so as to have a bit of root to each, are much more sure than cuttings.

Shrubs may be transplanted. It is not easy to make a selection where the variety is so large. Weigelas, Spiraeas, Calycanthus, Dwarf Lilacs, and Snow-balls, Gordonia, Rhododendrons, and even as many more, are all desirable. Don't forget our natives, the Azaleas, Clethra, Laurels, and others.

Perennials.—Divide and reset, and sow seeds for new stock. See an article last month, page 97.

Annuals.—Start the tender kinds, such as Balsams, Ricinus, etc., under glass; sow hardy ones as soon as the soil is ready. The list is so large that we must refer to the catalogues. Mignonette, Candy-tuft, Petunias, Portulacaeas, Asters, and many other standard varieties, every one must have. Then try some of the most promising "novelties," the seeds of which do not cost too much money.

Bedding Plants.—One of the mistakes of gardening is putting out the soft-wooded plants used for summer decoration too early. The long, cold rains, which we always have in the spring, give them a "set back," from which they are slow to recover.

Climbers.—Have a plenty of them. Let them hang about porticoes, over fences, along wire screens, and then where it will be appropriate, put up cedar or locust supports for them. Most of the annual ones are fine when fairly started; all the Morning Glories, not forgetting the new mottled ones, several Gourds, Cypress Vine, Thunbergias, Canary-bird Flower, and many others, may be used with good effect. The various new varieties of Clematis are splendid; Climbing Roses, Honeysuckles, Akebia, and a host of others, may be had at the nurseries, and our own woods furnish the charming "Virginia Creeper," (American Woodbine), the Wax-work, (Celastrus,) Moonseed, and others.

Roses.—Give them good, well-drained soil, and be prepared to fight insects. The Chinas and Teas bloom all summer. The Remontants, (also called Hybrid Perpetuals,) bloom in spring, and sparingly in autumn, and then there are the old-fashioned June Roses, which give a wealth of unsurpassed bloom, and are done with it. The Chinas and Teas may be bought started in pots; the others should be dormant when planted, to get the best results.

Green-house and Window Plants.

Warmer days will allow of more free ventilation. Sudden changes will occur, and during the cold, damp spells, fire heat will sometimes be needed.

Propagation of plants for out-of-door planting should be pushed, as with the increasing power of the sun this now becomes much more difficult.

Pot off plants, using light, rich soil, as fast as they are fairly rooted in the cutting bench.

Half-hardy Plants, Carnations and Roses, may be planted out as soon as the soil can be prepared.

Seeds.—Sow the tender Annuals in boxes, to get strong plants ready for the open ground.

Dallias.—Start, by placing in heat. Cut off the sprouts with a bit of root, and pot. Rare sorts may be propagated from cuttings of the shoots.

Tuberoses, for out-of-door blooming, should be potted and started in heat the last of the month.

Insects flourish in these spring days, and fumigation with tobacco stems and other means of prevention and destruction must be attended to.

Water will be needed more frequently now. Do not let growing plants suffer for the lack of it.

AMERICAN AGRICULTURIST.

ORANGE JUDD & Co., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies; Four to nine copies, \$1.25 each; Ten to nineteen copies, \$1.00 each; Twenty copies and upwards, \$1 each. Papers are addressed to each name.

TO BE

the possessor of one or more of the valuable things offered in next column, and that, too, without paying any money for them, is an easier thing than most of our readers imagine. Note the following facts: Since last September, thousands of persons have each taken a copy of the Agriculturist, shown it to friends and neighbors, exhibited its beauty and explained its value, obtained their names as subscribers, and in this way made up lists of four, eleven, twelve, thirteen, and twenty names, and from that up to hundreds, and forwarded them to us. In return we have sent them the premium articles desired, to which they were entitled—ranging in value from parcels of Rose Potatoes up to Steinway's magnificent pianos. Many of them, after getting one premium, have

CONTINUED

on, and got other premiums, and they are still at it. This is fact number one. Now, human nature and human wants are about the same everywhere in this country, and what one man or woman or child has done can be done by others; and what can be done in any one place, can be done in almost all other places. This is fact number two; and fact number three is, that the chance for success, by the Reader of this, is just as good as that of any other person. As a fourth fact, we may add that there are still over 20,000 (twenty thousand, mark you!) Post-offices in this country where no premium club has yet been started for 1869; and again, fact number five, there is room for another club in almost all places where clubs have already been raised. This is the case

ALL THROUGH

the country. And while about it, we will name fact number six, that April is a very good month to get up such clubs. The more there is to do, the more people want the help of such a journal as this, with its calendar of work to be done, and its many hints and suggestions scattered all through the pages. Thousands of people have told us that single hints obtained from this paper have returned them from ten to a hundred times its cost, in better crops. An extra bushel or two of roots or vegetables from the garden will pay. A bushel per acre more of corn, grain, roots, etc., from ten acres of land will pay well for a dollar and a half invested in the paper, and no one can fail to get some such benefit from the thoughts stimulated to activity, or set in motion, by reading others' thoughts. Now, please keep the above in mind during

APRIL

and MAY also. Use any and every opportunity to solicit some friends or neighbors to take the American Agriculturist. You will thus benefit them, and soon have a list of names that will bring yourself a valuable premium with no expense. (See, "Read and Note carefully" further on.) We could publish a thousand letters from those who have received these articles from us within a few weeks, all of whom feel pleased. Send on the names as fast as obtained, and we will at once forward the beautiful numbers of this volume as far as issued. We keep printing new editions from January for all new comers. With every name sent, note that it is to count towards a premium list, and we will so record it; and then at any time between now and June, when you are done increasing the list, you can have any premium your list entitles you to. With the exception of the animals, we can get abundance of all the premiums (all first-rate) that will be wanted. Will you, Reader, try for a premium at your Post-office, or get some one else to do it? Try it to-day!

[In this table are given the regular cash prices of each article, and the number of subscribers required at \$1.50 a year, to get it free, also at the lowest club rate of \$1 a year. For full descriptions of the articles see extra sheets, sent free.]

Table of Premiums and Terms, For Volume 28—(1869).

Table with columns: No., Names of Premium Articles, Price of Premiums, and Number of Subscribers required. Lists items like Alderney Bull, Cotswood Ram, Sewing Machine, etc.

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The thirty-two Premiums, Nos. 29, 30, 31, 61, 62, 63, 64, and 76 to 100 inclusive, will each be delivered FREE of all charges, by mail or express, (at the Post-office or express office nearest recipient), to any place in the United States or Territories. —The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance specified.

Read and carefully Note the following: (a) Get subscribers anywhere: all sent by one person count together, though from one or a dozen different Post-offices. But... (b) Say with each name or list of names sent, that it is for a premium list, and we will so record it... (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. Any time, from now to June, will be allowed to fill up your list as large as you may desire. The premium will be paid whenever you call for it... (d) Send the exact money with each list of names, so that there may be no confusion of money accounts... (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer the premiums... (f) Specimen Numbers,

Cards, and Show-bills, will be supplied free as needed by canvassers, but they should be used carefully and economically, for every extra copy of the paper costs, with the 2c. prepaid postage, about 12 cents. (g) Remit money in Checks on New York Banks or Bankers payable to order of Orange Judd & Co., or send Post-Office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk.

If from any Cause one fails to get the larger premium desired, the names can be used for a smaller one.

A Full Description of the Premiums is given on an extra sheet; a copy will be sent free to every one desiring it. For New Premium 106, see page 32, January No. We have only room here for the following:

No. 42—Clothes-Wringing Machine.—A very useful, time-saving, strength-saving, clothes-wringing implement, that should be in every family. The wringing of clothes by hand is hard upon the hands, arms, and chest, and the twisting stretches and breaks the fibres with lever power. With the Wringing Machine, the garments are passed rapidly between elastic rollers, which press the water out better than hand wringing, and as fast as one can pick up the garments.

No. 72.—Crandall's Improved Building Blocks furnish a most attractive amusement for children. Churches, Dwellings, Barns, Mills, Fences, Furniture, etc., in almost endless variety, can be built with them, and the structures remain so firm as to be carried about. The Blocks are put up in neat boxes, and with each box is a card giving many designs of buildings.

Nos. 76 to 81—Volumes of the American Agriculturist (Unbound).—These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. We have stereotype plates from the Sixteenth to the Twenty-seventh Volume complete, from which we print numbers as needed. The price of the volumes is \$1.50 each, at the Office, or \$1.75 if sent by mail, as they must be post-paid. They are put up in clean numbers, with full Index to each volume.—They are profusely illustrated, the Engravings used in them having alone cost about \$40,000. Those obtaining premiums for less than twelve volumes can select any volumes desired, from 16 to 27.

Nos. 82 to 87—Bound Volumes of Agriculturist.—These are the same as Nos. 76 to 81 above, but are neatly bound in uniform style, and cost us more for the binding and postage. Sent post-paid.

Nos. 88 to 99—GOOD LIBRARIES.—In these premiums, we offer a choice of Books for the Farm, Garden, and Household. The person entitled to any of the premiums 88 to 99 may select any books desired from the list on page 149, to the amount of the premiums, and the books will be forwarded, paid through to the nearest Post-Office, or Express office, as we may find it most convenient to send them.

No. 100—General Book Premiums.—Any one not desiring the specific Book premiums, 88 to 99, may select Books from list on page 149, to the amount of 10 cents' worth for each subscriber sent at \$1; or 30 cents for each name sent at the (ten) club price of \$1.20 each; or 60 cents' worth for each name at \$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through by us.

A Few Dollars' worth of books pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to make their heads help their hands. Any good book will, in the end, be of far more value to a youth than to have an extra acre of land on coming to manhood. The thinking, reasoning, observing man, will certainly make more off from 49 acres than he would off from 50 acres without the mental ability which reading will give him. Far better to sell the acre of land, than do without the books. Several good books are announced in the Advertising columns, and in the list on page 149.

No. 106—Pocket Rifle.—(Breech Loading).—A full description of this beautiful implement, with illustrations, was given on page 32, of Jan. No. No one who enjoys shooting, or who has occasion to carry a light but effective weapon in traveling or while at work, will regret the trouble required to gather the 24 (or 18) subscribers required to secure this weapon free. If any one does not care for the mahogany case, we will present the weapon all complete, with extension breech and 100 cartridges, all packed in a strong pasteboard box, neatly papered, on receipt of 18 subscribers for 1869 at \$1.50 each.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for the month ending Mar. 15, 1869, and for the corresponding month last year.

1. TRANSACTIONS AT THE NEW-YORK MARKETS.

Table with columns: RECEIPTS, Flour, Wheat, Corn, Rye, Barley, Oats. Rows for 23 days this month, 26 days last month, and 26 days last year.

Table with columns: SALES, Flour, Wheat, Corn, Rye, Barley, Oats. Rows for 23 days this month, 26 days last month, and 26 days last year.

Table with columns: 2. Comparison with same period at this time last year. RECEIPTS, Flour, Wheat, Corn, Rye, Barley, Oats. Rows for 23 days 1869 and 23 days 1868.

Table with columns: SALES, Flour, Wheat, Corn, Rye, Barley, Oats. Rows for 23 days 1869 and 23 days 1868.

Table with columns: 3. Exports from New York, Jan. 1 to Mar. 15. Flour, Wheat, Corn, Rye, Barley, Oats. Rows for 1869 and 1868.

4. Stock of grain in store at New York.

Table with columns: Wheat, Corn, Rye, Barley, Oats, Mill. Rows for 1869 and 1868, with sub-rows for bushels and quarters.

CURRENT WHOLESALE PRICES.

Table with columns: PRICE OF GOLD, Feb. 15, March 15. Rows for Flour, Wheat, Corn, Rye, Barley, Oats, and various other commodities.

Gold has declined 4@5 per cent within the month, which decline partially represents the market value of the improvement in the public credit, that has occurred. Since our last, Government securities have advanced even more notably, on an unusually brisk business, largely for export. The trade in Breadstuffs, since our last, has been on a restricted scale, and prices have yielded materially. The dealings have been almost wholly in a jobbing way, the chief exceptions having been a moderate export movement in Spring Wheat, and some speculative activity in Oats. Holders have made free concessions to induce custom, but have not been successful in this effort. At present, the prospect is against the interests of sellers, who have been suffering severely for some months past. Shippers express themselves disappointed by the steady, downward tendencies of the foreign, as well as the home markets, and are buying very cautiously. Provisions have been generally held with more firmness; but business, as a whole, has been quite moderate. Cotton has fallen off on more liberal offerings, and a reduced call from all classes of purchasers. Wool has been quoted rather cheaper, on a very moderate movement. The second regular trade-sale of Wool took place on Thursday, March 11, at the Park-place and

Barclay-st. salesrooms, a little back of the Agriculturist establishment. The offering was quite attractive as a whole, embracing some 500,000 lbs. of Wool, including choice selections of Picklock, XX., X., No. 1 and No. 2 Fleece from Ohio, Pennsylvania, Michigan, New York State, Iowa, etc. Also a variety of Pulled Wools, of City and country pulling. Also an assortment of Excelsior Company's and other regular Scoured Sorts, made from Fleece Wools. Also California Fleece Wool and South American Wools, all of which were announced as to be sold without reserve. A very full representation of the trade, as well as of manufacturers, was in attendance, and the bidding was moderately spirited, for all the desirable lines, which were marketed at generally fair prices. The terms were about the same as at the preceding sale. Hay, Hops, Seeds, and Tobacco, inactive.

New York Live Stock Markets.—

Table with columns: WEEK ENDING, Bees, Cows, Calves, Sheep, Swine, Total. Rows for Feb'y 23d, March 1st, do, 8th, do, 15th, and Total for 4 weeks, 5 weeks, and Average per Week.

Notwithstanding the season of Lent, trade in cattle has been brisk. The beef has averaged of better quality, the droves running more uniform in size and weight than previously. The cold weather, which has been quite constant, inspired butchers with confidence, and larger sales were made. Every thing good sold quickly and easily on market days, leaving only the thinnish lots for the afternoon trade. This stock is not liked in our market at any price, and always has a slow sale. Some drovers had paid a high price at the West for their stock, and such found it difficult to clear themselves without loss; many of them claimed to have sold at a sacrifice, and grumbled at the hard market. On the whole, we think trade has been fair, and a little advance in the prices paid.

The following list gives the range of prices, average price, and figures at which the largest lots were sold:

Feb. 23d ranged 10 @ 17 1/2 c. Av. 14 1/2 c. Largest sales 14 @ 16 1/2

Prices seldom reached above 17c. per lb., dressed weight, for the best; a few "Tops" sold about 1/2c. higher. Some "Washington Birthday" heaves brought 1 1/2 @ 19c., but these were extra fat. One pair, said to be the finest in market this winter, sold to Mr. Lalor, of Centre Market, for about 20c. per lb. live weight; they were very fat, and were owned and fed by Mr. W. H. Drew, of Putnam Co., N. Y. There were several other pairs, quite fat enough, which brought high prices as fancy beef. The advance in price over last month may be set down at about 1c. per lb. Milch Cows have been a little more plentiful, the supply quite equal to the demand at present prices. A first quality milker seldom brings more than \$100, and most of the sales are below \$90. Prices range for good young cows at \$75 @ \$90. Medium to poor sell all the way from \$70 down to \$40. Veal Calves.—With cold weather and light supply for the first two weeks of the month, prices advanced a little and trade was brisk. There has been a corresponding falling off in price for the week ending March 15th, and figures stand about the same as given for last month. Prices range at 11c. @ 13c., live weight, for good. Some few fat sold as high as 14c. Fat "Hog-dressed" range 12 @ 15c., and "Bobs" sell by the head for \$4 @ \$6 each. Sheep.—There has been a light run all the month, and prices have advanced. The stock has averaged better, and a few lots of really fat sheep were for sale. The market kept firm, and every thing really good sold quickly; prices ranging for good at 8 @ 8 1/2 c. for medium 6 1/2 @ 7c., while some very fat reached as high as 9c. per lb. live weight. Swine have been more abundant; prices but little changed. Sales have been steady and quickly made for live hogs at 10 1/2 @ 11c. per lb.; Western-dressed 13 1/2 @ 13 3/4; city-dressed firm at 14 @ 14 1/2 c. per lb.

Precocious Calf.—Mr. Eli De Voe, of Summit, N. J., has an Alderney calf, in which strains of blood of several famous milking families unite, that was one year old March 4th, and is now giving milk and regularly milked. It has not calved, of course, and the owner thinks cannot be with calf. The udder and teats are well developed; the milk is good and rich, and, though not yielded in large quantities, is increasing daily.

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Mark All Subscriptions sent in, as *New or Old*.

How to Remit:—Checks on New-York Banks or Bankers are best for large sums; made payable to the order of **Orange Judd & Co.**

Post-Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us *without any loss*.

Registered Letters, under the new system, which went into effect June 1st, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. *Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. Buy and affix the stamps both for postage and registry, put in the money and seal the letter in the presence of the postmaster, and take his receipt for it.* Letters sent in this way to us are at our risk.

Postage.—To our published terms for the *American Agriculturist*, postage must in all cases be added when ordered to go out of the United States. For Canada, send twelve cents besides the subscription money with each subscriber. Everywhere in the United States, three cents, each quarter, or *twelve cents, yearly*, must be prepaid at the Post-office where the paper is received.

Bound Copies of Volume XXVII (1868) are now ready. Price, \$2, at our office, or \$2.50 each, if sent by mail. Any of the previous eleven volumes (16 to 26) will be forwarded at the same price. Sets of numbers sent to our office will be neatly bound in our regular style for 75 cents per volume, (50 cents extra if returned by mail.) Missing numbers supplied at 12c. each.

Canada Postage Stamps cannot be used or sold here. Please remit in United States or Canada money.

Few Premium Animals Left.—It will be seen by the list on page 144, that only a few premium animals remain for distribution as premiums, viz: two Alderney bulls, five sheep, and some fowls, of which there were ten pairs of each kind originally offered. Those wishing these should hurry up, as the Publishers' rule is, "first come, first served." Of all the other good articles now in the table, the supply is abundant for all who want them, and we look for a large demand, judging from the success of our friends in April last year. Nos. 29, 30, 31, and 32, will not be wanted after this month.

"I Haven't a Foot of Land," writes a City Merchant, "and I may never have, but I take your paper for the advertisements. It is a luxury to get hold of at least one flourishing, well-patronized paper, and look over its business items with a feeling that they are, as a class, from good men. I actually read them all through, and often buy things that I would not think of sending for if I saw them announced along with a lot of good, bad, and indifferent advertisements. You have adopted just the right rule, in requiring advertisers 'not known to the editors personally, or by good repute, to furnish evidence that they have both the *ability* and *intention* to do what they promise to do in their advertisements.' That rule, with the rejection of the villainous quacks and patent medicines, thoroughly lived up to for a few years, would be the making of any paper in the country. Can't you stir up *all* your contemporaries to the importance of this, both for themselves and for the people? If practiced by all newspapers, it would every year save millions on millions of dollars, and thousands of lives, now destroyed by the oceans of syrups and decoctions, and the tons of pills, etc., annually consumed."

Whitewashing.—In these days of spring cleaning, the whitewash brush and pail are freely used by the good housekeeper, and none too freely, for aside from the effect that whitewash has upon the appearance of the dwelling rooms, its use in cellars, outhouses, etc., is doubtless of salutary effect. The essentials in whitewashing are, good lime and a good brush. Freshly burned hard lumps of lime are the best. Rhode Island lime has long been celebrated for its excellence, and is sent for long distances away from the little State. The brush should be a good one; not a cheap affair made to sell, but with long, good bristles, and plenty of them.

The lime is slaked by pouring boiling water upon it, stirring until the lumps disappear; more water is added, until a creamy liquid is obtained, of proper thickness for application. The pail should have a stiff wire stretched across the top, against which to draw the brush, to remove the excess of whitewash. Commence by sweeping the ceiling and walls, to remove all dust; then go over the surface, making the strokes of the brush all in one direction, and parallel; when the first coat is dried, apply another in a direction across, or at right angles with the former. A large paint brush will be found useful for corners and intricate places. Those who have never whitewashed must not be surprised to see the work look very badly while it is wet; the effect can only be judged of when dry. With a little practice, the operation can be done without spattering or letting a drop fall. Stir the whitewash occasionally, dip the brush in perpendicularly, and then draw it across the wire above spoken of, so as to leave as much in the brush as it will hold without drooping. Salt, white vitriol, starch paste, and other things are added with a view to prevent the wash from rubbing off, but there is little whitewash that will not rub off. For nice work, the lime may be slaked several weeks before it is used. A thin pellicle or crust of carbonate of lime will form on the surface, which is to be skimmed off, and then the wash may be poured off from the gritty particles which settle to the bottom.

KALSOMINING is a term given to another method of whitening walls. It is Paris white, which is a very fine whitening or chalk, to be had at the paint and drug stores, and put on with a glue size. The proportions are a quarter of a pound of *white glue* to six pounds of Paris white. Put the glue in water enough to well cover it, and let it stand until perfectly soft; then put the vessel containing the glue into a kettle of hot water, and stir until it is thoroughly dissolved. Put the Paris white into a pail, add hot water gradually, stirring all the time, until it is brought to a smooth, creamy consistence; add the dissolved glue, and then water enough to thin it sufficiently to work well with the brush. It is applied in the same manner as whitewash, and is used for hard-finished ceilings and walls that have become discolored.

Allen's "New American Farm Book,"—Allen's American Farm Book has been one of the standard farmer's hand-books for twenty years. It was a real hand-book, where one might go for reliable information about a thousand and one matters of practical or farm policy. This work is still valuable, but not up to the times, and as its author, Mr. R. L. Allen, could not give time to its revision, this was undertaken by his brother, Hon. Lewis F. Allen, the distinguished farmer of Niagara County, editor of the American Short-horn Herd-book. *The New American Farm Book* is just published. It contains much of the same matter as the other, but is greatly enlarged, and full of suggestions from the rich experience of its editor and reviser. It contains 526 pages. Published by Orange Judd & Co. Price, \$2.50.

Our Young Folks.—The March number of this boys' and girls' magazine is at hand, and as fresh and bright as a spring morning. This journal combines amusement with instruction in the most happy manner. There are pleasing stories, little poems, puzzles, and the like, and besides these, excellent articles on Glass-making, the Mariners' Compass, etc. The wonders of glass manufacture, cleverly told and illustrated, give just the kind of knowledge every boy and girl should have; indeed, most grown people might learn something from the article. The history of the production of things in daily use has a great charm for intelligent youth. We are glad to learn that the magazine is meeting with the success it deserves.

Iona Island.—This Island, which has been so long identified with the cultivation of the grape, is sold by Dr. Grant to Messrs. Hasbrouck & Businell.

Oils, Safe and Unsafe.—On several occasions we have pointed out the dangerous character of the Kerosene oil generally in use, and stated that that only was safe which would bear to be heated to 110° before it would take fire. As very little in the market would stand this test, there has been a general alarm felt in regard to the matter, and many letters have been received asking how good oil could be obtained. Mr. Charles Pratt now offers an oil, which, according to the testimony of competent chemists, will bear heating to 118° to 128° before forming an explosive vapor, and to 134° to 156° without burning. This, then, indicates perfect safety as far as danger from explosion goes. As it often happens that dealers purchase good oil and mix it with benzine and other dangerous fluids, Mr. Pratt has adopted a new plan of packing. Instead of sending it out in barrels, he puts his oils in cans, which are closed with a soldered seal of thin metal. Each can is placed in a box, and the whole is as readily handled and transported as a box of soap. The perfect seal is a guarantee that the oil has not

been tampered with. We have known Mr. Pratt from the time when he was struggling to acquire an education under difficulties, until he became a member of one of the largest establishments in the country, and have confidence in his integrity. We depart from our usual custom in especially commending a particular manufacture, as the welfare of the whole community is concerned, and it only needs that Mr. Pratt's endeavors to furnish a safe burning oil should be successful, to induce all other manufacturers to follow his example.

Rogers' Grapes.—Mr. M. B. Batcham writes that, in compliance with the request of the Lake Shore Grape Growers' Association, Mr. E. S. Rogers, of Salem, Mass., has proposed the following names for the leading varieties of his hybrid grapes, hitherto designated by numerals: No. 1, Goethe; 3, Massasoit; 4, Wilder; 9, Lindley; 14, Gartner; 15, Agawam; 19, Merrimack; 28, Regna; 41, Essex; 43, Barry; 44, Herbert.

Sweet Potatoes.—"S. F.," Green Co., O. A bushel of potatoes will produce from three to five thousand sets, which are to be removed as soon as well rooted. The quantity required for your bed can be estimated by measuring the space covered by a bushel of potatoes laid out so as to nearly touch one another. Only the large potatoes are split lengthwise. Around New York the beds are made about the first of April.

Van Buren's Golden Dwarf Peach.—"A. M. H.," Oregon, Ill. This is not a "lum-bing." It is more of a pomological curiosity than a variety to be planted for profit. It is pretty for small gardens, and bears a fruit (cling) of fair quality and great beauty.

Horticultural Protection.—A committee of the Lake Shore Grape Growers' Association has petitioned Congress to pass a law to grant patents for new varieties of plants. We regard this movement as premature, inasmuch as horticulturists have not yet fairly considered the subject, and when a movement of this kind is made there should be unanimity of action. Already Mr. P. Barry has entered his protest against the scheme, Mr. A. J. Caywood has replied at length, and the articles of the two indicate anything but harmony of views. Mr. C. has printed both articles in a small pamphlet, which he sends us, and asks the influence of the press in favor of the proposed law. We think it would be wiser to leave the whole matter until the meeting of the Am. Pomological Society in September next. There is much to be said for and against the proposed law. Both sides should be fairly heard, and the subject duly deliberated. It is too important to be hastily disposed of.

Tree Invigorators.—Circulars of these are continually sent, asking our opinion of the merits of the stuff advertised. One of these precious documents says: "When applied to the tree it penetrates every pore, destroying the worm in the heart, and by connecting with the mineral substances of the earth destroys the cause, and prevents the creation of any destructive insect,"—and more of the same sort, all utter nonsense.

Sundry Humbugs.—It is again necessary to call attention to the "Music Box Swindle." Every week some new complaint is sent to us, seeking redress. The musical instrument, properly called the Music Box, is not to be had for \$1.00 anywhere, no matter of how poor quality; and offering a "music box" for \$1.00 is an attempt to swindle. Paul & Paul, who are among the largest advertisers in the business just now, are not to be found at the number given. One of our readers sent \$1.00 to said firm, and got in return a ten-cent toy known as a "French Harp," or "Harmonica." He was induced to send for the "Music Box" by seeing it advertised in an "agricultural" journal. It is a shame that agricultural journals, or any other, should admit the advertisement of such things.... "Alaska Diamonds" are now offered by unscrupulous men, who are taking advantage of a desire for tawdry jewelry, and flooding the country papers with their advertisements of "Alaska Diamonds." A firm in Hartford, Conn., and Messrs. Monroe & Co., New York, are perhaps the largest dealers. The following, from the New York Tribune, will show the plan of operation pursued by Monroe & Co.:

"In their advertisements they state that, when forwarding them an order, it is necessary to inclose them a ring, to enable them to select one of the proper size. When they receive an order containing a size ring, if the ring is of any value, they retain it, and send the "Alaska diamond" ring, the price of which is collected on delivery. A case of the kind occurred a few days since, where a lady, seeing one of their advertisements, sent the "firm" twelve dollars, and a gold ring for a specimen of the size wanted. She received the "diamond" ring, worth, probably, twenty-five cents, but not the one she had sent them, which she valued at five or six dollars, and as she did not care to lose it, she wrote on to the "firm," and receiving no reply to her communication, wrote to other and responsible parties, who, after making diligent search and inquiry, came to the very

reasonable conclusion that "Messrs. Monroe & Co., Broadway," importers of jewelry, were a myth, as no such firm could be found at the place designated. No doubt they had hired an office at the above-mentioned number, and after this exposure has been forgotten by the public, will turn up in some other part of the city, and under some other name, circulate throughout the country advertisements, in which they will offer tempting baits, and those who are green enough to bite at the hook will have the same old story to tell us."

We advise persons who wish diamonds to buy them of regular dealers. Diamonds, like gold, have a fixed value; and any thing of low price, claiming to be a diamond, is false. Look out for Land Agents advertising land in Southern States by lottery. Lotteries are bad at best, but a lottery in which a plot of unknown land in an unknown location is the prize seems perfectly absurd. "Miller & Co." seem to have been driving quite a business in this line for the past few weeks, and we warn persons to have nothing to do with them or their lottery. The "recipe humbugs" are quite popular, and call for notice. We have before us no less than four of these recipes. They all consist of a "little powder," made from some unknown plant or unheard-of mineral, or both. One is for making "Beautiful Sugar" from Sorghum Syrup. A second is for making "Italian Cheese," and is imitation of the "Butter Powder," proposes to make a pound of cheese from a pint of milk. A third is an "Extract of Butter Plant," if any body knows what that is, and is used to make had butter good, sweet, and fresh; and the fourth for curing colic in horses! We mention the last-named to call attention to the fact, that many daily and weekly journals, that ought to do better, have published the same recipe, with no other warrant as to its reliability or efficacy as a remedy than the assertion of the person giving the recipe. We have taken pains to learn if the ingredients named, and which the writer says may be had at any drug store, were to be had in New York. We not only did not find what we went after, but some of our best chemists and pharmacists did not know of the existence of such substances. We therefore think it safe to say, that the whole thing is a "sell," or intended swindle. Gumbidge & Co., New York, are old offenders. Having tried everything, from patent medicines up to "Music Boxes" and "Charmed Caskets," they have now come out with "Greenbacks" for sale, at the rate of \$5,000 worth for \$5.00, which is very good of Mr. G., only the trick is too old to take. The "Express Package" swindle seems to have revived under the very impressive name of "N. Y. Central Express Company." Z. W. Nulock, Agent. They send a letter to the address of any person as follows: "To your address has been received (one package or box) upon which there are (\$2.00, \$3.00, or \$4.00) charges. Please send the same without delay. Unless paid within 20 days, the goods will be sold at public auction," etc. In some instances, we have no doubt, persons are found verdant enough to send the money, and that is the last they hear of it or the Express Company. As fashions repeat themselves after a term of years, so do the various forms of humbug. This one turns up after a long repose. We thought we had buried the old offender years ago.

Our Poultry Premiums.—The fowls offered as premiums for subscribers to the *Agriculturist* have been, as our readers are aware, in the yards of Mr. J. H. Mabbett, of Tarrytown, who has removed to Vine-land, and engaged in other business. The Paris Exposition prize trio of Houdans, and most of the imported La Fleche and Houdans have been transferred to the poultry yard of Mr. John Salisbury, Jr., of Nyack, N. Y. The Mallory Paris Exposition prize trio of Creveceurs, with some of their stock, also some of the La Fleche, Houdans, and Brhmas, have been placed in the yards of Mr. Geo. Smith, of Holliston, Mass. These gentlemen are careful and successful breeders of fine poultry. They will hereafter supply orders for premium birds, and our friends may be sure of getting pure stock.

The Insects of Missouri.—The First Annual Report of Charles V. Riley, State Entomologist of Missouri, comes just as we go to press, and too late for us to give it sufficient examination for such a notice as the importance of the work demands. Mr. Riley is admitted to be one of our most accurate and industrious entomologists, and the Report before us bears marks of a vast amount of labor. It is no doubt creditable to him and to the State, which, with enlightened liberality, has made it possible to produce such a work. We congratulate both parties upon their fortunate relations, and shall probably have occasion to refer to the work again.

Trichina.—When we published, a few years ago, an account of the minute parasite which is apt to occur in pork, some journals made merry over it, others denied the existence of the Trichina altogether, while many private letters remonstrated with us for slandering the animal which produces pork. We only did our duty, knowing of the occurrence of several cases, in showing

what the trouble was, and in cautioning our readers how to avoid it. Since then, deaths from Trichina have been sufficiently numerous to excite general attention, and those journals who accused us of making a "sensation" have been obliged to record the facts. A number of cases have occurred the past winter. Near Rome, N. Y., three died and five were dangerously ill, all in one family. In New York several in one boarding-house were made severely ill, and sent to different hospitals. Two died, two others are very sick, and the fate of the others is not known. The last case we know about from one of the physicians, and saw the parasites in a fragment of the muscle. All these cases are traceable to the use of raw ham and raw smoked sausage. Those who eat pork thoroughly cooked need have no fear of Trichina, even should they be present, but let those who will eat it raw, even though it be salted or smoked, or both, know that they do it at the risk of their lives.

Editorial.—Mr. A. S. Fuller withdraws from the editorial charge of the *Whitlock Exposition Recorder*.

Music should everywhere be a household institution; scarcely anything can equal it for giving pleasure and refinement and making home attractive. He who brings it within the reach of all is a public benefactor, and such we name Mr. B. W. Hitchcock, who is publishing the popular songs, etc., at only 5 cents per copy, neatly printed and arranged for the piano, etc. Who wouldn't sing and play, when it costs only half a dime?

Southern Pomologists.—Col. Marshall P. Wilder and a party of pomological friends, on their return from a tour through the Southern States as far as Florida, report the fruit-growers there as being as wide-awake and enthusiastic as ever. A large attendance from the South is expected at the meeting in Philadelphia in September. The fruit lists for the Southern States need thorough revision. The matter will be facilitated if those who have any suggestions to make will communicate with the Secretary, F. R. Elliott, Cleveland, Ohio.

Breck's Book of Flowers.—Mr. Breck is a gentleman who has grown gray among his flowers, but he talks about them with the enthusiasm of youth, tempered by mature experience. No work is better suited to those who wish to beautify their homes with a garden. Mr. B. tells of his failures as well as his successes, and all in that familiar way that is so pleasing to the novice. Price by mail, \$1.75.

Death of Willie Judd.—Mr. Judd suffered a great bereavement on Feb. 23, in the death of his eldest living son, William Orange, aged 13. (He had previously buried three eldest sons). The disease was a very unusual one, originally caused by some slight obstruction of the vermiform appendage of the colon, probably a small fruit seed, which resulted in general peritonitis. Even this almost always incurable disease, treated by the highest medical skill that New York could furnish, was ultimately conquered, but, as a result, a deep-seated abscess was formed which no human skill could reach, and after twenty-five days of intense suffering the strong physical frame wasted away. Willie was a very promising boy, having been favored with robust health and physical development, as well as a remarkably matured mind for one of his years. He had an extensive collection of coins, gathered abroad by himself, including over 200 ancient Roman coins, some of them dating back prior to the Christian era. With these and their history he had made himself quite familiar. His portfolio and scrap-book contain many compositions and notes of travel that would do credit to an adult mind. His manly and courteous deportment and kindness of heart will long be remembered by those who have seen him frequently at the Office, and by his schoolmates. One of the most consolatory memories to the bereaved parents is the fact that for full four years he had been a constant attendant upon the church communion, and a thorough Christian, and that he died, as he lived, confident of his eternal salvation through Christ. The design of Providence in removing one so promising for future usefulness is inexplicable to human understanding, but His ways are not our ways, and "He doeth all things well." B.

Good Books.—On page 149 of this number is a list of Rural Books offered by our Publishers. Both interest and profit will be found in these volumes. We have room to call special attention to only a few of them. The "Small Fruit Culturist," by A. S. Fuller, is a beautifully illustrated work, wholly devoted to small fruits. It was prepared to meet the wants of that rapidly increasing class, who, while they would gladly avail themselves of the results of experiments and observations of cultivators, have heretofore been unable to do so, because that information has been scattered through a thousand volumes, inaccessible to them. This book can be had

for only \$1.50. The "Grape Culturist" is another book by the same well-known author, and is the most practical work on the culture of the Hardy Grapes, with over one hundred excellent engravings. Price, \$1.50. "Gardening for the South," by the late Wm. N. White, of Athens, Ga., is an admirable treatise on gardening in general, as well as at the South in particular, and will rank among the best horticultural works of the day. Price, \$2.00. "Quincy's Mysteries of Bee Keeping" may be had for \$1.50, and contains the results of thirty-five years of successful experience, with full, plain, and practical directions for all details of Bee Culture. But our readers will select for themselves from among the many valuable books to be found in the list.

Gardening for Profit—Practical Floriculture.—These two works, by Mr. Peter Henderson, are valuable additions to that style of horticultural literature that was commenced by Fuller in his *Grape Culturist*—a cutting loose from foreign authorities, and presenting the author's own way of doing things, in plain language, and without any "secrets" held in reserve. The first book by Mr. Henderson, *Gardening for Profit*, so completely met a great want, that its sale is something astonishing. The second work, *Practical Floriculture*, is to the flower grower what the other is to the grower of vegetables, and meets with a hearty acceptance. Aside from being gratified at a pecuniary success, the publishers feel pleased that they have been able to present the public with works so thoroughly practical and useful, as well as thoroughly American in the treatment of their subjects. Price, \$1.50 each, by mail.

Cornell University.—We learn that the Hon. John Stanton Gould has been appointed Professor of Agriculture at the Cornell University.

The Prairie Farmer in a Bad Way.—Emery must have been away and left the boys to keep shop; at least we judged so on seeing an engraving from one of our books—well, say appropriated without a word of credit. We are accustomed to such treatment from "one-horse" papers, but in a journal so able and usually so courteous as the *Prairie Farmer*, we do not look for it, and are quite sure it was done by some one who did not know the custom with all respectable journals.

The Potato; Origin, Uses, Diseases, etc., is the title of a pamphlet by the Rev. W. T. Wylie, Newcastle, Pa. Mr. W. with a view to interest his parishioners in improved methods of culture, has published this little hand-book, and offers \$100 as a prize for the best essay on potato culture. The essays are to be sent to B. K. Bliss & Son, 41 Park Row, New York, before July 1st, 1869. Price of pamphlet, 20 cents.

The Early Rose in England.—Shirley Hibbard, editor of the excellent *Gardener's Magazine*, and an authority on Potatoes, says of the Early Rose: "A fine potato on the table, a good color, a most delicate texture, and the flavor equal to that of the old Ash-leaved Kidney, perhaps even superior to that standard of high quality."

How Horticulture is Encouraged in Boston.—Josiah Stickney, Esq., gives \$12,000 in trust to the Mass. Hort. Society for thirty years, the income to be devoted to increasing the library of the Society. It is a pleasant little way those Boston "princes" have.

Osage Orange Seed.—"Hodge Fence." See page 21, January, for directions to sprout seeds. A correspondent, whose letter is not at hand, says that seeds that have remained in the ball all winter, if planted as soon as washed out, will grow without being sprouted.

Moore's Rural and the Farmers' Club.—Moore's Rural New Yorker came to N. Y. City a few months ago, which was in obedience to the laws of gravitation; it at once wonderfully improved in matter and manner, which shows the effects of getting into good company, but—alas, that it is necessary to mingle blame with our praise!—it speaks slightly of the Farmers' Club. We have in our day good-naturedly poked fun at this remarkable assemblage, but we never were half so severe as the Rural. It has been a notion of ours that the Club was kept up in good part for our amusement. Now, Mr. Rural, don't try to annihilate it. Who knows what the farmers without farms, doctors without patients, and reporters without anything to report, would do if they could not get together once a week and "babble o' green fields" and cancer cures?

Foreign Help.—"Subscriber," Waterford, Va. Address the Commissioners of Emigration, Castle Garden, N. Y. If it is desired to engage a number of persons, visit Castle Garden and do the business yourself.

Breeding of Fur-bearing Animals.—"J. E. S.," Bridgeport, Conn. We entertain no doubts as to the possibility of profit—may, its certainty—under favorable conditions. Rabbits are bred so as to bring in a very fair income in England, both their flesh and fur contributing to the result. Where fish offal is abundant, we believe that *Cats* in large numbers have been bred profitably, solely for their fur,—the varieties chosen being, of course, those whose fur brings the highest price, namely: clear gray ones, with dark, tiger-like bands, and black ones. A variety of food would doubtless be desirable, but butcher's offal and fish of some kind are most acceptable to the animals. We know nothing of the particulars of this curious branch of industry, but would be glad of practical hints. A statement about a *Minkery* in the central part of the State of New York has gone the rounds of the papers. The attempt was on a rather limited scale, but we see no reason why the effort to breed minks should not succeed.

Domesticating Woodcock and Snipe is done in England, as a matter of fancy rather than of profit. The young ones, when captured, are stuffed with worms, in order to teach them to eat, the worms being put in at the side of the mouth, and crowded down with a feather. As they get older, they will eat live worms from a shallow vessel, covered slightly with mud. One wing must be clipped, if the birds are to be kept in confinement, or they would surely escape.

Horses and Cows may be Kept in the Same Stable without the least injury to either. The inquiries from different parts of the country we have received on the subject, though once answered, seem to demand another response, and we here add our most positive assurance to the above simple statement.

Hens Eating their Eggs.—R. B. Stafford asks how to break hens of eating their eggs. Supply plenty of finely pounded oyster shells, or, if these are not handy, provide bones; besides, some pork scrap cake daily. Give at the same time an abundance of wheat screenings or other grain, and good, soft, secret nests. Allow no eggs to freeze, use artificial nest-eggs, and remove all eggs daily. Hens learn this from finding broken eggs.

Gapes in Chickens.—Anderson Campbell, of Tennessee, writes the *American Agriculturist* that he finds from experience that by changing roosters every year, getting them from stock not akin to the hens, he is not troubled with gapes. Whether this is a preventive of gapes or not, there can be no doubt of the advantage of introducing new blood into the poultry yard, especially if care is used to get thoroughbred roosters of the best kinds. Stock from such is better able to resist disease of all kinds, than that from closely related progenitors.

Sending Chickens to the Rocky Mountains.—Mrs. J. A. Shreve, of Denver, Col., has received by express a trio of Brahmas in good order from G. H. Leavitt. The express messenger reported encountering a temperature of twelve degrees below zero on the plains. Provision was made for a supply of food and water. The fowls were sixteen days on the trip, and the express charges were \$25 from New York to Denver. This is the first importation of Asiatic fowls to the Rocky Mountain States we have heard of. The natural way to get stock of these breeds on the Western coast would seem to be to bring them across the Pacific, though by this means few are obtained of superior quality, unless selected by a poultry fancier on the ground.

Curelio.—"J. H. H.," Delphi, Ind. The Curelio is able to fly, though it may sometimes prefer to climb. A pretty full account of the insect is given in the *Agriculturist* for May, 1864.

Cabbage Caterpillars.—G. W. Grant, Oceana Co., Mich. We cannot tell, without a description, which "worm" it is that injures the cabbages. Try trapping, if salt, lime, and plaster have failed. Break off a cabbage-leaf and lay it over the head at night; the worms will go under this for shelter, and may be destroyed early in the morning. A coop of chickens will help keep them in check.

Painting a Barn.—J. Maught, Frederick Co., Md. The sooner a barn or any wooden building is painted after its erection, the better. It ought to have a priming coat before the scaffolding is taken down, and after that it may be left six months, if necessary. This coat should be of good boiled oil, thinned with a little turpentine or benzine, to make it work easily. It is unnecessary for the priming to have much body. As soon as this is dry, or later, if more convenient, we may

paint the building. Pure white lead is the best and cheapest paint that has an enduring color. (The most lasting is black paint; lamp-black in oil, or coal tar asphaltum dissolved in benzine makes a very lasting black paint.) White paint may be tinted of any color, and a barn should never be painted white. By taking a little pains, some pleasant neutral tint may easily be formed, which will harmonize with the landscape. To choose a color, go to a spot where the soil is not dark and peaty, (it matters not whether it be clayey or sandy) tear up a sod, let the earth dry, and take that for the color of the barn; wet it, and take that for the color of the door and window casings, cornice, and corner strips. The house should be decidedly lighter than the barn, and usually of a warmer tint, that is, inclining a little more towards red and yellow than towards blue. Blues, bluish-greens, and grays, are "cold" colors. Distinct yellows, reds, pinks, or blues, are horrible; cream and straw colors are almost as bad, but are easily modified with a dash of brown to very agreeable light, warm, stone colors. Browns are pretty, if neither too dark nor too red. Grays are cold, and should be warmed with brown or yellow ochre. Neither dwellings nor barns should be darker than the surface of fresh-plowed ground where they stand, unless of stone.

A Conundrum.—"We desire you to answer the following: We were driving two horses close along by a ditch or ravine, perhaps eight feet deep. One of the horses gave the other a jostle which threw him off his balance, and he fell into the ditch, back down, heels up, and he fitted in the ravine so nicely that it was impossible for him to get out. We were twelve and fourteen years old, and six miles from home. What would you have done in such a case? Please answer.—AN EGYPTIAN." The 12-year-old should have held the other horse. The 14-year-old should have unbuckled the harness of the one that was down, made a rope fast to the shank of the under hind leg, hitched his mate to it, and started up—easy! If that wouldn't do, he should have gone for help.

Stone Lime vs. Shell.—"A. B.," Syracuse, wishes to know which is the better for the land, shell or stone lime.—Oyster-shell lime contains about one per cent of phosphate of lime, and is generally considered better than the lime made from marble or limestone. The latter is used extensively in Pennsylvania and New Jersey, because it is the most accessible. All the shells on the shore, if burned, would not meet the wants of these sections. Either is a good application, and ought to be much more generally used. Stone lime containing a large proportion of magnesia should be avoided.

"The Idea of Underdraining is New to Me."—So writes a Tennessee correspondent of the *Agriculturist*, and he would like to receive further instructions. We shall have much to say in the future, as in the past, on this important branch of farming. In the meantime he should get Waring's *Draining for Profit and for Health*, and if there is any thing he does not understand we will do all we can to throw light on the point.

The Chemical News is a republication of the English periodical of the same name, with an American addition. It is of great value to all who would keep posted as to the progress of chemical science.

Refuse of the Rendering Vats.—"I can get a hundred loads of the refuse from the steam-tank of a slaughtering house, but the stench is distressing to my neighbors. How can I cart it without offense?"—So writes an Indiana correspondent. This is probably the solid or partly solid residue, after the "soup" has drained off, the whole solid and liquid mass having been thrown out into a heap. It decomposes very rapidly, and must either be composted, dried upon the spot, or carted away. To cart it in its decomposing state, without at least partial deodorization, is impossible. Gypsum would absorb ammonia if scattered liberally over the top of the cart, but would not destroy the effluvia. If the mass be solid enough to sustain a covering of two or three inches of dry earth, thrown upon it after it is in the tight box-cart or wagon, this would be efficient. The fresh material might be mixed with lime without loss, provided it were to be composted with earth or peat, or put into the soil before a great while. If the fresh refuse is very liquid, it might pay to move it in tight hog-heads or boxes, without attempting to deodorize it. Why not hire half an acre of land, and compost it thoroughly, somewhere near the slaughter-house?

The Illustrated Register of Rural Affairs for 1869. By J. J. Thomas, Albany. Luther Tucker & Son, By some oversight this Annual was not noticed at its appearance some months ago. Our appreciation of this admirable series is shown by our

keeping it on our book list. Whatever bears the name of John J. Thomas is sure to be good, and this year's Register is no exception. A series of these Annuals is a capital thing to have in one's library.

Sugar in Louisiana.—"A. B. B." writes from New Orleans: "We are learning much from the North now even about our own peculiar crops, for your Western small sugar mills and evaporators are revolutionizing the sugar culture, which it was once thought only the very rich could undertake."

Prickly Pear.—"P." says: "In your interesting account of the Cactus family in the January number you failed to notice one very valuable property of the plant, viz.: if the leaves are bruised and placed in the kettles used in rendering tallow or lard, it will cause the candles made out of the same to be hard and firm even in summer time."

Special Fertilizer for Potatoes.—"F. W. B.," of Edenton, N. C., asks: "Can you advise me that within your own knowledge, you have known 8 bushels of ashes, 6 of lime, 4 of plaster, and 2 of salt, to the acre to be applied to Irish potatoes with success?"—We have never used these articles mixed in these proportions for this crop, but have used them all separately. We have no doubt that the mixture is a good one, and that it will produce very marked effects upon this or any of the hood crops. A half a ton of muck or peat composted with the mixture, and afterwards mixed with 100 pounds of Peruvian guano, would improve it.

Starch Mills.—In Northern New Hampshire, remote from railroads and markets, starch making is profitable. Thereabouts, there are said to be forty starch factories, each turning out fifty tons a year of prime starch, worth \$150 a ton. A half million bushels of potatoes makes 2,000 tons of starch, which sells for about \$300,000. Thus the community realizes 60c. per bushel for the potatoes. The farmer's share is, of course, much less, in cash, but he is benefited by having the manufacture going on in his vicinity.

Soils and Trees.—"G. W. G." If a nursery tree is well grown, has good roots, and well-ripened wood, we should not care whether it was produced on a sandy soil or a clayey one.

Food and Freight.—Mr. Josiah Quincy argues ably before the Social Science Association against railroad monopolies, and high freight tariffs. In some parts of Maine the high price of food caused suffering, while in Minnesota corn was 50c. per bushel. Ought the freight charges on bread-stuffs to be established by law? This is contrary to the spirit of our institutions. Will the establishment of new lines of railroad cure the evil? Ask the President of the New York Central.

Oil-cake Adulterated.—"F. G. C.," Danham, Ct., writes: "I want to purchase some extra feed for my cattle this spring. Is there any security for the purity of oil-cake?"—There is none but the character of the dealer of whom you purchase it. We have not heard any complaint of adulteration in this country, but it is quite common in England, where it is much more extensively used. The singular fact that we can buy in New York City meal supposed to be pure at just about the same or even at a lower price than we can buy the unground cake leads people to suspect fraud, but we think it is because only the hard, whole cake is used for shipping, while the broken or soft cake of equally good quality is ground for consumption in this country.

Field Peas.—"J. L.," Washington Co., Ill. Your "peas" are beans of some variety which we do not recognize. Several are cultivated in the South which are not known to the books. We advertise only in our advertising columns; your stock of seed is too small for you to offer it for sale as proposed.

Natural Inbreeding often occurs. "J. E. E.," of Gettysburgh, O., sends us a specimen from a white oak and red oak which had formed a perfect union.

A National Potato Growers' Convention.—L. D. S., Huron, O., suggests: "We have Grape Growers' Conventions, Poultry Shows, Strawberry Shows, Squash Exhibitions, etc. Why not call together the potato growers of this country, so that all may be benefited by the experience of each one? It would save much trouble and confusion if potato growers could get together and agree upon the proper name of each variety of potato; then we should not have 'Shakers' Fancy' under twenty different local names, as it now is, 'Early Buckeye' with a dozen local names, and so on."

The "Hen Fever."—Why should not people have the "hen fever?" The hens are happily free from it. From Christmas time to near spring, *fresh laid eggs* are worth three to six cents each—40 to 60 cts. per dozen—and rarely less than \$3.00 per hundred. From May to September, "Broilers," that is, full-fledged chickens that will weigh one to two pounds each, and usually three pounds to the pair, will sell for \$1.00 to \$2.00 a pair, alive, which is quite as much as we used to pay for sucking pigs for roasters. The demand for eggs is insatiable. The "transactions" in this city alone are estimated to amount to some \$3,000,000 or \$4,000,000 per month; and during the cool weather from September to April, the sales in the dead fowl market, not exclusively chickens, however, probably exceed those figures. The value of poultry-yard products in the whole country is said to be not less than \$100,000,000 a year. The best breeds for eggs are not the best as to winter layers. The best for flesh are not the best for eggs, nor are those which quickly attain marketable size the best for fattening for the fall and winter market. The most beautiful fowls are found among those famous as layers, yet this class includes also the homeliest. Each breed has its uses, each has its fanciers, some are in fashion now, others will be two years hence. Fowls which sell for \$100 or \$200 a pair are not rare. These are the phases and symptoms of the hen fever—the cure, a liberal investment in hens.

Fowls—In-and-in Breeding.—Geo. C. Van Allen, Henry Co., Iowa. The subject of in-and-in breeding cannot be briefly discussed. In the writer's opinion, you may, without fear of deteriorating your stock, breed the old cock to his own pullets as long as he is vigorous; and, probably, selecting every year one or two of the very finest cockerels, use them also, keeping the best pullets with the old cock for your breeding stock of each year. After he dies, or is too old, you will need fresh blood, and of course you will try to get a cock a little better in size, form, and markings, than any thing you have in your own yard, and you can afford to pay a good price for a pair or trio of such birds.

Buying and Selling Eggs for Hatching.—A hen will lay during the best season for raising chickens about three dozen eggs. If the hen is a valuable one, and any of the eggs are sold, the owner knows he is likely to sell chickens which may, if well cared for, win prizes away from his own. Hence he is perfectly right in putting a high price upon them. It is reckoned that the eggs a hen lays in the spring are worth as much as she is herself. A choice breeding hen of any breed, such as a discriminating fancier is willing to breed from, is worth \$8 to \$10, usually; hence \$3.00 a dozen for eggs is reasonable. It is safe to calculate that not over 30 per cent of eggs that are sent 300 miles by express will hatch. It is good luck if out of a setting a trio or pair of good fowls are obtained. Sometimes all hatch, sometimes none. The packing has much to do with success. The best way is to wrap each egg in paper, laying them in a box with cotton or tow, closely packed, not allowing the eggs to come near the sides of the box anywhere. If an egg be broken, it is the packer's fault; if it be jarred, it is probably the fault of the expressman. There is no redress unless obvious violence to the box shows inexcusable carelessness of the carrier.

House Building Questions.—Many letters, concerning minor points, have been received respecting the houses described last month, from those now building dwellings for themselves. We answer these letters together: The Tank, X, is made with top and bottom frame of 3x6-inch pine, cased or lined with tongued and grooved pine plank—the side planks set perpendicular—planned side out in front. It is lined with heavy sheet lead, with plumber's "tacks" at several points around the sides, to keep the lead from settling down. On three sides it is protected, first by the brick filling in, between the wall studding of the house, and then by double lath and plastering, with an inch space between each coating. Heavy studding from the ground up supports the great weight. The whole is covered, having a trap-door on hinges; the front has ornamented panels and mouldings.... The filtering cistern is 4½ feet deep, and 4½ feet in diameter, with brick center partition having several holes at the base. The receiving side is filled with alternate layers of 2 to 3 inches of charcoal (at the bottom), then thoroughly washed gravel, and coarse sand, ending with gravel at the top—giving 3½ feet of filtering material, and a free space at the top. As the rain water falls pure, the chief object of a filter is to take out dust and leaves lodging on the roof.... The Oriental furnace is "24-inch," from J. E. Liddle, 250 Water Street, New York City.... The wall studding is 4 inches thick, and the filling, brick on edge, leaving 2½-inch space on each side. The siding is of 1-inch board. The filling is carried up to the roof. The walls thus have two air

spaces, an inch board, and the plastering, which give a very effective protection against cold and dampness.... The working plans and specifications in full, asked for by several, would occupy too much of our space. Any items of this kind, in part or in full, will be cheerfully furnished by the builder, Mr. John Donald, Flushing, N. Y., at the bare cost of time and labor required to prepare what may be wanted by any one.... We shall from time to time furnish plans of cheap houses, as we have done in past years, although it is often difficult to get common-sense plans from architects, who are usually too apt to consult style at the expense of convenience. It is no small matter to combine the two well. The following numbers of the *American Agriculturist* contain plans and hints on smaller houses: May and October, 1859; March, 1860; April, 1861; September and December, 1863; April and July, 1864; February, March, and June, 1865; February, 1866; January, February, and March, 1867. For more expensive houses see Feb., 1859; Feb. and December, 1860; March, 1867. (These and other single back numbers are sent post-paid for 15 cents each).

Hydraulic Rams.—Mr. Finning, of Riverhead, asks about the use of hydraulic rams, to throw spring water to farm buildings on elevated ground. He desires to convey the water about 25 rods to a level 100 feet above the spring, and asks how it should be arranged, what material is required, what the cost would be, etc. It may be stated, in general terms, that for so high a lift a large pipe should be used to lessen the friction, and that the drive-pipe should have a length of about 40 feet, and a fall, if possible, of 10 feet, although even 5 or 6 will answer. Probably it will not be possible to throw up more than one-tenth of the flow of the spring, the other nine-tenths being wasted. We should recommend, for such severe work as this, two medium-sized rams working in connection with the same drive-pipe, believing that the strain will be much less than upon a larger machine, and the cost not materially greater. As to the pipe, it would probably be best to use for the first 50 feet of elevation one-inch iron gas pipe, and for the remainder of the lift, as being cheaper, one-and-one-half-inch wooden pipe, such as is made at Elmira, New York. In addition to the cheapness, the extra size would make the flow somewhat more easy. If the height is less than 100 feet, the amount of gas pipe may be reduced; if not more than 50 feet, it need not be used at all. Rams may be purchased in New York City. The cost depends upon the size and outfit of pipe. The *American Agriculturist* for Nov., 1858, contains a lengthy article, with illustrations.

Irrigation.—"M." of Monticello, Arkansas, asks directions for irrigating a cultivated garden with a living spring, situated 150 yards distant, and 15 or 20 feet higher than the garden ground. The water may be brought through an open ditch to the highest point of the garden, where there should be a small reservoir having a copious outlet away from the garden, so that surplus water will flow off without doing harm. The reservoir should have, just at the level of the ground, one or two small openings, through which to discharge, at the will of the operator, a small quantity of water. It will be better to distribute the water, if the land can possibly be so graded as to receive it, by a gentle flow over the banks of small ditches. The most satisfactory, as well as the cheapest means for discharging the water from these ditches, is by simply opening their banks with a hoe, so as to allow a small stream to be discharged at each point from which it is desired to take the water. The ditches themselves should be accurately leveled, and should remain permanently undisturbed. All the rest may be easily done by the gardener himself, whenever watering is necessary. This is the system that has been adopted in the very extensive experiments with the sewage water of the city of London, it being found much cheaper, and in all respects much more satisfactory than any complicated system of pipes and movable gutters. Hydropulps and water engines, with the pipes and hose that their use requires, are expensive and troublesome; and he must be a persistent man in whose garden they would not very early fall into disuse.

The Eclipse and the Corn Crop.—A good many honest souls really believe that there will be a short corn crop because there will be an eclipse of the sun next August. We cannot prove that there will be a good crop, but these are facts. The moon will cut off the light of the sun partly, for less than half a day, because it will be exactly between the sun and the earth. Once in every month the moon always comes near the same relative position, and almost every year it eclipses the sun to some part of the earth. The only difference between this year and any other is, therefore, that the corn crop, and every other, will get perhaps a quarter of a day's less sunshine than if the eclipse did not occur. The sun and moon, separately and conjointly, influence the tides;

perhaps, also, aerial tides and storms, and the weather somewhat. They may, or may not. Somebody *guesses* so; but it is no guess-work to say that the eclipse will in no way affect the corn crop for good or ill.

Gypsum is Sulphate of Lime—Plaster, or Land Plaster. It is sometimes confounded with Plaster of Paris, which is made from ground gypsum by heating it. This drives off water, and reduces it from a granular condition to that of an impalpable powder. Gypsum is the best name for the agricultural article, for it is not in condition to be used as plaster, and no confusion can occur.

Gypsum on Clover.—Gypsum seems never to come amiss to clover. Early spring is a favorable time to apply it. A good time is just after mowing.

Liquid Manure.—In ordinary use, this term applies to all manures in solution in water, and not to urine alone. The application of dung to the land may be most economically effected by spreading it on the surface, when its soluble parts will become liquid manure during the first heavy rain, and the whole of it must be dissolved before the plants receive it. The dissolving of the manures of the stable and their distribution by means of solution in water is troublesome, but there is no doubt that when judiciously used such dissolved manures are the best of all applications for grass lands. The amount of water required for sewage irrigation is something fabulous. At the London sewage farm nearly 300,000 tons were applied in a single season to 50 acres of land.

Muck.—The best way for "Tyro" to convince his "man" of the value of muck is, to compel him to use it. The plan suggested of mixing it with the liquid and solid droppings of the animals in a concreted cellar, there to be worked over by hogs, is the best. Some muck, when properly prepared, is worth as much as stable manure,—some is not worth nearly so much,—but all swamp muck is worth using, and the simple fact that it *dilutes* the manure, and gives a greater bulk of material which may be more evenly distributed over the ground is, of itself, almost enough to make its use profitable.

Manure from the Cattle Cars.—A farmer who receives annually many car loads of manure from the cars on which live-stock are transported to market, asks if there is any danger of his stock taking disease from it. We are not a little startled by the question, as the fact is, there is danger. No great danger, perhaps, because the great proportion of cattle, sheep, and hogs which come to market are sound, and of those which are not, very few are diseased in such a way that their droppings could cause disease in other animals; but there is some risk. Such manure ought to be at once well composted with muck or soil, before it is put where cattle can graze over the land where it is applied, or stand, lie, or work over it. With horses there is no danger.

Canada Farming—Peas instead of Corn.—Henry Strange, of County Wellington, Ont., puts Canadian farming in a "nutshell" when he writes: "Nearly all the best farmers here devote themselves exclusively to raising fine cattle and sheep, and fattening them in the most profitable manner; hence turnips are indispensable, and corn unnecessary, peas taking its place."

Is it Well?—"Is it well to mix cow's feed with their own milk?"—Yes. Why not? Milk is as good feed for cows as for pigs; and a cow will often suck herself if she can, and no harm ever came of it, to our knowledge, except the loss of the milk.

Sassafras and Saw-Brier.—G. A. Gowin, Chicamanga Co., Tenn., writes, that the sandy soils thereabouts are infested with sassafras sprouts and "saw-briers," which are very hard to kill, and asks how to destroy them. The only way is to keep the ground fallow one year, plowing and harrowing it so often that neither has any chance to *breathe*. If thoroughly done, one season will finish the sassafras, according to our experience, and we presume the brier would go too.

Roofing Materials.—"E.W." (no address given) has 12,000 square feet of roof to cover, and asks which is best—Plastic Slate, Asbestos, Gravel, or Tin. We think the Asbestos roofing the best of these, having a basis of coal tar; the gravel is immensely heavy, but good if well applied. The tin excellent, and safest of all, if kept well painted, and not used as a promenade.

Increasing Pasture Lands.—"Tyro." Rather than add more acres of pasture to the little farm, creating a greater demand for manure, it will be better to make the pasture already in use as rich as possible, and then cut for feeding in the barn, instead of pasturing.

Soil for Barley.—"What is the best soil for barley, and what is the usual amount of seed per acre?"—A rather light sandy loam, provided it is rich enough, is best for barley. The crop can be got in early, and it makes a fair growth before the drouth sets in. But if the land is poor, the crop suffers greatly from drouth on a sandy soil, and is frequently not worth harvesting. And the same is true on a wet, cloddy, heavy soil, that is not half worked. But on a well-drained, thoroughly worked clay loam, we usually get the best barley, simply because such soils are naturally richer than light land. If the sandy loam was equally rich in available plant-food, the barley would be equally good—and we think better. If sown with a drill, on good land, 2 bushels is sufficient; we have had a good crop from 1½ bushels, but prefer more than 2 bushels rather than less.

Bee Items.—By M. Quinby.

Starting an Apiary.—Some one writes: "Why not tell people who have never kept bees how to start?"—This is what I have been doing for the last fifteen years, and now there is a class advanced to "Fourth Reader," and anxiously waiting for the "Fifth." These must be kept along, and at the same time the primary class duly cared for. The first thing for beginners to do is, to procure some *reliables* work on the natural history and management of the bee, study it thoroughly, and come to an understanding, if possible, of what a swarm of bees will do under all circumstances. There is very much spurious teaching and miserable guess-work in instructions concerning the apiary. The man who writes without experience of his own, giving only what others have said, will copy an error as readily as truth. Or sometimes a person interested in some particular point in a bee-hive will so distort the truth, that it is hardly to be recognized. When a correct knowledge of the fundamental principles of bee-keeping has been acquired by careful study, the next thing is to get a hive or two of bees; if in movable combs, all the better. Obtain them, if possible, of some reliable person, one who knows what he is selling, and at the same time will not take pay for a worthless article. Bees in the box hive are more uncertain than other stock. No man can guarantee the future prosperity of any hive after it passes beyond his control. In purchasing stocks, reject the very heavy, and very light. A large number of bees is more desirable than heavy stores—especially at this season of the year. Locate them on the summer stand at once. If moved afterward, let it be for two or three miles. Moving short distances in the apiary is bad. Place the stands six to ten feet apart. Recent observations in regard to the spread of diseased brood dictates a greater distance between stands than formerly recommended. Provide hives for the swarms, and if you have not already movable combs, with proper study you should by this time be sufficiently well informed to desire them in some form. I will not now recapitulate the advantages of movable combs, nor describe the method of transferring combs, but will say it is a paying investment as soon as the advantages are comprehended. That the tyro may have confidence in his operations among the bees, he may want to keep them from his face and hands—from his face by a bee-veil, such as described in "Bee-keeping," page 227—from his hands by thick woolen or rubber gloves. Any one who expects to do much among bees should learn to handle things "without mittens," until he finds out that a bee sting is not "killing." After preparing a veil according to the directions referred to, punch the pith out of a piece of elder or other pithy wood, ten inches long, or bore with a slender gimlet through a suitable stick of wood, and insert this tube in the wire cloth opposite the mouth, by which it is to be held when it is desirable to use smoke to pacify the bees. Hard wood, nearly rotten, sawed or split into pieces an inch square, makes the cheapest smoke. Have it thoroughly dry, ignite one end, and blow the smoke in any desired direction on any demonstrations of anger.

The Bee Malady Again.—R. M. Argo, Lowell, Kentucky, says: "Since writing you a few weeks since, I find the malady is far worse than I then thought, all over the State. I believe that by the 1st of April, about all will be gone. Strange to say, my bees are all right to this time, also those of four of my neighbors, that were attended to under my directions. I am asked to account for it, but cannot, and I write to you for your opinion and advice. The bees did not starve; both honey and pollen are left—from fifty to seventy-five pounds in each hive. Some say it is cholera, others that poison honey was gathered last fall. Why did it not attack my bees, and those put up under my direction? I would here remark that mine were all fed last fall on sugar (coffee). Some think they were saved because they were fed, others that they escaped because they were Italians; in proof of which latter view, James Adams, eighteen miles from here, has ten Italian colonies all

right, while the black bees are all gone. It was my opinion last fall, as well as that of others, that bees would starve; that is why I fed mine. But they have died from a far different cause."—It was suggested in a previous number that the malady has continued to spread by the bees taking the honey from hives in which the bees were all dead. Mr. Argo's bees were "put up," and having had no chance to obtain such honey, escaped. From fifty to seventy-five pounds of honey were often left, when it had been supposed there was danger of starving. On the theory advanced, this case could be accounted for by supposing the hives first infected to have been robbed. Mr. Argo's bees being fed would account for their not starving when put up. That his stocks escaped because of their being Italians is not sufficiently proved, as another individual writes that his Italians suffered with the others. I would urge still further extreme care in not leaving a deserted or dead hive standing. Every man, with a live hive remaining, should see to it that all dead stocks within an area of several miles are removed. Personally inspect every hive, whether dead or otherwise, that such as are dwindling and liable to be robbed may be driven out, and all honey put out of the way of doing harm. With regard to the original causes, J. E. E., of Gettysburgh, Ohio, says, "There were great quantities of what we call honey-dew observed on the bushes in this vicinity." If others in Ohio, Indiana, or Kentucky, have noticed anything of the kind, I hope they will report, as it is corroborative of the suggestion made in February.

