Competition: Worcester Victoria Institute.—Mr. Waterhouse, R.A., the assessor appointed by the Corporation to advise them in their choice of plans for the Victoria Institute buildings, has completed his examination of the sketch plans submitted in the first competition, and selected six. Sixty-eight architects in all sent in plans, which were hung in the Council Chamber of the Guildhall for inspection by Mr. Waterhouse. The six selected are Messrs. John W. Simpson and E. J. Milner-Allen, Strand, London; Messrs. Smith, Woodhouse, and Willoughby, Manchester; Messrs. Theo. Moore and W. Henry White, Mile-End-road, London; Messrs. S. Salter and Adams, Russell-square, London; Messrs. F. C. Ryde and Bedford, Great George-street, Westminster, London; and Messrs. Walter Cook and G. H. Grocock, Cardiff. By the conditions of the competition 300l. is divisible among these six architects or firms, and they will be requested to submit detailed plans and specifications in a second competition, the date for completing these being fixed as July 31. The Council, guided by Mr. Waterhouse, will then make the final choice of plans for the buildings. Mr. Samuel Smith, the secretary, writes to the local papers:—"On behalf of my committee, I have asked the whole of the unsuccessful architects engaged in the first competition for permission to publicly exhibit their plans. A large proportion decline to give permission, and many who do give it, attach such conditions that it will be impossible to hold a satisfactory exhibition. Under the circumstances, therefore, the committee have no alternative left but to regretfully return the plans at once to their authors. In the final competition, however, care will be taken to exhibit to the citizens the whole of the plans then sent in."

Central London Electric Railway.—At the twelfth sitting of the Committee on this Bill, on Tuesday, Mr. Pember, Q.C., proceeded to reply upon the whole case on behalf of the promoters. He said that there had been six points put forward by the opponents of the scheme,—(1) engineering risks; (2) injury to tradesmen on the line of route; (3) interference with the subsoil; (4) the question of the feasibility of the system of electrical traction proposed, and (5) the working expenses incidental to it; (6) the chances of traffic if the line were once put into operation; and (7) the plea for postponement. As regards the damage to the subsoil, he would be willing to have a clause inserted in the Bill providing that the owners of any subsoil should be compensated under the 68th section of the Lands Clauses Consolidation Act, and as regards the other points, judged by the ordinary standard of Parliamentary proof, the evidence in favour of the scheme and the probabilities of its ultimate success were unusually high. The opposition to the scheme was intended to bring about the utter waste of all the time, money, and energy which had been expended upon its promotion, to say nothing of the disappointment and mortification to the promoters, or the discouragement which, by such action as rejecting the Bill, Parliament would throw upon legitimate enterprise directed to satisfy great public needs. The Committee, after having deliberated in private for about half an hour, found that the preamble had been proved, on the understanding that (1) a compensation clause should be inserted in the Bill similar to the one in the Midland Railway (Additional Powers) Bill, 1881; (2) that stringent clauses should be inserted affording every opportunity to the Engineers of the Corporation of London and of the County Council to inspect the works during their progress, lest any possible damage should be done to the city until the City and estimated capital of the company should be somewhat reduced; and (4) that until the City and Southwark Subway had been opened and used by the travelling public for a certain time, no prospectus should be issued or capital raised by the Central London Company. The Committee then adjourned until Tuesday, the 13th inst., for the discussion of clauses.—Times.

Properties for Sale.—1. Armathwaite Hall, covering nearly 2,000 acres, situated upon the banks of the river Eden, and lying in Wetheral parish, five miles south-east from Carlisle. Near to the priority ruins are some curious caves, known as St. Constantine's cells, excavated out of the cliff some 40 ft. above the river; being somewhat similar to the artificial caves at Hawthornden, on the North Esk. The parish church of Holy Trinity was restored in 1872-3, at the cost of the Dean and Chapter of Carlisle, under directions of Mr. R. J. Withers, architect. It comprises a chapel, which contains many monuments to the Howards of Corby. 2. The Calderwood Estate, in Lanarkshire, to which we adverted in a "Note" on September 1, 1888, has again been placed in the market, and will be put up for sale by public roup, at Edinburgh, on June 11 next. Long Calderwood is famed as being the native place of William Hunter and his brother John, anatomists. Near to Calderwood House are Bothwell Brig, Drumclog, and other scenes whose names are familiar to readers of "Old Mortality."

Slow-Combustion Stoves.—From that well-known firm Messrs. Barnard, Bishop, & Barnards (Limited), Norwich, we have received their illustrated price-list of registered slow-combustion stoves. Stoves of this type have many advantages, and in this list they are shown in every conceivable variety, and in forms suited to widely-differing needs. We may specially mention "The Norfolk" stove, which, though constructed on "slow-combustion" principles, is so arranged that air can be admitted from below if a more rapid combustion be required. It is provided with a fluted firebrick back, which overhangs the fire, and by becoming heated helps to greatly diminish the amount of smoke which passes up into the flue. It and the catalogue generally (which includes wood and marble fenders, tile hearths and splays, and mantels and over-mantels in wood and cast-iron) are well worth the notice of architects, builders, and building-owners.

The A.A. Lyric Club.—A *propos* of our notice in last week's issue, we are asked to note that the 22nd inst. is not a Monday, but a Thursday.

MEETINGS.

SATURDAY, MAY 10.

Royal Institution.—Dr. Charles Waldstein on "Recent Excavations in Greece." I. 3 p.m.

MONDAY, MAY 12.

Surveyors' Institution.—Mr. R. F. Grantham on "The Encroachments of the Sea on some parts of the English Coast, and the Best Means of Preventing It." 8 p.m.

TUESDAY, MAY 13.

Royal Institution.—Mr. Louis Fagan on "The Art of Engraving." II. 3 p.m.

Society of Arts (Applied Art Section).—Professor W. C. Roberts-Austin, F.R.S., on "The Use of Alloys in Art Metal-Work." 8 p.m.

Institution of Civil Engineers.—(1) Further discussion on Mr. S. W. Barnaby's paper on "The Screw-Propeller." (2, time permitting) Paper on "The Keswick Water-Power Electric Light Station," by Messrs. W. P. J. Fawcett and E. W. Cowan. 8 p.m.

WEDNESDAY, MAY 14.

The Royal Society.—Conversation. 9 p.m.

Society of Arts.—Dr. J. A. Fleming, M.A., on "Professor Elihu Thomson's Electro-Magnetic Induction Experiments." 8 p.m.

THURSDAY, MAY 15.

Royal Institution.—Professor Dewar, M.A., F.R.S., on "Flame and Explosives." II. 3 p.m.

Society for the Encouragement of the Fine Arts.—Lecture by Professor Lodge.

Institution of Electrical Engineers.—8 p.m.

Society of Arts (Foreign and Colonial Section).—Mr. C. Washington Eves on "Jamaica and its Forthcoming Exhibition." 5 p.m.

Society of Arts.—Mr. Lewis F. Day on "Design Applied to Wood-Carving." III. 8 p.m.

FRIDAY, MAY 16.

Architectural Association.—(1) Election of Officers. (2) Special Business Meeting (for members only) to con-

LONDON.—For road-making and paving works, Epirus-road, Fulham, for the Vestry of Fulham. Mr. W. Sykes, New Streets Surveyor:—
 Neave & Son, Paddington £850 0 0
 Rogers, Notting Hill 760 0 0
 Nowell & Robson, Kensington 720 0 0
 Jones and Wimpy, Hammersmith 620 0 0

LONDON.—For alterations to the "White Hart," Kennington, S.E. for Mr. E. Bore, Mr. Belle, architect, S. Railway-approach, London Bridge:—
 Fritchard £878 10 0
 T. Hooper 685 0 0
 J. Seale 514 0 0

LONDON.—For alterations at No. 35, Beaumont-street, W., for Miss Slodden. Mr. T. Durran, architect:—
 Parker £495 0 0
 Bovis 403 0 0
 Edgar 488 0 0
 Altchison 430 0 0
 Clifton (accepted) 420 0 0

LONDON.—For the construction of a beer-cellar at the Cobden Club, Kensal-road, for the proprietors. Mr. J. W. Gracie, architect, Shepherd's Bush:—
 Williams & Richards £285 0 0
 Ransom & Co. 230 0 0
 R. Seed 220 0 0
 Scrafield 200 0 0
 Sweetland 194 0 0
 Oldrey (accepted) 185 0 0

LONDON.—For alterations and additions at Nos. 42 and 43, Cranbourne-street, Leicester-square, to adapt the premises for an Electric Testing Station, for the London County Council:—
 W. Buckenidge, Kensington £694 0 0
 * Accepted.

LONDON.—For alterations and additions to the General Post Office, St. Martin's-le-Grand, for H.M. Office of Works. Mr. Henry Tanner, architect:—
 W. Buckenidge, Kensington £2,340 0 0
 * Accepted.

LONDON.—For repairs and painting at London Salvage Corps Station, Commercial-road, E.:—
 John Greenwood (accepted) £376 0 0

LONDON.—For additions to 201, King-street West, Hammersmith, for Mr. C. A. Bond, Mr. William Hunt, architect, 5, York-buildings, Adelphi, W.C.:—
 J. Mears £562 0 0
 C. Wall 557 0 0
 S. Knight 510 0 0
 J. Freeman (accepted) 463 0 0

LONDON.—For sanitary improvements at 91, Lancaster-gate, Hyde Park, W. Messrs. N. S. Joseph & Smith, architects, 45, Finsbury-pavement, E.C.:—
 Phillips & Son £493 15 0
 Hearn & Co. 397 0 0
 Vane Bros. 254 0 0

NORWICH.—For erecting Bull Close-road Girls' School, for the Norwich School Board. Mr. John H. Brown, architect and surveyor, Cathedral Offices, Norwich:—
 Leggett, Yarmouth £4,440 0 0
 Fye, Norwich 3,990 0 0
 Haves, Norwich 3,890 0 0
 H. Lacey, Norwich 3,883 0 0
 Youngs, Norwich 3,883 0 0
 Wilkin, Norwich 3,809 0 0
 Seales Bros., Norwich 3,790 0 0
 Chapman & Son, Norwich 3,674 0 0
 Bennett (corrected), Norwich 3,642 0 0
 Ellis & Betts, Norwich* 3,660 0 0
 Smith & Watling, Norwich* 3,352 0 0
 * Provisionally accepted. † Withdrawn.

SEVENOAKS.—For levelling, metalling, kerbing, channeling, tar-paving, and the construction of sewers and storm-water drains, in Bayham-road, for the Sevenoaks Local Board. Mr. Jabez Mann, surveyor:—
 Freeman, Otford, Sevenoaks £1,034 0 0
 Osenton, Westerham 1,006 0 0
 Jackson, Forest Gate, E. 975 9 5
 Freeman, Swanley 808 3 11
 Porter, Lower Clapton 808 3 11
 Hulson, Crouch End, N. 829 9 9
 Hes, Wimbledon 798 6 11
 (Surveyor's estimate, £811.)
 * Accepted according to schedule of prices.

RIDDLEDOWN (Surrey).—For decorations, tile-heards, parquet-flooring, &c., at "Little Roke," Riddledown, Surrey, for Mr. P. Carle Smith:—
 Robert Eddie, Fyndale-place, Upper-street, Islington (accepted) £729 0 0
 (Forming new cellars, &c., at schedule of prices.)

SALISBURY.—For alterations and additions to the stables and coachman's cottage, Cowesfield Dean, Salisbury, for Mr. W. Lawrence, Mr. E. Carle Smith:—
 Crook & Sons, Southampton £1,347 0 0
 * Accepted. (Lowest of five invited.)

TAVISTOCK.—For additions to Kelly College, Tavistock. Mr. H. J. Snell, architect, 8, Courtenay-street, Plymouth:—
 T. Higman, Tavistock £8,734 0 0
 J. Finch, Plymouth 6,500 0 0
 J. J. Marshall, Plymouth 6,555 0 0
 G. Shellabear, Plymouth 6,270 0 0
 J. P. Berry, Plymouth 6,230 0 0
 Tozer & Son, Plymouth 5,534 0 0
 Laphorne & Goad, Plymouth 5,804 0 0
 Palk & Partridge, Plymouth 5,500 0 0
 Fethick Bros., Plymouth 5,740 0 0
 P. Blowey, Plymouth 5,650 0 0
 A. R. Debnam, Plymouth 5,640 0 0
 Reed, Blight, & Co., Lim., Plymouth 5,456 0 0

THORNTON HEATH (Surrey).—For the erection of a pair of semi-detached villa residences, for Mr. Robert Allen. Mr. Thos. Moody, architect, 35, Craven-street, W.C.:—
 Smith & Sons, Norwood £2,388 0 0
 J. W. Falkner, London 2,253 0 0
 Smith & Bull, Croydon 2,259 0 0
 G. E. Bryan, Norwood 2,154 0 0
 A. M. Deacon, Norwood 2,129 0 0
 E. J. Saunders, Croydon 2,010 0 0

TODENHAM.—For new wing and alterations at Todenham, Gloucestershire, for Sir Pery Van Notten Pole, Bart. Mr. Guy Dewber, architect, Bourton-on-the-Hill, Moreton-in-Marsh:—
 Groves, Milton-under-Wychwood £1,388 0 0
 Atwood, Brailes 1,350 0 0
 Eaton & Son, Gloucester 1,270 0 0
 Wiltshire, Swindon 1,240 0 0

(Lists of tenders for works at Camberwell and Deptford inadmissible, as sender did not enclose his name.)

SUBSCRIBERS IN LONDON AND THE SUBURBS by prepaying at the Publishing Office, 198, per annum (or 4s. 8d. per quarter), can ensure receiving "The Builder" by Friday Morning's post.

TERMS OF SUBSCRIPTION.
 "THE BUILDER" is supplied direct from the office to residents in any part of the United Kingdom at the rate of 12s. per annum PREPAID. To all parts of Europe, America, Australia, and New Zealand, 15s. per annum. To India, China, Ceylon, &c. 30s. per annum. 4-months payable to DOUTLAS'S SUBSCRIBERS, Publisher, No. 46, Catherine-street, W.C.

The Future of the Architectural Association.

THE meeting of the Architectural Association on Friday evening of the present week has been fixed for the discussion of the educational scheme recommended in the Report of the Special Committee appointed to inquire into the educational methods of the Association; and although this issue of the *Builder* is formally dated on the day after that, it will, of course, actually be published before the meeting, and cannot include any report of or comment on the proceedings and on the conclusions that may be arrived at. We rather desire to support beforehand the conclusions at which we hope the meeting will arrive.

The institution of examination for entry to the ranks of the Institute, and the success which has so far attended that movement, has no doubt had its influence in leading the Architectural Association to consider its position, and in suggesting the idea that the system of education by voluntary aid which has been hitherto kept up in the Association should be developed and systematised on a larger scale and with the assistance of a regular staff of salaried professors. But even without this stimulus, it is probable, as we suggested the other day, that the Association would find itself compelled before long to make some such change as that which is now suggested. Institutions which are conducted by voluntary work come naturally and almost invariably to one of two positions: either the voluntary labour flags by little and little and the institution decays; or it succeeds and enlarges its numbers and increases the complication of its working until it arrives at that stage when it is felt that the voluntary labour required to keep it going constitutes a greater task than ought fairly to be laid upon those who have their own labour to carry out for their own living. Hence voluntary effort, though it is an excellent method for the inauguration and for the earlier years of a society of this kind, must of necessity be only a temporary system: if it does not answer it comes to an end naturally; if it is successfully carried out, it creates a task beyond its own powers to cope with continuously. We look on it therefore that the Architectural Association

could not in any case have avoided the critical turning-point to which it has now come, though other circumstances combine to render the present moment a peculiarly suitable one for entering on what may be called a "new series."

It was at a meeting of the General Committee of the Association held on June 21 of last year that it was resolved "that a Sub-Committee be appointed to consider what alterations, if any, in the methods and working of the Association would improve its usefulness as an educational body"; the members appointed being Messrs. Baggallay, Collard, Farrow, Fleming, Gale, Millard, Pryce, Slater, and Stokes. The first step which the Sub-Committee took was to get a formal statement from the Institute as to whether it entirely abrogated any idea of acting as a teaching body; a question, as already observed, to which they had some difficulty in obtaining a direct answer, not because there was any doubt about the matter within the ranks of the Institute, but because there seems to exist in the official regions of the Institute a certain inability or objection to give plain answers to plain questions. As we have always maintained, the Institute was never constituted to be a teaching body, and could not become one on any scale which would be worth anything, except by entire reconstruction,—including, perhaps, even the necessity of obtaining yet another charter. The position of the Association, on the other hand, is that it was originally formed as a body for mutual help and advice, which has gradually developed into a system of what may be called mutual instruction, in which the older members teach the younger ones. This system has gradually extended into a number of classes for various branches of work in connexion with architecture, and the great step now proposed is to further organise a complete system of architectural instruction on the basis of that at present carried on, but in a more regular manner and with some important additions.

The question of funds is of course at the basis of every attempt of this kind. The first thing to be done is to engage a salaried secretary. The educational scheme proposed must immensely increase the secretarial work, which is already so heavy that we have heard that those who have undertaken it as honorary officers have said that they would never have done so had they been aware of the extent of the burden they were taking on themselves. This is only one among various increased expenses which would be

entailed in carrying out the new scheme; and as one method of meeting these the report proposes that the annual subscription should be raised from half a guinea to a guinea, for town members. We are told that this is regarded by a certain number of members as a weak point in the report, and one to which opposition is expected. In that case the opponents will be acting a very foolish part. They cannot expect to have increased burdens thrown on the funds of the Association without an increased revenue to meet them; and the plain fact is that although the subscription of half a guinea was a very suitable one in the early days of the Association, when it was only a handful of professional friends meeting for discussion, it is an almost ridiculous one now, considering the advantages which it opens to members,—young students especially; and even if raised, as proposed, to a guinea, it will still be a very low one for the advantages offered, and it may be safely said that very few professional societies in the kingdom, of any denomination, offer their members so good a guinea's worth. The aggregate increase to income will be very considerable, the individual burden very small. There are few members who can pay half-a-guinea who cannot pay a guinea without feeling the difference very much. The suggestion, we believe, that many old members who can no longer attend the meetings or take part in the work of the Association, but who keep up their half-guinea subscription for old friendship's sake, would withdraw it if raised. We do not believe a sufficient number would do so to make any material drawback to the increase of funds; we should imagine the majority of old members would be interested in seeing the Association entering on a wider sphere of usefulness, and that they would be desirous to assist in the movement; we therefore regard this as a groundless apprehension, and we hope to hear that the guinea subscription has been duly passed at the meeting.

Of course this extra half-guinea from town members will not suffice to pay the staff of teachers and lecturers. This it is proposed to provide for by special fees to be paid by those joining the classes (which will not be obligatory upon any member), the Association collecting the fees and paying the lecturer either a fixed salary or a fee in proportion to the number of students attending his classes. We may suggest that a combination of the two methods would be the best; a certain

fixed salary as a backbone, and an addition in proportion to the numbers who attend. If a teacher is entirely dependent on students' fees for his remuneration he is apt to get nervous and too anxious about pleasing his classes, and is too much at their mercy. If his remuneration is entirely independent of the numbers who attend, he has not sufficient direct stimulus to make the lectures interesting to his students.

The scheme proposed in the Report contemplates making the Architectural Association a completely-equipped educating body for the architectural profession. It is proposed that the scheme of instruction should be arranged with special reference to preparing students to pass the Institute Examinations, but (as the Report more than once emphatically points out) not by any means limiting the course of study to what is required for those examinations. The system proposed is a dual one: a system of lectures and classes on the one hand, and a studio in connexion with the Association on the other hand, at which problems of design and construction may be worked out at the drawing-board.

Two or three points on which there may be differences of opinion enter into the discussion of this suggested system. One is as to the preference to be given for teaching by lectures or by class work. The Sub-Committee issued a series of queries on this and other points to various members of the profession whose opinion they considered might be of value, and we gather from the Report that they have been to some extent guided in their conclusions by the answers to those questions. In regard to this the Report says:—

"The next points for enquiry were the desirability of teaching in classes or by lectures, and by one teacher or by a body of visitors, for each particular subject. After considering the evidence given, we are of opinion that a combination of lectures and classes is preferable to either of those methods taken singly; and also that, as a general rule, instruction in any one subject is likely to be better imparted by a single teacher; but we consider that, for advanced students, the system of Visitors is in some cases preferable."

This is, on the whole, a sound conclusion. The value of lectures consists mainly in giving a general insight into a subject, and awakening the interest of the students in it; but we do not believe that details of a subject are really well learned from lectures; a few notes as to isolated facts may be taken, but the lecturer cannot find out the special difficulties of special students as he can in a class, nor drive home some special points which require further enforcing or illustrating. We are entirely in favour of a single teacher for each subject: successive "Visitors" have different views, and cannot carry out a continuous and logical system, as one man dealing with one subject can.

Another point to which the Report directs attention is as to the desirability of establishing day classes, especially at the proposed studio. The Report says:—

"We have also given our attention to the question of the establishment of day classes, recognising that there is, at present, a strong feeling amongst many, and especially the leading members of the profession, that architects should allow their pupils additional facilities for study during office hours. We feel that, if such classes were established, attendance at them would soon be accepted by the profession as part of the ordinary work of pupils. We therefore strongly recommend that classes of this description should be established as part of the work of the Association. But, as these classes could not be made a part of the regular course, at any rate at first, we suggest that they should be a repetition of the whole, or of parts of it."

In our opinion this is rather too half-hearted a suggestion. We regard it as of the highest importance that a portion of the day should be given by architects' pupils to that kind of theoretic training in classes which they cannot have in an architect's office, and that the necessity for this will have to be recognised by architects taking pupils into their offices, whether they like it or not, though we believe the best men will be willing enough to agree to it and thereby make it practically necessary for the rest to

follow their example. The relegation of such classes to evening work entirely must reduce their usefulness very much, both because the student must be to some extent fatigued and less able to give his best mind to the work than in the daytime, and because the available time is so much reduced. The report suggests that twelve hours a week is as much evening work as can be reasonably expected from a student. It is quite as much, and more than will be got from many. Social engagements have some claim on a young man, and it is better for him not to be entirely cut off from them, which twelve hours a week evening work would pretty nearly do. Besides, there is the alternative of a student taking up the Association classes and studio work entirely for a time, going into office routine afterwards. We strongly advise the Association to take the bull by the horns in this matter, and to make day-work a part of their course at once. If their educational system is so organised and carried out as to be a success in itself, they will find no difficulty about the day-time work, we are convinced. Those architects who grudge it to their pupils will find public opinion, both within and without the borders of the profession, too strong for them.

In regard to the relation of the proposed educational course to the Institute Examination, it is proposed that the Association course should be so arranged that students who have passed the Preliminary Examination of the Royal Institute may be able to acquire the information necessary to pass the Intermediate Examination in the two years allowed as a minimum in the Institute programme; and the information for the Final Examination in another two years; but that any student so desiring should be able to extend his studies over a longer period.

The following table of studies for first-year students gives an idea of the manner in which it is proposed to lay out the work:—

lectures or classes calculated at the rate of 2s. 6d. each meeting.

This is certainly a very full programme, instruction to be given for so low a scaled fee. It is recommended that the ordinary meetings, the sessional and vacation visit the annual excursion, the *A. A. Notes*, and the "Sketch-book," should be maintained as present. This would seem a matter of course, or the Architectural Association would cease to be itself; unless we put query as to the maintenance of *A. A. Notes*, the special value of which we have no fear, rather failed to appreciate.

The proposal that the library should be available in the day-time is included, and of course on our principle that the whole thing ought to be started on a day-time basis this would follow as a matter of course; but with it comes also the necessity of a salary for a librarian. The alternative of an officer who would attend to the lending-libraries of both the Institute and the Association hardly recommends itself as practical; but there is another suggestion which may be made: why should not the lending-library of the Institute, which is chiefly for the good of students, be merged in that of the Association, on terms to be agreed upon between the two bodies? This would be much better than having two lending-libraries in the same building. The Institute would have the reference-library, and the Association the lending-library, and the work of each department would be better concentrated.

If this programme, or anything like it, is agreed to and fairly started, the Architectural Association will assume a very important position as the first and only Architectural College of this kingdom, and may have a very important effect on the future education of English architects. Nothing definite has yet been formulated for enabling country members to participate in the advantages of the proposed curriculum, except that it

Curriculum.

(The subjects required for the Institute examinations are printed throughout between inverted commas.)

FIRST YEAR.

Time allowed: 3 evenings of 3 hours each every week = 96 evenings in the Session (of 32 weeks) for study in this year's course.
One evening a week to be spent in attending Lectures and Classes, and two in the Studio.

Existing Classes of the A.A. embodied in Curriculum.	Lectures and Classes to be given on 32 evenings, each Lecture or Class lasting 1½ hour.	Studio.	Existing Classes of the A.A. embodied in Curriculum.
Lectures on History of Architecture.	12 Meetings. "The orders of Greek and Roman Architecture, their origin, development and applications." "The several varieties of Classic Ornament."	Geometrical drawing of ancient examples. One example, at least, to be drawn from actual measurements. (8 Meetings for criticism of drawings.)	Elem. Class in Design, Sec. 2.
Lectures on Construction and Elem. Class of Construction.	16 Meetings. "The nature of Ordinary Building Materials" and "The Elementary Principles of Construction." 10 Meetings. "Plane Geometry applied to Actual Work:—Projection of Solids and Development of Surfaces."	Elementary Construction. Freehand drawing.	Elem. Class in Construction.
Lectures on Theoretical and Applied Mechanics.	4 Meetings. "Elementary Physics as applicable to Building." (Mechanics.) 6 Meetings. The Rudiments of Perspective. 4 Meetings. "Mensuration." 6 Meetings. Chemistry 6 Meetings. Geology.	Plane Geometry applied to actual work. Perspective.	
Lectures on Geology.		Class for Sketching and Measuring (Saturday afternoons, as at present).	Class for Measuring and Drawing.

Other subjects added in the third and fourth years are Sanitary Science, Professional practice, Graphic Statics, Elementary Natural Philosophy (including Light, Sound, Hydrostatics, Electricity, &c.).

It is represented that the sum required to provide salaries for teachers would be raised, taking the probable number of students who would avail themselves, by a fee of five guineas a year for the lectures and classes, and five guineas a year for the studio, or ten guineas a year for the whole course. Members wishing to take up one or two subjects to be charged a fee for each individual course of

suggested that some portions of the class studies might be carried on by correspondence. But if the Association can carry out their spirited and ambitious programme, we should expect to find that one result would be that a good many country students, intending ultimately to start practice in their own neighbourhood, would come up to London temporarily to pursue their studies in the Architectural Association classes and studio. And this will be all the more likely to be so if the daytime work is made an integral part of the programme so that any man coming up for this course of

study can make the most of it in a given time. The whole educational move thus proposed for the Association is a very ambitious one, but in our opinion the more ambitious it is the more likely it is to be a success, and especially if it is laid out so as to be worth the attention of country students as a centre of architectural education for the whole kingdom. It is quite possible that it may become so: nothing short of that should be the aim.

THE TEMPLE OF DESPOINA AT LYKOSURA.

NO official report of the excavations at Lykosura, save for occasional notes in the *Δελτίον*, has yet been published. The following account we owe to the kindness of a member of the British School of Archaeology at Athens, who recently visited the site:—"The temple of Despoina at Lykosura lies high up in the mountains Tetraisi. To the north-west rises the summit of Mount Lykaon, which is connected with the earliest inhabitants of the land, and the human sacrifices to Pelagian Zeus. High above it is the Acropolis, a mass of bare rock, with parts of its walls still preserved. The village of Stala, where the excavators lived last summer, is at some distance to the north. The road, or rather mountain path, by which one reaches the temple, passes through extraordinarily grand scenery. After the crossing of the Alpheios, which is here very shallow and not so rapid as its tributary the Helisson, it winds upwards round hills and through deep gullies furrowed out by torrents and rocky slopes. The hills are covered with oaks; the 'acorn-eating men of Arcadia' (*Βαλανοφάγοι Ἀρκάδες ἀνθρώποι*) would certainly here have found abundant food to their liking. Nearly all the way up the hills are vineyards and presses, and cultivation goes on in patches between the rocks. About two hours after leaving the Alpheios one climbs up a slope, out of which trickles a fountain, and at the end of a ridge one comes upon a tree, near to which are the remains of the Chapel of St. Athanasius, which was entirely constructed out of the materials of the ancient temple. Running westward from this hill lines of foundations have been uncovered, which may be those of a stoa. Following these one reaches the Temple. It is built on a sort of platform, which was, no doubt, made, or at least widened artificially, at the side of the hill. On the north, beyond the heaps of earth thrown up by the excavators, is a steep slope downwards, and to the south the rock is seen above at a distance of about two yards from the line of wall. Immediately at the bottom is a great bank of earth. To the fall of earth from this steep slope we owe the preservation of the *Damophon* sculptures, to the importance of which attention has been already called in the *Builder*. At the back the rise is less steep, but just as evident. Thus there could be no question here of a peripteral temple, for there was no room.

The dimensions of the cella are but small. It consisted merely of an inner chamber with a pronaos and a row of columns in front,—*i.e.*, it is, technically, Doric hexastyle prostyle. All indications in the remains point to its being of a date not earlier than the fourth century B.C. The material is chiefly a local stone, rough in texture, blue-coloured with yellow veins. This is chiefly employed for the walls and floor. The columns, entablature and sculptures are of a marble which has a sparkling white grain, but when long exposed becomes a rich dark yellow on the surface. The temple is still only imperfectly cleared out, and heaps of earth lie about the floor, under some of which are buried the marbles that have not been yet transplanted to Athens.

Approaching from the east, one finds among the mass of materials that lie before the entrance two round bases, apparently *in situ*. Two steps lead up to the stoblate. Only two drums are still standing, *i.e.*, two at the south end, which were preserved from the seeker after building materials by the fall of

earth. The drum *in situ* at the south-east corner has two others close by which have evidently fallen from it. They are Doric, and just short of a meter in diameter. The pronaos behind was paved with local stone, and contained many votive bases with inscriptions, several of which remain. A doorway leads into the cella, the transverse wall on each side remaining, but better preserved to the south than to the west. The cella was paved with big, coarse red tiles, which lie for the most part in a heap in the centre. The *bathron*, as is known from the *Δελτίον*, filled almost the whole of the end of the temple. There is a space of only about 2 ft. between it and the north and south walls, and behind, certainly not more than 4 ft. The shape is peculiar: a long and lofty line, with a rectangular projection in the middle of the east side. The level of this wider centre is at present higher than that of the two sides; whether this was so originally is difficult to say. The higher level would suit the two seated and superior goddesses, in the centre, while the two accessory figures, Artemis and Anytos, would stand on a lower level at the two sides. The excavators alone could judge what the original level was; but, anyhow, the rough surface of the centre must have been covered by some smoother blocks.

At a distance of about a yard in front, and parallel with the *bathron*, runs across the temple a course of narrow blocks of the local stone, much covered by the uncleared rubbish. From a hole in the middle one of three that are visible together, one could conjecture that this served to carry a metal railing, by which, as in the case of the Zeus at Olympia, the worshippers were kept at a distance from the statues. Of the back walls there is visible a course of blocks, in which the greater part of their surface has not been dressed down to the level at the joinings, and above a projecting layer.

A curious feature of the cella is that in the south wall, quite close to the *bathron*, and facing the steep rock and the mass of fallen earth are remains of what must be called a doorway, as the side blocks seem to be certainly *in situ*. Possibly the worshippers, who came in through the pronaos, made their exit by this way, and left by the narrow passage (it must have been very narrow if it existed) running along the south side. This might be an arrangement to avoid crowding on festival occasions. The temple wall seems to stand on a single step, so far as the excavations have yet made the foundation visible. Among the *Abbris* one finds tiles of the entablature, and a corner of the pediment with an ornamental flower pattern on the cornice; but the greater part of the building material has been carried off, and only the lucky accident of the fall of the earth from the south slope has preserved for us the statues. For the finding of these every archaeologist owes a deep debt of gratitude to M. Leonardos, who carried on the excavations for the Greek Government."

Examination and Registration of Plumbers.

At the examinations of plumbers for registration, held at the Guilds Institute on Saturday last, there was a very satisfactory attendance of applicants, not only from London and the suburbs, but from Kent, Essex, Oxfordshire, Hertfordshire, Suffolk, Cambridgeshire, Salop, Berkshire, and Staffordshire. The examinations were such as to test the qualifications of the applicants in both the practical and theoretical branches of their craft, each applicant being required to execute a given amount of manual work, such as joint-making, pipe-holding, lead-laying, &c., besides answering a number of questions relating to the properties and qualities of the various materials used by plumbers, external and internal construction, sanitary arrangements, and water-supply. The examiners were Messrs. John Smeaton, J. C. Ashdown, G. Davis, J. W. Clark, C. T. Mills, and R. A. Nurse,—the last representing the United Operative Plumbers Association of Great Britain and Ireland. One-fourth of the masters and two-thirds of the operatives succeeded in passing the full examinations.

METROPOLITAN BUILDING LEGISLATION.

BY A DISTRICT SURVEYOR.

BUILDING legislation for London practically dates from 19 Charles II., cap. 3, 1667, the year after the Great Fire. That great calamity was the cause of all subsequent regulations of building, and the keynote is struck in the eloquent wording of the preamble to the Act of 1667: "Forasmuch as the City of London, being the Imperial Seat of his Majesty's Kingdom, and renowned for Trade and Commerce throughout the World, by reason of a most dreadful Fire lately happening therein, was for the most part thereof burnt down and destroyed within the Compass of a few Days, and now lies buried in its own Ruins; For the speedy Restoration whereof . . . and to the end that great and outrageous Fires (through the blessing of Almighty God), so far forth as human Providence (with Submission to the Divine Pleasure) can foresee, may be reasonably prevented and obviated for the Time to come, both by the Matter and Form of such Building; . . . Be it therefore enacted," &c., &c.

Section IV. of this Act directs the appointment by the City of one or more Surveyors to administer the Rules and Regulations, and as Sir Christopher Wren was appointed Chief Surveyor, he may fairly be claimed to be the Father of District Surveyors.

Mr. Slater, in his interesting paper lately read before the Institute, sought to prove that the time had come for new building legislation for London; complained of the insufficiency and arbitrariness of the present Building Act of 1855, and also of the way in which it is administered; and further laid down the lines upon which a new Act should be drawn. If we are to support him in this laudable effort, let us first of all endeavour to sum up our experience gained during the last 223 years. Between the years 1667 and 1855 sixteen Building Acts have been passed, and if examined *seriatim*, it will be seen that there is a tendency throughout to eliminate all those detailed regulations which Mr. Slater now wishes to re-introduce and to amplify. The Act of 1667 regulates the formation and width of streets, the "rates" (heights) of the building to be erected therein according to the widths of the streets, the sewerage of these streets and buildings, and finally "the proportions and scantlings for stories, walls, and timbers." Timbers here include girders, lintels, binding joists, joists, plates, and roof timbers, down to laths for plastering. This is certainly "detailed legislation."

Then follow the Acts of 1707, 1708, 1724, 1760, 1764, 1765 (two Acts, cap. 27 and cap. 37), 1772, 1774. The last-mentioned (14 Geo. III. c. 78) remained in force down to 1844. Truly the eighteenth century devoted great attention to the subject of building legislation.

In the present century we have the Act of 1844, which was in turn superseded by the Act of 1855, now in force throughout the Metropolitan area as defined by the Local Management Act of that year.

There were two unimportant Acts passed in 1810 and 1840, but they need not be further referred to here.

Now, if we turn to the Act of 1844, we find that it embraces and endeavours to legislate for nearly all the various matters referred to by Mr. Slater as subjects urgently needing legislative control at the present time. In short, the preamble of the Act of 1844 may be said to form a synopsis of Mr. Slater's legislative reforms of 1890. "The Improvement of Drainage, the Narrowness of Streets, the Ventilation of crowded Neighbourhoods, the use of Buildings unfit for Dwellings, the regulation of dangerous and noxious Manufactures, the diversity of practice among District Surveyors, making it expedient to provide them, under certain checks and control, a Discretion in the relaxation of the fixed Rules;" all these important matters the

Act of 1844 sets itself out to remedy and control with a complacent self-assurance worthy of the present young German Emperor himself.

But with what result? That in eleven years it was swept away, and the lean, abbreviated, unassuming Act of 1855 was substituted, an Act which has the air of a man who has come down in life, the dilapidated appearance of a "hanger-on" of police-courts. It is really an Act which gives just so much control over buildings as may insure a certain minimum of stability and the prevention of the spread of fire.

Mr. Slater says, "Both streets and buildings should be dealt with in one Act." This is clearly a mistake. The local management of London by its Vestries as constituted under the Act of 1855 is not perfect; but while this Vestry system exists (and it will not be lightly done away), the control of streets, with their cleansing, paving, lighting, and sewerage, naturally appertains to these Vestries; they only require such general control as may insure greater uniformity of system in their respective parishes. But it may be safely said that few, if any, provincial towns are better administered than any one of the London parishes; and if the comparison is made, that none of the borough municipalities do their work so economically.

With respect to building legislation proper, it is most important, as Professor Roger Smith says, that a Building Act should be definite in its rules, and as these have to be generally applicable to many classes of buildings over the whole Metropolitan area of 117 square miles, it is manifestly supremely difficult to frame such detailed regulations as may be universally workable; certainly for every ounce of detail you must allow a pound of discretion in administration, otherwise another dead-lock will ensue, as previously occurred in 1850. This can be provided against by correcting the defects in the machinery provided by the Act of 1844. No one who has had experience in administering the present Building Act would care to have thrown upon him singly that invidious "discretionary power" which Mr. Slater wishes to confer upon the District Surveyor. But the Metropolis might be divided into, say, six provinces (three on the north and three on the south side of the Thames), each province having two official referees appointed to consider any Building Act applications brought before them, assisted by the Surveyor for the District in which the building is to be erected. Such a tribunal sitting once a month could rapidly and effectively decide whether and how far any owner or builder should be allowed to depart from the strict rules of the Act, a right of appeal to a higher tribunal being reserved for those who thought the matter decided against them of sufficient importance for such appeal. With these exceptions, it would be the duty of the District Surveyor to see that the precise regulations of the Act were complied with; his hands would be greatly strengthened by the simplicity thus secured, and the desideratum of greater uniformity of practice would be attained.

But no reform or extension of building legislation will be of the slightest use unless at the same time an entirely new and competent tribunal is constituted to decide Building Act cases. Only a British Parliament could seriously relegate such cases to those Gallios, the police magistrates. Some of them so dislike administering the Act that they always decide against the District Surveyor, if possible, in order to discourage him as much as they can from appearing before them. Others appear to regard a jerry-builder as they do a cabman summoned before them by the police—that is, that the defendants in both cases are to have every possible chance of a decision being given in their favour. The magistrates do not appear to realise that the District Surveyor has no personal interest whatever in the matter at issue, and only appeals to their courts as a last resource, when all other means to amend the evil complained of have failed. This is

the secret of much of the diversity of practice among District Surveyors; it being frequently wiser to overlook faults here and there, than to take action before certain magistrates only to get an adverse decision; for that decision gets widely known in the particular district, discredits the Surveyor in his efforts to carry out his duties, and makes a bad precedent, of which other builders are only too ready to take advantage. The police magistrates are responsible for much of the jerry building which exists.

Two courts (one for each side of the Thames), each consisting of a barrister, assisted by two architects as assessors, sitting three days a week, could dispose, with practical and consistent decisions, of all Building Act and "Dangerous Structure" cases, and also of all the appeals upon special applications before referred to. One great advantage to the whole community of these double tribunals would be an immense saving of time; another would be the doing away with the necessity for all "By-Law" Regulations. Only those who have had experience in administering the existing By-Laws under the Amendment Act of 1878 can realise what a hopeless tangle they make, frequently rendering proceedings under them abortive, and consequently mischievous in their futile results.

The limitation of the height of buildings is a very difficult question, and will become more difficult in the future. The growth of the area of London has long been a subject of anxious consideration, and is an admitted evil. There is but one solution of the difficulty, and that consists in concentration. That solution is already being attempted by the erection of dwellings one above another over the same site; it is a necessary and economical consequence from the increased and increasing value of metropolitan land. How far, then, should Legislation interfere with this development of concentration, if one may be excused the paradox?

Sanitary experts, so called, say it is unhealthy to live in a street where the buildings are higher than the width of the roadway; but how much nervous disease and brain pressure are caused by the stampede of millions of Londoners from the suburbs to the business centres in the morning, and the stampede back again in the evening? To the true auditor of the Public Health Bill there is a debtor as well as a creditor side in this account.

The only sound basis of any limitation of height should be that of safe escape in case of fire; and it is a matter of regret that the Institute of Architects, as representing a body of scientific builders, should have supported any mere arbitrary limitation, instead of consulting together to provide that safety by scientific construction. In America, architects devote their talents and energies to the erection of buildings over 300 ft. high. Why should English architects be content to fetter their abilities by prohibitive legislation? Forth Bridges, Severn Tunnels, and Eiffel Towers would never be carried out if engineers were not animated by a much more independent spirit.

Finally, it must be borne in mind, as Professor Aitchison points out in his strong, common-sense, and practical "Remarks," that all these reforms and regulations will result in a question of "adequate rent," and that Mr. Slater's ideal London, "the best arranged, best built, most sanitary, and generally most magnificent city in the whole world," will be a luxury that will have to be paid for, like all the other good ideals of modern Socialism.

We are not, therefore, to hold our hands from reform, and join the "laissez faire" school, but we shall better adapt our means to our end, if we fully realise what that end will be.

PERCY HUNTER.

Board Schools, Harlesden.—Mr. J. Martin Brooks, of London, has been selected as architect for the new Board schools at Harlesden, in a limited competition.

NOTES.

COLONEL RICHI'S report to the Board of Trade on the accident at Carlisle, along with the detailed evidence which we now have for the first time, shows how delusive in such cases are the reports of evidence as published by the newspapers. Colonel Rich's report is almost contradictory of the verdict of the coroner's jury, and no one reading the detailed evidence and who can appreciate the points of it, will doubt that Colonel Rich's conclusion is in the main correct, though there may be room for difference of opinion on one or two points in it. The coroner's jury acquitted the driver of all blame, and only attacked the Company for having an unreliable brake; and we stated that on the published evidence we could see no blame attaching to the driver. Colonel Rich concludes that the accident was the driver's fault, though he mitigates his verdict by the remark that it is calculated to puzzle a driver at a critical moment that there should be two treatments of the vacuum brake, one "simple" and one "automatic," both worked by the same lever (backwards for "simple" and forwards for "automatic"); and as it appears that the breaks have to be set on each carriage for one or the other action by previous arrangement before the train is started, the recommendation that the company should as soon as possible do away with this dual system and adopt the automatic brake only certainly comes with additional force on reading this evidence. The driver, in his anxiety to do something to stop the train, pulled back the lever, which put the steam brake on the engine and "simple vacuum" on the carriages, but as the latter were set for automatic vacuum, the only effect of this was to take all brake-power off except the guard's hand-brake. But the main point of the detailed evidence is in the fact that there is a rule (as we said there ought to be) that trains must always approach terminal stations (or those which are classified with them, of which Carlisle is one) at such speed that the train could be brought to a stand at the proper place by the ordinary hand-brakes only. The driver, according to his own evidence, tested his vacuum brake at the proper place, and finding it wanting, tried to get up a vacuum and pulled the vacuum brake about in a confused endeavour to make it do something, all which time the train was getting nearer to the point of danger with little reduction of speed; had he at once abandoned it and whistled for the hand-brakes he would, if he was at the distance from the station which he states, have pulled up with them. A still more important point brought out in Col. Rich's report is as to the possible reason for the failure of the vacuum brake to act. We now learn from the evidence that two carriages were found with the wheels heated after the collision. Col. Rich considers that the driver having shut the small ejector at Shap Summit, when the train stopped, forgot to open it again. The office of this ejector is to keep up vacuum during the journey as against unavoidable leakage, and Col. Rich believes the vacuum had leaked away so far as to let down two of the blocks on the wheels sufficiently to cause friction, but not to stop the train on a falling gradient. "When the driver tested his vacuum at Wood Bank, there would be little or none in the pipe, he would feel no further check to his train than was already applied by the leaking on," and, as before said, he took off any power of working the brakes further by changing the lever to simple vacuum. There is nothing but circumstantial evidence for this view, but it accounts for the heated wheels of the two carriages mentioned, which does not seem to have been otherwise accounted for. Colonel Rich's moral as to this is that shutting off the small ejector at stations should be forbidden. It is only done, apparently, to avoid unnecessary noise from the engine while standing.

THOSE who look at the voting list for the Council of the Institute will be sufficiently surprised at one or two of the names included

in it, and there is nothing in the circular to draw attention to the fact that these persons have been forced on to the list under the powers of the by-law which admits of this kind of operation. It is for the general good, no doubt, that this power of making additions to the Council's list of nominees should exist: that it should be used to invite the suffrages of the voters for a member who has done all he can to injure the Institute, is a piece of assurance characteristic of the quarter from which it comes. It is desirable that those who wish the Institute, and the Council especially, to have the character of a society of artists and gentlemen, should not omit to record their vote for those who are likely to maintain its honour and dignity.

THE Railway Rates Inquiry is drawing to a close, the consideration of the classification being now at an end, with the exception of the hardware list. Lord Dalhousie and his colleague have not hesitated to state that, by taking the evidence of the traders and railway officials firsthand, they consider they have gained the necessary information far more satisfactorily than they would have done through the intervention of counsel. They have had direct evidence as to the nature of the traffic on the one hand, and the method of dealing with it on the other,— somewhat confusing at times, as we have before remarked, but still more to the point, and more intelligible perhaps, than if given under the direction of a legal prompter, with but a superficial acquaintance with the subject. Some traders have prolonged the inquiry by advancing claims which really appear preposterous. A representative of the glass trade, for instance, asked that plate-glass in 4-ton loads should be placed in Class B (which, it will be remembered, includes such traffic as g-iron and bricks). Lord Dalhousie naturally felt if the objector was serious in making his proposition, receiving a reply in the affirmative. Mr. Marshall Stevens has been examined at length upon his alternative scheme of classification, and he maintains that there is no reason why one scheme only, applicable to all railways in the United Kingdom, should not be submitted to Parliament. In evidencing the altered attitude of the traders to the terminals question, it may be noted that Mr. Stevens's proposal includes maximum station terminals and maximum service terminals,—the former item having previously been strenuously resisted. Another item in the proposal is for "maximum tolls," a term which has led to much misunderstanding in the past, and which might well be allowed to disappear from the new schedules possible.

THE Strand Improvement Bill came before a Select Committee of the House of Commons two days last week, and also on Monday and Thursday of the present week. The main struggle is as regards the question of "betterment," that is, whether some part of the cost shall be defrayed by a rent-charge on adjoining properties in proportion as they have benefited by the improvement. The issue of this improvement the promoters intend shall be assessed by an arbitrator. It will be more fitting to delay any expression of opinion on this subject until there has been time to consider the decision of the Committee. So far as regards the actual improvement, namely, the widening of the Strand by cutting away the south side of Holywell-street, there can be no difference of opinion as to its desirability.

THE Australasian colonies are not unanimous with regard to Mr. Goschen's tariff-reduction scheme. The Victorian Government is willing to adopt it, and New South Wales will probably concur. New Zealand, on the other hand, declines, and South Australia appears undecided. It is understood that the subject will shortly be discussed at a meeting of representatives of the Australasian colonies, when the dissentients perhaps are induced to reconsider their

decision. Mr. Hanniker Heaton's latest proposal in the way of postal reform is that the hour, as well as the date and place of collection, should be stamped on all letters passing through the post-office; and a memorial for presentation to the Postmaster-General in favour of the proposal has been largely signed in the House of Commons. This has long been done in America and elsewhere, and the additional information would doubtless often prove serviceable. If the suggestion is acted upon, it is to be hoped that the figures will be clearer than the date stamps upon railway tickets frequently are. A short time ago the return half of a ticket was presented at a station on one of the southern lines which the officials refused to pass on account of the date being indistinct,—compelling the holder to pay afresh for the return journey (the amount being subsequently recovered). Passengers are familiar enough with the warning that "change must be examined before leaving the booking-office, as mistakes cannot be afterwards rectified," but it would appear to be equally necessary for them to inspect every letter and figure on their tickets.

IN the current number of the *New Review* the Earl of Meath, sometime Chairman of the Metropolitan Public Gardens Association, discourses on "Lungs for our Great Cities," giving his impressions of the principal parks in the United States which he has recently visited. American (like English) cities are suffering from the overcrowding propensities of previous landowners, and have only recently become alive to the necessity of providing adequate breathing-spaces for their teeming populations; but the manner in which our cousins across the water are proceeding with this work, now that they feel its necessity, is somewhat different from ours. To take New York as an example: in addition to its "gardensque" Central Park, this city has recently acquired no less than five parks, of an aggregate area of nearly 4,000 acres, and at a cost of upwards of 2,000,000. These are, however, outside the city, and only at the present time are efforts being put forth to obtain open spaces in the heart of the city. For this purpose the State legislature has passed an Act "for the location, construction, and improvement of additional parks in the City of New York," whereby the Board of Street Opening and Improvement is empowered to condemn property and open as many parks below One Hundred and Fifty-fifth-street as they may think best. The Board has in consequence appropriated 2,000,000, to be expended during the next ten years in pulling down rookeries and "making air-holes in the crowded parts of the city." "It is to be hoped," says the Earl, "that our London County Council will take example from this energetic action on the part of New York. It would not be necessary for London to spend anything approaching the sum which New York is willing to find. There would be no necessity to pull down dwellings and purchase valuable land. Happily for London there are still over 200 disused burial-grounds closed to the public, and many neglected squares, in addition to a few spaces which are already laid out as gardens by private associations and individuals, who are desirous to extend their operations and to relieve the public of this heavy primary expense, if only the London Council will undertake to maintain the grounds thus laid out as gardens and playgrounds and open them to the public." As will be seen by our report on another page, the London County Council is now devoting itself to a consideration of this important question in its relation to the less-favoured portions of the metropolis.

WE presume Dr. Waldstein considers that he has on previous occasions sufficiently gauged the capacities of an afternoon Royal Institution audience, and that the first of his course of three lectures on "Recent Excavations in Greece," given last Saturday afternoon, was levelled for the assumed per-

ceptions of his hearers. This, however, is rather disappointing to those who went expecting to have a concise and connected statement of the results of recent researches, and had to listen to a demonstration of the objects of archaeological research, and a sketch of the career of Dr. Schliemann, and the means which he took to acquire languages and otherwise fit himself for his task, and an eulogy on his ability and energy, &c.; all of which (including the eulogy) is to be found in Dr. Schliemann's books. A Royal Institution audience ought not, at all events, to require to have it explained to them that the object of digging up ancient temples is not to secure curios for the archaeologist's own collection, but for the more serious end of an addition to the general stock of artistic and historic information. The value of a lecture on such a subject should be to give a connected exposition of the facts recently brought to light, for the benefit of intelligent hearers who may have been too busy to keep an eye on all the discoveries as they turned up. No one could do this better than Dr. Waldstein, if he would kindly think it worth while.

HOW much importance is attached by the Germans to good connexion by means of waterways, and easy navigation thereon, is evident if one bears in mind that, besides the long list of smaller works which outsiders scarcely hear of, a Danube-Oder Canal is being planned; that the Rhine is not only to be connected with the river Maas and the Dortmund-Ems Canal, but also with the Elbe, which latter is to have a new connexion with the Trave; and that complicated schemes are being prepared in reference to the deepening of the Rhine and Elbe, so as to make them navigable for ships of greater tonnage. Although, of course, many a plan does not receive prompt approval at the Ministry of Public Works, which latter body has lately unofficially notified that the number of these projects which are continually being handed in for consideration is far out of proportion to the financial means of the country, there is no doubt that the greater part of the projects will be taken in hand in the course of the next few years. In fact, this extension of waterways can be safely expected, all the more so if we look at the report of the meeting of the Association for the Improvement of the River and Canal Navigation in Germany,* held last month, where the president, Professor Schlichting (of the Berlin Technical College) showed that the traffic on the Oder (near Kustrin) is at present nine times greater than in 1873, on the Elbe (by Schandau) four times, and on the Rhine twice as great as on that date, 12,000,000 tons being now moved on these three rivers combined as against the 4,000,000 tons of sixteen years ago.

IN reference to the proposed building for the Prussian "Landtag," referred to on page 245 of our current volume, we are now able to state that it has been decided to erect on the sites of the present buildings of the Imperial "Reichstag" and the Prussian "Herrenhaus" two monumental buildings for each of the two "houses" (Herrenhaus and Abgeordnetenhaus) of the Landtag, and that these two buildings, each one forming a compact whole in itself, are to be connected by a third, in which room for the Chamber of Ministers will be found. It has been high time to come to some decision on the subject, considering that the project has now been some forty years under discussion, and that the plan now decided upon has for eight years been on the point of being approved of.

AT a meeting of the north-western branch of the Society of Medical Officers of Health, held in Manchester on the 9th inst., Dr. Hope, the Medical Officer of Health for Liverpool, delivered an interesting address on "Insanitary Houses and Areas, and the Methods of Dealing with them in Liverpool." The subject would be interesting enough at

* Centralverein für Hebung der Deutschen Fluss-und Kanal-Schiffahrt (some 4,000 members).

any time, but it is particularly so at a time when the London County Council has just decided to proceed on the lines adopted not very long ago by the great northern port. Such Corporations as Bolton, which have so far awakened from their lethargy as to pull down rookeries, but have not energy enough to proceed to build new and healthy houses in place of them, might well learn a lesson from Liverpool. For years the authorities of that city endeavoured to improve the sanitary condition of certain districts, and to some extent succeeded in their efforts, causing a reduction in the death-rate from 60 to 40 per 1,000; but it was felt that enough had not been done—the death-rate in these districts was still double that of the whole city. To improve further the condition of these places, two blocks of property, consisting of 650 houses, occupied by 2,537 persons, were dealt with by the Corporation. In nearly all these houses ventilation was an impossibility, and “the stagnant atmosphere was foul and noisome;” no wonder that the death-rate in these two blocks from pulmonary diseases alone equalled in ratio the death-rate of the whole city. The houses were demolished, and at a cost of 70,000*l.* the Corporation erected the Victoria Buildings to provide accommodation in their stead. “The mortality in the new buildings is about half what it was in the old.” Comment is unnecessary. It is interesting to learn that during the last ten years about 2,000 insanitary houses have been demolished in Liverpool, and 600 more are now awaiting the same fate.

THE *Athenæum* contains a passing reference to the circumstance that certain petitions and fair promises will no longer avail to save the gateway of Lincoln's Inn from the untoward fate with which it was threatened a few years ago. Commenting upon the ample resources at the Benchers' disposal,—largely due, we believe, to their recent sale of Furnival's Inn, acquired, in 1547, for 120*l.*,—our contemporary says: “Lord Grimthorpe, having pretty well destroyed everything of historical interest at St. Albans, is longing to destroy some other relic of the past, and display his incompetence as an amateur architect.” In this latter respect we are quite at one with the *Athenæum*. Yet the coming destruction which it laments forms, in fact, but the completion of the Benchers' scheme, already more than half accomplished, for an entire rebuilding of the various courts which composed their old chambers in Lincoln's Inn. These chambers were all soundly and solidly built, and a large quantity of oak,—no slight safeguard against fire,—was used in the building. So far as structural considerations are concerned, their removal is unnecessary.

THE walled park of 183 hectares (452 acres) at Elven and its castle in Brittany is offered for sale at a price of 300,000 francs. This well-preserved fortress stands near to Vannes, on the road to Ploermel, in the department of Morbihan, and has a high octagonal keep. It should be of some interest to our countrymen, inasmuch as it formed the prison-house for some while of Henry VII., when Earl of Richmond. Having sought refuge in France after the battle of Tewkesbury, and having been driven by a storm on to this coast, he was made captive by Duke Francis II., and, together with the Earl of Pembroke, was confined at Elven. In the neighbourhood are Auray, famed for its Champ des Martyrs, and a now vanished castle of King Arthur; Morbihan, or the Little sea, by some supposed to have been the Druids' chief seat; with Locmariaquer, or place of the Virgin Mary; and Carnac, renowned for its menhirs, dolmens, and other Celtic remains.

A PAMPHLET of sixty-two pages, entitled “Leaseholds and Legislation,” has recently been published by Messrs. Longmans. It is a *résumé* of the interim Report of

the Select Committee of the House of Commons upon Town Holdings. When that report was made we treated the matter very fully. This work is, however, not a mere *précis*; it prints arguments against the doctrine of leasehold enfranchisement. It is well and clearly written, and is worth perusal by any one who desires to get the report of the Committee in a convenient form.

THE French Exhibition at Earl's Court, Brompton (in the buildings and grounds occupied two years ago by the Italian Exhibition), is to be opened this Saturday, May 17. Judging from the appearance which the large Exhibition Gallery presented on Wednesday last, this part of the undertaking is not likely to be anything like ready on the opening day. The long gallery was almost empty on Wednesday; very few stands or show-cases were in position, and not many packing-cases containing exhibits had arrived. Two or three days may, of course, work wonders in this respect, but they will have to be wrought before the building can possibly present anything like an exhibition. In the grounds things seemed to be in a rather more forward condition. Passing out of the exhibition gallery, one finds that the first bridge on the left over the railway has been dubbed the “Pont de la Concorde,” which, of course, it in no way resembles. The farther railway bridge, now called the Pont Neuf, is equally unlike its namesake. The large entertainments theatre has been covered with scene-painters' architecture, and is intended to represent a portion of the Louvre. Closely adjoining this, and heedless of Paris topography, the canvas screen which was in the Italian Exhibition occupied by a view of the Forum at Rome, is now painted with a view of the Avenue des Champs Elysées, looking towards the Arc de Triomphe, which is seen terminating the vista. The buildings devoted in the Italian Exhibition to Wine and Alimentary Products are at present empty, with the exception of canvases still in progress of being painted for some parts of the Exhibition. The exteriors of these buildings are already covered with painted screens, giving them the appearance of two sides of a quadrangle of domestic buildings, with gaily striped blinds and jalousies. According to the programme, the Fine Arts section “will be exceptionally excellent. Among the contributors will be many of the best artists in France, including such names as Gerôme, Bartholdi, Barrias, Constant, Armand-Dumaresq, Anblot, Coutan, Yon, &c., &c. The section will doubtless be the most complete and representative of French Art, and several rooms in the Exhibition will be reserved for paintings from this year's two Paris Salons.” We will say more about the Exhibition later on if necessary. At present it does not show much indication of justifying the loud flourishes of trumpets which have heralded it. Whatever its success as an exhibition, it will no doubt be a popular place of *ad fresco* resort during the coming summer months.

THE collection of paintings of animal life by Madame Ronner, at the Fine Art Society's Gallery, is a very remarkable one, as far as the paintings of cats are concerned, which form the bulk of the collection. Not only is the mere imitative work of the highest class, in regard to the rendering of the creature's outer appearance, but the artist seems to have acquired a remarkable comprehension of and power of indicating the feline character. Mr. Spielmann, in an introductory note attached to the catalogue, which has the merit of being both shorter and less pretentious than many of the similar essays which preface the Fine Art Society's catalogues, remarks on the comparatively small number of animal painters who have given attention to the cat, and accounts for it partly on the ground that the animal is much less comprehensible, in regard to its feelings and its nature, than some other animals, besides having a peculiar suddenness in its move-

ments, which are very difficult to catch a fix in painting. There is perhaps another reason to be found, the difficulty of drawing an animal which, from the nature of its feline is devoid of distinctly defined outline. Frivolever causes it is certainly quite true that there are fewer good painters of cats than any other civilised animal, and Madame Ronner's painting ought to be seen, as representing a kind of artistic excellence which is rather rare.

THE set of sketches in Egypt and elsewhere in the East, by Mr. Ernest George, in the same gallery, includes a number of architectural subjects, mostly slightly but effectively sketched. Among the best are the view “Luxor,” half buried in the accumulated sediments of centuries, and with the masts of the ships seen in the harbour; “Karnac,” with spreading capitals and the hot purple shade on the columns very powerfully rendered; and “El Ghoury,” a mosque interior which an admirable example of brilliant effect, colour detail conveyed without any labour of execution.

A LETTER signed by Mr. W. B. Richmond and Mr. Somers Clarke appeared in the *Times* of Friday last week, urging that Stevens' great work, the Wellington Monument, should be removed from its miserable position in the side chapel and put where it was tended to go in the nave, and completed with the equestrian statue which Stevens designed for it. We have urged this over and over again in the strongest manner, and we are glad to see any fresh attempt made to draw public interest about it; but we imagine Messrs. Richmond and Clarke might just well talk to the winds. It is a matter which the English public mind is entirely dead and indifferent.

ARCHITECTURE AT THE ROYAL ACADEMY.—III.

1,740. “A Country Museum and Institute.” Mr. Gerald C. Horsley. We hope this is executed building, or to be executed. It is very original and picturesque design, very well suited to express the class of building named. The ground story is in plain course masonry with windows introduced in a purely utilitarian manner where wanted, and a round-arched doorway in the centre; above the string is a band of what we presume would be colour-decoration in tiles, a large symmetrical design; above this niches with seated statues serve to decorate the wall space; the building of course top-lighted. No. 1,739, a slight sketch by the same architect, shows a peculiar “rood-screen from S. Maria Maggiora, Bergamo,” with a very tall slender cross; crucifix rising over the doorway, the crucifix being shaded by what looks like a piece of embroidered cloth hanging over supports on a crucifix so as to make a semicircular hood over the figure, and a long droop at each side.

1,741. “A Reception Room.” Mr. Rok Hill. A coloured geometrical drawing showing a pleasing decorative treatment with woodwork and a warm tinted wall, probably intended for gold decoration; over the striated course are wall paintings in semicircular lunettes.

1,743. “Church of St. Luke, Richmond, Kent.” Messrs. Goldie Child & Goldie. A modern Gothic church in Early English style, chiefly noticeable for the solid and massive treatment of the junction of tower and spire, little heavy in effect, certainly.

1,747. “East Window of St. Hilda's, Darlington.” Mr. A. O. Hemming. A crucifixion subject filling three high and narrow lancet windows, designed in one plane and with good effect of colour. It would have been better, however, to have avoided the repetition made across the three windows by divisions of the subject by conventional lines; the windows might have been grouped and regard to subject without being actually connected in regard to the lines of the design. It is questionable whether this should be done across an ordinary mullion; but it certainly cannot be done with good effect across piers dividing separate lancet lights.

1,748. "Tom Tower, Christ Church, Oxford": Mr. T. L. Worthington: an effective little bit of architectural drawing in water-colour.

1,749. "A pair of Park Gates": Mr. George Aitchison, A.R.A. A design in wrought iron, of which we shall give an illustration shortly; there is a certain special character about it, as it is in general feeling of Renaissance type, but the large conventional leaves and the frames of the monogram panels are in a more free and less conventional style than the ordinary Renaissance leaf. The thin spirals contrast well with these broad leaves. The thin reposed treatment of the larger details is well indicated in the drawing. We should much like, however, to take a pair of cutters and chip off the two sprays of realistic foliage in the crowning ornament of the gate. This mixing of realistic with purely conventional elements is one of the prevalent weaknesses of wrought ironwork in the present day, and we wish Professor Aitchison had avoided sanctioning it by his example.

1,751. "Royal Yacht Club House Hunter's Quay Scotland; competitive design": Messrs. John Burnett, Son & Campbell. These are two drawings in one frame, slightly but effectively sketched in brown ink on a toned paper. No plan is given, but the design is picturesque and suitable for a yacht club-house; the rounded wing, with its open gallery under the eaves of the high roof, is a good incident in the design and gives it a good deal of its special character.

1,752. 1,753. One of these is described in the catalogue as "study for a country mansion in the manner of the eighteenth century," and the other as study for the same "in the early style of the Georgian period," both by Mr. F. W. Froug: they should have had one title, for they are front and back views of the same building. They are pretty little delicately-tinted elevations, and represent with correctness and good taste what they profess to represent; but we do not think much "study" is required to produce this kind of thing.

1,755. "Towers of Ely Cathedral": A. Needham Wilson: a good little pencil sketch.

1,756. "Design for Bronze Gates and Grille": Mr. John J. Shaw. This is hung too high to be well seen, especially considering the peculiar execution of the drawing; if the author had adopted a method of drawing that would have shown the detail more completely he would probably have got a better place for his work; all that can be said, as it is, is that the general effect appears rich and suitable to the material.

1,758. "Gamekeepers' Lodge, Sidbury, Sidmouth": Mr. Walter F. Cave. An artistic monochrome sketch of a lodge which is rather too obviously intended to be "picturesque."

1,760. "Offices, Blue Hart Court": Mr. Basil Champneys. As to general treatment this is a good and suitable bit of office architecture; the drawing, evidently made in a hurry, hardly does justice to the building or the draughtsman. The windows of the several storeys are grouped under lofty vaulted arches, down the centre line of the piers of which are fixed the rain-pouts, whether with an absolute intention to bring them into the design or not one cannot say. As such appendages are inevitable, it seems reasonable that they should be made to work into a design and not interfere with it. It is a pity that the old-fashioned and heavy brick window dressings of the Georgian era should be repeated and perpetuated as they are in this and other designs of similar proclivities. Those on the windows of the octagonal angle turret are mere excrescences, out of all proportion to the windows which they encrust.

1,764. "Design for Stained Glass": Mr. G. Parby. A triplet design with an angel in the centre compartment and a seraph in each of the side ones, which claims notice for its fine colour effect as well as a certain originality of conception in the subject. The architectural canopies are however much too heavy and solid in effect for stained-glass design, and seem to crush the other portion; at least this is the effect in the drawing.

1,766. "Design for Courts of Justice, York": Mr. Henry T. Hare. This is a well-executed water-colour drawing, and a design suitable enough in general style for Courts of Justice for a moderate-sized town. It is Elizabethan in general feeling, but with some originality of treatment; there are two projecting wings with a recessed centre kept lower, and occupied on either side of the door by two very large multi-paned windows which contribute more than anything else to the character of the design.

The balustrade line is broken by what the French call a *fronton*, a convenient word (as the French have applied it at least) for which we have no precise equivalent in English. The use of a bright blue in the shadows is intended to give a sunny effect to the drawing, we presume, but it is overdone and has rather a tricky effect, nor is there any obvious reason why some shadows should be treated this way and others not.

1,770. "Selby Abbey, from the South-east": Mr. Arnold Mitchell. This is the drawing from which the view of Selby Abbey in the New Year's number of the *Builder* was published; it is a style cleverly contrived, and which its author may be said to have invented, for suggesting a great deal of effect and contrast without heavy tinting. The wall colouring and surface are conveyed to the eye by elaborate "jointing" without interfering otherwise with the original surface of the paper, except at the upper portion of the building, where a slight Indian-ink brush tint gives the required dark effect against the sky, and enables the artist again to leave the lead roof an expanse of white, its construction only indicated by two or three lines suggesting the rolls. The ground in front of the building again is simply an exposure of white paper, contrasting with the jointed surface of the walls. A few darks touched here and there on the windows and elsewhere complete the scheme. There is a great deal of charm in this "harmony in grey and white," and a delicate sense of "values" is required to carry it out with effect; but it must be remembered that the result after all is a sketch rather than a picture, though of a highly artistic character.

1,772. "Buller's Wood Chislehurst": Mr. Ernest Newton. One ought to have a plan to appreciate this drawing, which merely represents a part of the garden side (apparently) of a house, with no indication of the meaning of the drawing. It is a remarkably good specimen of picturesque effect produced in pen line, accompanied by an apparently studious avoidance of anything that can be called architectural detail. There is no doubt a reticence in this which is expressive of home-like repose and is in good taste in a negative sense; it is a fancy with a certain school of architects at present to design houses with a studious avoidance of design, and this very negative quality gives such designs a certain recognisable and individual stamp of their own; but we regard this as little more than fancy of the moment. Those who do this will soon get tired of it, and will find out that architecture means architectural design after all, and not square chimney stacks with no finish to them.

1,774. "New Staircase, Remishaw Hall, Derbyshire": Mr. F. Moore Simpson. There appears to be some nice detail about the wall treatment of the staircase; at least the effect at a distance is good; but it is too high to be seen.

1,776. "Wrexham Church Tower": Mr. Arnold Mitchell. This is another example of admirably artistic sketching on the same principle as illustrated in the drawing of Selby Abbey, but in this case in pen line; the upper part of the tower is a little more worked upon and shaded than the rest, which is reduced nearly to an outline drawing, white against a shaded sky giving background to it. As a pictorial effect this is admirable in proportion to the means employed to give it, but the drawback is that it does not really represent the effect and expression of the tower, which is in fact a dark weather-stained mass of masonry. We also regret, in architectural drawing, the revival by so good an artist as Mr. Mitchell of the system of representing, for instance, the inner angle formed by the junction of wall and buttress by a strongly-marked vertical line drawn with a ruler. There is no "line" at such a point of junction of two planes; during the last few years the convention of representing it by a line had been tacitly abandoned by the best architectural draughtsmen, and it is a pity it should be revived.

1,778. "20, James-street Buckingham Gate": Mr. R. T. Blomfield. This is a small coloured perspective signed "inv. et del." by the architect, with a great deal of character about it both as a design and as a drawing. It is a vertical strip of London street house architecture, with a small plan in the corner; the whole is in bright red brick, which has been shown by patiently spotting on each brick with the brush, leaving whites between, instead of the easier

but more mechanical process of showing the pointing by lines in opaque white. The result is to give a special character and texture to the drawing, every part of which, the touching of the windows, the tone of the sky, shows a feeling for colour which makes the drawing a very complete whole, with a distinct effect of its own. The design is simple enough, and includes little ornament except a broad band of carved brick across the front about the springing of the stepped gable; the walls are relieved by courses of light-coloured stone, and the entrance treated as a segmental arch with alternating brick and stone voussiors. The house is set back a little from the street line, and one wall brought somewhat forward as a lintress; the front space is enclosed by some delicate wrought-iron railing. The whole is thoroughly artistic in feeling, though we do not see the logic, architecturally, of stopping the band of ornament by little engaged brick columns on brackets, which carry nothing.

FURTHER NOTES ON ACADEMY PICTURES.

A PROMINENT place in Gallery I. is assigned to Mr. Kennington's "Homeless" (24), in which the painter repeats the same class of subject as that with which he made such a success last year. This is a life-size painting of a poor outcast child apparently found fainting on the pavement of a London street by a benevolent woman. It is a pathetic picture in expression, rather marred by the prevalent dull grey tone which seems to pervade everything in the picture, and gives it a somewhat unreal effect. Among the noticeable pictures in this room is Mr. Wyllie's "Davy Jones's Locker" (81), a painting of seaweed and a big rusty anchor at the bottom of the sea, said to have been studied from the glass window of a diving-bell, a characteristic example of the trouble which painters will take nowadays in search of a new motive for a painting and in the effort to render the subject with fidelity. The fish, which are admirably painted, seem almost to glide through the water as one looks; the effort is a complete success in its way. Mr. David Murray's "The White Mill" (43) is a fine and truthful piece of landscape-painting, except in one odd oversight; the sails of the mill are so long that they would dig into the ground in turning, or rather could not possibly turn. A much finer landscape is Mr. Macartney's "Moorland" (57), a picture in broad and grand style. Mr. Oules's portrait of the "Mayor of Bradford" (74) in his robes is an exceptionally fine specimen of what may be called the class of official portrait. Mr. Seymour Lucas shows both very fine colour and a good deal of humour in "The Loving Cup" (4), a picture in which some seated figures at a table look on with various shades of satirical expression at the exchange of the cup between two ho-bred standing figures in the centre, whose "love" appears to be of a purely ceremonial cast; the principal figure is effectively relieved against a panel of crimson cloth behind the chair. Mrs. Merritt's "Love Locked Out" (32), a not very ideal Cupid leaning against a gilded door, seems to be partly suggested, in motive and scheme of colour, by some of Mr. Watt's recent Cupid pictures. A good little nude study by Mr. Godward, "A Pompeian Bath" (42) is to be noted in a corner of the room. What induced the Academy to purchase under the Chantry bequest Mr. Macbeth's painting of "The Cast Shoe" (19) we cannot understand.

Mr. Nettleship has hardly added to his reputation by his sensational and improbable picture "The Abyss" (110), an antelope leaping into a chasm with a lion perched on his back. It is impossible the animal could have taken a leap with such a savage burden on him, and we surmise that lions know better how to take care of themselves than to let their natural prey pitch them down a precipice. Mr. Abbey's "Mayday Morning" (109) appears to be a joke, and one not worth the canvas expended on it. Mr. Adrian Stokes's "Off St. Ives" (137) is to some extent a repetition of his study of breaking waves in the New Gallery, with some fishing craft added; it is a good picture, but not equal in sentiment to his beautiful work last year, the "Harbour Bar." Mr. Sokes, however, can paint sea, which cannot be affirmed of Mr. Leader, whose "Sandy Margin of the Sea" (131) is admirable as far as the study of sandhills is concerned, but very bad in the sea, which is hard and steely. Mr. F. D.

Millet's interior "How the Gossip Grew" (151) is one of his admirably-painted scenes of furniture and figures of the Georgian era; a picture totally devoid of sentiment or true pictorial effect, but which makes its mark from the thoroughness with which all the details and costumes are studied. Mr. J. Farquharson, a painter of very versatile abilities, shows himself this year as a painter of Egyptian architectural remains, "Luxor" (115) and "Karnac" (177). Among the portraits in this room is an admirable bust portrait of Mr. E. A. Waterlow, by Mr. Alma Tadema; Mr. Richmond's portrait of the present Bishop of Durham (121) is also a success among the portraits of the year.

Mr. Watts's child portrait, "Hester Fraser Tytler" (196), in Gallery III. can hardly be called a satisfactory example of his work; a little girl with very pink cheeks and hands that seem made of wool; it is eccentric altogether both in texture and colour. Mr. Briton Riviere sends a very clever little character picture under the title "Bus in Urbe" (224), a country lad with his collar scented at a street doorway, the dog desperately excited, apparently, at the sights and sounds of the street, the lad looking puzzled and *distrustful*. Mr. H. W. B. Davis's "Picardy Dunes" (212), a study of sheep in a barren undulating sandy waste, is the best work he exhibits this year, and particularly fine in colour. "The Birth of a Titan" (265), by Mr. Wylie—a large ship just launched; and "A Glimpse of Loch Katrine" and "Old Sherwood" (271, 279), both by Mr. MacWhirter, are among the small things in this room to be noticed, as also Mr. Woods's bright and effective Venetian scene, "La Promessa Sposa" (278). Mr. Burgess and Mr. Orchardson exhibit their diploma works, the former a very clever study of two priests under the title "The Freedom of the Press" (337), at which the holy fathers are much scandalised; the latter a rather washed-out looking painting of a figure of a girl walking in a breeze on "The North Foreland" (338), a picture certainly not exhibiting the artist at his best; but, as we have previously had occasion to remark, artists know better generally than to throw away their best efforts on a diploma picture. Mr. Calderon's "Hagar" (327) is a somewhat stayer-looking woman backed by a "practicable" rock also suggesting the theatre. Mr. Pettie repeats his "motive" of two or three gaily-dressed young people flouting along a country road, under the title "The World Wants Very Well Then" (302) a title the significance of which in relation to the painting is not in any sense very obvious.

Mr. Sauber's large painting "The Golden Lure" (202), a life-size nude figure, representing Ambition, borne upon what we find from the quotation is meant for a huge bubble, is a painting of the *Salon* type, effective in a sense, but by no means rising to the height of the subject. Passing to Gallery IV., we find among the most successful pictures there Mr. Calderon's portrait under the title "Lady Betty," a seated half-length of a fine young woman with the clear complexion of perfect health well represented in the face; she has fiery red hair which forms an element of colour in the picture, and a grey-furred crimson cloak; the rings on her finger, minutely shown, form a little point in the scheme; she turns round in a little point in an attitude and expression of distinction. This latter quality should go for something in painting a lady, though Mr. Sargent thinks otherwise, for in his "Portrait of a Lady" (421), so-called, he seems to have studied to avoid every appearance of dignity or refinement, to have given her face a vulgar smirk and her hands a vulgar action, bunching up in them a part of her voluminous skirt. The picture is a kind of advertisement to any lady who values a reputation for refined and ladylike manner not to allow Mr. Sargent to paint her portrait. Mr. Jacob Hood's portrait of Miss Shaw-Lefevre is refined in pose and expression but rather dingy in colour. Mr. Herkomer has rather a sensational kind of portrait of "Mrs Arthur Sassoon" (411) in a light dress, relieved against the dark, nearly black, shadow in a doorway, the architectural framework of which forms a kind of contrast of parallel vertical lines against the undulating lines of the figure. Among minor pictures in this room may be noticed "Sea Breezes" (380) by Mr. J. Olsson, a coast scene full of light and wind, only the breaking waves are not drawn at all, merely a shapeless collection of foam; "A Summer Shower" (345)

by Mr. John Brett, one of his smaller contributions; Mr. Boughton's "Puritans' First Winter in New England"; Watching for the *Fortune Relief Ship*" (392)—the pale pretty girl in Puritan costume whom we know so well may watch in vain, for no ship will sail over the sea as painted by Mr. Boughton; "North Comes the Moon" (410) by Mr. Walter F. Stocks, a pretty landscape of the romantic order; "The Haven under the Hill" (420) by Mr. Sidney S. Morrish, and "The Old Farm" (429) by Miss Florence A. Saltmer, a small landscape with a great deal of merit.

Gallery V. includes a remarkable little work by Mr. Swan, "The Piping Fisher-boy" (465), a small nude figure of a hoy lying face downwards on a rock piping to fishes in the water. There is a mingling of poetic fancy with fine execution of the figure in this little work, which gives it a peculiar interest. Mr. Leader's "Where Sea and River Meet" (458) is again a good study of sandy foreground and vegetation with a very bad sea; Mr. Leader has not a notion of painting the sea, and had better leave it alone. Mr. Brett's "Echoes of a Far-off Storm" (472) is his principal picture this year, and is in his best style of realism, but it is so nearly a repetition of the effect and composition of a painting exhibited there a few years ago that we at first regarded it as an instance of a work re-exhibited. The title accounts for the combination of a certain amount of surf on the beach and the rocks with perfect calm in the water in the shallow pools on the shore; the sky shows an indistinct line of darker tone among the clouds near the horizon, which we presume is also an indication of the distant storm; that effect taken from nature? It does not give us that impression. Mr. Albert Moore's "A Summer Night" (487) is one of the largest and most elaborate of his paintings of women who have nothing to do but look decorative; we look from a terrace under a verandah festooned with yellow flowerets, on to a twilight sea; three or four women, half nude, half draped in saffron drapery, recline or sit in indolent attitudes on couches with a delicately designed stuff; it is very harmonious in its way, but totally devoid of intellectual interest. "Mrs. McCorquodale and Children" (486) by Mr. Long, is a life-size portrait group with a great deal of bright colour, harmonious in general combination, hard in texture. Mr. Brett's "Harlyn Bay" (513) is one of those brightly-lighted warm scenes of summer sea which suggest the desire to bathe, but the possibility of doing so is perhaps even more strongly suggested by Mr. Hugh Wilkinson's "Calmday on the Coast, North Wales" (514) which hangs next to it, showing an inlet or small bay flanked by dark rocks and with a shingle beach as foreground; this is a piece of realistic painting so successful as to make one look out for what its author may produce in future. Mr. Knight's "Lengthening Shadows" (517), Mr. Herkomer's portrait of "Miss Vlasto" (502), and Mr. Sant's "Oliver Twist Walking to London" (507) are among the contents of this room; the latter a picture of considerable pathos, though unsatisfactory in colour.

In Gallery VI. is Mr. Moore's "Storm Brewing" (544), not so entirely fine as his other work of this year before mentioned, and considering there is a storm brewing the vessel in the distance seems to be carrying all canvas in a somewhat rash manner. This has for pendant a curious picture by Mr. Nowell of "Lucerne" (554), with strawberry-ice clouds which spoil what might otherwise be a good landscape. Mr. White's "Ups and Downs" (581) a subject of children see-sawing, is redeemed from commonplace as an attempt to paint the effect of an endless expanse member to have been treated before in painting. Mr. Musgrave's "Summer Seas, Cornwall" (619) is a clever echo of Mr. J. C. Flook; Mr. Meyerheim's "A Bright Day in February" (630) is one of his usual wooded scenes with cattle in a rather conventional but very pretty style; Mr. Cadogan's "Loch of the Lowes, Dunkeld" (636) seems to have been suggested by Sir John Millais' treatment of forest land in "Murthly Moss"; Mr. Cotman's "Where the Stour and Avon meet" (644) is a rather hard but presentable painting of Christ Church, Hants; and in "Benighted" (645) Mr. F. Frolich has realised a remarkable effect of moonlight.

In Gallery No. VII. Mr. Sargent again does his best to make his sitter ridiculous in his portrait of "Mrs. K." (652); we presume there

are some sitters who like being made gypsies of it is a taste which will probably not last very long. This room contains a grand mountain landscape by Mr. Johnson, "The last light" (687); a great rounded mountain, purple in the distance, shuts off most of the sky, leaving only a bright windy opening between its shoulder and the dark clouds; in the middle distance a lower hill catches a strong light. This is painted in a broad and grand style, and is both style and sentiment is one of the finest landscapes in the Exhibition. Mr. Macwhirter exhibits a large and spacious-looking view of "Mount Etna from the Greek Theatre Taormina" (708). Among other landscapes, Mr. Langlands's "Golden Autumn" (701) is a good painting, but not golden by any means in its effect—dingy autumn, rather; and Mr. Parsons's "A Bend of the Avon" (715) is an exquisite bit of river scenery. Popular subjects are represented in this Gallery by Mr. Dudley Hardy's "The Dock Strike" (671), a grey uninviting looking picture; and Mr. Geoffrey's "Ullavabo" (678) in a little boy's school, apparently a work with some character and humour but too high to be well seen.

In Gallery VIII. we may notice "Love's Stratagem" (743) by Mr. Heywood Hardy as a good painting of horses and riders, and Mr. Nohle's "By the Linn Pool" (759) as a rather powerful landscape in a very conventional style, an example of the old-fashioned practice of picture-making, rather than a representation of nature; but good of its kind. Mr. Seymour Lucas's "Mrs. Edward Greaves" (800) is a very pleasing portrait of the realistic order, bright in colour, expressive in feature, and very happily posed in its graceful standing lines of composition. In Gallery IX., devoted as usual to rather small pictures, we find Mr. Tadema's beautiful interior with a portrait figure of "Mrs. Ralph Sneyd" (900). Mr. Tadema has been trying the same experiment here which he tried so successfully in the background of a picture in the New Gallery, of repeating the same colour in decorative detail and in flowers adjoining it; in this case the elements are the red glass in the window and a group of red flowers closely adjoining it. Mr. Brett's "Mist off the Sea" (962), a comparatively small work, is one of the best of his contributions of this year.

In Gallery X. it must be extremely instructive to foreign artists who are visiting the Gallery to notice the place of honour assigned to such a piece of rampant absurdity as Mr. Sidney Cooper's "Casualties in the Hunting Field" (1,004). Mr. Hacker's "Væ Victis" Sack of Morocco by the Almohades" (1,005), is merely an excuse for drawing a number of semi-nude figures lying about the floor in theatrical confusion; a scene totally unreal and only looking like a stage effect in a melodrama. Mr. Blake Wirgman's portrait of "Sir James Hannen" (1,068) is one of the best portraits of the year in character and execution.

In Gallery XI. Mr. H. S. Tuke's "Persene and Andromeda" (1,076) is another instance of the ridiculous manner in which painters will reduce a poetic legend to the most ordinary prose. This is nothing but a couple of life studies of figures with most commonplace physiognomy, worked up with the necessary accessories and given a fine name. A pretty portrait of "Miss Ness" (1,085), by Mr. Walter Horsley, and a landscape by Mr. M. Lachlan, "The Last of the Light" (1,086), should be looked at, and we pass on to an admirable landscape by Mr. David Murray, one of the best things of the year in landscape, "The Young Wheat" (1,090). This is a wide expanse of field coloured by the green shoots, and a wide expanse of sky above it, with a belt of low hilly landscape in the distance dividing them. This is a really fine work, true in effect and with that unity of feeling about it which makes a real picture in the true sense of the word. Mr. Simmons's "John Anderson my Joe" (1,089) is at least a bold and original treatment of the subject, representing a man in a waterproof pilot coat kissing his wife; his back being turned to the spectator, neither of the faces are seen, yet the sentiment intended is well conveyed. "La Conyck, Serk" (1,092) is a good landscape by Mr. W. A. Toplis. Mr. Joseph Clark's one contribution to the exhibition, "The Cup that Cheers" (1,117), representing three old dames at tea, is not one of his best works, and perhaps its place in the hanging is intended as a gentle hint to this effect. Mr. Clark's best power lies in the painting of children and young people of the rustic type; at

ALTARS IN THE SOUTH A

PHOTO LITHO. SIMMONS & CO. 22, MARTIN LANE, CANNON ST., LONDON. E.C.

events this picture is the least interesting his that we have seen. Mr. Jacobm Hood's large painting of "The Witch's Dance" (1866) represents a naked witch standing in the centre of a rock from which fire issues, with lance of draped figures round her; the central figure is fine and well studied, and one or two of the others are remarkable in their expression, but regarded as what it is intended to be, a piece of "devilry" it is on the whole newhat tame. Of the Academy sculpture of the year we will say something on another occasion.

CLAIMS ON COVENANTS TO REPAIR.
SIR,—In your issue of May 10 you published note relative to a recent decision of the Court of Appeal as to the meaning of the words "tenantable repair." I enclose in connexion with this subject some correspondence of recent date with many of your readers. It illustrates a very common practice in London—namely, that of a demand by landlords at the end of a lease for a larger sum for dilapidations than is justly due to them. The object of the landlord is not only to obtain as much money from an outgoing tenant as it will cost him to put a lease in repair, but to obtain a sum over and above that amount, which balance goes into his pocket as cash. This is a thoroughly dishonest and reprehensible practice, but it is often successful, because many tenants scarcely know their legal liability, or are so businesslike that they are altogether in the hands of a landlord who is in the habit of making money when leases fall in. It will be observed that in the present case a demand was made the landlord for loss of use of the premises and that the house was being redecored. This demand for which in nine cases out of ten there is absolutely no foundation. There is no legal authority of any weight in support of it. The case of Woods v. Pope, which is relied on by some writers, occurred so long ago as 1835, and was in the first instance a case heard by a jury, when the plaintiff's counsel mentioned that the judge merely remarked that it was a wrong one, but that he should leave it to the jury to decide. A new trial was moved for, but was refused because the verdict was for less than £100, and because the Court were disinclined to question a decision of the jury on a matter left to them as a question of fact. There is really no sound legal ground for this contention as a general rule, though cases may occur, as where a tenant is actually prevented from entering by a man being in possession of a house, in which some damages in respect of loss of rent will be fairly due.

In the present instance the house was redecored before it was quieted by the tenant (D.), and the amount at which the tenant's surveyor placed the necessary cost of repairs he done well was 115*l.* The landlord (B.) was not aware of the amount at which the tenant's surveyor had arrived, and on the expiration of the lease sent in a demand for 10*l.* for dilapidations, and 10*l.* 10*s.* for loss of use during the time which would be occupied by the repairs. This latter charge was purely arbitrary, since the repairs when the demand for dilapidations had been sent in had not even begun. It well exemplifies the absolutely illegal manner in which such claims are made. This demand the tenant replied by sending a cheque for 104*l.* 17*s.* 6*d.* for dilapidations, and offering to pay the sum demanded for loss of use. To this the landlord A. B. replied as follows:—

"April 12, 1890.

DEAR SIR,—I have to acknowledge the receipt of your letter, enclosing an order for 104*l.* 17*s.* 6*d.*, and in reply, I have to say that I cannot accept your sum in payment for dilapidations at ———, it will not suffice to carry out the necessary repairs. I will, however, make you an offer (but it is not without prejudice to my legal rights), to accept the sum of 140*l.* as mitigated damages, and I will claim the sum of 10*l.* 10*s.* for loss of use of premises while the repairs are being executed by Fletcher on Dilapidation, page 59). If you are inclined to adopt this conditional proposal, I will ask you to appoint a properly-qualified person to act by name, Mr. ———, to go into the matter in the usual way, herewith return your order, and am, yours faithfully,
 A. B."

The reply of the tenant was as follows:—
 "April 15, 1890.
DEAR SIR,—I was not in town yesterday, and my letter of 12th inst. therefore did not come to hand till this morning. As regards your claim for loss of use, I must repeat it is inadmissible. Fletcher

on Dilapidations' is no binding authority. In each case an actual loss of a tenant's rent must be proved. In the present case no such loss can be proved; therefore the claim is invalid.

As regards the claim for dilapidations, I should be willing, for the sake of ending the matter, at once to pay you 10*l.* more, — viz., 115*l.*, — and will forward cheque for that sum should you accept this offer. If you are not willing to accept this sum, the matter must take its course, and your claim must be investigated by an official referee. — I am, yours faithfully,
 C. D."

The landlord's reply was prompt, and was as follows:—

"April 16, 1890.

DEAR SIR,—If you will send me an order, 115*l.*, as named in yours of yesterday, I will accept it, so as to settle the matter at once, although it will not pay the cost of my loss (3).—Yours faithfully,
 A. B."

This correspondence really requires no further comment; leaving the claim for rent out of notice, the landlord accepted as nearly as possible two-thirds of the sum claimed by him in the first instance. Dropping down 29*l.* at the first instance, as soon as the official referee is mentioned, he comes down another 25*l.* without any resistance whatever—merely stating, for the sake of decency, that it would not cover his loss. To use the right word, such attempts to obtain money are dishonest, and it is to be regretted that many builders and surveyors are parties to such attempts—swelling out claims simply to give their employers plunder of this kind.

LEX.

THE LAST OF OLD-SQUARE, LINCOLN'S INN.

HENRY DE LACY, the redoubtable Earl of Lincoln, died on February 5, 1811, and was buried in the St. Dunstan's Chapel, St. Paul's Cathedral, beneath the tomb which Dogdale and Weaver describe. The gateway of what had been his town house in Chancery-lane, and wherein he died, was begun in 1507, by Sir Thomas Lovel, K.G., who had received the honour of knight-banneret on the battlefield at Stoke. He became a great benefactor to an Inn of Court which, in the course of various changes, had been established here on the properties of the Bishops of Chichester and of the Earl of Lincoln. The bishops owned an estate here from the time of Ralph Nevil, in the reign of Henry 111, to about 1540. Chichester-rectors and Bishop's-court, on the western side of Chancery-lane, survive to this day.

Lovel built his gate-house with bricks and tiles made of clay taken from the adjoining Cogeharth, or William Cotterell's garden. It has no peers in London save Cardinal Morton's at Lambeth, and those of St. James's Palace, the Charter-house, and St. John's, Clerkenwell. In a "Note" of our current issue we advert to the proposed demolition of this gateway, and of some adjacent buildings of the Inn, now styled Old-buildings, or Old-square, but formerly known, in their entirety, by the names of Gatehouse, Dial, Kitchen-garden, and Garden Courts.

From a privately-printed, but incomplete, volume (1849), being an edition of William Melmoth's "Great Importance of a Religious Life," which Walpole wrongly ascribes to John Perceval, first Earl of Egmont, we extract the following particulars as to the dates of these buildings.* The kitchen (since converted into chambers), south of the old Hall, was built in the year 1557; twenty-five years later were erected some chambers over the kitchen, and over the passage which leads out of Kitchen-garden-court into Gatehouse-court. In 1602-3 Chancery Lane-row, north and south of the gate, was pulled down and rebuilt; extending respectively to the houses of Sir John Tyndal, Knight, and John Bevington. In 1608 it was ordered that the Long Gallery towards Bevington's house, and the Short Gallery, be rebuilt, as also what is now the southern side, Nos. 21-3, of Old-square. In 1609, Chancery Lane-row was to be extended by twenty chambers, having three stories above the ground floor, on a return (Nos. 7-9) facing the northern side of the chapel; and in the next year it was ordered that a third uniform block of sixteen chambers (Nos. 10-3, Dial-court) be made next westwards of the chapel.

In 1614 the "House" was to be divided into the four divisions, or courts, whose names we

have already mentioned; and in 1618 it was ordered that the chapel, its "fit model" having been committed to Inigo Jones, should stand in the "east" court. The new chapel was ready for opening on Ascension Day, 1623, a faculty having been obtained by Mr. Noy for pulling down the old one. Noy was a Master of the Bench, and the order for the faculty bears date June 19, 1623. This seems to determine certain doubts as to whether Inigo Jones's fabric occupies, or not, the site of the former chapel.

Of these chambers the greater portion, being Nos. 2 to 15, have been severally demolished within the past ten years. Some of them are replaced by two of the new blocks, erected between 1882 and 1887, after the designs of the late Sir G. G. Scott. Dial-court, including Nos. 13, together with the Council Chamber, that stood against the western wall of the chapel, was removed in the autumn of 1881, for lengthening by one bay, westwards, or 21 ft. internally, of the chapel. In the ceiling of a room at No. 13, lay an oaken beam bearing the initials "T. S." [Thomas Sanderson], with motto and date "Sans Dieu Rien, 1596." At No. 13, too, on the second and third floors, Thurloe, Solicitor-General to Charles I., and Lord Chief Justice of the Common Pleas, had chambers. It was in Dial-court, and not, as is commonly supposed, at his other chambers in this Inn—now No. 24, Old-square—that were accidentally found in the garret-ceiling, the mass of papers which Lord Somers caused to be bound in folio volumes, and which Thomas Birch edited in 1742.

Thus has it come about that of the original sets of chambers only Nos. 1 and 26, both in the gate, and Nos. 16 to 25, south of the (old) hall, now stand. The square-headed doorways, the exterior chimneys of "stock" brick, and most of the casements are comparatively modern. But a few lattices yet remain, and at No. 24 (tower staircase) and in the Chancery-lane front may be seen three or four of the mullioned windows. From some valuable particulars about the history of the "Thurloe" chambers, contained in an article by Mr. A. C. Ranyard in the *Athenaeum* of January 25, 1887, we learn that an early record of the use of distinguishing numbers for the staircases is furnished by an entry in the Lincoln's Inn manuscript "Red Books." The entry relates to the "admittance of a Mr. Hungerford to two chambers in Gatehouse-court and Chancery Lane-row, number (1)." This was in the year 1715. "No. 26" is cited under the year 1720; so we may conclude that by the latter date, which is several years anterior to the general adoption in London of numbers for postal purposes, all the staircases have the same numbers as they bear still, or did bear until, as we have shown, some of them were rebuilt. At his chambers in No. 1 staircase in the gate-house, William Murray, afterwards Lord Mansfield, began practice, removing hence, as Pope's couplet reminds us, to No. 5, King's Bench Walk, Inner Temple. Lord Hatherley, when Mr. Page Wood, had chambers at No. 25, and the late Mr. Tupper occupied a set in No. 21 soon after he was called, and during the time he wrote Part I. of his "Proverbal Philosophy." The "Thurloe" chambers are on the ground-floor of No. 24, looking out into Chancery-lane. Sir Matthew Hale tenanted the chambers over the central arch of the gateway, having previously lived in Garden-court. Mr. Spencer Perceval, who was treasurer in 1803, being then Attorney-General, had occupied chambers in Nos. 20 and 25. Amongst other celebrated men who are known to have resided here, we should not omit to mention Prynne, Speaker Lenthall, and Wentworth. Thurloe went from No. 24 to No. 13 in November, 1659, and it seems, continued there up to the day of his death. His gravestone, beneath the chapel, was inscribed:—"Here lies the body of John Thurloe (sic) Esquire, Secretary of State to the Protector Oliver Cromwell, and a Member of His Honourable Society. He died February 27, 1667." The Vice-Chancellor's two courts, which had been erected within Old-square in 1842, were pulled down in the last two months of 1883, and in March of the next year the court of Sir Lancelot Shadwell, last Vice-Chancellor of England, known to our generation as the late Vice-Chancellor Malins's Court, was demolished. It was erected in 1819, at the north-western corner of the Old Hall. The Chapel was re-opened on April 8, 1883, having been enlarged and repaired, under the direction of Mr. Salter, architect, the contractor being

* Presented to his fellow Benchers of the Inn, by C. E. Cooper, Q.C. Melmoth, born 1666, was called to the bench in 1719; buried beneath the chapel on April 14, 1743.

Mr. Longmore. To our notice of the works in our issue of April 7 of that year, we may add that the communion-table was replaced with one made out of wood from the old roof of St. Alhams Abbey.

Illustrations.

SOME CHURCHES UPON THE LOWER RHINE.—IV.

IN the aisles of the nave of St. Victor, Xanten, are a number of Early Medieval altars, six of which retain their original carved triptych retables. The two finest are close together in the south aisle; one is adorned with scenes from the Passion, and is probably a Flemish work. The wings are beautifully painted, and the whole of the architecture and groups of figures are painted and gilt. The second altar has subjects representing scenes from the life of the Blessed Virgin, but the centre statue is not of the same date as the rest of the work. Beneath the triptych is a most marvellous piece of carving representing the Tree of Jesse, almost Chinese in its extraordinary intricacy and elaboration. The whole of this reredos is of uncoloured oak, and is undoubtedly a work of the Calcar school—in fact, it bears a strong likeness to the triptychs in that church. Two of the other reredoses in the church appear to be of quite a different school, and resemble those which are to be found in some of the South German churches, such, for instance, as Moosberg, Rothenberg, Nordlügen, &c.; they consist, that is to say, of large niches filled with life-sized statues, and are far less complicated and intricate than the works of the North German and Flemish school of wood-carvers. With the exception of the six altars which we have already mentioned, all the others have rather late Renaissance reredoses,—far better, by the way, in design than one usually meets with in German churches. The altars themselves appear to be all Medieval, and form a most interesting study to an ecclesiologist; they have great aumbries cut into their southern ends, and the superaltars, where they exist, are movable features with little doors at their ends; in fact, they probably serve for retaining the candles to be used on the altar. One of these superaltars is very richly painted. The antependia or frontals are of every date, from the sixteenth century down to the present time, and many of them are splendid examples of ancient stuffs and embroidery. One of the altars has an arcaded frontal, like the high altar at Calcar; another of them bears the marks of decorative painting all over its stonework. It would, however, take us too long to enumerate the great number of objects of interest to be found in this most remarkable church, for not only is the building itself rich in every kind of furniture, but the sacristy and Chapter-house are perfect museums of Medieval art. The only features which are modern are the new stained-glass window at the west end, and the great organ-case; however good these may be in their way from a German point of view, we feel sure that every English archaeologist and architect will regret their introduction into a building which is so attractive from the genuine antiquity of all its contents.

H. W. B.

BUILDING FOR THE METROPOLITAN LIFE ASSURANCE SOCIETY.

THIS is the drawing of which we spoke at some length in our article of May 3 on Architecture at the Royal Academy. No plan is given with it, and we publish it simply as a piece of street architectural design of very refined character. The architects are Mr. Aston Webb and Mr. E. Ingress Bell.

BEDROOM IN A COUNTRY HOUSE.

THIS is the second of the two drawings under this title by Professor Aitchison which are hung at the Royal Academy. The explanation given with the publication of the other design in our last issue may be taken as applying to this also.

CHAPEL, ST. MARY OF NAZARETH, EDGWARE, N.

THE illustration is only a portion of a large work Mr. Brooks is erecting at Edgware for the Little Sisters of the Poor. The buildings con-

sist, on the east side, of several rooms for the sisters, and dormitories, with kitchens and other offices, laundry and drying-rooms. On the south side is the Mother Superior's sitting-room, dormitory, and reception-rooms, also the refectory. On the west side are the hospitals for incurables. On the north is the chapel. The enclosure within the several buildings is a large burial-ground, with a cloister on each of the four sides.

The chapel is groined throughout, and has a large choir for the sisters, with an ambulatory on the north, south, and east end of choir. Over this is the triforium gallery, the triforium and clearstory, the height to apex of groining being about 76 ft. On the south side of the choir is the Lady Chapel; on the north are two chapels and vestry; west of the choir come the transepts, with a double cloister on the south side leading to the burial-ground. The nave is without aisles; the ambulatory of the choir is carried through transepts and forms a kind of bridge connecting the triforium of the nave with that round the choir. At the west end is a tribune for the patients in the upper wards when attending service. The materials are red bricks and Ancaster stone. The interior of the chapel is wholly lined with stone ashlar. A part only of these buildings has been erected, and other portions are now in progress. The architect is Mr. James Brooks.

ORGAN CASE, ST. JOHN'S COLLEGE CHAPEL, CAMBRIDGE.

THE organ in St. John's College Chapel at Cambridge was built by Messrs. Hill & Son several years since,—at the time the chapel was rebuilt. The case was then omitted for want of funds. A new design for this has lately been made by Mr. J. Oldrid Scott, and executed, at a cost of about 700*l.*, by Mr. Thompson, of Peterborough. It is admirably carried out, the carved panels and other similar features being especially well executed. The cost has been defrayed by a College subscription.

COMPETITIONS.

Board Schools, Bromley.—The Bromley School Board recently invited a limited number of architects to compete for their new schools at Raglan-road for 700 children. We are now informed that on the award of their reference, Mr. R. Norman Shaw, R.A., the design of Mr. Charles Bell has been adopted, and the works will be commenced at once.

Germany.—A "preliminary" competition for a "Rheinvinz" monument in memory of the deceased Emperor William I., for which twenty-five designs were sent in, has been won by Messrs. Jacobs & Welling (of Düsseldorf). The winners, who have chosen for their site the far-famed "Drachenfels" of the Rhine, have placed the monument on the summit of this rocky height, and faced it with a magnificent scheme of terraces and cascades and have backed it with a Doric hall of monumental proportions.

The Chancery-lane "Safe Deposit."—The quinquennial anniversary of the Chancery-lane Safe Deposit was celebrated on the 7th inst., and the occasion witnessed the opening of the new extension by Alderman Sir R. N. Fowler, Bart., M.P. The accommodation added to the existing 5,750 safes consists of 250 new strong-rooms, intended for deed-boxes, &c., and two additional large strongholds for deposits, covering an area of 20,000 sq. ft.; these were designed principally to meet the requirements of solicitors and trustees who had the care of valuable deeds and other documents. The strong-rooms are fitted with the electric Light, and were arranged under the superintendence of the well-known firm of Milner, limited.

The A. A. Surveying Class.—This month will prove whether the members of the Architectural Association really desire the class for the study of land surveying and levelling to form a portion of their programme, or to be discontinued. The class started well eight years ago, but of late years has fallen off, an indication apparently that the younger members of the Association prefer the study of art to science. Full particulars are announced in the Brown Book. Names of those members desirous of joining should be sent to the Honorary Secretary of the Class, Mr. S. H. White, 7, Church-road, Brixton, S.W.

ON THE PLANNING AND CONSTRUCTION OF HOSPITALS.*

HAVING settled the dimensions of the ward, the next step is to place the beds and set out the windows. In some of the plans shown you will see that the beds are arranged in pairs with one window to every two beds. This plan of coupling the beds has many disadvantages. In the first place, each bed is unduly near one of its neighbours, instead of being placed in the centre of its own air-space; secondly, the ventilation cannot be so perfect as when each bed has a window each side of it; and, lastly, the beds are necessarily so close on one side to the windows that much inconvenience arises therefrom in the shape of draughts and cold currents of air from the condensing surface of the glass. Each bed, then, should occupy the centre of its own air-space, and should be between two windows.

There is one more point to be observed in the arrangement of beds and windows. You will notice that in the wards at the Great Northern Hospital a small window is, in each case, interposed between the end beds, and the end walls, and the length of the ward is increased by the space necessary to get this window in. The reason for this is that it has been observed that when, as is usually the case, the end bed stands in a corner with a window on one side only, that particular bed has acquired a bad reputation as one in which cases have not fared as well as they ought; and the interposition of a window between it and the end wall has had the effect of correcting this bad tendency.

There are certain necessary rooms and offices which must be attached to the wards, and form a part of the pavilion. These consist of a ward-scuttler (or "duty-room," as it is the fashion to call it), a small larder for keeping food, cupboards for the ward linen and for patients' clothes, bath-room, water-closets, sink-room, and lavatory. To these may be added a small ward, or perhaps two, for one or two beds for special cases. The ward scuttler should be immediately adjoining the ward, and is used for washing the crockery used for patients' meals, for making poultices, warming beef-tea, and for the minor processes of food preparation usually done near the ward. It should contain a sink, a small dresser, and plate-rack, and a small cooking-range. Of the cupboards it needs only to be said that they should be well lugged enough, and that they should be well lighted and ventilated. If small wards are required, they should be placed at the entrance end of the ward, and a separate water-closet and slop-sink provided for their use.

The water-closets are usually placed at the further end of the ward. In a long ward there is no doubt some inconvenience in this arrangement, but it is, I think, more than counterbalanced by the interference with light and ventilation that would ensue if the closets were projected out at one side of the ward,—the only alternative to the end position. The water-closets must be separated from the ward by a lobby having windows on each side and doors at either end, in order that there may be no communication of air between the closets and the ward. In order to promote the free passage of air around the building, it is desirable to restrict the height of this lobby to just sufficient to give head-room, and to leave the space between the roof of one lobby and the floor of the one above free and open. The sink-room should be in the same building as the closets, and should be large enough to hold a slop-sink, a sink for washing utensils, and a sufficient storage of vessels not in immediate use. The bath-room must be large enough to hold a bath so placed that only one end is against the wall; and large enough to admit of a patient being wheeled in and lifted into the bath.

As regards details of construction, the first and last thing to be thought of in designing a ward is cleanliness. Everything that favours the accumulation of dust or dirt must be studiously avoided. All avoidable corners, all ledges or recesses, all quirks and unnecessary mouldings, are things not to be tolerated within the ward-pavilion. Floors should be as solid as concrete and solid wood-blocks can make them. The ideal wall surface for a ward has yet to be discovered. Parian cement has proved a costly failure, and glazed bricks or tiles not only have

many joints, but cannot be had of sufficiently true a surface to prevent altogether the lodgment of dust. In France the ward-walls are usually finished with what is called "stuc," which is neither more nor less than some kind of cement painted and varnished. I think myself that there is much to be said in favour of the plan adopted at the Middlesex Hospital. Most, if not all, of the wards were many years ago covered with Parian cement, the surface of which was polished. This proved to be by no means the impervious surface that was expected, and eventually the lower surface of all the walls was covered with a painted and varnished dado, and the space above distempered. Every year each ward is in turn emptied, the distemper cleaned off down to the bare cement, and the walls and ceilings re-coloured. One obvious advantage is that each ward gets a thorough and systematic cleansing at regular intervals, which is probably the best safeguard against septic disease.

The ventilation of a ward is, of course, a matter of the highest importance, for upon its efficiency and thoroughness the health of the patients mainly depends. Ventilation is commonly divided into two classes, natural, and forced or artificial ventilation, the one being accomplished by the aid of open windows and the ordinary fireplaces, the other by the aid of aspirating fans or exhaust furnaces, or a combination of the two. It is impossible for me to enter into the complex details of artificial ventilation within the limits of this paper—nor is there, I think, any great advantage to be gained by doing so. There is, I think, a little doubt that in England the most suitable form of ventilation is the most simple. Opposite windows assisted by the extracting power of open fireplaces supply all that is required, where properly handled, to keep the atmosphere sufficiently diluted. With our humid atmosphere and comparatively equable climate, where the changes of temperature are seldom either rapid or great, there are very few days in the year when ventilation by open windows cannot be resorted to. In America, on the other hand, the changes of temperature are so sudden and excessive and the atmosphere so deficient in moisture, that mechanical ventilation would seem to be a necessity.

The best form of window for a ward is, I think, the double-hung sash, with a hopper-light above. The lower sash should have the deep bottom rail and sill-board, and the hopper should have glazed cheeks at the side, to give the entering air an upward current, and to prevent down-draughts. It is desirable, also, to have some means of admitting air at the floor-level under each bed.

Before we leave the ward-pavilion, I will just refer to the mode in which in many hospitals abroad the wards are raised above the ground upon piers, and the space thus obtained left open for the free circulation of air. The plan is a further development of the pavilion system, by isolating the ward from the ground, and preventing the stagnation of air around the building. We have adopted this plan at the Great Northern Hospital, but in this instance there are additional reasons in the matter of levels and light and air which rendered it almost a matter of necessity.

We now come to the operation-room, which I have not mentioned as a special department, as it is an essential part of the ward or in-patient department. In large hospitals with medical schools attached the operation-room becomes a theatre, with its tiers of benches for students. Where no school exists it should be a room of sufficient size to hold the table, with room all round it for the operating surgeons and their assistants and nurses. Its aspect should be north, and it should have a top-light and a vertical light, and means should be provided for shutting-off entirely either light at will. Everything in the operation-room should be made as aseptic and impervious as possible, and floor, walls, and ceiling should be capable of being washed down with a hose-pipe.

The new operation-room at Chartist Hospital, built in 1886, is a detached building fifty yards distant from the hospital, and with no covered communication between the two. Inside the room everything is formed of washable materials; the surfaces of floors, walls, and ceiling are of cement, the window-frames are of iron, the table and shelves are of glass, and the operation-table itself is of zinc.

At the Derbyshire General Infirmary we have recently rearranged the operation-room, with

the object of rendering it as aseptic and washable as possible. The walls are lined up to a height of about 7 ft. with marble, the vertical and horizontal angles being rounded to a radius of 6 in. The floor is of Mischiati mosaic, laid to a fall with a specially-made fitting of gun-metal, closing the aperture to an open pipe leading out to a gully. The walls above the marble lining are painted and varnished. The sashes, skylight, and doors are all of iron, and every part is flush, no projections of any kind being allowed. The sinks and lavatory-basins are of porcelain, and the tops of plate-glass. The advantage of using glass is that it can be seen at a glance whether the *under* side is clean. All pipes, the lavatory-tops, and the shelf for instruments, are kept clear from the wall, so that no corners are formed.

Adjoining the operation-room should be a room for the surgeons, in which the instrument-case should stand, and at least one room for the administration of anaesthetics. The position of the operation-room should not be too far removed from the wards; at the same time, care must be taken to isolate it from all possible communication with the ward air. It must also be remembered that the operation-room should be quiet, and kept free from disturbing sounds from without.

In many large hospitals there are, besides the large general operation theatre, smaller operation-rooms used for special purposes,—about which it is only necessary to remark that for operations on the eye a vertical light is an absolute necessity, and that for all purposes a north light is the most valuable.

The mortuary and *post-mortem* room must, as I have before remarked, be placed in an absolutely detached building; and must also be at a sufficient distance from the wards to put any chance of contamination of the air of the latter beyond the range of possibility.

Here, again, scrupulous cleanliness is all-important, and every part must be made easily washable. Cleanliness in the *post-mortem* room is of vital importance for the sake of those who have to work there, and I think as much care should be taken to make it washable and aseptic as if it were an operation-room.

The out-patient department is really a separate institution, and except for the convenience of having a dispensary common to both in and out-patients there is really no advantage in having both departments in one group of buildings. It is, of course, also the fact that the out-patient department is the source from whence many of the in-patients are drawn; but this fact certainly does not necessitate the very close proximity between the two departments. The fact is that very serious evils have occurred in the past through the intimate intercommunication existing between out-patients' departments and the wards, and there can be no doubt that the more distinct the two are kept the better for the patients in the wards.

I am unwilling to lay undue stress upon my own work; but in order to illustrate this part of my subject, I must once again refer to the Great Northern Central Hospital,* the out-patient department of which is a one-story building wholly detached from the rest of the hospital. There are two entrances, one for male and other for female patients. These each open into a small waiting-room for new patients, the two rooms being separated by the office for registration. These waiting-rooms and the office open into the large central hall, at the further end of which are grouped the four consulting-rooms, with their small rooms attached for special examination of patients, and a dark room for ophthalmoscopic work. All these rooms open into a corridor which leads to the dispensary waiting-room. The grouping of the consulting-rooms at the end of the waiting-hall rather than at each side, and the arrangement of the corridor at the back, are planned with a view to prevent patients retracing their steps, or, as far as possible, crossing each other. The closets for each sex are entirely outside the building. The dispensary serves for both in and the out-patient department, and as by far the heaviest part of its work is concerned with the latter, it must be placed with reference to it rather than to the former.

One of the most important things to observe in a hospital dispensary is to make it small enough. The work has to be done at such pressure that it is important to reduce as far as possible the labour involved in doing it. A room where the dispenser could reach all

the bottles he requires by simply stretching out his arm without moving his feet would, if it could be made, be an ideal dispensary.

We have now, I think, travelled over every part of the hospital, and considered in as full detail as the time at our disposal warrants, most of the arrangements upon which the health and comfort of the patients depend. Some things I have not touched upon. I have said nothing, for example, of drains, because there is nothing that has to be said of a hospital drain that does not equally apply to the drain of any other building intended for habitation. Neither have I said anything about circular wards, because I wished to confine myself to well-ascertained principles, and to avoid anything of a controversial nature. That circular wards are, within certain limits, as efficient, and, under certain conditions of site, superior to rectangular wards I am convinced, but the main principle involved has yet to be decided by the test of time—a test which will be applied in the new Royal Infirmary at Liverpool, now approaching completion from the designs of Mr. Waterhouse.*

Let me conclude by urging those of you who care to follow up this, to me, most interesting of all studies which fall to the lot of our profession, to learn well the lessons which the experience of the past has to teach us; and above all to study the matter, not from books, but from the hospitals themselves. The most valuable lessons that can be had are those which are got only by careful observation of the daily life of a hospital, and by noting how, by thoughtful care for this or that detail, the great and unceasing work of keeping a hospital clean can be helped and simplified.

The Chairman (Mr. Leonard Stokes, President), having invited discussion,

Mr. F. T. Baggally, in moving a vote of thanks to the author of the paper, said that Mr. Young had made the subject so entirely his own that his paper was especially valuable to them.

Mr. A. O. Collard said he had much pleasure in seconding Mr. Baggally's proposition, for Mr. Young had evidently taken great pains in placing the results of his valuable experience before them. He had spoken of the horrors of the old Hôtel Dieu, which were terrible to think of; but he had also been extremely kind in not calling attention to some of the older hospitals which we had in London, which were in many respects examples of what hospitals ought not to be. Several of our existing hospital buildings would require the expenditure of a large amount of money to put them into proper condition, and it was greatly to be regretted that their defects were not more widely known and more exposed to public criticism than they were. He (the speaker) noticed that in the isolation ward of the London Fever Hospital, Liverpool-road, the walls were of glazed bricks or tiles. He should like to know how alternations of temperature affected the surface of the tiles,—whether they did not frequently become streaming with wet in the shape of condensed moisture; and, if so, what was the effect upon the patients? Mr. Young, in giving them the maximum and minimum limits of cubical space, did not refer to the regulations issued by the Local Government Board. Those regulations were based upon the information provided by doctors and the Board's own professional architectural adviser, and they seemed to be very nearly a mean between the two extremes. They were very useful. Mr. Young had spoken so strongly upon the advantages of natural ventilation whenever it could be obtained that it was not necessary to say more upon that point. Mr. Young had very truly remarked that the subject of hospital planning must be studied, not only from books, but from the actual buildings themselves.

Professor McHardy, of King's College Hospital, in an amusing speech, said that Mr. Young, in his capacity of architect, was one of the best friends of the sick poor which Europe

* Amongst other hospitals with circular wards, we may mention the following, which have been described and illustrated in the *Builder* for the dates mentioned, viz.:—Civil Hospital, Antwerp (July 7, 1883). The "Miller" Memorial Hospital, Greenwich, erected as a memorial to the late Canon Miller, the founder of "Hospital Sunday;" a description and plan of the building, showing circular ward, were published in the *Builder* for Aug. 23, 1884. Hospital for Seaforth Cavalry Barracks, designed by Major-General Sir Andrew Clarke, R.E. (Nov. 15, 1884). Hospital of one story, with circular wards, for Egypt, designed by the Viscountess Strangford (Jan. 3, 1885). Design for a Military Hospital for a hot climate, by Sir Andrew Clarke and Mr. E. Ingress Bell (May 9, 1885). The Great Northern Central Hospital, Messrs. Young & Hill, architects (Dec. 25, 1886).—Ed.

* See plan published in the *Builder* for Dec. 25, 1886.—Ed.

possessed. He (the speaker) congratulated the architectural profession upon the advance which had taken place in the study of hospital planning during the last quarter of a century. Some twenty-five years ago there was opened the Poplar and Stepney Sick Asylum, which to the speaker's notion was the first really creditably-planned and arranged hospital for the sick poor of this country. Since then great advances had been made, and although he (the speaker) had been studying the question and writing upon it for many years, he had now given up writing on the subject, because he found that architects such as Mr. Young were able to teach him. He quite agreed with Mr. Young as to the importance of avoiding all mouldings, or quirks, or whatever they might be called, which would collect dust and dirt; for cleanliness and facilities for cleanliness were most essential conditions for successful nursing. Mr. Young had very well said that the nurses' quarters should be right away from the hospital wherever possible. While it was all very well and very proper to provide all that was necessary for the comfort of the patients, many of whom were hopelessly diseased and incurable, it was not desirable, nor was it necessary, that the nurses should be entirely sacrificed to the patients. It was a melancholy fact that the death-rate of nurses was just double that of any other class of women in the kingdom, and it was eminently desirable that their quarters should be right away from the hospitals whenever possible—i.e., in separate buildings, and not in the buildings where the hospital wards were situate. The nurses must no longer be stowed away in unwarmed and unventilated garrets, or in places where a man would not think of stabling his horse. It was also desirable that they should remember, as Mr. Young had pointed out, that every bed in the ward should have a window on each side of it. It had been noticed that a bed placed at the end or corner of a ward, with a window on only one side of it, was not so favourable in position for the recovery of the patient as a bed with a window on each side of it. The mortality in these end or corner beds had been found to be greater than in the others. Another important point for architects to remember was to insert clear glass panels in all cupboard doors, so that the interiors of the cupboards could be readily inspected. Some women, even hospital nurses, were very untidy, and he had known them make cupboards with opaque doors serve as receptacles for all kinds of filth. In regard to the heating appliances of hospitals, it was necessary to provide sufficient heating-power to meet the necessities of old and infirm patients in the very extreme of cold weather. It would not always be necessary to utilise the heating-power to its full capacity, or anything like it, but it should be so arranged as to afford the means of increasing or decreasing the heating-power, as might be necessary from day to day. As to the regulations of the Local Government Board they were all very well, but he urged architects not to be led by the Local Government Board, but to lead it. The Local Government Board, between the cross fires of opposing interests, was perhaps rather too prone to compromise matters, and compromises were not always satisfactory. Moreover, there was about the Local Government Board, as about all other Government departments, a great deal too much red tape.

Mr. P. Gordon Smith, Architect to the Local Government Board, who was called upon by the Chairman to address the meeting, said that he did not know that he could add anything of practical value to what Mr. Young had so well told them in his paper. He was a little surprised to hear the last remark of Professor McHardy, because as far as he (the speaker) was concerned, he was always only too eager to avoid the entanglements of red tape.

The chairman, in closing the discussion, said they could not be too thankful to Mr. Young for his paper. There was one point, however, upon which he should like to ask a question. Mr. Young had spoken of the desirability of keeping the out-patients' department as distinct as possible from the in-patients' department, with a view partly to prevent any infection being brought into the hospital. But he should like to ask what special precautions, if any, could be taken to prevent out-patients themselves from communicating infectious diseases to each other? He then put the vote of thanks to the meeting, which was carried by acclamation.

Mr. Young in briefly replying, said that no special means of preventing the communication

of infectious diseases from one out-patient to another could be taken beyond the precautionary measures which were taken at one or two hospitals he knew, where the nurse or other official in charge of the out-patients' department exercised all possible vigilance, and at once isolated all patients whose symptoms appeared to be those of infectious disease. As a matter of fact, the form in which infectious disease was most frequently detected in the out-patients' waiting-rooms was scarlatina. The nurse or nurses in charge of the out-patients' waiting-room consequently kept a vigilant eye upon all children, and isolated them in a separate room provided for the purpose until the doctor could see them. Where that system had been adopted it had been found to be very successful.

The meeting was then brought to a close.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

The third annual meeting of this society was held at the School of Art last Tuesday night, Mr. C. J. Innocent, Vice-President, occupied the chair, in the absence of Mr. F. Fowler, the President, who wrote expressing regret that he was indisposed. There was a good attendance of members.

The report of the Secretary, and the Treasurer's statement of accounts, were read, and showed that the Society now consisted of 44 Fellows, 24 Associates, and 6 Students, and that the balance in hand is 557.

The report stated that an invitation had been received last July from the Royal Institute of British Architects to hold the first Preliminary Examination in conjunction with the Institute and the allied societies. Seven candidates had presented themselves and passed, and had been registered as Probationers of the Royal Institute of British Architects, and their names published in the Institute Calendar for the current year. The Council gave a guinea book-prize, and remitted the examination fee in each case to signalise the importance of the inauguration of a series of examinations for the rising generation of architects. Interesting papers had been read on "Engineering Surveying for Railways and Waterworks," by Mr. W. H. Lancashire; "Old English Ironwork," by Mr. H. Longden; "Elementary Notes on the Mouldings of English Medieval Architecture," by Mr. J. B. Mitchell-Withers; "The Valuation of Property," by the President; "Municipal and Sanitary Engineering," by Mr. C. F. Wike, Borough Surveyor; and "The Present State of Questions relating to Quantities," by Mr. T. M. Rickman, of London.

The Council has also supplied information to the Standing Practice Committee of the Royal Institute of British Architects, having received a communication from the Hon. Secretaries, on the general practice relating to quantities in the Sheffield district. The Council has had under careful consideration certain suggestions to accompany the By-laws of the Sheffield Town Council as to new streets, buildings, and plans of the same.

The need of an independent meeting-room and room for the use of the Library was urged upon the members.

The report and balance-sheet were adopted, on the motion of the chairman, seconded by Mr. Gibbs, and supported by Mr. Smith. A ballot then took place, and Mr. W. Farrington was unanimously elected an Associate.

The meeting next proceeded to ballot for the election of Officers and Council for the coming year, Messrs. W. C. Fenton and C. Gibson acting as scrutineers. The following were elected for the season 1890-91:—President, Mr. F. Fowler; Vice-President, Mr. C. J. Innocent; Treasurer, Mr. J. B. Mitchell-Withers; Hon. Secretary, Mr. C. Hadfield. Council: Messrs. T. J. Flockton, E. M. Gibbs, W. F. Hemsoll, W. H. Lancashire, and W. C. Fenton.

The meeting had under consideration "detailed suggestions and particulars relating to the formation and construction of new streets, buildings, &c.," which it is understood will be considered at the next meeting of the Town Council; and as it appeared to the members some of these suggestions would involve considerable expense and trouble to the building public, and might well be modified without interfering with the objects aimed at, it was resolved to memorialise the Town Council on the subject.

THE ASSOCIATION OF PUBLIC SANITARY INSPECTORS.

AT the monthly meeting of this Association, held on the 3rd inst. at Carpenters' Hall, with Mr. H. Alexander in the chair, a paper on "The Drainage of Buildings and its Relation to Health" was read by the Deputy-Inspector of Nuisances of Bristol, Mr. Thomas Lowther. The existence of so many systems of drainage, and the great diversity in opinion among experts, made it, in the lecturer's opinion, highly necessary that "public officers" administering the laws of health should be thoroughly acquainted with the correct principles upon which the drainage of buildings should be carried out. Even where such work was entrusted to professional sanitary engineers, satisfactory results were not always obtained, for generally some local plumber or builder, possessing perhaps but little knowledge of this particular branch of sanitary work was called upon to do it. House-drainage properly carried out was the completion of a perfect system of sewerage. A town might be possessed of otherwise perfect drainage, but health would not be greatly improved if house drains were left in their old dilapidated state. The serious danger incurred by individuals continually inhaling foul gases from defective drains would not be endured but for hygienic and physiological ignorance. Drains in former times were vast in volume, and in them the velocity of passing sewage was so reduced as to lead to a rapid deposit of solid matter. They were thus converted into cesspools that produced gas laid on to the houses as completely as coal-gas could be from a company's mains. Unfortunately in modern houses a similar state of things too often still prevailed. Drainage systems were divisible into four classes, viz., the ordinary, sectional, manhole chamber, and iron connecting pipe systems. In the first, where no means for inspecting drains below ground were provided, and where it was impossible to tell in case of a stoppage where to look for it, and expensive excavations had often to be resorted to. In such systems fresh air inlets should be carried up above the main roof. To assist ventilation, powerful exhaust cowls should always be fixed on outlet vent-pipes to assist circulation. In systems like those of Hellyer, Banner, Buchan, and others, belonging to the "sectional" class, intercepting-traps were placed at the foot of each soil-pipe, and the air inlets being generally fixed right over them all portions were separately ventilated. Such a system was subject to serious defects, and in the lecturer's opinion it should not be applied to private dwellings, but should be confined to infirmaries and similar institutions, particularly infectious hospitals. He would advise the use of lead traps and connecting pieces with wiped lead joints. In any good system the only joint in a house would be that connecting water-closets with a soil pipe outside. The lecturer had for many years practised the "Manhole Chamber system," to which he gave a preference, as did nearly all advanced sanitarians now. In this class drains were laid out in straight lines from manhole to manhole, these being constructed with intercepting traps at angles and at other necessary points. Good workmanship in constructing such drains must be insisted on, and if either stoneware or cast-iron pipes were used, they should be truly laid in a uniform gradient. Stoneware pipes should further be laid on beds of concrete, their numerous joints being particularly liable to get started by vibration resulting from heavy traffic in adjacent streets. In the Scott-Moncrieff system, iron pipes were used in connexion with manhole chambers, fitted in this system with cast-iron manhole frames. Cast-iron pipes, which had been in partial use many years, possessed many advantages, but they were costly, were liable to interior fouling, and a fear was expressed with regard to the Moncrieff frames that unless inspections were frequent, the bolts would become immovable, and thus render this system useless. On account of its simplicity and other advantages, the lecturer considered the manhole system better than any previously brought forward, whether in conjunction with cast-iron or stoneware pipes. Among intercepting traps, Winsor's, Rogers Field's, Crapper's, and Buchan's were described as fairly good, Winsor's 4 ft. by 6 ft. taper traps being thought particularly worthy of mention. Damp sites were, in conclusion, touched upon,—diphtheria, consumption, and other preventable diseases being in

Mr. Lowther's opinion, very frequently induced by constantly breathing air charged with watery particles. Such sites should be carefully prepared by effectual drainage, distinct (if possible) from the house-drains, and the whole site should be concreted.

A discussion followed. Mr. Legg, the secretary, in moving the usual vote of thanks, expressed satisfaction that the vital question of codifying the sanitary regulations of the Metropolis was being considered by the London County Council. A uniform code would add to the number of Inspectors in the Metropolis, the 111 at present in office having a population of 45,000 per man, on the average, to look after. Mr. Fairbaird seconded the motion, which was supported by Messrs. Hills, Tidman, Richards, Perry, Grant, and others, besides the Chairman, by whom the discussion was brought to a close. The vote of thanks having been unanimously accorded, was briefly acknowledged by Mr. Lowther.

THE LONDON COUNTY COUNCIL.

The ordinary weekly meeting of this Council was held on Tuesday last in the County Hall, Spring-gardens, Lord Rosebery in the chair.

Parks and Open Spaces.—The following adjourned report of the Parks and Open Spaces Committee came up for further consideration:—

“Early in 1889 the Council was asked by the Metropolitan Public Gardens Association to undertake the maintenance of certain gardens and playgrounds, mostly of small size, in various parts of London, which the Association had laid out at a cost of 4,277. It is contrary to the rule of the Association to maintain grounds; but they obtain the necessary funds and lay out, either as gardens or as playgrounds, spaces in the poorest and most crowded districts of London; and then, having proved by a short period of maintenance the value of such places for recreative purposes, ask the local authorities to maintain them. Unfortunately, the places being generally situate in poor neighbourhoods, the local bodies themselves frequently do not feel justified in adding to their expenses, having regard to the fact that their ratepayers are already taxed for the maintenance of the large parks, into many of which they are debarred by distance from entering. The Association have, therefore, as regards the places to which we at present refer, applied to the Council for aid. We have given the subject careful consideration under every aspect. We first of all invited the local authorities to maintain the places or to contribute to their maintenance. The comparatively wealthy parishes of Hamstead and Islington have agreed to maintain in the one case Haverstock-hill playground, and in the other, Barnsbury and Edward-square-gardens. These three places are therefore not included in the list. As regards Red Lion-square garden, the Holborn District Board has agreed to contribute £52 annually for its maintenance, and the Whitechapel District Board, which already maintains one recreation ground of its own, has promised £50 a year towards the keeping up of the Winthrop-street playground. The other places being situate in parishes where the rates are already heavy, and the ratepayers mostly poor—viz, Mile-End, Bethnal-green, Ratcliff, Shadwell, Limehouse, and Rotherhithe, the local authorities have, whilst acknowledging the value of the places, expressed their inability to maintain or contribute. We should take this opportunity of stating, as the result of several visits paid to the places named, that we quite agree with the local bodies as to the value of them for recreation, and we also consider that the mere size of a place has nothing whatever to do with its value in this respect. Indeed, in the crowded parts of Eastern London, large open spaces cannot now be obtained. We would also remark that, maintained as part of a general system, these gardens and playgrounds can be more economically kept up by a central authority, which as a special gardening staff, than by a local body which, although possessing roadmen and servants of that class, has no skilled gardening staff. We consider, however, that the wealthier parishes should specially contribute to the Council's expenses in the matter. It is with great regret, therefore, that we have to mention the refusal of the Vestry of St. Martin-in-the-Fields, after more than one application made by us, to either maintain or in any way assist in the maintenance of the parish buryard as a recreation ground, or of

a disused burial-ground in Russell-court, Drury-lane, which is within their district. With regard to this latter place, we feel its value so much for the poor children of the congested neighbourhood where it is, that we have included it in the list; but, as regards St. Martin's Churchyard, we are not prepared to move. As regards the annual cost of maintaining the places which we recommend the Council to take over, we may state that it will probably be about £1,020. We would remind the Council that the taking over of these grounds does not bind it to assume the charge of every other place which may be laid out under similar circumstances, nor even to maintain the places here mentioned one hour longer than they are found to be of public utility. Having placed the Council in possession of the facts, we recommend:—

“That, subject to an estimate being submitted to the Council by the Finance Committee, as required by the statute, the Council do undertake, at an estimated cost of £1,020 a year, the future maintenance of the following places:—

	Area.	Estimated cost for wages.
1. Red Lion-square-garden, Holborn.....	1a. 2r.	£28
2. Winthrop-street-playground, Whitechapel.....	0a. 2r.	30
3. St. Dunsion's Churchyard, Stepney, garden.....	7a. 0r.	142
4. Limehouse Churchyard-garden.....	3a. 0r.	111
5. Holy Trinity Churchyard, Tredegar-square, Bow.....	1a. 1r.	50
6. Carlton-square-garden, Mile-end.....	0a. 3r.	50
7. St. Paul's Churchyard, Rotherhithe, garden.....	0a. 3r.	50
8. Spuffield-playground, Elm-month-street, Clerkenwell.....	2a. 0r.	50
9. Drury-lane-playground, Russell-court.....	0a. 1r.	50
10. St. Paul's Churchyard, High-street, Shadwell, garden.....	1a. 0r.	50
11. St. Bartholomew's Churchyard, Bethnal-green, garden.....	1a. 0r.	50
Materials.....		149
		£1,020

These recommendations led to a long discussion, several amendments being moved, and ultimately the further consideration of the subject was again adjourned.

The Strand Improvement.—Mr. Charles Harrison, chairman of the Parliamentary Committee, presented the report of that Committee, of which the following was the first paragraph:—“The Strand Improvement Bill came before the hybrid Committee of the House of Commons on the 8th inst., when the Council's case was opened by Mr. Pope, Q.C., and the chairman of your Committee was partly examined as a witness. The deposited plan showed that the width of the Strand after the widening opposite Norfolk-street would be 100 ft., and that the north line of the new street would be a little south of the eastern end of Holywell-street, with limits of deviation up to Wych-street in a triangular form. The Chairman of the Committee of the House desired counsel for the Council to state on the following morning what land out of that comprised in the present limits of deviation was required by the Council for the line of street. After consultation with the Valuer and Engineer, we concurred in their views, and were of opinion that the plan, as explained by them, would be the best plan to adopt, by which in effect the whole of the site of Holywell-street would remain as part of the site or addition to the new street, and that the narrow strip of land (about 3,000 superficial feet) south of Holywell-street, between that street and the line of the new street, should be added to the width of the new street,—thus making the street, immediately opposite Norfolk-street, about 120 ft. wide. It was explained that the adoption of this would avoid having to acquire trade and other premises on the north side of Holywell-street, and that certain houses facing Wych-street, within the limits of deviation and on the east and west of Newcastle-street at the northern or Wych-street end, would not be available for the purposes of occupation; but as we were advised that the value of the premises foreoccupied was about equal to the cost of their acquisition, we resolved that Mr. Pope, Q.C., should be authorised to state to the Select Committee the limits to which the amount of land to be taken for the improvement could be confined according to the plan discussed before us, and that copies

of such plan should be prepared and placed before the Committee of the House.”

This led to a somewhat acrimonious discussion, in the course of which Mr. Harrison was blamed by some members for the course he had taken; other members defended his action; while others, steering clear of personal references, said it would be regrettable if the Council did not get power to acquire the north side of Holywell-street, inasmuch as it would perhaps stand for years as an eyesore to what would otherwise be a great improvement.

The Water Companies and their Charges.—The Parliamentary Committee also reported as follows:—

“As instructed by the Council on the 6th inst., we have again considered the terms of the petition which we then recommended should be presented to the House of Commons, with a view to measures being taken to restrain the Water Companies from increasing their charges in consequence of increases of assessment due to the quinquennial valuations. On further deliberation we are of opinion that the petition should be confined strictly to the effect, which, in the absence of measures of restraint, the valuations must have on the power of the companies to increase their charges, and we recommend:—

- 1. That we be authorised to prepare a petition in the following terms or to the following effect:—
- (1) That it is inequitable to the ratepayers of the Metropolis, and prejudicial to any future acquisition of the water supply by a municipal body, that the charges of the water companies should be increased merely by reason of any increase in the quinquennial valuation of property in the County of London.
- (2) That your petitioners, therefore, pray your Honorable House to take such measures as shall restrain the power of the water companies of the Metropolis to make an increased charge merely by reason of any increase in the quinquennial valuation of property in the County of London.”

These recommendations were unanimously agreed to, and after the transaction of other business the Council adjourned.

NEW STREETS OBSTRUCTED BY GATES OR BARRIERS:

DAW & SON v. THE LONDON COUNTY COUNCIL.

An important question was raised in this case (heard a few days ago in the Queen's Bench Division of the High Court of Justice, before Lord Coleridge and Mr. Justice Mathew) between the building owners of a new street and the London County Council, as representing the Metropolitan Board of Works upon the statutory enactments in the Metropolitan Local Government Acts, which prohibit the new streets from being closed at either end by gates or otherwise. This is contrary to the common law, which allows owners to make a partial dedication of new streets or ways, and hence on many great horse estates in the Metropolis there are bars put up to be closed now and then in order to prevent unlimited public rights of passage from being created. Hence the first of the Acts in question (18 and 19 Vict., c. 135) contained a clause exempting existing bars, but the latter Act (25 & 26 Vict., c. 98) provided that no existing road, passage, or way should be hereafter laid out unless 40 ft. in width, and unless open at both ends, and that any road, passage, or way hereafter laid out should be deemed to be a “new street” and subject to the by-laws made on the subject; and one of the by-laws is that “every new street shall (unless the Board otherwise consent in writing) have at the least two entrances of the full width of the street, and shall be open from the ground upwards.” The question was now raised whether, under these enactments, the builders of a new street or place with homes on both sides can make it private by putting up gates at both ends, so as to prevent unrestricted traffic, and restrict the use of the way or passage of the street to the residents. The question had arisen in the present case under the following circumstances:—

The appellants were a firm of builders, of Palace-gate, Kensington, and are the owners of an estate called the Shaftesbury-road Estate on the Bayswater-road. For more than eighty years previously the estate consisted of a private house and grounds, and they proposed to open a passage through from the Bayswater-road to the Moscow-road, with houses on each side, called Torwood-gardens, but with gates at each end. In order that access might be obtained to the street, gateways were made in the old wall at the Moscow-road end, and gates were placed in the gateways, which have so remained ever since, and have been locked for a time every night. There were also archways at the Bayswater-road end, between which the builders proposed to hang gates for the purpose of forming a barrier across, and excluding the public from the use of the street. The street had been thus formed and laid out without the sanction of the Metropolitan Board of Works. It was proved that the gates at the Moscow-road end of the street, known as Torwood-gardens, were kept locked at night.

It appeared that on May 23, 1889, the builders were summoned and convicted upon the complaint of the Council for that they in March last year, at Torwood-gardens, did unlawfully form or lay out a road, or passage, or way for building on a street, in breach of the by-law. Shortly after the builders had been so convicted they caused the brickwork between the pier and the arches over the footway to be removed, and there was nothing but piers left standing on the street in a line with the building line in the Bayswater-road, and between the piers there was less than 40 ft. The gates, however, were kept up, and in December the builders were summoned again for a continuing breach of the by-law—that is, for keeping the passage not open at both ends.

The magistrate considered and found as a fact that the new passage was a "new street" within the Act, and that the gates at each end of Torwood Gardens were kept locked at night, and that the police were in the habit of patrolling the said street. It was contended for the builders that they had not continued the offence of which they had been convicted, and that the street, being in all respects a private road for the use of the occupiers of the houses erected on the estate, and not having been dedicated to or used by the public, it was not formed "or laid out for building as a street, or for the purpose of carriage traffic, or for the purpose of foot traffic only" within the meaning of section 93 of 25 and 26 Vict. c. 120, and that the County Council had no power to interfere to prevent the builders from placing barriers or gates across the road for the purpose of excluding the public from using it. The Magistrate thought otherwise, and convicted, and the builders appealed.

Mr. Forbes, Q.C. (with Mr. Cunningham Glen) appeared for the appellants, the builders, and contended that there was no violation of the Act.

Mr. Avory argued for the County Council in support of the conviction.

The Court came to the conclusion on the 5th inst. that the magistrate was right, and that the conviction must be upheld.

Lord Coleridge, in giving judgment, said two points had been argued—whether the passage was a new street within the by-law and the enactment, and whether there had been a continuing offence within the Act, though perhaps only the latter question was really raised. As to the first point, however—whether this was a new street within the enactment—he thought it was. The enactment had been the subject of judicial decision in "The Metropolitan Board v. Stead" (3 Q. B. D.) where it was held that "or" ought to be read "and." He knew the place in question at Bayswater, and the owners thought they would build houses upon it, with access from the roads at each end. They desired to have the advantage of communication with those roads, and yet to keep it private. But if it was used so as to make it part of the great system of roads and highways all round, it must be subject to the rules and laws which bound all other owners of property so laid out, in consideration of various advantages obtained at the public expense—drainage, sewerage, &c. If the owners thus acquired the advantages of the place being part of the metropolis, they must pay the price, one part of which was that the new street must be made 40 ft. wide, and that it must be made a thoroughfare, and open to the public at both ends; the Board, however, having the power under special circumstances of granting exemption from these obligations. The owners here, however, desired to have the advantages without the accompanying burdens. They obtained, indeed, the assent of the Board to the making of the street on the condition of their fulfilling those obligations, and then they had not fulfilled them. That would not do; and even without authority he should have held that the effect of the enactment was that no passage-way should be made into a carriage-road unless open at both ends. But it appeared that the passage was left less than 40 ft. wide, and with gates at both ends. That was done without the consent of the Board or Council, and it could not legally be done. Then there had been surely a "continuing offence" within the Act, as the gates were kept up. The Magistrate, therefore, was right on both points, and the conviction was right, and must be upheld.

Mr. Justice Mathew concurred, and observed that otherwise the building-owner might always free himself from the obligations of the Act. The offence was keeping the passage obstructed by the piers and gates, and the offence was continued by keeping up these obstructions.

Appeal accordingly dismissed.

Snowdon.—As many of our readers will be aware, Sir Edward Watkin some time ago purchased a big slice of Snowdon, extending from Llyn Dinas in the valley to the summit of Snowdon. We are now informed that Mr. Thomas Roberts, C.E., of Portmadoc, is designing several "buildings and improvements" for Sir Edward, including a chalet on one of the spurs of Snowdon, which will command the grandest scenery in North Wales.

Election of a new Royal Academician.—Mr. Hubert Herkomer, A.R.A., was on Tuesday evening elected a full Academician.

BOUNDARIES TO FOOTPATHS.

Str.—A public footpath runs between two hedges whose branches project into and obstruct the full and free use of footpath. What is the limit of ownership of the abutting land with respect to the hedges, *i.e.*, how far may the hedge legally project over the footpath beyond the roots? and, supposing a wall were erected instead of hedge, could it legally occupy a frontage line beyond the centre of hedge? If so, how far beyond? LONSDALE.

The Student's Column.

ELECTRICITY, MAGNETISM, AND ELECTRICITY SUPPLY.—XX.

SECONDARY CELLS.

EVERY common form of voltaic cell is that invented by Smee. A sheet of platinised silver is placed between two of zinc, and immersed in dilute sulphuric acid. When the poles are joined a current flows from zinc to platinum within the cell, the zinc is dissolved as sulphate of zinc, while hydrogen is liberated at the platinised plate and bubbles up out of the liquid. The chemical reactions are shown by the equation—

When the liquid is exhausted it must be removed and replaced by fresh acid solution. After a time the zinc plates are destroyed and must also be renewed. Such is the action of a simple type of primary cell.

If, however, instead of drawing off the exhausted acid solution, a current from some external source be sent through the cell from platinum to zinc, the above chemical reaction would be practically reversed:—

The zinc is recovered from the sulphate of zinc and deposited on the zinc plate, water is decomposed to supply the necessary hydrogen to form sulphuric acid, and the oxygen thus liberated rises from the platinum plate.

The cell is now in its original state, and can again furnish current. A Smee's cell which has been recharged in this latter way is a secondary cell. The only thing lost during the two operations is water, hydrogen during discharge, oxygen during charge; water must, therefore, be added from time to time, but, if water happened to be an expensive product, the two gases could be collected and re-formed into water by ignition.

The only essential difference between a primary and secondary cell consists, not in any detail of construction, nor in the chemical reactions which go on within it when giving current, but simply in the method of recharging. If a Smee's cell is used as a secondary cell, the zinc eventually becomes rotten and tumbles to pieces owing to its deposition being uneven over the surface of the plate.

A few only of the primary cells in common use can be used as secondary cells, and secondary cells of commercial value cannot, in practice, be charged as primary cells.

Secondary cells are frequently called "accumulators" or "storage cells"; they do not, however, "accumulate" or "store" electricity during the operation of charging, for as many coulombs come out from the negative terminal as go in at the positive. The coulombs lose potential, and the energy thus lost is left in the cell as chemical separation; what, therefore, is stored is chemical energy ready to reappear as electrical energy when required.

The materials hitherto found of most use for the construction of secondary cells are spongy lead and lead salts, with dilute sulphuric acid as the exciting fluid.

The lead secondary cell invented by Gaston Planté in 1860 has been modified by successive inventors until it has assumed the form of the cells in use at the present day.

If a current of sufficient strength be sent between two lead plates immersed in dilute sulphuric acid, water is decomposed; hydrogen is liberated at the negative plate and escapes into the air; oxygen is deposited on the positive plate, and attaching it covers it with a thin brown coating of peroxide of lead (PbO_2); this film of peroxide protects the lead beneath it from any further action, and oxygen bubbles up freely from the surface of the plate. The current must now be reversed, when the peroxide will be reduced to spongy lead and the former negative plate covered with peroxide, the object of the reversal being to form spongy lead and so increase the surface of the negative plate. The plates may now be joined; they will act as

a voltaic cell, and produce a current until both plates are covered with the lower oxide (PbO)

water, during discharge, oxidising the negative plate, and replacing the oxygen it has lost from that on the positive plate. In the above and following reactions there may be, and indeed probably are, certain intermediate reactions; the equations only give the final results, which are all that really concern us. As soon as the plates are exhausted a current may be sent through them in a direction opposite from that of the current they have furnished; after a time the plates will be found to have resumed their fully-charged state:—

Apart from local action, the equations for which are given below, the processes of charge (β) and discharge (α) can be repeated over and over again. It will be found, however, that the capacity of such a cell is so exceedingly small that practically it is of little value. Planté increased the capacity of his cells by leaving them fully charged for a time, sufficient to allow extensive local action between the peroxide and the lead plate to which it is attached, the cell being reversed after each period of repose, so as to make the quantity of lead actually acted upon equal for both plates. These operations, called "forming the cell," in some cases occupied many months, and the consequent expense rendered the commercial success of a Planté secondary battery out of the question.

The history of the development of the lead cell from the time of Planté to the present day is most interesting, but we must omit any account of the intermediate steps, and at once proceed to the description of the modern cell.

A mixture of lead oxides is mixed into a paste with dilute sulphuric acid, a certain amount of lead sulphate (PbSO_4) being formed during the process, the ingredients entering into the mixture in various proportions. The paste is pressed into the square holes of a grid, cast from a not easily oxidisable alloy of lead. The plates are put in the charging cell, when the following reactions take place:—

the mixtures on the positive and negative plates are converted into pellets of lead peroxide and spongy lead respectively, the holes being made of such a shape that they will not easily fall out. The liquid extends throughout the mass, which can therefore be acted upon at every point, and plates formed, the capacity of which becomes, in a few hours, greater than that of Planté's plates that have taken months to form.

The chemical reactions of discharge and charge have already been given (α i, ii) (β i, ii). Local action, however, cannot be overlooked, and is most disastrous when the cells have completely run down.

Sulphuric acid is taken from the liquid, and the plates become coated with insoluble sulphate of lead which has low conducting power. On recharging, this sulphate is destroyed with some difficulty (γ i, ii, iii), and may have permanently injured the plates.

A cell should always be left fully charged, if possible; practically nothing happens at the negative plate, and although some action takes place between the peroxide and its grid,

the acid can only be renewed from the mass of the liquid by slow percolation, and the sulphate formed tends to stop further action.

The common size of grid is about 10 in. b. 10 in. l., the thickness of plate varying somewhat, but not exceeding $\frac{1}{4}$ in. Cells contain from seven to thirty-one such plates, according to the storage capacity required, placed alternately positive and negative and connected abreast into these two groups, so that each plate exposes about 200 square inches of surface, while separated from a plate of opposite kind by the thickness only of thin strips of insulator. The internal resistance of a cell is therefore, as low as a thousandth of an ohm

or less, and if it be short-circuited it will discharge at the enormous rate of over a thousand amperes, the actual rate depending, of course, upon the size and number of the plates. This power of yielding an enormous current must not be supposed to be a peculiar property of the lead secondary cell, for if any of the common forms of primary cell, which do not polarise, were given an equal area of plate and the opposite plates placed equally near one another it would give similar results.

A secondary battery is a most valuable adjunct to a continuous current dynamo-machine, but its use is limited by its liability to rapid decay, unless placed in the hands of a skilled attendant, though much may be done by automatic arrangements. Under favourable circumstances a good battery will last for years, but, unless carefully looked after for the positive plates bulge, the grids are damaged, and the pellets fall out, while, if left uncharged for any length of time, an entire set of cells may be completely ruined.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

7,592, Plasterers' Lath. A. J. Hogan. This invention consists in bevelling each edge of the lath the reverse way, so that when the plaster is applied it will form a dovetail-shape key, each lath being also a dovetail shape.

8,230, Improved Wind-guard for Chimneys. K. Edge.

According to this invention, a funnel-shaped piece, with the bell upwards, is placed upon the top of the chimney-pot, and allowed to be moved sideways, so as to prevent the wind catching the smoke, and inducing up-draught.

8,511, Compounds for Bricks, Tiles, &c. E. Bussy.

According to this specification, bricks, tiles, architectural ornaments, &c., are made of a peculiar combination of common yellow and calcareous clay, and a white enameled surface is gained by using these clays in combination with metallic oxides in adjusted proportions.

9,103, Ventilating Rooms and Baths, &c. D. P. Menzies.

This invention proposes to force a jet of steam into a ventilating shaft, so as to cause an up-draught and to carry off foul or impure air.

13,957, Artificial Stone. B. Bertelmeier.

In making artificial stone, the cement, sand, &c., are, according to this invention, exhausted by means of an air pump, and mixed with air exhausted water. This exhaustion renders the mass homogeneous, and improves the quality of the product.

19,246, Hearths of Fireplaces. J. Wilson.

To prevent fires from over-heating, a cast-iron cantilever is, by this invention, laid across the wall below each jamb, according to the size of fireplace. A front plate is also fixed and bolted, a false-bottom is fitted below this, and the space filled up to the top of the metals with concrete. Tiles are laid over, if wished.

2,619, Flooring. J. Schultz and E. Hopf, Hamburg.

According to this invention, on a concrete layer or boarding are fastened two or more layers of carton-pierre, or roofing paper, by means of mastic cement or pitch. After the layers of carton-pierre have been pressed firmly together, by the application of rollers or other means of giving pressure, the surface of the upper layer is covered with mastic cement or pitch, and then with rough slabs or artificial stones. The combined use of slabs and carton-pierre is the main point of the invention.

MEETINGS.

SATURDAY, MAY 17. Royal Institution.—Dr. Charles Waldstein on "Recent Excavations in Greece." 11. 3 p.m. St. Paul's Ecological Society.—Visit to the Church of St. Peter-ad-Vincula and the Chapel of St. John in the Tower. Association of Municipal and Sanitary Engineers and Surveyors.—Midland Counties' District Meeting at Hereford.

MONDAY, MAY 19. Royal Institute of British Architects.—Mr. Frank Granger, M.A. Lect., on "German Technical Museums." 3 p.m. Victoria Institute.—Mr. W. N. Whitley, G.E., on "Flint Implements and the Antiquity of Man." 8 p.m.

TUESDAY, MAY 20. Royal Institution.—Mr. Louis Fagnon on "The Art of Engraving." 11. 3 p.m. Institution of Civil Engineers.—Messrs. Fawcett and Cowan on "The Keswick Water-Power Electric Light Station." 8 p.m. Society of Arts (Foreign and Colonial Section).—Mr. Lasenby Liberty on "The Industrial Arts of Japan." 5 p.m. Royal Society of Antiquaries of Ireland.—Ordinary General Meeting to be held in the Town Hall, Kilkenny, when nine papers will be submitted, including (a) "The Christian Abbey of Killeoley Co. Tipperary," by the Rev. W. Healy; (b) "Record of the Great Famine in Ireland," by Mr. John M. Thunders; (c) "Some Remarks on the Seal of the Dean and Chapter of St. Patrick's Cathedral, Dublin," by Mr. John Vincombe.

WEDNESDAY, MAY 21. The Auctioneers' Institute (Cannon-street Hotel).—Ordinary General Meeting. 3 p.m.—Annual Dinner, Cannon-street Hotel. 5 p.m. Royal Meteorological Society.—Three papers will be read. 7 p.m. Society of Arts.—Mr. J. G. Gordon on "The Manneman Process for making Seamless Tubes." 8 p.m. British Archaeological Association.—(1) Mr. W. J. Davis on "An Early Inscribed Altar Slab at Sheepcote." (2) Mr. E. P. Loftus Brock, F.S.A., on "Recently Discovered Saxon Architecture at Stevington Church, Beds." 8 p.m. Committee for Testing Smoke-Preventing Appliances.—Meeting at the Mansion House. 3 p.m.

THURSDAY, MAY 22. Architectural Association, Lyric Club.—Exhibition of Drawings, &c. (Ladies Night). 9 p.m. Royal Institution.—Professor Dewar, M.A., F.R.S., on "Flame and Explosives." 11. 3 p.m. Institution of Electrical Engineers.—8 p.m.

SATURDAY, MAY 24. Royal Institution.—Dr. Charles Waldstein on "Recent Excavations in Greece." 11. 3 p.m. Association of Public Sanitary Inspectors.—Fifth Annual Provincial meeting to be held at Leamington, when the President, Sir Edwin Chadwick, K.C.B., will deliver an address. Edinburgh Architectural Association.—Visit to Bridge Castle and Torphichen Church.

The Royal South London Ophthalmic Hospital.—The Prince of Wales has intimated his intention of laying the foundation-stone of the new building for the Royal South London Ophthalmic Hospital at St. George's-circus, Southwark, in July.

Miscellaneous.

Liverpool Engineering Society.—The fourteenth and concluding meeting of the present session of this Society was held on Wednesday evening, May 7, at the Royal Institution, Colquhoun-street, Mr. Henry H. West, M. Inst. C.E., President, in the chair. The ballot for officers for the ensuing session resulted in the election of Mr. F. Hadleston, Assoc.-M. Inst. C.E., as President; Messrs John T. Woode and James Morgan, as Vice-Presidents; Mr. J. H. T. Turner, B.Sc., Assoc.-M. Inst. C.E., as hon. secretary; Mr. O. S. Pilkington, Assoc.-M. Inst. C.E., as hon. treasurer; and Mr. J. A. Brodie, Assoc.-M. Inst. C.E., as hon. librarian. Mr. Henry H. West, the retiring president, in announcing the result of the ballot to the meeting, congratulated the members upon the growth and vigour of the Society. There were now 190 members of all classes on the books, and the income for the past financial year had amounted to 150*l*. Being in this strong financial position, the Council had felt justified in making a new departure in the past session by printing and issuing the papers read to members prior to the date of the discussion of the papers. The result had been to add greatly to the interest and value of the discussions, and the Council felt that the result justified the additional outlay involved. The forthcoming volume of the Society's proceedings was now in proof, and would shortly be issued to members. The importance of the Society was considered to warrant the presence of the President of the Institution of Civil Engineers, among other guests, at the annual dinner held in January last. Mr. West then announced that arrangements would be made for excursions during the summer to the Thirlmere Aqueduct, Manchester Ship Canal Works, Menai Straits, North Bridge and Edinburgh Exhibition, Liverpool Overhead Railway Works, and the Lancashire & Yorkshire Railway Works at Horwich. The adjourned discussion upon Mr. Thomas L. Miller's paper, entitled "The Efficiency of Gas Engineers," concluded the business.

The English Iron Trade.—For the last three weeks the English iron market has displayed a steadily downward tendency, and the volume of business transacted has been on a correspondingly dwindling scale. The reports received during that time with regard to pig-iron have been very discouraging, and the fall in prices has been marked. No. 3 Cleveland pig was pretty steady at 45*s*. 6*d*. until this week, when it has dropped 2*s*. 6*d*. a ton, and is now quoted 43*s*. to 43*s*. 6*d*. Glasgow warrants have run their usual course of fluctuation since we last wrote, but they are at the end of the present week not much below what they were three weeks ago. Scotch makers' iron, on the contrary, shows declines varying from 6*d*. to 3*s*. 6*d*. per ton. Although makers of Bessemer pig in the north-west are nominally but 3*s*. lower (00*s*, compared with 63*s*.), the fact appears to be that they are quoting down to hematite warrant prices, which are from 53*s*. 6*d*. to 54*s*. In other districts the rates now quoted are proportionately lower. Old materials may be had 5*s*. a ton cheaper, while spiegelisen registers a similar decline. The demand for finished iron and steel has not revived, and lower values are the rule. For manufactured iron from 5*s*. up to 20*s*. less per ton is now accepted. In steel, similar reductions in price have been made. Tin-plates have given way to the extent of but 6*d*. a box, but they are now firmer. Shipbuilders have still cause to complain of the absence of new orders, while engineers are booking but little fresh work.—Iron.

The North Sea-Baltic Canal.—We are now able to state on good authority that the number of cubic metres of ground which have to be moved before the completion of the canal is 8,000,000, and that the work will take five and a-half years. Up to date some 11,000,000 cubic metres have been removed, the present state of affairs permitting a movement of about 1,000,000 metres a month, which figure will, however, advance to one and a-half to two millions as soon as "full work" is being done. It may be of interest to know that the construction of the locks on the canal will alone require 130,000 cubic metres of "beton." The total of the estimate shows a figure not much under 8,000,000.

The Surveyors' Institution.—The Annual Dinner of this Institution is fixed for Monday, June 2, at the Holborn Restaurant.

Proposed National School of Forestry.

—On the 9th inst., a deputation from the Associated Chambers of Commerce waited upon Mr. Chaplin (with whom was Sir James Caird) at the offices of the Board of Agriculture, in St. James's-square, for the purpose of urging upon him the desirability of establishing a National School of Forestry.—Col. Hill, M.P., introduced the deputation, and addressed Mr. Chaplin, said those who were with him desired to point out that the most growing of timber as an industry might be most usefully extended in this country, especially in view of the timber supply from abroad becoming more and more diminished. They recommended therefore that her Majesty's Government should establish a National School of Forestry, which would be an encouragement not only to the planting of Crown lands with trees, but would also induce private landowners to utilise ground which was at present of little or no service in the same direction.—Mr. G. Harper next spoke, and said he had received letters approving of the objects of the deputation from Lord Basing, official Verderer of the New Forest, Sir Edward Lechmere, and other gentlemen. He further pointed out that with the exception of Spain this was the only country of any position that did not possess a National School of Forestry. England was the greatest timber-buying nation in the world, and at present imported annually something like 13,000,000*l*. worth of that commodity. There was a vast acreage of land now lying waste in this country which might, were the proper instruction forthcoming, be used for timber-growing, and practically enable it to produce all the timber it required. Mr. Chaplin said there could be no doubt of the growing interest and importance of the question under discussion. The purport of the remarks he had heard seemed to be that his department should establish a National School of Forestry. He desired, however, to point out that the Act under which that department was instituted provided only for its inspecting and reporting upon schools which provided education either upon agriculture or upon forestry. So far as he could see, his department had no power to institute a school, but he would consider the matter very carefully with a view to seeing if he could recommend such a course to the Government.

Camden Park Estate, Chislehurst.—This historic property, including Camden-place and a finely-timbered park of about 125 acres, fronting the common, will be sold at the Mart, in the course of next month, for building purposes. The house was built by the antiquarian, Camden, who died there in 1623. It gave a title to Charles Pratt, who, on July 16, 1765, being then Chief Justice of the Common Pleas, was elevated Lord Camden, and as Lord Chancellor was advanced Earl Camden. He sold it to a Mr. Lushington, who sold it to Mr. Bonar, who, with his wife, was murdered here by a footman in 1813. It then passed into the occupancy of Prince Esterhazy, the Austrian Ambassador. Camden-place is better known, perhaps, as the home for some years of the late Emperor Napoleon III. and his Consort. He died here on January 9, 1873. His remains (since removed to Farnborough) were buried in St. Mary's Catholic Church, in a side chapel built by the Empress, after the designs of Mr. H. Clutton, architect. Their son, the Prince Imperial, was buried in that same chapel, on July 12, 1879. The late Mr. N. W. Strode lent the house to the royal exiles. The furniture, &c., including some valuable Flemish tapestry, was sold in June last. Chislehurst village was the birthplace of Sir Francis Walsingham and of Sir Nicholas Bacon, Lord Keeper.

Association of Municipal and Sanitary Engineers and Surveyors.—The following gentlemen, having satisfied the examiners at the examination held in London on the 18th and 19th ult., have been granted certificates of competency by the Council of the Association, viz., Messrs. J. H. Catchpole, Hendon; L. Gibbs, Walsall; J. E. Miller, Durlam; and J. W. Wood, Rochdale. The next examination will be held in London on October 3 and 4.

Surveyorship, Burton-on-Trent.—Mr. J. E. Swindlehurst, Assoc.-Mem. Inst. C.E., Engineer and Surveyor to the Rawtenstall Local Board District, and late Deputy Borough Engineer of Barrow-in-Furness, was last week elected by the Council to the office of Borough Engineer and Surveyor of Burton-on-Trent, at a salary of 400*l*. per annum, with a horse and trap provided by the Corporation. There were 107 candidates for the appointment.

The Erosion of our Coast-line.—On Monday evening last, at the Surveyors' Institution, London, Mr. R. F. Grantham, M. Inst. C.E., read a paper entitled, "The Encroachment of the Sea on some parts of the English Coast, and the best means of arresting it." After bringing forward evidence to show the rate of erosion on several parts of the coast, the paper referred to various works for defending the coast-line from encroachment, and described a system of groyning which was stated to have been successful for the past twelve years at Shoreham, Sussex, in protecting some land lying below the level of high-water of the tides, and in driving high-water mark further seawards. The paper suggested that in some instances where shingle travelled along the coast, inasmuch as groynes were necessary to protect sea-walls, the sea-walls might be omitted, and only groynes erected, and thus a substantial saving in the first cost of protection might be effected.

The Two Salons at Paris.

THE "Salon Meissonier" has certainly not eclipsed the old Salon. It has this advantage, that its two principal galleries contain a very large proportion of really good pictures and but a small proportion of indifferent ones, and that cannot be said of any room in the old Salon. But though the vast collection at the Palais Nationale undoubtedly includes a great many paintings that are uninteresting and some that are vulgar, the actual amount of striking and powerful works collected is nevertheless, as before observed, a most remarkable testimony to the vitality of French painting: and the collection of sculpture in the central hall is a splendid one. In this latter branch of art the division in the Salon has not operated at all, the new Salon containing hardly any sculpture; as indeed could hardly be expected that sculptors would turn their backs on a site with such exceptional advantages in regard to space and light as the central court of the Palais National, to send their works to a comparatively narrow gallery with an unsatisfactory light. Accordingly, while the weakening of the old Salon in the department of painting is not very marked, the department of sculpture is in full force and has seldom been more and more interesting than in the present year.

In the vestibule hangs M. Martin's enormous painting representing the visit of the President of the Republic to Agen, one of the class of realistic paintings executed in flat tints and in very raw colour, which have become a feature of French decorative painting (so-called) of late, but which are in fact neither pictorial nor decorative in the true sense. Two paintings which are decorative in the true sense find place here; M. Michel-Lançon's decorative composition representing "France," "Force," "Paix," "Industrie moderne couronnée par le Génie du Progrès," and all the rest of it, and on the other side M. Matte's "Saint Vladimir et Sainte Olga aux Pieds de la Vierge"; both in semicircular lunettes, the former representing under the latter ecclesiastical decorative work; the former the best drawn, the latter

the richer in colour. Among the smaller works relegated to the vestibule and not of much importance, M. Chas. Landelle's "Fleurs de France," a half-length of a young woman leaning over a window-sill on which red white and blue flowers are shown, is worth mention not only as a very pretty work but as one which seems to be regarded as one of the popular successes of the exhibition, from the number of photographs of it going about. In the central large gallery (XII.) opening out of the vestibule, hangs opposite the door the leading work of the year in point of size and ambitious aim, M. Munkacsy's huge painting for the ceiling of the Art Museum at Vienna—a huge mistake. It is a ceiling-painting on the old fallacious *de sotto in sù* principle, in which we look up a staircase surrounded by a dome through which the sky is seen: all the figures and balustrades, &c., being seen as foreshortened from below. The subject is an allegory of the Italian Renaissance, and includes portrait figures of some of the great painters of the Renaissance, prominent among whom is Titian instructing another artist in painting from the nude figure who forms the salient point of the composition. Over all, under the eye of the dome, hovers a winged figure, the genius of the Renaissance. Hung vertically, the picture of course looks absurd; when fixed in its proper position it will no doubt show a certain power and largeness of conception of a not very refined order; but as a ceiling decoration it is heavy in effect without being rich in colour, besides the radical error of this method of designing ceiling decoration. Viennese taste, however, will not prove exacting in regard to these little matters. Another central work in this gallery is M. Jules Lefehvre's "Lady Godiva," one of those works in which a whole street of houses is painted full-size, with Godiva's horse in the foreground, led by a female attendant whose dark robes and brunette complexion serve as a foil to the blonde figure of the lady seated sideways on the horse. This attempt to realise the whole scenic surroundings of the story is worth something in its way, whether worth such an immense area of canvas may be another question; and what should be the central interest of the picture, the expression of Godiva, is a failure; a stubborn resolution seems to be what is intended, but there is a suspicion of coquetry mixed with it which is fatal to the sentiment of the story. The other centre places are occupied by M.

Lehoux' "Christ Accueillant les Ouvriers de la Miséricorde" (one of a series), a decorative picture in a fresco-like style and with an alarming preponderance of blue in the shadows, and a figure of Christ rather theatrical in attitude; and M. H. L. Lévy's allegorical painting of the City of Paris offering to Liberty the sacrifice of her children slain in the cause. This is a confused mass of figures not well made out, though with a fine energy of action about the foreground figure of "Paris." The other large room (XXI) at the west end contains the other works which are on such a scale as to require a great space to be seen, but none of them have merit or interest at all proportionate to their size; M. Biesbroeck's "Launching of the Argo" is an immense picture showing the fore part of the ship in side elevation and a number of men hauling at her with considerable vigour and variety of action, but the picture is essentially an academical study of nude figures in action. M. Poujol's painting of Dante seeing Paolo and Francesca in the circle of sinners is powerful as a representation of Dante's lurid conception of the mass of spirits swept away in a storm, but none of the figures are of interest separately, nor can those of Paolo and Francesca be readily disentangled from the mass. M. le Quesne's "The Legend Kerdeck" is a picture of a man enticed into the sea by (to borrow an expression of Daudet's) "a whole marmalade" of nymphs, who writhe and tumble about in the usual way. On another wall is Benjamin-Constant's picture of "Deethoven—le sonate au clair de lune," a melodramatic representation of the composer surrounded by a party of his friends and playing in a room lighted only by moonlight; rather striking as a piece of effect, but another instance of the absurd ignorance of painters as to the subjects they select, the whole story of the composition of the sonata by moonlight being a mere invention, and the title of "Moonlight Sonata" having only risen out of the passing fancy of some critic whose phrase hit the popular taste; but anything to make a sensational picture! A large decorative painting in the same room by M. Dupain, for the ceiling of a picture gallery in a private house—"Le Commerce apporte la Paix et l'Abondance aux Arts et à l'Industrie," has considerable merit as a decorative composition, and is refined in style and colour.

The principal contribution of M. Bouguereau, who is in a sense the leader of the

old Salon, is a painting of "The Holy Women at the Sepulchre" in Room XVI,* a perfect example of the ordinary type of biblical picture carried to its highest point of execution; the three women stand looking into the door of the tomb, which is lighted within from the radiance shed by the angel, a very commonplace angel indeed, but the faces of the three women have a sweet languid pathos about them, and their full dark draperies are beautifully disposed and drawn; in short, this is a perfect type of the art of learned and refined mediocrity. Of this serious class of subject, such as is included under the terms of religious or historical painting, there is not much in the Salon. In French exhibitions the place of historical painting is now mainly occupied by what may be called "life-size genre," and a great mistake, as to scale, much of this is. Among the few historical pictures is M. Gide's "Galileo Explaining his Discoveries to the Venetian Senate," (Salle XIII.) a very well-studied little picture of a subject which would have borne a larger scale. On the other hand we have immense paintings representing two or three rustics sitting at a cottage door, or something of that kind; good enough in their way, but containing no quality or sentiment that could not as well have been shown or expressed on a small scale. In this respect English painters show more common sense than many of the French; they have more perception of the proportion between scale and subject. No doubt they are under a wholesome practical restriction in this respect, for if they painted on the scale of the French *genre* pictures they could get hung nowhere for want of room. Among the pictures which come under the class of historical paintings, or figure subjects other than *genre*, are such as the large picture by M. René Gilbert, the starting of a balloon during the siege of Paris (Salle XIX.), a class of paintings the object of which seems to be to record in a life-size painting the plain facts of the incident, without any attempt at a pictorial composition. Here again there seems no gain whatever from the size of the painting; it is simply painted up to Salon scale, to ensure its being seen. M. Hardie's "Bénédiction de la Mer" (XV.), a comparatively small picture illustrating a rather favourite subject with French painters, is a good work, as also another church subject, not of the present day, M. Méliès's "Procession de Pénitents en Espagne dans le XVII. Siècle" (V.). The penitents, girt with sheets and bare to the waist, and with variously stolid expressions, come down the steps of a church between two parties of clerics.

Then there is M. Vibert's scene from the "Malade Imaginaire" (XVI.), a delightful piece of humour in its contrast (perhaps a trifle overdrawn) between the rubicund face of the *malade* and the serious countenance of the doctor; as far as the execution of the work is concerned the artist has done better than this, but it is a real piece of comedy. M. Pierrey's "Le Nuit de Noël" (VI.) is another of the large "religious" pictures for which there seems to be a certain demand still; an attempt at a moonlight effect contrasting with the supernatural light from inside the manger or shed; it is rather a sensational performance. M. Richemont's "La Rêve" (VIII.) is a scene from Zola's novel under that name, curious in colour and texture but expressive. M. Scherrer's "Duval d'Esprémil" (XIV.) is a life-size historical painting of the old school, and of no little force and power; the scene is at the moment when d'Esprémil was brought into the Corps de Garde at the Palais Royal after being half-killed by the mob; his wife hangs over him, and he says to his friend Pétion, the Mayor of Paris, "I too, Pétion, have been an idol of the people;" the point of the scene, powerfully portrayed, lies in that sentence and its application. M. Van den Bos

* We will give the number of the room in which each picture is to be found in the course of these remarks; the number of the picture it is little use to give, as it may be anywhere, but the rooms at least are numbered consecutively.

picture of "L'Héritier" (XVI.), perhaps in reality a couple of portraits, is a most striking picture of a lady with a noble and proud action laying her hand on the head of her boy; a very unusual work. So certainly is Mr. Veber's "St. Sébastien" (XXII.), bound to a tree and with a pagan public making faces at him, a treatment of the subject which seems rather like a bad joke, on which disproportioned canvas has been expended.

Among figure subjects not *genre* must also be counted the numerous nude studies always found at the Salon, generally well executed, sometimes poetic and refined, sometimes prosaic and commonplace, sometimes unhappily coarse and vulgar. In this category are some of the best pictures of the year however. Highest in the scale certainly are M. Benner's "Soir d'Été" (XXVIII.), a woman lying on the grass, and his "Dans la Grotte Verte" (XXVI.), a lovely nymph upright in the half light of a cavern; for M. Benner does not merely paint nudity, but grace and sentiment of pose and countenance; there is a poetry in his figures and in the tender dreamy expression of their faces which belongs entirely to the region of ideal painting and is quite out of the category of "life studies." M. Boyé has made a fine kind of bravura picture in his "Hippodamie" (XXVIII.), a naked woman bringing two great horses to drink; and Mr. Comerre's "Bain d'Alhambra" (XXIII.) is a splendid work of its kind—a highly decorative Moorish interior in which all the architectural details are shown with the greatest force and brilliancy, forming a background to the figure of a white woman, just emerged from the bath and with her back to the spectator, and a dark Moorish woman seated on the floor. M. Deully's "Après la pêche" (XXVII.) is a work rising to more than mere nude painting, as also M. N. A. Laurens's "Nocturne" (IX.), showing two women seated in the moonlight, beautifully composed as a group, their bodies blanched in the white moonlight, and listening to music from a third more shadowy figure in the rear. M. Ménard's "A la Tombée du Jour" (V.) is an idyll of rosy-inted figures in the evening light amid a rich arcadian scene. To go from the poetic to the realistic one may turn to M. Mousset's "La Toilette" in the same gallery, an admirably-painted picture at all events, and in which the "French matron" seems to take great interest; the "Figure Nue" of M. Doucet (XXIII.) is still better painted, and as a mere piece of painting is a truly remarkable work, it is a real living and breathing body with the life blood throbbing in it, though sensuous enough in sentiment (or want of sentiment). Among others that are out of the commonplace are M. Benjamin Constant's splendidly-painted "Victrix" (XX.) with its sumptuous accessories; M. Edouard's "Odalisque" (XXIII.); M. Hodebert's prettily-composed "Rêve d'Azur" (XXIII.), a young girl seated in a most graceful attitude by the sea with her back to the spectator; M. Georges Landelle's "Libellule" (XIX.) a pretty fancy of a flying woman's figure with dragon-flies' wings; M. Peel's "Après le Bain" (IV.) two dear little urchins warming themselves before the fire; M. L. Perrault's "Venus" (VIII.) with a poetic quotation from De Musset, but the poetry is all in the quotation, the figure is a very good life study, and that is all; and M. Emile Renard's "Le Sommeil" (VI.) another child-picture of a little girl asleep, a lovely little thing hot in feeling and execution, and which is one of the complete successes of this year's Salon.

Of the pictures included under the general term of *genre* there are of course an immense number, and it is only possible to mention a few of the best examples. M. Bisson's life-size group, "Après l'Opération" (XX.) is one of the best of those medical subjects the French have taken to of late years. The principal figures are no doubt portraits, that of the doctor who sits feeling the pulse of the patient is remarkable for its expression of intellect and sympathy. The same painter's "La Cigale" (XVIII.), a half-

length of a cloaked young woman with a lute amid falling snow, is a pretty fancy and one of the popular pictures of the year. A head of this class of pictures, however is certainly the "Pêcheur" (VIII.) of M. Tattagrain, a painter whose remarkable talent is far too little known on this side of the Channel, and who has usually devoted himself to large historical subjects. This year he confines himself to this one painting of an old fisherman standing in the shallow water of the Bay of Authie, lifting a net from the water. The old man's face is a perfect study of character, his weather-stained hat and accoutrements are painted with the greatest truth, the brightly-lighted stretch of sea-water behind makes an effective background to the figure. M. Blayn's "Repas du Soir" (XVIII.) is one of the best specimens of the "rustic group" class of subject. Another very original and pleasing work is M. Boquet's "La Prière," where a company of young girls in blue blouses kneel about on the floor joining in the prayer read by a "sister" from the desk. There is a touching and simple feeling about this work, which is totally without affectation. The "Enfant Malade" of M. Bosch-Reitz (XVI.), where an old woman watches by the side of a cradle, betrays in its feeling and treatment the Dutch nationality of the painter, a tone nevertheless of M. Bouguereau and Tony Robert-Fleury. M. Brisport's "La Bouteille de Champagne" (XVI.) opened for a company for whom this is a great event, and M. Brunet's "La Chanson de la Mariée" (XXII.) are pictures that suggest a comparison with the works of M. Stanhope Forbes; and though they are not truly pictorial in treatment, our English artist is superior in regard to the individuality and character of the figures taken separately. "Idées Noires" (XX.) one of the pictures purchased by the "Société des Amis des Arts" is a pathetic representation of a solitary artist brooding in the half-light of a littered studio, the pictures turned with their faces to the wall. There is a pathetic power too in "L'Océan" (XIV.) by M. Durang, illustrating some lines from Victor Hugo. M. Gelhay's "Chez le Juge d'Instruction" (XV.) is a clever study of that peculiarly French institution for tripping-up suspected criminals in a private examination. M. V. G. Gilbert's "La Valse" (XIX.) is a brilliantly-painted little ball scene in fashionable life, which may be paired off with a brilliant regatta picture by M. Gueldry (XVII.) in which the boats are well drawn as well as the people, which does not always happen in regatta pictures. M. J. P. Haug's "Un Jour de Fête" in the same room is a brightly-painted little Normandy interior. M. Lucien Simon's little size painting, "Chez le Pharmacien" (XIV.), another surgical scene, this time in a chemist's shop, a clever work far too large in scale for its subject. Better than this, of the same type is M. Laurent-Gsell's interior of a chemist's laboratory at the "Faculté de Médecine," a lesson to students by Dr. Thierry. "Voisins" (IX.) M. Lohrichon depicts the friendship of two small children. M. Marec's "La Veillée" (VII.) has the honour of having been purchased by the State; it is, however, only a clever piece of lamp-light effect. Marre's large painting, "L'Offrande Dimanche," in the same room, labelled with the sub-title "Pour les Ames en Purgatoire" is a painting of a more serious type, in which the point consists in the totally stolid and indifferent faces of the worshippers from whom the alms for this solemn end are collected; it is cold and hard in colour, in which we have termed the "fresco-like" manner which is affected by some French painters present, but it is a picture full of meaning and character. M. Moreau de Tours's "Fascinés de la Charité, 1889" (V.) is another medical subject, representing an experiment on the nervous system of patients in a hospital by Dr. Luys; this is one of the most carefully-studied works in the exhibition; every figure tells its own tale. The "Pauvre Enfant" (III.) of M. Pelez, the painter of old and miseries, is a masterpiece in its way, painting of a miserable little *gamin* who

apparently hurt his knee by a fall; the figure, tinted with painful realism, is sharply relieved against a nearly white wall surface; there are no accessories of any kind to draw the eye from the one figure. There is perhaps certain affectation of being pathetic in this, but it is a remarkable work nevertheless. Picard's "Repos du Soir" (III.) is another of the immense life-size groups of rustics whose figures have no special interest or character, and which, well enough painted, take up space out of all proportion to their interest. M. Roger's "La Fête de la Patronne," in the same room, equally large in scale, has more point and interest, partly from its peculiar manner of execution in half-tints, giving the effect of a flood of light in which tails are lost; but it is after all a gigantic etch rather than a picture.

Among works of pure idealism may be mentioned M. Henner's beautiful female head titled "Mélancolie" (XIII.), M. Jacquet's "L'Araignée" (XXV.), a woman catching flies with a net shown in the shape of a spider's web—an odd fancy which seems to have been rather a success; M. Luminais's "Rapt" (IX.), a powerful picture of a man on horseback carrying off a woman dragged to the horse behind him, the horse is seen shortened; and Madame Luminais's ethereal figure "Le Rêve de Psyche" (III.), a very poetic nude figure rising from her couch as if endeavouring to follow some figure flying over her on wings, which one just sees receding—this is one of the nude pictures of the intellectual type, a purely poetic creation; and M. Maignan's "La Naissance de la Perle" (II.) a brilliant but rather absurd fancy.

The most important of M. Gérôme's contributions of this year may be classed under animal paintings; it is entitled "La Bursuite" (XV.), and shows a tract of sandy desert under a glaring sun, with some pelopians in the distance, and in the foreground a lion in full chase of them; the lion in the middle of a bound, his shadow striking a great blue patch on the sand beneath. The picture is a small one, but the lion seems quite as striking and impressive as this vigorous action as if he were painted life-size.—A lesson to many contemporary French painters who think that the way to power is to paint on an immense scale. The artist's other work, "Abreuvoir," in the same gallery, a scene of camels and Arabs at a watering-pond, is not of equal interest, but his sloping lion will not be readily forgotten. Among animal paintings of the ordinary type Hermann-Léon has a capital dog-picture, "Chenil; ceux qu'on n'enlève pas" (III.), and M. Alfred Parisé's "Le Sucre à l'oeuf" (VI.) is a very good horse-study; a foal is held up in his father's arms to give a taste of sugar to a considerate and sober sire; there is a popular element in the picture, which will probably be largely reproduced in engraving.

Military pictures are nothing like so numerous as they used to be, but M. Detaille is one splendid one, "En Batterie" (XXIII.), a life-size (which is unusual with him); representing a troop of artillery advancing at a gallop, the prominent figure, which really makes the picture, being that of the officer at the head of the troop, who gallops into the foreground with his sword extended, a splendid figure, full of military honour. M. Boutigny's "Dernière Faction" (XVI.) is an outpost scene in an occupied place, a sentry lying dead on his back, and an officer examining the distance with a field-glass; the situation is told with great reality. Flameng's "L'Armée Française Marche à Amsterdam" (XII.), a last-century scene, a capital little painting somewhat inspired Meissonier.

Portraits are tolerably numerous, but they are rather remarkable for solid execution in for any special power of treatment or effect. The French in general make little effort to produce the pictorial kind of portraits on which English painters especially pride themselves,—carefully arranged "harmonies" in colour, &c.; the portraits of M. Carolus-Duran, which may

seem an exception in this respect, are rather costume-portraits than pictures in the higher artistic sense; of them more anon, they are to be found in the new Salon. Among the number we can only mention a few important ones, just noticing that there is rather a run this year on portraits of artists over their work, sculptors in their studios, &c. M. Boggio's portrait of Mme. Henri Daguerre, in her garden with her dog, is noticeable as an example of the *plein air* system in portraiture. M. Boulicaut's "M. Boyssot, Député" (XXIV.), is a good specimen of the plain prose portrait, forcibly painted with no pretence at effect, and that of M. Gusman by M. Bukovac (XVI.), who has given his sitter, in a blue blouse, the homely appearance of an artisan, but with much force of expression and character. M. Flour's "Mlle. Blanche Z..." (XV.) is one of the best of the artist portraits, a lady whose very *spirituelle* face is lighted from the reflection of a mirror over an etching-table. M. L. E. Fournier's "La Fille du Roman" (XXIII.), evidently a portrait, is charming; the lady sits with her book carelessly retained on her knee, and her face expressive of pleasant reflections arising out of the story she has been reading. M. Franzini d'Issoncourt's "Portrait de ma Mère" (XVII.) is a very fine and striking work, a dark picture from which the face of the lady, who is seated facing the spectator, stands out powerfully, a great dog of the Danish mastiff breed is grouped with her, but kept in shadow so as not to obtrude; there is a kind of heroic style and feeling about this, which puts it above the level of a mere portrait. M. Gron, in his "Tons de Suie" (XIII.) has essayed Mr. Herkomer's invention of a white-draped portrait of a lady against a white ground, while in "Tons de Fumée" (XXIII.) he gives us a little portrait of a sweep in a black frame, holding an orange in his hand as a point of colour; these are rather tricks of effect, but they are clever. M. Guay's "Mon Vieux Voisin" (XXII.) is a capital half-length portrait of an old artisan. Mr. Jardon gives a full-length portrait of "M. Jahlochoff" (XV.) in his laboratory. Mr. E. H. Lucas has a pretty portrait of two children in little blouses and with bare legs (VII.). Mlle. Marest's "La Lettre" in the same room, evidently a portrait, is noticeable as a fine study of colour. Another variety in the way of presenting a portrait is seen in M. Maurin's "Portrait of Madame —" (XI.), where the lady is just having her cloak put round her shoulders by her maid; and M. Mengin's "Méditation" (V.) is really a good portrait of a lady with a book in her hand. Like several of the best portraits of ladies, she is shown dressed in black; so is a still better portrait, the full-length of "Madame E. T..." by M. Mertens, an exceedingly vigorous and dignified work, remarkable for the fine painting of face. A small portrait of a young girl on horseback, by M. Aimé Morot (VII.) is a gem of its kind, both in regard to the figure and the horse; it is emphatically a painting of a lady, whose pose is the perfection of grace and refinement. M. L. Muraton has tried an experiment in painting the portrait of a lady by lamplight (XII.), standing before a screen which partially reflects the light and throws a kind of glow round the figure; it is cleverly done and an interesting experiment. M. Penet's "L'Improvisation" (III.) is another special treatment, a portrait of a lady at the piano. Mlle. Thérèse Pomey's "Portrait of Jeune H. T..." in the same room, deserves special mention, a charming and vivacious portrait of a little blonde-haired boy in knickerbockers with hat and whip in hand, strongly relieved against a white waistcoat background. M. Richir's "Le Famille W..." (III.) is worth looking at, especially the baby squatted on the carpet; and M. Paul Thomas's graceful "Portrait de Madame —" (VI.) seated on a park chair; Mme. Vallet's "Portrait de ma Petite Amie Othilde Langobois" (X.), remarkable both for character and colour; and M. Wencker's "Portrait of M. Boulanger" (VIII.) a worker in wrought-

iron, engaged over his craft and turning a scroll on an anvil.

French landscape painting is a rather peculiar problem at present. We read statements now and again from contemporary critics that the French are quite our masters in landscape painting. This seems to be a kind of survival in criticism; it was unquestionably true fifteen or twenty years ago, perhaps even ten years ago, but it is not true now. We have been advancing while the French have been declining, having lost some of their great lights in landscape painting, who have left no adequate successors. The special power which French landscape painters show at present is in the shape of a careful study of particular effects of light and colour, especially in twilight or under dull weather. The latter condition, indeed, they seem so fond of, that all sunlight seems to have vanished out of their landscapes, with a brilliant exception here and there; and amid their desire to show what can be got out of the barest materials, a flat field or common, they seem in danger of losing the poetry of landscape altogether. Pastoral scenes with cattle are among the favourite motives. M. Claus's "Rentrée des Vaches" (XXIII.) a small procession of cows along the margin of a cornfield at the close of a summer day, is a good example of this class of work. Mr. Davis (an American by birth but completely French in artistic style and education) gives a good example of the class of study of special effects in his large work "Le Ruissseau: Effet du Soir" (XXVIII.) This is mainly a flat expanse of grass-land looking a cold green in the twilight, with a crooked brook cutting through it; as a matter of truth to nature it improves on acquaintance, but it is a very depressing kind of work. M. Duval-Gozlan has a really fine work, the large painting of "The Seine at Goulet" with a mass of trees rising in full light on the right, the flat shore and the river on the left; it has very obviously the look of a composition, but a striking and effective one. M. Flahaut's "Le Camp de César, à Puy" (XXII.) is a fine sombre effect under a dull red sunset. There are various very good little moonlight pictures, of which one (not the best) by M. Hareux (XIII.), has the honour of purchase by the State, but hardly justifies this special choice. M. Harpignies' works we missed seeing, and had only the poor satisfaction of seeing his name in the catalogue, from which, as before observed, it is impossible, on the French system, to find the picture except by accident. M. Joubert's "La Seine à Pont-de-l'Arche" (XV.) is a fine work with more sunlight in it than usual; and M. Jourdeuil's "Derniers Rayons du Soleil" (XIV.), a mill and meadows with cattle, a little recalling Mr. Mark Fisher's style. M. Léopvre's "La Loire" (XII.), a large painting where the river is seen in the distance through a sparsely-planted grove of trees, is quite an exceptional work in its appearance of sunshine and aerial freshness, though here one complains that there is really no "landscape" in the higher sense, there is grass and trees, that is all; but one at least thanks the painter for sunlight. M. Le Marié des Landelles' two landscapes in Room VII. should be looked at, and M. Le Vilain's "Ile de Vaux-la-Reine" (XI.), an evening light effect; and M. Maincent's "Un Soir à Port-Marley" (XIII.) is a beautiful bit of evening effect on a river with wooded banks, and is one of the few which impresses one as a beautiful scene, and not merely a cleverly-painted one. M. Massaux's two pictures, "Dans le Prairie; le Matin," and "Dans les Polders; le soir" (V.) are very successful studies of morning and evening effect in a flat landscape. Mr. James Paterson's "L'Hiver sur La Cairn; Écosse" (VI.) which has been exhibited in London, holds its own very well here, and might give hints to some of the French painters as to representing light on a landscape. M. Pelouze painted a large picture on the "Bords de Seine"—dull, gloomy, and colourless to a degree; if nature were really that one life would not be worth living. M. Peiraire again, in "Le

Marais, environs de Corheil" (IV.), covers the earth with nasty green like the cloth of a billiard-table, and M. Pointelin's large painting of a scene in the Jura country (IV.) is still worse; dull greens and leaden skies; one feels choked for want of air in looking at them. M. Quignon's "Le Moisson" (IV.), is a fine work, with its dark masses of trees sailing above a golden sea of wheat; there is some colour here, at all events. M. Schenck's "Les Survivants de Troupeau" (XIV.), is a good snow-scene. A large picture by M. Tessier, "Marée Montante" (XXII.), a flat shore strewn with boulders, and where a cartload of seaweed is being painfully dragged through heavy sand, the man pushing at the wheel, is remarkable for the sense it gives of an impending danger; there is a stormy sky and the breakers of the rising tide are seen over the boulders; the evident struggle to get along with the cart as fast as possible emphasises this expression, and clenches the powerful effect of the whole.

Generally speaking, the French painters are not successful with the sea; they seem to want the feeling and sympathy for it. M. Lapeyrière's "La Plage à la Teste" (III.) is truthful in colour, but the waves are studio waves,—their forms are not from Nature. M. de Kerdréret's small painting of "L'Equinoxe" (XIX.), hought by the "Société des Amis des Arts," showing heaps of white water blown against a breakwater in a gale, has at least something of the wildness of the sea; the forms are good, but the stuff of which they are made is not watery enough,—at first glance it might be snow and ice. The two best sea-pieces are those by M. Charles Lizé (XI.) "L'Appareillage du Matin" and "Brise de Soir"; in the latter a ship and a steamer are gliding over a smooth evening sea, the latter under full sail; the former (the best work) is a fresh morning sea, with two fishing-boats bending before the breeze and sailing out of the right-hand side of the picture; a great deal of the effect depends on this little bit of composition, putting both the craft at one corner and leaving the rest open sea; the spectators seem conscious of their movement and almost expect them to sail out of the scene in a moment: the craft are well painted too, and the whole thing a complete success.

Of the splendid collection of sculpture, the glory of the Salon exhibition, we must speak separately, for it would be absurd to dismiss it with a few words, and we must devote some observation to the new Salon, a much smaller exhibition though with a good deal of special interest about it.

The "Salon Meissonnier" occupies the first floor galleries of the Palais de Beaux-Arts of last year's exhibition, the entrance to the exhibition being by the central hall and grand staircase. The best portion of the exhibition of pictures is to be found in the long galleries running southwards from the central hall at each side, called Galleries II. and IV., and in Gallery III. ranging with the width of the hall on the east side. The gallery running round the central hall is devoted to what works of sculpture there are, which are neither numerous nor for the most part important; the only one perhaps which is particularly worth mention is the plaster model of M. Dalou's seated statue of Lavoisier, a very expressive figure with the head leaning on one hand in attitude of contemplation, and the same sculptor's model of the figure of Victor Noir intended for his tomb; a bronze figure representing him lying on his back with his hat by his side, as if fallen after the fatal duel which ended his life. In giving in his adherence to the new Salon, M. Dalou does not seem to have put forth much of his power to support it. The central gallery also contains the one work which has any reference to architecture, viz., the cartoons and two models for M. Galland's decoration of the side gallery of the three large saloons of the Hotel de Ville. Two bays of this are given full size. They are divided by the broad transverse ribs of the vault, with flat soffits; between these, on the haunches of the vault, are small paintings in square frames surrounded again by oval-

shaped cartouches, the paintings representing the trades of Paris; below there are smaller cartouches containing eminent names in French architecture, "Ballu," "Depertthes," &c. The crown of the vault is occupied by a series of decorative symbols framed within architecturally disposed panels. The whole of the detail is exceedingly refined and has evidently been carefully studied. Two small models project from the wall, giving on a small scale the actual arrangement of the paintings on the surfaces of the vault. This exhibit in itself is a very interesting one. With this exception, architecture or architectural decoration finds no place in this exhibition.

The two ends of Gallery II. are occupied by large works of pictorial decoration. At the upper end, on each side of the door, are M. Lerolle's two paintings, of St. Martin as a soldier dividing his cloak with his sword to give half of it to a pauper, on the other side Christ appearing in a dream to St. Martin and relating to three angels that Martin had covered him with this cloak (according to the text "whosoever doth it unto one of the least of these hath done it unto me"). These are intended for the Church of St. Martin; they are painted in a flat fresco-like style suitable for decoration, and tell their story well. The whole of the opposite end is occupied by a great piece of "Puvisme," a great painting by M. Puvis de Chavannes, in a built-up framework of its own, intended for the staircase of the Museum at Rouen, and entitled "Inter Artes et Naturam." This has not the same merit of telling its story well, in fact it recalls the line from the Anti-Jacobin,—

"Story, God bless you! I have none to tell, sir."

It is a scattered composition of figures in which the groups have little relation to one another. On one side are three artists and an artisan in very modern costume doing nothing in particular; on the left hand are three young women in somewhat more idealised costume, one giving the other a lily to draw from, a third, a very graceful figure, half reclined on the grass with her back to the spectator, also not entering into any action involved in the subject; in the background some workmen are apparently employed in setting up again the fallen blocks of some architectural monument; engaged in a work of "restoration," possibly. The back of the scene is filled by a view of Rouen. Decorative the work is, in regard to its æsthetic and in delicate effect of colour, but it is singularly deficient in meaning and in unity of idea and composition.

After these we come to purely pictorial work. In this department the proportion of good things is very large, and there is no doubt an air of refinement and selectness which does not strike one among the more multifarious contents of the old Salon; there are many very good things, and few had ones; at least in the two principal galleries. As most of the new school have followed the new Salon, there is of course a good deal of painting with a special and progressive character of its own, which means a certain amount of eccentricity, but it is mostly eccentricity with an artistic purpose. In this connexion it is curious to find such a very mundane painter as M. Carolus Duran acting the part of Saul among the prophets. A whole row of his brilliant portraits of ladies in the height of fashionable costume are spaced equally along the end wall of Gallery II., and however lacking they are in the higher qualities of artistic feeling, they compel admiration for their brilliant execution and for the intimate knowledge, one might say instinct, which they display in the art of suiting the colour and costume to the personality of the sitter. The portrait of the graceful and *spirituelle* "Princesse de ——" in a cream-satin dress with a pink cloak, looking the very flower of aristocratic grace and refinement, is strikingly contrasted with the treatment of the more dignified portrait numbered 183, of an older lady in a plain red dress without a particle of ornament, hacked by the ample folds of a black velvet cloak; and as

another variety we have "Mlle. S——" as a study in greys, a young girl in an outdoor costume. Oddly assorted with these is the study entitled "Lelia," the torso of a nude woman seated on crimson velvet with her back to the spectator, the head just turned sufficiently to show the outline of brow and cheek, the flesh splendidly painted. All this is not very high art, certainly, but it has the merit of being superbly successful within its own range, the work of a painter who knows exactly what he wants to do and how to do it.

The Salon Meissonnier contains but one work by M. Meissonnier, "October 1806," Napoléon and his staff watching the effects of a charge of cavalry in we know not precisely what battle. The figure of Napoléon is as remarkable as in all the painter's other representations of him; he sits on his grey horse looking after the body of galloping horsemen as if his whole intellect were concentrated on the event of the movement, with an expression that haunts one afterwards. The execution of the picture is, as usual, complete in every other respect; but it is the personal interest concentrated in the principal figure that makes the picture: the rather a in this instance the soldiers in action are comparatively distant figures, and the staff officers seem merely ornamental.

In the matter of landscape it should seem that, whether intentionally or not, the new Salon shows a kind of revolt against the color greens and sunless skies which gave us so much cause of complaint in the old Salon. Here we find ourselves much more in a land of sunshine. M. Girardet's "Verger de la Vallée d'Auge" is one of the most perfect little landscapes we remember, in regard especially to the balance of the artistic relation between painting and nature; it is real but not realistic, nothing is hardly finished but everything is shown—the trees and the grass the admirably-drawn figure of the woman with her pail, the brown cow making a beautiful bit of colour in the middle of the scene; it is perfect nature, but nature interpreted (not prosaically copied) through the medium of pigments. M. Montenan has been painting about the south of France, and floods his works with southern sun; especially in "Le Quai de Toulon" and "Le Vieux Ponton," an old ship's hulk on the water, looking absolutely scorched in the glaring sunlight. M. Aublet too gives us a gay open-air scene in a large picture, "La Fête-Dieu," a company of young ladies gathering roses in a field full of grass which sparkles in the sun; the woman (except a dear little girl who holds a basket for the flowers) are rather mannered and overdressed, but after the Salon landscapes it is quite a comfort to get a scene in full sunshine. M. Aublet's collection of works here shows a remarkable variety of powers. One of the finest things in the long west gallery is M. Courten's "Matinée, Automne," a scene in which a calm stream is seen lighted by sunshine struggling through a thick mass of yellow autumn foliage from the overhanging trees covering in the whole scene; the effect of light and colour is given with wonderful truth and power, though by means of very broad and bold handling; there is little detail to be made out on a near inspection but the whole falls into its place and tells splendidly at the proper distance.

The best works are all in the two long galleries east and west, and in the shorter end gallery parallel with the central hall; a number of smaller rooms have been undividedly filled with works of little value to add to the numbers of the Exhibition, the worst possible policy in what professes to be an exhibition of select excellence. We can only now just notice in the order of the catalogue a few of the more striking works remaining. M. P. A. Baudouin's "Épisode du Siège de Paris" is one of the immense life-size pictures in which scenes of this kind are being perpetuated; apparently represents a giving-out of stores at some official place, with a crowd of people forming a queue to wait their turn; it is an impressive work of its class, with much character in it.

NOTES.

M. BALFOUR BROWNE waxed heroic towards the close of his summing-up in the Railway Rates Inquiry, his peroration contrasting strongly with the utterances of some of his clients, who have pleaded their helplessness against the "long purses" of railway companies. He said:—"Should this tribunal recommend the Board of Trade to agree with the railway companies and accept their schedule, then the traders must look elsewhere for help; and he believed that, in the long run, the traders were more powerful than the companies." It is doubtful whether anything will ever "turn up" likely to be of more advantage to the traders than the present inquiry. It has afforded them an unequalled opportunity for explaining their position and requirements,—an opportunity of which many have fully availed themselves. The companies still resist the claim for truck-load rates, being apparently apprehensive that intermediate carriers would spring up, who would take possession of the truck and fill it with small consignments of goods collected from various parties, thus diverting a portion of the profits. Sir Bernhard Samuelson's investigations showed that some of the continental trade is carried on under these conditions, to the advantage of the community. An important concession, announced by Sir Henry James on behalf of the associated companies, was as follows:—"In the case of merchandise in respect of which the service of loading, unloading, covering and uncovering is not performed by the company at any station, the maximum service terminal authorised by the schedule shall be reduced—in Class C, loading 3d. per ton, unloading 3d., covering 1d., uncovering 1d.; and in classes 1 to 5, such an amount as may be agreed upon; or, in case of difference, determined in a summary manner by the Railway Commissioners." Mr. Balfour Browne objected that the amount of rebate was insufficient, and that the words "classes 1 to 5," &c., were too indefinite. He suggested that all traders who did their own loading, unloading, &c., and provided their own station accommodation (like Messrs. Huntley & Palmer), should be allowed a rebate equal to the amount actually charged by the railway company to other traders doing the work. After all, the important point is that the principle of rebate under such circumstances is now admitted by the railway companies, and Mr. Balfour Browne's more logical suggestion may perhaps be eventually substituted for Sir Henry James's.

THE Strand Improvement Bill was on Monday last again before the Hybrid Committee appointed by the House of Commons to consider it, when Mr. Dickinson, the vice-chairman of the Parliamentary Committee of the London County Council, stated that since he had given his evidence to the effect that no experts other than the Council's own officers had been consulted on the scheme, he had learned that Mr. Vigers, the well-known surveyor, was consulted, and that he advised on the estimates. The Chairman of the Committee (Mr. H. H. Fowler) asked why Mr. Vigers had not been examined before the Committee. Mr. Pope, Q.C., the leading counsel for the promoters, replied that Mr. Vigers had not been called because he expressed disapproval of the scheme of "betterment." The next witness called was Mr. Daniel Watney, who denied that the south frontage of the Strand, or the property in the streets leading therefrom in the direction of the Embankment, would be "bettered" by the improvement. The "betterment" area which was scheduled in the Bill he considered to be very wide of the mark. Mr. Pember, Q.C., in addressing the Committee on behalf of the Strand District Board of Works against the opposition to the "betterment" clauses of the Bill, contended that it was a recognised principle which had hitherto underlain all

legislation on public improvements that the incidence of taxation should be determined by the motive of the expenditure, not by its accidental results. There was nothing in the preamble, he said, which pointed to the Bill being promoted for the special benefit of the Strand. On the contrary, they had not for a moment thought that in spending this money the County Council were actuated by a desire to improve the Strand property, their object really being to facilitate the traffic in one of the main thoroughfares of London. Mr. John Dunn, F.R.I.B.A., surveyor to the Strand estate of the Duke of Norfolk, was called, and said that he did not believe that the proposed improvement would "better" the south side of the Strand, nor Arundel, Norfolk, or Surrey streets. It was quite true that the Duke of Norfolk's Strand property had doubled in rateable value in about ten years, but that was to be attributed partly to the building and opening of the New Law Courts, and more largely to the fact that a large amount of property on the estate had been rebuilt. Mr. Tewson, another professional witness, confirmed the evidence previously given by Mr. Watney. Both these witnesses expressed the opinion that the first plan proposed by the Council, for taking the block north of Holywell-street for recoupment, was a better scheme than the alternative plan, which would leave the north side of Holywell-street the north side of the widened thoroughfare. If the latter plan were resolved upon, the Strand would be 120 ft. wide at this part; if the first plan were followed, it would be only 100 ft.—quite ample, we think. Two or three tradesmen on the south side of the Strand were called to give their opinions as to the possible effect of the proposed improvement on their businesses. One of these witnesses was Mr. Cole, the hatter, who said that he thought his business would suffer rather than gain if the improvement were carried out. He thought that a narrow street with congested traffic was better for his business than a wide street, because people who were in cabs and carriages had an opportunity given them by occasional blockages of the traffic to observe the shops and their contents. Mr. Cole has evidently quite changed his views since he attended the meeting of inhabitants held at King's College in December, 1888, to consider the question of the restoration or removal of the Church of St. Mary-le-Strand (see *Builder* for Dec. 8, 1888, p. 407). Then, Mr. Cole was a leader in the movement for the removal of the church, on the ground that it was an obstruction to the traffic! The Committee adjourned until Monday, June 9.

AS will be seen by the long report which we publish this week, the Architectural Association at its last meeting did not come to any decision as to the report of the special committee appointed to inquire into the educational methods of the Association, and the discussion has been adjourned to the 30th inst. While it is well to be deliberate in coming to a decision on recommendations which must largely affect the future of the Association, it seems to us that one or two of the speakers quite failed to realise the fact that the report must necessarily be considered as a whole. We quite agree with Mr. Cole Adams and others speakers that it would not be desirable to altogether eliminate "voluntary" workers from the Association. Some of the speakers, we are pleased to see, holdily advocated the establishment of day classes, for, as we said in our leading article on the subject last week, the Committee's suggestion on the question was rather half-hearted. Mr. Gotch, in his remarks, made the same suggestion as that which we made in our article as to the payment of the teachers or lecturers, viz., that their payment should be partially by salary and partially by capitation fees. Before the serious engagement of the evening commenced, there was a preliminary skirmish on the question whether it was advisable or not to publish the numbers of votes recorded for the candidates nominated to serve on the

separate figures. M. Jean Bérard's "Monte Carlo (rien ne va plus)" is, we are sorry to say, the popular attraction of the exhibition, for it is a most hard and commonplace work in style, but a very highly-finished representation of all the details and personages of the gaming-table, and therefore probably interesting, for opposite reasons, to those who have and those who have not taken each part in the proceedings. M. J. E. Blanche's portraits are among the best in the exhibition, especially that of "Mlle. J. M. sur son pony." There is a remarkable group of portraits by M. Boldini, in one of which he has represented a well-known Parisian artist, with his wife and daughter, with his mouth open in undisguised laughter; the effect is distinctly *not* happy, but the whole of this group of portraits are vulgar in style, though their cleverness is undeniable. M. J. C. Cazin has several good little works. M. Courtenay, by the way, whose autumn picture we noticed just now, sends a small work called "Coup de Vent (tempes pluvieux)" which is just as remarkable in its way, and wonderfully true to nature. M. Damoye has a variety of fine works, among which "Les Blés (Bretagne)" and "Dans les Dunes" are the best. M. Emile Friant's "La Lutte" is an exceedingly vigorous picture of a wrestling match between schoolboys who have been bathing; his landscape, "Le Rocher de Monaco" is also a fine thing. M. Gervex exhibits rather a medley of works of different types, the principal one being a portrait-group of French politicians of the day. The works of an American landscape painter, Mr. Harrison, are among the most original and powerful in the galleries, especially the study of the sea at night with a glance of moonlight on rough water. M. Kuehe's "Ave Maria"; M. Lafon's "En plein air," a nude figure seated with her back to the spectator (rather recalling Sir F. Leighton's "Psamathe"); M. Madeleine Lemaire's "Le Sommeil," a very fine painting of a lady asleep with a rich dress with artificial flowers pulled loosely over her; M. Lieberman's "Dans les Dunes," a painting of a dreary waste of sand with a woman tugging at a recalcitrant goat in the foreground; M. Mesdag's "Avant l'Orage"; M. Rixens' "La Toilette," a half-dressed lady before her glass, an admirably-drawn figure—these are all pictures worth looking at. M. Roll makes a good show; among his cleverest works is a portrait of M. Coquelin the younger, in evening dress and evidently in a character; and his "Enfant avec sa Bonne" is an admirable and quite unusual study of child character. It is a pity he exhibited his "Grande Marée," which looks little better than a mass of soapuds. Mr. Alfred Stevens is a large exhibitor of a great variety of works, among which "Réverie" and "La Lettre" are the best. M. Thaulow's snow scene, "Un Jour d'Hiver en Norvège," is a marvellous piece of realism, which however it is not so difficult to achieve with snow as with some other kinds of scene—the problem of light and colour is a good deal simplified. M. Tournès' "Femme qui se deshabille" has attracted a great deal of attention; it is a clever but not an interesting or beautiful work, and to our thinking has been much over-rated. Among smaller works are some admirable still-life paintings, "Prunes et Verre de Vin," and "Fromages et Fruits," by M. Zakarian, which are perfect in regard to colour handling and artistic perception.

The new Salon certainly gives one the opportunity of studying a small selection of pictures under different circumstances from the more crowded collection of the old Salon, and if it is kept as a small exhibition of high-class paintings it will be a gain; but it should be kept at the highest possible level in regard to quality rather than quantity. As it is, it would have been a much better exhibition and have preserved its special interest much more truly, if it had been confined to the contents of the three galleries we have named, and even those would have borne weeding.

Committee. We cannot see what objection there can be to stating the numbers, and therefore, as they were publicly announced, in accordance with the wish of the majority of members present, we include them in our report of the proceedings.

THE great gift of a quarter of a million pounds,* which Sir Edward Guinness last year proposed to bestow on trustees for the purpose of erecting in London and Dublin healthy houses for the working classes, requires, it seems, a special Act of Parliament to permit its acceptance. The law of mortmain, passed six centuries ago to prevent the accumulation of land in the hands of ecclesiastical bodies, now stops the building of artisans' dwellings. By the same law, Lord Cadogan's offer of land in Chelsea cannot be accepted by the Guinness trustees for the purposes of their trust. That such munificence may not go a-begging longer than need be, a Bill entitled "The Working-Class Houses Bill," has just been introduced into the House of Commons by Mr. Lees Knowles; it is backed by Conservatives, Liberals, and an Irish Home Ruler, and cannot, therefore, by any means be considered a party measure. The promoters of the Bill propose to exempt from the laws of mortmain any assurance (by deed or will) of land, or of personal estate to be laid out in land, for the purpose of providing dwellings for the working classes in populous places, provided that the quantity of land assured by will does not exceed five acres, and that the deed or will is, within six months of execution or of probate, enrolled in the books of the Charity Commissioners (for England and Wales), or (for Ireland) in the office at Dublin for registering deeds. A second clause extends the operation of the Act to assurances by deed made within twelve months before its passing by a person alive at that passing, thus permitting the acceptance by the Guinness trustees of the gifts of Sir Edward Guinness and Lord Cadogan. The Bill was read a first time on Thursday last, and we trust that it will soon become law, although we must confess that we have not overmuch sympathy with this continued tinkering of old statutes.

IN the case of the Commissioners of Works v. Banting, which was tried on Monday last, Mr. Justice Day sat with an assessor, Mr. Penfold, the architect. The case itself was of no public interest, relating only to the title to a wall at Kensington, but various technical details had to be gone into, and the Court itself was littered with plans. We note the case because, so far as we are aware, it is the first in which an architect has sat as assessor with a Judge of the High Court. The practice is very desirable, and the precedent ought to be followed in all cases in which technical questions as to buildings are involved. The Institute of Architects and the Surveyors' Institute might jointly appoint a rota of assessors from whom assessors might, when required, be selected. These bodies might well put themselves in communication with the Lord Chancellor on this point, and express their willingness to make such a selection. The Board of Trade has a regular list of nautical assessors for the purposes of shipping inquiries, and the Trinity House has also a rota of Elder Brethren for the sittings of the Admiralty Court. The Lord Chancellor can scarcely be expected to take the initiative on this point, and we therefore strongly urge on the bodies we have named that they should follow up the precedent set in this case. If assessors were employed in building cases, it would give confidence to suitors, and further the ends of justice. Lawyers, however able, cannot master technical details in a moment, but a skilled assessor can often make a technical point clear in a few moments, and thus prevent the loss of public time and judicial temper.

* See the *Builder* for November 23, 1889.

IN reference to the question of the proposed monument to the German Emperor William I., we are able to state on good authority that the Imperial "Bundesrath" will be asked by General Caprivi to come to the following decisions:—

1. That a monument to the deceased Emperor William I. be erected on the newly-opened-up extension of the so-called "Schlossfreiheit."
2. That the monument take the form of an equestrian statue.
3. That the Chancellor be empowered to organise a limited competition for the aforesaid monument.

It being a well-known fact that this idea has originated with the young Emperor, and that the latter is said to have notified to the members of his suite that he would be in favour of no other monument but one in the above form (to be placed in front of his palace), we have good reason to believe that the decision will be arrived at, in spite of public opinion throughout the country being absolutely against this mode of working out so important a project. It may be worth note that the new extension of the "Schlossfreiheit," on which the monument is apparently to find place, is being laid open by the aid of a lottery organised by a committee of financiers.

A NEW monument is to be erected at Dresden in memory of the famous German architect, Gottfried Semper, on account of the great services he rendered to the architecture of the present century. It will be a life-size statue of the architect, to be erected by the combined architectural and engineering societies of the Empire.

THE completion of the "Hofburg" at Vienna is being energetically taken in hand again, it having been decided to finish and cover in, with a cupola of some 25 metres diameter and 51 metres height, that part of the block situated towards the "Bathyanstiege," at present serving as entrance to the inner "Burgplatz," and which has for many a year shown a most ruinous appearance. The architect, Reg.-Rath Kirschner, who intends keeping the new erection in the same style and on the same lines as the riding-school close by, has planned a large portico entrance to the building, for which four pieces of sculpture of considerable dimensions, referring to the Hercules legends, are to be prepared. The opening ceremony cannot, however, be expected to take place for some time.

DR. TRISTRAM, Q.C., Chancellor of the Diocese, sitting in the Consistory Court of London, has granted a faculty for building over a reputedly "disused burial-ground," under the peculiar circumstances of the case. It appears that the open space which lies next northwards of St. Sepulchre, Holborn, and being, in fact, portion of the old parish churchyard, has, in the Chancellor's opinion, ceased to be a disused burial-ground within the meaning of section 3 of the Disused Burial Grounds Act, 1884. And this because the ground had been covered partly with flagstones, and partly—upon a higher level—with concrete (as a playground), with the parochial schools, and with an adjoining large coal-house. This coal-house it was sought to convert, at a cost of 500*l.*, into an extension of the infants' school. In view of these conditions, the Court held that the churchyard could not be considered as one of the disused burial-grounds, to which alone, as such, the Act in question applies. We may add that the Vicar's and the churchwardens' petition for the faculty was not opposed; and that the present schools, removed some years since from Ball-court, Giltspur-street, stand upon a raised bedding of concrete laid over the graveyard.

BY direction of the Charity Commissioners, the Governors of Robert Aske's Hospital have agreed to grant an eighty-years lease of the sites of Haberdashers' House and two adjoining messuages, being Nos. 59 and 75, Buttesland-street, Hoxton. The lessee is to

pay rent of 175*l.* for the first year, and the 350*l.* per annum; he undertakes to erect on this property, which covers about 23,000 sq. ft. superficial, some artisans' dwellings, at a minimum outlay of 20,000*l.* The hospital was built in 1691-2 by Dr. Robert Hook, the mathematician, upon the endowment of Aske, citizen and haberdasher, who demised a sum of 30,000*l.* in trust to the Haberdashers "ad viginti senum [to be freemen] aliment et totidem puerorum educationem;" according to an inscription under the former centrepediment. Haberdashers' House—now No. 55, Pitfield-street, *olim* Haberdashers'—forms the northern wing, and is the only remaining portion of the original fabric, which was rebuilt for almshouses in 1824-6, after the designs of D. R. Koper, architect. Separated from the present school by Buttesland-street, it is a conspicuous building, square on plan of red brick, three stories in height, having mansard roof, and high angle-pedimented dormers on the attic floor. Hook's design included the classical piazza, with an ambulatory 340 ft. long, that lay between the two wings as described by Hatton, and of which the company possess a model. The hall of the company, at one time the Hatters and Milners, was rebuilt by Wren after the Great Fire. In a return supplied to the Commissioners a few years ago the gross income of this particular charity is set down at nearly 8,500*l.*, derived from its estates at Hoxton and Kent.

DR. WALDSTEIN devoted the first part of his second lecture on "Recent Excavations in Greece," delivered at the Royal Institution on Saturday last, to an enumeration of the circumstances which led him and other archaeologists to the conclusion that Hissarlik was the site of the Homeric Troy. The topographical and physical conditions of the spot agreed with those described in the Homeric writings, and the excavations of Dr. Schliemann, coupled with the geological, zoological, and palæontological examination of the site made by Vieillot, had, in the lecturer's opinion, placed the matter beyond doubt. It was true that Strabo, in the thirteenth book of his "Geography," quoted from a certain Demetrius, a native of Skepsis, who was grammarian of the Pergamene school, a statement to the effect that the site was further inland; but there was reason to believe that Demetrius, as a native of a neighbouring and rival city, was a prejudiced witness, and certainly his unsupported testimony did not stand the test of modern criticism and research. The lecturer next described the excavations carried on under the auspices of the German Government at Olympia. These excavations he said, constituted one of the most important works of scientific investigation which have ever been undertaken, and it redounded to the everlasting credit of the German nation that it should have so unselfishly undertaken so great and expensive a work purely in the interests of research, for they were precluded from carrying away anything that was found. One of the most important findings during these excavations was a marble statue of Hermes, which was undoubtedly the work of Praxiteles. Two photographs of the statue were thrown on the screen by means of the electric lantern, and the lecturer pointed to the successful way in which the sculptor had treated the hair of the head of the statue, which was executed in what was at that time a new material, for it was not until the fourth century B.C. that marble was regarded as a sufficiently noble material for an important statue, ivory and metals having been previously used for the most important works of sculpture. Dr. Waldstein's third and concluding lecture will be given on Saturday, the 24th.

AT Lübeck, under the able management of the Architectural Department of the Board of Works, an entire restoration of the fine old Town-hall is being gone through piece by piece, without disturbing the business

carried on in the offices situated therein. The renovation, cleaning, and repairing of the fine old German Renaissance woodwork in this building is pretty well finished, and the excellence and fine detail of this old work can now be easily studied; the two halls situated on the ground-floor, and belonging to the "exchange," have been completely redecorated, and show some interesting Romanesque decoration; whilst a new main staircase in glazed brick (on one of the walls of which a mosaic in memory of the late Emperor William I. will perhaps be placed) is well worthy of note. In the same town a new Museum, showing elevations in brick in the style so natural to the place, is being erected, at a cost of about 20,000*l.*, and several new buildings, among which is an exceedingly well-proportioned post-office completed but a short time ago, are springing up in the picturesque old streets. In regard to the engineering work, the new town waterworks are being extended, and a central electric station, with an extensive net of underground wires, is now in use, this latter acquisition to the town having been carried out by the authorities so as to prevent private competition against the corporation works.

AT Hamburg the extensive new harbour works, with their multitude of warehouses, offices, minor buildings, and, last not least, bridges, may now be considered complete, and it will certainly be worth the while of any architect to visit this vast collection of structures, the elevations of which show throughout an adherence to moulded brick-work, which has always been a favourite method of building in this part of Europe. Among the buildings in the town completed during the last few years, the new Law Courts, showing façades in the German Renaissance style, and the new Post-Office, an imposing block in the modern free style, are specially worth notice; whilst of those buildings now in course of erection, the new "Rathhaus," which is unfortunately being placed on a too-crowded site in close proximity to the lately-enlarged "Exchange," may be said to be progressing as quickly as could be expected, and the new "Stadthaus" will soon be roofed in. In the suburbs villas of a more or less English type are being built in great numbers, and on the whole these private residences may be said to show some interesting elevations, besides well-finished interior work.

AT the Hall of the Armourers' and Braziers' Company in Coleman-street, an exhibition has been opened of various descriptions of metal-work, chiefly brass or combinations with brass. The exhibition occupies five rooms, but only one is devoted to work of recent date, for which prizes are given, the others being chiefly loan exhibits from South Kensington and firms of metal-workers. Upwards of one hundred and forty articles are exhibited, and of these the repoussé work in copper and brass is of the most interest and decorative value. Some especially fine plaques in copper and brass have been sent by the Guild and School of Handicraft, designed by Mr. Pearson (55), of similar character to those sent to the Arts and Crafts Exhibition last year, one of which we illustrated (*Builder*, November 2, 1889). Mr. Ashbee is represented by two coal vases in copper (53 and 31), a log box in copper and wood (35), and fireplace in the same materials. Both the latter are ornamented with a series of oblong copper panels with foliage. The Guild also sends a picture-frame in repoussé, designed by Mr. Holman Hunt for his picture of the May-morning Ceremony at Magdalen (34),—a large circular plaque with moulded edge, and a central oblong panel. From this rays extend to the border, and on ribbons are the words—
"And Fyry Phebus ryseth up so brighte
That all the orient lowlyeth at the sight."

There is also a copper bowl, of simple outline, designed by Mr. Pearson, and ornamented with flying dragons and fish. A fender in copper and iron (54) is bold, but a trifle

clumsy. It consists of a series of copper panels in an iron framework, with copper knobs at the angles. A candelabra in iron and copper (57) is also noteworthy. The work submitted by the Keswick School of Industrial Arts varies in quality. The brass and copper dishes (110-113) are very good, both in design and execution, but hardly the same can be said of the altar cross and alms-dish (23 and 24) which, although carefully wrought, are lacking in originality. Near the centre of the room is a ball lantern, exhibited by Messrs. Strode & Co., excellent in design, and awarded a special prize as being the best work in the Exhibition (67). We should, however, like to have seen a greater appearance of strength at the top. The foliage is dainty, but it lacks an air of stability. Among the smaller objects the following are most worthy of notice:—(26) a lunette panel in repoussé, (41) two brass finger-plates in brass, with delicate foliage and figures, (48) a round muffin-stool in copper, (69) a picture-frame in etched copper with an outer and inner border of wood, (70) a lock-plate in copper and brass, with Cupids, (102a) a door-knocker and knob in bronze, and (120) a tray in copper audin, with fighting birds—we suppose swans. At the end of the room is a tray with a low relief representation of fog, a figure poised in the air with flowing drapery, and the words, "Hover thro' the fog and filthy air." Some of the students' work in Room II. is good, but most of it lacks spirit. An exception to this, however, is a girandole with double sconces in brass, copper, and iron (168); a very fine piece of workmanship which has been awarded a first prize. The other rooms, as has been before mentioned, are occupied by the loan collection lent by South Kensington, and also some modern examples, many of which, we think, hardly add to the exhibition. We hope to give some sketches of the exhibits shortly.

ARCHITECTURE AT THE ROYAL ACADEMY.—IV.

1,779. "Trinity Hall, Cambridge: new buildings." Messrs. Grayson & Ould. A pen drawing of a block of buildings in Domestic Gothic style, with corbelled-out oriels under each gable. The rather high solid parapet over the upper oriel windows gives them rather a heavy effect. The double clusters of chimney-stacks with decorative surface tracery have a rich effect.

1,783. "Study for a portion of a Reredos at Dursley." Mr. H. J. Westlake. A monochrome drawing with a kneeling figure of a saint with very broad and massed treatment of the drapery, in a style suggesting a reminiscence of Albert Dürer; two other draped figures behind apparently standing, though their heads are hardly higher than that of the kneeling figure, perhaps for decorative reasons, like the arrangement of the heights of the standing and riding figures in the Parthenon frieze. The drawing is hung too high for detail to be much seen.

1,784. "Lichfield Cathedral; western façade." Mr. Arnold Mitchell. This very charming drawing, of which a reproduction appeared in the *Builder* for Jan. 5, 1889, is pretty nearly an elevation treated with some of the effect of a perspective view; the lines which are at an oblique angle, as on the sides of the spires, are inclined so as to give a perspective effect, but otherwise both the towers are seen in elevation simply. The centre spire, which is indicated in outline at the back, appears also to conform to some extent to the requirements of perspective, since it is represented as lower than the front towers. The building itself is in Mr. Mitchell's now well-known black-and-white style, but a background of trees and houses is slightly touched in colour on each side, and a sky is delicately indicated in colour. This method of treatment is of course quite illogical, but it has the merit of showing the architectural detail accurately while giving something of a pictorial look to the drawing and removing it from the category of mere elevations; the same kind of practice, as we observed when commenting on the Salon architecture, is not unfrequently adopted by French architectural draughtsmen, and it fulfils its purpose, and is carried out in this case with so much delicacy and finish that we do not

understand why the drawing was not given a place nearer the eye, which it certainly merited.

1,786. "Designs from Flowers of Paradise." Mr. Reginald Hallward. Two bits of decorative conventional floral design drawn with the brush in red, one on a light red the other on a white ground. The latter, in which the flowers form a heart-shaped cluster bounded by thin sprays of leaves, is a very good and effective piece of decorative work of its kind, drawn with a true feeling for the conventional treatment of foliage.

1,787 "Central Library Chelsea": Mr. J. M. Brydon. A very firm and well-executed pen drawing of a square mass of building with a hipped roof and cantilever cornice carried round, the window dressings treated in a style in keeping with the neighbourhood, rusticated with separated quoins and voussoirs cutting through the architrave mouldings; there is a semicircular porch with an Ionic order which is better connected with the building than is sometimes the case with features of this kind, though still looking a little as if it might have been added afterwards. This is what may be called a perfectly common-sense building, and there is little fault to find with it, taken for what it professes to be, but we not know that such a building adds very much to the architectural happiness of the neighbourhood.

1,789. "Armagh Cathedral": Messrs. Carpenter & Ingelow. A solid-looking pen drawing of a solid-looking church interior, with massive-looking tower arches with plain roll mouldings on the angles of the successive orders of arches, and corresponding plain chamfered piers below. The choir furniture, stalls, &c., which is carefully shown in the drawing, though rich in effect, partakes of the solid character of the whole interior.

1,790. "Broxwood Court, Herefordshire: additions." Mr. Leonard Stokes. There is nothing to show what are the additions,—no plan, and no distinction of them, of course, in the pen line perspective drawing, and all one can say is that as it now stands it is a curious and rather picturesque-looking old-fashioned style of house; but this is certainly not the way to illustrate architectural work. From our knowledge of Mr. Stokes's work we have little doubt that whatever additions he made were an improvement to the house; but wherein they consist and what is their merit it is impossible to conjecture from the drawing. Something more is surely required for the Architectural Room at the Royal Academy than merely to send a view of a house which has been added to, just a picture conveying no information at all.

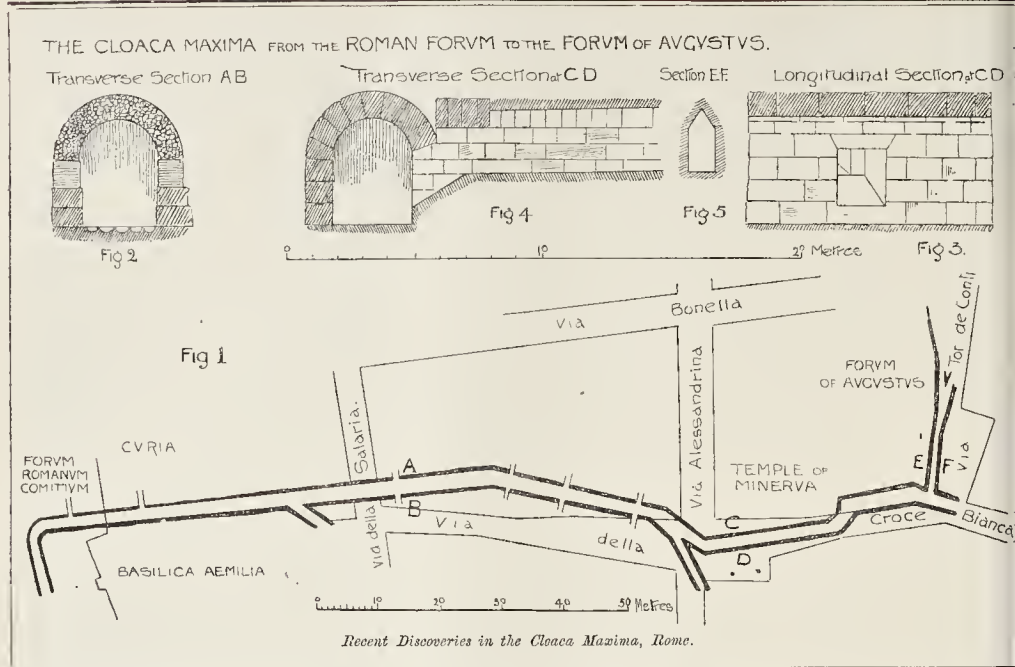

1,795. "Piazza dei Signori, Verona." Mr. A. C. Blomfield. A small and slight but delicately-executed pen sketch.

1,799. "Casket in cloisonné enamel." Mr. John J. Shaw. A rich and pretty piece of work; the top and side elevation are shown. The side and the outer part of the lid are divided into sections by bands of a pale green enamel between golden lines, and dotted with gold spots along the centre; this band assumes a kind of Moorish arch shape with foliations; the spaces between contain very daintily-designed sprays of flowers and leaves in two or three colours on a dark line ground; the edge of the lid is decorated with an undulating spray of a similar character. The floral design employed is rather of a Persian type. The feet of the casket are well designed, and the whole is a very artistic design shown in a very well executed drawing.

1801. "A Norman doorway, Glastonbury Abbey." Mr. A. B. Bamford. An apparently very well and carefully painted pen drawing of an interesting piece of ancient architecture; we do not see why it should have been pushed so high up to make room for No. 1800, which has the appearance of being a stray leaf out of a sketch book.

1802. "Seascale Church, Cumberland." Mr. C. J. Ferguson. We presume this little building is a country church in a mountain district; if so, its simple and solid character, with the small square-headed mullioned windows at the sides, seems exceedingly well adapted to the sentiment of a situation of that kind.

1803. "The Hall, Shiplake Court." Messrs. Ernest George & Peto. The style of drawing in which the works of these architects are usually shown here is far better suited to buildings which are more or less Gothic in feeling than to a Renaissance interior such as No. 1734, before referred to. There is little ornament to draw in this interior, which shows a long

lofty hall or gallery with the walls wainscotted to a considerable height with plain square-pannelled wainscot, large mullioned windows with segmental arched heads and deep internal reveals, and a rather ponderous open-timbered collar-beam roof over, with curved braces to the collar. At the further end of the hall is the orthodox traditional screen. The whole is to our taste somewhat too ostentatiously plain and solid to be in keeping with the taste and requirements of modern life; which is to say that were we to build a house with a big hall for our own use we should prefer to give it a nineteenth century rather than a Mediaeval air; but tastes differ, and as there are those who like a rather bare-looking open-timbered hall (against the latter element we have nothing to say) and an air of Mediaevalism about their house, it is well there should be architects who can do the thing as well as this is done.

1804. "St. Saviour's Southwark; New Nave": Sir Arthur W. Blomfield. This is a very carefully-drawn interior in plain pencil outline, with just the joints of the stonework filled in by way of giving a little surface to it. It is a severe and pure Early English treatment in the most conscientiously-correct style, and impresses one in fact as being a design of an ancient cathedral rather than a design for a new one, and this perhaps is the kind of commendation the architect would most desire. At the further end the wall is shown solid, with the exception of a series of lancet windows in the gable, and decorated with a series of niches giving a kind of screen effect. The tomb shown at the end is, we presume, an existing one which is to be preserved *in situ*. Slight as the drawing appears at first sight, it is a very careful piece of line drawing in regard to every detail of perspective.

1805. "Reredos in St. Mary's Church, Aberavon": Messrs. Kempson & Fowler. A coloured elevation drawing showing a wall-arcade of Early English style at each side, with the reredos raised in the centre, of rather richer work of nearly the same assumed date in detail, except that there is an open cusping to the arches over the five niches above the altar; these are filled with statues of Christ and the Evangelists. If archaeological correctness is intended, the battlemented finish to the reredos and the arcade seems a little out of keeping with the rest, the general appearance of which is architecturally satisfactory, though there is nothing out of the beaten track of modern Gothic reredoses.

1809. "Memorial Reredos in Harrow Church": Mr. R. Norman Shaw. This is a very original work. It shows a large panel with a gold

ground with a conventional floral pattern slightly indicated upon the surface, in the centre of which is a flat painting, in a decorative style, of Christ on the Cross, on one side the Virgin and on the other a figure of an Apostle; the robes of these figures form the only strong colour in the scheme. At the side of the panel, which has a moulded base, is a strip of carved work of foliage; above the panel an open-work border of foliage design. The drawing of this portion is somewhat slight and hurried, and probably does not do justice to the detail; the figures are carefully executed.

1822. "The Savelli Tomb in Ara Coeli, Rome," by Mr. J. T. Perry, is apparently a good little drawing, but cannot be well seen.

1813. "Interior of Halifax Cathedral Nova Scotia": Mr. Arthur E. Street. A large coloured drawing of an interior in the Early English style, with no triforium and a large clearstory; the bold shafts of the piers below the caps are of massive blocks of marble, which has a striking and rich effect in the drawing. The roof is ceiled with panel work, with wooden moulded tie rods; the chancel is shown as vaulted. The drawing is executed in a free and effective style, and there is a largeness and dignity of effect about the interior.

NEW DISCOVERIES AT THE CLOACA MAXIMA IN ROME.

I HAVE already described (see the *Builder*, 1889, March 30, page 235) the excavations made by the Municipality of Rome last year in the southern portion of the area of the Forum of Augustus. I mentioned that under the pontificate of Pius V., in 1570, an excavation was made in this area of the forum, in order to drain the waters that filtered through the soil, and that which descended from the Quirinal and Esquiline hills.

Recently, in order to drain the stagnant pools in the same spot, the engineer, Signor Narducci (author of an interesting work on the ancient drains of Rome), has cleansed the famous drain, Cloaca Maxima, built by Tarquinius Superbus in the year 138 of Rome,—530 years B.C.—and which runs very near the Forum of Augustus.

The part of the Cloaca drained by Signor Narducci, 91 metres in length, is between the eastern side of the Roman Forum and the Forum of Augustus (see plan, fig. 1). The results have been very satisfactory. The construction of this part of the Cloaca appears to be original only in the lower part of the walls, formed of large peperino blocks (1.20 by

4 metres). The upper part of the walls, constructed of bricks, was probably added by Agrippa when he restored the Cloaca, and but some additional branches to carry off the waters from his thermae, near the Pantheon.

The bed of the Cloaca Maxima is paved with polygonal blocks of silex; the vault, as far as the Temple of Minerva, is formed with chips of silex (see fig. 11, section A B) as a concrete, and from the temple to the Forum of Augustus with blocks of pietra gabina.

In the space of the Cloaca, between the two forums, seven mouths of secondary drains have been discovered (see plan), of the Imperial time. Near the Minerva Temple, a large ancient drain—perhaps the drain which in the Republican period ran in the valley of the Carinae—reaches the Cloaca Maxima (see plan C D and figs. 111., IV.). A drain of the Imperial time, built of bricks, and covered with imbricated tiles, which runs under the Forum of Augustus collected the drainage of the area of that forum (see plan E F, fig. V.).

L. B.

GERMAN TECHNICAL MUSEUMS.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE eleventh ordinary meeting of the presentation of this Institute was held on Monday evening last, Mr. Alfred Waterhouse, R. (President), in the chair.

Mr. Frank Granger, M.A. (holder of the Godwin Bursary, 1889), read a paper "German Technical Museums," of which the following is an abstract:—

The author considered that this class of buildings deserved the careful attention of architects, now that so much interest is being taken in technical education. The industrial art and trade museums of Germany had been suggested in great part by South Kensington Museum, but close inspection revealed essential differences. The German practice was frequently to locate industrial art museums in school buildings, while they were regarded from the student's point of view, not that the collector of curiosities. It was advisable to group objects of one kind together, so that the characteristic methods of a group of artists (district, or a period) could be seen in combination at a glance; the division of rooms by partitions and screens, as in Berlin and Hamburg greatly facilitated this. In planning a first museum it would be appropriate, on scientific as well as on practical grounds, to group together (1) the materials employed in the industries of construction; (2) the materials employed in the textile and allied industries.

THE BUILDER. MAY 24, 1890

THE PHOTO ENGRAVED BY J. S. MARTIN LANE, ARTIST ST. LONDON. E.

PERSPECTIVE VIEW OF DESIGN SUBMITTED IN COMPETITION FOR SHEFFIELD MUNICIPAL BUILDINGS.—By MR. ARNOLD MITCHELL, A.R.I.B.A.

Having dealt in some detail with the objects to be exhibited, Mr. Grainger referred in detail to the question of planning. All the buildings cited by him were characterised by great simplicity of plan. The rooms were square, oblong, and arranged along corridors, and generally speaking there was an absence of *turns de force* in the planning. In some of the larger buildings, the corridors overlooked interior courts. The rooms in which the objects were exhibited should not be the sun upon them; and as but a small portion of an ordinarily large collection could be exhibited at one time, accommodation should be provided for storage in an easily accessible manner. A library and reading-room should be provided in connexion with the museum, and it should not be necessary to pass through the museum to reach the library, near which lavatories should be provided. The majority of the objects in a museum required glass cases, and the museum authorities in Germany preferred wood to iron for the material to be employed. Details of cases were given very fully by the author, who then turned to trade schools, and trade continuation schools. The latter were interesting because they indicated one way in which the new Technical Instruction Act might be applied.

Mr. Grainger then gave extracts from his detailed reports on particular museums, commencing with the Museum at Hamburg, erected upon the designs of Herr Zimmermann at a cost of 120,000*l.* It formed a closed quadrilateral with two interior courts, which were separated by a central block. The chief elevation looked to the east, the greatest length was 343 ft., and the greatest width 247 ft. The Industrial Art Museum, Berlin, was from the designs of Opus and Schmieden; and was constructed with stone basement and brick superstructure, with tile and terra-cotta bands. The library was on the ground-floor to the right of the entrance. The Dresden Museum of Industrial Art was in the same building as a school; and, as at Hamburg, the museum occupied the ground-floor and the school the upper stories. The Leipzig and Hanover Museums and the Hanover Trade Museum having been referred to, the author drew attention to the Trade Museum at Chemnitz as an example of its class he had seen. It occupied the second story of the building of the *Arbeiterverein*, the floor below being devoted to their library; and consisted of four passages opening into one corridor, while the other corridor led to a fifth room and a small library. The Mining, the Agricultural, and the Ceramic Museums, Berlin, were next dealt with. The last consisted of rooms ranged round a central open courtyard. The ground-floor was devoted to models of workmen's dwellings; systems of heating, ventilation, drainage, &c. Mr. Grainger having described the Mineralogical Museum of the Charlottenburg Technical High School, proceeded to deal with technical high schools, that of Charleburg being first mentioned. It was used in a fine new building, the main block being 600 ft. long by 170 ft. deep from front to back, with two large projecting wings. It had two interior courts; the basement of the exterior was faced with red sandstone, while the upper stories were in yellow sandstone with white sandstone dressings. The principal staircases were of red granite, unpolished, with the exception of narrow strips at the side. In the grounds there was a chemical laboratory, a technical testing station, and an engine-house. Further details were given by the author, who next referred to the Dresden Polytechnicum, which covered an area of 4,200 square metres. The technical, engineering, architectural, telegraphic, and electro-technical collections there were all arranged with a view to their use in instruction. Many of the doors were provided with glazed panes for thermometers, so that the attendant could regulate the temperature of the rooms without disturbing the classes. The Hanover Technical High School was also described. Mr. Grainger then mentioned several miscellaneous matters which he had noted during his visit, among others the paving and lighting of Berlin streets. The scaffolding of the new buildings were usually constructed of squared timber, and carried up to the top soon after the foundations were commenced. The provision for safety of workmen in this particular was most seriously demanded, that in the form of a tract issued by the Ministry of Public Works ran thus:—"The contractor bears the responsibility for the soundness and

strength of the scaffoldings. On the order of the superintending architect he is bound to complete or to strengthen the same immediately and at his own expense." The bricks used for the interior walling of the new shops and residential blocks were ordinarily the local yellow. Some of the fronts were being faced with brick; the majority, however, were still faced with stucco in the old fashion, the brickwork being carefully adjusted to the stucco detail. At the Academy of Art, Leipzig, the ventilation and heating were kept independent; and the author described, with the aid of diagrams, the system employed, as well as the materials of the building generally. The roof was entirely of wood; the trusses at distances of about 12 ft. merely coupling the roof together, and not carrying the rafters. These were all 7 in. by 5½ in., and about 2 ft. 6 in. apart, and were covered with 1½ in. by 9 in. boards. The lightning conductors were secured to the roof by means of iron tiles or slates, which matched and bonded with the rest. The slates were secured by hooks at the bottom; no leverage was allowed to the wind, and even in exposed situations such roofs had stood for thirty years without suffering much damage. As an instance of German professional practice, Mr. Grainger stated that in the case of the University Library and of the Academy of Art at Leipzig, the buildings were not being executed under the superintendence of their designers, but the library under another architect, the Academy under the Municipal Building Inspector. Architects, also, were often master builders, and carried out the designs of other architects.

The paper, we may add, was not read *in extenso*, although it will be so published in the Proceedings of the Institute.

Mr. E. C. Robins, F.S.A., opened the discussion, and said that he had listened with great interest to Mr. Grainger's paper. The great want felt in connexion with technical institutions in this country was that there were no such museums attached to them as were to be found in Germany. As he listened to the paper, he could not help thinking that it would be a very good thing if some of the holders of the Godwin Bursary were to go and see what had been done in this country.* Because, since his (the speaker's) visit to those foreign institutions, a great change had taken place in the buildings erected here, while some of the last buildings erected in Germany had profited by the English examples. He had received letters from professors in Germany who stated that if they had received particulars of the buildings erected here they would have profited by what had been done in England. It could not fail, therefore, to be interesting to know what had been going on in England in this direction. It was to be regretted that so very few papers dealt with buildings which had been erected here, such as those designed by Mr. Waterhouse, where the details of construction were very much in advance of those of some foreign museums and buildings of that class. There could be no doubt that it was of great benefit to bring before the public the fact that there were existing in Germany museums of a remarkable character, illustrating every branch of technical education, so that the professors had no difficulty in finding specimens to explain their lectures. In the large building erected by Mr. Waterhouse for the technical institute at South Kensington, there was, up to the present time, no museum, for, though Mr. Waterhouse had provided the room for it, there was as yet nothing in it. That was the sort of thing to be found in all recent buildings of this nature in England, viz., that the museum was the last thing to be fitted up. He was therefore glad that attention was being drawn to the fact that we were standing at a disadvantage as compared with the Germans because of the want of corresponding museums. Thus in Berlin, Dresden, Nuremberg, Munich, and elsewhere the education was carried on much further than it was here. In Germany the objects designed and executed by the students were to be found in the museum itself, and at some of these institutions there was an annual sale of the products of the students' labour. The influence of the museum was very great, not only in the interest which it had in itself, but by developing progress from generation to

* We presume that Mr. Robins means in their individual capacity as architects, and not as holders of the Godwin Bursary, which was expressly founded for the promotion of the study of works of modern architecture abroad.—Ed.

generation. It was valuable because it enabled the present generation to profit by a knowledge of past methods of work, and so led to emulation. From what he had seen of the German museums, they were most liberally fitted up, and the collections of drawings were simply charming. At Owens College recently he inspected some models of all kinds of buildings, which had been purchased in Germany. These were of the most complete description; they could be taken to pieces, and illustrated manufacturing of all sorts to their slightest detail. He had pleasure in proposing a vote of thanks to Mr. Grainger for his excellent paper, which he hoped might make an impression on the public generally, by showing that we were still far behind our neighbours in such aids to the education of the people.

Mr. T. M. Rickman, F.S.A., seconded the vote of thanks. He was pleased to find that Mr. Grainger had studied at the museums the things which they contained. So many architects were in the habit of looking at the building as being the all-important thing, and of considering that the things which were in it were of secondary importance. Such museums as he had seen abroad contrasted very favourably with many of those in this country. Mr. Grainger had given them a description of what was to be seen in those buildings, and had then come to the conclusion as to bow far the building had been fitted for the purpose. He hoped that the rising generation of architects would learn the extreme value of the objects they saw inside the museums, and always recognise that these were of far greater importance than the buildings themselves. Until they knew the uses of the buildings, and the manner in which the different objects should be seen, they were utterly unable to design such a building as they ought. He trusted that Mr. Grainger's paper would be the commencement of a new system of essays on our public buildings,—in dispensing them not according to their external appearance, so much as the actual purpose for which they were designed.

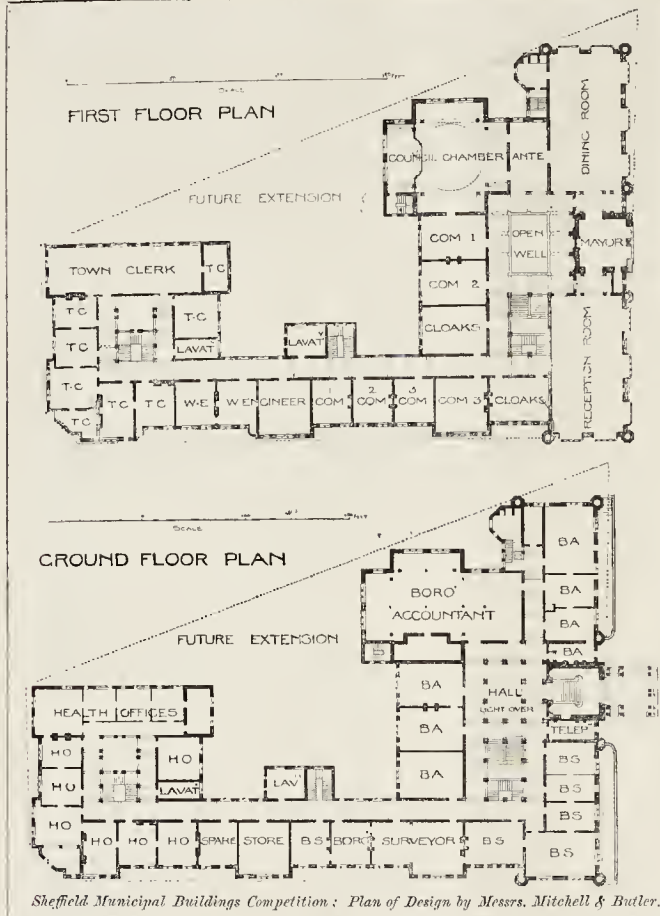

The President remarked that Mr. Grainger had certainly described very lucidly the fittings and the collections contained in the museums visited by him last year, and, with Mr. Rickman, he felt thankful to Mr. Grainger for having done so. He would have been glad, however, if Mr. Grainger had not ignored all construction in the way he appeared to have done, and he hoped that in his reply they might hear one or two facts about the buildings themselves. For instance, he would like to know whether those museums, which covered a vast amount of ground, were lighted from the roof in the upper stories, or by windows; also, if they were fireproof in their construction, and, if so, of what materials the floors and stairs were made. These would be interesting matters to them as architects. One item of information given by Mr. Grainger was very interesting,—viz., as to the advantages to be derived from photographs of accidents. When in Seville, a few months ago, he was lucky enough to obtain some very good photographs of the lamentable accident at the Cathedral, where one of the four great central piers fell, bringing down with it a corresponding portion of the vaulting. The photographs showed curiously how intact a large portion of the pier was when it fell to the ground, thus giving evidence of the excellent material of which it was constructed.

The vote of thanks was then put, and very heartily received.

Mr. Grainger, in his reply, said that in reference to the modern methods of construction used in the case of these museums, he had a capital opportunity of seeing those at Leipzig. The results would be found in his paper when it was published *in extenso*. In some of the buildings which he visited,—as, for instance, those at Hamburg,—the construction and arrangements did not strike him as being particularly good, so far as the structure or the placing of the windows was concerned. The external appearance of many of the buildings made no impression on his mind, and he kept no notes of the mouldings, &c., some of which he must say were execrable.

The President intimated that the next meeting would take place on June 2, to receive the report of the scrutineers appointed to check the election of the Council, Standing Committees, and auditors for the year of office 1890-91, and to declare the names of those elected. A paper would also be read on "An Arab house in Cairo" by Count d'Hulst.

The proceedings then terminated.

Sheffield Municipal Buildings Competition: Plan of Design by Messrs. Mitchell & Butler.

Illustrations.

DESIGN FOR SHEFFIELD MUNICIPAL BUILDINGS.

THIS is the perspective view of the design sent in by Messrs. Mitchell & Butler, and on which we have already commented in our Notes on Architecture at the Royal Academy. Plans of two floors are appended.

We regret that the drawing being obviously by Mr. Arnold Mitchell, his name alone was at first inadvertently appended to the title on the lithograph, instead of that of Messrs. Mitchell & Butler; this has been corrected in a portion of this issue, but the mistake was not noticed in time for its correction on all the copies of the lithograph.

DESIGN FOR CHURCH HOUSE, WESTMINSTER.

This elevation, which is now among the drawings hung in the architectural room at the Royal Academy, represents the north side, towards Dean's Yard, of a design prepared by Mr. J. T. Micklethwaite and Mr. Somers Clarke for the Church House at Westminster. The plan would have occupied the irregular quadrangle between Dean's Yard, Tufon-street, and Great and Little Smith streets. The left-hand block shown on the elevation contains the chapel above and library under; in the centre is the entrance gateway with the ante-chapel over it; the lower block on the right contains committee-rooms on the ground-floor and the Bishop's Convocation House above. Other portions of the plan, arranged round the quadrangle, would have included a great hall and a Lower Convocation House, &c.

The design was originally made at the request of several members of the Council, and the aim of the architects was to treat it so that it might grow naturally out of the practical requirements of the building, and at the same time have a character partly ecclesiastical and partly palatial, suited to the dignity of its purpose and the important site which it was intended to occupy.

PREMISES, No. 40, WIGMORE-STREET.

This building has been erected for Mr. Carl Bechstein, pianoforte manufacturer.

The front is built entirely of terra-cotta, made by Messrs. Doulton & Co.

Mr. Thomas E. Colcutt is the architect. The drawing from which the illustration is taken is hung in the Architectural Room at the Royal Academy.

HOUSE AT NORTHWOOD.

This hungalow-house has been built at Northwood, an estate near Pinner, and was designed with a view to great economy, the whole of the bedrooms being in the mansard roof. The house contains a hall, two sitting-rooms, kitchen and offices, five bedrooms, and a bath-room. The contract-price was 5200. The walls are faced with red bricks, and the roofs are tiled. The verandah and porch floors are laid in tiles, and the whole of the woodwork is painted white and varnished. The builder was Mr. S. Barnett, of 83, High-road, Kilburn, and the architect was Mr. R. A. Briggs, A.R.I.B.A.

HOUSE AT HAMPSTEAD.

This house is about to be built at Hampstead. The walls will be faced with red bricks, and the roofs will be tiled. The two large circular bays above the cill level will be

cemented and painted white to match the wood-work. The house contains a large hall with gallery, dining, drawing, and billiard-rooms, kitchen and offices; six bed-rooms and a dressing-room on the first-floor, and two servants' rooms on the second-floor.

The illustration is from a drawing by the architect, Mr. R. A. Briggs, A.R.I.B.A.

THE ARCHITECTURAL ASSOCIATION. THE PROPOSED NEW DEPARTURE.

THE last ordinary general meeting of this Association for session 1889-90 was held on Friday evening, the 16th inst., at 9, Conduit-street, Mr. Leonard Stokes, President, in the chair.

The minutes of the previous meeting having been read and confirmed, some discussion arose as to the resolution passed at the previous meeting instructing the scrutineers of the votes for the election of the Committee to announce the number of votes recorded for each candidate.

Mr. T. E. Pryce moved that the resolution in question should be rescinded.

Mr. H. D. Appleton seconded.

Mr. C. H. Brodie, having spoken in favour of the motion to rescind,

Mr. A. O. Collard spoke in defence of the resolution arrived at at the previous meeting. He said that it was of interest to the members at large to know what numbers of votes were recorded for the members nominated for the Committee. Certain candidates whom a large section of the members might wish to see elected might not perhaps be successful, and it would be of interest both to the candidates themselves and to the members to see how they stood in the voting.

Mr. Bernard Dickson moved as an amendment that the numbers of votes recorded for the successful candidates only be announced, and that the numbers for the members not elected be not declared.

Mr. E. Woodthorpe seconded this amendment, which, on being put, was lost by a large majority.

The Chairman then put Mr. Pryce's resolution to rescind the motion in question, which was declared lost, although only by a small majority.

The report of the scrutineers as to the election of officers and committee was then presented.

Mr. Leonard Stokes was unanimously re-elected President, and Messrs. F. T. Bagge and H. O. Cresswell were unanimously elected Vice-Presidents.

For the Committee the following were the results of the voting:—H. D. Appleton, 19 votes; T. E. Pryce, 173; John Slater, 153; A. E. Pite, 141; G. C. Horsley, 130; W. Burrell, 128; F. Hooper, 128; G. R. Julian, 128; Owen Fleining, 117; E. W. Mountford, 116. (The foregoing were declared elected.) The candidates not elected were:—P. J. Marvin, 114; A. C. B. Booth, 110; A. O. Collard, 92; T. McLaren, 86; B. F. Fletcher, 84; A. W. Earle, 68; F. T. W. Goldsmith, 55; F. M. Simpson, 45; and F. M. Elgood, 34.

Mr. H. W. Pratt was unanimously re-elected Treasurer, and Messrs. F. R. Farrow and E. S. Gale were unanimously re-elected honorary secretaries.

The President announced that Mr. Percy D. Smith had been elected Travelling Student of the Association for the current year, Mr. Tugwell obtaining the second prize.

The following gentlemen were elected members of the Association:—Messrs. J. Todd, R. H. Hunter, E. Cruikshank, H. Jefferis, A. G. Dutton, G. W. Haywood, S. Constanduros, H. G. Collins, S. D. Mitcheson, and Hubert C. Corlette.

The meeting then proceeded to consider the report of the Committee appointed to enquire into the educational methods of the Association, the salient points of which were referred to in the leading article in last week's *Builder*.

Mr. John Slater, in moving the adoption of the report of the Educational Committee, said that the proposals embodied in it were of great importance. Indeed, the report might be said to be epoch-making in the history of the Association. He should like to point out that this movement commenced within the Classes themselves. It was only on the earnest representations of the members of the Classes and Class secretaries as to the dissatisfaction of the

students themselves with the present means of education and the methods of receiving instruction within the Association, that the committee was appointed to institute an inquiry, first of all into the working of only two or three Classes. It was, however, soon found to be impossible to limit the inquiry in that way, and consequently it was determined to make an inquiry into the whole working of the Association. No one who had followed the history of the Association closely for the last ten years could be ignorant of the fact that the cry for change was no new one. It had been long evident that the voluntary principle had been loaded almost to the breaking-point; and successive Presidents, beginning with Mr. Cole A. Adams, had referred to the subject in their presidential addresses, and had pointed out that some radical change would become necessary in the near future. The sum and substance of the committee's report now before them was that that "near future," so often alluded to, had become the present. There was no doubt that the institution of the scheme of progressive examinations by the Royal Institute of British Architects had brought matters to a head. After all, examination was not education; and if the members of the Association were to enter for the examinations with the hope of passing them, it was necessary that some more efficient means of education than at present existed should be devised by the Association. He would just like to make one word of explanation as to the statement which had been made, and somewhat strongly criticised, that the rôle of the Royal Institute of British Architects was not that of a teaching body. He was afraid that that statement might have led some members of the Association to think that the Institute took no interest in education. That idea was erroneous, for the Institute was of opinion that some improved method of education was earnestly and strongly to be desired. Personally he thought it quite possible that in the future the Institute might have to become a teaching body; but it could not become a teaching body without very great changes in its constitution, and the changes which would be requisite would have to be very carefully thought over, and could not in any case be brought into operation for a very considerable time. That being the position of affairs, the Association thought that it ought not to wait for the Institute to devise a scheme of education, but that it ought to do its best to promulgate a scheme of its own. He might say that it appeared to him that the position of the Institute in relation to the architectural world was analogous to that of the University of London in relation to the educational world. Although the University of London was established only as an examining body, and not as a teaching body, yet its beneficial effect upon education had been very great and far-reaching. In like manner, he believed that the institution of the Architectural Examination would have a wonderfully fostering effect upon architectural education throughout the country. Going back to the subject of the report, he should be very loath to disparage the voluntary system, which had been worked for so many years in the Association; but it should be remembered that when the Association was first started, and for many years afterwards, it was an Association entirely consisting of students meeting for mutual help and instruction. So long as the only classes were the Class of Design and the Class of Construction it was very easy indeed to adhere to the voluntary system and to have unpaid visitors coming down time after time to help with their advice to the students; but they now had eighteen different classes or courses of lectures, with an aggregate attendance of some three hundred students. How was it possible for voluntary effort to cope with that enormous amount of work? They could not expect competent members to give up their time for that purpose. On the other hand, he was quite sure that it would be possible to find amongst the ranks of the Association some talented individuals who would be found willing to give their time to educational work. The Association had, *volens volens*, become a great teaching body, and it behoved them to be as efficient in their work as possible. It should be remembered that they were not starting upon altogether new lines. They had had a few Classes with paid instructors for some few years past, and it seemed to him that the knell of the voluntary system was struck as soon as they instituted classes with regular permanent

paid instructors. They would see from the report that the committee had taken a considerable amount of evidence as to what should be the basis of the instruction which it was recommended that the Association should endeavour to give; and that evidence was almost unanimously to the effect that the scheme of examinations which the Institute had set forth should be taken as the basis of the proposed curriculum. But, nevertheless, they all felt that there were a number of other important subjects which were not set forth in the Institute programme,—subjects without some knowledge of which an architect's education could not be said to be complete,—and therefore it would be found from a perusal of the report that, while the sub-committee proposed the Institute programme as the basis of the curriculum, they by no means meant it to be regarded as the limit of the instruction which they proposed to offer by this scheme. There was one new feature which had been introduced into the programme which the sub-committee had drawn up,—viz., the studio,—where members could meet and do their drawings. It was a modification of the studio system which they found abroad. Such studios as that which it was now proposed to establish were, however, not altogether unknown to members of the Association; and those who had experience of them were perfectly convinced that the benefit to the student drawing with a number of his fellows, and having their friendly advice and criticism, was of the greatest possible benefit and assistance to him. Therefore the committee had made such a studio a cardinal feature of their proposed scheme. He did not propose to go through the curriculum which the committee had laid down. They did not put it forward as a perfect scheme, but they had endeavoured to base it as closely as possible upon the lines of the old classes which had been established by the Association. One new and important feature had been suggested, viz., the day classes. The committee felt very strongly that those architects in practice who were responsible for pupils ought to give them time in which to obtain instruction otherwise than in the office, so that they would not be compelled to work every evening, or nearly so, when they had some claim to relaxation and rest. He should like to say that he was quite sure that nothing had been farther from the wish or the intention of the members of the Education Committee than to enter into rivalry with any existing institution. They believed that there was room for all the means of architectural education which we had in London, and that the University College classes, the King's College classes, and the Academy classes, would not be swamped by the scheme which the committee had propounded. They did not expect to start this big scheme out and dried in its entirety by the beginning of next session. Its adoption must be gradual, and to a very considerable extent at first of a tentative character. They hoped that the Classes of the Association would continue very much as they had been carried on in the past, but that instead of having sporadic instructors they would be able to appoint regular paid instructors. With regard to the question of fees the committee had come to the conclusion that for anyone who wanted to go through the whole course, ten guineas—five guineas for the lectures and five guineas for the studio—was not too much to ask. If they looked at their profession as a liberal profession, he would ask the education of those entering it could be obtained at so low a rate? It might be said that they were legislating too exclusively for the purely student class, and that not everybody would wish to go through the whole curriculum. But the committee quite hoped and believed that the scheme which they propounded would be of use to others than the merely new students. They confidently hoped that many country assistants would desire to come into some of the classes or to attend some of the courses of lectures without necessarily having to attend the other courses. In order to meet the wants of such students, the committee had fixed the rate of payment at 2s. 6d. per lecture—a fee which he thought was a very moderate one. Of course the committee had had to look upon the matter in some degree in a commercial light, but it might be taken that 2s. 6d. per lecture would be the *maximum* fee which a student would have to pay. He did not think, therefore, that the scheme of charges

which the committee had drawn up was too high. They contemplated that an aggregate number of 100 students would join these classes and the studio; that was to say, not 100 of each year's standing, but 100 for the four years' course. That was only about one-third of the number of members who now attended the various classes; if they could only get that number they thought that the scheme would be self-supporting. Then in connexion with the report there was another proposal which might excite some comment, viz., the proposal for raising the annual subscription of the members of the Association. He himself very much regretted that when that proposal was brought before the Association about five years ago it was not carried, because he firmly believed that if that proposal had been carried then they would not have a dozen fewer members now than they had. The only wonder was that they had gone on with a half-guinea subscription for so long. He found that the work of the Association, including classes, meetings, and visits to buildings, extended over thirty-two weeks of the year; and if they made the calculation they would find that their half-guinea subscription, entitling them to the advantages of the classes, the meetings, and the visits, worked out at a little over 3d. per week! Did they seriously believe that if the subscriptions were raised to a guinea, there would be any large number of members who would fall out of the ranks because they could not afford to pay it? Even apart from the extra work and expense involved in the adoption of the proposed new scheme, the time had come when the detailed routine work of the Association had so greatly increased that it could go on with honorary secretaries only no longer. Was it right that any member of that Association should be expected to devote his time to their affairs to such an extent that he was 40l. or 50l. a year out of pocket—for that, he was assured, was the case. They ought not to let such a state of things continue. They must remember that if that educational scheme, or even part of it, was carried out, it would add an enormous amount of clerical work to the present labours of the officers of the Association. The Association was barely paying its way now; it was only by starting its work that it did so. Let them look at the library, for instance. Would not the library of the Association be more valuable if there was some one there every day to change books? But that could not be done at present, because they had no one to do the work. How, then, could they avoid coming to the conclusion that they must raise the subscription if they were to go on with anything like the success which had attended their work hitherto? It should be borne in mind that the proposal to raise the subscription was only intended to apply to town members, because,—much as they regretted it,—they did not see their way to offer the whole benefits of the Association to the country members. There might be some means of doing that, but he did not see what those means were at present, and therefore, it would not be desirable to raise the subscription of country members. If the present scheme were adopted, it would be very easy to frame a precise definition of a country member, so that only those who benefited by the full work of the Association should pay the increased subscription. Before he sat down he should like to make an earnest appeal to the older members of the Association, many of whom he saw around him who had derived great benefit from the Classes when they were in them, and who had generously contributed much assistance in carrying them on in after years. He asked those old members not too hastily to assume that the new scheme was a bad one because it was a new one. Let them ask themselves whether it was not at least possible that those members of the Association who were now more closely in touch with its workings, might see more clearly than others the defects and shortcomings of the present system. New responsibilities were created by new necessities. The special committee, in presenting that report, invited criticism; but he asked that the old members should not withdraw their sympathy and countenance from the Association, but should give them the benefit of their experience and judgment and business insight. If they would only do that he did not fear for the future of the Association, but rather would have strong grounds for hope that as its past had been a glorious one, so a great career of increasing

usefulness was open to it in the future. He begged formally to move the adoption of the report.

Mr. A. O. Collard seconded the motion. He said that he believed some members were in favour of dividing the report into two portions, separating the proposal to increase the annual subscription from that dealing with the educational curriculum. But he did not see how that would have been feasible, for the two things were inseparably connected. As Mr. Slater had pointed out, the present annual subscription of half-a-guinea was ridiculously low, considering the advantages derived by the members; and even if it were increased to a guinea, the cost of the advantages of the Association to its town members would only be about 1d. a day. It was most essential that the Association should be able to put its secretarial work upon a sound footing. The proposal was to have an assistant secretary who should be paid, and who should work under the direction of honorary secretaries, just as in the Institute the Secretary was a paid officer, although the chief secretary was the Honorary Secretary. Although, as Mr. Slater had said, the proposed curriculum had been framed with a special view to the necessities of those who went in for the Institute Examinations, which did not profess to embody everything necessary for the education of an architect. What, however, was lacking in the course of studies prescribed in the examinations would be supplied by work under the proposed curriculum. The institution of the new education scheme as a whole would no doubt tend to the elevation and improvement of the Examination itself, at the character of which there were some who were at present only too ready to sneer. Some might think that the proposed fee of ten guineas,—five guineas for the lectures and classes and five guineas for the studio,—was too high; but while he did not think so himself, having regard to what they would get in return for it, he was quite alive to the fact that the fees would press heavily upon some of the members, and he could not help thinking that some arrangement might be and ought to be made by which the masters should pay the fees either in whole or in part. As to the proposed institution of day-classes, he thought the idea was an admirable one, and possibly it might be found advantageous for youths who contemplated entering architects' offices to spend a year or two in those day-classes before entering upon their articles. They would then come to the study of the work of the profession with some idea of what was before them.

Mr. Cole A. Adams said that there could be no doubt that by the adoption of the proposals contained in the report they would be making an important new departure in the history of the Association. He could only have wished that there had been present on that important occasion a larger number of the senior members of the Association. With regard to the scheme which had been brought forward by the committee, he wished to give his own unhesitating thanks to the members of the committee for their very admirable report. He was quite sure that all the members of the Association would join him in that expression of thanks, even although they might differ as to some of the recommendations made by the committee. They were also very much indebted to Mr. Slater for the admirable and lucid manner in which he had brought the scheme before them. But there was one part of Mr. Slater's speech, which found an echo in that of the seconder, which seemed to foreshadow opposition to the proposals contained in the report on the part of the older members. He himself did not think that there was much ground for that fear; but, on the other hand, he must say that he could not regard the report, or, at any rate, the form of it, as absolutely faultless. With regard to the scheme generally, he felt that it was one which was inevitable. He had long felt that the time must come when the system of mutual help which had prevailed for so many years in the Association would have to be largely augmented by regular, systematic, paid assistance. That time had now arrived, and the question must be faced. Any attempt to put back the hands of the clock would be a mistake. But, at the same time, he would put in a plea for the retention of the mutual or voluntary system as far as possible. He had no doubt that that was the intention of the committee, but in a report such as that which had been presented to them, it would be impossible to clearly put everything that was in the minds of those who were respon-

sible for it. He should be very sorry indeed to see the Association turned simply into a college of architecture, and for the old Association as they knew it to become a thing of the past. But was such a course either necessary or desirable? He did not think it was. While no doubt to a very large extent the future work of the Association must be conducted, upon the lines mentioned in the report, by systematic paid instructors, yet he thought it would be a great pity to eliminate the services of those who were willing to give voluntary assistance. He thought there would still be scope for the work of voluntary instructors. Part of the scheme proposed by the committee suggested the establishment of a studio which should have a salaried master. He would say at once that he did not think the proposed salary of 100*l.* a year for the master of the studio was at all adequate. He would be a very clever fellow indeed who would be able to undertake the work of the proposed studio and to carry out instruction in all the subjects included in the programme; and being a clever fellow, was it to be supposed that he would be content to value his services at only 100*l.* a year? It was not likely. But it was just in regard to the work of the proposed Studio where he thought voluntary assistance would best come in. The Association numbered within its ranks men of great artistic ability, as was evidenced, for instance, by the "Sketch-book"; and he thought it would be perfectly possible to enlist the services of many of those men as Visitors to the Studio. Many of them, he was quite sure, would be perfectly willing to take turns in visiting the studio for the purpose of inspecting the work of the students, and of giving them advice. If that feature could be introduced into the scheme of the studio, it would be one means of preserving the continuity of that element of voluntary help, and of maintaining that feeling of enthusiasm for their art, which together had been the mainstay of the Association in the past. The subject of colour-decoration, for instance, was one in which the services of such Visitors would be of great value to the Association. The Honorary Visitors to the proposed Studio would no doubt all be senior members of the Association,—men who were in practice for themselves, and who, although they would have no time to take part in the regular teaching of the classes, would be only too pleased to give occasional attendance and advice. By carrying out that system they would maintain that feeling of enthusiasm which, as he had said, had been for so long one of the mainstays of the work of the Association. Inadequate as the voluntary system had become to their present needs, and necessary as it was to engage paid assistants, yet it should be borne in mind that a reliance upon paid assistance alone involved the danger of the teaching becoming perfunctory and stereotyped. Therefore, he said, "Maintain the voluntary system in some part, at least, as a link between the past and the present." As to the question of the proposed increase of the annual subscription,—an increase which he had urged five years ago, when the proposal was defeated by a rather narrow majority—he regretted that the proposed increase was not then adopted; for he regarded it as an absolute necessity, if their work was to be carried on properly. He could have wished, however, that the proposal to increase the subscription had not been identified with the proposed change of curriculum. If the question could have been separated he thought it would have been better. They had present in that room, perhaps, two hundred members; but the Association numbered a thousand members; and were the two hundred to decide upon raising, not only their own subscription, but the subscription for the other eight hundred members? If the two questions could be separated, and if the opinions of the members at large on the subject could be taken by means of voting papers, he thought it would be a very desirable course to adopt. It was quite true that, as Mr. Slater and other speakers had said, that half-guinea subscription was ridiculously small to those town members who were reaping the full advantages offered by the Association; but it should be remembered that an extra half-guinea a year might be regarded as a ridiculously large subscription by those who were getting nothing in return for it. He could not but think, in the light of past experience, that it was a question at the present time upon which it was desirable

that they should take a plebiscite of the members. Personally he was strongly in favour of the increase of the annual subscription, but unless that question could be separated from that of the adoption of that part of the report which dealt with the curriculum, he should ask leave to move as an amendment to Mr. Slater's motion, that the opinion of the members as a whole be taken by voting papers on the question of the increase of subscription for he did not think it would be right that that meeting, which numbered only one-fifth of the members of the Association, should take upon itself to decide so important a question, after the opposition a similar proposal met with some five years ago.