Cultivation of Broom-corn.

It is usually said that any soil which will produce Indian corn will produce broom-corn. But while this may be true in a general sense, a *profitable* crop of broom-corn requires cleaner, warmer, and richer land than that on which Indian corn is often raised with advantage.

Broom-corn does not often germinate as soon, or grow so rapidly for the first few weeks, as Indian corn. Consequently it is more liable to injury from weeds. It is of the first importance to plant only on clean land, otherwise the labor of hand hoeing and weeding will be very great, and if delayed for a few days the crop may be severely injured. If the land is clean, a Λ -shaped harrow, with a tooth taken out in the centre, drawn along the rows, will destroy the small weeds, break the crust of the soil, benefit the plants, and save a great amount of hand hoeing.

Broom-corn is often planted on the same land year after year, and when the land is very rich, such a course is most profitable, as the thorough culture of the crop makes the land cleaner every year, and there is less labor in hoeing. But when broom-corn is raised in rotation on the upland portions of the farm, a good plan would be to plow under a heavy crop of clover in June, and summer-fallow, and fall-fallow the land by repeated "cultivatings," harrowings, and plowings, to kill the weeds, and make it rich and mellow. A soil so treated would be likely to give double the growth obtained on land planted without any previous preparation. The expense of hoeing and cultivating would be greatly reduced, and the profits of the crop would be quadrupled. The yield varies from 500 lbs. to 1,500 lbs. per acre. A poor crop is grown at a loss, a good one at a large profit. It is said that few people have ever engaged extensively in growing broom-corn without ruining themselves. The fluctuations in the price may have something to do with this result; but it is not improbable that it is also due in part to the profits derived from a small crop planted on well-prepared land leading to an extensive planting on land in poor condition. The labor of hoeing would be far greater per acre on the latter, and if it could not be obtained in the right season would be still further increased, and would be likely to lead to discouragement, neglect, and failure.

If the land is warm, dry, clean, mellow, and rich, the crop should be planted early—say as early or a little earlier than Indian corn. As the plant grows very slowly at first, other things being equal, early planting is very desirable.

From the remarkable effect which plaster, on some soils, has on the growth of sorghum, it is probable that it will prove equally useful for broom-corn. Unleached wood-ashes are also highly recommended; but if the soil is in good condition, we should not look for so great an effect as from the plaster. The great point is to encourage the early growth of the plants and the development of the roots. And plaster, in the case of sorghum, and probably in that of broom-corn, seems to have this effect. In Mr. Harris' experiments on sorghum, on a light loam soil near Rochester, N. Y., the plot having no manure produced only one and a half tons of stalks per acre, while the plot having 250 lbs. of plaster applied with the seed at the time of planting produced nearly twelve and a half tons per acre. (See *American Agriculturist*, vol. 21, p. 351.) One ton of unleached hard-wood ashes produced only a little over eight tons. Of all the manures used, plaster was not only by far the cheapest, but had the greatest effect.

When planted by hand, it is better to mark off the land in rows, three feet apart each way, and drop a dozen or more seeds in the hill, and afterwards thin out to eight or ten plants; but when a drill is used, the rows should be three and a half or four feet apart, and the seed drilled so as to have a plant every six or eight inches. Thinning out should never be neglected, as it is very objectionable to have the plants too thick.

The crop *must* be kept clean. This is a point of the greatest importance. As the plants are quite small, a light cultivator, such as is used in the market-gardens, is far better at first than the ordinary corn cultivators. Start it as soon as the rows can be distinguished, and run it as close to the hills as possible, without smothering the plants or disturbing the roots too much. If the land is clean, and the rows are straight, the cultivator will leave little work for the hoe and fingers. If plaster has not been used with the seed, it may be dropped on the plants at the first hoeing. The plaster will probably do more good on warm upland than on moist bottom land. The cultivator should be used as long as a weed is to be seen. Much of the success depends on thorough and clean cultivation.

As soon as about half the seed is out of its milky state, pass through the rows and break down the tops about one foot below the brush, bending them towards each other. The object of doing this is to prevent the brush from becoming crooked from the weight of the seed. It also accelerates the ripening.

In this state the crop is "tabled." A man walks backward between the rows, and breaks down the plants from eighteen inches to two feet above the ground. Cut the brush close above the upper joint, and lay it on the "table" to dry. In fair weather, this will take four or five days. Then tie into bundles, and draw to the barn. The seed is separated as soon as the brush is perfectly dry. This is done by hand or by machinery, according to the extent of the crop. A small crop can be cleaned with a comb made by sawing teeth in the end of a board, and pulling the brush through until the seed is stripped off. The amount of seed varies from fifteen to thirty-five bushels per acre, according to the luxuriance of the crop and the time of cutting. The brush is better when the crop is cut while the seed is in the milk, but in this case the yield of seed will be light. The seed is quite nutritious, and is usually fed out on the farm. As a marketable commodity, it is very uncertain. Sometimes it is \$5.00 per bushel (for seed), and then again it is not worth 50 cts.

Raising Onions.

BY AN OLD SEED GROWER.

The reason why many do not succeed in their first attempt at raising onions is because they do not select ground which has been suitably prepared in the cultivation of the two or three previous crops. It is a mistake that onions do better, year after year, on the same ground, simply because onions follow onions. It is the higher manuring, more thorough pulverization and mixture of the soil and manures, and the cleaner and more careful cultivation required every year for onions, than is given to any other crop, that fits ground better for them.

Onions will undoubtedly succeed better many years on the same ground than most other vegetables, but there is a limit to this success. In Wethersfield, which has been so famous for its onions, the cultivation has greatly declined on account of the diminished product to the acre. The onions grown there now in many of the old gardens are small; they start quickly and grow vigorously the forepart of the season, but suddenly meet with a check when they should go on growing, even if there be no signs of smut or blast, and ripen too early to attain their former size and productiveness. Much larger crops are now grown in other towns.

One great trouble among beginners on new ground is that the onions will not bottom and ripen at the usual time, but continue to grow all the season and produce too many "stiff necks" or scallions. There are several causes for this. One is, the land, which is too poor to commence the cultivation upon, is heavily manured and plowed deep, bringing the poor subsoil to the surface. The seed in such soil comes up weak, if at all, and the onions grow very slowly until they get hold of the decomposed manure, when it is too late in the season for them to mature. Late sowing, a wet season, and foreign or bad seed, are other causes of scallions. If they do not begin to bottom before September rains, they never will.

The onion is not so particular about the character of the original soil as many suppose. Good crops are obtained on almost any soil, not too wet or too dry, except a stiff clay, light sand, or lumpy gravel. It is essential, however, that the land should have been made rich by the thorough incorporation of manures in clean tillage for at least two years from the sod. Corn, and then potatoes, carrots, or beets, are good preparatory crops. One or two heavily manured tobacco crops admirably fit the ground

for onions; old vegetable gardens are perhaps the best, except where cabbages have been grown, which are the worst of all crops to precede onions. Heavy or rather clayey, moist, not wet, loam generally produces the largest onions. If coarse manure is to be used, spread on twenty to thirty loads to the acre late in the fall, say about the middle of November, and plow it in not very deep; or use one ton of fish guano, spread on after plowing and harrow it in. If raw fish is put on in the spring, the onions will continue to grow until too late to ripen. In the spring, as soon as the ground will work, plow four inches deep, and spread on a good dressing of fine compost or 300 lbs. Peruvian guano or superphosphate of lime, and harrow it in well; back harrow and harrow again, and if not smooth enough, dress with rakes. When not manured in the fall, fine hog-pen or stable manure, free from grass and weed seeds, should be plowed in in the spring and the guano or other fertilizers harrowed in.

Every farmer and gardener should have a reel and line, and a marking rake. They will save a great many steps in laying out; besides, the straight and uniform rows enable the workmen to accomplish a great deal more in cultivating and weeding with the new implements.

The Reel, (fig. 1) may be made of wood, though iron (which may be bought) is preferable. When made of wood it consists of a square frame with projecting top and bottom pieces with holes through the centres to insert a

Fig. 1.—REEL AND LINE.

Bore four $\frac{3}{4}$ -inch holes 14 inches apart, commencing 2 inches from the ends; one hole in the centre; and holes at 12, 15, 16 $\frac{1}{2}$ and 18 inches each side of it. Make four teeth 6 inches long, an inch thick, and round them at the points. Secure them with a pin or key at the tops so they can be easily changed and adjusted to the different widths. The handle of the marker should be six feet long, split, and spread so as to form braces where it is fastened to the head.

Another form of marker is shown at fig. 2, in which the teeth are not movable; they are fixed at the desired distances, on both sides of the head. The land being prepared for sowing, stick down the stake, run off the line, and lay it where it is desired to commence. Adjust the marking rake to 14 inches, draw the outside tooth carefully by the line, and follow back and forth to the last mark until completed. After the ground is marked off it should lie a little while for the surface to dry before commencing to sow the seed. It covers much better, and the dirt will not stick to the wheel of the seed sower. The best onion growers now do not use seed sowers with a roller attached. It packs

the earth so hard that it bakes after a heavy rain and very much impedes the growth of the young plant, and it is not so easy in weeding to break the crust formed where rolled down flat as when the seed is covered by rakes or a light drag. It is of the utmost importance to get good seed—not only good, strong-growing seed, but seed that has been raised from good-sized, well-ripened onions. Imported seed cannot be trusted. The Second Early Red Onion is the best for a general crop. Sow four to six pounds to the acre—say about three seeds to an

inch or five seeds to two inches; cover half an inch.

As soon as the onions are up so they can be seen the length of the rows, run Comstock's Onion Weeder (fig. 3), through them, with the rakes adjusted so as not to throw the earth upon the young plants, and repeat often enough to prevent the growth of weeds. This will keep the ground perfectly clean between the rows. When they are just out of the double, or when the first weeds begin

Fig. 2.—DRILL MARKER.

to show, after cultivating, the ground should be raked lightly, diagonally across the rows with a common wooden hay rake. This will break the crust, destroy the weeds in the rows, and give the young plants a good start.

Early in June, when the onions are 4 or 5 inches high, sow about three bushels to the acre of not very coarse salt broadcast over them. After the second weeding, spread on a good dressing of wood ashes. They require three or four weedings in the rows; but if pains were taken in marking to keep the rows straight and uniform, the Onion Weeder will run so close to them that there will be but few weeds to remove by hand.

When the tops have fallen and nearly dried down, draw four rows together with a wooden rake, raking two rows at a time toward the other two rows. Pull forks are sometimes used, but in careless hands they pierce a good many onions. They may remain as raked together several days, or until sufficiently cured to strip; cut the tops about an inch from the onions. If they are stripped while the tops are partly green they do not keep so well. After stripping, remove them to an outbuilding on a dry day, with a north-west wind, and spread over the floor, not more than a foot thick; turn them occasionally.

To keep onions in quantity through the winter: just before they are likely to freeze, and when perfectly dry, spread them 18 inches thick on a tight floor in a barn or outbuilding which is underpinned so as to keep the cold air from freezing them too severely next the floor. Leave a space of 2 feet next the walls of the building on all sides; spread a sheet entirely over them, fill the space with fine hay, (rowen is the best,) and tread it firmly; then cover the whole about two feet thick with the same, and the onions will ordinarily keep well. They should never be disturbed while frozen, but as soon as the frost is completely out in the spring, take off the covering and spread them all over the room, opening the doors and windows to give air in pleasant weather. If they are not well covered and the thermometer should fall to 15 degrees below zero, some of them may freeze to death, and be soft when thawed.

White onions are the worst to keep, on account of their gathering moisture so readily. They should be kept spread quite thinly on a floor in the light and where the air can circulate freely. Just before winter sets in, spread a few inches of straw on a floor, and place the

Fig. 3.—COMSTOCK'S ONION WEEDER.

onions on it 4 or 5 inches thick; let them freeze a little, then cover them with straw and let them remain undisturbed until spring; or put them into peach crates and cover with hay in the barn, or pile the crates next the walls of a cool cellar.—Onions are generally one of the most profitable crops, often yielding 400 to 600, sometimes 800 bushels, to the acre. Onions are now worth \$3.50 to \$4.00 per bushel. American seed, (and no other is safe to sow,) is in small supply and high. It looks as if onion raising would be profitable the coming season.

Tim Bunker on Being Smart Next Week.

"When are you going to bring home my sled, Neighbor Frink," I asked one morning as I drove up to Jake's door. There was a fresh snow upon the ground, fallen upon an old, well-frozen coat, and the sledding was first-rate.

"Well, I was calculating to bring it home next week, if that'll do," answered Jake, as he stood in the door chewing the last mouthful of his breakfast. It was eight o'clock, then, and he hadn't seen a creature in his barn or pig-pen.

"Next week!" I exclaimed. "You told me that ten days ago, and you haven't drawn a stick of wood since. I have got to draw ten cords of wood over to Shadtown, and I can't afford to lose this snow. If you can't bring that sled home this morning, I'll have to send for it."

"Send away, then, Tim Bunker, and next time I'll borrow of some decent man that's accommodatin'," said Jake, as he turned on his heel, and went into the house.

You see, Jake had had that sled already two months, during the best part of the winter. He came over one morning, and told me that his sled had broken down, and he only wanted mine just for a day or two; he would use it carefully and bring it back next week. I let him have it, knowing then, as well as I did afterward, that I should have to go after it, whenever I wanted it. Jake has a meek, honest sort of face, particularly when he wants any thing; and to look at him, you would think he was a deacon, if he was a little better dressed. I expect Polly has g'n him that look, for the world is indebted to her for pretty much all that Jake Frink has ever accomplished. Aunt Polly is smart right off to-day, especially in her tongue, and with that member and the broomstick she can make Jake smart almost any time. It's lucky that Jake got such a helpmeet, for he is naturally inclined to be smart next week, and if it hadn't been for Aunt Polly, I don't believe the world would ever have heard of him. In spite of her, he has always been full of next-week jobs. I knew him when he was a boy going to school, and setting rabbit traps. He was quick enough to get a lesson, if he would only apply his mind to it—that was the trouble. He was always the best scholar in his class next week; but to-day he liked tobacco, and red-pepper, and cider, better than his books. He did catch some rabbits and minks, but it was always too much trouble to set traps, and he never had half so many as he meant to next week. He didn't visit his traps regularly, and a good deal of the game caught was lost or stolen, for want of Jake's attention. His string of skins generally came out slim in the spring, and he always felt bad about it, for he meant to catch more game than any boy in the school. He was so certain that he was the smartest scholar in the school that he never half studied. He was always at the head of his class next week, but near the tail end to-day. He left school early, and carried his habit of being smart next week into his business. Folks all wondered how he ever got married, or got to doing any thing for a living, or how his way of doing things supported his family. He wouldn't have made out any thing if Aunt Polly hadn't been just as she was, to bring him right up to the scratch, with her sharp tongue, when things were getting behindhand. They find a great deal of fault with the women for having too long tongues, and talking too much. Aunt Polly's was the greatest blessing Jake had in his house. He has always been full of jobs next week, and none of them would ever have been finished if she

hadn't put the goads to him. He was five years shingling his house, and he wouldn't have finished it then, if a driving storm hadn't brought things to a crisis. The shingles were getting rotten, and patching did not stop the leaks. All the tubs and tin pans in the house had to be brought up into the garret every time it rained. The pans would overflow, and the water would go down through the plastering on to the carpets, over the chairs, into the bed-rooms, on to the beds, into Aunt Polly's wardrobe, and on to her clothes, spoiling every thing. The two days' rain made such a storm within, that Jake had to leave every thing else, and shingle. Matters have gone on much better in-doors than upon the farm, for Aunt Polly has some old-fashioned notions about her sphere, and don't follow Jake into the field.

I wrote you some years ago, that Jake Frink had brought water into his barn-yard by a lead pipe, and this was considered pretty good evidence that your paper was doing a good work, and making the farming world move. All the neighbors opened their eyes in astonishment, doubting if the age of miracles was really past. But he hasn't finished the job yet. He did not put any pipe into the trough to carry off the surplus water into the drain, and so it runs off over the top of the yard, making mud always, and in the winter ice, on which his half-fed cattle get many hard falls. Every time his cows lose a calf from this cause, or the slink fever, as he calls it, he determines to finish up this little job; but it is still waiting upon next week. The cure of the horse-pond made a sore place in Jake for several years, and he determined to drain a swamp back of his house, the same year I made my improvement. He actually dug the main drain, and debated a whole year whether he would use stone or tile. The tile carried the day, and were bought. They still lie piled up under Jake's shed, and he has been laying them down next week every fall since. It is well tile don't rot. If women's rights keeps on enlarging as they have done the last few years, I expect to see Aunt Polly under that shed, broomstick in hand, seeing that that job is put through. It will never get done by any other motive power. Slack as Jake is in regard to all business matters, there is one thing I have never known him to put off until next week. I don't want to slander my neighbors, or say any thing agin Hookertown; but we have one grogshop on the street, and Jake goes there as regular as sundown for his whiskey and tobacco. If he could only get the habit of putting off going there until next week, Jake Frink might be a very different man.

Now, Mr. Editor, I don't want you to think that I have any spite agin Jake Frink, or that he is a sinner above all others. I think there are spots in Jake's character, that, with a little rubbing up, would make good looking-glasses for some of your readers to see their faces in. Parson Spooner says pretty often that mankind are divided into two classes. I agree with him so far. The first class are those who are smart today, and do up things square. The second class are those who are smart next week. These may not be so numerous as Mr. Spooner's first class, but there is more of them round than I like to meet. The White Oaks is full of such people. There hasn't been an improvement up there in twenty years, not even in a coal cart. Every man's horse has a bobtail, because his father's had. I believe they tie up their broken harnesses with the same tow strings that their fathers used. I know they have the same old hats and pants stuffed in their broken windows. It has never been quite convenient to bring

home a few panes of glass and a little putty today. I can tell where one of this great class of people lives, as quick as a geologist could tell a fossil. When I see a farmer's carts, wagons, and tools, scattered all about his premises, I put number two agin him. He has been putting up a building to shelter these things for ten years, and has not done it yet. He is smart next week. When I find a man's barn-yard without muck or absorbents, I write him down number two. When I see the farmer's cattle with the bones sticking out, and the hair growing the wrong way, I say number two. When I see his fields covered with Canada thistles or wild carrot, I say number two. When I find his barn-roof leaking, and his stable-doors off the hinges, I say the smart man next week lives here. I am afraid if I marked all the sinners of this class, I should get out of chalk. These things are very bad—almost as bad as an issue of the *Agriculturist* not up to time. I wish they were as rare.

Hookertown, Conn., } Yours to Command,
March 15, 1869. } TIMOTHY BUNKER, Esq.

The Butter Market—Good and Bad Butter.

Butter is a more universal farm product than any other that can be named, except milk and grass; and of both these it is the culmination. Any one going through the country, sitting at the farmers' tables, and eating their butter, finds it, as a rule, excellent, well flavored, tolerably well worked, rarely a little too salt, seldom cheesy, and almost never in the least rancid, except possibly in the spring before the cows come in.

Ask the farmers if their wives and daughters make good butter, and they will almost universally express their candid belief that their butter is of extraordinary excellence,—not good simply.

What a different state of things the market discloses! Here we have the butter of these same wives and daughters selling at wholesale for 25 cents a pound, 30, 40 cents, and a little of it at 50 cents, and even 60 cents a pound. Fifty-five-cent butter, at the present state of the market, is classed as "prime." It is packed in tubs, has good color, good flavor, is well worked, well packed, and will keep. Taking this as a standard, (and it is the lowest standard a good dairy woman should be satisfied with, and not a very accurate standard either), what proportion of all the butter that comes to the New York market will reach it? how much is superior to it? and what will fall below? We estimate that it will include about the tenth part of all that comes from the close of one butter-making season to the commencement of a new one, and that not the fiftieth part of what remains will go above it. Butter superior to this is the product of a very few well-known dairies, which can almost always be depended upon, and dealers handle it with entire confidence. Butter worth over 55 cts. by the package has, of course, a fine color. When the trier is thrust into it, a drop of very slightly milky brine flows out around it, and as it is withdrawn, the air sucks back with a gentle *tz-s-p*. The trier is slightly bedewed with brine; the butter is waxy, firm, even in color and texture throughout, and has that indescribable fragrance which the dealers expressively call "rosy." It reminds one of white clover pastures in June and July, of every thing that is agreeable about a cow; and one thinks of the tidy dairy women, of the clean, cool, stone-floored spring-houses and dairies, and the odors of purity that pervade them. There are different grades of excellence even in this butter, and those who can discriminate have the first chance.

Very few commission merchants, though in

constant practice, can select the very best tubs from such "dairies," and when a consignment comes in, which they think is fully up to their own highest standard, they send to one of the few professional butter tasters, who buy for some of the first hotels and restaurants, that he may come, inspect the lot, and take what he wants. The past season was peculiarly unfavorable for the production of this kind of butter, and out of large lots of "extra," the taster sometimes finds only two or three tubs that will suit his fastidious patrons, and for these he pays roundly—several cents above the market price.

We might fill the whole paper with descriptions of butter worth less than the standard we have named. It is all either noticeably lacking in good qualities, or it exhibits positive bad ones. Some is beautiful to look upon, waxy and golden, but has lost the rosy odor of the fields, and gained something from the smoke of the kitchen, from milk spilt upon the floor of the dairy, from the damp mould of cellar timbers, or from the hog-pens near by—something, which may simply act as a neutralizer, while no bitterness or positively bad flavor can be detected. Other butter, from the same causes, is bitter, or smoky, or simply stale in flavor, and yet well worked, and appearing well. Then there is a large class of butter which lacks good flavor, and has more or less of bad, which is made at the creameries or butter factories. These establishments aim to employ the very best dairy folks, and to spare no pains in their processes to secure the best possible result. They fail, as a rule, from the fact that no means for rapid and perfect cooling of the milk as fast as it is drawn has as yet been generally introduced. The warm milk remains an hour or two in hot weather, shut up in close cans, which is enough to give it bad, foreign odors, which will be not only preserved, but concentrated, in the butter. We commend to those interested in the creameries the article on milk-coolers in the *Agricultural Annual* for 1869, adding that the inventor of the one most approved has produced another one much less expensive, though not so rapid in its operation.

Quite a large class of below-par butter is that which is *overworked*. Butter may be as surely spoiled by overworking as by not working enough. Such butter is often tallowy in cold, and greasy in warm, weather. The trier goes into the firkin with a dead feeling, and comes out as it would out of a cheese; no "*tz-s-p*," as the air sucks in; no dewy brine, or little; no fragrance of the pastures or sweet breath of kine; and yet it is not bad butter. The color is dull, however; it will grow pale on the outside, and this pallor will gradually work in, as soon as warm weather comes, and probably before, and it will gain a spermy or tallowy flavor, and begin to indicate rancidity. There is much less danger of butter being overworked than underworked. However, without discussing the general subject of butter making, we may not close without charging the butter makers among our readers not to be tempted to work their butter too warm; not to mash and grind with the ladle against the sides of the bowl, for this crushes the globules and makes greasy butter; not to salt, and work, and wash two or three times over, until the butter is as dry as a bone, and not moisture enough is left to dissolve the salt. All the water left in the butter should be a strong brine. If more salt be added, it will not be dissolved; if less be present, it shows either too much water, or it will be obvious to the taste that the butter is not salt enough. Hence overworked butter is either not salt enough, or the salt makes it harsh and dry.

The Wrens of the United States.

BY R. D., PHILADELPHIA.

In the United States there are nine species of wrens belonging to the genus *Troglodytes*, besides the *Regulus*, of which there are two species, the Golden Crested, and Ruby Crowned Wren, or Kinglet. The commonest and best known of our wrens is the House Wren (*Troglodytes adon*). Its peculiar places of building, with the partiality it shows to the habitation of man, makes it a general favorite. It builds in boxes or bird houses, or any convenient crevice, and has been known to take up its habitation in such odd places as an old hat, or the pocket of an old coat. There are

some things stated about this bird which are not altogether correct. It is said that two pairs of House Wrens will not build near each other, but will fight until one or the other is driven away. At our home, in Jersey, in the year 1867, we had three pairs breeding within the space of a hundred yards. Although they would not associate with each other, I never observed them quarreling. They all sought food in different directions. This species measures four and a half inches in length. The form of the bird is shown in the left hand figure of the engraving. The general color is a reddish brown, which is darker on the head, indistinctly barred with dark brown. The other species are mentioned in the order of their size.

The Rock Wren (*T. obsoletus*) is not much known. It was discovered in the rocky regions of the West, and was first described by Thomas Nuttall. It is nearly allied to the next, which it resembles in some of its habits. It breeds in the crevices of rocks, in which it also hides on being alarmed. The length of this bird is six inches.

The Great Carolina Wren (*T. ludovicianus*), although a common bird in the Southern States, it is not so with us. To find it, one must resort

to its favorite swamps, or rocks, near some brook or pond. Here it is easily found by any one who has ever heard its song, which, once heard, can never be forgotten. After satisfying itself with food, which consists chiefly of spiders, and such other insects as abound in

swampy places, it mounts to the top of some shrub, and there, with drooping wings and tail, it pours forth its loud and pleasing song. If disturbed, it drops from its perch, and disappears with the celerity of a mouse, running

of rocks, as well as under the trunks of fallen trees. The eggs are dull white, sprinkled with a reddish color, and are five or six in number. Length of the bird, five and a half inches.

Of Bewick's Wren (*T. Bewickii*), represented at the right hand of the engraving, which is taken from Audubon, I can say but little, as I have never seen any living specimens. It is found sparingly in the mountainous parts of Pennsylvania and Virginia, and is more plentiful farther south. Skins of this bird measure about five and one-third inches in length.

The Wood Wren (*T. Americanus*), was discovered by Mr. Audubon. Although it cannot be called rare, yet on account of its retired habits, it is not often seen, and consequently but very little is known about it. It is said to breed in decayed logs, constructing its nest of moss. It lives altogether in the woods and thickets, until compelled to leave by cold and hunger. Length, five inches.

The Short-billed Marsh Wren (*T. brevirostris*), resembles the next in many respects, but differs from it in inhabiting the fresh instead of the salt water marshes. It is rare everywhere. With all my searching, I have not been able to find the nest of this species, and can give no description of it. Its length from tip of bill to tip of tail is four and five-twelfths inches.

The Marsh Wren (*T. palustris*).—While clamming one day in the Shrewsbury River, or rather waiting for the low tide, I was attracted by the song of this little bird, from a small island covered with long grass, not far distant. On approaching the island to see the bird, and try to find its nest, I was surprised to see not only one, but a great many. In fact, the whole island was full of them. As soon as we landed, they disappeared, running along the ground between the grass, chattering and scolding at our approach. On hunting for the nests, I found them very plentiful, but none of them con-

tained anything. The second brood had been hatched, and those we saw were the young with their parents. These birds roost in the nests until cold weather drives them south. The nest of the Marsh Wren is placed in the top of a bunch of grass. It is made round, with a

THE HOUSE WREN.

BEWICK'S WREN.

into holes and between the roots of trees, so that it is very difficult to find by hunting; but if the observer remains still it will come from its hiding-place, mount the nearest bush, and sing, if possible, with more energy than before. Early in the spring of 1867, while the snow was still on the ground, I had the good fortune to obtain a specimen of this bird in a swamp, near West Philadelphia. Before shooting it, I closely observed its habits. It was running along the edge of a creek, picking up different things that had been washed down. On seeing me, it instantly disappeared in a thicket, where

THE BASKING SHARK.—(See next page.)

it could have easily escaped, had it not been for its song, which betrayed it. A friend, Mr. Tull, who was with me, procured another one, which proved to be the female. These birds had evidently been living in the swamp all winter. The Carolina Wren builds under the edges

hole, just large enough to admit the bird; this is always placed on the south-west side of the nest. The length of the bird is five inches.

The Basking Shark.—The "Great Sea-Monster."

BY PROFESSOR S. F. BAIRD.

[Some months ago, one of the illustrated weekly papers had an engraving of a "Sea-Monster," with a sensational account of its capture. It was stated that the animal had been examined by Professor Baird, of the Smithsonian Institution, at Washington, and that he and other naturalists regarded it as something heretofore unknown. The skin of the animal is now in a New York museum, and large posters about the streets represent, in brilliant colors, a terrific combat between the monster and its captors. Suspecting the "fishiness" of the affair, we asked Prof. Baird to give an account of the animal, which he does, as follows.—Eds.]

"I take much pleasure in complying with your request for some information concerning a 'wonderful sea-monster,' now on exhibition in one of the museums of New York, which it is stated was captured near Eastport, Maine, last summer, after a most desperate resistance, during which it used certain 'legs' to propel itself along the flats. As the published accounts connect my name with the animal, as having seen it last summer, and being *then* unable to assign it a place among the known members of the animal kingdom, you think that I may perhaps be able to do so *now* for the benefit of your numerous readers.

To answer your inquiries in the fewest possible words, I will therefore say that the beast is the common Basking Shark, (as I told the showman when I saw it) well known to every sea-faring man; that in its preparation it is distorted and changed from its true shape; and that the 'legs' are the so-called 'claspers,' found in all male sharks, large and small, and which are flabby appendages to the reproductive organs. In their ordinary state, they are club-shaped, ending in a rather blunt point. When I saw the animal at Calais, last summer, they were not materially altered from their natural shape, but I have been informed that they have been ingeniously manipulated so as to give them the appearance of toes, perhaps with claws, and bent to represent the joints of limbs. There is, however, no bone, or joint, or division of any kind in them, and they are about as well adapted to aid in progression as are the teats of a cow.

This Basking Shark, *Selache*, or *Cetorhinus maximus* of naturalists, is abundant in the North Atlantic, and is frequently captured for the oil contained in its liver. It has the habit of lying or 'basking' sluggishly on the surface of the water, probably while asleep, and will then allow boats to come very close to it. It forms an exception to our preconceived ideas of a large shark, being perfectly inoffensive, never attacking man; and, in fact, it is believed to subsist on sea-weeds and minute marine animals. The teeth are very small, scarcely larger than those of a codfish. The eyes are small, and situated further forward than in other sharks. The gill openings are very large, and the intestines are much convoluted.

In size, this shark is among the 'monsters of the deep,' a length of thirty to nearly forty feet being frequently attained, with a proportional thickness. There is another shark found

in the southern seas, a *Carcharodon*, still larger, however, and really a 'man-eater.'

The Basking Shark is figured and described in Storer's Fishes of Massachusetts, Dekay's Fishes of New York, etc., although many of the illustrations are incorrect, from having been drawn from stuffed specimens. I send you a figure, taken from a memoir of De Blainville, which is, perhaps, as good a representation of the true animal as can be now found. You will observe, probably, that it bears but little resemblance to the 'Utopia Lake and Passamaquoddy Bay Great Sea-Monster.'

Walks and Talks on the Farm—No. 64.

It is not pleasant walking about a farm in the spring of the year, when the first three or four inches of surface soil is thawed out, and while the ground beneath is still frozen solid. But to me there is a fascination about it that is hard to resist, and few days pass that I do not take a narrow, long-handled draining-scoop and wander all over the farm, forgetting that there are such tiresome people in the world as printers and editors, or that life has any other duty but to get water off the land. With rubber boots and water-proof coat, the harder it rains the greater the pleasure. I like to see the water pour out of the pipes, clear as crystal, while that in the open ditches is as muddy as the Missouri River. This clear water must have left its fertilizing matter in the soil, and the plants next summer will get the benefit.

At this season, when the ground is frozen underneath, but when we have had more or less thawing weather, it is curious to observe the effect of underdrains. It would seem impossible for the water to soak through the frozen earth. But it certainly manages to do so, and that quite rapidly. We are digging drains now, and as there is considerable water in the deep furrows which we plowed out last fall, where the drains were to be cut, the men try to dam it up, but find it almost impossible to do so. It gets through or underneath the frozen soil on each side of the dam.

Another fact is worth observing. The soil above an underdrain is completely thawed out, while the soil on each side is frozen solid. With a narrow spade, or a light crow-bar, I could trace every drain on the farm. I supposed, at first, that the soil was thawed by the water soaking through to the drain underneath. But this is not the true explanation of the fact; for I find that in a case where, three years ago, I dug a ditch three feet deep, intending to tile it, but from insufficiency of fall abandoned the undertaking and filled up the ditch, the soil is thawed out just the same as where there are tiles underneath. It would seem, therefore, that the effect is due simply to the fact, that the soil has been stirred two or three feet deep. Whether this soil is frozen during the winter, I do not know, but it seems more probable that it does not freeze than that it should thaw out earlier in spring. Both these fields, where I have observed these effects, have been under the plow more or less since the drains were laid, three, four, and five years ago. It seems clear that deep tilled land is warmer in winter than land plowed only six or seven inches deep. The fact is important to the gardener, if not to the farmer. Apparently, a rather heavy garden soil, well drained and sub-soiled, or trenched two or three feet deep, could be planted earlier than a similar soil worked

only on the surface. It would seem, too, that trees, shrubs, and vines, on such deeply stirred land, would not suffer as much from severe frost.

One of the most convenient methods of reviving chilled lambs or little pigs is, to bury them up to their heads in a barrel of steamed chaffed hay or straw. It is comparatively dry, and retains the heat for a long time. A few bags of steamed chaff or cut straw placed along the bag, and between the legs of a sick cow, as she lies prostrate, will often do more good than medicine. It is generally well, however, to give a little medicine of some kind, and let it be understood that the heat is necessary to its effect. In this way, the men can be induced to apply the steamed chaff more hopefully and steadily. Few men have any faith in such a simple thing as rubbing the legs of a sick horse, or of applying heat to the body. I have not tried it, but I presume where there is no steamer, it would answer nearly as well to pour a pailful of boiling water over the chaff. But it would be necessary to keep a good supply of hot water at hand, as it is desirable to apply the bags of hot chaff for several hours, or until the animal gets better.

"Why do you object," writes an old farmer, "to the practice of putting the lines round the shoulders in plowing?" Because a skillful plowman, with well-trained horses, can get along quite as well with the lines on the handles of the plow; and an awkward plowman ought not to be trusted with so much power. He will attribute his own want of skill to the perversity of the horses, and will vent his anger in jerks and yells, that will soon spoil the best team in the world.—Let a skillful man take a pair of well-trained carriage horses, that will answer to the slightest movement of the reins, and which you can guide to an inch, or turn in a moment, or stop on the instant. Provide him with a properly adjusted steel plow that, in ordinary soils, requires a draft of only 350 to 400 pounds. The horses can walk along steadily with such a plow, and do a fair day's work with ease. On the other hand, let these same horses be placed in the hands of a man who anticipates trouble, and who, being a coward, says he "ain't afraid of them;" allow him to tie the lines tightly round his body, and if the horses, being unused to the work, are a little awkward at first, he will begin to pull and jerk before they get fairly started. They do not know what to make of such treatment. They are commanded to go, but at the same time the man behind braces himself with his feet on the ground, and his hands on the plow, to hold them back. They must pull four hundred pounds by the collars, and one hundred pounds or more by the bits. If anything goes wrong, they are jerked back with all the force the man can exert, say two hundred and fifty to three hundred pounds, and if he is *very* mad, perhaps five hundred pounds. When a man holds tight lines in driving a carriage, there is no loss of power, because what is pulled by the bits reduces the draft on the collars. But in plowing, all that the horses pull by the bits is a total loss. It is not only a loss of power, but it frets the horses, and they cannot do nearly as much work as if they had their heads at liberty. A few weeks of such treatment will utterly spoil a pair of carriage horses. Their necks become as stiff and unyielding as a post, and they will no longer answer to the reins. I keep eight horses, and there is not one of them that can be driven in a carriage with any degree of pleasure. They have all been spoiled by this

utterly abominable practice of putting the lines round the body in plowing.

My Ohio friend, who wanted me to go West, and not wear out my life among the stones of Western New York, is not satisfied with what I said about the matter. He admits that the averages given in the Agricultural Survey of Delaware Co., Ohio, are correct, but thinks I should have stated that "It was there inserted, that on any of our lands, by proper rotation of crops and good tillage, forty bushels of corn per acre were produced in the most unfavorable seasons, and that without underdraining, or the use of special manures, and, indeed, very little of barn-yard manure—generally, none at all." I can do as well as that here, without barn-yard manure or artificials. Plaster, clover, and thorough cultivation, will give us forty bushels of shelled corn per acre. Of course our farmers do not average this, neither do they in Ohio. But we have good farmers who raise larger crops than this, and underdraining, barn-yard manure, and artificials, are as much the exception here as in Ohio. But of course I do not claim that our land is as rich as the Scioto Valley. All I claim is, that the difference in the average crops is not so much in favor of Ohio as we generally suppose. It is very common for farmers who visit the West to tell wonderful stories on their return of the magnificent crops they have seen. And the impression here is, that the West produces double what we do—an impression which the statistics do not confirm.

The Ohio State Board of Agriculture, at its recent Annual Meeting, awarded the prize for the best crop of corn grown in the State last year to Mr. Burras, of North Fairfield, Ohio. The field contained a little over 13½ acres. It was a sandy loam, pastured the two previous seasons, and manured the previous October and November with 295 loads of barn-yard manure. Land plowed 7 to 9 inches deep the first two weeks in May, and planted May 23d. Rows four feet apart, and hills eighteen inches apart, and thinned to two stalks in a hill. On the poorest half of the field forty bushels of ashes were also applied, with a very marked effect—this half of the field giving at least one hundred bushels of corn more than the other half. Thirty dollars were expended in cultivating the field, and seventeen dollars in hoeing. The yield was less than fifty-one bushels of shelled corn per acre. Mr. B. states that the grasshoppers injured the crop considerably, especially near the fences. He thinks that five acres might have been selected that would have yielded eighty bushels of shelled corn per acre. If so, the other eight and a half acres in the field yielded less than thirty-three bushels per acre. And this is the Premium Corn Crop of the State of Ohio for the year 1868.

"In regard to the average of our wheat crop," my friend writes, "it is to be observed that a large portion, perhaps one-half the crop, is sown upon corn ground, and almost always with timothy, to which clover is added the following spring. Under these circumstances, we can afford to put up with a lighter crop than the Eastern farmer, whose land is occupied two years in the production of one crop of wheat."

Perhaps so; but the profits of a crop of corn, of 33 bushels per acre, followed by a crop of wheat, of 11 bushels per acre, and this by pasture, two acres of which is required to graze a full-grown cow or ox, cannot afford exorbitant profits. Many of our farmers here

do no better than this, some not as well. But we can raise much larger crops, and obtain far higher profits. And doubtless the same is true of Ohio. All I wished to show was, that poor farming does not produce large crops in Ohio, and that this fear of competition with the rich lands of the West is unfounded. This fact is of as much importance to the farmers of Ohio as to those of Western New York. If they can raise corn cheaper than we can, there are farmers still farther West who can raise it cheaper still. But, fortunately for us, and for the farmers of Ohio, all the advantages of life are not concentrated on one particular spot, and all the disadvantages on another. They are pretty evenly distributed. A good farmer can succeed here,—a bad one prospers nowhere.

Summer-fallowing would not be so unpopular if the work was more thoroughly done. If the land was kept constantly stirred, and no weeds suffered to grow, we should hear no more about "sun-burning," and similar nonsense. I have seen but one good summer-fallow for a dozen years or more, and that was one of John Johnston's. Naturally a rather heavy clay, three plowings, and repeated harrowings, rollings, etc., made it as clean, moist, and mellow, as a garden. No wonder it produced good wheat.

Last spring, an intelligent and wealthy young farmer of this State promised me to make the following experiments. He had a capital piece of land, from which a crop of clover for hay and for seed had been removed in 1867, and which bid fair to produce a heavy crop the next year. One of the experiments proposed was this: Plow up half the field early in the spring, before the clover starts, and summer-fallow it thoroughly, plowing it three or four times, and barrowing and cultivating as often as a weed shows itself, and oftener. The other half to be allowed to remain until the clover was in blossom, and then turn it under. The surface afterwards to be kept clean and mellow by the use of the cultivator and harrow. Both pieces to be sown to wheat the first or second week in September. Such an experiment has a bearing on a scientific question of considerable interest and practical importance. I visited my friend in July, and found a splendid flock of sheep on the "summer-fallow," with feed enough to keep them fat. Of course this was not what I wanted, and the experiment fell through. But how many summer-fallows are there that are managed much better? One of my neighbors boasts of how he kills thistles. He "summer-fallows," and in August, when the thistles are hollow, puts on a cultivator that crushes the stems of the thistles. This, he says, kills them. He "had a field completely covered with thistles, and this method destroyed them." Perhaps it might. But is this summer-fallowing? It is only truth to add that his farm is by no means free from thistles and other weeds, and is not remarkably productive.

If a farmer summer-fallows, let him do it thoroughly; otherwise he loses his time and labor, and the use of the land.

I have lately received several letters from farmers in different parts of the country, expressing surprise that I should advocate the old-fashioned, and, as they thought, "exploded" practice of fallowing, and they ask for my reasons. If I lived on a light land farm, of course I should not summer-fallow. And if I lived in a section where land was worth two hundred dollars an acre, where manures, natural or artificial, could be obtained at reasonable rates, and where

there was a good demand for everything the farm could be made to produce, I do not think I should summer-fallow. The mere loss of the use of the land for a year would be fourteen dollars an acre. I could use this fourteen dollars to better advantage in purchasing manures. But let a farmer be situated as I am, or rather say as I was five years ago, and it will pay to summer-fallow. I bought a farm of two hundred and eighty-five acres. The land, a limestone, moderately heavy loam, not too light for wheat, nor too heavy for corn; the "clay spots" which the men talked about being simply hard and cloddy from want of drainage. An underdrain and good tillage converts them into the richest and best of land. The farm thoroughly run down; not "exhausted,"—simply neglected. My crops the first season were: Weeds, uncommonly good, large, heavy, early, luxuriant, and of the best quality; Barley, late, rusted, not fit for the maltster,—when run three times through the fanning mill, and ground with corn and peas, made excellent food for pigs; screenings abundant, and fair chicken food; yield, twelve bushels per acre, "thrashers' measure;" Oats, eight or ten bushels per acre,—quality not equal to the "Poland." I also sowed peas. They were better than the oats and barley, but I forget the yield per acre. In fact, it is possible that I did not thrash them at all, but fed them out to the pigs. I keep an exact and detailed account of every day's work done on the farm, but I am now talking from memory, and may not be giving the exact figures. Sometime I may give you all the particulars.

After the barley and peas, I sowed wheat. The land was plowed, and cultivated thoroughly. The yield was about fifteen bushels per acre. It was seeded with clover, which was very good—really encouraging. After the oats, the land was plowed in the fall, I think, and again in the spring, and was planted to corn. The corn was cultivated ten or a dozen times, and was a good crop—probably seventy or seventy-five bushels of ears per acre. After this it was sown to barley: yield, perhaps eighteen bushels; the wheat, eighteen bushels. This seeded with clover, which was capital.

What I want to say is this. If, instead of sowing oats, barley, and peas, I had summer-fallowed the land, it would have been money in my pocket. A summer-fallow would have enabled me to clear the land cheaper than I could do it with a cultivator among the corn.

The error I made is a very common one—*looking at the gross receipts instead of at the profits*. I thought two crops would bring in more money than one, forgetting that even if this is the case, one good crop will often afford far more profit than two poor ones, and leave the land in better condition. If I had the last five years to live over again, I would certainly summer-fallow more. I would clear the land, develop more plant-food, and put two crops into one. It is not "high-farming," but it would pay better than sowing so much land to spring crops.

Constant Supply of Water for Live-stock.

If water has to be supplied to stock by pumping, or if the animals must be driven to the trough or brook, aside from the great expense, in time there are other losses felt keenly by the thoughtful farmer, and which we have often commented upon. Besides, the duty of watering the animals, if left to irresponsible parties, is more likely to be neglected than perhaps any

other in the whole routine of farm labors. The remedy for all this trouble is a supply by means of flowing water in the barn and stock-yard. But water is quite as desirable at the house as at the barn, and when pipes have been laid and water flows both at the barn and house, it often happens that the barn being situated on lower ground than the house, if water flows there, it will not at the higher level. To obviate any difficulty from this source, or, in case of scarcity, to economize in the use of water, Mr. J. H. Mabbett, of Tarrytown, suggests an

Fig. 1.—WATER FOR STOCK.

application of the principles involved in a water fountain for chickens, which he described in the *Agriculturist* of November, 1861. This is shown in figure 1. The leader, which may be a branch from, or the terminus of, the pipe that comes from the spring, or elevated cistern, comes up from the ground at the post under the tub, and a short piece of rubber tube connects it with another piece of metal pipe, which delivers the water at the top of the tub. The post is of oak or cedar, made with a sharp edge at the upper end, which receives the weight of the tub when full; over this edge the rubber connection lies. The tub is balanced upon a frame, as shown, and when nearly full, it presses

Fig. 2.—WATER FOR FOWLS.

with sufficient force upon the rubber tube to close it. Thus the tub can never remain long empty, neither can it overflow, and the water is never flowing except when there is need.

Another application of the same principle is seen in figure 2, where a wooden tube conducts the water from a barrel along near the chicken coops. Near each coop a hole is bored in the pump tube, and a cork inserted, in which is a glass or tin tube, or a bit of pipe-stem. The tube may be made to fit water-tight in the cork by melting a little wax around it with a hot iron. Over this tube or pipe-stem a thin rubber tube is drawn, which is laid upon the board,

and passing under a *squeezer*, discharges the water into a pan at one end of the board, which is counterbalanced by a brick or stone at the opposite end. Should a chick, perchance, perch upon this brick, its weight might cause the water to overflow in the pan; hence a board is nailed over it, to prevent such a catastrophe.

Saddle Horses for Farmers.

Why don't our farmers ride more on horseback? It is strange that a people descended directly from the English, whose lives may almost be said to be passed in the saddle, should have so entirely abandoned this healthful and convenient means of locomotion. It is very rare to find, on an ordinary farm, a saddle and bridle suited for better work than the plowing of corn; and to find a thoroughly good saddle, one easy for the horse and easy for the rider, is almost impossible. We cherished the hope that one of the many beneficial effects resulting from the recent

war would be to stimulate the use of saddle horses among those farmers who passed three or four years in cavalry service; but, possibly, they may have been surfeited, as, indeed, the writer was, by an overdose of a rather disagreeable kind of horsemanship, (poking along at a slow gait on rainy and wearisome marches,) and did not, as a general thing, have an opportunity of riding good horses in a pleasant way.

We fancy that one reason why there is not a more active general demand for really good saddle horses in America is, because every effort to obtain such an animal is pretty sure to result in disappointment. The article does not, in reality, exist in this country, except in such rare cases as not to form an important exception to the general rule. The saddle horse should be lithe, short-backed, strong-joined, long-necked, free in his action, and perfect in his temper. Such an animal is susceptible of any amount of training that an amateur rider may choose to give him; but, in the furor of trotting horses that rages throughout the whole country, where almost every point that is desirable for the saddle is disregarded, and attention is wholly given

is any class of the community who should use him regularly, and should, as a matter of pride, know how to use him thoroughly well, how to ride strongly, gracefully, and securely, it should be the robust younger farmers of the country.

In England, where it is estimated that, during the hunting season, a hundred thousand people ride daily to fox hounds, fully one-half the number being farmers, who go out to enjoy the sport or to practice their sale horses, there is, of course, a more active demand than can be expected in this country, at least for a very long time; but, even at this day, in the New York market, a perfect saddle horse, nearly thoroughbred, perfectly bitted and broken, and in all respects suited for the use of a lady or gentleman, may be readily sold for from \$2,000 to \$3,000. And when we consider the fact that the animal belongs to a race that arrives at early maturity, while his whole training may be incidental to the doing of errands and the necessary recreation of the younger members of the farmer's family, it seems to us that the opportunity for a combination of pleasure and profit should be enough to induce the giving of greater attention to the saddle-horse question.

Chain-fastening for Tail-boards.

Why is it that anybody uses rods instead of chains to fasten in the tail-boards of farm wagons? The writer has experienced the inconvenience of them from time out of mind. The engraving represents the hind end of a wagon box, with the board held in place by

TAIL-BOARD OF WAGON.

a chain, permanently attached at one end, and terminated at the other by a screw bolt, some six inches long, which goes through the side and receives a nut by which the chain is tightened up. L. M. Lane, of Fairfield County, Conn., writes: "This way of keeping the tail-board of a wagon in its place is new to me, and it may be new also to some of your readers. It certainly must be very handy if one has to take the board out often. All one has to do is to unscrew the nut, put it in his pocket, and let the chain drop. It is always in its place, and no one has to look about for it, as I have seen many farmers do for the rod." The article described was new to us, but we find it can not justly lay claim to novelty. The only objection to the chain is, that it costs 12 cents a foot, while the iron rod costs perhaps a quarter as much.

Wooden Drains.

S. M. F., of Philadelphia, writes that he has had difficulty with the choking up of a stone drain. Tiles were not to be had, and he used two strips of 1½-inch pine plank, four inches wide, set on edge, with a 7-inch plank nailed on top of them. These troughs were put into the ditch with the open side down, stone being placed on top of them, and the remainder of the ditch filled with earth. This drain has worked well. He asks in what respect such a drain is inferior to a tile drain, how long the wood will probably last, and whether the stones on top are of any use. The wood will last a long time; where water generally flows through the drain, keeping the wood saturated,

probably long enough for all practical purposes. Its inferiority to a tile drain lies chiefly in the fact that its floor is not protected against the action of the water flowing within it. There is always danger that the earth will be washed away in some places, and deposited in others, and so obstruct the drain, which is not possible when pipe tiles are used. Furthermore, the excavation required for these longer and larger troughs must be considerably more than is needed for tiles. The stones on top of the trough are of no sort of use, while, by forming courses for water outside of it, they add to the danger that loose earth may obstruct the drain.

Destroying Animal Parasites.

Lice, ticks, the scab insect, and other animal parasites, become peculiarly annoying toward spring and when the weather begins to be decidedly warm. Then their powers are more active, and they multiply with astonishing rapidity. These creatures are oviparous. Eggs are laid in suitable places, and in due time hatched. In general, the mature and the growing insects are killed without great difficulty. Soft or oily grease, certain metallic or vegetable poisons, alum water, arsenic in solution, or a decoction of tobacco, are all fatal if well applied. Mercurial ointment ("unguentum") has great efficacy, but is more liable to be fatal also to the animals themselves. Flowers of sulphur is peculiarly disagreeable to almost all parasitic life, and is especially effective in driving off or destroying hen lice. It should always be at hand, and liberally sprinkled in the nests of sitting hens. We are, however, happily relieved from the necessity and danger of using the powerful poisons above named, by the comparatively recent application of carbolic acid, in the form of soaps, to the destruction of parasites. This sub-

Fig. 1.—APPARATUS FOR INSECT WASHES.

stance is powerful even in the form of a dilute vapor, and causes discomfort and partial paralysis. The soap is constantly giving off this vapor, as we observe by the strong odor like creosote and tar. The actual contact with the soap or a solution of it is usually soon fatal. The assured fact that the eggs are not effected may account entirely for the difficulty sometimes encountered in making thorough work of some

kinds of parasites. (Lice upon dogs have given us most trouble.) Two or three applications at intervals of a week are usually sufficient to relieve the animals. In the summer, sheep and lambs are dipped, and being laid upon a draining board, the liquid is well rubbed into the skin at every part of the body. This can not be done in cool weather. The simplest convenient apparatus for applying small quantities of any such fluid to the skin of any animal is, probably, an oiling flask, a kump filler, or a common bottle, with a perforated cork, in which is a quill, or a small glass or tin tube, but little longer than the cork. From this the fluid may be squirted by a slight jerk, and directed to the exact spot where it is wanted. A good deal more of a flow is secured by cutting a notch in the cork, but it is much better to make two holes through the cork, and to place in one a short tube, as before, and in the other a long one, to admit air, reaching nearly to the bottom of the bottle, and having the outer end bent, as shown at *a*, fig. 1, which represents a glass tube, or at *b*, which represents a tin one. Glass tubes as large as a pipe-stem, and having pretty thick walls, are easily bent if heated over the chimney of a common kerosene lamp. Holes in corks are made with rat-tail files, and if the tubes do not fit air-tight, a little beeswax melted over the top of the cork will make them. From a bottle thus arranged, the fluid will run in a steady stream, as strongly or gently as the operator chooses, according as the bottle is more or less inclined. A still more handy apparatus is also shown in figure 1. A pail containing the liquid is suspended at any convenient height; from it hangs a rubber tube of sufficient length to conduct the liquid to every part of the animal, which is placed upon a table, or made to stand beneath. The tube reaches from the bottom of the pail, passes over the side, where it is tied to prevent its slipping out, and perhaps favored by being laid upon a little saddle of tin or leather, so that the sharp bend shall not close it. Thus a siphon is formed, which will discharge a constant stream of the fluid, unless stopped. A little faucet may be placed in the discharging end, or the tube may be simply closed by the pressure of the thumb and finger, and this end hung by a string or wire upon the edge of the pail when not in use. The best plan, however, is to insert a bit of glass or tin tube in the end, and just back of it to place a "pinch faucet," if we may so call the little contrivance called *quetch-hahn* by the Germans. This is shown in fig. 2, and is a piece of brass wire, bent, and hammered flat, which makes it a stiff spring. This faucet is opened by pressing with the fingers on the coiled ends, and may be held open by slipping it over the end of the nozzle.

If the solution of Carbolic Soap is used, it may be made quite strong, following the directions given upon the packages, as usually sold.

Fig. 2.

The wool or hair should be parted, and the soap water made to touch the skin at every point. It is best to take both time and pains to rub it thoroughly in. It is not necessary or best to wash it out, but it should remain, in order to produce its full effects.

Corn-Cribs and Granaries.

We are glad to get a really new idea on the subject of corn-cribs. The way of bracing a twenty-four-foot corn-crib so that it shall be in no danger of blowing over in a gale, by a wing at right angles to it, and attached to the centre of one side, is to us quite new. It is communicated to the *Agriculturist* by Mr. P. Davis, of Newport News, Va., who describes his corn-house as consisting of four rooms, each eight feet square, the middle or front one having a closely-boarded front and floor, the others having both front and sides of open-work. Mr. Davis says, "No one but myself believed that it would save the corn, because there was so much

P. DAVIS'S CORN-CRIB.

of it bulked together." The result, however, has proved eminently satisfactory. He adds, in regard to the details, "I make the floor of narrow boards, placed three-quarters of an inch apart, and the sides of narrow strips, half an inch apart, thus giving plenty of ventilation. Corn may be husked as soon as it is safe to pull it from the stalk, and stored in such a crib in as large a bulk as one has room for, and it will not injure in the least. The open floor is what keeps it from heating. There is no need of making a corn-crib narrow at the bottom, for rain will not beat in on a perpendicular side, to do any harm, if the floor is an open one. The middle or front room should have a tight floor and front, as this is the place to shell the corn, keep seeds, etc. The sills should be three and a half feet from the ground, laid upon solid posts, set at least three feet in the ground. Sheets of tin nailed around the posts at the upper end are better than inverted pans or flat stones, as such things upon the top of the posts are liable to be injured, are not easily repaired, and are in the way. The tin should reach all round the post, and extend down ten inches from the top. Tenons in the tops of the posts should be made to enter mortises in the sills. There are two especial benefits in a crib such as I describe: First, the building has a broad foundation, without being a very large one, and is not liable to be turned over by the wind, as is often the case with the long, narrow (and narrower bottomed) ones we often see. Second, the door is in the middle, making it convenient to fill all the three store-rooms without either

carrying the grain far, or running over much corn. There is no use of more ventilation over the top than the three gable ends afford. The sides of the crib should be well girded, and the strips strongly nailed to them, so that the weight and pressure of the corn cannot open them. The floor must also be strong. There should be ten posts under the crib. I think ten by ten feet square the best size for each of the rooms, and that will make room for a good crop, and will hold all of a small one, and leave room to pack away anything that you wish to keep away from rats and mice."

Three-horse Evener.

There are thousands of intelligent farmers in this country who never saw three horses worked abreast. It is a rare sight in New England, and

THREE-HORSE EVENER.

in a great part of New York and New Jersey. The great gain in power leads us to present the subject frequently. In addition to the forms for evener and whiffletrees previously given, Mr. S. B. Fisher, of Westmoreland Co., Pa., sends us a drawing and description of a form he has used several years. It is more complicated than the common simple evener in two pieces, but has decided advantages. Mr. Fisher writes:

"The large or main beam is four feet ten inches long, the two outside beams are two feet three inches, and the center beam one foot six inches. The clevises in the outside beams are placed nine inches and a half from the large end of each, the holes being in the center, and the clevises riveted fast. The small ends of the outside beams and the ends of the center beam are ferruled, and small gudgeons with eyes in them are driven into them, and connected by a ring. This, if made right, is the most complete three-horse double-tree."

Good Cows for Poor Men.

Every poor man who can afford to do so naturally keeps a cow; but he generally makes the mistake of keeping a cheap cow, that is, a cow of poor quality. Spending from \$40 to \$60 for her purchase, he secures an animal that, on not very abundant food, but still kept at some expense, supplies the family with enough milk for their use. He considers the operation a profitable one, and undoubtedly it is so. Many poor men would be inclined, we fancy, to think us wild in advising them to pay so much as even \$100 or \$125 for an extra good cow, the best that can be found in the neighborhood; yet we are confident that in a majority of cases, due care being given to the animal's health, cleanliness, and ample nutrition, the profit would be very much greater than with an inferior animal. Probably the average of cows kept for the family use of poor men will not give more than 1,500 quarts of milk per annum, or, at the most, 1,800 quarts. This amount of milk, in the family of the ordinary mechanic or laborer, is worth five cents a quart for home consumption,—say \$75 or \$80 a year. Out of this sum is to be paid the interest of the animal's cost, her depreciation in value, and the price of purchased food, which is more or less according to the circumstances under which the family live.

For \$125, even in other districts than those which are chiefly devoted to the keeping of cows, an excellent animal, frequently a grade Ayrshire or Short-horn, may be purchased, that will give with good care, on rich food, not less than 4,000 quarts of milk per annum. Instances are not rare of the yield reaching even 5,000 quarts. With such an animal we will suppose that, as in the previous case, 1,500 quarts are consumed by the family, and are estimated to be worth \$75. This leaves 2,500 quarts of milk for sale; and, in almost every village in the land, this milk may be readily sold at the door for six or eight, and not seldom for ten cents a quart. At the least price,—six cents,—the total amount of sales would be \$150, which would pay for the extra food required to keep this larger animal in the best condition, and for the increased interest and depreciation, and leave a handsome profit besides. Any cow must be sheltered, fed, milked, and generally attended to. The amount of labor required in the case of the better animal is in no respect

greater than in the case of the poorer one. The profit of the operation is all real profit, and no small account should be made of the greater satisfaction and pleasure that result from full milk-pails than from those half full, from fine cows than from "scrubs." It is a return to that old principle that whatever is worth doing at all is worth doing well; and if it will pay to keep any cow at all it will surely pay to keep the best cow that we can afford to buy.

Experience with Fancy Pigs.

About a year ago we purchased a pair of pigs, descended from the stock of the Earl of Sefton, in England, for which we paid in their early infancy, \$60, calculating, with an utter disregard of the old story of the milkmaid in our spelling-book, that if the sow would give two litters a year it would be reasonable to hope for eight pairs of pigs, which, sold at \$60 a pair, would produce a gross income of \$480. Of course, \$80 would be ample for feed and care, and the very handsome profit of \$400 a year would make the investment of \$60 a most brilliant one.

And now for the result! After a year of most careful and somewhat expensive treatment, during which the animals purchased have grown to fair, but not to astonishing proportions, there has at last been produced a litter of five pigs, four fine ones and one "runt." Whether owing to the high mettle of the mother or to her natural viciousness, whether to predetermined infanticide or to accident, we are unable to say; but this promising family has been reduced, one by one, until now the sum total of the progeny available for future operations is one pig! While it might still be possible to sell to a credulous person a pair of these pigs for \$60, we have found it impossible to get an offer of \$30 for half a pair. Having invested in this enterprise, we propose to see it through, but our hope of magnificent results is slightly dimmed, and our plan of future operations will probably confine itself to such tactics as will get back for the whole concern, young and old, a gross sum of \$60, charging the cost of a year's keep and of baffled hopes to the account of experience. This, however, does not prove that the Sefton pigs are not excellent, and probably they are. There is no doubt that much of our misfortune is the result of too long continued in-breeding in the herd from

which the purchase was made. But the moral of the tale plainly points to the recommendation, not to invest large amounts of money in untried breeds of fancy animals, with a confident hope of making a good deal of money by the operation.

Thoroughbred Males.

It is not within the means of the very large majority of farmers in this country or in any other, to raise only, or chiefly, expensive thoroughbred stock. But it is within the power of every one of them, or it soon would be if they cared for it, to breed only from thoroughbred males. These, belonging to a fixed type or race, perpetuate their peculiarities with much greater certainty than do mongrel bred animals, and they will almost always overcome, in a great degree, the defects of mongrel females, thus constantly elevating the grade of the animal towards the type of the purer race.

This rule holds good with reference to every variety of farm stock, from horses to poultry.

Sir John Fenwick, in the reign of Charles II., said that "every blood horse, even if he be the meanest hack that ever came out of Barbary, is so infinitely superior in courage, stoutness and quality, both of bone and sinew, as well as blood, to the best cold-blooded mare that ever went on a shodden hoof, that he cannot fail to improve the stock, whatever may be his comparative standing among racers." And Sir John Fenwick was perfectly right, as the history, not only of running horses but of trotters, has amply proven; for there is not to-day a successful trotting horse in America who has not in his veins a very large proportion of thorough blood, derived probably through several generations from the side of the sire.

Cattle for the shambles are more economically fed and more rapidly raised to a larger size, if they have been sired by a thoroughbred Short-horn. Cows for the dairy are better and more profitable in proportion to the number of thoroughbred sires whose blood they carry. The commonest and coarsest sow will give far more easily kept and advantageously sold pigs, if these are sired by a thoroughbred Essex, Sefton, or other boar of fixed type. That the same rule holds good in the poultry-yard no breeder need be told. And throughout the whole range, the cost of securing the services of thoroughbred males is as nothing compared with the value of the result as shown in the progeny.

The Poultry-house at Ogden Farm.

As there is an immense demand among the summer visitors at Newport for early spring chickens—these sometimes selling in June for \$2.50 a pair—it has been attempted at Ogden Farm to perfect an arrangement by which early laying and early brooding may be secured. For this purpose, the poultry-house has been built on the south side of a five-foot stone wall. The width of the house at the top is 8 feet, and at the bottom, 10 feet. The plate at the eaves of the roof lies directly upon the wall, while its front edge is 3 feet higher, or 8 feet from the ground. The front is built with a batter, or slope, of two feet, and the whole front, for six feet down from the roof, is made of glass, there being six sashes, 4 feet wide and 6 feet long, having only longitudinal bars, between which the glass is set, as it is in ordinary green-house sashes. A row of "secret" nests runs the whole length of the house, immediately under

the windows, the sun falling directly upon the board covering of these nests, and adding somewhat to their warmth. The stone wall has been pointed with a cement and lime mortar, both on the inside of the house and on its north side, a little beyond the end of the house, each way. The roof and ends are covered with shingles, a board sheeting being nailed to joists, on the inside of which, lathes, set at intervals of six or eight inches, support a layer of sea-weed, which occupies a space equal to the thickness of the joists. The bottom of the house is banked all around with sea-weed or manure, and it would be difficult to conceive of a warmer and sunnier shelter than the whole arrangement affords. The perches, which are four in number, run lengthwise of the house, standing on the same level, about two feet above the ground. They are simply laid in sockets, and can be removed at any time for cleansing, and for the spading up or raking of the soft earth below, with which it is proposed to mix the droppings once or twice a week. The posts between the sashes support, on their inner side, a light, galvanized, iron netting, which covers the whole opening, serving to keep the fowls from flying against the glass, and for keeping them inside the house in summer, when the sashes are entirely removed. The whole cost of the house, built in the best manner, has been less than \$75, and it is large enough to accommodate fifty laying hens, and their early spring progeny. It is impossible yet to speak of the results of this experiment, but, as it involves no new principle, and depends only upon the perfection of methods which have already been tried, there is no reason for supposing that its success will not be complete. Certainly it will not add to the farm expenses in the items of interest, insurance, and wear and tear, more than \$7.50 per annum, equal to fifteen dozen eggs at the average February prices.

Milk Cooling and Coolers.

This is an important subject. The number of devices for effecting this object which will soon be pressed upon the farming community will, we presume, be equaled only by that of wringers and washing machines. Already many patents have been granted, some of which we know to be excellent, and the owners of these patents have the use of our advertising columns, in which to make known their merits.

The following description of a cooler, which is not patented, is sent us by a correspondent, W. C., of Oberlin, O., who has had it in use. We have no doubt it will cool milk quite rapidly, in the broad-mouthed cans such as are used in the dairy regions for carrying milk to the factories. It may be made by any tinsmith, and is not liable to be injured in use. Mr. C. writes: "For cooling milk in Carrying Cans holding thirty to forty gallons, take two tin tubes eight inches in diameter and twenty inches long, each with covers to fit; connect them at top by means of a round, or half round, bowed tin handle, an inch and a quarter in diameter, four inches long, and at bottom by a strap of double tin of the same width. For using, fill the cooler with ice and water to within two or three inches of the top, and set it in the milk-can. After putting two or three pails of milk into the can, lift the cooler a little, and turn it half round and back two or three times; this will stir the milk and equalize

MILK COOLER.

the temperature. Repeat this after the addition of each successive pail of milk, until the can is full enough. If the milk be not quite as cool as desired, the process may be continued until the desired result is attained, which will not be long. In this way we can prepare milk for raising cream, or for carrying to the factory or to market. It may be kept in good condition twenty-four hours, and then give better satisfaction to the cheese-maker and consumer, than if transported warm, immediately after being drawn from the cow. This simple mode of cooling milk gives entire satisfaction to all who have tried it."

WHITE CLOVER.—In seeding down land intended for pasture it is a great mistake not to sow a pound or two of white clover with the red clover and timothy. It will add greatly to the growth and value of the pasture.

What Lands Shall We Drain?

In the January number, in an article on Draining, several questions were set apart for future discussion. The first of these was the one which forms the title of this article.

The question immediately rises, when a farmer thinks of draining, Which of my fields shall I drain first? and he generally answers it by selecting the worst. In fact, writers on the subject of draining almost always recommend that it be first applied to such fields as are most in need of it, that is, to utterly worthless swamps and very wet brush pastures. Though, at first sight, the advice seems to be good, on farther consideration, it will be seen that there are some good reasons why these fields are not the ones whose early draining will result in the greatest early profit. The draining of a worthless swamp is an acquisition of more land, an extension of the actual limits of the farm; and it implies a greater amount of work to be done in cultivation and harvesting, more capital to be invested in implements and labor, and additional acres to be manured. The crop resulting from its reclamation must pay the charges of interest, labor, live-stock, and manure, before it can yield us any actual profit; and probably during the first ten years after the reclaiming of such land, when we come to consider the extent to which other land must be neglected for the sake of it, there will not be much clear profit resulting.

Probably the land which it will pay the farmer best to drain is the best land on his whole farm, if this needs draining at all. Interest on value, teams, and labor for cultivation, manure for fertilizing, and stock to consume products, are already provided; the field is already paying all these charges. Any process that will tend to increase its crop will be attended with very slight increase of expense, if any; and the entire benefit attributable to the drainage is so much clear profit, which, taxed by no charges, accumulates year by year into a fund which will enable us to extend our improvements to other lands. In the draining of the farm, we shall come finally to the worthless swamp, armed with experience in the work, confidence in its results, and means for its execution which will insure not only that the draining shall be complete and successful, but that the improved condition of the land shall immediately be made to yield its fair proportion of profit.

Of course, there are many fields and many whole farms which need nothing more than the very complete draining that Nature herself has given them in the form of a porous subsoil—such lands as are known all over the country as

"early" and "warm." A few years ago we contemplated the conversion of a field of heavy land into a market garden, and on consultation with an old-fashioned neighbor were dissuaded from doing so. "I don't think that'll make good garden land." "Why not?" "Well, it's kind o' cold and late." "But I intend to underdrain it." "Well, I know—but it's cold." "Is n't it cold because it's wet?" "Well, may be so, partly—but then it's naterally cold."

Now, if the experience of the last forty or fifty years in the use of draining tiles has proven anything, it has proven that "naterally cold" means wet, and means absolutely nothing else. In proportion as heavy, wet lands are thoroughly drained, in just that proportion do they become thoroughly warm; and while, owing to the quantity of clay they contain, it may not be possible ever to make them as light and warm as sandy land, it is always possible to make them light enough and warm enough for the most successful cultivation. If we desired to sum up in a single expression the whole gist of our advice to any farmer who wished to decide what fields it was best for him to drain, we should recommend him to try, first of all, such as are "naterally cold;" and if we wished to be more explicit, we should carry out the arguments which justify this suggestion by endeavoring to convince him that his greatest proportion, not of *return*, but of *profit*, is to be found in the draining of land which is already rich and profitable for cultivation, but is yearly subject to those many ill effects of too great wet or too great drought, which it is the chief object of underdraining to overcome.

The Pea-nut, or Ground-pea.

To judge from the number of letters inquiring about the culture of the Pea-nut, Ground-pea, or Pindar, there is considerable interest felt in this crop. The plant being a tropical one, it can be successfully grown only in the warmer States. Small quantities have been raised in New Jersey and Southern Illinois, but the main supply comes from further south. The best account of its culture that we have seen is one given some time ago in the Southern Cultivator, by Mr. N. M. Nixon, of North Carolina, a pea-nut grower of over fifty years' experience. We condense from Mr. N's rather extended article the essential points. The best soil is a light sandy loam; this is manured with 30 to 60 bushels of shell lime to the acre, and 80 to 100 loads of rotted leaves, or woods' mould; ashes are considered valuable. Coarse vegetable matter, or "trash," is burned off, the land thoroughly mellowed by plowing, and the surface made as level as possible. Rows are laid off with a plow or marker, from 27 to 32 inches apart each way, according to the quality of the land. At the intersections of the markings, two peas that have been carefully shelled are dropped, and covered from 2 to 3 inches deep with a hoe, using fine earth. Planting is done from the middle of April to the middle of May. Thorough cultivation is required, which may be done with the plow or horse-hoe, assisted by hand-hoeing, and hand-pulling such weeds as cannot be otherwise reached. The crop must not be allowed to get foul. Harvesting is done in October, and before any frost touches the vines. In harvesting, a plow arranged for the purpose is run along each side of the row; this loosens the vines, which are then pulled up, shaken, and placed upside down. They remain in this position to cure, which requires from two

[COPYRIGHT SECURED.]

HERONS AND THEIR NESTS.—FROM A PICTURE BY WOLF.—Drawn and Engraved for the American Agriculturist.

to six days. The vines, with the peas attached, are then folded in bunches, and stacked, the stack being capped with straw. After remaining in the stack for ten or fifteen days, they are removed to houses, which are tight sheds, thirty feet wide, sixteen to eighteen feet high, and sixty or seventy feet long. A ten-foot passage runs the length of the house; through this the wagon passes, and the vines are stacked on each side, and afterwards the passage itself is filled with vines. The peas are thrashed by a steam or horse-power machine, which has been invented for the purpose. The vines are considered equal in value to clover hay for oxen and mules, but are usually too sandy for horses. The yield varies from thirty to fifty bushels to the acre. Pea-nuts are very exhausting to the soil, and Mr. N. crops his land with them only once in three years; the next year he takes a crop of rye, and the third the land lies fallow.

A Heronry.

Our country abounds in varieties of herons, and they are so peculiar in their form and coloring, and so noticeable for their size, that they have an interest to almost every one. They are a race of fishers, living chiefly upon such fishes and other aquatic animals as frequent the shallow waters of ponds and brooks, though they are as fond of the young of other birds and of small quadrupeds, as frogs, mice, and shrews, as crows are of eggs. Herons, therefore, however interesting, are likely to do great damage in fish-ponds and trout-brooks, for they are ravenous feeders, and require an immense amount of food. Some varieties are shy and seldom approach the abodes of men, preferring, rather, almost inaccessible swamps or other quiet retreats. Other kinds, like the Night Heron and the Green Heron, or "Poke," are familiar birds, and will follow up

a trout-brook to our very barn-yards, and frequently visit the gold-fish ponds in gentlemen's lawns. The Heron family includes Waders, which have long, sharp, compressed, pointed bills, the edges of which are usually notched at the ends. They have a remarkable looseness and length of certain feathers, particularly those of the crest, neck, and back. They pass under the common names of Cranes, Herons, and Bitterns, although all that are called Cranes do not properly belong to the Heron family. Most of the species of Herons build their nests in communities, or, rather, perhaps we may say, they are not solitary from preference, but appear to enjoy life in what might be termed villages and large towns. And so there exist what are called Heronries, or places frequented by great numbers of herons during the breeding season. Heronries are usually in the midst of swamps or similar isolated places, as is represented in the above engraving.

The Persian Cyclamen. (*Cyclamen Persicum*.)

BY WM. J. DAVIDSON, FLATBUSH, N. Y.

Of the many winter and spring-blooming plants that we cultivate for green-house or home decoration, there are few more interesting or useful than the Cyclamen. Its remarkably neat habit of growth, and elegantly marbled or netted foliage, combined with the beautiful and rather odd-looking flowers, render it peculiarly attractive, while its delightful fragrance and easy management give it additional claims to our attention. Many have imagined that it requires some years to get blooming plants from seed, and have thus been deterred from attempting their management; indeed, I was recently asked by a florist of many years' standing, if our plants were three or four years from seed; when, in fact, it is little over a year since the seed was sown. We sow the seed in November, and as soon as the young plants are fit to handle, transplant them about an inch apart into boxes until spring, when they are potted into small pots singly, in rather open, loamy soil, a liberal addition of well-rotted manure and sand being used. By the first of June they are ready for larger pots, and are then placed in a frame and shaded during the day, by the glass being whitewashed, the sash being taken off at night to give them all the benefit of the cooling dews. They do not grow much during the hot weather, but as soon as the nights begin to lengthen and grow cooler the plants get fresh vigor, and by the end of September they are ready to be placed in the pots in which they are to flower. After potting, they are placed in a cool, airy house, and receive all the air that can safely be given to them during the winter months. With the beginning of November the earliest and strongest begin to bloom; others follow in rapid succession, and as

do not all open at once, the flowers are so remarkably persistent that the plants often remain in full beauty for over four months. As the warm months advance the plants will show signs of exhaustion, and the flower-stalks begin to coil themselves up in a spiral form having the seed-pod in the center, and bending towards,

THE PERSIAN CYCLAMEN.—(*Cyclamen Persicum*.)

often into, the earth, ripen their seeds for another season. Probably the best method of treating the old plants is to plunge the pots in a shady border out of doors during summer, and about September, as soon as they begin to make new leaves, take them up, and shaking away the greater part of the old soil, repot them, and treat them as recommended above. I would add that there are few better plants for parlor decoration than the Persian Cyclamen. It is especially a window plant, and if kept cool, say at a night temperature of 40°, and the leaves washed once a week, it will grow and flourish almost as well as in a green-house, standing the variations of temperature and dryness of atmosphere as well as the pet Hyacinth or Chinese Primrose. [The engraving given above is from a specimen from Mr. Davidson's collection, and is about half the natural size.—Eds.]

The Alpine Rock-Cress. — (*Arabis alpina*.)

A good horticultural friend sent us a bit of the Alpine Rock-Cress, and to accommodate its mountain habit, it was placed upon the top of a rock-work at least four feet high. Either because of this great elevation, or because it found a "pocket" of congenial soil, it flourished finely. Whenever the snow melts off during the winter, there are its green leaves, looking as brave as if in defiance of winter. At the first suggestion of spring, buds appear, and before the rest of the hardy plants have fairly waked up, this completely covers itself with a sheet of pure white flowers, and remains a long time in bloom. The flower stems are about six inches high—in rich borders, somewhat taller,—and the flowers and leaves about twice the size shown in the engraving. It is a great comfort to have plants that take care of themselves, and need neither potting nor shelter. Please do not

write to us for some of our stock, as many do for almost every plant we mention; every available bit is promised already. The seedsmen keep the seeds. Sow them this spring, take care of the plants through the summer, and in autumn set the plants where they are to flower. A stock, once obtained, multiplies itself readily by short prostrate branches or offsets which root freely, and a single plant will soon make a dense mat of foliage.

Our Native Sumachs.

The Sumachs belong to the genus *Rhus*, which is the ancient name for the genus. One from the south of Europe, *Rhus Cotinus*, is well known in cultivation as the Smoke-tree, or Venetian Sumach, and is often improperly called the Fringe-tree and Purple Fringe. It is conspicuous for its large masses of hairy flower-stalks. This species has simple leaves, while all our natives have compound ones. Leaving out of consideration for the present our two poisonous species, the Poison Sumach or Dogwood, and the Poison Ivy, which are both distinguished from the rest by their smooth, white, or dun-colored fruit, we notice three which are striking in the landscape for the tropical aspect of their foliage, as well as for their large clusters of crimson berries. The most common species is the Smooth Sumach (*R. glabra*), which is very abundant on poor soils, and often overruns neglected fields. It is usually about four feet

high, but sometimes attains ten or twelve feet. The leaves are a foot or more long, with eleven to thirty-one divisions. In December, 1866, we figured a remarkable cut-leaved variety of this. The flowers are borne in a large cluster at the ends of the branches, are small, greenish white, or yellowish, and not showy; but the resulting fruit, or berry, as it is popularly called, is of a brilliant crimson, hairy, and very acid to the

ALPINE ROCK-CRESS.—(*Arabis alpina*.)

the days begin to lengthen, they are a blaze of beauty, their many shades of color and delightful fragrance calling forth the admiration of every one. Each plant ought now to have from 12 to 30 flowers expanded, for though they

SMOOTH SUMACH.—(*Rhus glabra*.)

taste. The plant itself is smooth throughout. The Staghorn Sumach (*R. typhina*), is the largest of our species, often reaching the height of twenty or thirty feet, and with irregular and straggling branches. The ends of the branches

are covered with a thick down, and resemble the horns of a stag when in "the velvet,"—a peculiarity which gives the popular name. The leaves are of a lighter green than in the first mentioned species. The Dwarf or Mountain Sumach (*R. copallina*), is the handsomest of our native species, and rather less common than the other two. It is from one foot to six feet high, and while it has the same general appearance as the others, it is readily distinguished by its darker green and shining leaves, the stalk of which, or petiole, is winged or margined, so as to appear jointed. All three species add much to the beauty of our autumn scenery, their leaves giving us the most brilliant colors; those of the first two turn to yellow, scarlet, and crimson, and in the Dwarf Sumach they become a beautiful purple, while the crimson or purple heads of fruit make up a mass of color that few shrubs can equal. They are all easily propagated by cuttings of the root, and it is this facility with which they are multiplied that renders them in a great measure unsuitable for introduction into well-kept grounds. Still there are many sandy and barren places where nothing else will grow, which the Sumach would make green in summer, and aglow with the most brilliant hues in autumn. A species of the south of Europe (*R. coriaria*), furnishes in its leaves a valuable material for dyeing and tanning. The species we have named possess similar properties, though in a somewhat less degree. Analysis shows their relative value to be as 26 to 20. The leaves are collected when fully grown and before they begin to turn, usually in August. The leafy tops of the shrubs are cut off or the long leaves beaten off by means of sticks, and carefully dried. Where there is a demand from manufacturing establishments in the neighborhood, the leaves undergo no preparation, but to make them an article of commerce, they must be ground and bolted.

A New Method of Grafting Fruit Trees.

BY M. JEAN SISLEY, LYONS, FRANCE.

The readers of horticultural publications are aware that Mr. A. Boisselot, of Nantes, (France), is the inventor of a very useful method of grafting the vine, which is to insert the graft in the fork between two branches, as shown by the engraving. The advantage of this mode of grafting the vine has been generally recognized,

BOISSELOT'S GRAFT.

but no one has before thought of applying it to other trees, and A. Boisselot himself was not aware of the great service he rendered to horticulture when he published his invention. I have applied it to a great variety of trees, but

principally to the pear, to experiment with new varieties of pears which I receive in great number every year. Before I knew Boisselot's system I could not make use of a great number of the grafts I received, not being willing to sacrifice the trees that were yielding me yearly a quantity of fruit; the old system of cleft-grafting necessitating the mutilation of the whole tree, or at least its principal branches. During the last two years I have grafted every variety of pears I have received, (and at any time of the year), according to the Boisselot system. The grafts have grown like the other branches of the trees, and some of them bore fruit last year. I can thus keep my old trees until I find that the new sorts are preferable to the old ones, and most likely I shall not be obliged to cut them down, as several sorts of pears can very well live and prosper together on the same tree. I have thus increased my enjoyment. This method is, of course, not very practicable on large trees, but is principally useful for small gardens where espaliers and dwarfs are grown, to take up less space. By this method, with a limited number of trees, a great many varieties of fruit can be grown. It can also be usefully employed for experimenting with seedlings that show signs of excellence. It must be understood that no part of the branches between which the grafts are inserted is to be cut back; therefore no mutilation of any part of the old trees is necessary, as is the case in cleft-grafting. [The engraving shows the graft as inserted; it is to be tied, and the junction covered with grafting-wax, or waxed cloth, in the usual manner.—EDS.]

Experience with Vegetables.

BY J. ROBE, MT. LEBANON, N. Y.

BEANS.—The Fejee, or White's Early Bush Bean, is remarkably early as a shelled bean, and almost as good as the pole cranberry; but these dark-colored beans do not find so much favor as the white kinds. Some of the Fejees are nearly white, and I have been trying to run out the dark color by selecting, and planting only the whitest, but have not yet succeeded.

BEETS.—The Spinach Beet, I procured from Washburn & Co., Boston, is an excellent substitute for Spinach, being superior in flavor to it. It may be cut several times during the season. The roots, if slightly covered, will live through the winter, and make early greens, but if covered too much, they will be smothered. . . . The Imperial White Sugar Beet is, perhaps, the sweetest of beets. . . . For early beets to be eaten while small, the Scarcity or Mangel is the earliest and best, but when older, it becomes coarse, and is only fit for cattle. . . . The Bassano is not only very early, but for raciness of flavor is the *ne plus ultra* of beets, for, though we have tried Simon's Early, the Pineapple, the St. Osyth, etc., we have as yet found nothing to equal it.

CUCUMBERS.—The West India Gherkin makes a very good soup or stew, and is easily raised: sow at the same time as the common cucumber, about twenty seeds in a hill, for the black flies are very fond of them. Thin out, so as to leave, finally, but one or two plants in each hill.

OKRA.—This is an excellent vegetable, and should be more extensively cultivated. As with the tomato, the taste for it must be cultivated, and then no vegetable is nicer. The pods are eaten not only in soups, but cooked like asparagus. In our latitude, it needs a hot-bed to start it.

PEAS.—Sowed April 18th, without brushing, in triple rows, one foot apart, about one pint to

one hundred feet, the four following kinds: McLean's Little Gem, Advancer, Eugenie, and Champion of England. Time of blooming: Eugenie, June 6th; Gem, the 8th; Advancer, the 12th; and Champion, the 15th. Pods ready for picking: Gem, 23d June; Advancer, the 27th; Eugenie, July 4th; and the Champion, July 8th. From blossoming to full pods: Advancer and Gem, fifteen, Champion, twenty-three, and Eugenie, twenty-eight days. They are all excellent varieties of peas, but the Eugenie did not fill its pods well, although it is a great bearer.

POTATOES.—The Sebec, with us, yields poorly, and rots badly. . . . The Goodrich is productive and good. . . . The Gamet Chili is good, and does not rot; and although not called early, yet we can dig large ones sooner than from the Sebec or Goodrich. . . . The Harison, with us, is very productive, but also very poor and soggy; though a friend of ours, three miles off, got some of our Harisons, and from that stock raised splendid mealy potatoes. The Early Handsworth turns out early, small, very few, and very poor.

SCOLYMUS.—Is cooked like Vegetable Oyster, but is, I think, preferable, the roots growing much larger. [Called Spanish Oyster Plant.—EDS.]

TOMATOES.—The following kinds were sown in the house in boxes Feb. 27th; transplanted into hot-beds April 3d, and set out in open ground May 25th: about 300 Tilden, 300 Cedar Hill, and 80 each of Smooth Red, Early York, Keyes, and Orangefield. The first ripe were: Tilden, July 28th; Cedar Hill and Orangefield, August 7th; Keyes, August 12th; York and Smooth Red, August 15th. Crop to August 23d: Cedar Hill, forty-four bushels, or one bushel to seven plants; Tilden, twenty-five bushels, or one bushel to twelve plants; York, five bushels, or one bushel to sixteen plants; Keyes, four bushels, or one bushel to twenty plants; Smooth Red, two and a half bushels, or one bushel to thirty-two plants. So that, although the Tilden was ten days ahead of the Cedar Hill, yet by August 23d, we had picked forty-four Cedar Hill to twenty-five Tilden. At the end of the season, the Cedar Hill averaged one bushel to three and a half plants; the Tilden, one to four plants. One hundred Tildens were nipped in, and three hundred not nipped; when the first began to ripen, we picked thirty tomatoes from the one hundred nipped, and had to go over the three hundred to get the same number. . . . The Orangefield is almost as good as a plum for eating raw; it is the sweetest tomato I have tasted. I think that by selection of the sweetest, the tomato will finally rank as a table fruit.

Fruit at Alton, Ill.—Peaches, Apples, and Plums.—BY O. L. BARLER.

[Alton, Ill., has become one of our important pomological centres. Its fruit-growers and others are united in a Horticultural Society, which is a wide-awake body, and is doing a good work. We have arranged with Mr. Barler to keep our readers informed as to the horticultural doings in and about Alton.—EDS.]

On the night of the 10th of December, the mercury sank to 14° below zero, and killed every peach bud in all this region, so far as we have examined, or heard from. Never, in the knowledge of the "oldest inhabitant," have the buds been more thoroughly killed, whereupon some have been thinking that it would be a "heavy joke upon the euroelio." Dr. Hull predicts that, finding no peaches, the "little Turk" will turn upon and destroy our apple crop.

Dr. H. gives in substance the following sad picture: Until within a few years, the apple was grown almost without care. Of late, however, so numerous are its diseases and insect enemies, that in some districts its culture is no longer attended with success, and unless we combine our efforts against its insect enemies, we must wholly abandon its culture, or be contented to feast on the few wormy and knotty specimens which reach maturity. So rapid has been the increase of the plum curculio and the apple curculio, that in some districts these two insects, or even the plum curculio alone, are in sufficient force to totally ruin the apple crop. Hereafter, so far as we can now see, no escape from the ravages of these insects need be looked for, except by united effort in their destruction.

So numerous have curculios become in our own grounds and the surroundings, that for the past two years, our Janet apples have been destroyed, and other varieties made worthless, except for cider. In future, we shall have to bestow the same care in catching curculios on our apple trees that we do on our plum trees. Except in very early apples, the larvæ of the plum curculio do not perfect themselves, but the parts wounded by them furnish resting-places for fungi, which multiply and spread to all parts of the orchard. Horticulturists must recognize the fact that, as we increase the production of any fruit, we, at the same time, increase its peculiar insects and diseases. In the opinion of the Doctor, some varieties of plums may be grown to a profit in all parts of the State, and in many parts with far less care than will hereafter have to be bestowed on the apple. In this country, the curculio has so long held undisputed dominion over the plum, that a knowledge of its varieties has passed out of mind. We shall therefore refer to some of the best, that those who desire to enter the field against the enemy may have fruit in quantity, and of a quality to reward them for their labors. For a single variety for family and for market, we place the Jefferson at the head of the list. For the best three for family use, to ripen in succession, add Washington and Coe's Golden Drop. Add Smith's Orleans for a fourth, and Imperial Gage for a fifth. The Columbia is a desirable sort to plant in apple, pear, or peach orchards, on which to catch curculios. The curculios would be attracted to these trees when in fruit, where they might be caught. The Columbia generally discharges so much juice into the passage made by the larva of the plum curculios, as to drown it. On this account, it is recommended as a protection to our orchards.

The Improvement of the Wild Radish.

Within a few years, successful experiments have been made in the cultivation of the wild parsnip and carrot, resulting in the production of excellent varieties. More recently, M. E. A. Carrière, one of the most distinguished of French horticulturists, has experimented with the Wild Radish. A very interesting account is given by M. C. in the *Journal d'Agriculture Pratique* for February 4th, on the "amelioration" of plants in general, and of the processes and results with the wild radish. We can only briefly indicate the leading points in this admirable paper, using some of the author's drawings to illustrate them. The Wild Radish, or Jointed Charlock (*Raphanus Raphanistrum*), is a common weed in the fields of Europe, as it is in those of the older States in this country. It is different from the English Charlock, or Wild

Mustard, which is also a troublesome weed in many places. The Wild Radish, or Jointed

Fig. 1.

Fig. 7.

Charlock, has pale yellow flowers, which turn whitish or purple, and are marked with veins, and its pod is divided into joints by crosswise constrictions,—characters which serve to distinguish it from the other Charlock. Figure 1 gives the form of the root of the Wild Radish, as taken from the fields, of one-fourth its natural size, in which condition it is woody, and not at all eatable.

Fig. 4.

Fig. 3.

Fig. 5.

The following figures give the different forms of roots, obtained after five years of "amelioration," each reduced in size in the same proportion. In fig. 2 the root is of a deep rose color; that of fig. 3 white, with a violet-colored top; fig. 4 white, with a little violet; the root in fig. 5 is of a dark violet, with a violet flesh; another root of similar shape is black; in fig. 6 the color is of a fine rose, and in fig. 7 entirely white. Whatever their shape or color, all the varieties have a firmer flesh than the radish, and though the radish flavor predominates when tasted raw, when cooked they are more like the turnip. All who have eaten them have pronounced them delicious. Such being in brief the results, we will give the means by which they were obtained. It is commonly supposed that the difference between cultivated and wild varieties is due to the fact that the one has better soil and greater opportunities for development than the other. The character of the soil has its influence, but this alone would not produce the marked results we have described. Selection, and such treatment as will conduce to the desired end, must be added. The object in this case being to develop

roots, the seeds of the wild plant were sown in September, when it was too late for the production of seed, and the whole growth of the plant was expended in the formation of root. At the approach of cold weather, the roots were taken up, the best ones selected, deprived of most of their leaves, and stored for the winter. In spring the roots were set out, and allowed to produce seeds, which were sown in autumn, and the resulting plants treated as before; this process was continued for four generations. It was found that in a heavy, clayey soil the tendency was to produce short roots, while in a warm, light soil, the longer forms predominated. Each year those roots were selected for bearing seed which showed the strongest tendency towards the desired form. Had the object been to make an improvement in the leaves or seeds, spring sowing would have been done, and the development of the root neglected.

Fig. 6.

HOUSE PLANTS—THE SECRET.—A lady who lives in the country recently showed us a box of flowers which she had brought to a friend in the city, the product of the plants in her own dining-room windows. There were Geraniums, Roses, Hyacinths, Crocuses, fine variegated leaves of the beautiful Mrs. Pollock Geranium, a Calla, and other things,—all as beautiful as if they had come from the florist's. There are few private green-houses that could afford a better cutting than this lady's window garden. The secret of her success is this: she lives in an old-fashioned house, built before entries or halls were invented; the room is heated by an open fireplace as long as the weather will allow, a stove being put in only when the cold weather requires it; and no gas is burned. Gas and a furnace are very great conveniences, yet we doubt not that this lady's success in floriculture compensates for their absence. Every time the door is opened, the air of the room is more or less changed, and the plants are under the best possible circumstances that they can be in a dwelling-house. Let those who complain of ill luck with house plants make a note of this, and imitate the conditions as far as possible.

STRAWBERRIES.—There are hundreds of varieties of Strawberries, new and old, but if we ask a Strawberry grower of experience what is the best to plant for family use, the reply will almost invariably be—the Wilson. There are many better berries, but this possesses the quality that most of them lack—reliableness. No variety has yet been found that succeeds so generally in all parts of the country, and none can be so safely planted by the beginner. We, however, would plant other sorts, to test their adaptability to the soil. Jucunda, Charles Downing, Nicanor, and a host of others, are so much better than the Wilson, that where they are found to succeed this old variety is likely to be discarded.

Spring-flowering Bulbs.—The Bulbocodiums.

It sometimes happens that one will know all about a plant from descriptions and figures, yet never have seen it in bloom. So it was with Bulbocodium. Visits to the gardens all around showed no Bulbocodium. Then the writers in the English papers began to complain that it must be lost from cultivation, as they ordered Bulbocodium, and always received something

Fig. 2.

else. With all this we began to be a little anxious about *Bulbocodium*, when we happened in at Thorburn & Co.'s one day, and there was the very bulb staring us in the face, with a label as plain as could be written. Some *Bulbocodiums* were procured, and planted in autumn in a border with other bulbs on trial. One morning, the date now forgotten, but very early in spring, on looking to see if the Crocuses had peeped, there was a breaking of the ground in another part of the bed. A look at the label showed that the early comer was *Bulbocodium*. In a few days, there was a clump of violet-colored flowers, fully opened, beautiful to look upon, while the Crocuses were just showing their tiny spires. Then a snow-storm came, and *Bulbocodium* was rather laughed at for not knowing better than to be out so early. But what did it care for the snow? As soon as the snow was off, it flowered all the more, and kept on just as if it believed that snow was a fertilizer. The engraving gives the flowers about half the real size, with the bulb attached. Of course a portion of the flower is below the surface of the soil. The individual flowers are not very beautiful when taken singly, as they have a tendency to become double and rather irregular; but a mass of them is very bright and cheering. The leaves appear after the flowers have withered; there is a kind with leaves variegated with yellow. The plant multiplies rapidly by the formation of new bulbs. Every one who plants bulbs is sure to have a plenty of Crocuses; but while the Crocus deserves its popularity, we put in a claim for the *Bulbocodium*. It is a pity such a pretty plant had not a more

The Variegated Abutilon.

Having seen notices in the foreign catalogues of *Abutilon Thompsoni*, which had high commendations as a variegated-leaved plant, we were pleased to find a specimen of it from Messrs. Ben-

VARIEGATED ABUTILON.

nett and Davidson, sent at the same time with the Cyclamen, figured on page 137. The plant was introduced from Japan by the Messrs. Veitch, of London, and is without doubt the most novel, and at the same time, the prettiest new plant of the season. The ground color of the leaf is a bright green, which is shaded and mottled with yellow, the marking being so abrupt and dis-

distinct as to give it in many instances the appearance of mosaic work. It is of as free and easy growth and management as the old *Abutilon striatum*, often called "Fairy Bells," and more commonly and incorrectly the "Flowering Maple." It is suitable either for the parlor or conservatory, and has proved to be a valuable plant for outdoor decoration, its peculiar marking and variegation being best developed by bright sunshine. The plant being a "novelty," is now held at a high price, but the *Abutilons* are so easily propagated that it will probably soon become one of our popular plants. We give an engraving of a single leaf of the plant much reduced in size.

Some Varieties of Garden Lilies.

If the readers of the *Agriculturist* do not plant Lilies, it will not be because they have not been now and then reminded that they are among the most satisfactory and desirable flowers. They are hardy, multiply easily, keep in flower a long time, present an interesting variety in habit of plant and shape of flower, and give us colors from the purest white to the most dazzling scarlet. A good sandy loam where the water will not stand suits most of the species. A winter covering of coarse manure will add much to the vigor of the bulbs. In spring planting, the bulbs should be removed very early, before the buds start.

It is customary with florists to take up the bulbs in autumn, and pack them in sand in order to have them dormant for the spring

trade. The bulbs of lilies have fleshy roots, and are more injured by drying than are most others. Many species and varieties are in cultivation, some of which are very rare. We enumerate some of those readily obtained from the florists. GOLDEN BANDED LILY.—(*Lilium auratum*).—2 to 4 feet. White, with chocolate crimson spots, and a golden yellow stripe to each petal; very fragrant. 75c. to \$3.00, according to size.

JAPAN LILIES.—(*L. speciosum*—*L. lancifolium* of most catalogues).—2 to 5 feet. Numerous varieties pure white, rose, and crimson, spotted, etc. 30c. to 75c., according to the variety.

LONG-FLOWERED LILY.—(*L. longiflorum*).—1 to 1½ feet. Long, white, fragrant flowers. 25c.

WHITE LILY.—(*L. candidum*).—The oldest and best known. 3 to 4 feet; fragrant. 15c. to 20c.

TURK'S CAP LILY.—(*L. Martagon*).—3 to 5 feet in height. White to purple. 40c. to 50c.

CHALCEDONIAN LILY.—(*L. Chalcedonicum*).—3 to 4 feet; flowers a most brilliant scarlet, of the shape shown in the engraving. 35c. to 40c.

ISABELLE LILY.—(*L. testaceum*—*L. excelsum*, etc.).—4 to 5 feet; buff or manken color, with scarlet anthers. One of the most beautiful species.

UMBEL-FLOWERED LILY.—(*L. croccum*—*L. umbellatum*, etc.).—2 feet in height. Orange, and variously spotted, with flowers upright. 50c.

The above prices are those of the leading New York florists, who vary slightly in their prices for different varieties, but a collection purchased from either would probably cost about the same. It is best to allow the bulbs to remain for several years without taking them up, as they then form clumps of strong flowering plants. There is a small caterpillar that is very destructive to the

SPRING BULBODIUM—(*B. vernum*.)

popular name. Were it called something fanciful and pleasing, like Snow-drop or Snowflake, it would be better known than it now is.

CHALCEDONIAN LILY.

foliage. If a light-colored, semi-transparent spot is seen upon a leaf, a caterpillar will be found at work on the under side. Crush the rascal.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

A Rustic Jardinnet.

The French word *Jardinnet* (pronounced jar-de-nay) means a small garden, and is usually applied to small enclosures or beds margined with ornamental pottery work. The name is also given to large terra-cotta vases intended for growing plants.

RUSTIC JARDINET.

Some very beautiful ones of this description are now imported, some of them made in imitation of the trunk of a tree. One of our friends, not wishing to pay the high price asked for the imported article, has invented a home-made one, which is more "rustic" in appearance, and answers every purpose of the more costly affair. The lower part of a keg furnishes the receptacle, and split staves, nailed to this, support it at the desired height. The whole is then covered with bark neatly tacked on. Lichens—those ashen-colored and brownish plants found on the trunks of trees and often incorrectly called mosses—are used here and there with good effect. Such plants as are suitable for hanging baskets are appropriate for a *jardinnet* of this kind.

Household Management.

BY MRS. H. M. R., COLUMBIA CO., PA.

True economy does not consist in wearing shabby clothes, "slipshod" shoes, going with half clothing enough to keep warm, nor working yourself and family more than they are able to work, for the sake of getting along without hiring help. No woman ought to be obliged to work on her feet more than seven or eight hours a day; and by proper calculation and order in the household, it is not necessary that she should do so. Where there is a large family and a dairy to be looked after, there should be at least two women to do the work with as much help from the children as they are able to give. Let the work be divided in such a manner that it can be done to the best advantage. Say, let one woman do all the dairy work and help about the washing and ironing. If the dairy is large, this is as much as one can conveniently do, except what sewing, knitting, or reading, she may find time for. Her work will be about the same every day. A word to the girls: The first thing in the morning, see that your hair is neatly combed and put up, and your toilet made in such a way that you would not be ashamed to see any one. Of course you will dress according to your business, but always clean, whole, and tidy. Next get your churning going, strain the milk, work and pack your previous day's butter, etc. By this time the butter in the churn will probably need atten-

tion. As soon as it is washed and salted, empty the churns, wash and scald *thoroughly*, and cool with a pail of cold water. Then skim all the milk that will be ready that day, and thoroughly mix in the churn; cover closely, and it will be ready to churn next morning. Then wash all the pails in two waters, scald thoroughly, and turn down to dry. They should be wiped with a cloth before drying. See that everything in the dairy room is left in perfect order, and your work in this department is done except the straining of the night's milk, which, with rinsing the pails, will take only a few minutes. This will give you nearly or quite all the afternoon of each day to sew, read, or do anything else that is required to be done. It may be necessary on Mondays to let the milk skimming go until a little later, that you can attend to the washing while the other woman is seeing to the dinner, etc. Of course in all large dairies the churning is done by machinery. Now we will see how the woman in the kitchen gets along. We will commence with Monday and follow her through the week, as her work is necessarily varied. If you are well, never let trifles interfere with your daily duties. Let Monday be washing day; Tuesday baking; Wednesday iron, with the dairy girl's help; Thursday, see that everything is mended and in a proper condition to put on; Friday, general baking day; Saturday, general cleaning up. This ordinarily ought not to take longer than until two o'clock in the afternoon, but of course there will be extras some days, which will keep you pretty busy all day. The chamber work and keeping the house, except the kitchen, in order, may be done by either, as circumstances require, or by both, but if by both, let each one have her particular rooms, and look after them entirely. By following this method, or some other equally good, you will have time nearly every afternoon to devote to whatever you may think proper. But never allow yourselves to go slovenly, for of all things a slovenly woman is the most disgusting. There is no excuse for going with the hair looking like a fright, and hanging half way down the back a good part of the day, as too many farmers' wives do. It takes no more time to put it in order the first thing in the morning than the last thing at night, and I am sure if it pays to comb it for a few hours at night, it will pay to do it for all day.

An Ornamental Pineushion.

A very pretty Pineushion can be made in the following manner: Cut a square piece of satin, merino, or silk, and have a grape vine with fruit, arranged in the form of a wreath, stamped in the center. The leaves, stems, and tendrils, should be embroidered with white silk in the ordinary over-stitch, and upon each dot that represents a grape, fasten a wax bead of the size in *a*. Cut for the under side a square like the one em-

VINE FOR PINEUSHION.

broidered, and cover both over a cushion made of some common, thick material, stuffed with bran or sawdust; finish by fastening a quilling of white satin ribbon around the edge. The shape is improved by cutting each side of the material a little hollow. The color may be left to choice. A cushion of this kind makes a very pretty bridal present. The engraving shows a portion of the grape-vine wreath of about half the size needed for a large cushion.

Towel Rack and Clothes Airer.

There are several patented articles which are very convenient for drying towels, airing clothes after ironing, etc., but as a patent is a sort of challenge, and as we like with a few common tools to feel independent in such matters, we sometimes try our hand and see if we cannot make as good an article as we can buy. A three-inch piece was sawed off the end of a ten-inch oak slab, near the but, where the slab was fully four inches thick. It was barked, then smoothed and shaped. A board $2\frac{1}{2}$ feet long, and ten inches wide, was fastened to it by one end with two three-quarter-inch oak pins; and then holes were bored so as to receive eight dogwood sticks, three feet long, and an inch thick at the butts. These were driven in snug, and the

TOWEL RACK.

affair, looking like half a wagon wheel without the felloe, was hung up just high enough to clear the heads of persons walking under it. We find it a great convenience—not in the way at all; occupying no part of the floor; never falling down; out of reach of dogs, cats, and children. The engraving shows the uses and shape of the article.

The Table—Order and Ornament.

Some articles with the above heading have already been given. They were begun with a view of introducing the matter of simple ornamentation of the table, a division of the subject which has not yet been reached. It seems that what little has been said upon order has touched a point upon which our readers are interested. And why should they not be? If there is anything upon which a good housekeeper prides herself, it is her table, and if there is anything about that that is worth knowing which she does not know, she is ready to learn. We do not aim at introducing any "wrinkles" to induce "plain people" to imitate what are called fashionable folks. Our idea is to give such hints as will enable every one, no matter what her condition as to wealth may be, to make the best of what she has. If the housekeeper who lives in a log house in a Western clearing has put her pork and beans on a neatly arranged table, and had them served with order and propriety, she has done her best, and need not be ashamed should the President himself happen along at dinner time. Whatever there may be for dinner or other meal, and whoever may be the accidental guest, don't apologize. It places all parties in an unpleasant position, and does no good. Give the guest the best there is; serve pork and beans or other plain food with as much attention as if it were the choicest dish; and if the guest cannot appreciate the hospitality, he is not worthy of further thought. Several letters have been received asking questions concerning the table, to some of which we briefly reply. "Which is the head of the table?" One lady claims that her end is the head, and her husband differs from her. It is a delicate matter to decide between husband and wife; we will only state that we were brought up in the notion that the husband was the head of the family, and with

this view the place where he sits would be the head of the table. If this does not satisfy our inquiring friend, she must refer the matter to the next Woman's Rights Convention. "How should guests be seated?"—asks another. If the guest is a gentleman, his seat should be at the right hand of the lady of the house, and if a lady, her place is at the right of the head of the family. This is the proper way, but circumstances may modify it, as in families where there are young children for the mother to look after, and who must consequently be near her. All such matters depend upon circumstances. Where there are several guests, and strict etiquette is observed, the host asks the gentleman who is to be particularly honored to wait upon his wife to the table, while he takes the lady who is to sit at his right hand. Where there are several visitors, other things being equal, the most attention is shown to the greatest stranger, but age—if there be marked distinctions in this respect—takes precedence of everything else. No matter how "distinguished" may be the other persons present, the old gentleman or lady should have the place of honor. "Should milk and sugar be passed for each one to use in his or her own tea or coffee, or should the lady of the house add them?"—This is a question upon which we have known sensible people to differ. Some ladies think it their prerogative to prepare the cup before it is passed. Our own notions incline the other way. Some take their tea and coffee "dressed," and others like it "bare-foot," as we once heard a backwoodsman express the difference between coffee with sugar and milk, and without. Some take milk and no sugar, and *vice versa*; and again, tastes differ very much as to the quantity of these additions. We know of one person who does not consider his coffee as sweetened unless he can dip up some undissolved sugar from the bottom of his cup. The only objection we have heard to passing the milk and sugar is that it is "too hotel like." If hotels have found out how their guests are best suited, it seems to us an argument in favor of the practice, rather than against it. Those who advocate the propriety of "seasoning" tea and coffee by the lady of the house have the majority with them, but we think the other method worthy of consideration by those who would consult the comfort of those who sit at their tables; at any rate its adoption would avoid the often repeated "Is your tea agreeable?"

Hints on House Cleaning.

BY MRS. S. O. JOHNSON.

As the spring days approach, the housewife feels her daily cares increase. Every closet, drawer, and piece-bag must be ransacked, overlooked, and cleared up for the coming summer. Carpets must be taken up and shaken, beds well beaten, and bedsteads washed in strong brine to destroy all insects, etc. As any thing that can lessen the labor of a housekeeper is desirable, I venture to contribute my mite. Save the tea leaves for a few days, then steep them in a tin pail or pan for half an hour, strain through a sieve, and use the tea to wash all varnished paint. It requires very little rubbing or "elbow polish," as the tea acts as a strong detergent, cleansing the paint from its impurities, and making the varnish shine equal to new. It cleanses window sashes and oil cloths; indeed, any varnished surface is improved by its application. It washes window panes and mirrors much better than soap and water, and is excellent for cleansing black walnut picture and looking-glass frames. It will not do to wash unvarnished paint with it. Whiting is unequalled for cleansing white paint. Take a small quantity on a damp flannel, rub lightly over the surface, and you will be surprised at its effects. Wall papers are readily cleansed by tying a soft cloth over a broom, and sweeping down the walls carefully. The dust and ashes of furnaces and stoves are deposited in every crack and crevice of our rooms, and require vigilant and active treatment, for their removal. Carpets absorb great quantities of them. All who can afford it will find it a great improvement to use straw matting in sum-

mer, and in autumn cover them with carpet linings or even common newspapers, then put down the carpets over them. Cleansing silver is not an easy task; the use of kerosene will greatly facilitate the operation. Wet a flannel cloth in the oil, dip in dry whiting, and thoroughly rub the plated or silver ware; throw it into a dish of scalding soap-suds, wipe with a soft flannel, and polish with a chamois skin. Your silver or plate will look equal to that exhibited in a jeweler's window, and will retain its brilliancy for six months, if once a week, when washed, it is polished with a chamois skin. Bright silver adds much to the beauty of a table, and is easily attained by this method. Some may think it will injure the plate. I have used it spring and fall for five years, and neither plated articles nor silver sustain any injury. Those who use brass andirons will find it equally efficacious in restoring their brightness. Old feather beds and pillows are greatly improved by putting them on a clean grass plot during a heavy shower; let the beds become thoroughly wetted, turning them on both sides. Let them lie out until thoroughly dry, then beat them with rods; this will lighten up the feathers and make them much more healthful to sleep upon. It removes dust and rejuvenates the feathers.

Household Talks.

BY AUNT HATTIE.

My doctor often says to me, "Do you know that not one family in ten has good bread? Now, if you would benefit the human race, send a good recipe to the *Agriculturist* and tell the people how to make good, wholesome, sweet bread.".... "I would do so, Doctor, but there are so many things required in order to make good bread that it is difficult to give a recipe. They must have good flour.".... "Tell them that.".... "And they must have good yeast.".... "Well, tell them that.".... "And good judgment, perseverance, and good sense.".... "Well, tell them that. You write it, the editors will publish it, and millions will be benefited; half the doctors might go to farming if the women would invariably put good bread upon the table.".... "Many persons will not do just as the recipe tells them, and the blame will fall back upon me.".... "Tell them to do just as the recipe has it. It is not honest to take a recipe and mix it up with one's own ideas." Here are my directions for

HOME-MADE YEAST.—Take six large potatoes of a good kind, pare, and boil until soft, then mash as for the table. Boil a small handful of hops in two quarts of water for a few moments. Put the potatoes into a colander and rub through as much as possible; then pour on the hop water, and wash the remaining potato pulp through with it. When all is strained, return it to the kettle to boil. Take a tablespoonful of ground ginger and two tablespoonfuls of flour; mix with a very little water to a smooth paste, add more water to make of a thin batter; add to this a tablespoonful of salt and half a teaspoonful of sugar, which pour gently into the boiling hop and potato water, stirring all the time, to prevent its burning. Allow it to boil a few moments, then take from the stove and pour into a crock to cool. When warm as new milk, or lukewarm, stir well into it a teaspoonful of lively yeast, and keep of an even temperature until well risen, when it should be put into a suitable jug and corked loosely for a few days. After a few days, drive the cork in tight, and remember to keep it well corked; also shake up the yeast well before taking out a supply for bread-making. This yeast will keep any reasonable time, as the sugar, ginger, and salt, are excellent preserving agents. Persons who have been in the habit of using a pint or a quart of flour will say Aunt Hattie has made a mistake about the quantity of flour; not at all,—two tablespoonfuls is all that is required in this yeast.

MAKING BREAD.—I set my sponge about 8 o'clock in the evening. I consider the bread better when about a dozen potatoes are passed through the colander into the flour, but this is not always convenient, and I sometimes omit them. When this is the case, I pour about a quart of boiling water

into the flour, cooling with cold water until of the proper temperature for the yeast to be added; but inexperienced bread-makers had better mix with water a little more than lukewarm. Sift into the bread-bowl about seven quarts of flour, make a hole in the centre, and pour in about two quarts of warm water and a little salt; stir in some of the flour until you have made a moderately stiff batter. If it is so hot that you cannot bear to hold your finger in the batter, it is too warm for the yeast, and should be allowed to stand until lukewarm; then add a teaspoonful of yeast, and stir vigorously for a good while. The more it is beaten, the better, provided that it does not cool below the lukewarm point. Sprinkle a little flour over the batter, cover with a large milk-pan as closely as possible, cover this again with a blanket, and place in a warm room until morning. The first thing in the morning, mix the bread. By taking care, the flour may be introduced into the batter without its adhering to the hands; but where it does do so, it should be immediately rubbed off with some of the dry flour. Also, where it adheres to the sides of the bowl, it should be removed in the same manner. Be careful not to get too much flour into the dough. It should be spongy and spring under the hands while being kneaded; do not consider this part of the process complete until the bowl is perfectly free from dough, and until the hands may go in and out without sticking. Make the mass into a round ball, sprinkle a little flour on the bottom of the bowl, return the dough, and let it stay in a warm place until well risen. It should be covered with a clean cloth and blanket. In two hours it should have risen so that two or three cracks, an inch wide, are formed on its surface, when it may be moulded into loaves. If two or more loaves are put into the same pan or tin, a space of an inch and a half or two inches should be left between the loaves; they will rise sufficiently to touch, and will divide much easier after being baked. Ordinary-sized loaves will require an hour and a quarter in a moderate oven; if they are very large, it would be well for the inexperienced to thrust a thin skewer or knitting needle into the loaf. If it comes out free and clean, the bread is baked sufficiently. Do not divide the loaves or put them away into the crock until quite cold. Folding in a clean towel until nearly cold has a tendency to soften the crust, and is considered an advantage. To obtain good bread the following precautions must be observed: Be careful that the batter is lukewarm when the yeast is added, and as it will take some time to rise, it must be kept as nearly as possible at this temperature; hence the necessity of covering closely with the pan and blanket. The dough should be kneaded and moulded in a warm room, that it may not get cold. The loaves should be covered also. Avoid putting the pans of dough on the stove or on the hot-water boiler, as the bottom gets too warm and rises before the whole. If the dough gets cold, however, you will be obliged to resort to this means to obtain a fermenting temperature. Bread should be thoroughly cooked, and it is well to always make the loaves the same size, and by looking at the clock the baking may in a few trials be regulated to a nicety. If the bread should be clammy or doughy, make the loaf the same size next time, and bake a little longer, or make the loaf smaller and bake the same length of time.

A DELICIOUS DESSERT is made as follows: Put a small teaspoonful of tapioca to soak for a few hours in warm water. Pare six or eight good cooking apples. Core without dividing, and fill the holes with sugar and a little lemon juice, or grated nutmeg. Pour the tapioca mixture around the apples, grate a very little nutmeg over, and bake an hour, or until done; serve with sweetened cream.

How to Pop Corn.—A "Professor of Pop Corn" says: Put in a pan a heaping teaspoonful of butter or clean lard, a good pinch of salt, and a small handful of pop corn; cover, and put over the fire. Butter or lard improves the popping qualities of the corn, and it pops better than in the wire or screen poppers. If any one knows a better method than the above, let him give it.

BOYS & GIRLS' COLUMNS.

P's that it Pays to Possess.

ADVERTISEMENT—"Boys Wanted."—Wanted, by Uncle Sam, a lot of first-class Boys for the future needs of his estate. A few choice, well-selected boys for Presidents; a number of prime quality, for Senators and Governors; an assortment of good article for Congressmen, Legislators, and Mayors, for States and Cities now existing, and to be speedily erected; a large number, extra-fine, for Judges, College-presidents, and Professors, Doctors of Law, Divinity, and Medicine. Boys wanted to engineer the building of railways and canals, to get the gold out of the mountains, the iron from the hills, and the coal from everywhere. Boys wanted to run steamship-lines to Europe, Asia, and the rest of creation. Boys wanted to farm the prairies, to bridge the rivers, to run factories, to own stores, wholesale and retail, and for other employments too numerous to mention.

Said boys must possess the following Requisites to Success. They must be

In Action, prompt, patient, persevering, and painstaking.

In Mind, practical, progressive, and peaceable.

In Manners, pleasing and polite.

In Life, pure, principled, pious, patriotic, and prayerful.

All boys who can satisfy the above conditions can be readily supplied with good places, and none others need apply to

"UNCLE SAM."

Now, boys, there is your chance for the future. Count up these characteristics; see what they mean; possess them, and you will be sure to reap an abundant reward.

Dealing With Thieves.

The following story is related by an exchange, of Jacob Sheafe, Esq., a merchant of Portsmouth, in former times: A man had purchased some wool of him, which he had weighed and paid for, and Mr. Sheafe had gone to the back room to get change for a note. Happening to turn his head when there, he saw in a glass, which swung so as to reflect the shop, a stout arm reach up and take from the shelf a heavy cheese. Instead of appearing suddenly and rebuking the man for his theft, as another would, thereby losing his custom forever, the crafty old gentleman gave the thief his change as if nothing had happened, and then, under the pretence of lifting the bag to lay it on the horse for him, took hold of it and exclaimed—"Why, bless me! I must have reckoned the weight wrong." "Oh, no!" said the other, "you may be sure you have not, for I counted with you." "Well, well, we won't dispute the matter, it's so easily tried," said Mr. S., putting the bag into the scales again. "There," said he, "I told you so; knew that I was right—made a mistake of nearly twenty pounds; however, if you don't want the whole, you needn't have it; I'll take part of it out." "No!" said the other, staying the hands of Mr. S. on the way to the strings of the bag. "I guess I'll take the whole." And this he did, paying for dishonesty by receiving the skim milk cheese for the price of wool. On another occasion Mr. S. missed a barrel of pork. A few months after, a man one day asked him the question, "Did you ever find out who took that pork, Mr. Sheafe?" "Yes," was the reply; "you are the fellow! For none but myself and the thief knew of the loss." The fellow was detected by the shrewd dealer, who possessed the happy faculty of knowing when to be silent.

Use for the Fire-fly.

Mr. Parton, in the February number of "Our Young Folks," relates that during the recent war two prisoners who had been confined in Andersonville eleven months, hearing that Sherman was at Atlanta, about two hundred and forty miles distant, determined to make their escape and try to reach that point. One of them had a watch which contained a compass, and with this they expected to direct their course, which was northwest. But as they were to travel by night they determined not to start until they could get a box of matches to give necessary light to consult the compass. This, however, they failed to do, and at last, by the assistance of a colored man, they got away and lay hidden until evening, when they started through the woods. About midnight they came to a road which seemed to go exactly northwest. But it was so cloudy they could not see the North Star, they could not consult the compass, and they well knew that a mistake in the direction would lead to recapture and death. The more they talked it over, the less certain they grew. But presently one of them caught a fire-fly, and taking it between his thumb and finger, held it over the compass. To their great joy they found it gave light enough for their purpose, and very soon they ascertained that surely enough the road led straight to the Union Army, and eight nights of travel brought them safely to it.

A Picture Story for the Times.—Write it out yourself.

New Puzzles to be Answered.

No. 340. Puzzle Inscription.—Ec nouoy Dloti. One of our clerks brought us the above inscription, which he wishes very much to have translated. He did not inform us what language it is in. Please find out and read it.

No. 341. Illustrated Rebus.—A fact of recent occurrence.

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the March number, page 103...No. 339. Illustrated Rebus.—Honor upholds the humble in spirit. The following have sent in correct answers. George Brenner, Mrs. J. S. Coles, Frank Lockwood, Lilla Kirk. "Lucy," B. F. Greenman, Milton S. Lavidis, J. McK. Wray, Eldridge Johnson, D. R. Harford, John Conlon, Mary J. Sanborn, Henry Schulz, J. Milton Snyder, F. T. Snyder, Henry Burkholder, D. M. Munro, Lunette Drew, John Heglin, Maggie Wear, A. J. Deitrick, Albert H. Hall, James E. Eshleman, E. M. Clemens, Philip H. Ittel, William D. Hilliard, M. C. Hunter, A. D. Newton, Jas. Mudd, W. A. Ditson, Nannie Johnson, J. Chenoweth, J. M. Thompson.

The Defective Stone.

"Don't put in that stone," said one mason to another, as they were working together on the rear wall of a church. "Can't you see it's a poor quality, all flaky, and will scale away to pieces?"—"It isn't very good grain, I see; but it fits in here, and I don't want to wait for another. Besides, you can't see it from the ground, and nobody will take the trouble to climb up here to look at it."—"You'd better send for another block. That isn't fit for the wall; it won't stand the weather; and if it should go to pieces, it will damage the whole building."—"I guess it won't damage me, nor you either, so here goes." And he lifted the block of loose-grained, flaky freestone into its bed, though the outer thicknesses cracked and the shell sloughed off. He dashed over it a trowelful of mortar, and went on with the next tier. Nobody could see the defective stone, for it was covered by a projecting buttress, and only the two stone-masons were present when it was laid. But though unseen, it was not safe, and time brought about its own result. Every sunbeam loosened its texture a little, every storm helped to crumble off a minute fragment, and little by little, after many years the stone crumbled away. That was bad enough, but that was not all. It chanced that one of the great beams of the roof rested a few tiers above, directly over the defective block, and as the stone decayed, the beam sank a little. Presently a crack opened in the ceiling, disfiguring the fresco-painting, and the crack grew to a leak, letting in the rain. And when at last the worthless block fell out, the beam dropped down, the roof sunk in, and the church was no longer fit for use, until after the loss of much time, and the expense of much money, a new roof was built, and a new block inserted in the wall. It was only a small defect, but it did much damage in the end.—There is a structure which everybody is building, young and old, each one for himself. It is called character, and in it every act of life is a stone. If day by day we are careful to build our lives with pure, noble, upright deeds, at the end will stand a fair temple, honored by God and man. But, as one leak will sink a ship, and one flaw break a chain, so one mean, dishonorable, untruthful act or word will forever leave its impress and work its influence on our characters. Then, let the several deeds unite to form a perfect day, and one by one the days grow into noble years, and the years, as they slowly pass, will raise at last a beautiful edifice, enduring forever to our praise.

The Care of Canary Birds.

Few pets give more pleasure than these sweet singers. They are so perfectly at home in a cage that in looking at them one does not feel the regret experienced in keeping birds born in the free forest thus confined. Unpainted cages are best for birds, as they will industriously peck at every place that offers a hold to their bills, and a very little paint would poison them. The cage should be hung where plenty of light and air can be enjoyed, not near the ceiling where the atmosphere is usually foul. Opposite a window where the sunshine can come in is the best place. Birds are naturally very cleanly, and their cages should be kept scrupulously neat. A piece of brown paper laid upon the floor and changed every day will keep the floor clean; the perches should be washed frequently. Canaries greatly enjoy their morning bath. Give them clean water in a shallow dish daily, and their curious little freaks over it will afford much amusement. The drinking cup and seed cup should be cleansed and refilled daily. Canary seed is the best regular food; for variety, add summer rape seed, and occasionally a little hemp seed. Fresh fruit, sweet apples, berries, etc., will be relished, and are healthful; they are also very fond of sugar, which should be allowed them only in moderate quantity, as an occasional treat. A bit of cuttle-fish bone for them to peck at should be hung in the upper part of the cage, where it will be kept clean. Occasionally a cage becomes infested with mites,—little insects almost too small to be seen without a microscope,—which greatly irritate the bird, and if not destroyed, may cause its death. Their presence may be known by the bird persistently scratching and pecking at his feathers, especially after settling upon his perch for the night. In such a case wash the cage thoroughly with suds made from carbolic soap, and put a very little of it in their bathing water, which will soon clear out the pests without injury to the bird. With care never to frighten a bird, it may be taught to come to its owner from the cage, to feed from his hand, and even to perform many tricks; the feats of Signor Blitz's trained canaries, which many of our readers have probably seen, show that these household birds are capable of receiving no little education.

Spelling Test.—Read the following sentence to any person desirous of showing his knowledge of spelling and request him to write it out. "It is agreeable business to perceive the unparalleled embarrassment of a harassed peddler gauging the symmetry of a peeled pear which a shy! had stabbed with a pomard heedless the innendoes of the lilies of a cornelian bue when on Wednesday last they endeavored to separate a niece and aunt."

[COPYRIGHT SECURED.]

THE NEW-COMER.—DRAWN FOR THE AMERICAN AGRICULTURIST BY E. FORBES.

Boys who have been away from home to boarding-school will readily understand the feelings of the poor captive in the picture, now for the first time introduced to his new companions. One bullying fellow wants to pick a quarrel with him; another waggish character is about to play a practical joke by slyly pulling his hair; a third is disposed to ridicule him for his low spirits; while a few look on with real sympathy. The poor lonely creature, with no friends made as yet, sadly thinks of his native home, and can find little comfort. Yet if he have the true spirit of a monkey he will soon make his place, yielding to his superiors, putting down his inferiors, and taking rank according to his own merits. No doubt his fast friends will be those who at first gave him sympathy, which his gratitude will more than repay. While you may be amused with the comical figures of these animals, do not forget the lesson of the picture. When a new companion comes to your school or your neighborhood, try to make him feel at home. To take any advantage of such an one is despicably mean. Even if he should afterward prove unworthy of your intimate friendship, the exercise of kind feeling towards him will bring its own happiness to yourself and make you richer than any enjoyment would, that could be had by imposing upon him.

An East Indian Giant Story.

Many years ago a giant living in Ceylon fell in love with the daughter of another giant in Bengal; so he asked her father to let him marry her. But he refused because the lover lived on a little island, and was not of much account. But the Ceylonese determined to have his bride, and so crossed over, seized her, and carried her home. Then her father, in a great rage, started to rescue her, but found on arriving at the straits which separate the island from the main land, that he was not tall enough to wade over.

So back he went through the whole length of India to the Himalaya Mountains, and snatched up two of the largest to throw them into the strait, to fill it up so that he could pass over. But as he strode back with one mountain in each hand, large pieces slipped through his fingers, and thus came the chain of hills which extend for some three hundred miles through the country. It is to be hoped that on finally reaching the island he became reconciled to his son-in-law; but very likely the latter being the larger, made way with him, for, as it happens, the story very provokingly stops here without giving information on this most interesting point.

Too Much Medicine.

Among the American Indians the "Medicine Man" is next in importance to the Chief of the tribe. He is not only the physician, but the priest, prophet, and general agent with supernatural powers, with whom he is supposed to be familiar. During drouth he is in great demand as a rain maker. In this art they are very successful, as when they once commence their ceremonies they never stop until rain begins to fall. Those who have witnessed their performances say that their freaks are of the most extravagant kind, such as would provoke the laughter of all unbelievers in their power. It is related of one of these characters, named Wakhadahakee, that while going through his performances he fired an arrow toward the clouds and promised abundant water. Shortly after a vessel came up the river near the encampment, firing a salute. "Ah, my friends!" said the rain-maker, "my medicine is great—I have brought a thunder-boat." He continued his vaunts and threats from his high place, and truly his predictions were fulfilled; in a few moments the cloud was over the village, and the rain fell in torrents. Mr. Catlin, who related the incident, says it

was a memorable sight. Thunder roared, and livid lightning flashed, and in a moment of consternation, a flash struck one of the Mandan lodges, and killed a beautiful girl. He was rather alarmed lest his fame should be held from him; he ascended the medicine-lodge the next morning, and exclaimed: "My friends, my medicine, you see, is great—it is too great; I am too young, and I was too fast; I knew not when to stop. The wigwam of Mah-silsh is laid low, and many are the eyes that weep for Kokai, the otelope. . . . Who say that the medicine of Wak-ha-dah-ha-kee is not strong?" A unanimous shout of approbation ran through the crowd, and Hair of the White Buffalo, by which epithet he was distinguished before, was thereafter changed to the more familiar and honorable appellation of the "Big Double Medicine."

A Difficult Language.

A Frenchman of our acquaintance relates the following anecdote of himself with great good humor. Shortly after arriving in this country, and while he could speak the language very imperfectly, he was engaged as teacher of French in a young ladies boarding-school. He kept his ears wide open to learn every new phrase, and progressed rapidly. One expression at the meals puzzled him for some time. He noticed that the young ladies often replied "Yes'm," when asked if they would be helped to some of the dishes. He carefully consulted his lexicon, to find the meaning of "Yes'm," but the word was not there. So he asked the principal, who informed him that it was the same as "*Oui, Madame*," in French. He then was able to use the phrase correctly himself. But one day when asked to partake of something he chose to decline, he answered, "Nos'm," greatly to the amusement of the whole family. "They all laugh so happy," said he, in relating it, "I laugh too, very much.

THE BEST JUVENILE MAGAZINE EVER PUBLISHED IN ANY LAND OR LANGUAGE

"OUR YOUNG FOLKS."

The January, February, and March numbers of "OUR YOUNG FOLKS" have been welcomed by the Press and the Public with an enthusiasm never before accorded to a Magazine for Boys and Girls. The great variety and fresh interest of its contents, and the eminent literary skill of the writers, make the Magazine attractive to all intelligent persons, young or old, and give it a permanent value.

The leading serial, "The Story of a Bad Boy," by T. B. ALDRICH, has awakened an eager interest almost without precedent. The experiences and fortunes of *Tom Bailey* are followed with curiosity and delight by hundreds of thousands, and it is safe to state that the interest of the story increases to the end. We copy from the April instalment an account of the demoralization produced in school by the approach of Independence Day, and a part of

TOM BAILEY'S NIGHT BEFORE THE FOURTH.

Two months had elapsed since my arrival at Rivermouth, when the approach of an important celebration produced the greatest excitement among the the juvenile population of the town.

There was very little hard study done in the Temple Grammar School the week preceding the Fourth of July. For my part, my heart and brain were so full of fire-crackers, Roman-candles, rockets, pin-wheels, squibs, and gunpowder in various seductive forms, that I wonder I did n't explode under Mr. Grimshaw's very nose. I could n't do a sum to save me; I could n't tell, for love or money, whether Tallahassee was the capital of Tennessee or of Florida; the present and the pluperfect tenses were inextricably mixed in my memory, and I did n't know a verb from an adjective when I met one. This was not alone my condition, but that of every boy in the school.

Even Mr. Grimshaw was made a sort of accessory to the universal demoralization. In calling the school to order, he always rapped on the table with a heavy ruler. Under the green baize table-cloth, on the exact spot where he usually struck, a certain boy whose name I withhold, placed a fat torpedo. The result was a loud explosion, which caused Mr. Grimshaw to look queer. Charley Marden was at the water-pail at the time, and directed general attention to himself by strangling for several seconds and then squirting a slender thread of water over the blackboard.

Mr. Grimshaw fixed his eyes reproachfully on Charley, but

said nothing. The real culprit (it was n't Charley Marden, but the boy whose name I withhold) instantly regretted his badness, and after school confessed the whole thing to Mr. Grimshaw, who heaped coals of fire upon the nameless boy's head by giving him five cents for the Fourth of July. If Mr. Grimshaw had eaned this unknown youth, the punishment would not have been half so severe.

On the evening of the 3d I retired to bed very early, in order to disarm suspicion. I did n't sleep a wink, waiting for eleven o'clock to come round; and I thought it never would come round, as I lay counting from time to time the slow strokes of the ponderous bell in the steeple of the Old North Church. At length the laggard hour arrived. While the clock was striking I jumped out of bed and began dressing.

My grandfather and Miss Abigail were heavy sleepers, and I might have stolen down stairs and out at the front door undetected; but such a commonplace proceeding did not suit my adventurous disposition. I fastened one end of a rope (it was a few yards cut from Kilty Collins's clothes-line) to the bedpost nearest the window, and cautiously climbed out on the wide pediment over the hall door. I had neglected to knot the rope; the result was that the moment I swung clear of the pediment, I descended like a flash of lightning, and warmed both my hands smartly. The rope, moreover, was four or five feet too short; so I got a fall that would have proved serious had I not tumbled into the

middle of one of the big rose-bushes growing on either side of the steps.

I scrambled out of that without delay, and was congratulating myself on my good luck, when I saw by the light of the setting moon the form of a man leaning over the garden gate. It was one of the town watch, who had probably been observing my operations with curiosity. Seeing no chance of escape, I put a bold face on the matter and walked directly up to him.

"What on airth air you a doin'?" asked the man, grasping the collar of my jacket.

"I live here, sir, if you please," I replied, "and am going to the bonfire. I did n't want to wake up the old folks, that's all."

The man cocked his eye at me in the most amiable manner, and released his hold.

"Boys is boys," he muttered. He did n't attempt to stop me as I slipped through the gate.

Once beyond his clutches I took to my heels and soon reached the Square, where I found forty or fifty fellows assembled, engaged in building a pyramid of tar-barrels. The palms of my hands still tingled so that I could n't join in the sport. I stood in the doorway of the Nautalis Bank, watching the workers, among whom I recognized lots of my schoolmates. They looked like a legion of imps, coming and going in the twilight, busy in raising some infernal edifice. What a Babel of voices it was, everybody directing everybody else, and everybody doing everything wrong!

To show the kind and degree of interest produced by this story, and the other attractive articles in "OUR YOUNG FOLKS," we give the following letter, which expresses fairly the sentiments contained in numerous letters, received daily from all parts of the country.