Mr. J. A. Gotch said he very heartily welcomed the report of the committee, as it expressed very clearly views which he had been cherishing for a good many years. He was exceedingly pleased to see that the committee had grappled so thoroughly with the question, and had brought before them so comprehensive and so admirable a scheme. It appeared to him that to propose any half-measures would be worse than useless. While he thoroughly admired and appreciated the voluntary system of the past, it had long been apparent to him that it would be impossible to carry on the work of the Association with success by continuing to rely upon it. What they wanted was a thorough system of teaching by competent men,—men who would be able to devote themselves to teaching systematically. With regard to the proposed increase of the annual subscription of the members, his own feeling was that that question was now in an entirely different category to what it was four or five years ago. Even at that period he thought those who proposed the increase of the subscription had adequate reasons for doing so, although those reasons did not commend themselves to the majority of the members. But if they had adequate reasons then, how much more adequate were the arguments now put forward in support of the increase? He thought that in the Association as it would be worked under the proposed new educational scheme, the young architect would learn much more there than he would in the office of his principal. He was strongly in favour of the institution of day classes, because he thought it was a mistake to expect young men to work hard in learning their profession at the fag-end of the day. Young men in the prime of their strength and spirits might reasonably expect to have some time for relaxation and for the lighter occupations of life. Without the institution of day classes, what would be the position of young men entering upon the proposed curriculum? The earnest student would occupy his Saturday afternoons with visits to buildings; every alternate Monday he would be at the Institute meetings; and every alternate Friday at the Association meetings. What with these meetings and his work in the Classes and at the proposed studio, what time would remain to him for relaxation? Everything, in his opinion, pointed to the necessity of the establishment of day classes, and he only regretted that the committee had not seen their way to boldly recommend their institution at once. While the Association was making a change in its methods of procedure, why not make the change as complete as possible, and establish day classes? He was very much afraid that if the Association did not do so when making this new departure in their methods, they would be stereotyping and confirming evening work; and it might be much more difficult afterwards to institute day classes. The institution of day classes would be of special value to country members, many of whom would be able to come up and stay in London for a sufficiently long period to attend the courses of lectures, &c. One important point in that connexion was that country students needed to have a thorough general knowledge of construction, such as they would not necessarily get in a London architect's office. He quite agreed with Mr. Cole Adams as to the desirability of retaining voluntary work in the conduct of the Association as much as possible. The voluntary principle could, to quote the instance mentioned by Mr. Cole Adams, be very well maintained in connexion with such a class as that for the study of colour-decoration, where voluntary Visitors would be able to come down and give valuable advice; but in all matters relating to science and construction it would be much more advantageous to have regular lecturers,

taking up their subjects in a systematic way. For the proper teaching of such subjects continuity was a necessary element. How would it be possible, for instance, to conduct a class for the study of the principles of sanitary science on the voluntary system? If half-a-dozen men volunteered to come down and give instruction in that subject, one after the other, he thought the students in the class would obtain a very confused notion of the science of sanitation. He was convinced that with regard to nine-tenths of the proposed curriculum they would be obliged, to carry it out efficiently, to have a system of paid lecturers or teachers. No doubt, as had been suggested, they would be able to retain the voluntary system to a larger extent in the proposed studio. With regard to the question of fees to the lecturers or teachers, he was strongly inclined to the opinion that they should be paid partly by salary and partly by a capitation fee. He trusted that the meeting would adopt the report substantially as it had been presented by the committee. If they did, he believed that the Association would develop into the leading institution for the education of architects in Great Britain.

Mr. S. B. Beale said he quite agreed with the last speaker that the proposed day classes should be made part of the scheme under discussion. He wanted to know how, unless they were going to provide young architects with cast-iron constitutions, as well as with brains, they were going to get them to take up the proposed curriculum? He proposed to move that it be an instruction to the Committee of the Association that as an experiment day classes should be started concurrently with the initiation of the new programme of studies. They were all agreed that the young architect should be educated; but he maintained that without the day classes they would not be giving him a fair chance. Unless they saw to it that he had an opportunity of being educated in rational hours, he was afraid that the whole scheme of the special committee must be a failure.

The Chairman said that if Mr. Beale had read a little further on in the Report, he would find that the committee did recommend the institution of day classes as part of the ordinary work of the Association. They strongly recommended that they should be started if possible.

Mr. Hugh Stannus said he rose rather to raise a point of order than for the purpose of discussing the elaborate report which was before them. It appeared to him that there were five or six distinct points raised by the recommendations contained in the report, and he very much regretted that the adoption of the report as a whole should have been moved,—he would not say thrust upon them,—*en bloc*. The special committee who were responsible for it, naturally felt very anxious about it, and desired to see it adopted; but he thought that the various points which have been dealt with much better in discussion if the report had been divided up into heads or parts. It was exceedingly difficult to discuss it as it stood, for there was not even any numbering of the paragraphs. It would certainly have been the better for a little editing. He wished to ask Mr. Slater and those who were responsible for the report whether they could not take it back for reconsideration, with a view to its being arranged in such a way that it might be considered point by point. They would then have definite issues before them. At present some of them, while entirely sympathising with one portion of the report, were not in favour of other portions.

Mr. F. T. Beggally said he should certainly oppose any motion for dividing the report into sections, for the whole thing hung together.

Mr. E. Woodthorpe said he agreed with Mr. Stannus as to the desirability of dividing the report into sections. He thought that the fees proposed were too heavy to be paid by the young students. He could not agree with all that had been said in favour of the day-class system, nor could he agree that the studio or atelier system was everything that could be desired. He thought there was rather too much disposition on the part of some of them to join the eight hours movement. If young fellows wishing to advance in their profession were not disposed to use every available opportunity for study they could not expect to succeed. The wisdom of the proposal to raise the annual subscription was, he thought, doubtful. If it were true that the secretaries were 50*l.* a year out of

pocket by their work for the Association, he thought it ought to be made up to them. Although, perhaps, the curriculum laid down by the committee was an ideal one, yet he thought the charges to be made to the young students were much too heavy, and, therefore, he thought it would be a pity to take the report *en bloc*.

Mr. H. L. Florence said that of all the speeches which he had heard that evening he felt most in sympathy with that of Mr. Cole Adams, for he thought it would be very desirable that the old spirit of enthusiasm for their art, which had prevailed in the Association from its commencement, should be kept up even throughout the proposed changes. He thought it would be regrettable if they were to change the Association into a mere educational machine. He felt sure they were all desirous and anxious to further and forward any scheme which might be considered advantageous to the general body. He was willing to accept as a whole the report which had been presented by the committee, although he thought there were certain things in which it fell short of what was desirable. He certainly hoped that the voluntary system would as far as possible be kept up, side by side with the new aids. The question of day classes involved a point of very great importance; and it seemed to him that it would not be a very difficult thing to establish them. If the proposed studio were worked in the day time as well as in the evening, he was convinced that many architects who had pupils would not only allow their pupils to attend, but would pay their fees. With regard to the general question of ways and means, he was not convinced by the figures put before them that the proposed new scheme would be self-supporting. Some important points, it appeared to him, had not been taken account of. Their library, for instance, would need to be greatly developed if it were to become at all adequate to the work of the Association under the new scheme. What they would really want, and what they wanted now very badly, was a proper reading-room. It was of no use pointing to the Institute Library as providing a proper reading-room, for that was not a room in which anyone could read with comfort. Therefore he thought the question of providing a good reading-room, where the members could read and study, was one of the first importance. It was impossible to get any permanent good merely from attending lectures. Besides listening to lectures, they must afterwards study and read up the subjects of which the lecturers treated. Students required adequate means for deliberate study, and one of the first essentials was a good reading-room. Besides that, the library itself would have to be improved in the number and character of its books. A past-President of the Association, who attached great importance to that point, had commissioned him to say that if the proposed scheme, or some scheme of the kind, came into force, he would be willing to give a donation to the library of 100 guineas. With regard to the question of raising the subscription, for his own part he felt that that was an absolutely necessary step to take. There was no doubt, however, he thought, that the financial aspect of the proposed changes needed consideration in greater detail; but subject to that he was disposed to give the report of the committee his best support.

Mr. Stannus then formally moved that the report be referred back with a view to the committee preparing a series of separate resolutions embodying the principles involved in their recommendations, and that that report should be submitted to an adjourned meeting, the opinion of the members being taken on the question in the meantime by means of circulars.

Mr. Bernard Dicksee seconded.

After some discussion, in the course of which it was objected that by the rules of the Association the course proposed by Mr. Stannus with regard to voting papers would be out of order.

The Chairman, who was appealed to to give his opinion as to the best course to be taken under the circumstances, said it was rather an invidious thing to ask him to give his opinion on the matter. The special committee had made their report on the questions referred to them as a whole; and the Committee of the Association had adopted it as a whole, and sent it down to the present meeting for consideration as a whole. He might say, however, that in committee, ten members of the thirteen who were present voted for sending it down as a whole.

Mr. Max Clarke thought it would be advisable to divide the report, as suggested by Mr. Stannus. If put to the meeting as a whole he thought it would be lost.

Mr. W. Burrell said he thought it would be hardly fair to the special committee to refer the whole question back to them after the time and care they had bestowed upon it.

Mr. H. O. Crosswell said he could not see what Mr. Stannus was to gain by persisting in his amendment. Supposing the report were to be divided under several heads, and supposing some of the divisions of the report were carried and others were lost, they would find themselves in a ridiculous position. Surely those members who objected to any particular portions of the report could move amendments directed against them. As to the question of raising the subscription, it was of no use to say that the Association had been successful hitherto on the half-guinea subscription. Even under the voluntary system the amount had not proved adequate to maintain the Association in a state of efficiency. He thought that it would be very undesirable to send round to the members to ask them to say whether they would pay half a guinea or a guinea per annum. Those who took no active part in the working of the Association would naturally vote for the smaller sum.

Mr. Slater said that as the hour was getting late he desired to make an appeal to Mr. Stannus. The points which Mr. Stannus had touched upon had already been very carefully considered by the special committee. It appeared to him that they had had that evening a very good general discussion upon the scheme as a whole; and as it was the view of the special committee and of the majority of the Committee of the Association that the report must be taken as a whole he thought the best way to proceed would be to adjourn the discussion, and he, therefore, asked Mr. Stannus to withdraw his amendment. If Mr. Stannus's objection was only to the proposal to increase the annual subscription it would be perfectly competent for him to move an amendment on that point.

Mr. Gotch supported Mr. Slater's appeal, for on consideration he thought that that would be the best course to adopt.

Mr. Stannus, however, declined to withdraw his amendment, but on the contrary urgently appealed to Mr. Slater to withdraw his motion, as persistence in attempting to carry the report *en bloc* would imperil the whole scheme.

Mr. C. H. Brodie moved the adjournment of the discussion.

Mr. Leverton seconded, and on a show of hands being taken the motion for the adjournment was carried.

The date to which the discussion was adjourned was not announced from the chair.

"INDUSTRIAL CONCILIATION."

"The Position and Prospects of Industrial Conciliation" was the title of a paper read by Mr. L. L. Price, M.A., of Oriel College, Oxford, on Tuesday, the 20th inst., at the seventh ordinary meeting, for the present session, of the Royal Statistical Society, held at the Royal School of Mines in Jermyn-street, Sir Rawson W. Rawson, K.C.M.G., C.B., a past President of the society, in the chair.

The paper was, to some extent, a continuation of a previous paper read in December, 1886, in which the methods of preventing and adjusting industrial disputes in the iron and coal trades of the North of England had been described in detail. The writer commenced by alluding to the prominence of the subject at the present time, both in England and abroad. He pointed out that the continental *conseils de prud'hommes* did not as a matter of fact remove, and apparently were not intended to remove, all occasion for industrial quarrels. He then proceeded to notice the advantages which the prominence of the subject seemed to involve. In the first place the attention of the general public was directed to the question; and the conciliation scheme of the London Chamber of Commerce followed upon the London dock strike, while abroad, the International Labour Congress at Berlin was, to some extent at least, the result of the miners' strikes in Westphalia. In the second place, effective interest might be aroused in the history of past experiments, such as that of the Board of Conciliation and Arbitration on the manufactured iron trade of the North of England, which might, the writer held, be considered

as furnishing a crucial instance of the possibility of industrial conciliation; for the difficulties to be encountered in that trade were as serious as could well be conceived, and the Board had now been in successful working for more than twenty years. And, thirdly and lastly, some of the elementary principles of the subject were more likely at this than at other times to be generally understood. The necessity of effective representation of both parties, and the advantage of a trade union as supplying the means for such representation of the men were, the writer argued, gradually winning their way to recognition; and in this connexion the London dock strike presented some noteworthy features. But on the other hand there were disadvantages as well as advantages attaching to the present prominence of the question. The public were inclined to entertain extravagant expectations of the results to be achieved by industrial conciliation, and to underrate the importance of the element of human nature, which was necessarily involved in the solution of the problem. The abandonment in 1887 of the sliding-scale, which formerly regulated wages in the Northumberland coal trade, was quoted as an illustration of the possibilities of failure of the most admirable and advanced scheme of industrial conciliation; and the recent history of that trade was examined at some length. From this history it appeared that the system of the sliding-scale was liable to break down in seasons of rapid and extensive fluctuations in prices, and also that the authority of trades union officials was not invariably secure from impeachment on the part of the general body of the members of their organisation. The writer concluded by urging that industrial conciliation should not be regarded as a panacea, but rather as an advantageous and reasonable alternative to strikes and lock-outs, which might commend itself to sensible men as a practical means of adjusting disputed questions with tolerable assurance of success.

In the interesting discussion that followed, Mr. Sydney Buxton, M.P., Mr. George Howell, M.P., Mr. C. M. Norwood, Mr. S. B. Boulton, Mr. W. H. Hey, and the Chairman took part.

ARCHITECTURAL SOCIETIES.

Birmingham Architectural Association.—At the final meeting of the present session of this Association, held on the 13th inst., the President declared that the following gentlemen had been elected to the various offices named for session 1890-91, viz.:—President, Mr. T. Naden; Vice-President, Mr. W. H. Lloyd; Hon. Treasurer, Mr. C. E. Bateman; Hon. Librarian, Mr. H. Beck; Hon. Secretary, Mr. H. R. Lloyd, A.R.I.B.A.; Hon. Auditors, Messrs. A. T. Powell, chartered accountant, and E. F. Tildley, Council, consisting of four Members and three Associates, viz.:—Members: Messrs. W. H. Bidlake, M.A., A.R.I.B.A.; W. Donhead; W. Hale, F.R.I.B.A.; and W. H. Keudrick. Associates: Messrs. F. B. Andrews, A.R.I.B.A., G. T. Bassett, A.R.I.B.A., and H. R. Bewlay. A hearty vote of thanks was passed to the President for the services he had rendered to the Association during the past session, and the thanks of the Association was also voted to the retiring officers. It was announced that the services of Professor R. H. Smith, M.I.M.E., Assoc.-M.I.C.E., had been secured as lecturer on Statics, and that a number of members had already given in their names for the lectures.

Manchester Society of Architects.—An exhibition was held on Friday, the 9th inst., at the meeting room of the Manchester Society of Architects (Diocesan Chambers) of the drawings and descriptive report of a town, in Belgium and a portion of northern France, made by Mr. Th. E. Barker, A.R.I.B.A., who had been selected, in a preliminary competition, as the holder of the Society's Travelling Studentship for last year. The studentship, of the value of fifty guineas, was given on the condition of the holder submitting satisfactory proofs of work done during a tour of three months, and the Council of the Society, at a meeting held on February 20, passed a resolution expressive of their satisfaction with the result.

Association of Municipal and Sanitary Engineers and Surveyors.—A Lancashire and Cheshire District meeting of this Association is to be held at Burnley on Saturday next, May 31.

A NEW LIME.

SIR,—We are using a new patent lime (Ferguson's patent) in rebuilding the "Swiss Hotel," Old Compton-street, Soho, and as this is, to our knowledge, the first time that this lime has been practically used in this country, a few words of our experience concerning it may be of interest to the numerous readers of your paper.

We must confess that we are highly satisfied with the result, so far. The mortar made with this lime resembles in its properties more a Portland cement than a grey lime mortar, as it is very quick setting, becoming almost as hard as cement in a few days.

We made a very satisfactory concrete which, in spite of a heavy rain during the night, was hard enough next morning to build the foundations upon.

The usual proportion of lime to sand, however, is much too good for ordinary brickwork, and we find that one part lime to four parts sand makes perfectly satisfactory work.

The inventor says that the mortar will be in no way affected by frost, which, however, we had no opportunity of testing.

In plastering, which we shall begin shortly, the lime is said to give even better satisfaction, as it takes colour easier than common plaster or cement, and becomes dry enough to take paint or paper within three or four weeks.

Sold at the low value of ordinary grey lime, we should say that there is a large future in store for the lucky inventor, and we think it but right that publicity should be given to this invention, as in certain cases (as, for instance, where it is necessary to execute works with great rapidity) it will prove invaluable on account of its setting properties.

Any architect or builder interested in the subject can inspect the work done with this lime at the "Swiss Hotel," now in course of erection at 21, Old Compton-street, W.

WILLIAMS & HOPTON.

156, Regent-street, W.

** In reply to an inquiry, our correspondents state that the lime or cement in question is obtained from Germany, and is not at present manufactured in England.

"ON THE PLANNING AND CONSTRUCTION OF HOSPITALS."

SIR,—In your notice of Mr. K. D. Young's paper on "Hospitals" you refer to the circular ones erected, but omit to mention that of the Hampstead Workhouse Infirmary, which was built from my designs in 1885, and illustrated by you the following year.

It is of interest in consequence of it being the largest on the circular system, and the first which received the approval of the Poor-Law Board, having seventy-five beds and nurses' quarters, and a diameter of 50 ft.

It has been fully occupied for nearly six years, and has, therefore, been considered as having stood the test of time, a desideratum desired by Mr. Young in his able paper. The medical and nursing staff at Hampstead speak of the building in the highest terms; and the ventilating system leaves nothing to be desired. My experience with both kinds of wards enables me to say that, in this most important particular, the circular ward is greatly superior. Unless this form of building had been adopted at Hampstead, a valuable site would have been useless for the much-needed extension of sick wards accommodation.—I remain, yours, &c.,

CHARLES BELL.

SIR,—In the interesting and valuable paper on this subject by Mr. Keth D. Young, F.R.I.B.A., as published in your columns I observe Mr. Young stating (as per page 359, first column) "There is, I think, very little doubt that in England the most suitable form of ventilation is the most simple. Opposite windows, assisted by the extracting power of open fire-places, supply all that is required, where properly handled, to keep the atmosphere sufficiently diluted."

Now, while I admit the value of good, simple ventilation, I think it is a mistake to credit the open fire-place with first-class value as an efficient "extracting power." My reason for saying so is that it is far too low, only about thirty inches or so above the floor. As the vitiated air exhaled from the lungs is heated to 97 deg., and the vitiated air from gas lights still higher, it follows that before this warm vitiated air can get up the chimney it has to be driven down somehow to the thirty-inch level. Now I would ask why there should not be provision

made to carry off this warm vitiated air to the ceiling as it rises?

I respectfully think that provision for doing so should exist in a changeable climate like ours, quite independent of the windows, either by shafts or flues in the walls, or by sufficiently large pipes properly fitted in.

I write this after visiting a recently-erected hospital, and a large number of schools and churches, and watching the bad effect produced wherever there was deficient provision for carrying off the vitiated air at the top of the room.

At one school a good lesson was got as to not believing all you hear too readily. The headmaster and myself went into one school-room in which there were two female teachers; the window was open on the windward side, so I asked:—"Do you children not feel a draught from the window?" One of the girls immediately cried out, "No, sir," I remarked, "I fear that is not true." The headmaster then said: "All you children who feel the air blowing in upon you hold up your hands." About thirty immediately did so! Then a mistake occurred between the teachers, one stating the cold draught from the window was often very disagreeable, the other, who was out of the current, felt nothing wrong. There will be more published in this relation shortly.

W. P. BUCHAN.

THE OLD NAVE, SOUTHWARK.

SIR,—Instead of the nave of Southwark being demolished, as said on page 340, in 1838, I can vouch for its being untouched in July, 1838, having never visited London till that month, and that being the first building I entered, little dreaming I had ever seen it again. Since that time there was no south porch; but in any case the west end, now proposed to be solid, had a central entrance and carved doors of later date than any other part, but of rich and unique design, delineated in Pugin's "Specimens," vol. ii., plate K, described on page 9, where a note says, "See vol. v. of 'Architectural Antiquities,' by J. Britton, F.S.A., for ground-plan and five other views of this church." I cannot find these, nor is Southwark in any of the indexes to that work.

E. L. GARRETT.

3, Maddelton-square, E.C.

PRICE BOOKS.

SIR,—In your issue of May 3, I have read with considerable interest an excellent article on Messrs. Lockwood's, Laxton's, and Spon's new books on prices. With the whole of your remarks I cordially agree, and, moreover, I think no practical man would ever dream of consulting them as a guide in forming a correct estimate cost of work, and I am convinced that if any one took his ideas of prices from any yet-published book, and entered into competitive estimating, he would find himself completely out of it, as the greater portion of their prices are absurdly high, and not at all suitable to the present day, with its close-shaving and fierce competition.

What I would suggest is that one of the above-named firms should get a practical man, — a "tradesman," — in each of the trades, to treat upon his ideas on the subject, assuming, of course, that he has also sound ideas re establishment expenses, wear and tear, depreciation of plant, &c., and I feel confident by so doing to do far more valuable work could be brought before the public.

In my own case I could advise on one trade alone, but on that thoroughly, having served an apprenticeship to it in town, and since then have had six years' experience in an office as estimating clerk, bookkeeper, &c.; and in every trade there are numbers of such men who, it is reasonable to suppose, know their own individual trade better than any one man possibly can who attempts to lay down laws on all trades, and consequently cannot be a specialist in any one.

PRACTICAL.

"BOUNDARIES TO FOOTPATHS."

SIR,—The General Highways Act, 5 & 6 Will. IV., cap. 50, provides for cutting hedges by the side of carriageways but not footpaths. The presumption is that footpaths mostly crossed unenclosed land.

There are several cases that have been tried, and it is held that if a footway is fenced on either side the person fencing is bound to maintain a good hard path, and, failing this, can be indicted. It is held that when a footpath is unenclosed the public can walk on the adjoining land, but fencing prevents this. Since 1862, Highway Boards can authorise the fencing of footpaths.

I have no doubt an action could be brought against the owners of the hedges for obstructing the highway, and if the public broke through the hedge and trespassed on the adjoining land no conviction would follow.

The highway is "between the fences thereof," and if a wall or any other fence was built, the line would be the outside of the stem of the quick or briar at its contact with the earth.

The duty is to use jointly for the drainage of the land and road, and cannot be alienated.

ROBERT PHILLIPS,
County Surveyor.

CASE UNDER THE EMPLOYERS' LIABILITY ACT:

OLIVER v. GREENWOOD.

In the City of London Court, on the 16th inst., before Mr. Commissioner Kerr and a jury, the case of Oliver v. Greenwood was heard. The action was brought by John Oliver, carpenter and joiner, of 8, Manchester-road, Reading-hill, to recover 200*l.* in compensation for personal injuries he was alleged to have sustained through the negligence of the foreman of the defendant, Mr. James Greenwood, builder, of 86, Cannon-street, E.C.

Mr. Morton was counsel for the plaintiff and Mr. A. H. Ruegg for the defendant.

For the plaintiff, it was stated that the defendant was engaged in making structural alterations to two houses in Milton-street, City, which were being thrown into one. On Dec. 24 last, the plaintiff was in the defendant's service, and while at work an accident happened, which resulted very seriously for the plaintiff, as he was injured to such an extent that he was prevented from doing any work from then until the present time. A part of the work consisted of removing the party-wall, and to do this girders had to be employed. The plaintiff worked under the superintendence of a foreman named Fleming, and a deputy foreman named Edward. He was instructed to do some work on the ground floor. After dinner the foreman told a man named Deersley to commence drilling a hole in the wall on the second floor. To do this a ratchet-drill was employed. While the men were at work, Deersley, by some mistake, allowed the ratchet to slip. It fell on to a joist, and the plaintiff was struck on the head, hurting him very much. He was removed to St. Bartholomew's Hospital, and was afterwards sent home, where his private doctor attended him. It was asserted by the plaintiff that in the building trade it was a recognised custom to have either guard boards to prevent tools, &c., falling, or cloths to prevent any one being injured should anything fall. Had that been done, the accident would not have happened.

Evidence was given in support of the case, the doctor stating that it was impossible to fix the time how long the plaintiff might suffer.

For the defence, Mr. Ruegg admitted that the plaintiff had suffered injuries for which if he were entitled to anything he should be fairly and reasonably compensated. But the case for the defendant was that he was not liable for the sad occurrence. The customs of the building trade were at issue. It was not the habit of builders to provide guard boards or drop-cloths when work of this sort was being done. The man Deersley was working on a four-board scaffold, whereas many frequently worked on one board. No provision was necessary to avoid tools falling, as in the defendant's experience a ratchet drill had never fallen in this way before. The defendant was, under the Employers' Liability Act, only responsible for the negligence of such men as had superintendence, which the man Deersley had not.

Mr. Commissioner Kerr summed up and the jury, after a short deliberation, found a verdict for the defendant.

Judgment, with costs, accordingly.

SEWERAGE AND DRAINAGE.

Cleethorpe.—The Cleethorpe Local Board have instructed Mr. W. H. Radford, C.E., Nottingham, to prepare plans and obtain tenders for carrying their Beaconthorpe outfall 150 yards farther out to sea, in consequence of the tidal increase of sand on the beach.

Wolston.—The Leamington Courier says that the Rugby Union Rural Sanitary Authority has called in Mr. J. E. Willcox, C.E., of Birmingham, to report and submit a scheme for the drainage of Wolston.

SCHOOL BUILDING NEWS.

Ashton-under-Lyne.—A mission school is to be built at Ashton-under-Lyne for the Methodist New Connexion, at a cost of about £1,500, from plans prepared by Mr. J. H. Barton, architect.

West Hartlepool.—The schools which the West Hartlepool School Board have been erecting in Oxford-street are now completed. They comprise a mixed school for 360 boys and girls and infants' school for 270. The former has an assembly-hall, 54 ft. by 30 ft.; five class-rooms, each 25 ft. 6 in. by 24 ft.; masters' room, 15 ft. by 12 ft.; and cloak-room, 30 ft. by 20 ft. The infants' school is 50 ft. by 24 ft., with two class-rooms, each 24 ft. by 20 ft.; marching hall, 44 ft. by 14 ft.; mistresses' room, 15 ft. by 12 ft.; and cloak-room, 24 ft. by 12 ft. There is also a caretaker's house, with six rooms, and there are play-sheds and latrines, approached by covered ways, to each department. The buildings are erected in brick covered with slate, the woodwork being of

pitch-pine varnished. The playgrounds are paved with compressed concrete flags. The total cost has been about 4,200*l.*, including caretaker's house, or about 6*l.* a head for schools after deducting the cost of such house. The design selected in open competition was that of Mr. J. P. Pritchett, of Darlington, who has carried out the work with the assistance of Mr. Henderson, clerk of works, the contractor being Mr. Joseph Howe, of West Hartlepool.

The Student's Column.

ELECTRICITY, MAGNETISM, AND ELECTRICITY SUPPLY.—XXI. COMMERCIAL UNITS.

ELECTRICITY SUPPLY is a phrase used as a rule, to denote, not the supply of electricity, but the supply of work or energy by means of an electric current. When a building is being supplied from a central station, the extreme points in its circuit or circuits are joined one to each of the two mains belonging to the supply company. As many coulombs flow out from the building into the supply main, which is at the lower potential, as flow into the building out of that which is at the higher potential. The coulombs of electricity which flow out have lost potential, or capability of doing work, and it is the energy conveyed to the consumer in this way which constitutes an electricity supply. To put the same thing in other words, a current of electricity does not leave electricity behind it, but work.

The practical unit of energy, the joule (see article V.), is much too small for trade purposes; the Board of Trade have therefore fixed upon a commercial unit, which they define as follows:—"The expression 'unit' shall mean the energy contained in a current of one thousand amperes flowing under an electro-motive force of one volt during an hour." This unit is commonly spoken of as the Board of Trade unit, and written B.T.U. The B.T.U. is therefore equal to 1000 x 1 x 60 x 60, or 36 x 10⁶ joules.

The fact that a million joules can in certain districts be bought for about 2*d.* may give some idea of how relatively small an amount of energy it really represents. Before the joule was adopted as a unit, the B.T.U. was generally defined as 1,000 watt-hours; but unfortunately those who are incapable of distinguishing the difference between power and work have confused matters by defining the B.T.U. as 1,000 watts. The original definition, however, given by the Board of Trade can leave no doubt as to whether the B.T.U. is a measure of energy or of power.

Makers of dynamo-machines, finding the watt too small a unit of power in which to express the possible output from their plant, have adopted a unit equal to 1,000 watts. A 12-unit machine can, therefore, give an output of 12,000 watts, and we also immediately know that such a machine can in one hour deliver 12 B.T.U.'s. This new unit of power is also fairly convenient in its relation to horse-power, since 1 H.P. = 746 watts, or 1 unit [of 1,000 watts] = 1.34 H.P. If, therefore, a machine is specified as 30 many units, it follows that, allowing for the loss in the conversion of mechanical into electrical energy, it will take about 1 1/2 times that quantity of horse-power to drive it; a 12-unit machine must receive 18 H.P., actual, in order that it may work to its full capacity.

The unit of quantity employed in connexion with secondary cells is the ampere-hour; that is, the number of coulombs carried past any point in a circuit by an ampere flowing for an hour. The ampere-hour is, therefore, equal to 1 x 60 x 60, or 3,600 coulombs.

Makers commonly state the capacity of a cell in horse-power-hours, though the word hours is usually omitted. A "1-horse-power cell" means a cell that, under normal working conditions, stores an amount of energy equal to that delivered by one horse-power in one hour. Taking the discharging E.M.F. as 2 volts, such a cell will give $\frac{746}{2} = 373$ ampere-hours.

If a secondary battery be charged and discharged with care, it will be found that the ampere hours of discharge very nearly equal those of charge, and on these grounds it is sometimes stated that the efficiency of a cell may be very near 100 per cent.; but it must be pointed out that a secondary cell is required to store

energy. The difference of potential between the terminals is about 2.5 when being charged, and 2 when being discharged under ordinary conditions; hence, even if no loss of ampere-hours took place at all, only 80 per cent. of the energy used in charging would be returned. In point of fact it is considerably less than this, though no exact figures can be given, as the true efficiency varies considerably with the nature of the work a battery is called upon to do.

The number of watts required to drive a given current through a conductor of known resistance can be at once calculated (see article V.); the work thus used reappears as heat, and causes the temperature of the conductor to rise.

If J = number of joules, h = number of units of heat* produced:—
 $h = 0.24 J.$

MAINS.

In small installations of electric light or power plant, the loss of power, not the rise of temperature, which takes place in the conductors, is a very serious matter; but when long distances have to be traversed, or large currents carried, the question of the size of the conductors or mains can no longer be overlooked.

Loss of power involves merely the question of cost. When the conditions under which power will be produced are known, the cost can be calculated. Interest on capital outlay and depreciation are the items in the annual cost of a cable; to these, however, must be added the annual cost of the work done in getting the current through the cable. The larger the cable, the smaller the latter cost, but the greater the two former items; a medium course should therefore be taken to make the sum of the two a minimum. The mathematical solution of the problem was given by Sir William Thomson in 1881.

The rise of temperature permissible in a main is limited by the temperature to which it can be raised without injury to the materials of which it is constructed. This question was investigated mathematically in a very complete manner by Professor George Forbes, in a paper read by him before the Society of Telegraph Engineers in 1884, to determine what section the conductor of a main or cable should have to prevent overheating with any given current.

If in a cable the permissible loss of power per mile is proportional to the current, formulae already given show that if the current increases the cross-section of the cable must increase in the same ratio, or if D be the diameter of the cable, since the cross-section varies as D² then, D ∝ C² a very simple relation. Passing on, however, to the consideration of how the rise of temperature, T, varies with C and D—let R be the resistance of, say a mile of the cable, if h = the quantity of heat produced, we know that:—

$$h \propto C^2 R \propto \frac{C^2}{D^2}$$

$$\text{or } h = p \frac{C^2}{D^2} \text{ when } p \text{ is some constant.}$$

Again, the quantity of heat which passes out varies as the product of the area of the surface of the cable from which it can escape and the temperature of the surface. But in the case of a circular cable the surface is proportioned to D, hence

$$h \propto T D$$

$$\text{or } = q T D \text{ when } q \text{ is some constant.}$$

The value of h in both cases is the same, because when the cable is at the highest temperature the current can produce, as much heat must escape from the cable as is generated in it, or the temperature would continue to rise; therefore

$$q T D = p \frac{C^2}{D^2}$$

The value of T, however, must be the same for all sizes of cables when this value, the highest allowable, has been decided upon. We then have

$$\frac{C^2}{D^3} = \frac{q}{p} T \text{ a constant.}$$

$$\therefore D \propto C^{\frac{2}{3}}$$

This expression shows that with a cable of circular section, the weight of conductor per mile is proportional to the fourth power of the

* The unit of heat is the quantity required to raise one gramme of water, at its maximum density, 1 deg. centigrade.

cube root of the current; so that, to take an extreme case, if the current is increased a thousandfold, the weight, and consequent cost of conductor, will increase ten thousandfold; that is, the conductor must be ten times as large as it would have to be on the score of loss of power alone. The difficulty, however, is more apparent than real: either a number of conductors may be used, or a single conductor shaped so as to present a vastly increased cooling surface; by either of these means, then, may the excessive temperature in large cables be reduced without increasing the area of cross section abnormally.

Books.

Schliemann's Ausgrabungen in Troja, Tiryns, Mykené, Orchomenos, Ithaka, im Lichte der heutigen Wissenschaft. Dr. CARL SCHUCHARDT, mit 2 Porträts, 6 Karten, und Plänen, und 290 Abbildungen. Leipzig: Brockhaus, 1890.

THE results of Dr. Schliemann's excavations have always been given with remarkable promptness to the archaeological world. In no direction has his marvellous business capacity been more strikingly shown than by the readiness and completeness with which huge volumes like "Troja," "Ilios," "Myceen" have been put through the press. Spite of this, there are no excavations as to the net result of which for science it is so difficult for the ordinary student to form a distinct idea. Dr. Schliemann's books are, as is well known, loaded with personal and (for science) irrelevant detail, they are further vitiated by much erroneous theory. To make satisfactory use of them, a student had need be a trained specialist in prehistoric art. There was great need for Dr. Schuchardt's book, and this need it admirably fills. It is not saying too much to state that the student has now before him the whole results of Dr. Schliemann's various work so far as yet attained by science; he has it, moreover, in a book clearly arranged and admirably lucid in style, and abundantly illustrated with plans and cuts, taken not only from Dr. Schliemann's books but also from recent publications in the *Hesperia* and other periodicals not usually at hand for the student. Probably a work so admirable will not go long untranslated into English. Dr. Schuchardt notes in his preface—as, indeed, is well known to all,—that it is in England especially that Dr. Schliemann's merits have been most conspicuously recognised, and in England, surely, such a book will be widely circulated.

A Handbook on Investments in Houses and Land. By R. DENNY URLIN, Barrister-at-Law. London: Elingham Wilson, 1890.

THIS is a sensible book, which will give a layman a general idea of the legal steps required in order to carry through a purchase or a loan, though, of course, it cannot supersede the need for legal assistance. It also contains many little hints and bits of information of a practical kind, such as those on the advantage of the septennial system of fire insurance. There is also a short chapter on property in Ireland, which would have been better omitted. It does not attempt—as, indeed, would be impossible—to describe the Irish law of property in five pages. It contains odds and ends of statements of no particular force or use; "The purchase of land in Ireland is very legitimate as a speculation, but it should be entered upon with a full knowledge of facts." This oracular utterance is so much waste paper.

Die Altischen Grab-reliefs. Erste Lieferung. Textbogen 1-2. Tafel i.-xxv. Berlin: Speemann, 1890.

THE first issue of the long-expected corpus of Greek grave-reliefs, undertaken by the German Archaeological Institute, is now before us, and comprises forty-one reliefs, complete and fragmentary, all dated before the Persian war. The series opens with the beautiful and, to professionals, familiar stele of Lyseas, a model of exact coloured reproduction. The publishers of the corpus act indeed wisely in sparing no cost to facsimile these coloured stele, the tints from which are fast fading. In the present instance it is only by standing at a particular angle to the stele that the remaining colour can be at all adequately seen. The stele of Lyseas is followed by that of Aristion, long the only known sample of this sort of work,

but now, we believe, for the first time reproduced in colour. Side by side with it is the analogous stele, recently found by the American excavators at Dionysio. But few of the series are here published for the first time, but the superiority of the plates over all previous attempts at reproduction will apply alone in the eyes of the intending purchaser. The text is brief and to the point. It rightly confines itself to a precise statement as to provenance, dimensions, and present state of preservation, and full bibliography. The price of the first issue is 3*l.*, but no hint is given, and perhaps none could be, of the ultimate cost of the complete work.

Die Antiken Sarcophag-Reliefs im Auftrage des Kaiserlich deutschen archäologischen Instituts, mit Benutzung der Vorarbeiten von Friedrich Matz, herausgegeben und bearbeitet von Carl Robert, Zweiter Band. Mythologische Cyklen. Berlin: G. Grote'sche Verlagsbuchhandlung, 1890.

SIDE by side with the "Attic grave reliefs," noted above, appears the first instalment of the corpus of Greek and Roman sarcophagi, with text by Dr. Robert. The number first published is in reality the second volume of the complete series. It deals with certain cycles of mythological subjects, i.e., with the Trojan, Argonautic, and Theban sets of myths. The remaining volumes are to deal with isolated myths, Bacchic and Erotic scenes, and subjects purely decorative. All general considerations are reserved for the issue of the first volume, and hence any detailed criticism of the text would at present be premature. As regards these plates, it may be noted that quite special difficulties have had to be overcome. Very few of the sarcophagi were sufficiently well preserved to be photographed direct in most cases; and the drawing supervised by a trained archaeologist. To this difficulty has been added another. Many of the sarcophagi are to be found walled into halls and courtyards at a great height. Due inspection could only be carried on by the erection of platforms and scaffoldings. This will give some idea of the magnitude of the task undertaken by the editors and publishers,—a task in which they have everywhere, they own, met with the most real help from directors of museums and owners of private palaces and collections. Further, in the case of sarcophagi that have been known to exist, but have since disappeared, old publications have had to be collated, and a selection reproduced. A most useful portion of the book is a list of the original MS. drawings that have been laid under contribution. These include the remains of the collection of Cassiano del Pozzo, which later in 1672 passed into Cardinal Alhani's possession, and (acquired by George III.) are now most of them in Windsor Castle. Of the great importance of the work in relation to the study both of mythology and art, it will be best to postpone all mention till the issue of vol. I. Meanwhile, we may call attention to the admirable indexes topographical, provenance, and chronological. The dates of discovery vary from 1488-1889.

The Architects', Surveyors', and Engineers' Compendium, and Complete Catalogue. Edited by JOHN EDWARD SEARS, F.R.I.B.A. London: The Compendium Publishing Company, 16, New Bridge-street, 1890.

THIS issue of Mr. Sears's "Compendium" takes a somewhat different form to that of the three previous annual issues, and includes several new and useful features. It is, of course, largely composed of advertisement pages, and the building materials or appliances to which they relate are classified into several groups; but we are bound to say that not one of these groups is a "complete catalogue" in itself, and therefore the claim of the work as a whole to that designation is a trifle exaggerated. The publishers have no doubt brought together as many pages of advertisements as they could get, and on the whole they are fairly representative; but although the present volume is sufficiently bulky (it extends to nearly 700 pages), it will require a far bulkier tome to contain the advertisements of all the inventors, manufacturers, and merchants who appeal to the building trade. To quote only one or two examples, in Section A of the so-called "Complete Catalogue," devoted to "Bricks, Tiles, and Terra-Cotta," several well-known firms are not mentioned. The same remark applies to Section D, "Engineering and Fireproof Con-

struction," Section L, "Sanitary Manufactures," and other sections which we might instance. Nevertheless, a very large number of illustrated trade advertisements are here brought together and classified in a way that cannot but be found very useful to architects, surveyors, and builders. A few illustrations of modern architecture at home and abroad are included, but these will not be so useful as the "Price-Book" compiled by Mr. Henry Lovegrove; the Notes on Acts of Parliament and Legal Decisions of the past year, compiled by Mr. John Warburton, solicitor; and a great deal of other matter, for the reliability of the whole of which, however, we cannot vouch. The work is not free from mistakes both in editing and printing. For example, under the first head we find the leading and only really representative architectural body of the United Kingdom three times in succession spoken of as "the Royal Institution of British Architects." Under the second head, in the list of "builders nominated by architects," the name of the well-known firm of Cubitt & Co. is rendered as "Cubitt & Co." But notwithstanding these criticisms, the work has been very well produced on the whole.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

5,980, Fanlights. T. P. Graham.

This invention relates to a device for securing, at any angle doors, fanlights, &c. A semi-circular ratchet, with a stop or pin, is fixed in such a way that the teeth of the ratchet, engaging in the stop, fix the fanlight, &c., at any desired angle.

6,433, Building Material. W. Schleunig.

According to this invention, the residue of soda manufacture or soda gypsum is used, with lime and gypsum in suitable proportions (or chemically treated with sulphates to increase the hardness). The result is a substance which is stated to be particularly useful for building purposes.

9,045, Window-sash Fastener. G. F. Belling.

This invention consists of a small plate screwed to the outer sash. To this plate is attached by an upright pin a cross piece, which is of a shape that when the sashes are closed, and the piece brought into position, it draws the sashes together, and locks into the staples, giving an additional security. It is not opened by anything passed over or forced up between the sashes.

9,479, Hasp Locks. J. Bates.

According to this invention, two additional or supplementary bolts are controlled by springs, and lock into the staples, giving an additional security. These two bolts are placed so wide apart that an eye or loop may be used with the lock for fastening it by a padlock, should the bolt be inoperative.

19,548, Door Knobs. R. H. Rastrick.

The attachment between the handle and the shaft or bar is obtained, according to this invention, by means of a spiral spring tightly wound round the spindle, and acting as a grip or screw. The knobs can only be removed when one end of the spiral is raised from its seat, and the fastening may be adapted to a variety of uses.

NEW APPLICATIONS FOR PATENTS.

May 5.—6,904, G. Martin, Glazing Sash-lights and Sky-lights.—6,914, T. Fawcett, Machinery for Making and Pressing Bricks.—6,918, G. Deacon, Strips or Bars for Glazing.—6,922, E. Whitehead, Sash-fasteners or Holders.—6,950, M. Rodger, Ventilators.

May 6.—6,952, C. Kellner, Coating Iron, Steel, or other Metals with Portland Cement, &c.—6,953, J. Sankey, Butt Hinges.—6,999, W. Lancaster, Level.—7,023, A. Rosewater, Automatic Flushing-tanks.—7,025, J. Jones, Safety Appliances for Windows.

May 7.—7,074, A. Wilson, Bolts for Doors.—7,079, J. Mason, Door Springs and Checks.—7,099, B. McTeer, Kilns for Burning Bricks, &c.—7,106, J. Bayley, Folding Doors.—7,107, J. Bayley, Paving-blocks.

May 8.—7,153, W. Stock, Syphon-cisterns.—7,160, W. Peace, Chimney Cow.—7,174, E. Pearson, T-squares, &c.—7,184, C. Edwards, Drain-pipes, Cas-rotors, &c.

May 9.—7,215, D. Alport, Foundation for Light Buildings, &c.—7,225, T. Baker, Electric Bell Pushes.

May 10.—7,294, W. Thompson, Mortising and Boring Machines.—7,306, J. Boulstead, Paint-brushes, &c.—7,312, E. Baudry-Diot, Bridges.—7,318, J. Bailey, Drainage and Sewage.

PROVISIONAL SPECIFICATIONS ACCEPTED.

3,075, G. Light, Intercepting Traps for Drains.—4,458, G. Le Maistre, Sliding Sash Window.—4,608, C. Longley, Wood-block Flooring.—4,712, H. Doulton, Construction of Sewers.—4,738, S. Haslam, Window Sash and Frame.—4,749, W. White, Sliding Sashes of Windows.—5,121, J. Ring and J. Kelly, Flushing Apparatus for Water-

closets.—5,161, J. Gillespie, Water-closets.—5,363, L. Chambaz and L. Schmid fils, Wash Fasteners.—5,459, W. Mears and others, Water-Fastener Preventers.—5,572, W. Millington, Boiler for Fireplaces or Stoves.—5,899, T. Robinson, Wood Planing and Moulding Machines.—6,083, E. Brook, Kilns.—6,413, W. Junge, Saws.—6,461, W. Jones, Chimney Sweep.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to Opposition for Two Months. 10,297, J. Dealey, Syphon Flushing Cisterns.—10,463, W. Donlin, Door Fastener or Curbboard Turn.—19,524, S. Empsal and W. Fish, Syphon Water Flusher.—3,776, W. Ingram, Sash Fastener.—4,323, C. Hanneberg, Machines for Making and Laying Drains.

RECENT SALES OF PROPERTY:

Table listing recent sales of property with columns for location, agent, and price. Includes entries like 'May 8.—By CHASBY & SONS (at Brighton).', 'Southwick—F. Stage and oyster beds', 'Four plots of land, near the Station and garden', etc.

Table listing property for sale with columns for location, agent, and price. Includes entries like '14, Rochester-ter., ut. 54 yrs., g.r. 26, r. 252, 10s.', '34, St. Augustine's-rd., ut. 60 yrs., g.r. 26, r. 245', 'Marylebone—W. Green, c. r. 235', etc.

Table listing property for sale with columns for location, agent, and price. Includes entries like 'Chelsea—25 and 26, Tadema-rd., ut. 91 yrs., g.r. 214, r. 276 p.a.', 'By Messrs. VENTON, BULL, & COOPER.', 'Chiswick, High-rd.—"Merton Lodge," l. r. 2130', etc.

MEETINGS.

Table listing various meetings with columns for date, time, and location. Includes entries like 'SATURDAY, MAY 24.', 'Architectural Association.—Visit to the Field and Queen new printing offices, Bream's-buildings, Chancery-lane, 3 p.m.', 'Royal Institution.—Dr. Charles Waldstein on "Recent Excavations in Greece."', etc.

A New Convalescent Home at St. Leonards-on-Sea, in connection with the Chelsea Hospital for Women, Fulham-road, is now in course of erection. The site is at the western end of the Marina, St. Leonards, on the cliff, about 100 ft. above sea-level. It has a direct southern aspect, and very extensive sea and land views. The Home is approached from the road on the sea front by a main road leading from West St. Leonards to Hastings. It is within three minutes' walk of the West Marina (Brighton and South Coast Railway) and the West St. Leonards (South-Eastern Railway) Stations. The building will be faced with red bricks, with Bath stone dressings and red tile hanging, and the roof will be covered with brindled tiles. The internal joiner's work of the main building will be executed in pitch pine and varnished. The main building, which will be two stories high, will contain the following accommodation:—Ground floor: day-room, reading room, dining room, waiting room, matron's room and office, lavatories and water-closets, kitchen, scullery, ladders, stores, &c., and servants' hall. First floor: patients' bedroom, Matron's and nurses' bedrooms, and bath rooms, water-closets, &c. There will also be an attic floor for servants' bedrooms, box-rooms, &c. A corridor, 8 ft. wide, will run through the main building on ground and first floors from east to west, so that a current of fresh air can always be obtained through the building. A verandah, where the patients can sit and enjoy the sea breeze under shelter in wet weather or hot sunny days, will extend along the whole of the south front, and the day-room will have a door opening on to the same. The whole of the drains will be laid outside the building. The wastes from sinks, lavatories, baths, &c., will be entirely disconnected, and the soil pipes will have ventilation shafts with fresh-air inlets. Mr. Frank H. Humphreys, of Hastings, is the architect. The contract, which was submitted to tender, was secured by Messrs. Eldridge & Critchden, of St. Leonards-on-Sea. We are asked to point out that as the erection of this convalescent home will add very considerably to the financial responsibilities of the Board of Management, they earnestly beg for special annual subscriptions to help to maintain the Home in a state of efficiency, and for donations to the Furnishing Fund. Any donations or subscriptions will be thankfully received by Mr. Henry E. Wright, the Hon. Treasurer.

Miscellaneous.

Properties for Sale.—(1) "The Chimes," standing in nearly two acres of ground, in West End-lane, West Hampstead. This conspicuous house was designed by the late Edward Pugin, architect, for the late E. R. Herbert, R.A., who named it after one of Dickens's Christmas story-books. So rapidly has this once rural by-way changed its character that the only vacant land on either side is the ground attached to this residence. (2) By auction in Edinburgh, at an upset price of 15,000*l.*, the Underwood and Raglewhat estates, of about 450 acres, in Dry-fusdale parish, Dumfriesshire. Dryfusdale lies in the Annandale district, watered by the Annan and Dryfe. It has remains of Roman and Celtic camps; at the former of which Agricola encountered the forces of Corbred II. (Galdus) in A.D. 79. In Lockerbie is the ancient fastness of the Johnstones of that ilk, whose great contest with the Maxwells, on December 7, 1593, is commemorated by the "Maxwell's Thorns," with a tumulus at their base, about half-a-mile distant from the old churchyard. (3) Horton Manor house, Epsom, virtually rebuilt after the late Sir G. G. Scott's designs, together with 1,060 acres, including a home-park and farm, four other farms, several homesteads, &c.; and also, in lots, the Nork Park estate, lying near to the Banstead and Epsom Downs, and stretching over some 2,430 acres.

The English Iron Trade.—The depression in the English iron market has not passed away during the past week; on the contrary, it has become rather deeper. Pig-iron is without animation. In the North of England pig metal has been flat, Middlesbrough No. 3 having receded 1*s.* 6*d.* per ton. Scotch makers' iron is also quieter, and lower in price, quotations having dropped from 9*d.* to 3*s.* 6*d.* per ton, makers being rather anxious to book contracts with the shipping demand falling off. The warrant market is lifeless; Glasgow warrants are fairly steady, but Middlesbrough warrants have experienced a fall of 1*s.* 10*d.* per ton. There is but a poor demand for hematite iron both on the west and east coasts. Although makers in the north-west are quoting 57*s.* 6*d.* to 60*s.* for mixed numbers of Bessemer, a few sales have been made at 5*s.*, the price of hematite warrants. The finished iron market is weak and dull, and this is almost equally true of steel; but steel rails are somewhat better enquired for in the north-west, and keep steady. Tinplates are improving. The reports regarding shipbuilding are discouraging, speaking generally. Engineers, especially those making marine machinery, are still fairly well employed, but there is slackness here and there.—*Iron.*

Berlin.—The details of a prospectus of a newly founded "Crystal Palace Company" are circulating in the local press. The Company intends putting up a collection of buildings devoted entirely to public entertainment. The site will include a theatre with 1,700 seats, a large concert-hall for an audience of 1,500, four large assembly-rooms, with stages attached; a public dancing saloon, an aquarium, a diorama, and an extensive bazaar; besides restaurants of various nationalities. The whole group is to be connected by means of a system of arcades, which, whilst open in summer, will be kept closed during the winter season. The total estimate for the buildings shows the figure 200,000*l.*, whilst the annual expenditure is estimated at about 35,000*l.* If the project be really carried out under good practical management, it seems likely to be a success.

The Fine Art Exhibition at Cordwainers' Hall.—The Cordwainers' Company have resolved to keep open the Fine Art Exhibition, at the Hall of the Company, No. 7, Cannon-street, E.C., for another month, from the 17th instant, charging one shilling for admission, and devoting the proceeds to the fund now being raised for the relief of the survivors of the Balaklava Charge. We made brief mention of the Exhibition in the *Builder* for April 26, p. 310. The Exhibition is well worth seeing as an exhibition, apart from the laudable object to which the proceeds of the extra month's opening are to be devoted.

New School Buildings at Zurich.—A large school building, containing twenty-two classrooms, three large halls, and having two gymnasiums attached, is to be erected here at a cost of 680,000 francs, and a competition for the building has been opened to Swiss architects.

St. James's (R.C.) Church, Liverpool.—On the 4th inst. the R.C. Bishop of Liverpool opened a new high altar and reredos at St. James Church, Marsh-lane, Liverpool, the interior of which was illustrated in the *Builder* for March 27, 1886. The new altar and reredos, with screens and alabaster rails, have been presented by Mrs. E. Lynch, in memory of her brother, the late Mr. Christopher J. Corbally; and have been nearly two years in hand. The reredos is a departure from the regulation type of the modern R.C. reredos, and is carried round the chancel to a height of 25 ft., the upper portion of the side walls above the arching being lined with slabs of rouge fleur marble, and there are medallions with paintings of the Evangelists, by Westlake, on gold grounds. A central composition on the east wall has two tiers of niches, and rises to the east window-sill level. The window will later on be filled with stained glass, and complete the whole composition at a height of 50 ft. The niches have a series of twelve figures in polished white alabaster. Our Lord in Majesty, St. Joseph, the Blessed Virgin, SS. Peter and Paul, and others. The altar, throne, and tabernacle are of white polished alabaster and Irish and Derbyshire fossil marbles; and there is a relief in the frontal of the Last Supper, and at either corner figures of adoring angels. The wall arcade is worked in polished light alabaster, with Kerry red shafts and Comenara green veined panels. These marbles have all been arranged on the old North Italian model as to tone and figure, and are stated to harmonise well with the stone of the pillars, arches, vaulting ribs, and stonework of the church. Messrs. J. & H. Patteson, of Manchester, have executed the marble and alabaster work, including the carving; Mr. Boulton, of Cheltenham, executed the figures; and Messrs. Hardman, Powell, & Co., the tabernacle door, of chased, enamelled, and engraved metal, richly gilded, and enriched with rock crystals. Mr. C. Hadfield, F.R.I.B.A., of Sheffield, was the architect.

Rainfall of the Globe.—The usual monthly meeting of the Royal Meteorological Society was held on Wednesday evening, the 21st inst., at the Institution of Civil Engineers, 25, Great George-street, Westminster, Mr. Baldwin Latham, F.G.S., President, in the chair. Mr. W. B. Tripp, M.Inst.C.E., read a paper on "The Rainfall of the Globe." It was a comparative chronological account of some of the principal rainfall records. The earliest record was that of Paris, which commenced in 1689. The English records began in 1726. The rainfall observations in the southern hemisphere did not extend over a very long period; at Adelaide they were commenced in 1839, but they do not go back further than 1866 for New Zealand. The greatest fall in any particular year at the stations given by the author was 160.9 in. at St. Bernard in 1839, and the least, 3 in., at Sandiego, in California, in 1863. By combining the stations in the northern and southern hemispheres, the author found that in recent times the years with the highest average rainfall were 1878, 1879, and 1883, and the years with the lowest average were 1854 and 1861.

The Sanitary Institute.—At a meeting of the Council of this Institute, held on May 14, a scheme was adopted for establishing periodical examinations for inspectors of nuisances at various centres throughout England. Mr. Arthur Bates, F.R.I.B.A., Mr. Alfred E. Harris, L.R.C.P., and Mr. S. W. North were elected Fellows; four members and twenty-four Associates were also elected. Twenty-three applications were read for election at the next meeting.

The Church of St. Paul, Preston, has been enriched by the addition of a painted window in memory of John and Sarah Dewhurst. The window, which is the gift of their children, has subjects of "Joseph honouring his father" and "Solomon honouring his mother." Illustrated with rich ornamental surroundings in character with the church. Messrs. Charles Evans & Co., of London, have executed the window.

Appointments.—Mr. W. Grant, of the Borough Engineer's office, Plymouth, has received an appointment as assistant in the Borough Engineer's office, Croydon; and Mr. G. Reginald Davey, late of the same office, has been appointed assistant to the County Surveyor of West Sussex. They were both pupils of Mr. Geo. D. Bellamy, M.Inst.C.E., Borough and Water Engineer, Plymouth.

New Library at Streatham.—The new library which, together with the site, is to be presented to the parish of Streatham by Mr. Henry Tate, has been commenced. The style of the building is Greek, and the whole of the facing is to be Portland stone, the most prominent feature being a large cupola (covered with copper and supported on an arcade) over the main entrance. The floors of all public rooms are to be of wood blocks, and the walls plastered and decorated and the coffered ceilings in fibrous plaster. The contractors for the building and fittings are Messrs. Higgs & Hill, and the cost (exclusive of site) about 6,000*l.* Mr. Sidney R. J. Smith is the architect.

Dissolution of Partnership.—We are informed by Messrs. Henry Saxon Snell and Alfred Saxon Snell that their partnership has been dissolved by mutual consent, and that each of them will henceforth practise on his sole account. The dissolution of partnership will not affect their work or commissions now in progress. We understand that it is the intention of Mr. Henry Saxon Snell to restrict his practice generally to that of consulting architect, so far as consistent with his official appointments.

Freiberg.—A new chimney, having a height of some 450 ft. to an interior diameter of about 15 ft., is being built on the grounds of the Halsbruecke Smelting Works in this town, and as this erection is being placed on a piece of ground the summit of which is 260 ft. higher than the surroundings, the mouth of the chimney will be fully 710 ft. above the floor level of the workshops. The chimney will show a square base of 40 ft. side.

Some Sculpture of the Year.

THE remark made by a sculptor at the Art Congress at Edinburgh last year, that sculpture was only the highest development of mason's work, served at all events to suggest a new view of the relations between sculpture and architecture, as arts which are both concerned in modelling or building up conceptions in the round, in stone or some analogous material. In proportion as the masonic element is the more prominent in sculpture, in that proportion it approaches to closer contact with architecture, and is decorative; in proportion as it departs from these masonic or architectonic conditions it approaches to the conditions of pictorial art. A good deal of modern sculpture is pictorial in style rather than architectonic, and though this pictorial use of sculpture has its own charm, there can be little doubt that the tendency in this direction, so far as it has gone, marks a decline from the highest ideal of sculpture, which, even where it is not treated as a decorative adjunct to architecture, should be so far architectonic in character as to be simple in its lines and well balanced and firm in its structure. These conditions being satisfactory, we have then to consider the value of the intellectual idea expressed in the work, which must also be simple and concentrated. A complex idea can hardly be well represented in sculpture. What we look for is the portrayal of a moment of action and expression which seems to express and include the main characteristics of the personage, historic or ideal, who is portrayed, or the central thought which is in the sculptor's mind; and this should be expressed through the medium of a figure also simple and typical in its attitude and in its lines, well balanced constructively, having something of that character of standing firm on its base which belongs to architecture, something of that well-knit structure and that severity of line which are essential to architectonic conditions. An ill-balanced figure in sculpture is as much *hors ligne* as the leaning tower of Pisa in architecture.

The central work of the year, among Royal Academy sculpture, the monumental statue of Gordon (1,958) by Mr. Onslow Ford, appears to answer well to these requirements.

We fear that the idea of representing Gordon seated on a camel looks as if it arose a little more from the sculptor's desire to model a camel than from any innate conviction that this was the most suitable way of portraying our lost hero—every artist is on the *qui vice* nowadays for a new effect; but the group stands well, the figure is very well seated on the saddle, and the attitude is simple and devoid of any striving after effect. Mr. Ford has the honours of this year in sculpture, for his “Music” in the Lecture Room (2,118), although not placed in one of the central positions in the room, is certainly one of the best works, if not the best, of the year. This is a figure of a woman singing to a lyre which she has just struck with her right hand. The hand has been drawn back again with a dramatic flourish which Mdme. Schumann would have highly disapproved of; but the figure is finely modelled and most satisfactory in pose and balance. The lower portion is half concealed by a piece of drapery which hangs in a negligent manner from the girdle, this serves to give greater breadth to the figure. The odd fancy of placing an owl on the head of the figure seems to have arisen from a wish to get the effect of showing the face shadowed between the bird's drooped wings; this is very effective, and gives a special expression to the work, but one does not see its relation to the subject. The same artist's “Peace,” of which the completed bronze is exhibited this year, was hardly so great a success as to justify a second exhibition; it is a pretty and well-modelled figure but a poor conception.†

The central places on the two long walls of the lecture-room are occupied respectively by the two works of which illustrations are given in this number: Mr. Lawes's “Design for a Relief” (2,004) and Mr. Armstead's “Guardian Angel” (2,063). The former, which is a large work (figures nearly life-size) appears to be an allegory of the spread-eagle description, the figures representing “America, Liberty, Peace, Commerce, Indians, the Extinction of Slavery, and Abundance”; the catalogue omits “America.” From the list, which has been furnished to us by the artist. The whole is surrounded by an architectural framework, of which the

* Mdme Schumann, as related in a recently published book of musical gossip, strongly rebuked a young pianist for throwing her hands up at the end of a difficult passage, as a kind of flourish out of keeping with true artistic feeling.

† An illustration from the plaster model was given in the *Builder* for May 7, 1887.

lower portion, which is a kind of immense bracket for carrying the projected mass of sculpture, is not shown in the illustration. This is an exceedingly clever work with a great deal of spirit and energy, but it is decidedly not architectonic sculpture, in spite of its semi-architectural frame; in fact, it is a most pronounced example of pictorial sculpture, and looks like a picture of Lebrun or some other painter of “la Siècle” which has sprouted into relief. Instead of being architecturally combined with the background, the object of the sculptor seems to have been to detach it completely, and to leave the whole mass of struggling figures as a kind of excrescence protruding from the wall plane. This is certainly not the way to treat decorative sculpture. Mr. Armstead's more sober and reticent work is a part only, as appears from the catalogue, of “a memorial to an only daughter”; it would have been of interest to see a sketch of some kind of the whole memorial, so as to see the relation between the sculpture and the architectural design; the group, as it is and taken on its own account solely, is a graceful composition imbued with a touching sentiment; the manner in which the angel's wings form a kind of framework of shadow round the whole is very effective and adds to the sense of repose in the group. In his group of small-scale figures for the reredos of St. Mary's Church Aberavon (a general drawing of which is to be seen in the architectural room), Mr. Armstead seems to have been rather under the influence of ecclesiastical ideas and has adopted a certain rather mannered type of figure for Christ and the evangelists, such as may be said to be more orthodox than original, except in the case of the figure of St. John, which appears to us the most successful of the group, and of which we give an illustration.

The fancy for treating statues with the head in shadow is illustrated again in Mr. Frampton's figure “The Angel of Death,” (2,090), in which the head is also shadowed with wings, in this case attached to the figure itself, and by which the face is so far shadowed that it is somewhat difficult to see the features. The figure is a thin emaciated life-size nude, carrying a scythe over the shoulder and poised on one foot in the attitude of walking, the other foot being extended in the air behind it. This is an attitude which has been frequently used in bronze figures, for which only it could be practically possible without danger; and of course a bronze w r x

comes out of the category of masonic sculpture; but it may be questioned whether this method of planting a figure is not at variance with the true genius of sculpture. There is a poetic feeling in this work, which is very expressive in its way, but both the pose and the method of shadowing the face combine to place it rather in the category of pictorial sculpture—design which would be better suited for treatment in painting.

Mr. Harry Bates's "Design for an Altar, Holy Trinity, Chelsea" (2,861), is eminently suited for its position. It is a long panel in very low relief, a figure of the dead Christ in the tomb, with an angel stooping over the head and another in like attitude at the feet. The angels are treated in a manner entirely suitable to architectural decoration; they are in almost similar attitudes at each end of the panel, the wings drooped behind them are arranged as a decorative filling to the ends of the panel. The figure of the dead Christ, recumbent, seems to us to be open to question in one respect, that it is treated so as to show rather too much of the front of the figure and the further limb, so as to have the effect of lying on a plane inclined towards the spectator. Very low relief like this comes so nearly into the category of pictorial perspective that it is difficult to draw the line between the two; but it appears to us that, for a relief, this figure is treated a little too much like a drawing, with the effect on the eye which we have described, and which is not quite satisfying. Mr. Bates's other work is a kneeling marble figure of Pandora, with a small and beautifully-modelled head, stooping forward over the fatal casket, which is treated in ivory with a delicate frieze of figures on the sides, a very pretty decorative incident.

Mr. Hamo Thornycroft's diploma work "The Mirror" (2,037) is a small and very charming bas-relief of a mother and child, the latter leaning back from her knee to look in a hand mirror. Two other low-relief works near this which may be noticed are Mr. Le Queene's "Spring" (2,062) a pretty sketch in low relief of a head in profile with rather too long a neck, but graceful in design and free in execution, and a profile "portrait" (2,064) in marble by Mr. T. S. Lee, in which the artist has gone to about the furthest possible extreme in making sculpture into painting; the hair and portions of the profile are just lightly touched so as to lose themselves almost imperceptibly in the ground plane of the marble. The surface of the face is polished to the extent of giving it rather a waxy appearance. The effect is unusual and *recherché*, perhaps, but is this truly "sculpture"? It seems rather like playing on the confines of an art in which everything should be clearly defined.

Mr. A. G. Atkinson's "Out in the Fields" (1,956) is one of the attempts which we see now and then in modern sculpture to bring purely realistic subjects of rustic life within the boundaries of the art. Mr. Thornycroft's "Mower" has been the parent, probably, of some of these attempts in English sculpture; but though the hoots and other articles of dress of his figure were perhaps too forcibly realistic, the pose of the figure was statuesque and fine—hence a great part of its success. Mr. Atkinson gives us a "clod" of the fields, spade in hand, and with clownish countenance; the surface of the dress is stained so as to appear discoloured with soil. The thing is well done, but it is not a thing of beauty, nor can we imagine that any one would care to possess a life-size work of this type. This is the kind of thing to paint on a small scale, as has been done by Knaus and other German artists; it is not the sphere for sculpture, which is too ideal an art to be used in this way. The want of intellectual perception of another kind, often painfully evident in English sculpture, is to be seen in such figures as the commonplace "Hypatia" in the Central Hall, and the large figure in the lecture-room of "Sophocles leading the chorus of victory after the battle of Salamis." This latter shows a head of a well-worn conventional classic type, on the figure

St. John: one of a series of five figures for the Reredos of St. Mary's Church, Aberavon. Mr. H. H. Armstead, R.A., Sculptor. No. 2,050, Royal Academy Exhibition.

Design for a Medal for the Worshipful Company of Musicians. Mr. C. B. Birch, A.R.A., Sculptor. No. 1,984, Royal Academy Exhibition.

of a mature man of rather thin and lean torso, with the ribs showing in a very pronounced manner. Now the event supposed to be illustrated occurred when Sophocles was quite a youth, and he was chosen to lead the chorus and dance on account of his delicate and almost feminine beauty, so that the figure by no means represents the incident intended.

Among the numerous portrait busts is a very spirited one of Lord Dufferin by Sir J. Boehm, a fine bust of Mr. Blake Wirgman (1899) by Mr. Thornycroft, one by Miss Alice Thornycroft entitled "My Mother" (2,000), a very dignified head, and a fine study of an old woman's head by Mr. G. A. Lawson (3,008). Among minor things we may mention Miss E. M. Rope's very pretty little bas-reliefs of children, reliefs for a mantelpiece (1,985 1991), Miss Emmeline Halse's design for a decorative frieze (1,977), dancing figures modelled on a small scale in wax on a wood panel ground—this is a very pretty little bit of work; and Mr. Birch's design for a medal for the Company of Musicians (1,984), of which we append an illustration.

There are but two or three works among those we have mentioned in the Academy which could hold a place in the first rank in the Salon, if transported there. Not only is one struck with the far greater proportion of works in the numerous Salon collection, which show real power in modelling, but with the superior intellectual character and force of the best French sculpture of the day. As before observed, it may be questioned whether the French, with the exception of a few leading men, are not rather astray about painting at present: but there is no doubt whatever about their sculpture. Take what is perhaps the finest work of this year, the "Femme au Paon" of M. Falguière, which fronts the visitor opposite the principal entrance. The idea of this is really the same as that of the artist's painting called "Juno" last year, and it is not easy to understand why he should have abandoned this ideal title for a prosaic one, especially as the woman and peacock are standing on "conventional clouds," the only weak point in the work, for which the title of "Juno" would at any rate have afforded an excuse and explanation. Not only is this one of the most splendidly modelled examples of a perfectly fine female figure, but the head is of the noblest type—type which M. Falguière seems to have developed for himself, first in his "Diana" and now in this figure, and which is the very embodiment of womanly dignity and chastity of expression. The pose of the figure is as dignified as the physiognomy; in conception and execution this is an ideal type of sculpture, complete as far as it goes, but expressing one simple idea, and attempting no complication beyond the proper limits of sculpture.

Among the prominent works of this year M. Lemaire's colossal bronze statue of Du Guesclin, Constable of France in the fourteenth century, of which we give an illustration: a figure upon which Englishmen ought to look with respect, as it was he who was mainly instrumental in ejecting the England of that day from her partial footing in France. The sculptor of what may be called a portrait statue is at an immense advantage, no doubt, when he can make use of so picturesque a dress as a suit of Medieval armour; but even making allowance for this advantage, what a remarkable work is this both in sculptural quality and in the half-fierce half-herotic individuality which is given to the figure. We can recall nothing in English military sculpture to stand against it at all since Foley's "Outram," which unfortunately did not remain in England. Du Guesclin forms the centre figure in the southern portion of the sculpture court. Among the more prominent works grouped around is M. Rouleau's "Leda," which has been purchased by the State; this is unquestionably a very powerful work, the figure is finely modelled, the swan's plumage splendidly treated, the outer wing raised, the other forming a kind of background to the figure of the woman, who is not yet enlightened as to the supernatural character of the bird, and checks it with

her hand, with an expression of mild surprise on her face. All this is exceedingly clever, but it is a curious commentary on French ways of thinking, that a paternal Republican government should thus purchase, for the edification of its citizens, a work the real meaning of which could not be explained to any decent woman (or so at least we should think in England). That Leda should have been a favourite subject in the time of the Renaissance is not surprising, but one might think it was time to have done with such a motif in these more decorous days. In a prominent position in this part of the court is M. Fremiet's equestrian statue of Velasquez, a very fine and powerful thing, but the costume, no doubt historically correct, is unfortunate for sculpture. M. Cordier's "Eve" is a finely-modelled figure but not with any special originality of idea, and the representation of the loose hair hanging over the body, conveyed by scoring the torso with incised lines, is a false trick of execution which we do not approve of. There are a number of works around here not of the first order (according to Salon standard), but remarkable for the number of distinct and original fancies which they display; M. Dagonet's "La Nuit"; M. Guglielmo's "Faucheur" sharpening his scythe, a piece of frank and almost brutal realism—there is no attempt at sculptural grace, but also there are no boots, as in Mr. Thornycroft's "Mower"; M. Tony Noël's "Querelle d'Amour," a beautifully-modelled nymph raising an arrow into the air to chastise a little Cupid who clings about her legs; M. Gautherin's "Avant l'Orage," a girl with flowers gathered in her skirt, looking round with an expression of apprehension, her dress blown about by the coming storm, a very expressive work. M. Pech exhibits his idea of Sophocles dancing at the head of the Chorus, not a very great success, but M. Pech at least knows that Sophocles was a youth and not a man at the time, and does not misrepresent him as he is misrepresented at the Royal Academy. There are many other works on which we made notes, but which we must pass over to look up the side of the court where the monumental works of the year are mostly arranged. These are indeed a remarkable group. One of the principal of them, M. Delaplanche's monument to the Archbishop of Bordeaux, we give an illustration of. It is an admirable example of the combination of sculpture in an architectural whole, and also of that intellectual treatment of a monumental subject by the addition of ideal figures grouped around the portrait figure, in which the French so much excel. These two figures, of life-size and in a very grand and broad style, represent apparently Charity and Faith. The bold manner in which the escutcheon is treated as a decorative centre will not escape the architectural reader. Among the finest of the monumental works, after this, may be named first M. Coutan's colossal figure of a woman in large and ample draperies seated between two great scroll or cantilever features which seem like the buttresses to a tomb-stone; this is for the tomb of Madame Louis Herbet, and bears the inscription,—

Où vous qui j'aime et qui m'aimiez
Je vis, je vis en vous.

A fine work is M. Albert Lefeuve's "Pour la Patrie," two allegorical figures, the one robed the other armed, the latter represents "Duty"; the two step onward hand-in-hand, and each looking a little to the right as if at some common object of devotion. M. Chapu exhibits a monument to Flaubert the novelist; a mighty slab, in the upper portion of which is the head of Flaubert as a cameo in a sunk medallion; below is a fine nude nymph, apparently Truth seated on the well-curb; between her and the medallion a laurel grows over the slab in low relief. Near this is the same sculptor's "Danseuse," a figure in a tranquil pose and as if seen through transparent drapery,—a trick a little below M. Chapu; the figure is treated as a relief in a niche, and has a charmingly expressive head, to which

her fan forms a kind of nimbus. M. Levasseur's "Le Premier Né," a group of father mother and child, merits special mention for its fine and carefully-studied composition and the harmony of its lines, illustrating that architectonic quality which we have been claiming as a proper attribute of sculpture.

Among the works at the upper end of the court is M. Charpentier's fine and poetic figure entitled "Chanson," a kind of embodiment, in a splendidly-modelled female figure, of the abandon of Song,—

"Insoucieuse, un peu bohème,"

with head to one side and holding up a flower in one hand. The expression of light-hearted gaiety in this work, quite within the proper limits of sculptural expression, is remarkable; we could not do it in England, for we have not, as a nation, the quality which it represents; it would almost startle people if found in the room at Burlington House, that home of sobriety; there is an attempt at something of the kind in Mr. Montford's "Venus Triumphant," but how harmless and conventional in comparison with the French sculptor's exuberant and yet refined conception. M. Laporte's group "La Conscience," is a very fine work of a more serious type, illustrated by two lines from Victor Hugo's "Légende des Siècles":—

"Vous ne voyez plus rien, dit en tremblant Stella;
Et Cain répondit: 'L'œil est toujours là.'"

Stella (Cain's daughter) kneels looking up anxiously at him, Cain looks away in the same direction; in expression and in composition the whole thing leans as it were towards the direction of the dreaded vision; the composition is fine, the expression of the group very powerful. Among other works in this part of the court are M. Teixeira-Lopes' "Veuve," a most pathetic group of mother and child; M. Engrand's "La Réve," a strange but attractive fancy, showing a nude woman asleep in a beautiful half-seated pose on the back of a chimera monster which represents the dream; and M. Puech's very remarkable work "La Sirène," which is another striking example of the powerful intellectual treatment often found in French sculpture. This is a figure of a fish-tailed siren floating along in a prone position but with her body half raised, and carrying on her shoulder a youth to whom she is turning up her face in a feigned expression of love and tenderness; the boy's face expresses with remarkable power the mingled feeling of interest with apprehension; as a piece of expression this face is a most remarkable study, and the whole work, besides being splendidly executed, is a perfect poem in marble. This, we see, has been purchased by the State, and was well worth the honour. Another dream subject which is curiously expressive is M. Dampf's "La Fin du Réve," where also the chimera figures the dream, this time seen only as a subordinate object flying off; the point of the work lies in the expression of the awakened figure, sitting up with a face full of melancholy and apprehension. Another work purchased by the State, and one of the finest things of the year, is M. Marqueste's "Perseus Slaying the Gorgon." This is a remarkable group both for force of conception and finish of execution. Perseus, his handsome features, under a splendidly-decorated helmet, showing only a calm resolution, stoops over the prostrate figure of the Gorgon, clutching the snakes of her hair at the back of the head to keep her face from him; the woman-fiend, with her mouth open in a scream, struggles to get her face upwards to exercise her power of turning him to stone; but her adversary is relentless in his calm power. With the exception of the scream of the Gorgon, which is perhaps a slightly violent incident for sculpture, there is a Greek calm and reserve about the group, and the figure of Perseus is fine and impressive in shape and action from every point of view.

Another among the State purchases is M. Carlier's "Gilliati Saisi par le Pieuvre," from Victor Hugo's obstreperous romance; the

sculptor has shown a fitting reserve with the expression of terror in the man's face, which is powerfully represented without going beyond the limits imposed by sculpture.

There are many other works well worthy of mention among the Salon sculpture, which for lack of time and space we must pass over. Taking this as the representation of French sculpture for one year, and comparing it with our little show at the Royal Academy, the contrast is extraordinary enough, and the evidence of mental vigour and power of invention as well as of execution among French sculptors at present is extraordinary. Whilst in our opinion (which, as not feeling at liberty to speak with authority on the technique of sculpture, we express with a certain diffidence) the executive power of French sculptors is considerably higher than that of their English peers, the more striking contrast (whereon we speak with no diffidence at all) is in regard to the intellectual quality of the French work. In walking through the collection at the Palais d'Industrie we are confronted by new ideas, new treatments, and new force and meaning given to old subjects; we are gaining new poetic conceptions of the subjects; and this not in isolated instances, but in the case of a large proportion of works. How often do we get new ideas from the sculpture-room at the Royal Academy? The difference, however, is not only in the artists but in the public. In practical England the vast majority of people are absolutely indifferent to so purely abstract an art as ideal sculpture; they do not want it, they do not even know what it means. Until there is some difference in this respect, some desire on the part of the English public for high-class sculpture, we must probably remain in this respect at our ordinary level of respectable commonplace, in regard to the conceptions of sculpture.

BREAKWATER CONSTRUCTION.*

BY F. H. CHEESEWRIGHT, ASSOC.-M. INST. C.E.

As a fallen tree or a floating log may have given to the inhabitants of Tyre (the earliest sea-going people of whom there is any record) the first idea of a ship, so doubtless artificial breakwaters originated from the models supplied by nature herself in the projecting promontories of a rocky coast. The Tyrian sailors, storm-tossed in the Egean Sea, often found shelter in the smooth water formed by the jutting horns of a land-locked bay, the rocky horns breaking with passive yet stubborn force the fierce tumultuous masses of water hurled against them by the outer sea. It is but reasonable to suppose that the experience gained upon the coast of Greece, with its countless natural harbours, should have suggested to the Tyrians the way of rendering their own port, lying on an exposed and unprotected shore, accessible in all states of weather, and hence, doubtless, their famous mole. At first sea-going people would probably confine their voyages to ports which possessed safe anchorage; but it often happened that large populations, attracted by local advantages, such as a healthy site or a fertile soil, settled on various points of the sea-board which afforded no facilities for the reception of shipping. Increase of wealth made it necessary to open communications with other nations, and art had then to supply what Nature had begrudged. Large masses of stone were piled at a suitable spot upon the sea-shore, and gradually the heap was carried seaward, just as at the present day a railway embankment is carried across a wide stretching valley. This system of barrier or breakwater building was that first adopted; and, strange to relate, it is the only one that the ingenuity of man has up to the present day been able to conceive; for although modern engineers have modified, varied, and improved the system, it is no exaggeration to say that in all essentials the last magnificent structure erected by our most eminent

engineers is not one step in advance from the primitive mole, the work of hands that had returned to dust before the British or the Roman name had been heard of. It is not the writer's intention to deny that improvements have been made, but so far as the main idea in the construction of breakwaters is concerned, it must be admitted on all hands that it was tumble-stone at the beginning and is tumble-stone to-day, excepting of course such a costly structure as Dover.

Nowhere has the daring of man been more visible than in his awful struggle with that most unstable yet most powerful of all agencies—water. To erect seaworks that stand at all against the terrific forces of sea-waves hurled in endless succession against them by a wind travelling at the rate of eighty and even a hundred miles an hour is an undertaking that might well shake the resolution of the boldest. Yet it has been done in all ages, and on almost every coast. History, that takes notice and bands down to future races the names of heroes who have been the scourges of mankind, has too frequently let drop into oblivion the names of the dauntless engineers who have by their mighty structures tamed even the ocean, and have offered to the shattered ship a refuge upon an exposed and inhospitable shore.

It may be well at this point to give a somewhat fuller description of the system of construction hitherto employed both by ancient and modern engineers before proceeding to consider in detail some of the typical breakwaters of the world.

As previously stated, large masses of tumble-stone or *pierre perdue* were tipped into the sea till the rubble mound reached the surface, where it acted as a sbringly beach to receive the impact of the waves. The continued action of the waves gradually lowered the top of the mound and flattened the sea-slope. Consequently, the surface of the mound had to be continually fed with fresh material until the sea had worn it away into a natural slope. When this slope has at last been made, very little alteration takes place from the bottom to a point near low-water mark; but from thence upwards the mound is always liable to destruction or at least great injury, and as a consequence always remains a subject of great expense in order that it may be kept in efficient repair.

The celebrated Cherbourg breakwater was first formed in this manner, but as, after every storm, the sea left the mound reduced to low-water level and the harbour fully exposed to wind and wave, it became necessary to erect upon it as a basis the present magnificent superstructure. Our own Plymouth breakwater was similarly constructed, and was found to be equally unable to bear the action of the sea. Pitching, or facing with flat stones firmly set in cement, was resorted to, and with fair success. But when once any displacement takes place in regard to these surface stones, unless the breach be immediately repaired, the sea rapidly enlarges it, and would in a short while carry away the whole of the protecting surface, one wave being known to have ripped up as much as 70 ft. Another development of the tumble-stone system was the employment of concrete blocks for the formation of the mound at places where suitable stone was not to be obtained. Types of the concrete mound are the Biarritz breakwater, that at Leghorn, and the major portion of Port Said. The varieties of the tumble-stone system are too numerous to be fully gone into; but, as approximating most closely of them all to the system which will shortly be described, it will be well to mention the pile-driving system, by means of which the waste of the mound was to a considerable extent prevented. But whatever has been done by different engineers, many of them men of the greatest eminence, nothing would appear to have been discovered which supersedes the system of making a foundation of rubble or *pierre perdue*, and building upon it structures of stone or concrete. And, moreover, it may be said that whatever improvements the ingenuity of man has devised, in the way of building together

these structures either with iron clamps or the dove-tailing of the stones one into another, they have all been failures in a greater or less degree; moreover, their cost has been tremendous, and, in the few instances where a fair amount of efficiency has been obtained, it has been gained at the cost of thirty or forty years of incessant labour, armies of men being employed daily in tipping vast quantities of material into the sea for the sea to arrange and re-arrange at its pleasure. The Cherbourg breakwater actually took seventy years in constructing, having been begun in 1783 and not finished until 1853. A very important point which must not be lost sight of is revealed by a casual glance at any of the diagrams representing the breakwaters referred to in this paper. It will be noticed that in order to secure a basis for a superstructure of comparatively small dimensions it is necessary to encroach upon the waterway to the extent in some cases of at least ten times the basis required. Where the entrance to the port is sufficiently wide to allow of this encroachment the only thing to regret is the enormous waste of money and material incurred, but where the entrance is narrow it is clear that it puts an end to the possibility of building a breakwater at all, for by the time there was a sufficient basis formed for its erection there would not be left any waterway for ships to enter the port. It is owing to this important drawback that marine works have not been carried out in many of our principal ports, especially in the Colonies, which greatly require them.

It will scarcely be necessary in this paper for the author to go into the question of the varying forces of wave-power, nor into the theories of wave-action. It will only be necessary to take their results, which are certain and defined. But one thing it is very necessary to bear in mind, and that is, the well-known fact that a breaking wave exerts more percussive and destructive force than an unbroken one. It is also an admitted fact that waves begin to break when they enter a depth of water roughly approximating to their own height. It therefore follows that the very foundations of our present breakwaters, built on the talus or *pierre-perdue* system, are themselves unceasingly assisting in the destruction of their own superstructures. This was very forcibly brought out at one of the sittings of the Select Committee of the House of Commons on the Dover Pier Harbour Bill in 1875. The Chairman (Sir Seymour Fitzgerald) put question 1,676 to Captain E. K. Calver, R.N., as follows:—"The stability of an upright wall must depend upon the thickness of the wall?" and the witness answered, "It must depend upon the inertia of the mass and upon the profile. If you put a long batter on to a marine work, and create a wave, you bring into operation a power for its own ultimate destruction. On the details of construction I would not say a word; but upon matters of general design my experience is directly applicable." Further proof as to the inefficiency of the present system of construction may be obtained from the minutes of evidence taken before a Select Committee of the House of Commons on June 15, 1883. In question 1,513 Sir John Coode was asked if he was aware that the great drawback to the formation of, and great hindrance to, harbours hitherto has been the great failures that have taken place in harbour construction? Sir John replied, "I know that that has been a drawback, it has probably made the authorities timid in incurring a large expenditure." Question 1,514 was then put to him as follows:—"Are you aware that ten millions sterling have been expended by the Government mainly in what are called harbours of refuge, and that, excepting that magnificent work of yours, the Portland Breakwater, you may say that probably nearly the whole of the other harbours have been failures: for instance, Alderney?" Sir John replied, "Alderney has not been satisfactory, certainly."

As additional proof that the field is open for a new system of construction it may be well to quote the following paragraph from

* From a paper read before the Society of Engineers, on the 5th inst.

the appendix to the report of the Select Committee on Harbour Accommodation, July, 1884:—

"The next important point deserving of attention is the remarkable diversity of designs put forward by different engineers for sea harbour works, and the often defective results as regards outlay and failure in the works. This may be viewed as the result of long years of delay in carrying out harbour works, where the engineers who commenced seldom have lived to witness the completion of the works; and, consequently, the defects in any particular harbour have rarely been remedied in another one designed by the same engineer. We have no hesitation in stating that there is hardly a single harbour at home which will not show some defect worthy of being avoided in all future works; and a wasted outlay which must be burdensome to the nation."

It would be difficult to sum up the absolute inefficiency of the present system of breakwater construction more tersely than is done in the above paragraph by a body of experts appointed by the highest authority in the land as being the best men the country could find for the purpose. The Chairman of this same Committee read the following paragraph of a letter from Provost Rae referring to the disastrous failure at Wick, "The unfortunate breakwater was an engineering experiment, and although a ruinous burden to Wick, it has been worth the money to the country in showing how *not* to do it again." Perhaps it is only fair to add that Provost Rae was writing with a view to getting the country to share the burden of the failure with Wick.

The author will now give a short sketch of some of the typical breakwaters of the world, beginning with some of the more ancient, and giving in connexion with each such details as may be of interest to the meeting, or may serve to illustrate the multifarious difficulties with which engineers have had to contend, and then proceed to describe a system by which it is hoped they may be successfully overcome.

One of the most ancient, if not actually the most ancient, breakwaters in the world is the famous mole of Famagusta, in Cyprus. It is formed of rubble-stone thrown loosely in. These stones weigh roughly between 2 or 3 cwt. each. The top is capped with a layer of squared stones averaging 3 ft. long and 18 in. wide, which are bedded and jointed in mortar. This top is now destroyed, and its debris has considerably narrowed the entrance. The difference in the ground-level on the sea side and harbour side is worth notice.

Another ancient breakwater which deserves mention is that at Civita Vecchia constructed by order of the Emperor Trajan about A.D. 100. From the account of it given by Pliny the Younger, it would appear that it was made in a very similar manner to that at Plymouth. That means to say, no progress in seventeen centuries.

Coming to modern breakwaters we have that at Alexandria, which has a depth of five fathoms and upwards, and shelters 1,400 acres. It was begun in 1870, and completed in two years. This remarkably short time in constructing a very large work was due to the enormous quantity of forced labour employed, and to the fact that there was no tide to contend against. The breakwater mole, quays, and other harbour works cost about 2,000,000*l.* The detached breakwater, which is 9,675 ft. long, is composed of concrete blocks which are 11½ ft. by 6½ ft. by 5 ft., and weigh 20 tons; they were kept for three months to harden before being employed upon the outside of the work, the inside of which is composed of rubble and large stones.

The Marsouilles breakwater was begun in 1845 and took thirty-six years in construction, being finished in 1881. Its total length is 11,930 ft., its width 59 ft., depth 6½ to 12 fathoms. One portion cost 75*l.* 11s. per lineal foot; the portion opposite the Lazaret and Arene basins, 2,050 ft. long in a depth of 55½ ft., cost 109*l.* 14s. per ft., and the portion in front of the Maritime basin in a depth of 52 ft., and having a length of 1,660 ft., a similar sum. This structure is composed of

a rubble foundation supporting placed masonry, faced seawards, with blocks of cement weighing from 20 to 30 tons.

The harbour at Algiers is protected by a rubble and concrete block breakwater of similar construction to those at Port Said, Biarritz, and Alexandria. It is perhaps unnecessary to remind this meeting that what stands very well in the tideless and fairly peaceful Mediterranean would probably prove worthless if exposed to the terrific forces of an Atlantic storm.

From an inspection of plans of harbours it will very readily be seen that the breakwater at Cherbourg is one of the largest marine works ever undertaken, and that it has not been exceeded as regards extent of area sheltered by any more modern works. The Alexandria Breakwater indeed approaches it in length, whilst the mattress jetties at Galveston and Charlestown even exceed it; but, considering the solid nature of the work, the powerful batteries which it supports, and the period of its construction, it must be admitted to be a marvellous monument of engineering skill and perseverance. It does not equal in depth and in section several other breakwaters, but it furnishes a perfect type of a breakwater formed of a rubble mound supporting a superstructure of concrete blocks and masonry starting from the low-water level. This famous breakwater was begun in 1778, stones being tipped in until high-water mark was reached. Waves and storms continually beat the top of the mound down to low-water level, the debris considerably enlarging the area of the tumble-stone foundation, while the sea action materially altered the shape it was intended to have taken by its engineers. In 1832 an upright wall was built on the top of the mound and the whole works were completed in 1853 at a cost of 2,674,491*l.* The superstructure successfully supplies the place of the weak part in the rubble mound and fulfils precisely the object for which it was designed, while the rubble is not carried higher than is just required for the protection of the foundation course of the upper works. Since the success of the system employed at the Cherbourg works has become known many other noteworthy and fairly successful structures have been similarly raised; but in some cases without allowing sufficient time for the settlement and changing of the mound before proceeding to raise the superstructure upon it. It is, perhaps, not surprising that but few engineers have the patience to wait thirty or forty years for their foundations to properly settle. With regard to the cost of Cherbourg it is only fair to state that the sum just named includes the cost for the foundation of the central battery and some other works not strictly incidental to the construction of the breakwater proper. M. Bonnin puts the actual cost of the breakwater at 2,000,000*l.*, which gives an average of 164*l.* per lineal foot.

A very fine specimen of the tumble-stone and superstructure formation is the famous breakwater at Colombo. Its foundations were laid in 1875. They are of tumble-stone or *pierre perdue*. It has a concrete block superstructure begun in 1874, the blocks being from 16 to 33 tons in weight, and were deposited diagonally by a steam Titan. During the "monsoon season," from May till October, the work had to be altogether suspended. In 1878, during a very severe south-west monsoon, a length of 150 ft. of the superstructure was considerably deflected. The maximum advance made with the works during any one month was in January, 1880, and amounted to 154 ft. The depth of water at the outer end of the structure is 6 fathoms. It is of interest to know that the breadth at the bottom of the wall is 26 ft., while at the top it is 24 ft., that is to say, the Colombo breakwater is a specimen of a nearly vertical breakwater, the great desideratum in such structures. When the harbour is completed the area sheltered will amount to 235 acres, having a depth of 20 ft. at low water, whilst the total acreage of sheltered water at low water will amount to 502. The concrete

blocks of which the breakwater is composed are formed of 6 parts of broken stone, 2 parts of sea-sand, and 1 part of Portland cement.

It may here be mentioned that since the introduction of Portland cement for the formation of concrete, another very valuable auxiliary has been introduced into the building of sea-walls, breakwaters, &c., and there are already many other structures, besides Colombo, of considerable note in which this material has played a very successful part, in fact so successful has it been that it has now become an indispensable factor in the construction of all sea masonry.

The total length of the Colombo breakwater is 4,150 ft., its depth is 40 ft. The works averaged a cost of 170*l.* per lineal foot.

The first type of an English breakwater that will be considered is the well-known one at Plymouth. The famous admiral, Nelson's old chief, Lord St. Vincent, first proposed the formation of a breakwater here to Lord Howick, in 1806, when Lord Howick was First Lord of the Admiralty. But it was not until 1812 that Messrs. Rennie & Whidby's plan was adopted and the work begun. The mode of construction was by depositing in mid-channel large blocks of limestone obtained from a neighbouring quarry. These blocks were conveyed to the site for the breakwater in vessels of peculiar construction having openings in their stern out of which the stones were dropped to the bottom of the sea. In all fifty-three of these vessels, each being of fifty tons, were employed in conveying stone for the construction of the breakwater. From one of these vessels a load of fifty tons of material could be discharged in about three hours. In the course of 1812 the whole of this fleet discharged 16,045 tons of stone; in 1813 the amount discharged had risen to 71,198 tons; in 1814 to 239,480; in 1815 to 264,207 tons; while in 1816 it dropped to 206,033 tons. By the time this portion of the work was finished the sum total of the amount of limestone deposited reached the high figure of 1,000,000 tons. The proportionate dimensions of the deposited blocks were nearly as follows:—

Of 5 tons and upwards	12,760 tons
" 3 to 5 tons	150,593 "
" 1 to 3 tons	309,706 "
" 1 ton and under	423,904 "

For quarrying this stone the sum of 2s. 5d. a ton was paid, while the charge for its carriage was about 1s. 10d. a ton. According to the most accurate calculations the cost of each ton of stone sunk for the construction of this breakwater was about 8s. 13d.

The total estimate for the completion of this breakwater was originally 1,524,000*l.*, but the sums hitherto spent upon the work amount upon the whole to 1,562,639*l.* Mr. Rennie, the eminent engineer of the breakwater, died long before its completion. Plymouth breakwater, which is thrown right across the middle of the Sound, lies nearly due east and west; it stands completely isolated, having a channel half a mile in width on either side of it. It has also two wings, each being 350 yards long. The central part, which is straight, is 1,000 yards in length; the wings incline towards the north at an angle of 120 deg. from the straight portion. The breakwater stands 3 ft. above the level of the highest spring tide, is 120 yards broad at the base, 16 yards at the top, and has an average height of 14 yards. It has already been remarked that the mole at Civita Vecchia, built seventeen centuries ago, is constructed on almost a similar plan.

As will appear when describing Alderney, the cost for the maintenance of Plymouth breakwater amounts to the enormous sum of 5,000*l.* a year.

The works at Portland consist of an inner and outer breakwater. Early in the century a breakwater was suggested at this spot by a Mr. A. Lamb, and Mr. Idle, a local member of Parliament, entered warmly into the matter, and was the first subscriber to the necessary funds.* The area sheltered is 2,130 acres.

* Lamb's Vindication is in the British Museum; a small pamphlet.

Although advocated at so early a date active work was not begun until 1847. The inner breakwater has a length of 1,700 ft., while the outer or detached breakwater extends to 6,400 ft. The work advanced at an average rate of 450 ft. a year. The total sum of money expended on it from the beginning until 1871 was 1,034,000*l.*, a sum equivalent to 127*l.* per lineal foot; but this amount does not appear to include the cost of convict labour.

Though the breakwater has had ample time to consolidate, and though the exposure is comparatively moderate, the slopes are still liable to injury from the action of the sea between high and low water levels. In both easterly and southerly gales the stones of the outer slope are displaced by the recoil of the waves, while under north-easterly gales the waves break right over mound and dash violently against the inner slope.

As much as from 500 to 3,000 tons of stone have been known to be disturbed during the continuance of a single gale.

The Harbour at Alderney is protected by a rubble mound supporting a superstructure founded below low-water mark. The depth of water varies from 21 ft. to 134 ft. at the outer end. The works were begun in 1847, were modified in 1849, and twice in 1858. The Western breakwater was carried out to a length of 4,380 ft. Its actual cost up to the period of completion in 1864 was at the rate of 235*l.* per lineal foot. It is worthy of note that from 1875 to 1883 the cost for repairs of breaches alone has amounted to the very large sum of 52,850*l.* This breakwater appears to have been strongly constructed in its upper and monolithic works, but to have been neglected in the matter of its rubble base. The large masonry blocks forming the outer wall are tied or "dowelled" together with huge bolts of gun-metal, while the rubble and dry masonry base is being continually worn away by attrition. The same defect is to be seen at Wick and Arklow also.

Sir Andrew Clarke, B.E., in giving evidence before a Select Committee of the House of Commons on the Harbour and Fortifications of Alderney (Session of 1872), reported that "the cost of Alderney had been 300,000*l.* less than the cost of Plymouth breakwater, which was being maintained at a cost of 5,000*l.* or 6,000*l.* a year, and he did not think that Alderney was likely to cost more." Not a very hopeful way of speaking of a breakwater which, when built at a vast expense, is supposed to be at least efficient. Breakwater construction must be in a very bad way when it appears to be a recognised thing that a finished structure should, as a matter of course, require 5,000*l.* a year to keep it in repair, such repairs being required so soon as the breakwater is supposed to be finished.

The Admiralty Pier at Dover is stone, built on a chalk basis, in a maximum depth of water at spring tide low water of 45 ft. This pier has a base of 92 ft., and a clear roadway of 30 ft. in width. Its sectional area is 4,736 square feet, and it cost 360*l.* per foot run. From a Government return of August 17, 1883, it would appear that the total cost reached 693,077*l.*; but in addition to that a sum of 22,827*l.* has been paid for repairing the damage done by a storm in 1877, and by others in subsequent years. The whole cost has been paid by Parliamentary grant. The original engineers of this magnificent structure were Messrs. Walker & Co., who were followed by Messrs. McClean & Stileman, and at a still later period by Mr. Edward Druce, C.E., who had previously acted as Resident Engineer.

Notwithstanding the immense cost and care bestowed upon this really excellent work it is said to now show signs of failure at the base. Dover is an example of a very expensive structure, in point of fact unequalled by any other breakwater construction in the world. Mentioning Dover brings prominently to mind the fact that the authorities themselves appear at length to have arrived at the same conclusion, and that they seem to be holding their hand awaiting some new development of engineer-

ing skill. For a long while Government has entertained the idea of building another breakwater at Dover in order to make it a harbour of refuge. Plans and estimates have been submitted during the past fifty years by such very eminent engineers as Mr. James Abernethy, Mr. Michael Scott, Mr. James M. Rendell, Mr. William Cubitt, Captain Vetch, R.E., Mr. Charles Vignolles, Lieut.-Col. Harry D. Jones, Sir John Rennie, and others. Yet not one of these plans has been considered suitable, and the matter still remains in abeyance, partly from the want of suitable material in the neighbourhood, partly from the great cost attending the preparation of foundations fit to support a superstructure capable of standing the action of the waves. The estimates which have been sent in vary from Colonel Jones's 1,100,000*l.* to Mr. Cubitt's 5,000,000*l.*

The breakwaters at Tynemouth are other instances of the destructive action of the sea, even at a depth of 12 ft. below low-water level, on small rubble supporting a high superstructure. These breakwaters, which are perhaps unequalled as monuments of engineering skill and perseverance, are formed of concrete blocks of peculiar shape built on shore and thoroughly well aired before being lowered by very powerful "Titans" (designed by Mr. Philip Messent) on to each breakwater, where they are set in position by divers. The operation is very slow and costly. The work was begun more than thirty-five years ago, and is not yet finished. Up to 1879 the north pier cost about 160*l.* per lineal foot, and the south pier about 75*l.* The north pier has a length of 2,900 ft. The breadth at the bottom is 52 ft. and 35 ft. at the top. Their height varies from 53 ft. to 61 ft. From time to time great damage has been wrought to their respective bases during heavy gales.

For the Holyhead breakwater an abundance of stone of excellent quality for the work was obtainable at the quarries on Holyhead mountain only about a mile off. The design adopted for the breakwater was that of a rubble base with a superstructure on the harbour side of the mound, springing from low water level, the building being a sea harbour wall of masonry composed of large blocks of stone set in lime mortar. This seawall not only provides an upper roadway or promenade at the top, which is 21½ ft. above high water, but also shelters the quay level, which is 11½ ft. below the upper level. The quay has been formed by the deposit of suitable small material on the mound above high water level between the sea and harbour walls. The breakwater has an average depth of 40 ft. and extends into a maximum depth of 55 ft. with a slope on the sea side of about 12 to 1 between high and low water, 5 to 1 from low water to a depth of about 12 ft., and about 2 to 1 from thence to the bottom. On the harbour side the slope is about 1½ to 1 throughout. The total amount of stone in this stupendous mound is 7,000,000 tons. Holyhead breakwater was begun in 1849 and finished in 1873, at a cost of 1,285,050*l.* As the length is 7,800 ft. this gives 163*l.* 10*s.* as the cost per lineal foot. The cost of a bay of 30 ft. of the staging alone amounted to 586*l.* 10*s.* The charge for the maintenance of the mound has hitherto been very slight for the most part. At the extremity, however, the mound tends to travel round the head and is not quite stable. It has, therefore, been found necessary to protect the rubble slope for the last 200 ft. on the sea side near low water mark. This was first attempted by throwing down concrete blocks; but, as there was no adequate machinery for depositing the blocks, they got broken by the fall. Eventually old chains, amounting in weight to 1,000 tons, were placed in long coils upon the foreshore. By their weight these chains keep the foreshore from shifting, while, at the same time, they do not offer a solid face to the blow of the waves. A breach occurred in the breakwater last November by which some hundreds of tons of work had been displaced, and it is now very liable at any time to suffer considerable damage.

The breakwater at Wick is yet another example of the rubble base with block and concrete superstructure. It was begun in 1863, and in 1867 the pier had been advanced about 820 ft., while the rubble base was carried some 230 ft. further. The first material damage sustained occurred in December, 1868, when the outer portion of the superstructure was seriously damaged—the whole of the foundation up to a level varying from low water-mark to 10 ft. under it being uninjured—but the rubble base had, in some parts, been washed down to about 15 ft. under low water; in 1869 the damage had been repaired and reconstructed in cement, and in 1870 a severe storm occurred and a length of 360 ft. was damaged seriously. In 1871 about 30 ft. of the outer end was damaged; large blocks were built on the beach of cement rubble of from 70 to 100 tons each, and floated out by barges at high water, and deposited on the rubble base in advance of the proposed forward work. In 1872 further damage was sustained, and Mr. Rendell, being called upon to examine and report, attributed the failures of the work in 1868 and 70 to its want of "sufficient unity." In December of that year it was again attacked by a storm of great fierceness. Once more the storm in December, 1872, though not so disastrous from a pecuniary point of view as the storms previously experienced, was far more serious as regards the character of the damage done. The end of the work was protected by large blocks of 80 to 100 tons deposited as a foundation by three courses of large stones carefully set in cement, and the whole surmounted by a large monolith of cement rubble weighing upwards of 800 tons. This block was built in situ and, as a further precaution, iron rods of 3½ in. diameter had been fixed in the uppermost of the foundation courses of cement rubble, carried through the three courses of stone work by holes cut in the stone and finally embedded in the monolithic mass forming the upper portion of the pier. Yet the whole of this enormous work, weighing not less than 1,350 tons, succumbed to the force of the sea. During the course of the storm it was actually seen, from an adjacent cliff, to gradually slew round beneath the force of successive wave strokes until it finally tumbled over into the bay, where it has since rested.

Another example that will be taken of an existing breakwater is that of Aberdeen. This was begun in 1870 and finished in 1873. Its length is 1,050 ft., and it is 35 ft. wide at the head of the roadway, having a uniform batter of 1 in 8. The landward end for 500 ft. in length towards the sea is founded on rock, and the remainder on a bed of boulder clay, which had been covered with a thin layer of stones and sand. Of course the sand was cleared away in order to secure a solid foundation before the works were proceeded with. The manner in which the natural inequalities of the foundation were overcome was by levelling up with a deposit of concrete in small bags, on which blocks of Portland cement were built without being cemented. These blocks, weighing from ten to twenty tons, were carried up to a uniform level of 4 ft. 9 in. above low-water spring tides, except at the seaward end, where they were terminated at 9 in. above low-water spring tides. The blocks are composed of one measure of Portland cement, four measures of pit sand, and five measures of stones. The concrete superstructure, 18 ft. in height, was built over the blocks in frames, in situ, a large number of blocks being incorporated with it. The superstructure is composed of 1 measure of Portland cement, 3 measures pit-sand, and 5 measures of stone or sbringle. An apron of concrete deposited in bags lies at the bottom along a part of the sea or east side of the foundation. It commences about 600 ft. from the shore, or about 100 ft. from the rock foundation, is then carried round the head of the breakwater, and returned along the harbour side for 110 ft. There are two rows of piles along the breakwater, placed at 18 ft. apart. Each pile is 2 ft. in diameter and

passes through the whole depth of the work. The piles are stepped into iron shoes at the foundations, and, where they pass through the substructure, are surrounded by blocks moulded to the form of the piles, the junction of the blocks being formed at the middle of the pile. The upper foundation courses of blocks have sustained damage along the whole length of the breakwater on the sea face, and along a part of the harbour face. The holes excavated in the upper courses have hitherto been repaired at low-water spring tides by filling up with small bags of concrete, and finishing the surface with a facing of Portland cement mortar. These patches have stood well, with the exception of the repairs at a point 500 ft. from the commencement of the breakwater. The breach at this point was further repaired during the summer of last year. These repairs, however, again gave way last winter, and the breach was enlarged by successive storms from the north-east to the dimensions noted in reports of February 6, March 10, and May 18. The survey made on February 6 showed the hole to be 22 ft. in length by 12 ft. deep, extending along one row of blocks, or 8 ft. into the breakwater; the survey of March 10 showed an increase to 72 ft. in length by a depth varying from 4 ft. to 12 ft., with part of the inner row of blocks removed; and on May 18 this breach formed a cavern 90 ft. in length by 12 ft. deep, and 23 ft. into the breakwater. On examination of the breach by divers, the foundation of small bags of concrete, on which the blocks rested, was found to be removed from under the blocks to the seaward of the hole for a length of 18 ft. The superstructure was split vertically 150 ft. along the middle of the breakwater over the hole, forming a separate mass of 2,500 tons weight, which rested as a flat arch entirely on the blocks at each end of the breach.

Mr. Smith, the resident engineer, explains this disaster as follows:—

"I am of opinion that the concentrated waves from the north-east, coming upon the junction of the rock foundation with the stratum of stones on boulder clay at this point, in a depth of 13 ft. at low water, swept over the concrete in small bags, relieving the concrete blocks from the weight of the superstructure. At low water the top of the breach was exposed to the air, the sudden compression of which, by the water flowing after the wave again covered the entrance, blew out by its explosive force the blocks on both the harbour and sea face of the breakwater."

The superstructure was also damaged on the sea-face close to the lighthouse tower, a breach being formed 54 ft. long by 22 ft. deep, and about 4 ft. into the breakwater. At a point on the sea face 100 ft. landward from the tower another breach was made, extending partly into the base of the superstructure and the upper course of blocks. The blocks composing the substructure are clipped and abraded on the sea-face, especially near the level of low-water. The piles where they pass through the superstructure have been eaten away by the sea-worm (*teredo navalis*), leaving spaces 2 ft. diameter between the blocks. The cost of repairs was estimated at 17,000*l.*

A great advance was made in the construction of breakwaters in the case of Wicklow Harbour Works. Mr. William George Strype, M.Inst. C.E., there adopted for the first time the bold method of erecting a seawall, in a very exposed position, by means of concrete entirely laid *in situ*. The following is Mr. Strype's own description of the method of construction as given in that gentleman's evidence before a Committee of the House of Commons:—

"We claim that the system we have adopted in the construction of the Wicklow works is a novel system. I have prepared a diagram that will show the Committee the system of construction that has been adopted there. In other ports, such as Newhaven, and I believe also in the exposed work at Fraserburgh, the part below water was laid by means of concrete in bags; the concrete is put in long bags contained in hopper barges. The hopper barge door is slipped, and the concrete bags drop to the bottom. These are piled upon each other and raise the structure to low-water

mark. At Wicklow we adopted no such expedient as that, but in constructing the work we first formed a great central staging on which the engine, the waggon, and the cranes ran. That was extended in advance of the work to about half the length of the breakwater, and the staging trestles secured by means of a pad of concrete, which is shown upon figure No. 1. We deposit a pad of about 70 or 80 tons of concrete; No. 1 shows that pad. We carried the trestles thus secured by pads of concrete (as will be seen by this elevation) a long distance in advance of the general progress of the work. As soon as the staging was secured by this means, we deposited a great mound of concrete, which is shown in figure No. 2. Figure 2 shows the mound of concrete, representing about two-thirds of the volume of solid structure below low water. That great mound steadied the staging considerably, and also admitted of very rapid progress in the construction of the works. We were able during the construction of the mound to lay about 2,000 tons a week, and for a little while that is considered a very remarkable pace at which to lay concrete. Upon the mound we added an outside deposit of concrete to the form of the breakwater, as shown by figure No. 3, by means of a panel rendered heavy so as to make it sink. We raised this deposit to within 3 ft. of low water line. The difficulty with this system of construction is more when you get near to the level of low water. At low water the disturbing waves are apt to wash the cement out of the concrete before it sets. By putting our inner stretch of panel within 3 ft. of low water we are able to deposit or form the first profile toe, as shown in fig. No. 3, to within 3 ft. of low water. As soon as that sets, which it does in a day or two, as shown in fig. No. 4, we put a panel from that above the level of high water, and then lay a further portion of the profile. For that further portion we select very calm water, so as to avoid disturbance of the work. That is the most trying part of the work while the structure is being formed, as shown in fig. No. 4. We carry up the inside to the height of low water. As shown in fig. No. 5, the work being over low water mark is quite easy, and figure No. 6 shows simply the building of superstructure, which can be readily accomplished. The volume of the breakwater is about forty cubic yards per foot run, and the cost of the work which we paid is 17*s.* 3*d.* per cubic yard, so that it comes to under 40*l.* I am satisfied we could carry out this work in water 20 ft. deep, by making modifications in the system. We found the least loss of timber and the least loss of concrete in every part of the work until we got within 3 ft. of low water. Up to 3 ft. of low water no trouble existed; we never lost a single cubic yard of concrete in that lower work, and the work was frequently visited by storms, and we frequently deposited concrete with a wave of 3 ft. undulation."

The author thinks that without wearying the meeting with any further examples (many more could easily be cited), a sufficient case has been established to show that the present system of breakwater construction is thoroughly inefficient. Even with the most generous exchequer to carry out designs and plans in the future he maintains that both money and time will be again spent in vain, and that fresh failures will result, unless a totally different system of construction be adopted.*

NOTES.

THE Railway Rates Inquiry terminated quietly last week,—so far as the examination of witnesses is concerned,—and the recommendations of the Commissioners will now be awaited with interest. Evidence was taken at the concluding sitting concerning a number of articles which had been reserved for further consideration,—a curious medley, comprising hay and straw, flowers and fruit, hardware (in detail), and telegraph wire and poles. There have been eighty-five sittings in all,—so that the inquiry has occupied just about two-thirds as many days as did the Parnell Commission; and Lord Balfour of Burleigh and his colleague, Mr. Courtney Boyle, have conducted it throughout in a most praiseworthy manner. It was once remarked of a Colonial Railway Commission that "the real value of the Railway Commissioners to the country depends on their ability to free the department from the trammels of 'use and wont,' and to conduct its affairs on common-sense and business lines." In this country "use and wont" in railway administration represents the result of long experi-

ence, our railways being happily free from the red-tapeism which would probably have fettered them had they not been the outcome of independent enterprise. Still, there is room for expansion and reform in some directions, and there is the possibility of "precedent" being too slavishly respected; and this Inquiry affords scope for selecting and adopting the best of the various suggestions offered, even though such a step may be somewhat of a departure from the old lines. It is too much to expect the result to be satisfactory to everybody, but we hope that the Commissioners' decisions will, in the main, commend themselves to the business instincts of the commercial community.

ALMOST an entire sitting of the London County Council last week was occupied by an academic discussion of the licensing proposals of the Government contained in their new Budget and Local Government Bill. The discussion was made on a motion by Sir T. Farrer, condemning the proposals, and asking for a petition to be presented against them. Such waste of time as this is lamentable. The Council is essentially an administrative body, and it is absurd to have a kind of second-hand Parliamentary debate on a question which not only affects the whole country, but is one of more interest to the small towns and rural districts of England than to the Metropolis. All moderate men desire to see the London County Council carry out their work with success, and it is, therefore, grievous to know that by such debating-society talk as this the Council discredits itself, and weakens its authority and position.

THE last issue of the "Antike Denkmäler" of the Berlin Archaeological Institute completes the first volume of the new series. It contains two plates, with accompanying text, of special interest to architects. The first of these is devoted to plans of the Cloaca Maxima, from the Forum Augustum to where it falls into the Tiber. To this work we have already referred. How little has been up to this time known definitely of this Cloaca may be seen by a comparison of the present plan with the account in "Jordan's Topography of Rome," l. i. p. 447. The Institute owes the plan to Signor Narducci, and its previous publication has been prevented owing to a scheme for publishing collectively the whole drainage system of Rome, from ancient down to modern times. As the Cloaca Maxima is of special importance for the study of ancient topography, archaeologists will welcome this separate issue. The second plate (38) contains coloured facsimiles of archaic architectural fragments, in which distinct traces of colour remain. They are fragments attributed to the archaic Temple of Athene on the Acropolis. The lion heads, which serve as spouts, are crudely coloured—the hair blue, the eyes a bright emerald green. They are clearly analogous in style to the lion head spouts of the Temple of Zeus, at Olympia. The third plate gives the most beautiful reproduction we have yet seen of one of the most richly painted of the archaic Acropolis statues. How difficult it is adequately to reproduce the delicate yet rich effects of this colouring may be seen in the disastrous recent attempts of the "Ephemeris." Plates 44-46 should be of interest in England, as, among other fragments of painted terra-cotta sarcophagi, they reproduce some that are now in the British Museum. These Clazomena sarcophagi, which have excited so much attention, are now divided between museums at Constantinople, Smyrna, Berlin, Vienna, and London, so that to bring them together is of great advantage.

DR. WALDSTEIN'S third lecture on recent excavations in Greece, delivered at the Royal Institution on Saturday last, was the most interesting of the three, and it is not often that so much of history and so much of "higher criticism" is condensed into an hour's lecture. The lecturer gave a short

* To be continued.

but admirably-expressed criticism on the distinction between the characteristics of the art of the great Attic period and that of the later period and of the Græco-Roman school: the former showing that precision and distinctness of aim and idea which belonged to a complete school, and especially the clear perception of the relation between the subject and the means of execution: while in the later schools we found attempts to give to sculpture an expression and a treatment essentially pictorial. The latter part of the lecture was occupied with a brief review of the work done in recent years in Greek exploration; but the point of most interest in the lecture, as referring to a great future chance of discoveries as yet almost unattempted, was in regard to the work which might be accomplished on "Delphi's sacred side," if only the required funds were forthcoming. The site of Delphi is now built over by the village of Kastri, and the Greek Government has very rightly made it a condition of granting powers to excavate there that whoever undertakes the work shall find funds for fully compensating the expropriated inhabitants, or providing them other residences. Under these conditions it is estimated that it would be useless to commence the work unless 20,000*l.* were first collected towards it. The American School at Athens has the claim to the concession up to October of this year, and if they are not by that time in possession of the necessary funds, we gather that the concession will be open to other claimants who may be able to provide funds. There may be a chance in that case of England, either through her Government or through some wealthy Englishman or group of Englishmen, doing something to recover the ground which she has rather lost of late years in the honours of successful exploration. The attempt would be well worth an exceptional effort. As Dr. Waldstein observes, what might not be found at Delphi?

THERE has recently been published a little pamphlet called "On Principle Strikes," by Mr. J. S. Ransome, containing four sketches which originally appeared in the *Alobe*. The author does not improve his chance of success by a title which at first sight puzzles rather than enlightens the reader. But the publication is nevertheless apposite: its object is "to point out how little the real interests of the working-man are studied by the leaders of the present-day unions." In order to do this, sketches are given of typical persons engaged in strikes. The third sketch is that of "The Shop Lawyer,"—in other words, the talking leader, who gradually stirs up discontent, and then gets the men to come out on strike. In this, as in the other sketches, there is a good deal of truth; but, like many sketches with the brush, these with the pen are somewhat over-coloured. Yet this is in many ways just the kind of literature to bring home some truths to the mind of the working-man. The "shop lawyer," whose object is to help himself personally as much as to assist his fellow-workmen, and who hopes to turn into a salaried Trades Union delegate sooner or later, has done much harm; and the general body of workmen is too much under the control of a despotism of Trades Union officials. Mr. Ransome's sketches will expose the true character of some of the persons engaged in strikes, and cannot fail to do good.

THE current volume (Vol. XCIX.) of the "Minutes of Proceedings of the Institution of Civil Engineers" contains an interesting paper on "The Water-supply of some Italian towns," by Mr. A. F. Bruce, Assoc.M. Inst. C.E. The author states that the city of Venice was for a long time entirely dependent for water-supply on the rain which fell within its own area, collected in cisterns in the piazzas and courts. This being found inadequate, in the sixteenth century the Seriola Veneta Canal was constructed, the water being brought thence into the city by means of

boats. As time wore on, this source too was found to be insufficient, and in 1883 the new works were finished, which now form the main supply of the city. These consist of a number of comparatively shallow artesian wells sunk into a water-bearing stratum, near the village of S. Ambrogio. The supply pipe is capable of delivering 3,000,000 gallons per day, or twenty-two gallons per head, which the author says is nearly three times the quantity considered sufficient in Venice. Filter beds have also been constructed at Moranzani in order to utilise the water of the Seriola, if required. Genoa was entirely dependent on its own internal resources for water-supply until, in the fifteenth century, the Government constructed a masonry aqueduct, which conveys the water of the Bisagno from a point ten miles from the city and 500 ft. above the sea; its tributary, the Concasca, was afterwards connected by a branch. This aqueduct is still utilised, though its dilapidated condition permits the escape of considerable quantities of water along the route. Mr. Bruce estimates that of the 4,000,000 gallons admitted daily, only about 3,000,000 gallons actually reach Genoa, and owing to the aqueduct being partly open (and to other causes) fruitful sources of pollution are created. About twenty years ago an additional supply was obtained from the River Scrivia, near Busalla, by means of an infiltration gallery, which is said to be able to deliver nearly 12,000,000 gallons daily. The works of the Gorzente or Deferrari-Galliera Company are of still more recent date. "They have their source at the Torrent Gorzente to the west of Genoa, where there is a storage reservoir holding about 220,000,000 gallons." About 13,000,000 gallons daily are capable of being delivered. In addition to these sources, an English company has commenced to make works in Genoa, which, when finished, are expected to yield another 4,000,000 gallons daily from the Bisagno and Concasca basins. Rome is said to have inherited from the most ancient times the best water supply in Italy. At present the city "receives water from four aqueducts; three of these are of great antiquity—namely, the Vergine, Felice, and Paolo; and from a more modern, or rather an old work reconstituted, called the *Aequa Marcie* or *Pia Aqueduct*." The three former yield nearly 34,000,000 gallons daily, whilst the latter is capable of delivering 19,750,000 gallons, together making about 200 gallons per head, which is truly an enormous quantity. Most of the houses have cisterns containing 400 to 500 gallons. Leghorn derives its water from an old aqueduct from Pisan Hills, which only delivers 3-20 gallons per head per day. Turin merely gets a daily allowance of 6-75 gallons per head, whilst Florence has about 20 gallons, and Naples 44 gallons. The author says that "work can be done in Italy at prices which, with the exception of ironwork, are considerably below those ruling in Great Britain, owing chiefly to the cheapness of labour; a mason receives about 3*s.*, a quarryman 2*s.* 3*d.*, and a navvy 2*s.* per day. . . . Good hydraulic rubble masonry can be built for 8*s.* 6*d.* to 12*s.* per cubic yard; ordinary excavation costs about 8*d.*; rock, 1*s.* 6*d.* to 2*s.*; and tunnelling, 3*s.* to 4*s.* per cubic yard." Perhaps the most striking part of Mr. Bruce's paper is the table at the end, showing the sources of supply of the chief towns in Italy, the quantity of water supplied, cost of works, &c. It seems almost incredible that civilised communities like those of Leghorn, Turin, and many minor places can put up with such comparatively small supplies as from 3-20 gallons to 6 or 7 gallons per head per day, especially when we consider the nature of the climate. Yet such is the case, and bearing in mind the fact that in many large towns the drainage is also very imperfect, it is not to be wondered that the "fair cities of the south" are not always as salubrious and health-giving as they might be. Without an adequate and wholesome water-supply and efficient drainage, it is impossible to successfully cope with the zymotic and other diseases which so often

appear in towns along the borders of the Mediterranean, impeding commerce, and dealing destruction and desolation on all sides. When will the people be sufficiently educated to perceive this?

IN looking through a list of some sixty reports on technical matters sent in to the Ministry of Public Works of Berlin, by the six technical attachés of the different Embassies at Vienna, Paris, Rome, St. Petersburg, Washington, and London, we find that Great Britain has been treated by far the worst, the attaché stationed here having only sent in two* papers as against twenty-two sent in on French affairs, and the fourteen and twelve sent in respectively from America and Russia. We do not know if there be a dearth of material for technical reports on our Island, which has caused this minimum quantity of "report," or if the fault perhaps is to be found somewhere else; but it appears that the authorities at Berlin do not consider the English post worth its cost, and have made known their intention of withdrawing it,—a great pity, we venture to say, as it is quite certain the right man might be able still to find a thing or two in the country which would interest his countrymen.

IN October last an international competition was opened at Lausanne for a collection of buildings in which the public library of the Canton, the academy, assembly rooms for scientific purposes, and halls for several collections were to be placed; the site chosen for this erection being a most ideal one, situated on an incline, topped by the cathedral and overlooking the Gulf of Geneva. The "programme," which was compiled in a most thorough way by an international jury which was elected especially for the purpose, showed that three prizes of 12,000, 8,000, and 5,000 francs were to be given away, and that the amount at the disposal of the Town Council for the carrying out of the project was 3,000,000 francs. The members of the jury were Professor Auer, of Bern; the architect of the New Law Courts at Leipzig, Regierungsrath-Baumeister Ludwig Hoffmann; Professor Lassius, of Zürich; the City Architect of Lyon, M. Hirsch; and the architect of the new Sorbonne at Paris, M. Nônot. On the 22nd inst. the jury came to the unanimous conclusion that none of the designs merited the first prize; that the second should, however, be awarded to M. André, of Lyon, and the third to M. Demierre, of Paris, whilst the 12,000 francs due to a first prizeman should be divided among the owners of the four designs next in order of merit. These four designs were by Messrs. Legrand & Leroy, Paris; Kuder & Mueller, Strassburg; Recordon, Lausanne; and Hadberg, Berlin.

THE picturesque old town of Hildesheim is undergoing changes which may be necessary from the inhabitants' point of view, but some of which will probably be regretted by visitors. It appears that an extensive restoration is going on among the old timber houses so abundant in the town; and an entire renovation of the old "Rathaus" is being gone through, the new decoration of the great hall, with its timber roof, its interesting woodwork, its frescoes (which are still being worked at), and the Town Council's room, with the adjacent Mayor's study, being especially remarkable. Among the public buildings completed within the last few years, the new railway station and the new post-office, both of brick, may both be considered worthy of note, and among those still in course of erection, the public slaughter-house is certainly worth a visit. The rebuilding of the Government House (Regierung) is perhaps the most interesting work at present being done in the town, not only on account of this building showing a practical plan and some interesting German

* One on hospitals for infectious diseases; the other on the burning of the petroleum ship *United* in Bristol Harbour.

Renaissance elevations, but also on account of the rebuilding being cleverly carried out in three portions, one after the other, without materially disturbing the business routine of the house. This building, the west gable of which is one of the few pieces of architecture bearing the "F.III." of the deceased Emperor Frederic (who reigned ninety days), is now nearing its completion, and will, when finished, cover some 25,000 square metres of ground, having cost nearly 35,000*l.* Among the new private houses which are unhappily finding their way in between the picturesque old ones are several fine shops and a new hotel.

THAT unique little capital, Brunswick, in which one finds the picturesque old work, the palatial Renaissance of the public buildings, and the work of the present day so well blended together, now boasts of a restoration of the main part of the old "Burg Dankwarderode," the castle hall of which, finely situated in close proximity to the Dom, showing a strict German Romanesque exterior, has been pretty well entirely rebuilt, and is now nearing its completion. Among the public buildings of the town finished during the last few years the New Museum is certainly worth mentioning, especially on account of the good planning of the whole, and the picture-gallery in particular, and the monumental design of the façades; whilst among those buildings still on paper the new "Stadthaus" and the new railway-station may be noted, especially the latter, which is now under consideration, and for which much preliminary work will have to be done before a decision can be arrived at.

THE alterations which are to be carried out by Mr. Rowland Plumbe at the London Hospital, by the recommendation of Dr. Louis Parkes, extend to a complete remodelling of the sanitary arrangements, at an estimated cost of 7,000*l.* New drains are to be laid, the present imperfect soil and waste pipes, sinks, &c., removed, and two turret blocks, cut off from the wards and bedrooms by ventilated corridors, will be built upon advanced hygienic principles for the general purposes of the hospital. The new buildings comprise a central block, 80 ft. wide, and projecting 50 ft. towards the road, thus affording a covered approach for vehicles from the street. Medical baths, store-rooms, and students' lavatories will be fitted in the basement, and on either side a students' waiting room, with rooms for the nurses and for patients on reception and examination. The chapel, on the first floor, will give place to a new operating theatre, capacious enough for 250 students, standing on platforms ranged in form of an amphitheatre. This theatre is to be two floors in height, lighted and ventilated in the roof, and will be supplemented by a new theatre, 40 ft. by 23 ft., for clinical instruction, to receive 150 students. This hospital was built in 1752; it has been considerably enlarged from time to time,—by a south-west wing for 100 beds in 1830; in 1840 by a south-east wing for seventy-four beds, reserved to Jews; and by the "Alexandra" wing, for seventy beds, in 1864; and, in 1876, by the "Grocers" wing, opened by the Queen, the accommodation being thus raised to a total of 776 beds.

PLAS NEWYDD, close to and overlooking Llangollen, is about to be put up for sale by auction. A residence of the late General Yorke, C.B., who largely added thereto, the original cottage was built in 1778 by Lady Eleanor Butler and the Hon. Sarah Ponsonby. Their retirement here, as the "Ladies of Llangollen," has been described by Madame de Genlis. Dying in 1829 and 1831 respectively, they are buried in the parish churchyard. The cottage was next tenanted by their no less eccentric imitators, Miss Andrews and Miss Lolly. This property, which covers about 11 acres, is situated near to the Cistercian Abbey of Valle Crucis, and the well-known vale of the

river Dee; it includes another house, newly built in the same style as that of Plas Newydd.

A ROOM at Messrs. Dowdeswell's is now devoted to an interesting exhibition of Indo-Persian pictures and manuscripts. There are only a few manuscripts, the majority of the exhibits being pictures, chiefly portraits and figure subjects. Many of these are marvels of careful draughtsmanship and detail, and the borders of gold and colour, which in a few cases surround them, are very fine, particularly beautiful examples being (2), (17), and (28a). Others are mounted on a sort of marbled paper touched up, or rather powdered, with gold. Although good in themselves, they rather detract from the importance of the portraits, none of which are on a large scale. The clever way in which large masses of figures are grouped is well shown in (10) a "Fight on the Banks of a River," and again in one of the manuscripts (2) illustrating the wars of Mahomet. There are a few strictly architectural subjects in the collection, the best being (5) "The Iron Pillar," a view looking across the court of the mosque of Kubul Islam; (15) "The Tomb of Shekh Salim, at Fathpir Sikri," the white marble of the tomb contrasting well with the warm colouring of the pavement and surrounding buildings; and (35) a careful drawing of the Emperor Humayan's tomb, with the Jumma river in the background,—the warm, clear atmosphere very skillfully suggested without an appearance of hardness. The view of Mecca (89) suffers from bad perspective, and both it and 73 are poorer in colour than those already noted; 31 has a richly decorated architectural background, but most of the backgrounds to the figure subjects are treated in a simpler manner, the decorative detail being lavished on the costumes and the carpets on which the figures are seated. From a decorative point of view, in fact, the exhibition has its chief interest.

SANITARY CONGRESS AT LEAMINGTON.

ON Saturday last a large number of the members of the Association of Public Sanitary Inspectors of Great Britain attended the fifth provincial congress of their body, Leamington being the town selected for the meeting this year.

The proceedings commenced in the Town-hall, where, at 11 o'clock, the Mayor (Mr. John Fell, a well-known builder and contractor,) received and welcomed the visitors. It was not long ago, he said, when anybody could get an appointment as sanitary inspector. Sometimes army pensioners were found occupying the position, although they had absolutely no knowledge of the science required by the post which they filled. They had absolutely no idea of the importance of the duties they undertook, and did not realise their responsibilities. It was only when this Association and others like it began to be formed that sanitary science took its proper place, and the general public began to recognise the important status of sanitary inspectors; and no doubt they would shortly be recognised as a very much more important and influential body than they were regarded as being at the present time. It was certain that in trying to raise the dignity of their profession the general public would back them up.

The Mayor then left the chair, and in the absence of Sir Edwin Chadwick, President of the Association, Mr. Hugh Alexander, Chairman of the Council, presided for the remainder of the meeting.

Mr. Alexander, after thanking the Mayor for his hearty welcome, expressed the hope that he would find an opportunity of enunciating in the House of Commons his views on the importance of sanitary improvements. The Association had made great strides since its formation in 1833, having now 500 members, and it had accomplished a great work in the interests of public health. No body of men knew more about the requirements of sanitary science than sanitary inspectors. Among the things they had done was to propose a deputation to the President of the Local Government Board. Mr. Ritchie, however, preferred to have their views in writing, and the Council had submitted them. The Council, in their report, stated that

the conditions under which sanitary inspectors were appointed were inimical to the interests of the public health, these conditions being due to the defective state of the sanitary law in the following particulars:—

(1) That there is no statutory definition of the qualifications of candidates for the position of sanitary inspectors; (2) that there is no satisfactory provision as to tenure of office; (3) that inspectors are not empowered to initiate proceedings by serving notices for the abatement of nuisances, however urgent they may be; (4) that there is no prescriptive minimum salary; (5) that the officers employed are not uniformly designated. The Council found that the first four of these defects originated in the Nuisance Removal Act of 1855; that they have not been remedied by any of the numerous amendments to that enactment; that, on the contrary, they have been reproduced in the Public Health Act of 1875, and that in many districts they constitute a permanent hindrance to sanitary inspectors in the discharge of their duty to the public. The Council therefore recommended that the influence of the Association should be directed to secure the following amendments in the sanitary law:—

(1) That every candidate for the position of sanitary inspector should have a general knowledge of the building trade, and, in addition, should possess a certificate in sanitary science; (2) that sanitary inspectors should be elected to a permanent tenure of office, and should only be removed for misconduct or proved incompetence, with a right to appeal to the Local Government Board; (3) that it should be the duty of sanitary inspectors to periodically inspect the dwellings of the district to which they are appointed, and to receive complaints of nuisances, and serve notices forthwith, require all necessary work to be done for the abatement of the nuisances, such notices to be as valid as though served by the local authority's order; (4) that in all appointments requiring the officer's whole time to be given to the duties of his office, an adequate minimum salary should be prescribed; (5) that the officers, now variously named sanitary inspectors and inspectors of nuisances, be designated sanitary inspectors. No doubt, the Chairman went on, these recommendations have been pigeon-holed, but when the position of sanitary inspectors came to be considered by the Local Government Board, the views submitted in writing would have good effect.