SPRINGFIELD, Feb. 23., 1869.

TO THE EDITORS OF "OUR YOUNG FOLKS."

"Your magazine is such a source of delight in our family, and at the same time so valuable and instructive to our children, that I feel impelled to write you and thank you for what you are doing for them and for others like them. We have taken the magazine ever since it started, but we think it more interesting than ever this year.

"The 'Story of a Bad Boy' pleases my boys so much that they fairly commit each instal-

ment to memory. Mr. Trowbridge's articles on Glass-Making we have found particularly interesting, and so are the articles by Mr. Parton, and Mr. Hale, and Mrs. Agassiz. I assure you that the monthly arrival of your Magazine is a great event in our household. Expectation gets on tiptoe about the middle of each month, after which time the Post-office boy is closely watched by two pair of eager young eyes on the lookout for what they call 'the best magazine that ever was.'

"In sober earnest, dear Editors, I feel that you are doing my children an inestimable good, that you are furnishing to them a style of reading in every respect admirable and particularly adapted to them; and as I see the interest with which they read what you prepare for them, and observe its restraining and developing influence upon their young minds, I feel grateful that in their education I have such a valuable assistant as your magazine.

Respectfully yours
Mrs. ———."

Besides the "Story of a Bad Boy," "OUR YOUNG FOLKS" for this year contains an exceedingly interesting and valuable series of papers by REV. E. E. HALE, suggesting *How to Talk, How to Write, How to Read, How to Travel, How to Act in Society, and How to Work*; a number of articles by JAMES PARTON, including *Biographical Sketches of the noted Portuguese Discoverers and Navigators*; careful and graphic descriptions of *Glass-Making, Ship-Building, Coal-Mining*, and other attractive branches of Industry by J. T. TROWBRIDGE; a very valuable series of articles by MRS. PROF. AGASSIZ, the eminent naturalist, on *Coal Deposits, Coral Animals and Reefs, Earthquakes, etc.*, several articles on interesting topics of *American History* by J. H. A. BONE; *Declamations* by ELIJAH KELLOGG; *Dialogues* by EPES SARGENT, and other excellent articles by popular writers, all illustrated by the most skillful artists.

"OUR YOUNG FOLKS" is only Two Dollars a year, and the numbers for January, February, March, and April, 1869, will be sent free to any one who wishes to examine the Magazine, on application to the Publishers,

NEW AND CHOICE POTATOES.

EARLY ROSE.

CLIMAX.

BRESEE'S PROLIFIC, OR No. 2.

EARLY ROSE.

Among the many thousands of our patrons to whom we furnished this valuable potato, we have yet to hear from the first one who is not fully satisfied with his purchase. The only regret expressed is, that they had not procured more. We are daily in receipt of the most flattering testimonials, not only of its earliness and good quality, but of its astonishing productiveness, some of which seem almost fabulous. Several reports of having grown a barrel from a single pound; reports of a yield of one hundred-fold are of everyday occurrence.

We have no hesitation in recommending it as the *earliest*, *most productive*, and of *better quality* than any other variety in cultivation. It retains its good quality through the entire season, until a new crop is ready for the market. It is particularly recommended for culture in the Southern States, as new potatoes can be sent to the New York market as early as the more common varieties from Bermuda.

We are now receiving cash orders at the prices annexed, which, however, cannot be considered as binding for any stated time, as from present appearances the supply will not equal the demand.

One pound, \$1.00; Three pounds, \$2.00, by mail, post-paid. One peck, (15 lbs.), \$5.00; $\frac{1}{2}$ bush., \$8.00; 1 bush., (60 lbs.), \$15.00; 1 bbl., (165 lbs.) \$40.00; 5 bbls., \$175.00. Prices to the trade, in larger quantities, will be given upon application. The freight on all packages by express, boat, or railroad, to be paid by the purchaser. No charge for packages or cartage.

CLIMAX.

The CLIMAX is a seedling of the Early Goodrich, and is thus described by the raiser:

"It has a stout, erect stalk, large leaves; tuber, about medium size, smooth, cylindrical form, swelled out at center; eyes, shallow, but strongly defined; skin, considerably netted or russet, tough, white; flesh, entirely white, solid, heavy, brittle, and never hollow; boils through quickly, with no hard core at center, is mealy, of snowy whiteness, and of superior table quality. It is equally productive with the Early Rose, but a few days later, earlier than the Early Goodrich, while its keeping qualities are as good as the Peachblows."

SHIRLEY HEBBARD, Esq., Editor of the London Gardener's Magazine, and one of the best judges of the Potato in England, writes as follows after having tested the sample we sent him: "Flesh quite white, fine in texture and well flavored. This is an elegant potato for the table, and if a good grower, will be one of the most valuable for the garden and exhibition."

Price \$3.00 per pound by mail, post-paid.

BRESEE'S PROLIFIC, or No. 2.

This remarkable variety originated with Albert Bresee, who was also the originator of the justly celebrated *Early Rose*, both varieties being produced from the same Seed ball of the Garnet Chili.

The vines of *Bresee's Prolific* are of medium height, quite bushy, somewhat spreading, large leaves. Tubers, large, regular in shape, and very smooth, slightly oblong, somewhat flattened. Skin, dull white, inclined to be russeted; eyes, but little depressed and slightly pinkish; flesh, white; cooks quickly, is very mealy, and of excellent quality, yield very large, often exceeding *One Hundred-fold*. Matures about three weeks later than the *Early Rose*, and will prove a most valuable variety for field culture. A silver medal was awarded to this variety at the annual exhibition of the Mass. Hort. Society, last September.

An English correspondent of the London Gardener's Chronicle (Rev. W.R. Radclyffe) to whom several of our samples were sent for trial, thus speaks of this variety: "*Bresee's Prolific* is a most perfect potato. I think it is one of the best I ever saw. Its flesh is white and firm. As far as appearance goes they do immense credit to America. In a word, I never saw nicer potatoes."

Price \$2.00 per pound, by mail, post-paid.

Upon receipt of \$5.00 we will mail, post-paid, to any address in the United States or British Provinces, One Pound Each of the CLIMAX, BRESEE'S PROLIFIC, and the EARLY ROSE. No orders will be accepted unless accompanied with the cash.

In addition to the above, we have a large stock of EARLY SEBEC, EARLY GOODRICH, VANDERVEEN'S SEEDLING, JACKSON WHITE, HARRISON, &c., &c., which we offer at the lowest market prices.

Our descriptive and illustrated priced list of potatoes with explicit directions for culture, mailed free to all applicants.

OUR NEW ILLUSTRATED SEED CATALOGUE and Guide to the Flower and Kitchen Garden 132 pages, mailed to applicants upon receipt of 25 cents.

Grape Vines---New Arrangement.

We offer for spring planting a large and general assortment of grape vines comprising the entire stock recently purchased of C. W. GRANT. We have strong plants of all the leading varieties, but largest stock of Iona, Delaware, Israella, Diana Ives, and Concord, which we offer at very low prices, in either large or small quantities.

Terms to Clubs are especially favorable. With the purchase made of C. W. GRANT, we have become the possessors of the stock of vines of

The Eumelan Grape,

which stands alone in its quality among black grapes, and is unapproachable in its excellence for the table, and especially for red wine. This is the only new grape exhibiting marked and distinctive superiority over the now popular sorts, and it is offered as a grape far above all others in its adaptation to meet the wants of the present time.

THE EUMELAN originated at Fishkill, on the Hudson.

THE EUMELAN has had upwards of thirty years' trial.

THE EUMELAN has been growing on trial in nearly every northern State.

THE EUMELAN wherever grown, has proved a success.

THE EUMELAN is vigorous, hardy, and productive. THE EUMELAN ripens uniformly and perfectly all through.

THE EUMELAN is two weeks earlier than the Delaware.

THE EUMELAN is as sugary, rich, and sprightly as Iona.

THE EUMELAN has not a vestige of foxiness, or any impurity in its flavor.

THE EUMELAN is not only the best black grape for the table, but

THE EUMELAN is the only unexceptional black grape in quality.

THE EUMELAN is the best grape for red wine. THE EUMELAN must be in general demand,

and the wood for propagation will be sold at high rates for several years, as has been the case with other new varieties of merit. Vines planted this spring will produce cuttings during the first two years, to the value of many times the cost of the vines. Therefore buy and plant early, securing the best vines.

Prices of THE EUMELAN, for this spring, are as follows:
No. 1, one-year-old, one dozen or less, Each. Doz. Hundred.
by mail, prepaid..... \$3.00 \$30 \$300

Extra, one-year-old, one dozen or less,
by mail, prepaid..... 5.00 43 230

No. 1, two-year-old, one dozen or less,
by mail, prepaid..... 6.00 60 400

No. 2, two-year-old, one dozen or less,
by mail, prepaid..... 4.00 26 260

Repeated inquiries having been received for wood for grafting old vines, we have concluded to offer strong two-eye cuttings at \$1.00 each. Twelve cuttings (24 buds) for \$9.00, or one hundred buds for propagation for \$30.

Liberal inducements are offered to Club Agents or canvassers.

The Trade are invited to add THE EUMELAN to their list, and will be supplied with the vines at a liberal discount. Enclose stamp for pamphlet with price-list, and thirty years' history of the EUMELAN. Address

HASBROUCK & BUSHNELL,
IONA, (near Peckskill) Westchester Co., N. Y.
(Successors to C. W. Grant.)

CARD.

Having felt obliged to give up business on account of ill health, I have sold all of my interest at IONA ISLAND, to Messrs. HASBROUCK & BUSHNELL, who will continue the business as heretofore, under the name of their firm, as above. These gentlemen have been engaged with me at IONA ISLAND, for nearly ten years, and are entirely familiar with the details of the business, and worthy of general public confidence and patronage. C. W. GRANT.

**The Percheron Stallion Imported from
France,
NAPOLEON BONAPARTE,**

Will make the ensuing season, from April 1st to July 1st, at the Six-Mile House, Natural Bridge Road, 3 miles west of Fair Grounds, St. Louis Co., Mo., at \$25 the season, payable at time of service. Mares proved not to be in foal can return following season free of charge.
This horse is a beautiful dappled grey, 6 years old, 17 hands high, weighs 1,670 lbs., is of remarkably fine action, and trots very fast. This breed of horses is peculiarly adapted to the uses of the farmer, possessing extreme docility, great strength, fine action, beautiful carriage, durable color, and remarkable speed, combined with wonderful endurance, as shown from the following extracts of Mons. du Hays, of France.
"A grey mare, 7 years old, attached to a tilbury or gig, and over a mountainous and difficult road, trotted 58 miles in 4 hours, 1m. and 35 seconds, returning following day, same route, in 4 hours, 1m. 30 seconds, doing the last 13 1/2 miles in one hour. Valiant trotted 150 miles in 4 1/2 hours, or his mile in 23 1/4. The average time of 21 horses at 1 mile was 3:28." Good pasturage provided at \$1.00 per week. Grain \$4.00 per week. Accidents and escapes at owner's risk. For further particulars, apply to

FRITZ KRAUT, 6-Mile House.

MASSACHUSETTS AGRICULTURAL COLLEGE, Amherst, Mass. For Circulars or any desired information, address the President, W. S. CLARK.

WILSON'S FERTILIZER,
OR, PATENT AMMONIATED
Superphosphate of Lime,
AND
WILSON'S TOBACCO GROWER,
AND
Pure Ground Bone,

Are confidently offered to Farmers, Planters, Gardeners, and Nurserymen, as the best articles of their kind ever made and sold in this country.

They are guaranteed to have been made strictly according to the statements set forth in the pamphlets published in this and the preceding years.

These pamphlets contain many suggestions concerning the preparation and use of Manures, which are of great value to those engaged in Agriculture and Horticulture, gathered from the practical experience of the manufacturer, who is one of the largest farmers in New England; and they can be obtained free of all the dealers in these articles throughout the country.

Practical Floriculture;

A GUIDE TO THE
Successful Propagation and Cultivation
OF
FLORISTS' PLANTS.

BY
PETER HENDERSON,

AUTHOR OF "GARDENING FOR PROFIT."

BERGEN CITY, N. J.

Mr. Henderson is known as the largest Commercial Florist in the country. In the present work he gives a full account of his modes of propagation and cultivation. It is adapted to the wants of the amateur, as well as the professional grower.

NOTICES BY FLORISTS AND OTHERS.

Certainly the most practical and desirable work that has ever been published on this subject. We are selling them rapidly. Some no doubt will say that it exposes the "secrets" of the Trade too freely, and that it will make Gardeners and Propagators so plenty that our occupation, like Othello's, will be gone. H. A. DREER, Seedsman and Florist, Philadelphia, Pa.

Truly "practical," and ought to be in the hands of every one engaged in the culture of Flowers.

T. C. MAXWELL & Bros., Geneva, N. Y.

It might be entitled "Floriculture Made Easy." I do not see why any one with ordinary common sense should not succeed, with this book in his hands.

L. C. LISHY, Florist, Nashville, Tenn.

No work ever before published in this country was practically valuable to those in want of direct information (upon this subject). WM. SAUNDERS, Sup't Dep't of Agriculture, Washington, D. C.

Just the work for the young Florist or Amateur, as it tells him clearly there is no such thing as failure, if its simple teachings are followed.

GALVIN & GERAGHTY, Florists, Newport, R. I.

What is wonderful, the most of our Professional Florists here frankly admit their indebtedness to the work for information and suggestions. I am only an amateur in flowers, but feel gratefully indebted to its author for the pleasure its personal has given.

GEORGE W. SAUNDERS, Baltimore, Md.

Without exception the most practical work on Floriculture in the English language. All the prosy fossils of — — — &c., I consign to the lumber room. I shall order a dozen from the publishers to give to my friends.

JAMES FLEMING, Nurseryman and Florist, Toronto, Canada.

Complete in all its departments, a thoroughly common-sense book, valuable to all interested in Plants and Flowers. GEO. W. CAMPBELL, Nurseryman, Delaware, O.

We have been asked hundreds of times by our customers for a work on flowers; now we get something creditable to recommend. ELLIOTT BROS. & BURGESS, Florists, Pittsburgh, Pa.

Apart from its great working value, the book is delightful reading. MISS ANNA WARNER, "The Island," West Point, N. Y.

Thoroughly practical, yet readable as a novel. NEW YORK SUN.

A worthy contribution to every votary of Flora; style comprehensive, sharp and decisive, just what was to be expected from its well-known author.

FRANCIS RICHARDSON, Toronto, Canada.

ILLUSTRATED.

SENT POST-PAID. PRICE, \$1.50.

FARMERS' CLUB SWEET CORN.

Solon Robinson writes: "Your Sweet Corn is the best."—Levi Bartlett thinks it "Worthy of a wide dissemination."—Thomas Mehan calls it "A first-class variety."—M. C. Weld says: "It is the sweetest corn I have ever eaten."—Donald G. Mitchell says it is "Very excellent."—Chas. L. Flint thinks it a "Decided improvement."—Peter B. Mead says "It is 'The best sweet corn I have ever eaten.'"—Cheney Brothers "Esteem it the very best variety we have ever grown."

Description:—Comes to table in seventy to seventy-five days. Ears of the best table size, with eight regular rows. Kernels large, and pearly white. Stalks and leaves of medium size and heavily marked with purple. A very noticeable and distinct variety.

This corn is the choice of more than forty varieties, after fifteen years' search for the best. Enquire of dealers, or order directly of me. Sold in my own envelopes only. One package, sufficient for fifty hills, 50 cents. Five packages, \$2.00. By mail, prepaid.

JAS. B. OLCOTT, Buckland, Conn.

CURTIS & COBB'S
ILLUSTRATED ANNUAL CATALOGUE
OF SEEDS, BULBS, TREES, &c.

We are now fully prepared with our Spring stock of very choice Seeds and Bulbs of every description.
Our New Catalogue contains, besides a list of those very fine French and German Flower Seeds, in the original packages, New varieties of Vegetable Seeds, a large lot of New French Hybrid Gladiolus, many of which were the admiration of the public, as exhibited by us at the Massachusetts Horticultural Society last autumn, &c., &c. To amateurs and others ordering in quantity, special inducements will be offered.
All the Novelties and Specialties of the season will be found in our New Catalogue and Flower and Kitchen Garden Directory of 150 pages, (one of the best publications of its kind in this country,) beautifully illustrated, with price of each article, and explicit directions for cultivation, which will be mailed on receipt of 10 cents—one quarter its cost.
CURTIS & COBB, 348 Washington-st., Boston.

See our Flower Seed Catalogue for 1880.

Orders from the Trade solicited for Gladiolus in large quantities.

J. M. THORBURN & CO.,
15 John-st., New York.

THE "BOSTON PRIZE TOMATO"
is a very decided improvement on the "Boston Market." The fruit is large, firm and solid, as early as the earliest, and for productiveness it cannot be surpassed. One gardener says, "I grew every variety of Tomato last season, but none excelled the Boston Prize." Another, "It is the most productive Tomato I have ever grown, will always command a high price and ready sale." Per paper, 15 cts., per oz., 75 cts., postage paid.
CURTIS & COBB,
248 Washington St., Boston.

Flower Seeds. Flower Seeds.

BY MAIL, POST-PAID OR OTHERWISE.
The subscriber has for many years past spared no pains or expense in procuring, both in Europe and this country, every variety of *Annual Flower Seed* that could be obtained, and after cultivating over one thousand varieties, has selected one hundred kinds with a view of including all the most desirable for hardy garden cultivation, a list of which will be sent to any one. And for \$1 THIRTY-FIVE KINDS of any on the list will be sent by mail, postage paid.
G. R. GARRETSON, Flushing, Long Island, N. Y.

THE FARMERS' FAVORITE!
GREATLY IMPROVED.
BICKFORD & HUFFMAN'S
WORLD-RENOUNDED PREMIUM
GRAIN DRILL,

With the Improved Guano Attachment & Grass Seed Sower.

A CONTINUOUS GRAIN DISTRIBUTOR!

The Desideratum of Seedlers! Perfect in Mechanical Construction! Perfect in its Performance of Work!

Sowing all grains, from the coarsest Marrowfat Peas to the finest kernalled, with accuracy. Thistle balls and dirt do not clog it. Sending an even continuous stream through each tube; performing equally well up hill or down, side hill or level. No Bunching of Grain! No Liability to Get Out of Order or Broken! Built as a plain Grain Drill or with Compost or Seed Attachment. For one of these incomparable Machines, address
W. L. BUCKINGHAM, General Agent,
59 1/2 South Charles-st., Baltimore, Md.

FLAX BRAKES,

That break 2,000 to 3,000 lbs. Flax Straw in ten hours, and take out 65 per cent of woody matter. A man and boy, with one to two horses, can work them. Will break both tangled and straight straw, and save 120 lbs. to the ton more than any other machine, while it does the work better. No danger to life or limb. They weigh about 1,000 lbs., occupy about five feet square, and as now made are strong and durable. Sold all ready to put the bolt on pulley and start them. Hundreds are in use, and are admitted to be the best machine to break flax. Flax and tow now bring high prices, with increasing consumption. Send for circular to
JOHN W. QUINCY, 93 William-st., New York City,
Treasurer and Agent of the Mallory & Sanford Flax Machine Co.
The best instructions for raising flax are contained in a "Manual of Flax Culture," published by Orange Judd & Co., 245 Broadway, New York.

KNIFE GRINDER for Mowing Machines.—Sanford's Patent. It is light, and can be taken to the field for use. A boy can grind the knives accurately in 15 minutes, without injury to the knife, and with safety. It is a labor-saver. Price \$10.50. Send for Circular. Address JOHN W. QUINCY, 93 William-st., New York City. Rights for sale.

Agricultural Diplomas for Prizes.

Plain and in colors. Samples sent on application. Address
THE MAJOR & KNAPP ENGRAVING, M'F'G & LITH. CO.,
71 Broadway, New York.

THE COMSTOCK & GLIDDEN SPADER.—A broad-gauged substitute for the Plow, (except in sod breaking), now on sale at the Whitlock Exposition Rooms, 245 Broadway, N. Y. Farmers, Gardeners, and Nurserymen call and see it. C. COMSTOCK, Agent.

SAFETY!

CHARLES PRATT'S ASTRAL OIL

is intended to supply a great Public Want for a Safe, Reliable Illuminating Oil. It is manufactured by us, and packed only in our Guaranty Patent Cans, expressly for FAMILY USE. It has more body, and an equal quantity will burn longer and give more light than any other oil. It is

Perfectly Pure, no Mixture nor Chemicals.

E. N. Horsford, late Rumford Prof. Harvard Univ., etc.; R. Ogden Doremus, M.D., Prof. Chem., etc.; Bellevue Hospital, Medical College, and College of the City New York, say of the Astral Oil:—

"It is REMARKABLY CLEAR and FREE FROM DISAGREEABLE ODOR, and burns with a BRILLIANT FLAME, WITHOUT OFFENSIVE SMELL. A lamp filled with the Oil, and allowed to burn ENTIRELY OUT, DOES NOT ENCRUST the WICK. The "flashing point" may be fairly stated to be 125 degrees Fah., and the "burning point" not below 145 degrees Fah. The plan adopted for securing the PUBLIC AGAINST ADULTERATION OF THE OIL, by putting it up for sale in CANS OF CONVENIENT SIZE FOR FAMILY USE, and sealing the cans, to be opened ONLY by the consumer, IS TO BE COMMENDED IN THE STRONGEST TERMS. This system, faithfully carried out, MEETS A GREAT PUBLIC WANT."

Prices of Pratt's Astral Oil:

Single Case, containing one Patent Can, 5 galls. 60c. \$3.00
Case and Can..... 1.00
Double Case, containing two Pat. Cans, 10 galls.,.... 60c. 6.00
Case and Cans..... 1.75

CAUTION.—Purchasers should observe that the SEALS of the packages have not BEEN TAMPERED WITH. Full prices will be allowed for packages returned in good order, less the transportation charges.

For sale by Grocers, Druggists, and the Trade generally, and by the

OIL HOUSE of CHARLES PRATT,

(Successor to RAYNOLDS, PRATT & Co., established 1770.)
MANUFACTURER OF and DEALER IN STRICTLY PURE OILS,
108 Fulton St., New York.

3 HORSE
Clevis.
Light & Durable.

PRICE.—\$5 Each;
\$42 per Dozen.

Cash with order. Send for Circulars.
Address.—EDGAR M. POTTER,
Kalamazoo, Mich.

EMPIRE GRINDER.

Patented January 19th, 1869.

MILTON FOWKS, Inventor.

This invention relates to a new Machine for Sharpening the Cutter-bars of Mowing and Reaping Machines. It consists in the arrangement of machinery for imparting combined rotary and reciprocating motion to a Grindstone, mounted on a shaft, the edge of which is beveled, so that it will grind the two converging edges of two contiguous teeth at once.

It is so easily operated that a boy twelve years old can sharpen a knife in a few minutes.

—It only requires the use of one hand to operate it, as the cutter-bar remains stationary while the machine is in motion.

It is so arranged that the crank turns behind the cutter-bar, thereby being perfectly safe in its use. It has been examined and thoroughly tested by scientific men, and pronounced EXCELLENCE. Farmers are delighted with it. Every person using mowing machines should have one.

STATE AND COUNTY RIGHTS FOR SALE.

Address A. & J. A. FOOTE,
Catskill, N. Y.

ATTENTION, CANE GROWERS!

THE CLOUGH REFINING PROCESS A GREAT SUCCESS! Active Agents wanted in every County to introduce this valuable improvement. References required. Circulars and a sample of Refined Syrup free by mail. Address

RUSSELL, FISK & CO., 410 West 23d-st., New York City.
Send for a free Circular, with full particulars.

Portable Refrigerating and Preserving House.

Patented Oct. 20th, 1868.

No dwelling house complete without a safe conservatory
for the preservation of Meats, Fruits, Vegetables, Milk, But-
ter, &c.

For this Preservation we claim as near perfection as any
degree of coolness with absence of moisture and atmospheric
influences can obtain. It gives a good and pure ice-water
for drinking from all ice consumed. By the combination of
the Freezing Pans and ice floor, you obtain a very low tem-
perature when desirable. The Ice Chamber adapts itself to
the amount of ice remaining in it, allowing no vacuum to
form over the ice. All moisture is condensed, and readily
removed by Rubber wiper with hollow handle to contain it.
It is all encased in Galvanized Iron; no wood exposed to
take up impurities and decay. They are made of any size,
from 2½ feet square and 4 feet high, to 8 feet square and 8 or
10 feet high, and to sell at from \$25 to \$300. Individual rights
with instructions how to make and use, \$10 to \$20. Respon-
sible parties wanted to make and send Refrigerators or sell
rights. State, County, Town, and individual rights, with
Refrigerators, for sale, by the Patentee. Send for Circular.
T. L. RANKIN, New Richmond, Ohio.

COMSTOCK'S

New Horticultural Implements.

COMSTOCK'S HAND-CULTIVATOR AND ONION WEEDER
will do the work of six men with hoes. It is the only imple-
ment that *pulls the weeds* and thoroughly pulverizes the
soil. Price \$9.00.

COMSTOCK'S SEED SOWER.—The neatest and most perfect
yet invented. Combined with the Cultivator \$15, or sepa-
rate \$10.00.

COMSTOCK'S STRAWBERRY CUTTER for cutting strawberry
runners, with Cultivator combined \$12.00. **WEEDING HOOK,**
50 Cts. Send for descriptive circular to the manufacturer,

man-st., N. Y. **WARDERED TWELVE FIRST PREMIUMS**
AT TWELVE DIFFERENT STATE FAIRS, October and
November, 1868. **ONLY MEDAL and DIPLOMA at AMER-
ICAN INSTITUTE FAIR,** Oct. 26, 1867.

"VALUABLE AND WELL-MADE IMPLEMENTS."
HORACE GREELEY, Pres't.

HON. H. S. RANDALL,

*President New York Wool Growers' Association, and
Author of Sheep Husbandry, says in Rural New Yorker:*

"We much like the Sheep Shears made by **HENRY SEY-
MOUR & Co.** They possess the superior advantage of being
made from one piece of metal, which gives them solid
springs. The stops are tempered so they cannot wear away
and let the blades lap. Among their varieties we entirely
prefer for fine-wool sheep, Strong's Patent Thumb-piece
Shears. The Thumb-piece gives better facilities for clipping
the legs, heads, etc., of any kind of sheep. I also use their
Toe Nippers. No. 3 is most used. I have tested the articles,
and such is my verdict."
EVERY PAIR WARRANTED.

Improved Foot Lathes,

With Slide, Rest, and Fittings. Elegant, dura-
ble, cheap and portable. Just the thing for the
Artist or Amateur Turner.

Send for descriptive circular.

S. K. BALDWIN, Leonaia, N. H.

Missouri Lands for Sale.

Missouri Lands are very fertile, and situated in the heart of the Union; they furnish an extraordinary opportunity for the people of the Northern States to acquire cheap, healthy, and productive farms.

North Missouri contains about 25,000 square miles, or sixteen million acres, as desirable as any in the valley of the Mississippi.

All are invited! Let the industrious and enterprising, rich and poor, come and prosper.

Circulars, giving full and valuable particulars in English and German, are supplied gratis to all wishing to come themselves, or to circulate to induce others to come also.

A Sectional Map, showing the exact location of all our Railroad lands, is sold at thirty cts. Address GEO. S. HARRIS, Land Commissioner Hannibal & St. Joseph R. R. Co., HANNIBAL, Mo.

NEW BOOK FOR FARMERS and Geo. E. Waring, 200 Engravings. AGENTS wanted, \$200 a month made. TREAT & CO., Pub's, 654 Broadway, N. Y.

WOOD'S BOTANY.

25 CENTS.—Send it for a package of those Wonderful Magic Photographs. Library of Love, Etiquette, Courtship, and Marriage,—11 little volumes for 25 cents. W. C. WEMYSS, 3 Astor Place, New York.

A BOOK OF REFERENCES FOR MINISTERS, TEACHERS, and MEMBERS OF RELIGIOUS DENOMINATIONS IN GENERAL.

THE AMERICAN ECCLESIASTICAL & EDUCATIONAL ALMANAC, For 1869,

BY A. J. SCHEM. PRICE 50 CENTS.

The object of this Annual is to put in the hands of Clergymen, Teachers, and members of all Religious Denominations, and in general of all interested in the religious and educational movements of the day, a brief compend of important facts and figures relative to the Religious History of the year 1868, and the present condition of the religious and the educational world.

It Contains Four Departments:

HISTORICAL DEPARTMENT: Proceedings of the important Methodist, Protestant Episcopal, Baptist, Presbyterian, Lutheran, Congregational, Reformed, Unitarian, Universalist, and other denominational Meetings; the Favored List, and other denominational councils; articles on the Evangelical Alliance; the Temperance Cause, &c.

MISSIONARY DEPARTMENT: Condition and progress of every missionary field, as well as the operations of all the Missionary Societies.

STATISTICAL DEPARTMENT: Full information of every division of the Christian World, as well as the Non-Christian Religions.

EDUCATIONAL DEPARTMENT: The state of Education in our own and foreign countries, and General Summary of Important Educational Intelligence.

The Almanac, as the table of contents shows, is a supplement to every religious Cyclopaedia and every work on Church History, containing their account of the several churches to the close of the year 1868.

Opinions of the Press.—The first volume of the Almanac, which appeared in January 1868, received the highest recommendations from papers and Ministers of all religions denominations. The following are a few specimens:

Rev. Dr. Abel Stevens.—Superior to anything of the kind yet produced.

Rev. Dr. McClintock.—In no other publication, American or European, do I know of such a summary of church facts.

Rev. Dr. Schaff.—Full of reliable, interesting, and useful information, which every Minister and scholar ought to have within his reach.

The Presbyterian, Phila.—A wonderful amount of information, concerning all the churches in America, is here condensed into a small compass, and most excellently arranged.

The National Baptist, Phila.—It contains a large amount of information of highly important character.

N. Y. Tribune.—Recommended by the accuracy and impartiality of its information.

ESTABLISHED 1861.

THE GREAT AMERICAN TEA COMPANY

RECEIVE THEIR TEAS BY THE CARGO FROM THE BEST TEA DISTRICTS of CHINA and JAPAN, and sell them in quantities to suit customers

AT CARGO PRICES.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st.—The American house in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in the country have made their immense fortunes through their houses in China.

2d.—The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d.—The Importer makes a profit of 30 to 50 per cent in many cases.

4th.—On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1,000 to 2,000 packages, at an average profit of about 10 per cent.

5th.—The Speculator sells it to the Wholesale Tea Dealer in lines at a profit of 10 to 15 per cent.

6th.—The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th.—The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th.—The Retailer sells it to the Consumer for ALL THE PROFIT HE CAN GET.

When you have added to these EIGHT profits as many brokerages, cartages, storages, cooperages and wastes, and add the original cost of the Tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than other dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages and wastes, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Teas at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

For manner of getting up Clubs, see former advertisement in this paper.

Parties sending Club or other orders for less than thirty dollars had better send a Post-office draft or money with their orders, to save the expense of collections by Express, but larger orders we will forward by express, to collect on delivery.

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary packages for Clubs less than \$30.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House stores to our Warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend to meet the wants of clubs. They are sold at cargo prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST OF TEAS:

OOLONG (Black), 50c., 80c., 90c., best \$1.75 lb.
 MIXED (Green and Black), 70c., 80c., 90c., best \$1 per lb.
 ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.20 per pound.
 IMPERIAL (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
 YOUNG HYSON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
 UNCOLORED JAPAN, 90c., \$1, \$1.10, best \$1.25 per pound.
 GUNPOWDER (Green), \$1.25, best \$1.50 per pound.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of this Company.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound. Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction. ROASTED (Unground), 30c., 35c., best 40c. per lb. GREEN (Unroasted), 25c., 30c., 35c., best 35c. per lb.

NOTICE OF THE PRESS.

From the American Agriculturist.

THE GREAT AMERICAN TEA COMPANY.—To Queries.—Before admitting their advertisement, we learned that a large number of our clerks and others had for several months been buying their Tea and Coffee from this Company, without its being known who they were, and that they had been highly pleased with their purchases, both as to quality and price, and were all recommending their friends to the same course. As we have published the advertisement for many months, and received no complaints, we conclude "there is no humbug about the establishment."

N. B.—INHABITANTS OF VILLAGES AND TOWNS WHERE A LARGE NUMBER RESIDE, BY CLUBBING TOGETHER, CAN REDUCE THE COST OF THEIR TEAS AND COFFEES ABOUT ONE-THIRD, (BESIDES THE EXPRESS CHARGES), BY SENDING DIRECTLY TO "THE GREAT AMERICAN TEA COMPANY."

Gents:—Above I send my fourth order. Your Teas have given good satisfaction, and those who have used them will have no other, but induce their friends to send also. To prove this; I had made up my order and got a Post-Office Money Order, when others came in and nearly doubled the amount, as you will see by second money order, both of which I enclose.

The last order came safely to hand by Merchants' Union Express. Accept thanks for complimentary package.

Very respectfully,

S. LANPHEAR.

Caution.—As some concerns, in this city and other places, imitate our name and style of advertising and doing business, it is important that our friends should be very careful to write our address in full, and also to put on the number of our Post-Office Box, as appears in this advertisement. This will prevent their orders from getting into the hands of these bogus imitators.

POST-OFFICE orders and Drafts, make payable to the order of "The Great American Tea Company." Direct letters and orders (as below, no more, no less)

Great American Tea Company,

Nos. 31 and 33 VESEY-ST.,
 Post-Office Box, 5,643, New York City.

HORSFORD'S SELF-RAISING BREAD PREPARATION

Makes the most wholesome and best of BREAD, BISCUIT, CAKES, &c. Unlike some other yeast, it contains no POISON to create DYSPEPSIA, and the bread may therefore be eaten hot without detriment. Resolving itself into Phosphate of Lime and soda, it prevents RICKETS, CHOLERA, and decay of TEETH, and promotes the growth of Muscle and Bone. In "raising" the dough it does not, like other yeast, decompose flour, but adds nutriment to the bread, and otherwise improves it in quality and quantity. Each package contains full directions for use. Send for pamphlet, supplied gratis. Ask your Grocer for "Horsford's Bread Preparation." WILSON, LOCKWOOD, EVERETT & CO., Wholesale Agents, 201 Fulton-st., New York.

REED'S DRAWING LESSONS.—The Little Corporal's New Drawing Book for Beginners, either young or old, with or without a teacher, at home or in schools; the best ever published; full of lithographed engravings and common-sense lessons. If your bookseller does not have it, send \$1.50 to ALFRED L. SEWELL & CO., Publisher of The Little Corporal, Chicago, Ill., and the book will come post-paid. Circulars sent free.

FAIRBANKS' SCALES.

THE CHALK WAGONER.—FROM A PAINTING BY ROSA BONHEUR.—Drawn and Engraved for the American Agriculturist.

Rosa Bonheur ranks among the most eminent of living painters of animals, if she be not, indeed, the most celebrated of all. A number of her pictures are in this country, and those who have had the privilege of seeing them will recollect what marvels of color and drawing they are. Her portraits of single animals are marked by wonderful individuality, while her compositions show a vigor and action which but few artists are capable of imparting to their work. The pictures of this artist do not, as is often the case, depend upon color for their attractiveness; for when her compositions are

rendered in the black and white of an engraving, her power as an artist is still manifest. The engraving we present here is known by the English name of "The Chalk Wagoner." It is highly probable that the artist intended to represent a teamster with a load of bags of prepared plaster of Paris. The character of the load and the accepted title of the picture are of but little consequence, as the interest centers in the animals. The scene is an essentially foreign one, and one which recalls the rural districts of France. We have here the common type of the ponderous Normandy horse.

The leader travels at his ease down the hill, and is evidently looking out for any thing new and curious that may occur; but the solid shaft-horse shows by his whole expression that he feels the responsibility of bringing a heavily loaded cart down hill, over a rough road. Those familiar with Rosa Bonheur's paintings, can imagine the brilliant effect of the three scarlet tassels upon the heads, the pieces of deep blue sheepskin topping the high collars, and the bright-colored (red and yellow) saddle-cloths upon the gray or iron-gray horses, all kept well brushed and clear of the dust of the plaster kiln.

AMERICAN AGRICULTURIST.

NEW-YORK, MAY, 1869.

"Will it pay?" Shall we reduce every thing to a monetary standard and consider the question of pay or no pay as estimated in hard cash or greenbacks? This is not necessary, for work and investments pay in many more ways than in money simply. Still, in farming operations, questions which should continually recur are—Will it pay? Shall I get my money back? Can I afford it? Farmers' finances do not bear close scrutiny, as a rule. They make money when and where they do not know it, and they "make losses" in the same way. A close system of accounts, kept as accurately as those of a well-managed counting-house, would show many a farmer that crops on which he thinks he makes most are really less profitable than others. A good farmer said, "If I can get a dollar and a half a barrel for potatoes, I can't afford to raise corn at a dollar a bushel." If any man doubts the statement, let him figure upon it. Still, many operations which may pay pecuniarily, cost so much in anxiety, or are so uncertain in their returns, that they should be entered upon with caution. The culture of certain commercial crops, hops, tobacco, etc., may be thus classed. Almost every thing pays that makes hard labor lighter, that works the brain in place of the muscles, that makes horses do the labor of men, and that makes the farmer's life and that of his wife and family more comfortable. Every man considers the question, Will it pay? but it is as often decided wrongly as rightly.

Hints About Work.

Labor, this month, needs to follow well-matured plans. We shall have rain storms, coming just when we do not want them, putting us back in our work, giving weeds a start, rotting the seed in the ground, and making the land too wet to work. These troubles tend to make men sour, and to dishearten them; but if work is planned ahead for both fair and rainy weather, we shall find that the "set-backs" of May are not very serious ones after all. The season, as it progresses, makes up for early deficiencies, and it is a satisfaction to believe that late, cold springs, or cold snaps that put vegetation back, often do tenfold more damage to insect life, which thus receives often severe checks.

Spring Groins and Grass.—It seldom pays to sow any spring grain after the first of May. In very backward seasons it may be done, but every day's delay diminishes the probability of securing good crops. If the prime object of sowing grain is to seed to grass, (for the impression is prevalent that to get a good catch of grass seed, it must be sown with some grain crop,—which is a great mistake,) it would be much better to sow the grass alone on the well-harrowed surface, and brush it in lightly.

Roots.—Beets and mangels ought to be sown early. The soil should be in the best order it can be put,—deeply tilled, and well manured, and the rows placed two feet apart, so that they may be worked by horse-power. This distance is about as small as will do for field culture. The plants cover the soil well, and as large crops are gained as when the rows are closer. Parsnips may be sown in rows equally distant, but the seed should not be so deeply placed, nor should the sowing be done before the soil is warm and dry. Rows of Carrots may be placed a little nearer together—about twenty inches apart is best on most soils—though, in the garden, they are often 16 to 18 inches apart.

Potatoes.—There should be little delay now in planting the whole of the crop. On poor land, we think animal manure is quite as likely to prevent as to cause the rot; though in very rich soils, no doubt, it renders the plant more liable to take the disease. There is little risk of potato sets rotting now, if cut even to single eyes. Manuring in the hill with ashes and plaster is good practice, but this dressing is probably equally effective, if placed upon the hill at the first or second hoeing. Among the concentrated fertilizers in market, a good superphosphate is probably the best application for

potatoes. Guano is rather stimulating, but, like castor pomace, which is very good for this crop, must be mixed with earth in the drill.

Flax and Hemp.—Flax is occasionally sown in May, but it is too late for assured success. See that the weeding is thoroughly done before the shoots start up. Hemp may be sown any time this month, but the earlier the better. Sow in drills, on clean laud. A bushel to a bushel and a half to the aero of land is recommended for broadcast sowing. Less than half the quantity is required when drilled. Weeds, especially grass, are injurious, and may be fatal to the crop when quite young.

Broom-corn should be planted before Indian corn. Use a liberal quantity of seed, and thin it out after the wire-worms have done their work. It needs similar soil and culture to corn. See p. 126, (April).

Corn.—The corn crops of the country would be greatly improved if farmers would take more pains to plant early varieties, and make a careful selection of the earliest ripening ears for seed; but early or late kinds should not be planted before the seed will come up and grow. If we have cold weather, as we usually do have in May, corn struggles with weeds, and exists, between life and death, a prey to cut-worms and grubs, until hot weather. We find it much more satisfactory to wait until we are pretty sure of having warm, if not hot, weather within a week or ten days; then the growth is rapid and healthy from the start. Corn cannot be put on too rich ground, but it must not be planted too thick.

Peas may be sown broadcast, or in drills. The Canada Creeper is recommended, and three bushels per acre is an abundance of this kind. Larger sorts require more seed. Peas do well on a fresh clover sod. Peas and oats sown together—two bushels of each per acre—make good sheep or hog fodder.

Tobacco.—The seed-beds may need watering with liquid manure towards the end of the month. See that they are weeded thoroughly, and thinned.

Hops.—See book-list for pamphlet on hop culture, which contains full directions for management.

Soiling Crops.—In this climate there is no summer-soiling crop equal to corn. If the ground is very highly enriched, it may be sown early this month, but otherwise sow when the main crop is in, or about the same time. Drill it in two and a half feet apart, sowing any large, sweet variety. Stowell's Evergreen is good. Oats and peas sown now may be cut before the corn, and fed green.

Weeds.—Early and late, let the warfare go on. Weeds in the seed-leaf may be swept off, thousands at a blow, or push of the push-hoe. Stirring of the ground kills multitudes, and lays it open for a fresh lot of seeds to start. In using the push or common hoe to kill weeds, walk backwards, so as not to step upon the loosened soil, for this will re-plant weeds, which would otherwise be killed.

Cows pine for fresh grass, and they may be turned into swampy land or bog meadows when the bog grass springs green and tender. This is the only time of the year when they will eat it. Cattle must not go upon the summer pastures too early, for they will do great damage to the crop of feed. Manure, if possible, to make the roots last until the pastures are fit to turn the cattle upon.

Sheep.—Keep them off the pastures until there is a good stock of grass. Mow off the brush, if this has not been previously done. The sheep will keep down the young growth, and kill the bushes. Shearing may take place before the settled warm weather of June, provided the naked animals can have warm, sheltered sheds, and good feed until accustomed to the change. If the fleece is to be washed on the sheep, by all means delay shearing until warm weather. If wool be tub-washed, or if sheep be washed in tanks, from which the water may be drawn off and distributed over the land, much valuable manure may be saved. From an ordinary flock of merinos, we presume the value of the washings would not be less than six cents each on an average, and nothing could be better for grass.

Tools and Implements.—Every year gives us important additions to our labor-saving implements; and the necessity of buying the best whenever a

purchase is made is much greater than it was when the tools were chiefly made by the village blacksmith. Country store-keepers are allowed too much to decide what shovels, forks, hoes, and even mowing machines and hay-cutters, the people about them shall use. In hay-cutters the difference in labor between different kinds is fully fifty per cent; in dung forks the difference in durability is greater than that; and in the heavier implements and machinery, great differences also exist. It is for every farmer's interest to keep the store-keeper well posted, for, as a rule, the manufacturers pay just about the same commission, and the seller would as lief deal in one article as in another.

Work in the Horticultural Departments.

May brings with it abundant work in every department, but it also brings pleasures that belong to no other month. There is a charm about the early flowers, the swelling buds, and the tender shoots, that makes it a month of delight as well as of toil. In a backward season, much of the work set down for April will "linger in the lap of May."

Orchard and Nursery.

Planting.—If the trees have been heeled in and shaded, the work of planting may continue, as may

Grafting, but when growth has started, the bark separates very easily, and if care be not exercised, ugly wounds may be made. In sawing off a limb at this time, cut completely around the bark before sawing it off. Cover all wounds with grafting wax. For some unusual kinds of grafting, see page 178.

Young trees should have the soil kept clean and mellow about them from the start. Root crops, which are well manured, and require thorough cultivation, may be grown between the rows.

Mulch around young trees before the dry weather comes on. Bog hay, or, near the coast, salt hay, is generally the most available. If a mulch is not applied, keep the soil mellow by frequent stirring.

Nursery Trees.—Look to those budded last summer, and rub off all shoots that start from the stock before they get large enough to require cutting.

Seed-beds, of even hardy forest trees, will do all the better for shading, and some of them absolutely require it. A slat-work of laths, with the spaces between the laths as wide as the laths themselves, makes one of the best shades. Evergreen boughs put upon a rough support will answer.

Insects.—If any tent-caterpillars' eggs have been left, the little webs will soon manifest themselves. They are most readily seen when the dew is on them in the morning. They are easily destroyed by the hand, with a corn cob, or by use of a swab, with lye. Destroy them at any rate. Borers are to be cut out. Where there is a depression in the bark, the knife will usually reveal a borer. Often a wire will be needed to follow the fellow home. Try the plum and peach trees with a sudden jar, to see if the encephalo has commenced its work. As soon as it begins, the work of daily jarring the trees must be inaugurated. Catch and kill.

Fruit Garden.

Grape Vines.—Those grown with horizontal arms will need to have the ends of the arms bent downwards, to cause all the buds to start equally. With vines planted this spring, allow but one bud, which should be the strongest, to grow. Two buds may grow from vines planted last year.

Layers may be made by bending down a cane of last year's growth, placing it in a trench six inches deep, and fastening it there by means of hooked pins. When the buds have started, and the shoots have made a few inches' growth, gradually fill the trench with soil.

Currant Bushes.—The currant worm appears this month and next. No better application has been suggested than dusting with the powder of White Hellebore. Keep the ground well cultivated, or put a heavy mulch between the rows.

Strawberries.—Where the winter mulch still remains on, it should be parted over the plants if

not already done. Set plants, and if they show any blossom buds, remove them. Beds without mulch should have the surface thoroughly cleaned, without moving the soil so as to disturb the roots; then put on a thick mulch of bog or salt hay, straw, tan-bark, or whatever is most convenient.

Picking and Marketing.—Procure baskets and crates in good season, and have them distinctly marked. Hints are given in an article on page 163.

Insects.—Hand-picking is the only remedy for rose-bugs, as it is for the leaf-rolling caterpillars.

Flower Garden and Lawn.

Lawns.—Thin spots may be re-seeded; where small depressions in the surface appear, remove the sod, fill in with good soil, replace the turf, and pound it down firmly. A lawn mower is a necessity where there is much turf. Excellent hand-mowers are now to be had. With these the grass can be cut when two inches high, and the clippings left to act as a mulch and fertilizer. With the scythe, the grass must be four inches high to cut readily, and the crop must be removed.

Margins, where the lawn borders upon walks or beds, should be kept true with the edging knife.

Beds in Lawns are often introduced with good effect. Some of these are very elaborate, but it must be recollected that the more elaborate the plan, the greater the labor of keeping the design

in perfect condition. Choose curved figures rather than angular ones. Ovals, circles, and crescents, are to be preferred to squares, triangles, and stars. These may be filled with plants of colored foliage, such as Coleus, Achyrantes, Centaurea, variegated Geraniums, etc.; or with Verbenas, Scarlet and other Geraniums, Lobelias, etc.; or Cannas, Calceolarias (*Caladium*), and the like, may form taller groups in proper situations. Messrs. Olm Brothers, of Springfield, Mass., send us a design for a chain-like bed near a walk. The design is to be cut in the turf, according to the outer lines; the inner lines indicate the division of the plants used in filling, which may be such as the taste may dictate. Only those who have greenhouses where they can propagate a large stock of bedding plants, or who can afford to buy them, will be likely to do much of this "ribbon" planting. But a very good effect may be produced with annuals, though it can only be achieved later in the season. The various sorts of Phlox Drummondii will give several colors; *Tagetes signata* pumila is one of the best yellows; Sweet Alyssum a white; and so on. When a design is cut in the turf, pegs an inch square and a foot long should be driven at such points as will aid in preserving the outline when the turf is trimmed. These should be driven below the level of the grass, and be out of sight.

Evergreens are generally planted with success this month. It must be recollected that the roots of an Evergreen, if once dried, can never be restored. Young plants of Arbor Vitae and Hemlock, from the woods, may be bought for a few cents each; these should not be put at once into hedges, but set out in nursery rows, where they can be naturally or artificially shaded, and allowed to remain for a year. In this way but few will be lost, and those which survive may be safely planted in the hedge-row. In planting those evergreens that are to develop into trees, the very common mistake is made of setting them too close. An Austrian or White Pine should have at least twenty feet, and better thirty feet, in which to spread.

Bulbs.—Lilies may generally be had sufficiently dormant to plant. Gladioluses, Jacobean Lilies,

Tigridias, and other spring bulbs, may be set as soon as frosts are over.

Tuberose.—The bulbs should be potted or set in boxes of earth, and placed in a green-house or warm room. They will be sufficiently started to set out in three or four weeks.

Dahlias may be started in boxes of earth in a warm room, green-house, or a spent hot-bed. Divide the roots, leaving a bud to each.

Roses.—See article on page 163.

Transplant annuals that have been started in the hot-bed or window boxes when the weather will allow, leaving the tender kinds until the last.

Bedding Plants.—These having been raised under glass must not be put in the open border until cold storms and chilly nights are over.

Kitchen Garden.

In last month's notes there was given a list of all the hardy vegetables in general cultivation, with brief hints as to the manner of sowing them. It is not necessary to enumerate these again, and we include here only the tender vegetables which, in the neighborhood of New York, can rarely be sown with safety before the middle of May. In localities colder than the one referred to, the sowings indicated for April will be made this month.

Succession Crops.—The season of vegetables may be prolonged by sowing crops at intervals of a week or ten days. This may be done with radishes, lettuce, and other salad plants, peas, corn, etc.

Asparagus.—Cut with a sharp knife. When it is to be marketed, it must be bunched. The engraving shows a simple bunching frame. The bottom is ten inches wide and twelve inches long; the back, six by twelve inches, is nailed to it; four sticks, six inches long, are inserted in the bottom, four inches apart each way, beginning two inches from the back. Lay a string upon the

board, within the sticks, and place the asparagus, previously washed, between the sticks, with the heads against the back board. When sufficient is placed in to form a bunch, tie the string, and cut the but ends of the asparagus even. Place another string near the top. Bass mat furnishes the best strings. The usual size of the bunch is nine inches long, and four to five inches in diameter. The bundles should always be set erect to keep them straight, and when packed in boxes for market, fresh cut grass should be used below and between them.

Beans.—Continue to plant bush sorts. Limas are very sensitive to cold and wet, and the ground should be both warm and dry. Set the poles, which should be six or eight feet high, four feet apart each way. The hills should be manured if the ground is not already rich. Plant five or six beans around each pole, pressing them into the soil, eye down, and covering an inch. If plants of the Lima have been started under glass, put them out as soon as the weather is warm. The Wax bean is an excellent pole variety to use as snaps.

Beets and Carrots.—Weeding and thinning are to be done as soon as the plants are large enough to work. A slight supremacy of the weeds is very injurious to the carrot.

Cabbages and Cauliflower.—Keep the early set crop well hoed. A hoe-fork will be found useful. Sow seeds of the later sorts in well-prepared seed-beds in the open ground. See article on page 180.

Celery.—Sow seeds in seed-bed. The dwarf-growing kinds are preferable.

Corn.—Plant as soon as it is safe to do so. The Early Dwarf Sugar has small ears, but is sweet and early. See catalogues for other varieties.

Cucumbers.—Sow seed in frames from which lettuce has been removed, and in hills in the open air when it is warm enough; put in a plenty of seed,

to allow some for the hngs. Put out plants that have been started on sod under glase as soon as it is safe. Have some kind of a shelter to put over at night.

Egg Plants are among the most sensitive of garden plants, and must not go out until cold nights are over. Pot the plants if it is not already done.

Herbs.—Sow in seed-bed. Sage, Thyme, Sweet-Marjoram, and Summer Savory are most in use; Basil, Tarragon, and some others, are fancied by few.

Lettuce.—Transplant as soon as large enough; set a foot apart each way. Sow seed for succession.

Martynia.—The green and tender pods are used for pickles. Set the plants two feet apart each way.

Melons.—Plant the same as directed for cucumbers.

Onions.—In some localities sowing may still be done. Weed early. See article on page 127, April.

Parsley.—Sow in seed-beds early; it is very slow.

Parsnips.—Weed and thin to ten or twelve inches apart as soon as the plants are large enough.

Potatoes.—Use the cultivator or hoe as soon as they break ground. In most soils, a dressing of ashes and plaster will be found of great service.

Peas.—Brush the varieties that need it before they are large enough to fall down. In hoeing draw the earth towards them. Plant for a late crop.

Peppers are treated much the same as Egg Plants.

Rhubarb.—Do not pull from the plants set this spring. In removing leaves from established plants, never cut them. They readily come off if given a slight sidewise jerk, which is soon learned.

Spinach.—Sow; thin and weed that already up.

Sweet Potatoes.—Prepare the ridges, and have them ready for the plants, which must not be set until cold nights are over. Make the ridges thirty inches apart at the top, and well manured; set the plants every fifteen inches. Insert the plants down to the first leaf, press the soil firmly; if the earth is not moist, pour water into the holes in planting.

Squashes.—Observe the same precautions as with cucumbers. Put the bush sorts three to four feet apart each way. The Summer Crookneck is the best, but the scalloped varieties the most salable. For late varieties, the Boston Marrow and Hubbard are best. Gregory advises more room for the vines than is usually given, and we think he is right. Eight feet each way for the Marrow, and nine or ten feet for the Hubbard, is better than less. Make the soil rich all over, as the vines root at the joints.

Tomatoes.—Put out the plants when safe to do so, three or four feet apart, according to the variety. In gardens, some kind of a trellis or support for the vines adds to neatness, and improves the fruit.

Winter Cherry (Physalis).—The fruit of this is prized by many for sweetmeats, as well as to eat raw. Sow and cultivate the same as tomatoes.

Green-house and Window Plants.

There is no set time for bringing out plants; it must be governed by the season, and the nature and condition of the plant. So many plants have been injured by injudicious sudden change, in removal to the open ground, that some of our best cultivators prefer to leave them in-doors altogether.

Plunging plants means bedding the pot in the soil of the border without removing the plant. When this is done, a flat stone, coal ashes, or other matter, should be put at the bottom of the excavation, to prevent worms from finding their way through the hole in the pot into the ball of earth.

Turning out means that the ball of earth is to be removed from the pot, and planted in the border. Many things that are turned out to fill up the borders are not taken up again, but a new and much more vigorous stock is propagated from cuttings.

Camellias, and other broad-leaved evergreens, should be placed under a lattice work where they will be shaded during the heat of the day.

Window Plants which are neither plunged nor turned out in the border need shelter from the sun, plenty of water, and care in respect to insects.

Ivy that has been kept in-doors may be set in a shady place, or the plants may be turned out. Do not allow the branches to lie upon the ground.

AMERICAN AGRICULTURIST.

ORANGE JUDD & Co., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies; Four to nine copies, \$1.25 each; Ten to nineteen copies, \$1.00 each; Twenty copies and upwards, \$1 each. Papers are addressed to each name.

LARGE PAY

for a little work is very agreeable. We have heard of only one man lately who positively refused to receive it when directly offered. (The Mayor of Portland, Me., wants his salary reduced!) But many thousands are letting an opportunity to get such large pay pass by unimproved. No one can look through the table in next column, without finding many good things—things that are worth far more than the selling value set against them. There is not an article mentioned, which it would not pay well to purchase with money, if it could possibly be raised. But we put it in the power of those who cannot spare the money, to secure one or more desired articles without cost. Many thousands have done so recently, and many other thousands can yet do the same thing

DURING MAY.

A few odd hours—spent in collecting a small number of names—will secure an article worth many dollars. Last May a widow lady decided to try for a piano, and by the middle of June she brought us the last names to make up 540, and took home a splendid Steinway Piano, which she could have sold for \$600 cash. Many others took lesser premiums. One lady first got a beautiful Tea Set for herself, and then earned another for a friend. Sewing Machines, Wringers, Washing Machines, first-class Watches, etc., etc., were taken in great numbers. It can quite as easily be done

THIS MAY

by thousands of those who have premium clubs partly filled already, and by any number of others who will start new premium clubs. There are very few Post-offices where there are not still people enough to make up a premium club—persons, too, who would be greatly benefited as well as pleased by having this journal earnestly brought to their attention. The five beautiful and valuable numbers of this volume now issued are to be followed by seven others—as much better as it is possible to make them. Will anybody fail to get back the value of his subscription money, many fold?

READER,

here is a chance for you. Try your hand at getting a small club, at first, for some one of the premiums of moderate value, even if it be one of the smallest ones in the table. You will be quite likely afterwards to make it larger before sending for the premium; and if you do not, the few names secured, and the experience gained, will open the way for a splendid premium club next season.

Our experience last summer, and previously, assures us that if enterprising persons take hold of canvassing for subscribers now—and persist in the work until they learn how to canvass well—by securing our premiums and selling them, the following sums can be earned this summer: [Women can do quite as well as Men]

- 1000 Persons can Earn \$1000 each.
1000 Persons can Earn \$600 each.
1000 Persons can Earn \$500 each.
1000 Persons can Earn \$400 each.
1000 Persons can Earn \$300 each.
1000 Persons can Earn \$200 each.
1000 Persons can Earn \$100 each.

[In this table are given the regular cash prices of each article, and the number of subscribers required at \$1.50 a year, to get it free, also at the lowest club rate of \$1 a year. For full descriptions of the articles see extra sheets, sent free.]

Table of Premiums and Terms, For Volume 28—(1869). Open to all—No Competition.

Table with columns: No., Names of Premium Articles, Price of Premium, Number of subscribers required at \$1.50, and at \$1.00. Includes items like Alderney Bull, Crowsour Fowls, Brakmas Light, etc.

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The thirty-two Premiums, Nos. 29, 30, 31, 61, 62, 63, 64, and 76 to 100 inclusive, will each be delivered FREE of all charges, by mail or express, (at the Post-office or express office nearest recipient), to any place in the United States or Territories. —The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance specified.

Read and carefully Note the following: (a) Get subscribers anywhere; all sent by one person count together, though from one or a dozen different Post-offices. (b) Say with each name, or list of names sent, that it is for a premium list, and we will so record it. (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. Any time, from now to June 30th, will be allowed to fill up your list as large as you may desire. The premium will be paid whenever you call for it. (d) Send the exact money with each list of names, so that there may be no confusion of money accounts. (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer the premiums. (f) Specimen Numbers,

Cards, and Show-bills, will be supplied free as needed by canvassers, but they should be used carefully and economically, for every extra copy of the paper costs, with the 2c. prepaid postage, about 12 cents....(g) Remit money in Checks on New York Banks or Bankers payable to order of Orange Judd & Co., or send Post-Office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk.

If from any Cause one fails to get the larger premium desired, the names can be used for a smaller one.

A Full Description of the Premiums is given on an extra sheet; a copy will be sent free to every one desiring it. For New Premium 106, see page 32, January No. We have only room here for the following:

No. 42—Clothes-Wringing Machine. A very useful, time-saving, strength-saving, clothes-saving implement, that should be in every family. The wringing of clothes by hand is hard upon the hands, arms, and chest, and the twisting stretches and breaks the fibres with lever power. With the Wringing Machine, the garments are passed rapidly between elastic rollers, which press the water out better than hand wringing, and as fast as one can pick up the garments.

No. 72. — Crandall's Improved Building Blocks furnish a most attractive amusement for children. Churches, Dwellings, Barns, Mills, Fences, Furniture, etc., in almost endless variety, can be built with them, and the structures remain so firm as to be carried about. The Blocks are put up in neat boxes, and with each box is a card giving many designs of buildings.

Nos. 76 to 81—Volumes of the American Agriculturist (Unbound).—These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. We have stereotype plates from the sixteenth to the Twenty-seventh Volume complete, from which we print numbers as needed. The price of the volumes is \$1.50 each, at the Office, or \$1.75 if sent by mail, as they must be post-paid. They are put up in clean numbers, with full Index to each volume.—They are profusely illustrated, the Engravings used in them having alone cost about \$40,000. Those obtaining premiums for less than twelve volumes can select any volumes desired, from 16 to 27.

Nos. 82 to 87—Bound Volumes of Agriculturist.—These are the same as Nos. 76 to 81 above, but are neatly bound in uniform style, and cost us more for the binding and postage. Sent post-paid.

Nos. 88 to 99—GOOD LIBRARIES.—In these premiums, we offer a choice of Books for the Farm, Garden, and Household. The person entitled to any of the premiums 88 to 99 may select any books desired from the list on page 191, to the amount of the premiums, and the books will be forwarded, paid through to the nearest Post-Office, or Express office, as we may find it most convenient to send them.

No. 100—General Book Premium: Any one not desiring the specific Book premiums, 88 to 99, may select Books from list on page 191, to the amount of 10 cents' worth for each subscriber sent at \$1; or 30 cents for each name sent at the (ten) club price of \$1.20 each; or 60 cents' worth for each name at \$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through by us.

A Few Dollars' worth of books pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to make their heads help their hands. A good book will, in the end, be of far more value to a youth than to have an extra acre of land on coming to manhood. The thinking, reasoning, observing man, will certainly make more off from 49 acres than he would off from 50 acres without the mental ability which reading will give him. Far better to sell the acre of land, than do without the books. Several good books are announced in the Advertising columns, and in the list on page 191.

No. 106—Pocket Rifle.—(Breech Loading).—A full description of this beautiful implement, with illustrations, was given on page 32, of Jan. No. No one who enjoys shooting, or who has occasion to carry a light but effective weapon in traveling or while at work, will regret the trouble required to gather the 24 (or 18) subscribers required to secure this weapon free. If any one does not care for the mahogany case, we will present the weapon all complete, with extension breech and 100 cartridges, all packed in a strong pasteboard box, neatly papered, on receipt of 18 subscribers for 1869 at \$1.50 each.

SPECIAL OFFER

For the Month of May.

A Beautiful Book,

Valuable to Everybody;

Sold for only Half a Dollar,

(and sent Post-paid);

Well Worth a Whole Dollar.

It is also

Presented and sent Post-paid,

For only a Few Minutes' Work!

200,000 Readers will Please N. B.

The Offer is to Each one of You!

Our Agricultural Annual No. 3, for 1869, and our Horticultural Annual No. 3, for 1869, are among the most valuable and beautiful volumes issued in this country during the present year. They are packed full of good information, and each volume contains a large number of beautiful engravings. They are worthy a place in every family, in city, village, and country. They are universally admitted to be the cheapest volumes issued. They are original, the matter and engravings being all prepared exclusively for these volumes by a large number of first class practical writers. As these books are a permanent Annual Institution, and as we have made the volumes for 1869 decidedly superior to those of 1868 and 1867, (though those were good as first attempts,) we want everybody to have a copy, for all who get them this year will be sure to want the numbers for 1870 and thereafter. We therefore invite everybody who has not done so already, to send only 50 cents, and secure a post-paid copy of either the Agricultural Annual No. 3, or the Horticultural Annual No. 3, or send \$1 and get both of these volumes. They are entirely different.

But we will do even better, when desired, viz.: To any person sending during the month of May a subscriber to the American Agriculturist for 1869 at the regular price (\$1.50), we will present a copy of either of the above-named Annuals that may be desired, and we will send it post-paid to any point in the United States or Territories....A few minutes' work or talking will enable any person to secure a subscriber to the Agriculturist (as valuable as we are now making the paper), and then the Annual will be obtained free.

N. B.—One Annual is offered for each subscriber sent at \$1.50. The sender can choose any one of the six Annuals already issued, viz.: Agricultural No. 3 for 1869, or No. 1 for 1868, or No. 1 for 1867; or Horticultural No. 3 for 1869, or No. 2 for 1868, or No. 1 for 1867. One, two, three, four, or more subscribers will secure an equal number of Annuals, of any issue desired....N. B.—These premium Annuals are special, and are not included in the general premiums, which are separate, but are continued, as noted elsewhere.

Commercial Matters—Market Prices.

Gold has been variable during the month, selling up to 133%, but closing weak at 132%. There has been only a moderate trade in Breadstuffs during a month past. The export inquiry has been light and chiefly for low grades of flour, No. 2 spring wheat, and new mixed corn, which have been generally in good supply and depressed in price. The home demand for flour and grain has been confined to the supply of pressing wants as a rule, though there has been an occasional call from buyers on speculative account. Purchasers will not operate very confidently, until the resumption of navigation shall have enabled forwarders at the interior to place fresh stock in the seaboard markets....There has been a diminished business in most kinds of Provisions, and prices have tended downward, on increasing offerings, particularly of Pork and Beef....Wool has been slow of sale, all through the month, and prices close less firmly with a downward tendency. Manufacturers are not purchasing much at present, as they are looking for lower values.... Cotton has been comparatively steady, and in fair request.Hops have been in request at previous figures.... There has not been much call for Hay, Rice, or Seeds, prices of which have been rather depressed.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for the month ending April 14, 1869, and for the corresponding month last year.

1. TRANSACTIONS AT THE NEW-YORK MARKETS. RECEIPTS. Flour, Wheat, Corn, Rye, Barley, Oats. 26 days this m'th, 146,000 779,000 497,000 8,800 36,500 101,000 23 days last m'th, 114,500 519,000 357,000 8,100 25,000 187,000

SALES. Flour, Wheat, Corn, Rye, Barley, Oats. 26 days this m'th, 201,000 1,157,000 1,203,000 74,000 144,000 994,500 23 days last m'th, 194,000 1,393,000 1,274,000 35,700 175,000 1,115,000

2. Comparison with same period at this time last year. RECEIPTS. Flour, Wheat, Corn, Rye, Barley, Oats. 26 days 1868, 146,000 779,000 497,000 8,800 36,500 101,000 26 days 1869, 118,000 292,500 913,000 65,500 153,000 73,000

SALES. Flour, Wheat, Corn, Rye, Barley, Oats. 26 days 1869, 201,000 1,157,000 1,203,000 74,000 144,000 994,500 26 days 1868, 204,000 741,000 1,422,000 142,500 68,000 1,177,000

3. Exports from New York, Jan. 1 to April 10: Flour, Wheat, Corn, Rye, Barley, Oats. 1869, 252,219 2,144,724 788,278 148,822 24,407 54,934 1868, 205,245 815,889 2,393,946 148,822 24,407 54,934

4. Stock of grain in store at New York: Wheat, Corn, Rye, Barley, Oats, Mill. 1869. The weekly arrivals of beef cattle have been rather light for the increased demand after Lent, and the market has been brisk. There was a wide range in quality, and none really first class were for sale. The average quality was only what would be called medium. This estimate does not include some few droves of really poor steers of the "scallawag" order. The very best "tops" of good droves brought 17½c. per pound, net weight, while the majority of good steers sold for 17c. The weather has been unsettled, and rainy market days are always bad for owners. Those who were fortunate enough to be on paved yards got along pretty well, but those off the stones complained of mud and bad sales. Buyers have been more plenty for the two weeks ending April 12th, and competition quite lively. This state of things always makes stock men feel in good spirits, whether their cattle are really fat or not. The cattle were most of them sold on market days, and but little "peddling" was done. The following list gives the range of prices, average prices, and figures at which the largest lots were sold: Mar. 22d ranged 12 @ 17½c. Av. 15½c. Largest sales 15 @ 16½c. do. 29th do. 12 @ 17½c. do. 15½c. do. 14½ @ 16½c. Apr. 5th do. 13½ @ 17½c. do. 16c. do. 15 @ 16½c. do. 12th do. 11 @ 17c. do. 15½c. do. 14½ @ 16½c.

While 17½c. was the highest price paid this month for good beef, and the figures given vary but little from those for last month, still we think it safe to place the market at least ½c. higher for the same quality of cattle. Medium steers that last month sold for 15@15½c., this month brought 16c., and in some cases 16½c. per pound, net weight. **Milch Cows.**—The demand for cows has not been great and the market has been a dull one. There has been a little increase in numbers, and sellers had to drop a few dollars per head for common cows. The highest prices paid this spring for milch cows were for two Ayrshires, which brought \$400. Very good cows sell for \$80. Prices range from \$60@90, with poor milkers and old ones at \$50, or even less. **Veal Calves** are not plenty enough to make a brisk trade, and there is but little change in prices. Live calves sell readily if they are good and not too young. Butchers do not like to buy "bob" calves, for fear of having them confiscated after they are hung up in the stalls. "Bobs" therefore sell slow at low prices by the head. Good live calves sell for 12c.@13c.; medium, 10c.@11c. "Hog-dressed," fat and fresh, sell all the way from 12c.@18c. per pound, according to quality. **Sheep.**—There are a great many shorn sheep now coming into market, and they sell for 1½c.@2c. per pound lower than those unshorn. The arrivals have been light and the market rather lively. Shorn sheep, if fat, sell readily. Prices range from 5½c.@7c. per pound for shorn, 7c.@9½c. for unshorn, according to quality. **Swine.**—The live hog market has been more active for the last month. Western dressed are less abundant, and not in so great demand. Prices have kept firm all the month and the market steady. Good hogs sell quickly for 10½c.@11c.; for a few very fat and extra good 11½c. was paid. Dressed hogs keep firm, at 13½c.@14c.

1,500,000 Readers!—A canvasser for a premium, in a Western State, just tells us that he found 103 families who regularly read the *American Agriculturist*, although his club numbered but 24 copies. By exchanging papers, and borrowing, these 24 copies reached all of the 103 families, which averaged 4¼ readers in each. (In one case 26 persons read the same copy regularly.) If the above were the case generally, there would be between three and four million readers of this journal. By cutting down the estimate more than half, we still have a million and a half of Readers—quite enough to stimulate the Editors to constant exertions and care.

Hints to Advertisers.—A business man at first objected to our terms, but readily offered to furnish a neatly printed card to put in every paper if we would slip them in for 25 cents per 1,000. He thought if one in a large number of these cards reached a customer, it would pay. A little calculation showed him that it would cost over \$600 to provide the cards alone, while our charges were only \$30 to print the same card in the paper, where it would be seen several times over, both by the sub-

scribers and their friends, and not be in danger of dropping out. A nurseryman kept a large force of men, and sold about \$25,000 worth of stock annually, which just about paid expenses. He then spent \$5,000 in advertising, and thus ran up his sales to about \$65,000, while the increased cost of the nursery was only \$15,000 per annum. Many business men keep up large establishments that pay very lightly. With no increased expense for rent, etc., they might quadruple their trade by making their business known. One man scattered his advertisements in little items here and there, and found it paid moderately well. As an experiment, he put in a large, striking advertisement, that cost him over \$1,000. It was of such size and display that it attracted general attention; he was run down with customers, and made a small fortune in a brief time.

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Postage.—To our published terms for the *American Agriculturist*, postage must in all cases be added when ordered to go out of the United States. For Canada, send twelve cents besides the subscription money with each subscriber. Everywhere in the United States, three cents, each quarter, or twelve cents, yearly, must be prepaid at the Post-office where the paper is received.

How to Remit:—Checks on New-York Banks or Bankers are best for large sums; made payable to the order of **Orange Judd & Co.**

Post-Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect Oct. 1, 1863, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the *Registry fee*, as well as postage, *must be paid in stamps* at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. *Buy and affix the stamps both for postage and registry, put in the money, and seal the letter in the presence of the postmaster, and take his receipt for it.* Letters thus sent to us are at our risk.

Bound Copies of Volume XXVII (1868) are now ready. Price, \$2, at our office, or \$2.50 each, if sent by mail. Any of the previous eleven volumes (16 to 26) will be forwarded at the same price. Sets of numbers sent to our office will be neatly bound in our regular style for 75 cents per volume, (50 cents extra if returned by mail.) Missing numbers supplied at 12c. each.

How to Study Insects.—The Guide to the Study of Insects, by Dr. A. S. Packard, Jr., supplies what has long been needed—a work which will enable one to study the structure and transformations of insects, and learn the principles upon which they are classified. The work is published in parts, at 50 cents each, and is very abundantly illustrated. It is sent by mail from the office of the *American Agriculturist* on receipt of price.

A Book for Young Farmers.—"Thomas' Farm Implements and Machinery."—The basis of this admirable work was an essay published in 1850, in the Transactions of the N. Y. State Agricultural Society, which was enlarged, and in 1854 published by the Harpers. It has been, and remains, the only work in which the principles of Natural Philosophy, namely, the mechanical powers, and the powers of water, wind, and heat, are systematically discussed as applied to the operations of the farm. There has been unlimited discussion of the principles and facts of Agricultural Chemistry and the general philosophy of farming, while the principles of mechanics, etc., most important for every farmer to know, have had little attention. This work has now been most carefully revised by the author. It is much enlarged, and a great part has been re-written, while the illustrations, before abundant, now number two hundred and eighty-seven. A large number of new implements are described, with the heavier farm machinery, and the use of steam, both in cooking and as power on the farm, is clearly discussed. The whole work is of a thoroughly practical character, and the application of the principles taught to the farmer's daily work makes its instructions of very great value. There is not an agricultural writer that could be named more respected than John J. Thomas,

or one whose judgment and freedom from personal bias in discussing new implements could be more impartially relied upon. It contains 292 pages, 12mo. Published by Orange Judd & Co. Price, \$1.50.

Moistening Chopped Hay for Horses.—This practice is becoming more and more general. It is undoubtedly very beneficial. For horses that have any tendency to heaves, it is indispensable. The advantage, however, is not due merely to the fact that cutting the hay and moistening it with water "lays the dust": it does more than this; it softens the hay and meal, and renders it more easily digested. This, in fact, is the main point. And this suggests the question whether we can not carry the system farther. Steaming would be best, but at this hurried season it is out of the question on most farms. But cannot some way of *soaking the hay* be adopted that will involve little labor, and which will make the hay more digestible, without washing out the soluble nutritious matter, or inducing fermentation? If nothing more was done than to mix the food for the next meal, say at morning for noon, at noon for night, and at night for next morning, the hay and meal would be softened materially, and would approximate nearer to fresh grass. We soak our dried apples before cooking them; why not our dried grass?

Parsons on the Rose.—By Samuel B. Parsons, Flushing, N. Y. New York: Orange Judd & Company. The Rose is the only flower that can be said to have a history. It is popular now and was so centuries ago. In his work upon the Rose, Mr. Parsons has gathered up the curious legends concerning the flower, and gives us an idea of the esteem in which it was held in former times. A simple garden classification has been adopted and the leading varieties under each class enumerated and briefly described. The chapters on multiplication, cultivation, and training, are very full, and the work is altogether the most complete of any before the public. In preparing this edition a large amount of new matter has been added and the whole has been thoroughly revised. Illustrated, \$1.50 by mail.

A Poultry Number.—The very general interest manifested in all parts of the country in regard to poultry warrants us in devoting a large share of space in this issue to the subject. The Great Exhibition described elsewhere has furnished one of the weekly papers an opportunity to bring out an English Engraving, which it offers as portraits of the fowls at the show. Another gives us caricatures of a Wood Duck and hen, etc. As we have already published full length engravings of the leading breeds, we here give the heads of several of those now attracting attention. They are drawn with great care from life, and will be found to present the peculiar markings which distinguish these breeds more distinctly than any illustrations have heretofore done. But few are aware of the difficulties attending the portraiture of these restless birds, and the artists as well as engravers are to be congratulated upon their success.

Sundry Humbugs.—The various swindling concerns, under the guise of "Mutual Benefit Associations," of this and other cities, seem to have nearly died out, or taken other disguises. An entirely new Insurance scheme, now before us, may be one of the old "mutual" concerns. This association purports to be connected with a weekly journal of this city, and is under the management of one J. S. Rigney. The association proposes to engage agents everywhere, and pay them by giving one-half they collect of persons who become members of the "Mutual Society." The membership fee for an adult man is \$2.00; for a man and his wife, \$3.00. Besides this "liberal offer" to agents, they throw in a few lottery tickets, these tickets to draw valuable prizes in jewelry, and "upon presentation, accompanied with \$2.20 to pay expenses," etc. The old story. The plan is too old to catch many, and we warn all against them. Remember, every dollar sent to such and similar concerns is lost money. If any person or persons in Brooklyn are doing business under the name of "Westcott's Express," and have not found out that they are the medium of a great deal of wicked and unlawful traffic, it is time they did. Williamsburgh has some bad men, and one particularly wicked one by the name of Turner. Mr. Turner seems to have every thing, including his letters, sent to care of Westcott's Express. Now we suggest to Messrs. Express Co. to pay particular attention to this Mr. T's orders, and for the good of their own name, order Mr. T. to find some other medium of communication, or quit swindling people with pretended "Gift Lotteries," and selling poisons and wicked publications. Kelley, the well-known "Kelley Lottery" man, who, some time last fall, was locked up by the Buffalo authorities, is at his old tricks again. This time we are informed it is "most positively the last notice." It is the

same old story. Gold watches and chains, valued at \$300 or more, and then comes the assessment, \$10, or \$15, etc., etc. Mr. K., your experience out West does not seem to have improved you much; it can't be you read the papers. Your old trick has been worn thread-bare during your absence. Try to think of something new. Better change your name to begin with.... We are again called upon to warn persons against using any form of cheap burning fluid or Kerosene. A circular with the very imposing heading, "Sunlight Oil," is before us. This stuff, we are told, is "non-explosive," and the "cheapest and best oil in the world," and it costs only 28 cents per gallon to make it. "Agents to sell family rights wanted in every town." No safe oil or burning fluid of any kind can be made for any such price, and any person foolish enough to use the stuff places his life and property in jeopardy.... The "Mt. Vista Gold and Silver Mining Co." turns up after some months of rest, with surplus stock to sell. Suffice it to say, no such company is to be found at the number given.... The "One Dollar Time-keeper" man seems to reside in Chicago at present. Look out for him. His handsome "time-keeper" is only a very poor sun-dial, which may be worth 10 cents.... Gumbidge, having succeeded in keeping out of jail, notwithstanding his arrest for circulating bad money, has, by his example, stimulated others to try their hand at counterfeiting. W. H. Dailey & Co., New York, have gone into the business. They make "Fac-similes of U. S. Treasury Notes" for sale, and also have a "Magic Comb," for dyeing the hair any color you wish. Both are equally worthless and wicked.... We have said enough about Oroide Watches to make people careful about purchasing such things by name simply. Some companies make very tolerable watches, while a large proportion of the so-called Oroide Watches are perfectly worthless.... We are glad to find that our new Mayor reads the *American Agriculturist*. He has issued an official proclamation (given below) which contains what we have constantly proclaimed these many years past. We bid Mayor Hall good speed, and will be glad to second his efforts in this line vigorously.

MAYOR'S OFFICE, NEW YORK, March 27, 1869.

To the Press of the United States:

I beg to caution strangers against New York circulars, tickets, shares, chances and prospectuses in cooperative unions, or gift enterprises, or dollar stores, or in any other possible scheme whereby property or value is promised greater than the price asked to be paid.—Every such an advertised scheme is necessarily a swindle and a false pretence: there does not and cannot tangibly exist any such schemes in this City.—Country newspapers which advertise them simply aid in the swindle.—If all newspapers in the Union would now make a point of publishing and reiterating this information, they will charitably, and, I think, effectually, counteract the swindling intentions of those who use the mails for the false pretences, and will also save to the unwary hundreds of thousands of dollars.—A. OAKLEY HALL, Mayor of the City of New York.

"Orange Judd Prize Wheat."—Several parties offer wheat with Mr. Judd's name attached. While there is no impropriety in those who took the Orange Judd Prizes making known the fact that their wheat, of a certain variety, took the premium, no one has a right, on this account, to re-name old and well-known varieties, as all those were to which the prizes were awarded. Mr. J. Knight, Ottawa Co., Kansas, writes, that he "saw the 'Orange Judd Prize White Spring Wheat' offered by a party in Hartford, Conn., as a 'celebrated novelty.' Believing that whatever had your endorsement so emphatically must be superior, I was induced to send for a quart of the wheat. I have received a package of amber wheat, badly mixed with common black oats." Mr. Judd has never "endorsed" any wheat "emphatically" or otherwise, he has never seen any of the wheat which took the prizes, nor is his name used by his authority. Mr. Judd offered prizes for wheat, and placed them at the disposal of the N. Y. State Society. An award was made which satisfied no one but those who took the prizes. He probably has not thought of the matter since.—Eds.

The Market Assistant.—This is the title of a work by Col. Thos. F. De Voe, author of the Market Book, and numerous valuable historical papers, a practical butcher, who spends the first half of every working day at his stall in Jefferson Market, and is, and from childhood has been, thoroughly familiar with the subject on which he writes. The book contains "a brief description of every article of human food sold in the public markets of New York, Boston, and Philadelphia;" it tells the best ways to market, the best pieces to buy, how meat should be cut up; how to tell inferior qualities of meat, fish, vegetables, etc.; the seasons when certain fish, shell-fish, game, etc., are best; and in many other ways gives practical information, useful to every one who has a family to provide for, or who has animals to kill and dress for home consumption or for market. Notwithstanding the thoroughly useful character of the book, it is so enlivened with curious historical incidents,

anecdotes, etc., that it is entertaining reading. Few people, even of those who do their own marketing, really know what they eat, and we feel that we do our readers a service by bringing this book to their notice, and placing it within their reach for \$2.50. It is a 12mo, of 455 pages, illustrated. Published by Orange Judd & Co.

Death of Col. B. P. Johnson.

The veteran Secretary of the New York State Agricultural Society, Benjamin P. Johnson, died April 12th, at his home in Albany, at the ripe age of 76. He has been the Corresponding Secretary and chief business manager since 1844, until the last annual meeting, at which time he declined re-election on account of his increasing infirmities, but was elected to the Recording Secretaryship, in order that he might continue to feel that he was still officially connected with the Society, which owes so much to his zeal and untiring efforts. His memory will be held in high regard by all who knew him.

My Ten-Rod Farm; or, How I Became a Florist. By Mrs. Maria Gilman. Pp. 119. Loring, Boston. This work gives the story of a widow lady, who made a living for herself and family by the sale of flowers. The story is so interesting, and so well told, that one is tempted to finish it before laying it down. While the lesson of perseverance it inculcates is a good one, we cannot consider the work as affording a guide to those wishing to become florists, though some useful hints are given. Narratives of this kind, in which a slight foundation of fact is embellished by a superstructure of fiction, while they serve to create a taste for horticultural pursuits, are always unsatisfactory as to their practical details. Sent from this office at the publisher's price, 50 cents.

Grapes.—"D. P., Jr." The Delaware is apt to crack after a rain. The Iowa will probably ripen evenly when the vine gets older. Young vines should not carry too much fruit.

Black Knot.—"D. P., Jr." We know of no variety of plum that is exempt from the black knot.

Canary Seed.—"Subscriber." This is grown in the south of England and should succeed in N. J. In England it is sown in rows a foot apart, using 16 to 20 quarts of seed to the acre. It ripens in September. The yield is 30 to 40 bushels to the acre. The straw has but little value as fodder.

Varieties of the Grape.—M. Sisley sends us a work containing the descriptions and synonyms of the varieties of the grape cultivated by M. Pulliot at Chironbles (France). Four hundred and six varieties are described, and numerous synonyms referred to the proper name. A work of this kind demands a great amount of careful experiment and labor, and we hope to see the time when some one shall do for our American grapes what Mr. P. has done for those of Europe.

Diseases of the Grape.—Mr. Verdoc, an European Vine Dresser, has given a lecture before the Cincinnati Horticultural Society on the above subject, a copy of which has been sent us. The lecture was given in French, and we hope it has been incorrectly translated, as we have rarely seen so much false science as it presents in its English dress.

"California Bean."—"Subscriber," Point Edward, Ontario. The description given applies to the Asparagus or Yard-long Bean. Thorburn has it.

Manual of Fig Culture in the Northern and Middle States. By Mr. James T. Worthington, Chillicothe, O. Mr. W. has for some time been known as a successful fig-grower, and in this little pamphlet he gives his method. It is to grow the plants in such a manner that they may be laid down and covered with earth to protect them during the winter.

Honeysuckles and Aphides.—"W. A.," Poughkeepsie, N. Y., finds the flowers of his honeysuckles completely destroyed by plant-lice, which resist ordinary remedies; and he asks what to do. We have never been troubled with the lice upon the flowers. Probably if the vines are examined early, the trouble can be checked before it gets desperate. Try strong tobacco water and soft soap. Who will suggest something better?

Sage and Thyme.—Several Subscribers. These herbs are grown around New York as annuals. The seeds are sown in a seed-bed as early as the soil is ready and kept free from weeds. The plants are set out in June and July as a second crop, after cabbages, beets, peas, etc., have been cleared off. The details of culture, which we have not space for, were given in June, 1866.

We are unable to say how this method compares for profit with that in which the plants are grown as perennials and possess the land year after year.

Okra.—"A. S. R." See notes on work for planting. The pods are the parts used, and are taken when perfectly tender and not stringy. They are sliced crosswise and used for thickening soups. The whole pods are boiled tender, dressed with drawn butter, and served as asparagus. Most persons do not like them in this way at first trial, but soon become fond of them.

Gardening without a Garden.

"J. R. McF.," who has no garden, wishes to know what he can flower in summer in pots. Among annuals the Balsams, Asters, Phlox Drummondii, Petunias, Portulacas, Nemophila, Tagetes signata pumila, Bartonia aurea, Mignonette, and most of the medium-sized annuals, Geraniums, Fuchsias, Cuphea ignea, Mimulus, Gazanias, Lobelias, and many others, may be had of the florists. It would be well if the pots could be plunged in moss, sand, or some other material, to retain moisture and prevent the roots from becoming dry. Proper attention to watering and shading is essential to success.

Striped Bugs.—Every year brings proposed remedies. A. F. Gibboney, Millin Co., Pa., writes, that water in which refuse onions or the tops and peelings of onions have been steeped is efficacious in driving away bugs from squashes and all their family, as well as the insect that troubles cabbages.

To the Agriculturists and Horticulturists of Illinois.

Gentlemen:—As the spring is now opening, and "bugs" are about to commence operations, I wish to inform you all that I am on hand, ready and willing to attend to all such cases. Any information that any of you may desire on this subject, I shall always supply, so far as I am able, answering all communications promptly by mail, or, if preferred, through the columns of the *American Entomologist*. If possible, send in every case, along with your letter, specimens of the particular "bug" that is troubling you, with a full account of when he appeared, where he works, how he works, what amount of damage he has done, whether he is also troubling your neighbors, etc., etc. The more specimens you send, the better; and they should never be inclosed loose in the letter, because in that case Uncle Sam always "squashes" them so flat that it is often impossible to recognize them. Flies, beetles, moths, etc., may be packed either dead or alive in any little stout pasteboard box, along with a little cotton wool, or any such matter, to fill up the empty space. But grubs, maggots, caterpillars, worms, etc., should always be inclosed alive in a little tin box—the tighter, the better—along with a sufficient supply of their natural food to last them on the journey. Otherwise they generally die on the road, and shrivel up to nothing. For very small insects of any kind, and whether dead or alive, a quill, securely plugged at both ends, forms a very convenient package.

Rock Island, Ill.,
April 8, 1869.

BENJ. D. WALSH,
State Entomologist.

The Geological Survey of New Jersey.

The State of New Jersey has done two very sensible things. It has completed its geological survey, and then placed its report where those interested in it can obtain it otherwise than through political influence. The report is a handsome octavo, well illustrated, and is accompanied by a portfolio of geological maps. Every one interested in the agricultural and mineral resources of New Jersey should have this report, which may be obtained of the State Geologist, Professor Geo. H. Cook, New Brunswick, N. J. The report, with portfolio of maps, \$6.00; or with a single map of the State, \$4.00.

Barberry and Blight.—"Senex," Albany, N. Y. The blight upon grain is one of those obscure forms of vegetation that have several distinct stages of existence; the progeny of the grain blight may live upon a very distinct plant, the progeny of this upon another plant, and the offspring of this third may be the grain blight again. It is a subject which has but recently commanded the attention of naturalists, and though the matter is not decided, it looks as if the rust on the barberry leaf might be one of the forms of grain blight.

Whitewashing Trees.—"J. T. B.," Fall's Church, Va., asks for our ideas on whitewashing trees. The object in whitewashing is to destroy vegetable parasitic growth, such as mosses and lichens, as well as such eggs and cysts of insects as may be secreted under the loose bark. There are several objections to it: in the first place, the appearance of a whitewashed tree is unnatural and exceedingly ugly; this may be overcome by using coloring matter in the wash. An-

other, that the whitewash fills up the pores of the bark, and interferes with its functions. This depends upon the condition of the bark. When the bark is young and smooth, whitewash would be detrimental; but if the bark is so old that it has commenced to crack, and form flakes or scales, it is then dead, and of no further use to the tree. All the advantages proposed to be gained by whitewashing can be attained by the use of potash, or soda lye, or by strong soft-soap. After these have accomplished their work, they are washed off by the rains, and the old scales of the bark fall away, and leave a clean, smooth trunk. It is better to use whitewash on old trees rather than to neglect them altogether, but it is much inferior to the other applications, which, in order to obtain the best effect, should be applied in a damp time.

Melon Culture.—The amateur cares more for excellence in a melon than he does for quantity, while a melon for market must yield well, bear transportation well, and be of good quality besides. The Green Citron and Nutmeg are the varieties grown for the New York market, and those who give especial attention to melon culture obtain, by a careful selection of seed, a "strain" best suited to their purposes. A new variety, originating at Alton, Ill., the Alton Large Nutmeg, has received the commendations of both growers and dealers. Mr. O. L. Barler, by whom it was introduced, informs us that this variety is likely to be thoroughly tested, as six bushels of the seed have been distributed. The following is Mr. B's method of growing melons: "Select light, dry, and moderately rich soil, containing a considerable amount of sand. We prefer a hill-side, slanting to the south or east. The melon will endure heat, and drouth even, but will not bear 'wet feet.' The soil must be worked deep, and be finely pulverized. Plant in May, in rows eight feet apart, and five feet in the row. Put in the hill not less than twelve or fifteen seeds, to provide for the bugs, and finally thin to two or three plants. The cultivation must of course be clean and complete. It will probably be of service to pinch the runners when they are just beginning to show themselves—when they are no longer than the finger; to wait until they are two or three feet long is to waste labor. To produce the best results, thin out the number of fruits on the vine."

Pumpkin Spinach.—Shirley Hibbard, in his (English) Gardener's Magazine, suggests a use for the pumpkin vine, which will be new to most of our readers. It is to use the tender shoots as spinach, or greens. He recommends that the growth of the plants be well established before the cutting is commenced, and to remove all the young fruit that sets. He says: "Cook them in the same manner as turnip greens, and serve chopped up with butter, pepper and salt. The brilliant green color, delicate aroma, and grateful flavor of the pumpkin-tops, when properly cooked, will commend them to the nicest epicure."

Watermelons.—"J. N. G.," Burlington Co., N. J., writes: "It takes no small amount of work to raise good watermelons, and to have a crop, at the same time, that will pay. First, the ground should be well plowed, and hills made about eight feet apart each way, one foot square, and about ten inches deep. Each hill should be filled with well-composted manure, and trodden solid before finishing. Plant from eight to ten seeds to each hill, and cover lightly with a hoe. When the fourth leaf has formed, thin out to one or two to each hill; one is better than half a dozen, but it is best to leave more, until they get well started, as one may get destroyed. When the vines commence to run, the hills should be well trodden down again around the vine. The plants will require frequent "farming" or cultivating until the fruit commences to set, when they should not be moved. With plenty of manure, and some guano or bone-dust, a light, sandy soil, (which is the best) and good cultivation, there will be a large crop. I have seen the ground nearly covered with melons, some weighing from 30 to 40 lbs."

The Wax Bean.—"Where did it originate?" asks "J. B. H.," Petersham, Mass. This variety is known as Indian Chief Wax, German Wax, and has been for a long time in cultivation in France, under the name of Bean of Algiers, a name which would indicate its origin, but we cannot just now put our hand on any authority to show that it did originally come from Algiers. Geographical names are not always correctly applied to plants, as witness the "English Walnut."

Wild Parsnip.—"G. S.," Iona, Ontario. The wild and cultivated parsnip are one and the same species. The cultivated will become a weed, and the wild, by a treatment similar to that described for the wild radish on p. 133, last month, may, in a few years, be brought back to the cultivated form.

Yeoman's Grape Trellis.—T. G. Yeoman, a well-known fruit grower of Walworth, N. Y., has

invented a very simple contrivance for slackening and tightening the wires of a trellis. By the movement of a lever the wires of a vineyard can be made slack on the approach of winter, in a very short time, and in spring, when it is necessary to stretch the wires, it can be done with equal rapidity.

Learning Farming from Books.—"J. J.," Baltimore, says: "I am a city tradesman and know nothing of the farming business. I want a book that will teach me to farm profitably."—The art of agriculture is not learned from books alone. Perhaps the best thing you can do is to hire out to a good farmer for a year, and learn the handling of farm tools and crops. In that way you will acquire something of the art, and, what is more important, learn whether you like it or not. No one book contains what you wish to know upon the subject. A reprint of Allen's American Farm Book, greatly enlarged by Lewis F. Allen, now ready, is more nearly what you want than anything else we know of. Price \$2.50.

Garlic.—"Greenhorn," Honeoye Falls, N. Y. Garlic will grow with you. Get the bulbs, and break them up, so as to separate the small bulbs or "cloves," which are to be set in rows, six inches apart. They are sold by the New York seedsmen.

White Blackberries.—"J. M. McA.," Summerville, Mich. There is no good white variety in general cultivation, and if yours is as described, it is interesting. In going South, some of your stock should be left North; it may not be suited to a warm climate.

Apricots.—"Greenhorn." The plum makes the best stock for the apricot, but it is of no use to try apricots without first determining to fight the curculio.

Mixing Potatoes.—"Several inquirers." It does no good to argue the case. It is claimed that the mixing of the pollen of two varieties will affect the character of the tubers. We shall be glad to receive any evidence upon this point.

Herds-grass, Timothy, Red-top.—"T. L. S.," Lewisburgh, W. Va. These common names are transposed in some localities. Herds-grass of Pennsylvania is Red-top. Herds-grass of New England and New York, etc., is Timothy. In view of this the name Herds-grass might as well be dropped.

Compost Heaps.—It is often recommended that when manure is thrown into heaps in the field, it should be covered with a layer of earth to prevent the escape of the ammonia. The experiments of Dr. Voelcker, at the Royal Agricultural College at Cirencester, in England, have established the fact that the evaporation of ammonia from large heaps of manure goes on but slightly: for the reason that, during the decomposition of the manure, certain organic acids are formed at the same time the ammonia is evolved, and then immediately unite with the ammonia, forming non-volatile compounds. There is an active escape of ammonia from the interior of large heaps, where the heat is too great for the chemical changes above referred to; but, as it approaches the exterior parts of the heap, where the heat is very much less, the ammonia is completely taken up by the organic acids and retained. There will be but a trifling escape of ammonia while there is sufficient moisture to retain it, for water absorbs and retains many hundred times its bulk of ammonia gas at ordinary temperatures. These non-volatile compounds, from being highly soluble in water, are liable to be washed away by every rain storm, giving the well-known brown color to the drainings of manure heaps.

Fish Guano.—We advise all farmers, during the coming season, to purchase fish guano with extreme caution. The *Menhaden* or *Moss-bunker* seems to have deserted our shores during the past autumn, and most of the fish-oil works have remained idle. If the market is this year as largely supplied as it has formerly been with fish guano, the assumption will be natural that there is a good deal besides fish refuse in it.

Garget, or Caked Bag.—In very many cases, if this troublesome disease is taken in hand at its very outset, it may be entirely reduced by thorough and frequent sponging with cold water, and a subsequent gentle friction with the hand, previously dipped in cold water. This is much more simple, and less likely to produce injurious results, than the use of the various ointments recommended for the purpose.

Farm Roads.—There are two conditions which are essential to all good roads. One is a dry foundation, and the other a hard surface. A well-drained road-bed and a covering of stone and gravel make a

perfect passage-way for the heaviest of vehicles. Such roads, however, are too expensive to be universally adopted by the farmer; and he generally contents himself with laying stone or gravel, or both, over the wetter portions of his roads. It would be far better, if only one of the two conditions above named can be attained, to secure the dry foundation rather than the hard surface; and half the cost of stoning or graveling expended in the construction of a good underdrain, four feet below the surface of the road, either under the middle or at one or both sides, would accomplish better results: and during all but a small portion of the year, the road would be very satisfactory, and its condition yearly improve.

Manure for Corn and Potatoes.—"J. L. C.," asks, "Is guano for corn and potatoes preferable to a mixture of lime, ashes, and plaster?"—For potatoes, yes; for corn, no. It is probable that the ashes and plaster would be a valuable addition to the guano for potatoes. But the ashes should not be mixed with the guano, as they set free more or less of the ready formed ammonia, especially if the ashes are moist.

Deep Sowing.—"H. S.," Waverly, Pa., writes: "One of my neighbors says that peas and radishes do best planted 8 or 10 inches deep."—Some growers think that peas do better if planted 4 or 5 inches deep. If radish seed were buried 8 or 10 inches, we doubt if it would ever see daylight, but we never tried it.

Sowing Half the Farm to Barley.—"E. S. B.," of Pittsburgh, Pa., writes: "In the January number of the *American Agriculturist*, you hinted that barley would be a profitable crop if well cultivated. I have a farm of twenty acres. Do you think it would pay me to put in a crop of barley, say ten acres? My land is in splendid condition, as I plowed in a crop of clover last season."—If we are to understand that a crop of clover was plowed in last summer, and the land has had no crop on it since, but has been fallowed, there can be little doubt that, if the other conditions are favorable, a very heavy crop of barley will be obtained. But if the land was planted to corn last season, and well cultivated, it would also be in good condition to sow barley, though of course the growth will not be so large. As a rule, however, it is a mistake to sow half a farm to any one crop—especially of a crop of which, as we judge, you have had little experience. If the land has been thoroughly fallowed since the clover was plowed in, it will be in splendid condition for almost any crop. Potatoes, carrots, parsnips, onions, beets, mangel wurzel, and crops of this kind, would do well. If you are conveniently situated for marketing, and can command the necessary labor, they would pay better than barley. For root crops, on such a soil, two or three hundred pounds of a good superphosphate per acre would prove valuable.

Best Machine for Sowing Guano, etc.—"J. L. C." We cannot answer this question. There are several machines used for the purpose. But the one we happen to have, although it sows plaster very well, is apt to clog with superphosphate and other artificial manures. And as even distribution is desirable, we still continue to sow by hand. The cost of sowing is so small compared with the cost of the guano, that we do not feel it so much as in the case of plaster.

Burning Lime on the Farm.—"D. B.," German Settlement, West Virginia, asks for a plan of burning limestone, for manure on the farm, with wood. Some years ago he made the attempt, but failed. When wood or coal is abundant and cheap, lime may be burned without a kiln; but when wood is worth two, three, or four dollars a cord, it is cheaper to build a kiln and burn in the ordinary way. When a farmer has limestone on the farm, and he intends using a considerable quantity of lime for manure, it will pay him to erect a kiln for his own use, rather than draw the lime from a distance. But as a general rule, it is better to leave such work to those who make a business of it.

Selling Straw to the Paper Mills.—"S. D. S.," Hagerstown, Md. The policy or impolicy of doing this depends on circumstances. Straw is worth about \$3.00 a ton for manure. If you can get from \$5.00 to \$10.00 per ton, on the farm, as we can in the neighborhood of the writer, it will of course pay much better to sell it than to rot it down for manure. Instead of selling all the straw, the better plan would be to sell half of it, and buy oil-cake with the money, and feed it out to stock with the remaining half, on the farm. And if you make anything on the stock, buy guano with the money! In this way, you can sell straw with great advantage to the farm, and ultimately to yourself.

Poisoned Rats will poison hogs eating them,

A New Winter Pear.—Duchesse de Bordeaux. J. S. Houghton, a well-known pear grower of Philadelphia, informs us that he has fruited this variety for several years, and considers it to possess every good quality. The pear is of French origin, but seems perfectly adapted to our climate. Mr. H. says: "I know of no winter pear which can compare with it for size, beauty, keeping qualities, and general excellence, and no tree more hardy, thrifty, robust, and fruitful." It keeps until March and April. Mr. H. has no trees for sale, but says that it is being propagated in the nurseries.

Quinces.—"G. W. G." These require a deep and rich soil. They will do well on a sandy soil that is properly manured. Muck or woods' earth will be useful.

The Buchanan Pear is a chance seedling found by Mr. Isaac Buchanan near Astoria. It is of good size, St. Germain shape, and of positively good qualities. We tested it in February, and though the specimen had become shriveled from being kept in a warm room, it was very sweet, juicy, and vinous. With proper care it would no doubt keep very late.

Crop for an Orchard.—"Subscriber," Alexandria, Va. If your trees are 15 years old and the tops nearly meet, why put in any crop at all? No profitable crop can be raised in the shade, and trees of this size need all the soil. You cannot eat your cake and have it too, and a given area of land can not do double duty.

Apple Blossoms in January.—Doct. Wm. H. Trowbridge, Stamford, Ct., sends us some apple blossoms. His son cut from an apple tree a stake to support a climber, and the flowers expanded in a warm room. This serves as a hint for experiments with flowering shrubs.

Peach Orchard.—W. H. Finley. If you can raise peaches in your locality (which is not given) at all, land that is in good condition for farm crops will do for peaches.

Trouble with Cherry Trees.—Corresponding Secretary of Farina, Ill., Agricultural Society. Please forward a specimen. From the description, it looks like the beginning of the Black-knot.

Small Fruits.—"E. B. H.," Milford, O. Barn-yard manure, well decomposed, is as good or better than any other application. Ashes are valuable, as is bone-dust. Guano should be used with caution; about 200 lbs. to the acre is enough. Canes of blackberries that have once fruited are to be cut away. Your fruit for next year will be borne on the wood that grows this year. Cut quite down to the ground when they have done bearing. A shelter of pines or other trees would be a great advantage. You would have fewer plants winter-killed, and the crops would be earlier and surer.

The Stark Apple Again.—On page 99, last March, we gave Dr. Warder's description and outline of the Stark, and in a Basket item, recorded the opinion of the Fruit Committee of the American Pomological Society, that the apple is an old variety, the Pennock. Neither of these articles exactly suits some of our Western friends. A. H. Gaston, Henry Co., Illinois, writes that the statement that it "bears heavily on alternate years," (which is Dr. Warder's), is a mistake, as it is a certain and annual bearer. Mr. D. B. Page, of the same county, says, that the Stark and Pennock are as unlike as a "pumpkin and musk-melon," and thinks some one must have played a joke upon the Committee, by sending them the Pennock for the Stark. Mr. Gaston sent the specimens. Mr. H. McMasters, Leonardsburgh, O., also writes us an article defending the identity of the Stark, which is too long for us to insert. We can assure our correspondents that we have no desire to do other than justice to the Stark or any other apple. Such experienced pomologists as Downing, Barry, Elliott, and others, may be in error; still we think their deliberately considered opinion worth recording. We here give the opposing opinions more space than we did the statement which called them forth, and we would suggest as a final settlement of the matter that the parties interested in the Stark present their arguments to the Fruit Committee of the American Pomological Society, who, if shown that they erred in their decision, will be very ready to acknowledge it.

Troublesome Bugs.—"C. C. P.," Salina, Kansas. If you will send some specimens in a box we will try and find out what your annoying insect is. Smashed specimens are not to be identified.

Glazing Flower Pots.—"J. F. B.," asks for a "Solution for glazing flower pots." Earthenware is glazed in the furnace at the time of baking, and

we know of no ready means of doing it otherwise. Why glaze flower pots at all? All florists reject them as worthless. The porosity of the pot is essential to the well-being of most plants. A sickly plant in an old or over-baked pot, which has its pores filled up, will often recover if put into a new and porous one.

In Season and Yet Out of Season.—Several correspondents have sent us late in the winter, suggestions and devices suited to that season only. By the time we could present them to our readers they would be untimely. A number of them are good enough to salt down for next winter.

Tomato Experience.—Mr. J. A. Potter, Lowell, Mass., reports his experience with tomatoes as follows: "I planted on the 17th of March, seven different kinds of tomatoes, viz.: Large Smooth Red, Orangefield, Keyes' Early, Tilden, Cedar Hill, Sims' Early Cluster, and Maunpays Superior. Some of each kind were set May 23d, in a sloping piece of ground facing to the south, where the road-dust and sand had washed on about one foot thick some five years ago. They all did well last season. The Large Smooth Red I consider one of the most profitable of any in this vicinity, it being large, smooth, solid, and of good flavor, and about as early as any in the market; first ripe July 27th.... Orangefield. First ripe July 25th; the plant dwarf and very stout; very prolific; fruit of good flavor and fair size, but rather too rough for market.... Keyes' Early. First ripe July 28th; a great bearer; fruit of good flavor; rather too small for market; rather backward about ripening up to the stem.... Tilden. First ripe August 4th; large, smooth, fine-flavored, not very prolific, cracks badly before ripening up to the stem.... Cedar Hill. Ripens with the Tilden; too rough and irregular for this market.... Sims' Early Cluster. A rapid grower; great bearer and fruit of good flavor; too small for market; ripens with Cedar Hill and Tilden.... Maunpays Superior ripens with me the same time as the Tilden; a strong, healthy vine, and an enormous bearer; solid, splendid flavor; good for this market; one of the best.... The Large Red Smooth and Maunpays Superior are the best I have ever seen. I would not be willing to change them for any others I ever saw.

Hedges in Kansas.—E. Snyder, Highland, Kansas, writes: "This is decidedly a country for Hedges. In fact it is the best and cheapest method of fencing here, and a few years will see nearly all the old farms enclosed with hedge. The season must be favorable for a hedge of any kind to do well on freshly plowed sod, (prairie) in this section, and one of the important points of raising a hedge is to have a good growth and good 'stand' the first season of planting. It is not advisable to plant on ground that is not in good condition for the growth of plants. The article on page 99 (March) is calculated to mislead the inexperienced. I have no doubt but the person who wrote it did just as he said, and was successful, but according to my experience he would fail nine times out of ten here. I have tried every way the books and papers tell about, adding my own ways, and have planted early and late, fall and spring, and can positively say that early spring planting, done right, with good plants is preferable to any other time. As a general thing a hedge planted here in June would not make more than one-half the growth it would if planted in April. Millions of hedge plants are annually lost by following the plan recommended by "G. N. M.," although I have known a few to succeed tolerably well in following it under very favorable circumstances.

Drains and Trees.—"J. J. S." If your drains are four feet deep, as they should be, plant the trees as near as you please. The usual way in draining orchards is to lay the drains between the rows.

Flowers.—The new ones tested last year are described in the Horticultural Annual, by Peter Henderson. Beautiful illustrations are given.

Onions, Tobacco, Flax, Hops.—Our pamphlets upon these special cultures continue to be the standard works. They are each made up of essays from a number of practical cultivators living in different parts of the country, and one supplies what another omits. Sent by mail at a very low price. Onion Culture, 20c.; Tobacco, 25c.; Hops, 40c.; Flax, 50c., by mail.

Lining for a Fountain Basin.—"A 10-years' Subscriber" has cemented his basin with water lime and it is plastered upon the clay cracked by the frost. We are not informed of the size of the basin. A margin of stone laid in cement would stand. The trouble is probably in the freezing of the clay margin.

Manuring Grapes.—"F. W." We should not use manure at all, unless the land is very poor.

Manure should never be put in contact with the roots of a vine or tree at planting, but be thoroughly incorporated with the soil.

Windsor Beans.—J. C. Le Tonzel, Bermuda, writes: "I have now growing in my garden a nice bed of Broad Windsor Beans, that look as promising as any I ever saw, but will bear no fruit. The vines have been flowering for at least two months, without the sign of a pod; new flowers replace the old ones on the stalk, and wither off just at the time one would suppose the vines would bear. My neighbors are not better off than myself; their vines blossom, but yield nothing, although planted at about the same time."—We doubt if Windsor Beans can be raised in your climate. Even the heat of our summers is too much for them. They can be had in perfection only in cool, moist climates. Try them in your coolest month, and top them when they commence to flower.

The Schoolmaster Very Much "Abroad."—At one of the State Fairs last autumn, we saw a collection of Dabbias, on which was the following notice: "Any person wishing to buy any of these dabbias can select any collar."

A Low Hedge.—J. G. Caulkins, Dutchess Co., N. Y. We have never seen any attempt to keep the Honey Locust as low as 18 inches. The stems would probably get very "stubby" after a while. The nurseries have now several dwarf forms of Arbor Vita which would answer the purpose, as would the Holly-leaved Barberry, the Mahonia of the nurseries.

Bugs and Vines.—F. C. Blanchard. The plan of placing a frame with a pane of glass over the hill is a very old one and has often been mentioned in these columns. It is, however, very effective.

Trimming Trees.—A practical Fruit grower writes: "In a late No. of the *Agriculturist*, it was suggested that in trimming, large limbs must be supported or have a piece first taken out from below the branch, to prevent the falling limb from splitting off a portion of the wood or bark, which should be preserved unharmed. My method has been, first to saw the branch off, a foot or fifteen inches above the point of final trimming; thus making it easy to hold the stump with one hand while safely sawing it off with the other. Unless a person is well skilled and careful, and the saw keen and fine, it may be well first to cut through the bark below, while using this method. With care and a good saw, it is not necessary. Sometimes, where the angle of a branch is very small above, it is best to saw wholly through from below. My mode is convenient for this."

Lavender.—Anna, (who does not give her address). Lavender is a low, scrubby plant with pale green, narrow leaves. Sweet Basil is in some localities called Lavender. That is an annual with green broad leaves, and is probably the plant you have grown.

Gardening for Profit.—No person who grows vegetables for market, whether on the large scale or in a smaller way, should be without this valuable work. Though written by a market gardener, it is full of interest to the private gardener, and no one who has a garden can fail to find it of use. Price by mail, \$1.50.

Concentrated Manure.—W. Vintner. Peruvian Guano is used with great success in vegetable gardens. If stable manure has already been plowed in, 300 lbs. to the acre is sufficient. If no other manure is used, 1,000 lbs. to the acre is applied. In either case it is sown broadcast after plowing and harrowed in. Most other concentrated fertilizers vary so that it is difficult to tell much about them; a good superphosphate may be used in the above quantity, and probably equal quantities of that and guano, for general use, would be better than either alone. For plants set in hills it is better to incorporate the fertilizers with the soil of the hill before planting than to sow broadcast.

Tuberous Chervil.—C. D. Smith has tried the seeds spring and fall, and failed to raise any plants. We tried them once in autumn only, with the same result. The French, who grow it more or less extensively, say, that if sown too late the seed will not germinate until the second year. The probable trouble is that the seed is too old.

Chinese Yam.—"S. W. C.," Deer Isle, Me. The Chinese Yam will probably mature with you. It is not raised from seed, but from pieces of the roots, and little bulletts found upon the stem. It is not worth growing, as the labor of digging is too great. Those who are fond of it grow a few plants as a garden vegetable.

Coal Ashes.—The chief use that has hitherto been made of coal ashes is in the construction of foot walks and road-ways, for which they are excellent,—even better than gravel; but wherever the earth closet is used, it is an excellent plan to employ the finer sifting of coal ashes in combination with sifted earth—say $\frac{1}{2}$ ashes to $\frac{3}{4}$ earth—as the material for disinfecting.

Taming Bulls.—As ordinarily kept on farms, bulls are quite liable to become so cross and vicious, that it is not safe to keep them after they attain the age of four or five years. But if two are kept instead of one, and they are broken to the yoke, and worked as regularly as oxen are, they will do as much work, do it rather more briskly, remain docile longer than when not used, and seem to be made in all respects more useful.

Hanging a Grindstone.—"G." Lawrence, Kansas, asks how to rig a grindstone to run by the foot. This needs a double pair of friction rollers and an axle, square at one end to receive a hand crank, and with a short crank at the other to be connected with the pedal by a rod with a hook to go upon the crank. These "grindstone fixtures" may be bought at any agricultural establishment in the larger cities. They are hampered by no patents, and cost no more than a common blacksmith would make them for, and are better made. A grindstone cannot be driven by the foot if it has not friction wheels, and it is pretty hard work then if one grinds any thing heavier than a carving knife.

How to Make a Ewe Own her Lamb.—"W. A. T." has tried several plans, but without success. If the lamb dies soon after birth, we have generally succeeded in getting the ewe to take another lamb. The main point is to separate the ewe from the rest of the flock, and put her in a small pen. Hold her while the lamb suckles, and milk a little of the milk on the lamb. Do this four or five times a day, not neglecting it the last thing at night, and the first in the morning; and in nine cases out of ten the ewe will take to the lamb in two or three days, and frequently much sooner. Another of our Editors says: Cut off a portion of the skin of the dead lamb and put it over the neck and shoulders of the living one, wool side out, and the dam of the deceased lamb will always adopt it immediately. The skin may be removed after half a day or so. The best way is to have no dead lambs.

Cure for Hog Cholera.—"J. T. D." Rising Sun. We know of no rewards that have been publicly offered for a cure. There is one, however, which will surely be given to any one who makes known a certain cure or remedy, or even a tolerably efficient cure or preventive, and that is the reward of the consciousness of having done the country a great good. No man has a moral right to keep such a secret to himself for the hope of reward. After submitting it to sound veterinarians and physicians, if they approve, it should be published with great minuteness and particularity. The trials made and results obtained all over the country would settle the truth of the claim. Then there is not a State, which has offered a reward, which would not gladly pay it if proof of discovery be presented.

Holding on for High Prices.—A correspondent writes: "Your counsel against holding out for higher prices has been well exemplified in our neighborhood. Some raisers of sage herb refused 40c., waiting to get 50c., and now can't get 25 cents per pound."

What Ails the Hens?—Hen diseases have been very little studied. One subscriber writes: "Within three years I have lost a dozen hens. They begin to droop, and get black about the head; dung, loose and yellow; have but partial command over their movements, stagger and waddle about, and in from one to three weeks they die. They have been generally my best two or three-year-old Brahmas." Another says: "My hen acts dumpish, and will not eat. I found the nest covered with blood, and that she had been bleeding from the mouth." [Has she not been hurt?—Ed.] Yet another: "My hens have a very singular disease. The eye swells and closes; pus forms of an offensive character, and the skin surrounding the eye is distended with a substance of a yellowish white color, resembling cheese-curd in consistence. The fowls generally die, though this be cleaned out thoroughly and often. They are ravenously hungry, yet grow weaker all the time."—Our own experience suggests no certain treatment, and we would be glad to have successful practice described.

Carts versus Wagons.—It seems strange that so few carts should be used by farmers in this country. They are much more conveniently geared up, more easily worked in cramped places, are unloaded with less trouble, and are, in all respects, for the jobbing

work of the farm, more economical and convenient than wagons. Provided with a good set of top-boards and a bay rack, they ought to become in this country, as they have in England, the principal vehicle for use upon the farm, although wagons are better for journeys on the road.

Nutritive Value of Different Crops.

—A subscriber of the *American Agriculturist* in Ulster Co., N. Y., writes: "I would like to know 1st, the fattening properties contained in carrots, ruta-bagas, mangel wurzels, turnips, oats, and corn; 2d, How many pounds of each are equal to one hundred pounds of hay?"—We would like to know, too; but the question is surrounded with so many difficulties that no one has yet been able to give an entirely satisfactory and definite answer. The tables given by Professor Johnson in the appendix to "How Crops Grow," showing the "Proximate Composition of Agricultural Plants and Produce," furnish the latest and most reliable data to be obtained. But a volume is required to explain them, and this Professor Johnson will give us in due time. We may, however, assert that, of the roots named, carrots are the most nutritious; mangel wurzel next, and nearly equal to the carrot; ruta-bagas next, worth, perhaps, twenty per cent less than mangel wurzel; and turnips, worth one-third less than ruta-bagas. We cannot say how many pounds of carrots are equal to a bushel of oats or a hundred pounds of hay, any more than we can say how much bread is equal to a pound of beef, or a galloon of oysters. Those who pretend to give a definite answer on this subject are little better than quacks. We must take into consideration the question of digestion, of the importance of concentrated nutriment, and of the adaptability of the food to the kind of stock. The mere fact that one food contains more nutriment than another proves very little in regard to its value. If we could get the nutriment of one hundred pounds of hay concentrated into fifty pounds of hay, the fifty pounds would be worth much more than the one hundred pounds. Grain and the better class of roots are, consequently, from the fact that they contain a less quantity of crude, indigestible material, of much more value than the mere amount of nutriment that they contain would indicate. And hence it is that we so frequently insist on the importance of producing rich grass and hay. A farmer should never raise turnips when he can raise a good crop of ruta-bagas, or ruta-bagas when he can raise a good crop of mangel wurzel or beets. The advantage of the turnip lies in the fact that we can sow it later, and it requires less manure; and when fed out early in winter, it affords food at a comparatively cheap rate. But to compare a crop of common white turnips with a good crop of mangel wurzel is like comparing a crop of buckwheat with one of Indian corn. Both are good in their place.

Cotton Seed Meal, and Cotton Seed.

—Chemical analysis shows that cotton seed meal is one of the richest foods now available for farm stock, while its price is relatively lower than that of any other. After considerable experience in its use with milch cows and other animals, we are prepared to say that its effect in feeding seems fully to sustain the indications of the analysis. It is not well to feed it very largely; and there are authenticated instances of its having speedily produced death when given to young calves and young lambs, although sucking colts, eating it from the lambs' troughs in the fields, have not been injured. It is almost always necessary to teach cattle to eat it, by at first mixing a small quantity of it with other meal. Its effect on the value of manure is very great, probably even better than that of linseed meal or rape cake. A neighbor of ours used it last spring as a manure in the hill for corn with excellent results. He considered the application profitable, and proposes to repeat it during the coming season. An Arkansas planter recently informed us that he regarded a bushel of hulled cotton seed as equal in value to two bushels of corn in fattening hogs. The hulled seed, from which the oil has not been expressed, must be fed even more cautiously than the meal, which is deprived of the greater share of its oil.

The Ayrshires as Milkers.—Howard S. Collins, of Collinsville, Conn., furnishes the Practical Farmer an interesting account of how he came to select the Ayrshires as milkers. In 1856, he commenced farming on a poor, neglected hill-side farm, of one hundred and fifty acres, that, at the time, supported only six head of stock. He began by keeping a dozen head, soiling them in summer, and steaming food for them in winter, and every year taking up some poor land to be thoroughly cleared, manured, and seeded down again. We have visited his farm, and though beautifully situated, we have rarely seen a more unpromising field for testing the merits of high farming. There are few men who have studied agriculture more thoroughly than Mr. Collins, or who have carried to the task of renovating we might almost say creating, a farm, greater skill, system, energy,

perseverance, and science; and he deserves his success. On this farm he now keeps fifty head of cattle and three horses. He has tried the "Natives," grade Devons, grade Short-horns, grade Ayrshires, and has finally decided that, for his purpose, (selling milk the year round) properly selected thoroughbred Ayrshires are the most profitable cows for him to keep. We know Mr. Collins to be a very careful and systematic man, keeping an exact account of the produce of every cow on the farm, and his statement is entitled to great weight.

The season is fully three weeks later than last year. We do not publish poetry; observe, and save postage. An India-rubber sponge has been invented in England. The N. Y. Evening Mail estimates that 3,000 quarts of pea-nuts are retailed in New York daily.

"The times is the money," is the way one of our French exchanges renders our proverb "time is money."

William R. Prince, formerly known as a nurseryman, died at Flushing, N. Y., March 28th, aged 73 years. Ashes are beneficial to fruit trees. "J. S. K." should not heap them around the trunk, but scatter them.

A peck of clover seed per acre, especially on spring crops, is none too much.

Answer to several.—We have had many assertions that wheat would turn to chess, but no proof.

The Kansas State Agricultural College has 168 students, —71 ladies, and 97 gentlemen.

A Georgian has patented a bottomless flower pot for starting cotton in hot-beds.

The Southern Horticulturist is published by H. A. Swascy, M. D., at Yazoo City, Miss., at \$2 per annum.

The third Annual Fair of the State of Louisiana takes place at New Orleans on April 6th.

"Ex-Squire" is right when he says his record of the time of planting and of the coming up of seeds is interesting to look over. It is useful, too.

Notes on fruit prospects are interesting. "D. P., Jr.," would add much to the value of his by stating in what part of the country they are taken.

If, as a correspondent suggests, a plum-tree that was plugged with sulphur was free from canker, we do not believe that the immunity was due to the sulphur.

Farm laborers in Ireland are becoming scarce. A Tipperary paper says "the hands in the market look for 2s. 6d. to 3s. per diem," or nearly one dollar in currency.

France sends over ten million dollars' worth of butter per annum to England and about five million dollars' worth of eggs.

Now comes Nebraska, with a journal, the *Agricultural Intelligencer*, edited by S. W. Brooke, and published monthly at Rulo, for \$1.25 a year.

Forney's Weekly Press, (Philadelphia, Penn.) has a Farmer's Department. To say that it is conducted by Thomas Meehan is assurance that it is well managed.

Orono Potato is to be the name of the potatoes heretofore known as Foot, Reed, Carter, and Orono. So voted the Maine Agricultural Society.

"Shady Cottage" is a very pretty name, and so is "Lilac Dell;" but it would help correspondence wonderfully if people who date their letters in this way would say what their Post-office address is.

Pigs are so scarce in some sections that a common breeding sow sells for \$75 to \$100, and last fall pigs at prices equal to 20 cents per lb., live weight. Better eat more mutton than buy pork at these rates.

Grain is low and butter is high; a cow is a machine for converting the one into the other. But a flour-mill will be run to little advantage if there is no wheat in the hopper. Draw your own conclusion.

The Central Chamber of Agriculture in England represents the opinions of 15,000 Agriculturists by means of 90 deputed members, and it has great political power in all matters affecting the interests of farmers.

The Department of Agriculture sends out for trial white English "Excelsior Oats" that weigh 51 lbs. per bushel. Beautiful oats, but a little mixed with barley, that it would be well to pick out before sowing.

The Massachusetts Horticultural Society awarded in 1863, for premiums and gratinities, \$1,685. This will do very well for a provincial town, but the New York Horticultural Society gave \$0,000,000.

The Fireman's Journal is the latest specialty in the way of journalism. Full of interest to those who have any property to burn, as well as to those who keep property from burning. New York: semi-monthly. \$1.50.

The gentleman who puts questions to us through the Farmers' Club is informed that's not the way for us to receive communications. The Weekly Tribune was doubtless hard up for something to fill its "Agricultural" columns, and printed his letter. Thank you, Mr. Trib.

Pine Straw.—The old leaves or needles of the pine fall every summer as soon as the new growth is made. This material throughout the Southern country is known as pine straw, and more or less use is made of it as bedding and manure. Mr. Frank Heiderhoff, of Bay St. Louis, Miss., sends us an analysis, the name of the analyst not being given. This represents the whole amount of ash as 2½ per cent; and as it contains 4½ per cent of alumina, we conclude the straw contained more or less soil gathered with it. The ash contains, according to this analysis, about 5½ per cent of potash, a little soda, 13 per cent of lime, and more than one per cent of phosphoric acid. This indicates but a slight value, so far as ash ingredients are concerned, the most valuable ingredient, potash, amounting to less than 3 pounds to the ton. However, the amount of nitrogen, which is not stated, may be, and probably is, considerable. Mr. H. recommends composting pine straw with muck, marsh mud, or calcareous marls. Mr. Wm. R. Hammond, of Tyrrell Co., N. C., writes that he draws the straw from the woods every two or three weeks, uses it as bedding for stock, and then throws it into the hog-pen. Then he scatters "ditch-bank" muck over it, and when the ditch-bank is used up, has the men mix it in the hog-pen. In January it is gotten out, and lies under cover until spring.

Smart Hens in Vermont.—A correspondent calls our attention to the following clipping from a country paper, and asks what we think of it. "Mr. Martin Leonard, of Pittsford, Vermont, from eight hens raised last year 45 chickens, and sold 70 dozen eggs for \$162, besides using 110 dozen in his family. Mr. L. says his hens are a greater source of profit to him than his sheep." We think we will not try to match the Down Easters telling stories. Let us count: 45 and 8,520 and 1,320 make 9,885. That is the number of eggs that eight hens laid in one year, which is more than an average of three and one-third apiece for every day, allowing no time for hens to sit and take care of their broods!

Too Fat.—"S. W. H.," of Kansas, writes: "My neighbors tell me my mares are too fat for their colts to do well when foaled. What effect will the condition of the mare have on the foal?"—The mare ought not to be very fat, for excessive fatness is accompanied by a diseased condition of the system. Still, they ought to be in good condition, even moderately fat. In such case the mare will probably get on well, have an abundance of milk, and the foal will be finer, both at foaling and afterwards, until it is weaned, if not for life.

How to Raise a Calf without Milk.—"R. S.," of Richmond, Ind., writes that he is trying to raise a calf without milk, and is feeding it a mash of wheat middlings and Indian meal, but is in doubt whether this is the best way. We have had no experience, but have known of calves being raised with very little if any milk. They were given for drink tea, made by steeping and boiling good sweet hay, thickened with boiled fine Indian meal and wheat flour. Tendencies to constipation were checked by feeding a thin porridge of wheat bran and oil-cake, and the scours was stopped by boiled milk, thickened with fine wheat flour.

Norfolk Co., (Mass.) Agricultural Society.—At the recent annual meeting of this Society, the Hon. Marshall P. Wilder, who had been President ever since its organization, (twenty years,) took his leave of the office in a most interesting and touching address. The Norfolk Society is one of the most influential among the many Agricultural Societies in Massachusetts, and has always been foremost in promoting agricultural improvement in that State. Hon. John S. Eldridge succeeds Col. Wilder, who is made Honorary President.

Bee Items.—By M. Quinby.

The Bee Malady.—Since our last report, letters have been received from Clay Village and Carlisle, Ky., and Circleville and Rising Sun, Ohio, relating to the bee malady, but presenting no new feature. In suggesting probable causes, two or three describe the weather as far back as last May. "Cold, drenching rains, etc." One says they "froze to death;" another that "there was no pollen;" another that "there was plenty," and that "the honey was good;" another that "it was bad." And another, that "it could not have been poisoned honey, and carried from one hive to another in December—it was too cold." His commenced dying at that time, and were still dying up to March 15th. One correspondent says, "Maple and Willow were in bloom in February in Indiana." There must have been many days warm enough for bees to rob—especially deserted hives—before these blossoms appeared. Hence the fatality to this late day may be accounted for on the theory first suggested. I see no hope of saving a single colony, not even of those shipped there from other States, until every particle of

this honey is beyond their reach. Notwithstanding the impossibility of printing all the views and solutions offered, I hope those who have observed any thing unusual will report further.

Italian and Black Bees.—J. Scholl, Lyons Station, Ind., asks: "Will Mr. Quinby please inform your readers, whether he keeps Italian bees only, or if he has both Italians and black? Do not the Italians degenerate?"—Mr. Quinby keeps both Italian and black bees, has several yards, and manages in this way: In spring, when summer arrangements are completed, the home yard consists of about a dozen good Italian stocks, seventy-five native ones, and one hundred queen-rearing boxes. Box hives, if any, are transferred to movable combs. One or two of the strongest are fed, to induce early breeding of drones. A few of the native queens are destroyed, six or eight at first, and replaced by Italian queens from the full stocks. The Italians, deprived of their queen, will construct a score or two of queen cells. Remove more of the black queens, the day before these hatch out, then cut out all cells but one, and give one to each of the black hives, last deprived of its queen. These hatching, supply the hive with a pure queen, and Italian drones only being out, their purity is insured. This must all be done before black drones have made their appearance, or even before eggs for them are deposited. Otherwise, the combs with sealed drone brood must be lifted out and every larva or chrysalis cut in two, or destroyed in some other way. Long before the close of the season, all these colonies, as well as the increase—beside very many in other yards—are changed to Italian, and are sold off to reduce the stock to the original number by the next season.

Straight Combs.—John W. Shaw, Maryland, asks: "How can straight, single combs be secured in movable comb hives always, or a great majority of times? If this can not be done, the new system is nothing. I have failed with the Harbison and Langstroth hive. I would be glad if it could be answered satisfactorily and immediately."—After several years' experience, I find that this subject, like most others, demands labor and care, if we would accomplish what we wish. I have learned that if the under sides of the tops of the frames, as a guide, are acute angles, made very smooth, and they are placed at the right distances apart, and one end of the hive elevated about thirty degrees, the other way perfectly plumb, and this done at once, on hiving the bees, nine-tenths of the swarms will build their combs straight. Should the adjustment of frames and raising one end be put off until next morning, I can readily comprehend why the simple act of elevating would throw the combs across from one to the other. A part will follow the guide perfectly until almost across the whole length of a long frame, and then cross over to the next. The cause seems to be in the greater thickness of store combs, which they build near one end. Yet any one determined to have straight combs may succeed. Open the hive three days after hiving, and see that they start straight. There is the most danger when they are nearly across. Every second day is as long as it is safe to leave them. When any comb is being made crooked, get some heavy tin or zinc, or even thin shingle, three or four inches wide, and long enough to reach the bottom. With a carving knife, or a piece of shingle, this soft, new comb may be turned back in a line with the frame. Blow in some smoke to drive the bees away, to prevent crushing, and put in the tin to hold it until secured by the bees. Should a little honey be pressed out in the operation, no harm will be done. Repeat it, if they again go crooked. I have bought a great many bees, and furnished hives to put them in; often I did not see them until October, and when I found any combs crossing badly, I would leave them until the next spring, when I would take out all in one body, if necessary, and make the crooked part straight, and hold them until fastened by small strips of wood, as shown in "Bee-keeping Explained." I often break up a box hive, and transfer the contents to frames, and hold them in the same way until fastened. It is the fault of the operator if the combs are not made straight in these cases. It can be done. "M. Quinby" never intended to say that bees died of "buckwheat honey."

Corn Cultivation in Iowa.

We have an interesting statement from Mr. John Molony, Jr., Dubuque Co., Iowa, giving his experience in trying the *American Agriculturist* plan of raising corn. He made one mistake, and soon found it out. Clayey or loamy land must neither be worked nor even gone upon while it is too wet to plow. There is no objection to low, flat hills, but they will not hold the corn

up. It will usually stand better in flat culture than if much hilled. Mr. M. writes as follows:

"My crops for 1868 were pretty good,—I believe better than usual. I thank the *Agriculturist* for it, and go in for Book Farming; but my neighbors don't. In the fall of 1867 I commenced hauling out manure on a field of oat stubble for corn. The field being near the road, every one saw the manure, and thought I was crazy. My friends came into the field and told me that I was manuring twice too thick, and that I would have no corn, but all weeds; but I had read somewhere in the paper that corn ground could not be too rich, so I let them talk away. It being late in the season I could not finish the hauling out, and the ground was frozen so hard that I gave it up, leaving about an acre unfinished. In the spring I got at it again; every day that was not fit to plow I was hauling manure. I hauled what stable manure I made during the winter, then I got at the hog-pens. Some days were wet and the ground was so soft that I could hardly drive through the field, but I got the acre manured, and I left it so, in heaps, until I had the small grain in. I spread the manure in lands, and as soon as I had a rod or so spread, I plowed it down about ten inches deep, and worked in that way until I had it all plowed and harrowed, both ways. It was in good order, except what I manured in the spring, and every lump on that was as big as my head; the reason of which was driving over it so many times with team and wagon when wet, there being more clay in that side of the field. About the 18th of May I "listed" it both ways, with a marker, four feet each way; on the 19th, I planted it with Yellow Dent or Hackberry corn. I went through it three times each way, using the cultivator all the time, and any weeds that remained after the cultivator I pulled out, as I was trying flat cultivation. The neighbors said it would be great corn if I would plow to it with the one-horse plow; they said if I did not the wind would blow it down. I told them I would risk it. Haying and harvesting came on sooner than I expected, and I had to give up the corn. About the time it was earing out, we had a heavy rain with high wind: it blew down a good deal of my corn, and some of the neighbors', too, but more of mine than of theirs; of course they laughed, and said it was because I had not plowed to it. The land was manured, and the corn from eight to twelve feet high, and I suppose that made it blow down. This year I think I will use the plow for the last time, keeping about midway of the row, plowing rather shallow, throwing the soil two or three inches upon the stalk, leaving a flat hill, instead of the usual sharp ridge. The plan here is to run the plow close to the hill and throw the dirt from six to eight inches up on the stalks, scalding them, and cutting off the roots also. They say they want to smother the grass and weeds. They might smother some grass, but not many weeds, because the weeds are nearly as high as the corn.

The best way to get weeds and grass out of the hills is to pull them out by hand, and it pays to do it. I had about ten acres last season not in the manured field, but on pretty good land, only nine years in use. Harvest came on before I could finish weeding, and I had to let about forty rows go, and it wasn't very weedy; but when picking time came, there was a difference. Four rows of the clean corn filled the wagon box, while it took five rows of the weedy corn, and then it was small and a good deal of it soft. I will make it a rule from this time to plant no more corn than I can take care of. Although the wind blew down a good deal

of the manured field, I had over 70 bushels to the acre, just double what I had the year before, on the same kind of land, not manured, though I gave it nearly double the work. The weeds did not trouble me so much in the manured field, as in the other field. The best corn was where the horse and hog manure was put.