Sir Edwin Chadwick, the venerable President of the Association, who wrote regretting his inability to attend the Conference, also contributed a paper (read for him by Sir Douglas Galton). In it the author urged the necessity for improved measures for the sanitary welfare of the police. In London the men were compelled, by small wages, to live in unhealthy houses, and Sir Edwin advocated the provision of model dwellings on a large scale for their accommodation, maintaining that this could be economically done. He also referred to the use of machinery for cheap washing with tepid water, and its successful introduction in the German and French armies. The cost of washing 100 men with tepid water in France by Mr. W. Bartholomew's "improved jets, up as well as down," is about 4*d.* Turning to the necessity for good sanitary inspection, Sir Edwin said the chief obstacle to securing it was the inadequate pay given to inspectors generally, and incompetence to apply the necessary mechanical improvements. He emphasised the necessity for establishing a central authority on matters relating to health and sanitation—an agency for collecting for its own guidance, and communicating to each local authority for its guidance, the principles deduced from the experience of all other places from which information might be obtained; and in conclusion said that to secure such a central authority a Minister who could guide and direct sanitation in all its departments was necessary, and an object towards which every sanitarian should strive. The fact that a Minister of Agriculture had been appointed should only render them all the more determined to add to the Cabinet a Minister of Health. To them, as sanitary men, in the most practical of practical senses, the appointment was vital. They and their labours would never be understood until they had such an official exponent of what they were and what they did in one of the houses of Legislature, and he urged them to organise and agitate for this much-demanded public department until the thing was done. It must some day be done, and for the Association to take a

prominent part in the struggle to get it done would be a lasting honour, and a firmer surety of continued respect and prosperity.

Sir Douglas Galton read a paper on "The influence of recent legislation upon the duties of sanitary inspectors." He said this was a very appropriate time for considering certain questions relating to the status of inspectors and their functions in connexion with the wide attention which had been given to sanitary work in consequence of the passing of many Acts of Parliament. It was to be regretted that some of the recent Acts obtained by local authorities appeared to be directed to the regulation of small details of construction or management, rather than to lay down general principles. These details would more advantageously have been embodied in by-laws, as they could then more easily be varied to suit the requirements of particular districts. What would seem to be required was that there should be a new general Act of Parliament, embodying the principles of the Act of 1875 and subsequent Acts, and further enabling rural and urban authorities to give effect to them by means of by-laws dealing with details, which might be revoked or altered to suit requirements as they arose. When the scheme of decentralised local government was complete the County Council should settle the by-laws for each district. The advantage of legislating by means of by-laws was that it was necessary that the sanitation of the country should keep pace with increasing scientific knowledge and the improved education of the community in their knowledge of the laws of health. Their acquaintance with the causes of epidemic disease was daily widening, and as the people were becoming better informed upon sanitary questions the arrangements which were essential to-day would be found antiquated and insufficient in a few years. The subject connected with public health which had most frequently engaged the attention of Parliament during the last thirty or forty years was that of the housing of the poor, no fewer than thirteen Acts having been passed in that time. The laws were now sufficient, if they were duly enforced, to prevent the more wretched class of house property from being occupied, but there were some potent causes operating to prevent the full application of the law. In some cases the owners of the bad property themselves held positions in connexion with Vestries or on Local Boards or the bench of magistrates, which enabled them to prevent the enforcement of the Act. There were other cases in which the Medical Officer hesitated to carry out the law because the persons turned out would have no place to take refuge in, and in such cases it was difficult to avoid the conclusion that if the law as to sanitary dwellings was to be fully enforced the local authority must step in in some form or other. Probably the best form of relief would be the provision of common lodging-houses on the Glasgow principle, with separate sleeping accommodation, but the use in common of the cooking, eating, and washing places for a small payment. This accommodation should be wholesome, but intended only as a temporary refuge, and such as would induce the occupants to find suitable dwellings elsewhere; and where such lodging-houses were provided, the Acts of Parliament against insanitary dwellings should be most stringently enforced. The provision of water for the purposes of drinking and cleanliness had also been before Parliament several times. The Rivers Pollution Act was the most important of eleven passed during the past forty years, but it had never been adequately enforced. Streams and water-courses were still being polluted by refuse of various kinds, but very scanty efforts were made to prevent the evil. Manufacturers treated the rivers worst, and many streams had been allowed to become no better than foul sewers. On these two questions—the housing of the poor and the purifying of our water-courses—practical action was urgently needed. Another important matter was the compulsory notification of infectious diseases. The few local authorities that had decided to adopt the recent Act were governed by good sense. Its general adoption must necessarily lead to more systematic treatment of disease. Turning to the Local Government Act, 1888, which created the County Councils, he said it made an important advance towards systematising the sanitary administration throughout the country. Of the importance of bringing the sanitary administration of the counties to

a focus there could be no doubt. It might be said that as a rule the towns were well administered, but if they examined the Registrar-General's returns they would see that, while the death-rates of the urban populations had decidedly diminished within the past fifteen years, the death-rate of rural populations had remained stationary; and yet a large proportion of that rural death-rate arose from zymotic or preventable disease. The diminished rate in towns was the result of the careful system of sanitary administration, whilst the stagnant condition of things in the rural districts was mainly due to an absence of desire for good administration. The owners of property, often members of sanitary boards, had not encouraged the sanitary inspectors to bring forward cases of defective water-supply, or the prevalence of any other insanitary conditions which would involve them in expense, and it was upon this account that he looked upon the provisions of the Local Government Act as a most important advance. It empowered the Councils to appoint Medical Officers of Health, who would study the reports sent in by the district officers of health, and be able to advise what steps should be taken for preventing the pollution of streams, and, where necessary, for compelling local sanitary authorities to enforce the Public Health Acts. With the increased vigilance then enforced on all public bodies, the functions of the sanitary inspector would extend, and in proportion as the public were better educated in the laws of health, so would his duties become more onerous. He also desired to say a few words as to the qualifications of inspectors. He had had some opportunity of considering this question in connexion with the examinations held by the Sanitary Institute, which had passed hundreds of candidates. They had been asked to embrace in the examination a knowledge of building. When they looked at the large number of subjects which constituted the special business of the sanitary inspector, and which he should know thoroughly, he doubted the wisdom of requiring him to learn matters which more properly appertained to the duties of a clerk of works or Borough Surveyor. The subjects on which he must have sound knowledge were so extremely important, and in the cases of many of those who presented themselves for examination had been so little mastered, that he hesitated for the present to extend the examination to any subjects which would divert attention from more essential studies. With the recommendations of the Council as to securing stability in their appointments, remuneration, and retirement, he thoroughly agreed. Their position and duties were most important. They were the duties of the practical prevention of disease. The inspectors had access to every household, and they could point out beneficially many matters of insanitation before they had culminated in the production of fever or some other danger to health. If they performed these duties earnestly, strictly, and honourably, they would help to educate the public in sanitary knowledge, and thus obtain the esteem and retain the confidence of the public.

Subsequently, Mr. W. de Normville, C.E., the Borough Engineer, read a short paper describing the sanitary arrangements of Leamington, and the visitors during the day inspected the waterworks and the sewage works.

The English Iron Trade.—As was to be expected, business in the English iron trade is as yet very quiet after the holidays, and the market has not gained in strength. There has only been sparse buying of pig-iron, and, where any orders are taken, they are at lower figures than those quoted by manufacturers. There is very little demand for Scotch makers' iron, which is irregular in price. The hematite market in the North-west looks, on the whole, more cheerful. Although hematite warrants are 9d. a ton lower compared with last week, makers are holding more firmly to their present quotation of 57s., while a week ago they were selling, in isolated instances it is true,—at 54s. Manufactured iron is still dull, and prices are again lower. Steel has somewhat improved as regards inquiry, but values do not rise, the tendency being still the other way. Ship-builders are booking a few fresh orders, but the general situation remains unchanged. The same may be said of the engineering trade.—*Iron.*

Illustrations.

FEVEREY, SHROPSHIRE.

HIS house is being erected for Sir Offley Wakeman, Bart., on an estate near Beschurch, and is being built of local red sandstone and English oak, and covered with green Westmoreland slates, the chimneys being partly brick and partly stone.

The house contains on the ground-floor large living-ball, out of which open drawing- and morning-rooms, boudoir and billiard-rooms, and a small private chapel. Beyond is a business room, and the usual housekeeper's-rooms and kitchen offices, and, in addition to the principal and servants' stairs, there is also one for the family use, the staircases and principal rooms being finished in wainscot.

On the upper floors are some thirty bedrooms, grouped together for the convenient accommodation of guests, the family and nurseries, the men - servants, maid - servants, and stranger-servants.

The garden front, with terrace, faces nearly due south; the stables lie to the north-east, and the kitchen - gardens to the west; the main entrance being on the north, and the family one on the south.

A long, low stone house has been aimed at, with some half-timber work on the south front only.

The builder is Mr. John Bentley, of Waltham Abbey, Essex; and the clerk of works Mr. Urwin.

The gardens and grounds are being laid out by Mr. H. E. Milner.

The drawings illustrating the house are hung at the Royal Academy. Mr. Aston Webb is the architect.

LEEDS AND COUNTY LIBERAL CLUB.

This building, now in course of erection, provides for an increase of membership, which has caused the premises now held by the Club to be inadequate for the comfort of those using it. Its position is in the very centre of the town of Leeds, opposite to a site recently acquired by the Postmaster-General for the erection of a new post-office. The materials of which the building will be erected are, for the exterior, red and buff bricks and terra-cotta dressings, covered with green slates. The interior will be finished with some degree of elaboration with hardwood staircases and general joinery, and a considerable extent of ornamental plaster-work. The architects are Messrs. Chorley & Connon; the different builders as follows:—For terra cotta, Mr. J. C. Edwards, of Raubon; brickwork, Mr. Charles Myers; joiners' work, Messrs. Tomlinson & Sons; plumbing, Mr. J. Lindley; ironwork, Messrs. C. Anty & Co.; slating, Messrs. Sharp & Harper; plastering, Mr. T. Moore; and painting, Messrs. Jackson & Co.; all of Leeds.

The drawing from which the illustration is taken is in the Royal Academy Exhibition.

SCULPTURE AT THE ROYAL ACADEMY AND THE SALON.

The four sculpture subjects given in this number, from works exhibited at the Royal Academy and at the Paris Salon, are all referred to and described in the first article of the present issue.

Scottish Properties for Sale.—At the Mart, on June 24, (1) Durris, on Deeside, Kincardineshire, extending over 17,000 acres, whereof 8,000 are arable, and yielding a net rental of 9,000l. per annum. Durris parish lies on the river's south bank, and slopes upwards to a ridge of the Grampians, where Lord Peterborough laid out some extensive plantations of larch and Scots fir; (2) Dunalastair, with some adjoining estates,—20,000 acres in all,—situated in the Rannoch district of Perthshire, in the Lyon and Tay watershed, between Loch Tummel and Loch Rannoch, famed for its sporting advantages, and the Peak of Schiehallion. On July 22, (3) Ballalulish, on the western coast of Argyll, being 6,000 acres, mostly pasture, with the slate and granite quarries at the foot of Ben Naveay. In Ballalulish lies the Levin Loch, whilst but four miles distant lies the Pass of Glencoe; and (4) the whole of the river Thurso, in Caithness-shire, from its rise to the North Sea, well frequented by salmon, and the neighbouring grouse-moors (40,000 acres) of Braal, Dalnawallan, and Strathmore.

THE ARMOURERS' COMPANY EXHIBITION.

By the kind permission of the Armourers' Company we are enabled to give sketches of some of the chief objects in the Exhibition of Metalwork held in the Company's Hall, to which we referred in a "Note" last week.

THE INSTITUTION OF CIVIL ENGINEERS.

At the concluding ordinary meeting of the Session, on Tuesday, the 20th inst., Sir John Cooke, K.C.M.G., President, in the Chair, the Paper read was on "The Keswick Water-Power Electric-Light Station," by Messrs. W. P. James Fawcett and Edw. W. Cowan, Assoc.-M.M. Inst. C.E.

This was believed to be the first attempt to utilise available water-power in this country for the purposes of a public supply of electric light. Early in last year, the directors of the Keswick Electric-Light Company instructed the authors to prepare plans, and to procure tenders for the erection of a central supply station in or near Keswick. As the area proposed to be lighted was large and sparsely populated, it was seen that the only feasible system to adopt was an overhead high tension one. The alternating-current transformer system was finally selected, and a site on the River Greta, about 2 miles from Keswick, was chosen for the erection of the station, the river being here available at 20 ft. head. The saving effected in using this water-power was considerable. The rent paid for the water was 10s. per horse-power per annum. Taking the number of horse-power hours required per annum as 100,000 for the present output of the station from a 50-horse-power turbine, the cost per horse-power came out as 0.06d. On the other hand, taking the price of steam-coal at 15s. per ton, and the quantity burnt per horse-power per hour as 6 lb., the cost per horse-power hour came to 0.48d., or eight times the cost of the water-power. In addition to this, the attendance required for a turbine was, of course, less than that necessary for a steam-engine and boiler; the first cost, maintenance and depreciation, were also considerably less, and the chances of a breakdown much less likely. As there was a possibility of partial failure of the water-supply during extreme drought in summer, it was decided to provide steam in addition to water-power. The turbine was of American design, and was called the "Victor." It was of a "mixed-flow" type, the wheel being 20 in. in diameter. Its speed was 273 revolutions per minute; this was at least 70 per cent. greater than the speed of an "inward," an "outward," or a "parallel-flow" turbine would have been, working under a similar head. Its design was exceedingly compact, and the regulation, which was effected by opening and closing a cylindrical sluice working between the guide-passages and the wheel, was

all that could be desired. As the turbine was 16 ft. above the level of the tail-race, a draught-tube was necessary to give full effect to the head of 20 ft. This draught-tube was of wrought-iron, 14 ft. long and 3 ft. in diameter. The maximum velocity of water flowing through it was a little over 4 ft. per second. The engine was a Westinghouse of simple type, having two single-acting cylinders, 10 in. in diameter by 9 in. stroke; it gave with 50 lb. of steam, at 350 revolutions per minute, 50 H.P. brake horse-power. The floor-space taken up by the engine was 7 ft. by 4 ft. The boiler was a 20 nominal horse-power Hyde duplex, 4 ft. 6 in. in diameter, and 11 ft. 6 in. in height. Its working pressure was 120 lb. to the square inch. The alternator, which was designed by Mr. Gisbert Kapp, and manufactured by Messrs. Johnson & Phillips, the contractors for the electrical plant, was a 30-kilowatt separately-excited machine, giving an output of 15 amperes at 2,000 volts. Its speed was 750 revolutions per minute, and the frequency 75. The armature had a cast-iron supporting-ring, 28 in. in diameter and 2 1/2 in. wide, provided with six arms. The armature-core was of charcoal-iron strip, 2 1/2 in. wide, wound with paper insulation to a depth of 8 in. There were nineteen coils, each containing 100 turns of 0.072-in. wire, covered to 0.092 in. in two layers. The resistance of the armature, after working some hours, was found to be 7 ohms. The magnetic field consisted of twelve magnets on each side of the armature. The cores and pole-pieces were of wrought-iron, the yoke-rings of cast-iron. The former were cylindrical, 3 3/4 in. in diameter. The latter were 4 in. by 7 1/2 in. Each core was wound with six layers of 58 turns per layer, with 0.102 in. wire covered to 0.117 in. The total resistance of the field after working some hours was 11.2 ohms. At full load the energy of the field was 3 per cent. of the output of the machine. The framework was of substantial construction, and the machine, when running, was remarkably free from vibration. Its open design admitted of the free passage of air to the armature, which would carry 20 amperes without overheating. The magnets could be racked aside for access to the armature. The exciting dynamo was a 1-kilowatt machine of the gramme type, giving 10 amperes at 100 volts. Regulation was effected by varying by hand the resistance in the field-magnet circuit. Two circuits left the station, both of which were double-pole fused, and provided with double-pole switches and lightning-arresters. There were some special features in the method of carrying out the overhead mains. If wire of high insulation had been used, the expenditure would have been considerable, and it did not appear that any great advantage, other than increased durability of the mains, would have resulted. It was, therefore, determined to use a lower insulation for the mains, and to rely upon the points of support for insulation, also to use special arrangements for

cutting off all surface leakage where the wires entered the consumer's premises. The authors were not aware that attention had been paid to this point before, yet it would seem that in wet weather, upon a long line of overhead mains, even with the best insulation, the surface leakage, when high-tension currents were employed, would be considerable; and if devices were not adopted for cutting this off where the wires entered buildings, leakage to earth must result, which might be a source of danger as well as of loss. The mains at Keswick were being insulated from earth, and from each other, by oil throughout the system. The house leading-in wires were insulated with vulcanised india-rubber of the highest quality, and were threaded through a shackle oil-insulator, the wire being cemented in with Chatterton's compound. Such an arrangement should effectually cut off surface-leakage from the mains. The leading-in wires entered the roof through a stone-ware pipe, provided with a covering-piece to keep out rain and cover a reservoir of oil in the mouth of the pipe. The sizes of the mains were fixed for a current density of 500 amperes to the square inch. The fall of potential, between the generating station and the town, was only slightly above 1 per cent. at full load. Steel suspension-strand was used for supporting the mains for all circuits, consisting of three strands, each strand being 14 B.W.G., and galvanized. One short run of underground mains was being tried, the Brooks fluid-system being used. This system had much to recommend it; it was simple, cheap, and durable, and did not take long to lay down. The transformers were Kapp's patent, and they transformed the high-tension current of 2,000 volts to 100 volts. A double-pole, quick-make and quick-break switch, with double-pole fuse and lightning-arrestor, was used in the high-tension circuit with each transformer. Both the transformers and the switches were enclosed in cast-iron water-tight cases. A series of experiments had been made to test the efficiency of the machinery, with the result that the total efficiency of the generating-plant at the station came out at about 40 per cent. at 1/2 full load, and over 70 per cent. at full load. In connection with the arrangement of this central-station scheme, the authors had occasion to make a comparison between the illuminating power of the glow-lamp and gas; the results showed that the relative values usually given were misleading, and they almost invariably dealt with a standard London Argand, a burner seldom used for ordinary lighting. This burner was generally taken as giving from 15 to 16 candle-power for five cubic feet of gas consumed per hour; whereas out of a large number of ordinary burners taken haphazard, and tested where they were in use, in Chester, Manchester, and Keswick, at various times, it was found that the light given by five cubic feet of gas per hour was more frequently

equal to eight candles or less. This would show that, in practice, one 16-candle-power glow-lamp gave approximately the same degree of light as two ordinary burners, each consuming five cubic feet of gas per hour. This conclusion seemed to be borne out by the result obtained by Dr. Hopkinson, who, experimenting upon some ordinary burners, found the average candle-power to be 1.76 per cubic foot of gas. As regarded glow-lamps, Sir David Solomonson found that 100-volt 16-candle-power Edison-Swan lamps averaged 17-candle-power at 100 volts. The light had been received with great favour at Keswick, and already the demand was equal to the supply of the present plant. Supply was commenced at the beginning of the year, and the station had run without hitch up to the present time—a man and a boy being found sufficient for tending the machinery.

It was announced that the Council had recently transferred Messrs. A. W. D. Bell, J. S. Brown, M. Grant-Dalton, H. B. Harvey, G. R. Lynn, H. A. Purdon, and W. J. Wilson, F.C.H., to the class of *Members*; and had admitted Messrs. N. P. Anderson, H. T. Ashton, E. S. Burrough, P. V. McMahon, R. W. Newman, H. E. Newton, J. Perez-Seoane y Villalobos, W. J. A. Watkins, and C. E. Wolf as *Students* of the Institution.

The last ballot of the session resulted in the election of Messrs. J. B. Allott, W. P. von der Hörst, and T. H. Wickes as *Members*; and of Messrs. G. E. Abrahams, P. Allan, O. Archer, W. Banks, Stud. Inst. C.E., W. F. Barry, B. R. Beale, B.A., Stud. Inst. C.E., G. W. Budd, H. A. Caffin, Stud. Inst. C.E., G. B. Dunn, M. Elliot, H. T. Foord, Stud. Inst. C.E., H. Hinds, A.K.C., Stud. Inst. C.E., G. H. Holden, A. H. Kingsley, B.A., T. E. Laing, C. Law-Green, J. Lee, M.A., T. S. McCallum, H. W. Prince, Stud. Inst. C.E., H. W. Ravenshaw, A. Stewart, V. de Timonoff, and W. H. Todd as *Associate-Members*.

The annual general meeting, to receive the report of the Council, session 1889-90, and to elect the Council for the ensuing year, will be held on Tuesday, June 3, at 8 p.m.

THE EMPLOYERS' LIABILITY BILL.

The Joint Parliamentary Committee of the Institute of Builders, the Central Association of Master Builders of London, and the National Association of Master Builders of Great Britain, requested the Home Secretary to receive a deputation from the Joint Committee to lay before him the objections which the building trade, as large employers of labour, and specially affected by the proposed amendment of the law, entertain to the provisions of the Employers' Liability Bill. The Home Secretary has caused the following letter to be sent to the Secretary of the Institute of Builders:—

"Home Department, May 23, 1890.
Dear Sir,—I have laid your letter of the 23rd inst. before Mr. Matthews, and he desires me to say that, though he would have been glad to have conferred with the members of your Institute, yet he feels that under all the circumstances, and in consideration of the fact that the views of your Institute were fully laid before him last session, and are now present to his mind, no useful object would be served by his receiving another deputation on this subject at the present time.—Yours faithfully,

(Signed) R. RUGGLES-BRICE.
R. S. Henshaw, Esq."

THE ARCHITECTURAL ASSOCIATION VISITS:

NEW PRINTING-OFFICES IN BREAM'S-BUILDINGS.

The last of the visits for this session took place on Saturday afternoon, when a party of members of the Association, under the guidance of the architects, Messrs. Satebell & Edwards, paid a visit to the new printing and publishing offices in Bream's-buildings, Chancery-lane, of the *Field*, the *Queen*, and the *Law Times*, which are now almost ready for occupation, and will supersede the well-known building in the Strand.

No expense has been spared to make the new building structurally sound, and if the result externally is not an aesthetic success, the blame need not be wholly attributed to the architects. The site is a rectangular one, and has been almost covered with buildings, every part of which is thoroughly well lighted, and in this respect cannot be too highly commended.

Heavy machinery occupies most of the basement, whilst the ground-floor contains the publishing and general offices. The first floor is occupied by the manager's and secretary's offices and other centres of administration, including editors' rooms. The second and third floors contain large printing and compositors' rooms, with manager's offices, foundry, and other necessary departments in contact therewith. The walls of the workshops are lined with glazed bricks of varying colours, whilst the floors are covered with pitch-pine wood blocks.

The construction of the floors and also the roof is fireproof throughout. The latter is flat and is covered with Claridge's asphalt, which forms an excellent finish.

The front and side elevations are treated with Portland stone, relieved by Fareham red bricks. Messrs. Dove Brothers are the contractors for this carefully-planned and well-erected building. Mr. Fisk is the clerk of works and Mr. T. Pratt the general foreman.

"THE TIVOLI," STRAND.

The new building for the "Tivoli" Concert-hall and Restaurant, in the Strand, close to the Adelphi, has a frontage of about 90 ft. The buildings are of fireproof construction. The following description has been sent to us:—
"The elevation is after the style of the old houses in the market-place of Hôtel de Ville, Brussels, the pilasters in the front being composed of marble and bronze, and the front itself of Corsham stone."

The entrances to the concert-hall are on three sides of the building. The area is entered by a broad staircase, and is provided with three exits. The balcony is entered from the grand entrance-hall, and has two exits.

The first balcony is approached by a wide staircase, and also has two exits, the exit accommodation being equal to over 5,000 persons, whereas the actual seating accommodation is calculated at about 1,000, and the promenade, lounges, &c., about the same. On each tier ample space has been set apart for promenade purposes. The staircases throughout are composed of concrete, which is imperishable. On each level retiring-rooms for both sexes have been provided. The interior decoration is Indian in style.

Sprinklers on the non-automatic system have been placed over the stage, and are controlled by valves fixed near the artistes' door, where is also placed a hydrant, the whole being under the control of the fireman. The whole building is provided with hydrants. The artistes' rooms are well ventilated, and are fitted with every accommodation, the lady artistes being on one side of the stage, and the gentlemen on the other. There are two exits from the stage.

The restaurant consists of a buffet on the Strand level, the 'Palm Room' on the first-floor, the 'Flemish Room' on the second-floor, and the private dining-rooms on the floor above, with the kitchens and offices on the top floor. The restaurant is entered from the corner of the Strand and Durham-street by a grand staircase, and a lift enables diners to reach every floor without trouble. The floor of the 'Palm Room' will consist of tiles of marble. The dado, which is paneled, is also of alabaster and marble. The room was to be divided into sections (so as to partially screen each table) by carved figures representing Cupids driving swans, supporting real palms intermingled with leaves of bronze palms, the latter rising to the ceiling supports, and dividing the wall surface above the dado into panels which are filled with Venetian mirrors to correspond with the windows, but this design has been somewhat modified, the Cupids and swans being omitted. The ceiling is divided by groups of palm-leaves, forming pendants, from which hang globes representing the fruit of the palm, the ceiling being lighted from these points. The colouring will be enamel, ivory-white, and gold. The room is about 60 ft. long by 25 ft. wide.

On the second floor, the 'Flemish Room,' another large dining-room of the same size, is decorated in the old Flemish style with carved oak. The walls and ceilings are paneled in oak, with tapestry panels to walls and polished oak floor.

On the third floor are the private dining-rooms, decorated in the different styles: Moorish,

Whatever merit the *facade* might have possessed as an architectural composition is marred by the gigantic letters TIVOLI which have been fixed on the top story.—ED.

Japanese, Louis XV., Pompeian, &c. On this floor is also provided a Masonic Temple, decorated in the French Gothic style in paneled oak, with all the necessary ante-rooms. Each floor is provided with lavatory accommodation.

The electric light will be used throughout the entire buildings, although gas will be laid on for use in case of emergency.

The whole of the restaurant is heated by hot water.

The building has been designed by Mr. Walter Emden, architect; Messrs. Kirk & Randall are the contractors; Messrs. Heighway & Depree have executed the marble work and decorations, the sculptors being Messrs. Goyer, of Louvain; Messrs. Shand, Mason, & Co., the fire appliances, for which Mr. George Harrison, A.M.I.C.E., is the engineer; Messrs. Hackford & Farthing are the surveyors. The lifts are by Messrs. Waygood, the gas and special Indian gas fittings being by Messrs. Vanglian & Brown, the beating by Messrs. Cowan.

As to the heating arrangements, we may add that the diameter of the boiler is 40 in.; height 64 in. The number of "flows and returns" employed in this theatre is ten of each. The total number of feet of pipe used, exclusive of bends and elbows is 3,440 ft., of which 1,150 are 2 in., the remainder being 1½, 1, and 1 in. Of this quantity, 2,260 ft. is run horizontally. There are also heated by this boiler 41 radiators, containing 608 loops, each radiator averaging 14½ loops, and in height 36½ in. The system is a low-pressure one.

A PLEA FOR IMPROVEMENT OF SIX- AND EIGHT-ROOMED HOUSES.

SIR,—In these days of improved dwellings for the poor and superior planning of the houses of the rich, it seems inconsistent that the houses rented by persons of smaller means should be comparatively neglected. Houses of six and eight rooms are built on one stereotyped plan, and the sooner this is attacked and improved, the better.

As we judge of all things by contrast and comparison, I propose to do so in this case by examining the defects of the everlasting plan (fig. 1) upon which these small houses are erected. The door on one side, staircase beyond in centre of block, lighted by two square feet of glass over front door, and about 12 ft. distant; the room behind lighted by a hybrid French window squeezed into one corner, and looking down an alley overshadowed by back addition, making this (the usual sitting-room) so cheerless and sunless as to force upon us the remembrance of that dreary passage in Scott's "Rokeby,"—

"Although the sun was on the hill,
In that deep dell 'twas twilight still."

Then up the dark staircase we come to a drawing-room on first floor, a back-room in rear, and on second-floor two bedrooms and a sort of dressing-room. The back addition sometimes has a passage-way out to side alley, sometimes not; then come kitchen, with door opening opposite front door, that every one who calls may see what is going on; beyond, a scullery, and outside this a w.c. and dustbin, so that where there is a garden the scullery and water-closet have the privilege of it; the children being relegated to a sunless room, although air and sunshine are of vital importance to juvenile life. Above this block are frequently two rooms, one beyond the other, and one a passage-way to the other, that is to say, the privacy of each is destroyed; sometimes a bath and w.c. are provided on this floor. To this antiquated arrangement I propose an alternative, adding little to the cubic contents, but improving the distribution of the rooms; *vide* sketches (figs. 2, 3, 4, and 5). By any of these arrangements, the two best rooms in the house have the best outlook,—one over the road in front, the other over the garden (the usual position selected for a drawing-room). Neither of these rooms need be dominated or overshadowed by other parts of the building, whilst the working rooms (kitchen and scullery) have a central position, with side-alley set apart as a kitchen court, the staircase being lighted and ventilated by a tall window, which may also light the passage. If the tenants can afford it, the front room on first floor could be set apart for a drawing-room, and the room on ground-floor overlooking the garden might be used as an ordinary living-room, being bright and sunny and available for children, enabling the other

Fig. 1.
"The Everlasting" Plan.

Fig. 2.—Ground Floor.
Stairs lighted over Scullery.

Fig. 3.—Ground Floor.
Stairs lighted over China Closet.

parts of the house to be kept neat and tidy. On the first floor there can be four bedrooms, a bath-room, w.c., and rooms in roof. Again, if the tenant should sublet a moiety, the arrangement would be found most convenient, one family occupying the front portion, the other the back.

I appear not to be alone in this my advocacy for improved planning, as houses have been built something on this plan in several parts of London, and in neighbourhoods that are ripe for building they are taken with avidity. I have treated of houses of two and three stories only, without basements, as basements for such property are not popular.

Reference to the several plans will demonstrate the convenience recommended.

T. E. KNIGHTLEY.

106, Cannon-street, E.C., May 19, 1890.

ARCHAEOLOGICAL SOCIETIES.

British Archeological Association.—At the meeting of this Association held on May 21, Mr. J. W. Grover, F.S.A., in the chair, a series of flint implements found during the progress of sewerage works at Forest-gate and Wanstead, Essex, were exhibited by the chairman, among the objects being a singular flint knife, very smooth and thin. Two bronze celts were also exhibited, which were recently found near Mitcham Junction, 6 ft. deep in drift gravel. Mr. Macmichael described several articles of Roman fibulae wares which have been found in some excavation works in Bow-lane, among them being an almost perfect mortarium and a fragment of a very large vase of Upchurch ware. A paper was then read by Mr. W. J. Davis on an altar-slab which exists at Sheepscombe, Gloucestershire. After referring to many curious evidences afforded by ancient place-names in the locality he indicated their bearing upon the recorded history. Many of the old names are similar to those found in Scandinavia, and there are many indications of the presence of the Danes, Deadcombe being the site of a battle in which the invaders were routed. The Earls of Shrewsbury had an extensive mansion in the parish, and the altar-slab which formed the subject of the paper belonged to the private chapel of the mansion. This has long since been demolished, the ruins being used as a

Fig. 4.—Ground Floor.
Stairs lighted over Scullery.

Fig. 5.—Ground Floor

quarry. The slab is now built up over the door of a pig-sty. It bears an inscription recording that it was consecrated by Nicholas, who was Suffragan Bishop of Worcester, 1392-1421, and dedicated to the Holy Trinity and All Saints. In the discussion which ensued, Mr. E. Walford referred to the very few examples which remain

of inscribed altar-slabs. The second paper was by Mr. E. P. Loftus Brock, F.S.A., who described some curious features of Saxon architecture at Sterrington Church, Beds. The western tower has been found to be of Saxon work. This was revealed during the restoration of the church in 1872. Still more recently,

the Rev. J. R. H. Duke, Vicar, observing some indications of openings in the north and south walls (now within the later aisles), had the plaster removed, with the result that a south doorway has been found, and two windows played on both sides alike. In one of them a thin oak slah, in which an opening had been cut, still remains, but very greatly decayed.

Essex Archaeological Society.—On the 22nd inst. a quarterly meeting of the Essex Archaeological Society was held at East Tilbury. The visitors alighted at Low-street station (which is the site of the discovery of a Roman burial-place, whence many urns have been obtained), and drove to East Tilbury, where a meeting was held in the schoolroom. The Rev. H. J. E. Barter, the Vicar, read an interesting paper on the place and neighbourhood, with an account of the more recent discoveries and evidences of the remains of Roman and other early occupation of the district. Mr. F. C. J. Spurrell, the well-known archaeologist, also read a paper. East Tilbury Church, a highly-interesting structure, with Transition-Norman north arcade and early English chancel, was described. It suffered greatly by having been battered by the Dutch fleet which passed up the Thames in 1667, when the tower was destroyed, and, probably by the same attack, the south aisle of the Decorated period was demolished. In anticipation of the meeting, the Vicar had kindly caused the site of the tower and south aisle to be excavated, which had led to the discovery of their foundations. A visit was afterwards made to the Roman Causeway across the marsh to the margin of the Thames, which corresponds with Higham Causeway on the opposite side of the river. Extensive Roman potteries appear to have existed in this district. One kiln has recently been discovered close to the churchyard wall.—*Essex County Chronicle.*

Royal Society of Antiquaries of Ireland.—A largely-attended meeting of this Society (until lately known as the Royal Historical and Archaeological Association of Ireland) was held in the Town-hall, Kilkenny, on the 20th inst., Lord James Wandersford Butler, President, in the chair. The President, in his address, said it gave him much pleasure to preside at the first meeting of the Royal Society of Antiquaries of Ireland, a title which her Majesty had thought well to grant them, he believed, he might say, in consequence of the exertions made by members of the body formed in Kilkenny as far back as the year 1849 by his (the President's) brother, the late Lord Ormonde, who was aided by the late Rev. James Graves. Though not a native of the city of Kilkenny, he had resided there for a long time, and was deeply interested in all that concerned it, more particularly in the subjects which more especially concerned that society. Having touched on the objects and scope of the Society, he expressed himself as feeling peculiarly honoured by being chosen as the first President of the Royal Society of Antiquaries.—Twenty-five new members were declared elected.—Mr. Cochrane mentioned that he understood the Irish Government were bringing in a Bill to give them increased powers for repairs, and Kilmallock Abbey would be specially mentioned and specially dealt with. He hoped that before long the Government would take the Abbey in hand, but in the meantime they proposed to spend a little money on the place themselves.—The report on the matter laid before the meeting by the hon. sec. was unanimously adopted.—Mr. D. H. Creighton, hon. sec., read a list of objects presented to the museum, which included several articles of great interest.—In the evening a meeting was held for the reading of papers, and on the following two days there were excursions to various places of interest. We understand that the following resolution, proposed by Mr. P. M. Egan, seconded by Colonel Vigners, has been unanimously adopted by the Society:—

"That, in view of the announcement recently made that the Irish Government are at present engaged in drafting a Bill to amend the National Monuments Act and the Ancient Monuments Protection Act, 1882, the Council of this Society be requested to place themselves in communication with the authorities, and to point out the necessity that exists to make the proposed Act sufficiently comprehensive to enable the Government to take into its custody any church, monument, tower, or other building of a like character, and of archaeological interest, such as are scheduled in either of the above Acts, provided satisfactory title cannot be obtained. We trust the legislation on the subject will empower the Treasury to contribute an amount equal to the local aid for maintaining any monument which the Board of Works may approve of."

PROVINCIAL NEWS.

Billesdon (Leicestershire).—Mr. J. T. Harrison, M. Inst. C.E., an Inspector of the Local Government Board, recently held an inquiry at the "Castle," in Leicestershire, with respect to the application of the Billesdon Union Rural Sanitary Authority to borrow 6,203*l.*, for works of street improvement and storm drains. The money intended to be spent in making the storm drains is 1,266*l.*, and for street improvements 4,937*l.* Mr. J. B. Everard, M. Inst. C.E., of Leicestershire, produced plans, and explained the former, and Mr. William F. Ault, Assistant Surveyor to the Board, produced plans, and gave evidence as to the street improvements. There was no opposition.

Birmingham.—A large block of buildings, consisting of residences, and having a frontage of about 500 ft., is now approaching completion at Edghaston. The houses have good reception-rooms, kitchens, &c., entrance and back halls, and vestibules, bedrooms, bath-rooms, and other conveniences. They have large gardens both at front and back. The front elevation is Gothic in character, with bay windows, two-light windows above, with stone columns, arches, labels, and tympana. The total cost is about 10,000*l.* The architect is Mr. J. Statham Davis, and the builder Mr. Edward Airey, both of Birmingham.

Brighton.—An important addition to the sea-side improvements at Brighton, in the shape of a terrace, shelter-hall, and lift, were opened on Saturday last at the eastern end of the sea front. The erection of extra groyne, more especially a great groyne of concrete, has led to an extensive accretion of shingle, and has enabled the Corporation, who now own the foreshore, to lay down several grass lawns similar to, though not quite so large as those which flank the beach at West Brighton. The development of this undercliff roadway, known as "Madeira-road," has had the effect of making this part of the sea-front increasingly popular, so much so that the Corporation at last found themselves impelled to give effect to the suggestions that had been repeatedly offered to provide a shelter to a large portion of the roadway, and to afford some more ready means of reaching the top of the cliff than has hitherto been furnished by the long flights of steps which have done duty since the sea-wall was constructed, half-a-century ago. The work comprises a raised terrace, 1,304 ft. in length, projecting from the sea-wall and carried on massive iron girders supported by iron columns. This will serve as a promenade, and will also afford shelter for many thousands of persons. In the centre of the terrace a shelter-hall, reading-rooms, and lavatories have been provided, as well as a lift worked by hydraulic power, large enough to be used for the raising of handcars. The cost of the work will be about 14,000*l.* We gave a detailed description of the work in the *Builder* for May 18, 1889.

Bromley (Kent).—New baths, public hall, and theatre at Bromley, Kent, have lately been opened, so far as completed. The entire scheme is described as unique, the building being cut into a hill in the rear of the High-street, and 35 ft. below the level of the High-street, so that although the baths are under the theatre, the floor of the theatre is about level with the pavement in the High-street. The building is executed entirely of concrete up to the floor of the theatre. The total height of the building is 110 ft. by 55 ft. wide; the size of the bath is 80 ft. by 35 ft., and is lined with white glazed bricks. The floor over the bath is of compound iron girders, 250 lbs. to the foot, resting on 9-in. cast-iron columns. The whole of the ceiling upon the bath is rendered in Robinson's cement upon wirework, thereby making it fireproof. There is box accommodation for forty bathers, while the lavatory accommodation here, as in other parts of the building, has been carefully considered. The method of emptying the bath into the sewer is by a receiver, 30 ft. deep, below the bath, from whence it is pumped into the sewer. Machinery has been fitted for heating the bath to 70 or 75 degrees, pumping all the water-supply from a well which has been sunk upon the site to a depth of 300 ft., emptying the receiver into the sewer, in addition to heating the bath. This part of the work has been carried out by Messrs. Russell, of Oxford-street, W. The spacious hall and theatre, 80 ft. by 35 ft., is brick-built, lofty, and has a domed ceiling; the lighting and ventilation being by Messrs. Vaughan & Brown. The main entrance

from the High-street is by a wide corridor and crush room, 35 ft. by 22 ft., with efficient doorways to hall, with additional exit doors on each side, for which a verandah of iron has been erected at one side leading to the road and fields in rear of premises, all the doors being fitted with "panic" fittings. There is a large and lofty stage, with arrangements for working the scenery, and a fire-resisting curtain; while a large orchestra is provided at the other end to meet the requirements for orchestral entertainments, serving as a gallery during the theatrical performances; underneath this is a green-room, with exit doors at each end, the entire being rendered fireproof with Robinson's plaster on wirework. In connexion with the stage there is every accommodation for the artists, together with a large property-room under the stage. Fire-hydrants are provided in the hall, bath, and stage, and connected with the water company's high-pressure main. Mr. W. A. Williams, A.R.I.B.A., is the architect. The works were executed by Messrs. Thomas Gregory & Co., of Clapham Junction.

Gloucester.—On the 23rd inst. the foundation stone of the new municipal buildings for Gloucester was laid by the Duke of Beaufort, Lord High Steward of the City. The new buildings, which are expected to cost from first to last about 30,000*l.*, were designed by Mr. George H. Hunt, architect, London. The site, which was formerly occupied by Sir Thomas Rich's School, offered special difficulties to the architect, and though it was originally hoped that at least some portion of the existing building might be utilised, Mr. Hunt found this impracticable. In his design he placed the offices, for easy access and facilities of working, on the ground-floor; the Council Chamber and committee-rooms on the front part of the first-floor; and a public hall at a slightly lower level to the rear. The Town Clerk's, Surveyor's, Accountant's, rate-collectors', School Board, and other offices, are commodious, and Mayor's parlour, retiring-rooms, kitchen, and other departments are provided. The Council Chamber is 45 ft. by 31 ft., exclusive of a public gallery; and the public hall is 78 ft. by 40 ft., with a platform and gallery. The main front of the building is designed in a phase of the Renaissance style, and will be executed in stone; the floors in the entrances, halls, and gallery, in vitreous mosaic; the remainder of the galleries paved. The internal fittings will be of wainscot oak and red deal. We gave a detail elevation of the principal front, a perspective view, and two plans of the building, in the *Builder* for July 13, 1889.

Ipswich.—We are informed that a theatre is about to be erected by a new company in Ipswich, under the patronage of the leading men of the district. In the old theatre of this town David Garrick made his first appearance; and Mrs. Keeley, then Miss Goward, a native of Ipswich, began her dramatic career, whilst in later years Mr. J. L. Toole made his debut on its boards. Ipswich has greatly increased in latter years and has now some 60,000 inhabitants. The new theatre will be constructed to hold about a thousand people. The site is in the middle of the town, in Carr-street, which, under the town improvements, has been widened; it should prove an admirable site. The theatre will be fireproof, and will be lighted by electricity; it will also be isolated from other buildings. Mr. Walter Emden has been appointed architect, and Mr. Arthur Pearce, F.C.A., is secretary.

Manchester.—The new "Palace of Varieties," Oxford-road, Manchester, will soon have the Salvation Army for a very close neighbour. The opposite corner site to the above, facing Oxford-road, with 90 ft. frontage and the new 60 ft. thoroughfare called Whitworth-street, with 120 ft. frontage, has been secured by General Booth for close upon 15,000*l.* Preliminary sketches of the buildings proposed to be put upon the site,—viz., a large "citadel" accommodating 3,000 persons, temperance hotel, and several shops and offices, are being prepared by Mr. J. Williams Dunford, architect, of 101, Queen Victoria-street, E.C. The cost of the buildings will be about 12,000*l.*

Newcastle-on-Tyne.—The first contract in connexion with the erection of "Citadel" buildings in Westgate-road, Newcastle-on-Tyne, for the Salvation Army, has lately been let to Messrs. Middlemiss, Bros. of the same town, for 3,125*l.* The block comprises a large hall seating 3,000 persons, Divisional Headquarters, shop, and other usual appearances. The total outlay will be about 8,500*l.* Mr. J. Williams

The Student's Column.

ELECTRICITY, MAGNETISM, AND ELECTRICITY SUPPLY.—XXII. DISTRIBUTION—DIRECT SUPPLY.

IF a current C pass through mains of resistance R , and e is the electromotive force used in driving the current through them, then $e=CR$, and eC is the power absorbed for this purpose. If E is the electromotive force producing the current, EC is the total amount of power generated and $EC:eC=E:e$. The value of E may now be increased while that of C remains unchanged; this will increase the total power in the same proportion without in any way adding to that lost in the mains. The higher the electromotive force employed the better must be the insulation of the circuit, but it is much less costly to reduce the proportion of the loss in the mains by increasing E and improving the insulation than by using larger mains for the purpose of reducing R . In the various systems now adopted for the distribution of a large amount of power over extended areas, the one object kept in view is to avoid the necessity of carrying large currents for any distance. The descriptions of the various systems of distribution will be made shorter and clearer by supposing that small electric lamps only, requiring a constant E.M.F. of 100 volts, and a current of 0.5 ampere, are in circuit. When plant is used for which the E.M.F. or current must vary, special regulating devices have to be added to enable such modifications to be made without interfering with the rest of the circuit.

Fig. 58.

When none of the lamps are at a great distance from the generating plant, as in the case of a building which has its own engine-room, a dynamo-machine D , fig. 58, compound-wound to give a constant E.M.F. of 100 volts, is connected to the mains, and all the lamps, l , placed abreast between them.

Any lamp l_1 can be turned off by opening its circuit, without affecting any of the others, since the machine maintains a constant difference of potential of 100 volts between the points T_1 and T_2 . The current given by the machine is always proportional to the number of lamps in use, being 0.5 multiplied into this number, and since the E.M.F. is constant, the exact amount of power required for lighting is sent into the mains without waste. For a large number of lamps this arrangement, known as the Simple Parallel System, is impracticable: for, say, 10,000 lamps, 5,000 amperes must be passed through the mains from the machine, and though the distances may be small, the cost of the cables is prohibitory. As each lamp or group of lamps is passed, going along the mains, from the machine, the current becomes less, and the size of the conductor may therefore be reduced, but sufficient saving cannot be made to render the distribution of a large amount of power by this system a commercial possibility.

Fig. 59.

In a Simple Series System of distribution all the lamps are placed in series, as in fig. 59, with a constant current dynamo-machine. No matter what the number of lamps, the current never exceeds 0.5 ampere, and a lamp l_1 can be extinguished by a short circuiting switch S . On such a circuit it is the E.M.F. between T_1 and T_2 , which is proportional to the number of lamps in use, and, as in the previous case, the power supplied depends upon the lamps actually giving light. It will be seen, however, that should a lamp break, the current through all the rest would be stopped; a piece of apparatus called a "cut-out," for the purpose of automatically filling the breach, must therefore be

unford, of Queen Victoria-street, London, is he architect.

Oxford.—The Academy states that Mr. S. B. Vorthington, a member of the committee, is instructed to prepare plans for the new buildings of Manchester New College. The works re-estimated to cost 49,000*l.*, of which nearly three-fourths have been already subscribed. The College was founded in 1786, for "free-teaching and free learning in theology." After successive settlements at York, Manchester, and University Hall, Gordon-square, London, it has recently been removed to Oxford, where it is temporarily housed in the former quarters of Mansfield College, opened in October last.

Peterborough.—The Salvation Army has recently purchased a very prominent site in Cowgate, Peterborough, and intend erecting on it some a large "Citadel" capable of accommodating 1,000 persons, and two large shops. Mr. James Wenlock, builder, of Peterborough, has secured the first contract, but the main portion has not yet been tendered for. The architect is Mr. J. Williams Denford, of Queen Victoria-street, London. The scheme will cost about 5,000*l.*

Purley (Surrey).—The "John Bentley Gymnasium," in connection with the Warehousemen, Clerks, and Drapers' School at Purley, has been opened by Mr. S. Hope Morley. The gymnasium is the gift to the Institution of Mr. John Bentley, and has been built from plans prepared by Mr. J. Kingwell Cole, architect, London.

Ramsgate.—At a recent meeting of the Ramsgate Town Council, held at the Town-hall, the Mayor in the chair, the following recommendation of the Sands and Cliffs Approaches Committee was unanimously adopted:—"That Mr. W. A. Valon, C.E., Engineer to the Gas and Water Department, be appointed the Engineer to the Corporation for the purpose of preparing the plans and specifications to be annexed to the proposed agreement with the Board of Trade relating to the improvement of the sea-front."

The Committee recommended that the plans and specifications relating to the proposed front improvements, as now submitted by Mr. W. A. Valon, be forwarded to the Board of Trade for their approval. The improvements may be summarised as follows:—The north side of the inner harbour is to have a new sea-wall extending from the corner of Harbour-street to the West end, which gives an opportunity of building the front walls of the ornamental arches on the present wall of basin, and forms a good wide road in front of them. On their completion it is intended to clear away the Harbour-custos, Customs-house, and Harbour Master's-ouse at present in the Pier-yard, and throw it open to the sea, thus widening and improving the approach to the London, Chatham, and Dover Railway Station, making the road in one place 75 ft. wide. On the completion of his work the Albion Hotel will be removed, and a road formed rising at a regular gradient from Harbour-street, so that when the whole is finished there will be an easy and improved approach to both cliffs. By the deepening of the basin, coal vessels and merchant ships will unload alongside the New Military road and Cross Wall opposite, leaving that part immediately facing the hotels and streets clear for gentlemen's yachts. The total cost of the improvements, including compensation, but without recoupments, which will be considerable, amounts to about 65,000*l.*

St. Helen's.—The foundations for the new public baths here having been completed, the contractor, Mr. John Whittaker, of St. Helen's, has commenced to erect the building. Messrs. Thomas Bradford & Co., of London and Manchester, have the contract for plumbing, &c. The building contains a large swimming-bath, 100 ft. by 20 ft.; one for ladies, 8 ft. by 24 ft.; and thirty-nine private baths. The whole building is to cost 10,000*l.*, and is being erected from the design and specification of Mr. Geo. J. C. Broom, the Borough Surveyor. Mr. John Sadler, of Widnes, is the clerk of works.

Walsall.—Mr. W. H. Westwood, of the Gaiety Theatre, Walsall, is about to demolish his present premises and those occupied by Mr. J. Greenslade, outfitter, adjoining, and to erect a new and far more commodious theatre at the corner of Station and Park-streets. The auditorium of the new building will comprise stalls, pit, dress-circle, private boxes, and gallery, and is promised that from all parts of the house an uninterrupted view of the spacious stage will be obtained. Externally the building is stated to be an entirely new departure from the accepted forms of this class of structure, and

is designed in an adaptation of the Romanesque style. The wallings will be principally of red brick, plentifully relieved with stonework, and enriched with carving and sculptured Shakespearian figures, whilst at the angle of the two streets a large carved panel will represent a scene from "The Play in 'Hamlet.'" Towering above the roof at the angle of Station and Park-streets will be a lofty turret, partly covered with lead and copper, richly embellished, and with lunettes for electric light, and finished on top with gilded figures representing Painting, Music, and the Drama; these figures support a gilt canopy, surmounted with a high flag-staff. The side next Station-street will be of a plainer character. The ground floor of the building will be occupied principally by commodious halls, smoke-rooms, and their accessories. The total cost of the building and fittings, complete, it is estimated will be about 14,000*l.* The architect is Mr. Daniel Arkell, Birmingham.

CHURCH BUILDING NEWS.

Bournemouth.—Designs by Messrs. Cox, Sons, Buckley, & Co., have been approved for decorating the chancel of St. Michael's Church, Bournemouth, and the works are in progress under the superintendence of Mr. R. G. Pinder, F.R.I.B.A. The upper part of the east wall is to have a representation of the Lamb upon the Book with Seven Seals, and the four Evangelists. The retables is to be finished in gilt and colour. On the north and south sides of the chancel a procession of apostles, prophets, martyrs, and fathers of the Church, is to be represented, to embody the idea of the Te Deum. There will be emblems of the Passion near the altar-rail. Praise is to be represented by groups of angels above the organ-chamber, and other groups will occupy corresponding positions on the opposite side.

Heavitree (near Exeter).—The dedication of the new tower of Heavitree parish church took place on Saturday last. The new tower stands on the site of the old one. The latter was condemned some years before its demolition in 1887 as being unsafe; but it was found, after about 10 ft. had been removed, that the masonry was solid, especially on the south side. Mr. Phillips, of Exeter, the contractor, had to resort to dynamite in order to separate the masonry of the old pile, which was about 45 ft. high, and succeeded in doing so without serious injury being done to the church. In an open competition for designs for rebuilding the tower, the plans of Mr. E. H. Harbottle, architect, Exeter, were selected by Mr. Ewan Christian, of London, the adjudicator. From those plans the new tower has been built, in the Perpendicular style. The foundations are of concrete, and the tower is built of limestone from the Babbacombe Quarries, the main quoins being of Chudleigh limestone with Bath stone dressings. Great care had to be exercised in selecting the stone, some of the blocks being of exceptional dimensions. The height of the tower from the ground to the battlements is something like 101 ft.; the total height to the top of the vane is about 133 ft. Besides being an inauguration of a scheme for extending the church, the new tower is also a memorial of her Majesty's Jubilee. The foundation-stone was laid on August 28, 1888, by Lord Poltimore. The large west window of the tower is to be utilised for the erection of a memorial to the late Rev. R. Barnes, for many years the Vicar of the parish. The memorial is to take the form of a stained-glass window, the artists being Messrs. Clayton & Co. It is also intended to have a peal of eight bells put in the tower. There has not been a single accident during the progress of the work. Mr. F. S. Mitchell, of Heavitree, has acted as clerk of works; and Mr. E. T. Rogers, of Exeter, has executed the carving. The cost of the work is about 3,000*l.*

London Water Supply.—The Vestry of St. James, Westminster, have invited the other Vestries and district boards of the metropolis to appoint delegates to a conference shortly to be held for the purpose of considering the whole subject of the metropolitan water supply, and especially the desirableness of asking the Government to introduce a Bill (1) either to confer on the County Council power to acquire the present undertakings or to establish a competing supply; and (2) to require the water companies to supply water by meter at a fixed tariff.

attached to each lamp, and so run up the cost of the installation. Nor does a cut-out entirely get over the difficulty, for should it fail to act, or be tampered with, every lamp on the circuit would be extinguished; but, apart from these objections, the E.M.F. required soon renders this system impracticable, though with lamps of special construction taking a much larger current and a reduced E.M.F., it may sometimes be used with advantage for small straggly installations.

Fig. 60.

Fig. 61.

Figs. 60 and 61 need not be discussed at length, as they are modifications of figs. 58 and 59 respectively, in which groups of lamps, placed in series in the first case and abreast in the second, are substituted for single lamps. Both systems possess, to a less degree, the advantages and disadvantages of the single-lamp arrangements, but they also have this additional drawback, that, unless a whole group of lamps be turned off, no power is saved, although the wear and tear of the individual lamps turned off in any group may be thus lessened.

In fig. 60, if l_1 is simply open-circuited all the lamps in its group go out; if l_1 is short-circuited the remaining lamps in Group I. are submitted to the full E.M.F. of the mains, and the current through them will be excessive. To turn off l_1 , therefore, the current must be diverted through a path of equal resistance, r ; the rest of the lamps in the group will not then suffer, but as much power will be used in driving the current through the new path as was previously absorbed by the lamp.

In fig. 61, if l_1 is short-circuited, all the lamps in Group I. are short-circuited also; if, on the other hand, l_1 is open-circuited, the remaining lamps in the group have to divide the whole current from the machine among them, and their life is shortened. In this case also, therefore, an equivalent resistance r must be substituted, and power wasted.

Fig. 62.

The Three-Main System, fig. 62, closely resembles that shown in fig. 61; instead, however, of a single constant current dynamo-machine being used, two constant E.M.F. machines are put in series, and the intermediate main joined to their intermediate terminals. It would, perhaps, be more accurate to describe the three-main system as two complete parallel systems, machines and all, put in series, by which means one intermediate main is made to serve instead of the two in the pair of simple Parallel Systems I. and II. It will also be seen that if a third machine and group of lamps are added, only one additional main is required. If there are the same number of lamps in each group, no current at all flows along the main T_2 , but if a lamp l_1 is open-circuited, then a current of 0.5 ampere starts from T_2 along the main, as the current from Group I. falls short by 0.5 ampere of that required by Group II. The currents actually flowing in the case drawn are indicated in direction and magnitude by

arrow-heads, one arrow-head representing 0.5 ampere. If all the lamps in Group I. are turned off, then machine I. gives no current, and the main T_2 has to carry the whole of the current for Group II.

As it is not likely that all the lamps in one group would be turned off while all in the other would be on, the outer mains only need be of sufficient size to carry the maximum current. It is claimed, in America, that 60 per cent. saving over the simple parallel system has been effected by this means, but 40 per cent. is about what would be saved in this country.

Whatever system of distribution may be adopted the short leads to the lamps, no matter how they may be arranged, will be the same; in estimating the saving effected by any of the above systems over the simple parallel system the mains alone need be considered, and the relative costs can be easily calculated in the following way:—Measure up the length of main L in each case and find the maximum current C it will have to carry. If P is the amount of power allowed to be lost in distribution, a quantity which, for the sake of comparison, will be the same in each case, then $R = \frac{P}{C^2}$ is the resistance the mains may have. If ρ is the specific resistance of the conductor and s the cross-section, then, $s = \frac{\rho L}{R} = \frac{\rho L C^2}{P}$ and the bulk

of conductor used is $s L = \frac{\rho L^2 C^2}{P}$ but ρ and P are the same in all cases, hence the cost is proportional to $L^2 C^2$ or $(L C)^2$. The precise way in which L will vary can only be determined by actual measurement for each arrangement of lamps.

When distribution has to be made over wide areas, so-called "feeder-mains" or "feeders" are used. In any of the systems described above, except in the case of the simple series, a certain variation of E.M.F. is experienced by the more distant lamps as the currents in the mains rise and fall. If this variation is excessive, a feeder,—that is, a main from which no branches are led throughout its whole length—is taken from the supply station to a distant point in the circuit, and the distant point is kept at a constant potential. The far end of a feeder, therefore, acts like a little local supply station. A feeder-main is, in fact, rather a valuable adjunct to other systems than a system in itself.

VARIORUM.

We have received the first quarterly part of the current year's volume of the "Journal of the Proceedings of the Royal Society of Antiquaries of Ireland, formerly the Royal Historical and Archaeological Association of Ireland" (Dublin: Hodges, Figgis, & Co. London: Williams & Norgate). It is a very interesting number, and contains, amongst other illustrated papers, three which are of special interest, viz., (1) on "Celtic Remains in England," by Mr. John L. Robinson, A.R.H.A.; (2) on "The Ancient Chapter House of the Priory of the Holy Trinity, Dublin," by Mr. Thomas H. Drew, R.H.A.; and (3) on "Ancient Mural Inscriptions," by Mr. J. G. Barry. "Picturesque Wales," by Godfrey Turner (London: W. J. Adams & Sons, and Simpkin, Marshall, & Co.), is a sixpenny "handbook of scenery accessible from the Cambrian Railways," and although it is published mainly in the interests of the railway companies, and is therefore little more than a tourist's itinerary, it is clearly and pleasantly written, and, as far as we have examined it in detail (we have sampled a great many of its statements, and tested them by comparison with information derived from other and more pretentious handbooks, as well as from personal acquaintance with some of the places), it appears to be tolerably free from errors. In saying this, we must not be supposed to endorse all the archaeological theories which the author has adopted (with due acknowledgment in most cases) from other writers. Nor do we necessarily endorse the author's criticisms as to some modern buildings: it would have been more to the purpose if instead of amateur criticism of the style of important modern buildings of a public character he had recorded the names of their architects. Although Strata Florida is mentioned, there is no reference to the important excavations made on the site of the Abbey there within the last two or three years (see *Builder* for October 13, 1888, and May 4, 1889). The book

contains two or three maps of the Principality, and a great many wood-cuts of the picturesque scenery traversed by the Cambrian Railways. It is very nicely printed on good paper, and will be found exceedingly useful by visitors to those parts of Wales which are served by the Cambrian Railways.—"London in 1890" (London: W. H. Allen & Co.) is this year's edition of the well-known guide-book originally compiled by Mr. Herbert Fry. It is illustrated by two maps and by twenty bird's-eye views of principal streets and claims to be revised and corrected to date. These claims seem to be fairly well sustained, but we would point out that the correct official title of the body spoken of as the "Metropolitan School Board" is "The School Board for London." The book is also behind the time in saying that the "debates" of the London County Council are held in the Guildhall Council Chamber: they ceased to be held there nearly two months ago. In other respects the book is lacking in information,—for instance, there is no mention of Ravenscourt, Clissold, Waterlow, and Brockwell parks, four considerable additions to the public parks of London,—the first three of which have been actually acquired, while powers to acquire the fourth are being sought in Parliament by the London County Council. But the book contains a fund of information about London, and is copiously indexed. This is its ninth year of publication.

Trade Catalogues.

Messrs. J. Tylor & Sons, of Newgate-street send us the fifteenth edition of their Illustrated Catalogue (1890), now being issued. It differs from many other catalogues of the kind in being contained within a small compass, though it consists of 500 pages. It is well printed and illustrated, and provided with a convenient index. Its contents, we need hardly say, include descriptions of a great variety of articles required by architects, contractors, and house-owners. The "Compound" wash-out closet described on p. 118 has some good points, the force of the flush being exerted on the water remaining in the trap without change of direction; it is trapped above floor-level, easily cleaned, and available both as a urinal and slop-sink. The catalogue also includes some good lavatory and bath apparatus. The water-meters manufactured by the firm are fully described; they consist of the "Rotary," the "Positive," and the "Bascule," they have been extensively used for many years. The "Positive" meter registers with great accuracy, and the "Bascule" meter is designed to give a meter-supply at small costs to cottages, &c. It appears to be particularly well adapted to the supply of small communities in the East or other countries abroad. A great variety of pumping apparatus, suitable for both large and small supplies of water, is described, and to those engaged in the work of laying water-mains, a simple appliance, called the "Patent Elastic Clip," will be of interest; it is calculated to effect a great saving in men's time, and makes a perfect joint in less than half the time required when clay is used. Turner's apparatus for tapping mains under pressure (p. 453) is also well worth attention.—Messrs. John Gibbs & Son, of Liverpool, send us their new illustrated descriptive catalogue of warming and ventilating appliances (third edition) it will repay perusal. One of the illustrations is a section of the new wing of the Children's Infirmary, Myrtle-street, Liverpool, showing Messrs. Gibbs's combined system of warming and ventilating.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

8,961, Window Fastenings. E. Hauff. This invention consists in fixing upon the upper edge of the lower sash at the side a frame with two cheeks, with a pawl and spring so fixed, that it engages with a plate fixed on one of the upright side frames of the top sash. There are recesses in the plate, and to lock the device a pin is inserted in a hole on one side cheek to another cheek opposite side. The effect of this is that when the sashes are so fixed they can only be moved up or down together, and it is claimed to be a secure fastening.

9,305, Water-closet Basins and Traps. J. Johns.

According to this invention, a combined box up or enclosed water-closet basin and trap is made in two parts, capable of being detached. The top piece is formed with projecting flanges or lugs, fit with recesses or sockets on the piece on the underside. The two are then joined by screws, bolts, or cement.

9,760, Ceilings, A. Katz.

According to this invention, wires are stretched across upon the beams or rafters. Upon the wires are supported blocks or plates of papier maché, cement, plaster, &c. When the blocks are in place the joints are filled in, and the under surface of the ceiling is coated with a comparatively thin coat of plaster.

10,044, Warming and Ventilating. Reeve & Hatchell.

A filtering medium or baffle plate, a swing plate, and regulating valve are used by the inventor to check the heat, and when necessary these plates, &c., are controlled by counter-weighted levers.

10,120, Rising or Falling Hinges. S. H. Wormald.

The hinge which is the subject of this patent is composed in two parts, the parts which form the joint in each half being made so that when they are brought together they form two helical screws, and, so, so that it is impossible to separate one from the other, disposing with a centre pin. The half fixed to the door-frame remains stationary, the other half rising up on it.

10,348, Tipping Carts or Wagons. T. Hill.

In carts or vans which are mounted on side runnions, an improvement is effected by this inventor, who provides an elastic pedestal for the runnions, and an elastic buffer to support the forward part of the van.

MEETINGS.

SATURDAY, MAY 31.

St. Paul's Ecclesiastical Society.—Visit to the Churches of Stone and Northfleet. Train leaves Cannon-street (for Greenhithe) at 2.47 p.m.

Association of Municipal and Sanitary Engineers and Surveyors.—Lancashire and Cheshire District Meeting, to be held at Burnley.

Edinburgh Architectural Association.—Annual Excursion to Dunfermline, Inverkeithing, &c.

MONDAY, JUNE 2.

Royal Institute of British Architects.—(1) To receive the report of the Scrutinisers as to the election of Council, Standing Committees and Auditors, and to declare the names of those elected. (2) Paper by the Comptroller-in-Chief on "The Arab House in Cairo." 8 p.m.

Surveyors' Institution.—Annual General Meeting to receive the Report of the Council, and the Announcement of the Result of the Election of Officers for the ensuing year. 3 p.m. Annual Dinner, Holborn Restaurant. 6.30 p.m.

Society of Engineers.—Mr. P. F. Nursey on "Pick's System of Manufacturing Salt in Vacuum." 7.30 p.m.

Clerks of Works' Association (Carpenters' Hall).—Mr. T. Edmond on "Eddystone Lighthouse." 8 p.m.

Royal Institution.—General Monthly Meeting. 8 p.m.

TUESDAY, JUNE 3.

Institution of Civil Engineers.—Annual General Meeting to receive the Report of the Council and to elect the Council and Officers for the ensuing year. 8 p.m.

Society of Biblical Archaeology.—8 p.m.

WEDNESDAY, JUNE 4.

British Archaeological Association.—Mr. J. T. Irvine on "Bartholme Church, Lichfield, and its bearing on so-called Saxon Architecture." 8 p.m.

THURSDAY, JUNE 5.

Royal Institution.—Professor Dewar, M.A., F.R.S., on "Flame and Explosives."

Society for the Encouragement of the Fine Arts.—Third Conversation. 8 p.m.

Royal Archaeological Institute.—Four papers to be read, including one by Mr. H. S. Cowper on "Brasses in the Parish Churches of Willesden, Great Greenford, and Acton." 4 p.m.

FRIDAY, JUNE 6.

Royal Institution.—Professor W. Boyd Dawkins, M.A., F.R.S., on "The Search for Coal in the South of England." 9 p.m.

Miscellaneous.

"Fortis"—Under the name of "fortis," a new blasting agent is about to be introduced into practical use in this country. Fortis belongs to the class of high explosives, and was invented some three years since. As soon as the invention had assumed a practical shape, a factory was started at Herenthals, Belgium, where it can be turned out at the rate of about seven or eight tons per week. The powder finds in Belgium a ready sale with mine and quarry proprietors. It is composed of nitrate of potash, sulphur, tan, glycerine, and some few other ingredients, and is made of five different strengths and qualities to suit the varied requirements of mining. Fortis No. 1 is less strong than gunpowder, while No. 5 is equal in strength to dynamite. It was tested last year at the Bolehill Limestone Quarries, near Sheffield, by Mr. Perry F. Nursey, C.E., the results being in every way satisfactory. The modified action of the various numbers of the powder was demonstrated, and the strength of the powder of the quality suitable for limestone was shown to be about three times that of ordinary English blasting-powder. Its action on granite was successfully tried by Mr. C. Napier Hake, F.I.C., at the Mount Sorrel Granite Quarries, Loughborough. It was there proved that Fortis developed about two and a-half times the power of ordinary blasting-powder, the work being done in a very satisfactory manner. It would appear to be well adapted for all purposes of coal-mining, quarrying granite, stone, and slate, and it can be used with greater advantage and economy than gunpowder.—*Iron.*

The late City Architect of Glasgow.—The Council of the Glasgow Institute of Architects have agreed to place upon record their deep sense of the loss sustained by the city, the architectural profession, and the Institute, by the death of Mr. John Carrick, the Glasgow City Architect.

Smoke Abatement.—A meeting was held last week at the Mansion House, under the presidency of the Lord Mayor, for the purpose of bringing before the public the subject of smoke abatement.—Mr. Fred Scott, the secretary, read a number of letters of apology and sympathy with the object from noblemen and others, including the Duke of Westminster, the Earl of Rosebery, Lord Egerton of Tatton, Earl Percy, Viscount Cross, Lord Rayleigh, the Mayors of Manchester, Nottingham, Sheffield, and Leicester.—Mr. A. E. Fletcher, Chief Inspector of Alkali Works and Chairman of the Executive Committee for Testing Smoke-preventing Appliances, explained the objects the Committee had in view, which were, he said, to test the various known appliances thoroughly by going where they were in operation, and reporting on the kind of coal used and the conditions under which the appliances were used, and when they had found out all ascertainable facts, they would publish a report that would give all the information that could be required by any person who wished to rid his chimney of black smoke.—Lord Derby moved a resolution approving of the objects of the Committee, and in doing so said the diminution of smoke and the necessary accompaniment of dirt was a matter that concerned everybody. He wished he could say that it interested everybody. He regretted to say that it did not. Indifference was the real evil which they had to encounter. His lordship proceeded to point out the waste of coal itself that at present prevailed, and the injury to property caused by perpetual dirt; and in regard to the important subject of injury to health, he remarked that an oak would not flourish near London or Manchester or Liverpool, and he would leave them to judge if an atmosphere that killed an oak could be beneficial to a child. He believed that three-fourths or even nine-tenths of the smoke was absolutely unnecessary and preventable. They must produce a strong public feeling on the subject.—Lord Howard of Glossop seconded the resolution, which was carried unanimously.—Sir H. E. Roscoe, M.P., proposed, "That it is necessary to raise a fund to meet the expenses of this work, and this meeting pledges itself to use its best efforts to this end."—Earl Fitzwilliam seconded the resolution, which was carried.

Surveyorship, Chelmsford.—At a special meeting of the Chelmsford Town Council last week, the following letter was read from Mr. Charles Pertwee, the Borough Surveyor:—

"Surveyor's Office, May 12.

Dear Mr. Mayor,—I regret to say that, having lost nerve and vital power, I am compelled to seek, under medical advice, recuperation in rest and change of air. I intend leaving home to-morrow. My clerk, Mr. Mayhew, will attend the committee and other meetings in my absence, and render such assistance as, in conjunction with Mr. Batten, he may be able. I should be glad if you would ask the Council to take into their consideration the question of the relieving me of my official duties, as it is my intention, at such date as may suit the convenience of the Corporation, in the near future to place my resignation as Surveyor in the hands of the Council. At the same time I am most anxious, if circumstances permit, to complete the new water scheme, various details of which remain still to be carried out, so that the town may be in possession of the increased water supply so much needed.—I am, dear Mr. Mayor, faithfully yours, CHARLES PERTWEE."

—Councillor Chancellor said that this was one of the most important communications they had received for some time past. The office of Borough Surveyor had become very important, and he thought the time had now arrived when it should be looked at in all its bearings. He proposed that the matter should be referred to the General Purposes Committee, who should thoroughly thresh it out, and put before the Council some definite proposition.—The motion was seconded by Councillor Gepp, and carried unanimously.

Value of New River Shares.—Last week Mr. Bousfield (of the firm of Edwin Fox & Bousfield) submitted to auction at the Mart, Tokenhouse-yard, a King's freehold share in the New River Company. Not for three centuries had a King's undivided share been offered for sale, and the event naturally drew together a very large number of gentlemen. This share came to the market through the death of the late owner. The only guide to the value of the share was furnished by the sale in July last of an entire Adventurers' Share, which realised 122,800l. The bidding commenced at 80,000l., and went on slowly to 95,100l., at which price the hammer fell.—*Standard.*

Hucknall Torkard Drainage.—Some time ago (says the *Nottingham Guardian* of the 23rd inst.) the Hucknall Torkard Local Board invited competitive designs from engineers for dealing with the disposal of the sewage at the various outfalls, and for the best means of effectually treating the same. After considerable discussion the scheme submitted by Mr. Herbert Walker, Assoc.-M.Inst.C.E., and Mr. W. H. Radford, Assoc.-M.Inst.C.E., were selected for further consideration with the result that the scheme submitted by Mr. Walker was eventually selected by the Local Board. The system advocated by Mr. Walker is that known as the "international process," and consists of (1) the precipitation and deodorisation of the sewage by means of a magnetic precipitant and deodorant called "ferozone," which is produced from polarite by a chemical process; (2) the removal of the organic matter in solution, and the aeration of the tank effluent by passing it through a specially-constructed filter-bed containing polarite, a pure and absolutely insoluble mineral substance, very hard, porous, and absorbent. The sewage will be conducted into precipitation tanks of a capacity to suit the hourly flow of sewage. Immediately before entering the tanks the sewage will receive a dose of "ferozone" by means of a patent automatic sewage-mixer. After remaining in the tank a short time it will be drawn therefrom by a floating arm and conducted over the surface of the polarite filters. These filters are formed of 6 in. of broken stones (in which 4-in. agricultural drain-pipes are embedded), 3 in. of gravel, 6 in. of sand, 12 in. of sand and polarite in equal quantities, and 9 in. of fine sand, making a total depth of filtering material of 3 ft. The sludge deposited in the tanks will be inoffensive, having been deodorised by the ferozone. This sludge will be forced into filter-presses, and pressed into cakes ready for sale as a fertiliser. The effluent, after being passed over and through about four acres of land, will be conducted into the river Leen. Storm overflows will be arranged at various points, so that the storm-water will find its way direct into the river, and only the sewage will be conducted to the tanks for purification. The estimated cost of this scheme is about 4,000l.

Defective Sanitary Condition of Derbyshire Infirmary.—At a meeting of the Governors of the Derbyshire Infirmary, at Derby, on the 22nd inst., a report was presented from Messrs. Young & Hall, architects, London, who had been specially appointed to examine the building owing to the discovery of sanitary defects, which had led to an epidemic of typhoid fever amongst the nurses. The report disclosed a very serious state of affairs, the drainage being so bad that work was recommended which would cost 50,000l., and as an alternative the architects suggested the entire reconstruction of the Infirmary, at a cost of about 60,000l. The President, Sir William Evans, said all the in-patients who could be sent away had been removed, and no fresh ones were being admitted. A house had been hired for the nurses to sleep at, and a temporary wooden hospital had been erected in the grounds for cases of accident or emergency. It was proposed to erect hospital tents in the grounds for the treatment of those who could not be accommodated in the wooden building. A strong committee was appointed to consider the best course to pursue in this serious crisis. It was stated that the institution had been regarded as a model hospital. The older part of it was built about seventy years ago.—*Leeds Mercury.*

Discovery of Wooden Water-Pipes in Belfast.—While workmen were engaged excavating for the foundations of an addition to Messrs. Lindsay's wholesale premises, now extending from Donegall-place to Fountain-street, Belfast, they came upon a curiosity in the shape of a number of wooden water-pipes. The *Belfast Newsletter* says that the main pipe is in the form of a square log of solid wood. In the centre of this a round hole is cut, through which the water flowed. At several points in the main there are holes for the joining of smaller pipes, a number of which have also been discovered. The wood, which of course is in an advanced stage of decay, having, it is believed, been embedded since 1678, is a species of menul. It is assumed that these are some of the pipes which supplied the fountain which at one time played there, and from which the street took its name. Mr. Wm. McCammond, J.P., the builder of the new premises, transferred the find to the Museum.

Edinburgh Architectural Association.

Saturday afternoon last the members of the Edinburgh Architectural Association proceeded to Bathgate, and thence went to Bridge side, which they inspected under the leadership of Mr. Thomas Bonnar. In pointing out interesting features of the building, Mr. Bonnar described it as a Baronial mansion of a regality of Ogidale, in the parish of Torphichen, situated in a beautifully-wooded dell up from the Barhauch Burn, a small tributary of the Avon. The castle was originally of the L plan, but a smaller block containing a kitchen has been added to the south of the wing. It has been considerably altered from its original construction, and has been converted from a ruin into a comfortable mansion within the memory of living persons. The whole of the ground-floor vaulted in the larger block. On the second there is a kitchen with two bars, and on the first floor of the south or smaller block there is another vaulted kitchen with a fire-arched fireplace, having a recess at the end. After having inspected the building and other objects of interest, a cordial vote of thanks was accorded to Mr. Thomas Hope, of Bridge Castle, for his courtesy in permitting a visit. The party then proceeded to Torphichen, which Mr. Bonnar said was historically interesting from its association with the once powerful and famous order of military churchmen, the Knights of St. John of Jerusalem, who were also known as the Knights of Malta of Rhodes. The Preceptory at Torphichen as established by King David I., that "Saint for the Crown," and was by him richly endowed. Of the cruciform church of the Preceptory, the chancel and nave have entirely disappeared, and there is only left a portion of the transept or "quier," which is Early Second pointed in style, and the site of the nave is now occupied by an edifice of a very different character from it—the plain modern parish church. Mr. Bonnar briefly sketched some of the incidents connected with the order and its preceptors from the date of its establishment in 1153 until the final suppression and extinction of the Knights of St. John in 1560, when Sir James Sandilands, the last on the list of Grand Priors, became Protestant at the Reformation, and joined the Reformers, and was rewarded by his adherence to the new order of things by receiving possession of the remaining estates of the order for a payment of 10,000 crowns and small annual rent. He was also raised to the peerage under the title of Lord Torphichen. In the conclusion of Mr. Bonnar's remarks, a hearty vote of thanks was awarded to him for his interesting papers. The party afterwards proceeded to Lanlithgow.

Western Infirmary, Glasgow.

By the munificence of Colonel Horner of Mauldsheie Castle, a convalescent home, with land attached, situated in the Lanark district, has been given to the infirmary. The building in question was originally fitted, at a cost of 5,000l., for use as military store-house.

An "Art" or a "Profession" ?

It is gratifying to find that in spite of the rather illogical side issues which were raised at the penultimate meeting of the Architectural Association in regard to the educational programme that has been under discussion, the programme as in all essentials adopted at the last meeting of the Association. But while this subject of architectural education is prominent in the minds of those who are in earnest in the cause of architecture, it is a suitable time to suggest that there is a further side of the subject to be considered; not only how an architect is best to be educated, but for what he is to be educated. It is to be qualified to carry on a profession in the same sense that law, for instance, is a profession, or surveying; to look after the business and practical interests of those who consult him; or is he to be educated with the special view of evolving his artistic powers and perceptions for the production of buildings which shall be a contribution to the stock of artistic beauty in the world? On the spirit in which this question is regarded by the younger generation of architects the future of English architecture to a great extent depends.

There are not a few, on both sides of the question, who will be ready to answer it with no hesitation of any kind. On the one side there are those who regard architecture as a mere business of making plans and passing accounts, with (to quote an expression which is likely to become unhappily proverbial) "a little art added on, more or less." On the other hand there are those who regard architecture as a pure art, and who do not scruple to say that an architect "should have nothing to do with surveying," not by any means in any derogation of that profession, but because they would consider that the art of architecture in its highest sense is enough, and more than enough, for any man's intellectual energy, and that the division of aim between two occupations which, though often classed together, are so radically distinct in nature, is certain to lead to the inadequate performance of one or other of them. And in this case there is no doubt whatever which

side of the dual profession will be neglected. Surveying is a kind of work which must be accurate or it is nothing; but the accuracy or inaccuracy, the right or wrong, of architectural design cannot be logically demonstrated, and the client who will feel injured by a careless or incompetent survey will for the most part contentedly accept such architectural design as is offered to him. The inevitable result is that the "architect and surveyor" will tend continually to become less of an architect and more of a surveyor, and the natural consequence is the erection of buildings of mechanical and commonplace design, in which no one can take the slightest interest, and the combination perhaps of convenient plans with elevations which, as we heard remarked one day in regard to the successful design in a large competition, the best possible plan could not justify the erection of.

As to the wrong position of the first-mentioned party, of those who regard architecture merely as a business avocation, there can be no doubt whatever, unless the word architecture is to have a different meaning from that which it has hitherto borne in all history. The word has stood, in all time up to the present century, for the art of producing beautiful buildings with beautiful detail. It has nothing to do with business. There was a book published two or three years ago, an able one within its lines, entitled "The Consulting Architect," and one likely to be very useful to those involved in difficulties or disputes arising out of building operations, or those who might be called on to arrange such disputes. But the title of the book, as we ought to have pointed out at the time, was a complete misnomer. The architect, in the true sense of the word, has nothing to do with such matters. The book should have been called "The Building Arbitrator." As long as this merely business view of the architect's occupation is prevalent, so long shall we see the unhappy spectacle of buildings growing up in every street which are absolutely dull and commonplace; at the best, vain repetitions of worn-out and stereotyped forms; at the worst ugly, tawdry, and vulgar. It is under this "business" influence that architecture in the true sense has almost disappeared from our modern streets except in isolated instances, happily now a little more numerous than they were a few years ago. Public indifference is of course to some extent to blame for this. If the mass of the people felt the burden of this

architectural dulness and want of character as those few feel it who really care for architecture, it would be impossible for the "business architect" to go on; he would disappear by a process of natural selection.

The proposition of the opposite party is not quite so easily disposed of. We fear that some of those who say "an architect should not trouble himself with surveying" really include under that term whatever belongs to the practical part of building. That will never do; and perhaps there is hardly any one who would admit that view in so many words; but we are inclined to think that among the decidedly artistic section of the profession, among the younger men especially, some are too much inclined to practically adopt it, and to confine their interest entirely to design. To say that this is a mistake is not to call in question the supreme interest of the artistic element in architecture. It is only to say that architecture is not an art absolute but an art relative; it is artistic treatment in relation to certain practical conditions, or we might in some cases say, arising out of those conditions. The merely convenient planning of a house is not art; but after all questions of mere convenience are considered there is an artistic element in plan, and perhaps there can hardly be a really good plan which does not include the artistic element. Some of our best architectural designers are admirable planners, some it must be confessed are not; but the more frequent defect is to find those who can produce an admirable plan but who entirely fail to impart any artistic interest to a building, except that degree of artistic interest which is inseparable from a good plan, and who produce, as before observed, elevations the erection of which no plan could justify. So again with construction, which is so far from being in any sense a separate or antagonistic study to design, that in fact architectural design cannot be fully developed or appreciated apart from a perception of the constructive system which is its basis, and an architectural artist who neglects the study of construction is in fact only studying half his art. There are a small number of exceptional types of work, such as commemorative monuments, in which the importance of the constructive and practical element is reduced to a minimum, or at least becomes so simple a nature,—merely the provision for endurance in a structure not hampered by any restrictions as to plan,—that it almost

take care of itself, and the purely artistic element of design is left far more unfettered than it can possibly be in erections intended for practical use. But these are exceptional cases, and cannot be taken as in any way converting the general truth that the art of architecture must be treated in relation to plan and construction, and that the two elements are inter-dependent.

Assuming however that all whose opinion is of any value are agreed in thinking that architecture is art, and that artistic beauty is the principal aim of the architect, there may be and are differences of opinion among earnest men as to the means of developing and fostering the art of constructing with beauty. And it is in regard to these differences of opinion that the question of the direction of architectural studies in the future becomes important. Is the architect of the future to be a man in an office at a drawing-board, or a modeller and craftsman with a studio, or directing the work on the spot? There are those, startling as it may seem to men of the quantity-surveyor type of mind, who strongly believe in the transformation of the architect into the artist pure and simple, as the hope of modern architecture, and who think that no really living architecture will be produced until the drawing-board and the T-square have been eliminated. If we ask how the plan is to be made, they reply by asking if there is necessarily any occasion for drawing plans, and whether buildings cannot be set out on the spot. Those who are called practical men would of course dismiss this theory with a laugh; but those who know a little more than the practical man know that many of the finest buildings of the Middle Ages were in all probability set out on the ground without a full plan being drawn; and it is a fact that in modern times Pugin in some cases dispensed with either plans or elevations drawn out to scale, and made sketches with figured measurements. And if we take the plans still existing by Wren, or some of those of the Italian architects of the Renaissance which are in existence in various libraries, we find nothing that any modern contractor would estimate on or any modern quantity surveyor take quantities off. No more was done, in fact, than was just necessary to set the building out. The argument of those who wish to confine architectural planning again to this kind of mere "setting-out"—and it is an idea which is entertained by men eminent in the art, and of which more is likely to be heard—is not that there is anything essentially baneful in the act of drawing out elaborate plans in the modern manner, if time were unlimited, but that it occupies time which is wasted as regards the real end of architecture, that of producing beauty; that the study of architecture as an art is in itself all-absorbing, or should be; and that the architect should be busied rather in the designing and modelling of detail and in more direct relation with the craftsman who executes it. He should be less at the drawing-board and more in the atelier.

All this has been said before, and been regarded by a number of respectable people as Utopian talk; but the idea is persistently recurring to those who are in earnest about architecture; it is very strong, we believe, in the minds of the band of enthusiasts who have got up the "Arts and Crafts" exhibitions, and it is likely to be taken up and urged by men occupying a very important position in the architectural work of the day, and is an idea that has to be reckoned with, and a conclusion come to in regard to it, by those who are entering on the career of an architect.

Accepting as we do entirely the view that the real value of architecture to a nation is as an art, there seems to be among the ranks of what may be called the "anti-drawing-board" school a certain forgetfulness of the changed conditions of modern life in comparison with the periods when the great examples of "anti-drawing-board" architecture were produced. These changed conditions may be classified as resulting first from

greater complication of requirements for modern buildings, secondly from greater hurry. As far as plan and practical requirements were concerned, the Medieval cathedral was a simple problem compared with a modern municipal building for a large city, for instance. So also with the great Renaissance buildings. The plans of Bramante and Inigo Jones were made, as far as they were made, for purely architectural reasons, structural and artistic combined. Those of Bramante, as published in the Baron de Geymüller's interesting work, as far as plan is concerned show merely what we should call the setting-out of walls and piers, portions of a building in which some special difficulty might have occurred in carrying out the work. But the architects of Medieval cathedrals and Renaissance palaces were equally freed, by comparison, from the two modern influences we have referred to, complication and hurry. They had no considerations of electric lighting, of sanitary drainage, or even of ventilation, to trouble them. In some respects, no doubt, in Mr. Besant's phrase, "The world went very well then," but the world had not discovered that matters of drainage and ventilation had any important bearing on human life, and the architect was not troubled much about these matters. The less crowded condition of life, indeed, made sanitation much easier; and when the conventional architect had built his "garde-robe" over a running stream he had possibly done all that was necessary under the circumstances. And as to hurry, one knows how the Medieval cathedral dragged on from generation to generation in a manner which would horrify a modern contractor; and the owners for whom the Riccardi and Pitti palaces were erected were probably in no great hurry, any more than their peers for whom some of the great English mansions were erected; they built a house as an heirloom at a time when the present rapid and unexpected changes in the conditions of property were unknown; the progress of the work was a continual interest to the princely owner, and if he did not live to inhabit it for long, his descendants would have it, at all events. But nowadays a building, even a private mansion, is to be built to a given day, and provided with complicated arrangements for warming, ventilation, electric lighting, and other conveniences with which modern life will less and less dispense; and as to street buildings in London, "business premises" as they are called, they are to be hurried up by relays of workmen working night and day, because they are always commercial investments around which investors are gaping for the first touch of the money. We have before remarked on the absolute impossibility of any consideration for architecture under these conditions. There is not time to think of it, or time to execute the detail; it is a mere scramble to get a building up and opened for occupation by a given date. There is nothing wrong, of course, in this; only if people want architecture they cannot have it in that way.

But it must be evident, we think, to any man, however enthusiastic for the artistic side of architecture, who looks fairly at the problem of modern building, that the comforts modern civilisation requires and has a right to expect (at all events will not be content without) in a building for public or private occupation, cannot be provided properly except on the basis of a detailed and drawn-out plan beforehand. We agree that it is practical folly to spend time in highly elaborating such a plan, however it may be that some minds find in the production of a perfectly neatly-executed and finished plan a joy with which a stranger intermeddeth not. But the plan must be elaborated beforehand in sufficient detail to arrange where and how everything is to be placed, or there will be loss of time, money, and temper afterwards. It will be bad for architecture in another sense if our few artistic architects take to neglecting plans as matters of inferior interest, for in that case

they will unquestionably have less employment than they have now. But we may ask them to consider whether the act of drawing plans, even with the vicious T-square on the demoralising drawing-board, is of necessity deadening to the artistic sense. It is urged, we believe, by some who think so, that preliminary drawings of buildings are only a modern invention; and that argument (rather shaky in a logical sense) seems to be that as fine buildings have hitherto been produced without plan-drawing, this latter operation is not only unnecessary but inimical to art. The reply that always occurs to us when this argument is used is—how was the Parthenon built? In order to carry out the work as we find it carried out, there was as much refinement of setting-out necessary as in the Forth Bridge, though for a very different kind of reason; and it is difficult to imagine how the front, with its delicate adjustments of horizontal curvatures, and setting inward of the columns, and entasis, &c., could have been carried out without a careful delineation of some kind before the details were proceeded with: it would almost seem as if it must have been set-out full size, as in a ship-builder's moulding-loft, or how were the stones to be worked with the minute accuracy required?

As to the question of the deadening effect of practical detail on the mind and work of the architect himself, on the necessity of his giving his whole attention to pure artistic design, it is rather a pertinent question, Do you consider Wren an architect in the artistic sense or not? Oddly enough, the modern worship of Wren, which has been carried a little too far, was set up mainly by the very school of men who are crying out for exclusive attention to the artistic side of architecture. Now Wren certainly was not an art-architect in the modern sense. He was essentially a scientific—a very scientific—constructor, with a great attention to practical detail. But was he not an architectural artist? It is true that his decorative detail was, in our opinion, nearly always bad; but in the main designs of his buildings he exhibited a gracefulness, variety, and originality, which few individual architects have exhibited since; perhaps we might say not one, though there might have been more (Barry for instance) who could have done so if they had had the same exceptional opportunities.

The view of the art-architect party, as we understand it, is that the hope of architecture depends on architects become far more of sculptors and modellers than they are at present, more in fact of artists and less of professional men. So far we are with them, and we believe the more an architect attains to the power of modelling his own decoration, the more we shall have of artistic interest and life in our architecture. But it must be decorative art founded on good plan and good construction to begin with. Architecture means artistic arrangement of plan, and expressive treatment of construction, and artistic detail only after that. It is perfectly true that all this work is essentially an art, not a business or a profession in the ordinary sense of the word profession. But those who are desirous to emphasise the artistic view of an architect's work must remember that it is an art which reposes on adequately considered plan and construction, and is the expression of those. To make it a matter of sculptor's or modeller's detail only is simply to take the backbone out of it.

The Movement for the Registration of Plumbers.—The District Council for Devon and Cornwall have decided to hold public meetings in Truro and other towns in the district. The District Council for Sheffield and district have resolved to include Barnsley, Doncaster, Penistone, and Chesterfield in the area of their operations. The Plumbers' Company have offered a series of prizes to the students in the plumbing classes at the Townshend Institute.

BREAKWATER CONSTRUCTION.*

BY F. H. CHRESEWRIGHT, ASSOC.-M. INST. C. E.

ALL practical and theoretical experts are agreed that what is wanted is a vertical wall, or a wall as vertical as it is possible to obtain. For many years a great difference of opinion existed among engineers and scientific men as to the relative advantages and disadvantages of the long slope and vertical wall systems of construction; many authorities insisting upon the theory that in the case of a vertical wall, rising from the bottom in deep water, the wave is a simple undulation, and that it would rise up against a vertical face, and act by its statical pressure only; whereas in the case of the adoption of the long slope, the character of the wave would be so completely and entirely changed that it would have a considerable amount of progressive motion imparted to it, and consequently great percussive force, the result being that the whole weight of the mass of water, multiplied by the velocity with which it was moving, would be the measure of the force exerted on the slope, or rather upon the vertical wall reared at or near the termination of the slope.

Professor Airey says that "waves do not break against an upright surface, and exert no percussive force upon the wall,—they will exert the same sort of pressure that there is against a lock-gate; that is, a hydrostatic pressure."

Sir Wm. Cubitt also says that "if in constructing a wall in the sea 72 ft. high in deep water we could be sure of all our premisses, the thing could be done, and would be the most perfect."

Capt. Vetch says that "he would prefer a wall of solid masonry rising holdly and perpendicularly out of deep water, but for the expense and difficulty of preparing foundations and carrying on such structures, as the time and expense would be so great 'on the usual mode of procedure' as to render it impracticable."

It may, therefore, be taken that there is a general consensus of opinion; 1st, That an upright wall is best adapted to repel heavy waves; 2nd, That it should rise direct from the bottom of the sea; and, lastly, that the great drawback to the construction of works of this description has been the cost and difficulty of preparing foundations for them in deep water.

A very fair contrast may be drawn between the breakwaters at Plymouth and Dover. Plymouth breakwater is a sloping one, while that at Dover is nearly an upright wall. They are somewhat similarly situated with respect to exposure to south-westerly gales, the height of the waves at Plymouth being 13 ft. and at Dover 12 ft.; during these gales the sloping breakwater suffers considerable damage in its "toe" and "head," while the upright wall receives no damage whatever. Moreover, taking into consideration the supposed more exposed position of Plymouth breakwater, all the more important advantage of such structures, as shelter for shipping, remains with the upright wall; and, in regard to the expense of maintenance, we have seen that the Plymouth slope may be put down at 5,000*l.* per annum, while the upright wall is comparatively *nil*.

The vast expense necessary for the erection of breakwaters on the old system has proved too frequently an insurmountable obstacle to their erection in places where they were much required. Frequently half-measures have been resorted to, and with the result common to half-measures at all times and places,—a dead loss of the money expended and no benefit obtained. It is no exaggeration to say that the colossal sums of money which have been fruitlessly cast into the sea in the construction of futile breakwaters amount in the aggregate to a national disaster. The history of those ports which have been erected by private and local enterprise presents

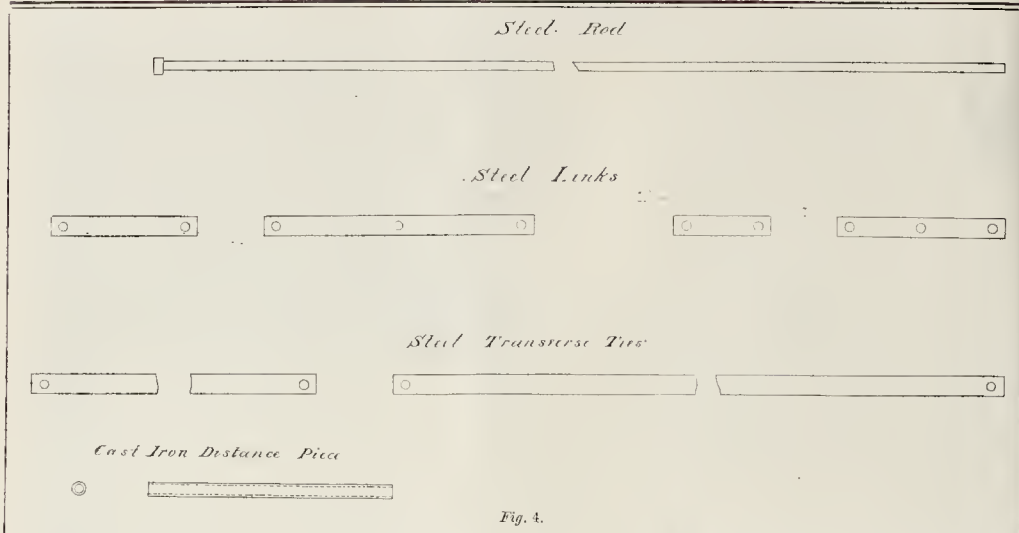

but a record of building makeshift piers at a time when funds were low, and of taking them down again when trade had expanded and more room was required. The want of funds has prevented too frequently the original work from being carried into deep water, and in consequence the most expensive part of the projected breakwater is often put down at the very place which has afterwards to be converted at great expense into deep water-way or herthage.

The author has now to call the attention of the meeting to the invention of Mr. John Lewthwaite for erecting upright walls in any

position, however exposed, and on any foundation, whether it be rock, sand, reef, or mud. Fig. 1 shows Lewthwaite's patent in elevation as adapted on an uneven rocky bottom where rock in any quantity can be obtained for filling; whereas fig. 2 shows the system employed on a sandy or soft bottom where only silt, sand, chalk, or other material of a loose nature is obtainable. In this latter case it will be seen that the loose filling is kept in place by concrete blocks threaded over steel rods, which are made to any desired dimension, the size being regulated by the amount of sea to be resisted. Fig. 3 shows a cross

* From a paper read before the Society of Engineers, on the 5th inst. See p. 390, ante.

section with details of all parts that are necessary to construct a breakwater or seawall of any size in any depth of water, let the nature or contour of the bottom be what it may.

One of the most important merits claimed for this invention is its simplicity of construction, there not being one piece in its formation requiring the hand of the skilled artisan. But though an important one, it is by no means the only one. Works on this system can be carried on with very great rapidity in almost

any weather short of a terrific hurricane. Staging, that most expensive of items, is only needed when the breakwater is not connected with the shore. Another, and that the distinctive characteristic of this new system, is that the work is one connected whole, and therefore, unlike most breakwaters or seawalls yet erected, perfect continuity is obtained. Again, there need be no fear about the works receiving damage during the course of construction, for, by this system, and this system only, the upright or vertical wall from

the sea-bottom to any desired height above water is rapidly and easily attained.

The method of erecting works on this principle is to form two horizontal stages parallel to each other, spaced the distance apart required for the two outer walls. In order to form an absolutely stable structure, the width should be about equal to the depth of water; i.e., if there be 40 ft. of water the breakwater should be 40 ft. wide. These horizontal stages have slotted pieces of iron (grippers) their entire length, being placed at stated intervals, and they are so disposed as to hold the upper ends of the vertical rods in position when dropped by the overhead traveller used in the construction of the work. These operations are carried out simultaneously on either side. When a rod on each side has been dropped, a transverse tie is threaded on, the "grippers" are drawn back, the tie allowed to pass, the "grippers" replaced on the rods, and the tie then lowered. This defines the transverse distance of the vertical rods. Other rods are then lowered in the same manner, and links are threaded on to them in the direction of the work to be done, each link being threaded over three rods. When a rod has three links on it, the "grippers" are drawn back and the links allowed to drop. The "grippers" are then replaced and the rods again secured to them in their proper position.

Should the construction be similar to that shown in fig. 1, pieces of tube called "distance pieces" are threaded over the rods to regulate the distance between the links vertically.

As will be seen by reference to this figure, "distance pieces" are of varying lengths when the bottom is uneven, until a horizontal line has been attained; when this has been accomplished the "distance pieces" used will be of equal lengths and the work continued in a regular and consecutive manner, until a further dip in the foundation is encountered, when the "distance pieces" will again be of various lengths until another horizontal section has been attained, and so on to the end of the work. The above sketch shows these "distance pieces" in the regular part of the work to be 6 ft. long, so that the cable links will be kept at that distance apart throughout the structure. The distances that these transverse ties are to be placed may be left to the discretion of the engineer. When this part of the work has been accomplished rock filling is thrown in, shoots being, of course, employed in order to prevent any damage to the transverse ties.

The same process is carried out when forming a breakwater, as shown on fig. 2, only that no "distance pieces" are required, the concrete blocks themselves acting in this

case as distance pieces. The concrete blocks are threaded over the vertical rods and allowed to glide into position. In addition to the "ties" used, further strength and continuity is gained by having the concrete blocks so made as to dovetail one with another.

The iron or steel used in this work (fig. 4) is of such forms that there is no need for any finished or skilled labour. The concrete blocks are shown in fig. 5. Some engineers entertain doubts as to the duration of iron under water. The following extract from a paper appended to the report of the Harbour Commission should suffice to set their minds at ease:—

"We are told that the *Mary Ross* was capsized when under sail at Spithhead in 1545, and recovered in 1837, after having been under water 292 years. It was then found that the guns, which were of the ancient type of wrought-iron bars bound together with iron hoops, having detached chambers keyed into solid wood, are corroded to the depth of a quarter of an inch."

Now, as the iron rods used in the construction of a breakwater on the Lewthwaite plan would be about 2½ in. in diameter, it would at this rate take over 1,000 years to wear them away; a very fair period for a breakwater to stand. But long before that distant epoch was reached the constant movement of the ceaseless ocean would have thoroughly solidified the rock fillings into a gigantic monolith, which would stand for yet another thousand years.

In conclusion, the author begs to say that the object for which this paper has been written will be fulfilled if it prove the means of introducing to his professional brethren a method of successfully making breakwaters, piers, and sea-walls with an upright wall, with such absolute continuity of structure, in any position, however exposed, on any bottom, and to overcome difficulties that have defied the most eminent in the profession during all ages.

NOTES.

AFTER a discussion which has extended over a considerable time, and after repeated divisions, the London County Council, at its meeting on Tuesday last (reported in another column), came to a decision on the question of maintaining eleven small gardens and open spaces which were planted and opened to the public through the agency of the Metropolitan Public Gardens Association, but which were recently closed in consequence of the inability of that Association to bear the annual cost of their maintenance as well as the first cost of planting and throwing them open. As will be seen, the London County Council have decided, by a very small majority, to maintain the spaces in question until October 31, 1892. There has been a great deal of rancour imported into the discussion, not between the "Moderates" and the "Progressists" so much as between the partisans of what may be called the dutiful Vestries and the negligent Vestries. Large numbers of each party in the Council took opposite views on the question, and the "cross-voting" thus caused is accountable for the narrowness of the majorities on the various motions and amendments discussed. Certain of the metropolitan Vestries, that of St. Pancras, for instance, have shown a great deal of public spirit in supporting many small open spaces in their respective localities out of local funds, and many of the representatives of these public-spirited Vestries opposed the proposition of the Parks Committee of the Council, on the ground that the Vestries and District Boards in whose Districts the eleven spaces in question are situate have neglected their duty in not supporting their own local spaces. On the other hand, the last-named authorities say that they are too poor to do so. To this it is replied that in most cases their rates are much lower than in those districts of the metropolis which have done their duty as to open spaces, and that they receive large subsidies in aid of local burdens. The Vestries and other authorities who have maintained

their own open spaces complain of the injustice of being doubly taxed for the benefit of those districts which have not and will not do their duty. The whole dispute, like that as to a similar question which arose last year about the provision of baths and washhouses in the many metropolitan parishes which are without those necessities of health and cleanliness, points to the necessity of the constitution of the District Councils which have been promised as an integral part of the reform of London government. The continual conflicts which take place as to the provision of open spaces and other necessities of health are not creditable to any one concerned. We are glad to think that there is a prospect of the spaces in question being reopened.

DR. STUDNICKZA'S brilliant monograph "Kyrene" should meet with special attention in England, owing to the light it throws on some of the most important vases fragments recently discovered at Naukratis. Where the vases known as "Cyrenaic" were actually made has been of late matter of much discussion. Puchstein attributed them to Cyrene itself, Klein to Sparta, Milchhoeffer believed their origin to be Creten, Dr. Studnickza now steps in and, we think, settles the question in favour of Cyrene itself. Not only that, but he creates a new goddess for us, the eponym of the town. "Cyrene" is no longer to be regarded as a mere late impersonation of a place, but she is the counterpart of Artemis the *lady snipa*, and her early image is to be seen on one of the most curious and interesting of the Naukratis vases now in the British Museum; there she stands holding the silphium in her hand, and a bough of the golden Hesperid tree is close beside her; the ground of the vase is thickly covered with small winged figures, male and female impersonations of the favouring winds of the city. In the ninth Pythian of Pindar Kyrene appears not as a great goddess, but as a lovely maiden whom Apollo saw wrestling with a lion and loved for her strength and beauty. In relief in the British Museum she is depicted struggling with a lion, and, as Dr. Studnickza notes, for the first time, this type explains some fragments of the archaic pedimental group which decorated the Kyrene treasure house at Olympia. The first type of Kyrene, in a word, and in part her legend, arose from the familiar figure of Artemis taming these wild creatures of the wood and field,—a figure so familiar to literature as art. Kyrene is one of the many instances of the degradation of goddess to heroine.

THE twenty-second annual report of the Council of the Surveyors' Institution, presented at the annual general meeting of members on Monday last, shows, we are pleased to see, that the Institution continues to make most satisfactory progress. The total number of members of all classes is now 1,617, made up of 15 Honorary Members, 1,080 Fellows, 310 Professional Associates, 89 Associates, and 123 Students. During the past year there has been a net increase of 184 in the number of Fellows, there having been 152 elections and 47 transfers from the class of Professional Associates. The balance-sheet shows the financial position of the Institution to be excellent. During the year there was a total increase of 304L 10s. in the revenue derived from members' subscriptions. The total receipts for the year, including a small balance brought forward, amounted to 5,406L 12s. 1d. In addition to meeting all current expenses, which amounted to 3,931L, the Council have been able to add the sum of 1,500L to the invested funds of the Institution. The report points out that the examination system becomes more and more vital to the future of the Institution "as the time approaches when it will be the only avenue to membership," and it is satisfactory to see that the system is "each year strengthening its hold on the rising generation of surveyors."

* Kyrene eine altgriechische Göttin von Franz Studnickza. Mit 38 Abbildungen. Leipzig: Brockhaus, 1900.

During the ten years (1881-90) during which the examination system has been in operation, 435 candidates have presented themselves for the Preliminary Examinations; of this number, 309, or 71.03 per cent., have passed. For the Professional Examinations, 461 candidates have presented themselves; and 333, or 72.33 per cent., passed. The number of candidates, and the average percentage of marks obtained by them, show encouraging signs of increase. With regard to the proposed new Special Certificate Examinations, the report says:—

"The passing of a technical examination has hitherto, with the exception of the direct Fellowship Examination (now suspended), been a mere condition precedent to membership; but surveyors, like members of every other profession, having developed a greater tendency within recent years to become specialists as regards particular branches of practice, it has been thought desirable by the Council to introduce, in a tentative way, a system of Special Certificate Examinations open to those actually members of the Institution, in the three subjects, Forestry, Sanitary Science, and Land Surveying and Levelling.

These three subjects obviously lend themselves to a much more exhaustive test than is possible or necessary in connexion with the General Examinations of which they already form a part, and a Special Certificate, as the result of a searching Examination in any one of them, could hardly fail to be of value to any rising practitioner possessed of sufficient ambition and capacity to pass the ordeal. Examinations in Forestry and Sanitary Science, for which a fair number of candidates have sent in their names, will be held during the present month."

The report informs us that the marked success which has attended the tentative course taken by the Council in the establishment, two years ago, of six Provincial Committees, has encouraged them to extend the system by the formation of several more Provincial Committees. One result of the working of these committees has been to bring the Council into much closer and more effective relations with the members in distant parts of the country. The report concludes by recapitulating the proceedings of the Council with reference to Bills now before Parliament. In one paragraph we read that

"The Council have been saved the necessity of opposing the Architects' Registration Bill, which it seemed might possibly prejudice surveyors in some of their relations with their clients, by the introduction of a clause specially exempting professional members of the Institution from its restrictive provisions, in the not very probable contingency of its receiving the sanction of the Legislature."

WITH regard to the very material changes proposed in the Law of Bankruptcy by Sir Albert Rollit's Bill, now before the House of Commons, the lending wholesale grocers and merchants in the tea, coffee, provision, spice, and colour trades have petitioned Parliament against the Bill. As the Bill, of course, affects all other traders equally with the grocers, &c., we give the terms of the petition, wherein are indicated the main proposals of the Bill:—

"That your petitioners have carefully considered Sir Albert Rollit's Bill to amend the Law of Bankruptcy, and are strongly of opinion that, if passed as it stands, the Bill would almost completely prevent creditors having the control over the assets of estates to which they are justly entitled, and it would hand over to officials of the Court the realisation thereof.

Experience has conclusively shown that such a course is neither economical nor calculated to benefit either the public, debtors, or creditors, and your petitioners feel very strongly that the property of an insolvent debtor should belong to his creditors, who are the proper and only persons who should decide how that property is to be dealt with.

The Bill, if passed, would practically repeal the Deeds of Arrangement Act of 1857, which provides for the registration of deeds of arrangement, and has been received with considerable favour.

Under these circumstances your petitioners ask your Honourable House to consider whether such a retrograde step should be for a moment tolerated, and they respectfully venture to suggest that if the Bill be not withdrawn, at least the important clauses should be amended to counteract the evident tendency to officialism."

A CASE of some interest not only to Hastings, from which place it came, but to other localities governed by Improve-

ment Acts similarly worded, is published in the current number of the "Law Reports." The case is that of *Meadows v. Marshall*. By Section III. of the Hastings Improvement Act, 1885, "the making of any addition to an existing building by raising any part thereof . . . shall for all the purposes of this Act . . . and of any By-law made thereunder, be deemed to be the erection of a new building," &c. By one of the By-laws made under the Public Health Act, 1875, notice of the erection of a new building was to be sent to the Surveyor of the Sanitary Authority. Mr. Taylor, the respondent in the case, built a house with a conservatory on the first floor, in accordance with plans duly passed by the Sanitary Authority. About a year afterwards he pulled down the conservatory and built a bedroom in its place nearly of the same size as the conservatory, the walls, which supported the glass of the latter, being raised for the purpose. No notice of this alteration was given to the Surveyor, it being contended—as the justices thought rightly—by Mr. Taylor that the case did not fall within the Act of Parliament, since this was not an addition to an existing building. On appeal, the Judges of the Queen's Bench Division thought differently, and reversed the decision of the magistrates. It does not require a legal training to construe the section in question, and apply it to the facts of the particular case. There was, in fact, an addition to the house by the adding on of a new bedroom formed out of a new structure. The fact that it was of the same dimensions as the conservatory did not make it less an "addition to an existing building." In fact, it is scarcely possible to understand how the magistrates came to the decision, though it was probably because they considered that no harm had been done by a technical breach of the law. But if the High Court had agreed with them it would have clearly defeated the intention of the Act.

WITHIN the past six months considerable attention has been bestowed in Germany on the results of certain experiments carried out last year with a view of testing the comparative advantages of using a volcanic sand in making mortar. This sand is found in the Eifel, being the residue of ejections from the recently-extinct volcanoes of the district. In chemical composition it is silica and alumina, with rather large proportions of lime and magnesia, and for years has been known to make good hydraulic mortar when mixed with lime. Details of the experiments will be found in a paper by Dr. Böhme in the "Mittheilungen aus den Königlichen technischen Versuchsanstalten zu Berlin," Supp. I., 1889; but we may state that they indicate that mortar made with the ordinary Prussian standard sand is inferior, both in tensile and crushing strength, to that in which the volcanic sand was employed. For example, a mortar made with 3 parts of the standard sand and 1 of Portland cement, after having been immersed in water for one year, indicated a tensile strength of 34.15 kilograms per square centimetre, whilst precisely the same kind of mortar, but made with volcanic sand, under similar conditions, gave a strength of 50.15 kilograms per square centimetre. Their respective crushing weights were 320.8 and 499.1 kilograms per square centimetre. When mixed with rich limes, the volcanic sand also showed its superiority to the standard sand; whilst experiments made as to the powers of adhesion to stone and resistance to frost (as far as this latter can be artificially ascertained), also prove the great advantages of mortar made of the former kind of sand. The first question which naturally arises on considering these results, is whether such a product exists in this country. We have not seen a sample of the volcanic sand experimented with, but from its description it appears to be an ordinary kind of material, which is in reality merely lava in an extremely comminuted condition, which latter was brought about by its having been blown out of the crater into the air during

eruptions, and which fell as dust and sand on the volcanic pile. Such a sand might possibly also result from the decomposition of certain classes of lavas. It would be useful to know how far the chemical composition of the volcanic sand influences its quality as an ingredient of mortar, because if this element is permitted to be elastic a similar product might possibly be found in some of the volcanic areas of Britain. The compositions of the Eifel sand alluded to, and the Vesuvian lavas of 1631 and 1867-8, are very similar. Could the same superior class of mortar be manufactured from sand obtained by crushing such lavas?

SEVERAL Roman inscriptions and sculptures have been found in the North Wall of Chester, and it is thought that further exploration will result in new discoveries. A circular, appealing for subscriptions towards the cost of such exploration, has recently been issued in Oxford, and bears the signatures of Professor Pellham, F.S.A., Dr. Collingwood Bruce, and others. Professor Mommsen, of Berlin, has also written in aid of the movement, saying:—"I approve with all my heart the project of taking up on a larger scale the excavations at Chester. For the story of the Roman Empire, so far as it has to be based on the monuments, there is nothing so instructive as the great headquarters of the Imperial army . . . We Latin scholars will pray very earnestly for good luck to the English pickaxes occupied at Deva; and the last discoveries give good hope." The Bishop of Oxford (Dr. Stubbs) is strongly of opinion that the researches begun three years ago should be resumed, and has no doubt that further discoveries will be made. "Of all the historic sites in England," says the circular, "none are so likely to aid our knowledge of Roman history as the Roman military centres, and it is well-known that Deva was garrisoned by the Twentieth Legion from the earliest times until the end of the Roman occupation of our island. The area of search would be the Dean's Field and the North wall adjoining the portions examined previously. . . All Roman inscriptions and sculptures found will be deposited in the Grosvenor Museum with those found in the previous exploration of the North-wall. The scheme has the hearty approval of the Council of the Chester Archaeological and Historic Society." The Dean has given consent for excavations to be carried on in his field, and the Corporation of Chester has just granted permission for the walls to be explored. What is now required is money; this may be sent to Professor Pellham, Bradmore-road, Oxford. Doubtless there are many antiquaries who will be willing to give something towards this object, and we certainly wish the movement success, although we do not think that the excavations will result in the discovery of anything of much purely architectural interest.

IT had originally been the intention of the Municipality of Berlin to erect a monument to the deceased Emperor Frederic in the capital. We now hear that the young Emperor will not permit such an erection on the part of the municipality, but that he himself intends dedicating a monument in memory of his father, and that he has already given the necessary instructions to the Minister of Public Works. According to good authority, this Minister will be in favour of placing the proposed monument on an extension of the Frederic Bridge, situated between the Museum and the Exchange.

THE good people of Ulm, amid the ringing of bells and general rejoicing, laid the last stone of their cathedral spire on Saturday last. In 1492 the tower had reached the height of 316 ft., but the work was then stopped on account of the yielding of the two eastern piers; after four centuries the spire has been added, and it is now (so say the people of Ulm) "the highest in the world, having an altitude of 530 ft." The official celebration of the event will take place on June 28 and three following days.

FEATHERS - COURT, No. 261, High Holborn, is in course of being rebuilt, for the purpose of making a widened thoroughfare, to be named Holborn-avenue, into Whetstone-park, at the back of Lincoln's-in-fields. The sign of the "Feathers" (shown as the Prince of Wales's cognisance) distinguished a tavern formerly in Hand-court, nearly opposite, in High Holborn which was a favourite haunt of Lamb and Coleridge, perhaps during the former's residence in Little Queen-street, at a house whose site is now occupied by Holy Trinity Church, being the house wherein, on September 22, 1796, Lamb's mother met with her death. Hand-court is so styled from the tavern by sign of the "Hand in Hand," which also was not an uncommon sign with former matrimonial agencies in the town.

THE delay in the appearance of "Bradshaw" this month was probably due to the fact that nearly the whole of the tables have been re-arranged. The guide is considerably improved in several respects, the compilers having at last discarded the bewildering practice of utilising every inch of space between the figures by cramming in notes and references. The latter are now clearly set forth at the end of the respective tables; or, in the case of a main line, in an ample margin at the side. There are also a greater number of fares and distances inserted, and the headings are printed in bolder type. The great economy of space which was effected by the old system of abbreviating and "cramming" (in which art "Bradshaw" has long stood unequalled) is strikingly evidenced by the fact that, under the new arrangement, no fewer than 100 additional pages are required for the time-tables. These now occupy 523 pages, the complete guide consisting of 726 pages, exclusive of the index. Few, however, will object to the increase in bulk, while the improvements effected in the familiar "monthly" will doubtless be greatly appreciated by those who have to study its pages.

IN reviewing a work on the railways of America a little while ago, we remarked on the impression given in the book as to the carelessness with which railways are constructed in the States, and the want of feeling of responsibility among American railway officials, as evidenced by some of the statements made in the book. The terrible disaster at Oakland, California, reported in the daily papers, when an engine and train went through the opening in a swing bridge, comes as a unhappy example of this. It seems the bridge was at the end of a curve where the driver could not see it, and he neglected the danger signal because "he expected that the bridge would be closed by the time he reached it." This sort of thing seems only too characteristic of the American railway system.

THE President and Council of the Royal Academy have commissioned Mr. W. Reynolds Stephens to paint a "Wall Decoration" in the refreshment-room of the Royal Academy. The sketch for it obtained the "Prize for a Decoration" of the Academy-Schools in 1887, and was exhibited at the Academy in 1888. The subject is "Summer." The work will be commenced directly the present Exhibition closes. We published an illustration of the design in the *Builder* of December 31, 1887.

Strikes in the Building Trade.—The Dublin carpenters, to the number of nearly 400, struck work on Monday, on account of the refusal of their demand for shorter hours. Some of the men returned to work on Tuesday, on their demands being conceded.—The Exeter carpenters and joiners also struck on Monday, to the number of about 150. Their ground of action is that the masters refused to agree to a uniform code of rules and the payment of a minimum wage of 6½d. an hour. On the other hand, it is reported that the operative bricklayers of South Shields, who have been on strike several weeks for an advance of wages to 9½d. per hour, have accepted the award of the arbitrators of 9d., and have returned to work.

ARCHITECTURE AT THE ROYAL ACADEMY.—V.

1,816. "Pevery, Shropshire": Mr. Aston Webb. The two general perspectives in this frame we published among our lithographs in last week's issue, and they require therefore no description here. They present an exceedingly good example of a large house designed on the "home-like" principle; a house which would be called a "mansion" if it were a rectangular and symmetrical block of building, but which is too picturesque to merit that rather doubtful title. Plans of ground and first floor are appended. A long corridor from end to end of the house forms the backbone of the plan; we presume that some break in the way of either curtains or swing-doors would be made use of to shut out the vista of the kitchen region from the best end of the house. The main staircase seems rather small for a house on this scale; no effect appears to be made with it. One of the most agreeable features is the block of plain masonry which rises in a partially tower-like form on the north front, over the entrance, with a little cupola at one angle of it. A larger drawing of this portion is appended in the same frame, showing also a coat-of-arms with a finely-treated mantling over the door. The whole makes a very pleasing collection of drawings.

1,817. "The Bishop's Door, Lincoln Cathedral": Mr. John Begg. A slightly-executed but very artistic sketch, lightly tinted in Indian-ink for the shadows. The author, who gained the Pugin Studentship this year, has established himself as one of the best of the younger architectural sketchers of the day.

1,818. "House at Weybridge": Mr. Ernest Newton. A very nice pen-drawing, but rather too much of an affectation of rural simplicity in the house; especially in the porch with its little sticks of columns. This is the kind of thing that amuses one by its naïveté in houses of the last century, but the deliberate adoption of it is merely an appeal to sentiment.

1,819. "East Gallery, Avery Hill": Mr. T. W. Cutler. This is part of the same house of which the sculpture gallery is shown in No. 1,731; though here the drawing is a sketchy one in ink line in a recognisable hand: the architecture is of much the same type as in the latter drawing, consisting of the ordinary *réchauffé* of paneled pilasters &c. Avery Hill is evidently a house on which much money has been or is being expended; we wish we could say that its architectural interest appeared at all proportionate to its probable cost.

1,820, 1,821. "Cottages at Higbam, Colchester": Mr. W. H. A. Berry. Two pretty little pen drawings; perhaps the picturesque effect is a little more due to the touching of the drawings than to the actual details of the architecture shown.

1,822. "Junior Constitutional Club, Piccadilly; New Buildings": Mr. R. W. Edis, F.S.A. We do not know whether it is "of malice aforethought" that this is hung just over No. 1,819, but the result at all events is amusing. Here are two drawings of different buildings in different localities and bearing the names of different architects, yet it does not require the draughtsman's signature in the corner to show that they are both by the same hand. Ought it not to be a requirement in the Architectural Room that architects should exhibit some of their own individuality in the drawing of their designs, instead of merely sending them to a recognised draughtsman to make a show drawing in his own style? Whatever the actual merit of the drawings, it is making the whole thing too much of a mere architectural draughtsman's illustrated catalogue to have this vicarious drawing all about the place. If it were required that the drawing should be done by the person whose name is appended to it in the catalogue, the latter would be a fairer representation of the real state of things in the Architectural Room; it might be put this way in the catalogue:—

"19.—HOUSE, MUDDLEBOROUGH (Peckniff & Co., architects),..... Thomas Pinch."

As it is Thomas Pinch's draughtsmanship that gets the drawing hung, this would be putting matters on a proper footing. Or if it were made a rule that the architect of every building exhibited should make his own drawing, we should then have the additional interest of finding out who could draw and who could not, in which respect perhaps some curious revelations would be made. With regard to the

actual design in this case, we may say that the Junior Constitutional Club is a true lineal descendant of its senior, and shows, probably with intention, just the same features and treatment; satisfactory of their kind and suitable for club architecture, but hardly suggesting any further comment that that.

1,823. "Design for Public School": Mr. F. W. Bedford. This was one of the designs submitted for a recent Soane medallion competition; and in spite of its eccentricity of colour and design, there is an originality and a certain picturesque quality about it which justifies its being hung here, though we are not quite prepared to say whether anything could justify its being built.

1,824. "Priory of Our Lady, Haywards Heath": Messrs. Goldie, Child, & Goldie. This is a rich and finely-finished water-colour drawing of the interior of a chapel in late Gothic style, with a rich *recofes* of gilded tabernacle work, and roofed with a single hammerbeam roof, with longitudinal as well as transverse curved braces. It is very correct and satisfactory, but we do not know that there is anything more to be said about it.

1,827. "Stables, Asham Hall": Messrs. Chorley & Cannon. A creditable attempt to give a picturesque effect to stable buildings, chiefly by piling up a large irregularly shaped heap of half-timber work over the centre entrance: it looks a little too much, however, like an affectation of the picturesque.

1,829. "Alms-houses, Welbeck": Mr. John Brooke. This is a very unpretending, but pleasing and home-like building of a simple Elizabethan type, with long low mullioned windows; the coupled arches, with a much-enriched column, at the entrances between each block, have a good effect. No plan is given, but the architectural expression of an almshouse, as a haven of rest, is very well attained.

1,830. "Sauchieburn, Stirlingshire, N.B.": Messrs. Sidney Mitchell & Wilson. It is difficult to make out whether this is an addition to an old castle, or an entirely new building in the Scotch castellated style. Upon this question the architectural merit of the thing would rather depend. As a new building, it is very deficient in interest and has no higher merit than that of consistency with a type; if a portion of it is an old building, and the rest additions in keeping therewith, one might regard it differently; but there is no plan or other indication to show. As a pen drawing, it is exceedingly delicately executed.

1,832. "Church of St. Wulfran, Abbeville, West Front": Mr. H. Wilson. Another exceedingly artistic though slight water-colour sketch by the same hand as No. 1,735 already referred to, but a good deal superior to the latter. A slight touch or two to relieve the extreme bareness of some of the subsidiary buildings, such as might have been given in half a minute, would have balanced it better as a whole and removed the raw look of the foreground; but the author understands the art of seizing effect and colour in a rapid sketch.

1,833. "Interior of the Lady Chapel, St. Alban's Abbey, Herts": Mr. Roland W. Paul. These two drawings, on one sheet of paper, were made as illustrations for this journal, and were published among our lithographs in the *Builder* of April 5 of this year. They were made with the view of preserving a record of the appearance of the interior of the Lady Chapel before its apparently impending disfiguration under the hand of Lord Grimthorpe. It now remains to be seen, however, whether the change in the bishopric of St. Alban's will leave Lord Grimthorpe with as free a hand as before. Report says not.

1,834. "Poles, Herts": Messrs. Ernest George & Peto. This is a charmingly picturesque drawing of a long straggling house of a semi-cottage Elizabethan type, in which the effect is got entirely by the arrangement of the windows and the effect of some projecting semi-octagon bays happily placed. There is absolutely no ornament, only mouldings and what some architectural writers affect to call "fenestration." In the drawing the effect is most pleasing, but we cannot help asking how much of this depends on the drawing,—on the method of getting it up, whereby the look of an ancient and weather-stained building is imparted to it; and whether the actual house, as a new building, has or can have the peculiar charm which is imparted to it by the manner of drawing. We have not seen the house, but we should very much doubt, in regard both to this and other drawings we have seen at different

times by the same hand, whether the actual building produces the effect of picturesqueness which the drawing does.

1,835. "Barusdale Hill, Rutlandshire": Mr. E. J. May. A reproduction of this drawing appears in our pages this week. Mr. May is one of the few exhibitors who thoroughly recognise the importance of plan, and in this case, as in the others, occupies as much of his paper with the plans as with the view of the house; and a study of the ground plan will show that for comfort, and privacy of various portions, it is a very good house plan. The house, like most of its author's, is picturesque and expresses its plan and purpose well; but we cannot say that we think the system of sketching off a drawing in a rather hurried and scribbly manner over different parts to give it a little effect, is precisely the best kind of example to set in getting up drawings for the Academy, though the drawing has the merit in this case of individuality, which is something.

1,837. "77, Welbeck-st.," Mr. Beresford Pite. This is another drawing also with a strong—very strong, flavour of individuality. It is a water-colour showing a brick building with stone dressings, Renaissance frameworks to the windows, with stone halls over the cornices, &c., in the middle of an expanse of brick wall. The projected bays are carried on cupid figures at the angles in a pretty manner, and the cupola in the centre of the roof-line is also original and picturesque; but the striking element in the drawing is the colour, in which the author has shown his usual originality of perception. As shown here it looks like an old building and not like a new, and looks moreover very dilapidated; but as a bit of colour it is one of the cleverest things in the room.

LETTER FROM PARIS.

It has been already mentioned, in the review of the two Salons at Paris, that the secession in the camp did not seem to have materially affected the prosperity of the old Salon, and a further practical proof of this may be mentioned here in the fact that while the entries on "vanishing day" in 1889 were 1,964, this year they have been 2,384, realising a sum of 23,840 francs, which has been applied towards the creation of a "maison de retraite" for aged artists. At the Champ de Mars the "vanishing day" was free, so that no financial comparison can be made in this case; but we learn from good authority that the managers of the new Salon are abundantly satisfied with the commercial results of the enterprise.

The old Salon, however, has no need to be jealous of the new one as far as regards its official position, for the State has been prodigal towards it, and has voted a sum of 225,000 francs for the purchase of works of art from its collection. Nevertheless, since the new minister, M. Bourgeois, has shown himself determined to encourage all new efforts, a sum of 75,000 francs is to be appropriated to the purchase of works from the new Salon. The prizes and bursaries given on the recommendation of the Conseil Supérieur des Beaux-Arts are all appropriated to the old Salon to which they were first attached, though it is said that M. Antonin Proust intends to propose, when the matter comes up for discussion, that next year these revenues should be equally divided between the two establishments.

There is a small exhibition on the Champ de Mars, not far from the Salon Meissonier, and a little crushed by the latter, which deserves a word; this is the ground-floor gallery on which M. Henri Dupray, a painter of the School of De Neuville and Détaillé, has revived the history of the French army for the last hundred years, with its variety of costumes and arms, in a long series of pictures showing much talent and scrupulous exactitude.

The Chamber of Deputies has pronounced in favour of the preservation of the Exhibition Palace of 1889, and its annexation to the City, on certain conditions which we have already recorded. This matter may probably now be regarded as settled; at any rate M. Alphand thinks so, for he is at present making out the arrangements for a grand fête to be given on the Champ de Mars.

The political events of this month, and especially the artisans' manifestations of May 1, have had for one consequence to bring to

* This seems rather like confederation, as regards the vested rights of the old Société.—Ed.

Hôtel de Ville the Préfecture of the Seine and all the administrative services which have since 1879 been installed in the Pavillon de Flore. The Museum of the Louvre will therefore at last be able to take possession of all the buildings along the quay, to install here a number of collections which have hitherto been consigned to the attics, and to isolate the works of art completely from the neighbourhood which left them in constant risk from fire.

Since the Exhibition, and the sale of the Crown diamonds, the Salle des États of the Louvre has been unoccupied. There is a talk of transforming it into a museum to receive various pictures taken from Versailles since the Exhibition, and which since then have been hidden away in Paris. Among these are "Le Sacre" of David and the "18th Brumaire" of Bouchot. In the new Salle would also find place a series of portraits at present put away in lumber-rooms. If the necessary funds are not forthcoming, the galleries will be temporarily arranged and the decoration of the Salle des États postponed, the necessary repairs only being undertaken at a probable cost of 25,000 francs. On the other hand, a gallery is being prepared for the exhibition of antiquities from Tunis and Algeria. This gallery, which will be reached from the Daru staircase, and which will be ready in about two years, is situated under the gallery of Early Italian art.

The Louvre is about to receive Millet's picture of "Les Glaneuses," left by Mme. Pommeroy of Rheims, and which will be shortly exhibited. The gallery of Renaissance sculpture is also enriched by a statue of the Virgin by Germain Pilon, which decorated the Ecole Militaire at St. Cyr. In exchange for this statue, the State has offered to the Ecole one of the most important pictures of Protais, "La Reserve," bought at the posthumous sale of the artist's works.

The question of a house for the Opéra Comique is to come before Parliament again shortly. The Budget Committee appears to have shown itself utterly hostile to the reconstruction of this unfortunate theatre on the Place Boildieu, and it is feared that things will be left as they are, and the Opéra Comique be maintained on the Place du Châtelet, without undertaking any new building. The French architects who have asked for a competition for the new theatre will therefore probably be disappointed in their hopes. Another disappointing prospect awaits those who were looking for a competition for the rebuilding of the Ecole Polytechnique at St. Cloud. This scheme, which would have entailed a great deal of inconvenience in regard to carrying on the educational work of the school, is probably abandoned. The Minister of War is personally opposed to it, and as M. Freycinet is an old Polytechnic man, his opinion will have considerable weight with the Government. Probably the present establishment will be opened out by the acquirement of some adjacent property, and the neighbouring area put into a better sanitary state. The architects will however have, as a consolation, the competition for the reconstruction of the Caserne des Célestins, decided on in principle since 1886.

The cost of the new Caserne to be built adjoining Boulevard Henri IV. is estimated at 1,700,000 francs. The author of the project classed as No. 1 will receive a premium of 6,000 francs if he is commissioned to carry out the work, and 10,000 francs otherwise. Other competitors are to receive premiums of 4,000, 3,000, 2,000, and 1,000 francs. The competition will be closed on July 22. Among the works in progress in Paris, those of the rope railway, at Belleville, are being actively carried on. They were commenced in March last under the direction of M. Bievenue, Ingenieur des Ponts et Chaussées. This work, which will be completed in autumn, will be of great convenience to the neighbourhood, and the Administration thinks of establishing two other similar railways up the hills of Montmartre and Montsouris.

At the Bourse de Commerce, the gate which closes the principal entry has just been fixed. It is a piece of open wrought-iron work, with decorative designs (palms, griffins' heads, escutcheons, &c.) in massive bronze. The gates, which are folding, have been executed after the designs of M. Blondel, the architect.

M. Injalbert and M. Rodin have just completed the models for their decorative sculpture for the Panthéon, the former, as before noted, taking the monument to Mirabeau, and the latter that of Victor Hugo, and the Commission des Beaux-Arts has decided that a temporary

imitative model of each should be set up in the Panthéon in order to judge of the effect; an excellent expedient which might well be adopted more often in such cases, to avoid ultimate disappointment. If the same had been done with the paintings in the Panthéon, we should not now be regretting the grotesque contrasts of style and subjects which have spoiled this decorative scheme.

It is to obviate further disappointments of this kind that the committee for the decoration of the Hôtel de Ville has resolved to require from all the painters who have been selected to cooperate, that they should put up full-size sketches in position before proceeding to the finished work. The result so far has been most useful, for it has enabled the artists to judge of, and modify where necessary, the scale of the figures, the height of the sight line, the values of colour, and the general harmony between the architecture and the painting. The question of the ceilings has yet to come, and the committee will have some difficulty in bringing about a harmonious combination between the odd and incomprehensible project of M. Besnard for the Salon des Sciences (exhibited at the Champ de Mars Salon) and the ceilings by MM. Bonnat and Jules Lefebvre which are to be in near neighbourhood to it.

The competition for a monument to Condoreet has been decided at the Hôtel de Ville. Among the three artists in the second competition the commission for execution has been given to M. Perrin. M. Louis Noël has carried off the first premium, and M. Steiner the second. We must confess that none of the three models have captivated us much, and we doubt whether the result will be improved in the bronze.

Among artistic news may be noticed the exhibition of paintings, designs, pastels, and sculptures by M. Raffaelli. This rather intractable artist refused to exhibit at either Salon, and has made his own exhibition at the Goupil Gallery in the Boulevard Montmartre.

Among works recently executed is the bust of the late M. Perrin, former administrator of the Comédie Française, executed by M. Guillaume for the State; and the statue of the Princess of Wales which has been completed by M. Chapu, and which will shortly be exhibited at the National Gallery of Copenhagen.

We announced recently that M. Alfred Normand had been elected a member of the Académie des Beaux-Arts in place of the late M. Diet; and we have now to announce also the election of M. Pascal, the learned architect of the Bibliothèque Nationale, in place of the regretted André. M. Jean Louis Pascal was born in Paris, and obtained the Grand Prix de Rome in 1866, as well as a medal at the Salon of the same year; and in 1880 he gained the Cross of the Legion of Honour. M. Pascal had as competitors for the honour MM. Ancelet, Guadet, Guillaume, Hardy, Dutert, Scailles, and Corroyer.

At its last sitting, the Academy of Science awarded the Fremont prize to M. Lavalley, painter, and M. Danguy, architect, and the Deschamps prize to M. Gigot, architect.

At the Ecole des Beaux-Arts the Conseil Supérieur, on an official return by M. Guillaume, has formulated an opinion the realisation of which would make a kind of revolution in the artistic world here. It has demanded that women should be given the same facilities as men in regard to artistic education, and be put in all respects on the same footing. In support of this proposition it is urged, and with truth, that for twenty years back the number of female artists, painters and sculptors, has been continually increasing. Admitted to the Salon exhibitions, and with liberty to participate in all the honorary awards along with men, they find themselves often occupying a secondary position which would not exist if they could profit equally with the other sex in the higher education of the Ecole. In all the "Facultés," it is added, the "étudiantes" enjoy the same privileges as the men. Female artists, on the contrary, are obliged to content themselves with instruction given in private ateliers, and which is often unsatisfactory even as far as it goes. The administration of the Beaux-Arts will have now to consider the means of satisfying the views of the Conseil Supérieur, and if they arrive at an affirmative conclusion, the Ministry of Fine Arts will have to ask the Chambers for a vote for the necessary funds.

The competition in decorative composition has just been adjudged at the Ecole. A première médaille has been awarded to M. Binet, pupil of MM. André and Laloux, and troisième

médailles to MM. Armbruster and Lerolle. M. Armbruster was the author of the premiated design for a sun-dial, published in the *Builder* for April 5 of this year. In the competition for the second-class students, the subject of which was, "Trois hôtels construits sur un terrain irrégulier," the jury have awarded "premières mentions" to MM. Binet and Labouret. In the competition in "Éléments Analytiques" of which the programme was "Un petit arc de triomphe décoré d'un ordre Corinthien Grec," sixty-four projects have been sent in, of which not less than fifty-nine have received honourable mention.

We learn that M. Gustave Moreau, painter, and Member of the Institute, has been appointed by the Government a member of the Conseil Supérieur des Beaux-Arts in place of M. Robert-Flcury. To be appointed to succeed such a master is an honour of which M. Moreau may well be proud.

As to the venerable Robert-Flcury, whom we followed on the 8th of May to his last resting-place, he was for some time past overborne with the weight of years, and belonged, so to speak, to the past rather than to the present; yet up to the last, at the age of 93, he still preserved all the faculties of his mind intact.

Robert-Flcury was born at Cologne in 1797. He carried on his artistic studies in Paris in the ateliers of Girodet, Gros and Horace Vernet. He first exhibited at the Salon in 1820, where his picture attracted much attention; and from that date his reputation increased year by year. Among his principal works we may mention "The Triumphal Entry of Clovis into Tours," which is at Versailles; "Galleo before his Judges," and "Christopher Columbus," both of which are in the Luxembourg Museum; "Tasso in the Monastery," "The Last Moments of Montaigne," "Charles V. at the Monastery of St. Just;" works well known and widely popularised by engravings. In the course of his long and laborious career he had honours showered upon him. He received medals in the Salons of 1824 and 1834, was "décoré" in 1836, made officer of the Legion in 1849 and Commander in 1867, and had been elected a member of the Institut in 1850. In 1855 he replaced Blondel as Professor at the Ecole des Beaux-Arts, of which he became Director in 1863. In 1865 he went to Rome to direct the Villa Medici establishment. He was a member of nearly all foreign Academies, and had received decorations from most of the Sovereigns of Europe. For the last twenty years he had taken no part in exhibitions, but he did not cease to interest himself in the art in which he was so distinguished. His name will remain prominent among the annals of that interesting artistic period of the first half of the century, the epoch in which the romantic school began to give to French painting that new impulse which freed it from the cold classicism into which it had been congealed during the Imperial epoch.

The death is also announced of the sculptor Camille Demesmay, who had his time of celebrity. He died at Bezançon at the age of seventy-four; he was the author of various decorative statues, notably that of Mlle. de Montpensier which adorns the terrace of Luxembourg Jardin, and procured its author a deuxième médaille in the Salon of 1848. He executed also the "Mater Christi" of the Church of Ste. Genevieve, the "Saint Philippe" of the Ermité, the "Justice" at the new Louvre, &c. We may also cite among his works various busts which are in the Museum of Versailles, and a Virgin and Child which is in the Museum at Bezançon.

Competition: Hymers College, Hull.—Mr. E. C. Robins, the assessor appointed in this competition, has sent in his report on the designs, which were thirty-seven in number. After a general analysis, seventeen of these were rejected as unsuitable, and after a full examination of the remainder, the assessor reported in favour of that marked "Supervisor" (Messrs. Botterill, Son, & Bilson, Hull) as first, that marked "Balbus" (Mr. Wigram, London) as second, and that marked "Wilberforce" (Messrs. Chorley & Connon, Leeds) as third. Mr. Robins speaks highly as to the generally high order of merit of the designs sent in, and observes that "The Governors have every cause to be grateful to the architectural profession, for the ready and able response it has made to their appeal for its technical assistance in this important matter."

THE BUILDER. JUNE 7, 1890.

PHOTO-LITHO. SCHEIDT & CO. 27 MARKT-PLATZ, DARMSTADT.

THE CHURCH OF ST. QUIRINUS, NEUSS.

H. W. Brewer. 1889.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The twelfth ordinary general meeting of the present session took place on Monday evening last, Mr. Alfred Waterhouse, R.A. (President), in the chair.

Election of Officers and Council.

The President read the report of the scrutineers as to the election of the Council. The voting was as follows:—

President.—Mr. Alfred Waterhouse, R.A.†
Vice-Presidents.—Prof. Geo. Aitchison, A.R.A.†; Mr. John Macvicar Anderson,† Mr. Arthur Cates,† and Mr. Henry Currey.†

Honorary Secretary.—Mr. Aston Webb.†

Members of Council.—For eighteen seats to be filled by Fellows there were thirty candidates. The voting was as follows:—Collcutt, T. E.,† 442 votes; Slater, John,† 399; Graham, Alex.,† 391; George, Ernest, 388; Emerson, Wm.,† 383; Belcher, John,† 379; Spiers, R. Phené,† 377; Blashill, T.,† 376; Brooks, James,† 364; Papworth, Wyatt,† 360; Douglas, Campbell (Glasgow), 300; Brydon, J. McK., 298; Sedding, J. D., 297; Hansard, O.,† 288; Robins, E. C.,† 281; Holden, John† (Manchester), 280; Gruning, E. A.,† 268; Fraser, J. B.† (Leeds), 254. The foregoing eighteen were declared elected. *Not Elected.*—Ridge, L. W., 247; Hall, E. T., 235; Johnson, R. J. (New-cast), 234; May, E. J., 207; Seddon, J. P., 206; Goddard, Joseph (Leicester), 197; Plunbe, R., 173; Conroy, J. W. (Leeds), 142; Drink-water, H. G. W. (Oxford), 142; Ingelow, B., 120; Seward, E. (Cardiff), 113; Gough, Hugh Roumieu, 102.

Associate-Members of Council.—To fill the two seats on the Council allotted to Associates, there were five candidates. The voting was as follows:—Blomfield, R. T., 292; Rickman,† T. M., 241. The foregoing were elected. *Not elected.*—Street, A. E., 236; Julian, G. R.,† 159; Middleton, G. A. T., 50.

Presidents of Allied Societies, elected to seats on the Council:—Crisp, H.† (Bristol Society of Architects); Drew, Thos. R.H.A. (Royal Institute of the Architects of Ireland); Freeman, R. E. (Manchester Society of Architects); Reade, T. M. (Liverpool Architectural Society); Walker, Herbert (Nottingham Architectural Society).

Representative of the Architectural Association (London).—Mr. Leonard Stokes, President.

Auditors.—Wm. Kidner, Fellow; Wm. Woodward, Associate.

Election of Standing Committees.

Art Standing Committee.—Fellows: J. M. Brydon, R. H. Carpenter, T. J. Flockton (Sheffield), C. F. Hayward, W. Kidner, E. M. Macartney, E. J. May, R. Nevill, E. Newton, and E. S. Prior. **Associates:** A. Aitchison, E. J. Ball, G. H. Birch, G. C. Horsley, James Neale, and A. B. Pite.

Literature Standing Committee.—Fellows: F. T. Baggallay, E. P. Loftus Brock, T. H. Eagles, C. L. Eastlake, J. A. Gotch (Kettering), B. Ingelow, E. M. Macartney, Wyatt Papworth, H. W. Pratt, and Hugh Stannus. **Associates:** R. T. Blomfield, H. O. Cresswell, T. Garratt, G. R. Julian, A. E. Street, and P. Waterhouse.

Practice Standing Committee.—Fellows: Cole A. Adams, H. C. Boyes, S. F. Clarkson, G. R. Crickmay, Prof. B. Fletcher, G. E. Grayson (Liverpool), E. T. Hall, J. S. Hansom, L. W. Ridge, and S. Salter. **Associates:** A. R. Barker, T. Batterbury, F. H. A. Harcastle, T. M. Rickman, R. S. Wilkinson, and E. Woodthorpe.

Science Standing Committee.—Fellows: Lewis Angell, H. D. Appleton, T. W. Cutler, H. Dawson, A. J. Gale, J. D. Mathews, Prof. T. Roger Smith, B. Tabberer, Ernest Turner, and T. H. Watson. **Associates:** H. A. K. Gribble, C. Henman, F. Hooper, H. Lovegrove, W. C. Street, and H. Tanner.

On the motion of Mr. Hall, a vote of thanks was passed to the scrutineers for the trouble they had taken in connection with the election.

The Arab House in Cairo.

Mr. R. Phené Spiers, F.S.A., then read a paper by Count D'Hulst, entitled "The Arab

* For the offices of President, Vice-Presidents, and Honorary Secretary, as well as for the seats on the Council filled by the Presidents of the Allied Societies and the representative of the Architectural Association, there was, of course, no balloting.

† Marked thus were members of the outgoing Council.

House in Cairo," of which the following is an abstract:—

In introducing the subject, the author stated that it was the custom in the East for a monarch to build a fresh capital on ascending the throne. Among the examples of this habit, Cairo was conspicuous; and, again, Egypt had been the most conquered and exposed to internecine quarrels. These causes, time, and an unreasonable imitation of European architecture, had furthered the destruction of Arab houses. Some beautiful old ones were, however, still left in Cairo, and proved that the richness and elegance displayed in Arab public buildings were also attributes of the private houses. According to Arab writers, private houses in Damascus were built after the fashion of the late Roman houses; in Persia, especially in Bagdad, the ancient Persian houses served as examples; while in Northern Africa and Spain the Moors evidently had copied those of the ancient Roman. The principles of the plan of the Arab house were: (1) Grouping of the rooms around courts and gardens; (2) absolute separation of the rooms for each sex; (3) prevention of passers-by seeing into the courts; (4) windows arranged so that a man on camel-back could not see in, and so that they neither overlooked, nor were overlooked by, others; (5) railing the windows of upper floors so that the women could see into the streets and courts without being observed; (6) arrangement of the entrance to the harim (female apartments) in a special court, or in a place remote from that to the salamlik (male apartments); and (7) the arrangement of rooms, kitchen, bath, stables, &c., with due regard to the ruling breezes, and the construction of ventilators to air the rooms.

The Cairo house had generally several floors, and not infrequently, towards the streets, a row of small shops on the ground floor; while in the upper part of the house, by-like constructions protruded about 1 ft. 6 in., mostly composed of turned wooden lattice-work; the roof was flat, and surrounded by a pendant fretwork ornament. The foundation walls to the height of the first floor were of quarried stone or cased externally with the soft calcareous stone of the Mokattam, while the superstructure was of plastered brick. The house was entered by a more or less narrow dark vestibule leading to the court, and forming one or two angles to prevent those in the street seeing into it. A detailed description of the court and the various halls and rooms was then given, allusion being made to the fact that the horse-shoe arc, commonly considered a characteristic of the Mohammedan arch, was not very frequent in Cairo, the author stating that in all the remains of Arab houses he had examined he had only discovered two instances in which the arcades of the *mahad* (a reception-room on the first floor) were horse-shoe shaped. In the Cairo Arab house all decoration, exterior and interior, was the work of the architect, and not of the decorator or the upholsterer. The exterior was very plain: all ornamentation, if any, being displayed upon the entrance. It was much to be regretted, Count d'Hulst considered, that this style of house building, so suitable to the conditions and requirements of the country, was rejected for the building à la Française, the suitability of which was very doubtful. The house of the French Consulate General, better known as Count St. Maurice's house, showed how well Cairene architecture could be adapted to modern requirements, and what handsome and artistic effects it could produce.

Local taste and exigencies were important factors in Egypt; and in the towns of the Lower Delta and along the sea-shore there existed an altogether different style—namely, brick architecture. What was most noticeable were the doors and doorways, which were ornamented with delightful geometrical designs in a kind of mosaic, composed of thin pieces of red and black bricks, whose furrows were filled in with white plaster and inlaid in the brickwork. Another mode of decoration was the utilisation of the brick itself to constitute the intended design. It was notable that, notwithstanding such a developed technique, no trace of moulded bricks had yet been discovered. All the towns of the Lower Delta had a number of portals of mosques with pendentives constructed entirely of bricks. At Rosetta the ground-floors were exclusively devoted to warehouses and offices; a separate door leads to the dwelling with a staircase to the first floor; a peculiarity is that this staircase very often protrudes with half of

its breadth. In Damietta, as well as in other places, another arrangement existed: the house formed three sides of a square; the entrance on the open side led into a place partly court, partly hall, having roof only in that part which is built over, and this place served for reception. Another style of brick architecture which was interesting was to be met with at Assiout. These brick constructions, being mostly in a ruinous state, were disappearing fast, their material being used for new buildings; yet Count d'Hulst thought the places mentioned in his paper would well repay a thorough exploration.

Mr. Phené Spiers himself added some notes to the paper, of which notes the following is a brief abstract:—Broadly speaking, Saracenic domestic architecture derived its architectural inspiration from religious buildings. The entrance doorways were simpler versions of the magnificent portals which were the characteristic features of Mohammedan architecture, the doorway being placed at the back of a square niche, which rose the whole height of the building, and was arched over with a stalactite vault. It was generally about 5 ft. wide, and from 8 ft. to 10 ft. high, and its decoration was confined to the elaboration of its voussoirs, and to its enclosure within a flat decorative moulding. The corbels which carried the projecting upper floors were generally of stone, and inclined slightly upwards. The principal feature in the chief court was the *mahad* or open gallery, placed on the south side, and facing the north; its architectural design was derived from the arcades surrounding the courts of a mosque. The ceilings, cornices, &c., of the reception-rooms, Mr. Spiers considered, were based on those found in the mosques, which were the finest and earliest. It was possibly due to the absence of published plans of these houses that great diversity of opinion existed in the distinction between the *mandarah* and the *hakh*, and attention was drawn to the points of difference of Mr. Stanley Lane Poole, Mr. Dillon, and Count d'Hulst. In all cases the ceilings were richly painted and partially gilt. The openings between the *durkakh* and the *teenân*, and between the latter and its recesses, were spanned by beams supported on curved brackets and carried on stalactite corbels, the whole being elaborately carved, painted, and gilt. Mr. Spiers joined with Count d'Hulst in deploring the daily destruction of these beautiful works of art. Many of those in Mr. Dillon's drawings had already been pulled down and their decorative features broken up or stolen.

Mr. J. D. Crace, in opening the discussion, remarked that all those who had visited Cairo would thank Count d'Hulst for his extremely interesting paper, and Mr. Spiers for having taken the trouble of reading it. There were one or two points in the paper which struck him as being worth attention. The *mandarah* was always the ground-floor room, but the first-floor room above was often quite as handsome, or even more so. Europeans rarely had the opportunity of seeing the *hakh*, as it was so intimately connected with the ladies' department. Many of the phrases used in the paper appeared to have been taken from Mr. Lane's book. It was well that architects should notice that some of the provincial towns of Egypt presented interesting examples of coloured brickwork, and with regard to the whole subject, the architecture of Egypt presented all the excellences which rendered it suitable for such climates as India and East Africa. People went on building, in tropical countries, houses suitable for London or Paris, instead of adopting some of the architectural arrangements of the Mediaeval East, which would really be of practical utility to Europeans who were resident in hot countries. Mr. Crace concluded by proposing a vote of thanks to Count d'Hulst and to Mr. Phené Spiers.

Mr. W. A. Boulnois asked if the exportation of wood carvings from Cairo still went on as it did some ten or twelve years ago? He spoke from experience, because on one occasion he had instructions from a client to build a room in the Eastern style, with the fittings he had brought home. There was very little to adapt in the interior, but the exterior was made to look like Egyptian work, with zinc and other appliances, and the process was very humbling.

Mr. R. H. Carpenter said that at one end of Cairo there was a museum, containing all kinds of woodwork of this description. It was, however, badly arranged, and there was no cata-

logue. In 1876 he was offered the whole of a house-front, from top to bottom, and though it was wonderfully cheap the difficulty of getting people to pull it down and remove it was too great.

Mr. W. Brindley scolded the vote of thanks. He considered that more might have been made of the subject, by showing what dissimilarity there was between a Cairo house and such houses as were to be found in the South of Spain, in Algiers, and even in Tunis. The marble mosaic pavement of the house of the Muffi, illustrated by Mr. Spiers, had probably been taken from one of the churches built by Justinian. There appeared to be scarcely any remains of these churches left in Egypt, though Procopius stated that Justinian erected several churches in Egypt. Where then were these churches, and where were the mosaics they contained? He did not believe they had all gone to Venice, as most of the mosaics to be found in that city had undoubtedly come from Constantinople. The mosaic referred to by Mr. Spiers was probably part of Justinian's work; and he was persuaded that many of such mosaics were Christian mosaics, adapted frequently with Moorish interlacings of soft marble. He did not believe the Arab ever tackled the working of red and green porphyry. The nearest approach to mosaic with Arab feeling in it was seen in the mosaics to be found at Salerno, Palermo, and Amalfi. There the real Arab feeling was to be seen running through the mosaic, while the Arab mosaic work in Cairo was not in many instances so original. In Granada the old houses remained in some instances as perfect as when left by the Moors. Nearly all the well-to-do modern houses of Seville were on the Arab model, consisting of a central court with marble colonnades, round which were placed the rooms. They were very beautiful, and certainly suited the climate.

The President said that architects might learn much, as artists, from the wonderful works of the Moors, from the manner in which they used geometry, and the beautiful forms from it.

The vote of thanks was then put, and carried by acclamation.

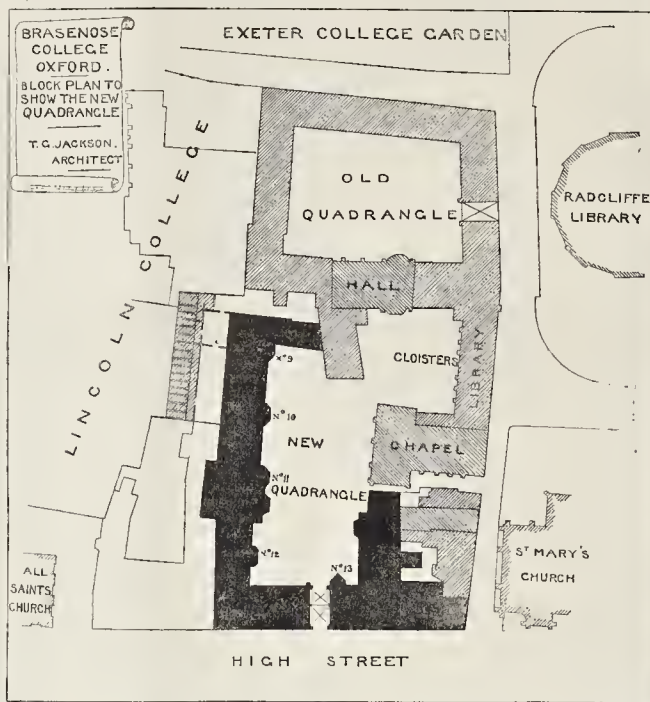

Mr. Phené Spiers, in replying, said that the importation of Calene woodwork still went on to a certain extent. Some little time ago he was able to get an interesting shop-front, but it was becoming more and more difficult to get good Egyptian woodwork out of the country. The adaptation of materials had gone on to a very large extent; old capitals of the Roman period, and occasional specimens of marble and even of porphyry having been used. Still there remained the admirable patterns of the Arabs, or rather of the Copts, who had always been the art-workers of the Mahomedans. The Copts were extremely clever with geometrical patterns, and he had no doubt that the one he had referred to was of the thirteenth or fourteenth century. The number of these patterns was practically endless.

The President announced that the next meeting would take place on Monday, the 16th inst., when the Royal Gold Medal would be presented to Mr. John Gibson (Past Vice-President), and a business meeting would also be held.

The proceedings then terminated.

The English Iron Trade.—The English iron market is in an even worse condition than it was last week, its tendency being still downwards. There is very little business doing in any branch of the trade. Pig-iron has been very quiet. Scotch warrants have gone down steadily, and Scotch makers' iron has declined, in sympathy, from 6d. to 2s. 6d. a ton, according to brand. Cleveland iron has lost another shilling in value, and even at that rate is little inquired after. In other districts similar conditions prevail, lower prices and a dull demand. Bessemer pig has settled down to 5s. in the north-west, the trade being without life. There is little animation either in finished iron or steel. Further reductions in price are noted, ranging from 2s. 6d. to 7s. 6d. a ton. The prospects of the shipbuilding trade are not improving. Those of engineers are slightly better.—*Iron.*

Ventilation.—Messrs. Baird, Thompson, & Co., have introduced their system of ventilating into the large new Abbey Parochial Hospital, erected at Paisley, their improved patent self-acting exhaust ventilators being used for the extraction of the vitiated air.

Illustrations.

SOME CHURCHES UPON THE LOWER RHINE.—V.

ST. QUIRINUS AT NEUSS.

THE little town of Neuss, on the Lower Rhine, a little south of Dusseldorf, is not a very agreeable place. It stands in the midst of a dreary-looking plain, and is unattractive to the general traveller who is in search of pleasure or recreation. The architect or antiquary will, however, pardon its dingy appearance and odours on account of its archaeological treasures. It is undoubtedly a place of Roman origin, and monuments of a very early date, coins, and other relics are constantly being found. There are considerable remains of Mediaeval walls, and two very fine gates, built of brick, with extinguisher-capped towers, which may date as far back as the fifteenth century. The principal street is not unpicturesque, and possesses some fairly good gabled houses. There are four churches in the town, but only one of them is specially worthy of notice; it is the minster, or Church of St. Quirinus. The building is a remarkably interesting example of Transition from Romanesque to First Pointed, consisting of a nave and four aisles, western tower with transepts, and a "crossing" from which two short apsidal transepts and an eastern apse radiate. This crossing is crowned by an octagonal lantern terminating in a dome, each side of the lantern being gabled. Whether the dome is part of the original design or not it is difficult to say. Externally the west front is by far the finest portion of the church. It is a singularly rich and beautiful composition, more like the Late Romanesque work of Lombardy than that of Germany. The date inscribed near the western doorway is 1209, but probably this only refers to the upper portion of the work.

The tower appears to be slightly later than the gables below it, and has rather an English look about it. The parapet and pinnacles are, of course, later,—fifteenth- or, possibly, sixteenth-century work. In all probability, as originally erected, the sides of the tower were gabled, and the composition terminated in a square spire with its angles set upon the apices of the gables.

The interior of the Church of St. Quirinus is very striking. It is remarkably lofty in proportion for an early church. The nave is vaulted

in square quadripartite bays, each containing two pier arches and two triforium openings. The latter are subdivided into two lights, and the triforium itself is vaulted with moulded ribs.

The outer aisles are subdivided into chapels containing modern Romanesque altars. The lantern is internally vaulted with octopartite groining, which has been decorated by Overbeck. The work, however, is unworthy of that master, and singularly feeble and poor. Standing under the lantern is a huge modern Romanesque baldacchino and high altar of the most wretched design. The three apses which form the eastern portion of the church are beautifully treated, and, if the wretched modern high altar were cut down, would have a charming effect when seen from the nave. There is a very original treatment of the choir here which offers a most valuable and useful suggestion for our modern churches. The choir-stalls, which are excellent examples of fourteenth-century woodwork, instead of running in a straight line from east to west so as to cut off the transeptal apses, follow the curves of the apses themselves. This is not only a utilisation of space, which is generally lost, but has two other advantages, for, while it places the choir in its correct position, it prevents the singers being so very conspicuous as they generally are in a stalled choir; and, secondly, there can be no doubt that each set of stalls being backed by a semicircular apse is better for sound than a flat wall or open screen.

Beneath the three eastern apses and the "crossing" is a very early crypt, which is visible from the nave, and is entered by a flight of steps in the centre going down into it; this crypt is divided into three aisles by two rows of small columns, and has a grand, mysterious effect.

Except the stalls previously mentioned, the Church of St. Quirinus, at Neuss, contains no furniture worthy of notice. H. W. B.

BRASENOSE COLLEGE, OXFORD.

THE illustration shows one bay of Mr. Jackson's new front of Brasenose College, in the High-street of Oxford, and is reproduced from the drawing exhibited in the Royal Academy this year.

The completion of the new front will be the last portion of an extensive scheme for the enlargement of the College by a new quadrangle

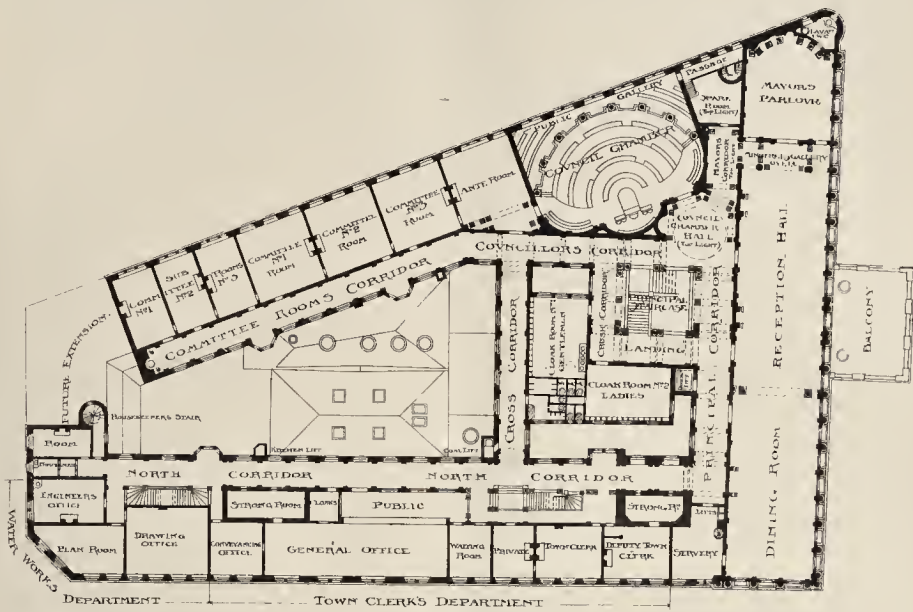

MUNICIPAL BUILDINGS, SHEFFIELD.

DESIGN SUBMITTED IN THE FIRST COMPETITION BY MESSRS MORRIS & HUNTER.

No. 1879 Royal Academy Exhibition, 1890.

may 1890

FIRST FLOOR PLAN

E. J. MAY, Architect.

which was begun in the year 1882, and has been carried out in successive instalments down to the present time. There still remains one block to be added in order to complete the new quadrangle, which has to await the expiration of some leases. The accompanying block plan shows the extent of Mr. Jackson's additions to the College.

The bay we illustrate to-day is at the south-east corner of the new front, next to St. Mary's Church, and forms part of the new house for the Principal.

The general contractor for the last part of the work was Mr. Dobson, of Colchester. The Clerk of Works was Mr. Mocketford.

BARNSDALE HILL, RUTLAND.

THIS house is being built on a fine site, about three miles from Oakham. The walls are built and faced with stone from Exton Park, in the neighbourhood. The general stone dressings are of Weldon stone, and the copings, cornices, and weatherings of Doulting stone. The red moulded bricks for the chimneys are from Cossey, near Norwich, and the facing bricks from the same neighbourhood. The roof is tiled. Mr. Grundy is to warm part of the house with hot air. The hall is eventually to be panelled with some of the fine oak from Wentworth Park, Yorkshire. The contractors are Messrs. Foster & Dicksee, of Rugby, and the architect Mr. E. J. May, F.R.I.B.A. The clerk of the works is Mr. Woolcott. The illustration is from a drawing in this year's Royal Academy Exhibition.

COMPETITION DESIGN FOR SHEFFIELD MUNICIPAL BUILDINGS.

WE give this week the elevation and two plans of the design submitted in the first competition by Messrs. Morris & Hunter, the elevation of which is exhibited at the Royal Academy. In regard to the intention and scheme of the design, the architects give the following notes embodying a portion of their report:—

"The conditions governing the plan are briefly these:—That it should be convenient in its general arrangement for the effective working of each of the several departments, whether taken separately or in their necessary inter-communication; that the corridors should be direct; that the general entrance doors and those to the public offices and principal rooms should be centrally placed and easily discerned; the staircases convenient to the departments to which they lead; and that finally, the various departments may admit of future extension and rearrangement, and that this last proposition is best provided for by continuous and circumambulant corridors. Beside the small spaces shown on the ground and first floors for future extension, an additional area of 6,400 sq. ft. is provided on the second floor for the same purpose."

The Council-chamber has been placed in the angle formed by the diverging line of Cheney-row, partly because by having direct communication on either side with the Mayor's parlour and committee-room suite it is better adapted for the general transaction of Council business, and partly because, by being so situated, it avoids the objections to a Council-chamber placed in a central area and surrounded on all sides by corridors, while the requisite quiet and absence of bustle is secured by its being placed, together with the committee-rooms, towards the side overlooking the churchyard. The Council-chamber is semicircular in form and is lighted principally by a range of clerestory windows. Directly beneath, on the ground floor and partaking generally of its form, is the Borough Accountant's public office. The ceiling of this room, above the public portion, is 15 ft. high, but by the upward slope of the Council-chamber floor above and the public gallery, a height of 21 ft. is reached at the outer wall, in which are placed windows of that height, throwing a flood of light into the room. In the Waterworks Department the administrative and clerical portions are placed on either side of the departmental corridor.

The grand staircase rises directly from the entrance-hall, and being the state staircase leading to the reception-rooms suite, it has been treated with greater elaboration. The entrance-hall is comparatively low, and its ceiling is broken up into panels by heavy beams supported by solid stone columns. This hall has been purposely kept low in tone and heavy in character to give full value to the arched staircase, with its bright dome light, which rises directly beyond. On the first floor the staircase is surrounded by corridors, giving access to the reception-rooms suite, the Council-chamber, committee-rooms, and cloak-rooms. As the promoters desire that the latter shall be placed on the first floor and be common to the reception rooms and Council-chamber suites, an effort has been made to secure the avoidance of the unfortunate crush some-

times observable during receptions when ladies and gentlemen's cloak-rooms are respectively on either side of a staircase, and opening from a reception corridor. In a continuous line are the reception-room, dining-room, and Mayor's parlour, and these occupy the entire length of the Pinstone-street front.

The heating throughout would be by hot water. Fresh-air inlets are provided to each room, and these, together with the hot-water pipes and foul-air extracts, would be under the control of the occupants of each room, the foul air being conducted by a series of exhaust tubes to the large upmost exhaust shafts fitted at either end of the building. The entire drainage system is concentrated at two points, from whence it would be discharged into the main sewer, and at the head of each system are automatic flushing tanks.

Externally the design is influenced by its site, its surroundings, and the material of which it is supposed to be built. To be effective one ventures to think that it should be treated simply and in mass, with strong broad mouldings and detail, and this is perhaps rendered the more imperative by the smoky condition of the city atmosphere. These considerations seemed to point to the Italian Renaissance as a style combining the simplicity and breadth considered essential, together with the dignity associated with the abode of a civic body. The range of reception rooms having naturally settled themselves towards the main front, and requiring a much greater height of ceiling than that necessary for offices, the Surrey-street front has been detached from it by the tower, and treated separately as two floors. The greater height of the reception-rooms suite seeming to preclude the idea of rooms being placed above for any practical use, and increased vertical height not being thereby obtainable, the necessity for a strong horizontal treatment more distinctly asserted itself; while again, if the grand length internally of the reception-rooms suite were broken by the contracted walls of a heavy central tower, it seemed clear the effect of these rooms would be considerably reduced. The desirability of an unbroken range of building having thus arisen from the requirements of the plan, it was endeavoured to give expression to the same in the elevation.

As a tower rising from the Pinstone-street front could not be well seen from any very important point near, it has in consequence been kept behind the line of the front walls, and placed so that rising from the Surrey-street wing, its upper and richer stages could be seen above the roof of the front block, and from its great height and mass form the crowning feature of that summit of the city."

THE ARCHITECTURAL ASSOCIATION: A NEW DEPARTURE RESOLVED UPON.

THE adjourned special business meeting, to further consider the report of the special Education Committee* was held on Friday, May 30, at 9, Conduit-street, the President, Mr. Leonard Stokes, in the chair.

Mr. Owen Fleming announced that the first vacation visit would be made on Saturday, June 7, to Ship-lake Court, by permission of the architects, Messrs. Ernest George & Peto.

The President said they would now proceed with the discussion on the report of the special Education Inquiry Committee, but, before doing so, he would just like to point out that although the report as printed in *A. A. Notes* was the report of the special Committee, the report had been submitted and approved by the general Committee of the Association, and the general Committee having adopted it, it was therefore now not merely the report of the special Committee, but was the report of the general Committee. He had also to announce that in the interval which had elapsed since the last meeting, the Committee had considered the suggestion made by Mr. Stannus of dividing the report into sections, or of submitting resolutions covering certain definite portions of the report. As the result of that consideration, the Committee had drafted a series of resolutions which would be submitted to the meeting. With regard to the latter portion of Mr. Stannus's amendment, directing that the opinion of the members should be taken by paper on a certain part or parts of the scheme, Mr. Stannus was not there, but he understood that he only proposed that the opinion of members should be taken after the discussion of the report, and therefore he would gain nothing by pressing that part of his amendment then.

Mr. C. H. Brodie, as the mover of the adjournment of the discussion on the last occasion, then rose to continue the discussion. He said that he thought it was gratifying to find that the Committee should have adopted Mr. Stannus's suggestion as to dealing with the

report by sections. But that having been done, he hardly knew now upon what he was going to speak.

The Chairman said that Mr. Stannus's amendment having been virtually accepted by the Committee, they proposed to take the report in sections, each of which would be covered by one of the resolutions which had been drafted by the Committee. Passing over the first portion of the Report, from page 123 to a little way down p. 125 in *A. A. Notes*, which was purely historical, they came to the actual recommendations of the report in which the Committee recommended the necessity of the adoption of a methodical system of teaching. In order to give effect to that portion of the Report, he would move from the chair the following resolution:—

"That some more methodical system of study is essential in the Architectural Association, and that the need of such a system is emphasised by the recent publication of the Institute programme of progressive examinations."

Mr. Brodie said he should be very happy to second that.

Mr. Leverton supported the motion.

Mr. Needham Wilson said he failed to see what were the arguments to show that the present system had failed. He thought it would be a great mistake for the Association to convert itself into a mere cramming machine for the Institute Examination. He went further than saying, with Mr. Cole Adams, that the Association should not become a mere College of Architecture, and he said that they must not make it into a mere cramming machine.

The Chairman then put the resolution to the meeting, which was carried unanimously.

The Chairman said that the next resolution that he would move was as follows:—

"That the mutual system, which was adopted by the Association at a time when the number of members was small, now presents great disadvantages and difficulties."

Mr. Leverton opposed this motion. He said that each Class under the present system had either a chairman or a number of Visitors who were generally far removed from the members of the class, both in years and in knowledge. He thought that Mr. Slater failed to prove his case that the mutual system had failed. When the Association was first established it was quite true that it had not anything like the same number of junior members that it now had; but then it had few or no senior members to draw upon for Visitors. Now, they had in their "Brown Book" the names of some of the very first men in the profession. Mr. Slater had mentioned the fact that they had now eighteen classes, and he urged that as a reason why they could not go on with the voluntary system. Mr. Slater said that the voluntary system had been strained to the breaking point. On the contrary, he (Mr. Leverton) did not think that it had reached the limit of elasticity. The great disadvantage of having paid Visitors was that it would restrict them to the choice of young and comparatively unknown men as teachers, for they could not expect the leading men of the profession to come down and teach them for the remuneration they would be able to offer. But on the other hand, if the teachers were honorary officers, there was no reason why they should not ask the leading men in the profession to come and act as Visitors. He was quite aware that, on the other hand, a great disadvantage of having honorary Visitors, instead of paid teachers, was that a great many would be required to work the Classes; and there was the further disadvantage that with a succession of Visitors there would be some loss of continuity in the work. There were a great many things in architecture which were matters of individual opinion, upon which one could not lay down the law and say "This is right" or "That is right." Naturally the pupils would favour the views of the men whom they best knew or admired. He suggested, therefore, that for the first half of the proposed course—

Mr. F. R. Farrow, hon. sec., here rose to order, on the ground that Mr. Leverton was referring to the details of the curriculum, which would be dealt with in subsequent resolutions.

Mr. Leverton, resuming, proceeded to quote from a letter written by Mr. Farrow to *A. A. Notes* in November, 1887, concerning that the mutual system had worked well, and that it would be undesirable for the Association to put itself into competition with the classes at University College or elsewhere. And yet Mr. Farrow had signed the report of the special Committee

* See pp. 316, 349, 371, and 376, ante.

Mr. Farrow said it was quite true that he had changed his views on the question, but the present position of architectural education and of the profession in general was totally different to that which it held when he wrote the letter quoted from. Since that time the Institute had established a scheme of progressive examinations. Had not that scheme of examinations been established, the need for the proposed new departure on the part of the Association would not have been so imperative as it was. The Royal Institute of British Architects had changed its tactics, and had said that every man entering the profession must pass through a systematic course of study. But where was that course of study to be pursued? It could be obtained easily on the Continent, and in America even, but was not to be obtained in this country; and he thought that the Association, as the largest architectural society in the country, would be very much to blame if it did not take some steps to provide the deficiency. Mr. Leverton had said that they had a large number of Visitors to draw upon for their classes. It was no doubt true that a great many of their members were competent to act as Visitors, but it was exceedingly difficult to get them so to act, even for one night per session. That was his experience, and he thought it would be the experience of all who had been engaged in the working of the Classes during the past ten years. As a matter of fact there had, for some few years past, been some departure from the mutual system, as was seen in the fact that they had already one or two classes in which they had paid lecturers or teachers.

Mr. Cole A. Adams said that if he thought for one moment that the intention of the resolution before the meeting was to eliminate altogether the mutual system from the work of the Association, he should support Mr. Leverton in opposing it. But he did not read it so. He thought that the resolution was simply an expression of opinion that now that the Institute had established the Examination, the voluntary system of work in the Association needed supplementing. He therefore hoped that they would vote upon the motion without further delay.

Mr. Max Clarke thought that the resolution was somewhat too vague. The question was, if the resolution were carried, how far would the Committee be bound to employ paid teachers? He was sorry to see that there was, comparatively speaking, such a small attendance of members present.

The Chairman then formally put the motion, which was carried with only one or two dissentients.

The Chairman then moved the next resolution:—

"That it is advisable to adopt the Institute programme as the basis (but not the limit) of any systematic course of instruction established by the Association."

Mr. Harry Sirtt thought that the resolution rather committed the Association to do too much,—that was, if he understood it aright. If it were carried, would it bind the Association to establish a class with a paid teacher for every subject in the Institute programme?

The President, in reply, said certainly not. Classes would only be established as they were needed, and in response to a demand for them on the part of the members.

Mr. W. Barrall said that he did not like the wording of the resolution at all. Why should they make the Institute programme the basis for their work in the Association? He did not say that that programme was a bad one, and he should have no objection to the formation of classes for the study of the subjects mentioned in it, and others besides.

The President said that that practically amounted to the same thing.

After some further discussion, the resolution was carried with only five or six dissentients.

The President said the next resolution he had to move was as follows:—

"That a combination of lectures and classes is preferable to teaching in classes or by lectures taken singly; and also that, as a general rule, instruction in any one subject is likely to be better imparted by a single teacher, but that for advanced students the system of Visitors is in most cases preferable."

Mr. Max Clarke moved, as an amendment, the omission of the words "in most cases" in the last line of the resolution.

After some discussion, this amendment was negatived by a large majority, only about a dozen hands being held up in its favour, and the resolution was then adopted.

The President next moved the following resolution:—

"That in formulating any curriculum of study, the work should, as far as possible, be so arranged as not to necessitate, generally speaking, more than twelve hours of evening work in each week."

After some little discussion this was carried unanimously.

The President next moved:—

"That it is particularly desirable that an architectural studio be established by the Association."

Mr. Leverton moved, as an amendment, "That the consideration of the establishment of a studio be postponed for a year." This, however, finding no seconder, dropped to the ground, and after some remarks by Messrs. E. S. Beale, C. H. Brodie, and Percy D. Smith (A.A. Travelling Student for this year), all in favour of the recommendation of the Committee, the resolution as put from the chair was unanimously adopted.

The President next moved:—

"That it is desirable that a course of day instruction be established on the same basis as the evening instruction."

Mr. Needham Wilson said he was not in favour of that proposal, and must protest against the establishment of any such thing as a day-class, except for pupils preparing to enter architects' offices. After an article pupil had been a short time in an architect's office his principal expected to get some small return in the shape of work for the pains bestowed upon the pupil. He did not think it fair to ask the principal to allow his pupils to go to a day-studio or to day-classes.

Mr. Cole A. Adams said he heartily supported the resolution before the meeting. The establishment of day-classes was inevitable. It would be in the knowledge of all who were members of the Institute that quite recently that body had issued what might be called a model form of articles of pupilage, and one express stipulation in those articles was to the effect that the principal should give all reasonable facilities for enabling the pupil to improve his knowledge, and to go up for the Institute Examination. Now that form of articles had been issued to practically all the senior members of the profession who were principals, and who had a tolerably fair knowledge of the pulse of the profession. He was therefore decidedly of opinion that the establishment of day-classes would be a very great success, and that the principals themselves would welcome them. Those who did not would probably find it difficult to get pupils after a time.

Mr. Beale said that the Association was taking a very great step in the passing of the report. They had heard various arguments in favour of day-classes, and the report of the Committee, indeed, was in favour of them. Why not, then, start these day classes directly they started with their new scheme? He thought it would be most advisable to do so, and he therefore begged to move as an amendment "that it be an instruction to the Committee that arrangements for the formation of a day-class should be made concurrently with any departure that may be decided upon in connexion with the new scheme."

The President pointed out that that amendment would not be necessary, for if the meeting adopted the resolutions, the Committee would certainly take steps to establish a day class as soon as opportunity offered.

After some further discussion, in the course of which the amendment did not find a seconder, the resolution was carried with only one dissentient.

The President then moved:—

"That it shall be made possible for members to obtain books from the library during the day-time."

Mr. Brodie said he heartily supported the motion, but he strongly deprecated any countenance being given to the suggestion made in the Report that possibly the library of the Association might be amalgamated with that of the Institute, or placed under the control of an officer of the Institute. He should strongly object to anything of that kind. Let there be as much good feeling as possible between them and the Institute, but let them keep their affairs quite separate.

The motion was unanimously carried.

The Chairman said the next resolution he had to move was

"That, inasmuch as it would not be possible to carry out the proposed curriculum relying only on voluntary helpers, it is desirable that additional paid teachers be appointed."

After some discussion, in the course of which the Chairman said it was by no means desired to abolish voluntary helpers altogether, the resolution was carried by a large majority.

The Chairman next moved:—

"That this meeting approves the scale of fees mentioned in the report, subject to such modification as may be found necessary."

This proposition led to a desultory discussion in the course of which three or four members expressed the opinion that the fees suggested were too high. The general opinion, however, appeared to be that the fees were as moderate in amount as could be expected, and the President pointed out that if these resolutions were passed, the whole scheme would be remitted to a Committee to carry out; and they might be quite sure of it, that if the fees could be placed at a lower figure than those named, it would be done. Mr. Barrall thought that the whole scheme, if carried, would press somewhat hardly upon some of their members who were unable to afford the fees; because while they would be arranging by this scheme for a series of classes with paid teachers and lecturers, they would not be carrying on concurrently the free classes which were now available for those of their members who would not be able to afford fees. Mr. Brodie, referring to this point, said that no doubt there would be some cases of hardship, but was any reform ever effected without pressing hardly upon some people? Mr. Leverton strongly opposed the scale of fees. He expressed his belief that if it were adopted it would wreck the whole scheme. He moved as an amendment "That members of classes with paid teachers pay 10s. 6d. per term for each class." He was proceeding to quote figures with a view to showing that some arrangement of this sort would be sufficient, when Mr. Cole Adams suggested that Mr. Leverton should put the details of his scheme on paper and place it before the Committee for their consideration. Mr. Leverton was understood to consent to do so; as any rate his amendment was not seconded, and the resolution as proposed from the chair was carried almost unanimously.

The President next moved:—

"That it has become absolutely necessary that a paid Assistant Secretary be employed."

Mr. Earle having said a few words in support of this motion, it was carried unanimously.

The President then moved:—

"That this meeting considers that the annual subscription for town members should be raised to one guinea, and that for country members should remain as at present."

He explained the reasons for this recommendation, as set forth in the Report, and said that after giving very close and careful attention to this matter the Committee saw no alternative but to submit this proposal for their acceptance. It was absolutely necessary to adopt that course.

Mr. Cole Adams having made some remarks on the subject,

Mr. Max Clarke said he was now convinced that the time had come to take the step indicated in the resolution, which he therefore cordially supported.

Mr. Brodie said he feared that the motion if carried would cause a great many old members to fall out of the ranks of the Association, and he therefore desired to move, as an amendment, "That it be an instruction to the Committee to provide for the creation of a class of honorary members, whose annual subscription shall remain at 10s. 6d., provided that they have been subscribing members for not less than ten years."

Mr. Needham Wilson spoke against the proposal of the Committee.

Mr. Owen Fleming asked whether Mr. Brodie suggested the creation of a "finite" class of members who had paid their subscriptions for ten years, or whether he meant that the ranks of that class should be added to from year to year by the inclusion of all members who had subscribed for ten years?

Mr. Brodie said that his intention was that suggested in the last part of Mr. Fleming's question.

Mr. H. W. Pratt said that, as Treasurer, he thought there was something worth consideration in Mr. Brodie's proposal.

Mr. Brodie's amendment having been seconded, a good deal of discussion ensued, Mr. Mountford and other members expressing it as their decided opinion that with scarcely an exception the old members of the Association would prefer to pay the increased subscription.

They would have sufficient *esprit de corps* not only not to desert the Association at a time of difficulty, but to do all they could to help on the new departure. One member made the suggestion that the "half-guinea" members should be distinguished in the "Brown Book" from those who paid a guinea a year. The Chairman said that was a detail: if the amendment were carried no doubt some means would easily be found of distinguishing the "honorary" members. The amendment was then put, and as only 17 hands were held up in its favour it was declared lost. The discussion was continued by Mr. Needham Wilson, who protested against the proposed increase of town members' subscriptions, and by Mr. Leverton, who moved a further amendment to the effect that the meeting be adjourned with a view of eliciting the opinions of the members at large. This having been seconded, was put to the meeting, when twenty-one members voted for it, and a very much larger number against it. The motion proposed from the chair was then put and carried by a large majority, and the following motions were one by one unanimously agreed to,—

"That this meeting approves the suggestion of the Committee that a Guarantee Fund and an Endowment Fund be established."

"That the best thanks of the Association be expressed to those gentlemen who so kindly, considerately, and ably assisted the Special Committee in the preparation of their report."

"That the resolutions which have been passed be referred to the General Committee, with instructions to take the necessary steps to carry the same into effect."

This concluded the business of the evening. It was announced that a special general meeting of members would be held on Friday, June 13, to consider the alterations of rules which will be necessary to give effect to the foregoing resolutions.

ARCHITECTURAL SOCIETIES.

Nottingham Architectural Society.—The annual general meeting was held on the 23rd ult. It was resolved that the Society subscribe the sum of 10*l.* 10*s.* to the guarantee fund for holding the Congress of the National Art Association in the town in 1891, and 5*l.* 5*s.* to be awarded as a prize to architectural students studying at the School of Art or University College, the special fund for the prize will take effect as decided by the Council of the Society after consulting the authorities of the institutions named. Mr. G. T. Hine, F.R.I.B.A., retired from the presidency, after two and a half years of office, and Mr. Herbert Walker, F.R.I.B.A., was elected in his place, with Mr. William Jolley, F.R.I.B.A., vice-president.—Messrs. Fred. Jackson, F.S.I., R. Booker, F. Watson, J. Howitt, and A. E. Heazell were chosen members of the Council, and Mr. J. W. J. Barnes, F.S.I., honorary secretary and treasurer.

Edinburgh Architectural Association.—The annual general meeting of this Association was held on the 30th ult. in the Architectural Hall, George-street.—Professor G. Baldwin Brown, President, in the chair. The Secretary (Mr. T. Fairbairn) read the report of Council, which stated that during the session twenty-seven new members had been admitted, the number on the roll being now 273. Mr. A. Dods Fairbairn, C.A., submitted the balance-sheet, which showed an excess of revenue over expenditure of 28*l.* 16*s.* 6*d.*, the balance in hand being now 192*l.* 6*s.* 2*d.* Mr. R. M. Cameron read his report on the library; and Mr. Hippolyte J. Blanc submitted his reports of the Work Class and Sketch-book Committees. All the reports were adopted. Mr. John Kinross was appointed President. The retiring President (Professor G. Baldwin Brown) then delivered his valedictory address. After reviewing the work of the Association, he referred briefly to the present position of the architectural profession in Scotland. Questions of the organisation of architects and of the architectural education of students were under discussion, he said, and it was to be hoped that the outcome would be a closer union among members of the profession for the furtherance of common aims, as well as improvements in the methods of art education.—The annual excursion of the Association took place on Saturday last, when about thirty members of the Association left the Waverley Station for Dunfermline early in the day, under the leadership of Mr. Russell Walker.

THE LONDON COUNTY COUNCIL.

The London County Council re-assembled on Tuesday last in Spring-gardens, after the Whitson recess, Lord Rosebery in the chair.

Petitions.—Among the petitions was one from the St. Luke's Vestry, presented by Councillor Benn, praying that the Council would take over and maintain as open spaces St. Luke's Churchyard and the Seward-street burial-ground, both of which have been hitherto maintained by the Vestry of St. Luke's. The petition was referred to the Parks and Open Spaces Committee for consideration and report.

Gardens and Open Spaces and the Local Authorities.—The Council then resumed, for the fourth day, the discussion of the report of the Parks and Open Spaces Committee, recommending—

"That, subject to an estimate being submitted to the Council by the Finance Committee, as required by the statute, the Council do undertake, at an estimated cost of 1,020*l.* a year, the future maintenance of the following places:—

	Area.	Estimated cost for wages.
1. Red Lion-square-garden, Holborn.....	1a. 2r.	£28
2. Whitdore-street-play ground, Whitechapel..	0a. 2r.	30
3. St. Dunstan's Churchyard, Stepney, garden.....	7a. 0r.	142
4. Lindhouse Churchyard, garden.....	3a. 0r.	111
5. Holy Trinity Churchyard, Finsbury-square, Bow, garden.....	1a. 1r.	50
6. Carlton-square-garden, Mile-end.....	0a. 3r.	50
7. St. Paul's Churchyard, Rotherhithe, garden....	0a. 3r.	50
8. Spa-fields-playground, Exmouth-street, Clerkenwell.....	2a. 0r.	50
9. Drury-lane-playground, Russell-court.....	0a. 1r.	50
10. St. Paul's Churchyard, High-street, Shadwell, garden.....	1a. 0r.	50
11. St. Bartholomew's Churchyard, Bethnal-green, garden.....	1a. 0r.	50

Materials..... 19 0 acres. 571
 £1,020"

The reasons which induced the Committee to make this recommendation were stated in their report, which we printed *in extenso* in the *Builder* for May 17 last, p. 361. In the course of the discussion on previous days the recommendation of the Committee had been modified, and the following amendment carried, viz.—

"That the Council is unable to agree to the principle involved in the recommendation that the Council shall take over small spaces which are purely local in their benefits, and which ought therefore to be maintained by the local authority; but, subject to an estimate being submitted to the Council by the Finance Committee, as required by the statute, the Council do undertake, at a cost of 1,020*l.* per annum, to re-open and maintain the places recommended by the Committee, for eighteen months, at the expiration of which time it is hoped that the District Councils will be in office, and may be induced to take them over and maintain them; and that an application be made to the Charity Commissioners for a grant out of the City Parochial Charities Fund towards the maintenance of these grounds."

This having become a substantive motion, the following amendment, moved by Councillor Phillips at a previous meeting of the Council, but not then disposed of, also stood upon the paper, viz.—

"That on the understanding that no precedent for future action is hereby established, the Council do undertake the maintenance until October 31, 1892, at a cost not exceeding 500*l.* per annum, of the undermentioned disused burying-grounds which the Metropolitan Public Gardens Association have laid out, but the maintenance of which they have intimated inability to continue."

On the amendment being put to the vote, 23 hands were held up for it, to 22 against. A division being demanded, the votes were: For the amendment 42, against 36. The amendment was therefore declared to be carried. On the Chairman proceeding to put this as a substantive motion,

Councillor Beresford-Hope moved the following amendment:—

"To leave out all the words after 'That,' and to insert the words—'subject to the Vestries or District Boards of the parishes or districts within which the undermentioned gardens or playgrounds are situated, entering into proper agreements to undertake the management and control thereof, the Council do contribute towards the annual expenses thus incurred an amount not exceeding in each case that stated in the report of the Parks Committee; and that this arrangement do continue until a Bill for establishing District Councils shall have been passed into law.'"

* That is to say, those mentioned in the foregoing list.—Ed.

Councillor Acworth seconded this, partly on the ground, he said, that it would not be decent to decide the question while petitions such as the one from St. Luke's were under the consideration of the Council. Councillors Howell, Williams, Westcott, Probyn, Elliott, and Hughes supported this amendment.—Col. Hughes on the ground that if the recommendation of the Parks Committee were adopted, the Council would have many of the local authorities coming to it and asking it to take over their duties and liabilities with regard to the maintenance of small open spaces, gardens, and playgrounds, such as were mentioned in the Committee's recommendation. He wished to know whether the respective local authorities in whose districts the various gardens and spaces referred to were situate had been applied to to bear the cost of maintaining and keeping open their own local spaces? Alderman Lord Meath replied that they had been repeatedly applied to, but without result. Councillors Edis and Eneas Smith protested against the injustice involved in the proposal of the Committee. Many of the Vestries and District Boards in the metropolis (the St. Pancras Vestry, for instance) had cheerfully done their duty in maintaining their own open spaces. Were they now to be doubly taxed by having to contribute to the maintenance of gardens and playgrounds in districts where the local authorities had shamefully neglected their duty in that respect? Alderman Sir Thomas Farrer and Councillor Antrobus pointed out that the local authorities in whose districts the eleven open spaces mentioned in the Committee's recommendation were mostly those who received large subventions (ranging from about 8,000*l.* in the case of Bethnal-green down to 1,000*l.* in another district) from the general Metropolitan rate, and yet they refused to maintain their own local gardens and playgrounds. The amendment, on being put to the vote by show of hands, was declared lost.

Councillor Lord Compton then moved the following amendment, viz.—

"To omit all words after 'That' and to substitute the following words—'the Council, whilst strongly of opinion that it is the duty of the local authorities to maintain public gardens and playgrounds which are for the benefit of their respective districts, is unwilling that the gardens and playgrounds referred to in the Parks Committee's report should be closed for want of funds, and will, therefore, subject to the Metropolitan Public Gardens Association agreeing to continue for a time the maintenance of the small open spaces in question, contribute towards the cost of such maintenance a sum not exceeding 1,000*l.* a year until such time as District Councils are established in London.'"

Councillor James seconded this amendment, which after a short discussion was lost.

Alderman Stuart then moved as a further amendment:—

"That, in the opinion of this Council, it is inexpedient that the Council should undertake the maintenance of the eleven open spaces referred to in the report of the Parks and Open Spaces Committee."

Councillor Westcott seconded this, which was supported by Councillors Osborne, Benn, and Howell Williams,—the last-named urging that the Council ought to obtain a perpetual easement over each of the areas mentioned before they took any action in the direction recommended by the Parks Committee. Councillor John Barns also supported the amendment, on the ground that if the Committee's recommendation were adopted, the Council would be asked to take over some sixty more small open spaces which ought to be maintained by the local authorities. On being put to the vote, forty-two hands were held up in favour of the amendment, and forty-eight against. A division was demanded, with the result that forty-seven voted for the amendment, and fifty-three against. The amendment was therefore lost.

Alderman Barker next moved another amendment, viz.—

"That this debate be adjourned for one month, the Council being of opinion that it is undesirable to adopt the recommendation of the Parks and Open Spaces Committee until the opinion of the London Vestries generally had been obtained on the subject."

In support of this amendment, Alderman Barker pointed out that the annual vestry elections had only just taken place, and that they had hardly had time to meet yet. Those bodies had received a large infusion of new blood, and it would be better to wait and see whether they would not, after all, decide to do their duty in the matter in question. Councillor Farvell seconded the amendment. After being discussed for some time, it was put to the vote, and was lost on a show of hands by 43 for to

45 against, and on a division by 49 for to 53 against.

Councillor Hutton moved a further amendment to the effect that the Council should obtain a perpetual easement over all the open spaces in question before pledging itself to maintain them. This amendment having been seconded, Alderman Lord Meath said he believed that a clergyman had no power to give a perpetual easement over a disused churchyard or burial ground. After some further discussion, the amendment was lost, on a show of hands, by 45 for to 47 against.

Councillor Hughes then moved, and Councillor Corbett seconded:—

"That the Council do proceed to the next business."

This was at once put to the vote, 49 hands being held up for it, and 50 against. On a division being taken, the numbers were 48 for and 53 against the motion, which was consequently lost.

The closure was then moved, and Councillor Phillips's amendment, verbally altered so as to read as follows:—

"That, subject to an estimate being submitted to the Council by the Finance Committee, and on the understanding that no precedent for future action is hereby established, the Council do undertake the maintenance until October 31, 1892, at a cost not exceeding 900*l.* per annum, of the undermentioned* grounds, which the Metropolitan Public Gardens Association have laid out, but the maintenance of which they have intimated inability to continue,"

was put to the vote and carried on a show of hands by 45 votes for to 42 against. A division was not demanded.

Alleged Sub-letting of Brickwork by a Contractor.—The first paragraph of the adjourned Report of the Special Committee on Contracts was as follows:—

"On April 30 last year the Main Drainage Committee reported to the Council that the contractor for the construction of the precipitation works at Crossness had practically sub-let the brickwork, contrary to the terms of his contract, and they recommended that he should be fined 200*l.* The Council, however, referred the matter back to the Committee, with instructions to invite the contractor before them. On October 22 the Committee reported that, having taken further evidence, they did not consider that what had been done amounted to sub-letting, and they recommended that no further action should be taken. This recommendation was not adopted by the Council, but the minutes of the evidence were referred to your Committee for report. Wishing to put the matter as far as possible beyond dispute your Committee consulted a Solicitor, who concluded his report with the following words:—

"Unless, therefore, some stronger evidence can be obtained of a sub-contract having been made by the contractor, I could not advise the Council to sue for the penalties. Not content with this, your Committee submitted the whole of the evidence for the opinion of Mr. Meadows White, Q.C., and the conclusion at which he arrived was stated as follows:—'On the whole I am of opinion that there is not enough evidence in the statements, the whole of which I have read and considered, to justify the expectation that penalties could be recovered for breach of contract under clause 11'; and he further states:—'I do not think that the Council is in a position to enforce the penalties under clause 11', and my strong impression is that Messrs. Jones were acting under an arrangement, in substance such as that described by Mr. Webster and Mr. Hunter Jones, and, if so, they were not sub-contractors under Mr. Webster.' Having regard to the opinions above stated, your Committee consider that no good result would be obtained from their making any further inquiry into the matter; and they, therefore, recommend:—That no further action be taken, and that the reference be discharged."

This was unanimously agreed to.

The Supervision of Painting Work.—The same Committee also reported that they had received a deputation from the Executive Council of the Amalgamated Society of House Decorators and Painters, who urged the necessity of the employment of practical painters as inspectors of painting work done for the Council. The deputation stated that under the present system work of this kind was sometimes badly done, and that, as the clerks of the works employed were often unacquainted with painting, they were unable to detect imperfect work. The Committee said that they had fully considered the suggestion and that the statements made by the deputation in support of it, and were of opinion that it should be adopted by the Council. They therefore recommended:—

"That when a contract which includes extensive work of painting or decoration is entered into by the Council, a practical painter shall be employed to superintend that portion of the work."

This was agreed to after some discussion, in the course of which it was suggested that the Council should do its own painting.

After transacting other business, the Council adjourned.

* Those mentioned in the foregoing list.

BUILDERS' BENEVOLENT INSTITUTION.

ELECTION OF A PENSIONER.

An election of one pensioner on the funds of this Institution was held at the offices, 4, Vernon-place, Bloomsbury-square, on Thursday, May 24. Mr. Geo. Plucknett, J.P. (hon. treasurer), presided, in the absence of the president, Mr. J. W. Hobbs, J.P., through domestic bereavement. There were six candidates for the one vacancy—viz., one man and five women.

Shortly after the close of the poll, the scrutineers (Messrs. F. Stirling and E. Hilder) announced the results of the polling to be as follows, viz.:—Charles Sabeys, 97, St. Peter's-street, Islington, aged 70, builder (second application), 1,198 votes; Margaret Alice Richardson, Preston, North Shields, aged 65, widow of T. B. Richardson, builder (third application), 1,179 votes; Mary Ann Shapland, 132, Stamford-street, Lambeth, aged 70, widow of William Shapland, builder (second application), 690 votes; Emma Bird, 48, Clapnam-road, Paddington, aged 60, widow of Joseph Bird, builder (second application), 3,055 votes; Elizabeth Darby, 2, Sangora-road, Clapham Junction, aged 80, widow of Edward Darby, builder (second application), 728 votes; and Bessy Webb, 314, Old-street, E.C., aged 60, widow of Robert Webb, builder (first application), 1,050. A successful candidate was therefore declared to be Emma Bird.

Among the friends of the Institution (other than those already named) who took part in the proceedings were Messrs. J. T. Bolding, W. Scrivener, C. Ansell, G. B. New, C. Bussell, and R. Richardson.

Votes of thanks to the chairman and scrutineers closed the proceedings.

THE PROPOSED INCREASE IN THE SUBSCRIPTION AT THE ARCHITECTURAL ASSOCIATION.

Sir,—Will you kindly allow me through the medium of your valuable paper to appeal to all members of the A. A. to make an effort to attend the next meeting and vote, ye or nay, on the proposed alteration in the rule relating to the subscription.

At the last meeting a surgestion which had been made both by Mr. Cole Adams and Mr. Stannus, that a paper should be sent to every member asking his opinion on the question, was formally moved as an amendment, and although supported by some influential officials, who know the risk that is run at the present crisis in losing a large number of members, was lost when put to the vote. The comparatively-speaking haudful present objected to those who were not there having an opportunity of expressing their opinions.

Those members who will not be able to attend might write to the honorary secretaries stating their views. It is most important that such radical changes as are now proposed in the rules should not be voted on until as many expressions of opinion as possible have been heard. AN OLD MEMBER.

** We willingly give "An Old Member" space to express his views; but we cannot help expressing our own strong opinion that members who make a rally to vote against the raising of the subscription will act in an exceedingly foolish and mischievous way.—Ed.

PRICE-BOOKS.

Sir,—I cordially agree, to an extent, with the opening remarks of your correspondent "Practical" in your issue of May 24, so far as they relate to competitive estimating. Assuming we are dealing with a job of some 20,000*l.* to 25,000*l.*, the first thing any estimator would do would be to run through his bill of quantities and mark all the important items, and write off as quickly as possible for special quotations, giving all necessary information as to quantities required, stations for delivery, &c., particulars which of themselves may influence quotations enormously; and in these days of what your correspondent calls "close shaving and fierce competition," any other course would be sheer madness.

I cannot, however, go any further with your correspondent as to a price-book being the joint production of a number of men, be they ever so practical, and I fully endorse your own view in the article on Price-books of May 3, which, while admitting that they require a combination of qualities rarely found in one person, yet goes on to state that one qualified person could do it better than an association of several. I have about as much faith in the result that might be expected from your correspondent's suggestion as I have in the almost obsolete system of letting a building contract into the hands of several tradesmen. Estimating is, perhaps, the most important function in a builder's office, and, above all other requirements, it is most essential that it should never be undertaken by any one but those of thorough experience. Many an impetuous young man, whose intense anxiety appears only to be "to get the job," has succeeded, but only to his employer's loss, or even actual ruin; and although it may seem rather divergent to make such a statement here, yet I do so with the fullest assurance of its truth, that no

man under forty to forty-five years of age ought ever to touch an estimate of any weight or importance, as upon the subject of estimating, as well as the compilation of a price-book, nothing can possibly take the place of, or stand one in the stead of, good sterling experience.

Nothing can be easier than to make the sweeping assertion that price-books, as a rule, give prices at which no one could expect to secure a large competitive contract, and the reason of this is so obvious that it is not worth the time of entering into any explanation for the benefit of those who cannot perceive it for themselves. But I hope that the day is very distant when the pages of "Laxton's Price-book" shall have become unanswerable for the loss and ruin entailed on builders by such foolish and reckless pricing as evidently must exist in many of the estimates we see published.

THE EDITOR OF "LAXTON'S PRICE-BOOK."

GERMAN TECHNICAL MUSEUMS.

Sir,—In replying, after reading my paper on Technical Museums, at the Royal Institute, on May 19 last, I am reported as having condemned generally the buildings I saw. My criticism was only intended to apply to one or two of the older buildings, especially the Museum of Industrial Art at Berlin and the Technical High School at Charlottenburg, are admirable in every way.

FRANK GRANGER.

DUTIES OF BOROUGH SURVEYORS.

Sir,—As Surveyor to a somewhat important borough in the South of England, I should like to ask some of your subscribers in the same predicament what the position of such an official is as regards private roads and improvements. Where the appointment excludes any private work, it seems such an anomaly that he should be compelled to do it, but without any extra recompense in the shape of a commission on the work, which is surely outside his regular duties. Such commission would not come out of the pockets of the ratepayers, but would form a perfectly fair adjunct to the sum payable by the owners. Why should they have the services of a Surveyor for nothing?

I am compelled to make all the necessary plans, sections, and estimates, reference of all owners and occupiers; no assistants or assistance allowed me, and have to carry out all daily and routine duties. The salary is a miserable one, and there is no chance of a rise.

SURVEYOR.

May 27, 1890.

WOODEN WATER-PIPES.

Sir,—Your last issue contained an interesting paragraph [p. 404, *contd.*] on the discovery of wooden water-pipes in Belfast. Such things are not infrequently found in London, one case particularly coming under my notice a few weeks ago. While passing through a street at the West-end the other day I happened to look down into an excavation then being made, apparently for the inspection of gas-pipes. In doing so I observed an old elm-tree water-pipe, which local influence enabled me to secure from re-burial.

The accompanying sketch gives a general idea of its size and appearance. It is in sound, hard condition, and displays very slight signs of decay. It has absorbed from the surrounding soil in which it was once a strong smell of gas, which exposure to the air does not remove. The spigot end is reduced to an outside diameter of 6 in. to enable it to be fitted into the socket end of another pipe. The socket end measures 18 in. outside diameter, and has an iron ring driven into it as a precaution against splitting.

Towards the centre of the pipe is a square hole, presumably for the insertion of a service-pipe to a house. The total length of the pipe is 6 ft., and, as an evidence of its weight, it took three labourers to lift it about.

Very little seems to be known on the subject of these tree-trunk pipes, and it might, perhaps, be interesting if you were to supply an account of the origin, use, and gradual displacement of this primitive method of water-supply in London.

A. O. COLLARD.

8, Craig's-court, Charing Cross, S.W.

May 30, 1890.

** We were aware that such wooden water-pipes as Mr. Collard has described and sketched have been frequently and are still occasionally found in London; our own pages have from time to time chronicled instances of their discovery. Such tree-trunk pipes were used by Sir Hugh Widdelton in his New River scheme. But the special interest of the Belfast discovery seems to consist in the fact that the pipe found there was square in external section. How these square-shaped pipes were joined the *Belfast Newsletter* did not say. Can Mr. McCann afford any information on this point?

SPRAY JETS FOR WASHING.

Sir,—Could you, or any of your readers, oblige with some particulars of the washing with "improvement jets, up as well as down," referred to in Sir Edwin Chadwick's paper, reported on p. 396 of your last number, or with the address of Mr. W. Bartholomew, the inventor or designer of the arrangement? I should be glad to learn something more of such an appliance, and, if possible, to see it in operation.

* * A somewhat similar system, especially intended for use in barracks or to schools, has been elaborated by Mr. David Grove, the well-known engineer to the German Imperial Court, and was described in the *Builder* for September 7, 1889, pp. 167-8. Of the system referred to by Mr. Chadwick we have at present no further information.

DANGER TO IRON BUILDINGS FROM LIGHTNING.

Sir,—I shall be glad if you, or any of your correspondents, will kindly, through your columns, give me any information as to the effect of lightning on iron roofs.

(a) Whether a corrugated iron-roof is liable to suffer from lightning, or whether it would act as a conductor.

(b) In case of danger, what form of lightning conductor would be advisable.

I shall be grateful for any information on the point.
J. ARTHUR WALLINGTON.
May 31, 1890.

The Student's Column.

ELECTRICITY, MAGNETISM, AND ELECTRICITY SUPPLY.—XXIII.

DISTRIBUTION (continued).—TRANSFORMER SUPPLY.

SECONDARY batteries were not referred to in the last article, as they are not essential to any of the systems of distribution which were described in it. The size of the generating plant, however, required at any station supplying by means of the continuous current, can always be reduced by the addition of secondary cells. In the day time, or at such times as the current going out from the station is small, the surplus power of the dynamo-machines is available for charging the cells; and during certain hours of the night when the call for power is greater than that which the machines are capable of delivering, the batteries discharge into the mains and relieve the machines of a considerable portion of the load. There is also the additional advantage that in the event of the break-down of a portion of the generating plant, or of an abnormal output being required for a short time, a store of power is ready to meet the emergency. Used in this way secondary batteries are the most valuable auxiliaries to a continuous current dynamo-machine, but their services may be, and often are, entirely dispensed with.

In the systems hitherto described, it can be seen from the diagrams (figs. 58 to 62) that the currents or current sent into the mains by the machines are ultimately conducted through the lamps, but in the systems about to be described the main current is used to supply power for the generation of local currents, which can be produced under such varying conditions as will suit the requirements of each consumer. The chief advantage of this class of distribution systems is this: If the supply companies carefully lay their mains underground in such a way that it is absolutely impossible for a consumer to get at them either intentionally or by accident, potentials may be used a hundred, in the future perhaps a thousand times, greater than can possibly be allowed in a public or private building. The main current and section of its conductor may thus be reduced almost without limit, provided always that the insulation can be made thoroughly efficient.

Any system in which the main current is made to produce another current for the use of the consumer, is called a transformer system. We shall consider three such systems: (i) The Battery-transformer System, (ii) The Motor-transformer System, (iii) The Transformer System. It is the third system in which the piece of apparatus, already described as the "transformer," is employed, and an alternating current used; systems *i* and *ii* requiring a continuous current.

In the early days of electric lighting battery-transformer systems were tried and failed; but in recent years modifications, in detail, have

been introduced that give every prospect of success. Groups of local cells (fig. 63) are charged

Fig. 63.

in series by the dynamo-machines, D, in the generating station. In each group a portion of the cells, B, is being charged, whilst another set, B', is connected to the consumers' circuit; so that a single current, of high E.M.F., charges the various groups, B, &c., while the consumers' circuits are supplied by local currents entirely distinct from one another, and from the charging current, by means of the groups B', B'. At certain intervals of time, B and B' are interchanged, and the supply thus kept up. Occasionally the cells are placed on the consumers' premises, and automatic devices are then relied on to keep them in order; but there is considerable risk in this, and it seems wiser to place the cells in local distributing centres in the hands of skilled attendants, who can at once remedy any sign of failure in a cell.

It has been shown (article xiv.) that when a current passes through the armature of a dynamo-machine certain reactions are set up. Fig. 35 gives the direction of the resultant field, and if we regard the armature as an electromagnet it is evident from the figure that since the north and south poles of the armature are not opposite the south and north poles of the field magnets, a couple acts on the armature pulling it in the opposite direction from that in which it is turned. The same thing is true also in figs. 40 and 44. Mechanical power forces the armature round against this couple, and is converted into an output of electrical power from the machine. If, in fig. 40 for example, a current is sent through the machine from some external source, this same couple is called into play, and the armature, if free to do so, will spin round in the reverse direction from that supposed in the figure; the motion through the field being reversed, an E.M.F. is set up in the armature which opposes the current. The current, and therefore the couple, is maintained so long as sufficient electrical power is supplied to the machine, and the armature turns round, giving out mechanical power. A dynamo-machine so used is called a "motor." It should be noted that if a current is sent between the brushes of the shunt-wound machine, fig. 44, the relative direction of the currents in the armature and coils of the field magnets will be the reverse of that which they have when the machine runs as a dynamo; hence in the shunt machine the armature turns in the same direction, whether it is used as a dynamo or a motor, though in the latter case also the E.M.F. produced opposes the current.

Fig. 64.

The motor-transformer or motor-generator assumes the form of a dynamo-machine or motor with a double armature. The main current from the dynamo-machines, D, fig. 64, in the supply station excites the field magnets, and passes through one section of the armature, M, in each of the motor-generators in succession. By this means the armature is kept in rotation, and the second section, G, generates the current for local use. The windings of the two parts of the armature and the two commutators are kept totally distinct; the generator portion

can, therefore, be wound to meet the requirements of the consumer.

Fig. 65.

The transformer, as well as certain peculiarities of an alternating current circuit, have already been considered (articles xviii. and xix.). The alternating current is sent from the generating plant, D, into the mains, across which the primary coils of the transformers P are connected abreast, and the independent secondary circuits, S, are connected to the lamps L. This system, therefore, has all the simplicity of the simple parallel system, and the transformers transform the power given them by the mains into a current under suitable electromotive force for lighting purposes. The figure given in the concluding paragraph of article xix. must be regarded as propiætiæ rather than true at the present time, an extra 0 inadvertently inserted itself. In cases where the power from the machines may be transmitted under very high E.M.F. in order to traverse long distances, the transformers, fig. 65, would be placed in local distributing stations, and the current from these secondary coils would be sent into the street mains. Abreast, across the street mains, come the primary coils of a second set of transformers, out of whose secondary coils flow the currents for final use.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

3,758, Plane-irons. W. Dowland.

According to this invention the plane-iron is made with grooves at the back, either flat or curved at bottom. The face is left thin, and strengthened by ribs between the grooves.

7,001, Door-check. B. A. Mitchell, jun.

This device consists of a check or weight, detachable from the doors and fitting to them by means of springs. The shape is not unlike a horseshoe, with the springs upon the inner edge. At the bottom of the "yoke," as it is called by the inventor, is a wedge which, when the device is properly weighted, prevents the door from closing or opening.

9,567, Heating and Ventilating Apparatus. W. Jones.

This invention consists in combining the low and high pressure systems of heating by water, and using the low-pressure system for heating the lower stratum of air and the high-pressure system for heating the higher stratum. By this combined method the time required to raise the temperature of the air to the desired degree will be shortened, and a higher temperature can be maintained than by using the low-pressure system alone. Other details are enumerated for improvements in the general ventilation of buildings.

4,219, Graining, Decorating, &c. G. Engel.

This invention relates to improvements in the method and means for decorating walls, doors, &c., and graining and marbling. Paper is prepared with a suitable pattern on the front, which, when mounted on the back, allows the design to "set off" on the work.

4,678, Indicators for Doors. H. Hincley.

This invention relates to that class of indicators, for closets and other apartments, comprising a wood sign or visual sign adapted to be exposed to view on the outside of the door by the act of holding or locking the door from the inside, and to be withdrawn or concealed upon unlatching the same. A bent bar at the back of the sign is engaged by a projector on the bolt, and caused to be pushed or raised forward so as to allow the wood to be seen, and another stop withdraws the wood from view as the bolt is withdrawn.

4,783, Screw Nail. S. E. Groff.

According to this invention a number of parallel spiral grooves are cut in the length of the nail, and these being slightly turned from head to point, the

nail rotates as it is driven in the wood, forming a thread to prevent it being withdrawn.

FRIDAY, JUNE 13.
Royal Institution.—Professor Sylvanus P. Thompson on "The Physical Foundation of Music." 9 p.m.

Miscellaneous.

Adams's Sewer-flushing Syphon-tanks.—The Narrey Gazette publishes this account of the inspection by the Sanitary Committee of the Town Council of Guildford of the new flushing-tank at Meadvale.—The Sanitary Committee were called together at Cronk's-hill on Tuesday morning, to look at the new automatic flushing-tank at work. Present: Mr. Alderman Summers (Chairman), Alderman Yerworth, and Councillors Dr. Walters, Walby, and Farrington. Mr. W. B. Waterlow was also present, and the Borough Surveyor (Mr. F. D. Clark), and the contractor (Mr. Faulkner). The tank is built of 9-in. brickwork, surrounded with concrete, and is fitted with one of Adams's patent automatic syphons; it has a capacity of 500 gallons, and can be regulated to discharge at will; at present it is so regulated to discharge 500 gallons of water down each sewer (Cronk's-hill and Somerset-road) once a week. The examination was perfectly satisfactory, the tank when full emptying itself in under one minute, and all expressed themselves perfectly satisfied. This is the first automatic flushing tank erected in the borough, and was designed by the Borough Surveyor, Mr. F. D. Clark, A.M.C.E., and built by Mr. Faulkner, contractor, Lesbourne Lands, Reigate.

The Portsmouth Sewage Outfall Works are seriously threatened by the action of the tide, and the Drainage Committee of the Town Council propose an expenditure of between 6,000, and 7,000, for the protection of the massive sewage tank, constructed from the plans of Sir Frederick Bramwell, C.E. on the glaciis of Fort Cumberland, and the outfall pipes from it, which extend in the direction of the Wolcsvers. Considerable quantities of shingle and soil have already been carried away by the sea, and, unless steps are taken at once to protect the huge tank and pipes, it is feared that they may soon be seriously damaged.—Standard.

Northumberland and Durham Archaeologists.—On Saturday last the members of this society held their first meeting for the present season in Northallerton district, when they visited the parish church of Kirby Sigston, which is in process of restoration, being at present unroofed, and Mount Grace Priory, at Ingleby, Arncliffe.

Society of Engineers.—At a meeting of the Society of Engineers, held at the Town-hall, Westminster, on Monday evening last, Mr. Henry Adams, President, in the chair, a paper was read by Mr. Perry F. Nursey (Past-President), on "Pick's System of Manufacturing Salt in vacuo." The author commenced by observing that the manufacture of salt was carried on in the present day mainly in the same way as it was by our remote ancestors,—namely, in open evaporating brine-pans. He then described an ordinary salt plant, and pointed out the disadvantages of the system. These included constant expense in repairs and renewal of the pans, which sealed and buckled, and, at the best, only lasted about three years; heavy cost for fuel, for land (the pans covering large areas), and for labour, and the production of noxious gases which were alike deleterious to animal and vegetable life. The author then proceeded to describe Dr. Pick's vacuum process, which is based on the Rillieux, or triple effect system. Dr. Pick's apparatus is made in three duplicate sections, each consisting of four main parts,—namely, the boiling-chamber, the heating-chamber, the collecting-chamber, and the filtering-chamber. The steam used enters the heating-chamber of the first section, and there heats the brine; and the steam given off from that brine enters the steam-chamber of the second section, and heats the brine there. The same process is repeated in the third section. The steam generated in the latter section from the brine is drawn off by means of a vacuum pump condenser. The advantages, as demonstrated by the working of an apparatus put up by Mr. Nursey at a salt-works in Staffordshire, were stated to be a saving in fuel, in labour, in area occupied, and the avoidance of the production of deleterious gases. The consumption of coal by the pan process is 12 cwt. per ton of fine white salt. By the new process a saving of 7 cwt. of coal per ton is said to be effected where waste or exhaust steam is not available. The process was shown to be automatic, and to require no skilled labour in carrying it on. With regard to space, it was stated that an apparatus consisting of three sections, each 2 1/2 yards in diameter, will turn out 50 tons of salt per day, or 300 tons per week, while a salt-pan 12 yards long by 2 1/2 yards wide, exclusive of brickwork, only turns out about 40 tons per week.

Berlin.—The new group of buildings erected for the "Tattersall" Company, which may now be considered complete, shows some clever planning on a very difficult site. Besides stabling for 300 horses and a set of coach-houses, two large riding-schools are to be found in the institute, the larger one of which (measuring some 150 ft. by 100 ft., having a height of some 75 ft., and being equipped with two extensive balconies and a minstrel gallery) is intended for gentlemen riders and instructors, whilst the smaller one will be used by the stablemen and private servants for exercising and training purposes. In planning the stables, the greater part of which has been placed on two floors, one above the other, special care has been taken to have a number of smaller divisions instead of the, in such cases, usually more extensive ones, and each of these small sets of stalls has been furnished with its own loose-boxes, harness and duty rooms, &c.; whilst the hospital, common to the whole, has received an isolated position. The general disposition may be considered highly practical, and the visitor on entering the establishment will be struck by the cheerful appearance throughout, this owing to the plentiful supply of light and air, both in the stables, as well as in the riding-school and the halls connecting. As to the interior arrangements, it need only be mentioned that whilst the stables show fittings of a most modern type (constructive parts, iron; wall surfaces in blue and white tiles), no exception to the national tendency of treating dressing-room and lavatory accommodation as badly as possible is here noticeable.

Sheffield and the Electric Light.—After having had the matter under consideration for some months, the Parliamentary Powers Committee of the Sheffield Town Council on the 22nd ult. passed the following resolution:—"That considering the present position of the question of supplying electricity in large towns, and the probability of applications for power to do so in Sheffield being made by outside companies or persons, the Committee recommend the Council to adopt the needful steps for obtaining power themselves to supply electricity within the borough."

Society for Preserving Memorials of the Dead.—The annual meeting of the members and supporters of this society took place on Saturday afternoon last in the school adjoining Lambeth Church, Mr. W. Tipping occupying the chair. The report of the Council stated that the past eighteen months had been a most trying time for the Society, and especially since the last general meeting. This state of things arose chiefly from the deaths of many of the most important subscribers, amongst them being the Earl of Glasgow and the Bishop of Durham.—The Chairman, in opening the proceedings, pointed out the important and interesting work carried on by the society on very small means, and made a strong appeal to its members to do all in their power to help on the funds. It was also announced that various works of necessary repair and preservation of ancient monuments, tombs, &c., in churches throughout the country had been ordered to be carried out or duly paid for.—The members of the Society afterwards visited the parish church, and listened with interest to a paper read by the rector, the Hon. and Rev. F. G. Pelham, on the monuments contained in it.

Land at Milford-on-Sea.—We may call the attention of our readers to an important sale of land fixed for Tuesday next at Milford-on-Sea, by Messrs. Furber, Price, & Furber. The particulars will be found in our advertisement pages.

Royal Institution.—The last Friday evening discourse will be given on June 13 by Professor Silvanus P. Thompson on "The Physical Foundation of Music."

Excavations of the British School at Megalopolis.

THE end of May the students of the British School at Athens have brought to a close, for the present season, their excavations on the site of Megalopolis, in Arcadia. Work

has been carried on continuously since the middle of March, and, while several points on various parts of the site have been prospected, attention has been mainly confined to the theatre which lies on the south bank of the river, the Hellisou, its auditorium facing almost due north, being partly cut out of the low hill side, and made up at the ends by artificial embankments supported by strong double retaining walls.

When the School started work here nothing was visible above ground except the general curve in the hill side which indicated the site, and a few fragments of the end retaining walls; the auditorium was overgrown with thick brushwood and small trees, and the ground in front, over the orchestra and stage, was ploughed land. Trenches were first dug across this latter in order to get at the position of the stage walls. Traces of these were come across at a depth of from 6 ft. to 8 ft. below the surface, and they were followed up east and west, and gradually the general outlines of the stage buildings were laid bare. At the same time the remains of a large square court were discovered in front between the stage and the river, and the lines of the auditorium were unearthed, where the first four lower rows of seats were found to be *in situ*, and almost entire, with the gutter running round in front of them.

The accumulation of earth over the general level of the orchestra has been as much as from 10 ft. to 12 ft., which has necessitated a considerable amount of heavy cutting in the trenches, and, of course, it has been impossible to completely clear the whole area of the orchestra and stage in the short period during which the excavations have been in progress. This must be reserved for another season, but enough has been done to show the general nature of the plan, and to give us an idea of the size and arrangement of this, the largest of the theatres of Greece.

The results of the excavations show us a theatre with an orchestra of about 100 ft. diameter. The auditorium is slightly more than a semi-circle, about 7 ft. or 8 ft. on each side, and the line of the arc is continued round beyond the semi-circle, as at Epidaurus, and not run in straight towards the stage as at Athens. The face of the Greek stage is about 30 ft. in front of the ends of the seats, so that there is hardly room for a complete circular orchestra as at Epidaurus. The auditorium has nine sub-divisions, with stairways between each, and one at each end. These stairs are 2 ft. 6 in. wide, and rise two steps to each tier. The lowest row of seats takes the form of continuous benches, with seats 16 in. wide, arms at each end next the stairs, and slightly sloping backs, 1 ft. 9 in. high. They are solid, and cut out of large blocks of stone from 4 ft. to 5 ft. long. Each bench is 16 ft. 6 in. long, and formed of three or four stones in length. The front of the lower part of these, under the seat, is cut back to allow of more room for the feet. They stand on a level with the gutter, which is built of stone blocks, is 1 ft. 8 in. wide by about a foot deep, and falls towards the west. The space between benches and gutter, a foot wide, is very narrow, hardly enough to let one person pass another. Round the orchestra side of the gutter is a stone kerb, presumably level with the floor; nothing remains to show what the covering of this floor has been; it was probably merely beaten earth, as at Epidaurus. No traces have been found of a base stone to receive the central altar, although a trench was dug specially to search for this. Opposite each end of the auditorium, and a few feet within the orchestra, two circular pedestals have been found; these measure about 2 ft. 6 in. in diameter, and have bases and capitals, as well as inscriptions, showing that they supported statues. As yet, however, the statues themselves have not been brought to light, but they may lie hidden in the adjacent masses of earth still to be removed.

Behind the front benches runs a passage-way 3 ft. wide, entered from each end. This must have been the only approach to the lower seats, as the gutter is not bridged across at the foot of each stairway, as we find it in the Athenian theatre, to allow of the people passing out and in through the orchestra. The seats behind are merely plain stoues, 12 in. wide and about 15 in. high, slightly hollowed in front, and standing up about 4 in. from the footways, which are 18 in. wide. The

footways and seats are not cut out of one stone, as at Athens, but are separate pieces.

As the one passage and the narrow stairs do not seem to provide a sufficient access to the whole of the upper part of the theatre, it is possible that there may have been end staircases; the existence of the double retaining walls some distance apart seems to supply a place for these, but this problem wants working out by further excavation. These double retaining-walls only commence about 50 ft. or 60 ft. back from the front of the auditorium, and the single wall which serves on each side as far as that point, is finished with a broad raking coping splayed at the sides and about 2 ft. 3 in. above the line of steps adjoining; this in its turn abuts against an oblong pedestal with cap and base, and which is lineable with the first row of plain seats behind the passage.

A most interesting discovery has been made in the series of inscriptions cut in large letters on both sides of the backs of the front benches. These inscriptions are of two dates, and, of course, will be published in detail by-and-by. The earlier one records the donation of the seats themselves; the later, the names of the tribes to whom they were allotted. This may refer either to the benches only, or to the whole tier of seats behind them as well.

The remains of the Greek stage consist of a series of courses of stone setting in from the front edge irregularly like steps, but broad and narrow alternately, and which run straight along the face of the orchestra. The lowest one is about 1 ft. above the level of the orchestra floor and the top one about 2 ft. higher; 15 ft. back from this line is the main outer wall of the stage 2 ft. 6 in. wide, and with cross walls at right angles opposite the ends of the benches. In this outer wall are traces of three doorways, the centre one projecting outwards about 2 ft. from the wall. The threshold of the east side door remains in position and shows the sinkings for the hinges and rebates for the wood and bronze covered jamb linings. This door has been 5 ft. wide, and the central one, of which only the foundations remain, was possibly 1 ft. or 2 ft. wider, and may have had pillars on each side. The level of this threshold is about 1 ft. higher than the top of the steps of the inner wall.

The inner wall of the stage extends along on each side as far as the line of the second row of seats of the auditorium. About 10 ft. in front of this has been discovered the wall of what must be a later stage of

Roman times. The top of this wall is 1 ft. above the orchestra floor, and thus level with the lowest step of the Greek stage. Fragments of columns have been found *in situ* on this wall and others lying near. These columns are 1 ft. in diameter; they have no bases, and have plain projecting fillets about 2 in. wide running up each side to allow of the insertion of the movable scenery in the spaces between the columns. The front faces show marks of chisel-dressing and the backs, which would have been hid behind scenery, are much rougher. The pieces found vary in length, so it is difficult to say what their total height has been. The wall on which they rest returns back to the line of the Greek stage at the ends.

Between the ends of the auditorium and the line of the original stage where we usually find the Parodoi or entrances, are, on each side, spaces about 30 ft. wide by 63 ft. deep from the face of the seats. These spaces are closed in across each by high walls which show no means of communication with the outside. In fact, it seems as if the ground beyond must always have been at a much higher level. What these spaces were used for has yet to be determined. At either end of the stage, at right angles to the long walls, are two passages which probably supplied the means of entrance to the orchestra in this case.

Outside the main wall of the stage, and parallel with it, have been discovered the foundation-stones of six pillars which point to the existence of a stoa in front. As the level of these bases is 2 ft. or 3 ft. below the sill of the door in the wall, there must have been a broad flight of steps down under the stoa, although no traces remain of supporting walls for these. Unfortunately, very few fragments of the superstructure of these stage-buildings have been found, and no reconstruction can be made of their architectural treatment; but we hope sufficient remains yet lie buried, which, when brought to light, will supply the necessary data, and make a reconstruction of the whole design possible.

This stoa has been superseded in Roman times by a large square atrium or court 220 ft. wide and projecting 175 ft. in front of the stage-buildings. This has been enclosed all round by a wall, the outer stage wall having been continued for this purpose on each side.

In the interior on three sides are large piers 4 ft. 3 in. square, seven piers on front and five on each side, counting the corner ones. These are some distance in from the face of the outside walls, and the space between was probably roofed in and formed a covered stoa, the central part having been open to the air.

Scattered about are a number of drums of Doric columns, varying from 2 ft. 6 in. to 3 ft. in diameter, also one cap and portions of an entablature, having the characteristics of late Roman work. They are of porous stone covered with gesso, and it is quite probable that they belonged to this colonnade. Entrances have been discovered in the side walls of this court. The floor of the stoa was probably about the same level as that of the stage, the ground having been filled up and the foundation of the original stoa buried under.

Almost in the centre of the court, and at a considerably lower level, are foundation stories of four columns, which formed a square; one stone still bears a drum of a circular, unfluted pillar. These either belong to an early shrine which stood just outside the original stoa, or perhaps the colonnade went round the court as a terrace, with the central part at a lower level and approached by steps. Further excavations may throw more light on this, at present, rather complicated problem.

The outside walls of the atrium are well built of large squared blocks in courses, the stones roughly dressed with a hammer and projecting in the centre and cut in towards the joints. With the exception of the columns mentioned the stone generally is the rather coarse white-grey marble of the district.

A somewhat similar court is known to have existed in front of the Odeum of Hierodes Atticus at Athens, and of many of the Roman theatres.

A short distance to the west of this court a large altar has been unearthed. It is about 36 ft. long by 6 ft. wide, and is built of metopes and triglyphs standing on a double-stepped base, the whole being of porous stone covered with gesso. None of the cornice has been discovered. It was probably one of the main altars of the city. Its design confirms Dörpfeld's theory regarding that of the great altar of Zeus at Olympia. Trenches were sunk west of this on the chance of finding traces of a temple, but without result.

A small altar has also recently been discovered east of the theatre. In this part many pits were dug where columns and other fragments showed above ground, but nothing of importance has been brought to light; the columns were mostly found to be out of their original position.

No further progress was made on the north side of the river, where operations had to be suspended early in the season owing to the standing crops of corn.

The gold ornaments discovered at the tumulus in the small, round, marble sarcophagus, and which at first were thought to be prehistoric, on further examination turn out to be of Roman or late Greek time. Nothing further of particular interest has been found here.

A number of general objects of pottery, terra-cottas, bronzes, &c., have been turned up from time to time during the progress of the works, but the collection contains nothing of any consequence.

It is probable that work may be continued in October, when it is hoped the whole area of the orchestra and stage buildings of the theatre may be completely cleared of earth, and an effective start also made with the sites on the other side of the river, which look very promising.

Meanwhile, the School is to be congratulated on the results of its first season's work on Greek soil. The site is a particularly interesting one to architects, and we look forward to getting, as the result of further excavation, much valuable information regarding the arrangement and design of the public buildings of a Greek city of the fourth century before Christ.

HYMERS' COLLEGE, HULL.

As this competition has been decided, as it must necessarily have been, almost entirely on practical grounds, it is most to the point, in offering some remarks on the plans exhibited, to consider how they fulfil the practical requirements of a school of this class as now understood. The result of our inspection of the designs, mainly in regard to this quality of practical suitability, is somewhat of a surprise. The instructions to architects, supplemented afterwards by a general statement in reply to queries, were particularly minute and detailed. What was to be expected was a large amount of uniformity, if not of monotony, of treatment. The very reverse is the case. The designs are as different as can well be. They are the more interesting for that reason. But the fact that the competitors have found it possible to diverge so widely makes it all the more probable that they have ventured to work somewhat outside their instructions. A detailed examination shows this to have been the case in a large percentage of the plans. It is to be regretted. Numerous meritorious designs are put out of court at once; many because of disregard of the central instruction, viz., that the building must be constructed to admit of perfect supervision, and not a few because the cost of executing the plans was out of all proportion to the amount stated to be at the disposal of the Building Committee.

The one pivot of the whole of the instructions was stated by the assessor as follows: "The controlling idea in the arrangement of

the plans is that of perfect openness to supervision, and generally to carry out the spirit of the hall-passage system thoroughly." The failure to grasp this condemns at least two-thirds of the plans. Out of thirty-seven competitors more than twenty made supervision difficult. The ways of doing it were varied. The first method, and the favourite one, was to build a wall between the administrative block and the hall, so that the headmaster, secretary, and porter should be unable to have any supervision whatever. No less than eleven designs contain this fault. A second set placed a pair of staircases in front of the windows of the headmaster and porter, with almost equal disregard of the requirements of those officials. This was done in two of the very best designs, those of "Three Stars" and "Minerva." A third set put the headmaster and his administrative staff far back from the hall, or round a corner, or separated from the hall by an entrance hall. This was the case in the artistic set of drawings marked "Wilherforce," which received the third premium. A few put class-rooms outside the hall, and therefore out of the reach of supervision. On these and similar grounds not less than twenty-three competitors seem to have disqualified themselves. The most extraordinary design is that of "Sic," in which the class-rooms are represented as flying out from the central hall like the spokes of a wheel; the author of this design has succeeded in introducing no less than six corridors and four staircases.

A very general misconception appears to have prevailed as to the functions and utility of the central hall. The very name, "hall-passage," should have shown what it is intended for. The hall is to be minimised, therefore, not to be emphasised. And not only for reasons connected with scholastic management, but on grounds of expense. The one great flaw in the so-called "hall-passage" type, as opposed to the old corridor type of school, is that while, on the one hand, the advocates of the central hall hold that a hall is of very little value nowadays; on the other hand, in order to avoid corridors, they are obliged to build their central hall of inordinate size. Surely, then, the first consideration of the designer should be to get the hall not as large, but as small, as possible. This has been the last consideration with most of the competitors. Twenty-one have constructed halls of 5,000 to 8,300 ft. area, the assessor's requirement being a minimum of 4,000 ft. Many of the halls, moreover, to obtain fine effects, externally and internally, are unnecessarily lofty, and, consequently, costly. Very beautiful halls, indeed, many of them are, especially that of "Three Stars," which shows an interior that seems to be a reminiscence of a Belgian church. However, it is needless to say that the temptation to make a fine feature of the hall was a very strong one. Those who have succumbed to it have thereby raised the cost of their building out of all bounds. The successful firm, Messrs. Botterill, Son, & Bilson show a hall of 4,232 ft. area, with an estimate of 14,970*l.* for the complete block of buildings. "Three Stars" has a hall of 5,000 ft. area, and a total cost of 20,000*l.* The lofty hall of "Balbus" helps to bring up his total to 27,200*l.* Matters have been made worse in many cases by the construction of spacious corridors all round the hall, still further increasing its area, height, and cost.

Another problem that has vexed the competitors has been the position of the staircases leading from the gallery into the central hall. Only two designs contain the right solution. The solution depends on three points. First, the staircase must not encroach on the area of the central hall. Secondly, it must not be constructed to block the inspection windows of the headmaster, porter, or assistant-masters. Thirdly, it must not be constructed on the west side of the hall, for the great mass of the class-rooms should be on the east side. The successful design had it right; so also had Mr. Wigram ("Balbus"), who obtained the second premium. The proper position for this main staircase is face to face

with the windows of the administrative block, so as to be under perfect supervision. Some placed it in the very centre of the hall; a few round a corner in a corridor. The following designs seem to have been most successful in carrying out the spirit of the hall-passages plan: "Supervision," "Balbus," and "Aula" (Messrs. Beazley & Burrows), and "Equo Animo" (Mr. Norman M. Brown), or, as the Hull printers have it, "Egus Amino." Of these, that of "Supervision" is assessed, as before said, at 14,970*l.*; that of "Aula" at 20,900*l.*; that of "Equo Animo" at 22,400*l.*; that of Mr. Wigram at 27,200*l.* There is also a good plan by "Quodlibet." "Supervision" is the only one of the five which at all approaches the sum mentioned by the assessor, 10,000*l.*

Externally there is no place for towers. Several competitors have introduced them. Towers have no business in a hall-passages plan. They do not grow out of it, or point to it, and they enormously increase the expense. The tower is unnecessary in the excellent plan of "Balbus," and puts his design out of court by the additional expense entailed. The other premiated design, "Wilherforce," (Messrs. Chorley & Connon, of Leeds,) also has a highly ornate and costly tower. In some cases the towers seem to be present merely as attractions to the eye of the Committee-men, the architect not in the least expecting them to be built.

Very few of the competitors have been able to provide, for 10,000*l.*, more than a central hall with eight class-rooms. The successful design, with a few others, offers twelve class-rooms. "Balbus" does not propose to build even the central hall at first.

Good as the ground-plans of "Supervision" and "Balbus" are, a careful study of them suggests several improvements. There are at least three matters in which both have erred. It is only fair to add that they erred in accordance with instructions. In the first place, the lavatories are badly placed, in a corridor or behind a staircase, and therefore being out of reach of adequate supervision, the arrangement is condemnable, as being contrary to the spirit of the hall-passages plan. Boys' lavatories should not be placed in the central block at all, but among the external offices; partly to have no slopping of water in or near the central hall, and partly because when boys need to wash their hands,—viz., at the end of games,—the porter is outside the building, supervising the games, urinals, &c. The porter is not supposed to be in the hall, except when the boys are all in the class-rooms or hall. When they are out of doors, he must be. The supervision of the hall, with its cloak cupboards, would, most properly, be entrusted to a master or masters in the half-hour or so before school, when the pupils are allowed to come early for their games. Secondly, the cloak-room attached to each class-room on the ground-floor is objectionable. The addition of these cloak-rooms very greatly increases the area of the class-rooms, and consequently the area and height and cost of the internal hall. The smell of wet clothes would probably find its way into the class-room. And during the half-hour before school begins, when the class-rooms must be kept locked, the cloak-rooms would be inaccessible to boys who wished to deposit their books and overcoats before joining the games. On very ground the system of cloak cupboards as used at St. Paul's School, by which each boy has a lock-up cupboard of his own, is far preferable. It is approved by Dr. Abbott, and Mr. Walker finds that it works well. A special merit of the cupboard system is that since each is fitted with a small shelf, a boy can deposit on it part of the large stock of books which is required in the higher forms of a public school, and for which sufficient space cannot be found in the ordinary box-est. These cupboards should be arranged round the walls of the hall. If more room still is required, they may well be arranged between the piers of the central hall on which the three galleries rest. As this second set of cupboards would face the inspection windows of each class-room, from

which each master has a view of the hall, they would be perfectly under supervision. Moreover, they would form a screen about 5 ft. high, separating the central space of the hall from the corridors running round it, and thus securing privacy in the central space of the hall, when examinations or prayers are going on there; for boys in the centre of the hall, when seated, would be unable to see over the screen of cupboards thus formed. A third error is to design all the class-rooms of the same size. In no school are the classes all of equal size; nor should the class-rooms be. The highest class, composed of boys on the eve of entering the University, tends to be small. The lowest class is usually small for another reason; it is composed of young children, and they require too much individual attention to allow of many being placed in the same class. Therefore, at least two of the eight class-rooms on each floor may be diminished in area, without making the block in any way less adapted for use. This diminution of the area of the class-rooms again means a corresponding diminution of the area, height, and cost of that *article de luxe*, the hall. In fact, by cutting away the cloak-rooms, putting the lavatories out of doors, and curtailing the size of two class-rooms on each floor, the area of the central hall of a two-story school for 500 boys may be brought down to 3,200 square feet.

Messrs. Botterill, Son, & Wilson propose to lay wood blocks in the hall, where no one ever treads except at prayers or examinations, and noisy, boarded floors in the class-rooms, where, of all places, noise is to be avoided. This arrangement should be reversed. The hall corridors, indeed, need to be either wood blocks or granitic cement; but not the area within the hall piers. From considerations of cost they lament that they can offer nothing but open fires by way of heating; and, in spite of their agreement with Sir Henry Roscoe's pamphlet, they plaster the class-room walls. It is to be desired that the Governors of the school should not allow a plan, in other respects so admirable, to be spoiled for want of adequate funds to secure proper heating and pure air. A minor point is the deficiency in urinals; the percentage of one for twenty-two boys is far too low. At most schools there is a break in the middle of the morning and afternoon schools, and a crowd collects round these offices, and unpleasant results follow. With the modifications suggested above, the two first designs are admirable instances of planning, and the selected design fairly represents the furthest point of excellence which school planning has hitherto reached.

THE TOWN HOLDINGS BILL.

THE principle of this Bill is one which we have for a long time consistently advocated. It is that compensation should be paid by landlords to tenants for improvements made by the latter which are of permanent benefit to the landlords' property. The Bill itself is a practical result of one branch of the interim report of the Town Holdings Committee of the House of Commons, though it seems to go somewhat beyond that report. In that document it was recommended that compensation should be made for improvements made by a tenant "for the purpose of carrying on his trade or business." By this Bill compensation is to be paid to tenants for any kind of permanent improvements, not necessarily made for the purposes of business. This is just. For it is unreasonable to limit compensation for improvements to those made for business purposes: a tenant of a dwelling-house has on every ground as much claim to be recouped money he has spent on premises, some portion of which results to the benefit of the landlord, as a tenant of business premises.

The Bill is confined in its operation to future tenancies, so that for many years it will not have the large effect which would sooner or later be the case. It also guards

against persons contracting themselves out of its provisions, since "any contract, agreement, or covenant made by a tenant" by which he would be deprived of his right to compensation is null and void. Compensation is also limited to improvements mentioned in the schedule to the Bill, which is as follows:—"Such improvements *bonâ fide* made for the purpose of carrying on a business, or otherwise, as may have added to the permanent letting value of the premises. Any work, outlay, benefit, improvement, or advantage exacted, done, or accruing (during the occupying tenancy by the occupying tenant, and his predecessors in occupancy) in, to, or upon the holding, whereby, or in consequence whereof, the holding would, in the opinion of the arbitrator in the Act mentioned, increase or augment the amount paid as rent by the occupying tenant of the holding, if the same were let for a period extending over seven years from the determination of the tenancy of the occupying tenant to a hypothetical tenant or tenants on the same terms as regards tenancy as those held or enjoyed by the occupying tenant at the time of the determination of the tenancy."

As regards the second part of the schedule, we do not see why its wording should not follow the latter part of the first portion of the schedule, and give compensation in respect of any addition to the permanent letting value of the premises. There appears also to be no clause in the Bill providing that compensation shall not be paid if the full value of the cost of the improvement has been obtained by the tenant before the expiration of his tenancy. It is quite conceivable that an improvement, whether in a trade or a domestic building, might be so used by the tenant that before he leaves he will have repaid himself the cost of the improvement. In such a case it is questionable whether the tenant should receive compensation, for he would then be money in pocket, whilst the object of the Act is to prevent him from being money out of pocket. Two months' notice of an intended improvement must be given to the landlord; if no agreement as to the improvement is then made between the tenant and the landlord, or if the landlord does not agree to do the improvement himself, the tenant may proceed to do the work, and will be entitled to compensation in respect of it at the expiration of his tenancy. Such is the basis of this Bill. That it will require some amendments in Committee we cannot doubt. Section 7, for example, requires to be broken up, and section 6 is at present unintelligible. We cannot but think that the word "not" is omitted before "unreasonable," and that it is intended to exempt from compensation improvements which the landlord has not unreasonably refused to allow. It may perhaps be as well to add that the Bill contains provisions for estimating compensation in disputed cases by means of arbitration. That this Bill must ultimately become law we cannot doubt; it has for a precedent the Agricultural Holdings Act; and it is moderate and reasonable. It does not interfere with existing tenancies, and it leaves abundant opening for landlords and tenants to make agreements between themselves in regard to improvements. It need, in fact, never come into operation at all, unless tenants or landlords behave in an unreasonable manner.

NOTES.

THE Railway Commissioners had a case before them last week in which a railway company had objected to dissect certain rates on the ground that the applicant was not a "person interested" within the meaning of the Acts. The counsel for the applicant argued that every one was interested in rates which practically competed with those charged to him, and that the applicant need not be paying the particular rate required to be dissected, since it is not those who pay exceptional rates, but those who do not, who

are usually the most concerned. Judgment has not yet been given in this case, but Mr. Justice Willis indicated his sympathy with the applicant by his remarks during the hearing of the arguments. For one thing, he made a suggestion which may advantageously be noted by others wishing to obtain similar information. He remarked that all difficulty would have been avoided if some friendly customer at the other end had been requested to ask for the required particulars under section 33. It was explained that application had been made as suggested, but without effect, the company stating that, inasmuch as the rates did not exceed the authorised maximum, it could not be said that any terminal charges were included therein. Mr. Justice Willis' rejoinder to this was still more encouraging to "persons interested." He said that the Court would not be so strictly bound by the letter of the Act as to assume that valuable services were rendered by the company for nothing, and they would not be satisfied with such an answer. It frequently happens that the letter of the law is held to be even more binding than its spirit and intention, and we are glad to note that the President of the Commission has such a regard for the latter. There are exceptional circumstances connected with the case in question which explain in some measure the reluctance of the railway company to disclose the facts, but there is seldom any difficulty now in obtaining information of this nature. The difficulty is, at present, to make any use of it when obtained, as the charging powers of the railways companies are so uncertain. When the new schedules are settled, however, and have received Parliamentary sanction, these powers will be more clearly defined.

THE Committee of the House of Commons on the Strand Improvement Bill rejected the principle of "betterment" on Monday last. It must be pointed out, however, that they strictly confined their rejection to its inapplicability to the facts of the present case. In other words they do not condemn the principle, but only its application. It may be that they do in theory privately condemn it, but it was not necessary for them to go so far openly, because they do not consider that the principle was properly applied. But it cannot be disguised that one of the chief difficulties of the "betterment" principle is the difficulty of applying it practically and deciding what the area of "betterment" is to be. If, by an improvement, a house is made lighter, there is here a direct improvement, the value of which is capable of being ascertained. On the other hand, to enclose an area and say that this area is improved, and beyond there is no improvement, is so arbitrary a method, and must always leave matters so uncertain, that this alone must render the principle very difficult of practical application. The Committee were to meet to consider the general clauses of the Bill on Thursday afternoon, as we were going to press.

FROM a paragraph that has been forwarded to us from a Hertfordshire paper, we observe that there is a talk being made about setting up a monument to Lord Grimthorpe in commemoration of his munificence—

"Firstly, because he has preserved and replenished, with unstinting bounty, a fine old Parish Church; and, secondly, because for many successive years he has been the cause of thousands of pounds per annum being circulated in our midst. It need not be pretended that, in order to concur in this idea, anyone and everyone must perforce think Lord Grimthorpe's architectural style unassailable, or his authority unimpeachable. All that we are urging is that those who exercise fairly their faculties of observation and reflection must perceive at once how tangible and real are the public obligations of St. Albans to the Abbey restorer."

The gratitude to Lord Grimthorpe for having "circulated money in our midst" while engaged in defacing a great building, is truly English. But the good people who argue in this way have missed the real point of the case. Lord Grimthorpe has by his own action abandoned any claim to recognition or admiration which he might have had

under different circumstances. As we pointed out long ago, if he had given his wealth to the repair and partial rebuilding of the church under the hands of an architect competent to do justice to such a building, he would have been a great public benefactor and would have deserved and received the gratitude due for such munificence. To gratify his own obstinacy and vanity he persisted in being his own architect, in undertaking a task for which he was perfectly unqualified, and in making a great Medieval building a plaything for the exhibition of his own bungling efforts at architectural design; a proceeding which, as we have before said, we believe would not have been permitted in any other civilised country; certainly not in France or Germany. However, if the grateful tradespeople of St. Albans, among whom Lord Grimthorpe has "caused money to circulate," are bent upon setting up a monument to him in the neighbourhood of the cathedral he has defaced, we will recommend them an appropriate motto: let them adopt that to Wren,—"Si monumentum requiris, circumspecte." Rightly read, nothing could be more neat, more to the point, or more cutting.

THERE seems no question that the removal of most if not all of the gates which bar various thoroughfares in London, at the will of Ducal owners, is only a question of time; it is against the convenience of the majority of the public, unquestionably. But we are surprised at the light-hearted manner in which the Select Committee on the subject, at their meeting on Tuesday last, settled that no compensation was due to any one for the removal of such gates. No one who knows the neighbourhood in which the Duke of Bedford's rather numerous gates are found can doubt for a moment that the removal of these gates would depreciate house property in their vicinity. We know of one case where a house in Upper Woburn-place was recommended by the owner of the lease to a proposing tenant, mainly on the ground that being close to the gates, it was for the greater part of the twenty-four hours as "quiet as in the country," no continuous through traffic being possible. This quietness is one of the greatest and rarest boons to be had in a London dwelling; surely it cannot be pretended that it is worth nothing to the value of house property.

HERR KONRAD WERNICKE'S monograph on Greek vases with "love names" has been long looked for, and its appearance will be welcomed by all students of ceramography. It is the natural sequel of Dr. Klein's well-known "Meister-signaturen." The first essential was to collect all known instances of artists' signatures; that done, it was soon seen to be imperative that all instances of inscribed "love names" should be in like manner gathered together. The book is, of course, in the main a catalogue, but one chapter is devoted to the scientific results deducible from this catalogue, and here we have a substantial contribution to the history of ceramography. Briefly, Herr Wernicke finds—1. That these "love names" do not appear indifferently at all periods of vase paintings, but are almost exclusively confined to about one century,—i.e., simply from 550 to 450 B.C.—i.e., the late black and early red figured periods. 2. That the practice of inscribing love-names was almost wholly confined to Attica. 3. That, as a rule, the same love-name refers to the same person and not to a succession of persons bearing the same name,—a conclusion most important for chronology. 4. That the names refer sometimes to the obscure favourites of the vase-painters themselves, but far more frequently to beautiful boys and youths aristocratic birth. This custom of in-

scribing vases with the names of famous beauties, Herr Wernicke reminds us, was not confined to Greeks; it obtained also among the makers of majolica ware in the first half of the sixteenth century A.D., in whose wares frequently appears a female head inscribed, "Juha bella, Angelica diva," &c.

THE "programme" of the biennial meeting of the combined societies of German architects and civil engineers, which will be held at Hamburg from August 24 to 30th next, shows that, besides a series of lectures, among which those on "Style," "Hamburg," "Modern road-building in regard to the disposition of subways," "The North Sea-Baltic Canal," and "Modern wide-span bridges" promise to be of special interest, ample preparations have been made for the facilitation of an inspection of the new harbour works, public buildings, and private residences of the city, as well as of the sights of the neighbouring towns, Lübeck and Kiel, and of the works on the new North Sea-Baltic Canal close by.

WE have received some specimens and a description of a material called "Tectolith," which appears to possess some important qualities as a covering material, somewhat in the same manner as concrete slabs have been used in this country. It is described vaguely as "a mixture of various materials, chiefly magnesite," but it appears to have come into considerable use in Germany, for the construction of houses and goods-sheds on railways, and for exportation in the shape of portable houses to the colonies. These are made of slabs of Tectolith on wooden framing, on the same principle as the Lascolles concrete cottages; or they can be fixed on iron framing, if greater durability is desired; they can also be used for flooring, for which purpose they have been already applied in some factories in Saxony. We understand that Messrs. Kirkaldy & Sons have obtained very satisfactory results in testing Tectolith for strength (which test reports, however, have not been forwarded to us), and it is claimed for the material that it is one of the most fire-resisting of materials, and has stood very severe tests in this respect. Besides being used in hard slabs, it can also, by a different mixture of the ingredients, be produced in a softer consistency, suitable for use in pugging or deadening sound in floors and partitions.*

THE case of Rendle v. J. Edgcombe Rendle & Co., Limited, which was tried on Saturday last, and is reported in another column, brought into court the well-known glazing business of which many of our readers have had practical experience. The dispute was one of a personal nature, the plaintiffs being the trustees of the will of the late William Edgcombe Rendle, and the manager of the defendant company, being a son of the "original" Rendle. The Judge decided in favour of the plaintiffs, and granted a perpetual injunction to prevent Mr. J. E. Rendle from using his name or doing anything to make the public believe that he had succeeded to W. E. Rendle's business. Many of our readers have probably received prospectuses of the defendant company, and this case should be a warning to them to be careful in the matter. Into the unfortunate personal details of the case it is unnecessary for us to enter. It is sufficient here to state, as the result of the case, that Mr. J. E. Rendle has now no interest in the original firm.

NO. 9, St. James's-square, is in course of being altered and repaired for the members of the Portland Club. This finely-built house, recently occupied by Miss Hoare and Miss Prince, stands on the northern side of the square, with its main entrance in York-street, western side. The walls are unusually

* We understand that a company is being formed for manufacturing the material in this country. It appears worth a trial.

* "Die griechischen Vasen mit Lieblingsnamen. Eine archäologische Studie von Konrad Wernicke." (Berlin: Reimer, 1890.)

† Mr. F. G. Davis, of 54, Theobald's-road, W.C. builder and contractor.

substantial; all the principal rooms are fitted with doorways carrying richly-carved pediments,—the doors, in pairs, having a depth of 2 ft. and more between them,—and these rooms, up to the third floor, are handsomely panelled and wainscotted. Two large apartments, fronting the square, on the ground and first floors, will serve, respectively, as the dining and card rooms. The chief staircase carries a noble balustrade of mahogany. This is reputedly the actual house that was inhabited, in Queen Anne's reign, by James, second Duke of Ormonde, (grandson of Dryden's "Barzilai") who suffered attainder for his share in the "15." In this case, and appearances favour the statement,* it must be one of the original "thirteen or fourteen great and good houses" for the erection whereof, upon the Earl of St. Albans' land, a warrant, dated September 23, 1664, was issued to Abraham Cowley and Baptist May—whence, perhaps, the neighbouring Babmaes-mews, in Jernyn-street—by name, at first, of the Piazza. It is known that the Duke lived on this site, and that his house was sold by the Crown for 7,500*l.*, being valued at 300*l.* a year. In his "Journey Through England," De Foë refers to it "as a noble palace, now purchased and finely adorned by the Duke of Chandos." The Duke of Chandos, it seems, thereupon abandoned his scheme for building a vast mansion along the northern side of Cavendish-square,† Ormond-yard, in York-street, commemorates the name of the attainted Duke, who went into exile at Avignon, with a pension from the Court of Spain. Dying on November 16, 1745, he was buried in the family vault beneath Henry VII.'s Chapel, at Westminster.

THE Holmewood estate, Huntingdonshire, the seat of the late Mr. William Wells, will be put up for sale by auction at the Mart on July 16 next. Yielding a rent-roll of about 7,000*l.* a year, this property extends over 6,400 acres. It comprises various farms and homesteads, some of them upon land reclaimed from the fens, together with the whole of Denton and Holme parishes and nearly all of Glatton. As is not commonly known, the last-named village gave a name to one of our now obsolete ironclads. Glatton is supposed to be a corruption of the British *glästanen*, or later *glästen*, the holm-oak. It is stated that the draining of Whitlesey Mere, some forty-five years ago, was done at Mr. Wells's expense. Amongst his collection of old plate sold at Christie's on Tuesday, June 3, were the thurible of silver-gilt, with silver chains, and the "naviculaire," or incense boat that were then dug up in the mere, and are supposed to have belonged to the wealthy Benedictine abbey at Ramsey, but a few miles distant in the same county. The former was bought for 1,155*l.*, the latter for 900*l.*, the boat being regarded as of the Early Tudor period, the thurible as of the end of Edward III.'s reign.

IN our list of "Tenders" of last week were included two tenders for carrying out some alterations, &c., at the "Bag o' Nails," now No. 6, in Buckingham Palace-road. This is a representative of one of the old taverns for which Pimlico was once famous; such as the "Gun" (demolished in 1857), the "Goat and Compasses" (dating from the Commonwealth), and others. The sign is a corruption of Ben Jonson's "Bacchanals." The original device consisted of a wood satyr, attended by a band of choice spirits. These latter, when the satyr was repainted black, became "translated," and the sign for a while was vulgarly known as the "Devil," the cloven feet being still conspicuous.

SOMETIME ago the classical temple which surmounts St. Bernard's Well, Edinburgh, was restored, at considerable cost, by the late Mr. William Nelson, pub-

lisher. The restoration was thorough, including a new marble figure of Hygeia, mosaic inlay for the domed roof, tessellated floor, and extensive terracing, &c., upon the grounds. It appears that doubts have arisen as to the real character of the water, and, in consequence of this, a customer of a firm of druggists in the city requested them to make inquiry into the matter. It had been remarked that there was an absence of the odour of sulphuretted hydrogen, which forms the chief characteristic of the water, and the presence of which constitutes its peculiar virtue. A sealed sample of the water was sent to Dr. Stevenson Macadam for analysis, without informing him of the source from which it came. After giving details of his analysis Dr. Macadam concludes:—"These results prove this sample of water contains in solution much saline matter, and is very hard in character. It further holds in solution substances derived from the decomposition of putrescent organic matters, and which render the water very impure and unfit for domestic purposes or for the watering of cattle." The City Analyst, however, assures the public that "the result of repeated analyses within the last few days of this water, at various hours, is to show that its constitution is, if anything, purer than it was at the opening of the present well, and that there is a total absence of anything indicating sewage contamination." The builders, Messrs. R. Thorburn & Son, who were employed in the restoration of the well, write to the *Scoteman* as follows:—

"When taking down the stonework of the old pump, Mr. Nelson directed us to see the tank from which the water was drawn, and, if necessary, have it cleaned out. Accordingly, we had the pavement floor lifted, and found underneath a space, with a rocky surface, the full size of the well-building, intersected with walls carrying the floor above, and in the centre a barrel sunk down in a cavity of the rock. Under instructions of Mr. Lessels, architect, this barrel was taken out and the cavity cleaned, when the water was observed coming up through the bottom in three well-defined feeders, all on the north and east sides (two next the river and one a little to the south and east). After being thoroughly brushed and cleaned out, the bottom of the cavity was covered with 6 in. of clean broken stones, on which was set a cylindrical tank made of two salt-glazed spigot of faucet pipes, jointed with cement, standing faucet downward, and having the bottom of the lowest pipe filled in with a disc of Portland cement, through which two holes were pierced. Between this tank and the walls of the cavity was packed clean broken stones for eighteen inches of the height, at which point three holes were cut in the cylinder. The remaining height up to the floor of the space under well-room was tightly packed with stone and cement. The top of the cylinder or tank finished about 9 in. or 12 in. above the surrounding rock by being covered over with a flag bedded in clay and pierced in the centre for the pump pipe. There was always a good deal of water on this rocky floor, apparently coming from the high ground and mill lade to the south, and having made certain that it could not get into the tank, we cut an overflow hole through the wall of the well to the north to allow of its escape to the river. While the tank was being fitted up, visitors were supplied from a cistern previously filled; and it was a matter of remark that in a few hours the water had lost its peculiar odour and flavour."

The mill lade to the south, from which it was "made certain" that no water could get into the tank, is little better than a common sewer, and the certainty of the measures taken for preventing contamination from that or any other source should be carefully investigated.

TWO additional galleries of the Scottish National Portrait Gallery were opened to the public on Saturday. These contain a large and interesting collection of engraved portraits of Scottish historical characters, drawings of old Edinburgh by the late James Drummond, R.A., a set of engravings illustrative of the art chiefly of French masters of the seventeenth and eighteenth centuries, and casts of classical celebrities. These last formed part of what is known as the Albani collection, purchased in 1839 by the Board of Manufactures for the Trustees' Academy.

THE eastern half of the building in Queen-street, Edinburgh, which is to be appropriated by the Scottish Society of Antiquaries, is not yet in a fit state for occupation, but we are given to understand that it will probably be so before the lapse of another year.

THE Stover collection, the property of the late Edward, Duke of Somerset, will be put up for sale by auction, at Christie's, on June 28 current. The pictures for the greater part are by old masters of the Dutch and Italian schools, such as Hobbema, Backhuysen, and Adrian Ostade, Bronzino and Claude. There are also Paul Potter's "Dairy Farm" (1646), formerly in M. de la Hante's gallery; Reynolds's portrait of Anne, eldest daughter of James, fifth Duke of Hamilton, who married, in 1761, Arthur, first Marquess of Donegal; Gainsborough's Duke of Hamilton and his brother, Lord Douglas, afterwards summoned to the House as Duke of Brandon. The claim of the elder brother, James, seventh Duke, who died, unmarried, in 1769, to the Douglas estates was disallowed on appeal to the Lords in the famous suit known as the Douglas cause. Also a female portrait by Hoppner; and portraits by Van Dyck (Queen Henrietta Maria), Lely, and Dobson; together with Rubens's sketch for his "Daniel in the Lions' Den." These paintings were purchased by Archibald, ninth Duke of Hamilton, who died in 1819, and given by him to his daughter Charlotte, wife of Edward, eleventh Duke of Somerset. Thus they passed to the late nobleman, who, when Lord Seymour, married, in 1830, Jane, granddaughter of Richard Brinsley Sheridan, who took the part of the Queen of Beauty at the Eglintoun Tournament.

THE architectural and topographical library of the late Thomas Henry Wyatt, F.S.A., was sold a few days since by Messrs. Puttick & Simpson in their auction-rooms at Leicester-square. Amongst the more important works were included the following:—Nash's "Collections for the History of Worcestershire," 1781-2; E. Hasted's "History of Kent," 12 vols., 1797-1801 (Hill, 5*l.* 3*s.*); Winkles's "French and English Cathedrals," 4 vols., 1836-7 (2*l.* 16*s.*); G. E. Street's "Gothic Architecture in Spain," 2nd edit., 1869 (Quaritch, 1*l.* 12*s.*); A. W. Pugin's "Glossary of Ecclesiastical Ornament and Costume," roy. 4to, 1814 (Quaritch, 2*l.* 18*s.*); Dollman and Jobbins' "Examples of Ancient Domestic Architecture," 2 vols., 4to, 1858 (1*l.* 1*s.*); Dollman's "Priory of St. Mary Overie, Southwark," imp. 4to, 1851 (1*l.* 3*s.*); "Revue Générale d'Architecture," &c.; several volumes unbound, "Paris, 1840-77" (2*l.*); "Architectural Association Sketch-Book," vols. 3 to 12, 1869-80 (Batsford, 6*l.*); Richardson's "Old English Mansions, Plate, and Furniture," vols. Nos. 1, 3, and 4, imp. fol., 1841-8 (Batsford, 4*l.* 10*s.*); "Vitruius de Architectura cum Emendationibus et Illustrationibus," A. Marinio, 140 plates, 4 vols., Rome, 1836—with King Louis Philippe's monogram on covers (1*l.* 2*s.*); V. Petit's "Châteaux de la Vallée de la Loire," 2 vols., imp. fol., Paris, 1861 (Batsford, 5*l.* 2*s.* 6*d.*); P. Letarouilly's "Édifices de Rome Moderne," 4 vols., imp. fol., Paris, 1843-57; F. Mazois's "Les Ruines de Pompei," 198 plates, 4 vols., atlas fol., Paris, 1812-38 (Batsford, 5*l.* 12*s.* 6*d.*); V. Place's "Ninive et l'Assyrie," with F. Thomas's designs for restorations, 82 plates, 3 vols., atlas fol., Paris, 1867 (Batsford, 4*l.* 17*s.* 6*d.*); James Neale's "Abbey Church of St. Alban," 60 plates, imp. fol., 1877 (Wyatt, 1*l.* 10*s.*); Pugin and Heath's "Paris and its Environs;" and C. Wieck's "Spires and Towers of the Medieval Churches of England, 3 vols., imp. fol., 1853-9 (Quaritch, 8*l.*). Copies of Mr. Norman Shaw's "Architectural Sketches," with 100 plates of famous buildings in France, Italy, and Germany, 1858, and J. S. Cotman's "Architectural Antiquities of Normandy," 2 vols., imp. fol., 1822, were bought for 16*s.* (Berry) and 17*s.* (Parsons) respectively.

* We have since learned that No. 9, St. James's-square is part of the house of the great Duke of Ormonde. His house extended to Ormond-yard.
† Confer Mr. H. B. Wheatley's "Round about Piccadilly," 1879, ad loc.

A MOSAIC has just been completed, from the design of Mr. Holman Hunt, by Messrs. Powell & Sons, as a reredo for the chapel at Clifton College. The subject is Christ discussing with the Rahhis in the Temple. Messrs. Powell have produced a fine piece of mosaic work, but the subject has not, in our opinion, been treated by the artist in a sufficiently decorative manner, considering the position it is intended to occupy; the head in the figure of Jesus is certainly too large for the body, and the whole would have been vastly improved by a simpler scheme of colour.

MR. DRESSLER has at his studio, in Chelsea, a copper relief representing the Holy Family, one of two for a side chapel of St. Xavier's Church, Liverpool. The panel measures about 4 ft. square. The Virgin and St. Joseph are seated on a panelled dais with the Child between them. The background is occupied by arcading, the spaces being filled by a representation of the Deity in the centre, and angels playing on musical instruments on either side. The principal figures seem to have been carefully modelled; the weak point in the panel is the architectural background, which can scarcely be considered a success.

TWO elaborate cabinets, made by Boule as a present for Philip V. of Spain from Louis XIV., are now to be seen at Mr. Ichenhäuser's, in New Bond-street. They were formerly in the Château de Marieumont, in Belgium, and are both of the same general design. The fronts of the various drawers are filled with representations of the victories of Philip,—a series of eight on each cabinet,—the figures being of tortoiseshell on a background of tin. Ebony has been largely used, and the hands of ornament, and the decoration of the circular columns at the angles, are of great delicacy of detail. The centre bay of the cabinet is made to open either door, the hinge being formed by the bolts attached to the locks, one on either side. Over the centre portion is a figure of Pama blowing a horn, and holding the monogram of Philip V.

THE idea so long entertained and acted upon in India, that engineers are the fittest persons to be entrusted with new architectural work in the country, though it has been somewhat modified of late years, seems to die hard. A correspondent in *Indian Engineering* of May 17 writes:—

"What are the wisecracks of the Allahabad Municipality thinking of when, having made up their minds that the capital of the North-West Provinces demands a town-hall as an illustration of its dignity and proud status, they repudiate the assistance of professionally-trained architects, and decide to entrust the design for their grand Hôtel de Ville to the assistant engineer who looks after their water-works. An accomplished and estimable young man I make no doubt. Still I hope I may be pardoned if I fail to see how having charge of water-works—even in Allahabad—can inform a man about the principles and practice of architecture *en grande tenue*, or render him an authority on that art."

THE ways of American journals are certainly interesting. We observe that the New York paper called *Architecture and Building* has been reprinting Professor Aitchison's lectures on Roman Architecture, of course from our columns, as with the exception of the first lecture they were communicated to no other journal. Not only does the American editor reprint them without a word of acknowledgment as to the source from which he obtained them, but even one or two editorial comments of our own on points in the lectures, printed as footnotes, are duly reproduced with the affix "Ed." at the end of them, leaving the reader to suppose that this is the comment of the American editor.

Erratum.—In "Notes" last week, line 3 of first column on p. 412, for Meadows v. Marshall read "Meadows v. Taylor."

ARCHITECTURE AT THE ROYAL ACADEMY.—VI.

1840. "St. Swithin's Church, Mither Green, Kent": Mr. Ernest Newton. This is shown in a bird's-eye view, which gives rather too great a prominence to the expanse of roof; it is an exceedingly solid-looking building with massive plain buttresses and windows with equally massive tracery between them. The west end is rather oddly treated; there is apparently a narrow narthex between two deep buttresses, and above this what looks like a chimney rises in the centre of the front up to the gable, with a window on each side of it. What the meaning of this is is not apparent, unless it is a buttress to hold up the front, but as it has no visible base externally, and only rises out of the porch roof, it adds no appearance of stability. On the other hand the side aisle, instead of being a lean-to roof, is treated as a longitudinal gabled roof, the inner slope falling back against the nave wall. There is no particular objection to that, but the treatment of the west end of the nave is eccentric rather than effective, and rather spoils an otherwise good church. This drawing, being one with a high sight-line, is as usual hung at the very top of the wall as high above the eye as possible, so as to appear as if falling over. This stupidity about such a simple matter, which is constantly repeated in the hanging of the architectural drawings at the Academy, year after year, is quite inconceivable. Is there no one in the Academy who knows that a drawing looks best when viewed from the position nearest to the spectator's imagined position?

1841. "An East-end Mission-house": Mr. E. W. Mountford. A prettily-executed pen-drawing; there is no plan, but we presume that the upper portion, with the windows beneath pointed arches springing from buttress to buttress, is an open-roofed hall, and the lower portion with the square mullioned windows consists of offices or small rooms of some kind. The building is picturesquely grouped, the different portions of it being distinctly marked, and the effect of the whole is suitable to its purpose and position.

1842. "Hertford College, Oxford: New Hall and other buildings": Mr. T. G. Jackson. The prominent feature in this small drawing is an octagonal staircase lighted by a series of elliptical headed windows built on the rake following the stair line; a neat problem in masonry, but having to our thinking a rather crippled effect architecturally. The addition is entirely in keeping with its surroundings, which is an excuse for the flower-pot finials at the top, which otherwise we do not much sympathise with.

1843. "Industrial Schools, Knowle, Bristol: Entrance Front": Mr. J. D. Sedding. A reproduction from this drawing is published in the present number. It is exceedingly picturesque, though we question whether there is not a little too much determination to be picturesque about it, and whether it will not be thought in a few years rather an eccentric experiment. However, it is better than making a school a mere commonplace square mass of building, certainly; and this school has the merit of being homelike, as we think schools (especially Industrial Schools) should be, and not like jails or workhouses. No plan is given with the exhibited drawing, but we are enabled to append a plan in the present number, from which the relation of plan and design will be seen. A word is due to the drawing; a slightly-executed water-colour, which, however, in regard to feeling for colour, tone, and composition, is one of the best things in the room. It is a pity that, with all these merits, the little cupola on the left, the most prominent object, should be crooked and out of drawing.

1844. "Home of Rest, Littlehampton, Sussex": Mr. Halsey Ricardo. A good deal of the picturesque effect of this is due to the drawing, in which all the sides of brick piers in shadow are shown with every brick shaded dark, the front being left nearly untouched. This is a purely artificial effect, but it gives a look of originality and picturesqueness to a drawing. The building is characteristic enough in treatment: the upper stories oversailing and carried on large piers of brick wall projecting on the ground story.

1845. "Proposed New Catholic and Apostolic Church, Westminster": Mr. John Belcher. Elevation plan, and section; the plan is cleverly treated on a long site with one end to a street cutting it at an oblique angle. The east end

faces the street, and the entrance is by a door at one side of the chancel and a passage parallel to the latter. The central portion of the plan is treated as a hexagon, the piers opening out somewhat on the same principle as in St. Stephen, Wallbrook; this space is roofed by a semicircular dome, a plain semicircle externally, but internally the treatment is of Late Gothic type, the dome having groining ribs, twelve in number; the springing of the dome is a narrower hexagon carried on arches thrown from centre to centre of the bays of the lower hexagon, across its angles. Externally we see a rather poor little gable with a Tudor type of traceried window in it; and a brick tower on which is bluntly set an iron and lead campanile contrasting picturesquely with the plain brick-work which carries it. The main arcade round the hexagon is treated with large Tudor shaped arches with the main portion of the "arch" perfectly straight in line from the apex to the small curve at the springing; not a very strong sort of arch nor very agreeable to the eye. There is however a great deal of originality and interest in this set of drawings.