Most farmers here are very careless about their manure. In my travels through the country, I have seen manure thrown over the fence into the high-road. I have seen corn not two feet high, and plenty of manure going to waste around the stable and cattle-yard. Hog manure is hardly ever used at all, nor the cleaning of the fowl-house; and wood-ashes are all thrown away. No wonder that the land is giving out, and crops getting light. A good many here are selling out and going West. They say the land here is giving out. Won't it be the same with the Western farm in a few years? I think so. I have seen farmers haul manure away from their stables and throw it in a heap in the pasture, or on the road side, and they having plenty of land in cultivation that never got an ounce in thirty years, while corn on this land, I believe, did not yield ten bushels to the acre."

Picking and Packing Strawberries for Market.

BY S. B. COMOVER, WEST WASHINGTON MARKET, N. Y.

A large proportion of the strawberries and other small fruits sent to market arrive in bad order, and are consequently sold at such low prices that they do not pay the raiser. Indeed, they are frequently a loss, as they do not realize enough to pay the shipping expenses. It is useless to spend time and money in obtaining the best varieties, and producing fine fruit, if it is not properly picked and packed, and handled with care, until it reaches market. It should then be in such a perfect condition as to last at least twenty-four hours after it is received, to give time for selling and use.

The marks or names of the producers become known to the buyers and dealers, and great care should be used by the producer in putting up fruit, to build up a character. When a certain mark acquires an established reputation for honesty and uniformity of packing, it is invariably spoken for and engaged at the highest prices by the dealers, and always meets ready sales; while those of doubtful character are the last sold, at reduced prices, and, in case of a glut in the market, are not sold at all. Strawberries should be carefully picked after the dew has dried off the vines, carried to a shed or shady place in the field, and spread out thinly on a clean sheet or cloth. When perfectly cool from sun heat, and all external moisture is dried, they should then be carefully sorted by trusty persons who will use care to put none in the cups or baskets that are over-ripe, bruised, or of inferior size. The cups or baskets should be well filled, and slightly rounded. Place the top layer, which should be of choice berries, with the hulls down, or out of sight as much as possible, but not "topping off" so much that the top of the cup will not be a fair representation of the rest. All sandy fruit should be kept by itself, and if sent to market, not faced with fruit that is not sandy, but put up to be sold for what it is. Neither should unripe berries be put in the bottom, and faced with ripe ones; they had better be thrown away. The pickers must be watched, and those who will not pick the fruit carefully, and in proper condition, should be discharged. One

bruised or over-ripe berry in a cup, will, in twenty-four hours, ferment, mold, and spoil the whole cup full. In picking strawberries, the hulls should be left on, as it prevents bleeding, and the fruit will keep a great while longer.

The packages should hold what they profess to contain, a full quart, pint, or one-third of a quart, and should be so filled when packed as to be full when they arrive in market. From the experience of myself and all the principal dealers in fruits for the past ten years, there is no basket in which berries will carry so well, and command such ready sale, and consequently such high prices, as the Beecher cups or baskets, or one of similar size and shape, and equally strong. Baskets of this kind are preferred for the following reasons: They hold full measure, and are well ventilated; being larger at the top than at the bottom, each layer of fruit forms an arch with the sides, which prevents the top berries from crushing those below; they are strongly made, having a firm bottom, which prevents crushing the berries in handling; and having flaring sides, they will pack into each other, and take up less room when empty, while in the hands of the retailer; and being round on top they show the fruit off to better advantage than any of the square ones. The crates should hold from twenty-four to forty-eight quarts, in order to be handled easily and carefully, and the grower's name and residence, as well as the name and address of the consignee, should be marked plainly upon the crate. In order to prevent delay and mistakes, inform the consignee of the shipment by early mail or telegraph, so that he may know when and where to look for the packages promptly on arrival.

Sparrows—Are They Useful or Not?

BY M. JEAN SISLEY, LYONS, FRANCE.

In the Feb. number you express some doubts about the usefulness of the European Sparrow.

This subject has been much discussed in Europe. Sparrows have their advocates and their detractors, but the general impression is now, that they must be to a certain degree protected.

In support of this opinion, it may be useful to state a fact not generally known. Since more than a century ago the question was solved in the north of Italy, where rice and other grains are grown very extensively. At one time people thought that sparrows were a nuisance, and the cultivators of that country destroyed them all; but they soon had to regret it, as all sorts of injurious insects soon propagated in large quantities. They went to consult a celebrated naturalist (whose name is forgotten), and his answer was:

"Get all the sparrows you can procure from neighboring countries, and make as many holes as you can in the walls of your houses and churches; each hole will become the temporary abode of a pair of sparrows, and each pair, to feed its offspring, will have to destroy thousands of insects, which you cannot yourself put down. You will object, that when harvest time comes, your fields will be covered with flocks of sparrows and the destruction of grain will be enormous; but this you can very easily avoid.

"Young sparrows, just before they are able to leave the nest, are a delicious meal. Visit the nests regularly, take all the broods except the last one, which will come after you have stored your crops and will feed on what has escaped your notice. The loss will therefore be scarcely perceptible. This is the only and rational solution to the question of sparrows."

This advice was strictly followed, and the

destruction of the early broods is still practised in northern Italy. In France, sparrows are not disturbed and their mischief is very little felt.

About Roses.

Those who wish to purchase roses become much bewildered when they look into the catalogues. They find several classes of roses, with "no end" of varieties under each class. The classification of roses is very puzzling, even to those who have given some attention to the subject, and Mr. Parsons, in his work on the Rose, (a new and revised edition of which is just ready) has very much simplified the matter by making only three classes. The first of these is Garden Roses, which includes the old-fashioned kinds, and many newer ones, that bloom only once a year, and does away with the distinctions of Damask, Provence, Hybrid China, etc. This class also includes the Moss Roses, Briers, and Climbing Roses; they are all hardy. The second class is the Remontants, a word signifying to bloom again. These are often called "Hybrid Perpetuals," a name calculated to deceive those unacquainted with the fact that they are not at all "perpetual," but give a fine bloom in the spring, and usually a weak one in autumn. These are all hardy, and among them are found some of the finest bloomers. The third class is the Everblooming Roses, and includes the Tea, Noisette, Bourbon, and Bengal Roses. These are really perpetuals, and are in bloom nearly all the season. Unfortunately they are tender at the North, and must either be "heeled-in" in a dry place, or be laid down and covered with sods and a bank of earth. It is now too late for our readers to do much with any but the last named class, the Everblooming roses, which are sold by the florists in pots. They will do well in any good garden soil, but if the soil is old it is better to make an excavation and put in some fresh earth from the pasture, mixed with well-decomposed manure. It is difficult to make a selection when there are so many varieties, and all of them charming. Perhaps after all the best way for the inexperienced is to send to a reliable florist for a given number of plants, to be free bloomers, and to include as great a range of colors as possible. When the roses are planted then trouble begins, and no one need expect to have flowers without trouble. The tender shoots and buds will be covered with plant-lice (green-fly, or aphid). Syringe with tobacco-water, soapsuds, or a weak solution of cresylic soap; many can be destroyed by going over the plants with a soft brush. When the rose-bugs come, as they sometimes will, and make havoc, nothing short of hand-picking will avail. But neither of these troubles is anything compared to the rose-slug. If any of the leaves appear to be eaten, look upon the under side for a small green worm. A few days' neglect, and the bush will be stripped of every leaf, and it will be a long time before it recovers. Having tried all the proposed washes, we accept the slug as a conundrum and "give it up," as far as they are concerned. No doubt that cresylic, whale-oil, and tobacco soap, would "do" for them, if one could readily apply it to the under side of the leaves. We have found it much less trouble, and a great deal more efficacious, to give the bushes a smart shake, early in the morning; this will dislodge all the worms, which are to be dispatched, as they lie curled up on the ground. This is only practicable where there are a few bushes, but any one who cares for roses will be willing to take the trouble.

Swine—Breeds and Breeding.

There are probably not less than 37,000,000 hogs in the United States at this time—there certainly will be more than that number in the

JEFFERSON COUNTY.—(LARGE BREED.)

course of the summer, or before the autumn slaughtering. There is no domestic animal more easily improved, and none which so quickly repays care and attention. It is a great pity that such careless methods of breeding and feeding should prevail, for we venture to say the wealth of the country is thereby lessened at the average rate of at least \$5 a hog, amounting, in the aggregate, to \$185,000,000 a year. The temptation to kill the best hogs in the fall is so great that breeding sows are often selected simply because they are poor and not fit to kill, and these are paired with males chosen from common stock in forty-nine cases out of fifty, we presume. Though the boars may be good, of their poor kind, the sows are, as often as not, bad, and so very little, if any, improvement takes place in the race. Now and then a little fresh blood is brought into a district, which makes its mark, and for years an improvement is observed.

Among other excellent articles in the *American Agricultural Annual* for 1869, is one by our collaborator, Mr. Harris, on Pigs. He there inculcates forcibly the doctrine, that for profitable market pork, we should use large, pretty well-bred sows, with great digestive functions, crossing them with some of the fine, pure breeds, like the Berkshire, Essex, or Suffolk. This cross imparts to the progeny the fineness of bone, and smallness of offal or worthless parts possessed by the sire, and the great capacity of digestion, characteristic of the dam. By such crosses, pigs of exquisite beauty, to

a high price for them as breeding animals. The sows may be used to breed from with partial success, but, for the production of really good breeding sows, should be crossed back with some large breed, like the Chester Co. Whites,

or the Jefferson Co. Breed. This would produce fine, large, grade sows, of strong constitutions—great milkers, and, of course, ravenous feeders—just what are wanted to cross with the fine-boned Essex or Suffolk, to give us pigs fit to kill at 9

months old, weighing 300 to 350 pounds. They are easy keepers, too, for they make the most of every ounce of feed they have, whether in the pasture or penned. They are always plump and round, unless half-starved. Mr. Harris tells of his selling such pigs at a year old, right out of his pasture, to a drover, to "top off" a car load of pork for the New York market.

There is no secret about having such pork, and there is no question about whether it is

dresses just as white as that of a white pig, and we know no reason why color should make any difference in our preference of breeds except as it may be one of the points to indicate good breeding or purity of race. The Jefferson Co.

BERKSHIRE.—(SMALL BREED.)

Breed is a composite race of immense hogs, reaching not very rarely the weight of 800 or 1,000 pounds, which latter weight was that of the one sketched for our engraving. They are a finer boned breed than the Chester Co. Whites, and, we are inclined to think, have less rugged constitutions. The last named are too well known to need description. Originating in Chester Co., Penn., they have now been carefully bred for several years, and enjoy a wide reputation.

Both these breeds are white and large, and make admirable stock for breeding sows. The engravings of them are from sketches taken by Mr. Edwin Forbes. This gives us another opportunity to reiterate one of the cardinal principles of good farming—the use of thoroughbred males. We cannot otherwise reckon with certainty upon improvement in any of our stock. By using full-blooded boars, a stock of coarse pigs, in two generations, may be brought up to great excellence, but a continuance of the same system is necessary to maintain its

ESSEX.—(SMALL BREED.)

high character. The continual use of males of a small breed will refine and reduce the size of pigs, especially after the first generation. Hence there is especial need of maintaining pure both the large and the small breeds. By this means we gain, in the way above specified, strong digestive powers, constitution, rapidity of growth, fineness of bone, and smallness of offal in hogs destined for feeding and slaughter. The same principles apply to raising beef, mutton, and poultry, and those who

good to eat, if the pigs feed in clover pastures, and are hardened up for killing with sound corn. If all our pork was treated in this way, we should hear of no hog cholera or trichinae and other parasites, from one end of the land to the other. When these views become disseminated, and accepted, and lived up to, we shall have in every part of the country careful breeders, who profitably devote themselves to raising certain breeds pure. Our farmers ought to have a personal knowledge of the best breeds of swine, and intelligently make

their own selections, to unite qualities they most desire. We give engravings of several of the best breeds. The Essex and Suffolks are famous for fineness of bone, smallness of offal, and the certainty of imparting these valuable peculiarities to their offspring. The

SUFFOLK.—(SMALL BREED.)

a breeder's eye, are produced—often far surpassing their parents. The boars, however, should be used only for slaughter, though thousands of farmers may be found who would pay

Berkshire is a somewhat larger breed, also fine in bone, and very economical feeders. The black color of the Essex and of the Berkshire is with some farmers considered an objection. The pork

CHESTER CO. WHITE.—(LARGE BREED.)

follow them will be sure to be the gainers. The time has passed for an intelligent farmer to advocate using mongrel or grade male breeding animals with any class of stock however inferior.

Walks and Talks on the Farm—No. 65.

A farmer in this vicinity, who is a liberal feeder, a month or two ago killed a hog that weighed 650 pounds, and he got over \$100 for him. He was twenty months old. This will pay. But I am told by a large dealer that the demand for such excessively large hogs is falling off. "Even the boatmen, who formerly would buy nothing but the fattest and heaviest pork, now prefer lighter pork, provided it is firm and good."

I killed and put down this winter a thoroughbred Prince Albert Suffolk, and also some grade Essex. The latter were very fat, and the quality and quantity of the lard produced quite excellent. The pork of the Suffolk is good, but that of the Essex is far better. It is remarkably firm, tender, and fine flavored. It has always been claimed for the Essex that they afford the best family pork, but I never more than half believed it, as breeders are very apt to attribute all manner of excellencies to their favorites. I am not altogether convinced yet, from the fact that the Essex were fed a month later than the Suffolk, and were much fatter. A farmer who will keep either a Suffolk, Berkshire, or Essex, and cross him with good-sized common sows, will have pigs that will make pork good enough for any man. But one thing is important, whatever breed is selected,—he must be *thoroughbred*. It seems impossible to convince farmers of the value of an established breed in transmitting their good qualities to their offspring. The remark, "A good hog needs no pedigree," is sheer nonsense. Those who talk in this way only exhibit their ignorance of the first principles of breeding. It is not enough that the animal to be used has the right form and fattening qualities. You want to be sure that his ancestors for several generations have had the same qualities, and that they are fully established in the breed. Such an animal, when crossed with common stock, will impress his qualities on the offspring. A grade, or common animal, no matter how superior he may be in form, lacks the necessary force to overcome the defects of the animals he is bred to. This fact is so well established, that I have no patience with a farmer who will use a cross-bred pig when he could buy a first-class thoroughbred for ten or fifteen dollars more than he has to pay for the nondescript animal he uses. I have no sort of doubt that a good grade Essex pig (the offspring of a common sow and a *thoroughbred* Essex) will be worth for the butcher at nine months or a year old, at least ten dollars more, in proportion to cost of feeding, than a common pig. And if so, what is the value of a thoroughbred Essex, Berkshire, or Suffolk, in a neighborhood of farmers with sense enough to patronize him?

"As to pasture," writes our friend in Ohio, "you say that one of your fields, the past summer, supported stock equal to at least two cows per acre until after hay harvest. Yes, until after hay harvest; but how much stock would it have carried after that? If you have any way of making the land in your neighborhood carry stock at the rate of *one* cow per acre say six months, I will be under great obligations to you if you will tell us how it is done."

The field alluded to was plowed up in August, and "fall-fallowed" for spring barley, and consequently I cannot tell how much stock it would have carried through the season. Probably not more than a cow to the acre. And during the month of August, *one* cow to two acres,

even, might have had rather a short allowance. But it is not necessary to confine stock to one field. We have to make hay; and a field of rich clover, cut early, would afford good aftermath by the time the pasture began to fail. Or we might soil the cows with green corn fodder during a drouth. I will not say that I can take a twenty-acre field of grass and make it carry twenty cows from the middle of May until the middle of October. I should have too much pasture at one time, and too little at another. But that I can make it produce as much grass as twenty cows can eat in six months, I have no sort of doubt. I think, in a favorable season, I *could* make it produce as much as thirty cows could eat in six months. In Mr. Lawes' "experiments with different manures on permanent meadow land," an annual top dressing of mineral manures, and 400 lbs. each of sulphate and muriate of ammonia, produced the first year, 6,970 lbs. of hay per acre; the second year, 6,940 lbs.; and the third year, 7,508 lbs.; or an average of 7,139 lbs.; while the unmanured plot produced an average of only 2,691 lbs. The hay was cut the last week in June. The aftermath was allowed to grow until October, and was then fed off with sheep. On the average of the three seasons, the unmanured plot kept thirty-three sheep per acre for one week, and the plot manured as above, sixty-six sheep per acre, for one week. This was calculated to be equivalent to over half a ton of hay per acre, on the basis that the sheep (Hampshire Downs) would eat grass equal to sixteen pounds of hay per week. This plot, therefore, produced grass of the most superior quality, equal to a little more than four and a quarter tons per acre. And if a large-sized cow or ox will eat grass equal to half a ton of hay per month, twenty acres of such land would afford grass for over twenty-eight cows or oxen for six months.

I think I *can* make my land do better than this. The field on which these experiments were made had been in grass "for certainly over a century; indeed," Mr. Lawes says, "for as long a period as is included in any record that can be found relating to it." Now, however unprofitable it may be to break up such land, there is little doubt that a greater amount of produce can often be obtained by so doing.

Our land is far better adapted to the growth of clover than that at Rothamstead, and yet in some experiments made while I was there, ten thousand nine hundred and twenty-eight pounds of clover hay was obtained in one year from three cuttings, (June 26th, August 6th, and October 19th,) or nearly five and a half tons per acre. This produce was obtained from a simple top-dressing of three hundred pounds of sulphate of potash per acre. And from clover sown in a "garden soil," there were cut at three cuttings in one year, eighty-nine thousand six hundred and twenty pounds of green clover, or over forty-four and three-quarter tons per acre, or eighteen thousand one hundred and twelve pounds of hay,—over nine tons per acre. This soil had been used as a kitchen garden for "probably two or three centuries." It was one of those delightful old English gardens that we read about so much, but so seldom see in this country. It received, doubtless, abundance of "spit-manure," thoroughly incorporated with the soil. But I have reason to believe that no artificial manure was used. At least I recollect once asking the gardener if he used any, and he said he did not, and I brought him a little superphosphate from the laboratory to use on lettuce, and he said the effect was magical. Now, if a soil will produce nine tons of hay per

acre without artificial manures, how much stock would it carry if we gave it an occasional dressing of plaster, superphosphate, guano, etc.? My Ohio friend will laugh at this kind of reasoning. But in all seriousness, I believe we have little conception of how much grass an acre of land can produce. There is, doubtless, a limit—perhaps determined by the power of the sun's rays; and if so, we can produce more here than in England. But of course the real question is, Will it pay? Each farmer must determine this matter for himself. It is often a question of capital. But more frequently it is a question of faith and pluck. A farmer, at any rate, should determine to cultivate his land a little better every year. If on the rich land of the Scioto Valley he cannot bestow cultivation sufficient to produce more than thirty-three bushels of corn per acre, followed by a crop of wheat of eleven bushels per acre, followed by clover and timothy that will not support more than one cow on two acres, I *think* the better plan would be to plant only half the field to corn, and summer-fallow the other half. If the corn is cultivated thoroughly, and if the fallow is a *real* summer-fallow, the effect on the wheat will probably be very decided, and, at any rate, the clover and grass will be vastly better. And this good crop of clover can be made the basis of further improvement.

A few days since one of my horses was taken lame in the fore leg. He had been drawing logs out of the woods, and it was thought that he had sprained his shoulder. This is a serious affair. Nothing but absolute rest will effect a cure. But on consulting the authorities, I found that Youatt, Mayhew, and McClure, all agree in saying that shoulder lameness is of very rare occurrence. Youatt says: "In not more than one case in twenty is the farrier right when he talks of his shoulder lameness." "The symptoms of shoulder lameness can scarcely be mistaken; and when I have mentioned them," says Youatt, "the farmer will recollect that they very seldom occurred when the village smith pointed to the shoulder as the seat of disease, and prescribed for the animal to no purpose. In sprain of the shoulder, the horse evidently suffers extreme pain while moving, and, the muscle underneath being inflamed and tender, he will extend it as little as possible. *He will drag his toe along the ground.* It is in the lifting of the foot that the shoulder is principally moved. If the foot is lifted high, let the horse be ever so lame, the shoulder is little, if at all, affected." He gives other tests. And a thorough examination satisfied me that the trouble was not in the shoulder. I then concluded to again examine his foot carefully, and then I found the trouble. A piece of wood, an inch or more long and as thick as my little finger, had entered the foot between the hoof and the frog. It had been broken off level with the hoof, and was nearly concealed by the frog. It was not an easy matter to get it out. I got hold of it with a pair of pincers, but it broke, and I had to cut away the hoof and dig it out with a knife. So much for consulting "the books." I might have doctored this horse for shoulder sprain for a couple of weeks until the piece of wood worked itself out; and at this season of the year the loss of a good horse for a week or ten days would amount to more than all the best books on the horse would cost. The great point when an animal is sick, is to find what the trouble is. And I am not sure but that the best way is to call in all one's neighbors and let them give their opinions on the point. If it should be a case where there

are but six possible causes of trouble, and they name five of them, you will be pretty safe in doctoring for the sixth! The other day I was consulted in regard to a cow that was taken sick. She had been doctor'd for the "hollow horn." I thought the disease had been brought on by hollow stomach, and recommended some nice hay, bran mash, a little linseed tea, and a pint of *sound ale* a day. I think I should be a popular cow doctor—with the cows. Some one once told Hood that he "had never been sick a day in his life." "What a fool you must be!" was the prompt but not very polite reply. It would be better for our animals if farming was not such a healthful occupation. This man who had the sick cow is a strong and healthy man, who has been used to "rough it." And sick as his cow was, he turned her out with the rest into a field to water, with a keen north-east wind blowing, and the next time I met him, on asking "How's the cow?" he replied "I've taken her hide off." She was worth \$75; a few days' nursing would have saved her.

I used to have a great deal of trouble, and have lost several cows and horses. But for a year past I have not had a single trouble until the horse lamed himself in the woods the other day, except a slight attack of colic in a horse, which an injection of soap and water cured at once. We have made no change in the manner of feeding, except that when the teams go to the city, and are likely to be out beyond the usual hour of feeding, I insist on the men taking some cut feed along for the horses. Indigestion is the source of nearly all ordinary complaints in horses, and this is brought on by irregular feeding and watering, by exposure, fatigue, by long journeys without food in a storm, and then by overfeeding and *neglecting to rub them dry* before leaving them for the night.

A Kentucky farmer writes me: "I have three hundred acres of cleared land. There are three fields of fifty acres each, the rotation on which is corn, wheat, and clover, successively, and one field of one hundred and fifty acres in permanent meadow. Now, would it be better to divide the farm into four fields of seventy-five acres each, with corn, wheat, clover, and Timothy successively? With such a rotation, would there be too much clover with the Timothy when the object is to bale it for market?" The rotation would be as follows:

75-acre Fields.	1st year.	2d year.	3d year.	4th year.	5th year.
A.	Timothy.	Corn.	Wheat.	Clover.	Timothy.
B.	Corn.	Wheat.	Clover.	Timothy.	Corn.
C.	Wheat.	Clover.	Timothy.	Corn.	Wheat.
D.	Clover.	Timothy.	Corn.	Wheat.	Clover.

If the Timothy seed is sown in the fall, with the wheat, and the clover seed in the spring, we should, in this section, get an excellent kind of hay for consumption on the farm—say half Timothy, and half clover; and the next year the hay would be nearly all Timothy. If the Timothy seed is sown in the spring with the clover seed, the first crop of hay would be nearly all clover, and the next year it would probably be about half and half; and if kept in meadow another year, it would be nearly all Timothy. I have no doubt that more produce can be obtained by dividing the farm into four fields of seventy-five acres each, and cultivating them in the way proposed, than by cultivating only half the farm, and keeping one hundred and fifty acres in permanent meadow. And if all the clover and all the corn and stalks and the straw of the wheat are consumed on the farm, and the manure carefully saved and applied, the productiveness of the land may, per-

haps, be maintained, even if seventy-five acres of Timothy hay are annually sold. Much, however, depends on the natural fertility of the soil, and the thoroughness with which the land is cultivated for corn. If it was my case, I should be inclined to let the three cultivated fields of fifty acres each remain as it now is, and divide the one hundred and fifty acres now in permanent meadow into three fields. The farm would then have six fields of fifty acres each. I would then try to adopt a system of rotation, having two objects in view: first, to raise as much clover as possible, and second, to cultivate and clean the land thoroughly. And instead of selling seventy-five acres of hay, I would endeavor to raise as much from fifty acres. And the same with wheat. That it can be done, I have little doubt. At all events, if as much wheat and Timothy was not obtained from the fifty acres as from the seventy-five acres, I should expect the *profit* to be as much, or more. I would try the following rotation: 1st, corn; 2d, wheat; 3d, clover; 4th, clover; 5th, fallow; 6th, Timothy. I would sow nothing but clover with the wheat. Mow it for hay the first season; then pasture. The next year pasture until June, and, if it could be spared, then let it go to seed; if not, pasture the whole year. The next spring, pasture until June, and then plow it up, and summer-fallow thoroughly, and in August, seed it down with half a bushel of Timothy seed. The next year mow it for hay, and pasture it until time to turn it over for corn the next spring. If nothing is sold but wheat and Timothy hay, it will not be difficult to keep the land in good condition. A large stock can be kept. There will be fifty acres of clover hay every year, fifty acres of wheat straw, and fifty acres of cornstalks to be used for fodder. And there will be always fifty acres of pasture; and in the spring and fall, one hundred and fifty acres. Sheep will do better on the clover than cattle will. They can be wintered on wheat straw, and a bushel of corn to a hundred sheep. In this section, we could winter a good many cattle on fifty acres of cornstalks, with a little clover hay and corn meal. I have never been in Kentucky but once, and that was years ago. It is not improbable, if I was better acquainted with the agriculture of that State, I should see many objections to this plan. But if I wished to sell Timothy hay, I should adopt some such plan here. I have great faith in summer-fallowing for Timothy. But the hay is so good, that I should want to feed it out myself.

Here we cannot sow wheat after corn without great labor, and the practice is almost entirely abandoned. We generally sow barley after the corn, and wheat after the barley, seeding down with the wheat. We are planting less corn than formerly, on account of the high price of labor, and the difficulty of getting it husked. If the Husking Machines prove satisfactory, or we can obtain reliable labor at fair wages, we shall probably plant more. Corn is a splendid crop—the King of Cereals—and it is nearly the only "fallow-crop" that is adapted to our climate and wants. But at present I have made up my mind to try summer-fallowing more, and corn planting less, until we can obtain labor at reasonable rates. I have a piece of rather low land that is of too mucky a nature for wheat and barley. It needs plowing and re-seeding. I intended to summer-fallow it and seed it with Timothy this fall. But there is far less advantage in fallowing such land than a clayey loam. The Deacon urges me to plant

it to corn, and then seed it down with oats next spring. But I will not do it, because there can be no doubt of the fact that the oats take from the soil the very plant-food necessary to produce rich grass. I would rather seed it down with the corn. Cultivate the corn thoroughly, without hilling it up, and then when we can cultivate it no more—say in August—mount a horse, and go through the rows and sow from a peck to half a bushel of Timothy seed per acre. We cut our corn close to the ground, but if the stalks should interfere with the mowing machine, let the Timothy get ripe enough for seed, and cut it with a reaper, and bind it in bundles. Then in the winter, lay these bundles on the barn floor, and give the heads of Timothy a few sharp raps with a flail. Then if you want to sell Timothy hay, you will have an article that is just the thing for those city people, who are so fearful of feeding the least particle of clover. You can assure them that it is "clear Timothy," and entirely free from "dust."

"An Enquirer" in Ohio writes to the *American Agriculturist*, expressing surprise at my remarks in regard to the pair of wild turkeys being so much finer boned than the domestic turkey, and he asks "Is not the wild *always* better than the tame?" Most certainly not. The wild hog is far inferior to a well-bred domestic pig. A short-horn is vastly superior to a buffalo, and a Northern Spy is better than the Crab-apple. It may be that wild animals have better constitutions than the tame, owing to the fact that weakly wild animals, lacking the fostering care of man, die off, and thus the race is propagated only from the strongest. But for domestic animals we provide food and shelter, and often take more care of the weak. By and by the butcher comes along, and offers more for the best than for the poorest, and a short-sighted policy accepts his offer; so we breed from the very animals which, in a state of nature, would have died. If wild turkeys are better than our domestic turkey, (and I am inclined to think they are,) this is doubtless the cause. We kill those which are the fattest and mature the earliest, and *breed from the poorest*. Judicious selection and careful breeding would soon make the domestic turkey far superior in early maturity and fattening qualities to the wild.

Another Ohio farmer asks me whether plaster will do good on heavy clay land. If it is wet, no; if dry, probably yes. Also, how many rods of drain, three feet deep, a man will dig in a day. It depends on the character of the land, and the energy and skill of the ditcher. Some men will use the pick where another man, with more pluck and a narrower spade, would not; and in this way he would do double the work. I have never paid more than twenty-five cents a rod for digging a three-foot ditch, and the men board themselves. But where it is very stony, I am obliged to have it done by the day, and it costs a good deal more, depending on the number of stones, etc.

The Pennsylvania Hay Wagon.

The engraving on the next page shows the hay wagon generally employed in the vicinity of Philadelphia, which has some advantages over the wagons and carts in common use in other localities. The total length of the top of the body is twelve feet. The two forward corners are supplied with sharpened iron pins, 8 inches long, one of which is shown in the engraving.

and two poles hinged at the rear, which, when not in use, are turned down and lie against the sides at the bottom of the wagon. These project about 6 feet above the frame, and, expanding on the same angle with the body, are about

Fig. 1.—PENNSYLVANIA HAY WAGON.

8 feet apart at their tops. At each end of the body outside and near the bottom there is a windlass, shown enlarged at fig. 2, having holes through which the hay rope is passed, and other holes to receive a short hand-lever.

The hay is built up above the level of the tops of the stakes, *b, b*, and is so laid on as to considerably overhang the iron points in front, which reach so far into the compressed

Fig. 2.—WINDLASS.

load as to prevent its shifting sideways. The half ropes are then passed over the load lengthwise, one lying near each side of the load. Their ends are secured in the holes of the windlasses and it is then drawn as tightly as possible, one lever being left in each windlass to prevent its turning back. This is an excellent vehicle for carrying either manure or sea-weed, and its body may be, with little trouble, replaced by a more convenient box for carting earth, spreading dung, etc.

A Good Home-made Harrow.

Thorough pulverization of the soil, especially upon the surface, is of vastly more importance than cultivators are generally willing to admit. If once harrowing is very useful, how does any one know that a second and third harrowing are not just as useful? The fact is, any one who

HOME-MADE HARROW.

tries it will be surprised at the obvious improvement in most crops on spots in the field subjected to extra harrowing. Some harrows will do nearly twice the work that others will without taxing the team perceptibly more. Mr. A. L. Curtis, of Little Hocking, Ohio, sends us a sketch from which the engraving is made, and

writes: "The mass of farmers still follow the old 'A'-harrow, which their ancestors for generations back used, and which will accomplish less for the amount of draft-labor than any other tool which is used by the agriculturist.

Having long felt the want of something which would do more work and do it better, I made several different kinds of harrows, and at last the one shown in the accompanying sketch. This proved a complete success. It is 4½ feet long, 4½ feet across the front end, and spreads to 6½ feet at the rear end. The frame is made of the best white oak; the bars being 3 inches wide by 2½ thick. There are 36 teeth, 8½ inches long, by ¾ths of an inch square. The hinges should be bent up about an inch high where they are bolted together, which allows the sections to fold together at the back when necessary to lift it into a wagon or upon a drag. Bolts with nuts should be used at every joint, as pins will work out. The team is attached by a common 'stretcher,' hooked into the 'eyes' in front. If farmers want a harrow which is worth three of the old style, and is not hard for the team, they may, if they please, try this plan, which is free to all, not being patented."

Do Turkeys Pay?

Turkeys do not pay the careless farmer, who has no place for them to lay or hatch, and no range or roost for them. The eggs get chilled, the nests are broken up by vermin, or, if the eggs hatch, the young ones are exposed to the long cold storms, and the most of them die. Fall comes, and the flock is barely doubled. This does not pay. But a good stock and careful handling pays about as well as anything on the farm. We give the balance sheet of a Connecticut farmer, to show how the thing may be done. He had 8 turkeys, from which he raised 101 birds. He sold 98 of them, weighing dressed, 1,426 lbs., at the close of the year, for 27 cents a pound, making \$385, and the remaining three he valued at \$9, making the gross proceeds of the flock, \$394. He fed them 110 bushels of corn, worth \$165, and the dressing cost \$10, making \$175. This gives \$219 profit, if we reckon the feathers and manure as an offset to the attendance. This is a handsome item in the operations of the year. It does not take a great deal of labor to raise a flock, but a little timely attention must be bestowed every day during the spring, which is the critical time with them. After the chicks are two months old, they require less care than any other kind of poultry. The nests should be sheltered, and for this an old barrel, covered with brush, is better than a more expensive and tidy covering. If you can make them think they are stealing their nests, it is all the better. By a little timely attention they can be made to lay and rear their broods near the house. The eggs should be brought into the house, to guard them from frost, and be turned half way over every day, until the hen is ready for them. Make a pen of boards about a foot high, in some sheltered sunny spot, for the young brood, and keep them there until they can fly over. Feed chopped

eggs, liver, or some fresh animal food, with the scalded hominy. Have a roost of poles in some sheltered spot, and as soon as they incline to forsake the shelter of the mother, train them to mount the poles. They will soon come home as regularly as the chickens to their roost, and much labor will be saved in looking after them. Turkeys, like other farm crops, are profitable according to the attention bestowed upon them.

Grinding Mowing Machine Knives.

Grinding mowing machine knives takes two persons, and it is tedious work at that. The farmer must generally do it himself, or see his knives spoiled, and it is often a serious tax upon his time. This has set the wits of inventors at work, and they have suggested and patented a number of ingenious devices for aiding in this necessary operation. We have examined many plans, but have seen none yet which will dis-

pen-
pend with the common grindstone, or holding the knife bar in the hands. Preferences may be in favor of the flat, or of the V-faced grindstone; a good grinder can use either, but we doubt if one side of two sections can ever be ground well at the same time. It is very important to have a rest for the bar, so that the angles of the ground surfaces on the different sections shall vary as little as possible. Mr. J. H. Burr, of County Lambton, Canada, describes to us a very simple rest, of which we think it would pay every farmer to make one or two before the mowing season. He uses a very large stone with a short crank arranged with a dripping water pot, to keep it uniformly wet. The stone has a flat face, and the short crank makes it easier to give it a rapid motion. The Rest is represented in the accompanying sketch. It is a post two inches square, and five feet high, having wooden pins set in one side, two inches apart, mortised into a two-inch plank, one foot square. The rest may be set conveniently near the stone, and the one who holds the knives can have a seat. In use it takes the weight of the bar off from the arms of the grinder. When the sections are ground on one side, the rest is shifted to the other side of the stone, and they are ground upon the other edges. The labor being so much reduced, and the rest giving so much accuracy to the grinding, Mr. B. thinks even bright boys of fourteen years can do the work very well after a little practice.

KNIFE-BAR REST.

The Outlets of Underdrains.

It is shameful to see expensive underdrains allowed to fall into disuse through neglect. During the first few years after drains are laid, there is always some silt entering at the joints, more or less according to the care with which the tiles were originally laid, and according to the character of the soil. Almost always this silt is of so light a character that any constant flow of water will keep it gradually moving towards the outlet, and prevent its accumulating to an injurious extent. But if, in any part of the drain, the tile is, to use a professional term,

"drowned," that is, if the water lies stagnant in it, this "drowned" portion will gradually accumulate silt, often sufficient in time to obstruct the passage beyond the power of the current of the drain to free it. Generally, drains being laid with a regular fall, this accident is little likely to occur, except where, from carelessness in allowing an accumulation of silt in front of the outlet, the mouth of the pipe is under water. Five minutes' work, once or twice during the winter and spring, will usually suffice to remove this accumulation, and re-establish the cleansing flow; and the work should be promptly done.

As a means of preventing this annoying and sometimes disastrous result, it is best to so arrange the outlet that its obstruction by silt is impossible, or nearly impossible. The best means for doing this is to lay the lower end of the last tile on a little wall of brick or stone masonry, built upon the rear end of a large, flat stone or brick platform, in such a manner that the water flowing from the mouth of the drain will fall clear of the wall and strike below upon the stone or platform, this in turn standing at its farther edge a little above the bottom of the ditch through which the water is discharged. By this means we prevent any interruption to the flow of the drain, except such as might result from an obstruction of the ditch below, which nothing but the grossest carelessness would ever allow to remain to an injurious extent. An engraving of an outlet of this kind was given in the March number, on page 95.

Portable Hitching Ring.

Who has not been annoyed by not being able to find a suitable place to tie a horse? In the country, perhaps, one might find trees, or buildings, or timbers; in the town, wooden sidewalks, awning posts, trees, etc., but often no hitching posts at convenient points. A valued correspondent, whose letter is unfortunately mislaid, writes that he finds an article like the one figured exceedingly convenient. This is a strong, tapering screw, with ring handle, which may with ease be firmly set in any fixed wood-work, or tree, by the roadside. This is a form of cooper's vise, which may probably be found in the hardware stores, though the common form of cooper's vise has a longer shank and too small a hole in the flat handle. A good blacksmith can easily make one.

HITCHING RING.

What Use Have We for Crows?

Farmers regard crows as their natural enemies. This is a wrong view to take, for the question may well be discussed whether crows do more harm than good. They do a great deal of good, but this is very nearly balanced at any rate, if not overbalanced, by their destruction of grain and useful birds. It becomes therefore an interesting problem, if we can not prevent the harm and make the most of their good offices. A flock of crows on a newly plowed field will destroy more white grubs and cut-worms than are seen by the farmer and his men in the course of an entire season, and where these pests are abundant in cornfields, the crows will, as the writer has repeatedly seen, go

from hill to hill, stopping only at those where a wilted spear shows that grubs or cut-worms are at work. At these points they persevere until they find the little marauders, being guided apparently by the sense of smell as well as by sight. Now, it may be all very well to say a good word for the crows when they deserve it, but few are inclined to do so when they find hill after hill of corn pulled up, or see the rascals at work pulling the young wheat, or tearing open the husks of the roasting ears.

A crow is a very shy animal, and if by any means one can be trapped upon a field, or be exposed a few days while living, as if caught in a snare or trap, it is a safeguard for the season. It is no easy matter to trap a crow and yet it may be done. We illustrate a plan which is said to be very sure in its operation. A steel trap is laid in the shallow water of a pond, and a tuft of grass is placed upon the pan, and partly conceals the trap. Then the crow's natural fondness for eggs is taken advantage of in selecting the bait, and a blown egg-shell put upon a stick, which is stuck in the bottom of the pool at such a distance from the trap that to get it the crow must light upon the tuft of grass. The egg is half filled with water and seems to float only a little out of water. The jaws of the trap should be bound with tow or wrapped with cloth, to prevent them breaking the bird's legs. The trap must be frequently looked to, lest a crow being caught become exhausted, and falling over into the water be drowned. When one is taken it may be brought to the cornfield, its wings bound fast to a stick or in some way pinioned so that it cannot fly, and then tied. Its cries will attract all the crows in the vicinity, who will come down close to it, but do no damage to the corn. If a crow is pinioned on its back it is said that it will clutch and hold any crow that comes near enough. (This we have heard called a Maryland crow trap). We are assured by Mr. J. H. Mabbett, who gives us this plan of catching crows and who has practiced it with success, that during the rest of the season no crow of the neighborhood will light upon a field where a crow has been so displayed.

Earth Closets for Cows and Horses.

Much interest is now being taken in the question of the introduction of the earth closet; and it has occurred to us, (a limited experience on the subject confirming our idea,) that the application of the same principle to the cow stable, the horse stable, and, indeed, to every place where live-stock is kept, is perfectly feasible, and will be attended with the best results. Much is said in favor of the use of swamp muck in and under stables; and, indeed, too much cannot be said in its praise. But, for the consolation of those to whom muck is inaccessible, we are glad to be able to say, that, although common surface soil contains within itself probably less actual fertilizing material, yet it is even a better absorbent of the escaping gases of the manure heap, and of its soluble fertilizing ingredients. A few cart-loads of good, fertile soil, taken up during the dry season in July or August,

screened through a coal-screen, or sifted with an ash-sifter, and put away under a shed where it will not get wet, will afford a better material than muck, charcoal dust, or plaster, to be sprinkled in stables and thrown upon the accumulated droppings in a cellar or manure shed. While, probably, the value of this addition to the compost heap, in view of its absorbent qualities, will be quite as great as that of muck, the effect upon the atmosphere of the stable will be even better. In the hog-pen, the use of dry earth will accomplish equally beneficial results;

A TRAP TO CATCH A CROW.

and even the ground under the hen-roost, or the floor of the hen-house, supplied with this material in sufficient quantity to cover and absorb the droppings, the mass being forked over once or twice a week, will be productive of the most desirable effect. It will amply repay, in the increased value of the manure, the labor that it requires; while the purity of the air of the poultry-house, and the beneficial influence of this on the health of the fowls, will be greater than could be attained in any other way.

The Rhode Island Muller.

An implement used by the Rhode Island farmers, called a muller, is an excellent tool for all fine cultivation. It should follow the harrow and roller. Its effect in comminuting the smaller lumps, left by even a fine-toothed harrow, is almost equal to that of the hand-rake, while its work is both expeditious and cheap. It should be made of oak and iron. There is nothing about it that cannot be made by any common blacksmith and wheelwright; and there is no patent to prevent its general adoption. The horse is hitched by means of long traces, to the ends of the beam, which is about six feet long. The operator will soon discover that by tipping the implement forward or backward, as circumstances require, he can cut off the tops of little

RHODE ISLAND MULLER.

ridges and fill up little gullies so as to leave the ground in a very level condition, fit for the reception of even the finest seeds. For the crumbling of small lumps it may be well, when the

land is dry, to put a narrow strip of board directly in front of the rear teeth, securing it by two or three nails driven into the beam. This will mash such lumps as pass between the front teeth. The distance between each pair of teeth in the rows is about five inches, and the teeth in the rear row stand opposite the middle of the spaces between those in the front row.

How to Raise Carrots.

BY AN OLD SEED GROWER.

A light, rich, sandy loam is the best for carrots, though they will grow very well on heavier soil, if rich and well tilled. Fine old manure, well-rotted compost, or the scrapings of the barn-yard, should be used in preference to fresh and coarse manure, which will cause the roots to grow pronged and ill-shaped. Carrots had better not be sown before May, and it will do to sow quite late in the month. June I think too late to get very large roots.

It is better to plow twice: first, as soon as the ground becomes dry and warm, as deep as the soil will admit; and again, about two-thirds as deep, after the weeds have started, immediately before sowing. Prepare the ground by harrowing and back-harrowing, as directed for onions in the April number of the *Agriculturist*. Mark off the land with the reel and line, and marking rake, in 16 $\frac{1}{2}$ -inch drills, and sow the seed pretty thickly, say 2 $\frac{1}{2}$ to 3 pounds to the acre. Some carrot seed is twice the size of other samples, and some samples are very badly cleaned, so that no definite quantity can be stated; only sow so thick that there shall not be half an inch space between the seeds in the drill.

As soon as the carrots are up and have put out the third leaf, weed the rows with Comstock's Hand-Cultivator and Weeder, as directed for onions—no hand-weeding being required at this stage of the crop. When they are up three inches or so, or of suitable size to thin out, commence at one corner of the plot, (which should be as nearly square as convenient, unless the field is large,) and lay the line across the rows the whole width; adjust the marking rake to 14, 15, or 16 $\frac{1}{2}$ inches, (using the largest space when large roots are wanted,) and mark in straight lines. Lay the line again half way between the marks first made, and mark again; the cross-marks will then be 7, 7 $\frac{1}{2}$, or 8 $\frac{1}{4}$ inches apart. Then adjust the Weeder to such width as will take out all the carrots between the marks, except a few in the angles, which are very quickly thinned and weeded by hand; select the strongest plant to remain, and remove all the others.

The object of sowing thick is to make sure of a carrot in every angle. The perfect regularity of this way of thinning presents a beautiful appearance when the crop is half grown, gives very uniform sized roots, and the labor is not half that of hoeing and thinning by hand. No hoeing is needed, the Cultivator and Weeder doing the work so much quicker and better. Carrots require cultivating to keep the weeds down until the tops nearly cover the ground.

When a heavy soil has been packed by rains early in the fall, I have found great benefit in running the smallest sized subsoil lifting plow between the rows to loosen it. To do this without injury, it is necessary to use a small, well-trained horse or mule that treads narrow. When intending to use this, the rows should be 18 or 21 inches apart. When the land has lacked strength I have sown on Peruvian guano before subsoil plowing, with good effect.

The last week in October or first in Novem-

ber, dig the carrots on a dry day, when the roots will come up clean. This may be done with spades, or by turning a furrow away from the rows with a plow so near that they can be pulled out by hand. Strip off the tops and put the roots into small heaps to dry, a day or two, in the sun, covering them with the tops at night. They must not be allowed to get wet or freeze after they are dug. Keep in long heaps, in a cool, dry cellar, secure from frost. Carrots are very apt to heat when packed away in large heaps. They should be examined occasionally, and overhauled if they begin to sweat. The yield is anywhere from 400 to 800 bushels to the acre. Price, in Connecticut, the last five years, 50 cents per bushel of 50 pounds. Always of ready sale for horses and cows.

The American Deep Long Orange Carrot is the best for general crop. Messrs. Bliss & Son have an improved variety of this, very productive, smooth, and handsome. The French Half Long Searlet, (stump-rooted Early Horn, not Early Short Horn,) is an early and very desirable sort, more delicate for the table, and will yield about as much to the acre if allowed to stand thicker in the rows. This variety is better adapted to shallow soils.

Portable Fence or Hurdle.

The accompanying figure represents a very cheap and strong hurdle, which is sufficient to turn any *ruly* animals, except hogs. The fence proposed is made of half-inch oak, or three-quarter-inch pine, or spruce, with slats four inches wide, fastened with clinch nails to six-inch cross-strips, the cross-strips being placed a foot from the ends. If the panels are more than 10 feet long, two two-inch strips should be

PORTABLE FENCE OR HURDLE.

nailed in the form of an inverted V in the center, as braces. In setting the fence up, the ends are simply lapped, and stakes are driven crossing beneath the upper rail. These will hold the fence well unless strong winds prevail, in which case a strong block, with holes bored obliquely through it, like that represented at the left of the engraving, may be placed on at the time the stakes are driven, to connect them; or they may be bound together by a withe. The cross-strips, which ought to project three to six inches below the bottom slat, should rest upon stones or blocks of wood to prevent decay; and low stakes twelve or fourteen inches long, driven into the ground at the side of each cross-strip, will hold the bottom so firmly that we think the fence would even confine pigs.

WASHING SHEEP.—Grease or yolk, with which the fleece of all sheep is more or less imbued, is a natural soap, consisting chiefly of potash and oily matter. It is not immediately soluble in water, but after the fleece is wet, and remains so for a few hours, it is in condition to be quickly washed out, bringing the dirt with it. This is, to a considerable extent, accomplished by the sheep being exposed to a rain the day before the washing. Sometimes sheep are dipped, and then shut in close sheds or

rooms over night, to keep one another warm, and washed the next day, and this secures a very thorough cleansing. Shearing may be done much earlier in the season if the sheep are not washed. Colds and snuffles ensue if the weather be not very favorable, and there is even great risk of losing valuable sheep.

The Great Poultry Show.

The week ending March 27th was devoted by the New York State Poultry Society to an exhibition of poultry and animal pets, having the use of the building known as the Empire Skating Rink, 350 feet long and 150 feet wide, the roof resting upon trestle-work arches, spanning the floor without support, and springing to a height of 70 feet. It was well lighted by windows, and by gas jets arranged beneath the arches. The arrangements for the exhibition were very complete, the preparations were ample, the room the best that could be devised, the entries unprecedented, and the quality of the fowls, etc., and the number of varieties, better and greater than ever before exhibited in this country.

From an elevated gallery a view could be had of the entire floor, showing the coops (*coup d'œil*) arranged in circles or ovals, each class by itself,—the central pyramid of startling groups of stuffed wild beasts and large dogs, surmounting the coops for pheasants, swans, and pea-fowl,—the dog show at the extreme end,—the ponies at the sides, etc. The classes attracting most notice, and indeed, most worthy of study, were the French fowls and the Asiatics. Of the former not less than three-fourths were imported, and most of the remainder were the direct progeny of imported fowls. They comprised many noble specimens—the Creve Cœur and La Fleche varieties rivaling the Brahmas and Cochins in size, and the Houdans were the recipients of endless encomiums from their breeders as hardy and excellent in every particular. No La Bresse fowls were shown. We presume none have ever been imported, but there were two coops of Guelders fowls, white and black,—for many years rare birds at our shows. (See page 175.)

The Asiatic fowls comprised Light and Dark Brahmas, Buff, Partridge and Black Cochins. Of the first there were nearly or quite sixty coops, the majority of them worthy of receiving first prizes, had there been none better. We did not learn of a single Light Brahma importation, nor of a coop the progeny of imported stock. Several trios of the finest in point of size and feathering were from the yard of Mr. Tees, of Pennsylvania, owned by Mr. S. B. Haines, of New Jersey, who is reported to have sold a trio during the exhibition for \$200. An English fancier who admired these fowls and asked the owner from which of the famous English breeders he had received his stock, was answered "We do not go to England for our Light Brahmas, Sir,"—much to his surprise. The Dark Brahmas were a select few, and either magnificent or unworthy of notice. The trio admitted to be the finest, after no little consideration by the judges, was sent to the show with others by Mr. James Cooper, of Limerick, Ireland. They were sold at the close of the show for \$235, and bought by Mr. Hicks, of Long Island. The groups of single-combed Dark and Light Brahmas contained not one even fair trio. The hens were pretty good, but the cocks very faulty in plumage and size. We think this indicates that they should hereafter be dropped from the premium lists. The great Buff Cochins rolled about in their roomy cages like balls of fluff and fat.

Here again Mr. Cooper, with close competition, bore off the palm, and the trio sold afterwards for \$315 to the Messrs. Hodgson of Long Island. The best coops of Dark Brahmans and Cochins were of recent importation. They are rapidly rising in favor, from fashion and from real merit.

The Society's medals and diplomas are open to the competition of the whole world. Mr. James Cooper, already mentioned, was the only foreign contributor. He showed nine coops of fowls, which were sold at the close of the exhibition with a large number of other fowls and animals. The good prices brought by these, and which are likely to be given for really fine foreign fowls, should induce other breeders to follow Mr. Cooper's example. Mr. C's. Gray Dorkings were very fine, his Creve Cœurs and La Fleche hard to beat; Black Spanish, above the average; his Sultans, the only ones shown; and his Toulouse Geese, large and fine.

The beautiful Hamburgs were exhibited in all their varieties—Pencilled and Spangled, of Gold and of Silver, Black and White. Polish fowls were shown also in goodly numbers, of all allowable plumage, except white, and certainly were worthy the admiration they received.

Black Spanish fowls, with all the style and pomp of Castilian nobles, made a splendid show, though the frost had touched their combs a little, and reddened their faces.

The Bantams challenged the admiration of all.

The Dorkings, White and Gray, are a distinct English breed and as economical producers of flesh of superior quality have few equals. There was a very instructive show of these birds, including the largest White Dorkings we have ever seen. At the same table Leghorns and White Spanish were grouped and shown in considerable numbers, and some of them of great beauty.

Turning from these breeds of homely utility or simple beauty of form and plumage, we come to the Game Fowls, as we turn from cart and carriage horses, fancy saddle horses and ponies, to the Arabian or the thoroughbred. The largest exhibitor, Mr. R. Huntington, of New York, won a victory for his stock quite as marked as if it had been more sharply contested; for the very fact that his birds were present seems to have been enough to have kept the New York "sports" and their birds out of the arena. The game-cock exhibits all the traits and points of a cock in perfection. He is of good size, firm fleshed, close feathered, small boned, neat, and trim. The amount of meat compared with the weight of the carcass is greater than that borne by any other breed of fowls. He fattens easily, and the flesh is white, tender, and high flavored. The game cross ennobles all the great flesh-producing breeds, especially the Asiatics, and the finest Christmas market chickens and capons are thus produced. The hens are fair layers, excellent setters, and brave mothers. Aside, therefore, from his employment in the cock-pit, the game fowl has very high claims upon breeders. The show was rich in instructive varieties. Several coops were importations made a year or two since, and held at high figures since the courage and good qualities of their stock have been put to the test of battle.

The great native American fowl, the Turkey, was shown in great variety and beauty. Wild and Bronze, Black, White, Gray, and Buff, they vied with each other in strutting and puffing, except the timorous wild ones, which vainly tried the bars of their cages for a place of escape. The heaviest Bronze turkey weighed 36 pounds, but is said to have weighed 43 in December, which we do not doubt.

There were several coops of Guinea fowls, only one of which was of the old, original, beautiful, uniform slate color, covered with nearly spots. Many were disfigured with white.

There were Geese in considerable numbers and of notable excellence in a few cases. The show of ducks was better, but those two most useful breeds, the Aylesbury and Rouen, made up the greater part of it in merit and value.

The Pigeon show was not what it would have been at any other season, owing to the justifiable refusal of fanciers to disturb the birds in the height of the breeding season. Numerous pens of lop-eared rabbits were shown, some of which for size, perfection of ears and uniformity of lop, fullness of dewlap, and other valued points, were very meritorious. The dogs and ponies formed besides a very attractive feature.

The unprecedented success of this exhibition was due to the enthusiastic efforts of a few individuals. The high prices our breeders are ready and willing to pay for first-class fowls and the liberality of the public towards the Society convince us that the interest taken in the subject is not temporary but growing, and we anticipate a brilliant future for the Society and its shows. It is too much to expect that no mistakes should be made, but as experience accumulates, no doubt there will be less reason for criticism. The time of holding the exhibition operated against the show, as few breeders were willing to disturb choice fowls in the midst of their breeding. It seemed hardly fair to insist upon taking the weights of fowls which had to be shipped on Friday to be received on Saturday in order to be exhibited on Monday at 10 o'clock, and which were examined by the judges on Tuesday afternoon. This will account for the fact that no weights can be published. It was, besides, a grave error that the names of exhibitors were not uniformly placed upon the coops; the public were thus kept in ignorance of the breeders of the fowls, and the fair failed in good part to accomplish the good it might. Another great mistake was in not announcing the awards until the afternoon of the last day—thus again depriving the public of the privilege of examining the prize fowls. The decisions of the Judges in many classes may, and will, no doubt, be sharply criticized. The bad effect of an indiscreet award is in a great measure counteracted by the free discussion of it, which takes place after the ribbons are distributed.

Very Useful Fowls.

The very great value of the feathered farm stock of the country, and the extraordinary efforts now made to improve it and increase its worth, warrant us in devoting considerable space this month to the late poultry fair, and the general subject. The introduction of the Asiatic breeds is clearly within the memory of the majority of poultry breeders now upon the stage. The effect upon the stock of the country, though at first deprecated, has been eminently salutary. The Shanghais and Chittagongs certainly gave size and early maturity, as well as increased hardiness, to our common barn-door fowls; and there is scarcely a farm-yard in the country with the stock of which this blood did not mingle. The Brahmans and Cochins of the present day retain the good characteristics of their not so well-bred relatives, now rarely seen or heard of, and their effect when mingled with common fowls is more striking and more beneficial. Within a few years, English breeders of poultry have discovered the great excellences

of the French breeds. They have been extensively introduced into Great Britain, and, within three or four years, have been known here.

Three breeds have often been discussed in the *Agriculturist*, namely; the Creve Cœurs, Houdans, and La Fleche. The La Bresse is another breed, without marked peculiarities of plumage, but otherwise much like the "Creves" and La Fleche. The Guelders, or Guelderland fowls, in some respects are strikingly like the La Fleche, but are not so large. They, too, are classed as French fowls, though longer known both to English and American breeders. All these breeds have double (not "rose") combs, either top-knots or a tendency to crests, and wide, open nostrils connected by a horny ridge, frequently flattened into a spoon-shaped affair on the top of the bill. A little prong or branching bit of comb often appears in front of this, giving a very peculiar expression to the fowl. The Guelders have next to no comb at all, there being merely two small points, invisible at a short distance. The cocks have immense wattles, and both cocks and hens red ear-lobes, and a few erect feathers forming a crest, scarcely an eighth of an inch high. They are of medium size, of several colors, and feather-legged. The La Fleche have two, rarely branching, spikes of combs, a sprig of coral appearing in front of the nostrils. They have often a slight crest, and always well developed, white ear-lobes. They are of a glossy black color and large size, but rather long-legged, firm, and solid. The Houdans have combs which branch more or less, like the antlers of a stag, or are palmated, which is a common form. An idea of this form is gained by placing the open hands together, wrist to wrist, as one does to catch a ball. They have moderately full crests or top-knots, like the well-known Polish fowls, which have similar, but smaller combs. The Houdans have full muffs or beards, irregularly spangled or blotched, black and white plumage, and the general effect is quite comical. They are above medium size, five-toed, very active and hardy, yet quiet in disposition. Creve Cœurs are like Houdans in the garniture of their heads, but have more of a crest. They are black in color of plumage, of very large size, short-legged, and are remarkably broad, deep, and solid fowls.

All these breeds are persistent layers, and non-setters. They all have excellent flesh, and the young mature early. The Creve Cœurs, La Fleche, and La Bresse, are famous for fattening heavily and quickly. They prove, however, rather delicate in a cold climate. The Houdan nearly equals the others in size, and is very hardy, laying freely even in the winter, and is subject to but few diseases. This will, we think, become at once a favorite fowl with the Northern farmer, and we anticipate also that the Creves and La Fleche will be equally valued throughout the cotton belt, and will rapidly become acclimated at the North. We have, in fact, proof of this in the stock of Mr. Jas. P. Swain, which he imported as "French layers" some 20 years ago. These are doubtless Creve-Cœurs, though of less size, retaining their good points, and are as hardy as common dunghills.

The pictures on the following page are accurate portraits of the heads of some French fowls imported for the *Agriculturist* premiums, and among the finest birds at the late show. The Dark Brahma pictures were taken from the trio sent out by Mr. Cooper, of Limerick, which sold for \$235. The head of the cock is a little faulty in having wattles much longer than the ear-lobes, but he was an admirable bird.

The Art of Grafting.

Those whose knowledge of grafting is confined to the old and prevailing practice of cleft-grafting would be surprised at a work of 320 pages devoted solely to this method of propagation. Mr. Charles Baltet, Horticulturist of Troyes, France, has published the Art of Grafting (*L'Art de Greffer*), in which forty-seven dif-

Fig. 1.—FORMS OF SIDE-GRAFTING.

ferent kinds of grafting (including budding) are explained, and generally illustrated by engravings. Some of these methods are only suited to particular varieties of trees, while others have a more wide application. The success of grafting of all kinds—as far as the mechanical part is concerned,—consists in bringing the growing parts into close contact. The growth of the stem (in diameter, at least) takes place between the bark and the wood. It is here we find the "pulp" or cambium layer, as the newly forming wood is called, and the directions given, that the bark of the stock and cion shall accurately meet, really mean that the newly forming wood of the stock shall be in close contact with that of the cion. In cleft-grafting, a limb or the top of a young tree is sacrificed, a matter of no importance, when we wish to change the tree or limb entirely; but if the object be to simply test a variety of fruit, it is then desirable to be able to do it without disfiguring the tree. On page 138, last month, we gave M. Sisley's method of

ture are practised to as great an extent as they are neglected with us, fruit trees are trained as espaliers, cordons, pyramids, etc., with a care which very few of our cultivators are disposed to give. In trees of this kind, regularity is essential, and if a branch does not appear in the place where it is needed, one is put there. Some of the forms of side-grafting may be used for this purpose. Three forms of side-grafting are shown in figure 1, which is from Warder's American Pomology. A is a curved cion, selected in order that the branch shall not make too sharp an angle with the tree; it is whittled down at its lower end, or chamfered, on one side only, and has a bud opposite the cut portion. The cion thus prepared may be introduced under the bark of the stock, in which a T incision is made, as in C; or the incision may be as in B, in which a notch is cut in the stock down to the wood, above the longitudinal incision. At D is another form of cion, with a terminal bud; the cut at the lower end should be longer than is shown in the engraving. A fruit bud, E, is sometimes inserted by amateurs who wish to test a variety at once. These forms of grafting can only be done after the leaves have started, and the bark will "run"; they are to be bound and covered with waxed cloth in the usual way. A very simple form of side-

grafting is that in which the cion is cut at the base to a thin wedge, and inserted in an incision made downward into the wood of the stock, as in figure 2. This is used with evergreens, camellias, etc., the incision being more or less oblique, as experience has shown the particular plant to require. M. Baltet gives another plan for restoring branches where they are needed, which he calls a variety of the inlaid graft (*greffe en placage*). We give M. B.'s figure. The cion is prepared as in A, fig. 3. A strip of bark is removed from the stock B, and the sap-wood cut away sufficiently to allow the bevel

Fig. 2.

of the cion to exactly fit; the binding is shown in C, the parts being properly covered with wax. Above the insertions incisions are made to check the flow of sap and throw it into the grafts. Grafting of this kind needs the most accurate fitting, and an implement is used consisting of two blades, which are brought together or separated by a screw. This serves to measure the width of the cion as well as to mark the incision in the bark.

A Circular Grape Trellis.

Those who understand the laws governing the growth of the vine can train it in a great variety of ways. A subscriber in Manchester, N. H., writes as follows: "I send you a sketch of a trellis that I have used in my garden with satisfactory results, both as an ornament and support for the vine. It is not patented, and any one can make it who chooses, as follows: Procure a post long enough to stand 7½ or 8 feet out of the ground; if turned, with an ornament at the top, it will look all the better. Eighteen inches above the ground, set in six arms to support a rim four inches deep, and ten feet in circumference; halve the ends of the arms on to the under side of the rim, and fasten with nails or screws. Three feet above this rim, put another just like it; put in some eyes made of wire, at the top of

the post, say twelve or fourteen. Divide the rims into as many spaces as you have put in eyes, and stretch some No. 16 galvanized wire from the eye to the lower rim, taking a turn round a nail in the edge of the top one, and fasten it securely at the bottom. Give it one

CIRCULAR GRAPE TRELLIS.

or two coats of paint, and it is ready for the vine. Plant two vines under or near the trellis and grow them with double arms. Train the arms, one pair around the upper and one around the lower rim. Allow two fruit canes, after the first year of fruiting, to each wire; keep them tied to the wires, and by midsummer the trellis will be covered and will look very pretty, especially if you get near enough to see the rich clusters of fruit. This gives the same amount of vine as on a straight trellis ten feet long and two tiers high, and it can be used in many places where other kinds can not."

Hedge Planting on the Prairies.

"H. N. P.," Bloomington, Ill., writes: "Your correspondent 'G. N. M.' has given good advice on page 99, (*March Agriculturist*), but let

METHOD OF SETTING A HEDGE.

me add a suggestion. I can best illustrate the practice of our most rapid hedge planters by reference to the sketch. First insert the spade in the line of a—d, then bearing down or backward on the handle, bring it to b, which will throw the point upward and forward toward e, then a little pressure of the foot will push the

Fig. 3.—INLAID GRAFTING.

accomplishing this by grafting in the forks of the branches; and there are several methods of side-grafting which accomplish the same end. In Europe, where the refinements of horticul-

point of the spade down toward *f*, when the handle should be raised to *c*; thus a space is left behind the spade large enough for the set to be put in quickly, and without danger of breaking off the fibrous or branching roots, or of drawing the plant out with the spade, as often happens without this preparation. It is but the work of an instant, and is a great saving of time in the end. By working forward instead of backward, the 'tramping' is all done as the men pass along performing their work."

A Bracket for Garden Purposes.

Many have doubtless been puzzled how to manage when they wished to train a vine or climber to the house or fence. To fasten the plant directly to the building is not good for either, and to make a projecting lattice that shall be both strong and neat is troublesome. Mr. C. Marvin, Port Jervis, N. Y., sends us a sample of a bracket which he has found useful to support horizontal slats to which plants may be trained. With a few brackets, and slats, and some wires, the object may be accomplished neatly and efficiently. Mr. M. says: "I cut the pattern of the bracket (fig. 1) for the moulder, and he cast, drilled, and coated them at the small sum of six cents each. The time and trouble of putting up is trifling. The first two brackets I screw on the house eight feet apart, the third one seven feet, nine inches, (to allow for the lapping of the slats); the pine slat, which slips into the bracket, is one inch thick, by two

Fig. 1.

Fig. 2.—BRACKETS AND SLAT.

inches wide, and sixteen feet long; the ends of the slats I cut wedge-shaped where they are to be joined, and make the lap inside of the bracket, which holds the ends securely, and gives the appearance of one continuous slat, as shown in fig. 2." The length of the bracket is 5 1/4 inches; it is covered with a black varnish, to prevent rusting.

A Bit of Rock-work.

Artificial rock-work is generally out of place and out of taste. If rock-work can be introduced where such a formation might naturally be expected, the effect is pleasing; but a mass of stones built up on a lawn is seldom anything but a rubbish heap. Others differ in opinion, but we, nevertheless, express our own. The writer, in preparing a piece of ground for a flower border, discovered a most disagreeable geological fact in the shape of a large rock, too near the surface for anything to grow above it; digging was impracticable, as it was an outcrop of the general underpinning, and blasting could not be resorted to for fear of injury to established plants. The remedy was—more rocks; as nature had determined that a rock should be just there, we determined to help her, and made a pile of rocks which is called a rock-work, though the principal care was devoted to making it strong, and securing a plenty of cavities or "pockets" for soil. It is not a very artistic heap of rocks and soil, but it affords more pleasure than if the space were a nice deep border. The very top is crowned with the Alpine Rock-Creeps, which was described last month. From a

shelf, a little lower down, a Money-wort hangs its slender branches; on the other side, the *Linaria Cymbalaria* flourishes finely. Our graceful native Columbine has a nook, House-leeks, Stone-crops, Prickly Pears, and many other things, find a foothold here and there, and over all a plenty of European Ivy spreads its dark green foliage. To enliven the whole, when warm weather comes, some Portulaccas and dwarf Nasturtiums are put with the rest, and their flowers blaze away more brilliantly than they would in a more promising spot. All the "ribbon" borders and beds that were ever planted would not be accepted in exchange for this rude little bit of rocks. Now, while this rock-work was made in a border from sheer necessity, we do not advise our readers to follow the example unless under similar circumstances, but if there are nooks and corners in their grounds where rocks will not appear out of place, they will find that many plants will seem to flourish better, or, at any rate, show to better advantage, on a rock-work than elsewhere. In building up, use stones that are all alike, and lay them as naturally as possible, taking care to have a sufficient number of pockets or cavities to hold the soil necessary to sustain the plants.

Grape Trellises.

For gardens and small vineyards there is nothing in the way of a trellis so neat and convenient as the one proposed by Mr. Fuller in his *Grape Culturist*, in which upright wires are stretched from an upper to a lower bar, nailed to posts at the desired distance apart. This trellis we have already figured. In large vineyards, where there must be the greatest economy of labor, horizontal wires are adopted. The only advantage they have over the upright ones is the cheapness with which they can be put up. The wires are stretched between strong posts at the ends of the rows of the vineyard, and supported at intervals by stakes. It will be seen that the two principal difficulties in putting up a trellis are, to properly stretch the wires at the time of putting them up, and to avoid the troubles that must result from the effects of heat and cold. If the wires are put up in spring and tightly stretched, the contraction caused by the cold in winter will either break them or pull the post out of the perpendicular. Several contrivances have been proposed for overcoming the difficulties of expansion and contraction.

Fig. 1.—POST AND BRACE.

Before alluding to these we will give the plan of trellising adopted at Hammondsport, N. Y., which is both simple and efficient. The end posts of the rows are braced as shown in fig. 1, the upper end of the brace resting in a notch in the post, and its lower end against a stone buried for the purpose. The coils of wire are placed upon a reel, fig. 2, which revolves on an upright axis fixed to a small bench. The coils are dropped upon the reel and kept separate by means of sticks, which are passed through holes made in the reel. The reel being placed at one end of the row, a man takes the ends of the three wires and walks towards the other end, where he makes them fast to the post at the proper distances, by a turn around the post, and a twisting of the end of the wire upon

itself. The man at the reel cuts the wire at the proper length, passes the end of it through an

Fig. 2.—REEL FOR WIRE.

auger hole in the post, and begins to stretch. The stretching is done by means of a small windlass, a stick of hard wood about two feet long, with a small hole in the center, and arms at each end, fig. 3. The end of the wire which comes through the hole in the post is put through the hole in the windlass; on turning the windlass by the arms, its body resting against the post, the slack of the wire is taken up. The man

Fig. 3.—WINDLASS.

who has carried out the wires, on his way back, sees that all is right, and when they are sufficiently stretched, he drives a strong, wooden pin in the hole through which the wire passes, and, for additional security, a turn or two may be taken around the projecting end of the pin. The trouble from contraction by cold is avoided

Fig. 4.—LEYRISSEON'S STRETCHER.

by the very simple expedient of knocking away the brace, and allowing the posts to yield to the tension. This rather rough method of overcoming all trouble from contraction of the wires has been found perfectly practicable at Hammondsport, on thousands of acres.—The French have several more or less complicated *raidisseurs* for accomplishing the same end. One of these is a small windlass to be turned by a key, and which is held from turning back by a catch which falls into a ratch-wheel. One of these is attached to each wire. A lever attachment to the wires has been patented, as noticed in the "basket," by Mr. T. G. Youmans. One of the

Fig. 5.—NATURAL STRETCHER.

simplest things of this kind we have seen is that proposed by M. Leyrisson, and figured in the *Revue Horticole*. The shape of the apparatus is shown in fig. 4; it consists of a curved piece of wood with a strong pin inserted in it. Near the pin a nail is driven. It will be seen that by catching the wire between the pin and nail, and turning, the wire will be wound upon the pin. When the wire is sufficiently stretched, the long arm is caught in a wire or willow ring which slides upon the horizontal wire. In fig. 5, one of our associates shows how *raidisseurs*, or stretchers, can be cut ready formed, and without the trouble of inserting a pin

Some Early Wild Flowers.

In this country, at the North at least, we cannot follow the example of our English ancestors, and celebrate May-day as a floral festival. We

RUE ANEMONE.—(*Thalictrum anemonoides*.)

may console ourselves with the thought that the custom had a heathen origin, as it perpetuates the ceremonials in honor of the Latin goddess Flora. The few attempts we have seen at "Maying" in our fickle climate have been characterized by a general paucity of flowers, and chilliness of person. Still, the true lover of flowers can find enough to interest him in a May-day walk, even if the day be chilly, and anything but festive. There are many early flowers to be found, which, if not gay enough for garlands, are well worth the seeking. Wherever the Trailing Arbutus, or May-flower, (*Epigaea*) is found, there is no lack of either beauty or fragrance. Unfortunately this gem of our wood-sides only grows here and there. Some violets are to be found, but provokingly without the odor which every one associates with the violet. On the exposed hill-sides the Early Saxifrage and the little Plantain-leaved Everlasting have been in bloom for some time, as has the Early Crowfoot, or Buttercup. Some of the Cresses grow on the banks of the streams, and in the moist woods we find the pure white flowers of the Bloodroot, the delicately veined Spring Beauty, the oddly shaped Dutchman's Breeches, and its closely related Squirrel Corn. But it is not our intention to give a list of all the plants to be found at this time, as it would not be possible to give one which would be other than local. One very common spring flower has been sent to us so often for a name, that we give an engraving of it—the Rue Anemone, *Thalictrum anemonoides*. It is often found in

company with the Wind-flower, *Anemone nemorosa*, which it somewhat resembles. The engraving (after Sprague,) is so life-like, that the plant needs no description. It is not a true Anemone, but a *Thalictrum*, a name which is an old one, the meaning of which is not understood. The specific name, *Anemonoides*, means resembling the Anemone. The difference between *Thalictrum* and *Anemone* is seen when the flower has fallen, and the seed-like fruits are formed. In the first case they are little ribbed cylinders, and in the second, they are flattened, with a hooked beak. Another pretty flower of early spring is found in rocky woods,—the Violet Wood-Sorrel, *Oxalis violacea*. The slender stems are sent up from scaly bulbs, and bear several delicate violet-colored flowers. The flowers of early spring have a charming delicacy, which is wanting in most of the later ones, and they are welcomed with a feeling that those which come later fail to excite.

Improvement in the Gladiolus.

Since florists have turned their attention to the Gladiolus, a marked improvement in the form and color, as well as the texture of the flower, is manifest. Instead of the one-sided flower with the petals all pointed, we have now flowers quite symmetrical in shape, and of great substance. The engraving shows a fine flower taken from a specimen in the magnificent collection of Mr. Geo. Such, South Amboy, N. J., who has been very successful in producing new varieties from seed. The Gladiolus is one of the plants that need to be popularized, for we seldom see it in the gardens of the people at large. Good bulbs can be bought for \$2.00 a dozen, but the new and choicest varieties sell for 50 cents or more, each. They will flourish in any good garden soil, and all the better if it is rich and light. The bulbs may be planted this month or next, and when the leaves begin to wither in autumn they are taken up and kept in a cool place, free from frost. The old bulb produces one or more new ones, according to the variety. To those quite unacquainted with the Gladiolus it may be well to say that single flowers, similar to that in the engraving, are borne upon a stem to the number of twenty or

REGULARLY FORMED GLADIOLUS.

more. They vary in color, from white and yellow, to scarlet and the most brilliant crimson, and are variously marked. Those known as the Hybrid Gladioluses (*Gladiolus Gandavensis*), are the finest, and are the ones referred to. They are kept by florists and seedsmen.

Trouble with Cabbages.

The cabbage plant has many enemies; those which are particularly annoying in the early stages of its existence are the small white maggot, at the root of the seedling, and the cut-

VIOLET WOOD-SORREL.—(*Oxalis violacea*.)

worm, after the plant has been set out. Several small flies of the genus *Anthomyia* infest the radish, turnip, and other plants of the same family, as well as the cabbage. The troublesome "maggots" which infest the roots of these plants are the larvæ of these insects. They sometimes attack a seed-bed of cabbages in such numbers as to render all of the plants worthless. We have already given the proposed remedies, such as dusting with lime, ashes, etc. The latest suggestion we have seen is to grow the seedling plants in boxes, elevated six or eight feet above the ground. It is said that this places the plants above the reach of the parent insect. The cut-worm—which includes the grubs of several distinct insects—is often destructive in the garden or field. It works in the night, stripping off the leaves or cutting the stems square across, and retires to its hole during the day. Hunting the grub, digging it out, and killing, have been the only sure remedies. White, in his Gardening for the South, states that an old negro gardener told him that the cut-worms would not attack cabbages that were planted in trenches six inches deep, and that he practised upon the suggestion with success. It is a very simple remedy, and is worthy of a trial by those living in localities where the crops are liable to be injured by cut-worms.

SPENT HOPS.—The waste hops from the breweries are an excellent fertilizer. From some experience in their use, we estimate their value to be equal—cord for cord—to stable manure.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Insects and Flowers.

Some odd things have been ingeniously worked into the forms of flowers. We have seen flowers

FLOWERS MADE OF INSECTS' WINGS.

made of shells, feathers, seeds, etc., and now one of our friends has made them of insects' wings. He probably had the notion that a great many flowers are destroyed by insects, and it is only fair that insects should be used to make flowers. The engraving shows the grotesque appearance of these imitations. The flower made from butterflies' wings looks something like a strangely shaped orchid, while the other, made of the wing-cases of beetles, presents a more regular form. In both flowers the foundation is a small disk of card-board, to which the wings are gummed. Butterflies' wings should be carefully handled with a delicate pair of forceps or tweezers, to prevent injuring them.

Experience in Soap-making.

BY MRS. M. L. GAGE, ROSS CO., OHIO.

Whatever may be said about the advantages of selling ashes and grease and buying soap, it is best for most living in a farming community to make their own soap, and in a new country there is no alternative. I came into Ohio from Eastern Mass., on one of the first through Ohio canal-boats. Every one, of course, practised soap-making in the spring, and I feared they would think little of the person who could not do what they had always done, and so was unwilling to ask questions, and thus expose my ignorance. My husband said it was a pity that though I had studied chemistry and he had been through college we could not make soap. I knew, however, that book-keeping and cooking were two things; so I sent for information to some of my aunts at the East, who I knew made soap, and was kindly referred back to my neighbors. I wanted a rule, but I could not get one. I got hints, blundered, sometimes had "luck," and sometimes not, until I had experience enough to make a rule for myself. The fact is, there is a great deal of good soap made, and uniformly too, for which the makers have a rule, but do not know it. They burn the same kind of wood, kill the same number of hogs, and make the soap in the same kettles, year after year, and it comes out right. I start the lye to boiling, and then while boiling, if the lye is not strong enough to eat the feather off a quill, boil it down until it is. When it will just eat the feather, let the kettle be a little more than one-third full of lye, and put in grease, skins of the hogs, bacon rinds, meat fryings, and the like, until the kettle is about two-thirds full. The kettle must not be full, for

with the least bit too much fire, over the soap goes. It is better to put in a little less than the necessary amount of grease. Lye and grease combine in certain proportions, but pass the limit, and no amount of boiling will take up an excess of grease. It will remain on top, hot or cold, and will be very troublesome; whereas a little too much lye will sink to the bottom when the soap comes. If the proportions are good, a little fire only is required to keep it boiling, and in a few hours it is done. Then take a bucket of weak lye, and let it boil up with the soap once. This will not disturb the already made soap, but will wash the dirt out that was in the grease, and with it settle to the bottom. When the soap is cold it can be cut out in cakes. Exposure to the air will soften it down until it is of about the consistence of mush, and little darker, growing fairer and fairer. Some, instead of putting in lye to wash the dirt out of the soap, put in salt and water. The soap thus made is whiter, but is apt to be too stiff to use easily in the wash-tub. It makes excellent ball soap for washing dirty hands. I take some weaker lye and the clean part of that which is left in the bottom of the soap kettles, and enough to half fill one of the kettles or more, setting it in some convenient place outdoors. I put a stick of wood on the north side of the top of the kettle, lay on some boards, making a roof which is easily managed to shed rain, and lay another stick on top to keep the roof in place. By lifting one of the boards a little, I can put in from time to time whatever soap-fat is gathered in the family through the summer. Whenever the sun shines, I remove the cover and stir the lye. I facilitate the business a little in this way, and I have by fall a half kettle of decent soap, and no trouble with soap-fat in hot weather.

Bags for Shoes and Slippers.

The suggestions made in regard to boxes for boots and shoes have called out several letters, all essentially the same as that of "G. R. S.," which we here give: "My arrangement in the shoe line is a flat foundation tacked around the edges to the inside of the closet door in my bedroom. It contains 18 pockets (as shown in the figure), each of which will hold a pair of thin shoes or packages of laces; for thick shoes a pocket each is required. This foundation is 27 inches deep by 24 inches wide, with a facing around the edge underneath, to give strength. For the pockets, take three strips, 7 inches wide by 42 inches long, and hem at top; a cord is sewn in the lower part of each to gather it to the size of the back. Sew each strip tightly across the back, equidistant, commencing at the lower edge. Each strip being divided into 6 equal

BAG FOR SHOES, ETC.

parts, stitch them upwards in place, of course 4 inches apart; the pockets thus formed will receive the shoes, the size in all cases being proportioned to the requirements. I make these articles with two rows for closets in spare rooms, and shallow ones for small shoes in nursery and children's bedrooms. I put square ones with 6 or 8 pockets behind doors in servants' rooms, to prevent their

shoes being thrown in all directions about the room. All of these are made of chintz, figured or plain, generally selected to correspond with the colors of the room. As gentlemen like their changes of shoes close at hand, I made for the library a square box covered with Brussels carpet, using one deep enough for boots, stuffed a seat on the lid, and around this put a wide worsted webbing or fringe; inside the lower part, a few inches from the top, I tacked a wide piece of tape, so arranged as to hold slippers. I am sorry to state, these were often torn down by hasty movements, and the slippers added to the boots and overshoes in the box. This is very useful, and can be made pretty also. Boxes of any form covered with chintz and muslin de laine, the lids stuffed and ruffles arranged around them, are convenient for seats in rooms."

The Table—Order and Ornament.

The winter and early spring months do not allow most housekeepers to place upon their tables the most beautiful of all ornaments—flowers. Only those who have green-houses or are remarkably successful at window gardening can achieve this.

Fig. 1.—RADISHES BADLY PREPARED.

A bouquet of the first wild flowers may now be had with a little trouble; but it is not our purpose just now to speak of floral ornaments; we leave those until flowers become a little more abundant, and attend to leaves instead. Green leaves of themselves are welcome, and all the more so if, besides serving to decorate the table, they are eatable. All who have water-creases,—and every one who has a clear stream should have them—can give the break-

Fig. 2.—RADISHES PROPERLY PREPARED.

fast table an air of freshness by the presence of a dish of this pungent salad plant. There is order to be observed even with cresses. The plants thrown promiscuously into a dish, while they are just as good to eat, do not do their whole duty in making a table ornament. Cresses should be picked over before they go upon the table. In doing this, gather them in the fingers into little bunches or bouquets, cut the stems even, and set them in a deep dish, stem end down. The result will be a dense mass of bright green, with no light-colored stems in sight. Radishes are among the first things the garden affords. As an article of food they can hardly be called nutritious, but they are highly relished by most persons. To our notion the radish is more valuable to look at than to eat. There is a brilliancy in its scarlet and a freshness about its green that are very satisfying, and radishes on the table are evidence that the garden has commenced to furnish its stores, and a forerunner of many good things to come. Sad work is sometimes made in preparing radishes for the table. There is a right way and a wrong one to do so simple a thing as this. We scarcely ever knew a servant who, if uninstructed, would not cut off all the tops of the radishes. Fig. 1 shows a plate of the early turnip-shaped radish as it often appears on the table, the tops cut off and the tail-like prolongations of the root left, all looking like so many mice. Cut off the long portion and trim the leaves so as to leave a bit of green to each one; set them regularly in a dish, as in fig. 2, and there is a display of green and scarlet, almost as beautiful as a bouquet. The same treatment should be given to long radishes; these generally have a few fibres along their sides which should be removed and the lower end shortened

somewhat. Leave a tuft of green at the top, and place in a tumbler or arrange tastefully on a plate. These are little matters, but let the housekeeper who cares for the appearance of her table try both ways of serving water-cresses and radishes, and we have no doubt which will permanently be adopted.

A Perforated Lamp Shade.

[Mary, Roxabelle, O., writes a very pleasant, gossip letter; we can publish only that portion which describes her method of making a lamp shade. Eds.]

While Brother Henry was home during vacation our store-bought lamp shade gave out, and for his

PERFORATED LAMP SHADE.

temporary convenience he begged some pasteboard and cut out and sewed up a piece, the size and shape of the old shade. This, indeed, was a shade. The board was so thick it permitted no rays of light to pass through it, and the reflection only served to make "darkness visible" throughout the rest of the room. Such gloom was not to be borne, so four oblong openings were cut in the shade; next fancy-colored tissue paper was pasted on the outside, and, the edges of the openings being finished with gilt paper, pictures were inserted on the under side as transparencies. Two of them were scenes from Central Park; one, the head of Washington; and the last, but not the least attractive, a gay young lady, fairly dazzling at night with diamonds, caused by the lamp-light shining through the holes pricked for that purpose. White tissue paper was pasted on the under side of the shade, and the lower edge bound around with gilt paper. In the four alternate spaces, flowers were then pricked. But this one is not my *chef d'œuvre*. I have just finished one for the college brothers, which, though simple, is really quite elegant. This last I made out of six equal-sized pieces of Bristol board, of the shape shown in the engraving. These pieces are to be joined near the top and the bottom by ribbon passed through holes stamped for the purpose; afterwards the lamp shade can be set on the brass rim as common ones are. Around the lower edge I traced by means of impression paper, a wreath, vine, tendrils, leaves, and clusters of grapes, and at the top a plain, narrow braiding pattern. In the centre of each piece I traced some design, such as a butterfly, oak branch, leaves and acorns, ivy vine, a full-blown rose with stem and leaves, a grape vine, and lastly a bouquet of various kinds of flowers and leaves. Then, with the Bristol board resting on a cushion, began the slow and tedious work, prick, prick, prick, with various sized needles, using occasionally a knitting needle and then a stiletto, until all was completed. Upon holding the paper up to the light, the various designs were developed in unsuspected beauty. The pieces are to be lined on the inside with white tissue paper, and then joined together.

Household Talks.

BY AUNT HATTIE.

Edward and I drank tea with a few other invited friends, at Mrs. B.'s last evening. It was the first time we had had the pleasure of partaking of a meal at her house, as she has been in the neighborhood only about three months; however, I have met her several times at the little introductory tea parties that are always given here whenever a stranger comes to settle among us. As this was her first tea drinking, and perhaps because she came from the West, I expected quite an elaborate supper, but was, I think agreeably, disappointed. It was what we call a decidedly plain table. The spread was extremely brilliant and beautiful, crimson being the prevailing shade of color, and the napkins of the finest damask, and of alabaster whiteness; the gilt-edged china was tasteful and pretty; the knives, forks, and spoons, were of silver; the flowers, of which there were two or three small bouquets, were fragrant and delicious. For the refreshing of the inner man was provided, a cup of baked custard for each, deliciously white raised biseuit, one kind of plain fruit cake, (I make a cake very much like it, if not the same, and will give the recipe,) puff pastry tarts with jelly, canned peaches, shaved beef, small cucumber pickles, graham bread in slices, butter, sugar, cream, and green tea. That was all, but there was plenty of it, and everything was made in the most perfect manner, and Edward declared afterwards that it was the best company supper he had ever eaten, and that Mrs. B. was the most sensible woman of his acquaintance.

PLAIN FRUIT CAKE.—Put into the cake bowl a small teaspoonful of butter, and two larger teaspoonfuls of white coffee sugar. If the butter is hard, allow the bowl to stand in the oven or near the fire until it is nearly melted; then beat to a foam. Separate the yolks and whites of four or five eggs, and beat each thoroughly, the whites to a stiff froth, as usual; add the beaten yolks to the cake, and two heaping teaspoonfuls of cream of tartar dissolved in a small teaspoonful of milk, which may be a little sour. If flavored with lemon, it may be put in now. Beat the batter as long as your patience will allow, adding flour as you do so, in small quantities, until stiff enough. It is well to always stir or beat the batter one way. Now put in half a pound of stoned raisins, half a pound of currants, and a quarter of a pound of chopped candied peel. Have a suitable tin for baking, and grease with a little butter; lay a clean sheet of paper on the bottom of the pan, and butter it a little also; just before placing in the oven add a teaspoonful of carbonate of soda, dissolved in a tablespoonful of warm (not boiling) water; stir in quickly but thoroughly. Now the egg froth or foam should be stirred in lightly, but intimately, as its chief use is to coagulate, and to help the flour to sustain the cake after it is risen in the oven. Pour into the tin and bake in a moderate oven; do not open the oven door oftener than necessary after the cake is in. Wait at least ten or fifteen minutes before doing so. It will take from half an hour to an hour to bake, but it will be necessary to try if it is done by running into it a thin skewer or straw. If the instrument comes out clear, the cake is baked sufficiently. I have always observed that cake with raisins and currants takes a longer time to bake than that which is without fruit, though I have not yet solved the problem. Be sure to stone the raisins carefully.

PUFF PASTRY TARTS.—Take a quarter of a pound of very hard and firm lard, and a little over a quarter of a pound of butter, also very cold and hard. Sift three quarters of a pound of the very best white flour; cut the lard into very small bits, but do not chop, or mash, or heat it at all, and mix gently into the flour. Then add gradually about a gill of ice-cold water; you must be the judge of the quantity of water, however, as it is difficult to give an exact rule, but the paste should be soft and yielding, though not at all sticky. Mix as little as possible, hardly touching it. A marble slab is the best to roll it on, but if one is not at hand, use the common rolling-board. Roll thin, and drop the butter

in small bits all over it, pressing lightly in order to fix it. Fold three times and roll again, and fold again the same; roll again, always from you, and fold; now again and fold. It is now ready to be rolled and made into cakes of the desired shape; I use a little gingersnap cutter about an inch and a half in diameter. Make very thin, and keep cold until put into the oven, which should be very hot. Do not look at them under five minutes. They should not brown, and when well risen are done. When desired for the table, put a small piece of firm jelly in the center of each one, and arrange tastefully in a pyramid shape, on a round plate. They give a very pretty effect to an evening table, besides being delicious to eat.

SALADS.—Cabbage chopped fine and mixed with an equal quantity of celery, also chopped fine, makes an excellent salad where lettuce cannot be obtained. We are having fresh green lettuce now every day. It is rather expensive for so large a family, but Edward and I both agree that it is cheaper to pay the gardener than the doctor, and salads and vegetables in the spring of the year are as necessary to health as are comfortable homes and clothing in the winter.

PARSNIPS we get from our own garden. We never have them dug in the fall, as I find that they are not wanted at my table until after the frost is out of the ground, and some kind of a vegetable change is desired. They seem also to keep better in the ground than in the cellar, the frost not hurting them at all, but rather the contrary. I scrape and halve them, boiling very tender. Lay lengthwise, side by side, in a small dish, and put a trifle of butter, and pepper and salt over them.

DANDELION LEAVES.—Gather large, green, and healthy looking leaves, wash, boil tender, and season the same as spinach, or send to table without chopping, allowing each one to season to taste. It is a pleasant vegetable, and is valued by many.

LADIES' FINGERS.—Use any kind of light sponge cake batter. Take a sheet of buttered paper and with a spoonful of the batter draw a shape on the paper the length and size of your finger. Make an even number, bake until crisp and slightly brown, remove from the paper, and join two together by means of a little good jelly. They may be cemented with frosting, or with white of egg alone, if desirable.

TO BOIL PEELED POTATOES.—Wash, and as fast as peeled, throw into cold water and let them stand until twenty-five minutes before wanted for the table. Have ready a tea-kettle of boiling water, put the potatoes into a pot, (a large saucepan is best), put the pot on to a brisk fire, and cover the potatoes with water from the tea-kettle; some add salt, but I reserve it until after the water is poured off. Boil twenty minutes, try with a fork, and if they split they are done; keep on the lid and pour the water from them as dry as possible; return the kettle to the fire for a minute or two, but not long enough to endanger burning. I throw in now a little salt, and take hold of the handle and toss the kettle in such a way that the potatoes will be thrown up and down. When they look white and floury, they have been shaken sufficiently, and may then be dishd for the table. This way of boiling peeled potatoes is the best, but some housekeepers may object to it because it not only involves the trouble of shaking the pot, but of cleaning it afterwards, as some of the floury portion adheres to the bottom and sides; and if this is not removed while moist, it dries, and of course is hard to clean. If the kettle is filled with water immediately after the potatoes are removed, the difficulty will be obviated.

Furs and Moths.—"J. F. W." Put the furs in a box so tight that moths cannot get in to lay their eggs. Few boxes are safe for this, but they all may be made so by pasting strips of paper over every joint, including the crack between the lid and cover. Paper bags made of strong paper, without even a pin-hole, will answer; after the furs are put in, paste the mouth of the bag securely. Aromatics of various kinds are more or less repulsive to the insect, but the only sure way is to see that there are no moths in the furs, and then, beating them well, put them where none can get in.

BOYS & GIRLS' COLUMNS.

A School Girl's Composition. "Spring."

"This is spring. The grass is green—what there is of it—but it's a kind of invisible green just now; and snow isn't. The days are longer than they were when they was shorter, and they'll be a good deal longer yet if they keep on stretching at both ends. The nights aint so long as they used to be. Ma said it was cold yesterday, and I thought so, too. It was scold, scold, scold, all day; it was washing-day. Carrie and me is going to have a May-day party next June. Won't that be jolly! We'll have such fun, and shall invite all the rest of the boys. Spring is one of the four seasons—the foremost one. I like spring; it is such a nice time to go skating. The buds have commenced to sprout on the potatoes down cellar. The end. SARAH ANN."

Picture Story.—Showing the remarkable adventures and escapes of an amphibious individual; every reader can give his own version with variations to suit listeners.

Ready Wit.—It is told of Billy Hibbard, the Methodist, that once when roll was called in the Conference, his name was read "William." He rose at once and objected, saying that his name was not William, it was Billy. "But Brother Hibbard," pleaded Bishop Asbury, "Billy is a little boy's name!" "Yes, Bishop," was the quick reply of the eccentric preacher, "and I was a little boy when my father gave it to me!"

One Secret of "Good Luck."

Clafin, Stewart, Vanderbilt, and many others of less note whom we could name, are regarded by thoughtless persons as "lucky" men. If "luck" means success obtained by constant, untiring attention to business, they have had "luck," for harder working men it would not be easy to find. They worked as faithfully for small gains at the beginning of their career, as they now do, when their transactions involve millions. The first beginnings of one of our heaviest merchants was in a dry goods house where he sought employment, and out of mere pity the proprietor set him to straightening out bent nails that had been drawn from boxes. His pay was scarcely enough to keep body and soul together, but this did not prevent his working industriously and steadily. His faithfulness was soon observed—employers are not as blind as many a fault-finding clerk thinks—and he was advanced to other work at better wages. The same course of devotion to business was followed by promotion, until, step by step, he gained his present independence.

Another with whom we are personally acquainted, now the head of a large commercial firm, at first when a mere lad, besides faithfully attending to his duties in the store, devoted all his spare hours to reading every publication he could find, which gave any information on the branch of business he was engaged in. Some of his fellow clerks attended balls, parties, and other places of amusement, while he was thus engaged, and laughed at him for a stupid plodder. In less than a year he knew more of the business than many who had been employed there for years, and was rapidly advanced accordingly. He is now reaping the fruits of his "seeds of luck" planted with such laborious pains. Stop gumbling, boys, and begin to try this method of compelling fortune to favor you.

"I Want My Own Umbrella."

The following incident is related by a correspondent of the Methodist: "Standing on the middle porch of the Capitol, witnessing the re-forming of the line of procession, after the ceremonies were concluded, I saw several carriages drive up to the steps, and the invited guests, who were to head the column, got in and were driven to their positions in the line. When the President's carriage was brought up, he stepped forward, and was in the act of getting in, when he asked his servant for his umbrella. The man replied that he had placed it in one of the rooms in the Capitol, but on his return to the room, he could not find it. In a moment several gentlemen rushed to the President and offered him their umbrellas in the most kind and pressing terms. 'I thank you, gentlemen, but I want my own umbrella.' Then turning to his servant, he said very quietly: 'I gave you my umbrella in charge; go back and look for it again.' The man left. The head of the column in the meantime was halted. The carriages of the corps diplomatique were waiting their turn to come up. The long line of carriages behind these were at a stand-still. The military companies formed in front were wondering at the delay; everybody seemed to be impatient but the little man who was waiting for his umbrella. He was calm, and looked thoughtful; and well he might, after just coming down from the platform where, before congregated thousands of the people, he had pressed the Bible to his lips in confirmation of the oath of office, to execute the laws, and defend the Constitution. After about ten minutes of most perplexing waiting to all who did not know the cause of the delay, the servant made his appearance, very red in the face, and very much out of breath. Tipping his beaver, he handed the President a well-worn umbrella, which he took, saying at the same time, 'Yes, this is mine;' and quietly poked it under the carriage-seat, and got in, when the procession moved on. This was Grant all over; nothing seems to disconcert him, or turn him to the right or left. He goes straight along, demanding what is right—refusing to compromise short of the right."

A Bear Story.

"Our Boys and Girls" gives the following account of the antics of a pet bear. He was captured when a little cub, and was brought up by hand as one of the family. He claimed the warmest place on the hearth-stone, and nestled in cold weather with the dogs before the fire. None of the pet animals about the farm were tamer than he; and none better loved to climb up into his master's lap and receive his caress, or understood the whims of his mistress when begging for a choice morsel. He was of a prying disposition, and forever peeping into every hole, so the family were obliged to lock up every thing, even the closets where they kept their clothing. If a hen cackled when an egg was laid, Mr. Bear understood it; and if he was not prevented, he would very soon find it and suck it before the cackling fowl had ceased her song. One Sunday the family went to church, and left the bear alone at home. Bruin improved the opportunity, and rummaged all over the house in search of fun or some-

thing to eat. Unfortunately, the good housewife had left the cellar door unlocked and ajar; and it was not long before the bear discovered it and crept down the stairs. Once down in the cellar, he espied the molasses barrel; and if there was any thing in the house he was excessively fond of, it was molasses or honey. Bruin pawed over the barrel, licked the tightly driven bung, and was about abandoning it in despair when he espied the spile. Grasping it with his strong teeth, he easily withdrew it, and out came the molasses in a stream, to the great delight of the bear, who clapped his mouth to the hole and sucked away with grunts of self-satisfaction.

The molasses still flowed, and still the bear kept his mouth to the orifice, pausing now and then to take a long breath. At length he was full; his stomach could hold no more; yet his appetite was not satisfied. He squatted on his haunches and viewed the still running stream with disgust, to think that the supply was so abundant, and that, alas! he could hold no more. The molasses had now run out in large quantity, and had formed a great pool on the floor; but Bruin dove into it, and rolled himself a thousand times in the thick fluid, until his shaggy coat, from his nose to his tail, was covered with molasses, dirt, and gravel stones! There he caroused in the sweet pool, as cats roll and tumble in a field of the catnip herb. All at once Mr. Bear became sick at the stomach! And it was a new sensation to him—something he had never felt before. As he grew worse, he thought of his master and mistress, and so crept upstairs to ask for their consolation; but they had not returned from church. Then he crawled up another story, and got into the girls' bed, drawing the snowy white sheets over his besmeared form. There he lay groaning and grunting, the sickest bear ever seen by anybody in that part of the country.

When the girls arrived they were horrified at the scene, and were going to lay the broomstick over Bruin, when he started on the run for the haymow with the sheets sticking to his back! It was some time before the bear got well, and still longer before his mistress forgave him.

Answers to Problems and Puzzles.

The following are answers to the puzzles in the April number, page 143. . . . No. 340. Puzzle Inscription.—Read backwards, it is "I told you once." Some have had considerable amusement by telling a friend the answer when he was trying to solve the puzzle; the friend, of course, denied having been told, and kept on trying to read it correctly. . . . No. 341.—Illustrated Rebus.—A party of soldiers on the plains firing at the Indians (Good, new puzzles of all kinds are always welcome from our readers.) . . . The following have sent in correct answers: John Shabo, G. A. Harpel, Charles Miller, Leonard A. James, E. W. P. Heeney, Charlie Rickner, T. Joralemon, B. B. Keeler, C. C. Keeler, M. C. Woodward

[COPYRIGHT SECURED.]

COVETOUSNESS.—FROM A PICTURE BY PEYROL BONHEUR.—Drawn and Engraved for the American Agriculturist.

"Johnny must not go out of the yard" was the caution which his mother gave her little boy. They were spending a month in the country, and Johnny, all unused to such a life, found wonders enough to occupy his attention for a long time, without wandering out of the safe bounds of the ample yard surrounding the dwelling. But as these grew familiar, he longed to see what was beyond. Especially did he want to go across a field which lay opposite, and see how it looked in the woods which bordered it. There must be wonderful things there, he thought. His nurse had told him stories about Indians and monkeys, and curious birds that lived in the woods, and here, he thought, was a chance which he might never have again to see them for himself. So one morning after dreaming all night about it, he slipped away unperceived, and soon reached the edge of the unknown land. "Grapes! Grapes!" he shouted, as he saw the ripe clusters hanging from a wild vine, and quickly grasped a bunch. What strange noise was that he heard? "Ca-dork—dork—dork." Just then remembering that he was doing wrong, his heart fluttered with alarm; nor was he less frightened when on turning around he saw what appeared to him a real monster, eyeing him keenly, and uttering that fearful "Ca-dork—dork—dork." It was the farmer's pet Brahma rooster, an enormous bird, enough to frighten any child, and no wonder the little fellow dropped the grapes and ran for the house, screaming with all his might, "Mamma! Mamma!" In telling of it, when safe at home again, he greatly amused his friends by very solemnly assuring them, that the "big thing with feathers on" hallooed after him, "Cut, cut, cut," "and," said he, "I did cut just as fast as I could, and I'll never go out of the yard alone again." And he faithfully kept his word.

Revenge.—Different persons have various ways of taking revenge; the following was a humorous man's

way. He called at a house to see a friend and inquired, "Is this Mr. Jones's house?" "No, it aint," replied the servant, very snappishly, and slammed the door in his face. Thus repulsed, the man walked away, but suddenly an idea struck him and he returned for his revenge. He rang the bell, and when the same servant appeared, he snapped out as shortly as possible, "Who said it was?" and retreated, well satisfied with his peculiar revenge.

A Genuine Ghost.—(A FACT.)

"No, I never saw one in my life, and never saw anybody who had seen one, either. And what's more, I don't believe in 'em. Just show me one—a genuine ghost,—and then I'll have faith."

"Well," said old Aunt Debby, "I have seen a ghost,—as real a ghost as anybody ever laid eyes on. 'Twas more'n thirty year ago, just after I buried my first husband. I was lookin' round for a place to live in, and heard of a house in Jackson-street, where the rent was very low. One of the neighbors told me it was offered so cheap because no family could stay on account of a ghost of the man who had lived there last that haunted it."

"Did I feel afraid? No, not a bit; for I didn't believe in such things; and besides, I had known the old man well in his lifetime, and been good friends with him, too. I didn't know any cause why he should turn to be my enemy after he was dead. So I took the house, glad to get it at so low a price, and moved in my furniture. Towards evening, I went over and made ready to pass the night there. Was I alone? Aye,—that I was, all alone, for I was a poor widow, and my children across the sea."

"'Twas a warm night, and so I opened the doors and windows, after I had lighted my lamp. Then I sat down by my table, to knit awhile, and read my chapter in the Bible, before going to bed. I was a knittin' and a readin' together, with the Bible open at the Ninety-first Psalm,

when all of a sudden, I heard a strange sound upstairs. It was a low cry, just like a wailin', sobbin' child would make; and seemed to be goin' round and round the gullet. 'It's nothin' but the wind,' says I to myself, but when I looked out o' doors, and saw how still and quiet every thing was, with the stars a shinin' down so calm, I knew it couldn't be the wind. Then I thought it might be a rat or a mouse, but I knew very well that no such animal could make that sad, melancholy moan, which seemed to pierce to my very soul. I listened a little while, tryin' to think what could make such a strange noise, and at last says to myself, 'Deb, that is a ghost, sure enough, and no mistake.'

"Frightened? No; at any rate, not much, for I had no cause to fear aught on earth, or in the grave. I read my chapter through,—all about the angels havin' charge over us, and the 'terror by night'—and the rest of the dangers. But all the time, the sound—that awful wail,—kept on with its solemn voice. I heard it coming down stairs, and with it a gentle footfall,—down, down, a step at a time. It reached the floor, and then stopped. I looked—for I could not help lookin',—and there, right at the doorway, I saw standing in the dark, two gleamin', flashin' balls of fire! Now, I began to be scared, but I gathered up all my courage and spoke out loud, 'Come forth!' And upleaped—a big black cat!

"That was all there was of the ghost. I knew the cat as soon as I saw it plainly; and it knew me too, and came towards me, purrin' and moanin' by turns. You see, the old cat was weepin' for its dead master; and as it stood in the door, the candle-light on its eyes made them look like balls of fire. That was the only time I ever saw a ghost; and I don't believe anybody ever saw a better one. I kept the old cat, and well I might, for she had saved me forty dollars rent, besides drivin' away the rats and mice from the house."

"THE BEST JUVENILE MAGAZINE EVER PUBLISHED IN ANY LAND OR LANGUAGE."

OUR YOUNG FOLKS.

The popularity of this Magazine for Boys and Girls, although very great from its commencement, has been largely increased this year by Mr. ALDRICH's remarkable "Story of a Bad Boy," and by the very instructive and fascinating articles on subjects of practical interest and importance by Mr. PARTON, Mr. TROWBRIDGE, Mrs. AGASSIZ, Mr. HALE, MAJOR TRAVERSE, and other popular writers. The tastes and benefit of all classes of readers have been consulted; provision has been made for the best of Stories to please those who prefer stories to any other reading; while for those who desire to learn, as well as to be amused, excellent articles have been prepared by the most skillful and pleasing writers on Glass-Making, Coal-Mining, Ship-Building; on Voyages, Discoveries, and the Lives of Great Navigators; on Earthquakes, Coral Animals, and the Islands they build; on fresh and attractive topics of American History; on Gardening for Girls; How to Talk, How to Read, How to Write, How to Travel, How to Act in Society, and How to Work. For entertainment and sharpening the wits of the readers of "OUR YOUNG FOLKS," the Evening Lamp furnishes a choice and abundant collection of Enigmas, Riddles, Puzzles, etc.

To show the estimation in which the Magazine is held by those who are acquainted with it, the Publishers annex the following letters:

FIELDS, OSGOOD & Co.:

I got from you four numbers of "Our Young Folks," and I read every word of them. I have showed them to several boys here. Every boy likes them. Ten boys told me they would sign with me for them, but all of them couldn't get the money now. I send you the money for five names. Some boys say they can't get their fathers to sign for any papers. Their fathers are able to sign. I think "Our Young Folks" the best Magazine in the world. Here are the names.
Truly yours,
H. A. L.

CLEVELAND, Ohio, March 24th, 1869.

MESSRS. FIELDS, OSGOOD & Co.:

I am a little boy, and live here at the far West. I used to live in Mass., near Boston. I have been in your store many times, and have several books published by you. I came here near two years ago. My brother has given me the first and second volumes of the "Young Folks." I liked it so well, I want to own them all, and have tried to earn money enough to pay for them. I have found it hard work, as money is not as plenty as work is. But I have succeeded now. I want to know how much you will let me have the back numbers of 1867 and 1868 for—and I will also subscribe for 1869. I mean to keep on taking them as long as they are published, which I hope will be for a long time.
C. W. K.

HERMANN, Mo., Jan. 3, 1869.

Please find enclosed \$2.00, renewal of subscription for "Our Young Folks" for 1869. We enjoy the book so much we feel as though we could not get along nicely without it. Many a lonely and sick hour has been passed pleasantly by its help, and I think it improves all the time.
Your friend,
Miss L. M. M., Bloomington, Ill.

COLD WATER, Mich., Feb. 12, 1869.

I wanted so many new books and tools this year, I thought I would try and get along without "Our Young Folks," but I can't do it. I am lame and cannot go off and play with the other boys, so I must have my old friend again.
D. L.

Enclosed I send you two dollars, to pay for "Our Young Folks" another year. Times are very hard, and we thought we would have to give up "Our Young Folks" for the coming year, but when the Dec. No. came, 'twas like parting with an old and tried friend, and to think that was the last No. caused an extra effort among the young folks, and I shall not say that the "Old Folks" did not assist; the consequence of which was "Peter was robbed to pay Paul."
J. M. C., West Glaze, Missouri.

February 1st, 1869.

I have taken your Magazine for nearly two years, and I like it very much. "Cast away in the Cold" was a very good story, and I think that the "Story of a Bad Boy" will be a good one, too. I am eleven years old and I think I will take it all my lifetime. I buy the Magazine every month from Mr. Winters, who keeps the stationery in Rondout.
Yours truly,
E. S. C.

ALLENVILLE, Mifflin Co., Penn., Feb. 15th, 1869.

I have long felt the need of some interesting Magazine to enliven the reading class. "Our Young Folks" is what we need. I am going to make the experiment, and use every effort to have it in the hands of every pupil who can understand it. Had we something fresh and instructive to interest our pupils, we should not have near the difficulties we have in keeping a quiet, orderly school.
B. I. S.

ELIZABETH, N. J., Feb. 16th, 1869.

I have long admired your Magazine, "Our Young Folks,"—ever since a copy came by chance under my observation. I think it is the best magazine for young folks published in this country, or even in the world, for I don't see how it could be better. It is just the thing for a family, there is something in it for all ages. I like "Farming for Boys," and "Gardening for Girls." I like Mr. Aldrich's story. It commences some like "Tom Brown."
C. F. C.

BINGHAMTON, N. Y., Feb. 23d, 1869.

I have read "Our Young Folks" ever since it was first published, and like it famously. I think it much superior to any other Magazine for Young Folks, and hope it may long continue to delight their homes and improve their minds.
Truly,
H. L. K.

I read one number over and over, till I get another number. William Henry's letters are very good indeed. I intend saving all the numbers of "Our Young Folks," and have them bound—they will make a very pretty book. I am the only one that takes "Our Young Folks" in this town, but they all like it so well that I think I can raise a club for it.
L. D.

HEBRON, Porter Co., Indiana, March 30th, 1869.

GENTLEMEN:—At the commencement of the publication of "Our Young Folks," wishing my young folks to have the benefit of it, I procured and sent you a small list of subscribers in this place, and so far as I can learn, they were all, both young folks and old, well pleased. I believe it will be a pleasure to you to know that even now, although the old numbers have been read through time and again, and are sadly worn by faithful use, still, every once in a while, they are again brought out to undergo another satisfactory perusal; and the only regret ever expressed in my hearing is that there are no more of them, and I know surely, that anything that will give so much pure, harmless pleasure at so little cost is too valuable to part with voluntarily. So now I propose that if you will send me the four specimen Nos., and the terms, I will see how many subscribers I can procure in this vicinity.
S. B. K.

LA GRANGE, March 5th, 1869.

As I have just received March number, I thought I would write and tell you that it was a perfect gem. The story of a "Bad Boy" is splendid, and so is Glass-Making. I did not think there could be any better than January or February numbers—but it is. I know I shall be interested in Coal-Mining and Ship-Building. This is the first year I have taken "Our Young Folks," and I wonder I could have done without it so long, now that I take it.
L. G.

VASSAR, Michigan, March 9th, 1869.

I thank you very much for the present you sent me in the March No. of "Our Young Folks." I am a poor little boy, have had to split wood for this dollar, thought you would send it to me for six months for it. You do not say anything about doing any such thing, and I am almost afraid to ask you, but I do want your Magazine the worst way. I like the History part of it. Please send me "Our Young Folks" as long as you can for the dollar I have enclosed, and I will thank you ten thousand times.
J. F. D.

A lady in Amsterdam, N. Y., writes this about "Our Young Folks": "I have been a reader and admirer of 'Our Young Folks' ever since it was published. Deeply interested in children myself, fully in sympathy with their needs and tastes, I have also been for their dear sakes, a hungry reader of juvenile works, and have never found anything that suited me as well as your publications,—nothing that seemed so well adapted to their wants as an educational force, morally and intellectually. One thing which your competitors have overlooked, you have admirably and earnestly labored for—the development of the love for the beautiful lying latent in every child's heart. The Magazine has a loving and beautiful mission, a ministry to all child life, and I would love to put it in the hands of every boy and girl in the land."

PHILADELPHIA, March 24th, 1869.

MESSRS. FIELDS, Osgood & Co.—Dear Sirs: Do, for goodness' sake, send on "Our Young Folks" for April. The March number for my boys has not arrived, and there has been no peace in the house for the last ten days. My boys are so much interested in the story of a "Bad Boy," that it is nothing but Tom Bailey from morning till night. If I were any judge of such matters, this story is what I call a hit. Do hurry along the April number.
Yours,
L. M. C.

SPRINGFIELD, Feb. 23., 1869.

TO THE EDITORS OF "OUR YOUNG FOLKS."

"Your magazine is such a source of delight in our family, and at the same time so valuable and instructive to our children, that I feel impelled to write you and thank you for what you are doing for them and for others like them. We have taken the magazine ever since it started, but we think it more interesting than ever this year.

"The 'Story of a Bad Boy' pleases my boys so much that they fairly commit each installment to memory. Mr. Trowbridge's articles on Glass-Making we have found particularly interesting, and so are the articles by Mr. Parton, and Mr. Hale, and Mrs. Agassiz. I assure you that the monthly arrival of your Magazine is a great event in our household. Expectation gets on tiptoe about the middle of each month, after which time the Post-office boy is closely watched by two pair of eager young eyes on the lookout for what they call the best magazine that ever was."

"In sober earnest, dear Editors, I feel that you are doing my children an inestimable good, that you are furnishing to them a style of reading in every respect admirable and particularly adapted to them; and as I see the interest with which they read what you prepare for them, and observe its restraining and developing influence upon their young minds, I feel grateful that in their education I have such a valuable assistant as your magazine.

Respectfully yours,
Mrs. A. M.'

"OUR YOUNG FOLKS" is only Two Dollars a year, and the numbers for January, February, March, and April, 1869, will be sent free to any one who wishes to examine the Magazine, on application to the Publishers,

FIELDS, OSGOOD & CO., 124 Tremont Street, Boston.

Choice Seed Potatoes.

Early Rose.—One pound, \$1.00; Three pounds, \$2.00. by mail, post-paid. 1 peck, \$5.00; 1/2 bushel, \$8.00; 1 bushel, \$15.00; 1 bbl., \$40.00; 5 bbls., \$175.00. Climax.—One pound, \$3.00. Bresee's Prolific.—One pound, \$2.00. One pound each of Climax, Bresee's Prolific, and Early Rose, mailed post-paid to any address upon receipt of \$5.00. London White.—Early and good. 4 pounds, by mail, \$1.00; 1 peck, \$2.50; 1 bushel, \$9.00; 1 bbl., \$20.00. Vanderveer's Seedling.—4 pounds by mail, \$1.00; 1 peck, \$1.50; 1 bushel, \$5.00; 1 bbl., \$12.00. Early Goodrich and Harison.—\$1.00 per barrel. Our new Illustrated Potato Catalogue, with instructions for culture, mailed free to all applicants. See advertisement in Agriculturist for April.

B. K. BLISS & SON, 41 Park Row, (Box 5,713 P. O.) New York.

New Sweet Potato.

Southern Queen.

This New Sweet Potato, lately introduced from South America, is of wonderful productiveness, and in the estimation of all who have tested it, the finest flavored and best for table use, of any ever before offered to the public. We offer for sale a limited number of sprouts at \$2.00 per 100, \$3.00 per 500, \$5.00 per 1,000.

No orders received for less than 100.

NANSEMOND SWEET

Potato sprouts at 75 cents per 100, \$3.00 per 500, \$5.00 per 1,000.

Sent by mail for 10 cents per 100 additional. Cash must accompany the order. B. K. BLISS & SON, P. O. Box 5,712, 41 Park Row, New York.

Collections of Flower Seeds by Mail.

The following collections have been sent out from our establishment for the past 15 years, and are now favorably known in every section of the country. They contain the most showy varieties in our large assortment, with full directions for culture. Each packet contains a mixture of the different colors and varieties of its species, so that a greater display can be made at a much less price than when ordered in separate packets. Those unacquainted with Flowers, as well as the experienced cultivator, may order without fear of disappointment.

- No. 1—contains twenty choice varieties of Annuals... \$1.00
No. 2—contains twenty choice varieties of Biennials and Perennials... 1.00
No. 3—contains ten extra varieties of Annuals and Perennials, embracing many of the new and choicest in cultivation... 1.00
No. 4—contains five very choice varieties, selected from Prize Flowers, of English Pansies, German Carnation and Picotee Pinks, Verbenas, Truffaut's French Asters, Double Hollyhocks... 1.00
Any one remitting \$3.00 will receive the four assortments, postage free.

B. K. BLISS & SON, Box 5,712, 41 Park Row & 151 Nassau-st., New York.

Collections of Kitchen Garden Seeds.

A COMPLETE ASSORTMENT OF VEGETABLE SEEDS FOR ONE YEAR'S SUPPLY, FOR A LARGE OR SMALL GARDEN.

The following Collections are made up in the most liberal manner, care being taken to give a sufficient quantity of all the finest varieties and most useful sorts of Vegetables required in the Kitchen Garden.

- Assortment No. 5 contains 55 varieties, \$3.50
No. 6 contains 33 varieties, 2.00
No. 7 contains 15 varieties, 1.00

The above are prepared expressly for sending by mail, and will be sent post-paid, upon receipt of prices annexed. Larger Collections, which can be safely sent by express (freight paid by purchaser), to any part of the country, as follows:

- No. 1, \$20.00; No. 2, \$15.00; No. 3, \$10.00; No. 4, \$5.00.
For a list of the contents of each Collection, see Catalogue, pages 192 and 193. Address

B. K. BLISS & SON, Box 5,712, 41 Park Row & 151 Nassau-st., New York.

New and Choice Melons.

PERSIAN WATERMELON.—Introduced by Bayard Taylor, Esq., the well-known traveler, from the borders of the Caspian Sea, and first offered for sale in 1867. After a trial of two years we can confidently recommend it as a most valuable acquisition, particularly for the Middle and Southern States. It is globular and elliptical in form, of pale green color, with dark stripes; flesh crimson and of remarkably fine texture; delicious flavor, with only half an inch of rind. A peculiarity of this Melon is that it can be taken off the vine to ripen, and will keep till winter. It grows to a large size. 25 cents per packet of 10 seeds, 5 packets for \$1.00.

MINORCA MUSKMELO.—A new and valuable variety of the Muskmelon, grows to a very large size, flesh of fine texture, excellent flavor and very productive. 25 cts. per packet of 10 seeds; 5 packets for \$1.00.

HUNTER'S IMPROVED PERSIAN MUSKMELO.—Grows to a large size, very productive, and of superior quality, per packet of 10 seeds, 25 cents. For sale by B. K. BLISS & SON, 41 Park Row, & 151 Nassau-st., P. O. Box 5,712, New York.

Wethersfield Onion Seed.

Red Wethersfield, Yellow Danvers, and White Portugal, by mail, post-paid, at 50 cts. per ounce; \$1.50 for 4 ounces; \$5 per pound. B. K. BLISS & Son, P. O. Box 5,712, New York.

Seeds to be Sown in May and June.

Table with 2 columns: Seed Name and Price. Beet, Mangel Wurzel, Long Red, and Yellow Globe; White Sugar; Ruta-baga, Purple Top; Turnip, Long White French.

FERRE, BATCHELDER & CO., 231 Main-street, Springfield, Mass.

Rhode Island White Cap Seed Corn.

Acknowledged to be one of the best varieties. Fourteen bushels by measure of ears yield ten bushels by weight of shelled corn. This corn, raised by me in Rhode Island, is better adapted for seed corn south of this State, than corn raised on the spot, as it will ripen earlier.

Also for sale a full-blooded Ayrshire Bull Calf one year old this month, with pedigree, and from the best of stock. Address AMASA M. EATON, Providence, R. I.

New and Rare Vegetables.

Having been the original introducer of the Hubbard Squash, Marblehead Mammoth Cabbage, and many other new things, I still continue to make the raising of the seed of new and rare vegetables a specialty, in addition to the standard kinds. Catalogues gratis to all. JAMES J. H. GREGORY, Marblehead, Mass.

DUTCH BULBS, imported by LONGHURST & LAUREL, 52 Cedar St., New York, on special orders from Messrs. L. VAN WAGEN & Co., the celebrated Florists, of Haarlem, Holland, whose superior products have given such universal satisfaction for the past years. Parties desirous of ordering selected bulbs of superior quality will please forward their orders to us before the 1st of June. Price Currents and further information furnished upon application.

SEND FOR THEM.

CROSMAN'S New Improved Frankfort Head Lettuce, and the Early Prolific Nantuck Muskmelon, 15 cents each or both for 25 cents. Two of the most valuable New Vegetables ever introduced, which I will send post-paid to any address upon receipt of price. C. W. CROSMAN, Seedsmen, P. O. Box 80, Rochester, N. Y.

OLM BROTHERS' New and Rare Plants.

We would call the attention of Amateurs to our large and fine stock of New Plants. Golden tricolor Pelargoniums, Mrs. Pollock, and others. All the new double-flowering Zonale Pelargoniums, Symphitum peregrinum, Salvia tricolor, Macleaya yedoensis, New Begonias, Cannas, Coleus, Gloxinias, Gesnerias, Achimenes, Ferns, Fancy Show, and Bedding Dahlias, Roses, Verbenas, Tritomas, and a general Collection of Bedding-out Plants, Shrubs, etc. Send stamp for our Illustrated Catalogue. Address OL M BROTHERS, successors to B. K. Bliss, Springfield, Mass.

VANDERVEER'S SEEDLING.

In introducing to the public my new seedling potato I would say, it was grown from seed raised by me in 1862 from imported California potatoes. Having cultivated it from that time, it has each year proved more and more its superior quality and merits, possessing all the points desirable in that highly esteemed esculent. I claim for it that as to productiveness, size and uniformity, carliness, whiteness, fine flavor, and dryness in cooking, no rot while growing or keeping, freedom from blight, it excels all others. As a winter and spring variety it has no equal, retaining its solidity, freshness, and flavor, having had prime old on my table one day and ripe new ones the next. Prices for 1869 as follows: per barrel, \$12, bushel \$5, half bushel \$3.75, peck \$1.50, 4 lbs., postage paid, \$1. Sample can be seen and circular obtained of the undersigned or at this office. Address orders to W. H. VANDERVEER, Port Washington, Queens Co., N. Y.

SEED POTATOES.

Our Catalogue and Price List of 100 VARIETIES OF POTATOES is now ready and will be sent free to all applicants. Address REISIG & HEXAMER, New Castle, Westchester Co., N. Y.

EARLY ROSE AND WHITE CHILI.

Early Rose, the best early Potato, \$5 per peck; 4 lbs. by mail, post-paid, \$2. White Chili, the best late, \$2 per peck; 4 lbs., by mail, \$1.50. Early Goodrich, \$3.50 per bbl. Harison, \$4 per bbl. Orano, very good, \$1.50 per bbl. Also, Forfarshire Red, most productive kind; Cueco; Lapstone Kidney; Andes; New White Parading; and every desirable sort at lowest rates. Send a stamp for our Illustrated Descriptive Priced Catalogue of the newest and best Garden and Field Seeds and Seed Potatoes. L. D. SCOTT & CO., Huron, Ohio.

Early Rose and Goodrich Seedling Potatoes for Sale,

By pound, bushel, or barrel. Circular sent free. RICHARD YOUNG, Morton's P. O., Springfield, Delaware Co., Penn.

CABBAGE AND CELERY PLANTS—See advertisement in June number, or write for price list, etc. G. H. HOLDEX, South Norwalk, Conn.

Early Rose and Harison Potatoes.

Early Rose, 5 lbs., \$2, free by mail. 1/2 bushel, \$7. 1 bushel, \$12. 1 barrel, \$35. Harison, 1 barrel, \$1, 10 barrels, \$25.00. One barrel Harison and 4 lbs. Early Rose, \$5. Climax \$3 per bbl. Address W. S. CARPENTER, 156 Reade-st., New York.

HARISON POTATOES!—Warranted genuine. 200 bbls. at \$4 per bbl. Early Goodrich at \$1 per bbl. E. Rose, \$1 per bbl. Warren L. Baker, Portlandville, Otsego Co., N. Y.

NANSEMOND SWEET POTATO SPROUTS, 75 cents per 100, by mail, prepaid, \$3.00 per 500, by Express. Price per 1,000, by Express.

Carefully packed, with full directions for culture. Address J. M. HALSTED, Box 23, Eye, N. Y.

SWEET POTATO PLANTS for sale by I. J. SIMONSON, at 58 Cortlandt-st., New York. Price per 100, 75 cents. Price per 500, \$2.00. Price per 1,000, \$5.00.

SWEET POTATO PLANTS, by the 100, 1,000, or 10,000. Delivered in New York, or sent by mail. Send for Priced list of Vegetable Plants. H. E. ACKER, Woodbridge, N. J.

Strawberry Plants by Mail.

We will send by mail, post-paid, to any address in the United States, the following Strawberry Plants, carefully packed, at the following prices: One dozen each Agriculturist, Hovey's Seedling, and Russell's Prolific, \$1.00. One dozen each Agriculturist, Hovey's Seedling, Russell's Prolific, Wilson's Albany, and Juncuda, \$2.00. One dozen each Nicanor, Agriculturist, Wilson's, and Russell's, \$2.00. For a complete list of PLANTS, FRUIT AND ORNAMENTAL TREES, &c., see our ILLUSTRATED CATALOGUE OF PLANTS, price 5 cents. Address FERRE, BATCHELDER & CO., 231 Main-st., Springfield, Mass.

Strawberry Plants.

Our Catalogue of over 100 varieties of Strawberries and other valuable Small Fruit Plants will be mailed to all applicants. Address REISIG & HEXAMER, New Castle, Westchester Co., N. Y.

Strawberries Selected from 100 Varieties.

Dr. Nicaise, Napoleon III, Romeyn Seedling, Nicanor, White Alpine, and Negro plants 75c. doz., \$3, 100. Charles Downing, 50c. doz., \$1.50, 100, \$12, 1,000. Juncuda, Green Prolific, Agriculturist, and Barnes' Mammoth, 35c. doz., \$1.25, 100. President, \$1.50 doz., \$5, 100. Peak's Emperor, \$1.50, doz. The 13 varieties, 1 doz. each, for by mail, for \$5. Boule de Ver, \$1 each. Lev. and Roy, Hat box, 75c. each. Address W. S. CARPENTER, 156 Reade-st., New York.

A General Variety of Plants, &c.

It is still in time to plant Strawberries, Raspberries, Blackberries, Potatoes, &c., and let those remember who wish to plant that if they send and get my Price List of reduced prices they will find them as low, if not lower, than are offered in this paper. If you wish to purchase, don't fail to send for one, or send a list of what you want and I will return the price of same. THOS. C. ANDREWS, Moorestown, N. J.

JOHN S. COLLINS, Moorestown, New Jersey, continues to fill orders for plants promptly.

The Continental Fruit Package

Combines COVERED box, SPRING crate, and thorough ventilation. Illustrated circular free. CONTINENTAL BOX CO., No. Bridgewater, Mass.

JOHN S. COLLINS, Moorestown, New Jersey, continues to fill orders for plants promptly.

Missouri Lands for Sale.

Missouri Lands are very fertile, and situated in the heart of the Union; they furnish an extraordinary opportunity for the people of the Northern States to acquire cheap, healthful, and productive farms. This can never occur again so near the centre of population.

North Missouri contains about 25,000 square miles, or sixteen million acres, as desirable as any in the valley of the Mississippi. Through this garden of Missouri the Hannibal and St. Joseph Railroad extends, and all its lands lie near its track and numerous depots. The climate, so temperate and healthful, and a virgin soil so capable of producing almost every kind of vegetation, invite emigrants from the cold and bleak North to settle on our rich prairies.

All are invited: Let the industries and enterprising, rich and poor, come and prosper. They should come at once and preoccupy this splendid country. Circulars, giving full and valuable particulars in English and German, are supplied gratis to all wishing to come themselves, or to circulate to induce others to come also.

A Sectional Map, showing the exact location of all our Railroad Lands, is sold at thirty cts. Address GEO. S. HARRIS, Land Commissioner Hannibal & St. Joseph R. R. Co., HANNIBAL, Mo.

FEMALE AGENTS wanted in every City and Town to sell the LADIES' ELASTIC SUPPORTER, the most comfortable article ever invented. Send One Dollar for sample, which will be returned if not approved. Address Dr. G. CLINTON STILLSON, Box 347, Derby, Conn.

It is the best I have ever grown.—D. W. HALLOCK, Upper Aquobogue, L. I. It is superior in every respect to any other that has come within my knowledge.—JAMES M. REEVE, Northville, L. I. Without exception the best variety corn ever grown here.—HARRISON HALLOCK, Oregon, Suffolk Co., N. Y. Yielded at the rate of 60 bushels shelled corn per acre.—ADAM RANKIN, MOXNOUTH, Warren Co., Ill. It is the finest Corn I ever saw. On most of the stalks there were two ears, and on many of them three. WM. B. BULLARD, West Meriden, Mass. From my limited experience I think it is as early as the Burlington, yields better, and will plant it another year in preference to any other variety.—WILLIAM J. CONOVER, MARLBORO, N. J., December 17th, 1868.

I believe it to be far superior to any other variety. It yielded at the rate of 99 bushels shelled corn per acre.—GEORGE V. SCOTT, Thompsonville, Ill. Mr. FANNING. Your Sanford Corn gave me good satisfaction. I like it well. J. McCAIN, Delaware Station, N. J. I planted it the 28th of May, on a piece of ground 6 by 10 rods, four feet apart each way. I cut it up the 7th day of Sept., and husked 43 bushels of ears, all very sound, which result was highly satisfactory.—A. J. BROWN, Olivett, Ill.

PARK HOTEL,

ON THE AMERICAN & EUROPEAN PLAN. Cor. BEEKMAN and NASSAU STS., Near City Hall Park, NEW YORK. GEORGE WIGHT, Proprietor.

N. B.—Located in the very heart of the wholesale business this is one of the most conveniently located Hotels for Merchants, Business men and others visiting the city.

New and Rare Vegetables.

Having been the original introducer of the Hubbard Squash, Marblehead Mammoth Cabbage, and many other new things, I still continue to make the raising of the seed of new and rare vegetables a specialty, in addition to the standard kinds. THE LADIES' OWN MAGAZINE,

Edited by Mrs. M. Cora Bland,

AND PUBLISHED BY THE NORTH WESTERN FARMER COMPANY, is a superb and charming Monthly of 32 double-column pages, besides cover, and contains a magnificent full page engraved frontispiece each month. TERMS, \$1.50 a year. This is eminently a LIVE, PRACTICAL, SENSIBLE WOMAN'S MAGAZINE, devoted to Literature, Art, Dress, Household Economy, Health, Physical and Mental Culture, and the promotion of true womanhood.

THE LADIES' OWN MAGAZINE has proven so immensely popular, that the first four numbers are already exhausted, and a short volume of eight months will begin with the May number.

OFFER EXTRAORDINARY.

THE LADIES' OWN MAGAZINE will be sent from the first of May till the close of the year, (8 months), for only 75 cents; single numbers 15 cents each. An extra copy will be given for a Club of six. We also offer a large list of VALUABLE PREMIUMS for larger Clubs. Now is the time to subscribe and make up Clubs.

Address **NORTH WESTERN FARMER CO.,** INDIANAPOLIS, IND.

"It is the most popular magazine ever attempted in the West."—Cincinnati Times.

"It sparkles among other ladies' magazines like a diamond among Pinchbeck Jewelry."—Illinois Statesman.

"Mrs. BLAND is a lady of rare literary attainments, and her magazine will undoubtedly prove a great success."—Indianapolis Journal.

"Mrs. BLAND is a vigorous, polished, fearless, and forcible writer, and her magazine is destined to be very popular."—Indianapolis Mirror.

"This magazine is devoted to a pure literature, a higher physical and moral culture, and a nobler ideal of true womanhood, than our lady friends are accustomed to read."—Danville Union.

"GARDENING FOR PROFIT" and "Practical Floriculture."

By **PETER HENDERSON.**
The former detailing the modes of MARKET GARDENING, the latter descriptive of the methods of COMMERCIAL FLORICULTURE, as practiced in the vicinity of New York. Mailed post-paid, for \$1.50 each.

Our Illustrated Catalogues of SEEDS and IMPLEMENTS, together with that of NEW and RARE PLANTS, are now ready, and both will be mailed on receipt of 25c., or sent with either of the above books without charge.

GREEN-HOUSES, Bergen City, N. J.

GEORGE W. WARRING, Jr.,
AGRICULTURAL ENGINEER,
Ogden Farm, Newport, R. I.

Particular attention given to all Works of Agricultural Improvement, such as Land Drainage; the Construction of Farm Buildings, including Earth Closets; the Renovation of Worn-out Lands; Road-making, etc.

THE NEW METHOD FOR THE PIANO-FORTE, by WILLIAM MASON (the distinguished pianist), and E. S. HOADLY, is a great improvement upon all previous works, and is used and recommended as such by the best teachers. It preserves what is valuable in previous books, and adds many new features. It is the only modern piano-forte instructor published, presenting the technics of modern piano-forte playing. It is easier to teach and learn from, and secures more rapid and thorough progress than any other book. No teacher of the piano-forte can afford to do without its aid. It is the best book for beginners, and the best for those who have made progress. Price \$1.00. To facilitate its examination by teachers, we will, until July 1st, send a single copy to any teacher of the piano-forte by mail, postage paid, for half price, two dollars. An edition is published with *European fingering*, and one with *AMERICAN FINGERING*.

NASBY'S PAPER

THE TOLEDO BLADE.