1846. "St. Mary's, Clumber; the side chapel": Mr. G. F. Bodley, A.R.A. A regulation coloured drawing of a regulation Gothic interior.

1850. "British and Foreign Marine Insurance Company's Offices, Liverpool": Messrs. Grayson & Ould. This drawing is reproduced in the present number. It is an effective sepia drawing, with the two angles of the foreground buildings forming a frame to the principal one, and is a creditable attempt to give architectural effect to a business building, as well as a certain meaning in the decorative details, the ship keystones, the pictorial panels (of mosaic) contrasting the ancient with the modern ship. The tracery diaper over the second-floor windows has a good effect, but we fear there is rather a want of refinement in details, and the third-floor windows appear to belong to another building, and have no architectural relation to the rest of the detail.

1854. "New Grammar School, Bedford": E. C. Robins. This is an example of a kind of drawing not often seen at the Academy, a perspective view in which part of the exterior is broken away to show the interior construction. The portion shown is the great hall, with a lofty arcade and aisles, and galleries round it at two levels, with an open timber roof. A plan is appended, showing that the school is one of the type in which the hall is really the access to and meeting ground of the class-rooms. These all open on the corridors and galleries, and the master's room and common room are at one end, opening on the great hall, with a dais immediately in front of them reached by a few steps from the hall. The plan is an admirable one; the exterior design is what may be called "Collegiate Gothic" of a type now rather passé.

1855. Offices of the *Glasgow Evening Citizen*: Mr. T. L. Watson. This, which is obviously with intention hung next to No. 1,850, is another example of the class of costly business buildings which are becoming so common now. It is a building of the "handsome" order, but rich and dignified in effect. The newspaper office only occupies a portion of the facade, being distinguished from the "Citizen Buildings" forming the other portion by a slight projection forward of the ground-floor story, which is treated with a Corinthian order of Renaissance type, between terminal pilasters, while the "Citizen Buildings" portion is treated with circular-headed openings with deep reveals and heavy panelled piers. Above the projecting portion of the ground story are bay-windows on the first-floor, over which the wall and cornice lines run through on the same plane. The top story below the gables is treated very richly, with round arches on low square piers, carved on the panels, the spandrels of the arches, and the large brackets supporting the main cornice being also richly carved. The plain masonry of the gable walls produces a good effect of contrast over this, though we do not like the dog-legged outline of the scrolls which diversify the corbie-steps. Taken as a whole, however, there is more power and originality of design about this than about most buildings of the type to which this belongs—that of the "handsome" street building.

1856. "Triumphal Arch at Timgad, Algeria, Restored": Mr. Alexander Graham. A French architect would have given drawings of the entire remains as existing, so that one could see the basis of the restoration. An English architect who sends a drawing of a restoration never

thinks of that; and very probably, if he did, the Academy would not hang the drawings. All we can see is that there is a charming tinted water-colour drawing of a Roman arch with an order attached on either side of the archway in the usual fashion, and that it is shown with a great deal of truth and precision of effect, and need not have been hung so high.

1859. "New Church, St. Peter's, Ealing; exterior view." Mr. J. D. Sedding. It would take a long description to do justice to the extent of originality in this design; fortunately we can refer the reader to an illustration in the *Builder* of Nov. 16, 1889, for the general design, which, however, has been altered and improved in various details in the exhibited drawing. The ink-line drawing, like that of No. 1,777, is hasty and scrawly in style, but not without effectiveness. The treatment of the end window is remarkable; it is set deep under a great arch abutting against a kind of buttress turret on each side; two large plain deep buttresses stand edgewise to the window plane opposite the principal mullions, and are connected with them by a kind of small flying buttresses. Between these buttresses below is the segmental arched doorway, with a parapet filled with figures over it. The treatment of the tower with its arcades, with the angels filling in the spandrels over the window, is very rich and picturesque. The whole thing is a piece of real originality in design, which it is refreshing to come across after seeing so many repetitions of old forms, Classic and Gothic. It is to be regretted that the affectation of archaism in the drawing produces an effect of eccentricity which is really not inherent in the design itself.

1860. "Pulpit, Siena Cathedral." Mr. Thos. Maclaren. This is a really beautiful specimen of pencil drawing, soft in general effect but clearly and decisively finished in detail. The bas-relief sculpture at the top is drawn with great care, and the capitals of the columns, and the smaller ornamental details, are shown very minutely and effectively. It is a pleasure to see such a drawing as this, at once artistic and architectural.

1861. "Exeter College Chapel, Oxford." Mr. Cecil B. Roper. This is another of the ink-line drawings, similar to those by the same hand which were exhibited last year, in which an unusual degree of aerial softness of effect in line drawing is aimed at, and realised, by a system of working entirely in small detached strokes. The drawing is executed with great care and patience, and the resulting effect is exceedingly delicate, but there is rather a tendency to lose distinctness and meaning in the detail by this method, as in the treatment of the marble shafts. On the whole the style and effect are artistic rather than truly architectural, but the author may be said to have made an original hit in drawing.

1864. "View of Premises, Wigmore-street." Mr. T. E. Colcutt. We may refer the reader to the *Builder* of May 24 for an illustration of this drawing, which is a line drawing. It is one of the best and most refined designs for a street front in the room, though perhaps the vertical striping with narrow slips of pilasters is rather over-done; but the details are all good and refined, and the drawing ought to have been hung lower.

1865. "New Buildings at the Cross, Chester." Mr. T. M. Lockwood—an example of the modern reproduction of the old Chester timber style of street house. The drawing, a monochrome in sepia, is a boldly-executed one, but there is not much to distinguish the design from others of its type which have been carried out in Chester of late years. The timber-work is richly treated, in foliated panels, &c.; but the whole is a little heavy in effect. If local building acts permit the continuance of this manner of building in the streets of a town, there is something more to be done with it architecturally than has usually been done; and in this case the most unusual point, the projection of a stump of timber into the middle of a panel, is hardly a good method of treatment, as it is entirely at variance with construction; and this kind of building should be, emphatically, timber construction, treated in an effective and decorative manner, but still construction.

The Society of Arts' Conversazione is fixed to take place at the Natural History Museum (by permission of the Trustees of the British Museum), on Friday, June 27.

ARCHITECTURAL ASSOCIATION VACATION VISITS:

I.—SHIPLAKE COURT, NEAR HENLEY.

The first vacation visit of the Association this year was made on Saturday by some thirty members to Shiplake Court, near Henley, which is now approaching completion, having been erected from the designs of Messrs. Ernest George and Peto, for Mr. Robert Harrison.

The house is charmingly situated on the high bank of the Thames, and commands an extensive view over the surrounding country to the south and south-west. The designs have been worked out in fifteenth century style, the materials used for the external parts being red bricks from Bracknell, and black headers for diapers, while the dressings and tracery are of Bath stone, which has been stained to bring it to a tint more harmonious with the red and black brickwork. By a careful selection of the bricks, the crudeness that might have been expected has been most happily avoided. Thick stone slates from the Forest of Dean are used for the roof, which is capped by a solid stone ridge. The entrance front has considerable charm and picturesqueness, and may certainly rank as one of the happiest efforts of Mr. Ernest George. The chief entrance is emphasised by carrying up a part of the building in a low square tower with an octagonal turret corbelled out from one angle, and this forms the central point of the grouping of this front.

The garden front, looking towards the river, is far more symmetrical in treatment, inasmuch as the greater portion of the facade is taken up by the great hall, which forms the chief feature by the internal arrangement. A halustrated terrace carried out in flint work, and handed with red bricks, forms an important part of the design of the garden front. Internally, as already mentioned, the great hall is the chief feature of the plan; this is 70 ft. in length, and has an open-timbered roof with moulded purlins and wind braces, while the walls are panelled in oak to a portion of their height, and finished with stone ashlar above it. A screen and minstrel gallery are intended at one end of the hall, but these are not yet in position. In the centre of the long side opposite the windows, is an important feature in the projecting fireplace and chimney, which is carried out with a considerable amount of detail in warm-coloured Hamhill stone.

The dining-room and billiard-room are at one end of the hall, and library and morning-room at the other. The principal staircase was at the time of the visit not sufficiently advanced to allow us to form any adequate idea of its effect, but from the drawings which were exhibited, and the detail already commenced, there can be little doubt that this will be yet another of the many charming features to be found in the house. Besides the main building, stables have been erected at some little distance, and in connection with them one of the most notable features in the composition, the great tower devoted to the storage of water and provision for the electric lighting plant consisting of boiler, engine, dynamo, and accumulators; this tower contrasts very notably with the design of the house tower and the church tower adjacent, by reason of the very foreign character of its general outline; the object of the designer has probably been to avoid competition between these three towers, and to produce a harmonious group of dissimilar elements. The entrance-ledge next the main road has been treated in a Jacobean spirit, with dark-stained woodwork and white rough cast above a ground floor of red brick; here again stone slates have been used, though of a finer variety (from Boughton-on-the-Water) than those on the main house; we are inclined to think that a tile roof however would have been more happy in this case, as there is a decided want of contrast between the tones of the roof and of the rough-cast in the upper story of this lodge.

The halli's house and dairy have also been erected from Messrs. Ernest George and Peto's designs; this block is kept entirely subordinate in design to the main building, perhaps too much so, as, *per se*, it rather lacks interest in design from the apparently too great regularity of the haak diaper and the dulness of the dark-stained wood window frames.

The Artists' Benevolent Fund.—The eighty-first anniversary dinner of this Fund is fixed for Wednesday, June 25, at Freemasons' Hall, Sir Richard Temple in the chair.

THE INSTITUTION OF CIVIL ENGINEERS:

ANNUAL MEETING.

The annual general meeting of corporate members—"to receive and deliberate upon the report of the Council on the state of the Institution, with the annual statement of the accounts and to elect the Council and officers for the ensuing year"—took place on Tuesday, the 3rd inst., Sir John Coode, K.C.M.G., the President, being in the chair.

This meeting was held on the sixty-second anniversary of the incorporation of the Institution by Royal Charter. At that time the number of members was 156, and the gross annual receipts were 447. At the close of the past financial year the number of members was 5,872, and the gross receipts for the twelve months amounted to 22,478. This increase—thirty-seven-fold in numbers and fifty-fold in revenue—sufficiently indicated the position which the Institution had taken in connexion with the profession it was designed to promote. It should always be borne in mind that a large rate of increase was by no means desirable. There was no object, however, in limiting the numbers, as was the custom in some exclusive bodies, for the Institution had always opened—and it was hoped always would open—its doors to all engineers who had an honest title to be entered on its register; but it refrained from augmenting its numbers by the admission of persons who were merely attracted to it for their own advantage. Above all things, the Council desired it to be understood that membership in the Institution should be a real guarantee of the professional standing and (as far as possible) also of the personal character, of those on whom it was conferred. For these reasons the Council repeated the recommendation, often previously made, that every member should take care not to attach his signature to any proposition, unless fully satisfied as to the truth of the representations it contained, and as to the general eligibility of the candidate.

During the past year, there were elected 3 Honorary Members (Sir Henry Bessemer, F.R.S., Sir William Thomson, LL.D., F.R.S., and General Edward Frome, R.E.), 32 Members, 263 Associate-Members, and 3 Associates, while the name of 1 Member was restored to the list. On the other hand, 138 names had been removed from the register, 87 of which were losses by death. Among the latter, the Council recorded with regret the names of three Honorary Members, the King of Portugal, Dr. John Percy, F.R.S., and General Edward Frome, R.E., who died shortly after his election. The roll of the Institution therefore showed a net increase of 104, the number of members of all classes (irrespective of students) being now 4,903. This represented an increase at the rate of about 3½ per cent. per annum. Owing to more stringent regulations as to the admission of Students, there had been a decrease of 20 in the number of that class. The admissions had included 156 Students, and 1 was restored to the list, whilst 73 had been elected Associate-Members and 104 had passed out of the list.

At the ordinary meetings, papers on important constructive engineering works had been read, and also on many branches of mechanical and electrical engineering. It was hoped that some branch of metallurgy might have been brought forward, but in that hope the Council had been disappointed. It was, however, confidently believed that the omission would be made good next session. For two of the papers the Institution was indebted to Mr. Lyster, Member of Council, and to Sir Frederick Bramwell, Bart., D.C.L., F.R.S., Past-President. In conformity with long-established usage, these communications were not taken into consideration in the adjudication of the premiums. Telford Medals and Telford Premiums had been awarded to Messrs. John Robinson, C.O. Burge, and F. T. G. Walton; Telford Premiums to Messrs. S. W. Barnaby, W. H. Wheeler, James Price, jun., C. Hopkinson, H. G. Sheppard, and W. Army; and the Manby Premium to Messrs. W. P. James Fawcus and E. W. Cowan. For papers read at the supplemental meetings of students, a Miller Scholarship had been awarded to Mr. C. Frewen Jenkin, and Miller Prizes to Messrs. C. H. Wordingham, A. E. Young, L. A. Legros, F. P. Reynolds, J. Hale, and G. H. Sheffield.

Since the last annual meeting four volumes of "Minutes of Proceedings" had been issued.

The Council trusted that the members would continue to contribute to this part of the work of the Institution, as being that which was of the greatest permanent importance. It was intended shortly to issue a pamphlet of about sixty pages, enumerating those public educational establishments in the British dominions which included special preparation for the engineering profession. The abstract of receipts and expenditure showed, on the credit side, income, 17,677l. 13s. 10d.; capital (that was admission-fees and life-compositions), 3,794l. 14s.; trust-fund receipts, 1,057l. 6s. 9d. (including the Crompton Bequest of 500 and the Trevithick Memorial Donation, 100l. 0s. 9d.), making a total of 22,477l. 14s. 7d. On the other side of the account, the general expenditure had been 14,696l. 6s. 3d., the investments on account of capital, 6,900l. 19s., and payments or investments of trust funds, 1,049l. 2s. 4d. At present the Institution invests in Consols, Metropolitan Board of Works Stock, and Railway Debenture Stocks aggregated 43,560l.; the freeholds of the three contiguous houses in Great George-street, 40,000l.; the Whitworth legacy, 5,400l.; and Trust Funds, 15,286l. 0s. 10d., making a total of 104,186l. 0s. 10d.

In conclusion, the report referred to the visit, last summer, to Europe, of a representative body of members of the American Societies of Civil, Mining, Mechanical and Electrical Engineers, which their Institution had the honour of entertaining for six days. Many and various were the means which the reception committee took to arrange for the amusement and recreation of the visitors. On the whole the visit might be considered to have been a great success, and was one full of pleasant memories for the hosts.

The adoption of the report was moved, seconded, and carried, and it was ordered to be printed in the "Minutes of Proceedings." Cordial votes of thanks were then passed to the President, to the Vice-Presidents and other Members of the Council, to the Auditors, to the Secretaries and Staff, and to the Scrutiners.

The ballot for Council resulted in the election of Sir John Coode, K.C.M.G., as President; of Mr. G. Berkeley, Mr. H. Hayter, Mr. A. Giles, M.P., and Sir Robert Rawlinson, K.C.B., as Vice-Presidents; and of Mr. W. Anderson, D.C.L., Sir Benjamin Baker, K.C.M.G., Mr. J. Wolfe Barry, Mr. E. A. Cowper, Sir Jas. N. Douglass, Sir Douglas Fox, Mr. J. Clarke Hawkeshaw, M.A., Mr. C. Hawksley, Sir Bradford Leslie, K.C.I.E., Mr. G. Fosbery Lyster, Mr. J. Mansergh, Mr. W. H. Peerce, F.R.S., Sir E. J. Reed, K.C.B., F.R.S., M.P., and Mr. W. Shelford, and Mr. F. W. Webb as other members of the Council.

The Session was then adjourned until the second Tuesday in November, at 8 p.m.

The following is a detailed list of the awards made for communications submitted during the past session:—

For Papers Read and Discussed at the Ordinary Meetings.

1. A Telford Medal and a Telford Premium to John Robinson, M.Inst.C.E., for his Paper on "The Barry Dock Works, including the Hydraulic Machinery and the Mode of Tipping Coal."
2. A Telford Medal and a Telford Premium to Charles Ormsby Burge, M.Inst.C.E., for his account of "The Hawkesbury Bridge, New South Wales."
3. A Telford Medal and a Telford Premium to Frederick Thomas Granville Walton, C.I.E., M.Inst.C.E., for his description of "The Construction of the Dufferin Bridge over the Ganges, at Benares."
4. A Telford Premium to Sydney Walker Barnaby, M.Inst.C.E., for his Paper on "The Screw-Propeller."
5. A Telford Premium to William Henry Wheeler, M.Inst.C.E., for his Paper on "Bars at the Mouths of Tidal Estuaries."
6. A Telford Premium to James Price, jun., B.E., M.Inst.C.E., for his account of "Lough Erne Drainage Works."
7. The Manby Premium to William Paul James Fawcus, and to Edward Woodrowe Cowan, Assoc.M.M.Inst.C.E., for their joint Paper descriptive of "The Keswick Water-Power Electric-Light Station."

For Papers Printed in the Proceedings without being Discussed.

1. A Telford Premium to Charles Hopkinson, B.Sc., M.Inst.C.E., for his Paper on "Hydraulic Packing-presses."
2. A Telford Premium to Herbert Gurney Sheppard, Assoc.M.Inst.C.E., for his Paper on "The Reclamation of Lake Aboukir, near Alexandria, Egypt."
3. A Telford Premium to Wilfrid Atry, B.A., M.Inst.C.E., for his Papers, "On the Action of Quick-sands," and on "The Probable Errors of Surveying by Vertical Angles."

* Has previously received a Watt Medal and a Telford Premium.

† Has previously received Telford Premiums.

‡ Has already received Telford and Manby Premiums.

For Papers Read at the Supplemental Meetings of Students.

1. The Miller Scholarship to Charles Frewen Jenkin, B.A., Stud.Inst.C.E., for his Paper on "Some Applications of Electricity in Engineering Workshops."
2. A Miller Prize to Charles Henry Wordingham, A.K.C., Stud.Inst.C.E., for his Paper on "Telephonic Switching."
3. A Miller Prize to Alfred Ernest Young, Stud.Inst.C.E., for his account of "The Deflection of Spiral Springs."
4. A Miller Prize to Lucien Alphonse Legros, Stud.Inst.C.E., for his Paper on "Economy Trials of a Compound Mill-engine and Lancashire Boilers."
5. A Miller Prize to Frank Paul Reynolds, A.K.C., Stud.Inst.C.E., for his description of the "Roof over the Carbide Markets."
6. A Miller Prize to John Hale, Stud.Inst.C.E., for his description of the "Hydraulic Station and Machinery of the North London Railway at Poplar."
7. A Miller Prize to George Harrison Sheffield, Stud.Inst.C.E., for his Paper on the "Principles of Iron Foundry Practice."

It has been determined to print the first three Students' Papers, either in whole or in part, in the Minutes of Proceedings.

LONDON AND MIDDLESEX ARCILEOLOGICAL SOCIETY.

A MEETING of this Society was held on the 3rd inst. at Brewers' Hall,* previously to which the members and friends assembled in the Bank of England to view the site of the church and churchyard of St. Christopher-le-Stocks in the courtyard of the Bank, which is now a very pretty garden, with a large fountain in the centre. Dr. Freshfield, the President of the Society, met the members, and pointed out the site of the church which was taken down when the Bank was enlarged in 1781. Part of this church escaped the Great Fire, and that part which was rebuilt was of the Tuscan order. Dr. Freshfield then described the course of the Wall Brook, which flowed past this church towards St. Margaret's Church, Lothbury, which latter church the members afterwards entered. Here again the course of the old Wall Brook was pointed out as running under the chancel window and past the altar. Having inspected the font and carved woodwork in the church, said to be by Gibbons, the President led the party up Tokenhouse-yard, still pointing out the course of the Wall Brook in a northerly direction as far as London-wall. The members then proceeded to Brewers' Hall, in Adde-street, Aldermanbury. Dr. Freshfield here presided, and introduced Mr. Charles Welch, F.S.A., one of the hon. secretaries of the society, who read a paper on "The Early History of the Brewers' Company as told by their own Records." The Brewers' Company is the fourteenth on the list of the City companies. It was incorporated in the sixteenth year of Henry VI., which was afterwards confirmed in the nineteenth of Edward IV. The charters and the old minute-books and books of accounts of these periods were exhibited to the meeting, and afterwards inspected.

Mr. E. W. Brabrook, F.S.A., who had written a paper on "Some Eminent Members of the Company," was unfortunately unable to be present, so, at the request of the President, the paper was read by Mr. John E. Price, F.S.A., and after inspecting the hall and other rooms the members dispersed.

SURVEYORSHIPS.

Cheltenham.—The *Western Morning News* reports that on the 6th inst., Mr. Joseph Hall, Surveyor to the Torquay Local Board, was appointed Borough Surveyor to the Cheltenham Town Council, at a salary of £550 a year. Mr. Hall, who was elected by a majority of seventeen to six over the local candidate, was unanimously recommended to the Council for the appointment, as the result of a visit to Torquay a few days since of the Mayor of Cheltenham and four other members of the Corporation, and their inspection of the roads and pleasure-grounds. Mr. Hall, who was formerly chief assistant to the Borough Surveyor of Leeds, has been Surveyor to the Torquay Local Board nearly nine years, succeeding Mr. John Little, one of the present County Surveyors.

Bournemouth.—At a meeting of the Bournemouth Improvement Commissioners, held on the 3rd inst., it was unanimously resolved to increase the salary of Mr. F. W. Lacey, the Surveyor, to 5000l. a year, to commence from the half-quarter. Mr. Lacey has held this appointment since March of last year.

* For a descriptive account of the Brewers' Hall, vide *Builder* of July 6, 1889, p. 10.

NEW BATHS FOR ST. GEORGES', HANOVER-SQUARE.

The new public baths, &c., which have been erected by the Commissioners of Public Baths and Washhouses for the parish of St. George, Hanover-square, situate in Buckingham Palace-road, were recently opened by the Duke of Westminster.

In an address presented to the Duke on the occasion, it was stated that the new baths and washhouses have been erected for the benefit of the residents of the southern part of the parish. The buildings were commenced in August, 1888, the necessary outlay having been approved by the Vestry of the parish. In open competition, the design selected was that of Mr. Francis James Smith, architect, of Winchester House, Old Broad-street. Tenders for the construction of the buildings were invited by public advertisement, and the lowest tender was that of Messrs. J. Mowlem & Co., for a sum of 28,209l., which was accepted. But we understand that the total outlay will considerably exceed this sum. The building has been erected in a thoroughly substantial manner, and advantage has been taken of every modern improvement and appliance suitable to this class of work.

The accommodation provided is as follows, viz.:—First-class swimming bath, 90 ft. by 30 ft.; second ditto, 57 ft. by 33 ft. First-class private baths (men), twenty-three in number; first-class ditto (women), ten in number; second-class ditto (men), twenty-nine in number; second-class ditto (women), fourteen in number. Laundry accommodation for forty-four washers. Private laundry for use of the establishment. In connexion with these several departments provision has been made for the requisite offices necessary for their successful working. The fittings and machinery, which include mangels, hydro-extractors, drying-horses, steam and hot-water washing machines, washing troughs, with a "Vowel" washing machine, are worked by steam-power. A lift, by which access is gained to the laundry, is worked by hydraulic power.

An ample supply of surplus water is secured by the provision of a large tank erected over a portion of the back building, which has a storage capacity of 60,000 gallons. The basement are placed four 30-horse-power boilers for generating steam for the machinery, and providing hot water for the baths and laundry. There are two engines, one of which drives the laundry machinery, and the other works the "Siemens" dynamo which generates the electric current for lighting the buildings throughout. These engines are both of special type. The electric lighting system adopted is that of the storage battery, with sufficient power for a supply of twelve hours' duration.

Special attention has been paid to ensure the rapid filling and emptying of the swimming baths, with the result that the large bath can be filled in eighty minutes and emptied in twenty-five minutes, and the smaller one can be filled in forty-five minutes and emptied in fifteen minutes. They are heated by means of steam injectors, which is asserted to be the best and most economical method of heating large quantities of water.

The foregoing is a brief description of these buildings. The engineering portion of the work has been ably executed under the contractors by Messrs. H. Young & Co., of Pinlco. The electric light installation, the lift, and general furnishing of the buildings were not included in the original contract. The front of the elevation towards the Buckingham Palace-road is of red brick and Corshill stone. The entrance to the laundry and second-class baths is on the north side.

NEW PREMISES, HOLLOWAY:

THE "ARKTOS" REFRIGERATOR.

The large block of buildings for Mr. W. Beale, which was in course of erection for about twelve months, has lately been opened for business. The block combines restaurant, baker's and confectioner's shop, jeweller's shop, provision, poultry, and fish store, machine bakery, and electric-lighting station. Situate at the junction of Holloway-road with Tellington-road, and being directly opposite Camden and Caledonian roads, the site is a prominent one. The building is six stories high, including the central raised portion, which forms a caretaker's residence, and

"Salisbury" Chantry, Christchurch, Hants. 1541.

Ceiling Plan.

Part Elevation to Aisle.

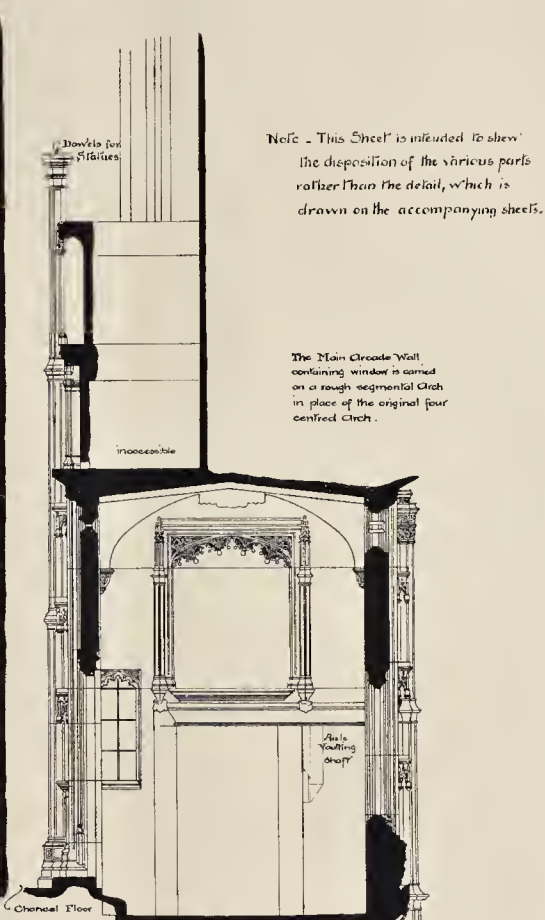

Scale of Feet.

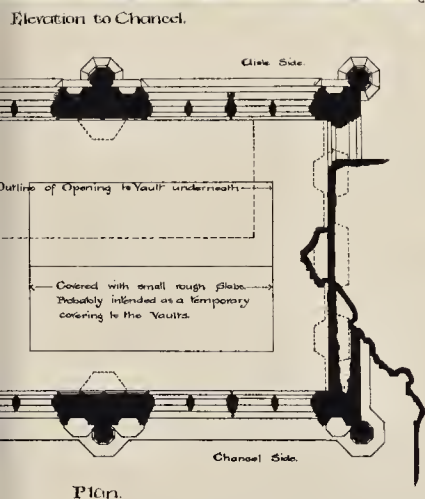

Note - This Sheet is intended to shew the disposition of the various parts rather than the detail, which is drawn on the accompanying sheets.

The Main Arcade Wall containing window is carried on a rough segmental Arch in place of the original four centred Arch.

Simple Vaults originally intended for the Cloisters of Salisbury, and has son Cardinal's Seal.

Entrance to vault under Channel now bricked up.

Section looking West.

Built in Coen Stone throughout.

Ascribed to Torregiano.

Measured & Drawn
March & April 1890.
Percy D. Smith

is surmounted by a small turret and dormer windows.

The elevation is of red brick, with stone dressings and Gothic tracery panels, moulded string-courses, mosaic floral panels, and Gothic window-heads surmounted by crocketed finials in relief. The upper portion has a large frieze in mosaic work, originally intended, we believe, for figures, but that idea has been abandoned, and the panel is mainly occupied with the letters forming the name of the proprietor. Provision was made by the architect in the elevation just above the first-floor window-head at the angle of the building for a stone statue on a pedestal at the corner of the building, standing underneath a stone canopy. This has been abandoned in favour of a time-ball, worked by electric current direct from Greenwich, and rising and dropping at a given hour of the day.

There are some good examples of joinery work in the shop, restaurant, and café. The front is of polished teak framing, glazed with bevelled plate and geometrical leaded lights, the counters and cases having twisted standards and satinwood panels. The café screen is in keeping, and is glazed with ornamental glass in device, with octagonal semi-columns with fret-work frieze panels, and carved terminals. This has been executed by Messrs. F. Sage & Co.

There are five public entrances to the premises, one leading to the front shop, at the side of which there is a hold entrance, with stone staircase leading to billiard-room, dining-room, and banquetting-hall. There is a distinct entrance to the electrical station, others to the baker's and provision shops, and a stone staircase leading to the counting-house.

The entire premises cover an area of 8,510 square feet, including a jeweller's shop at the corner, occupied by Messrs. Jones & Son.

The ground-floor and basement contain the electrical engineering station for supplying current not only to these premises but to the neighbouring shops, and for lighting the adjacent portions of the public thoroughfares. The entire electrical plant will comprise four tubular boilers of 52 horse-power each, two high-speed steam engines of 30 horse-power each, and two similar engines of 40 horse-power each, making a total of 240-horse engine power. The smaller engines have been running for some time, each operating two 350-light dynamos, running at 450 revolutions per minute, and one large one operating a 700-light dynamo running at 425 revolutions. The rest of the plant is in course of erection, and is needed for the requirements of the new shops being built between Tooting-road and the "Nag's Head." A concession has been granted by the Vestry to lay mains to this section, and five customers are already being supplied with electric light and power. Above the engine-room is a machine bakery, equipped with two of Perkins' patent steam ovens, and all kinds of modern machinery for the trade. This, together with the lifts, hoists, and cranes, are all driven by electricity, Messrs. Sharp & Kent being the contractors.

In the basement is to be seen in use one of Messrs. Perkins & Sons' patent refrigerating rooms, called "The Arkots" for storing or freezing all kinds of perishable edibles. This being a new development of applied science, a few notes on its construction will not be out of place. In size it is about 10 ft. cube. The walls, 2 ft. thick, are composed of a double metal lining, filled with insulating material. The refrigerating process is effected from the outside by means of two horizontal pipes, connected with each other, charged with liquid ammonia, which are also attached to and form part of the liquefier and refrigerator inside the cold room. The application of heat (by a small gas jet, or a fire as here employed) to the horizontal tubes containing the liquid ammonia separates the ammonia from the liquid, and causes it to pass through the condenser into the refrigerator in its original gaseous form. The density of the gas in the tubes absorbs the heat of the chamber, reducing it to any required degree, even as low as 30 below zero. On the occasion of our visit it registered 18 degrees below zero. When reaching a certain temperature the heat is removed, and the gas returns to the combiner and is again united with the liquid. This is generally done when the thermometer reaches 270 deg. Fahr. In most cases it is only necessary to apply heat every alternate day, but in this instance the fire is usually lighted for a few hours in the morning and again in the afternoon. The process is automatic, and the system of pipes is hermeti-

Stanley's Portable Saw.

cally sealed. On entering the cold room we find a dry, cold, healthy atmosphere, the pipes being covered with hoar, absolutely undistinguishable from a natural hoar-frost. Mr. Beale regards the refrigerator as a valuable adjunct to his business in giving him complete control over his perishable comestibles. As this is one of the first installations in use it is satisfactory to learn that the system is completely successful. The water required for the condenser is procured from a well on the premises. A lift-pump for this purpose is driven by an electric motor.

The first and upper floors of the building contain dining, billiard, and smoke-rooms, a pastry bakehouse, kitchen, larders, &c. A banquetting-hall, about 40 ft. by 30 ft., and 24 ft. high, is approached from the first-floor landing. The walls are lined with an oak-framed dado, with pitch-pine panels, with doors and pediments to match. A gallery of oak and pitch-pine extends the width of the hall, and is entered from the second-floor corridor.

The premises are warmed throughout with Messrs. Perkins' patent steam-pipes, supplied by the patentees and manufacturers of the "Arkots." The electric lighting of this room is a special feature, including large incandescent ceiling-lamps and wall-brackets equalling 2,000 candle-power, besides several movable electric table-lamps. Messrs. Sharp & Kent, of 34, Victoria-street, Westminster, have carried out the complete installation, and supplied the entire electrical plant, boilers, engines, and fittings. The building and the floors are fireproof. This and other ironwork has, we understand, been supplied by Messrs. Homan & Rodgers. Messrs. Rust & Co. are responsible for the vitreous mosaic work, and Messrs. Cliff & Sons for the facade pilasters.

Mr. Frederick Wallen is the architect, and Messrs. Oldrey & Co., of Westbourne Park, the builders.

The entire cost exceeds 30,000l.

STANLEY'S PORTABLE SAW.

This saw, of which an illustration is subjoined, is made of hardened steel plates rivetted together in double series; the rivets are sufficiently loose to form joints; each plate is shaped on one side to form a pair of saw-teeth cutting in opposite directions. A cross handle at each end of the saw fits into a ring for use; these handles are withdrawn from their rings for packing; for inaccessible trees, &c., ropes may be attached to the rings in place of the cross handles. It can be used by one man; weights complete only 2½ lb., including case, which measures over all 1½ in. by 4 in., by 8 in. It is manufactured by Mr. H. T. Tallack.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday last at the offices in Spring-gardens, Sir J. Lubbock, Vice-Chairman, presiding, in the absence of the Chairman, Lord Rosebery.

Management of Parks and Open Spaces.—The consideration of the following paragraph of the annual report of the Parks and Open Spaces Committee was proceeded with:—

"We have to submit for the consideration of the Council an important proposal with respect to the future management of the parks and open spaces, and the organisation of the staff employed in connexion therewith. We have previously been in communication with the Standing Committee on this subject, and it will

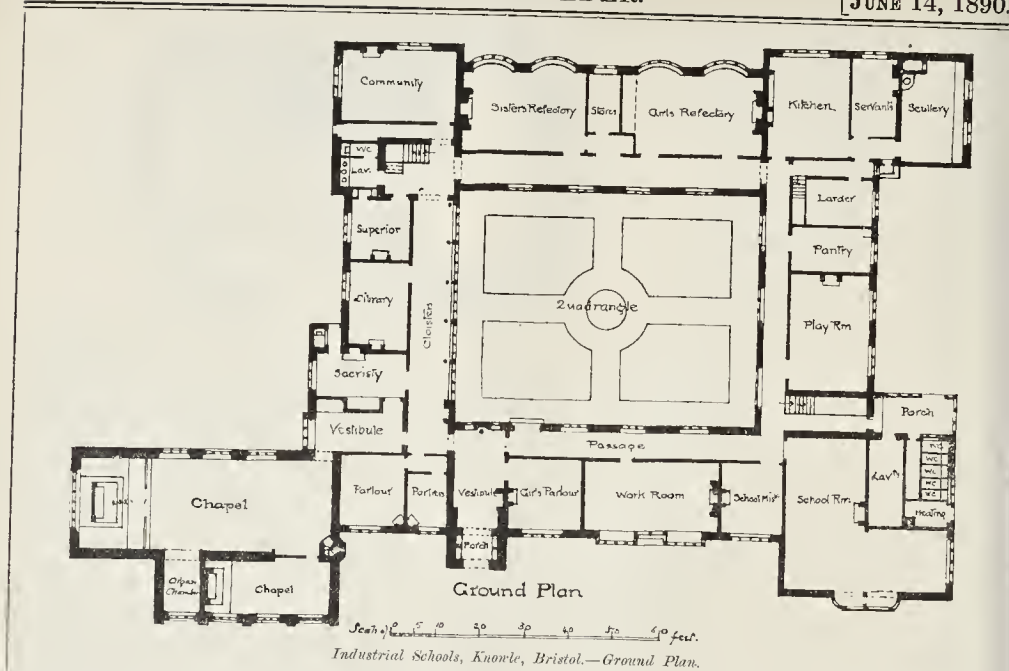

be within the recollection of the Council that on February 11 last the Standing Committee brought up a report suggesting, as the result of the conferences that had taken place between us, that the business connected with the parks and open spaces should no longer form a branch of the Architect's department, but that a separate sub-department of the Council should be formed to deal with it. Subsequently, on March 26, the Standing Committee, after considering our proposals, informed us that we had better bring up direct to the Council any suggestions that we had to make with respect to the constitution of the new sub-department.

We may preface what we have to say by the statement that we have been impressed with the necessity of a reorganisation of the staff employed upon parks and open spaces work, with a view especially to uniformity of system and unity of direction and control. During the last twenty years the area of the parks and open spaces of London under municipal control has increased from 178 acres to more than 3,000 acres, and the number of persons employed is nearly 400. The annual expenditure is now nearly 50,000l. for maintenance only, whilst the combined expenditure on capital and working accounts amounts to no less than 100,000l., a sum which does not promise to diminish.

These figures are sufficient to indicate the necessity of a thoroughly good organisation, and, as we believe, of efficient control under a single responsible head. We are, therefore, of opinion that there should be a separate Parks and Open Spaces Sub-Department, and for the sake of clearness we may explain that in using the word Sub-Department we do not mean that the sub-department should be either an adjunct or subordinate to any other department. What we wish to convey is that the new organisation and its head should not claim to be equal in point of official position and salary with the other departments of the Council's service.

The question of the kind of man to be placed at the head of the new sub-department is one of great importance, to which we have accordingly given much attention, and the conclusion we have come to is that he should be a professional landscape gardener of a high class, having a thorough technical knowledge of everything connected with the formation and maintenance of parks and gardens, together with such general business capacity and experience in the management of men as would enable him to direct the large staff of men that would be placed under his control. We are of opinion that the Council could obtain a person possessed of these qualifications for a salary of 600l. a year, but hardly for less, and that is the salary which we should accordingly recommend the Council to pay.

We deem it essential that the new head should have complete control of all the persons, of whatever class, employed exclusively in connexion with the parks and open spaces, subject of course to the limitation that the Clerk of the Council should continue to be responsible for recording the proceedings of the Parks Committee as of all other committees, and for the control of the official correspondence; and it would be the duty of the head of the parks sub-department to give the Clerk all the information and assistance he may require for this purpose. Hitherto, whilst the Architect has had the superintendence of all the men employed in the parks, whether keepers or labourers, and also of the labourers on the open spaces, the common-keepers have been under the control of the Clerk of the Council. He has directed

them through his assistant, Mr. C. W. Nairn, who has acted for many years as clerk to the Parks Committee, and has also been superintendent of common-keepers. This division of responsibility we propose to do away with, so that the whole staff may be under one control. To give effect to the views above expressed, we submit the following recommendations:—

(1) That a separate Parks and Open Spaces Sub-department be formed, consisting of all persons employed exclusively in connexion with the parks and open spaces, subject to the reservation of such work as properly devolves on the Clerk of the Council.

(2) That the head of the new sub-department be a professional landscape gardener of a high-class, thoroughly versed in the management of parks, gardens, and open spaces, and possessed of business capacity, and experience in the control and direction of men.

(3) That the head of the new sub-department be designated "Superintendent of Parks and Open Spaces," and that his salary be £600 a year.

(4) That such superintendent do supervise and be responsible for the whole of the sub-department, and do control all the officers and servants employed therein.

(5) That in consideration of Mr. Nairn, of the Clerk's department, being deprived of his position as superintendent of common-keepers, and of the allowance of £52 a year which he has received (in addition to his salary of £60) by way of payment for extra work and travelling expenses in connexion with that position, his salary as an assistant in the Clerk's department be in future £50 a year.

The presentation of this report gave rise to a long discussion, and an amendment was moved to postpone the consideration of the matter for a year. This was lost, as was a subsequent amendment to postpone the matter for six months. The report was then substantially agreed to, the questions of the salaries proposed being referred to the Standing Committee for consideration.

The Property of the Livery Companies.—The Corporate Property Committee reported that they had last month drawn attention to the subject of the Livery Companies of London, and, in view of steps which they had reason to apprehend were in contemplation by some of the Companies as to the alienation or division of their property or part of it, they made a recommendation that the Council should address a further communication to the Government, drawing attention to the desirability of some action being taken in the direction indicated by the report of the Royal Commissioners on this subject in 1884, one of the recommendations of the Commissioners being that the Companies should be placed under restrictions to prevent the alienation of their ancient corporate property, and the other recommendations having reference to its better application for the

future. The matter was referred back to them by the Council, since which their attention had been drawn to a Bill now before Parliament, and awaiting second reading in the Commons, entitled the Corporate Associations (Property) Bill, by which it was proposed to restrain certain corporate associations established for other than trade purposes (and including apparently the City livery companies), or rather the individual members thereof, from terminating the existence of such associations by arrangement and dividing the property among themselves. The objects of this Bill were less extensive than those recommended by the Royal Commissioners, but as an intermediate or preliminary step towards effecting the recommendations of the Commissioners, the Bill appeared to the Committee such as the Council should support. They therefore recommended "That the Council do petition Parliament in favour of the Corporate Associations (Property) Bill, and that it be referred to the Parliamentary Committee to prepare such petition."

The consideration of the report was deferred.

Proposed Iron Chimney-shaft.—The Building Act Committee, in their report, recommended "That the application of Messrs. Maudslays, Sons, & Field, Limited, for approval of the construction of a wrought-iron chimney-shaft at the Engine Works, Blackwall-lane, Greenwich, be not granted, as the Committee are of opinion that the construction of iron furnace chimney-shafts is objectionable." Some opposition arose to this proposal, but it was explained by Councillor Hutton, the Chairman of the Committee, and by Councillors Roberts and Marsland, that in view of the public safety the Committee had no option but to refuse permission for the erection of iron factory chimneys, which were likely to become dangerous after twenty years or less. Eventually the Committee's recommendation was agreed to by a large majority, and

After transacting other business the Council adjourned.

Alton Parish Church.—A new clock, by J. W. Benson, has just been made and fixed for the parish church at Alton, Hants. It is made with all the latest improvements, and shows the time upon a copper dial 8 ft. in diameter. The clock chimes the St. Mary's, Cambridge, quarters, upon the second, third, fourth, and seventh bells of a peal of eight, and the hours upon the tenor, which weighs 20 cwt.

Illustrations.

INDUSTRIAL SCHOOLS, KNOWLE, BRISTOL.

THE illustration shows the main front of the new buildings for the House of Charity, St. Raphael's, Bristol. The scheme provides accommodation for children, the inmates of the Home, and a community of eighteen sisters. A large chapel is to be built at the south-east corner of the quadrangle, and a detached laundry forms part of the design. The whole is to be built of local stone quarried on the site, with Doubling stone dressings, and overhanging upper stories of half timber-work or rough-cast. The roofs will be tiled. The building is to be commenced immediately, and the estimated cost, exclusive of the chapels, is £10,000. The architect is Mr. John D. Sedding. The drawing is hung in the Architectural Room at the Royal Academy Exhibition.

BRITISH AND FOREIGN MARINE INSURANCE COMPANY'S OFFICES, LIVERPOOL.

The building illustrated has been erected in Castle-street, Liverpool, for the British and Foreign Marine Insurance Co.

The lower portion is faced with polished red granite, and the upper portion with Dumfries red stone, and Ruabon terra-cotta.

A special feature in the building is the frieze under the first-floor windows, the subjects in which have been executed in glass mosaic by Messrs. Salviati, from cartoons by Mr. Frank Murray. They represent ancient and modern shipping, in bright colour on a gold ground.

The whole of the work has been carried out by Messrs. Jones & Sons from the designs of Messrs. Grayson & Ould, architects, of Liverpool.

The drawing from which the illustration is taken is hung in the Architectural Room at the Royal Academy.

SALISBURY CHANTRY, CHRISTCHURCH, HANTS.

THIS interesting little chantry, built by the Countess of Salisbury, and intended for her own burial-place, shows a curious mixture of Gothic and Renaissance. The work is ascribed to Torregiano, and has never been restored, but was cleaned down in 1813.

We are indebted to the successive white-washings of preceding centuries for the mark-

ARCHITECTURAL SOCIETIES.

Northern Architectural Association. — The second summer gathering of the Northern Architectural Association took place on Saturday last at Sunderland, when there was a large assembly representing the profession in the whole of the district. They were received at the railway station by a number of Sunderland

gentlemen, and also by Mr. Brightwen Binyon of Ipswich, who subsequently conducted them over the new Municipal Buildings in Fawcett-street, designed by him. On their arrival at Roker, the party were received by Mr. H. H. Wake (Chief Engineer) and Mr. G. T. Nicholson, his assistant. They proceeded to the Commissioners' Offices on the works, where Mr. Wake, by means of a large plan, ex-

plained the nature of the important pier works which the Commissioners are now carrying out under his direction, and also exhibited a model of the huge crane used at the end of the pier in laying the blocks, together with other working models. The party were next conducted by Mr. Wake through the Concrete House, where they saw the process of mixing the materials of which the blocks are made. They were then shown blocks which have been allowed to solidify, and of which a large number has been accumulated during the winter months. One block, weighing about 43 tons, was hoisted on to a waggon and drawn by a locomotive to the extreme end of the pier. About 15 tons of concrete were deposited on the second course of the pier, and on that the block was placed. The operation, at once difficult and delicate, was watched with the greatest interest. It may be stated that close upon 2,000 ft. have been laid, and that 760 ft. more remain to complete the North Pier. There is some expectation that the South Pier, its complement, will be started next year. The scheme is now under consideration. After a thorough survey had been made, and the process of dropping a concrete bag, weighing 105 tons, in the sea from the barge had been witnessed, and the subway had been inspected, the visitors returned to shore, and proceeded to the new Municipal Buildings, where Mr. F. W. Rich said he had very great pleasure in moving the best thanks of the Association to Mr. Wake for his kind reception of them, and for the careful manner in which he had explained the pier works at Roker. Mr. John Tillman seconded the motion, which was carried by acclamation, and Mr. H. H. Wake replied.

Glasgow Architectural Association.—The twelfth annual report of this Association, covering the Session 1889-90, says that the following were the office-bearers for the Session:—Honorary President, Mr. David Barclay, F.R.I.B.A.; President, Mr. John Keppie; Vice-President, Mr. William J. Anderson; Secretaries, Mr. Alex. M'Gibbon and Mr. Wm. Ritchie; Treasurer, Mr. George Tudhope, who, retiring in September, was succeeded by Mr. L. Douglas Penman; Librarian, Mr. Fred. M. Miller; Members of Committee, Mr. Wilson Beaton, Mr. Wm. Tait Conner, Mr. John Jas. Joass, Mr. Chas. R. McIntosh, Mr. Wm. H. M'Nab, and Mr. Wm. M'W. Petrie. Beside the change of Treasurer, occasioned by Mr. Tudhope going to Edinburgh, of the Committee, Mr. Petrie resigned in August, and Messrs. Conner and Joass at the beginning of this year. There are now on the roll, 9 Honorary, 60 Ordinary, and 20 Corresponding Members, in all, 80; a decrease of 14 upon last year's report. Twelve new members have joined and 26 left. Among these the Committee have to regret the loss by death of Mr. Robert S. Symington, architect, Paisley, and of Mr. Angus M'Anslane, whose death occurred during his passage home from the Gold Coast on furlough. Two ordinary members have, after passing the Examination, become Associates of the Royal Institute. There have been eleven ordinary monthly meetings held, at which essays, exclusively by members, have been read and discussed; these in their order were:—"Neo-Greek Architecture," by Mr. John A. Campbell; "Modern American Architecture," by Mr. Wm. H. M'Nab; the President's opening address, which dealt with "Architectural Education"; "The Three Periods of the Italian Renaissance," by Mr. William J. Anderson; "Mohammedan Architecture in India," by Mr. George Mackenzie, but read by another, as he a few days previous to its delivery left for that country; "The Decorated Style of English Gothic," by Mr. Wilson Beaton; "The Perpendicular Style of English Gothic," by Mr. John Jas. Joass; "The Elizabethan Style," by Mr. Charles R. McIntosh; "Elgin Cathedral," by Mr. Wm. Tait Conner; "Domestic Furniture," by Mr. Fred M. Miller; and "French Renaissance," by Mr. Henry D. Walton. The visits, nine in number, made during the session have been more interesting than perhaps those of any previous series, and notable as including two made conjointly with the Edinburgh Architectural Association. The measurement of Glasgow Cathedral has progressed but little, although to encourage interest in the work, the Association Prize is this year offered to be competed for by apprentices for measured drawings, of portions of the nave, north aisle. Undoubtedly it calls for no little self-sacrifice to labour at the less interesting work which necessarily bulks largely in such a large building if

it is to be accurately illustrated, work not at all calculated to evoke much enthusiasm. The credit of the Association being in some measure bound up with the furtherance of this work, our thanks are due to those who have engaged in it. Specially would we acknowledge the kindness of Messrs. A. & D. Mackay slaters, in providing ladders for the members' use. In October the Association became affiliated to the London Architectural Association. This was a step taken only after due consideration, as for long there had been felt a desire for closer union among the scattered Associations, if not their amalgamation. It would be unfortunate if the movement were hindered by the fact, that at the first there may be little actual return to such Association as ours for the subscription given the central body,—for that goes to the support of what undoubtedly is the principal educational body in the country,—the nearest approach to a College of Architecture. Any enlargement of its sphere of influence is of interest to us all, and it is likeliest that such growth of influence will be for good only as the wants of the junior members of the profession are known and recognised, and this can best be done by some such organisation as affiliation implies.—The usual monthly meeting was held on the 3rd inst., when the President gave an address on the study of architectural styles. He referred to the fact that the greater part of the papers read by members dealt with this important subject in detail; not too much, in his opinion. The right knowledge and appreciation of the work of the past is the surest guide for good modern architecture. The methods in vogue for attaining this knowledge, measuring and sketching actual buildings, and the study of books that illustrate works abroad, were discussed, and some hints added, the result of his own experience, that beginners might find useful. A short discussion followed. A copy of Mr. Anderson's book, "Italian Architecture," presented to the Association library, was laid on the table.

Dundee Institute of Architecture, Science, and Art.—The members of the Dundee Institute of Architecture, Science, and Art held the first excursion for the season on Saturday last. The place chosen was Lintlogow, and the party, numbering about seventy, left the Tay Bridge Station by the 9.55 a.m. train, travelling by the Forth Bridge to Forth Bridge Station, where the train was specially stopped to allow the party to alight. Brakes were in waiting to drive through the beautiful grounds of Hopetoun House, permission for this being kindly granted by Mr. Phillips, Lord Hopetoun's factor. Passing the mansion, the palatial character of its front was much admired, and the road was taken to Abercorn Church. Here, by the courtesy of the Rev. Mr. Crawford, the church was open for inspection, and he kindly pointed out the various parts of interest to the architect and antiquary. The church dates from the twelfth century, and is a very interesting specimen of architecture. The party then walked through the Den to Mid Hope House, an interesting specimen of an old Scotch mansion, dated 1582, containing a handsome oak staircase. Getting into the brakes again, Lintlogow was reached at half-past two, after a beautiful drive, partly through the Hopetoun policies. Luncheon was served in the Star and Garter Hotel, after which the old parish church and palace were visited. Mr. Russell Walker, architect, Edinburgh, who is publishing a work on the pre-Reformation churches of the Lothians, kindly acted as guide to the church, and gave interesting information as to its history and architecture. After inspecting the church, the palace was visited, under the leadership of the Messrs. Henderson, of Lintlogow, who were at much pains to explain the various sections of the ruin. The fine Parliament Hall and chapel were much admired. The room in which Queen Mary was born, and the bower in which Queen Margaret "wept the weary hour" watching for the return of King James IV. from Flodden were regarded with great interest, while the view from the bower amply repaid the toil of ascending the long staircase, the towers of the Forth Bridge looming in the distance. Having inspected the dungeons, torture-chamber, kitchens, stables, &c., connected with the Palace, the various interesting sights of the burgh were examined, such as the fish hatcheries on the loch and the portrait tablet of the Regent Murray, erected opposite the spot on the street where he was shot by Hamilton of Bothwellhaugh in 1570.—*Dundee Advertiser.*

OBITUARY.

Mr. Robert Hodge.—The death is announced of Mr. Robert Hodge, C.E., late Borough Surveyor of Plymouth. Mr. Hodge, who was born in the parish of Cardross, Dumfriesshire, has lived in Plymouth for nearly fifty years, but in his early life he was officially connected with a number of important engineering enterprises in Glasgow and neighbourhood. He was resident engineer on the first locomotive line constructed in Scotland. He was engineer of the Glasgow and Garmkirk Railway and the Govan Railway. He put up the first malleable iron-plate bridge in Scotland, and he superintended the erection of the St. Rollox chimney-stalk and the construction of the locks on Monkland Canal. In 1854 he was appointed Borough Surveyor of Plymouth, an office which he held till 1879, when he retired, and was retained as consulting surveyor-engineer.

Mr. Hugh Symington, the well-known railway contractor, died suddenly at his residence, Stewarton House, Coatbridge, on the 3rd inst., in his 58th year. During his career Mr. Symington carried out successful work for all the Scotch railway companies, the Glasgow and Greenock Corporations, and the Greenock Harbour Board.

RENDEL'S SYSTEM OF GLAZING: THE RIGHT TO THE NAME.

RENDEL & CO., LIMITED.

THIS case, reported at length in last Saturday's *Times*, came before Lord Justice Kay, and may serve as a warning against what is not an uncommon practice in trade of a person endeavouring to avail himself, through an identity or close similarity of name, of the reputation acquired by an old-established business. It was a motion by the plaintiffs in the action, the trustees of the will of the late William Edgcombe Rendle, roofing contractor, and also proprietor of the Clarendon Hotel, Brighton, to restrain the defendant company and their manager, John Edgcombe Rendle, a son of the testator, from carrying on the business of glass-roofing contractors under the name of J. Edgcombe Rendle & Co., Limited, or any other name calculated to mislead the public into the belief that the defendant company were, as assignees of the defendant, John Edgcombe Rendle, or otherwise, entitled to the system of glazing used by W. Edgcombe Rendle & Co. for the purpose of carrying out the contracts carried out by W. Edgcombe Rendle & Co. mentioned in the defendant company's prospectus and circulars, or that the defendant, John Edgcombe Rendle, was the inventor of Rendle's system of glazing, or was the senior partner in the firm of W. Edgcombe Rendle & Co., or that he introduced their most successful patents; and to restrain the defendant, John Edgcombe Rendle, from engaging in any business of a description in any way similar to the business carried on by the defendant William Edgcombe Rendle, under the style of W. Edgcombe Rendle & Co., or from doing anything to prejudice the business of that firm, or affect the sale thereof. Upon the death of the testator, William Edgcombe Rendle, in September, 1881, disputes arose in the administration of his estate, which comprised his business of W. Edgcombe Rendle & Co., formerly carried on by him in Victoria-street, Westminster, and at Battersea, and an action was commenced for the administration of his estate by the Court, which action is now pending. Subsequently, the action was commenced in which the present motion was made. The other facts of the case sufficiently appear from his Lordship's judgment.

His Lordship granted a perpetual injunction in the above terms, and ordered the defendants to pay the costs of the action.

Stuart's Granolithic.—We understand from the *Scottish Leader* that Messrs. Stuart & Company, Limited, of Edinburgh and London, have had placed in their hands several large contracts for Granolithic. One of these is connected with the New Hôtel Métropole, Brighton, which contains 1,300 rooms. Every room in the building, including corridors, is to be paved,—261,360 square feet, or six acres of paving in all,—thereby rendering the building fireproof. The surface of the paving is to be covered with cloth felt, on which the carpets are to be laid. This firm has also received contracts for the paving for the Local Boards of East Ham, Willesden, and South Hornsey, the new town of Barry, and other places. Altogether, it is stated that over 700 miles of the pavement have been laid in Great Britain, America, and the Colonies since 1882.

Plans accompanying letter by
Mr. W. A. Pite.

Ground Plan - Upper Plan

together, and which goes to show that it should not be so hurriedly condemned.

WILLIAM A. PITE.

SIR,—Mr. Knightley's letter, and the plans accompanying it in the *Builder* of the 31st ult., deal with a subject which deserves more consideration than would appear to have been hitherto accorded it.

The alternative sketches given by Mr. Knightley show some careful and ingenious modes of planning, as they not only secure for one of the most important rooms on the ground floor a cheerful position,—instead of leaving it to look down a narrow space, with but a poor view of the garden (if any),—but they show how to derive good light in the case of the usually imperfectly-lighted staircase.

The late Metropolitan Board of Works by their Act of 1882 did much to improve the open spaces at the rear of dwellings; it is now for us to avail selves of the altered form in which this area can be distributed by looking into and breathing from it.

The plan is such as will commend itself to most minds and freeholders. Architects and clients would do well to take advantage of the useful innovation.

LIGHT AND AIR.

June 2, 1890.

I speak from experience, many cases having come under my own observation.

This evil is not necessarily due to downright carelessness, though the more carefully drains are laid, the less they will settle and shift afterwards. Let it be assumed the drain has been so well hedged that the pipe, D, remains stationary without settling in the least degree, and let the pipe-bend be hedged

on, clay, at B, with considerable oare. Still the impact of the continually-repeated discharges of fluid, descending from a considerable height upon B, compresses the bedding of clay, and eventually forces the bend so far backward as to dislocate the joint of bend with D, discharging a large percentage of each flush from the w.c. through the joint at C into the foundations.

I have seen gable walls split from foundation to coping from having their foundations sapped in this filthy fashion.

Thanks to this bel of Achilles-Sanitarus, now, in 1890, in every large town, I believe there are thousands of dwellings, including those of the higher classes, standing thus on their own cess-pools.

How can this be remedied?

I suggest the absolute necessity for bedding the upper end of pipe D, and the whole of the bend, on solid concrete of considerable horizontal spread or area. I also suggest that drain-pipe makers form the outfall ends of bends, not square, as usual and

"A PLEA FOR THE IMPROVEMENT OF SIX- AND EIGHT-ROOMED HOUSES."

SIR,—In all probability I am not the only one of your constant readers who, while admitting, with Mr. Knightley [see p. 398, ante] that there is vast room for improvement in the planning of six- to eight-roomed houses, are quite unable to accept the four alternatives which he submits as being in any way an improvement on what he terms the "everlasting plan," which, when carefully examined, has undeniable advantage over its companions.

In each case access or egress to or from the drawing-room for an afternoon caller is through a passage, the darkness of which is black as the historical "hole of Calcutta," where "twilight" never comes, and dirt is never seen, averaging about 30 ft. in length, passing the staircase, which surely is most objectionable, while in three cases odoriferous waftings from the kitchen, to say nothing of the condition of the scullery on washing-day, have to be met; while in two instances the rotting of the waste-preventers to the water-closets in such close proximity to the drawing-room is certainly detrimental to the comfortable occupation thereof.

Much more could be said upon the subject, but a little personal examination will suffice.

The annexed diagram is only a casual suggestion, showing Mr. Knightley's "everlasting plan" pulled

SIR,—I think Mr. Knightley's plans for six- and eight-roomed houses are ingenious, but he does not go far enough. Will he publish some plans of the upper floors?

JUNCTION OF SOIL-PIPE WITH DRAIN.

SIR,—I desire to draw attention to a danger and evil which seems to have escaped the notice of sanitarians.

Vertical soil-pipes frequently discharge their fluid from great heights. At the foot of the soil-pipe the vertical stream is diverted to a nearly horizontal direction by means of the earthenware bend which unites the vertical soil-pipe with the underground drain-pipe.

Great care is generally exercised by the architect, clerk of works, and builder, to make a good joint where the plumber's soil-pipe joins the earthenware bend. But the danger of leakage is much greater at the joint of this earthenware bend with the drain into which it discharges. I believe in the vast majority of cases if this last-named joint were examined a few years after the pipes have been in use, it would be found to be discharging a large percentage of the sewage into the foundations; and in this way converting the sites of single dwellings and of whole towns into concealed cesspools!

as here dotted, but to a slight bevel, as per firm line on sketch, giving the pipe, so to speak, a slightly longer underlip than is now customary. And I also suggest that the architect or clerk of works and the surveyor for the local sanitary authority should henceforth personally examine the joint C of old as well as new drains; and I think if a general examination of such joints were instituted a vast danger to public health would be exposed in such hideous repulsiveness as to hasten a general overhaul and repair of such open joints as are now secretly vomiting death and corruption wholesale amongst us.

FRANK CAWS.

"BREAKWATER CONSTRUCTION."

SIR,—Referring to a description of a proposed mode of constructing breakwaters, &c., by Mr. F. H. Chacewright, Assoc. M. Inst. C.E., published in your issue of the 7th inst., I do not wish to suggest that the inventor has been guilty of plagiarism, or that the proposed mode, or modes, of construction are not *bona fide* inventions, so far as those associated with them are concerned; but, the basis of the idea, the employment of ironwork in the construction of breakwaters, was advocated by me in the columns of *The Engineer* over two years ago. I proposed to use old railway rails.

W. GALLON, Assoc. M. Inst. C.E.

Highbury, N., June 8, 1890.

SPRAY JETS FOR WASHING.

We notice a letter signed "W." in your issue June 7, 1890, p. 421. We shall be happy to give your correspondent any information he may require with regard to the washing apparatus referred to by Sir Edwin Chadwick. We made this for him some years ago, and it was exhibited, we believe, at the Inventions Exhibition, and we have the original apparatus in stock here now.

Lambeth, S.E. DOULTON & Co.

PRICE-BOOKS.

Sir,—Referring to the correspondence on this subject, there will always be a difficulty in estimating from a price-book, because of the variation in the cost of material alone. At one time I contemplated issuing a complete price-book for competition work, but there is so small a patronage for these kind of works that it would not pay for the time spent on it. Such a work would take a huge amount of labour for one man. I have reviewed several price-books, and my opinion coincides with your last review.

THE AUTHOR OF "ESTIMATING."

HYMERS' COLLEGE, HULL.

Sir,—May I ask you to make a correction with regard to the above competition? The design placed second was by Messrs. Wigram & Rawlinson, not Wigram alone. EDGAR T. A. WIGRAM.

VIBRATION OF TOWER FROM BELL-RINGING.

Sir,—There is a beautiful peal of bells in a church tower in my neighbourhood with a lofty spire, and, though the bells were mounted with every care by, I believe, Messrs. Taylor, of Loughborough, about twenty years ago, there is considerable vibration when the full peal is rung. The tower and spire are excellent examples of good masonry, and in perfect preservation.

Can you suggest any way of reducing this vibration by use of a compensating weight or otherwise? If a compensating weight is hung inside the spire, what rule is there to determine the length of the chain supporting the weight, and the dimension of the weight?

I can find no reference to this in any work on architecture. Perhaps some of your readers can help me.

WILLIAM HENRY JOHNSON.

WOODEN WATER-PIPES.

Sir,—I have read with much interest the remarks in your paper upon this subject.

I have now in my possession a fine specimen of a wooden pipe with a bore of about 7 in., hollowed out of a trunk of wych-elm.

The spigot end is reduced in the manner shown on page 420 of the *Builder* of June 7, and measures about 8 in. diameter. This pipe was taken out of the river here yesterday, and I am told that various specimens have been found in Sheen and Mortlake from time to time.

I shall be most happy to afford any of your readers every facility for inspecting the pipe, and taking such drawings or particulars as they may consider desirable.

HENRY RICHARDS,
Member of the Association of Municipal and Sanitary Engineers and Surveyors.
Murtle Villa, St. Leonards, Mortlake, June 11.

SYMBOLISM OF THE PASTORAL STAFF

Sir,—We frequently meet with the statement that the head of the pastoral staff, by its turning either inwards or outwards, indicates the extent of the jurisdiction enjoyed by the personage commemorated by the effigy; a bishop, signifying the extensive jurisdiction of his See, and an abbot or abbess will have his or hers turned inwards, denoting the more limited jurisdiction over his or her establishment.

May I venture to say that such an opinion, though expressed by many very eminent men, is not, I believe, borne out by an inspection of the effigies remaining, and by adducing the following examples I shall attempt to disprove a statement which, so far as I know, is quite unsupported by facts, and an assertion alone, though I am well aware of that high value.

The brass of Richard Bewforiate at Dorchester, Oxfordshire, c. 1529, represents the abbot with the head of his staff turned outwards.

The brass of Elizabeth Harvey, at Elstow, Beds, c. 1530, shows the abbess with her staff turned outwards.

The effigy of Bishop Hugh Tattershall, in Lichfield Cathedral, c. 1243, has the head of his staff turned inwards.

The effigy of Bishop Vesey, in the church of Sutton Coldfield, Warwickshire, c. 1550, shows the bishop with the head of his staff turned neither one way nor the other, but standing straight out, a very valuable example for my purpose, as apparently indicating that no importance was attached to the position of the crozier head.

The Student's Column.

ELECTRICITY, MAGNETISM, AND ELECTRICITY SUPPLY.—XXIV.

"HIGH AND LOW PRESSURE."

THE expressions "high pressure," "low pressure," or "high tension," "low tension," are very commonly used in speaking of mains distributing electrical power. As their precise meanings are somewhat arbitrary, the following quotations from the Board of Trade Regulations will show the sense attached to them by that body:—"Low-pressure conductor" means a conductor in which the difference of electric potential either between that conductor and the earth or between that conductor or any part thereof and any other conductor on the same poles or supports does not exceed 300 volts, if the supply be on the continuous current system, or the equivalent of 150 volts if on the alternating current system. A difference of potential on the alternating current system shall be deemed to be the equivalent of a difference of potential on the continuous current system, when it produces an equal heating effect if applied to the ends of a thin stretched wire or carbon filament. "High pressure conductor" means a conductor in which the difference of electric potential as above described is greater than that of a low pressure conductor.

"Pressure" or "tension" may, therefore, be taken to be a popular way of saying "difference of potential."

For some time past a paper warfare has been waged between the advocates of high-pressure and low-pressure systems as to the relative amounts of danger involved in the use of each. Any person, having the smallest real knowledge of electrical science, can judge of the risks attendant upon the use of either system. We have no intention of entering upon the controversy, but it may be of assistance to those who read the arguments brought forward by both sides to put the customary premises and deductions in a partly algebraic form. Danger from electricity supply occurs when electrical power gets misplaced, and it is roughly proportional to the quantity of misplaced power. Now it has been shown (article v.) that quantity of power can be calculated by any one of the three products (i) EC , (ii) CR , (iii) $\frac{E^2}{R}$.

The advocates of high-pressure select product (i), and point out that danger varies as the square of the current, therefore a low-pressure system using 2,000 amperes is 400 times as dangerous as a high-pressure system using 100 amperes, since $(2,000)^2 : (100)^2 = 400 : 1$. The advocates of low-pressure select product (ii), and point out that danger varies as the square of the electro-motive force, therefore a high-pressure system using 2,000 volts is 400 times as dangerous as a low-pressure system using 100 volts, since $(2,000)^2 : (100)^2 = 400 : 1$. Both statements are of great interest, showing as they do what may be done in a controversy by judiciously concealing a part of the truth. We leave those who care to do so to make similar deductions from product (i).

FUSES.

Having considered the generation and distribution of electrical power, it is necessary to turn to some of the more important appliances, by means of which electricity supply can be safely used for various purposes. It may be convenient to trace the course of the current round some circuit, and to note the different pieces of plant or apparatus through which it flows, though in a few cases different devices have to be used for the continuous and alternating currents.

The main current may be supplied direct from dynamo-machines, or from secondary cells, or from machines and cells placed abreast. A most important difference must be pointed out in the cases where cells are and are not connected to the mains. If the resistance in the circuit of a secondary battery be lowered, the E.M.F. of the cells will not fall, at all events for some little time; the current from them will therefore increase in proportion, and should the resistance of the circuit be sufficiently reduced, the battery may give a current one hundred times that which it discharges under ordinary working conditions. Such a current, if allowed to flow for a short time into the mains, would make them red-hot and finally melt them. When dynamo-machines

are used, unaided by cells, the consequences of unduly lowering the resistance of the circuit will not be nearly so serious. The characteristics of all machines (articles xv., xvi., xvii.) show that when the current flowing from them exceeds a certain amount, the electromotive force, owing to increased armature reaction, falls with extraordinary rapidity; indeed a machine running at its usual speed cannot give many times its normal output of current. Again, a large dynamo-machine is almost invariably driven by a steam-engine, capable of developing only a relatively small amount of horse-power in excess of its normal load, so that even supposing the dynamo-machine could give four or five times its working current, the steam-engine would certainly fail to maintain the speed. The only injury likely to be done to the mains themselves is that arising from an undue rise in their temperature, and this is hardly likely to occur if they are dynamo-fed. But whether the nature of the supply is such that the mains are likely to suffer or not, the fact that the resistance of the circuit has fallen, and excess of current is passing, clearly indicates that some accident has occurred and that current is going where it should not flow, probably doing great damage.

To avoid risks arising from excess of current, a "fuse" should be placed at both ends of each set of mains in the generating station, and also throughout the whole circuit, wherever a conductor branches off from one of a higher current-carrying capacity. There are many forms of fuses, but they all consist of a short length of conductor, usually made of some metal or alloy that melts at a comparatively low temperature, wholly enclosed in a case of some unflammable material, such as earthenware or slate. The fuse is placed in series with the wire or cable to be protected, and it is made with a cross-section so small that it will melt when a current passes that the protected cable can easily carry. If a fuse be put in a branch circuit at some distance from the junction of the smaller wire of the circuit with the main, the portion of the conductor between the fuse and the main is wholly unprotected. This is the practice of many who wire private houses for the electric light, a fuse being frequently put in the lamp-switch, and accounts for many of the so-called electrical fires which occur from time to time. A certain difficulty arises when a high E.M.F. is being used; the fuse will break at some one point, and at the instant of breaking, the resistance, per mass of conductor in the immediate neighbourhood of the break, is very large, the temperature becomes, therefore, very high, and the material of the fuse may not only melt but be converted into vapour. Vapour at a high temperature is a conductor, and the well-known "electric arc" may be formed. When this occurs the fuse is itself a source of the very danger it is intended to prevent. Mr. Ferranti, who, we believe, deals with higher electromotive forces in his mains than any one else, uses a fuse case of peculiar construction to get over this difficulty.

Fig. 66.

The fuse A, B, fig. 66, rests between two slabs of earthenware, the sections of which look like rows of arches. If vapour is formed, it is immediately cooled by being brought in contact with a mass of cold earthenware, it ceases to conduct, and the circuit is broken. Suppose, however, arcs are formed, the fuse can still be made to act; an arc opposes an E.M.F. to the current producing it, arcs can only be formed in the arches, by making a sufficient number of arches, therefore, an opposing E.M.F. is set up against which the current cannot flow.

A magnetic cut-out is frequently used as well as a fuse, the cut-out being made to act with a lower current than that which melts the fuse, the fuse being intended to go only when the cut-out fails to act. A magnetic cut-out consists of an electro-magnet with its coils placed in the circuit; to the armature of the magnet is attached a conductor which bridges over a gap in the circuit by dipping into two cups of mercury or some other form of contact to which also are joined the ends of the protected conductor. When the current exceeds a certain amount the magnet attracts its armature and pulls the bridge out of the circuit.

Books.

Blackie's Modern Cyclopaedia of Universal Information. Edited by CHARLES ANNANDALE, M.A., LL.D. Vol. VI. Blackie & Son: London, Glasgow, Edinburgh, and Dublin.

THE sixth volume of this useful work, just issued, brings it nearly to the end of the letter P. It continues to exhibit the same excellent qualities as a popular cyclopaedia, by which the former volumes were characterised, and architectural subjects and terms receive due attention in it, in proportion to the scale of the work. There is a good and tolerably long article on "Paris", another on the "Post Office," into which a great deal of information is compressed. "Norman Architecture" is briefly but correctly characterised, with a woodcut of the interior of the Abbaye aux Hommes as an illustration of the style. The Cyclopaedia ought to be a great boon to the smaller class of private libraries, in which more expensive and costly works of reference are unattainable.

Inventions and How to Patent Them. A Practical Guide to Patentees. By T. ESTACE SMITH, Barrister-at-law. Third edition. Whitaker & Co. 1890.

This is an excellent little book, clear and concise. The fact that it has reached a third edition shows that it has been found useful. It will be useful, not only to laymen, but also to lawyers who wish to get an outline of patent-law fixed in their minds, for the leading cases on which the propositions of case-law are based are given. A good index and hard binding together make up a serviceable publication.

Newspaper Reporting in Olden Time and Today. By JOHN PENDLETON. London: Elliot Stock. 1890.

THIS is one of the class of books which answers the demand now made by so many people for information as to the working of professions and occupations with which they have no other concern than what is sometimes called "enlightened curiosity." Mr. Pendleton's book is pleasantly written, and gives a sketch of the past history of Parliamentary reporting, in the days of such heroes of the old press as "Memory Woodfall," as he was called from the abnormal development of this faculty, which did for him some part at least of what the art of shorthand-writing has since achieved, and the author gives an account of the system by which the present elaborate and wonderfully rapid reporting of the Parliamentary debates is carried out. Some information on this latter head ought to be of interest to every educated reader, considering how immensely the whole political life of the country is indebted to and influenced by the full reporting of the leading daily papers. There is a chapter on shorthand, and one on "Experiences and Adventures of Reporters" which retails a good many anecdotes and anecdotes, good and bad, among which we may cite that of the reporter at the Salvation Army meeting who was asked, "Are you saved?" and replied, "No, I'm a reporter." A list of publications on newspapers and reporting is added to the book.

Sewerage Works, Walton-on-the-Hill, Liverpool.—The Walton Local Board have just completed an enlargement in their sewerage system. The present 24 in. outfall has been increased to 4 ft. 6 in. by 3 ft. 6 in. length of 2,380 yards, also a length of 1,100 yards of 3 ft. 2 in. cast iron pipes has been laid in addition to the present 18 in. pipes. At the sewerage farm, a small portion abutting the River Alt has been set aside for intermittent filtration. A large tank has been built of concrete, and faced with blue Staffordshire bricks, 100 ft. by 102 ft., containing with the present tank over 700,000 gallons, so that the whole of the sewage received between six p.m. and six a.m. next day may be stored for distribution at the latter hour. In case of flood, overflows are provided running direct to the filtration beds. To prevent flooding of cellars intercepting sewer has been constructed, about one mile in length, varying in size from 3 ft. by 2 ft. to 3 ft. 6 in. by 2 ft. 8 in. The scheme has cost nearly 20,000l., and has been carried out by Mr. W. Hope, Earle-street, Liverpool, under the direction of the engineer, Mr. S. Middlebrook.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

9,011.—Chimney-top. J. J. Downes. According to this invention, the chimney-top is constructed in terra-cotta or iron, galvanised or painted, the base having a flange to stand on the brickwork, and the pot being fitted with louvres. Above the louvres is fixed a cone, contracted at the top, and the dimensions of all the parts are regulated to the position of the chimney. A similar arrangement may also be applied as a ventilator for soil pipes, or an exhaust ventilator for dwelling-houses.

9,338.—Window-sashes. J. Ingleson. The upper and outer sash is, by this invention, made narrower than the lower and inner one, to permit of the former being easily withdrawn from its race. The sash-heads are also divided at a suitable distance above the meeting-bar, and then the upper and lower portions are decreased in width to admit of the upper and outer sash being withdrawn. The object of the improvements is to provide means for withdrawing each sash separately, or both at the same time, and to dispense with the use of a large pocket at the upper portion of the frame; also those improvements may be applied to counterbalance sashes where the use of weights are dispensed with, in which case it will be found necessary to partially or wholly withdraw one sash at a time.

10,000. Glass Roofs. S. Deards. This invention has reference to "dry glazing," and the chief object is to enable this to be effected without the use of putlins in order to secure the bars that receive the edges of the sheets of glass. Bars of X section run along the top of rafters, and are secured thereto by screws passed vertically through them into the rafters. Any water getting between the edges of the glass and the bars runs down the lower part of the bars, and escapes through holes made in the lower plate, which overlaps the eaves.

11,117. Paint-brushes. J. H. Dickson. The object of this invention is to manufacture a brush with a bristle of thin sheet metal, provided with perforations so that snips or pieces may be severed from it as the bristles wear.

1,185. Extracting Cowl. C. J. Hunter. Consists of a circular pipe carrying one or more truncated cones, and terminating with a hollow cone fitted to the shaft or chimney.

1,594. Ventilating and Flushing, &c. R. H. Wilding. Ventilation is secured by outlets and pipes connected with the closet basin. The flushing arrangements are much more perfect than most other inventions, and thorough ventilation is secured.

NEW APPLICATIONS FOR PATENTS.

- May 27.—8,203, C. Showell, Metallic Sashlifters.—8,208, A. Wright, Door and Gate Checks.—8,234.—W. Birch, Device for use with Lockbolts and Latches of Doors.
May 28.—8,271, C. Crawley, Window Fastening.—8,292, J. Kirkbride, Raising, Lowering, and Securing Window Sashes.—8,301, C. Houlser, Self-acting Cutting Apparatus for Brick Presses.
May 30.—8,355, G. Farmiloe & Sons, Water-closets.—8,376, J. Thompson, Urinal Flusher.—8,402, R. Frame & C. Neft, Water-Closet Fittings, &c.—8,404, F. Ross, Traps for Gullies, House-drains, &c.—8,410, T. Brown, Ventilators for House-drains, &c.—8,412, G. & G. Strawson, Attaching Glass to Greenhouses, Roofs, &c.
May 31.—8,428, H. Goodson, Water Waste-preventing Valve.—8,444, R. Oakeshott, Stoves and Fireplaces.—8,445, H. Major, Screws.—8,468, F. MacNulty, Doors.—8,482, H. Gould, Wood Screws.

PROVISIONAL SPECIFICATIONS ACCEPTED.

4,770. F. Batting, Operating the Outlet-valve of Water-closets.—5,796, E. Jeyes, Gully-trap for Waste-water.—6,068, W. Silcock, Fastenings for Windows.—6,086, E. Edwards, Supporting Window and other Sashes.—6,147, A. Drummond, Glazing Structures.—6,171, J. Montgomery, Self-feeding.—6,187, A. Orwood, Montgomerie, &c.—6,616, T. Hughes, Door-closers.—6,747, G. Elliott, Apparatus for Exhausting or Removing Gases, &c.—6,844, O. Gray, Drain or Sewer-traps.—6,950, M. Rodgers, Ventilators.—6,952, C. Kilner, Cooking Iron, Steel, &c., with Portland Cement, &c.—7,160, W. Peace, Chimney-cowl.—7,357, A. Boulton, Chimney-pots or Cows.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to Opposition for Two Months.

9,807, J. Upton, Bolts or Fastenings.—10,770, E. Edwards, Movable Centerings for Masonry.—12,262, R. Condy, Print or Pigment.—13,228, J. Oates, Painter's Brushes, &c.—5,268, S. Jennings, Draw-off Taps for Baths.—5,406, W. Thompson, Holding Doors or Window-sashes in a more or less open position.—5,887, D. Rawlinson, Metallic Framing for the Doors of Strong Rooms.

MEETINGS.

MONDAY, JUNE 16.

Royal Institute of British Architects.—(1) To ballot for candidates who desire to be admitted as members. (2) To present the Royal Gold Medal to Mr. John Gibson, Past Vice-President, for his works as an architect. 8 p.m.

TUESDAY, JUNE 17.

Society of Engineers.—Visit to the Thames Iron-works, Blackwall, and inspection of the ironclads in course of construction.
Statistical Association.—Mr. G. G. Chisholm, M.A., B.Sc., on "An Examination of the Coal and Iron Production of the Principal Coal and Iron Producing Counties of the World, with reference to the English Coal Question." 7.45 p.m.

WEDNESDAY, JUNE 18.

Meteorological Society.—Four papers to be read. 7 p.m.
British Archaeological Association.—(1) Mr. J. M. Wood on "Some of the Round Towered Churches of Essex." (2) Alderman C. Brown on "The Discovery of a Roman Column at Chester." 8 p.m.

THURSDAY, JUNE 21.

Liverpool Engineering Society.—Visit to the Thirlmere Aqueduct.

Miscellaneous.

The Pharmaceutical Society of Great Britain.—About three years ago this Society built an examination hall, dispensaries, research laboratories, &c., at the rear, in Galen-place, but the approach was a very bad one, and the connexion with the old building extremely inconvenient, besides which more accommodation was necessary for committee-rooms and offices, &c. Consequently, it was resolved to secure the two old houses adjoining, viz., 15 and 16, Bloomsbury-square, and erect thereupon the auxiliary structure. Messrs. Lansdown & Harriss are the architects who have connected the whole block conveniently with the existing building, and designed an elevation facing the square. The lower part is Portland stone, supporting two large bays on the first floor, and the upper part is red brick, with Portland stone dressings and cornices. From the entrance doors the examination hall is reached by a straight corridor, the old building being accessible by doorways with iron doors. The new building is adapted for the whole of the official work, and comprises secretary's and clerks' offices, stores, strong-room, lavatories, committee-rooms, president's room, and handsome council-chamber with oak door, dado, sashes, floor and carved chimney-piece. Messrs. Kirk & Randall are the builders, and Mr. H. R. Butson, the clerk of works; and the following specialist firms have contributed to the work:—Electric light, bells, gas, hot water and speaking tubes, Messrs. Strode & Co.; stone staircase from the Hopton Wood Quarries. Works worth, Derbyshire; wrought iron panels to ditto, Messrs. Jones & Willis; ventilation, Messrs. R. Boyle, Son, & Co.; chimney-pieces, Messrs. A. J. Arrowsmith & Co.; sanitary fittings, Messrs. J. Tyler & Sons; Parian plastering (including cornices and mouldings) and granolithic floors, Mr. J. Bickley; art decoration to ceilings and friezes, Messrs. G. Jackson & Sons; mosaic paving, Messrs. De Grelle, Hondret, & Co.; tiling to stair-case dado, Messrs. Minton & Co.; lift, Messrs. Waygood & Co.; locks and fastenings, Messrs. Kaye & Sons' "push and pull;" fanlight and sash openers, Messrs. W. & R. Leggett; fire main, hydrant, &c., Messrs. Shand & Mason; strong-room, door, &c., Messrs. Chubb & Son. The opening of the whole premises as being completed was inaugurated by a conversation, when a large and distinguished company congratulated the architects upon the success of their labours.

Removals.—Mr. T. Fairbairn, Hon. Sec. of the Edinburgh Architectural Association, asks us to note that he has removed from 5, N. St. David-street, to 35, S. Castle-street.—Mr. H. L. Beckwith, Hon. Sec. of the Liverpool Architectural Society, asks us to mention that the Library of that Association has been removed from No. 5, Cook-street to 15, Cable-street.

Water Supply, Earls Barton.—We are informed that the Wellingborough Rural Sanitary Authority have instructed Mr. W. H. Radford, C.E., of Nottingham, to prepare a scheme for the Water Supply of Earls Barton, as an alternative to a scheme previously submitted by a local engineer.

St. Werburgh's, Derby.—We are informed that at a meeting of the general committee for the rebuilding of St. Werburgh's, Derby, it was unanimously agreed that Sir Arthur W. Blomfield, A.R.A., be the architect for the rebuilding of the church, which is to cost 9,000l., towards which about 5,000l. are already forthcoming.

The English Iron Trade.—Although there has been a reaction in the Glasgow and Middlesbrough markets, the English iron market, taking it on the whole, has not gained in strength, notwithstanding the favourable nature of the Board of Trade returns for May. The Glasgow warrant-market has seen better prices this week, and shown greater firmness, while some branches of Scotch makers' iron are quoted higher. Cleveland iron has improved to the extent of 1s. 3d. per ton since last week, and the market is a little stronger. From other districts, however, reports as to the state of the pig-iron trade continue unfavourable. Some makers of Bessemer iron in the north-west are ready to sell their produce as low as 51s., or 4s. lower, while hematite warrants rule at 50s. 6d. The finished iron market is unsettled, and there is considerable depression in the sheet and hoop iron departments, while shipbuilding iron and steel is in declining demand. The feeling in steel has not improved, and the competition for orders is keen. Shipbuilders are no better off as regards fresh work, both engineers are doing fairly well.—Iron.

Fire at the Works of Messrs. Peto Bros., Pimlico.—On Wednesday about midday a fire of great magnitude broke out at Pimlico, in a great area of ground, bounded by Gillingham-street, Hindon-street, Berkeley-street, and Wilton-road; and the property on which the fire originated was the extensive series of workshops and stores owned and occupied by Messrs. Peto Bros., builders. According to the Times, the flames suddenly burst out in the centre of the block of buildings, while the works were in full operation and all the hands busily engaged. The fire extended rapidly. The fire was not overcome until after many hours of hard work; and although the destruction of the dwellinghouses and shops surrounding the fire was fortunately prevented, Messrs. Peto's large buildings were entirely gutted, and, as is shown by the official report, very serious damage was caused to other property.

The Sanitary Institute's Congress at Brighton.—A deputation from the Institute visited Brighton on Saturday, and met the Mayor and other members of the committee for the purpose of further considering the Congress and Exhibition to be held in the Pavilion Buildings at the end of August. The large Dome of the Pavilion, the Corn Exchange, and the Picture Gallery are all devoted to the Exhibition, but the applications for space are considerably in excess of previous years, and probably some difficulty will be found in accommodating exhibitors.

Institution of Mechanical Engineers.—Sheffield is to be visited this summer by the Institution of Mechanical Engineers, and arrangements are being made to give the members a fitting reception. A committee for this purpose was appointed a short time since, of which the Mayor is chairman, the Master Cutler the vice-chairman, Mr. R. A. Hadfield honorary treasurer, and Professor Ripper and Mr. R. Heber Radford the honorary secretaries. It is expected that nearly 400 members will be present.

Camden-place, Chislehurst.—This historic mansion and park, which formed the subject of a paragraph in our columns on May 17, are to be sold at the Auction Mart on the 27th inst. by Mr. David J. Chattell. The first edition of the "Particulars," now before us, gives a view of the mansion, and two suggested plans for the "development" of the property by cutting the greater part of the park into building plots.

The Edinburgh Public Library was opened on Monday last by Lord Rosebery. It will be remembered that in 1886 Mr. Carnegie, of Pittsburg, offered to the City of Edinburgh the handsome sum of 50,000l. to build a public library if the citizens would adopt the Public Library Acts. In October of the same year they resolved to do so, and subsequently steps were taken to carry out the resolution in conjunction with the Corporation, the members of which are, in the first instance, charged with certain responsibilities connected with the provision of suitable buildings and furnishings for the Library. From among several competing designs, those of Mr. Washington Browne, architect, Edinburgh, were selected, and the Library has been built from his designs on the site of the old Hope House, Cowgate. We gave interior and exterior views and plans of the Library in the Builder for July 16, 1887.

PRICES CURRENT OF MATERIALS.

Table with columns for material names (e.g., Greenheart, Teak, Mahogany), units, and prices in £, s., and d. Includes sub-sections for TIMBER, METALS, and OILS.

LONDON.—For alterations and additions to St. Saviour's National Schools, Paddington, W. Mr. F. G. Coward, architect:— Pollock & Son 44,926 1 9

LONDON.—For altering the old Wells-street College, Hackney, into an auxiliary workhouse. Messrs. A. & C. Harston, architects. No quantities:— Todd 44,520 0 0

LONDON.—For iron and concrete fire-escape stairs, and some lavatory buildings at the workhouse, Bethnal-green. Messrs. A. & C. Harston, architects. No quantities:— Flew & Co. 2,028 0 0

LONDON.—For internal distempering and painting at the Poplar and Stepney Sick Asylum, Bromley-by-Low, Messrs. A. & C. Harston, architects. No quantities:— Webb 4,350 0 0

CONTRACTS AND PUBLIC APPOINTMENTS.

"Historic Towns": Carlisle and Winchester.

RIOUSLY contrasted in the nature of their history and their interest are the two towns treated of in the latest volumes of the "Historic Towns" series.* To the

modern public Carlisle is a great railroad junction, the name of which has been rather painfully familiar in newspapers lately; while Winchester, considered from the same point of view, is little more than a roadside station. The ordinary traveller who passes it is little aware that the town whose name is painted up at the modest station was in the early days of English history the great centre of English political and ecclesiastical life and strife (the two things were nearly synonymous then), not second to London, even at times and in some lights more important than the London of those early days. But this is not all. In the history of architecture and archaeology Winchester is as interesting as in her political history, and whilst the author of the book on Carlisle expressly points out that he has treated Carlisle in reference to national history and not to local detail (probably conscious of the insufficient interest of the town in itself), the author of "Winchester," although dealing with a town of far greater ancient importance politically than Carlisle ever was, has so much of interest to relate in regard to the town itself that there is no excuse for going outside the subject; the archaeology of Winchester itself is of sufficient interest, independent of the great interests which cluster round it.

Considering the far inferior interest of Carlisle, we may be content with a brief reference to Mr. Creighton's well-written but rather discursive little book. Carlisle (Cærluel) was always essentially a border city, as it is now a border railway station; and in ruder times led the troubled life naturally incidental to a border city; and the epithet "merrie Carlisle," which Scott adopted from an older source, probably referred to the character of a city where there was always some fighting going on or

* "Historic Towns": Edited by E. A. Freeman and A. W. Hunt. "Carlisle"; by M. Creighton, M.A., D.C.L., LL.D.; "Winchester," by G. W. Ritchie, D.D., F.S.A.; Dean of Winchester. London: Longmans, Green, & Co. 1889.

likely to go on. The architectural importance of Carlisle may be said to be centred in the east window of the cathedral, a world-renowned specimen of tracery which has redeemed the building from obscurity. Mr. Creighton mentions its foundation by Norman Walter in 1083, "the same year in which Bishop William of St. Carilef laid the foundations of the great minster at Durham, which the church of Carlisle greatly resembled in design. When it was dedicated the choir, and perhaps the transepts had been built; the building of the nave was slowly carried on as the state of funds allowed." The author thinks that it was this financial operation which led, in this case, to the church being a double one, the choir and transepts belonging to the canons, the nave forming the parish church; the resources of the town not being equal to two separate churches on a large scale. Speaking of the rebuilding of the choir in the thirteenth and fourteenth centuries, the author pays a tribute, not undeserved, to the energy and ambition of the builders who, in spite of the continual misfortunes from fire and violence which befell their building, were determined at least to aim high, and produced a choir which, if fully completed according to its original design, would have been worthy to form a part of a cathedral of the first class, and the famed east window at all events is a continual memorial of the artistic feeling and refinement of the worthy, whoever he was, who set out its beautiful tracery lines. Had the whole cathedral been completed and kept up with the same beauty of detail, Carlisle would have been one of the architectural shrines of the country; but times were too turbulent for this, and the cathedral remains an unhappy monument of the fact.

No one could have been a better or more suitable author for a short history of Winchester than the Dean of its Cathedral, who combines archaeological taste and knowledge of the place and neighbourhood with a good literary style. His book is a model of its kind, easily written, readable, yet full of information. Some gift of imagination and picturesque description is needed to take the reader back to the distant epoch when the future site of Winchester first presented itself to the Roman invader; for one need not of course remind most readers that the "chester" termination is the *castra*, the first part of the name being apparently a double corruption, first of "Gwent" (ancient British) into "Venta"—"Venta Castra,"

subsequently Germanised as "Vintanceaster," whence the transition to the modern name is obvious. Like most historians of the modern school, Dean Kitchin endeavours to picture the landscape and surroundings of the city as affecting the original choice of the site. The south coast in early times we can easily imagine as all wooded, the chief break in the line of forest being caused by Southampton Water. To explore that was a natural impulse almost; a partial lead up into the country. "Even now, if any one lands at the head of the tidal waters just below Bishopstoke, and looks northwards from a rising ground, he will see well-wooded slopes stretching away to right and left, while at the head, apparently, of the valley just beyond where Winchester lies hidden in the lower ground, he will discern an open breadth of country, which seems to invite him onwards into the heart of England, and this, we may well believe, is just what the Roman saw," and fixed his camp at the British hut village. The Dean traces the line of the present High-street as that of the usual central road across the rectangle of the Roman camp. Of all this there is no historic record beyond what the pick and mattock might supply perhaps still, and what fancy may conjecture. As the author says with a pleasing touch of rhetoric, "with the first breath of Christ's religion, like silent strings touched by the wind, history begins to speak in low mysterious tones," some of which echo down to the present time in a very practical manner, for in the seventh century the first endowment of the church in Wessex was granted to the Winchester monks attached to the Saxon cathedral which was the forerunner of the Norman one, in the shape of a grant of land for some distance round the city, given for the building of the church; "and some of these estates remain to the present day, after a lapse of nigh twelve centuries and a half, in the hands of the Dean and Chapter of Winchester"; a curious example of that slow-changing and conservative state of existence which characterises the cathedral cities of England, in such strange contrast with the quickly changing life of modern cities, and which makes them seem like ancient bridges stretching backward across the stream of time, connecting us with the far-away past of our country.

Perhaps the genuine career of Winchester may be said to date from the great King Alfred, who held his court there as King of

Wessex, who made the first existing chronicle of the English people, the first-known survey, ("Liber de Winton") in the country, and founded the "new minster," which occupied the site that is now the northern or north-eastern portion of the present cathedral precinct, but of which the very memory is now only preserved in some of the names, "Abbey-passage," &c., which still cling around the ancient site. For some centuries, however, there was the spectacle presented of two churches of cathedral type and scale, close beside each other in the same city.

Of course at that time the other cathedral, on the site of the present one, was of a much more simple character than that which we now know so well, though it appears to have been an important and imposing building for its early date. It was the work of Bishop Ethelwold at the end of the tenth century, and is described by the enthusiastic eye-witness of its erection, Wulfstan, as of so many chapels, such intricate passages, such numerous columns, that a man might easily be lost in it; "it was crowned also with a mighty tower, with pinnacles and balls of burnished gold, and a weathercock which caught the morning sun, and filled the traveller coming down the hill into the city with amazement." There is something delightfully characteristic of Saxon times in this; one can fancy the cathedral like a kind of child's toy building on a great scale, or like some of those naive pictures of Medieval architecture, towers with bells swinging out at the windows, drawn in Gustave Doré's illustrations to Rabelais.

All this was to pass away when the strong hand of the Norman conqueror was laid upon the land. William made Winchester his headquarters, "for so long as the king over England was also Duke of Normandy, Winchester lay handiest for Rouen. It was not till this connexion was shaken that the importance of the Southern capital began to wane." William found a congenial spirit in Bishop Walkelin, who in 1079 began to build the new cathedral. The Dean's comment on the architectural influence of the Norman rule is so picturesquely put that we may quote it:—

"The new lords of the land, strong and resolute, seem to have considered the cathedral, abbey, and parish churches built in the native style to be deficient in size and dignity; and therefore many older buildings of note were swept away, and new ministers rose to express in stone the dominant ideas of the new masters. These massive churches were eloquent of the constructive boldness of their builders; they became centres of Roman rather than English worship, and belonged rather to the larger and more general church system attached to the revived Papacy, than to the older national system; garrisoned by friendly monks, each church became a Norman fastness; the bishop, high-seated at the easternmost point of the apse, looked down on the worshippers from behind the altar, and seemed to embody the highest claims of the Medieval Church. In Winchester Cathedral the altar above and the sacred well in the crypt below, the one directly over the other, in the exact centre point of the circular apse, were the significant centres of religious worship. No wonder that the English disliked these characteristic apses, symbols of Norman dominance, and, when they had the power, replaced them by a square east end. The apse of Winchester was soon swept away when Bishop Godfrey Lucy undertook to refashion the church, before the end of the twelfth century, in the new style, which is now called First Pointed or Early English."

The Saxon Cathedral was not demolished till the new choir was completed in 1093, when the monks are related to have taken St. Swithun's shrine from the old church to the new. The Dean suggests that Walkelin perhaps built his eastern apse close to the west door of the old cathedral, and then pulled down the latter and built the new Lady Chapel on the site of it; and thus the very ancient-looking work in the crypt beneath is actually part of the oldest Christian building of these parts. The rude style of the work in parts of the crypt certainly warrants this opinion, which has been often before expressed.

Another curious survival of ancient practice is mentioned in connexion with the chapel

of St. Laurence, the palace chapel of the Conqueror's day, to which to this day each bishop goes before his installation in the Cathedral. Originally this was to pay homage to the king in his palace, which was a necessary ceremony before taking possession of the see; and the practice is still kept up though the real meaning for it has been for centuries in abeyance.

Winchester was omitted from the Domesday Surrey, probably because it was to be treated on a different principle, and the author's summary of the results of the survey of the city made under Henry I. collects in a short space a good deal of curious information. The general impression conveyed, he tells us, is that the houses were few and the population only from six to eight thousand. We may direct the reader's attention also to the chapter on the days of Henry of Blois (1129-1171), whom the Dean calls perhaps the greatest of Winchester bishops, certainly a strong though turbulent and tyrannical character, who on his death bed denounced Henry II., who came to see the dying man, "durissime et dirissime" for his share in Becket's death. It is interesting to note that, like Pope Julius in later days, he combined with violence and wilfulness of temper a great love of art, and was a collector of silver work and jewels and carvings, for which he built a treasure house in the cathedral, which in its peculiarities of style shows some reminiscence probably of his foreign travel. Not long after him came the days of Bishop Lucy, and of the removal of Walkelin's Lady Chapel, and all the excitement of the new building in the new style. He, it is noted, established the first English Church Building Society, "a confraternity for the repair of the church, to last five years." Like many other medieval builders, as well as some modern ones, they did not understand the subject of foundations, and part of their work has settled far out of the perpendicular. The Dean's remarks as to the special object of the new building, as far as plan was concerned, are worth citation; we say advisedly "as far as plan was concerned," for no doubt architectural enthusiasm for the new style was the most urgent influence in the work; people removed and rebuilt things then because they thought they had something better in their mind, and could not help doing it; but the description of the motive for the arrangement of plan is of considerable interest:—

"The object of Bishop Lucy's enlarged church, which lay to the eastward of the ancient building with a new Lady Chapel, is plain; it was intended to provide space for the crowds of pilgrims who flocked to St. Swithun's shrine. That shrine was placed in the centre of this part of the church (between the present chantries of Waynflete and Beaufort); and the monks, though willing enough to receive their offerings, turned their faces away from the persons of the dirty unwholesome crowd, and excluded them carefully from the main church. They made them enter by a Norman doorway in the north transept, which opened into the churchyard, away from the conventual buildings; after they had paid their offerings or fees in that transept, they visited the shrine, and were stopped on the south side by those interesting gates of wrought iron, still preserved in the Cathedral, and which are probably the oldest specimen of English wrought iron-work. And so this part of the building became practically a second church under the same roof, with nave, aisles, and Lady Chapel all its own."

Of the more popularly celebrated Winchester bishop, Wykeham, the Dean speaks with due appreciation but without enthusiasm, as one who "left to us a somewhat dull and monotonous architectural style, capable however of very dignified effects, and a sound type of traditional education. . . . while there is no genius in him or originality, he is the English churchman at his best." To speak of Wykeham as the personal inventor of the Perpendicular style is surely going too far; styles were not personal inventions, even less so then than now; and on the other hand the scheme which he apparently originated and carried out, or at least superintended, for transforming the Norman nave of his Cathedral into the new style of his day, is certainly marked by that kind of boldness in conception

and fearlessness in execution which is a special characteristic of genius.

Among the later historical associations which cluster round Winchester none certainly is more memorable than that first meeting of Philip II. and Mary, after the long ride of the King and his Spanish followers in the wind and rain from Southampton, told with such picturesque force by Froide; but this belongs to the realm of history proper, unconnected with the architectural development of the city, with which we are chiefly concerned. Some account is given in a later chapter of the book as to the comparatively modern transformations of Winchester; the general repair of the Cathedral Close in 1661, and the insanitary state of the city about the same period. Just before the Great Plague year various sanitary regulations of a primitive kind were passed, but even these were not attended to; drainage, as now understood, was unknown, and the houses, many of them built of mud and thatched with straw, were not of a character to make the best of bad sanitation. Accordingly, the plague had its fling at Winchester. Another matter about which we believe very little is known, is the intention of Charles II., who frequented Winchester a good deal, to have a grand approach to the Cathedral made. The Dean tells us that in the Cathedral archives there exist two documents bearing on this project, one signed by Christopher Wren and the other by Rochester, forbidding the Dean and Chapter to lease any of their land to the south of the town until the King's pleasure was known. It would have been highly interesting to see what Wren would have made of this opportunity of laying out an approach to the Cathedral in his own way.

In conclusion we may say that this volume is by far the best, to our thinking, of the "Historic Towns" series. No doubt the author has been exceptionally fortunate in his subject; but his literary ability and picturesqueness of style have enabled him to turn his materials to the best account in producing a short history which is not only full of information, but as interesting reading as a novel.

THE GERMAN NATIONAL MONUMENT QUESTION.

WE have more than once referred to the discussions in Berlin as to the proposed national monument to the Emperor William I., and the form in which it should be embodied; and as the Government seem now about to take the matter in hand, it may be convenient to sum up the position at the present moment in regard to a matter which is of some importance in the art world, and which has been the subject of some very acrimonious criticism in the artistic circles of the German capital.

In accordance with a bill passed in December, 1888, the sum of 5,000L. was placed at the disposal of the Government for the purpose of obtaining a suitable design for a monument to the Emperor William I., by means of competition.

For the purpose of facilitating the choice of a site for the monument, as well as for the purpose of obtaining ideas as to what kind of monument might be deemed suitable, a preliminary competition was opened in March, 1889, and 1,600L. of the 5,000L. offered in prizes.

This competition was decided in October of the same year. Of the 147 designs sent in, the two classed first were by architects, whilst the four classed second bore the names of sculptors. By far the majority of the designs showed extensive schemes to be planned on sites outside the town proper (on the Königsplatz, Siegesallee, &c.); of those still remaining the larger number was destined for the Pariser Platz, just inside the old Brandenburg Gate, whilst the rest were either to find room on the Schlossfreiheit (in front of the Imperial Palace), on the Castle Bridge, or on the finely-situated Opera Place, at the corner of which

the historical window of the deceased monarch's residence is to be found. The jury were, however, unable to come to a unanimous conclusion as to the site to be preferred, and merely noted in their statement that on putting this question to the vote, nine of the members voted for a site outside the gate, and that the votes of the remaining five of their number were divided between the Opera Place and Schlossfreiheit sites inside the town.

Since the date of this statement, which otherwise simply treated of the various designs, in order of merit, without in any way recommending any special idea, nothing definite could be reported for a long time, although it was an open secret that the young Emperor had been keeping the subject before him, and had even gone so far as to consult his favourite sculptor, Reinhold Beggs, together with a court architect of indifferent merit, as to their ideas, at the same time stating his view of the question.

Then came the distinct news that Professor Beggs had been working out a design in accordance with the ideas of his patron; and now during the last month the subject has at last, as it seems, been taken firmly in hand.

During a sitting of the "Kronrath," under the presidency of the Emperor, the subject was discussed; and, some three weeks ago, we were able to state that the "Bundesrath" would be asked to come to certain decisions* very different to what the public at large would be in favour of; and now, after these decisions have really been requested from this body, the "Reichstag" has last week received an official notification that they would be asked to come to similar conclusions.

As before observed, we have every reason to believe that such requests of the Government will be granted, as it is well known that no other idea would have much chance of being approved of by the Emperor, and we do not even believe that the decisions will require debates of noticeable length, now that the Government has at the same time notified their opinion that they consider that the monument should in the first place be a monumental representation of the monarch himself, as a person; and that to go farther than this, and to erect an extensive architectural monument on which also those persons should be memorialised who have played important parts during the foundation of the new German Empire, would be likely to lessen the predominance of the Emperor himself in the design, or, if this was not to be the case, would require that his figure should be treated in a spirit of self-assertion quite at variance with his simple ideas and manners.

Taking their own views into consideration, *é.é.*, that no extensive architectural design would be advisable, and that an equestrian portrait statue only would be the more suitable style of monument to the deceased monarch, the Government has naturally not given those sites outside the Brandenburg Gate any more thought, but has recommended instead, for several reasons (among which that of economy appears to be predominant), the Schlossfreiheit, or rather the new extension thereof, now being acquired by means of a lottery.

In itself the idea of commemorating the old Emperor by a simple equestrian statue is suitable enough; but it is another matter when this is regarded as the national monument, the result of a national subscription, especially as every province and every important town has its own scheme for a monument to the founder of the modern German empire. The city of Berlin might very well itself dedicate an equestrian statue to the memory of the Emperor, as the monument of the capital city, and place it on this very easily acquired site in front of the present Emperor's residence; but a monument which is to stand as the offering of the German nation seems hardly to be adequately represented by a single portrait statue. And it would seem only fitting that a national monu-

ment to the founder of the empire should include some memorial of those who were most prominent and distinguished among his servants, even if it did lead to the introduction in a prominent position of the figures of the Emperor Frederick and of Prince Bismarck who are at present very unpopular in high places.

The objection made to any larger scheme than the single equestrian statue seems, indeed, to be the result either of jealousy, or of a desire to do the thing cheaply, or of both feelings combined. But in this case why was there any competition opened at all, to delude artists with false hopes? It can scarcely be pretended that the ideas now promulgated on the subject arose in any way out of the first competition; and why has the time and labour of artists been so lavishly played with for no purpose? It is to be hoped the German Government will in future be less reckless in opening competitions which are to have no result, and that the present ill-managed affair, and the annoyance and criticism it has raised, will serve as a warning against similar mistakes in the future.

While sympathising with the Berlin architects and artists in their disappointment, and while concurring in their idea that a monument to an Emperor by national subscription should be something on a large scale,—something that may seem an adequate expression of the recognition and loyalty of a great nation, and that a mere portrait statue can hardly be so considered; we must admit that it is rather a difficult matter to decide what the nature of such a monument should be. The result of the competition for the Victor Emmanuel Monument was not encouraging in regard to the idea of built-up monuments, squares or semicircles of architecture surrounding a central statue or group. To justify a work of that kind, it is necessary that every portion of it should possess sculptural or other detail of special interest and significance; a mere piece of built-up ornamental architecture, like that which many of the Victor Emanuel competitors proposed, is apt to impress one with an idea of its uselessness and baldness of expression in comparison with what has been expended on it. The choice seems to lie between a great group of sculpture, such as M. Dalou has executed to commemorate the French Republic, or an architectural erection serving as a framework for sculpture or a *point d'appui* for sculptural groups. The monument to Gambetta at the Tuileries is not a bad type of this latter kind of monument, in which the architectural element is exceedingly simple, and merely serves as a centre point for the sculpture to cluster round and be relieved against. If it be desired to develop the architectural element rather more, it may be said that in general idea the Albert Memorial in this country is a good example, although open to much criticism in regard to points of detail. But something of this kind, an architectural shrine for the principal figure, with bas-reliefs and supporting groups of sculpture in which events and subordinate actors can be represented, so as to compose into a united whole, might be recommended to our German friends as the best type for the solution of the problem, if they are still to have any chance of engaging in it.

THE WORKING OF THE CONCILIATION CLAUSES OF THE RAILWAY AND CANAL TRAFFIC ACT.

A REPORT by the Board of Trade upon the above subject has recently been laid before Parliament, in accordance with the provisions of the Act, in which the cases dealt with are set forth in more or less detail, accompanied by some valuable observations by the Department. It will be remembered that this mode of procedure, which is entirely new to English practice, was introduced into some of the earlier Bills, but was allowed to drop. In 1887 it was abandoned while the measure was in the House of Lords, on the ground that no

new tribunal for dealing with railway questions was necessary; but it was again inserted in the Bill of 1888 (which became law), and the report under consideration gives a good idea as to how far the experiment has proved successful.

The Board remark that the clause "imposes upon the Department the duty of endeavouring to arrange the differences between traders and railway companies, which, in some instances, might be brought before the law courts, but which the Legislature appear to consider might be usefully dealt with by the friendly action of the Department." That the Legislature were justified in anticipating a beneficial result may be considered proved by the fact that out of forty-nine complaints which have been made under the section, twelve have been settled to the satisfaction of the complainants; while in nineteen other cases explanations have been made through the medium of the Board of Trade, and the complainants have taken no further action. It is not unreasonable to assume (as the Report observes) that in some, at least, of these latter cases the explanations obtained have been considered satisfactory.

Of course, the Department had to consider, in the first place, whether they could properly deal with the various matters submitted to them. They were placed in a rather peculiar position, being authorised, "if they think there is reasonable ground for complaint, to call upon the railway company for an explanation, and endeavour to settle amicably the differences between the complainant and the company." Although the Board of Trade have no power to enforce their decisions, there could be no doubt that any expression of opinion on their part would have considerable weight as coming from a State Department; so that it was necessary for them to carefully avoid taking up matters which could only be properly determined by legal action. The Report explains that they took the opinion of the law officers of the Crown as to the extent of their jurisdiction, and that they were advised to act upon a wide interpretation of the section, until experience had shown that interference in any particular class of cases was useless or injurious. This rule the Department seem to have adopted, as they have entertained most of the applications made, while cases occasionally arose which they declined to proceed with. For example, in the case of a complaint of an increased rate charged by the Brecon and Merthyr Railway, the company contended that the increase was due to the discontinuance of a rebate in accordance with another section of the Act, and that its further allowance would be illegal. This case, the Board decided, was one which should be submitted to the Railway Commissioners. Another complaint by the Liverpool Chamber of Commerce and others was based upon the relative severity of the rates from Liverpool to Birmingham and district, compared with those between Cardiff and the Birmingham district. The answers of the different railway companies interested opened up a wide field for inquiry,—such as the effect of water competition and various other circumstances,—and the Board wisely came to the conclusion that the complaint was too wide and complicated a problem for them to deal with.

In other cases their interposition was clearly beneficial, and was much appreciated. In an important colliery case, although no settlement could be arrived at, the Board arranged a meeting at which the question in dispute was discussed; subsequently receiving a letter in which the complainants expressed their indebtedness to the Board of Trade, and stated that it had been arranged to present a friendly case to the Railway Commissioners for their decision. It is not at all improbable that amicable discussions such as these, due to the friendly interposition of a neutral mediator, might not otherwise have been brought about at all. Several complaints of increased charges resulted in the old rates being reinstated, the explanation of the railway company in one of these cases being that the increase was due to a clerical error. An appli-

* See Builder, May 24, 1890.

cation by a Glasgow manufacturer resulted in the reduction of a certain rate from 2*l.* 10*s.* to 1*l.* 10*s.* 10*d.* per ton, "with which," the Board are particular to add, "the complainant is satisfied."

At the same time the Report is not without cases terminating in a way calculated to "satisfy" the railway companies. On investigating one case they found that "there was no just ground for complaining of unreasonable or oppressive treatment on the part of the railway company, as the increased rate, which was reasonable in itself, was the ordinary rate charged in the district under similar circumstances, and was considerably below the company's maximum of charge." We may mention another case in which an interview was arranged, resulting in an offer on the part of the railway company to reduce a rate from 7*s.* 7*d.* to 6*s.* The complainants declined to accept this (because other disputed rates were not altered), upon which the Board stated that they considered the offer made a fair one, and that they could not consent to ask the company to reconsider the matter.

When the scheme was first proposed the railway companies regarded it with disfavour, not considering the Board of Trade competent to deal with the questions which would be submitted to them. A railway journal, under date June 21, 1888, remarked that the only method by which a system of conciliation could be successfully worked would be by the appointment of a number of railway men, thoroughly conversant with goods rates business, as assistants in the Board of Trade Department. It was further declared necessary for this body of assistants to be men who had not only been engaged in the ordinary goods rates departments of the railways, but who had also an all-round knowledge of railway freight business both of this country and also of the Continent and of America and the Colonies! Now it is evident that, although the Board have no doubt found it advisable to strengthen their railway department since the passing of the Act, the writer alluded to entertained a very exaggerated estimate of the duties imposed upon them by this section. This first report affords proof, we think, that as intermediaries,—which was all that the measure designed them to be,—they have been fairly successful; and we may safely assume that they have not found it necessary to call to their aid an array of experts possessing all the qualifications supposed to be so indispensable.

NOTES.

AS will be seen by our report of the meeting of the London County Council this week, the Building Act Committee have at length reported on the referreces made to them many months ago as to the appointment and tenure of office of District Surveyors. The report of the Committee was not reached until too late in the sitting for any consideration to be given to it; but inasmuch as, by its appearance on the *agenda*, it has become a public document, we print it this week for the information of our readers. The Committee do not see their way to the payment of District Surveyors by any other method than by fees, as at present; but by way of counterbalancing this negative conclusion they make the positive recommendation that future District Surveyors be appointed only on condition that they devote their whole time to the duties of their office. The Committee recommend that the Districts be re-arranged as opportunities offer, so that the average of the fees received may in no case amount to less than 500*l.* per annum. It is more than questionable, we think, whether, if these changes be adopted, men of capacity and integrity will be induced to become candidates for District Surveyorships. In the proposed conditions of candidature for such appointments, the Committee, curiously enough, make no mention of the fact that no one can become a candidate unless he

pass the statutory examination and hold a certificate of competency issued by the Royal Institute of British Architects, the examining body for such purpose under the Metropolitan Building Act.

COMMITTEES who are concerned in organising competitions, and who appoint a professional assessor either to adjudicate or to guide them in adjudicating, should bear in mind that in the case of buildings of a special character and for a special technical purpose, it is utterly useless, and worse than useless, to appoint as assessor any architect who has not special knowledge and experience in regard to that particular class of building. We have known of cases (and one was mentioned to us recently) where an assessor has been appointed to adjudicate on plans for a technical building who had never had any experience in planning that type of building at all, his own rather moderate reputation having been made in connexion with works of quite a different class and requiring no special knowledge, and this too in a case where the competing architects were mostly specialists; which makes the matter worse. To choose a competition assessor on such a system, and act on his advice, is casting a slur on the competing architects, and putting them in a most unfair and derogatory position, the probable result being that the plans are selected without any real reference to their technical fitness, and the appointment of an assessor becomes a mere farce.

THE Corporation of Eastbourne are about to adopt a plan which we have long advocated,—viz., the granting of certificates to the proprietors of such lodging-houses as are certified as being in a proper sanitary state. For this purpose the staff of sanitary inspectors is to be enlarged. This plan will have, sooner or later, to be adopted by all watering-places, but none the less is the utmost praise due to the authorities of Eastbourne for appreciating its necessity and for carrying it into execution. But care must be taken that old certificates are not shown to visitors, and that the houses are periodically inspected. It is obvious that if a house gets into bad repair, and the owner possesses an original certificate, it would be easy to get the better of unsuspecting or careless visitors. Of course, the latter should be their own protectors; but none the less should care be taken that the system of inspection is kept continually perfect. One of the great dangers of a sea-side residence will then be removed.

THE jurors appointed to consider the competition designs for the project for a tower to overtop the Eiffel Tower have issued their report to the directors of the "Tower Company." They report that they have given very careful examination to every drawing, and although there were good points about many of them, they confess to being disappointed with the general result, and express regret that "there is no single design which we could recommend as it stands for execution." This we are at all events glad to hear. The design which they recommend for the first premium of 500 guineas, that by Messrs. Stewart, Maclaren, & Dunn, is the one we pointed out in our "Note" of May 3 as the best one in regard to design, with an entrance façade treated in a rather Oriental style; but they state that though many of the designs were at once eliminated as unsuitable, they did not arrive at the final award without repeated and prolonged consideration. The second premium of 250 guineas is awarded to Messrs. Webster & Haigh, of Liverpool. The Jurors are Mr. E. H. Carbutt (Chairman), Sir F. Bramwell, Sir B. Baker, Mr. E. J. Harland, Professor A. W. B. Kennedy, and Messrs. C. Liddell, J. F. Moulton, and Thomas Verity. We cannot help regretting to see the name of Sir Benjamin Baker connected with so foolish a business.

MORE than two years ago we suggested that some of the porous fragments of colossal snake-bodies found to the south of the Parthenon might possibly turn out to belong to Cecrops, the earliest of Athenian legendary kings; but hitherto the majority of the fragments have turned out to belong to the bodies of a Typhon and of Tritons. Our suggestion has, however, now been realised. Dr. Alfred Brückner, who has done so much for the restoration of these porous pediments, publishes in the last issue of the Athenian *Mittheilungen* his reconstruction of the last remaining fragments. The composition consists in the main of a figure of Herakles wrestling with a Triton, the Triton's tail filling the left-hand angle of the pediment; but on the right-hand angle is another snake-tailed figure quietly watching the contest. He, moreover, holds in one hand an unmistakable bird, which can scarcely be other than the eagle of Zeus. In fact, the famous struggle of Herakles is conceived of as taking place not in the Peloponnesus but in Attica itself, under the auspices of the old Athenian king. Very little of the figure remains, but the hand holding the bird is distinctly preserved. Up till now our earliest representation of Cecrops has been the well-known Berlin terra-cotta, where he watches the birth of Erichthonios. The newly-constructed pediment now takes the first place. The eagle in the hand of Cecrops in place of Zeus will raise some interesting questions for mythologists,—questions that cannot be discussed here. Dr. Brückner's long and able paper is devoted chiefly not to these side issues, but to a justification of his ingenious restoration.

IN reference to the Leipsic "Rathhaus" question mentioned on page 149 *ante*, we now hear that the municipal authorities have decided against their City Architect's design, in which was shown a clever solution of the problem of saving the old Town-hall, and the former Booksellers' Exchange close by, and the connection of these two archaeological relics, with a well-planned extension, in which the committee-rooms and offices required were to be placed. The authorities, contrary to the advice and expectation of most competent judges, have come to the conclusion that a renovation of the old buildings, combined with an extension, would be inadvisable; that an entirely new building, containing the administrative offices, in combination with a new Town-hall, presentation rooms, &c., would be preferable, and that for the fulfilment of this idea a special committee should be elected for the purpose of working out a clear programme of requirements in such a building and framing a set of conditions for a competition for designs open to all architects residing in Germany. Whilst the official *Centralblatt der Bauverwaltung* expresses a hope that architects of repute will not send in designs for this competition, another architectural paper sarcastically remarks that many a long year will still elapse before the Leipsic citizen will see his new town hall. From our point of view, we hope that the number of designs sent in at the proposed competition may be 0, and that, as the City Architect has expressed his intention of not troubling himself about the matter any more, the authorities may some day find out that advice from competent persons should not be overlooked.

AT Hamburg there is a good deal of interest aroused at present in regard to the new scheme for extensive harbour works for Cuxhaven, to be situated on and off that piece of ground at the mouth of the Elbe which belongs to the old free Hanse Town farther up the river. The scheme, which has just been formally laid before the governing authorities of the town, and which has every chance of being soon approved of, shows that 380,000*l.* is the figure at the foot of the estimate, and that full three years' time will be necessary to do the work in. These new harbour works, when complete, besides being of great service as a place for

landing the passengers and mails of transatlantic steamers, unable to pass up the river at low water, will also be of considerable value as a harbour of refuge to such ships when waiting to pass through the North Sea-Baltic Canal, now in construction, and will have the great advantage of being "free," hence permitting the unloading and reloading of cargoes, and the temporary warehousing of them, without duty dues.

IN the *Semaine des Constructeurs* for June 14 there are published a series of small sections and plans illustrating the proposed extension of the Sceaux railway inward into Paris, by means of what is practically an underground railway with a terminus near the Luxembourg Museum. Those who have experienced the difficulty and loss of time in being conveyed to the present terminus of the Sceaux railway, which forms a kind of *ultima Thule* on the outskirts of Paris, will appreciate the gain to the public from this proposed construction.

WE have had an opportunity of seeing a model of what is claimed to be an "improved system" of road-paving, invented and patented by Mr. Frederick G. Helmore, and which forms the subject of Specification No. 12,011 of 1889. Briefly described, the method proposed by the patentee consists in the provision of what he calls "sectional casements," or shallow trays, as we may call them, measuring at their maximum (say) 20 ft. or 25 ft. long by 10 ft. broad; or they could be made of any other smaller size, so that one, two, or more of them would cover the width of the roadway of a street. These "sectional casements" the patentee proposes to make of malleable iron, steel, or other material (including wood). They are provided with flanges at the edges, which enable the sections to be bolted together, and which also serve, in conjunction with a central raised rib, to enable the wood or other paving-blocks to be keyed together. The paving-blocks rest directly on the iron or other surface which forms the bottom of the "sectional casement," which surface it is proposed to groove or furrow, so as to carry off into side-channels any liquid passing down through the joints of the wood blocks. In the case of a street only 20 ft. or 25 ft. wide as to its roadway, one of these "sectional casements" would cover the whole roadway. Each section is cambered, so as to give the roadway a proper amount of fall from its crown to the sides. The advantages claimed by the patentee are (1) that these "sectional casements" could be made at the factory, and filled in with wood blocks or other paving material before being brought to the street where they are wanted; (2) that they would require no bed of concrete under them, only bearing or foundation slips at each side (and at an intermediate point or points where more than one "sectional casement" is required to cover the road); and (3) that roads could be repaved very expeditiously with this system, drains, gas-pipes, &c., being readily got at by lifting up one or two of the "sectional casements" at a time. The inventor claims that his system would be nearly as economical in cost as the present systems, the cost saved in concrete going towards the cost of the iron-work. We confess that even if the cost of the inventor's system would compare with those of the present systems, which we very much doubt, there seem to us to be other practical difficulties which it would not be easy to overcome. In the first place, it would be very difficult to adjust the proposed "sectional casements" to the ever-varying and irregular widths of London streets. Secondly, the comparatively thin iron trays (for such, practically, are the so-called "sectional casements") would hardly, we should imagine, sustain heavy traffic without fracture, unless carefully and tightly packed underneath with earth between the bearing-points on the concrete. It is very easy for a plate-layer to pack a sleeper; but how is the space under an object 10 ft. in width to be effectually packed? While we are glad to

find inventors working at the problem of improved street paving, in view of cleanliness, convenience, and safety, we cannot think that the invention under notice solves the problem. There is, however, something to be said for the idea of the inventor's patent, No. 20,945 (1889), for providing a ready means of quickly flushing the surfaces of roads from the crown. But this last-named patent is applicable to any kind of road, and the adoption of some such method would not only abolish the water-cart, but would prevent an incalculable amount of suffering to horses on wood and asphalt roadways at certain times.

MR. SPEARS' report to the Local Government Board on an outbreak of enteric fever in the Pemberton Urban Sanitary district, Lancashire, turns in part on causes belonging to purely medical administration; but, as usual in such cases, there are defective conditions of sanitation favourable to the development of disease. Of the Pemberton and Orrell division it is observed:—

"The privy midden is in universal use in both districts. The structures, speaking generally, are large and deep, admitting of much accumulation of refuse, and, no doubt, of soakage of foul matters into the soil. They are often in very close proximity to dwellings, and when emptied, the refuse has first to be thrown on to the unimproved surface of the yards. This work of removal is provided for in the Pemberton district by the Authority; in Orrell it is left to owners and tenants, who are dependent upon the goodwill of neighbouring farmers. At New Town, Pemberton, nuisance has been caused by the deposit of the collected midden refuse on vacant land in close proximity to rows of houses."

Further conditions which require the attention of the sanitary authority are noted as follows:—

"The house accommodation of the district requires much attention. There are houses at Lamborn-green that from dilapidation, dampness, want of proper ventilation, and from the sewage-soaked state of the surrounding surface are unfit for habitation. At New Town, a damp, low-lying locality, there is a great want of proper surface drainage and paving; the houses are largely of the "jerry" class, and often dilapidated and dirty; middens containing foul accumulations of refuse stand close by the kitchen doors and windows, and at one spot, close by a row of houses, a quantity of midden refuse was last summer deposited by the contractors in the employ of the authority. Speaking again of the sewer system, it is evident that much unpurified sewage finds its way into the Douglas. There is only one tank for the deposition of sludge before the sewage is applied to the land, and whenever the tank requires cleaning the sewage is passed by the overflow direct to the river."

WE understand that a deputation from the London United Building Trades' Committee is to wait upon the Royal Institute of British Architects on Monday next, at 4 p.m., to ask that body to place clauses in all contracts to prevent sub-letting, sub-contracting, and "sweating" in the building trades.

A PORTION of a lecture on "Electrical Phenomena in Nature," by Mr. Shelford Bidwell, published in *Nature* for June 12, contains an important suggestion in regard to the circumstances in which lightning-conductors are or are not efficient. The real value of a lightning-conductor, according to Mr. Bidwell's view, is that it establishes a silent and harmless discharge of electricity as fast as it is generated, in the case where a cloud charged with electricity is hovering over a building. According to this view it would seem that we are to consider that a kind of safe and easy path for electrical discharge is formed. But Mr. Bidwell maintains (and he illustrated the theory by experiments at the original lecture) that if a harmless uncharged cloud received suddenly an overflowing charge of electricity from a distant cloud, there is no certainty that the overflow discharge from it, instantaneously made and without a previous electrical condition of the air, would seek out the lightning-conductor. The electrical path would not have been formed in

that case, and it is hopeless, we are told, to make the lightning-conductor so much the easiest path that all others are protected. This does not in our opinion alter the statistical fact that in the immense majority of cases lightning-conductors are an efficient protection, but it points out a certain state of things in which they will not be, and perhaps accounts for some of the injuries by lightning done to buildings supposed, according to the generally-received theory, to be fully protected.

IN the course of this week were sold by auction, on the premises, all the furniture, fittings, and effects, including the wings, scenery, &c., of the theatre, appertaining to Evans's Club, King-street, Covent-garden. The once favourite resort known as "Evans's" formed part of a hotel, at the north-western corner of the Market-square, of which W. C. Evans, of Covent Garden Theatre, was at one time lessee. He was succeeded here, in 1844, by John, or "Paddy," Green, who carried on the business for nearly thirty years. The large music-room, familiar, doubtless, to some of our older readers, was built in 1856, after the designs of Mr. Finch Hill, on ground which had been the garden of Orford House. It has since been converted into a theatre, with an end and side galleries. We believe it is still a moot point whether "Evans's" or the "Cyper Cellars" is the original of that "Cave of Harmony" wherein, on one memorable evening, Colonel Newcome sang "Wapping Old Stairs" as he had learnt it from Inledon. The lease of the whole premises, held for an unexpired term of five years, at a ground rent of 200*l.* per annum, with an estimated rental value of 2,000*l.* a year, was withdrawn from the sale, as the reserved price was not reached.

ORFORD HOUSE is depicted in Hogarth's (reversed) plate of "Morning," and in Canaletto's large painting of Covent Garden Market, circa 1750. It was built about 1716 for Edward, grandson of Francis, fourth Earl of Bedford, who for his victory over the French fleet under De Tourville off Cape La Hogue, 1692, was created Earl of Orford on May 7, 1697. Its lofty Dutch facade, since altered, was intended to resemble the stern of a man-of-war; and a large quantity of ships' timber was used in the building. The house, constructed of red brick, contains a fine main-staircase and a spacious suite of rooms upon the first-floor. The billiard-room, on the top-floor, is fitted up after the style of "Old London." Lord Orford died, *æt.* 72; his house passed to Lord Archer, and then to James West, P.R.S., the bibliographer. Two years after West's death, in 1772, it was opened as a private family hotel,—the first of its kind in the town,—by David Lowe. Of late years it has been occupied, in succession, by the Savage, Vauxhall, Falstaff, and other clubs. The site of this house alone has many interesting associations. For Lord Orford's mansion took the place of one that had been occupied in turn by such celebrities as Sir William Alexander of Menstrie, the Scots poet and statesman, friend of Henry, Prince of Wales; Tom Killigrew; Denzell, Lord Hollis; Sir Harry Vane, the younger; Sir Kenelm Digby, who, according to Aubrey, had his laboratory there; and Nathaniel, Lord Crewe, Bishop of Durham, at whose door they were wont to lay the parish foundlings.

WE hear that the once-celebrated Tinted Venus, executed at Rome by Gibson, in 1852, for Mr. R. B. Preston, is to be put up to auction at Christie's on the 28th. It was the first piece of sculpture upon which the experiment of colouring has been tried in our time, and was one of the central attractions in the great Exhibition of 1862. The gold decoration was done by Castellani. It is a

* *Travels* Mr. E. Walford, in his "Old and New London."
† Vide a "Note" in the *Builder*, July 7, 1888; sold at Christie's for 210*l.*, on June 30 of that year; from the Wimpole Collection.

beautiful work of its kind, with that superficial beauty of form and modelling which characterised the work of Gibson, who did not however succeed, in this and other examples, in proving the aesthetic superiority or fitness of tinted sculpture. The flesh tones are not, of course, realistic, only a slight warm tint suggestive of flesh tones is put over the nude portions of the figure. Gibson's reputation, in spite of his real ability, is one that has hardly stood the test of time; he was content to be little more than an echo of Greek sculpture, and his works, as far as the ideas and feeling embodied in them are concerned, are out of touch with the spirit of modern art. It will be curious to see what will be the result of the practical test of the auction-room, as to the appreciation in which Gibson's work is now held.

ARCHITECTURE AT THE ROYAL ACADEMY.—VII.

1,868. "Music": Mr. Percy E. H. Bacon. This is a rather large coloured drawing meant as a decorative design, but it looks too much like a modern lady on a drawing-room sofa with a harp, who has fixed a gold nimbus behind her head; the nimbus makes a rather irritating bright spot in the composition. The face is expressive and the whole well executed, but it has none of the idealism which the subject and the nature of the work demand.

1,869. "Northington Church, Hants, interior." Mr. T. G. Jackson. A view of the exterior of this church (also in the Academy collection,) is published in this number; the interior is a small pen-drawing the main object of which is to show the organ-case and the stalls. The former shows a screen with traceried panels below, there is a coved cornice to this, on part of which stands the upper part of the organ front, consisting of three square "towers" of pipes, finished with a group of pinnacles; the towers and the recesses between are decorated with rich tracery work partly concealing the pipes. The effect is very refined and artistic, but there are two practical mistakes here; the front part of the organ alone stands out from the arch, the bulk of it is closeted up far too much; and of the towers the largest is in the centre and the smaller ones at the sides, which is a contradiction of the real internal construction of an organ, in which the larger pipes are placed at each side and the smaller ones in the middle. We have often called attention to this, which is habitually overlooked in organ-case designs.

1,871. "South Chapel, Catholic Apostolic Church, Camberwell": Mr. John Belcher. Remarkable chiefly for the harmonious colour, which however does not easily lend itself to description; but there is some nice detail in the treatment of the mouldings and caps of the arcade.

1,875. "Campanile, Holy Trinity Church, Gosport": Sir A. W. Blomfield. Apparently a brick campanile, very simply treated, with a battered basement story and four stages, the upper one filled with a triplet of round-beaded lights. Some individuality is given to it by the solid circular brick (?) spire which forms the finis.

1,876. "Crozier, silver-gilt, enamelled, and jewelled": Messrs. Saul & North. The colour effect must be taken on credit, as the drawing is only an outline one, but it indicates a true taste in the treatment of metal work. A kind of glory is formed round the outer curve of the staff (a form, by the way, to which some ecclesiastical authorities deny the title of "crozier" at all) by light open work scrolls and leaves of metal, with a novel and rich effect.

1,878. "Cavendish College, Cambridge": Messrs. Giles, Gough, and Trollope. A small drawing of a Gothic building, apparently chapel or hall, with some effective treatment in the window design at the end, but too big to be properly seen.

1,880. "Zenobia, Design for a Mural Painting": Mr. P. H. Newman. There is some very clever work in this, in the separate figures, but the colour effect is too confused and multitudinous for good decorative effect. Zenobia and her children look like a modern lady and her family taking part in a tableau.

1,881. "Adelphi Bank, Castle-street, Liverpool": Mr. W. D. Caröe. Two coloured elevations and a small plan. Apparently a terracotta-faced building, Elizabethan in general

feeling but very freely treated, and with a good deal of richness of detail. The upper windows are mullioned, the ground-story ones left plain to give light to the bank. This is a very good specimen of rich and picturesque street architecture, treated nevertheless in a style not out of keeping with a business building, and an appropriate protest against the prevalent treatment of bank buildings with cold and threadbare Classical details. The bulbous angle spirelet sits rather awkwardly on the roof, though this would not be seen from below in most situations.

1,882. "All Saints' Church, West Dulwich; view of north-east end": G. H. Fellowes Prynne. This is a picturesque building in general design and grouping, but rather hard and bald-looking in detail. A two-storied gallery runs round the east end (the main feature of which is a polygonal apse), an open arcade below, with passage way through the buttresses; a closed gallery with small windows above. A tall square turret, placed obliquely on plan, rises from the junction of nave and chancel on the north side, balanced or contrasted by a tall flèche on the ridge. Below, on the north side of the aisle, a circular stair turret with a conical roof is placed with good effect. The upper windows of the main apse are traceried, as also those of one of the two smaller apses at the east end of the aisle, which is further accentuated with external sculpture. The rest of the windows are plain pointed lights. The building is certainly an unusual and should be rather a striking one; but it very much needs a plan to explain its construction and the reason of the various parts.

1,884. "Harrow School; New Music School": Mr. E. S. Prior. This is an original and very well-executed coloured drawing, but it is vexatious to find so clever an architect as Mr. Prior is, giving his mind to the production of such a very ugly building. Good honest brick-work, no doubt, (as Cobbett is made to say of Drury Lane Theatre in "Rejected Addresses"), but where does the architecture come in? The open arches in the basement, just down on the ground level, produce the effect of the building having been partially covered by accumulations on the site, and requiring excavation. It is not commonplace, but its originality seems to consist in its extreme ugliness, combined no doubt with the artistic execution of the drawing. From the plan we see that the building consists of a central hall with an orchestra, surrounded by side blocks (on the other side of the corridors) containing small practising-rooms. These have corners canted off and circular lines introduced in the blocks thus left between—looking as if they were to carry off superfluous sound, but in reality we presume for warming.

1,885. "New Organ Case, Paignton Parish Church": Mr. A. Mardon Mowbray. Unless the scale is deceptive, this seems to be a large example of the Parish Church organ; we presume the large metal pipes to right and left belong to a 16 ft. metal pedal diapason; the two largest are marked out for a little special decoration—a new idea. The architect has here rightly treated the design with the larger pipes at the side; the pipes introduced in the front are very multitudinous; if all speaking pipes, rather too much so for the benefit of the instrument, musically speaking; it is not well to displace so many pipes from their proper position on the sound board. The design, treated with a good deal of carved woodwork, has a rich effect, though the eye does not feel quite satisfied with the stepped skyline (so to speak) of the facade.

1,892. "Hotel, Scheveningen": Mr. T. W. Aldwinckle. This is a praiseworthy attempt to give something of picturesque and architectural effect to a hotel, without losing hotel character, or what is supposed to be so. The upper portion of the gabled front is treated with that kind of profusion of colonnettes and pilasters so common in Dutch Renaissance buildings, and there is a large octagonal campanile, with open stages at the top, the ground floor of which forms the entrance-hall apparently; but there is no plan. The series of verandah hanging roofs on various stories, no doubt necessary to the comfort of a hotel in hot weather, form a feature which unfortunately militates very much against architectural character, and would give to the best building a kind of Chinese pagoda character.

1,894. "Reid's New Hotel, Madeira": Mr. Somers Clarke. This is a large and effective sepia drawing, showing the hotel white and bright in the sunlight, on a rocky cliff, with gardens in front and a range of hills behind.

The hotel consists of two main blocks placed at right angles, forming two sides of a square, each block terminated by an oblong tower with a lower range of buildings between butting against the sides of the tower. The adjacent towers of the two blocks are connected by a lower building forming part of an octagon on plan, the upper story of which is an open one, with the roof carried on posts. There is little pretence of architectural treatment in a decorative sense, but the whole is picturesquely grouped and looks like what it is, a hotel for a warm climate.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The final meeting of this Institute for the present session took place on Monday evening last, Mr. Alfred Waterhouse, R.A., President, in the chair.

Mr. W. H. White (Secretary) announced a long list of donations to the library, and votes of thanks were passed to the several givers.

Election of New Members.

A ballot was then taken, when the following gentlemen were elected as *Fellows* of the Institute, viz., Messrs. Frederick William Tarring, New Southgate; Edward William Monning (Associate), London; Stockdale Harrison (Associate), Leicester; Christopher Harston, London; Nathan Solomon Joseph, London; John Salmon Quillor (Associate), London; William Henry Spaul, Gwestry; Philip Henry Tree (Associate), St. Leonards-on-Sea; Edward Henry Bruton (Associate), Cardiff; James Neale, F.S.A. (Associate), London; Walter Augustus Hills, London; William Henry Thorp (Associate), Leeds; Leslie Over, Dundee; William Douglas Caröe, M.A., Gantab, London; Leonard Aloysius Scott Stokes (Associate), London; Robert William Collier (Associate), London; Frederick Atkinson Powell (Associate), London; and Stephen Shaw, Kendal.

The following gentlemen were next elected as *Associates* upon a show of hands, viz., Messrs. Herbert William Doe, London; Frederick Moore Simpson, London; Samuel Edward Wall, London; Herbert Stone Wood, Beckenham; Bastick William Nunn, Brighton; Thomas Edgar Eccles, Liverpool; William John Mettam, Leeds; William Eaton, Leicester; Eustace Corrie Frere, London; Richard Thomas Beckett, Hartford, Cheshire; Robert Stodart Lorimer, Edinburgh; Henry Harold Hughes, Ealing; James Sivewright Gibson, London; George Harvey, London; Samuel Bridgman Russell, London; Alfred Eustace Habershon, St. Leonards-on-Sea; William Braine Goodwin, London; Henry Leonard Hill, London; Alfred Henry Hart, London; Arthur Edward Ascombe, Harpenden; Edward Carter, Sarpton; Arthur Harry Heron, Usbridge; and Harold Arthur Woodington, London.

The following were elected as *Honorary Associates*,—viz., Mr. Alexander Stuart Murray, LL.D., F.S.A., Keeper of the Greek and Roman Antiquities, British Museum; and the Right Hon. Lord Savile, G.C.B. *As Hon. Corr. Member*, Professor Johannes Otzen, Berlin.

Alliance with a Provincial Society.

The President: I have great pleasure in announcing that the Council have at their meeting to-day resolved to recommend to the general body that the Leeds and Yorkshire Architectural Society be admitted to alliance with the Royal Institute, under the provisions of by-laws 77 and 81.

Presentation of the Royal Gold Medal.

The President: Gentlemen and colleagues, before proceeding to the most pleasing duty which falls to the lot of your President in the course of his year of office, that of presenting, in the Queen's name, her most gracious Majesty's annual gift to some architect, or man of science of any country, who has produced a work tending to promote the knowledge of architecture, it may be interesting to this meeting if I remind you that, of the forty-two gold medals already awarded, twenty have been given to fellow-countrymen whose greatest claim to distinction was their success as practising architects, while seven other medals were awarded to Englishmen whose claims were rather that as authors or archaeologists they had done something noteworthy for the advancement of our art. Of the fifteen foreigners

who have received this honour, more than half the number have been so distinguished by us for their achievements as architects,—for their buildings rather than for their books. Now, I trust that the choice of the Institute having fallen in twenty-eight cases out of forty-two, or on two-thirds of the total number, on practising architects, may be looked upon as a matter for congratulation, and as a sign of architectural vitality during Her Majesty's reign. When the medal was first instituted there were giants in the land. Cockrell and Sir Charles Barry were the first two English recipients. Such men seem now hardly of ourselves, their achievements were so splendid, so numerous, so varied. Still, we must not forget that it is easier to see the excellences of those who have passed from us, than of those who are with us still. There are now a greater number than ever before of men of capacity, merit, and sterling character, who are doing their best, by their lives and practice, to uphold the status of the profession, and make it appreciated by the world, though their opportunities for distinction may not be so great as those of their predecessors half a century ago, and though there may be many more to share such opportunities as present themselves. Now, I think prominently among those stands the colleague whom we have chosen to honour, by recommending him to Her Majesty as the recipient of her gold medal this year. Mr. John Gibson entered the office of Sir Charles Barry, then in Foley-place, as his articled pupil, in the year 1835. In the following year, when the first premium in the great competition for the New Palace of Westminster was awarded to his master, he had the enviable distinction of being his only pupil. He was soon joined, however, by a host of others,—George Villiam, W. H. Brakspear, James Murray, and George Somers Clarke amongst the number. After serving a three years' term of pupillage, he remained his master's assistant for six years, and must have been more or less engaged on such works at Tretham Hall, University College, Oxford, Harewood House, Duncombe Park, the Board of Trade, Whitehall, and above all the Houses of Parliament, which were then occupying the attention of Sir Charles Barry, at 32, Great George-street, whither he removed to be near his great work, on the details of which, I believe, Mr. Gibson was largely employed. Sir Charles had a high appreciation of his pupil's talent and character, and in course of time they became dear friends, and friendship which Mr. Gibson highly prized, and which continued to the last. Commencing practice therefore in 1844, after so excellent a training, Mr. Gibson appears to have entered at once on his most successful career. Among his earlier works I may enumerate the National Bank of Scotland, Glasgow, the Imperial Fire and Life Office, Threadneedle-street, and the well-known and characteristic twin-spired Romanesque chapel in Bloomsbury, erected in 1847. He appears to have carried out many works in Warwickshire about this time—Compton Verney for Lord Willoughby de Broke, Wroxton Abbey for Colonel North, Charlotte Park for Mrs. Lucy, Guy's Cliffe, and several churches. He built his ecclesiastical *chef d'œuvre*, Bodelwyddan Church, for Lady Willoughby de Broke. Plas Power, near Deubigh (1858), is a clever re-clothing of a once commonplace-looking house. The Todmorden Fielden family have availed themselves largely of Mr. Gibson's skill—Mr. Joshua Fielden at Nutfeld Priory; Mr. John Fielden at Dobroyd Castle; Mr. Samuel Fielden, at Central Hall, both near Todmorden, where also he built the Town Hall and Unitarian Church, both for the same family. But by far to me the most remarkable of Mr. Gibson's professional connections is that with the National Provincial Bank of England. This great company apparently employed nobody but Mr. Gibson as its architect as long as he remained in practice. He built for them, not only the very striking and original head office in Threadneedle-street, and the branch banks in Piccadilly, but upwards of forty branches, some of them, as at Birmingham, of great merit and importance. It is worth while to note again in London Childs' Bank, and the house of the Society for the Propagation of Christian Knowledge, the first building erected in Northumberland-avenue, where its fine proportions are now seen to a disadvantage from the height to which its neighbours have risen. Time will not allow of my giving you

at greater length a catalogue of Mr. Gibson's achievements. In fact, so modest is he, in speaking of his works, that I have had some difficulty in getting to know what they have been. I shall ask the Editor of our *Journal of Proceedings* to give us correct a list of them as possible.* When you come to look over that list you will, I think, deduce from it the inference that Mr. Gibson's clients were all very fond of him. When they had once discovered him, they found him a treasure. They stuck to him and never dreamt of looking about to see if any one else could be found to take his place. One who knew him most intimately says of him—"He was on the most excellent terms with all his clients, and was always held in the highest esteem, not only by them, but by the whole of his staff, and by those employed in executing his work." Gentlemen, what can any of us wish to have said of ourselves more than those words convey in Mr. Gibson's case?

Addressing Mr. Gibson, and handing him the medal, the President said:—Mr. Gibson, I have now the greatest possible pleasure in handing you this, the highest distinction which it is in the power of the Institute to confer, and which is presented to you with her Most Gracious Majesty's expressed approval.

Mr. Charles Barry said that, as the representative of his late father, he might perhaps be permitted to congratulate Mr. Gibson on the receipt of the honour which had just been conferred upon him. Mr. Gibson had several old friends in the room, but he ventured to doubt if he had any older friend than himself (Mr. Barry), as their friendship dated back more than fifty years, from the time when he (the speaker) was a schoolboy. In the quiet and unostentatious life which Mr. Gibson had led, he had been an ardent and zealous worker, imbued with the most genuine artistic feeling, as well as with great powers, constructively and otherwise. All his works were distinguished by a plain solidity and a refinement of feeling, combining excellent proportions and purity of detail, without straining after those ruinous fantasies which nowadays seemed to be so attractive to the public. Any one who had passed a long life of practice in that way was of peculiar use, as a protest against the opinion that anything but careful study and attention to proportion, purity, and simplicity of style, represented the goal to which an architect should press, and by which he would be most creditably known in all future time. The President had really expended the subject in the anxious care which he had taken to ascertain the various credentials of Mr. Gibson's architectural work for the honour which had been conferred upon him. He would, therefore, conclude by congratulating the Institute on having made such a choice. He could only have wished that it had been conferred upon Mr. Gibson years ago, for he deserved it then as much as he did now.

Mr. Jobu Gibson, in replying, said:—Mr. President and gentlemen, there is no position more difficult to me than that of replying to a compliment, especially when that compliment has been paid and conveyed in such eloquent and eulogistic words. I therefore, from late severe illness and present emotion, must make a very short speech in thanking you for the honour you have done me in making me the recipient of the only gift, I may say, of great eminence, which it is in the power of the Institute to bestow. I beg you will kindly excuse the shortness of my reply, and accept my grateful thanks for the honour which you have conferred on me, an honour which I never expected, and one which, coming from her Most Gracious Majesty the Queen, at your voluntary recommendation, I shall ever look upon as one of my most precious treasures. I thank you collectively and individually for your kindness.

* The following is a list of Mr. Gibson's works which have been published in the *Builder*:—Bloomsbury Baptist Chapel, volume for 1848, page 186; Imperial Insurance Office, Threadneedle-street, volume for same year, p. 238; Bodelwyddan Church, near St. Asaph, volume for 1860, p. 637; National Provincial Bank of England, Threadneedle-street, 1865, pp. 885, 908; Dobroyd Castle, Todmorden, 1869, 947; National Provincial Bank of England, Newcastle, 1873, p. 966; Nutfeld Priory, Surrey, 1874, p. 53; National Provincial Bank of England, Middleborough, 1874, p. 155; Todmorden Town Hall, 1875, pp. 306, 324; Saloon and Staircase, Dobroyd Castle, Todmorden, 1875, p. 953; National Provincial Bank of England, London-lease, 1877, p. 61; Chisney Piece, Nutfeld Priory, 1878, p. 1146; Building for the Society for Promoting Christian Knowledge, Northumberland-avenue, 1879, p. 1153; National Provincial Bank of England, Sunderland, 1879, p. 1379; and Childs' Banking House, Fleet-street, Nov. 27, 1880, p. 646.

Professor Aitchison said he had had the honour of knowing Mr. Gibson for a great many years, and could reiterate all that had been said as to his amiability and kindness. As Mr. Barry had already mentioned, what struck him about Mr. Gibson's works was their extremely noble proportions, which, he was sorry to say, were not so commonly met with in the present day as one would wish. They might all therefore consider that her Majesty had been well advised in giving encouragement to those grand proportions which distinguished architecture so greatly. Mr. Gibson had handed down those proportions, which, coming from the Greeks and the Romans, were transmitted through Palladio and the great masters to the father of Mr. Barry.

The President: I am particularly pleased that my remarks have been supplemented by the words of Mr. Barry and Professor Aitchison. I most thoroughly agree with every word they have uttered as to the beauties of refinement and proportion which have distinguished our present Gold Medalist's work, and the valuable lessons they inculcate to us. We may now bid each other affectionately farewell at the close of this session. I cannot allow it to close without thanking you, from the chair, for the assiduous way in which very many of you have attended the meetings of the session, and I hope next session we shall have even a better attendance than we have had this.

The proceedings then terminated.

THE ARCHITECTURAL ASSOCIATION.

THE last ordinary meeting of the Association, adjourned from May 16, was resumed on Friday last, June 13, when the alterations of the rules drawn up by the Committee in order to carry out the instructions given them by the special business meeting of May 30, to carry into effect the various resolutions dealing with the report of the Special Education Committee, were proposed; in addition, a further alteration of Rule 43 was proposed in writing by several members: "After show of hands,"

"But no question touching any alteration of the rules or constitution of the Architectural Association shall be decided upon at any meeting without first submitting such proposed alterations to the whole of the members, and furnishing each member with a printed voting paper; the decision of the majority so voting shall be considered final."

Rule 43 will then read as follows:—

"All voting shall be taken by show of hands, but no question touching any alteration of the Rules or Constitution of the Architectural Association shall be decided upon at any meeting without first submitting such proposed alterations to the whole of the members, and furnishing each member with a printed voting paper; the decision of the majority so voting shall be considered final."

The ordinary meeting was then terminated, and the special business meeting called for that evening commenced, when the minutes of the last special business meeting were read and confirmed. Mr. J. Douglass Mathews then proposed that the alteration of Rule 43 should be considered prior to the alterations proposed by the Committee. This was seconded by Mr. Stannus, and a long discussion ensued, in which Messrs. H. Sirr, A. W. Earle, A. Needham Wilson, W. J. Leverton, A. Beresford Pite, Frederic R. Farrow, Owen Fleming, H. O. Crosswell, Percy Hunter, and F. H. Collins, took part.

The proposition being put was carried by 28 votes to 26. Mr. Collard then proposed that the special business meeting be adjourned for a fortnight. This was seconded by Mr. Earle. Mr. Stannus proposed as an amendment that the alteration of Rule 43 be considered that day week, and the remainder of the proposed alterations adjourned till next session. Mr. Max Clarke proposed a further amendment that the special business meeting be adjourned for one week. After some discussion, Mr. Collard's proposition was withdrawn, and Mr. Stannus's amendment was put and lost by 43 votes to 30. Mr. Max Clarke's proposition was then put and carried by a large majority, and the President accordingly declared the meeting adjourned until Friday, June 20, at 7 p.m. It is to be hoped that there will be at the adjourned meeting a larger attendance than was present last Friday; many members evidently considered that the business of last Friday would be merely formal, but it is evident that there is a small but active opposition who are determined to leave no means untried to upset the proposed extension of the educational methods of the Association, and it is therefore incumbent

upon all who wish to see the new scheme carried into effect to attend and support the Committee, and especially to notice the alteration of the hour to the earlier time of 7 p.m.

SURREY ARCHEOLOGICAL SOCIETY.

A VERY successful afternoon meeting of this Society was held at Wimbledon on Saturday afternoon last.

Meeting at the parish church (St. Mary's) at three o'clock, an interesting paper on the fabric and its history was read by one of the Hon. Secs., Mr. Mill Stephenson. The greater part of the church is modern, it having been rebuilt in 1843 (in succession to a curious "Classical" structure built at the end of last century) by the late Sir Gilbert Scott, then a partner in the firm of Scott & Moffatt.

The visitors then walked across Wimbledon Common to inspect what remains of the remarkable circular earthwork, long (and still) erroneously called "Caesar's Camp" or "the Roman Camp." Here Mr. Ralph Nevill read a paper, in which he said he gave in short compass the little that was known and had been said about the place, together with such considerations as had suggested themselves to him. All that had been previously written about the Camp was well brought together by Mr. Tregellas, in a paper published in 1866 in the *Archeological Journal*. The Battle of Wimbledon, the first fight between Saxon and Saxon, had been very ably treated in an article on the "West Saxon Conquest of Surrey," by Mr. Henry Elliot Malden, published in the *English Historical Review* for 1886. Although later Roman camps were of more various formation than was sometimes imagined, it might be taken for certain that this was not Roman, since at the only time that a Roman camp could have been required in that district, viz., at the time of one of the two first invasions, the form would certainly have been the orthodox rectangular. There was nothing in the contents found in the barrows that once existed, and that were examined by Douglas in 1786, to determine the date of their formation. Mr. Nevill thought that it might safely be concluded from its regular shape (almost a true circle) that the place was made as a war-camp, and was not one of those entrenched towns that were with certainty referred to a British date. He was strongly inclined to think that it was of Saxon or Danish date.

Sir James Ramsay, in some remarks which followed, said that the remains were unquestionably British. In this he was supported by Mr. George Lambert, F.S.A. After a vote of thanks had been given to Mr. Nevill, on the motion of the President, Viscount Middleton (who deplored the havoc that had been made with the remains during the last twenty years), the visitors walked back over the Common and proceeded to—

Eagle House, now the residence of Mr. T. G. Jackson, the eminent architect. Mr. Jackson received the visitors in his library, the largest room in the house, and read to them an interesting and pleasantly-written paper. The interest attaching to the house, independently of such architectural character as it still retains, arises from the fact that it is a well-preserved example of the private residence of a London merchant of the reign of James I. The house was built early in that reign by one Robert Bell, citizen and Girdler, and subsequently deputy-alderman of the Ward of Lime-street, where he carried on business as a merchant. His father and his grandfather, both Robert Bells, had lived at Wimbledon before him, as appears by the Herald's Visitation of 1633-34, where his arms are recorded—*azure an eagle displayed argent below three fleurs de lys or*. Mr. Jackson has not been able to discover the exact date of the building of the present house. The first mention of it occurs, according to Manning and Bray's "History of Surrey," in the Survey of the Manor in the year 1607. It is there spoken of as "a fair new house." But by the kindness of Mr. Plaskett, the present Steward of the Manor, Mr. Jackson has been able to see this survey, and finds that the date is not 1607, but 1617. All, therefore, that can be said with certainty of the date of the house is that it was standing in 1617. From other evidence Mr. Jackson believes that it was built before 1613. The description given by Manning and Bray of the heraldry still holds good. The arms mentioned by them are still

on the ceiling of the large room on the first floor, now used as a library, one of the coats being that of Robert Bell. The initials which Manning and Bray saw on the front of the house in several places disappeared under the coat of stucco with which a subsequent owner covered the handsome red brick and ashlar of the outside walls; but when the back of the house was partly restored in 1887, the stucco was removed from the two lower stories and exposed some little square stones, spaced at regular intervals, in the frieze of the entablature that marks the second-floor level; and on two of these may still be seen, though much defaced by the plasterers (who hacked the stone to obtain key for their stucco work), the ciphers of Robert Bell and Alice his wife. The excellence of Robert Bell's building is testified by its perfect condition at the present day. The walls are of solid brickwork, those outside varying from 2 ft. 3 in. thick in the basement, to 18 in. in the attics, while the two party-walls that divide it from front to back, and contain the flues and chimney-stacks, average 3 ft. in thickness. There are three gables to the front, the middle one slightly in advance, with an oriel window over the entrance, and in the two side spaces each a bay-window from the ground to the second floor. The back is similar, except that the middle bay-window runs up from the ground instead of being cut short as an oriel, and that the middle space recedes instead of projecting. The sides of the house have each two gables, making in all ten gables, of the picturesquely-broken profile characteristic of Jacobean architecture. The quoins and the lower windows are of Caen stone, but all the mullions, window-frames, and transoms of the upper stories are of oak, inserted in brick reveals, with a simple moulding worked in the brickwork round the opening. The allowance of windows was so liberal that it is no wonder that many of them have been closed with lath and plaster, and however much one may have wished to re-open them as part of the original design, it would have been very difficult, had one done so, to find places for the furniture. The architect was not less liberal in the matter of height from floor to floor, for instead of the usual low-pitched rooms of Jacobean houses, he has provided rooms of 12 ft. and 13 ft. high. The house was evidently handsomely finished within; as late as 1763 it appeared by an old inventory that the principal rooms were wainscotted, and had high chimney-pieces up to the ceiling. Although this has all but disappeared, we have left four rather remarkable plaster ceilings, which date from the building of the house, and are still perfectly preserved. They are unusually good specimens of this kind of work, both as regards design and execution. The finest is that in the large room, now used as a library, which measures nearly 31 ft. by 20 ft. The plan of the original house was extremely simple. On each of the three lower floors there was one large room in the middle from front to back, with light at each end, and rooms and a staircase on both sides of it. The back or secondary staircase is still the original one, constructed with framing of great oak beams in post and pan work, like the staircases in an Oxford college, and with treads of elm. The best staircase, on the other side, has, unfortunately, disappeared, and been replaced by an inferior one of deal, dating from the last century, when the block of building containing the present dining-room was added, and one of the bay-windows had to be removed and the staircase altered to make way for it. In concluding his paper, Mr. Jackson very pleasantly described the history of the house since the time of Robert Bell. In 1787 we find the Right Hon. William Grenville, the relative and colleague of Pitt, living here. Grenville probably left the house in 1789, on his election to the Speakership. From his time until the house came into the possession of Mr. Jackson, about four years ago, the house was used as a school. At one time it was called "Nelson House School," from the fact that Nelson and Lady Hamilton once visited it and heard the boys recite their pieces. The school was afterwards kept by a Mr. Stoughton, then by Messrs. Stoughton & Mayer, Messrs. Mayer & Brackenbury, and finally by Dr. Huntingford. It is to Dr. Huntingford that it owes its present name; he had previously had a school at Eagle House, Hammersmith, and when he brought it to Wimbledon, he brought with it not only the name but the eagle which now surmounts the middle gable of the front.

A vote of thanks was accorded to Mr. Jackson for his interesting paper.

THE FRENCH ARCHEOLOGICAL SOCIETY.

THE annual meeting of the Société Française d'Archéologie commenced on the 17th inst., under the presidency of Count de Marsy, Director of the Society. It is held this year at Brive, a small town in the Department of Corrèze, about two-thirds of the distance from Paris to Toulouse. On Monday next the Archaeologists will move their headquarters to the neighbouring little town of Tulle.

At 1.30 p.m. on the opening day the President and members were received by the Maire of Brive, and by the President of the Société Scientifique et Archéologique de la Corrèze, at the Hôtel de Ville, and after the usual expressions of welcome from the Maire had been duly responded to, the Count de Marsy, as President, read his usual address. This consisted almost entirely of a review of the archaeological work done in France during the past year, chiefly by members of the society, and of a comparison of the state of the science in the present day and at the time of the foundation of the Société Archéologique by the late M. de Caumont.

This was followed by a paper on the authorities for the history and archaeology of the district, after which the members and their friends inspected the church and other antiquities of the town, under the guidance of the Presidents of the two societies. Among the archaeologists present besides the Count de Marsy, were the Count A. de Dion, Baron de Loë, of Brussels; M. M. E. Travers, of Caen; Cathailac, of Toulouse; L. Germain, Francart; the Rev. S. S. Lewis, of Cambridge, and many others.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday afternoon at Spring-gardens, Lord Rosbery in the chair.

New Standing Orders as to Tenders.—The Standing Committee reported as follows:—"The Council on the 3rd inst. had before it a report by the Parks Commission, stating that, in consequence of the long interval between the date of a certain tender and its final acceptance by the Council, the person who had sent in the tender was not prepared to adhere to it, and had asked for an additional payment. This has led the Deputy-Chairman to suggest for consideration an amendment of the standing orders relating to tenders so as to obviate unnecessary delays. The proposed alterations appear to us desirable, and we recommend—

"That the Standing Orders of the Council in relation to tenders be as follows:—

All tenders where the estimated expenditure exceeds 500*l.* shall be opened in the Council by the Chairman, and be immediately referred without discussion to the Committee which they concern. In such cases the Solicitor shall at once, and without waiting for the meeting of the Committee to which the tenders are referred, make such inquiries (if any) as he may consider necessary as to the competence of the lowest tenderer, and, if the information obtained do not appear satisfactory, then into the competence of the next lowest, and so on until a satisfactory result shall have been obtained, reporting the result to the Committee as early as possible.

Where the estimated expenditure is below 500*l.*, tenders may be opened by a Committee, and shall then be reported to the Council. The Committee shall, however, as soon as the tenders are opened, instruct the Solicitor to make such inquiries as the Committee may consider necessary.

When a contract has been executed by the contractor, it shall be submitted for sealing at the next meeting of the Council, without being again brought before the Committee."

These recommendations were agreed to *non. dis.*

City Improvements.—The Improvements Committee brought up an adjourned report stating that the Committee had had under consideration an application from the City Commissioners of Sewers for a contribution towards the cost of improvements in the following thoroughfares, viz.:—(1) Threadneedle-street; (2) Upper Thames-street; (3) Pauls-chain and Godman-street; (4) Houndsditch and Abchurch-lane; (5) Warwick-lane; (6) New Broad-street; (7) Minories. The Committee recommended that the Council should contribute 3,547*l.* (one-third of the total estimated cost) towards No. 1; 2,500*l.* (one-third of the cost) towards No. 3; and 1,837*l.* 6*s.* 8*d.* (one-third of the cost) towards No. 6. With regard to improvements Nos. 2, 4, 5, and 7, the Committee recommended that the Commis-

sioners be informed that the Council is not prepared to contribute towards their cost, and these recommendations were agreed to at once. On recommendations 1, 3, and 6, however, which were taken separately, long discussions arose. Eventually No. 1 was rejected on a division by 51 votes against to 36 for; No. 3 was negatived without a division; and No. 6 was rejected on a division by 48 votes against to 42 votes for.

District Surveyors and their Tenure of Office.—The first portion of the report of the Building Act Committee was as follows:—

"Your Committee present a report upon the following references:—

'A. As to a reform of the system hitherto followed in the appointment of District Surveyors in the Metropolitan, with the view of arranging that the duties hitherto discharged by the District Surveyors shall be performed by a department of this Council, and that all fees received in connexion with such duties shall be paid direct to the Council.

B. Whether all District Surveyors to be appointed by the Council should not be appointed at a fixed salary instead of by fees and on condition that they shall devote their whole time to the office, and not engage in private practice, also whether all fees payable in respect of their office should not be paid into the County Council Account.

Speaking generally, very grave and extended dissatisfaction exists in the public mind as to the present system. An impression prevails that the office as now constituted is frequently sought, not only for the emoluments belonging to it, but for the advantageous position in which it places an architect to secure other professional work, and it would, in the opinion of your Committee, be desirable to bring the District Surveyors into closer touch with the Council.

The conditions of appointment in force since June, 1886, the Council is doubtless aware, prohibit a District Surveyor from practising in his own district, but it is competent for him to nominate another architect for such work, and thus this restriction may be rendered, to a certain extent, a fiction.

Before considering the references A and B, we sought the opinion of the District Surveyors' Association, the Royal Institute of British Architects, the Architectural Association, the Surveyors' Institute, and the Institute of Builders, upon the changes contemplated by these references. With the exception of the Architectural Association, which was unwilling to express a definite opinion as to debarring District Surveyors from private practice, all unite in the desire that no change should be made in the present system, but numerous alterations of the law in other directions are suggested.

In considering reference A, your Committee was at a very early stage of its investigation, impressed with the opinion that putting on one side the delay consequent upon any attempt at an alteration of the law, the duties devolving upon District Surveyors are not likely to be efficiently carried out by a 'Department of the Council.' London is, in fact, too large to administer this detail work from one centre. In practice, a great many cases would, in our opinion, remain unreported under such a plan. Not only would this cause considerable decrease in the fees received, but what is more important, the system would fail to secure, in the public interest, more efficient administration of the Building Acts.

In considering reference B, a joint report was presented by the Solicitor and the Superintendent Architect, upon the power of the Council with regard to paying District Surveyors by salary instead of by fees. In their report, sections 65 and 66 of the Act of 1855 are quoted, by which the Council is enabled to pay a salary to any District Surveyor, instead of fees, provided the amount of such salary be not less than the amount of the average fees for the previous three years, and in such case the fees would be payable by the District Surveyor to the Superintendent Architect, who would account for and pay them to the Council, and your Committee is advised that those conditions apply to old as well as new appointments.

If the plan were adopted of paying District Surveyors a fixed salary based upon the average fees for the previous three years (and this, it appears from the Act, must be the basis for such payment), we think that injustice might be done to a District Surveyor in whose district building operations were increasing, because, although extra work would devolve upon him, the Council would be receiving the increased fees. The system would be equally unsatisfactory in the case of a District where the

fees might fall either from diminished building operations, or from a cause which may be suggested, viz., that a salaried District Surveyor might not be so anxious to recover the fees as at present.

We have carefully considered this matter, and are of opinion that the Council should continue the payment of District Surveyors by fees as at present, but, having in view the public advantage likely to result from a more systematic and personal inspection of buildings by District Surveyors than it is evident exists generally at the present time, recommend that they be appointed on the condition that they devote their whole time to the duties of their office.

Since the references to the Committee upon this subject, two vacancies have occurred: one in South St. Marylebone, caused by the death of Mr. J. Jennings, and one in East Islington, by the death of Mr. John Turner, so that the Council has now two vacancies to fill.

Your Committee submit the following recommendations to the Council:—

1. That no person shall be accepted as a candidate for the appointment of District Surveyor unless he shall have attained twenty-eight years of age, and be under fifty years of age, and that every such candidate shall deliver with his application satisfactory evidence of his age.

2. That every candidate shall be required to sign a declaration and deliver it with his application that he becomes a candidate, and will accept the appointment if he should be appointed on the following understanding:—(a) That he will personally discharge the duties of his office subject to section 35 of the Metropolitan Building Act, 1855. (b) That he will give his whole time to the duties of his office. (c) That he will not during his continuance in office (except in the discharge of the duties thereof) carry on business as an architect, surveyor, or builder, or directly or indirectly as a partner or otherwise be interested in such business. (d) That he will furnish the Council with information of those cases in his district in which the orders of the Council or the requirements of the Metropolitan Local Management Acts with regard to the width of streets, or to any building, structure, or erection, or projection therein beyond the general line of buildings are not complied with. (e) That he will make no claim for compensation in case a diminution of his income shall at any time hereafter arise. (f) That he will keep his District Office open from Monday to Friday (both inclusive) between the hours of 9.30 a.m. and 5 p.m., and on Saturday from 9.30 a.m. until 2 p.m., and give his personal attendance there daily from 9.30 a.m. to 11 a.m., and (except Saturday) from 4 to 5 p.m. (g) That he will retire if required to do so on attaining the age of sixty-five, or at any date subsequent to his attaining that age.

3. That the aforesaid declaration of the appointed candidate shall on his appointment be entered on the Council's minutes.

4. That the fees to be re-arranged by the Building Act Committee as opportunities may occur, so that the average of the fees received may in no case amount to less than 500s. per annum.

The Council reserves to itself the exercise of its powers of dismissal, if the District Surveyor so appointed should not act consistently with the understanding above set forth in any of the matters referred to therein, or for other sufficient reason."

Owing to the lateness of the hour when this report was reached, its consideration was postponed, and the Council, after transacting other business, adjourned.

THE ROYAL MILITARY EXHIBITION.

This Exhibition, now being held in temporary buildings erected on the grounds of Chelsea Hospital and Gordon House, in aid of the funds of Church of England Soldiers' Institutes, is one of some magnitude. It is, for the most part, housed in corrugated iron buildings, forming an irregular quadrangle enclosing the gardens of Gordon House, several annexes having been built partially around the open space known as the "Arena," which forms part of the grounds of Chelsea Hospital, and is used for various displays of a military or semi-military character. The main entrance is from the Chelsea Embankment. The Tite-street entrance is described in the catalogue as a reproduction on a small scale of the well-known double gateway at Malta. The grounds of the Exhibition buildings cover 7½ acres, 3½ acres being the garden of Gordon House (which has been laid out by Mr. Dick Radclyffe), and 4 acres forming part of the park of Chelsea Hospital, so that there is abundant space for *al fresco* delights. The grounds are illuminated at night by electric light and by coloured lamps. The roofs of the Exhibition buildings cover a space of 120,000 superficial feet.

The Exhibition is divided into three main sections, "Military Industrial," "Commercial," and "Loan." The first-named section is a very comprehensive one, and includes numerous exhibits of interest by the War Office from Woolwich Arsenal, the Ordnance Office, Dublin, the Tower of London, and the Ordnance

Factory. The Honourable Artillery Company, the Brigade of Guards, the Royal Artillery, the Royal Engineers the Life Guards, and many of the "territorial regiments" of the British Army, send collections of exhibits, varying from patchwork quilts to portraits in oils. Of course military clothing and accoutrements, past and present, and weapons old and new, are very largely represented in this section.

One of the objects of the Exhibition has evidently been to encourage our soldiers to devote some of their spare time to industrial pursuits. The results of their spare hours of labour are, it must be confessed, very unequal in quality. The best things are of course produced by the men who have been brought up to some trade, and who are wise enough to content themselves with sticking each man to his own *métier*. The industrial products of the soldier's leisure, when he is without the knowledge of a trade, or when he seeks to go outside of his own trade, are often just as unsatisfactory as those of his civilian brother who labours under the same conditions. Nevertheless, there is a great deal of very creditable work by soldiers in the Exhibition, the best display, on the whole, being, as might be expected, that made by the Royal Engineers, every man in that corps having a knowledge of some trade or other. In addition to their industrial exhibits, properly so-called, the Royal Engineers exhibit models of many temporary structures which they are called upon to build in time of war, such as bridges. Many of these are simple and rough-and-ready in construction, though quite adequate for their purpose. From some of these models many a carpenter and scaffolder in the building trade might derive useful hints.

We can only notice a few of the exhibits in detail. Colour-Sergeant-Major Armitage, R.E., No. 2,515 in the catalogue, exhibits an improved metallic lashing for spar bridges (equally applicable to scaffolding for building purposes), and a very ingenious shifting spanner, which consists of two parts, a shank or handle, and a head. The handle is forked to receive the head, which works on a pivot, allowing it to revolve through half a circle. The head can be adjusted by means of a pawl which engages in slots provided in the back part of the head. The head can be removed, and heads of different sizes put in, by taking out a screw-pin. The advantages of this form of spanner are very considerable, for it can be used in cramped places, is portable, and has great strength in the jaws. Colonel Fraser, C.M.G., 2,552 in the catalogue, shows some improvised glass drinking-vessels, &c., made from common glass bottles. The bottles are cut down evenly and smoothly by the following expedient:—A piece of string is passed rapidly to and fro round the bottle for a minute or two; the friction caused by the string makes the glass of the bottle warm on the line where the cut is wanted, and by immediately dipping the bottle into cold water far enough to cover this line the desired cleavage is cleanly effected, and the sharp edges of the improvised drinking-vessels are ground down by rubbing them on stone. No. 2,670 in the catalogue refers to an exhibit in the shape of a wrought-iron gate made by the "blacksmith boys" of the Royal Engineers, under the instruction of Sergeant H. Romain. Although it is a rather crude piece of work, it gives promise of better things. Various other specimens of workmanship, including plumbing, are shown by the members of this corps. The mention of plumbing work reminds us we may say that the Exhibition includes a great deal bearing upon the hygiene of the soldier, both in barracks and under canvas. But we must take exception to the name bestowed upon one exhibit, which is described as "a model hospital ward." It is true that in size it is a model, but it is by no means a model for imitation. The exhibitor, Mr. H. Mark, if his model as we saw it correctly represents his ideas, offends against some of the cardinal rules now insisted upon in all good hospital-ward plans. In the model referred to, the beds are crowded together, some immediately under the windows, and others half-way under the windows, and others on one side. While speaking of hospitals, we may mention the "Ambulance Gallery," facing the Arena, where, amidst painted scenery and realistic mounting by Mr. Rowland Ward, we may gain some idea of the horrors of war from the full-sized models of wounded men being

tended by surgeons and members of the Army Hospital Corps.

There is a large "historic loan collection," consisting of arms, armour, accoutrements, trophies of battle, and pictures, including portraits of military celebrities by Kneller, Reynolds, Romney, Sir Thos. Lawrence, and other masters. Some of these portraits, we see, are lent by the Trustees of the National Portrait Gallery. There is also a "Music Loan Collection" and an "Art Loan Collection." To complete the whole, there is a "Trade Section" which includes a great variety of miscellaneous exhibits, from Messrs. Doulton & Co.'s artistic and sanitary pottery to Messrs. Thurston & Co.'s hilliard-tables and Mr. Gawthorp's memorial brasses.

As will be gathered from this brief sketch of the Exhibition, there is a great deal worth seeing in it. The main exhibition buildings were erected by Mr. Charteris, contractor, of Page-street, from plans by Mr. J. Wilson Dennison, surveyor, Mr. C. Miller being the clerk of works. Messrs. North & Son, of London-road, South wark, have erected a number of the corrugated iron buildings facing the Arena, including farriers' shop, ambulance buildings, Press-room, fire and police stations, &c.

COMPETITIONS.

The Sheffield Municipal Buildings.—Thursday's Sheffield papers announce that notices have been issued calling a special meeting of the Town Council for Monday next to "receive the report of Mr. Waterhouse, R.A., and of the Improvement Committee on the six final competitive designs for the new municipal buildings, and as to the set of designs to be adopted, to consider the same, and to pass such a resolution or resolutions thereon as may be deemed expedient."

The Drainage of Guildford.—A limited competition for the drainage of the county town of Surrey has recently taken place, four engineering firms having submitted plans in response to the invitation of the Guildford authorities. The competitors were:—Mr. W. H. Radford, Assoc.-M.Inst. C.E., of Nottingham; Mr. F. Deesley, M.Inst. C.E.; Mr. F. Wentworth Shields, M.Inst. C.E.; Messrs. Stone & Ault; and Mr. C. N. Lailley, Assoc.-M.Inst. C.E., of Westminster. Pumping will have to be resorted to in order to raise a small portion of the sewage to a suitable elevation for purification. Four of the engineers advocate the purification of the sewage by what is known as the "International" process, which consists of adding a precipitant called "Ferozone," or ferrous carbon to the sewage, and allowing subsidence to take place in suitable tanks, the sewage being then passed through filter-beds composed of sand, gravel, and "Polartie" (a rustless magnetic oxide of iron in a highly porous condition), whereby a perfectly innocuous effluent can be obtained. Mr. Wentworth Shield's recommendation embraced treating the sewage upon land. The plans prepared by Mr. C. N. Lailley have been selected by the Committee appointed by the Guildford Corporation as the best suited for the town, and in these plans the "International process" will be carried out. Mr. Lailley designed the sewage works at Acton, at which place the International process was first put into operation more than three years ago. The total cost of the works included in Mr. Lailley's scheme is 22,408*l.*, and this design has received the approval of Sir Joseph Bazalgette.

The English Iron Trade.—On the whole, there is a slight improvement perceptible in the English iron market. Prices seem to be getting steadier, generally speaking, and the inquiry is somewhat better. The demand for pig iron is reviving, the low rates now ruling probably tempting buyers. The Glasgow warrant market has been firmer this week, and Scotch makers' iron is rather more readily taken up, some brands being quoted 1*s.* lower. In the North of England prices ruling last week have been maintained, and this, to some extent, is true of the value of pig iron in other districts. The hematite iron market of the north-west has also recovered, mixed numbers of Bessemer iron being quoted 1*s.* a ton higher. There is rather more inquiry for finished iron, but prices are not getting stronger; on the contrary, common Staffordshire bars can be bought 5*s.* and black sheets 10*s.* a ton cheaper. Steel is still quiet, and cheaper. The condition of the shipbuilding trade is not improving. Engineers keep fairly busy.—*Iron.*

Illustrations.

CHURCHES ON THE LOWER RHINE :

THE ABBEY OF ALTENBERG.

THE beautiful and interesting Abbey-church of Altenberg is without doubt one of the finest examples of "Geometric Decorated" work in Germany. It is, however, in such a very out-of-the-way spot, and so difficult to get at, that it is far less frequently visited than it deserves to be; so much so that when the writer, with two of his friends, was at Cologne last July, he could not come across a single person there who had seen the place, though it is only some fourteen miles distant. After, however, making the expedition, the wonder ceased, for the roads about Altenberg are the very worst in Europe, and the way, as the innkeeper at Schneebuck, the nearest town, informed us, is impossible to find without a guide. The railway goes to within a few miles of Schneebuck, through a desolate and hideous country. Then there is a disagreeable drive by omnibus from the station to Schneebuck itself, an uninteresting place. Altenberg is eight miles off, and a carriage has to be hired for the journey there and back. The first two or three miles are simply a continuation of the ugly-scenery which surrounds Cologne, but after a while we came in sight of a range of hills of considerable altitude, though looking rather bare; but when we arrived at the top the view was most interesting,—the whole valley of the Rhine was visible, with the great city of Cologne in the midst of a vast plain. The spires of its cathedral and churches, although some nine miles off, told out distinctly against a background of blue hills. Looking in the opposite direction, we saw another range of hills, higher than the one we were upon, separated from us by a valley, with a clear and rapid river. Down we went into the valley, and here we at once saw the truth of our driver's assertion, that a guide would be necessary to point out the way, for off we turned to the right down a lane, then to the left down another, then we zig-zagged up a hill, then we zig-zagged down on the opposite side, then we plunged into a river, then up the opposite bank past a pretty little village nestling amongst oak trees. More narrow lanes, when a huge hill, covered with a beech-forest, seemed to block our way and shut off all further progress; but no, the plucky old German horse,—he was certainly a true Prussian,—laboured bravely on up one zig-zag lane to the right, then sharply to the left, the beech-trees meeting over our head and sweeping the sides of the carriage. At last, with a pull and a struggle, we were on the very top of the hill, but surrounded on every side by other beech-clad hills, the counterpart of the one we had ascended. The driver passed, and, pointing down to the ground beneath the horse's feet, exclaimed:—"Dort ist kloster Altenberg." Where, in Heaven's name!—under the ground? No. Looking down through an opening in the trees we saw, 200 ft. below, a rapid river with an ancient Gothic bridge, and on the opposite bank a picturesque gateway with a vast, cathedral-like church rising over it. The effect was so strange, so unexpected, that one could scarcely believe it to be real. But how on earth were we to reach it? To jump down plump on to the roof of the church seemed to be the quickest plan, but then it might be attended with disagreeable consequences. However, the mystery was soon solved. Zig-zags again, but this time all down hill, with the turns so sharp that every moment I expected we should enter the church, carriage and all, through the roof. However, at last we got down to the bank of the lovely river, and crossing the bridge, we entered the courtyard of the monastery, and the great lofty west front of the church, with its magnificent eight-light window and double doorway, was before us.

The order of monks who erected this magnificent church are no longer here—they were driven out of their monastery in 1802. The Prussian Government turned the place into a manufactory of "Prussian blue," and in 1833 the whole of the buildings, with the exception of the two churches, were burnt to the ground. The cloisters, chapter-house, and refectory were magnificent twelfth-century work, as some of the capitals and bits of mouldings kicking about in the inn-yard opposite the great church still testify. The church was much injured by

the fire, its outer timber roof was destroyed, but, fortunately, the fourteenth-century glass with which all the windows are filled escaped. The Government of the day restored the church, and hence the ugly slate roof which we now see. The church belonged to the Cistercian order, and is consequently very plain and has no towers. It is, however, a noble structure, some 360 ft. long, with deep transepts, and choir terminating in an apse and chévet with seven radiating chapels. The height to the vaulting is at least 100 ft.

Upon entering the building, its proportions and vast size at once impress one; but it is bare and cold to a painful degree, whitewashed all over! The only colour being in the windows, which are beautiful examples of grisaille work, dating from the close of the thirteenth and commencement of the fourteenth centuries. There is a little old furniture. A remarkably beautiful tabernacle (sacraments-hauslein) attached to one of the columns of the apse, a pretty sixteenth-century iron screen half-way down the nave, a great bronze pascal-candlestick, and a wrought-iron crane for lifting the font cover. The old altars all exist. They are simple square masses of stone, with slightly-moulded "mense." Between the columns of the choir is a series of magnificent monuments of abbots of the church and counts of Berg. They are, however, terribly mutilated, mere ruins in fact. In the north transept is an immense Flemish brass. The chapel immediately behind the high altar is full of magnificent fragments of sculpture, which may possibly have belonged to a great reared or a roof-screen.

This church is often called "The parent of Cologne," and has been supposed to have had the same architect, Gerhard von Rile. It was, however, commenced in 1253, and Cologne in 1248, so that it cannot be regarded as an earlier work. Whether Altenberg is by Gerhard von Rile, or the architect of Cologne, whoever he may have been, is a difficult question; I am inclined to think that they are not the work of the same man, and I venture to think that the architect of Altenberg was the greater man of the two. The proportions of Altenberg are far less exaggerated than those of Cologne, and there is a much greater air of repose about the interior. The principal points of variation in the two designs are the following:—Cologne has eight bays to the nave, Altenberg has nine; Cologne has four bays to each transept, Altenberg has only three; Cologne has four bays to the choir, Altenberg three; Cologne has four aisles to the nave, Altenberg only two; Cologne has clustered columns throughout, Altenberg cylindrical columns everywhere, with carved caps in the choir and moulded ones in the nave. The triforium at Cologne is glazed throughout the whole church, at Altenberg it is nowhere pierced through the outer walls. At Cologne the flying buttresses are double (in height), and at Altenberg single. Of course, I have not alluded to those variations which would necessarily follow from one being an abbey church and the other a cathedral, but simply to those which seem to display a different school of thought. It seems to me that Cologne shows the influence of the South-German School of Gothic working upon a French plan, whereas Altenberg, especially in the use of cylindrical columns, and the treatment of the flying buttresses, is more like northern work, with a strongly-marked Flemish feeling about it. The only features in the two churches which strike me as being very similar, are the treatment of the chévet. In both cases the treatment is purely French, undoubtedly copied from Amiens. This is remarkable in the case of Altenberg, because the Cistercian order very rarely built apsidal ends to their churches, though even in England we find one example, that of Croxden Abbey. It must, however, be conceded that the similarity of planning noticeable between the apses of Altenberg and Cologne is very remarkable. I can, however, scarcely think it a sufficient proof that the two churches were the work of the same architect—probably both men had seen Amiens, and copied its arrangement. A very curious feature at Altenberg is the row of blank square panels over the triforium arcade. In any other church than one belonging to the Cistercian order one would say that they were intended for pictures, but the Cistercians at this early date did not have pictures in their churches, and we see that even in the glass, immediately above, figures are excluded from the design.

The west front is considerably later than the

THE ABBEY CHURCH, ALTENBERG, NEAR COLOGNE.

rest of the church, and was not completed until 1379. It contains a fine eight-light window, a double door, and is adorned with some good sculpture. The Cistercian order had by this time relaxed the severity of their rule, and thus we find statues attached to the doorway and figures in the stained glass. If the latter is in its original condition, the order had not gained much by this relaxation, for the glass of this window is the most inharmonious old glass painting we have ever seen, and very inferior in general effect to the beautiful grissaille of the other window.

The smaller abbey-church, or chapel, is a pretty twelfth-century building, well vaulted with a good western doorway; it is, however, no longer used for religious purposes. About half a mile from the Abbey is a very fine old grange, which formerly belonged to the abbots.
H. W. B.

NORTHINGTON CHURCH, HANTS.

The church at Northington, near Arlesford, in Hants, of which the last remains are now being pulled down, was a modern structure of no particular architectural interest, though it was improved to some extent a few years ago by Mr. Butterfield.

The new church which will shortly be completed is designed by Mr. T. G. Jackson, and stands a few yards from the site of its predecessor.

It was begun by the late Lord Ashburton, who took the greatest interest in the work, but unhappily has not lived to see it completed, and it is now being finished by his executors. The walls are built with cement concrete constructed without the usual planking and bolts by building up an inner and outer lining between which the concrete was filled in. The inner lining where exposed is of thin Caen stone ashlar, elsewhere of concrete bricks, the outer is of flintwork with dressings of Oldham stone from the Wardour bed. This work has been carried out without a contractor by the workmen of the estate under Mr. Potter, his lordship's clerk of works, who is well-known as an authority on concrete building.

The exterior flintwork is inlaid in various panels, finished flush with flat tracery of stonework, in the manner common in the Eastern counties, where the richest examples of flintwork are found.

The church, which seats 260, consists of a chancel, nave, and north aisle, with an organ-chamber eastward of the aisle and on the north of the chancel.

The rapid fall of the ground allows of a vestry below the chancel, which takes the form of an octagonal chamber, with a central pillar, from which vaulting of stone ribs, with panels of rubbed red brick and stone in hands, spring to the side walls.

The six windows of the chancel and apse are filled with stained glass executed by Messrs. Powell from cartoons by Mr. H. E. Woodbridge. Each of the twelve lights contains the figure of an Apostle, one of them being a portrait of the late Lord Dighy, father-in-law to the late Lord Ashburton.

The seating throughout the church is of black American walnut; the nave seats have traceried ends, with a carved panel containing heraldic and other devices, and the chancel-stalls have high backs and canopies and carved standard ends, in which are introduced figures of the four Evangelists and their emblems. The organ-case is of the same material, and overhangs the stalls on the north side.

The reredos is of alabaster, with a panel representing the Last Supper, under canopy work with carved and pierced cresting.

The following have been employed to carry out Mr. Jackson's designs:—Messrs. Farmer & Brindley for the carving, the marble pavement, reredos, and font; Messrs. Watts & Co. for the embroidered altar-cloth; Messrs. Hart, Son, Peard, & Co. for the wrought-iron altar-rail, an unusually elaborate piece of smith's work, and for the bronze lectern and eagle, the bird itself being modelled by Mr. George, of Messrs. Farmer & Brindley's. The organ is built by Mr. Martin, of Oxford; and the church is heated by Messrs. Haden & Son, of Trowbridge, under the direction of their London manager, Mr. Blake. The bells are being rung, and two of them recast, by Messrs. Taylor, of Loughborough.

The illustration is from a drawing in the Royal Academy this year, where is also hung a view of the interior of the chancel.

Rigg's Automatic Self-closing Tap. (See description below.)

LAUNDRY AND ELECTRIC LIGHT BUILDINGS, ASKHAM HALL, YORK.

THE block of buildings shown in the illustration published this week is for the accommodation of the engines, dynamos, and accumulators required for the purpose of lighting the hall; and for the washhouse, laundry, drying-closets, &c., requisite in connection with the same. The architects for the buildings are Messrs. Chorley & Connon, of Leeds, who have designed them to correspond with the hall, recently completed from their darwings.

STABLES, &c., ASKHAM HALL, YORK.

THESE buildings, like the laundry ones, are built to correspond with the recently-erected hall. Of their kind they are very complete, providing accommodation for sixteen horses, with large coachhouses, coachman's houses, groom's rooms, hospital, machine and engine rooms, &c. The architects are Messrs. Chorley & Connon, of Leeds.

The drawing is exhibited in the Royal Academy of this year.

SCULPTURE: "MUSIC" AND "DANCING."

THESE two works in bronze, one of which is at present exhibited at the Royal Academy and the other at the New Gallery, are both the work of Mr. Onslow Ford, A.R.A., and though exhibited separately, are, as might be gathered from the identical design of the pedestals, companion works, and are executed for the Maharajah of Durhuhang, Bengal.

They are certainly two of the most successful works in sculpture of the year, both in regard to ideal fancy and to sculpturesque style. In regard to the birds placed on the heads of the figures, which have puzzled some people, Mr. Ford tells us that the cockatoo was used for the dancing figure because it is a dancing bird: "The owl on the head of the other figure was intended to express solemnity, 'nocturne,' or anything else the reverse of gay." The wings drooping on either hand at all events add very much to the poetic and fanciful effect of the figure.

Mr. Ford suggests that a bird headdress may have been worn by some remote people, from which the metal bird headdress worn by Egyptian ladies may have had its origin.

RIGG'S AUTOMATIC SELF-CLOSING TAP.

This is a tap contrived to close automatically and without jar by utilising the water-pressure from the supply-pipe, a cushion of water being formed against which the valve has to close. The section shows the tap open and water passing, the "Cataract Chamber" A being filled automatically by water admitted along the central passage B in the spindle, which is always in communication with the supply-pipe. On releasing the finger the pressure on the greater area C overcomes that on the lesser D, causing the pipe to close automatically without concussion. A spring is provided in case of the pipe being empty or the pressure low; but the special advantage of it is that it depends on a power which in the normal state of the water-supply is always the same, and does not weaken by usage, as a spring must inevitably do. The agents are the Automatic Pipe Syndicate Company.

The Printing-machine Managers' Superannuation Fund.—The annual excursion in aid of this deserving institution will this year be run to Ramsgate, Margate, and Canterbury on Saturday, July 5.

INCLINED GAS-RETORTS.

THE automatic system of charging and discharging gas-retorts by gravitation attracted last week a large party of visitors to the Brentford Gas Works. That it should remain to be demonstrated at this day that there is great advantage and economy in setting the retorts for distilling the coal at an angle, so that the charges may slide down into them,—and that such an arrangement is a novelty,—does not seem to indicate any remarkable amount of inventive, or even engineering, genius in several generations of gas engineers and managers. Clay is said to have tried it in 1803, but no one seems to have accomplished it before Coze, the Frenchman, at Rheims, in 1885,—some five years ago. Everybody knew that masses of material once set in motion have a tendency to come to rest at some particular angle which varies with the form, weight, and other characteristics. But no one during ninety years of gas industry has substituted this simple means for the old horizontal setting in the loading of the retorts by long scoops, containing about a hundredweight of coal borne on men's shoulders and launched thence into them with much scorching labour and fatigue. Instead of a special angle being needful for each kind and dimension of material, it is found that in practice an angle of 80 degrees will serve for all kinds of coals and sizes. This simplification is important, and bases the rest of the processes upon a tangible foundation. Last year further improvements, in the setting of the retorts, by which the cost of erection is much reduced and also in the mechanical means of charging and discharging, were effected by Messrs. Morris & Van Vestrant. These improvements are embodied in the portion of the Brentford Works which have been fitted up on the new principle.

The ordinary horizontal retorts there are 20 ft. long, and are charged at both ends simultaneously, six men being engaged in the operation,—some minutes being frequently taken to perform it. These men must be of strong physique, and trained to work skilfully together. A deficiency on the part of one man may tend to the injury of another, and the training required for the filling of the retorts by the shoots, evenly and properly from end to end, is not attainable without experience. Thus it is difficult always, and sometimes in emergencies impracticable, to fill the places of men falling out through illness or disagreements. For the higher reasons of civilisation the new system deserves encouragement, in that it obviates the need for arduous toil.

The new system is worked in the following way at Brentford:—The coals are elevated to a platform at a convenient height above the retorts; and the charge of 7 cwt. is put in a truck which moves along a line of rails. Under this platform also are movable vertical tubes or shoots, telescopically adjustable to the different levels of the mouths of the upper ends of the retorts. The charge of coals is injected into the shoot from the truck by the withdrawal of a slide. In their descent the coals acquire sufficient velocity to overcome the tendency to rest on the slope of the retort, and, consequently, they travel downwards along its floor until arrested by a stop-piece, which is inserted in the lower end of the retort before closing the lid. The front portion of the charge being thus arrested, the remainder is gradually brought to a stand in succession, the whole charge being so regularly distributed that the retort will contain one-seventh more than the ordinary quantity. The charges can be shot in far quicker than they can be put in by the old hand proceedings—from five to seven seconds sufficing. When charged the retort lid is closed, and the carbonising goes on in the usual manner, but in

superior degree. When the distillation is effected the lid at the lower end of the retort is opened and the stop removed. The coke within is now seen in radiant red heat, slightly expanded against the sides, sufficiently to hold it up. A light rake or sicc is inserted under the coke, which then slips forward rapidly with but the slightest labour, and falls down in a continuous flow into the quenching-vault below, whence it is carried out of the retort-house and stored or put into trucks as required. The wear and cost of tools is much diminished. A most important practical result of the system is the greater control it affords over the illuminating properties of the gas produced,—in this, that no gang work being needed, the time of carbonising can be shortened optionally to any extent in lieu of the ordinary six hours' work. Thus, a more highly carbonised gas can be secured by sacrificing the weak carbonic oxide and marsh gases given off towards the end of the six hours' charge. In foggy weather, also, by thus shortening the time of distillation, one quarter more gas can be made in the same retorts, provided the heating is kept up; which, where gaseous fuel is used, as it is at Brentford, is very easily accomplished.

CASE UNDER THE METROPOLITAN BUILDING ACT.

NEGLECT TO GIVE NOTICE TO DISTRICT SURVEYOR.

THE case of the District Surveyor for East Hackney North v. Anthony & Co., Limited, was heard in the North London Police-court on the 12th inst., before Mr. Montagu Williams.

The defendants were summoned for neglect to give notice. They had recently erected on the front of the Old Town Hall, Hackney, two wooden advertisement framings, each measuring about 15 ft. by 12 ft., supported on wood brackets driven into the wall and fixed with iron holdfasts, some with and some without screws.

The District Surveyor relied on sections 9 and 14 and section 25, rule 1.

The defendants, by counsel, contended that the Building Act was only intended to apply to what was a permanent part of a building, and not to such temporary things as advertisement-boards and hrowers' signs.

The defendants were ordered to pay a penalty of 10s. and 12s. 6d. costs, the Magistrate refusing to grant a case.

THE PRESENT POSITION AT THE ARCHITECTURAL ASSOCIATION.

SIR,—I wish to ask for the opportunity of urging that further and calmer discussion should be given by the members of the Association to the proposals of the now lapsed Committee on Education. A unusual amount of controversial heat has been engendered at the last few meetings on the subject, and almost angry looks have been exchanged between nearly equally-matched bodies of supporters. The Session, according to the rules, lapsed with May, and in the season of evening tennis and boating and, let us hope, of sketching, it will be difficult to fairly obtain the opinion of the great body of members. Surely the present constitution of the Association is good enough to last until the cooler days and longer evenings of autumn, for we should not be forced to suppose that more time and thought must be prejudicial to the new scheme.

The rules must be carefully readjusted and the constitution re-drawn before the alterations can become operative, and unless the new army of lecturers at "21s. 6d. per lecture" are already engaged in preparing their syllabuses, nothing can be done before the next brown-hook goes to press in August.

Two things have to be done if the Education report is to become the new constitution of the Association—each independent of the other, but strangely linked in the amateurish report of the committee. The first is to substitute an architectural paid "dominie" for a real architect in practice as a voluntary teacher, and to publicly (and I urge the importance of full consideration by the profession of this point) disown and discard the pupillage system, which, after all that can be said against it, has produced the Architectural Association and a National School of Architecture that for extraordinary vigour and freshness is unrivalled in the records of the century.

The second point is that the Association is to have a purge of a drastic character. After diving in a course of undeterred progress advanced to a membership of over 1,000 members, the subscription is to be doubled, and the hands of the clock put back into darkness, as far as progress in membership is concerned. Do the members who have built up the Association realise this? The reason given is that the work of the Association is so great that more money must be paid for secretarial

assistance, &c. No doubt this is true, and I admit it, with hearty thanks to the honorary labourers who, in accordance with the old motto of the Architectural Association, have worked hard and lovingly for no pay. But it should be remembered that last year the Association spent *one quarter* of its income on the contrasalone and soiree, and that if the expenditure on these heads was limited to 50l., the 150l. requisite would be found for further clerical help without raising the subscription and "the wind."

There has seldom been wanting, either in the Institute Council or among the Presidents of the Association, the expressed desire to bind the junior body to the senior one in some satisfactory manner that shall be a source of strength to both. May I suggest that as the Royal Institute are enlarging their premises, and have an efficient official staff, that the office and gallery, rent and clerical expenses of an honorary and mutual body like the Association might be eased by some paternal help? It is idle and—like other ideas floating in the minds of some "A. A." orators—childish to expect the Institute to become the body to teach architecture, or to make grants for paying masters for the young in the art, but the nature of official and clerical help is very different, and could with dignity be asked for and with grace given; and as guineas and their halves are considerations to young architects, the Royal Institute of British Architects will be likely to gain more recruits for the Associateship at 2gs. with the "A. A." subscription at 10s. 6d., than if the latter is doubled.

I hope that those senior members who expressed the hope that an adjournment of the battle might be made till next session will be supported at Friday's meeting, and that their request may prevail.

June 17, 1890.

A. BELSFORD PITE.

THE OLD NAVE, ST. SAVIOUR'S, SOUTHWARK.

SIR,—In reference to a letter on this subject by Mr. Garbett, which appeared in your issue of May 24, July 29, 1839, is the date on which, according to the article on "St. Saviour's, Southwark," in the current *Quarterly Review*, the first stone of the new nave was laid by Bishop Sturges, of Winchester. It is hardly likely that there is an error as to this date in an article so carefully written, and evidently with access to original parochial memoranda. The same article states that in 1838 "the old nave was levelled to the ground." If we interpret this as meaning that the work of destruction was begun in that year, the building could hardly be described as "untouched" in July, 1839, the month in which the rebuilding commenced.

The first stone would certainly not be laid until the ground had been cleared for the builders' operations. Is it possible that Mr. Garbett, writing after the lapse of half a century, has made a very natural slip in the date of his first visit to St. Saviour's? He is certainly in error as to the south porch, the existence of which he questions. That there was one, attached to the second bay from the west on the south side, is absolutely certain. I saw it hundreds of times before its demolition, which I witnessed with bitter grief. It is exactly reproduced in Sir Arthur Blomfield's design for the rebuilding of the nave. Mr. Garbett is quite correct as to the western entrance, which was a very beautiful example of Perpendicular work, with richly carved oaken doors (can any one say what has become of them?), as depicted in Pugin's "Specimens," vol. ii., plate xvii., K*. Mr. Garbett's reference is accurate, but he has been misled by the asterisk. The note referring to "Briton's Architectural Antiquities," vol. v., belongs to the preceding paragraph describing Illey Church, of which "a ground-plan and five plates," as stated, will be found in that work. The explanation of the misleading asterisk is this:—Each plate has two signatures, one in Roman numerals at the upper right-hand corner; one in Roman capitals at the lower. The plates being more than fifty in number, one alphabet would not suffice, and a second was used, distinguished from the first by an asterisk—A*, B*, K*. EDMUND VENABLES.

A PLEA FOR THE IMPROVEMENT OF SIX- AND EIGHT-ROOMED HOUSES.

SIR,—Pray, Goody, moderate the rancour of your tongue. Why flash those sparks of angry fire from thine eyes?—they quite obscure thy vision. Corridors in my proposed houses need not be dark; glass in upper parts of partitions and over-doors would obviate that, and are usual expedients. Corridors in large city buildings and in hotels, say the Grand Hotel, Paris, nearly as long as streets, are dimly lighted only, and many approve; evidently a delusion. However, Knightley can't do it. Pite can, and (very good of him) shows his model, which he modestly calls a "casual." Eighth scale gives 18 ft. frontage (very usual width), back parlour well lighted, kitchen 9 ft. by 8 ft., dear little place; rather tropical, large jambs for kitchener; dresser, table, two chairs, three persons seated in kitchen, two on chairs, one on fire or table. Scullery,

7 ft. 6 in. by 4 ft. 6 in., no copper (useful article, though, but then at times makes steam, so leave it out); back w.c. in direct line of passage, gross and palatable to visitors, who might say, "How very convenient." First floor, two bed-rooms 8 ft. wide; don't see where to put bed; front room very good, but one bed-room short allowance; dressing-room dispensed with; pity this; fellow likes to keep brush, comb, and towel to himself; water-closet instead (this over hall—thought it a sunk porch); music of machinery to amuse callers whilst waiting. In case of w.c. overflowing, pretty good benefit for heads of folks in hall (alias sunk porch). First-floor plans in time for next week, and then from me nothing more. T. E. KNIGHTLEY.

SIR,—I quite agree with Mr. William A. Pite [p. 437, ante], that the casual suggestion he has lightly thrown off and published in your last number goes far to show that the "everlasting plan" of the six and eight-roomed houses with which we are so familiar, should not be hurriedly condemned, for it is evident from Mr. Pite's plan that the jerry builder has been merciful and spared us in many things.

He does not, for instance, place the drawing room door immediately facing the fire-place, so that anyone sitting in front of it would be seriously inconvenienced by it, nor does he increase the evil caused by the dining-room window being forced into the corner to a greater extent than necessary, by putting the widest room in the rear. He has contrived for us a narrow stair, but a well-lighted one, delivering towards the front door and public rooms. We can see by Mr. Pite's sketch how the staircase might descend into inner darkness, and the kitchen lobby, while securing sometimes with a little more light a pleasing vista through the kitchen and scullery to w.c. in rear; how the kitchen which everyone says is too small at present might be made still smaller, being half the size of the "dining-room;" how the cost of the house, and, therefore, its rent, could be increased by adding another 4 ft. to the depth for a cross-passage, lady's store, and glass pantry, which would certainly be ample for the occupant's requirements in that way. It also shows how the w.c., which present sentiment consigns to a back place, could surmount the position usually allotted to the good-man's dressing-room, and could be made quite a feature in the front elevation; how the door in the adjacent bedroom could be put in the wrong wall and hung in the wrong way; how to make one of the back bedrooms still more uncomfortable by a novel arrangement of door, window, fireplace, and cupboard. It also exhibits clearly how our builder, if he forgot scale and dimensions, could produce still more wonderful effects in tight places; see the ladder and the scullery, where a copper might be easily omitted.

Sir, if we look for improvement it must not be from casual suggestion. I am well aware of the difficulty of improving upon a plan which is really the result of a long evolution; but Mr. Knightley's plan (though open to criticism in some respects) yet makes an advance which should be considered. I am sure he deserves our thanks for placing his ideas at our service. W. D.

JUNCTION OF SOIL-PIPE WITH DRAIN.

SIR,—On p. 437 of the *Builder* for June 14, Mr. Frank Caws begins his letter on this subject by saying:—"I desire to draw attention to a danger and evil which have seemed to have reared their heads among sanitarians"; and he goes on to explain that the discharges falling down inside high vertical soil-pipes, and striking the fire-clay head at the bottom, by-and-by disturb the bend and cause leakage of its joints, on account of this bend not being properly supported or bedded.

Now, sanitarians and practical plumbers did not allow this to escape their notice, for, as far back as twenty years ago or so, I published that when of iron this bend at the bottom of the soil-pipe should have a strong iron stud or heel below it, which heel was to be made to rest on a solidly-laid stone, so that it could not be moved. When of lead this bend was to be otherwise firmly fixed.

I do not approve of the bend at the bottom of the soil-pipe being either fire-clay or stone-ware, or of "earthenware," as Mr. Caws terms it. This bend should be part of the soil-pipe, and not part of the drain.

I do not believe a properly set and properly cement-jointed fire-clay head, bedded on clay, would give way as Mr. Caws says. I support his idea of bedding the socket and of the drain-pipe in cement or concrete. This is an old practice with me. W. P. BUCHAN.

IRON BUILDINGS AND LIGHTNING.

SIR,—In answer to your correspondent "J. Arthur Wallington," who inquires [p. 421, ante] as to the effect of lightning on iron roofs, and whether a corrugated iron house is liable to suffer from lightning, or whether it would act as a conductor, I beg to refer him to the "Report of the Lightning Rod Conference" (London: E. & F. N. Spon, * There are two doors between it and the visitors, however.—Ed.

CHURCH BUILDING NEWS.

1882). That Conference consisted of delegates from the Meteorological Society, the Royal Institute of British Architects, the Society of Telegraph Engineers and Electricians, and the Physical Society, besides two oopted members, Prof. W. E. Ayrton, F.R.S., and Prof. D. E. Hughes, F.R.S. On p. 70 of that Report there will be found an abstract by Prof. T. Haylor Lewis of "Instructions" issued with the "Army Circulars" of May 1, 1876, "as to the application of lightning-conductors for protection of powder magazines, &c." In his abstract of these instructions, Prof. Lewis says:

"The principles adopted by Sir W. S. Harris, as shown in Appendices A and B to this paper, are still held to be sound. . . ."

"Iron verandahs and railings are good conductors when with good earth connections. Iron buildings are good conductors. But if covered with asphalt, concrete, &c., rods or points must be provided, projecting above asphalt, &c., and with good earth connections."

In the Appendix A, just referred to, the late Sir W. Snow Harris, F.R.S., says:—

"Electricity when confined to substances resisting its progress, as air, glass, dry wood, stones, &c., exerts a terribly explosive power."

"Resistance is connected to bodies, such as metals, offering small resistance, its violent expansion or disruptive action is greatly reduced, or avoided altogether, and becomes a continuous current comparatively quiescent. But if a body be small, as wire, it may be heated or fused. Resistance is so small that a shock has traversed copper wire at the rate of 576,000 miles a second; resistance increases with length and diminishes with area of section of conductor."

"So a building metallic in all its parts, or a man in armour, is safe. . . . It follows that if metal would be safer than if built in the usual way."

These dicta of Sir W. Snow Harris would seem to be confirmed by the following paragraph from the current number of your contemporary *Iron*:—

"THE EIFFEL TOWER IN A THUNDERSTORM.—From recent experience during thunderstorms, the Eiffel Tower at Paris seems to be proof against lightning. On one occasion it was subjected to a remarkable bombardment from aerial electricity, being struck by lightning no less than six times in eleven minutes. Three of the flashes are said to have reached the top of the conductor simultaneously, resulting in a remarkable display and considerable vibration on the part of the big iron frame. A rattling of the metal was heard, but no apparent damage was done."

The "Report of the Lightning Rod Conference" is not as well known as it should be to architects and builders. It is well worth their attention, the conclusions of experts on a matter of great importance to the protection of life and property being very clearly and succinctly laid down in it.

London, June 18. Δ
* In reference to the quotation from *Iron*, it must not be forgotten that the Eiffel Tower, though of iron, is fully furnished with special lightning-conductors.—Ed.

THE WOODEN WATER-PIPES FOUND AT BELFAST.

SIR,—The wooden water-pipes found in the Fountain at Belfast [see pp. 431, 420, 438 ante] were in lengths of about 12 ft. each. We took up three lengths; they were 9 in. in diameter, and the timber is quite sound. There is a waterway 3 in. in diameter through them, and they are jointed

(fig. 1) by simply opening one end a little wider and cutting away the other to fit in (but with no iron rings). The one end of this stretch of pipe was connected into a junction 8 ft. long, 12 in. by 12 in., with a 3 in. diameter waterway through same (fig. 2). This square pipe had several connections, one at right-angles each way (fig. 3), and one for up-stand, which was likely used for supplying some of the old fountains. It was closed up at one end and open at the other. This seemed only to be a junction for connecting the pipes.

Belfast. W. MACDONALD & SON.

SYMBOLISM OF THE PASTORAL STAFF.

SIR,—With reference to Mr. Littlehale's letter [p. 438, ante], my own impression is that the examples mentioned are only exceptions to the rule. The carelessness of sculptors may be answerable for those deviations. It has just been my lot to behold at Farleigh Castle (Wilts), a seventeenth-century effigy represented in armour of the fifteenth.

J. BAGNALL.

Burnham Thorp.—An influential committee has been formed, with the Prince of Wales as chairman, and comprising some distinguished naval officers, for rebuilding the parish church of St. Peter's, at Burnham Thorp, Norfolk, after the designs of Sir Arthur Blomfield. This church, which was repaired and beautified fifty years ago, consists of chancel, nave, north aisle, and western tower, mostly in the Perpendicular style. It contains some memorials of Lord Nelson's family, including a tablet to his father, who was rector here; and a brass, representing Sir William Calthorpe in a complete suit of chain armour, with inscription and date, "1420."

Denton.—The Church at Denton, in the diocese of Durham, which was only built in 1830, on the site of an ancient church, is now being demolished, and a new and more substantial fabric erected in its place in the Early English style. It is to consist of nave, chancel, south porch, vestry at west-end, and organ-chamber on south side of chancel. The walls are to be faced with random blockers from Houghton Bank, lined with buff-pressed bricks from Normanby, the internal panels and arches being of stone. The pulpit, choir-fittings, reredos, and chancel screen are all to be of Anstrian oak, the rest of the woodwork being of pitch-pine. The gangways and chancel are to be paved with mosaic tiles, the rest of the floors being laid with wood blocks. The windows are to be glazed with cathedral-tinted glass, having coloured roundels and margins. The warming is to be by hot water, and the lighting by corona. The architect is Mr. J. P. Pritchett, of Darlington.

London.—The new Church of the Holy Trinity, Sloane-square, Chelsea, was consecrated on the 13th ult. It replaces an old and smaller structure, and has been erected at the cost of Earl Cadogan, the congregation and parishioners providing the amount required for the fittings. It is stated by the *Guardian* that up to the present time 22,000, has been spent, but before the church is completed the total sum will probably reach 35,000. Internally the church is 150 ft. long by 40 ft. 9 in. wide, and 60 ft. high. In plan the church is a parallelogram, with narrow but lofty aisles, and on the north side are the morning-chapel and organ-chamber. Within the wall arches are the clearstory windows, and below the springing of the arcade a deep frieze, which is carried throughout the length of the church, and which is intended to be decorated with a series of subjects illustrating our Saviour's life, for which sketches have been prepared by Mr. Burne Jones. The spandrels of the nave arches are filled with tracery panelling, with large medallions intended to contain figures of the Prophets, which are to be executed by Mr. Armstead, and upon the face of the piers are to be figures of the twelve Apostles, for which sketches have been prepared by Mr. Hamo Thornycroft. The chancel, which is of the same width as the nave, is separated from it by a low screen of green marble. A flight of white marble steps leads from the nave level to the chancel floor, which is paved with black and white marble. On the right and left of the entrance are two pillars of green marble, on which are seated bronze angels bearing scrolls. The chancel gates and side wings are only partially executed. The chancel stalls are of novel design, and show the unusual admixture of beaten and cast brass panels with oak stained a dark colour. In the panels are a series of angels holding inscribed scrolls. There are also large panels representing David and St. John the Divine. The figures, both upon the screen and the stalls, are the work of Mr. F. W. Pomeroy. The altar, which is 12 ft. long, is internally of oak, and has a marble front, in which occurs a carved panel showing the entombment, by Mr. Harry Bates, of which the model is to be seen in this year's Royal Academy Exhibition. The pulpit is formed of white marble with coloured panels, supported on columns of alabaster and red marble. The panels are to be enriched with metal reliefs by Mr. Alfred Gilbert. At the west end of the morning chapel is the font, the bowl and shaft of which are made of Mexican onyx, supported on steps of golden veined marble. On the shaft of the font is a band of cherubs holding scrolls, the work of Mr. F. Boucber, under the direction of Mr. Onslow Ford. At the east end of this chapel is a marble reredos, above which hangs a piece of tapestry work executed by Morris &

Co. The front of the altar in the Morning Chapel, which is being painted by Mr. Reynolds Stephens, represents the homage of the nineteenth century to the Saviour. The design shows a figure of the infant Saviour and His mother, before which kneel the figures of typical men of the time, such as Gordon as a soldier, Damien as a martyr, Selwyn as Bishop, Browning as poet, Lowder as priest, &c. The church is lighted with electric light, the fittings having been made from the architect's design by Messrs. Longden & Co. The lights are enclosed in wrought iron lanterns, which are surrounded by filigree work of wrought iron gilded. The wiring and other details have been carried out by the Brush Electric Supply Corporation. The architect is Mr. J. D. Sedding, and the works have been carried out under his superintendence, assisted by Mr. E. H. Sedding. Messrs. Higgs & Hill were the general contractors, their foreman being Mr. Swain. The following illustrations of the church have appeared in the *Builder*, viz.: A large view of the interior and a perspective view of exterior, on October 6, 1888; one bay of nave arcade, October 12, 1889; sketch of chancel, January 4, 1890.

PROVINCIAL NEWS.

Northampton.—A good deal of new building has been done here recently, partly for some of the London shoemakers, who, finding that ground can be purchased at about one shilling per square foot, have run up a number of new factories, although, perhaps, not quite so substantially as this description of buildings would be erected in London, Manchester, or Leicester. The architects are, for the most part, beginners in practice, among them Messrs. Brown & Fisher, of Wellington, the following being some of their works:—Messrs. Stimson's factory, Abington-street, just commenced; Messrs. Crockett & Jones's shoe factory, Mages-street; builder, Mr. Wingrove. Heating and ventilating by Mr. B. F. Startovant, of London. The building is built of red bricks and Bath stone. About ten other factories have been designed by the same firm, also a bank in Mercer's-row. Messrs. Holding & Jeffrey are making extensive additions to the Town-hall. The "Dolpin Hotel" is being rebuilt by the Northampton Brewery Company, from the designs of Messrs. Brown & Fisher. Mr. Hull has added an extensive wing to the Convent School, Abington-street. Messrs. Ingram & Shaw have nearly completed the new Masonic Hall, Albert-street; also a very handsome building as a shoe factory close by. Within the last four years several extensive estates by the race-course have been covered with about 800 or 900 houses and shops. Several new villas have been erected round the racecourse, but owing to the utter disregard one architect or builder has for the designs of his neighbours, the grouping is anything but agreeable.

Prescot (near Liverpool).—A new gymnasium, club-house, and coffee tavern are being erected at Prescot from the designs of Mr. Thomas W. Cubbon, architect, Birkenhead, for Miss Ruth Evans, of Rainhill and Rhyll. The buildings will include a public gymnasium, 51 ft. by 24 ft., having dressing-room and all necessary conveniences attached; billiard and reading-rooms, with lavatories and cloak-rooms, &c.; coffee tavern, consisting of large refreshment-room fitted with serving-bar, seats and tables, bicycle-shed, verandah, &c. The buildings, which will be Gothic in character, will be of two stories high, and faced externally with red sandstone from local quarries. All internal woodwork will be of pitch-pine varnished. The whole of the buildings are being erected by Messrs. Hughes & Stirling, contractors, of Bootle-cum-Linacre and under the supervision of the architect.—A new public swimming-bath, designed by the same architect, is now in course of erection at Prescot, for Miss Ruth Evans. It consists of swimming-bath room 50 ft. by 23 ft., having eleven dressing-boxes, all being fitted-up in the best style, and with all modern conveniences and fittings. The design is Gothic, all the external walls being faced with local red sandstone, the internal walls faced with selected bricks, the sides of bath lined with white glazed bricks, and the bottom laid on concrete bed with heavy white tiles, all set in cement. The internal woodwork is of pitch-pine, varnished; roof lights glazed with Hartley's rolled plate, and slated with Vellenhelli slates. Movable Louvred ventilators, which may be opened and closed at will, are provided in the roof. The

contract is being carried out by Messrs. Hughes & Stirling, under the architect's superintendence.

Ripon.—Messrs. W. Lewis & Son, architects, have just completed considerable improvements to Grantley Hall, and other work on the Grantley estate, near Ripon, for the Right Hon. Lord Grantley. Other work is in progress and contemplation to generally improve the estate, from the plans and designs of Messrs. Lewis & Son.

The Student's Column.

ELECTRICITY, MAGNETISM, AND ELECTRICITY SUPPLY.—XXV.

METERS.

IN some districts it is the custom to charge for electricity supply at so much per lamp, or other piece of apparatus, per annum; but a far more satisfactory way is to meter the B.T.U.'s which are used in a building, by placing some form of electric meter where the street mains are tapped for the local supply current. The following properties of the electric current can be used for the purpose of metering (i) the decomposition of a compound conducting liquid, (ii) the rise in temperature of a conductor, (iii) the field of force produced. A meter may measure either coulombs or joules. If a building is supplied under constant E.M.F. the coulombs alone need be recorded, for if their number be multiplied by the E.M.F. the joules are at once obtained; again if the current be constant but the E.M.F. be varied the meter is placed as a shunt across the house mains, and so arranged that the current which flows through it shall be proportional to the E.M.F. between the terminals; in this case also the coulombs registered, multiplied by some number, will give the joules used.

Meters, based on the fact that if a continuous current be passed between, say, two plates of metallic copper immersed in a solution of sulphate of copper, a definite weight of copper will dissolve from the positive plate and deposit on the negative, for every coulomb that passes, irrespective of the current, have long been employed. Among early meters of this kind may be mentioned those of Edison and of Wright. An ingenious modification was introduced for use with an alternating current by Lowrie and Hall. If an alternating current be passed through an ordinary depositing cell, there would, as a whole, be no change in weight of either plate because as many coulombs would pass in one direction as the other. The inventors therefore put a charged secondary cell in series with the depositing cell; as a result, the current is helped in one direction but opposed in the other by the E.M.F. of the cell, and the excess of coulombs in the direction of this E.M.F. is recorded, its proportion to the whole number of coulombs passed being easily calculated. A practical defect in all meters of this kind is that the plates have to be periodically removed and weighed; a consumer cannot see on a dial the number of B.T.U.'s he has used at any time, in the same way that the number of cubic feet of gas passed through a gas meter can be determined by mere inspection.

A meter introduced by Professor George Forbes is equally efficient for either continuous or alternating currents, as its action depends upon the heating of conductors by an electric current. A number of wires connect together two horizontal concentric rings, and the heated air which rises from this arrangement, fig. 67, impinges on little mica plates set at an angle of 45 deg. round a horizontal mica disc. This disc and its vanes revolve like a windmill, the number of revolutions made being recorded. The whole is placed under a glass shade to prevent disturbance from external currents of air.

Dr. Aron's meter, which is very largely used, consists of two pendulum clocks timed to go at exactly the same rate, and geared to a dial so that one clock train undoes the record of the other. One pendulum has its rate of vibration changed by a field produced by the current or currents passing through coils, and it is this change of movement which the dial records.

Other meters, too numerous to mention by name, are simply little motors whose rate of revolution is made to vary directly as the

Fig. 67.

current, and the work they do is to turn round the index on the recording dial. When these motor-meters are used for the alternating current, the alternating current in the field coils induces currents in a short-circuited armature, so that nothing of the nature of a commutator is required.

SWITCHES.

It is absolutely necessary to be able to stop at any moment the current in any main or branch, and for this purpose the continuity of the conductor carrying the current is broken. A switch is an arrangement by which a removable part is introduced into any circuit, and when a large current is flowing under a high E.M.F. there is danger of an arc forming at the break across the gap made, for the reasons already explained in connexion with fuses.

The means adopted for getting over the danger of arcing in a switch are to introduce breaks simultaneously in two places, and to make the separation so rapidly that sufficient heated vapour cannot be produced to form the arcs. Fig. 68 represents an exceedingly simple, but very effective, main switch. The current is

Fig. 68.

led across a bar of brass or other metal, B, bent over at the ends and gripped by two split rings, S, S, which can be tightened to any desired degree by means of nuts, and the separated ends of the main cable are connected to these rings, through the terminals T, and T. Some little force is required to release the bar from contact with the rings, and when they do let go it comes away with a jerk, so that the circuit is broken in two places with great rapidity. A switch must be constructed so as to make it impossible to leave it "partly on," that is making loose contacts, which, while allowing the current to pass, introduce a high resistance, and cause heating to a dangerous degree. A spring therefore, always acts, to pull the bar out of contact, so that, unless it is tightly gripped, it will not stay in a position to let the current pass.

Fig. 69.*

A similar kind of switch is shown in fig. 69, suitable for single lamps or small groups of lamps. The bar is kept away from the clips by a spring, unless held tightly by them. The handle, which is held in place by the cover (not shown in the figure), is not in any way attached to the bar, and is cut away underneath, so that on turning it through a fairly large angle it will touch the bar on one side or the other; the handle turns the bar until the clips loosen their hold, and are unable to resist the spring, when it flies out rapidly and slides away independently of the handle. As an arc does not form when contact is made, in neither form of switch need contact be made with such rapidity. Any switch in which the current passes on to the arm through the pin about which it turns should be avoided, and the material on which the working parts are mounted should be unflammable.

Surveyorship, Banbury.—Mr. S. E. Burgess, Assoc. M. Inst. C.E., Assistant Borough Surveyor of Stockton-on-Tees, was last week appointed to the position of Borough Surveyor of Banbury, Oxon. There were ninety-three applicants for the post.

* The block for this figure has been kindly lent by Mr. P. G. Hart, of Westminster.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

10,237, Syphon Flushing-cisterns. T. Deeley.

This invention has for its object the production of a perfect water-waste preventer, combined with a noiseless flusher. It is an improvement on a previous patent, and consists of a long and short leg syphon arrangement, with the short leg or inlet passage pierced near its upper end, over which is fitted a flexible sleeve-valve carried by a sliding tube, the tube being raised by a float connected at its lower end. The outlet or long-leg of the syphon has an open-topped branch which is closed by a self-closing valve, operated by the cistern-pull. By the rising of the valve water for the creation of the vacuum is allowed to pass into the long-leg and down pipe of the cistern.

10,386, Brick Facings. R. Kerr.

According to this invention, the bricks which are exposed to the surface and form the face of the wall, &c., are fluted or rippled, rounded, or indented for the purpose of distributing the light by reflection. The surface is also sometimes composed of special materials, pottery, glass, &c.; or the outside surface of the bricks are highly glazed in order that light may be reflected from them.

10,463, Cupboard-turn or Door-fastener. W. Donslin.

In place of the ordinary latch with a square socket-hole, and held upon the spindle of a cupboard-turn by means of a nut,—which frequently works loose,—according to this invention a latch is mounted upon a spindle of nearly square section, upon the corners of which spindle a screw-thread is formed and this spindle is fitted into a knob. A set-screw passing through a slot in the spindle enables the latch to be screwed up to the side of the door.

10,900, Liquid Glue. W. G. Richardson.

This invention refers to a liquid waterproof glue, prepared by dissolving gum-shellac in spirits of wine, naphtha, &c. This glue is not soluble by either water or heat.

3,776, Sash Fastener. W. J. Ingram.

The fastener which is the subject of this patent is a sliding-bolt attached to a spiral spring, which, when locked, throws the bolt back, enabling a projection to enter a groove towards the front. To unlock it the bolt must be pushed in so as to disengage it from the groove, then turned half round, when the spring will throw the bolt back. This bolt is made to pass between two lips on the bottom sash, and through a tongue on the top sash, the tongue passing between the two lips. This tongue is screwed on the edge of the meeting-rail in addition to the surface, which renders it impossible to cut the bolt or open the sash without breaking the glass.

MEETINGS.

SATURDAY, JUNE 21.

St. Paul's Ecclesiastical Society—Visit to Waltham Abbey. Train leaves Liverpool-street at 2.50 p.m.

Liverpool Engineering Society—Visit to the Thirlmere Aqueduct.

MONDAY, JUNE 23.

Victoria Institute.—Mr. HORNUM Rassam on "The Sites in the East earliest mentioned in Holy Writ." 8 p.m.

Junior Engineering Society—Visit to Messrs. Allen Scott & Co.'s Printing Works, Bouvier-street, E.C. 5. 5.30 p.m.

WEDNESDAY, JUNE 25.

Artists' Benevolent Fund.—Annual Dinner, Freemasons' Hall, Sir Richard Temple presiding. 7 p.m.

THURSDAY, JUNE 26.

Association of Municipal and Sanitary Engineers and Surveyors.—Annual meeting to be held at Liverpool. Address by the President (Mr. H. P. Bothnis, City Engineer of Liverpool); and papers on "The London Sewage Question," by Mr. Crawford Barlow; "The Mersey," by Mr. W. Spinks; "The Maintenance of Main Roads," by Mr. E. P. Hooley; and "Traction Engines and their Effect upon Roads and Buildings," by Mr. J. H. Burton.

FRIDAY, JUNE 27.

Association of Municipal and Sanitary Engineers and Surveyors.—Annual Meeting (continued). Visit to the Docks, Abattoirs at Birkenhead, and the Tunnel, &c.

SATURDAY, JUNE 28.

Association of Municipal and Sanitary Engineers and Surveyors.—Annual Meeting (continued). Visits to Salt Water Baths, Pierhead; Electric Lighting Station, Highfield-street; Liverpool Hydraulic Power Company's Athol-street Pumping Station; St. George's Hall; New Royal Infirmary (work in progress); and "Walker Engineering Laboratories."

Miscellaneous.

Enforcement of Building By-Laws at Hornsey.—Some of the evening papers last week described an "extraordinary scene at Hornsey" but inasmuch as the evening journalist is nothing if not sensational we were not disposed to refer to the matter in our own columns. The facts were, however, substantially as stated, as will be seen by the following extract from the Local Board's Plans Committee's Report, sent to us by Mr. De Courcy Mordaunt, the Surveyor to the Board:—

"Your Surveyor reports that the builder . . . on receipt of the Board's decision on Monday, June 2, to remove the portions of two houses in . . . road, instead of availing himself of the opportunity of removing the small portions of the buildings which had been erected at the time they were condemned, continued with the erection of the buildings with more than ordinary despatch. Your Surveyor, therefore, acting on the advice of counsel proceeded to remove the buildings on Monday, the 9th inst. The police authorities were communicated with, and sent some constables to ensure there being no breach of the peace between the builder's men and those employed by the Board for the removal of the buildings. The pulling-down was executed in a business-like and orderly manner, and was completed on the following day, viz. the 10th inst. The Surveyor reports further, that the adjoining houses, erected by the same builder, are in contravention of By-law 24, and states that he has this day served him with the necessary notice to remove the defective work."

The By-laws under which this action has been taken are, as may be imagined, somewhat severe in their terms, but they are deemed by the authorities to be none too stringent to meet the cases of jerry-building which at times come under their notice.

The Association of Municipal and Sanitary Engineers and Surveyors will hold their annual meeting at Liverpool, on Thursday, Friday, and Saturday next, June 26, 27, and 28.

After the adoption of the annual report, the presentation of general business, the President, Mr. H. P. Bothnis, City Engineer of Liverpool, will deliver his address. This will be followed by papers on "The London Sewage Question," by Mr. Crawford Barlow, B.A., M.Inst.C.E.; "The Mersey," by Mr. W. Spinks, Assoc.-M.Inst.C.E.; "The County Management and Maintenance of Main Roads," by E. P. Hooley, Assoc.-M.Inst.C.E.; and "Traction Engines and their Effect on Roads and Buildings," by J. H. Burton. The annual dinner will take place at Eberle's Restaurant, Eberle-street, in the evening. On the second day, Friday, June 27, there will be visits to the Docks, to the abattoirs at Birkenhead, and to the Mersey Tunnel; arrangements having been kindly made by Sir Douglas Fox, the Engineer, for an inspection of this work. On Saturday, June 28, the members will visit the Salt Water Baths, Pierhead; the Electric Lighting Station, Highfield-street; the Liverpool Hydraulic Power Company's Athol-street Pumping-station, passing Artisans' and Labourers' Dwellings, Cancaus-terrace, and Juvenal-street; St. George's Hall; passing the Walker Art Gallery, the Free Library and Museum; the New Royal Infirmary (work in progress); and the "Walker Engineering Laboratories; and, if time permits, will drive round Sefton Park.

Civil and Mechanical Engineers' Society.—The members of this Society, under the guidance of the President, Mr. Henry Adams, visited the Broad-street Goods Station of the London and North-Western Railway Company on the 12th inst. They were received by Mr. David Stevenson, and shown round by Mr. Hignett, of the Locomotive Department, and Mr. Carston, of the Goods Department. This station, being arranged in the heart of the City of London, was constructed under some difficulty. It extends beneath the whole of the Broad-street, Passenger Station, and some distance beyond. On this side the goods are received for transmission by rail; they are sorted out and loaded into trucks, which are then raised to the upper level and made up into trains. There is a large open yard, and on one side a warehouse of several floors, where the goods arriving by rail are received for distribution. A few of the trucks run over a viaduct into the warehouse upon one level, but the majority have to be brought from and returned to the upper level by means of 14-ton hydraulic wagon hoists working at the rate of fifty lifts per hour. These hoists, made by Sir William Armstrong & Co., are ingeniously arranged with a constant pressure cylinder alongside the vertical lifting cylinder, but with a smaller diameter, in order to nearly counterbalance the heavy platform upon which the trucks are carried, so that no water is expended in lifting the dead-weight, being simply forced back into the accumulator when the lift descends. There are five pumping-engines of 50 effective horse-power, each supplying the water pressure of 730 lb. per square inch, these being until recently the standard pattern adopted over the whole of the London and North-Western Railway system, so that all parts might be interchangeable. They are automatically regulated by the rise and fall of the accumulators, the supply of power being thus exactly equal to the demand, and determined by it. The capstans, cranes, jiggers, and lifts were all seen in work, and the various details of the mechanism were fully explained to the visitors. Before leaving, a hearty vote of thanks was passed to the officials of the Company, not forgetting the veteran Biggs, under whose charge the machinery has been from its first inception, twenty-two years ago.

Sanitary Congress at Brighton.—The following arrangements have been made by the Sanitary Institute for the Congress and Exhibition at Brighton, which commences August 25.—President, Sir Thomas Crawford, K.C.B., M.D.; Hon. Treasurer, the Mayor of Brighton; Hon. Secretary, A. Newsholme, M.D., D.P.H.; President, Section I, "Sanitary Science and Preventive Medicine," George Vivian Poore, M.D., F.R.C.P.; President, Section II, "Engineering and Architecture," Professor Roger Smith, F.R.I.B.A.; President, Section III, "Chemistry, Meteorology, and Geology," Mr. Wm. Topley, F.R.S., F.G.S.; Conference of Medical Officers of Health, President, A. Newsholme, M.D., D.Ph., M.O.H.; Conference of Inspectors of Nuisances, A. Carpenter, M.D., M.R.C.P. (President). The arrangements also include a *conversazione* in the Pavilion Building, a lecture to the Congress by W. H. Preece, F.R.S., and excursions, and an address to the working-classes by B. W. Richardson, M.D., LL.D., F.R.S. The meetings of the Congress and Exhibition will be held in the Pavilion Buildings.

The Claybury Asylum, near Woodford. On the 12th inst., Lord Rosebery, Chairman of the London County Council, laid the foundation-stone of the new pauper lunatic asylum for London. We published a view, plan, and description of this extensive building in our issue for November 23 last year. Mr. G. T. Hine is the architect, and Messrs. Gahbutt & Co., of Liverpool, are the contractors, the amount of their contract being 337,945*l.* Accommodation is to be provided for 2,000 inmates. Lord Rosebery incidentally mentioned that pauper lunatics in London were now increasing at the rate of 400 a year. If that rate were maintained they would require to erect another such "palace of desolation" every five years!

New Central Telegraph Factory, Coldhath-fields.—We understand that the tender of Messrs. Treasure & Son, of Shrewsbury and London, has been accepted for the Government Telegraph Factories and Water Tower, on part of the site of Coldhath-fields Prison. The architect is Mr. Henry Tanner, of H.M. Office of Works.

A Discussion on a Certificate.—At a recent meeting of the Chelmsford Town Council, a certificate was presented from the Borough Surveyor (Mr. C. Fertwe) for the payment of 800*l.* to Messrs. Longley, the contractors for the new water tower, but it was decided to defer payment until the receipt of further particulars from the Surveyor as to the amount still due to the contractors. At a subsequent meeting of the Town Council, the Surveyor wrote:—"With regard to my certificate for 800*l.* to be paid to Messrs. Longley & Co., on account of their contract, while I am willing to afford any explanation to the Council and the contractors, my position is such under the contract that I decline to receive dictation with regard to my action from either party. The works are practically completed, but unfortunately I was unable personally to examine and report before leaving home. The payments as set forth in the contract amount to 3,818*l.* 5*s.* during the progress of the works, and 763*l.* 13*s.* within three months of completion, making in all 4,581*l.* 18*s.*, of which some 3,500*l.* has been already certified for, leaving 1,081*l.* 13*s.* now due, from which I have deducted 281*l.* 13*s.*, and this, together with 509*l.* 2*s.*, payable six months hence, will, in my judgment, amply secure the interests of the Council and meet all contingencies and penalties arising out of the contract, or which could be recovered from the contractors." Alderman Dutton proposed that the certificate be at once honoured, and after some discussion it was decided by 7 votes against 4 to pay the 800*l.*

Classes and Examinations for Plumbers.—The steady progress made by the plumbing classes is one of the most satisfactory features of the movement for the registration and training of plumbers. Among the latest and most successful classes is that established last Session at Greenock in connexion with the District Council for Glasgow and the West of Scotland. This class, which commenced in October last, and has just terminated for the Session, was held at the Mearns-street Public School. A report which the teacher of the class has furnished to the District Council shows that out of the total number of thirty-six students the average attendance was thirty. The happiest results have been visible in the greater intelligence manifested by the rising generation of plumbers in executing their work. During the preceding Session many of the students in the Greenock class were given elementary instruction in the plumbing class connected with the Glasgow Technical College, and they have, therefore, received advanced instruction in the Greenock class during last Session. The result of the examinations held at the close of the Session was eminently satisfactory, the students taking the second and fifth prizes, out of five prizes with medals offered to plumbing students in the United Kingdom.

Sanitary Appliances and Builders' Ironmongery.—From Messrs. Young & Marten, of the Caledonian Works, Stratford, we have recently received an illustrated catalogue and price-list of baths, lavatories, water-closets, urinals, sinks, and countless other appliances and fittings, including plumbers' brass-work, ventilators, &c. Accompanying this catalogue was Messrs. Young & Marten's illustrated "Tariff No. 13," illustrated with selections of stock articles in the shape of stoves, gas-fittings, chimney pieces, and builders' ironmongery, of which the wholesale trade prices are quoted. The two catalogues are very conveniently arranged, and will be found to include fittings to suit all tastes and requirements. We may specially call attention to the "steamless and noiseless" baths and lavatories which are figured in the first-named catalogue, and which are excellent in every respect. The two catalogues taken together form a comprehensive whole, and may be advantageously studied by architects and builders, and those who, being "about to build," desire to count the cost.

Nineteenth Century Art Society.—We are asked to mention that the One Hundred Pound Prize of the Art Union of London has been selected from the Nineteenth Century Art Society's Exhibition in Conduit-street. The work is by Mr. Hamilton Marr.

New Baths for St. George's, Hanover-square.—In our account of this new building last week (see p. 432), we inadvertently omitted to say that the clerk of the works was Mr. John Herbert, C.W.A.

Tectolith.—In mentioning this new material in a "Note" in our last issue (page 428) we observed that while high results were said to have been obtained from it at Mr. Kirkaldy's testing works, the results of these tests had not been forwarded to us. We have since received the papers of the tests referred to, and we give the following extracts from them:—

BERKHAMPTSEAD.—For the erection of a villa residence at Berkhamptead, for Mr. S. Rowland Trueman, Mr. James F. Goodley, architect, 2, Victoria-chambers, Colchester:—

C. Miskin, St. Alban's £2,318 0 0
H. & J. Mathews, Berkhamptead 2,072 0 0
W. Smith, Tring 1,878 0 0
Co-operative Builders, Brixton 1,790 0 0
O. Dobson, Colchester 1,748 0 0
F. Dupont, Colchester (accepted) 1,672 0 0

BERMINGHAM.—For erecting new Bar and Throat Hospital, Edmonstone street, for the Building Committee, Messrs. Jethro A. Cassin & Peacock, architects, 33, Colmore-row, Birmingham. Quantities by Mr. George Kenrick:—

Table with 3 columns: Builder, Extra for facings, Total. Includes entries for S. Surman & Sons, H. J. Moffatt, H. Lovatt, etc.

BOURNEMOUTH.—For proposed alterations to Linden Vale, Christchurch-road, Bournemouth, for Mr. J. T. Exton, Messrs. Lawson & Donkin, architects and surveyors, Bournemouth. Quantities supplied:—

Table with 3 columns: Builder, Extra for facings, Total. Includes entries for McWilliam & Son, W. Hoare, George & Harding, etc.

BOURNEMOUTH.—For proposed stable, Denbigh Lodge, for Mr. A. Jones, Messrs. Lawson & Donkin, architects, Bournemouth:—

Table with 3 columns: Builder, Extra for facings, Total. Includes entries for F. Hoare & Son, Barrow & Entwistle, etc.

GARSTON (Liverpool).—For erecting a new Jubilee Church Institute at Garston, for the Rev. T. Oliver, B.D., Mr. H. T. Waklam, Assoc.-M.Inst. C.E., architect, May Cottage, Allerton, Liverpool. Quantities supplied:—

Table with 3 columns: Builder, Extra for facings, Total. Includes entries for Turner & Moss, Garston, C. Curt, Wellington-road, Liverpool, J. Williams, Garston, etc.

LEYTONSTONE.—For building the "Red Lion Hotel" and four shops, High-road, Leytonstone, Essex. Mr. W. D. Church, architect, 12, South-place, Finsbury, E.C. Quantities by Messrs. C. Stanger & Son, 21, Finsbury-pavement, E.C.:—

Table with 3 columns: Hotel, Shops, Total. Includes entries for J. Johnstone, Kilby & Gye, J. Marsland, etc.

LONDON.—For proposed alterations to premises, Nine Elms-lane, S.W., for Messrs. Underwood & Co., Ltd. Mr. John A. J. Woodward, architect. Quantities supplied:—

Table with 3 columns: Name, Amount. Includes entries for Jones, Higgs & Hill, Leggy Bros., Ford, etc.

LONDON.—For rebuilding the "Primrose" No. 53, Oxford-street, W., for Mr. W. G. Dickinson, Mr. Edward Clark, architect, 432, West Strand, W.C.:—

Table with 3 columns: Name, Amount. Includes entries for Drew & Adams, C. F. Kearley, E. Toms, etc.

LONDON.—For building warehouses, Golden-lane, E.C. Mr. C. J. C. Pawley architect. Quantities by Mr. W. Walter Browne, 1, Boxworth-grove, Barnsbury, N.:—

Table with 3 columns: Name, Amount. Includes entries for J. R. Hunt, St. Paul's-road, Bow Common, C. Simmons, etc.

LONDON.—For pulling down and rebuilding Nos. 460 and 471, Bethnal Green-road, for Mr. Alderman Evans, Mr. Rowlandson, architect:—

Table with 3 columns: Name, Amount. Includes entry for A. Hood, Bethnal Green (accepted) £2,450 0 0.

LONDON.—For the erection of a detached house on "The Frogmal Mansion Estate," Hampstead (exclusive of stoves, mantel-pieces, painted glass, mosaic, painting, papering, and decoration). No quantities supplied. Mr. James Neale, F.S.A., architect and surveyor, 10, Bloomsbury-square, London, W.C.:—

Table with 3 columns: Name, Amount. Includes entry for Allison & Koskett, Hampstead £2,000 0 0.

LONDON.—For alterations and additions to the "Salisbury" Hotel, Fulham, S.W., for Mr. James H. Squires, Mr. H. I. Newton, architect, 49, Victoria-street, Westminster, S.W.:—

Table with 3 columns: Name, Amount. Includes entries for Tirk & Randall, Woodwich, Patman & Fotheringham, etc.

LONDON.—For alterations, &c., to the "Lord Elgin" Hotel, Elgin-square, Maidstone, W., for Messrs. Rolfe & Co. Mr. H. I. Newton, architect, 49, Victoria-street, Westminster, S.W.:—

Table with 3 columns: Name, Amount. Includes entries for Todd & Hackney, J. Tjerman, S. Godden, etc.

LONDON.—For alterations and additions to the "Red Lion" Waltham Green, S.W., for Mr. James H. Squires, Mr. H. I. Newton, architect, 49, Victoria-street, Westminster, S.W.:—

Table with 3 columns: Name, Amount. Includes entries for Turtle & Appleton, Clapham Junction, F. Mark, Edgware-road, etc.

LONDON.—For repairs and alterations to the South-wark Wesleyan Chapel, for the South London Wesleyan Mission, Mr. F. Boreham, architect, 75, Finsbury-pavement:—

Table with 3 columns: Name, Amount. Includes entries for Goodman, Castle, Goad, etc.

LONDON.—For pulling down and rebuilding the "William the Fourth" Tavern, Vauxhall-cross, for Messrs. Thorne, Messrs. Lee Bros. & Pain, architects. Quantities supplied:—

Table with 3 columns: Name, Amount. Includes entries for Roberts, Gregory & Co., Turtle & Appleton, etc.

LONDON.—For erecting a boundary-fence between Parliament Hill, Hampstead, and Lord Mansfield's property, in accordance with the terms of the Hampstead Heath Enlargement Act, for the London County Council:—

Table with 3 columns: Name, Amount. Includes entries for Wilson & Watson, J. Wood, J. Stanning & Son, etc.

LONDON.—For rebuilding premises Nos. 383, 385, 387, and 389, Commercial-road E., for Mr. G. F. Bence, Messrs. H. S. & C. A. Legg, architects, Mile End. Quantities by Mr. W. Hawker:—

Table with 3 columns: Name, Amount. Includes entries for Henric & Son, F. & F. J. Wood, Ashby & Horner, etc.

LONDON.—For the erection of Christ Church Mission Church and caretaker's premises on the site of 612, Old Ford-road, Bow, E. Messrs. Walter A. Hills & Son, architects:—

Table with 3 columns: Name, Amount. Includes entry for Coleman, Ward, Clarke, & Co., etc.

LONDON.—For repairs, &c., at the "Yorkshire Grey Tavern," 124, Great Suffolk-street, South-wark, for the directors of the Hatcham Brewery, Mr. W. E. Potter, architect:—

Table with 3 columns: Name, Amount. Includes entries for D. Dawes, Peckham, T. Channing, etc.

LONDON.—For alterations and additions to No. 16, Woodchurch-road, Priory-road, West Hampstead, N.W., for Mr. L. Wood, Mr. Walter J. Ebbetts, architect, Naylor's House, 115, Strand, W.C.:—

Table with 3 columns: Name, Amount. Includes entries for Teten & Sons, South Kensington, Macey & Sons, Strand, etc.

LONDON.—For internal fittings, &c., for the "Anchor and Hope" Fore-street, E.C. Mr. C. J. C. Pawley, architect, 68, Victoria-street, Westminster:—

Table with 3 columns: Name, Amount. Includes entries for Geo. Stephenson, Turtle & Appleton, F. Gill, etc.

LONDON.—For paving the Fulham-road with wood-paving from "The George" Waltham Green, to Putney Bridge (20,056 square yds.) for the Vestry of Fulham, Mr. James P. Norrington, Surveyor:—

Table with 3 columns: Name, Amount. Includes entries for Improved Wood-Paving Co., Newell & Robson, T. H. English, etc.

LONDON.—For tarp-paving two paths and forming three cinder-paths, with gullies, &c., on Peckham Rye, for the London County Council:—

Table with 3 columns: Name, Amount. Includes entries for James Bowles, Thomas Adams, W. E. Constable & Co., etc.

LONDON.—For making-up and paving Dobly-road, for the Vestry of Fulham, Mr. W. Skyes, New Streets Surveyor:—

Table with 3 columns: Name, Amount. Includes entries for Nash, Fulham, Greenham, Hammermith, etc.

LONDON.—For alterations and additions to the "Lord Elgin" Hotel, Elgin-square, Maidstone, W., for Messrs. Rolfe & Co. Mr. H. I. Newton, architect, 49, Victoria-street, Westminster, S.W.:—

Table with 3 columns: Name, Amount. Includes entries for Todd & Hackney, J. Tjerman, S. Godden, etc.

LONDON.—For alterations and additions to the "Unicorn," Vivian-road, Old Ford, for Messrs. Beach Bros. :— A. Hood, Bethnal Green (accepted). £223 0 0 [No competition.]

LONDON.—For the erection of a public staircase, for Messrs. Francis & Son, Limited, Clapham Junction. Mr. J. Sawyer, architect, 63, Chancery-lane, W.C. :— Carmichael, * Wandsworth-common £190 0 0 * Accepted.

PRESTATYN (North Wales).—For the erection of a house, "Bryn Hyryd," for Mr. F. J. Smith, Chester. Mr. J. H. Burton, architect, Ashton-under-Lyne :— J. Mayers, Chester £502 5 0 Jones & Roberts, Rhyl 790 0 0 W. Williams, Idlyl 753 0 0 S. Foulkes & Sons, Rhyl 680 0 0 Griffiths Eames, Prestatyn 610 0 0 G. Wright & Sons, Chester* 580 0 0 * Accepted subject to certain alterations.

SHEERNESS.—For the erection of news-shop, &c., at Sheerness. Mr. James F. Goodey, architect, 2, Victoria Chambers, Colchester :— Rollason Bros. Eastbourne £5,072 0 0 E. P. Hughes, Sheerness 6,413 0 0 Grimwood & Son, Sudbury 5,632 0 0 G. Dawson, Colchester 5,338 0 0 L. Seager, Sittingbourne 5,575 0 0 F. Dupont, Colchester 5,575 0 0 Co-operative Builders, Barton-road, Eriston, S.W. (accepted) 5,365 0 0

SOUTHEND-ON-SEA.—For the erection of stables at Florence Villa, Southend, for Mr. T. Hudson. Mr. W. J. Wood, architect, 1, Finsbury-circus, E.C. :— Darke & Son, Southend £324 0 0 Dupont, Colchester 287 0 0 Woodhams, Southend (accepted) 237 0 0

SOUTHEND-ON-SEA.—For the erection of house and offices at Southend, for Mr. Walter J. Wood, architect. Quantities by Mr. Henry Bushell, 1, Finsbury-circus, E.C. :— Baker & Wiseman, Southend £502 10 0 Woodhams, Southend 797 0 0 Orfer, Colchester 795 0 0 Dupont, Colchester 735 0 0 Edmunds, Poplar (accepted) 715 0 0

SOUTHEND-ON-SEA.—For repairs, &c., 15, Royal-terrace, Southend Essex, for Mr. J. Taylor. Mr. W. J. Wood, architect, 1, Finsbury-circus, E.C. :— Woodhams, Southend (accepted) £113 0 0 (Drainage, sanitary work and fittings extra.)

SOUTHEND-ON-SEA.—For the erection of stables at "Ernesbrake," Southend, Essex, for Mr. J. Baldwin. Mr. W. J. Wood, architect, 1, Finsbury-circus, E.C. :— Woodhams, Southend (accepted) £208 0 0

TOTTENHAM.—For the erection of school buildings for 975 boys and infants, for the Tottenham School Board. Mr. Edward E. Ellis, architect. Quantities by Messrs. D. Campbell & Son :— Willmott & Sons £11,439 0 0 Lewis 11,400 0 0 Longley 11,100 0 0 Linzell 11,000 0 0 Porter 10,795 0 0 Brass & Son 10,465 0 0 Selmon & Co. 10,460 0 0 Kilby & Grayford 10,450 0 0 Watson 10,250 0 0 Chappell 10,247 0 0 Treasure & Son 10,230 0 0 Lawrence & Sons 9,907 0 0 Nighthale 9,980 0 0 Flew & Co. 9,970 0 0 Fairhead & Son 9,900 0 0

SUBSCRIBERS IN LONDON and the SUBURBS, by prepaying at the Publishing Office, 12s. per annum (or 4s. 9d. per quarter), can ensure receiving "The Builder" by Friday Morning's post.

TERMS OF SUBSCRIPTION. "THE BUILDER" is supplied direct from the Office to residents in any part of the United Kingdom at the rate of 12s. per annum. Foreign, to all parts of Europe, America, Australia, and New Zealand, 20s. per annum. To India, China, Ceylon, &c., 30s. per annum. Remittances payable to DOUGLAS FOURDRINER, Publisher, No. 45, Catherine-street, W.C.

TO CORRESPONDENTS. W. M. C. & Son.—H. H.—F. M.—P. E. (thanks).—K. D. Y.—C. W. W. (we cannot see any novelty in this to claim mention).—A. J. (we never do public notices of that kind).—Central London Railway Bill (we can take no notice of anonymous communications).—Dunlop Railway (we have already published notice of it).—H. A. G. (no space).—E. H. L. B. (shall have attention). All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses. Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond mere news-items) which have been duplicated for other journals are NOT DESIRED. All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES. Registered Telegraphic Address, "THE BUILDER, LONDON."

CHARGES FOR ADVERTISEMENTS. SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS. Six lines (about fifty words) or under 4s. 6d. Each additional line (about ten words) 1s. 6d. Terms for Series of Trade Advertisements also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c., may be obtained on application to the Publisher. SITUATIONS WANTED. FOUR Lines (about thirty words) or under 2s. 6d. Each additional line (about ten words) 1s. 6d. PREPAYMENT IS ABSOLUTELY NECESSARY. * * * Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Cornhill, W.C. to DOUGLAS FOURDRINER, Publisher. Addressed to No. 45, Catherine-street, W.C. Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY, but those intended for the front page should be in by the same hour on WEDNESDAY.

SPECIAL. ALTERATIONS IN STANDING ADVERTISEMENTS OR ORDERS TO DISCONTINUE same must reach the Office before TEN o'clock on WEDNESDAY morning. The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the LATER COPIES ONLY should be sent. PERSONS Advertising in "The Builder" may have Replies addressed to the Office, No. 45, Catherine-street, W.C. Free of charge. Letters will be forwarded if addressed in envelopes are sent, together with sufficient stamps to cover the postage.

AN EDITION Printed on THIN PAPER, for FOREIGN and COLONIAL CIRCULATION, is issued every week.

Now ready. READING CASES, {By post (carefully packed), 1s.

The Sheffield Municipal Buildings: Second Competition.

HE six designs submitted in the second competition for the Sheffield Municipal Buildings have been exhibited this week in the Mappin Art Gallery. The architects who

were selected to take part in the second competition were (we give them alphabetically) Messrs. Flockton & Gibbs (Sheffield); Messrs. Harvey and Bernard Smith, in conjunction (London); Mr. Hare (London); Mr. Lindsay (Glasgow); Mr. E. W. Mountford (London); and Mr. Tulloch (London). Mr. Waterhouse, the assessor, reported on Thursday last week in favour of the design of Mr. E. W. Mountford, but the formal acceptance of the choice was not confirmed by the Town Council till their meeting on Monday last,* when, after a desultory discussion on various points connected more or less distantly with the immediate object of the meeting, the decision of the assessor was accepted by a majority of 39 to 12, 3 members declining to vote. We gather from the nature of the discussion, however, that the division in the voting did not arise so much from any question as to the acceptance of the design selected by the assessor, as from differences of opinion as to whether it was advisable to erect such a building at all at present, on which subject there seems to have been a good deal of party warfare in the Council.

The perspective view and the two principal plans of Mr. Mountford's design are published in the present number, and a considerable portion of the architect's report is reprinted in another column, which will sufficiently explain his intention in regard to plan and design. The design we think exceedingly suitable for the purpose and situation of the building. It is eminently municipal in character, and proclaims itself unmistakably in that sense; it is dignified without losing picturesqueness; and considering that a tower of very large dimensions and striking character

could not have been included for the limits of cost desired by the corporation, the idea of placing it rather in a side position, as a picturesque addition, is a good one; though we rather like to see a tower represent something more decisive on the plan than is the case here, nor can we quite see that the tower grows out of the plan, as the architect claims (and justly) that his design does in general; it seems to us rather to be utilised on the plan afterwards, as a place for strong rooms, &c. The upper portion of the tower, with its rather crowded treatment as contrasted with the plain stalk below, is very picturesque: it is worth notice in passing how commonly this idea of a tower has come to be accepted by the present generation of architects, as the means merely of raising a picturesque bit of architecture high in the air, the main portion of the tower being treated plainly and regarded merely as affording the element of height and verticality. Ruskin was to some extent responsible for starting this kind of view of the function of a tower, for which he adduced the example of the early Italian campaniles, and there is much to be said for it; it is an almost unerring means of giving character to a tower, and at less cost than in the case of a tower carried up with the same degree of richness from the ground; but the latter type, when it can be afforded, has its characteristic beauties also, and must not be despised. The open loggia in connexion with the suite of entertaining rooms is a good feature both in plan and architecturally, and fills up the angle by the tower agreeably. Mr. Mountford has not overdone his building with sculpture, and the amount which he has shown is (see the report) proposed to be carried out with a distinct illustrative intention which will give the more interest to it; but we doubt whether even this moderate amount will come into the "80,159.2"; the question was asked at the Council meeting, we perceive, and no reply was forthcoming. Tenpence per foot is not a large price for a building of this class, and if it is to be carried out within the stipulated sum we think it will be, as Mr. Waterhouse cautiously remarked, "with care." There is one little detail we may suggest for improvement (as the author modestly appends to his report the remark that the plans and design must only be considered as first sketches capable of much improvement), that is, the finials to the balustrade piers over the plasters. Surely it is time we endeavoured

to vary a little the small choice between vases and decanter-stoppers, which seems to be all that modern architecture affords us.

In regard to the plan, the arrangement of the Mayor's entertaining-rooms *en suite* along the Pinstone-street front appears the only one which the conditions of the competition admitted of. From the placing of the accountant's public office close to the central entrance from Pinstone-street, we presume the author entirely threw over the idea of making this in any way a state entrance. The arrangement for access to the accountant's office is convenient enough in itself, but we should have thought the motley crowd who will assemble there at rate-receiving times were more suitably kept away from the principal entrance. That is a matter, however, of taste rather than convenience. We presume that the principal staircase, however, will be kept mainly as a special staircase for Councillors and for use at receptions, as it leads into the very middle of the state-rooms and Council Chamber portion of the building. The Council Chamber is in exactly the right place, facing the quiet side of the site, and with good windows and not dependent only on roof-lighting. The arrangement by which each department lies wholly between two staircases or entries, so as to be reached from any one of them without going past any other department, is of course a good one, but appears to be almost a matter of course in planning such a building; too obviously so to be made a special claim. The plan is very compactly arranged, and simple in its lines of traffic, but there are points in it which we cannot concur in. In the first place we have always been of opinion that a mistake was made in the "Instructions" in ordering the lavatories for ladies and gentlemen in connexion with the reception-rooms to be placed upstairs. The result of this must inevitably be that at a reception the staircase cannot be a state staircase at all; it will be practically part of the street; guests will be coming up it in cloaks and coats and hats, instead of getting rid of these below and ascending the staircase *en grande tenue*. A state staircase is part of the dignity of a reception; but with the cloak-rooms placed above this must all vanish. The position of the ladies' cloak-room, opening right off the main corridor, seems to us extraordinary; it would have been quite easy to have made a small lobby and entrance round the corner to it, over a small part of the auditor's room. The

* We should nevertheless have stated last week Mr. Waterhouse's decision in favour of Mr. Mountford, had it not been for the eccentricities of a London Post-office, whose messenger failed to deliver the Borough Surveyor's official telegram, sent in good time, till it was too late to be of any service. The fault is admitted as theirs by the Post-office manager.

ante-room to the Council Chamber is not in the proper sense an ante-room, which should be a room interposed between the main room and the outer corridor to give greater quiet and privacy, and afford a neutral ground for meeting and conversation. The Mayor might have claimed a private stair from the street; and he has to traverse the whole length of the Council-chamber to arrive at his chair of state. The committee-rooms are placed on the noisy and not on the quiet side of the building. But what surprises us most is the immense distance which separates the Town Clerk's private office from the Mayor's private room. If the Town Clerk wishes to consult the Mayor, he has to traverse nearly the whole length of two sides of the building. Surely this is not as it should be. If the Council of Sheffield are satisfied with this plan, of course no one has any right to complain; it certainly seems to us to be open to a good many minor objections of this kind, when regarded with a view to its special functions, though no doubt a well-arranged plan in regard to general principle. We think also that it might have been possible to have arranged for future extension so as not to leave the building with an unfinished appearance, as this must have on the Cheney-row side.

Mr. Hare's plan reverses the arrangement of the principal suite of reception-rooms, placing the Mayor's parlour at the Surrey-street end, and the dining-room at the Cheney-row end. The Mayor's parlour seems unnecessarily large and the reception-room too small; the dining-room would be a fine room: but the author evidently takes a different view of the functions of the Mayor's parlour, regarding it as for use only on State occasions, he gives the Mayor a small sitting-rooms on the Cheney-row side, between the Town Clerk's room and the Council-chamber; this is convenient enough in itself, but unless it is to be regarded only as a retiring-room from the Council-chamber, and to be reached through it, it is in a very out-of-the-way part of the building. The Borough Accountant's office is L-shaped, with a large entrance adjoining it on the Surrey-street side, but the counter space for the public is not large enough. The Town Clerk is hidden away at the back of the building; he should be as central and accessible as possible from the principal entrance; he is the mainspring of the Corporation business. The committee-rooms are all on the wrong side for quiet, Surrey-street side, except one which appears to be regarded as a kind of state committee-room, placed on the Cheney-row side, close to the state dining-room, with which it has nothing to do, and with a most roundabout access from all the departments to which the labours of a committee might bear relation. The ante-room is properly placed, and is a real ante-room; the ladies' cloak-room opens out of it, and as on reception occasions the council-room would be closed, this would do well enough, but the gentlemen's room should not open exactly opposite to it. It is strange how these little matters of arrangement are so constantly overlooked. It seems odd that as nearly two entire sides of the Council-chamber are outside walls, it should not have occurred to the author to give the Councillors some windows to look out of.

The tower is placed very much in the same position as in Mr. Mountford's design, and, as in that, is only used for accessory rooms, a plan-room on the ground-floor, a mayor's robing-room (in connexion with Mayor's parlour) on the first floor. There are affinities of style between this and Mr. Mountford's design; the tower is not so good, but the Pinstone-street front we prefer; the drawing is not one to do full justice to it, but it is very dignified in treatment and would have had a fine effect in execution. The author adopts the device of strengthening and projecting the ends of the facade and retiring the centre portion; the ends have two large gables richly treated, and a large and lofty oriel window is corbelled out from each, these windows forming the main

ones of the Mayor's parlour and the dining-room. In the centre portion the lower story is kept rather plain, with mullioned windows; the main story has deeply recessed arches between pilasters, with mullioned windows occupying part of the wall plane in the rear of the arches. The author understands the value of the contrast afforded by massing the windows and having plenty of expanse of plain wall space; and also the value of a strongly marked continuous horizontal line, formed by the cornice with triglyph frieze which runs continuously along the wall between the ground and first floor stories. Altogether this is a very fine building as an architectural design, though we think the plan far inferior to the design.

Messrs. Harvey and Bernard Smith adopt a plan which fills up the whole site as nearly as possible, following the outline of the ground, with unbroken corridors running right round on the ground-floor; but on the first floor the main staircase and its landings is entirely cut off from all corridor communication with the rest of the building, merely leading to the Council-chamber and reception-rooms. This seems to us a great defect. The business corridors at the side communicate direct with doors into the Mayor's parlour and the dining-room, one at the end of each long corridor; a very naive arrangement, convenient for the Mayor's parlour, but utterly unnecessary as far as the dining-room is concerned. The Council-chamber, top lighted, is placed in the centre across the building between the corridors. The staircase to public gallery of the Council-chamber is not from the street, but from one of the ground-floor corridors; close to an external entrance, however. The plan is a very inartistic one, there is no effect or climax in it at all; it is simply spaces cut up into rooms; the ante-room to the Council-chamber is placed in the most ineffective manner, a long room turned end on to the entrance-door of the Council-chamber, so that it becomes a sort of passage, an effect which is increased by its being preceded by another lobby of the same width, out of which the cloak-rooms open. On the other hand, the plan has some practical merits: the committee-rooms are all ranged in a row on one corridor on the Cheney-row side (the quiet side), and are easily accessible from the council-chamber; and the Town Clerk is put close to the Mayor's private rooms as well as near the council-chamber. The two doors right off the corridor, however, into one end of the council-room, practically do away with all the good of the ante-room at the other end, which should be a kind of buffer between the Council-chamber and the ordinary business traffic of the building. The ground plan is a great deal better arranged than the first-floor plan, except as to the rates office; there would be a great crush in the corridor on rate-paying days. But the authors seem to have no feeling for the art of planning, as distinguished from mere arrangement. The place of their design in the second competition is probably in great measure owing to its principal elevation, which is a good one of the chateau type, with a strongly rusticated ground story, and a pilaster order above, with lofty roofs above; a pavilion at each end and a roof a little lower, but accentuated with a ridge turret, in the centre. The windows are mullioned, with cornices and decorative friezes over them. There is no tower in connexion with the principal front, but a small and graceful tower breaks the line of the Surrey-street front and marks one of the principal entrances.

Mr. Lindsey submits a classic design with a tower in the same position as in that of Mr. Mountford, set back from the Pinstone-street front with one side facing and shutting on Surrey-street, and rising immediately behind (in this case) the Mayor's parlour. The whole design has been kept very simple, and with strongly-marked horizontal lines. The Pinstone-street, or principal front, has a circular-headed entrance in the centre, approached by a broad

flight of steps, the Mayor's reception and dining-rooms being lighted by seven large windows set between single partly-engaged columns of what appears to be the Composite order. At each end the front is brought forward slightly and finished with a low pediment, the whole being connected by a balustrade which is carried over the central portion of the frontage. The tower, 25 ft. square, is of two stages above the roof of the Pinstone-street front. It has broad angle pilasters and a single arched opening in each face with a balcony in front. No clock is, however, shown. The pilasters are finished with angle turrets, which are connected with the central lantern by radiating walls. The top is finished with what may be styled an egg-shaped dome. In the Cheney-row and Surrey-street elevations the horizontal lines in the design before mentioned are very apparent. The centre of the Surrey-street front, and the portion facing Norfolk-street, have been carried up a story higher than the others, and are devoted, the former to the offices of the Sewage Department, and the latter to spare offices. The public entrance to the offices has been placed in the centre of the Surrey-street elevation, and is treated in almost an exactly similar way to the main entrance. The plan may be roughly described as an irregular square, occupying the eastern half of the site, with the Surrey-street side prolonged to its full extent. The Cheney-row front has been only partially used, the half towards Norfolk-street being left for extensions. In the centre of this square, the Council-chamber has been placed at right-angles to the Grand reception-rooms, around it and the two open areas between which it is placed runs a corridor communicating with the various offices and committee rooms. On the ground-floor is the large entrance hall with gentlemen's and ladies' lavatories immediately in front (under the Council-chamber), some of the Water offices on the left, and the Health offices on the right, the Borough Surveyor's offices being placed at the further half of the Surrey-street side. The lower ground-floor, entered from Surrey-street, has the principal Water offices on the right (some top-lighted from the area) and the Borough Accountant's department on the left. The Council-chamber is shown with a domed roof, and has a public gallery at the south end within easy access of the public entrance in Surrey-street.

The design bearing the name of Mr. James Tulloch is Renaissance, with a free use of ornament in portions of the chief front. The principal front towards Pinstone-street has three large gables flanked by octagonal turrets, and a central entrance. The tower here occurs in the same position, and, with the exception of a small oriel on the Surrey-street front, which lights a serving-room, it rises well above the roofs, without windows, the sides being relieved by shallow pilasters. Up to the main cornice it is square on plan; above this it rises in three stages, octagonal, with open arcades, and a dome finishing the whole. The Surrey-street elevation has four gables, between which are octagonal turrets. The plan shows the whole site covered by buildings. No doubt this has been partly rendered necessary by the amount of space given to the hall and staircase, which has pushed back the Council-chamber to the centre of the site. This arrangement gives three spacious courts, which light the corridors, but it results in the extension of the whole scheme considerably. The Town Clerk's office, and those of the Water and Health departments, are on this floor, but some of the rooms of both these latter are also found on the ground-floor, which does not seem to us a good arrangement. The Borough Surveyor's rooms are also divided.

Messrs. Fleckton & Gibbs propose an altogether different treatment of the site and arrangement. The building has been put diagonally on the site with the chief entrance facing the moulding. In plan it may be described as a cross with a block of buildings at the end of each arm, these blocks being joined together by octagonal turrets, two

(those on the chief front) being used as official staircases, and the other two as lavatories on the various floors. As less ground is covered greater height has become necessary, and there are two mezzanines placed below and above the principal or first floor. The entrance is under a lofty tower, the hall extending directly in front of it, with the staircase at its further end, forming two arms of the cross. On the first floor the Council-chamber is opposite the top of the grand staircase, and the reception-rooms are at right-angles to it, forming the other two arms of the cross. Committee-rooms are also arranged on this floor. On the lower ground-floor are the Health and Waterworks departments, some of them being top-lighted. The lower mezzanine is devoted to the offices of the Borough Surveyor and the Town Clerk, and the upper to the Sewage offices, and some rooms in connexion with the Town Clerk's offices. The elevation, as may be supposed, varies greatly from those of the other designs in general proportion, there being much greater height for the frontage, and this in itself seems a defect, as it necessitates a greater number of stairs. The future extension has been placed at the Norfolk-street end of the site, detached from the main building, which thus forms a complete design in itself. This is a better way of doing it than omitting a portion from what would be otherwise a complete design. But all things considered, we believe the right choice has been made in the final competition.

GROUND-RENTS.

THE title of the work before us, which is really "Urban Rating," is somewhat misleading, since the book deals chiefly with the subject of the proposed taxation of ground-rents. The object is stated in the preface, and the first chapter deals with "The Origin and Nature of Ground-Rents." Such a book as this fulfils a useful purpose. It is difficult for a general subject such as the taxation of ground-rents to be adequately considered by readers of the daily press. It is one which should be considered impartially in its bearings after reading a careful treatise such as that before us. On the other hand, Mr. Sargent is too much impressed with the importance of his subject, and he often becomes both prolix and pompous. "When suburban land gradually comes into the building market it is very rarely indeed that the landowner possesses the capital and the special knowledge required for the erection of houses; and that being so, he is in general compelled to dispose of it to some other person for the purpose." After this long-winded way of telling us what every one knows,—that landowners often dispose of their property for building purposes,—Mr. Sargent proceeds to inform us that it may be either sold outright or leased. We advert to this fault because books of this kind, if they are to be widely read, ought to be written in a readable manner and as concisely as may be.

As regards the question of the taxation of ground-rents, Mr. Sargent is adverse to the proposal, chiefly on the ground that they already bear a share of taxation. That this is the case is undoubted, and it would be well if persons who speak as if the ground-landlord was unaffected by local rates were to bear this in mind. It is clear, because the amount of taxation which a house has to bear affects the amount of the rent, and thus the rent which the ground-landlord receives is reduced by the amount of taxation which the tenant bears. Examples of this elementary proposition are really not needed; the curious thing is that persons who are comparatively well informed do not appear to realise it. The payment by the ground-landlord is, of course, done indirectly, for a proportion of the taxes which the tenant bears, and which, if

they did not exist, would go into the landlord's pocket, form the contribution of the landlord. It comes to the same thing as if the tenant paid the landlord a higher rent than in fact he does, and the latter were himself to pay a corresponding proportion of the taxes.