A large quarto sheet, containing fifty-six columns filled with News from all parts of the World. Choice original and selected Tales, Sketches, Poetry, Wit and Humor, a Commercial Department, a Religious Department, a Children's Department, and a carefully edited Agricultural Department. In short, it is our constant aim to make the BLADE as nearly as possible a **Perfect Family Newspaper.**

THE NASBY LETTERS!

The rich, racy, rollicking humor of the Letters of "Rev. PETROLEUM V. NASBY, P. M.," which is Post-master,"—their quaint irony, keen sarcasm, and cutting satire,—their merciless exposure of the heresies of political demagogues or ALL PARTIES, and, withal, their profound philosophy and unanswerable arguments, have rendered them the most popular political literature ever published. These letters are written expressly for the BLADE, and will be continued regularly in its columns.

A New Story by **Petroleum V. Nasby** will shortly be commenced in the BLADE.

TERMS.—Single copies, 5¢ per year; Clubs of five, \$1.75 each; Clubs of ten and over, \$1.50 each, and an extra copy to every person getting up a Club.

PAY! PAY! PAY!—We pay liberally, in cash, all who assist us in extending the circulation of the BLADE.

AGENTS WANTED.—We want an Agent at every Post-office in the United States. Send for our Special Circular to Agents.

SPECIMEN COPIES sent free to any address. Send for a copy, and at the same time give us the address of a dozen or so of your friends, at as many different Post-offices, to whom we will send copies free and postage paid.

Address **MILLER, LOCKE & CO.,**
Toledo, Ohio.

OSAGE ORANGE SEED.

We take this means of apprising Dealers, Nurserymen, and Farmers, of the fact of our being in receipt of a large and superior lot of Osage Orange Seed from Texas. As an evidence of its genuine quality we would add, that it was gotten out under the supervision of our own Agent in Texas. We would be pleased to hear from those in want of seed, and will assure purchasers that our seed is of superior quality. Parties wishing seed of us will please order early. We will furnish at as low a figure as possible as far as is furnished elsewhere.

GARDENING FOR PROFIT IN THE MARKET AND FAMILY GARDEN.

By PETER HENDERSON. FINELY ILLUSTRATED.

This is the first work on Market Gardening ever published in this country. Its author is well known as a market gardener of eighteen years' successful experience. In this work he has recorded this experience, and given, without reservation, the methods necessary to the profitable culture of the commercial or

MARKET GARDEN.

It is a book which commends itself, not only to those who grow vegetables for sale, but to the cultivator of the

FAMILY GARDEN,

to whom it presents methods quite different from the old ones generally practiced. It is an ORIGINAL AND PURELY AMERICAN work, and not made up, as books on gardening too often are, by quotations from foreign authors.

Every thing is made perfectly plain, and the subject treated in all its details, from the selection of the soil to preparing the products for market.

CONTENTS.

Men fitted for the Business of Gardening.	Location, Situation, and Laying Out.	Formation and Management of Hot-beds.	Transplanting; Insects.
The Amount of Capital Required, and Working Force per Acre.	Soils, Drainage, and Preparation.	Forcing Pits or Green-houses.	Packing of Vegetables for Shipping.
Profits of Market Gardening.	Manures; Implements.	Seeds and Seed Raising.	Preservation of Vegetables in Winter.
	Uses and Management of Cold Frames.	How, When, and Where to Sow Seeds.	Vegetables, their Varieties and Cultivation.

In the last chapter, the most valuable kinds are described, and the culture proper to each is given in detail.

SENT POST-PAID. PRICE, \$1.50.

ORANGE JUDD & COMPANY, 245 Broadway, New York.

GARDENING FOR THE SOUTH,

Or, HOW TO GROW VEGETABLES AND FRUITS.

By THE LATE WILLIAM N. WHITE, OF ATHENS, GA.

WITH ADDITIONS BY MR. J. VAN BUREN, AND DR. JAS. CAMAK.

Though entitled "Gardening for the South," the work is one the utility of which is not restricted to the South. It is an admirable treatise on gardening in general, and will rank among the most useful horticultural works of the present day. Horticultural operations are clearly explained, and more in detail than is usual in works of this kind. To those living in the warmer portions of the Union, the work will be especially valuable, as it gives the varieties of vegetables and fruits adapted to the climate and the modes of culture which it is necessary to follow.

CHAP. III.—The Improvement of the Soil.

CHAP. IV.—Manures.

CHAP. V.—Manures—Their Sources and Preparation.

CHAP. VI.—Rotation of Crops.

CHAP. VII.—Hot-beds, Cold Frames, and Pits.

CHAP. VIII.—Garden Implements.

CHAP. IX.—Propagation of Plants.

CHAP. X.—Budding and Grafting.

CHAP. XI.—Pruning and Training.

CHAP. XII.—Transplanting.

CHAP. XIII.—Mulching, Shading, and Watering.

CHAP. XIV.—Protection from Frost.

CHAP. XV.—Insects and Vermin.

CHAP. XVI.—Vegetables—Description and Culture.

CHAP. XVII.—Fruits—Varieties and Culture.

CONTENTS.

CHAP. I.—Formation and Management of Gardens in General.

CHAP. II.—Soils—Their Characteristics.

Illustrated. Revised and Newly Stereotyped.

THE
MARKET ASSISTANT,

Containing a brief description of
Every Article of Human Food
Sold in the Public Markets
of the cities of
New York, Boston, Philadelphia,
and Brooklyn;
Including the various
Domestic and Wild Animals, Poultry, Game, Fish, Vegetables, Fruits, etc.,
with
MANY CURIOUS INCIDENTS AND ANECDOTES.

BY
THOMAS F. DE VOE,
AUTHOR OF "THE MARKET BOOK," ETC.

ILLUSTRATED.

The object of this volume is to present that which may be found practically useful as well as interesting. It aims at bringing together, in as small compass as possible, and in a form easy of reference, those items of information which many would desire to possess when called upon to cater for the household. In order fully to carry out the practical views here indicated, the work is divided into several headings; all of which, however, harmonize into one connecting form, "What we Eat," Domestic, or Tame Animals; Wild Animals, or Animal Game; Poultry; Wild Fowl and Birds, or Bird Game; Fish; Vegetables; Pot and Medicinal Herbs; Fruits and Nuts; Dairy and Household Products, etc.

The author has gleaned what he deems the *useful*, from the daily wants, and the common expressions of almost every home. "What shall we have to-day for dinner?" "What is there in our markets fit to eat?" "What kinds of meats, poultry, game, fish, vegetables, and fruits, are in season?" "What names are given to the different joints of meats, and what dishes are they severally and generally used for?" These, and many other similar questions are often discussed, with no one to answer. For this book it is claimed that it contains a comprehensive reply to all queries of this nature.

In order the more fully to carry out the views the author has entertained in relation to the various articles of food, he has used as illustrations the outlined diagram figures of such animals as are usually portioned out and sold by the public market butchers, with the various names, given with the accompanying engraved cuts of the principal joints. These are intended to assist in their recognition when called for, as well as to aid in rendering perfect the dishes commonly made from them.

After the Butcher's Meats will be found a brief description of other articles of food, with the periods of their season or when considered best; also instructions to guide in judging of and selecting them in the various public market-places.

THE TRAPPER'S GUIDE;

A Manual of Instructions

For capturing all kinds of fur-bearing animals, and curing their skins; with observations on the fur trade, bluts on life in the woods, and narra-

tives of trapping and hunting excursions.

By S. NEWHOUSE,

And other Trappers and Sportsmen.

Edited by the Oneida Community.

216 Pages Octavo.

With 32 full page Illustrations, and numerous smaller Engravings.

This book is designed for practical working men, who make, or propose to make, trapping a means of livelihood. Mr. Newhouse, having become widely known as the manufacturer of an excellent kind of steel trap, and it being generally understood that the practical perfection of his traps is owing to the wisdom in wood-craft which he gained in early life by actual experience in trapping, has often been applied to for information in regard to the best methods of capturing various animals. The most convenient way to answer such applications seemed to be to put his wisdom in print. In preparing for publication the material furnished by him for this purpose, the editors found new facts, inquiries, and written contributions relating to trapping and kindred pursuits, crowding upon them; until the original idea of a small pamphlet swelled to the dimensions of the present work.

CONTENTS.

INTRODUCTION.

Connection of Trapping with other Trades.—Observations on the Fur Trade.—Season for Trapping.—Statistics of the Fur Trade.

THE TRAPPER'S ART.

- I. PRELIMINARIES.
II. CAPTURE OF ANIMALS.

ELEMENTS OF AGRICULTURE.

A BOOK FOR YOUNG FARMERS,

By GEO. E. WARING, Jr.,

Formerly Agricultural Engineer of the Central Park, in New York.

CAREFULLY REVISED.

CONTENTS.

THE PLANT; THE SOIL; MANURES; MECHANICAL CULTIVATION; ANALYSIS.

The foregoing subjects are all discussed in plain and simple language, that any farmer's boy may understand. The book is written by a successful practical farmer, and is full of information, good advice, and sound doctrine. HORACE GREELEY says of it: "Though dealing with facts unfamiliar to many, there is no obscure sentence, and scarcely a hard word in the book; its 254 fair, open pages may be read in the course of two evenings and thoroughly studied in the leisure hours of a week; and we pity the man or boy, however old or young, who can find it dull reading. Hardly any one is so wise that he will not learn something of value from its perusal; no one is so ignorant or undeveloped that he cannot generally understand it; and no farmer or farmer's son can study it thoughtfully without being a better and more successful cultivator than before."

SENT POST-PAID, PRICE, \$1.00.

Address.

THE TRADE

Will do well to send for our PRICE LIST, as the above Standard Articles sell readily at good profit.

THE VICTOR GRAIN DRILL,

Manufactured by BLYMYER, DAY & CO., Mansfield, Ohio. Send for circulars of this by far the best and cheapest Drill yet produced. Agents wanted.

Fence and Vineyard Wire. Fence Staples.

Eagleton Manufacturing Co., 81 John-st., New York. Send for Price Lists.

Little Giant Horse-Power. PRICE \$80.

This has been in use over three years, and highly approved. Is very simple, strong, compact and durable; easily loaded, and moved from place to place by two men. Weight 650 lbs. Valuable for Thrashing, Sawing Wood, Churning, Cleaning Cotton, or where from one to four horse-power is wanted. Send for Circular.

JOHN W. QUINCY, 98 William-st., New York.

HEXAMER'S PRONG-HOE.

The best labor-saving implement ever invented. Hoe, Rake, Cultivator, and Potato-digger combined. Each Hoe is labeled with our Trade Mark.

"HEXAMER'S PRONG-HOE;"

and all tools not so marked are imitations intended to deceive the purchaser. Circulars sent on application. Price \$1.50 per piece; \$15 per dozen.

Address REISIG & HEXAMER, New Castle, Westchester Co., N. Y. Or, B. K. BLISS & SON, 41 Park Row, New York.

"The Franklin Brick Machine"

Tempers the Clay, brings out the molds, and makes 2,500 to 3,500 first-class Bricks per hour, with only eight men and two horses, or 4,000 to 5,000 per hour by steam-power; has no complex machinery to be getting out of order or breaking down. No pay required until after the machine has performed as above on the part of the purchaser. J. H. RENICK, No 71 Broadway, (Room No. 28), New York.

"EAGLE BRICK MACHINE." The best for the price. See cut in February number. Address FREY, SHEKLER & CO., Bucyrus, Ohio.

The Most Perfect and Successful Harvester in the World.

In eleven years the sale of the BUCKEYE has increased from 75 Machines to 20,000, in a single season, and over 100,000 are now in use in the United States.

It has received the Highest Premiums at the most important Field Trials ever held in any country.

Its Great Durability has been thoroughly Established, and it is everywhere known and recognized as the

Standard of Excellence in Material and Workmanship, as well as Perfection of Principle.

Valuable improvements added for 1869.

Manufactured by ADRIANCE, PLATT & CO., N.Y.—Poughkeepsie, N. Y. 165 Greenwich-st., N. Y.

THE CLIPPER MOWERS AND REAPERS.

It is claimed that the CLIPPER has more essential points of excellence than are found in any other Mower made in the world.

Its mechanical construction and finish of its working parts are not equalled by any implement of its kind. This, with our patented draft attachment, makes it one-third lighter in draft than any other Mower. It is the lightest, yet the strongest, the most beautiful in design, yet the most durable, of any Mower made. Nearly one-fourth of its cost is for steel, with less than ten dollars of wood-work. Finger-bars and fingers are made of solid cast steel. We attach to the No. 4 Mower, for reaping, a dropper or hand-rake.

An examination of the CLIPPERS will convince any one of their superior merits over all others in strength, durability, ease of draft, and reliability for work over all kinds of ground and in every variety of grass. Confident of this, we invite those in want of machines to examine for themselves before purchasing elsewhere.

For pamphlet, giving full information, address THE CLIPPER MOWER AND REAPER CO., P. O. Box 6,173. No. 154 Chambers-st., New York.

THE American Hay Tedder.

The best and only perfect machine ever invented for **TURNING OR TEDDING HAY.**

Hay cut, cured, and stored in the barn **IN ONE DAY!!** The quality of the Hay Crop Very much Improved. Very Light, and so Simple and Durable that it cannot get out of repair.

BURT'S SELF-ADJUSTING HORSE HAY RAKE. For Simplicity, Durability, and Ease of Operation, **UNEQUALLED.**

Made only by **AMES PLOW COMPANY,** Quincy Hall, Boston, and 53 Beekman-street, New York. Send for ILLUMINATED CIRCULARS.

WE call attention to our new **HAY TEDDER.**

an illustrated circular of which we will send on receipt of stamp. R. H. ALLEN & CO., P. O. Box 376, New York.

PACKER'S Patent Stump Extractor and Wall Builder.

We believe this machine to be unequalled for power, ease of working, convenience, and durability. Send for Descriptive Circular. Address

G. W. PACKER & CO., Successors to PACKER & FISH, Mystic River, Conn. Or, **S. S. LONG & BRO.,** 77 Dey-st., New York.

The Eagle Horse Rake.

Patented 1864, and improved for 1869, is the most simple, durable, easiest operating, and best Sulky Wire-tooth Rake ever invented. It is offered to Farmers in all the States except Iowa, and Berks Co., Penn., for \$34, or without the Wheels, \$24.

The following liberal offer is made to purchasers of Territory in all the States, except Iowa, and Connecticut, and Berks Co., Penn. Any time previous to Sept. 1st, on receipt of \$100, will send Assignment (recorded in the Patent Office) of any County, also one complete Rake, and a fine Electrotype engraving of the same. Any carpenter can make them during the winter season, and thus secure a lucrative employment. Send stamp for Circular. Be in time and secure the County or Counties you wish. Address **S. H. JENNINGS,** Deep River, Conn.

CHEAP LAWN MOWER.

Cutting 14 inches. Weighing only 60 pounds. PRICE \$30. R. H. ALLEN & CO., P. O. Box, 356, New York.

Coates' Lock Lever Hay Rake.

BLAKE'S HORSE-POWER, THRESHERS, SEED DRILLS, HAY PRESSES, CIDER MILLS. Agents wanted. Send for circular. **SHAW & WELLS,** Chicago-st., Buffalo, N. Y.

KNIFE GRINDER for Mowing Machines.—Sanford's Patent. It is light, and can be taken to the field for use. A boy can grind the knives accurately in 15 minutes, without injury to the knife, and with safety. It is a labor-saver. Price \$10.50. Send for Circular. Address **JOHN W. QUINCY,** 98 William-st., New York City. Rights for sale.

REGISTERED FOR SALE.

POTTER'S 3 HORSE CLEVIS. A PERFECT EQUALIZER. Light & Durable.

COUNTY AND STATE

Price.—\$5 Each; \$42 per Dozen. Cash with order. Send for Circulars. Address.—**EDGAR M. POTTER,** Kalamazoo, Mich.

M. T. VERNON IRON WORKS (Established 1833) Manufacture **STATIONARY STEAM ENGINES AND BOILERS,** from 10 to 1,000 horse-power. **PORTABLE ENGINES AND CIRCULAR SAW-MILLS,** so complete that they are put in operation in three days' time. **PORTABLE CRIST-MILLS AND BOLTS.** Merchant and Custom **FLOURING MILLS,** complete with drawlives for buildings and millwrights to erect and put them in operation. Vernon, Ohio.** Branch Office and Warehouse, No. 88 Michigan-ave., Chicago, Ill.

INGERSOLL'S COTTON AND WOOL PRESSES, INGERSOLL'S HAY AND STRAW PRESSES, INGERSOLL'S RAG AND PAPER PRESSES, INGERSOLL'S HIDE AND HAIR PRESSES, BOTH HAND AND HORSE-POWER PRESSES. for baling all kinds of material, on hand and made to order. Also, a practical machine for sawing down timber. Price \$25. For price-list and full information, call on or address the manufacturers, **INGERSOLL & DOUGHERTY,** Greenpoint, (Brooklyn), N. Y.

Comstock's Weeding Hoe.

A little steel instrument, with a hook at each end, one pointed and the other cleft, for hand-weeding, which it greatly facilitates, and is just the thing for Ladies in the Flower Garden. Sent by mail, post-paid, for 75 cents. **W. G. COMSTOCK,** East Hartford, Conn.

The Planet Hand Drill

Sows perfectly Guano and Phosphates, &c., Peas, Beans, Turnips, and all other seeds. Is simple, efficient, durable. Circulars of **SAM'L L. ALLEN,** Cincinnati, N. J.

"Get the Best."

THE BLANCHARD CHURN.

For the season of 1869, is now ready for the market.

This Churn completes the operation of Butter-making, Churning, Working, and Salting, without touching the hands to the Butter.

We have made this Churn for more than ten years, and there are more than ten thousand now in use.

The steadily increasing demand for them, and the opinion universally expressed by those who have used them, that they are the simplest, cheapest, best made, and every way most satisfactory Churn ever made, has induced us to add to our facilities for manufacture, and to present their claims to persons who desire to "Get the Best."

For further information, Try the Churn.

We will send one to any responsible party in any part of the United States, who may examine and use it, and if it is not what we represent it to be, they may return it to us, at our expense.

We make three sizes,—small, medium, large,—for 4, 8, and 12 gallons. For Chorus, Agencies, or Terms, apply to the

THE GREAT PURIFIER.

CRESYLIC SOAP

AND

Saponaceous Compounds.

Disinfectant, Insect Destroyer, Preventive of Fungus, etc.

Frequent mention has been made in the columns of the *American Agriculturist* of Cresylic Compounds, as being valuable for destroying insects on animals and plants, and for other purposes. For some months past we have been investigating the merits of these preparations, with the following results.

Cresylic Acid is extracted from gas-tar, to which it gives the peculiar odor perceived on burning the tar. It has been used to a limited extent by chemists and physicians, for various purposes, and their experiments have shown it to possess remarkable properties as a disinfectant, and in destroying insect life and fungus growth. In its ordinary form it could not be readily applied, and hence was not available for common use. About two years since, Messrs. JAMES BUCHAN & CO., of New York, well-known as extensive manufacturers of family soaps, conceived the idea of combining this acid in saponaceous compounds. By long and careful experimenting, they succeeded in producing soaps in various forms, possessing the active properties of this acid, and thus bringing it within the reach of all classes. These compounds have been patented.

We have watched with great interest the results of various applications of these compounds, knowing that if successful, they would be of incalculable benefit to the community. By tests made under our own supervision, and the reports of careful observers, we believe it to be established that these Cresylic Compounds are

1st. Complete Disinfectants.—They not only remove all noxious odors from sinks, privies, stables, etc., but will destroy all infection in clothing, rooms, etc., washed with their solution. Thus, contagion from Small Pox, Typhus Fever, Cholera, and other diseases, may be effectually prevented. They are used in the New York and other Hospitals for these purposes.

2d. Insect Destroyers.—An animal washed with Cresylic Soap will be entirely freed from all vermin. It will destroy ticks on sheep, fleas on dogs, lice on cattle or poultry, roaches, ants, bedbugs, etc., in rooms. It repels flies from animals, and thus is especially useful in cases of wounds or sores from any cause.

So far as tried, it has been efficacious in repelling insects from plants. We desire to have it more thoroughly tested for this purpose, and reports to be made. We believe it will free plants from Aphides, bark lice, slugs, bugs, caterpillars, striped bugs, curculio, and the whole host of minute but powerful enemies in the garden and fruit yard.

3d. Preventive of Fungus Growth.—On this point we ask for further experiment. We feel confident this soap, properly applied, will prevent smut in wheat, mildew on vines, and similar parasitic growth, and trust that experimenters will furnish the result of their trials.

4th. Cleaning Sores, etc.—For washing ulcers and other foul sores, and preventing gangrene in wounds, etc., Cresylic Soap is, we believe, unequalled. We know also that it has been successful wherever used, for foot rot in sheep, and mange, itch, ring-worm, and other skin diseases.

From numerous RECOMMENDATIONS of Cresylic Compounds, the following are selected as being specially valuable.

FIVE POINTS HOUSE OF INDUSTRY, 155 Worth St. New York, Nov. 15, 1867.

Messrs. BUCHAN & Co.—*Gentlemen*—Some months since we purchased a large building which had been used as a tenement establishment for thirteen years, and was occupied by some ninety families. We tore away partitions, turning between three and four hundred rooms into less than one hundred. We found the walls and floors perfectly infested with vermin. We used freely in cleansing the CRESYLIC SOAPS, manufactured by your firm, and with the very best results, as the bugs, etc., have entirely disappeared. We propose to continue its use in cleaning our dormitories, hoping then to keep clear of a plague so common to all house-keepers in cities. S. B. HALLIDAY, Supt.

BROOKLYN, November, 1867.

M. C. EDEY, Agent for Sale of JAMES BUCHAN & Co's, Cresylic Soaps, etc.—*Dear Sir*—We have had the Cresylic Soap used in the Raymond Street Jail and County Court House, and in washing and cleansing prisoners' clothing cells, etc.; and we are so much pleased with its cleansing

disinfecting and insect-destroying effects, that we not only continue its use in above places, but recommend that it should be generally used for those purposes.

JOHN L. RYDER, } Committee on Jails
STEPHEN CLARK, } of Supervisors of
D. S. VOORHIES, } Kings County, N. Y.

CORPUS CHRISTI, Texas, March 15, 1868.

Messrs. JAMES BUCHAN & Co.—*Gentlemen*: Your Sheep Dip is wonderful in its effects. I have dipped 2,150 head with nine months' fleeces on their backs. It is now three weeks since, and no scratching as yet. Your Dip is far superior to tobacco, not so disagreeable or unpleasant, much less trouble and more permanent.

I have used it on horses when diseased with a species of mange or itch, and it has the same good effect as on sheep. F. W. SHAEFFER.

On the use of disinfectants, the following is the testimony of Dr. ELISHA HARRIS, Registrar of the Metropolitan Board of Health, New York City:

"THE DISINFECTING AND ANTISEPTIC POWER OF GOOD CARBOLIC ACID" IS SO GREAT THAT ONE PART OF IT TO FIFTY OR ONE HUNDRED PARTS IS SUFFICIENT FOR ORDINARY PURPOSES."

* CRESYLIC ACID is the active property of Carbolic Acid.

Desiring that our readers should be benefited by the extended introduction of what we believe to be so valuable, we have established a general agency for the sale of these compounds, at our branch office, No. 41 Park Row, and are prepared to fill orders at wholesale or retail, at the following prices.

Sheep Dip, for Curing Scab and Destroying Insects on Sheep.

5 lb Canisters.....	\$1.25
10 " " ".....	2.25
50 " Kegs.....	10.00
200 " Bbls.....	35.00

Proportions are 1 lb Dip to 5 gallons water for 5 to 10 Sheep, if they are very large and heavily fleeced. For ordinary sized animals, or those recently shorn, 1 lb Dip will take 9 to 10 gallons water. The solution must be graded according to the age and condition of the animal.

Plant Protector.—In solution for destroying and repelling insects from Trees or Plants.

In 1 lb. Canisters, @50 cts.; in 3 lb. Canisters, @ \$1.00; larger packages same price as Sheep Dip. See above.

Cresylic Ointment, for Cure of Foot Rot, &c. In solution for killing Insects, &c., on stock. In 3 lb. Canisters, \$1.

Carbolic Disinfecting Soap.—In tablets for convenient use in washing Horses, Dogs, Pigs, &c., destroying Insects of all kinds, protecting from Flies, curative of Sores, Scratches, and Chafes of all kinds. In boxes, 3 dozen tablets, \$3.00; in boxes of 1 lb bars, 10 each, \$1.00.

Cresylic No. 1 Soap.—10 Bars. For all common uses in the House and Laundry; 24 lb boxes, 13 cts. per lb; 60 lb boxes, 12 1/2 cts. per lb.

Cresylic Laundry Soap.—A finer Soap, for the Laundry, and for the Bath, etc.; 60 lb boxes, 14 cts. per lb. 24 lb boxes, and in 10 paper boxes containing 6 lbs. each, packed in a case, 15 cts. per lb. Address orders to

ORANGE JUDD & CO.,
41 Park Row, New York.

DRAINING FOR PROFIT AND DRAINING FOR HEALTH.

By GEO. E. WARING, JR.,

Engineer of the Drainage of Central Park, New York.

CONTENTS.

LAND TO BE DRAINED; HOW DRAINS ACT; HOW TO MAKE DRAINS; HOW TO TAKE CARE OF DRAINS; WHAT DRAINING COSTS; WILL IT PAY? HOW TO MAKE TILES; RECLAIMING SALT MARSHES; HOUSE AND TOWN DRAINAGE.

EXTRACTS FROM NOTICES BY THE PRESS.

He (the author) describes the action of draining upon the soil, the construction of single drains and systems of drains, the cost and the profit of thorough drainage, the making of tiles, and the reclaiming of salt marshes, treats sensibly of malarial diseases, and closes with a chapter which should be widely read, on house drainage and town sewerage in their relations to the public health. [Portland (Me.) Press.

Nowhere does this book merit a wider circulation than in the West. Every year adds to the thousands of dollars lost to this State from want of proper surface drainage, to say nothing of the added gain to result from a complete system of under-drainage. This book will prove an aid to any farmer who may consult it. [Chicago (Ill.) Republican.

A Book that ought to be in the hands of every Farmer. SENT POST-PAID, - - - - PRICE, \$1.50.

ORANGE JUDD & CO.,
245 Broadway, New York.

Quinby's Bee Keeping.

By M. QUINBY, Practical Bee-keeper. Fully Illustrated. This book gives the result of 35 years' of successful experience—with directions for all contingencies that can ordinarily occur; treating of Breeding, Movable-Comb and other Hives, Pasturage, Robbing, Feeding, Swarming, Queens, Diseases, Anger, Enemies, Wax, Transferring, Sagacity, Wintering, Care of Honey, Italian Bees, Purchasing, etc. Bee-keepers will find this new work of Mr. Quinby's fully up to the times in all practical matter.

Sent Post-paid.

Price \$1.50.

Gratifying Opinions of the Press.

From the *Christian Intelligencer*.

Quinby's Work is the very best. It has long been regarded as of the highest authority in the matters concerning which it treats."

From *Moore's Rural New Yorker*.

"This is a newly written and illustrated edition of Mr. Q.'s former work. That has proved of value to thousands of Bee-keepers, and this, with its riper experience and added knowledge, can not fail of giving better satisfaction. Thirty-five years experience!—What beginner in bee-keeping will not bring this to his aid? We notice the author has no Patent Hive to introduce, and expresses his opinions freely on the merits and demerits of the various hives seeking popular favor."

From the *Vermont Farmer*.

"The book is written in familiar style, with the endeavor to be practical rather than scientific, thereby making it a guide to the tyro in Apian knowledge, as well as a standard work of reference for the more experienced bee-keepers."

From the *N. Y. Christian Advocate*.

"All bee-keepers should have this manual, and others may read it as a book of wonders."

ORANGE JUDD & Co.,
245 Broadway, New York.

FLAX CULTURE.

A NEW AND VERY VALUABLE WORK, consisting of full directions, from selection of ground and seed to preparation and marketing of crop, as given by a number of experienced growers. 8vo, paper. PRICE 50 Cents.

HOP CULTURE.

PRACTICAL DETAILS fully given, from the Selection and Preparation of the SOIL, SETTING and CULTIVATION of the Plants, to PICKING, DRYING, PRESSING, and MARKETING the Crop. By Ten Experienced Cultivators. Illustrated with over forty engravings. Edited by PROF. GEORGE THURBER. 8vo, paper. PRICE 40 Cents.

TOBACCO CULTURE.

This is by far the most useful and valuable work ever issued on this subject. It contains full details for the Selection and Preparing of the Seed and Soil, Harvesting, Curing, and Marketing the Crop, with Illustrative Engravings of the operations. The work was prepared by FOURTEEN EXPERIENCED TOBACCO GROWERS, residing in different parts of the country. It also contains Notes on the Tobacco Worm, with Illustrations. Octavo, 43 pp., in neat paper covers. PRICE 25 Cents.

ONIONS.

How to Raise them Profitably

Practical Details, given very plainly by Seventeen Onion Growers of long experience, residing in different parts of the country. No more valuable work of its size was ever issued. Octavo, 32 pp. Neat paper covers. Price 20 cents.

HINTS TO HORSE-KEEPERS.

A COMPLETE
MANUAL FOR HORSEMEN.
BY THE LATE HENRY WILLIAM HERBERT. (FRANK FORESTER.)

There are very few books which all who own or use the horse, can peruse with greater satisfaction than this. For indicating the principles which should guide one in breeding, buying, training, and using horses, it stands unrivalled among American books.

CONTENTS.

HOW TO BREED A HORSE.—CHOICE OF STALLION. CHOICE OF THE MARE. MUTUAL ADAPTATION OF SIRE AND DAM. CANADIAN BLOOD. NORMAN BLOOD. MODERN ARAB BLOOD.

PONIES—DIFFERENT BREEDS, CHARACTERISTICS AND UTILITY.—Origin—Different Breeds—Shetlands and Scots—Galloways and Narragansetts—Mustangs and Indians—Profit of raising Ponies.

HOW TO BREED MULES.—Value of Mules—Their History and Natural History—Thorough-blood wasted in the Dam for Mules—The Mule in the United States—Varieties of the Ass—The kind of Mares to be selected.

HOW TO BUY A HORSE.—Of whom to Buy it—How to Examine the Eye—Broken Wind—Roaring—Whistling—Broken Knees—To examine the Legs—Splints—Damaged Back Sinews—Spavins—Ringbones—Curbs—How to tell the Age of a Horse.

HOW TO FEED A HORSE.—Consequences of Improper Feeding—Different Food for different conditions—Food for the Brood Mare—For the Foal—For Working Horses—Green Food—Carrots—Corn.

HOW TO STABLE AND GROOM A HORSE.—Requisites for a good Stable—The economy of Proper Arrangements—Ventilation—Grooming.

HOW TO BREAK AND USE A HORSE.—What is required in a well-broken Horse—His education should commence

when a Colt—Bittling—Putting in Harness—How to Use a Horse—Travelling—Working—Pleasure Horses—Punishment.

HOW TO PHYSIC A HORSE.—SIMPLE REMEDIES FOR SIMPLE AILMENTS.—Causes of Ailments—Medicines to be given only by the order of the Master—Depletion and Purging—Spasmodic Colic—Inflammation of the Bowels—Inflammation of the Lungs—How to Bleed—Balls and Purgatives—Constiveness, etc.

FARRERY, ETC.—Castration—Docking and Nicking—Blood-letting—Treatment of Strains and Wounds—Galls of the Skin—Cracked Heels—Clipping and Singeing—Diseases of the Feet.

HOW TO SHOE A HORSE.—Unskillful Shoers—Anatomy of the Foot Illustrated—The Foot of a Colt—Preparation of the Foot—Removing the Old Shoe—Paring the Foot—The Shoe—Fitting the Shoe.

BAUCHER'S METHOD OF TRAINING HORSES.—What Constitutes a Well-trained Horse—To make him come at your call—The Philosophy of Training—Flexions of the Jaw—Flexions of the Neck—Flexions of the Croup—Backing—The Paces—Leaping.

HOW TO RIDE A HORSE.—The Saddle—The Girths—The Stirrups—Saddle-Cloths—The Crupper—The Martin-

gale—The Bridle—Spurs—Mounting and Dismounting—The Seat—The Hands—The Legs—The Paces—Hints for Special Cases—The Art of Falling—Riding with Ladies.

LADIES' RIDING.—WRITTEN BY A LADY.—Learning to Ride—The Side-saddle—The Girths—The Stirrup—The Bridle—The Martingale—The Bit—The Dress—Mounting and Dismounting—The Position—The Hands—The Leg and Whip—Accidents.

HOW TO DRIVE A HORSE.—The Art of Driving—Pleasure Driving—How to Hold the Reins—Driving a Pair—

Four-in-hand Driving—Driving Working Horses—Plowing—Three-a-breast.

RAREY'S SYSTEM OF HORSE-TAMING.—Rarey's System a New Discovery—Previous System—Principles of this System—Instructions for practicing Rarey's Method—To Stable the Horse—To Approach the Horse—Tying up the Leg—Laying the Horse Down—Vices and Bad Habits.

VETERINARY HOMEOPATHY.—Principles of the System—Table of Remedies—General Directions—Treatment of a Sick Animal—Diet—Remedies for Specific Cases—Glossary of Diseases.

BEAUTIFULLY ILLUSTRATED. . . SENT POST-PAID. . . PRICE, \$1.75.

ORANGE JUDD & COMPANY, 245 Broadway, New York.

(Advertisements on this page, \$2.50 per Agate Line of Space.)

ESTABLISHED 1861.

THE
**GREAT AMERICAN
 TEA COMPANY**
 RECEIVE THEIR
TEAS BY THE CARGO
 FROM THE
BEST TEA DISTRICTS
 of
CHINA and JAPAN,
 and sell them in quantities to suit customers
AT CARGO PRICES.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st.—The American house in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in the country have made their immense fortunes through their houses in China.

2d.—The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d.—The Importer makes a profit of 30 to 50 per cent in many cases.

4th.—On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1,000 to 2,000 packages, at an average profit of about 10 per cent.

5th.—The Speculator sells it to the Wholesale Tea Dealer in lines at a profit of 10 to 15 per cent.

6th.—The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th.—The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th.—The Retailer sells it to the Consumer for ALL THE PROFIT HE CAN GET.

When you have added to these EIGHT profits as many brokerages, cartages, storages, cooperages and wastes, and add the original cost of the Tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than other dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages and wastes, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Teas at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

For manner of getting up Clubs, see former advertisement in this paper.

Parties sending Club or other orders for less than thirty dollars had better send a Post-office draft or money with their orders, to save the expense of collections by Express, but larger orders we will forward by express, "to collect on delivery."

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary packages for Clubs less than \$30.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House stores to our Warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend to meet the wants of clubs. They are sold at cargo prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST OF TEAS:

OOLONG (Black), 70c, 80c, 90c., best \$1 3/8 lb.
 MIXED, (Green and Black), 70c., 80c., 90c., best \$1 per lb.
 ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
 IMPERIAL (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
 YOUNG HYSON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
 UNCOLORED JAPAN, 90c., \$1, \$1.10, best \$1.25 per pound.
 GUNPOWDER, (Green), \$1.25, best \$1.50 per pound.
 Consumers can save from 50c. to \$1 per pound by purchasing their Teas of this Company.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound.
 Hotels, Saloons, Boarding-house keepers and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction. ROASTED (Unground), 30c., 35c., best 40c. per lb. GREEN (Unroasted), 25c., 30c., 35c., best 35c. per lb.

NOTICE OF THE PRESS.

From the American Agriculturist.

THE GREAT AMERICAN TEA COMPANY.—To Queries.—Before admitting their advertisement, we learned that a large number of our clerks and others had for several months been buying their Tea and Coffee from this Company, without its being known who they were, and that they had been highly pleased with their purchases, both as to quality and price, and were all recommending their friends to the same course. As we have published the advertisement for many months, and received no complaints, we conclude "there is no humbug about the establishment."

N. B.—INHABITANTS OF VILLAGES AND TOWNS WHERE A LARGE NUMBER RESIDE, BY CLUBBING TOGETHER, CAN REDUCE THE COST OF THEIR TEAS AND COFFEES ABOUT ONE-THIRD, (BESIDES THE EXPRESS CHARGES), BY SENDING DIRECTLY TO "THE GREAT AMERICAN TEA COMPANY."

CLUB ORDER.

\$65.55

Gents:—Above I send my fourth order. Your Teas have given good satisfaction, and those who have used them will have no other, but induce their friends to send also. To prove this; I had made up my order and got a Post-Office Money Order, when others came in and nearly doubled the amount, as you will see by second money order, both of which I enclose.

The last order came safely to hand by Merchants' Union Express. Accept thanks for complimentary package.

Very respectfully,

S. LANPHEAR.

Caution.—As some concerns, in this city and other places, imitate our name and style of advertising and doing business, it is important that our friends should be very careful to write our address in full, and also to put on the number of our Post-Office Box, as appears in this advertisement. This will prevent their orders from getting into the hands of these bogus imitators.

POST-OFFICE orders and Drafts, make payable to the order of "The Great American Tea Company."
 Direct letters and orders (as below, no more, no less)

BOOKS FOR THE COUNTRY.

HARPER & BROTHERS, NEW YORK,

Publish the following Works:

FLAGG'S EUROPEAN VINEYARDS. Three Seasons in European Vineyards. Treating of Vine-Culture; Vine Disease and its Cure; Wine-Making and Wines, Red and White; Wine Drinking as affecting Health and Morals. By WILLIAM J. FLAGG. 12mo, Cloth, \$1.75. (Nearly ready.)

SCOTT'S FISHING-BOOK. Fishing in American Waters. By GENO C. SCOTT. With 170 Illustrations. Crown 8vo, Cloth, \$3.50.

MEAD'S GRAPE CULTURE. An Elementary Treatise on American Grape Culture and Wine Making. By PETER B. MEAD. Profusely Illustrated. 8vo, Cloth, \$3.00.

THE AMERICAN HOME GARDEN. Being Principles and Rules for the Culture of Vegetables, Fruits, Flowers, and Shrubbery. To which are added brief Notes on Farm Crops, with a Table of their average Product and Chemical Constituents. By ALEXANDER WATSON. Several Hundred Illustrations. 12mo, Cloth, \$2.00.

VATX'S ARCHITECTURE. Villas and Cottages: A Series of Designs Prepared for Execution in the United States. By CALVEET VATX, Architect, (late DOWNING & VATX). New Edition, Revised and Enlarged. Illustrated by nearly 500 Engravings. 8vo, Cloth, \$3.00.

WOOD'S HOMES WITHOUT HANDS: Being a Description of the Habitations of Animals, classed according to their Principle of Construction. By J. G. WOOD, M. A., F. L. S., Author of "Illustrated Natural History." With about 130 Illustrations engraved on Wood by G. Pearson, from Original Designs made by F. W. Key and E. A. Smith, under the Author's Superintendance. 8vo, Cloth, Beveled, \$4.50.

HARPER & BROTHERS will send any of the above Works by Mail, postage free, to any part of the United States, on receipt of price.

WALTHAM WATCHES.

19 & 20 SIZES.

To the manufacture of these fine watches the Company have devoted all the science and skill in the art at their command, and confidently claim that for fineness and beauty, no less than for the greater excellencies of mechanical and scientific correctness of design and execution, these watches are unsurpassed anywhere.

Also, stem-winding watches which are warranted to satisfy the most exacting demand for beauty, finish, and accuracy.

In this country the manufacture of this fine grade of watches is not even attempted, except at Waltham.

For Sale by all Leading Jewelers.

HORSFORD'S SELF-RAISING BREAD PREPARATION

Makes the most wholesome and best of BREAD, BISCUIT, CAKES, &c. Unlike some other yeast, it contains no POISON to create DYSPEPSIA, and the bread may therefore be eaten hot without detriment. Resolving itself into Phosphate of Lime and soda, it prevents RICKETS, CHOLERA, and decay of TEETH, and promotes the growth of Muscle and Bone. In "raising" the dough it does not, like other yeast, decompose flour, but adds nutriment to the bread, and otherwise improves it in quality and quantity. Each package contains full directions for use. Send for pamphlet, supplied gratis. Ask your Grocer for "Horsford's Bread Preparation." WILSON, LOCKWOOD, EVERETT & CO., Wholesale Agents, 201 Fulton-st., New York.

INTERESTING TO LADIES.—The Grover & Baker machine which I purchased in June, 1857, has given me the greatest satisfaction during the eleven years it has been in constant use, and it has never required the least repair.

Mrs. J. G. PHYFE,

108 West 12th-street, New York.

GET THE BEST.—FIRST-CLASS ADVERTISERS who wish to reach the best families; fathers, mothers, teachers, housekeepers, and children, should advertise in THE LITTLE CORPORA, which has a larger circulation than any other two Juvenile Magazines in this country combined. It is entirely original, national, and first-class; and because of its immense circulation is afforded for only one dollar a year. Address the publishers,
 ALFRED L. SEWELL & CO., Chicago, Ill.

[COPYRIGHT SECURED.]

THE PAST AND THE PRESENT.—DRAWN BY EDWIN FORBES.—Engraved for the American Agriculturist.

The little fellow sits upon the decaying earth-work, quite bewildered; he looks in vain for the martial display which only a few years ago so delighted him, and instead of seeing the sun reflected from the bayonets of the marching soldiery it now gleams only from the well-used implements of peaceful husbandry. The sheep no longer fly affrighted to the shelter of the woods, but rest among the relics of former strife. All over the world agriculture removes the scars of war. Kind mother earth forgives the disfigurement caused by the march of armies,

the building of breastworks, and the plowing of cannon balls. The traces of war are obliterated by the furrow turned by the plow, and the olive is not more the sign of peace than is the harvest of corn or of cotton. Let, then, the earth-works be levelled and an improved agriculture make glad the waste places. It is very gratifying to see how rapidly the more southern States are awaking to a new system of things, and the increase in the number of agricultural papers, as well as their generally excellent character, is a strong indication of progress.

Smaller farms and a mixed husbandry bring a dense population, without which schools, churches, social intercourse, and all the accessories of general intelligence, are not possible. Some of these States are making great efforts to induce immigration, and a few years hence the census will doubtless show not only a large increase in population but a great increase in the value of their agricultural products. The States north of these will be benefited by the receipt of fruits and garden products, which will soon be forwarded in great abundance.

AMERICAN AGRICULTURIST.

NEW-YORK, JUNE, 1869.

What a glorious month June is! We have much more of sunshine than in any other month, and this is usually accompanied by heat and moisture in such degrees, that the whole country has an atmosphere like a green-house, and vegetation of all kinds makes its most rapid growths. The chilly days and cold nights of May have past; the backward corn now makes amends for its tardy development, loses the sickly yellow hue, and puts on the bright green of health. Wheat pushes up its bearded ears, and the clover heads make the meadows rosy. Long dormant seeds are warmed to life, and plants spring up unbidden wherever the fresh mould has been stirred. The pastures are in their best condition, and the distended udders, full pails, thick cream, and golden butter, make us glad. Fruits are ripening, and fresh vegetables appear in increasing variety upon the table. It is the month of Roses, and with the queen of flowers comes a charming throng bearing, some chalcies of beauty, others vials of odors, to crown with radiance and fragrance the measure of the month.

June is no play-time. Work, hard work, is the order of the day. All this energy of Nature must be directed, checked, taken advantage of, utilized. If corn grows, so will weeds. Every additional pound of milk makes more work for us in the dairy. In almost every department the farmer may have more work than he can do, and to accomplish well the most important, all the labor must be thoroughly systematized.

Hints About Work.

Corn.—Early varieties will mature if planted the first week in June in all ordinary seasons, and as there are often drawbacks and hindrances, every farmer should have some early corn which he can plant if necessary. Large crops of even very small kinds may be secured if well manured and planted close enough. With the small kinds of corn we are apt to err in planting too far apart, just as with the large sorts we fail in the opposite way. The secret of easy, successful corn culture is allowing no weeds to grow—at least much beyond the seed leaf—before the corn is so large that horse cultivation is prevented. Weeds are killed both by stirring the soil in dry weather and by burying them.

Corn-fodder.—Corn may be sown up to the middle of July, or even later; and that which is not needed for green fodder should be cut and cured for winter use before it begins to turn yellow.

Roots.—It is not too late for fair crops of man-gels, carrots, or parsnips. They should be sown as early in the month as possible. Sowing Swedish turnips (ruta-bagas), is usually set down for the 20th of June. They may be sown either before or after that, as convenient. Use one or two barrels of good superphosphate to the acre in the drill, according to the condition of the soil. The drills should not be less than two feet apart. Farmers ought to put in more roots, and ruta-bagas are the best to begin with. They are easily sold at a good price in our large markets, and are invaluable for cows, hogs, and sheep, in winter and spring.

Cabbages.—Sow seed for main crop. They are equal or superior to roots as feed for animals, and succeed well, especially upon stiff or clayey soils.

Green manure crops.—Clover is the best. Plow it under in full blossom. Buckwheat may be sown at any time, and if quickened by 100 or 200 lbs. of guano to the acre, may be plowed in in time to sow and turn under a second crop before frost, even on very poor land. Corn is one of the best crops for green manuring, though awkward to plow under. Sow in drills a foot apart, or broadcast, and when it fassels out, roll or drag it flat with the rows if drilled, and turn it in as it is laid with a large plow.

Fodder crops.—Besides corn for fodder, sorghum, millet, and Hungarian grass, offer useful substitutes for hay, or for feeding dry. They should, however,

be cut early, before the outside of the sorghum or the tough seed envelops of the Hungarian millet are hard, as it is from these indigestible substances that harm arises, if it comes at all.

Grass.—It is often a question which meadow to mow first. Usually, we prefer to cut that first which is newest seeded, because the grass and clover will start up at once, and no harm will result to the roots should a drought come on next month. Where there are a great many daisies, they must be cut when just coming into blossom. This not only destroys many seeds, but the daisies make very good hay; whereas, if cutting be delayed, in a very short time they are quite worthless, and every seed is ripened. Orchard grass and June grass precede Timothy, and accompany clover in time of fitness to cut. Red-top and grasses of its kind are later, and fields where red-top is in excess are usually best left until the last. It is much better to cut grass a little too soon than too late. The hay is a little lighter, but it is all eaten; otherwise, the manure heap is increased at the expense of the mow. The experiences of last summer warn us to provide hay caps; and those who were obliged to get in their hay before it was dried to death, according to custom, may also have learned a lesson not to overdry hay. That cured as much as possible in the cock is sweetest and best.

Pastures.—Be careful not to overstock those pastures depended upon for the summer. Top-dressings of bone-dust, guano, ashes, gypsum, superphosphate, or fish manure, will tell at once.

Brush Pastures, or those on which bushes of various kinds are gradually encroaching, may be nearly cleared in one or two seasons by feeding down with sheep. Cut the brush with a bush-hook, or scythe, and soon after turn the sheep in. They will gnaw down the succulent young growth, kill the roots of the bushes, and thrive upon the diet. It is best, however, to decidedly overstock the pasture for the most thorough work, the animals being kept on but a few days at a time through the hot season.

Potatoes.—Top-dress with gypsum, or gypsum and ashes. Use the horse hoe as often as the soil is compacted by heavy rains, very dry, or weedy, until the vines would be injured by the operation; then clean up between the rows with a Share's horse-hoe, or other similar double-mould-board affair, and leave them, except as you go through, frequently, if necessary, to hand-pull the weeds.

Peas sowed after the 10th of June, (Lat. 41°) will be less productive, but not attacked by the weevil.

Tobacco.—Water seed-beds with dilute manure water. Prick out crowded plants, so as to make them grow stocky. Prepare the field to be ready for transplanting by the 20th, or before.

Implements.—Have a grindstone well hung, to be run by the foot. Keep axes, hoes, mattocks, spades, and all earth cutting tools, whether for the garden or the field, sharp all the time. Buy the best and lightest steel tools, and the most improved and superior implements of all kinds. Keep them housed. See description of tool-sled on page 212, and make one for moving implements to and from the field. Attend to repairs as soon as they are in the least degree needed. "A stitch in time," etc.

Weeds.—Destroy while in the seed leaf, if possible. Mow those which grow rank in the fence rows and elsewhere. Repeated mowings will kill most, and cutting off at the ground will finish almost every one in one season. Even Canada thistles will succumb after four or five cuttings at the surface of the ground, and on some soils with less.

Poultry.—Give young chickens free range of the garden, and feed well. They will take many insects. Even chickens for early marketing should not be confined. They must be well fed. Give them some meal, like pork scraps, cut fine, and soaked over night, and keep them growing fast. Confine old ducks, not needed as breeders, as soon as they stop laying, and give them fattening food. They will never be tenderer than if fattened and eaten at once, and that is saying little enough.

Swine.—Young pigs are useful in an orchard. Keep store pigs in pens, working over and tramp-

ing the manure from the stables, together with sods, bog hay, weeds, and last year's old cornstalks.

Sheep.—See that they are not scalded by the hot sun on their bare backs after shearing. Give new shorn sheep good shelter, both from cold and sunshine, until they have become used to their naked condition. Two weeks after shearing, ticks will usually be found upon the lambs. These, at least, should be dipped twice or three times, a week apart. Once dipping the old sheep will commonly answer. The best dip is unquestionably carbolic soap.

Cows.—Feed enough must be prepared to keep up the flow and the quality of the milk through wet weather or through droughts. Pea vines or clover, cut and fed at evening in the yards, may fill out the time between the cutting of wheat and rye for soiling, and the time when corn is ready to cut, which will not be before the 1st to the 15th of July.

Working cattle must have good, long nooning, if they are worked hard, and be well fed. Look out for yoke galls, and apply wet cloths at night and on Sundays. Foot-sore cattle must have rest in clean stables, where cut grass can be fed to them.

Horses at pasture thrive at this season; later, flies torment their flesh off. Mares with their foals should be pastured by themselves.

Work in the Horticultural Departments.

While the month of June brings abundant work, it gives us also rewards for our labors. Strawberries, early vegetables, and the choicest products of the flower garden, come with the warm days of June. The soil is now well warmed, and not only do established plants grow rapidly, but seed germinates with surprising quickness. Those who have been obliged to delay sowing, or who lost their early crops in the cold storms of May, can still sow seeds of most crops with good prospect of success.

Orchard and Nursery.

Young trees set this spring will need looking after. Much can be done towards giving them the desired shape, by rubbing off shoots which start where limbs are not wanted. Stop the growth of useless limbs, and nearly all pruning may be avoided. Shapeless trees, with crowded heads, come from neglect in their youth.

Pinching is preventing the prolongation of a branch by nipping out its "growing point,"—the young and tender end—by means of the thumb and finger. Where a shoot appropriates the nourishment to the detriment of others, pinch it.

Grafts will need similar care to that required by young trees; indeed, a graft is only a young tree, planted in the wood of another tree instead of in the soil. Where two cions were inserted, and they are likely to become crowded, remove the weaker. Govern the growth by pinching.

Budded stocks need similar attention. The shoot from the bud is often very vigorous, and the newly formed wood is not sufficiently firm to withstand the winds without staking.

Pruning.—This month is generally preferred for the removal of large limbs. We have, in previous numbers, given the precautions to be observed.

Cultivate young orchards, and keep the soil mellow. If there are crops between the rows, keep them well worked.

Thinning cannot be too often advocated, as it is very generally neglected. There are but few trees which fruit at all that would not be benefited by the removal of one-half of the crop. The sooner it is done, the better.

Seed-beds, especially of evergreens and deciduous forest trees, will require shading. This may be done by a frame of lattice-work, by sticking branches over the bed, or by placing a horizontal frame-work over it, upon which are placed branches of evergreens or brush.

Insects are most numerous and destructive this month. Use vigilance, and let patent remedies alone. Go among the trees frequently, and remove nests of caterpillars. The eggs of some caterpil-

lars are laid upon the leaves, and a whole colony may be found upon a small branch. It will be better to cut this off and destroy the insects, than to allow them to spread over the tree.

Borers.—The parent of the borer deposits its eggs upon the trunk, near the ground, and the young hatch and eat their way into the wood. Occasional rubbing with a corn cob is practised, but a more certain preventive is to wrap the base of the tree with stiff paper, the lower edge of which should be below the surface of the soil.

Cureulio.—We must repeat the often told story. The cureulio can only be successfully controlled by daily jarring the trees, catching the insects on a sheet, and destroying them.

Slugs will appear on the leaves of the cherry and pear. They are small, green, and slimy fellows, of a repulsive aspect. Lime, or dry dust, shaken from a bag of loose fabric, will destroy them.

Plant Lice.—See articles among "Basket" items.

Fruit Garden.

Strawberries, if they have not already been mulched, should have the surface between the rows covered with some material to protect the fruit from being soiled. Salt or bog hay, straw, or even cornstalks, may be used. Some useful directions for those who pick fruit for market will be found on page 168, last month.

Blackberries.—The new canes should not be allowed to grow higher than 4 or 5 feet. Pinch them, and an abundance of branches will be thrown out, which are to be stopped by pinching when they are about 18 inches long.

Raspberries.—Let only four new canes grow to a stool, and remove all others, unless needed for planting. Give the new growth a chance to develop, which may be done by a little care in training. For several methods of training, see page 219.

Currants.—Mulehng around the bushes will be of great service if the weather is dry. The best remedy for the attacks of the currant worm is powdered white hellebore.

Grape Vines.—It cannot be too often repeated that, to get a strong and vigorous vine, a newly planted one should, the first season after planting, bear but one shoot. Rub off all the rest, and keep the one shoot tied to a stake. Do not let young vines overbear. Two bunches to a shoot are enough, and one is generally better than two. Use sulphur freely upon the first appearance of mildew.

Insects will be troublesome. Hand-pick for the large beetles and worms that are found upon grape vines. See notes on the Orchard for other hints.

Kitchen Garden.

Hoe and Rake will be in constant requisition. Several forms of hand weeders are preferable to the common hoe. Whatever the implement selected, let the work be thoroughly done, and before a stubborn growth of weeds makes it hard work. A sharp steel rake used frequently will save much hoeing, as it will kill the weeds just as they are germinating.

Seeds of many things will need to be sown to keep up a succession as well as to replace those which have failed. Even as late as the first of June the majority of garden vegetables may be sown at the North, and produce fair crops.

Asparagus.—Stop cutting when peas are ready, and let it grow. Hoe over the bed, if weedy, and if there is any manure to spare, apply it.

Beans.—Continue to plant the bush sorts. See article on Lima Beans on page 217.

Beets.—Keep well weeded, and thin as soon as large enough to handle. The market gardeners sell the young beets that are thinned out for enough to pay for the labor. They are much prized as "greens" by those who know how good they are.

Cabbages.—Transplant the early sorts from the seed-bed, and sow late varieties. Those that were properly forwarded will be ready for the market or table. As soon as the crop is off, prepare the land for some other.

Carrots may yet be sown. This crop, when young, needs especial care to keep free from weeds.

Celery.—The young plants in the seed-bed should not become crowded or weedy.

Corn.—Sow for a succession every two weeks. If late in the season, sow early varieties.

Capsicums, or Peppers.—Set in rows, two feet apart, with fifteen inches between the plants. Select a warm and rich spot, and give good cultivation.

Cucumbers.—Make well-manured hills, about four feet apart, and put in a plenty of seed. When the plants are strong enough to be beyond injury by bugs, thin out to three in each hill. We have given so many devices for keeping off the "striped bug," that it is unnecessary to repeat them.

Egg Plants, like peppers, need rich soil and a warm situation. They repay extra manure and care. The same "green worm" that attacks the tomato will prey upon the egg plant.

Endive.—Transplant, and sow for a late crop.

Lettuce for summer use does best in a somewhat shaded and moist place. The India is the best.

Melons need the same treatment as cucumbers.

Onions.—No crop needs more careful cultivation. See article in April last. Where onions are marketed, they often pay better if sold when half grown than if allowed to ripen.

Parsnips.—Continue to cultivate until the growth of leaves prevents working between the rows.

Peas.—Plant succession crops. Put brush or other support to those that need it.

Radishes.—Seed may be sown for a late supply.

Rhubarb.—Cut away the flower stalks as soon as they show themselves. Stop pulling, and let the plants rest as soon as fruit comes.

Ruta-bagas, or the French turnip, may be sown late in the month. Dust the plants with plaster and ashes as soon as up, to keep off insects.

Salsify may still be sown, but the roots will not be so large as if put in earlier. The treatment is in all respects the same as that of carrots.

Spinach.—The common sorts are not so well suited to hot weather as the New Zealand, but a fair crop may be had if the weather is not too dry.

Squashes.—See last month's notes for directions.

Sweet Potatoes.—At most places at the North the first week in June is early enough to set them. The preparation of the ridges was given last month.

Tomatoes.—Set out plants. Keep well hoed. In the garden, some support is required, which may be a slat supported upon crooked stakes, a low wire trellis, or the plants may have a hoop support like that shown on page 219. In field culture, the plants are allowed to fall over by their own weight.

Flower Garden and Lawn.

Lawns.—To obtain a velvety surface, the grass must be clipped frequently. See last month's notes for remarks on lawn mowing machines.

Annuals may be sown, and the tender ones will come on rapidly, now that the soil is warm. Transplant or thin out those already up.

Bedding Plants, of the more delicate kinds, flourish better if put out now than if planted earlier. This is especially the case with Heliotropes, etc.

Specimen Plants, from the green-houses, may be used to ornament the grounds. The pots should be set in the ground up to their rims. Oranges, Oleanders, and the like, may be turned out of the pots and planted in the borders, but they must be taken up and potted quite early in autumn.

Fuchsias are only satisfactory in the open ground where they have considerable shade.

Tuberose.—Procure bulbs that have been started under glass, if possible, but if dry bulbs are set, give them a warm and rich place.

Bulbs.—Tulips, Hyacinths, and other spring blooming ones, may be left from year to year, if no regard is had to the quality of the bloom. To obtain the finest flowers, the bulbs should be taken up as soon as the leaves show signs of decay.

Spread in a shed, and when the leaves are dry, remove them, and store the bulbs in a cool, dry place until time to plant—September or October.

Roses.—Cut back the Remontants as soon as they have done flowering. Remove faded flowers from the Everblooming varieties. Keep the new shoots of the climbing varieties trained up to the trellis. See article on Roses on page 168, last month.

Sticks and Strings will be in constant requisition if proper neatness is preserved. Manage to have supports of all kinds as inconspicuous as possible.

Feeds should never appear in the flower garden. Use the bayonet or the lance-headed hoe and narrow rake to work among the plants, and where very close together, a hand-weeder will be found useful.

Green-house and Window Plants.

Every thing that is to come out at all will be placed outside this month, and the sooner repairs are made, the better. The plants left in the house should not suffer from neglect. Those outside will need care in watering. Some must have shade during the greater part of the day, and all should be so placed that they will not be injured by high winds. Provide for potting soil, which, for general purposes, is best when made of decayed sods and well-decomposed manure, or rotted refuse hops.

Mowing Machine Premium.—1,000 Acres of Grass Cut by the Buckeye.

Those who are getting subscriptions to the Agriculturist with a view to taking this splendid premium should fill them up and send them in as early in the month as possible. For their encouragement, we give the following memorandum, received from Gen. N. N. Halsted, one of the largest and most influential farmers of New Jersey, and President of the State Agricultural Society: "In May, 1859, I purchased a Buckeye mower of Adriance & Platt. It has cut on an average 100 acres of grass per year for my neighbors and myself, and has done its work well, though on stony ground. It has cost in repairs \$5.87 (about 53 cents a year). This, I think, is a good record of this mower's durability and economy." So it is; and it is one of the reasons why we choose the Buckeye Mowing Machine to place upon our premium list.

The New England Agricultural Society

announces that its next Fair will be held at Portland, Maine, on the 7th to the 10th of October. All entries must be made two weeks before the exhibition. Notice of intention to enter live-stock must be sent to S. L. Boardman, Augusta, Me., prior to August 18th. The Secretary of the Society is Col. Daniel Needham, of Groton, Mass. A liberal list of premiums is issued. No prizes are offered for trotting horses; but this whole subject is left with the trustees of the Maine State Agricultural Society. We earnestly commend to these gentlemen the perusal of the retiring address of President Faile, of the N. Y. State Society. The inducements offered by the Society in the form of prizes will settle the question whether or not there will be a con-course of professional gamblers, drunken and "lewd fellows of the baser sort" drawn together, as to a regular horse-race, or whether the exhibition will be one beneficial to the agriculture and the people of the State, and of New England. The scenes enacted at the fair at New Haven last year should be a warning.

Mole-plow Draining.

—An Arkansas correspondent asks whether he can drain a wet clay cotton soil by using a mole-plow?—Imperfectly, he can; satisfactorily, he can not. If the clay is stiff enough to hold its form and keep the plow track open, it will be a very simple matter to mould it into draining tiles, burning them in a cheap kiln, of the kind described in Waring's Book on Draining, and permanent benefit may be thus secured. The mole-plow is not a very cheap tool to work, and its effect is very temporary. The gully of the hill-sides complained of by our correspondent would be very greatly prevented by thorough underdraining, especially in connection with horizontal cultivation.

Fattening Steers.

—"C. S. Wilcox," Ash-tabula Co., O. If your pasture is very good, you will not find it necessary to feed grain to your steers, but they must be kept gaining well all the time, and a moderate quantity of corn meal or oil-cake would push them ahead faster. Oats are too high to feed profitably to fattening stock. A pair of yearlings weighing 1,580 pounds are remarkable, and it will pay to give them first-rate care and feed. It all depends on the quality of the pasture whether or not they will need grain before autumn.

AMERICAN AGRICULTURIST.

ORANGE JENN & Co., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies: Four to nine copies, \$1.25 each; Ten to nineteen copies, \$1.20 each; Twenty copies and upwards, \$1 each. Papers are addressed to each name.

AN EARTHQUAKE

would hardly awaken some people out of the drowsy dream-life they have always lived, or stir them from the "easy-go-along" gait they have always traveled. But these are not the sort of people that are found among the thousands upon thousands of wide-awake folks, who have helped send the American Agriculturist all over the land, from Nova Scotia to Darien, from Lower California to Alaska, all through the great Mississippi Valley, and to many foreign lands. And a large number of these wide-awake people are enjoying the reward of their efforts, in the form of splendid and valuable Premiums which they have received from this Office. (See list in next column.) Well, the year is nearly half gone, and

ON JUNE 30TH

we shall close up our general premium offers for this year, except for localities too distant to forward names by that time. As all our present readers, of course, belong to the wide-awake class, and as not quite all of them have yet obtained premiums, we write this to privately (very privately) remind them that there is ample time during the next thirty days to finish up all partially completed premium lists, and draw on us for the premiums offered. And those who have no partial lists begun can start and fill up new ones. We have a good supply of the excellent things named in the table in next column. THEY ARE EASILY OBTAINED! Large numbers

of Men, Women, and Children, have gathered names enough in a day or two, often by a few hours' effort, to secure an article for which they would gladly have worked weeks. Try it with a will and determination to succeed, and in nine cases out of ten you will be successful. Take a copy of the paper, exhibit it among neighbors and friends, in your own neighborhood and elsewhere, (for premium clubs need not be all at one post-office,) show what the paper is, what it is worth, how cheap it is, and in a brief time the desired number of subscribers can be gathered, and the premium secured. Just to help the matter along, and to accommodate those who wish to try the paper for six months, at 75 cents, we will count two subscribers for half a year as equal to one subscriber for the whole year, in supplying the premiums—that is, we will now make

Two Halves equal One Whole One.

[In this table are given the regular cash prices of each article, and the number of subscribers required at \$1.50 a year, to get it free, also at the lowest club rate of \$1 a year. For full descriptions of the articles see extra sheets, sent free.]

Table of Premiums and Terms, For Volume 28—(1869).

Table with columns: No., Names of Premium Articles, Price of Premiums, and Number of Subscribers required at \$1.50 and at \$1.00. Includes items like Alderney Bull, Cotswood Ram, Narseny Stock, Sewing Machine, etc.

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The thirty-two Premiums, Nos. 29, 30, 31, 61, 62, 63, 64, and 76 to 100 inclusive, will each be delivered FREE of all charges, by mail or express, (at the Post-office or express office nearest recipient), to any place in the United States or Territories. —The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance specified.

Read and carefully Note the following: (a) Get subscribers anywhere; all sent by one person count together, though from one or a dozen different Post-offices. But... (b) Say with each name or list of names sent, that it is for a premium list, and we will so record it... (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. Any time, from now to June 30th, will be allowed to fill up your list as large as you may desire. The premium will be paid whenever you call for it... (d) Send the exact money with each list of names, so that there may be no confusion of money accounts... (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer the premiums... (f) Specimen Numbers, Cards, and Show-bills, will be supplied free as needed by canvassers, but they should be used carefully and economically, for every extra copy of the paper costs, with the

2c. prepaid postage, about 12 cents....(g) Remit money in Checks on New York Banks or Bankers payable to order of Orange Judd & Co., or send Post-Office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk.

If from any Cause one fails to get the larger premium desired, the names can be used for a smaller one.

A Full Description of the Premiums is given on an extra sheet; a copy will be sent free to every one desiring it. For New Premium 106, see page 32, January No. We have only room here for the following:

No. 42—Clothes-Wringing Machine.—A very useful, time-saving, strength-saving, clothes-saving implement, that should be in every family. The wringing of clothes by hand is hard upon the hands, arms, and chest, and the twisting stretches and breaks the fibres with lever power. With the Wringing Machine, the garments are passed rapidly between elastic rollers, which press the water out better than hand wringing, and as fast as one can pick up the garments.

No. 72.—Crandall's Improved Building Blocks furnish a most attractive amusement for children. Churches, Dwellings, Barns, Mills, Fences, Furniture, etc., in almost endless variety, can be built with them, and the structures remain so firm as to be carried about. The Blocks are put up in neat boxes, and with each box is a card giving many designs of buildings.

Nos. 76 to 81—Volumes of the American Agriculturist (Unbound).—These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. We have stereotype plates from the Sixteenth to the Twenty-seventh Volume complete, from which we print numbers as needed. The price of the volumes is \$1.50 each, at the Office, or \$1.75 if sent by mail, as they must be post-paid. They are put up in clean numbers, with full Index to each volume.—They are profusely illustrated, the Engravings used in them having alone cost about \$40,000. Those obtaining premiums for less than twelve volumes can select any volumes desired, from 16 to 27.

Nos. 82 to 87—Bound Volumes of Agriculturist.—These are the same as Nos. 76 to 81 above, but are neatly bound in uniform style, and cost us more for the binding and postage. Sent post-paid.