But on the other hand it is obvious that ground-landlords are not equally burthened. The hargain which is made when a building-lease is entered into is made, of course, having regard to existing taxation, with probable increase. It is necessarily an approximate calculation only, and if rates and taxes increase faster than the landlord and his lessee expected the occupier may have to pay in one district a larger proportion of taxes than in another, or, again, a larger proportion than the landlord and his sub-lessee contemplated when the contract was entered into. But even admitting this, it is obvious that to tax existing ground-rents would lay a burden on the ground-landlord which he did not expect, and which would in the case of fresh contracts necessarily raise the rents of occupiers, unless it were a portion of the taxes paid by occupiers generally. Because, as we have already pointed out, and as is known to all who have to do with property in land or buildings, the amount of rent which a landlord receives is regulated, to some extent, by the rates and taxes which tenants have to pay.

But apart from this theoretical objection to the taxation of ground-rents, there is a practical objection,—namely, the difficulty of levying it. The owners of ground-rents do not reside on the property as a rule, and, indeed, are often purchasers of the rents from the ground landlord or from intermediate parties, and in order to get at them, it would be necessary for an occupier to refer the authorities to the immediate landlord, and for him to pass them on to the ground landlord or his assigns. The more, in fact, the subject is considered, the more strong do the practical objections to it appear. One of the great objects of all competent financiers is to levy taxes which are most easily collected; a tax on ground-rents would be one surrounded with difficulties, and one which is not required by any urgent necessity. In some respects, also, it would appear to be positively an unjust tax. Thus, if A and B each buys half of a particular estate, and A lets his share out on huddling leases, but B sells his share to the occupiers, A has,—assuming taxation of ground-rents to be in force,—to pay a tax on the interest of his money which comes to him in the shape of rent, whilst B, having invested his purchase-money in stocks and shares, has to pay no such tax (p. 6). The report made last year by the Town Holdings Committee showed that the leasehold tenure was not open to many of the objections urged against it, and, therefore, the question must be asked, why should it be made liable to taxes which would tend to put an end to it? It may be that many of those who are in favour of the taxation of ground-rents would reply that that result is one for which they pray.

It may be just as well also to remind our readers that it would probably in nine cases out of ten offend against a proper constitutional maxim,—viz., that taxation without representation is tyranny. The occupiers of the metropolis are the masters of the local rates, and the ground-landlords have nothing to do with them. Consequently persons would be taxed who had no voice in the levying of the taxes, and instead of taxpayers recognising more fully their responsibility for local taxation they would care less about it. Such a result is one which cannot be too strongly deprecated.

Stapleford and Sandiacre Waterworks.—These works are now commenced, and a good supply of water has been found in the Dunter pump at a considerable depth. A steam-pump has been used to test the quantity of water, and 240,000 gallons a day have been pumped without any appreciable diminution. The engineer to the works is Mr. W. H. Radford, C.E., of Nottingham, and the contractor is Mr. W. Cooke.

NOTES.

THE important trade deputations to the Institute of British Architects, of which we publish a report in another column, were, we may presume, mainly prompted on the part of the trades represented by a desire to escape the cutting down of wages and the sweating consequent upon an extensive employment of the system of subletting, the argument addressed to the Institute of Architects being that this system was also a prominent cause of bad work and scamping. This we can readily believe, though we hope that some of the extreme instances quoted are not of such general occurrence as the deputation would perhaps have wished the architects to think. A case, however, seems to be made out for a serious consideration of the question whether subletting of contracts should or can be disallowed. The question really is whether in the present state of life it is possible to do away with it; of the advisability of putting an end to it if possible we have no doubt at all, as far as good building is concerned. The mischief of the present system of hurry and competition is that the master-builder, who should be the real head of the work, is getting pushed further and further from direct contact with the work, becoming a mere calculator of quantities, and sometimes not even seeing the drawings. That all this, and the hurried erection of buildings by gangs of overtime workmen, is directly adverse to the production of good architecture or good building, we have long felt and said. What is to be feared is that we live in an age when there is no time to consider this, and when every one must go the pace or drop out. But we should welcome an effort to stem the torrent.

THE *Semaine des Constructeurs* for June 21 contains a short leading article by M. César Daly on Architectural Education, drawing attention to what he describes as "a grave cause of error." The substance of the article in brief is this—That there is a "fâcheuse" tendency in many minds to cut up the moving panorama of history into distinct portions, considered without relation to one another; one person hetaking himself to the study of Classic architecture, another to Gothic, another to Renaissance, as if these were unconnected developments of architecture, which is as reasonable as it would be to consider the stages of childhood, manhood, and old age, in a human life, as if each were a separate evolution of the individual. He lays down in substance the following propositions: (1) that each historic style is an integral portion of the whole past of architecture; (2) that no one of these styles can be imposed on modern society as completely satisfactory; (3) that each of the styles having had its own æsthetic principle, that principle cannot be applicable to any other period—we must create our own principle; (4) that such principle must be founded on a co-ordination of all the constant truths of the past with the new truths of our own day. The public, at present so indifferent to architecture, will take a new interest in it when they see it as the art of to-day and not of yesterday. The point of departure, for this end, is to renounce "that detestable system" of confining ourselves to studies of fragmentary portions of architectural history, and looking at only one of the many sides of architectural evolution. "Il faut voir le tout pour voir vrai."

THE annual report of the Society for the Protection of Ancient Buildings presents the same characteristics as usual; an absurd but apparently perfectly unconscious self-complacency, combined with a most amusing frankness in recording all the slights the Society has received from persons upon whom they have pressed their services, e.g.:—
"I am in receipt of your letter from the Society for the Protection of Ancient Buildings. I was perfectly aware of all in that letter previously, and a good deal besides. I beg leave to state that I

* "Urban Rating; being an Inquiry into the Incidence of Local Taxation in Towns." By C. H. Sargent, Barrister. London: Longmans & Co. 1890.

have perfect confidence in my architect, and I mean to alter the church as he and I think fit."

Apparently the idea of the Society is that the publication of such a letter can only redound to the discredit of the writers of it. Some persons, we fear, will think that it is a very natural kind of answer for any man with a grain of spirit to make to the communications of a Society which habitually assumes such an offensive tone of superiority in its communications. If the clergyman (we presume) who wrote that letter really meant to pull about an old church, irrespective of its past history, "as he thought fit," he would be going quite beyond our sympathies; but it does not follow that he intended to do anything of the kind; only that he was not going to be schooled by the Society for the Protection of Ancient Buildings. The Society demanded also that Sir Arthur Blomfield should submit to them his design for the new nave at Southwark. We are in no sympathy with the idea of building a new nave in the Mediaeval style; we have already said so; but none the less we think the application to the architect to submit his plans to a purely self-constituted body having no official standing of any kind is a piece of sheer impertinence. We do not think Sir Arthur Blomfield's polite answer, and the argument that he "would not be acting fairly to his professional brethren" in complying with the request, is at all the best reply that could have been made, and the remark about the "professional brethren" gives the Society an opening for a point which they have adroitly turned to account: the letter quoted above is a much better specimen of a reply. The Society, we observe, reiterate, though in a veiled way, the nonsense they circulated last year about this Journal being conducted in the interests of architects and of restoration. They got some plain language on the subject on that occasion, with some references showing the utter falsity of the statement; but they are again mauding about the practice of "running historical and art criticism on party and professional lines," and a "fettered press" &c. By a free press they would mean (like a great many other people) one which would only see their side of the question. What is wrong with us is that we have a faculty of seeing both sides, while the S.P.A.B. people have not. Mr. William Morris, in seconding the report at the meeting, told the truth very pithily about St. Alban's and Lord Grimthorpe. As reported in the *Times*, he said that—

"They might think the design of the restoration of St. Alban's Abbey had been made by the greatest fool in England. On the contrary, the man who made that design was one of the cleverest men in England. He was so clever that he had made a large fortune, and he had bought the people who ought to have taken care of the building and put them in his pocket."

That is exactly the truth. But the Society would have tried to prevent any one from putting a new west front to the newly-constituted cathedral, irrespective of whether he could do it well or ill. The right or wrong of that depends mainly on the condition of the old west front, which in fact was merely a patched up and decaying fragment. The transepts are another matter; there was no valid reason for meddling with them, but the S.P.A.B. can understand no distinctions of this kind. Their whole position is radically wrong, first in worshipping whatever is old irrespective of its value; second, in assuming the right of private interference. Let them indulge in public criticism, public meetings, readings of papers, &c. as much as they please and in as strong language as they please—no one will blame them; but their system of writing private letters, often in a most absurdly "superior" style, to those concerned about a building, and demanding that architects should submit their plans to them, is a systematic impertinence, and will be felt to be so by every man of sense and spirit. The fact is, that, whatever the individual merit of many of its members, the Society in its official communications is habit-

ually what is called "priggish," and no one can be surprised that they get treated accordingly.

WE give in another column a brief report of the last meeting of the Architectural Association for the consideration of its new departure, and of the resolution proposed and carried. We think that the malcontents who have carried on so determined an opposition to the schemes of the Committee have acted in a manner very detrimental to the best interests of the Association. The resolution referred to is, we presume, practically intended to shelve the whole scheme, at any rate for the present, and certainly appears to us a direct vote of want of confidence in the Committee, whose labours in preparing the proposed alterations of the rules in accordance with the instructions given them by the special business meeting on May 30 appear to have been so unsatisfactory to the meeting of last Friday, that they have deliberately ignored the work of the Committee and appointed a special committee to do the work in a more satisfactory manner. We fear the committee must now feel themselves in rather a dilemma, as, on the one hand, the resolutions passed on May 30, and the instructions given by that meeting to carry them into effect, have not been rescinded, and on the other hand the first step taken by the Committee has been discredited by the proceedings of last week. We are quite unable to understand the motives of "the opposition," as they may be termed, but their action appears to us to be characterised equally by want of foresight and want of public spirit.

IN reference to Mr. Tate's generous gift of pictures to the nation, and his desire to make the beginning of a gallery of English painting, an English Luxembourg, it is pointed out by a correspondent, "Y," in the *Times* that Mr. Sheepshanks contemplated exactly the same thing, and left directions to that effect, and "Y." urges that it would be a very inconvenient and illogical thing to have two galleries of British art under two different managements. That, however, does not by any means militate against the idea that the erection of a new and specially British Gallery would be desirable. The two collections could be united in it, as more space at South Kensington is continually being wanted. The proposition that St. James's Palace might be made the London Luxembourg is not, we fear, practical. Better to have a building designed for the purpose, and properly lighted. As the Government have had the onus of providing a National Portrait Gallery building taken off their hands by individual liberality, they may very well show their appreciation of this by devoting some public money to building a British Art Gallery. As to the position of this gallery it is not easy to suggest anything at the moment, but we may be quite certain it will not be in Whitechapel, according to the Rev. S.A. Barnett's rather preposterous suggestion. The excellent loan picture exhibitions which have been annually got up by him in Whitechapel have been a new interest to the neighbourhood, certainly; but they served to prove one thing, viz. that however eagerly "the lower classes" may crowd to a picture exhibition, they do so only as a child takes to a "picture-book"; of the real meaning of painting they have not a notion, and will not have till after some generations of improved educational methods.

THE Roman section of the *Mittheilungen* of the German Archaeological Institute has just issued its first number for 1890, and publishes in plate i. a very curious and interesting monument belonging to a class of which but few specimens are at present known. The monument in question is a terra-cotta, and represents a parody of a scene in a school. The head-master's chair is occupied by a figure draped in a long *himation* and having a donkey's head. In front of him, on two benches one above the other, are six figures of small children with monkeys'

heads, while several monkey-headed figures are standing about, one apparently saying his lesson. Isolated instances of parodied scenes in art are, of course, known, but, spite of Panoika's preliminary tract on the subject (1851), their consecutive history has yet to be written. More frequently mythological scenes are selected for animal parody, as e.g., when in a wall-painting at Pompeii the well-known scene of the flight of Æneas with his father and son from Troy is represented by three monkey figures; or, again, the judgment of Paris by a cock presiding over an assembly of three female birds of various kinds. Two notable parodies, however, of purely human scenes of ordinary life occur on papyri, one in the Turin, the other in the British Museum,—in the one a besieged fortress is defended by an army of cats, in the other an instrumental concert is being given by a band consisting of a donkey, a lion, a crocodile, and a monkey. Both papyri belong to the twenty-sixth dynasty (*circa* twelfth century B.C.).

AT the annual meeting of the Hellenic Society on the afternoon of Monday, the 23rd, Mr. Ernest Gardner, Director of the British School of Archaeology at Athens, read some extracts of his annual report. He observed—and most truly—that though the amount of discoveries made during the past year,—i.e., since the close of the Acropolis excavations,—were sensibly less than in the years immediately preceding, no year could be held uneventful which was marked by discoveries so signal as those at Lycosura and at Baphio, near Sparta. The Lycosura "find" we have already noted in some detail; it only remains to add from Mr. Gardner's report that the Damophon sculptures are now shown to the public in the Central Museum, and that of the four principal heads three remain,—i.e., those presumably of Persephone, Anytos, and Artemis; only Demeter is missing. Of the remarkable find at Baphio it was scarcely possible to speak,—so extraordinary were the rumours,—until the publication of the pair of remarkable *reposés* cups, in the last issue of the *Εφημερίς Αρχαιολογική*. Both cups represent scenes, depicted in an extraordinarily naturalistic style, of the capture of wild bulls,—a bull tossing a man, a bull caught in a net, a bull escaping at full gallop, and the like. They have certainly little resemblance to anything at present known in archaic Greek art, but we may note that the galloping bull reminds us of the galloping Assyrian lions of the British Museum basement; and the bull with head turned back seems also an echo of archaic common type; or rather, perhaps, all show the common inspiration of a close study of animal nature. The gold cups are, of course, the most sensational portion of the "find," but the collection of "island gems" is well worth attention. The principal of these are also published in the same issue.

AT a meeting on June 17th current the City Sewers Commissioners decided to refer to their Improvements Committee the question of pulling down All Hallows Church, London-wall, which, it is alleged, forms a serious hindrance to the traffic in that part of Broad-street Ward. The church was built after the designs of George Dance the younger, in 1765-7, at a cost of 2,914*l.* It occupies the site of one that had been demolished, in the previous year, by reason of its ruinous condition. Hatton describes the earlier fabric, which, together with the neighbouring old Carpenters' Hall, escaped the Great Fire, as being "of the Gothic and Tuscan Orders." About five years ago we published a view of its exterior, from the work produced by W. H. Toms and R. West, in 1740. The description given by Toms, and quoted in our columns, is manifestly copied *verbatim* from Hatton's "New View" of 1708*. A Corinthian temple surmounts the present stone tower, which has urns at the four angles; the rest of the church is of brick, and presents a very

* For the view, Mr. Brock's lecture, and the description, see the *Builder*, April 25, 1885.

plain exterior. In his "Churches of London," the late Mr. George Godwin animadverts upon the interior. He describes it as "a monument of bad taste, being not merely inappropriate, but of itself ill-designed, and very ugly. Attached columns of the Ionic order at the sides of the building support a frieze—instead of an entablature—from which rises a cambered ceiling, divided into a number of small panels, all absurdly overlaid with leaves and flowers, by way of ornament." The dedication of this church to All the Saints is indicative of an early foundation. The parish books begin with the year 1455; they record some benefactions by an anchorite who was then living near; and one Thomas, called Richer de Sanston, was rector in 1835. Close to the church's northern side stands the old City wall, whereof some superimposed portions may yet be seen here, and elsewhere, in the street known as Londowall. The portion eastwards of All Hallows forms a garden wall to some houses in New Broad-street. In the spring of 1855, a piece, of 150 or more feet in length, of the original wall was exposed during the construction of some buildings, named Blomfield House, at the corner of Blomfield-street (*antiquæ*, Brokers-row), on the site of the former Portuguese Synagogue, and close to All Hallows Church. This length was found to be laid upon a foundation of large flints; above this lay a course of rough rag, then two layers of tiles, or bricks, embedded in mortar—the tiles being about 1½ in. thick—and next, a course of rag stone, 2½ ft. deep, to nearly level with the existing ground. At the suppression, in King Edward VI.'s reign, of the fraternity of poor priests known as St. Augustine Papey in the Wall, their church, near to Bishop's Gate, was demolished, and the parish added to that of All Hallows. The patronage of All Hallows had already passed from the Priory of Holy Trinity without Ald Gate, to the Crown. It is now in the Lord Chancellor's gift, and worth about 1,100*l.* a year, *teste* Mackeson's "Guide."

THE City of Bath has now been lighted by electricity. One by one the provincial towns set an example to the Metropolis, which is singularly slow in adopting the new light. The question of expense is no doubt a difficulty, and it is becoming a serious question whether, if electric lighting companies are to do a good general business, they must not make a general lowering of their charges. Rightly or wrongly, cheapness is what people look for in these days, and they make use of cheap articles often much to their own detriment. But electricity as an illuminating power will not become general, and cease to be a luxury for the rich and for wealthy companies, until it is lower in price.

THE "I. Allgemeine deutsche Pferde-show," just opened at Berlin, has some points of interest to the architect. The horses (some 2,000 in number) have been housed on the barrack system, and not only have these barracks been neatly disposed on the site, and placed in good connexion with the show-rings, and not too far from the central hall of the "dead" exhibition, but they also show careful interior arrangements, practical and cheap division into loose-boxes, stalls and loose-stalls, ample central passage, and very pretty straw decoration, which latter deserves special mention. In the "dead" exhibition the numerous three-stall stables, full size, with every possible novelty in the way of construction, drainage, fittings, &c., will be of great interest to the specialist, as will also be the numerous models of larger stable-accommodation, and such architectural designs as a "Royal stable," an "ideal riding-school," and a "horse-hospital." The main exhibition building, in which these exhibits are to be seen, shows some interesting wood construction, well coloured, and having on its chief frontage a highly-decorated Royal box. It may be well to take note that even at a horse-show an architectural and constructional

department can be easily arranged, and that if well contributed to, this department would by no means be the least interesting part of the whole.

THE case of *in re* an arbitration between Ward and Cave, decided by Mr. Justice Grantham on Monday last, is of interest, though a full report of his judgment is not yet before us. He overruled some objections to an award by an arbitrator who was an architect. One of the objections to the award was that the arbitrator allowed his clerk to go round the buildings, and that the arbitrator should have done the work himself. It would appear, therefore, according to this judgment, that an architect who is arbitrator may depute the merely rule-of-thumb work to a clerk. This is common sense and sound law. If, however, the judgment goes further than this, and empowers an arbitrator to depute anything more than the merest rule-of-thumb work to an assistant, then it appears to be wrong both in common sense and law. We express a doubt on this point because on the report of the case before us it is doubtful in what way the word "inspecting" is used. If an arbitrator acts in any way on the judgment of another, then he deposes his judicial duties to another, which is exactly what he ought not to do.

DR. PARSONS'S report to the Local Government Board on the prevalence of enteric fever in the Coppen Urban Sanitary District, Northumberland, turns mainly on the point of defective water-supply. Not only is the present water-supply stated to be insufficient for the requirements of the increasing population, but the manner of supply is unsatisfactory. Where the water is not under pressure it is supplied through 9-in. earthenware socket-pipes. The report says:—

"The course of this conduit runs through the Bedlingtonshire Urban District, parallel with the Blyth and Tyne Railway, by Choppington, Barrington, and Bedlington station. In walking over it I saw one place where there was a considerable loss of water, and the earthen pipes are said to be frequently obstructed by roots of trees. At Bedlington station there are several privies within a few feet of the line of pipes, which are here of earthenware and about 12 ft. below the surface, a state of things which must involve risk of contamination of the water. At Belside, also, close to the reservoir, the conduit passes through a field which, at the time of my visit, was heavily manured with heaps of night-soil over the course of the pipes, which here also are of earthenware. The water passes through a filter bed into a covered reservoir, and is thence distributed in iron pipes under pressure." . . . There can be no doubt that the water supply of Coppen much needs improvement in the direction both of obtaining a larger daily quantity of water and of securing better filtration, and it is to be hoped that the Local Board will not delay taking the necessary steps."

IT is an unfortunate thing in England that no competition can be decided, apparently, without an immediate attempt on the part of one or more of the unsuccessful competitors to prove that they have been wronged in the decision. In the case of the Sheffield competition this characteristic is not absent, but it takes the rather novel form of an attempt on the part of the authors of one of the unsuccessful designs, Messrs. Flockton & Gibbs, to show that the accepted plan, as modified in the second competition, is an infringement of a patent, for which they have obtained what is termed "provisional protection, for a special arrangement of the plan of a public building. Messrs. Flockton & Gibbs have addressed a letter to the Town Clerk of Sheffield on the subject, the following extract from which shows the nature and assumed ground of the claim they are making:—

"The patent was embodied in our original design, and described by us as follows:—'Each set of offices for a department is made complete in itself, the entrance for the public being into, and by way of, the general or inquiry office, from which access is easy and direct to a corridor in which are the private offices. These corridors give the officers the means of communication with each other without entering the general office, and also with the general office at different points.' The advantages of this plan over the usual

arrangement of public corridors consist, not merely in the feature that no facilities are given for the public to seek admittance where they are not wanted, but that the private offices are rendered more quiet and undisturbed, the intercommunication more easy, and the control by the heads of the departments more perfect.

The arrangement (though something approaching it has been adopted in municipal buildings, such as the Corporation of Sheffield already used for some of their departments) has, so far as is known to us, never been adopted in municipal buildings where there is a combination of such departments; so that our design, as originally submitted, was entirely novel in this respect.

Your supplemental instructions were, we take it, prepared after our original design had been inspected and reported upon by the head of each department, and probably the self-evident advantages of our novel arrangement led to its being made a condition of the final competition, and its consequent incorporation in Mr. Mountford's final designs; probably also in the other four final designs."

How far the assumption in the last paragraph is correct we are in no position to form an opinion; but we have a very decided opinion that the arrangement of the plan of a building does not come under the class of inventions which can be protected by a patent, and that architects will find it better to dismiss that idea from their minds.

ARCHITECTURE AT THE ROYAL ACADEMY.—VIII.

1,896. "The Cathedral, Athens": Mr. R. W. Schultz. Two elevations and a plan of this curious old Byzantine building, an illustration and some account of which, along with other Byzantine buildings in and about Athens, was given in the *Builder* for November 30, 1889.

1,898. "Norwich Cathedral from the north transept": Mr. Albert D. Smith. This shows what cannot but be a favourite view with all who visit Norwich; looking through one of the Norman arches of the crossing with its flat soffit and parallel shafts, to the low ponderous arcade of the triforium gallery, with the large clear-story and spreading ribs of the late vaulting over it. The drawing is a well-executed one, in pencil, though it does not give all the force of contrast of the actual scene. It is not very apparent where it is taken from; it appears to be below the level of the triforium gallery but above the floor of the church.

1,899. "Business Premises, Davies-street, Berkeley-square": Messrs. Wimpey & Arber. A building treated with some character as regards its three stories of mullioned windows, the lower story beneath wall arches; but the details, such as the semicircular finish to the dormers, are either coarse or coarsely drawn; the broken circular pediment over the doorway shows the illogical character of this feature even more than usual, being deeply recessed and thin in substance; it looks exactly as if the middle portion had given way and fallen out.

1,900. "St. Mary's, Clumber": Mr. G. F. Bodley, A.R.A. A rather heavy water-colour drawing of the exterior of the church, showing the east end with a decorated tracery window, and the tower with a plain spire rising in rather an effective manner out of a mullioned and battlemented open screen surrounding the base of the spire, and through which are carried the flying buttresses from the angle pinnacles: there is open tracery in the leads of the screen-pinnacles. This screen round the base of the spire is the only individual feature in the building, which is otherwise like scores of other modern Medieval churches in general aspect, though we have no doubt it is better carried out in detail than many.

1,901. "Organ for Great Library, Blenheim Palace": Messrs. Romaine Walker & Tanner. This is the case for the large new organ which has been built for the Duke of Marlborough by Messrs. Henry Willis & Sons, in Vanbrugh's building, decorated too as it is with paintings of sham Classic architecture and flying figures, a design in any very pure style would have been out of place, and perhaps what is done does not exactly represent what the architects would have done for a building of more refined taste. The front is treated with a centre flanked by two towers with richly carved cylindrical wooden capping finishing with a Classic cornice; the wings terminate with two lower towers of similar design; all the towers being protected on brackets. The base of the whole is panelled with a cornice and frieze, and the panels filled with carvings of fruit and foliage &c.

Between the main towers is a kind of tribune with a niche, as if for a statue, and a little railed platform looking as if it were intended as a place to make a speech from. Above the main design rises another portion of the organ, set back and in shadow; not the swell apparently (which is sometimes put in this position), as there are front pipes and no shutters are seen, so it is not very easy to understand what part of the organ this is. There is a generally rich and rather dignified effect about the whole, though it cannot be said that it presents any new idea in the designing of organ-cases.

1,902. "West Window, north aisle, St. Benedict's Church, Ardwick, Manchester": Messrs. Ward & Hughes. This looks a pleasing window of two lights, each light divided in the centre and the four filled each with an angel; but it is hung too high to see any of the detail.

1,903. "North Front, St. Mark's, Venice": Mr. Gerald C. Horsley. Not the north front (a blunder of the catalogue compiler), but a charming little pencil-drawing of an arch and some sculpture beneath, which was illustrated in the *Builder* for January 4 of the present year.

1,904. "Design for an Entrance-hall Window": Mr. P. H. Newman. Rather original and very suitable as a hit of domestic Renaissance glass. A large scrolled shield, with ornament on a white ground, encloses a framed picture indicating apparently the reception of a guest who has just dismounted. The angles of the window beyond the shield are filled up with festoons &c. on a light blue ground.

1,906. "St. Sepulchre's, Holborn. Design for reconstruction of the organ": Mr. W. D. Caröe. This is a very interesting and delicately-executed drawing, illustrating a scheme of great architectural merit, but which on other grounds we view with considerable apprehension. St. Sepulchre's is one of the finest and most monumental organs in London, and it is here proposed to divide it into two separate organ-cases at either extremity of a screen stretching across the church, the player being placed amid a little erection of pipes in the centre of the screen. The nitty of the instrument will be impaired by this, however the architectural effect may be improved; and after all, organs are built to hear and not to look at. Architecturally the treatment is very good. The two organ-cases stand on the screen and are bracketed out from it so as to oversail in a picturesque manner; the pipes are picturesquely grouped, the woodwork is diversified by various figures of cherubs, &c., effectively put in. The old and very pleasing arrangement is used of representing a small organ of small pipes bracketed in front of the lower portion of the main mass. In the old German organs this was really the choir organ (*positiv*) with its pipes; whether these are really choir organ pipes, or only a pretty little bit of sham, of course one cannot say from the drawing. The whole design, a water-colour elevation on a small scale, is quite the best of the organ-case designs which appear this year; we only hope it is not going to spoil the organ.

1,907. A frame including pen sketches of Thring Memorial Chapel, Uppingham; Guests' House, East Grinstead; and Infant Schools, Westminster, by Mr. Arthur E. Street. The first, a quiet hit of true Gothic; the second, a very pleasing little house with a half-timber upper story on plain stone walls with a few mullioned windows irregularly introduced; the third, infant schools with ecclesiastical-looking windows, but we fear not quite efficiently lighted for London air.

1,908. "Congregational Church and Schools, Beckenham": Messrs. H. D. Appleton and E. W. Monntford. A picturesque group of buildings of a simple Gothic style, which however owes some of its effect, we are inclined to think, to the artistic execution of the pen-and-ink drawing.

1,909. "Design for Interior Decoration": Mr. Rowland G. Jones. Apparently a music-room decoration, intended to be gay in effect, and with some originality. The main wall is left a plain surface of rather sickly tint, the pilasters and frieze with light fawn and strap ornament on a warm buff ground; or rather this is not the frieze, but a kind of sub-frieze ranging with the gilt capitals of the pilasters; the genuine frieze is in a faint green tone, also with lighter floral ornament and gilt panels with the names of musicians. The dark purple of the dado is not a nice colour, and rather kills

the rest of the scheme, which has distinct merit, however, as an original effect.

1,915. "Illustration from Flowers of Paradise": Mr. Reginald Hallward. Looks like a sketch for a window in imitation of Blake's manner, but the colour effect is good and unusual.

1,917. "Design for West Window of South Aisle, Wells Cathedral": C. Hardgrave. A very nice bit of window design, in four lights each containing a figure: on the left the angel of the Annunciation, in the next compartment the Virgin with bowed head and hands crossed on her bosom; the next the same figure turning the other way to meet the hennidion of Elisabeth, whose aged figure is seen on the right-hand panel. This and the angel figure are both raised a little above the line of the Virgin figures, giving a little point to the composition, as the two outside figures are each conferring a blessing on the central one. The colour effect of the draperies and the diaper ground is rich and harmonious, and the whole a very pleasing example of a window with some individuality of design in it.

1,918. "Business Premises, New Broadstreet": Mr. G. Vigers. A red brick building with dressings and horizontal bands of light-coloured stone, with terra-cotta figures and ornament introduced in panels and over the sprandils of windows. The heavily moulded round arches in the ground story have a good solid effect, and there is a certain breadth of effect in the general treatment, with its parallel lines of vertical buttresses (rather than pilasters) under the gable, but the details are wanting in refinement; e.g. the great stone decanter-stopper finials to the said buttresses. What is the beauty or advantage of these lumps of coarsely-moulded stone?

1,919. "St. Catherine's Church, Melincryddan": Messrs. Seddon & Carter. Three sketches of a simple unostentatious country church in the Early English style, the interior view showing a timber arcade and piers dividing centre from side aisles; a characteristic treatment, with which more might be done in churches for country districts and where economy is an object.

1,921. "Riding School, Palace Court": Messrs. W. Harvey & B. Smith. There is nothing to show how the riding-school is treated in the way of roofing and arrangement of space, which is the real *crux* in a riding-school. This is nothing but a neatly-drawn brick front with a large circular-headed window; it might be anything else besides a riding-school.

1,922. "Glass and Decoration of Folkestone Parish Church": Mr. Alfred O. Hemming. This is an important scheme of decoration, shown in a geometrical coloured drawing. The groups of lancet windows beneath segmental arches are filled with stained glass, each light containing a figure of a bishop, with a scene from his life as a predella beneath. A series of frescoes of scenes in the life of Christ form a broad band of decoration running between the windows, the wall-space below the pictures being treated with decorative jointing with a simple ornament added. Above the frescoes the wall is powdered with flowers on a warm light-tinted ground, the heads of the window arches cutting into this field of decoration. A strong red dado forms the base to the whole. The only details we do not like are the trellis ornament immediately above the dado, and the notch ornament beneath the pictures: both these are out of keeping with Gothic work, and they are coloured so as to have an effect of relief which is unpleasing, especially as all the rest of the ornament is kept perfectly flat.

1,923. "Church Schools, Ice-me Bay": Mr. Ernest Turner. A very pretty pen-and-ink sketch, which certainly owes its place to the draughtsman rather than to the architect. The school may be very well planned; Mr. Turner's schools are likely to be so; but there is no plan to tell us this.

1,927. "All Saints' Church, Moda, Constantinople": Mr. J. Coates Carter. We should have liked a plan of this also, which seems to be a rather interesting attempt to combine European Gothic forms (lancet windows, &c.) with a somewhat Byzantine form of building. What we see in the drawing is two rather low-pitched gables side by side, with a lower one filling up the space between and forming the porch, the wall of which is decorated with bas-relief figures. Behind this, and recessed, a higher gable rises in the centre of the composition, with a circular window in it. The whole com-

position is quite unusual in appearance, and it would be interesting to see how it is treated in plan.

1,930. "New Premises, Duke-street, Grosvenor-square": Mr. W. D. Caröe. A rather heavy and loaded pen-drawing, which has however a good deal in it that is worth original at, and has the merit of being so far original that it is difficult to describe it under the generally accepted architectural terms. The property is one, as shown by the continuous treatment of the ground-floor shops as one design; but overhead it soars into variations of a very picturesque description. One portion rises into a stepped gable (which would be better without the scrolls), under which the windows are specially grouped in reference to it, at another point a projecting bay goes up on corbels, finished by a bulbous turret, which (like that in No. 1,881) is plumped down rather awkwardly on its supportings; but it is a thing one would sketch if one found it in a seventeenth-century building. The Building Act walls above the roofs are shaped at the lower portion into large console forms, and architecturally related to engaged columns on the wall below. Altogether a very interesting piece of street architecture.

1,931. "Hotel Sta. Catalina, Las Palmas, Grand Canary": Mr. J. M. Maclaren. A capital pen-drawing, but it is a tropical landscape with a building dimly seen in the distance, rather than an architectural design. As far as can be seen, the hotel is laid out with some originality of disposition, but a plan should have been given.

1,936. "Holy Trinity Church, Chelsea": view of entrance to Chancel: Mr. J. D. Sedding. This shows the lower portion of the chancel of this church, of which a sketch was given in the *Builder* for Jan. 4 of this year; there is nothing more original in the collection than this bit of interior church furnishing; especially to be noted are the treatment of the organ gallery stretching across the north arch, with its panels filled with painted figures, and the fine and free design of the wrought iron altar railing. We ought equally to commend the admirable and artistic execution, though slight, of the water-colour drawing in which it is illustrated, by the same hand as the sketches of Beauvais and Abbeville (1735 and 1832) previously mentioned. Those who do not soar above the "architectural draughtsman's" style of water-colour should look at this bit of free and artistic water-colour work, which forms in this sense one of the best drawings in the room.

1,937. "Symbolic Figures designed to be modelled in terra-cotta for Porch of a Public Building": Mr. W. Ammonier. These are good specimens of architectural sculpture; the figures represent "Mercy," "Temperance," "Fortitude," and other virtues, but it is a pity the author did not get some one to design the architectural framework for him, the details of which are very bad; the interpenetration of the arch by the head of the fugal spring from the decoration below is in the very worst architectural taste.

1,939. "New Class-rooms, Crouch Hill Presbyterian Church": Mr. W. Dunn. No plan; a pretty pencil-sketch showing that the class-rooms are treated with three successive shallow polygonal bay windows, which promise to combine good light with a picturesque external effect. The range of low windows on the left we presume indicates a passage to the class-rooms. If so, the building tells its tale well; still, we could have estimated that better with the help of a plan.

1,940. "View in South Aisle, St. Victor, Xanten, Germany": Mr. H. W. Brewer. A pencil edition of the drawing published in the *Builder* of May 17 of this year.

1,941. "Heraldic Design for Painted Glass": Mr. Rowland G. Jones. Nine panels with small oblong leaded lights, which are independent, however, of the design. The designs show treatments of armorial bearings and scrolls in light colour on the white ground, with very good and refined effect; they are eminently suited for domestic windows, where the object is to have decoration without obscuring light.

1,942. "St. John, Stansted Mountfitchet, Interior looking West": Mr. W. D. Caröe. This large and powerful pen-drawing, the last we shall have occasion to mention in this year's exhibition, is reproduced in the present number of the *Builder*, and description of it is therefore unnecessary. As the reader will see from the illustration, it is an exceedingly solid hit of

church building and church roofing. It perhaps has the defect of looking rather low in proportion to its width and length; possibly this is partly owing to an unintentional exaggeration of length in the perspective.

AN ANTEFIXA OF THE TEMPLE OF JUNO, DISCOVERED AT CIVITÀ LAVINIA, NEAR ROME.

In making some excavations for Lord Savile, at Cività Lavinia (the ancient Lanuvium), near Rome, were found some *antefixa* of terra-cotta, representing the head of Juno, in archaic Greek style of the sixth century B.C.

Undoubtedly these *antefixa*, one of which is illustrated, belonged to the roof of the Temple of Juno Sospita, or Lanuvina, celebrated by Livy, and which probably stood on the eminence now called S. Lorenzo, on the property of Lord Savile, where further excavations are also in progress.—L. B.

THE CONGRESS OF FRENCH ARCHITECTS.

THE French architects have this year, in holding their annual congress, celebrated also their jubilee of the Société Centrale. It was in 1840 that, thanks to the initiative of some eminent men, such as Visconti, Constant Dufeux, Lassus, Viollet-le-Duc, Lacroix, Albert Lenoir, and Baillly, an association was formed to look after the moral and material interest of the profession. Of the first founders there remain now only the venerable M. Lenoir, active and alert in spite of his ninety years, and M. Baillly, of whom

"la verte vieillesse
s'illumine parfois des feux de la jeunesse,"

but who has nevertheless handed over to M. Garnier, for a year past, the onerous duty of presiding at the meetings of the Société Centrale.

In deference to the wishes of a certain number of the Departmental Societies, the meeting, which generally takes place at the beginning of June, has been postponed to the third week of the month, and it is probably owing to this change of date that the unusually large influx of provincial delegates is to be attributed.

The opening meeting took place on the 16th in the hémicycle des Beaux-Arts, under the Presidency of M. Joly, assisted by MM. Chenais (Nantes), Journaud (Lyons), Marteau (Lille), and Boileau and Roux (Paris). As usual, the special technical questions in regard to such subjects as "concours publics," "honoraires," "hygiène," "voirie," "propriété artistique," "responsabilité en matière de construction" &c., were referred to Special Committees.

On the same day M. Daumet read an interesting paper on the life and works of Diet, whose decease has been already commemorated in the *Builder*, and who died prematurely, it is to be feared, from the effects of the strain of over-work.

At this paper M. Achille Hermant dealt with "Propriété Artistique," which is the subject of a decree now being proposed and considered by the legislature. M. Eugène Guillaume, who followed, treated at some length of "architecture, son rôle et son engagement spécial." This eminent sculptor, who also possesses the highest talent as a lecturer, was much applauded, but his paper was to some extent a repetition of that which he read at the Congress of 1886 on "The Unity of Art," expressed in the same kind of flowing and elegant language. In his opinion, a concurrent education in the three arts is above all things to the profit of architecture, which he calls the "le plus inventif," and of which M. Garnier's Opera House is the most complete type, in view of the association of architecture, painting, and sculpture exemplified in it.

On the next day, at a meeting presided over by M. Marteau, M. Lucas read a paper on "Sociétés d'Architectes." He observed that a complete study of Architectural Societies, native and foreign, ought to form a part of the proceedings of the annual Congresses. Then, in a historic sketch of ancient societies, he passed in review the colleges of priests, the constructors and master-workmen of the Middle Ages, the Académie Royale, the "experts jurés de bâtiment," the societies founded in Paris at the commencement of the century, that of Lyons, the regional and departmental societies, and lastly the provincial association which has been founded at Tours. No one can treat such

Ancient Roman Antefixa lately found at Cività Lavinia.

a subject better than M. Lucas, who is thoroughly acquainted with it, and his lecture was of the greatest interest.

M. Duchâtelet, who is one of the oldest Commissioners of Roads of the City of Paris, had promised to speak on the new road regulations, but had to send an excuse at the last moment, which is much to be regretted, as the subject is intimately connected with questions of public health and of construction generally. It would have been interesting to the foreign architects to have heard a competent treatment of the subject of the new legislation and of the treatment of main and lesser roads, the regulations as to flues in party-walls, for the prevention of danger from fire, as well as that relative to the heights of buildings, which are now determined in relation to the width of the roads on which they are built. According to this last legislation, houses cannot now contain more than seven stories, of which the minimum heights vary from 2.80 to 2.60 metres.

On the same day, at the école des Beaux-Arts, there was a lecture on decorative art and industrial art in the Exhibition of 1889, and another by M. Guadet on the life and works of André.

The next day most of the members visited Beauvais, which was this year the object of the country excursion. Beauvais, now the chief town of the department of the Oise, is about eighty kilometres from Paris, in a fertile valley at the meeting of two rivers. Boulevards planted with trees have replaced the old fortifications made in the thirteenth century. This shady promenade looks in some places over fields, in some over the ruins of old churches among which rises the imposing height of the cathedral. The town is badly laid out, the streets crooked and narrow, but many objects of interest are to be met with.

The members, under the direction of M. Voillez, Architect of the Department and President of the Society of Architects of the Oise, visited first the national tapestry manufactory, founded in 1664, by a merchant named Hynard. This establishment, the productions of which rival those of the Gobelins, includes two blocks of buildings. That situated between the court and garden preserves the character of the architecture of the seventeenth century, with stone façades surmounted by an enormous roof. The ateliers are convenient and well-lighted for the work. In summer, the windows let in a flood of fresh air laden with the scent from the trees in the garden. There are five ateliers, containing about forty frames; four out of the five are always in active operation. The method differs from that at the Gobelins, the looms being worked by pedals instead of by the hand, and the workman, with both hands at liberty, gets through his work much faster.

The garden contains many fine trees planted

under the direction of Hynard, and under their shade is a stone building, a range of stables, which is a memorial of the visit made here by Louis XIV. in 1686. Near these old buildings are various schools built in modern times for the use of the workmen, and the manufactory also possesses now an industrial museum which is of much service to those engaged in learning the art of tapestry weaving.

The church of St. Étienne, next visited, was commenced in the eleventh century and finished in the sixteenth. The portal dates from the thirteenth century. There are many splendid windows and some curious pictures painted on wood. But the principal object of the visit was of course the cathedral, commenced in 1225 on the site of the church built in the tenth century, and which twice suffered conflagration. The existing church would certainly have been one of the largest in existence if the nave and principal façade had been completed. As it is, it consists only, as is well-known, of a transept and an immense choir. The history of the fall of the vault (in 1284), and the necessity for building intermediate piers, is well known. The cathedral does not offer much of interest in regard to its contents. The grille at the entrance is very simple, and the tomb of the Cardinal Forbin interior worthy of special note.

Adjoining the cathedral is the Church de la Basse Œuvre, now almost entirely ruined and built up with houses. It was formerly the cathedral. Some archaeologists contend that this ancient church dates from the Roman foundation of the town; and there is certainly some resemblance to Roman masonry here and there; but other indications point to a date not earlier than the eighth century. Internally there are neither carvings nor ornaments of any kind. It has never been vaulted, and ought to be covered in with a timber roof. The façade, with three entrances and crowned with a gable, dates from the eleventh century.

The Congress next visited the fine episcopal residence built some years ago by M. Vaudremer, as well as the Palais de Justice installed in the ancient episcopal palace with its eleventh-century tower.

Thursday morning, the 19th, was devoted to the meeting of Committees and to various communications received, and in the afternoon the members repaired to the Boulevard de Vaugirard to visit the new Lycée Buffon built by M. Vaudremer, who did the honours of the visit. The building we have described in a former communication. The various classrooms, of natural history, physical science, chemistry &c., were all visited, and were all judged to be convenient and very well lighted; and the building itself is rather heavy in appearance, and without that rather heavy and prison-like character

which is often seen in French buildings for secondary schools.

The same day took place the banquet which always forms a feature of the Congress, at which 350 guests assembled at the Hôtel Continental. Among those present were M. Bourgeois, Minister of Fine Arts, M. Jules Roche, Minister of Commerce, M. Tirard, M. Larroumet, M. Jules Comte, and many political and literary celebrities. At the end of the dinner M. Charles Garnier made a very humorous speech in compliment to the Ministers—the outgoing Ministers whom we all regretted, and the incoming ones from whom we had so much to hope for. The Minister of Fine Arts showed not less piquancy in his brief reply. The evening was concluded by a musical and theatrical performance for which M. Escalier had designed the programme, and in the course of which the actors of the Théâtre Cluny gave an amusing little piece by M. Charles Garnier entitled "Architecture Revue."

Friday morning the 20th was devoted to the work of the "caisse de défense mutuelle," and in the afternoon took place the delivery of the medals awarded by the Société Centrale. This ceremony was presided over by M. Larroumet, the Directeur des Beaux-Arts, supported by MM. Garnier, Bailly, Kaempfen, Moyaux, Marteau, Chenantais, de Joly, Boileau, Paul Sédille, and Roux. M. Paul Sédille then presented his report on the awards made in regard to domestic architecture. The silver medal prize founded by M. Lesoufaché and M. Jules Sédille was awarded to M. Destailleur of Paris for his works, among which may be mentioned the Hôtels Béchague, Luynes, and Monclay at Paris; in the provinces, the château of the Duc de Massa, and the enlargement of the Château Mouchy; abroad, a splendid mansion in Silesia, and in England the mansion of the Baron Ferdinand de Rothschild.

M. Auhurtin, architect, of Paris, the designer of various schools and private houses, and M. René Ménard, of Nantes, also received silver medals. The silver medal for jurisprudence in connexion with architecture was awarded to M. Gaston Rozet, author of a work on "La Législation de la Propriété," a convenient summary of the subject. The silver medal for archaeology was given this year to M. Grébaud, director of the museum of Boullak, who continues worthily the work commenced by Mariette-Bey and M. Maspero.

In the absence of M. Loviot, who was prevented by a family bereavement from taking part in this year's Congress, M. Roux presented the second report in the name of the "Commission des récompenses."

M. Lechat, who has directed, with a zeal and intelligence worthy of the highest praise, the excavations undertaken in the island of Corfu, on the site of the ancient Corcyra, obtained the silver medal given for the French School at Athens; and M. Henri Deverin obtained the medal for studies of French monuments.

The Destors medal was awarded to M. Chaussemiche, student of the école des Beaux-Arts; M. Berger obtained the Chaplain medal, and M. Bruniaux, pupil of M. Trélat, obtained the medal founded by M. Bouvens van der Boyen in favour of private schools of architecture.

The usual medals were then awarded in connexion with the school of apprentices, the Masons' Club, the "Société Civile d'Instruction du Bâtiment," and lastly the medals to old artisans for continued and faithful service. Among the names of these venerable workmen may be mentioned that of M. Palluan, foreman slater, seventy-seven years of age, who has obtained the bronze medal founded by M. Salleron. At the close of the ceremony M. Garnier announced that the Minister of Commerce and Industry also intended to present M. Palluan with a silver medal in the name of the Government.

On the 21st the Congress devoted two sittings to reports of various societies and to the study of propositions formulated by various committees, and was then adjourned to next year.

Moscow.—The famous old tower on the Town Hall-buildings will have to be pulled down as quickly as possible, as the foundations have suddenly shown signs of giving way. Nothing has yet been settled as to the re-erection of the tower. According to a Russian contemporary, a simple ridge-turret is thought of instead of the more monumental idea.

SUB-CONTRACTING, &c., IN THE BUILDING TRADE.

On Monday afternoon last the Council of the Royal Institute of British Architects received two deputations of building operatives who desired to bring their views of the disadvantages of sub-contracting before the representative body of the architectural profession. There was a largely-attended meeting of the Council, Mr. Waterhouse, R.A., in the chair.

The first deputation was received at four o'clock, and consisted of six representatives of the London United Building Trades Committee, which claims to represent all branches of the London building trades. The deputation consisted of Mr. John Mackie, of the Associated Carpenters and Joiners (Chairman); Mr. Paul Weighill, of the Operative Stonemasons' Society; Mr. Jesse Bell, of the Operative Bricklayers' Society; Mr. Alexander Turner, of the National Union of Operative Plasterers; Mr. Charles Drinkwater, of the "Perseverance" Society of Carpenters and Joiners; and Mr. J. Douglas, of the Glaziers' Society.

Mr. Mackie, who first addressed the Council, apologised for the unavoidable absence of Mr. George Dew, the Secretary of the London United Building Trades' Committee, the body they represented. That Committee, he might say, consisted wholly of the representatives of the London building operatives, and it had been formed partly in consequence of the apathetic manner in which the London Trades' Council had dealt with the interests of the building trades. He understood that a deputation from the London Trades' Council was to appear before the Council of the Institute an hour later, and that the members of that body were practically at one with the deputation on whose behalf he was speaking as to the objects which they sought to attain; but he believed he was right in saying that the London Trades' Council had not moved in the matter until they heard of the intended action of the Committee for whom he was speaking. That Committee consisted of practical building operatives elected by the various trade societies connected with the building industries, such as the "Amalgamated," the "Associated," and the "Perseverance" carpenters, and the stonemasons', bricklayers', plasterers', slaters' and tilers', glaziers', and lath-renders' societies; they also had the support and sympathy of the plumbers, although, owing to some informality, the plumbers were not represented in the deputation. Their object in coming to the Council of the Royal Institute of British Architects was to ask them and the members of the architectural profession generally to use their influence with their clients to procure the insertion in contracts of stringent clauses requiring that all work should be carried out in a tradesmanlike manner. They believed that the best way to secure that end would be to insert clauses in all contracts binding the builder to pay not less than the recognised trade union rate of wages; that the hours worked should be those generally recognised as fair in the trade; and that no portion of the work in any trade should be sublet. He thought that it would be agreed that subletting was one of the worst forms of "sweating."

Mr. Waterhouse asked for a definition of the term "sweating."

Mr. Mackie, continuing, said that while, perhaps, there were some few forms of subletting work which could not fairly be described as "sweating," it was their experience as executive workmen that where building work was sublet it was generally "scamped" either in workmanship, owing to the employment of cheap and inferior labour, or in material, owing to the sub-contractor seeking to make his living out of the job by using adulterated materials. Sometimes the sub-contractor took work at so low a rate that he had to resort to both cheap and inferior labour and bad materials in order to make his profit. Perhaps there was no trade in which subletting was so general as that of the plasterer, and there was certainly no trade in which so much deception was practised. All sorts of rubbish were used in sub-contracted plasterers' work—rubbish that would not be used by the general contractor who had a name to lose, and who ought to be held responsible. Such clauses as the deputation advocated had lately been introduced into all contracts for work to be done for the School Board for London and the London County Council. That such clauses were necessary was shown by the had results obtained in certain

Board School buildings, in an important public building completed a few years ago, and in another important public building now nearing completion. In regard to the last-named building, the general contractor, although bound down not to sub-let the work, had sublet nearly the whole of it; the stonework had been sub-let twice over, and the second sub-contractor had sub-let the fixing. In the same building the plasterers' work had been shamefully "scamped." With the permission of the Council, he would read the propositions which the deputation had formulated, and for which they asked the careful consideration of the architectural profession, viz.:

(1) "That the contractor shall not be allowed to sublet any portion of his contract."

(2) "That all labour employed by the contractor shall be of the best quality."

(3) "That the contractor shall pay not less than the recognised or trades union rate of wages, and shall observe all recognised rules and customs as to working hours."

They did not ask that every man should be paid the same rate of wages, whether he was worth it or not; they asked that only competent workmen should be employed, and that they should be paid the regular fair rate of wage. If architects insisted upon good workmanship, the end which they as trade unionists had in view would be attained, for the best work in all trades was done by trades unionists; that was not his testimony; it was the testimony of one of the largest and most respectable of London builders. The best workmen in the trade lamented the degeneracy of craftsmanship which was engendered by the sub-contracting system, with its natural tendency to hurried and "scamped" work, and which he feared sometimes induced architects to put less art-work into their designs than would be the case if they had less difficulty in getting it properly carried out. That difficulty was due to the present system of sub-contracting, and another consequence which was greatly to be deplored was that the coming generation of carpenters, joiners, and other craftsmen would have less and less scope for their skill if the sub-contracting system were to continue unchecked.

Mr. Paul Weighill, as a representative of the operative stonemasons, supported the general tenor of Mr. Mackie's remarks, and referring in particular to his own special trade, he said that the system of sub-letting work was productive of the worst results. If the general contractor sublet the work, the sub-contractor necessarily took it at a lower price than the general contractor received for it, even although the general contractor might have put in a low price for the work; the natural result was that the sub-contractor, rather than lose money by the job, "took it out" of the workmanship, by employing inferior workmen at under-paid rates, or out of the material,—so that when people thought they had a Portland stone front it often happened that other stone was mixed with the Portland. The system of sub-contracting led to the use of machine-worked stuff in situations where machine-worked stuff ought never to be used. When such machine-worked stuff was new and wet, it was often possible with one's finger-nail to scrape off the surface to the extent of an eighth of an inch, owing to the pulverisation of the surface by the machinery. Was it any wonder under such circumstances that mouldings and other features rapidly decayed and lost their sharpness? He confirmed the statement of Mr. Mackie as to the sub-letting two or three times of the stonework of a new public building, in contravention of the terms of the contract. The result of such arrangements always was that the workmen employed were underpaid and unskilled, and that the material used was not such as was specified.

Mr. Jesse Bell, on behalf of the operative bricklayers, said that bricklayers' work, in common with other branches of the building trade, suffered greatly in quality owing to the sub-letting system. The sub-contractors, taking the work at a low figure, sought to recoup themselves partly at the expense of the workmen and partly by using inferior materials. The workmen were driven to scamp their work, and they became demoralised and careless. It was often said that building craftsmen of the present day were not as skilled as those of old, but he contended that the workmen who had been regularly brought up to their trades were quite as skilful, although, owing to the pernicious system of sub-contracting, they had few opportunities of demonstrating their skill. It was obvious that if the sum allotted by the general con-

INGS.—MR. E. W. MOUNTFORD, F.R.I.B.A., ARCHITECT.

er for brickwork or the work of any other was a fair one, the sub-contractor who work at a lower figure must make the ly him somehow, and in making it pay him the work necessarily suffered.

Alexander Turner, speaking on behalf of operative plasterers, said that there was no of the building trade in which the evils of sub-contracting were more serious than in work of the plasterer. Obviously the materials were very easily tampered with, and the materials and workmanship plastering generally seriously scamped. That was a which was very detrimental to the interests of operative plasterers. The sub-contractors work at such low prices,—fivepence or once a yard, to wit,—that they could hardly it pay, even though the workmen were and the materials adulterated. kinds of tricks were resorted to by sub-contractors. For instance, in running a cornice, durable the material should consist of half plaster and half putty; but the general now was to use four or five pails of putty ly one pail of plaster: hence the failure of ch plaster-work. Other branches of work also "scamped," including even work done a fibrous plaster system. Again, stringings, or other features where hardness and ability were most essential, and for which it usual to specify Keene's, Parian, or some cement, were often run simply in putty or coloured so as to deceive the architect a clerk of the works. Not only did the ing-owner suffer from such malpractices, the architect suffered in reputation as well e workmen, to whom such a system was demoralising. They had either to connive deceptions which were practised, or lose bread and cheese.

Charles Drinkwater on behalf of the tive carpenters and joiners, spoke of the y systematic overtime brought about in ade by the sub-contracting system. They that overtime was often unavoidable, but objected to sub-contractors persistently their hands fourteen, sixteen, or even hours a day. The work would be done by men working the normal number ours.

J. Douglas, on behalf of the glaziers, that the work of his trade also suffered the system of sub-contracting.

Waterhouse asked whether the third e which had been submitted by Mr. us was meant to strictly limit the number urs worked by the men, or whether there to be some amount of elasticity, as sug- y by Mr. Drinkwater's remarks?

Mr. Mackie replied to the effect that they did wish to lay down a hard-and-fast rule, as quite recognised that on many jobs over- was unavoidable.

Professor Aitchison asked this question: osing by some alteration of trades union there was less work ordered to be done e men than was done by them at the time contract was entered into, and supposing ilder or contractor who wished to get his done (and had to get it done under ty) at a remunerative rate found he was g money by the altered conditions of work, was he to protect his interests except by letting the work?

Mr. Mackie said he could not conceive of any eulty of the kind arising. A contractor e in the rates of wages and hours of labour of men in the different trades, and took those into account in framing his estimates. changes as were hinted at in the question not brought about without due notice. In ver to other questions by Mr. J. D. Sedding, Waterhouse, and other members of the eel, Mr. Mackie said that it was the un- der if not the written law of the building es that six months' notice of any changes ed be given on either side.

Answer to Mr. T. E. Colcutt, Mr. Turner, representative of the plasterers, said that hough the insertion of clauses against sub- ing work might not greatly ameliorate the of the working plasterer (for the general ractor would perhaps prove as hard a task- er as the sub-contractor), it would un- tedly improve the character of the plaster s, for work done under a general contractor always done with better materials than e done under a sub-contractor.

Mr. Weighill, on behalf of the operative emasons, wished to add to his former arks a word or two as to quarry-work- e. Having stone worked at the quarries

simply meant having it sub-contracted for. It was done with cheap labour, and no discrimina- tion was made in the selection of the stone, except that that which was softest to work was naturally selected by those who had to work it. The quarry-master and the general contractor profited by that arrangement, but the durability of the building inevitably suffered. Stone worked at the quarries was sent on to the works "faked" so as to hide defects,—"slobbered" over with slurry, and so forth.

Mr. Waterhouse thanked the members of the deputation for their remarks, and promised that the subject to which they had called attention should have the careful attention of the Council of the Royal Institute of British Archi- tects.

The deputation then withdrew, Mr. Mackie expressing their thanks for having been per- mitted to lay their views before so august a body as the Council of the Institute.

The second deputation, representing the Building Trades' Department of the London Trades' Council, was then, at 5 o'clock, introduced. It consisted of Mr. George Shipton, of the Amalgamated Decorators and Painters Society; Mr. Abrey, of the "Perseverance" carpenters and joiners; Mr. E. Coulson, of the Operative Bricklayers' Society; Mr. Gregory, of the Operative Stonemasons' Society; Mr. Smyth, of the "Metropolitan" Plasterers; and Mr. Hobbs, of the Amalgamated Plumbers' Society.

Mr. Shipton, Secretary of the London Trades' Council, in introducing the deputation, said that they were all practical men, fully conversant with the essentials of good work in their respective branches of trade; and they were there to say that the prevailing system of sub-letting work was detrimental to the best interests of the public and of the workmen. Fully impressed with that view, they came to the Council of the Institute of British Archi- tects, whom they regarded as the guardians of the public interests in building, first of all to express their thanks for what the Institute had already done, and secondly to ask them to do a little more. They were aware that the Institute, in the Fourth Clause of their "Heads of Conditions of Builders' Contracts," had sanctioned the following stipulation:—

"The Contractors are not to sub-let the works, or any part thereof, without the consent in writing of the Architect."

He did not know how often or to what extent sub-contracting was sanctioned by architects under that clause. The clause as it stood was of a permissive nature; could it not be modified and made imperative, so as to permit of no sub-contracting whatever? If the Institute could make the condition referred to compul- sory, they would strike at some of the worst abuses in the building trades, those, namely, which arose out of the system of sub-letting work.

Mr. Abrey, on behalf of the carpenters and joiners, said that amongst other evils of the system of sub-letting work, it was a fact that the work had to be done under such conditions of hurry-scurry and "scamping" that in vain was all the knowledge gained by assiduous apprentices and earnest workmen who, desiring to excel in their trade, attended Polytechnic classes in the evening. Strivings after good work were thrown away when men were constantly told "not to waste time" on their work, but to "knock it off" accompanied by the remark that "anything was near enough."

Mr. Smyth, on behalf of the plasterers, cor- roborated the remarks of the plasterer who spoke as a member of the first deputation. He said, in effect, that in no trade were the evils of sub-contracting so rampant as in that of the plasterer. Not only were the men "sweated" for their earnings, but the materials were shamefully sophisticated. He cited the new public building mentioned by the other plasterer as a case in point. He argued that it was necessary to take steps to stop so much rascality, and quoted from the Report of the Royal Commission on the London Livery Companies* the following extract from the return of the "Plasterers' Company":—

"The Plasterers' Company was incorporated in the year 1601, to search, and try, and make, and exercise due search as well in, upon, and of all manner of stuff touching and concerning the Art and Mystery of Pargetors, commonly called Plasterers, and upon all work and workmen in the said Art or Mystery, so that the said work might be just, true, and lawful without any

deceit or fraud whatsoever within the City of London, or suburbs thereof."

It was greatly to be regretted that there was no such system of surveillance now in vogue.

Mr. Gregory, on behalf of the operative stone- masons, lamented that in builders' yards of the present day there were so few masons to be seen at work. Why? Because stonework had all gone into the hands of sub-contractors, who had now the biggest yards in London. All sorts of tricks were played with masons' work in some of these sub-contractors' yards and shops. Hardly a single stop or moulding was worked on the stone; they were stuck on with plaster and the joints disguised with slurry before the stone went on to the job. Balusters, instead of being cut out of the die, were in sub-contractors' yards often made in two halves and stuck together, the *modus operandi* being disguised in the same way. Needless to say that one kind of stone was often substituted for another with impunity, the substitution never being discovered by the clerk of the works or the architect. There was always a good substantial bag of plaster in a sub-contractor's workshop, and shellac was an article which was also in much request there.

Mr. Hobbs, operative plumber, said that the sub-contracting system operated detrimentally to plumbing work and to the good plumber by encouraging the employment of cheap and im- perfectly skilled labour. For instance, an un- skilled workman would be liable to make imperfect joints, thus allowing of the passage of sewer-air. Take again the case of a bend in a 4-in. soil-pipe. Although the soil-pipe might be of 7-lb. lead, the unskilful workman in making the bend would reduce the thickness of metal in the heel of the trap to that of perhaps only 4-lb. lead.

Mr. Octavius Hansard said he supposed that in the London building trade there were very few contractors who had a staff of slaters. How would the proposed clause prohibiting sub- contracting affect the work of that trade, which was mostly done by one or two respectable firms?

Mr. Shipton, after consulting with the deputation, said they were of opinion that slating was a very exceptional trade, and would be an exception to the general rule against sub-con- tracting.

Professor Aitchison asked whether it was not a general rule for all builders to sublet the whole of their work?

Mr. Shipton replied that it was by no means a universal custom. There were some firms who did so, but they were mere capitalists rather than builders. A firm of capitalists did not care a rap for the art of building. The best firms of builders were those where the partners had served their time to some trade, and who took a pride in their work. Naturally, if the head of the firm were a mason by trade, he would care most for the mason's work; if he had been a joiner, he would take special pains with the woodwork. But a man who had a practical acquaintance with any one branch of the building trade would have a general knowledge of the other branches, and would take some pride in their proper execution.

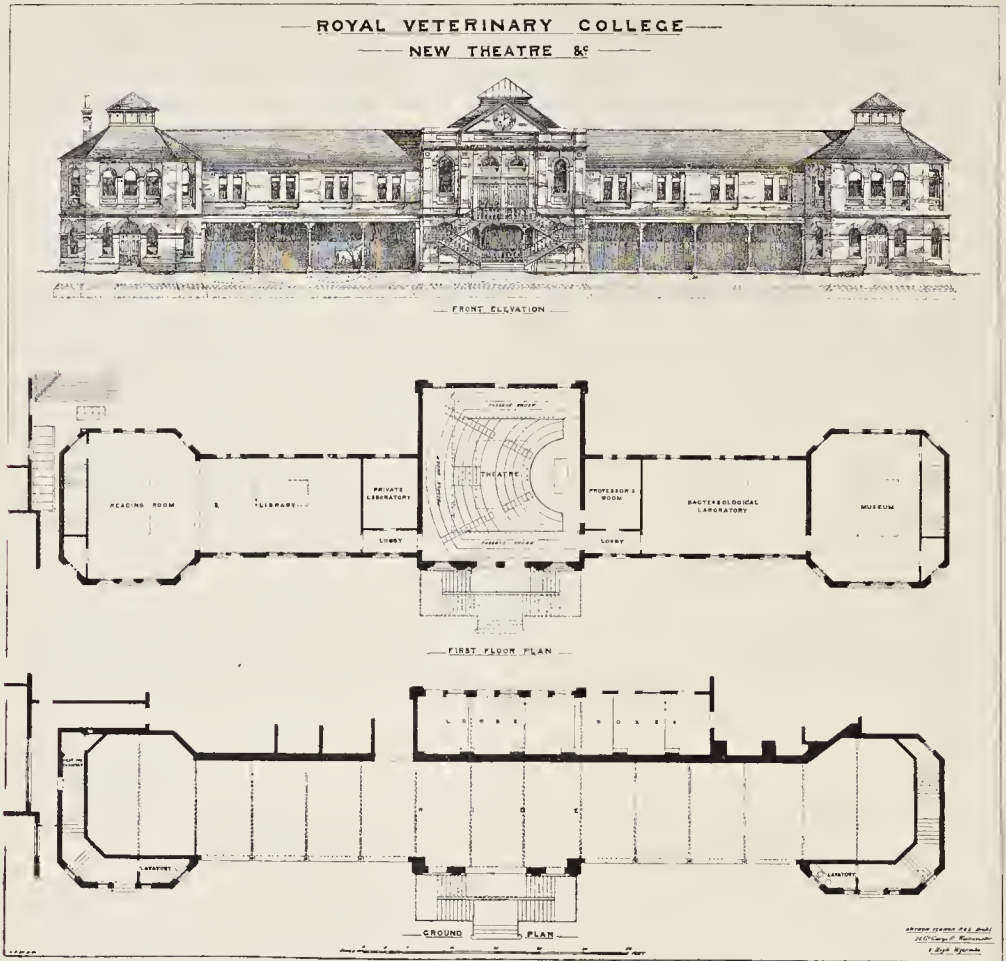

Mr. J. M. Brydon asked whether the Brick- layers' Society objected to the payment by the piece for cut and carved work?

Mr. Coulson, in replying, said that although they considered the system under which such work was done to be a form of "sweating," they could not stop it. In some general remarks he lamented the degeneracy of modern brickwork. The old method of doing brick- work, with struck joints was far preferable to the modern pointed work.

Mr. Macvicar Anderson said he had been in the habit sometimes of selecting the tradesmen for one or two trades, and of leaving the work they were to do out of the general contract, carrying out to a certain extent the system in vogue in Scotland and the North of England. He had generally found the results of such a course to be very satisfactory. What were the views of the deputation in regard to that method of getting work done?

Mr. Shipton said that if he understood the question aright, each specialist employed for each special kind of work was the contractor for that work. If that were so, they were decidedly in favour of that system, for by it the

* The Charter from which these words are quoted was granted by Henry VII., March 10, 1601, and was confirmed by Henry VIII., Elizabeth, and Charles II.

skilled workman would be employed directly by the contractor.

Professor Aitchison said that no doubt the best work was done under the separate contract system if the architect could take the trouble of it, but that system of doing work would add enormously to the architect's labours.

Professor Aitchison said it had been represented to him by some builders that when they had entered upon a contract to carry out works at a certain price, they sometimes found that the men would not work with such celerity as would enable them to carry out their contracts without serious loss, and that they had no option but to let the work to sub-contractors to save themselves from ruin.

Mr. Shipton said he thought such representations on the part of contractors should be taken *cum grano salis*. He in all his long experience of workmen had never known them to fail to respond to all reasonable calls made upon them to do a fair day's work. If a sub-contractor could afford to carry out a work at a lower rate than the original contractor, it was difficult to see how the original contractor, paying a fair rate of wages, and getting the best and most efficient workmen, would be unable to do so.

Mr. Thomas Drew, R.H.A., of Dublin, said he was not conversant with all the conditions of London work: but he should like to know whether the Operative Bricklayers' Society had any rule prohibiting a bricklayer from laying bricks with both hands; and, if so, how they justified that rule?

Mr. Coulson, in reply, said that the alleged rule was a pure myth,—a fiction. He had been in the trade for over forty years, and he had been Secretary of the Society for thirty years, and

there was no such rule upon their books, nor had any such rule ever been passed.

Mr. Waterhouse having assured the deputation that their statements should have the careful consideration of the Council, the deputation withdrew shortly after six o'clock, Mr. Shipton expressing their thanks.

THE ROYAL VETERINARY COLLEGE.

THE illustration represents the additional building to the well-known Veterinary College in Great College-street, Camden Town, and which was opened by the Duke of Cambridge a week or two ago. The new building is opposite the main entrance to the College grounds, and it comprises a new wing exceeding 200 ft. in length, and it provides on the ground-floor for a ride or testing space for horses. On the first floor, in the centre, is a large lecture theatre, to hold from 350 to 400 students; it has an external staircase of iron, and is about 40 ft. by 36 ft. Adjoining this lecture theatre will be provided a private laboratory and professor's-room, large bacteriological laboratory, 37 ft. by 22 ft.; museum, of octagonal shape, 34 ft. by 30 ft.; and on the opposite side a large reading-room and library, nearly 70 ft. in length. The buildings are intended for the special training of students, with increased facilities in the higher branches of the veterinary science. They are being constructed in white gault brick, with malm dressings, and slated roofs. A good deal of iron is in use in the construction. The cost will be between 6,000*l.* and 7,000*l.* The contractors are Messrs. G. H. & A. Bywaters, and the architect Mr. Arthur Vernon.

Illustrations.

SHEFFIELD MUNICIPAL BUILDINGS: SELECTED DESIGN.

WE publish this week the perspective view and two principal plans of the design, by Mr. E. W. Mountford, which has been recommended by the Assessor, Mr. Waterhouse, R.A., for adoption, from among the six sent in, by his previous selection, for the second competition.

The following extracts from Mr. Mountford's report will explain the intention of the plan:—
“The various rooms of the respective departments, with the few exceptions specified in the ‘Instructions,’ are invariably placed upon the one floor therein assigned to them.”

Each of the four fronts having a central entrance, with a closely adjacent staircase, direct access to every part of the building is attainable from either of the surrounding streets. Moreover, each department, being contained wholly in the space between two of these entrances, or the stairs leading therefrom, may be reached without the necessity of traversing any other department.

The whole of the official or state apartments, including the three large committee-rooms and the grand staircase, may be shut off and used independently of the remainder of the building without, in the least degree, interfering with the working of the business departments.

All rooms and corridors are thoroughly well-lighted throughout. I believe, as an absolute certainty, that there would not be a dark corner in the building, excepting in certain unimportant parts of the basement, and this without the necessity of using ‘borrowed’ light.

Future extension is amply provided for, as is

THE BUILDER. JUNE 28, 1890.

FIRST PREMIATED DESIGN FOR HYMERS' COLLEGE

PHOTO LITHO. SPRUCE & CO. 22, MARTIN LANE, LONDON E. C.

LL.—MESSRS. BOTTERILL, SON & BILSON, ARCHITECTS.

shown upon both plans and elevations, and forming part of the general scheme will be an absolute improvement to the building, both internally and externally. Exclusive of corridors, 2,270 square feet additional space is provided, upon each of four floors, equivalent to twenty-eight new offices, each measuring 20 ft. by 16 ft.

Principal, or First, Floor.

This contains the Mayor's apartments and the rooms for Town Clerk, and is approached by four staircases, one on each entrance.

The principal staircase (8 ft. wide, with a rise of less than 6 in. to each step) leads direct to the Council Chamber and Mayor's reception-hall. The alteration in plan of this stair, in deference to your suggestion, is undoubtedly an improvement both to the staircase and hall, the latter being made much more open and dignified.

The Mayor's apartments occupy the whole of the Pinstone-street front, the three state rooms measuring together 157 ft. by 35 ft., exclusive of bays, with a clear height of 23 ft. These can all be thrown into one grand hall when required, and, if desired, the openings between them may be made very much larger than shown in plans.

A corridor, 11 ft. wide, well lighted by windows and lantern lights, as well as from the grand staircase, communicates with all these rooms, to facilitate the circulation of guests.

An open gallery, external from the Mayor's reception-room, is provided off principal entrance, and another, opening out of dining-room, at the corner of the Pinstone and Surrey-street fronts. These galleries, while adding considerably to the appearance of the principal front, would be extremely useful at elections or other similar occasions, as well as at large receptions or banquets.

The Council Chamber, approached directly from the grand staircase, occupies the centre of the site, measures 64 ft. by 39 ft. and is 30 ft. in height. It is lighted by two large traceried windows at each end, and three upon the east side. The ceiling is flat, with moulded and enriched panels. The drawings clearly indicate the suggested fittings, but, of course, these are open to any modification to meet the views of the Council.

The ante-room is shown to be lighted principally from above, and immediately adjoining are the gentlemen's cloak-room and lavatory, the ventilation of the latter having been carefully considered and numerous windows provided. The ladies' cloak-room is upon the opposite side of the grand staircase, and here again the lighting and ventilation of the lavatory is made as perfect as possible.

The various committee and sub-committee rooms are placed in one corridor, close to the Town Clerk and Council Chamber. The three large rooms adjoin the official or state apartments, and may be used on suite with them, while, by closing the Town Clerk across the corridor, near the head of the Town Clerk's stairs, these, with the other official apartments, are entirely severed from the departmental offices, and then only be approached by the grand stairs. These committee-rooms have, after the official rooms, the finest position in the building, and may, under ordinary circumstances, be readily approached from either of the four entrances.

A business room for the Mayor communicates with the suite of large committee-rooms on the one side, and the Town Clerk's office on the other, and is close to the Council Chamber.

The planning of this important department has been most carefully studied. The rooms are all close together, the Town Clerk's own rooms being placed between his general office and the Mayor's business room, and at the same time close to the Council Chamber and committee-rooms. The department communicates by means of the staircases, directly with the Surrey and Norfolk-street entrances, and is also accessible from the grand staircase, and that from Cheney-row.

Ground Floor.

The principal entrance from Pinstone-street is 20 ft. in width, and 16 ft. in height, having an inner glazed screen with swing-doors in addition to the outer doors.

Directly in front of entrance are the grand staircase and hall, the latter being 44 ft. by 40 ft. and 45 ft. high. The domed ceiling of the hall is surrounded by an arched lantern-light, having inner and outer skylights, the inner one paneled and filled with tinted glass. It is proposed to decorate the walls of this hall with tapestry or frescoes, representing scenes in the history of the town. The staircase would be of stone, with marble balustrade, and it is proposed to make the supporting columns also of marble, with moulded caps and arches of stone. The ball would be paved with marble mosaic.

The Borough Accountant's department extends from the left of the principal entrance to that from Surrey-street, being thus equally accessible from either. The general office is 32 ft. by 47 ft., exclusive of bay, and 16 ft. high. This remains as in the sketch design, but the arrangement of the minor offices has been somewhat modified in accordance with your supplemental instructions.

The Borough Accountant's room now opens out of his general office, being approached upon the other side thereof and mortgage office, which also opens out of the general office.

The strong-room is transferred to the Tower, where it is better placed for several reasons. It has the advantage of the thick walls of the Tower, is brought behind the counter instead of being upon the public side of it, and, requiring no windows, it allows the walls of the lower stage of the Tower to be left solid,—a great improvement, structurally and aesthetically.

Here follow descriptions of other rooms on this and the remaining floors.

Architectural Character.

"The style may most safely be described as Modern Renaissance, and as far as possible it is English in character and detail. So far as I know the design is as original as may be in the nineteenth century, that is to say, no existing building has been consciously copied either in whole or part, excepting, of course, in the matter of detail of doors, windows, &c.

My idea has been to obtain the dignity essential for the Municipal Buildings of a great town, combined with the utmost convenience of internal arrangement, and the largest possible amount of light for the interior. The first consideration has always been the convenience of plan, and in no case has this been sacrificed in order to improve the elevations. But these have not lost by this course of procedure, for, growing as they do naturally from the plan, they indicate externally the internal arrangements, and thus gain considerably in interest and variety. Throughout I have endeavoured to group the parts, so that they may look best in perspective, and upon this grouping, with its contrast of light and shade and general picturesqueness of sky-line, I depend for my effect.

Great ornamentation has been avoided, for the sum to which we are limited and the atmosphere of Sheffield unite in forbidding it. What carving there is about the building is in low relief, and confined almost entirely to the Pinstone-street front, while everywhere the ornament is concentrated in masses, and contrasted with broad effects of plain wall surface.

In looking at the site the necessity for a tower at the corner of Pinstone and Surrey-streets strikes one very forcibly. I have, therefore, placed mine there, where it will be conspicuous from all points, subdues into harmonious the opposite lofty buildings of the Yorkshire Penny Bank, and very conveniently separates the Pinstone-street front, with its lofty rooms, from the Surrey-street elevation and its lower offices.

The carving upon the Pinstone-street front I should propose to make of a distinctly local character, and would suggest the employment of Mr. Creswick, a Sheffield man, to carry it out. The frieze above the ground-floor windows represent six of the trades carried on in Sheffield. In the niches provided I should propose that statues of Gilbert, Earl of Shrewsbury; Sir Francis Chantrey, R.A.; James Montgomerie, the poet; Francis Hunsman, Mr. Henry Bessemer, and John Ruskin be placed, while the topmost niche of central gable would contain a statue of her Majesty the Queen, with the Arms of England upon the shield above her. The shields in the spandrels of the principal entrance would bear the arms of the town and diocese respectively, while those in the semicircular pediments on first-floor might have the arms of the Cutlers' Company and the Duke of Norfolk.

The elevations towards Surrey and Norfolk-streets and Cheney-row, as well as those towards the internal courtyards, have been as carefully studied as that to Pinstone-street, and are probably equal to it in merit. Upon the drawings they are shown as when completed, the future extension being drawn in lighter ink than the rest.

The Council-chamber is made the principal feature upon the south front (as seems desirable), and when completed this elevation will probably be the most successful of the four.

Heating and Ventilating.

I should propose to heat this building on the low-pressure system of steam heating. The boilers, placed in the heating-chamber shown on plan, would be of the Cornish type, with cross tubes and set in brickwork.

The principal divisions of the building would be heated by separate services, and every radiator or group of radiators would be separately governable by valves, so that any part of the building could be worked independently of the remainder.

In the Council Chamber and other large rooms the admission of fresh air would be arranged in connexion with the radiators, and, having regard to the Sheffield atmosphere, arrangements would be made for filtering the air before its admission to these rooms.

The hot-water circulation to the different parts of the building would be provided by heating water by steam in a copper vessel and conducting it thence to the various points where it is required, by copper pipes. This is an expensive process, but appears to be the most necessary by the nature of the water supply in Sheffield.

The architect estimates the cost of the building, at 103,700 cubic foot, as 80,150*l.*

He adds to this report the remark that the drawings should still only be regarded as sketches capable of improvement.

CHURCH OF ST. JOHN, STANSTEAD-MONTFICHET.

This drawing, which is exhibited in the Royal Academy of this year, shows the interior of a church of which exterior views were published in the *Builder* of August 10, 1889, and November 23 of the same year.

The architect is Mr. W. D. Caröe. The drawing is commented upon in the review of "Architecture at the Royal Academy" in another column. Nothing need be added to the description of the church which has already been published with the former illustrations.

HYMERS' COLLEGE, HULL.

THIS design was submitted by Messrs. Botterill, Son, & Bilson, of Hull, in the recent competition, and placed first by the assessor, Mr. E. C. Robins, F.S.A., who stated in his report that he considered it to be the only one which realised in every essential particular what he understood by the "Hall Passage" system. The general arrangement of the plan was definitely laid down in the instructions prepared by the assessor. Two floors of eight class-rooms each are grouped around a central hall, every class-room being entered directly from the hall or from the galleries which surround it on three sides. The administrative offices are placed beneath the hall windows on the fourth side, and the principal staircase is directly opposite the main entrance,—an arrangement by which the head-master's and porter's rooms command the entire hall with its entrances and staircase. The Classical school, on the ground-floor, consists of eight class-rooms for thirty scholars each, with a cloak-lobby screened off the end of each room, and entered from the class-room only. The class-rooms in the modern school (first floor) accommodate forty each, a floor-area of 18 ft. per head being allowed in both cases. A dado of cloak-lockers around the central hall provides accommodation for the cloaks of the modern school. In carrying out the design, it is proposed to omit the separate cloak-rooms on the ground-floor, and provide cloak-lockers for the scholars of both classical and modern schools, following the system adopted at St. Paul's School. A music-room with a drawing-school over, completes the main building. The dining-hall, with its kitchen offices, and a porter's house, were provided in a separate block, connected with the main building by a covered way. The latrines are placed to the east of the main building, opposite the end entrances. The materials proposed are red brick, with Ancaster stone dressings and red tiled roofs. The author's estimate for the main building, dining-hall, porter's house, and latrines was 14,970*l.*

THE ARCHITECTURAL ASSOCIATION.

At the adjourned special meeting, held on Friday last, there was a larger attendance than at the previous meetings; the whole of those present, however, were not members of the Association.

The President having announced that this, being a continuation of the former meeting, there would be no minutes, letters were read from Mr. William White, Past President; Mr. H. L. Florence, Past President; Mr. J. A. Gutch, Past President; and others, with reference to the object of the meeting.

Mr. Leverton and Mr. Douglas Mathews objected to the letter which had been sent out from the hon. secretary, Mr. Farrow, announcing the date of this meeting.

After some objections on the part of the leaders of the opposition, the real business of the evening commenced, and Mr. Brodie resumed the discussion, moving,—

"That the consideration of the alteration of Rule 43 be taken at an early date next session, and the remaining business proceeded with at once."

This, however, was not seconded, and the suggestion was dropped.

Mr. Garbutt moved as an amendment to the alteration of Rule 43 proposed at the last meeting,

"That all voting shall be taken by a show of hands, and the question decided by the majority, but no proposal involving any alteration of the Rules or Constitution of the Association shall be passed unless at least two-thirds of the members present agree thereto."

Messrs. Stannus, Needham, Wilson, Cole A. Adams, H. Surr, and A. B. Pite took part in the

discussion which followed, and this having become somewhat desultory owing to various suggestions having been put forward by some of the speakers, the President called attention to the fact that Mr. Garbutt's amendment was before the meeting, and that speakers must confine themselves to the discussion of that motion.

Mr. Stannus took the opportunity in discussing the amendment to urge his views once more, and was followed by Messrs. Earle, Mathews, Farrow, Hudson, and Fleming. Mr. Garbutt's amendment having been put to the meeting, and lost by a considerable majority, Mr. Stannus then proposed

"That a Special Committee be appointed by this meeting to revise the whole body of rules, and that all suggested alterations be referred to it, and that it shall report at an early date next session."

This was seconded by Mr. Cole A. Adams, and, after a brief discussion, in which Messrs. Brodie, Douglass Mathews, Slater, Millard, and Collard spoke, was carried by a considerable majority. The proposition of Mr. Stannus having been carried,

Mr. A. B. Pite moved:—

"That it is desirable that no question touching any alteration of the rules or constitution of the Architectural Association shall be decided upon at any meeting without first submitting such proposed alteration to each of the members, and furnishing each member with a printed voting paper."

This was seconded by Mr. Needham Wilson. On the question being put, the numbers voting on each side were equal,—36 for and 36 against,—under which circumstances the President declined to give the casting vote, and declared the proposition to be not carried.

It was then proposed by Mr. Bernard Dicksee, seconded by Mr. Stannus:—

"That the Special Committee consist of not less than nine members, five to form a quorum."

This was put to the meeting, and carried.

Mr. Stannus then suggested the following list of nine members, which was seconded by Mr. Dicksee:—Messrs. J. Slater, Cole A. Adams, A. B. Pite, F. R. Farrow, H. Sirr, R. Phené Spiers, H. W. Pratt, Leonard Stokes, and H. Stannus. Further additions were then suggested by various members: Messrs. T. E. Pryce, Needham Wilson, Max Clarke, W. J. Leverton, and Professor T. Roger Smith, being duly proposed and seconded.

It was then proposed by Mr. A. B. Pite, and seconded by Mr. Dicksee,—

"That the original nine members proposed by Mr. Stannus be appointed as the Special Committee."

Mr. Mathews proposed, and Mr. Pite seconded,—

"That nine, and nine only, be the number of the Committee."

Mr. Stannus then proposed, and Mr. Dicksee seconded,—

"That the original nine be asked to serve, and that any refusal be made up from those proposed subsequently."

This being put to the meeting as a resolution, was carried.

Mr. Stannus then proposed a vote of thanks to the President for the manner in which he had fulfilled the duties of his office during the year, which was seconded by Mr. Leverton, and carried by acclamation, and the proceedings then terminated.

THE ARTISTS' BENEVOLENT FUND.

The eighty-first anniversary dinner in aid of this Fund was held on Wednesday evening last at the Freemasons' Hall, Sir Richard Temple, Bart., G.C.S.I., & Co., in the chair. Amongst those present were the Earl of Derby, Mr. C. B. Birch, A.R.A.; Mr. T. Brock, A.R.A.; Mr. C. B. Dimond, and Mr. C. Purdon Clarke.

The "Artists' Fund" was established in 1810, and consists of two branches—the Annuity Fund and the Benevolent Fund. The former is raised and supported by the contributions of its members for their own relief in sickness or old age, and does not receive any assistance from the general public. The latter is purely charitable, having for its object the relief of the widows and orphans of such members of the Annuity Fund as may die without leaving them an adequate maintenance. The claims of all those who are entitled to the benefits of the society are admitted as soon as it appears that they stand in need of help, and the numbers are unlimited. The annual sums payable to those in the greatest need are supplemented by donations, and by the interest on benefactions and legacies made in former days. During the past year forty-nine widows and sixteen orphans received annuities amounting to 1,077. Since

the institution of the Fund a sum amounting to upwards of 53,000*l.* has been distributed in relieving distress. The society is under the special patronage of, and receives liberal support from, her Majesty the Queen.

Sir Richard Temple, in proposing "Prosperity to the Fund," referred to its twofold character, and pointed out the sound economical basis on which it worked, since it was the principle of the founders that charity should follow self-help. The claims of the society upon the alms of the public rested on the recognition of the value of art to the nation, educationally and in other ways. After speaking of the value of drawing to architects and engineers, he referred to the great architectural works of the Middle Ages,—works which he said were produced by men who were artists first, architects afterwards, and then civil engineers. Unfortunately in these degenerate days the order was too often reversed, a man becoming a civil engineer first, and then an architect, and finally taking his chance of becoming an artist,—a chance which was often very remote. For his own part he believed that art was a great addition to the happiness of the country; that it conducted to a proper view of religion; and that it assisted in a very large degree to raise people in the scale of civilisation.

The Earl of Derby, the President of the Fund, responded. He remarked that he was scarcely the right person to do so, but took confidence from the fact that it was a curious custom of the English always to allot important functions to those who knew little or nothing about them. He had personally no closer connexion with art than could be gained from a very sincere admiration of, and sympathy with, those who followed its laborious paths. It was often asked why, when pictures were sold at higher prices than ever before, and when the status of art and artists was so much improved, such a society as that which they were met to support existed. It was, indeed, true that very large sums were sometimes given for paintings; but he noticed that such paintings were usually the works of dead artists. Even if it were the fact that the prizes of the artistic profession were greater than they had ever been, that would almost constitute the chief reason for the continued existence of the Fund. When any profession was exceptionally favoured and successful, the result was that many more men were tempted into it—some, indeed, well qualified, others with no qualification except a strong desire to succeed. He thought there ought to be, and he was glad to think that there was, a real feeling of sympathy for those who, while possessing a true love for art and doing their best, had not been successful. Lord Derby concluded by giving "The Health of the Chairman."

Other toasts followed, including "The Artists' Annuity Fund," which was proposed by Mr. T. W. Wheeler, Q.C., coupled with the name of Mr. Thomas Brock, A.R.A., who, in responding, said that during the eighty years of its existence the Annuity Fund had disbursed 100,000*l.* to its members, and it now had a reserve of upwards of 17,000*l.*, so that it was in a sound condition financially.

During the evening, a list of subscriptions and donations, amounting to nearly 600*l.*, including a donation of 100 guineas from the Queen, was read by the Secretary, Mr. Lambton Young.

Industrial Schools, Shustoke.—An extension to accommodate 100 additional boys at the Industrial Schools, Shustoke, for the Corporation of Birmingham, is now being carried out by Mr. Daniel Arkell, architect, Birmingham, and will comprise a new large school-room, or an assembly hall, that will hold the whole of the boys. This will be carried out with a Renaissance treatment, the inside walls to have coloured glazed bricks as a dado, and red-brick facing above; a wrought moulded groined open timbered roof; and a large clock tower and bell turret carried above at the end next of the road. A stage is provided at the one end of the school, with ante-rooms adjoining; access is obtained to each by an underground corridor. The heating apparatus is in the basement. At the opposite side of the quadrangle is a large swimming-bath lined with glazed brick and heated by steam; the bath is provided with dressing-rooms, and adjoining is the officers' room, with the board room and Master's office over. The builder is Mr. William Hopkins, of Latimer-street, Birmingham. The works will cost between 3,000*l.* and 4,000*l.*

ARCHITECTURAL ASSOCIATION VACATION VISITS:

II.—AUDLEY END AND SAFFRON WALDEN.

On Saturday last the second Vacation Visit was made to Audley End and Saffron Walden. A party of about twenty members, including the President, assembled at Liverpool-street Station and proceeded by the 2.30 train to Audley End Station, where they were joined by two of their members who had ridden down on a tandem tricycle. A walk of twenty minutes brought the house into view from the road, while in the distance beyond, the tower and spire of the church of Saffron Walden could be recognised.

The name of Audley has only been associated with the locality since the sixteenth century, as will be explained by the following outline history of the Manor of Walden.

In the time of Edward the Confessor Walden (or Waledon) belonged to Ausgar, Master of Horse to that King. William I. granted it to Geoffrey de Mandeville, together with 117 other lordships, including thirty-nine in Essex, for his distinguished services at the Battle of Hastings. He commenced his castle here, the ruins of which still exist, and were visited by some of the party, although nothing remains of the house or residence connected with it. But it is probable that it was the building that we find referred to by the Patent Rolls of 1343, which Humphrey de Bohun, Earl of Hereford and Essex, obtained licence to enclose. In the time of Stephen the representative of the Mandeville family fell into disgrace from his mercenary and treacherous conduct, and, after being captured by the King, was compelled to give up the Tower of London, of which he was Constable, and also the castles of Pleshy and Walden. He then placed himself at the head of a robber band, and, after attacking and robbing Ramsey Abbey in order to pay his men, he laid siege to Burwell Castle, belonging to the same religious house. Owing to the heat he exposed himself without protecting his head, and was shot by an arrow. As he was under sentence of excommunication at the time, the Knights Templars placed his body in a leaden coffin, which they hung on a tree in their orchard until the sentence was annulled, when he was buried in the churchyard of the New Temple.

The title and property was restored by Henry II. to Geoffrey, second son of the last-mentioned nobleman, but on his death without issue in 1189, there was considerable controversy as to the rightful heir. William FitzPiers, who was a member of the family, and also Chief Justice at the time, managed to obtain the estates by agreeing to pay at once the sum of 7,000 marks offered in instalments by one of his kinsmen (it is said, however, that he never paid more than 3,000*l.*)

On the accession of Richard III. Henry, Duke of Buckingham, who had inherited a portion of the property, obtained a grant of the whole, but this was not confirmed by Parliament, which did not meet till after his attainder and execution. Historians think that the defection of the Duke was owing to the King's breach of faith, and it seems probable that this was the view which Shakespeare took when he makes him say:—

My Lord, I claim the gift my due by promise,
For which your honour and your faith is pawned,
The Earl of Hereford, and the noble knights,
Which you have promised I shall possess.

Rich. III., act IV., sc. 2.

From this time the manor of Walden was absolutely held by the Crown till 1538, when Henry VIII. granted it, together with the dissolved Abbey of Walden and many of the estates belonging to that foundation, to Thomas Audley, Speaker of the House of Commons, in exchange for land in Hertfordshire, and as a reward for his services in connexion with the Bill for the suppression of the smaller monasteries; he was rapidly promoted, and after being knighted became Lord Keeper, and next year Chancellor. He now undertook the larger measure of suppressing the larger monasteries. He was made K.G. 1538, and is said to have been the first Chancellor who obtained this distinction for other than military services. On the death of Lord Audley, his daughter Marjorie succeeded to his possessions. She afterwards married the Duke of Norfolk, but during the reign of Mary he received no recognition, having been brought up as a Protestant, Fox, the martyrologist, being his tutor. Audley's daughter was his second wife, and on her death

he married again, but being left a widower for the third time, he conceived the project of an alliance with Mary, Queen of Scots, which, of course, placed him in danger. It is said that Elizabeth once hinted to him "To beware on what pillow he rested his head."

He, however, continued to plot against the Queen, and was arrested, but released on a promise not to offend again; this he broke, and was beheaded 1572.

His son Thomas was restored in 1583, and served in the fleet under his kinsman Charles, Lord Effingham, against the Armada. He was created Baron Howard of Walden, and K.G. James I. made him Earl of Suffolk and Lord Chamberlain, and it was in the execution of his duties in the latter office that he discovered the preparations made by Guy Fawkes for the Gunpowder Plot.

It was this nobleman that built the house. The work was commenced in 1603, and completed about 1666, at a cost of 190,000*l.* In 1669, James, the third earl, sold the property to Charles II. for the sum of 50,000*l.*, 20,000*l.* of which was to be provided by the Hearth-tax. In 1691 this money had not been paid, so William III., who was anxious to get this tax repealed, agreed to restore the house and other properties to the representatives of the family, if they would agree to cancel the debt, which was done.

Among the earlier historians of Audley End there appeared to be some doubt as to who was employed as the architect of this famous house, the names of both Bernard Jansen and John Thorpe being mentioned in connection therewith, while it was also stated that a model in wood was obtained from Italy. The late Lord Braybrooke, who was the author of a very exhaustive history of Audley End, with the manor and parish of Saffron Walden, devoted considerable attention to this subject, and after studying the book of Thorpe's designs, then in the possession of Sir John Scane, came to the conclusion, from the similarity of the plans and many of the sketches for detail, that there was no longer any doubt that Thorpe was engaged upon it, although it seems very probable that his noble client took a large share in the direction of the work. The original plan embraced two quadrangles, the first of which extended in front of the present building, the existing entrance-front forming the fourth side; the three others were pulled down by the advice of Sir John Vanbrugh. It should be mentioned that there was an entrance gatehouse in the river front, forming a central feature which is somewhat wanting in the existing facade.

In 1750 the gallery forming the eastern side of the inner court was pulled down.

The remaining portion therefore consists of three sides of the inner quadrangle, the hall occupying a central position in the principal front, between the two entrance porches. The stone screen which is at the northern end of the hall is a fine specimen of Jacobean carving.

At the south end of the hall two flights of stairs lead to the drawing-room and the other principal apartments on the first floor. The features most worthy of note are the elaborate plaster ceilings, in some cases with pendants, but in others with simply a flat ribbon pattern, while the chimney pieces show some good carving and heraldry.

The private chapel is decidedly disappointing. It is nothing more than one of the ordinary oblong rooms in which side aisles have been formed by means of thin attenuated columns supporting pointed arches all in the most meagre neo-Gothic.

The fittings in the library are of a later date than the house, and may possibly be the work of Vanbrugh, who, as mentioned above, was employed for some time on alterations to the house. Externally, the house shows considerable signs of restoration, the two porches being perhaps the most interesting part of the front. The angle turrets, with their green copper roofs, are probably similar to the original ones, but appear from the somewhat heavy character of some of their details to have received considerable modification.

On leaving Audley End the party proceeded to Saffron Walden, and visited the fifteenth-century church, which is of large size, and contains some good brasses and other features of interest. The market square, with its Town Hall by Edward Bagnall, and the Bank by Nesfield, excited considerable attention, while several of the visitors were attracted by the old half-timber and plaster work of some of the houses in the town, which are worthy of study.

Reynolds's Power Mortising Machine, with Boring Attachment.

PATENT POWER MORTISING MACHINE WITH BORING ATTACHMENT.

Messrs. F. W. REYNOLDS & Co., engineers, have lately designed and patented a power mortising machine to work upon what is claimed to be an entirely new principle. The machine is capable of mortising through 11 in. to a width varying from 1/2 in. to 1 in. The chief features of improvement are the means used for actuating the chisel-bar, and the arrangement of foot-lever for bringing the chisel down into the work. The great difficulty experienced by engineers for years past has been the arrangement of a mechanical motion whereby a vibrating-chisel can be made to descend, whilst vibrating, by means of a hand or foot lever, and do its work upon the mortise without jerking or throwing the resistance to the blow upon the arm or foot of the operator. Messrs. Reynolds & Co. consider that by their patent these difficulties are entirely overcome. Instead of connecting the chisel-bar to the driving-shaft by means of complicated levers, as in the old style of machine, the connexion is made simply by a leather belt working in the interior part of the frame, and so arranged by passing over two pulleys that it vibrates the chisel with a stroke of 6 in., and also allows it to descend 9 in. when brought down to its work. The blow of the chisel, which works at a speed of from 250 to 300 strokes a minute, is modified by the spring of the belt, and there is consequently less danger of breakage. The foot-lever, for bringing the chisel down, is connected to this interior belt by means of a compound link, which throws the resistance and strain of the working on the frame of the machine instead of on the foot.

The bed for holding the work is made to rise and fall, and has the ordinary longitudinal and transverse motions. A pressure-plate and screw can be used for holding heavy work, and adjustable clips can be substituted for mortising sashes and similar light work. A guard is provided for placing over the chisel when vibrating at its highest point, which effectually prevents any damage to the work whilst it is being placed in the machine. The guard, however, is made so that it can be instantly lifted off without unscrewing any bolts or nuts. For re-

versing the chisel there is a simple arrangement which will turn the chisel for mortising in the opposite direction whilst the chisel is either in motion or at rest. A screw at the back of the machine is supplied for tightening the interior connecting-belt, and the tightening can be done, if required, without stopping the machine.

THE LONDON COUNTY COUNCIL.

THE ordinary weekly meeting of the London County Council was held on Tuesday afternoon at Spring-gardens, Lord Rosebery in the chair.

The Housing of the Working Classes: The Guinness Trust.—The adjourned Report of the Housing of the Working Classes Committee contained the following paragraphs:—"Your Committee reported to the Council on December 17 last that they had received a letter from the President of the Local Government Board, stating that the trustees of the Guinness Fund would be glad of any assistance the Council might be able to give them, as regards sites in its possession, or others which it might propose to acquire, and that they had addressed a reply to Mr. Ritchie to the effect that the Committee had learned with great pleasure the wishes and intentions of Sir E. Guinness, and would carefully consider in what way assistance could best be given to the Trustees, and had suggested the desirability of a conference on the subject. On December 18 the Trustees replied, thanking the Committee for their suggestion, and inquiring whether the Cable-street, Shadwell, site was for sale, and, if so, upon what terms. A conference was held on February 3 between the Trustees and six members of the Committee, at which the subject was discussed in all its bearings; and on February 22 the Trustees were informed that, without prejudice to future negotiations, the Committee would be prepared to recommend the sale of the three plots in the Cable-street scheme at a price named per square foot, upon condition that 970 persons of the working class were re-housed in dwellings not more than four stories high, that if a portion only of the area were acquired, a higher price should be paid for the land, and that the plans should be submitted to the Council for approval, and be

subject to a general observance of the building conditions approved by the Council on December 3. On February 26 the Trustees replied, stating that they were prepared to negotiate for plot A on the basis of the price named for the whole site, and to re-house the required number of persons, but were unable to comply with the stipulations as to the building regulations or as to the approval of the plans, as they desired to remain largely freehanded in making their practical experiment. The Committee answered this communication on March 10, pointing out that the building regulations had been approved by the Council after careful consideration, and expressing their opinion that it was absolutely necessary that plans of buildings to be erected on land, in dealing with which they were directly responsible, should in all cases be submitted for the approval of the Council. The Committee at the same time expressed their great anxiety to afford all possible assistance to the trustees. The Trustees replied on March 26, stating that they were willing to submit plans for approval, but were unable to comply with the general building regulations; and on April 14 the Committee pointed out to them in reply that the price of the land had been fixed at a specially low figure in order that satisfactory buildings might be erected, and expressed their willingness to consider on their merits any plan submitted to them. Your Committee have now received a communication from the Trustees in the following terms:—

"THE GUINNESS TRUST.
17b, Great George-street, Westminster, S.W.,
May 22, 1890.

SIR,—I am directed by the Guinness Trustees to inform you that they have to-day had under their consideration the letter of April 14, from the Housing of the Working Classes Committee.

The Trustees are greatly obliged to the Committee for the assurance that, in the event of their submitting plans for building on the Cable-street site to the Committee, they will be considered on their merits, but as the Trustees have now obtained all the sites on which they are at present prepared to build, they are not in a position to treat for the site in question.

The Trustees regret there should have been any misunderstanding as to the requirements of the Committee, but they concluded from the communications they had with the Committee, that the general regulations of the Council were indispensable.

Yours faithfully,
(Signed) THOS. H. VICKERS, Captain,
H. De la Hooke, Esq., Secretary,
Clerk to the London County Council.

Your Committee report the above facts for the information of the Council.

"The Home Secretary, as already reported, has signified his consent to the modification of the Cable-street scheme, and to the arrangement with the School Board for London for the extinction of their right-of-way into Chancery place. Your Committee think that the land should now be offered for sale, and they recommend,—

"That the Corporate Property Committee be instructed, as soon as the necessary modifying order has been received from the Home Office, to offer for sale by auction the vacant land comprised in the Cable-street scheme, with a view to the erection of artisans' dwellings, four stories in height, for the accommodation of the 970 persons required to be re-housed."

The recommendation was agreed to, after some discussion.

The London Sewage Sludge.—The Main Drainage Committee reported as follows:—

"Your Committee hoped before this to have received the report of Sir Benjamin Baker and the Chief Engineer upon the sewerage system, and upon the approximate cost of conveying the sewage to an outfall upon the coast. But your Committee do not now expect that this report will be received before the recess, or that it can be in the possession of the Council in time to admit of Parliamentary notices being given in November if any scheme shall be recommended and accepted requiring such procedure. Your Committee are therefore forced to the conclusion that no alternative system, if such were constructed, could be in operation before the expiry of six years from the present time. Meanwhile, they are assured that the Crossness works will be completed and in full operation next summer. These conditions have led your Committee to consider the provision of another sludge-vessel. Improvements and experience have brought about a reduction in the volume of sludge by lessening the percentage of water carried away and discharged at sea, and it might be possible for the two vessels, upon a system of continuous working, together with the auxiliary force of pressing machines which are to be set up at Barking, to deal with the whole of the sludge made at the Barking and Crossness outfalls.

But in the event of serious accident to either of the vessels at a time when the boilers of the other ship were being cleaned, the whole of the crude sewage must be poured into the river. Your Committee have met with no success in their efforts to obtain assistance by hiring vessels. If the preliminary work of preparing plans and revised specification and the advertising for and obtaining tenders is deferred till after the vacation, it may not be practicable to get the vessel built and ready at the time of the opening of the Crossness works. The condition of the metal market and of shipbuilding renders the present time very favourable for placing such an order, and when the tenders are opened, the Council will probably be in possession of the report of Sir Benjamin Baker and the Chief Engineer, and will be able then to determine whether it is desirable to contract for the construction of the vessel. In these circumstances your Committee recommend—

"That tenders be obtained for the construction of a sludge vessel upon the model of the older and less costly ship, with certain modifications to be described by the Engineer."

Mr. Eneas Smith moved an amendment which proposed to refer the matter back to the Committee, to be brought up again when Sir Benjamin Baker's report should be in the hands of the Council; but after a long discussion, the amendment was negatived, on a division, by 34 votes against to 28 for, and the report of the Committee was then adopted.

London Water Supply.—The Special Committee on Water Supply and Markets reported as follows:—

"We have received a communication from the Town Clerk of the City of London to the effect that the City Corporation has by a Committee entered upon a public inquiry on the question of water supply, and that the Corporation will be glad if any member of the London County Council will attend the sittings. We consider that upon the question of the water supply of London it is most desirable that there should be united action on behalf of the County, and with a view to securing it we submit the following recommendation:—

"That the Special Committee on Water Supply and Markets be authorized to enter into communication with a Committee of the City Corporation with a view to the promotion next Session jointly by the Council and the Corporation of a Bill for (a) Revising the method by which the Water Companies now charge on a basis of rating; (b) giving power to the Council and the Corporation jointly to establish an independent water supply to the County of London."

This was agreed to, and, after transacting further business, the Council adjourned.

"A PLEA FOR THE IMPROVEMENT OF SIX- AND EIGHT-ROOMED HOUSES."

SIR,—The casual plan of mine you were good enough to publish (p. 437, *ante*), and to which your correspondents refer, is to no scale; and so it is manifestly unfair to criticise its scintillations. The original was drawn double the size of Mr. Knightley's for the purposes of reduction.

Permit me, however, to add that what I submitted was Mr. Knightley's "everlasting plan" re-arranged; and surely our resources are not exhausted with the alternatives on page 399.

The plaintive melody of Mr. Knightley's outcry, together with the flaunting of such mediocre plans, recalls the challenge of Bombastes concerning his boots.

WILLIAM A. PITE.

June 21, 1890.

THE SYMBOLISM OF THE PASTORAL STAFF.

SIR,—I cannot agree with Mr. Bagnall (p. 455, *ante*) in his explanation of the examples I have given respecting the alleged symbolism of the pastoral staff. So far, at least, as my experience goes, rather than being exceptional, it is the rule to find monastic effigies grasping the staff with its head turned outwards.

As is well known, the examples of sepulchral abbatial effigies are very limited in number, and some are too much mutilated to be of use in the point now under consideration. Of those fairly perfect, with which I am acquainted, I know but two having the staff turned inwards,—one at Peterborough, the other at Folesworth; besides these, with the staff turned outwards, besides those already given, we have two at Westminster (Abbots Crispin and Estesney), and two more at Peterborough, making six in all. Thus, if there be any significance in regard to the disposition of the staff, now current.

I may add, too, that in the case of ecclesiastical seals, both episcopal and conventual, we find the

staff sometimes turned towards, sometimes away from, the effigy; no order whatever being observed with reference to this distinction.

I have no opportunity of examining the grave-stones at St. Albans, but believe they would be found to bear out my contention. Though the brasses may have been purloined, the matrices will afford evidence equally valuable to anyone interested in making an investigation with reference to the matter in point.

Perhaps at some future time, I may, with your permission, deal somewhat more fully with this subject.
HENRY LITTLEHALES.

MECHANICAL ENGINEERS.

SIR,—Will any of your readers inform me if there are any county or other boarding schools where boys, in addition to the usual routine of a commercial education, are prepared for the calling of a mechanical engineer? And does the Institution of Mechanical Engineers examine youths presented from any of the above schools, and issue certificates? If it does, and any of your readers would kindly give the names of the most successful ones, it would be valued. Or is there any better way of fitting a youth for such a calling? The fees would have to be moderate.
A. B.

SPRAY JETS FOR WASHING.

SIR,—In your issue of June 7, your correspondent "W." asks for particulars of the washing apparatus referred to by Sir Edwin Chadwick in his address to "The Association," at Leamington. The inventor is Mr. W. Bartholomew (Messrs. B. Finch & Co.), 82, Belvedere-road, Lambeth, S.E.

I enclose a circular of the spray bath mentioned.
SAMUEL C. LEGG,
Hon. Sec. Association of Public Sanitary Inspectors of Great Britain.

** We printed a note a fortnight ago [p. 435] from Messrs. Doultou, stating that they had made the form of bath in question for Sir E. Chadwick. That referred to by Mr. Legg, as illustrated in the circular enclosed, is a kind of cupboard with folding doors, into which the bather steps, and regulates the spray, by two valves, to any desired temperature. The sides can be made of marble, slate, glass, or waterproof canvas.

DISSENTING CHURCH BUILDING NEWS.

Prescot (near Liverpool).—Designs prepared by Mr. Thomas W. Cubbon, architect, Birkenhead, have been adopted for a new Congregational Memorial Church and Schools, about to be erected in memory of the late Mr. Richard Evans, of Haydock, by his daughter, Miss Ruth Evans. The buildings are being erected at "The Holt," Prescot, on a site containing about 3,000 square yards fronting the main road to Rainhill, and will include a church providing seating accommodation for about 650 on the ground floor, having organ-chamber, vestry, cloak-room accommodation, &c., in connexion therewith; also school buildings, including large assembly-room for about 300 children, having four class-rooms at the rear, each for about eighteen scholars. The buildings will be decorated Gothic in character, the church being cruciform on plan, having transepts and chancel, the latter being fitted with rostrum and communion. Three main entrances are provided. The clearstory will be carried upon moulded arches and octagon pillars having moulded caps and bases which, together with chancel and other internal arches, will be of Cefn stone. The whole of the buildings will be faced externally with local red sandstone. A tower and spire occupies the south-west angle of the building, and reaches an altitude of over 120 ft. The schools, which harmonise with the larger building, have an octagon bell turret to the right of the main gable, from which it is corbelled out and carried upon red granite shafts. The whole of the internal woodwork will be of pitch-pine, varnished, the windows being filled in with enriched cathedral lead-lights. A contract has been entered into with Messrs. Hughes & Stirling, of Bootle and Liverpool, whose tender was the lowest submitted in a limited competition. The buildings will be erected under the personal supervision of the architect, whose designs were selected from a large number submitted for approval.

Penryn (Cornwall).—The Trustees of the Wesleyan Methodist Society of Penryn, Cornwall, have accepted the plans prepared by Mr. J. Wm. Trounson, F.R.I.B.A., Penzance, for their new chapel and school buildings. The estimated cost is 3,500.

Liverpool.—Mr. Alfred E. Grindrod, heating and ventilating engineer, of Dovey-street, Liverpool, has been successful in competition

for the beating of the United Methodist Free Church and Schools, Grove-street, Liverpool, and he has just completed the erection of his improved hot-water heating apparatus there.

CHURCH BUILDING NEWS.

The Quinton (Worcestershire).—On the 19th inst. Christ Church, The Quinton, was re-opened, after restoration and re-arrangement, by the Hon. and Rev. Canon Pelham, rector of Lambeth, formerly rector of Halesowen. The works have been carried out under the superintendence of Messrs. Osborn & Reading, architects, Birmingham, by Messrs. J. Smith & Sons, contractors.

Birmingham.—A reredos has been placed in the Church of St. Catherine, Nechells, Birmingham, as a memorial of the first vicar of the parish, the late Rev. T. H. Nock. The dedication was on Saturday last, when a sermon was preached by the Bishop of Worcester. The reredos is oak in panels, having carved, canopied, and crocketed gables between buttresses, and has been constructed by Messrs. Jeffrey & Son, from designs by Messrs. Osborn & Reading, architects, Birmingham.

ROMAN CATHOLIC CHURCH BUILDING NEWS.

Crewe.—A new Catholic church has just been commenced in St. Mary's-street, Crewe, from the design of Messrs. Pugin & Pugin, of 117, Victoria-street, Westminster, S.W. Messrs. Treasure & Son, of Shrewsbury & London, are the builders.

Herne Bay.—The new R.C. church of "Our Lady of the Sacred Heart" was opened on the 26th inst. The plan consists of nave, sanctuary, baptistry, and two aisles, and contains three altars and two confessionals. There is a priest's sacristy, with organ-chamber over. In addition there is a large refectory for the community, with choir over and a tribune opening on to the sanctuary. The interior length is 90ft., the width 44 ft., and the height to apex of ceiling 40 ft. The spire is 97 ft. high. The church is built of Purbeck stone, with Bath stone dressings, and the style of architecture adopted is Early English. The architect is Mr. Albert Vicars, of Somerset-chambers, 151, Strand, London. The contractor is Mr. Adams, of Herne Bay.

The Student's Column.

ELECTRICITY, MAGNETISM, AND ELECTRICITY SUPPLY.—XXVI.

LAMPS.

THE ordinary incandescent lamp, fig. 70, is too well known, and, indeed, too simple to need any special description. The ends of a thin carbon wire or filament, P, are cemented to two platinum wires, P P, sealed into a glass globe in which the most perfect possible vacuum has been produced. A current is sent through the filament and raises it to a white heat; the

Fig. 70.

filament cannot, however, burn, as there is nothing within the globe with which it can combine. Platinum wires are used to conduct the current to the filament, as platinum has practically the same co-efficient of expansion as glass; when, therefore, the glass has been pressed in a semi-liquid state round the wires, an air-tight junction still exists, after both have cooled.

The efficiency of a filament depends upon the temperature to which it is thought advisable to raise it; about 35 watts per candle-power may be taken as the power usually employed. If more power is forced upon an incandescent lamp, the candle-power increases in much greater proportion, but the time the filament will last also decreases in greater proportion. Reliable experimental data are still required on these points. There is a close connexion between an electric incandescent lamp and an ordinary gas flame, in the former a carbon filament is raised to incandescence by an electric current, in the latter finely divided carbon particles are liberated and heated to incandescence by burning gas.

Far more efficient, however, is the electric arc lamp; in it two carbon rods touch to allow a current to flow between them when they are separated an arc is established as previously explained. At the surface where the arc springs from the solid carbon the temperature approaches that of the sun, and the carbon is slowly turned into vapour which produces further heat by burning in the air. From the heated carbon surface comes a pure white light closely resembling sun light. The arc itself emits a cold violet light, but the light from the carbon surface is white. The reason why the light from arc lamps appears to be so blue is because it is usually seen at night in contrast with the warm yellow light from gas or incandescent lamps; but when seen in daylight the resemblance between the light emitted from an arc lamp and that from the sun is very striking.

The mechanism of an arc lamp is very intricate and of importance, as similar devices are used in many pieces of electro-magnetic apparatus employed in the distribution of electric-power.

Fig. 71.

Fig. 71 shows, in the form of a diagram, the essential parts of a Brush arc lamp, a lamp which may be regarded as the prototype of most of the modern ones. The current enters the positive terminal P, passes round the coils of a sucking magnet M, and thence to the positive carbon, across the arc A and out of the lamp through the negative terminal N. The core of the magnet is sucked up and tilts a washer W which grips the rod carrying the positive carbon, raising the whole to keep the carbons apart and produce the arc.

An electric arc hinders the passage of a current not only because it has a resistance of so many ohms but also on account of its introducing an opposing electromotive force of so many volts. As, however, this back E.M.F. may be regarded as equivalent, with a given current, to so many resistance, we shall speak simply of the resistance of the arc.

If a constant E.M.F. is maintained between P and N, the resistance of the arc gets greater as the carbons burn away, the current diminishes, and the core, slightly drooping, causes the washer to release the carbon-rod, and allows it to slip by its own weight, until the points of the carbons are the proper distance apart. The Brush lamp, however, was designed to work on a series or constant current circuit, so that while the arc is established and maintained in the way described, a supplementary coil is necessary for its regulation. From P there also starts a great length of very fine wire, f, taking a fraction of the current, in the opposite direction to the bulk of it, round the bobbin of M, and is then connected to N. The fine wire circuit is therefore placed as a shunt across P and N. When the resistance of the arc increases the difference of potential between P and N rises, and a larger proportion of the total cur-

rent flows through the fine wire, the shunt-current reduces the magnetic effect of the magnet bobbin until the core falls, and the length of arc is reduced. The Brush lamp is furnished with an excellent form of cut-out for use on a series circuit,—a piece of apparatus already referred to but not described. The fine or shunt-wire, after leaving the magnet M, passes round a second little magnet M'. When the current in f exceeds a certain amount owing to the increased resistance of the arc, the electro-magnet, m, becomes sufficiently strong to attract an iron lever, l, which makes a contact at K, and so closes a circuit between P and N, as shown in the figure. A few turns of this wire, B, are carried round the cut-out bobbin in order to hold l in position when the current in the fine wire has fallen, owing to this short-circuiting of the arc circuit. If the arc is re-established by the falling together of the carbons, so large a proportion of the current is taken from B that the lever l falls, and the cut-out ceases to act. A cut-out of this description can be used in conjunction with any piece of apparatus on a series circuit, and will open a new path for the current when the resistance of the apparatus in question exceeds a given amount.

There is little doubt that electricity supply will eventually be used more widely for power than for lighting purposes; it might, therefore, have been reasonably expected that more space, than that taken up by a few brief references, would have been devoted to motors. But so far motors have been comparatively rarely used, and they have not yet emerged from the controversial stage, though a few years will doubtless change all this. It has, therefore, been thought better to omit any special treatment of motors, and to regard them simply, as, indeed, they practically are at present, in the light of dynamo-machines, arranged to convert electrical into mechanical power.

CONCLUSION.

The rapid developments, now being made in all branches of electricity supply, are causing many to turn their attention to the general principles of electrical engineering. Unfortunately we are endowed with no special senses, by which we can detect the presence of electricity or magnetism, similar to those which enable us to feel matter, light, or heat; indeed, the "electric shock" produced by the passage of electricity through the body, is the only way in which electricity directly produces a sensation. There is, then, no cause for wonderment that most approach the subject as one of a shadowy nature, if not altogether involved in mystery. Now, though little may be definitely known about electricity itself, probably more facts have been brought to light about phenomena due to electrification, in its widest sense, than of those arising from any other cause. Far more is known about electricity than, for instance, gravitation; yet so familiar is every one with gravitation phenomena, that the mystery of gravitation is entirely overlooked in the simplicity of many of its effects. In the same way, then, will the uncertainty of the true nature of electricity and magnetism prove no bar to the complete understanding of the influences of electricity or magnetism on matter.

The science of electricity cannot be learnt from books, except for the purposes of examinations; the real grasp of the subject must be acquired in the laboratory and workshop. Every student, in any branch of science, has felt of how little value is the clearest description of a piece of apparatus, even with the aid of working drawings, compared with the knowledge and experience gained by the actual use of the real thing. Reading alone will, however, teach the object to be achieved and the underlying principles involved in any class of electrical plant.

Having in view these facts, we have avoided any attempt to give, by lengthy description of details, complete information about any special mechanism. For, even assuming that such descriptions would serve any useful purpose, the space at our disposal would have enabled us to teach no more than could be learnt during a few hours spent in a manufactory. We have endeavoured, therefore, to explain broad principles and methods in language free from the higher branches of mathematics and requiring only the most elementary knowledge of algebra and geometry. If the general principles according to which electric machinery is constructed be first understood, every piece of

British Archaeological Association.—The closing meeting of the session was held on the 18th, the Rev. S. M. Mayhew being in the chair. The discovery of an ancient dungeon in Lancaster Castle was announced by Dr. Harker. An apparently solid block of walling having attracted attention, an effort was made to penetrate the mass. Traces of an opening were soon met with, and a curious vaulted chamber, which must have been closed for many years, was laid open to view. Mr. Loftus Brock, F.S.A., described a small and curious leaden hodge, found in London, similar to the pilgrims' signs, consisting of one half of a Tudor rose joined to a comet-like tail. Mr. J. W. Grover, F.S.A., exhibited some iron keys worked to patterns of great beauty, one of which, found many years ago at Hitcham Rectory, Bucks, was probably the key of a reliquary. A Roman knife-handle, carved with figures, a dog chasing a rabbit of almost unique workmanship, found at Dorchester, was also exhibited. The chairman described a large and remarkable series of ancient articles brought by him for exhibition. Among the most curious were three small Roman bowls, perfect, found in London; several beautiful examples of Roman glass; and a British urn found a few weeks ago at Burgate, Canterbury, thus rendering evidence of occupation of the city anterior to the Romans. Of later date was a head of the Saviour, found in Cripplegate, and a small gold reliquary picked from a barrowful of old iron. A paper was then read by Mr. Wood on two round-towered churches of Essex, South Ockendon (St. Nicholas), and Bardfield Sailing (St. Peter and St. Paul). These two completed the description of the churches, six in all, in the county which possess round towers, the others having been previously described. South Ockendon has been "restored" in recent years, and its identity destroyed. During the process the ancient hour-glass was thrown away with the rubbish, but was fortunately recovered by the village blacksmith, and is now replaced. Bardfield Sailing Church is known to have been dedicated in 1380, and this date agrees with the appearance of the workmanship, although the base of the tower, like the first example, is probably of much older date. A paper was then read by Mr. Macmichael on "Ancient Horn Books," and several specimens were exhibited, some of which were lent for the purpose by Mr. John Evans, F.R.S. The proceedings terminated with a description of a Roman column and its base, of large dimensions, which has just been found in Water-gate-street, Chester, by Mr. Alderman Brown, who, with great public spirit, has preserved the remains *in situ*. The base is on the level of the street, showing that the latter must have existed at the same time, without regard to the levels of the Mediaeval "rows," which are much above it.

The New Montpellier Baths, Harrogate.—On Wednesday night a special meeting of the Harrogate Town Council was held in the Council Chamber, for the purpose of receiving the assessor's (Mr. Corson's) report on the final Montpellier Baths plans competition. Mr. Corson recommended that the set of plans No. 13 be awarded the first premium, set No. 12 second, set No. 26 third, and set No. 17 fourth. The names of the competitors having been kept a strict secret, the Mayor announced that the winners of the first premium, 150*l.*, were Messrs. Baggallay & Bristowe, of London; second, 100*l.*, Messrs. Thomas & Frank T. Verity, London, and Mr. W. Phipson, engineer, London; third, 75*l.*, Messrs. C. O. Ellison & Co., Liverpool; fourth, 50*l.*, Messrs. Morley & Woodhouse, Bradford.—*Leads Mercury.*

Artesian Well-Boring.—Messrs. C. Isler & Co., of Southwark, have recently completed artesian bore tube wells for the following among other breweries:—Mr. J. A. Chadwick, Burton Brewery, Wrexham, where the depth reached is 331 ft., and the water rises 10 ft. above the surface; Mr. J. W. Wright's Brewery, Leeds, where what appears to be an inexhaustible supply has been tapped a few yards deeper than the depth of the original well (formerly the supply could be exhausted after a few hours' running).

Fox Hill, Berkshire.—This pleasantly-situated property, in White Knight's Park, near to Reading, is placed in the market by the late Mr. A. E. Phillips's executors. The house, standing in a small park, was built *circa* 1870, after the Gothic style, by Mr. Alfred Waterhouse, R.A., for his own occupation, and there he lived for some time. Nearly all the estate is leasehold, with sixty-eight years still to run.

International Congress of Hygiene and Demography, 1891.—The seventh International Congress of Hygiene is to be held in London next year. The Congress has been held (biennially as a rule) in each of the following cities:—Brussels, Paris, Turin, Geneva, The Hague, and Vienna. The last Congress was held at Vienna in 1887. Before the close of that Congress a Permanent International Committee was appointed to decide on time and place of meeting of the next Congress of the series. On account of the fact that it had been decided to hold a Hygienic Congress in connection with the Paris Exhibition in 1889, it was resolved that the next International Congress of the series should be held in 1891, and London was chosen as its place of meeting. As England has taken the lead in sanitary science and administration, it may be expected that her Colonies and that Foreign Countries will send numerous representatives, both official and unofficial, and that the Congress will be of great magnitude and importance. The aim of the Congress is to awaken public interest in the progress of hygienic and demography, by which latter term is understood the study of the life conditions of communities from a statistical point of view; to afford persons interested in these subjects an opportunity of meeting, with the object of advancing their progress; and, by conferences and debates, to elucidate questions relating to hygiene, demography, and public health. The Governments of all countries, Municipalities, County Councils, and other provincial administrations, Public Health Authorities, Universities, Colleges, and all Societies which are occupied in the study of the sciences more or less immediately connected with hygiene are invited to co-operate and appoint delegates to represent them at the Congress. An exhibition of articles of hygienic interest will be held in connection with the Congress. A meeting in support of the objects of the Congress will be held at the Mansion House on Thursday next.

Properties for Sale.—(1) Lord Waterpark's Doveridge Hall Estate, of about 2,000 acres, Derbyshire, close to Uttoxeter Station, and near to Derby and Burton-on-Trent, and having a net rental of about 6,000*l.* a year. The finely-situated mansion was built in 1763, and is at present rented by Lord Hindlip. (2) The late Sir William Heatcote's agricultural estates, covering about 10,000 acres, lying between Winchester and Romney, together with two farms, of 1,720 acres, at Stoke Charity, Micheldever, and the sporting estate of Fullerton, Andover (600 acres), with fishing in the rivers Anton and Test. These will be offered in thirty-three lots at the Mart on July 9. (3) Furze Caundle Manor, Dorsetshire, a freehold of nearly 500 acres in all, and including a good fifteenth-century manor-house, with banqueting-hall, minstrel's gallery, and principal apartments panelled and roofed with oak. (4) Rawdon House, Hoddesdon, Hertfordshire, a Jacobean mansion built in 1622, and since restored. The conduit mead and conduit house will be included in the sale. The conduit was given to the town by one Marmaduke Rawdon in 1679,—it is mentioned in no very complimentary terms by Matthew Prior in his ballad "Down Hall." Hoddesdon was long famous for its old houses and inns; one of the former, known as Champion House, was for a long time a residence of the Dymock family. (5) The Marlborough Rooms, Regent-street, adjoining the Polytechnic Institute, held on lease, and licensed for music, dancing, &c. (6) The Albert Palace, Battersea, is still in the market, no bid having been made when it was put up at auction on the 12th inst.

The Carpenters' Strike in Dublin.—On Tuesday morning a deputation from the joint committee of the carpenters on strike had an interview with Mr. Wardrop, the secretary of the Employers' Committee, with reference to a settlement. Mr. Wardrop expressed the opinion that if the men were to him that they would be willing to fix October 1 instead of September 1 as the date when the shorter hours should begin he would summon a meeting of his committee. The joint committee of the men held a meeting on Tuesday night at their rooms near the Metal-bridge. Bachelor's walk, to discuss the matter, but no definite result was arrived at, according to the *Arbman's Journal*. According to the same authority, it appears that a large number of men have already resumed work on the terms that the shorter hours should begin on September 1.

The Liverpool Engineering Society at Thirlmere.—The Liverpool Engineering Society made a visit of inspection to the Thirlmere works on Saturday last. The party, numbering about twenty-five, reached Keswick the previous evening, and on arrival visited the works of the Keswick Electric Lighting Company. (These works were described in the *Builder* for May 31 last, p. 397.) On Saturday morning the visitors made an early start for Thirlmere, where they were met by Mr. E. P. Hill, the resident engineer, who conducted them over the works. The dam, like that of Lake Vyrnwy, will, according to the *Liverpool Post*, be founded upon the solid rock, which is now being excavated and prepared for that purpose. The discharge tunnel is being bored through massive rock, which occupies the middle of the valley, and which will itself form a substantial part of the dam. The lake is to be raised about 50 ft. in level, and the effect of this will be to nearly double the water area of Thirlmere. The basin or watershed area is about one-half that at Vyrnwy, but the rainfall, and consequently, the available water per acre of ground, is somewhat greater. On the other hand, the Thirlmere aqueduct will be nearly half as long again as that of Vyrnwy. A very considerable part of the aqueduct consists of tunnelled conduit, the longest tunnel passing under Dunmail Raise, and being very nearly completed. This tunnel is nearly four miles in length, and it is expected that the miners, who can already hear one another at work, will meet in a fortnight's time. Inspection of the outlet works showed that very complete arrangements would be made for controlling and regulating the flow down the aqueduct; and strainers, to be placed in a well already built for the purpose, will ensure the clearness of the supply. As most of our readers will know, the Thirlmere scheme is mainly intended for the supply of Manchester with water.

"Expanded" Metal.—On the 18th inst., the formal opening of a new industry took place at West Hartlepool, viz., that of the British Metal Expansion Co., Limited, on the site of the Stranton Steel Works, a concern long since defunct. "A complete industry in one machine" is described as the expression of a visitor on seeing the metal produced. The raw material, consisting of strips of mild steel, is transformed into the finished article (which somewhat resembles diamond netting or lattice work) by the single operation of slitting the metal into strands, leaving uncut connecting spans, and expanding or opening the metal at the incisions; the cut edges thus become the surface of the finished sheet, which is many times the superficial area of the original strip. A strip of steel 6 in. in width of any desired length is fed into a powerful automatic machine, which with great rapidity and accuracy performs this operation and produces a sheet of expanded metal 4 ft. wide or eight times larger than the strip. The works of the Company have three of these machines in operation, which produce fencing of 2½ and 4 in. mesh, designed for railways, farms, parks, lawns, &c.; and 1½ in. mesh, designed for an almost innumerable variety of purposes, such as guards for windows, skylights, doors, arbours, and in fact the whole range of horticultural trellis work. This last machine also produces expanded metal lathing of various sized mesh in sheets about 8 ft. long by 2 ft. wide. Expanded metal lathing possessing the essential features of flatness, rigidity, and quickness of application, is one of the most important products of these machines. By its use for walls and ceilings a building is rendered to that extent fireproof; it is in fact a builders' material, as both the outer and inner finish of a building may be made fireproof with this lathing, nailed upon proper studding and covered with cement or plaster.

Argyllshire.—The sporting estate of Melfort, in Argyllshire, lying at the head of Loch Melfort, near to Oban and westwards of Loch Awe, is offered for sale by private tender. It extends over 3,600 acres, yielding an estimated rental of 1,355*l.* per annum. King James II. gave grant of the Barony of Melfort, with Duhal, to John Drummond, son to James, third Earl of Perth, who was advanced Earl of Melfort in 1686. Attainted in 1695 by the Scots Parliament "for having been seen, at St. Germain's," whether he had accompanied his sovereign, Lord Melfort died in Paris in 1744. The titular honours were restored, on reversal of the attainder, to his descendant about forty years ago.

The Manganese Bronze and Brass Company's Works, Deptford.—Manganese bronze (Parsons's patent) has for some years taken a most important place amongst materials for the manufacture of screw propellers and other purposes requiring a combination of strength, toughness, and hardness. The premises originally built for the Company in 1883 at St. George's Wharf, Deptford, have recently been nearly doubled in extent, and now, it is said, form the largest alloy foundry in Britain. The works now consist of a foundry 200 ft. in length; the width between the large stanchions carrying the gantry girders and roofs is 29 ft. 6 in., and the gantry girders are calculated to carry 25 tons in addition to the weight of the traveller. There are in addition rolling mills 128 ft. by 60 ft., ingot foundry, drying shed, engine sheds, ingot stores, pattern shop, offices, &c., the whole having a river frontage of 232 ft., where two jetties have been constructed in connection with the works. These buildings, for which Mr. Thomas Arnold acted as architect, presented some special difficulties in construction, the most important arising from the nature of the foundation. The site being little more than alluvial deposit quite unfit to carry the concentrated weights of the various stanchions, chimneys, &c., it became absolutely necessary to carry down all important bearings in cement concrete to the firm bed of gravel which was found generally at about a depth of 22 ft. below the surface. The main portion of these works has been carried out by Messrs. Kirk & Randall, of Woolwich; the jetties and one of the large chimneys were built by Mr. Samuel Chafin, of Rotherhithe.

Baths, Newport (Mon.).—The new baths here were officially opened by the Mayor of Newport (Mon.), on Thursday, the 19th inst. These baths were designed by the Borough Engineer, Mr. Conyers Kirby, and the building contains two plunge baths (first and second class), eighteen slipper baths (first and second—male and female), and a complete suite of Turkish baths, together with laundry plant for towel washing, &c. The whole of the engineering work was carried out by Messrs. Bradford & Co., London and Manchester. The plunge baths are heated by steam, as are also the dressing-boxes and corridors to the various baths. The Turkish baths are heated by an improved furnace specially designed by the above firm, the temperature in the hot rooms ranging from 300 deg. in the first room to 180 deg. in the third. Special attention has been paid to the admission of fresh air and the extraction of the vitiated atmosphere. A supplementary boiler is provided for hot-water supply to Turkish and slipper baths and laundry, and a gas-engine is also provided in the latter; so that in the event of the plunge baths being closed during the winter months, the remaining baths and the laundry could be worked independently of the steam boiler.

The Sanitary Institute's Examinations for Local Surveyors.—At an examination for Local Surveyors, held by the Sanitary Institute on June 19 and 20, eighteen candidates presented themselves. Questions were set to be answered in writing on the 19th, and the candidates were examined *visu voce* on the 20th. The following candidates were certified to be competent, as regards their sanitary knowledge, to discharge the duties of Local Surveyor:—Thompson Clothier; George Alexander Craig; Neville Brooke Davis; Arthur Charles James; George Percival Milnes; Elsie John Poggio; James Thorpe; and Arthur Gray Wallis.

New Premises at Holloway.—In our description of Mr. Benles' new premises at Holloway, in our issue of the 14th inst., it was stated that the whole of the ironwork was supplied by Messrs. Homan & Rodgers. Messrs. W. H. Lindsay & Co., of South Wharf, Paddington, write to say that they supplied the constructional ironwork and the fireproof flooring to the main building, together with the balcony railing and the cresting over the shops.

The Royal South London Ophthalmic Hospital.—The Prince of Wales has fixed Thursday, the 24th of July, for laying the foundation-stone of the new building for the Royal South London Ophthalmic Hospital, St. George's Circus, Southwark.

Vicarage, St. Arvans, Monmouthshire.—A new vicarage has just been completed at St. Arvans, near Chepstow. The architects were Messrs. Osborn & Reading, Birmingham, and Mr. James Morgan, of Rockfield, Monmouth, was the contractor.

The Condition of the River Lea.—No question of sanitation has a more vital importance than that which deals with the purity and cleanliness of the rivers in this country, and more especially with those in the immediate neighbourhood of vast cities. The subject is continually being rudely brought before the public either by outbreaks of epidemic diseases or through means of the susceptibilities of the organs of special sense. For some years a sanitary war has been waging between the various parties to whom the interests of what concerns the River Lea and the inhabitants on its banks respectively have been entrusted. The latest phase of the conflict is the appearance of the Tottenham Local Board of Health at the Edmonton Petty Sessions before the local justices, in answer to a summons issued at the instance of the Lea Conservancy Board. After bearing as much of the case as to leave but little doubt of the insanitary condition of the river below the Tottenham outfall, technical objections as to the non-responsibility of the Tottenham Board of Health were urged, and the Bench decided that the responsibility rested with the Joint Drainage Committee of the Tottenham and Wood-green Local Boards. Having, then, this assurance, we hope speedily to see this joint committee spontaneously concerting measures to amend a state of matters which cannot but be a source of danger.—*Lancet.*

Surveyorship, Hertford.—Mr. T. R. Dickinson, A.M.I.C.E., Deputy City Surveyor of York, has been appointed Borough Surveyor, Waterworks Engineer, and Inspector of Nuisances to the Corporation of Hertford. Eighty-eight applications for the post were received.
